1. *R. multiflora* Thunb. Stems 1-2 m. tall, climbing, reddish, the prickles mostly paired, infrastipular, curved, flattened: leaflets 5-9, deciduous; blades mostly obovate or elliptic, 2-3.5 cm. long, obtuse or acute, sharply serrate, dull above, grayish-green beneath, softly pubescent, petiolulate: flowers in pyramidal corymbs, often many together; pedicels softly pubescent: sepals ovate-lanceolate, 12-15 mm. long, short-acuminate or with lanceolate appendages, densely pubescent, the outer often lobed, in fruit reflexed and deciduous: petals mostly white, 10-15 mm. long: mature hypanthium globose to ellipsoid, pubescent.—(JAPANESE-ROSE.)—Thickets and roadsides, various provinces, Ala. to Md. Nat. of E Asia.—(C. A.)

2. *R. moschata* Mill. Stem several m. long, sarmentose or climbing, the prickles scattered, somewhat curved, rather strong: leaf-rachis sparingly glandular: leaflets 5-7; blades oval, elliptic, or lanceolate-elliptic, 1.5-7 cm. long, more or less acuminate, finely serrate, usually pubescent and paler beneath, more or less persistent: flowers corymbose: pedicels more or less glandular-hispid: sepals narrowly lanceolate, long-acuminate, caudate-attenuate, 15-20 mm. long, glandular and pubescent without, tomentose within, soon reflexed and in fruit deciduous, the outer sometimes lobed: petals white, 15-20 mm. long: mature hypanthium ellipsoid, more or less pubescent and glandular.—(MUSK-ROSE.)—Roadsides, waste-places, and about gardens, Coastal Plain, Ala. Nat. of S Asia.—(W. I.)

3. *R. setigera* Michx. Stems 2-5 m. long, climbing, glabrous, the prickles scattered, curved, flattened: leaflets 3, or on the new shoots sometimes 5, the median long-petiolulate, the lateral ones nearly sessile; blades lanceolate, or rarely ovate, 4-9 cm. long, dark-green, glabrous and shining above, pale and glabrous beneath: flowers corymbose: pedicels glandular-hispid: sepals glandular-hispid on the back: petals 2-3 cm. long, pink: mature hypanthium globose to broadly ellipsoid, more or less glandular-hispid.—(PRAIRIE-ROSE.)—Thickets, low-grounds, and woods, various provinces, N Fla. to Kans., Ky., and N. C.; also naturalized further N E.

4. *R. rubifolia* R. Br. Stems 2-4 m. long, climbing, glabrous, the prickles curved, flattened, scattered: leaf-rachis glandular and sometimes prickly: leaflets 3 or rarely 5; blades usually ovate, or ovate-lanceolate, 3-7 cm. long, abruptly acuminate, serrate with gland-tipped teeth, glabrous and rather dull above, pale and densely short-villous, almost velutinous beneath: flowers

corymbose: pedicels glandular-hispid: sepals ovate, 12–15 mm. long, abruptly acuminate, glandular as well as pubescent on the back: petals 1.5–2.5 cm. long, pink: mature hypanthium globose or rounded-ellipsoid, glandular-hispid, purple.—Woods, thickets, and fence-rows, various provinces N of Coastal Plain, Ga. to Tex., Wis., and Ont.—Specimens of a representative of the group INDICAE, with distinct exserted styles, have been collected at Mobile, Ala. The plant has small obtuse leaflets and small flowers.

5. *R. laevigata* Michx. Stems 2–5 m. long or more, high-climbing, the prickles stout, recurved, more or less flattened, rarely with some intermixed bristles: leaflets 3 or rarely 5; blades lanceolate or elliptic, finely but sharply serrate, evergreen, subcoriaceous, glabrous, dark-green and shining above, paler and reticulate beneath, petioled: flowers solitary: peduncle and hypanthium strongly hispid: sepals often more or less glandular-bristly: petals cuneate-obcordate, 3–4 cm. long, white or rarely pink: mature hypanthium pyriform, bristly, 3.5–4 cm. long. [*R. cherokeensis* Donn.]—(CHEROKEE-ROSE.)—Woods, roadsides, and thickets, Coastal Plain and adj. provinces, Fla. to Tex. and N. C. Nat. of China.—(W. I.)

6. *R. bracteata* Wendl. Stems greatly elongate, usually decumbent or sarmentose, the prickles usually paired, stout, recurved: leaflets 5–9, persistent; blades coriaceous, glabrous or lightly pubescent on the midvein beneath, dark-green and shining above, paler beneath, obovate to oval, finely serrulate, short-petioled: flowers solitary or a few together, short-pedicelled: sepals tomentose on both sides: petals white or pink, about 3 cm. long, deeply oboordate: mature hypanthium pyriform, 1.5–2 cm. long, densely tomentose.—(MAC-ARTNEY-ROSE. HEDGE-ROSE.)—Pine woods, prairies, and thickets, Coastal Plain, Fla. to Tex. and Va. Nat. of China.—(W. I.)

7. *R. tomentosa* Smith. Stems 2 m. tall or less, often with elongate drooping branches, the prickles straight or nearly straight, often paired, somewhat flattened toward the base: leaf-rachis villous and glandular-hispid, sometimes prickly: leaflets 5–9; blades oval or ovate, 2–4 cm. long, acute or short-acuminate at the apex, rounded at the base, more or less doubly serrate, finely appressed-pubescent above, villous and glandular-pruinose beneath: flowers solitary or few together: pedicels often glandular-hispid: sepals lanceolate, about 2 cm. long, glandular on the margins and on the back, acuminate, usually more or less lobed, tardily deciduous before the ripening of the fruit: petals 18–20 mm. long, pale-pink: mature hypanthium globose or somewhat ellipsoid, 9–13 mm. long, often glandular-hispid at the base.—Rich soil and thickets, Coastal Plain, N. C. and Tex. Nat. of Eu.

8. *R. rubiginosa* L. Stems 2 m. tall or more, climbing or reclining, the prickles strong, flattened, curved, sometimes accompanied by bristles: leaf-rachis glandular-hispid, and prickly; leaflets 5–7; blades suborbicular or broadly oval, 1–3 cm. long, rounded at both ends or acutish at the apex, 1–3 cm. long, doubly serrate with gland-tipped teeth, densely glandular-pruinose beneath: flowers 1–4 together, subtended by foliaceous bracts: pedicels glandular-hispid: sepals lanceolate, 15–18 mm. long, caudate-attenuate, ultimately spreading, tardily deciduous: petals bright-pink, 1.5–2 cm. long: mature hypanthium pyriform or ellipsoid, 12–15 mm. long, orange or scarlet, often bristly at least near the base.—(SWEET-BRIER. EGLANTINE.)—Roadsides, woods, and waste-places, various provinces, Ga. to Miss., Kans., Pacific coast, Ont., and N. S. Nat. of Eu.—The bruised leaves give off the fragrance of ripe apples.

9. *R. micrantha* Smith. Stems 4 m. long or less, climbing or reclining, the prickles uniform, hooked, flattened: leaf-rachis pubescent and glandular-

hispid, rarely prickly: leaflets 5-7; blades broadly ovate, 1-3 cm. long, rounded at the base, short-acuminate at the apex, more or less pubescent on both sides, and densely glandular-pruinose beneath, doubly serrate with gland-tipped teeth: flowers 1-4 together: pedicels glandular-hispid, 1-2 cm. long: sepals lanceolate, caudate-attenuate, 12-18 mm. long, glandular-hispid on the back, tomentose within, more or less lobed: petals 10-15 mm. long, pink: mature hypanthium narrowly ellipsoid, 15-20 mm. long, tapering at both ends, glabrous.—Roadsides, banks, and open woods, various provinces, S. C. to Tex. and Mass.; also Wash. and Ore. Nat. of Eu.

10. *R. canina* L. Stems erect, 2-3 m. tall, upright, terete, the prickles uniform, stout, curved, flattened: leaf-rachis often glandular-hispid, otherwise glabrous; leaflets 5-7; blades oval or ovate, 1-4 cm. long, acute, glabrous on both sides, shining above, not at all glandular beneath except rarely so on the midrib, sharply-serrate, occasionally with double teeth: flowers 1-3 together; pedicels glabrous, 1-3 cm. long: sepals lanceolate, caudate-attenuate, 15-20 mm. long, glabrous on the back, tomentose within, entire or with linear lobes, in fruit reflexed and deciduous: petals about 2 cm. long, pink: mature hypanthium ellipsoid, 16-20 mm. long, acute at both ends, glabrous, orange, red, or scarlet.—(DOG-ROSE. DOG-BRIER. BRAMBLE-ROSE.)—Waste places, hill-sides, and woods, various provinces, Tenn. to D. C. and Mass. Nat. of Eu.

11. *R. palustris* Marsh. Stems erect, 0.3-2 m. tall, sometimes reddish, glabrous, the prickles strong, but rather short, curved, usually paired, flattened at the base: leaf-rachis pubescent, rarely prickly, not glandular or rarely slightly so: leaflets 7, rarely 9; blades lanceolate-elliptic, or oblanceolate on vigorous shoots, sometimes elliptic, usually acute at both ends, 2-6 cm. long, finely and closely serrulate, with simple non-glandular teeth, dull, dark-green, glabrous or nearly so above, paler and more or less finely appressed-puberulent beneath, at least on the veins, short-petioluled flowers usually corymbose, sometimes solitary: pedicels short, usually glandular-hispid: sepals narrowly lanceolate, caudate-attenuate, 2-2.5 cm. long, sometimes with foliaceous tips, glandular-hispid on the back, tomentose within and on the margins, reflexed or spreading after anthesis, soon deciduous: petals pink, 1.5-2 cm. long: mature hypanthium subglobose or somewhat depressed, 10-12 mm. broad, glandular-hispid, usually acute at the base. [*R. carolina* L. 1762. Not 1753.]—(SWAMP-ROSE.)—Swamps and low grounds, various provinces, Fla. to Miss., Minn., and N. S.

12. *R. floridana* Rydb. Stems 1 m. tall or less, with spreading branches, reddish, glabrous, the prickles short, curved, somewhat flattened at the base: leaf-rachis glabrous or slightly pubescent, unarmed: leaflets 5; blades elliptic, varying to ovate or obovate, 1-4 cm. long, acute at each end, finely and closely serrulate, with simple, non-glandular teeth, dull and dark-green and glabrous above, somewhat paler and usually glabrous beneath: flowers usually solitary, rarely in pairs: pedicels usually glandular: sepals linear-lanceolate, caudate-attenuate, 2-2.5 cm. long, glandular-hispid on the back, tomentose on the margins, reflexed after anthesis and soon deciduous: petals obovate, 1.5-2 cm. long, pink: mature hypanthium globose or somewhat depressed, glandular-hispid, 8-9 mm. thick.—Open woods, low-ground, and river-banks, Coastal Plain, E Fla. to N. C.

13. *R. virginiana* Mill. Stems 2 m. tall or less, glabrous or bristly on the shoots, the prickles stout and straight or slightly curved but often somewhat reflexed, decidedly flattened: leaflets 7-9; blades lanceolate-elliptic, 2-6 cm. long, usually acute at both ends, dark-green and shining, glabrous above, pubescent on the veins or glabrous beneath, serrate with numerous sharp, strongly ascending teeth: flowers corymbose, rarely solitary: hypanthium glandular-hispid: sepals narrowly lanceolate, 2-2.5 cm. long, caudate-attenuate,

after anthesis reflexed and deciduous: petals pink, 2-3 dm. long: mature hypanthium depressed-globose, 1-1.5 cm. long.—Moist thickets, low woods, shores, and swamp-margins, various provinces, Ala. to Ark., Ont., Newf., and Va.

14. *R. obtusiuscula* Rydb. Stems about 1 m. tall, dark-brown, practically unarmed: leaf-rachis sparingly pubescent, unarmed: leaflets 5 or 7; blades elliptic, 1-4 cm. long, rounded at the apex, crenate, dark-green, glabrous on both sides or sparingly pubescent beneath: flowers 1-4 together: pedicels short, sparingly glandular: sepals lanceolate, caudate-attenuate, 1.5-2 cm. long, rather copiously glandular-hispid, spreading and at last deciduous: mature hypanthium depressed-globose, 8-10 mm. long, sparingly glandular-hispid.—Wooded slopes and river-banks, Appalachian Valley, Tenn.

15. *R. Lyoni* Pursh. Stems 3-15 dm. tall, glabrous, more or less bristly, especially on the young shoots, the prickles infrastipular, spreading, usually slender and terete, or rarely stouter and then slightly flattened below: leaf-rachis villous, sometimes prickly or glandular-dentate: leaflets 5-7; blades oval to lanceolate-elliptic, 1.5-5 cm. long, usually acute at both ends or rarely obtuse at the apex, regularly serrate, the lateral ones short-petioluled, rather thin and dull, sparingly pubescent or glabrate above, decidedly villous beneath: flowers 2-4 and corymbose or solitary: pedicels glandular-hispid: sepals lanceolate, caudate-acuminate, 1.5-2 cm. long, glandular-hispid on the back, tomentose within, some of them usually with linear or subulate lobes, after anthesis reflexed and soon deciduous: petals pink, 2-2.5 cm. long: mature hypanthium usually depressed-globose, 8-10 mm. long, more or less glandular-hispid or rarely glabrous.—Woods and prairies, various provinces N of Coastal Plain, Ga. to Ark., Kans., Minn., and N. Y.

16. *R. carolina* L. Stems 3-10 dm. tall, slender, glabrous, usually very bristly when young, the prickles slender, straight, paired, terete, infrastipular: leaf-rachis sparingly pubescent or glabrous, rarely with a few prickles: leaflets usually 5, rarely 7; blades 1-3 cm. long, elliptic or lanceolate-elliptic, rarely oval, or oblanceolate, glabrous, but not very shining above, usually somewhat paler and pubescent on the veins or glabrate beneath, sharply and regularly serrate with ascending teeth, usually acute at both ends or obtuse at the apex, short-petiolulate: flowers usually solitary: pedicels glandular-hispid: sepals lanceolate, caudate-acuminate, 1.5-2 cm. long, usually very glandular on the back, tomentose within, all, or at least the outer ones with linear or subulate lobes, reflexed after anthesis and soon deciduous: petals pink, 2-2.5 cm. long: mature hypanthium globose or a little depressed, about 8 mm. long, glandular-hispid. [*R. humilis* Marsh.]—(LOW-ROSE. WILD-ROSE. CAROLINA-ROSE. PASTURE-ROSE.)—Dry woods, hillsides, thickets, and rocky soil, various provinces, Fla. to Tex., Kans., Minn., and N. S.

17. *R. serrulata* Raf. Stems 3-10 dm. long, glabrous, but bristly, especially on the young shoots, the prickles slender, infrastipular, straight, terete: leaf-rachis glandular-hispid, otherwise glabrous or nearly so: leaflets usually 5, rarely 3 or 7; blades lanceolate-elliptic or rarely oval, 1-4 cm. long, acute at both ends, light-green, glabrous or nearly so and somewhat shining above, often paler, glabrous or slightly pubescent on the veins and sometimes glandular beneath, sharply serrate with gland-tipped teeth, some of which are often denticulate or glandular-ciliate: flowers solitary: pedicels more or less glandular-hispid: sepals lanceolate, glandular-hispid on the back, tomentose within, caudate-acuminate, 2-2.5 cm. long, some of them usually with lanceolate or subulate appendages, after anthesis reflexed and soon deciduous: petals pink, 1.5-2.5 cm. long: mature hypanthium globose or slightly depressed, 10-15 mm. broad, glandular-hispid.—Roadsides and thickets, various provinces, Fla. to Tex., Ont., and Mass.—(*Mex.*)

18. *R. lancifolia* Small. Stems 1-2 m. tall, gray, the prickles stout, straight, only slightly flattened: leaf-rachis sparingly strigose: leaflets 3-7; blades lanceolate or elliptic-lanceolate, 2-6 cm. long, acute, subcoriaceous, finely crenate-serrulate, glabrous, somewhat-shining above, sessile: flowers corymbose: pedicels short, glabrous or sparingly glandular: sepals narrowly lanceolate, caudate-attenuate, about 2 cm. long, often with a few subulate lateral lobes, glandular-hispid on the back: petals pink, 1.5-2 cm. long: mature hypanthium somewhat glandular-hispid, globose, in fruit 8-10 mm. thick.—Margins of cypress swamps, pen. Fla.

FAMILY 13. CALYCANTHACEAE — STRAWBERRY-SHRUB FAMILY

Shrubs or trees, with an aromatic bark. Leaves opposite: blades usually entire: stipules wanting. Flowers perfect, terminal. Calyx and corolla of several sepals and petals each, borne on the edge of the hypanthium. Androecium of many stamens, the inner reduced to staminodia. Gynoecium of numerous distinct carpels borne on the inside of the hypanthium. Fruit consisting of several achenes enclosed in the capsule-like hypanthium.—Two genera and 6 species, North American and Asiatic.

1. **CALYCANTHUS** L. Shrubs with opposite branches. Flowers often strawberry scented, the perianth, wholly or mainly, dull purple. Mature hypanthium nodding. [*Butneria* Duham.]—Five species, the following and one Californian.—CAROLINA-ALLSPICES. SWEET-SHRUBS. BUBBY-SHRUBS.

Leaf-blades not tomentose beneath.

Lower surface of the leaf-blades glabrous, not glaucous.

Lower surface of the leaf-blades glaucous.

Leaf-blades tomentose beneath:

Blades of an ovate type, obtuse or subcordate at the base.

Blades of an elliptic or oval type, acute or acuminate at the base.

1. *C. nanus*.

2. *C. fertilis*.

3. *C. Mohrii*.

4. *C. floridus*.

1. *C. nanus* (Loisel.) Small. Shrub 1-3 m. tall: leaf-blades deep-green and scabrous above, slightly paler-green beneath: sepals and petals linear or linear-lanceolate: seed 10-12 mm. long. [*C. laevigatus* Willd.]—Woodlands and banks, Appalachian Plateau, extending into adj. provinces, Ga. to La. and Pa.

2. *C. fertilis* Walt. Shrub 1-3 m. tall: leaf-blades bright-green and scabrous above, glaucous beneath: sepals and petals linear or nearly so: mature hypanthium glaucous: seed 12-14 mm. long. [*C. glaucus* Willd.]—Woods and banks, Blue Ridge and Appalachian provinces, Ga. to Ala., Ky., and Va.

3. *C. Mohrii* Small. Shrub 1-2 m. tall: leaf-blades 6-20 cm. long, somewhat toothed: sepals and petals broadly linear to linear-oblancoate, 2-3 cm. long: mature hypanthium not seen.—Rocky soil, Appalachian Plateau, Ga., Ala., and Tenn.

4. *C. floridus* L. Shrub 0.5-3 m. tall: leaf-blades 4-14 cm. long, entire: sepals and petals mostly linear or nearly so, 1.5-2 cm. long: mature hypanthium finely tomentose.—(SHRUB. STRAWBERRY-SHRUB. BUBBY-BLOSSOMS.)—Rich woods, hillsides, and stream-banks, Coastal Plain and Piedmont, rarely extending into other provinces, Fla. to Miss. and Va.—Frequently cult. even northward of its natural range as an ornamental.—Spr.

## FAMILY 14. MALACEAE — APPLE FAMILY

Trees or shrubs. Leaves alternate: blades simple and pinnately veined, or pinnately compound. Flowers perfect, regular. Hypanthium adnate to the ovary. Calyx of mostly 5 sepals. Corolla of mostly 5 petals. Androecium of numerous, or rarely few, stamens. Gynoecium of 2-5 wholly or partially united carpels, or rarely of 1 carpel. Fruit a pome. About 20 genera and 500 species of wide geographic distribution.

Endocarp of the mature carpels papery or thin coriaceous.  
Endocarp of the mature carpels bony, distinct or coherent.

I. MALEAE.  
II. CRATAEGEAE.

## I. MALEAE

Leaf-blades pinnately compound.

Leaf-blades simple, entire, toothed, or lobed.

Cavities of the ovary (carpels) as many as the styles.

Cyme simple; pome relatively large.

Pome elongate, broadened upward; flesh with grit-cells; hypanthium-orifice nearly closed by a disk.

Pome depressed, not dilated upward; flesh without grit-cells; hypanthium-orifice open.

Cyme compound: pome small, berry-like.

Cavities of the ovary becoming twice as many as the styles.

1. *SOREUS*.

2. *PYRUS*.

3. *MALUS*.

4. *ARONIA*.

5. *AMELANCHIER*.

## II. CRATAEGEAE

Ovules solitary in each carpel, or, if 2, dissimilar.  
Ovules 2 in each carpel, alike.

6. *CRATAEGUS*.

7. *COTONEASTER*.

1. **SORBUS** [Tourn.] L. Leaf-blades pinnate: leaflets toothed. Cyme compound, flat-topped. Hypanthium urceolate, not bracteolate. Corolla white. Pome berry-like, bright-colored, persistent.—About 10 species, natives of the north temperate zone.

1. *S. americana* Marsh. Small tree, with smooth bark: leaflets 11-17; blades lanceolate, acuminate, glabrous or slightly pubescent when young, 3.5-10 cm. long, sharply serrate with mucronate teeth: cymes 8-15 cm. broad: corolla creamy white, 4-6 mm. broad: pome globose, bright-red, 4-6 mm. in diameter. [*Pyrus americana* DC.]—(MOUNTAIN-ASH.)—Rocky woods and swamps, often in acid soil, Blue Ridge and more N Provinces, N. C. to Tenn., Man., and Newf.—Spr.

2. **PYRUS** [Tourn.] L. Leaf-blades simple, usually toothed. Cyme simple. Corolla white. Pome usually tapering to the base.—About 12 species, natives of the Old World.

1. *P. communis* L. Tree, usually thorny: leaf-blades ovate, elliptic, or obovate, slender, petioled, 3-8 cm. long, glabrous or nearly so in age, acute or acuminate: cyme few-several-flowered: pedicels 1.8-5 cm. long: sepals about as long as the hypanthium: corolla creamy white, about 2.5 cm. broad: pome, in the wild form, seldom over 5 cm. long, in the numerous cultivated forms often much larger.—(PEAR.)—Woods, thickets, and roadsides, various provinces, Fla. to Tex., Calif., and Me. Nat. of the Old World and cult.—Spr.

3. **MALUS** Mill. Leaf-blades simple, toothed or lobed. Cymes simple. Corolla pink or white. Pome depressed at both ends.—About 15 species, natives of north temperate regions.—Spr.—APPLES. CRAB-APPLES.—Sometimes planted for ornament. The wood is used for tool-handles and other small objects. The fruits are used for preserves.

Leaves glabrous, at least when mature.

Blades of the leaves on flowering branches acute or acuminate.

Flowering branches bearing leaves with lobed or incisely serrate blades; leaves of vigorous shoots with prominently lobed blades.

Leaf-blades rounded or truncate at the base, with the lowest pair of veins remote from the base.

Blades of the mature leaves glaucescent beneath, thickish.

Blades of the mature leaves green beneath, thin.

Leaf-blades subcordate at the base, with the lowest pair of veins at the base of the blade.

Flowering branches bearing leaves with serrate blades; leaves of vigorous shoots with shallowly lobed blades.

Leaf-blades of an ovate or oval type: pome much depressed.

Leaf-blades of a lanceolate type: pome subglobose.

Blades of the leaves on flowering branches obtuse or merely acutish.

Leaves permanently pubescent beneath.

Leaf-blades obtuse or acute at the base: sepals glabrous.

Leaf-blades rounded or cordate at the base: sepals pubescent.

1. *M. glaucescens*.

2. *M. coronaria*.

3. *M. glabrata*.

4. *M. platycarpa*.

5. *M. lancifolia*.

6. *M. angustifolia*.

7. *M. bracteata*.

8. *M. Malus*.

1. *M. glaucescens* Rehder. Tree up to 4.5 m. tall with a trunk less than 1.5 dm. in diameter, or frequently a gregarious shrub, the branches stiff, branches forming an irregular head, the branchlets red-brown, becoming gray-brown: leaf-blades ovate to triangular-ovate, 2.5–7.5 cm. long, glabrous when old, sharply serrate and often somewhat lobed, obtuse or abruptly acuminate at the apex, rounded or truncate at the base: cymes 5–7 flowered: pedicels 2–3.4 cm. long: flowers very fragrant: corolla rose-colored, 2.5–5 cm. broad: pome 3–3.5 cm. in diameter, greenish-yellow, fragrant.—Open woods and thickets, various provinces, Ala. to Ohio and Ont.

2. *M. coronaria* (L.) Mill. Tree, sometimes reaching a height of 9 m. the trunk 3 dm. in diameter, the stout spreading branches forming a wide head, the branchlets becoming red-brown: leaf-blades ovate to oval, 5–7.5 cm. long, sharply serrate and often somewhat lobed, acute or acutish at the apex, rounded or truncate at the base: cymes 3–6-flowered: flowers very fragrant: pedicels 3.5–5 cm. long, glabrous: corolla deep-pink, 3–4 cm. broad: pome 2.5–3.5 cm. in diameter, greenish-yellow, fragrant. [*M. coronaria elongata* Rehder.]—Thickets and woods, various provinces, N. C. to Mo. and Ont.

3. *M. glabrata* Rehder. Tree up to 8 m. tall, the trunk 2–3 dm. in diameter, the branches spreading into a round head, the branchlets becoming purple-brown or red-brown or ultimately grayish: leaf-blades deltoid-ovate or triangular-ovate, 4–8 cm. long, yellowish-green, acute or short-acuminate at the apex, subcordate at the base, serrate and shallowly several-lobed: cymes 4–7 flowered: pedicels 2–3 cm. long: flowers fragrant: corolla pink, 2.5–3 cm. broad: pome 3–3.5 cm. in diameter.—Woods in valleys, Blue Ridge, N. C.

4. *M. platycarpa* Rehder. Tree sometimes 6 m. tall, the trunk up to 1.5 dm. in diameter, the branches spreading, the branchlets brown or purple-brown, becoming grayish: leaf-blades ovate or oval, 4-8 cm. long, yellowish-green, abruptly pointed at the apex, rounded at the base, doubly serrate: cymes 3-6-flowered: pedicels 3-6 cm. long: flowers fragrant: corolla pink, 3-3.5 cm. broad: pome 3-4 cm. in diameter, greenish-yellow.—Woods and stream-banks, Blue Ridge and more northern provinces, N. C. to Ohio and W. Va.—*M. redolens* Ashe, from N. Ga. and W. N. C., is said to differ from this species in the narrower leaf-blades and smaller fruits.

5. *M. lancifolia* Rehder. Tree sometimes 8 m. tall, the trunk up to 3 dm. in diameter, the spreading branches forming a pyramidal head, the branchlets reddish-brown, and ultimately gray-brown: leaf-blades lanceolate, ovate-lanceolate or elliptic-lanceolate, 3.5-8 cm. long, acute or short-acuminate at the apex, rounded or cuneate at the base, doubly serrate: cymes 3-6-flowered: pedicels 2.5-3.5 cm. long: corolla white or pink, 3-3.5 cm. broad: pome 2.5-3.5 cm. in diameter, green.—Woods and thickets, various provinces, N. C. to Mo. and Pa.—*M. carolinensis* Ashe, N. C. to Ky., is said to differ from this species in the oblong, crenate-serrate leaf-blades.

6. *M. angustifolia* (Ait.) Michx. Tree sometimes 9 m. high, the trunk 3 dm. in diameter, the branches rigid (or pendulous in *M. angustifolia pendula*), the branchlets becoming light-brown and glabrous: leaf-blades elliptic to lanceolate or elliptic-ovate, 2.5-5 cm. long, thick, dark-green above, crenate-serrate, rather obtuse or acutish at the apex, rounded or cuneate at the base: cymes 3-5-flowered: pedicels 2-3 cm. long, slender: flowers fragrant: corolla pink, mostly about 2.5 cm. broad: pome about 2.5-3.5 cm. in diameter, yellow-green.—Thickets and edges of woods, various provinces, W. Fla. to La., Ill., and Va.

7. *M. bracteata* Rehder. Tree up to 9 m. tall, the trunk 1-1.5 dm. in diameter, the branches stout, spreading into a broad head, the branchlets becoming red-brown, glabrous or somewhat persistently pubescent: leaf-blades ovate to elliptic-ovate, 3.5-7.5 cm. long, thin, yellowish-green above, serrate or somewhat incised, obtuse or acutish at the apex, mostly rounded at the base: cymes 3-5-flowered: pedicels 1.5-2.5 cm. long: flowers fragrant: corolla pink, mostly 2.5-3 cm. broad: pome 2.5-3.5 cm. in diameter, yellowish-green.—Woods and stream-banks, various provinces, M. Fla. to Mo. and N. C.

8. *M. Malus* (L.) Britton. Tree with spreading branches, the trunk sometimes reaching a diameter of 1 m. in cultivation: leaf-blades petioled, broadly ovate or oval, 2.5-7.5 cm. long, obtuse or abruptly pointed at the apex, rounded or slightly cordate at the base, dentate or nearly entire, glabrous or nearly so above, pubescent and often woolly beneath, especially when young: pedicels generally tomentose, 2.5-5 cm. long: corolla pink or white, 3.5-7.5 cm. broad: pome depressed-globose or elongated, hollowed at the base, 3.5-7.5 cm. in diameter.—Old fields, thickets, and fence-rows, various provinces, Ga. to Mo. and Ont. Nat. of Eurasia.—Spr.—The common apple, in many varieties, of commerce, frequently escapes from cultivation.

4. *ARONIA* Pers. Leaf-blades simple, shallowly toothed. Cyme compound. Corolla mainly white. Pome berry-like, globular to pyriform.—Following are the only known species.—Spr.—CHOKEBERRIES.—Plants are occasionally grown as ornamentals.

Cymes and lower surfaces of the leaf-blades woolly: fruit red or purple-black.

Fruit broadly pyriform, bright-red.

Fruit oval or globose, purple-black.

Cymes and surfaces of the leaf-blades glabrous: fruit black or purple.

1. *A. arbutifolia*.

2. *A. atropurpurea*.

3. *A. melanocarpa*.

1. *A. arbutifolia* (L.) Ell. Shrub sometimes reaching a height of 3.5 m.: leaf-blades oval, elliptic or obovate, obtuse or abruptly short-pointed at the apex, narrowed or somewhat cuneate at the base, 2.5–7.5 cm. long, serrulate-crenulate: cymes terminal, but at length overtopped by the young sterile shoots: corolla white or purplish-tinged, 8–12 mm. broad: pome 4–6 mm. in diameter, long-persistent. [*Pyrus arbutifolia erythrocarpa* Michx.]—(RED CHOKE-BERRY.)—Bogs and low pinelands, often in acid soil, various provinces, Fla. to La., Minn., and N. S.

2. *A. atropurpurea* Britton. Shrub reaching a height of 4 m.: leaf-blades and flowers quite similar to those of the preceding species: pome oval to globose, 6–10 mm. long, purple-black.—(PURPLE-CHOKEBERRY.)—Acid swamps and bogs, various provinces, Fla. to N. S.

3. *A. melanocarpa* (Michx.) Ell. Shrub resembling the preceding species, but larger: leaf-blades obovate or oval, obtuse, acute, or abruptly acuminate at the apex, narrowed or cuneate at the base, crenulate: flowers similar to those of the preceding species: hypanthium and pedicels nearly glabrous: pome globose or oval, 6–8 mm. in diameter. [*Pyrus arbutifolia melanocarpa* Michx. *A. nigra* (Willd.) Britton.]—(BLACK CHOKEBERRY.)—Rocky woods and swamps, various provinces, Fla. to Mich. and N. Y.

5. **AMELANCHIER** Medic. Leaf-blades simple, toothed or rarely entire. Panicles raceme-like, simple. Corolla white. Pome berry-like, globular.—About 25 species, natives of the north temperate zone.—Wint.-spr.—JUNE-BERRIES. SERVICE-BERRIES. MAY-CHERRIES.—Grown as ornamentals for their early profusion of flowers. The wood is used for tool handles and other small objects. The fruits which ripen in late spring or early summer in the south are edible.

Leaf-blades with fine teeth (5–12 per cm. on average leaves), and irregular, unequally spaced veins and usually irregular intermediate ones.

Leaf-blades densely white-tomentose when young, becoming green: panicles with the lower pedicels 10–25 mm. long in fruit.

Leaf-blades rounded at the apex or rarely or individually subacute or mucronate: hypanthium 3–5 mm. wide: sepals lanceolate or triangular-lanceolate: petals 7–9 mm. long.

Leaf-blades of an elliptic type generally, with 10–15 pairs of veins: hypanthium campanulate: ovary glabrous or nearly so on top.

Leaf-blades of an oval type generally, with 7–11 pairs of veins: hypanthium saucer-shaped: ovary woolly on top.

Leaf-blades acuminate, sometimes abruptly so, or decidedly acute: hypanthium 2.5–3 mm. wide: sepals triangular-ovate or nearly deltoid: petals 10–14 mm. long.

Ovary glabrous on top: sepals permanently thin, reflexed, without a midrib.

Ovary pubescent on top: sepals thick in fruit, not reflexed, with a midrib.

Leaf-blades nearly or quite glabrous from the first: panicles with the lower pedicels 30–50 mm. long in fruit.

Leaf-blades with coarse teeth (mostly 3–5 per cm. on average leaves), and usually straight, parallel, close-set veins, with few or no intermediate ones.

1. *A. oblongifolia*.

2. *A. stolonifera*.

3. *A. canadensis*.

4. *A. alabamensis*.

5. *A. laevis*.

6. *A. sanguinea*.

1. *A. oblongifolia* (T. & G.) Roemer. Shrub with clustered erect stems, 2–8 m. tall, fastigiately branched, not stoloniferous: leaf-blades of an elliptic type, varying to oval or slightly obovate, mostly 3–5.5 cm. long, rounded at the apex, subacute or mucronate, with sharp teeth extending nearly or quite to the base, rounded or subcordate at the base, slender-petioled: panicles erect, 2.5–6 cm. long, dense in anthesis: sepals lanceolate, 1.5–2.5 mm. long, tomentose within, acute: petals oblanceolate, narrowly obovate, or nearly linear, mostly 7–9 mm. long: pome nearly black under the glaucous coat. [*A. Botryapium* (Fl. SE. U. S.)]—(SHADBUSH. THICKET-SHADBLOW.)—Swamps, low grounds, and woods, Coastal Plain and adj. provinces, Ga. to Pa. and Me.—The leaf-blades when young are densely white-tomentose beneath, glabrous or nearly so at maturity. The fruits are moderately sweet and agreeably flavored.

2. *A. stolonifera* Wiegand. Shrub with erect stems, 3–12 dm. tall, stoloniferous thus forming colonies: leaf-blades of an oval type, varying to broadly obovate or broadly ovate, or suborbicular on shoots, mostly 2.5–5 cm. long, rounded or mucronate, or sometimes subacute at the apex, with the fine teeth rarely extending to the base, rounded or subcordate at the base, very slender-petioled: panicles erect, 1.5–4 cm. long in anthesis: sepals triangular-lanceolate, 2.5–3 mm. long, tomentose within: petals elliptic-obovate, 7–9 mm. long: pome purplish-black under the glaucous coat. [*A. spicata* (Fl. SE. U. S.)]—(Low JUNE BERRY.)—Dry rocks, sandy bluffs, river banks, and sandy places, various provinces, N. C. to Mich., and Newf.—The leaf-blades are densely white-tomentose beneath when young, but soon glabrous. The fruits are sweet, juicy, and agreeable.

3. *A. canadensis* (L.) Medic. Tree up to 10 m. tall, or an irregularly branched shrub with few stems: leaf-blades ovate, oval, elliptic, or obovate, 4–10 cm. long, acuminate or decidedly acute, sharply serrate nearly or quite to the base, rounded or cordate at the base, slender-petioled: panicle nodding, 8–17 cm. long in anthesis: sepals triangular-ovate or nearly deltoid, 2–3 mm. long, tomentose: petals linear or elliptic-linear, 9–14 mm. long: pome maroon-purple. —(JUNE BERRY. SUGAR-PEAR.)—Woods, river-banks, sandy or rocky ridges, and swamps, various provinces, Ga. to La., Kans., Ont., and Newf.—The leaf-blades are white-tomentose when young, less densely so above than beneath, often persistently sparingly hairy. The fruits are rather dry and lack flavor.

4. *A. alabamensis* Britton. Tree up to 5 m. tall, related to *A. canadensis*, but with relatively thicker, broader, and shallower or inconspicuously toothed leaf-blades: sepals triangular-ovate, thick and with a midrib at maturity, not reflexed: pome purplish-black.—Sandy lands, S of Auburn, Ala.

5. *A. laevis* Wiegand. Tree up to 13 m. tall, or low and shrubby northward: leaf-blades ovate, elliptic, or oval, varying to obovate or suborbicular, 3–6 cm. long, short-acuminate, acute, or sometimes rounded at the apex, sharply and finely serrate nearly or quite to the base, mostly subcordate or rounded at the base, usually slender-petioled: panicles drooping, 3–7 cm. long, usually many-flowered: sepals triangular-lanceolate to subulate-lanceolate, 3–4 mm. long: petals linear-elliptic, 10–18 mm. long: pome dark-purple or nearly black beneath the glaucous coat.—Wooded slopes, banks, fields, and about swamps, Blue

Ridge and adj. provinces, Ga., Ala., Tenn., and N. C. and various provinces to Kans., Ont., and Newf.—The leaf-blades are glabrous from the first or merely with few silky hairs when young. The fruits are sweet and moderately flavored.

6. *A. sanguinea* (Pursh) DC. Shrub with arching or straggling branches up to 2.5 m. tall, not stoloniferous: leaf-blades oval, varying to ovate or more rarely to obovate, or suborbicular on shoots, 2.5–6 cm. long, rounded or acutish at the apex, rather coarsely dentate-serrate nearly or quite to the base, rounded or subcordate at the base, slender—but often rather short-petioled: panicles drooping, 4–7 cm. long, loosely flowered: sepals lanceolate or narrowly triangular-lanceolate, about 4 mm. long: petals linear or narrowly spatulate, 10–15 mm. long: pome nearly black beneath the glaucous coat. [*A. rotundifolia* (Fl. SE. U. S.)]—Rocky banks, woods, and bluffs, Blue Ridge and adj. provinces, Ga., Ala., and Tenn. and various provinces, to Minn., Ont. and Que. The leaf-blades are densely yellowish-tomentose beneath when young, sometimes retaining some of the pubescence to maturity. The fruits are juicy, sweet, and agreeably flavored.

6. *CRATAEGUS* L.<sup>1</sup> Small trees or shrubs, usually armed with thorns or spines. Leaves alternate: blades simple, petioled. Flowers terminal, cymose or corymbose. Hypanthium cup-shaped or campanulate, adnate to the carpels. Sepals 5, reflexed after anthesis. Corolla white or pink. Petals 5, spreading, inserted on the margin of the disk in the throat of the hypanthium. Stamens 5–25, inserted in 1–3 rows on the edge of the hypanthium: filaments slender, incurved: anthers oblong or subglobose, white, pink, or purple. Ovary inferior, or with its summit free, composed of 1–5 carpels: styles 1–5, free, persistent: stigmas terminal. Fruit globose, pyriform, or oval, yellow, orange-red, blue, or black, containing 1–5 bony carpels, each usually 1-seeded. Seed erect, the testa membranous.—The plants bloom in spring.—HAWES. HOG-APPLES.—Many different kinds of *Crataegus* were described in the first decade of this century. A large number were admitted into manuals and floras published about that time. For many species not accounted for in this Manual see *Flora of the Southeastern United States*, pages 532–569.

Leaf-blades not conspicuously cordate-deltoid, often slightly cordate.

Petioles 4 mm. long or more.

Leaf-blades not deeply cut.

Leaf-blades cuneate or abruptly contracted at base, broadest at the middle or towards the apex.

Leaf-blades prevailingly broadest towards the apex, or varying to orbicular on the same plant.

Corymbs usually compound, many-flowered.

Leaf-blades not impressed-veined, usually shining.

Leaf-blades with impressed veins above, dull.

Corymbs simple, few-flowered.

Pedicels and hypanthium glabrous: petioles and leaves usually not glandular.

Pedicels, or at least calyx-lobes glandular: petioles or leaf-margin glandular.

Leaf-blades prevailingly broadest at the middle, varying to obovate or ovate on the same plant.

Leaf-blades impressed-veined.

- Leaf-blades not impressed-veined.  
 Corymbs usually compound, many-flowered: petioles usually glandless.  
 Sepals glandular-margined. V. ROTUNDIFOLIAE.  
 Sepals not glandular-margined.  
 Sepals short-triangular, glabrous: corolla 10-12 mm. broad: fruit bright blue. VI. BRACHYACANTHAE.  
 Sepals narrower and longer: corolla usually broader: fruit varying from yellow to red. VII. VIRIDES.  
 Corymbs simple, few-flowered: petioles glandular.  
 Petioles with small stalked glands. VIII. INTRICATAE.  
 Petioles with large, sessile glands. IX. FLAVAE.  
 Leaf-blades broadest at or near the base.  
 Leaves vivid green to yellowish-green, the base of the blade varying from rounded to cordate.  
 Sepals 3-5 mm. long, entire or serrate: leaf-blades 2-7 cm. long. X. TENUIFOLIAE.  
 Sepals 5 mm. long or more, glandular-serrate: leaf-blades 3-9 cm. long. XI. COCCINEAE.  
 Leaves bluish-green, the base of the blade varying from broadly cuneate to cordate: sepals 3-5 mm. long, entire or serrate.  
 Leaf-blades deeply cut (only those of the vegetative shoots in *C. spathulata*).  
 Thorns 6-18 mm. long: leaf-lobes 3-15.  
 Thorns 25 mm. long or more: leaf-lobes 3-7.  
 Petioles usually very short, about 2 mm. long or slightly more.  
 Leaf-blades conspicuously cordate-deltoid, varying to broadly ovate, often 3-7-lobed, glabrous. XII. PRUINOSAE.  
 XIII. OXYACANTHAE.  
 XIV. MICROCARPAE.  
 XV. PARVIFOLIAE.  
 XVI. CORDATAE.

## I. CRUS-GALLI

Leaf-blades coriaceous, glandless: petioles 6-20 mm. long: corymbs many-flowered: sepals usually entire: fruit reddish or red, the flesh hard, greenish.

Corymbs, leaves, and branchlets glabrous (at least at maturity).

Leaf-blades toothed above the middle: stamens 7-12.

Leaf-blades toothed to near the base: stamens about 20.

Corymbs, leaves, and branchlets more or less villous.

Leaf-blades toothed above the middle: stamens about 20.

Leaf-blades serrate or often incised-serrate: stamens 7-12.

1. *C. Crus-galli*.

2. *C. Mohrii*.

3. *C. berberifolia*.

4. *C. signata*.

## II. PUNCTATAE

Leaf-blades subcoriaceous: petioles 6-12 mm. long: corymbs many-flowered: sepals usually entire: fruit yellow to scarlet, the flesh hard.

Corymbs tomentose or canescent: sepals entire: fruit ellipsoid: leaf-blades dull gray-green.

Corymbs pubescent to glabrous.

Sepals entire.

Leaf-blades bright yellow-green: fruit ellipsoid.

Leaf-blades dull gray-green: fruit globose.

Sepals glandular-serrate: fruit villous.

5. *C. punctata*.

6. *C. cuneiformis*.

7. *C. Margaretta*.

8. *C. collina*.

## III. AESTIVALES

Leaf-blades subcoriaceous: petioles usually short, winged: corymbs few-flowered: sepals entire or serrulate: fruit red or orange-red, the flesh usually juicy and acidulous.

Leaf-blades rufous-tomentose to pubescent beneath, cuneate-oblong or elliptic to obovate, 2-7 cm. long, acute or rounded, crenate-serrulate to few-lobed.

Leaf-blades glabrous or nearly so (often whitish pubescent when unfolding).

Leaf-blades abruptly contracted at the base.

Leaf-blades cuneate-oblancoelate.

9. *C. aestivalis*.

10. *C. maloides*.

11. *C. luculenta*.

## IV. MACRACANTHAE

Leaf-blades rhombic-elliptic, rhombic-ovate, obovate, or oval: petioles 6-20 mm. long: corymbs many-flowered, pubescent: sepals lanceolate, glandular-laciniate, villous: fruit red, orange, orange-red to dark-red, the flesh glutinous.

Leaf-blades dark-green, glabrous and shining above, coriaceous.  
 Leaf-blades gray-green, pubescent and dull above, subcoriaceous.

12. *C. succulenta*.  
 13. *C. Calpodendron*.

## V. ROTUNDIFOLIAE

Leaf-blades (in our species) ovate-orbicular or obovate: petioles 6-24 mm. long, glandular-serrate: fruit red, the flesh soft.

14. *C. chrysocarpa*.

## VI. BRACHYACANTHAE

Leaf-blades oblong-lanceolate to ovate, crenate-serrate: corymbs few-flowered: fruit glaucous-blue, 8-12 mm. thick.

15. *C. brachyacantha*.

## VII. VIRIDES

Leaf-blades membranous, oblong-ovate to oval or rhombic-ovate, dark-green, shining and glabrous above; petioles 6-30 mm. long: corymbs many-flowered: calyx-lobes entire or nearly so: fruit red or orange, the flesh hard, edible.

16. *C. viridis*.

## VIII. INTRICATAE

Leaf-blades subcoriaceous, elliptic to ovate, glandular-toothed: petioles 6-30 mm. long: corymbs 3-7-flowered, the bracts glandular, deciduous: calyx-lobes lanceolate, usually toothed towards the apex: fruit greenish-yellow to reddish-brown, orange, or red, the flesh hard.

Corymbs and hypanthium usually villous or pilose-pubescent: leaves serrate or serrate and incised.

17. *C. intricata*.

Sepals not foliaceous, glandular-serrate: leaf-blades usually yellow-green.

Sepals foliaceous, glandular-serrate: leaf-blades dark-green, shining and scabrate above: bracts large and conspicuous.

18. *C. Harbisonii*.

Corymbs and hypanthium usually glabrous or nearly so.

Leaf-blades cordate to ovate or rhombic-ovate, serrate and incised.

19. *C. populifolia*.

Leaf-blades oval or slightly obovate, varying to ovate-lanceolate or slightly oblanceolate.

20. *C. mendosa*.

## IX. FLAVAE

Leaf-blades membranous, oval, obovate, orbicular, spatulate, cuneate, or cuneate-spatulate: petioles 6-20 mm. long: corymbs few-flowered: calyx-lobes glandular or glandular-serrate: fruit green to orange or red, the flesh usually soft.

Leaf-blades oval, ovate to obovate or orbicular, 2-5.5 cm. long, crenate-serrate to incised, abruptly contracted into a winged petiole.

21. *C. flava*.

Leaf-blades with a distinctly cuneate base.

Leaf-blades obovate to spatulate or suborbicular, 1-4 cm. long, rounded or often somewhat truncate, entire, dentate to crenate or lobed, somewhat tomentose and bluish-green.

22. *C. Michauxii*.

Leaf-blades spatulate or cuneate, 1-4 cm. long, entire to serrate, rounded, pointed or lobed, glabrous at maturity, yellowish-green.

23. *C. floridana*.

## X. TENUIFOLIAE

Leaf-blades membranous, oval or ovate, often slightly pubescent: petioles 12-30 mm. long: young foliage usually bronze-green: corymbs many-flowered: fruit red or pruinose-red, glabrous, the flesh succulent.

24. *C. macrosperma*.

## XI. COCCINEAE (Molles)

Leaf-blades membranous to subcoriaceous, oblong-ovate to broadly ovate: petioles 20-35 mm. long: corymbs many-flowered: fruit usually red and pubescent, the flesh soft, edible.

Hypanthium tomentose or pubescent.  
 Hypanthium glabrous or nearly so.

25. *C. mollis*.  
 26. *C. albicans*.

## XII. PRUINOSAE

Leaf-blades membranous to subcoriaceous, broadly ovate, elliptic-ovate, or deltoid, blue-green, glabrous (with some exceptions): petioles 6-30 mm. long: young foliage usually bronze-green: corymbs many-flowered: fruit pruinose.

27. *C. pruinosa*.

## XIII. OXYACANTHAE

Leaf-blades ovate, 3-15-lobed or cleft: corymbs many-flowered: fruit red: style and nutlet usually solitary: introduced species.

28. *C. monogyna*.

## XIV. MICROCARPAE

Leaf-blades membranous, mostly lobed: corymbs few- to many-flowered: fruit small, usually red.

Leaf-blades of the vegetative shoots only, lobed, the lower spatulate: styles and nutlets 3-5.

Leaf-blades deeply lobed or cut: styles and nutlets 1-3.

29. *C. spathulata*.

30. *C. Marshallii*.

## XV. PARVIFOLIAE

Leaf-blades usually small, subcoriaceous, cuneate to obovate, toothed or shallowly lobed: corymbs few-flowered: fruit globose to pyriform, yellow to red.

Inflorescence pubescent to tomentose.

31. *C. uniflora*.

Inflorescence glabrous.

32. *C. lacrimata*.

## XVI. CORDATAE

Leaf-blades often conspicuously 3-7-lobed: petioles about 12 mm. long: corymbs many-flowered: fruit small, scarlet: nutlets bare at apex.

33. *C. Phacnopyrum*.

1. *C. Crus-galli* L. A tree up to 9 m. tall, with a trunk 3-4 dm. in diameter, covered with dark-gray or brownish scaly bark: leaf-blades obovate or oblanceolate, 2-5 cm. long, 1-3 cm. broad, or larger on leading shoots, glabrous, obtuse or pointed, sharply serrate above the middle: sepals 3.5-5 mm. long, linear-lanceolate: corolla 12-14 mm. broad: fruit oval or oblong, or slightly obovoid, 8 mm. thick or more, dull-red when mature: nutlets mostly 2.—Woods, thickets, and fence-rows, various provinces, N Fla. to E Kans., Ont., and Que.

2. *C. Mohrii* Beadle. A tree sometimes 10 m. tall (rarely a shrub), with dark-gray or brownish scaly bark: leaf-blades obovate-cuneiform to elliptic, or on leading shoots varying to orbicular, 2-5 cm. long, glabrous in age, serrate to near the base: sepals 2-5 mm. long, entire or glandular-serrate: corolla about 15 mm. broad: fruit globose, red or greenish-red: nutlets 3 to 5.—Fields and low woods, Coastal Plain and adj. provinces, NW Ga. to La. and Tenn.

3. *C. berberifolia* T. & G. A tree often attaining a height of 8 m., with dark-gray scaly bark: leaf-blades oblong-cuneiform or spatulate to obovate-cuneiform, 2-6 cm. long, smooth or scabrous, pale, or sometimes pubescent beneath, toothed above the middle: sepals 3-5 mm. long, serrate or entire: corolla 10-15 mm. broad: fruit globose or nearly so, yellow-orange or red: nutlets 2 or 3.—Low woods and hillsides, Coastal Plain, La.

4. *C. signata* Beadle. A tree sometimes 7 m. tall, with a trunk 2 dm. in diameter or more, covered with ashy-gray or brownish scaly bark: leaf-blades oval to obovate-cuneiform, 2-6 cm. long, 1-4 cm. broad, rounded or mostly pointed at the apex, serrate or frequently incised-serrate: sepals 4-6 mm. long, entire or glandular-serrate: corolla 13-16 mm. broad: fruit oblong to globose, about 9 mm. thick, mostly red at maturity, more or less pruinose: nutlets 3-5.—Stream-banks, moist coves, and dry slopes, various provinces, Ala. to Tex. and Tenn.

5. *C. punctata* Jacq. A tree sometimes 9 m. tall, with dark-gray or reddish-brown scaly bark: leaf-blades obovate to oblong, 3-7 cm. long, cuneate or abruptly contracted at base, irregularly serrate, doubly serrate or incised, glabrous in age: sepals 5-7 mm. long, linear-lanceolate, pubescent: corolla about 2 cm. broad: fruit subglobose or oval, 1 to 2 cm. long, red or yellow: nutlets 2 or 3.—Hillsides and in rocky soil, Blue Ridge and adj. provinces, N. C. and Tenn., and more northern provinces to Ia., Minn., and Que.

6. *C. cuneiformis* (Marsh.) Eggleston. A tree sometimes 8 m. high, with dark-brown scaly bark: leaf-blades obovate-oblong, acute, the base cuneate, serrate or doubly serrate, 2-5 cm. long, glabrous in age: sepals entire: corolla 12-16 mm. broad: fruit ellipsoid, scarlet or red, about 1 cm. thick. [*C. pausiaca* Ashe].—Limestone hills and low bottom lands, various provinces, SW Va. to C Ill., W N. Y. and Penn. Perhaps immediately beyond our range.

7. *C. Margaretta* Ashe. A shrub or small tree, sometimes 8 m. high, with dark gray-brown bark: leaf-blades ovate or obovate-oblong, 2-5 cm. long, cuneate or rounded at base, obtuse or acute, serrate or doubly serrate, or lobed, glabrous in age: sepals triangular, entire or slightly serrate: corolla 14-20 mm. broad: fruit globose or short-ellipsoid, 8-16 mm. thick, yellow or red: nutlets usually 2 or 3.—Along streams and in woods, various provinces, Tenn. to Mo. and S Ont.

8. *C. collina* Chapm. A tree 4-6 m. tall, with dark-gray scaly bark: leaf-blades obovate or oval, 2.5-7 cm. long, acute, narrowed or contracted at base, serrate or doubly serrate with obtuse lobes, nearly entire below: sepals lanceolate, pubescent or glandular: corolla 15-20 mm. broad: fruit globose, 10-14 mm. thick, red or orange-red: nutlets 3-5.—Along streams, in fields and woods, various provinces, Ga. to Miss. and Va.

9. *C. aestivalis* (Walt.) T. & G. A tree often 9 m. tall, with dark reddish-brown scaly bark: leaf-blades cuneate-oblong to obovate or elliptic, 2-7 cm. long, dentate or crenate-serrate, sometimes lobed, rufous-tomentose or -pubescent beneath, glabrate in age: sepals triangular, entire or serrulate: corolla about 2 cm. broad: fruit depressed-globose, punctate, red: nutlets 3-5.—(MAX-HAW. APPLE-HAW.)—Along streams and in shallow ponds, various provinces, Fla., w to Tex. and S. C.

10. *C. maloides* Sarg. A tree 4-5 m. tall, or often a large shrub: leaf-blades oval to orbicular or obovate, 1.5-5 cm. long, serrate, doubly serrate or lobed: sepals lanceolate: corolla 2 cm. broad or more: fruit subglobose or oval, red, 8-12 mm. thick: nutlets 3-5. [*C. rufula* Sarg.].—Along streams, Fla.

11. *C. luculenta* Sarg. A tree 4-5 m. tall, with gray or dark-reddish bark: leaf-blades spatulate or cuneiform to ovate or elliptic, 2-4 cm. long, irregularly serrate or incised: sepals lanceolate, glabrous: corolla 15 to 18 mm. broad: fruit globose or nearly so, red or orange-red, 8-10 mm. in diameter: nutlets 3-5.—Swampy woods, Fla.

12. *C. succulenta* Schrader. A tree, sometimes 8 m. tall, with gray scaly bark: leaf-blades obovate or rhombic-ovate, 2-5 cm. long, obtuse or acute, serrate, doubly-serrate or also lobed, glabrous above: sepals lanceolate, acuminate, glandular-laciniate: corolla about 2 cm. broad: fruit subglobose, orange-red to dark-red, villous to glabrate, 6-16 mm. thick: nutlets 3-5.—Along streams, Blue Ridge and adj. provinces, N. C. to Tenn.; and more northern provinces, Va. to Minn., Ont., and N. S.

13. *C. Calpodendron* (Ehrh.) Medic. A shrub or small tree, sometimes 6 m. tall, with gray or dark-brown bark: leaf-blades rhombic-ovate to oval, rounded or acute, serrate to incisely lobed, pubescent on both faces, permanently so above: sepals lanceolate, pubescent: corolla about 15 mm. broad: fruit pyriform or ellipsoid, red or orange-red, 10-15 mm. long: nutlets 2-3. [*C. tomentosa* Du Roi, not L. *C. Chapmani* Ashe.].—Low ground near watercourses, various provinces, N Ga. to Mo., Minn., and C N. Y.

14. *C. chrysocarpa* Ashe. A shrub or tree, sometimes 8 m. tall, with dark-brown scaly bark: leaf-blades ovate-orbicular or obovate, the base broadly cuneate, doubly serrate with rather coarse teeth, occasionally lobed, subcoriaceous, pubescent or glabrate: sepals glandular-serrate: corolla 14–18 mm. broad: fruit depressed-globose or short-ovoid, red, about 1 cm. thick: nutlets 3–5. [*C. rotundifolia* Borekh. not Lam.]—Woods, fields, and stream-banks, various provinces, N. C. to N. M., Sask., Ont., and N. B.

15. *C. brachyacantha* Engelm. & Sarg. A tree, often 9 m. tall, with dark-brown scaly bark: leaf-blades oblong-lanceolate to ovate, 1–5 cm. long, crenate-serrate, glabrous at maturity: sepals short-triangular, glabrous: corolla 10–12 mm. broad: fruit subglobose, bright-blue at maturity, glaucous: nutlets 3–5.—Borders of swamps and streams, Coastal Plain, La. to Tex.

16. *C. viridis* L. A tree sometimes 10 m. tall, with gray or reddish-brown bark: leaf-blades ovate-oblong to ovate or rhombic-ovate, with the base cuneate to rounded, 2–8 cm. long, serrate, doubly serrate or lobed, usually glabrous: sepals glabrous, entire or nearly so: corolla 10–16 mm. broad: fruit globose or nearly so, bright-red or orange, 5–8 mm. thick: nutlets 4 or 5. [*C. arborescens* Ell.]—Along streams and lakes, mostly in alluvial soil, various provinces, Fla. to Tex. and Kans.

17. *C. intricata* Lange. A shrub or small tree, 1–7 m. tall, with dark-gray or reddish-brown bark: leaf-blades round-ovate to ovate-oblong, 2–7 cm. long, usually acute, rounded or contracted at base, serrate or incised: sepals glandular-serrate, 4 to 9 mm. long: corolla 2 to 3 cm. broad: fruit globose to oblong, 9–15 mm. thick, yellow, orange or red (at maturity): nutlets 3–5. [*C. triflora* Chapm.]—Rocky woodlands and stream-banks, various provinces, S. C. to Ala., Mo., N. Y. and Va.

18. *C. Harbisonii* Beadle. A shrub or tree, 3–8 m. tall, with ashy-gray or brownish bark: leaf-blades round-ovate to oval or obovate, the petioles margined, rounded or acute, serrate, brownish-pubescent beneath: sepals lanceolate, 4–10 mm. long, glandular-serrate: corolla about 2 cm. broad: fruit globose or short-oval, red, 10–14 mm. thick: nutlets 3–5.—Limestone hills and ridges, Interior Low Plateaus, Ala. and Tenn.

19. *C. populifolia* Walt. A shrub or tree, sometimes 7 m. tall, with dark-gray or brownish to nearly black scaly bark: leaf-blades cordate to ovate or rhombic-ovate, serrate to incisely lobed, acute, 2.5–6 cm. long: sepals 3–9 mm. long, usually glabrous or with few hairs: corolla 15–20 mm. broad: fruit depressed-globose to somewhat pyriform, yellowish-green to red, 8–15 mm. thick: nutlets 3–5.—(POPLAR-LEAVED HAW.)—Along streams, in rocky woods and on bluffs, various provinces, S. C. to Ala., Miss., Mich., and Mass.

20. *C. mendosa* Beadle. A shrub or small tree, 3–6 m. tall, with dark-gray scaly bark: leaf-blades oval, or elliptic to slightly oblanceolate, 3–6 cm. long, rounded or contracted at base, serrate or incisely lobed: sepals 3–4 mm. long, glandular-serrate: corolla 15–18 mm. broad: fruit globose or nearly so, 8–10 mm. thick: red at maturity: nutlets 3–5.—Rocky woods and glades, Appalachian Plateau, Ala.

21. *C. flava* Ait. A large shrub or tree, sometimes 8 m. tall, with gray or brownish, scaly bark: leaf-blades oval or obovate to orbicular, cordate or truncate to abruptly contracted into a cuneate base, crenate-serrate to dentate or incised: sepals 4 mm. long or more, glandular or glandular-serrate: corolla 15 mm. broad or more: fruit globose to pyriform, 9 mm. thick or more, yellow, orange, or red: nutlets 2–5.—(SUMMER-HAW.)—Margins of swamps, in sandy and rocky soil, various provinces, Fla. to Ala., Tenn., and Ga.

22. *C. Michauxii* Pers. A shrub or small tree, often 7 m. tall, with dark rough bark: leaf-blades cuneate-spatulate, obovate or orbicular, 1-4 cm. long or more, nearly entire to irregularly dentate, sometimes shallowly lobed, glandular: sepals 4 mm. long or more, glandular-serrate: corolla 15 mm. broad or more: fruit subglobose to oval, 10 mm. thick or more, varying from yellow to red, the flesh usually soft: nutlets 3-5.—Woods, river-banks, clearings, and roadsides, various provinces, Fla. to Miss. and N. C.

23. *C. floridana* Sarg. A tree, reaching a height of 5 m., with dark gray or nearly black bark: leaf-blades spatulate or cuneate, usually entire below, 2-4 cm. long, entire to lobed above: sepals 3 mm. long or more, glandular-serrate: corolla 15 mm. broad or more: fruit obovoid to globose, orange to reddish: nutlets 3-5.—River banks, woods, and hillsides, Coastal Plain and adj. provinces, Fla. to Ala. and Ga.

24. *C. macrosperma* Ashe. A shrub or small tree, 1-7 m. tall, with ashy-gray to dark or brownish bark: leaf-blades oval or ovate, truncate or cordate, serrate or lobed and serrate, glabrous: sepals 3-5 mm. long, entire or serrate: corolla 14-17 mm. broad: fruit subglobose to short-oblong, 7-15 mm. thick, red or pruinose-red at maturity: nutlets 2-5.—Wooded slopes and clearings, Blue Ridge and adj. provinces, Ga. to Ala., Tenn., and N. C., and more northern provinces up to Minn. and N. S.

25. *C. mollis* (T. & G.) Scheele. A tree, often 10 m. tall, with dark-gray or brownish scaly bark: leaf-blades broadly ovate, 4-9 cm. long, rounded, truncate or cordate at base, acute, sharply serrate or incised lobed, pubescent or somewhat tomentose beneath, glabrous or pubescent above: sepals 5 mm. long or more, serrate, glandular, tomentose; corolla 2 cm. broad or more: fruit subglobose, 13 mm. thick or more, red: nutlets 3-5.—(DOWNY-HAW. SCARLET-HAW.)—Moist hillsides and rich woods, Interior Low Plateaus and more northern provinces, Tenn. to Mo. and Mich.

26. *C. albicans* Ashe. A shrub or small tree, sometimes 6 m. tall: leaf-blades broadly ovate to oblong-ovate, 3-8 cm. long, cordate, truncate or broadly cuneate at base, serrate or doubly serrate and lobed, glabrous or slightly pubescent at maturity: sepals 5 mm. long or more, glandular-serrate: corolla 16 mm. broad or more: fruit subglobose to somewhat pyriform, 10-15 mm. thick, red: nutlets 3-5.—Hillsides and woods, Interior Low Plateaus and more northern provinces, Tenn. to Mich. and W Mass. Perhaps a form of *C. mollis*.

27. *C. pruinosa* (Wendl.) K. Koch. A shrub or tree, sometimes 6 m. tall, with dark-gray or brownish bark: leaf-blades elliptic-ovate to broadly ovate or deltoid, the base varying from broadly cuneate to cordate, serrate or lobed and serrate, 2-6 cm. long, acute or acuminate, glabrous in age: sepals 3-5 mm. long, entire or serrate: corolla 15-20 mm. broad: fruit globose or subglobose, 7-13 mm. thick, reddish-green to red: nutlets 3-5.—Woods, old fields, meadows, and mountain slopes, Blue Ridge and adj. provinces, Ga. to Ala., Tenn., and N. C.

28. *C. monogyna* Jacq. A shrub or tree, sometimes 12 m. tall: leaf-blades ovate or broader, sharply 3-15-lobed or -cleft, acute, the lobes serrate, cuneate to truncate at base, glabrous when mature: sepals deltoid, entire: corolla white or pink, about 15 mm. broad: fruit globose or nearly so, red, about 6 mm. thick: nutlets usually 1.—Sparingly escaped from cultivation in the northern states and perhaps also within our area. Nat. of the O. W.

29. *C. spathulata* Michx. A shrub or small tree, sometimes 8 m. tall, with gray or brown bark: leaf-blades spatulate or oblanceolate, 1-4 cm. long, narrowed into winged petioles, obtuse or acute, crenate or crenate-serrate to incised,

glabrous: sepals triangular, glabrous: corolla 7-10 mm. broad: fruit globose, red, 4-6 mm. thick: nutlets 3-5.—Along streams and in rich moist soil, Coastal Plain and adj. provinces, Fla. to Tex. and Va.

30. *C. Marshallii* Eggleston. A shrub or small tree, often 6 m. tall, with smooth, gray bark: leaf-blades broadly ovate to orbicular, 1-4 cm. long, pinnately and deeply 5-7-lobed, the lobes serrate, pubescent when young: sepals lanceolate, usually glandular-serrate: corolla 10-12 mm. broad: fruit oblong or oval, 4 to 7 mm. long, scarlet: nutlets 1-3. [*C. apiifolia* Michx.]—(PARSLEY-HAW. PARSLEY-LEAVED THORN.)—In low places along swamps and streams, Coastal Plain, Fla. to Texas and Va.

31. *C. uniflora* Muench. A shrub or small tree (?), with light brown bark: leaf-blades obovate or oblong-cuneiform to cuneate, 1-4 cm. long, crenate or crenate-serrate, often shallowly lobed, pubescent beneath, glabrate or pubescent above: sepals lanceolate, serrate to deeply incised, glandular: corolla 10-15 mm. broad: fruit globose to pyriform, 7-14 mm. thick, yellow to red at maturity: nutlets 3 or 4. [*C. yadkinensis* Ashe.]—(DWARF-THORN.)—Fields, sandy flats, woods, and pinelands, Coastal Plain and adj. provinces, Ga. to N. Y.

32. *C. lacrimata* Small. A small tree, sometimes 5 m. tall, with ashy-gray, scaly bark: leaf-blades cuneate-spatulate, 1-2.5 cm. long, glabrous in age, dentate above the middle, glandular, rounded, truncate, or pointed: sepals small, entire or nearly so, glabrous: fruit globose or nearly so, yellow or orange to reddish: nutlets 3-5.—Stream-banks and sandy woods W Fla.

33. *C. phaenopyrum* (L. f.) Medic. A tree, often 10 m. tall, with grayish or brown scaly bark: leaf-blades conspicuously cordate-deltoid to broadly ovate, serrate, often incisely 3-7-lobed, green and glabrous, 2-7.5 cm. long: sepals deltoid, entire: corolla 8-12 mm. broad: fruit depressed-globose, small, scarlet: nutlets usually 5. [*C. cordata* (Mill.) Ait.]—(HEDGE-THORN. RED-HAW. WASHINGTON-THORN.)—Stream-banks, woods, thickets, and fence-rows, various provinces, Ga. to Ark. and N. J.—Native southward, naturalized N.

7. **COTONEASTER** Medic. Shrubs. Leaf-blades simple, toothed or entire. Cymes cluster-like. Pomes small, the carpels becoming bony.—About 50 species, natives of the Old World.

1. *C. Pyracantha* (L.) Spach. Evergreen shrub with slender spines: leaf-blades oval to slightly oblanceolate, 2-5 cm. long, obtuse, crenulate: pedicels and hypanthium white-woolly: sepals ovate: petals white, about 3 mm. long: pomes about 4 mm. high, scarlet, bitter.—(FIRETHORN. SCARLET-FIRETHORN.)—Thickets and cult. grounds, various provinces, Ala. to Tenn. and Pa. Nat. of Eurasia, and cult.—Spr.—Many species of *Cotoneaster* are in cultivation. They are first class ornamentals, not only with attractive foliage, but they are also showy in flower and in fruit. Many of those used in landscape work are of Asiatic origin.

## FAMILY 15. AMYGDALACEAE — PLUM FAMILY

Shrubs or trees, commonly with prussic acid in the tissues. Leaves alternate, with free, often early deciduous stipules: blades simple, mostly

toothed. Flowers perfect, in corymbs, cymes, racemes, or panicles, sometimes clustered. Calyx of 5 sepals, borne on the edge of the hypanthium, deciduous. Corolla of 5 petals. Androeceium of many stamens. Gynoeceium of a single carpel, or rarely of 2 or 3 carpels. Ovary 1-celled: style entire. Fruit a drupe.—About 10 genera and 125 species, most abundant in north temperate regions.

Style basal: ovules erect.

Style terminal: ovules pendulous.

Tribe I. CHRYSOBALANEAE.

Tribe II. PRUNEAЕ.

I. CHRYSOBALANEAE

Inflorescence axillary: drupe with a fluted stone.

Inflorescence terminal: drupe with a terete stone.

1. CHRYSOBALANUS.

2. GEOBALANUS.

II. PRUNEAЕ

Drupe with a pulpy exocarp: leaves deciduous: flowers in clusters or terminal racemes.

Flowers sessile or nearly so: stone coarsely wrinkled and pitted.

Flowers manifestly pedicelled: stone neither wrinkled nor grooved.

Flowers in corymbs from scaly buds of the branches of the preceding year, before the leaves, the corymbs often umbel-like.

Flowers in racemes terminating branches of the year, after the leaves.

Drupe with a dry exocarp: leaves persistent: flowers in axillary racemes.

3. AMYGDALUS.

4. PRUNUS.

5. PADUS.

6. LAUROCERASUS.

1. **CHRYSOBALANUS** L. Shrubs or trees. Leaf-blades of an orbicular or obovate type. Cymes axillary. Petals clawed, white. Filaments distinct or nearly so. Stone of the fruit pointed at the base, ridged.—About 3 species, American and African.—COCOA-PLUM.

Drupe globular or spheroidal: petals cuneate.

Drupe obovoid or oblong-obovoid: petals spatulate.

1. *C. Icaco*.

2. *C. interior*.

1. **C. Icaco** L. Shrub, or tree sometimes 10 m. tall, and when growing on the beach, with radially creeping branches: leaf-blades broadly obovate to orbicular-obovate, mostly 4–8.5 cm. long, typically retuse: sepals about 2.5 mm. long: drupe globose or spheroidal, 3–4 cm. long, yellow, red, or purple; stone broadly obovoid, blunt-ridged. — (COCOA-PLUM.)—Beaches, sand-dunes, and coastal hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—The fruits are used for preserves. Sometimes planted as an ornamental. It thrives far removed from its maritime habitat.

2. **C. interior** Small. Shrub or small tree: leaf-blades oval, obovate, or orbicular, mostly 2–6 cm. long, typically rounded or abruptly pointed: sepals about 2 mm. long: drupe obovoid or oblong-obovoid, 1.5–2 cm. long, purple: stone ellipsoid or ellipsoid-obovoid, sharp-ridged. [*C. pellocarpus* (Fl. SE. U. S.) not Mey.]—(SMALL-FRUITED COCOA-PLUM. EVERGLADE COCOA-PLUM.)—Hammocks, Everglade Keys, hammock islands in Everglades, and cypress-heads, S pen. Fla.—(*W. I.*)

2. **GEOBALANUS** Small. Shrubs, with underground stems. Leaf-blades more elongate than in *Chrysobalanus*. Cyme terminal. Petals not

clawed, white. Filaments markedly united. Carpels sometimes 2 or 3. Stone of the fruit terete, not pointed at the base.—Following are the only known species.—GOPHER-APPLES. GROUND-OAKS.

Ovary pubescent: drupe 3-4 cm. long.  
Ovary glabrous: drupe 2-2.5 cm. long.

1. *G. pallidus*.  
2. *G. oblongifolius*.

1. *G. pallidus* Small. Similar to *G. oblongifolius* in habit: blades of the upper leaves elliptic, 4-10 cm. long, acute, densely white-tomentose beneath, the hairs partly deciduous: drupe subglobose or oval.—Pinelands, S pen. Fla.—All year S.—The gopher—one of the large land turtles of Florida—is not the only animal that appreciates the fruits of these shrubs. The plants being low hold their fruits within easy reach of turtles and other short-legged animals. The fruits are in such demand that it is often difficult to find one, even in a large colony of the plants.

2. *G. oblongifolius* (Michx.) Small. Plant 1-3 dm. tall: blades of the upper leaves oblanceolate to elliptic, 3-12 cm. long, glabrous, obtuse or retuse and mucronate: drupe ovoid to obovoid. [*Chrysobalanus oblongifolius* Michx.]—Pinelands, sand-hills, and sand-dunes, Coastal Plain, Fla. to Miss. and Ga.—Spr.

3. *AMYGDALUS* L. Shrubs or trees. Leaves very strongly impregnated with prussic acid. Flowers sessile or short-pedicelled. Corolla mostly pink. Drupe velvety-pubescent, the stone wrinkled and pitted.—About 5 species, natives of Asia.—PEACHES.

1. *A. Persica* L. Tree: leaf-blades narrowly elliptic to lanceolate, or rarely elliptic-obovate, shining, sharply serrate: petals pink, 8-20 mm. long: drupe subglobose or ellipsoid, 4-10 cm. long, grooved on one side, velvety.—(COMMON PEACH).—Roadsides, woods, and thickets, various provinces, Fla. to Tex., Calif., and N. Y.—Nat. of Old World.—Spr.—Cult. in many varieties for its fruit.—Two distinct forms of the peach appear as escapes from cultivation; the one has large, conspicuous light-pink flowers, the other has small, inconspicuous reddish-pink flowers. These may represent two of the ancestral species which may be combined in the ordinary cultivated peach.

4. *PRUNUS* L. Shrubs or trees, sometimes thorny. Leaves occasionally impregnated with prussic-acid, deciduous: blades broad or narrow, membranous or somewhat leathery, more or less toothed. Flowers perfect, in umbel-like or corymb-like clusters from scaly buds, usually rather long-pedicelled. Hypanthium turbinate, campanulate, or hemispheric, deciduous. Sep-

als 5, short. Petals 5, white or nearly so, broad. Stamens 13-20. Pistil solitary. Ovary with 2 ovules. Drupe glabrous, often glaucous, with a fleshy exocarp and a bony stone.—About 100 species, most abundant in the north temperate zone, tropical America, and Asia.—Spr.—PLUMS. CHERRIES.—The fruits of both wild and cultivated trees are extensively used as food, both raw and preserved.

Drupe with a ventral groove: stone more or less flattened.—PLUMS.

I. AMERICANAE.

Drupe without a ventral groove: stone very turgid.—

CHERRIES.

Flowers corymbose.

II. PENNSYLVANICAE.

Flowers in umbel-like corymbs.

III. CERASI.

I. AMERICANAE

Flowers, and drupes, distinctly pedicelled.

Teeth of the leaf-blades pointed or acute, mostly not gland-tipped when the leaves unfold: sepals glandless except sometimes for inconspicuous glands in *P. americana*.

Leaf-blades rather abruptly acuminate, rather coarsely and deeply serrate: corollas 18-25 mm. wide: drupes red or reddish-yellow, 18-30 mm. in diameter.

Tree, sprouting from the roots, thus forming thickets: bark scaly on older trunks: leaf-blades glabrous or sparingly pubescent, or rarely tomentose beneath, acuminate, even when they unfold: fruits ripening in July: stone oval.

1. *P. americana*.

Tree, not sprouting from the roots, thus not forming thickets: bark somewhat furrowed on older trunks: leaf-blades usually copiously tomentose beneath, commonly somewhat obtuse when they unfold: drupes ripening in October and November: stone obovoid to merely round.

2. *P. mexicana*.

Leaf-blades gradually acuminate, or merely acute, rather finely serrate: corollas 6-14 mm. wide: drupes purple or rarely red to yellow, about 15 mm. in diameter or less.

Drupe globular: stone subglobose: leaves glabrous. Drupe oval or ellipsoid: stone somewhat elongate: leaves pubescent.

3. *P. umbellata*.

Twigs glabrous and shining.

4. *P. mitis*.

Twigs closely pubescent.

5. *P. injuncunda*.

Teeth of the leaves rounded or obtuse (sometimes apparently acute by the presence of pointed glands), mostly glandular, at least when unfolding: sepals glandular, except in *P. angustifolia*, in which the sepals are ciliate.

Leaf-blades rather thick, ovate to ovate-lanceolate, only slightly lustrous on the upper surface, conspicuously veiny beneath, rather coarsely and irregularly serrate.

6. *P. hortulana*.

Leaf-blades usually rather thin, oblong-lanceolate to oval, lustrous above, not conspicuously veiny beneath, finely and evenly serrate.

Leaf-blades 6-10 cm. long: sepals glandular.

7. *P. Munsoniana*.

Leaf-blades usually 2-6 cm. long: sepals non-glandular.

8. *P. angustifolia*.

Flowers, and drupes, short-pedicelled or nearly sessile.

9. *P. geniculata*.

II. PENNSYLVANICAE

Small tree with reddish-brown branches, acuminate leaf-blades, and small red fruits 5-7 mm. in diameter.

10. *P. pennsylvanica*.

III. CERASI

Low shrubs: corolla about 1 cm. broad: leaf-blades appressed-serrate: drupes mostly less than 10 mm. in diameter.

11. *P. cuneata*.

Large trees: corolla 1.5-3 cm. broad: leaf-blades sharply serrate: drupes mostly over 10 mm. in diameter.

Drupe sour: leaves glabrous.

12. *P. Cerasus*.

Drupe sweet: leaves pubescent.

13. *P. Avium*.

1. *P. americana* Marsh. Tree becoming 10 m. tall, the young twigs chestnut-brown: leaf-blades oval or elliptic-oval to narrowly obovate, 6–10 cm. long, glabrous or sparingly pubescent beneath (densely pubescent in *P. americana lanata*), rather gradually narrowed at the base: flowers 3 or 4 together in nearly sessile umbels: sepals lanceolate or elliptic-lanceolate, usually obscurely glandular on the margins, toothed near the apex, glabrous or inconspicuously pubescent without: petals mostly 8–10 mm. long, sometimes slightly ciliate near the base: drupe subglobose, 2–2.5 cm. long or less, reddish-orange to red, often with bloom: stone oval, 13.5–16 mm. long.—(WILD-PLUM. WILD YELLOW-PLUM. RIVER-PLUM. RED-PLUM. THORN-PLUM.)—Edges of woods, river-banks, thickets, and fence-rows, various provinces, Fla. to Colo., Mont., and N. Y.—Fr. ripe late sum. or fall.

2. *P. mexicana* S. Wats. Tree becoming 12 m. tall, the young twigs grayish: leaf-blades elliptic-obovate or obovate, 7–10.5 cm. long, pubescent, at least beneath, rounded to subcordate at the base: flowers 2–4 together in nearly sessile umbels: sepals elliptic to ovate-elliptic, obscurely glandular on the margins, toothed at the apex or entire, pubescent without: petals 6 mm. long, or rarely longer, often sparingly pubescent without: drupe globose or very rarely ellipsoid, 18–30 mm. in diameter, dark purplish-red, with bloom: stone obovoid to nearly round, 12.5–16 mm. long.—(BIG-TREE PLUM.)—Open woods, rich bottoms, and upland prairies, Coastal Plain and adj. provinces, Ala. to Tex., Okla., and Ky.—(Mex.)—Fr. ripe fall.

3. *P. umbellata* Ell. Tree 8 m. tall or less, the young twigs dark reddish-brown, glabrous: leaf-blades lanceolate, elliptic-lanceolate, or oval, 4–7 cm. long, acute, glabrous above, pubescent beneath along the midrib, and also sometimes along the veins, narrowed or rarely rounded at the base: flowers 2–4 together: sepals ovate, obtuse, entire or minutely toothed at the apex, obscurely pubescent without: petals 4–6 mm. long: drupe globose, 12–20 mm. in diameter, red, yellow, or more often dark-purple, with bloom: stone oval or nearly globose.—(SLOE. BLACK-SLOE. HOG-PLUM.)—Dry, often sandy woods and river-banks, Coastal Plain, Fla. to La. and S. C.—Fr. ripe sum.

4. *P. mitis* Beadle. Shrub or small tree, 4–8 m. tall, seldom spiny, with dark-gray or reddish-brown bark and glabrous shining twigs: leaf-blades 2–9 cm. long, elliptic, elliptic-lanceolate or rarely ovate or obovate, acute or acuminate, sharply serrate, narrowed or rounded at the base, finely pubescent on both surfaces and especially along the prominent midrib and veins beneath: sepals triangular, subacute, pubescent without and densely so within: petals 6–8 mm. long: drupe ellipsoid, 10–14 mm. long, dark-purple beneath the bloom: stone ovoid or oval, slightly compressed, about 1 cm. long, pointed at both ends and especially at the apex, crested on one margin.—Dry soil, often in open woods, Coastal Plain and adj. provinces, Ga. and Ala.

5. *P. injucunda* Small. Shrub or small tree, seldom spiny, the bark dark-gray and on the younger branches covered with a velvety pubescence: leaf-blades 2–6 cm. long, oval or obovate, acute or somewhat acuminate, finely but sharply serrate with apiculate teeth, conspicuously and densely pubescent beneath, inconspicuously pubescent and slightly rugose above: sepals finely ciliate, obtuse: petals 6–8 mm. long; blades oval to orbicular: drupe ellipsoid,

12-15 mm. long, dark-purple, beneath the bloom: stone ovoid, 8-10 mm. long, much compressed, pointed at both ends, crested. [*P. maritima* (Chapm. Fl.).]—(HOG-PLUM.)—Sandy soil, mainly in the granite districts, Piedmont, Ga. and Ala.—Fr. ripe sum.

6. *P. hortulana* Bailey. Tree becoming 9 m. tall, the young twigs dark reddish-brown: leaf-blades elliptic-obovate or elliptic-oval, 7.5-11 cm. long, decidedly acuminate, somewhat lustrous above, pubescent, often sparingly so beneath, rather abruptly rounded at the base: umbels 2-5-flowered: sepals elliptic-ovate, mostly obtuse, glabrous or obscurely pubescent, glandular on the margin: petals 6-8 mm. long, abruptly clawed: drupe globose or slightly ellipsoid, 18-25 mm. in diameter, red to yellow, sometimes with thin bloom: stone mostly oval or ellipsoid, 11-17 mm. long. [*P. hortulana* Mineri Bailey.]—(WILD-GOOSE PLUM.)—Rich bottom lands, various provinces, Ga. to Tex., Mo., and Ill.—Fr. ripe sum.—fall.

7. *P. Munsoniana* Wight & Hedrick. Tree, becoming 6 m. tall or more, the young twigs usually chestnut-brown: leaf-blades lanceolate to elliptic-lanceolate, usually 6-10 cm. long, acute or occasionally somewhat acuminate, shining above, sparingly pubescent especially near the veins beneath, or glabrous, rounded at the base: flowers 2-4 together: sepals elliptic-ovate to elliptic, obtuse, glabrous or sparingly pubescent without, glandular on the margins: petals 6-7 mm. long, entire or slightly erose: drupe globose to oval, 25-30 mm. in diameter, usually bright-red, with light bloom, sometimes yellow: stone elliptic to oval or ovoid, 11-20 mm. long or longer.—Rich soil, often in river-valleys, various provinces, Tenn. to N Tex. and Mo.—Fr. ripe sum.

8. *P. angustifolia* Marsh. Tree 3 m. tall or less or a shrub, the young twigs reddish-brown: leaf-blades lanceolate to oval-lanceolate, 2-5 cm. long, usually acute, shining above, sparingly pubescent beneath or glabrous, narrowed or rarely rounded at the base: flowers 2-4 together: sepals ovate, obtuse, glabrous without, ciliate, eglandular: petals about 4 mm. long, abruptly clawed: drupe subglobose, 13-23 mm. in diameter, red to yellow: stone oval, obovoid, elliptic, or oval, 1-1.5 cm. long. [*P. Chicasa* Michx.]—(CHICKASAW-PLUM. SAND-PLUM.)—Sandy soil, edges of woods, thickets and fence-rows, Coastal Plain, Fla. to Miss. and N. J.—Fr. ripe spr.

9. *P. geniculata* Harper. Shrub with diffusely branched stems, 1.5 m. tall, the numerous zigzag branches somewhat spinescent: leaf-blades elliptic to ovate-elliptic, 1-2.5 cm. long, mucronate, finely crenate-serrate, rather short-petioled: flowers in lateral few-flowered sessile umbels appearing before the leaves: pedicels stout, 2-3 mm. long: corolla white, 1 cm. wide or less: drupe oval or globose-oval, 12-25 mm. long or less.—(SCRUB-PLUM.)—Scrub and dry sandy pinelands, C pen. Fla.—Fr. ripe spr.

10. *P. pennsylvanica* L.f. Tree 11 m. tall or less, the young twigs reddish and somewhat shining: leaf-blades lanceolate or elliptic-lanceolate, 6-15 cm. long, acuminate, glabrous or sometimes sparingly pubescent beneath, narrowed or rounded at the base: flowers 3-7 together in umbel-like or corymb-like clusters: sepals elliptic or ovate-elliptic, obtuse, glabrous, eglandular: petals about 5 mm. long: drupe globular, 5-7 mm. in diameter, red, the flesh thin: stone ovoid to broadly ellipsoid to subglobose.—(BIRD-CHERRY. PIN-CHERRY. PIGEON-CHERRY. WILD RED-CHERRY.)—Rocky woods and clearings, often in acid soil and burned-over land, various provinces N of Coastal Plain, Ga. to Colo., Ont., and Newf.—Fr. ripe sum.

11. *P. cuneata* Raf. Shrub 1.5 m. tall or less, the twigs glabrous: leaf-blades oval, elliptic, elliptic-obovate, or obovate, 3.5-8 cm. long, obtuse or some-

times acute, green above, pale beneath, cuneate or gradually narrowed to the base: flowers usually 3 together: sepals elliptic, obtuse, glabrous, minutely glandular on the margins: petals about 6 mm. long: drupe globose or subglobose, 10–15 mm. in diameter, black, without bloom: stone acute.—(DWARF-CHERRY.)—Moist or rocky woods, various provinces N of Coastal Plain, N. C. to Minn. and N. H.—Fr. ripe sum.

12. *P. Cerasus* L. Small tree: leaf-blades ovate, oval-ovate, or ovate-lanceolate, 4–11 cm. long, abruptly acute or acuminate, finely serrate-dentate, glabrous, resinous when young: corolla 1.5–2.5 cm. broad: drupe nearly globose, 8–10 mm. in diameter, or larger in cultivation, sour, red or black: stone subglobose.—(SOUR-CHERRY. MORELLO-CHERRY.)—Woods and fence-rows, various provinces, N Fla. to Colo. and N. H. Nat. of Eu.—Fr. ripe sum.

13. *P. Avium* L. Large tree leaf-blades ovate to oval or oval-ovate, 5–10 cm. long, abruptly short-acuminate, coarsely doubly serrate, pubescent beneath, sometimes only on the veins: corolla 2.5–3 cm. broad: drupe ovoid-globose, 8–10 mm. in diameter, not acid, usually sweet: stone globular.—(SWEET-CHERRY. MAZZARD.)—Thickets, fence-rows, and edges of woods, various provinces, N Fla. to Mo. and Ont. Nat. of Eurasia.—Fr. ripe sum.

5. *PADUS* Borekh. Shrubs or trees. Leaves deciduous, manifestly impregnated with prussic acid. Flowers in terminal racemes, white. Hypanthium green. Sepals relatively large. Petals rounded. Drupe with a juicy exocarp.—About 15 species, natives of the north temperate regions.—WILD CHERRIES. CHOKE CHERRIES.

Sepals deciduous: leaf-blades mostly serrulate with very slender teeth.

1. *P. nana*.

Sepals persistent: leaf-blades mostly serrulate with relatively coarse teeth.

Young shoots, raceme-rachis, and pedicels glabrous.

2. *P. virginiana*.

Young shoots, raceme-rachis, and pedicels pubescent.

Leaf-blades finely and rather sparingly pubescent beneath (except along the midrib), becoming glabrate and glaucous with age.

3. *P. Cuthbertii*.

Drupe red: leaf-blades prevailing obovate, blunt.

4. *P. alabamensis*.

Drupe purple: leaf-blades ovate or elliptic, acute or acuminate.

5. *P. australis*.

Leaf-blades densely and permanently clothed with tawny or rufous tomentum, not glaucous.

1. *P. nana* (Du Roi) Roem. Shrub with diffuse branches, or small tree with spreading or drooping branches: leaf-blades thinnish, oval or obovate, 5–10 cm. long, sharply serrulate, usually rounded at the base, glabrous or nearly so on both sides: raceme rather lax, 8–15 cm. long: sepals reflexed, often ovate, glandular-margined: petals 3–4 mm. long: drupe globose, 8–10 mm. in diameter, red or almost black, or rarely yellow, very astringent. [*P. virginiana* Roem. not *Prunus virginiana* L.]—(CHOKE-CHERRY.)—Rocky woods, sand-dunes, and river-banks, various provinces, Ga. to Tex., Man., and Newf.—Spr.

2. *P. virginiana* (L.) Mill. Tree with ascending branches, becoming 35 m. tall: leaf-blades firm, elliptic, varying to obovate, or elliptic-lanceolate, 5–15 cm. long (coriaceous, often lanceolate, whitish beneath, coarsely serrate, and with the racemes few-flowered and divergent in *P. virginiana montana*—on mtn. tops), acumi-

nate or acute at both ends, or rounded at the base, crenate-serrulate with callous-tipped teeth, glabrous or nearly so: sepals ovate, longer than broad: corolla 8–10 mm. broad: drupe globose, 8–10 mm. in diameter, dark-purple or nearly black, sweet but slightly astringent. [*P. serotina* (Ehrh.) Agardh.]—(WILD BLACK-CHERRY. RUM-CHERRY.)—Woods and roadsides, various provinces, Fla. to Tex., N. D., and Ont.—Spr.—sum.—The bark of this and of other species is used in medicine. The wood is used in cabinet-work.

3. *P. Cuthbertii* Small. Tree 6 m. tall, with tomentose twigs: leaf-blades coriaceous, typically obovate, varying to oval or pandurate, 4–9 cm. long, blunt or notched at the apex, shallowly serrate, not markedly biglandular at the often cuneate base, dull-green above, pale or glaucescent beneath, the midrib and petioles copiously tomentose, the lateral veins slightly so: raceme 5–8 cm. long, the rachis and pedicels pubescent like the twigs: sepals broader than long, obtuse: petals 3–4 mm. long, crisped: drupes subglobose, 8–9 mm. in diameter, red.—Rocky and sandy woods, river-bluffs, and steep-heads, Coastal Plain and Piedmont, Fla. and Ga.—Spr.

4. *P. alabamensis* (C. Mohr) Small. Tree rarely over 10 m. tall, the bark rough: leaf-blades coriaceous or thick-membranous, ovate to elliptic, 6–12 cm. long, short-acuminate but sometimes obtuse at the apex, serrate with blunt appressed gland-tipped teeth, paler beneath than above and finely pubescent with simple or forked hairs, rounded or slightly narrowed at the base: raceme 10–15 cm. long, spreading, the rachis and peduncles, like the calyx, pubescent.—Mt. slopes, Appalachian provinces, Ga. and Ala.—Spr.

5. *P. australis* Beadle. Tree 10–20 m. tall: leaf-blades obovate, oval, or elliptic, 4–10 cm. long, 2–6 cm. wide, abruptly and rather bluntly pointed at the apex, or occasionally obtuse, rounded or obtusely narrowed at the base, finely serrate, dark-green and glabrous above, densely and permanently clothed on the lower surface with tawny or rufous tomentum, not at all glaucous: raceme 8–12 cm. long, the rachis and pedicels, like the young shoots, pubescent: drupe globose, 5–8 mm. in diameter, purple.—Clay soil, Coastal Plain, near Evergreen, Ala.—Spr.

6. **LAUROCERASUS** Reichenb. Shrubs or trees. Leaves evergreen, copiously impregnated with prussic acid. Flowers in axillary racemes, white. Hypanthium white. Sepals minute. Petals more or less angulate. Drupe with a dry exocarp.—About 20 species, natives of tropical and temperate regions.—CHERRY-LAURELS.

Petals larger than the sepals: drupe subglobose.  
Petals smaller than the sepals: drupe ellipsoid or oval.

1. *L. myrtifolia*.
2. *L. caroliniana*.

1. *L. myrtifolia* (L.) Britton. Shrub or small tree: leaf-blades elliptic: racemes loosely flowered, the pedicels slender: petals slightly angled: drupe 8–12 mm. in diameter: stone spheroidal. [*Prunus sphaerocarpa* Sw. *L. sphaerocarpa* (Sw.) Roem.]—(WEST-INDIAN CHERRY.)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(*W. I.*)—Fall-wint.

2. *L. caroliniana* (Mill.) Roem. Shrub or small tree: leaf-blades narrowly elliptic to elliptic-oblongate: racemes densely flowered, the pedicels stout: petals saliently angled: drupe 10–13 mm. long: stone ovoid. [*Prunus caroliniana* Ait.]—(MOCK-ORANGE.)—Woods, usually in river banks and hammocks, Coastal Plain, Fla. to Tex. and N. C.—Wint.—spr.—(*W. I.*)—Rare as a native tree, but commoner as an escape from cult.

## FAMILY 16. MIMOSACEAE — MIMOSA FAMILY

Herbs, shrubs, or trees. Leaves alternate: blades compound, usually 2-3-pinnate: stipules sometimes spine-like. Flowers mostly perfect, borne in capitate or elongate usually dense spikes or racemes. Calyx of 3-6 partially united sepals. Corolla of 3-6 equal, distinct or partially united petals. Androecium of 3-6, or many, stamens which are usually conspicuously exserted. Gynoecium 1-carpellary. Fruit a legume.—About 40 genera and 1,500 species, most abundant in the tropics.

Stamens numerous, more than 10.

Filaments partly united into a tube.

Filaments distinct.

Stamens as many as the petals or corolla-lobes or twice as many.

Anthers without glandular appendages at the top.

Anthers, at least in the bud, topped by glandular appendages.

Tribe I. INGEAE.

Tribe II. ACACIEAE.

Tribe III. MIMOSEAE.

Tribe IV. ADENANTHEREAE.

## I. INGEAE

Valves of the pod not separating from the continuous margin.

Pods with thick-leathery valves: leaves with few (usually 4) leaflets.

Pod with membranous or thin-leathery very flat valves: leaves with several or many leaflets.

Valves of the pod separating from the continuous margin.

1. PITHECOLOBIUM.

2. ALBIZZIA.

3. LYSILOMA.

## II. ACACIEAE

Ovary stipitate: petals distinct or united, commonly only to below the middle: pod flat, dry, the seeds not in two distinct rows.

Ovary sessile: petals united into a tubular-funnelform, shallowly lobed corolla: pod nearly terete or broader than high, pulpy within, the seeds in two separate rows.

4. ACACIELLA.

5. VACHELLIA.

## III. MIMOSEAE

Valves of the pod not separating from the continuous margin.

Shrubs or trees: seeds transverse in the pod.

Herbs: seeds lengthwise or oblique in the pod.

Valves of the pod separating from the continuous margin.

Pod slightly, if at all, flattened, 4-angled or with a broad margin, beaked, not jointed.

Pod flat, jointed, not beaked.

6. LEUCAENA.

7. ACUAN.

8. LEPTOGLOTTIS.

9. MIMOSA.

## IV. ADENANTHEREAE

Herbs with prostrate wiry or very slender unarmed branches: spikes uniform, the neutral and perfect flowers the same size: pod short and even.

Shrubs or small trees with erect, spine-armed branches: spikes not uniform, the neutral flowers at the base of the spike much longer than the perfect ones: pod elongate, constricted between the seeds and contorted.

10. NEPTUNEA.

11. CAILLEIA.

1. **PITHECOLOBIUM** Mart. Shrubs or trees. Leaves 2-pinnate: leaflets few, often 4. Spikes capitate, white or pink. Calyx-lobes minute. Corolla prominently lobed. Pod narrow, contorted, often pulpy within. Seed with colored arils.—About 100 species, widely distributed in tropical and sub-tropical regions.—Spr.-sum. or all year.

Ovary glabrous, shorter than the stipe: petioles longer than the petiolules.

Ovary pubescent, longer than the stipe: petioles shorter than the petiolules.

1. *P. Unguis-Cati*.

2. *P. guadelupense*.

1. **P. Unguis-Cati** (L.) Benth. Armed or rarely unarmed shrub or small tree: blades of the leaflets thinnish, broadly obovate, oval, or suborbicular,

1-4.5 cm. long; calyx 1.5-2 mm. long; lobes wider than long, blunt; corolla 3.5-4.5 mm. long; pod long-stipitate. — (CAT'S-CLAW. BLACK-BEAD.) — Hammocks, Everglade Keys and lower W coast, pen. Fla. and Florida Keys.—(W. I.)

2. *P. guadelupense* Chapm. Unarmed or rarely armed shrub or small spreading tree: blades of the leaflets leathery, elliptic to cuneate, oval, or sub-orbicular, 3-7 cm. long; calyx 2.5-3 mm. long; lobes longer than wide, acute; corolla 5-6 mm. long; pod short-stipitate. — (BLACK-BEAD.) — Pinelands, hammocks, and sand-dunes, Everglade Keys and lower E coast, pen. Fla. and Florida Keys.—(W. I.)

2. **ALBIZZIA** Durazz. Shrubs or trees. Leaves 2-pinnate: leaflets numerous. Spikes capitate, white or pink. Calyx-lobes relatively short and small. Corolla about twice as long as the calyx. Pod linear, flat.—About 50 species, natives of the Old World.

Blades of the leaflets acute, the midrib nearly marginal: pod-valves veiny all over.

Blades of the leaflets rounded at the apex, the midrib not lateral: pod-valves veiny only over the seeds.

1. *A. Julibrissin.*

2. *A. Lebbek.*

1. *A. Julibrissin* (Willd.) Durazz. Shrub or tree becoming 10 m. tall: leaves with 16-24 pinnae; leaflets 5-7, the blades falcate-lanceolate, 7-16 mm. long, obliquely acute; calyx about 2 mm. long; corolla 6-8 mm. long; larger lobes ovate: pod broadly linear, 10-15 cm. long; seed elliptic, 3.5-4.5 mm. wide.—(JULIBRISSIN. ACACIA. SILK-TREE.)—Pinelands, hammocks, roadsides, and cult. grounds, Coastal Plain and rarely adj. provinces, Fla. to La. and Md. Nat. of Asia and cult.—(W. I.)—Spr.-sum.—The spikes are pink.

2. *A. Lebbek* (Willd.) Benth. Tall tree: leaves with 4-8 pinnae; leaflets 10-22, the blades elliptic to elliptic-obovate, 2-5.5 cm. long, acute; calyx about 4 mm. long; corolla 9-11 mm. long; larger lobes lanceolate: pod linear, 15-40 cm. long; seed oval, 6-7 mm. wide.—(LEBBEK. WOMAN'S TONGUE TREE.)—Hammocks and cult. grounds, Florida Keys. Nat. of Africa and cult.—(W. I.)—Spr.—The spikes are cream-color.

3. **LYSILOMA** Benth. Shrubs or trees. Leaves 2-pinnate: leaflets numerous (or few). Spikes capitate (or cylindric), white or greenish-white. Calyx-lobes relatively long. Corolla slightly longer than the calyx. Pod elliptic to linear.—About 10 species, natives of tropical America.

1. *L. bahamensis* Benth. Tree becoming 20 m. tall, with spreading branches: leaves with 4-8 pinnae; leaflets 20-40, the blades elliptic to elliptic-lanceolate, 8-11 mm. long; calyx about 2 mm. long; corolla 2.5-3 mm. long; lobes ovate: pod elliptic, 8-15 cm. long, long stipitate. [*L. latissilqua* Chapm. not Benth.]—(WILD-TAMARIND.)—Hammocks, Everglade Keys, pen. Fla. and Florida Keys.—(W. I.).

4. **ACACIELLA** Britton & Rose. Shrubs or trees, or sometimes herbs. Leaves mostly 2-pinnate, sometimes reduced to phyllodia: leaflets usually numerous. Spikes capitate or cylindric. Calyx cupulate or resembling the corolla. Petals distinct or partially united. Filaments distinct, or some of them slightly united at the base. Pod flat.—About 50 species, mostly in subtropical or tropical regions.

1. **A. hirta** (Nutt.) Britton & Rose. Shrub with hirsute foliage: leaf-pinnæ mostly 10–13: leaflets very numerous; blades elliptic or narrowly elliptic, 4–5 mm. long: spikes white, pinkish, or yellowish: calyx less than 1 mm. long; lobes deltoid, acute: corolla 2–2.5 mm. long: pod linear, 3–7 cm. long, 6–9 mm. wide. [*A. filicioides* (Fl. SE. U. S.)]—(ACACIA).—Pinelands, pen. Fla.; also various provinces, Tex. to Ariz., Kans., and Mo.—(*Mex.*)—Spr.

5. **VACHELLIA** Wight & Arn. Shrubs or small trees. Leaves 2-pinnate: leaflets numerous, small. Spikes globose. Calyx-lobes minute and relatively short. Corolla about twice as long as the calyx, the lobes short. Filaments distinct. Pod very turgid.—Several species of wide geographic distribution.—Spr.—sum. or all year S.—**OPOPANAX. YELLOW-OPOPANAX. POPINACK. HINSACH. CASSIE. SWEET-ACACIA.**

Leaflets separated; blades relatively large 4.5–6.5 mm. long, veiny: spikes over 1 cm. in diameter: pod blunt or merely abruptly acute, the suture prominently 2-ridged.

Leaflets contiguous; blades relatively small, 1.5–3.5 mm. long, not veiny: spikes less than 1 mm. in diameter: pod beaked or bluntly tapering, the suture inconspicuous.

Pod beaked, turgid.

Flower-heads 1–3 together, the peduncles nearly 2 cm. long: terminal mucro of leaf-rachis glabrous or nearly so: spines proportionately slender.

Flower-heads 1–7 together, the peduncles mostly less than 1 cm. long: terminal mucro of leaf-rachis pubescent: spines proportionately stout.

Pod beakless, not turgid.

1. *V. Farnesiana*.

2. *V. peninsularis*.

3. *V. densiflora*.

4. *V. insularis*.

1. **V. Farnesiana** (L.) Wight & Arn. Stout shrub or small tree, armed with rather short stout spines: leaf-rachis and branches finely pubescent: leaflets glabrous, the longer ones of each rachis 4.5–6.5 mm. long: peduncles closely fine-pubescent: spikes fully 1 cm. in diameter: calyx about 2 mm. long: corolla 3–4 mm. long, much exceeding the calyx: pod stout, 3.5–8 cm. long: seeds about 6 mm. long.—Hammocks, pine-lands, and waste-places, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)

2. **V. peninsularis** Small. Shrub up to 4 m. tall, armed with slender spines mostly 1–3 cm. long: leaf-rachis glabrous: leaflets glabrous, the larger ones of each rachis 1.5–3.5 mm. long: peduncles nearly 2 cm. long, with few sessile glands and sometimes slightly puberulent: spikes yellow, less than 1 cm. in

diameter: calyx about 2 mm. long: corolla about 2.5 mm. long, slightly exceeding the calyx: pod stout, inequilaterally ellipsoid, more or less turgid, 3-6 cm. long: seeds 5-5.5 mm. long.—Pinelands and hammocks in the Everglades, S. pen. Fla.—All year.—In the pinelands of the lower Florida Keys there is a dwarf opoponax, usually less than 1 m. tall, the pods are linear, 5-10 cm. long, curved and relatively stout-beaked.

3. *V. densiflora* Alexander. Shrub up to 4 m. tall, armed with short spines mostly less than 1 cm. long: leaf-rachis glabrous, terminal mucro long-pubescent: leaflets glabrous, the larger ones up to 3.5 mm. long: peduncles mostly less than 1 cm. long, rather stout in proportion, with numerous sessile resinous glands, accompanied by some caducous puberulence: spikes deep orange-yellow, less than 1 cm. in diameter: calyx about 2 mm. long: corolla about 2.5 mm. long, slightly exceeding the calyx: pod stout, with a short, stout beak, only slightly turgid, 3-5 cm. long: seeds about 5 mm. long.—Bayou-banks, fills, and waste-fields, along and near the Gulf Coast, W Fla. to Tex.—Spr.

4. *V. insularis* Small. Shrub up to 3 m. tall, armed with pale spines 1-2.5 cm. long: leaf-rachis glabrous: leaflets glabrous, the longer ones of each rachis 1.5-3 mm. long: peduncle glabrous or with small sessile glands: spikes less than 1 cm. in diameter: calyx about 2 mm. long: corolla about 2.5 mm. long, slightly exceeding the calyx: pod narrow, stout, but not inflated, 2.5-7 cm. long, acute, but not beaked.—Hammocks and pinelands, Fla. Keys.—All year.

6. *LEUCAENA* Benth. Shrubs or trees. Leaves mostly 2-pinnate: leaflets often small and numerous. Spikelets capitate. Calyx-lobes minute. Petals distinct, or rarely slightly coherent. Filaments distinct or nearly so. Pod linear, flat.—About 10 species, mostly in tropical America.

1. *L. glauca* (L.) Benth. Shrub, or tree becoming 10 m. tall: leaflets 6-12 mm. long; blades narrowly elliptic to lanceolate, over 1.5 mm. wide: spikes white or pinkish: calyx 2-2.5 mm. long or rarely shorter: petals 4-4.5 mm. long: pod 10-15 cm. long.—(LEAD-TREE.)—Hammocks, Coastal Plain, Fla. and Tex.—(W. I., Mex., C. A., S. A.)—All year.

7. *ACUAN* Medic. Perennial herbs, often somewhat woody near the base. Leaves 2-pinnate: leaflets small, numerous. Spikes capitate, white or greenish. Calyx-lobes minute. Petals distinct, sometimes clawed. Filaments distinct. Pod flattish. [*Desmanthus* Willd.]—About 10 species, most of them in tropical America.

Stamens 5: pods flat, broad, curved, in a dense-head: seeds few. Stamens 10: pods turgid, narrow, straight, spreading: seeds several.

Gland between the lower pair of pinnae orbicular: pod 3-5.5 cm. long.

Gland between the lower pair of pinnae elliptic: pod 6-8 cm. long.

1. *A. illinoense*.

2. *A. depressum*.

3. *A. virgatum*.

1. *A. illinoense* (Michx.) Kuntze. Plant 3-12 dm. tall, glabrous or nearly so: leaves with 20-28 pinnae; blades of the leaflets lanceolate to linear-elliptic,

2.5–3.5 mm. long: calyx about 1.5 mm. long: petals 2.5–3 mm. long: ovary broad: pod about 1.5 cm. long. [*D. brachylobus* (Willd.) Benth.]—(PRICKLE-WEED.)—Rich soil and river banks, various provinces, Fla. (?), Ala. to Tex., Colo., Minn., and Ohio.—Spr.—fall.

2. *A. depressum* (H. B. K.) Kuntze. Stem 3–8 cm. long: blades of leaflets narrowly elliptic, 2–5 mm. long: calyx 1.5–2 mm. long: petals 2.5 mm. long: blades spatulate: pod 3–5.5 mm. long. [*D. depressum* H. B. K.]—Pinelands and open sandy places, S pen. Fla. and the Keys, and Tex.—(*W. I., Mex., C. A., S. A.*)—All year S.

3. *A. virgatum* (L.) Medic. Stem 3–11 dm. long: blades of the leaflets linear to elliptic, 4–8 mm. long: calyx about 2.5 mm. long: petals about 3 mm. long: blades spatulate: pod 6–8 cm. long. [*D. virgatus* (L.) Willd.]—Hammocks and cultivated grounds, Florida Keys.—(*W. I.*)—All year.

8. **LEPTOGLOTTIS** DC. Perennial herbs or partly woody plants, with spreading or prostrate angled prickly stems. Leaves 2-pinnate, sensitive: leaflets numerous, entire. Spikes globular, bright-pink or rose-purple. Calyx-lobes minute. Petals united to the middle or above it. Filaments distinct or nearly so. Pod narrow, stout-subulate or linear, prickly, beaked. [*Schrankia* Willd. *Morongia* Britton.]—About 10 species, most of them in tropical and temperate America.—Spr.—sum.—SENSITIVE-BRIARS. SENSITIVE-PLANTS.

Blades of the leaflets prominently veined beneath.

Blades of the leaflets obtuse or acutish; pod elongate, over 1 dm. long.

Blades of the leaflets cuspidate: pod short, less than 1 dm. long.

Blades of the leaflets not prominently veined beneath.

Pod slender, long-beaked, not densely prickly: prickles of the peduncles mostly not very wide at the base.

Blades of the leaflets 3.5–7 mm. long: pod mostly 9–15 cm. long, 3–4 mm. thick.

Blades of the leaflets 2.5–3.5 mm. long: pod mostly 6–7 cm. long, about 2 mm. thick.

Pod stout, short-beaked, densely prickly: prickles of the peduncles mostly much widened at the base.

1. *L. floridana*.

2. *L. Nuttallii*.

3. *L. microphylla*.

4. *L. angustisiliqua*.

5. *L. Chapmanii*.

1. *L. floridana* (Chapm.) Small. Stem with the prickles wide at the base: leaflets with the midrib ending at or below the apex: pod mostly 11–15 cm. long, armed with broad-based prickles, long-beaked: seed about 3 mm. long. [*S. floridana* Chapm. *M. uncinata* (Fl. SE. U. S.)]—Pinelands, Fla.—Spr.—sum.

2. *L. Nuttallii* DC. Stem with the prickles little, if at all, dilated at the base: leaflets with the midrib excurrent as a terminal cusp: pod mostly 3–7 cm. long, armed with slender prickles, slender-beaked: seed 3.5–4 mm. long.—Dry woods and pinelands, Coastal Plain and more northern provinces, Ala. to Tex., S. Dak., Ill., and S. C.—Sum.—fall.—This, the most widely distributed of our species of *Leptoglottis*, has usually passed under the specific name of *uncinata*.

3. *L. microphylla* (Dryand.) Britton. Stem with rather slender curved prickles: blades of the leaflets narrowly elliptic to linear-elliptic, 3.5–7 mm. long: upper peduncles mostly shorter than the leaves: pod mostly 9–15 cm. long, much longer than the peduncle: seed fully 4 mm. long. [*S. angustata* T. & G. *M. angustata* Britton *M. microphylla* Britton]—Dry woods and pinelands, various provinces, Fla. to Tex., Tenn., and Va.—Spr.–fall.

4. *L. angustisiliqua* Britton & Rose. Stem with weak rather distant prickles: blades of the leaflets linear-elliptic, 2.5–3.5 mm. long: peduncles shorter than the leaves: pod 6–7 cm. long, nearly or quite as long as the peduncle: seed about 3 mm. long.—Pinelands, S pen. Fla.—All year.

5. *L. Chapmanii* Small. Stem and leaflets as in *L. microphylla*: upper peduncles mostly longer than the leaves: pod mostly 3.5–8 cm. long, about as long as the peduncle or somewhat longer: seed fully 3 mm. long. [*S. angustata brachycarpa* Chapm.]—Pinelands, Coastal Plain, Fla. to Tex. and N. C.—Spr.–sum.

9. **MIMOSA** L. Shrubs or trees, or herbs, usually prickly. Leaves 2-pinnate: leaflets few or numerous, often sensitive. Spikes globose or cylindric. Calyx-lobes minute. Petals united to the middle or above it, or rarely distinct. Filaments distinct or nearly so. Pods clustered, flat, jointed.—About 325 species, mostly natives of warm and tropical regions.—Spr.–sum. or all year S.

Peduncles shorter than the leaves: stamens as many as the corolla-lobes with spine-like bristles in the margins, the faces glabrous.

Peduncles as long as the leaves or longer: stamens twice as many as the corolla-lobes: pod bristly-pubescent all over.

1. *M. pudica*.

2. *M. strigillosa*.

1. *M. pudica* L. Plant usually partly woody, the branches with loosely spreading hairs, sometimes densely hirsute: leaves with 2 approximate pairs of pinnae or rarely with a single pair; leaflets mostly 6–12 mm. long, with long appressed stiff hairs: spike rose-purple: calyx minute: corolla about 3 mm. long: pod mostly 1–2 cm. long, 3–4 mm. wide, decidedly constricted between the joints: seed 2–2.5 mm. long.—Waste-places, cult. grounds, and roadsides, Coastal Plain, Fla. to Tex. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A., O. W.*)

2. *M. strigillosa* T. & G. Plant herbaceous, the branches with appressed hairs: leaves with 5–8 pairs of pinnae; leaflets smaller than those of *M. pudica*, with minute hairs or glabrous: spike deep-pink: calyx nearly 0.5 mm. long: corolla about 2 mm. long: pod mostly 2–3 cm. long, 8–11 mm. wide, sometimes slightly constricted on the central suture, about 5 mm. long.—Stream-banks, hammocks, pinelands, and meadows, Coastal Plain and rarely adj. provinces, Fla. to Tex., Ark., and Ga.—(*Mex.*)

10. **NEPTUNIA** Lour. Perennial unarmed diffuse, prostrate, or floating plants. Leaves 2-pinnate: leaflets numerous, small. Spikes globose or ellipsoid, yellow or greenish-yellow. Calyx-lobes shorter than the tube. Petals distinct or partly united. Filaments distinct or nearly so. Ovary short-stipitate. Pod oblique, sometimes only slightly so.—About 10 species, natives of America, Asia, and Australia.

Calyx-lobes deltoid: pod-body somewhat rhombic-elliptic, usually very inequilateral, sometimes curved, pubescent.

1. *N. lutea*.

Calyx-lobes lanceolate; pod-body broadly linear to linear-elliptic, only slightly inequilateral, straight.

2. *N. floridana*.

1. *N. lutea* (Leavenw.) Benth. Stem and branches short-villous: leaflets numerous; blades broadly linear, ciliate: spikes very dense, terminating pubescent peduncles: pod 3-5 cm. long, the body relatively broad, long-stipitate: seed oval or orbicular. [*Desmanthus luteus* Benth.]—Moist soil, often on prairies, various provinces, Fla. to Tex. and Kans.—Spr.—sum.

2. *N. floridana* Small. Stem and branches sparingly pubescent or glabrous: leaflets very numerous; blades narrowly linear to linear-lanceolate, ciliate: spikes lax, terminating glabrous peduncles: pod 2.5-3.5 cm. long, the body relatively narrow, short-stipitate: seed elliptic.—Pinelands, hammocks, and sea-shores, Coastal Plain, Fla. to La.—(W. I.)—Spr.—fall or all year S.

11. **CAILLEIA** Guill. & Perr. Shrubs with thorn-armed branches. Leaves 2-pinnate: leaflets very numerous, small. Spikes cylindric, the lower part of neutral flowers with long staminodia, the upper with perfect flowers, the two kinds of flowers of different colors. Calyx-lobes much shorter than the tube. Petals united to above the middle. Filaments distinct or nearly so. Ovary short-stipitate. Pod linear, more or less constricted between the seeds and twisted.—About 7 species, natives of tropical Africa, Asia and Australia.

1. *C. glomerata* (Forsk.) Macbride. Shrub with pubescent twigs: leaves very numerous: leaflets close together; blades linear, 3-4.5 mm. long, finely pubescent: spikes very dense, peduncled: neutral flowers with slender pink or rose-purple staminodia: perfect flowers with bright yellow stamens: calyx about 1 mm. long; lobes broadly deltoid: corolla greenish-white, 2.5-3 mm. long; lobes lanceolate to ovate-lanceolate: pod 5-7 cm. long, clustered: seeds ellipsoid.—Pinelands, S Fla. Nat. of Africa.—(W. I.)—All year.

#### FAMILY 17. CASSIACEAE—SENNA FAMILY

Trees, shrubs, or herbs. Leaves alternate: blades compound, 1-2-pinnate, rarely 1-foliolate. Flowers perfect, polygamous, monoecious, or dioecious, more or less irregular. Calyx of 3-5, usually slightly united, sepals, sometimes borne on the edge of a well developed hypanthium. Corolla of 3-5 unequal distinct petals. Androecium of 6-10 distinct or nearly distinct stamens. Gynoecium 1-carpellary. Fruit a legume.—About 90 genera and 1000 species, mostly tropical.

Sepals, and petals, usually 5: stamens 5 or 10, sometimes partly represented by staminodia.

Corolla apparently papilionaceous: leaves with 1-foliolate blades.

Tribe I. BAUHINIEAE.

Corolla more or less irregular; leaves with pin-  
nately compound blades.

Leaves with 1-pinnate blades.

Leaves with 2-pinnate blades.

Sepals 4; petals 3, and usually accompanied by 2 rudiments; stamens 3.

Tribe II. CASSIEAE.

Tribe III. CAESALPINIEAE.

Tribe IV. TAMARINDEAE.

#### I. BAUHINIEAE

Shrubs or small trees with broad leaflets and clusters of bright flowers.

#### II. CASSIEAE

Corolla nearly regular, the 5 petals slightly unequal; calyx-lobes obtuse; pod not elastically dehiscent.

Pod tetragonal or nearly terete.

Shrub: pod indehiscent or opening irregularly; leaflets 6 or more.

Herb: pod dehiscent by both sutures; leaflets 6 or fewer.

Pod flat.

Valves of the pod coriaceous, not impressed between the seeds.

Valves of the pod chartaceous, impressed between the seeds.

Corolla quite irregular, one of the lateral petals (standard) and the lowest petal large, the other 3 petals often greatly reduced; calyx-lobes acuminate; pod elastically dehiscent.

#### III. CAESALPINIEAE

Flowers dioecious or polygamous.

Flower with a very small receptacle; stamens surpassing the petals; pod leathery.

Flower with a long receptacle; stamens shorter than the sepals; pod woody.

Flowers perfect.

Pod long, smooth; standard with a suborbicular or reniform blade.

Leaf with a very short petiole which ends in a spine, each division with a long flat phyllode-like rachis.

Leaf with a decided petiole, the rachises not phyllode-like.

Calyx-lobes valvate.

Calyx-lobes imbricate, the lower one cucullate.

Petals long-clawed; stamens greatly elongate.

Petals, except the standard, sessile or with very short claws; stamens short.

Pod short, prickle-armed; standard with a cuneate or spatulate blade.

#### IV. TAMARINDEAE

Tree with numerous fine leaves, pale flowers, and thick pod with sour pulp.

1. **CERCIS L.** Shrubs or trees. Leaves 1-foliolate: leaflet broad. Calyx shallowly lobed: tube gibbous. Corolla pink-purple: keel-petals of the apparently papilionaceous corolla longer than the others. Anthers short, opening lengthwise. Pod very flat.—About 7 species, natives of North America, Europe, and Asia.

1. **C. canadensis L.** Small tree, with curved trunk, smoothish bark, and brown heart-wood: leaf-blades broadly cordate to reniform: pedicels mostly less than 1.5 cm. long: sinuses of the calyx nearly as broad as the lobes: corolla light pink-purple (or white in *C. canadensis alba*): larger petals 12–13 mm. long; blades ovate: pod linear-oblong, 6–9 cm. long.—(RED-BUD. JUDAS-TREE.)—Dry rich woods, often in calcareous

1. **CERCIS.**

2. **ADIPERA.**

3. **EMELISTA.**

4. **DITREMEXA.**

5. **PEIRANISIA.**

6. **CHAMAECRISTA.**

7. **GLEDITSIA.**

8. **GYMNOCLADUS.**

9. **PARKINSONIA.**

10. **DELONIX.**

11. **POINCIANA.**

12. **CAESALPINIA.**

13. **GUILANDINA.**

14. **TAMARINDUS.**

regions, various provinces, Fla. to Tex., Nebr., Ohio, and Conn.—(Mex.)—Spr.—Often grown as an ornamental tree.

**2. ADIPERA** Raf. Shrubs. Leaflets few: blades of a lanceolate or elliptic type. Flowers borne in terminal panicles. Petals 5, nearly equal. Perfect stamens often 7, accompanied by often 3 staminodia: larger anthers with stout disk-like tips. Pod stoutish, thick, indehiscent. Seeds transversely or obliquely placed.—About 8 species, mostly natives of tropical America.

**1. A. corymbosa** (Lam.) Small. Shrub 2–4 m. tall: leaflets mostly 6; blades lanceolate to linear-elliptic or elliptic-lanceolate, 2–5 cm. long, glabrous: panicle-branches ending in corymbs: flowers bright-yellow: petals obovate, about 1 cm. long: pod 7–15 cm. long, with convex sides and furrowed sutures. [*Cassia corymbosa* Lam.]

—(GOLDEN-SHOWER.)—Woods, waste-places, and roadsides, Coastal Plain, Ga. to La. and Tenn. Nat. of Argentina.—Spr.-fall.—Widely cult. on account of its numerous clusters of bright-yellow flowers.—A second species, *A. bicapsularis* (L.) Britton & Rose, with obovate or cuneate leaflet-blades, has been collected in S Fla. It is widely distributed in the tropics.

**3. EMELISTA** Raf. Herbs. Leaflets few: blades of an obovate type. Flowers solitary or clustered in the axils or aggregated in a terminal cluster. Petals 5, nearly equal in size, but unequal in shape. Perfect stamens 6 or 7, accompanied by 3 or 4 staminodia: larger anthers with a terminal disk-like appendage. Pod slender, tetragonal or nearly terete, dehiscent along both sutures. Seed longitudinally placed.—About 7 species, mostly natives of tropical America.

**1. E. Tora** (L.) Britton & Rose. Plant annual, 4–15 dm. tall, nearly glabrous: leaflets 4–6; blades obovate or cuneate-obovate, very slightly cuspidate, the terminal pair much the largest, 3–5 cm. long: petiolar gland elongate, between the lower pairs of leaflets: stipules linear-spatulate to setaceous: flowers yellow: sepals 7–9 mm. long, the larger ones ovate: petals 13–15 mm. long, very diverse in shape: pod falcate, more or less tetragonal, 3–4 mm. wide. [*Cassia Tora* L.]—(COFFEE-WEED. SICKLE-POD.)—Pinelands, waste grounds, fields, and roadsides, various provinces, Fla. to Tex., Kans., and Va. Nat. of trop. Am.—(W. I., Mex., C. A., S. A.)—Sum.-fall, or all year S.

**4. DITREMEXA** Raf. Herbs, shrubs, or trees. Leaflets several: blades mostly of an ovate, elliptic, or lanceolate type. Flowers in axillary clusters or the upper clusters borne in an erect thyrsoid panicle, yellow. Petals 5,

mostly equal in size, but unequal in shape. Perfect stamens usually 7, accompanied by 3 staminodia: larger anthers unappendaged. Pod mostly flat, dehiscent along both sutures. Seeds transversely placed or oblique.—More than 100 species, natives of tropical and temperate regions.—**NIGGER-COFFEES.** **COFFEE-WEEDS.**—The seeds of some species are used as a coffee-substitute.

Blades of the leaflets of a lanceolate, ovate type, acute or acuminate.

Leaflets with broad blades: gland near the base of the petiole globular: pod thick-margined.

Leaflets with narrow blades: gland near the base of the petiole elongate.

Blades of the leaflets of an elliptic type, exceptionally elliptic-lanceolate, prominently mucronate.

Ovary long-hairy: pod-valves with divisions fully as long as wide.

Ovary short-hairy: pod-valves with divisions much shorter than wide.

1. *D. occidentalis*.

2. *D. ligustrina*.

3. *D. marylandica*.

4. *D. Medsgeri*.

1. ***D. occidentalis* (L.) Britton & Rose.** Plant annual, 5–15 dm. tall, nearly glabrous: leaflets 8–12; blades ovate to ovate-lanceolate, somewhat acuminate, 3.6–5 cm. long; stipules broadly lanceolate: sepals 11–14 mm. long; petals 15–19 mm. long: pod linear, glabrous, with the septa externally prominent, 8–13 cm. long, 6 mm. wide. [*Cassia occidentalis* L.]—(**COFFEE-WEED.** **COFFEE-SENNA.** **NIGGER-COFFEE.** **STYPTIC-WEED.**)—Pinelands, cult. grounds, and waste-places, various provinces, Fla. to Tex., Kans., and Va. Nat. of trop.—(*W. I., Mex., C. A., S. A., O. W.*)—Sum. or all year S.

2. ***D. ligustrina* (L.) Britton & Rose.** Plant partly woody, 6–20 dm. tall, nearly glabrous: leaflets 12–16; blades lanceolate often narrowly so or linear-lanceolate, 2–6 cm. long: stipules linear-lanceolate: sepals 9–12 mm. long, the larger ones obovate: petals 13–16 mm. long: pod curved, flat, prominently margined, 7–8 mm. wide. [*Cassia ligustrina* L.]—Hammocks, pen. Fla.—(*W. I.*)—All year.

3. ***D. marylandica* (L.) Britton & Rose.** Plant perennial, 8–20 dm. tall, sparingly pubescent; leaflets 12–20; blades elliptic to elliptic-lanceolate, mucronate, 4–5 cm. long: petiolar gland obovate, stipitate, near the base of the rachis: sepals 6–8 mm. long: petals 10–12 mm. long, cuneate to spatulate: pod curved, somewhat hispid, 10–12 cm. long: seed flat, nearly as wide as long. [*Cassia marylandica* L.]—(**WILD-SENNA.**)—Moist stream-banks and alluvial soil, various provinces, N. C. to Tenn., Ind., and Mass.—Sum.

4. ***D. Medsgeri* (Shafer) Britton & Rose.** Plant perennial, similar to *D. marylandica* in habit: leaflets 8–16; blades elliptic to elliptic-lanceolate, 3–6 cm. long, mucronate: petiolar gland subglobose, near the base of the rachis: stipules linear-lanceolate: sepals 5–8 mm. long: petals 9–11 mm. long, obovate to broadly spatulate: pod falcate, glabrous, 6–10 cm. long, 8–11 mm. wide. [*Cassia Medsgeri* Shafer.]—(**WILD-SENNA.**)—Woods, and roadsides, various provinces, Fla. to Tex., Kans., Ia., and Pa.—Sum.—fall.—***Ditreuxia* Nashii** Britton & Rose, closely related to *D. Medsgeri*, but with the leaflets more nearly approaching a lanceolate type, occurs in central pen. Fla.

5. **PEIRANISIA Raf.** Shrubs or trees. Leaflets several or many: blades broadest above the middle or below it. Flowers in axillary clusters or

in terminal cluster-like panicles, yellow. Petals 5, unequal in size and in shape. Stamens usually 7, with 2 or 3 of the lower ones beaked, accompanied with usually 3 staminodia: larger anthers with a snout-like appendage: pod elongate, flat, dehiscent along both thickened sutures. Seed transversely placed.—About 25 species, natives of tropical America.

1. *P. bahamensis* (Mill.) Britton & Rose. Shrub 2 m. tall or less: leaflets 6–10; blades subcoriaceous, ovate or elliptic-ovate to lanceolate, mucronate, 1.5–4 cm. long: petiolar gland depressed, between lower pair of leaflets or near it: stipules ovate to lanceolate: sepals 7–12 mm. long: petals 10–15 mm. long, or sometimes smaller: pod flat, with lateral depressions between the seeds, 9–11 cm. long, 5 mm. wide. [*Cassia bahamensis* Mill.]—Pine-lands, Everglade Keys, S pen. Fla. and the Keys.—(W. I.)—All year. A shrub or small tree, *Psilorhegma suffruticosa* (König) Britton (*Cassia suffruticosa* König) from S Asia and Australia, with numerous leaves, and clusters of showy yellow flowers, related to *Ditremexa* and *Peiranisia*, but with ten perfect stamens, is naturalized in and about Brickell hammock, Miami, Fla. A very showy shrub, *Chamaesenna didymobotrya* (*Cassia didymobotrya* Forsk.), a native of Africa, with racemes of large yellow flowers, glandular leaves, and thin flat pods, occurs in vacant lots in Miami, Fla.

*Cassia biflora* was first recorded from Florida by Chapman in 1860 on an imperfect specimen of *Peiranisia bahamensis* collected on Key West.

6. **CHAMAECRISTA** Moench. Herbs or shrubs. Leaflets few or numerous, with 1, 2, or 3 glands near the lower pair. Flowers clustered in leaf-axils. Sepals nearly distinct, membranous. Petals mainly yellow or whitish, sometimes marked at the base. Pod flattish, linear, promptly dehiscent, the valves elastic.—About 100 species, widely distributed in tropical and temperate regions.—SENSITIVE-PEAS. SENSITIVE-PLANT. DWARF-SENNAS. HONEY-CUPS. BEE-BLOSSOMS. PARTRIDGE-PEAS.

Corolla conspicuous, more than 1 cm. wide, one petal slightly larger than the other four: stamens 10: pedicel 7 mm. long or more.

Plant perennial.

Leaflets 8–14, pubescent: petiolar gland small: pod 4.5 cm. long or less, pubescent with incurved hairs.

Leaflets 24–40, glabrous: petiolar gland large (1–2 mm. wide): pod 6.5 cm. long or more, sparsely appressed-pubescent.

Plant annual.

Petiolar gland depressed, 1.5–2.5 mm. wide: leaflets mostly more than 24.

Petiolar gland not depressed, 1.5 mm. wide or less: leaflets usually fewer than 24.

Leaflets glabrous or occasionally slightly puberulent.

Stems and pedicels with incurved hairs: pod appressed-pubescent with short hairs.

Stems and pedicels hirsute: pod hirsute.

Leaflets 18–36, large, 15–20 mm. long: corolla mostly 3–4 cm. wide.

1. *C. keyensis*.

2. *C. Dceringiana*.

3. *C. brachiata*.

4. *C. fasciculata*.

5. *C. robusta*.

Leaflets 12-20, small, 8-12 mm. long: corolla about 2.5 cm. wide.

Leaflets pubescent with incurved or spreading hairs.

Pod and pedicel pubescent with incurved hairs.

Pod and pedicel pubescent with spreading hairs.

Corolla inconspicuous, less than 1 cm. wide: one petal much larger than the other four: stamens 5-9: pedicel 1 mm. long or more.

Petiolar gland with a discoid head much wider than the stalk-like base: corolla with the odd petal twice as long as the others: pod pubescent with incurved hairs.

Leaflets glabrous: sepals puberulent: pod finely appressed-pubescent.

Leaflets pubescent: sepals hirsute: pod hirsute.

Petiolar gland with the head scarcely wider than the stalk: corolla with the odd petal less than twice as long as the others: pod hirsute.

6. *C. depressa*.

7. *C. mississippiensis*.

8. *C. littoralis*.

9. *C. procumbens*.

10. *C. Mohrii*.

11. *C. aspera*.

1. *C. keyensis* Pennell. Rootstock short and usually contorted: stems solitary or several together, 1-8 dm. tall, closely gray-hirsute: leaves gray-pubescent, the larger ones 2.5-3.5 cm. long: petiolar gland saucer-shaped, about 0.5 mm. wide: leaflets 4-9 pairs, 4-9 mm. long; blades oval, elliptic, linear, or obovate: sepals 8-9 mm. long, or rarely larger, hirsute: petals deep-yellow, 9-10 mm. long: anthers reddish-purple, 8 mm. long or less: pod 4-5 mm. wide, gray: seed about 3 mm. long. [*C. grammica* (Fl. SE. U. S.)]—Rocky pineland, Big Pine Key, Fla.—All year.

2. *C. Deeringiana* Small & Pennell. Rootstock horizontal: stems solitary or few together, 3-9 dm. tall, green, glabrous or nearly so: leaves green, the larger ones 4-10 cm. long: petiolar gland depressed-discoid, 1-1.5 mm. wide: leaflets 12-20 pairs, 8-18 mm. long; blades linear or nearly so, acute or mucronate: sepals 10-12 mm. long, glabrous or nearly so: petals bright-yellow, 14-21 mm. long: anthers yellow or reddish, 8 mm. long or more: pod 5-6 mm. wide, green: seed about 4 mm. long.—Rocky pineland, Everglade Keys, Fla., and lower Florida Keys.—Spr.—sum.

3. *C. brachiata* Pollard. Stem 8-24 dm. tall, often widely branched: stipules eciliate: petiolar gland single or sometimes 2 or 3, discoid or saucer-shaped, 1.5-2.5 mm. wide: leaflets 10-25 pairs, 10-20 mm. long; blades linear to linear-lanceolate, acute-mucronate: pedicels glabrous or nearly so: sepals 10-12 mm. long, reddish or purplish: pod 6-10 cm. long.—Pinelands, Coastal Plain, Fla. and Ala.—All year.—A decoction made with cold water is used by the Seminoles in cases of nausea.

4. *C. fasciculata* (Michx.) Greene. Stem 3-9 dm. tall, often much-branched: stipules ciliate: petiolar gland single, saucer-shaped, mostly about 1 mm. wide, thin-edged: leaflets 6-12 pairs or rarely more, 9-20 mm. long; blades linear-elliptic to linear, obtuse to acute, mucronate: pedicels pubescent with incurved hairs: sepals 9-12 mm. long, pubescent on the midrib: petals 10-17 mm. long: anthers 8-10 mm. long, yellow or rarely reddish: pod 4-5 cm. long, finely appressed-pubescent. [*Cassia Chamaecrista* (Chapm. Fl.) *Chamaecrista bellula* Pollard.]—(PATRIDGE-PEA. SLEEPING-PLANT.)—Hillsides, open woods, and fields, various provinces, Fla. to C. Tex., Kans., Minn., and Mass.—Sum.—fall.

5. *C. robusta* Pollard. Stem erect, 6-16 dm. tall, somewhat branched, hirsute: stipules 10-14 mm. long: petiolar gland saucer-shaped, 1-1.5 mm. wide, thick-

edged: leaflets 9–18 pairs, 15–20 mm. long; blades linear-elliptic to linear or linear-lanceolate: pedicels hirsute: sepals 14–17 mm. long, hirsute on the midrib: petals 15–21 mm. long: anthers 7–11 mm. long, often reddish: pod 5–7 cm. long, hirsute.—Bottom lands and alluvial banks, various provinces, N Fla. to La., Mo., and S Ohio.—Sum.—The flowers are sometimes white.

6. *C. depressa* (Pollard) Greene. Stem and branches diffusely spreading, 1–3 dm. tall, hirsute: stipules 7–9 mm. long: petiolar gland saucer-shaped, 1–1.5 mm. wide, often uneven: leaflets 6–10 pairs, 8–12 mm. long; blades linear-elliptic to broadly linear: pedicels hirsute, and also with some shorter incurved hairs: sepals 9–13 mm. long, hirsute on the midrib: petals 13–17 mm. long: pod 4–6 cm. long, hirsute. [*C. chamaecristoides* (Fl. SE. U. S.)]—Pinelands and Apalachicola River hills, Coastal Plain, Fla. and Ala.—Sum.

7. *C. mississippiensis* Pollard. Stem erect, 2–6 dm. tall, often diffusely branched, pubescent with fine incurved hairs: stipules ciliate: petiolar gland single, depressed saucer-shaped, less than 1 mm. wide: leaflets 8–15 pairs, 5–12 mm. long; blades elliptic to linear-elliptic or broadly linear, acutish to acute-mucronate: pedicels with incurved hairs: sepals 5–10 mm. long, appressed-pubescent: petals 8–15 mm. long: anthers 7–9 mm. long, yellow: pod 3–5 cm. long, appressed-pubescent. [*C. Tracyi* Pollard.]—Pinelands, Coastal Plain, Ala. to Tex.—Sum.

8. *C. littoralis* Pollard. Stem erect, 4–8 dm. tall, more loosely pubescent than in the next preceding species: stipules sparingly ciliate: petiolar gland saucer-shaped, mostly 0.5–1 mm. wide: leaflets 8–18 pairs, 7–15 mm. long; blades linear-elliptic to broadly linear: pedicels hirsute: sepals 10–12 mm. long: petals 12–15 mm. long: anthers yellow: pod 2.5–4 cm. long, hirsute.—Sand-dunes and pinelands, Coastal Plain, W Fla. to E Tex.—Sum.

9. *C. procumbens* (L.) Greene. Stem erect, 1–4 dm. tall, branched, minutely pubescent with incurved hairs: stipules finely ribbed, 5–8 mm. long, ciliate: petiolar gland single, the disk narrowed into the obconic base: leaflets 9–18 pairs or more, 7–15 mm. long; blades linear, slenderly mucronate, ciliate: sepals 3–4 mm. long, minutely puberulent on the midrib: petals 3–8 mm. long: anthers 2 mm. long: pod 2.5–4 cm. long, appressed-pubescent. [*Cassia nictitans* L.]—(WILD SENSITIVE-PLANT.)—Sandy roadsides, fields, slopes, and open woods, various provinces, rarely Coastal Plain, Fla. to Tex., Kans., and S Vt.—Sum.—fall.—*Chamaecrista multipinnata* Pollard [*C. multipinnata* Nashii Pollard], with often narrower and more numerous leaflets (15–26 pairs), ranging from Fla. to Miss. and S. C., may be specifically distinct from *C. procumbens*.

10. *C. Mohrii* (Pollard) Small. Stem 3–6 dm. tall, widely branched, rather coarsely pubescent with incurved hairs: stipules strongly ribbed, 8–10 mm. long, ciliate: petiolar gland a large disk abruptly contracted into a slender columnar base: leaflets 16–23 pairs, 9–12 mm. long; blades broadly linear, strongly mucronate: sepals 6–7 mm. long, hirsute, especially on the midrib: petals 3–7 mm. long: pod 3–4.5 cm. long, hirsute.—Sandy fields and pine woods, Coastal Plain, Ga. to La. and Ark.—Sum.—fall.

11. *C. aspera* (Muhl.) Greene. Stem erect, 3–7 dm. tall, usually branched, hirsute, (diffuse or prostrate and with fewer and smaller leaflets in *C. aspera Simpsonii*): stipules 8–11 mm. long: petiolar gland single, stalked, the apex scarcely wider than the stalk: leaflets 15–27 pairs, 8–15 mm. long; blades strongly mucronate, eciliate: pedicels appressed-pubescent: sepals 3–5 mm. long, hirsute on the midrib: petals 3–7 mm. long: anthers 2 mm. long, yellow: pod 1.5–2.5 cm. long, hirsute. [*Cassia nictitans aspera* Chapm.]—Hammocks, pinelands, and sand-dunes, Coastal Plain, Fla. to S. C.—Sum.—fall.

**Chamaecrista rotundifolia** (Pers.) Greene, with radially prostrate branches and leaves with cordate stipules, glandless petioles and one pair of obovate leaflets, has been found along the railroad south of Orlando, Fla. Nat. of W. I.

**7. GLEDITSIA** L. Trees with simple or branched thorns. Leaves relatively small, 2-pinnate: stipules present. Racemes narrow, closely-flowered. Flowers green or greenish-white. Calyx-lobes obtuse, about as long as the petals. Pod flat.—About 6 species, natives of eastern North America and Asia.—Spr.

Ovary glabrous: pod oval or elliptic, 1-seeded, or rarely 2-seeded. 1. *G. aquatica*.  
Ovary pubescent: pod linear or elliptic-linear, many-seeded. 2. *G. triacanthos*.

1. *G. aquatica* Marsh. Tree becoming 20 m. tall: leaflets 2–4.5 cm. long: blades oblong to ovate or elliptic-lanceolate: sepals lanceolate to elliptic-lanceolate: pod oblique, 3–5 cm. long, not pulpy within.—(WATER-LOCUST.)—River swamps and low hammocks, Coastal Plain and rarely adjoining provinces, Fla. to La., Mo., and S. C.

2. *G. triacanthos* L. Tree becoming 40 m. tall: leaflets 1–2.5 cm. long; blades ovate-lanceolate varying to elliptic: sepals narrowly elliptic to lanceolate: pod black and lustrous, pulpy within.—(HONEY-LOCUST. SWEET-BEAN. THREE-THORN ACACIA.)—Rich woods, various provinces, Fla. to Tex., Kans., and Ont.—As in the case of the preceding species, the trunk and branches are armed with compound thorns (or unarmed in *G. triacanthos inermis*). The wood, hard and durable, is used where strength is required. The tree is widely cultivated.

**8. GYMNOCLADUS** Lam. Unarmed trees. Leaves very large, 2-pinnate: stipules wanting. Panicle loosely flowered. Calyx-lobes acuminate, markedly shorter than the petals. Pod turgid.—One species.

1. *G. dioica* (L.) Koch. Tree becoming 30 m. tall, the bark furrowed: leaves with 5–9 pinnae; leaflets 2–7 cm. long; blades ovate or oval, acuminate: panicles 1–3 dm. long: flowers greenish-white: sepals linear-lanceolate, 5–6.5 mm. long, glandular-margined: petals elliptic: pod elliptic, 1–2 dm. long: seed nearly 2 cm. broad.—(KENTUCKY COFFEE-TREE. LUCK-BEAN.)—Rich woods, various provinces N of Coastal Plain, Tenn. to Okla., Nebr., Minn., Ont., and Pa.—Spr.—The tree is widely cult. as an ornamental. The wood is sometimes used in cabinet-making. The seeds were formerly used as a coffee-substitute.

**9. PARKINSONIA** [Plum.] L. Shrubs or trees, with simple or branching thorns. Leaflets numerous, borne on the phyllode-like rachis. Blades of

the short-clawed petals mainly of an ovate type. Pod markedly torulose, the swollen portions nearly terete.—Three species, natives of tropical and subtropical America and Africa.

1. **P. aculeata** L. Shrub or small tree: leaves 2–4 dm. long, the rachis winged; leaflets numerous, distant, the blades linear to linear-oblongate, 1–10 mm. long: sepals elliptic, 8–10 mm. long: petals 10–17 mm. long, bright-yellow; blades except that of the standard, oval or ovate: pod 5–10 cm. long, acuminate.—(HORSEBEAN. CROWN-OF-THORNS. JERUSALEM-THORN.)—Roadsides, hammocks, and stream-banks, various provinces, Fla. to Tex. and Calif. Nat. of trop. Am. and cult.—(W. I., Mex., C. A., S. A.)—Spr.-sum.—Extensively grown as an ornamental and as a hedge-plant. Now naturalized far beyond its natural geographic limits.

10. **DELONIX** Raf. Unarmed shrubs or spreading trees. Leaflets relatively small and numerous: blades narrow. Sepals much shorter than the petals. Blades of the petals mainly flabellate, all long-clawed. Pod elongate-linear, flat, the valves woody.—Three species, natives of Africa.

1. **D. regia** (Boj.) Raf. Shrub or tree with a wide top: larger leaves with 20–50 pinnae: leaflets numerous, the blades linear-elliptic, 4–10 mm. long: sepals 22–26 mm. long: petals 5–7 cm. long, red or orange; blades broader than long, crisped: pod linear, commonly 3–5 dm. long.—(ROYAL-POINCIANA. FLAME-TREE. PEACOCK-FLOWER.)—Hammocks and pinelands, S pen. Fla. and the Keys. Nat. of Madagascar and cult.—(W. I.)—Spr.-sum.—The most gorgeous of our trees when in bloom. The massive clusters of large crimson or orange-colored flowers are conspicuous before the leaves unfold.

11. **POINCIANA** [Tourn.] L. Erect mostly unarmed shrubs or trees. Leaflets usually few and relatively large: blades rather broad. Sepals much shorter than the petals. Blades of the petals, except the standard, flabellate. Pod flat, narrow, the valves thick-coriaceous. Seed flattened.—About 6 species, of tropical and subtropical regions.

1. **P. pulcherrima** L. Shrub or small tree: leaflets numerous; blades elliptic to cuneate, 15–25 mm. long: sepals 15–16 mm. long: corolla mainly red or yellow; standard 25–27 mm. long: filaments 40–45 mm. long: pod 9–13 cm. long.—(BARBADOS-FLOWER. DWARF-POINCIANA. FLOWER-FENCE.)—Hammocks and pinelands, S pen. Fla. and the Keys.

Nat. of W. I.—All year.—Extensively grown as an ornamental for its continuous flowering habit. The pods are elastically dehiscent.

**12. CAESALPINIA L.** Erect unarmed or slightly armed shrubs or trees. Leaflets usually few and relatively large: blades broad. Sepals slightly shorter than the petals. Blades of the petals, except the standard, not flabellate, often obovate. Pod flat, narrow, the valves thin-coriaceous. Seed flattened.—About 35 species of tropical and subtropical regions.

**1. C. pauciflora** (Griseb.) C. Wright. Shrub 2 m. tall or less: leaflets glabrous, mostly 6–12 on each pinna; blades elliptic to obovate, 6–12 mm. long: sepals 8–10 mm. long: corolla mainly yellow; standard 8–10 mm. long: filaments 8–11 mm. long: pod elliptic, 2–3.5 cm. long.—Pinelands, lower Florida Keys.—(W. I.)—Sum.

**Ticanto Nuga** (L.) Medic. A tough woody vine with greatly elongate stems and branches, bipinnate leaves with coriaceous leaflets, racemes or panicles of bright-yellow flowers, and flat, oblique, indehiscent pods, is a native of the East Indies, cultivated and locally naturalized in S Fla.

**13. GUILANDINA L.** Reclining or spreading prickly shrubs. Leaflets relatively few or numerous and large: blades broad. Sepals as long as the petals or nearly so. Blades of the narrow petals mainly spatulate. Pod nearly as wide as long, turgid. Seed turgid.—About 12 species, mostly West Indian.—NICKERS. HOLD-BACKS. WAIT-A-BIT VINES.—The pods are rather tardily dehiscent.

Leaves with foliaceous stipules: seed gray or lead-colored.

1. *G. Crista*.

Leaves without stipules: seed yellow.

Leaflet-blades neither rounded nor retuse: corolla 2.5 cm. wide or more.

2. *G. Bonduc*.

Leaflet-blades rounded or retuse: corolla 1.5 cm. wide or less.

3. *G. ovalifolia*.

**1. G. Crista** (L.) Small. Straggling or spreading shrub: leaflets numerous; blades ovate, elliptic-ovate, or nearly elliptic, 1.5–3.5 cm. long, mucronate: racemes or panicles 1–4 dm. long: sepals 9–11 mm. long, mostly obtuse: petals dull-yellow, the narrower ones 10–13 mm. long, truncate and 3-toothed at the apex: pod oval or oval-elliptic, 5–7 cm. long.—(GRAY-NICKER.)—Low hammocks, and coastal sand-dunes, S pen. Fla. and the Keys.—(W. I.)—The seeds are sometimes persistently green.

**2. G. Bonduc** L. Plant similar to *G. Crista* in habit, but leaflets relatively larger: sepals mostly acute: narrower yellow petals rounded and merely uneven at the apex.—(YELLOW-NICKER.)—Coastal sand-dunes and shore-hammocks, S pen. Fla. and the Keys.—(W. I.)

**3. G. ovalifolia** (Urban) Britton. Straggling shrub with curved or hooked prickles; leaflets numerous, the blades oval or suborbicular, varying to ovate or

obovate, mostly 1-2 cm. long, rounded or retuse and mucronate at the apex: racemes, 1.5-2 dm. long: bracts spreading: corolla light-yellow, less than 1.5 cm. wide: pod obovate, 6-8 cm. long, prickly all over: seed yellow or yellowish.—HAMMOCKS, S. Fla.—(W. I.)

**14. TAMARINDUS** [Tourn.] L. Unarmed trees. Leaves relatively small: leaflets numerous. Sepals 4. Petals 3, often with 2 additional rudiments. Stamens 3, the filaments united to about the middle, alternating with 3 minute staminodia. Ovary elongate. Pod indehiscent, succulent within.—One species.

**1. T. indica** L. Tree with spreading branches: leaflets 18-36, 1-2 cm. long, the blades elliptic to linear-elliptic, becoming reticulate: sepals 10-12 mm. long: petals yellowish or reddish, 13-16 mm. long, crisped: pod thick, 6-13 cm. long, more or less curved, the edges rounded.—(TAMARIND.)—HAMMOCKS and cult. grounds, Everglade Keys, Fla. and Florida Keys. Nat. of E. I. and cult.—(W. I., Mex., C. A., S. A.)—Spr.-sum.—The green fruit is used to make an acid drink and the ripe fruit may be eaten.

#### FAMILY 18. KRAMERIACEAE — RHATANY FAMILY

Shrubs or perennial herbs. Leaves alternate: blades simple or rarely 3-foliolate. Flowers very irregular. Calyx of 4 or 5 unequal sepals. Corolla of 2 scale-like and 3-clawed partially united petals. Androecium of 3 or 4 stamens with partially united filaments, the anther-sacs opening by terminal pores. Gynoecium 1-carpellary, the ovary pubescent and echinate. Fruit indehiscent, spine-armed.—Comprises the following genus.

**1. KRAMERIA** Loefl. Herbs with prostrate stems, or spinescent shrubs. Calyx with petaloid inner sepals. Fruit woody.—About 20 species, American. The flowers, mainly red or yellowish, have a superficial resemblance to some orchids, and are frequently fragrant.

**1. K. spathulata** Small. Stem shaggy-pubescent: blades of the upper stem-leaves short-pointed, narrowly linear, often elongate: flowers purplish: common claw of the 3 partially united petals usually much longer than the blades: fruit with rather short and stout brown spines, the body globular. [*K. secundiflora* (Fl. SE. U. S.)]—(SANDBUR.)—Sandy pinelands and sand hills, Coastal Plain, Fla. and Ga. The color of the foliage of the prostrate branches usually renders the plants scarcely distinguishable from the sand in which they grow. The plants, however are readily seen when in flower on account of the decided purple of the petals.

## FAMILY 19. FABACEAE — PEA FAMILY

Herbs, shrubs, trees, or vines. Leaves alternate: blades 1-compound, sometimes 1-foliolate, or rarely simple. Flowers mostly perfect, irregular. Calyx of 5 more or less unequal partially united sepals. Corolla of 5 (or of 1 petal in *Amorpha*) unequal distinct or nearly distinct petals comprising 2 keel-petals, 2 wings and 1 standard which surrounds the others. Androecium of 10 monadelphous, diadelphous, or rarely distinct stamens, or rarely 9 or 5. Gynoecium 1-carpellary. Ovary superior. Fruit a dehiscent or indehiscent legume or a loment.—About 325 genera and 5,000 species, most abundant in warm and temperate regions.

Stamens 10; filaments distinct.

Leaflets pinnate.

Leaflets digitate, 1-foliolate or simple.

Stamens 10 or fewer: filaments monadelphous or diadelphous.

Leaf-rachis terminated by a leaflet, at least not produced into a tendril or spine.

Fruit 2-valved or indehiscent, but not a loment.

Foliage glabrous or pubescent, but not glandular-dotted.

Anthers of 2 kinds: filaments monadelphous: leaflets digitate: calyx 2-lipped.

Anthers all alike: filaments usually diadelphous (the upper filament is sometimes united with the others near the middle): calyx merely 5-lobed or obscurely 2-lipped, except in *Bonaveria*.

Blades of the leaflets toothed (in our species).

Blades of the leaflets entire.

Filaments, at least 5 (alternately) dilated above: flowers solitary or in umbel-like clusters.

Filaments all filiform.

Herbs, shrubs, or trees: if woody vines the keel of the corolla neither coiled nor much curved.

Pod dehiscent.

Wing-petals with a spur or pocket in the base of the blade: anther-connective produced into a small appendage.

Wing-petals without a spur or pocket in the base of the blade: anther-connective not produced.

Leaf-blades pinnately several-foliolate.

Leaf-blades 3-foliolate and usually with stipules (except in *Galactia Elliottii*).

Pod indehiscent.

Herbaceous vines: keel of the corolla much curved or coiled.

Foliage glandular-dotted or warty.

Fruit a loment, breaking up transversely into 1-seeded sections.

Leaf-rachis terminated by a tendril or by a spine or a bristle.

Tribe I. SOPHOREAE.

Tribe II. PODALYRIEAE.

Tribe III. GENISTEAE.

Tribe IV. TRIFOLIEAE.

Tribe V. LOTEAE.

Tribe VII. INDIGOFEREAE.

Tribe VIII. GALEGEAE.

Tribe X. PHASEOLEAE.

Tribe IX. DALBERGIEAE.

Tribe X. PHASEOLEAE.

Tribe VI. PSORALEAE.

Tribe XI. HEDYSAREAE.

Tribe XII. VICIEAE.

## I. SOPHOREAE

Inflorescence racemose: pod moniliform.

Inflorescence paniculate: pod flattened.

1. SOPHORA.

2. CLADRASTIS.

## II. PODALYRIEAE

Ovary sessile or nearly so: pod flat.

Ovary manifestly stalked: pod inflated or turgid.

3. THERMOPSIS.

4. BAPTISIA.

## III. GENISTEAE

Herbs: calyx-lips, at least the lower one, with long lobes.

Stipules at least the upper ones, decurrent: pod inflated.

Stipules not decurrent: pods flat.

Shrubs: calyx-lips with very small lobes.

5. CROTALARIA.

6. LUPINUS.

7. CYTISUS.

## IV. TRIFOLIEAE

Pod curved or coiled.

Standard with a broad blade: pod coiled.

Standard with a narrow blade: pod curved.

Pod straight.

Pod centrally beaked; valves leathery.

Pod obliquely beaked; valves membranous.

8. MEDICAGO.

9. TRIGONELLA.

10. MELILOTUS.

11. TRIFOLIUM.

## V. LOTEAE

Calyx slightly irregular but not 2-lipped: pod not beaked, dehiscent.

Leaflets 5: stipules foliaceous: flowers in umbel-like clusters.

Leaflets 1-3: stipules gland-like: flowers solitary.

Calyx 2-lipped: pod long-beaked, indehiscent.

12. LOTUS.

13. ACMISPON.

14. BONAVERIA.

## VI. PSORALEAE

Petals free from the staminal-tube: filaments borne on the edge of the hypanthium.

Shrubs: ovary 2-6-ovuled: pod 1- or 2-seeded: corolla with the standard only.

Herbs: ovary 1-ovuled: pod 1-seeded: corolla with standard, wings, and keel.

Pod indehiscent.

Leaves 1-3-foliolate, the pod finely warty: seed adnate to the pericarp.

Blades of the leaflets coarsely toothed: pod with a short persistent beak, the body prominently warty.

Blades of the leaflets entire: pod with a long flat deciduous beak, the body not conspicuously warty.

Leaves digitately compound, if pinnately 3-foliolate or 1-foliolate in *O. virgatum*, the pod with few large wart-like projections: seed not adnate to the pericarp.

Leaves pinnately 3-foliolate.

Leaves digitately compound.

Pod circumscissile or irregularly bursting, sharply beaked.

Petals, except the standard, adnate to or borne on the staminal tube.

Stamens 10 or 9: wings and keel-petals borne near the middle of the staminal tube.

Stamens 5: wings and keel-petals borne near the top of the staminal tube.

Spike not subtended by an involucre: calyx-lobes narrow or broad but shorter than the tube: standard blade much wider than the other petals.

Spike subtended by an involucre: calyx-lobes bristle-like, much longer than the tube: standard-blade slightly wider than the other petals, long-clawed.

15. AMORPHA.

16. CULLEN.

17. ASPHALTHUM.

18. ORBEXILUM.

19. RHYTIDOMENE.

20. PEDIOMELIUM.

21. PAROSELA.

22. PETALOSTEMON.

23. KUHNISTERA.

## VII. INDIGOFEREAE

Firm-tissued or partly woody herbs with pink or salmon-pink corollas and stout or slender often curved pods.

24. INDIGOFERA.

## VIII. GALEGEAE

Shrubs or trees, or woody vines.

Vines with high climbing woody stems: pod turgid.

Shrubs or trees: pod flat.

Herbs.

Leaf-blades equally pinnate.

Pods wingless, more or less compressed, but very thick in *Sesban*.

Pod several-many-seeded, with thick margins, seeds not in a bladderly envelope.

Standard broad and longer than the keel petals: calyx with acute or acuminate lobes.

25. KRAECHIA.

26. ROBINIA.

27. SESBAN.

Standard narrow and shorter than the keel petals: calyx with broad, low lobes.

Pod 2-seeded, the margins thin: seeds remaining in the bladderly inner part of the pod when the valves fall away.

Pods 4-sided and 4-winged.

Leaf-blades unequally pinnate.

Leaf-blades with parallel veins running from midrib to margin.

Leaf-blades not thus parallel-veined.

Pod 2-celled, with a perfect partition.

Pod fleshy, indehiscent, at least the first year.

Pod membranous, leathery or woody, dehiscent.

Pod 1-celled, the partition, if any, rudimentary.

Both sutures inflexed, each valve of the pod almost circular in cross-section.

Upper suture prominent, the pod obcordate in cross-section.

Pod with a false partition arising from the dorsal suture.

Pod without a false partition.

28. AGATI.

29. GLOTTIDIUM.

30. DAUBENTONIA. *Shrub*

31. CRACCA.

32. GEOPRUMNON.

33. ASTRAGALUS.

34. HOLCOPHACOS.

35. TIUM.

36. PHACA.

#### IX. DALBERGIEAE.

Leaf-blades 1-foliolate: pod flat.

Pod suborbicular: calyx not 2-lipped: standard-blade orbicular-reniform.

Pod oval to elliptic: calyx 2-lipped: standard-blade elliptic or obovate.

Leaf-blades pinnately several-foliolate: pod broadly 4-winged or drupaceous.

Pod winged, elongate.

Pod drupaceous, subglobose.

37. ECATOPHYLLUM.

38. AMERIMNON.

39. ICHTHYOMETHIA.

40. ANDIRA.

#### X. PHASEOLEAE

Keel of the corolla neither coiled nor strongly incurved.

Style glabrous or sparingly pubescent below or near the stigma.

Standard not spurred at the base.

Corolla yellow.

Pod 1- or 2-seeded.

Flowers solitary or occasionally 2 or 3 together, sessile or short-stalked in the axils of the leaves: wing-petals with a slender reflexed spur at the base of the blade.

Flowers few to many in peduncled lax or glomerate racemes: wing-petals angled, lobed, or broadly spurred at the base of the blade.

Calyx not 2-lipped; lobes nearly equal, the 2 upper scarcely more united than the 3 lower: pod scimitar-shaped.

Calyx 2-lipped, the lobes of the upper lip partly united: pod elliptic or rhombic, often inequilateral.

Corolla much exceeding the calyx: blade of the wing-petals auricled on one side: calyx not accrescent.

Corolla mostly exceeded by the calyx: blade of the wing-petals auricled on both sides: calyx accrescent.

Pod several-seeded.

Corolla blue, purple, scarlet, or white.

Pod terete, torulose: corolla scarlet.

Calyx scarcely 2-lipped: keel-petals and wings about equal in length.

Calyx prominently 2-lipped: keel-petals much longer than the wings.

Pod flattened, not torulose: corolla blue, purple, or white.

Standard much shorter than the keel.

Pod even or slightly wrinkled: seed with a scar-like hilum: herbaceous vines.

Pod transversely ridged: seed with a band-like hilum: woody vines.

Standard nearly or quite as long as the keel.

Calyx subtended by 2 bractlets.

41. PITCHERIA.

42. DOLICHOLUS.

43. LEUCOPTERUM.

44. RHYNCHOSIA.

45. CAJAN.

46. ERYTHRINA.

47. MICROPTERYX.

48. STIZOLOBIUM.

49. MUCUNA.

- Standard and the filament opposite,  
partly adnate. 50. *DIOCLEA*.  
Standard and the filament opposite,  
free from each other. 51. *GALACTEA*.  
Calyx without bractlets.  
Calyx-tube campanulate; lobes longer  
than the tube; wings and keel-  
petals with blades longer than the  
claws. 51a. *PUERARIA*.  
Calyx-tube cylindric; lobes shorter  
than the tube; wings and keel-  
petals with blades shorter than the  
claws. 52. *FALCATA*.  
Standard spurred at the base. 53. *BRADBURYA*.  
Style bearded along the upper side.  
Leaves several foliolate; pod-valves flat, ribless. 54. *CLITORIA*.  
Leaves 3-foliolate: pod-valves convex or with a promi-  
nent midrib. 55. *MARTUSIA*.  
Keel of the corolla coiled or curved.  
Keel spirally twisted. 56. *GLYCINE*.  
Leaflets not stipellate, 5 or more. 57. *PHASEOLUS*.  
Leaflets stipellate, 3.  
Keel incurved.  
Inflorescence capitate. 58. *STROPHOSTYLES*.  
Pods flattened. 59. *VIGNA*.  
Pods nearly terete.  
Inflorescence racemose or paniculate.  
Standard-blades somewhat reniform: blades of the  
keel-petals sickle-shaped: pod flat, with beaded  
edges. 60. *DOLICHOS*.  
Standard-blade suborbicular: blades of the keel-  
petals curved: pod turgid, with smooth edges. 61. *CANAVALI*.

XI. *HEDYSARAEAE*

- Corolla yellow.  
Flowers perfect.  
Leaf-blades unequally compound: stamens diadelphous  
(5 and 5). 62. *AESCHYNOMENE*.  
Calyx spathe-like, the 2 long lobes minutely toothed  
at the apex: standard-blade longer than wide,  
cuneate at the base: wings and keel-petals ses-  
sile or short-clawed, minutely auricled at the  
base.  
Calyx not spathe-like, the short lips prominently  
lobed: standard-blades as wide as long or wider,  
cordate at the base: keel- and wing-petals slender-  
clawed, prominently auricled. 63. *SECUA*.  
Leaf-blades equally compound: stamens monadelphous. 64. *ARACHIS*.  
Leaves pinnate: calyx-tube greatly elongate. 65. *ZORNIA*.  
Leaves digitate: calyx-tube not elongate.  
Flowers monoecious, at least some of them sterile, others  
fertile. 66. *STYLOSANTHES*.  
Anthers of 2 kinds. 67. *CHAPMANIA*.  
Anthers alike.  
Corolla white, blue, violet or purple.  
Leaflets stipellate: loment of several joints.  
Loment-joints flat, usually thin. 68. *MEIBOMIA*.  
Flowers in racemes or panicles.  
Flowers in solitary or 2-4 together in axillary  
clusters or opposite the leaves. 69. *SAGOTIA*.  
Loment-joints subterete or turgid and fleshy. 70. *ALYSICARPUS*.  
Leaflets not stipellate: loment of 1-2 joints. 71. *LESPEDEZA*.

XII. *VICIEAE*

- Herbs, diffuse or climbing by the tendrils that terminate the  
leaf-rachis: seeds dull-colored, not persistent.  
Style terete, with a tuft of hairs at the apex. 72. *VICIA*.  
Style flattened, pubescent along the inner side. 73. *LATHIRUS*.  
Partly woody vine with twining branches: leaf-rachis ter-  
minating in a spine: seed scarlet except the black base,  
somewhat persistent on the pod-valves. 74. *ABRUS*.  
1. *SOPHORA* L. Shrubs, trees, or herbs. Leaf-blades several-foliolate.  
Racemes erect. Calyx nearly equally 5-lobed or truncate. Standard markedly

clawed. Wings and keel-petals auricled on one side. Pod thick. Seed thick.—About 25 species, of warm and tropical regions.

1. *S. tomentosa* L. Shrub, with copiously pale-pubescent foliage: blades of the leaflets elliptic, elliptic-ovate, or oval, or rarely spatulate, 2.5–6 cm. long, finely pubescent beneath: calyx 5–8 mm. long, the limb undulate: corolla yellow, 18–25 mm. long: blades of the wings and the keel-petal narrowly elliptic: pod 5–11 cm. long, torulose. —(NECKLACE-POD.)—Coastal sand-dunes and shore-hammocks, S pen. Fla. and the Keys, and S Tex.—(W. I.)—All year.

2. *CLADRASTIS* Raf. Trees. Leaves with obsolete stipules and many-foliolate blades. Panicles drooping. Calyx nearly tubular, about equally 5-lobed. Wings and keel-petals about equally auricled, oblong. Pod flat, thick-margined. Seed flat.—One species.

1. *C. lutea* (Michx.) Koch. Tree, becoming 17 m. tall: leaves 2–4 dm. long; blades of the leaflets oval, elliptic, ovate, or sub-orbicular: panicles many-flowered: calyx 8–10 mm. long; lobes rounded: petals white, or the standard with a yellow blotch, 16–20 mm. long: pod linear to narrowly linear-elliptic, 4–8 cm. long.—(YELLOW-WOOD. YELLOW-ASH. VIRGILIA.)—Rich woods and bluffs, various provinces N of Coastal Plain, Ala. to Mo., Ky., and W N. C.—Spr.-sum.—Often grown for ornament outside of its natural range. The hard, close-grained wood is used for various objects and yields a yellow dye.

3. *THERMOPSIS* R. Br. Perennial herbs. Leaves with large stipules and 3 leaflets. Calyx with an entire or slightly lobed upper lip and a 3-lobed lower lip. Corolla yellow or rarely purple: standard broad: blades of the wings and the keel-petals ovate, elliptic, or obovate, auricled on one side. Style usually shorter than the ovary. Pod sessile or nearly so.—About 20 species, natives of North America and Asia.

Stem virgate: raceme dense, spike-like: pod erect and appressed: blades of the leaflets not rhombic.

Stem widely branched: raceme lax: pod spreading: blades of the leaflets somewhat rhombic.

Bracts surpassing the pedicels during anthesis: calyx pubescent without.

Pod broadly linear; stipe  $1/5-1/6$  as long as the body.

Pod narrowly linear; stipe  $1/10$  as long as the body or less.

Bracts shorter than the pedicels: calyx glaucous without.

1. *T. caroliniana*.

2. *T. mollis*.

3. *T. Hugeri*.

4. *T. fraxinifolia*.

1. *T. caroliniana* M. A. Curtis. Stem 6–16 dm. tall, often sparingly tufted: blades of the leaflets oblanceolate to elliptic: raceme-rachis woolly: calyx

woolly; lower lobes deltoid, about  $\frac{1}{2}$  as long as the tube: pod 4-6 cm. long, tomentose.—(AARON'S-ROD.)—Woods, Blue Ridge and Appalachian provinces, Ga. to Tenn. and N. C.—Spr.—Often grown as a garden plant.

2. *T. mollis* (Michx.) M. A. Curtis. Stem pubescent, 3-9 dm. tall: raceme-rachis tomentulose: calyx densely pubescent without: lower calyx-lobes triangular, shorter than the tube: ovary tapering: pod 2-4 cm. long.—(BUSH-PEA.)—Dry soil, mostly in woods, Blue Ridge to Appalachian Plateau, Ala. to Va.

3. *T. Hugerii* Small. Stem pubescent, 3-7 dm. tall: raceme-rachis thinly pubescent: calyx more or less pubescent without: lower calyx-lobes lanceolate, mostly about as long as the tube: ovary linear: pod 5-9 cm. long.—Woods and thickets, Blue Ridge, Ga. to N. C.—Spr.

4. *T. fraxinifolia* (Nutt.) M. A. Curtis. Stem glabrous, 3-9 dm. tall: raceme-rachis mostly glaucous: calyx glabrous without: lower calyx-lobes deltoid, mostly less than  $\frac{1}{2}$  as long as the tube: ovary very narrowly linear: pod 7-11 cm. long.—Dry woods and thickets, Blue Ridge to Appalachian Plateau, Ala. to Tenn. and N. C.—Sum.

4. **BAPTISIA** Vent. Perennial herbs with rootstocks, the foliage often blackening in drying. Stipules not decurrent on the stem, sometimes deciduous. Leaflets mostly 3, digitate, usually broadest above the middle. Calyx somewhat 2-lipped. Corolla white, cream-colored, yellow, or blue. Style subulate, usually longer than the short ovary. Pod globose or elongate, often inflated, beaked, stipitate.—About 24 species, North American.—FALSE-INDIGOS. WILD-INDIGOS.—In the first group the leaves are simple.

Leaf-blades simple, rarely lobed: stipules wanting.

Leaf-blades 3-foliolate: stipules present.

Plant bushy-branched: flowers axillary to leaves towards the ends of the branches or in terminal panicles.

Flowers scattered in the leaf-axils towards the ends of the branches, sometimes the main branches terminated by a cluster of few flowers.

Flowers in terminal panicles, the lateral branches of the panicles with bractlets, but usually without flowers.

Plant not bushy branched: flowers in nearly naked or conspicuously bracted racemes.

Flowers in bracted racemes which are apparently lateral by the prolongation of a leafy shoot.

Flowers in erect terminal racemes which are naked by the early falling of the small bracts.

#### I. SIMPLICIFOLIAE

Leaves with perfoliate blades: flowers axillary.

Leaves with sessile blades: flowers racemose.

#### II. TINCTORIAE

Stipules foliaceous, more or less adnate to the leaflets towards the ends of the branches.

Stipules minute, free from the leaflets.

Keel less than 1.5 cm. long: leaflets small (1-3 cm.); blades of an obovate or cuneate type.

Pod-body oval or ellipsoid, gradually beaked.

Pod-body globular or globose-ovoid, abruptly beaked.

#### I. SIMPLICIFOLIAE.

#### II. TINCTORIAE.

#### III. CALYCOSAE.

#### IV. BRACTEATAE.

#### V. ALBAE.

1. *B. perfoliata*.
2. *B. simplicifolia*.

3. *B. microphylla*.

4. *B. tinctoria*.
5. *B. Gibbesii*.

Keel more than 1.5 cm. long: leaflets large (4-10 cm.); blades of an oblanceolate or elliptic type.  
 Standard-blade broadly reniform: pod-body subglobose to globose-ovoid, somewhat didymous, short-beaked.  
 Standard-blade orbicular-reniform: pod-body narrowly ovoid or ellipsoid-ovoid, with lateral ridges, long-beaked.

## III. CALYCOSAE

Calyx-lobes about as long as the tube, not foliaceous.  
 Calyx-lobes several times longer than the tube, foliaceous.  
 Foliage glabrous or nearly so: calyx-lobes sparingly ciliate or ultimately ciliate.  
 Foliage copiously hirsute: calyx-lobes permanently shaggy-ciliate.

## IV. BRACTEATAE

Plant with horizontal or nearly horizontal branches, the racemes borne on the under side of the branches, sometimes nearly or quite on the ground.

## V. ALBAE

Corolla white or yellow.

Corolla yellow.

Calyx pubescent: ovary silky: pod decidedly acuminate.

Calyx glabrous, except the ciliate edges: ovary glabrous: pod abruptly pointed.

Pod ellipsoid or oval: corolla over 1.5 cm. long: blades of the leaflets mostly of an elliptic type.

Pod cylindraceous: corolla less than 1.5 cm. long: blades of the leaflets of an obovate or oblanceolate type.

Corolla white.

Corolla 1-1.5 cm. long: pod-body cylindraceous, 1 cm. thick or less.

Inflorescence-rachis and pedicels pubescent.

Inflorescence-rachis and pedicels glabrous.

Corolla 2 cm. long or more: pod-body oval, between 1.5 and 2 cm. thick.

Corolla blue.

1. *B. perfoliata* (L.) R. Br. Plant with several stiff, arching branches, less than 1 m. tall: leaves perfoliate, mostly vertical; blades orbicular, oval, or ovate, 5-10 cm. long, rounded at both ends or notched at the apex: flowers solitary in the leaf-axils, short-pedicelled: calyx glabrous without; lower lobes ovate; lobes of the upper lip deltoid; standard-blade reniform: ovary glabrous: pod-body oval to ovoid, 1-1.5 cm. long, short-beaked.—(CATBELLS. GOPHER-WEED.)—Sandhills, Coastal Plain, C Fla. to S. C.—Spr. Plants dry green.

2. *B. simplicifolia* Croom. Plant 1 m. tall or less, usually much-branched: leaves spreading; blades ovate to oval, 3-10 cm. long, obtuse or notched at the apex, sessile: flowers in terminal racemes, short-pedicelled, yellow: calyx glabrous without; lower lobes narrowly ovate; upper lip broad, entire or minutely notched: standard globose-reniform: ovary pubescent: pod-body ellipsoid or ovoid, less than 1 cm. long, long-beaked.—(SCARE-WEED.)—Pinelands, M Fla.—Sum.—Plants dry black.

3. *B. microphylla* Nutt. Plant 1 m. tall or less, the usually numerous branches glabrous: leaves 3-foliolate, with foliaceous stipules; leaflets 1-5 cm. long, the blades obovate to cuneate, or individually elliptic: flowers axillary to 3-foliolate or 1-foliolate leaves, yellow: calyx glabrous without; lower lobes deltoid or often longer than wide; upper lip notched: standard-blade suborbicular or wider than long: pod-body oval or subglobose, about 1 cm. long or less, short-beaked.—Sandhills, Coastal Plain, Fla. to Ala. and S. C.—Spr.—sum.—Plants dry green.

6. *B. lanceolata*.

7. *B. elliptica*.

8. *B. LeContei*.

9. *B. calycosa*.

10. *B. hirsuta*.

11. *B. bracteata*.

12. *B. villosa*.

13. *B. megacarpa*.

14. *B. Serenae*.

15. *B. albescens*.

16. *B. alba*.

17. *B. leucantha*.

18. *B. australis*.

4. *B. tinctoria* (L.) R. Br. Plant very bushy, with slender branches, mostly 1 m. tall or less, glabrous: leaflets 1-3 cm. long; blades obovate to spatulate-cuneate: calyx becoming 4-5 mm. long; lower lobes deltoid, acuminate: corolla yellow; wings 12-14 mm. long; blade of the standard 7-9 mm. wide; pod-body 8-11 mm. long, longer than the slender stipe.—(HONESTY-WEED. RATTLE-WEED. SHOO-FLY. YELLOW WILD-INDIGO.)—Dry woods, hillsides, and roadsides, often in acid soil, various provinces, N. C. to La., Minn., and N. H.—Sum.—Plants dry black. Southern mountain folk use the plant both for dye and as a fly-brush.
5. *B. Gibbesii* Small. Plant similar to *B. tinctoria* in habit: leaves smaller, the blades more cuneate: flowers yellow: pod-body 6-7 mm. long, about as long as the stipe or shorter.—Sandy woods, Coastal Plain, S. C.—Spr.—sum.
6. *B. lanceolata* Walt. Plant mostly less than 1 m. tall, the stem finely pubescent, or glabrous in age, with ascending zigzag branches: leaflets 4-9 cm. long; blades spatulate to oblanceolate or almost broadly linear, finely reticulate: calyx-lobes much shorter than the tube, the lower ones short-triangular, acuminate: corolla yellow; standard-blade over 1.5 cm. wide; keel-petals 17-20 mm. long: pod-body as wide as long, or nearly so, more or less 2-lobed, short-stipitate, the valves somewhat woody, glabrous in age.—Dry pinelands, Coastal Plain, Ala. to N. C.—Spr.
7. *B. elliptica* Small. Plant 1 m. tall or less, the stem finely pubescent, with ascending or spreading zigzag branches: leaflets 5-11 cm. long; blades elliptic, varying to slightly broader above the middle or below it, or those of the lower leaves oblanceolate, all finely reticulate in age: calyx-lobes somewhat shorter than the tube, the lower ones deltoid, acute: corolla yellow; standard-blade over 1.5 cm. wide; keel-petals fully 2 cm. long or rarely shorter, with very broad blades: pod-body much longer than thick, not lobed, long-stipitate, the valves parchment-like, copiously pubescent.—Pinelands, N. Fla.—Spr.
8. *B. LeContei* T. & G. Plant bushy, 1 m. tall or less, with strigillose branches: leaves 3-foliolate, with minute stipules; leaflets 1-4 cm. long, the blades oblanceolate, spatulate, or narrowly cuneate, sparingly pubescent: flowers in terminal panicles with lanceolate bracts and minutely bracted flower-stalks: calyx finely pubescent; lower lobes lanceolate or subulate-lanceolate; upper lip mostly entire: corolla yellow; standard-blade suborbicular: ovary pubescent: pod-body ellipsoid, less than 1 cm. long, narrowed at both ends, short-beaked, finely pubescent.—Pinelands and scrub, Coastal Plain, Fla. and Ga.—Spr.—sum.—Plants dry green.
9. *B. calycosa* Canby. Plant usually less than 1 m. tall, with many straight glabrous branches: leaves with elliptic or lanceolate stipules mostly 1-2 cm. long; leaflets 3, the blades spatulate to narrowly cuneate, 1-3 cm. long, sparingly pubescent: bracts and bractlets lanceolate to elliptic, foliaceous: calyx glabrous except the sparingly ciliate lobes; lobes foliaceous, all five nearly equal: corolla yellow; standard-blade suborbicular: ovary glabrous: pod-body narrowly ovoid or ellipsoid, about 1 cm. long, glabrous, slender-beaked.—Pinelands, E. Fla.—Spr.—sum.—Plants dry black.
10. *B. hirsuta* Small. Plant about 1 m. tall or less, with numerous straight hirsute branches: leaves with spatulate to lanceolate foliaceous stipules; leaflets 3, the blades spatulate, oblanceolate, or narrowly cuneate, 1-3 cm. long, hirsute: bracts and bractlets similar to the stipules: calyx hirsute; all five lobes foliaceous, the upper two (upper lip) united for about half their length: corolla yellow; standard-blade suborbicular: ovary hirsute: pod-body broadly ovoid, nearly 1 cm. long, pubescent, long-beaked. [*B. calycosa villosa* Canby.]—Dry sandy pinelands, W. Fla.—Spr.—Plants dry green.

11. *B. bracteata* Muhl. Plant less than 1 m. tall, the stout pubescent stem with widely spreading branches: leaflets 5–10 cm. long; blades oblanceolate to obovate, or elliptic-obovate, finely reticulate in age: racemes stout, 1–3 dm. long, declined: bracts lanceolate or ovate-lanceolate: calyx-lobes as long as the tube or slightly shorter, the lower ones triangular or lanceolate: corolla cream-colored; standard-blade fully 1.5 cm. wide, with brown spots; keel-petals over 2 cm. long: pod-body ellipsoid, 4–5 cm. long, short-stipitate, long-beaked.—(CREAM WILD-INDIGO).—Oak woods, Coastal Plain and Piedmont, Ga. and N. C.—Spr.—Plants dry black.
12. *B. villosa* Ell. Plant less than 1 m. tall, the stout pubescent stem with spreading zigzag branches: leaflets 4–12 cm. long; blades elliptic to rhombic-elliptic, or individually oblanceolate or obovate, coriaceous, reticulate: racemes 2–4 dm. long, erect or spreading, stout, naked; calyx-lobes shorter than the tube, the lower ones triangular to ovate: corolla yellow; standard-blade about 2 cm. wide; keel-petals about 2 cm. long: pod-body ellipsoid or nearly so, 2.5–3 cm. long, long-stipitate, slender-beaked.—Sandy woods, often on sandhills, Coastal Plain, S. C. and N. C.—Spr.
13. *B. megacarpa* Chapm. Plant more than 1 m. tall or less, the stout stem terminating in a long raceme and with spreading branches which bear short lateral racemes: leaflets 4–8 cm. long; blades elliptic, varying to broadest above the middle or below it, thinnish, minutely pubescent beneath or merely glaucous: terminal raceme many-flowered: calyx-lobes much shorter than the tube, the lower ones deltoid or deltoid-ovate: corolla pale-yellow; standard-blade about 1.5 cm. wide; keel-petals nearly 2 cm. long: pod-body ellipsoid or nearly so, 3.5–5 cm. long, parchment-like, slender-stipitate, very short-beaked.—Rich soil, mostly on river-banks, Coastal Plain, M. Fla. and S. Ga. (to Ala?).—Spr.—Plants dry green.
14. *B. Serenae* M. A. Curtis. Plant about 1 m. tall or less, the slender stem with several or many ascending leafy branches which often terminate in short racemes, the main terminal raceme elongate: leaflets 1–3 cm. long or rarely longer; blades obovate, cuneate-obovate, or spatulate-oblanceolate, glabrous, pale beneath: raceme slender: calyx-lobes shorter than the tube, the lower ones triangular or ovate-triangular: corolla bright-yellow; standard-blade less than 1.5 cm. wide; keel-petals less than 1.5 cm. long; pod-body cylindraceous, 1.5–2 cm. long, slender-stipitate.—Sandhills, Coastal Plain, Ga. and S. C.—Spr.
15. *B. albescens* Small. Plant mostly 1 m. tall or less, rather slender, the stem green, with ascending branches and a short raceme: leaflets 3–6 cm. long; blades elliptic to elliptic-oblanceolate, deep-green, sparingly pubescent beneath: raceme short; few-flowered: calyx-lobes shorter than the tube, the lower ones ovate or deltoid-ovate: corolla white; standard-blade 15–18 mm. wide; keel-petals mostly more than 1.5 cm. long: pod-body cylindric, 3–3.5 cm. long.—(SPIKED-INDIGO).—Woods, Blue Ridge and adjoining provinces, Ga., Tenn. and N. C.—Spr.—Leaves dry green. The stem and calyx are usually purple.
16. *B. alba* (L.) R. Br. Plant about 2 m. tall or less, slender, the stem green or purple with horizontal branches and a slender virgate erect raceme: leaflets 2–5 cm. long; blades narrowly elliptic to elliptic-spatulate, light-green: racemes, at least the main one, often conspicuously elongate, many-flowered, slender: calyx-lobes much shorter than the tube, the lower ones deltoid, or broader than long: corolla white; standard-blade 11–13 mm. wide; keel-petals less than 1.5 cm. long: pod-body cylindric, 2.5–3 cm. long or rarely shorter, short-stipitate.—Rich woods, often in pinelands, Coastal Plain and occasionally adjoining provinces, Fla. to N. C.—Spr.—sum.—Foliage dries green. The pod is erect.

17. *B. leucantha* T. & G. Plant 1.5 m. tall or less, stout, the stem glaucous, with ascending branches: leaflets 2.5–6.5 cm. long; blades obovate, cuneate, cuneate-obovate, or nearly elliptic, deep-green: racemes stout: calyx-lobes shorter than the tube, the lower ones deltoid or ovate-deltoid: corolla white; standard-blade 1.5–1.8 cm. wide; keel-petals fully 2 cm. long: pod-body oval, 2.5–4 cm. long, rather slender-stipitate. — (WHITE WILD-INDIGO. PRAIRIE-INDIGO.)—River-banks, woods, pinelands, and prairies, various provinces, N only west of the Blue Ridge, N Fla. to Tex., Minn., Ont., and N. C.—Spr.-sum.—The pods are drooping.

18. *B. australis* (L.) R. Br. Plant 1.5 m. tall or less, stout, the stem glaucous, with ascending simple or sparingly branched branches: leaves relatively few, with slender petioles; leaflets 4–8 cm. long, the blades cuneate to oblanceolate, cuneate-elliptic, or elliptic: calyx glabrous; lower lobes deltoid to ovate, much shorter than the tube: corolla indigo-blue; blade of the standard about 1.5 cm. wide; keel-petals mostly about 2 cm. long; pod-body ellipsoid, 3–3.5 cm. long, short-beaked. — (BLUE WILD-INDIGO.)—Rich woods and river-banks, various provinces N of Coastal Plain, Ga. to Tenn. to Pa.—Spr.—Foliage blackens in drying. Often grown in gardens, outside its natural range, for the brilliant blue inflorescence.

5. **CROTALARIA** [Dill.] L. Herbs. Stipules often decurrent on the stem or branches. Leaflets 3 or 1. Calyx with a prominently 2-lobed upper lip and a deeply 3-lobed lower lip. Corolla yellow in our species: standard with a pair of callosities near the base of the blade: wings with the scarcely auricled blades broadened upward: blades of the keel-petals broadly scythe-shaped. Pod globular to cylindric.—About 250 species, mainly of tropical regions.—Spr.-fall or all year S.—RATTLE-BOXES.—Some of the large-flowered species are grown as garden plants.

Leaves with 1-foliolate blades.

Standard shorter than the calyx or about equalling it: blades of the upper leaflets linear, elliptic, oval, or lanceolate: stipules more or less decurrent.

I. SAGITTALIS.

Standard much longer than the calyx: blades of the upper leaflets of a spatulate or oblanceolate type: stipules not decurrent.

II. RETUSAE.

Leaves with 3-foliolate blades.

III. INCANAE.

#### I. SAGITTALIS

Leaflets with orbicular or oval blades predominating: stems prostrate or decumbent.

Stems, branches, and peduncles with relatively long loose or spreading hairs.

1. *C. rotundifolia*. —

Stems, branches, and peduncles with short appressed hairs. Leaflets with linear, lanceolate, or elliptic blades predominating; stems erect or ascending.

2. *C. maritima*. —

Stems appressed-pubescent: calyx inconspicuously strigose.

Calyx 7–9 mm. long, the pubescence tawny: pod narrow, not inflated.

3. *C. Linaria*.

Calyx 1 cm. long or more, the pubescence pale: pod very thick, turgid.

4. *C. Purshii*. —

Stems loosely pubescent: calyx loosely pubescent.

5. *C. sagittalis*. —

#### II. RETUSAE

Flowers subtended by minute caducous bracts.

6. *C. retusa*.

Flowers subtended by ovate, cordate, persistent bracts.

7. *C. Retzii*.

#### III. INCANAE

Plant annual: pod 2.5–4.5 cm. long.

Racemes short and stout: calyx-lobes lanceolate: keel with a short blunt beak.

8. *C. incana*.

Racemes long and slender: calyx-lobes subulate-tipped: keel with a slender acute beak.

9. *C. striata*.

Plant perennial: pod 1–1.5 cm. long.

10. *C. pumila*.

1. *C. rotundifolia* (Walt.) Poir. Stems radiating from the stout root: blades of the lower leaflets orbicular to obovate; of the upper ones oval, oval-ovate, or broadly elliptic: calyx loosely pubescent: standard 11–14 mm. long: pod ellipsoid-obovoid, 2–2.5 cm. long.—(RABBIT-BELLS.)—Pinelands, dry woods, and sandy places, Coastal Plain and occasionally adj. provinces, Fla. to La. and Va.—(*Mex.*, *C. A.*, *S. A.*)

2. *C. maritima* Chapm. Stems radiating from a stout root: blades of the lower leaflets suborbicular to oval; or of the upper ones narrower: calyx strigose: standard 9–12 mm. long: pod ellipsoid, 2–3 cm. long.—Pinelands, Coastal Plain and rarely adj. provinces, Fla. to La. and N. C.—(*W. I.*)—An infusion made from the pods is used by the Seminoles as a cure for sore-throat. There is much variation in the leaflets. Although typically of a broad type, those on elongate branches often have narrow blades.

3. *C. Linaria* Small. Plant 1–3 dm. tall, the wiry stems tawny-strigose, often clustered on the woody root: blades of the leaflets linear, often narrowly so, or those of the lower leaves sometimes linear-elliptic or oblanceolate, all pubescent like the stem: stipules wanting: calyx strigose: corolla bright-yellow: pod narrowly cylindric, 1.5–2 cm. long.—Pinelands, hammocks, and shell-mounds, near or along the coast, pen. Fla. and the Keys.—Plants are perennial. Stems are often numerous on the woody root. The very narrow blades of the leaflets and small purple calyx are distinctive characters. Stipules may rarely be present.

4. *C. Purshii* DC. Plant 1–5 dm. tall, the stems solitary or clustered on the stout root, strigose: blades of the lower leaflets spatulate, oblanceolate, linear-elliptic, or oval, those of the upper ones lanceolate to linear: calyx strigose: corolla light-yellow: pod slightly obovoid, turgid, 2–3 cm. long.—Pinelands, prairies, sand-dunes, and grassy woods, Coastal Plain, Fla. to Tex. and Va.—Plants are perennial. Stipules are usually present, but often very small.

5. *C. sagittalis* L. Plant 1–5 dm. tall, the stem villous-hirsute: blades of the leaflets elliptic to lanceolate or linear-lanceolate: stipules conspicuous: calyx loosely-pubescent: corolla pale-yellow: pod ellipsoid, 2.5–4 cm. long.—(WILD-PEA.)—Dry woods and sandy banks, various provinces, Fla. to Tex., S. D., and Mass.—(*W. I.*, *Mex.*)—Plants are annual or at the South often perennial. Stipules are usually present, and conspicuously decurrent on the stem, thus inverse-sagittate.

6. *C. retusa* L. Plant 4–9 dm. tall, minutely pubescent: blades of the leaflets cuneate to oblanceolate, not bristle-tipped: stipules minute: calyx 12–14 mm. long; lower lip shorter than the tube: standard with a suborbicular or orbicular-reniform blade 22–26 mm. wide: pod nearly cylindric, 3–5 cm. long.—Pinelands and sandy soil, waste-places and roadsides, S pen. Fla. and the Keys. Nat. of E. I.—(*W. I.*, *Mex.*, *C. A.*, *S. A.*)

7. *C. Retzii* A. Hitchc. Plant erect, up to 1 m. tall, finely pubescent: blades of the leaflets elliptic to cuneate, often bristle-tipped: stipules broad: calyx 16–18 mm. long; lower lip longer than the tube; lobes lanceolate: corolla yellow; standard with a suborbicular blade about 2 cm. in diameter: pod slightly broadened upward, 3–5 cm. long. [*C. spectabilis* Roth.]—Cult. grounds and roadsides, pen. Fla. and the Keys. Nat. of E. I.—(*W. I.*)

8. *C. incana* L. Plant erect, the stem finely and loosely pale-pubescent, 3–8 dm. tall: blades of the leaflets oval to obovate: calyx becoming 10–12 mm. long: keel 14–16 mm. long: ovary pubescent: pod cylindric-ellipsoid, 2.5–4 cm. long.—Pinelands, cult. grounds, and waste-places, pen. Fla. and the Keys. Nat. of tropics.

9. *C. striata* DC. Plant erect, mostly 1.5 m. tall or less: blades of the leaflets oval, elliptic, or obovate, 2.5–7 cm. long, minutely pubescent beneath: calyx becoming 5.5–6.5 mm. long; lobes slender-tipped, longer than the tube: keel 12–14 mm. long: ovary minutely pubescent: pod turgid, cylindric-clavate, 3.5–4.5 cm. long, stout-beaked.—Waste-places, pinelands, and roadsides, pen. Fla. Nat. of E. I.—(*W. I., S. A., O. W.*)

10. *C. pumila* Ortega. Plant decumbent: blades of the leaflets cuneate to elliptic-cuneate: calyx becoming 4–5.5 mm. long: keel 8–10 mm. long: ovary pubescent: pod oval or ellipsoid, 1–1.5 cm. long.—Hammocks, pinelands, and coastal sand-dunes, pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)

6. **LUPINUS** [Tourn.] L. Annual, biennial, or perennial herbs, or woody plants. Stipules not decurrent. Leaflets several-many or rarely 1. Calyx with a lobed upper lip and an entire or slightly 3-lobed lower lip. Corolla variously colored or white: standard without callosities: wings with blunt auricles: keel-petals scythe-shaped. Pod ellipsoid to linear.—About 120 species, natives of temperate and warm regions.—LUPINES.

Leaves not evergreen; blades palmately several-foliolate: foliage glabrous or inconspicuously pubescent. I. DIGITATI.

Leaves evergreen; blades 1-foliolate: foliage copiously and conspicuously pubescent.

II. SIMPLICIFOLII.

#### I. DIGITATI

Upper calyx-lip half-orbicular, with a shallow notch and 2 deltoid lobes.

Upper calyx-lip deltoid, with a deep notch and 2 lanceolate lobes.

1. *L. perennis*.

2. *L. Nuttallii*.

#### II. SIMPLICIFOLII

Blade of the standard with a white spot.

Standard-blade orbicular-reniform: stems prostrate or decumbent.

Standard-blade ovate: stems erect.

Blade of the standard with a red-purple spot.

Blades of the keel-petals with a sharp basal auricle: hairs of the pistil much shorter than the ovary: pod elliptic, about 2.5 cm. long.

Blades of the keel-petals with a broad basal auricle: hairs of the pistil longer than the ovary: pod broadly linear, 3.5–4.5 cm. long.

3. *L. diffusus*.

4. *L. cumulicola*.

5. *L. Westianus*.

6. *L. villosus*.

1. *L. perennis* L. Plant 2–6 dm. tall, the stipules early deciduous: leaflets 7–11; blades oblanceolate to elliptic, obtuse or mucronulate: lower lip of the calyx with the middle lobe acute and projecting, beyond the others: corolla blue or purplish-blue: pod 7–8 mm. wide, long-pedicelled.—(SUNDIAL-LUPINE.)—Open woods and fields, in acid sandy soil, various provinces, Fla. to La., Minn., and Me.—Spr.

2. *L. Nuttallii* S. Wats. Plant smaller and more slender than in *L. perennis*, but with the stipules persistent and the leaflets fewer, their blades narrow, mostly spatulate and acute: lower lip of the calyx with the middle lobe obtuse and about equalling the others: corolla blue: pod mostly 9–10 mm. wide,

short-pedicelled.—(SANDHILLS-LUPINE.)—Pinelands, Coastal Plain, Fla. to Miss. and Ga.—Spr.

3. *L. diffusus* Nutt. Stems and branches several to many, close-together at the top of the root, prostrate or decumbent, terminating in erect panicles: leaf-blades oblanceolate, narrowly obovate, or elliptic, 4–10 cm. long; corolla deep-blue, except the white center of the standard: standard as wide as long or wider: blade of wing-petals nearly as wide as long: pod broadly linear, rather flat, 3.5–4 cm. long, silky, the beak nearly straight.—Pinelands and oak ridges, Coastal Plain, Fla. to Miss. and N. C.—Spr.—sum.

4. *L. cumulicola* Small. Stem usually solitary, erect, 1.5–15 dm. tall, branched above, the branches terminating in erect panicles: leaf-blades oval or elliptic, varying to broadest above the middle or below it, 3–15 cm. long: corolla sky-blue, except the white center of the standard: standard longer than wide: blade of wing-petals much longer than wide: pod linear, turgid, 4–5 cm. long, silky, the beak curved upward.—(SKY-BLUE LUPINE.)—Scrub and sandhills, pen. Fla.—Wint.—spr.

5. *L. Westianus* Small. Stem usually solitary, erect, 3–12 dm. tall, branched above, the branches terminating in erect panicles: leaf-blades elliptic or nearly so, 4.5–9 cm. long: corolla bright-blue, except the red-purple spot in the center of the standard: standard with an orbicular-ovate blade: pod elliptic, turgid, about 2.5 cm. long closely shaggy-villous, the beak nearly central.—Sand-dunes along or near the coast, M and W Fla.—Spr.

6. *L. villosus* Willd. Stem and branches close together at the top of the root, often radiating, prostrate and terminating in erect, stout, dense panicles: leaf-blades elliptic, elliptic-lanceolate, or linear-elliptic, or sometimes oblanceolate, 4–15 cm. long: corolla deep-lilac or purple, except the deep-purple or red-purple center of the standard: standard with a suborbicular blade: pod broadly linear, flattish, 3.5–4 cm. long, shaggy with more or less tangled long hairs, the beak lateral.—(LADY-LUPINE.)—Dry pinelands and sandy barrens, Coastal Plain, Fla. to Miss. (or La.?), and N. C.—Spr.

7. **CYTISUS** [Tourn.] L. Shrubs with much-branched stems, sometimes broom-like. Leaflets 3 or 1: blades narrow or broad, mostly entire, or obsolete. Calyx with an obscurely lobed upper lip and a minutely 3-lobed lower lip. Corolla mostly yellow: standard with a broad blade: wings with broad auricles: keel-petals with broad blades. Pod rather narrow.—About 45 species, natives of the Old World.—BROOMS.

1. *C. scoparius* (L.) Link. Plant with many stiff erect sharp-angled branches, 1–1.5 m. tall, the younger parts finely pubescent: leaflets 3, or 1 in the upper leaves; blades obovate to elliptic, 5–15 mm. long, obtuse or acute, entire: raceme leafy-bracted: calyx about 4 mm. long: corolla bright-yellow; standard suborbicular, 1.5–2 cm. long: pod broadly linear, 4–5 cm. long, long-ciliate.—(BESOM. GINSTER. SCOTCH-BROOM.)—Roadsides, banks, and fields, various provinces, rarely Coastal Plain, Ga. to N. S. Nat. of Eu.—Sum.—In part parasitic on oak roots.

8. **MEDICAGO** [Tourn.] L. Annual or perennial herbs, or partly woody plants. Leaflets 3, pinnate. Racemes capitate or slightly elongate. Calyx-lobes nearly equal, about as long as the tube or longer. Corolla yellow, blue, or violet: wings with a hooked auricle at the base of the blade. Style very short, at least shorter than the ovary.—About 50 species, natives of the Old World.—MEDICS.

Corolla violet or blue: standard with an elliptic or cuneate blade: perennial upright plant.

Corolla yellow; standard with a blade about as broad as long: annual spreading or prostrate plants.

I. SATIVAE.

II. LUPULINAE.

#### I. SATIVAE

Stem often bushy branched: flower-clusters conspicuous: pod twisted.

1. *M. sativa*.

#### II. LUPULINAE

Pod unarmed, 1-seeded: blade of the keel-petals longer than the claw.

2. *M. lupulina*.

Pod prickly-armed, several-seeded: blade of the keel-petals shorter than the claw.

Stem and branches downy-villous: stipules entire or toothed. Stem and branches glabrous or nearly so: stipules incised.

Pod loosely coiled, not furrowed on the edge between the prickles: style very short.

4. *M. hispida*.

Pod tightly coiled, furrowed on the edge between the prickles: style slender.

5. *M. arabica*.

1. ***M. sativa*** L. Leaflets 8–16 mm. long; blades cuneate-obovate to cuneate or oblanceolate; calyx 4–6 mm. long; standard 8–10.5 mm. long; pod 3–4 mm. broad.—(ALFALFA. LUCERNE.)—Fields and waste-places, various provinces, nearly throughout U. S. and Can. Nat. of Eu.—Spr.-sum.—Extensively grown as a fodder.

2. ***M. lupulina*** L. Leaflets 5–15 mm. long; blades obovate or rhomboidal; calyx 1.5–2 mm. long; standard 1.5–2 mm. long; pod 2–3 mm. broad; strongly curved.—(NONE-SUCH. BLACK-MEDIC. HOP-MEDIC.)—Waste-places and roadsides, various provinces, U. S. and S Can. Nat. of Eu.—Spr.-sum.

3. ***M. minima*** L. Leaflets 0.5–1.5 cm. long; blades broadly or narrowly cuneate, rounded or truncate at the apex, denticulate; calyx pubescent, 2.5–3 mm. long; lobes as long as the tube or longer; corolla yellow, 3–4 mm. long; pod closely twisted into 4 or 5 coils, 5–8 mm. broad, the edges armed with toothed prickles.—Roadsides, waste-places, and cult. grounds, Coastal Plain and adj. provinces, Fla. to Tex. and N. C. Nat. of Eu.—Spr.-sum.

4. ***M. hispida*** Gaertn. Leaflets 5–15 mm. long; blades cuneate to oval, green; calyx 2.5–3 mm. long; keel-petals mostly shorter than the broad wings; pod with 2 or 3 coils, 5–8 mm. broad. [*M. denticulata* Willd.]—(BUR-CLOVER.)—Waste-places, fields, and roadsides, various provinces, Fla. to Tex. and N. S.; also Pacific States. Nat. of Eurasia.—(W. I., Mex., C. A., S. A.)

5. ***M. arabica*** All. Leaflets 10–25 mm. long; blades broadly cuneate to obovate, usually with a brown spot in center; calyx 2–2.5 mm. long; keel-petals mostly longer than the wings; pod with 3 or 4 coils, 6–9 mm. broad. [*M. maculata* Sibth.]—(SPOTTED-MEDICK.)—Waste-places, roadsides, fields, and cult. grounds, various provinces, M Fla. to La. and N. B. Nat. of Eu.—(S. A.)

**9. TRIGONELLA L.** Annual or rarely perennial herbs, with erect or spreading stems. Leaflets 3: blades broadened upward, toothed, commonly sharply so. Flowers perfect, in short racemes or panicles, or clustered. Calyx-lobes nearly equal, narrow. Corolla yellow, blue, or white: standard with an obovate or cuneate sessile blade: wings elliptic or ovate, longer than the rounded keel. Style very short or subulate. Pod curved, narrow, indehiscent or nearly so.—About 50 species, mostly of the Old World temperate regions.

**1. T. monspeliaca L.** Plant finely pubescent: stem simple or branched, 0.5–4 dm. long: leaflets 3, the blades cuneate to obovate, 3–11 mm. long, sharply toothed above the middle: flowers clustered: calyx 2–2.5 mm. long; lobes subulate, slightly shorter than the tube: corolla yellow, about  $\frac{1}{3}$  longer than the calyx; standard cuneate, 3–3.5 mm. long, emarginate: pod linear, curved, 11–15 mm. long, reticulate, finely pubescent.—Dry soil, fields, and hillsides, Coastal Plain, Ala. Nat. of Eu.—Sum.

**10. MELILOTUS [Tourn.] Juss.** Annual or biennial herbs. Leaflets 3-pinnate. Racemes greatly elongate and ultimately interrupted. Calyx-lobes nearly equal, shorter than the tube. Corolla yellow or white: wings with a slender auricle at the base of the blade. Style long. Pod stout, straight.—About 20 species, natives of the Old World.—Sum.—SWEET-CLOVERS. MELILOTS.

Corolla 4–9 mm. long; pod 3–4 mm. long.

Corolla white: standard surpassing the wing-petals.

Corolla yellow: standard shorter than the wing-petals.

Corolla 2.5 mm. long or less: pod about 2 mm. long.

1. *M. alba*.

2. *M. officinalis*.

3. *M. indica*.

**1. M. alba Desv.** Leaflets 1–3 cm. long; blades linear-elliptic, oblanceolate, or elliptic: racemes 4–15 cm. long, or becoming longer: calyx-lobes slightly shorter than the tube: keel-petals about equal to the wings: ovary sessile: pod 3–3.5 mm. long, glabrous.—(WHITE-MELILOT. WHITE SWEET-CLOVER.)—Waste-places, fields, cult. grounds, and river banks, especially in calcareous regions, various provinces, nearly throughout U. S. and S Can. Nat. of Eu.

**2. M. officinalis (L.) Lam.** Leaflets 1–3 cm. long; blades narrowly elliptic, oblanceolate, or oval: racemes 2–12 cm. long: calyx-lobes about  $\frac{1}{2}$  as long as the tube: keel-petals much shorter than the wings: ovary stipitate: pod about 4 mm. long, pubescent.—(YELLOW-MELILOT.)—Waste-places, cult. grounds, and roadsides, often in calcareous soils, various provinces, nearly throughout U. S. and S Can. Nat. of Eu.

**3. M. indica (L.) All.** Leaflets 0.5–2 cm. long; blades elliptic, oval, cuneate, or obovate: racemes 1–2 cm. long: corolla yellow: pod about 2 mm. long.—

(INDIAN-CLOVER.)—Waste-places, fields, and roadsides, Coastal Plain, Fla. to Tex., and locally northward to E Canada; also Pacific States, and rarely in the interior. Nat. of Eurasia.

**11. TRIFOLIUM** [Tourn.] L. Annual or perennial herbs. Leaflets 3, digitate or pinnate, or rarely 5 or 7. Calyx-lobes nearly equal, or the 2 upper longer than the 3 lower ones and some times partly united. Corolla variously colored or white: standard elliptic or obovate, or elongate and clawed: other petals with long claws, the wings with an angle or a rounded auricle at the base of the blade.—About 275 species, natives mainly of the north temperate zone.—CLOVERS. TREFOILS.—Various species, particularly *T. pratense* and *T. hybridum*, are grown for fodder.

Corolla white or colored but not yellow.

Racemes peduncled: claw of the standard shorter than the blade, except in *T. lappaceum*, which has the corolla shorter than the calyx.

Calyx not 2-lipped.

Corolla shorter than the calyx.

Standard with the blade longer than the claw:  
mature racemes ellipsoid: corolla white.

I. ARVENSIA.

Standard with the blade shorter than the claw:  
mature racemes globular: corolla pink.

II. LAPPACEA.

Corolla longer than the calyx.

Calyx-lobes plumose: raceme cylindric.

III. INCARNATA.

Calyx-lobes not plumose: raceme globular.

Plant annual or biennial: calyx-lobes several times longer than the tube.

IV. REFLEXA.

Plant perennial: calyx lobes and tube about equal in length.

V. REPENTIA.

Calyx 2-lipped.

VI. CAROLINIANA.

Racemes sessile: claw of the standard longer than the blade.

VII. PRATENSIA.

Corolla yellow.

VIII. AGRARIA.

#### I. ARVENSIA

Plant with grayish-pubescent foliage and silky-plumose racemes.

1. *T. arvense*.

#### II. LAPPACEA

Plant with glabrous foliage and sparingly hairy racemes.

2. *T. lappaceum*.

#### III. INCARNATA

Plant erect: flowers ascending or ultimately spreading, in cylindric somewhat plumose racemes.

3. *T. incarnatum*.

#### IV. REFLEXA

Plant with several to many radially spreading stems at maturity: flowers ultimately strongly reflexed, forming a depressed flat-topped head.

4. *T. reflexum*.

#### V. REPENTIA

Calyx-lobes subulate, not dilated, the sinuses pubescent.

Upper calyx-lobes slightly united: blades of the keel-petals longer than the claws.

5. *T. stoloniferum*.

Upper calyx-lobes distinct: blades of the keel-petals shorter than the claws.

6. *T. hybridum*.

Calyx-lobes lanceolate or triangular with dilated bases, the sinuses glabrous.

Leaflets not prominently veined, serrulate; terminal leaflet longer-stalked than the lateral.

7. *T. repens*.

Leaflets prominently veined, spinulose-serrate: terminal leaflet not longer-stalked than the lateral.

8. *T. saxicola*.

#### VI. CAROLINIANA

Slender depressed herb with slender peduncled small capitate racemes: corolla white, pink, or purplish; standard abruptly pointed.

9. *T. carolinianum*.

#### VII. PRATENSIA

Coarse erect herb with sessile large capitate racemes: corolla red or magenta, or rarely white; standard obtuse or nearly truncate at apex.

10. *T. pratense*.

## VIII. AGRARIA

Terminal leaflet longer-stalked than the lateral ones: standard entire.

Racemes 8-12-flowered, much less than 1 cm. long.

Racemes 20-40-flowered, about 1 cm. long.

Terminal leaflet not longer-stalked than the lateral ones: standard with toothed edges.

11. *T. dubium*.

12. *T. procumbens*.

13. *T. agrarium*.

1. *T. arvense* L. Stem 1-4 dm. tall, villous-lanuginous: leaflets 1-2.5 cm. long; blades linear to oblanceolate, entire or nearly so: racemes 1-3 cm. long: calyx 4.5-5 mm. long; lobes subulate, plumose: standard 3-3.5 mm. long, the blade nearly elliptic, white.—(OLD-FIELD CLOVER. RABBIT-FOOT CLOVER. STONE-CLOVER.)—Dry banks, fields, and roadsides, various provinces, Fla. to Mo., Ont., and Que. Nat. of Eurasia.—Sum.

2. *T. lappaceum* L. Stem glabrous: leaflets 1-2 cm. long; blades cuneate to obovate, finely toothed: racemes 1-2 cm. in diameter: calyx 6-7 mm. long; lobes filiform-subulate, with separated long spreading hairs: standard 5-6 mm. long, the blade ovate, pink.—Waste-places, and roadsides, Coastal Plain, Ala. and Miss. Nat. of Mediterranean reg.

3. *T. incarnatum* L. Stem 2-9 dm. tall, like the branches appressed-pubescent, or somewhat villous: leaflets 1-4 cm. long; blades obovate to orbicular-obovate or broadly cuneate, denticulate, finely veined; raceme cylindric, 3-8 cm. long: calyx densely strigillose, obscurely 2-lipped; lobes setaceous, longer than the tube, those of the upper lip slightly longer than those of the lower lip: corolla crimson; standard 11-13 mm. long, linear-spatulate.—(CRIMSON-CLOVER. ITALIAN-CLOVER.)—Fields, waste-places, and roadsides, various provinces, N. C. to Ark. and Me. Nat. of Eu., and cult.—Sum.—*T. angustifolium* L. of the Mediterranean reg., with linear leaflet-blades and slightly exserted corollas has been found in Montgomery Co., Ala.

4. *T. reflexum* L. Stem decumbent or spreading, villous or downy: leaflets 1.5-3 cm. long; blades elliptic, elliptic-obovate, or suborbicular, denticulate: calyx 7-8 mm. long; lobes lanceolate-subulate, ciliate: standard oval, 10-12 mm. long, red or purple.—(BUFFALO-CLOVER.)—Dry fields and sandy woods, various provinces, northward only W of Blue Ridge, Fla. to Tex., Nebr., Ont., and W N. Y.—Spr.

5. *T. stoloniferum* Muhl. Stem widely spreading, glabrous: leaflets 1-3 cm. long; blades obovate, broadly cuneate, or nearly orbicular, denticulate: calyx 5-6 mm. long; lobes much longer than the tube: standard oval or oval-ovate, 10-12 mm. long, white tinged with purple.—(BUFFALO-CLOVER. RUNNING-CLOVER.)—Woods and prairies, various provinces, Tenn. to Mo., Nebr., and Ohio.—Spr.—sum.

6. *T. hybridum* L. Stem erect or decumbent: leaflets 1-2.5 cm. long: blades oval to elliptic, varying to ovate or obovate, or suborbicular, denticulate: calyx 3.5-4 mm. long; lobes about as long as the tube: standard elliptic, 7-9 mm. long, pink or rarely nearly white: style mostly shorter than the ovary.—(ALSKE-CLOVER. SWEDISH-CLOVER. ALSATIAN-CLOVER.)—Fields, roadsides, and waste-places, various provinces, nearly throughout U. S., and S Can. Nat. of Eu. and cult.—(*W. I.*)—Spr.—fall.

7. *T. repens* L. Stem creeping: leaflets 9–15 mm. long; blades obovate to orbicular-obovate or oval: calyx about 5 mm. long; shorter lobes abruptly acuminate from dilated bases: standard elliptic, 7–8 mm. long, white: style mostly longer than the ovary.—(WHITE-CLOVER. DUTCH-CLOVER.)—Roadsides, fields, woods, and waste-places, various provinces, U. S. and S Can.—Flourishes on the highest mts. and in the coastal region of the Gulf of Mexico; persists for some time when naturalized in S Fla.—Sum. or all year S.
8. *T. saxicola* Small. Stem creeping: leaflets 3–8 mm. long; blades cuneate to obdeltoid: calyx about 3 mm. long; shorter lobes triangular or triangular-lanceolate: standard elliptic, 6–7 mm. long, white; keel-petals with claws usually shorter than the blades: style mostly shorter than the ovary.—Granite rocks, Stone Mt. on the Piedmont of Ga.—Spr.-sum.
9. *T. carolinianum* Walt. Stem ascending or decumbent, pubescent: blades of the leaflets obovate to cuneate: calyx pubescent; lower lobes much shorter than the linear-lanceolate lateral ones: standard white, pink, or purplish: free portion of the filaments 1 cm. long or less.—Dry woods and sandy soil, various provinces, N pen. Fla. to Tex., Kans., and Md. Introd. further N.—Spr.-fall.—*T. nigrescens*, Viv. of S Eu. with glabrous foliage and calyx and corolla twice as long as the calyx and *T. resupinatum* L., of W Eu. and Mediterranean reg., with an inflated calyx, at maturity, have been found about Snow Hill, Ala.
10. *T. pratense* L. Stem 2–7 dm. tall, pubescent: leaflets 1–4 cm. long; blades elliptic or oval: calyx about 8 mm. long; lobes filiform, the longest one much longer than the tube: corolla red, purple, or white: standard 12–14 mm. long, the claw very broad.—(RED-CLOVER. PURPLE-CLOVER.)—Fields, waste-places, roadsides, and woods, various provinces, U. S. and S Can. Nat. of Eu. and cult.—Sum.—Flourishes best at moderate altitudes in the mts.; somewhat persistent when introduced in S Fla.—*T. glomeratum* L., with globular racemes less than 1 cm. in diameter, short-petioled, small leaves and short broad-based spreading calyx-lobes; and *T. suffocatum* L., with long petioled leaves; both glabrous and from the Mediterranean reg., have been found at Snow Hill, Ala.; also *T. striatum* L., with small cylindric racemes and calyx-lobes shorter than the tube, from the Mediterranean region, has been found near Bowman, Ga.
11. *T. dubium* Sibth. Plant erect or ascending, diminutive: leaflets 4–8 mm. long: racemes loosely 8–12-flowered: calyx mostly less than 2 mm. long: wing-petals 2–2.5 mm. long.—(SHAMROCK.)—Waste-places and fields, various provinces, Fla. to Tex., B. C., and Mass. Nat. of Eu.
12. *T. procumbens* L. Plant prostrate or procumbent, diffuse: leaflets 6–12 mm. long: racemes rather densely 20–40-flowered: calyx mostly over 2 mm. long: wing-petals 3–4 mm. long.—(LOW HOP-CLOVER.)—Fields, roadsides, and waste-places, various provinces, N. Am., except the extreme N. Nat. of Eu.
13. *T. agrarium* L. Plant erect or nearly so: leaflets mostly 10–16 mm. long: racemes densely many-flowered: calyx 2.5–3 mm. long: wing-petals 4–5 mm. long.—(HOP-CLOVER. YELLOW-CLOVER.)—Thickets, fields, and waste-places, various provinces, Ga. to Ia., Ont., and N. S. Nat. of Eu.
12. **LOTUS** [Tourn.] L. Herbs with diffusely spreading branches. Leaflets 3: blades entire. Flower-clusters long-peduncled. Calyx obscurely 2-lipped: lobes slightly unequal, long and narrow. Corolla yellow or reddish: standard with a broad blade: other petals slender-clawed, the blades of the wings prominently auricled: keel-petals strongly curved, very broad.—About 70 species, widely distributed in the Old World.

1. *L. corniculatus* L. Plant perennial, with several or many decumbent or ascending branches, 1-6 dm. long: leaflets 3; blades obovate to elliptic, 6-17 mm. long: calyx 8-9 mm. long; lobes subulate, the larger ones as long as the tube or nearly so: corolla bright-yellow, or partly reddish; standard 11-13 mm. long; blade cuneate to reniform: pod 2-2.5 cm. long, the body narrowly linear, with a slender-subulate beak.—(BIRD'S-FOOT TREFOIL. CAT-CLOVER. GROUND-HONEYSUCKLE.)—Waste-places and ballast, Coastal Plain, Atlantic and Gulf States. Nat. of Eurasia.

13. *ACMISPON* Raf. Annual or perennial herbs or woody plants. Leaflets 3, pinnate, or solitary. Flowers solitary, axillary. Calyx-lobes nearly equal, usually elongate. Corolla usually pinkish; standard with a broad blade and a short claw: other petals with distinct claws, the blades slightly auricled: keel-petals scythe-shaped.—Six or 8 species, mostly in western North America.

Calyx-lobes less than twice as long as the tube, not surpassing the wings.

Calyx-lobes fully twice as long as the tube, surpassing wings.

1. *A. Helleri*.
2. *A. americanum*.

1. *A. Helleri* (Britton) Small. Plant 2-6 dm. tall, the branches glabrous or minutely pubescent: leaflets 5-15 mm. long; blades mostly linear to linear-elliptic: calyx-tube glabrous: claws of the keel-petals about  $\frac{1}{2}$  as long as the blades. [*Hosackia Purshiana* (Chapm. Fl.)]—Pinelands, Piedmont, S. C. and N. C.—Sum.

2. *A. americanum* (Nutt.) Rydb. Plant 2-6 dm. tall, the branches villous: leaflets 8-25 mm. long; blades mostly elliptic to ovate: calyx-tube densely pubescent: claws of the keel-petals about  $\frac{1}{4}$  as long as the blade.—Dry soil, various provinces, Tex. to Calif., Wash., and Minn., eastward to Ala.—Sum.—fall.

14. *BONAVERIA* Scop. Herbs with diffuse branches and nearly glabrous foliage. Leaflets several, pinnate: blades entire. Flowers in peduncled heads.

Calyx short, the lobes about as long as the tube, the 2 upper ones decidedly united. Corolla yellow: standard broad, longer than the other petals, clawed: wings longer than the incurved keel. Pod elongate, falcate, flat, slender-beaked.—One species.

1. *B. Securidàca* Scop. Plants mostly 1 m. tall or less: leaflets 1-2.5 cm. long; blades cuneate to elliptic-cuneate, rounded, or truncate and apiculate at the apex: peduncles pubescent near the base: calyx 2.5-3 mm. long; lobes of the lower lip lanceolate-acuminate: standard oval, 6-8.5 mm. long: pod 6-9 cm. long, the slender beak hooked

at the apex.—Waste-places and roadsides, Coastal Plain, S. C. Nat. of Eu.—Spr.—sum.

15. **AMORPHA** L. Shrubs. Leaflets several or many, dotted: blades entire or nearly so. Racemes spike-like. Calyx 2-lipped, sometimes obscurely so. Standard erect, the broad blade folded around the androecium and gynoecium. Wings and keel-petals wanting. Filaments united at the base. Style pubescent, straight. Pod turgid, nearly indehiscent. About 20 species, North American.—**LEAD-PLANTS.** **PLUME-LOCUSTS.**—Several species are grown as ornamentals.

Calyx-lobes lanceolate to subulate, at half as long as the tube.  
Calyx-lobes short, the upper deltoid or half-round.

Branches, petioles, leaf-rachis, peduncle, and upper surface of the leaflets glabrous or nearly so.

Calyx-lobes very short, almost obsolete, separated by broad sinuses.

Calyx-lobes prominent, the upper broad, the lower narrow.

Branches, petioles, leaf-rachis, peduncle, and leaflets manifestly pubescent, at least when young.

Petioles very short, less than the width of the leaflets, the lowest pair of leaflets therefore close to the stem: pod 5 mm. long or less.

Petioles longer than the width of the leaves: pod 6 mm. long or more.

Pod nearly straight on the back: leaflets mostly subcoriaceous or membranous in *A. Bushii*.

Pod curved on the back: leaflets membranous.

#### I. CANESCENTES.

#### II. GLABRAE.

#### III. CAROLINIANAE.

#### IV. HERBACEAE.

#### V. VIRGATAE.

#### VI. FRUTICOSAE.

#### I. CANESCENTES

Calyx-lobes fully half as long as the tubes: leaflets canescent beneath: racemes clustered.

Calyx-lobes fully as long as the tube: leaflets brown-villous beneath: racemes single or two together.

1. *A. canescens*.

2. *A. Schuerini*.

#### II. GLABRAE

A glabrous or sparingly pubescent shrub with broad leaflets and a short campanulate calyx.

3. *A. glabra*.

#### III. CAROLINIANAE

Pod curved, narrow, scarcely punctate: blades of the leaflets broadest below the middle, pubescent beneath.

Pod straight on the back, broad, conspicuously punctate: blades of the leaflets broadest at the middle or above it, glabrous.

4. *A. nitens*.

Calyx with numerous conspicuous glands: pod 4–7 mm. long.

Corolla bluish: blades of the leaflets elliptic, rounded or obtuse at both ends: racemes mostly single: pods glandular throughout.

Lower calyx-lobes lanceolate or subulate-lanceolate: standard truncate and retuse at the apex: pod with a lateral beak.

5. *A. cyanostachya*.

Lower calyx-lobes deltoid: standard rounded at the apex: pod with a nearly centric beak.

6. *A. Dewinkeleri*.

Corolla white: blades of the leaflets linear-elliptic, acute, at least at the base: racemes usually clustered: pod glandular above the middle.

7. *A. crenulata*.

Calyx with few inconspicuous glands: pod 7–8 mm. long.

8. *A. Curtissii*.

#### IV. HERBACEAE

Calyx-tube densely pubescent: pod straight on the dorsal suture.

9. *A. herbacea*.

Calyx-tube glabrous: pod curved on the dorsal suture.

10. *A. floridana*.

#### V. VIRGATAE

Blades of the leaflets coriaceous, shining above, reticulate at maturity.

11. *A. virgata*.

Blades of the leaflets membranous, dull, not reticulate.

12. *A. Bushii*.

## VI. FRUTICOSAE

Pod narrow, about 2 mm. wide, slightly curved.

Pod broad, about 3 mm. wide, strongly curved.

Foliage sparsely pubescent with gray hairs.

Foliage copiously pubescent, especially when young, with orange or yellow hairs.

13. *A. tennesseensis*.

14. *A. fruticosa*.

15. *A. croceolanata*.

1. *A. canescens* Pursh. Stem 3-9 dm. tall, white-canescent: leaflets 15-47; blades oval to ovate-lanceolate, 0.9-1.8 cm. long, subacute: racemes dense, clustered, 5-18 cm. long, the flowers on very short pedicels: calyx about 5 mm. long; lobes subulate-lanceolate, nearly equal, 2-2.5 mm. long: standard obovate or broadly spatulate, about 5 mm. long, light-blue: pod 3-4 mm. long, densely tomentose.—Dry prairies, various provinces, Tenn. to Tex., N. M., Man., and Ind.—Sum.

2. *A. Schwerini* C. K. Schneid. Stem 1-2 m. tall, with densely fine-pubescent branches: leaflets 11-23; blades elliptic to ovate-elliptic, 0.8-3 cm. long, rounded or notched at both ends, copiously soft-pubescent beneath: racemes solitary or two together, 4-6 cm. long, copiously pubescent: calyx 4.5-5.5 mm. long; lobes pubescent, subulate, longer than the tube; standard obovate, 4 mm. long, purplish: pod 5-5.5 mm. long, the dorsal edge straight. [*A. densiflora* F. E. Boynton.]—Rocky woods, Piedmont, N. C.—Sum.

3. *A. glabra* Desf. Stem 1-2 m. tall: leaflets 9-19; blades ovate, elliptic-ovate, or oval, 2-5 cm. long, glabrous on both surfaces, obtuse, often emarginate, rounded or subcordate at the base: racemes usually clustered, 6-15 cm. long, glabrous: calyx campanulate, about 3 mm. long; lobes very shallow and sparsely ciliate: standard orbicular, short-clawed, about 7 mm. long, purple: pod 7-8 mm. long, rounded on the ventral edge, nearly straight on the dorsal, light-brown, marked with few small glands. [*A. montana* F. E. Boynton.]—(MOUNTAIN-INDIGO.)—Dry soil and swamp-margins, various provinces, Ga. to Ala., Tenn., and N. C.—Spr.

4. *A. nitens* F. E. Boynton. Stem 1.5-3 m. tall, with glossy twigs: leaflets 7-19; blades elliptic-ovate or ovate, 2-6 cm. long, sparsely pubescent or glabrate beneath: racemes slender, usually solitary, 12-25 cm. long: calyx obconic, about 3 mm. long; lobes short and rounded or the three lower short-pointed, ciliate on the margins: standard purple: pod 5-7 mm. long, narrow, much-curved and nearly glandless. Swamps near Waynesboro, in the Coastal Plain of Ga.—Sum.

5. *A. cyanostachya* M. A. Curtis. Stem 1-2 m. tall: leaflets numerous; blades elliptic, usually broadly so, 0.9-1.8 cm. long, rounded at both ends, dotted with dark glands: racemes one or several, 9-20 cm. long, nearly glabrous: calyx about 3 mm. long; lobes ciliate, the two upper deltoid, the lower subulate-pointed: standard purple: pod 4-5 mm. long, rounded on the ventral edge, nearly straight on the dorsal, marked with numerous large dark glands. [*A. glabra* F. E. Boynton not Desf. *A. caroliniana* Rydb. not Croom.]—Stream-banks, woods, and dry ridges, various provinces, Fla. to Okla., N. D., and Ky.—Spr.—sum.

6. *A. Dewinkeleri* Small. Stem 1.5-2.5 m. tall: leaflets numerous; blades elliptic or nearly so, sometimes narrowly so, 1.5-2.5 cm. long, usually emarginate at the apex, with small glandular-dots: racemes mostly solitary, 1-1.5 dm. long, glabrous: calyx about 4 mm. long; lobes ciliolate, the two upper half-orbicular, the lower deltoid: standard dark-purple: pod about 6 mm.

long, rounded on the ventral suture, nearly straight on the dorsal, marked with rather numerous small dark glands.—Pinelands, hammocks, and prairies, S W pen. Fla.—Spr.

7. *A. crenulata* Rydb. Stem 1–1.5 m. tall, glabrous: leaflets 25–33; blades elliptic to linear-elliptic, 1.5–3.5 cm. long, acute, at least at the base, glandular-dotted beneath: racemes loosely clustered, 9–20 cm. long: calyx about 4 mm. long, the two upper lobes triangular-ovate, acuminate, the three lower lanceolate and subulate-tipped: standard cuneate-spatulate, about 6 mm. long, white: pod 6–7 mm. long, nearly straight on the dorsal suture, conspicuously glandular-dotted above the middle.—Pinelands and edges of hammocks, Everglade Keys, Fla.—Spr.—sum.

8. *A. Curtissii* Rydb. Stem 1–3 m. tall, glabrous: leaflets 11–21; blades elliptic or ovate, 1.8–4.5 cm. long, rounded and mucronate at the apex, reticulate, minutely glandular-punctate beneath: racemes clustered, 5–15 cm. long: calyx 3.5–4 mm. long, the two upper lobes rounded, the three lower lobes triangular, acute: standard broadly obovate, about 5 mm. long, purplish-blue: pod 7–8 mm. long, nearly straight on the dorsal side, conspicuously glandular-dotted.—River-banks and low grounds, Coastal Plain, Fla. to N. C.?—Sum.

9. *A. herbacea* Walt. Stem 3–8 dm. tall, grayish-pubescent: leaflets 11–37; blades elliptic or elliptic-ovate, 0.8–1.6 cm. long, obtuse: racemes clustered, 4–30 cm. long: calyx about 4 mm. long, the two upper lobes broader and shorter than the acute lower ones: standard broadly spatulate, 4–5 mm. long, varying from violet-purple to white: pod 4–5 mm. long, strongly curved on the ventral and nearly straight on the dorsal suture, marked with numerous small dark glands.—Pinelands, Coastal Plain, Fla. to N. C.—Sum.

10. *A. floridana* Rydb. Stem about 1 m. tall, sparingly short-villous: leaflets 27–41; blades elliptic or linear-elliptic, 0.9–2 cm. long, rounded at both ends, strongly reticulate, conspicuously glandular-dotted beneath: racemes clustered, 5–15 cm. long: calyx about 3 mm. long, the two upper lobes broadly triangular, acute, the three lower lobes triangular-lanceolate: standard broadly obovate-spatulate, 4 mm. long, light-purple or lavender: pod 4–5 mm. long, strongly curved on both sutures, marked with few large glands.—Sandy pinelands and about hammocks, N Fla.—Spr.—sum.

11. *A. virgata* Small. Stem 1–2 m. tall: leaflets 11–19; blades elliptic, elliptic-ovate, or ovate, 2–5 cm. long, nearly smooth above, sparsely pubescent beneath: racemes one or several, 8–15 cm. long: calyx about 3 mm. long, sparsely pubescent; lobes triangular, acute standard orbicular, about 6 mm. long, abruptly narrowed at the base, purple: pod 6–7 mm. long, rounded on the ventral edge, nearly straight on the dorsal, dark-brown, marked with small glands.—(MOUNTAIN-INDIGO.)—Dry woods, Coastal Plain to Appalachian Valley, N pen. Fla. to Ala. and Tenn.—Sum.

12. *A. Bushii* Rydb. Stem 1–2 m. tall, puberulent or glabrous in age: leaflets 15–25; blades elliptic to oval, 2.5–6 cm. long, rounded or retuse at the apex, finely pubescent beneath: racemes usually few together, 18–20 cm. long: calyx about 3 mm. long, the two upper lobes short, rounded, the three lower triangular, acute: standard purple: pod 6–7 mm. long, straight on the dorsal suture, inconspicuously glandular-punctate.—Banks of the Chattahoochee River, Fla.—Sum.

13. *A. tennesseensis* Shuttlw. Stem 1.5–6 m. tall: leaflets 13–35; blades elliptic to elliptic-ovate, 0.5–2 cm. long: racemes mostly clustered, 7–15 cm. long: calyx about 3 mm. long, the two upper lobes rounded, the three lower ones triangular, acute, the middle one a little longer than the others: standard obovate, narrowed into a claw-like base, about 4.5 mm. long, purple: pod 6–8 mm. long, slightly curved, marked with many raised glands.—(TENNESSEE-

INDIGO.)—Banks of streams, various provinces, rarely E of Blue Ridge, Ga. to La., Mo., and N. C.—Spr.

14. *A. fruticosa* L. Stem 1.5–6 m. tall: leaflets 11–25; blades elliptic-ovate, oval, or elliptic, 1.5–4 cm. long: racemes usually clustered, 7–15 cm. long: calyx about 3.5 mm. long, the two upper lobes rounded, the three lower ones triangular, acute, the middle one a little longer than the others: standard round-ovate, emarginate, abruptly narrowed at the base, about 6 mm. long, purple: pod 7–8 mm. long, usually much curved, conspicuously marked with large amber-colored, raised glands.—(INDIGO-BUSH.)—Swamps and banks, especially in calcareous regions, various provinces, Fla. to La., Minn., and Conn.—Sum.

15. *A. croceolanata* Wats. Stem 1–2 m. tall, or rarely more, densely pubescent with orange-colored hairs: leaflets 19–29; blades elliptic to lanceolate-elliptic, 1.8–5 cm. long, rounded at each end, sometimes mucronate at the apex, softly pubescent with yellowish or orange-colored hairs, at least when young: racemes usually 2–4 together, 7–18 cm. long: calyx 3.5–4 cm. long, the two upper lobes short and rounded, the three lower lobes triangular, acute: standard broadly obovate-cuneate, 4–6 mm. long, retuse, blue: pod 7–9 mm. long, more or less curved on the dorsal suture, conspicuously glandular-dotted.—Stream-banks, borders of lakes, hammocks, and low woods, Coastal Plain, Fla. to La. and Ga.—Spr.-sum.—Rarely grows as a small tree in pen. Fla.

16. **CULLEN** Medic. Annual or perennial herbs, sometimes partly woody at the base. Leaflets 1 or 3: blades coarsely toothed, glandular-dotted. Spikes axillary, peduncled. Calyx glandular-punctate: tube campanulate: lobes 5, the lowest lobe the longest. Corolla scarcely longer than the calyx: wings about equalling the standard. Pod short, glandular-warty, the short erect beak persistent.—Three species, natives of the Old World.

1. *C. americanum* (L.) Rydb. Stem 6–12 dm. long, pubescent: leaflets 3; blades suborbicular or rhombic-orbicular in outline, crenate, 1.5–3.5 cm. long: upper calyx-lobes broadly lanceolate; lower lobe conspicuously longer and broader than the lateral ones: corolla mainly white; standard 4–5.5 mm. long, the blade obovate, purple-spotted at the apex: pod elliptic or ovate, about 3 mm. long. [*Psoralea americana* L.]—Waste-places, Coastal Plain, Fla. to Miss. Nat. of Madeira and Spain.—The species name was given through error.

17. **ASPHALTHIUM** Medic. Perennial glandular-dotted herbs. Leaflets 3: blades rather narrow, entire. Spikes head-like, long-peduncled. Calyx obscurely glandular-punctate: tube campanulate: lobes narrow, the lower one longer than the others. Corolla about twice as long as the calyx: wings shorter than the standard. Pods not conspicuously warty, the long flat beak ultimately deciduous.—About 3 species, natives of Eurasia.

1. *A. bituminosum* (L.) Kuntze. Stem 4–11 dm. tall, sometimes decumbent, strigose: leaflets 4–6 cm. long, blades lanceolate, veined, acute: spikes 15–25 cm. long: calyx strigose; lobes subulate-lanceolate, the lower one much longer than the tube: corolla lilac or pink,

and the keel usually purple-tipped; standard 12–17 mm. long, the blade narrowly obovate: pod 12–14 mm. long, lanceolate in outline. [*Psoralea bituminosum* L.]—Waste-places, Coastal Plain, Fla. to La. Nat. of O. W.—Sum.—fall.

**18. ORBEXILUM** Raf. Perennial herbs with rootstocks or fusiform roots, rarely woody at the base. Leaflets 1 or 3 or rarely 5: blades entire. Spikes or racemes long-peduncled. Calyx usually glandular-dotted: tube campanulate: lobes narrow or broad, the lower one often the longest. Corolla longer than the calyx, mostly blue or purple: standard with a broad blade: wings longer than the standard. Pod short, not included, cross-wrinkled, the beak incurved.—Eight species, North American.

Pod obliquely ovoid: plants with rootstocks: blades of the leaflets of the upper leaves ovate to ovate-lanceolate.

Pod subglobose: plants with fusiform roots: blades of the leaflets of the upper leaves linear to linear-lanceolate, lanceolate, or narrowly elliptic.

#### I. MACROPHYLLA.

#### II. VIRGATA.

#### I. MACROPHYLLA

Blades of the leaflets rounded at the base: wing-petals 6–7 mm. long.

Blades of the leaflets cordate or truncate at the base: wing-petals 8–9 mm. long.

#### II. VIRGATA

Leaves mostly 1-foliolate.

Leaves 3-foliolate.

Bracts lanceolate: corolla 7–9 mm. long.

Bracts broadly ovate: corolla 4–6 mm. long.

Calyx obscurely glandular-dotted; upper lobes lanceolate, longer than the tube.

Calyx conspicuously glandular-dotted; upper deltoid, shorter than the tube.

1. *O. Onobrychis*.

2. *O. macrophyllum*.

3. *O. virgatum*.

4. *O. simplex*.

5. *O. pedunculatum*.

6. *O. gracile*.

1. *O. Onobrychis* (Nutt.) Rydb. Plant 9–20 dm. tall: leaflets 3; blades ovate to ovate-lanceolate, 3–12 cm. long: calyx-lobes ovate or deltoid, obtuse, shorter than the tube: standard 3–4 mm. long: ovary glabrous: pod 8–10 mm. long, sharp-beaked, reticulate.—[*Psoralea Onobrychis* Nutt.]—Along streams, interior provinces, Tenn. to Mo. and Ohio.—Sum.

2. *O. macrophyllum* (Rowlee) Rydb. Plant 5–9 dm. tall: leaflets 3; blades broadly ovate, 6–10 cm. long: calyx-lobes lanceolate, acuminate, longer than the tube: standard 8–9 mm. long: ovary pubescent: pod not seen.—[*Psoralea macrophylla* Rowlee]—Woods, Tryon Mt. in the Blue Ridge, N. C.—Spr.—sum.

3. *O. virgatum* (Nutt.) Rydb. Plant 3–7 dm. tall, strigillose: leaflets mostly 1; blade linear, often narrowly so, or the lower ones elliptic or ovate-elliptic, 5–8 cm. long: lateral calyx-lobes lanceolate to elliptic-lanceolate, acuminate; lower lobe slightly longer and narrower: corolla purplish; standard 5–6 mm. long, the blade broadly cuneate: pod about 4 mm. long, much exceeding the calyx, the minute beak lateral. [*Psoralea virgata* Nutt.]—Pinelands, Coastal Plain, Fla. and Ga.—Spr.—sum.

4. *O. simplex* (Nutt.) Rydb. Plant 3–9 dm. tall, softly strigillose: leaflets 3; blades linear-lanceolate to linear or narrowly linear-elliptic, 2–7 cm. long: lateral calyx-lobes ovate, acute; lower lobe longer and broader: corolla purple; standard 7–9 mm. long, the blade broadly cuneate, inequilateral: pod about

4 mm. long, about equalling the calyx, the minute beak eccentric. [*Psoralea simplex* Nutt.]—Moist woods and thickets, Coastal Plain and rarely adj. provinces, Ala. to Tex. and Okla.—Sum.

5. *O. pedunculatum* (Mill.) Rydb. Plant 3–8 dm. tall: leaflets 3; blades lanceolate to narrowly elliptic, or those of the lower ones obovate, oval, elliptic, or elliptic-lanceolate, 3–7 cm. long: calyx strigose-hirsute; upper lobes lanceolate, longer than the tube: corolla purplish; standard 5–7 mm. long, the blade ovate, rounded: pod about 4 mm. long, less than twice as long as the calyx. [*Psoralea pedunculata* Vail]—CONGO-ROOT. SAMPSON'S SNAKEROOT.)—Dry woods, various provinces, Fla. to Tex., Kans., Ind., and Va.—Spr.-sum.

6. *O. gracile* (Chapm.) Rydb. Plant 2–7 dm. tall: leaflets 3; blades lanceolate to elliptic-lanceolate, or some of the lower ones narrowly elliptic or broadened upward, 1.5–5 cm. long: calyx slightly strigillose; upper lobes deltoid or triangular-ovate, shorter than the tube: corolla purplish; standard 4–5 mm. long; blade suborbicular: pod about 4 mm. long, more than twice as long as the calyx. [*Psoralea gracilis* Chapm.]—Pinelands, Coastal Plain, Fla., and Ga.—Spr.-sum.

19. **RHYTIDOMENE** Rydb. Perennial herbs with rootstocks and gland-dotted foliage. Leaflets 5 or 7: blades very slender. Racemes axillary, long-peduncled, lax. Calyx with 5 lobes, all broad except the lower one. Corolla blue or violet, longer than the calyx: standard with a very broad blade: wings slightly longer than the standard. Pod crescent-shaped, exserted, somewhat twisted, obliquely cross-wrinkled, short-beaked.—One species.

1. *R. Lupinellus* (Michx.) Rydb. Plant 2–6 dm. tall, glabrous or obscurely pubescent about the stem-nodes: leaflets 5–7; blades linear-filiform, 3–8 cm. long: upper calyx-lobes deltoid; lower one lanceolate, twice as long as the others: standard 4.5–6 mm. long, the blade suborbicular: pod about 10 mm. long. [*Psoralea Lupinellus* Michx.]—Sandhills and dry pinelands, Coastal Plain, C Fla. to N. C.—Spr.-sum.

20. **PEDIOMELUM** Rydb. Perennial herbs with deep-seated tuberous roots. Leaflets 3–7, digitate: blades glandular-punctate. Spikes or racemes dense, peduncled. Calyx somewhat 2-lipped: tube campanulate, gibbous at the base on the upper side: lobes 5, the lower one the longest: corolla blue or purple, longer than the calyx: standard with a broad blade: wings much shorter than the standard. Pod exserted from the calyx, the body broad, compressed, beaked.—About 22 species, North American.

Stem erect, elongate, with alternate branches: blades of the leaflets broad: standard with a pair of callous spurs at the base of the blade: pod glabrous.

Stem very short, a mere caudex on which the leaves and flower-stalks are clustered: blades of the leaflets narrow: standard without spurs: pod strigose.

1. *P. canescens*.

2. *P. subacaulis*.

1. *P. canescens* (Michx.) Rydb. Plant 3–9 dm. tall, bushy-branched, canescent: leaflets 1 or 3; blades obovate or oval to suborbicular, 1.5–6 cm. long:

upper calyx-lobes lanceolate or elliptic-lanceolate, acuminate; lower lobe longer than the others, narrow, longer than the tube: corolla blue, turning greenish; standard 8–11 mm. long, the blade obovate: pod 9–11 mm. long; body reticulate. [*Psoralea canescens* Michx.]—Dry pineland and oak ridges, Coastal Plain, C Fla. to Ala. and N. C.—Spr.—sum.

2. *P. subacaulis* (T. & G.) Rydb. Plant 1–2 dm. tall, hirsute: leaflets 5–7; blades narrowly elliptic or elliptic-oblancoate to obovate-elliptic, 1.5–3 mm. long: upper calyx-lobes ovate to deltoid, acute; lower lobe dilated, obtuse; all shorter than the tube: corolla blue or purple; standard 12–15 mm. long, the blade narrowly obovate: pod 8–9 mm. long; body not reticulate. [*Psoralea subacaulis* T. & G.]—Rocky limestone soil, cedar glades, in the Interior Low Plateau, Tenn.—Spr.—The plants of *P. canescens* have the habit of species of *Baptisia*; those of *P. subacaulis* that of species of *Lupinus*.

21. **PAROSELA** Cav. Shrubs or herbs. Leaflets numerous, few or 3. Spikes slender or stout. Calyx nearly regular or the lower lobe elongate. Petals purple or yellow, or white. Standard with a broad, often cordate blade. Wings and keel-petals with broad blades auricled on one side. Filaments united nearly to the top. Pod oblique, mostly included in the calyx.—About 150 species, American.

Plant annual: calyx-lobes shorter than the tube.  
Plant perennial: calyx-lobes longer than the tube.

Herb with a tap-root: spikes elongate: blades of the leaflets narrow: calyx plumose at maturity.

Shrub: spikes short and thick: blades of the leaflets broad: calyx not plumose.

1. *P. alopecuroides*.

2. *P. enneandra*.

3. *P. floridana*.

1. *P. alopecuroides* (Willd.) Rydb. Plant 2–10 dm. tall: leaflets 15–41; blades elliptic, cuneate, or oblanceolate, 3–8 mm. long: spikes continuous: bracts ovate to lanceolate: calyx-lobes shorter than the tube: corolla white, tinged with rose or lilac; standard 5–6 mm. long, the blade ovate, shorter than the claw: pod obovoid, 2–2.5 mm. long. [*Dalea alopecuroides* Willd. *P. Dalea* (Fl. SE. U. S.)]—Dry soil, stony hills, sandy bottoms, roadsides, and waste-places, various provinces, Ala. to N. M., S. D., and Ill.—Spr.—fall.

2. *P. enneandra* (Nutt.) Britton. Plant 3–12 dm. tall, glabrous: leaflets 5–11: blades linear-elliptic to cuneate-oblancoate, 5–10 mm. long: bracts suborbicular, copiously glandular: calyx-lobes long-hairy: corolla white; standard 6–7 mm. long, the blade about 4 mm. wide: stamens 9: pod about 3 mm. long, longer than wide. [*Dalea enneandra* Nutt.]—Prairies and stony hills, various provinces, Miss. to N. M., N. D., and La.—Spr.—sum.

3. *P. floridana* Rydb. Plant 8–30 dm. tall, velvety-pubescent: leaflets 13–15: blades oval, elliptic, obovate, or cuneate, 4–8 mm. long, or rarely longer:

bracts ovate, sparingly glandular: calyx-lobes short-hairy: corolla white or yellowish, or pink, turning deeper; standard 4–5 mm. long, the blade about 3 mm. wide: stamens 10: pod about 2 mm. long, as wide as long. [*P. dominicensis* (Fl. SE. U. S.)]—Hammocks and adj. pinelands, Everglade Keys, pen. Fla.—All year.

**22. PETALOSTEMON** Michx. Herbs. Leaflets few or numerous. Spikes dense. Calyx-lobes broad, or broad at the base. Standard with a short broad blade. Filaments united to above the middle. Pod short, oblique, included in the calyx.—About 50 species, North American.—Some of the species are very showy when in flower and are frequently to be seen in gardens.

Calyx glabrous, or the lobes merely ciliate.

Cauline leaves with 3–11 leaflets.

Standard-blade elliptic to orbicular: calyx not strongly 10-ribbed.

Standard-blade cordate or reniform: calyx strongly 10-ribbed.

Cauline leaves with 11–37 leaflets.

Calyx densely pubescent, at least on the angles and the lobes.

I. CARNEI.

II. CANDIDI.

III. FOLIOSI.

IV. PURPUREI.

#### I. CARNEI

Spikes ellipsoid or cylindric: bracts nearly or quite as long as the calyx.

Corolla white.

Stem and elongate branches decumbent: leaves remote, not clustered, shorter than the internodes: spikes inconspicuously bracted, the bracts about equalling the calyces.

Stem and branches erect or ascending: leaves more numerous, usually equalling the internodes, with clustered secondary ones in their axils: spikes conspicuously bracted, the bracts exceeding the calyces.

Corolla rose or deep-pink.

Spikes globose: bracts much shorter than the calyx.

1. *P. gracilis*.

2. *P. albidus*.

3. *P. carneus*.

4. *P. Feayi*.

#### II. CANDIDI

Conspicuously leafy plant, with narrowly cylindric spikes, the main one often elongate, the bracts with dilated bodies and slender tips.

5. *P. candidus*.

#### III. FOLIOSI

Copiously leafy plant, with stout cylindric spikes, the bracts slightly dilated above the stipe-like base and terminated by caudate tips.

6. *P. foliosus*.

#### IV. PURPUREI

Calyx appressed-pubescent: spikes compact: bracts with narrow bases and pubescent acuminate tips.

7. *P. purpureus*.

Calyx loosely pubescent: spikes not compact: bracts with broad bases and caudate pubescent tips.

8. *P. Gattereri*.

1. *P. gracilis* Nutt. Plant 3–6 dm. tall: leaflets 5–7; blades linear or linear-elliptic, or rarely elliptic-oblongate, 6–12 mm. long: calyx-lobes acute, about  $\frac{1}{2}$  as long as the tube: standard about 3 mm. long; blade obovate to cuneate: gynoeceum glabrous or nearly so: pod less than 2 mm. long, glabrous.—Sandy pinelands, Coastal Plain, Fla. to Miss.—Spr.—sum.

2. *P. albidus* (T. & G.) Small. Plant 6–10 dm. tall: leaflets 5–7; blades elliptic to oblongate, 4–8 mm. long, acute: calyx-lobes acute, about  $\frac{1}{2}$  as long as the tube: standard about 4 mm. long; blade ovate to orbicular-ovate, notched: gynoeceum pubescent: pod over 2 mm. long, pubescent.—Dry sand and pinelands, Coastal Plain, Fla., Ala. and Ga.—Sum.

3. *P. carneus* Michx. Plant 3–10 dm. tall: leaflets 5–9; blades linear, linear-elliptic, or linear-oblancoate, 5–10 mm. long: calyx 3–3.5 mm. long: corolla rose or deep-pink: standard about 4 mm. long; blade oval or orbicular-ovate: gynoeceium pubescent: pod curved, about 3 mm. long, exserted beyond the calyx-tube, pubescent at the apex. [*P. roseum* Nutt.]—Pinelands, scrub, and sand-dunes, Coastal Plain, Fla., Ala., and Ga.—Spr.-fall.

4. *P. Feayi* Chapm. Plant 2–5 dm. tall: leaflets mostly 3–11; blades linear, but strongly involute, 8–18 mm. long: calyx 3.5–4 mm. long: corolla deep-pink or lavender: standard about 4 mm. long; blade broadly ovate: gynoeceium glabrous: pod straight, about 3 mm. long, exserted beyond the calyx-lobes, glabrous.—Dry pinelands and scrub, Coastal Plain, C pen. Fla. and S Ga.—Spr.-sum.

5. *P. candidus* (Willd.) Michx. Plant 3–7 dm. tall: leaflets 7–9; blades linear, elliptic, oblanceolate, or obovate-oblancoate, 9–30 mm. long: lower calyx-lobes more than  $\frac{1}{2}$  as long as the tube: standard 4–5 mm. long; blade sub-orbicular or orbicular-reniform, cordate at the base: gynoeceium sparingly pubescent: pod curved, 2–2.5 mm. long, sparingly pubescent.—(WHITE-PRAIRIE-CLOVER. WHITE TASSELS.)—Dry soil, prairies, various provinces, Miss. to Tex., Sask., and Ind.—Sum.

6. *P. foliosus* A. Gray. Plant 3–9 dm. tall: leaflets 13–31; blades elliptic to elliptic-oblancoate, 3–11 mm. long: calyx about 4 mm. long; lobes lanceolate or triangular-lanceolate, acute: corolla rose-purple: standard 4.5–5.5 mm. long; blade suborbicular or ovate-orbicular: gynoeceium glabrous: pod straight, 2 mm. long, turgid on the upper side, glabrous.—River banks, Interior Low Plateau, Tenn. to Ill.—Sum.

7. *P. purpureus* (Vent.) Rydb. Plant 3–9 dm. tall: leaflets 3–5; blades narrowly linear or slightly broadened upward, 8–20 mm. long: calyx about 4 mm. long; lobes triangular to lanceolate, slightly acuminate: corolla violet or rose-purple: standard 5–6 mm. long; blade orbicular-reniform: gynoeceium minutely pubescent: pod nearly as wide as long, 2–2.5 mm. long, minutely pubescent.—(PURPLE-TASSELS.)—Prairies, plains, and hills, various provinces, Ala. to N. M., Sask., and Tenn.—Sum.

8. *P. Gattingeri* Heller. Plant 2–5 dm. tall: leaflets 5–7; blades narrowly linear to linear-elliptic, 9–20 mm. long: calyx nearly 4 mm. long, villous-pilose; broader lobes triangular, acute, narrower ones lanceolate: corolla rose-purple; blade of the standard orbicular-reniform: gynoeceium coarsely pubescent: pod ovate, about 2.5 mm. long, pilose. [*P. decumbens* (Chapm. Fl.)]—Rocky calcareous prairies, cedar-glades, and grassy hillsides, Interior Low Plateau, Ala. and Tenn.—Spr.-sum.

23. **KUHNISTERA** Lam. Perennial herbs. Leaflets few or several. Spikes mostly depressed-corymbose, resembling heads of *Carduaceae*. Flowers white. Calyx-lobes setaceous. Standard with a narrow tapering blade. Filaments united to below the middle. Pod as in *Petalostemon*.—Three species.—Sum.-fall.—The fruiting heads, persistent into the winter, are gray as a result of the copiously pubescent calyx-lobes.

Blades of the leaflets linear-clavate to filiform, acute: involucre 6–7 mm. high.

Blades of the leaflets elliptic to elliptic-oblancoate or obovate, or sometimes spatulate, obtuse: involucre narrowly 9–11 mm. high.

Inner bracts of the involucre elliptic or elliptic-oblancoate, mucronate, copiously ciliate.

Inner bracts of the involucre lanceolate, acuminate, sparingly ciliate.

1. *K. pinnata*.

2. *K. truncata*.

3. *K. adenopoda*.

1. *K. pinnata* (Walt.) Kuntz. Plant 3–12 dm. tall: leaflets 3–7; blades linear-clavate to filiform, finely glandular-dotted, 5–12 mm. long: spikes usually several or many: bracts ciliate, the inner oval to elliptic, 5–6 mm. long: calyx-lobes filiform-setaceous, much longer than the tube, plumose: standard 6–8 mm. long; blade lanceolate: pod about 2 mm. long. [*Petalostemon corymbosus* Michx. *P. corymbosus trifoliatum* Chapm.]—(SUMMER-FAREWELL.)—Dry pinelands and sandhills, Coastal Plain, Fla. to Miss. and N. C.

2. *K. truncata* Small. Plant 7–10 dm. tall: leaflets mostly 5–7; blades narrowly elliptic to elliptic-obovate or obovate, coarsely glandular-dotted, 3–6 mm. long: heads few: involucre 10–11 mm. thick; bracts copiously ciliate, the inner elliptic or elliptic-oblongate, 7–8 mm. long, mucronate: standard blade elliptic-cuneate: pod 2.5 mm. long.—Pinelands and scrub, E. pen. Fla.

3. *K. adenopoda* (B. L. Robinson) Rydb. Plant 5–10 dm. tall: leaflets mostly 5; blades elliptic to obovate, 4–10 mm. long, coarsely glandular-dotted, 4–10 mm. long: heads few: involucre 9–10 mm. thick; bracts sparingly ciliate, the inner lanceolate, 7–8 mm. long, acuminate: standard-blade elliptic: pod 2.5 mm. long.—Pinelands, Tampa Bay region, Fla.

24. **INDIGOFERA** L. Herbs or partly-woody plants. Leaflets several to many or rarely 3, or rarely solitary. Flowers in spikes or racemes. Calyx-lobes nearly equal, shorter than the tube, or elongate. Corolla often pink or salmon-pink: standard broad, scarcely clawed: wings with blades dilated at the apex and auricled at the base, short-clawed: keel-petals scimitar-shaped, gibbous or spurred on the side, clawless.—About 275 species, of temperate and tropical regions.—INDIGO-PLANTS.

Plant perennial.

Calyx less than half the length of the corolla; lobes lanceolate to deltoid, not exceeding the tube in length.

Pod ellipsoid or ovoid, turgid: seeds 2 or 3.

Pod linear, curved or straight: seeds 3–12.

Calyx more than half the length of the corolla: lobes subulate or subulate-tipped, twice as long as the tube or more.

Leaflets manifestly petioluled; blades rounded at the base.

Leaflets subsessile; blades acute at the base.

Plant annual.

#### I. DISPERMAE

Tall slenderly branched herb with numerous thin leaflets and lax racemes.

#### II. TINCTORIAE

Standard mostly between 4 and 5 mm. long: pod stout-linear, strongly curved, less than 2 cm. long.

Standard mostly between 5 and 6 mm. long: pod slender-linear, straight or slightly curved, over 2 cm. long.

#### III. MUCRONATAE

Diffuse plant, the several stems spreading from the tap root: racemes elongate; pods deflexed.

#### IV. LEPTOSEPALAE

Racemes many-flowered: keel 9–11 mm. long: pod with a long, slender beak.

I. DISPERMAE.

II. TINCTORIAE.

III. MUCRONATAE.

IV. LEPTOSEPALAE.

V. PARVIFLORAE.

1. *I. caroliniana*.

2. *I. suffruticosa*.

3. *I. tinctoria*.

4. *I. keyensis*.

5. *I. leptosepala*.

Racemes few-flowered: keel 4-6 mm. long: pod with a short, stout beak.

6. *I. miniata*.

#### V. PARVIFLORAE

Herb with virgate branches, and small cluster-like axillary racemes: pods deflexed, curved at the beak.

7. *I. parviflora*.

1. *I. caroliniana* Mill. Stem erect, 0.5-2 m. tall: leaflets 9-15; blades elliptic, oval, cuneate, obovate, or oblanceolate: calyx 1-1.5 mm. long; lobes deltoid: corolla yellowish-brown; standard 5-6.5 mm. long; wing usually shorter: pod 5-10 mm. long.—Dry sandy pinelands and scrub, Coastal Plain, Fla. to La. and N. C.—Spr.-fall.

2. *I. suffruticosa* Mill. Stem erect 0.5-2 m. tall: leaflets 7-15; blades elliptic, oblanceolate, or obovate: calyx 1.5-2 mm. long; lobes deltoid to triangular-lanceolate: corolla orange; standard 4-5 mm. long; wing often slightly longer: pod linear, 1-1.5 cm. long. [*I. Anil* L.]—Pinelands, cult.-grounds, and hammocks, Coastal Plain, Fla. to Tex. and N. C. Nat. of Asia.—(*W. I., S. A.*)—Sum.-fall, or all year.

3. *I. tinctoria* L. Stem erect, 1-2 m. tall: leaflets 7-15; blades elliptic, oval, or obovate: calyx 1.5-2 mm. long; lobes deltoid to triangular-lanceolate: corolla reddish-yellow; standard 5-6 mm. long; wings about the same length: pod linear, 2.5-3 cm. long.—(INDIGO.)—Cult. grounds and waste-places, various provinces, Fla. to La. and N. C. Nat. of S Asia.—Extensively cult. by the early colonists, in the Carolinas, Ga., and Fla., for making indigo.—(*W. I.*)—Sum.-fall or all year.

4. *I. keyensis* Small. Stem decumbent, 3-9 dm. long: leaflets 7-9; blades elliptic-obovate to cuneate: calyx 2-3 mm. long; lobes subulate: corolla reddish; standard 3-4 mm. long, very broad; wings mostly 3-4 mm. long: pod linear, 3-3.5 m. long. [*I. subulata* (Fl. SE. U. S.)]—Hammocks, upper Florida Keys.—All year.

5. *I. leptosepala* Nutt. Stem decumbent, 3-10 dm. long: leaflets 7-9; blades elliptic-obovate to cuneate: calyx 4.5-5 mm. long; lobes subulate: corolla pink; standard 8-10 mm. long; wings mostly 7-8 mm. long: pod linear, 3-3.5 m. long.—Dry soil, prairies and plains, Coastal Plain and adj. provinces, N Fla. to Tex., Kans., and Ga.—(*Mex.*)—Sum.-fall.

6. *I. miniata* Ortega. Stems several or many from a tough root, prostrate: leaflets 5-9; blades linear-elliptic to narrowly oblanceolate: calyx 3-5 mm. long; lobes subulate or lanceolate-subulate: corolla red; standard 7-8 mm. long or rarely smaller; wings usually longer: pod elliptic-linear or linear, 1-2 cm. long.—Pinelands and sandy places, Everglade Keys, pen. Fla., and Florida Keys. Introd. into Coastal Plain of other Gulf States.—(*W. I., Mex.*)—All year.

7. *I. parviflora* Heyne. Annual: stem 3-12 dm. tall: leaflets 7-9; blades linear to narrowly oblanceolate, 1-2 cm. long, acute at both ends: calyx 2-2.5 mm. long; lobes subulate: corolla lilac; standard 3-4 mm. long; wings about as long: pod narrowly linear, 2.5-4 cm. long, slightly curved at the abruptly acute beak.—Waste-places and ballast, Coastal Plain, Ala. Nat. of E. I.—Spr.-fall.

**25. KRAUNHIA** Raf. Woody vines. Leaflets several: blades entire. Flowers borne in drooping racemes or panicles. Calyx 2-lipped. Corolla blue, violet, purple, or white: standard clawed, the broad blade with 2 appendages at the base. Wings and keel-petals with long slender auricles at the base and slender claws. Pod turgid, torulose. [*Bradleia* Adans. *Wisteria* Nutt.].—About 5 species, North American and Asiatic.—Spr.—WISTERIAS.

Leaflets 4-7 pairs: calyx tubular-campanulate: blade of the wing-petals with a long slender spur: flowers on short stout pedicels: ovary glabrous.

Calyx 8-10 mm. long; lower lobe shorter than the tube: lower spur of the wings much shorter than the claw. 1. *K. frutescens*.

Calyx 11-14 mm. long; lower lobe as long as the tube or longer: lower spur of the wings about as long as the claw. 2. *K. macrostachya*.

Leaflets 7-9 pairs: calyx open campanulate: blade of the wing-petals with a short blunt spur: flowers on long slender pedicels: ovary pubescent. 3. *K. floribunda*.

1. *K. frutescens* (L.) Britton. Stem twining: leaves 1-2.5 dm. long; leaflets 1.5-6 cm. long, the blades mainly elliptic or narrowly ovate, acute or obtuse at the base: racemes stout, 4-12 cm. long: standard 15-18 mm. long: pod 5-10 cm. long, glabrous. [*W. frutescens* DC. *Bradleia frutescens* Britton]—(AMERICAN-WISTERIA).—Banks of creeks and rivers, and swampy borders of woods, Coastal Plain and rarely adj. provinces, Fla. to Ala. and Va.—The contrast in color of the early foliage and the purple flower-clusters is a pigimentary perfection even Nature rarely attains.

2. *K. macrostachya* (T. & G.) Small. Larger than *K. frutescens* throughout: leaves 2-3 dm. long; leaflets 3-7 cm. long, the blades ovate, often broadly so, rounded or cordate at the base: racemes slender, 2-3 dm. long: standard 19-23 mm. long: pod 7-14 cm. long, glabrous. [*Bradleia macrostachya* Small]—(KENTUCKY-WISTERIA).—Swamps and low woods, Coastal Plain and occasionally adj. provinces, La. to Tex., Mo., and Tenn. (or Ind.?)

3. *K. floribunda* (Willd.) Taub. Stem becoming very large: leaves 2-4 dm. long; leaflets 5-9 cm. long, the blades elliptic to elliptic-ovate, acuminate: racemes elongate and lax: lower calyx-lobes triangular: standard 15-20 mm. wide: pod mostly 6-10 cm. long, pubescent.—(JAPANESE-WISTERIA. CHINESE-LA. and S. C. Nat. of E Asia and cult. WISTERIA).—Woods, roadsides, thickets, and abandoned homesteads, Fla. to

**26. ROBINIA** L. Shrubs or trees, often with stipular spines. Leaflets several, thin. Flowers racemose. Calyx markedly 2-lipped, the 2 upper lobes wholly or partially united. Corolla pink or purplish, or white: standard glabrous: blades of the wings auricled on one or both sides: keel-petals with a rounded auricle at the base of the blade. Pod flat, sometimes bristly or prickly.—About 20 species, North American.—LOCUSTS.

Corolla white: racemes drooping: pod smooth and glabrous, broadly wing-margined on the seed-bearing suture: calyx-lobes broad. I. PSEUDO-ACACIAE.

Corolla pink, rose-violet, or rose-purple: racemes erect or spreading: pod prickly, hispid or hirsute: calyx-lobes narrow.

Racemes with small narrow caducous bracts: branches and peduncles with rather long bristles bearing inconspicuous glands, or not armed with bristles.

Racemes with large conspicuous caudate-acuminate bracts: branches and peduncles densely beset with sessile or short-stalked conspicuous glands.

#### I. PSEUDO-ACACIAE

Tree with rough bark and thorn-like stipules.

#### II. HISPIDAE

Branches not bristly: peduncles sometimes with short hairs.

Blades of the leaflets oval or elliptic to elliptic-ovate.

Branches, peduncles, and lower leaflet-surfaces short-villous, and somewhat canescent when young: peduncles not glandular-hispid.

Branches, peduncles, and lower leaflet-surfaces finely puberulent when young, glabrate in age: peduncles somewhat glandular-hispid.

Shrub over 1 m. tall: calyx-lobes not longer than the tube.

Shrub less than 1 m. tall: calyx-lobes longer than the tube.

Blades of the leaflets lanceolate or elliptic-lanceolate.

Branches and peduncles bristly hispid.

Branches with rather few short glandular bristles.

Branches usually copiously glandular-bristly with long hairs.

Branch, leaf-rachis, and peduncle rather densely or copiously pubescent.

Blades of the leaflets broadly oval, rounded at the apex.

Blades of the leaflets ovate or elliptic-ovate, acute or obtuse.

Blades of the leaflets permanently villous beneath.

Blades of the leaflets glabrate on both sides or sparingly pubescent beneath.

Branch, leaf-rachis, and peduncle merely hispid or with only a few scattered hairs.

Blades of the leaflets oval, elliptic-oval, or sub-orbicular, rounded at the apex.

Branches with bristles 1-2 mm. long: stipular spines usually present: pod hispid.

Branches with bristles 3-5 mm. long: stipular spines usually wanting: pod glandular.

Blades of the leaflets lanceolate or ovate, acute.

#### III. VISCOSAE

Blades of the leaflets puberulent or glabrate: branches and peduncles with subsessile glands, not densely puberulent.

Blades of the leaflets densely villous beneath: branches and peduncles with stalked glands and also densely puberulent.

#### II. HISPIDAE.

#### III. VISCOSAE.

11. *R. hispida*.

12. *R. fertilis*.

13. *R. viscosa*.

14. *R. Hartwigii*.

1. *R. Pseudo-Acacia* L. Tree becoming 30 m. tall, with furrowed bark: stipular-spines subulate, often stout; leaflets 9-19; blades elliptic, oval, or ovate, 2.5-5 cm. long, sparingly pubescent or glabrous in age: racemes numerous, 1-2 dm. long, slender-peduncled: flowers very fragrant: calyx finely pubescent; lateral lobes deltoid or triangular, or the lowest one lanceolate, acute: standard 1.5-2 cm. wide: pods broadly linear, 5-11 cm. long, somewhat veiny when dry.—(BLACK-LOCUST. COMMON-LOCUST. FALSE-ACACIA. LOCUST-TREE. SWEET-ROBIN.)—Rich woods and river-banks, various provinces, Ga. to La., Okla., and Pa., and escaped from cult. as far north as S Can.—Spr.—The wood is hard and very durable in contact with the soil.—Although naturally of a moist climate, this is used as a shade tree in desert regions.

2. **R. Elliottii** (Chapm.) Ashe. Shrub up to 2 m. tall, with virgate stem and short branches above: stipular-spines stout: leaflets 9-15; blades thin, oval to elliptic, 1.5-5 cm. long, villous-canescens beneath when young: racemes 5-10 cm. long: calyx villous-canescens and often with a few bristles; lateral lobes deltoid and subulate-tipped, shorter than the tube: standard-blade less than 2 cm. wide: pod linear, hispid. [*R. hispida Elliottii* Chapm.].—Pinelands and sandhills, Coastal Plain and adj. Piedmont, Ga. to Ala. and N. C.; also in Md.—Late spr.
3. **R. Boyntonii** Ashe. Shrub up to 2 m. tall, with ascending branches: stipular-spines short, stout: leaflets 9-13; blades elliptic to elliptic-ovate, mostly 2-4 cm. long: racemes 7-9 cm. long: calyx with few short-stalked glands; lateral lobes ovate, short-acuminate, about as long as the tube: standard-blade about 2 cm. wide, slender-clawed: pod glandular-hispid.—Woods, Blue Ridge and to Appalachian Plateau, Ga. and Ala. to Tenn. and N. C.—Spr.—Hybridizes with *R. Pseudo-Acacia* = *R. albicans*.
4. **R. nana** (Ell.) Spach. Shrub 2-3 dm. tall, with slightly branched stems: stipular-spines short or obsolete: leaflets 7-11, or rarely 13; blades elliptic or nearly so, 3-4 cm. long: racemes nodding, few-flowered: calyx pilose or sparingly hispid; lateral lobes narrowly triangular-lanceolate, caudate-acuminate, fully as long as the tube: standard-blade fully 2.5 cm. wide.—Sandy ridges and banks, Coastal Plain and Piedmont, S. C. and N. C.—Spr.
5. **R. Kelseyi** Cowell. Shrub 1-3 m. tall, with spreading stems: stipular-spines subulate: leaflets 9-13; blades narrowly elliptic to lanceolate or elliptic-lanceolate, 2-4 cm. long, glabrous: racemes 5-8-flowered: calyx with few rather short-stalked glands; lateral lobes deltoid and subulate-tipped, longer than the tube: standard-blade less than 1.5 cm. wide: pods broadly linear or linear-elliptic, 4-6 cm. long, very densely glandular bristly.—Woods, Blue Ridge, N. C.—Spr.
6. **R. longiloba** Ashe. Shrub 4-6 dm. tall, the branches pubescent with curved hairs and short-stalked glands: stipular-spines short or obsolete: leaflets 7-17; blades oval, ovate, or elliptic, 3.5-5 cm. long, silky-canescens beneath: racemes 9-21-flowered: calyx with long slender tips, much longer than the tube: standard-blade fully 2.5 cm. wide: pods not seen.—Woods, Blue Ridge and Piedmont, S. C. and N. C.—Spr.—Suspected of being a hybrid between *R. Boyntonii* and *R. grandiflora*.
7. **R. grandiflora** Ashe. Shrub 1-5 dm. tall, the branches appressed-pubescent and glandular-hispid: stipular-spines rarely developed: leaflets 7-17; blades oval, 2-5 cm. long, glabrous at maturity or somewhat silky beneath: racemes 5-18-flowered: calyx grayish-puberulent or short-villous, and glandular-hispid; lateral lobes ovate and with a long filiform tip, much longer than the tube: standard-blade about 3 cm. wide: pod narrowly ellipsoid, 6-8 cm. long, hispid with short gland-tipped hairs.—Woods, Blue Ridge to Appalachian Plateau, Ga. to Ala. and N. C.—Spr.
8. **R. speciosa** Ashe. Shrub mostly 1-2 m. tall, the branches densely puberulent, sparingly bristly: spines wanting: leaflets mostly 9-13; blades ovate to elliptic-ovate, 3-5 cm. long, villous beneath: racemes 5-8-flowered: calyx mainly villous-puberulent; lateral lobes ovate-acuminate, shorter than the tube: standard-blade fully 2 cm. wide: pods not seen.—Woods, Blue Ridge, N. C.—Spr.
9. **R. pallida** Ashe. Shrub up to 2 m. tall, the branches densely puberulent or glabrate in age, sparingly bristly: leaflets 9-15; blades ovate or elliptic-ovate, 4-5.5 cm. long, pale and glabrous or sparingly pubescent beneath: racemes 5-9-flowered: calyx grayish-pubescent and sparingly bristly; lateral lobes broad and abruptly acuminate: standard-blade about 1.5 cm. wide: pod not seen.—Blue Ridge, N. C.—Spr.

10. *R. pedunculata* Ashe. Shrub up to 4 m. tall, the branches puberulent and with short glandular bristles: stipular-spines often present, subulate, about 1 cm. long: leaflets 7-13; blades oval, 3-4.5 cm. long, glabrous or nearly so; raceme 7-12-flowered, glandular-hispid: calyx pubescent and glandular; lateral lobes ovate and abruptly acuminate, about as long as the tube: standard-blade about 2.5 cm. wide: pod ellipsoid, 3-5 cm. long, densely hispid.—Woods, Blue Ridge, Tenn.—Spr.—Suspected of being a hybrid between *R. hispida* and *R. Boyntonii*.

11. *R. hispida* L. Shrub up to 2 m. tall with erect or diffuse usually densely hispid and somewhat pilose branches: stipular-spines short or wanting: leaflets 7-13 or rarely 15; blades suborbicular, ovate, or elliptic, mostly 2-5 cm. long, glabrous or with scattered hairs on the veins beneath: racemes 3-5-flowered: calyx hispid with numerous long-stalked glands; lateral lobes broadly lanceolate, acuminate, about as long as the tube or longer: standard-blade nearly 2.5 cm. wide: pod 5-8 cm. long, densely hispid.—(MOSS-LOCUST. ROSE-ACACIA.)—Dry slopes, various provinces N of Coastal Plain, Ga. to Ala., Ill., and Va.; escaped from cult. N.—Spr.—early sum.—Hybridizes with *R. Pseudo-Acacia* =  $\times$  *R. Margaretta*.

12. *R. fertilis* Ashe. Shrub up to 1 m. tall, the branches puberulent and more or less hispid: stipular-spines slender, or wanting: leaflets 7-19; blades lanceolate to ovate, 1.5-4 cm. long, glabrous, or sparingly pubescent beneath: racemes 3-5-flowered: calyx more or less hispid; lateral lobes deltoid-lanceolate, acuminate, about as long as the tube: standard-blade nearly 3 cm. wide: pod linear-ellipsoid, 5-6 cm. long, densely glandular-hispid.—Woods, Blue Ridge, Ga. and N. C.—Spr.

13. *R. viscosa* Vent. Shrub or small tree with spreading branches: stipular-spines short-subulate or wanting: leaflets 11-27; blades elliptic, oval, or narrowly ovate, 2.5-5 cm. long: racemes 6-15-flowered: calyx copiously fine-pubescent and usually with few stalked glands; lateral lobes triangular-lanceolate, acuminate, about as long as the tube: standard-blade 1.5-2 cm. wide: pod linear, 4-8 cm. long, copiously glandular-bristly.—(CLAMMY-LOCUST. RED-LOCUST. ROSE-ROBIN.)—Rocky woods, Blue Ridge to Appalachian Plateau, Ala. to N. C. and Pa.; escaped from cult. in NE N. A.—Spr.—Hybrids between this and *R. Pseudo-Acacia* appear as two forms,  $\times$  *R. dubia* and  $\times$  *R. bella-rosea*.

14. *R. Hartwigii* Koehne. Shrub up to 3 m. tall, the branches densely puberulent and with short-stalked glands: stipular-spines small or rarely 2-3.5 cm. long, leaflets 13-23; blades elliptic, oval, or ovate, 1.5-5 cm. long, villous on both sides or glabrous above: racemes dense: calyx villous-puberulent; lateral lobes triangular, acute, about as long as the tube: standard-blade over 2 cm. wide: pod linear 6-11 cm. long, densely glandular-hispid.—Woods, Blue Ridge and Piedmont, Ga. and Ala. to N. C.—Spr.

27. **SESBAN** Adans. Annual or perennial herbs, or shrubs. Leaflets numerous. Racemes several-flowered. Calyx slightly 2-lipped, the 5 prominent lobes nearly equal. Corolla yellow, sometimes with purple dots: standard with a suborbicular blade: wings nearly straight, short-clawed, with an angle or slender basal auricle curved: blades of the keel-petals angled or auricled at the base, long-clawed. Pod greatly elongate, curved.—About 15 species, natives of warm and tropical regions.—Sum.—fall.

Standard 2 cm. wide or more: wing-petals with a slender deflexed spur at the base of the blade. 1. *S. Emerus*.

Standard 1.5 cm. wide or less: wing-petals with a small blunt angle at the base of the blade. 2. *S. exaltatus*.

1. *S. Emerus* (Aubl.) Britton & Wilson. Plant 1-5 m. tall: leaves 7-18 cm. long; leaflets 20-50, the blades elliptic, elliptic-cuneate, or broadly linear, 1-3

cm. long, somewhat glaucous beneath: calyx 6–7 mm. long, the lobes acuminate: standard 2 cm. long or more: keel about 2 cm. long, with a reflexed auricle at the base of the nearly straight blades: pod 1.5–2 dm. long. [*Sesbania macrocarpa* Muhl.]—Moist soil, waste-places, and hammocks, Fla.—(W. I., Mex., C. A.)—Original natural range not known. One of our very vigorous annuals. The woody stems with the naked branches supporting dangling pods persist through the winter.

2. *S. exaltata* (Raf.) Rydb. Plant 1–4 m. tall: leaves 12–30 cm. long; leaflets 30–70, the blades linear-elliptic to linear, 1–2.5 cm. long, often glaucescent beneath: calyx nearly similar to that of *S. Emerus*, but the lobes rather more subulate-tipped: standard 1.5 cm. long or less: keel 11–13 mm. long, with an angular lobe at the base of the strongly curved blades: pod rather longer than that of the preceding species.—Low grounds, stream-banks, and fields, Coastal Plain and adj. provinces, Miss. to Tex., Okla., and Mo.

28. *AGATI* Adans. Trees or shrubs, but short-lived. Leaflets numerous. Racemes 2–4 flowered. Calyx slightly 2-lipped, but usually with obscure, very broad lobes. Corolla large, pinkish or red: standard with an oblong or ovate blade: wings not auricled: keel-petals merely angular at the base of the blade. Pod greatly elongate, straight or nearly so.—One species.

1. *A. grandiflora* (L.) Desv. Shrub or small tree: leaves 1–3 dm. long; leaflets numerous, the blades elliptic to linear-elliptic, 2–4 cm. long: calyx 2–2.5 cm. long: standard 6–10 cm. long, the blade ovate: pod elongate-linear, 2–4 dm. long.—(AUSTRALIAN CORKWOOD-TREE.)—Hammocks and cult. grounds, Key West, Fla. Native of East Indies.—(W. I.)—Spr.-sum.

29. *GLOTTIDIUM* Desv. Herbs, but often woody-stemmed. Leaflets numerous. Racemes several-flowered. Calyx slightly 2-lipped, the 5 lobes acute. Corolla yellow, reddish, or purple: standard with a reniform blade: wings and keel-petals more or less angular at the base of the blade. Pod short, wingless.—One species.

1. *G. vesicarium* (Jacq.) Harper. Plant 1–4 m. tall, annual but rather woody: leaflets 24–52; blades elliptic, 1.5–4 cm. long, mucronate: calyx-lobes shorter than the tube: corolla yellow (or black-purple in *G. vesicarium atrorubrum*): blade of the standard reniform: pod ellipsoid, 5–8 cm. long, acuminate at both ends. [*Sesbania vesicaria* DC.]—(BLADDER-POD.)—Rich damp

soil and waste-places, Coastal Plain, Fla. to Tex. and N. C.—Sum.—Evidently introduced.—(*W. I.*)—A very vigorous annual. The firm woody stems, sometimes in large colonies, with the bladdery pods dangling from the branches, usually persist throughout the winter.

**30. DAUBENTONIA** DC. Shrubs or trees. Leaflets numerous. Racemes several-flowered. Calyx minutely 5-lobed and scarcely 2-lipped. Corolla yellow to crimson and vermilion: standard with an orbicular-reniform blade: wings and keel-petals not auricled. Pod relatively long, the body winged.—About 5 species, mostly American.

Calyx-lobes acute; corolla yellow: keel-petals with the blades abruptly narrowed into the claw: pod long-stipitate. 1. *D. Drummondii*.

Calyx-lobes, except the lower one, obtuse: corolla deep-rose to crimson: keel-petals with the blades tapering into the claw: pod short-stipitate. 2. *D. punicea*.

**1. D. Drummondii** Rydb. Shrub: leaflets 12-60; blades narrowly elliptic to linear-elliptic, 1-2.5 cm. long, mucronate: calyx-lobes acute: racemes loosely flowered, rather slender: standard-blade 15-18 mm. wide; wings and keel-petals 15-18 mm. long: pod 6-9 cm. long, the stipe 1-1.5 cm. long.—(*RATTLE-BUSH. RATTLE-BOX.*)—Sandy waste-places and cult. grounds, Coastal Plain, Fla. to Tex.—(*Mex.*)—Spr.-fall.

**2. D. punicea** (Cav.) DC. Shrub or small tree: leaflets 12-40: blades linear-elliptic, rounded or truncate at the apex and mucronulate: calyx-lobes broad, except the lower one, obtuse: racemes densely flowered, stout: standard-blade about 2.5 cm. wide; wings and keel-petals 20-22 mm. long: pod 6-8 cm. long, the stipe less than 1 cm. long. [*Sesbania punicea* Benth.]—(*PURPLE-SESBAN.*)—Waste-places, roadsides, and fence-rows, Coastal Plain, Fla. to La. Nat. of trop. Am.—(*S. A.*)—Spr.-fall.

**31. CRACCA** L. Perennial long-rooted herbs or woody plants. Leaflets several or many, thick. Flowers in racemes or spike-like panicles. Calyx somewhat 2-lipped, the upper lobes usually shorter than the others and partially united. Corolla pink, purple, or red, or white: standard pubescent: wings auricled on one side at the base of the blade: keel-petals usually with an angular auricle. Pod flat or flattish. [*Tephrosia* Pers.]—*HOARY-PEAS*. About 130 species, natives of warm and tropical regions.—Sum. or spr.-fall S.

Stem monopodial: panicles terminal and axillary, not opposite the leaves.

Leaflets 11-37; blades of an elliptic type.

Leaflets 3-11; blades of an obovate type.

Stem sympodial: panicles theoretically terminal, but apparently opposite the leaves, by the development of a branch in the uppermost axil, which elongates and produces another terminal panicle and so on.

Petioles very short, 3 mm. long or less.

Petioles longer, 5 mm. long or more.

Corolla more than 12 mm. long.

Corolla less than 12 mm. long.

I. VIRGINIANAE.

II. RUEGLIANAE.

III. CHRYSOPHYLLAE.

IV. SPICATAE.

V. PURPUREAE.

## I. VIRGINIANAE

Calyx-lobes lanceolate: foliage pubescent with lax more or less spreading hairs.

Calyx-lobes ovate to ovate-lanceolate: foliage silky or strigose, the hairs strictly appressed.

Calyx-lobes ovate, the upper ones shorter than the tube: blades of the leaflets broadly elliptic or obovate.

Calyx-lobes ovate-lanceolate, the upper ones longer than the tube: blades of the leaflets narrowly elliptic.

1. *C. virginiana*. ✓

2. *C. latidens*.

3. *C. Mohrri*.

## II. RUEGLIANAE

Stems clustered on top of a stout woody root: foliage copiously and conspicuously pubescent.

4. *C. Rugelii*.

## III. CHRYSOPHYLLAE

Stem loosely pubescent.

Panicles shorter than the leaves.

Panicles longer than the leaves.

Stem finely appressed-pubescent.

Corolla fully 1 cm. long: pod 3.5–4.5 cm. long: blades of the leaflets obovate.

Corolla less than 1 cm. long: pod 2 cm. long: blades of the leaflets elliptic.

4. *C. Rugelii*.

5. *C. chrysophylla*.

6. *C. Carpenteri*.

7. *C. Chapmanii*.

## IV. SPICATAE

Panicles few-flowered, with 1 or 2 flowers at each node and mostly near the tip of the peduncle.

Pubescence of the stem of spreading hairs.

Leaflets spreading; blades elliptic to obovate, that of the terminal leaflets nearly similar to those of the lateral.

Stem and leaflets densely pubescent with long lax hairs.

Stem sparsely pubescent with short hairs: leaflets appressed-pubescent.

Leaflets reflexed; blades linear, that of the terminal one much longer than those of the lateral.

Pubescence of the stem of appressed hairs.

Petioles not much longer than the lower leaflets: blades of the leaflets of an elliptic type.

Petioles much longer than the lower leaflets: blades of the leaflets of an oblanceolate, cuneate or linear type.

Blades of the leaflets oblanceolate to cuneate or obovate.

Blades of the leaflets linear, varying to linear-subulate or slightly broadened upward.

Panicles elongate, many-flowered, with the flowers often 2–4 at each node.

Leaflets 19–25; blades narrowly elliptic or slightly broadened upward: leaf-rachis hirsute.

Leaflets 13–19; blades linear-oblanceolate to linear-elliptic or linear: leaf-rachis strigillose.

8. *C. spicata*. ✓

9. *C. intermedia*.

10. *C. flexuosa*.

11. *C. hispidula*. ✓

12. *C. ambigua*. ✓

13. *C. gracillima*.

14. *C. onobrychoides*.

15. *C. angustifolia*.

## V. PURPUREAE

Stem with spreading pubescence: leaflets velvety-pubescent.

Stem with appressed pubescence: leaflets strigillose or silky.

Calyx-lobes about equalling the tube.

Blades of the leaflets oblanceolate, narrowly cuneate, or linear-cuneate, rounded or retuse at the apex.

Blades of the leaflets narrowly linear, acute or acuminate.

Calyx-lobes manifestly longer than the tube.

Standard less than 1 cm. wide: calyx-lobes slightly longer than the tube.

Standard over 1 cm. wide: calyx-lobes nearly or quite twice as long as the tube.

16. *C. corallicola*.

17. *C. Curtissii*.

18. *C. angustissima*.

19. *C. purpurea*.

20. *C. cinerea*.

1. *C. virginiana* L. Stem 3–6 dm. tall, loose-pubescent: leaflets 11–21; blades of the lateral ones 10–30 mm. long, elliptic; rachis mostly villous: calyx 9.5–

10.5 mm. long; lobes with very slender tips, the upper ones much longer than the tube: standard 18–24 mm. long, pale-yellow: wings and keel pink or purplish; pod 3–5 cm. long.—(CAT-GUT. GOAT'S-RUE. DEVIL'S SHOE-STRINGS. DOLLY-VARDEN. RABBIT'S-PEA.)—Dry, usually acid sandy soil, various provinces, Fla. to La., Man., and Me.

2. *C. latidens* Small. Stem 2–5 dm. tall, strigose: leaflets mostly 19–37; blades of the lateral ones broadly elliptic or obovate, 9–20 mm. long; calyx 5.5–6.5 mm. long; lobes with broadly ovate bodies: petals nearly similar to those of *C. virginiana*, but keel-petals scarcely auricled at the base.—Pinelands, pen. Fla.

3. *C. Mohrii* Rydb. Stem 2–3 dm. tall, strigose: leaflets 11–21; blades of the lateral ones narrowly elliptic, acute, 6–18 mm. long, glabrous above, strigose beneath, the rachis strigillose: calyx about 5 mm. long; lobes ovate-lanceolate, longer than the tube: corolla yellowish and rose-tinged; standard about 1 cm. long; pod about 5 cm. long.—Pinelands, Fla.

4. *C. Rugelii* (Shuttlw.) Heller. Stem more or less diffuse, up to 7 dm. long, finely loose-pubescent with bronze-colored hairs: leaflets 3–11; blades of the lateral ones obovate, 8–17 mm. long; calyx about 5 mm. long; lobes subulate: corolla white, turning purple; standard 1.5–2 cm. long; pod somewhat falcate, 3.5–4 cm. long.—Pinelands, S pen. Fla.

5. *C. chrysophylla* (Pursh) Kuntze. Stem copiously loose-pubescent, the hairs somewhat viscid and tawny: leaflets 3–9; blades of the lateral ones cuneate-obovate, 13–30 mm. long; calyx 5.5–7 mm. long; lobes of the upper lip lanceolate, about as long as the other lobes: corolla white, turning purple; standard 17–20 mm. long; pod 5–6 mm. wide.—Pinelands, Coastal Plain, Fla. to Miss. and Ga.

6. *C. Carpenteri* Rydb. Stem strigose: leaflets 5–7; blades of the lateral ones obovate, 9–15 mm. long; calyx about 4 mm. long; lobes of the upper lip deltoid-ovate, acute: corolla white or pale-pink, turning purple; standard 10–12 mm. long; pod about 4 mm. wide.—Pinelands, W Fla. and La.

7. *C. Chapmanii* (Vail) Small. Stem loosely appressed-pubescent: leaflets 3–7; blades of the lateral ones elliptic to obovate, 6–15 mm. long; calyx 3–3.5 mm. long; lobes of the upper lip deltoid, shorter than the tube: corolla white or pink, becoming purple; standard 7–12 mm. long; pod 3–4 mm. wide.—Dry soil, N Fla.

8. *C. spicata* (Walt.) Kuntze. Stem copiously loose-pubescent: leaflets 5–15; blades of the lateral ones oval, elliptic, or cuneate-elliptic, 10–25 mm. long, mucronulate: calyx 7–8 mm. long; lobes of the upper lip subulate; lower and lateral lobes subulate, nearly equal: corolla white, turning reddish or purple; standard 16–19 mm. long; pod 5–6 mm. wide.—Pinelands and dry woods, various provinces, Fla. to La., Tenn., and Del.

9. *C. intermedia* Small. Stem sparingly loose-pubescent, and somewhat sticky: leaflets 5–13; blades of the lateral ones elliptic to elliptic-obovate, 10–32 mm. long, apiculate: calyx 5.5–7 mm. long; lobes of the upper lip shorter than the other lobes or nearly as long: corolla pink turning purple; standard 16–18

mm. long; pod 4-5 mm. wide.—Woods and pinelands, Coastal Plain, Fla. to La., Ala., and Ga.

10. *C. flexuosa* (Chapm.) Heller. Stem loose-pubescent: leaflets 3-17; blades of the lateral ones linear or nearly so, 12-53 mm. long, acute or short-acuminate, sometimes reflexed: calyx 7-8 mm. long; lobes of the upper lip subulate; lower and lateral lobes narrow, much longer than the tube: corolla pale-pink; standard 12-15 mm. long; pod not seen.—Pinelands, Coastal Plain, Fla. to Ala.

11. *C. hispidula* (Michx.) Kuntze. Stem finely-pubescent: leaflets 7-15; blades of the lateral ones elliptic, oval-elliptic, or linear-elliptic, 8-20 mm. long, acutish, obtuse, or abruptly pointed: calyx 5-6 mm. long; lobes of the upper lip lanceolate; lower and lateral lobes broad, about as long as the tube: corolla white to pink; standard 16-18 mm. long; pod 4-5 mm. wide.—Pinelands, Coastal Plain, Fla. to La. and N. C.

12. *C. ambigua* (M. A. Curtis) Kuntze. Stem loose-pubescent: leaflets 7-13; blades of the lateral ones oblanceolate, cuneate, or obovate, 20-60 mm. long, or rarely more, truncate or mucronate: calyx 4.5-5 mm. long; lobes of the upper lip subulate; lower and lateral lobes subulate, nearly equal: corolla purple; standard 16-18 mm. long; pod about 5 mm. wide.—Pinelands, Coastal Plain, Fla. to La. and N. C.

13. *C. gracillima* (B. L. Robinson) Heller. Stem minutely appressed-pubescent: leaflets 9-13 remote; blades linear varying to linear-subulate or slightly broadened upward, 9-30 mm. long, abruptly acute: calyx 3.5-4 mm. long; lobes of the upper lip lanceolate; lower lobe much narrowed and longer than the lanceolate lateral ones: corolla purple, at least becoming so; standard 12-14 mm. long; pod 4-5 mm. wide.—Pinelands, E coast of pen. Fla.

14. *C. onobrychoides* (Nutt.) Kuntze. Stem copiously loose-pubescent: leaflets 11-23; blades of the lateral ones narrowly elliptic to slightly broadened upward, 18-50 mm. long; calyx 5-6 mm. long; lobes of the upper lip subulate; lower lobe much longer than the lateral ones, 4.5-5 mm. long: corolla white, tinged with purple, turning red; standard 19-23 mm. long; pod 5-6 mm. wide.—Dry soil, often in pinelands, Central Plain and rarely adj. provinces, Ala. to Tex. and Okla.

15. *C. angustifolia* (Featherman) Pennell. Stem 5-11 dm. tall, strigose and often with longer spreading hairs: leaflets 13-19; blades linear-oblanceolate, linear-elliptic or linear, 18-40 cm. long, veiny above, grayish and reticulate beneath: calyx 6-7 mm. long; lobes of the upper lip triangular-lanceolate, the middle lobe of the lower lip narrower and longer than the others: corolla pale rose-purple or nearly white when young; standard 15-18 mm. long; pod about 4 mm. wide.—Prairies, pinelands, open places, Coastal Plain, Ala. to Tex.—Spr.-sum.—A related species, *C. texana* Rydb., with more strigose and broader leaflets is said to have been found near Mobile, Ala.

16. *C. corallicola* Small. Stem copiously loose-pubescent, or glabrate in age: leaflets 11-15; blades linear to linear-elliptic, 7-13 mm. long; calyx 4-5 mm. long; lobes of the upper lip lanceolate; lower and lateral lobes lanceolate, about equal in length: corolla light-purple or deep-pink; standard 7-10 mm. long; pod 2-4 mm. wide.—Pinelands, Everglade Keys, Fla.

17. *C. Curtissii* Small. Stem minutely appressed-pubescent when young, glabrous in age: leaflets 7-17; blades of the lateral ones oblanceolate, narrowly cuneate, or linear-cuneate, 9-30 mm. long, truncate or retuse, or mucronate: calyx 3-4 mm. long; lobes of the upper lip deltoid; lower lobe narrowly lanceolate, longer than the ovate or triangular-lanceolate lateral ones: corolla pur-

plish, pale when opening; standard 9–12 cm. long: pod about 4 mm. wide.—Sand ridges, eastern coast, Fla.

18. *C. angustissima* (Shuttlw.) Kuntze. Stem glabrous: leaflets 11–17; blades of the lateral ones narrowly linear or very narrowly linear, 13–45 mm. long: calyx 4–5 mm. long; lobes of the upper lip lanceolate; lower lobe lanceolate, much longer than the lateral ones: corolla usually pale, turning reddish-purple; standard 9–11 mm. long: pod about 3 mm. wide.—Pinelands, Everglade Keys, Fla.

19. *C. purpurea* L. Stem diffuse or vine-like, sparingly strigillose: leaflets 9–21; blades of the lateral ones linear to linear-cuneate, 9–25 mm. long, abruptly pointed: calyx about 6 mm. long; lobes of the upper lip lanceolate-subulate: corolla white or pinkish; standard 9–10 mm. long: pod 3.5–4 mm. wide, usually curved.—Prairie, Big Cypress Swamp, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)—A decoction made from this plant is used by the Seminoles as a specific for nose-bleed.

20. *C. cinerea* (L.) Morong. Stem lax, copiously strigose: leaflets 9–17; blades of the lateral ones linear to elliptic-oblongate, 19–50 mm. long; obtuse or acutish: calyx 5–6 mm. long; lobes of the upper lip subulate-tipped, those of the lower lip subulate: corolla purplish; standard 10–15 mm. long: pod 4–5 mm. wide.—Waste-places and cult. ground, Coastal Plain, Ala. Nat. of trop. Amer.—(*W. I., Mex., C. A., S. A.*)

32. **GEOPRUMNON** Rydb. Perennial tufted herbs. Leaflets numerous; blades usually not notched. Corolla purple or white or rarely ochroleucous: wings much longer than the keel-petals. Pod globular to ovoid or ellipsoid, fleshy, becoming spongy, the partition formed by the intruded and modified lower suture meeting the upper suture.—Six species, natives of central North America.—Spr.—sum.

Pod pubescent, obliquely ovoid, sometimes narrowly so, beaked.

Calyx-lobes about  $\frac{1}{4}$  as long as the tube: pod curved, over 2 cm. long, coarsely wrinkled, gradually pointed. 1. *G. tennesseense*.

Calyx-lobes over  $\frac{1}{2}$  as long as the tube: pod straight, less than 2 cm. long, finely wrinkled, abruptly pointed. 2. *G. plattense*.

Pod glabrous, globose or ellipsoid-globose, beakless. 3. *G. crassicaupum*.

1. *G. tennesseense* (A. Gray) Rydb. Plant villous-hirsute: leaflets 15–33; blades elliptic to oval, 12–14 mm. long: peduncles about as long as the accompanying leaves: calyx-lobes long-hairy: standard 16–19 mm. long: keel abruptly curved upward: ovary pubescent: pod 3–3.5 cm. long, gradually beaked. [*Astragalus plattensis tennesseensis* A. Gray]—Rocky glades, interior provinces, Ala. to Mo. and Tenn.

2. *G. plattense* (Nutt.) Rydb. Plant hirsute or somewhat strigose: leaflets 13–23; blades elliptic to obovate or cuneate, 5–15 mm. long: peduncles shorter than the accompanying leaves: calyx-lobes short-hairy: standard 15–18 mm. long: keel gradually curved upward: ovary pubescent: pod 1–1.5 cm. long, abruptly beaked.—Prairies, various provinces, Ala. to Tex. and Ind.

3. *G. crassicaupum* (Nutt.) Rydb. Plant strigillose: leaflets 13–27; blades elliptic, to elliptic-lanceolate, 8–20 mm. long: calyx 7–8.5 mm. long; lobes lanceolate to subulate-lanceolate: corolla purple: ovary glabrous: pod 2–2.5 cm. long. [*Astragalus caryocarpus* Ker.]—Prairies, various provinces, Tenn. to Tex., Man., and Minn.

33. *ASTRAGALUS* L. Perennial or annual herbs. Leaflets numerous or several: blades sometimes notched. Flowers in long racemes. Corolla variously colored, ours cream-colored or somewhat greenish: wings and keel-petals about equal in length. Pod coriaceous, ovoid or ellipsoid, turgid, but scarcely inflated, perfectly 2-celled, the septum formed by the intruded lower suture which meets the upper one. About 500 species, most abundant in Asia. —Spr.—sum.

Calyx-lobes more than  $\frac{1}{2}$  the length of the tube: pod ascending when mature.

Calyx-lobes less than  $\frac{1}{2}$  the length of the tube: pod spreading or reflexed when mature.

1. *A. carolinianus*.

2. *A. Halei*.

1. *A. carolinianus* L. Stem up to 1 m. tall, glabrous, or sparingly pubescent above: leaflets 15–31; blades elliptic or elliptic-lanceolate, 2–4 cm. long: racemes elongate: calyx-lobes  $\frac{2}{3}$ – $\frac{3}{4}$  as long as the tube: standard 11–13 mm. long: keel gradually turned upward; blades narrow: pod narrowly ellipsoid, 12–16 mm. long, nearly straight, the beak straight or slightly curved. — (RATTLE-VETCH.) — Dry woods and river-banks, various provinces, Ga. and Ala. to Tenn., W. Va., and Md.

2. *A. Halei* Rydb. Stem up to 5 dm. tall, pubescent: leaflets 13–27; blades elliptic to elliptic-ovate, 1–3.5 cm. long: racemes short: calyx-lobes about  $\frac{1}{2}$  as long as the tube: standard 15–17 mm. long: keel abruptly curved upward; blades broad: pod 10–14 mm. long, curved, the beak hooked. —Woods and fields, Coastal Plain, Ala. to La.

34. *HOLCOPHACOS* Rydb. Perennial low spreading herbs. Leaflets numerous, the blades entire, mostly truncate or notched. Flowers few in short racemes. Corolla pink or purplish: standard with a broad deeply notched blade: wings slightly longer than the keel-petals. Pod linear or ellipsoid, coriaceous, deeply sulcate along both sutures, but 1-celled, without even a partial partition. About 12 species, North American.

1. *H. distortus* (T. & G.) Rydb. Stem glabrous or sparingly pubescent, branched at the base, the branches ascending or prostrate, 1–4 dm. long: leaflets 17–23; blades oval, obovate, or cuneate, 3–10 mm. long: peduncles about as long as the subtending leaves or longer: racemes ovoid or cylindric: calyx-lobes lanceolate, shorter than the tube, erect: corolla purplish-blue, 8–10 mm. long: pod crescent-

shaped, 2-2.5 cm. long, short-beaked. [*Astragalus distortus* T. & G.]—Woods and hillsides, various provinces, Miss. to Tex., Ia., and W. Va.—Spr.—sum.

**35. TIUM** Medic. Perennial erect, virgate herbs. Leaflets numerous: blades mostly obtuse. Calyx campanulate with short lobes. Corolla white or purple: wings as long as the standard or nearly so. Pod narrow, short-stipitate, with a deep narrow groove along the ventral suture which is produced within into a partial false partition, ridged along the dorsal suture.—About 60 species, mostly natives of North America and Asia.

1. **T. Michauxii** (Kuntze) Rydb. Plant glabrous in age: leaflets 15-25; blades linear or nearly so, 9-20 dm. long: calyx 4-5 mm. long; lobes deltoid or triangular-lanceolate, 1-1.5 mm. long: corolla white; standard 13-16 mm. long: pod 2-4 cm. long, slightly curved, glabrous. [*Astragalus glaber* Michx. *Psoralea multijuga* Ell. *Tium apilosum* Rydb.]—Sandhills and dry pinelands, Coastal Plain, Fla. to N. C.—Spr.

**36. PHACA** L. Perennial or annual diffuse herbs with several or many stems from the top of the root. Leaflets numerous: blades broad, often notched. Calyx campanulate or cylindric-campanulate, with rather narrow lobes. Corolla blue, purple, or yellow. Pod sessile, narrow, curved, with a deep wide shallow groove along the ventral suture and a ridge along the dorsal, without a false partition.—About 20 species, North American.—Spr.

Pod pubescent: calyx-lobes longer than the tube.  
Pod glabrous: calyx-lobes shorter than the tube.

1. *P. intonsa*.  
2. *P. obcordata*.

1. **P. intonsa** (Sheldon) Rydb. Plant villous: leaflets 9-15; blades elliptic, obovate, or suborbicular, 3-10 mm. long; calyx 9-10 mm. long; lobes lanceolate-subulate, 4.5-5.5 mm. long: corolla dull-yellow: standard 9-11 mm. long: pod about 2 cm. long, villous. [*Astragalus villosus* Michx. *Tium intonsum* Rydb.]—Pinelands, riverbanks, and roadsides, Coastal Plain, Fla. to Ala. and S. C.

2. **P. obcordata** (Ell.) Rydb. Plant glabrous in age or nearly so: leaflets 15-25; blades obcordate to oblong-cordate, 3-8 mm. long: calyx 5-6 mm. long; lobes narrowly lanceolate, 2.5-3 mm. long: corolla purple or blue; standard 8-10 mm. long: pod 3-3.5 cm. long, veiny. [*Astragalus obcordatus* Ell. *Tium obcordatum* Rydb.]—Pinelands, Coastal Plain, Fla. and Ga.

**37. ECASTOPHYLLUM** L. Shrubs. Leaflets solitary: blades broad. Racemes short. Calyx not 2-lipped, the 5 broad lobes short. Corolla white or

pink: standard with a suborbicular or reniform blade and a long claw. Free portions of the filaments long. Pod lenticular.—About 5 species, natives of tropical and subtropical America.

1. *E. Ecastophyllum* (L.) Britton. Shrub with wide-spreading or trailing branches: leaflets 5–15 cm. long; blades ovate or elliptic: calyx campanulate, becoming 3.5–4 mm. long: corolla white or pink; standard 3–9 mm. long, the blade suborbicular: pod suborbicular, 2–3 cm. in diameter. [*E. Brownei* (Chapm. Fl.).—*Dalbergia Brownei* (Fl. SE. U. S.)]—Coastal sand-dunes and shore hammocks, S pen. Fla. and Keys.—(*W. I., Mex., C. A., S. A., O. W.*)—In marshes behind sand-dunes the branches form almost impenetrable jungles.

38. *AMERIMNON* Jacq. Shrubs. Leaflets solitary. Racemes short. Calyx 2-lipped: upper lip with 2 broad lobes: lower lip with 2 short lateral lobes and a long middle one. Corolla white or pink: standard with an obovate or cuneate blade and a short claw. Filaments and ovary as in *Ecastophyllum*. Pod more or less elongate, stipitate.—About 12 species, tropical American.

1. *A. Brownei* Jacq. Shrub with reclining or trailing branches: leaflets thickish, the blades 6–12 cm. long, ovate to elliptic-ovate, obtuse or acutish, glabrous in age: racemes short: calyx 4–5 mm. long; upper lip with 2 broad lobes; lateral lobes of the lower lip ovate, the middle lobe lanceolate: corolla white or pink; standard 8–10 mm. long, the blade obovate or cuneate: pods oval, oblong, or linear-oblong, 1–3.5 cm. long.—Shore hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—The greatly elongate, often rope-like branches, frequently form almost impenetrable entanglements on the edges of hammocks.

39. *ICHTHYOMETHIA* P. Br. Trees. Leaflets several, pinnate. Panicles thyrsoid. Calyx slightly 2-lipped, the upper lip notched: lower lip of three broad lobes about equal in length. Corolla white or partially colored: standard with a broad blade cordate at the base, and a short claw. Pod narrow, 4-winged.—About 6 species, natives of tropical and subtropical America.

1. *I. piscipula* (L.) A. Hitchc. Medium-sized tree: leaflets 7–9; blades oval or obovate, or nearly ovate, 2–10 cm. long, undulate or shallowly toothed: calyx campanulate, 6–7 mm. long: petals white and partially striped with red: standard 14–16 mm. long, the blade suborbicular: pod 5–10 cm. long,

the wings undulate or incised. [*Piscidia Erythrina* L.]—(JAMAICA-DOGWOOD.)—Hammocks, coastal region, S pen. Fla., Everglade Keys, and Florida Keys.—(W. I.)—Spr. The hard durable wood is valued for boat-building. The bark of the roots and powdered other parts of the tree were formerly used to stupefy fish.

40. **ANDIRA** Lam. Trees. Leaflets several. Panicle terminal, ample. Calyx slightly 2-lipped, the upper lip notched: lower lip of three broad acute lobes. Corolla purple or reddish: standard with a broad blade. Pod thick, drupaceous, subglobose or somewhat elongate.—About 20 species, most abundant in tropical America.

1. **A. jamaicensis** (W. Wright) Urban. Tree with wide spreading branches and finely pubescent twigs and inflorescence: leaves 1–3 dm. long; leaflets mostly 9–13, the blades elliptic or oval, varying to ovate or obovate, 3.5–8 cm. long, abruptly acuminate, short-petioluled: panicle many-flowered, much-branched: flowers purplish: calyx campanulate; lobes wider than long, the lower ones acute: standard 9–10 mm. long; the blade suborbicular: pod subglobose, oval, or obovoid, mostly 5–7.5 cm. long.—Hammocks, Bahia Honda Key, Fla.—(W. I.)—Sum.—Living specimens collected on Bahia Honda Key were grown on the former Deering reservation at Buena Vista, Fla., where they flowered in 1924.

41. **PITCHERIA** Nutt. Perennial erect wiry herbs. Leaflets 3: blades coriaceous. Flowers axillary, solitary. Calyx 2-lipped, the lobes elongate, the 2 upper well united. Corolla yellow: blade of the standard broadened upward: blade of the wing-petals with a slender auricle at the base: blade of the keel-petals broad, strongly curved. Pod flat, short, margined, the small beak nearly or quite central at the rounded tip.—One species.

1. **P. galactioides** Nutt. Plant 6–12 dm. tall, widely branched: leaves short-petioled; leaflets 5–20 mm. long; blades oval or obovate-oval, reticulate and resinous-dotted: lower calyx-lobes lanceolate, long-acuminate, 5–7 mm. long: standard 7–9 mm. long; blade obovate: pod elliptic-obovate, 15–22 mm. long. [*Rhynchosia galactioides* Endl.]—Dry sandy pinelands, Coastal Plain, Fla. to Miss.—Spr.—sum.

42. **DOLICHOLUS** Medic. Perennial herbaceous vines. Leaves long-petioled, leaflets 3; blades thin, not reticulate. Flowers in interrupted axillary racemes. Calyx slightly 2-lipped, the 2 upper lobes scarcely more united than the others. Corolla yellow: blade of the standard broadened upward:

blade of the wing-petals auricled at the base: blades of the keel-petals rather narrow, curved. Pod flat, scimitar-shaped, slightly margined, the beak eccentric.—Few species, mostly tropical.

Racemes several-flowered: blades of the leaflets of a rhombic type: pod 1–1.5 cm. long.

1. *D. minimus*.

Racemes 2–4-flowered: blades of the leaflets of an ovate type: pod 2.5–4 cm. long.

2. *D. Swartzii*.

1. *D. minimus* (L.) Medic. Stem minutely retrorse-pubescent: leaflets 0.8–4 cm. long; blades of the lateral ones semirhombic, that of the terminal one rhombic-orbicular, sparingly pubescent: calyx-lobes narrowly lanceolate, longer than the tube: standard 5–6 mm. long; blade orbicular-cuneate: auricles of the wings acute: pod 10–15 mm. long. [*Rhynchosia minima* DC.].—Pinelands and edges of hammocks, Coastal Plain, Fla. to Tex. and S. C.—(*W. I., Mex., C. A., S. A.*)—Spr.–fall or all year S.

2. *D. Swartzii* Vail. Stem finely retrorse-pubescent: leaflets 3–6 cm. long; blades ovate, acuminate, softly pubescent: calyx-lobes broadly lanceolate, shorter than the tube: standard 6.5–8 mm. long: pod 25–40 mm. long. [*Rhynchosia caribaea* DC.].—Hammocks, S pen. Fla. and the Keys.—(*W. I.*)—All year.

43. **LEUCOPTERUM** Small. Herbaceous vines. Leaves long-petioled: leaflets 3: blades rather broad, thickish. Flowers few, in peduncled axillary racemes. Calyx 2-lipped, not accrescent, the lobes of the upper lip well united, the middle lobe of the lower lip much longer than the lateral ones. Corolla yellow: blade of the standard broadened upward: blade of the wing petals with a rounded lobe at the base: blade of the keel petals rather broad, slightly curved: ovary short-stipitate: style elongate, hairy and glandular near the base, much swollen near the apex. Pod broad, nearly equilateral, the beak eccentric and oblique. One species.

1. *L. parvifolium* (DC.) Small. Stem grayish-tomentose: leaflets 1.5–3.5 cm. long; blades elliptic to elliptic-lanceolate or sometimes broader: lower calyx-lobe linear-lanceolate: standard 7–8 mm. long; blade suborbicular: lobe of the wings obtuse: pod elliptic, 13–17 mm. long. [*Rhynchosia parvifolius* DC. *Dolicholus parvifolius* Vail].—Pinelands, S pen. Fla. and the Keys.—(*W. I.*)—Spr.–fall or all year S.

44. **RHYNCHOSIA** Lour. Perennial herbs with erect or climbing stems. Leaves long-petioled: leaflets 3 or 1; blades broad, often wider than long. Flowers in short-stalked axillary congested racemes. Calyx 2-lipped, accrescent: lobes of the upper lip well-united: middle lobe of the lower lip longer

than the lateral. Corolla yellow, about as long as the calyx or shorter: blade of the standard suborbicular to orbicular-obovate: blade of the wing-petals with a salient auricle on each side at the base: blades of the keel-petals broad, strongly curved. Pod flat, short, the beak very eccentric.—About 150 species, in tropical and temperate regions.

Stem prostrate or climbing.  
Stem erect.

I. LATIFOLIAE.  
II. ERECTAE.

#### I. LATIFOLIAE

Leaves unifoliolate, or rarely the uppermost trifoliolate: racemes axillary.  
Leaves trifoliolate.

Racemes very short-peduncled or sessile.

Stem and branches prostrate, cinereous: pod broad at each end; beak lateral.

Stem and branches generally climbing, retrorse-hirsute: pod narrowed at each end; beak oblique.

Racemes peduncled, or the uppermost short-peduncled, elongating.

#### II. ERECTAE

Leaves unifoliolate, the leaflets with reniform blades.

Leaves trifoliolate or some of the basal ones unifoliolate.

Racemes terminal and axillary, never long-peduncled and elongate.

Stem 1–2 dm. tall: median lobe of the lower calyx-lip subulate: inflorescence strigose-hirsute.

Stem 2–8 dm. tall: median lobe of the lower calyx-lip lanceolate: inflorescence strigose-sericeous.

Racemes mainly terminal or a few of them axillary, commonly much elongate.

1. *R. Michauxii*.
2. *R. cinerea*.
3. *R. tomentosa*.
4. *R. Lewtonii*.
5. *R. simplicifolia*.
6. *R. intermedia*.
7. *R. erecta*.
8. *R. mollissima*.

1. *R. Michauxii* Vail. Stem densely gray-pubescent: leaflets 2.5–5 mm. long; blades broader than long, soft-hirsute beneath: calyx 12–17 mm. long; lobes abruptly acuminate: standard 12–14 mm. long; blade cuneate: pod 11–16 mm. long, obliquely beaked. [*Rhynchosia menispermoides* (Chapm. Fl.) *Dolicholus Michauxii* Vail.]—Pinelands, Fla.—Spr.-fall.

2. *R. cinerea* Nash. Stem cinereous-pubescent: leaflets 1–3 cm. long; blades obliquely orbicular to ovate-orbicular or the terminal one reniform, thick: lateral calyx-lobes lanceolate, markedly shorter than the lower one; lobes of the upper calyx-lip lanceolate: standard 6–7 mm. long: pod 14–15 mm. long. [*Dolicholus cinereus* Vail]—Pinelands, pen. Fla. and the Keys.—Spr.-fall or all year S.

3. *R. tomentosa* (L.) H. & A. Stem retrorse-hirsute: leaflets 3–6 cm. long; blades ovate to ovate-rhombic, or the terminal one wider than long, thinnish, softly pubescent: lateral calyx-lobes nearly linear, about equalling the lower one; lobes of the upper calyx-lip subulate; standard 7–8 mm. long: pod 16–20 mm. long. [*Dolicholus tomentosus* Vail]—Pinelands, Coastal Plain and rarely adj. provinces, Fla. to La. and Va.—Sum.-fall.

4. *R. Lewtonii* (Vail) Small. Stem soft-pubescent: leaflets 3–6 cm. long; blades obovate-elliptic to obovate-orbicular, or the terminal one wider than long: calyx 10–12 mm. long; lower lobe narrow and longer than the lateral ones: standard 8–9 mm. long; blade broadly obovate. [*Rhynchosia reticulata* (Chapm. Fl.) *Dolicholus Lewtonii* Vail]—Pinelands, pen. Fla.

5. **R. simplicifolia** (Walt.) Wood. Stem hirsute: leaflets 2-5 cm. long; blades depressed-orbicular or reniform, hirsute on the veins beneath, strongly reticulate: calyx 8-10 mm. long; upper lobes typically ovate, lower lobe about equalling the lateral ones: standard 6.75 mm. long; blade broadly obovate or suborbicular: wings about as long as the standard: pod 15-17 mm. long, elliptic; beak nearly lateral. [*Rhynchosia reniformis* (Pursh) DC. *Dolicholus simplicifolius* Vail]—(DOLLAR-WEED.)—Pinelands, open woods, and fields, Coastal Plain and rarely adj. provinces, Fla., and La. and Va.—Spr.—fall.

6. **R. intermedia** (T. & G.) Small. Stem tomentose: leaflets 2-5 cm. long; blades suborbicular and often somewhat rhombic, or ovate-orbicular, or those of the lateral ones ovate or oval: lower calyx-lobes various, the lateral ones lanceolate-subulate, the median one subulate, slender-tipped; upper lobes subulate-lanceolate: standard 7-8 mm. long; blade nearly elliptic or elliptic-obovate: wings much shorter than the standard: pod 15-18 mm. long, narrowly elliptic. [*Dolicholus intermedius* Vail]—Pinelands, Coastal Plain, Fla., Ala. and Ga.—Spr.—sum.

7. **R. erecta** (Walt.) DC. Stem 2-8 dm. tall, softly pubescent: leaflets 2.5-5 cm. long; blades oval, elliptic or elliptic-oval, velvety beneath: lower calyx-lobes narrowly lanceolate; lobes of the upper calyx-lip lanceolate, shorter than the tube: standard 5-6.5 mm. long; blade suborbicular: ovary short-hairy: pod 14-16 mm. long, elliptic; beak eccentric. [*Dolicholus erectus* Vail]—Dry soil, especially in pinelands, Coastal Plain, and rarely adj. provinces, Fla. to La., Tenn., and Del.

8. **R. mollissima** (Ell.) S. Wats. Stem 3-6 dm. tall, closely and silvery soft-pubescent: leaflets 2.5-4.5 cm. long; blades oval or oval-elliptic: calyx hispidulous; lower lobes narrowly lanceolate, the middle one the longest: standard 6.5-7.5 mm. long; blade obovate: ovary hispidulous: pod 19-21 mm. long, slightly curved; beak lateral. [*Dolicholus mollissimus* Vail]—Pinelands, Coastal Plain, Fla. and adj. Ga. to Miss.—Spr.—fall.

45. **CAJAN** Adans. Partially woody herbs. Leaflets 3. Racemes few-several-flowered. Calyx somewhat 2-lipped, the upper lobes partially united. Corolla yellow or mainly so: blade of the standard suborbicular, sharp-auricled at the base: blades of the wings rather prominently, but unequally auricled on each side: blades of the keel-petals obtuse at the apex. Pod turgid, elongate.—One species.

1. **C. Cajan** (L.) Millsp. Plant 9-30 dm. tall, velvety-tomentose: leaflets mainly 4-12 cm. long; blades narrowly elliptic, acute or short-acuminate, pale and prominently veined beneath: calyx 8-14 mm. long: standard-blade 16-20 mm. long: pod narrowly elliptic to linear-oblong.—CONGO-PEA. PIGEON-PEA.—Pinelands, cult. grounds, and hammocks, S pen. Fla., and the Keys.—Nat. of Old World Tropics and cult.—(W. I.)—All year.—Grown extensively for its pea-like seeds which are boiled and eaten or used for feeding poultry.

46. **ERYTHRINA** L. Herbs, shrubs, or trees. Leaflets 3. Racemes several-many-flowered. Calyx obliquely truncate. Corolla red, scarlet, or crim-

son: standard conspicuous, erect, narrowed upward: wings and the keel-petals very small, nearly equal in size, the blades short-clawed. Androecium exerted: filaments united to about the middle and slightly above it. Ovary long-stipitate. Pod torulose.—About 20 species, natives of tropical and warm-temperate regions.—Wint.-spr.—CORAL-BEANS. CHEROKEE-BEANS. DRAGON'S-TEETH. SNAKEWEEDS.—An infusion, made from the leaves, is used by the Seminoles in canine diseases.

Herb: stem annual: standard elliptic.

Shrub or tree: stems perennial, very woody: standard lanceolate.

1. *E. herbacea*.

2. *E. arborea*.

1. *E. herbacea* L. Herbs 6–12 dm. tall: leaflets 3–9 cm. long; blades deltoid to hastate: racemes many-flowered: calyx campanulate: standard 45–50 mm. long; blade about 2 cm. wide: wing-petals 15–17 mm. long.—(CARDINAL-SPEAR.)—Pine-lands, hammocks, thickets, and edges of woods, Coastal Plain, Fla. to Tex. and N. C.

2. *E. arborea* (Chapm.) Small. Shrub or tree 3–8 m. tall, or a woody vine: leaflets 3.5–10 cm. long; blades deltoid to hastately 3-lobed: racemes few-flowered: calyx cylindric: standard 35–40 mm. long; blade about 1 cm. wide: wing-petals 11–12 mm. long: pod drooping, 8–15 cm. long. [*E. herbacea arborea* Chapm.]—(RED-CARDINAL.)—Hammocks, S pen. Fla., and the Keys.—The brilliantly colored seeds are often gathered and used as beads.

47. **MICROPTERYX** Walp. Shrubs or trees. Leaflets 3. Flowers clustered in the axils or in elongate panicles. Calyx 2-lipped, but with shallow lobes. Corolla crimson: standard conspicuous, spreading, broadened upward: wings and keel-petals very unequal in size, the former short, the latter elongate, clawless. Androecium included in the keel: filaments united to near the tip. Ovary short-stipitate. Pod cylindric.—About 6 species, tropical.

1. *M. Crista-galli* (L.) Walp. Shrub or small tree, often prickly-armed: leaflets 5–14 cm. long; blades elliptic, oval, or ovate, glabrous: racemes several-flowered: calyx 13–15 mm. long: standard obovate, 40–45 mm. long: wings 9–11 mm. long: keel-petals lanceolate, 30–35 mm. long: pod 18–25 mm. long. [*Erythrina Crista-galli* L.]—Waste-places, Coastal Plain, Gulf States. Nat. of S. A., and cult.

48. **STIZOLOBIUM** P. Br. Leaflets 3. Racemes or panicles erect, usually few-flowered. Calyx 2-lipped: upper lip often slightly notched; lower lip 3-lobed. Corolla red or purple: standard much shorter than the other petals,

the blade longer than broad: blades of the wings auricled on one side: keel-petals scythe-shaped. Pod turgid.—About 20 species, mostly in tropical regions.

1. *S. Deeringianum* Bort. Herbaceous vine: leaflets 7–16 cm. long; blades sparingly pubescent, those of the lateral ones very obliquely ovate, that of the terminal one rhombic or ovate-rhombic; lower calyx-lobes triangular or triangular-lanceolate: standard 23–26 mm. long, the blade ovate; wings broadened at the apex; keel-petals narrowed at the bent apex: pod 5–9 cm. long, coarsely pubescent. [*Mucuna Deeringiana* Small]—(VELVET-BEAN. FLORIDA-BEAN.)—Pinelands, hammocks, citrus groves, and old-fields, pen. Fla. Nat. of Asia.—Extensively grown as a ground-cover.

49. *MUCUNA* Adans. Woody vines. Leaflets 3. Racemes pendent, head-like, the several flowers borne in a radiating cluster. Calyx 2-lipped, the upper lip entire, the lower lip prominently 3-lobed. Corolla greenish-yellow: standard much shorter than the other petals: keel-petals scythe-shaped. Pod thick, but flattish, with prominent transverse corrugations.—About 25 species, mostly tropical.

1. *M. Sloanei* Fawc. & Rendle. Vigorous woody vine: blades of the leaflets ovate (the lateral ones oblique and inequilateral), thinnish, 7–15 cm. long, more or less acuminate, silvery-hairy beneath: calyx 1.5–2 cm. long, the upper lip broad: corolla lemon-yellow, 5–7 cm. long; standard about half as long as the keel, enfolding the other petals at the base: pod drooping, somewhat woody, elliptic, but often irregular from the unequal development of the seeds, with irregular transverse crests and brown stinging hairs.—(COWITCH-VINE. SEA-BEAN.)—Hammocks, Everglade Keys, pen. Fla.—(W. I., S. A.)—All year.—The hairs of the pod are exceeding irritating to the skin—hence “cowitch.” The seeds are used as beads and ornaments for watch-chains.

50. *DIOCLEA* H. B. K. Vines or woody plants. Leaflets 3. Panicle raceme-like, long-peduncled. Calyx 2-lipped, the lobes, except the middle lower one, short. Corolla blue or purple, or white: standard reflexed, narrowed at the base. Ovary sessile or nearly so. Pod flat.—About 16 species, mostly natives of tropical America.

1. *D. multiflora* (T. & G.) C. Mohr. Plant pubescent: leaflets 5–15 cm. long; blades oval, suborbicular, or reniform: calyx 5–7 mm. long; lower lobes lanceolate: corolla purple; standard 12–15 mm. long, the blade suborbicular: pod elliptic, 5–6 cm. long. [*D. Boykinii* A. Gray]—River banks, Coastal Plain, and occasionally adj. provinces, Ga. to La., Ark., and Ky.—Sum.

51. *GALACTIA* P. Br. Vines with prostrate or twining stems, or erect partially woody plants. Leaflets 3, or rarely 1, 5 or 7. Panicles raceme-like.

Calyx 2-lipped, the lobes relatively long. Corolla violet, red, or white: standard erect or spreading: wings and keel-petals with relatively short claws. Ovary sessile or nearly so. Pod turgid, elongate, or the subterranean ones, when present, short.—About 70 species, natives of warm and tropical regions.—Sum.—fall or all year S.—MILK-PEAS.—The corollas are mainly purple.

Stem erect: leaf-rachis not prolonged beyond the lateral leaflets: flower-clusters sessile or nearly so in the axils. I. ERECTAE.

Stem prostrate or twining: leaf-rachis prolonged: panicles elongate, continuous or interrupted.

Plant with decumbent or prostrate stems and branches.

II. DIFFUSAE.  
III. VOLUBILES.

Plant with twining stems and branches.

#### I. ERECTAE

Plant with solitary or clustered, wiry, somewhat zigzag stems. 1. *G. erecta*.

#### II. DIFFUSAE

Panicles shorter than the leaves, at least, in anthesis: flower-clusters approximate.

Calyx coarsely hirsute.

Panicles usually with one flower-cluster: leaflets of the upper leaves narrow.

Panicles with several flower-clusters: leaflets broad.

Calyx glabrous or glabrate.

Panicles exceeding the leaves: flower-clusters separated.

Blades of the leaflets oval or elliptic: calyx 6–9 mm. long.

Panicle at least half as long as the peduncle.

Panicle much shorter than the peduncle.

Blades of the leaflets mostly linear-lanceolate to linear: calyx 10–16 mm. long.

2. *G. brachypoda*.  
3. *G. floridana*.  
4. *G. regularis*.

5. *G. brevipes*.  
6. *G. prostrata*.

7. *G. pinetorum*.

#### III. VOLUBILES

Leaves with 3 leaflets: corolla violet.

Panicles several (2–7) in a leaf-axil, the rachis zigzag.

Panicles solitary (rarely 2) in a leaf-axil.

Peduncle shorter than the panicle-rachis, shorter or somewhat longer than the leaves.

Standard not striped: upper calyx-lobe triangular to lanceolate.

Leaflets of the upper leaves with ovate, oval, or elliptic-ovate blades: standard mostly less than 11 mm. long.

Leaflets of the upper leaves with linear or nearly linear blades: standard over 11 mm. long.

Standard striped: upper calyx-lobe broadly ovate.

Panicles sessile or nearly so: leaflets coriaceous.

Panicles long-peduncled: leaflets membranous.

Peduncle much longer than the panicle-rachis and leaves.

Leaves with 7–9 leaflets: corolla white.

8. *G. fasciculata*.

9. *G. volubilis*.

10. *G. parvifolia*.

11. *G. spiciformis*.

12. *G. striata*.

13. *G. mollis*.

14. *G. Elliottii*.

1. *G. erecta* (Walt.) Vail. Stem glabrous or nearly so: leaflets 2.5–4 cm. long; blades elliptic to linear: calyx 5–6 mm. long; lateral lobes longer than the tube: keel-petals 6–7 mm. long: pod 1.5–2 cm. long. [*G. sessiliflora* T. & G.]—Pinelands, Coastal Plain, W Fla. to Ala., (La.?), and N. C.

2. *G. brachypoda* T. & G. Stem puberulent or nearly glabrous: leaflets 2–3.5 cm. long; blades elliptic to linear-elliptic: calyx 4.5–5 mm. long; lateral lobes acute: keel-petals 5–6 mm. long: pod not seen.—Pinelands, Fla.

3. *G. floridana* T. & G. Stem hoary-pubescent: leaflets 1.5–4.5 cm. long (smaller and on petioles less than 1 cm. long in *G. floridana microphylla* Vail): blades oval or elliptic-oval: flowers scattered nearly the

length of the rachis (or borne 2-4 together at regular intervals above the middle of the rachis in *G. floridana longiracemosa* Vail): calyx 7-8 mm. long; lateral lobes acuminate: keel-petals 10-11 mm. long: pod 4-5 cm. long.—Pinelands, Coastal Plain, Fla. and Ala.

4. *G. regularis* (L.) B. S. P. Stem minutely retrorse-pubescent: leaflets 2-4.5 cm. long; blades elliptic or ovate-elliptic: calyx 7-9 mm. long; lobes obscurely scarious-margined: keel-petals 11-13 mm. long: pod 2.5-4.5 cm. long. [*G. glabella* Michx.]—Pinelands and sandhills, and edges of hammocks, Coastal Plain, and occasionally adj. provinces, Fla. to La., Tenn., and N. Y.

5. *G. brevipes* Small. Stem closely pubescent with short crisped hairs and somewhat clammy: leaflets 2-4 cm. long; blades oval or nearly so: calyx 6-7 mm. long; lateral lobes several times longer than the tube: keel-petals 11-13 mm. long: pod not seen.—Pinelands, near Trader's Hill, on the Coastal Plain of Ga.

6. *G. prostrata* Small. Stems finely pubescent with short straight appressed or ascending hairs: leaflets mostly 1.5-3 cm. long, or rarely longer; blades elliptic or oval varying to ovate or obovate: calyx 8-9 mm. long: standard 15-17 mm. long: pod not seen.—Pinelands, Everglade Keys, pen. Fla.—All year.

7. *G. pinetorum* Small. Stem finely pubescent: leaflets 1.5-5 cm. long; blades typically linear-lanceolate or linear, or rarely broader: calyx 11-16 mm. long: standard 15-20 mm. long: pod 4.5-6 cm. long.—Pinelands, Everglade Keys, Fla.—All year.

8. *G. fasciculata* Vail. Stem retrorsely canescent: leaflets 1.5-3 cm. long; blades suborbicular to elliptic-orbicular: calyx 8-9 mm. long; lateral lobe lanceolate, about as long as the tube: keel-petals 11-12 mm. long: no subterranean pod.—Sandy soil, Tampa, Fla.

9. *G. volubilis* (L.) Britton. Stem finely retrorse-hirsute: leaflets 2-5 cm. long; blades ovate, oval, or elliptic-ovate, or lanceolate-elliptic: calyx 5-6 mm. long; lobes ciliate: keel-petals 9-11 mm. long: pod 3-5 cm. long. [*G. pilosa* Ell.]—Pinelands and dry thickets, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Okla., Mo., and N. Y.—A form occurs on the Everglade Keys with a very numerous—and densely—flowered panicle.

10. *G. parvifolia* A. Rich. Stem minutely pubescent: leaflets mostly 1-4 cm. long; blades various, linear, varying to broadest above or below the middle, or those of the lower leaves broader, varying from ovate or oval to obovate, all thin or thinnish, usually faintly veined: calyx 5-8 mm. long: keel-petals 6.5-8 mm. long: pod 3.5-4.5 cm. long. [*G. filiformis* (Chapm. Fl.)]—Pinelands and hammocks. Everglade Keys, pen. Fla. and the Keys.—All year.

11. *G. spiciformis* T. & G. Stem retrorse-pubescent: leaflets 2.5-8 cm. long; blades elliptic or elliptic-oval: calyx 5-6 mm. long: standard 9-10 mm. long; blade auricled at the base: keel-petals 8-9 mm. long: pod 4-5 cm. long. [*G. cubensis* (Fl. SE. U. S.)] Hammocks and pinelands, S Fla.—(*W. I.*)—The sessile panicles have short internodes and the flower-clusters are close together.

12. *G. striata* (Jacq.) Urban. Stem loosely fine-pubescent: leaflets mostly 2.5-8.5 cm. long; blades elliptic or oval, varying to ovate: calyx 7-8 mm. long: standard 9-10 cm. long; blade truncate at the base: keel-petals 9-10 mm. long: pod 4-8 cm. long.—Hammocks and thickets, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)—The peduncled panicles have long internodes and the flower-clusters are often widely separated.

13. *G. mollis* Michx. Stem villous or somewhat hoary: leaflets 2.5-5 cm. long; blades oval or elliptic: calyx 5-6 mm. long: standard 7-8 mm. long;

blade not auricled: keel-petals 5-6 mm. long: pod 2.5-4 cm. long—Pinelands, swamps, and river-banks, Coastal Plain, Fla. to N. C.—Sum.—*G. mollis* Nashii Vail has stem only lightly pubescent.

**14. *G. Elliottii* Nutt.** Stem retrorse-hirsute (or silky in *G. Elliottii* Leavenworthii T. & G.): leaves evergreen or nearly so; leaflets 2-3 cm. long; blades elliptic: calyx 7-10 mm. long; the upper lip and lower lobe conspicuously longer than the lateral lobes: standard 11-13 mm. long; keel-petals 10-12 mm. long: pod elliptic, 3-4 cm. long.—Low pinelands, Coastal Plain and occasionally adj. provinces, Fla. to Tenn. and N. C.—Sum.

**51.a PUERARIA DC.** Woody vines. Leaflets 3. Panicles raceme-like, dense, stiff. Calyx 2-lipped: the lobes longer than the campanulate tube. Corolla showy, purple or purplish: blade of the standard suborbicular: wings and keel-petals with rather short claws. Ovary short-stipitate. Pods flat, narrow, rather long.—About 10 species, Asiatic. The following is widely cultivated.

**1. *P. Thunbergiana* (S. & Z.) Benth.** Stem and branches hirsute, becoming woody and glabrous, greatly elongate: leaflets 3-6 inches long; blades rhombic or ovate-rhombic, more or less lobed, abruptly acuminate, short-petioluled; panicles short-peduncled, raceme-like, mostly 1-2.5 dm. long; flowers pedicelled; calyx campanulate, 9-11 mm. long, purple-tinged; lobes longer than the tube, the lower lobe the longer: corolla mainly dull reddish-purple; standard about 2 cm. long, the blade suborbicular, with a yellow blotch at the base: blades of the keel-petals longer than the claws: pod linear, 4-5 cm. long, shaggy-pubescent.—(KUDZU VINE.)—Road-sides, fence-rows, and woods, various provinces, E U. S. generally. Nat. of E. Asia.—Sum.—fall.

**52. FALCATA Gmel.** Herbaceous vines. Leaflets 3. Racemes or panicles several-many-flowered. Calyx 2-lipped, the upper lip broader than the lobes of the lower lip which are shorter than the tube. Corolla not showy, blue, violet, or white: blade of the standard obovate: wings and keel-petals with elongate claws. Ovary stipitate. Pod rather flat, short. [*Amphicarpa* Ell.]—About 7 species, natives of North America and Asia.

**1. *F. comosa* (L.) Kuntze.** Leaflets 3-10 cm. long; blades ovate to ovate-lanceolate: calyx 6-8 mm. long; upper lip deltoid; lower lobes triangular-subulate, less than 1/2 as long as the tube: blades of the keel-petals much shorter than the claws: pod 2.5-3 cm. long. [*A. monoica* Nutt.]—Meadows, thickets, and rich or damp woods, various provinces, Fla. to La., Nebr., Minn., and N. B.—Sum.—*F. Pitcheri*, originally described from Ark., differing in the longer calyx-lobes and shorter claws (slightly longer than the blades) of

the wings and keel, may occur east of the Mississippi River. Subterranean 1- or 2-seeded pods are often produced after the manner of the peanut of commerce. These are known as HOG-PEANUTS.—Sum.

**53. BRADBURYA** Raf. Vines. Leaflets 3, or 5 or 7. Racemes few-flowered. Calyx 2-lipped, the upper lip shorter than the lobes of the lower lip, which are much longer than the tube. Corolla pink, blue, violet, or white: blade of the standard suborbicular or reniform spurred above the base on the outside: wings and keel-petals with short claws, the blades of the latter strongly curved, narrower than those of the former, and with a prominent auricle at the base. Pod elongate, long-beaked, its margins thickened. [*Centrosema* Benth.]—About 30 species, American.—BUTTERFLY-PEAS.—The corollas of our species are mainly violet.

Lateral lobes of the lower calyx-lip as long as the median one: upper lobes subulate: bracts acuminate.

Lateral lobes of the lower calyx-lip much shorter than the median one: upper lobes lanceolate: bracts acute.

Blades of the leaflets cordate or subcordate at the base: lateral lobes of the lower calyx-lip much longer than the lobes of the upper lip.

Blades of the leaflets rounded at the base: lateral lobes of the lower calyx-lip about as long as the lobes of the upper lip.

1. *B. virginiana*.

2. *B. arenicola*.

3. *B. floridana*.

1. ***B. virginiana*** (L.) Kuntze. Leaflets 3–11 cm. long; blades linear, often narrowly so and elongate, to ovate, with distinct scalloped marginal veins: upper calyx-lobes nearly as long as the lower ones, like the lateral ones of the lower lip, setaceous-subulate: blade of the standard 21–25 mm. wide or larger: pod slender-linear, 7–14 cm. long, 3.5–4 mm. wide: seed ellipsoid-cylindric, 2.5–3.5 mm. long. [*C. virginiana* Benth.]—Pinelands, hammocks, sandy fields, and scrub, usually in acid soil, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and N. J.

2. ***B. arenicola*** Small. Leaflets 2–5 cm. long; blades ovate to elliptic-ovate, retuse, blunt, or minutely apiculate at the apex, cordate or subcordate at the base: bracts ovate: upper calyx-lip much shorter than the lower one, its lobes and the lateral lobes of the lower lip lanceolate: blade of the standard 25–30 mm. wide: pod not seen.—Pinelands, C pen. Fla.—Sum.

3. ***B. floridana*** Britton. Plant similar to *B. arenicola* in habit: leaflets 2–8 cm. long; blades lanceolate to oval, obtuse or acutish at the apex, rounded at the base: bracts ovate: calyx similar to that of *B. arenicola*, but somewhat smaller, but the corolla larger: pod 8–15 cm. long, 5–6 mm. wide; seed sub-cylindric, 6–7.5 mm. long.—Pinelands, Fla.

**54. CLITORIA** L. Vines. Leaflets several. Racemes or panicles 1-several-flowered. Calyx 2-lipped, the lobes of the upper lip partly united, resembling the lateral lobes of the lower lip, but often shorter. Corolla blue, purple, red, or white: standard erect, the blade suborbicular: blades of the

wings and the keel-petals long-clawed, often adherent, those of the former not auricled, those of the latter very small. Style curved, pubescent. Pod narrow, somewhat flattened.—About 6 species, natives of the Old World tropics.

1. **C. Ternatea** L. Stem and branches high-twining: leaflets 5–7 cm. long; blades ovate, oval, or orbicular: calyx 16–19 mm. long; lobes of the upper lip acute: standard 40–50 mm. long; blades of the keel-petals longer than the claws: pod 8–11 cm. long.—(BLUE-PEA.)—Pinelands and hammocks, Everglade Keys, Fla., and Florida Keys.—Grown extensively, as an ornamental vine. The deep-blue, or rarely white, flowers are very conspicuous. Nat. of E. I.—(W. I.)—All year.

55. **MARTIUSIA** Schult. Erect or diffuse herbs with long roots. Leaflets 3. Racemes few-flowered. Calyx 2-lipped, the lobes of the upper lip slightly united. Corolla violet-blue or blue: standard erect, the blade obovate or rhombic: blades of the wings and keel-petals long-clawed, those of the former small, auricled at the base. Style curved. Pod narrow, turgid.—About 8 species, all American,—BUTTERFLY-PEAS. PIGEON-WINGS.

Leaflets of the upper leaves with ovate, elliptic-ovate, or ovate-lanceolate blades: pod with a stipe shorter than the calyx. 1. *M. mariana*.  
 Leaflets of the upper leaves with linear or linear-elliptic blades: pod with a stipe longer than the calyx. 2. *M. fragrans*.

1. **M. mariana** (L.) Small. Stem 3–12 dm. long, diffuse, or rarely twining, green: leaflets of the upper leaves 2.5–7 cm. long; blades ovate, elliptic-ovate, or ovate-lanceolate, not reticulate, green: calyx 21–23 mm. long; median lobe of the lower lip much longer than the lateral ones: corolla mainly pale-blue: standard 5–6 cm. long: blades of the keel-petals shorter than the claws: anthers ellipsoid: pod 4–7 cm. long, or rarely shorter, green, short-stipitate. [*Clitoria mariana* L.]—Woods, riverbanks, and pinelands, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. Y.—Sum. or spr. S.

2. **M. fragrans** Small. Stem 1–5 dm. tall, erect, often sparingly branched, glaucous: leaflets of the upper leaves 2–5 cm. long; blades linear or linear-elliptic, reticulate, glaucous: calyx 14–16 mm. long; median lobe of the lower lip slightly longer than the lateral ones: corolla pale-purple: standard 4.5–5 cm. long: blades of the keel-petals about as long as the claws: anthers oval: pod 6–8 cm. long, glaucous, long-stipitate. [*Clitoria fragrans* Small]—Scrub and sandhills, S. part of lake region, Fla.—Spr.

**56. GLYCINE** L. Vines with tuberous rootstocks. Leaflets 5-9. Racemes or panicles many-flowered, dense. Calyx 2-lipped: upper lip broad, often 2-lobed: lower lip 3-lobed. Corolla red, purple, or chocolate-colored: standard reflexed, the blade often broader than long: blades of the wings and keel-petals short-clawed, the former auricled at the base, those of the latter spiral. Style spiral, glabrous. Pod turgid. [*Apios* Moench.]—Five species, natives of North America and Asia.

Corolla brownish-purple or chocolate-colored: standard with the blade rounded or retuse at the apex: lower calyx-lobe ovate.

Corolla greenish-white, tinged near the apex with rose-purple or magenta: standard with the blade produced into a spongy appendage at the apex: lower calyx-lobe subulate.

1. *G. Apios*.

2. *G. Priceana*.

1. *G. Apios* L. Rootstock bearing numerous fleshy oblong, oval, or globose tubers 1-2 cm. thick: leaflets 5-7, or rarely 3; blades ovate to lanceolate, 3-10 cm. long: calyx 4-5 mm. long: standard 9-13 mm. long: pod 6-12 cm. long. [*Apios tuberosa* Moench.]—(GROUNDNUT.)—Thickets, meadows, river-banks, and low grounds, various provinces, Fla. to Tex., Minn., and N. B.—Sum.—fall.—The tubers were an important aboriginal food.

2. *G. Priceana* (B. L. Robinson) Britton. Rootstock bearing an obovoid-spheroidal tuber mostly 12-20 cm. thick: leaflets 5-9, rarely 3; blades ovate to ovate-lanceolate: calyx 8-10 mm. long: standard 25-30 mm. long: pod 12-15 cm. long. [*Apios Priceana* B. L. Robinson]—Rocky woods, Interior Low Plateaus, Tenn. and Ky.—Sum.

**57. PHASEOLUS** [Tourn.] L. Vines or diffuse plants. Leaflets 3 or rarely 1. Racemes or panicles simple or branched. Calyx short and very broad, 2-lipped, the upper lip entire or broadly 2-lobed, the lower lip 3-lobed. Corolla variously colored: blades of the wings much smaller than that of the standard, short-clawed: blades of the keel-petals not dilated at the base, short-clawed. Style curved. Seed with rounded ends.—About 470 species, natives of warm and temperate regions.—BEANS. PHEASANT-FLOWERS.—The various species and varieties furnish a great variety of beans for human food.

Perennial native plants: ovary glabrous.

Stem trailing: leaflets mostly broader than long.

Stem climbing: leaflets mostly longer than broad.

Blade of the terminal leaflet not hastate.

Blade of the terminal leaflet hastate.

Annual introduced plants: ovary pubescent.

Standard blade 7-14 mm. wide: wings 8-15 mm. long.

Calyx 5-6 mm. long: pod turgid: seeds tumid.

Stem glabrous or puberulent: pod broad, over 1 cm. wide, 12-20 cm. long.

Stem retrorse-hirsute: pod narrow, less than 1 cm. wide, 7-9 cm. long.

Calyx 3-4 mm. long: pod flat: seeds flat.

Standard blade 20-30 mm. wide: wings 30-34 mm. long.

1. *P. sinuatus*.

2. *P. polystachyus*.

3. *P. smilacifolius*.

4. *P. vulgaris*.

5. *P. angularis*.

6. *P. lunatus*.

7. *P. adenanthus*.

1. *P. sinuatus* Nutt. Stem glabrous or nearly so, trailing, 1-4 m. long, branching; leaflets 3; blades deltoid-ovate in outline with 3 more or less

prominent lobes, 2-4 cm. long, reticulate, mucronulate, truncate or very broadly cuneate at the base: racemes several times longer than the subtending leaves, simple; rachis wire-like: pedicels 5-10 mm. long: calyx campanulate, 2.5-3 mm. long; lobes rounded or apiculate: corolla pale-purple; standard with a blade nearly 1 cm. wide: pod somewhat scimitar-shaped, 3.5-4 cm. long.—(WILD-BEAN.)—Dry pinelands and hammocks, Coastal Plain, Fla. to Miss. and N. C.—Sum. or all year S.

2. *P. polystachyus* (L.) B. S. P. Stem minutely pubescent, climbing, 1-4 m. long, branching: leaflets 3, the blades ovate to orbicular-ovate, 4-10 cm. long, acuminate, often conspicuously nerved, rounded or subcordate at the base: racemes or panicles slender, surpassing the subtending leaves, simple or compound, short-peduncled: pedicels 4-8 mm. long: calyx campanulate, 2.5-3 mm. long; lobes rounded or somewhat triangular: corolla purple or whitish: pod scimitar-shaped, 4-8 cm. long, often glaucous. [*P. perennis* Walt.]—(BEAN-VINE.)—Woods, stream-banks, and thickets, often in alluvial soil, various provinces, Fla. to Tex., Neb., Minn., Ont., and Me.—Sum.—fall.

3. *P. smilacifolius* Pollard. Stem minutely pubescent, twining, 1-4 m. long, branching: leaflets 3, the blades very thin, ovate in outline, 4-8 cm. long, acute, more or less distinctly 3-lobed, soon glabrous: racemes usually shorter than the subtending leaves: pedicels slender, 5-15 mm. long: calyx glabrous, campanulate, 2.5-3 mm. long; lobes rounded: standard pink or white; blade about 1 cm. wide: wings 12-14 mm. long; pod 5-6 cm. long.—Hammocks, pen. Fla.—Spr.—fall.

4. *P. vulgaris* L. Stem erect or climbing: petioles glabrous or puberulent: leaflets 5-12 cm. long; blades broadly ovate or that of the terminal one rhombic-ovate or orbicular-ovate, mostly acuminate: panicles cluster-like, few-flowered: middle lobe of the lower calyx-lip triangular-lanceolate: standard white to purple; blade 12-16 mm. wide: wings 14-17 mm. long: pod linear, straight or slightly curved: seed 12-20 mm. long.—(STRING-BEAN. POLE-BEAN. KIDNEY-BEAN.)—Pinelands, hammocks, and waste-places, various provinces, Fla. to Tex.—Sum.—fall or all year S. Nat. of Eu. and cult.

5. *P. angularis* (Willd.) W. F. Wight. Stem erect, 1 m. tall or less, usually branched: petioles retrorse-hirsute: leaflets 3; blades 5-11 cm. long, rhombic-ovate or that of the terminal one rhombic, somewhat hastately lobed, those of the lateral ones usually only on one side: lobes of the upper calyx-lip broadly rounded, glabrous or nearly so, those of the lower lip deltoid, long-hirsute: standard yellowish; blade reniform, 12-15 mm. wide: wings about 1 cm. long: pod narrowly linear, turgid, mostly 7-9 cm. long, often slightly curved near the apex: seed 4-6 mm. long.—(ADZUK-BEAN. SELF-PERPETUATING PEA.)—Fields, roadsides, and stream-banks, Coastal Plain, S Miss. and S La. Nat. of Asia.—Sum.

6. *P. lunatus* L. Stems twining or rarely erect: leaflets 3, the blades 4-9 cm. long, triangular or rhombic, mostly acute: panicles elongate, raceme-like, many-flowered: middle lobe of the lower calyx-lip broadly deltoid: standard greenish-white; blade 7-10 mm. wide: wings 8-10 mm. long: pod broad, scimitar-shaped.—(LIMA-BEAN.)—Hammocks and cult. grounds, Fla.—Sum. or all year S. Nat. of Eu. and cult.

7. *P. adenanthus* G. W. F. Meyer. Leaflets 2.5–6 cm. long; blades ovate to elliptic-ovate, mostly acute: panicles slightly elongate, several-flowered: lobes of the lower calyx-lip triangular-lanceolate: standard yellow, tinged with purple; blade 20–30 mm. wide; wings 30–34 mm. long, purple-striped: pod linear, curved.—Pinelands, S pen. Fla. Nat. of trop. Am. and cult.—Sum.-fall or all year S.

58. **STROPHOSTYLES** Ell. Vines or trailing plants. Leaflets 3. Racemes or panicles cluster-like. Calyx similar to that of *Phaseolus*, but the lower lip with a longer middle lobe. Corolla mainly pink-purple or white: blades of the keel-petals widely dilated at the base. Style spiral. Seed with truncate ends. About 6 species, American.—WILD-BEANS. SAND-BEANS. TRAILING-BEANS.

Calyx gaping; tube glabrous; lateral lobes much smaller than the others: ovary and pod glabrous.

Perennial plant: blades of the wing-petals cuneate.

1. *S. umbellata*.

Annual plants: blades of the wing-petals not cuneate.

2. *S. helvola*.

Calyx not gaping; tube hirsute; lateral lobes not much smaller than the others: ovary and pod densely pubescent.

3. *S. pauciflora*.

1. *S. umbellata* (Muhl.) Britton. Stem trailing: leaflets 1–4 cm. long; blades elliptic-lanceolate, varying to ovate or lanceolate: corolla pink or pale-purple, often fading yellowish; blade of the standard reniform, 1–2 cm. broad: pod 2.5–5 cm. long. [*Phaseolus helvolus* (Chapm. Fl.)]—Dry sandy fields and woods, Coastal Plain and adj. provinces, Fla. to La., Mo., and N. Y.—Sum.-fall.

2. *S. helvola* (L.) Ell. Stem trailing: leaflets 2–4 cm. long; blades rhombic-oval, often 3-lobed: corolla purple or purplish, fading greenish; blade of the standard sub-orbicular, emarginate: pod 6–10 cm. long. [*Phaseolus diversifolius* (Chapm. Fl.)]—River shores and damp thickets, various provinces, Fla. to Tex., S. D., and Que.—Sum.-fall.

3. *S. pauciflora* (Benth.) S. Wats. Stem diffuse or trailing: leaflets 1.5–3.5 cm. long; blades linear to lanceolate: corolla pale-purple; blade of the standard 5–8 mm. broad: pod 2–3 cm. long. [*Phaseolus pauciflorus* Benth.]—River banks, various provinces, Miss. to Tex., Colo., S. D., and Ind.—Sum.-fall.

59. **VIGNA** Savi. Vines. Leaflets 3. Racemes or panicles cluster-like. Calyx slightly 2-lipped, the upper lip broad, shorter than the lower lip, the middle lobe of the lower lip slightly longer than the lateral ones. Corolla yellow or purple: blades of the wings and the keel-petals very broad, with an angular or reflexed auricle at the base. Pod narrow.—About 30 species, natives of warm and tropical regions.

Corolla mainly yellow: pod 6.5 cm. long or less: seeds irregular turgid, round-cubic, nearly or quite as thick as high: plant pubescent.

Blades of the leaflets acute or acuminate at the apex: lower lobes of the calyx acute or acuminate.

1. *V. repens*.

Blades of the leaflets rounded and emarginate at the apex: lower lobes of the calyx obtuse.

2. *V. marina*.

Corolla mainly purple or violet: pod 12 cm. long or more: seeds reniform, flattened, much thinner than high: plant glabrous.

3. *V. sinensis*.

1. **V. repens** (L.) Kuntze. Stem usually pubescent throughout: leaflets 2-8 cm. long; blades ovate to lanceolate or linear-lanceolate: calyx about 5 mm. long; lower lobe subulate, much longer than the lateral ones; lateral lobes longer than wide: standard 18-23 mm. wide: keel 16-19 mm. long: pod 4-6.5 cm. long. [*V. luteola* (Jacq.) Benth.]—Cult. grounds waste-places, woods, and thickets, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A.*)—All year.

2. **V. marina** (Berm.) Merrill. Stem pubescent mainly near the nodes: leaflets 3-11 cm. long; blades broadly ovate or orbicular-ovate, suborbicular, or orbicular-obovate: calyx about 4 mm. long; lower lobe deltoid, not longer than the tube; lateral lobes wider than long: corolla nearly as in *V. repens*: pod 4-6 cm. long.—Shores and waste-places, S. Fla.—(*W. I., O. W.*)—Spr.-fall.

3. **V. sinensis** (L.) Endl. Stem glabrous: leaflets 8-15 cm. long; blades ovate to ovate-hastate or hastate: calyx 7-9 mm. long; lower lobe much shorter than the tube, abruptly narrow from a broad base; lateral lobes gradually narrowed from the base: standard 2.5-3.5 cm. wide: pod 12-20 cm. long or more.—(*COW-PEA. CHINA-BEAN.*)—Waste-places, fields, and thickets, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. C. Nat. of Asia.—Sum.-fall.

60. **DOLICHOS** L. Herbs resembling *Phaseolus*, and with a similar calyx. Corolla with a prominently appendaged standard, very broad wings and narrow keel-petals which are bent at right-angles, but not coiled. Pod linear to scimitar-shaped.—About 30 species, all tropical.

1. **D. Lablab** L. Leaflets 5-13 cm. long; blades broadly ovate, or that of the terminal one ovate-reniform, acute or short-acuminate: bracts ribbed: calyx 9-11 mm. long; lobes of the lower lip lanceolate or elliptic-lanceolate: corolla purple, violet, or white; blade of the standard 16-21 mm. wide; wings 17-21 mm. long: pod elliptic, 6-8 cm. long, toothed-margined: seed 10-13 mm. long, with a white scar.—(*HYACINTH-BEAN. BLACK-BEAN. EGYPTIAN-BEAN.*)—Pinelands, hammocks, and waste-places, pen. Fla., and the Keys. Nat. of E. I., and cult.—(*W. I.*)—Frequently grown as an ornamental vine. The erect panicles of white or tinted flowers are conspicuous. One-half the stamen-tube is illustrated.

61. **CANAVALI** Adans. Vines. Leaflets 3. Racemes or panicles mostly erect. Calyx prominently 2-lipped, the upper lip very broad, longer than the lower lip, the 2 lobes broadly rounded, the lower lip with 3 small lobes. Corolla variously colored or white, often conspicuous: blades of the wings and keel-petals narrow, those of the latter with a prominent curved auricle at the base. Pod broad.—About 15 species, natives of tropical and subtropical regions.

Blades of the leaflets obtuse or retuse at the apex: pod mostly less than 15 cm. long: seed brown. 1. *C. lineata*.  
 Blades of the leaflets abruptly acute or acuminate: pod mostly over 15 cm. long: seed red or white. 2. *C. gladiata*.

1. *C. lineata* (Thunb.) DC. Leaflets 4–10 cm. long; blades fleshy-coriaceous, suborbicular to oval or obovate: calyx sparingly pubescent; lower lobes obtuse: corolla pink or rose-purple: pod 10–12 cm. long. [*C. obtusifolia* (Lam.) DC.]—(BAY-BEAN. JUNE-BEAN.)—Coastal sand-dunes, Fla. and Tex., and sandy shores of Lake Okeechobee, Fla.—(*W. I., Mex., C. A., S. A., O. W.*)—All year.—The stem and branches trail.

2. *C. gladiata* (Savi.) DC. Leaflets 5–12 cm. long; blades ovate, oval, or elliptic-ovate, chartaceous: calyx glabrous (?); lower lobes acute: corolla white or purple, sometimes tinged with yellow: pod 15–25 cm. long.—(HORSE-BEAN.)—Waste-places and cult. grounds, Fla. Nat. of E. I.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.—The stem and branches climb.

62. *AESCHYNOMENE* L. Annual erect or diffuse plants. Leaflets several or many. Racemes several-flowered. Calyx spathe-like, the lips respectively minutely 2-lobed and 3-lobed. Corolla yellow or reddish: standard with a broad blade: wings and keel-petals with narrow curved blades which are auricled at the base. Ovary bent, sparingly muricate. Loment several-jointed, the sections oval or quadrate.—About 55 species, widely distributed in warm and tropical regions.—SENSITIVE JOINT-VETCHES. SHY-LEAVES.

Standard-blade oval or ovate: pod with nearly quadrate sections. 1. *A. virginica*.  
 Standard-blade suborbicular: pod with hemispheric or oval sections.  
 Leaflets separated; blades entire; pod-sections about 6 mm. wide. 2. *A. pratensis*.  
 Leaflets nearly contiguous; blades ciliate-denticulate near the apex: pod-sections about 3 mm. wide. 3. *A. americana*.

1. *A. virginica* (L.) B. S. P. Plant 2–15 dm. tall: leaflets mostly 25–55: blades linear to elliptic-linear, 3–12 mm. long: calyx-lips 3–3.5 mm. long: blades of the keel-petals and wing-petals very narrow above the auricle: pod almost straight-edged, the valves not reticulate. [*Ae. hispida* Michx.]—Swamps, river-banks, ditches, and low grounds, Coastal Plain, and occasionally adj. provinces, Fla. to Tex., Pa., and N. J.—(*W. I., Mex.*)—Sum.-fall.

2. *A. pratensis* Small. Plant 9–20 dm. tall: leaflets mostly 15–25; blades narrowly elliptic, 5–6 mm. long: calyx-lips 4.45 mm. long: blade of the standard suborbicular, 10–13 mm. wide; blades of the keel and wing-petals slightly narrowed above the auricles: pod scalloped-edged, the sections oval, reticulate.—Everglades, S. pen. Fla.—All year.—The lower part of the stem is usually thickly coated with spongy tissue.

3. *A. americana* L. Plant up to 2 m. tall: leaflets mostly 21–61; blades nearly linear, 3–9 mm. long, mucronate and ciliate-denticulate near the apex: calyx-lips about 4 mm. long; blades of the keel-petals and wing-petals somewhat obovate above the auricle: pod straight on one edge, scalloped on the other, the sections nearly half-orbicular, pubescent and often warty on the faces.—Waste-places, road-sides, and ditches, M pen. Fla.—Spr.—sum.

63. **SECULA** Small. Herbs with prostrate stems and branches. Leaflets few. Panicles few-flowered. Calyx 2-lipped; upper lip with 2 broad lobes; lower lip with 3 lobes. Corolla yellowish or purplish: standard with a very broad blade: wings and keel-petals auricled on one side, the keel-petals with the narrower blades and abruptly bent. Loment few-jointed, the sections half-orbicular.—About 10 species, most abundant in tropical America.—Spr.—fall.

Leaflets mostly 5–7; blades prominently reticulate beneath: loment viscid-pubescent; joints about 5 mm. long. 1. *S. viscidula*.

Leaflets mostly 17–25; blades not reticulate: loment not viscid; joints about 3 mm. long. 2. *S. Hystrix*.

1. *S. viscidula* (Michx.) Small. Plant sticky-pubescent, the branches 1–12 dm. long, with many short spreading hairs: leaflets 5–7, or rarely more; blades obovate to cuneate, 3–12 mm. long, prominently reticulate and sparingly pubescent beneath with stiff hairs: lateral lobes of the lower calyx-lip obtuse: standard 5–6 mm. long: ovary copiously pubescent: loment-joints about 5 mm. long and 4 mm. wide, pubescent with short viscid hairs and long stiff hairs. [*Aeschynomene viscidula* Michx.]—Pinelands, sandhills, and sandy woods, Coastal Plain, Fla. to Miss. and S. C.

2. *S. Hystrix* (Poir.) Small. Plant fine-pubescent, the branches mostly less than 1 m. long, closely pubescent with minute hairs and with fewer long spreading hairs: leaflets 17–25 or rarely fewer; blades narrowly elliptic to linear-elliptic, 3–5 mm. long, not reticulate, copiously pubescent beneath with lax hairs: lateral lobes of the lower calyx-lip acute: standard 4.5–5 mm. long: ovary sparingly pubescent: loment-joints about 3 mm. long and 2.5 mm. wide, pubescent with short crisped hairs.—Waste-places and road-sides, W Fla. Nat. of trop. Am.

64. **ARACHIS** L. Perennial low herbs. Leaflets few: blades entire. Flowers solitary in the lower leaf-axils. Calyx 2-lipped, the upper lip broad, 3-lobed at the apex, the lower lip narrow and elongate. Corolla yellow or whitish: standard very broad, notched at the apex: wings with relatively large and broad blades: keel-petals much smaller than the wings, auricled. Pod subterranean, turgid, constricted between the seeds.—Six or seven species, mostly South American.

1. *A. hypogaea* L. Stem and branches decumbent: leaves rather numerous; stipules linear-lanceolate, acuminate; leaflets usually 4, the blades elliptic to

obovate, 1.5–5 cm. long, finely pubescent: flowers slender-pedicelled: calyx 9–11 mm. long: corolla yellow; standard 12–15 mm. long, the blade suborbicular; keel much shorter than the wings: pod 2–8 cm. long, reticulate.—(PEANUT. PINDERS. GOOBER NUT.)—Waste-places, old fields, roadsides, and hammocks, pen. Fla. Nat. of S. A. and cult.—Sum.—fall or all year S.—Grown, commercially, in many tropic and temperate countries for its seeds—“nuts”—which are used as a food and a confection. Although only locally escaped in most regions, in others, especially in south-eastern N. C., it is abundantly established.

**65. ZORNIA** Gmel. Annual or perennial herbs. Leaflets 2 or 4. Spikes conspicuously bracted. Flowers of one kind. Corolla yellow or variously colored: standard with a broad blade: blades of the wings broadened upward, auricled on one side: blades of the keel-petals lunate, not auricled. Loment with several indehiscent joints.—About 12 species, all American.

**1. Z. bracteata** (Walt.) Gmel. Stem 1–7 dm. tall, strigillose: leaflets often 4; blades oval to elliptic or nearly linear: spikes few-flowered; bracts 7–11 mm. long, reticulate, auricled: calyx-lobes ciliate, the lower one about as long as the tube: corolla yellow; standard 9–12 mm. long: pod 1–2 cm. long, 3–4-jointed. [*Z. tetraphylla* Michx.]—Pinelands, and sandy roadsides, Coastal Plain, Fla. to Tex. and Va.—(Mex.)—Spr.—sum.

**66. STYLOSANTHES** Sw. Perennial tufted herbs. Leaflets 3; blades veiny. Flowers of two kinds, the one complete, but sterile, the other without perianth, but fertile. Corolla yellow or orange: standard with a very broad blade: blades of the wings and the keel-petals auricled, the latter incurved. Loment turgid, 1- or 2-jointed, the lower joint empty, the upper one veiny, opening at the apex.—About 30 species, natives of warm and temperate regions.—PENCIL-FLOWERS.

Flower accompanied by an appendage within the bract: standard scarcely clawed: calyx of complete flower less than 3 mm. long: pod slender-beaked.

Pod with soft, silky hairs mostly on the lower joint; upper joint curved into a hook.

Pod with stiff white hairs all over both joints; beak straight or curved at the apex.

Flower not accompanied by an appendage within the bract: standard decidedly clawed: calyx of complete flower about 4 mm. long: pod stout-beaked.

Blades of the leaflets prevailingly narrow, narrowly elliptic to lanceolate or oblanceolate: calyx with middle lobe of lower lip lanceolate: terminal joint of pod with the beak lateral.

Blades of the leaflets prevailingly broad, oval to broadly oblanceolate or cuneate-obovate: calyx with middle lobe of lower lip ovate: terminal joint of pod with the beak nearly axial.

1. *S. hamata*.

2. *S. calcicola*.

3. *S. biflora*.

4. *S. riparia*.

1. *S. hamata* (L.) Taub. Stem stout, ascending or decumbent: blades of the leaflets elliptic to elliptic-obovate, 1-2 cm. long or shorter, sparingly pubescent, acute: lobes of the calyx-lips in the complete flower obtuse: style in the incomplete flower, as long as the ovary or longer: terminal joint of the pod obliquely ovoid, with few cross-ribs, the beak as long as the body or nearly so, hooked.—Hammocks, Florida Keys and locally in the peninsula.—All year.

2. *S. calcicola* Small. Stem slender, decumbent or prostrate: blades of the leaflets linear-elliptic, or slightly broadest above the middle, to linear-subulate, mostly 1 cm. long or less, glabrous, slenderly acuminate: lobes of the calyx-lips in the complete flower usually acutish or acute: style in the incomplete flower much shorter than the ovary: terminal joint of the pod ellipsoid, with several cross-ribs, the beak much shorter than the body, curved.—Pinelands, Everglade Keys, S Fla.—All year.

3. *S. biflora* (L.) B. S. P. Stem and branches upright, usually stiff, finely pubescent, (more or less hispid in *S. biflora hispidissima*): leaflets 0.9-3.5 cm. long; blades prevailing narrowly elliptic varying to lanceolate or oblanceolate, or sometimes nearly linear: terminal joint of the pod very inequilateral, mostly 4-5 mm. long, the beak lateral. [*S. elatior* Sw. *S. hispida procumbens* Pursh.]—Dry sandy soil, often in woods, various provinces, Fla. to Tex., Kans., and N. Y.—Sum.—*S. floridana* Blake has less hispid inflorescence.

4. *S. riparia* Kearney. Stem and branches decumbent, sometimes long and pliable, finely pubescent: leaflets 1-1.8 cm. long; blades prevailing oval to broadly oblanceolate or cuneate-obovate: terminal joint of the pod slightly inequilateral, mostly 3-4 mm. long, the beak nearly axial.—Sandy soil, often on grassy banks, various provinces, Fla. to Tex., Mo., and Pa.—Sum.—Forms with rather narrow leaflets, except on the lower parts of the branches, occur in the range.

67. **CHAPMANNIA** T. & G. Perennial herbs. Leaflets 5-7. Flowers of two kinds, the one perfect but not fruit-producing, the other imperfect and fruit-producing. Calyx 2-lipped; upper lip with 4 short lobes; lower lip with 1 longer lobe. Corolla yellow, fugaceous: standard with an elliptic suborbicular blade: wings and keel-petals dissimilar in shape, neither auricled. Loment nearly terete, 1-4-jointed.—One species.

1. *C. floridana* T. & G. Plant 2-11 dm. tall, hirsute, virgately branched: leaflets 5-7; blades narrowly elliptic, oblanceolate, cuneate, or obovate, 5-20 mm. long: calyx becoming 7-10 mm. long: standard 10-13 mm. long: pod 1-3 cm. long, the sections longitudinally striate, hispid.—(ALICIA).—Dry pinelands, pen. Fla.—Spr.—sum.

**68. MEIBOMIA** Heister. Herbs or shrubs, sometimes vines. Leaflets 3, or rarely 1 or 5. Racemes simple or compound. Calyx 2-lipped, sometimes obscurely so, the middle lobe of the lower lip often smaller or narrower and longer than the lateral ones. Corolla variously colored or white: standard with a broad blade: blades of the wings and the keel-petals auricled on one side, short-clawed. Loment few-several-jointed, usually with hooked hairs. [*Desmodium* (Fl. SE. U. S.)]—About 160 species, natives of temperate and tropical America, Asia, and Australia.—Sum.—fall or all year in S Fla.—The corollas of our species are purple or violet, or rarely white.—TICK-TREFOILS. STICK-TIGHTS. TICK-CLOVERS.—Species are grown for fodder.

Loment constricted into nearly separate rhomboidal, half-rhomboidal, or half-orbicular joints.

Loment straight above, deeply constricted below, long-stalked.

Peduncle arising from the base of the plant: pod long-stipitate.

Peduncle terminating the stem: pod short-stipitate.

Loment constricted both above and below, but usually much more deeply below than above.

Constrictions deeper below than above.

Stem and branches trailing or reclining.

Stem and branches erect or ascending.

Constrictions equally deep on both edges of the loment.

Loment not constricted into separate joints, straight above, merely undulate below.

I. NUDIFLORAE.

II. GRANDIFLORAE.

III. ROTUNDIFOLIAE.

IV. PANICULATAE.

V. PURPUREAE.

VI. SUPINAE.

#### I. NUDIFLORAE

Leaves approximate at the top of the sterile stem: flowering stem (peduncle) leafless.

1. *M. nudiflora*.

#### II. GRANDIFLORAE

Leaves more or less clustered at the base of the peduncle: corolla purple.

2. *M. acuminata*. ✓

Leaves scattered, distant, along the stem: corolla white.

3. *M. pauciflora*. ✓

#### III. ROTUNDIFOLIAE

Blades of the leaflets narrow, elliptic to linear.

4. *M. polymorpha*.

Blades of the leaflets broad, suborbicular to ovate.

Leaflets with suborbicular blades, or if narrower, the racemes axillary.

Leaflets mostly less than 2.5 cm. long, leathery, the blades glabrate.

5. *M. arenicola*.

Leaflets mostly over 2.5 cm. long, the blades membranous, pubescent.

6. *M. Michauxii*.

Leaflets with ovate or oval blades: racemes terminal as well as axillary.

Corolla cream-colored or ochroleucous: stipules ovate: racemes mostly simple.

7. *M. ochroleuca*.

Corolla purple: stipules subulate: racemes mostly paniculate. ✓

8. *M. glabella*.

#### IV. PANICULATAE

Petioles wanting or very short.

9. *M. sessilifolia*.

Petioles manifest.

Leaflets with narrowly linear blades.

Joints of the pod with a nearly straight or a depressed back, somewhat triangular in outline.

10. *M. stricta*.

Joints of the pod with a rounded back, not triangular in outline.

11. *M. tenuifolia*. — ✓

Leaflets with lanceolate to ovate or rhomboidal blades, not linear, except in No. 17.

Joints of the loment manifestly longer than broad.

Bracts subtending the flowers small and inconspicuous: blades of the leaflets reticulate.

12. *M. canescens*.

Bracts subtending the flowers conspicuous, mostly over 1 cm. long: blades of the leaflets not reticulate.

Leaves pubescent: bracts ciliate and pubescent.

13. *M. longifolia*.

Leaves glabrous: bracts not ciliate and otherwise glabrous.

14. *M. grandiflora*.

Joints of the loment barely longer than broad.

Loment-joints predominantly more than 3.

Loment long-stipitate.

Leaflet-blades glabrous or sparingly pubescent beneath, but not velvety.

Leaflet-blades green beneath.

Loment-joints rounded or angled on the dorsal suture, thus scalloped.

Leaflet-blades thin, not reticulate, glabrous or finely pubescent beneath.

Blades of the leaflets broad, of an elliptic, ovate or lanceolate type.

Stem glabrous or nearly so: joints of the loment rounded on the ventral side, curved on the dorsal.

Stem puberulent or finely pubescent: joints of the loment prominently angled on the ventral side, somewhat angled on the dorsal.

Blades of the leaflets narrow, of a linear or linear-lanceolate type.

Leaflet-blades thick, reticulate-veined rather stiffly pubescent beneath.

Loment-joints straight on the back, the dorsal suture thus nearly even.

Leaflet-blades glaucous beneath.

Leaflet-blades velvety beneath.

Loment sessile or short-stipitate.

Loment-joints predominantly fewer than 3.

Leaflet-blades scabrous or pubescent and ciliate.

Terminal leaflet usually twice as long as wide.

Terminal leaflet little longer than wide.

Leaflet-blades smooth and glabrous.

15. *M. paniculata*.

16. *M. pubens*.

17. *M. Chapmanii*.

18. *M. rhombifolia*.

19. *M. Dillenii*.

20. *M. laevigata*.

21. *M. viridiflora*.

22. *M. canadensis*.

23. *M. rigida*.

24. *M. ciliaris*.

25. *M. marylandica*.

#### V. PURPUREAE

Tall light-green plant, with slender spreading branches.

26. *M. purpurea*.

#### VI. SUPINAE

Depressed, prostrate, or reclining dark-green plant.

27. *M. cana*.

1. *M. nudiflora* (L.) Kuntze. Leaves clustered on the short decumbent or ascending stem: leaflets 2-8 cm. long, the blades oval or ovate: standard 8-10 mm. long: wings not auricled on the lower side: joints of the loment 3-3.5 mm. wide. [*D. nudiflorum* DC.]—Woodlands and hill-sides, various provinces, Fla. to La., Kan., Ont., and Me.

2. *M. acuminata* (Michx.) Blake. Leaves clustered at the end of the short erect stem: leaflets 8-13 cm. long, the blades broadly ovate to orbicular-ovate: standard 7-9 mm. long: wings minutely auricled on the lower side: loment-joints 4.5-6 mm. wide. [*D. acuminatum* Kuntze.]—Woodlands and thickets, various provinces, Fla. to Tex., Minn., Que., and Me.

3. *M. pauciflora* (Nutt.) Kuntze. Stem decumbent or ascending: leaflets 3: blades ovate or rhombic-ovate, 2.5-8 cm. long: corolla white: standard 4-5 mm. long: wings and keel-petals very narrow, diverging: loment-joints 5-5.5 mm. wide. [*D. pauciflorum* Nutt.]—Rich woods, various provinces, Fla. to Tex., Kans., Ont., and N. J.

4. *M. polymorpha* (A. Gray) Small. Stem spreading: stipules subulate or with a lanceolate base: leaflets 1-3; blades linear to elliptic, 1-3 cm. long: lateral calyx-lobes deltoid, acute: standard mostly over 4.5 mm. long: loment-joints half-rhombic, 3-3.5 mm. wide. [*M. arenicola polymorpha* Vail.]—Pinelands, Coastal Plain, Fla. to La.
5. *M. arenicola* Vail. Stem prostrate: stipules lanceolate: leaflets 1-5; blades ovate-orbicular to suborbicular, 1-2.5 cm. long: lateral calyx-lobes ovate, obtuse or acutish: standard mostly less than 4.5 mm. long: loment-joints elliptic or oval, but inequilateral, 2-2.5 mm. wide. [*D. lineatum* (Michx.) DC.]—Sandy soil, often in pine woods, Coastal Plain and adj. provinces, Fla. to La. and Md.
6. *M. Michauxii* Vail. Stem prostrate: stipules ovate: leaflets 3; blades suborbicular, 3-6 cm. long: lateral calyx-lobes lanceolate, longer than the tube, acuminate: standard 9-11 mm. long: loment-joints rounded on one side, half-rhombic on the other, about 3 mm wide. [*D. rotundifolium* (Michx.) DC.]—(DOLLAR-LEAF.)—Open woods and pinelands, various provinces, Fla. to La., Minn., Ont., and Mass.
7. *M. ochroleuca* (M. A. Curtis) Kuntze. Stem decumbent: leaflets 3; blades rhombic-ovate, yellowish-green, 2-5 cm. long: lower calyx-lobes lanceolate, longer than the tube, the middle one slightly the longest: standard 4-6 mm. long: keel-petals distinctly clawed: loment-joints oval to suborbicular, the sides glabrous.—Woods, Coastal Plain and adj. provinces, Fla. to Mo. and N. J.
8. *M. glabella* (Michx.) Kuntze. Stem procumbent: leaflets 2.5-8 cm long; blades ovate or oval, bright-green: lower calyx-lobes lanceolate, longer than the tube, the middle one the largest: standard 7-9 mm. long: keel-petals not auricled, the blade extending to the base: loment-joints half-rhombic, the sides pubescent. [*D. glabellum* DC. *D. humifusum* DC.]—Sandy soil, often in rocky places, various provinces, rarely Coastal Plain, Ala. to Mass.
9. *M. sessilifolia* (Torr.) Kuntze. Stem erect: stipules linear: leaflets 2-5 cm. long; blades linear or linear-elliptic, reticulate, pubescent beneath: lateral calyx-lobes deltoid, the markedly longer lower one triangular-lanceolate: standard 5-6 mm. long: wings dilated near the tip: loment-joints obliquely half-obovate, 3-3.5 mm. wide.—Woods, open slopes, and river shores, various provinces, Miss. to Tex., Kans., Mich., and Mass.
10. *M. stricta* (Pursh) Kuntze. Stem erect: stipules setaceous: leaflets 2-5 cm. long; blades linear, reticulate, glabrous: lateral calyx-lobes deltoid, the much longer lower one linear-subulate: standard 5-6 mm. long: wings not dilated at the apex: loment-joints obliquely half-obovate, 2-2.5 mm. wide. [*D. strictum* DC.]—Woods and pinelands, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. J.
11. *M. tenuifolia* (T. & G.) Kuntze. Stem lax: stipules subulate: leaflets 3-8 cm. long; blades linear: lateral calyx-lobes mostly shorter than the tube, the lower lobe not much longer: standard 3-4 mm. long, broadly obovate: androecium 3-4 mm. long: loment-joints obliquely obovate, about 2 mm. wide. [*D. tenuifolium* T. & G.]—Sandhills and pinelands, Coastal Plain, Fla. to La. and N. C.
12. *M. canescens* (L.) Kuntze. Stem erect: stipules ovate: leaflets 3-10 cm. long; blades ovate to ovate-rhomboid: lateral calyx-lobes lanceolate, longer than the tube, acute, the lower lobe longer and slender-tipped: standard 9-12

mm. long, narrowly obovate: androecium 9–11 mm. long: loment-joints half-rhombic, 4.5–5.5 mm. wide. [*D. canescens* DC.]—Fence rows, thickets, and edges of woods, various provinces, Fla. to Tex., Minn., Ont., and Mass.

13. *M. longifolia* (T. & G.) Vail. Stem erect: stipules ovate-lanceolate: leaflets 5–11 cm. long; blades lanceolate, lanceolate-ovate, or ovate, acuminate: lateral calyx-lobes subulate, the lower lobe much longer: corolla lilac-purple; standard elliptic-obovate, 7–9 mm. long: loment-joints inequilaterally rhombic, the one side very prominent.—Low woods, and stream-banks, various provinces, Ala. to La. and Ill.

14. *M. grandiflora* (Walt.) Stem erect: stipules lanceolate: leaflets 5–15 cm. long; blades ovate to ovate-lanceolate, cuspidate or long-acuminate: lateral calyx-lobes lanceolate, the lower lobe slightly longer: standard broadly obovate, 8–10 mm. long: loment-joints half-rhombic, the one side somewhat more prominent than the other. [*D. cuspidatum* Hook. *M. bracteosa* (L.) Kuntze.]—Barren hills, thickets, and clearings, various provinces, Fla. to Tex., Minn., Ont., and Me.

15. *M. paniculata* (L.) Kuntze. Stem glabrous or nearly so: stipules subulate: leaflets 3–9 cm. long; blades mainly elliptic to lanceolate, obtuse or acutish: lateral calyx-lobes triangular, sometimes deltoid, acute, the lower lobe decidedly longer and attenuate: standard cuneate or cuneate-obovate, 4.5–5.5 mm. long: keel-petals about as long as the standard: loment-joints 4–5 mm. wide, the ventral side prominently rounded, the dorsal side curved. [*D. paniculatum* DC.]—Dry soil, often in woods, various provinces, Fla. to Tex., Minn., Ont., and Me.

16. *M. pubens* (T. & G.) Young. Stem puberulent or finely pubescent: stipules subulate: leaflets 2–7 cm. long; blades mainly ovate-elliptic to elliptic-lanceolate, mostly twice or thrice as long as wide: lateral calyx-lobes triangular to ovate-triangular, the lower lobe slightly longer than the lateral ones: standard cuneate, 6–7 mm. long: keel-petals mostly longer than the standard: loment-joints 3–4 mm. wide, the ventral side rather prominently angled, the dorsal side angled. [*D. paniculatum pubens* T. & G.]—Woods and river-banks, Coastal Plain and rarely adj. provinces, Fla. to Tex., Okla., and Ark.

17. *M. Chapmanii* (Britton) Small. Stem puberulent or nearly glabrous: stipules subulate: leaflets 3–11 cm. long; blades linear or linear-lanceolate, several times longer than wide: lateral calyx-lobes deltoid or ovate-deltoid, the lower lobe much longer: standard obovate, 4–6 mm. long: keel-petals longer than the standard: loment-joints 4–5 mm. wide, the dorsal side prominently angled, the ventral side rounded. [*D. paniculatum angustifolium* T. & G. *M. paniculata Chapmanii* Britton]—Woods or low grounds, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Ark., and Va.

18. *M. rhombifolia* (Ell.) Vail. Stem pubescent: stipules subulate: leaflets 5–9 cm. long; blades ovate to ovate-lanceolate, pubescent beneath: lateral calyx-lobes lanceolate, the lower lobe scarcely longer: standard 6–9 mm. long: keel-petals mostly shorter than the standard: loment-joints 3.5–4 mm. wide, the ventral side abruptly rounded. [*D. floridanum* Chapm.]—Pinelands and open woods, Coastal Plain and adj. provinces, Fla. to La. and Va.

19. *M. Dillenii* (Darl.) Kuntze. Stem glabrous or sparingly pubescent: stipules subulate: leaflets 4–10 cm. long; blades elliptic or elliptic-ovate, not scabrous: lateral calyx-lobes lanceolate, the lower lobe longer but about as wide: corolla bright-purple; standard narrowly obovate, 5–6 mm. long: loment-joints obliquely rhombic, much longer than wide. [*D. Dillenii* Darl.]—Thickets and woods, various provinces, Fla. to Tex., Minn., Ont., and Me.

20. *M. laevigata* (Nutt.) Kuntze. Stem often glaucous: stipules subulate: leaflets 4–11 cm. long; blades ovate to ovate-elliptic, glabrous and glaucous beneath: lateral calyx-lobes lanceolate, the lower lobe decidedly longer: standard 8–9 mm. long: keel-petals mostly longer than the standard: loment-joints 2.5–3 mm. wide, the ventral side gradually rounded. [*D. laevigatum* (Nutt.) DC.]—Pinelands and dry woods, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. J.

21. *M. viridiflora* (L.) Kuntze. Stem downy: stipules lanceolate: leaflets 4–9 cm. long; blades elliptic to ovate or ovate-oblong, densely pubescent beneath: lateral calyx-lobes deltoid, shorter than the tube, the lower lobe lanceolate, longer and narrower; corolla pale-purple, turning green; standard broadly obovate, 6–9 mm. long: loment-joints about as wide as long, obliquely obovate. [*D. viridiflorum* Beck.]—Dry woods, various provinces, Fla. to Tex., Mo., Mich., and N. Y.

22. *M. canadensis* (L.) Kuntze. Stem pubescent: stipules lanceolate-linear: leaflets 4–10 cm. long; blades elliptic or elliptic-lanceolate, pubescent beneath: upper calyx-lip deeply notched; lateral calyx-lobes subulate-lanceolate, longer than the tube, the lower one scarcely longer: standard narrowly obovate, 8–10 mm. long: loment-joints obliquely obovate. [*D. canadense* (L.) DC.]—(BUSH TICK-CLOVER.)—River banks, woods, various provinces, rarely Coastal Plain, N. C. to Okla., Kans., Ont., and N. B.

23. *M. rigida* (Ell.) Kuntze. Stem minutely pubescent: leaflets 2.5–8 cm. long; blades ovate-elliptic or elliptic, pubescent and reticulate beneath: lateral calyx-lobes deltoid, acute, the lower lobe triangular: standard 4–5 mm. long: stipe of the loment much less than  $\frac{1}{2}$  as long as the joints. [*D. rigidum* DC.]—Dry thickets, various provinces, Fla. to Tex., Nebr., Mich., and Mass.

24. *M. ciliaris* (Muhl.) Blake. Stem hirsute or minutely pubescent: leaflets 1–2.5 cm. long; blades orbicular-ovate or oval, sparingly pubescent beneath: lateral calyx-lobes deltoid, acute, the lower lobe lanceolate: standard 4–5 mm. long: stipe of the loment  $\frac{1}{2}$  as long as the joint.—Dry soil, often on hillsides, and sandy fields, various provinces, Fla. to Tex., Nebr., Mich., and Ont.—(Mex.)

25. *M. marylandica* (L.) Kuntze. Stem glabrous or rarely with scattered hairs: stipules subulate: leaflets 1–2.5 cm. long; blades ovate or sometimes suborbicular or elliptic, glabrous or nearly so: lateral calyx-lobes ovate, obtuse, the lower lobe scarcely longer: standard 3.5–4.5 mm. long: loment-joints oblique. [*D. marylandicum* Boott *M. obtusa* (Muhl.) Vail]—Woods, thickets, and hillsides, various provinces, Fla. to La., Mo., Mich., and Mass.

26. *M. purpurea* (Mill.) Vail. Stem pubescent, 1–3.5 m. tall: stipules ovate: leaflets 2–11 cm. long; blades ovate, ovate-elliptic, or elliptic, pubescent, and often reticulate beneath: lateral calyx-lobes linear-lanceolate: standard 3.5–4 mm. long, cuneate at the base: keel-petals obliquely pointed: loment-joints suborbicular, over 2.5 mm. wide. [*D. tortuosum* (Sw.) DC.]—(FLORIDA-BEGGARWEED.)—Roadsides, fields, and hammocks, Coastal Plain, Fla. and Ga.—(W. I., Mex., C. A., S. A., O. W.)

27. *M. cana* (Gmel.) Blake. Shrub with glabrous or nearly glabrous stems: stipules lanceolate or ovate-lanceolate: leaflets about 2 cm. long; blades oval or elliptic: lateral calyx-lobes lanceolate: standard 5–6 mm. long, truncate or subcordate above the short claw: androecium 5–6 mm. long: loment-joints 1–1.5 mm. wide, much longer. [*D. incanum* DC. *M. supina* (Sw.) Britton]—Hammocks, S Fla.—(W. I., Mex., C. A., S. A., O. W.)

**69. SAGOTIA** Duch. & Walp. Perennial diffuse or prostrate herbs. Leaflets 3. Racemes much reduced, of 2-4 flowers in a cluster, axillary to or opposite a leaf, or flower solitary. Calyx 2-lipped, the upper lobes partly united. Corolla blue, purple, or white: standard with a broad long-clawed blade: blades of the wing-petals angled at the base. Loment few-jointed.—Three species, natives of the Old World, the following perhaps also native in the New.

**1. S. triflora** (L.) Duch. & Walp. Stem procumbent or trailing, pubescent, the branches more or less elongate, but closely creeping: leaflets 3-12 mm. long; blades broadly obovate or broadly cuneate; lateral calyx-lobes lanceolate-subulate: standard 3-4 mm. long, purplish-pink, cunately narrowed into a long claw: androecium 3-4 mm. long: loment-joints 2-2.5 mm. wide, scarcely longer. [*Desmodium triflorum* DC. *Meibomia triflora* Kuntze]—Pinelands, roadsides, and cult. grounds, pen. Fla.—(W. I., Mex., C. A., S. A.)—Resembles *Lespedeza striata* in habit. Used as a lawn-cover.

**70. ALYSICARPUS** Neck. Herbs. Leaflet 1. Racemes terminal, few-flowered. Calyx narrow, 2-lipped; lobes narrow, the 2 of the upper lip more united and shorter than the 3 of the lower lip. Corolla purple or blue: standard with a broad blade longer than the claw: blades of the keel- and wing-petals with a rounded shoulder at the base, that of the keel the less prominent, rather long-clawed. Ovary slender. Loment, several-jointed, with or without constrictions.—About 16 species, natives of the Old World tropics.—Sum.—fall or all year S.

Calyx-lobes acuminate, those of the upper lip united about half-way: loment with parallel sutures. 1. *A. vaginalis*.

Calyx-lobes acuminate, those of the upper lip united to near the tips: loment deeply constricted between the joints. 2. *A. rugosus*.

**1. A. vaginalis** (L.) DC. Stem often branched at the base, the slender branches more or less diffuse, up to 1 m. long: blades of the leaflets of various shapes, often orbicular to linear on the same plant, mostly 1-5 cm. long, finely reticulate: calyx 4.5-5.5 mm. long; lower lobes narrowly lanceolate, finely striate, acuminate: corolla purple; standard broadly cuneate-obovate, 5.5-6.5 mm. long: loment 1.5-2.5 cm. long linear, acute or the joints truncate, reticulate, slightly longer than wide.—(FALSE-MONEYWORT.)—Low pinelands and waste-places, pen. Fla.—(W. I., S. A., O. W.).

**2. A. rugosus** (Willd.) DC. Stem more or less diffusely branched, up to 1 m. tall: blades of the leaflets elliptic to lanceolate or linear-lanceolate, 2-7 cm. long, reticulate: calyx 6-7 mm. long; lower lobes lanceolate,

rather coarsely striate, narrowly acute: corolla purplish; standard obovate-cuneate, 5-6 mm. long; loment 1-2 cm. long, constricted at the nodes, the joints very turgid, suborbicular, coarsely transverse-wrinkled.—Waste-places and roadsides, S. pen. Fla. Nat. of trop. regions.

**71. LESPEDEZA** Michx. Herbs or shrubs. Leaflets 3 or rarely 1. Flowers perfect, but sometimes partially apetalous. Calyx 2-lipped, the 2 upper lobes more or less united. Corolla pink, purple, yellow, or white: standard with a broad blade: blades of the wings and the keel-petals auricled on one side, long-clawed. Loment with 1 or 2 joints. About 40 species, natives of eastern North America, Asia, and Australia.—Sum.-fall.—BUSH-CLOVERS.

Plant annual: stipules ovate: calyx-lobes about as wide as long.  
Plant perennial: stipules subulate, calyx-lobes much longer than wide.

I. STRIATAE.

Flowers of 2 kinds, petaliferous and apetalous: calyx-lobes shorter than the pod: corolla purple or purplish.

II. VIOLACEAE.

Flowers all alike, petaliferous: corolla whitish or yellowish (or purple or white in *L. bicolor*).

III. BICOLORES.

Panicles open: calyx-lobes much shorter than the pod.

IV. CAPITATAE.

Panicles congested, usually capitate: calyx-lobes fully as long as the pod.

I. STRIATAE

Low diffuse slender plant: leaflets mostly less than 2.5 cm. long.

1. *L. striata*.

II. VIOLACEAE

Flower-clusters slender-peduncled, mostly surpassing the leaves.

Petaliferous flowers in spike-like or head-like clusters.

Stem branched at the base: branches trailing or procumbent.

Foliage glabrous or pubescent with appressed hairs.

Pod 3-4 mm. long: stem pubescent.

2. *L. repens*.

Pod 5-6 mm. long: stem essentially glabrous, at least below.

Foliage downy or woolly.

Stem upright.

Petaliferous flowers in loose or close panicles.

3. *L. texana*.

Flower-clusters of both kinds sessile or nearly so.

4. *L. procumbens*.

Leaflets with suborbicular, oval or elliptic blades.

5. *L. Nuttallii*.

Calyx 5.5-6.5 mm. long; lobes as long as the pod or longer.

6. *L. violacea*.

Calyx 2-3 mm. long; lobes much shorter than the pod.

7. *L. simulata*.

Foliage glabrate, or pubescent with appressed hairs.

8. *L. frutescens*.

Foliage downy.

9. *L. Stuevei*.

Leaflets with linear or elliptic-linear blades.

10. *L. neglecta*.

Foliage downy.

11. *L. virginica*.

Foliage finely appressed-pubescent or glabrate.

III. BICOLORES

Tall perennial plant, with slender branches, sparingly pubescent leaflets, and lax panicles or purple or white flowers.

12. *L. bicolor*.

IV. CAPITATAE

Leaflets with suborbicular, oval, ovate, or elliptic blades.

Peduncles longer than the leaves: spike cylindric.

13. *L. hirta*.

Peduncles shorter than the leaves: spike subglobose.

14. *L. capitata*.

Leaflets with linear to linear-elliptic blades.

Bracts and calyx-lobes conspicuously long-tipped: calyx about 8 mm. long.

15. *L. longifolia*.

Bracts and calyx-lobes not conspicuously long-tipped: calyx about 6 mm. long.

16. *L. angustifolia*.

1. *L. striata* (Thunb.) H. & A. Plant erect or diffuse, 1-4 dm. tall: leaflets 8-25 mm. long; blades elliptic to elliptic-obovate: calyx 2-2.5 mm. long;

lobes ovate: standard purple or pinkish, often striped with white: keel-petals 5-7 mm. long: pod somewhat longer than the calyx. — (JAPANESE-CLOVER.) — Roadsides, fields, and woods, various provinces, Fla. to Tex., Mo., and N. J.—Nat. of Asia.—Frequently overruns pastures, fields, and roadsides, especially in poor soil, where it is grazed by horses and cattle.

2. *L. repens* (L.) Bart. Plant procumbent: leaflets 6-15 mm. long: blades oval or obovate: calyx 4-5 mm. long; lower lobes longer than the tube, subulate, acuminate: corolla white and pink; keel-petals 6-7 mm. long: pod 3.5-4.5 mm. long.—Dry places and roadsides, various provinces, Fla. to Tex., Minn., and Conn.

3. *L. texana* Britton. Plant similar to *L. repens* in habit: leaflets 10-26 mm. long; blades elliptic to elliptic-obovate: calyx 2-2.5 mm. long; lower lobes shorter than the tube, lanceolate to deltoid, acute: keel-petals 5-6 mm. long: pod several times longer than the calyx.—Dry soil and prairies, Coastal Plain, Miss. to Tex.

4. *L. procumbens* Michx. Plant procumbent: leaflets 10-25 mm. long; blades oval or elliptic, or sometimes obovate: calyx 4-5.5 mm. long; lobes subulate, about twice as long as the tube: keel-petals 4.5-5.5 mm. long, or sometimes longer: style mostly glabrous: pod 4-5 mm. long.—Dry banks and roadsides, various provinces, Fla. to Tex., Mo., and N. H.

5. *L. Nuttallii* Darl. Plant 5-10 dm. tall, often copiously pubescent: leaflets 8-20 mm. long; blades obovate, oval, or suborbicular: calyx 3.5-4.5 mm. long; lobes linear-lanceolate, somewhat longer than the tube: ovary copiously pubescent: pod 6-8 mm. long.—Thickets and woods, various provinces, Fla. to Kans., Mich., and N. H.

6. *L. violacea* (L.) Pers. Plant 3-9 dm. tall, diffuse, sparingly pubescent: leaflets 9-20 mm. long; blades elliptic or oval: calyx 4-4.5 mm. long: pod short-beaked, mostly 5-6 mm. long, with short scattered hairs.—Dry banks and thicket-margins, various provinces, Fla. to La., Kans., Minn., and N. H.

7. *L. simulata* Mackenzie & Bush. Plant 6-9 dm. tall, pubescent: leaflets 12-20 mm. long; blades elliptic to linear-elliptic, silvery-pubescent: calyx 5.5-6.5 mm. long; lobes of the upper lip united to below the middle: standard 6.5-7.5 mm. long; blade elliptic: pod 4.5-5.5 mm. long.—Stony soil, often in woods or on plains, various provinces, Tex. to Mo., Conn., and Pa.

8. *L. frutescens* (L.) Britton. Plant 3-10 dm. tall, appressed pubescent or glabrate: leaflets 10-35 mm. long; blades oval or elliptic, slightly pubescent beneath: calyx 3-4 mm. long: standard about 5 mm. long: pod oval or oval-ovate, 6-7 mm. long.—Dry soil, often in rocky woods, various provinces, Fla. to Tex., Minn., Ont., and Me.

9. *L. Stuevei* Nutt. Plant 6-12 dm. tall, velvety or downy: leaflets 9-20 mm. long, or rarely longer; blades elliptic, oval, or suborbicular, densely pubescent: calyx 2-3 mm. long; lobes subulate, those of the upper lip united to below the middle: standard 5-6 mm. long; blade suborbicular: pod beaked, 4-6 mm. long, copiously pubescent.—Rocky shores and woods, various provinces, Ala. to Tex., Ark., Mich., and Vt.

10. *L. neglecta* (Britton) Mackenzie & Bush. Plant similar to *L. Sturvei* in habit and pubescence, but smaller: blades of the leaflets linear to linear-elliptic: calyx 2.5–3 mm. long; lobes lanceolate, those of the upper lip united mostly to above the middle: pod oval, 6–7 mm. long, short-beaked.—Dry soil, Coastal Plain and occasionally adj. provinces, Ga. to Tex., Mo., and N. J.

11. *L. virginica* (L.) Britton. Plant 3–11 dm. tall, appressed-pubescent: leaflets 12–35 mm. long; blades linear to linear-elliptic, sometimes finely pubescent beneath: calyx 3–4.5 mm. long: pod elliptic to ovate, 5–6 mm. long, minutely pubescent.—Dry woods and barrens, various provinces, Fla. to Tex., Minn., Ont., and N. H.

12. *L. bicolor* Turez. Plant up to 3 m. tall, finely appressed-pubescent: leaflets 11–65 mm. long; blades obovate, oval, elliptic, or ovate, pubescent beneath, especially on or near the midrib: calyx 5–6 mm. long: pod elliptic to oval, narrowed at both ends, 7–8 mm. long, reticulate and strigillose.—Roadsides, waste-places, and woods, Fla. to N. C. Nat. of Japan.

13. *L. hirta* (L.) Ell. Plant 5–12 dm. tall, the stem villous: leaflets 12–40 mm. long; blades oval to suborbicular: calyx 6–6.5 mm. long; lobes 3–4 times as long as the tube: style glabrous: pod 7–8 mm. long.—Dry woods, pinelands, and fields, various provinces, Fla. to Tex., Minn., Ont., and Me.

14. *L. capitata* Michx. Plant 5–16 dm. tall, the stem usually velutinous with short spreading hairs: leaflets 25–35 mm. long; blades elliptic to oval, sericeous, especially beneath: calyx about 9 mm. long: corolla 7–8 mm. long, yellowish-white: style pubescent: pod elliptic, 5–5.5 mm. long.—(DUSTY-CLOVER.)—Dry, often sandy soil in woods, various provinces, Fla. to La., Nebr., Minn., and Mass.

15. *L. longifolia* DC. Plant 5–12 dm. tall, the stem densely velutinous; leaflets 25–60 mm. long; blades linear to linear-elliptic, somewhat sericeous, especially beneath: calyx about 8 mm. long: corolla 8–9 mm. long, white: pod elliptic, about 6 mm. long.—Open woods and fields, various provinces, Ala. to La., Ia., and Ky.

16. *L. angustifolia* (Pursh) Ell. Plant 6–10 dm. tall, the stem closely fine-pubescent, the hairs more or less appressed: leaflets 10–35 mm. long; blades linear to narrowly linear-elliptic, those of the lower leaves often wider than those of the upper, pale-strigillose beneath: calyx about 6 mm. long: corolla 6–7 mm. long, whitish or cream-color: pod oval to suborbicular, about 4 mm. long.—Dry soil, open wood and pinelands, various provinces, Fla. to La., Mich., and Mass.

72. *VICIA* [Tourn.] L. Trailing or climbing herbs. Leaflets few or many; blades entire, or toothed at the apex. Racemes few-many-flowered, usually 1-sided. Calyx more or less 2-lipped: lobes of the lower lip usually longer than those of the upper. Corolla variously colored or white: blades of the wings more prominently auricled than those of the keel-petals. Filaments usually united to near the tips. Style with a tuft of hairs at the apex, or pubescent on the side opposite the keel. Pod relatively flat. About 130 species, of wide geographical distribution.—Spr.-sum. or all year S.—VETCHES. TARES. PEA-VINES.—Some species are grown as fodder-plants, others for their edible seeds—"beans." Some species are used as ornaments.—The corollas of our species are mostly purple or pale-lavender.

Peduncle well-developed, sometimes exceeding the leaves.

Plant annual: standard 2-5 mm. long.

Plant perennial: standard 5-12 mm. long.

Raceme densely very many-flowered.

Raceme loosely few-several-flowered or 1-flowered.

Peduncle wanting or very short.

#### I. HIRSUTAE.

#### II. CRACCAE.

#### III. MICRANTHAE.

#### IV. SATIVAE.

#### I. HIRSUTAE

Leaflets 12-18: pod pubescent: seeds 2: corolla whitish.

Leaflets 8-12: pod glabrous: seeds 3-8: corolla bluish.

1. *V. hirsuta*.

2. *V. tetrasperma*.

#### II. CRACCAE

Very diffuse plant: corolla deep-blue or purple.

3. *V. Cracca*.

#### III. MICRANTHAE

Racemes 8-18-flowered.

Leaflets with blades of an elliptic type.

Leaflets with blades of a linear type.

Corolla 5-6 mm. long: calyx 1.5 mm. long: pod less than 2.5 cm. long.

Corolla 7-8 mm. long: calyx 2 mm. long: pod over 2.5 cm. long.

Racemes 1-6-flowered.

Peduncles longer than the leaflets.

Leaflets 4-6.

Leaflets 6-12.

Leaflets about 5 times as long as broad.

Leaflets less than 3 times as long as broad.

Peduncles shorter than the leaflets.

4. *V. caroliniana*.

5. *V. Hugerii*.

6. *V. acutifolia*.

7. *V. floridana*.

8. *V. texana*.

9. *V. ludoviciana*.

10. *V. micrantha*.

#### IV. SATIVAE

Corolla mostly over 1.5 cm. long: leaflets of the upper leaves inclined to be elliptic.

Corolla mostly less than 1.5 cm. long: leaflets of the upper leaves inclined to be linear.

11. *V. sativa*.

12. *V. angustifolia*.

1. *V. hirsuta* (L.) Koch. Leaflets 12-18; blades linear to elliptic, 6-15 mm. long, truncate or notched: calyx-lobes subulate, ciliate, longer than the tube: standard and keel 2-3 mm. long: ovary pubescent: pod 6-8 mm. long.—(HAIRY-VETCH. TARE.)—Waste-places, roadsides, and fields, various provinces, Ga. to Ohio and N. B. Nat. of Eu.

2. *V. tetrasperma* (L.) Moench. Leaflets 8-12; blades linear to linear-elliptic, 8-20 mm. long, acute or mucronate: calyx-lobes lanceolate, mainly shorter than the tube, not ciliate: standard and keel 4-5 mm. long: ovary glabrous: pod 9-12 mm. long.—(LENTIL-TARE.)—Waste-places, fields, and roadsides, Blue Ridge and more northern provinces, N. C. to Ont. and N. S. Nat. of Eu.

3. *V. Cracca* L. Leaflets 18-24; blades linear to elliptic-linear, 9-20 mm. long, acute or mucronate: calyx 5-6 mm. long; upper lobes deltoid; lower lobes lanceolate, about as long as the tube: corolla blue or purple; standard pandurate, 10.5-11.5 mm. long: keel 8-8.5 mm. long: pod 2-2.5 cm. long.—(CANADA-PEA. COW-VETCH.)—Fields and waste-places, Blue Ridge and more northern provinces, N. C. to B. C., S Ont., and Newf. Nat. of Eu.

4. *V. caroliniana* Walt. Leaflets 8-16; blades elliptic to oval-elliptic, 1-2 cm. long, mucronate: calyx 2.5-3 mm. long; lobes triangular: corolla white, except the blue-tipped keel; standard 9-10 mm. long: keel 5-6 mm. long: pod 2.5-3 cm. long.—(WOOD-VETCH. DEVIL'S-SHOESTRING.)—Woods and thickets, various provinces, Ga. to Kan., Minn., Ont., and W N. Y.

5. *V. Hugerii* Small. Leaflets usually 10-12; blades linear, 2-3.5 cm. long, mucronulate: calyx-lobes triangular, the lower narrower than the lateral ones, but not longer: standard 5-6 mm. long: keel about 4 mm. long: pod about 2 cm. long.—(VETCHLING.)—Open woods, Piedmont, Ga. and Ala.

6. *V. acutifolia* Ell. Leaflets 2-6, usually 4; blades linear to linear-elliptic, acute or mucronate: calyx-lobes triangular, the lower one longer than the lateral ones: standard 7-8 mm. long: keel about 6 mm. long: pod 2.8-3 cm. long.—(SAND-VETCH.)—Low calcareous hammocks, swamps, and ditches, Coastal Plain, Fla. to Ala. and Ga.

7. *V. floridana* S. Wats. Leaflets 4-6; blades elliptic to elliptic-oblaneeolate, 0.5-1.5 cm. long, mucronulate: calyx-lobes triangular, the lower one narrow and slightly longer than the deltoid lateral ones but much shorter than the tube: standard narrowly obovate, 5-6 mm. long: ovary glabrous: pod about 1.5 cm. long.—Sandy soil, Fla.

8. *V. texana* (T. & G.) Small. Leaflets 6-10; blades linear, mucronulate: calyx-lobes filiform-subulate, the lower one as long as the tube, all copiously ciliate; standard 5-6 mm. long; keel about 4 mm. long: pod 2-2.5 cm. long.—Dry prairies and plains, Coastal Plain, Miss. to Tex. and Ark.

9. *V. ludoviciana* Nutt. Leaflets 6-12; blades elliptic to oval, sometimes varying to broadest above or below the middle, or rarely linear-elliptic, 7-23 mm. long: calyx lanceolate, the lower one shorter than the tube: standard 6-7 mm. long; keel 4-5 mm. long: pod 2.5-3 cm. long.—(DEER-PEA.)—Low grassy places, various provinces, Fla. to Tex., Kans., and Mo.

10. *V. micrantha* Nutt. Leaflets of the lower leaves with obovate or oval blades, 5-12 mm. long, those of the upper leaves narrowly elliptic to linear, 9-35 mm. long: calyx-lobes triangular, much shorter than the tube: standard 5 mm. long: keel about 4 mm. long: pod about 1 cm. long.—Thickets and shaded banks, Coastal Plain and occasionally adj. provinces, Ala. to Tex., Mo., and Tenn.

11. *V. sativa* L. Leaflets 8-14; blades linear, linear-lanceolate, or elliptic, 1-4 cm. long: calyx 10-12 mm. long: corolla purple or deep-pink: standard and wings mostly over 15 mm. long: pod 4-8 cm. long.—(COMMON-VETCH.)—Waste-places, fields, and roadsides, various provinces, Ga. and Ala. to Minn. and Me. Nat. of Eurasia.

12. *V. angustifolia* Roth. Leaflets 8-16; blades linear varying to lanceolate or oblanceolate, 1-3.5 cm. long: calyx 7-9 mm. long: standard and wings mostly less than 15 mm. long.—Waste-places and fields, various provinces, Fla. to N. S.; also locally in the interior. Nat. of Eu.

73. **LATHYRUS** L. Plants similar to *Vicia* in habit, but usually larger: filaments usually less united: style pubescent on the side opposite the standard: pod more turgid.—About 110 species, natives of the Northern Hemisphere and South America.—Spr.-sum.—VETCHLINGS. EVERLASTING-PEAS.—Some species are cultivated for their edible fruits, others for fodder-plants. Sweet-peas are cultivated varieties of *L. ornatus*.

Plant annual: stem winged: leaflets 2: keel-petals less than 1 cm. long.

Standard-blade elliptic or obovate: calyx-lobes twice as long as the tube: pod glabrous. 1. *L. pusillus*.

Standard-blade suborbicular: calyx-lobes as long as the tube or slightly longer: pod pubescent.

Plant perennial: stem ridged or angled: leaflets 4 or more: keel-petals over 1 cm. long. 2. *L. hirsutus*.

Racemes several- (10-20) flowered: leaflets mostly 8-12; blades ovate to oval.

Racemes few- (2-6) flowered: leaflets mostly 4-6; blades elliptic or nearly so.

3. *L. venosus*.

4. *L. myrtifolius*.

1. *L. pusillus* Ell. Stem 2-winged, glabrous: leaflets 1-5 cm. long; blades narrowly linear to linear-elliptic or sometimes elliptic: peduncle mostly shorter than the leaves, often 1-flowered: calyx 5-7 mm. long; lobes subulate-lanceolate, attenuate: standard 9-10 mm. long: ovary glabrous: pod narrowly linear, 1.5-4 cm. long.—Stream-banks, low woods, and prairies, Coastal Plain and more northern provinces, Fla. to Tex., Kans., and N. C.

2. *L. hirsutus* L. Similar to *L. pusillus* in habit, but leaves usually larger: peduncles mostly longer than the leaves, often few-flowered: calyx 5-7 mm. long; lobes ovate to ovate-lanceolate, rather abruptly acuminate: standard 8-10 mm. long: ovary pubescent: pod broadly linear, 3-4 cm. long.—Waste-places, fields, and roadsides, M. Miss. Nat. of Eu.

3. *L. venosus* Muhl. Stem angled, pubescent: leaflets 3-6 cm. long; blades ovate or oval: calyx 9-10 mm. long, pubescent; longer lobes lanceolate, ciliate, slightly longer than the erect shorter lobes: standard cuneate-obovate, 14-18 mm. long: pod 3.5-4.5 cm. long.—(BUSH-VETCH.)—Woods and river-banks, various provinces, rarely Coastal Plain, Ga. to La., Ont., Sask., and N. J.

4. *L. myrtifolius* Muhl. Stem ridged, glabrous; leaflets 2.5-4 cm. long; blades elliptic or nearly so: calyx 7.5-8.5 mm. long, glabrous; longer lobes lanceolate, ciliate, much longer than the spreading shorter lobes: standard broadly cuneate-spatulate, 13-16 mm. long: pod 4-6 cm. long.—Swamps, dry rocky woods, and stream-banks, various provinces on Coastal Plain only N, N. C. to Tenn., Man., and Que.

74. **ABRUS** L. Vines with partly woody stems and branches. Leaflets numerous, relatively small; blades rather narrow. Panicle narrow, raceme-like. Calyx with 5 rounded lobes. Corolla white or pink: standard spreading; blade rounded or inconspicuously auricled at the base: wings auricled at the base of the blade: keel-petals longer than the wings, not auricled. Pod flat, relatively small, short and broad.—Five species, natives of tropical regions.

1. **A. Abrus** (L.) W. F. Wight. Stems slenderly elongate. Leaflets light-green, numerous; blades elliptic to elliptic-cuneate, 9-15 mm. long, obtuse or mucronulate: panicles dense, mostly 2-5 cm. long: calyx about 3 mm. long, the lobes rounded: corolla mostly pink: standard 13-15 mm. long; blade oval or orbicular-oval: keel-petals longer than the wings: pods clustered, rhombic-elliptic, 2.5-3.5 cm. long, slender-beaked, closely pubescent: seed oval, 6-7 mm. long, scarlet except the black

base.—(CRAB'S-EYE. INDIAN-LICORICE. LICORICE-VINE. ROSARY-PEA. WEATHER-VINE.)—Woods, thickets and roadsides, pen. Fla. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)—The bright-colored seeds, designed, perhaps, to attract birds, are used as beads in various countries.

### ORDER GERANIALES

Herbs, shrubs, or trees. Leaves alternate or opposite: blades simple or compound. Flowers perfect, monoecious, or dioecious, mostly regular. Calyx of distinct sepals. Corolla of distinct or nearly distinct petals, or rarely wanting. Androecium of as many stamens as there are sepals or twice as many, or rarely more. Gynoecium of 2 or several united carpels. Ovary superior. Fruit various.

Plant without secreting glands or cells in their tissues.

Filaments partially united.

Styles adnate around a column from which they break at maturity.  
Fam. 1. GERANIACEAE.

Styles not united around a central column.

Sepals unappendaged.

Stamens twice as many as the sepals.

Fam. 2. OXALIDACEAE.

Stamens as many as the sepals.

Fam. 3. LINACEAE.

Sepals appendaged, each bearing one or two glands on the back.

Genera in

Fam. 8. MALPIGHIACEAE.

Filaments distinct.

Calyx irregular, one sepal spurred or saccate.

Anthers distinct: carpels 1-ovuled.

Fam. 4. TROPAEOLACEAE.

Anthers united over the top of the gynoecium: carpels several-ovuled.

Fam. 5. BALSAMINACEAE.

Calyx regular, none of the sepals spurred or saccate.

Style basal, arising from between the nearly distinct carpel-bodies.

Fam. 6. LIMNANTHACEAE.

Style not basal, the carpel-bodies well-united.

Herbs, shrubs or trees with conspicuously or loosely articulate stems, and opposite or alternate mostly compound leaves, the flower-stalks arising from the axils of the interpetiolar stipules when the leaves are opposite: calyx without glands: anthers with inconspicuous connectives; filaments usually with a scale at the base: gynoecium mostly 4-12-carpellary, and with united styles and 2-several ovules, or rarely a single ovule in each carpel: embryo straight or nearly so.

Fam. 7. ZYGOPHYLLACEAE.

Shrubs, trees, or woody vines with inconspicuously jointed stems and opposite simple leaves: calyx commonly with a gland or a pair of glands on the back of each sepal; anthers mostly with conspicuous connectives; filaments without scales at the base: gynoecium mostly 3-carpellary and with distinct styles and a single ovule in each carpel: embryo usually abruptly bent or coiled.

Fam. 8. MALPIGHIACEAE.

Plants with secreting glands or cells which are often in the leaves, or only in the bark.

Filaments distinct nearly or quite to the base.

Leaves punctate by oil glands.

Fam. 9. RUTACEAE.

Leaves not punctate.

Gynoecium of distinct carpels.

Fam. 10. SURIANACEAE.

Gynoecium of more or less united carpels.

Bitter-barked shrubs or trees with oil-sacs in the bark.

Fam. 11. SIMARUBACEAE.

Resiniferous shrubs or trees.

Fam. 12. BURSERACEAE.

Filaments united into a cup or tube, wholly or in part.

Fam. 13. MELIACEAE.

## FAMILY 1. GERANIACEAE—GERANIUM FAMILY

Herbs, or somewhat woody plants. Leaves typically opposite: blades toothed, lobed, or divided. Flowers perfect, regular or nearly so, cymose. Calyx of 5 persistent sepals. Corolla of 5 deciduous petals. Receptacle with 5 glands. Androecium of 10, or rarely of 5, stamens. Gynoecium of 5 carpels whose styles are adnate to an elongate column from which they separate at maturity, each carpel 2-ovuled but with only 1 seed at maturity. —Twelve genera and 470 species, natives of temperate regions.

Carpel-bodies turgid: carpel-tails (styles) glabrous within and merely recoiling at maturity: anthers usually 10. 1. GERANIUM.

Carpel-bodies spindle-shaped: carpel-tails (styles) pubescent within and spirally coiled at maturity: anthers 5. 2. ERODIUM.

1. **GERANIUM** [Tourn.] L. Annual, biennial, or perennial herbs. Leaf-blades palmately or radially lobed, cleft, or parted. Flowers with equal petals. Sepals usually awn-tipped. Stamens 10 or rarely 5. Carpels thick, rounded at the base.—About 190 species, widely distributed in temperate regions.—CRANESBILLS. WILD-GERANIUMS.

Plant perennial, with a stout caudex and tough fibrous roots: corolla showy.

I. MACULATA.

Plant annual or biennial, with a slender tap root; corolla inconspicuous.

II. PUSILLA.

## I. MACULATA

Stem erect, from the axils of several basal long-petioled leaves: corolla over 2 cm. wide.

1. *G. maculatum*.

## II. PUSILLA

Sepals without subulate tips: seed smooth.

Carpel-body wrinkled: stamens 10.

Carpel-body strigillose: stamens 5.

Sepals with subulate tips: seed reticulate or pitted.

Seed pitted: mature sepal-bodies less than 5 mm. long.

Seed reticulate: mature sepal-bodies over 6 mm. long.

Pedicels hirsute: calyx partly glandular-pubescent: carpel-body hirsute.

Pedicels strigillose: calyx glandless: carpel-body glabrous or nearly so.

2. *G. molle*.

3. *G. pusillum*.

4. *G. dissectum*.

5. *G. carolinianum*.

6. *G. columbinum*.

1. ***G. maculatum*** L. Stem 2–6 dm. tall, retrorse-pubescent: leaf-blades 5–12 cm. wide, the lobes cuneate: sepals 8–10 mm. long, elliptic to elliptic-lanceolate, slender-tipped: petals light-purple, pubescent at the base: style-column pubescent: seed wrinkled.—(WILD-CRANESBILL.) —Rich woods, banks, and fields, various provinces, on Coastal Plain only N. Ga. to Kans., Man., and Newf.—Spr.-sum.

2. ***G. molle*** L. Stem and branches weakly spreading or decumbent, softly pubescent: leaf-blades 2–6 cm. wide, not finely cut: pedicels pubescent with both short and long hairs: sepals orbicular-ovate: petals rose: carpel-body about 2 mm. long, transverse-wrinkled.—(DOVE'S-ROOT.) —Fields, roadsides, and lawns, various provinces, N. C. to Ohio, Ont., and Me.; also Wash. to B. C. Nat. of Eu.—Spr.

3. ***G. pusillum*** Burm. f. Stem and branches diffuse, glandular-villous: leaf-blades 1.5–5 cm. wide, rather coarsely cut: pedicels pubescent with very short

glandular hairs: sepals ovate or elliptic-ovate: petals purplish: carpel-body about 2 mm. long, strigillose.—Waste-places, cult. grounds, and woods, various provinces, N. C. to Ark., Utah, B. C., and Ont. Nat. of Eu.—Sum.—fall.

4. *G. dissectum* L. Stem and branches spreading, rétrorsely pubescent: leaf-blades 2-4 cm. wide, with narrow spreading segments: sepal-bodies slender-tipped: petals purple: carpel-body less than 3 mm. long, finely-pubescent: seed about 2 mm. long.—Waste-places and cult. grounds, various provinces, S. C. N nearly throughout U. S. and S Can. Nat. of Eu.—Sum.—fall.

5. *G. carolinianum* L. Stem erect, 2-5 dm. tall, copiously pubescent: leaf-blades 2-6 cm. wide, with rather broad not divergent lobes: cymes rather compact: sepals mostly less than 10 mm. long at maturity, loosely pubescent: petals pinkish or pale-purple: style-column coarsely pubescent, stout-beaked: carpel-body copiously pubescent with long and short hairs.—Dry banks, woods, and cult. grounds, various provinces, Fla. to Calif., B. C., and Ont.—(*W. I., Mex.*)—Spr.

6. *G. columbinum* L. Stem and branches diffuse, 1-5 dm. long, sparingly pubescent: leaf-blades 2-4 cm. wide, with narrow irregularly divergent lobes: cymes very lax: sepals mostly over 10 mm. long at maturity: petals rose-purple: style-column strigillose, slender-beaked: carpel-body glabrous or with few short appressed hairs.—Roadsides and cult. grounds, various provinces, on Coastal Plain only N, N. C. to S. Dak. and N. J. Nat. of Eurasia.—Spr.

2. **ERODIUM** L'Her. Annual or perennial herbs. Leaf-blades toothed, pinnatifid, or pinnately parted. Flowers with the upper petals smaller. Sepals awn-tipped, the tips sometimes bristle-appendaged. Stamens 5, accompanied by 5 staminodia. Carpel-body narrow, acute at the base.—About 60 species, widely distributed in warm and temperate regions.

Sepal-tips with 1 or 2 bristle-like appendages: anther-bearing filaments toothless.

1. *E. cicutarium*.

Sepal-tips without bristle-like appendages: anther-bearing filaments 2-toothed.

2. *E. moschatum*.

1. *E. cicutarium* (L.) L'Her. Branches villous and viscid: leaf-blades elliptic in outline; petioles shorter than the blades: sepals elliptic, 4-5 mm. long: petals hardly longer than the sepals, rose-purple: carpel-body 4-6 mm. long, the beak 2-4 cm. long.—(*ALFILERIA. STORKSBILL. PINE-NEEDLES.*)—Waste-places, cult. grounds, and roadsides, locally U. S. and S Can. Nat. of Eu.—Spr.—sum.

2. *E. moschatum* (Burm. f.) L'Her. Branches loosely viscid-pubescent: leaf-blades elliptic in outline: sepals elliptic, 7-9 mm. long: petals slightly longer than the sepals, rose-purple: carpel-body about 5 mm. long, the beak 3.5-4.5 cm. long.—(*HERON-BILL.*)—Waste-places and roadsides, N Fla.; also Calif. Nat. of Eu.—(*Mex.*)

## FAMILY 2. OXALIDACEAE—WOOD-SORREL FAMILY

Herbs or rarely shrubs, the sap sour. Leaves mostly alternate: blades 3-foliate or 1-foliate, the leaflets commonly notched at the apex.

Flowers perfect, essentially regular, cymose. Calyx of 5 persistent sepals. Corolla of 5 white or colored petals. Androecium of 10–15 unequal stamens: filaments united at the base. Gynoecium of 5 partially united carpels: styles distinct. Fruit a loculicidal capsule, rarely baccate.—About 15 genera and 300 species, most abundant in the tropics.

Plant acaulescent, with short or long rootstock, succulent: corolla not yellow, except in no. 2. Tribe I. OXALIDEAE.

Plant caulescent, annual or perennial, not succulent: corolla yellow. Tribe II. XANTHOXALIDEAE.

#### I. OXALIDEAE

Sepals without apical tubercles: rootstocks elongate, merely scaly at the apex.

##### 1. OXALIS.

Sepals with apical tubercles: rootstocks bulblike, solitary or connected, borne at the nodes of a long rootstock.

Plant with a long rootstock which bears bulblets at the nodes.

Plant with a coated bulb.

##### 2. BOLBOXALIS.

##### 3. IONOXALIS.

#### II. XANTHOXALIDEAE

Erect or creeping herbs, the flowers in umbel-like or forking cymes.

##### 4. XANTHOXALIS.

1. **OXALIS** L. Spreading herbs. Leaf-blades palmately 3-foliolate, each usually with a membranous fold in the apical sinus. Flowers commonly solitary. Sepals not tuberculate at the apex. Filaments commonly glabrous. About 6 species, natives of the Northern Hemisphere.

1. **O. montana** Raf. Rootstock scaly at the end: blades of the leaflets obovate, 10–15 mm. long: scape 5–15 cm. long: sepals elliptic to lanceolate: petals white or pink and delicately veined, 1–1.5 cm. long: capsule ovoid-globose, 2–4 mm. long. [*O. acetosella* (Fl. SE. U. S.)]—(WOOD-SHAMROCK. WOOD-SORREL.)—Cold damp woods, often in acid soil, Blue Ridge and more N provinces, N. C. to Tenn., Man., and N. S.—Spr.-sum.

2. **BOLBOXALIS** Small. Erect herbs with rootstocks which bear bulblets at their nodes. Leaf-blades palmately 3-foliolate: leaflets sessile with broadly obovate or somewhat obreniform blades. Flowers borne in umbel-like cymes. Sepals 5, each bearing a pair of apical tubercles. Petals yellow, typically large and conspicuous.—Few species natives of southern Africa.

1. **B. cernua** (Thunb.) Small. Plant 1–4 dm. tall, bright-green: blades of the leaflets 2–3.5 cm. broad, very broadly obovate, glabrous or sometimes pubescent beneath: peduncles surpassing the leaves: sepals lanceolate to linear-lanceolate, 4.5–6.5 mm. long, the outer ones more pubescent than the inner: petals deep-yellow, 2–3 cm. long: filaments glabrous: capsule 5–8 mm. long.—(BUTTERCUP-OXALIS.)—Waste places and cult. grounds, N Fla. Nat. of S Africa.—Spr.-fall.

**3. IONOXALIS** Small. Erect herbs with coated bulbs, often producing clusters of bulblets. Leaf-blades palmately 3-10-foliolate: leaflets with tubercles in the apical sinus. Flowers usually borne in umbel-like cymes. Sepals tubercled at the apex. Petals violet, blue, red, or white.—About 120 species, natives of North America and South America.

Inflorescence simple.

Tubercles of the sepals confluent: blades of the leaflets obreniform.

Tubercles of the sepals distinct: blades of the leaflets obdeltoid.

Inflorescence compound.

**1. I. violacea** (L.) Small. Plant 5-35 cm. tall: leaflets 3; blades 1-2.5 cm. wide: scape glabrous: sepals elliptic to ovate-elliptic: petals rose-purple or rarely white: capsule 4-5 mm. long.—(VIOLET WOOD-SORREL.)—Woods, shaded banks, rocky slopes, and prairies, various provinces, Fla. to Tex., Colo., and Me.—Spr.-fall.

**2. I. intermedia** (A. Rich.) Small. Plant 1-3 dm. tall: leaflets 3; blades 2-6 cm. wide: scape pubescent: sepals ovate to broadly elliptic: petals violet: capsule columnar, 6-7 mm. long.—Hammocks, S pen. Fla.—(W. I.)—All year.

**3. I. Martiana** (Zucc.) Small. Plant stout, 8-30 cm. tall: blades of the leaflets larger than those of *I. violacea*: scape pubescent: sepals elliptic to narrowly elliptic: petals rose-purple often pale: capsule narrowly ellipsoid, mostly 9-11 mm. long.—Waste-places and cult. grounds, near dwellings, Coastal Plain, Fla. to Tex. and S. C. Nat. of trop. Am. and cult.—Spr.-fall.

**4. XANTHOXALIS** Small. Herbs. Leaf-blades palmately 3-foliolate: leaflets not tubercled at the apical sinus. Flowers in umbel-like or dichotomous cymes. Sepals 5, the inner narrower than the outer ones. Filaments glabrous or the longer ones pubescent. Capsules elongate, erect.—About 50 species, of wide distribution.—SOURGRASSES. YELLOW WOOD-SORRELS.—Oxalic-acid is quite evident to the taste in the tissues of these plants.

Pedicels appressed-pubescent.

Longer filaments glabrous.

Stem appressed-pubescent, usually copiously so: capsule pubescent

Stem loosely pubescent: often nearly glabrous: capsule glabrous, except in *X. corniculata*.

Plants erect.

Cymes open in fruit: leaves bright-green.

Cymes cluster-like in fruit: leaves reddish or purplish.

Plants spreading and creeping.

Longer filaments pubescent.

Petals glabrous.

Plant creeping.

Plant erect, but sometimes with decumbent branches.

Stem pubescent, but neither villous nor hirsute.

Corolla pale- or light-yellow; sepals 3-4 mm. long.

Cymes typically 1-flowered: leaves numerous; leaflets small, mainly 4-8 mm. wide.

**1. X. stricta.**

**2. X. Bushii.**

**3. X. rufa.**

**4. X. corniculata.**

**5. X. Langloisii.**

**6. X. filipes.**

Cymes typically several-flowered: leaves few; leaflets large, 10–16 mm. wide. Corolla golden-yellow; sepals 5–6 mm. long. Stem villous or hirsute, sometimes sparingly so. Corolla light-yellow; petals 8–11 mm. long. Corolla golden-yellow; petals 11–15 mm. long.

Petals pubescent.  
Pedicels loosely pubescent.

Cyme umbel-like: capsule densely pubescent.

Cyme dichotomous: capsule glabrous or thinly pubescent.

Capsule-body several times longer than the sepals; leaflets uniformly green.

Capsule-body scarcely twice as long as the sepals; leaflets brown-margined.

7. *X. Brittoniae*.  
8. *X. macrantha*.

9. *X. colorea*.  
10. *X. recurva*.  
11. *X. Priceae*.

12. *X. hirsuticaulis*.

13. *X. cymosa*.

14. *X. grandis*.

1. *X. stricta* (L.) Small. Plant pale-green: simple or branched and tufted: leaflets glabrous or with scattered hairs: sepals elliptic to linear-lanceolate, sparingly ciliate, and more or less pubescent on the back: petals pale-yellow: capsule 16–30 cm. long.—Banks, fields, and waste-places, various provinces, Fla. to N. M., Wyo., and N. S.—(*Mex.*)—Spr.-sum.

2. *X. Bushii* Small. Plant bright-green: stems 1–3 dm. tall, loosely-pubescent: leaves few; blades of the leaflets mostly 7–8 mm. wide: cymes umbel-like, usually maturing 1 flower at a time which is accompanied by several drooping buds: petals pale-yellow, 9–12 mm. long: capsule 8–10 mm. long.—Dry soil or thickets, various provinces, Ga. to Ark., Mo., and Mass.—Spr.-sum.

3. *X. rufa* Small. Plant mainly reddish or purplish: stem 1.5–4 dm. tall, loosely-pubescent: leaves usually numerous; blades of the leaflets 8–20 cm. wide: cymes dichotomous, but with short primary branches, maturing several flowers at a time: petals rather bright-yellow, 7–10 mm. long: capsule 7–9 mm. long.—Damp soil or woods, various provinces, Ga. to Minn. and Mass.—Spr.—fall.

4. *X. corniculata* (L.) Small. Plant bright-green or purplish: stem and branches 5–40 cm. long, with spreading hairs: leaflets deep-green; blades 5–12 mm. broad, or larger, ciliate: sepals 3–4 mm. long: petals 7–10 mm. long, bright-yellow.—(*CREeping-oxalis. LADY'S-SORREL.*)—Hammocks, pinelands, waste-places, and cult. grounds, various provinces, Fla. to Tex., Calif., and Ont. Nat. of trop. Am.—Spr.—fall.

5. *X. Langloisii* Small. Plant similar to *X. corniculata* in habit, but relatively smaller throughout and sepals rather broader: petals 5–8 mm. long, pale-yellow.—Woods and waste-places, Coastal Plain and rarely adj. provinces, Fla. to Tex. and Tenn.—(*W. I.*)—All year.

6. *X. filipes* Small. Plant bright-green: stems usually tufted on the slender rootstock: leaves mostly clustered, usually irregularly so; blades of the leaflets mainly 4–8 mm. wide, glabrous or sparingly pubescent: sepals lanceolate to elliptic-lanceolate: petals 5–9 mm. long, light-yellow: capsule slender, 8–12 mm. long.—Sandy woods and thickets, various provinces, Ga. to La., Mo., and N. J.—Spr.-sum.

7. *X. Brittoniae* Small. Plant deep-green: stems 1–4 dm. tall, loosely-pubescent: leaves not clustered; blades of the leaflets 10–16 mm. wide: cymes dichotomous when well developed: sepals 3–4 mm. long, ciliate all around: petals

5-10 mm. long, pale- or light-yellow: capsule 7-12 mm. long.—Woods, fields, and hill-sides, Coastal Plain and rarely adj. provinces, Fla. to Mo. and N. Y.—Spr.-sum.

8. *X. macrantha* (Trelease) Small. Plant bright-green: stem usually solitary at the nodes of the woody rootstock: leaves scarcely clustered: blades of the leaflets mostly 7-12 mm. wide, pubescent: sepals broadly elliptic to elliptic-lanceolate: petals 10-20 mm. long, deep-yellow: capsule stout, 10-14 mm. long.—Open woods and banks, Coastal Plain, Fla. to Miss., Tenn., and Ga.—Spr.-fall.

9. *X. colorea* Small. Plant brown or reddish-brown: stem 1-2 dm. tall: leaflets 4-11 mm. wide: cymes umbel-like, the peduncle scarcely overtopping the leaves: sepals 3-4 mm. long, ciliate mainly at the apex: petals 8-11 mm. long, light-yellow: capsule 9-12 mm. long.—Woods, Coastal Plain, Ga. to Miss. and N. C.—Spr.-sum.

10. *X. recurva* (Ell.) Small. Plant deep-green: stem 1-3.5 dm. tall, villous: leaf-blades 6-11 mm. wide: cymes umbel-like, the peduncles much overtopping the leaves: sepals 4-5.5 mm. long, ciliate all around: petals 11-15 mm. long, golden-yellow: capsule 11-13 mm. long.—Dry woods and rocky soil, Coastal Plain and rarely adj. provinces, Fla. to Miss., Mo., and N. C.—Spr.-sum.

11. *X. Priceae* Small. Plant deep-green: stem slender, 1-2 dm. tall, loosely but sparingly pubescent: leaflets 8-13 mm. wide: cymes umbel-like: sepals about 7 mm. long: petals pubescent: capsule 14-17 mm. long.—Woods and fields, Interior low Plateaus, Ala. to Ky.—Sum.-fall.

12. *X. hirsuticaulis* Small. Plant light-green: stem stout, 1-2 dm. tall, vilous-hirsute: leaflets 8-17 mm. wide: cymes umbel-like: sepals 5-7 mm. long: petals glabrous: capsule 10-12 mm. long.—Woods, Piedmont to Appalachian Plateaus, Ga. and Tenn.—Spr.-sum.

13. *X. cymosa* Small. Plant light-green: stem 2-11 dm. tall, loosely pubescent: leaflets 10-27 mm. wide: cymes dichotomous: sepals 3-4 mm. long: petals 7-10 mm. long, deep-yellow: filaments glabrous: capsule slender.—Thickets, cult. grounds, and waste-places, various provinces, Fla. to Tex., Nebr., and Ont.—Sum.

14. *X. grandis* Small. Plant deep-green: stem 3-12 dm. tall, sparingly loosely pubescent: leaflets 25-40 mm. wide: cymes dichotomous: sepals 4.5-6 mm. long: petals 13-18 mm. long, deep-yellow: longer filaments ciliate: capsule stout.—Shaded banks, various provinces N of Coastal Plain, Ga. to Ala., Ind., and Pa.—Sum.-fall.

### FAMILY 3. LINACEAE—FLAX FAMILY

Herbs or woody plants, the sap bland. Leaves alternate or opposite: blades simple. Flowers perfect, regular. Calyx of 4-6 deciduous or persistent sepals. Corolla of 4-6 ephemeral petals. Receptacle glandular. Androecium of 4-6 stamens, often with staminodia: filaments united at the base. Gynoecium of 2-5 partially united carpels, the styles wholly or partially distinct. Fruit capsular.—About 14 genera and 160 species, widely distributed.

Stigmas introrse and more or less elongate; sepals glandless.  
Stigma terminal and capitate: sepals, at least the inner ones,  
with marginal glands.

1. LINUM.

2. CATHARTOLINUM.

1. **LINUM** [Tourn.] L. Herbs. Leaves alternate, without stipules. Sepals 5, glabrous, or the inner ones sometimes ciliate. Petals blue or rarely white, unappendaged. Androecium of 5 stamens and 5 short staminodia. Styles 5, distinct. Capsule 5-celled and with incomplete partitions, the carpels ridged on the back.—About 8 species, natives of warm and temperate regions.—**FLAXES.**

1. **L. usitatissimum** L. Stem 2-9 dm. tall: leaves relatively few, long and thin: blades long-pointed: corolla blue, 1.5-2 cm. wide: capsule 7-10 mm. long.—(**COMMON-FLAX.** LINN.)—Fields, roadsides, and railroad embankments, often in acid soils, various provinces, U. S. and S. Can. Nat. of Eu. and cult.—Sum.—The bark furnishes flax and linen, and the seeds are the sources of linseed-oil.

2. **CATHARTOLINUM** Reichenb. Herbs. Leaves alternate or occasionally opposite, sometimes with stipular glands. Sepals 5, the inner ones at least with gland-tipped teeth. Petals yellow, sometimes pubescent within near the base. Androecium of 5 stamens, generally without staminodia. Styles 5, distinct or united. Capsule 5-celled, or completely or incompletely 10-celled by false partitions.—About 70 species, of wide geographic distribution.—Sum. or all year S.—**YELLOW-FLAXES.**

Styles distinct: corolla approximately 1 cm. wide.

I. VIRGINIANA.

Styles more or less united: corolla wider.

Sepals persistent: capsule without thickenings at the base: stipular glands present: corolla about 1.5 cm. wide.

II. SULCATA.

Sepals deciduous: capsule with cartilaginous thickenings at the base: stipular glands wanting or obscure: corolla 2-3 cm. wide.

III. RIGIDA.

#### I. VIRGINIANA

Staminodia wanting.

Sepals entire at maturity, the inner ones sometimes erose on account of the bases of the deciduous glandular hairs.

Stem paniculately branched: outer sepals 2-2.5 mm. long at maturity.

1. *C. striatum*.

Stem corymbosely branched: outer sepals 3-3.5 mm. long at maturity.

2. *C. virginianum*.

Sepals, either those of the inner series, or of the outer, or of both series, glandular-toothed.

Capsule depressed.

Outer sepals typically lanceolate: inner sepals abruptly long-pointed.

3. *C. medium*.

Outer sepals typically ovate: inner sepals acute or abruptly short-pointed.

4. *C. Curtissii*.

Capsule ovoid.

Outer and inner sepals nearly equal at maturity, shorter than the capsule or about equalling it.

Outer sepals mostly over 3 mm. long: capsule broadly ovoid, obtuse.

5. *C. floridanum*.

Outer sepals less than 3 mm. long: capsule narrowly ovoid, acute.

6. *C. intercursum*.

Outer sepals much longer than the inner, all surpassing the capsule.

7. *C. macrosepalum*.

8. *C. arenicola*.

Staminodia present.

#### II. SULCATA

Sepals, especially the outer ones, coarsely and irregularly toothed, elliptic-lanceolate, short-acuminate: capsule narrowly ovoid.

9. *C. Harperi*.

Sepals, especially the outer ones, finely and regularly toothed, narrowly lanceolate, long-acuminate: capsule globose-ovoid or slightly depressed.

10. *C. sulcatum*.

### III. RIGIDA

Plants stout, erect, sparingly branched above: corolla showy, golden-yellow.

11. *C. Carteri*.

1. *C. striatum* (Walt.) Small. Stem 2-8 dm. tall, paniculate, winged below the nodes: leaves mainly opposite; blades elliptic, 1-3 cm. long: outer sepals lanceolate to elliptic-lanceolate, 2-2.5 mm. long; inner sepals ovate to suborbicular: capsule depressed-globose, 2 mm. broad.—Low grounds, swamps, and wet meadows, various provinces, Fla. to Tex., Man., Ont., and Mass.

2. *C. virginianum* (L.) Small. Stem 2-6 dm. tall, corymbose above, the branches long: leaves mainly alternate, spreading; blades thinnish, spatulate or oblanceolate to elliptic, 1-3 cm. long: outer sepals lanceolate to elliptic-lanceolate, 3-3.5 mm. long; inner sepals rather broader than the outer: capsule depressed, 2 mm. broad.—Roadsides, thickets, and dry woods, various provinces, Ga. to Ala., Ont., and Me.

3. *C. medium* (Planch.) Small. Stem 3-6 dm. tall, corymbose above, the branches rigid: leaves mainly alternate, erect or appressed; blades spatulate to linear-elliptic or linear-lanceolate, 0.6-2 cm. long: outer sepals elliptic to lanceolate, 2-4 mm. long: capsule depressed-globose, 2-3 mm. broad.—Hillsides, roadsides, and thickets, various provinces, Fla. to Tex., Ont., and N. Y.

4. *C. Curtissii* Small. Stem 2-6.5 dm. tall, corymbose above: leaves mainly alternate, ascending or erect; blades elliptic-spatulate to oblanceolate or linear above, 0.5-1.5 cm. long: outer sepals ovate, 2-2.5 mm. long: capsule depressed, 2.5 mm. broad.—Everglades and low pinelands, S pen. Fla.—(W. I.)

5. *C. floridanum* (Planch.) Small. Stem 3-8 dm. tall, corymbose: leaves mainly alternate, nearly erect or appressed; blades oblanceolate to linear-lanceolate or linear above, 0.8-1.8 cm. long: inner sepals ovate to elliptic-ovate, nearly as long as the outer ones: capsule broadly ovoid, 2-2.5 mm. broad.—Low pinelands, Coastal Plain and rarely adj. provinces, Fla. to La., S Ill., and N. C.

6. *C. intercursum* (Bicknell) Small. Stem 1.5-3 dm. tall, or sometimes taller, corymbose above, sometimes copiously so: leaves erect or ascending; blades oblanceolate, oval, or elliptic, 0.7-2 cm. long: inner sepals ovate or oval-ovate, shorter than the outer ones: capsule narrowly ovoid, 1.5-2 mm. broad.—Dry sandy woods and barrens, various provinces, Ga. and Ala. to Mass.

7. *C. macrosepalum* Small. Stem 2.5-9 dm. tall, corymbose: leaves alternate, erect-ascending or appressed; blades linear-subulate to subulate, or narrowly linear or linear-spatulate near the base of the stem, 1-1.5 cm. long: inner sepals lanceolate to elliptic-lanceolate, much shorter than the outer ones: capsule ovoid, 2-2.5 mm. broad.—Low grounds and swamps, Coastal Plain, Fla., Ala., and Ga.—Plants with slightly broader capsules have been found in scrub near Naples, Fla.

8. *C. arenicola* Small. Stem or branches 2-7 dm. tall: leaves alternate, early deciduous; blades, at least of the leaves above the base of the stem, subulate to subulate-acicular, mostly less than 1 cm. long, entire: outer sepals broadly elliptic to elliptic-ovate, becoming 2.5-3 mm. long, acuminate: capsule depressed, about 1.5 mm. long.—Low pinelands, Everglade Keys Fla. and lower Florida Keys.

9. *C. Harperi* Small. Stem 3-8 dm. tall: leaves mainly alternate; blades linear-spatulate to narrowly linear, 0.5-2 cm. long: outer sepals lanceolate. 3.5-4 mm. long, sparingly toothed: capsule narrowly ovoid, 2.5 mm. long, obtuse.—Dry pinelands, Coastal Plain, Fla. and Ga.

10. *C. sulcatum* (Ridd.) Small. Stem 2-7 dm. tall: leaf-blades linear to linear-lanceolate, 0.8-2.5 cm. long: outer sepals lanceolate, 5-6 mm. long, copiously toothed: capsule globose-ovoid or slightly depressed, about 3 mm. long.—Dry soil, various provinces, rarely Coastal Plain, Ga. to Tex., Man., Ont., and Mass.

11. *C. Carteri* Small. Stem 1-6 dm. tall: leaf-blades narrowly linear to linear-subulate, mostly 1.5-2.5 cm. long: outer sepals lanceolate to ovate-lanceolate, 6-7 mm. long: capsule about 4 mm. long. [*Linum rigidum* (Chapm. Fl.)]—Pinelands, especially along the Everglades, the Everglade Keys, and Big Cypress Swamp, Fla.—Spr.

#### FAMILY 4. TROPAEOLACEAE—NASTURTIUM FAMILY

Herbs. Leaves alternate: blades peltate, or palmately lobed or dissected. Flowers perfect, axillary, irregular. Calyx of 5 sepals slightly united at the base, the upper one spurred at the base. Corolla of 5, or fewer, petals, the 2 upper ones more or less different from the lower ones. Androeceum of 8 unequal declined stamens. Gynoeceum of 3 united carpels. Fruit baccate.

1. *TROPAEOLUM* L. Vines or diffuse plants with succulent stems. Calyx-spur cornucopia-like. Petals narrowed at the base. Berry 3-lobed.—About 35 species, native from Mexico to Chile and cult.

1. *T. majus* L. Plants diffusely climbing: leaf-blades suborbicular, undulate, the veins ending in the notches of the margin: petals mostly red, orange, or purple; claws toothed; blades rounded at the apex: berry 14-19 mm. broad.—(NASTURTIUM.)—Waste-places and about gardens, various provinces, Atlantic States. Nat. of Peru.—Sum.-fall. Cultivated in many forms, dwarf and vine-like, for the bright-green foliage and the brilliant-colored flowers. The aromatic fruits are used as a flavoring-agent. This species has been in cultivation for a long time, and has been developed into many forms. It is the only species of ten or a dozen, that escapes from cultivation.

FAMILY 5. **BALSAMINACEAE**—JEWEL-WEED FAMILY

Herbs with succulent tissues. Leaves mostly alternate: blades simple. Flowers perfect, irregular. Calyx of 3 sepals (2 obsolete), the posterior one petaloid, saccate and spurred, all deciduous. Corolla of 5 petals, the lateral pair on each side united. Receptacle glandless. Androecium of 5 stamens: filaments appendaged and partially united. Gynoecium of 5 united carpels. Styles very short or wanting. Fruit an elastically bursting capsule.—Two genera and 220 species, most abundant in tropical Asia.

1. **IMPATIENS** [Rivinius] L. Herbs with stems enlarged at the nodes. Capsule drooping.—About 130 species, widely distributed.—Sum-fall.—TOUCH-ME-NOTS. SNAPWEEDS.—Our species are annuals.

Flowers in peduncled panicles: outer sepals broad: capsule elongate, glabrous. Spur incurved,  $1/3$  as long as the sac, or more: sac longer than broad.

Spur at right angles to the sac,  $1/4$  as long as the sac, or less: sac as broad as long.

Flowers in sessile clusters: outer sepals narrow: capsule short, pubescent.

1. *I. biflora*.

2. *I. pallida*.

3. *I. Balsamina*.

1. *I. biflora* Walt. Plant 1–2 m. tall: leaf-blades ovate to elliptic, 2–12 cm. long, deep-green: flowers conspicuously spotted with black: sepals and petals orange, the saccate sepal conic, heavily spotted, with the spur long and sharply incurved. [*I. fulva* Nutt.]—(JEWEL-WEED. SPOTTED-SNAPWEED.)—Swamps and banks of spring-runs, various provinces, Fla. to Mo., Mack., and Newf.—Spr-fall.

2. *I. pallida* Nutt. Plant similar to *I. biflora* in habit, but the foliage pale-green or glaucescent: flowers sparingly spotted with black, or sometimes spotless: sepals and petals yellow, the saccate sepal cup-like, scarcely spotted, with the spur very short.—(PALE TOUCH-ME-NOT.)—Rich shaded hill-sides and stream-banks, various provinces, on Coastal Plain only northward, Ga. to Kans., Sask., and N. S.—Sum.

3. *I. Balsamina* L. Plant 3–6 dm. tall, the stem succulent, finely pubescent: leaf-blades oval or elliptic to elliptic-spatulate, those of the upper leaves larger than the lower ones, more or less acuminate at both ends, rather sharply serrate: flowers variously-colored: capsule ovoid or elliptic-ovoid, 2–3 cm. long, pubescent.—(GARDEN BALSAM.)—Waste-places, cult. grounds, and roadsides, various provinces, E U. S. Nat. of S Asia and cult.—(W. I.)—Sum.

 FAMILY 6. **LIMNANTHACEAE**—FALSE-MERMAID FAMILY

Herbs with tender tissues. Leaves alternate: blades pinnately divided. Flowers perfect, axillary. Calyx of 2–5 sepals. Corolla of 2–5 petals. Androecium of 4–10 stamens. Gynoecium of 2–5 carpels united only by their bases and styles. Fruit 2–5-lobed, fleshy, the carpels separating as achenes.—Two genera and about 9 species, natives of North America.

1. **FLOERKEA** Willd. Annual diffuse herbs. Leaf-segments narrow. Flowers inconspicuous. Sepals 3. Petals 3, white. Stamens 6. Ovary 3-celled.

Achenes 1-3, rough.—Two species, the following and one in the W U. S.

1. *F. proserpinacoides* Willd. Stems decumbent, 1-4 dm. long: leaves 2-8 cm. long, the segments 3-5, distant: sepals ovate-lanceolate to lanceolate, 3 mm. long: petals white, elliptic-obovate, 1-1.5 mm. wide; achene subglobose, 2-2.5 mm. in diameter.—(FALSE-MERMAID.)—Shaded creek-banks, various provinces, on Coastal Plain only N, Del. to Tenn., N. D., and Que.—Spr.—In favorable localities the plants often grow in dense carpets, especially on moist clay banks.

### FAMILY 7. ZYGOPHYLLACEAE—CALTROP FAMILY

Shrubs, trees, or perennial herbs. Leaves opposite or alternate by the suppression of one of each pair: blades compound. Flowers perfect. Calyx of 4-6, mostly 5, sepals. Corolla of 4-6, mostly 5, petals or rarely wanting. Androecium of twice as many stamens as there are sepals. Gynoecium of 2-4-united carpels. Fruit capsular, sometimes baccate at maturity, or again separating into nut-like carpels.—About 20 genera and 160 species, widely distributed in warm and temperate regions.

Herbs: ovary sessile: stigmas lateral: corolla yellow or red.  
Shrubs or trees: ovary stipitate: stigmas terminal, corolla blue.

Tribe I. TRIBULEAE.

Tribe II. GUAIACEAE.

#### I. TRIBULEAE

Fruit armed: ovary 5-celled; carpels septate, 3-seeded.  
Fruit unarmed: ovary 10-12-celled; carpels 1-seeded.

1. TRIBULUS.

2. KALLSTROEMIA.

#### II. GUAIACEAE

Leaves with few leaflets: flowers blue.

3. GUAICUM.

1. *TRIBULUS* L. Diffuse herbs. Leaves pubescent. Sepals 5, deciduous. Petals white or yellow. Filaments unappendaged. Fruit spiny.—About 12 species, natives of warm and temperate regions.—BUR-NUTS. CALTROPS.

Corolla less than 2 cm. wide: peduncles shorter than the leaves: plant annual.

Corolla over 3 cm. wide: peduncles: plant perennial.

1. *T. terrestris*.
2. *T. cistoides*.

1. *T. terrestris* L. Branches 2-11 dm. long: leaves 2-6 cm. long; leaflets 10-14, the blades 3-12 mm. long: sepals 3-5 mm. long, acute: petals about 1 cm. long, yellow: stamens about as long as the petals: mature carpel 6-7 mm. long.—(PUNCTURE-WEED.)—Waste-places, Coastal Plain, Fla. to Tex. and N. Y., and occasional in the interior. Nat. of Old World.—(Mex.)—Spr.—fall.

2. *T. cistoides* L. Branches diffusely procumbent, pubescent: leaves 2-6 cm. long; leaflets 12-16, the blades elliptic: sepals lanceolate, 8-11 mm. long, acuminate: petals broad, 2-2.5 cm. long, bright-yellow: stamens shorter than the petals: mature carpel 8-9 mm. long.—Hammocks and waste-places, Coastal Plain, Fla. to Tex. and Ga.—Nat. of trop. Am.—(W. I., Mex., C. A., S. A.)—Spr.—fall, or all year S.

2. **KALLSTROEMIA** Scop. Herbs resembling *Tribulus*. Sepals 5, persistent. Petals yellow or red. Filaments unappendaged. Fruit uneven or tuberculate.—About 20 species of wide geographic distribution.—**CALTROPS**.

Sepals lanceolate, not hirsute, mainly appressed-pubescent: fruit glabrous.

Sepals linear-subulate, bristly hirsute: fruit pubescent.

1. *K. maxima*.

2. *K. parviflora*.

1. **K. maxima** (L.) T. & G. Branches prostrate or procumbent, 2–6 dm. long or longer, appressed-pubescent and often somewhat hirsute: leaflets usually 6–8, the blades of the terminal pair 9–18 mm. long, elliptic or oval, often curved: sepals lanceolate, 3–4 mm. long: petals greenish-yellow, obovate, 6–8 mm. long: fruit 7–10 mm. long, the conic beak slightly longer than the body, the carpels tuberculate and cross-ridged.—Waste-places, roadsides, and cult. grounds, Coastal Plain, Fla., Ala., and Ga. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.

2. **K. parviflora** Norton. Similar to *K. maxima* in habit: sepals 4.5–6 mm. long: petals yellow: fruit 10–12 mm. long, the slender beak slightly longer than the body.—Dry soil, Coastal Plain and southwestern provinces, Miss. to Ariz.—(*Mex.*)—Spr.–fall.

3. **GUAIACUM** [Plum.] L. Shrubs or trees. Leaves relatively large, persistent, the leaflets but little longer than wide. Sepals 5 or rarely 4, unequal. Petals blue or purple. Filaments unappendaged. Fruit angled or winged.—About 8 species, natives of tropical America.

1. **G. sanctum** L. Shrub or tree sometimes 10 m. tall, with very hard heavy wood, the bark pale: leaves 5–10 cm. long; leaflets 6–8, the blades broadly elliptic to obovate, 2–3 cm. long, bright-green: sepals obovate to elliptic-obovate, 6–7 mm. long: corolla about 2.5 cm. wide; petals blue, broadly obovate: fruit obovoid, 15–17 mm. long, orange.—(**LIGNUM-VITAE**.)—Hammocks, Florida Keys.—(*W. I.*)—Spr.—The heart-wood contains a resin. It is used for making small objects where hardness, weight, and strength are needed.

## FAMILY 8. MALPIGHIACEAE—MALPIGHIA FAMILY

Shrubs or trees, or partially woody herbs or vines. Leaves opposite: blades simple. Flowers usually perfect, sometimes cleistogamous. Calyx of 5 often gland-bearing sepals. Corolla of 5 usually clawed petals, or wanting. Androeceium of 5–10 perfect or partly sterile stamens. Gynoeceium of 2–4, usually 3, distinct or united carpels. Fruit drupaceous, capsular, or nut-like.—About 60 genera and 750 species, widely distributed in tropical and subtropical regions.

1. **BYRSONIMA** L. C. Rich. Shrubs or trees. Flowers in terminal racemes or panicles. Petals white, reddish, or purplish, reflexed. Stigmas acute. Carpels permanently united. Cotyledons circinate-coiled.—About 100 species, natives, mainly, of tropical America.

1. **B. cuneata** (Turcz.) P. Wilson. Evergreen shrub or small tree, mostly 3–18 m. tall: leaf-blades spatulate to obovate-spatulate, 2–4 cm. long, lustrous above: racemes 2–4 cm. long: petals pink or white, turning yellowish or rose, 7 mm. long, the blades reniform: drupe 4–6 mm. in diameter. [*B. lucida* (Sw.) DC.] — (LOCUST-BERRY.) — Hammocks and low pinelands, Everglade Keys, Fla. and Florida Keys.—(W. I.)—All year.

### FAMILY 9. RUTACEAE—RUE FAMILY

Shrubs or trees or rarely herbs, often prickly-armed, with glandular-punctate tissues. Leaves alternate or opposite: blades simple or pinately compound, sometimes 1-foliolate. Flowers perfect or polygamous, mostly regular. Calyx of 3–5, or rarely more, sepals, or wanting. Corolla of 3–5, or rarely more, petals. Androecium of as many stamens as there are sepals or petals or rarely thrice as many. Gynoecium of 2–5 distinct or united carpels. Fruit capsular, samaroid, drupaceous, or baccate.—About 110 genera and 950 species, most abundant in Africa and Australia.

Fruit dry, follicular or samaroid.

Flowers perfect: ovules 5 or more in each carpel: herbs.

Flowers dioecious or polygamous: ovules 1 or 2 in each carpel: shrubs or trees.

Fruit dehiscent: a follicle.

Fruit indehiscent: a samara.

Fruit fleshy, drupaceous or baccate.

Fruit a drupe: ovary 1-celled.

Fruit a berry: ovary 2–several-celled.

Tribe I. RUTAEAE.

Tribe II. ZANTHONYLEAE.

Tribe III. PTELEAE.

Tribe IV. AMYRIDEAE.

Tribe V. CITREAE.

#### I. RUTAEAE

Heavy-scented smooth herbs or partly woody plants with yellow flowers and lobed capsules.

1. RUTA.

#### II. ZANTHONYLEAE

Shrubs or trees, often with prickly stems and leaves.

2. ZANTHONYLUM.

#### III. PTELEAE

Unarmed shrubs or small trees with greenish-white flowers, the fruits winged all around.

3. PTELEA.

#### IV. AMYRIDEAE

Unarmed aromatic shrubs or trees, with white flowers and erect clusters of dark fruits.

4. AMYRIS.

#### V. CITREAE

Stamens 6–10: carpels 1-ovuled.

Styles very short or obsolete, persistent: ovary 5-celled.

Styles elongate, deciduous: ovary 3- or 4-celled.

Stamens 20 or more: carpels several-ovuled.

Leaves 3-foliolate: stamens distinct: fruit densely pubescent.

Leaves 1-foliolate: stamens more or less united: fruit glabrous.

5. GLYCOSMIS.

6. TRIPHASIA.

7. PONCIRUS.

8. CITRUS.

1. **RUTA** L. Herbs, sometimes woody at the base, heavy-scented. Leaf-blades divided. Flowers in corymbose or panicled cymes. Sepals 4 or 5, per-

sistent. Petals 4 or 5: blades involute, toothed or somewhat ciliate, often clawed. Ovary 4-5-celled. Capsule sessile, 4- or 5-lobed, dehiscent at the apex.—About 40 species, natives of the Mediterranean region and Asia.

1. *R. graveolens* L. Plant 2-8 dm. tall: leaf-blades twice ternately divided, the lobes obovate or obovate-cuneate: sepals deltoid or ovate: petals yellow, 5-7 mm. long, the blades involute, denticulate: capsule 8-11 mm. wide.—(RUE.)—Waste-places and cult. grounds, various provinces, E U. S. Nat. of Eu.—Spr.-fall.—Formerly much used in medicine.

2. *ZANTHOXYLUM* [Catesby] L. Shrubs or trees. Leaf-blades pinnate, sometimes 1-foliolate. Flowers dioecious or polygamous, in axillary spikes or terminal corymb-like or cyme-like panicles. Sepals present or wanting. Petals 4 or 5, mostly erect, white or green. Mature carpels solitary, or 2-5 together. [*Fagara* L.]—About 150 species, natives of temperate and tropical regions.—Spr.-sum. or all year S.

Calyx present: flowers appearing after the leaves.

Flowers in small axillary spikes: sepals, petals, and stamens 4.

Flowers in large terminal cyme-like or corymb-like panicles: sepals, petals, and stamens 3 or 5.

Sepals, and petals, 5: leaflets herbaceous.

Sepals triangular or deltoid, partially united, persistent.

Sepals ovate or ovate-lanceolate, distinct, deciduous.

Sepals, and petals, 3: leaflets leathery.

Calyx wanting: flowers appearing before the leaves.

1. *Z. Fagara*.

2. *Z. flavum*.

3. *Z. Clava-Herculis*.

4. *Z. coriaceum*.

5. *Z. americanum*.

1. *Z. Fagara* (L.) Sarg. Shrub, or tree sometimes 10 m. tall, the trunk slender, often inclining: leaves 2.5-11 cm. long, the rachis winged; blades of the lateral leaflets mostly obovate to oval, 1-2.5 cm. long, shallowly crenate: mature carpel subglobose, 3.5-4 mm. long. [*Z. Pterota* H. B. K.]—(WILD-LIME.)—Coastal hammocks, southern pen. Fla. and hammocks of the Everglade Keys and Florida Keys.—(W. I.)—The heart-wood is heavy and hard, usually brown.

2. *Z. flavum* Vahl. Shrub, or tree sometimes 12 m. tall, unarmed, the twigs stellate-canescenscent: leaves 9-25 cm. long, the rachis terete; blades of the lateral leaflets mostly elliptic or ovate, 3.5-10 cm. long: mature carpel obovoid, 5-9 mm. long. [*Z. caribaeum* Lam.]—(YELLOW-WOOD. SATIN-wood.)—Hammocks, lower Florida Keys.—(W. I.)—The heart-wood, exceedingly hard and heavy, is orange-colored.

3. *Z. Clava-Herculis* L. Shrub, or tree sometimes 17 m. tall, the prickles raised on corky bases: leaves 1-3 dm. long; blades of the lateral leaflets ovate,

4-5 cm. long, appressed-serrate: mature carpels mostly 2-5 together, about 4-6 mm. long. [*Z. carolinianum* Lam.]—(TOOTHACHE-TREE. PRICKLY-ASH. SEA-ASH. PEPPER-WOOD. HERCULES'-CLUB.)—Woods and hammocks, Coastal Plain, mostly near the coast or in phosphatic soils, Fla. to Tex., Ark., and Va.—The light and soft heart-wood is pale-brown. The bark is used medicinally.

4. *Z. coriaceum* Rich. Shrub, or tree becoming 7 m. tall: leaves 6-15 cm. long; blades of the leaflets leathery, rigid, obovate to cuneate or elliptic with acuminate base, 2-6 cm. long: mature carpel 5-6 mm. long.—(HERCULES'-CLUB.)—Coastal hammocks, S. pen. Fla. and the Keys.—(*W. I.*)

5. *Z. americanum* Mill. Shrub 1-3 m. tall, with prickly branches: leaves 1-3 dm. long; leaflets 4-8 cm. long, the blades ovate, elliptic, or rarely oval: corolla 3-3.5 mm. wide: mature carpel 4-5 mm. in diameter.—(NORTHERN PRICKLY-ASH. TOOTHACHE-TREE.)—River-banks and rocky woods, various provinces, rarely Coastal Plain, Ga. to Nebr., Minn., and Ont.

3. **PTELEA** L. Shrubs or trees. Leaf-blades 3-foliolate or rarely 5-foliolate. Flowers polygamous or sometimes dioecious, in cymes. Sepals 4 or 5. Petals 4 or 5, narrow, white or greenish. Ovary 2-3-celled. Ovules 2 in each cavity, superposed. Samara winged all around.—About 6 species, North American.—SHRUBBY-TREFOILS.—The bark is bitter and is used as a tonic.

Leaflets mostly 6-12 cm. long; blades broad, 2-8 cm. wide; samara-body orbicular to oval.

Samara suborbicular to oval-orbicular.

Samara obovate.

Leaflets with sharply serrate blades: samara 16-19 mm. long, acute or acutish at the base, the body merely glandular-dotted.

Leaflets with entire blades: samara 8-11 cm. long, rounded or truncate at the base, the body pitted.

Leaflets mostly 1-3 cm. long; blades narrow, about 1 cm. wide: samara-body elliptic.

1. *P. trifoliata*.

2. *P. serrata*.

3. *P. microcarpa*.

4. *P. Baldwinii*.

1. *P. trifoliata* L. Shrub, or tree sometimes 8 m. tall: blades of the leaflets ovate, oval, elliptic, elliptic-lanceolate, or oblanceolate, 4-12 cm. long, glabrous, (or densely pubescent in *P. trifoliata tomentosa*): panicles many-flowered: sepals ovate or elliptic-ovate, 1.5 mm. long: petals nearly elliptic, 4-6 mm. long: filaments 3.5-4 mm. long: anthers ovoid, about 1.5 mm. long: samara suborbicular or oval-orbicular, 2-2.5 cm. long.—(HOP-TREE. WAFER-ASH.)—Rich woods, hammocks, and rocky river-banks, various provinces, Fla. to Ariz., Minn., and Ont.—(*Mex.*)—Spr.

2. *P. serrata* Small. Shrub 1-2 m. tall, with slender, blackish branches: blades of the leaflets thinnish, 2.5-7 cm. long, serrate, mostly acuminate, much paler beneath than above, those of the lateral ones ovate to elliptic-oval, that of the terminal one elliptic or elliptic-obovate: samara pale-green, with the body copiously black-dotted, the wings thin, sparingly dotted.—Granite rocks, in the Piedmont of Ga.—Spr.

3. *P. microcarpa* Small. Shrub 1.5-3 m. tall, with dark-brown branches: blades of the leaflets thickish, 5-10 cm. long, entire, obtuse or acutish, slightly paler beneath than above, those of the lateral ones ovate or ovate-lanceolate, that of the terminal one elliptic or elliptic-obovate: samara brownish, with the body

copiously pitted, the wings thickish, sparingly pitted.—Hillsides and limestone ridges, Appalachian provinces, Ga., Ala., and Tenn.—Spr.

4. **P. Baldwinii** T. & G. Low shrub with dark, pustulate branches; blades of the leaflets thinnish, 2–4.5 cm. long, entire, acute or acutish, those of the lateral ones lanceolate to ovate, that of the terminal one elliptic varying to slightly broadest above or below the middle: samara obovate to orbicular-obovate, 1.5–2 cm. long, with the body dotted and wrinkled, the wings thinnish dotted.—Sandy places, NE Fla.—Spr.

4. **AMYRIS** [P. Br.] L. Shrubs or trees. Leaf-blades pinnate, or 1-foliolate, the petiole wingless. Flowers perfect or polygamous, paniculate. Sepals 4 or 5. Petals 4 or 5, broad, white. Ovary 1-celled: style short or wanting. Ovules 2. Drupe with a single seed.—About 15 species, mostly in tropical America.—Spr.-sum. or all year S.—The heavy, hard, and close-grained heartwood is sometimes used in cabinet-work, and yields a balsamic resin.

Fruit globose: ovary glabrous: leaflets shining beneath.  
Fruit obovoid to elliptic-obovoid: ovary pubescent: leaflets dull beneath.

1. *A. elemifera*.

2. *A. balsamifera*.

1. **A. elemifera** L. Shrub, or tree becoming 17 m. tall: leaflets 3 or 5; blades ovate to rhombic-ovate, 2–8 cm. long: petals 2.5–3.5 mm. long: drupe 4–8 mm. long, black beneath the bloom. [*A. maritima* Jacq.]—(TORCHWOOD.)—Coastal hammocks, pen. Fla., hammocks on the Everglade Keys and Florida Keys.—(W. I.)

2. **A. balsamifera** L. Shrub, or small tree sometimes 10 m. tall: leaflets 3–5; blades ovate to rhombic-ovate, 5–13 cm. long, dull beneath: drupe obovoid-ellipsoid to obovoid, 6–14 mm. long.—(BALSAM-TORCHWOOD.)—Coastal hammocks, southern pen. Fla.—(W. I.)—This plant ranges up the coasts of Florida, on the eastern coast even as far north as the Halifax River. In its northern distribution it is confined to the aboriginal kitchenmiddens, village sites, and burial mounds that lie close to the ocean or the lagoons.

5. **GLYCOSMIS** Correa. Shrubs or trees. Leaf-blades 1-several-foliolate: leaflets mostly entire. Flowers perfect, relatively small. Sepals nearly distinct. Petals 5, elongate, white. Ovary 2–5-celled: styles very short. Ovules solitary in each cavity. Berry globular, the pulp very thin.—Five species, natives of Asia and Australia.

1. **G. citrifolia** (Willd.) Lindl. Shrub 1–4 m. tall or small tree: leaves 1–5-foliolate; leaflets elliptic, or broadest above the middle, 8–16 cm. long, glabrous: sepals orbicular to oval, 1–2 mm. long: petals elliptic, sometimes broadly so, 3–4 mm. long: filaments clavate: berry 7–10 mm. in diameter, white or pink.—(GLYCOSMIS.)—Hammocks, Key West, Fla. Nat. of trop. Asia and cult.—(W. I.)—Spr.-sum.

6. **TRIPHASIA** Lour. Shrubs. Leaf-blades 3-foliolate: leaflets with toothed blades. Flowers perfect, relatively large. Sepals united. Petals 3 or 4, narrow, white. Ovary 3- or 4-celled: styles elongate, united. Ovules solitary in each cavity. Berry resembling a small orange.—One species.

1. **T. trifolia** (Burm. f.) P. Wilson. Shrub mostly 1–2 m. tall: leaflets 3; blades ovate to nearly elliptic, or oval, 1–5 cm. long, shallowly crenate: calyx-lobes acute: petals 12–16 mm. long: berry ellipsoid to globular-ellipsoid, 10–16 mm. long.—(BERGAMOT-LIME. LIME-BERRY.)—Hammocks, fields, and cult. grounds, Coastal Plain, Fla. to Tex. Nat. of E. I. and cult.—(W. I.)—Spr.

7. **PONCIRUS** Raf. Shrubs or trees with deciduous leaves. Leaf-blades 3-foliolate, the petiole narrowly winged. Flowers perfect, on the old wood. Sepals nearly distinct. Petals mostly 5, flat, thinnish, white, with claw-like bases. Ovary 6–8-celled, pubescent: styles united, deciduous. Ovules several. Berry many-seeded.—One species.

1. **P. trifoliata** (L.) Raf. Small tree with stout thorns: leaflets 2.5–6.5 cm. long; blades oval or elliptic, varying to ovate or obovate, shallowly toothed, obtuse: sepals ovate to elliptic: petals obovate to spatulate, mostly 1.5–2 cm. long: berry globular, 4–5 cm. in diameter, lemon-yellow.—(TRIFOLIATE-ORANGE.)—Woods and hammocks, Coastal Plain, Fla. to Tex. and Ga. Nat. of China.—Spr.—Extensively used as stock for grafting oranges; also for hedges and ornament. The peel contains a disagreeable-flavored oil and the pulp is scanty, but aromatic.

8. **CITRUS** L. Shrubs or trees with evergreen leaves. Leaf-blades 1-foliolate, the petiole often winged. Flowers perfect, axillary. Sepals united. Petals 5, or 4–8, thick and wax-like, white, not narrowed at the base. Ovary several-celled, glabrous: styles united, deciduous. Ovules several. Berry several-seeded.—Several species, natives of Asia, long cult. and extensively hybridized. Perhaps the earliest fruit trees introduced in America. Seeds brought over by the Spanish expeditioners were sown in the coastal regions of Florida and in the more remote parts. The descendants of these early introductions have since maintained a foothold in the hammocks and in the kitchenmiddens.—Plants flower mainly in spr.

Berry of a globose or subglobose type, not mammillate at the apex.

Petioles broadly winged: berry with a hollow core.

Petioles slightly winged: berry with a solid core.

1. *C. Aurantium*.

2. *C. sinensis*.

Berry of an ellipsoid type, commonly mamillate at the apex.

Berry relatively small, the rind thin, the pulp well-developed with abundant juice and very acid: petioles narrowly winged or wingless.

Corolla 2-2.5 cm. wide: blades of the leaflets commonly rounded at the apex: berry 3-6.5 cm. long, the pulp greenish.

Corolla 3-5 cm. wide: blades of the leaflets often acute: berry 6-10 cm. long, the pulp light-yellow.

Berry large, 12-20 cm. long, the rind 3-7 mm. thick, the pulp scant, insipid.

3. *C. aurantifolia*.

4. *C. Limonum*.

5. *C. Medica*.

1. *C. Aurantium* L. Thorny shrub or small tree: leaflets ovate to elliptic, 6-12 cm. long, often acuminate, the petioles usually broadly winged: flowers in small cymes: sepals often obtusish: berry dark-orange or reddish, the rind thick, the pulp sour and bitter. [*C. vulgaris* Risso.](BITTER-SWEET ORANGE.)—Woods and hammocks, Coastal Plain, Fla. and Ga.—(W. I.)

2. *C. sinensis* Osbeck. Thorny erect, shrub or small tree: leaflets oval, elliptic-ovate, or ovate, 6.5-13 cm. long, often acute or rounded, the petioles usually narrowly winged: flowers in axillary clusters: sepals often acute: berry mostly yellow, the rind usually thin, the pulp sour or sweet. [*C. Aurantium* (Fl. SE. U. S.)]—(SWEET-ORANGE. SEVILLE-ORANGE.)—Woods and hammocks, pen. Fla. and the Keys.—(W. I.)

3. *C. aurantifolia* (Christm.) Swingle. Small tree or straggling shrub, with numerous sharp thorns: leaflets oval to elliptic, 6.5-9 cm. long, commonly rounded at the apex, crenulate: petioles narrowly winged: flowers in clusters of 3-10: petals white without and within: berry small, mostly less than 6 cm. long, the rind very thin, the pulp greenish. [*C. Lima* Lunan.](LIME.)—Woods, thickets, and hammocks, pen. Fla. and the Keys.—(W. I.)

4. *C. Limonum* (L.) Risso. Small tree or spreading shrub, less thorny than *C. aurantifolia*: leaflets elliptic or ovate-oval, 5-11 cm. long, commonly acute or acuminate at the apex, crenate: petioles winged or wingless: flowers solitary or 2 together: petals purplish without, white within: berry large, mostly over 6 cm. long, the rind relatively thin, the pulp yellowish.—(LEMON.)—Woods and hammocks, pen. Fla. and the Keys.—(W. I.)

5. *C. Medica* L. Small tree or shrub, sometimes with stout thorns: leaflets elliptic, or slightly broadened upward, 12-20 cm. long, rounded and often emarginate at the apex, serrulate-crenate, dull-green: flowers in clusters of 3-10: petals purple-tinged without, white within: berry oblong or oval, usually very large, mostly 12-20 cm. long, often coarsely wrinkled, the rind very thick.—(CITRON.)—Pinelands and hammocks, pen. Fla. and Florida Keys.—(W. I.)

#### FAMILY 10. SURIANACEAE—BAY-CEDAR FAMILY

Shrubs or trees of coastal sands. Leaves alternate: blades entire. Flowers perfect, solitary, or few in terminal clusters. Calyx of 5 persistent sepals. Corolla of 5 clawed petals. Androecium of 8 or 10 stamens, those opposite the petals more or less reduced. Gynoecium of 4 or 5 distinct carpels opposite the petals. Ovules 2, side by side. Fruit achene-like.—The following genus and species comprise the family.

1. **SURIANA** [Plum.] L. Shrubs with erect stems or trees with wide-spreading branches, the bark flaky. Leaves numerous, fleshy. Fruits seated in the persistent calyx.

1. **S. maritima** L. Shrub or tree 8 dm. tall, the wood very hard and heavy: leaves fleshy, appressed-pubescent, approximate; blades linear-spatulate, 1.5–4 cm. long: sepals ovate, 6–8 mm. long: petals yellow, about as long as the sepals: mature carpels 4–4.5 mm. long.—(BAY-CEDAR. THATCH-LEAF.)—Sand-dunes and coastal hammocks, S pen. Fla. and the Keys.—(W. I.)—All year.—The heart-wood is reddish-brown, hard, heavy, and close-grained.—The bay-cedar is usually a shrub with many stems, growing in coastal sands, often just back of the tide line. In the shifting sands it gets little chance for a long life. However, on the leeward side of islands, protected from the winds and waves, plants sometimes grow to the size of trees.

#### FAMILY 11. SIMAROUBACEAE—QUASSIA FAMILY

Shrubs, trees, or rarely herbs. Leaves alternate or rarely opposite: blades pinnately compound, 1–3-foliolate or rarely simple. Flowers polygamous, deciduous, or rarely perfect, solitary, spicate, racemose or paniculate. Calyx of 3–5 sepals. Corolla of 3–5 petals or wanting. Androecium of as many stamens as there are sepals or twice as many, or rarely very many. Gynoecium of 2–5 more or less united carpels. Ovary usually lobed. Stigmas mostly introrse. Fruit a drupe or a samara, or baccate.—About 30 genera and 150 species, most abundant in the tropics.

Fruit drupaceous or baccate.

Carpels becoming distinct, forming simple fruits: leaf-blades equally pinnate.

1. SIMAROUBA.

Carpels permanently united, forming a compound fruit: leaf-blades unequally pinnate.

2. PICRAMNIA.

Fruit samaroid.

Petals present: stamens 10: mature carpels separate.

3. AILANTHUS.

Petals wanting: stamens 5: mature carpels united.

4. ALVARADOA.

1. **SIMAROUBA** Aubl. Trees. Leaf-blades abruptly pinnate, the leaflets thick. Flowers monoecious or dioecious, paniculate. Sepals 4 or 5, short. Petals 4 or 5, much larger than the sepals, imbricate. Stamens 8 or 10, each with a fringed appendage at the base. Ovary 4–5-celled, scarcely lobed at the apex: style very short. Fruit a cluster of 5, or fewer, drupes, with the style-base lateral.—About 5 species, tropical American.

1. **S. glauca** DC. Tree sometimes 16 dm. tall: leaflets 6–12; blades elliptic or nearly so, 4–8 cm. long, entire: flowers yellow or yellowish: drupe oval, about 2 cm. long, scarlet or dark-purple.—(PARADISE-TREE. BITTER-WOOD.)—Hammocks, near the coast,

S pen. Fla., Everglade Keys, and Florida Keys.—(*W. I., Mex., C. A., S. A.*)—Spr.—The light-brown heart-wood is close-grained, but soft and light.

2. **PICRAMNIA** Sw. Shrubs or trees. Leaf-blades unequally pinnate, the leaflets thickish. Flowers dioecious, spicate or racemose. Sepals 3–5, short. Petals 3–5, imbricate, white or greenish-white, or wanting. Stamens 3–5, unappendaged. Ovary 2–3-celled, not lobed: style very short. Fruit a berry.—About 30 species, most abundant in tropical America.

1. **P. pentandra** Sw. Shrub or small tree: leaflets 5–7; blades elliptic, or rarely ovate, 5–10 cm. long, lustrous above: berry ellipsoid, 10–15 mm. long.—(*BITTER-BUSH.*)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(*W. I.*)—Wint.-spr.—The heavy and hard wood, like the bark, contains a bitter principle.

3. **AILANTHUS** Desf. Trees. Leaf-blades unequally pinnate, the leaflets thin. Flowers polygamo-dioecious, paniculate. Sepals 5, short. Petals 5, valvate, much larger than the sepals, white or greenish-white. Stamens 10, unappendaged at the base. Ovary 2–5-celled, deeply lobed at the apex: style columnar. Fruit a cluster of 5, or fewer, samaras with the style-bases lateral.—About 3 species, Asiatic.

1. **A. altissima** Swingle. Tree becoming 30 m. tall: leaflets 13–41; blades lanceolate to elliptic-lanceolate, 7–18 cm. long: samaras 4–5 cm. long, linear-elliptic, numerous in drooping panicles, the seed in the middle. [*A. glandulosa* Desf.]—(*TREE-OF-HEAVEN. COPEL-TREE.*)—Roadsides, woods, and waste-places, various provinces, U. S. and S Can. Nat. of China and cult.—Spr.—sum.

4. **ALVARADOA** Liebm. Shrubs or trees. Leaf-blades unequally pinnate, the leaflets thinnish. Flowers dioecious, borne in spreading or drooping racemes. Sepals 5, short, greenish. Petals wanting. Stamens 5, alternating with 5 staminodia. Ovary flattened or 3-angled, 2–3-celled, apically notched. Fruit samaroid.—About 6 species, tropical American.

1. **A. amorphoides** Liebm. Shrub or small tree: leaves approximate at the ends of the branches; leaflets numerous, the blades 1–2 cm. long, those of the lateral leaflets mostly elliptic or oval: flowers numerous, slender-pedicelled: sepals ovate, about 1.5 mm. long: filaments pubescent: samara elliptic or ovate-elliptic, 12–14 mm. long, ciliate,

notched.—(ALVARADOA.)—Hammocks, Everglade Keys, Fla.—(W. I., Mex., C. A.)—All year.

#### FAMILY 12. BURSERACEAE—TORCHWOOD FAMILY

Trees with a resinous sap. Leaves alternate: blades pinnate, rarely 1–3-foliate. Flowers perfect or polygamo-dioecious, racemose or paniculate. Calyx of 3–6 sepals. Corolla of 3–6 petals. Androecium of 6–12 stamens. Gynoecium of 2–5 united carpels. Fruit drupaceous, the epicarp sometimes valvate.—About 20 genera and 325 species, mostly of tropical regions.

1. **ELAPHRIUM** Jacq. Trees. Leaves approximate at the ends of the branches: leaflets thick. Sepals 4–6, imbricate. Petals 4–6, mostly valvate. Stamens 8–12, erect. Ovary 3–5-celled. Drupe with a valvate epicarp. [*Bursera* Jacq.]—About 80 species, mostly of tropical America.

1. **E. Simaruba** (L.) Rose. Tree, becoming 20 m. tall: with soft wood and smooth reddish bark: leaflets 3–7; blades oval or elliptic, varying to ovate or obovate, 3–5 cm. long, entire: racemes 5–10 cm. long: petals 2–2.5 mm. long, green or brownish-green: drupe elliptic, 8–11 mm. long, or rarely smaller, the epicarp 3-valved.—(WEST-INDIAN BIRCH. GUMBO-LIMBO. GUM-ELEML.)—Hammocks, along or near the coast, S pen. Fla., Everglade Keys, and Florida Keys.—(W. I.)—Wint.-spr.—Conspicuous always by its smooth reddish bark and in winter by its leafless branches. It is the only deciduous-leaved tropical tree among its evergreen associates. A section of a branch or trunk planted will strike root and grow rapidly.

#### FAMILY 13. MELIACEAE—MAHOGANY FAMILY

Shrubs or trees, or partially woody herbs. Leaves alternate: blades pinnately 1–3-compound. Flowers perfect or polygamo-dioecious, paniculate. Calyx of 3–5 sepals. Corolla of 3–5 petals. Androecium of 8–10, or rarely fewer or more, stamens, with the filaments united into a tube. Gynoecium of 3–5 united carpels. Ovary 3–5-celled. Fruit a berry, a capsule, or a drupe.—About 50 genera and 700 species, most abundant in the tropics.

Fruit drupaceous, clustered, drooping: androecium and style elongate.

Fruit capsular, solitary, erect; androecium and style short.

1. MELIA.  
2. SWIETENIA.

1. **MELIA** L. Trees with variegated wood. Leaf-blades thrice unequally pinnate. Sepals 5 or 6. Petals 5 or 6. Staminal tube elongate, the lobes

cleft. Anthers sagittate. Stigma 3-6-lobed. Drupe coriaceous-fleshy. Seed not winged.—About 25 species, Asiatic.

1. *M. Azedarach* L. Tree becoming 15 m. tall (in *M. Azedarach umbraculifera* with an umbrella-like top): leaflets numerous; blades herbaceous, ovate, oval, or elliptic, 3-7 cm. long, incised-serrate or lobed: flowers fragrant: petals lilac-colored, about 1 cm. long: drupe subglobose, 1.5-2 cm. in diameter.—(CHINA-BERRY. CHINA-TREE. PRIDE-OF-INDIA.)—Roadsides, fields, fence-rows, and woods, various provinces, Fla. to Tex., Okla., and N. C. Nat. of Asia and cult.—(W. I.) A favorite shade-tree about cabins. Once much used for cabinet-work. Extensively naturalized and very showy when in flower.—Spr.—The leaves are deciduous.

2. *SWIETENIA* Jacq. Trees, with hard wood. Leaf-blades once equally pinnate. Sepals 5. Petals 5. Staminal-tube short, the lobes entire. Stigma discoid. Capsule woody. Seed winged.—Three species, 2 American and 1 African.

1. *S. Mahagoni* Jacq. Tree becoming 25 m. tall: leaflets 4-8; blades leathery, ovate to ovate-lanceolate, 3-8 cm. long, entire: petals usually 3-4 mm. long, white or greenish: capsule ovoid, 6-12 cm. long, erect.—(MAHOGANY. MADEIRA-REDWOOD. WEST-INDIAN MAHOGANY.)—Hammocks, Everglade Keys to Cape Sable, pen. Fla. and Florida Keys.—(W. I., C. A., S. A.)—Sum.—The source of the mahogany much used in cabinet-work. The leaves are persistent.

## ORDER POLYGALALES — POLYGALAL ORDER

Herbs, shrubs, or trees. Leaves alternate, opposite, or whorled, sometimes scale-like. Flowers perfect. Perianth mostly irregular, each whorl of 5, or rarely 3 or 4, parts. Androecium of 6, 8, or 10 stamens, the filaments often partially united. Anthers opening by terminal pores or cracks. Gynoecium of 2 united carpels, or rarely of more. Fruit capsular.

### FAMILY 1. POLYGALACEAE — MILKWORT FAMILY

Herbs, or rarely shrubs or trees. Leaf-blades mostly entire. Flowers solitary, spicate, or racemose, irregular. Calyx of mostly 5 sepals, the 2 inner petaloid. Corolla of 5, or often of 3, small, partially united petals, the lower one keel-like. Androecium of 6-8 stamens, partially coherent with the petals. Anthers 1-celled. Capsule usually 2-seeded.—About 10 genera and 1,000 species, widely distributed.

Corolla-keel blunt, crestless and beakless.  
Corolla-keel appendaged, with a lobed or tufted crest.

#### 1. ASEMEIA.

Flowers axillary to leaf-like bracts: perennial plants with slender rootstocks.

Flowers in terminal spikes or racemes: annual plants, or perennials with taproots.

Sepals and petals not decurrent on the pedicel: pedicels not winged: flowers not yellow: racemes not in cymose-panicles.

Wings less than  $\frac{1}{2}$  the length of the keel: aril equitant, obscurely lobed.

Wings equalling the keel or exceeding it: aril 2-lobed.

Sepals and petals decurrent on the pedicel: pedicels winged: flowers yellow or orange, or if white then in cymose panicles.

2. *TRICLISPERMA*.

3. *GALYPOLA*.

4. *POLYGALA*.

5. *PILOSTANIS*.

1. **ASEMEIA** Raf. Annual or perennial herbs, or shrubs. Leaves often alternate: blades broad or narrow. Raceme narrow, spike-like. Sepals persistent, usually glandular-ciliate, the 2 lower ones wholly or partly united. Wings persistent, petaloid, with broad blades. Keel about as long as the wings, sometimes slightly lobed. Upper petals shorter than the keel, adnate to the filament tube at the base. Capsule broad, wingless, more or less margined. Seeds pubescent, the aril scarcely lobed.—About 20 species, mostly North American.—Spr.—fall or all year S.—CANDYWEEDS. **POLYGALAS.**

Capsule much shorter than the wings.

Wings green or merely purple-tinged: capsule broadly elliptic, abruptly narrowed at the base: wings slightly inequilateral.

Wings bright-purple: capsule narrowly elliptic, gradually narrowed at the base: wings very inequilateral, very oblique.

Capsule as long as the wings or longer.

Mature wings suborbicular: capsule as long as the wings or slightly longer: keel 3.5–4 mm. long.

Mature wings obovate: capsule much longer than the wings: keel 2–2.5 mm. long.

1. *A. grandiflora*.

2. *A. leiodes*.

3. *A. cumulicola*.

4. *A. miamiensis*.

1. ***A. grandiflora*** (Walt.) Small. Plant 2–5 dm. tall, the stem finely, often closely pubescent: blades of the upper leaves elliptic, elliptic-lanceolate, or lanceolate (or nearly erect and linear in *A. grandiflora angustifolia* [*Polygala corallicola* Small]), loosely ascending or spreading: flowers greenish or sometimes purple-tinged: upper sepal broadly ovate, becoming 2.5–3 mm. long: mature wings 6–7 mm. long: capsule about 5 mm. long, much exceeded by the wings: seed-body cylindric, about 2.5 mm. long. [*Polygala grandiflora* Walt.]—Pinelands, sandy woods, old fields, and sand-dunes, Coastal Plain, Fla. to Miss. and S. C.—A stout copiously pubescent form with bright rose-purple flowers growing mainly in pen. Florida may represent a distinct species.

2. ***A. leiodes*** (Blake) Small. Plant 2–4.5 dm. tall, the stem usually minutely pustulate: blades of the upper leaves linear, typically narrowly so, or filiform-linear: flowers purple, usually dark-purple: upper sepal becoming less than 2.5 mm. long: mature wings 4.5–5.5 mm. long: capsule 3.5–4 mm. long, much exceeded by the wings: seed-body about 2 mm. long. [*Polygala grandiflora leiodes* Blake.]—Pinelands and adj. Everglades, Everglade Keys, Fla. and Florida Keys.

3. ***A. cumulicola*** Small. Plant 3–4 dm. tall, the stem finely and closely pubescent: blades of the lower leaves spatulate to linear-spatulate, those of the upper leaves narrowly elliptic to linear-elliptic or narrowly linear-lanceo-

late: flowers purple, often pale: upper sepal becoming 1.5–2 mm. long: mature wings broadly obovate, 4.5–5 mm. long: capsule 4.5–5.5 mm. long: seed-body about 2 mm. long. [*Polygala Krugii* (Fl. SE. U. S.) *P. cumulicola* Small.]—Coastal sand-dunes, lower eastern coast, pen. Fla.

4. **A. miamiensis** Small. Plant 3–4 dm. tall, the stem minutely pubescent: blades of the lower leaves spatulate to elliptic-spatulate, those of the upper leaves linear-elliptic: flowers pale-purple: upper sepal becoming 1–1.5 mm. long: mature wings obovate, 2.5–3 mm. long: capsule 3–3.5 mm. long, exceeding the wings: seed-body about 2 mm. long. [*Polygala miamiensis* Small.]—Everglades near the source of the Miami River, Fla.

2. **TRICLISPERMA** Raf. Perennial caulescent herbs with elongate rootstocks. Leaves alternate, persistent, the lower ones scale-like, the upper larger, approximate. Flowers of two kinds, the petaliferous showy, axillary to leaf-like bracts, rose-purple or rarely white, the cleistogamous inconspicuous, borne on short basal branches. Wings conspicuous. Sepals (and wings) deciduous. Corolla about as long as the wings. Stamens in two distinct groups of three each, but with the filaments adnate to the two posterior petals. Stigma discoid, not lobed. Capsule 2-lobed. Seed with a prominently 3-lobed aril.—One species.

1. **T. paucifolia** (Willd.) Nieuwl. Plant 0.5–2 dm. tall: leaf-blades various, those of the lower leaves scale-like, those of the upper elliptic, oval, or ovate: bracts similar to the upper leaves: flowers rose-colored, rose-purple, or white: sepals 4–6 mm. long: wings spatulate to obovate, 10–18 mm. long: keel about as long as the wings, the claw longer than the body: lateral petals 12–14 mm. long: capsule suborbicular or orbicular-obcordate, 5–8 mm. wide, winged at the notched apex: seed ovoid, the body 2.5–3 mm. long, the linear aril-lobes reaching nearly or quite to the base of the seed. [*Polygala paucifolia* Willd.]—(BIRD-ON-THE-WING. POLYGALA. FLOWERING-WINTERGREEN. FRINGED-POLYGALA. GAY-WINGS.)—Moist woods and ravines, often in subacid soils, various provinces, N of Coastal Plain, Ga. to Ill., Man., Que., and Me.—Spr.—sum.

3. **GALYPOLA** Nieuwl. Annual caulescent, slender, usually simple herbs. Leaves alternate, inconspicuous: blades very narrow, erect. Flowers all alike, borne in a terminal rather dense cylindric spike-like raceme. Wings inconspicuous. Sepals (and wings) persistent. Corolla rose-purple or rarely white, about thrice as long as the wings, the petals united in a slender tube which is cleft at the base. Stamens 8, the filaments adnate, and united to the posterior petals. Stigma prominently 2-lobed. Capsule wingless, obscurely notched at the apex. Seed with an obscurely lobed aril.—One species.

1. *G. incarnata* (L.) Nieuwl. Plant 2-7 dm. tall, the stem glaucous; blades of the upper leaves linear-subulate to subulate: flowers mainly rose-purple, or white: upper sepal becoming 2-2.5 mm. long: mature wings lanceolate to spatulate, 3-4 mm. long: keel 6-8 mm. long, the claw longer than the body: lateral petals 5-7 mm. long: capsule ovoid, 3-3.5 mm. long, notched at the base: seed oval or oval-ovoid, the body about 2 mm. long, capped with the aril.—(PROCESSION-FLOWER. *POLYGALA*.)—Pinelands, dry woods, and prairies, in rather sterile soil, various provinces, Fla. to Tex., Nebr., Ont., and S N. Y.—(*Mex.*)—Sum. or all year S.

4. *POLYGALA* L. Annual or perennial herbs. Leaves alternate, opposite, or whorled: blades narrow or broad, herbaceous or fleshy. Flowers in slender and spike-like or short and stout racemes. Sepals persistent, distinct. Wings persistent, petaloid, with usually broad blades. Keel about as long as the wings, with a lobed appendage or tufted crest below the apex. Stamens with the filaments united and usually adnate to the posterior petals. Capsule broad, wingless or slightly winged. Seeds usually pubescent, the aril with 2 lateral appressed lobes.—About 400 species, widely distributed.—CANDYWEEDS. *POLYGALAS*.

Leaves all alternate.

Racemes elongate, interrupted or continuous: flowers persistent, and persistent fruits, not densely crowded.

Wings and corolla white or greenish-white: plant perennial.

I. *SENEGAE*.

Wings and corolla rose-purple: plant annual or biennial.

Plant biennial, with basal shoots bearing cleistogamous flowers.

II. *POLYGAMAE*.

Plant annual, without basal shoots: no cleistogamous flowers.

III. *LEPTOCAULES*.

Racemes short and stout, not interrupted: flowers and fruits deciduous, leaving an elongate scarred rachis, or a bristly rachis when the bracts are persistent.

Leaves reduced to minute scales.

IV. *SETACEAE*.

Leaves not scale-like.

V. *MARIANAE*.

Leaves, at least at some of the nodes of the stem, whorled.

Bracts persistent on the raceme-rachis after anthesis.

VI. *CRUCIATAE*.

Bracts deciduous from the raceme-rachis after anthesis.

VII. *BOYKINIANAE*.

#### I. *SENEGAE*

Perennial herb with stems tufted on a short caudex and stout root: stems scaly at the base: flowers inconspicuous.

1. *P. Senega*.

#### II. *POLYGAMAE*

Capsule orbicular-ovoid or oval, slightly longer than wide: wings about as long as the capsule or much longer: seed ovoid, sometimes narrowly so.

Flowers long-pedicelled: pedicels exceeding the bracts: wings much longer than the capsule.

2. *P. polygama*.

Flowers short-pedicelled: pedicels shorter than the bracts: wings about as long as the capsule.

3. *P. aboriginum*.

Capsule elliptic, about twice as long as wide: wings much shorter than the capsule: seed cylindric.

4. *P. Leightonii*.

#### III. *LEPTOCAULES*

Annual herb with very slender simple or sparingly branched stems and narrow leaf-blades: flowers very small, in narrow continuous racemes.

5. *P. leptocaulis*.

#### IV. *SETACEAE*

Perennial slender herb with almost filiform inconspicuously scaly stem and branches: flowers very small, in pale very dense racemes.

6. *P. setacea*.

#### V. *MARIANAE*

Flowers small: wings becoming 4 mm. long or less: capsule less than 3 mm. long.

Bracts persistent on the raceme-rachis.

Wings broad, oval to ovate: racemes usually acuminate at the tip.

Wings narrow, elliptic, varying to broadest above the middle or below it: racemes blunt or abruptly pointed at the tip.

Mature wings about 2 mm. long: capsule wider than long: seed about 1 mm. long.

Mature wings 3.5-4 mm. long: capsule longer than wide: seed about 1.5 mm. long.

Bracts deciduous from the raceme-rachis.

Mature wings not clawed: capsule slightly exceeded by the wings.

Mature wings clawed: capsule much exceeded by the wings.

Flowers large: wings becoming 5 mm. long or more: capsule over 3 mm. long.

#### VI. CRUCIATAE

Raceme loosely and rather sparsely flowered, tapering to the apex: persistent bracts separate.

Raceme densely many-flowered, rounded or abruptly narrowed at the apex: persistent bracts close together.

Mature wings ovate, abruptly pointed: sepals obtuse.

Mature wings hastate-deltoid, acuminate, sometimes caudate-acuminate: sepals acute.

Raceme manifestly peduncled: mature wings much longer than wide, caudate-acuminate.

Raceme sessile or nearly so: mature wings about as wide as long, abruptly short-acuminate.

#### VII. BOYKINIANAE

Plant perennial.

Leaves whorled, at least up to the middle of the stem.

Seed stout, less than twice as long as thick, rounded at the base.

Seed slender, over twice as long as thick, acute at the base.

Leaves whorled only near the base of the stem.

Plant annual.

Internodes of the stem greatly elongate: seed fusiform, glabrous.

Internodes of the stem not greatly elongate: seed ovoid, pubescent.

Raceme elongate, with the fruits persistent on the lower part of the rachis: wings about as long as the capsule: seed-body about thrice as long as thick.

Raceme conic on account of the prompt falling away of the fruits as they mature: wings shorter than the capsule: seed-body about twice as long as thick.

Capsule about 1 mm. long: seed finely pubescent.

Capsule about 1.5 mm. long: seed hirsute.

7. *P. Chapmanii*.

8. *P. Nuttallii*.

9. *P. Curtissii*.

10. *P. mariana*.

11. *P. Harperi*.

12. *P. viridescens*.

13. *P. Hookeri*.

14. *P. brevifolia*.

15. *P. ramosior*.

16. *P. cruciata*.

17. *P. Boykinii*.

18. *P. flagellaris*.

19. *P. praetervisa*.

20. *P. leptostachys*.

21. *P. ambigua*.

22. *P. verticillata*.

23. *P. Pretzii*.

1. *P. Senega* L. Plant 1-5 dm. tall, the stem glabrous or puberulent: blades of the upper leaves linear to lanceolate, more or less serrulate (or ovate and distinctly serrulate and with large capsule and seed in *P. Senega latifolia*): flowers greenish-white: upper sepals becoming 1.5-2 mm. long: wings orbicular-ovate or sub-orbicular, 2-3 mm. long, obtuse: keel about as long as the wings, short-clawed: lateral petals 2-3 mm. long: capsule wider than long, 3.5-4.5 mm. long: seed ovoid, about 2.5 mm. long.—(SENECA-SNAKEROOT.)—Dry woods and rocky soil, often calcareous, various provinces, Miss. to Ark., Alas., N. B., and N. C.—Spr.—The roots are sometimes used medicinally.

2. *P. polygama* Walt. Plant 1-5 dm. tall, the stem glabrous: leaves not clustered;

blades spatulate to elliptic-oblongate or linear: bracts minute: flowers rose-purple to pink, or white: upper sepal becoming 2-2.5 mm. long: mature wings obovate, 3-6 mm. long: keel 3-4 mm. long, the claw shorter than the body: lateral petals 3-4 mm. long: capsule broadly orbicular-ovate, 2-4 mm. long: seed ovoid, about 2.5 mm. long.—Acid sandy soil, pinelands and grassy places, various provinces, Fla. to Tex., Man., and N. S.—Spr.—sum.

3. *P. aboriginum* Small. Plant 1-3 dm. tall, the stem glabrous: leaves alternate; blades elliptic-spatulate to narrowly elliptic: flowers mainly pink, sometimes tinged with purple: upper sepal becoming about 1.5 mm. long: mature wings orbicular or orbicular-oval, 3-4 mm. long: keel about 2 mm. long, the claw shorter than the body: lateral petals about 2.5 mm. long: capsule oval and somewhat quadrate, about 3.5 mm. long: seed narrowly obovoid or slightly cylindric-obovoid, about 3 mm. long.—Hammocks, coastal sand-dunes, S of Coronado, Fla.—Spr.

4. *P. Lewtonii* Small. Plant 1-2 dm. tall, the stem glabrous: leaves in clusters; blades spatulate to linear-spatulate: flowers mainly deep-pink: upper sepal becoming 1.5-2 mm. long: mature wings rhombic-obovate, 4-5 mm. long: keel 3-3.5 mm. long, the claw about as long as the body: lateral petals about 3 mm. long: capsule elliptic, about 5 mm. long: seed cylindric, 3-3.5 mm. long.—Dry scrub, C Fla.—Spr.—sum.

5. *P. leptocaulis* T. & G. Plant 2-6 dm. tall, the stem very slender, the branches almost filiform: upper leaves acicular or filiform: flowers pale-purple or pinkish: upper sepal becoming about 1 mm. long: mature wings spatulate, elliptic-obovate, or elliptic, 1.5-2 mm. long: keel about 1.5 mm. long, the claw much shorter than the body: capsule elliptic, about 1.5 mm. long: seeds elliptic-obovoid, fully 1 mm. long. [*P. paludosa* (Fl. SE. U. S.)]—Sandy swamps, low pinelands, and wet prairies, Coastal Plain, Miss. to Tex.—(W. I., Mex., C. A., S. A.)—Spr.—sum.

6. *P. setacea* Michx. Plant 1-5 dm. tall, the stem glabrous, pale-green: leaf-blades mere subulate scales: flowers pinkish or whitish: upper sepal becoming 1-1.5 mm. long: mature wings narrowly obovate, about 2 mm. long, usually abruptly pointed: keel about 2 mm. long: lateral petals 1.5-2 mm. long: capsule deltoid-ovate, about 1.5 mm. long: seed 1 mm. long with a globose-obovoid body, and a slender tip.—Low pinelands, Coastal Plain, Fla. to Miss. and N. C.—Spr.—sum. or all year S.

7. *P. Chapmanii* T. & G. Plant 2-5 dm. tall, the stem glabrous: blades of the upper leaves narrowly linear or linear-subulate: flowers pale-purple or purplish: upper sepal becoming 1.5 mm. long: wings ovate or oval, 2.5-3 mm. long: keel about 2 mm. long, the claw as long as the body or longer: capsule suborbicular, fully 1.5 mm. long: seed 1-1.5 mm. long, with a globose-oval body and a slender tip.—Pinelands, Coastal Plain, Fla. to Miss.—Spr.—sum.

8. *P. Nuttallii* T. & G. Plant 1-2.5 dm. tall, the stem usually finely pubescent below: blades of the lower leaves linear-spatulate, those of the upper ones narrowly linear: flowers purple, purplish, or greenish: upper sepal becoming 1 mm. long: mature wings elliptic or elliptic-lanceolate, 2-2.5 mm. long: keel about as long as the wings: lateral petals about 2 mm. long: capsule about 1.5 mm. long: seed about 1 mm. long, ovoid, with a short stout tip.—Pinelands, sand-dunes, old-fields, and barrens, often in acid soil, various provinces, Ala. to Miss., Pa., Mass., and N. C.—Sum.

9. *P. Curtissii* A. Gray. Plant 1-3 dm. tall, the stem glabrous: blades of the lower leaves spatulate, those of the upper ones linear: flowers rose-purple,

bright-pink, or white: upper sepal becoming 1.5–2 mm. long: mature wings elliptic to ovate-elliptic, 3.5–4 mm. long: capsule about 2.5 mm. long: seed 1.5 mm. long, with an ovoid body and slender tip. [*P. Hugerii* Small.]—(BUTTON-ROSEY.)—Woods, rocky banks, ledges, pinelands, and sandy barrens, various provinces, Ga. and Ala. to Ky. and Pa.—Sum.—fall.—Ascends to 4,000 feet in N. C., its size and vigor increasing with the altitude.

10. *P. mariana* Mill. Plant 1–5 dm. tall, the stem glabrous: blades of the lower leaves spatulate, those of the upper ones linear: flowers pink or purple: upper sepal fully 1 mm. long: mature wings ovate to elliptic, 2.5–3 mm. long: keel nearly as long as the wings: lateral petals about 3 mm. long: capsule about 2 mm. long: seed fully 1 mm. long, with an ovoid body and short stout tip.—Pinelands, woods, savannas, and prairies, various provinces, Fla. to Tex., Ark., and N. S.—Sum.—fall.

11. *P. Harperi* Small. Plant 1.5–4 dm. tall, the stem glabrous: blades of the lower leaves spatulate, those of the upper ones linear-spatulate to linear or linear-subulate: flowers pink: upper sepal becoming 1.5 mm. long: mature wings elliptic, about 4 mm. long: capsule 1.5–2 mm. long: seed about 1 mm. long, with an ovoid body and short stout tip.—Pinelands, Coastal Plain, Fla. to La. and Ga.—Spr.—sum.

12. *P. viridescens* L. Plant 1–5 dm. tall, the stem glabrous: blades of the lower leaves spatulate, those of the upper ones linear to linear-elliptic: flowers reddish-purple, green, or white: upper sepal becoming 2 mm. long: mature wings broadly ovate, 5 mm. long or more: keel 2.5–3 mm. long: lateral petals much shorter than the wings: capsule fully 3 mm. long: seed fully 1.5 mm. long, with ovoid bodies and stout tips. [*P. sanguinea* L.]—Dry woods, pastures, meadows, and prairies, various provinces, S. C. to La., Okla., Ont., and N. S.—Sum.

13. *P. Hookeri* T. & G. Plant 1–3 dm. tall, the stem glabrous: blades of the lower leaves short-spatulate, those of the upper ones linear-spatulate to linear: flowers pink: upper sepal ovate, becoming 1.5 mm. long: mature wings ovate-lanceolate or ovate, about 3 mm. long: capsule about 2 mm. long: seed fully 1 mm. long, ovoid, minutely tipped.—Low pinelands, Coastal Plain, W Fla. to Tex.—Sum.—fall.

14. *P. brevifolia* Nutt. Plant 1–6 dm. tall, the stem glabrous: blades of the lower leaves obovate, those of the upper ones oblanceolate, linear, or narrowly elliptic: flowers rose-purple: upper sepal suborbicular, becoming fully 1.5 mm. long, ciliate: mature wings ovate to ovate-oblong, 3–4 mm. long, acute or slightly acuminate: capsule orbicular or orbicular-reniform, about 2 mm. long: seed about 1.5 mm. long, ovoid, with a very minute tip.—Acid sandy swamps, Coastal Plain and New England Coast, Fla. to Miss. and R. I.—Spr.—fall.

15. *P. ramosior* (Nash) Small. Plant 1–5 dm. tall, the stem glabrous: blades of the lower leaves obovate or spatulate, those of the upper ones narrowly spatulate to linear-spatulate, thick: flowers light-purple or dark-purple, or rarely white: upper sepal becoming 1.5 mm. long: mature wings hastate, much longer than wide, 5–6 mm. long, caudate: capsule about 2.5 mm. long: seed oval, less than 1.5 mm. long. [*P. cruciata ramosior* Nash.]—Low pinelands and swamps, Coastal Plain and rarely adj. provinces, Fla. to La. and Miss.—Sum.—fall or all year S.

16. *P. cruciata* L. Plant 0.5–2 dm. tall, the stem glabrous or nate: capsule blades of the lower leaves spatulate or obovate, those of the upper ones linear to linear-spatulate, thinnish: flowers rose-purplish or greenish:

not ciliate, becoming about 1.5 mm. long: mature wings deltoid or hastate-deltoid, 3.5–4 mm. long, abruptly short-acuminate: capsule 2 mm. long: seed less than 1.5 mm. long, oval-ovoid.—(DRUM-HEADS.)—Acid bogs and wet meadows, various provinces, Ga. to La., Minn., and Mass.—Sum.—fall.

17. *P. Boykinii* Nutt. Plant 2–6 dm. tall: leaf-blades various, those of the lower leaves obovate or elliptic-obovate, those of the upper ones linear-lanceolate to linear: flowers white or greenish-white: upper sepal becoming nearly 1.5 mm. long: mature wings suborbicular, 2.5–3 mm. long: keel 2–2.5 mm. long: capsule suborbicular, about 3 mm. long: seed narrowly ovoid, nearly 2.5 mm. long.—Woods, river-banks, prairies, and pinelands, often in calcareous soils, Coastal Plain and adj. provinces, Fla. to La. and Ga.—Spr.—sum.

18. *P. praetervis* Chodat. Plant erect, 3–6 dm. tall, or with partly decumbent branches: leaves in few whorls near the base of the stem, the upper scattered; blades of the lower leaves obovate to elliptic, those of the upper ones lanceolate to linear-subulate, often almost scale-like: flowers greenish or greenish-white: upper sepal becoming 1.5 mm. long: mature wings oval to suborbicular-oval, nearly 2.5 mm. long: keel 2–2.5 mm. long: capsule oval-elliptic, about 2 mm. long: seed narrowly ovoid, less than 2 mm. long.—Pinelands and palmlands, lower Florida Keys.—All year.

19. *P. flagellaris* Small. Plant with decumbent or prostrate branches 2–8 dm. long: leaves mostly in whorls, only a few near the inflorescence scattered; blades of the lower leaves spatulate or broadly spatulate, those of the upper ones narrowly so, or linear-spatulate: flowers whitish or pale-green: upper sepal becoming fully 1.5 mm. long: mature wings oval to obovate, 3 mm. long or nearly so: keel 2.5–3 mm. long: capsule elliptic, fully 2.5 mm. long: seed cylindric-ovoid, about 2 mm. long.—Pinelands, Everglade Keys, Fla.—All year.

20. *P. leptostachys* Shuttlw. Plant 1.5 dm. tall: leaves in distant whorls: blades of the lower leaves obovate to linear-spatulate, those of the upper ones linear-subulate or filiform: flowers greenish: upper sepal becoming less than 1 mm. long: mature wings oval to elliptic, about 1.5 mm. long: keel 1–1.5 mm. long: lateral petals mostly 1–1.5 mm. long: capsule elliptic, about 2 mm. long: seed fusiform, about 1.5 mm. long.—Sandhills and pinelands, Coastal Plain. Fla. to Miss.—Spr.—sum.—Seed glabrous or usually so.

21. *P. ambigua* Nutt. Plant 1–3 dm. tall, the branches erect or nearly so: blades of the lower leaves spatulate to linear-spatulate, those of the upper ones linear, usually narrowly so: flowers purplish or greenish-purple: upper sepal becoming about 1 mm. long: mature wings about 1.5 mm. long; blades suborbicular, short-clawed: keel 1.5 mm. long: capsule suborbicular to broadly ovate, fully 1.5 mm. long: seed ovoid, 1.5 mm. long.—Woods, slopes, pastures, and roadsides, various provinces, Ga. to La., Okla., Mich., and Me.—Sum.

22. *P. verticillata* L. Plant 0.5–2 dm. tall, the branches more or less spreading: blades of the lower leaves spatulate, those of the upper ones linear: flowers pinkish-purple or green: upper sepal becoming about 1 mm. long: mature wings 1.2 mm. long; blades ovate to obovate, or orbicular-ovate: keel about 1.5 mm. long: capsule broadly elliptic to ovate-elliptic, 2 mm. long: seed as long nearly 1.5 mm. long.—Banks, fields, roadsides, and woods, various provinces, scla. to Tex., Man., and Que.—Sum.  
dunes, o.

Miss., *P. retzii* Pennell. Plant 1–4 dm. tall, the branches virgate, ascending: the lower leaves linear-spatulate to linear, those of the upper ones  
9. *P. Curt* flowers mainly white or pinkish: upper sepal becoming 0.6–0.8 mm. lower leaves wings about 1.5 mm. long; blades suborbicular, short-clawed: keel

about as long as the wings, often yellowish: capsule ovate, fully 1.5 mm. long: seed narrowly ovoid, about 1.5 mm. long.—Pastures, open woods, and sandy slopes, various provinces, W. Tenn. to Mich. and Me.—Sum.—fall.

**5. PILOSTAXIS Raf.** Annual or biennial caulescent somewhat succulent herbs. Leaves alternate, sometimes mainly basal: blades entire. Flowers all alike, borne in single or corymbosely paniculate dense spike-like racemes, yellow or orange, or rarely whitish or greenish. Wings conspicuous. Sepals (and wings) persistent. Corolla about as long as the wings. Stamens with the filaments united and adnate to the posterior petals. Capsule obovate, sub-orbicular, or didymous, relatively small, hidden in the persistent perianth. Seed ovoid, oval, or globular, sometimes with an aril.—Represented only by the following species.—POLYGALAS.

Racemes solitary at the end of the stem or terminating branches, not in terminal cymes.

Wings acuminate: seed with large apical appendages  $1/3$ – $1/4$  as long as the seed-body: sepals long and narrow.

Keel curved over the stamens and pistil, but prolonged as a straight fringe, with the fringes nearly as long as the body: petals shorter than the fringe of the keel.

Keel arched over the stamens and pistil as a hood, entire: petals as long as the keel or longer.

Wings cuspidate or mucronate: seed with minute apical appendages: sepals short and broad.

Mature wings 6.5–7.5 mm. long, 3 mm. wide or less: capsule about 1.5 mm. wide: seed less than 1.5 mm. long: raceme orange-yellow.

Mature wings 8–9 mm. long, over 3 mm. wide: capsule about 2 mm. wide: seed fully 1.5 mm. long: raceme lemon-yellow.

Racemes in terminal compound cymes.

Racemes yellow.

Wings acuminate: upper sepal acuminate: capsule orbicular: seed oval.

Wings cuspidate: upper sepal acute: capsule didymous: seed ovoid-globose.

Racemes white or greenish-white.

Wings and upper sepal acuminate: capsule less than 1.5 mm. wide: seed less than 0.5 mm. wide.

Wings and upper sepal cuspidate: capsule fully 1 mm. wide: seed over 0.5 mm. wide.

1. *P. nana*.

2. *P. arenicola*.

3. *P. lutea*.

4. *P. Rugelii*.

5. *P. ramosa*.

6. *P. cymosa*.

7. *P. Baldwinii*.

8. *P. Carteri*.

1. *P. nana* (Michx.) Raf. Plant 0.5–1.5 dm. tall: leaf-blades spatulate, often broadly so: raceme green or yellowish: upper sepal lanceolate or ovate-lanceolate, 5–6 mm. long, acuminate: wings elliptic-lanceolate or ovate-lanceolate, 7–8 mm. long, commonly abruptly cuspidate-acuminate: capsule about 1.5 mm. wide: seed usually less than 1.5 mm. long, the body oval, tipped with a stout, curved, beak. [*Polygala nana* (Michx.) DC.]—(BACHELOR'S-BUTTON.)—Pinelands and occasionally upland woods, Coastal Plain and occasionally adj. provinces, Fla. to La., and S. C.—All year.

2. *P. arenicola* Small. Plant 0.2–0.5 dm. tall: leaf-blades oblanceolate to linear-oblanceolate: raceme yellow-green: upper sepal lanceolate, 4–5 mm. long, acuminate: mature wings lanceolate, about 7 mm. long, gradually long-acuminate: capsule about 1.5 mm. wide: seed about 2 mm. long, the body ellipsoid, tipped with

a stout curved beak. [*Polygala arenicola* Small.]—Pinelands, Everglade Keys, Fla.—All year.

3. *P. lutea* (L.) Small. Plant 1-3 dm. tall: leaf-blades various, those of the lower leaves spatulate, obovate, or ovate, those of the upper leaves oblanceolate to almost linear: upper sepals becoming 2 mm. long, broadly ovate: raceme orange-yellow: mature wings elliptic to obovate-elliptic, 6.5-7.5 mm. long, cuspidate: capsule about 1.5 mm. long: seed less than 1.5 mm. long, ellipsoid, with a minute tip. [*Polygala lutea* L.]—(BOG BACHELOR'S-BUTTON. CANDYWEED. WILD BACHELOR'S-BUTTON.)—Low pinelands and sandy bogs, often in acid soil, Coastal Plain, Fla. to La. and N. Y.—Spr.-sum.

4. *P. Rugelii* (Shuttlw.) Small. Plant 3-7 dm. tall: leaf-blades various, those of the lower leaves spatulate, those of the upper leaves oblanceolate to lanceolate: raceme lemon-yellow: upper sepal becoming 2.5 mm. long, broadly ovate: mature wings obovate to elliptic or elliptic-lanceolate, 8-9 mm. long, cuspidate: capsule over 1.5 mm. wide: seed fully 1.5 mm. long, ellipsoid, with a minute tip. [*Polygala Rugelii* Shuttlw. *P. Reynoldsiae* Chapm.]—(YELLOW BACHELOR'S-BUTTON.)—Low pinelands, swamps, and ponds, pen. Fla.—Spr.-fall.—A hot infusion of this plant is drunk by the Seminoles, in cases of snake-bite.

5. *P. ramosa* (Ell.) Small. Plant 1-5 dm. tall: leaf-blades various; those of the lower leaves spatulate or obovate, those of the upper leaves oblanceolate to linear: raceme lemon-yellow: upper sepal ovate, becoming 1.5 mm. long: mature wings ovate, 2.5-3 mm. long, acuminate: capsule about 1 mm. wide: seed pubescent, oval, fully 0.5 mm. long, minutely tipped. [*Polygala ramosa* Ell.]—Moist pinelands, acid swamps, marshes, and ponds, Coastal Plain, Fla. to Tex. and N. J.—Sum.-fall.

6. *P. cymosa* (Walt.) Small. Plant 4-12 dm. tall: leaf-blades various, those of the lower leaves linear, those of the upper narrowly linear: raceme lemon-yellow: upper sepal orbicular-ovate, becoming 2 mm. long: mature wings oval or somewhat obovate, 3.5-4 mm. long, mucronate: capsule didymous, about 1 mm. long, fully 1.5 mm. wide: seed glabrous, globose-ovoid, nearly 1 mm. long. [*Polygala cymosa* Walt.]—Pineland pools, meadows, and acid cypress swamps, Coastal Plain, Fla. to La. and Del.—Spr.-fall.—The fragrant principle common to the other species seems to be absent from the roots of this one.

7. *P. Baldwinii* (Nutt.) Small. Plant 2-6 dm. tall: leaf-blades various, those of the lower leaves spatulate to obovate, those of the upper leaves narrowly spatulate to lanceolate: raceme blunt, white: upper sepal ovate-lanceolate, becoming 2.5 mm. long, acuminate: mature wings ovate-lanceolate to narrowly ovate, or slightly broadened upward, 3 mm. long, acuminate: capsule less than 1 mm. wide: seed ovoid, 0.5-0.7 mm. long. [*Polygala Baldwinii* Nutt.]—(WHITE BACHELOR'S-BUTTON.)—Low pinelands and swamps, Coastal Plain, Fla. to Miss. and Ga.—Sum.

8. *P. Carteri* Small. Plant 1-5.5 dm. tall: leaf-blades various, those of the lower leaves spatulate, those of the upper linear-elliptic to almost linear: raceme acute, greenish: upper sepal ovate, becoming 2 mm. long, cuspidate: mature wings elliptic, sometimes broadly so, about 4 mm. long, abruptly pointed: capsule fully 1 mm. wide: seed oval, nearly 1 mm. long. [*Polygala Carteri* Small.]—Low pinelands and prairies, Everglade Keys, and Big Cypress Swamp, S pen. Fla. and lower Florida Keys.—(W. I.)—All year.

#### ORDER EUPHORBIALES — EUPHORBIAL ORDER

Herbs, shrubs, or trees, sometimes aquatic or amphibious, but mainly terrestrial, commonly with milky juice. Leaves various, sometimes re-

duced to scales, or almost wanting. Flowers mainly monoecious or dioecious, regular. Calyx of several sepals. Corolla of several petals, or often wanting. Androecium of more than one stamen, except when the staminate flowers are scattered over the inside of an involucre. Filaments distinct or united into a column. Anthers opening by longitudinal or transverse valves. Gynoecium of 2, 3, or 4, or rarely more, united carpels, superior. Styles, or stigmas, usually distinct and cleft or foliaceous, united by pairs in *Callitrichaceae*. Ovules 1, 2, or 3 in each cavity. Fruit capsular, achene-like, drupaceous or baccate. Seeds often carunculate.

Styles or stigmas distinct or mainly so, cleft or foliaceous: ovary 3-celled or rarely 1- or 2-celled: stamens several, except when on the inside of an involucre. Fam. 1. EUPHORBIACEAE.  
 Styles united by pairs: ovary 4-celled: stamen solitary. Fam. 2. CALLITRICHACEAE.

### FAMILY 1. EUPHORBIACEAE — SPURGE FAMILY

Herbs, shrubs, or trees, often with milky sap. Leaves opposite, whorled, or alternate: blades simple and entire, toothed or lobed, or compound. Flowers monoecious or dioecious, solitary or variously clustered, or much reduced and in an involucre (*Euphorbia* and related genera). Calyx of 2-several sepals or obsolete. Corolla of 2-several petals or wanting. Androecium of few-many stamens. Fruit depressed or slightly elongate.—About 250 genera and 4,000 species, widely distributed.

Flowers not in an involucre: calyx of several sepals.

Ovules, and seeds, 2 in each gynoecium-cavity.

Corolla present: stamens 5.

Corolla wanting: stamens 2 or 3.

Plants monoecious or rarely dioecious: ovary 3-celled: fruit capsular or baccate.

Plants dioecious: ovary 1- or 2-celled: fruit drupaceous.

Ovules, and seeds, solitary in each gynoecium-cavity.

Flowers, either staminate or pistillate, or both, in more or less elongate spikes or racemes, the pistillate basal.

Corolla present in either staminate or pistillate flowers, or in both kinds (except in *Croton punctatus* and *C. texensis*).

Stamens 5 to many: filaments distinct.

Stamens 10 or fewer: filaments monadelphous.

Corolla wanting.

Gynoecium 2-carpellary: styles 2: sepals distinct: herbs.

Gynoecium 3-several-carpellary: styles 3-several, or gynoecium 2-carpellary and sepals united.

Stamens 8-16.

Stamens 1-5.

Sepals valvate in the bud.

Sepals imbricate in the bud.

Flowers, either the staminate or the pistillate, or both, in cymes or corymbs, or in open racemes.

Leaf-blades not peltate: filaments not repeatedly branched.

Flowers borne in forking cymes.

Flowers borne in racemes or panicles.

Leaf-blades peltate: filaments repeatedly branched.

Flowers in involucre: calyx represented by a minute scale at the base of a filament-like pedicel: involucre and contents simulating a flower.

Involucre regular or nearly so, not oblique.

Involucre oblique and very irregular.

I. ANDRACHNEAE.

II. PHYLLANTHEAE.

III. DRYPETEAE.

IV. CROTONEAE.

V. DITAXEAE.

VI. MERCURIALEAE.

VII. ACALYPHEAE.

VIII. TRAGIEAE.

IX. HIPPOMANEAE.

X. ADENOROPHAEAE.

XI. MANIHOTEAE.

XII. RICINEAE.

XIII. EUPHORBIEAE.

XIV. PEDILANTHEAE.

## I. ANDRACHNEAE

Evergreen dioecious shrubs or trees: flowers axillary, the staminate sessile, the pistillate pedicelled.

1. SAVIA.

## II. PHYLLANTHEAE

Androecium and gynoecium surrounded by a disk at the base.

Anthers opening horizontally: fruit capsular.

Flower-bearing branches dilated, leaf-like, leafless or nearly so.

Flower-bearing branches not dilated, leafy.

Anthers opening vertically: fruit baccate.

Androecium and gynoecium not surrounded by a disk at the base.

2. XYLOPHYLLA.  
3. PHYLLANTHUS.  
4. CICCIA.  
5. BREYNIA.

## III. DRYPETEAE

Evergreen shrubs or trees.

6. DRYPETES.

## IV. CROTONEAE

Ovary 3-celled or rarely 2-celled: capsule 3-celled or rarely 2-celled, 3-lobed or rarely 2-lobed, dehiscent: flowers in clusters, spikes, or racemes.

Ovary 1-celled: capsule 1-celled, achene-like, indehiscent: flowers scattered.

7. CROTON.  
8. CROTONOPSIS.

## V. DITAXEAE

Style once branched: petals distinct.

Style several times branched: petals united at the base.

9. DITAXIS.  
10. CAPERONIA.

## VI. MERCURIALEAE

Annual (or perennial) herbs.

11. MERCURIALIS.

## VII. ACALYPHEAE

Annual or perennial monoecious or rarely dioecious herbs, or shrubs: flowers in axillary or terminal spikes or spike-like racemes, the pistillate flowers subtended by lobed bracts: stigmas much branched.

12. ACALYPHA.

## VIII. TRAGIEAE

Perennial monoecious herbs, with erect or climbing stems, pubescent with often stinging hairs.

13. TRAGIA.

## IX. HIPPOMANEAE

Gynoecium 3-carpellary, or rarely 2-carpellary (*Sapium*): styles 3, or rarely 2 (*Sapium*): fruit dehiscent.

Receptacle with 3 horn-like projections under the capsule. Receptacle with a central column.

Calyx of the staminate flower present.

Gynoecium 3-carpellary: stigmas 3: stamens usually 3.

Capsule dry: seed with a caruncle: leaf-blades not biglandular at the base.

Capsule fleshy: seed without a caruncle: leaf-blades biglandular at the base.

Gynoecium 2-carpellary: stigmas 2: stamens 2.

Calyx wanting or rudimentary.

Gynoecium 6-8-carpellary: styles 6-8: fruit indehiscent.

14. STILLINGIA.  
15. SEBASTIANA.  
16. TRIADICA.  
17. SAPIUM.  
18. GYMANTHES.  
19. HIPPOMANE.

## X. ADENOROPHAEAE

Petals wanting: stamens 10 or more: calyx corolloid.

Petals present: stamens 10 or fewer: calyx not corolloid.

20. RIVONIA.  
21. ADENOROPHAEUM.

## XI. MANIHOTEAE

Large herbs, shrubs, or rarely trees, with usually large tuberous roots.

22. JATROPHA.

## XII. RICINEAE

Annual herbs, or shrubs or trees, with large palmately lobed leaf-blades: capsule echinate.

23. RICINUS.

## XIII. EUPHORBIEAE

Herbs, annual or perennial, unarmed, or partly woody plants. Glands of the involucre with petal-like appendages, these sometimes much reduced.

Leaves all opposite: leaf-blades inequilateral, oblique at the base.

Leaves alternate or scattered at least below the inflorescence: stem topped by an umbel.

24. CHAMAESTEC.

Annual or biennial: stipules narrow: bracts petal-like.

Perennial: stipules none: bracts not petal-like.

Glands of the involucre without petal-like appendages, entirely naked, sometimes with crescent-like horns.

Stem topped by an umbel: stipules none: involucre in open cymes, each with 4 glands and entire or toothed lobes.

Stem not topped by an umbel: stipules gland-like: involucre in cluster-like cymes, each with a single gland or rarely 4 glands and fimbriate lobes.

Shrubs with fleshy cactus-like branches, spine-armed.

25. *LEPADENA*.

26. *TITHYMALOPSIS*.

27. *GALARHOEUS*.

28. *POINSETTIA*.

29. *EUPHORBIA*.

#### XIV. PEDILANTHEAE

Fleshy plants with usually many stems, the involucre clustered at the ends of branches.

30. *PEDILANTHUS*.

1. *SAVIA* Willd. Shrubs or trees. Leaves alternate: blades thick, entire. Flowers green, dioecious; the staminate densely clustered, with 5 broad rounded sepals and 5 thin petals broadened upward: stamens 5, exserted. Pistillate flowers solitary or few together, with 5 broad sepals and 5 nearly similar petals: ovary 3-lobed; styles 2-parted. Capsule depressed.—About 6 species, West Indian.

1. *S. bahamensis* Britton. Shrub or small tree, the bark pale-gray or whitish: leaf-blades typically obovate, varying to narrowly obovate or oval-obovate, 2-5 cm. long, pale-green, shining above, glabrous, short-petioled: staminate flower with orbicular-ovate sepals about 2 mm. long and cuneate or flabellate thin petals shorter than the sepals: pistillate flower with sub-orbicular sepals and petals about 2 mm. long: capsule spheroidal, 5-6 mm. long: seed 4-5 mm. long.—(MAIDEN-BUSH.)—Hammocks, lower Florida Keys.—(Bah.)—Spr.

2. *XYLOPHYLLA* L. Shrubs or small trees, with flattened leaf-like, usually distichous, branchlets. Leaves minute or obsolete. Flowers green, borne in clusters along the margins of the leaf-like branchlets. Staminate flowers mostly with 6 sepals and 3 stamens. Pistillate flowers mostly with 6 sepals and a 3-celled ovary. Fruit capsular.—About 10 species, West Indian and South American.

1. *X. angustifolia* Sw. Shrub 1-2 m. tall: flattened branches almost linear, varying to somewhat spatulate or lanceolate, commonly 4-10 cm. long: larger sepals of the staminate flower 1-1.5 mm. long: capsule 4-5 mm. broad. [*X. Epiphyllanthus* (Fl. SE. U. S.)]—(SWORD-BUSH.)—Hammocks, Key West, Fla.—(W. I.)—This and other species are cultivated for ornament in warm countries.

3. *PHYLLANTHUS* L. Herbs or partly woody plants. Leaf-blades entire. Flowers apetalous, green or purple-tinged. Staminate flowers with 5

or 6 sepals and usually 3 stamens. Pistillate flowers with 5 or 6 sepals and a 3-celled ovary. Fruit capsular.—About 60 species, mostly in tropical regions. Calyx of the pistillate flower about as large as that of the staminate, at anthesis,

or only slightly larger; sepals scarcely accrescent in fruit.

Stems solitary from a slender root, sometimes branched at the base.

Stems several or many from a thick woody root.

Calyx of the pistillate flower much larger than that of the staminate, conspicuously accrescent.

I. CAROLINENSES.

II. PENTAPHYLLI.

III. PLATYLEPIDES.

#### I. CAROLINENSES

Stem herbaceous: annual herbs.

Branches erect or ascending.

Mature pistillate sepals broadly linear to broadly spatulate; calyx much wider than the capsule: seed about 1 mm. long.

Mature pistillate sepals broadly ovate to broadly obovate: calyx as wide as the capsule or slightly wider: seed much less than 1 mm. long.

Branches recurved-spreading.

Staminate sepals longer than wide: calyx of the pistillate flower not reaching the middle of the capsule.

Staminate sepals wider than long: calyx of the pistillate flower reaching above the middle of the capsule.

Stem woody: short-lived shrub.

1. *P. carolinensis*.

2. *P. pruinosis*.

3. *P. Niruri*.

4. *P. lathyroides*.

5. *P. Garberi*.

#### II. PENTAPHYLLI

Stems tufted on the root, slender-wiry: leaves numerous and approximate on the short branches: flowers usually approximate.

6. *P. pentaphyllus*.

#### III. PLATYLEPIDES

Stems solitary or several from the thickened root: flowers few, borne in the upper leaf-axils, rather long-pedicelled.

7. *P. platylepis*.

1. *P. carolinensis* Walt. Plant 1–5 dm. tall, the stem glabrous: leaf-blades obovate to elliptic-obovate, rather gradually narrowed to the base: staminate calyx 1.5–2 mm. wide; sepals suborbicular: mature pistillate calyx 2.5 mm. wide; sepals broadly linear to broadly spatulate: capsule about 2 mm. wide.—Woods, river-banks, and roadsides, various provinces, Fla. to Tex., Mo., and Pa.—(*W. I.*)—Spr.—fall.

2. *P. pruinosis* Poepp. Plant 0.5–3.5 dm. tall: leaf-blades cuneate to obovate, abruptly narrowed at the base: staminate calyx 1.5–2 mm. wide; sepals suborbicular: mature pistillate calyx 2–2.5 mm. wide; sepals broadly ovate to broadly obovate: capsule about 1.5 mm. wide. [*P. saxicola* Small]—Low pinelands and hammocks, Everglade Keys, Fla. and the Florida Keys.—(*W. I.*)—All year.

3. *P. Niruri* L. Plant 1–3 dm. tall: leaf-blades thickish, elliptic or nearly so, rounded at the base: staminate calyx 1–1.5 mm. wide; sepals orbicular-ovate: mature pistillate calyx about 2 mm. wide; sepals broadly linear to linear-ovate: capsule about 2 mm. wide.—Pinelands and waste-places, pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—All year.—Sometimes used medicinally.

4. *P. lathyroides* H.B.K. Plant 2–6 dm. tall: leaf-blades thinnish, elliptic to obovate, acute or obtuse at the base: staminate calyx 1 mm. wide; sepals flabellate or reniform: mature pistillate calyx 2 mm. wide; sepals ovate to oval: capsule about 2.5 mm. wide.—Hammocks, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)—All year.

5. **P. Garberi** Small. Plant 1-5 dm. tall: leaf-blades thickish, elliptic, sometimes narrowly so, or linear-elliptic: staminate calyx about 2 mm. wide; sepals ovate to orbicular-ovate: mature pistillate calyx 3 mm. wide; sepals elliptic to ovate: capsule 2.5-3 mm. wide. [*P. abnormis* (Fl. SE. U. S.)]—Coastal sand-dunes, pen. Fla. and the Keys.—All year.

6. **P. pentaphyllus** C. Wright. Plant 0.5-4 dm. tall: leaf-blades thinnish, mainly cuneate, often inequilateral: staminate calyx 1.5 mm. wide; sepals sub-orbicular: mature pistillate calyx about 3 mm. wide; sepals obovate to elliptic: capsule less than 1.5 mm. wide.—Pinelands, Everglade Keys, Fla. and lower Florida Keys.—(W. I.)—All year.

7. **P. platylepis** Small. Plant 1.5-4 dm. tall: leaf-blades obovate to elliptic-ovate: staminate calyx about 3 mm. wide; sepals elliptic to obovate: mature pistillate calyx about 6 mm. wide; sepals suborbicular to rhombic-orbicular, abruptly pointed: capsule 4-5 mm. wide.—Low hammocks, Gulf Hammock region, W pen. Fla.—All year.

4. **CICCA** L. Shrubs or trees. Leaf-blades entire. Flowers similar to those of *Phyllanthus*, but with vertically opening anther-sacs. Fruit baccate.—About 12 species, tropical.

1. **C. disticha** L. Shrub or small tree, the branchlets spreading or drooping, glabrous: leaves various, those near the base of the branchlets with suborbicular to orbicular-ovate blades 1.5-3 cm. long, those above them with larger ovate to elliptic-lanceolate blades: larger sepals suborbicular to orbicular-ovate, 1.5-2 mm. long: berry depressed, 1.5-2 cm. broad.—(OTAHEITE-GOOSEBERRY. GOOSEBERRY-TREE.)—Pinelands and waste-places, Everglade Keys, Fla. and Florida Keys. Nat. of E. I. and cult.—(W. I.)—All year.—Plants usually bear an abundance of fruits. These are light-green and very acid. They are used for making pies, preserves, and wine. The root and leaves are medicinal.

5. **BREYNIA** Forst. Shrubs or trees. Leaves alternate: blades broad, entire. Flowers solitary in the axils, or the staminate few together. Staminate flower with a turbinate calyx-tube and 6 minute broad lobes surrounding the minute orifice: stamens erect, united, the narrow anthers opening vertically. Pistillate flower with a short, broad calyx-tube and 6 very broad imbricate lobes: ovary 3-celled: styles very short: stigmas 2-lobed. Berry depressed.—About 15 species, natives of Asia and Oceania.

1. **B. nivosa** (W. J. Smith) Small. Shrub with irregularly and loosely branched stems, the branches dark-red: leaves somewhat distichously spreading; blades oval, varying to ovate or obovate, green and white, varie-

gated with red and pink; staminate calyx about 3 mm. wide, the lobes shallow: pistillate calyx 8-10 mm. wide, the lobes reniform: capsule 9-12 mm. broad.—(SNOWBUSH.)—Pinelands and waste-places. Everglade Keys, Fla.—Nat. of South Sea Islands, and cult.—(W. I.)—All year.—A very ornamental hedge-plant in pen. Florida. The leaves are well-colored and mottled with white. The flowers are mainly greenish and inconspicuous.

6. **DRYPETES** Vahl. Shrubs or trees. Leaf-blades entire or undulate-toothed. Flowers apetalous, green or brownish. Staminate flowers in rather dense clusters, with 4-8 sepals and 4-16 stamens. Pistillate flowers few in a cluster, with 4-8 sepals and a 1-2-celled ovary. Fruit a berry or a drupe.—About 10 species, West Indian and South American.

Sepals 4: gynoecium 2-carpellary: drupe subglobose, less than 15 mm. long.

1. *D. lateriflora*.

Sepals 5: gynoecium 1-carpellary: drupe elongate, over 15 mm. long.

2. *D. diversifolia*.

1. *D. lateriflora* (Sw.) Krug & Urban. Shrub, or tree becoming 10 m. tall, with brownish bark: leaf-blades elliptic or nearly so: stamens 4: drupe 9-11 mm. in diameter, red, ripe in spring or summer. — (GUIANA-PLUM.) — Hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—Fall-wint.—The sap-wood is yellow; the dark-brown heart-wood, close-grained, heavy, hard, but brittle, is used in cabinet-work.

2. *D. diversifolia* Krug & Urban. Shrub, or tree becoming 12 m. tall, with milk-white roughish bark: leaf-blades oblong, elliptic or oval: stamens 8: drupe 2-2.5 cm. long, ripe in fall. [*D. keyensis* Krug & Urban]—(WHITEWOOD.)—Hammocks, Cape Sable region, Fla. and Florida Keys.—(W. I.)—Spr.—The sap-wood is yellowish-brown; the brown and yellow streaked heart-wood, close-grained, heavy, hard, but brittle, is used in cabinet-work.

7. **CROTON** L. Shrubs or herbs. Leaf-blades entire, toothed, or lobed. Flowers mostly green, usually spicate or racemose. Staminate flower with 4-6, usually 5, sepals, small, often rudimentary, petals alternating with glands, and 6-many stamens, rarely less. Pistillate flower with 5-10 sepals, usually no petals and a 3-celled ovary. Fruit a capsule.—About 650 species, widely distributed in warm and tropical regions.

Staminate and pistillate flowers with petals.

Staminate flowers with petals, or both staminate and pistillate flowers without petals.

Petals present in the staminate flowers, wanting or rudimentary in the pistillate.

Plant with scaly foliage.

Plant with stellate-pubescent foliage.

Pistillate calyx mostly not accrescent: leaf-blades entire.

Leaves with blades of an ovate or elliptic type.

Leaves with blades of a linear or narrowly elliptic type.

Pistillate calyx mostly accrescent: leaf-blades toothed or entire.

Petals wanting in both the staminate and the pistillate flowers.

I. ALABAMENSES.

II. ARGYRANTHEMI.

III. FRUTICULOSI.

IV. LINEARES.

V. GLANDULOSI.

VI. PUNCTATI.

## I. ALABAMENSES

Evergreen shrub, with leaf-blades silvery-scaly beneath.

## II. ARGYRANTHEMI

Perennial herb, the stem often branched at the base: leaves, beneath, and inflorescence silvery-scaly.

## III. FRUTICULOSI

Shrub with slender branches: leaves with very slender petioles, the blades of an ovate or elliptic type.

## IV. LINEARES

Leaf-blades narrowly linear, glabrate above, yellow-pubescent beneath.

Leaf-blades narrowly elliptic to broadly linear, stellate above, white-pubescent beneath.

## V. GLANDULOSI

Leaves with prominently toothed blades.

Calyx, and capsule, glabrous or merely with few short appressed stellate hairs.

Calyx, and capsule, pubescent with long hirsute or hispid branching hairs.

Leaf-blades shallowly crenate to shallowly serrate.

Seed elliptic, minutely punctate, dull: leaf-blades crenate.

Seed oval or ovoid, smooth and shining: leaf-blades serrate or crenate-serrate.

Leaf-blades coarsely crenate or crenate-dentate.

Leaves with entire blades, except in *C. Engelmannii*.

Pistillate flowers not pendulous from the base of the raceme.

Lower leaves with lanceolate, oval, or ovate blades: sepals not hooded.

Petioles long: tomentum of inflorescence purplish.

Petioles short: tomentum of inflorescence yellowish.

Lower leaves with linear or linear-lanceolate blades: sepals hooded.

Pistillate flowers early drooping from the base of the raceme.

## VI. PUNCTATI

Plant perennial, more or less woody: leaves stout petioled.

Plant annual, herbaceous: leaves with slender petioles.

1. *C. alabamensis*.

2. *C. argyranthemus*.

3. *C. Berlandieri*.

4. *C. linearis*.

5. *C. Fergusonii*.

6. *C. floridanus*.

7. *C. arenicola*.

8. *C. glandulosus*.

9. *C. miquelensis*.

10. *C. capitatus*.

11. *C. Engelmannii*.

12. *C. Elliottii*.

13. *C. monanthogynus*.

14. *C. punctatus*.

15. *C. texensis*.

1. *C. alabamensis* E. A. Smith. Shrub 2-3 m. tall: leaf-blades evergreen, elliptic to elliptic-lanceolate, 5-8 cm. long, green and glabrate above, clothed beneath with silvery overlapping scales: staminate flowers 10-20; sepals and petals ciliate; stamens 10-25; pistillate flowers 4-7; sepals 3-4 mm. long; petals scaly without; glands 5: capsule 6-8 mm. long: seed oval, 5-7 mm. long.—River-bluffs of shale and limestone, Tuscaloosa and Bibb Counties, Appalachian Plateau, Ala.—Spr.

2. *C. argyranthemus* Michx. Perennial herb, 3-6 dm. tall: leaf-blades obovate to oval, or elliptic to elliptic-lanceolate above, 1-5 cm. long, blunt, scaly or glabrate above, clothed with silvery scales beneath: staminate flowers often 10-15; sepals lanceolate, acute; petals elliptic, scaly without; stamens mostly 10; filaments swollen at the base: pistillate flowers few; sepals partly united, acute; capsule globular or oval-globose, about 5 mm. long: seed less than 5 mm. long.—Sandhills and pinelands, Coastal Plain and SW provinces, Fla. to Tex. (N. M.?) and Ga.—Sum.

3. *C. Berlandieri* Torr. Shrub 3-8 dm. tall: leaf-blades ovate to elliptic, 2.5-3.5 cm. long, usually abruptly acute, the edges slightly repand and glandular, rounded or subcordate at the base, tomentose above when young, paler below: staminate flowers on slender pedicels, with 15-20 stamens (30-35 in western forms): pistillate flowers 2-6 at base of raceme, usually short-pedicelled; sepals elliptic-spatulate with sessile or short-stipitate marginal glands; styles 3, palmately 4-parted or twice 2-parted: capsule globose, 4-5 mm. high.—Sandy soil, thickets, and waste-places, Key West, Fla. and coastal region, S. Tex.—(*Mex.*)—Spr.—fall.

4. *C. linearis* Jacq. Shrub 6-20 dm. tall: leaf-blades narrowly linear, 4-7 cm. long, obtuse, dark-green and smooth above, yellowish-pubescent beneath: racemes 4-8 cm. long or longer: sepals 5-6, triangular: petals spatulate, surpassing the sepals, obtuse, ciliate: stamens about 15: pistillate racemes 4-5 cm. long, frequently exceeded by the leaves: sepals narrow, acuminate: capsule subglobose, 5 mm. high, yellowish-floccose: seed broadly elliptic, about 3 mm. long.—Pinelands and coastal sand-dunes, Everglade Keys, Fla. and Florida Keys.—(*W. I.*)—All year.—The leaves of this species are used for tea.

5. *C. Fergusonii* Small. Shrub 4-12 dm. tall: leaf-blades narrowly elliptic to broadly linear, 3-6 cm. long, blunt, entire, white-pubescent beneath, the upper surface channeled and green but minutely stellate: staminate flowers 12-25 in stout interrupted racemes 3-5 cm. long: sepals deltoid, acute: petals spatulate, 2.5-3 mm. long, surpassing the sepals, ciliate: stamens about 15: pistillate flowers about 6, in racemes 2-3 cm. long: capsule subglobose, about 5 mm. long: seed 3.5-4 mm. long.—Pinelands, S pen. Fla.—All year.

6. *C. floridanus* Ferguson. Herb 2-5 dm. tall: leaf-blades various, those of the lower leaves elliptic to ovate, those above elliptic to lanceolate, 1-2 cm. long, serrate-crenate: racemes 2-4 cm. long: staminate flowers inconspicuous: sepals ovate or elliptic-ovate; petals elliptic or nearly so, narrower than the sepals, ciliate; stamens about 10: pistillate flowers solitary or several below the staminate, subtended by deltoid bracts; sepals linear to oblanceolate or spatulate, accrescent: capsule oblong-oval, about 4 mm. long: seed oval, about 3 mm. long.—Sand-dunes, pen. Fla.—Spr.—fall.

7. *C. arenicola* Small. Herb 1.5-4.5 dm. tall: leaf-blades ovate to elliptic-ovate, 1-3 cm. long, blunt, coarsely toothed: staminate sepals elliptic or oval, acute; petals elliptic to oblanceolate: stamens 9-12: pistillate flowers solitary or 2-3 below the staminate; sepals spatulate, accrescent: capsule globose-oval, 4.5-5 mm. long: seed 3-3.5 mm. long.—Pinelands and sand-dunes, Everglade Keys, Fla. and Florida Keys.—All year.

8. *C. glandulosus* L. A tropical American species represented in our area by the following: *C. glandulosus septentrionalis* with coarsely-stellate foliage and serrate mainly elliptic leaf-blades, ranges in various provinces, from Fla. to Tex., Ia., and Va.; *C. glandulosus Simpsonii* with densely stellate foliage and coarsely serrate-crenate ovate leaf-blades, occurs in S pen. Fla. and on the Keys; *C. glandulosus angustifolius* with thinly appressed stellate foliage and linear remotely serrate upper leaf-blades, occurs in Fla. and Tex.—Spr.—fall or all year S.

9. *C. miquelensis* Ferguson. Herb 3-5 dm. tall: leaf-blades ovate to lanceolate, 2-4 cm. long, acute or acutish, crenate or dentate-serrate, finely pubescent beneath, biglandular at the base, slender-petioled: racemes sessile or nearly sessile, short: staminate flowers inconspicuous; sepals ovate; petals narrowly oblong, ciliate; stamens 8-10: pistillate flowers 3 or 4, subtended by ovate bracts; sepals lanceolate; petals obsolete or rudimentary: capsule globose, 3.5-4 mm. long: seed oval, 3-3.5 mm. long, the caruncle minute.—Woods and waste-grounds, W Fla. Nat. of S. A.—Spr.—fall.

10. *C. capitatus* Michx. Herb 5-20 dm. tall: leaf-blades various, those of the lower leaves oval, those of the upper elliptic, 2-5 cm. long, mucronate, entire, rounded or rarely cordate at the base, velvety above, densely stellate-tomentose and paler beneath: racemes 1-3 cm. long, with loose purplish-tinged tomentum: staminate flowers short-pedicelled; sepals 5, oval, nearly equal; petals 5, spatulate, ciliate; stamens 7-12; filaments pubescent below: pistillate flowers usually clustered below the staminate; sepals 6-8, elliptic to oblanceolate; styles 3, 2-3 times 2-cleft, 5-6 mm. long: capsule globular, 7-9 mm. long: seed sub-orbicular, 5 mm. long.—(HOGWORT. WOOLLY-CROTON.)—Waste-places, various provinces, Ga. to Tex., Ia., and S N. Y.—Spr.-fall or all year S. Introduced, at least eastward.

11. *C. Engelmannii* Ferguson. Herb 5-20 dm. tall: leaf-blades lanceolate, those of the lower leaves 10-20 cm. long (white in *C. Engelmannii albinoides* and broadly ovate), those of the upper much shorter, acute or somewhat acuminate, often shallowly and unevenly toothed, rounded or usually cordate at the base: racemes 5-15 cm. long, with yellow-tinged tomentum: staminate flowers distinctly pedicelled; sepals ovate, acute; petals spatulate, ciliate; stamens 9-12; filaments stellate-pubescent below: pistillate flowers usually 3, short-pedicelled; sepals 7-8, acuminate, the inner ones smaller; styles 3, twice 2-cleft, 6-10 mm. long: capsule depressed, 6-8 mm. long: seed oval-orbicular, 4.5-5 mm. long.—Dry soil, Coastal Plain, Fla. to Tex., Ark., and Ga.—Sum.-fall.

12. *C. Elliottii* Chapm. Herb 5-9 dm. tall: leaf-blades linear or linear-lanceolate, 4-5 cm. long, or shorter above, entire, usually blunt, 3-nerved at the narrowed base, velvety-stellate, gray-tomentose beneath, slender-petioled: racemes 1-2 cm. long: staminate flowers short-pedicelled; sepals 5, narrowly elliptic; petals linear, ciliate; stamens 8-10: pistillate flowers clustered; sepals 6-7, unequal; styles 3, twice 2-cleft, 2-3 mm. long: capsule globose, 4-5 mm. long, sometimes surpassed by the accrescent hooded sepals: seed oval, 3-4 mm. long.—Pinelands, Fla. to S. C.—Sum.-fall.—Rare.

13. *C. monanthogynus* Michx. Herb 3-5 dm. tall: leaf-blades various, those of the lower leaves suborbicular, those of the upper ovate to elliptic-ovate, 1-4 cm. long, or slightly longer, usually mucronate, entire: racemes about 1 cm. long: staminate flowers short-pedicelled; sepals 3-5, ovate; petals spatulate, ciliate; stamens 3-10: pistillate flowers 1-4 below the staminate, nodding at maturity; sepals 5, elliptic; ovary 2-celled: capsule ovoid or oval, 3-4 mm. long: seed solitary by the abortion of one ovule, 2.5-3.5 mm. long.—(PRAIRIE-TEA.)—Limestone outcrops and waste-places, various provinces, rarely Coastal Plain, Ga. to Tex., Ia., and Ind.—(*Mex.*)—Sum.-fall.

14. *C. punctatus* Jacq. Plant partly woody, 5-12 dm. tall: leaf-blades elliptic or ovate, 1-5 cm. long, entire or merely undulate: pistillate sepals triangular, nearly equal; stamens normally 12, barely exerted; filaments pubescent: pistillate flowers solitary or 2 or 3 together; sepals elliptic or cuneate, not accrescent: capsule subglobose, 5-8 mm. long: seed about 6 mm. long. [*C. maritimus* Walt.]—(SILVER-LEAF CROTON. BEACH-TEA.)—Sand-dunes, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall or all year S.

15. *C. texensis* (Kl.) Muell. Arg. Plant herbaceous, 4-16 dm. tall: leaf-blades linear-lanceolate or elliptic, those of the staminate plant the narrower, 4-12 cm. long, entire, rounded or blunt at the apex: racemes few-flowered: staminate flowers in racemes 1-3 cm. long; sepals elliptic to ovate-elliptic; stamens 8-12; filaments pubescent: pistillate flowers 2-4-together or solitary; sepals triangular: capsule oval or globular, 4-6 mm. long: seed orbicular, 3-5 mm. long.—(SKUNK-WEED.)—Dry soil, low hills and plains, various provinces, Ala., to Ariz., Wyo., S. D., and Ill.—(*Mex.*)—Sum.-fall or all year S.

8. **CROTONOPSIS** Michx. Annual herbs, covered, except the upper surface of the leaves, with silvery appressed peltate stellate scales. Leaf-blades entire, upper surface with slender-rayed stellate hairs. Flowers monoecious, green or greenish-white. Staminate flowers with 5 sepals, 5 petals, and 5 stamens. Pistillate flowers with 3-5 sepals, no petals, and a 1-celled ovary. Fruit an achene-like capsule, erect.—Two species.—RUSHFOLLS.

Staminate flowers with petals longer than the sepals: filaments longer than the sepals: spikes long, with 3-6 fruits: fruit ellipsoid, without veins on the sides, the scales with minute disks fringed with irregular lax stellately spreading rays: stellate hairs on upper surface of leaf with short rays.

Staminate flowers with petals equalling the sepals: filaments shorter than the sepals: spikes short, with 1 or 2 fruits: fruit ovoid, with an evident vein on each side, the scales umbonate to tubercular-spiny, the margin with relatively uniform, appressed rays: stellate hairs on upper surface of leaf with long rays.

1. *C. linearis*.

2. *C. elliptica*.

1. *C. linearis* Michx. Plant 3-8 dm. tall, the scales with small disks fringed with irregular lax stellately spreading rays: leaf-blades narrowly elliptic, linear-lanceolate, or linear: spikes elongate, with 3-6 fruits: staminate flower with ovate or oval sepals and spatulate petals: pistillate flower with linear or linear-lanceolate sepals; fruit ellipsoid, 2.5-3 mm. long, the stellate scales with blunt or spine-tipped disks; seeds 2-2.5 mm. long or more, slightly ridged, often bronze-colored. [*C. spinosa* Nash]—Dry acid sandy soil, flat rocks, and barren prairies, Coastal Plain and occasionally adj. provinces, Fla. to Tex., and S. C.—Spr.—fall.

2. *C. elliptica* Willd. Plant 1-4 dm. tall, the scales with large disks surrounded by finely radiating closely appressed rays: leaf-blades ovate-elliptic, ovate-lanceolate, lanceolate or linear-lanceolate: spikes short, appearing axillary, bearing 1 or 2 fruits: staminate flower with obovate sepals and spatulate petals: pistillate flower with ovate sepals: fruit ovoid, 2.5-3.2 mm. long, the radiate scales with umbonate to tuberculate-spiny disks: seed about 2-2.5 mm. long, brown, smooth.—Dry sandy soil, various provinces, rarely Coastal Plain, Fla. to Tex., Kans., and Conn.—Sum.—fall.

9. **DITAXIS** Vahl. Shrubs or perennial herbs. Leaves alternate: blades entire or rarely toothed. Flowers inconspicuously bracted, green. Staminate flower with 4 or 5 sepals, 4 or 5 petals, and 10 stamens or sometimes fewer. Pistillate flower with a perianth similar to that of the staminate, but with smaller or rudimentary petals, and a 3-celled ovary. Capsule depressed.—About 20 species.

1. *D. Blodgettii* (Torr.) Pax. Plants 1-6 dm. tall: leaf-blades oval or elliptic, or those of the lower leaves spatulate, 1.5-4 cm. long: staminate calyx 7-8 mm. wide; sepals lanceolate; petals broadly elliptic, shorter than the sepals: mature pistillate sepals lanceolate to linear-lanceolate, 5-6

mm. long: capsule 4–5 mm. wide.—Pinelands and hammocks, Everglade Keys, Fla. Florida Keys.—All year.

**10. CAPERONIA** St. Hil. Herbs or partially woody plants, mostly monoecious. Leaves alternate: blades toothed. Flowers in elongate, interrupted spike-like racemes, green. Staminate flowers approximate, with 5, unequal sepals, 5 petals and 10 stamens or fewer through abortion. Pistillate flowers separated, with 5 sepals, 5 petals, smaller than those of the staminate flower, and a 3-celled ovary. Capsule 3-lobed, depressed. Seed without a caruncle.—About 20 species, tropical American.

**1. C. castaneæfolia** (L.) St. Hil. Plant 1 m. tall or less, with spreading or decumbent branches: leaf-blades obovate, elliptic, oval, elliptic-lanceolate or ovate, mostly 2–6 cm. long, rather coarsely toothed, petioled: larger staminate sepals about 2.5 mm. long: petals obovate, 3–3.5 mm. long: sepals and petals of the pistillate flowers smaller than those of the staminate: capsule depressed, 6–7 mm. wide: seed globose, about 3 mm. in diameter.—Wet soil, Everglades, about the Everglade Keys, pen. Fla.—(W. I.)—All year.

**11. MERCURIALIS** L. Herbs or partly woody mostly dioecious plants. Leaves opposite: blades often toothed. Flowers green, apetalous. Staminate flower with 3 sepals and 8–20 stamens. Pistillate flower with 3 sepals and a 2-celled ovary. Stigmas pinnatifid. Capsule 2-lobed.—About 7 species, natives of the Old World.—DOG'S-MERCURIES.

**1. M. annua** L. Stem 2–6 dm. tall: leaf-blades ovate to lanceolate: staminate flowers in spikes which surpass the leaves: capsule 4–5 mm. broad, hispid.—(HERB-MERCURY.)—Waste-places, various provinces, Fla. to Tex., Ohio and Del., and locally further NE. Nat. of Eu. and Africa.—(W. I.)

**12. ACALYPHA** L. Herbs or shrubs, monoecious or sometimes dioecious. Leaf-blades entire or toothed. Flowers green (in our species). Staminate flower with 4 sepals and 8–16 stamens. Pistillate flower with 3–5 sepals and a 3-celled ovary, each flower subtended by a foliaceous bract. Capsule somewhat 3-lobed.—About 250 species most abundant in subtropical and tropical regions.—Spr.-fall, or all year S.—THREE-SEEDED MERCURIES. TAR-WEEDS. COUPLE-CAPS.

Staminate and pistillate flowers in the same spike: capsule glabrous or pubescent. I. CORCHORIFOLIAE.  
Staminate and pistillate flowers in separate spikes: capsule tuberculate-echinate. II. OSTRYAEOFOLIAE.

## I. CORCHORIFOLIAE

Plant annual.

Bracts subtending the pistillate flowers with 5-7, or rarely 9, long, elliptic to lanceolate, acute or obtusish lobes: leaves of the main stem with ovate or rhombic-ovate blades.

Bracts subtending the pistillate flowers with 9-15 short lobes or teeth: leaves of the main stem with mostly ovate-lanceolate to linear blades.

Bracts of the pistillate flowers with lanceolate acute lobes: blades of the cauline leaves broadly to narrowly lanceolate, tapering to a blunt tip.

Bracts of the pistillate flowers with ovate to deltoid lobes: blades of the cauline leaves elliptic-lanceolate to linear, obtusish; petioles a fourth to a tenth as long as the blades.

Plant perennial, prostrate: stems wire-like: seeds barely 1 mm. long.

1. *A. rhomboidea*.

2. *A. virginica*.

3. *A. gracilens*.

4. *A. chamaedrifolia*.

## II. OSTRYAEFOLIAE

Mature pistillate spikes slender, interrupted, not plumose; bracts with lanceolate or subulate scabrous lobes: capsule depressed.

Bracts with lanceolate lobes about as long as the body: capsule about 3.5 mm. wide, echinate-tuberculate: seed tubercled.

Bracts with slender-subulate lobes much longer than the body: capsule about 2.5 mm. wide, sparingly pubescent: seed obscurely pitted.

Mature pistillate spikes stout, continuous, plumose; bracts with slender-caudate long-ciliate lobes: capsule globose-ovoid.

5. *A. ostryaeifolia*.

6. *A. setosa*.

7. *A. alopecuroidea*.

1. *A. rhomboidea* Raf. Stem 1-7 dm. tall: blades of the cauline leaves ovate to rhombic-ovate, 2-10 cm. long, glabrous except for a few long scattered hairs: bracts of the pistillate flowers, at least when young, with long stipitate whitish glands, ciliate, but not hispid: capsule 2.5-3 mm. in diameter: seeds 1.5-1.8 mm. long.—Woods and thickets, various provinces, Fla. to Nebr., Minn., Que., and Me.—Plant is reputed to have medicinal properties.

2. *A. virginica* L. Stem 2-5 dm. tall, with a few long spreading hairs, or often villous: blades of the cauline leaves broadly to narrowly lanceolate, 2-6 cm. long, finely toothed, finely pubescent: bracts of the pistillate flowers hispid on the veins and margins, usually not glandular: capsule 2.5-3 mm. in diameter: seed about 1.5 mm. long.—Woods and stream-banks, various provinces, Ga. to Tex., Mo., and Mass.

3. *A. gracilens* A. Gray. Stem 1-8 dm. tall, puberulent to pubescent with in-curved or ascending hairs: blades of the cauline leaves elliptic-lanceolate to elliptic (or linear, often elongate-linear, in *A. gracilens* *Fraseri*), 1-6.5 cm. long, shallowly toothed, finely pubescent: bracts of the pistillate flowers sparsely beset with whitish or red sessile glands, ciliate to copiously pubescent: capsule about 2 mm. in diameter: seeds 1.5-2 mm. long.—Dry woods, hillsides, sandy banks, and old fields, various provinces, Fla. to Tex., Mo., Wis., and Mass.

4. *A. chamaedrifolia* (Lam.) Muell Arg. Stem and branches mostly prostrate, 5-30 cm. long: blades of the upper leaves ovate to elliptic-lanceolate 7-20 mm. long, crenate-serrate: larger bracts 4-6 mm. long, toothed: capsule

nearly 2 mm. in diameter.—Pinelands and sandy places, Everglade Keys, pen. Fla. and Florida Keys.—(*W. I.*).

5. *A. ostryaefolia* Ridd. Stem 3–8 dm. tall, closely fine-pubescent: leaf-blades ovate, 5–10 cm. long, serrate: larger bracts of the pistillate spike 4–5 mm. long, with lanceolate lobes: capsule about 3.5 mm. wide: seed broadly ovoid, 2 mm. long, finely tuberculate. [*A. caroliniana* Authors, not Ell.]—Thickets and waste-places, various provinces, Fla. to Tex., Kans., and N. J.—(*W. I., Mex.*)

6. *A. setosa* A. Rich. Stem 1 m. tall or less, usually glabrous: leaf-blades ovate or orbicular-ovate, 3–9 cm. long, rather finely serrate: larger bracts of the pistillate spike 3–4 mm. long, with slender-subulate lobes: capsule about 2.5 mm. wide: seed oval-ovoid, about 1.5 mm. long, obscurely pitted.—Woods, waste-places, and roadsides, pen. Fla. Nat. of Cuba.—(*W. I., Mex., C. A., S. A.*)

7. *A. alopecuroidea* Jacq. Stem mostly less than 1 m. tall, often widely branched, glandular-pubescent: leaf-blades ovate, usually broadly so, 2–8 cm. long, finely serrate: larger bracts of the pistillate spike about 8 mm. long, with slender-caudate long-ciliate lobes: capsule globose-ovoid; seed fully 1 mm. long, minutely pitted.—Waste-places and roadsides, Coastal Plain, Ala. Nat. of S. A.—(*W. I., Mex., C. A.*)

13. **TRAGIA** [Plum.] L. Herbs or shrubs. Leaf-blades entire, toothed, or lobed. Flowers green or purple, on a slender rachis, racemose. Staminate flower with 3–5 sepals and 1–3, or rarely more, stamens. Pistillate flower with 3–8 entire or pinnatifid sepals and a 3-celled ovary. Capsule prominently 3-lobed.—About 50 species, most abundant in tropical regions.—Spr.-fall or all year S.

Stem not twining: leaf-blades not conspicuously long-petioled.

Leaf-blades linear, entire.

Leaf-blades broader and manifestly broadest above or below the middle.

Leaves with more or less cuneately narrowed blades.

Leaves, at least the lower ones, truncate or cordate at the base.

Leaf-blades of a triangular or lanceolate type.

Leaf-blades of a suborbicular, oval, or elliptic type.

Leaf-blades slender-petioled, cordate or subcordate at the base, the teeth sharp.

Leaf-blades sessile or very short-petioled, obtuse or truncate at the base, the teeth rounded.

Stem twining: leaf-blades conspicuously long-petioled.

1. *T. linearifolia*.

2. *T. urens*.

3. *T. urticaefolia*.

4. *T. saxicola*.

5. *T. betonicaefolia*.

6. *T. macrocarpa*.

1. *T. linearifolia* Ell. Plant 1–5 dm. tall: leaf-blades linear, 3–12 cm. long, undulate: staminate calyx 3–3.5 mm. wide: mature pistillate calyx 5 mm. wide; sepals ovate: capsule 7–8 mm. wide, strigillose.—Pinelands and sandhills, Coastal Plain, Fla. to Ala.

2. *T. urens* L. Plant 1–4 dm. tall, green: leaf-blades elliptic above the cuneate base to cuneate, 2–5 cm. long, irregularly few-toothed: staminate calyx about 3 mm. wide; sepals lanceolate to ovate: mature pistillate calyx 4–4.5 mm. wide; sepals linear: capsule 8–10 mm. wide, hirsutulous: seed 3.5–4 mm. long. [*T. innocua* Walt.]—Dry, often acid soil, Coastal Plain, Fla. to Tex. and S Va.

3. *T. urticaefolia* Michx. Plant 1-4 dm. tall: leaf-blades triangular or lanceolate, those of the lower leaves typically broadly lanceolate, 3-7 cm. long: staminate calyx 2.5-3 mm. wide; sepals ovate to suborbicular: mature pistillate calyx 11-12 mm. wide; sepals lanceolate: capsule 7-10 mm. wide, hirsutulous: seed 3.5-4 mm. long.—Dry sandy soil, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Ark., Tenn. and S. C. (or Va. ?)

4. *T. saxicola* Small. Plant 0.5-2 dm. tall: leaf-blades suborbicular to broadly oval, 1-2.5 cm. long, crenate-dentate, finely and sharply many-toothed: staminate calyx 3-3.5 mm. wide; sepals linear to narrowly linear-lanceolate: capsule 7-8 mm. wide, hirsute.—Pinelands, Everglade Keys, pen. Fla. and Florida Keys.

5. *T. betonicaefolia* Nutt. Plant 1-3 dm. tall: leaf-blades orbicular to broadly elliptic, 2-4 cm. long, coarsely crenate-serrate, or somewhat lobed: mature pistillate calyx 4.5-5.5 mm. wide; sepals linear to linear-oblong: capsule mostly 8-9 mm. wide: seed about 4 mm. long.—Sandy soil, Coastal Plain, Fla. to La.

6. *T. macrocarpa* Willd. Plant with twining stems: leaf-blades ovate, 5-12 cm. long, coarsely dentate-serrate: staminate calyx about 2.5 mm. wide; sepals ovate to orbicular-ovate: mature pistillate calyx 8-9 mm. wide; sepals elliptic or ovate-elliptic: capsule 12-16 mm. wide, finely pubescent: seed about 5 mm. long.—Dry or rocky soil and wooded bluffs, various provinces, Fla. to Tex., Mo., and Ky.

14. *STILLINGIA* Garden. Shrubs or herbs. Leaf-blades entire or toothed. Flowers monoecious, apetalous, in a green, yellow, or red spike. Staminate flower with 2 or 3 sepals and 2 or 3 stamens. Pistillate flower with 3 sepals and a 2- or 3-celled ovary. Fruit a capsule.—About 15 species, mostly American.—QUEEN'S-DELIGHTS. QUEEN'S-ROOTS.

Plant herbaceous.

Capsule less than 10 mm. wide; seed 4-6 mm. long.

Stem leaves with linear or essentially linear blades.

Stem leaves with spatulate or elliptic-spatulate blades.

Capsule over 10 mm. wide; seed 7-9 mm. long.

Plant shrubby.

Spikes yellow; glands smaller than the bracts; seed coarsely reticulate.

Spikes mainly red; glands as large as the bracts or larger: seed finely reticulate.

1. *S. angustifolia*.

2. *S. spathulata*.

3. *S. sylvatica*.

4. *S. aquatica*.

5. *S. tenuis*.

1. *S. angustifolia* (Torr.) S. Wats. Stem 2.5-6 dm. tall: leaf-blades linear or essentially so, 2-5 cm. long, crenulate-serrulate: spike 2-4.5 cm. long: capsule 5-6 mm. wide.—Sand-dunes and pine-lands, pen. Fla. and Florida Keys.—All year.

2. *S. spathulata* (Muell. Arg.) Small. Stem 3-7 dm. tall: leaf-blades spatulate to elliptic-spatulate, or linear-spatulate on the branches 7-15 cm. long, crenulate: capsule 7-9 mm. wide.—Sand-dunes and pinelands, Coastal Plain, Fla., Ala., and Ga.—All year.

3. *S. sylvatica* L. Stem 4-12 dm. tall: leaf-blades obovate, oval or elliptic, 3-11 cm. long, obtuse: spike stout: capsule 12-15 mm. wide.—(QUEEN'S-ROOT.)—Dry, usually sandy, soil, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.—Sum.-fall.—The root is used medicinally.

4. *S. aquatica* Chapm. Short-lived shrub with wood lighter than cork, 6-20 dm. tall, stout-stemmed: blades of the upper leaves linear to linear-elliptic serrulate: spike stout, mainly yellow: capsule about 10 mm. wide.—(CORKWOOD.)—Ponds and wet pinelands, Coastal Plain, Fla. to Miss. and S. C.—Spr.—sum.

5. *S. tenuis* Small. Short-lived shrub with light brittle wood, 3-12 dm. tall, with slender stem not umbellately branched at the top: blades of the upper leaves narrowly linear, crenulate: spike slender, mainly red: capsule about 7 mm. wide.—Everglades, Fla.—All year.

15. **SEBASTIANA** Muell. Arg. Shrubs or rarely herbs. Leaf-blades entire or barely toothed. Flowers monoecious, apetalous. Staminate flower with a calyx of 3-5 sepals and 3, or rarely 4, stamens. Pistillate flower with 3 sepals and a 3-celled ovary. Fruit a dry capsule.—About 40 species, mostly tropical.

1. *S. ligustrina* (Michx.) Muell. Arg. Shrub 1-4 m. tall: leaf-blades elliptic or oval, 3-8 cm. long: spikes shorter than the leaves, green or yellowish: capsule depressed, nearly 1 cm. broad: seed subglobose, about 4 mm. long.—(SEBASTIAN-BUSH.)—Swamps, stream-banks, and hammocks, Coastal Plain, Fla. to La., and N. C.—Spr.—sum.

16. **TRIADICA** Lour. Shrubs or trees. Leaf-blades entire, usually broad. Flowers monoecious, in dense spike-like panicles, apetalous. Staminate flower with 2 or rarely 3 sepals and 3 stamens. Pistillate flower with 2 or 3 sepals and a 3-celled ovary. Fruit a fleshy capsule.—Few species, of tropical Asia.

1. *T. sebifera* (L.) Small. Tree resembling a poplar: leaf-blades broad, rhombic, acuminate, 4-8 cm. long, entire, long-petioled: spikes green: capsule about 1.5 cm. broad: seed 8-9 mm. long. [*Sapium sebiferum* (L.) Roxb.]—(CHINESE TALLOW-TREE.)—Hammocks and roadsides, Coastal Plain, Fla. to La. and S. C.—Nat. of E Asia and cult.—Spr.

17. **SAPIUM** P. Br. Shrubs or trees. Leaf-blades entire or sparingly toothed. Flowers monoecious, in narrow spike-like panicles, apetalous. Staminate flower with 2 or 3 sepals and 2 stamens. Pistillate flower with 2 or 3 sepals and a 2-celled ovary. Fruit a dry capsule.—About 3 species, American.

1. *S. glandulosum* (L.) Morong. Small tree or shrub, resembling a willow: leaf-blades linear-elliptic to narrowly elliptic, acute, 8-16 cm. long, serrulate, short-petioled: spikes green or yellowish: capsule about 1 cm. broad: seed 6-7 mm. long.—(MILK-TREE.)—Roadsides and waste-places, W. Fla. Nat. of S. A.—Spr.

18. **GYMNANTHES** Sw. Shrubs or trees. Leaf-blades entire or toothed. Flowers monoecious or rarely dioecious, apetalous. Staminate flower with a rudimentary or obsolete calyx and 2 or 3 stamens. Pistillate flower with a rudimentary calyx and a 3-celled ovary. Fruit a capsule.—About 12 species, American.

1. **G. lucida** Sw. Shrub, or tree becoming 10 m. tall: leaf-blades cuneate to elliptic-spatulate, or nearly elliptic, 4–10 cm. long, undulate or obscurely toothed near the apex, spikes shorter than the leaves, green; capsule depressed, about 1 cm. wide: seed ovoid, 6–8 mm. long.—(CRABWOOD.)—Hammocks, Everglade Keys, pen. Fla. and Florida Keys.—(W. I.)—Spr.—The sap-wood is bright-yellow; the dark-brown and yellow streaked heart-wood, close-grained, heavy, and hard, is used in cabinet work.

19. **HIPPOMANE** L. Trees. Leaf-blades entire or toothed, pinnately veined. Flowers on a simple rachis, forming a green spike. Staminate flower with 2 or 3 sepals and 2 or 3 stamens. Pistillate flower with 3 sepals and a 6–8-celled ovary. Fruit a drupe, with a sharply tuberculate stone imbedded in the pulp.

1. **H. Mancinella** L. Tree becoming 18 m. tall: leaf-blades ovate, elliptic, or oval, 4–10 cm. long: spikes 4–8 cm. long: drupe spheroidal, 2.5–3.5 cm. broad.—(MANCHINEEL.)—Hammocks, Everglade Keys and Cape Sable region, pen. Fla. and Florida Keys.—(W. I., Mex., C. A., S. A.)—The milky sap is a powerful irritant, a skin poison. The sap-wood is yellow or light-brown, the dark-brown heart-wood is close-grained, but light and soft.

20. **BIVONEA** Raf. Herbs or shrubs, often bristly-stinging. Leaf-blades entire, lobed, or divided. Flowers in forked cymes, white. Staminate flower with a corolla-like 5-lobed calyx and 10–30 stamens. Pistillate flower with a usually 3-celled ovary. Fruit a somewhat 3-lobed capsule. [*Cnidoscolus* Pohl.]—About 20 species, mostly in tropical America.

1. **B. stimulosa** (Michx.) Raf. Plant 1–12 dm. tall: leaf-blades 8–30 cm. broad, coarsely or finely lobed: staminate calyx with a cylindric tube, and lobes about equal in length: capsule 10–16 cm. long, bristly. [*Jatropha stimulosa* Michx.]—(SPURGE-NETTLE. FINGER-ROT. TREAD-SOFTLY.)—Dry woods, sandy hammocks, pinelands, and sand-dunes, Coastal Plain and adj. provinces, Fla. to Tex. and Va.—Spr.-fall or all year S.

**21. ADENOROPHIUM** Pohl. Partly woody plants or herbs. Leaf-blades angled or lobed. Flowers monoecious, petaliferous, mostly red or purple. Staminate flower with 5 sepals, 5 small petals, and 8-10 stamens. Pistillate flower with a mainly 2-3-celled ovary. Fruit a capsule. [*Jatropha* L. in part.]—About 85 species, mainly tropical. All year.

Leaf-blades 3-5-lobed; lobes toothed, glandular-ciliate: inflorescence pubescent.

1. *A. gossypifolium*.

Leaf-blades 9-11-lobed; lobes entire or incised, eciliate: inflorescence glabrous.

2. *A. multifidum*.

1. *A. gossypifolium* (L.) Pohl. Shrub 5-11 dm. tall: leaf-blades palmately 3-5-lobed, 8-15 cm. wide, the lobes broad, shallowly toothed and glandular-ciliate: cymules paniculate: petals scarcely twice as long as the sepals: capsule globular-ellipsoid, about 1 cm. long, slightly warty: seed 7-8 mm. long.—Roadsides and cult. grounds, Key West, Fla. Nat. of tropical regions and cult.—Like many of these plants this one is more or less poisonous when eaten, hence the popular name BELLY-ACHE BUSH.

2. *A. multifidum* (L.) Pohl. Shrub 9-20 dm. tall: leaf-blades palmately 9-11-lobed, mostly 10-20 cm. wide, the lobes narrow, entire or incised, not ciliate: cymules corymbose: petals thrice as long as the sepals: capsule globose-obovoid, 2.5-3 cm. long, smooth: seed 18-25 mm. long.—Pinelands, Everglade Keys, Fla. Nat. of tropical regions and cult.—This plant, like its relatives, has been used in popular medicine and also as a hedge-plant. It is known as PHYSIC-NUT or CORAL-PLANT.

**22. JATROPHA** L. Shrubs or herbs. Leaf-blades entire, or palmately lobed or parted. Flowers monoecious, apetalous. Staminate flower with 5 sepals and 8 or 10 stamens. Pistillate flower often smaller than the staminate, with a 3-celled ovary, green or purple. Fruit a capsule. [*Manihot* Adans.]—About 80 species, South American.

1. *J. Manihot* L. Plants 9-16 dm. tall, with a very large root: leaf-blades 3-7 parted: flowers green or purple-tinged: capsules with crenate-undulate wings. [*M. Manihot* (L.) Karst.]—(CASSAVA.)—Roadsides, cult. grounds, and pinelands, Everglade Keys, Fla. and Florida Keys. Nat. of S. A., and cult.—(W. I.)—The large root yields starch in the form of cassava-meal and tapioca. It contains a poison, however, which must be dissolved out before these products are edible.

**23. RICINUS** [Tourn.] L. Herbs, shrubs, or trees. Leaf-blades peltate, palmately lobed. Flowers monoecious, apetalous. Staminate flower with 3-5

sepals and numerous stamens, mainly yellow, Pistillate flower with caducous sepals and a 3-celled ovary, green. Fruit a capsule.—One species.

1. *R. communis* L. Small tree or shrub, 1-5 m. tall, the stem widely branched, or an annual herb northward: leaf-blades nearly orbicular, 6-11-lobed: capsule 12-16 mm. in diameter.—(CASTOR-OIL PLANT. CASTOR-BEAN. PALMA-CHRISTI.)—Pinelands, hammocks, roadsides, and waste-places, locally escaped from gardens in various provinces, throughout SE U. S. Nat. of Africa, and cult.—(Widely distr.)—Sum.—fall or all year S.—The seeds yield the castor oil of commerce.

24. *CHAMAESYCE* S. F. Gray. Annual or perennial herbs or shrubs. Leaves opposite: blades oblique at the base. Involucres axillary or in axillary cymes, each with 4 naked or appendaged glands, one sinus being glandless. Capsule smooth, sometimes pubescent. Seed smooth or transverse-wrinkled.—About 225 species, widely distributed.—SPURGES. EUPHORBIAS.—The flower-like involucres have appendages to the marginal glands, either green tinged with red, red, greenish-white or white. Some of the species have reputed medicinal properties.

Leaf-blades entire.

Plant with prostrate stems and branches.

Leaves succulent: seed not angled, sometimes terete or nearly so.

I. POLYGONIFOLIAE.

Leaves herbaceous or chartaceous: seed sharply angled.

II. CORDIFOLIAE.

Plant with erect or ascending stems and branches.

III. BUNIFOLIAE.

Leaf-blades toothed, sometimes only at the apex.

Capsule glabrous.

Plant with prostrate stems and branches.

II. CORDIFOLIAE.

Plant with erect or ascending stems and branches.

IV. HYSSOPIFOLIAE.

Capsule pubescent.

Involucres axillary to the leaves or leaf-like bracts.

Stem, or branches, erect.

V. TRACYANAE.

Stem, or branches, prostrate.

VI. MACULATAE.

Involucres in peduncled clusters.

VII. HIRTAE.

#### I. POLYGONIFOLIAE

Seed 1.5 mm. long or more, somewhat 3-sided.

Seed unequally 3-sided, covered with a silvery-gray bloom, usually 2 mm. long or more.

Seed equally 3-sided, covered with a whitish or speckled bloom, usually about 1.5 mm. long.

Seed less than 1.5 mm. long, nearly terete.

1. *C. polygonifolia*.

2. *C. Ingallsii*.

3. *C. cumulicola*.

#### II. CORDIFOLIAE

Capsule, and ovary, glabrous.

Leaf-blades, at least those of the stem or main branches, decidedly longer than wide, mainly elliptic to narrowly ovate.

Involucre about 1.5 mm. long, broadly campanulate: leaf-blades thick and parchment-like.

4. *C. Chiogenes*.

Involucre about 1 mm. long, narrowly campanulate: leaf-blades thin-herbaceous.

5. *C. Blodgettii*.

Leaf-blades broadly ovate to orbicular.

Appendages of the involucre-glands minute or obsolete.

6. *C. serpens*.

Appendages of the involucre-glands petal-like.

Ultimate divisions of the inflorescence open, long-branched.

Ultimate divisions of the inflorescence comparatively dense, raceme-like clusters.

Capsule, and ovary, pubescent.

Stem, branches, and leaves permanently and usually copiously pubescent.

Plant with few stout or wiry branches, not forming dense mats.

Foliage finely hirsute.

Leaves of the branchlets much reduced in size, crowded: capsule with many long hairs.

Leaves of the branchlets not much reduced in size, not crowded: capsule with few short hairs.

Foliage canescent.

Plant with many very slender, usually filiform branches, forming dense mats appressed to the ground.

Branches strigillose: leaf-blades much longer than wide.

Branches villous-hirsutulous: leaf-blades nearly or quite as wide as long.  
(than 4 mm. long), as wide as long or nearly so.

7. *C. cordifolia*.

7a. *C. Nashii*.

8. *C. brachypoda*.

9. *C. Mosieri*.

10. *C. Garberi*.

11. *C. Serpyllum*.

12. *C. adhaerens*.

13. *C. deltoidea*.

### III. BUXIFOLIAE

Stem, branches, and leaves glabrous.

Twigs and leaves succulent: beach plant.

Twigs and leaves not succulent: pineland plants.

Leaf-blades very broad: stem sparingly branched.

Leaf-blades rather narrow: stem much-branched and broom-like.

Stem, branches, and leaves pubescent.

Single-stemmed woody plants, sometimes branched near the base: stem and leaves finely, usually sparingly canescent.

Leaf-blades relatively small (on the main stem less than 4 mm. long), as wide as long or nearly so.

Leaf-blades relatively large (on the main stem over 5 mm. long), twice as long as wide.

Many-stemmed, wiry, caespitose plant: stem and leaves villous-hirsute.

14. *C. buxifolia*.

15. *C. Porteriana*.

16. *C. scoparia*.

17. *C. adicioides*.

18. *C. keyensis*.

19. *C. pinetorum*.

### IV. HYSSOPIFOLIAE

Involucres in dense axillary cymes, the cymes rarely branched.

Involucres in loose cymes, rarely also with some axillary, the cymes much-branched.

20. *C. hypericifolia*.

21. *C. hyssopifolia*.

### V. TRACYANA

Stem usually branched at the base and above, the branches and branchlets very leafy.

22. *C. Tracyi*.

### VI. MACULATAE

Glands of the involucre with inconspicuous appendages.

Capsule pubescent along the angles.

Capsule pubescent all over, but often mainly so, below the middle.

Leaf-blades twice as long as wide or less.

Involucre not cleft on one side: seed sharply 4-angled, the faces with 3 or 4 prominent transverse ridges.

Involucre deeply cleft on one side: seed bluntly angled, the faces minutely roughened or nearly smooth.

Leaf-blades thrice as long as wide.

Glands of the involucre, at least two of them, with petal-like appendages.

Branches densely and copiously floriferous, the involucres crowded: leaves of the flowering branches much reduced in size, of a different shape from those of the stem, and usually acuminate.

Branches not densely or copiously flowered, the involucres not approximate: leaves of the flowering branches much reduced in size, but not changed in shape, rounded at the apex.

23. *C. prostrata*.

24. *C. maculata*.

25. *C. humistrata*.

26. *C. Mathewsii*.

27. *C. conferta*.

28. *C. adenoptera*.

## VII. HIRTAE

Plant erect: heads of involucre axillary, never terminal only, but rarely subtended by 2 or more leaf-like bracts.  
 Plant prostrate: heads of involucre terminal, or terminating branches and subtended by 2 leaf-like bracts.

29. *C. hirta*.30. *C. gemella*.

1. *C. polygonifolia* (L.) Small. Leaf-blades narrowly elliptic to linear-lanceolate, fleshy: involucre between 1.5 and 2 mm. long: capsule globose-ovoid: seed ellipsoid-ovoid, usually over 2 mm. long.—(SEASIDE-SPURGE.)—Coastal sand-dunes, Coastal Plain, and New England Coast, Fla. to N. S.; also Great Lake Lowland, N. Y. to Wis.—Sum.—fall.

2. *C. Ingallsii* Small. Leaf-blades elliptic to ovate-elliptic, fleshy: involucre between 1 and 1.5 mm. long: capsule depressed: seed broadly ovoid or globose-ovoid, usually less than 2 mm. long.—Coastal sand-dunes, Fla. to Tex.

3. *C. cumulicola* Small. Branches prostrate, string-like, zigzag, glabrous; leaf-blades elliptic to elliptic-ovate, veinless: involucre campanulate, about 1 mm. long, glabrous; appendages whitish and narrower than the glands or obsolete: capsule about 2.5 mm. broad, glabrous: seed 1-1.3 mm. long, nearly terete, smooth.—(SAND-DUNE SPURGE.)—Sand-dunes and scrub, Cape Romano region and lower eastern coast, Fla.—All year.

4. *C. Chiogenes* Small. Leaf-blades narrowly ovate or elliptic, sometimes the lower ones suborbicular: involucre about 1.5 mm. long; appendages mostly smaller than the glands: capsule about 1.5 mm. broad: seed about 1 mm. long, angled, the faces uneven.—Pinelands, lower Florida Keys.—All year.

5. *C. Blodgettii* (Engelm.) Small. Branches glabrous or nearly so: leaf-blades narrowly ovate, elliptic, or spatulate: involucre about 1 mm. long, glabrous: gland-appendages white or pinkish, commonly slightly larger than the glands: capsule fully 1.5 mm. broad, glabrous: seed about 1 mm. long.—Coastal sand-dunes and low hammocks, S pen. Fla. and the Keys.—(W. I.)

6. *C. serpens* (H.B.K.) Small. Branches glabrous: leaf-blades orbicular, orbicular-ovate, or ovate: involucre barely 1 mm. long; appendages mostly smaller than the glands: capsule between 1 and 2 mm. broad: seed barely 1 mm. long, prominently angled.—Sandy woods, plains, and tablelands, various provinces, Fla. to Tex., N. M., Ia., and Ill.—(W. I.)—Spr.—fall.

7. *C. cordifolia* (Ell.) Small. Branches glabrous: leaf-blades broadly elliptic to ovate, or sometimes broadest below the middle: involucre fully 1 mm. long; appendages mostly much larger than the green glands: capsule between 2 and 3 mm. broad, glabrous: seed fully 1 mm. long, gray, obscurely angled.—Sandy hammocks and sandhills, Coastal Plain, Fla. to Tex. and S. C.—Spr.—fall.

7a. *C. Nashii* Small. Branches glabrous: leaf-blades broadly elliptic to ovate: involucre nearly 1.5 mm. long; appendages narrow, delicate, white or greenish: seed shallowly transverse-wrinkled.—Coastal sands and pinelands, pen. Fla. and Florida Keys.—All year.

8. *C. brachypoda* Small. Branches hirsute or villous-hirsute, with many short internodes: leaf-blades elliptic to ovate, hirsute: involucre fully 1 mm. long;

appendages much smaller than the red glands, or minute or obsolete: capsule about 2 mm. wide, pubescent: seed 1 mm. long, brown, obscurely angled.—Pinelands, Everglade Keys, Fla.—All year.

9. *C. Mosieri* Small. Branches prostrate, wiry, dark, villous-hirsutulous: leaf-blades orbicular-reniform to ovate, 4–8 mm. long, loosely-pubescent, acute or acutish: involucre campanulate, about 1 mm. long, pubescent; appendages red or deep-pink, some of them larger than the glands, others smaller, sometimes lobed: capsule globose-ovoid, about 1.5 mm. broad, sparingly pubescent: seed ovoid, about 1 mm. long, the faces nearly smooth.—Pinelands, Everglade Keys, S pen. Fla.—All year.

10. *C. Garberi* Small. Branches canescent: leaf-blades ovate or oval: involucre about 1.5 mm. long; appendages minute, or obsolete: capsule fully 1.5 mm. broad, pubescent: seed about 1 mm. long, reddish-brown.—Pinelands, hammocks, and sand-dunes, Everglade Keys and Cape Sable, pen. Fla. and Florida Keys. Adv. at Mobile, Ala.—All year.

11. *C. Serpyllum* Small. Branches puberulent-canescant, filiform, very numerous: leaf-blades deltoid or ovate-deltoid to triangular or triangular-ovate, 3–5 mm. long, obtuse: involucre about 1 mm. long; appendages very minute: capsule about 1.5 mm. broad, pubescent: seed less than 1 mm. long, yellowish or grayish.—Pinelands, lower Florida Keys.—All year.

12. *C. adhaerens* Small. Branches very numerous, forming closely prostrate mats, finely villous-hirsutulous, wiry-filiform: leaf-blades reniform to orbicular-ovate, or reniform-ovate, 2–3.5 mm. long, rounded at the apex, minutely pale-pubescent: involucre broadly campanulate or hemispheric, about 1 mm. long; appendages mere pale margins to the glands or obsolete: capsule fully 1.5 mm. broad, pubescent: seed ovoid, about 1 mm. long, the faces slightly wrinkled.—Pinelands, Everglade Keys, pen. Fla.—All year.

13. *C. deltoidea* (Engelm.) Small. Branches glabrous, closely appressed to the ground: leaf-blades deltoid-ovate or reniform, rarely minutely pubescent when young: involucre less than 1 mm. long, glabrous: glands yellow; appendages obsolete: capsule about 2 mm. broad, glabrous or sometimes sparingly pubescent: seed less than 1 mm. long, even, yellowish.—Pinelands, Everglade Keys, pen. Fla.—All year.

14. *C. buxifolia* (Lam.) Small. Branches, like the stem woody, 1 m. tall or less, glabrous, often purple, with long or short internodes: leaf-blades ovate to broadly elliptic or cuneate near the base of the stem, rather fleshy, 8–12 mm. long, obtuse or acutish, involute, rounded or subcordate, nearly sessile: involucre campanulate, about 1.5 mm. high, as long as the peduncles or shorter: glands transversely elliptic, 0.5 mm. broad: appendages whitish: capsule 2.5–3 mm. broad, glabrous.—Coastal sand-dunes and rocks along shores, S pen. Fla. and the Keys.—(*W. I.*)

15. *C. Porteriana* Small. Branches glabrous: leaf-blades ovate, or oval: involucre about 1 mm. long, glabrous: gland-appendages reddish, fully as long as the glands, or sometimes narrower: capsule about 2 mm. broad, glabrous: seed about 1 mm. long, markedly angled.—Pinelands, Everglade Keys, pen. Fla.—All year.

16. *C. scoparia* Small. Branches glabrous, pale: leaf-blades narrowly elliptic to narrowly ovate, 2–8 mm. long, obtuse or acutish, pale or glaucescent beneath: involucre about 1.5 mm. long, glabrous: gland-appendages white or pink, 2 of them prominent and 2 partly obsolete: capsule 1.5–2 mm. broad, glabrous: seed about 1 mm. long, grayish, scabrous.—Pinelands, lower Florida Keys.—All year.

17. *C. adicioides* Small. Shrub mostly less than 0.5 m. tall, finely pubescent with pale hairs, rather copiously branched above, zigzag: leaves numerous; blades ovate to oval, 2-3 mm. long, acute or acutish, entire, short-petioled: involucre campanulate, barely 1 mm. high, longer than the peduncles, minutely pubescent, deciduous: glands about 0.4 mm. broad: appendages obsolete: capsule pubescent, less than 1 mm. long.—Sandy shores and hammocks, Florida Keys.—All year.

18. *C. keyensis* Small. Branches erect or nearly so, finely pale-pubescent: leaf-blades elliptic-ovate, to elliptic, oval, or ovate, 3-9 mm. long: involucre turbinate, a little over 1 mm. long, finely pubescent; appendages white or pinkish, about as wide as the glands: capsule about 2 mm. broad, pubescent: seed nearly 1 mm. long.—Sand-dunes and pinelands, lower Florida Keys.—All year.

19. *C. pinetorum* Small. Branches villous-hirsute often ascending near the tips: leaf-blades reniform or deltoid to orbicular or ovate, conspicuously pubescent: involucre fully 1 mm. long, pubescent: glands green; appendages very narrow, even-edged: capsule fully 2 mm. broad, pubescent: seed 1 mm. long, transversely wrinkled, yellowish.—Pinelands, Everglade Keys, pen. Fla.—All year.

20. *C. hypericifolia* (L.) Small. Branches glabrous or nearly so, the ultimate ones slender: leaf-blades mainly elliptic, elliptic-lanceolate, or ovate, unequally serrate, usually nearly straight: involucre 1 mm. long or more: gland-appendages obovate to reniform, rather conspicuous: capsule fully 2 mm. wide, glabrous: seed brown or reddish-brown, about 1 mm. long.—Pinelands, waste-places, and roadsides, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)

21. *C. hyssopifolia* (L.) Small. Branches glabrous: leaf-blades elliptic, elliptic-ovate, elliptic-lanceolate, or sometimes linear-lanceolate, often slightly curved or even falcate, mostly 1-3 cm. long, usually toothed: involucre 1-1.5 mm. long, glabrous, few together in terminal cymes; appendages suborbicular or reniform, unequal: capsule 1.5-2 mm. wide, glabrous: seed gray, brown, or black, about 1 mm. long. [*Euphorbia brasiliensis* Lam. *E. nutans* Lag. *E. Preslii* Guss.]—(EYE-BANE).—Hammocks, roadsides, fields, and waste-places, nearly throughout U. S. and S Can.—(*W. I., Mex., C. A., S. A.*)—Sum. or all year S.

22. *C. Tracyi* Small. Branches thinly canescent: leaf-blades elliptic to slightly broadest above the middle: involucre fully 1 mm. long, sparingly pubescent: gland-appendages minute, unequal and uneven: capsule nearly 2 mm. broad, slightly pubescent all over: seed less than 1 mm. long.—Sand-dunes and pinelands, Coastal Plain, Fla. to Miss.—Sum. or all year S.

23. *C. prostrata* (Ait.) Small. Branches pubescent: leaf-blades oval, obovate, or elliptic: involucre 1 mm. long or less, usually sparingly pubescent: appendages very narrow: capsule about 2 mm. broad, pubescent about the angles: seed 1 mm. long or less.—Sandy soil, Coastal Plain, Fla. to Tex.—All year.

24. *C. humistrata* (Engelm.) Small. Branches puberulent or finely pubescent: leaf-blades ovate-elliptic or sometimes narrower: involucre about 1 mm. long, pubescent: appendages white or red, commonly narrower than the glands: capsule about 1.5 mm. broad, pubescent: seed about 1 mm. long.—Dry or sandy soil, various provinces, W of Blue Ridge, Ala. to Tex., Nebr., Minn., Que., and N. Y.—Spr.—fall.

25. *C. maculata* (L.) Small. Branches like the stem puberulent or pilose: leaf-blades elliptic or ovate-elliptic, 8-12 mm. long: involucre mostly 1 mm.

long, pubescent; appendages white or red, narrow, nearly equal, entire: capsule less than 1.5 mm. wide, pubescent: seed nearly 1 mm. long, black beneath the pale coating.—(MILK-PURSLANE.)—Roadsides, cult. grounds, waste-places, and especially along railroads, various provinces, nearly throughout U. S. and S. Can.—Spr.—fall or all year S.

26. *C. Mathewsii* Small. Branches prostrate, copiously loosely pubescent: leaf-blades broadly linear-elliptic to elliptic, 1–1.5 cm. long, with a black-purple blotch above, and scattered hairs beneath: involucre campanulate, slightly over 1 mm. long; appendages pale, very narrow, unequal, uneven: capsule about 1.5 mm. broad, pubescent: seed less than 1 mm. long.—Barren beaches, opposite Miami, Fla.—All year.

27. *C. conferta* Small. Branches villous: leaf-blades elliptic to ovate: involucre 1.5–2 mm. long, villous; gland-appendages red or magenta, 2 of them petal-like, much larger than the others, toothed: capsule less than 1.5 mm. broad, minutely pubescent: seed less than 1 mm. long, coarsely wrinkled.—Pine-lands, Everglade Keys, pen. Fla.—All year.

28. *C. adenoptera* (Bertol.) Small. Branches closely villous: leaf-blades elliptic or ovate-elliptic: involucre 1–1.5 mm. long, finely pubescent; gland-appendages white or pink, petaloid, 2 of them much larger than the glands: capsule about 1.5 mm. broad, densely pubescent: seed about 1 mm. long, finely wrinkled.—Pinelands, S. Fla.—Spr.—sum.

29. *C. hirta* (L.) Millsp. Branches closely pubescent: leaf-blades elliptic to elliptic-lanceolate, or somewhat triangular, often prominently blotched: involucre mostly in axillary clusters, 1 mm. long or less, minutely pubescent; gland-appendages imperfectly developed: capsule fully 1 mm. broad, finely pubescent: seed about 1 mm. long. [*C. pilulifera* (L.) Small]—Hammocks, roadsides, and cult. grounds, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A.)—All year.

30. *C. gemella* (Lag.) Small. Similar to *C. hirta* but smaller, and with more closely prostrate branches: leaf-blades elliptic to elliptic-lanceolate, mostly evenly green: involucre mostly in terminal clusters, about 1 mm. long, finely pubescent: gland-appendages white, narrower than the glands: capsule fully 1 mm. broad, often closely pubescent: seed less than 1 mm. long. [*C. pilulifera procumbens* (Boiss.) Small]—Hammocks, cult. grounds, roadsides, and waste-places, pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—All year.

25. **LEPADENA** Raf. Annual or biennial herbs, often topped by an umbel. Leaf-blades entire. Involucre in rather dense cymes, each with 5 conspicuously appendaged glands. Capsule pubescent. Seed wrinkled or tuberculate. [*Dichrophyllum* Kl. & Garcke.]—About 4 species, North American.—EUPHORBIAS.—SPURGES.

1. *L. marginata* (Pursh) Nieuwl. Plant 3–11 dm. tall: blades of the upper leaves obovate to ovate, like the bracts white-margined and conspicuous: involucre-glands with white appendages: capsule strigillose: seed 3–4 mm. long, coarsely wrinkled, obtuse.—(SNOW-ON-THE-MOUNTAIN.)—Dry soil and waste-places, various provinces, Ga. to N. C. and W; native from Tex. to N. M., Mont., and Minn.—Spr.—fall.—Extensively cultivated for the showy effect of the massed foliage which suggested the popular name.

**26. TITHYMALOPSIS** Kl. & Garcke. Perennial, mostly glabrous herbs often topped by an umbel. Leaf-blades entire. Involucres scattered or somewhat clustered in an umbel-like inflorescence, each with appendaged glands. Capsule smooth. Seed punctate.—About 18 species, North American.—**EUPHORBIAS.**—Some of the species, *T. corollata* and *T. Ipecacuanhae*, are used medicinally.

Leaves exceedingly numerous, approximate or imbricate.

Leaves less numerous, never imbricate.

Stem normally underground; branches of the inflorescence tufted; all leaves or bracts opposite.

Glands of the involucre with inconspicuous margin-like appendages.

Branches spreading or prostrate: leaf-blades fleshy.

Branches erect or ascending: leaf-blades thin.

Glands of the involucre with conspicuous white appendages.

Stems erect, topped by the umbel-like inflorescence: leaves alternate on the inflorescence branches.

Stem-leaves reduced to scales: bracts foliaceous.

Stem-leaves with normally expanded blades.

Inflorescence of scattered long-peduncled involucre.

Involucres 2-4 mm. across the appendages.

Stem-leaves with linear blades, fugacious.

Stem-leaves with elliptic or lanceolate blades, persistent.

Involucres 6-10 mm. across the appendages.

Inflorescence aggregated into terminal cymes or cymose clusters.

Leaf-blades manifestly petioled, the petioles over 2 mm. long.

Leaf-blades sessile or nearly so, the petioles, if present, less than 1 mm. long.

Involucres 3.5 mm. across the appendages or narrower.

Involucres 4-8 mm. across the appendages.

Appendages about as long as the involucre.

Appendages much longer than the involucre.

Appendages longer than wide: leaf-blades relatively narrow.

Appendages as wide as long or wider: leaf-blades relatively broad.

1. *T. polyphylla*.

2. *T. Ipecacuanhae*.

3. *T. gracilis*.

4. *T. eriogonoides*.

5. *T. mercurialina*.

6. *T. Curtisii*.

7. *T. exserta*.

8. *T. zinniflora*.

9. *T. apocynifolia*.

10. *T. discoidalis*.

11. *T. olivacea*.

12. *T. corollata*.

13. *T. paniculata*.

1. ***T. polyphylla*** (Engelm.) Small. Plant 0.5-2.5 dm. tall, the stems stout, often tufted, copiously leafy: leaf-blades linear or linear-spatulate, 5-15 mm. long: involucres 1.5-2 mm. long; gland-appendages white or pinkish, mostly reniform, crenate: capsule 4-5 mm. broad: seed about 2.5 mm. long, white.—Pinelands, pen. Fla.—All year.

2. ***T. Ipecacuanhae*** (L.) Small. Plant 0.2-3 dm. tall, the stem slender, sparingly leafy: leaf-blades linear to orbicular, 1-7 cm. long: involucres 1.5 mm. long, or rarely longer: appendages of the glands very narrow or obsolete: capsule 4.5-5 mm. broad: seed 2.5 mm. long.—(IPECAC-SPURGE.)—Dry acid sand, often in pinelands, where vegetation is too sparse to carry fire, Coastal Plain and occasionally adj. provinces, Fla. to Tenn., Ind., and Conn.—Spr.—fall.

3. *T. gracilis* (Ell.) Small. Plant 1-3 dm. tall, the stems very slender, sparingly leafy: leaf-blades suborbicular to ovate or linear or rarely broader than long: involucre about 2 mm. long; appendages of the glands narrow: capsule 3-4 mm. broad: seed 2.5 mm. long.—Pinelands and sandhills, Coastal Plain, Fla. to S. C.—All year.

4. *T. eriogonoides* Small. Plant 1-3 dm. tall, the stem, diffusely branched: leaf-blades linear to linear-spatulate, 0.5-1.5 cm. long: involucre about 1 mm. long; appendages reniform to suborbicular, about 1 mm. broad: capsule about 4 mm. broad: seed about 2.5 mm. long.—Pinelands and roadsides, Coastal Plain, Fla. to N. C.—Spr.—fall.

5. *T. mercurialina* (Michx.) Small. Plant 1-4 dm. tall, often with several stems together: bracts oval, elliptic, or oblong-ovate, 2-9 cm. long: involucre 2 mm. long; appendages white, mostly narrower than the glands, undulate: capsule 5-6 mm. broad: seeds 2.5 mm. long, tuberculate.—Rocky woods, Coastal Plain and Appalachian provinces, Fla. to Ala., Tenn., and Ga.—Spr.—sum.

6. *T. Curtisii* (Engelm.) Small. Plant 1-5 dm. tall, the branches green: leaf-blades linear, 1.5-4 cm. long: involucre 1-1.5 mm. long; appendages white, reniform to orbicular-reniform, as wide as the glands or wider: capsule 4-5 mm. broad: seed about 2 mm. long.—Pinelands, Coastal Plain, Fla. to N. C.—Spr.—fall.

7. *T. exserta* Small. Plant 1-3 dm. tall, the branches reddish or purple: leaf-blades elliptic to lanceolate, 2-6 cm. long: involucre about 2 mm. long; appendages white, reniform, about as broad as the glands, or narrower: capsule long-exserted, 4-5 mm. broad: seed 3-3.5 mm. long.—Pinelands or coastal sands, Fla.—All year.

8. *T. zinniiflora* Small. Plant 3-5 dm. tall: leaf-blades linear-lanceolate to nearly linear, 2-5 cm. long, sessile or nearly so: involucre few, about 2 mm. long; appendages white or pink, suborbicular or 4-sided: capsule exserted, 4.5-5 mm. broad: seed about 2.5 mm. long.—Sandy soil, Coastal Plain, Fla. and Ala.—Spr.

9. *T. apocynifolia* Small. Plant 2-7 dm. tall: leaf-blades elliptic to oval, 2-7 cm. long, manifestly petioled: involucre numerous, about 1.5 mm. long; appendages white, orbicular to cuneate, or sometimes reniform: capsule about 5 mm. broad: seed 2.5 mm. long.—Sandy soil, Coastal Plain, Fla. to Miss. and N. C.—Sum.—fall.

10. *T. discoidalis* (Chapm.) Small. Plant 2-6 dm. tall: leaf-blades linear, 2-6 cm. long, sessile: involucre numerous, fully 1 mm. long; appendages white, reniform to ovate or 4-sided: capsule exserted, about 3 mm. broad: seed about 2 mm. long.—Pinelands, W Fla.—Sum.—fall.

11. *T. olivacea* Small. Plant olive-green, 2-7 dm. tall: leaf-blades elliptic, obovate-elliptic, or cuneate, 1-3 cm. long: involucre numerous, 1.5-2 mm. long; appendages white, reniform to ovate or cuneate: capsule slightly exserted, 3.5-4 mm. broad: seed 2.5 mm. long.—Sandy soil, Coastal Plain, Miss. to Tex.—Sum.—fall.

12. *T. corollata* (L.) Small. Plant bright-green, 2-9 dm. tall: leaf-blades linear, elliptic, or elliptic-spatulate, 2-4 cm. long: involucre numerous, conspicuous, 1-1.5 mm. long; appendages white, mostly cuneate or orbicular-cuneate: capsule exserted, 3.5-4.5 mm. broad: seed 2.5 mm. long.—(FLOWERING-SPURGE. TRAMP'S-SPURGE.)—Woods, fields, thickets, and roadsides, various provinces, Fla. to Tex., Minn., Ont., and Mass.—Sum.

13. **T. paniculata** (Ell.) Small. Plant deep-green, 3-9 dm. tall: leaf-blades elliptic to oval, 2-6 cm. long: involucre commonly few, about 1.5 mm. long: appendages white, suborbicular, somewhat reniform, or somewhat 4-sided: capsule 3-3.5 mm. broad: seed 2.5 mm. long.—Sandy or rocky woods, Coastal Plain and adj. provinces, Ga. and Ala. to N. C.—Spr.—fall.

27. **GALARHOEUS** Haw. Annual or perennial herbs or partially woody plants, the stem topped by an umbel. Leaf-blades entire or finely toothed. Stipules wanting. Involucres in open or compact cymes, each with 4 naked or appendaged glands. Capsule smooth or tuberculate. Seed pitted, grooved, reticulate, or smooth. [*Tithymalus* (Fl. SE. U. S.)]—About 250 species, widely distributed.—Sum.—SPURGES. EUPHORBIAS.

Leaf-blades entire.

Leaves of the stem mainly opposite and decussate: capsule 1.5 mm. wide or more. I. LATHYRI.

Leaves of the stem alternate or scattered: capsule 1 cm. wide or less.

Bracts or leaves of the inflorescence-branches (rays) opposite: rays simple or dichotomous.

Stem topped by a repeatedly forked inflorescence.

II. PEPLI.

Stem topped by an umbel-like simple or sparingly forked inflorescence.

III. CYPARISSIAE.

Bracts or leaves of the inflorescence-branches (rays) alternate: rays trichotomous.

IV. TRICHOTOMI.

Leaf-blades serrulate.

V. OBTUSATI.

#### I. LATHYRI

Annual or biennial coarse plant: leaf-blades entire: glands of the involucre crescent-shaped.

1. *G. Lathyrus*.

#### II. PEPLI

Glands of the involucre without horn-like processes.

Glands with erose-crumpled edges.

2. *G. floridanus*.

Glands entire or merely undulate.

Bracts of the rays longer than broad.

Stem-leaves with narrowly oblanceolate to linear blades.

3. *G. inundatus*.

Stem-leaves with obovate, spatulate, or oblanceolate blades.

4. *G. telephioides*.

Bracts of the rays fully as broad as long.

5. *G. Darlingtonii*.

Glands of the involucre lunate or crescent-shaped by horn-like processes.

Surfaces of the seeds reticulate or rather finely and irregularly pitted.

Stem-leaves with spatulate to ovate blades: bracts ovate-reniform or reniform: seeds pitted.

6. *G. commutatus*.

Stem-leaves with linear blades: bracts deltoid: seeds reticulate.

7. *G. austrinus*.

Surfaces of the seeds longitudinally grooved or with large pits in longitudinal rows: capsule with prominently keeled lobes.

8. *G. Peplus*.

#### III. CYPARISSIAE

Plants growing in dense colonies, the stems with numerous very narrow leaves, topped by a many-rayed umbel.

9. *G. Cyparissias*.

#### IV. TRICHOTOMI

Fleshy plant with few or many stems or branches.

10. *G. trichotomus*.

#### V. OBTUSATI

Capsule smooth.

11. *G. Helioscopia*.

Capsule warty.

Leaves obtusely rounded at the tip, glabrous; seed reticulated.

Blades of the cauline leaves with cordate or truncate blades, more or less auricled: glands of the involucre stalked.

12. *G. obtusatus*.

Blades of the cauline leaves narrowed to the base, not auricled: glands of the involucre sessile.

13. *G. arkansanus*.

Leaves acute, pubescent beneath; seed smooth.

14. *G. platyphylla*.

1. *G. Lathyris* (L.) Haw. Stem 2–12 dm. tall: blades of the upper leaves lanceolate to linear-lanceolate, 3.5–12 cm. long: bracts ovate to ovate-lanceolate: involucre 4–5 mm. long; lobes triangular, toothed at the apex, surpassing the broad crescent-shaped glands: capsule 1.5–2 cm. broad: seed ellipsoid, ovoid, 5–6 mm. long, wrinkled. — (MOLE-PLANT. CAPER-SPURGE. MYRTLE-SPURGE.)—Roadsides, cult. grounds, and waste-places, various provinces, N. C. to Tex., W. Va., and Conn. Nat. of Eu.—Spr.—sum.—Used medicinally. The seeds yield an oil similar to castor oil.

2. *G. floridanus* (Chapm.) Small. Stem 2–6 dm. tall: leaf-blades linear to narrowly lanceolate, 3–6 cm. long: bracts ovate to lanceolate: involucre 3.5–4 mm. long; lobes ovate, erose, surpassed by the flabellate glands which have crumpled edges: capsule 8–10 mm. broad: seed subglobose or spheroidal, 4 mm. broad, smooth.—Pinelands, Coastal Plain, M Fla. to Ala. and Ga.—Spr.—sum.

3. *G. inundatus* (Torr.) Small. Stem 1–5 dm. tall: leaf-blades narrowly oblanceolate to linear, or slightly broadest above the middle, 3–10 cm. long: bracts ovate to elliptic-lanceolate: involucre campanulate, 2–3 mm. long; lobes ovate, several toothed, about as high as the glands: capsule 6–7 mm. broad, smooth: seed subglobose or ovoid-globose, 3–3.5 mm. long, smooth.—Low pine-lands, Coastal Plain, W Fla. to Ala.—Spr.

4. *G. telephioides* (Chapm.) Small. Stem 0.5–2.5 dm. tall: leaf-blades obovate, broadly spatulate, or oblanceolate, 2–5 cm. long: bracts ovate to deltoid: involucre broadly campanulate, about 2 mm. long; lobes half-orbicular, about as high as the glands: capsule 7–8 mm. broad, granular: seed subglobose, about 3 mm. in diameter.—Pinelands, near the coast, M Fla.—Spr.

5. *G. Darlingtonii* (A. Gray) Small. Stem 3–15 dm. tall: leaves few; blades oblanceolate to elliptic-lanceolate, 3.5–10 cm. long: bracts reniform to orbicular-reniform: involucre 3–4 mm. long; lobes ovate or quadrate, toothed or often notched; glands elliptic: capsule 8–9 mm. broad, warty: seed ovoid-globose, 3–4 mm. long.—Woods and thickets, Piedmont and occasionally adj. provinces, N. C. to N. J. (or N. Y.?).—Spr.—fall.

6. *G. commutatus* (Engelm.) Small. Stem decumbent, 1–4 dm. long: leaf-blades spatulate to ovate (or those of the upper ones somewhat lanceolate in *G. commutatus erectus*), 1–4 cm. long, with slender petiole-like bases; bracts reniform or ovate-reniform: involucre 2.5 mm. long; horns 1 mm. long or nearly so: capsule 3.5–4 mm. broad, smooth: seed ovoid, fully 2 mm. long, irregularly pitted.—(WOOD-SPURGE.)—Woods and stream-banks, various provinces, Fla. to Mo., Minn., and Pa.—Spr.—sum.

7. *G. austrinus* Small. Stem erect, 3–4 dm. tall: leaf-blades linear, mostly 2–5 cm. long, acute or acuminate, very short-petioled: bracts deltoid: involucre 1–1.5 mm. long; horns about 0.5 mm. long: capsule 3–3.5 mm. broad; smooth: seed ovoid, nearly 2 mm. long, finely reticulate.—Pinelands, W Fla.—Sum.

8. *G. Peplus* (L.) Haw. Stem erect, 1–3 dm. tall: leaf-blades elliptic or obovate, 1–4 cm. long: bracts ovate or triangular-ovate: involucre 1–1.5 mm.

long; horns less than 1 mm. long: capsule 2.5–3 mm. broad, smooth: seed ellipsoid or ovoid-ellipsoid, 1.5 mm. long or less, with 1–4 series of pits.—(PETTY-SPURGE.)—Roadsides, waste-places, and cult. grounds, various provinces, Ala. to Ia. and N. B.; also Calif. Nat. of Eu.—Spr.–fall.

9. *G. Cyparissias* (L.) Small. Stem often tufted. 1–3 dm. tall: leaves very numerous; blades linear, 2–4 cm. long, acute or acutish, entire: bracts ovate, deltoid, or reniform: involucre campanulate, about 2 mm. long, sessile: glands lunate, nearly 1 mm. wide: capsule 3-lobed, about 3 mm. wide, granular, the lobes rounded: seed ovoid, nearly 2 mm. long, smooth.—(CYPRESS-SPURGE.)—Fence-rows, roadsides, and waste-places, various provinces, E. U. S. Nat. of Eu.—Sum.–fall.

10. *G. trichotomus* (H.B.K.) Small. Stem 1–4 dm. tall: leaf-blades cuneate to elliptic, 0.5–1.2 cm. long: bracts similar to the leaves: involucre 2 mm. long: glands obreniform: capsule about 4 mm. broad, minutely wrinkled: seed subglobose, fully 1.5 mm. in diameter.—Coastal sand-dunes, S pen. Fla. and the Keys.—(*W. I., Mex.*)—All year.

11. *G. Helioscopia* (L.) Haw. Stem 1–3.5 dm. tall: leaf-blades spatulate to cuneate, 1.5–4 cm. long, finely toothed near the rounded or emarginate apex: bracts of the rays cuneate to elliptic-cuneate: involucre turbinate-campanulate, about 1.5 mm. high, short-peduncled; glands transversely oval, about 0.5 mm. wide, unappendaged: capsule about 4 mm. broad, the lobes rounded: seed ovoid, nearly 2 mm. long, finely reticulate.—(WARTWEED.)—Fields, waste-places, and cult. grounds, various provinces, N. C. to Ill., Ore., Que., and N. Y. Nat. of Eu.—Sum.–fall.

12. *G. obtusatus* (Pursh) Small. Stem 3–6 dm. tall: leaf-blades spatulate-elliptic, 1–3 cm. long: bracts ovate: involucre 1–1.5 mm. long: capsule 3.5–4 mm. broad, warty: seed ellipsoid or orbicular-ellipsoid, 2 mm. long or less, faintly reticulate.—(WARTY-SPURGE.)—Dry soil, often in woods, various provinces, S. C. to Tex., Ia., and Pa.—Spr.–sum.

13. *G. arkansanus* (Engelm. & Gray) Small. Stem 2–5 dm. tall: leaf-blades spatulate or cuneate, 1–3 cm. long: bracts ovate to ovate-reniform: involucre about 1 mm. long: capsule 2.5–3 mm. broad, with elongate warts: seed ovoid-lenticular, 1.3–1.5 mm. long, finely reticulate.—Prairies and shaded banks, various provinces, Ala. to Tex., Colo., and Kans.—Spr.–sum.

14. *G. platyphylla* (L.) Small. Stem 2–10 dm. tall: leaf-blades oblanceolate, acute, cordate and auricled at the base, 2–5 cm. long, softly pubescent beneath especially at and near the margin, sometimes with scattered pubescence above: bracts obovate, triangular-ovate or reniform-ovate: involucre about 1.5 mm. long, cottony pubescent, the glands large, sessile: capsule 2.5–3 mm. broad with depressed warts: seed ovoid-lenticular with a slight dorsal keel, 2 mm. long, smooth.—Waste places and roadsides, various provinces, Lake Champlain and the Great Lake region, also central N. Y. and southern La. Nat. of Eu.—Spr.–early fall.

28. **POINSETTIA** Graham. Annual, biennial, or perennial herbs or woody plants. Leaf-blades entire, toothed, or lobed, those of the upper ones often like the bracts highly colored or discolored. Involucres solitary or cymose, each with 1, or rarely 3 or 4, unappendaged glands. Capsule smooth. Seeds tuberculate.—About 12 species, mostly tropical American.—Sum.–fall or all year S.—EUPHORBIAS. SPURGES.

Gland or glands of the involucre stalked: bracts and upper leaves barely if at all discolored.

Gland of the involucre sessile or nearly so: bracts and upper leaves discolored at the base.

Bracts white or pale-pink at the base.

Bracts red, scarlet, or purple at the base.

Leaves throughout the plant with very narrowly linear entire blades: plant glabrous: involucre glands mostly 3 or 4.

Leaves, at least those of the main stem, and the bracts, with broad, toothed, pandurate or pinnately lobed blades, those of the branches often narrow: plant pubescent: involucre glands mostly solitary.

Broad leaves with toothed blades.

Broad leaves with pandurate or pinnately lobed blades.

1. *P. dentata*.

2. *P. geniculata*.

3. *P. pinetorum*.

4. *P. heterophylla*.

5. *P. cyathophora*.

1. *P. dentata* (Michx.) Small. Stem 2-4 dm. tall, pubescent: leaf-blades 1-9 cm. long, ovate, lanceolate, or nearly linear: involucre 2.5-3 mm. long; glands usually solitary: capsule 4-4.5 mm. broad: seed prominently tuberculate.—Rich soil, dry hills, and plains, various provinces, rarely Coastal Plain, N. Fla. to N. M., Wyo., S. D., N. Y., and Va.

2. *P. geniculata* (Ortega) Small. Stem 3-9 dm. tall, glabrous or nearly so: leaf-blades elliptic or ovate, 4-9 cm. long, entire or obsoletely dentate: bracts often serrate or crenate: involucre 3-3.5 mm. long: capsule 4-5 mm. broad: seed ovoid, 3-3.5 mm. long.—Hillsides and roadsides, Rio Grande Region, Tex. and Fla. Keys.—(*W. I., Mex.*)

3. *P. pinetorum* Small. Stem 3-10 dm. tall, glabrous: leaf-blades narrowly elongate-linear, 4-15 cm. long: bracts entire: involucre turbinate, mostly less than 3 mm. long: capsule 2.5-3 mm. long: seed 2-2.5 mm. long, slightly tuberculate. [*P. havanensis* (Fl. SE. U. S.)]—Pinelands and sandy places, Everglade Keys, pen. Fla. and Florida Keys.—(*W. I.*)

4. *P. heterophylla* (L.) Small. Perennial, stem 3-12 dm. tall: leaf-blades obovate, elliptic, or ovate, or narrower, especially on the branches, 5-15 cm. long: involucre campanulate, mostly over 3 mm. long: capsule 3.5-4 mm. long: seed 3-3.5 mm. long, prominently tuberculate.—(PAINTED-LEAF. FIDDLER'S-SPURGE.)—Hammocks, wooded banks and rocky places, Coastal Plain, Fla. to Tex., Kans., Minn., and Ill.—(*W. I., Mex., C. A., S. A.*)

5. *P. cyathophora* (Murr.) Small. Annual, stem 1.5 m. tall or less, pubescent: leaf-blades elliptic or oval, varying to obovate or ovate, or narrower especially on the branches, 5-18 cm. long: involucre campanulate, 3.5-4 mm. long: capsule 4-4.5 mm. long: seed 3-3.5 mm. long, tuberculate.—(PAINTED-LEAF.)—Hammocks, cult. grounds, waste-places, and roadsides, Fla.—(*W. I., Mex., C. A., S. A.*)—A form, apparently of one or the other of the two preceding species occurs, perhaps as an immigrant in the Central States up into Kans., Minn., and Ill.

29. **EUPHORBIA** L. Very succulent cactus-like shrubs or trees, with angled or ribbed spine-armed jointed stems and branches. Leaves small or

minute, often scale-like, fleshy, early deciduous, or obsolete. Involucres solitary or clustered, each with five mostly unappendaged glands. Capsule usually smooth.—About 30 species, of the Old World.

1. *E. lactea* Haw. Plants 1-5 m. tall, copiously branched, the branches 3-angled, the angles repand, with the faces whitish-marbled: spines stout-subulate, 3-7 mm. long, divergent; leaves between the spines; blades suborbicular to orbicular-reniform, 2-4 mm. wide, glabrous, nearly sessile.—(MOTTLED-SPRUGE.)—Hammocks and waste-places, Florida Keys. Nat. of E. I.—(*W. I., Mex.*)—Frequently planted for ornament and for hedges in tropical regions.

30. *TITHYMALUS* Mill. Shrubs with fleshy branches. Leaves succulent: blades flat, entire or undulate-crisped. Involucres borne in dichotomous, often contracted cymes, oblique and strongly 2-lipped, the lower lip much larger than the upper. Capsule 3-lobed, the carpels often keeled or horned.—About 30 species, tropical American. [*Pedilanthus* Neck.]

1. *T. Smallii* (Millsp.) Small. Plant 3-16 dm. tall or more, the stem and branches sometimes zigzag; leaves spreading; blades ovate to ovate-lanceolate, 4-11 cm. long: involucres 12-14 mm. long, mainly red, the two terminal lobes broadly ovate, ciliolate: stamens and style exserted: capsule 6-7 mm. long; seed 3-3.5 mm. long. [*P. tithymaloides* (Fl. SE. U. S.) *P. Smallii* Millsp.]—(JEW-BUSH. RED-BIRD FLOWER.)—Hammocks and pinelands, Everglade Keys, pen. Fla. and Florida Keys. Nat. of trop. Am., and cult.—All year.—Used medicinally.

## FAMILY 2. CALLITRICHACEAE — WATER-STARWORT FAMILY

Herbs, often aquatics, with tender tissues. Leaves opposite: blades entire, or 3-nerved. Flowers polygamous, minute, axillary, often minutely bracted. Calyx wanting. Corolla wanting. Androeceium of a single stamen. Gynoeceium of 4 united carpels. Ovary 4-celled. Fruit coriaceous, indehiscent, 4-lobed.—One genus.

1. *CALLITRICHE* L. Aquatic or more or less amphibious plants, the opposite leaves often approximate or congested at the ends of the stem and branches. Flowers inconspicuous, green.—About 20 species, of wide geographic distribution.—WATER-STARWORTS.

Carpels permanently united: leaf-blades in terrestrial plants, or of floating leaves in aquatics, obovate to spatulate and 3-veined. I. VERNAE.  
Carpels, in fruit, separate nearly to the axis: leaf-blades uniformly linear and 1-veined. II. AUTUMNALES.

## I. VERNAE

Fruit manifestly pedicelled: leaves uniform.

Fruit about 0.8 mm. long: styles persistent.

Fruit about 0.7 mm. long: styles deciduous.

Fruit essentially sessile.

Styles much shorter than the fruit.

Styles fully as long as the fruit.

Aquatic: fruit 1 mm. broad.

Terrestrial: fruit 0.5 mm. broad.

1. *C. terrestris*.

2. *C. Nuttallii*.

3. *C. palustris*.

4. *C. heterophylla*.

5. *C. peploides*.

## II. AUTUMNALES

Submerged perennial, with leaf-blades notched at the apex.

6. *C. autumnalis*.

1. *C. terrestris* Raf. Terrestrial, fragrant in drying, the foliage scaleless: leaf-blades spatulate, 2-3 mm. long: fruit broader than long. [*C. Austini* Engelm.]—Damp shaded soil, various provinces, rarely Coastal Plain, Ala. to Tex., Mo., Conn., and Va.—(*Mex.*)—Sum.—fall.

2. *C. Nuttallii* Torr. Terrestrial, the foliage scaleless: leaf-blades spatulate to elliptic, 2-4 mm. long: pedicels without scales: fruit broader than long.—Moist soil, Coastal Plain and occasionally adj. provinces, Ala. to La. and Ky.—Spr.—sum.

3. *C. palustris* L. Aquatic, the foliage scaly: blades of the submerged leaves linear, those of the emerged ones spatulate, shorter than the submersed ones: flower-stalks with 2 scales: fruit obovoid, about 1.5 mm. long. [*C. verna* L.]—(WATER-CHICKWEED.)—

Ponds and streams, various provinces, U. S. and Can.—(*S. A., O. W.*)—Spr.—sum.

4. *C. heterophylla* Pursh. Aquatic or rarely uliginous; blades of the submersed leaves filiform or linear, those of the emerged ones spatulate: fruit decidedly pedicelled.—Slow-flowing streams, pools, and ditches, various provinces, Fla. to La., Colo., Man., and Newf.—Sum.

5. *C. peploides* Nutt. Terrestrial, the plant matted: leaf-blades uniform, obovate, oblanceolate, or elliptic: fruit sessile or nearly so.—Moist soil, various provinces, Fla. to Tex. and Ark.—Spr.—sum.

6. *C. autumnalis* L. Aquatic with stems 6-17 cm. long: leaf-blades narrowly linear, 5-12 mm. long: fruit orbicular-reniform, scarcely 2 mm. wide, 2-lobed, sessile.—Ponds, lakes, and streams, various provinces, La. to Colo., Ore., Man., and Que.—(*Eu.*)—Sum.—fall.

## ORDER SAPINDALES — SAPINDAL ORDER

Shrubs or trees. Leaves various: blades simple and entire or toothed, or compound. Calyx of distinct sepals. Corolla of distinct petals, regular or rarely irregular, or wanting. Androecium of as many stamens as there are petals, or of twice as many, or rarely of more or fewer. Filaments distinct. Gynoecium of a single carpel, or of several united carpels. Ovary superior. Ovules 1 or 2, or several, in each cavity of the ovary, pendulous, with the raphe away from the axis of the ovary, or erect or ascending. Fruit various.—Exceptions to the woody plants are *Pachysandra* and *Cardiospermum*.

Corolla wanting: stamens 4 (in our genus): styles wanting.

Fam. 1. BUXACEAE.

Corolla present or if wanting (*Dodonaeaceae*) stamens 6: styles present, distinct or united, rarely single.

Stigmas tufted or many-cleft.

Fam. 2. EMPETRACEAE.

Stigmas entire.

Plant with resin-bearing tissues.

Fam. 3. SPONDIACEAE.

Plant not resin-bearing.

Leaf-blades simple, pinnately veined.

Each cavity of the ovary with a single ovule.

Flowers in racemes: fruit a dry terete or a winged, coriaceous drupe.

Fam. 4. CYRILLACEAE.

Flowers not racemose: fruit a fleshy drupe.

Fam. 5. AQUIFOLIACEAE.

Each cavity of the ovary with 2 or more ovules.

Disk present: corolla present.

Anthers introrse: seed often arilled.

Fam. 6. CELASTRACEAE.

Anthers extrorse: seed not arilled.

Fam. 7. HIPPOCRATEACEAE.

Disk obsolete: corolla wanting.

Fam. 8. DODONAEACEAE.

Leaf-blades simple and palmately veined or compound.

Leaves opposite.

Fruit capsular.

Flowers regular: fruit a membranous, bladderly 3-lobed capsule: leaf-blades pinnately compound.

Fam. 9. STAPHYLEACEAE.

Flowers irregular: fruit a leathery globular capsule: leaf-blades digitately compound.

Fam. 10. AESCULACEAE.

Fruit a samara.

Fam. 11. ACERACEAE.

Leaves alternate, in our species.

Fam. 12. SAPINDACEAE.

## FAMILY 1. BUXACEAE — BOX FAMILY

Shrubs, trees, or perennial herbs. Leaves alternate or opposite, often persistent: blades simple. Flowers monoecious or dioecious. Calyx of several sepals or wanting. Corolla wanting. Androeceium of 4-7 stamens. Gynoeceium of 2-4 united carpels. Fruit a capsule or a drupe.—About 6 genera and 35 species, widely distributed.

1. **PACHYSANDRA** Michx. Herbs with leaves and flowers on separate branches. Leaves alternate, approximate. Flowers brownish, monoecious, spike. Staminate flowers with 4 sepals and 4 stamens. Pistillate flowers with 4 or more sepals and a 3-celled ovary. Capsule 3-celled, 3-lobed. Seeds 2 in each cavity. Several species, mostly Asiatic.

1. **P. procumbens** Michx. Stem 1-3 dm. long: leaves evergreen; blades thickish, 3-12 cm. long, obovate, oval, or ovate, sometimes coarsely toothed: spikes 3-10 cm. long: flowers musk-scented, the pistillate few at the base of the spike: outer sepals ovate or elliptic, the inner broader, 4-6 mm. long: capsule subglobose, about 1 cm. in diameter, each carpel with a long curved beak.—(ALLEGHENY-MOUNTAIN SPURGE.)—Rich woods, often in calcareous soils, various provinces, W. Fla. to La., Ky., and W. Va.—Spr.

## FAMILY 2. EMPETRACEAE — CROW-BERRY FAMILY

Shrubs, mostly resembling heaths. Leaves alternate or whorled, sometimes numerous and crowded. Flowers dioecious or rarely polygamous. Calyx of 2 or 3 sepals. Corolla of 2 or 3 petals, or wanting. Androeium of 2-4, mostly 3 stamens. Gynoeium of 2-several united carpels.—Three genera and few species, but widely distributed.

1. **CERATIOLA** Michx. Evergreen shrubs. Leaf-blades narrow, revolute and thus almost tubular. Flowers 2 or 3 in an axil. Sepals 2. Petals 2. Stamens 2. Ovary 2-celled. Drupe with 2 nutlets.—One species.

1. **C. ericoides** Michx. Shrub 3-15 dm. tall: leaves crowded and spreading, 8-12 mm. long: flowers red or yellowish: sepals about 1 mm. long: stamens exserted: drupe subglobose, 2-3 mm. in diameter, yellow or red.—(ROSEMARY.)—Dry pinelands, sandhills, and scrub, often in very acid soil, Coastal Plain, Fla. to Miss., and S. C.—Spr.-sum. or all year.—A peculiar shrub of somewhat uncertain relationship, but associated with the crowberries of northern North America. It resembles the heaths in habit and in the peculiarly pleasant aroma it gives off. It has two deadly enemies. Throughout its range fire has destroyed vast areas of it, while in lower peninsular Florida the parasitic woevine (*Cassytha*) is equally as destructive.—Specimens of this species collected at Palma Sola, Florida, have been described as *C. falcutia* Gandoger.

## FAMILY 3. SPONDIACEAE — SUMAC FAMILY

Shrubs, trees, or vines, with a milky, resinous, often acid or caustic sap. Leaves alternate: blades simple or pinnately compound. Flowers monoecious, dioecious, or polygamous. Calyx of 3-6 sepals. Corolla of 3-5 petals, larger than the calyx. Androeium of 3-6, or rarely more, stamens. Gynoeium of 1, or 3-5 more or less united carpels. Fruit a drupe or a berry.—Sixty genera and 500 species, mostly tropical.

Gynoeium 1-carpellary: style single: ovary on a swollen receptacle: leaves with simple blades.

## I. MANGIFEREAE.

Gynoeium 3-carpellary: styles or stigmas 3: ovary not on a swollen receptacle: leaves with simple or compound blades.

## II. RHOEDEAE.

## I. MANGIFEREAE

Trees with narrow leaf-blades and paniced flowers.

## 1. MANGIFERA.

## II. RHOEDEAE

Ovary, and drupe, very oblique: style laterally oblique: leaves with broad simple blades.

## 2. COTINUS.

Ovary, and drupe, not oblique: style terminal: leaves with compound blades.

## 3. METOPIUM.

Drupe somewhat elongate, the coats permanently united.

Drupe depressed, the coats ultimately separating.

## 4. TOXICODENDRON.

Drupe with a glabrous or sparingly pubescent outer coat: stone ribbed.

Drupe with a copiously pubescent outer coat: stone smooth.

## 5. RHUS.

Flowers polygamous, in terminal thyrsoid panicles appearing after the leaves.

Flowers polygamo-dioecious, in solitary or clustered spikes in the axils, before the leaves.

## 6. SCHMALTZIA.

1. **MANGIFERA** L. Trees. Leaf-blades simple, relatively narrow. Flowers polygamo-dioecious, in stiff panicles, the branches not plumose. Sepals 4 or 5. Petals 4 or 5. Ovary oblique: style 1, lateral. Drupe ovoid to somewhat reniform, smooth: stone tenaciously fibrous-coated.—About 14 species, Asiatic.

1. *M. indica* L. Leaf-blades leathery, elliptic to linear-elliptic or linear-lanceolate, mostly 1–3.5 dm. long, reticulate: panicles 1–4 dm. long: flowers greenish, yellowish, or red: sepals ovate: petals elliptic or obovate, 3.5–4 mm. long: drupe 5–10 cm. long, aromatic. — (MANGO.) — Hammocks and fields, S. pen. Fla. and the Keys. Nat. of the E. I., and cult.—Spr.—Grown in many varieties for its esculent fruit.

2. **COTINUS** Adans. Shrubs or trees. Leaf-blades simple, relatively broad. Flowers mostly polygamous or dioecious, in loose panicles which often have plumose branches. Sepals 5. Petals 5. Ovary oblique: styles 3, eccentric. Drupe obliquely reniform, veiny: stone glabrous.—Two species, the following and one Eurasian.

1. *C. americanus* Nutt. Shrub, or tree becoming 12 m. tall: leaf-blades membranous, obovate or oval, 4–15 cm. long: panicles 1–3 dm. long, the branches glandular-villous: sepals ovate: petals elliptic-ovate, green: drupe 5 mm. long. [*C. cotinoides* (Nutt.) Britton.]—(SMOKE-TREE.)—Rocky limestone hills, Interior Plateau provinces, Ala. to Ark. (or Tex?), Mo., and Tenn.—Spr.—The sapwood is whitish; the orange heartwood is coarse-grained, light and soft, but durable in contact with the soil as fence-posts. It yields a yellow dye.

3. **METOPIUM** P. Br. Shrubs or trees. Leaf-blades pinnate. Flowers dioecious, in open panicles. Sepals 5. Petals 5. Ovary equilateral. Styles united: stigma 3-lobed. Drupe not oblique.—Three species, West Indian.

1. *M. toxiferum* (L.) Krug & Urban. Shrub, or tree becoming 14 m. tall, with a very poisonous sap: leaflets 3–7; blades leathery, ovate, 3–9 cm. long: panicles 1–2 dm. long: sepals reniform or suborbicular: petals elliptic to ovate or oval yellow-green and often dark-lined within: drupe 10–15 mm. long.—(POISONWOOD. DOCTOR-GUM. CORAL-SUMAC.)—Hammocks, pinelands, and coastal sand-dunes, S. pen. Fla. and the Keys.—(W. I.)—Spr. or all year.—The sap is a powerful skin-poison. The sap-wood is yellow or light-brown; the dark-brown and

red-streaked heart-wood is heavy and hard, but not strong. A large tree in hammocks, a shrub, often with diffuse or depressed stems in pinelands.

4. **TOXICODENDRON** [Tourn.] Mill. Shrubs, trees, or woody vines, with poisonous sap. Leaf-blades pinnately compound. Flowers polygamous or dioecious, in rather dense panicles, white or greenish. Sepals 4-6. Petals 4-6. Ovary glabrous. Styles short. Drupe mostly glabrous, the sarcocarp wax-secreting. Seed ribbed.—About 20 species, North American and Asiatic.—Spr.—sum.—The sap is a powerful skin poison. Some of the species are used medicinally.

Leaf-blades 3-foliolate: vines or low shrubs: panicles of fruits spreading.

Stems climbing or erect especially when young: blades of the leaflets coarsely toothed or entire, thin.

Stems erect: blades of the leaflets lobed, thickish.

Leaf-blades 7-11-foliolate: tall shrub or tree: panicles of fruits drooping.

1. *T. radicans*.

2. *T. Toxicodendron*.

3. *T. Vernix*.

1. **T. radicans** (L.) Kuntze. Stem climbing by aerial roots: blades of the leaflets membranous, ovate to ovate-lanceolate, 3-20 cm. long: sepals ovate, 1-2 mm. long: petals elliptic to elliptic-ovate, 3-4 mm. long: drupe 3-6 mm. in diameter. [*Rhus radicans* L.]—(POISON-IVY. POISON-OAK.)—Woods, hammocks, thickets, fence rows, and swamps, various provinces, Fla. to Miss., Nebr., Minn., and N. S.—(W. I.)

2. **T. Toxicodendron** (L.) Britton. Shrub, with densely pubescent twigs: blades of the leaflets ovate in outline or rarely obovate, 4-12 cm. long, coarsely crenate-lobed: panicles densely flowered: petals elliptic-lanceolate, about 2.5 mm. long: drupe depressed-globose. [*Rhus Toxicodendron* L.]—(POISON-OAK.)—Dry woods and pinelands, Coastal Plain and rarely adj. provinces, Fla. to Tex., Tenn., and N. J. The stems are simple or little branched. The leaflet-blades are much firmer in texture than in *R. radicans*, and strongly pubescent beneath.

3. **T. Vernix** (L.) Kuntze. Shrub or small tree: blades of the lateral leaflets elliptic, or oval, 4-15 cm. long, undulate: petals linear-elliptic, about 2 mm. long: drupes subglobose, about 5 mm. broad, in drooping panicles. [*Rhus Vernix* L. *Rhus venenata* DC.]—(POISON-SUMAC. THUNDERWOOD. POISON-ELDER. POISON-DOGWOOD. SWAMP-SUMAC.)—Non-alluvial swamps and wet woods, various provinces, Fla. to La., Minn., and Me.—The heart-wood, coarse-grained, light and soft, is brown streaked with yellow.

5. **RHUS** L. Shrubs or trees, not poisonous. Leaf-blades pinnately compound, several-foliolate. Flowers polygamous or dioecious, borne in terminal usually compact panicles, white or greenish-white. Sepals commonly 5. Petals commonly 5. Ovary pubescent. Style short. Drupe pubescent. Seed smooth and even.—About 125 species, natives of temperate and warm regions.—Spr.—SUMACS. The bark and leaves are sometimes used for tanning.

Rachis of the leaf wingless, terete or nearly so: fruiting panicles erect.

Rachis of the leaf winged: fruiting panicles nodding.

I. HIRTAE.

II. LEUCANTHAE.

## I. HIRTAE

Foliage more or less glaucous or pale.

Twigs, panicles, and drupes usually pubescent with soft very short hairs.

Leaflets with acuminate, sharply serrate blades.

Leaflets with crenate-serrate blades, rounded at the apex.

Twigs, panicles, and drupes bristly pubescent with long spreading hairs.

Foliage densely pubescent with brownish hairs, not glaucous.

1. *R. glabra*.

2. *R. Ashei*.

3. *R. hirta*.

4. *R. Michauxii*.

## II. LEUCANTHAE

Bark of the trunk gray, dull: petals about 2.5 mm. long: anthers broadly ellipsoid, scarcely 1 mm. long.

Blades of the leaflets acuminate, and usually acute: leaf-rachis broadly winged.

Blades of the leaflets obtuse: leaf-rachis narrowly winged.

Bark of the trunk red, shining: petals about 3 mm. long: anthers linear-ellipsoid, fully 1 mm. long.

5. *R. Copallinum*.

6. *R. obtusifolia*.

7. *R. leucantha*.

1. *R. glabra* L. Shrub or tree becoming 6 m. tall, leaflets 11-31; blades elliptic or lanceolate (that of the terminal one often ovate), 3-8 cm. long: petals about 2 mm. long: drupe velvety, the stone 3-3.5 mm. long.—(SMOOTH-SUMAC. SCARLET-SUMAC. RED-SUMAC.)—Dry rich soil and thickets, various provinces, N. Fla. to La., Minn., and N. S.—Spr.-sum.—The orange-colored and green-streaked heart-wood is coarse-grained, soft, and brittle. The fruiting panicles are erect.

2. *R. Ashei* Small. Shrub with glaucous stems: leaflets 13-17; blades elliptic to oval-elliptic, 3-9 cm. long: stone of the drupe about 3 mm. long. [*Rhus caroliniana* Ashe. Not Mill.]—Sandy soil, Piedmont, N. C.—Spr.

3. *R. hirta* (L.) Sudw. Shrub, or tree becoming 12 m. tall, with pubescent foliage: leaflets 11-31; blades elliptic to lanceolate, or that of the terminal one ovate-lanceolate, 4-15 cm. long: petals about 3 mm. long: drupe bristly, the stone 3-3.5 mm. long. [*Rhus typhina* L.]—(STAGHORN-SUMAC. HAIRY-SUMAC. VELVET-SUMAC.)—Roadsides and hillside-thickets, various provinces, Ga. to La., S. D., Minn., and N. B.—Spr.-sum.—The fruits of this and of related species are used to make an acid drink, similar to lemonade.

4. *R. Michauxii* Sarg. Shrub with densely pubescent stems: leaflets 9-15; blades elliptic, oval, or elliptic-ovate (that of the terminal one often ovate), 5-10 cm. long: stone of the drupe about 3.5 mm. long. [*Rhus pumila* Michx. Not Meerb.]—(FALSE POISON-SUMAC.)—Sandy soil, Piedmont, Ga. to N. C.—Spr.

5. *R. Copallinum* L. Shrub, or tree becoming 10 m. tall and 2.5 dm. in diameter, the bark thick, scaly: leaflets 9-21; blades elliptic to elliptic-lanceolate or sometimes oval, 3-10 cm. long: stone of the drupe 2.5-3 mm. long.—(DWARF-SUMAC. MOUNTAIN-SUMAC. BLACK-SUMAC. SHINING-SUMAC. SMOOTH-SUMAC.)—Dry, often stony soil, and hillsides, various provinces, Fla. to Tex., Minn., and Me.—Sum.—The heart-wood, light-brown streaked with green, is coarse-grained, light and soft. The fruiting panicles are drooping.

6. *R. obtusifolia* Small. Shrub: leaflets 17-21; blades ovate to elliptic, 2-5 cm. long: petals about 2.5 mm. long: stone of the drupe 3.5-4 mm. long.—Pinelands, Fla.—Spr.—sum. or all year S.

7. *R. leucantha* Jacq. Shrub, or tree becoming 9 m. tall, the bark thin, soft, smooth, peeling: leaflets 15-33; blades narrowly elliptic to linear-lanceolate, 3-9 cm. long: stone of the drupe about 3 mm. long.—(SOUTHERN-SUMAC.)—Hammocks, Everglade Keys, Fla.—(W. I.)—All year.

6. **SCHMALTZIA** Desv. Shrubs or trees, aromatic, not poisonous. Leaf-blades pinnately compound, usually 3-foliolate. Flowers polygamous or dioecious, in ament-like racemes or panicles before the leaves, yellowish-green. Sepals commonly 5. Petals commonly 5. Ovary pubescent: styles short. Drupe pubescent with crimson hairs, the sarcocarp not wax-secreting. Seed smooth and even.—About 8 species, North American.—SWEET-SUMACS.—The bark of some species is used medicinally.

1. *S. crenata* (Mill.) Greene. Shrub with diffuse stems, 1-2.5 m. tall: leaflets 3; blade of the terminal one mostly ovate or obovate: flowers yellow: drupe 7-8 mm. in diameter.

[*S. aromatica* (Ait.) Desv.]—(FRAGRANT-SUMAC. SWEET-SCENTED SUMAC.)—Dry woods, often in calcareous soils, various provinces, Fla. to La., Minn., and Ind.—Spr.—The genus *Schmaltzia* has been interpreted as made up of many species. All, except the present species have geographic ranges northward and westward of our range.

#### FAMILY 4. CYRILLACEAE — TITI FAMILY

Shrubs or trees. Leaves alternate, mostly evergreen: blades entire. Flowers perfect, borne in lateral or terminal narrow racemes or raceme-like panicles. Calyx of 4 or 5 persistent sepals. Corolla of 5 or 8 petals, white. Androecium of 5 or 10 stamens. Gynoecium of 2-5 united carpels: styles united: stigmas 2-5. Fruit a dry terete or winged nut-like drupe.—Three genera and about 12 species, American.

Panicles lateral: sepals equal: petals acute, narrowed upward: stamens 5: ovary 2-celled: fruit terete, not winged.

1. CYRILLA.

Panicles terminal: sepals unequal: petals obtuse, broadened upward: stamens 10: ovary 3- or 4-celled: fruit winged.

2. CLIFTONIA.

1. **CYRILLA** Garden. Shrubs or small trees, with pale close bark. Leaves with veiny blades at maturity. Panicles raceme-like, narrow, clustered, spreading in anthesis. Sepals acute or acuminate. Petals narrowed upward, clawless, about twice as long as the sepals. Stamens equal: filaments flattened. Style short. Fruit an almost terete spongy drupe, spreading.—Four or five species, the following and the others tropical American.—IRONWOODS. TITIS. RED-TITIS. WHITE-TITIS.

Leaves mostly 5-10 cm. long; blades thick-membranous: petals 3 mm. long or more: drupe conic-ovoid or ovoid.

1. *C. racemiflora*.

Leaves mostly 1-4 cm. long; blades coriaceous: petals less than 3 mm. long: drupe globose-ovoid or subglobose.

2. *C. parvifolia*.

Sepals ovate: anthers apiculate.

3. *C. arida*.

Sepals lanceolate: anthers notched.

1. *C. racemiflora* L. Much branched glabrous shrub or small tree reaching a height of 10 m. and a maximum trunk diameter of 3 dm., semi-evergreen, the trunk clothed with a close pale or whitish bark: leaf-blades thick-membranous, oblanceolate, obovate, or nearly elliptic, 5–10 cm. long, obtuse, acute or acuminate, more or less strongly reticulate, lustrous above, dull and paler beneath: racemes slender, 8–15 cm. long: pedicels ascending or finally spreading: sepals ovate or ovate-lanceolate, 1 mm. long, acute: corolla white, 4–5 mm. broad: petals lanceolate or oblong-lanceolate, 3 mm. long or more, acute: drupe conic-ovoid or ovoid, 2.5–3 mm. long, obtuse, minutely granular: seeds narrowly ovoid.—(LEATHERWOOD. HE-HUCKLEBERRY. BLACK-TITI. MYRTLE.)—Swamps and stream-banks, Coastal Plain, and rarely adj. provinces, Fla. to Tex., Mo., and S. Va.—Spr.—The brown and red-tinged heart-wood is close-grained, heavy, and hard. The flowers are an important source of honey.

2. *C. parvifolia* Raf. Glabrous evergreen compact, rigid, and much branched shrub 1–5 m. tall, evergreen: leaf-blades thin-coriaceous, oblanceolate or linear-oblanceolate, 1–4 cm. long, acute or apiculate, lustrous above, paler beneath, more or less reticulate: racemes slender, 3–8 cm. long: pedicels 1–2 mm. long, commonly surpassing the subulate bracts: sepals ovate, 1 mm. long, acute: corolla white, 3–4 mm. broad: petals broadly elliptic-lanceolate, 1.5–2 mm. long, more than twice as long as the sepals, obtuse, thickened at the base and above the midrib: stamens included: drupe subglobose or globose-ovoid, 1.5–2 mm. long, slightly granular.—Swamps and bays, Coastal Plain, N Fla. to La.—Sum.

3. *C. arida* Small. Small tree, perhaps also a shrub, usually with vine-like branches: leaves evergreen, approximate near the ends of the branches; blades elliptic-spatulate, elliptic-oblanceolate, or narrowly elliptic, 1–3 cm. long, thick-coriaceous: panicles mostly 2–6 cm. long: sepals acuminate: petals elliptic-lanceolate about twice as long as the sepals, 2–2.5 mm. long: drupe globose-ovoid, often depressed, about 2 mm. long.—Scrub, inland sand-dunes, S lake region, Fla.—Sum.

2. **CLIFTONIA** Gaertn. Shrubs or small trees, with dark scaly bark. Leaves with smooth blades. Panicles raceme-like, stout, not clustered, erect in anthesis. Sepals very broad and rounded, often reniform. Petals broadened upwards, clawed, many times exceeding the sepals. Stamens unequal: filaments appendaged. Style wanting. Fruit a winged nut-like drupe, nodding.—One species.

1. *C. monophylla* (Lam.) Sarg. Shrub or tree becoming 8 m. tall: leaves evergreen; blades narrowly elliptic to elliptic-oblanceolate, oval, or obovate, 3–6 cm. long, pale or glaucous beneath: panicles 2–9 cm. long: flowers fragrant: sepals about 0.5 mm. long: petals spatulate, elliptic-obovate, or cuneate, 4–5 mm. long, or sometimes shorter: drupe ovoid to oval, 6–7 mm. long, the wings notched at both ends. [*C. ligustrina* Sims]—(TITI. BLACK-TITI. BUCK-

WHEAT-BRUSH. IRONWOOD.)—Non-alluvial swamps and bays, often in acid soil, Coastal Plain, N Fla. to La. and Ga.—Spr.—The brown and red-tinged heartwood is close-grained and heavy, but brittle. The flowers are an important source of honey.

## FAMILY 5. AQUIFOLIACEAE — HOLLY FAMILY

Shrubs or trees. Leaves alternate: blades simple. Flowers perfect or polygamous. Calyx of 4-6 persistent sepals. Corolla of 4-6 petals, often united at the base. Androeceum of 4-6 stamens. Gynoeceum of 4-8 united carpels. Fruit drupaceous.—Three genera and 300 species, in temperate and tropical regions.

1. **ILEX** L. Shrubs or trees. Leaves mostly persistent: blades entire or toothed. Flowers sometimes nearly dioecious. Sepals persistent. Corolla deciduous, white or greenish-white. Drupe with 4-8 nutlets.—About 280 species, mostly American.—**HOLLIES**.—The flowers of some species are an important source of honey. Some of the red-fruited species are used for decorations for winter festivals.

Fruit with smooth nutlets.

Subgenus I. PRINOS.

Fruit with ribbed or striate nutlets.

Nutlets many-striate on the back: leaves deciduous: blades thick-membranous or herbaceous.

Subgenus II. PRINOIDES.

Nutlet few-ribbed or 1-grooved on the back: leaves persistent, evergreen: blades coriaceous.

Subgenus III. AQUIFOLIUM.

### I. PRINOS

Drupe black, except in a red-fruited form of *I. glabra*: leaves persistent: blades leathery.

Leaves with blades of an obovate or spatulate type prevailing; petioles relatively short and stout.

Leaf-blades entire or distantly serrate above the middle, not spine-tipped: drupes mostly less than 6 mm. in diameter.

Leaf-blades spinescent-toothed above the middle or spine-tipped: drupes mostly over 6 mm. in diameter.

Leaves with blades of an ovate type prevailing; petioles relatively long and slender.

Drupe red, orange-red, or scarlet: leaves deciduous; blades herbaceous.

Staminate and pistillate flowers on pedicels of about equal length.

Staminate flowers on conspicuously slender and long pedicels: the pistillate shorter-pedicelled.

1. *I. glabra*.

2. *I. coriacea*.

3. *I. Krugiana*.

4. *I. verticillata*.

5. *I. laevigata*.

### II. PRINOIDES

Staminate flowers solitary or clustered, without a common peduncle.

Leaf-blades typically broadest above the middle.

Nutlets faintly ribbed and striate: leaf-blades glabrous or merely ciliate.

Leaf-blades 3-9 cm. long: drupe shorter than the pedicel.

Leaf-blade 1-2 cm. long: drupe longer than the pedicel.

Nutlets prominently ribbed and striate: leaf-blades pubescent beneath or usually so.

Pedicel much longer than the drupe: drupes solitary or 2 together.

Pedicel much shorter than the drupe: drupes more or less clustered.

Leaf-blades broadest at the middle or below it.

Leaf-blades glabrous or with few hairs about the nerves: calyx glabrous without.

Leaf-blades 2-7 cm. long, inconspicuously toothed: Carolinian.

6. *I. longipes*.

7. *I. Curtissii*.

8. *I. Cuthbertii*.

9. *I. decidua*.

Leaf-blades subcoriaceous: drupe 9–11 mm. in diameter.

Leaf-blades membranous: drupe 6–7 mm. in diameter.

Leaf-blades 6–20 cm. long, conspicuously toothed: Alleghenian.

Leaf-blades densely pubescent beneath: calyx pubescent.

Staminate flowers several on a common peduncle.

10. *I. Buswellii*.

11. *I. ambigua*.

12. *I. monticola*.

13. *I. Beadlei*.

14. *I. Amelanchier*.

### III. AQUIFOLIUM

Leaf-blades entire or with a few appressed teeth near the apex.

Leaf-blades linear or narrowly elliptic, or broader on shoots, 1–4 cm. long.

Leaf-blades elliptic, oblanceolate, or obovate, 4–10 cm. long.

Leaf-blades toothed or sinuate.

Teeth crenate.

Teeth spine-like, rarely only the terminal one present.

Leaf-blades cuneate or cuneate-obovate, with the teeth directed forward: nutlets oval, shallowly grooved and blunt-ridged.

Leaf-blades oval, elliptic, or elliptic-obovate, with the teeth spreading: nutlets deeply grooved and sharp-ridged.

15. *I. myrtifolia*.

16. *I. Cassine*.

17. *I. vomitoria*.

18. *I. cumulicola*.

19. *I. opaca*.

1. *I. glabra* (L.) A. Gray. Shrub 0.5–1.5 m. tall, with velvety-pubescent twigs: leaf-blades obovate, oblanceolate, elliptic, or oval, or rarely ovate, 1–5 cm. long, acute or obtuse, entire or distantly serrate above the middle, deep-green and lustrous above, short-petioled: staminate calyx fully 3 mm. wide: staminate corolla about 7 mm. wide: drupe 4–6 mm. in diameter, shorter than the stalks.—(INK-BERRY. EVERGREEN-WINTERBERRY. GALLBERRY.)—Low pinelands, swamps, and prairies, often in acid soil, Coastal Plain and rarely adj. provinces, Fla. to La. and N. S.—Spr.—early sum.—An interesting form, rather smaller throughout than typical *I. glabra* occurs in pen. Florida. The drupe is red and rather pointed.

2. *I. coriacea* (Pursh) Chapm. Shrub 1–3 m. tall, glabrous or nearly so: leaf-blades obovate, elliptic, elliptic-oblanceolate, or oval, 2–9 cm. long, acute or usually short-acuminate, entire or with appressed spinescent teeth above the middle, dark-green and lustrous above, short-petioled: staminate calyx 3.5–4 mm. wide: staminate corolla 5.5–7 mm. wide: drupe globose, 6–8 mm. in diameter, black, shining. [*I. luoida* (Ait.) T. & G.]—(LARGE-GALLBERRY.)—Non-alluvial swamps, Coastal Plain, Fla. to La. and S Va.—(Mex. (?))—Spr.

3. *I. Krugiana* Loesener. Shrub, or tree 11 m. tall, with glabrous twigs: leaf-blades elliptic or ovate, 4–7.5 cm. long, acuminate, mostly entire, deep-green and lustrous above, slender-petioled: staminate calyx about 3 mm. wide: staminate corolla 5–5.5 mm. wide: drupe 5.5–6.5 mm. in diameter, about as long as the stalk.—(KRUG'S-HOLLY.)—Hammocks, Everglade Keys, Fla.—(W. I.)—Wint.

4. *I. verticillata* (L.) Gray. Shrub, or small tree sometimes 7 m. tall, with glabrous or slightly pubescent twigs: leaf-blades thickish, elliptic or oval, varying to ovate or obovate, 2–8 cm. long, acute or acuminate at both ends, more or less pubescent beneath, often strongly reticulate, serrate: staminate calyx about 2.5 mm. wide: staminate corolla 6–7 mm. wide: drupe 6–8 mm. in diameter, red.—(BLACK-ALDER. WINTERBERRY. FEVER-BUSH.)—Swamps and low woods, various provinces, Fla. to La., Mo., Ont., and N. S.—Sum.

5. *I. laevigata* (Pursh) A. Gray. Shrub, or small tree rarely 6 m. tall, with glabrous twigs: leaf-blades thinnish, elliptic or oval, or sometimes lanceolate or oblanceolate, 3-9 cm. long, acute or mostly acuminate, appressed-serrate, glabrous on both surfaces or sometimes sparingly pubescent on the veins beneath: staminate calyx 3.5-4 mm. wide: staminate corolla 6-7.5 mm. wide: drupe 8-18 mm. in diameter, orange-red.—(SMOOTH-WINTERBERRY. HOOPWOOD.)—Swamps and wet woods, often in acid soil, various provinces, in Coastal Plain only N, Ga. to Pa., N. H., and Me.—Spr.—early sum.
6. *I. longipes* Chapm. Shrub or tree 7 m. tall, with widely spreading branches and glabrous twigs: leaf-blades rather coriaceous, nearly elliptic or oval but broadest slightly above the middle, often abruptly short-acuminate, obtuse or acute, dark-green above, glabrous or nearly so beneath at maturity, crenate-serrate, the teeth often tipped with appressed spine-like bristles: staminate calyx about 2.5 mm. wide: staminate corolla 6-7 mm. wide: drupe globose, red, 7-10 mm. in diameter.—Rocky banks, various provinces, Fla. to La., Tenn., and N. C.—Spr.
7. *I. Curtissii* (Fernald) Small. Shrub or small tree with spreading branches and glabrous twigs: leaf-blades thin-coriaceous spatulate to elliptic-spatulate, acute or obtuse, glabrous, obscurely crenate, short-petioled: flowers not seen: drupe globose, red, 4-5 mm. in diameter. [*I. decidua Curtissii* Fernald]—Hammocks, along rivers, Fla.—Spr.
8. *I. Cuthbertii* Small. Shrub or small tree with sometimes densely pubescent twigs: leaf-blades thickish, mainly obovate to nearly elliptic, obtuse, shallowly and usually inconspicuously toothed, permanently more or less pubescent on both sides, but especially so beneath: flowers not seen: drupe subglobose, 8-10 mm. in diameter.—Woods, Coastal Plain, Fla., and Ga.—Spr.
9. *I. decidua* Walt. Shrub, or small tree 10 m. tall, the twigs glabrous or nearly so: leaf-blades thickish, spatulate, oblanceolate, or nearly elliptic, 2-6 cm. long, obtuse or retuse at the apex, crenate-serrate, dark-green and glabrous above, paler and usually pubescent beneath: staminate calyx 2.5-3 mm. wide: staminate corolla 4.5-6 mm. wide: drupe globose, 7-9 mm. in diameter, orange or nearly scarlet.—(DECIDUOUS-HOLLY. BEAR-BERRY. POSSUM-HAW. WELK-HOLLY.)—Alluvial swamps, various provinces, Fla. to Tex., Kans., and Md.—Spr.—The creamy-white heart-wood is close-grained, heavy, and hard.
10. *I. Buswellii* Small. Shrub up to 3 m. tall, with numerous branches, the dark-purple twigs glabrous: leaf-blades elliptic, oval, or ovate, 2-3 cm. long, serrulate above the middle: drupe globose, 9-11 mm. in diameter, red shining—Hammocks, along the Caloosahatchee, Fla.—Wint.—spr.
11. *I. ambigua* (Michx.) Chapm. Shrub or small tree rarely up to 6 m. tall, the purple twigs glabrous: leaf-blades elliptic, oval, or suborbicular, 4-7 cm. long, serrulate or crenate-serrulate, at least above the middle: drupe globose-oval, 6-7 mm. in diameter, red. [*I. caroliniana* (Walt.) Trelease, not Mill.]—Hammocks, scrub, and sandhills, Coastal Plain and rarely adj. provinces, Fla. to Tex., Ark., (Mo. ?) and N. C.—Spr.
12. *I. monticola* A. Gray. Shrub, or tree 12 m. tall, with glabrous twigs (or with pubescent twigs and leaves in *I. monticola mollis*): leaf-blades thinnish, elliptic to oval, varying to broadest above or below the middle, 6-20 cm. long, acuminate, serrate, deep-green above, paler beneath, glabrous except on the nerves: staminate calyx 3-4 mm. wide: staminate corolla 4-5 mm. wide: drupe globose, about 1 cm. in diameter, bright-scarlet.—(MOUNTAIN-HOLLY. MOUNTAIN-WINTERBERRY. HULVER.)—Woods, especially mountain slopes, Blue Ridge and more northern provinces, Ga. and Ala. to N. Y.—Spr.—The creamy-white heart-wood is close-grained, heavy, and hard.

13. **I. Beadlei** Ashe. Shrub or small tree, with pubescent twigs: leaf-blades elliptic, oval, or suborbicular, sometimes varying to slightly broader below the middle, 3-8 cm. long, acute or short acuminate, serrate, densely pubescent beneath and finely pubescent above: staminate calyx 2-2.5 mm. wide: staminate corolla 5-6 mm. wide: drupe oblong-globose, 8-10 mm. long.—Rocky woods, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., and N. C.—Spr.
14. **I. Amelanchier** M. A. Curtis. Shrubs with more or less persistently soft-pubescent foliage: leaf-blades leathery, elliptic, or elliptic-lanceolate, 4-8 cm. long, acute or short-acuminate, inconspicuously serrate, glabrous, dull and finely reticulate above, thinly tomentose beneath, acute or rounded at the base, 6-10 mm. long, pubescent: flowers not seen: drupe globose, 7-10 mm. in diameter, dull-red.—Sandy swamps, Coastal Plain, S. C.—Spr.
15. **I. myrtifolia** Walt. Shrub or small crooked tree, with smooth gray bark, and rigid branches: leaf-blades evergreen, leathery, narrowly elliptic or linear, broader on shoots, 1-4 cm. long, apiculate, more or less revolute, dark-green and glabrous above, pale and usually glabrous beneath, short-petioled: calyx 1-1.5 mm. broad: corolla 4-5 mm. broad: drupe globose, about 6 mm. in diameter, red.—(YAUPON.)—Swamps and cypress ponds, Coastal Plain, Fla. to La. and N. C.—Spr.—A yellow fruited form is known.
16. **I. Cassine** L. Shrub, or small tree 12 m. tall, with smooth gray bark, usually pubescent twigs: leaf-blades leathery, oblanceolate or elliptic, or rarely obovate, 4-10 cm. long, obtuse, acute, or rarely retuse at the apex, more or less revolute, dark-green and glabrous above, pale and more or less pubescent beneath, or sometimes glabrous, rather slender-petioled: calyx 1.5-2 mm. broad: corolla 4-4.5 mm. broad: drupe globose, 6-8 mm. in diameter, red or sometimes nearly yellow. [*I. Dahoon* Walt.]—(DAHOON. YAUPON. CASSENA. HENDERSON-WOOD.)—Swamps, stream-banks, and hammocks, often in acid soils, Coastal Plain, Fla. to La. and S. Va.—Spr. or all year S.—The pale-brown heart-wood is close-grained but light and soft.
17. **I. vomitoria** Ait. Shrub, or small tree 8 m. tall: leaf-blades leathery, oval or elliptic, sometimes elliptic-lanceolate on shoots, 1-2.5 cm. long, obtuse, crenate-serrate, deep-green and lustrous above, pale-green beneath: calyx 2 mm. broad: corolla 5-5.5 mm. broad: drupe globose, red, 5-6 mm. in diameter, longer than the pedicel. [*I. Cassine* Walt.]—(CASSENA. YAUPON.)—Sandy hammocks, sand-dunes, and sandhills, often in neutral soil, Coastal Plain and rarely adj. provinces, Fla. to Tex., Ark., and Va.—Spr.—The leaves contain caffeine. A decoction made from them was a ceremonial drink of the aborigines. The white heart-wood, turning yellow on exposure, is close-grained, heavy, and hard.
18. **I. cumulicola** Small. Shrub or small tree with fastigate branches and pale-gray or whitish bark: leaf-blades 2.5-4.5 cm. long, more or less revolute, shallowly sinuate: sepals of the pistillate flowers acute or rather obtuse, ciliate, sometimes obscurely ciliolate: drupe globose, 7-8 mm. in diameter, deep-red: nutlets 5-6 mm. long. [*I. arenicola* Ashe]—Scrub, lake region, pen. Fla.—Spr.—Used locally for holiday decorations.—Additional species and varieties, apparently conspecific with this plant, have been described.
19. **I. opaca** Ait. Tree up to 15 m. tall, with spreading branches and pale-gray bark: leaf-blades 4-10 cm. long, flat or nearly so, rather deeply sinuate: sepals of the pistillate flowers acuminate, ciliate: drupe globose to ovoid-globose, 8-10 mm. in diameter, bright-red, or yellow, nutlets 6-7 mm. long.—(HOLLY. AMERICAN-HOLLY. WHITE-HOLLY.)—Woods, ravines, hammocks, bluffs, and river-banks, often in sub-acid soil, various provinces, Fla. to Tex., Mo., W. Va., and Mass., (Me.?).—Spr.—Collected in large quantities in winter.

FAMILY 6. CELASTRACEAE — STAFFTREE FAMILY

Shrubs or trees, or vines. Leaves alternate, opposite, or whorled: blades simple. Flowers perfect, polygamous, or dioecious, variously borne. Calyx of 3-5 sepals. Corolla of 3-5 petals. Androecium of 3-5 stamens borne on or under the disk. Gynoecium of 3-6 united carpels. Fruit a capsule, a drupe, or a berry. Seed often arillate.—About 45 genera and 375 species, widely distributed in temperate and warmer regions.

Fruits capsular, dehiscent.  
Fruits drupaceous, indehiscent.

I. CELASTREAE.  
II. RHACOMEAE.

I. CELASTREAE

Leaves opposite.

Ovary 3-celled: capsule 3-5-lobed: 3-5-valved: aril red:  
anther-sacs divergent.

Ovary 2-celled: capsule not lobed, 2-valved: aril white:  
anther-sacs parallel.

Leaves alternate.

Climbing woody vines: ovary free.

Erect shrubs: ovary confluent with the disk.

1. EUONYMUS.
2. PACHYSTIMA.
3. CELASTRUS.
4. MAYTENUS.
5. RHACOMA.
6. GYMINDA.
7. SCHAEFFERIA.

II. RHACOMEAE

Flowers perfect: ovary 4-celled: fruit oblique.

Flowers dioecious: ovary 2-celled: fruit not oblique.

Leaves opposite: flower-clusters peduncled: calyx deciduous:  
drupe not lobed.

Leaves alternate: flower-clusters sessile: calyx persistent:  
drupe lobed.

1. **EUONYMUS** [Tourn.] L. Shrubs, often weak-stemmed, trees, or rarely vines. Leaves opposite: blades entire or toothed. Flowers perfect. Sepals 4 or 5. Petals 4 or 5. Stamens 4 or 5, borne on the lobes of the disk: filaments very short: anther-sacs diverging. Stigmas 3-5. Capsules drooping.—About 65 species, in the north temperate zone.

Cymes mostly 1-3-flowered: sepals, petals, and stamens, typically 5: leaf-blades sessile or nearly so: capsule slightly lobed, warty.

Sepals ciliate: petals orbicular-ovate or suborbicular, manifestly broad-clawed:  
capsule copiously warty.

Sepals erose-ciliate: petals orbicular-reniform, clawless:  
capsule sparingly warty.

Cymes mostly 5-many-flowered: sepals, petals, and stamens,  
typically 4: leaf-blades petioled: capsule deeply lobed,  
smooth.

1. *E. americanus*.
2. *E. obovatus*.
3. *E. atropurpurea*.

1. **E. americanus** L. Erect or straggling shrub 2 m. tall or less: leaf-blades oval to lanceolate, 2-10 cm. long, acute or acuminate, crenate-serrate: calyx about 5 mm. wide: sepals usually 5, equal: corolla mostly over 1 cm. wide: petals greenish or greenish-purple: filaments arising from the edge of the disk: anthers fully 1 mm. wide: seed-body 4.5-5.5 mm. long.—(STRAWBERRY-BUSH.)—Rich woods, bluffs, and hammocks, various provinces, N pen. Fla. to Tex., Nebr., and N. Y.—Spr.-sum.

2. **E. obovatus** Nutt. Shrub with trailing, often rooting branches: leaf-blades thin, obovate, 2-6 cm. long, mostly obtuse, crenulate-serrulate: calyx about 4 mm. wide: sepals usually 5, erose-ciliate, equal: corolla mostly less than 8 mm. wide: petals greenish-purple, about 3 mm. wide: filaments arising from the top of the disk: anthers fully 1

mm. wide: seed-body 4-5 mm. long.—(RUNNING STRAWBERRY-BUSH. RUNNING-EUONYMUS.)—Shaded banks and low grounds, various provinces, Tenn. to Ill., Ont., and W N. Y.—Sum.—The rough red fruits of this and of the preceding species, suggested the name strawberry-bush.

3. *E. atropurpureus* Jacq. Erect shrub, or tree becoming 8 m. tall: leaf-blades elliptic, oval, ovate, or obovate, 5-16 cm. long, short-acuminate, serrate: calyx about 4 mm. wide; sepals usually 4, in unequal pairs: corolla mostly less than 1 cm. wide; petals dark-purple: filaments arising from the top of the disk; anthers less than 1 mm. wide: seed-body 8-9 mm. long.—(BURNING-BUSH. WAAHOO. SPINDLE-TREE. STRAWBERRY-BUSH. ARROW-WOOD. BLEEDING-HEART.)—Woods and thickets, various provinces, Ala. (or Fla.?) to Okla., Mont., and N. S.—Spr.—The bark of the root is used medicinally. The white heart-wood, often tinged with yellow, is very close-grained, heavy, and hard. The dangling fruits are pinkish-purple.

2. *PACHYSTIMA* Raf. Shrubs. Leaves opposite, evergreen: blades toothed or entire. Flowers perfect. Sepals 4. Petals 4. Stamens 4, borne below the disk: filaments short: anther-sacs nearly globular. Stigmas 2.—Two species, North American.

1. *P. Canbyi* A. Gray. Diffuse and creeping, 1-4 dm. tall: leaf-blades linear, linear-elliptic or rarely oblanceolate, 0.5-2 cm. long, serrate: petals white, about 1.5 mm. long: capsule ellipsoid, about 4 mm. in diameter. — (MOUNTAIN-LOVER. RAT-STRIPPER. CLIFF-GREEN.)—Limestone cliffs and shaded banks, Blue Ridge and Appalachian Plateau, N N. C. to Ohio and Va.—Spr.—Its closest relative grows in the N Rocky Mountains.

3. *CELASTRUS* L. Vines with woody stems. Leaves alternate, deciduous: blades membranous, broad, entire or toothed. Flowers inclined to be dioecious, racemose or paniculate. Sepals 5. Petals 5. Stamens 5, borne at the sinuses of the disk. Capsules in drooping clusters.—About 30 species, most numerous in Asia.

1. *C. scandens* L. Diffuse climber: leaf-blades elliptic or oval, varying to ovate or obovate, 6-10 cm. long, serrate: panicles drooping: corolla greenish, about 8 mm. broad: capsule subglobose, about 1 cm. in diameter, orange, 3-valved, the scarlet seeds persistent and conspicuous in early winter. — (STAFF-TREE. SHRUBBY-BITTERSWEET. CLIMBING-BITTERSWEET. WAXWORK. GNOME'S GOLD.)—Thickets, woods, and fence-rows, various provinces, Ga. to La., Okla., Man., and Me.—Spr.—sun.—The bark is used medicinally. The ripe fruits are used for interior decoration in winter.

4. *MAYTENUS* Molina. Shrubs or trees. Leaves alternate, persistent: blades leathery, entire or toothed. Flowers polygamous or dioecious, solitary

or clustered. Sepals 5. Petals 5. Stamens 5, borne beneath the disk. Capsule erect.—About 10 species, tropical American.

1. *M. phyllanthoides* Benth. Shrub or tree: leaf-blades obovate to elliptic-oblongate, 2–4 cm. long: hypanthium broadly turbinate: sepals reddish: corolla 2–3 mm. broad, white or greenish-white: capsule obovoid or ellipsoid, 8–12 mm. long: seeds exposed by the recurved capsule valves, red.—Hammocks and sand-dunes, coast of lower pen. Fla. and Florida Keys, and lower Rio Grande region, Tex.—(*W. I., Mex., C. A.*)—Spr.-sum.—The leaves yield gutta-percha.

5. *RHACOMA* L. Shrubs or small trees. Leaves alternate, opposite, or whorled, persistent: blades entire or toothed. Flowers perfect, few together or solitary in axillary peduncled cymes. Sepals 4 or 5. Petals 4 or 5. Stamens 4 or 5, borne between the lobes of the disk. Drupe smooth.—About 12 species, tropical American.

Leaf-blades crenate or entire: cymes long-stalked (10–15 mm.)

1. *R. Crossopetalum*.

Leaf-blades spiny toothed: cymes short-stalked (3–5 mm.)

2. *R. ilicifolia*.

1. *R. Crossopetalum* L. Erect shrub or tree, with glabrous twigs: leaf-blades obovate or rarely somewhat elliptic, 1–4 cm. long, shallowly crenate or entire: cymes long-peduncled: petals oval or obicular, 1 mm. long or less, red or purplish: drupe obovoid, 5–6 mm. long, red.—Hammocks and sand-dunes, coasts of S. pen. Fla. and the Keys.—(*W. I.*).—All year.

2. *R. ilicifolia* (Poir.) Trelease. Depressed shrub with pubescent twigs: leaf-blades oval or ovate, 10–15 mm. long, coarsely spiny toothed: cymes short-peduncled: petals suborbicular, less than 1 mm. long, red: drupe subglobose, 3–4 mm. long, red.—(CHRISTMAS-BERRY.)—Pinelands, Everglade Keys, Fla. and Florida Keys.—(*W. I.*).—All year.—Grows in small sinks.

6. *GYMINDA* Sarg. Shrubs or trees, the twigs 4-angled. Leaves opposite, persistent: blades mostly entire. Flowers dioecious, in axillary cymes. Sepals 4, or rarely 3. Petals 4, or rarely 3. Stamens 4, borne without a disk. Drupe smooth.—Two species, the following and 1 in C. A.

1. *G. latifolia* (Sw.) Urban. Shrub or small tree: leaf-blades obovate to elliptic-obovate, 2–4 cm. long, bright-green (or glaucous above in *G. latifolia glaucifolia*): petals elliptic to obovate-elliptic, 1.5–2 mm. long, white: drupe ellipsoid to ovoid, 7–8 mm. long, bluish-black.—(FALSE-BOXWOOD.)—Hammocks, Florida Keys.—(*W. I., Mex.*)—The dark heart-wood is heavy, and hard.

7. **SCHAEFFERIA** Jacq. Shrubs or trees, the twigs terete. Leaves alternate, persistent; blades entire. Flowers dioecious, in axillary clusters. Sepals 4. Petals 4. Stamens 4, borne without the disk. Stigmas recurved. Drupe tuberculate.—Five species, tropical American.

1. *S. frutescens* Jacq. Shrub or small tree: leaves not clustered; blades elliptic, oval, elliptic-obovate, or elliptic-oblongate, 4–6 cm. long, shining above: flowers manifestly pedicelled, greenish: drupe about 5 mm. in diameter.—(Boxwood. YELLOW-WOOD.)—Hammocks, lower eastern coast of Fla. Everglade Keys, and Florida Keys.—(W. I.)—Spr.—The bright-yellow heart-wood is close-grained and heavy. It is sometimes used as a substitute for boxwood in engraving.

#### FAMILY 7. HIPPOCRATEACEAE — HIPPOCRATEA FAMILY

Shrubs or trees, or vines. Leaves opposite: blades simple. Flowers perfect, in axillary racemes, panicles, or cymes. Calyx of 5 persistent sepals. Corolla of 5 petals. Androecium of mostly 3 stamens. Gynoecium of 3 united carpels. Fruit a berry, a drupe, or a capsule, of 3 or fewer carpels cohering at the base. Seeds flattened.—Three genera and 170 species, mostly tropical.

1. **HIPPOCRATEA** L. Trees or woody vines. Leaf-blades leathery. Sepals and petals 5. Stamens 3: filaments dilated at the base and partly united. Capsule lobed. Seeds winged. About 70 species, tropical America.—Spr.—sum.

1. *H. volubilis* L. Climber: leaf-blades elliptic, varying to ovate or obovate, 5–14 cm. long, crenate-serrate: corolla 5–6 mm. broad, white: mature carpels broadly obovate, 2.5–3 cm. long. [*H. ovata* Lam.]—Hammocks, stream-banks, and shores, S pen. Fla. and the Keys.—(W. I.)—Wint.—sum.—In both hammocks and mangrove swamps the stems of this liane clambering over shrubbery or climbing to the tops of trees are much-branched, often diffusely so. The branches and branchlets hook or coil and thus bind the mass of growth into an impenetrable network.

#### FAMILY 8. DODONAEACEAE — VARNISH-LEAF FAMILY

Shrubs or trees. Leaves alternate: blades simple. Flowers polygamous or polygamo-dioecious, variously borne. Calyx of 3–5 sepals. Corolla wanting. Androecium of 5–8 stamens. Disk obsolete. Gynoecium of 3 or 4 united carpels. Fruit a reticulated septicidal capsule. Seeds subglobose or somewhat flattened.—Only the following genus.

1. **DODONAEA** [Plum.] L. Erect shrubs or trees, with usually viscid foliage. Leaf-blades broadened upward. Flowers green, yellow, or purplish. Capsule winged.—About 50 species, tropical and subtropical.—Spr. or all year.  
—VARNISH-LEAVES.

Leaf-blades spatulate to elliptic; fruit 10–30 mm. wide.

Leaf-blades narrowly spatulate; fruit less than 2 cm. wide; seed 2–2.5 mm. in diameter. 1. *D. jamaicensis*.

Leaf-blades broadly spatulate to elliptic; fruit over 2 cm. wide; seed 3–3.5 mm. in diameter. 2. *D. viscosa*.

Leaf-blades cuneate to obovate-cuneate; fruit 5–7 mm. wide. 3. *D. microcarya*.

1. *D. jamaicensis* DC. Shrub 1–4 m. tall; leaves 3–11 cm. long; blades narrowly spatulate, gradually narrowed to the base: sepals elliptic or oval, 2.5–3 mm. long, ciliate; anthers about as long as the sepals: fruits 10–16 mm. long, deeply notched at the apex: seed orbicular-lenticular, 2–2.5 mm. in diameter.—Pinelands, hammocks, and coastal sand-dunes, pen. Fla. and the Keys.—(W. I.)—All year.

2. *D. viscosa* L. Shrub 2–5 m. tall; leaves 8–15 cm. long; blades broadly spatulate to elliptic, gradually or abruptly narrowed at the base: sepals ovate or oval, 2.5–3 mm. long; anthers rather shorter than the sepals: fruit 23–30 mm. long, deeply notched at the apex: seed orbicular-reniform, 3–3.5 mm. in diameter.—Woods and hammocks, pen. Fla.—(W. I., Mex., C. A., S. A.)—Sum.—fall.

3. *D. microcarya* Small. Shrub or small tree: leaves 2–5 cm. long; blades cuneate to obovate-cuneate: sepals smaller than in the two preceding species: fruit 5–7 mm. wide, emarginate at the apex: seed subglobose, nearly 2 mm. in diameter.—Hammocks, lower Florida Keys.—Fall.

## FAMILY 9. STAPHYLEACEAE — BLADDERNUT FAMILY

Shrubs or trees. Leaves mostly opposite: blades pinnately compound. Flowers perfect or polygamous, racemose or paniculate, drooping. Calyx of 5 sepals. Corolla of 5 equal petals. Androeceium of 5 stamens. Gynoeceium of 2 or 3 partially or wholly united carpels. Fruit an inflated capsule.—Five genera and 22 species, widely distributed.

1. **STAPHYLEA** L. Shrubs or small trees. Leaf-blades pinnate, often 3-foliate. Racemes cluster-like, drooping. Sepals and petals nearly erect. Capsule bladderly, 2- or 3-lobed.—About 6 species, of the north temperate zone.

1. *S. trifolia* L. Shrub or small tree: leaflets 3: blades oval or elliptic, varying to ovate or obovate, 5–10 cm. long, serrate: racemes 5–10 cm. long: sepals 7–10 mm. long: petals spatulate, surpassing the sepals, green and cream striped: capsule 4–6 cm. long, the lobes apiculate.—(BLADDERNUT)—Rich woods and stream-banks, various provinces, rarely Coastal Plain, Ga. to Okla., Kans., Minn., and Que.—Spr.—Near the southern end of its range it may attain a trunk-diameter of six inches.

## FAMILY 10. AESCULACEAE — BUCKEYE FAMILY

Shrubs or trees. Leaves opposite: blades palmately compound. Flowers polygamous, in terminal racemes or panicles. Calyx of 5 partially united sepals. Corolla of 4 or 5 unequal clawed petals. Androecium of 5-8 stamens. Gynoecium of 3 united carpels. Fruit a leathery loculicidal capsule.—Two genera and about 15 species, North American and Asiatic.

**1. AESCULUS L.** Shrubs or trees. Leaf-blades palmately 5-11-foliolate. Petals with their claws mostly in the calyx-tube. Filaments slender. Capsule smooth or echinate.—About 24 species, North American and Asiatic.—BUCKEYES. HORSE-CHESTNUTS.

Panicle much elongate and narrow: corolla of petals not very different in shape: stamens several times longer than the calyx. Subgenus I. MACROTHYRSUS.

Panicle short and thick: corolla of very differently shaped petals: stamens twice or thrice as long as the calyx.

Upper petals with small rounded blades much shorter than the elongate claw: ovary and capsule smooth and glabrous.

Upper petals with spatulate blades about as long as the claw: ovary and capsule soft-prickly.

Subgenus II. PAVIA.

Subgenus III. EUAESCULUS.

## I. MACROTHYRSUS

Shrub with erect, slender, elongate panicles of white flowers.

1. *Ae. parviflora*.

## II. PAVIA

Calyx tubular: broad petals not twice as long as the calyx.

2. *Ae. Pavia*.

Calyx campanulate: broad petals more than twice as long as the calyx.

3. *Ae. octandra*.

## III. EUAESCULUS

Tree: blades of the leaflets serrate: flowers pale-yellow, in short panicles.

4. *Ae. glabra*.

**1. *Ae. parviflora* Walt.** Shrub: leaflets 5-7; blades elliptic-oblancoolate to obovate, 5-18 cm. long: calyx 5-7 mm. long: corolla white: petals 16-20 mm. long: capsules globular, 2.5-3 cm. in diameter. — (BOTTLEBRUSH-BUCKEYE.) — Rich woods, Coastal Plain and adj. provinces, W Fla. to Ala. and S. C.—Spr.

**2. *Ae. Pavia* L.** Low shrub or small tree: leaflets 5-7 or rarely 3; blades oval, oval-ovate, oblanceolate, or elliptic-lanceolate: calyx 8-12 mm. long or rarely longer; tube about 5 times as long as the lobes: narrow petals 3.5-4 cm. long, the claws more than twice as long as the calyx: capsule 3-5 cm. in diameter. — (FIRECRACKER-PLANT. RED-BUCKEYE. SCARLET-BUCKEYE.) — Rich or dry woods, Coastal Plain and adj. provinces, Fla. to Tex., SE Mo., and Va.—Spr.—Additional species, related to *Ae. Pavia* have been proposed.

**3. *Ae. octandra* Marsh.** Shrub or large tree: leaflets mostly 5; blades oblanceolate to elliptic: calyx 12-16 mm. long or rarely shorter; tube about 8 times as long as the lobes: narrow petals 2.5-3 cm. long, the claws less than twice as long as the calyx: capsule 3-6 cm. in diameter. [*Ae. flava* Ait.] — (YELLOW-BUCKEYE. SWEET-BUCKEYE. LARGE-BUCKEYE.) — Rich woods and river banks, various provinces, Ga. to Tex., Ia., and W Pa.—Spr.—Additional species, related to *Ae. octandra*, have been proposed.—The creamy-white heart-wood is close-grained, soft, and light. It is used for artificial limbs and various utensils.

4. *Ae. glabra* Willd. Tree: leaflets 5, or rarely 7; blades elliptic to elliptic-oblongate: calyx 6-8 mm. long: corolla pale-yellow; lateral petals 11-12 mm. long: capsule 3-7 cm. in diameter.—(OHIO-BUCKEYE. FETID-BUCKEYE.)—Woods, various provinces, rarely Coastal Plain, Ala. to Okla., Kans., Mich., and W Pa.—Spr.—The wood is used for artificial limbs and various utensils.

### FAMILY 11. ACERACEAE — MAPLE FAMILY

Shrubs or trees. Leaves opposite: blades simple or compound. Flowers perfect or polygamous, in cymes, racemes, or panicles, or often in congested clusters. Calyx of 4 or 5, or rarely more, deciduous sepals. Corolla of 4 or 5, or rarely more, petals, or wanting. Androecium of as many stamens as there are sepals or twice as many. Gynoecium of 2 more or less united carpels. Fruit 2 nutlets with wings (samaras).—Six genera and more than 100 species, in the north temperate zone.

Leaf-blades simple: flowers polygamous, monoecious, andromonoecious, or androdioecious; disk present: anthers ellipsoid or oval, not tipped.

Flowers in terminal racemes or panicles: stigmas shorter than the style.

Flowers in lateral or terminal clusters: stigmas as long as the style or longer.

Flowers filiform-pedicelled, in drooping clusters appearing with the leaves: sepals united into a lobed cup-like calyx, the staminate and pistillate similar.

Flowers sessile or short-pedicelled, in dense lateral involucrate clusters, appearing before the leaves.

Sepals united, the staminate and pistillate calyx very distinct: petals wanting.

Sepals distinct, those of the staminate and pistillate flowers similar: petals present.

Leaf-blades pinnately compound: flowers dioecious: disk wanting: anthers linear, minutely tipped.

1. ACER.

2. SACCHARODENDRON.

3. ARGENTACER.

4. RUFACER.

5. NEGUNDO.

1. *ACER* L. Shrubs or trees. Leaf-blades broad, coarsely toothed or 3-5-lobed. Flowers borne in terminal racemes or panicles, appearing after the leaves, polygamous. Calyx of usually 5 distinct or slightly united sepals. Petals 5, narrower or broader than the sepals. Stamens exserted or included: stigmas shorter than the style.—About 30 species, North American and Eurasian.—Spr.—MAPLES. ACERS.

Flowers in erect panicles: petals linear or linear-spatulate, about twice as long as the sepals.

Flowers in drooping racemes: petals obovate, about as long as the sepals or slightly longer.

1. *A. spicatum*.

2. *A. pennsylvanicum*.

1. *A. spicatum* Lam. Shrub, or small tree 10 m. tall, the bark thin, relatively smooth: leaf-blades mostly longer than broad, mainly 3-lobed, sometimes with 2 additional lobes near the base, serrate, glabrate above, paler and more or less tomentulose beneath, cordate or subcordate: panicles many-flowered: pedicels spreading, 6-10 mm. long, or longer at maturity: petals yellow: stamens exserted: fruit green, about 2.5-3.5 cm. broad, the wings of the samaras spreading at about 90 degrees.—(MOUNTAIN-MAPLE. LOW-MAPLE.)—Damp rocky woods, Blue Ridge and more northern provinces, Ga. to Man. and Newf.—Spr.—early sum.—The heart-wood is soft, and light.

2. *A. pennsylvanicum* L. Shrub or tree, rarely over 11 m. tall, the bark relatively smooth, longitudinally striped: leaf-blades

sometimes broader than long, 1-3 dm. broad, deep-green, with 3 nearly erect acuminate lobes, sometimes with 2 additional lobes, finely or doubly serrate, glabrous above, finely pubescent beneath, rounded or subcordate at the base: racemes relatively few-flowered: pedicels not spreading, 5-10 mm. long: petals pale-green or yellowish-green, obovate, slightly surpassing the elliptic sepals: stamens included: fruit bright-green, 3.5-5.5 cm. broad, glabrous, the wings of the samaras spreading at an angle of about 120 degrees.—(MOOSEWOOD. MOUNTAIN-ALDER. STRIPED-DOGWOOD. STRIPED-MAPLE.)—Rocky woods, Blue Ridge and more northern provinces, Ga. to Ont. and N. S.—Spr.—The heart-wood resembles that of *A. spicatum*.

2. **SACCHARODENDRON** Nieuwl. Trees or shrubs. Leaf-blades 3-5-lobed. Flowers in terminal umbels, somewhat precocious, appearing with the leaves, andromonoecious, long-pedicelled. Calyx campanulate, the lobes mostly shorter than the tube. Petals none. Stamens exserted: anthers ellipsoid or oval. Stigmas mostly longer than the style.—About 6 species, North American.—MAPLES. ACERS.—The sap of some of the species, particularly of *S. nigrum* and *S. barbatum*, is rich in sugar—the source of maple sugar.

Leaf-blades glabrous or sparingly pubescent and glaucous beneath.

Leaf-blades with 3-5 acute or acuminate, often toothed lobes.

Leaf-blades with 3 blunt few-toothed lobes.

Leaf-blades downy pubescent beneath, not glaucous.

Leaf-blades green beneath: calyx campanulate: samaras green.

Leaf-blades greenish, tinged with red beneath: calyx hemispheric: samaras red.

1. *S. barbatum*.

2. *S. floridanum*.

3. *S. nigrum*.

4. *S. leucoderme*.

1. ***S. barbatum*** (Michx.) Nieuwl. Tree sometimes 40 m. tall, the bark usually separating in coarse scales at maturity, the twigs red-brown: leaf-blades firm, mostly with 5 sinuate-toothed lobes, 8-15 cm. in diameter, deep-green above, pale or glaucous beneath, with an open shallow sinus: flower-clusters yellowish-green: calyx campanulate, about 5 mm. long; sepals obtuse: samaras slightly spreading, 3.5-4 cm. long. [*Acer saccharum* Marsh. *A. barbatum* Michx.]—(SUGAR-MAPLE. HARD-MAPLE. ROCK-MAPLE. SUGAR-TREE.)—Rich woods, rocky slopes, and stream-banks, various provinces, rarely Coastal Plain, Ga. to Tex., Man., and Newf.—Spr.—The light-brown heart-wood is close-grained, tough, hard, and strong.—*Acer saccharum* Marsh. is merely a misspelling of *A. saccharinum* L.

2. ***S. floridanum*** (Chapm.) Nieuwl. Tree rarely over 18 m. tall, the bark rather close, but rough in age, chalky-white: leaf-blades rather broader than long, 5-6 cm. broad, with 3-5 blunt undulate lobes about as long as the body, deep-green above, glaucous and more or less pubescent beneath, truncate and shallowly cordate at the base: flower-clusters yellowish: pedicels sparingly pubescent at least until the fruit matures: calyx campanulate, 1-1.5 mm. long: samaras green, 1.5-2 cm. long, sparingly pubescent near the base; wings rather widely spreading. [*Acer saccharinum floridanum* Chapm. *A. floridanum* Pax]—(HAMMOCK-MAPLE.)—Rich woods, bluffs, and hammocks, Coastal Plain and rarely adj. provinces, Fla. to La. and S. C. Naturalized in N. C. Reported from Va.—Wint.-spr.

3. ***S. nigrum*** (Michx. f.) Small. Tree sometimes 30 m. tall, the bark dark, coarsely flaky, the twigs light orange-brown: leaf-blades mainly broader than

long, often 15–20 cm. broad, relatively thin, deep-green above, scarcely paler and more or less downy beneath, with 3–5 entire or merely undulate lobes; basal sinus closed by the overlapping lobes: calyx campanulate, about 5 mm. long; sepals rounded: samaras 3–4 cm. long, slightly spreading. [*Acer nigrum* Michx. f.]—(BLACK-MAPLE.)—Woods, open slopes, and fields, various provinces, Ga. to La., Minn., Ont., and N. H.—Spr.—The wood is nearly similar to that of *S. barbatum*.

4. *S. leucoderme* (Small) Nieuwl. Shrub, or tree reaching a height of 8 m., the bark smooth, white: leaf-blades broader than long, or rarely orbicular in outline, mostly 4-lobed, sometimes imperfectly 5-lobed, 4–9 cm. in diameter, cordate or truncate, with a rather open and shallow sinus, dark-green, glabrous and marked with light nerves above, greenish, tinged with red, prominently nerved and velvety (especially to the touch) beneath, the lobes acute or acuminate (the fourth or fifth when present, obtuse), each, or the terminal one only with 2 obtuse teeth: flower clusters yellow: calyx 2 mm. long: samaras red; wings elliptic-spatulate, 1–2 cm. long, red, conspicuous, parallel or nearly so. [*A. leucoderme* Small]—(CHALK-MAPLE.)—Rocky river-banks, woods, and cliffs, inner edge of Coastal Plain and Piedmont, Ga. to La., Ark. and N. C.—Spr.—The heart-wood is very close-grained and hard. The trunk is often crooked.

3. **ARGENTACER** Small. Trees. Leaf-blades mostly 3-lobed. Flowers in dense lateral clusters, subtended by an imbricate involucre, very precocious, appearing long before the leaves, androdioecious, sessile or nearly so. Calyx various, that of the staminate flowers narrow and elongate, that of the pistillate short and broad, the lobes shorter than the tube. Petals wanting or minute. Stamens long exserted: anthers ellipsoid. Stigmas longer than the style.—One species.

1. *A. saccharinum* (L.) Small. Tree rarely 36 m. tall, the bark flaky at maturity, gray, or that of the twigs reddish-brown: leaf-blades about as long as broad, 10–15 cm. long, with 3–5 prominent incised lobes longer than the body, silky when young, glabrate, bright-green above, glaucous or silvery-white beneath, truncate or cordate at the base: calyx greenish or yellowish: samaras 5–6 cm. long, tomentose, or glabrate at maturity, green, at length, widely spreading. [*Acer dasycarpum* Ehrh.]—(SILVER-MAPLE. WHITE-MAPLE. SOFT-MAPLE.)—

Woods, river-banks, and alluvial soil, various provinces, N. Fla. to La., Okla., N. D., Ont., and N. B.—Wint.-spr.—The pale-brown heart-wood is close-grained and hard, but brittle.

4. **RUFACER** Small. Trees. Leaf-blades coarsely toothed or 3–5-lobed. Flowers in dense lateral clusters subtended by an imbricate involucre, appearing long before the leaves; androdioecious, short-pedicelled. Calyx of usually 5 distinct or nearly distinct sepals. Petals somewhat smaller than the sepals. Stamens, in the staminate flowers, exserted: anthers oval. Stigmas longer than the style.—About 6 species, North American.—MAPLES. ACERS.

Leaf-blades glabrous or glabrate beneath: samaras less than 4 cm. long: wings rather spreading.

Leaf-blades prominently and sharply lobed, the lobes prominently toothed: samaras mostly less than 3 cm. long.

1. *R. rubrum*.

Leaf-blades mostly shallowly 3-lobed, the lobes shallowly toothed: samaras mostly over 3 cm. long.  
 Leaf-blades copiously woolly beneath: samaras over 4 cm. long: wings tending to converge.

2. *R. carolinianum*.

3. *R. Drummondii*.

1. *R. rubrum* (L.) Small. Tree sometimes 35 m. tall, the bark dark-gray and fissured on the trunk, smooth and pale or white-gray on the branches: leaf-blades commonly broader than long, deep-green above, pale or glaucous beneath, mostly shallowly 5-lobed, rather evenly serrate, cordate at the base: flower-clusters red or yellowish: sepals nearly distinct: petals narrower than the sepals: samara-wings commonly red.—(RED-MAPLE. SWAMP-MAPLE. WATER-MAPLE. SCARLET-MAPLE.)—Woods and swamps, various provinces, Fla. to Tex., Man., and N. B.—Wint.-spr.—The heart-wood is close-grained and very heavy.

2. *R. carolinianum* (Walt.) Small. Tree resembling *R. rubrum*, but usually smaller, the bark of the trunk pale-gray: leaf-blades as long as broad, or longer, mostly shallowly 3-lobed, but sometimes merely toothed, dark-green above, pale beneath, unevenly serrate, rounded or subcordate at the base: flower-clusters red or yellowish: sepals nearly distinct: petals about as broad as the sepals: samara-wings usually diverging at less than 45 degrees.—(CAROLINA-MAPLE. RED-MAPLE. SOUTHERN RED-MAPLE.)—Moist, often acid, soil, Coastal Plain and occasionally adj. provinces S Fla., to Tex., Mo., and N. J.—Wint.-spr.—The wood is nearly similar to that of *R. rubrum*.

3. *R. Drummondii* (Hook. & Arn.) Small. Tree reaching a height of 26 m., the bark pale or whitish, rough on the trunk: leaf-blades thick, mostly broader than long, 8–15 cm. broad or sometimes smaller, coarsely and irregularly toothed, deep-green above, white and woolly beneath, rounded or cordate at the base: flower-clusters red: sepals nearly distinct, elliptic or slightly narrowed upward: petals nearly like the sepals only narrower: samaras over 4 cm. long, the wings tending to converge.—(RED-MAPLE.)—River swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex., Mo., and Ga.—Spr.—The wood is nearly similar to that of the two preceding species.

5. **NEGUNDO** [Ray] Ludwig-Boehmer. Trees. Leaf-blades pinnately compound. Flowers dioecious, the staminate in lateral clusters, long-pedicelled; the pistillate in lateral racemes. Sepals 5, partly united. Petals wanting. Stamens exserted: anthers linear, minutely appendaged at the tip. Stigmas much longer than the style.—Three or four species, North American.

1. *N. Negundo* (L.) Karst. Tree becoming 25 m. tall, with light-green twigs: leaflets 3–9; blades oval, ovate, or ovate-lanceolate, often 5–12 cm. long, coarsely toothed: flowers greenish, drooping: samaras 2.5–3.5 cm. long.—(BOX-ELDER. ASH-LEAVED MAPLE. WATER-ASH.)—Low woods and stream-banks, various provinces, Fla. to Tex., Man., Ont., and Me.—Spr.—The whitish heart-wood, close-grained, but soft, is made into wooden-ware and cheap furniture.

## FAMILY 12. SAPINDACEAE — SOAPBERRY FAMILY

Shrubs, trees, or vines. Leaves alternate in our species: blades simple or pinnate, sometimes 1-foliate. Flowers dioecious, polygamous, or polygamo-dioecious, or rarely perfect, borne in racemes, panicles, or corymbs. Calyx of 4 or 5 sepals. Corolla of 4 or 5 petals or wanting. Disk sometimes gland-bearing. Androecium mostly of 5 or more stamens. Gynoecium of 2-4 more or less united carpels. Fruit capsular or baccate. —About 125 genera and over 1,000 species.

Vines: fruit bladdery.

Shrubs or trees: fruit not inflated.

Fruit baccate, not stipitate.

Fruit capsular, loculicidal, stipitate.

Tribe I. CARDIOSPERMEAE.

Tribe II. SAPINDEAE.

Tribe III. CUPANIEAE.

## I. CARDIOSPERMEAE

Climbers with tendrils and herbaceous or woody stems: capsule inflated, with 1 seed in each cavity.

1. CARDIOSPERMUM.

## II. SAPINDEAE

Petals appendaged, longer than the calyx.

Fruit lobed, the carpels nearly distinct: petals with short claw-like bases.

2. SAPINDUS.

Fruit not lobed, the carpels united: petals with long claw-like bases.

3. TALISIA.

Petals unappendaged, about as long as the calyx.

Ovary 2-celled: leaflets 2, 4 or 6: calyx persistent.

4. EXOTHEA.

Ovary 3-celled: leaflets 3: calyx deciduous.

5. HYPELATE.

## III. CUPANIEAE

Shrub or tree: leaflets with toothed blades.

6. CUPANIA.

1. **CARDIOSPERMUM** L. Herbaceous or woody vines. Leaves alternate: blades biternate or decompound. Flowers polygamo-dioecious, irregular. Sepals 4. Petals 4, unequal, white. Disk one-sided, with 2 glands opposite the lower petals. Stamens 8. Capsules bladdery.—About 15 species, of the warmer parts of America.—BALLOON-VINES. HEART-SEEDS.

Capsule subglobose, obovoid, globose-obovoid, or oval, slightly longer than wide, not angled: blades of the leaflets rather large and acute or acuminate.

Outer sepals glabrous: seed about 5 mm. in diameter, the aril reniform: leaflets glabrous or nearly so.

1. *C. Halicacabum*.

Outer sepals pubescent: seed about 3.5 mm. in diameter, the aril heart-shaped: leaflets finely pubescent.

2. *C. keyense*.

Capsule obpyramidal and lobed, wider than long: blades of the leaflets small, usually decidedly acuminate.

3. *C. microcarpum*.

1. **C. Halicacabum** L. Twigs glabrous or sparingly pubescent: blades of the leaflets lanceolate to ovate, acute to acuminate, coarsely serrate and incised, sparingly pubescent or glabrous: calyx glabrous; outer sepals about 2 mm. long, rounded: petals 3.5-4.5 mm. long: capsule subglobose to obovoid or globose-obovoid, about as wide as long, 3.5-4.5 cm. in diameter, short-stipitate.—(HEART-PEA.)—Waste-places and cult. grounds, various provinces, Fla. to Tex., Kans., and Del. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—Sum. or all year S.—The root is medicinal.

2. **C. keyense** Small. Twigs closely and finely pale-pubescent: blades of the leaflets ovate, more or less lobed or incised, and crenate, or crenate-serrate, acute to somewhat acuminate, copiously fine-pubescent:

calyx similar to that of *C. Halicacabum*, but outer sepals pubescent: petals 3.5–4 mm. long: capsule subglobose to oval, 3–3.5 cm. in diameter, mostly longer than wide, rather long-stipitate.—Hammocks, Florida Keys.—All year.

3. *C. microcarpum* H.B.K. Twigs glabrous or obscurely fine-pubescent: blades of the leaflets lanceolate to ovate-lanceolate, decidedly acuminate, incised and coarsely toothed, glabrous or with scattered hairs: calyx glabrous or nearly so; outer sepals 1–1.5 mm. long: petals 2–3 mm. long: capsule broadly obpyramidal, 1.5–2 cm. wide, not stipitate.—Hammocks, pinelands, and swamps, S pen. Fla. and the Keys, and S Tex.—(*W. I., Mex., C. A., S. A.*)—All year.

2. **SAPINDUS** [Tourn.] L. Shrubs or trees. Leaves alternate: blades pinnate. Flowers polygamous, regular. Sepals 4 or 5. Petals 4 or 5, appendaged, white or greenish. Stamens 8–10. Baccate fruit not elongate, lobed.—About 10 species, American and Asiatic.—Wint.-spr.—The fruits contain saponin.

Leaf-rachis winged: blades of the leaflets obtuse, at least not acuminate: petals short-clawed.

1. *S. Saponaria*.

Leaf-rachis wingless: blades of the leaflets acuminate: petals long-clawed.

2. *S. marginatus*.

1. *S. Saponaria* L. Shrub, or tree becoming 10 m. tall: leaflets 4–7; blades elliptic, oval, or obovate, 3–12 cm. long; leaf-rachis winged: mature carpels globose, 14–18 mm. in diameter.—(SOAPBERRY. FALSE-DOGWOOD.)—Hammocks, pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—All year.—The light-brown heartwood is close-grained, hard, and heavy.

2. *S. marginatus* Willd. Tree 10–15 m. tall, the twigs and inflorescence pubescent: leaflets 7–13; blades lanceolate to elliptic-lanceolate, 5–15 cm. long: leaf-rachis margined above: mature carpel globose, 10–15 mm. in diameter.—(WILD-CHINA. SOAPBERRY.)—Hammocks, near the coast, Fla., Ga. and S. C. Adv. elsewhere.—Spr.—The light-brown heartwood is close-grained, heavy, and strong, being easily split it is used for making light frames and baskets.—*S. manatensis* Radlk. seems to be a form of this species.

3. **TALISIA** Aubl. Shrubs or trees. Leaves alternate, the rachis wingless: blades pinnate, the leaflet-blades slightly inequilateral. Flowers polygamodioecious, regular. Sepals 5. Petals 5, appendaged. Stamens 5–7, or usually 8. Baccate fruit somewhat elongate, not lobed.—About 33 species, all but the following exclusively South American.

1. *T. pedicellaris* Radlk. Small tree with puberulent twigs: leaflets 4–6; blades elliptic to elliptic-ovate, 5–9 cm. long, acuminate, short-petioled: panicle small, the branches pubescent: petals ovate to ovate-lanceolate, 4–5 mm. long, green or yellowish: fruits ovoid or ellipsoid, 1.5–2 cm. long, papillose.—Brickell hammock, Miami, Fla.—(*S. A.*)—Spr.

4. **EXOTHEA** Macfadyen. Shrubs or trees. Leaves alternate; blades equally pinnate. Flowers mostly polygamous, irregular. Sepals 5. Petals 5, unappendaged, short-clawed. Stamens mostly 8. Baccate fruit not lobed.—One species.

1. **E. paniculata** (Juss.) Radlk. Tree or shrub: leaflets 2-4, or rarely 6; blades elliptic, 5-13 cm. long, entire; buds clove-shaped: sepals 3-4 mm. long: petals white, smaller than the sepals: fruit subglobose, 10-13 mm. in diameter, orange turning purple.—(INKWOOD. IRONWOOD. BUTTER-BOUGH.)—Hammocks, pen. Fla. and the Keys.—(W. I.)—The light-brown heart-wood, close-grained, heavy and very hard, is used for cabinet work, boat-building, and small articles. The trees flower in wint. and spr. Has been carried far up the coast and planted on kitchenmiddens by birds.

5. **HYPELATE** P. Br. Shrubs or trees. Leaves alternate: blades 3-foliolate. Flowers polygamo-dioecious. Sepals 5. Petals 5, unappendaged, clawless. Stamens 8-10. Baccate fruit not lobed.—One species.

1. **H. trifoliata** Sw. Tree: leaflets 3; blades spatulate to narrowly obovate, 2.5-4.5 cm. long: petals white, suborbicular, 1-1.5 mm. long: fruit ovoid, 5-7 mm. long, black.—(WHITE-IRONWOOD.)—Hammocks, Florida Keys.—(W. I.)—The dark-brown heart-wood, close-grained and very heavy, is used for cabinet-work, tool-handles, and in boat-building. The largest trees in our range occur on Umbrella Key. On Big Pine Key specimens of this typically hammock plant are scattered in the pinelands. The trees flower in spr. and sum.

6. **CUPANIA** [Plum.] L. Shrubs or trees. Leaves alternate: blades pinnate. Flowers polygamo-dioecious, regular. Sepals 4 or 5, rarely 3 or 6. Petals 4 or 5, sometimes appendaged, or wanting. Stamens 8, or 5, 6, 10, or 12. Capsule 2-4-lobed.—About 32 species, tropical American.

1. **C. glabra** Sw. Tree: leaflets 6-12; blades oblong with a cuneate base, 6-11 cm. long, crenate or crenate-serrate above the middle: sepals ovate, 2-2.5 mm. long: petals cuneate-flabellate, 2-2.5 mm. long, green, often tinged with yellow or red: capsule turbinate 11-14 mm. broad, stipitate.—Hammocks, Big Pine Key, Fla.—(W. I.)—Spr.—This is one of the trees discovered about a century ago on the Florida Keys, and up to several years ago thought to be exterminated in our range.

## ORDER RHAMNALES — RHAMNAL ORDER

Shrubs, trees, or vines. Leaves typically alternate. Flowers regular, sometimes imperfect or incomplete. Calyx present. Corolla present or wanting. Androecium of as many stamens as there are sepals. Gynoecium of 2 or more united carpels. Ovary superior or nearly so. Fruit a capsule or a berry, or drupaceous.

Sepals manifest: petals involute or wanting: fruit capsular, berry-like, or drupaceous. Fam. 1. FRANGULACEAE.  
 Sepals minute or obsolete: petals valvate: fruit baccate. Fam. 2. VITACEAE.

## FAMILY 1. FRANGULACEAE — BUCKTHORN FAMILY

Shrubs, trees, or vines. Leaf-blades simple, pinnately veined. Flowers perfect or polygamous, or sometimes dioecious. Calyx of 4 or 5 sepals. Corolla of 4 or 5 petals, or wanting. Androecium of 4 or 5 stamens opposite the petals. Gynoecium of 2 or 3 united carpels. Fruit capsular, berry-like, or drupaceous, sometimes separating into nutlets.—About 50 genera and 600 species, of temperate and tropical regions.

Fruit wingless.

Fruit drupaceous, pulpy, with a 1-4-celled stone.

Fruit dry or berry-like, with 2-4 separate nutlets.

Fruit winged.

Tribe I. ZIZYPHEAE.

Tribe II. RHAMNEAE.

Tribe III. GOUANIEAE.

## I. ZIZYPHEAE

Petals wanting.

Sepals crested.

Sepals not crested.

Petals present.

Petals hooded and clawed, broadly rounded at the apex.

Petals involute, sessile, obtuse or acute.

1. KRUGIODENDRON.

2. REYNOSIA.

3. ZIZYPHUS.

4. BERCHEMIA.

## II. RHAMNEAE

Fruit pulpy.

Hypanthium flattish: disk conspicuous.

Hypanthium cup-like: disk inconspicuous, lining the hypanthium.

Fruit dry.

Sepals inflexed: petals on slender claws.

Sepals spreading: petals sessile, involutely folded over the filaments.

5. SAGERETIA.

6. RHAMNUS.

7. CEANOTHUS.

8. COLUBRINA.

## III. GOUANIEAE

Vine with tendril-like twigs.

9. GOUANIA.

1. **KRUGIODENDRON** Urban. Shrubs or trees. Leaves nearly opposite: blades entire. Flowers perfect, green. Sepals 5, crested within. Petals wanting. Stamens 5: filaments longer than the anthers. Drupe apiculate.—One species.

1. **K. ferreum** (Vahl) Urban. Shrub, or small tree 9 m. tall, the bark ridged: leaf-blades ovate or oval, 3-6 cm. long: sepals ovate: drupe subglobose or oval, 5-8 mm. long, black. [*Rhamnidium ferreum* (Vahl) Sarg.] — (BLACK-IRONWOOD.) — Hammocks, lower E coast of Fla., Everglade Keys, and Florida Keys.—(W. I.)—Spr.—The orange-brown heart-wood, hard and very heavy, is used locally for cabinet-work. The geographic range of this species is not as wide as its relative the darling-plum, for it has not yet been found on the lower western coast of Fla.

2. **REYNOSIA** Griseb. Shrubs or trees. Leaves opposite: blades entire. Flowers perfect, green. Sepals 5, crestless. Petals wanting. Stamens 5: filaments longer than the anthers. Drupe apiculate.—About 9 species, West Indian.

1. *R. septentrionalis* Urban. Shrub, or tree 9 m. tall, the bark scaly: leaf-blades elliptic, varying to ovate or obovate: sepals deltoid or ovate-deltoid: drupe subglobose, oval, or obovoid, 1.5–2 cm. long, purple or nearly black.—(RED-IRONWOOD. DARLING-PLUM.)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—Spr.-sum.—The fruit is edible.—The dark-brown heartwood, close-grained and very hard, is used locally for cabinet-work.—The fruits are pleasantly flavored.

3. **ZIZYPHUS** Juss. Shrubs. Leaves alternate: blades three-ribbed, entire, or sometimes shallowly toothed. Flowers perfect. Sepals 5, keeled within. Petals 5, hood-like. Stamens 5, opposite the petals. Drupe fleshy, edible, with a 1–3 celled stone. About 40 species, most abundant in the Old World tropics.

1. *Z. Zizyphus* (L.) Karst. Shrub or small tree, with glabrous branchlets: leaf-blades ovate, oval, or elliptic-ovate, 3–6 cm. long, obtuse or retuse at the apex, shallowly toothed, inequilateral, oblique at the base, short-petioled: cymes contracted, axillary: sepals ovate, 2–2.5 mm. long: petals white or greenish, 2–2.5 mm. long; blades oval or suborbicular, short-clawed: drupe ovoid or ellipsoid, 15–25 mm. long, red or nearly black.—(JUJUBE-TREE.)—Thickets and roadsides, Coastal Plain, Ala. to La. Nat. of Eu. and cult.—Spr.—The fruit is edible.

4. **BERCHEMIA** Neck. Shrubs or vines. Leaves alternate: blades many-ribbed. Flowers perfect or polygamous. Sepals 5, flat. Petals 5, involute, sessile. Stamens 5, often shorter than the petals. Drupe somewhat flattened, slightly longer than thick.—About 10 species, the following and the others in tropical Asia and Africa.

1. *B. scandens* (Hill) Trelease. Glabrous climber with wide-spreading branches: leaf-blades oval, elliptic, or sometimes varying to lanceolate, 4–8 cm. long, entire or undulate-crenate: sepals longer than the hypanthium: petals greenish-yellow, obovate, about as long as the sepals: drupe ellipsoid or ovoid-ellipsoid, 6–8 mm. long. [*B. volubilis* DC.]—(SUPPLE-JACK. RATTAN-VINE.)

—Swamps and low hammocks, Coastal Plain, and occasionally adj. provinces, Fla. to Tex., Mo., and Va.—Spr.

5. **SAGERETIA** Brongn. Shrubs with diffuse branches. Leaves opposite or nearly so: blades of firm-texture, finely toothed. Flowers perfect. Sepals 5, keeled within. Petals 5, concave, short-clawed. Stamens 5, about as long as the petals. Drupe separating into 3 leathery nutlets.—About 10 species, mostly Asiatic.

1. **S. minutiflora** (Michx.) Trelease. Pubescent, spinescent shrub: leaf-blades ovate or orbicular-ovate, 1–5 cm. long: spikes 1–4 cm. long: calyx 2–2.5 mm. broad: petals orbicular, ovate, about  $\frac{1}{2}$  as long as the sepals, white: drupe subglobose, 7–9 mm. in diameter.—(BUCKTHORN.)—Calcareous hammocks and bluffs, Coastal Plain, Fla. to Miss. and N. C.—Spr.—The flowers are very fragrant.

6. **RHAMNUS** [Tourn.] L. Shrubs or trees. Leaves alternate: blades entire or toothed, many-ribbed. Flowers perfect or polygamo-dioecious, green. Sepals 4 or 5, keeled within. Petals 4 or 5, commonly concave, clawless, shorter than the sepals, or wanting. Stamens 4 or 5, included: anthers acute. Drupe berry-like, not lobed, with 3 or 4 nutlets.—About 90 species, of warm and temperate regions.—Spr.—BUCKTHORNS.

Flowers usually dioecious: nutlet deeply grooved on the back; raphe dorsal; cotyledons leaf-like.

Flowers perfect: nutlet not grooved; raphe lateral: cotyledons thick.

1. *R. lanceolata*.

2. *R. caroliniana*.

1. **R. lanceolata** Pursh. Shrub 1–2 m. tall: leaf-blades elliptic, elliptic-lanceolate or sometimes oval, 2.5–9 cm. long: calyx about 3 mm. broad: petals about  $\frac{1}{2}$  as long as the sepals: drupe 5–7 mm. in diameter.—River-banks and moist hillsides, various provinces, rarely Coastal Plain, Ala. to Tex., Ia., and Pa.

2. **R. caroliniana** Walt. Shrub, or tree becoming 11 m. tall: leaf-blades elliptic or slightly obovate, 5–12 cm. long: calyx about 4 mm. broad: petals about  $\frac{1}{2}$  as long as the sepals: drupe black, 10–11 mm. in diameter.—[INDIAN-CHERRY. YELLOW-WOOD. POLECAT-TREE.]—Shaded banks and hillsides, often in calcareous soils, various provinces, Fla. to Tex., Kans., and Va.—The bark is medicinal. The light-brown heart-wood is close-grained, light but rather hard.

7. **CEANOTHUS** L. Shrubs or trees. Leaves alternate: blades usually toothed, commonly 3-ribbed. Flowers perfect, white. Sepals 5, keelless. Petals 5, longer than the sepals, clawed, the blades hooded. Stamens 5, ex-

serted: anthers emarginate. Drupe lobed, separating into 3 carpels.—About 55 species, North American.—RED-ROOTS.

Leaf-blades toothed, membranous or nearly so.

Erect shrubs: leaves deciduous.

Common peduncle elongate.

Leaves 3–10 cm. long: corolla about 5 mm. wide.

Leaves 1–3 cm. long: corolla about 4 mm. wide.

Common peduncle abbreviated.

Twigs and branches viscid-puberulent: lower surface of the leaf-blades glabrous or with few scattered hairs.

Twigs and branches copiously pubescent: lower surface of the leaf-blades closely and permanently pubescent.

Low decumbent shrub: leaves 5–10 mm. long, persistent.

Leaf-blades entire, fleshy.

1. *C. americanus*.

2. *C. intermedius*.

3. *C. ovatus*.

4. *C. pubescens*.

5. *C. serpyllifolius*.

6. *C. microphyllus*.

1. *C. americanus* L. Shrub 2–9 dm. tall: leaf-blades ovate to ovate-lanceolate or rarely orbicular-ovate, prominently serrate: sepals about 1.5 mm. long: petals about 2 mm. long: fruit 5–6 mm. broad. —(NEW JERSEY TEA. RED-ROOT. RED-SHANK.)—Dry woods and hillsides, various provinces, Fla. to Tex., Man., and Me.—Spr.—sum.—The leaves were used as a tea substitute in colonial times. The root is used medicinally.

2. *C. intermedius* Pursh. Shrub 3–10 dm. tall: leaf-blades ovate to elliptic-ovate, or nearly elliptic, finely serrate: sepals about 1 mm. long: petals about 1.5 mm. long: fruit 4–5 mm. broad.—(RED-ROOT.)—Pine-lands and woods, Coastal Plain and occasionally adj. provinces, Fla. to La., Tenn., and Ga.—Spr.

3. *C. ovatus* Desf. Shrub 2–6 dm. tall: leaf-blades thinnish, elliptic, oval, or ovate, 1.5–6 cm. long, somewhat veiny: sepals ovate, about 1.5 mm. long: petals about 2 mm. long.—Sandy woods, various provinces, Fla. to Tex., Minn., Vt., and Ga.—Spr.

4. *C. pubescens* (T. & G.) Rydb. Shrub similar to *C. ovatus* in habit: leaf-blades relatively thick, ovate-elliptic to narrowly elliptic, usually prominently veined: sepals deltoid, about 1 mm. long: petals about 2 mm. long.—Dry soil, various provinces, rarely Coastal Plain, Ga. to Tex., Mich., and Va.—Spr.

5. *C. serpyllifolius* Nutt. Shrub with diffuse or decumbent, very slender or filiform branches: leaf-blades elliptic to ovate-elliptic, serrulate, strigose beneath: sepals mostly 1 mm. long and obtuse: petals about 1.5 mm. long.—Pinelands, Coastal Plain, Fla. and Ga.—Spr.—Rare.

6. *C. microphyllus* Michx. Plant 3–6 dm. tall, diffuse: leaf-blades suborbicular, oval, or elliptic, 3–6 mm. long: sepals acute or abruptly pointed: petals about 1.5 mm. long: anthers brown: fruit depressed, 4–5 mm. wide.—Dry pine-lands and sandhills, Coastal Plain, Fla., Ala., and Ga.—Spr.

8. **COLUBRINA** L. C. Rich. Shrubs or trees. Leaves alternate: blades entire or toothed, sometimes 3-nerved at the base. Flowers perfect. Sepals 5, spreading, often keeled. Petals 5, folded around the stamens, clawless. Sta-

mens 5: anthers notched. Drupe slightly 3-lobed, the carpels separating at least at the top.—About 15 species, with one exception tropical American.—Fall-spr. or all year.—The bark of some species is used as a substitute for hops.

Leaf-blades rather evenly pinnately veined: seeds shining, black.  
Leaf-blades 3-ribbed from the base: seeds gray, dull.

I. AMERICANAE.  
II. ASIATICAE.

#### I. AMERICANAE.

Leaf-blades mostly of an ovate type, neither prominently reticulate, nor copiously pubescent all over.

Drupe 4-6 mm. in diameter: pedicel abruptly dilated into the hypanthium: leaf-blades glabrate, at most not rusty tomentose.

Drupe 8-10 mm. in diameter: pedicel gradually dilated into the hypanthium: leaf-blades rusty-tomentose beneath.

Leaf-blades mostly of an elliptic type, prominently fine reticulate, and copiously pubescent all over.

1. *C. reclinata*.
2. *C. Colubrina*.
3. *C. cubensis*.

#### II. ASIATICAE.

A diffuse shrub, the dark-green leaf-blades shining.

4. *C. asiatica*.

1. *C. reclinata* (L'Her.) Brongn. Shrub or small tree becoming 20 m. tall, with puberulent twigs: leaf-blades ovate-elliptic or rarely oval or obovate, 3-8 cm. long: sepals about 2 mm. long: petals about 1.5 mm. long, yellow or greenish-yellow: drupe slender-pedicelled, seated on the hypanthium.—(NAKED-WOOD. SOLDIER-WOOD.)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—The dark-brown heart-wood is close-grained, heavy, and hard.

2. *C. Colubrina* (Jacq.) Millsp. Shrub or tree, with rusty-tomentose twigs: leaf-blades ovate, elliptic, or rarely oblanceolate, 5-15 cm. long: sepals about 2.5 mm. long: petals somewhat longer than those of *C. reclinata*, yellow, sometimes redtinged: drupe stout-pedicelled, partly immersed in the deep hypanthium.—(WILD-COFFEE.)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)

3. *C. cubensis* (Jacq.) Brongn. Shrub or small tree, with closely fine-pubescent twigs: leaf-blades elliptic, mostly 4-9 cm. long, prominently ribbed: sepals nearly 1.5 mm. long: petals about 1 mm. long: drupe slender-pedicelled, immersed in the hypanthium nearly or quite to the middle.—Hammocks, Everglade Keys, Fla.—(W. I.)—Rarely occurs as a woody vine climbing high into trees.

4. *C. asiatica* (L.) Brongn. Shrub with weak, diffuse or prostrate branches and glabrous twigs or sometimes erect and tree-like; leaf-blades ovate, 4-9 cm. long, acuminate or sometimes acute, crenate-serrate, glabrous, dark-green and shining above, truncate or cordate at the base, slender-petioled: sepals about 2 mm. long: petals nearly as long as the sepals, greenish: drupe subglobose, 7-10 mm. in diameter.—Hammocks and shores, S pen. Fla. and the Keys. Nat. of Asia.

9. *GOUANIA* Jacq. Shrubs or vines. Leaves alternate: blades broad. Flowers polygamous, the inflorescence-branches often tendril-bearing. Sepals

5, spreading. Petals 5, clawed, the blades scoop-like. Stamens 5, each surrounded by a petal. Drupe capsule-like, 3-winged, separating into 3 carpels.—About 40 species, widely distributed in the tropics.

1. *G. lupuloides* (L.) Urban. Climber: leaf-blades oval or elliptic, varying to ovate, 3–9 cm. long: spikes 6–15 cm. long: petals 1 mm. long, short-clawed, yellowish or greenish-yellow: drupe depressed, about 10 mm. broad. [*G. domingensis* L.]—(CHEW-STICK.)—Hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—The wood is used for cleaning the teeth.—Spr.—sum.

## FAMILY 2. VITACEAE — GRAPE FAMILY

Vines, sometimes bushy or tree-like, usually with tendrils. Leaves alternate, or the lower ones opposite: blades simple or compound. Flowers perfect, polygamous, or dioecious, in flat-topped or elongate clusters. Calyx of 4 or 5 sepals, or obsolete. Corolla of 4 or 5, often caducous, petals, or wanting. Androecium of 4 or 5 stamens opposite the petals. Gynoecium of usually 2 united carpels. Fruit a berry.—About 10 genera and 500 species, widely distributed.

Hypogynous disk present, either annular, cup-shaped, or glandular: leaf-blades simple or ternately compound.

Petals cohering into a cap, caducous, never separating.

Bark shreddy: pith interrupted by diaphragms at the nodes: tendrils forking.

Bark not shreddy: pith continuous through the nodes: tendrils simple.

Petals distinct, spreading.

Floral envelopes mostly in 4's: disk 4-lobed: plant-tissues fleshy.

Floral envelopes mostly in 5's: disk entire or nearly so: tissues not fleshy.

Hypogynous disk wanting or obsolete: leaf-blades digitately 5–7-foliate.

1. VITIS.
2. MUSCADINIA.
3. CISSUS.
4. AMPELOPSIS.
5. PARTHENOCISSUS.

1. *VITIS* [Tourn.] L. Woody vines. Leaf-blades palmately lobed, angled or coarsely toothed. Flowers in elongate racemes or panicles, green. Calyx minute. Petals cohering. Berry juicy, mostly edible. Seed pyriform.—About 40 species, widely distributed in warm and temperate regions.—Spr.—GRAPES.—Some species have been cultivated in many varieties from very ancient times, for the fruit. Some of our native species are represented in many hybrids which are grown commercially for their fruits.

Leaf-blades green and glabrous beneath at maturity, or merely cobwebby about the nerves or in their axils.

Leaf-blades merely toothed, or sometimes angled or shallowly lobed.

Low shrub.

Elongate, trailing or climbing vines.

Shoots terete, glabrous or early becoming so: leaf-blades usually lustrous above.

Shoots angled, pubescent throughout the year: leaf-blades not lustrous on either side.

Leaf-blades prominently lobed.

Lobes and sinuses of the leaf-blades acute: berries with a bloom.

1. *V. rupestris*.
2. *V. cordifolia*.
3. *V. Baileyana*.
4. *V. vulpina*.

Lobes of leaf-blades acuminate: sinuses obtuse: berries destitute of any bloom.  
 Leaf-blades at maturity densely woolly, or glaucous and sparingly cobwebby-flocculent beneath.

Lower surface of leaf-blades very glaucous, and pale, glabrate, the veins tawny pubescent.

Lower surface of leaf-blades more or less woolly or cobwebby.

Leaf-blades cobwebby or flocculent beneath at maturity.

Young foliage gray-cobwebby or white-tomentose: leaf-blades gray-cobwebby beneath.

Young foliage ferrugineous-pubescent, at least on the nerves of the leaf-blades.

Berry 12 mm. or more in diameter.

Berry 5-6 mm. in diameter.

Twigs and petioles tomentose: panicle-branches felty-flocculent, at least during anthesis.

Twigs, and often petioles, glabrous or nearly so: panicle-branches not felty-flocculent.

Leaf-blades felt-like or densely tomentose beneath at maturity.

Tendrils, or flower-clusters, intermittent, usually every third node without tendril or inflorescence.

Leaf-blades densely tomentose with white hairs: berries less than 12 mm. in diameter.

Leaf-blades densely tomentose with rusty or tawny hairs.

Tendrils continuous, usually every node with a tendril, or inflorescence.

5. *V. palmata*.

6. *V. bicolor*.

7. *V. cinerea*.

8. *V. Linsccomii*.

9. *V. rufotomentosa*.

10. *V. aestivalis*.

11. *V. coriacea*.

12. *V. Simpsonii*.

13. *V. Labrusca*.

1. *V. rupestris* Scheele. Stems 1-2 m. tall: leaf-blades commonly broader than long, reniform to ovate-reniform, 4-10 cm. in diameter, coarsely toothed and rarely slightly, and sometimes somewhat irregularly, lobed, and with an abrupt tip at the apex, mostly lustrous above, glabrous or sparingly pubescent. on the veins beneath, somewhat glaucescent on both sides: panicles 2-10 cm. long, slender, not dense: berry subglobose, 7-14 mm. in diameter, purple-black, somewhat glaucous, pleasant-tasted. — (SAND-GRAPE. SUGAR-GRAPE.) — River-banks and hillsides, various provinces, N of Coastal Plain, Tenn. to Tex., Mo., Pa., and Va.

2. *V. cordifolia* Lam. Leaf-blades thin, deep-green, longer than broad, commonly ovate in outline, rarely 3-lobed or 3-angled near the apex, rather coarsely and irregularly toothed, glabrous or sometimes sparingly pubescent beneath when young, more or less deeply cordate at the base (persistent and lustrous in *V. cordifolia sempervirens*): panicles 1-3 dm. long, commonly drooping: berry globose, 8-10 mm. in diameter, black under a slight bloom, pleasantly acid, persistent.—(FROST-GRAPE. CHICKEN-GRAPE.)—Woods, thickets, and stream-banks, various provinces, Fla. to Tex., Nebr., Wis., and N. Y.

3. *V. Baileyana* Munson. Leaf-blades thinnish but firm, ovate or orbicular-ovate, 5-10 cm. long, glabrous and somewhat rugose above in age or pubescent on the nerves beneath, toothed, otherwise entire or angularly 3-lobed near the apex, cordate at the base: panicles 8-13 cm. long, compact: berry globose, 7-10 mm. in diameter, black, destitute of bloom or nearly so.—Woods and mountain slopes, Blue Ridge and Appalachian Plateau, Ga. to Ala. and W. Va.

4. *V. vulpina* L. Leaf-blades thin, commonly longer than broad, 5-20 cm. broad, mostly sharply 3-lobed and coarsely and irregularly toothed, glabrate or pubescent on and about the nerves beneath, cordate or nearly truncate at the base, the teeth and lobes acuminate: panicles 6-20 cm. long, often much branched: berry globose, 8-10 mm. in diameter, very dark with a copious bloom, the pulp sour.—(RIVERSIDE-GRAPE. FROST-GRAPE.)—Rocky banks and along streams, various provinces, rarely Coastal Plain, Ala. to Miss., Colo., Man., N. B., and Md.

5. *V. palmata* Vahl. Leaf-blades thin, deeply 3-5-lobed and very coarsely toothed, green and glabrous on both sides or glaucescent beneath and sparingly pubescent on the nerves, cordate at the base: panicles 5-12 cm. long, slender: berry subglobose, 7-10 mm. in diameter, black, destitute of any bloom.—(RED-GRAPE. CAT-GRAPE.)—Sandy banks and rocky places, various provinces, Tenn. to La., Tex., and Ind.

6. *V. bicolor* Le Conte. Leaf-blades thinnish, mostly longer than broad, 1-3 dm. in diameter, 3-5-lobed, shallowly toothed, glabrous above, pale and very glaucous and glabrous beneath or the veins usually pubescent, glabrous or glabrate at maturity: panicles 5-10 cm. long, commonly long-peduncled: berry globose, 10-14 mm. in diameter, black beneath the bloom, rather sour but pleasant-tasted.—(SUMMER-GRAPE. BLUE-GRAPE. WINTER-GRAPE.)—Rocky woods and river-banks, various provinces, N of Coastal Plain, Ala. to Mo., N. H., and N. C.

7. *V. cinerea* Engelm. Leaf-blades thinnish, mostly longer than broad, 8-20 cm. in diameter, shallowly toothed, otherwise entire, or distinctly angularly 3-lobed near the apex, cowebby above or glabrous and rugose in age, more or less softly pubescent beneath with ashy or dark-brown webby hairs, cordate at the base: panicles 1.5-3 dm. long, irregular, drooping: berry subglobose, 10-14 mm. in diameter, black, barely glaucous, rather numerous.—(DOWNY-GRAPE. SWEET WINTER-GRAPE.)—Woods and stream-banks, various provinces, Fla. to Tex., Nebr., and Ill.

8. *V. Linsecomii* Buckl. Leaf-blades firm, as long as broad or a little longer than broad, 3-lobed and toothed, cordate, glabrate above, densely cobwebby or glabrate beneath (glaucous-blue beneath, except the rusty veins, in *V. Linsecomii lactea*): panicles 5-10 cm. long: berry subglobose, mostly 12-20 mm. in diameter, black beneath the bloom, pleasantly tasted.—Dry oaklands, various provinces, Tenn. to La., Tex., and Mo.

9. *V. rufotomentosa* Small. Leaf-blades suborbicular to ovate-orbicular, 10-20 cm. long, or sometimes shorter, dull-green above, finely and closely tomentose on the veins, otherwise cobwebby beneath, especially rusty on and about the nerves, rather coarsely and irregularly toothed, cordate at the base: panicles rather small, or ample, sometimes 2.5-3 dm. long: peduncles much shorter than the panicles: berry black, with little or no bloom, often 5-6 mm. in diameter.—(WILD-GRAPE.)—Hammocks, Coastal Plain, Fla. to La.

10. *V. aestivalis* Michx. Leaf-blades varying from broader than long to longer than broad, 1-3 dm. in diameter, angularly or deeply 3-5-lobed, shallowly toothed, dull-green and glabrate above, more or less densely, often unevenly, cobwebby or flocculent beneath, with rusty or brown hairs, cordate; petioles usually glabrous: panicles 1-2.5 dm. long, often conspicuously elongate and rather simple: berry globose, 8-10 mm. in diameter, black, under a bloom, with a tough skin, and pulp varying from sweet to very astringent.—(SUMMER-GRAPE. PIGEON-GRAPE.)—Thickets and rocky places, various provinces, Fla. to Tex., Kans., and N. H.

11. *V. coriacea* Shuttlw. Leaf-blades reniform to suborbicular in outline, 3-10 cm. broad, shallowly toothed, angularly lobed (those of shoots often deeply lobed), becoming glabrate above, felty beneath, cordate or truncate and subcordate: panicles 5-12 cm. long: berry subglobose, less than 12 mm. in diameter, pleasantly acid.—Hammocks, pen. Fla.—(*W. I.*)

12. *V. Simpsonii* Munson. Leaf-blades suborbicular in outline, 5-18 cm. broad, prominently or mostly deeply 3-5-lobed, and shallowly toothed, glabrate above, more or less densely tawny- or rusty-tomentose beneath, cordate: panicles 5-10 cm. long, usually compact: berry commonly 15 mm. in diameter, black, mostly 4-seeded.—Sandy soil, especially in scrub and on shell mounds, pen. Fla.

13. *V. Labrusca* L. Leaf-blades thickish, suborbicular to broadly ovate, mostly longer than broad, shallowly toothed or scalloped, otherwise entire, or 3-lobed near the apex, glabrate above, densely tomentose or felty beneath: panicles 5-12 cm. long, usually simple: berry globose, 1.5-2 cm. in diameter, amber to purple, with a slight bloom, the skin and tough pulp sweet and musky, or astringent.—(FOX-GRAPE. PLUM-GRAPE.)—Thickets and woods, various provinces, Ga. to Miss., Ind., and Vt.

2. **MUSCADINIA** Small. Vines. Leaf-blades angled or coarsely toothed. Flowers in racemes or panicles, green. Calyx minute. Petals cohering. Berries rather juicy, ultimately edible.—Two species.—SCUPPERNONGS.

Berries 1.5-2.5 cm. in diameter; the skin and pulp tough, the latter musky: seed 6-9 mm. long. 1. *M. rotundifolia*.

Berries 1-1.5 cm. in diameter; the skin and pulp tender, the latter acid: seed 3-5 mm. long. 2. *M. Munsoniana*.

1. *M. rotundifolia* (Michx.) Small. Leaf-blades firm or leathery, suborbicular to ovate-orbicular, 4-9 cm. in diameter or larger, usually acuminate, coarsely toothed, glabrous, except the axils and sometimes the nerves beneath, cordate: berry subglobose, dull-purple, without bloom, with musky pulp, the bunches globular.—(MUSCADINE. SOUTHERN FOX-GRAPE. SCUPPERNONG.)—Thickets, swamps, river-banks, and hammocks, various provinces, Fla. to Tex., Kans., and Del.—(*Mex.*)—Spr.-sum.

2. *M. Munsoniana* (Simpson) Small. Leaf-blades thinnish, but rather firm, suborbicular or reniform, 4-8 cm. broad, coarsely toothed, glabrous, except the axils of the vein beneath, persistent, cordate at the base: berry globose, 1-1.5 cm. in diameter, nearly black under a slight bloom or shining, the skin and pulp tender, acid: seed 3-5 mm. long.—[? *Vitis peltata* Raf.]—(BULLACE-GRAPE.)—Hammocks and scrub, Fla. and Ga.—(*W. I.*)—Spr.-fall, or all year S.

3. **CISSUS** L. Fleshy vines. Leaf-blades simple or 3-foliolate. Flowers in small cymes, green. Petals spreading. Berry inedible.—About 225 species, tropical.—Spr.-sum. or all year S.—POSSUM-GRAPE.

Leaf-blades 3-foliolate, the leaflets coarsely toothed.

Flowers in trichotomous cymes: berry thickest above the middle.

1. *C. incisa*.

Flowers in compound umbel-like cymes: berry thickest below the middle.

2. *C. trifoliata*.

Leaf-blades simple, distantly serrate.

3. *C. sicyoides*.

1. *C. incisa* Desmoul. Plant glabrous: leaf-blades 3-foliolate; leaflets pale-green, very fleshy, 3–10 cm. long, coarsely toothed and incised, the terminal one sometimes 3-lobed, the lateral ones 2-lobed, all more or less cuneately narrowed at the base, on stout petiolules: berry obovoid or obovoid-globose, 10–12 mm. long, apiculate.—(MARINE-IVY.)—Sand-dunes and hammocks, various provinces, Fla., except the Florida Keys, to Tex., Kans., and Mo.—Sum.

2. *C. trifoliata* L. Plant glabrous: leaf-blades 3-foliolate; leaflets 1–3 cm. long, sub-orbicular varying to ovate or obovate, often flabellate: berry globose-ovoid or ovoid, abruptly pointed, 5–7 mm. in diameter, dark-purple. [*C. acida* L.]—(SORREL-VINE.)—Hammocks, mostly near the coast, S pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—Sum.

3. *C. sicyoides* L. Plant pubescent: leaf-blades ovate or elliptic-ovate, 2–8 cm. long, acute or often acuminate: berry subglobose, about 1 cm. in diameter, black.—The inflorescence is often infected by a fungus, *Ustilago Cissi*, which transforms the flowers into cigar-shaped bodies.—Hammocks, S pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—Spr.-fall or all year S.

4. **AMPELOPSIS** Michx. Woody vines. Leaf-blades simple or bipinnate; flowers in flat cymes, green. Petals spreading. Berry inedible.—About 15 species, of temperate and tropical regions.

Leaf-blades simple: ovary not surpassing the disk but nearly free from it.

Calyx scarcely lobed: petals elliptic, about 2.5 mm. long.

Calyx prominently lobed: petals broadly ovate or sub-orbicular, about 1.5 mm. long.

Leaf-blades bipinnate: ovary surpassing the disk, the latter mostly adnate to it.

1. *A. cordata*.

2. *A. heterophylla*.

3. *A. arborea*.

1. *A. cordata* Michx. Leaf-blades ovate or triangular-ovate, 4–12 cm. long, shallowly serrate, long-petioled: style slender: berry 6–8 mm. in diameter, bluish or greenish-blue. [*Cissus Ampelopsis* Pers.]—River-banks and woods, various provinces, Fla. to Tex., Nebr., and Va.—Spr.

2. *A. heterophylla* Sieb. & Zucc. Leaf-blades broadly ovate, or deltoid in outline, 3–8 cm. long, crenate, short petioled: style stoutish: berry light-blue or white, dark-spotted.—Cult. grounds, various provinces, Ga. to N. C. and locally elsewhere. Nat. of E. Asia and cult.—Sum.-fall.

3. *A. arborea* (L.) Rusby. Leaf-blades bipinnate, 1–2 dm. long; leaflets several or many, the blades ovate, often broadly so or cuneate-obovate, 1–3 cm. long, coarsely toothed, incised, or lobed: berry 10–13 mm. in diameter, dark-purple. [*Cissus stans* Pers.]—(PEPPER-VINE.)—Hammocks, low thickets and swamps, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Mo., and Va.—(W. I., Mex.)—Spr.-fall.

5. **PARTHENOCISSUS** Planch. Vines, the tendrils often disk bearing. Leaf-blades digitately compound. Flowers in compound cymes, green. Petals spreading. Berry inedible.—About 10 species, North American and Asiatic.—**VIRGINIA-CREEPERS. WOODBINES. AMERICAN-IVIES.**

Twigs, tendrils, and leaves pubescent.  
Twigs, tendrils, and leaves glabrous.

1. *P. hirsuta*.
2. *P. quinquefolia*.

1. *P. hirsuta* (Donn.) Small. Leaflets 5; blades oval, elliptic, or ovate, acute or short-acuminate, coarsely toothed above the middle, all except the terminal one: berry 7–8 mm. in diameter, dark-blue, with a slight bloom, slightly pulpy: seed 5 mm. long, glossy, notched at the top, with a conspicuous spatulate raphe.—Rocky places, various provinces, Ga. to Tex.—(*Mex.*)—Spr.

2. *P. quinquefolia* (L.) Planch. Leaflets 5; blades usually thinnish, oval or elliptic, the lateral ones inequilateral, coarsely serrate above the middle with rather appressed teeth: tendrils with disks: berry 8–9 mm. in diameter, deep-blue with scant bloom, pulpy: seed 4–4.5 mm. long, prominently rugose, mostly rather dull, with an orbicular raphe.—(**VIRGINIA-CREEPER. WOODBINE. AMERICAN-IVY.**)—Woods, thickets, sand-dunes, and hammocks, various provinces, Fla. to Tex., Man., and Que.—(*W. I., Mex.*)—Spr. or all year S.—The bark is used medicinally.

## ORDER MALVALES — MALVAL ORDER

Herbs, shrubs, or trees. Leaves alternate or opposite: blades simple, often lobed and toothed. Flowers mostly perfect, regular and involucre. Calyx of distinct or partially united sepals. Corolla of distinct petals. Androecium of numerous monadelphous or grouped stamens. Gynoecium of several distinct or united carpels. Fruit capsular, follicular, berry-like, or nut-like.

Stamens numerous (in our genera).

Stamens distinct or in several groups: anthers 2-celled.

Stamens monadelphous: anthers 1-celled.

Stamens as many as the sepals.

- Fam. 1. TILIACEAE.  
Fam. 2. MALVACEAE.  
Fam. 3. BUETTNERIACEAE.

## FAMILY 1. TILIACEAE — LINDEN FAMILY

Shrubs or trees, or rarely herbs. Leaves mostly alternate: blades simple. Flowers usually perfect. Calyx of 4 or 5 sepals. Corolla of 4 or 5 petals which sometimes bear a petaloid scale at the base. Androecium of usually numerous stamens, sometimes of as many or twice as many as the sepals. Gynoecium of 2–several united carpels. Fruit capsular, nut-like, or berry-like.—About 35 genera and 275 species, widely distributed.

Peduncles or pedicels without a conspicuous bract: filaments not forked: fruit capsular.

Petals inserted with the stamens: capsule often silique-like.

Petals inserted below the stamens, at the base of an elevated receptacle: capsule subglobose.

1. CORCHORUS.
2. TRIUMFETTA.

Peduncles each with a conspicuous adnate bract: filaments forked: fruit nut-like.

## 3. TILIA.

1. **CORCHORUS** [Tourn.] L. Herbs or small shrubs. Leaf-blades serrate. Sepals 5, or rarely 4, unappendaged at the tip. Petals 5 or rarely 4, naked at the base, larger than the sepals, yellow. Anther-sacs contiguous. Ovary elongate. Ovules numerous. Capsule many-seeded.—About 40 species, mostly tropical.—**JUTES. JEW'S-MALLOWS.**—The fibrous bark of some species form at least part of the jute of commerce.

Capsule long (4 cm. or more) and narrow, neither angled nor winged: leaf-blades without basal appendages, the teeth not bristle-tipped: seed about 1 mm. long.

Petals of a spatulate type, often linear-spatulate: capsule with a single beak.

Petals of an obovate type, often rhombic-obovate: capsule with 4 tooth-like beaks.

Capsule short (2 cm. or less) and stout, angled and winged: leaf-blades with a pair of basal bristle-tipped appendages, the teeth bristle-tipped: seed much less than 1 mm. long.

1. *C. orinocensis*.2. *C. siliquosus*.3. *C. acutangulus*.

1. *C. orinocensis* H. B. K. Stem usually sparingly branched: leaf-blades ovate, elliptic, or lanceolate, 2–6 cm. long, acute or acutish, crenate-serrate, short-petioled: flower-clusters sessile: sepals linear to narrowly linear-lanceolate, 5–6.5 mm. long or rarely longer: petals spatulate, mostly 4.5–6 mm. long: capsule slender, 4–7 cm. long, subulate-beaked, finely pubescent.—Hammocks, waste-places, and roadsides, Coastal Plain and southwestern provinces, Fla. to Tex. and Ariz.—(*W. I., Mex., C. A., S. A.*)—All year.

2. *C. siliquosus* L. Stem often widely much-branched: leaf-blades ovate, oval-ovate, or elliptic-lanceolate, mostly 1–3 cm. long, sometimes longer, mostly acute, serrate, short-petioled: flower-clusters sessile: sepals nearly linear, 6–8 mm. long, acuminate: petals rhombic-obovate, 4.5–5.5 mm. long: capsule slender, 5–8 cm. long, 4-beaked at the truncate apex, obscurely pubescent.—Hammocks, roadsides, and cult. grounds, S Fla.—(*W. I., Mex., C. A., S. A.*)—All year.

3. *C. acutangulus* Lam. Stem finely pubescent, 1 m. tall or less, widely branched: leaf-blades elliptic-ovate, ovate, or orbicular-ovate, 2.5–7.5 cm. long, acute or acutish, crenate-serrate, slender-petioled: flower-clusters nearly sessile: sepals linear to linear-lanceolate, 4–4.5 mm. long: petals spatulate, 4–5 mm. long: capsule stout, 1–2 cm. long, the angles winged, each with 5 spreading or recurved beaks.—Waste-places and roadsides, W Fla. Nat. of E. I.—(*W. I., S. A.*)—Spr.-fall.

2. **TRIUMFETTA** [Plum.] L. Herbs or shrubs. Leaf-blades mostly toothed and lobed. Sepals 5, often appendaged at the tip. Petals 5, each with a pit at the base, often shorter than the sepals, yellow, or rarely wanting. Anther-sacs contiguous. Ovary globular. Ovules few. Capsules few-seeded.—About 70 species, of warm and tropical regions.—**BURWEED.**

Twigs hirsute: capsule-body glabrous or with scattered hairs: the prickles as long as its diameter or longer.

Twigs softly pubescent: capsule-body cinereous-tomentulose: the prickles shorter than its diameter.

1. *T. semitriloba*.2. *T. Bartramia*.

1. **T. semitriloba** Jacq. Plants stellate-tomentose, 1-2 m. tall: leaf-blades ovate, rhombic, or suborbicular, serrate, angulate or 3-lobed, 3-8 cm. long: sepals linear, 5-6 mm. long, or longer: petals cuneate-spatulate or linear-spatulate: capsule-body 4-5 mm. in diameter, rigidly prickle-armed.—Pinelands, hammocks, and cult. grounds, pen. Fla. and the Keys. Nat. of S. Am.—(*W. I., Mex., C. A., S. A.*)—The bark yields a fiber similar to jute.

2. **T. Bartramia** L. Plants pubescent, fully 2 m. tall or less, usually widely branched: leaf-blades reniform, suborbicular, ovate or elliptic, commonly 1 dm. long or less, 3-5-lobed and toothed, cuneate to nearly truncate at the base; petioles shorter than the blades: panicles elongated, much interrupted: sepals linear or nearly so, 5-6 mm. long: petals spatulate, commonly shorter than the sepals: capsule-body 2.5-3.5 mm. in diameter, weakly prickled-armed.—Cult. grounds, waste-places, and roadsides, W Fla. Nat. of trop. Am.—(*W. I.*)—Spr.—fall.

3. **TILIA** L.<sup>1</sup> Trees with roundish stoutish branchlets without terminal buds, the large acute axillary buds covered with numerous imbricate scales. Leaves deciduous: blades long-petioled, cordate, truncate, or cuneate at base, generally more or less oblique, mucronate-crenate: stipules caducous. Flowers in axillary or terminal cymes or corymbs, the peduncle more or less adnate to a reticulate bract. Sepals 5, distinct, alternate with the five white or yellow petals opposite each one of which in our species, stands a spatulate staminodium or petal-like scale. Stamens borne in clusters of five on the receptacle: filaments united at base and adnate to the staminodia, forked near apex, each branch bearing an extrorse anther-sac. Ovary sessile, 5-celled: stigmas 5. Fruit woody, nut-like, sometimes ribbed, 1-celled, 1- or 2-seeded, globose or subglobose.—About 65 species, in the Northern Hemisphere.—Spr.—early Sum.—BASSWOODS. LINDENS.—The wood is soft, light, pale, and straight-grained, and the inner bark is fibrous. The flowers are fragrant and yield fine honey, and are used medicinally. The European-lime, *Tilia europaea* L., without staminodia in the flowers, is often planted, and yields lime-flower oil used as a perfume. The leaves are variable in shape and pubescence, marked differences sometimes being found on the same tree. Leaves from suckers and new shoots are not so serviceable in identification as those on flowering branches.

Leaf-blades pubescent beneath at maturity.

Hairs, when present, all stellate and closely appressed.

Leaf-blades with brown or rusty pubescence beneath.

Leaf-blades obliquely cordate at the base.

Bracts mostly gradually narrowed to a peduncle above the base.

Bracts mostly abruptly narrowed to or nearly to the base of the peduncle.

Leaf-blades obliquely truncate at the base.

Bracts 1-1.5 cm. wide.

Bracts over 1.5 cm. wide.

Leaf-blades with white, gray, or silvery-gray pubescence beneath. (Sometimes brown in No. 7).

1. *T. neglecta.*
2. *T. caroliniana.*
3. *T. porracea.*
4. *T. georgiana.*

<sup>1</sup> Contributed by Benjamin Franklin Bush.

Bracts mostly gradually narrowed to the peduncle above the base.

Sepals pubescent on the outside, with short, felt-like hairs.

Sepals nearly glabrous outside, with few scale-like hairs.

Bracts mostly abruptly narrowed to the base of the peduncle.

Leaf-blades gray or silvery-gray beneath.

Leaf-blades white beneath.

Hairs on branchlets, peduncles, and pedicels long and spreading.

Leaf-blades glabrous beneath at maturity.

Bracts more or less pubescent at anthesis.

Bract 0.5-2 cm. wide.

Bract 3-4 cm. wide.

Bracts glabrous at anthesis.

Leaves not glaucous beneath: cymes loosely few-flowered.

Leaves glaucous beneath: cymes compactly many-flowered.

Bract 1.5-2 cm. wide: staminodia erose.

Bract 3-4 cm. wide: staminodia entire.

5. *T. Michauxii*.

6. *T. truncata*.

7. *T. heterophylla*.

8. *T. eburnea*.

9. *T. lasioclada*.

10. *T. littoralis*.

11. *T. glabra*.

12. *T. leucocarpa*.

13. *T. floridana*.

14. *T. australis*.

1. *T. neglecta* Spach. Tall tree, with deeply furrowed and scaly reddish-brown bark, often pendulous branches, and slender glabrous branchlets: leaf-blades thick, acute or abruptly acuminate, obliquely concave, or unsymmetrically cordate at base, coarsely mucronate-crenate, dark-green, smooth and lustrous above, covered below, except on the midrib and veins with a short persistent pubescence and with conspicuous axillary tufts, 10-15 cm. long, 8-12 cm. wide: flowers 5-15 together in long-branched glabrous cymes: peduncles slender, glabrous, the free portion 3-4 cm. long: bract narrow, long-attenuate to the base, rounded at the apex, glabrous, 7-11 cm. long, 2-4 cm. wide: sepals broadly ovate, ciliate, glabrous without, pilose with long white hairs within, half as long as the lanceolate petals. [*T. americana* Marsh. Not L.]—Rich moist ground, often in woods, various provinces, rarely Coastal Plain, N. C. to N. Miss., N. Y., Que., and W. Mass.

2. *T. caroliniana* Mill. Large tree, with slender reddish branches: leaf-blades ovate, 7-11 cm. long, abruptly long-pointed, oblique, truncate, or cordate at base, coarsely mucronate-crenate with broad gland-tipped teeth, coated below with a rusty or pale detaching stellate pubescence, at first hoary-tomentose, the upper surface glabrous, dark and lustrous at maturity: flowers 8-15 together in small, stout-branched, pubescent cymes: peduncle slender, pubescent, the free portion 2-3.3 cm. long: bract linear-elliptic, 10-12 cm. long, sessile or nearly so, becoming glabrous or glabrate: sepals ciliate, brown and pubescent without, bearing long white hairs within. [*T. pubescens* Ait. *T. apposita* Ashe *T. lata* Ashe]—Woods, Coastal Plain, Ga. to N. C.; also W. La. to S. W. Ark., and rather generally in Tex. to the Edwards Plateau.

3. *T. porracea* Ashe. Tree: leaf-blades on flowering branches elliptic-ovate, 8-10 cm. long, taper-pointed, about twice as long as broad, cuneate at base or rounded on one side, mucronate-crenate with gland-tipped teeth, dull blue-green above, pale grayish-green below, the early appressed straight pubescence deciduous by flowering time, or a little easily detached fascicled pubescence remaining; corymbs 7-15 flowered, pubescent; peduncle slender, pubescent, the free portion 2-3.5 cm. long; bract linear-elliptic or lingulate, often falcate, finally glabrous, 4-8 cm. long, narrowed to the rounded sessile base: sepals

pubescent without, long silky within at the base, three-fourths as long as the elliptic, obtuse petals, not longer than the staminodia.—Hammocks, Okaloosa Co., Fla.

4. *T. georgiana* Sarg. Small tree, with the slender branchlets at first pale-pubescent and rusty, ultimately red-brown and glabrous: leaf-blades ovate, abruptly short-pointed, cordate, oblique, or truncate at base, coarsely mucronate-crenate, reddish and tomentose when unfolding, ultimately dark yellow-green and scabrate above and covered below with a thick pale or reddish tomentum, or glabrous in autumn, conspicuously reticulate-veined: flowers 10–15 together in pubescent compact corymbs: peduncle slender, densely pubescent, the free portion 2.5–4 cm. long: bract linear-elliptic to spatulate, pubescent or becoming nearly glabrous, 6.5–10 cm. long: sepals ovate, half as long as the lanceolate-acuminate petals.—Hammocks, Coastal Plain, C Fla. to S. C.

5. *T. Michauxii* Nutt. Tree similar to *T. heterophylla*, but the leaf-blades longer and narrower, generally abruptly acute and obliquely cordate, the vein-axils generally without axillary tufts: flowers in puberulent cymes; peduncle glabrescent, the free portion 3.5–5 cm. long: bract oblanceolate to spatulate, occasionally linear-elliptic, 9–12 cm. long: sepals pubescent and ciliate without, tomentose within: petals lanceolate.—Woods, various provinces, though rarely Coastal Plain or higher mountains, Ga. to Miss., Ark., Mo., S Ill., and S N. Y.

6. *T. truncata* Spach. Large tree, with stout glabrous branchlets, which are bright-red the first season and later brown, the bark of the trunk furrowed and scaly: leaf-blades ovate or ovate-elliptic, or triangular-ovate, abruptly acuminate, obliquely cordate at the base, deeply crenate-serrate, dark-green and lustrous above, hoary-tomentose below, 10–18 cm. long, 8–10 cm. wide: flowers 7–10, in glabrous cymes: peduncle glabrous, slender, the free portion 3.5–4 cm. long: bract elliptic, obtuse, glabrous, 5–7 cm. long: sepals ovate, pale-pubescent outside, silky inside, half as long as the lanceolate petals. [*T. cinerea* Raf. *T. monticola* Sarg.]—Wooded hills, Blue Ridge to Appalachian Plateau, N. C. to Tenn. and Va.

7. *T. heterophylla* Vent. Large tree, with slender, glabrous reddish or yellowish-brown branchlets: leaf-blades ovate, gradually narrowed to the acuminate apex, obliquely truncate or slightly cordate at base, pubescent above at unfolding but at maturity dark-green and glabrous above, with the lower surface covered with thick firmly attached pale (sometimes brown) tomentum, the vein-axils with rusty tufts, mucronate-crenate with gland-tipped teeth, 8–12 cm. long; flowers 10–12 together in pubescent more or less corymbs; peduncle glabrous, the free portion generally 3–4 cm. long, or sometimes less: bract linear-elliptic to oblanceolate or spatulate, unsymmetrically cuneate at base, finally glabrous, 10.5–15 cm. long: sepals pale-pubescent without, villous within: petals lanceolate. [*T. tenera* Ashe]—Wooded slopes, various provinces, though rarely Coastal Plain or higher Appalachians, N Fla. to S Ind. and W. Va.

8. *T. eburnea* Ashe. Tall tree, with dark gray-brown furrowed bark on the trunk and smooth silver-gray bark on the branches, the twigs stout, 5–6 mm. thick, soft, glabrous, occasionally sparingly glaucous, those of the first season bright-green, brown, or red-brown, becoming gray the second year, the buds large and glaucous: leaf-blades ovate or round-ovate, 8–14 cm. long, abruptly acuminate, obliquely cordate or truncate at the base, sharply mucronate-crenate, thick, dark-green and glabrous above, densely pubescent beneath with soft ivory-white hairs which are sometimes deciduous by autumn: bract linear-elliptic or spatulate, 10–20 cm. long, or occasionally shorter, glabrate above, often pubescent beneath, nearly sessile: ovary coarsely brown-pubescent.—Rich soil and cool glens, various provinces, N W Fla. to N. C., in Coastal Plain only in the former State.

9. *T. lasioclada* Sarg. Large tree, becoming 20 m. tall: leaf-blades thick, ovate, 10–15 cm. long, abruptly acuminate, finely mucronate-crenate with gland-tipped teeth, bright-green and lustrous above, covered below with a thick, pale-brown or rufous, easily detached stellate pubescence: petioles at first with long spreading hairs mixed with fascicled hairs: flowers mostly 10–15 together in small, branched cymes shorter than the bract, the branches with long spreading hairs, the free portion 2.5–3 cm. long; bract linear-elliptic to spatulate, abruptly tapering to a short peduncle: sepals acute, pubescent without, villose within, about one-third as long as the lanceolate acuminate petals, about the same length as the staminodia.—Rich soil, Coastal Plain and Piedmont, Fla. to S. C., so far as known only the Valleys of the Apalachicola and Savannah Rivers—Distinct from all other American species in its long and spreading hairs on the branchlets, veins of the leaves, and the peduncle and branches of the inflorescence.

10. *T. littoralis* Sarg. Tree, the branchlets slender, reddish or purplish and pale-pubescent the first season, becoming glabrous and light gray-grown: leaf-blades ovate, 8–12 cm. long, 8–10 cm. wide, abruptly short-pointed, unsymmetrically rounded on one side at base, and cuneate at the other, finely serrate, at first tomentose, soon glabrous and even glaucous beneath, pale yellow-green above, only the vein-axils bearing conspicuous rusty tufts: flowers 9–15 together in small compact pubescent cymes: peduncle somewhat pubescent, the free portion 2–2.5 cm. long: bract oblanceolate, 5–17.5 cm. long, glabrous but for the ciliate margins and pubescent midrib beneath: sepals pale-pubescent without, villose on the margins and with long white hairs within: petals acuminate.—Coast and Sea-Islands of Ga.

11. *T. glabra* Vent. Tall tree, with stout, red, ultimately glabrous branchlets: leaf-blades broadly ovate, 10–18 cm. long, 10–15 cm. wide, abruptly acuminate, cordate, obliquely-cordate, or truncate at base, coarsely serrate-crenate with gland-tipped teeth, at first coated with pale tomentum, soon glabrous, dark yellow-green above, pale beneath, the vein-axils without axillary tufts: flowers 10–15 together in broad, slender-branched, nearly glabrous cymes: peduncle stout, glabrous, red, the free portion 2.5–4 cm. long: bract elliptic to obovate, gradually narrowed to the base, 8–16 cm. long: sepals one-third shorter than the lanceolate petals. [*T. venulosa* Sarg. *T. fulva* Raf.]—Cool upland woods, Blue Ridge and Appalachian provinces, N. C. to Tenn., and E Ky.

12. *T. leucocarpa* Ashe. Small tree, with pale furrowed bark, narrow crown, and rather slender, glabrous, orange or red-brown branchlets: the winter-buds dull-red, ovoid: leaf-blades thin, variously ovate, 10–15 cm. long, 8–10 cm. wide, abruptly pointed unsymmetrically cordate or truncate at base, coarsely mucronate-crenate with glandular teeth, on unfolding dark-red and sparsely pubescent, soon glabrous or with small axillary tufts in the vein-axils beneath, dark-green above, pale and lustrous beneath: flowers usually 10–12, or sometimes as many as 40 together in long-branched pubescent cymes: peduncle glabrous: bract linear-lingular, sometimes broadly-lingular, 8–10 cm. long, usually 1.5 cm. wide, or occasionally 2.5 cm. broad, nearly sessile: sepals acute, rusty-tomentose without, glabrous within. [*T. nuda* Sarg.]—Woods, Coastal Plain and adj. provinces, Ala. to E Tex., S E Okla., and S W Ark.—Closely similar to *T. americana* L., of the northern States, differing chiefly in its densely tomentose pedicels.

13. *T. floridana* Small. Small tree, with furrowed bark and slender red-brown or yellowish glabrous branchlets: leaf-blades broadly ovate, 6–12 cm. long, 5–10 cm. wide, acuminate at apex, truncate or cordate at the unsymmetrical base, or variously oblique, coarsely mucronate-crenate with rather large teeth, the mucro exceedingly long, reddish and tomentose in unfolding, but at maturity

dark and glabrous above, pale below, or sometimes with a silvery-white bloom, sometimes tufted in the vein-axils: cymes compact, few-flowered: peduncle pubescent, the free portion 2-4 cm. long, pedicels hoary-tomentose: bract linear-elliptic to nearly spatulate, often falcate, glabrous, 8-16 cm. long, mostly narrow: sepals hoary-tomentose without, two-thirds as long as the lanceolate petals. [*T. crenoserrata* Sarg. *T. alabamensis* Ashe]—Rich woods, various provinces, but not in the higher mountains, W Fla. to Tex., S E Okla., Ky., and W N. C. —(*Mex.*)

14. *T. australis* Small. Tree becoming 20 m. tall: leaf-blades relatively thin, ovate to oval-ovate, 7-17 cm. long, abruptly acuminate, crenate-mucronate with prominently gland-tipped teeth, deep-green above, glaucous beneath and essentially glabrous, cordate or nearly truncate at base: peduncle glabrous, the free portion 2-4 cm. long; bract lingulate, relatively large, often 4 cm. broad, peduncled, glaucous and glabrous beneath: sepals about three-fifths as long as the petals: staminodia linear-spatulate.—Wooded hillsides, Blue Ridge to Appalachian provinces, Ala. to N. C.

## FAMILY 2. MALVACEAE — MALLOW FAMILY

Herbs, shrubs, or trees. Leaves alternate: blades simple, palmately veined. Flowers perfect. Calyx of 5 more or less united valvate sepals. Corolla of 5 convolute petals. Androecium of numerous monadelphous stamens. Gynoecium of several united, often whorled, carpels. Fruit capsular or sometimes baccate.—About 45 genera and 900 species, widely distributed.

Fruit of several radially disposed carpels which separate from each other at maturity.

Carpels as many as there are stigmas: staminal-column anther-bearing at the summit.

Stigmas short, capitate or truncate.

Stigmas elongate, usually filiform, introrse.

Carpels one half as many as there are stigmas: staminal-column anther-bearing on the upper part, but not at the lobed or truncate summit.

Fruit a loculicidal capsule or rarely indehiscent.

Tribe I. SIDEAE.

Tribe II. MALVEAE.

Tribe III. URENEAE.

Tribe IV. HIBISCEAE.

### I. SIDEAE

Seeds 2—several in each carpel.

Involucel wanting.

Carpels leathery or parchment-like, not bladdery.

Carpels membranous, bladdery.

Involucel of 3 bractlets.

Seeds solitary in each carpel.

Involucel of 2 or 3 bractlets.

Involucel wanting.

1. ABUTILON.

2. GAYOIDES.

3. MODIOLA.

4. MALVASTRUM.

5. SIDA.

### II. MALVEAE

Petals notched at the apex: carpels beakless, without internal processes.

Petals erose at the apex: carpels beaked, with an internal process above the seed.

6. MALVA.

7. CALLIRHOE.

### III. URENEAE

Carpels dry, achene-like.

Involucel wanting: inflorescence capitate.

Involucel of several bractlets: inflorescence axillary or racemose.

Involucel of 5 partially united bractlets: carpels spiny all over.

Involucel of 5-15 distinct bractlets: carpels unarmed or with 1-3 spines on the back.

Mature carpels spine-armed.

Mature carpels spineless, sometimes cuspidate.

Carpels forming a drupe-like berry, but separating at maturity.

8. MALACHRA.

9. URENA.

10. PAVONIA.

11. MALACHE.

12. MALVAVISCUS.

## IV. HIBISCEAE

Styles distinct, spreading: seeds usually reniform.

Capsule as long as broad or much longer, the cavities 2-many-seeded.

Bractlets of the involucl distinct.

Calyx not bladdery, surrounding the base of the capsule, persistent or deciduous.

Calyx cup-like, persistent, nearly equally 5-lobed.

Calyx spathe-like, split on one side and deciduous about the base.

Calyx bladdery-inflated, scarious and conspicuously veined.

Bractlets of the involucl united into a lobed cup.

Capsule much depressed, the cavities 1-seeded.

Styles united: seed not reniform.

Bractlets of the involucl entire, rather inconspicuous.

Sepals wholly united or nearly so: capsule indehiscent.

Sepals merely united at the base: capsule loculicidal.

Bractlets of the involucl laciniate, conspicuous.

13. HIBISCUS.

14. ABELMOSCHUS.

15. TRIONUM.

16. PARITI.

17. KOSTELETZKYA.

18. THESPESIA.

19. CIENFUEGOSIA.

20. GOSSYPIMUM.

1. **ABUTILON** [Tourn.] Mill. Herbs, shrubs, or rarely trees. Leaf-blades entire, toothed, or lobed. Involucl wanting. Sepals 5, united below. Petals 5, often yellow. Carpels 5-30, beaked at maturity.—About 100 species, mostly in tropical regions.—INDIAN-MALLOW.—The bark yields a fiber. The plants, especially the flowers, are mucilaginous.

Carpels 11 or more: fruit hirsute at the top: mature carpels short-beaked or merely mucronate.

Plant annual: petals yellow.

Plant perennial: petals pink, salmon-pink, or red, or yellow above a purple base.

Petals yellow above a purple base: mature carpels less than 15 mm. long: seed merely minutely stellate.

Petals pink, salmon-pink or red: carpels mostly over 15 mm. long: seed hirsute.

Carpels 10 or fewer: fruit finely pubescent or puberulent at the top: mature carpels slender-beaked.

1. *A. Abutilon*.

2. *A. hirtum*.

3. *A. pauciflorum*.

4. *A. permolle*.

1. *A. Abutilon* (L.) Rusby. Stem 3-18 dm. tall, velvety-pubescent: leaf-blades suborbicular to ovate or reniform-orbicular, 9-30 cm. long: calyx-lobes abruptly pointed: petals yellow, 10-15 mm. long: carpels 15-20 mm. long. [*A. Avicennae* Gaertn.] — (INDIAN-HEMP. VELVET-LEAF.)—Roadsides, cult. grounds, and waste-places, various provinces, Fla. to Tex., S. D., and Me. Nat. of Asia.—(W. I.)

2. *A. hirtum* Sweet. Stem 1-3.5 dm. tall, velvety-canescens, and somewhat villous-hirsute: leaf-blades ovate to suborbicular, 2-15 cm. long: calyx-lobes acute or acuminate: petals 15-20 mm. long: carpels 8-10 mm. long. Coastal sands, pen. Fla. and the Keys.—(W. I., E. I.)—All year.

3. *A. pauciflorum* St. Hil. Stem 9-40 dm. tall, hirsute: leaf-blades ovate to suborbicular, 5-8 cm. long: calyx-lobes acuminate: petals 20-25 mm. long: carpels 15-17 mm. long. [*A. pedunculare* H.B.K.]—Roadsides, pinelands, and waste-places, pen. Fla. and the Keys.—(W. I., S. A.)—All year.

4. *A. permolle* (Willd.) Sweet. Stem 5-16 dm. tall, velvety-tomentose: leaf-blades ovate, 2.5-10 cm. long: petals yellow, 10-15 mm. long: carpels

11-12 mm. long.—(INDIAN-MALLOW.)—Coastal hammocks, cult. grounds, and roadsides, pen. Fla. and the Keys.—(W. I.)—All year.

2. **GAYOIDES** Small. Herbs, sometimes vine-like. Leaf-blades commonly toothed. Involucel wanting. Sepals 5, united below. Petals 5, usually yellow. Carpels numerous, beakless at maturity.—One species.

1. **G. crispum** (L.) Small. Stem and branches 3-9 dm. long: leaf-blades ovate, 1-5 cm. long, mostly acute or rather obtuse: calyx-lobes rather abruptly pointed: mature carpels angled at the summit.—Pinelands, hammocks, waste-places, and cult. grounds, Coastal Plain, Fla. and southwestern provinces, Tex. to Ariz.—(W. I., Mex., C. A., S. A.)—All year.—*G. imberbe* (Fl. SE. U. S.) has merely velvety pubescent foliage. It seems otherwise to be the same as *G. crispum* and occupies the same geographic range.

3. **MODIOLA** Moench. Herbs. Leaf-blades palmately lobed or divided. Involucel present. Sepals 5, united below. Petals 5, entire. Carpels many, transversely 2-celled, beaked at maturity, the faces smooth or merely wrinkled.—One species.

1. **M. caroliniana** (L.) G. Don. Branches spreading or prostrate, 1-7 dm. long: leaf-blades 2-6 cm. long, with coarsely serrate or incised lobes: calyx-lobes ovate or ovate-lanceolate: petals scarlet, obovate or oval-obovate, 6-10 mm. long: head of fruit depressed. [*M. multifida* Moench.]—Low grounds, waste-places, and roadsides, Coastal Plain and occasionally adj. provinces, Fla. to Tex. and Va.—(W. I., Mex., C. A., S. A.)—Sun.—The petals are sometimes orange.

4. **MALVASTRUM** A. Gray. Herbs or partly woody plants. Leaf-blades entire, lobed, or parted. Involucel of distinct bractlets, or wanting. Sepals 5, partially united. Petals 5, variously colored. Carpels 5 or more, 1-celled, beaked or beakless.—About 75 species, American and African.—FALSE-MALLOWS.

Plant annual:

Plant perennial:

Flowers solitary in the axils or in terminal interrupted spikes or spike-like racemes: stem strigose.

Mature carpels beakless, sometimes with a mere protuberance behind the apex.

Mature carpels with a subulate beak behind the apex.

Flowers in congested terminal and axillary spikes: stem hirsute.

1. *M. angustum*.

2. *M. corchorifolium*.

3. *M. coromandelianum*.

4. *M. spicatum*.

1. *M. angustum* A. Gray. Stem 1-3 dm. tall; leaf-blades elliptic-lanceolate to linear-elliptic, 2-4 cm. long, remotely serrate: calyx-lobes broadly triangular: petals yellow, about equalling the calyx-lobes: carpels 5 or 6, pubescent.—(YELLOW FALSE-MALLOW.)—Dry soil and rocky hills, various provinces, rarely Coastal Plain, Ala. to Kans., Ia., and Tenn.—Sum.

2. *M. corchorifolium* (Desr.) Britton. Stem 3-9 dm. tall; leaf-blades ovate to elliptic-lanceolate, 2-6 cm. long, coarsely serrate: calyx-lobes triangular-ovate, acuminate: petals orange-yellow: carpels hispidulous. [*M. Rugelii* S. Wats.]—Hammocks, waste-places, and cult. grounds, pen. Fla. and the Keys.—(W. I.)

3. *M. coromandelianum* (L.) Garcke. Stem 3-9 dm. tall; leaf-blades orbicular-ovate to elliptic-ovate, 2-8 cm. long, sharply serrate: calyx-lobes triangular-ovate: petals light-yellow: carpels hirsute on top. [*M. americanum* (L.) Torr.]—Hammocks, roadsides, cult. grounds and waste-places, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A., O. W.)

4. *M. spicatum* (L.) A. Gray. Stem 3-9 dm. tall; leaf-blades ovate to deltoid-ovate, 3-8 cm. long, crenate-serrate, or sometimes slightly lobed: calyx densely pubescent; lobes triangular-lanceolate, 3-4 mm. long: petals orange, 8-11 mm. long: carpels 3 mm. long, the tip inflexed.—Sandy soil, Coastal Plain, Fla. and Tex.

5. **SIDA L.** Herbs or partially woody plants. Leaf-blades usually toothed. Involucre usually wanting. Sepals 5, partially united. Petals 5, pale, often yellow. Carpels 5 to many, 1-celled, commonly singly or doubly beaked.—About 100 species, widely distributed.—The bark of some species yields a strong fiber.

Leaf-blades palmately lobed: corolla white: calyx terete at the base.—Subgenus PSEUDO-NAPAEA.

Leaf-blades merely toothed: corolla colored: calyx angled.—

I. HERMAPHRODITAE.

Subgenus MALVINDA.

Flowers or flower-clusters in leafy involucres at the ends of the branches.

II. CILIARES.

Flowers or flower-clusters axillary or sometimes in terminal panicles.

III. SPINOSAE.

#### I. HERMAPHRODITAE

Tall perennial: lobes of the leaf-blades toothed.

1. *S. hermaphrodita*.

#### II. CILIARES

Diffuse perennial, somewhat resembling a *Stylosanthes* in habit: flower-clusters leafy-involucrate.

2. *S. ciliaris*.

#### III. SPINOSAE

Stems or branches decumbent or prostrate.

3. *S. procumbens*.

Stems erect or ascending.

4. *S. cordifolia*.

Leaf-blades cordate.

Leaf-blades acute, rounded, or truncate at the base.

5. *S. rhombifolia*.

Leaf-blades ovate to cuneate or lanceolate.

Mature carpels with 1 tooth each: peduncles, at least those arising from the stem, much longer than the pedicels.

Mature carpels with 2 teeth each: peduncles shorter than the pedicels or only slightly longer.

- Stem-leaves with petioles less than 1 cm. long.  
 Stem-leaves with petioles over 1 cm. long.  
 Leaf-blades linear or linear-elliptic.  
 Leaf-blades and calyx with red margins.  
 Leaf-blades of a narrowly linear type: mature carpels 4-5 mm. high.  
 Leaf-blades broader: mature carpels 3-4 mm. high.  
 Leaf-blades and calyx with green margins, not discolored.

6. *S. carpinifolia*.  
 7. *S. spinosa*.

8. *S. Elliottii*.

9. *S. rubromarginata*.

10. *S. leptophylla*.

1. *S. hermaphrodita* (L.) Rusby. Plant erect, 9-40 dm. tall: leaf-blades palmately 3-7-lobed: calyx-lobes triangular: petals white: mature carpels 6-7 mm. long. [*S. Napaea* Cav.]—(VIRGINIA-MALLOW.)—River-banks and rocky slopes, various provinces N of Coastal Plain, Tenn. to Ohio, Pa., and Va.—Sum.

2. *S. ciliaris* L. Plant with diffuse branches 1-3 dm. long; leaf-blades elliptic to cuneate, 1-4 cm. long, serrate: calyx-lobes triangular: petals reddish-purple: mature carpels 5-8, 2-2.5 mm. long.—Hammocks and open places, Florida Keys and S Tex.—(*W. I., Mex., C. A., S. A.*)—All year.

3. *S. procumbens* Sw. Plant with tomentose branches, 1-6 dm. long: leaf-blades suborbicular to ovate, 1-2.5 cm. long, crenate: calyx-lobes deltoid-acuminate: petals yellow, 4-6 mm. long: mature carpels often 5, about 2 mm. long, puberulent. [*S. supina* L'Her.]—Hammocks and waste-places, Florida Keys.—(*W. I., Mex., C. A., S. A.*)—All year.

4. *S. cordifolia* L. Plant 6-15 dm. tall, the stem and branches velvety-tomentose: leaf-blades ovate or suborbicular, 4-10 cm. long, irregularly crenate: calyx-lobes triangular: petals tawny-yellow, 5-7 mm. long: mature carpels often 10-12, about 3 mm. long, retrorse-pubescent.—Pinelands, hammocks, waste-places, and roadsides, pen. Fla. and the Keys; also Gulf seaports.—Nat. of trop. Am. (*W. I., Mex., C. A., S. A.*)—All year.

5. *S. rhombifolia* L. Plant 5-12 dm. tall, the branches puberulent or glabrate: leaf-blades rhombic, elliptic-obovate, or oblanceolate, 1.5-8 cm. long, serrate: calyx-lobes triangular: petals pale-yellow or sometimes red-blotched at the base: mature carpels 10-12, about 5 mm. long.—Roadsides and waste-places, Coastal Plain, Fla. to Tex. and N. C.—Spr.—fall or all year S.

6. *S. carpinifolia* L. f. Plant 3-9 dm. tall, the branches puberulent or glabrate: leaf-blades lanceolate, oblong-ovate, or ovate, 2-10 cm. long, irregularly serrate: calyx-lobes triangular: petals yellow to white: mature carpels 8-10, about 4 mm. long.—Pinelands, hammocks, and cult. grounds, Coastal Plain, Fla.—Spr.—fall or all year S.

7. *S. spinosa* L. Plant 1-6 dm. tall, pubescent: leaf-blades elliptic to ovate or ovate-lanceolate to linear-lanceolate, 1-5 cm. long, serrate: calyx-lobes triangular: corolla pale-yellow or orange: mature carpels about 5, 4 mm. long.—(INDIAN-MALLOW. FALSE-MALLOW. PRICKLY-SIDA.)—Roadsides, cult. grounds.

and waste-places, various provinces, Fla. to Tex., Ia., and Me.—Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—Sum.

8. *S. Elliottii* T. & G. Plant 3–5 dm. tall or sometimes depressed: leaf-blades linear or nearly so, 2–7 cm. long, serrate: calyx-lobes triangular: petals deep-yellow: mature carpels 8–12, 4–5 mm. long, rugose-reticulated on the back.—Pinelands and edges of hammocks, Coastal Plain, Fla. to Miss., Mo., and Va.—Sum.

9. *S. rubromarginata* Nash. Plant 5–10 dm. tall: leaf-blades varying from narrowly obovate to elliptic or oblong-lanceolate, 1.5–5.5 cm. long, serrate: calyx-lobes triangular: petals light-orange: mature carpels 8–10, 3–4 mm. long, rugose-pitted on the back.—Sandy pinelands, Fla.—Spr.–fall.

10. *S. leptophylla* Small. Plant 9–13 dm. tall, thinly pubescent: leaf-blades linear to linear-elliptic, 2–10 cm. long, sharply serrate: calyx-lobes triangular: petals light orange: mature carpels about 4 mm. long.—Sandy soil, Coastal Plain, Ga. to La.—Spr.–fall.

6. **MALVA** [Tourn.] L. Herbs. Leaf-blades lobed or dissected. Involucel of usually 3 bractlets. Sepals 5, partially united. Petals 5, sometimes eroded. Carpels many, 1-celled, beakless, the faces radially striate or ribbed at maturity.—About 30 species, natives of the Old World.—MALLOWS.—The leaves and flowers of some species are mucilaginous and are used medicinally.

Corolla less than 2 cm. broad: bractlets linear to lanceolate.

Branches procumbent: carpels finely pubescent and smooth on the back.

Branches erect or ascending: carpels glabrous and reticulated on the back.

Corolla over 2 cm. broad: bractlets elliptic to ovate-lanceolate.

1. *M. rotundifolia*.

2. *M. parviflora*.

3. *M. sylvestris*.

1. *M. rotundifolia* L. Plant depressed: leaf-blades obscurely lobed, crenate-dentate; calyx-lobes ovate to triangular-ovate: petals light-blue, pink, or white, 9–14 mm. long: carpels 1.5–2 mm. long.—(CHEESES. LOW-MALLOW.)—Cult. grounds, waste-places, and roadsides, various provinces, throughout U. S. and S Can. Nat. of Eu.—Spr.–sum.

2. *M. parviflora* L. Plant erect or ascending: leaf-blades angularly or obtusely lobed and crenate: calyx-lobes triangular: petals white or purple-tinged, 3.5–7 mm. long: carpels 2–2.5 mm. long.—Waste-places, various provinces, Fla. to Tex., Calif., and B. C. Nat. of Eu.—(*Mex.*)—Sum.

3. *M. sylvestris* L. Plant 3–4 dm. tall: leaf-blades prominently lobed and crenate-dentate: calyx-lobes triangular or nearly so: petals light-purple to reddish-purple, 2–2.5 cm. long: carpels obovate, 3 mm. long.—(HIGH-MALLOW.)—Fields, waste-places, and about gardens, local in various provinces, U. S. and S Can. Nat. of Eu.—(*Mex.*)—Sum.

7. **CALLIRRHÖE** Nutt. Herbs, resembling species of *Malva*. Leaf-blades lobed, cleft, or dissected. Involucel of distinct bractlets, or wanting.

Sepals 5, united below. Petals 5, sometimes erose-fimbriate. Carpels 10-20, 1-celled, more or less beaked, the faces smooth or reticulate at maturity.—About 8 species, North American.—POPPY-MALLOWS.

Peduncles several-flowered.

Peduncles 1-flowered.

Involucels present.

Involucels wanting.

1. *C. triangularis*.

2. *C. Papaver*.

3. *C. alceoides*.

1. *C. triangularis* (Leavenw.) A. Gray. Stem 3-9 dm. tall, rough-pubescent: leaf-blades triangular-ovate to triangular-hastate, 3-1.5 cm. long, those of the lower ones crenate or lobed: calyx-lobes deltoid-ovate: petals deep-purple, 2-2.5 cm. long: carpels 3.5-4 mm. long.—(CLUSTERED POPPY-MALLOW).—Dry woods, various provinces, rarely Coastal Plain, Ala. to Tex., Minn., Ill., and N. C.—Spr.-sum.

2. *C. Papaver* (Cass.) A. Gray. Stem with decumbent branches 2-7 dm. long, strigillose or glabrate: leaf-blades 3-5-lobed or 3-5-parted: calyx-lobes lanceolate to elliptic-lanceolate, 1-1.5 cm. long: petals red-purple, 2-4.5 cm. long: carpels 3 mm. long.—Sandy woods, Coastal Plain, Fla. to Tex. and Ga.—Spr.-sum.

3. *C. alceoides* (Michx.) A. Gray. Stem with strigillose branches 2-5 dm tall: leaf-blades palmately lobed or incised: calyx-lobes triangular or triangular-lanceolate, less than 1 cm. long: petals pink or rose, 1-1.5 cm. long: carpels 4 mm. long.—Dry soil, various provinces, Ala. to Tex., Nebr., and Ky.—Spr.-sum.

8. **MALACHRA** L. Herbs or woody plants, sometimes with stinging hairs. Leaf-blades lobed. Involucel wanting. Sepals 5, partially united. Petals 5, broad. Carpels 5, 1-celled, beakless, the faces reticulate-veiny.—About 6 species, tropical American.

Bracts acuminate: calyx-lobes acuminate, with rather weak hairs.

Bract acute: calyx-lobes setaceous-tipped, with stout hairs.

1. *M. urens*.

2. *M. alceifolia*.

1. *M. urens* Poit. Stem 2-6 dm. tall, more or less branched and spreading, finely pubescent in lines and with coarse simple or branched hairs: leaf-blades ovate to lanceolate, sometimes slightly 3-lobed, 3-10 cm. long, rather coarsely dentate or dentate-crenate: flower-clusters sessile or nearly so: calyx-lobes with acuminate tips: petals 6-12 mm. long, light-yellow, orange, or red, usually sparingly pubescent: carpels about 3 mm. long: seed nearly as wide as long.—Roadsides, cult. grounds, and waste-places, S pen. Fla. and the Keys.—(W. I.)—All year.

2. *M. alceifolia* Jacq. Stem mostly 3-10 dm. tall or diffusely branched and spreading, finely soft-pubescent all over and with stiff forking hairs: leaf-blades suborbicular to ovate, sometimes 3-lobed, 3-15 cm. long,

rather finely dentate or crenate; flower-clusters manifestly short-peduncled: calyx-lobes with setaceous tips as long as the body or longer: petals 11–16 mm. long, bright-yellow, pubescent without and ciliate: carpels about 4 mm. long: seed much longer than wide.—Waste-places, roadsides, and pinelands, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)—All year.

**9. URENA** [Dill.] L. Shrubs or partly woody herbs. Leaf-blades angled or lobed. Involucel present. Sepals 5, united below, and often partially adnate to the bractlets. Petals 5, yellow, pink, or purplish. Carpels 5, or rarely more, 1-celled, indehiscent, usually bristly with barbed spines.—Three species, tropical.

**1. U. lobata** L. Stem mostly 1–2 m. tall, tomentose: leaf-blades suborbicular to oval, shallowly lobed and serrulate: bractlets linear-lanceolate, 3–5 mm. long: calyx about as long as the involucel: petals pink or rose, about 2 cm. long: carpels 4–5 mm. in diameter.—Hammocks, waste-places, and roadsides, Fla. Nat. of E. I.—(*W. I., Mex., C. A., S. A.*)—The bark yields a fiber; the flowers are used medicinally.

**10. PAVONIA** Cav. Shrubs or woody herbs. Leaf-blades angled or lobed. Involucel present. Sepals 5, partially united. Petals 5, often showy. Carpels 5, 1-celled, spine-armed.—About 60 species, mostly tropical.

Carpels 3-awned, the awns barbed: leaf-blades of an ovate type: calyx-lobes lanceolate to ovate-lanceolate.

1. *P. spinifex*.

Carpels awnless and pointless: leaf-blades of a hastate type: calyx-lobes broadly ovate.

2. *P. hastata*.

**1. P. spinifex** (L.) Cav. Shrub 1–3 m. tall, hirsute and strigillose: leaf-blades ovate to elliptic-ovate, 5–10 cm. long: bractlets linear to lanceolate: calyx-lobes lanceolate to ovate-lanceolate: petals yellow, 2.5 cm. long: mature carpels 5–6 mm. long, the spines slender-subulate.—Sandy woods, hammocks, and shell-mounds, Coastal Plain, Fla. to S. C.—Spr.–sum.—Formerly this mallow was thought to be confined to the coastal regions in Florida, and suspected as being an introduction. However, in recent years it has been found in the wildest hammocks of the interior.

**2. P. hastata** Cav. Plant 9–20 dm. tall, roughish-canescenscent: leaf-blades of a hastate type, 2–5 cm. long: bractlets ovate to ob-ovate, 4–5 mm. long: petals 15–25 mm. long, mainly pale red: carpels 4 mm. long. [*P. LeContei* T. & G.]—Sandy soil, Coastal Plain, Ga. Nat. of S. A.—(*W. I.*)—Spr.–fall.

**11. MALACHE** B. Vogel. Shrubs or partly woody plants. Leaf-blades broad, remotely serrate or repand, 3-ribbed. Involucel of 6–8 bractlets or more.

Sepals 5, partially united. Petals 5, pale. Carpels with a median crest at the apex and 2 lateral cusps.—Three species, tropical American.

1. *M. scabra* B. Vogel. Plant 1–3 m. tall, puberulent: leaf-blades ovate to elliptic-ovate, 6–15 cm. long: bractlets elliptic-lanceolate: calyx-lobes ovate: petals greenish-yellow or whitish, 2–2.5 cm. long: mature carpels about 10 mm. long, reticulate on the back. [*Pavonia racemosa* Sw.]—Coastal hammocks, S pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—All year.—Previous to the beginning of this century this mallow was thought to be rare in Florida. However, when the southern part of the state became accessible it was found to be very abundant on the shores of bays. It is often copiously and intricately branched.

12. **MALVAVISCUS** Dill. Shrubs, trees, or partially woody plants. Leaf-blades entire, toothed, or angulately lobed. Flowers horizontal or nodding, peduncled. Involucl of 7–12 narrow bractlets. Sepals 5, partly united. Petals 5, each with a lateral auricle. Carpels 5, ultimately forming a baccate fruit.—About 10 species, tropical American.

1. *M. Drummondii* T. & G. Stem 8–19 dm. tall, tomentose: leaf-blades suborbicular, angulately 3–5-lobed, softly pubescent: bractlets of the involucl about 9, linear or linear-spatulate, 5–6 mm. long: calyx tubular-campanulate, about 1 cm. long; lobes triangular, often deltoid, or sometimes ovate, shorter than the tube, acute: petals vermilion, 3 cm. long or less: berry drooping, much depressed, 1.5–2 cm. in diameter, scarlet.—(WAX-MALLOW.)—Hammocks, Coastal Plain, S Fla. to Tex.—(W. I., Mex.)—Spr.—fall

13. **HIBISCUS** L. Herbs, shrubs, or trees. Leaf-blades entire, lobed, or parted. Involucl of several, rarely 3, distinct bractlets. Sepals 5, more or less united. Petals 5, white, colored or variegated. Carpels forming a 5-valved capsule.—About 180 species, widely distributed.—ROSE-MALLOW.—The bark of some species yields a fiber, and the leaves are used as pot-herbs.

Corolla cylindric or the petals merely spreading at the tip: seed woolly.

I. TUBIFLORI.

Corolla funnellform to rotate: seeds glabrous or hirsute.

Bractlets of the involucl dilated or forked at the apex.

Bractlets of the involucl entire, not dilated at the apex.

Herbs, often tall perennials.

Involucl and calyx herbaceous, not succulent.

Corolla broadly funnellform or campanulate; petals mainly pink or white.

Calyx and involucl finely spinescent.

II. FURCELLATI.

III. CANNABINI.

Calyx and involucl glabrous or softly pubescent.

Corolla rotate; petals red.

Involucl and calyx succulent.

Shrubs or trees.

Corolla open-funnelform: leaf-blades lobed.

Corolla with a short funnelform tube and a large rotate limb: leaf-blades merely toothed.

#### I. TUBIFLORI

Shrub with slender branches and nodding flowers.

#### II. FURCELLATI

Leaves softly pubescent; blades shallowly lobed; petals 8 cm. long or more.

Leaves harshly pubescent; blades deeply lobed: petals 7 cm. long or less.

#### III. CANNABINI

Erect bright-green plant, the leaf-blades with narrow coarsely toothed lobes: bractlets very slender: calyx-lobes slenderly attenuate from a broad base.

#### IV. GRANDIFLORI

Leaf-blades glabrous.

Leaf-blades pubescent at least beneath.

Capsule glabrous.

Corolla pink: capsule blunt.

Corolla white, with a crimson eye: capsule beaked.

Capsule pubescent.

Leaf-blades closely whitish-pubescent beneath.

Leaf-blades closely and minutely stellate-canescens beneath: capsule beaked.

Leaf-blades lanceolate to ovate, toothed.

Leaf-blades as wide as long, 3-5-lobed, the lobes toothed:

Leaf-blades loosely stellate-tomentose beneath:

capsule rounded or truncate at the tip.

Leaf-blades brownish-pubescent beneath.

#### V. COCCINEI

Leaf-blades with 5-7 narrow elongate more or less incised lobes.

Leaf-blades merely toothed or with 3-5 prominent, but short and broad lobes.

#### VI. SABDARIFFAE

Plant more or less suffused with red, the 3-5 leaf-lobes shallowly toothed: succulent calyx-lobes elongate.

#### VII. SYRIACI

Leaf-blades typically cuneate at the base: short-pedicelled.

#### VIII. ROSAE-SINENSES

Leaf-blades rounded to cordate at the base: flowers long-peduncled.

#### IV. GRANDIFLORI.

#### V. COCCINEI.

#### VI. SABDARIFFAE.

#### VII. SYRIACI.

#### VIII. ROSAE-SINENSES.

1. *H. pilosus*.

2. *H. furcellatus*.

3. *H. aculeatus*.

4. *H. cannabinus*.

5. *H. militaris*.

6. *H. Moscheutos*.

7. *H. oculiroseus*.

8. *H. incanus*.

9. *H. grandiflorus*.

10. *H. lasiocarpus*.

11. *H. mutabilis*.

12. *H. coccineus*.

13. *H. semilobatus*.

14. *H. Sabdariffa*.

15. *H. syriacus*.

16. *H. Rosa-sinensis*.

1. *H. pilosus* (Sw.) Fauc. & Rendle. Plant 3-18 dm. tall, stellate-hirsute: leaf-blades triangular-ovate or angulately 3-lobed, crenate, 1-4 cm. long: bractlets linear or nearly so, 7-9 mm. long: calyx-lobes acuminate: petals crimson, 2-2.5 cm. long: capsule fully 1 cm. long. [*H. spiralis* Cav. *H. tubiflorus* DC.]—Hammocks, Florida Keys.—(W. I., Mex.)—All year.

2. *H. furcellatus* Lam. Plant 9-25 dm. tall, finely gray-tomentose: leaf-blades orbicular-ovate to ovate or lanceolate, 5-15 cm. long, angulate or 3-5-lobed, crenate: bractlets narrow, 1-2 cm. long, not bristly: calyx-lobes lanceolate to triangular-lanceolate: petals pink or rose-purple, 8-10 cm. long: capsule ovoid, about 2.5 cm. long, copiously strigose.—Sandy shores, Indian River, Fla.—(W. I., S. A.)—All year.

3. *H. aculeatus* Walt. Plant 9–20 dm. tall, very rough-pubescent: leaf-blades angulate, 3–5-lobed or 3–5-parted, 4–12 cm. in diameter, the lobes rhombic to spatulate, coarsely toothed: bractlets linear, about 15 mm. long, bristly: calyx-lobes lanceolate, bristly ciliate: petals yellow or cream-colored, except the purple base, 7–8 cm. long: capsule conic-ovoid, about 1.5 cm. long or rarely longer, stellate-pubescent and hispid.—Pinelands, Coastal Plain, N. Fla. to La. and S. C.—Sum.

4. *H. cannabinus* L. Plant 3–22 dm. tall, sparingly pubescent: leaf-blades palmately 3–7-parted, the divisions linear to elliptic, unevenly toothed: bractlets narrowly linear, flat, bristle-margined or spiny: calyx-lobes lanceolate, long-acuminate, rather thin, bristle-margined or spiny: petals white or pink, sometimes darker-colored, and purple at the base: capsule conic, 1.5–2 cm. long, strigose.—(AMBARÉE. BASTARD-JUTE. BROWN INDIAN-HEMP.)—Hammocks and cultivated grounds, pen. Fla. and the Keys. Nat. of the O. W. tropics.—(W. I.)—All year.

5. *H. militaris* Cav. Plant 9–20 dm. tall, glabrous or nearly so: leaf-blades ovate to broadly lanceolate in outline, 6–16 cm. long, serrate-dentate and hastately 3–5-lobed: bractlets 1.5–2 cm. long: calyx-lobes ovate: petals pink with a purple blotch: capsule ovoid, 2–3 cm. long, glabrous: seeds velvety.—(HALBERD-LEAVED ROSE-MALLOW. SWEATING-WEED.)—Alluvial swamps and river-banks, various provinces, Fla. to La., Minn., and Pa.—Sum.—fall.

6. *H. Moscheutos* L. Plant 8–20 dm. tall, velvety-tomentose: leaf-blades lanceolate to broadly ovate, dentate-serrate and often angulately 3–5-lobed: petals mainly pink, 10–12 cm. long: capsule ovoid, 2.5–3 cm. long.—(SWAMP ROSE-MALLOW. SEA-HOLLYHOCK. MARSH-MALLOW.)—Brackish and fresh marshes, Coastal Plain, and occasionally adj. provinces, Fla. to Tex. and Conn., also Central Lowland, Mo. to S. Ont.—Sum.—fall.

7. *H. oculiroseus* Britton. Plant similar to *H. Moscheutos* in habit: leaf-blades lanceolate to ovate, unequally toothed: petals white, except the purple spot at the base: capsule conic-ovoid, 2.5–3 cm. long.—Marshes, various provinces, N. Ala. to N. J. and N. Y.—Sum.—fall.

8. *H. incanus* Wendl. Plant 9–20 dm. tall, pale or gray velvety-tomentose: leaf-blades ovate to lanceolate, dentate-serrate: petals white, sulphur-yellow, or pinkish, with a crimson base, 8–10 cm. long: capsule ellipsoid-ovoid, 2.5–3 cm. long, finely hirsute.—Swamps, Coastal Plain, Fla. to Ala. and Md.; perhaps in the interior.—Spr.—sum.

9. *H. grandiflorus* Michx. Plant 8–21 dm. tall, velvety-tomentose: leaf-blades hastately 3-lobed, the lobes irregularly toothed: bractlets linear, 1.5–2 cm. long, not bristly: calyx about twice as long as the bractlets: petals 12–15 cm. long, pink, purple, or red at the base: capsule ovoid, 2–5.3 cm. long, coarsely hirsute.—Marshes and wet hammocks, Coastal Plain, Fla. to Miss. and Ga.—Spr.

10. *H. lasiocarpus* Cav. Plant 9–20 dm. tall, densely stellate-tomentose: leaf-blades ovate, 5–14 cm. long, serrate-dentate: bractlets linear, 2.5–3 cm. long, bristly: calyx lobes triangular lanceolate, little longer than the bractlets: petals white or pink with a dark base, 6–10 cm. long: capsule about 2.5 cm. long.—Swamps, various provinces, Ga. to Tex., Mo., and Ill.—Spr.—sum.

11. *H. mutabilis* L. Shrub, sometimes tree-like, scurfy-pubescent with brownish hairs: leaf-blades suborbicular in outline, cordate at the base, angu-

lately 3-5-lobed, the broad lobes unevenly toothed: bractlets narrowly linear, 2-2.5 cm. long: calyx-lobes ovate: petals white or pink, becoming deep-red: capsule 2.5 cm. long.—(COTTON-ROSE.)—Waste-places and pinelands, S Fla. and S La. Nat. of China.—(*W. I., Mex., C. A., S. A.*)—Spr.-sum.

12. *H. coccineus* Walt. Plant 9-30 dm. tall, glabrous: leaf-blades with linear or lanceolate lobes 4-25 cm. long: bractlets 2.5-3 cm. long: calyx 4-5 cm. long; lobes acuminate: petals crimson or deep-red: capsule globose-ovoid, 2-2.5 cm. long, reticulate.—Swamps, near the coast, Fla. to Ala. and Ga.—Sum.

13. *H. semilobatus* Chapm. Plant similar to that of *H. coccineus* in habit: leaf-blades orbicular or ovate, coarsely toothed and 3-5-lobed, 8-15 cm. in diameter: bractlets 2-2.5 cm. long: calyx 4-5 cm. long; lobes acute: petals crimson: capsule about 2.5 cm. long.—Swamps, near the coast, E Fla.—Spr.-fall.

14. *H. Sabdariffa* L. Plant 6-26 dm. tall, the foliage red throughout: leaf-blades digitately 3-5-lobed, the lobes crenate-serrate, the teeth shallow: bractlets linear to linear-lanceolate, very thick, sparingly pubescent, juicy: calyx-lobes lanceolate, like the bractlets dark-red, very thick, copiously fine-pubescent within: petals pink with a dark base: capsule ovoid, 1.5-2 cm. long, pubescent.—(JAMAICA-SORREL. ROSELLE.)—Pinelands, hammocks, and waste-places, Everglade Keys, Fla. and Florida Keys. Nat. of the O. W. trop. and cult.—(*W. I., Mex., C. A., S. A.*)—All year.—The succulent tissues contain much mucilage, coloring matter, and an acid, all of which combines to make an excellent jelly. The succulent calyces are cooked and served as "cranberries."

15. *H. syriacus* L. Shrub or small tree, minutely pubescent when young: leaf-blades 3-lobed, coarsely crenate, 3-12 cm. long: bractlets linear or linear-spatulate, 10-20 mm. long: calyx-lobes triangular-ovate: petals rose-purple, or white, usually with crimson blotches at the base: capsule ellipsoid-ovoid, 2-2.5 cm. long.—(SHRUBBY-ALTHAEA. ROSE-OF-SHARON.)—Roadsides, fields, and thickets, various provinces, Fla. to Tex. and Conn. Nat. of western Asia and cult.—Sum.-fall.

16. *H. Rosa-Sinensis* L. Shrub or small tree, usually sparingly pubescent: leaf-blades ovate to ovate-lanceolate, rounded or abruptly narrowed at the base, coarsely and unequally toothed: bractlets narrowly linear: calyx-lobes lanceolate, more pubescent within than without: petals rose-red or of other colors: capsule 2-2.5 cm. long.—(SHOE-BLACK PLANT. CHINESE-ROSE.)—Fields, waste-places, and roadsides, pen. Fla. Nat. of China and cult.—(*W. I.*)—All year.—Extensively grown as an ornamental in warm and tropical countries. It is represented by many color forms. The flowers yield a black dye.

14. **ABELMOSCHUS** Medic. Herbs, usually large and coarse, mostly annual. Leaf-blades entire or lobed. Flowers solitary and terminal. Involucl of 4-many narrow bractlets. Sepals united into a long spathe-like calyx which splits and falls away from the fruits. Petals 5, broad. Carpels elongate, forming a long and narrow pointed capsule. Seed glabrous.—About 12 species, tropical.

Leaf-blades with short broad lobes: bractlets of the involucl linear, caducous:

1. *A. esculentus*.

Leaf-blades with long narrow lobes: bractlets of the involucl elliptic or elliptic-lanceolate, persistent:

2. *A. Manihot*.

1. *A. esculentus* (L.) Moench. Plant 9–20 dm. tall, hirsute: leaf-blades 1–3 dm. broad, with 5–7 ovate, lanceolate, or oblanceolate, coarsely toothed or incised segments: corolla greenish-yellow: capsule columnar, 9–21 cm. long.—(OKRA. GUMBO.)—Waste-places, gardens, and cult. grounds, Coastal Plain, Fla. to Tex. Nat. of Africa and cult.—(W. I.)—Spr.–fall.—The unripe capsules are a very mucilaginous esculent.

2. *A. Manihot* (L.) Medic. Plant usually 20–25 dm. tall, ultimately glabrous: leaf-blades 1–4 dm. in diameter, with 5–9 coarsely toothed or again lobed segments: corolla pale yellow with a dark eye: capsule ellipsoid, 4–8 cm. long.—Waste-places, cult. grounds, and river-banks, Coastal Plain, Fla. to Tex. Nat. of Asia and cult.—Sum.–fall.

15 **TRIONUM** Medic. Annual pubescent herbs. Leaf-blades palmately 3–5-lobed. Flowers solitary at the ends of the branches. Involucels of several—many narrow bractlets: sepals 5, united into a ribbed and shallowly lobed calyx, which is persistent and inflated at maturity. Petals 5, broad. Carpels forming a short capsule which is included in the persistent calyx. Seed glabrous.—One species.

1. *T. Trionum* (L.) Wooton & Standley. Plant 1–4 dm. tall, hispid: leaf-blades ovate to suborbicular in outline, pedately 3–5-lobed or 3–5-parted, the lobes coarsely toothed or incised: bractlets about 1 cm. long: calyx-lobes triangular: petals yellow or whitish with a purple or brown-purple blotch: capsule about 1.5 cm. long. [*Hibiscus Trionum* L.]—(FLOWER-OF-AN-HOUR. BLADDER-KETMIA.)—Roadsides, fields, and waste-places, various provinces, Fla. to N. M., S. D. and N. S. Nat. of Eu. and cult.—Sum.–fall.

16. **PARITI** Adans. Shrubs or trees, resembling *Hibiscus* in habit, but with the bractlets of the involucl united into a lobed cup.—About 4 species tropical.—Spr. or all year.

Petals straight or spreading at the tip, pure-yellow, becoming reddish-pink: capsule velvety: seeds papillose.

1. *P. tiliaceum*.

Petals strongly recurved, bronze or orange and blood-red toward the center, becoming very dark-red: capsule hirsutulous: seed hirsutulous.

2. *P. grande*.

1. *P. tiliaceum* (L.) St. Hil. Shrub or large tree, the young parts velvety-tomentose: leaf-blades thick, suborbicular to orbicular-ovate, mostly 1–2 dm.

long, blunt entire, grayish-tomentose beneath: calyx-lobes lanceolate to triangular-lanceolate: corolla campanulate or tubular-campanulate; petals broadly obovate or orbicular-obovate, pure-yellow, becoming reddish-pink: capsule velvety, beaked, 1-2 cm. long, nearly or quite as long as the sepals.—(MAHOE)—Shore hammocks and sand-dunes coasts of southern pen. Fla. and the Florida Keys.—(*W. I., Mex., C. A., S. A.*)

2. *P. grande* Britton. Tree with wide-spreading branches; the young parts thinly pubescent: leaf-blades thin or thinnish, sub-orbicular, mostly 1.5-3 dm. long, sharp-pointed, more or less crenate, thinly pubescent beneath or glabrous: calyx-lobes lanceolate: corolla rotate-campanulate: petals spatulate to narrowly obovate, bronze or orange along the edges and blood-red toward the center, becoming very dark-red: capsule hirsutulous, beakless, larger than in *P. tiliaceum*, much shorter than the sepals.—(MAHOE)—Sandy shores, S pen. Fla.—(*W. I.*)

17. **KOSTELETZKYA** Presl. Herbs or partly woody plants. Leaf-blades angulate-lobed, hastate, or sagittate. Involucre of 7-10 bractlets, or obsolete. Sepals 5, partly united. Petals 5. Carpels forming a depressed capsule.—About 8 species, of temperate and tropical America.—Spr.—fall or all year S.—FEN-ROSES.

Corolla pink; petals 3-4 cm. long: calyx over 1 cm. wide, surpassing the capsule. Stem and leaves copiously pubescent.

Calyx merely stellate-canescens: upper part of the stem sparingly scabro-pubescent.

Calyx densely stellate-hirsute as well as canescent: upper part of stem densely pubescent, usually velvety.

Stem and leaves glabrous or sparingly pubescent.

Corolla white; petals about 1 cm. long: calyx less than 1 cm. wide, surpassed by the capsule.

1. *K. virginica*.

2. *K. althaeifolia*.

3. *K. smilacifolia*.

4. *K. pentasperma*.

1. *K. virginica* (L.) A. Gray. Foliage pubescent with stellate hairs but not velvety, often scabrous: leaf-blades 3-15 cm. long, ovate to ovate-hastate, serrate-dentate, the lateral lobes triangular, acute: calyx-lobes lanceolate or elliptic-lanceolate, acute or acuminate: petals pink, 2-4 cm. long: capsule about 10 mm. broad: seed 3.5-4 mm. long.—(SALT-MARSH MALLOW.)—Marshes and wet hammocks, Coastal Plain and rarely adj. provinces, Fla. to La. and N. Y.

2. *K. althaeifolia* (Chapm.) A. Gray. Foliage mainly velvety-pubescent; leaf-blades ovate to ovate-lanceolate or nearly lanceolate, 5-15 cm. long, acuminate, irregularly dentate, the lower ones angularly 3-lobed, cordate, the upper ones truncate or subcordate at the base: calyx-lobes lanceolate, acuminate: petals pink, about 4 cm. long: capsule 12-15 mm. broad: seed about 3 mm. long.—Swamps, hammocks, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)

3. *K. smilacifolia* A. Gray. Foliage nearly glabrous: leaf-blades 5-10 cm. long, those above the base of the stem hastate, with a linear-lanceolate or linear

entire or denticulate middle lobe and linear or nearly linear reflexed entire or toothed basal lobes; calyx-lobes lanceolate or ovate-lanceolate, acute or slightly acuminate, about as long as the bractlets: petals 2.5–3.5 cm. long, bright-pink: capsule hispid, fully 1 cm. broad, surpassed by the sepals: seed nearly 3.5 mm. long.—Low pinelands, W pen. Fla.

4. **K. pentasperma** (Bert.) Griseb. Foliage pubescent with stinging-hairs: stem up to 2 m. tall, widely branched: leaf-blades lanceolate to ovate-lanceolate or ovate, with the larger ones sometimes slightly lobed, 2.5–9 cm. long, serrate, slender-petioled: calyx bristly-pubescent; lobes ovate, acute, exceeding the bractlets: petals about 1 cm. long, white: capsule nearly 1 cm. broad, surpassing the sepals: seed about 2.5 mm. long.—Hammocks, Cape Sable region, Fla.—(W. I.)—All year.

18. **THESPESIA** Soland. Shrubs or trees, resembling species of *Hibiscus*. Leaf-blades entire or angulate-lobed. Involucel of 3–5 narrow deciduous bractlets. Sepals 5, partially or wholly united. Petals 5, showy. Carpels united into a mostly indehiscent capsule.—About 8 species, tropical.

1. **T. populnea** (L.) Soland. Low tree or shrub: leaf-blades ovate, 5–12 cm. long: calyx cup-like: petals 5–7 cm. long, yellow and purple: capsule depressed, 3–4.5 cm. broad.—(SEASIDE-MAHOE. PORTIA-TREE.)—Shore hammocks and sand dunes, Everglade Keys, Fla. and Florida Keys. Nat. prob. of the O. W. tropics, and cult.—(W. I.)—All year.—A sacred tree in some countries. This tree grows luxuriantly on shores of bays and inlets. By its elongate, spreading lower branches it makes almost impenetrable thickets. Large crops of fruits continuously increase its dense growth.

19. **CIENFUEGOSIA** Cav. Shrubs or woody herbs, resembling species of *Hibiscus*. Leaf-blades entire or lobed. Involucels of 3–many bractlets. Sepals 5, united below. Petals 5. Capsule 3–5-valved.—About 20 species, half of them American.

1. **C. heterophylla** (Vent.) Garcke. Leaf-blades 1.5–5 cm. long, those of the upper leaves narrow: peduncles clavate: bractlets minute: petals yellow, capsule rarely equaling the calyx.—Hammocks and open places, Florida Keys.—(W. I., S. A.)—All year.—This species ranges from Florida to northern South America. Forms from South America often appear quite distinct from those from the more northern West Indies. Another species, *C. Drummondii* occurs in the Coastal Plain of Texas. Like other Texan relatives, *Gayoides* and *Malvaviscus* it may occur on Key West.

20. **GOSSYPIMUM** L. Herbs, shrubs, or trees. Leaf-blades palmately lobed or rarely entire. Involucel of 3 large bracts. Sepals 5, united into a cup-like calyx. Petals 5, usually dark-colored at the base. Capsule 5-valved.—

About 40 species, tropical.—COTTONS.—The bark of the root of some species is medicinal; the hairs of the seeds constitute cotton; the seeds yield oil.

Seed 4-5 mm. broad, glabrous, that is, completely separable from the wool: lobes of the leaf-blades mostly longer than the body.

Seed 6-7 mm. broad, woolly: lobes of the leaf-blades mostly shorter than the body.

Wool tawny: plant woody: foliage closely pubescent with very short hairs.

Wool white: plant herbaceous: foliage if pubescent, hirsute.

1. *G. barbadense*.

2. *G. hirsutum*.

3. *G. herbaceum*.

1. *G. barbadense* L. Shrub with glabrous twigs, often 2 m. tall or more: leaf-blades with 3-5 lanceolate or ovate-lanceolate lobes: corolla pale-yellow: capsule ovoid, acute, 3.5-5 cm. long.—(SEA-ISLAND COTTON.)—Thickets, old fields, and hammocks, Coastal Plain, Fla. to La. Nat. of trop. Am. and cult.—Seeds black, smooth when the long fibers are removed.

2. *G. hirsutum* L. Shrub or small tree, with usually hirsute twigs: leaf-blades 4-11 cm. wide, sometimes pubescent, 3-lobed, the lobes ovate to deltoid, as long as the body of the leaf or very short: calyx becoming 1-1.5 cm. wide: corolla creamy-white except the purplish base, but becoming pink; petals 3-5 cm. long: capsule ovoid, 2.5-3 cm. long: seed with tawny cotton.—(WILD-COTTON.)—Hammocks, sand-dunes, and kitchen-middens, S pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—All year.

3. *G. herbaceum* L. Plant glabrous, or with long scattered hairs: leaf-blades with 3-5 triangular or ovate lobes: corolla creamy white, becoming pink; petals 5-7 cm. long: capsule subglobose: seed with white cotton.—(COMMON COTTON. UPLAND-COTTON.)—Fields, thickets, and waste places, various provinces, Fla. to Tex., Ark., and S Va Nat. of Asia, and cult.—(W. I., Mex., C. A., S. A.)—Sum.

### FAMILY 3. BUETTNERIACEAE — CHOCOLATE FAMILY

Shrubs or trees, or herbs, often resembling *Malvaceae*. Leaves alternate: blades simple. Flowers mostly perfect. Calyx of 5, or rarely fewer, sepals. Corolla of 5, or rarely fewer, petals, or wanting. Androecium of as many stamens as there are sepals, or more. Staminodia sometimes present. Gynoecium of 5, more or less united carpels, or fewer. Fruit capsular or follicular.—About 45 genera and over 600 species, mostly tropical.

Corolla present.

Petals with flat blades.

Gynoecium of 5 united carpels: styles 5, not eccentric: stigmas capitate.

Involucel wanting: capsule angular or pyramidal, loculicidal.

Involucel of 3 or more bractlets: capsule globose, loculicidal and septicidal.

Styles distinct: flowers and fruits mostly in interrupted spike-like panicles.

Styles partly united: flowers and fruits mostly in a terminal cluster.

Gynoecium of a single carpel: style 1, eccentric: stigma brush-like.

Petals with hooded blades.

Corolla wanting.

1. MOLUCHIA.

2. MELOCHIA.

3. RIEDLEA.

4. WALTHERIA.

5. AYENIA.

6. FIRMIANA.

1. **MOLUCHIA** Medic.\* Herbs, shrubs, or small trees. Leaf-blades toothed. Involucel wanting. Sepals 5, united at the base. Petals 5, marcescent. Filaments united at the base. Styles 5, distinct. Capsules 5-valved, angled.—About 6 species, tropical.

1. **M. tomentosa** (L.) Britton. Much-branched shrub up to 2 m. tall, the foliage densely pale stellate-tomentose: leaf-blades ovate, lanceolate, or linear-lanceolate, 1.5–6 cm. long, crenate or serrate-crenate, prominently veined beneath: calyx-lobes acuminate: petals mostly rose-purple, about 1 cm. long: capsule 6–8 mm. long, beaked, with 5 shoulder-like blades: seed 1.5 mm. long. [*Melochia tomentosa* L.]—(BROOM-WOOD.)—Pinelands, S pen. Fla. and S Tex.—(W. I., Mex., C. A., S. A.)—Spr.–fall.

2. **MELOCHIA** [Dill.] L. Herbs or shrubby plants. Leaf-blades toothed and sometimes also slightly-lobed. Involucel present. Sepals 5, partly united. Petals 5, marcescent. Filaments well united. Styles 5, distinct. Capsule primarily loculicidally 5-valved.—About 25 species, tropical and subtropical.

1. **M. corchorifolia** L. Stem up to 1.5 m. glabrous or sparingly pubescent, virgately branched: leaf-blades ovate to ovate-lanceolate, irregularly serrate and often slightly 3-lobed, long-petioled: flower-clusters dense: calyx-lobes acute: petals purple, or with the claw yellowish, 4–7 mm. long: capsule subglobose, 4–4.5 mm. in diameter. [*M. hirsuta* (Chapm. Fl.) not Cav.]—Old fields, cult. grounds and waste-places, various provinces, Fla. to Tex., and S. C.—Spr.–fall.

3. **RIEDLEA** Vent. Herbs or low woody shrubs. Leaf-blades toothed. Involucel of 3 bractlets. Flowers in terminal and axillary clusters. Sepals 5, partly united. Petals 5, marcescent. Filaments partly united. Styles 5, partly united. Capsule 5-valved.—About 20 species, mostly tropical American.

1. **R. hirsuta** (Cav.) DC. Stem diffusely branched, the branches decumbent or ascending, up to 1.5 m. long, hirsute and often with some appressed hairs: leaf-blades ovate to lanceolate, serrate, short-petioled: calyx-lobes ovate to deltoid, 9–13 mm. long: petals violet: capsule subglobose, about 3 mm. in diameter. [*Melochia hirsuta* Cav.]—Pinelands, S pen. Fla.—(W. I., Mex., C. A., S. A.)—All year.

4. **WALTHERIA** L. Herbs, shrubs, or trees. Leaf-blades toothed. Involucel of 3-bractlets. Sepals 5, united to the middle or above it. Petals 5, loosely spreading, narrow, slender-clawed, yellow. Stamens 5: anthers with 2 sacs: staminodia wanting. Ovary 1-celled. Capsule smooth, often pubescent, longer than thick.—About 35 species, tropical American.

1. **W. americana** L. Stem erect or rarely diffuse and prostrate, 6–16 dm. long, often much-branched: leaf-blades ovate or orbicular-ovate, 1–8 cm. long, serrate or dentate-serrate, stout-petioled: flowers in dense axillary clusters: calyx 4–5 mm. long at maturity; lobes triangular to lanceolate or subulate-lanceolate, mostly nearly as long as the tube or shorter: petals 3–4 mm. long: capsule about 2 mm. long, obliquely rounded or truncate at the top and long-hairy.—Hammocks, pinelands and sand-dunes, S pen. Fla. and the Keys. Adv. on coast of Ala.—(*W. I., Mex., C. A., S. A.*)—All year.—Reputed to have medicinal properties.

5. **AYENIA** L. Herbs often partially woody. Leaf-blades toothed. Involucel wanting. Sepals 5, slightly united. Petals 5, converging, the claws involute. Stamens 5; anthers with three parallel sacs. Staminodia present. Ovary 5-celled. Capsule muricate, depressed.—About 10 species, tropical American.

Petals 6–6.5 mm. long; blades about 1.5 mm. wide; appendages stout, over 0.5 mm. long.  
 Petals 4–4.5 mm. long; blades about 1 mm. wide; appendages slender, less than 0.5 mm. long.

1. *A. euphrasiaefolia*.

2. *A. pusilla*.

1. **A. euphrasiaefolia** Griseb. Tap-root stout: stem prostrate: leaf-blades predominately suborbicular to reniform, 0.5–1 cm. long, sharply few-toothed: calyx about 3 mm. long: petals reddish: capsule 4–5 mm. in diameter: seed bluntly tuberculate.—Pinelands, Everglade Keys, Fla. and lower Florida Keys.—(*W. I.*)—All year.

2. **A. pusilla** L. Tap-root slender: stem erect or ascending: leaf-blades predominantly elliptic to elliptic-ovate, 1–2.5 cm. long, rather bluntly many-toothed: calyx about 2 mm. long; lobes ciliate: petals red: seed sharply tuberculate.—Waste-places, Everglade Keys, Fla. and Key West. Perhaps introduced from the *W. I.*; also in rocky places, *W. Tex.*—(*W. I., Mex., C.A., S. A.*)—Spr.–fall.

6. **FIRMIANA** Marsigli. Shrubs or trees. Leaf-blades entire or lobed. Flowers unisexual or polygamous. Sepals 5, or rarely 4, often petaloid.

Petals wanting. Staminal-column broad. Carpels nearly distinct. Stigmas peltate. Capsule opening before maturity, the carpels stellately spreading.—About 10 species, Asiatic.

1. *F. platanifolia* (L.) R. Br. Tree becoming 12 m. tall, or a shrub: leaf-blades 1–3 dm. broad, palmately 3–5-lobed: panicle commonly 2–3 dm. long: sepals linear: carpels 6–9 cm. long. [*Sterculia platanifolia* L.]—(CHINA PARASOL-TREE. JAPANESE VARNISH-TREE. BOTTLE-TREE.)—Roadsides, woods, thickets, and fields, Coastal Plain, Fla. to Tex. and S. C. Nat. of eastern Asia and cult.—Spr.—Like the tallow-tree (*Triadica*) this Asiatic tree is extensively naturalized in the Coastal Plain of South Carolina and less abundantly within the range given above. In open places the trunk may be widely branched, in the dense growth of large colonies the trunks are usually pole-like.

#### ORDER HYPERICALES — HYPERICAL ORDER

Herbs, shrubs, or trees. Leaves various. Flowers mostly perfect, complete and regular (irregular in Violaceae), sometimes involucrate. Calyx of distinct or essentially distinct sepals. Corolla of distinct petals (partially united in Fouquieriaceae), rarely wanting. Androecium of several united carpels. Ovary superior, mostly with parietal placentae. Fruit capsular, baccate, or drupaceous.

Stamens united into a tube which surrounds or encloses the gynoecium.

Placentae parietal.

Placentae axial.

Stamens distinct.

Styles wanting: stigmas introrse.

Placentae axial: herbs or shrubby plants.

Placentae basal: shrubs or trees.

Styles present, distinct or united: stigmas terminal.

Styles distinct or partially united or coherent until maturity, if united to the stigmas, then grooved.

Stigmas not brush-like: endosperm little or none.

Herbs or shrubby plants, with opposite or whorled leaves.

Shrubs or trees, with alternate leaves.

Stigmas brush-like: endosperm copious.

Styles wholly and permanently united.

Corolla regular.

Corolla irregular, the petals markedly unequal and one of them spurred; stamens 5.

Fam. 1. CANELLACEAE.

Fam. 2. CLUSIACEAE.

Fam. 3. ELATINACEAE.

Fam. 4. TAMARICACEAE.

Fam. 5. HYPERICACEAE.

Fam. 6. THEACEAE.

Fam. 7. TURNERACEAE.

Fam. 8. CISTACEAE.

Fam. 9. VIOLACEAE.

#### FAMILY 1. CANELLACEAE — WILD CINNAMON FAMILY

Trees. Leaves alternate: blades entire, pellucid-punctate. Flowers perfect. Calyx of 3 thick imbricate sepals. Corolla of 4–12 narrow petals, or wanting. Androecium of numerous stamens, the filaments united into a tube around the pistil. Gynoecium of 2–5 united carpels. Fruit a berry.—Five genera and 7 species, in tropical America and Africa.

1. **CANELLA** P. Br. Trees with gray bark. Leaf-blades leathery. Flowers in cymes. Petals 5. Stamens mostly 15–20, the tube projecting beyond the anthers. Ovary 1-celled. Berry subglobose.—One species.

1. **C. Winteriana** (L.) Gaertn. Trees 5–15 m. tall: leaf-blades oblanceolate, spatulate, or elliptic-spatulate, 3–10 cm. long: sepals 2.5–3 mm. broad: petals 5, elliptic, 4.5–5 mm. long, purple: berry about 10 mm. in diameter, crimson or nearly black.—(WILD-CINNAMON. CINNAMON-BARK.)—Hammocks, Cape Sable region, pen. Fla. and Florida Keys.—(W. I.)—Sum.—fall.—The leaves and bark are spicy-aromatic, and are used in medicine and as a condiment. The red-brown heart-wood is close-grained, very hard, and very heavy. The contrast of the cymes of purple flowers and the deep-green foliage is striking. The clusters of almost black berries also render the tree conspicuous.

## FAMILY 2. CLUSIACEAE—BALSAM-TREE FAMILY

Shrubs or trees. Leaves opposite: blades entire. Flowers mostly dioecious or polygamous. Calyx of 2–6 imbricate sepals. Corolla of 4–9 petals. Androecium of numerous stamens, the filaments wholly or partly united. Gynoecium of 2 or more united carpels. Fruit baccate, drupaceous, or capsular.—About 25 genera and over 250 species, mostly tropical.

1. **CLUSIA** L. Shrubs or trees, often epiphytic, at least when young. Leaf-blades leathery. Flowers solitary or few together. Petals 4–9. Ovary 8–10-celled. Capsule leathery or fleshy.—About 80 species, tropical American.—BALSAM-APPLES. FAT-PORKS. MONKEY-APPLES.—Incomplete specimens of both the following species were collected on Big Pine Key and Key West many years ago.

Flowers yellow: fruits slightly elongate or globular: stigmas 12–14.

1. *C. flava*.

Flowers white or pink: fruits depressed: stigmas 6–8.

2. *C. rosea*.

1. **C. flava** Jacq. Tree, sometimes 20 m. tall: leaf-blades cuneate-obovate, 1–1.5 dm. long, many-ribbed: sepals suborbicular: petals yellow, obovate, 2.5–3 mm. long: capsule slightly elongate or globular.—Hammocks, Key West, Fla.; not collected in recent years.—(W. I.)

2. **C. rosea** L. Tree similar to *C. flava* in habit, but leaves rather larger: petals white or pink: capsule depressed.—Hammocks, Big Pine Key, Fla.; not recently collected.—(W. I.)—Among the several shrubs and trees discovered on the lower Florida Keys in the earlier part of the past century and then “lost,” the two balsam-apples appear to be the only ones not yet rediscovered. They may yet be found in the hammocks not visited in recent years. Their discovery was due to the activities of a resident botanist, Dr. Blodgett, of Key West.

FAMILY 3. **ELATINACEAE** — WATER-WORT FAMILY

Herbs or partly woody plants. Leaves opposite. Flowers perfect. Calyx of 2-5 imbricate sepals. Corolla of 2-5 petals. Androecium of 2-5, or sometimes 10, stamens. Gynoecium of 2-5 carpels. Fruit a capsule.—Two genera and 30 species, widely distributed.

1. **ELATINE** L. Wholly succulent plants. Leaf-blades commonly entire. Sepals ribless. Ovary 2-4-celled: styles 2-4. Capsule membranous, 2-4-celled.—About 10 species, natives of warm regions.

1. **E. americana** (Pursh) Arn. Stem 1-5 cm. long: leaf-blades cuneate-ovate to elliptic, 1-5 mm. long: flowers greenish: sepals 2, obtuse: petals 2: stamens 2; capsule subglobose, about 1 mm. in diameter.—(WATER-WORT. MUD-PURSLANE.) — Ponds and slow streams, various provinces, Tenn. to Tex., Minn., Ont., and N. C.—Sum.—The petals may sometimes be pink-tinged. The plants, creeping on mud, resemble diminutive chickweeds and pimpurnels.

FAMILY 4. **TAMARICACEAE** — TAMARISK FAMILY

Shrubs or trees, or partially herbaceous plants. Leaves alternate: blades entire, often scale-like. Flowers mainly perfect, sometimes in profuse panicles. Calyx of 5, or 4 or 6, sepals. Corolla of 5, or 4 or 6, petals. Androecium of 5 or many stamens. Gynoecium of 2-5 united carpels. Ovary 1-celled. Fruit a capsule—Four genera and 90 species, of Africa and Eurasia.

1. **TAMARIX** L. Irregularly branching evergreen shrubs or trees. Leaves scale-like, clasping or sheathing. Flowers borne in plume-like panicles. Capsule many-seeded.

1. **T. gallica** L. Small tree or shrub, with weak branches, the branchlets clothed with the imbricate leaves: panicles with numerous spikes: sepals about 0.5 mm. long: petals white or pinkish: capsule about 1 mm. long.—(TAMARISK.) — Roadsides, waste-places, and stream-banks, various provinces, Fla. to Tex., Ark., and S. C.—Nat. of Eu.—(W. I.)—Spr.-sum.—This species is widely cultivated and is naturalized in the Coastal Plain and adjacent provinces. It appears in several forms, varying with green or glaucous foliage, slender or stout branchlets and long or short racemes.

FAMILY 5. **HYPERICACEAE** — ST. JOHN'S-WORT FAMILY

Shrubs or herbs. Leaves opposite: blades mostly punctate, entire or nearly so, sometimes scale-like. Flowers perfect. Calyx of 4 or 5, sometimes unequal sepals. Corolla of 4 or 5, yellow, pink, or purple-tinged

petals. Androecium of few or many stamens, sometimes grouped, the groups sometimes alternating with the glands. Gynoecium of 3-7 united carpels. Fruit a capsule.—Ten genera and more than 300 species, mostly in temperate and tropical regions.

Sepals 4, in more or less unequal pairs: petals mostly 4.

Pairs of sepals very unequal in size or shape or both, the outer pair enclosing the capsule.

Pairs of sepals nearly equal in size and shape, much surpassed by the capsule.

Sepals and petals mostly 5.

Petals yellow.

Plants without basal branches, or with elongate ones with opposite leaves: petals deciduous: capsule not dehiscent to the base.

Leaves with flat, more or less spreading blades.

Leaves reduced to erect or appressed, minute or slightly elongate scales, without blades.

Plants with clusters of short branches with crowded, decussate, bladeless leaves at the base, and wiry, remotely scaly flowering stems which terminate in slender-branched cymes: petals marcescent: capsule dehiscent to the base.

Petals pink, sometimes tinged with green or purple.

1. ASCYRUM.

2. CROCKEA.

3. HYPERICUM.

4. SAROTHTA.

5. SANIDOPHYLLUM.

6. TRIADENUM.

1. **ASCYRUM** L. Shrubs. Sepals 4, very unequal. Corolla yellow, Stamens not in groups. Styles relatively short. Capsule included in the calyx.—Seven species, American.—ST. PETER'S-WORTS. ST. ANDREW'S-CROSSES.

Styles 2: inner sepals very small, petal-like or obsolete.

Peduncles reflexed at maturity: calyx without bractlets, conspicuously surpassing the leaves.

Peduncles not recurved: calyx subtended by a pair of bractlets, not conspicuously surpassing the leaves.

Outer sepals ovate at maturity: capsule included.

Outer sepals elliptic at maturity: capsule exerted at the tip.

Styles 3-4: inner sepals slightly smaller than the outer.

Outer sepals obtuse or rounded at the apex.

Leaf-blades predominately cuneate or obovate-cuneate, sessile: outer sepals suborbicular.

Leaf-blades predominately of an elliptic or oval type, somewhat clasping: outer sepals broadly ovate-orbicular.

Outer sepals acute or acuminate at the apex.

Leaf-blades predominately of an ovate type: outer sepals quite different from the leaves.

Leaf-blades predominately of an elliptic or linear-elliptic type: outer sepals resembling the leaves.

1. *A. pumilum*.

2. *A. hypericoides*.

3. *A. linifolium*.

4. *A. cuneifolium*.

5. *A. stans*.

6. *A. Edisonianum*.

7. *A. tetrapetalum*.

1. **A. pumilum** Michx. Shrub, depressed, the short stems often matted: leaf-blades oval, obovate, or linear-elliptic, 3-9 mm. long: outer sepals ovate to suborbicular, 6-10 mm. long, the inner obsolete or nearly so: petals yellow, obovate: capsule about 5 mm. long.—Pinelands, Coastal Plain, Fla. and Ga. to Miss.—Spr.—sum.

2. **A. hypericoides** L. Shrub, diffuse: leaf-blades linear, often narrowly so, 5-15 mm. long: outer sepals cuneate-obovate to elliptic or elliptic-lanceolate, 7-9 mm. long, the inner petaloid: petals pale-yellow: capsule 7-8 mm. long.—(ST. ANDREW'S-CROSS.)—Dry woods, thickets, and hammocks, various provinces, Fla. to Tex., Nebr., and Mass.—(W. I.)—Spr.—fall or all year.

3. *A. linifolium* Spach. Shrub, mostly erect: leaf-blades linear-spatulate to oblanceolate, elliptic, or obovate-elliptic, 1-3.5 cm. long: outer sepals ovate to elliptic-ovate, 6-9 mm. long, the inner petaloid: petals bright-yellow: capsule 5-8 mm. long.—Pinelands, Coastal Plain, Fla. to Tex., Ark., and S. C.—(W. I.)—Spr.-fall or all year.

4. *A. cuneifolium* Chapm. Shrub 1-2 dm. tall: leaf-blades cuneate or obovate, 5-20 mm. long: inner sepals elliptic or nearly so: petals yellow: capsule broadly ovoid.—Low pinelands, Coastal Plain, Fla. to Miss.—Sum.-fall.

5. *A. stans* Michx. Shrub 3-9 dm. tall, the stem simple above the base or sparingly branched: leaf-blades broadly elliptic, varying to obovate obtuse: petals bright-yellow: inner sepals lanceolate, short-acuminate: capsule ovoid, 8-10 mm. long.—Acid swamps and moist sandy soil, Coastal Plain and adj. provinces, rarely Blue Ridge, Fla. to Tex., Tenn., and N. Y.—Sum.-fall.

6. *A. Edisonianum* Small. Shrub 3-6 dm. tall, the stem often much-branched: leaf-blades narrowly elliptic to linear-elliptic, acute: petals yellow: inner sepals linear-lanceolate, long-acuminate: capsule narrowly ovoid, 4-6 mm. long.—Pinelands S pen. Fla.—Spr.-sum.

7. *A. tetrapetalum* (Lam.) Vail. Shrub 2-9 dm. tall: leaf-blades ovate to oval: outer sepals resembling the leaf-blades, the inner elliptic to lanceolate: petals bright-yellow; capsule about one-half as long as the sepals.—Low pinelands and swamps, Coastal Plain, Fla. and S Ga.—Spr.-fall or all year.

2. **CROCKEA** Small. Shrubs resembling species of *Ascyrum*, evergreen. Sepals 4, nearly equal. Stamens numerous: filaments distinct. Styles relatively long. Capsule not included. One species.

1. *C. microsepala* (T. & G.) Small. Branching shrub, with erect, ascending, or decumbent stems less than 1 m. tall: leaves numerous; blades cuneate to linear-cuneate or narrowly elliptic, 6-14 mm. long, rounded at the apex, often slightly revolute, sessile: flowers showy, 2-2.5 cm. broad: sepals linear to elliptic, obtuse: petals 4, yellow, unequal, the smaller elliptic, the larger obovate, obtuse: capsules conic-elliptic, 7-8 mm. long, much surpassing the sepals: seeds less than 1 mm. long, striate and pitted. [*Ascyrum microsepalum* T. & G. *Hypericum microsepalum* (T. & G.) A. Gray] —Low pinelands, edges of woods, and fence-rows, Coastal Plain, N Fla. and S Ga.—Spr.

3. **HYPERICUM** [Tourn.] L. Herbs or shrubs. Leaves more or less black-dotted. Sepals 5, essentially equal. Corolla yellow: petals inequilateral or nearly equilateral. Stamens mostly in groups. Style relatively long. Capsule not included.—About 210 species, widely distributed.—ST. JOHN'S-WORTS.—Some species are used medicinally.

Stamens few or several, 5-12, usually in 3 clusters: petals copper-yellow.

I. CANADENSIS.

Stamens numerous, 15-40, distinct or in clusters.

Styles 3, or rarely 4: capsule 3-celled or 1-celled and with 3 more or less intruding placentae.

Capsule 1-celled or incompletely 3-celled.

Capsule with parietal placentae, 1-celled.

Capsule incompletely 3-celled by the intrusion of the placentae.

Capsule completely 3-celled.

Herbs, perennial, often stoloniferous: stem simple or sparingly branched.

Shrubs with tap roots: stem much-branched.

Styles 5: capsule 5-celled.

II. VIRGATA.

III. AMBIGUA.

IV. MACULATA.

V. PROLIFICA.

VI. LOBOCARPA.

#### I. CANADENSIA

Leaf-blades linear.

Leaf-blades ovate, oval, or oblong.

Sepals obtuse or somewhat acute: leaf-blades obtuse.

Sepals acuminate: leaf-blades acute.

1. *H. canadense*.

2. *H. mutilum*.

3. *H. gymnanthum*.

#### II. VIRGATA

Styles distinct: stigmas capitate.

Foliage glabrous: sepals not ciliate.

Sepals conspicuously imbricate, at least the outer broadest at the base: leaf-blades broadest about the middle.

Sepals not conspicuously imbricated, at least the outer broadest about the middle: leaf-blades broadest about the base.

Foliage tomentose: sepals ciliate.

Styles coherent, at least below: stigmas minute.

Corolla 18 mm. broad or more: capsules over 6 mm. high.

Corolla less than 18 mm. broad: capsules less than 6 mm. high.

Capsules broadest at the top, about as long as the sepals.

Capsules broadest at the base.

Sepals obtuse: seeds striate and pitted.

Sepals acute or acutish: seeds transversely wrinkled.

4. *H. denticulatum*.

5. *H. acutifolium*.

6. *H. setosum*.

7. *H. dolabriforme*.

8. *H. turgidum*.

9. *H. opacum*.

10. *H. cistifolium*.

#### III. AMBIGUA

Sepals very small or at least not foliaceous.

Leaves never in conspicuous axillary clusters: blades relatively broad.

Sepals obtuse or merely acutish.

Sepals less than  $\frac{1}{2}$  as long as the petals: capsules 6-7 mm. long.

Sepals over  $\frac{1}{2}$  as long as the petals: capsules 12-13 mm. long.

Sepals manifestly acute or acuminate.

Leaves in conspicuous axillary clusters: blades narrow.

Leaves of the axillary clusters mostly much smaller than the main pair: blades neither subulate, nor fleshy.

Cymes in terminal congested corymbs: buds broadly ovoid: mountain species.

Cymes in elongated narrow panicles: buds conic: lowland species.

Leaves linear-oblong, spatulate or oblanceolate.

Leaves narrowly linear or narrowly linear-spatulate.

Leaves of the axillary clusters about as large as the main pair or slightly shorter: blades subulate or linear-subulate, fleshy, about as thick as wide.

Sepals as long as the petals or fully  $\frac{1}{2}$  as long: leaves mostly over 10 mm. long.

Sepals less than  $\frac{1}{2}$  as long as the petals: leaves mostly less than 10 mm. long.

Sepals foliaceous.

Leaf-blades cordate-clasping.

Leaf-blades more or less narrowed to the sessile or short petioled base.

Flowers sessile: buds ovoid-globose.

Flowers pedicelled: buds conic.

11. *H. nudiflorum*.

12. *H. apocynifolium*.

13. *H. adpressum*.

14. *H. glomeratum*.

15. *H. ambiguum*.

16. *H. galioides*.

17. *H. fasciculatum*.

18. *H. aspalathoides*.

19. *H. myrtifolium*.

20. *H. aureum*.

21. *H. splendens*.

## IV. MACULATA

Corolla less than 15 mm. broad.

Leaf-blades short-petioled or merely sessile, with a rounded base.

Leaf-blades sessile and more or less clasping.

Corolla over 15 mm. broad.

Upper leaves and bracts with ovate or ovate-lanceolate blades: petals spotted all over.

Upper leaves and bracts with oblong blades: petals spotted around the edges.

Sepals and petals merely dotted: capsules usually less than 6 mm. high.

Sepals and petals striped with black: capsules usually over 6 mm. high.

Corolla about 3 cm. broad: styles filiform.

Corolla 1.5-2 cm. broad: styles subulate.

22. *H. subpetiolatum*.

23. *H. punctatum*.

24. *H. pseudomaculatum*.

25. *H. perforatum*.

26. *H. graveolens*.

27. *H. Mitchellianum*.

## V. PROLIFICA

Stems diffusely spreading or decumbent.

Stems erect, relatively tall.

Flowers few in narrow panicles: corolla over 1.5 cm. broad.

Flowers numerous in rather corymb-like panicles: corolla less than 1.5 cm. broad.

28. *H. Buckleyi*.

29. *H. prolificum*.

30. *H. densiflorum*.

## VI. LOBOCARPA

Much-branched shrub, with numerous small flowers and a 5-lobed capsule.

31. *H. lobocarpum*.

1. *H. canadense* L. Plant 1-6 dm. tall: leaf-blades 3-nerved: sepals lanceolate or linear-lanceolate, 3-5 mm. long: petals 3-6 mm. long: capsule 4-8 mm. long, acute.—Moist, often acid, soil, various provinces, rarely Coastal Plain, Ga. to Ala., Wis., Man., and Newf.—Sum.

2. *H. mutilum* L. Plant 1-8 dm. tall: leaf-blades oblong-ovate to ovate, or sometimes oblong, 5-nerved: sepals elliptic to elliptic-lanceolate: petals about 3.5 mm. long: capsule 2-3 mm. long, obtuse.—(DWARF ST. JOHN'S-WORT.)—Wet sand and miry places, various provinces, Fla. to Tex., Man., and N. S.—Sum.—fall.

3. *H. gymnanthum* Engelm. & Gray. Plant 2-9 dm. tall: leaf-blades ovate, 5-7 nerved: sepals lanceolate: petals 3-6 mm. long: capsule about 4 mm. long.—Moist places and wet sandy soil, various provinces, Fla. to Tex., Mo., Mich., and N. C.—Sum.

4. *H. denticulatum* Walt. Plant perennial, 2-9 dm. tall: leaf-blades elliptic or nearly so, 1-3 cm. long, acute, (oval and relatively shorter, with the sepals oval to ovate, in *H. denticulatum ovalifolium*): sepals more or less foliaceous, lanceolate, elliptic-lanceolate or slightly broadened upward, 4-10 mm. long: petals copper-yellow, 5-10 mm. long: capsule ovoid, about 4 mm. long. [*H. virgatum* Lam.]—(COPPERY ST. JOHN'S-WORT.)—Acid sandy soil and pine-lands, various provinces, Fla. to Ill. and N. J.—Sum.

5. *H. acutifolium* Ell. Plant perennial, 2-6 dm. tall: leaf-blades narrowly lanceolate to linear-lanceolate, 1-2.5 cm. long, acuminate: sepals linear to linear-lanceolate, 3.5-5 mm. long: petals copper-yellow, 5-6 mm. long: capsule ovoid, about 4 mm. long.—Low pinelands, Coastal Plain and occasionally adj. provinces, Fla. to Miss., Tenn., and N. C.—Sum.

6. *H. setosum* L. Plant annual or biennial, 3-6 dm. tall: leaf-blades elliptic, oval or ovate-lanceolate, 3-15 mm. long: sepals oval, ovate, or ovate-lanceo-

late, 2.5–3.5 mm. long: petals yellow, 5–6 mm. long: capsule oval or ovoid-oval, 4–5 mm. long. [*H. pilosum* Walt.].—Moist pinelands, Coastal Plain, Fla. to La. and N. C.—Sum.

7. *H. dolabriforme* Vent. Plant perennial, woody, 2–5 dm. tall: leaf-blades linear or nearly so, 2–5 cm. long: sepals foliaceous, lanceolate to ovate-lanceolate, 6–10 mm. long: petals yellow, 8–11 mm. long: capsule conic-ovoid, 7–9 mm. long.—Dry hillsides, various provinces N of Coastal Plain, Ala. to Mo., Ky., and Ga.—Spr.-sum.

8. *H. turgidum* Small. Plant perennial, woody, 3–6 dm. tall: leaf-blades almost linear to linear-lanceolate, 1–2.5 cm. long: sepals ovate to elliptic, 3–4 mm. long: petals yellow, 6–8 mm. long: capsule subglobose, about 3.5 mm. long, turgid.—Wooded slopes, Appalachian provinces, Ala.—Sum.

9. *H. opacum* T. & G. Plant perennial, woody, 3–16 dm. tall: leaf-blades elliptic to elliptic-lanceolate, or sometimes linear-elliptic, 1–3 cm. long: sepals orbicular or obovate to elliptic-ovate, 2.5–4 mm. long: petals bright-yellow, about 5 mm. long: capsule ovoid, 5–6 mm. long.—Low pinelands, Coastal Plain, Fla. to La., and S. C.—Sum.

10. *H. cistifolium* Lam. Plant woody, 3–9 dm. tall: leaf-blades linear-elliptic to linear-lanceolate, or sometimes narrowly elliptic, 1.5–8 cm. long: sepals ovate to lanceolate, 3–4 mm. long: petals cuneate to obovate-cuneate, 5–8 mm. long, bright-yellow: capsule globose or globose-ovoid, 4–6 mm. long. [*H. sphaerocarpum* Michx.].—River-banks, and rocky-slopes, various provinces, Ala. to Miss., Kans., Ia., and Ohio.—Sum.

11. *H. nudiflorum* Michx. Plant woody, 3–10 dm. tall: leaf-blades elliptic to elliptic-lanceolate, 1.5–6 cm. long: sepals elliptic to elliptic-oblancoate, 3–3.5 mm. long: petals bright-yellow, 7–8 mm. long: capsule conic-ovoid.—Sandy soil, Coastal Plain and rarely adj. provinces, Fla. to Ala. and N. C.—Sum.

12. *H. apocynifolium* Small. Plant 4–7 dm. tall: leaf-blades elliptic or nearly so, 2–4 cm. long: sepals spatulate, elliptic or oval, 4–5 mm. long: petals elliptic, 7–8 mm. long, yellow: capsule ellipsoid-conic.—Swamps, Coastal Plain, Fla. to Tex., Ark., and Ga.—Sum.

13. *H. adpressum* Bart. Plant 2–6 dm. tall: leaf-blades narrowly elliptic to lanceolate, 2–6 cm. long, conspicuously veined: sepals lanceolate to ovate-lanceolate, 4–6 mm. long: petals cuneate, 6–8 mm. long, bright-yellow: capsule ovoid, the body 5–6 mm. long.—(CREEPING ST. JOHN'S-WORT.)—Swamps and pond-margins, various provinces, Ga. to La., Tenn., and Mass.—Sum.

14. *H. glomeratum* Small. Shrub 3–10 dm. tall: leaf-blades narrowly elliptic to linear-elliptic or nearly linear, 2–4 cm. long, sessile: sepals rather foliaceous, narrowly elliptic to linear-elliptic, 5–6 mm. long: petals bright-yellow, cuneate-spatulate, fully 1 cm. long: capsules densely clustered, ellipsoid-ovoid, 5–6 mm. high.—Rocky woods, Grandfather Mtn. and Table Rock, in the Blue Ridge of N. C.—Sum.

15. *H. ambiguum* Ell. Shrub 0.5–1.5 m. tall, evergreen: leaf-blades linear-elliptic to spatulate, 1–2.5 cm. long: sepals linear or slightly broadened upward, 3–5 mm. long: petals obliquely obovate or cuneate, almost laterally apiculate, 5–7 mm. long, bright-yellow: capsule almost conic, 5–6 mm. high. [*H. galioides pallidum* C. Mohr.].—River swamps and stream-banks, Coastal Plain, Fla. to Miss. and S. C.—Spr.-sum.

16. *H. galioides* Lam. Shrub 3-18 dm. high or taller, evergreen: leaf-blades narrowly linear or slightly broadened upward, 0.5-1.5 cm. long: sepals linear or linear-spatulate, 3-4 mm. long: petals cuneately narrowed, obliquely or almost laterally pointed, 4-7 mm. long, bright-yellow: capsule conic, 5-6 mm. long, acute.—Low pinelands and swamps, Coastal Plain and rarely adj. provinces, Fla. to Miss., Tenn., and N. C. (or Del.?).—Sum.—fall.

17. *H. fasciculatum* Lam. Shrub 9-45 dm. tall, evergreen: leaves numerous, a bunch usually clustered in the axils of the larger ones; blades leathery, linear-filiform, 1-2 cm. long, or shorter in the clusters: sepals linear, 3-4 mm. long, about 1 mm. wide: petals bright-yellow, obliquely apiculate, 7-8 mm. long: capsule ovoid or conic-ovoid, 4-5 mm. long. —(SAND-WEED.)—Ponds and low pinelands, Coastal Plain, Fla. to Tex. and N. C.—Spr.—fall.—A growth of this shrub in a pond indicates a hard sand bottom, hence the common name. It often reaches tree-like form in swamps near the gulf coast.

18. *H. aspalathoides* Willd. Shrub 2-8 dm tall, evergreen: leaves very numerous, with clusters of small ones borne in the axils of the large ones; blades linear-subulate to subulate, 5-8 mm. long, or shorter in the clusters: sepals linear or nearly so, 2-3 mm. long: petals 6-7 mm. long, intense orange-yellow: capsule 4 mm. long.—Pinelands and prairies, Coastal Plain, Fla. to La. and N. C.—Spr.—sum.—The flowers of some of the St. John's-worts are of such a bright yellow that they seem to irritate the eye. Those of this species come in that class, particularly when the plants are in open sunny places.

19. *H. myrtifolium* Lam. Shrub 3-10 dm. tall, evergreen: leaf-blades ovate to elliptic-ovate, or ovate-lanceolate or rarely nearly elliptic, 1-3 cm. long: sepals foliaceous, ovate, 5-8 mm. long: petals obovate, 12-15 mm. long, bright-yellow: capsule pyramidal-ovoid, incompletely 3-celled or rarely 4-celled, 5-6 mm. high.—Low pinelands and ponds, Coastal Plain, Fla. to Miss. and S. C.—Spr.—sum.

20. *H. aureum* Bartr. Shrub 6-12 dm. tall: leaf-blades elliptic to ovate-elliptic, 2.5-7 cm. long, glaucous beneath: flowers very showy, usually solitary, sometimes 3 in terminal or axillary cymes: sepals very unequal, broadened upward: petals quite oblique, 15-23 mm. long, golden-yellow: capsule conic, 1.3-2 cm. high, acuminate at the apex. (GOLDEN ST. JOHN'S-WORT.)—Bluffs and stream-banks, often in calcareous soil, various provinces, rarely Coastal Plain, Ga. to Tex., Tenn., and S. C.—Sum.

21. *H. splendens* Small. Shrub 0.5-1.5 m. tall: leaf-blades elliptic, 1.5-2.5 cm. long, glaucous, especially beneath: flowers very showy, several or many in terminal or axillary cymes: sepals unequal, elliptic, firm, apiculate, the outer about 8 mm. long, the inner 5 mm. long: petals golden-yellow, cuneate, oblique, 1.5-2 cm. long: capsules often crowded, conic, 1.5 cm. high, acuminate at the apex.—Granite rocks, Stone Mt. on the Piedmont of Ga.—Sum.

22. *H. subpetiolatum* Bicknell. Plant bright-green, heavy-scented, 2-8 dm. tall: leaf-blades thin or thinnish, elliptic, varying to elliptic-obovate or elliptic-ovate, 3-6 cm. long, narrowed, often gradually so, at the base, short-petioled: sepals becoming 3-4 mm. long, the narrower ones linear, the broader elliptic-lanceolate, all mostly acute: petals dull-yellow, 5-7 mm. long, sparingly black-streaked: capsule ovoid or globose-ovoid, 4-6 mm. long.—Woods and thickets, various provinces, Ga. to Miss. and Me.—Sum.

23. *H. punctatum* Lam. Plant dark-green, not heavy-scented, 2-9 dm. tall: leaf-blades thick, elliptic, varying to elliptic-obovate to elliptic-ovate, 1-7 cm. long, obtuse or retuse at the apex, abruptly narrowed or subcordate, and often partly clasping at the base: sepals becoming 3.5-4.5 mm. long, narrower ones elliptic, the broader elliptic-lanceolate or elliptic-ovate, all acute.

sometimes abruptly pointed: petals deep-yellow, 5-7 mm. long, copiously black-streaked: capsule ovoid, 3-5 mm. long. [*H. maculatum* Walt.].—(SPOTTED ST. JOHN'S-WORT.)—Dry soils or hillsides, various provinces, Fla. to Tex., Kans., Ont., and Que.—Sum.

24. *H. pseudomaculatum* Bush. Plant bright-green, not heavy-scented 4-9 dm. tall: leaf-blades ovate to lanceolate or nearly elliptic, 1.5-4.5 cm. long, acutish or obtuse, often revolute, sessile and clasping by the broad cordate base: sepals becoming 5-6 mm. long, the narrower ones lanceolate, the broader ovate-lanceolate or ovate, all acuminate, glandular-margined: petals copper-yellow, 11-15 mm. long, black-streaked: capsule ovoid, 4-5 mm. long.—Woods and dry soil, various provinces, Fla. to Tex., Mo., Ill., and S. C.—Spr.-sum.

25. *H. perforatum* L. Plant 4-7 dm. tall: leaf-blades linear-elliptic, 0.5-2 cm. long, glandular-punctate, those of the main stem usually subtending leafy branches: sepals linear-lanceolate, 3-4 mm. long, acute, glandular-punctate: corolla deep-yellow, 19-24 mm. wide; petals toothed on one side from the middle to the apex, bearing black glands near the teeth: capsule ovoid, oblique, 6-8 mm. high.—(ST. JOHN'S-WEED.)—Dry fields and waste-places, various provinces, nearly throughout U. S. and S Can. Nat. of Eu.—Sum.

26. *H. graveolens* Buckl. Plant erect or decumbent, 2-9 dm. tall: leaf-blades ovate to elliptic, often broader or subcordate at the base: sepals lanceolate to linear-lanceolate, 6-8 mm. long, acuminate: corolla copper-yellow, about 3 cm. broad; petals decidedly obliquely narrowed below the middle, faintly streaked with brown on one side: capsule conic-ovoid, 10-12 mm. long.—Moist woods and open slopes, Blue Ridge, N. C. and Tenn.—Sum.—Most abundant at about 6,000 feet alt.

27. *H. Mitchellianum* Rydb. Plant similar to *H. graveolens*: leaf-blades thickish, elliptic or ovate-elliptic, 2-6 cm. long, obtuse, mostly rounded at the base: sepals ovate to lanceolate, 5-6 mm. long, acute: corolla copper-yellow, 1.5-2 cm. broad; petals delicate, decidedly spotted with brown on one side: capsule ovoid, 8-10 mm. long.—(BLUE RIDGE ST. JOHN'S-WORT.)—Moist mtn. slopes, Blue Ridge, N. C. and Tenn. to Va.—Sum.—Most abundant at 4,000-5,000 feet alt.

28. *H. Buckleyi* M. A. Curtis. Plant 1-3 dm. tall, decumbent or ascending, often diffusely matted: leaf-blades obovate, elliptic-obovate, or elliptic, 0.5-2 cm. long, rounded at the apex or retuse: sepals obovate or spatulate, 4-5 mm. long, obtuse: corolla yellow, 2-2.5 cm. broad: petals rather delicate, about twice as long as the sepals: capsule conic, 6-10 mm. long, 3-celled.—(MOUNTAIN ST. JOHN'S-WORT.)—Cliffs and rocky mtn. summits, Blue Ridge and adj. provinces, Ga. to N. C.—Sum.

29. *H. prolificum* L. Shrub 3-12 dm. tall, the branches narrowly 2-winged leaf-blades narrowly elliptic or rarely lanceolate, 2-8 cm. long, short-petioled: cymes few-flowered, short-peduncled, in cylindric panicles: sepals mostly obovate, 4-6 mm. long: corolla deep-yellow, 2-2.5 cm. broad: capsule conic or narrowly ovoid, 8-10 mm. long, acute.—(BROOM-BRUSH. SHRUBBY ST. JOHN'S-WORT.)—Rocky and sandy woods and stream-banks, often in calcareous soil, various provinces, rarely Coastal Plain, Ga. to Miss., Ark., Minn., and N. Y.—Sum.

30. *H. densiflorum* Pursh. Shrub 6-24 dm. tall: leaf-blades linear, linear-oblancheolate, or linear-elliptic, 1-5 cm. long, acute: sepals unequal, elliptic to elliptic-lanceolate, 2-2.5 mm. long: corolla bright-yellow, 1-1.5 cm. broad; petals obliquely pointed: capsule ovoid, 4-6 mm. long, slightly 3-lobed, completely 3-celled.—(BUSHY ST. JOHN'S-WORT.)—Acid swamps and marshes, various provinces, Fla. to Tex., Mo., and N. J.—Sum.

31. *H. lobocarpum* Gattinger. Shrub 1-2 m. tall: leaf-blades narrowly elliptic or oblanceolate, 2-7 cm. long: flowers numerous: sepals elliptic to obovate-elliptic, 2.5-3.5 mm. long, rather obtuse: corolla yellow, 1-1.5 cm. broad: petals rather cuneate: capsule 5-celled, 5-lobed, 5-7 cm. long, separating into 5 carpels at maturity.—Swamps and low grounds, Coastal Plain, Tenn. and Blue Ridge, N. C.—Spr.—sum.

4. *SAROTHRA* L. Wiry scaly-leaved annual herbs. Sepals 5, equal or nearly so. Stamens grouped. Styles relatively long. Capsule exserted.—Two species, of eastern North America.

Flowers sessile or nearly so: sepals much shorter than the conic capsules.

Flowers pedicelled: sepals and ovoid or oval-ovoid capsule about equal in length, or sepals slightly shorter.

1. *S. gentianoides*.

2. *S. Drummondii*.

1. *S. gentianoides* L. Stem 1-5 dm. tall: leaves scale-like, appressed, much shorter than the internodes, often subulate or those on the lower part of the stem sometimes linear or narrowly elliptic: sepals linear or linear-lanceolate, 2-3 mm. long: corolla yellow or orange, 4-8 mm. broad: stamens 5-10: capsule conic, 4-5 mm. long.—(PINEWEED. ORANGE-GRASS.)—Sandy and rocky soil in fields, pastures, and on roadsides, various provinces, Fla. to Tex., Ont., and Me.—Sum.—fall.—Sometimes used medicinally.

2. *S. Drummondii* Grev. & Hook. Stem 1-6 dm. tall: leaves scale-like, but longer than the internodes, narrowly linear or linear-subulate, erect or strongly ascending: sepals linear-lanceolate, 3-4 mm. long: corolla deep-yellow, 10-12 mm. broad: stamens 10-20: capsule ovoid or oval-ovoid.—Dry soil, pastures, and hillsides, various provinces, Fla. to Tex., Kans., and Va.—Sum.—Rare E.

5. *SANIDOPHYLLUM* Small. Biennial or perennial herbs. Leaves minutely pustulate, rather succulent: blades very narrow, those of the flowering stem erect or appressed. Sepals unequal, 2-4-ribbed. Corolla yellow: petals with the midnerve nearly lateral and an oblique blade on one side. Stamens grouped in 4's. Styles filiform. Capsule invested by the persistent perianth at the base, the 3 valves distinct.—One species.

1. *S. cumulicola* Small. Flowering stems few or many together, wiry, 2-7 cm. tall, with the leafy shoots on the caudex-like base: leaves linear-subulate, 1-6 mm. long: sepals broadly linear to ovate, 1-1.5 mm. long: petals yellow, 3-4 mm. long: capsule 5-6 mm. long, subulate-tipped, brown.—Scrub S pen. Fla.—All year.—The plants grow only in the white sand of the scrub and resembles some species of yellow-flax (*Cathartolinum*) in habit as well as the color and size of the flowers.

5. **TRIADENUM** Raf. Leafy perennial herbs, resembling species of *Hypericum*. Corolla pink, sometimes tinged with green or purple. Sepals 5, equal. Stamens mostly 9, grouped in 3's, the filaments of each group well united. Styles relatively long. Capsule exserted. Three species, of eastern North America.—Sum.—MARSH ST. JOHN'S-WORTS.

Filaments united near the base.

Filaments united to above the middle.

Leaf-blades sessile, truncate or subcordate at the base.

Leaf-blades petioled, narrowed at the base.

1. *T. virginicum*.

2. *T. longifolium*.

3. *T. petiolatum*.

1. **T. virginicum** (L.) Raf. Stem 2-6 dm. tall: leaf-blades elliptic or ovate, 2-10 cm. long, obtuse, clasping: sepals lanceolate to elliptic, 5-6 mm. long, acute: petals obovate to oblanceolate or nearly elliptic, 8-10 mm. long, acute, delicately nerved: capsule ellipsoid, 8-10 mm. long.—Acid bogs and sandy swamps, various provinces, Fla. to La., Man., and Lab.

2. **T. longifolium** Small. Stem 3-6 dm. tall: leaf-blades oblanceolate to elliptic: sepals lanceolate or linear-lanceolate, 3-4 mm. long, acuminate: petals broadened upward, 4-5 mm. long: capsule ellipsoid, about 1 cm. long.—Swamps and low grounds, Coastal Plain, Ga. to Ala. and Ky.

3. **T. petiolatum** (Walt.) Britton. Stem 3-10 dm. tall: leaf-blades elliptic or narrowly elliptic, 2-15 cm. long: sepals elliptic or nearly so 2.5-3.5 mm. long, obtuse: petals elliptic-obovate, 4-6.5 mm. long: capsule ellipsoid, prismatic 8-10 mm. long.—Swamps and borders of ponds, Coastal Plain, Fla. to La., Mo., and N. J.

## FAMILY 6. THEACEAE — CAMELLIA FAMILY

Shrubs, trees, or vines. Leaves alternate. Flowers perfect and showy. Calyx of 5, or rarely 4-7, imbricate sepals. Corolla of 5, or rarely of 4-7, petals. Androecium of numerous, or rarely few, stamens. Gynoecium of 3-5 partly or wholly united carpels. Fruit mostly capsular, sometimes indehiscent.—Sixteen genera and about 160 species, natives of tropical and temperate regions.

Sepals slightly unequal: ovules 2, ascending: seeds lenticular, sometimes margined.

Sepals ovate, united at the base: filaments united at the base: styles united: capsule not beaked: seeds marginless.

Sepals narrowly oblong, distinct: filaments distinct: styles distinct: capsule long-beaked: seeds margined.

Sepals very unequal: ovules 4-8, pendulous: seeds strongly angled or winged.

Leaf-blades membranous, deciduous: flowers nearly sessile: filaments distinct: capsule globose: seeds angled.

Leaf-blades leathery, persistent: flowers long-pedicelled: filaments united into a thick tube: capsule ovoid: seeds winged.

1. STUARTIA.

2. MALACHODENDRON.

3. FRANKLINIA.

4. GORDONIA.

1. **STUARTIA** L. Shrubs. Leaf-blades usually toothed. Sepals mostly 5, relatively broad. Petals mostly 5, white. Style columnar. Stigma radiate.

Capsule globular or depressed.—Four species, American and Japanese.

1. **S. Malachodendron** L. Shrub 1-5 m. tall: leaf-blades oval, elliptic, or sometimes ovate or obovate, 5-11 cm. long: sepals about 1 cm. long: petals obovate, 3-5 cm. long: capsule depressed-globular, 12-17 mm. in diameter.—(SILKY CAMELLIA. VIRGINIAN-STUARTIA.)—Wooded banks and hillsides, Coastal Plain and adj. provinces, W Fla. to La., Tenn., and Va.—Spr.—In Florida only in the Knox Hill country, where it grows in company with *Illicium floridanum* and *Magnolia Ashei*.—The stamens are usually purple.

2. **MALACHODENDRON** Cav. Shrubs resembling *Stuartia*. Sepals mostly 6, relatively narrow. Petals mostly 5, white. Styles 5, subulate. Stigmas introrse. Capsule slightly elongate.—One species.

1. **M. pentagynum** (L'Her.) Small. Shrub 1-5 m. tall: leaf-blades ovate, oval, or elliptic, 6-12 cm. long: sepals 1-1.5 cm. long: petals obovate, 3-3.5 cm. long: capsule ovoid, 1.5-2 cm. long. [*Stuartia pentagyna* L'Her.]—(MOUNTAIN CAMELLIA. MOUNTAIN-STUARTIA.)—Along streams and rich woods, Blue Ridge to Appalachian Plateau and adj. Piedmont, Ga. to Ala., Ky., and Va.—Spr.—early sum.—Contrary to *Stuartia* which seeks the lower provinces, this genus inhabits the higher ones, apparently entering the Coastal Plain only in SE Va.

3. **FRANKLINIA** Marsh. Trees. Leaves deciduous. Flowers nearly sessile. Sepals 5. Petals 5, unequal, white. Stamens distinct, adnate to the bases of the petals. Style ridged. Capsule loculidical from the top and septicidal from the bottom.—One species.

1. **F. Alatomaha** Marsh. Shrub or small tree with smooth black bark: leaf-blades oblanceolate to oblong-obovate, 6-15 cm. long, serrate: sepals 12-14 mm. long: corolla 7-9 cm. broad: capsule subglobose, 1.5-2 cm. in diameter: seeds 12-14 mm. long. [*Gordonia pubescens* L'Her.]—(LOST CAMELLIA. FRANKLIN-TREE.)—Moist acid sandy soil in swamps N or E of Ft. Barrington, on the Altamaha River, S W of Townsend, in the Coastal Plain of Ga.—Sum.—Associated with *Pinckneya pubens*. Discovered by John and William Bartram in 1765. Not seen in its native place since 1790, but preserved in cultivation.

4. **GORDONIA** Ellis. Trees. Leaves persistent. Flowers long-pedicelled. Sepals and petals, 5, concave. Stamens borne on a 5-lobed disk.

Style terete. Capsule loculicidal.—About 16 species, American and Asiatic.

1. *G. Lasianthus* (L.) Ellis. Large trees with firm furrowed gray bark: leaf-blades narrowly elliptic or oblanceolate, 5–15 cm. long, appressed-serrate: sepals 8–10 mm. in diameter: corolla 5–7 cm. broad, white: capsule ovoid, 15–18 mm. long.—(LOBLOLLY-BAY. TAN-BAY. RED-BAY. BLACK-LAUREL.)—Non-alluvial swamps and bays, often in acid soil, Coastal Plain, Fla. to La. and N. C. (or S Va.?).—Sum.—The southern extremity of the range is about the latitude of Lake Okeechobee in Florida. The bark is some times used for tanning. The red heartwood, close-grained but light and soft, is locally used for cabinet-work.

### FAMILY 7. TURNERACEAE — TURNERA FAMILY

Herbs or shrubs. Leaves alternate: blades entire, toothed, or pinnatifid, pinnately veined. Flowers mostly perfect. Calyx of 5 imbricate sepals. Corolla of 5 convolute delicate petals. Androecium of 5 distinct stamens. Gynoecium of 3 united carpels. Ovary 1-celled, with 3 parietal placentae opposite the styles. Fruit a 3-valved capsule.—Six genera and about 180 species, tropical and subtropical.

Ovary seated in a receptacle with a crown-like edge: plant herbaceous. 1. *PIRIQUETA*. Ovary seated in a receptacle without a crown: plant partially woody.

2. *TURNERA*.

1. *PIRIQUETA* Aubl. Herbs. Sepals slightly united. Stigmas lobed.—About 20 species, mostly in tropical and subtropical America.—Spr.—fall or all year southward.

Foliage glabrous, at least to the inflorescence.

Pedice and calyx glabrous: bracts leaf-like.

Pedice and calyx pubescent: bracts scale-like.

Foliage tomentose or hirsute throughout.

Stem tomentose.

Stem hirsute as well as tomentose.

1. *P. viridis*.

2. *P. glabrescens*.

3. *P. tomentosa*.

4. *P. caroliniana*.

1. *P. glabrescens* Small. Plants glabrous up to the inflorescence, 4–6 dm. tall: leaf-blades narrowly linear, 1–5 cm. long, entire: corolla light-yellow: capsule about 5 mm. long.—Everglades and swamps, Fla.

2. *P. viridis* Small. Plants glabrous, 1–5 dm. tall: leaf-blades linear-spatulate to linear, 3–8 cm. long, repand: calyx-lobes lanceolate: corolla yellow: capsule 7–8 mm. in diameter.—Pinelands, Fla.

3. *P. tomentosa* H.B.K. Plants stellate-tomentose, 2–4 dm. tall: leaf-blades oval, elliptic, or rarely narrowly elliptic-lanceolate, 1–4 cm. long, crenate-serrate: corolla bright-yellow: capsule 5–6 mm. in diameter.—Pinelands, S pen. Fla. and the Keys.—The stems are sometimes hirsute near the base.

4. *P. caroliniana* (Walt.) Urban. Plants fulvous-hirsute, 1-4 dm. tall: leaf-blades obovate, elliptic, cuneate, lanceolate, or rarely oval, 1-7 cm. long, repand or crenate-serrate: corolla deep-yellow: capsule 5-7 mm. long.—Pinelands and sand-dunes, Coastal Plain, Fla. to N. C.

2. **TURNERA** L. Shrubs or partly woody plants. Flowers usually solitary and axillary. Corolla yellow. Stigmas 3, brush-like.—About 75 species, mostly American.

1. *T. ulmifolia* L. Shrub 2 m. tall or less, with appressed-pubescent branchlets: leaf-blades ovate, varying to elliptic or spatulate, mostly 3-9 cm. long, serrate or crenate-serrate, 2-glandular at the base, short-petioled: calyx 14-17 mm. long; lobes lanceolate to ovate-lanceolate, acuminate: petals yellow, 2.5-3 cm. long: capsule globular to ovoid, 8-10 mm. long.—Hammocks and waste-places, Coastal Plain, Fla. to La. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.—Used medicinally. This plant naturalized on Key West many years ago. The washing and scouring of storms and the clearing and building operations covering most of the island have not eliminated it from the flora.

#### FAMILY 8. CISTACEAE—ROCK-ROSE FAMILY

Shrubs or partially woody plants. Leaves alternate or opposite: blades simple. Flowers generally perfect. Calyx of 3-5 persistent sepals. Corolla of 5 or 3 often fugacious petals, or wanting. Androecium of 6 or more stamens. Gynoecium of usually 3 united carpels. Fruit a capsule.—Nine genera and about 160 species, natives of the Northern Hemisphere.

Petals 5, yellow, fugacious or wanting.

Leaves with flat blades; style short.

Leaves scale-like or subulate; style elongate.

Petals 3, greenish or purplish, withering-persistent.

1. *CROCANTHEMUM*.

2. *HUDSONIA*.

3. *LECHEA*.

1. **CROCANTHEMUM** Spach.<sup>1</sup> Erect plants. Leaf-blades flat, but often narrowly revolute-margined. Flowers of two kinds, the earliest complete, showy with yellow petals and many stamens, some or all of the later ones apetalous, inconspicuous, and with few stamens. Ovules pendulous. Capsules of the petaliferous flowers larger than those of the apetalous ones. [*Helianthemum* (Fl. SE. U. S.)]—About 25 species, American.—ROCK-ROSES. SUN-ROSES. FROST-WEEDS.

Flowers few, in a simple raceme-like leafy-bracted inflorescence. Flowers, at least the apetalous ones, clustered.

I. *CAROLINIANA*.

Petaliferous and apetalous flowers in the same clusters.

II. *CORYMBOSA*.

Petaliferous flowers solitary or few; apetalous flowers numerous, clustered, later in the season.

III. *CANADENSIA*.

I. *CAROLINIANA*

Leaves mostly in a basal rosette.

1. *C. carolinianum*.

II. *CORYMBOSA*

Flowers in a dense terminal cyme.

2. *C. corymbosum*.

Flowers in scattered or paniced clusters.

Flower-clusters scattered or solitary.

<sup>1</sup> Contributed by John Hendley Barnhart.

Sepals becoming 6-8 mm. long; lateral nerves of leaves not prominent beneath.

Sepals becoming 4-6 mm. long; lateral nerves of leaves prominent beneath.

Flower-clusters in more or less elongate thyrsoid panicles.

Sepals of the apetalous flowers fully 2 mm. long at maturity.

Sepals canescent-puberulent.

Sepals hirsute.

Sepals of the apetalous flowers less than 2 mm. long.

3. *C. arenicola*.

4. *C. georgianum*.

5. *C. Nashii*.

6. *C. thyrsoides*.

7. *C. rosmarinifolium*.

### III. CANADENSIA

Petaliferous flowers 1 or 2, their capsules far overtopped by the apetalous inflorescence.

Petaliferous flowers 5-12, the apetalous inflorescence on short lateral branches.

8. *C. canadense*.

9. *C. Bicknellii*.

1. *C. carolinianum* (Walt.) Spach. Stem hirsute, 0.5-2.5 dm. tall: leaves mostly in a basal rosette; blades oblanceolate to elliptic, 2-4 cm. long: flowers few, in a raceme-like, leafy-bracted inflorescence: petaliferous flowers with 25-35 stamens and 80 ovules, the apetalous with 5 stamens and 50-60 ovules: inner sepals becoming 10-15 mm. long, acuminate: corolla yellow, 2.5-3 cm. broad: capsule subspheric, 8-10 mm. in diameter. [*H. carolinianum* (Walt.) Michx.]-Dry pinelands, Coastal Plain, N Fla. to E Tex. and N. C.—Spr.

2. *C. corymbosum* (Michx.) Britton. Stem finely and densely canescent, 1.5-2 dm. high: leaf-blades elliptic, or the lowest obovate, 1.5-3 cm. long, pale beneath, dark-green above: corolla bright-yellow, 16-20 mm. broad: capsule of the larger flowers 4-6 mm. broad, many-seeded, that of the apetalous ones smaller and few-seeded. [*H. corymbosum* Michx.]-Pine-lands, dunes, and open hammocks, Coastal Plain, Fla. to S. C.—Spr.—sum. or all year S.

3. *C. arenicola* (Chapm.) Barnhart. Stem canescent-tomentulose, 1-2 dm. long: leaf-blades linear-elliptic, 1-2.5 cm. long, obtuse, only the midrib prominent beneath: petaliferous flowers with 25 stamens and 20 ovules, the apetalous with 5 stamens and 10 ovules: sepals various, the larger ovate or oval-ovate, becoming 6-8 mm. long: corolla yellow, 16-20 mm. broad: capsule oval, about 4 mm. long. [*H. arenicola* Chapm.]-Coastal sand-dunes, Fla. to Miss.—Spr.

4. *C. georgianum* (Chapm.) Barnhart. Stem 1.5-3 dm. long: leaf-blades elliptic or slightly narrower below the middle, 1-2.5 cm. long, the lateral nerves as well as the midrib prominent beneath: petaliferous flowers with 15-30 stamens and 35 ovules, the apetalous with 8 stamens and about 17 ovules: sepals various, the larger ovate or oval, becoming 4-6 mm. long, acute or slightly acuminate: corolla yellow, 15-18 mm. broad: capsule ovoid-globose, about 4 mm. long, apiculate. [*H. georgianum* Chapm.]-Sandy woods, pine-lands, dunes, and fields, Coastal Plain, N Fla. to E Tex. and Va.—Spr.

5. *C. Nashii* (Britton) Barnhart. Stem 1.5-4 dm. long: leaf-blades elliptic or linear-elliptic, 1-3 cm. long, the midrib very prominent beneath: petaliferous flowers with 15 stamens and 8-10 ovules, the apetalous with 5 stamens and 3-6 ovules: sepals various, the inner oval or oval-elliptic, becoming 4-5 mm. long: corolla yellow, 16-20 mm. broad: petals broadly cuneate, slightly eroded: capsule broadly ovoid, 3-3.5 mm. long, blunt. [*H. Nashii* Britton]—Scrub, pen. Fla.—Spr.

6. *C. thyrsoides* Barnhart. Plant similar to *C. Nashii* in habit, but the inflorescence less widely branched, and the sepals densely hirsute. [*H. thyrsoides* Barnh.]—Dry sandy soil, Pinellas Co., Fla.—Spr.

7. *C. rosmarinifolium* (Pursh) Barnhart. Stem 1.5–4 dm. tall: leaf-blades linear or narrowly linear-oblongate, or those on basal shoots broader, 1–3 cm. long: petaliferous flowers few, with 12–30 stamens and 8 ovules, their sepals ovate, 2–3 mm. long, the corollas 12–15 mm. broad, their capsules 2–3 cm. long: apetalous flowers in dense clusters, with 3 stamens and 3 ovules, the capsule short-pedicelled, about 1 mm. broad. [*H. rosmarinifolium* Pursh]—Pinelands, sandy fields, and roadsides, Coastal Plain, N. Fla. to E. Tex. and S. C.—Sum.

8. *C. canadense* (L.) Britton. Stem 1–6 dm. tall: leaf-blades elliptic, linear-elliptic, or oblanceolate, nearly sessile, 1.2–3 cm. long, rough and dark-green above, paler and canescent beneath: petaliferous flowers with 30 stamens and 30–60 ovules, their corollas 1.8–3 cm. wide, the capsule ovoid or obovoid and 6–8 mm. long: apetalous flowers appearing later, axillary, nearly sessile, with 4 stamens and 6–20 ovules, the capsule about 4 mm. in diameter: seed papillose. [*H. canadense* (L.) Michx.]—(FROST-WEED.)—Acid sandy or rocky soil, often in woods, various provinces, N. C. to Miss., Wis., and Me.—Spr.–fall.

9. *C. Bicknellii* (Fernald) Barnhart. Stem 3–6 dm. tall: leaf-blades elliptic-lanceolate or oblanceolate, acute or obtuse, 1.5–3.5 cm. long, stellate-canescens beneath, darker above, short-petioled: petaliferous flowers with 30 stamens and 30–60 ovules, their sepals densely canescent, the outer nearly as long as the inner, their corollas 1.5–2.5 cm. broad, light-yellow, the capsule ovoid, 3–4 mm. long: apetalous flowers appearing later, with 4 stamens and 6–20 ovules: seed evenly reticulate. [*H. majus* (Fl. SE. U. S.) *H. Bicknellii* Fernald]—(HOARY FROST-WEED.)—Dry soil, often in open woods or old fields, various provinces, S. C. to Tex., Colo., and N. S.—Spr.–fall.

2. **HUDSONIA** L. Diffuse-spreading tufted or matted shrubs. Leaf-blades subulate or scale-like. Flowers complete. Corolla bright-yellow. Ovules erect. Capsules all alike.—Three species, of eastern North America.—**BEACH-HEATHERS.** **FALSE-HEATHERS.**

Flowers sessile or nearly so: leaves scale-like: ovary glabrous.

Flowers slender-pedicelled: leaves subulate: ovary pubescent.

Ovary pubescent all over: one sepal, at least, with a linear-subulate lobe.

Ovary pubescent at the top: one sepal, at least, with a tooth near the apex.

1. *H. tomentosa*.

2. *H. montana*.

3. *H. ericoides*.

1. *H. tomentosa* Nutt. Densely tufted and intricately branched, matted hoary-pubescent, pale, 1–2 dm. high, the branches stout, ascending: leaves 2 mm. long, oval or elliptic, densely imbricate and appressed: sepals obtuse: capsule ovoid, glabrous.—(BEACH-HEATHER.)—Sands of the seashore and in pinelands, Coastal Plain and New England Coast, N. C. to N. B.; and on lake and river shores, Great Lakes Lowland, Ind. to Man.—Spr.–early sum.

2. *H. montana* Nutt. Bushy, somewhat villous throughout, the branches tufted, 1–1.5 dm. long: leaves commonly erect, sometimes spreading in age, 3–6 mm. long, approximate: pedicels 8–10 mm. long: flowers several: sepals 5–6 mm. long, acuminate, densely pubescent: corolla yellow, 9–11 mm.

broad: capsule oval-ellipsoid or broadly ellipsoid, 3-4 mm. long, sparingly pubescent.—Dry, stony summit of Table Rock and adj. peaks, in the Blue Ridge of N. C.—Sum.—Now localized on a few mountain peaks, but doubtless once of wider distribution, and perhaps the ancestor of the following species.

3. *H. ericoides* L. Bushy, softly-pubescent, 1-2 dm. high, the principal branches slender, ascending: leaves 6-8 mm. long, somewhat spreading, densely imbricate on the younger branches, more scattered on the older ones: pedicels 10-15 mm. long: flowers numerous: corolla about 8 mm. broad: sepals 4-6 mm. long, obtuse or acutish: capsule ellipsoid, slightly pubescent.—(GOLD-HEATHER.)—Dry sandy or rocky soil, especially in pinelands near the coast, Coastal Plain and New England Coast, N. C. to N. S.—Spr.

3. *LECHEA* Kalm. Erect plants with many very leafy shoots at the base of the stem in the fall. Leaf-blades narrow, or those of the leaves on the shoots often broad and short. Flowers complete, minute. Corolla purplish or greenish. Ovules erect. Capsules all alike.—Sum.—PINWEEDS.—Some species are used medicinally.

Plants with annual flowering stems from the base of which rosettes of leafy shoots spring.

Flowers, and fruits, relatively long-pedicelled, in long-peduncled lax clusters.

Flowers and fruits not drooping.

Calyx with the outer (narrow) sepals longer than the inner.

Calyx with the outer (narrow) sepals shorter than the inner.

Flowers and fruits drooping.

Flowers, and fruits, very short-pedicelled, in short-peduncled close or dense clusters.

Plants largely woody, much branched, with copiously leafy branches which later develop panicles at the tip.

I. LONGISEPALAE.

II. BREVISEPALAE.

III. CERNUAE.

IV. DIVARICATAE.

V. MYRIOPHYLLAE.

#### I. LONGISEPALAE

Blades of the cauline leaves of an oval or elliptic type.

Capsule oval or obovoid-oval: outer sepals much longer than the inner: basal shoots, stem, and branches appressed-pubescent.

Capsule subglobose: outer sepals slightly longer than the inner: basal shoots, stem, and branches with lax or spreading hairs.

Blades of the cauline leaves of a linear or subulate type.

Capsule subglobose ellipsoid, or oval, not angled.

Outer sepals slightly longer than the inner: capsule slightly exserted from the calyx, longer than wide.

Outer sepals much longer than the inner: capsule included, about as wide as long.

Capsule ellipsoid-prismatic, decidedly 3-angled, fully 1.5 mm. long.

1. *L. minor*.

2. *L. villosa*.

3. *L. patula*.

4. *L. tenuifolia*.

5. *L. prismatica*.

6. *L. racemulosa*.

7. *L. exserta*.

8. *L. Leggettii*.

9. *L. Torreyi*.

10. *L. maritima*.

#### II. BREVISEPALAE

Capsule ellipsoid:

Capsule oval or subglobose:

Capsule oval:

Capsule narrowly oval, much exserted: sepals sparingly pubescent.

Capsule broadly oval, scarcely exserted: sepals copiously pubescent.

Capsule subglobose.

Blades of the cauline leaves linear-subulate: inner sepals about 1.5 mm. long.

Blades of the cauline leaves linear to narrowly elliptic: inner sepals about 2 mm. long.

#### III. CERNUAE

Plant with several inconspicuously-pubescent flowering stems and several very stout copiously silvery pubescent branched and copiously leafy basal shoots.

11. *L. cernua*.

## IV. DIVARICATAE

Plant more or less diffuse, the branches with numerous relatively short branches: the whole plant loosely gray-pubescent.

12. *L. divaricata*.

## V. MYRIOPHYLLAE

Leaf-blades subulate to elliptic-subulate: capsule depressed-globose.

13. *L. Deckertii*.

Leaf-blades elliptic, sometimes narrowly so: capsule globose.

14. *L. myriophylla*.

1. *L. minor* L. Stem 1.5–6 dm. tall, the often numerous branches rather short, erect or strongly ascending, which terminate in open clusters: blades of the cauline leaves oval or elliptic, 0.8–1.5 cm. long: basal shoots with strigose branches and suborbicular or oval leaf-blades: calyx in fruit obovoid; inner sepals 1.5 mm. long at maturity; outer sepals decidedly longer than the inner: capsule oval or obovoid-oval, about 1.5 mm. long, included.—Dry woods and banks, various provinces, Fla. to La., Mich., and Mass.—Sum.

2. *L. villosa* Ell. Stem 3–8 dm. tall, with short or long ascending branches above, which terminate in dense flower, or fruit, clusters: foliage loosely, sometimes copiously pubescent with gray hairs: blades of the cauline leaves elliptic, 1.5–2.5 cm. long: basal shoots slender with numerous leaves with elliptic, oval, or ovate blades much smaller than those of the cauline-leaves: calyx in fruit globose-turbinate and angular: inner sepals about 1.5 mm. long at maturity, outer sepals slightly longer than the inner: capsule subglobose, bluntly 3-angled, fully 1.5 mm. long, slightly exserted.—Dry woods, pinelands, sandhills, and prairies, various provinces, Fla. to Tex., Nebr., S Ont., and Mass.—Sum.

3. *L. patula* Leggett. Stem 1.5–4.5 dm. tall, with loosely spreading or divergent branches: blades of the cauline leaves linear or nearly so, 4–9 mm. long: basal shoots with linear-elliptic or somewhat spatulate leaf-blades: calyx in fruit obovoid; inner sepals 1–1.5 mm. long at maturity; outer sepals slightly longer than the inner: capsule oval, often broadly so, 1.5 mm. long or more, exserted at the tip.—Dry pinelands, sand-dunes, and hammocks, Coastal Plain, Fla. to S. C.—Sum.—fall or all year S.

4. *L. tenuifolia* Michx. Stem 1–3 dm. tall, laxly much-branched: foliage finely strigose: blades of the cauline leaves narrowly linear or linear-subulate, 0.4–1.5 cm. long: basal shoots with leaves nearly or quite similar to those of the stem: calyx in fruit subglobose or oval; inner sepals about 2 mm. long at maturity; outer sepals much exceeding the inner: capsule subglobose or globose-obovoid, 1.5 mm. long or less, included.—Dry, often rocky or sandy woods, plains, and prairies, various provinces, Fla. to Tex., Kans., Wis., and Mass.—Spr.—fall.

5. *L. prismatica* Small. Stem 1–3 dm. tall, loosely-branched, the branches loosely ascending or spreading: foliage rather coarsely strigose: blades of the cauline leaves narrowly linear or linear-subulate, about 1 cm. long: basal shoots with narrowly linear-elliptic to linear-spatulate leaf-blades: calyx in fruit narrowly turbinate; inner sepals about 1.5 mm. long at maturity; outer sepals much longer than the inner: capsule ellipsoid-prismatic, about 2 mm. long, 3-angled, exserted at the tip.—Scrub, S end of Lake Region, Fla.—Sum.—fall.

6. *L. racemulosa* Michx. Stem simple or branched at the base, the branches erect or ascending, 1-5 dm. tall, copiously branched above, the branchlets slender, mostly ascending, rather inconspicuously strigillose: blades of the cauline leaves elliptic-spatulate to elliptic, or linear-elliptic, mostly 1-2 cm. long, strigillose or glabrate: basal shoots with narrowly elliptic leaf-blades: calyx in fruit narrowly pyriform; inner sepals about 1.5 mm. long at maturity; outer sepals much shorter than the inner: capsule ellipsoid, fully 1.5 mm. long, slightly exserted.—Dry woods, often in sandy or rocky soil, various provinces, Fla. to Ala., Ind., and E Mass.—Sum.
7. *L. exserta* Small. Stem usually branched at the base, the branches erect, 3-6 dm. tall, fastigiately much-branched above, inconspicuously pubescent: blades of the cauline leaves linear-elliptic to almost linear, glabrous or nearly so: basal shoots not seen: panicles many-flowered: bracts linear-elliptic to subulate: calyx in fruit campanulate; inner sepals 1-1.2 mm. long, at maturity; outer sepals slightly shorter than the inner: capsule narrowly oval, about 1.5 mm. long, much-exserted.—Dry pinelands, S pen. Fla.—Spr.—fall or all year S.
8. *L. Leggettii* Britt. and Hollick. Stem branched at the base, the branches erect or nearly so, loosely branched above, the branches long and slender, inconspicuously strigillose: blades of the cauline leaves linear-spatulate to linear, 1-2.5 cm. long, sparingly strigillose or glabrous: basal shoots with linear-elliptic leaf-blades: calyx in fruit broadly pyriform; inner sepals about 1.5 mm. long, at maturity; outer sepals much shorter than the inner: capsule oval, about 1.5 mm. long, scarcely exserted.—Dry woods, pinelands, old fields, and sand-dunes, various provinces, Fla. to La., Ind., and E. Mass.—Sum.—fall.
9. *L. Torreyi* Leggett. Stem usually branched at the base, the branches 1.5-5 dm. tall, the branchlets rather long and slender, pale-strigose: blades of the cauline leaves linear-subulate, mostly 1-1.5 cm. long, acute, strigillose: basal shoots with leaves nearly similar to those of the stem or slightly wider: calyx in fruit globose-obovoid; inner sepals about 1.5 mm. long at maturity; outer sepals much shorter than the inner: capsule subglobose, about 1.5 mm. long, not exserted.—Pinelands, Coastal Plain, Fla. to S. C.—Spr.—fall or all year S.
10. *L. maritima* Leggett. Stem often branched at the base, the branches 1.5-3.5 m. tall, much-branched above, the branchlets rather short, gray-strigillose: blades of the cauline leaves linear to narrowly-elliptic, mostly 1-2 cm. long, whitish-strigose: basal shoots with narrowly elliptic leaf-blades: bracts similar to the cauline leaves, but much smaller: calyx in fruit globose-obovoid: inner sepals about 2 mm. long at maturity; outer sepals much shorter than the inner: capsule subglobose, about 1.5 mm. long, not exserted.—Sandy seashores and pinelands, Coastal Plain and New England Coast, Ga. to Me.—Sum.—fall.
11. *L. cernua* Small. Stem usually branched at the base, the branches 3-6 dm. tall, often numerous, widely often much-branched above, the branchlets rather finely strigose: blades of the cauline leaves elliptic or ovate-elliptic, about 1 cm. long or less, strigose, several-ribbed: basal shoots with ovate to suborbicular densely pale-hairy leaf-blades: calyx in fruit turbinate; inner sepals about 2 mm. long at maturity; outer sepals minute: capsule obovoid, about 2 mm. long, slightly exserted.—Scrub, on sand-dunes, Lake Region and eastern coast, Fla.—Sum.—fall.
12. *L. divaricata* Shuttlw. Stem often branched at the base, the branches erect, ascending, or spreading, copiously pubescent with lax or spreading hairs;

the branchlets usually divaricate, relatively short, ending in compact flower- or fruit-clusters: blades of the numerous cauline and branch-leaves, elliptic, often narrowly so, or oval, 4-8 mm. long, acute: calyx in fruit obovoid; inner sepals about 1.5 mm. long, loosely pubescent; outer sepals slightly shorter than the inner: capsule subglobose or globose-obovoid, 2 mm. long, exserted.—Dry sandy soil, pen. Fla., also reported from Tex.—Sum.—fall.

13. *L. Deckertii* Small. Stem branched at the woody base, the branches forming tufts, very leafy, usually minutely and sparingly pubescent, sooner or later developing terminal panicles: leaves numerous; blades elliptic-subulate to subulate, 1.5-2.5 mm. long, acutish, glabrous or nearly so: panicles few-several-flowered, with minute bracts: calyx in fruit lax, not enveloping the capsule; inner sepals about 1.5 mm. long at maturity; outer sepals fully one-half as long as the inner: capsule depressed-globose, 1.2-1.4 mm. long, much exserted.—Scrub, Coastal Plain, pen. Fla. to S Ga.—Sum.—fall.

14. *L. myriophylla* Small. Stem branched at the woody base, the branches forming tufts, very leafy, more or less pubescent, sooner or later developing panicles at their tips: leaves numerous; blades elliptic, sometimes narrowly so, 3-5 mm. long, acute, somewhat loosely strigose or glabrous: panicles many-flowered, with the bracts much smaller than the leaves: calyx in fruit, lax, not enveloping the capsule; inner sepals nearly 1.5 mm. long at maturity; outer sepals about half as long as the inner: capsule globose, about 1.5 mm. long, much-exserted.—Scrub, S part of Lake Region, pen. Fla.—Sum.—fall.

#### FAMILY 9. VIOLACEAE — VIOLET FAMILY

Herbs, or in tropical regions occasionally shrubs or trees, with simple alternate or opposite stipulate leaves, and perfect irregular solitary or clustered flowers. Sepals and petals 5, the latter hypogynous, imbricate in the bud, the lowermost often spurred. Stamens 5, the anthers erect, syngenesious or connivent. Gynoecium 3-carpellary. Ovary 1-celled, enclosing numerous ovules on the 3 parietal placentae and becoming in fruit a loculicidal capsule. Seeds anatropous.—Fifteen genera and about 300 species, widely distributed.

Sepals auriculate at base.  
Sepals not auriculate at base.

1. *VIOLA*.  
2. *CUBELLUM*.

1. *VIOLA* L.<sup>1</sup> Herbs, either leafy stemmed and rather low or stemless; petaliferous flowers mostly in early spring on one-flowered peduncles: succeeded throughout the season by cleistogamous flowers that bear abundant seed; stamens 5 in the petaliferous flower, the two lowest with appendages that project into the sac or spur of the odd petal; these two stamens alone developed in the cleistogamous flower.—Allied species freely hybridize when growing together; the hybrids commonly display characters more or less intermediate to those of the parent species, and show marked vegetative vigor but impaired fertility; their offspring are often much unlike the mother plant and unlike each other, reverting variously to the characters of the two original species.—About 200 species, of wide geographic distribution.—VIOLETS.—Some species are used medicinally; others for ornamental gardening.

Plant stemless: leaves and scapes from a rootstock or a runner.

Flowers scentless or with a faint pungent fragrance: plants indigenous.

Corolla violet or purple (white in albino forms): plant without stolons.

All petals beardless: apetalous flowers wanting.

I. PEDATAE.

<sup>1</sup> Contributed by the late Ezra Brainerd for Flora of the Southeastern United States (Ed. 2), and adapted with slight changes, for the present work by Edward Johnston Alexander.

Lateral petals bearded: apetalous flowers present.

Corolla white or yellow, the petals often with dark lines: plant stoloniferous.

Flowers very fragrant: corolla violet or white: plant introduced.

Plant with leafy stems: flowers axillary.

Style scarcely enlarged at the tip or merely capitate.

Style capitate, beakless: spur of the corolla short: stipules nearly entire, soon scarious.

Style not capitate, slender and bent at the tip: spur of the corolla at least twice its width: stipules bristly toothed, somewhat herbaceous.

Style stout, much enlarged upward into globular hollow summit: stipules large, leaf-like, lactinate at the base.

II. PALMATAE.

III. BLANDAE.

IV. ODORATAE.

V. HASTATAE.

VI. ROSTRATAE.

VII. ARVENSES.

# I. PEDATAE

Leaf-blades pedately finely divided: petals lilac, or the two upper ones dark-violet.

# II. PALMATAE

Cleistogamous flowers ovoid, on short prostrate peduncles, their capsules usually brown.

Leaf-blades all palmately 5-11-lobed or -parted, or rarely the first leaf of spring uncut: seed brown.

Plant villous-pubescent.

Plant nearly or quite glabrous.

Earliest and later leaf-blades usually uncut, others pedately 3-7-lobed, -parted, or -divided: seed generally buff.

Plants villous-pubescent.

Cut leaf-blades mostly 3-lobed, with broadly open sinus.

Cut leaf-blades mostly 5-7-parted, with narrow sinus.

Plants obscurely pubescent and glabrate: corolla deep-violet: inhabitant of shady uplands.

Plants glabrous: corolla pale-violet: inhabitant of wet woods.

Leaf-blades all uncut.

Plant nearly or quite glabrous.

Flowers violet or purple (except in albinos).

Flowers violet-purple: seed brown.

Flowers rose-purple: seed buff.

Flowers pale-violet or whitish.

Petals uniformly pale violet, with only a few darker veins at the base: seeds buff: leaf-blades reniform-hastate.

Petals grayish, the basal veins so numerous as to make large blotches of brilliant violet-blue: seeds brown: leaf-blades cordate.

Plant villous-pubescent, especially on petiole and lower leaf-surface: seed dark-brown.

Plant hirsutulous on upper leaf-surface, elsewhere glabrous: seed buff.

Cleistogamous flowers on long ascending peduncles, their capsules more or less brown.

Leaf-blades at vernal flowering narrowly cordate-acuminate: seed buff.

Auricles of sepals short appressed.

Auricles of sepals 2 mm. long, spreading.

Leaf-blades at vernal flowering subcordate, 3-lobed: seed bronze.

Cleistogamous flowers subulate or sagittate, on erect peduncles, their capsules green.

Spurred petal glabrous, the lateral ones with clavate beard: leaves glabrous; blades uncut, cordate-ovate.

Spurred petal villous at base, the lateral ones with capillary beard.

Foliage finely pubescent.

Leaf-blades ovate-elliptic, acute.

Leaf-blades ovate to orbicular, obtuse.

Foliage nearly or quite glabrous.

Leaf-blades elliptic-lanceolate, incised at base.

Leaf-blades deltoid to broadly ovate, coarsely toothed at base.

Leaf-blades uncut or pedately 3-9-lobed.

1. *V. pedata*.

17. *V. fimbriatula*.

18. *V. villosa*.

19. *V. sagittata*.

20. *V. emarginata*.

21. *V. septemloba*.

## III. BLANDAE

Corolla white.

Cleistogamous flowers on prostrate peduncles, their capsules ovoid, commonly reddish-brown: plants of cold ravines and low rich woods.

Lateral petals bearded: seed obtuse at base.

Lateral petals beardless: seed acute at base.

Cleistogamous flowers on erect peduncles, their capsules ellipsoid, green: plants of open bogs.

Leaf-blades broadly elliptic to cordate-ovate.

Leaf-blades broadly cordate-ovate.

Leaf-blades ovate or elliptic.

Leaf-blades rugose, cordate-tapering at the base.

Leaf-blades smooth, not rugose, sub-cordate or tapering at the base.

Leaf-blades narrowly elliptic to linear.

Leaf-blades lanceolate or elliptic, 10–15 mm. wide: petals usually rounded at the tip.

Leaf-blades narrowly lanceolate or linear, 4–10 mm. wide: petals usually acute or acutish.

Corolla yellow.

## IV. ODORATAE

Plants producing leafy stolons and fragrant flowers: style terminating in a sharp hook.

## V. HASTATAE

Petals yellow.

Rootstock long, thick, whitish, bearing crisp, capillary roots.

Rootstock short, woody, brown, bearing coarse, fibrous roots.

Petals tinged outside with violet.

Leaf-blades 3-lobed to 3-divided.

Leaf-blades uncut, ovate or rhombic-ovate.

Petals yellow outside.

Sparingly pubescent, root-leaves usually 1–3.

Markedly pubescent, root-leaves usually wanting.

Petals white inside, usually violet outside.

## VI. ROSTRATAE

Corolla-spur less than 8 mm. long: lateral petals bearded.

Petals white or cream-colored.

Petals violet-blue.

Stem ascending: later leaf-blades subacuminate.

Stem soon prostrate: leaf-blades obtuse, usually mottled.

Corolla-spur 10–12 mm. long, slender: lateral petals beardless.

## VII. ARVENSES

Upper leaf-blades entire, or obscurely crenulate: petals twice the length of sepals.

Upper leaf-blades plainly crenate: petals usually shorter than the sepals.

1. *V. pedata* L. Plant nearly glabrous: rootstock short, erect: leaf-blades 3-divided, the lateral divisions pedately 3–5-parted or -cleft, the segments linear to spatulate, often 2–4-toothed or -cleft near the apex; the leaf-blades of early spring and of late autumn often smaller and less deeply dissected: corolla 2–3 cm. broad, the upper petals dark violet, the three lower lilac-purple, all beardless (all petals lilac-purple in *V. pedata lineariloba*): the orange tips of the stamens large and conspicuous at the center of the flower: capsule green, glabrous: seed copper-colored: apetalous flowers wanting, but petaliferous frequent in late summer and autumn.—(BIRD'S-FOOT VIOLET. CROWFOOT-VIOLET. PANSY-VIOLET. JOHNNY-JUMP-UP.)—Open woods and dry fields, often in acid soil, various provinces,

22. *V. incognita*.23. *V. blanda*.24. *V. pallens*.25. *V. rugosa*.26. *V. primulifolia*.27. *V. lanceolata*.28. *V. vittata*.29. *V. rotundifolia*.30. *V. odorata*.31. *V. hastata*.32. *V. tripartita*.32a. *V. tripartita glaberrima*.33. *V. eriocarpa*.34. *V. pubescens*.35. *V. canadensis*.36. *V. striata*.37. *V. conspersa*.38. *V. Walteri*.39. *V. rostrata*.40. *V. Rafinesquii*.41. *V. arvensis*.

Fla. to La., Minn., and Mass.—Shows marked variations in leaf-form and coloration of petals; the color-form with the upper two petals dark-violet is more common in the east-central part of its range.

2. *V. palmata* L. Plant villous: leaf-blades palmately 5–11-lobed or -parted, the segments variously toothed or cleft, the middle segment usually widest; petioles, and veins of the lower leaf-surface, villous, the upper surface often glabrous: sepals ovate-lanceolate, rather blunt: corolla violet-purple, 2–3 cm. broad: cleistogamous flowers on prostrate peduncles, their capsules ovoid, mottled with brown, 8–12 mm. long: seeds brown.—Wooded hillsides in dry rich soil, various provinces, Fla. to Miss., Minn., and Mass.

3. *V. Egglestonii* Brainerd. Plant glabrous, of spreading habit especially in spring: leaf-blades truncate at base, often flabellately decurrent, rarely subcordate; early leaf-blades simply 3–5 lobed, the later ones 3-parted, with the middle or all three primary segments 2–3-cleft, the subdivisions oblanceolate or linear, crenately serrate towards the summit and bearing a few long narrow acute teeth below: corolla violet-purple, the lateral petals bearded at the throat; spurred petal somewhat villous: cleistogamous flowers and fruits on short underground peduncles till seeds ripen: capsule green turning pale-yellow, broadly ellipsoid, 13 mm. long, with lanceolate sepals one third as long, their auricles short, appressed: seed brown, 2.5 mm. long.—Barrens, Interior Low Plateaus, Tenn. and Ky.

4. *V. triloba* Schwein. Plant villous: earliest leaf-blades, and those put forth in late summer, broadly cordate-ovate, usually uncut, sparsely pubescent or glabrate; those unfolding at petaliferous flowering, densely villous beneath like the petioles, 3-lobed or rarely 3-parted, the middle segment broad, the lateral lunate, divaricate, often coarsely toothed or pedately cleft, the upper subdivision narrow, with more and deeper incisions, and the middle primary segment ovate, elliptic or rhombic-lanceolate in *V. triloba dilatata*; blades 10–15 cm. wide when mature: peduncles mostly glabrous, shorter than the leaves: petals deep-violet: outer sepals ovate-lanceolate, somewhat obtuse, slightly ciliate: cleistogamous capsules ovoid, purplish: seeds buff or brown.—Dry woodlands, various provinces, Ga. to Tex., Mo., and Mass.

5. *V. Lovelliana* Brainerd. Plant often minutely hoary-pubescent on the upper part of the petiole and the adjacent lower surface of the blade, elsewhere obscurely pubescent: leaf-blades cordate at base, earliest often uncut, later ones hastately 3-lobed, the middle lobe much the longest, lanceolate, sometimes contracted at the base and undulately serrate, the lateral lobes divaricate, either lunate or variously 2–3-cleft; leaf-blades at petaliferous flowering 2–5 cm. long, those of later summer twice as long, glabrate, often less deeply cut, or uncut: flowers on stalks often exceeding the leaves: sepals broadly lanceolate, acute, one third the length of capsule; the auricles short, appressed, rounded, sparsely ciliate: corolla violet-purple, the three lower petals villous at the throat and marked with dark-purple lines: cleistogamous flowers and immature fruit on prostrate peduncles: capsule purple-dotted, 14 mm. long: seed buff, 2 mm. long.—Sparsely wooded hillsides and knolls, Coastal Plain and adj. provinces, Miss. to La., Okla., and Ark.

6. *V. esculenta* Ell. Rootstock stout, ascending, sometimes with purple horizontal branches 5–7 cm. long; the foliage spreading, usually glabrous, becoming stiff and succulent: first leaf-blades usually uncut, broadly cordate-ovate, 2–3 cm. long, followed at flowering time by leaf-blades 3–5-lobed, successively larger and longer-petioled till blade may be 8 cm. in length and in breadth, the late summer ones with obscure lobes or none: flowers long-peduncled: sepals ovate-lanceolate with emarginate auricles: corolla pale-

violet or white, the spurred petal slightly villous: cleistogamous flowers ovoid-acuminate: mature capsule trigonous-cylindric, closely purple-dotted, 12-16 mm. long; their sepals one third as long: seed dark-brown or sometimes buff, 2 mm. long.—River swamps and borders of slow streams, Coastal Plain, Fla. to S. C.

7. *V. papilionacea* Pursh. Plant glabrous, commonly robust, from a stout horizontal branching rootstock: leaf-blades often 12 cm. broad, sometimes deltoid in outline above the cordate base, sometimes rounded and abruptly pointed; petioles often sparingly pubescent: outer sepals ovate-lanceolate: corolla deep-violet, white or greenish-yellow at the base, sometimes wholly white, the odd petal often narrow and boat-shaped, usually glabrous: cleistogamous flowers ovoid, on horizontal peduncles usually underground but lengthened and erect when the capsules ripen: capsule ellipsoid or cylindric, green or reddish-brown, 10-15 mm. long: seed 2 mm. long, dark-brown.—(WOOD-VIOLET.)—Moist meadows and woods, and frequently about dwellings, various provinces, Fla. to Tex., Minn., and Mass.

8. *V. rosacea* Brainerd. Plant nearly or quite glabrous: leaf-blades at vernal flowering narrowly cordate-ovate, acute or acuminate, crenate-serrate, 2-4 cm. long, sparsely hirtellous above; later leaf-blades much wider, subcordate, acuminate, glabrous, 5-7 cm. long: corolla rose-purple, about 2 cm. broad, the spurred petal glabrous or slightly villous: cleistogamous flowers ovoid on prostrate peduncles, their mature capsules ellipsoid, about 12 mm. long, purple-dotted, enclosed for over half their length in lanceolate sepals: seeds buff, 2 mm. long, about 50 in a capsule.—Dry open woods and well-drained bayou margins, Coastal Plain, Miss. and La.

9. *V. floridana* Brainerd. Leaf-blades at time of petaliferous flowering on spreading petioles, cordate, acute, finely crenate-serrate, often somewhat puberulent above, 2-3 cm. wide, 3-4 cm. long; leaves with blades twice as long and wide appearing soon after, on long erect petioles, glabrate, sometimes persisting through the winter: flowers on peduncles much surpassing the leaves: corolla whitish or pale-violet, the odd petal glabrous; apetalous flowers concealed under soil or dead leaves, narrowly ovoid-acuminate; their ripe capsules reddish-brown, about 16 mm. long, on decumbent peduncles: sepals broadly lanceolate, about one third the length of the capsule: seed 2 mm. long, salmon-colored or dark-brown, about 60 in a capsule.—Moist rich woodlands, C and N Fla.

10. *V. Priceana* Pollard. Plant glabrous, robust, from a stout, branching rootstock: leaf-blades glabrous, rather dark green, cordate-ovate in outline, the tip obtuse or abruptly acute: scapes equalling or exceeding the leaves: sepals lanceolate-acuminate: corolla 3 cm. broad, grayish, the petals heavily veined at the base with brilliant violet-blue, the veins extending well into the blades; the spurred petal somewhat smaller than the others, keel-shaped, glabrous: cleistogamous flowers ovoid on horizontal peduncles: capsule broadly ellipsoid, purplish-green; seeds brown.—(CONFEDERATE VIOLET.)—Rich soil, in partially shaded situations, various provinces, Ga., Ark., Ken., N. C., and S. C. Brainerd regards this plant as an albino of *V. papilionacea*, but that species has flowers violet with white center, while this is reversed. This species also is very constant in its form and continually comes true from seed, never reverting to *V. papilionacea*.

11. *V. sororia* Willd. Leaf-blades broadly cordate-ovate, villous-pubescent especially on the under surface when young, and on the petioles, often 10 cm. wide when mature: vernal flowers on peduncles about the length of the leaves: outer sepals ovate-elliptic, commonly obtuse, all finely ciliate below the middle

and on the short rounded auricles: corolla violet to lavender and occasionally white: cleistogamous capsule usually mottled with brown: seed dark-brown, 2 mm. long.—Moist meadows, shady ledges, and dooryards, various provinces, N. C. to Okla., Minn., and Que.

12. *V. hirsutula* Brainerd. Plant of small size: leaf-blades frequently appressed to the ground, 2–5 cm. wide, cordate-ovate to reniform, obtuse, purplish and glabrous beneath, silvery-pubescent above, often purple-veined and mottled with different shades of green: flowers on peduncles exceeding the leaves: corolla reddish-purple: apetalous flowers small, ovoid, on short prostrate peduncles, developing ovoid purplish capsules, 6–8 mm. long, bearing each 20–30 light-brown seeds.—Dry rich woods, various provinces, Ga. to Ala. and N. Y.

13. *V. affinis* LeConte. Plant nearly glabrous: leaf-blades that unfold at vernal flowering narrowly cordate-ovate and commonly attenuate toward the apex, becoming 4–6 cm. wide in summer, the margin noticeably crenate-serate; petioles slender: corolla violet with the white base conspicuous, the spurred petal more or less villous: cleistogamous flowers small, ovoid, on rather long ascending peduncles: capsule ellipsoid, 5–8 mm. long, usually reddish-brown, sometimes green, either glabrous or clothed with minute dense pubescence: sepals half the length of the capsule, with small appressed auricles: seed normally buff.—Moist meadows, low woods, and shaded stream-banks, various provinces, Ga. to Ala., Wis., and Vt.

14. *V. Langloisii* Greene. Leaf-blades glabrous, cordate-ovate, attenuate, crenate-serrate (3–5-lobed in *V. Langloisii pedatiloba*); those that mature after flowering relatively wider, cordate-deltoid, about 6 cm. long: flowers on peduncles taller than the leaves: sepals lanceolate: corolla violet, 2–3 cm. broad, the lateral petals bearded, the spurred petal mostly glabrous: cleistogamous flowers on ascending peduncles, sagittate, their mature capsule narrowly ellipsoid, pale-yellow faintly dotted with purple, 10–12 mm. long, with lanceolate acuminate sepals one half as long, the auricles glabrous, dentate, 2 mm. long: seed buff, 1.5 mm. long.—Wet and shady borders of slow streams, Coastal Plain, Miss. to Tex.

15. *V. chalcosperma* Brainerd. Plant glabrous, heterophyllous: leaf-blades at the beginning and at the close of the season's growth uncut, the former cordate 2–3 cm. long, the latter truncate at base, broadly deltoid 4–5 cm. long; vernal leaf-blades cordate, 3-lobed, the middle lobe ovate, acute, the lateral ones more or less incised: flowers small, raised above the leaves on slender peduncles; corolla lilac-purple, the lateral petals bearded, the odd petal sparsely villous, all finely purple-veined: cleistogamous flowers sagittate, on ascending peduncles: ripe capsule pale-yellow tinged with purple at base, ellipsoid, about 11 mm. long, with sepals dark purple, lanceolate, 5 mm. long, the auricles 3–4 mm. long, the three outer sepals with one or more sharp teeth: seeds bronze-colored, 1.5 mm. long, about 50 in a capsule.—Wet soil in shaded ravines, near Jacksonville, Fla.

16. *V. cucullata* Ait. Plant glabrous: leaf-blades, except the earliest, cordate-ovate, acute or subacuminate, often 9 cm. wide when mature: peduncles commonly much exceeding the leaves: sepals narrowly lanceolate: corolla violet-blue, darker-colored at the throat, the lateral petals with strongly clavate beard, the spurred petal glabrous, generally somewhat shorter than the lateral ones: cleistogamous flowers long and slender, on erect often elongate peduncles: capsule ovoid-cylindric, green, 10–15 mm. long, but little exceeding the long-auricled sepals: seed nearly black, 1.5 mm. long.—(BLUE MARSH-VIOLET. MEADOW-VIOLET.)—Wet soil, various provinces, Coastal Plain only N, Ga. to Ont., Que., and Me.

17. *V. fimbriatula* J. E. Smith. Rootstock becoming long and stout, usually erect: earliest leaf-blades ovate, obtuse, the later ones ovate-elliptic, acute, finely pubescent, obscurely crenulate toward the apex, the basal lobes often sharply toothed, incised, or auriculate: scapes commonly exceeding the leaves: auricles of the sepals somewhat spreading and ciliate: corolla violet-purple: capsule green, ovoid, 6–10 mm. long; seed brown: cleistogamous flowers on erect peduncles.—Hillsides and dry fields, various provinces, Fla. to La., Wis., and N. S.

18. *V. villosa* Walt. Rootstock simple, often long and jagged; foliage spreading, minutely villous throughout: leaf-blades ovate, varying to elliptic-ovate and orbicular, obtuse, obscurely crenate, cordate with small narrow sinus, when mature sometimes 6 cm. long and on petioles 12 cm. long: flowers early: sepals ciliolate, elliptic-ovate with rather short auricles: corolla violet, the three lower petals bearded, the spur large globose: capsule green, ovoid-cylindric, 10 mm. long: seed dark brown, 1.8 mm. long. [*V. carolina* Greene]—Dry soil, open woods and roadsides, various provinces, Fla. to Miss., Tenn., and S W Va.; also W Ark., Tex., and E Okla.

19. *V. sagittata* Ait. Plant usually glabrous, except the often ciliate leaves, or finely pubescent throughout: leaf-blades lanceolate or elliptic-lanceolate, becoming 4–8 cm. long, hastately or sagittately toothed or cleft at the base; the earliest and those produced in late summer often deltoid-ovate, obtuse, merely crenate at the base: sepals narrowly lanceolate, acute, glabrous: corolla violet-purple: capsule 8–14 mm. long, containing 50–70 brown seeds.—(ARROW-LEAVED VIOLET.)—Moist banks and wet meadows, various provinces, Ga. to La., Minn., and Mass.

20. *V. emarginata* (Nutt.) LeConte. Plant glabrous: mature leaf-blades deltoid or broadly ovate, the base truncate or subcordate often decurrent, obscurely crenate-serrate above the middle, coarsely toothed or incised below: corolla violet-blue, the petals sometimes emarginate: cleistogamous capsule ellipsoid, 8–14 mm. long: peduncles erect, somewhat shorter than the leaves: seed brown.—Dry woods and hillsides, various provinces, N Ga. to Okla. and S E N. Y.

21. *V. septemloba* LeConte. Plant glabrous with a vertical rootstock: leaf-blades cordate-ovate; the first ones often, and sometimes all the leaves, uncut, the others primarily 3-lobed, 3-cleft or 3-parted with widely open sinuses, the middle segment uncut, relatively long and broad, usually narrowed at the base; the lateral segments sometimes uncut, but generally pedately cleft into 2–4 narrow divergent parts that become smaller towards the base of the leaf: flowers usually raised above the foliage: sepals narrowly lanceolate, with entire rounded auricles: corolla violet, the three lower petals villous at the base: cleistogamous flowers erect: capsule green, ovoid-cylindric, about 14 mm. long: seed dark-brown, 2 mm. long. [*V. vincialis* Greene]—Pinelands, Coastal Plain, Fla. to Miss. and Va.

22. *V. incognita* Brainerd. Peduncles, petioles and lower surface of leaf-blades pubescent with soft white hairs especially when young (nearly or quite glabrous in *V. incognita* Forbesii), the upper leaf-surface glabrous; aestival leaves large, the blades rugose, broadly cordate-ovate with open sinus, acute: petals white, the lateral bearded, the upper pair obovate: seed narrowly obovoid, obtuse at base, smooth, brown, 2 mm. long: plants flowering early, in summer producing numerous filiform runners.—Moist woods, Blue Ridge and more northern provinces, Tenn. to N. Dak. and Que.

23. *V. blanda* Willd. Leaf-blades cordate-ovate with narrow sinus, commonly acute, often acuminate, glabrous except for minute scattered hairs on the

upper surface; petioles, and scapes, usually tinged with red: lateral petals beardless, the upper pair often long, narrow, and strongly reflexed, sometimes twisted: cleistogamous capsules ovoid, dark-purple: seed dark-brown, minutely rugose, acute at base, 1.5 mm. long: plants freely producing in summer, slender leafy runners. [*V. LeConteana* G. Don]—(SWEET WHITE-VIOLET.)—Cool ravines and moist shaded slopes, often in humus, various provinces, on Coastal Plain only N, Ga. to Minn. and Que.

24. *V. pallens* (Banks) Brainerd. Leaf-blades broadly cordate-ovate, obtuse or rarely acute, glabrous on both sides; petioles and scapes often dotted with red in summer and more or less hirsutulous: lateral petals usually bearing a small tuft of hairs, the upper petals broadly obovate: seed 1 mm. long, almost black. [*V. blanda* of recent authors, not Willd.]—(WILD WHITE-VIOLET.)—Springy soil and banks of cool streams, various provinces, on Coastal Plain only N, S. C. to Ala., Tenn., Mich., and Lab.—Plants often grow in slow-flowing streams after the manner of water-lilies, the leaves and flowers only raised above the surface of the water. In most cases the plant sinks to the bottom in winter, retaining two or three leaves, and rises again in the spring to bloom.

25. *V. rugosa* Small. Leaf-blades ovate-elliptic, cordate at the base and in the larger leaves decurrent as wings down the petioles, 4–6 cm. long, rugose, sparsely pubescent on the veins, bright green, paler beneath; petioles about as long as the blades, copiously hirsutulous; scapes about as long as the leaves, hirsutulous, usually red: petals all about the same size; the lateral was a small tuft of hairs; the spurred petals veined at the base with brownish-purple: sepals lanceolate: cleistogamous capsule green, about 1 cm. long, on short erect peduncles, ellipsoid, seeds red-brown.—Edges of white-cedar swamps, Liberty Co., Fla.

26. *V. primulifolia* L. Plant often quite glabrous, but usually more or less pubescent especially toward the base of the petioles (with densely villous petioles and lower leaf-surfaces in *V. primulifolia villosa*): leaf-blades elliptic or ovate, the base slightly cordate, rounded or tapering, obscurely crenate-serrate; petioles often broadly winged above: flowers white: capsule green, the peduncle erect as in *V. lanceolata*: seed reddish-brown, 1.5 mm. long.—Marshes and swamps, various provinces, Fla. to Tex., W. Va., and N. B.

27. *V. lanceolata* L. Stolons leafy, often bearing apetalous flowers: leaves and scapes glabrous, 5–8 cm. high at time of vernal flowering; later leaves with lanceolate or elliptic blades, 10–15 mm. wide, 7–15 cm. long, obscurely crenulate, gradually tapering into margined, often reddish, petioles: sepals broadly lanceolate, acute: lateral petals usually beardless: cleistogamous capsules 6–12 mm. long, on erect peduncles but usually shorter than the leaves; seed dark-brown.—(BOG WHITE-VIOLET. LANCELEAF-VIOLET.)—Moist meadows, bogs, and marshes, various provinces, Fla. to Tex., Minn., and N. S.

28. *V. vittata* Greene. First leaf-blades narrowly lanceolate, obtuse, succeeded after flowering by linear leaves 4–10 mm. wide, 15–30 cm. long, the blades acute at the apex and gradually tapering at the base, mucronulately serrulate; petioles, peduncles, and lower leaf-surface usually more or less villous: flowers and capsules as in the preceding species: seed obovoid, brown, 1.3 mm. long. [*V. denticulosa* Pollard]—Marshes, bogs, and borders of hammocks, Coastal Plain, Fla. to Tex. and N. C.

29. *V. rotundifolia* Michx. Rootstock long and stout, jagged with the persistent bases of former leaves: runners short, usually without roots or leaves, bearing 1–4 cleistogamous flowers: leaf-blades oval or orbicular, cordate with

short and narrow sinus, repand-crenate, at vernal flowering sparsely hirtellous, 2-3 cm. wide, in midsummer mostly glabrate, 6-10 cm. wide, prostrate: corolla bright-yellow, the three lower petals with brown veins, the lateral ones bearded: style clavate, abruptly capitate, beakless: capsule ovoid, 6-8 mm. long, closely dotted with purple: seed nearly white.—(EARLY YELLOW-VIOLET.)—Cool woods, various provinces, coastal Plain only N, N Ga. to Ont. and Me.

30. *V. odorata* L. Plant producing above ground leafy stolons rooting freely at the nodes: leaf-blades broadly cordate-ovate, finely pubescent: flowers violet or white, very fragrant: style hook-shaped: capsules from apetalous flowers broadly ovoid, angled, pubescent, purple: seed large, cream-colored. [*V. Thompsonae* Chapm.]—(SWEET-VIOLET. ENGLISH-VIOLET.)—Roadsides, fence-rows, and waste-places, locally established throughout U. S., as are some of its hybrids with other European species.

31. *V. hastata* Michx. Plant slightly puberulent: stem slender, 1-2.5 dm. high, from a long white brittle horizontal rootstock: stem-leaves 2-4 near the summit; blades halberd-shaped with rounded basal lobes: radical leaves occasional; blades elliptic-lanceolate, more deeply cordate; all distantly serrulate: sepals linear-lanceolate, acute: corolla yellow, the upper petals often tinged outside with violet: capsule ovoid, glabrous, 8-10 mm. long: stipules ovate, small, often with a few bristly teeth.—Rich woods, various provinces, Fla. to Ala., Ohio, and Pa.

32. *V. tripartita* Ell. Rootstock short and woody, with long coarse fibrous roots: stem erect, usually solitary, beginning to bear flowers when 1-2 dm. high, bearing foliage above the middle; the first two or three leaves with petioles 2-8 cm. long; blades commonly 3-lobed to 3-divided, ovate or rhombic-ovate merely toothed in *V. tripartita glaberrima* [*V. tenuipes*], the middle segment narrowly lanceolate to ovate, usually constricted at the base, remotely serrate toward the apex, the lateral segments falcate or lunate, coarsely toothed on the outer margin; upper leaves smaller, ovate-lanceolate, mostly uncut; petioles and lower leaf-surface more or less pubescent when young, at length nearly glabrate: peduncles slender, 2-9 cm. long, axillary: sepals linear-lanceolate, ciliate: petals yellow, the upper usually tinged outside with violet, the three lower ones somewhat bearded: capsule trigonous-ovoid, glabrous: seed large, brown.—Rich woods, various provinces, N Fla. to Ala., Tenn., and N. C.

33. *V. eriocarpa* Schwein. Plant glabrous except for minute pubescence along veins on lower leaf-surfaces and on upper parts of petioles and stem: stems ascending, commonly 2-4 from one rootstock: basal leaves 1-5; blades cordate-reniform, on long petioles; cauline leaves only on upper half of stem; blades broadly ovate, subcordate, acuminate, the uppermost smaller, truncate, nearly sessile; stipules ovate to lanceolate, nearly entire, glabrous, tardily scarious: sepals narrowly lanceolate: lateral petals bearded: capsule ovoid, woolly or sometimes glabrous: cleistogamous flowers on short peduncles from axils of upper leaves: seed brown, 2.5 mm. long. [*V. scabriuscula* Schwein.]—(YELLOW-VIOLET.)—Low open woods, various provinces, Coastal Plain only N, Ala. to Okla., Man., and N. S.—This and the following yellow-flowered violets are frequently called WILD-PANSY.

34. *V. pubescens* Ait. Plant softly pubescent: stems 2-3 dm. high, often solitary: leaves, either cauline, 2-4, near the summit, or occasionally a long-petioled basal-leaf is present; blades broadly ovate, cordate or truncate-decurrent at the base, crenate-dentate, somewhat pointed; stipules large, ovate-elliptic: sepals narrowly lanceolate: lateral petals bearded: capsule ovoid, 10-12 mm. long, glabrous or sometimes woolly: seed brown, 2.5 mm. long.—(DOWNY VIOLET.)—Dry rich woods, various provinces, rarely Coastal Plain, Ala. to Miss., Mo., N. D., N. S., and N. C.

35. *V. canadensis* L. Stems usually 3-4 dm. high, minutely pubescent: leaf-blades cordate-ovate, pointed, serrate; stipules sharply lanceolate: sepals slender, acuminate, spreading: lateral petals bearded, the spurred petal yellow at the base and striped with fine dark lines: capsule subglobose, 6-10 mm. long, often downy or puberulent: seed brown.—(TALL WHITE-VIOLET. SUMMER-VIOLET.)—Rich woods, various provinces, N of Coastal Plain, S. C. to Ala., Sask., Ont., and N. B.

36. *V. striata* Ait. Stems several, ascending, 15-30 cm. long when in flower, in late summer often 6 dm. long, decumbent: leaves glabrous or nearly so; blades cordate-ovate, 2-4 cm. broad, usually acuminate, finely crenate-serrate: stipules large, elliptic-lanceolate: sepals ciliolate, narrow, attenuate: corolla white or cream-colored: style beaked: capsule ovoid, glabrous, 4-6 mm. long: seed light-brown.—(CREAM-VIOLET.)—Low woods and thickets, various provinces, rarely Coastal Plain, Ga. to Mo., Minn., and Conn.

37. *V. conspersa* Reichenb. Rootstock oblique, often much branched: stem, at time of vernal flowering, 8-16 cm. high: lower leaf-blades cordate-orbicular, obtuse, the upper ones cordate-ovate, crenate, subacuminate, becoming 2-4 cm. wide: flowers numerous, usually pale-violet, sometimes white, raised above the leaves on axillary peduncles 5-8 cm. long: cleistogamous flowers in summer on short peduncles from the same axils that bore vernal flowers, or from axils of later leaves of the lengthened stem: style bent downward at the tip and slightly hairy: seed light-brown.—(AMERICAN DOG-VIOLET.)—Low grounds and shaded banks, various provinces, Coastal Plain only N, Ga. to Minn., Que., and Me.

38. *V. Walteri* House. Plant finely puberulent: stems several, at first ascending, leafy, bearing in early spring small violet-blue flowers in the axils of basal leaves, later elongating, becoming prostrate, and bearing through the season apetalous flowers on long slender axillary peduncles: stems often surviving the winter and sending up in spring from their tips rosettes of leaves and petaliferous flowers, afterwards rooting and forming new plants: leaf-blades glabrous, cordate, orbicular to ovate, mostly obtuse, mottled with darker-green bordering the veins, 2-4 cm. wide: stipules bristly fimbriate, 6-10 mm. long: capsule purplish, ovoid-globose, 6 mm. long: seed brown. [*V. multicaulis* (T. & G.) Britton]—Dry woodlands and moist rocky ledges, various provinces, Fla. to Tex., Ky., and S. C.

39. *V. rostrata* Pursh. Stems often numerous, commonly 1-2 dm. high: leaf-blades orbicular to broadly ovate, cordate, nearly or quite glabrous, serrate, the upper acute or pointed: petaliferous flowers borne on long peduncles above the leaves: petals spotted with darker violet, all beardless, the spur slender, 10-12 mm. long: later cleistogamous flowers with minute or aborted petals and on short peduncles from the axils of the upper leaves: style straight, beakless, glabrous: capsule ovoid, 3-5 mm. long, glabrous: seed light-brown.—(BEAKED-VIOLET. LONG-SPURRED VIOLET.)—Shady hillsides and rich woods, various provinces, N of Coastal Plain, Ga. to Ala., Mich., Que., and Pa.

40. *V. Rafinesquii* Greene. Plant glabrous, annual, with the slender stem often branched from the base: leaf-blades small, the lowest 6-10 mm. wide, orbicular, on slender petioles, the upper obovate to linear-oblongate, sparsely crenulate, attenuate at the base; stipules pectinately cut, the upper segment elongate, narrowly spatulate, mostly entire; internodes usually exceeding the leaves: flowers small, but the obovate bluish-white to cream-colored petals nearly twice the length of the lanceolate sepals: seed light-brown, 1.2 mm. long.—(FIELD-PANSY.)—Open woods, exposed hillsides, and fields, various provinces, Ga. to Tex., Mich., and N. Y.—The roots have a wintergreen scent.

41. *V. arvensis* Murr. Similar to the next preceding, but stouter, often 3-4 dm. high, erect or branching and decumbent: leaf-blades ovate to lanceolate, noticeably crenate; stipules more coarsely pectinate, the upper lobe usually much enlarged, oblanceolate and sparsely crenate: petals usually shorter than the lanceolate acute sepals, pale-yellow, or sometimes the upper with violet tips, and the spurred petal deep-yellow at base: capsule globose: seed brown, narrowly obovoid, 1.7 mm. long.—(WILD-PANSY.)—Fields and roadsides, various provinces N of Coastal Plain, N. C. to Ont., and Newf.—Nat. of Eu.

2. *CUBELIUM* Raf. Perennial caulescent, rather tall herbs. Leaves alternate: blades entire or slightly toothed. Flowers borne in axillary clusters, inconspicuous. Sepals 5, nearly equal, not auricled. Petals 5, green, nearly equal in length, the lower one largest and gibbous near the base. Stamens 5, filaments united into a sheath around the pistil and bearing a gland on the lower side. Style hooked at the apex. Capsule longer than thick, slightly 3-lobed, 3-valved.—One species.

1. *C. concolor* (Forst.) Raf. Stem up to 1 m. tall, pubescent: leaf-blades elliptic or elliptic-obovate, 7-16 cm. long, acuminate or acute at the apex, tapering to a rather slender petiole-like base: sepals linear-subulate or linear-lanceolate, more than half as long as the corolla: lower petal 5-6 mm. long, notched at the apex: connective-tips ovate: capsule ellipsoid or nearly so: 1.5-2 cm. long: seed about 5 mm. in diameter.—(GREEN-VIOLET.)—Rich woods, ravines, and stream-banks, various provinces, rarely Coastal Plain, Ga. to Miss., Kans., Ont., and N. Y.—Spr.

## ORDER PASSIFLORALES — PASSIFLORAL ORDER

Herbs, vines, or shrubby plants, or succulent tree-like plants with milky sap. Leaves alternate: blades entire, toothed, or lobed. Flowers perfect or dioecious. Calyx of 4 or 5 more or less united sepals. Corolla of 4 or 5 distinct or united petals, sometimes accompanied by a fringed crown, or rarely wanting. Androeceium of 5 stamens, or of 10 stamens in 2 unequal rows. Gynoeceium of 3-5 united carpels. Ovary superior. Fruit a berry or a capsule.

Corolla not accompanied by a crown: flowers mainly dioecious, the staminate and pistillate different. Fam. 1. PAPAYACEAE.  
Corolla accompanied by a crown: flowers perfect, all alike. Fam. 2. PASSIFLORACEAE.

### FAMILY 1. PAPAYACEAE — PAPAYA FAMILY

Shrubs or trees. Leaves with ample 7-9-lobed blades. Corolla salverform. Stamens 10: filaments adnate to the corolla-tube. Anthers erect. Fruit baccate, borne near the top of the stem.—Two genera and over 30 species tropical and subtropical.

1. *CARICA* L. Plants with milky juice, the stem rather tender, simple or branched, much-scarred above. Leaf-blades palmately or pinnately lobed.

Staminate flowers in long-peduncled cymes:  
pistillate flowers in short-peduncled cymes.  
Berries nearly sessile, many-seeded.—About  
25 species, tropical American.—(PAPAYA.  
PAPAW. CUSTARD-APPLE. MELON-TREE.)—  
The flowers are sometimes polygamous.

1. *C. Papaya* L. Stem 3–6 m. tall, simple, leafy at the top: leaf-blades 3–6 dm. broad, on stout spreading petioles: corolla yellow or reddish, that of the pistillate flower the larger: berry ellipsoid to subglobose, 2–18 cm. long.—Hammocks, pinelands, and waste-places, pen. Fla. and the Keys. Nat. of Trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.—Frequently found in wild localities remote from human habitations, but doubtless sown there by birds who greatly relish the seeds. In cultivated forms the fruit is very large. The milky juice of unripe fruit has properties similar to those of pepsin.

## FAMILY 2. PASSIFLORACEAE — PASSION-FLOWER FAMILY

Herbs, tendril-bearing vines, or shrubby plants. Leaves with entire or lobed, simple, or rarely compound blades. Corolla mostly rotate. Stamens 5: filaments usually monadelphous around the gynoeceium. Fruit baccate.—Eighteen genera and about 350 species, most abundant in South America.

1. **PASSIFLORA** L. Perennial vines. Leaf-blades entire, lobed, or parted. Crown filamentous, single, double, or triple. Anthers versatile.—About 300 species, mostly of tropical America.—PASSION-FLOWERS. PASSION-VINES.—Some species are used medicinally; others in ornamental gardening.

Peduncle bearing an involucre of 3 bracts near the calyx.  
Peduncle without an involucre, or this obscure.

Petioles without glands.

Petioles with glands at the middle or near the base of the leaf-blade.

Peduncles single.

Peduncles clustered.

I. INCARNATAE.

II. LUTEAE.

III. SUBEROSAE.

IV. MULTIFLORAE.

### I. INCARNATAE

Leaf-lobes toothed: stipules minute: petiolar glands sessile.  
Leaf-lobes entire: stipules foliaceous: petiolar glands stalked.

1. *P. incarnata*.
2. *P. pallens*.

### II. LUTEAE

Cymes several-flowered: berry pubescent.  
Cymes 1-flowered: berry glabrous.

3. *P. sexflora*.
4. *P. lutea*.

### III. SUBEROSAE

Calyx or corolla 2.5–3 cm. wide: leaf-blades, or lobes, toothed.  
Calyx less than 2 cm. wide: leaf-blades, or lobes, not toothed.

5. *P. Warmingii*.
6. *P. pallida*.

### IV. MULTIFLORAE

Woody tomentose vine, with thick leaf-blades.

7. *P. multiflora*.

1. *P. incarnata* L. Twigs finely pubescent or glabrate: leaf-blades 8–12 cm. long, glabrous or sparingly pubescent, the lobes finely serrate: sepals 25–30

mm. long: petals pale-lavender: crown lavender and purple: berry ellipsoid or oval, 4–10 cm. long, yellowish: seed 5–6 mm. long.—(MAY-POP. APRICOT-VINE.)—Dry roadsides, rocky slopes, and old fields, various provinces, Fla. to Tex., Mo., and Va.—Spr.-sum.—The fruit is edible.

2. *P. pallens* Poepp. Twigs glabrous, glaucous: leaf-blades nearly equally 3-lobed, 4–8 cm. long, the lobes ovate, the terminal one usually slightly larger than the others: stipules foliaceous, ovate to reniform: sepals lanceolate to linear-lanceolate, 20–30 cm. long, white or greenish-white: corolla wanting: berry 4–5 cm. long, yellow.—Hammocks, Everglade Keys and Cape Sable region, Fla.—(W. I.)—All year.

3. *P. sexflora* Juss. Twigs tomentulose: leaf-blades 6–14 cm. broad, pubescent: cymes several-flowered: sepals 9–11 mm. long: corolla greenish-white: berry globular, 9–11 mm. in diameter, greenish-purple, pubescent: seed about 2.5 mm. long.—Hammocks, Everglade Keys, Fla.—(W. I.)—All year.

4. *P. lutea* L. Twigs finely pubescent or glabrous: leaf-blades 3–15 cm. broad, mostly obtuse, glabrous: cymes 1-flowered: sepals 8–12 mm. long: corolla greenish-yellow, about 2 cm. broad: berry 10–15 mm. in diameter, purple-black.—(YELLOW PASSION-FLOWER.)—Rich woods and thickets, various provinces, Fla. to Tex., Kans., and Pa.—Spr.-sum.

5. *P. Warmingii* Mast. Twigs sparingly fine-hirsute: leaf-blades 5–14 cm. in diameter; lobes triangular or ovate, remotely toothed: sepals lanceolate, 18–21 mm. long: corolla pale-yellow, 2.5–3 cm. broad: berry globular, 25–30 mm. long, white-hairy: seed 4.5–5 mm. long, wrinkled.—Thickets and woods, near Clemson College, in the Piedmont of S. C. Nat. of Brazil.—Spr.-sum.

6. *P. pallida* L. Twigs glabrous or minutely pubescent: leaf-blades entire to 3-lobed, mostly 2–10 cm. long: calyx greenish; sepals linear to lanceolate or elliptic, 7–9 mm. long: corolla wanting: berry 6–10 mm. in diameter, purple-black: seeds 2.5–3 mm. long. [*Passiflora suberosa* L. *P. minima* L. *P. angustifolia* Sw.]—(CORKY-STEMMED PASSION-FLOWER.)—Hammocks and pine-lands, pen. Fla. and the Keys.—(W. I., C. A., S. A.)—The older stems frequently develop broad corky wings.

7. *P. multiflora* L. Twigs velvety: leaf-blades elliptic or nearly so, 5–12 cm. long, entire, rugose beneath: sepals 5–6 mm. long, yellow-green: petals linear or nearly so, white: berry subglobose, 6–8 mm. in diameter, purplish-black.—Hammocks, S pen. Fla. and the Keys.—(W. I.)—The old stems are frequently covered with a thick corky bark.

## ORDER OPUNTIALES — OPUNTIAL ORDER

Succulent, typically spine-armed, herbs, shrubs, or trees, mainly leafless or essentially so, or leafy rigid herbs, with more or less specialized hairs. Flowers perfect. Hypanthium present. Calyx of 4 or 5, or many, sepals. Corolla of 4 or 5, or many, stamens, in several series or groups, sometimes partially reduced to staminodia. Gynoecium of 4, or 2-several, united carpels. Ovary inferior. Fruit baccate or capsular.

Sepals and petals 4 or 5 each, very different: leaves with entire or dissected blades: erect or climbing plants, with rigid hairs. Fam. 1. LOASACEAE.  
 Sepals and petals nearly alike, at least the latter numerous: leaves typically mere scales or wanting: succulent plants, usually armed with spines. Fam. 2. OPUNTIACEAE.

**FAMILY 1. LOASACEAE — LOASA FAMILY**

Rigid herbs with barbed or stinging hairs. Leaves with entire lobed, pinnatifid, or dissected blades.—About 20 genera and 250 species, mostly American.

1. **MENTZELIA** [Plum.] L. Brittle-stemmed, mostly diffuse or reclining herbs. Leaf-blades relatively broad, sinuate or lobed. Androecium without staminodia. Seeds angled.—About 35 species, American.

1. **M. floridana** Nutt. Leaf-blades 2–9 cm. long, ovate to deltoid-ovate toothed and 3-lobed: sepals lanceolate, often very broad at the base: petals golden-yellow, 15–18 mm. long: capsule 1–1.5 cm. long.—(POOR-MAN'S PATCHES. STICK-LEAF. BLAZING-STAR.)—Hammocks, sand-dunes, and shell-mounds, pen. Fla. and the Keys.—(*W. I.*)—Spr.-fall or all year S.—The barbed hairs on the leaves cause them to adhere very closely to clothing. They are also very effective in cutting off the feet and legs of small insects that alight on them.

**FAMILY 2. OPUNTIACEAE — CACTUS FAMILY**

Shrubs or trees with more or less succulent tissues over a woody framework, the stem depressed or elongate, simple or branched, continuous or jointed, terete, fluted, or flattened, usually armed with spines which arise from cushions (areolae) of hairs or minute stiff bristles. Leaves rudimentary, obsolete, or wanting, or rarely well-developed. Flower solitary, often showy, diurnal or nocturnal. Calyx of several or numerous sepals. Corolla of few or many white or colored (except blue) petals. Androecium of numerous stamens in several series. Gynoecium of several united carpels. Ovary inferior, with the hypanthium often much produced beyond it, 1-celled, with several parietal placentate. Styles united. Stigmas clustered. Fruit a fleshy berry, either spiny or scaly, hairy or naked.—About 100 genera and over 1,200 species, American.—Many of the plants are used for foods and for ornamental gardening.

Plant copiously leafy, the leaves with broad blades, persistent. Plants leafless, or leaves obsolete or rudimentary, mere succulent scale-like deciduous structures.

Plants conspicuously jointed, sometimes loosely so, the internodes (joints) relatively short, more or less flattened: leaves mere thick deciduous scale-like structures: areolae with barbed bristles and often with single or clustered spines: hypanthium not prolonged beyond the ovary, deciduous from the ovary with a clean scar leaving a flat or more or less depressed umbilicus.

Plants inconspicuously jointed, the internodes (joints) terete, grooved, or angled: leaves none or obsolete: areolae without bristles, but spine-bearing: hypanthium much prolonged beyond the ovary, persistent on the fruit or rotting off irregularly, or very short.

I. PERESKIEAE.

II. OPUNTIEAE.

Flower rotate: hypanthium not prolonged: perianth of few sepals and petals.

Flower funnelform, trumpet-shaped, or narrowly campanulate: hypanthium much prolonged: perianth of numerous sepals and petals.

## III. RHIPSALIDAE.

## IV. CEREEAE.

## I. PERESKIEAE

Climbing or reclining plants with broad leaves and a pair of reflexed spines at each areola which is devoid of bristles: flowers stalked.

## II. OPUNTIEAE

Plant prostrate or with erect diffusely branched stems, without a continuous terete trunk: seed glabrous.

Plant with erect terete unjointed trunks: seed pubescent.

Trunk supporting dimorphous branches, the lateral ones terete, the succeeding ones flat: hypanthium short and terete: corolla with narrow, loosely spreading petals: berry subglobose.

Trunk supporting all flat irregularly placed branches: hypanthium elongate, flattened, resembling a small joint: corolla with broad, short, closely imbricate petals: berry elongate.

## III. RHIPSALIDAE

Pendent much-branched epiphyte with small white flowers.

## IV. CEREEAE

Stem and branches unequally 3-5-angled, not terete: berry persistently scaly or spiny.

Hypanthium scaly and hairy, the scales subtending tufts of hairs.

Hypanthium scaly or spiny, but not hairy.

Hypanthium scaly: berry more or less clothed with broad scales: plant climbing with aerial roots.

Hypanthium spiny: berry armed with clusters of spines: plant erect, diffuse, or reclining.

Stem and branches terete in outline, more or less fluted: berry neither persistently scaly or spiny.

Flower trumpet-shaped: hypanthium elongate, copiously scaly at the base: sepals and petals long and narrow: berry with stout scale-bases and often tufts of hair.

Flower narrowly campanulate: hypanthium short, naked at the base: sepals and petals broad and short: berry naked and glabrous.

## 1. PERESKIA.

## 2. OPUNTIA.

## 3. BRASILIOPUNTIA.

## 4. CONSOLEA.

## 5. RHIPSALIS.

## 6. SELENICEREUS.

## 7. HYLOCEREUS.

## 8. ACANTHOCEREUS.

## 9. HARRISIA.

## 10. CEPHALOCEREUS.

1. **PERESKIA** Plum. Woody and partly succulent vines with reclining or clambering stems and branches with spines at the leaf-axils. Leaves alternate: blades broad, flat, entire, short-petioled. Flowers often paniced. Hypanthium depressed, smooth or scaly. Sepals narrow. Corolla rotate: petals relatively few and broad, white or colored, broader than the sepals. Stamens numerous. Berry pyriform to subglobose, translucent, sometimes scaly.—About 20 species, tropical American.

1. **P. Pereskia** (L.) Karst. Stems and branches reclining or clambering, elongate, glabrous: leaf-blades ovate to lanceolate-elliptic, 4-9 cm. long, often acute or abruptly pointed, coriaceous, short-petioled: flowers very fragrant: sepals lanceolate, 1-1.5 cm. long, recurved: corolla 3.5-4 cm. wide: petals ovate-lanceolate, elliptic, or elliptic-obovate, the outer green, the inner white or nearly so, or sometimes yellowish or pinkish: berry subglobose, yellowish, 1-1.5 cm. in diameter, smooth in age: seeds 3-4 mm. in diameter. [*P. aculeata* Mill.] —(WEST-INDIAN GOOSEBERRY. LEMON-VINE. BARBADOS-GOOSEBERRY.)—Hammocks, thickets, and woods, S pen. Fla. Nat. of trop. Am.—Although frequently grown as an ornamental, the fruits are eaten raw or as a preserve and the leaves as a pot-herb.

**2. OPUNTIA** [Tourn.] Mill. Shrubs or trees, the trunk of fused joints, more or less irregular, usually widely or diffusely branched, the branches (joints) flat, armed at the areolae with solitary or clustered spines which arise from among clusters of bristles, or spineless. Leaves small, fleshy, thick scales, deciduous. Flowers large, at least relatively so, solitary or several on a joint. Hypanthium broadened upward, with areolae like the joints. Sepals fleshy, mostly green. Petals broad, usually broadened upward. Berries longer than thick, enlarged upward, mostly fleshy. Seeds flattened, cochleate, with even edges and glabrous sides.—About 260 species, American.—**PRICKLY-PEARS.** **DEVIL'S PINCUSHIONS.** **TUNAS.** **DEVIL'S-TONGUES.**—The fruits of prickly-pears are edible. They formed an important food-supply for the aborigines, who also used the stems as food by roasting them. The fruits are much used for food in some countries to-day. In the following descriptions the color of the spine is first stated for the immature stage, followed by the mature stage when dry and the mature stage when wet.

Joints of the stem and of the branches loosely attached, readily separating when shocked or touched, or even when blown by the wind, at least in the case of the smaller plants: fruits early deciduous; plants of some species often propagating only by the easily separating joints.

Spines acicular, gray or salmon-colored the first year, when dry.

Longer spines of each areola solitary or paired, gray the first year, when dry.

Longer spines of each areola several, salmon-colored the first year, gray the second year, when dry.

Spines subulate, ivory-white the first year, gray the second year, when dry.

Joints of the stem and of the branches firmly attached: fruits persistent.

Joints glabrous; spines acicular to elongate-subulate: very rigid, or wanting; hypanthium with few areolae.

Plants with spine-armed joints.

Mature spines gray when dry, at least in the second year.

Mature plants prostrate or erect and diffuse, often bushy; spines gray, or white, or yellow the first year, becoming gray at maturity, when dry.

Spines bright-yellow the first year, gray the second year.

Spines gray the first year or white the first year and gray the second.

Mature plants erect, with the joints of the main stem fused into a subterete trunk which divides above into a few or many branches: spines red the first year, becoming gray at maturity, when dry.

Mature spines yellow, red, or red-brown when dry, unchanged from year to year, uniform, discolored or banded.

Mature spines yellow or slightly discolored, often stout and clustered, sometimes curved, rarely very short and then mostly hidden in the areolae, not closely spirally twisted.

Mature spines red or red-brown, banded in our species, closely spirally twisted.

Plants with unarmed joints.

Joints thin or thinnish, with persistent bristles in the areolae: berries small, less than 5 cm. long.

Joints thick and turgid, with deciduous or obsolete bristles in the areolae: berries large, over 5 cm. long.

Joints pubescent: spines setaceous, pliable: hypanthium with numerous areolae.

I. CURASSAVICAE.

II. PISCIFORMES.

III. TUNAE.

IV. OCHROCENTRAE.

V. TORTISPINAE.

VI. AMMOPHILAE.

VII. DILLENIANAE.

VIII. ELATIORES.

V. TORTISPINAE.

IX. FICUS-INDICAE.

X. LEUCOTRICHAE.

## I. CURASSAVICAE

Larger joints broad, obovate, oval, suborbicular, or subglobose: spines setaceous-acicular, exceptionally long and slender: berry urceolate, tuberculate.

Larger joints elliptic, linear-elliptic, spatulate, or subcylindric: spines acicular-subulate: berry of a turbinate, obovoid or clavate type.

Joints mostly subcylindric, only slightly flattened, repand-tuberculate: berry narrowly turbinate or clavate-turbinate.

Joints decidedly flattened, although often quite turgid, not repand: berry obovoid to obconic-turbinate or clavate.

Corolla lemon-yellow: joints deep-green: spines dark-gray: berry narrowly obovoid to obconic-turbinate, less than twice as long as thick.

Corolla bright-yellow: joints pale-green: spines light-gray: berry clavate, over twice as long as thick.

1. *O. abjecta*.

2. *O. Tracyi*.

3. *O. Drummondii*.

4. *O. impedita*.

## II. PISCIFORMES

Plants in dense colonies with turgid very spiny narrow, deep-green joints, the spines conspicuously long and slender, salmon-colored in the first year, gray in the second: flowers numerous, bright-yellow: berry turbinate-obovoid, 4 cm. long or less.

5. *O. pisciformis*.

## III. TUNAE

Plants in depressed colonies with conspicuously spiny broad pale-green joints, the spines conspicuously short and stout, white in the first year, gray in the second: flowers few, clear-yellow: berry obovoid, 2 cm. long or less.

6. *O. eburnispina*.

## IV. OCHROCENTRAE

Plants erect and diffusely branched, with rather narrow light-green joints: spines stout, bright-yellow in the first year, gray in the second.

7. *O. ochrocentra*.

## V. TORTISPINAE

Plants prostrate, the stem and branches often forming depressed mats or colonies of joints.

Plants not armed with spines.

Joints narrow, much longer than wide, thick or turgid: berry 4-6 cm. long.

8. *O. macrarthra*.

Joints broad, little longer than wide, usually thin-nish:

Joints deep-green: berry clavate-obovoid or narrowly obconic.

9. *O. Opuntia*.

Joints bluish-green: berry obovoid:

10. *O. Pollardi*.

Plants spine-armed, the spines mostly solitary in an areola.

Mature joints broad, not much longer than wide.

Joints dull, deep-green or bluish-green: inner sepals not reniform: corolla 6 cm. wide or more: mature spines gray in the first and second years: inner petals longer than wide.

Joints deep-green: berry clavate-obovoid or narrowly obconic: spines dark-gray, slender.

9. *O. Opuntia*.

Joints bluish-green: berry obovoid: spines pale-gray, stout.

10. *O. Pollardi*.

Joints shining: inner sepals reniform: corolla 5 cm. wide or less: mature spines ivory-white in the first year, gray in the second: inner petals nearly or quite as wide as long.

11. *O. atropensis*.

Mature joints narrow, often elongate.

Intermediate sepals ovate: inner sepals merely acute: berry obconic-obovoid: seed usually less than 5 mm. in diameter.

8. *O. macrarthra*.

Intermediate sepals lanceolate: inner sepals abruptly acuminate: berry clavate, constricted at the base: seed usually over 5 mm. in diameter.

12. *O. lata*.

Plants erect, often diffusely branched, sometimes forming thickets.

Plants not armed with spines.

Hypanthium elongate: leaves spreading and recurved: berry broadly obovoid, nearly or quite as wide as long: seeds about 4 mm. in diameter.

13. *O. turgida*.

Hypanthium about as wide as long: leaves ascending: berry ellipsoid-obovoid, much longer than wide: seeds about 6 mm. in diameter.

14. *O. polycarpa*.

Plants armed with single or clustered spines at the areolae.

Mature spines (first year) gray, darker gray the second year.

Young spines mainly pale-yellow: berry rounded at the base: seeds 6 mm. in diameter.

14. *O. polycarpa*.

Young spines brown: berry narrowed, often constricted at the base: seeds 4 mm. in diameter.

15. *O. nitens*.

Mature spines (first year) white, becoming gray the second year.

Corolla 6-7 cm. wide: spines 2-4 cm. long: berry narrowly obovoid, 2.5-3.5 cm. long.

16. *O. austrina*.

Corolla 8-10 cm. wide: spines 5-7 cm. long: berry broadly obovoid, 4-5 cm. long.

17. *O. cumulicola*.

# VI. AMMOPHILAE

Plants tree-like, the stout or stocky trunk divided above into few or many divergent branching joints, sometimes semaphore-like: joints gray-green, usually copiously armed.

18. *O. ammophila*.

# VII. DILLENIANAE

Spines subulate to acicular, rigid, spreading.

Areolae bearing 4-13 short-subulate spines which seldom exceed the bristles, the joints thus apparently unarmed: corolla campanulate or cupulate.

19. *O. keyensis*.

Areolae bearing 2-6 long spines which much exceed the bristles, the joints thus conspicuously armed (individually sometimes unarmed): corolla rotate, except in *O. tenuiflora*.

Corolla campanulate: hypanthium and berry contracted into a long slender base, thus decidedly clavate.

20. *O. tenuiflora*.

Corolla rotate: hypanthium and berry not contracted into a long slender base.

Berry decidedly longer than thick, the umbilicus depressed.

Hypanthium long-turbinate or obconic-turbinate, much longer than its greatest diameter.

All the areolae armed with a cluster of spines.

Intermediate and inner sepals acute: berry more or less constricted at the base: seeds large, 5-6 mm. in diameter.

21. *O. Dillenii*.

Intermediate and inner sepals truncate or emarginate: berry not constricted at the base: seeds small, 3-4 mm. in diameter.

22. *O. Lindheimeri*.

Some of the areolae armed with 1, 2, or 3 spines.

23. *O. stricta*.

Hypanthium short-turbinate or obovoid-turbinate, slightly longer than the greatest diameter.

Outer sepals of a deltoid type; intermediate sepals reniform or rhombic-reniform, rounded and minutely pointed.

24. *O. Bentonii*.

Outer sepals of a reniform type: intermediate sepals papilionaceous, emarginate.

25. *O. tunoidea*.

Berry globose-turbinate, nearly or quite as thick as long, the umbilicus convex.

26. *O. turbinata*.

Spines acicular-setaceous, weak and pliable, sparse, reflexed or recurved.

Joints short, orbicular to orbicular-obovate, the larger ones 1-1.5 cm. long: leaves subulate, recurved-spreading.

27. *O. cantabrigiensis*.

Joints elongate, elliptic, oval or narrowly obovate, the larger ones 3-5 dm. long: leaves loosely ascending.

28. *O. magnifica*.

## VIII. ELATIORES

Plants erect, but diffusely branched: spines banded: hypanthium broadly turbinate: berry broadly obovoid, not constricted at the base.

29. *O. zebrina*.

## IX. FICUS-INDICAE

Plants very robust, more or less tree-like, the thick joints supported on the subterete trunk, mostly about 3 dm. long: corolla large, mostly 8-10 cm. wide: berry red or orange, said to be sometimes yellow.

30. *O. Ficus-Indica*.

## X. LEUCOTRICHAE

Plants erect, often with the joints of the main stem fused into a trunk, the older parts especially, clothed with white hair-like bristles: joints with numerous, rather close-set areolae: hypanthium with numerous areolae: berry aromatic.

31. *O. leucotricha*.

1. *O. abjecta* Small. Plant prostrate, often growing in large irregular patches on almost bare limestone or where some sand and humus has collected, very irregularly branched, often with small tuberous roots: joints suborbicular, sometimes nearly subglobose, oval or broadly obovate, mostly 4-8 cm. long, very thick, frequently very turgid, light-green, often much-branched, loosely attached to each other: leaves ovoid to conic-ovoid, 2-3 mm. long, ascending and slightly curved upward, green or purplish, accompanied by fine bristles, but without spines: areolae not very conspicuous: spines acicular, mostly solitary, brown, mottled light and dark, becoming chalky-gray when dry, reddish-purple, except the paler and more or less mottled distal part when wet, the larger ones 2-6 cm. long: flowers usually solitary on a joint: hypanthium turbinate: sepals green, the outer subulate-lanceolate, 5-8 mm. long, acute: corolla light-yellow, 2.5-3.5 cm. wide; petals few, obovate, usually minutely pointed: berry urceolate, 2-2.5 cm. long, somewhat tuberculate, red or purple-red, rounded at the base, the umbilicus relatively very broad, concave: seeds few, flattish, about 4 mm. wide.—Hammock, S end of Big Pine Key, Fla.—Although the plants of this species flower and fruit in their native haunts, they have thus far failed to flower in cultivation.

2. *O. Tracyi* Britton. Plant similar to that of *O. Drummondii*, but usually more diminutive; joints narrowly ellipsoid to narrowly cylindric, more or less flattened, 2.5-8 cm. long or longer and worm-like, bright-green, very loosely attached to each other: leaves green, ovoid, sometimes narrowly so, sometimes accompanied by the young spines: areolae small but conspicuous, usually all of them armed: spines solitary or 2-4 together, pink, at maturity light-gray when dry, brown or purple-brown when wet, slightly flattened: flowers 1 or 2 on a joint: hypanthium turbinate-obconic: sepals sometimes purple-tinged, the outer subulate, the intermediate triangular, the inner rhombic-ovate: corolla bright-yellow, nearly similar to that of *O. Drummondii*: berry narrowly turbinate to clavate-turbinate, 3-4 cm. long, purple, the umbilicus depressed: seeds few, 5-5.5 mm. in diameter, flattish.—Sand-dunes and sandy woods near the coast, N E Fla. and S E Ga. to Miss.

3. *O. Drummondii* Graham. Plant prostrate, diminutive and scattered in the sand, or diffusely sprawling, sometimes forming depressed mats by the copious branching and hanging together by the armament, tuberous: joints ellipsoid.

usually narrowly so, or slightly broadest above the middle or below it, thick or turgid and sometimes globular, 2–12 cm. long, light-green or pale-green, loosely attached to each other: leaves stout-subulate or ovoid-subulate, 3–6 mm. long, ascending and slightly recurved, green, unaccompanied by prominent bristles or spines: areolae inconspicuous, the upper ones, at least, armed: spines slender-subulate, solitary or 2, 3, or 4 together, pink, reddish, or red, at maturity gray, often dark-gray, except the sometimes darker tip, when dry, purple-black when wet, nearly terete: flowers usually solitary on a joint: hypanthium obconic: sepals green, the outer linear-subulate to lanceolate, 5–9 mm. long, acute or acuminate, the intermediate triangular-ovate to rhombic-ovate, acuminate, the inner orbicular-ovate above the broad claw-like base, about 2 cm. long, abruptly pointed: corolla lemon-yellow, 5–6 cm. wide: petals few, broadly obovate, truncate and emarginate at the apex and mucronate: anthers fully 2 mm. long: berry narrowly obovoid to obconic-turbinate, 2.5–3.5 cm. long, reddish purple, the umbilicus concave: seeds few, turgid, about 5 mm. in diameter. [*O. frustulenta* Gibbs. *O. Pes-Corvi* LeConte]—Sand-dunes and pinelands, outer part of Coastal Plain, Fla. to Miss. and N. C.—This and the next preceding species are so thoroughly disguised in connection with their habitats that the loosely articulated joints are frequently to be found adhering to one's clothing before they are noticed on the ground.

4. *O. impedita* Small. Plants closely prostrate, ultimately copiously branched, the joints often piled several layers deep and forming viciously armed mats, elliptic or nearly so, mostly 7–15 cm. long, rather thick, light-green: leaves stout-subulate, 4–6 mm. long, erect or ascending, slightly curved upward, dark-green, unaccompanied by exserted bristles or spines: spines stoutish, usually numerous, solitary or 2 together, pale-gray, except the brown at the tip when dry, salmon-colored and faintly banded when wet: flowers often several on a joint, numerous: hypanthium obconic, nearly terete and even: sepals green, the outer lanceolate to ovate, 4–8 mm. long, acuminate, the inner much larger, with the shoulders of the very broad body narrowed into the stoutish tip: corolla bright-yellow, 4.5–5.5 cm. wide; petals several, about 12, about 2.5–3 cm. long, broadly obovate to cuneate-obovate, broadly rounded at the apex, mostly mucronate; anthers nearly 2 mm. long: berry clavate, about 3 cm. long, rounded at the base, the umbilicus rather small, somewhat concave: seeds rather few, 4–4.5 mm. in diameter. [By error first published as *O. impedita*.]—Sand-dunes, Coastal Plain, N E Fla. to N. C.

5. *O. pisciformis* Small. Plant prostrate, copiously branched forming dense mats often 1–3 m. in diameter, with the joints piled several layers deep, with sparingly tuberos-thickened roots: joints narrowly elliptic, linear-elliptic, or spatulate, mostly 1–3 dm. long, very thick, deep-green: leaves stout-subulate, 2–4 mm. long, incurved, acute: areolae rather prominent, mostly armed: spines solitary or 2 or 3 together, cream-colored, becoming salmon-colored and gray with a dark tip when dry, salmon when wet, the longer ones 5–6 cm. long: flowers numerous: hypanthium turbinate, angular and tuberculate: sepals green, the outer lanceolate to triangular-lanceolate, 9–12 mm. long, acuminate, the inner much larger, the broad ovate or suborbicular base broadly tapering into the very stout tip: corolla bright-yellow, 6–7.5 cm. wide: petals several, about 12, 3–4 cm. long, broadly cuneate, mostly truncate or emarginate at the apex, mucronate: anthers nearly 2 mm. long: berry broadly turbinate-obovoid, 3.5–4 cm. long, purple, narrowed at the base, the umbilicus deeply concave: seeds rather numerous, 5–5.5 mm. in diameter.—Sand-dunes, estuary of the Saint Johns River, Fla.—This and the next preceding species are vigorous growers and loose-jointed. This combination causes plants to form disorderly masses of joints often a foot high.

6. *O. eburnispina* Small. Plant prostrate, widely branched and forming mats in the dune sands, with tuberos roots: joints oval or suborbicular, varying

to broadest above the middle, thickish, 6-13 cm. long, light-green, somewhat shining, especially when young: leaves ovoid-subulate, 4-5 mm. long, pale green, recurved-spreading: spines relatively stout, 2-4 together or sometimes solitary, 1-2 cm. long, ivory-white with yellowish tips when young, becoming dark-gray, not spirally twisted, greenish when wet: flowers few: hypanthium obconic: sepals triangular, green, 5-7 mm. long: corolla yellow, 4-5 cm. wide; petals few, narrowly cuneate, often minutely pointed: anthers nearly 1.5 mm. long: berry obovoid, about 2 cm. long, red, the umbilicus depressed: seed few, 3-3.5 mm. in diameter, flattish.—Coastal sands, Romano Island, Fla.—The numerous ivory-white spines contrasted against the green joints render patches of the plants very conspicuous.

7. *O. ochrocentra* Small. Plant erect, 1 m. tall or less, much-branched, sometimes more or less diffuse, with coarse fibrous or somewhat swollen roots: joints elliptic to oval, varying to broadest above the middle, 1-3 dm. long, thickish, bright-green: leaves ovoid or subulate-ovoid, 2-4 mm. long, often pink or purplish, acute, erect or slightly spreading: areolae rather prominent, armed: spines 5-6 together or sometimes fewer on new joints, yellow, becoming gray when dry, yellowish-green when wet, straight, the longer ones 4.5-5 cm. long: flowers rather few: hypanthium turbinate or obovoid-turbinate: sepals often purple tinged, deltoid to rhombic-orbicular or rhombic-reniform, acute: corolla bright lemon-yellow, 7-8.5 cm. wide, usually rotate: petals few, cuneate to obovate, notched at the apex or with a minute tip: anthers about 2 mm. long: berry obovoid-pyriform, 2-3.5 cm. long, red to red-purple, sometimes slightly constricted at the base: seeds numerous, 2.5-3 mm. long.—On edge of hammock, S E end of Big Pine Key and Cape Romano, Fla.

8. *O. macrarthra* Gibbes. Plant prostrate, the young growth sometimes ascending, rather sparingly branched, but seldom forming mats, conspicuous on account of its long, thick, smooth joints, with fibrous roots: joints elliptic to broadly linear, sometimes broadened upward, mostly 15-35 cm. long, very thick, shining, light-green: leaves ovoid-subulate, green, 5-8 mm. long, nearly straight: areolae few and distant, mostly unarmed: spines, when present, solitary, slender-subulate, brown, except the pale tip, becoming gray when dry, straw-colored when wet, 1.5-3.5 cm. long: flowers few, rarely several on a joint: hypanthium obconic, 4-4.5 cm. long: sepals mostly green, the outer subulate to lanceolate, 7-14 cm. long, acute, the intermediate triangular-lanceolate to deltoid, the inner ovate to rhombic-ovate, acute: corolla rotate, bright-yellow, 6-7 cm. wide; petals broadly cuneate-obovate to obovate, 3-3.5 cm. long, rounded at the apex, mucronate, broad at the base: anthers about 3 mm. long: berry narrowly obovoid or clavate-obovoid, 4-6 cm. long, red or red-purple, the umbilicus concave: seeds relatively few, 4-4.5 mm. in diameter, flattish.—Sand-dunes, coast of S. C. and N. C.

9. *O. Opuntia* (L.) Karst. Plant prostrate, the new growth sometimes ascending, with fibrous roots, often forming extensive bright-green mats: joints obovate, varying to suborbicular or elliptic, 5-18 cm. long, deep-green, often somewhat shining: leaves stout-subulate, 5-7 mm. long, often purple-tinged, ascending, nearly straight, usually unaccompanied by spines: areolae inconspicuous: spines when present pinkish, becoming dark-gray when dry, dark brown when wet: hypanthium obconic, somewhat angled: sepals mostly green, the outer subulate to lanceolate, 4-9 mm. long, acute, or abruptly sharp-tipped, the intermediate ovate-lanceolate, acuminate, the inner rhombic-obovate, abruptly pointed: corolla rotate, bright-yellow or sometimes reddish at the center, 5-8 cm. wide: petals few, 8-10, broadly obovate to broadly cuneate-obovate, about 3-4 cm. long, rounded or emarginate and erose at the apex, mucronate; anthers 2.5-3 mm. long: berry narrowly obovoid to clavate-obovoid, 2.5-5 cm. long, red or purple-red, the umbilicus concave: seeds 4-5

mm. in diameter.—(ATLANTIC PRICKLY-PEAR.)—Sandy or rocky places, various provinces, Coastal Plain only N. Ga. to Ala., N. Y. and Mass. Has been confused with *O. vulgaris* Mill., a South American plant.

10. *O. Pollardi* Britton & Rose. Plant prostrate, forming irregular mats, somewhat tuberous: joints suborbicular or oval, varying to broadly obovate, usually quite thick, 10–15 cm. long, or sometimes smaller, deep-green beneath the more or less glaucous surface, dull: leaves ovoid, 3–4 mm. long, erect or appressed, slightly incurved, deep-green, unaccompanied by bristles or spines: areolae rather conspicuous, much scattered, some of the upper ones, at least, usually armed: spines stout, usually solitary, yellowish or pinkish, becoming pale-gray at maturity when dry, cinnamon-brown when wet: hypanthium obovoid or obconic-obovoid, uneven: sepals green, the outer ovate to deltoid, 2–12 mm. long, acute, the inner cuneate-obovate, abruptly pointed or mucronate: corolla 5–7 cm. wide, bright-yellow: petals few, 7–10, cuneate, sometimes broadly so, 2.5–3 cm. long, notched and often mucronulate at the apex: anthers about 1.5–2 mm. long: berry obovoid, 2.5–3 cm. long, purple, the umbilicus concave: seeds sometimes rather numerous, 5–6 mm. in diameter, turgid.—Pinelands, sand-dunes, and rarely oak woods, Coastal Plain, Fla. to Miss. and Del.

11. *O. atrocapiensis* Small. Plant diffusely prostrate, sometimes assurgent at the tip, much-branched, the decumbent branches with fibrous (?) roots: joints obovate, elliptic, or broadly oval, 0.5–1 dm. long, deep-green, sometimes shining, not glaucous: leaves stout-subulate, 2–4 mm. long: areolae small, often armed: spines usually solitary, light-yellow, becoming white or finally gray when dry, straw-colored and often brown-mottled when wet, the longer ones 2–3.5 cm. long: hypanthium obconic, 2–2.5 cm. long, nearly even, blunt at the base: sepals green, the outer ovoid to triangular-lanceolate, 3–7 mm. long, acute, the inner deltoid, about 1 cm. long, acute: corolla pale-yellow, 4.5–5 cm. wide: petals few, 8–10, oval to suborbicular, 2–3 cm. long, rounded or notched at the apex, crisped, somewhat mucronate, rounded or truncate at the base: anthers nearly 2 mm. long: berry narrowly obovoid, 3–3.5 cm. long, reddish-purple, many-seeded, the umbilicus depressed: seeds 3–3.5 mm. in diameter, flat.—Sand-dunes, Cape Sable, Fla.

12. *O. lata* Small. Plant prostrate, often radially branched, sometimes forming mats nearly a meter across, the tips of the branches sometimes assurgent, with elongate cord-like roots: joints elliptic to narrowly obovate, often narrowly so, thick, 0.4–1.5 dm. long, deep-green, sometimes glaucous, especially when young: leaves subulate, 6–11 mm. long, green or purple-tinged: areolae scattered, often conspicuous, sometimes very prominent and densely bristly, the marginal ones, at least, armed: spines slender, solitary or 2 together, pink, turning red or red-banded, at maturity gray or nearly white when dry, pale stramineous when wet: hypanthium obconic to clavate: sepals green, the outer subulate to lanceolate, acute, the intermediate lanceolate to triangular-lanceolate, acuminate, the inner rhombic, abruptly acuminate: corolla yellow, 7–9 cm. wide; petals rather numerous, the outer broadly cuneate-flabellate, the inner ones broadly obovate to flabellate or suborbicular, erose at the broad minutely mucronate apex: anthers about 3 mm. long: berry clavate, 5–6.5 cm. long, red or red-purple, many-seeded, the umbilicus concave: seeds about 5–6 mm. in diameter.—Pinelands, lime-sink region, Fla.

13. *O. turgida* Small. Plant erect, more or less diffusely branched, 0.5 m. tall or less, with fibrous roots: joints elliptic to elliptic-obovate, 5–12 cm. long, thickish, deep-green, sometimes slightly glaucous when young: leaves subulate, 6–10 mm. long, spreading and more or less recurved, green, sometimes accompanied by fine bristles, but without spines: areolae scattered, often

prominent and densely bristly on the older joints: spines (as far as known) wanting: flowers often several on a joint: hypanthium obovoid or obconic-obovoid, 2–2.5 cm. long, slightly tubercled: sepals green or purple-tinged, the outer subulate to lanceolate, 4–10 mm. long, acute, the inner rhombic-ovate, fully 1.5 cm. long, stout-pointed: corolla bright-yellow, 5.5–6.5 cm. wide: petals 10–12, about 3 cm. long, broadly cuneate, abruptly narrowed, rounded or subtruncate at the apex, mucronate: anthers 2 mm. long: berry obovoid, 2–2.5 cm. long, greenish-purple, even, broadly rounded at the base, the umbilicus flat or a little depressed at the middle: seeds rather numerous, about 4 mm. in diameter, somewhat turgid.—Hammocks on the mainland along the Halifax River to the St. Mary's River, Fla.

14. *O. polycarpa* Small. Plant erect, 1 m. tall or less, copiously and diffusely branched, often in large colonies or patches: joints elliptic, narrowly rhombic-elliptic or sometimes broadly so, more or less twisted, mostly 1–4 dm. long, bright-green: leaves subulate, 3–7 mm. long, or sometimes longer, ascending and more or less curved upward, often purple-tinged, accompanied by very fine bristles, with or without spines: areolae scattered, often prominently bristly: spines, when present, solitary or 2 or 3 together, rather slender, pale-yellow or marked with darker-yellow or salmon below, gray except the brown tip when dry, brown or reddish when wet, the longer ones 2–3 cm. long: hypanthium narrowly obconic, 3–3.5 cm. long with very few areolae, the scales erect or ascending: sepals mostly green, the outer subulate to narrowly lanceolate, 6–15 mm. long, acute, the intermediate lanceolate, the inner nearly or quite as wide as long, more or less rhombic, sometimes broadly shouldered and narrowed into a short tip: corolla bright-yellow, 6.5–7.5 cm. wide; petals about 12. 2.5–3 cm. long, flabellate or cuneate-flabellate, broadly rounded or truncate at the apex, mucronate: anthers 2.5–3 mm. long: berry ellipsoid-obovoid, 4–5 cm. long, purple or reddish-purple, even, rounded or slightly narrowed at the base, the umbilicus flattish and shallowly pitted at the center: seeds, numerous, about 6 mm. in diameter, rather wide-margined, somewhat turgid.—Coastal sand-dunes from the mouth of the Saint John's River to the Halifax River and on dunes, islands of the Cape Romano region, also locally in the interior, Fla.

15. *O. nitens* Small. Plant 1 m. tall or less, more or less diffusely spreading, with long fibrous roots: joints mostly obovate, 6–15 cm. long, thickish, green, not glaucous, shining, sometimes slightly twisted: leaves short-subulate, 3–5 mm. long, ascending: areolae often prominent on account of the exerted coarse bristles, mostly armed: spines solitary or 2–4 together, brown with a light tip, becoming dark-gray with a brown tip when dry, most of the longer ones 2–3 cm. long: flowers usually several to a joint: hypanthium obconic, about 3 cm. long: sepals green, the outer subulate or lanceolate to triangular-lanceolate, 6–16 mm. long, the inner rhombic-ovate to broadly rhombic-cuneate, 1.5–2 cm. long, all acute: corolla light-yellow, rotate, 5.5–6.5 cm. wide; petals broadly cuneate-obovate, 2.5–3 cm. long, rounded or truncate at the apex, mucronate, rather broad at the base: anthers about 2.5 mm. long: berry clavate-obovoid, about 4 cm. long, purple, the stipe-like base much shorter than the body, the umbilicus concave: seeds numerous, about 4 mm. in diameter, very turgid.—Hammocks, on shell-mounds along the western side of the Halifax River, Fla.

16. *O. austrina* Small. Plant erect, 1 m. tall or less, irregularly branched, tuberous: joints broad, oval or suborbicular, varying to obovate, or nearly elliptic, thinnish, 5–10 cm. long or rarely longer, deep-green or bright-green: leaves stout-subulate, 4–7 mm. long, ascending, usually accompanied by spines; green or purple-tinged: areolae rather prominent, the marginal and upper ones usually armed: spines slender-acicular, yellowish or reddish, at maturity white or light-gray when dry, pale-brown when wet, solitary or 2 together: hypan-

thium obovoid-turbinate, 2.5–3 cm. long: sepals green, the outer subulate to lanceolate, 7–14 mm. long, acute, the intermediate lanceolate to ovate, somewhat acuminate, the inner rhombic-ovate, broadly acuminate: corolla 6–7 cm. broad, light-yellow, or sometimes very pale; petals few, the outer cuneate, emarginate and abruptly-pointed, the inner obovate, rounded and minutely pointed at the apex: anthers about 2 mm. long: berry narrowly obovoid, 2.5–3.5 cm. long, purple: seeds numerous, 2.5–4.5 mm. in diameter, very turgid.—Pine-lands, S pen. Fla.

17. *O. cumulicola* Small. Plant similar to that of *O. austrina*, but more robust and larger throughout: joints elliptic, obovate, or suborbicular, 9–30 cm. long, thick, bright-green: leaves subulate, 5–11 mm. long, more or less spreading: areolae prominent, mostly marginal, nearly all often armed: spines stout-acicular, usually solitary, if 2, the additional one very small, light-yellow, becoming light-gray or whitish when dry, light-brown when wet: corolla mostly 8–11 cm. broad, deep-yellow; petals rather many, the outer cuneate-flabellate, truncate or slightly emarginate and pointed, the inner flabellate and broadly rounded at the apex: anthers about 2.5 mm. long: berry obovoid, 4–5 cm. long, purple, the umbilicus concave: seeds numerous, 4.5–5 mm. in diameter, very turgid.—Coastal sand-dunes, S pen. Fla.

18. *O. ammophila* Small. Plant erect, more or less branched throughout, or ultimately with a stem 1–2 m. tall or more, becoming 1–2.5 dm. in diameter, bearing several spreading branches at the top, thus tree-like, the roots tuberous: joints various, those of the main stem elongate, ultimately fused at the nodes and subcylindric, those of the branches typically obovate or cuneate, varying to elliptic or oval, thickish, 0.5–1.7 dm. long, becoming gray-green: leaves stout-subulate, 6–10 mm. long, spreading or ascending, sometimes purple-tinged: areolae relatively numerous, conspicuous on account of the densely crowded long bristles, especially on the older joints, the marginal ones, at least, armed: spines very slender, solitary or two together, reddish or red, at maturity gray, mostly 2–6 cm. long, nearly terete, scarcely spirally twisted: flowers usually several on a joint, the buds sharp-pointed: hypanthium turbinate, 3–3.5 cm. long, more or less tuberculate-ridged, with several areolae, the scales lax or spreading: sepals green or purple-tinged, the outer lanceolate, 8–16 mm. long, acute, the intermediate ovate-lanceolate to ovate, short-acuminate, the inner rhombic to broadly rhombic-cuneate, abruptly pointed: corolla bright-yellow, 5–8 cm. wide; petals broadly cuneate, cuneate-obovate or obovate, truncate or notched at the apex, prominently mucronate, even or obscurely erose: anthers 3–3.5 mm. long: berry obovoid, 2–3 cm. long or rarely somewhat larger, flushed with red-purple, tuberculate, somewhat juicy, the umbilicus concave: seeds numerous, about 4 mm. in diameter, narrowly margined, very turgid.—(SCRUB PRICKLY-PEAR.)—Scrub, pen. Fla.—This plant reaches its maximum development in the Lake George region of Florida. Bartram observed it there in his travels. However, in recording it in his narrative he confused the vegetative parts of this plant and the large fruits of the prickly-pear of the coastwise kitchenmiddens.

19. *O. keyensis* Britton. Plant erect, much-branched, sometimes forming clumps 3 m. tall, with long fibrous roots: joints elliptic, oval, obovate, or spatulate, thick, 1–3 dm. long, bright-green: leaves conic-subulate or narrowly ovoid, 2–4 mm. long, ascending, straight or nearly so, green, accompanied by inconspicuous bristles, but without spines: areolae rather conspicuous, often relatively large and prominent, apparently unarmed: spines stout, 4–13 together, very short, mostly hidden in the bristles, pink, at maturity salmon-colored, sometimes protruding from the areolae as tufts of very coarse bristles, slightly flattened: buds short-pointed: flowers solitary or 2 or 3 on a joint: sepals green, the outer deltoid to subreniform, acute or acutish, or abruptly pointed, inter-

mediate ones somewhat reniform, the inner rhombic-reniform, abruptly pointed: corolla salmon-colored, cup-like or short-campanulate, 3–3.5 cm. wide; petals rather few, the outer broadly cuneate, the inner broadly obovate or orbicular-obovate, undulate, scarcely, if at all, mucronate: anthers about 2 mm. long: berry obovoid, 4–6 cm. long, purple, slightly constricted at the base, the umbilicus flattish around the edge, depressed in the middle: seeds numerous, about 5 mm. in diameter.—Hammocks and coastal sand-dunes, Florida Keys and Cape Sable region to Cape Romano region, Fla.

**20. *O. tenuiflora* Small.** Plant partly erect, 1 m. tall or less, usually much-branched and decumbent and diffuse, with coarse fibrous roots: joints spatulate to elliptic-spatulate, or narrowly elliptic, mostly 1.5–4 dm. long, thickish, deep-green and often sparingly glaucous: leaves ovoid or ovoid-subulate, 3–3.5 mm. long, spreading or ascending, accompanied by short spines: areolae not very conspicuous, mostly armed: spines mostly 3–6 together, pale-yellow, becoming sordid-yellow when dry, pale-brown or yellow tinged with brown when wet, curved, the longer ones 2–5 cm. long: flowers few: hypanthium clavate, 4–4.5 cm. long, prominently ridged and tuberculate, with a slender stipe-like base: sepals green, the outer deltoid, to broadly reniform and with lateral wings or shoulders, 5–8 mm. long, acute, the inner rhombic-reniform to rhombic-obovate, 1–1.5 cm. long, abruptly pointed, winged: corolla deep-salmon colored, campanulate, about 3 cm. wide; petals few, narrowly obovate to cuneate-obovate, 2–2.5 cm. long, rounded or truncate at the apex, mucronate, slightly narrowed at the base: anthers about 2.5 mm. long: berry stout-clavate, 6–7 cm. long, purple, the stipe-like base nearly or quite as long as the body, the umbilicus concave: seeds numerous, 3–3.5 mm. long.—Hammocks, upper Florida Keys.

**21. *O. Dillenii* (Ker) Haw.** Plant erect, rather strict and sparingly branched or much-branched and sometimes diffuse, or sometimes 2 m. tall and often somewhat tree-like, with stout fibrous roots: joints elliptic to obovate or oval, thickish, 1–3 dm. long, light-green, often glaucous: leaves conic-subulate, 2–5 mm. long, ascending, straight or nearly so, usually green, accompanied by bristles but without spines: areolae remote but conspicuous, mostly armed: spines stoutish, clustered, usually 3–6 together, flattened, often curved, pale-yellow, at maturity deeper yellow and often sordid when dry, paler yellow when wet: flowers several on a joint: hypanthium narrowly obconic, 4.5–5.5 cm. long, slightly ridged, not stipitate at the base: sepals green, the outer ovate to triangular or deltoid, 3–9 mm. long, wingless or obscurely winged, acute; the inner orbicular-reniform to rhombic-reniform, 1.5–2 cm. long, abruptly pointed: corolla yellow, salmon, or reddish, rotate, 6–8 cm. wide; petals rather few, broadly obovate to cuneate-flabellate, 3.5–4.5 cm. long, erose and usually notched at the apex, decidedly narrowed at the base: anthers about 2 mm. long: berry pyriform, 5–8 cm. long, or sometimes smaller, purple, narrowed to the base, the umbilicus flattish with a depressed center: seeds numerous, 5–6 mm. in diameter, turgid.—Hammocks, along or near the coast, tidal hammocks, and coastal sand-dunes, pen. Fla., adj. islands and Florida Keys.—(*W. I., Mex.*)

**22. *O. Lindheimeri* Engelm.** Plant robust, 3 m. tall or less, often widely branched throughout, thus forming a large shrub with coarse fibrous roots: joints obovate or elliptic-obovate to oval, more or less twisted, 2–3.5 dm. long, thickish, light-green or somewhat glaucous: areolae often prominent, conspicuous on account of the numerous long bristles, armed: spines stout, 5–13 together or fewer, flattened, light-yellow, becoming dingy-yellow or salmon when dry, stramineous when wet, curved, the larger ones 2–4 cm. long: flowers numerous: hypanthium obconic-turbinate, about 6 cm. long: outer sepals broadly reniform, 5–6 cm. long, mucronulate, dark-green near the center; inner sepals cuneate-flabellate, mucronate, thin-edged: corolla rotate, clear-yellow; petals about 10, the outer broadly obovate, 4–5 cm. long, the inner scarcely as broad as the outer,

all notched and mucronulate, rather thin-edged and crisped, contracted at the base: anthers 2.5–3 mm. long: berry pyriform, varying to obovoid or nearly ellipsoid, 4–5.5 cm. long, purple, the umbilicus somewhat depressed: seeds numerous, 3–4 mm. in diameter, very turgid.—Pinelands, especially about old settlements and homesteads, pen. Fla. Nat. of Tex. and Mex.

23. *O. stricta* Haw. Plant erect, but ultimately diffusely much-branched, 1–2 m. tall: joints spatulate, elliptic, oval, or obovate, rather thick, mostly 1–3.5 dm. long, somewhat glaucous: leaves subulate, mostly 5–7 mm. long, ascending or spreading, sometimes accompanied by young spines: areolae widely separated, but evenly scattered, some of them usually armed: spines solitary or 2 or 3 together, pink or salmon, at maturity yellowish when dry, red-brown or orange-brown when wet; flowers showy, often several on a joint: hypanthium elongate-turbinate, 5–6.5 cm. long: sepals green, the outer with a very broad abruptly pointed body, the intermediate somewhat reniform, abruptly pointed, the inner cuneate-flabellate, truncate and mucronate: corolla light-yellow, up to 1 dm. wide; petals mostly 8–10, the outer cuneate-obovate, the inner obovate, obscurely pointed: anthers about 2.5 mm. long: berry pyriform or obovoid-clavate, 5–7.5 cm. long, purple, the umbilicus depressed: seeds rather numerous, 4.5–5 cm. in diameter, flattish.—Shell mounds, kitchenmiddens, and aboriginal village sites, Fla. and S E Ga.—(*W. I.*)—This and the next following species are two of the prickly-pears the early Spanish records tell us the aborigines feasted on for three months of each year and also cured, like figs, for food when out of season.

24. *O. Bentonii* Griffiths. Plants erect, but ultimately diffusely or widely branched, mostly less than 1 m. tall, not tuberous: joints broadly spatulate, obovate, elliptic, or oval, thinnish, or quite thick at the base of the plant, mostly 1–3 dm. long, bright-green: leaves stout-subulate, 4–6 mm. long, or rarely longer, spreading, straight or slightly recurved, not accompanied by spines and only obscurely bristly at the base: areolae rather evenly scattered or more numerous along the edges than on the faces of the joints, few of the upper marginal ones armed: or joints individually unarmed: spines slender, solitary, or 2 or 3 together and sometimes with several shorter ones, pale-yellow, at maturity deeper-yellow when dry, pale yellow when wet, nearly terete, obscurely spirally twisted: flowers showy, mostly few on a joint: hypanthium obovoid to short turbinate, 4–4.5 cm. long, glaucous: sepals green, darker near the center and the tips, the outer broadly ovate to deltoid, 5–10 mm. long, acute, the intermediate reniform or rhombic-reniform, the inner flabellate-reniform, rounded and minutely pointed: corolla yellow, 8–9 cm. wide; petals 12–15, the outer cuneate, often broadly so, the inner obovate to orbicular-obovate, deep-yellow within, often finely crisped and mucronulate: anthers about 3 mm. long: berry obovoid, sometimes slightly pyriform, 3.5–5 cm. long, purple, the umbilicus depressed in the middle: seeds numerous, 4–5 mm. in diameter, slightly turgid, unevenly thick-margined.—Pinelands and sand-dunes, mostly near the coast, N Fla. to Tex.

25. *O. tunoidea* Gibbes. Plant erect, but ultimately diffusely and widely branched, 2 m. tall or less, the roots not tuberous: joints broadly spatulate, obovate, elliptic or oval, mostly 1–3 dm. long, thick or sometimes thinnish, bright-green and more or less glaucous: leaves stout-subulate, 4–6 mm. long or rarely longer, spreading, straight or slightly recurved, not accompanied by spines, and only obscurely bristly at the base, green or purplish-green: areolae rather evenly placed, more numerous along the edges than on the faces of the joints, few of the upper marginal ones armed or all armed, or joints individually unarmed: spines solitary or clustered, 2–4 together or more, pale-yellow, becoming dingy-yellow at maturity when dry, pale yellow when wet, the longer ones 1–3 cm. long, straight or slightly curved: flowers solitary or few on a joint, showy: hypanthium short-turbinate or obovoid-turbinate: sepals green, the outer

reniform, 4–8 mm. long, abruptly pointed, the intermediate papilionaceous, the inner flabellate-cuneate, emarginate and mucronate: corolla bright-yellow, 6.5–8 cm. wide, rotate; petals few, the outer flabellate-cuneate, the inner broadly cuneate-obovate, all toothed, emarginate, mucronate: anthers 2.5–3 mm. long: berry globose-obovoid, 4.5–6 cm. long, purple, the umbilicus shallowly concave: seeds numerous, 5–6 mm. in diameter, turgid, thick-margined.—Coastwise sand-dunes, Ga. (N E Fla.?) to N. C.

26. *O. turbinata* Small. Plant erect, but diffuse, less than 1 m. tall, much-branched, with stout fibrous roots: joints oval, suborbicular or obovate, 1–1.5 dm. long, light-green and glaucous, very thick: leaves ovoid, about 3 mm. long, areolae rather prominent, mostly armed: spines solitary or 2–5 together, pale-yellow to bright-yellow, becoming sordid-brown when dry, dark-brown when wet, the longer ones 2–3 cm. long: hypanthium turbinate: sepals green, the outer deltoid-ovate, acute, the intermediate orbicular-ovate, the inner somewhat reniform and broadly pointed: corolla light-yellow, 4.5–5.5 cm. wide; petals cuneate to obovate, minutely pointed: berry globose-turbinate, 3.5–4.5 cm. long, purple, the umbilicus convex: seeds numerous, about 4.5–5 mm. in diameter, very inequilateral.—Coastal sand-dunes, N E Fla. to Ga.

27. *O. cantabrigiensis* Lynch. Plant erect, 1 m. tall or less, diffusely branched, but with no definite main stem, with fibrous, sometimes stout roots: joints orbicular to orbicular-obovate, mostly 1–1.5 dm. long, thickish, bright-green, somewhat glaucous when young: leaves subulate, 5–11 mm. long: areolae small, nearly all armed and with long white hairs: spines solitary or 2–4 together, acicular, cream-colored when young, at maturity pale-yellow, except the dark tip when dry, light yellow-brown when wet, the longer ones 2–3 cm. long: hypanthium obovoid, green: corolla yellow, or sometimes red in the center, rotate, mostly 5–6 cm. wide: berry globose-obovoid or globular, 3.5–4.5 cm. long, purple: seeds numerous, 3–4 mm. long, somewhat turgid.—Coastal sand-dunes about Beaufort, N. C. Nat. of Mex.

28. *O. magnifica* Small. Plant 2 m. tall or less, more or less widely branched and diffuse, with thick fibrous roots: joints elliptic, oval, or narrowly obovate, 2–5 dm. long or more, relatively thin, more or less twisted, bright-green and glaucous: leaves subulate, 6–8 mm. long, usually loosely ascending: areolae rather inconspicuous, feebly armed: spines very slender, even weak, solitary or 2 or 3 together, pale-yellow, becoming sordid and minutely banded when dry, pale yellow when wet, the longer ones 1.5 cm. long: flowers not very numerous, usually several to a joint: hypanthium obconic, 5.5–7 cm. long, green or sometimes purple-tinged: sepals mostly green, the outer subulate to triangular-lanceolate, 8–20 mm. long, the inner rhombic-ovate or rhombic-obovate, 2.5–3 cm. long, all acute or somewhat acuminate: corolla deep-yellow, rotate, 9–12 cm. wide; petals 12 or fewer, broadly-obovate to orbicular-obovate, 4–6 cm. long, rounded at the apex, mucronate, slightly narrowed at the broad base: anthers linear, 4–5 mm. long: berry obconic-turbinate, 8.5–9.5 cm. long, purple, the umbilicus flat or nearly so: seeds about 3 mm. in diameter, very numerous.—Pinewoods and bluffs, Amelia Island, Fla.

29. *O. zebrina* Small. Plant erect, more or less branched throughout, fully 1 m. tall, or less, the roots fibrous: joints oval or obovate, thickish, mostly 1–2 dm. long, deep-green, sometimes obscurely glaucous, not twisted: leaves conic-ovoid, 4–6 mm. long, or rarely smaller, erect or appressed, often slightly curved upward, bright-green, unaccompanied by bristles or spines: areolae scattered, some of them, usually the lower ones, unarmed, the upper ones irregularly armed: spines slender, solitary or 2, 3, or 4 together, red-brown and finely banded when dry, paler or salmon-pink and less conspicuously banded when wet, nearly terete, closely spirally twisted: flowers few, sometimes several on a

joint: hypanthium obovoid or turbinate-obovoid, about 4 cm. long: sepals green, the outer lanceolate to deltoid, acute, the intermediate rhombic-obovate, acuminate, the inner rhombic-cuneate or broadly cuneate, abruptly pointed: corolla rich-yellow, rotate, 6–8 cm. wide; petals about 8, the outer obovate-cuneate, the inner broadly obovate, all undulate, emarginate or notched at the apex and mucronate: anthers 2–2.5 mm. long: berry broadly obovoid, not constricted at the base, mostly 5–6 cm. long, red-purple, the umbilicus very broad, raised about the edges and somewhat depressed in the middle: seeds numerous, 5–6 mm. in diameter or rarely larger.—Coastal sand-dunes and hammocks, lower Florida Keys, Cape Sable, and Ten Thousand Islands, Fla.

30. *O. Ficus-Indica* (L.) Mill. Plant erect, often tree-like, 4 m. tall or less, the early joints somewhat fusing to form a thick trunk which supports irregularly spreading heavy branches: joints elliptic, varying to slightly broadest above the middle or below it, thick, mostly 3–4 dm. long, often slightly glaucous: areolae small, with yellowish bristles and white wool: spines wanting, or occasionally and irregularly developed, and mostly solitary, pale, at maturity turning white, nearly terete: flowers usually several on a joint: corolla yellow, 8–10 cm. wide: berries obovoid, red or orange (said to be sometimes yellow), 5–9 cm. long: seeds 3.5–4.5 mm. in diameter.—Old fields, roadsides, and waste-places, Fla. Naturalized from cultivated plants. The original home is not known.

31. *O. leucotricha* DC. Plant stout, 5 m. tall or less, widely branched above, with stout fibrous roots: joints elliptic, oval, or suborbicular, mostly 1–2 dm. long, often thickened and narrowed in the main stems, thinnish, minutely pubescent, gray-green: areolae numerous, closely set, armed: spines 3–5 together when young, later developing as many as 19, very unequal, becoming white or gray when dry, nearly white when wet, straight or nearly so, partly deflexed, the longer ones 2.5–3 cm. long: flowers few: hypanthium turbinate or obovoid-turbinate, 2.5–3.5 cm. long, with many close-set areolae bearing clusters of small spines: sepals green, the outer lanceolate, 8–14 mm. long, with curved acuminate tips, the intermediate rhombic-obovate, slender-acuminate, the inner with obovate, oval, or orbicular-obovate bodies which are abruptly narrowed into curved tips: corolla yellow, 7.5–9 cm. wide; petals broadly cuneate or cuneate-obovate, 3–4 cm. long, rounded at the apex and mucronate: anthers fully 2 mm. long: berry short-obovoid or globose-obovoid, 4–6 cm. long, yellow, or sometimes paler or red, finely pubescent, the hair-like spines fugaceous.—(DURASNILLA. AARON'S-BEARD CACTUS.)—Hammocks, W side of Saint Lucie Sound, Fla. Nat. of Mex.—Naturalized in the hammock south of Ft. Pierce from plants taken there by the pioneers during Seminole War times.

3. *BRASILIOPUNTIA* Small. Trees, more or less shrub-like in the early stages, with terete trunks and dimorphic branches, the lateral often horizontal ones terete like the trunk, spiny, supporting flat, dilated, leaf-like, relatively thin branchlets. Leaves small, stout, early deciduous. Spines various, clustered on the trunk and branches, often solitary on the branchlets. Flowers relatively small, sometimes numerous. Hypanthium stout, with bristly areolae. Sepals broad. Petals relatively narrow, often spatulate. Berry globose to clavate, juicy. Seeds few or solitary, relatively large, woolly.—Three species, South American.—Interpreted under this generic name as a subgenus, by Schumann.

1. *B. brasiliensis* (Willd.) Haw. Plant erect, tree-like, 5 m. tall or more, or often much smaller, with a terete upwardly tapering trunk which in mature

plants supports terete spreading branches, these in turn divide into joints: leaves flat, oblong, elliptic, or obovate, mostly 1-3 mm. long, clear-green or light-green, nearly straight, unaccompanied by bristles or spines, deciduous; areolae small, minutely white-woolly, those of the stem, branches, and edges of the joints armed: spines slender, usually solitary on the flat branchlets, terete, mostly 1-3 cm. long, pale with reddish or brown tips, ultimately gray: flowers usually several on the terminal joints: sepals ovate, the inner ones broadly so: corolla lemon-yellow, mostly 3-4 cm. wide: berry subglobose to oval, 2.5-4 cm. long, light-yellow, the areolae conspicuous on account of the tufted brown bristles, the umbilicus slightly concave in the middle: seeds 7-9 mm. in diameter. [*Opuntia brasiliensis* Haw.]—Hammocks, mostly on shell-mounds, or occasionally in waste-places, pen. Fla. and the Keys. Nat. of E. S. A.

4. **CONSOLEA** Lemaire. Shrubs or small trees, the main stems or trunk ultimately a continuous terete or flattened shaft more or less copiously armed with acicular, clustered, often greatly elongate reflexed spines, the branches flat, inequilateral, thin, mostly spiny joints more or less irregularly spreading. Leaves usually very small deciduous scales. Flowers relatively small, commonly several on a joint. Hypanthium somewhat elongate, more or less flattened, usually with spiny, often numerous areolae. Sepals broad. Petals broad, often of an obovate type. Berry more or less elongate, enlarged upward, fleshy. Seeds flattened with cristate edges and hairy sides.—Eight species, West Indian and the following.

1. **C. corallicola** Small. Plants tree-like, 2 m. tall or less, or ultimately larger, light-green: stem (trunk) erect, arising from coarse fibrous roots, strict, copiously and bristly armed, elliptic or oval in cross-section: areolae numerous, each with a cluster of 5-9 spines: spines salmon-colored when young, light-gray when mature and dry, darker when wet, acicular, one of each areola much longer than the others, often 7-12 cm. long: joints arising from the top or near the top of the stem or trunk, elliptic or broader above the middle or below it, inequilateral, more or less curved, relatively thin, the larger ones 2-3 cm. long, all copiously armed, the spines similar to those of the trunk, but smaller: flowers rather numerous: sepals green, the outer ones deltoid, 3-4 mm. long, very thick, the inner more or less reniform, thinner, abruptly pointed: petals bright-red, obovate to orbicular-obovate, 1 cm. long or less: style with an obovoid base: berry obovoid or clavate-obovoid, 2.5-5 cm. long, yellow, with spreading spines, the umbilicus deeply concave: seeds few, irregular, 7-9 mm. in diameter.—Hammocks, Key Largo and Big Pine Key, Fla. All year.—This plant has several unusual characteristics. The flat branches are inclined to grow in one plane from the trunk, hence the name semaphore-cactus; the unfertilized flower reverts to a vegetative branch; the berries are frequently proliferous.

5. **RHIPSALIS** Gaertn. Succulent pendent shrubs, sometimes with aerial fibrous roots. Main stem woody, the branchlets terete, but heteromorphic, very succulent. Leaves obsolete or minute scales. Areolae scattered. Flowers small for the family, diurnal and nocturnal. Hypanthium short-campanulate or hemispheric, naked, not produced beyond the ovary. Sepals very broad. Petals few, broad, white in our species. Stamens few. Style erect: stigmas 3, stout. Berry white, as thick as long or nearly so, smooth.—About 50 species, mostly tropical American.

1. **R. Cassutha** Gaertn. Plants in much-branched clusters a meter or more in length, the branches often very slender (1 mm. in diameter), becoming stouter (4-8 mm.), two together or 4-8 in a cluster, the areolae with 5-9 deciduous bristles: flowers sessile: sepals reniform to ovate-reniform, about 1 mm. long or less: petals white, oval or elliptic, varying to ovate or obovate, about 3 mm. long: stamens 1-2 mm. long: berry globose or oval varying to ovoid or obovoid, 4-5 mm. in diameter.—(PENCIL-CACTUS. MISTLETOE-CACTUS.)—Hammocks, Everglade Keys, pen. Fla.—(*W. I., Mex., C. A., S. A.*)—Nat. in the O. W.—All year.

6. **SELENICEREUS** Britton & Rose. Succulent shrubs with angled or ridged, trailing, sometimes creeping, clambering, or climbing stems and branches, the angles or ridges supporting separated areolae, each of which has a tuft of wool and single or clustered spines. Leaves obsolete. Flowers nocturnal, showy, arising from an areola. Hypanthium clavate, scaly and hairy. Sepals colored, often green or yellow, very narrow. Petals white, broader than the sepals. Berry oval, varying to ovoid or obovoid, or subglobose, armed with clusters of deciduous spines.—About 18 species, tropical American.—Spr.—SNAKE-CACTI.

Branches armed with short conic inconspicuous spines: hypanthium about 15 cm. long, funnelliform at the top.

1. *S. pteranthus*.

Branches armed with long slender-subulate spines: hypanthium about 10 cm. long, scarcely dilated at the top.

2. *S. coniflorus*.

1. **S. pteranthus** (Link & Otto) Britton & Rose. Vine, the stem and branches clambering, extensively rooting, dull green: old stems subterete, the branches obtusely usually 4-angled, the branchlets sharply 4-5-angled or ridged, altogether forming serpent-like masses over objects: areolae small, the hairs white, very short, the spines conic, usually 2-4 together: flowers lateral, starting as short conic buds which soon greatly elongate; basal part of the hypanthium subglobose, covered with close-set subulate scales which subtend tufts of long stiff white hairs and clusters of long slender spines; tubular part of the hypanthium about 15 cm. long, dilated into a funnelliform throat, bearing widely scattered scales with tufts of long hairs and usually a long and a short spine in their axils: sepals narrowly elongate-linear, 9-12 cm. long, except the very outer ones, light-green,

acuminate: petals white, linear-spatulate to spatulate, the narrow ones acuminate, the broader somewhat erose and mucronate: anthers 4.5–5 mm. long; berry globose, 6–8 cm. in diameter, red.—Hammocks on high sand-dunes, S pen. Fla.—Nat. of Mex.—Introduced into the hammock south of Ft. Pierce by the pioneers during Seminole War times.

2. *S. conflorus* (Weingart.) Britton & Rose. Vine, the stem and branches diffusely clambering and climbing by copious roots, deep-green, the older portions stout and turgid, the younger parts more slender, mostly rather sharply 5-angled: areolae small, the hairs pale or nearly white, often about 1 cm. apart, the spines acicular, 5–7 together, gray, the larger ones 1–1.5 cm. long: flowers lateral, starting as conic buds which soon elongate: basal part of the hypanthium ovoid, covered with close-set stiff subulate scales which subtend tufts of short white hairs and clusters of short spines; tubular part of the hypanthium about 10 cm. long, scarcely dilated at the top, bearing rather closely scattered scales with tufts of relatively short hairs and clusters of spines in their axils: sepals very narrowly elongate-linear, 3–9 cm. long, except the outermost ones, bright-green, attenuate: petals white: berry subglobose, 5–7 cm. in diameter.—Pine-lands near the Everglades, west of Halendale, and fence-rows in pen. Fla.—Nat. of Mex.

7. *HYLOCEREUS* Britton & Rose. Coarse vines with 3-angled or 3-winged stems and branches, climbing by aerial roots, the areolae remote on the ridges, each with a tuft of short hairs and a cluster of spines. Leaves obsolete. Flowers nocturnal, very large and showy. Hypanthium trumpet-shaped, with foliaceous scales. Sepals various, the outer ones resembling the hypanthium scales, the inner resembling the petals. Petals white, narrow. Berry ovoid to globose, with broad scales.—About 18 species, tropical American.

1. *H. undatus* (Haw.) Britton & Rose. Stem and branches stout, 8–12 cm. thick, light-green, commonly high-climbing, often formed in dense or compact masses: areolae usually with 3–5, relatively stout, dark spines 2–4 mm. long in the stem-sinuses: hypanthium relatively very stout, copiously scaly, shorter than the diameter of the calyx: sepals linear-lanceolate to linear, loosely spreading: petals spatulate to obovate, shorter than the sepals: berry ovoid, 8–10 cm. long, scarlet, the scales flat.—(NIGHT-BLOOMING CEREUS. QUEEN-OF-THE-NIGHT.)—Hammocks, S pen. Fla. and the Keys. Nativity not known.—Spr.-sum.—Originally described from specimens grown in China, perhaps, from tropical America. Apparently first introduced into Florida by the pioneers of the lower Indian River region during Seminole War times.

8. *ACANTHOCEREUS* Britton & Rose. Coarse shrubs with 3–6-angled, erect, diffuse, or reclining, often greatly elongate, stems and branches, the areolae remote on the ridges, each with a tuft of short hairs and a cluster of spines. Leaves obsolete. Flowers nocturnal, relatively large. Hypanthium trumpet-shaped, armed with spines. Sepals various, the outer short, the inner long and narrow. Petals white, linear to spatulate. Berry ovoid or oval, spiny-armed.—About 8 species, of continental tropical America.

1. **A. floridanus** Small. Stems and branches diffusely spreading or reclining, 3-10 m. long, stout, starting as a several-ribbed plant about as thick as a lead-pencil, the successive joints thicker and prominently 3-5-angled, the mature branches mostly 3-angled, dark-green, often forming impenetrable thickets: areolae remote, with mostly 4-7 slender or subulate spines, the central one often 1-2 cm. long, or more: hypanthium stout-trumpet-shaped, 8-10 cm. long, with few large separated tubercled areolae at the base, the areolae at the base of the hypanthium bearing mostly 3-5 diverging spines, those on the tubular part usually with one spine each: calyx green or purple-tinged; sepals deltoid to triangular-lanceolate, lanceolate-subulate and almost linear, the longer ones 3.5-4 cm. long, acuminate: corolla 8-11 cm. wide, white; petals broadly linear, 3.5-4.5 cm. long, about six times as long as wide, broadly acuminate: filaments adnate more than half way up from the base of the hypanthium: anthers less than 2.5 mm. long: berry ovoid, 4-6.5 cm. long, scarlet, shining. [*A. pentagonus* (Fl. SE. U. S.)]—(DILDOE. BARBED-WIRE CACTUS.)—Hammocks, along or near the coast, S pen. Fla., and the Keys.—Sum.

9. **HARRISIA** Britton. Succulent shrubs, with fluted stems and branches, the ridges supporting areolae, each of which supports a tuft of spines, the spines of each areola arising below the tuft of wool and varying greatly in length. Leaves obsolete. Flowers nocturnal, showy, arising from the upper side of an areola. Hypanthium narrowly funnellform or clavate, scaly. Sepals colored. Petals white, narrow. Berry globose or ovoid-globose, with few scale-bases, often with tufts of hairs. Seeds very numerous.—About 18 species, distributed from Florida to Argentina.—Spr.—PRICKLY-APPLES.

Flower-buds brown-hairy: scales of the hypanthium with tufts of brown hairs in their axils: berry yellow.  
 Flower-buds white-hairy: scales of the hypanthium with tufts of white hairs in their axils: berry red.  
 Hypanthium prominently ridged, the scales turgid at the base: berry depressed-globose.  
 Hypanthium even or scarcely ridged, the scales flat or nearly so: berry obovoid.

1. *H. Aboriginum*.
2. *H. Simpsonii*.
3. *H. fragrans*.

1. **H. Aboriginum** Small. Plants 6 m. tall or less, usually forming dense thickets, terrestrial, the stems erect or more or less reclining, simple or some of them usually branched, 9-11-ridged: spines 7-9 in each areola, very slender, the longer ones mostly 1 cm. long or less, or sometimes longer near the ends of the branches, all pink when young, becoming gray with brown near the tips: young buds clothed with brown hairs: hypanthium longer than the flower-limb, long-funnel-form, the swollen base partly covered with lanceolate scales which are very small below, but larger above, all of them more or less separated, with stiff long brown hairs protruding from beneath them: scales on the tubular part of the hypanthium, distant, lanceolate, turgid, each with short brown

hairs protruding from beneath: flowers faintly scented: longer inner sepals narrowly linear, acuminate: petals white, most of them exceeded by the longer sepals, oblanceolate, erose near the apex, broadly acuminate and minutely slender-tipped: stamens erect: berry globular, 6.5–7.5 cm. in diameter, dull yellow, the scar at the apex about 1 cm. in diameter: seeds 3 mm. long.—Shore hammocks and shell-mounds, Tampa Bay region, Fla., to the Ten Thousand Islands.

2. *H. Simpsonii* Small. Plants 4 m. tall or less, scattered or in colonies, terrestrial or often epiphytic, the stems sometimes vine-like, simple or individually branched, 9- or 10-ridged: spines mostly 7–9 in each areola, slender, the longer ones of each cluster 1–2.5 cm. long: young buds clothed with white hairs: hypanthium longer than the flower-limb, long-funnelform, prominently and coarsely ridged, the swollen base clothed with broadly lanceolate, closely set or imbricate scales, with white hairs protruding from beneath them: scales of the tubular part of the hypanthium rather numerous and close-set, very turgid, lanceolate, each with white hairs protruding from beneath: flowers inodorous: longer inner sepals linear, 4.5–5.5 cm. long, acuminate: petals white, narrowly spatulate or narrowly cuneate-spatulate, erose near the apex, each abruptly narrowed into a short tip: stamens nearly erect: berry depressed-globose, about 6 cm. in diameter, dull-red, usually with partly persistent scales, the scar at the apex less than 1 cm. in diameter: seeds fully 3 mm. long. [*H. Brookii* (Fl. SE. U. S.)]—Hammocks and mangrove swamps, terrestrial or epiphytic, Cape Sable to Ten Thousand Islands and Madeira Bay region, Fla. and Florida Keys.

3. *H. fragrans* Small. Plants 5 m. tall or less, growing singly, sometimes approximate, but not in colonies, the stems erect, reclining, or clambering, prominently 10–12-ridged, the ridges more or less depressed between the areolae, the grooves rather deep and sharp: areolae about 2 cm. apart, each with a dense tuft of very short hairs on the upper side: spines acicular, 9–13 in each areola, mostly grayish and yellowish at the tip, one of each areola longer than the others, mostly 2–4 cm. long: young buds copiously white-hairy: buds about to expand fully 15 cm. long (18–20 cm. long): hypanthium light-green, longer than the flower-limb, slender-funnelform, scarcely ridged, the swollen base bearing subulate or lanceolate-subulate separated scales, with long white hairs protruding from beneath them and very lax: scales of the tubular part of the hypanthium few and remote, subulate, slenderly acuminate, not turgid, with a tuft of long white hairs in each axil: sepals very narrowly linear, slenderly acuminate: petals white or pinkish, spatulate, caudate-tipped: ovary-cavity ovoid: berry obovoid, about 6 cm. in diameter, dull-red, with tufts of long hairs persistent with the scale-bases: seeds nearly 3.5 mm. long.—Hammocks on high sand-dunes, kitchenmiddens, and coquina ledges, from Mosquito Inlet to Saint Lucie Sound, Fla.

10. *CEPHALOCEREUS* Pfeiff. Succulent shrubs or trees with fluted stems and branches, the ridges supporting areolae, each of which supports a tuft of spines, the spines of each areola arising from all parts of the tuft of wool and varying greatly in length. The bark at length scaly. Leaves obsolete. Flowers diurnal, inconspicuous, arising from the center of an areola. Hypanthium campanulate, naked or scaly above. Sepals colored. Petals white or pale, broad. Berry more or less depressed, naked. Seeds numerous.—About 40 species, tropical American.—Wint.-spr.—TREE-CACTI.—The two following species have a definite geologic distribution. *C. Deeringii* inhabits the Key Largo limestone, *C. keyensis* the Key West oölite. Where these two limestones meet on Big Pine Key the ranges of the two species come together.

Sepals and petals obtuse, rounded or emarginate: spines of the areolae mostly more than 25 (25-31). 1. *C. Deeringii*.

Sepals and petals acute, abruptly pointed or acuminate: spines of the areolae mostly fewer than 15 (9-15). 2. *C. keyensis*.

1. *C. Deeringii* Small. Shrub or small tree becoming 10 m. tall, the stem erect, simple or with few erect elongate fastigate branches forming a very narrow head, the branches deep-green, usually 10-ribbed: areolae copiously hairy, the hairs rather persistent; spines 25-31, the longer ones 1 cm. long or more: flowers about 6 cm. long, narrowly campanulate: sepals obovate, obtuse or emarginate: petals 9-11 mm. long, clawless, oval, obtuse, scarcely narrowed at the base: anthers less than 2 mm. long: berry much depressed, 3-5 cm. in diameter, dark-red.—Rocky hammocks, upper Florida Keys, from the S front of Big Pine Key to Upper Matecumbe Key.

2. *C. keyensis* Britton & Rose. Shrub or small tree, becoming 5 or 6 m. tall, the stem erect, ultimately much-branched, often forming a compact narrow head, the branches light-green or somewhat glaucous, 9- or 10-ribbed: areolae copiously short-hairy, the hairs mostly deciduous; spines 9-15, the longer ones mostly less than 1 cm. long: flowers about 5 cm. long, campanulate: sepals ovate, acute: petals 14-16 mm. long, the outer ones clawed, with ovate or elliptic blades, the inner clawless, oblanceolate to almost broadly linear, all acute, erose: anthers over 2 mm. long: berry depressed, about 3.5 cm. in diameter, reddish.—Rocky hammocks, lower Florida Keys, from Key West to Big Pine Key.

## ORDER BEGONIALES — BEGONIAL ORDER

Succulent herbs, shrubby plants or vines. Leaves alternate: blades commonly inequilateral, toothed or lobed. Flowers monoecious, usually somewhat irregular, cymose: staminate flowers with 2 or more sepals, 5 minute petals and many stamens, whose anthers open by pores or valves. Pistillate flowers with a calyx, a corolla and a gynoeceium of 2-5 united carpels. Ovary inferior, 2-several-celled, the placentae entire or lobed. Stigmas curved, twisted or coiled. Ovules numerous. Fruit capsular, winged.

### FAMILY 1. BEGONIACEAE — BEGONIA FAMILY

Unusual looking plants with odd-shaped leaves and conspicuous inflorescence, the staminate and pistillate flowers usually borne in the same clusters. Capsule many-seeded.—About 4 genera and over 400 species, widely distributed in tropical regions.

1. *BEGONIA* L. Succulent plants sometimes woody below. Leaf-blades oblique. Staminate flowers with 2 unequal pairs of petals. Pistillate flowers

with 5 somewhat unequal petals. Gynoecium with a short style, spiral stigmas and 2-lobed placentae. Capsule unequally 3-winged.—About 400 species, widely distributed.—ELEPHANT'S-EARS. **BEGONIAS**.—Many species with showy leaves and highly colored wax-like flowers are widely cultivated.

1. **B. semperflorens** Link & Otto. Plants 3–10 dm. tall: leaf-blades 4–7 cm. broad, the teeth apiculate: bracts ciliate-fimbriate: corolla white; larger petals of the staminate flowers 6–14 mm. long, the smaller ones spatulate: capsules drooping.—(PERPETUAL-BEGONIA)—Swamps and low grounds, pen. Fla. Nat. of S. A.

### ORDER **PROTEALES** — PROTEAL ORDER

Perennial herbs, or shrubs or trees. Leaves alternate or rarely opposite: blades simple or compound. Flowers perfect, or occasionally polygamous or dioecious. Perianth of 4 valvate distinct or partially united sepals. Androecium of 4 stamens, one borne on each sepal. Gynoecium a single carpel. Ovary superior, often oblique. Fruit indehiscent, or often follicular or capsular.

### FAMILY 1. **PROTEACEAE** — PROTEA FAMILY

Leaf-blades simple, entire, toothed, or divided. Flowers borne in spikes, racemes, or panicles, which are commonly congested. Calyx, androecium, and gynoecium, various, often very irregular.—Fifty genera and about 1,000 species, mostly of Asia, Africa, and Australia.

1. **GREVILLEA** R. Br. Shrubs or trees. Leaf-blades often pinnately parted. Flowers borne in racemes or panicles, sometimes irregular. Ovary stipitate. Style often protruding from the cleft of the calyx. Fruit follicular or 1- or 2-valved. Seeds flat, often winged.—About 175 species, most abundant in Australia.

1. **G. robusta** A. Cunn. Tree becoming 20 m. tall: leaf-blades 2–4 dm. long: panicle showy, orange or red: the racemes 1–2 dm. long, many-flowered: sepals 9–11 mm. long: follicles recurved, the bodies 1.5–2 cm. long, slender-beaked.—(SILK-OAK).—Road-sides, waste-places, and cult. grounds, Fla. Nat. of Australia.—(W. I.)—Spr.—This tree, wholly different from our native trees in both foliage and inflorescence, was introduced into Florida many years ago as an ornamental and a shade tree. It is unusual among our trees in that it bears the flower clusters along the trunk and the main branches.

ORDER **THYMELEALES** — THYMELEAL ORDER

Shrubs or trees, or partially herbaceous plants. Leaves opposite or alternate, the blades simple, rarely mere scales, or obsolete. Flowers perfect, polygamous, or dioecious, regular or nearly so. Calyx of 6 or fewer sepals. Corolla wanting (in our species). Androecium of as many stamens as there are sepals or of twice as many. Anthers opening by slits or hinged valves. Gynoecium a single carpel. Ovary inferior. Ovules mostly solitary. Fruit usually baccate or drupaceous.

Anthers opening by slits.

Ovule and seed pendulous: leaves green, sometimes merely pubescent.

Ovule and seed erect: leaves silvery-scurfy.

Fam. 1. **DAPHNACEAE**.

Fam. 2. **ELAEAGNACEAE**.

Anthers opening by hinged valves.

Leafy shrubs or trees: fruit seated on the hypanthium.

Fam. 3. **LAURACEAE**.

Leafless, twining, parasitic vines: fruit enclosed in the accrescent hypanthium.

Fam. 4. **CASSYTHACEAE**.

• FAMILY 1. **DAPHNACEAE** — MEZEREON FAMILY

Shrubs or trees, or rarely herbs, often pubescent. Leaves opposite or alternate: blades entire. Calyx of 4 or 5 sepals, sometimes with 4 or 5 scales within. Androecium of as many stamens as there are sepals or twice as many. Gynoecium seated in the bottom of the hypanthium. Style usually eccentric.—Forty genera and about 425 species, most abundant in Australia and southern Africa.

1. **DIRCA** L. Shrubs. Leaves alternate. Flowers appearing before the leaves. Sepals usually shorter than the hypanthium. Filaments slender. Ovary 1-celled: style filiform. Drupe slightly elongate.—Two species, North American.

1. **D. palustris** L. Shrub 0.5–2 m. tall: leaf-blades oval or obovate, 4–8 cm. long: flowers lemon-yellow: hypanthium 7–8 mm. long: sepals very short: drupe oval, 7–9 mm. long, red.—(LEATHERWOOD. SWAMP-WOOD. MOOSE-WOOD. LEATHER-BARK.) — Rich woods, bluffs, and stream-banks, various provinces, rarely Coastal Plain, Fla. to La., Ont., and N. B.—Spr.—The bark has been used medicinally. The wood is soft and brittle but the bark is unusually tough, and was used by the aborigines for thongs.

FAMILY 2. **ELAEAGNACEAE** — OLEASTER FAMILY

Shrubs or trees, scaly or stellate-pubescent. Leaf-blades entire. Calyx of 4, or rarely of 2, sepals. Androecium of 4 or 8 stamens. Gynoecium closely invested by the hypanthium which is thickened and often ridged within. Style usually axial.—Three genera and about 25 species, widely distributed.

1. **ELAEAGNUS** L. Shrubs or rarely trees, pubescent with silvery scales. Leaves alternate. Flowers white or yellow within, silvery without. Sepals

shorter than the hypanthium. Stamens 4: filaments very short or wanting. Ovary 1-celled: style elongate. Drupe somewhat elongated.—**SILVER-BERRIES.**—About 20 species, Eurasian, Australian, and North American.—Some species are used in horticulture. The fruits of some species are edible.

Leaf-blades beneath, and hypanthium, not brown-sealy: sepals less than  $\frac{1}{2}$  as long as the prolonged portion of the hypanthium.

1. *E. umbellatus*.

Leaf-blades beneath, and hypanthium, brown-sealy: sepals over  $\frac{1}{2}$  as long as the prolonged portion of the hypanthium.

2. *E. multiflorus*.

1. *E. umbellatus* Thunb. Shrub, 1-3 m. tall. Leaves numerous; blades elliptic, 2-4 cm. long, mainly obtuse, green above, silvery beneath, short-petioled: flowers few, in umbel-like clusters, short-pedicelled: hypanthium narrowly funnel-form, 4-6 mm. long during anthesis: sepals ovate, 2.5-3 mm. long, silvery scaly without like the hypanthium: anthers less than 1.5 mm. long: fruit globose to oval, 6-8 mm. long. — (AUTUMN-ELAEAGNUS.) — Thickets, banks, and cult. grounds, near Augusta, in the Piedmont of Ga. Nat. of Japan.—Sum.—fall.

2. *E. multiflorus* Thunb. Shrub, mostly 1-2.5 m. tall. Leaves rather numerous; blades elliptic or somewhat obovate to oval, 3-6.5 cm. long, rounded or abruptly blunt-tipped at the apex, bright green above, silvery beneath, short-petioled: flowers few or several together in umbel-like clusters, rather long-pedicelled: hypanthium stout, slightly dilated upward, 5.5-7 mm. long during anthesis: sepals orbicular-ovate to reniform, 3-4 mm. long, copiously scaly without, like the hypanthium: anthers over 1.5 mm. long: fruit oval, 7-10 mm. long.—(JAPANESE CHERRY.)—Roadsides and fields, Coastal Plain, Miss. and La. Nat. of Japan.—Sum.

### FAMILY 3. LAURACEAE — LAUREL FAMILY.

Aromatic shrubs or trees. Leaves alternate or opposite: blades entire or lobed. Flowers in open or congested cymes. Calyx of 5 (or rarely 4-10) sepals in 2 series. Corolla wanting. Androecium of usually more stamens than there are sepals, in 2-4 series, those of the third series usually glandular-appendaged, those of the fourth series mostly mere staminodia. Gynoecium a single carpel. Ovary 1-celled. Fruit drupaceous.—Forty genera and about 1,000 species, most abundant in tropical regions.—Some of the species are of great economic value.

Anthers 4-celled, 4-valved.

Anther-sacs of outer stamen-series extrorse.

Anther sacs introrse.

Anthers 2-celled, 2-valved.

Mature hypanthium large, succulent: inflorescence of erect panicles: anther-sacs extrorse.

Mature hypanthium minute, dry: inflorescence of umbel-like clusters: anther-sacs introrse.

Tribe I. CINNAMOMEAE.

Tribe II. LITSEAE.

Tribe III. ACRODICLIDIEAE.

Tribe IV. LAUREAE.

#### I. CINNAMOMEAE

Staminodia present, large, often sagittate.

Sepals deciduous.

Calyx falling away as separate sepals: leaf blades ribbed.

Calyx falling away with the sepals united: leaf-blades pinnate-veined.

1. CAMPHORA.

2. PERSEA.

Sepals persistent under the fruit.  
Staminodia small, subulate, or wanting.

## II. LITSEAE

Sepals persistent on the cup-like hypanthium.  
Sepals deciduous from the cylindric hypanthium.

## III. ACRODICLIDIEAE

Large trees with whitish flowers: leaf-blades coriaceous.

## IV. LAUREAE

Shrubs with yellow flowers: leaf-blades membranous.

1. **CAMPHORA** [Gronov.] L. Trees or shrubs. Leaves alternate or opposite, persistent: blades entire. Flowers in paniced axillary cymes, mainly white or greenish. Style slender. Stigma minute. Drupe equilateral, as broad as long, or nearly so.—Few species, natives of eastern Asia.

1. **C. Camphora** (L.) Karst. Small tree or shrub: leaf-blades elliptic to ovate, 4–12 cm. long, short-acuminate, pale beneath, long-petioled: panicles slender-peduncled: sepals 1–1.5 mm. long: drupes globose to oval-globose, 6–9 mm. in diameter.—(CAMPHOR-TREE.)—Pinelands and hammocks, pen. Fla. to Tex. Nat. of E Asia and cult.—Spr.—The wood yields the camphor of commerce.

2. **PERSEA** [Plum.] Gaertn. Trees. Leaves alternate, persistent: blades entire. Flowers in terminal paniced cymes, greenish. Sepals 6, nearly equal, united at the base. Style subulate: stigma minute. Drupe inequilateral.—One species, in many cult. forms.

1. **P. Persea** (L.) Cockerell. Large tree: leaf-blades elliptic or oval or nearly so, 8–15 cm. long, short-petioled (relatively small and with long and slender petioles in *P. Persea mexicana*): inner sepal 4–5 mm. long, somewhat surpassing the outer: fruits slightly elongate, often pyriform, 8–18 cm. long, the flesh butter-like.—(AVOCADO. ALLIGATOR-PEAR.)—Hammocks and pinelands, S pen. Fla. and the Keys.—Grown in many varieties for its edible fruit. Nat. of trop. Am. and cult.—(W. I., Mex., C. A., S. A.)—Spr.

3. **TAMALA** Raf. Shrubs or trees. Leaves alternate, persistent: blades entire. Flowers in axillary peduncled cymes, greenish. Sepals 6, dissimilar. Style long-columnar: stigma capitate. Drupe equilateral. Few species, American.—Spr. or all year S.

Peduncles, pedicels and petioles glabrous or appressed-pubescent: fruit over 1 cm. thick.

Leaf-blades glabrous or nearly so, except sometimes the nerves beneath.

3. **TAMALA**.  
4. **NECTANDRA**.

5. **SASSAFRAS**.  
6. **GLABRARIA**.

7. **MISANTECA**.

8. **BENZOIN**.

Leaf-blades finely reticulated beneath, mainly over thrice as long as wide.

Leaf-blades not reticulated beneath, mainly about twice as long as wide.

Leaf-blades lustrous-pubescent beneath.

Peduncles, pedicels and petioles tomentose: fruit less than 1 cm. thick.

1. *T. Borbonia*.

2. *T. littoralis*.

3. *T. humilis*.

4. *T. pubescens*.

1. ***T. Borbonia*** (L.) Raf. A large tree with bark broken into flat ridges: leaf-blades elliptic or nearly so, 5–15 cm. long, often acuminate at both ends, bright-green and lustrous above, glaucescent and finely reticulate beneath: sepals ascending, the inner ovate, 2–3 times longer than the outer, acutish: drupe obovoid or globose-obovoid, 1–1.5 cm. long, dark-blue or nearly black, lustrous. [*Persea Borbonia* (L.) Pax]—(RED-BAY. SWEET-BAY. FLORIDA-MAHOGANY. TISS-WOOD. LAUREL-TREE.)—Hammocks and swamps, Coastal Plain, Fla. to Tex. and Va.—The bright-red heart-wood, close-grained, heavy, and strong, is used for cabinet-work and construction.

2. ***T. littoralis*** Small. Shrub or tree: leaf-blades elliptic, 2–5.5 cm. long, mostly obtuse at the apex, bright-green and lustrous above, pale and glabrous beneath, not reticulate, the lateral veins inconspicuous: drupe globular, 12–14 mm. long, purple-black under the bloom. [*Persea littoralis* Small]—(SHORE-BAY.)—Coastal hammocks, pen. Fla.

3. ***T. humilis*** (Nash) Small. Shrub or small tree, the twigs, lower leaf-surfaces and the inflorescence silky-pubescent: leaf-blades elliptic, 4–10 cm. long, more or less revolute, glabrous and shining above, lustrous beneath: sepals erect, obtuse, the inner oblong, 5 mm. long: drupe globular, about 1.5 cm. long, purplish-black under the bloom. [*Persea humilis* Nash]—(SILK-BAY.)—Scrub, C pen. Fla.

4. ***T. pubescens*** (Pursh) Small. Shrub or small tree, the twigs, lower leaf-surfaces and inflorescence tomentose: leaf-blades narrowly elliptic or elliptic-lanceolate, or rarely oval, 5–20 cm. long, usually obtuse, often acuminate at the apex, slightly revolute: sepals erect, acutish, the inner elliptic-obovate, about twice as long as the outer: drupe oval, 8–11 mm. long, dark-blue with a thin bloom. [*Persea pubescens* (Pursh) Sarg.]—(SWAMP-BAY. SWAMP RED-BAY.)—Swamps and low hammocks, Coastal Plain and rarely adj. provinces, Fla. to Tex. and N. C. (or Va.?).—The orange-colored and brown-streaked heart-wood, close-grained and heavy, is used like that of *T. Borbonia*.

4. **NECTANDRA** Roland. Shrubs or trees. Leaves alternate, persistent: blades entire. Flowers in paniced cymes, white, fragrant. Sepals 6, nearly similar, somewhat elongate, spreading. Style cylindric: stigma capitate. Drupe somewhat elongate, seated in the cup-like hypanthium from which the calyx has fallen away.—About 300 species, mostly tropical American.

1. ***N. coriacea*** (Sw.) Griseb. Shrub or small tree: leaf-blades narrowly elliptic or elliptic-lanceolate, 5–12 cm. long, lustrous above: calyx creamy-white, 8–9 mm. broad; sepals obtuse: drupe subglobose or oval, 10–15 mm. long, dark-blue or black, seated in the red or yellow hypanthium. [*Ocotea Catesbyana* (Michx.) Sarg.]—(LANCEWOOD.)

Hammocks, pen. Fla. and the Keys.—(*W. I.*)—Spr.—The dark-brown heart-wood, hard, and heavy, is used locally for cabinet-work.

5. **SASSAFRAS** Nees. Trees or shrubs. Leaves alternate, deciduous: blades lobed or partly entire. Flowers in axillary clustered cymes. Style columnar: stigma depressed. Drupe somewhat elongate.—Two species, the following and one Asiatic.

1. **S. Sassafras** (L.) Karst. Tree or shrub, with ridged bark: leaf-blades 3-lobed, or rarely entire or 2-lobed: flowers greenish-yellow, fragrant: sepals 6, narrowly elliptic, 2.5–3 mm. long: drupe oval, 8–10 long, dark-blue.—(**SASSAFRAS. SASSAFRAX. AGUE-TREE.**)—Woods, fields, and roadsides, various provinces, N Fla. to Tex., Ia., and Me.—Spr.—Used medicinally and as a flavoring agent. The orange-brown heart-wood, coarse-grained, brittle, and weak, is used in boat-construction, cooperage, and for articles requiring lightness.

6. **GLABRARIA** L. Shrubs or trees. Leaves alternate (ours deciduous): blades entire. Flowers in clustered umbel-like involucrate cymes. Style subulate. Drupe (ours) subglobose. [*Mala-poena* Adans.]—About 100 species, widely distributed in tropical and warm regions.

1. **G. geniculata** (Walt.) Britton. Spreading shrub 2–3 m. tall, with zigzag branches: leaf-blades elliptic, 1.5–6 cm. long: flowers 2–4 together: calyx yellow: sepals yellow, 2–3 mm. long: drupe 5–6 mm. in diameter, red.—(**POND-SPICE. POND-BUSH.**)—Swamps and ponds, Coastal Plain and rarely adj. provinces, Fla. to La., Tenn., and Va.—Wint.-spr.—One of our rarer shrubs of somewhat uncertain relationship. Its closest relatives are tropical.

7. **MISANTECA** Cham. & Schlecht. Shrubs or trees. Leaves alternate, persistent: blades entire. Flowers inconspicuous, in paniced cymes. Sepals 6, nearly similar, short, erect, about as long as the enlarged portion of the hypanthium. Style columnar: stigma minute, surrounded by the 3 erect stamens. Drupe slightly elongate, seated in the cup-like hypanthium which is bordered by the persistent calyx.—Four species, tropical American.

1. **M. triandra** (Sw.) Mez. Tree with somewhat flaky bark: leaf-blades elliptic or oval, 4.5–11 cm. long, abruptly acuminate, but often blunt, lustrous above: calyx white, 2–2.5 mm. broad; sepals obtuse: fruits

acorn-like, the drupe ovoid or ellipsoid-ovoid, 2-2.5 cm. long, green, the hypanthium reddish.—(MISANTECA.)—Hammocks, Everglade Keys, pen. Fla.—(W. I.)—Sum.—Known definitely only from the Brickell hammock, Miami, and now probably destroyed as a result of the real estate developments there.

8. **BENZOIN** Fabr. Shrubs or trees, strong-scented. Leaves alternate, deciduous: blades entire. Flowers yellow, in sessile cluster-like or umbel-like cymes. Style slender-columnar. Drupe somewhat elongate.—Seven species, North American and Asiatic.—Spr.—SPICE-BUSHES. BENJAMIN-BUSHES. SPICE-WOODS.

Leaf-blades tapering at the base: petioles slender and rather long.

1. *B. aestivale*.

Leaf-blades rounded or cordate at the base: petioles stout and rather short.

2. *B. melissaefolium*.

1. **B. aestivale** (L.) Nees. Shrub 1-3 m. tall, the branches often glabrous: leaf-blades obovate, oval, or elliptic, 5-12 cm. long, thin, obtuse or usually short-acuminate and acute at the apex, often slightly ciliate, acute or acuminate at the base, deep-green and glabrous above, pale or glaucescent and glabrous or sparingly pubescent beneath: flowers in dense clusters appearing before the leaves, 6-8 mm. broad: pedicels 3-5 cm. long: sepals thin, obovate or elliptic, obtuse, truncate or retuse at the apex: drupe oval, about 1 cm. long. [*Lindera Benzoin* (L.) Blume]—(SPICE-BUSH. BENJAMIN-BUSH.)—Wet woods, swamps, and stream-banks, various provinces, Fla. to La., Kans., Ont., and Me.—The bark and twigs are used medicinally and the fruit as a condiment.

2. **B. melissaefolium** (Walt.) Nees. Shrub 3-10 dm. tall, the branches pubescent: leaf-blades quite firm, elliptic-ovate or elliptic-lanceolate, 3-12 cm. long, acutish, usually short-acuminate, more or less densely pubescent on both sides, rounded or cordate at the base: flowers in dense lateral clusters, appearing before the leaves: pedicels equalling the sepals or longer: sepals thin, 1-1.5 mm. long: drupe obovoid, nearly 1 cm. long.—(JOVE'S-FRUIT.)—Swamps and pond-margins, Coastal Plain and adj. provinces, Fla. to La., Mo., Ill., and N. C.—Bushes make a brilliant show in early spring.

#### FAMILY 4. CASSYTHACEAE — CASSYTHA FAMILY

Parasitic vines. Leaves mere scales, or wanting. Flowers perfect, in heads, spikes, or racemes. Calyx of 6 sepals in 2 unequal series, surmounting the accrescent hypanthium. Androecium of 9 stamens with 2-celled anthers, and 3 staminodia. Gynoecium of a single carpel. Drupe included.—One genus and about 15 species, tropical.

1. **CASSYTHA** [Osbeck] L. Vines with yellow or pale-green stems and branches, clinging to herbs and shrubs.—The flowers and fruits of *Cassytha*, although of quite different structure, resemble those of species of *Rhipsalis*. The drupe of our *Cassytha* resembles the berry of our species of *Rhipsalis* (page 913) in size, shape and color.

1. *C. filiformis* L. Stems matted, yellowish-green: flowers 3-6 in a spike: inner sepals triangular-ovate, 2-3 times larger than the outer: drupe globose, 5-7 mm. in diameter or rarely larger.—(LOVE-VINE. WOE-VINE.)—Coastal sand-dunes, hammocks, scrub, and pinelands, pen. Fla. and the Keys.—(W. I.)—This parasite appears to nearly all new acquaintances as a dodder (*Cuscuta*) which it resembles in habit and in color. Besides the technical characters closely associating it with the Lauraceae, it has the spicy fragrance of members of that family. The plants thrive on both herbaceous and woody hosts.

### ORDER MYRTALES — MYRTAL ORDER

Herbs, shrubs, or trees, sometimes aquatic or amphibious. Leaves alternate or opposite. Flowers regular or irregular, complete or much reduced. Hypanthium merely enclosing the ovary or adnate to it. Androecium of few or many stamens: anthers opening by slits or pores. Gynoecium 1-several-carpellary. Fruit capsular, baccate, or achene-like.

Style present, simple or compound: stigma terminal.

Anthers opening by pores.

Anthers opening by longitudinal valves.

Hypanthium merely enclosing the ovary.

Hypanthium adnate to the ovary or mainly so.

Cotyledons spirally convolute in the embryo.

Ovary several-celled: ovules numerous, not pendulous.

Ovary 1-celled: ovules 2-5, pendulous.

Cotyledons not spirally convolute.

Sepals imbricated, or united and the calyx falling away as a cap.

Sepals valvate.

Leaves stipulate: sepals leathery.

Leaves not stipulate: sepals membranous or herbaceous.

Styles wanting: stigmas sessile.

Fam. 1. MELASTOMACEAE.

Fam. 2. LYTHRACEAE.

Fam. 3. PUNICACEAE.

Fam. 4. TERMINALIACEAE.

Fam. 5. MYRTACEAE.

Fam. 6. RHIZOPHORACEAE.

Fam. 7. EPILOBIACEAE.

Fam. 8. GUNNERACEAE.

### FAMILY 1. MELASTOMACEAE — MEADOW-BEAUTY FAMILY

Herbs, shrubs, or trees. Leaves opposite: blades with 3-several ribs. Flowers perfect. Calyx of 3-6 sepals surmounting the hypanthium. Corolla of 3-6 oblique petals. Androecium of 6-12 stamens, those opposite the petals sometimes abortive. Gynoecium of 3-5 united carpels. Ovary enclosed in or adnate to the hypanthium. Fruit baccate or capsular.—One hundred and fifty genera and about 2,500 species, most abundant in tropical South America.

Herbs: fruit a capsule.

Shrubs or trees: fruit a berry.

1. RHEXIA.

2. TETRAZYGIA.

1. *RHEXIA* L. Perennial herbs with rootstocks. Leaf-blades usually 3-5-ribbed. Hypanthium urceolate, prolonged beyond the ovary. Sepals 4. Petals 4, deciduous. Ovary 4-celled, free. Capsule included, 4-valved.—About 15 species, natives of eastern North America and Cuba.—MAID-MARIAN. MEADOW-BEAUTIES.—Most of the species grow in highly acid soils.

Anthers relatively short, elliptic, not spurred at the base.  
Anthers elongate, linear, spurred at the base.

1. ELLIPTICAE.  
2. LINEARES.

## I. ELLIPTICAE

Corolla yellow.

Corolla purple or rarely white.

Hypanthium glandular-pubescent: upper surface of the leaf-blades glabrous.

Hypanthium glabrous: upper surface of the leaf-blades bristly.

## II. LINEARES

Neck of the mature hypanthium as long as the body or longer.  
Leaf-blades narrowly linear, the midrib only prominent and conspicuous.

Leaf-blades not linear, the 3 nerves prominent and conspicuous.

Stems rather sparingly pubescent with delicate hairs: leaf-blades nearly glabrous.

Stems densely pubescent with coarse yellow hairs: leaf-blades shaggy-pubescent with hairs like those on the stem.

Neck of the mature hypanthium much shorter than the body.

Stems and branches terete or nearly so.

Hypanthium glabrous or with a few scattered hairs.

Leaf-blades linear to lanceolate.

Leaf-blades oval, elliptic, or oblong-ovate, very thin.

Hypanthium densely glandular-pubescent.

Stems sharply angled or narrowly 4-winged.

Corolla over 2 cm. broad, colored.

Sepals less than  $\frac{1}{2}$  as long as the hypanthium at maturity.

Stems with pubescent internodes: hypanthium pubescent at maturity.

Stems with glabrous internodes: hypanthium glabrous at maturity.

Sepals fully  $\frac{1}{2}$  as long as the hypanthium at maturity.

Corolla less than 2 cm. broad, white.

1. *R. lutea*.

2. *R. serrulata*.

3. *R. ciliosa*.

4. *R. cubensis*.

5. *R. mariana*.

6. *R. Nashii*.

7. *R. lanceolata*.

8. *R. delicatula*.

9. *R. Alifanus*.

10. *R. virginica*.

11. *R. stricta*.

12. *R. aristosa*.

13. *R. parviflora*.

1. *R. lutea* Walt. Stems 1-3 dm. tall: leaf-blades cuneate to elliptic or elliptic-linear, 1-2.5 cm. long: petals yellow, 9-13 mm. long: capsule about 4 mm. long.—Moist pinelands, Coastal Plain, Fla. to La. and N. C.—Spr.-sum.

2. *R. serrulata* Nutt. Stems 5-30 cm. tall: leaf-blades ovate, oval, or suborbicular, 0.5-1 cm. long: petals purple, about 10 mm. long: capsule about 4 mm. long, subglobose.—Low pinelands and open hammocks, Coastal Plain, Fla. to Miss. and Ga.—Spr.-sum.

3. *R. ciliosa* Michx. Stems 2-6 dm. tall: leaf-blades broadly ovate to ovate-lanceolate or elliptic, 1-2 cm. long: petals violet-purple or deep-pink, 9-15 mm. long: capsule 4-5 mm. long.—Moist pinelands and sand-hill bogs, Coastal Plain, C Fla. to La. and Md.—Spr.-sum.

4. *R. cubensis* Griseb. Stems 2-5 dm. tall, glandular-hirsute: leaf-blades linear or nearly so, 1.5-4 cm. long: sepals lanceolate or triangular-lanceolate: petals purple, 11-17 mm. long: capsule 6-7 mm. long. [*R. floridana* Nash].—Sandy and clayey swamps, Coastal Plain, Fla. to Miss. and Ga.—Sum. or all year S.

5. *R. mariana* L. Stems 2-8 dm. tall, villous-hirsute: leaf-blades narrowly elliptic, lanceolate, or elliptic-lanceolate, 1.5-8 cm. long: sepals ovate to triangular: petals pale-purple or deep-purple, 14-28 mm. long: capsule 6-7 mm. long.—(PALE MEADOW-BEAUTY).—Swamps, marshes, and ditches, various provinces, Fla. to Tex., Mo., and N. Y.—Spr.-fall.

6. *R. Nashii* Small. Stems 3-6 dm. tall, densely hirsute: leaf-blades narrowly elliptic-lanceolate, 2-5 cm. long: sepals triangular: petals purple, 14-17 mm. long: capsule 5-6 mm. long.—Swamps, Coastal Plain, Fla. to La.—Sum.

7. *R. lanceolata* Walt. Stems 1-4 dm. tall, villous-hirsute: leaf-blades oblanceolate, elliptic-oblanceolate, or linear-lanceolate, 1-2.5 cm. long: sepals lanceolate: petals white to pale-purple, 12-17 mm. long: capsule 6-7 mm. long. [*R. filiformis* Small.]—Marshes and swamps, Coastal Plain, Fla. to La., Tenn., and N. C.—Spr.-sum.

8. *R. delicatula* Small. Stems 1-4 dm. tall, sparingly pubescent: leaf-blades elliptic to ovate, 1-2.5 cm. long: sepals triangular: petals pale-purple, 10-15 mm. long: capsule 4-5 mm. long.—Stream-banks, in the Blue Ridge of Ga.—Sum.

9. *R. Alifanus* Walt. Stems 3-10 dm. tall, glabrous: leaf-blades lanceolate to linear-lanceolate, 3-8 cm. long: sepals triangular: petals bright-purple, 17-22 mm. long: capsule 6-7 mm. long. [*R. glabella* Michx.]—Moist pinelands, Coastal Plain, N Fla. to La. and N. C.—Spr.-sum.

10. *R. virginica* L. Stems 2-10 dm. tall: leaf-blades elliptic, oval, lanceolate, or ovate-lanceolate, 2-10 cm. long: sepals lanceolate or triangular-lanceolate: petals bright-purple, 11-17 mm. long: capsule 5-6 mm. long.—(DEER-GRASS. MEADOW-BEAUTY. HANDSOME-HARRY.)—Sandy swamps and damp meadows, various provinces, Fla. to La., Mo., and Me.—Spr.-fall.—The entire plant is sometimes red.

11. *R. stricta* Pursh. Stems 6-13 dm. tall: leaf-blades lanceolate to elliptic-lanceolate, 2-1 cm. long: sepals triangular: petals purple, 12-16 mm. long: capsule 6-7 mm. long.—Moist pinelands and ponds, Coastal Plain, Ga. to Miss. and N. C.—Sum.

12. *R. aristosa* Britton. Stems 2-6 dm. tall, glabrous: leaf-blades linear to linear-lanceolate or sometimes linear-elliptic, 1-3 cm. long: sepals linear to linear-lanceolate: petals magenta-red, 12-20 mm. long: capsule about 6 mm. long.—Sandy swamps and damp pinelands, Coastal Plain, Ga. to N. J.—Sum.

13. *R. parviflora* Chapm. Stems 1-3 dm. tall, pubescent: leaf-blades elliptic or nearly oval, 1-2 cm. long: sepals triangular-lanceolate: petals white, less than 10 mm. long: capsule about 3 mm. long.—Shallow ponds, near Apalachicola, Fla.—Sum.

2. **TETRAZYGIA** L. C. Rich. Shrubs or trees. Leaf-blades 3-5-ribbed, mostly scurfy or tomentose beneath. Sepals, and petals, 4-6. Ovary 4- or 5-celled. Berry included, the hypanthium-neck short.—About 16 species, West Indian.

1. *T. bicolor* (Mill.) Cogn. Shrub or small tree with scaly bark: leaf-blades lanceolate to elliptic-lanceolate, 8-20 cm. long, silvery beneath, stout-petioled: panicle 1-2 dm. long: calyx about 1 mm. long: petals white, 7-8 mm. long, cuncate: anthers lanceolate, 5-6 mm. long: berry purple or black, the body 8-10 mm. long.—(TETRAZYGIA.)—Hammocks and pinelands, Everglade Keys, Fla.—(W. I.)—Sum.—This is one of the conspicuously tropical West Indian plants which are so numerous on the Everglade Keys that, floristically these limestone

islands may be considered a part of the West Indies. In hammocks *Tetrazygia* is usually a small tree; in pinelands it is usually a shrub.

## FAMILY 2. LYTHRACEAE — LOOSESTRIFE FAMILY

Herbs, shrubs, or trees. Leaves mostly opposite: blades usually entire. Flowers perfect. Calyx of 4 or 5 sepals, commonly accompanied by accessory teeth. Corolla of 4 or 5 petals, or wanting. Androeceum of few or many stamens: anthers versatile. Gynoeceum of mostly 2-6 united carpels. Ovary 2-6-celled, or rarely 1-celled, free from the hypanthium. Fruit a capsule, included in the hypanthium.—Twenty-one genera and about 400 species, widely distributed.

Flowers regular or nearly so: hypanthium symmetrical.  
Flowers irregular: hypanthium oblique.

Tribe I. LYTHREAE.  
Tribe II. PARSONSIEAE.

### I. LYTHREAE

Hypanthium campanulate or turbinate, becoming hemispheric or globose.

Herbs.

Petals wanting: capsules indehiscent.

Petals 4, except in *Ammannia latifolia*: capsules dehiscent, sometimes irregularly so.

Capsules bursting irregularly.

Capsules septicidally dehiscent.

Shrubs or trees.

Flowers in axillary cymes: aquatic shrubs.

Flowers in terminal panicles: terrestrial shrubs or trees.

Hypanthium elongate, cylindric or tubular.

1. DIDIPLIS.

2. AMMANNIA.

3. ROTALA.

4. DECODON.

5. LAGERSTROEMIA.

6. LYTHRUM.

### II. PARSONSIEAE

Hypanthium enlarged or spurred on one side: petals unequal. 7. PARSONSIA.

1. **DIDIPLIS** Raf. Flaccid herbs, resembling *Callitriche*. Leaf-blades narrow, entire, pellucid. Flowers solitary in the axils. Sepals 4, without accessory teeth. Petals wanting. Stamens 2-4. Style very short: stigma 2-lobed. Embryo with narrow cotyledons.—One species.

1. **D. diandra** (Nutt.) Wood. Stem 1-3 dm. long: emerged leaves with linear to linear-spatulate blades, thicker than the submerged ones, 1-2 cm. long: capsule urceolate, about 1 mm. in diameter.—(WATER-PURSLANE.)—Ponds and wet shores, various provinces, Fla. to Tex., Minn., and N. C.—(Mex.)—Sum.

2. **AMMANNIA** L. Leathery-succulent herbs. Leaf-blades, narrow, often auricled at the base. Flowers in axillary, sometimes 1-flowered, cymes, greenish, or sometimes tinged with red. Sepals 4, often accompanied with small teeth. Petals 4, early deciduous, or wanting. Stamens 4-8. Style filiform, sometimes short: stigma capitate. Embryo with auricled cotyledons.—About 20 species, most abundant in warm regions.

Corolla present.

Leaves broadest below the middle: capsule 3-4 mm. in diameter.

Leaves broadest above the middle: capsule 5-6 mm. in diameter.

Corolla wanting.

1. *A. coccinea*.

2. *A. Koehnei*.

3. *A. latifolia*.

1. **A. coccinea** Rottb. Plant 1-5 dm. tall: leaf-blades linear to linear-lanceolate, 2-6 cm. long, partly clasping: petals broadly obovate: capsule 3-4 mm. in diameter.—Swamps and low grounds, various provinces, Fla. to Tex., S. D., and N. J.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

2. **A. Koehnei** Britton. Plant 1-6 dm. tall: leaf-blades spatulate, oblanceolate or elliptic, 2-8 cm. long, those of the lower ones merely sessile: petals spatulate: stamens and short style included: capsule 5-6 mm. in diameter.—(**TOOTH-CUPS.**)—Swamps and along streams, Coastal Plain and adj. provinces, Fla. to N. J.—Sum.-fall.

3. **A. latifolia** L. Plant 2-11 dm. tall: leaf-blades linear-elliptic to linear-lanceolate, mostly 3-7 cm. long, slightly auricled and clasping at the base: corolla wanting: capsule 4-5 mm. in diameter.—Low hammocks, lime-sinks, and swamps, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—All year.

3. **ROOTALA** L. Herbs resembling *Ammannia*. Leaf-blades narrow, entire. Flowers greenish, usually solitary in the axils. Sepals 4, accompanied by appendages in the sinuses. Petals usually 4. Stamens 4. Style very short.—About 30 species, most abundant in warm and tropical regions.

1. **R. ramosior** (L.) Koehn. Stem 0.5-4 dm. long: leaf-blades elliptic to linear or spatulate, 1-3 cm. long: sepals acute: petals obovate or cuneate, as long as the sepals or longer: capsule 2.5-3.5 mm. in diameter.—Hammocks, wet, sandy places, and swamps, various provinces, Fla. to Tex., Minn., and Mass.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

4. **DECODON** J. F. Gmel. Short-lived shrubs or shrubby herbs. Leaves deciduous: blades entire, somewhat elongate. Flowers in axillary peduncled cymes. Sepals 5-7, alternating with small teeth. Petals 5-7. Stamens 10 or rarely 8, alternating short and long, the longer exserted. Capsule loculicidally 3-6-valved. One species.

1. **D. verticillatus** (L.) Ell. Stem arching, mostly 4-16 dm. long: leaf-blades lanceolate or elliptic-lanceolate, 3-20 cm. long: sepals acuminate: petals purple-pink, lanceolate to ovate, 7-9 mm. long: capsule about 5 mm. in diameter.—(**SWAMP-LOOSESTRIFE.** **WILLOW-HERB.** **WATER-OLEANDER.** **PEAT-WEED.**)—Swamps and ponds, various provinces, Fla. to La., Minn., and Me.—Sum.

5. **LAGERSTROEMIA** L. Shrubs or trees. Leaves persistent: blades short. Flowers in terminal panicles. Sepals 5-7. Petals 5-7, the blades crisped. Stamens numerous. Capsule loculicidally 3-6-valved.—About 25 species, in Asia, Africa, and Australia.

1. **L. indica** L. Small tree or shrub with fluted trunk: leaf-blades obovate or oval, 1-2.5 cm. long, entire: sepals shorter than the hypanthium: petals purple, pink, or white, or rarely red, the blades crisped: capsule oval-globose, 8-9 mm. long.—(CRAPE-MYRTLE. LADIES'-STREAMER.)—Waste-places, cult. ground, old fields, and about gardens, various provinces, Fla. to Tex. and Va. (or Md.?). Nat. of Asia and cult.—Spr.—fall.—Trees are long-lived. They suggest premature age, but are very showy when in flower. They frequently indicate the position of residences or settlements that have long ago disappeared. The thin bark peels off the trunk leaving a smooth clean surface which gives the tree a pale ghostly appearance at night.

6. **LYTHRUM** L. Herbs or shrubs. Leaf-blades entire. Flowers axillary or in terminal spikes or racemes, rose-purple or white. Sepals 4-6, not involute, alternating with spreading appendages. Petals 4-6, nearly equal.—About 30 species of wide geographical distribution. Spr.—fall or all year S.—LOOSESTRIFFES.

Leaves mostly alternate.

Leaf-blades rounded or cordate at the base.

Leaf-blades narrowed at the base.

Leaf-blades thick, those of the branches numerous, approximate, mostly less than 1.5 cm. long: hypanthium 6-8 mm. long.

Leaf-blades thin, those of the branches few, mostly over 1.5 cm. long: hypanthium 3-5 mm. long.

Leaves mostly opposite.

Leaf-blades linear or nearly so, those on the flowering branches much reduced.

Leaf-blades elliptic to orbicular or rarely cuneate, those on the flowering branches not much reduced.

1. *L. alatum*.

2. *L. lanceolatum*.

3. *L. Curtissii*.

4. *L. lineare*.

5. *L. flagellare*.

1. **L. alatum** Pursh. Stem 3-13 dm. tall: leaf-blades lanceolate, elliptic, or ovate-lanceolate, 1-5 cm. long: mature hypanthium 5-8 mm. long, the appendages slender-subulate, much longer than the triangular sepals: petals obovate or cuneate-obovate, 5-6 mm. long: capsule 4.5-5 mm. long.—(WINGED-LOOSESTRIFFES.)—Low grounds, swamps, and ditches, various provinces, Ga. to La., Colo., Minn., Ont., and Mass.—*L. cordifolium* Nieuwl. is based on an aberrant specimen of *L. alatum* from Florida.

2. **L. lanceolatum** Ell. Stem 6-16 dm. tall: leaf-blades elliptic to linear-elliptic, 1-6 cm. long: mature hypanthium 5-6 mm. long, the appendages subulate, much longer than the triangular sepals: petals obovate to cuneate-obovate, 6-7.5 mm. long: capsule

4.5–5 mm. long.—Ditches, stream-banks, and swamps, Coastal Plain and adj. provinces, Fla. to Tex., Okla., and S. C.

3. *L. Curtissii* Fernald. Similar to *L. lanceolatum* in habit: leaf-blades thin, oval, elliptic, or elliptic-lanceolate, 2–5.5 mm. long: mature hypanthium 3–4 mm. long, the appendages slender-subulate, longer than the minute sepals: petals elliptic to obovate-elliptic, 2.5–3.5 mm. long: capsule about 4 mm. long.—Muddy, often calcareous swamps, Coastal Plain, N Fla. and adj. Ga.

4. *L. lineare* L. Stem 3–12 dm. tall: leaf-blades linear, 1–4 cm. long: mature hypanthium about 4 mm. long, the appendages triangular, about as long as the deltoid sepals: petals cuneate or cuneate-elliptic, 4–5 mm. long: capsule barely 4 mm. long.—Coastal sand-dunes and open hammocks, Coastal Plain, Fla. to Tex. and N. J.

5. *L. flagellare* Shuttlw. Stem creeping: leaf-blades elliptic to orbicular or rarely cuneate, 0.5–1 cm. long: mature hypanthium 6–8 mm. long or longer, the appendages subulate, several times longer than the glabrous sepals: petals purple, cuneate-obovate, 4–5 mm. long: capsule 3–4 mm. long or shorter. [*L. Vulneraria* (Fl. SE. U. S.)]—Low grounds and swamps, S pen. Fla.

7. **PARSONSIA** P. Br. Herbs or woody plants, mostly clammy-pubescent. Leaf-blades entire. Flowers axillary, or in terminal spikes or racemes. Sepals 6, alternating with small teeth. Petals 6, unequal. Stamens adnate to near the top of the hypanthium. Embryo with orbicular cotyledons. [*Cuphea* P. Br.]—About 200 species, American.

Calyx-limb prominently 2-lipped: posterior pair of stamens not reduced.

Style pubescent: stamens 12; anthers not woolly.

Style glabrous: stamens 11; anthers of the longer pair densely woolly.

Calyx-limb with 5 equal lobes: posterior pair of stamens often much reduced.

Plant perennial: hypanthium with glandular hairs all over; calyx more or less spreading: petals 1.5–2 mm. long.

Plant annual: hypanthium with few simple hairs on the ribs: calyx erect: petals 5–6 mm. long.

1. *P. petiolata*.

2. *P. procumbens*.

3. *P. lythroides*.

4. *P. Balsamona*.

1. *P. petiolata* (L.) Rusby. Plant annual, 1–7 dm. tall: leaf-blades lanceolate to ovate-lanceolate, 1–1.5 cm. long: hypanthium and calyx 8–10 mm. long: flowers rose-purple: upper lip of the calyx much broader than long: upper petals 4.5–5.5 mm. long: capsule 6–8 mm. long.—(WAX-WEED. TAR-WEED. WAX-BUSH. CLAMMY-WEED.)—Dry rocky soil, hillsides, and old fields, various provinces, Ga. to La., Kans., and N. H.—Sum.–fall.

2. *P. procumbens* (Cav.) Small. Plant perennial, 10–12 dm. tall: leaf-blades lanceolate or ovate-lanceolate, 2–6 cm. long: hypanthium and calyx 18–22 mm. long: flowers purple or reddish: upper lip of the calyx about as long as broad: upper petals 12–14 mm. long: capsule 9–10 mm. long.—Waste-places and thickets, Blue Ridge, N. C. Nat. of Mex. and cult.—Sum.–fall.

3. *P. lythroides* Small. Plant perennial, 2-6 dm. tall: leaf-blades elliptic, 1-2 cm. long: hypanthium and calyx 8-10 mm. long: flowers lavender or white: calyx-lobes deltoid: petals spatulate, 5-6 mm. long, or the upper ones 7-8 mm. long: capsule 3.5-4.5 mm. long.—Low pinelands, M and W Fla.—Spr.-sum.

4. *P. Balsamona* (C. & S.) Standley. Plant annual, 2-9 dm. tall: leaf-blades elliptic to oval, or somewhat obovate, 2-6 cm. long, usually rugose in age: hypanthium and calyx 5.5-6.8 mm. long: flowers bluish: calyx-lobes broadly deltoid: petals elliptic or nearly so 1.5-2 mm, long: capsule 4-5 mm. long.—Low hammocks, lake region, pen. Fla.—(Mex., C. A., S. A.)—Spr.-fall.

### FAMILY 3. PUNICACEAE — POMEGRANATE FAMILY

Shrubs or trees. Leaves opposite or nearly so, persistent: blades simple. Flowers perfect, solitary or in short-peduncled axillary clusters. Hypanthium leathery. Calyx of 5-7 sepals. Corolla of 5-7 wrinkled petals. Androecium of numerous stamens in several series: anthers versatile. Gynoecium of several united carpels. Ovary inferior. Fruit a several-celled berry crowned with the calyx, the seeds in a watery pulp.—One genus and 2 species, mostly in the Old World tropics.

1. *PUNICA* [Tourn.] L. Leaf-blades entire. Flowers showy. Sepals persistent on the fruit. Petals deciduous. Berry pendulous.

1. *P. Granatum* L. Small tree or shrub: leaf-blades oval, elliptic, or elliptic-lanceolate, varying to broadest above or below the middle, 1-8 cm. long: sepals triangular to triangular-lanceolate: petals scarlet, 1.5-2.5 cm. long: berry subglobose or depressed, 5-10 cm. in diameter.—(POMEGRANATE.)—Old-fields, woods, and waste-grounds, Fla. Nat. of the Orient and cult.—(W. I.)—Persistent on old settlement sites and homesteads long after the habitations have disappeared.—This plant in cultivation from prehistoric times has developed into a variety of habits and flower-color, vermilion, yellow, white, and variegated.

### FAMILY 4. TERMINALIACEAE — WHITE-MANGROVE FAMILY

Shrubs or trees, or woody vines. Leaves alternate or opposite: blades simple, leathery. Flowers often apetalous, regular, perfect or polygamous, racemose or capitate. Calyx of 4-5 valvate deciduous or rarely persistent sepals. Corolla of 4-5 petals, or wanting. Androecium of twice, or rarely thrice, as many stamens as the sepals. Filaments distinct. Gynoecium a single carpel. Ovary 1-celled. Style terminal. Stigma entire or nearly so. Fruit drupaceous or berry-like, indehiscent, often crowned with the accrescent calyx.—Fifteen genera and 275 species, mostly tropical.

Sepals deciduous: corolla wanting.

Flowers in heads: hypanthium flattened: fruit small, in a cone-like head.

Flowers in spikes: hypanthium terete: fruit separate, large. Sepals persistent.

Corolla wanting: leaves alternate.

Corolla present: leaves opposite.

1. CONOCARPUS.

2. TERMINALIA.

3. BUCIDA.

4. LAGUNCULARIA.

1. **CONOCARPUS** L. Shrubs or trees, evergreen. Leaves alternate. Flowers perfect, in spicate or paniced heads. Hypanthium not ribbed. Stamens 5. Fruit capitate.—One species.

1. **C. erecta** L. Shrub, or tree sometimes 20 m. tall, with glabrous or fine-silky foliage: leaf-blades elliptic or oval, 2–5 cm. long, entire: heads 9–14 mm. in diameter at maturity: flowers greenish: drupe 2-winged, 4–7 mm. long.—(BUTTONWOOD.)—Coastal hammocks and sandy shores, pen. Fla., Everglade Keys, and Florida Keys.—(W. I., Mex., C. A., S. A.)—All year.—The bark is used medicinally and for tanning. The yellow-brown heart-wood, close-grained, very heavy, and hard, is used, in southern Florida for making charcoal.—A silvery pubescent variety occurs on the Florida Keys and on both coasts of the peninsula.

2. **TERMINALIA** L. Shrubs or trees, deciduous. Leaves clustered near the ends of the branches. Flowers in simple or branched spikes. Hypanthium not ribbed. Stamens 10.—About 100 species, of the Old World tropics.

1. **T. Catappa** L. Shrub, or tree sometimes 17 m. tall: leaf-blades cuneate to oblanceolate: spikes 5–15 cm. long: flowers green or whitish: hypanthium and calyx 8–11 mm. long: drupe elliptic or nearly so, glabrous.—(INDIAN-ALMOND. WEST-INDIAN ALMOND.) Pinelands and old fields, S pen. Fla. and the Keys. Nat. of the E. Indies and Oceanica; escaped from cult.—(W. I.)—All year.—The seeds are edible. Although a native of the tropics where storms are usual, this tree never developed a wood or foliage capable of resisting the force of a hurricane. A severe storm will often tear a tree to pieces.

3. **BUCIDA** L. Shrubs or trees, evergreen. Leaves relatively small, clustered at the ends of the branches. Flowers in simple or branched spikes, often crowded. Hypanthium terete. Stamens 10. Fruit in short spikes.—Two species, West Indian.

1. **B. Buceras** L. A tree sometimes 15 m. tall: leaf-blades spatulate to obovate, oval, or elliptic: spikes 2–10 cm. long: flowers greenish: hypanthium and calyx 4–5 mm. long: calyx-lobes shorter than the tube: drupe ovoid-conic or flask-shaped, pubescent.—(BLACK-OLIVE.)—Hammocks, upper Florida Keys.—(W. I., C. A.)—The light yellow-brown heart-wood is close-grained, very heavy, and hard. Great numbers of trees are used as shade-trees and ornamentals in Florida.

**2. LAGUNCULARIA** Gaertn. Shrubs or trees, evergreen. Leaves opposite. Flowers polygamous, in simple or branched spikes. Hypanthium ribbed. Petals mostly shorter than the sepals. Stamens 10. Fruit spicate or paniculate.—One species.

1. *L. racemosa* Gaertn. f. Shrub, or tree sometimes 20 m. tall: leaf-blades oblong, varying to oval or obovate, 2–5 cm. long, entire, alike or nearly so on both sides: spikes 3–6 cm. long: drupe elliptic-obovoid, 2 cm. long.—(WHITE-MANGROVE. WHITE-BUTTONWOOD.)—Rocky and sandy shores and coastal hammocks, pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—Spr.—The white flowers are very fragrant. The dark yellow-brown heart-wood is close-grained, heavy, and hard. The bark is rich in tannic acid.

#### FAMILY 5. MYRTACEAE — MYRTLE FAMILY

Shrubs or trees, or rarely herbs, abounding in pungent and aromatic volatile oil, evergreen. Leaves opposite, or rarely alternate or whorled: blades often simple, pellucid-punctate, flat or often very thick, often with nerves parallel with the margins. Flowers perfect, regular. Calyx of 4 or 5, or many, valvate or imbricate, persistent sepals, or cap-like and deciduous. Petals borne on the margin of a hypanthium or wanting. Androecium of numerous stamens, or very rarely of as many as the sepals. Gynoecium compound. Ovary inferior or partly so, 1–many-celled. Styles united. Fruit sometimes dehiscent, often crowned with the calyx.—Sixty genera and about 1,750 species, widely distributed in the tropics.

Fruit fleshy, baccate: leaf-blades pinnately veined.

Calyx of several persistent or tardily deciduous, valvate sepals, not lid-like: petals present: disk annular: fruit a berry crowned with the persistent calyx or a capsule with an annular ring.

Calyx of regularly separating sepals.

Calyx of irregularly separating sepals.

Calyx lid-like, early deciduous: petals wanting: disk cup-like: fruit crowned with the cup-like disk and hypanthium.

Fruit dry, capsular: leaf-blades parallel-veined.

Tribe I. EUGENIEAE.

Tribe II. MYRTEAE.

Tribe III. MYRCIEAE.

Tribe IV. MELALEUCEAE.

##### I. EUGENIEAE

Inflorescence centripetal: flowers in raceme-like, umbel-like, or contracted clusters: persistent calyx inconspicuous.

Inflorescence centrifugal: flowers in sessile or peduncled dichotomous cymes: persistent calyx conspicuous.

Cymes markedly peduncled, the terminal flowers sessile: disk contracted at maturity, the sepals crowded and converging on the top of the fruit: seeds one or two.

Cymes sessile or nearly so, the terminal flowers stalked: disk expanded, the sepals lax, more or less spreading on the top of the fruit: seeds several to many.

1. EUGENIA.

2. ANANOMIS.

3. MOSIERA.

##### II. MYRTEAE

Leaf-blades prominently ribbed: cymes 1–few-flowered, axillary.

4. PSIDIUM.

##### III. MYRCIEAE

Leaf-blades obscurely ribbed: cymes several–many-flowered.

5. CALYPTRANTHES.

## IV. MELALEUCEAE

Tree with thick peeling bark in many papery layers: leaves very numerous: inflorescence conspicuously copiously flowered.

## 6. MELALEUCA.

1. **EUGENIA** [Mich.] L. Shrubs or trees. Leaf-blades thickish, neither prominently ribbed nor veiny, persistent. Cymes cluster-like, sessile or short-peduncled. Flowers white. Sepals broad, not accrescent. Petals much larger than the sepals. Stamens numerous, borne on the annular disk. Style filiform or subulate-filiform. Berry minutely crowned in the calyx. Seeds 1-4.—About 600 species, mostly of tropical regions.—STOPPERS.

Pedicels short and stout, usually shorter than the flowers and much shorter than the fruits.

Fruit oval or ellipsoid-oval.

Fruit subglobose, sometimes depressed.

1. *E. buxifolia*.

Leaf-blades of a rhombic type, more or less constricted at the base and the tip: fruit depressed, 10-12 mm. in diameter.

2. *E. axillaris*.3. *E. anthera*.4. *E. rhombea*.5. *E. confusa*.

Leaf-blades of an oval or elliptic type, obtuse: fruit subglobose, 6-8 mm. in diameter.

Pedicels relatively long and slender, longer than the flowers and usually longer than the fruits.

Leaf-blades bluntly acuminate, dull above: fruits depressed, 9-16 mm. in diameter.

Leaf-blades slenderly acuminate, shining above: fruits subglobose or globose-obovoid, 5-8 mm. in diameter.

1. **E. buxifolia** (Sw.) Willd. Shrub or small tree, the bark scaly: leaf-blades cuneate to nearly elliptic, 2-4 cm. long, much paler beneath than above: corolla 4-5 mm. broad; petals longer than wide: fruit oval or ellipsoid-oval, 6-7 mm. broad, black.—(SPANISH-STOPPER.)—Coastal hammocks, S pen. Fla. and the Keys.—(W. I.)—The dark-brown heart-wood, close-grained, heavy, and very hard, is used locally in cabinet work.

2. **E. axillaris** (Sw.) Willd. Shrub or small tree, the bark scaly: leaf-blades elliptic-ovate to nearly elliptic, 3-5 cm. long, slightly paler beneath than above: corolla 5-6 mm. broad; petals mostly wider than long: fruit depressed, 10-12 mm. broad, black.—(WHITE-STOPPER.)—Coastal hammocks, S pen. Fla. and the Keys.—(W. I.)—The brown heart-wood, close-grained, heavy, and hard, is used locally for cabinet work.

3. **E. anthera** Small. Shrub or small tree, the bark pale, rather smooth: leaf-blades oval to elliptic or nearly so, 2-5.5 cm. long, slightly paler beneath than above: corolla 5-6 mm. broad; petals slightly longer than wide: fruit subglobose, 6-7 mm. in diameter, dark red to black.—Hammocks along or near the coast, S pen. Fla.—The brown heart-wood is close-grained and hard.

4. **E. rhombea** (Berg) Urban. Tree, the bark smooth: leaf-blades ovate to elliptic, 3-6 cm. long, slightly acuminate: corolla about 10 mm. broad; petals slightly longer than the sepals: fruit depressed, 9-16 mm. broad, orange tinged with red, or black at maturity.—(RED-STOPPER.)—Hammocks, lower Florida Keys.—(W. I.)—The light-brown heart-wood, close-grained, heavy, and hard, is used locally for cabinet work.

5. **E. confusa** DC. Tree, the bark scaly: leaf-blades ovate, oval-ovate, or elliptic-ovate, 3-5 cm. long, markedly acuminate: corolla 4-6 mm. broad; petals about twice as long as the sepals: fruit subglobose or globose-obovoid, 5-8 mm. broad, scarlet. [*E. Garberi* Sarg.]—(IRONWOOD.)—Hammocks, Everglade Keys, Fla. and the Keys.—(W. I.)—The red-brown heart-wood, close grained, heavy, and very hard, is used locally for cabinet work.

2. **ANAMOMIS** Griseb. Shrubs or trees. Leaf-blades thickish, not ribbed, with rather faint lateral veins. Cymes decidedly peduncled, 1-many-flowered, the branches shorter than the peduncle. Flowers fragrant. Sepals ciliate, one pair much larger than the other. Petals paired, white. Stamens numerous, borne on the small annular disk. Style filiform. Berry crowned with the persistent calyx, red or reddish. Seeds solitary or 2.—About 8 species, West Indian and Floridian.—Spr.—NAKEDWOODS.

Corolla over 1 cm. wide: petals 4.5-6 mm. long: stamens mostly 60-70: cymes several-flowered.

Corolla less than 1 cm. wide: petals 2.5-3.5 mm. long: stamens mostly 30-40: cymes few-flowered.

1. *A. Simpsonii*.

2. *A. dicrana*.

1. **A. Simpsonii** Small. Tree becoming 20 m. tall, the trunk with pale-tan bark, strongly buttressed at the base: leaf-blades narrowly obovate, elliptic-obovate, or nearly elliptic, 2.5-6.5 cm. long, acutish, obtuse or notched, much paler beneath than above, rather long-petioled: cymes long-petioled in anthesis, 7-14 flowered, the primary bracts small, but leaf-like: calyx 6-7 mm. wide; larger sepals about 3 mm. long: berry ellipsoid, often broadly so, 8-10 mm. long, red.—Hammocks, lower E coast and Everglade Keys, Fla.—The foliage contains a volatile oil, somewhat resembling that of nutmeg in flavor.

2. **A. dicrana** (Berg) Britton. Shrub or small tree becoming 8 m. tall, the trunk with a light-red or red-brown bark, not buttressed: leaf-blades cuneate, elliptic-cuneate, or narrowly elliptic, 1-4 cm. long, acute or obtuse, slightly paler beneath than above, short-petioled: cymes short-petioled in anthesis, 3-flowered, the primary bracts minute: calyx 4-5 mm. wide; larger sepals about 2 mm. long: berry globose or ellipsoid, 6-7 mm. long, reddish-brown. [*A. dichotoma* (Fl. SE. U. S.)]—Hammocks, E coast, M pen., Caloosahatchee region to Cape Romano, and Key West, Fla.

3. **MOSIERA** Small. Shrubs or small trees. Leaf-blades thick, obscurely veined, but finely reticulate. Cymes sessile or nearly so, 1-3-flowered, the branches longer than the peduncle. Flowers fragrant. Sepals eciliate, not decidedly paired. Petals nearly equal, white. Stamens numerous, borne on the large annular disk. Style slender-columnar. Berry globular, crowned with the persistent conspicuous calyx, black. Seeds several or many.—Few species, tropical.—STOPPERS.

Calyx less than 1 cm. wide: petals more than twice as long as the sepals: shrub with many prostrate-diffuse branches.

Calyx over 1 cm. wide: petals less than twice as long as the sepals: shrub with erect branches or small tree.

1. *M. longipes*.

2. *M. bahamensis*.

1. *M. longipes* (Berg) Small. Shrub with many wiry often decumbent branches 1-9 dm. long from a short woody base: leaf-blades ovate or oval, mostly 1-3 cm. long, finely reticulate: sepals about 2 mm. long: corolla mostly 10-12 mm. wide: berry globose or obovoid-globose, 6-9 mm. in diameter, black. [*Eugenia longipes* Berg.]—Pinelands, Everglade Keys, pen. Fla. and Florida Keys.—(W. I.)

2. *M. bahamensis* (Kiaersk.) Small. Shrub with erect branches or small tree: leaf-blades orbicular, oval, or elliptic, or somewhat ovate, mostly 2-5 cm. long, often decidedly shining above, minutely reticulate beneath: sepals about 3 mm. long: corolla mostly 1.5 cm. wide: berry subglobose, about 1 cm. in diameter, black (?). [*Eugenia bahamensis* Kiaersk.]—Hammocks and pinelands near hammocks, Everglade Keys, pen. Fla. and Florida Keys.—(W. I.)

4. *PSIDIUM* L. Shrubs or trees. Leaf-blades thickish, prominently many-ribbed. Cymes 1-few-flowered. Sepals separating irregularly. Petals 4 or 5, much larger than the sepals, white. Stamens very numerous, borne on the disk. Style subulate-filiform. Berry fleshy, crowned with the calyx. Seeds very numerous.—About 11 species, mostly tropical.

1. *P. Guajava* Raddi. Tree sometimes 8 m. tall, with roughish bark, or a shrub with smooth-bark; leaf-blades elliptic or nearly so, 4-8 cm. long, pubescent beneath: sepals 9-15 mm. long: petals 15-20 mm. long: berry globular or pyriform, 3-6 cm. in diameter.—(GUAVA.)—Hammocks, roadsides, pinelands, and old fields, especially in pen. Fla. and the Keys. Nat. of trop. Am. and cult.—(W. I., Mex., C. A., S. A.)—Grown extensively in several varieties for its fruit, which is eaten raw or made into a jelly or a preserve.

5. *CALYPTRANTHES* Sw. Shrubs or trees. Leaf-blades thick, faintly veined. Cymes panicle-like. Flowers several or numerous. Hypanthium produced beyond the ovary. Calyx cap-like, deciduous, white. Petals wanting. Stamens numerous, borne on the edge of the cup-like disk. Style slender. Berry conspicuously crowned. Seeds 1, 2, or 3. [*Chytraculia* P. Br.]—About 75 species, of tropical and subtropical America.

Calyx-lid not mammillate, hypanthium pubescent: leaf-blades manifestly petioled.

1. *C. pallens*.

Calyx-lid mammillate: hypanthium glabrous: leaf-blades sessile or nearly so.

2. *C. Zuziygum*.

1. *C. pallens* (Poir.) Griseb. Shrub, or tree becoming 9 m. tall, the bark light-gray or nearly white, smooth or ultimately scaly, the branchlets 2-edged:

leaf-blades elliptic or oval, varying to broader above or below the middle, 3–5 cm. long, or rarely larger, mostly short acuminate, pubescent beneath, at least when young, manifestly petioled: inflorescence pubescent: hypanthium about 2 mm. wide during anthesis: calyx pubescent, less than 2 mm. in diameter: berry subglobose or oval, 5–7 mm. in diameter, pubescent: seed about 4 mm. long. [*Chytraculia chytraculia* (Fl. SE. U. S.)]—(SPICEWOOD.)—Hammocks, coast of S pen. Fla., Everglade Keys, and Florida Keys.—(W. I.)—The brown heartwood is close grained, heavy, and hard.

2. *C. Zuzygium* (L.) Sw. Shrub, or tree becoming 12 m. tall, the bark pale-gray, smooth, the branchlets terete: leaf-blades oval or elliptic, varying to ovate or obovate, 4–6 cm. long, obtuse or abruptly blunt-tipped, glabrous, sessile or nearly so: inflorescence glabrous: hypanthium about 4 mm. wide during anthesis: calyx glabrous, 3.5–4 mm. wide: berry subglobose or depressed, 8–10 mm. in diameter, glabrous: seed about 5 mm. long.—(MYRTLE-OF-THE RIVER.)—Hammocks, Everglade Keys, pen. Fla.—(W. I.)

6. *MELALEUCA* L. Shrubs or trees with much branched stems. Leaf-blades coriaceous, narrow, parallel-veined, persistent. Spikes dense, on woody branchlets, the rachis growing into a leafy shoot after anthesis. Sepals very broad, deciduous. Petals much longer than the sepals. Stamens numerous, borne in five bundles opposite the petals, the free parts of the filaments greatly elongate. Style elongate, nearly filiform. Capsule woody, with an annular orifice. Seeds numerous.—More than 100 species, Australian, many of them cultivated.

1. *M. Leucadendra* L. Tree with irregular, often drooping branches, the bark thick and spongy, whitish: leaf-blades elliptic, often narrowly so, 4–12 cm. long, acute, bright-green, with short petiole-like bases: spikes many-flowered, conspicuous: sepals ovate-deltoid or orbicular-ovate, about 2 mm. long, obtuse: petals white, obovate, 3–4 mm. long, firm: filaments 1–1.5 cm. long: capsule short-cylindric to nearly hemispheric, 3.5–4.5 mm. long.—(CAJUPUT-TREE. PUNK-TREE. BOTTLE-BRUSH.)—Low grounds, hammocks, and cypress swamps, S Fla. Nat. of Australia.—All year.—Another Australian tree, *Callistemon lanceolatus*, with leaves resembling those of the above species, but with bright-red stamens which are distinct, is cultivated in southern Florida and often spontaneous on old homesteads.

#### FAMILY 6. RHIZOPHORACEAE — MANGROVE FAMILY

Maritime shrubs or trees. Leaves usually opposite: blades entire or toothed. Flowers perfect, solitary or variously clustered. Calyx of 3 or 4 valvate sepals. Corolla of 3 or 4 petals. Androecium of twice, or

thrice as many stamens as sepals, or of 4 times as many. Gynoecium of 2-5 united carpels. Ovary inferior, at least partly so. Styles united. Fruit a leathery berry crowned with or surrounded by the calyx.—Fifteen genera and about 50 species, of tropical and subtropical regions.

1. **RHIZOPHORA** L. Evergreen trees with aerial roots arising from the trunk and branches, which branch and interlace about the base of the plant. Leaf-blades leathery, entire, persistent. Flowers 2-several in peduncled clusters, nodding. Sepals 4, leathery. Petals 4, leathery. Stamens 4-12. Ovary 2-celled, provided with a fleshy cone at maturity. Fruit pendulous, the seed germinating and sending out a long radicle before the fruits fall.—Three species, natives of tropical regions.

1. **R. Mangie** L. Shrub, or tree becoming 20 m. tall, with pale ultimately furrowed bark, forming impenetrable thickets on salt and brackish shores: leaf-blades elliptic to elliptic-obovate, 5-15 cm. long: sepals lanceolate, about 10 mm. long: petals pale-yellow, linear or nearly so: fruits 2-3 cm. long, the radicle becoming several dm. long.—(MANGROVE. RED-MANGROVE.)—Coasts of pen. Fla., and on the shores of creeks and rivers mostly to the limit of salt or brackish water, and on the Florida Keys.—(W. I., Mex., C. A., S. A.)—Grows most extensively in salt water; rarely in fresh water; but reaches its greatest size in brackish water. The bark is used in dyeing and tanning. The reddish-brown and streaked heart-wood, close-grained, heavy, and hard, is used for cabinet work. The clavate precocious embryo when it falls into the water floats in a perpendicular position. When stranded on the muddy bottom it strikes root.

## FAMILY 7. EPILOBIACEAE — EVENING-PRIMROSE FAMILY

Herbs or rarely shrubs. Leaves alternate or opposite: blades simple. Flowers typically perfect. Hypanthium often elongate. Calyx of 2-6, usually 4, sepals. Corolla of 2-9, usually 4, petals, or rarely wanting. Androecium of as many stamens as the sepals or twice as many. Gynoecium of several, usually 4, united carpels. Ovary 1-6-celled, usually 4-celled, inferior. Fruit capsular or nut-like.—Forty genera and about 350 species, widely distributed, but most abundant in America.

Floral whorls of 4 parts, or more.

Fruit a capsule, opening by valves or pores, or by the breaking down of the walls.

Fruit dry and indehiscent, nut-like.

Floral whorls of 2 parts.

Tribe I. OENOTHEREAE.

Tribe II. GAUREAE.

Tribe III. CIRCAEAE.

### I. OENOTHEREAE

Hypanthium not prolonged beyond the ovary.

Seeds naked, i.e., without a tuft of hairs.

Stamens 4, in 1 row.

Leaves opposite: stems prostrate, creeping or floating: flowers sessile or on peduncles longer than the leaves.

Flowers sessile: petals wanting or very small: leaf-blades petioled: capsules sessile, short, flat at the apex.

1. **ISNARDIA**.

Flowers long-peduncled: petals conspicuous: leaf-blades sessile: capsule long-peduncled, elongate, curved, with a prominent 4-lobed stylopodium at the apex.

Leaves alternate: stems erect or ascending: flowers sessile, the hypanthium and ovary sometimes narrowed into a pedicel-like base.

Stamens 8-12 in 2 rows.

Seeds furnished with a tuft of silky hairs.

Hypanthium prolonged beyond the ovary.

Seeds with a tuft of silky hairs.

Seeds naked or merely tuberculate.

Flowers with all the stamens equal in length: capsule subcylindric or somewhat tetragonal and tapering to the apex.

Ovules and seeds horizontal, borne in 2 or rarely more rows, prismatic-angled.

Ovules and seeds ascending, not angled.

Flowers with the alternate stamens longer: capsule obovoid to clavate, tetragonal, short.

Ovules and seeds numerous, not tuberculate, clustered on slender funiculi.

Corolla yellow: capsules depressed at the apex.

Style terminating in an obscurely lobed stigma: capsule 4-winged.

Style terminating in 4 narrow stigmas: capsule 4-angled.

Corolla red, purple, or white: capsules pointed.

Ovules and seeds few, sessile in 1 or 2 rows.

2. LUDWIGIANTHA.

3. LUDWIGIA.

4. JUSSIAEA.

5. CHAMAENERION.

6. EPILOBIUM.

7. OENOTHERA.

8. RAIMANNIA.

9. KNEIFFIA.

10. PENIOPHYLLUM.

11. HARTMANNIA.

12. LAVAUXIA.

## II. GAUREAE

Herbs with entire, toothed, or pinnatifid leaf-blades: hypanthium dilated upward in anthesis: achene angled.

13. GAURA.

## III. CIRCAEAE

Tender herbs with toothed leaf-blades: petals 2-lobed: fruits clavate to pyriform.

14. CIRCAEA.

1. **ISNARDIA** L. Perennial succulent herbs. Leaf-blades relatively wide. Flowers axillary. Sepals 4, broad. Petals minute, reddish or greenish, or wanting. Filaments very short. Ovary short. Style wanting or nearly so. Capsule obovoid or turbinate.—About 4 species, North American.—MARSH-PURSLANES. WATER-PURSLANES.

Capsule 2.5-6 mm. long; corolla usually wanting.

Plant glabrous: capsule not turgid and not constricted at the top.

Capsule 2.5-3 mm. long: sepals acute.

Capsule 5-6 mm. long: sepals acuminate.

Plant pubescent: capsule turgid and constricted at the top.

Capsule 6-7 mm. long: corolla usually present.

1. *I. palustris*.

2. *I. intermedia*.

3. *I. spathulata*.

4. *I. repens*.

1. ***I. palustris*** L. Leaf-blades spatulate to oval or ovate, 1.5-2.5 cm. long: hypanthium glabrous: buds acute: sepals triangular; green or reddish: petals wanting or minute and reddish: capsule 2.5-3 mm. long, short-turbinate.—Ditches, wet shores, and swamps, various provinces, Fla. to Calif., Ore., Man., and N. S.—(*Mex.*, *C. A.*, *S. A.*, *O. W.*)—Spr.—fall.

2. ***I. intermedia*** Small & Alexander. Plant similar to *I. palustris* in habit, but the flower-buds mostly acuminate: capsule 5-6 mm. long, long-turbinate or subcylindric.—Hammocks, wet shores, and stream-banks, pen. Fla.—All year.

3. ***I. spathulata*** (T. & G.) Small. Leaf-blades spatulate to oval, 2-2.5 cm. long: hypanthium pubescent: sepals broader than

long, or as broad as long, green: capsule globose-obovoid or obovoid, 2.5–3 mm. long.—Pineland ponds, M Fla.—Sum.

4. *I. repens* (Sw.) DC. Leaf-blades ovate, elliptic, or oval, 1–3 cm. long: hypanthium obpyramidal: sepals ovate-lanceolate: petals as long as the sepals or wanting: capsule obpyramidal. [*I. natans* (Ell.) Small]—Lime-sinks in hammocks, streams and marshes, Coastal Plain, and rarely adj. provinces, Fla. to Tenn. and N. C.—(*Mex.*)—Spr.—fall.

2. **LUDWIGIANTHA** Small. Perennial fleshy depressed herbs. Leaves numerous: blades narrow, entire. Flowers axillary. Sepals 4, narrow. Petals yellow, conspicuous. Filaments elongate. Ovary long. Style filiform. Capsule clavate.—One or 2 species, of the eastern United States.

1. *L. arcuata* (Walt.) Small. Stem creeping: leaf-blades oblanceolate, to almost linear, 7–25 mm. long, obtuse or acute: peduncles slender, elongate, longer than the leaves: sepals linear-lanceolate, 7–10 mm. long, acuminate: corolla 2–2.5 cm. wide; petals spreading, obovate, slightly clawed: stamens much shorter than the petals: capsule curved, 7–10 mm. long, as long as the persistent sepals or longer.—Swamps, marshes, springy places, and pond-margins, Coastal Plain, Fla. to Va.—Spr.—sum.—A related species, *L. brevipes* Long, from N. J. might occur on the southern Atlantic seaboard.

3. **LUDWIGIA** L. Annual or perennial erect or matted herbs. Leaf-blades entire or rarely shallowly toothed. Flowers axillary or terminal. Sepals generally persistent, green or reddish. Petals usually 4, yellow. Ovary usually 4-celled. Capsule cylindric or prismatic to subglobose.—About 25 species, most abundant in North America.

Corolla conspicuous; flowers peduncled: capsule opening by a terminal pore.

#### I. ALTERNIFOLIAE.

Corolla inconspicuous, obsolete, or wanting: valves of the capsule separating from the disk-like top.

#### II. MICROCARPEAE.

##### I. ALTERNIFOLIAE

Foliage, sepals, and capsule glabrous, puberulent or minutely appressed-pubescent.

Stem-leaves with short-petioled blades: petals about as long as the sepals: pedicel shorter than the capsule.

Stem-leaves with closely sessile blades: petals about twice as long as the sepals: pedicel longer than the capsule.

Sepals thrice as long as the hypanthium in anthesis: style longer than the sepals.

Sepals twice as long as the hypanthium in anthesis: style shorter than the sepals.

Foliage, sepals, and capsule hirsute.

1. *L. alternifolia*.

2. *L. virgata*.

3. *L. maritima*.

4. *L. hirtella*.

##### II. MICROCARPEAE

Petals wanting or minute, shorter than the sepals.

Capsule 1–3 mm. long; stem-leaves of a spatulate type.

Leaf-blades entire.

Leaf-blades toothed near the apex.

Leaf-blades broadly spatulate: sepals much shorter than the hypanthium.

5. *L. microcarpa*.

6. *L. Simpsonii*.

Leaf-blades narrowly spatulate: sepals about as long as the hypanthium.

Capsule 3-8 mm. long.

Blades of the stem-leaves spatulate.

Blades of the stem-leaves not spatulate.

Capsule about as thick as long, not cylindric.

Foliage and fruit glabrous or merely appressed-puberulent.

Flowers in a terminal head or congested panicle.

Flowers in elongate interrupted spikes or axillary.

Capsule turbinate, cubic-turbinate, or obpyramidal.

Capsule slightly longer than broad, the angles rounded or merely square.

Capsule glabrous, the angles rounded: bractlets adnate to the hypanthium.

Capsule puberulent, the angles square: bractlets not adnate to the hypanthium.

Capsule slightly broader than long, the angles winged or margined.

Sepals nearly as broad as long, almost as long as the capsule: seeds oval.

Sepals broader than long,  $\frac{1}{2}$  as long as the capsule: seeds cylindric.

Capsule globular.

Foliage and fruit copiously pilose-tomentose.

Capsule cylindric.

Petals as long as or longer than the sepals.

Capsule cylindric, terete or nearly so.

Capsule narrowly obpyramidal.

7. *L. Curtissii*.

8. *L. spathulifolia*.

9. *L. suffruticosa*.

10. *L. polycarpa*.

11. *L. simulata*.

12. *L. alata*.

13. *L. lanceolata*.

14. *L. sphaerocarpa*.

15. *L. pilosa*.

16. *L. glandulosa*.

17. *L. linifolia*.

18. *L. linearis*.

1. *L. alternifolia* L. Plant 6-12 dm. tall: leaf-blades lanceolate, 6-12 cm. long: sepals ovate: petals about equalling the sepals: capsule slightly winged on the angles, 5-7 mm. long.—(SEEDBOX).—Swamps and wet places, various provinces, Fla. to Tex., Kans., Ont., and N. H.—Spr.-fall.

2. *L. virgata* Michx. Plant fastigiate branched, glabrous or nearly so; leaf-blades linear to lanceolate: sepals 3-4 times as long as the hypanthium, permanently reflexed: style longer than the sepals: capsule very slightly winged on the angles.—Pine-lands, Coastal Plain, Fla. to Miss. and N. C.—Spr.-fall.

3. *L. maritima* Harper. Plant fastigiate branched, glabrous or nearly so: leaf-blades linear to lanceolate: sepals twice as long as the hypanthium, permanently reflexed: capsule very slightly winged on angles, 2 mm. long.—Ditches and low pinelands, pen. Fla.—Spr.-fall.

4. *L. hirtella* Raf. Plant 3-6 dm. tall: leaf-blades elliptic-lanceolate or ovate-lanceolate, 2.5-3 cm. long: sepals ovate-lanceolate: petals longer than the sepals: capsule cubic above the rounded base, about 5 mm. long.—Moist sand, mainly in acid pinelands, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and N. J.—Spr.-fall.

5. *L. microcarpa* Michx. Plant low or depressed: leaf-blades spatulate or obovate-spatulate, 0.5-3 cm. long: sepals triangular: petals wanting: capsule broadly obpyramidal, 1.5-2 mm. long.—Hammocks, limesinks, and marshes, Coastal Plain, Fla. to Miss. and N. C.—Spr.-fall.

6. *L. Simpsonii* Chapm. Plant weak, often decumbent: leaf-blades 1-2.5 cm. long: sepals triangular: petals wanting: capsule broadly turbinate, about 2 mm. long.—Hammocks, ditches, and low pinelands, pen. Fla.—Spr.—fall.
7. *L. Curtissii* Chapm. Plant erect or ascending: leaf-blades 1-2 cm. long: sepals lanceolate or triangular-lanceolate: petals wanting: capsule turbinate, 2-3 mm. long.—Everglades, ponds, and ditches, pen. Fla.—Spr.—fall.
8. *L. spatulifolia* Small. Plant 1.5-8 dm. tall, the stem narrowly ridged: leaf-blades spatulate, 1-2.5 cm. long, those of the basal shoots somewhat broader than those of the stem: sepals deltoid: petals wanting: capsule broadly obpyramidal, about 4 mm. long, the angles blunt.—Wet ground, Everglades, Fla.—All year.
9. *L. suffruticosa* Walt. Plant 3-10 dm. tall: leaf-blades narrowly elliptic to narrowly lanceolate or linear, 2-10 cm. long: sepals broadly ovate or triangular-ovate: petals minute or wanting: capsule broadly obpyramidal, 4-5 mm. long. [*L. capitata* Michx.]—Wet pinelands, and shores of ponds, Coastal Plain, Fla. to N. C.—Spr.—fall.
10. *L. polycarpa* Short & Peter. Plant 3-9 dm. tall, the stem winged: leaf-blades narrowly lanceolate, 5-10 cm. long: sepals triangular-lanceolate: petals minute, greenish: capsule 4-sided, the angles rounded, 5 mm. long.—(FALSE-LOOSESTRIFE.)—Swamps, various provinces, Tenn. to Nebr., Minn., Ont., and Mass.—Spr.—fall.
11. *L. simulata* Small. Plant 4-9 dm. tall, the stem nearly terete: leaf-blades narrowly elliptic to almost linear, 1.5-5.5 cm. long: sepals triangular to ovate-triangular: petals minute: capsule obpyramidal, about 4 mm. long.—Swamps, Coastal Plain, Fla. to N. C.—Spr.—fall.
12. *L. alata* Ell. Plant 3-9 dm. tall, the stem winged: leaf-blades linear-ob lanceolate, to linear-lanceolate, or nearly linear, 2.5-10 cm. long: petals wanting: capsule 3-4 mm. long, the angles winged.—Marshes, Coastal Plain and adj. provinces, Fla. to La., Mo., and N. C.—Spr.—fall.
13. *L. lanceolata* Ell. Plant 3-9 dm. tall, the stem angled or sometimes winged: leaf-blades linear-ob lanceolate to linear-lanceolate or linear, 2-10 cm. long: sepals very broad, acute: petals wanting: capsule 4-5 mm. long, the angles margined.—Everglades, swamps, and marshes, Coastal Plain, Fla. to N. C.—Sum.—fall.
14. *L. sphaerocarpa* Ell. Plant 6-9 dm. tall, the stem leaf-blades lanceolate, 5-10 cm. long: sepals triangular: petals commonly wanting: capsule about 4 mm. long.—Swamps, often in acid soil, Coastal Plain and adj. provinces, Fla. to La. and Mass.; and Great Lake Lowland, Ind.—Sum.—fall.
15. *L. pilosa* Walt. Plant 6-12 dm. tall, the stem nearly terete: leaf-blades lanceolate, elliptic, or linear-elliptic, 1-6 cm. long: sepals triangular-ovate: petals minute or wanting: capsule cubic-globose, 4-6 mm. in diameter, hoary.—Swamps and ponds, Coastal Plain, Fla. to La. and N. C.—Sum.—fall.
16. *L. glandulosa* Walt. Plant 3-9 dm. tall, the stem nearly terete: leaf-blades elliptic-lanceolate, 5-10 cm. long: sepals triangular-ovate, acute: petals wanting: capsules cylindrical, 6-8 mm. long.—Swamps, and marshes, Coastal Plain and adj. provinces, Fla. to Tex., Kans., Ill., and S. C.—Sum. & fall.
17. *L. linifolia* Poir. Plant 1-5 dm. tall, the stem 4-angled: leaf-blades linear-ob lanceolate to linear, 2-6 cm. long: sepals lanceolate or ovate-lanceolate,

acuminate: petals about as long as the sepals: capsule about 10 mm. long.—Pineland swamps, Coastal Plain, Fla. to Miss. and N. C.—Spr.-fall.

18. *L. linearis* Walt. Plant 3-7.5 dm. tall: leaf-blades narrowly linear, 2.5-5 cm. long: sepals triangular-ovate: petals slightly longer than the sepals: capsule 6-8 mm. long.—Swamps, often in acid soil, Coastal Plain, Fla. to La. (Tex.?), Tenn., and N. J.—Sum.-fall.

4. **JUSSIAEA** L. Perennial herbs or partially woody plants, erect or diffuse and creeping. Leaf-blades usually entire. Flowers axillary. Sepals 4-6, persistent. Petals 4-6, white or yellow, or rarely none. Stamens 8-12. Ovary 4-6-celled. Capsule linear, ellipsoid, or clavate.—About 50 species, mostly of the American tropics.—Spr.-fall or all year S.

Plant diffuse, the stems and branches creeping (rooting) or floating. I. DIFFUSAE.  
Plant erect, the stem more or less branched. II. ERECTAE.

#### I. DIFFUSAE

Corolla 2-3 cm. broad: leaf-blades long-petioled.  
Corolla 4-5 cm. broad: leaf-blades short-petioled.

1. *J. diffusa*.
2. *J. grandiflora*.

#### II. ERECTAE

Capsule long-clavate, the body narrowly cylindric, more than 3 cm. long.

Calyx of 5 sepals.

Calyx of 4 sepals.

Leaf-blades narrow:

Leaf-blades broad:

Capsule short-clavate, the body obconic or cylindric-obovoid, mostly less than 2 cm. long.

Leaf-blades sessile, decurrent as wings on the angles of the stem: fruit winged.

Leaf-blades short-petioled: fruit not winged.

Corolla about 1 cm. broad.

Corolla 4-6 cm. broad.

Blades of the upper leaves long and narrow.

Blades of the upper leaves broad and short.

3. *J. leptocarpa*.
4. *J. angustifolia*.
5. *J. scabra*.
6. *J. decurrens*.
7. *J. erecta*.
8. *J. neglecta*.
9. *J. peruviana*.

1. *J. diffusa* Forskl. Stem glabrous: blades of the upper leaves elliptic to lanceolate, 2.5-10 cm. long: sepals 5-8 mm. long: petals 1-1.5 cm. long: capsule-body 2.5-4 cm. long.—Ponds, Coastal Plain and adj. provinces, Fla. to Tex., Kans., and Ky.—(W. I.)

2. *J. grandiflora* Michx. Stem villous or hirsute: blades of the upper leaves narrowly elliptic or lanceolate, 3-12 cm. long: sepals about 12 mm. long: petals fully 2 cm. long: capsule body 1-2 cm. long.—Ponds and streams, Coastal Plain, Fla. to La. and N. C.

3. *J. leptocarpa* Nutt. Stem hirsute, 6-20 dm. tall: leaf-blades narrowly elliptic or lanceolate, 3-20 cm. long: hypanthium hirsute: sepals lanceolate: corolla about 15 mm. broad: capsule 3.5-6 cm. long.—Ditches and low grounds, Coastal Plain, Fla. to Tex., Ark., and Ga.—Glabrous forms with very narrow leaf-blades and four-merous flowers occur in S Fla.

4. *J. angustifolia* Lam. Stem mostly 1-2 m. tall, glabrous or sparingly pubescent: leaf-blades elliptic to almost linear, varying to broadest above the middle or below it, 2-11 cm. long, usually glabrous or nearly so: hypanthium

longer than the calyx in bud, minutely pubescent in anthesis: sepals ovate, mostly less than 1 cm. long: corolla less than 4 cm. wide: capsule 4-6 cm. long, much longer than the pedicel-like base.—Swamps, stream-banks, and low grounds, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)—Spr.—fall or all year S.

5. *J. scabra* Willd. Stem hirsute, 6-14 dm. tall: leaf-blades ovate to ob-ovate, 2-6 cm. long: hypanthium hirsute: sepals ovate: corolla 2-2.5 cm. broad: capsule 3-5 cm. long.—Moist soil, Fla.—(*W. I.*)

6. *J. decurrens* (Walt.) DC. Stem 3-6 dm. tall, glabrous: leaf-blades lanceolate, 2.5-10 cm. long: sepals ovate-lanceolate: corolla 8-12 mm. broad: capsule-body 2-2.5 cm. long.—Ditches and low grounds, Coastal Plain and adj. provinces, Fla. to Tex., Ark., Ill., and Md.

7. *J. erecta* L. Stem 9-20 dm. tall, glabrous: leaf-blades lanceolate to linear-lanceolate, 5-12 cm. long: hypanthium short-pubescent or glabrate: sepals lanceolate, about 5 mm. long: petals about 5 mm. long: capsule-body cylindric, much longer than the base, 1.5 cm. long.—Hammocks, near Manatee, Fla.—(*W. I., C. A.*)

8. *J. neglecta* Small. Stem mostly less than 1 m. tall, or taller in age, copiously pubescent: leaf-blades elliptic, varying to elliptic-ob lanceolate or elliptic-lanceolate, especially on the lower part of the stem, to elliptic-linear or narrowly linear above, mostly 4-15 cm. long, pubescent on both sides: hypanthium shorter than the calyx in bud, copiously pubescent with short and long hairs, in anthesis: sepals broadly ovate, mostly over 1.5 cm. long: corolla over 5 cm. wide: capsule 1-2 cm. long.—Waste-places and river-banks, about seaports, Coastal Plain, Fla. to La. and N. C.—Referred to *J. suffruticosa* in Fl. SE U. S., in error.

9. *J. peruviana* L. Stem 1-4 m. tall, hirsute: leaf-blades ovate, oval, lanceolate, or oblong-lanceolate, 4-10 cm. long, or more: hypanthium hirsute: sepals lanceolate to ovate-lanceolate, 10-15 mm. long: petals 2-3 cm. long: capsule-body ellipsoid-obovoid, slightly longer than the base.—Everglades, swamps, and banks of streams, pen. Fla.; and adv. elsewhere along the Gulf Coast.—(*W. I., Mex., C. A., S. A.*)

5. **CHAMAENERION** Adans. Perennial herbs. Leaf-blades entire or nearly so. Flowers irregular, in showy racemes. Sepals 4, deciduous. Petals 4, entire. Stamens 8, declined. Stigmas 4. Capsule elongate, obtusely angled. Seeds comose.—Four species, of the north temperate zone.

1. *C. angustifolium* (L.) Scop. Plant 5-25 dm. tall, often clustered: leaf-blades lanceolate, 5-15 cm. long: corolla purple or sometimes white; petals 1-1.5 cm. long: capsule 5-7.5 cm. long: coma of seeds about 10 mm. long.—(**FIRE-WEED. SALLY-BLOOM. WILLOW-HERB. WILLOW-WEED.**)—Open woods, thickets, and especially clearings and recently burned areas, various provinces, Coastal Plain only N N. C. to N. M., Calif., Alas., Ont., and Lab.—Sum.—fall.—Its abundance in burned over areas has given it the name of fireweed.

6. **EPILOBIUM** L. Perennial herbs or somewhat woody plants. Leaf-blades entire or toothed. Flowers solitary, spicate, or racemose. Sepals 4, short, deciduous. Petals 4, pink or white, often notched. Stamens 8. Stigmas 4, or united and clavate. Capsule elongate, 4-sided. Seeds comose.—About 75 species, chiefly northern.—Sum.—fall.—WILLOW-HERBS. COTTON-WEEDS.

1. **E. coloratum** Muhl. Plant 3-9 dm. tall: leaf-blades lanceolate, 5-15 cm. long: flowers generally nodding: sepals 2.5-3.5 mm. long: petals 3-4 mm. long, shallowly notched: capsule 4.5-6 cm. long.—(BRONZE WILLOW-HERB.)—Meadows and low grounds, various provinces, Ala. to Kans., S. D., Ont., Me. and S. C.

7. **OENOTHERA** L. Annual or biennial large herbs. Leaf-blades undulate or toothed. Buds erect. Flowers nocturnal, spicate. Sepals elongate. Corolla yellow. Capsules 4-sided, tapering. [*Onagra* Adans.]—About 15 species, mostly North American.—Sum.—EVENING-PRIMROSES.—Species additional to the ones given below have been described from the northern States and some may occur within our range. Some species are used in ornamental gardening.

Sepals less than 3 cm. long, the free tips subulate, less than 4 mm. long: corolla 2-5 cm. wide.  
 Sepals over 3 cm. long, the free tips filiform, over 5 mm. long: corolla 8-12 cm. wide.

1. *O. biennis*.

2. *O. grandiflora*.

1. **O. biennis** L. Stem 13-25 dm. tall, hirsute: leaf-blades elliptic to lanceolate, 2.5-15 cm. long, repand-denticulate: petals bright-yellow, 1-2.5 cm. long: capsule narrowly oblong-conic, 18-25 mm. long, nearly terete.—(WEEDY EVENING-PRIMROSE.)—Fields, roadsides, and thickets, various provinces, Fla. to Tex., Minn., and Lab.—Sum.—fall.

2. **O. grandiflora** Ait. Similar to *O. biennis*, but larger throughout sometimes 3 m. tall: petals 4-6 cm. long, golden-yellow: capsule linear-conic, 3-4 cm. long, 4-sided.—Woods and river-banks, and roadsides, Coastal Plain, Ala.—Sum.—fall.—This species seems to be known in the wild state only in the type region in Alabama where Bartram discovered it late in the eighteenth century. Large flowered forms of *Oe. biennis* are sometimes recorded as *Oe. grandiflora*.

8. **RAIMANNIA** Rose. Annual, biennial, or perennial herbs. Leaf-blades sinuate or pinnatifid. Flowers axillary, sometimes aggregated in a spike, nocturnal. Petals yellow. Ovary slender. Capsule narrowly cylindric, or rarely slightly tapering. Seeds tubercled. [*Oenothera* L. in part.]—About 20 species, American.—Several species are used in horticulture.

Flowers axillary: stem and branches decumbent or prostrate.  
Flowers in a terminal bracted spike.

I. HUMIFUSAE.  
II. HETEROPHYLLAE.

## I. HUMIFUSAE

Corolla less than 5 cm. wide.

Leaf-blades entire or sinuate: capsule densely pubescent.

Stem and capsule with appressed silky pubescence:  
plant appearing grayish.

Stem and capsule with loose, spreading pubescence:  
plant appearing green.

Leaf-blades mostly pinnatifid: capsule not densely pubescent.

Corolla over 6 cm. wide.

1. *R. humifusa*.

2. *R. mollissima*.

3. *R. laciniata*.

4. *R. Drummondii*.

## II. HETEROPHYLLAE

Plant relatively slender: blades of the lower leaves slender-petioled, pinnatifid, those of the upper ones sessile or nearly so, entire or obscurely toothed: capsules in a virgate spike.

5. *R. Curtissii*.

1. *R. humifusa* (Nutt.) Rose. Stem branched below, the branches spreading or decumbent, 2-5 dm. long, silky-canescenscent: leaves various, the basal with oblong-spatulate pinnatifid blades, the cauline with oblanceolate to lanceolate acute, undulate repand or toothed blades, 2-3.5 cm. long: flowers axillary: hypanthium 2-3 cm. long: sepals about  $\frac{1}{2}$  as long as the hypanthium: corolla 2-3 cm. broad: capsule narrowly cylindric, 2-3 cm. long, somewhat curved upward: seed 1.5-2 mm. long, striate. — (SEASIDE EVENING-PRIMROSE.)—Seabeaches and sand-dunes, Coastal Plain, Fla. to Miss. and N. J.—(W. I.)—All year S.

2. *R. mollissima* (L.) Sprague and Riley. Stem branched, the branches ascending or decumbent, softly hirsute: leaf-blades elliptic or ovate-elliptic to lanceolate or linear-lanceolate, mostly 2-5 cm. long, acute or acuminate, entire or shallowly toothed: flowers axillary: hypanthium 2.5-3 cm. long: corolla yellow, mostly 3-4 cm. broad: capsule cylindric, 2-2.5 cm. long, copiously pubescent: seed fully 2 mm. long, early smooth.—Fields, roadsides and waste-places, Coastal Plain, Fla. to Tex. and Ga. Nat. of S. A.—Spr.-fall.

3. *R. laciniata* (Hill.) Rose. Stem decumbent or ascending, often branched, 5 dm. tall, glabrous or sparingly hirsute: leaf-blades oval, lanceolate, elliptic, or oblanceolate to spatulate at the base of the plant, 2.5-5 cm. long, acute or obtusish at the apex, sinuate-dentate or often pinnatifid: flowers axillary: hypanthium 3-4 cm. long: sepals reflexed: corolla 12-36 mm. broad: capsule linear-cylindric, 2.5-3.5 cm. long, more or less pubescent: seed 1.2-1.5 mm. long, strongly pitted. [*Oenothera sinuata* L.]—Sandy woods, plains, fields, and roadsides, various provinces, Fla. to Tex., S. D., and Vt.—(W. I., Mex.)—Spr.-sum.

4. *R. Drummondii* (Hook.) Rose. Stem branched, the branches decumbent, 7 cm. long, pubescent with appressed stiff-silky hairs: leaves various; blades spatulate to lanceolate, or sometimes ovate or obovate towards the ends of the branches, 1-4 cm. long, entire or distantly toothed: flowers axillary: hypanthium 2-4 cm. long: sepals nearly linear, more than  $\frac{3}{4}$  as long as the hypanthium: corolla 7-9 cm. broad: capsule cylindric, 2.5-4 cm. long, spreading, curved upward: seed nearly 1.5 mm. long, pitted.—Sand-dunes, pinelands, and roadsides, Coastal Plain, Fla. to Tex. and N. C. Native only in Tex.—All year S.

5. *R. Curtissii* Rose. Stem slender, 1 m. tall or less, sparingly appressed-pubescent: leaf-blades lanceolate to almost linear and entire or obscurely

toothed, or oblanceolate at the base of the stem and coarsely toothed or pinatifid, all narrowed at the base: sepals mostly 9–11 mm. long, with very short free tips, glabrous or with few long hairs: corolla about 3 cm. wide: petals obovate, about 1.5 cm. long: capsule stout-subulate, 12–16 mm. long, decidedly tapering to the apex, curved, appressed-pubescent: seed about 1.5 mm. long.—Dry sand, pinelands, edges of hammocks, and river-banks, Coastal Plain, Fla. and adj. Ga.—Sum.—fall.—Formerly included in *Oenothera heterophylla*, a western species which does not occur in our range.

9. **KNEIFFIA** Spach. Perennial small herbs. Leaf-blades spatulate to linear or ovate, entire or shallowly toothed. Buds mostly erect. Flowers spicate, diurnal. Petals yellow. Ovary clavate or stout. Capsule erect, clavate or with an ellipsoid body, 4-winged, opening in wet weather. Seed not tubercled. [*Oenothera* L. in part.]—About 12 species, mostly of temperate North America.—Sum.—**SUNDROPS.**

Inflorescence and buds erect: flowers relatively large, the petals of the earlier ones 15–25 mm. long. I. FRUTICOSAE.

Inflorescence, at the tip, and buds nodding: flowers relatively small, the petals of the earlier ones 5–10 mm. long. II. PUMILAE.

#### I. FRUTICOSAE

Capsule linear-clavate, not stipitate.

Capsule with a clavate or ellipsoid stipitate body.

Capsule-body decidedly clavate at maturity, pubescent with incurved glandless hairs, or with interspersed gland-tipped hairs in *K. semiglandulosa*.

Capsule-body about as wide as long, usually much shorter than the stipe: blades of the basal leaves narrow.

Capsule with minute appressed hairs: leaves strigillose or glabrous, the basal narrowly oblanceolate: blades of the cauline leaves linear.

Capsule hirsute-strigose: leaves densely silvery-silky: blades linear-lanceolate.

Capsule-body decidedly longer than wide, longer than the stipe or about equalling it: blades of the basal leaves broad.

Capsule-body and stipe both pubescent with glandless hairs: stipe frequently about equalling the capsule-body.

Stipe of capsule equalling or somewhat exceeding the permanently pubescent body.

Stipe of capsule shorter than the body, which tends to become glabrate.

Capsule-body pubescent with minute hairs: leaves of the main stem 7–9 cm. long, glabrate.

Capsule-body pubescent with coarse hairs: leaves of the main stem 3–6 cm. long, densely pubescent.

Capsule-body pubescent with glandless hairs: stipe with glandular hairs: stipe shorter than the capsule-body.

Capsule-body ellipsoid or nearly so, pubescent with short straight gland-tipped hairs, sometimes glabrate.

Leaves of the main stem with linear-lanceolate, lanceolate, or lanceolate-ovate blades, not glaucous: stem pubescent or rarely glabrous: petals of the earlier flowers 1–2.5 cm. long.

Stem pubescent with long lax or spreading hairs.

Stem pubescent with short crisped hairs.

Capsule-body gradually narrowed into the stipe: corolla 2–4 cm. wide.

Capsule-body abruptly narrowed into the stipe: corolla 4–5 cm. wide.

Leaves of the main stem with ovate to lanceolate-ovate blades, glaucous beneath: stem glabrous or

1. *K. pratensis*.

2. *K. subglobosa*.

3. *K. arenicola*.

4. *K. fruticosa*.

5. *K. riparia*.

6. *K. brevistipata*.

7. *K. semiglandulosa*.

8. *K. hybrida*.

9. *K. tetragona*.

10. *K. latifolia*.

rarely pubescent: petals of the earlier flowers 2.5-3 cm. long.

## II. PUMILAE

11. *K. glauca*.

Plants with assurgent often gregarious flower-stems and thickish leaf-blades.

12. *K. perennis*.

1. *K. pratensis* Small. Stem 5-11 dm. tall: leaf-blades narrowly elliptic to elliptic-lanceolate, 3-11 cm. long, undulate or sinuate, acute, thin, hirsute, flat: hypanthium more or less hirsute: sepals 17-22 mm. long, the free tips 2.5-4 mm. long: petals 2-3.5 cm. long: capsule-body clavate, 17-21 mm. long, hirsute.—(MEADOW-SUN-DROPS.)—Low grounds, woods and prairies, various provinces, N of Coastal Plain, Tenn. to Ark., Ia., Wis., and Ohio. Introd. in more E States.—Sum.—fall.

2. *K. subglobosa* Small. Stem 2-3 dm. tall, puberulent, widely stoloniferous: basal leaves 4-10 cm. long, with spatulate undulately toothed blades: stem-leaves often numerous: blades linear or nearly so, 2-7 cm. long, entire or distantly toothed: hypanthium villous or silky: sepals 6-9.5 mm. long: petals 1.5 to almost 2 cm. long: capsule-body globose-obovoid, 6-7 mm. long.—Sandy soil and rocky places, Piedmont, Ga. and Ala.—Sum.—fall.

3. *K. arenicola* Small. Stem 1.5-4.5 dm. tall, strigillose: leaf-blades linear or nearly so, or some of them narrowly elliptic, 1.5-5 cm. long, entire or essentially so: hypanthium somewhat hirsute: sepals 5.5-8 mm. long: petals 16-23 mm. long: capsule-body globular or obovoid-globose, about 4 mm. long.—Sand-hills or dry pinelands, Coastal Plain, Ga. to Miss., Ark., and N. C.—Sum.—fall.

4. *K. fruticosa* (L.) Raimann. Stem 1-6.5 dm. tall, pubescent with short, usually incurved hairs: basal leaves with oval, elliptic or spatulate blades commonly 2-8 cm. long: stem-leaves not crowded; blades spatulate to linear or linear-lanceolate, undulate or shallowly toothed: sepals 1-1.8 cm. long, finely pubescent: petals 1.5-2.5 cm. long: capsule-body narrowly obovoid to ellipsoid-clavate, 6-14 mm. long. [*O. fruticosa* L. *K. linearis* Spach *K. longipedicellata* Small]—(SUNDROPS.)—Open sandy places or barrens, various provinces, Fla. to Tex., Mo., and N. Y.—Spr.—sum.

5. *K. riparia* (Nutt.) Small. Stem 5-12 dm. tall: basal leaves with spatulate blades commonly over 10 cm. long: stem-leaves often numerous; blades linear to linear-lanceolate, 5-13 cm. long, or shorter on the branches, entire or undulate denticulate: sepals about 2 cm. long, finely pubescent: petals over 2 cm. long: capsule-body clavate, pubescent all over, with minute hairs, mostly over 2 cm. long.—River banks and swamps, Coastal Plain, Ga. to N. C.—Spr.—sum.

6. *K. brevistipata* Pennell. Stem 2-4 dm. tall, pubescent, leaves 3-6 cm. long: blades linear, lanceolate, acutish, densely strigose: sepals 7-9 mm. long: petals 12-15 mm. long: capsule-body clavate-ellipsoid, 5-6 mm. long, winged, pubescent with coarse hairs, but becoming glabrate.—Dry pine ridges, Coastal Plain, N Fla. to La.—Sum.

7. *K. semiglandulosa* Pennell. Stem 3-6 dm. tall, finely pubescent, becoming glandular above, purple-red: leaves 5-9 cm. long; blades lanceolate-linear, acutish, finely pubescent or glabrate: sepals 10-13 mm. long, acuminate: petals 15-25 cm. long: capsule-body clavate, 8-10 mm. long, the wings exceed-

ing the ridges, finely pubescent with gland-tipped and glandless hairs, often nearly glabrous, the stipe-like base shorter than the body.—Pinelands, Coastal Plain, W Fla. to Miss.; introd. in E N. C.—Spr.—sum.

8. *K. hybrida* (Michx.) Small. Stem 3–10 dm. tall, hirsute, sometimes thinly so; leaf-blades oblanceolate to elliptic or lanceolate, 2.5–11 cm. long, entire, undulate, or denticulate: sepals 10–15 mm. long, the free tip usually about 2 mm. long: petals 14–21 mm. long: capsule-body obovoid-ellipsoid, 4.5–10 mm. long, sharply angled below, winged at the apex, very short-stipitate.—Woods, meadows, and roadsides, various provinces, N. C. to Tenn. and N. S.—Sum.

9. *K. tetragona* (Roth.) Pennell. Stem 3–9 dm. tall, purple throughout or green above: leaf-blades narrowly elliptic to lanceolate or linear, 2.5–10 cm. long, entire or denticulate: sepals 9–14 mm. long, the free tips about 1 mm. long: petals 10–18 mm. long: capsule-body ellipsoid, 6–12 mm. long, sharply angled and usually winged above, short-stipitate.—Dry soil, barren places, rocky river-banks, and swampy grounds, various provinces, Ga. to Ala., Mo., Mich., and N. Y.—Sum.—fall.

10. *K. latifolia* Rydb. Stem 3–6 dm. tall, pubescent, purplish or brownish below: leaf-blades elliptic, often narrowly so, to elliptic-lanceolate or ovate-lanceolate, 3–9 cm. long, entire or undulate-denticulate: sepals 12–18 mm. long, the free tips about 1 mm. long: petals 18–22 mm. long: capsule-body ellipsoid 7–9 mm. long, prominently sharply angled below, winged above, usually very short-stipitate.—Woods, Blue Ridge, N. C. and Tenn.—Sum.

11. *K. glauca* (Michx.) Spach. Stem glaucous, 4–9 dm. high: leaf-blades oval, ovate, or lanceolate-ovate, 5–14 cm. long: sepals 20–25 mm. long: petals 2.5–3 cm. long: capsule-body ellipsoid, 11–13 mm. long, broadly 4-winged. [*K. fruticosa* (Fl. SE. U. S.)]—(BLUE-LEAF SUNDROPS.)—Dry woods, usually on mt. slopes, Blue Ridge to Appalachian Plateau, Ga. to Ky. and Va.—Spr.—fall.

12. *K. perennis* (L.) Pennell. Stem puberulent, 2–6 dm. tall: basal leaves mostly with oblanceolate or spatulate blades: stem-leaves few or many: blades elliptic to linear, 2–8 cm. long, entire or very nearly so: sepals 5–7 mm. long: petals 6–9 mm. long: capsule-body obovoid or ellipsoid-obovoid, 6–12 mm. long, glabrous or nearly so. [*O. pumila* L. *K. pumila* Spach]—Open woods and moist sandy grounds, Blue Ridge and more northern provinces, N. C. to Minn., Ont., and N. S.—Spr.—sum.

10. **PENIOPHYLLUM** Pennell. Annual or biennial slender-stemmed herbs. Leaves of two forms, the basal with broad blades, the cauline linear-filiform to filiform, entire. Flowers in terminal spikes. Petals triangular. Stigma capitate, the four lobes scarcely or not distinguishable. Capsule ellipsoid, sharply 4-angled, not stipitate. Seeds angled, irregularly clustered.—One species.

1. *P. linifolium* (Nutt.) Pennell. Stem 1.5–4.5 dm. tall; basal leaves clustered, with oblanceolate or spatulate blades about 2–5 cm. long: sepals 2–3.5 mm. long: corolla yellow, 6–8 mm. broad: capsule-body ellipsoid, 4–6 mm. long: seed about 1 mm. long, brown. [*Oenothera linifolia* Nutt. *Kneiffia linifolia* (Nutt.) Spach]—Dry rocky hills and prairies, Coastal Plain and adj. provinces, Ga. to Tex., Kans., and Ill.—Spr.—sum.

11. **HARTMANNIA** Spach. Annual or perennial caulescent herbs. Leaf-blades commonly pinnatifid or lyrate. Buds drooping. Flowers spicate, diurnal. Hypanthium funnelliform. Petals white, pink or purple. Capsule-body ellipsoid to subglobose, 4-winged, narrowed to a stipe-like base. Seeds not tubercled. About 10 species, American.—Spr.—fall.—PRIMROSES.

1. *H. speciosa* (Nutt.) Small. Plant 2-7 dm. tall: blades of the basal leaves oblong-lanceolate to spatulate in outline, lyrate-pinnatifid: sepals 2-4 cm. long: petals 2.5-5 cm. long: capsules 1-2 cm. long. [*Oenothera speciosa* Nutt.]—Dry soil, fields and roadsides, various provinces, La. to Ariz., Kans., and Mo.; also abundantly naturalized from Miss. to Fla., Ill., and N. C.—(*Mex.*)—Spr.—fall.—Commonly grown in gardens whence it escapes.

12. **LAVAUXIA** Spach. Perennial or annual usually acaulescent herbs. Leaf-blades pinnatifid. Flowers few. Petals white, pink, or pale-yellow. Hypanthium tubular, slender. Ovary short. Capsule short and stout, often winged above. seeds granular, few.—About 6 species, North American.—Spr.—sum.—PRIMROSES.

1. *L. triloba* (Nutt.) Spach. Perennial, nearly glabrous throughout: leaves basal: blades oblong-lanceolate in outline, 7-30 cm. long, runcinate-pinnatifid or sinuate, sometimes ciliate: corolla white or pink, 4-6.5 cm. broad: petals often 3-lobed: capsule ovoid, 20-30 mm. long, manifestly longer than broad, 4-winged above, reticulate-veined. [*Oenothera triloba* Nutt.]—Dry, often calcareous soil, various provinces, Miss to Calif., Wyo., and Ky.—(*Mex.*)

13. **GAURA** L. Annual, biennial, or perennial herbs. Leaf-blades entire, toothed, or pinnatifid. Flowers spicate or racemose. Hypanthium narrow, somewhat prolonged beyond the ovary. Petals unequal, with clawed blades. Stamens 8, declined. Style declined. Stigma 4-lobed, surrounded by a cup-like border. Fruit ribbed or angled.—About 18 species, North American.

Anthers linear to narrowly elliptic, attached near the base.  
Anthers oval, attached near the middle.

I. BIENNES.  
II. PARVIFLORAE.

#### I. BIENNES

Fruit not stipitate, sometimes with a stout stipe-like base.

Fruit 6-8 mm. long: flower-buds less than 2 cm. long.

Fruit with rounded or obtuse angles.

Fruit with sharp angles.

Fruit pubescent: flower-buds pubescent.

Stem simple or with few ascending branches  
above: species ranging from South Carolina to  
Florida and Alabama.

1. *G. biennis*.

2. *G. angustifolia*.

Stem diffusely much branched: species of the lower Mississippi valley.

Fruit glabrous: flower-buds glabrous.

Stem, leaves, and inflorescence-rachis pubescent:

Stem, leaves, and inflorescence-rachis glabrous, at least at maturity:

Fruit 3-4 mm. long: flower-buds over 2 cm. long.

Fruit contracted into a slender stipe which resembles a pedicel.

3. *G. filiformis*.

4. *G. simulans*.

5. *G. Eatonii*.

6. *G. longiflora*.

7. *G. Michauxii*.

## II. PARVIFLORAE

Rather coarse herb, with slender elongate spikes of inconspicuous flowers.

8. *G. parviflora*.

1. *G. biennis* L. Stem 6-15 dm. tall, villous-hirsute: leaf-blades lanceolate, elliptic-lanceolate, or elliptic, 3-10 cm. long, remotely denticulate or merely undulate: buds pubescent: base of the hypanthium villous: sepals 8-9.5 mm. long: petals white, sometimes turning pink, 7-11 mm. long: fruit elliptic to oval-elliptic, 6-10 mm. long, more or less hirsute.—(MORNING-HONEYSUCKLE.)—Dry soil and stream-banks, various provinces, Ga. to Miss., Minn., and Que.—Sum.—fall.

2. *G. angustifolia* Michx. Stem 7-12 dm. tall, finely appressed-pubescent: blades of the stem-leaves spatulate to linear or linear-lanceolate, 1-6 cm. long, acute, sinuate or nearly entire, sparingly pubescent: buds pubescent: petals white or pink, 5-6.5 mm. long: fruit elliptic, 5-9 mm. long, pubescent.—Dry woods and sandy fields, Coastal Plain, Fla. to Miss. and N. C.—Spr.—fall.

3. *G. filiformis* Small. Stem 1-2.5 m. tall, canescent-puberulent: leaf-blades linear to narrowly linear-lanceolate, 2-10 cm. long, sharply, but finely toothed, or entire above: buds puberulent, less than 1.5 cm. long: sepals 9-10 mm. long: petals pink-purple, 7-8 mm. long: fruit narrowly elliptic, 6-7 mm. long, canescent.—Sandy soil, Coastal Plain, Miss. to Tex. and Ark.—Sum.—fall.

4. *G. simulans* Small. Stem 9-20 dm. tall, loosely pubescent below: blades of the stem-leaves oblanceolate or narrowly spatulate to lanceolate or linear-lanceolate, 2-12 cm. long, pinnatifid to sharply toothed: sepals broadly linear, rather obtuse: petals pinkish, 4.5-5 mm. long: fruit 8-10 mm. long, glabrous.—Coastal sand-dunes and pinelands, S Fla.—Sum.—fall.

5. *G. Eatonii* Small. Stem 3-11 dm. tall, glabrous or with scattered hairs: leaf-blades nearly similar to those of the two preceding species: buds glabrous: sepals narrowly linear, rather acute: petals pinkish, 5-6.5 mm. long: fruit glabrous, the body ellipsoid-ovoid, 7-10 mm. long, 4-angled, contracted into a very short stipe-like base.—Sand-dunes, Punta Rassa, Fla.—Spr.

6. *G. longiflora* Spach. Similar to *G. angustifolia* in habit: leaf-blades linear, narrowly so above, remotely and inconspicuously toothed or entire, somewhat revolute: buds canescent-puberulent, over 2 cm. long: sepals 11-13 mm. long: petals pink, 9-10 mm. long: fruit oval-elliptic, about 4 mm. long, canescent.—Sandy soil, Coastal Plain, Miss. (or Ala.?), La. and Tex.—Spr.—sum.

7. *G. Michauxii* Spach. Stem 6-18 dm. tall, puberulent, leaf-blades linear or linear-elliptic, 2.5-8 cm. long, sinuate or remotely dentate: buds canescent: petals white, turning reddish, 4-6 mm. long: sepals 4-6 mm. long: fruit nar-

rowly ovoid, puberulent, the body 3-4 mm. long, sharply 4-angled above, narrowed to a pedicel-like base, longer than the body.—Dry woods and fields, various provinces, Fla. to La., Kans., and N. C. (or Va.?).—Sum.—fall.

8. *G. parviflora* Dougl. Stem 6-35 dm. tall, villous-hirsute: leaf-blades lanceolate, ovate-lanceolate or elliptic, 3.5-10 cm. long, repand-dentate, softly pubescent: buds glabrous or nearly so: sepals 2-3 mm. long: petals 1.5-4 mm. long: fruit fusiform, 6-8 mm. long, 4-nerved, obtuse between the angles.—Dry soil, fields, and roadsides, various provinces, Ala. to Calif., Ore., and S. Dak.—(Mex.)—Spr.—sum.

14. *CIRCAEA* [Tourn.] L. Perennial herbs. Leaves opposite: blades mostly toothed, petioled. Flowers racemose. Sepals 2. Petals 2, white, notched. Stamens 2, alternate with the petals. Ovary 1-2-celled. Fruit obovoid, usually bristly with hooked hairs—About 8 species, natives of the Northern Hemisphere.

Plant herbaceous: leaf-blades ovate: bracts obsolete: fruit over 3 mm. long, 2-celled.

Plant succulent: leaf-blades cordate: bracts minute: fruit less than 3 mm. long, 1-celled.

1. *C. latifolia*.

2. *C. alpina*.

1. *C. latifolia* Hill. Plant 3-6 dm. tall: leaf-blades ovate, 5-10 cm. long, remotely denticulate: pedicels 4-8 mm. long: corolla about 3 mm. broad: fruit broadly obovoid, about 4 mm. long, with stiff hairs. [*C. lutetiana* (Fl. SE. U. S.)] — (ENCHANTER'S-NIGHTSHADE.) — Rich woods and thickets, various provinces, Ga. to La., Kans., S. D., Ont., and N. S.—Sum.—*C. intermedia* Ehrh. with saliently toothed leaf-blades, the upper ones more or less cordate, and minute bracts, has been reported from Texas and may occur in our range.

2. *C. alpina* L. Plant 0.5-2 dm. tall: leaf-blades ovate, 2.5-5 cm. long, coarsely dentate: pedicels 3-4 mm. long: corolla about 2 mm. broad: fruit narrowly obovoid, about 2 mm. long, with soft hairs.—Cold woods, Blue Ridge and more northern provinces, Ga. to Ind., S. Dak., Alas., and Lab.—(Eurasia.)—Sum.—fall.

## FAMILY 9. GUNNERACEAE — WATER-MILFOIL FAMILY

Perennial, or rarely annual, aquatic or amphibious herbs. Leaves alternate to whorled: blades entire to dissected, often 2 kinds on the same plant. Flowers perfect or monoecious. Calyx of 2-4 sepals. Corolla of 2-5 small petals, or wanting. Androeium of 1-8 relatively large stamens. Gynoecium of 1 or of 2-4, sometimes united, carpels. Ovary inferior. Stigmas 1-4.—Eight genera and about 100 species, widely distributed.

Gynoecium 3-carpellary: stamens 3: flowers perfect.

Gynoecium 4-carpellary: stamens 4 or 8: flowers monoecious or polygamous.

1. *PROSERPINACA*.

2. *MYRIOPHYLLUM*.

1. *PROSERPINACA* L. Herbs with stems decumbent or creeping at base. Leaves alternate: blades toothed or pectinate, sometimes both kinds on

one plant. Flowers perfect, with the perianth in 3's, apetalous. Sepals broad, often deltoid, green or sometimes whitish. Stamens 3. Stigmas 3, erect. Fruit 3-carpellary. Four species, North American.—MERMAID-WEEDS.

Leaves all nearly alike and pectinate; blades of those subtending the flowers or flower-clusters finely pectinate: stigmas stout. 1. *P. pectinata*.

Leaves all nearly alike and toothed; blades of those subtending the flowers or flower-clusters serrate or serrulate, or the submersed ones pectinate, in aquatic forms all pectinate or pinnatifid-pectinate: stigmas slender.

Fruit not auricled; nutlets with even or uneven angles.

Fruit ovate or suborbicular in outline, with obtuse or rounded angles, and turgid faces.

Fruit deltoid or rhombic in outline, with acute or margined angles, and concave faces.

Fruit auricled; nutlets with prominently appendaged angles.

2. *P. amblygona*.

3. *P. palustris*.

4. *P. platycarpa*.

1. *P. pectinata* Lam. Leaf-blades elliptic to ovate in outline, 1-3 cm. long, one-half as wide or nearly so, the segments slender or filiform-subulate, about as wide as the rachis: fruit ovoid or globose-ovoid, 3-3.5 mm. long, tuberculate-rugose, thick-angled.—Ponds, ditches, and sluggish streams, various provinces, Fla. to La. and Me.—Spr.—fall.—This species is less widely distributed than the two following, and is more decidedly restricted to coastal regions.

2. *P. amblygona* (Fernald) Small. Leaf-blades linear, elliptic, lanceolate, or spatulate, 1.5-5 cm. long, less than one-half as wide as long, serrate or the submersed ones pinnatifid or pectinate, the segments coarse or slender, but mostly narrower than the rachis: fruit ovoid or subglobose, 3-3.5 mm. long, tuberculate-roughened, thick-angled.—Ponds, swamps, and ditches, various provinces, Ga. to Tex., Mo., and Ont.—Spr.—fall.—Specimens of this species from Georgia have been erroneously referred to *P. intermedia* Mackenzie.

3. *P. palustris* L. Leaf-blades elliptic, linear, linear-lanceolate or broadened upward, mostly 2-6 cm. long, serrate or serrulate, or the submersed ones pinnatifid or pectinate, the segments slender: fruit pyramidal or rhomboidal, 4-5 mm. long, thin-angled, tuberculate-roughened.—(MERMAID-WEED.)—Moist soil, ponds, ditches, and swamps, various provinces, Fla. to La. (or Tex.?), Minn., and N. S.—Spr.—fall.

4. *P. platycarpa* Small. Leaf-blades elliptic varying to oblanceolate or obovate, 1-3 cm. long, serrate, or those of the submersed ones, or in aquatic forms all pectinate: fruit broad, mostly obreniform by the auricled angles, the faces sparingly rugose.—Pools, lime-sinks, and cypress swamps, pen. Fla.; perhaps further N along the Atlantic coast.—(W. I.)—All year.

2. **MYRIOPHYLLUM** L. Herbs with mostly submersed stems, or sometimes creeping in the mud. Leaves alternate to whorled: blades of the emersed (floral) ones entire, toothed, or pectinate; those of the submersed ones larger and with finer divisions than the others. Flowers monoecious or polygamous, with the perianth in 4's and the staminate ones petaliferous, green, red, or purplish. Sepals mostly narrow. Stamens 4 or 8. Stigmas 4, recurved. Fruit 4-carpellary.—About 20 species, widely distributed.—WATER-MILFOILS.

Sepals broad and short: plants monoecious or polygamous.

Stamens 4: corolla persistent.

Floral leaves with entire or serrate blades: anthers acuminate: petals broadly ovate.

1. *M. heterophyllum*.

Floral leaves with incised-pinnatifid blades: anthers obtuse: petals elliptic.

2. *M. pinnatum*.

Stamens 8: corolla deciduous.

3. *M. laxum*.

Sepals long and slender: plants dioecious.

4. *M. proserpinacoides*.

1. *M. heterophyllum* Michx. Leaves in 4's to 6's; blades of the usually crowded submersed ones with 6-10 pairs of linear-filiform or capillary segments; those of the floral ones elliptic, ovate, linear, or broadened upward, serrate: petals broadly ovate, 2-2.5 mm. long, abruptly pointed: anthers narrowly elliptic, 1.5-2 mm. long; fruit globose-ovoid, 2-2.5 mm. long; carpels with 2 dorsal ridges, tuberculate-roughened.—Ponds and sluggish streams, various provinces, Fla. to Tex., Minn., Ont., and N. J.—(*Mex.*)—Sum.—Forms of *M. heterophyllum* have often been erroneously referred to *M. verticillatum* in our range.

2. *M. pinnatum* (Walt.) B. S. P. Leaves in 3's to 6's, or some of them scattered; blades of the usually crowded submersed ones with 3-5 pairs of linear-capillary segments; those of the floral ones narrow, incised-pinnatifid, thus jagged-edged; petals elliptic, 1-1.5 mm. long, obtuse: anthers nearly 1 mm. long, obtuse: fruit oval or globose-ovoid, 1.5-2 mm. long; carpels with 2 tuberculate dorsal ridges.—Ponds, ditches, and muddy shores, various provinces, Fla. to Tex., Ia., and Man.—(*W. I.*)—Spr.—sum.

3. *M. laxum* Shuttlw. Leaves in 4's; blades of the approximate submersed ones with 3-7 pairs of capillary segments; those of the floral ones spatulate: petals elliptic, 2.5-3 mm. long: anthers linear to narrowly elliptic, about as long as the filaments: fruit ovoid-globose, about 1.5 mm. long; carpels minutely warty.—Ponds and lakes, Coastal Plain, N Fla., S Ga. and S Ala.—Sum.

4. *M. proserpinacoides* Gill. Leaves in 4's and 5's, feather-like; blades of the submersed and floral ones nearly or quite similar, all rather remote, with mostly 10-15 pairs of linear-subulate or rarely linear-spatulate segments: hypanthium subtended by minute or subulate bracts: sepals very slender.—(*WATER-FEATHER. PARROT'S-FEATHER.*)—Pools, and ditches, Coastal Plain, Fla. to Tex.; also locally as far N as N. Y.—Native of S. Am.—Spr.—fall.

### ORDER AMMIALES

Herbs, shrubs, trees, or vines. Leaves alternate or opposite: blades simple or compound. Flowers perfect, polygamous, or dioecious, often borne in umbels. Calyx of typically 5 small sepals surmounting the hypanthium. Corolla typically of 5 petals, or wanting. Androeceum of as many stamens as the sepals. Gynoeceum 2-carpellary or rarely several-1-carpellary. Ovary inferior. Fruit drupaceous or baccate, or dry and when a cremocarp.

Fruit drupaceous or baccate: gynoeceum 1-several-carpellary, if 2-carpellary, stigmas introrse.

Styles single or united: ovule with a dorsal raphe: leaves mostly opposite; blades entire or merely toothed.

Fam. 1. NYSSACEAE.

Styles distinct: ovule with a ventral raphe: leaves mostly alternate; blades lobed or compound.  
 Fruit dry, a cremocarp: gynoeceium 2-carpellary: stigmas terminal.

Fam. 2. HEDERACEAE.

Fam. 3. AMMIACEAE.

## FAMILY 1. NYSSACEAE — DOGWOOD FAMILY

Shrubs or trees, or rarely partly herbaceous plants. Leaves opposite or alternate: blades usually entire. Flowers perfect or unisexual, borne in naked or involucre open or congested cymes. Calyx of mostly 4 or 5 sepals. Corolla of 4 or 5, or rarely more, petals, or wanting. Androeceium of usually as many stamens as the sepals. Gynoeceium of 1 or of 2-4 united carpels. Styles united. Fruit mostly a drupe.—Sixteen genera and about 90 species, most abundant in the northern hemisphere.

Flowers dioecious or polygamo-dioecious; stigmas lateral: drupe 1-celled.

1. NYSSA.

Flowers perfect: stigmas terminal: drupe 2-celled, 2-seeded.

Flowers in open cymes, not subtended by an involucre: fruit surmounted by the style, globular, not red.

2. SVIDA.

Flowers in a head, subtended by a large involucre: fruit surmounted by the calyx, elongate, red.

3. CYNOKYLON.

1. *NYSSA* L. Shrubs or trees, with terete branches. Leaves alternate, deciduous. Flowers polygamo-dioecious, green, the staminate with 5-several sepals and 5-many stamens, the pistillate with 5 sepals and a 1-celled pistil. Drupe somewhat elongate.—About 8 species, North American and Asiatic.—Spr.

Pistillate flowers 2 or more together: drupe small (1-1.5 cm.), black, beneath a bloom; stone smooth or bluntly ridged.

I. MULTIFLORAE.

Pistillate flowers solitary: drupe large (3-4 cm.), purple to red; stone winged or sharply ridged.

II. UNIFLORAE.

## I. MULTIFLORAE

Leaf-blades obovate to ovate: stone nearly ribless.

1. *N. sylvatica*.

Leaf-blades spatulate, oblanceolate or elliptic: stone ribbed.

Drupe oval to ellipsoid: leaf-blades mostly 8-12 cm. long.

2. *N. biflora*.

Drupe globular: leaf-blades mostly 2.5-7 cm. long.

3. *N. ursina*.

## II. UNIFLORAE

Pistillate flowers short-pedicelled: drupe red; stone winged.

Leaf-blades narrow, acuminate: shrub with underground stems and erect branches.

4. *N. acuminata*.

Leaf-blades broad, obtuse or abruptly pointed: tree with spreading branches.

5. *N. Ogeche*.

Pistillate flowers long-pedicelled: drupe purple or blue; stone sharp-ridged.

6. *N. aquatica*.

1. *N. sylvatica* Marsh. Tree becoming 50 m. tall, with angular-checked bark: leaf-blades oval or obovate, sometimes pubescent beneath, 5-15 cm. long: drupe oval, 10-15 mm. long; stone oval or ellipsoid, rarely broadened upward and slightly curved. — (BLACK-GUM. SOUR-GUM. PEPPERIDGE.)—Rich soil, wet places or dry hillsides, various provinces, Fla. to Tex., Mo., Mich., and Me.—The wood of this and the next following species is used for making various utensils. It is light-yellow or nearly white and soft, but tough.

2. *N. biflora* Walt. Tree becoming 40 m. tall, with longitudinally ridged bark: leaf-blades oblanceolate, spatulate, or elliptic, mostly 2-12 cm. long: drupe oval or ellipsoid, 10-13 mm. long; stone ellipsoid, 8-10 mm. long or sometimes longer, or rarely smaller.—

(WATER-GUM. WATER-TUPELO. BLACK-GUM.)—Swamps and pond-margins, Coastal Plain and adj. provinces, Fla. to Tex. and Del. (or N. J.).—A form with rather small blunt leaves and roundish drupes 6–7 mm. in diameter from the coastal regions from South Carolina to Virginia may represent an additional species.

3. *N. ursina* Small. Shrub with copiously branched stems or a small much-branched tree: leaf-blades elliptic, often narrowly so, to spatulate, 2.5–7 cm. long, coriaceous, mostly rounded at the apex: drupe globular, 9–12 mm. in diameter, very fleshy; stone oval, 8–10 mm. long.—(BEAR-GUM.)—Pineland swamps, Apalachicola River delta, Fla.—A much-branched shrub with the habit of *Cliftonia* and *Cyrilla*, with which it grows, conspicuous by its numerous small leaves and in flower or fruit, by the very numerous flower clusters or fruits, respectively. The juicy drupes, although intensely bitter, are a favorite food of the bears of the region.

4. *N. acuminata* Small. Shrub becoming 3 m. tall, usually with numerous erect branches: leaf-blades narrowly elliptic or oblanceolate, 4–16 cm. long, acuminate: drupe ellipsoid, about 2 cm. long.—Pineland swamps near the coast, Ga.

5. *N. Ogeche* Marsh. Tree becoming 20 m. tall, the stem crooked; leaf-blades elliptic, varying to oblanceolate or lanceolate, or rarely oval, 5–20 cm. long, usually entire: petioles about 1 cm. long: drupe 3–4 cm. long, red, longer than the pedicel; stone papery-winged.—(OGECHÉ-LIME. OGECHÉ-PLUM. TUPELO-GUM.)—Wet swamps, Coastal Plain, Fla. to S. C.—The fruits are used to make an acid drink and for a preserve. The wood is white, light, soft and tough.

6. *N. aquatica* L. Tree becoming 35 m. tall, the stem erect: leaf-blades ovate to elliptic, 9–30 cm. long, often sinuate or coarsely toothed; petioles 2.5 cm. long: drupe nearly 3 cm. long, dark-purple, shorter than the pedicel; stone sharp-ridged.—(TUPELO-GUM. COTTON-GUM.)—River-swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex., Ill., and Va.—The wood is used for making various utensils. It is light-brown or nearly white, soft, but tough.

2. *SVIDA* Opiz. Shrubs or trees. Leaves opposite or rarely alternate. Flowers in naked corymb-like cymes. Sepals 4, minute. Petals 4, white, spreading. Stamens 4. Drupe globular or depressed. [*Cornus* L. in part.]—About 15 species, North American.—Spr.—CORNELS.—Some species are used medicinally.

Leaves alternate, approximate at the end of the branches: drupe deep-blue or blue-black. 1. *S. alternifolia*.

Leaves opposite, remote: drupe white or pale-blue or light-blue.

Lower leaf-surfaces glabrous.

Twigs gray: drupe white: stone broader than long. 2. *S. femina*.

Twigs reddish-brown: drupe pale-blue: stone mostly longer than broad. 3. *S. stricta*.

Lower leaf-surfaces with straight or curled hairs.

Stones longer than broad: drupe 3–4 mm. in diameter.

Leaf-blades membranous, those below a peduncle elliptic or oval. 4. *S. microcarpa*.

Leaf-blades leathery, those below a peduncle ovate to ovate-lanceolate. 5. *S. Priceae*.

Stones broader than long: drupe 6–8 mm. in diameter.

Sepals much shorter than the hypanthium: drupe white: stone sharply 4-angled. 6. *S. asperifolia*.

Sepals about as long as the hypanthium: drupe pale-blue: stone slightly angled. 7. *S. Amomum*.

1. *S. alternifolia* (L. f.) Small. Shrub, or tree sometimes 9 m. tall: leaf-blades elliptic or oval, varying to ovate or obovate, 5–15 cm. long, whitish be-

neath, prominently ribbed: petals oblong-ovate: drupe depressed-globose, 8–10 mm. in diameter, blue-black.—(PAGODA-CORNEL. UMBRELLA-CORNEL.)—Bluffs, woods and thickets, various provinces, Fla. to Ala., Minn., and N. B.—The brown heart-wood is close-grained and hard.

2. *S. femina* (Mill.) Small. Shrub with gray twigs: leaf-blades elliptic or lanceolate, 4–15 cm. long: sepals triangular: petals oblong to oblong-lanceolate: drupe subglobose, 4–5 mm. in diameter. [*S. candidissima* (Marsh.) Small]—River-banks, thickets, and roadsides, various provinces, Ga. to Nebr., Minn., and Me.

3. *S. stricta* (Lam.) Small. Shrub, or small tree with smoothish bark: leaf-blades elliptic, oval, or ovate, 4–12 cm. long: petals linear-oblong to linear-lanceolate: drupe 5–6 mm. in diameter, pale-blue.—Swamps, Coastal Plain, Fla. to Tex., Mo., Ind., and Va.

4. *S. microcarpa* (Nash) Small. Shrub with brownish twigs: leaf-blades oval or elliptic, 3–9 cm. long: petals ovate-lanceolate to lanceolate: drupe about 4 mm. in diameter, light-blue.—Low woods, Coastal Plain, Fla. and Ga.

5. *S. Priceae* Small. Shrub with red twigs: leaf-blades elliptic, ovate-elliptic, ovate or ovate-lanceolate, 5–12 cm. long: petals narrowly lanceolate: drupe about 3 mm. in diameter, white.—Bluffs and river banks, Interior Low Plateaus, Tenn. and Ky.

6. *S. asperifolia* (Michx.) Small. Shrub with brownish twigs: leaf-blades ovate to elliptic or oval, 4–15 cm. long: drupe 5–6 mm. in diameter, white.—(ROUGH-LEAF CORNELL.)—Low grounds or moist banks, various provinces W of Blue Ridge, Ala. to Tex., Minn., and Ont.

7. *S. Amomum* (Mill.) Small. Shrub with purple twigs: leaf-blades lanceolate to broadly ovate, 3–13 cm. long, silky and often somewhat rusty beneath: drupe 6–8 mm. in diameter, pale-blue.—Common, in moist thickets and along streams.—(KINNIKINNIK. SILKY-CORNEL.)—Wet places and stream-banks, various provinces, Fla. to Tex., N. D., and Newf.

3. **CYNOXYLON** Raf. Trees. Leaves opposite. Flowers perfect, borne in involucre heads. Sepals 4, broadly ovate to oblong. Petals 4, greenish or yellow-green, recurving. Stamens 4. Drupe elongate. Two species, North American.

1. *C. floridum* (L.) Raf. Tree sometimes 15 m. tall, with rough black bark, leaf-blades elliptic to oval, 5–18 cm. long, pale beneath: involucre bracts white or pink, obovate, 4–6 cm. long: petals linear, 3–4.5 mm. long: drupe ellipsoid to oval, about 15 mm. long, red. [*Cornus florida* L.]—(FLOWERING DOGWOOD.)—Hammocks and rich woods, various provinces, Fla. to Tex., Minn., and Me.—There is always a black crumple at the tip of each involucre bract. The very close-

grained wood is sometimes used as a substitute for boxwood, in wood engraving and for a variety of articles.

## FAMILY 2. **hederaceae** — ivy family

Herbs, shrubs, trees, or vines. Leaves alternate: blades simple or compound. Flowers perfect or polygamous, often umbellate. Calyx of 5 sepals, or obsolete. Corolla of 5 or 10 petals. Gynoecium of 2-5 united carpels. Styles often distinct. Fruit a berry or a drupe.—Fifty-two genera and about 475 species, natives of the north temperate zone.

Vines: leaf-blades simple.

Herbs, shrubs or trees: leaf-blades compound.

Umbel simple: plant scapose, the bracts whorled: styles 2 or 3.

Umbel compound: plant caulescent, the leaves alternate: styles 5.

1. *hedera*.

2. *panax*.

3. *aralia*.

1. ***hedera*** L. Vines. Leaf-blades leathery, entire or lobed. Flowers polygamous, in paniced umbels. Sepals 5, or obsolete. Petals 5. Stamens 5. Ovary 5-celled. Styles united. Fruit angled.  
—One species, in many cult. varieties.

1. ***H. Helix*** L. Evergreen vine, with aërial rootlets: leaf-blades ovate to suborbicular, angular or 3-5-lobed, 2-10 cm. long: hypanthium pubescent: petals ovate to elliptic-ovate, yellowish-green, 2-3 mm. long: fruit about 10 mm. in diameter.—(ENGLISH IVY.)  
—About houses, fences, and cemeteries, locally naturalized from Europe, and cult., throughout U. S.—Sometimes used medicinally.—Ivy is a historic plant, its record going back into ancient mythology. The name *Hedera* comes down through the Romans. In Europe it has furnished a resin for varnish, a dye, and tanning material.

2. ***panax*** L. Perennial herbs. Leaf-blades palmately compound. Scape topped with a whorl of bracts quite similar to the leaves. Umbel simple. Ovary mostly 2- or 3-celled. Styles distinct. Fruit red, yellowish, or yellow.—Seven species, North American and Asiatic.

Rootstock globular: leaflets sessile, obtuse: berry yellow.

Rootstock fusiform: leaflets stalked, acuminate: berry red.

1. *P. trifolium*.

2. *P. quinquefolium*.

1. ***P. trifolium*** L. Plant 1-2 dm. tall: bracts 3: leaflets 3, the blades elliptic, 1-8 cm. long: petals white: berry 4-5 mm. broad.—(DWARF-GINSENG. GROUND-NUT.)—Damp places in woods, various provinces, Coastal Plain only N, Ga. to Ill., Minn., and N. S.—Spr.

2. ***P. quinquefolium*** L. Plant 2-4 dm. tall: bracts 3 or 5: leaflets 5-7, the blades ob-ovate, or those of the basal leaflets oval or suborbicular, 2-12 cm. long: petals greenish: berry 8-10 mm. broad.—(GINSENG. SANG.)—Cool places in rich woods, various provinces, Fla. to La., Nebr., Minn., and Que.—Sum.—The root is exported to China where it is used in superstitious practices. The natural supply being much depleted, the plant is now extensively cultivated.

3. **ARALIA** [Tourn.] L. Perennial herbs, shrubs, or trees, sometimes prickly-armed or spiny. Leaves alternate: blades pinnately or ternately compound. Umbel compound. Flowers white or greenish. Ovary mostly 5-celled. Styles distinct or united at the base. Fruit black. About 30 species, North American and Asiatic.—SPIKENARDS. SARSAPARILLAS.—Several of the species are used in medicine.

Umbels few, in terminal corymbs or few-rayed umbels.

Plant with elongate rootstock, a peduncle or a leaf, or both, arising together at intervals from the rootstock.

Plant with leafy branches arising from the rootstock.

Umbels numerous, in terminal or axillary racemes or panicles.

Large unarmed herb: leaflets membranous: hypanthium campanulate: anthers globular.

Shrub or small tree, with prickly-armed stems: leaflets leathery: hypanthium broadly turbinate: anthers ellipsoid.

1. *A. nudicaulis*.

2. *A. hispida*.

3. *A. racemosa*.

4. *A. spinosa*.

1. *A. nudicaulis* L. Plant 2–3.5 dm. tall, sparingly soft-pubescent or glabrous: leaf usually solitary: inflorescence overtopped by the leaf: berry 6–8 mm. in diameter: seed 4.5–5 mm. long, very flat.—(WILD SARSAPARILLA.)—Woods and rocky hillsides, various provinces, Ga. to Mo., Man., and Newf.—Spring–sum.

2. *A. hispida* Vent. Plant 2–9 dm. tall, bristly pubescent: leaves several or many: inflorescence overtopping the leaves: berry rather smaller than those of *A. nudicaulis*: seed 2.5–3 mm. long, swollen.—(WILD-ELDER. BRISTLY-SARSAPARILLA.)—Sandy thickets and rocky woods, various provinces, Coastal Plain only N, N. C. to Ind., Minn., Ont., and Lab.—Sum.

3. *A. racemosa* L. Large herb 1–2 m. tall, unarmed: blades of the leaflets membranous: hypanthium campanulate: petals rather shorter than the hypanthium: berry 4–5 mm. in diameter: seed about 2.5 mm. long.—(SPIKENARD. HUNGRY-ROOT.)—Rich woods, various provinces, Ga. to Miss., Mo., S. D., and N. B.—Sum.

4. *A. spinosa* L. Shrub or small tree, prickly-armed: blades of the leaflets leathery: hypanthium broad-turbinate: petals longer than the hypanthium: berry 6–7 mm. in diameter: seed about 4 mm. long.—(PRICKLY-ASH. TOOTHACHE-TREE. HERCULES-CLUB. PRICKLY-ELDER. DEVIL'S-WALKINGSTICK.)—Low grounds and woods, various provinces, Fla., to Tex., Mo., and N. Y.—Sum.—Sometimes cultivated for ornament. The bark and fruits are occasionally used in medicine. The brown heart-wood is streaked with yellow, close-grained but light and soft.

### FAMILY 3. AMMIACEAE — CARROT FAMILY

Herbs with hollow stems. Leaves typically alternate: blades dissected, or sometimes merely toothed, or entire. Flowers perfect or polygamous, umbellate. Calyx of 5 tooth-like sepals, or obsolete. Corolla of 5 petals. Androecium of 5 stamens. Gynoecium of 2 united carpels, often with a stylopodium. Fruit dry, a cremocarp, the ribbed or winged carpels separating at maturity.—About 250 genera and more than 2,000 species, widely distributed, but most abundant in the tropics.

- Flowers densely capitate: fruit scaly, ribless. Tribe I. ERYNGIEAE.  
 Flowers evidently umbelled, the umbels sometimes compact:  
 fruit ribbed, or if ribless, not scaly.  
 Fruit ribless, covered with hooked prickles or stellate hairs.  
 Fruit with hooked prickles, pointed at the apex, the carpels broadly united: leaf-blades pinnately or palmately 3-7-foliolate.  
 Fruit with stellate hairs, broadly rounded at the apex, the carpels nearly distinct: leaf-blades lobed.  
 Fruit ribbed, at least on the beak.  
 Secondary ribs of the carpels more prominent than the primary, armed with prickles, the primary ribs bristly.  
 Secondary ribs wanting, the primary ones evident or prominent.  
 Fruit narrow, linear or linear-clavate, several times longer than wide.  
 Fruit short, ellipsoid to globose, less than twice as long as wide.  
 Fruit terete in cross-section or compressed laterally.  
 Umbels simple, rarely proliferous: leaves with blades.  
 Umbels compound, if simple the leaves mere hollow phyllodia.  
 Fruit much flattened dorsally, with the lateral ribs more or less strongly winged.
- I. ERYNGIEAE
- erect or prostrate herbs, often with bristly or spiny leaves and bracts, the inflorescence frequently highly colored.
- II. SANICULEAE
- erect herbs with palmate leaf-blades and irregular umbels, the flowers perfect and staminate.
- IIa. BOWLESIEAE
- Weak-stemmed herbs, with slender-petioled leaf-blades and short-peduncled, few-flowered axillary umbels.
- III. CAUCALIEAE
- Carpels obsolete: fruit dorsally flattened.  
 Carpels prominent: fruit laterally flattened.
- IV. OSMORRHIZEAE
- Fruit bristly.  
 Fruit with an elongate beak longer than the body, not narrowed at the base.  
 Fruit beakless, narrowed at the base.  
 Fruit not bristly.  
 Fruit beaked, the beak shorter than the body: oil-tubes wanting.  
 Fruit beakless or slightly beaked: oil-tubes present.  
 Seed-face concave: leaf-blades decompose: annual plants.  
 Seed-face flat: leaf-blades 3-foliolate: perennial plants.
- V. HYDROCOTYLEAE
- Fruit without secondary ribs or reticulations: involucre wanting.  
 Fruit with secondary ribs and reticulations: involucre present.
- VI. AMMINEAE
- Corolla white, greenish, or pinkish.  
 Fruit terete or nearly so.  
 Umbel compound: leaves much-divided.  
 Ribs of the carpels all corky thickened.
- II. SANICULEAE.
- IIa. BOWLESIEAE.
- III. CAUCALIEAE.
- IV. OSMORRHIZEAE.
- V. HYDROCOTYLEAE.
- VI. AMMINEAE.
- VII. ANGELICEAE.
1. ERYNGIUM.
2. SANICULA.
- 2a. BOWLESIA.
3. DAUCUS.
4. TORILIS.
5. SCANDIX.
6. OSMORRHIZA.
7. CEREFOLIUM.
8. CHAEROPHYLLUM.
9. DERINGA.
10. HYDROCOTYLE.
11. CENTELLA.
12. CYNOSCIADIUM.

- Ribs of the carpels slender, the lateral sometimes corky.  
 Fruit subglobose.  
 Fruit ellipsoid.  
 Umbel simple: leaves philodia-like, linear or spatulate.  
 Fruit laterally flattened.  
 Fruit tubercled.  
 Fruit smooth.  
 Carpels strongly flattened laterally, the fruit nearly orbicular.  
 Carpels nearly terete, or only slightly flattened.  
 Carpels without oil-tubes.  
 Involucre present: carpel-ribs wavy-margined.  
 Involucre wanting.  
 Carpels with oil-tubes.  
 Seed-face concave: oil-tubes more than one in the intervals.  
 Seed-face flat or nearly so: oil-tubes usually solitary in the intervals.  
 Umbels terminal or axillary.  
 Stylopodium depressed.  
 Carpels with the lateral ribs largest: leaf-blades bipinnate, the segments lanceolate.  
 Carpel-ribs nearly equal: leaf-blades pinnate or finely dissected with linear or filiform segments.  
 Carpel-ribs winged: leaf-blades pinnate.  
 Carpel-ribs not winged: leaf-blades finely dissected into linear or filiform segments.  
 Stylopodium conic.  
 Carpel-ribs, at least the lateral, corky-thickened.  
 Fruit narrow; 8-10 mm. long, umbel rays 5 or less.  
 Fruit broad; 1.5-4 mm. long, umbel rays numerous.  
 Carpel-ribs not corky-thickened.  
 Umbels, at least the lower ones, opposite the leaves.  
 Carpel-ribs slender winged, stylopodium prominent on the mature fruit.  
 Carpel-ribs corky-thickened, stylopodium not prominent on the mature fruit.  
 Corolla yellow or greenish-yellow, sometimes purple in *Thaspium*.  
 Leaf-blades simple, perfoliate: carpels without oil-tubes.  
 Leaf-blades compound: carpels with oil-tubes.  
 Fruit not flattened: carpel-ribs winged.  
 Fruit flattened laterally: carpel-ribs not winged.  
 Leaf-segments entire.  
 Leaf-segments toothed, incised, or lobed.  
 Stylopodium wanting.  
 Stylopodium present.  
 Involucre of 2-4 linear bracts: stylopodium depressed.  
 Involucre wanting: stylopodium conic.
13. CORIANDRUM.  
 14. LIGUSTICUM.  
 15. LILAEOPSIS.  
 16. SPERMOLEPIS.  
 17. ERIGENIA.  
 18. CONIUM.  
 19. AEGOPODIUM.  
 20. EULOPHUS.  
 21. CICUTA.  
 22. SICUM.  
 23. AMMI.  
 24. TREPOCARPUS.  
 25. PTILIMNIUM.  
 26. HARPERELLA.  
 27. CELERI.  
 28. CYCLOSPERMUM.  
 29. BUPLEURUM.  
 30. THASPIUM.  
 31. TAENIDIA.  
 32. ZIZIA.  
 33. APIUM.  
 34. FOENICULUM.

## VII. ANGELICEAE

- Corolla yellow: stylopodium depressed.  
 Fruit with thick corky lateral ribs and obsolete dorsal ribs: oil-tubes several in the intervals.  
 Fruit with thin-margined lateral ribs and evident dorsal ribs: oil-tubes solitary in the intervals.  
 Leaf-segments very narrow.  
 Leaf-segments broad.
35. PLEIOTAENIA.  
 36. ANETHUM.  
 37. PASTINACA.

Corolla white: stylopodium conic (except in *Angelica*).

Oil-tubes more than one in the intervals.

Leaf-blades 2-3 pinnately decomposed, the segments narrow.

Leaf-blades 1-2 ternately divided, the segments broad.

Oil-tubes solitary in the intervals.

Fruit notched at the apex, the carpels very flat.

Fruit not notched at the apex, the carpels not very flat.

38. CONIOSELINUM.

39. ANGELICA.

40. HERACLEUM.

41. OXYPOLIS.

1. **ERYNGIUM** Tourn. L. Biennial or perennial herbs. Leaf-blades spiny-toothed, lobed or incised, or rarely entire. Bracts of the involucre often colored, otherwise often resembling the leaves. Sepals acute or spine-like. Petals 5, blue, white, or greenish, each prolonged into an inflexed tip. Carpels with obsolete ribs and 5 oil-tubes. About 175 species, of tropical and temperate regions.—**ERYNGOS**. **BUTTON-SNAKERROOTS**.—Some species are accredited with medicinal properties.

Leaf-blades parallel-veined.

Leaf-blades not parallel-veined.

Blades of the basal-leaves lobed or parted, the segments spine-tipped.

Heads subglobose, spiny-bristly: bracts and bractlets 3-5-pronged.

Heads ovoid to ellipsoid, not bristly: bracts and bractlets not 3-pronged.

Blades of the basal leaves entire or merely toothed.

Stem and branches filiform or very slender, prostrate: plants biennial.

Stem relatively stout, erect or ascending: plants perennial, or, perhaps rarely biennial.

I. AQUATICA.

II. AROMATICA.

III. DIVARICATA.

IV. PROSTRATA.

V. INTEGRIFOLIA.

#### I. AQUATICA

Petals ovate, acuminate: bristles on the leaf-margin solitary.

Petals suborbicular, mucronate: bristles on the leaf-margin mostly 2-4 together.

1. *E. aquaticum*.

2. *E. synchaetum*.

#### II. AROMATICA

Diffuse plant, the branches from the top of the root decumbent: inflorescence near the tip of the branches widely branched.

Plant erect, the stem corymbosely branched at the top: leaf-blades with 3-5 apical prong-like teeth.

3. *E. aromaticum*.

3a. *E. cuneifolium*.

#### III. DIVARICATA

Prostrate plant, the heads mostly axillary, much longer than wide.

#### IV. PROSTRATA

Bractlets longer than the flowers: stem-leaves with narrow blades or segments: fruit strongly tuberculate.

Bractlets shorter than the flowers: stem-leaves with broad blades or segments: fruit not strongly tuberculate.

4. *E. divaricatum*.

5. *E. Baldwinii*.

6. *E. prostratum*.

#### V. INTEGRIFOLIA

Lower leaves with elongated hollow petioles and long blades.

Bractlets entire.

Bractlets 3-pronged.

Teeth of the bractlets unequal, the lateral teeth smaller.

Teeth of the bractlets about equal.

Lower leaves with short petioles and blades.

Leaf-blades ovate, elliptic or lanceolate, serrate or crenate: heads mostly over 7 mm. high.

Leaf-blades linear or linear-spatulate, laciniately toothed, at least near the base: heads mostly less than 7 mm. high.

7. *E. floridanum*.

8. *E. virginianum*.

9. *E. Ravenelii*.

10. *E. integrifolium*.

11. *E. ludovicianum*.

• *E. aquaticum* L. Plant 3-18 dm. tall: blades of the lower leaves broadly linear, mostly 2-9 dm. long, stiff: sepals ovate to elliptic-ovate, about 2.5 mm.

long: petals over 2 mm. long: fruit 3.5–4 mm. long.—(CORN-SNAKEROOT. RATTLE-SNAKE-MASTER.)—Low woods, swamps, and acid meadows, various provinces, Fla. to Tex., Minn., and Conn.—Spr.—fall.—The specific name is somewhat of a misnomer, as the plant often grows in rather dry soil.

2. *E. synchaetum* (A. Gray) Rose. Plant 3–9 dm. tall: blades of the lower leaves narrowly linear, usually pliable: sepals broadly ovate to deltoid-ovate, 1.5–1.8 mm. long: petals less than 2 mm. long: fruit 2–2.5 mm. long.—Pinelands and prairies, Coastal Plain, Fla. to Tex., Ark., and Ga.—Spr.—fall.—A decoction made from the roots constitutes the ceremonial “black-drink” of the Seminoles.

3. *E. aromaticum* Baldw. Plant ultimately diffuse, the branches 1–6 dm. long: blades of the lower leaves spatulate in outline, pinnatifid or pinnately parted, 3–4 cm. long, pale-margined: heads becoming 8–10 mm. long: sepals lanceolate, 2–2.3 mm. long, acuminate: petals fully 1.5 mm. long: fruit granular, 1.5–2 mm. long, or rarely smaller.—Dry pinelands, Coastal Plain, Fla. and adj. Ga.—Spr.—Sometimes erroneously accredited to Ala.

3a. *E. cuneifolium* Small. Plant erect, 2–5 dm. tall: blades of the numerous basal leaves cuneate, long-petioled, the 3–5 apical teeth callous-margined spine-tipped: heads becoming 5–8 mm. in diameter: sepals lanceolate, 1.5–2 mm. long, acuminate: petals about 1.5 mm. long: fruit scarcely 1.5 mm. long.—Scrub, S part of Lake Region, Fla.—Sum.—fall.

4. *E. divaricatum* H. & A. Plant prostrate: blades of the lower leaves bipinnatifid, those of the upper ones pinnatifid, the segments linear to lanceolate, minutely spine-tipped: heads ovoid, becoming ellipsoid, 1 cm. long or less: bracts of the involucre linear-subulate, spreading: fruit less than 1 mm. long, bristly.—Low grounds and waste-places, around sea-ports, Fla. to N. C. Nat. of Argentina.—Spr.—fall or all year S.

5. *E. Baldwinii* Spreng. Plant prostrate: blades of the basal leaves elliptic varying to broadest above or below the middle, 2–9 cm. long: heads ovoid to cylindric: bracts of the involucre subulate.—Swamps and wet sandy soil, Coastal Plain, Fla. to La. and Ga.—Spr.—fall.

6. *E. prostratum* Nutt. Plant prostrate: blades of the basal leaves elliptic or ovate, 2–4 cm. long: heads ellipsoid: bracts of the involucre linear-lanceolate to linear-spatulate.—Low grounds and wet places, Coastal Plain and adj. provinces, Fla. to Tex., Mo., Ky., and Ga.—Sum.

7. *E. floridanum* Coult. & Rose. Stem 6–9 dm. tall: blades of the lower leaves narrowly elliptic to linear-lanceolate, 3–11 cm. long, entire or nearly so: heads becoming about 1 cm. long: sepals ovate, about 2 mm. long: petals about 1 mm. long: fruit about 2 mm. long.—Brackish marshes, Fla.—Spr.—fall.

8. *E. virginianum* Lam. Stem 3–9 dm. tall: blades of the lower leaves linear, to oblanceolate, 15–40 cm. long, undulate or toothed, often coarsely so: heads becoming about 1.5 cm. long: sepals lanceolate, about 2.5 mm. long, slender-tipped: petals 1–1.5 mm. long: fruit about 1.5 mm. long. [*E. praealtum* A. Gray]—Low grounds and swamps, Coastal Plain, Fla. to Tex. and N. J.—Spr.—fall.

9. *E. Ravenelii* A. Gray. Stem 5–10 dm. tall: blades of the lower leaves narrowly elongate-linear, 25–50 cm. long, undulate or slightly toothed: heads becoming 1–1.5 cm. long: sepals ovate or ovate-lanceolate, 2–3 mm. long, short-acuminate: petals 1.5–2 mm. long: fruit about 2–2.5 mm. long. [*E. Mettaueri* Wood]—Swampy pinelands, Coastal Plain, Fla. to S. C.—Sum.–fall.

10. <sup>M</sup>*E. integrifolium* Walt. Stem 4–9 dm. tall: blades of the lower leaves ovate to elliptic, 5–8 cm. long, serrate-crenate: heads becoming about 1 cm. long: sepals ovate, about 1.5 mm. long, acute: petals 1–1.3 mm. long: fruit 1.5–2 mm. long. [*E. virgatum* Lam.]—Sandy bogs, Coastal Plain and rarely adj. provinces, Fla. to Tex., Tenn., and N. C.—Sum.–fall.

11. *E. Ludovicianum* Morong. Stem more slender than in *E. integrifolium*: blades of the lower leaves linear-spatulate, 3–7 cm. long, laciniately toothed: heads depressed, less than 1 cm. long at maturity: sepals ovate, 1–1.5 mm. long, abruptly pointed: petals 1–1.5 mm. long: fruit about 1 mm. long.—Low pine-lands, Coastal Plain, Ga. to Tex.—Sum.–fall.

2. **SANICULA** [Tourn.] L. Biennial or perennial, glabrous or nearly glabrous herbs. Leaves alternate: blades pinnatifid or palmately 3–7-foliolate: leaflets toothed or incised. Umbels irregular, compound, few-rayed. Bracts of the involucre resembling the leaves. Sepals 5, persistent. Petals white, yellowish, or purple. Fruit subglobose or ellipsoid, somewhat dorsally flattened, armed with hooked bristles: carpels ribless: oil-tubes usually 5.—About 25 species, of wide geographic distribution.—Spr.–fall.—**SNAKE-ROOTS.** **BLACK SNAKE-ROOTS** **SANICLES.**—Some species are used in medicine.

Perennial plants: stamens and style exserted.

Roots slender: leaf-blades 5-divided or 5-foliolate: stamens and styles exserted.

Petals and anthers greenish-white: sepals linear-subulate:

fruit about 6 mm. long.

Petals and anthers yellow: sepals ovate: fruit about 3 mm. long.

Roots tuberous thickened: leaf-blades 3-divided or 3-foliolate: stamens and style short-exserted.

Biennial plants: stamens and style included.

Pedicels of the staminate flowers 3–4 times the length of the hypanthium and calyx: seed with 2 large oil tubes.

Pedicels of the staminate flowers 1–2 times the length of the hypanthium and calyx: seed with 5 large oil-tubes.

Leaf-blades becoming 8–15 cm. broad: leaflets or leaf-segments thin, the teeth weakly aculeate.

Leaf-blades mostly less than 6 cm. broad: leaflets or leaf-segments thickish, the teeth spinulose-cuspidate.

6. *S. floridana*.

1. *S. marylandica* L. Stem 4.5–13 dm. tall, mostly simple below the inflorescence: leaves bluish-green: involucre of scale-like bractlets: petals slightly longer than the sepals: fruit obovoid, not stipitate.—(**BLACK-SNAKE-ROOT.**)—Rich woods and thickets, various provinces, Ga. to Miss., Colo., Alb., Ont., and Newf.

2. *S. gregaria* Bicknell. Stem 3–9 dm. tall, widely branched: leaves bright-green: involucre of foliaceous bractlets: petals much longer than the sepals: fruit broadly obovoid, stipitate.—Moist woods and thickets, various provinces, rarely Coastal Plain, Fla. to Kans., Nebr., Wis., and Vt.

3. *S. Smallii* Bicknell. Stem 2.5–6 dm. tall, widely branched: leaves pale-green: involucre of very small bractlets: petals

not longer than the sepals, greenish: fruit ovoid.—Rich soil or rocky woods, various provinces, Fla. to Miss., Mo., and N. C.

4. *S. trifoliata* Bicknell. Stem 3–8 dm. tall: divisions of the leaf ovate or rhombic: involucre of foliaceous bracts: petals greenish: fruits ellipsoid or broader, 7 mm. long at maturity.—Rich woods, various provinces N of Coastal Plain, Tenn. to Ind., Ont., Vt., and Me.

5. *S. canadensis* L. Stem 3–13 dm. tall: divisions of the leaf-blade cuneate-ovate to narrowly elliptic: involucre of minute bracts: petals greenish: fruit subglobose, 3–5 mm. long, very short-stipitate.—Rich woods and thickets, various provinces, Fla. to Tex., Nebr., Minn., and N. H.—Apparently not in Canada as the name implies.

6. *S. floridana* Bicknell. Similar to *S. canadensis* in habit, but smaller throughout: divisions of the leaf-blades abruptly cuneate with concave sides: involucre of very small or minute bracts: petals green: fruit smaller than that of *S. canadensis*.—Sandy soil, Coastal Plain, Fla. to Miss. and S. C.

2a. **BOWLESIA** R. & P. Annual caulescent herbs, with stellate pubescence. Leaves opposite: blades merely lobed. Flowers in simple, few-flowered umbels which terminate axillary peduncles. Sepals 5, prominent. Corolla white. Disk rather flat. Fruit turgid, smooth, stellate-pubescent: carpels ribless, becoming depressed on the back, nearly distinct: oil-tubes wanting or obsolete. Seed dorsally flattened, the face essentially flat.—About a dozen species, mostly South American.

1. *B. septentrionalis* Coult. & Rose. Stems weak, reclining or decumbent, 0.5–6 dm. long, dichotomously branched: leaf-blades reniform to ovate-cordate, 1.5–3 cm. broad, thin, 3–5-lobed, slender-petioled: umbels short-peduncled, 1–4-flowered; fruit about 2 mm. long, sessile or nearly so.—Rich soil, marshes, swamps, and woods, various provinces, La. to Calif.—Spr.

3. **DAUCUS** [Tourn.] L. Annual or biennial herbs. Leaf-blades pinately decomposed. Umbels compound. Involucres and involucels various, or wanting. Sepals minute or obsolete. Petals white or rarely colored, often unequal, broadest above the middle, inflexed at the apex. Fruit longer than broad: carpels with 5 low primary ribs and 4 winged secondary ribs which are also armed with a row of barbed bristles: oil-tubes solitary under the secondary ribs and 2 on the inner face.—About 25 species, widely distributed.—CARROTS.

Carpels broadest at the middle; wings divided into 12 or more bristle-like prickles.

1. *D. Carota*.

Carpels broadest below the middle; wings parted into 1–8 flat prickles.

2. *D. pusillus*.

1. *D. Carota* L. Stem bristly-hispid, erect, 4–12 dm. tall, often branched, channeled: leaf-segments acute or cuspidate, cleft or toothed: rays of the com-

ound umbel numerous: corolla white or rarely pink, a few in each umbel larger than the rest, the central one often purple: petals very unequal, suborbicular, unequally left, crisped: fruit 3-4 mm. long, the carpels broadest at the middle, the wings divided into 12 or more bristle-like prickles. — (WILD-CARROT. QUEEN-ANNE'S LACE. DEVIL'S PLAGUE.)—In fields and waste-places, nearly throughout N. A.; except the extreme N and S. Nat. of Eurasia.—(W. I.)—Spr.-fall. The root of the cultivated plant is esculent.

2. *D. pusillus* Michx. Stem retrorsely hispid, erect, 1-8 dm. tall: umbels long-peduncled: rays several or numerous, 1-2 cm. long, nearly equal: corolla white, or the central one larger and purple: fruit ovoid-ellipsoid, 3-4 mm. long, the wings parted into 1-8 flat prickles. Fields and waste-places, various provinces, Fla. to Tex., Calif., B. C., and Mo.—Spr.-fall.

4. *TORILIS* Adans. Annual herbs. Leaf-blades pinnately decompose. Umbels capitate or spreading. Involucres of few bracts or wanting. Involucels of several or many narrow bracts. Sepals acute. Petals white, unequal. Carpels short, with 5 primary ribs and 4 winged secondary ribs. Oil-tubes solitary under the ribs and 2 in the inner face.—About 20 species, natives of the Northern Hemisphere.

5. *T. nodosa* (L.) Gaertn. Plant diffuse, the branches hispid, 1-4 dm. long: fruit ovoid or elliptic-ovoid, about 3 mm. long, the outer ones spine-armed.—(HEDGE-PARSLEY.)—Waste-places, various provinces, Fla. to Tex., Ia., and Pa., also in Calif. Nat. of Eu. and Afr.—Spr.-sum.

5. *SCANDIX* [Tourn.] L. Annual herbs. Leaf-blades pinnately dissected; umbel compound. Involucre wanting or nearly so. Involucel of several entire lobed or dissected bractlets. Sepals minute or obsolete. Petals white, unequal. Fruit narrow, much elongate, the body prolonged into a long slender beak, the primary ribs prominent, the secondary ones wanting: oil tubes solitary or wanting.—about 10 species, natives of the Old World.

6. *S. Pecten-Veneris* L. Stem 1-5 dm. tall, pubescent, commonly branched at the base: leaf-blades 2 or 3 pinnately dissected, the lobes acute: umbels usually paired or in threes: fruit needle-like, erect, the body narrow grooved, the beak 4-6 cm. long,

ciliate.—(VENUS'-COMB. LADY'S-COMB. CROW-NEEDLES.)—Waste-places, Atlantic sea-ports, Ga. northward; locally to the Pacific Coast. Native of Eurasia.—(S. A.) Sum.—fall.—The shoots are used as salad.

**6. OSMORRHIZA** Raf. Perennial herbs. Leaf-blades ternately compound, the segments broad. Umbels loose, compound. Involucres and involucels of few bracts or bractlets, or wanting. Sepals obsolete. Petals white, inflexed at the apex. Fruits elongate; carpels 5-angled, with barely equal ribs: oil-tubes obsolete or wanting. [*Washingtonia* Raf.]—About 15 species, American and Asiatic.—Spr.—SWEET-CICELIES.

Rachis of the leaf-blades with villous hairs: stylopodium and styles about 1 mm. long.

Rachis of the leaf-blades glabrous or with short hairs: stylopodium and styles fully 3 mm. long.

1. *O. Claytonii*.

2. *O. longistylis*.

1. "*O. Claytonii* (Michx.) DC. Roots slightly if at all aromatic: foliage villous-hirsute: stem erect or ascending, 3-9 dm. tall, usually branched: leaf-segments 4-8 cm. long, acute or acuminate, coarsely toothed, cleft, incised, or divided: umbel-rays 4-6, 2-5 cm. long: bracts of the involucres and bractlets, linear to oblong-linear, acute: corolla white, about 4 mm. broad: fruit narrowly oblong, 18-20 mm. long, the body longer than the slender strigose base.—(SWEET-JARVIL.)—Rich woods and thickets, various provinces, rarely Coastal Plain, Ala. to Kans., S. D., Ont., N. S., and N. C.

2. "*O. longistylis* (Torr.) DC. Root sweet-aromatic: foliage glabrous or finely pubescent: leaf-segments mainly ovate or oblong-ovate, 5-10 cm. long, acute or short-acuminate, coarsely serrate or incised, or even divided: umbel-rays usually 3-6, ascending: corolla white, 4-5 mm. broad: fruit narrowly oblong, 15-18 mm. long: the body longer than the slender very strigose base.—(ANISE-ROOT.)—Rich woods, various provinces, Ala. to Colo., Assina., N. S., and N. C.

**7. CEREFOLIUM** [Rivin.] Haller. Annual herbs, resembling *Chaerophyllum*. Leaf-blades ternately decomposed, the segments small. Umbels compound, regular or nearly so. Involucre of toothed or compound bracts. Involucels of narrow, mostly entire, bractlets. Sepals obsolete. Petals white, usually nearly or quite equal, inflexed at the apex. Fruit elongate. Carpels more or less angled, but not ribbed: oil-tubes wanting. [*Anthriscus* Bernh.]—Few species, in the warm and temperate parts of the Old World.

1. *C. Cerefolium* (L.) Britton. Plants 1 m. tall or less, often weak-stemmed: leaf-blades broad, the segments rather numerous, thin: umbels long-peduncled, the rays few, 2-4

mm. long: petals white, obovate, 1.5–2 mm. long: fruit linear-subulate, 8–10 mm. long, shining, slender-beaked.—(CHERVIL.)—Waste places and roadsides, various provinces, La. to Tenn., Ont., and Pa.—Nat. of Eu.—Spr.

**8. CHAEROPHYLLUM** [Tourn.] L. Annual herbs. Leaf-blades ternately decompound, the segments narrow. Umbels irregular, compound. Involucres of 1 or 2 bracts, or usually wanting. Involucels of several small bracts. Sepals obsolete. Petals white, usually unequal, inflexed at the apex. Fruit elongate: carpels 5-angled, the angles equally ribbed: oil-tubes solitary in the intervals and 2 in the inner face. About 40 species, natives, mostly, of the warmer parts of the north temperate zone. Spr.—CHERVILS.

Fruit sometimes contracted below the apex, but beakless: plants glabrous.

Fruit less than 2 mm. broad, constricted below the apex.

1. *C. procumbens*.

Fruit fully 2 mm. broad, not constricted below the apex.

2. *C. Shortii*.

Fruit beaked or narrowed to the apex: plants more or less pubescent.

Fruit with the ribs narrower than the intervals.

3. *C. dasycarpum*.

Fruit pubescent.

4. *C. floridanum*.

Fruit glabrous.

Fruit with the ribs broader than the intervals.

5. *C. Teinturièri*.

1. *C. procumbens* (L.) Crantz. Stem weak, decumbent or spreading, 1–5 dm. long, simple or sparingly branched: umbels few-rayed, peduncled or nearly sessile: pedicels sometimes 8 mm. long, lax and spreading: fruit narrow, about 8 mm. long, glabrous, contracted below the apex, the ribs narrower than the intervals.—(WILD-CHERVIL.)—Open woods and damp thickets, various provinces, Ala. to Ark., Kans., Mich., and N. Y.

2. *C. Shortii* (T. & G.) Bush. Stem 2–5 dm. long, spreading or decumbent, often branched: umbels few-rayed, sessile or peduncled: fruit oblong, 5–6 mm. long, not contracted below the apex, the ribs narrower than the intervals.—Thickets and fields, various provinces, Tenn. to Va. and Pa.

3. *C. dasycarpum* Nutt. Stem erect, 2–6 dm. tall, branching: umbels sessile or short-peduncled, the rays ascending or spreading, 3–5 cm. long: fruit narrow, 5–6 mm. long, pubescent, beaked, the ribs prominent, narrower than the intervals.—Hillsides and thickets, Coastal Plain, Ala. to Tex.

4. *C. floridanum* (Coult. & Rose) Bush. Stems erect, 2–6 dm. tall, glabrous or somewhat pubescent: umbels peduncled, the rays 2–5 cm. long: fruit narrow, 7 mm. long, glabrous, the beak one-fourth or one-fifth as long as the body.—Woods, Coastal Plain, Fla. to S. C.; (also in Mo.?).

5. *C. Teinturièri* Hook. Stem erect, 2–7 dm. tall, more or less branched: umbels sessile or short-peduncled: rays 2–3, 2–5 cm. long: fruit narrow, 6–7 mm. long, beaked, glabrous or nearly so, the ribs prominent, broader than the intervals.—Thickets, cedar-glades, waste-places, and roadsides, various provinces, Fla. to Tex., Ky., and Va.

**9. DERINGA** Adans. Perennial herbs with fibrous roots. Leaf-blades 3-foliolate. Umbels irregular, compound. Involucres and involucels wanting.

Sepals obsolete. Petals white. Fruit elongate: carpels with 5 low ribs, and an oil-tube beneath each rib and in each interval.—One species.

1. *D. canadensis* (L.) Kuntze. Plant glabrous or nearly so: stem 3–10 dm. tall, finally widely branched: leaf-blades 3-foliate: leaflets ovate, oval, or elliptic, 4–10 cm. long, acute or abruptly pointed, doubly serrate with sharp teeth, the lateral ones often lobed: umbels peduncled: rays few, slender, unequal in length: pedicels 2–25 mm. long: corolla white, 2–3 mm. broad: fruit oblong 4–6 mm. long, straight, or curved at full maturity.—(HONEYWORT.)—Thickets and rich woods, various provinces, Ga. to Tex., S. D., Ont., and N. B.—Spr.—sum.

10. **HYDROCOTYLE** [Tourn.] L. Perennial amphibious herbs. Leaves solitary at each node. Umbels simple or proliferous. Sepals manifest. Petals valvate, white. Carpels with distinct ribs, and oil-bearing tissues beneath the epidermis.—About 75 species, widely distributed.—Sum. or all year S.—MARSH-PENNYWORTS. WATER-PENNYWORTS. NAVELWORTS.—Some species are used medicinally.

Leaf-blades suborbicular to transversely elliptic, peltate.

Fruit notched at the base and the apex at maturity: intermediate ribs corky.

Umbels not proliferous, at least not normally so.

Umbels or most of them proliferous.

Peduncle produced beyond the first umbel as a single rachis, bearing one or more umbels beyond it.

Peduncle produced beyond the first umbel branching and bearing several more or less proliferous umbels.

Fruit rounded at the base and the apex or cuneate at the base: intermediate ribs not corky, very slender.

✓ Fruit rounded or truncate at the base, not cuneate.

✓ Fruit cuneate at the base.

Leaf-blades reniform to suborbicular, not peltate.

Umbel long-peduncled: leaf-blades deeply lobed.

Umbel nearly sessile: leaf-blades shallowly lobed.

1. *H. umbellata*.

2. *H. Canbyi*.

3. *H. bonariensis*.

4. *H. verticillata*.

5. *H. australis*.

6. *H. ranunculoides*.

7. *H. americana*.

1. *H. umbellata* L. Leaf-blades suborbicular, 2–5 cm. wide, crenate or crenate-lobed: pedicels slender, 4–12 mm. long: fruit about 3 mm. wide, with corky-thickened ribs.—Swamps, meadows, ditches, and low pinelands, various provinces, Fla. to Tex., Minn., and Mass.—(W. I., Mex., C. A., S. A., O. W.)

2. *H. Canbyi* Coult. & Rose. Leaf-blades 1.5–4 cm. wide, shallowly crenate-lobed: pedicels 1–4 mm. long: fruit between 3 and 4 mm. wide.—Damp places, usually sandy soil, Coastal Plain, Fla. to Miss. and N. J.

3. *H. bonariensis* Lam. Leaf-blades depressed, orbicular to orbicular-reniform, 3.5–9.5 cm. wide, shallowly lobed, the lobes crenate: fruit about 3 mm. wide.—Waste-places, ponds and ditches, Coastal Plain, Fla. to Tex., Tenu., and N. C.—(W. I., Mex., C. A., S. A.)—Often grows very large and forms floating masses.

4. *H. verticillata* Thunb. Leaf-blades suborbicular to oval, 1-6 cm. wide, shallowly crenate: pedicels very short or wanting: fruit 3-4 mm. wide, with slender ribs.—Low grounds, swamps, and ponds, Coastal Plain and adj. provinces, Fla. to Tex., Ark. and Mass.

5. *H. australis* Coult. & Rose. Similar to *H. Canbyi* in habit: fruit slightly broader than long.—Low grounds, Coastal Plain, Fla. to Tex. and Va.—(W. I.)

6. *H. ranunculoides* L. f. Leaf-blades reniform to orbicular-reniform, 2-5 cm. wide, deeply lobed: petals over 1 mm. long: fruit 2.5-3 mm. wide, obscurely ribbed, oblong in cross-section.—Swamps, ditches, shallow ponds, and muddy shores, various provinces, Fla. to Tex., Ark., and Pa.; also Pacific Coast.—(W. I., C. A., S. A., O. W.)

7. *H. americana* L. Leaf-blades reniform, 2-5 cm. wide, crenate-lobed; petals less than 1 mm. long: fruit 1-1.5 mm. wide, sharply ribbed, oval in cross-section.—(MARSH-PENNYWORT.)—Moist thickets, wet banks, and swamps, various provinces, Coastal Plain only N, N. C. to Tenn., Minn., and N. S.

11. **CENTELLA** L. Perennial amphibious plants. Leaves clustered at the nodes. Umbels capitate. Sepals obsolete. Petals imbricate, white. Carpels without large oil-tubes, the prominent ribs anastomosing.—About 20 species, most abundant in Southern Africa.

1. *C. repanda* (Pers.) Small. Leaves clustered; petioles erect, 9-30 cm. long (about 2.5 cm. long, and with larger fruit, in *C. repanda floridana*); blades thickish, ovate, 2-6 cm. long, repand, cordate or nearly truncate at the base: peduncles usually several together, mostly shorter than the petioles: umbels 2-4-flowered: fruit 4-5 mm. wide. [*Hydrocotyle repanda* Pers.]—Moist pinelands, lake-shores, and shallow ponds, Coastal Plain, Fla. to Tex., and Md.—(W. I., Mex., C. A., S. A.)—Spr.-fall, or all year S.

12. **CYNOSCIADIUM** DC. Annual herbs. Leaf-blades pinnately or palmately divided into narrow segments, or the basal leaves with entire blades: umbels compound. Involucres and involucels of persistent or deciduous narrow bracts. Sepals persistent. Petals white, broadest above the middle. Fruit elongate: carpels with strong ribs, the lateral ribs more prominent: oil-tubes solitary in each interval or two in the inner face.—About 10 species, natives of the north temperate zone.

1. *C. digitatum* DC. Plant 2-6 dm. tall: leaf-blades, or segments, linear to linear-lanceolate: umbel-rays 3-8, 1-3.5 cm. long: pedicels 2-8 mm. long: fruit beaked.—Wet grounds, Coastal Plain and adj. provinces, Ala. to Tex. and Ark.—Spr.-sum.

**13. CORIANDRUM** [Tourn.] L. Annual slender herbs. Leaf-blades pinnately dissected. Umbels compound. Involucres wanting. Sepals acute, unequal. Petals white, often unequal, broadest above the middle. Fruit sub-globose, not constricted at the commissure: carpels with 5 delicate ribs: oil-tubes solitary under the secondary ribs.—Two species, natives of the Old World.

1. *C. sativum* L. Stem 2–6 dm. tall: blades of the lower cauline and basal leaves with coarse-toothed, incised, or lobed segments, those of the upper leaves with narrowly linear segments: umbel-rays 4–8, 12–21 mm. long: pedicels 1–3 mm. long: fruit subglobose or ovoid-globose, 3–3.5 mm. long: carpels slightly ribbed.—(CORIANDER.)—Waste-places and cult. grounds, in and about towns and cities, nearly throughout U. S. Nat. of Eurasia.—Sum.—The fruit is used medicinally and as a condiment.

**14. LIGUSTICUM** L. Perennial herbs with large roots. Leaf-blades ternately compound. Umbels compound. Involucres of a few narrow bracts. Involucres of a few narrow bracts. Involucels of numerous narrow bractlets. Sepals obsolete. Petals white, broadened upward. Fruit more or less elongate: carpels with sharp prominent ribs and 2–6 oil-tubes in each interval.—About 20 species, natives of the Northern Hemisphere.

1. *L. canadense* (L.) Britton. Stem 5–20 dm. tall: leaflets elliptic, elliptic-oval, or ovate, 3–8 cm. long, coarsely toothed: fruit ellipsoid, oval, or ovate, 4–6 mm. long, the ribs narrow-winged.—(ANGELICO. NONDO. LOVAGE.)—Dry or rich woods, various provinces, rarely Coastal Plain, Ga. to Miss., Mo., and Pa.—Sum.—The root is aromatic.

**15. LILAEOPSIS** Greene. Perennial herbs, with creeping stems. Leaves clustered, reduced to terete clavate, separate organs, sometimes dilated above. Bracts of the involucre several. Umbels several-flowered, simple. Sepals acute. Petals white, concave. Fruit subglobose, or lenticular: carpels with thick corky lateral ribs and filiform dorsal and intermediate ribs or all sometimes corky, with oil-tubes solitary in the intervals. [*Crantzia* Nutt.]—About 10 species.—Sum.

Peduncles surpassing the leaves: fruit pinched at the base; lateral ribs only corky.

1. *L. lineata*.

Peduncles shorter than the leaves: fruit not pinched at the base; all ribs corky.

2. *L. carolinensis*.

1. *L. lineata* (Michx.) Greene. Stem creeping in the mud: leaves 2–5 cm. long; petioles dilated upward, usually linear-spatulate, barely broadened into

blades, conspicuously cross-partitioned: peduncles 3–7 cm. long, surpassing the leaves: fruit orbicular-ovoid, pinched near the base, about 2 mm. long, the lateral ribs corky, the dorsal not at all corky. [*Crantzia lineata* Nutt.]—Salt or brackish marshes and low grounds, Coastal Plain and New England Coast, Fla. to Miss. and Mass.

2. *L. carolinensis* Coult. & Rose. Stem creeping in the mud: leaves 5–25 cm. long; petioles elongate; blades oblong or spatulate, shorter than the petioles: peduncles 1–1.5 cm. long, shorter than the leaves: fruit suborbicular or oval-orbicular, about 3 mm. long, not pinched near the base; all the ribs corky.—Low grounds, Coastal Plain, Fla. to N. C.

16. **SPERMOLEPIS** Raf. Annual herbs. Leaf-blades finely dissected. Umbels compound. Involucres wanting. Involucels of few narrow bracts. Sepals minute or obsolete. Petals white. Fruit tuberculate or bristly: carpels with 5 prominent or obsolete ribs: oil-tubes solitary in the intervals and sometimes under each rib, except in the inner side where there are two.—Four species, natives of North America.—Spr.

Fruit tubercled.

Umbel-rays divaricate, the primary ones mostly 3 or 4.

Umbel-rays erect or nearly so, the primary ones mostly 6–8.

Fruit covered with short bristly hooked hairs.

1. *S. divaricata*.

2. *S. patens*.

3. *S. echinata*.

1. *S. divaricata* (Walt.) Raf. Stem 1–6 dm. tall, often widely branched, sometimes diffusely so, the branches very slender or nearly filiform: leaf-blades 2–8 cm. long, twice or thrice pinnately parted; segments narrowly linear or filiform: corolla white, about 1 mm. broad: fruit broadest about the middle, about 1 mm. long, tuberculate, prominently ribbed.—Dry or sandy soil, various provinces, Fla. to N. M., Kans., and N. C.

2. *S. patens* (Nutt.) B. L. Robinson. Stem 2–6 dm. tall: leaf-segments filiform: fruit ovoid, about 1 mm. long, granular.—Dry soil, various provinces, Tenn. to Tex., Nebr., and Ind.

3. *S. echinata* (Nutt.) Heller. Stem 1–5 dm. tall, more or less diffusely branched: leaf-blades 1–6 cm. long; twice or thrice pinnately parted; segments narrowly linear or filiform: umbels slender-peduncled, 1.5–4 cm. broad: rays slender, more or less variable in length: corolla white, less than 1 mm. broad: fruit broadest below the middle, 2 mm. long, covered with hooked bristles, the ribs obsolete.—Dry soil, various provinces, Ala. to Tex., Calif., and Mo.—(*Mex.*)

17. **ERIGENIA** Nutt. Perennial herbs with tuberous roots. Leaf-blades ternately decompound. Umbels few-rayed, compound. Involucres usually of a

single bract. Sepals obsolete. Petals white, broadest above the middle, flat. Fruit broader than high, laterally flattened: carpels with 5 delicate ribs: oil-tubes 2-3 in each interval.—One species.

1. *E. bulbosa* (Michx.) Nutt. Plant 5-20 cm. tall from a depressed tuber: leaf-segments of an elliptic type: fruit about 2 mm. high, 3-4 mm. broad.—(HARBINGER-OF-SPRING. PEPPER-AND-SALT.)—Rich open woods and thickets, various provinces, rarely Coastal Plain, Ala. to Miss., Kans., Minn., Ont., and Md.—Spr.

18. *CONIUM* L. Biennial large herbs with spotted stems. Leaf-blades broad, pinnately decompose. Umbels compound, the rays unequal. Involucres and involucels inconspicuous, of entire, scarious-margined bracts or bractlets. Sepals minute or obsolete. Petals white, somewhat unequal, broadest above the middle, inflexed at the apex. Fruit short and thick: carpels with prominent wavy ribs: oil-tubes wanting.—One species.

1. *C. maculatum* L. Plant 1-2 m. tall, the stem usually much branched: leaf-blades broad, the segments very numerous; umbels rather long-peduncled; rays 2-4 cm. long: petals white, obovate or cuneate, mostly about 1 mm. long: fruit ovoid, 2.5-3 mm. long.—(POISON-HEMLOCK.)—Waste-places, cult-grounds, and roadsides, various provinces, Ala. to Tex., Mich., Ont., and Del.; also on Pacific Coast. Nat. of Eu.—(W. I., Mex., C. A., S. A.)—Sum.—The fruit is used medicinally.

19. *AEGOPODIUM* L. Perennial caulescent herbs. Leaf-blades ternate, the leaflets or segments large, toothed. Umbel compound, the rays equal or nearly so. Involucres and involucels of narrow bracts and bractlets, or wanting. Sepals minute or obsolete. Petals white, equal or nearly so, broadest above the middle, inflexed at the apex. Fruit short, but longer than thick; carpels turgid, the angles margined: oil-tubes wanting.—One species.

1. *A. Podagraria* L. Plant 3-11 dm. tall, simple or sparingly branched: leaflets elliptic to ovate, 2.5-9 cm. long, serrate, incised or lobed: umbels long-peduncled; rays 2-4 cm. long: petals white, obovate or orbicular-

obovate, 1-1.5 mm. long: fruit conic-ovoid, about 4 mm. long.—(GOUTWEED.)  
—Waste-places, roadsides and thickets, N. C. to Pa. and Mass.—Nat. of Eu.—  
Sum.—A form with variegated leaves is used in gardening.

**20. EULOPHUS** Nutt. Perennial herbs with tuberous roots. Leaf-blades ternately compound. Umbels compound. Involucre wanting or of 1 bract. Involucels usually of 2 bracts. Sepals prominent. Petals white or pink, broadest above the middle, inflexed at the tip. Fruit somewhat elongate, laterally flattened: carpels delicately ribbed: oil-tubes 2-5 in the intervals.—About 8 species, North American.

**1. E. americanus** Nutt. Plant 8-15 dm. tall: segments of the upper leaves much narrower than those of the lower ones: fruit elliptic or elliptic-ovoid, 4-6 mm. long.—Low grounds, various provinces, Tenn. to Ark., Kans. and Ohio.—Sum.

**21. CICUTA** L. Perennial herbs with tuberous roots. Leaf-blades pinnately compound or decomposed. Umbels compound. Involucres of few bracts or wanting. Involucels of several small bractlets. Sepals acute. Petals white. Fruit short: carpels with 5 corky ribs, and one oil-tube in each interval and 2 in the inner face.—About 8 species, of the North-temperate zone.—Sum.—fall—WATER-HEMLOCKS.—The roots are poisonous.

Fruit ridged at the commissure, typically oval or ovoid.

Fruit grooved at the commissure, typically subglobose or reniform-globose.

1. *C. maculata*.

2. *C. Curtissii*.

**1. C. maculata** L. Plant stout, 1-2 m. tall: leaf-blades 1-6 dm. long, the veins ending in the notches of the segments: fruit with lateral ribs manifestly much larger than the others and wedge-shaped in section, and contiguous. (SPOTTED-COWBANE. MUSQUASH-ROOT.)—Swamps, low-grounds, and river-banks, various provinces, Miss. to Tex., Man., Ont., N. B., and N. C.

**2. C. Curtissii** Coult. & Rose. Plant resembling *C. maculata*, but with thicker and more reticulate leaf-segments: fruit with apparently equal ribs, the lateral ones neither wedge-shaped nor contiguous.—Swamps and low grounds, Coastal Plain and adj. provinces, Fla. to La., Tenn., (Ky. ?), and Va., also represented by sporadic stations as far North as Nova Scotia.

**22. SIUM** [Tourn.] L. Perennial herbs. Leaf-blades pinnately compound. Umbels compound. Involucres and involucels of narrow bracts and bractlets. Sepals small, acute. Petals white. Fruit stout, somewhat laterally

flattened: carpels ribbed, the intervals with 1-3 oil-tubes. Seed 5-angled.—About 8 species, natives of the north temperate zone.

Blades of the leaflets saliently sharp-serrate or incised: larger petals about 1 mm. long: umbels large, the terminal ones at least 5 cm. or more wide in anthesis.

1. *S. cicutaeifolium*,

Blades of the leaflets appressed-serrate: larger petals much less than 1 mm. long: umbels small, the terminal ones, at least, 4 cm. wide or less.

2. *S. floridanum*.

1. *S. cicutaeifolium* Schrank. Plant 6-19 dm. tall, glabrous: stem stout, sparingly branched: stipular expansion at base of the petiole auriculate at the top: leaflets 7-17; blades linear to linear-lanceolate, or rarely wider, finely, or usually coarsely and saliently, toothed, or those of the submerged ones coarsely or finely pinnatifid: umbel-rays slender: larger corollas fully 2 mm. wide: fruit oval, 3-3.5 mm. long, prominently 10-ribbed.—(WATER-PARSELEY.)—Swamps, marshes, and ponds, various provinces, N. C. to La., Calif., and S. Can.—Sum.—fall.

2. *S. floridanum* Small. Plant smaller and more slender than that of *S. cicutaeifolium*, the stem slender, the branches very slender: stipular expansions at base of the petiole oblique at the top: leaflets 3-11; blades ovate, elliptic or elliptic-lanceolate, finely appressed-serrate: umbel-rays filiform: larger corollas less than 2 mm. wide: fruit not seen.—Swamps and banks of the Chipola River, Fla.

23. **AMMI** L. Herbs resembling *Daucus* in habit and inflorescence. Leaf-blades finely divided or dissected. Flowers perfect, very numerous in compound umbels. Involucres and involucels present, the bracts of the former, at least, divided. Sepals obsolete. Petals white, very unequal, cleft at the apex. Fruit short: carpels 5-angled, with prominent ribs and an oil-tube in each interval.—Seven species, natives of the Old World.—(BISHOP'S-WEEDS.)

Leaf-segments numerous, very narrowly linear or filiform and entire: umbel-rays concreted into a disk-like structure at the base.

1. *A. Visnaga*.

Leaf-segments few, at least in the lower leaves slightly broadened and toothed: umbel-rays not concreted at the base.

2. *A. majus*.

1. *A. Visnaga* (L.) Lam. Stem 5-12 dm. tall: mature umbels and umbellets contracted, the concreted bases of the rays of the latter 3-4 mm. broad: fruit 2-2.5 mm. long.—Waste-places, Fla. and Gulf State seaports to N. C. Nat. of Eu.—Spr.

2. *A. majus* L. Stem 3-15 dm. tall: mature umbels and umbellets open, the concreted bases of the rays of the latter barely 2 mm. broad: fruit 1.5-2 mm. long.—Waste-places, Coastal Plain, Ala. to Tex. Nat. of Eu. and cult.—The plants of these species of *Ammi*, like those of very many species of other genera of this family, especially those of the Old World, have been used as medicinal remedies, real or reputed, by both the aborigines and medical men, in all countries.

24. **TREPOCARPUS** Nutt. Annual herbs. Leaf-blades pinnately compound. Umbels compound. Involucre usually present. Sepals unequal. Petals white, broad. Fruit elongate: carpels with 4 secondary ribs, the primary ribs wanting: oil tubes solitary under the secondary ribs.—One species.

1. **T. Aethusae** Nutt. Stem 1–10 dm. tall, branched: leaf-blades 5–10 cm. long, finely dissected, the lower ones with petioles about equal to them in length, the upper short-petioled, the segments narrowly linear, entire or incised: umbels commonly long-peduncled: rays 2–5, becoming 1–2 cm. long: flowers few in each umbellet: fruit oblong, 8–10 mm. long, sharply ribbed.—Dry soil, Coastal Plain and adj. provinces, Ala. to Tex., Okla., and Ark.—Spr.—sum.

25. **PTILIMNIUM** Raf. Annual, faintly-scented, slender herbs. Leaf-blades 1–3-pinnately or ternately divided, the ultimate segments entire or nearly so. Umbels compound. Involucres and involucels of several very slender, entire or pinnate bracts, and bractlets. Sepals small, broad or narrow. Petals white, each with a broad body and a short entire inflexed apex. Stylopodium depressed or elongate. Fruit short, as wide as long or nearly so: carpels with prominent separated dorsal and intermediate ribs and thick corky lateral ribs; oil-tubes small between each rib. Seed terete-angled, the inner face convex.—Following are the only known species.—MOCK BISHOP'S-WEEDS.

Sepals deltoid, often broadly so.

Sepals subulate to narrowly lanceolate.

Styles long, much longer than the stylopodium: stylopodium ovoid, together with the styles over 1 mm. long: leaf-blades rather long-petioled.

Styles short, about as long as the stylopodium: stylopodium depressed, together with the styles, less than 1 mm. long: leaf-blades short-petioled.

1. *P. capillaceum*.

2. *P. costatum*.

3. *P. Nuttallii*.

1. **P. capillaceum** (Michx.) Raf. Plant 2–8 dm. tall: leaf-segments relatively few and lax: umbel-rays few—several, less than 2.5 cm. long at maturity: bracts lobed: fruit ovoid, about 2 mm. long, acute.—Wet soil, marshes, swamps, and ditches, various provinces, Fla. to Tex., Kans., and Mass.

2. **P. costatum** (Ell.) C. & R. Plant 8–16 dm. tall: leaf-segments narrowly linear, numerous, but not crowded: umbel-rays stout, over 3 cm. long at maturity: bracts entire or lobed: petals fully 1 mm. long: fruit ovoid, 3–4 mm. long or rarely longer, not constricted at the apex.—Swamps, Coastal Plain, Ga. to N. C.—Sum.—fall.

3. **P. Nuttallii** (DC.) Britton. Plant 3–7 dm. tall: leaf-segments almost capillary,

not very numerous, lax: umbel-rays slender, mostly over 3 cm. long at maturity: bracts entire: petals less than 1 mm. long: fruit ovoid, 1.5 mm. long or less, barely constricted at the apex.—Swamps and damp hillsides, various provinces, Ala. to Tex., Kans. and Ill.—Spr.-fall.

**26. HARPERELLA** Rose. Perennial aquatic caulescent herbs. Leaves alternate, reduced to terete jointed phyllodia. Flowers perfect, in compound umbels. Involucres and involucels inconspicuous. Sepals acute, slightly unequal. Petals white, broad. Stylopodium short. Fruit oval, flattened laterally: carpels rather prominently 5-angled: oil-tubes solitary in the intervals and 2 in the inner side.—Three species, natives of the southeastern United States.

Basal and lower cauline leaves mostly over 2 dm. long: corolla 3-3.5 mm. wide: fruit about 1.5 mm. wide.  
 Basal and lower cauline leaves mostly less than 1.5 cm. long: corolla 1-1.5 mm. wide: fruit about 1 mm. wide.

1. *H. nodosa*.

2. *H. fluviatilis*.

**1. H. nodosa** Rose. Plant stout, stiff, 3-13 dm. tall, rather freely branched, the stem fluted: basal and lower cauline leaves mostly 2-4.5 dm. long, without bulblets in the axils: peduncles elongate, mostly 2-4 cm. long: umbel-rays 5-15, becoming 1-2.5 cm. long: corolla 3-3.5 mm. wide: anthers barely 0.5 mm. long: fruit about 1.5 mm. wide.—Shallow ponds, Coastal Plain, S W Ga.—Spr.-sum.

**2. H. fluviatilis** Rose. Plant slender, weak, 1-3 dm. tall, sparingly branched, the stem angled: basal and lower cauline leaves mostly 1-1.5 dm. long, with bulblets in their axils: peduncles short, mostly 1-2 cm. long: umbel-rays 2-5, becoming 5-8 mm. long: corolla 1-1.5 mm. wide: anthers barely 0.3 mm. long: fruit about 1 mm. wide.—Rocky beds of streams, in the Appalachian provinces in Ala.—Sum.-fall.

**27. CELERI** Adans. Annual or perennial herbs. Leaf-blades pinnate or ternately decompound. Umbels compound. Involucres present or wanting. Sepals obsolete or minute. Petals white, broad. Fruit somewhat smooth or tuberculate: carpels 5-angled or 5-ribbed, with 1 oil-tube in each interval or 2 in the inner face.—About 5 species, widely distributed.

**1. C. graveolens** (L.) Britton. Stem 2-9 dm. tall: leaf-segments cuneate to suborbicular, incised and toothed: petals 0.5-1 mm. long: fruit ovoid, about 1.5 mm. long. [*Apium graveolens* L.]—(CELERY.)—Waste-places and fields, near the coast, various provinces, Fla. to N. M., Calif. and Va.—Nat. of Eu.—Spr.-sum.—Used in medicine. The blanched leaves are esculent.

**28. CYCLOSPERMUM** Lag. Annual or perennial herbs. Leaf-blades pinnately or ternately decompound. Umbels compound. Involucre present or wanting. Sepals obsolete or minute. Petals white, broad. Fruit somewhat smooth or tuberculate: carpels 5-angled or ribbed with 1 oil-tube in each interval or two in the inner face. [*Apium* L. in part]—About 6 species, natives of the Old World.—Spr.—sum.

Leaf-blades ternate; segments linear-filiform to filiform.  
Leaf-blades pinnate; segments ovate, oval, or elliptic.

1. *C. Ammi*.
2. *C. nodiflorum*.

1. ***C. Ammi*** (L.) Britton. Stem erect, 1-6 dm. tall, more or less branched: leaf-blades ternately divided; segments filiform or narrowly linear, acute: corolla white, less than 1 mm. broad: fruit oval or ovoid-oval, 1.5-2 mm. long, prominently ribbed. [*A. leptophyllum* (DC.) F. Muell.]—(MARSH-PARSLEY.)—Roadsides and waste-places, various provinces, Fla. to Tex., Mo. and N. Y.—(*W. I., Mex., C. A., S. A.*)

2. ***C. nodiflorum*** (L.) Koch. Stem prostrate, often creeping, 3-7 dm. long, sparingly branched: leaf-blades pinnately compound, 5-10 cm. long; leaflets oblong, ovate-lanceolate or lanceolate, serrate, mostly acute: umbels opposite the leaves 1.5-3 cm. broad, short-peduncled: bractlets of the involucre 5-6: corolla white, about 1 mm. broad: fruit oval or orbicular-oval, about 2 mm. long.—Ditches and waste-places, near Charleston, S. C., and other seaport towns. Nat. of Eu.

**29. BUPLEURUM** [Tourn.] L. Annual or perennial herbs. Leaf-blades entire. Umbels compound. Involucre wanting (in our species). Involucels conspicuous, of entire bractlets. Sepals obsolete. Petals broad, yellow or greenish. Fruit elliptic or oval: carpels with slender ribs and no oil-tubes in our species.—About 65 species, widely distributed.

1. ***B. rotundifolium*** L. Plant 3-10 dm. tall: leaf-blades ovate or elliptic, 2-8 cm. long, perfoliate: corolla yellow: fruit 3-3.5 mm. long, about 2.5 mm. broad.—(HARE'S-EAR. THOROUGH-WAX.)—Roadsides, fields, and waste-places, various provinces N of Coastal Plain, Ala. to Ariz., S. D., N. H., and N. C. Nat. of Eu.

**30. THASPIUM** Nutt. Perennial herbs. Leaf-blades 3-foliolate or ternately compound, or those of the basal leaves sometimes simple. Umbels compound. Involucre of few bracts. Involucels of many bracts. Sepals present.

Petals yellow or rarely purple. Fruit longer than wide: carpels with winged ribs and oil-tubes solitary in the intervals.—Only the following species known.—Sum.—MEADOW-PARSNIPS.

Petal-blades less than 1 mm. long: leaves with ternate blades: leaflets relatively thick, crenate.

Petal-blades over 1 mm. long: leaves with biternate blades: leaflets relatively thin, incised or lobed.

Peduncles and umbel-rays glabrous, except at the nodes, or merely puberulent: fruits, between the wings, glabrous, 5-6 mm. long: leaves 1-2-ternate.

Peduncle and umbel-rays scabrous-pubescent: fruits, between the wings, permanently pubescent, 4-5 mm. long: leaves 2-3-ternate.

Blades of the leaflets coarsely divided, the ultimate segments or teeth of an ovate type: styles about 2 mm. long: petals about 1.5 mm. long.

Blades of the leaflets finely divided, the ultimate segments or teeth of a lanceolate type: styles about 1 mm. long: petals about 1 mm. long.

1. *T. trifoliatum*.

2. *T. barbinode*.

3. *T. Chapmanii*.

4. *T. pinnatifidum*.

1. *T. trifoliatum* (L.) A. Gray. Stem 2-7 dm. tall, sparingly branched, often zigzag: leaf-blades various, those of the basal or lower stem-leaves ovate and undivided or 3-foliolate; segments ovate to lanceolate, serrate; petioles slender, often longer than the blades: upper stem-leaves similar to the divided basal leaves; petioles shorter than the blades, winged: umbels peduncled, 2-5 cm. broad: rays variable in length: corolla dark-purple (or yellow in *T. trifoliatum aureum*): fruit oval, 4 mm. long, the ribs prominently winged.—(PURPLE MEADOW-PARSNIP.)—Woods, bluffs, stream-banks, and sunny slopes, various provinces, Fla. to Miss., Wyo., Ill., and R. I.—Sum.

2. *T. barbinode* (Michx.) Nutt. Stem 3-12 dm. tall, sparingly branched, pubescent at the nodes: leaf-blades 1-2-ternate; leaflets coarsely cut; ultimate segments large, those of the upper leaves mostly 3-6 cm. long, coarsely toothed: mature umbels 3-6 cm. wide: corolla about 3 mm. wide, pale- or light-yellow: fruit ellipsoid or oval, 5-6 mm. long, the lateral wings somewhat wider than the dorsal ones.—A form with pinnatifid leaf-segments grows in Ala.—Wooded hillsides and streams-banks, various provinces, rarely Coastal Plain, Ga. to Miss., Kans., Ont., and N. Y.—Spr.-sum.

3. *T. Chapmanii* (C. & R.) Small. Stem 8-15 dm. tall, often much-branched, pubescent at the nodes and sometimes sparingly so along the internodes: leaf-blades 2-3-ternate; leaflets much cut; ultimate segments relatively small, those of the upper leaves mostly 1-2.5 cm. long, incised-toothed or pinnatifid: mature umbels 2.5-7 cm. wide: corolla light yellow, fruit elliptic or oval, 4-5 mm. long, the lateral wings much wider than the dorsal ones.—River-bluffs, woods and hillsides, Coastal Plain and Piedmont, Fla. and Ga.—Spr.-sum.

4. *T. pinnatifidum* (Buckl.) A. Gray. Stem 5-12 dm. tall, finely pubescent about the nodes and sometimes also along the internodes: leaf-blades usually 3-ternate; leaflets finely cut and with narrow divisions; ultimate segments small, those of the upper leaves pinnatifid, the lobes usually lanceolate: mature umbels 3-4 cm. wide: corolla light yellow: fruit ellipsoid, 3-4 mm. long, all the ribs narrowly winged.—Woods, hillsides and river-banks, Blue Ridge to Interior Low Plateaus, Ala. to Ky. and N. C.—Spr.-sum.

**31. TAENIDIA** Drude. Perennial herbs with fibrous roots. Leaf-blades pinnate or ternately compound. Umbels compound. Involucres and involucels wanting: sepals obsolete or minute. Petals 5, their tips inflexed. Fruit oblong: carpels 5-angled, with slender ribs and 3 oil-tubes in the intervals. Seeds nearly terete except the flat face.—One species.

**1. T. integrerrima** (L.) Drude. Plant 3-9 dm. tall, from a tough root: leaflets ovate to elliptic or elliptic-lanceolate, 1-3 cm. long, entire: umbel-rays 10-20, elongate: corolla yellow: fruit broadly ellipsoid, 3.5-4 mm. long. — (YELLOW-PIMPERNEL.)—Rocky hillsides and sandy woods, various provinces, rarely Coastal Plain, Ga. to La., Minn. and Que.—Spr.

**32. ZIZIA** Koch. Perennial erect herbs. Leaf-blades 3-foliolate or ternately compound, or the basal ones sometimes simple. Umbels compound, the central umbellet sessile. Involucres wanting. Involucels of a few bractlets. Sepals prominent. Petals yellow. Fruit somewhat elongate, laterally flattened: carpels with 5 slender wingless ribs and an oiltube in each interval and sometimes under each rib.—Following are the only known species.—Spr.—sum.—MEADOW-PARSNIPS.

Blades of the basal leaves merely toothed cordate.

Blades of the basal leaves ternately compound.

Blades of the basal leaves 2-ternate.

Blades of the basal leaves 1-ternate.

Blade of the terminal leaflet much longer than wide, with few or relatively few blunt teeth.

Fruit ovoid or ellipsoid, 4-4.5 mm. long: longer umbel-rays 2.5-5 cm. long at maturity.

Fruit suborbicular or broader than high, to ovoid-orbicular, 3-3.5 mm. long: longer umbel-rays 6-11 cm. long at maturity.

Blade of the terminal leaflet about as wide as long or wider, with many sharp salient teeth.

1. *Z. cordata*.

2. *Z. aurea*.

3. *Z. arenicola*.

4. *Z. Bebbii*.

5. *Z. latifolia*.

**1. Z. cordata** (Walt.) DC. Stem 4-10 dm. tall, pale-green: leaf-blades various, those of the basal leaves ovate or suborbicular, 3-10 cm. long, crenate, deeply cordate, long-petioled, those of the cauline leaves mostly 3-foliolate or sometimes 5-foliolate; segments crenate or serrate-crenate: umbels 2-6 cm. broad; rays 7-16, ascending, 1-5 cm. long: corolla yellow, about 2 mm. broad: fruit oval or ovate-oval, 3-4 mm. long, 10-ribbed.—(GOLDEN-PARSNIP.)—Woods, thickets, and prairies, various provinces, rarely Coastal Plain, Ga. to Mo., Ore., Alb., and Conn.

**2. Z. aurea** (L.) Koch. Stem 3-8 dm. tall, simple or branched above: leaf-blades twice to thrice ternately compound, those of the basal and lower cauline leaves long-petioled, those of the upper stem-leaves once ternate, on short winged petioles; segments oblong-ovate to lanceolate, 2-8 cm. long,

sharply serrate: umbel 3-6 cm. broad: rays 9-25, stiff, ascending, unequal, 2-5 cm. long: corolla yellow, 3-3.5 mm. broad: fruit ellipsoid, 4-4.5 mm. long.—(GOLDEN-ALEXANDERS.)—Meadows, woods, and swamps, various provinces, rarely Coastal Plain, Ga. to Tex., Sask., Ont., and N. B.

3. **Z. arenicola** Rose. Stem 4-7 dm. tall, sparingly branched above: leaf-blades once ternately compound; leaflets 1-6 cm. long, the blades oval or ovate to lanceolate, often rounded at the apex, coarsely toothed: umbels long-peduncled; rays few, slender, nearly equal, 1.5-2.5 cm. long, erect or ascending: fruit ovoid to ellipsoid, 4-4.5 mm. long, prominently ribbed.—Dry woods, Coastal Plain, N. Fla. and adj. Ga.

4. **Z. Bebbii** (Coult. & Rose) Britton. Stem often tufted, 1-8 dm. tall, simple or branching, dark-green: leaf-blades once ternately compound, the lower ones long-petioled, the upper with winged petioles: leaflets 1-7.5 cm. long, the blades thickish, oval, elliptic, or lanceolate, serrate or crenate: umbels slender-peduncled, straggling; rays 2-12, filiform, unequal, 2-11 mm. long, unequally spreading: fruit suborbicular or broader than high, to ovoid-orbicular, 3-3.5 mm. long or rarely smaller.—Woods, Blue Ridge to Appalachian Plateau, N. C. to Tenn., W. Va., and Va.

5. **Z. latifolia** Small. Stem mostly 4-6 dm. tall, sometimes sparingly branched, pubescent at the nodes: leaf-blades 3-foliolate, long-petioled, except the uppermost; leaflets 3-6.5 cm. long, the blades ovate, suborbicular or orbicular-reniform, irregularly and sharply toothed, except at the broadly cuneate or truncate base: umbels stout-peduncled; rays stoutish, usually 6-12, mostly ascending, unequal, some usually twice as long as the others, the longer becoming 2-3 cm. long: fruit ellipsoid, 3-3.5 mm. long, ribbed.—Borders of fields, near Bristol, Fla.

33. **APIUM** [Tourn.] L. Annual or biennial herbs. Leaves alternate: blades 1-3-pinnate, the leaflets toothed, incised or lobed. Umbels compound. Sepals minute or obsolete. Petals small, yellow, very broad, excepting the bent tip. Fruit slightly flattened laterally: carpels with 5 slender ribs, with a single oil-tube in each interval and 2 in the inner face.—About 5 species, European.

1. **A. Petroselinum** L. Stem 2-5 dm. tall: leaf-segments linear or linear-filiform, or those of the basal leaves cuneate: petals mostly less than 1 mm. long: fruit ovoid, 3.5-4 mm. long.—(PARSLEY. ACHE.)—Waste-places and cult. grounds, various provinces, N. C. to Tex., Ark., and Ont. Nat. of Eu.—Sum.—Used medicinally. The leaves are used in culinary practices.

**Aethusa cynapium** L. (FOOL'S-PARSLEY), has been found as fugitive on ballast at Mobile, Ala. It differs from the preceding genus by the globose-ovoid fruit which is not flattened either way, and the white flowers.

34. **FOENICULUM** Adans. Biennial or perennial herbs. Leaf-blades pinnately decomposed, the segments often very slender. Umbels compound.

Involucre and involucels wanting. Sepals obsolete. Petals yellow or yellowish. Fruit elongate: carpels 5-ribbed: oil-tubes solitary in the intervals and 2 on the inner side.—Four species, natives of the Old World.

1. **F. Foeniculum** (L.) Karst. Stem 5–15 dm. tall: leaf-segments filiform or linear-filiform: umbel-rays 5–6: fruits ellipsoid, about 5 mm. long.—(FENNEL.)—Waste-places, roadsides, and fields, various provinces, Fla. to Tex., Tenn. and N. J.—Nat. of Eu.—(W. I.)—Sum.—fall.—Used medicinally and as a culinary herb.

35. **PLEIOTAENIA** Coult. & Rose. Perennial caulescent herbs. Leaf-blades pinnately decompose. Umbels compound. Involucres and involucels of few narrow bracts or the former wanting. Sepals triangular. Petals yellow, broadest above the middle. Fruit broad: carpels with the dorsal and contiguous ribs corky but obscure and thick, broadly winged lateral ribs with a nerve near the margin: oil-tubes numerous, 12–18, accompanied by smaller ones irregularly disposed.—One species.

1. **P. Nuttallii** (DC.) C. & R. Stem 2–9 dm. tall, slightly scabrous: leaf-segments narrowly cuneate: umbel-rays 2–3 cm. long or a few conspicuously short: fruit broadly elliptic, 6–10 mm. long (obovate and thin-winged in *P. Nuttallii texana*). [*Polytaenia Nuttallii* DC.]—Dry soil, prairies, and barrens, various provinces, Ala. to Tex., Ia. and Mich.—Spr.

36. **ANETHUM** L. Annual or biennial herbs. Leaves alternate: blades decompose, the segments narrowly linear or linear-filiform. Flowers in naked compound umbels. Hypanthium truncate. Petals yellow. Stylopodium depressed. Styles short. Fruit slightly elongate, flattened dorsally: carpels ribbed and with narrow lateral wings.—Two species, natives of Eurasia.

1. **A. graveolens** L. Plant 1 m. tall or less, glaucous: leaf-segments numerous: umbels many-flowered, the rays unequal: sepals minute: petals ovate to orbicular, 1 mm. long or less: fruits ellipsoid to oval-ellipsoid, 4.5–5 mm. long, glaucous.—(DILL. DILLWEED.)—Hammocks and cultivated grounds, S pen. Fla. and the Keys. Nat. of Eu.—(W. I.)—The aromatic fruit is used as a condiment.

**37. PASTINACA L.** Annual or biennial herbs. Leaf-blades pinnately compound. Umbels compound. Involucres and involucels usually wanting. Sepals obsolete. Petals yellow. Fruit somewhat longer than broad, much dorsally flattened: carpels with the dorsal and contiguous ribs slender, and thin lateral wings: oil-tubes solitary in the intervals and 2-4 in the inner side.—About 7 species, natives of Eurasia.

1. *P. sativa* L. Plant coarse, strong-scented, 6-20 dm. tall: leaf-segments ovate or elliptic, crenate-serrate, incised or lobed: fruit obovate, oval, or orbicular-oval, 5-6 mm. long.—(WILD-PARSNIP.)—Roadsides, fields, thickets, and waste-places, nearly throughout U. S. and S. Can. Nat. of Eurasia.—Sum.—The root is esculent.

**38. CONIOSELINUM Hoffm.** Perennial herbs. Leaf-blades 2-3-pinnately decompound, the alternate segments narrow, incised or lobed. Umbels compound. Involucres and involucels of several narrow bracts, or the former wanting. Sepals obsolete. Petals white. Fruit longer than broad: carpels with the dorsal and contiguous ribs prominent and the lateral ones winged: oil-tubes solitary in the dorsal intervals, 1-several in the lateral, and 4-8 in the inner face.—About 10 species, natives of the north temperate zone.

1. *C. chinense* (L.) B. S. P. Plant 5-15 dm. tall: leaf-segments incised: umbel-rays 2-4 cm. long: fruit oval or ellipsoid-oval, 4-5 mm. long.—(HEMLOCK-PARSLEY.)—Swamps and wet cliffs, Blue Ridge and more northern provinces, N. C. to Ind., Minn., Lab. and Pa.—Sum.—fall.

**39. ANGELICA L.** Perennial caulescent herbs. Leaf-blades pinnate or decompound. Umbels compound. Involucres and involucels present or wanting. Sepals small or obsolete. Petals white or greenish, broadest above the middle. Fruit longer than broad: carpels with the dorsal and contiguous ribs prominent, and broadly winged lateral ribs: oil-tubes solitary or several in the intervals and 2-10, or more, in the inner face.—About 40 species, mostly in the northern hemisphere.—Sum.—fall.—(ANGELICAS.)—The roots and fruits of some species are used medicinally.

Peduncles and rays pubescent.

Peduncles and rays glabrous.

Leaflets thin; lobes ascending: oil-tubes 1-3 in each interval.

Leaflets leathery; lobes spreading: oil-tubes about 20, contiguous and continuous.

1. *A. villosa*.

2. *A. Curtisii*.

3. *A. dentata*.

1. *A. villosa* (Walt.) B. S. P. Plant 6-18 dm. tall: leaflets 2-5 cm. long, the blades thickish, elliptic, elliptic-lanceolate, or oval, 2-5 cm. long, serrate: umbel-rays 2-5 cm. long: pedicels 3-4 mm. long: corolla white: fruit orbicular or orbicular-obovate, 4.5-5 mm. long, pubescent.—(ANGELICO. HAIRY-ANGELICA.)—Dry thickets and woods, various provinces, Fla. to Miss., Ark., Minn., and Conn.—The leaves are used to discourage the use of tobacco.

2. *A. Curtisii* Buckl. Plant 6-18 dm. tall: leaflets with ovate or lanceolate, sharply serrate or incised, acuminate: umbel-rays 12-25: pedicels 6-12 mm. long: corolla greenish: fruit ellipsoid or oval, 4-6 mm. long, glabrous.—(FILMY ANGELICA.)—Woods, mt. slopes and summits, Blue Ridge to Appalachian Plateau, N. C. to Pa.

3. *A. dentata* (Chapm.) Coult. & Rose. Plant 5-10 dm. tall: leaflets with elliptic to lanceolate, incised or incised-serrate blades, acute: umbel-rays 5-12; corolla white: fruit oval, 5-6 mm. long.—Dry pinelands, Coastal Plain, M Fla. and adj. Ga.

40. **HERACLEUM** L. Perennial herbs. Leaf-blades ternately compound. Umbels compound. Involucres and involucels of few, often deciduous, bracts and bractlets or the former wanting. Sepals minute or obsolete. Petals white, broadest above the middle, those of the outer and inner flowers different in shape. Fruit usually longer than broad, strongly dorsally flattened: carpels with the dorsal and contiguous ribs slender, and broadly winged lateral ribs, the latter nerved near the outer edge: oil-tubes solitary in each interval, and 2-4 in the outer face, rarely extending beyond the middle of the carpel.—About 60 species, natives of the Northern Hemisphere.

1. *H. lanatum* Michx. Plant course and heavy-scented, 6-25 dm. tall: leaf-blades 1-4 dm. long, the segments sharply toothed: umbel-rays 8-30, stout, 3-15 cm. long: fruit oval to obovate-oval, 8-12 mm. long.—(COW-PARSNIP.)—Thickets, fence-rows, fields, and waste-places, various provinces, Ga. to Calif., Alas., Ont., and Newf.—Sum.—The roots and fruits are mechanical.

41. **OXYPOLIS** Raf. Perennial herbs. Leaf-blades pinnate or ternate, or rarely reduced to hollow septate phyllodia. Umbels compound. Involucres and involucels present. Sepals acute. Petals white. Fruit longer than broad, dorsally flattened: carpels with the dorsal and contiguous ribs thin, and winged lateral ribs, the latter nerved near the inner part of the wing: oil-tubes solitary in the intervals and 2-6 in the inner face. [*Tiedemannia* DC.]—Five species, North American.—Sum.—fall or all year S.—DROPWORTS.

Leaves reduced to hollow, terete, transversely-jointed petioles (phyllodia).

Leaves with simple, pinnate or palmate blades.

Leaf-blades simple, or of 3 palmately disposed leaflets at the end of an elongate petiole.

Leaf-blades pinnately divided.

Fruit thinnish, the wings papery.

Fruit turgid, the wings corky.

1. *O. filiformis*.

2. *O. ternata*.

3. *O. rigidior*.

4. *O. turgida*.

1. *O. filiformis* (Walt.) Britton. Plant 5-18 dm. tall: phyllodia 3-60 cm. long: fruit elliptic-oval or oval obovate, 5-6 mm. long, broadly winged.—(WATER-DROPWORT.)—Low pinelands and shallow ponds, swamps, Coastal Plain, Fla. to La. and S. C.—Erroneously, apparently, reported from further N.

2. *O. ternata* (Nutt.) Heller. Plant 5-9 dm. tall: leaf-blades, or leaf-segments, linear or filiform: fruit elliptic, 4-5 mm. long.—Low pinelands, Coastal Plain, Fla. to N. C.

3. *O. rigidior* (L.) Raf. Plant 5-18 dm. tall: leaves with relatively short, often broad segments, the blades entire or saliently toothed, pale beneath: umbel usually many-rayed: fruit elliptic, 4-5 mm. long, thin-winged.—(PIG-POTATO. WATER-DROPWORT. COW-BANE.)—Wet woods, swamps, and cliffs, various provinces, Fla. to La., Minn., and N. Y.—*O. longifolia* seems to be an extreme form of this species with very narrow leaf-segments.

4. *O. turgida* Small. Plant 4-12 dm. tall: leaves and umbels similar to those of *O. rigidior*: fruit elliptic-oval or elliptic-obovate, 2.5-3 mm. long, thick-winged.—Swamps, Blue Ridge and adj. provinces, S. C. to Va., and Coastal Plain, S E N. Y.

## SERIES 2. GAMOPETALAE

Petals more or less united, or occasionally distinct, or very rarely wanting.

### ORDER ERICALES — ERICAL ORDER

Herbs, undershrubs, shrubs, or trees, sometimes humus-plants or saprophytes. Leaves alternate, often evergreen: blades simple. Flowers mainly perfect and complete. Calyx of 2-8, usually 5, partially united sepals. Corolla of 2-8, usually 5, mostly united petals. Androecium of as many or twice as many stamens as petals, sometimes partially reduced to staminodia: filaments mostly free. Gynoecium of several united carpels. Fruit capsular, baccate, or drupaceous.

Stamens with free and distinct filaments.

Ovary superior: fruit exposed or enclosed in the calyx.

Gynoecium 3-carpellary: pollen-grains simple.

Fam. 1. CLETHRACEAE.

Gynoecium 4-7-carpellary, but the ovary rarely

1-celled: pollen-grains simple or compound.

Herbaceous root-parasites or saprophytes, with

scale-like leaves: plants devoid of chloro-

phyl: pollen-grains simple.

Fam. 2. MONOTROPACEAE.

Herbs, undershrubs, shrubs, or trees: plants with chlorophyl: pollen-grains compound.

Herbaceous or partly woody plants with rootstocks.

Shrubs or trees with erect or diffuse stems.

Ovary wholly or partly inferior.

Stamens with the filaments wholly or partly adnate to the corolla.

Androecium without staminodia: caulescent plants.

Androecium with staminodia: acaulescent plants.

Fam. 3. PYROLACEAE.

Fam. 4. ERICACEAE.

Fam. 5. VACCINIACEAE.

Fam. 6. DIAPENSIACEAE.

Fam. 7. GALACACEAE.

## FAMILY 1. CLETHRACEAE — WHITE-ALDER FAMILY

Shrubs or trees, the pubescence of branched hairs. Leaves deciduous: blades mostly toothed. Flowers in racemes or panicles. Calyx of 5 persistent sepals. Corolla white, of 5 distinct petals. Androecium of 10 stamens: filaments elongate: anthers inverted in anthesis. Gynoecium of 3 united carpels: stigmas 3. Fruit a 3-valved loculicidal capsule.—Only the following genus, and about 30 species, widely distributed, except in Europe and Africa.

1. **CLETHRA** [Gronov.] L. Erect shrubs or trees, with toothed leaf-blades and elongate racemes or panicles.—Sum.—PEPPERBUSHES. WHITE-ALDERS.

Filaments glabrous: style pubescent: racemes erect.

Sepals acute: leaf-blades glabrous beneath, or nearly so.

Sepals obtuse: leaf-blades tomentose beneath.

Filaments pubescent: style glabrous: racemes nodding.

1. *C. alnifolia*.

2. *C. tomentosa*.

3. *C. acuminata*.

1. **C. alnifolia** L. Shrub 1–3 m. tall, the twigs sparingly pubescent: leaf-blades obovate or cuneate, 3–8 cm. long: pedicels 1–3 mm. long: sepals elliptic to lanceolate, 2.5–3 mm. long: petals 5–6 mm. long: capsule subglobose, 2.5–3 mm. in diameter, erect.—(SUMMERSWEET. SWEET-PEPPERBUSH.)—Acid swamps, low sandy woods, and wet pinelands, Coastal Plain and adj. provinces, Fla. to La., Pa. and Me. The flowers are very fragrant. Pink-flowered forms are occasional.

2. **C. tomentosa** Lam. Shrub 1–3 m. tall, the twigs tomentose: leaf-blades obovate to narrowly or broadly cuneate, 4–10 cm. long: pedicels 2–5 mm. long: sepals oval or ovate-elliptic, 3–3.5 mm. long: petals 5–6 mm. long: capsule spheroidal, 4–4.5 mm. in diameter, drooping.—Swamps, Coastal Plain, N Fla. to Ala. and N. C.—Sometimes this species has an extra flowering season in the winter. The inciting cause is not evident.

3. **C. acuminata** Michx. Shrub, or tree becoming 6 m. tall, the twigs tomentulose: leaf-blades oval or elliptic, 9–20 cm. long: racemes nodding: pedicels recurved: sepals ovate, 3.5–4 mm. long, acute: petals 6–7 mm. long: capsule ovoid, 4–5 mm. long, drooping.—Woods, ravines, and cliffs of non-calcareous rocks, inner Piedmont to Appalachian Plateau, Ga. to Tenn., W. Va., and Va.

## FAMILY 2. MONOTROPACEAE — INDIAN-PIPE FAMILY

Saprophytic or humus herbs, with matted roots. Stems scape-like, simple. Leaves reduced to scales. Flowers in racemes, or solitary, nod-

ding. Calyx of 2-6 deciduous sepals. Corolla white or colored, of 3-6 petals, or wanting. Androecium of 6-12 stamens: anthers with valves or pores. Gynoecium of 4-6 united carpels: stigma capitate, disc-like, or funnelform. Fruit a 4-6-valved loculicidal capsule.—About 9 genera and 16 species, most abundant in North America.

Corolla of several distinct petals, deciduous.

Flowers solitary: plants white or pink (black in drying).

Flowers several: plants yellowish or red.

Corolla gamopetalous, campanulate, persistent.

1. *MONOTROPA*.

2. *HYPOPITYS*.

3. *MONOTROPSIS*.

1. **MONOTROPA** L. White or pale-pink wax-like herbs blackening in drying. Flowers colorless, pink, ochroleucous, or salmon-colored. Sepals 2-4, unequal. Petals 5 or 6, saccate at the base, dilated at the apex. Gynoecium glabrous.—About 3 species, in North America and Asia.—INDIAN-PIPES. CORPSE-PLANTS.

Flowers white or pale-pink: petals obscurely ciliate: filaments sparingly pubescent.

1. *M. uniflora*.

Flowers ochroleucous or salmon-colored: petals copiously ciliate

and densely pubescent within: filaments copiously pubescent.

2. *M. Brittonii*.

1. *M. uniflora* L. Stem 0.5-3 dm. tall, white: leaves lanceolate or elliptic-lanceolate, somewhat pointed: sepals and petals deeply saccate at the base, entire or eroded at the top: filaments slightly pubescent with short hairs: lobes of the disk slender, acute, projecting downward: capsule ovoid, 1-1.5 cm. long.—Woods and rich shaded banks, various provinces, N Fla. to Calif., Wash., and Newf.—Sum.—A pink-stemmed form flowering in fall, at higher altitudes in our range, may represent a distinct species.

2. *M. Brittonii* Small. Stem 1-4 dm. tall, ochroleucous: leaves ovate or oblanceolate, or spatulate near the top of the stem, obtuse: sepals and petals shallowly saccate at the base, sometimes toothed at the top: filaments densely pubescent with long hairs: lobes of the disk stout, blunt, projecting outward or upward: capsule ellipsoid-ovoid, 1.5-2 cm. long.—Serub, Coastal Plain, S pen. Fla. to SE N. C.—Wint.

2. **HYPOPITYS** Adans. Colored fragrant herbs. Flowers in a terminal raceme, deep-pink, yellow, red, or crimson. Sepals and petals 5 each in the earliest flower, or 4 in the later ones. Gynoecium pubescent.—About 7 species, in the north temperate zone.—Sum.—fall.—PINE-SAPS. FALSE BEECH-DROPS.

Stigma not retrorsely bearded: style sparingly pubescent: sepals and petals with short cilia.

1. *H. americana*.

Stigma retrorsely bearded: style copiously pubescent: sepals and petals with long cilia.

2. *H. lanuginosa*.

1. *H. americana* (DC.) Small. Plant tawny or yellow, finely pubescent or nearly glabrous, 1-3 dm. tall: sepals 7-10 mm. long: petals sparingly pubes-

cent: capsule oval or oblong-oval, 7-10 mm. long.—Woods, Blue Ridge, N. C. and Tenn. to Md., and various provinces, N. J. to W. Va. and Ont.

2. *H. lanuginosa* (Michx.) Nutt. Plant deep-pink and crimson, markedly or copiously pubescent, 0.5-3.5 dm. tall: sepals 6-9 mm. long: petals markedly pubescent: capsule globular, 4-5 mm. long.—Woods and thickets, various provinces, Fla. to La., Ky., Que., and Newf.—A late-blooming and bright-red-flowered species, with flowers and leaves tipped with yellow, has been published as *H. insignata* Bicknell, and may prove to be only a form of the above species, or the original plant of Michaux.

3. **MONOTROPSIS** Schwein. Colored herbs. Flowers in a raceme, fragrant, white, pink, or purple. Sepals 5, erose near the apex, persistent. Petals partially united: tube 5-saccate at the base.—Three species, given below.—SWEET PINE-SAPS. PYGMY-PIPES.

Corolla about as long as the calyx during anthesis or shorter, colored.

Corolla-lobes much shorter than the tube: calyx and corolla about equal in length.

Corolla-lobes about as long as the tube: calyx about twice as long as the corolla.

Corolla about twice as long as the calyx during anthesis, white.

1. *M. odorata*.

2. *M. Lehmaniae*.

3. *M. Reynoldsiae*.

1. *M. odorata* Ell. Stems 5-11 cm. tall, purple or purplish-brown: flowers violet-scented: sepals 7-10 mm. long: corolla 7-8 mm. long, the lobes much shorter than the tube. [*Cryptophila pudica* W. Wolf.]—(CAROLINA BEECH-DROPS.)—Moist acid woods, various provinces, N. Ga. to Ala., Ky., and Md.—Early spr.—The corolla is usually pink, but varies to almost white and purplish.

2. *M. Lehmaniae* Burnham. Stem 4-10 cm. tall, mainly brownish-purple: flowers not fragrant: sepals 7-8 mm. long: corolla mainly pink, the lobes about as long as the tube.—Woods, in Blue Ridge, W. N. C.—Fall.

3. *M. Reynoldsiae* (A. Gray) Heller. Stem 4-12 cm. tall, purple: sepals 2-4 mm. long: corolla 6.5-8 mm. long, the lobes 1/3 as long as the tube.—Woods, E. Fla.—Fall.

### FAMILY 3. PYROLACEAE — WINTERGREEN FAMILY

Perennial mostly evergreen herbs, with elongate rootstocks. Leaves alternate, mostly near the base of the stem: blades leathery. Flowers in terminal racemes, corymbs, or umbel-like clusters, or solitary, sometimes irregular. Calyx of 4 or 5 persistent sepals. Corolla white or pink, of 4 or 5 essentially distinct, wax-like petals. Androecium of twice as many stamens as there are petals: anthers inverted in anthesis. Gynoecium of 4 or 5 united carpels: stigmas united. Fruit a 4- or 5-valved loculicidal capsule.—Three genera and about 25 species, natives of the Northern Hemisphere.

Style elongate: flowers racemose: filaments unappendaged: capsule opening from base to top. 1. *PYROLA*.

Style very short: flowers corymbed or umbelled: filaments appendaged at the base: capsule opening from top to base. 2. *CHIMAPHILA*.

1. **PYROLA** [Tourn.] L. Leaves with broad blades. Flowers white, greenish, or pink, in elongate racemes. Filaments unappendaged, glabrous. Capsule nodding, the valve-margins cobwebby.—About 18 species, widely distributed in temperate and cool regions.—Sum.—WINTERGREENS. SHIN-LEAFs.

Leaf-blades suborbicular: calyx-lobes mainly longer than the tube: filaments less than twice as long as the anthers. 1. *P. americana*.

Leaf-blades elliptic-oval or oblong: calyx-lobes mainly shorter than the tube: filaments over twice as long as the anthers. 2. *P. elliptica*.

1. *P. americana* Sweet. Plant 2–3 dm. tall: leaf-blades thickish, 2–3 cm. long, mostly shorter than the petiole: sepals elliptic or lanceolate, 2–3 mm. long: petals obovate to orbicular-obovate, 7–9 mm. long: capsule 6–7 mm. wide. [*P. rotundifolia* Michx. not L.]—Woods, Blue Ridge, N. C. and Tenn., various provinces, Va. to Wisc. and N. S.

2. *P. elliptica* Nutt. Plant 1–3 dm. tall: leaf-blades thinnish, 3–9 cm. long, mostly longer than the petiole: sepals triangular-ovate: petals oblong to elliptic-obovate, 5.5–7 mm. long: capsule 5–6 mm. wide.—Thickets and woods, Blue Ridge, Tenn., and various provinces, Tenn. to N. M., B. C., Ont., and Va.—The petals of both species are usually white, but pink tinged corollas occur in occasional forms.

2. **CHIMAPHILA** Pursh. Leaves with relatively narrow blades. Flowers white, in corymbs. Filaments with pubescent or erose-ciliate appendages at the base. Capsule erect, the valve-margins glabrous.—About 7 species, distributed from the equator to the Arctic regions.—Sum.—PIPSISSEWAS.

Sepals longer than wide: petals ciliolate all around: filament-appendages pubescent. 1. *C. maculata*.

Sepals wider than long: petals erose-ciliolate and jagged at the apex: filament-appendages erose-ciliate. 2. *C. corymbosa*.

1. *C. maculata* (L.) Pursh. Plant 7–22 cm. tall: leaf-blades lanceolate or sometimes broader, 2–5 cm. long, dark-green with whitish veins: inflorescence usually 1–5-flowered: sepals rounded at the apex, ciliolate: petals white, 10–12 mm. long: filament-appendages narrow.—(SPOTTED-WINTERGREEN.)—Dry woods, various provinces, Ga. to Ala., Minn., and Me.

2. *C. corymbosa* Pursh. Plant 9–32 cm. tall: leaf-blades oblanceolate, cuneate, or obovate-cuneate, 2–10 cm. long, deep yellow-green, not variegated: inflorescence usually 3–10-flowered: sepals not rounded at the apex, erose: petals 9–11 mm. long, white except the pink base: filaments and broad appendages purplish-pink.—(PRINCE'S-PINE.)—Dry acid woods, Blue Ridge, Ga. to N. C., and various provinces, Va. to Wisc. and N. S.—*Chimaphila mexicana* is sometimes included in *C. maculata*. *C. domingensis* and *C. guatemalensis*, of Santo Domingo and Central America, respectively, have sometimes been included in *C. corymbosa*. Hence the ranges of the above species are sometimes extended into the tropics.

FAMILY 4. **ERICACEAE** — HEATH FAMILY

Shrubs, trees, or undershrubs. Leaves often persistent: blades commonly leathery. Flowers typically perfect. Calyx of 4-7 distinct or partially united sepals. Corolla of 4-7 distinct or partially united petals, sometimes slightly 2-lipped. Androecium of as many or twice as many stamens as there are petals: anthers opening by pores, chinks, or valves. Gynoecium of 2-7 united carpels. Fruit a capsule, or sometimes baccate or drupaceous.—About 60 genera and 1,100 species, widely distributed.

Calyx not accrescent: capsule exposed.

Capsule septicidal.

Capsule loculicidal or marginicidal.

Anther-sacs opening by apical pores or chinks above the middle: capsule loculicidal: erect shrubs, trees, or vines.

Anther-sacs opening lengthwise: capsule marginicidal: prostrate shrub with creeping branches.

Calyx accrescent, enclosing the capsule and becoming fleshy.

Tribe I. RHODODENDREAE.

II. ANDROMEDEAE.

III. EPIGAEAE.

IV. GAULTHERIEAE.

## I. RHODODENDREAE

Corolla of distinct petals.

Anther-sacs opening by apical pores: petals 6 or 7.

Anther-sacs opening lengthwise.

Anthers sagittate: tall shrub with thin-membranous leaf-blades: petals long and narrow.

Anthers globular-didymous: low or depressed shrubs with leathery leaf-blades: petals short and broad.

Corolla of partly united petals.

Corolla decidedly 2-lipped, funnellform.

Corolla not 2-lipped, campanulate or rotate-campanulate, urceolate or saucer-shaped.

Flower-body, and usually leaf-buds, scaly-strobilaceous.

Corolla campanulate or rotate-campanulate.

Upper corolla-lobe interior: calyx-lobes small, but prominent: leaves persistent; blades leathery.

Upper corolla-lobe exterior: calyx-lobes minute: leaves deciduous; blades membranous.

Corolla urceolate.

Flower-buds, and leaf-buds, not scaly-strobilaceous.

Calyx persistent: corolla-lobes rounded: capsule depressed.

Calyx deciduous: corolla-lobes acute: capsule ovoid.

1. BEFARIA.

2. ELLIOTTIA.

3. LEIOPHYLLUM.

4. AZALEA.

5. RHODODENDRON.

6. BILTIA.

7. MENZIESIA.

8. KALMIA.

9. KALMIELLA.

## II. ANDROMEDEAE

Calyx-lobes imbricate, at least in the bud.

Capsule depressed: anther-sacs opening by apical pores or chinks.

Capsule-wall double, the outer layer 5-valved.

Capsule-wall single, 5-valved.

Anthers awned: panicles terminal.

Anthers awnless: panicles axillary.

Capsule elongate: anther-sacs opening by chinks above the middle.

Calyx-lobes valvate or separated in the bud.

Anther-sacs awned: capsule-sutures not thickened.

Awns of the anther-sacs ascending: seeds smooth.

Awns of the anther-sacs deflexed: seeds reticulate or with a loose coat.

Flowers in terminal compound panicles: filaments subulate, straight or nearly so.

Flowers in axillary simple raceme-like panicles: filaments much-flattened, sigmoid-curved.

Anther-sacs awnless: capsule-sutures thickened.

Filaments appendaged: corolla about twice as long as the calyx.

Style fusiform: corolla of an urceolate type: leaf-blades with intramarginal veins: sepals persistent.

Style columnar: corolla of a cylindraceous-campanulate type: leaf-blades without intramarginal veins: sepals deciduous.

10. CHAMAEDAPHNE.

11. EUBOTRYS.

12. LEUCOTHOE.

13. OXYDENDRON.

14. ZENOBIA.

15. PIERIS.

16. AMPELOTHAMNUS.

17. DESMOTHAMNUS.

18. NEOPIERIS.

Filaments unappendaged: corolla several times exceeding the calyx.

Capsule longer than thick, prominently angled: lepidote shrubs with persistent leaves: flowers in axillary clusters.

Capsule depressed, not angled: pubescent shrubs with deciduous leaves: flowers in paniced racemes.

19. *XOLISMA*.

20. *ARSENOCOCCUS*.

### III. EPIGAEAE

Plant with creeping stems and evergreen leaves: flowers in axillary clusters: corolla salverform: calyx-lobes dry.

21. *EPIGAEA*.

### IV. GAULTHERIEAE

Stem erect from a horizontal rootstock: leaves evergreen: flowers solitary in the axils: corolla urceolate: calyx-lobes fleshy.

22. *GAULTHERIA*.

1. **BEFARIA** Mutis. Evergreen shrubs with erect branches. Leaves alternate: blades thick. Flowers large in long erect spike-like racemes. Calyx-lobes 6 or 7. Petals broadened upward, spreading. Stamens 12 or 14: anthers with terminal pores. Ovary 6- or 7-celled. Capsule subglobose.—About 15 species, mostly tropical American.—Sometimes spelled *Bejaria*.

1. **B. racemosa** Vent. Shrub 1-2.5 m. tall, the branches hirsute: leaf-blades mainly elliptic to oval, 2-5.5 cm. long, often somewhat hirsute: calyx-lobes about 4 mm. long: petals white, sometimes pink-tinged, spatulate to linear-spatulate, 2-3 cm. long, glutinous: filaments pubescent: capsule depressed-globose, 6-9 mm. in diameter.—(TAR-FLOWER, FLY-CATCHER.)—Pinelands, Coastal Plain, Fla. to Ga.—Spr.-fall.—This outlier of a typically Mexican-South American genus is a striking plant when in flower. Bouquets made of the inflorescence as it starts to flower, will continue to bloom for nearly or quite a week.

2. **ELLIOTTIA** Muhl. Deciduous shrubs, with more or less spreading branches. Leaves alternate: blades thinnish. Flowers small, numerous, in short panicles. Calyx-lobes 3 or 4. Petals not broadened upward. Stamens 4-10: anthers with longitudinal valves. Ovary 3-5-celled. Capsule subglobose.—One species.

1. **E. racemosa** Muhl. Shrub 1-5 m. tall, the branches glabrous: leaf-blades elliptic, oval, or elliptic-oblongate, 4-12 cm. long: calyx-lobes about 1 mm. long: petals white, linear-elliptic, 12-14 mm. long, not glutinous: filaments glabrous: capsule ovoid-globose.—(ELLIOTTIA.)—Oak ridges and sandhills, Coastal Plain and adj. provinces, Ga. and S. S. C.—Sum.—One of the rarest of American shrubs, known to have been found at but 7 or 8 stations, and at some of these now exterminated. At each station but a single individual is represented, although this may often spread into a large patch by its rootstocks. Being sterile to its own pollen, seeds are only produced when cross-fertilization from one clump to another is brought about. Before the coming of the white man, such plants must have grown close enough together for

insects to accomplish this crossing at times, but lumbering and agriculture have destroyed so many, that propagation by seeds seems to have ceased.

**3. LEIOPHYLLUM Pers.** Evergreen shrubs with erect, spreading, or prostrate branches. Leaves alternate or opposite, box-like: blades coriaceous, entire, often shining. Flowers in terminal umbel-like clusters. Calyx-lobes 5, longer than the tube. Petals 5, white or pink, spreading. Stamens 10: anthers opening lengthwise. Style straight. Capsule ovoid. [*Dendrium* Desv.]—Only the following species.—Spr.—sum.—SAND-MYRTLES.

Style slender, fully twice as long as the ovary in anthesis: disk minute: petals elliptic to ovate-elliptic: pedicels glabrous.

1. *L. buxifolium*.

Style stout, less than twice as long as the ovary: disk prominent: petals ovate to rhombic-ovate: pedicels pubescent.

Leaves mostly opposite: capsule-valves sharp-tuberculate: depressed or diffuse shrub.

2. *L. Lyoni*.

Leaves alternate: capsule-valves muricate or scabrous: erect shrub.

3. *L. Hugerii*.

1. *L. buxifolium* (Berg.) Ell. A much-branched shrub resembling a dwarf-box plant, 3 dm. tall or less: leaf-blades elliptic or slightly broadened upward, mostly 3–8 mm. long, shining above, paler and dull beneath: calyx-lobes elliptic-lanceolate or lanceolate, about 1 mm. long: petals elliptic to ovate-elliptic, 2–2.5 mm. long: capsule ovoid, about 3 mm. long, more than twice as long as the calyx. [*D. buxifolium* Desv.]—Sandy pine-barrens, Coastal Plain, N. C. to N. J.; recorded from as far south as Fla.

2. *L. Lyoni* Sweet. A low, diffuse or depressed shrub 2 dm. tall or less, the usually numerous branches often prostrate and matted: leaf-blades oval or broadly elliptic, 4–7 mm. long or sometimes smaller: calyx-lobes lanceolate to almost linear, about 1.5 mm. long: petals ovate to oval, about 2.5 mm. long: capsule broadly ovoid to globose-ovoid, 2.5–3 mm. long. [*D. prostratum* (Loud.) Small]—Rocky summits, Blue Ridge, N. C. and Tenn.

3. *L. Hugerii* (Small) K. Sch. A much-branched shrub, 9 dm. tall or less: leaf-blades elliptic or individually elliptic-ovate, 9–15 cm. long: calyx-lobes lanceolate, 2 mm. long or sometimes shorter: petals broadly ovate to rhombic-ovate, 3.5–4 mm. long: capsule ovoid, 3.5–4 mm. long. [*D. Hugerii* Small]—Rocky summits, Blue Ridge and inner Piedmont, S. C. and N. C.

**4. AZALEA L.** Erect deciduous-leaved shrubs, sometimes tardily deciduous at the extreme south. Leaves alternate: blades sometimes bristle-toothed. Calyx deciduous: lobes 5, conspicuously ciliate. Corolla variously colored, funnel-form: tube elongate: limb 2-lipped. Stamens 5 or rarely 10, conspicuously inserted: anthers with terminal pores. Style declined. Capsule elongate, opening at the apex.—About 40 species, American and Asiatic.—WILD-HONEY-SUCKLES. AZALEAS.—Natural hybrids are to be expected.—Several of the species are much used in horticulture.

lower-clusters appearing before the leaves or as the leaves unfold.

I. NUDIFLORAE.

lower-clusters appearing after the leaves.

Twigs strigose: style usually pubescent.

II. VISCOSAE.

Twigs glabrous: style usually glabrous.

Corolla white or pinkish; tube glandular pubescent without.

Corolla crimson; tube glabrous or nearly so without.

III. ARBORESCENTES.

IV. PRUNIFOLIAE.

#### I. NUDIFLORAE

Corolla red, orange, or yellow.

Flowers appearing as the leaves unfold: scales of the winter-buds glabrous on the back.

Corolla-tube glandular without, as long as the lobes or shorter; limb yellow to orange or scarlet.

Corolla-tube pubescent with glandless hairs without, longer than the lobes; limb scarlet or bright red.

Flowers appearing before the leaves unfold: scales of the winter-buds pubescent on the back.

Corolla white, pink, or carmine.

Shrubs with tap-roots and erect, usually much-branched stems, mostly 1-2 m. tall: flower-buds without prominent rows of stipitate glands at the apex.

Corolla pink.

Corolla-tube hirsute or strigose without.

Corolla-tube more or less glandular-pubescent.

Leaf-blade thick, usually pubescent beneath when mature: capsule softly pubescent and hirsute: corolla-tube abruptly expanded into the limb.

Leaf-blade softly pubescent beneath when mature, but green.

Leaf-blade white or pale-tomentose beneath when mature, not green.

Leaf-blade thin-membranaceous: capsule glandular-hirsute: corolla-tube gradually expanded into the limb.

Corolla white.

Shrub with horizontal underground stem and low erect simple or nearly simple branches, in small or large colonies (stoloniferous): flower-buds with conspicuous rows of stipitate glands at the apex.

1. *A. calendulacea*.

2. *A. speciosa*.

3. *A. austrina*.

4. *A. nudiflora*.

5. *A. canescens*.

6. *A. candida*.

7. *A. prinophylla*.

8. *A. alabamensis*.

9. *A. atlantica*.

#### II. VISCOSAE

Twigs pale: scales of the winter-buds few (15 or less), obtuse or acutish, usually brown: leaves usually glabrous beneath: northern plant.

Twigs red-brown: scales of the winter-buds many (15 or more), aristate-mucronate, pale, except the dark margin: leaves often pubescent beneath: southern plant.

10. *A. viscosa*.

11. *A. serrulata*.

#### III. ARBORESCENTES

Shrub or small tree, with glabrous yellowish-brown or reddish-brown twigs: leaf-blades of an obovate type, usually glaucous beneath.

12. *A. arborescens*.

#### IV. PRUNIFOLIAE

Shrub with dark purplish-red twigs: leaf-blades of an elliptic or elliptic-lanceolate type, light-green beneath.

13. *A. prunifolia*.

1. *A. calendulacea* Michx. Shrub 0.5-5 m. tall, the twigs strigillose: leaf-blades oval, elliptic, or obovate, 3-8 cm. long, more or less canescent beneath: calyx-lobes ovate to elliptic, 3-4 mm. long: corolla yellow, orange, or scarlet, often somewhat variegated; tube 1.5-2 cm. long, glandular-pubescent: upper lobe with an orange blotch: capsule ovoid-ellipsoid, 1.5-2.5 cm. long, or sometimes shorter, hirsute. [*A. lutea* L.?] —(FLAME-AZALEA. YELLOW-AZALEA.)—Acid humus, in open woods, inner Piedmont to Appalachian Plateau, Ga. to Ala., Tenn., W. Va., and S N. Y.—Late spr.—A red azalea native in the Cumberland mountains, with pedicel and calyx non-glandular and leaf-blades glaucous beneath, flowering in late June and July, may be distinct.

2. *A. speciosa* Willd. Shrub 0.5–2 m. tall, the twigs strigillose: leaf-blades obovate to elliptic, 3–6 cm. long, finely pubescent beneath and more or less strigillose on the midrib: calyx-lobes broadly ovate to elliptic, 0.5–3 mm. long, long-ciliate: corolla scarlet or bright-red; tube 2–2.5 cm. long; upper lobe with an orange blotch: capsule 2–3 cm. long, narrowly ovoid to elliptic-ovoid, strigose.—Woods and sandhills, Piedmont and adj. provinces, Ga. and S. C.—Spr.

3. *A. austrina* Small. Shrub mostly 3 m. tall or less, the twigs sparingly strigose and softly pubescent, and usually glandular: leaf-blades oval, obovate, elliptic, or elliptic-spatulate, 2.5–9 cm. long, rather firm in age, finely pubescent, usually permanently so: calyx-lobes deltoid to triangular-lanceolate, acute, glandular-ciliate: corolla yellow and orange; tube 1.8–2 cm. long, finely glandular-pubescent; lobes broad, acute or abruptly short-acuminate: capsule narrowly cylindric ellipsoid, slightly narrowed upward, 2–2.5 cm. long, finely glandular-pubescent.—Woods and stream-banks, in moderately acid sandy soils, N W Fla.—Spr.—The flowers are slightly fragrant.

4. *A. nudiflora* L. Shrub 3 m. tall or less, the twigs finely pubescent and more or less strigose: leaf-blades elliptic to obovate or elliptic-obovate, 3–10 cm. long, thick and firm in age, strigose on or near the veins beneath, or glabrous, except the margins: calyx-lobes ovate to half-orbicular, copiously ciliate: corolla pink (or deep-pink or carmine, the tube with some equal gland-tipped hairs in *A. nudiflora glandifera*); tube 2–3 cm. long, pilose or strigose; lobes rather broad, shorter than the tube: capsule ellipsoid, often narrowly so or somewhat narrowed upward, strigose or hirsute-strigose.—(PINXTER-FLOWER. HONEY-SUCKLE. EARLY-AZALEA.)—Woods and low grounds, various provinces, N. C. to Tenn., Ohio and Mass.—Spr.—The flowers are scarcely fragrant.

5. *A. canescens* Michx. Shrub up to 5 m. tall the twigs minutely soft-pubescent and usually also strigose: leaf-blades elliptic, elliptic-oblongate, oblongate, or narrowly obovate, thickish and firm at maturity, 4–10 cm. long, ciliate, with scattered hairs above or nearly glabrous, permanently tomentose-canescens beneath, (or glabrous, except the margins and the midrib in *A. canescens subglabra*): calyx-lobes deltoid to ovate or half-orbicular, usually about 1 mm. long, ciliate: corolla pink; tube 1.5–2.5 cm. long, or rarely somewhat longer, finely glandular-pubescent, abruptly dilated near the throat; lobes shorter than the tube: capsule cylindric-ellipsoid, narrowed upward, 1.5–2.5 mm. long, canescent and hirsute.—Stream-banks, in rather acid sandy soil, Coastal Plain and adj. provinces, Fla. to Tex., Ark., Tenn., and N. C.—Spr.—The flowers are slightly fragrant.

6. *A. candida* Small. Shrub 2 m. tall or less, the twigs tomentulose and often somewhat glandular: leaf-blades obovate, obovate-oblongate, cuneate, or elliptic, coriaceous at maturity, 1–7 cm. long, thinly fine-pubescent above, glaucous and white- or pale-tomentose beneath and sometimes reticulate-veiny: calyx-lobes deltoid, ciliate, obtuse: corolla white: capsule narrow, gradually narrowed upward, 2–2.5 cm. long, canescent, curved.—Hammocks, Coastal Plain, N Fla. to S Ga.—Spr.—The flowers are slightly fragrant.

7. *A. prinophylla* Small. Shrub up to 5 m. tall, the twigs finely loose-pubescent and somewhat strigose: leaf-blades oval or elliptic, varying to obovate, 2–8 cm. long, thinish and not very firm at maturity, ciliate, canescent beneath or glabrate, especially in age: calyx-lobes half-orbicular to deltoid or ovate, sparingly ciliate, obtuse: corolla deep-pink, or sometimes pale; tube 1.5–2 cm. long, thinly villous-tomentose and glandular-pubescent; lobes as long as the tube or slightly shorter: capsule ellipsoid to ovoid-ellipsoid, 1.5–2 cm. long, or smaller, glandular-pubescent. [*A. canescens* (Fl. SE. U. S.) not Michx.]—Woods and rocky banks, various provinces N of Coastal Plain, Tenn. to Ark., Vt., and Va.—Spr.—The flowers are very fragrant.

8. *A. alabamensis* (Rehder) Small. Shrub up to 1 m. tall, the twigs pale-strigose: leaf-blades obovate to elliptic or elliptic-obovate, 3–6 cm. long, loosely short-pubescent beneath and strigillose on the midrib: calyx-lobes ovate, often broadly so, bristly pubescent: corolla white; tube 2–3 cm. long, usually glandular-pubescent without; lobes shorter than the tube: anthers 2–3 mm. long: capsule cylindric-ellipsoid, about 1.5 cm. long, loosely pubescent and more or less glandular-bristly. [*Rhododendron alabamense* Rehder.]—Dry woods, Coastal Plain and adj. provinces, Ala.—Spr.—The flowers are fragrant.

9. *A. atlantica* Ashe. Shrub with the more or less gregarious branches usually less than 0.5 m. tall, the twigs sparingly strigillose and sometimes glandular-hirsute: leaf-blades obovate, elliptic-obovate, or sometimes elliptic, 3–6 cm. long, mostly glabrous beneath, except the pubescent midrib, (finely pubescent on both sides and bluish-green in *A. atlantica luteo-alba*): calyx-lobes broadly ovate or elliptic-ovate, 2–4 mm. long, ciliate, often with gland-tipped hairs: corolla white or pink, (purplish-pink in *A. atlantica neglecta*); tube 2–2.5 cm. long or barely longer, glandular-pubescent without; lobes shorter than the tube: anthers 2–3 mm. long: capsule ovoid-ellipsoid, 1.5–2 cm. long, bristly with glandless or gland-tipped hairs.—Low pinelands, Coastal Plain, S. C. to Del.—Spr.—The flowers are very fragrant.—An azalea apparently referable to *A. atlantica luteo-alba* occurs in S Ala.

10. *A. viscosa* L. Shrub 0.5–5 m. tall, the twigs loosely pubescent and strigillose (or decidedly hispid in *A. viscosa hispida*); the winter-buds typically glabrous (or densely pubescent, and the leaves up to 6 cm. long in *A. viscosa aemulans*, or silky-pubescent, and the leaves up to 4 cm. long in *A. viscosa montana*): leaf-blades cuneate to obovate or individually elliptic or elliptic-oblancoate, 2–6 cm. long, thickish, ciliate, strigillose on the midrib beneath, (or finely and rather densely pubescent beneath in *A. viscosa tomentosa*), dull (or small and shining in *A. viscosa nitida*; glaucous on one or both sides in *A. viscosa glauca*): calyx-lobes ovate to semi-orbicular, pectinate-ciliate: corolla white or pink-tinged; tube 1.5–2.5 cm. long, rather abruptly dilated near the limb; lobes much shorter than the tube: capsule ellipsoid-ovoid, 1.5–2 cm. long, glandular-hirsute.—(SWAMP-AZALEA.)—Acid swamps, various provinces, Fla. to Miss., Ohio, and Me.—Late Spr.—sum.—The flowers are very fragrant.

11. *A. serrulata* Small. Shrub 7 m. tall or less, the twigs red-brown, strigose, and usually also finely villous, the winter-buds with numerous glabrous scales, (or with few and densely gray-pubescent in *A. serrulata georgiana*): leaf-blades elliptic to obovate or obovate-elliptic, or individually elliptic-oblancoate, 4–9 cm. long, serrulate-ciliate, shining, finely reticulate, glabrous, except for scattered hairs on the midrib beneath: calyx-lobes ovate or broader, long-ciliate, obtuse: corolla white; tube 3–3.5 cm. long, somewhat enlarged near the base, expanded near the limb, glandular-pubescent; lobes narrow, shorter than the tube: capsule ovoid-ellipsoid, 1–1.5 cm. long, glandular-setose.—Wet hammocks, Coastal Plain, Fla. to La. and S. C.—Spr.—sum.—The flowers are very fragrant.

12. *A. arborescens* Pursh. Shrub with tall stems, (or with low widely branched stems and small very glaucous leaves in *A. arborescens Richardsonii*), or tree becoming 6 m. tall, with the scales of the winter-buds short-mucronate: leaf-blades elliptic, oblanceolate, or cuneate, 4–10 cm. long, glabrous beneath except the midrib and more or less glaucous: calyx-lobes ovate to linear-elliptic, 3–6 mm. long: corolla white or pale-pink; tube 2.5–3 cm. long, densely glandular-hirsute without; lobes acuminate, much shorter than the tube: anthers about 3 mm. long: capsule ellipsoid-ovoid, 1–2 cm. long, stout, bristly-glandular, abruptly narrowed at the apex.—(SMOOTH-AZALEA.)—Stream-banks and rocky woods, in rather acid soil, various provinces, N of Coastal Plain, Ga. to Ala., Ky., and Pa.—The flowers are fragrant and have conspicuous red filaments. The dried leaves give off the fragrance of coumarin.—Late spr.—early sum.

13. *A. prunifolia* Small. Shrub 3 m. tall or less, with the scales of the winter-buds short-aristate: leaf-blades elliptic or elliptic-lanceolate, varying to somewhat obovate, 2.5–13 cm. long, acute or slightly acuminate, deep-green above, light-green beneath, glabrous, except for scattered hairs on the midrib and on the veins beneath, and the ciliolate margins: calyx-lobes ovate or half-orbicular, about 1 mm. long, coarsely long-ciliate, obtuse: corolla crimson, 2–2.5 cm. long; tube glabrous or merely with scattered hairs, gradually dilated from the base to the limb; lobes broad, abruptly pointed: anthers 2.5–3 mm. long: capsule gradually narrowed upward, about 2 cm. long, strigose and puberulous.—Moist woods, Coastal Plain, Ga. and Ala.—Sum.

5. *RHODODENDRON* L. Evergreen shrubs or trees. Leaves alternate: blades leathery, not ciliate. Calyx persistent: lobes broad and short. Corolla variously colored, campanulate: tube very short: limb 2-lipped. Stamens usually 10, slightly exserted with terminal pores. Style declined. Capsule elongate, opening at the apex.—About 100 species, most abundant in Asia.—ROSE-BAYS. *RHODODENDRONS*. Many species are used in horticulture.

Leaf-blades neither glandular-dotted nor scaly.  
Leaf-blades glandular-dotted or scaly.

I. MAXIMA.  
II. MINORA.

#### I. MAXIMA

Calyx-lobes longer than wide: corolla mainly white or pink: pedicels viscid.

Calyx-lobes wider than long: corolla rose-purple or lilac-purple: pedicels not viscid.

1. *R. maximum*.

2. *R. catawbiense*.

#### II. MINORA

Flower-clusters appearing after the leafy shoots of the season: leaf-blades acute or acuminate.

Corolla 1.5–2 cm. long: calyx-lobes of a deltoid type.

Corolla 2.5–3 cm. long: calyx-lobes of an ovate type.

Flower-clusters appearing before the leafy shoots of the season: leaf-blades obtuse or retuse.

3. *R. carolinianum*.

4. *R. minus*.

5. *R. Chapmanii*.

1. *R. maximum* L. An evergreen shrub commonly 5 m. tall, or rarely a small tree, with scurfy-pubescent twigs: leaf-blades elliptic or elliptic-oblancoelate, 10–25 cm. long, acute or short-acuminate, glabrous, or somewhat scurfy beneath, bright-green above, pale-green beneath, abruptly narrowed at the base, the stout petioles tomentulose when young: calyx-lobes ovate to oblong, mostly longer than wide: corolla mainly white or pink, often somewhat greenish in the throat and with yellow or orange spots within, broadly campanulate, 2–3 cm. long; lobes not crisped: filaments slender, the longer ones about 2 cm. long: anthers about 2 mm. long: style elongate: capsule narrowly ellipsoid or cylindric-ellipsoid or slightly narrowed upward, 1–1.5 cm. long: seeds less than 2 mm. long.—(GREAT-LAUREL. ROSE-BAY.)—Acid woods, mt. slopes, and stream-banks, various provinces, in Coastal Plain only N, Ga. to Ala., Ont., and N. S.—Sum.—The hard, close-grained brown heart-wood is used for tool handles. The root is used for making tobacco pipes.

2. *R. catawbiense* Michx. An evergreen shrub commonly 1–3 m. tall, or rarely a small tree, with finely pubescent twigs: leaf-blades elliptic, or nearly so, or oval, 7–16 cm. long, abruptly pointed at the apex, glabrous, dark-green above, pale-green beneath, mostly rounded or subcordate at the base, the stout petioles

pubescent: calyx-lobes half-orbicular or broadly deltoid, much wider than long: corolla rose-purple or lilac-purple, broadly campanulate, 3.5–5 cm. long; lobes scarcely undulate: filaments slender, the longer ones about 3 cm. long; anthers about 3 mm. long: style elongate: capsule narrowly ellipsoid, or slightly enlarged at the base, 2–2.5 cm. long: seeds less than 3 mm. long.—(PURPLE-LAUREL. MOUNTAIN ROSE-BAY.)—Mt. slopes, summits, bluffs and cliffs, in acid soils, Piedmont to Appalachian Plateau, Ga. to Ala. and W. Va.—Spr.—early sum.—The form growing in the Piedmont is *R. catawbiense insulare*.

3. *R. carolinianum* Rehder. A much-branched shrub, with resinous-dotted foliage; leaf-blades elliptic or somewhat broadened upward, 8–13 cm. long, acute or acuminate at both ends, somewhat shining above, paler beneath and copiously resinous-dotted; petioles stout but relatively long, resinous-dotted and slightly pubescent above: calyx-lobes ovate, often broadly so: corolla rose-colored, often mottled, 1.5–2 cm. long, broadly funnel-form; tube short: longer filaments less than 2.5 cm. long; capsule ellipsoid-ovoid, 8–12 mm. long.—Woods and mountain summits, Blue Ridge, S. C. to Tenn. and N. C.—Spr.

4. *R. minus* Michx. A branching straggling shrub, with resinous-dotted foliage: leaf-blades elliptic or oval, 3–12 cm. long, acute or somewhat acuminate at both ends, deep-green above, paler and copiously resinous-dotted beneath; petioles stout, but relatively long, resinous and more or less pubescent at least when young: calyx-lobes deltoid, often broadly so or rarely deltoid-ovate: corolla clear rose-colored, 2.5–3 cm. long, funnel-form-campanulate; tube rather long: longer filaments more than 2.5 cm. long: anthers about 2.5 mm. long: capsule ellipsoid or ellipsoid-ovoid, 8–12 mm. long. [*R. punctatum* Andr. *R. Cuthbertii* Small]—Sandy woods, inner Coastal Plain to lower Blue Ridge, Ga. to Ala. and N. C.—Spr.—Albinos of this as of other species occur.

5. *R. Chapmanii* A. Gray. An evergreen shrub 2 m. tall or less, with glandular-dotted foliage and erect rigid branches: leaf-blades elliptic or oval, 2–5 cm. long, obtuse or retuse at the apex, somewhat lustrous above, glandular-dotted beneath, revolute, abruptly narrowed at the base; petioles short, resinous-dotted, glabrous: calyx-lobes broadly deltoid or rounded, broader than long: corolla rose-colored, 2.5–3 cm. long, funnel-form-campanulate; tube rather short and stout: longer filaments more than 2.5 cm. long: anthers less than 2.5 mm. long: capsule nearly 1 cm. long.—Low pinelands, W. Fla.—Early Spr.

6. *BILTIA* Small. Deciduous-leaved shrubs. Leaves alternate: blades thinish, ciliate. Calyx undulate. Corolla bright-colored, rotate-campanulate: tube short: lobes 5, the 2 lower ones overlapping the others, the middle lobe of the three upper ones exterior. Style declined. Capsule narrowed upward, opening only along the sides, the apex remaining closed.—One species.

1. *B. Vaseyi* (A. Gray) Small. Shrub 1–5 m. tall, the twigs sparingly pubescent: leaf-blades elliptic, 6–15 cm. long: corolla rose-colored with yellow-orange or reddish-orange spots on the 3 upper spreading lobes: capsule ellipsoid-ovoid, about 10 mm. long. [*Rhododendron Vaseyi* A. Gray. *Azalea Vaseyi* Rehder]—Rocky mt. slopes and summits in rather acid soil, Blue Ridge, N. C.—Spr.—Frequently used in ornamental gardening, under the name PINK-SHELL AZALEA.

7. **MENZIESIA** J. E. Smith. Deciduous-leaved shrubs. Leaves alternate: blades entire. Calyx persistent: lobes 4 or 5, very broad. Corolla regular, white, pink, greenish, or reddish, campanulate or urceolate. Stamens 5, 8 or 10, inclined: anthers elongate. Capsule of an ovoid type.—About 7 species, North American and Japanese.

1. **M. pilosa** (Michx.) Pers. Shrub 0.5–2 m. tall, the twigs finely pubescent: leaf-blades elliptic to oval or elliptic-oblancoelate, 1.5–5 cm. long, ciliate, gland-tipped: calyx-lobes glandular-ciliate: corolla greenish to reddish, 6–7 mm. long; lobes rounded, much shorter than the tube: capsule ovoid, 5–6 mm. long.—(MINNIE-BUSH.)—Acid woods, Blue Ridge to Appalachian Plateau, Ga. to Tenn. and Pa.—Spr.

8. **KALMIA** L. Evergreen shrubs or trees. Leaves alternate, opposite, or whorled: blades entire. Calyx persistent: lobes 5, leathery. Corolla regular, white, pink, purple, or crimson, rotate, the lobes obtuse: tube short, with 10 sacs. Stamens 10: filaments elastically straightening at maturity: anthers short, attached near the top. Capsule spheroidal.—Six species, North American.—LAURELS.

Corymbs or flower-clusters terminal: corolla large, over 2 cm. wide.

#### I. LATIFOLIAE.

Corymbs or flower-clusters lateral: corolla small, 1.5 cm. wide or less.

#### II. ANGUSTIFOLIAE.

#### I. LATIFOLIAE

Shrub or rarely a tree: leaf-blades broad: flower-clusters clammy-pubescent: inflorescence compound: filaments short-pubescent, at least above the middle: capsule spheroidal: branchlets terete.

##### 1. *K. latifolia*.

#### II. ANGUSTIFOLIAE

Corolla large, about 1.5 cm. wide: calyx glabrous: leaf-blades of a cuneate or spatulate type.

##### 2. *K. cuneata*.

Corolla small, 5–10 mm. wide: calyx pubescent: leaf-blades of an oblong, oval, or lanceolate type.

Leaf-blades green, and dull above: pedicels and calyx usually glandular: corolla crimson or purplish.

##### 3. *K. angustifolia*.

Leaf-blades glaucous above and shining: pedicels and calyx not glandular: corolla pink or white.

##### 4. *K. carolina*.

1. **K. latifolia** L. Shrub, or tree becoming 12 m. tall, the twigs often fuzzy when young: leaf-blades elliptic to oval, 5–12 cm. long, glabrous, dark-green: calyx-lobes elliptic to elliptic-ovate, about 2 mm. long: corolla white or pink, 20–25 mm. wide: filaments 10–12 mm. long: capsule 5–7 mm. wide.—(MOUNTAIN-LAUREL. IVY. CALICO-BUSH. SPOON-WOOD.)—Dry rocky woods, hillsides, and prairies, in rather acid soil, various provinces, W Fla. to La., Ont., and N. B.—Spr.—The hard root is used for making tobacco pipes. The hard, brown heart-wood is used for tool-handles.

2. **K. cuneata** Michx. Shrub 2–10 dm. tall, the twigs hispidulous: leaf-blades spatulate to cuneate, 1.5–5 cm. long, sparsely pubescent beneath: calyx-lobes elliptic, 3–3.5 mm. long: corolla mainly white or pinkish, 14–15 mm. wide: cap-

sule 4-5 mm. wide.—(WHITE-WICKY.)—Acid swamps, Coastal Plain, S. C. and S N. C.—Spr.

3. *K. angustifolia* L. Shrub 2-12 dm. tall, the twigs glabrous or nearly so: leaf-blades elliptic to lanceolate, 2-6 cm. long, pale beneath: calyx-lobes ovate to elliptic-ovate, 1-1.5 mm. long: corolla purple to crimson, 6-10 mm. wide: filaments 3-4 mm. long: capsule 3-3.5 mm. wide.—(SHEEP-LAUREL. LAMBKILL. WICKY.)—Banks, hillsides, pastures and swamps, various provinces, Ga. to Ont. and Lab.—Sum.

4. *K. carolina* Small. Shrub similar to *K. angustifolia* in habit, but with copiously fine-pubescent foliage: leaf-blades oval to elliptic, 1.5-4.5 cm. long, canescent-tomentulose beneath: calyx-lobes elliptic-lanceolate, about 2 mm. long: corolla mainly rose-colored, 5-7 mm. wide: capsule 2.5-3.5 mm. wide.—(WICKY.)—Woods, inner margin of Coastal Plain to Blue Ridge, S. C. to S Va.—Sum.

9. *KALMIELLA* Small. Evergreen low shrubs. Leaves alternate: blades relatively small. Calyx deciduous: lobes 5, foliaceous. Corolla regular, pink or sometimes purplish, mainly similar to that of *Kalmia*, but lobes acute. Stamens 10: filaments elastic, anthers short, attached near the middle. Capsule of an ovoid type.—Three species, the following and two Cuban.

1. *K. hirsuta* (Walt.) Small. Shrub 1-6 dm. tall or often incumbent, the twigs hirsute: leaf-blades elliptic, lanceolate, or oval-orbicular, 4-10 mm. long: pedicels 4-10 mm. long, hirsute: calyx-lobes elliptic-lanceolate, 5-7 mm. long, acuminate: corolla 10-15 mm. wide: capsule about 3 mm. long.—(WICKY.)—Low pinelands and sandhills, Coastal Plain, Fla. to Miss. and S Va.—Spr-sum.

10. *CHAMAEDAPHNE* Moench. Evergreen shrubs. Leaves alternate: blades shallowly toothed. Flowers in terminal leafy-bracted racemes. Calyx-lobes 5, much longer than the tube. Corolla white, urceolate; lobes 5, shorter than the tube. Stamens 10, included: anthers awnless, tubular at the apex. Capsule depressed.—One species.

1. *C. calyculata* (L.) Moench. Shrub 1-12 dm. tall: leaf-blades elliptic, obovate, or oblanceolate, 1-5 cm. long: calyx-lobes triangular or triangular-ovate: corolla 6-7 mm. long; lobes oblong or oblong-ovate: capsule 3-4 mm. wide.—(LEATHER-LEAF.)—Bogs, various provinces, Ga. to Ill., B. C., Alas., Ont., and Newf.—Spr.

11. *EUBOTRYS* Nutt. Deciduous-leaved shrubs with rigid stems and branches. Leaves alternate: blades finely toothed. Flowers white, in terminal racemes. Calyx-lobes very short. Stamens 10, included: anthers awned. Capsule depressed.—Only the following species.—Spr.—FETTER-BUSHES.

Capsule not lobed; seeds wingless; panicles straight or nearly so.

Calyx-lobes of an ovate type, less than one-half as long as the corolla; capsule exceeding the calyx.

Calyx-lobes of a lanceolate type, one-half as long as the corolla or longer; capsule shorter than the calyx.

Capsule lobed; seeds winged; panicles curved.

1. *E. racemosa*. *2 awns/anther sac*
2. *E. elongata*. *2 awns/anther sac*
3. *E. recurva*. *1 awn/anther sac*

1. *E. racemosa* (L.) Nutt. Shrub 1-4 m. tall, the twigs glabrous, at least in age: leaf-blades elliptic, 2-7 cm. long: calyx-lobes triangular, becoming triangular-lanceolate or deltoid-ovate: corolla 8-9 mm. long: anthers much shorter than the filaments: capsule 4-5 mm. wide.—Acid swamps and bogs, Coastal Plain, and occasionally other provinces, Fla. to La., Pa., and Mass.

2. *E. elongata* Small. Shrub 1-3 m. tall, the twigs copiously pubescent: leaf-blades elliptic, or sometimes elliptic-lanceolate or elliptic-ovate, 2-5 cm. long: calyx-lobes lanceolate, often narrowly so: corolla 7-8 mm. long: anthers slightly longer than the filaments: capsule 3-4 mm. wide.—Acid swamps and sandhill ponds, Coastal Plain, Fla. to La. and S Va.

3. *E. recurva* (Buckl.) Small. Shrub 1-4 m. tall, the twigs glabrous at least in age: leaf-blades oval-elliptic or oval, 4-10 cm. long: calyx-lobes ovate or elliptic-ovate: corolla 6-7 mm. long; lobes ovate: anthers nearly as long as the filaments: capsule 5-6 mm. wide.—Rocky woods, in acid soil, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn. and Va.

12. **LEUCOTHOE** D. Don. Evergreen shrubs with weak stems and branches. Leaves alternate: blades shallowly toothed, sometimes obscurely so, or entire. Flowers in racemes from the axils of the persistent leaves. Calyx-lobes longer than the tube; corolla white, ovoid or mostly urceolate: lobes very short. Stamens 10, included: anthers awnless. Capsule depressed. About 30 species, American and Asiatic.—Spr.—FETTER-BUSHES.

Filaments scabrous or short-pubescent, straight or nearly so: anthers prominently bimucronate.

Calyx-lobes strongly imbricate in anthesis: leaf-blades abruptly pointed or short-acuminate.

Calyx-lobes scarcely imbricate in anthesis: leaf-blades long-acuminate.

Filaments villous, sigmoid-curved above: anthers obscurely bimucronate: twigs pale: leaf-blades reticulate, acute or short-acuminate.

1. *L. axillaris*.
2. *L. Catesbaei*.
3. *L. acuminata*.

1. *L. axillaris* (Lam.) D. Don. Shrub 1-2 m. tall: leaf-blades elliptic to elliptic-lanceolate, or rarely suborbicular to broadly elliptic, 4-15 cm. long: larger calyx-lobes ovate: corolla 6-7 mm. long; lobes ovate: capsule 6-7 mm. wide. [*L. platyphylla* Small] —Damp woods, swampy thickets, and stream-banks in rather acid soil, Coastal Plain, Fla. to Miss. and S Va.

2. *L. Catesbaei* (Walt.) A. Gray. Shrub 1-2 m. tall: leaf-blades lanceolate to narrowly elliptic, 6-15 cm. long: larger calyx-lobes ovate: corolla 5.5-6.5 mm. long; lobes ovate: capsule about 5 mm. wide.—(IVY. SWITCH-IVY. DOG-HOBBLE.)—Wooded slopes, usually along streams, Piedmont to Appalachian Plateau, Ga. to Ala., Tenn., and Va.

3. *L. acuminata* (Ait.) D. Don. Shrub 1-4 m. tall: leaf-blades lanceolate to ovate-lanceolate, 3-10 cm. long: larger calyx-lobes broadly ovate, ciliate: corolla 8-10 mm. long; lobes ovate: capsule about 5-6 mm. wide.—Swamps, ponds, and low hammocks, Coastal Plain, Fla. to S. C.

13. *OXYDENDRUM* DC. Deciduous-leaved shrubs or trees. Leaves alternate: blades serrate. Flowers drooping in horizontally expanded panicles. Calyx-lobes 5, persistent. Corolla white, ovoid or conic, 5-lobed. Filaments dilated, pubescent all over: anthers linear, awnless, narrower than the filaments. Stigma entire. Capsule ovoid, erect on a recurved pedicel, the valve-margins thickened.—One species.

1. *O. arboreum* (L.) DC. Shrub or tree becoming 20 m. tall: leaf-blades elliptic or elliptic-lanceolate, 8-20 cm. long, acuminate: panicles 1-2 dm. long, the pedicels strongly curved at maturity: calyx-lobes ovate: corolla 6-7 mm. long, pubescent like the calyx: capsule 4-6 mm. long, pubescent.—(SOURWOOD. SORREL-TREE. TITI.)—Woods, various provinces, N Fla. to La., Ind., and S Pa.—Sum.—The tree is used in horticulture. The brown, hard, close-grained heartwood is used for tool-handles and machinery. The flowers furnish a very pale honey.

14. *ZENOBLA* D. Don. Deciduous-leaved shrubs. Leaves alternate: blades entire or shallowly toothed. Flowers in clusters from axillary buds. Calyx-lobes 5, longer than the tube. Corolla white or pink, often campanulate: lobes 5, very broad. Stamens 10, included: anthers slender-awned. Capsule depressed.—Only the following species.—Spr.

Pedicels and lower surfaces of the leaf-blades green: calyx less than 7 mm. wide.

1. *Z. cassinefolia*.

Pedicels and lower surface of the leaf-blades densely glaucous: calyx over 7 mm. wide.

2. *Z. pulverulenta*.

1. *Z. cassinefolia* (Vent.) Pollard. Shrub 1-2 m. tall, the foliage green: leaf-blades elliptic, varying to ovate or obovate, 2-6 cm. long, shallowly serrate: corolla 8-10 mm. long.—Pinelands, Coastal Plain, NE Fla. to N. C.

2. *Z. pulverulenta* (Willd.) Pollard. Shrub 1-2 m. tall, the foliage glaucous: leaf-blades elliptic to oval, 2-7 cm. long, entire or obscurely serrate: corolla 6-7 mm. long.—Pinelands, Coastal Plain, Ga. (or Fla.?) to N. C.—The two zenobias are distinctive among our heaths by the peculiar shades of their foliage. The one is a pale-green the other is glaucous.

15. *PIERIS* D. Don. Evergreen shrubs. Leaves alternate: blades distinctly toothed. Flowers in axillary and terminal racemes formed the year before they expand. Calyx-lobes 5, much longer than the tube. Corolla white,

of an ovoid type, 5-lobed. Filaments unappendaged: anthers appendaged. Capsule globular, varying to spheroidal or ovoid.—About 6 species, North American and Asiatic.

1. *P. floribunda* (Pursh) Benth. <sup>+ Hooker.</sup> Shrub 3–18 dm. tall, with rigid branches and strigose twigs: leaf-blades elliptic or elliptic-lanceolate, 2–8 cm. long, serrulate all around: calyx-lobes lanceolate or ovate-lanceolate, mostly less than  $\frac{1}{2}$  as long as the corolla: capsule 5–6 mm. long, not depressed.—(MOUNTAIN FETTER-BUSH.)—In acid soil, Blue Ridge to Appalachian Plateau, Ga. to Tenn. and S Va.—Spr.—sum.

16. *AMPELOTHAMNUS* Small. Evergreen shrubs or woody vines, the branches nearly terete. Leaves alternate: blades leathery, more or less toothed above the middle. Panicles raceme-like, borne solitary in the leaf-axils. Calyx-lobes 5, appressed to the corolla, leathery. Corolla white, ovoid, the tube slightly, if at all angled: lobes very short, nearly erect. Filaments flat, broad, sigmoid-curved near the top, unappendaged: anthers appendaged. Capsule spheroidal.—One species.

1. *A. phillyreifolius* (Hook.) Small. Shrub with weak branches and puberulent twigs, or a vine ascending trees by creeping under their bark: leaf-blades elliptic or oval, or rarely elliptic-ob lanceolate or obovate, 2–7 cm. long, serrate near the apex: calyx-lobes lanceolate or narrowly triangular-lanceolate, mostly  $\frac{1}{2}$  as long as the corolla: corolla 7–8.5 mm. long: capsule slightly depressed, 3–4 mm. long.—Moist pinelands and ponds, Coastal Plain, N Fla., to Ala. and Ga.—Wint.—spr.—Apparently the only climbing vine in this family in our range.

17. *DESMOTHAMNUS* Small. Evergreen shrubs with prominently angled branches and glabrous foliage. Leaves alternate: blades thick-leathery, entire, with intramarginal veins. Flower-clusters axillary to the leaves of the preceding year. Calyx-lobes 5, narrow, somewhat succulent, persistent. Corolla white, pink, or red, ovoid-conic, urceolate, nodding, constricted at the orifice. Filaments slender above the slightly dilated bases, glabrous, each with a pair of appendages near the top: anthers unappendaged. Style fusiform. Capsule globose or ovoid-globose, rounded at the apex, the sutures thickened.—One species.

1. *D. lucidus* (Lam.) Small. Shrub 1.5–2 m. tall: leaf-blades leathery, elliptic to oval or obovate, 2–8 cm. long, abruptly acuminate: flower-clusters axillary: calyx-lobes narrowly lanceolate, acuminate: corolla white or rose, 7–9 mm. long, fully twice as long as the calyx: capsule 3.5–4 mm. long. [*Pieris nitida* B. & H.]—(FETTER-BUSH.)—Moist pinelands, swamps, ponds, bays, and scrub, Coastal Plain, Fla. to La. and S Va.—Spr.—sum.

**18. NEOPIERIS** Britton. Deciduous-leaved shrubs with terete branches and sparingly pubescent or glabrate foliage. Leaves alternate: blades thin-leathery, entire, without intramarginal veins. Flower-clusters along the leafless branches of the previous year. Calyx-lobes 5, narrow, deciduous with the leaves. Corolla white or pink, cylindraceous-campanulate, nodding. Filaments flat, pubescent, each with a pair of appendages near the top: anthers unappendaged. Style columnar. Capsule of an ovoid type, truncate at the contracted apex, the sutures much thickened.—One species.

**1. N. mariana** (L.) Britton. Shrub 1–2 m. tall: leaf-blades membranous, elliptic to oval, or nearly so, 2–6 cm. long, obtuse or apiculate: flower-clusters lateral: calyx-lobes broadly lanceolate, acute: corolla white or pinkish, 10–12 mm. long, less than twice as long as the calyx: capsule 7–9 mm. long.—(STAGGER-BUSH.)—Pinelands and acid prairies, Coastal Plain, and occasionally other provinces, Fla. to Ark., W. Va. and R. I.—Spr.

**19. XOLISMA** Raf. Evergreen shrubs with lepidote foliage. Leaves alternate: blades leathery, entire or nearly so, often reticulate. Flower-clusters in the axils of the persistent leaves of the previous year. Calyx-lobes broad, short, persistent. Corolla white or pink, globular to urceolate, with short spreading or recurved lobes. Filaments tapering up to the anthers, unappendaged. Capsule somewhat elongate, often of an ovoid type, prominently angled.—About 35 species, North American.—Spr. or all year S.—STAGGER-BUSHES.

Leaves slightly reduced toward the ends of the branches; blades inconspicuously reticulate.

1. *X. ferruginea*.

Leaves much reduced toward the ends of the branches; blades prominently reticulate.

2. *X. fruticosa*.

**1. X. ferruginea** (Walt.) Heller. Evergreen tree sometimes 5 m. tall or shrub: leaves not much reduced in size at the ends of the branches; blades elliptic, oval, obovate, or oblanceolate, 2.5–7 cm. long, scarcely reticulate: corolla 2.5–3 mm. long, angled at the base: capsule 4.5–5 mm. long.—Hammocks with acid humus, sandhills and scrub, Coastal Plain, Fla. to S. C.

**2. X. fruticosa** (Michx.) Nash. Evergreen shrub 1–3 m. tall: leaves much reduced toward the ends of the branches; blades oval, obovate, or oblanceolate, reticulate: corolla 3.5–5 mm. long, rounded at the base: capsule 4–4.5 mm. long.—Hammocks and pinelands, Coastal Plain, Fla. to S. C.

**20. ARSENOCOCCUS** Small. Deciduous-leaved shrubs with more or less pubescent foliage. Leaves alternate: blades membranous or thickish. Flower-clusters in terminal paniced racemes. Calyx-lobes broad, short, persistent. Corolla white, urceolate, usually globular or depressed, with very short spreading or recurved lobes. Filaments thickened below the anthers, unappendaged. Capsule depressed, not angled.—Only the following species.—Spr.—sum.—MALE-BERRIES.

Racemes and panicles leafy-bracted.  
Racemes and panicles naked or nearly so.

1. *A. frondosus*.
2. *A. ligustrinus*.

1. *A. frondosus* (Pursh) Small. Deciduous-leaved shrub 1-4 m. tall: leaf-blades elliptic to narrowly elliptic, or sometimes oval or obovate, 2-8 cm. long, serrulate: corolla mostly less than 3.5 mm. long, often depressed: capsule mainly 2.5-3 mm. wide. [*Andromeda paniculata foliosiflora* Michx.]—Swamps and low pinelands, Coastal Plain, Fla. to La. and S Va.

2. *A. ligustrinus* (L.) Small. Deciduous-leaved shrub 1-4 m. tall: leaf-blades elliptic or obovate, 3-7 cm. long, entire or indistinctly serrulate: corolla mostly 3.5 mm. long, not appressed: capsule globular, mainly 3-4 mm. wide.—Dry woods and thickets, hill-sides, moist thickets, and acid swamps, various provinces, Fla. to Ark., W. Va., and Me.

**21. EPIGAEA** L. Evergreen creeping undershrubs, with woody roots, Leaves alternate: blades entire. Flowers perfect or dioecious, in axillary clusters. Calyx-lobes 5, persistent, but scarcely accrescent. Corolla white or pink, salverform, the limb 5-lobed. Filaments slender, with a tuft of hairs near the middle: anthers ellipsoid-ovoid, awnless. Stigma 5-lobed. Capsule depressed.—Two species, the following, and one in Japan.

1. *E. repens* L. Stem and branches 5-30 cm. long, hirsute: leaf-blades elliptic to elliptic-ovate or suborbicular, 2-10 cm. long, finely reticulate: calyx-lobes lanceolate, acuminate: corolla about twice as long as the calyx; lobes ovate: capsule depressed, 5-lobed.—(TRAILING-ARBUTUS. MAYFLOWER.)—Dry woods and banks, in acid soil, various provinces, Fla. to Miss., Sask., and Newf.—Spr.—One of the very popular spring-flowers, and eradicated in many localities. The flowers are very fragrant. ❖

**22. GAULTHERIA** L. Evergreen undershrubs, with rootstocks. Leaves alternate, approximate near the ends of the branches: blades shallowly toothed.

Flowers axillary. Calyx-lobes 5, persistent and accrescent. Corolla urceolate, 5-lobed. Filaments dilated near the base, pubescent; anthers awned. Capsule enclosed in the accrescent fleshy calyx.—About 100 species, American and Asiatic.

1. *G. procumbens* L. Plant 3–15 cm. tall: leaf-blades oval or elliptic, varying to ovate or obovate, 1.5–6 cm. long, serrate: calyx-lobes ovate: corolla white, 6–7 mm. long; lobes recurved: fruit globular, 7–11 mm. thick, red or white, spicy.—(WINTERGREEN. CREEPING-WINTERGREEN. CHECKERBERRY. WINTER-BERRY. TEABERRY.)—Woods and swamps, in acid humus, various provinces, in Coastal Plain only northward, Ga. to Ala., Mich., Man., and Newf.

#### FAMILY 5. VACCINIACEAE—HUCKLEBERRY FAMILY

Shrubs, in some cases with underground stems, or small trees, or rarely trailing or creeping plants. Leaves alternate, in some species evergreen: blades simple. Flowers perfect, regular, either solitary, in racemes, or in panicles, usually nodding. Calyx of 4 or 5 sepals. Corolla of 4 or 5 petals, in most genera partly united. Androeceum of twice as many stamens as there are corolla-lobes. Anthers in most species bearing dorsal appendages and apical tubes. Gynoeceum of 4 or 5 united carpels. Ovary inferior, or in one genus half-inferior. Styles united. Fruit a berry or drupe.—About 25 genera and 300 species, widely distributed.—Most species thrive best in sandy acid soil.

Ovary 10-celled: fruit a berry-like drupe with 10 nutlets. Tribe I. GAYLUSSACIÆ.

Ovary 4- or 5-celled: fruit a many-seeded berry or in one genus few-seeded berry.

Ovary wholly inferior: anther-sacs with tubular tips: berry typically colored.

Petals more or less united: berry variously colored, but when red not markedly acid.

Petals distinct: berry red, very acid.

Ovary one-half inferior or less: anther-sacs 2-pronged at the apex: berry white.

II. VACCINIÆÆ.

III. ONYCOCCÆÆ.

IV. CHIUGENÆÆ.

##### I. GAYLUSSACIÆÆ

Leaves deciduous; blades entire.

Inflorescence with deciduous bracts: hypanthium and fruit glabrous.

Inflorescence with persistent bracts: hypanthium and fruit pubescent or glandular.

Leaves evergreen; blades toothed.

1. DECACHAENA.

2. LASIOCOCCOS.

3. BUXELLA.

##### II. VACCINIÆÆ

Petals united nearly to their tips: corolla campanulate to globose, more or less urceolate: berry not red.

Upright shrubs or trees.

Corolla campanulate: anthers awned.

Anthers included: hypanthium jointed to the pedicel, deep: berry black, rather dry.

Anthers exserted: hypanthium continuous with the pedicel, shallow: berry in some species pale, thick-skinned, and bitter, in others sweet, but insipid.

Corolla urceolate, campanulate-urceolate, or cylindraceous: anthers awnless: berry blue, black, or rarely whitish, juicy and sweet.

4. BATODENDRON.

5. POLYCODIUM.

6. CYANOCOCCUS.

Trailing shrub.  
Petals united only near the base, recurved: corolla rotate:  
berry red or purplish.

7. HERPOTHAMNUS.

8. HUGERIA.

## III. OXYCOCCEAE

Slender plants with trailing and creeping stems, and small  
pink or pinkish corollas: calyx-lobes meeting over the top  
of the mature ovary.

9. OXYCOCCLUS.

## IV. CHIOGENEAE

Aromatic creeping plant with inconspicuous flowers: calyx-  
lobes not meeting over the top of the mature ovary.

10. CHIOGENES.

1. **DECACHAENA** T. & G. Resinous-dotted or resinous-coated shrubs,  
with tap-roots, or with underground stems. Leaves deciduous: blades mem-  
branous, entire. Flowers in lax panicles from wood of previous season, the  
bracts and bractlets small and minute, deciduous. Sepals broad, ciliate.  
Corolla white, greenish, or red, urceolate to campanulate or conic-urceolate.  
Filaments narrowed upward. Anthers with tubular tips. Drupe black or  
blue, glabrous.—Represented by the following species.—**HUCKLEBERRIES**.—The  
fruits are often gathered for the market along with blueberries.—This and  
the two following genera are often included in *Gaylussacia* which, however, tech-  
nically considered, forms a group of plants confined mostly to northern South  
America.

Leaf-blades thick-membranous, obtuse or notched at the apex: sepals ovate to del-  
toid: filaments glabrous: anther-tubes long. I. FRONDOSAE.  
Leaf-blades thin-membranous, acute or acuminate: sepals broader  
than long: filaments pubescent: anther-tubes short. II. URSINAE.

## I. FRONDOSAE

Corolla campanulate or globular-campanulate: drupe blue, glaucous.

Corolla about 4 mm. long: sepals about one-third as long as the corolla-tube.

Corolla-lobes about one-fifth as long as the tube: leaf-  
blades glaucous, and sometimes finely pubescent be-  
neath.

Corolla-lobes about one-third as long as the tube: leaf-  
blades copiously pubescent beneath.

Corolla about 3 mm. long: sepals nearly one-half as long as  
the corolla-tube.

Corolla conic to cylindraceous: drupe black.

1. *D. frondosa*.2. *D. tomentosa*.3. *D. nana*.4. *D. baccata*.

## II. URSINAE

Slenderly branched shrub: sepals broad, half-orbicular to reni-  
form.

5. *D. ursina*.

1. ***D. frondosa*** (L.) T. & G. Stem widely branched, up to 3 m. tall, the young  
foliage finely pubescent, or the twigs glabrous: leaf-blades elliptic to oval,  
somewhat rhombic or broadened upward, mostly 3–6.5 cm. long, thickish, permanently  
fine-pubescent beneath or glabrous, finely  
rugose: panicles scattered, the branches gla-  
brous or with scattered hairs: hypanthium  
and calyx glabrous: corolla white: stamens  
about 3 mm. long: anthers slightly longer  
than the filaments: drupes 8–10 mm. in di-  
ameter, dull, but bright-blue. [*Gaylussacia*  
*frondosa* T. & G.]—(BLUE-TANGLE. DANGLE-  
BERRY. TANGLEBERRY.)—Acid swamps and  
moist woods, various provinces, Fla. to La.,  
Ohio, and N. H.

2. ***D. tomentosa*** (Pursh) Small. Stem  
strict, up to 11 dm. tall, the twigs copiously

tomentose: leaf-blades elliptic to oval, or somewhat broadened upward, 2.5-7 cm. long, rugose, brownish-tomentose: panicles spreading, the branches pubescent: hypanthium and calyx resinous-dotted and often pubescent: corolla white or pinkish: stamens nearly 3.5 mm. long; anthers longer than the filaments: drupe 8-9 mm. in diameter, dull. [*Gaylussacia tomentosa* Small]—Moist pine-lands, Coastal Plain, Fla. to Ala. and Ga.

3. *D. nana* (A. Gray) Small. Stem strict, up to 6 dm. tall, the twigs finely pubescent: leaf-blades elliptic to narrowly obovate, 2-3 cm. long, rugose, glaucous: panicles rather numerous, the branches glaucous or resinous-dotted: hypanthium and calyx glabrous, glaucous: corolla white or greenish: stamens about 2.5 mm. long; anthers about as long as the filaments: drupe 6-7 mm. in diameter, dull. [*Gaylussacia nana* Small]—Dry to moist open woods and pine-lands, Coastal Plain, Fla. to Ala. and Ga.

4. *D. baccata* (Wang.) Small. Stem much-branched up to 12 dm. tall: leaf-blades elliptic to oval or somewhat obovate or ovate, 2-4.5 cm. long, sticky-resinous and finely pubescent; finely rugose at maturity: panicles spreading, the branches finely pubescent: hypanthium and calyx glabrous, but usually resinous-dotted: corolla pink or reddish: stamens 4 mm. long; anthers and filaments about equal in length: drupe shining, 6-10 mm. in diameter, without bloom (or blue and with bloom, in *D. baccata glauccarpa*), sometimes shining, sweet. [*Gaylussacia resinosa* (Ait.) T. & G.]—(BLACK-HUCKLEBERRY.)—Rocky woods, thickets, and swamps, usually in acid soil, various provinces, Ga. to La., Sask., Ont., and Newf.

5. *D. ursina* (M. A. Curtis) Small. Stem loosely branched, up to 1.5 m. tall, the twigs finely pubescent: leaf-blades varying from elliptic, to obovate and somewhat rhombic, 4-10 cm. long, thin, bright-green with scattered hairs, especially on the veins: panicles lax, the branches with scattered hairs: hypanthium and calyx glabrous, with resinous globules: corolla greenish, 4-5 mm. long: stamens 3.5-4 mm. long; anthers much shorter than the filaments: drupe 10-12 mm. in diameter, shining, insipid or sometimes sweet and of good flavor. [*Gaylussacia ursina* M. A. Curtis.]—(BEAR-HUCKLEBERRY. BUCKBERRY.)—Wooded slopes and summits, often in acid humus, Blue Ridge and occasionally adj. provinces, Ga. to Tenn. and N. C.—Erroneously reported from Ky.

2. **LASIOCOCCUS** Small. Glandular-pubescent shrubs, often with underground stems, the branches erect. Leaves tardily deciduous: blades thick-membranous, veiny. Flowers in lateral somewhat raceme-like panicles on previous year's wood, with large persistent bracts and bractlets. Sepals glandular-ciliate. Corolla campanulate, white or pinkish. Stamens about equaling the corolla. Anthers much longer than the filaments, with subulate tubular tips exceeding the sacs. Drupe black, shining, pubescent.—Only the following species.—Spr.—GOPHERBERRIES. DWARF-HUCKLEBERRIES.

Hypanthium glandular-puberulent: corolla globular-urceolate, wider than long.	1. <i>L. dumosus</i> .
Hypanthium glandular-hirsute: corolla campanulate-urceolate, longer than wide.	
Sepals deltoid, slightly acuminate: corolla-lobes broadly ovate, acute: hypanthium long-hirsute.	2. <i>L. Mosieri</i> .
Sepals ovate-deltoid, obtuse: corolla-lobes reniform acutish: hypanthium short-hirsute.	3. <i>L. orocola</i> .

1. *L. dumosus* (Andr.) Small. Stem 1-3 dm. tall or rarely more, the twigs puberulent: leaf-blades obovate to spatulate, or sometimes nearly elliptic or

oval, 2-4 cm. long, minutely pubescent, at least when young: hypanthium with granular very short glandular hairs: sepals ovate to deltoid-ovate, often unequal: corolla 5-7 mm. long, the lobes subreniform: stamens between 4 and 5 mm. long; anthers between 3 and 4 mm. long, the tubular appendages slightly longer than the sacs: drupe 6-8 mm. in diameter. [*Gaylussacia dumosa* (Andr.) T. & G.] — (DWARF-HUCKLEBERRY.)—Acid swamps, low pinelands, and scrub, various provinces, though most abundant in Coastal Plain, Fla. to La., W. Va., and Newf.

2. *L. Mosieri* Small. Stem 3-15 dm. tall, the twigs hirsute with silvery, minutely gland-tipped hairs: leaf-blades elliptic to elliptic-spatulate or oblanceolate, 3-6 cm. long, sparsely and minutely pubescent on both sides when young, somewhat veiny in age: inflorescence-branches spreading, often divaricate, pubescent like the twigs: sepals deltoid, slightly acuminate: corolla 8-9 mm. long, the lobes broadly ovate: stamens between 6 and 7 mm. long; anthers between 5 and 6 mm. long, the tubular appendages much longer than the sacs: drupe 8-10 mm. in diameter. [*Gaylussacia hirtella* (Fl. SE. U. S.)]—Hammocks, Coastal Plain, Fla. to La.—A plant from the Big Cypress Swamp, Fla., differs from both the preceding species in the thicker leaf-blades which are predominately elliptic or oval and not gradually narrowed to the base. It is known locally as woolly-berry.

3. *L. orocola* Small. Stem up to 11 dm. tall, the twigs downy: leaf-blades elliptic or slightly broadened upward, 2-4 cm. long, with minute scattered hairs on both sides, at least when young: inflorescence-branches erect or ascending, softly glandular-pubescent: sepals ovate-deltoid, obtuse: corolla 8-9 mm. long, the lobes reniform: stamens about 6 mm. long; anthers about 5 mm. long, the tubular appendages very slender, much longer than the sacs.—Swamps, Blue Ridge, N. C.

3. **BUXELLA** Small. Nearly glabrous shrubs with extensive underground stems and branches, the branchlets erect or assurgent, sharply ridged. Leaves evergreen: blades coriaceous, toothed. Flowers in axillary congested raceme-like panicles with deciduous bracts. Hypanthium saucer-shaped. Sepals broad, glabrous. Corolla urceolate, pink. Stamens much shorter than the corolla. Anthers shorter than the broad filaments, with apical tubes shorter than the bodies. Drupe dark-blue, usually glaucous, or rarely white with a pink cheek.—One species.

1. *B. brachycera* (Michx.) Small. Plant forming extensive "colonies," the branchlets mostly 2-5 dm. tall, the twigs often puberulent: leaf-blades elliptic to ovate, 1.5-2.5 cm. long, shining above, shallowly crenate-serrate, each tooth with a deciduous stipitate gland: sepals ovate to triangular, acute or obtuse: corolla angled, 5-7 mm. long, the lobes as broad as long or broader, much shorter than the tube: drupe subglobose to pyriform, 7-12 mm. long. [*Vaccinium brachycerum* Michx.

Flat Rock  
Henderson Co.  
N.C.

*Gaylussacia brachycera* A. Gray]—(BOX-HUCKLEBERRY. JERUSALEM-HUCKLEBERRY. JUNIPER.)—Wooded slopes, mostly facing north, in acid soil, various provinces, E Tenn., E Ky., and S border of Va. to Pa., Md., and Del.; best developed in SE W. Va., and occurring elsewhere only in isolated patches, each representing a single plant.—Spr.—Where abundant the berries are made into a preserve.

4. **BATODENDRON** Nutt. Shrubs or small trees, with much-branched stems. Leaves somewhat persistent: blades thin-coriaceous, often glandular-denticulate. Flowers in leafy-bracted panicles. Sepals acute. Corolla campanulate, white or pinkish. Stamens shorter than the corolla: anther-sacs longer than the filaments, shorter than the apical-tubes. Berry black, shining, many-seeded.—Two or three species, in the southern United States.

1. **B. arboreum** (Marsh.) Nutt. Stem and branches rigid, the twigs finely pubescent: leaf-blades oval, elliptic, or obovate, 2.5–5 cm. long, shining above; racemes usually many-flowered, the flowers often profuse, the bracts persistent: corolla 5–6 mm. long; lobes acute or acutish, much shorter than the tube: anthers about 3 mm. long; berry globose, 5–6 mm. in diameter, the pulp rather dry.—(SPARKLEBERRY. FARKLEBERRY. TREE-HUCKLEBERRY. GOOSEBERRY. WINTER-HUCKLEBERRY.)—Woods, various provinces, Fla. to Tex., Mo., and S Va.—Spr.—One of the few plants of this family which can grow in calcareous soil. The brown, hard, very close-grained wood is used for tool-handles.

5. **POLYCODIUM** Raf. Shrubs with irregularly branched stems. Leaves deciduous: blades thick-membranous, often pubescent or glaucous, entire. Flowers in leafy panicles. Sepals rounded, acute, or acuminate. Corolla white or greenish, open-campanulate. Stamens longer than the corolla: anther-sacs shorter than the filaments, much shorter than the apical tubes. Berry green, yellow, blue, purple, or black, in many species glaucous, dull, few-seeded.—About 10 species, in eastern North America.—Spr.—BUCKBERRIES. SQUAW-HUCKLEBERRIES. DEERBERRIES. GOOSEBERRIES.

Racemes or panicles with bracts resembling the leaves of the branches and usually about as large: berry greenish or blue.

Leaves and branchlets pubescent.

Leaves and branchlets glabrous.

Racemes or panicles with bracts conspicuously smaller than the leaves.

Leaves and branchlets glabrous.

Leaves and branchlets pubescent.

Sepals deltoid to ovate-deltoid, not exceeding the corolla-sinuses: corolla-lobes usually shorter than the tube.

Hypanthium and calyx glabrous, except the ciliate sepals, green or glaucous: berry green, yellowish, or glaucous.

Leaf-blades rather pale-green beneath: berry green or yellowish.

Leaf-blades glaucous, sometimes chalky-white beneath: berry glaucous.

1. *P. floridanum*.

2. *P. Ashei*.

3. *P. neglectum*.

4. *P. stamineum*.

5. *P. candicans*.

Hypanthium and calyx pubescent: berry plum-purple or nearly black.

Sepals acuminate: plants erect up to 1.5 m. tall.

Corolla about thrice as long as the calyx: sepals about 1 mm. long in anthesis: stamens 7-8 mm. long.

Corolla scarcely twice as long as the calyx: sepals about 2 mm. long in anthesis: stamens 3.5-4.5 mm. long.

Sepals obtuse or merely acute: plants depressed.

Sepals lanceolate, exceeding the corolla-sinuses: corolla-lobes longer than the tube.

6. *P. melanocarpum*.

7. *P. macilentum*.

8. *P. depressum*.

9. *P. leptosepalum*.

1. *P. floridanum* (Nutt.) Greene. Stem up to 1.5 m. tall, the branchlets loosely fine-pubescent: leaf-blades oval to ovate or obovate, or a few suborbicular, 1.5-4 cm. long, finely pubescent, especially on the whitish lower surface, abruptly narrowed at the base, rounded or even subcordate, closely reticulate-veined: pedicels pubescent: sepals bearded at the apex: stamens 4-5 mm. long: berry subglobose to pyriform, about 10 mm. in diameter. [*P. caesium* Greene]—Pine-lands, scrub, and hammocks, Coastal Plain, Fla. to S. C.

2. *P. Ashei* Harbison. Stem up to usually 1 m. tall, the branchlets glabrous: leaf-blades elliptic to oval, varying to somewhat ovate or obovate, 2.5-5.5 cm. long, glaucous, especially beneath, obtuse or rounded at the base, rather sparingly reticulate-veined: pedicels glaucous: sepals glabrous: stamens mostly 5-6 mm. long: berry subglobose, 9-12 mm. in diameter, with copious bloom.—Pinelands and barren ridges, Coastal Plain and rarely adj. provinces, Ga. to S. C.

3. *P. neglectum* Small. Stem up to 2 m. tall, with glabrous branchlets: leaf-blades elliptic to oval, elliptic-lanceolate, or cuneate, glabrous: hypanthium glabrous: sepals glabrous: stamens mostly 5-6 mm. long: berry subglobose to globose-obovoid, 5-8 mm. in diameter, green or yellow.—Open woods and thickets, various provinces, Fla. to La., Kans., and S. Va.

4. *P. stamineum* (L.) Greene. Stem up to 2 m. tall, with pubescent branchlets: leaf-blades oval to elliptic, varying to somewhat ovate or obovate, 3-7 cm. long, rounded or abruptly narrowed at the base, usually pale beneath: hypanthium glabrous: sepals very broad, sometimes ciliolate: stamens about 7 mm. long: berry globular, about 10 mm. in diameter, green.—Hillsides and open woods, in rather acid soil, various provinces, Ga. to La., Minn., Sask., and Me.

5. *P. candicans* Small. Stem up to 2 m. tall, with softly pale-pubescent branchlets: leaf-blades elliptic, sometimes narrowly so, varying to somewhat ovate or obovate, 3-10.5 cm. long, acute or somewhat acuminate, light-green above, white beneath and more or less finely pubescent: pedicels minutely pubescent: hypanthium glaucous: sepals sparingly pubescent or ciliate with simple hairs, and sometimes with slender gland-tipped hairs in addition: stamens 5-6 mm. long: berry globular, about 10-11 mm. in diameter, glaucous.—Acid woods, Piedmont to Appalachian Plateau, Ga. to Ala. and Pa.

6. *P. melanocarpum* (C. Mohr.) Small. Stem 1-1.5 m. tall, with copiously pubescent branchlets: leaf-blades elliptic to elliptic-lanceolate, elliptic-oblan- ceo-

late, or a few ovate, 4–11 cm. long, acute or somewhat acuminate, permanently pubescent, at least beneath: pedicels pubescent and sometimes glandular: hypanthium pubescent: sepals pubescent, ciliate and sometimes with large sessile glands on the edges: corolla 6–7 mm. long: stamens 7–8 mm. long: berry globose, about 10 mm. in diameter, pubescent when young, glabrous at maturity.—Sandy woods and pinelands, Coastal Plain and adj. provinces, Ga. to Miss., Mo., and N. C.

7. *P. macilentum* Small. Stem about 1 m. tall, with closely fine-pubescent branchlets: leaf-blades elliptic, sometimes narrowly so, varying to somewhat ovate or obovate, 2.5–8 cm. long, finely pubescent, especially beneath, slightly veiny at maturity: pedicels closely pubescent with glandless hairs: hypanthium and calyx closely pubescent: sepals ciliate: corolla 2–3 mm. long: stamens 3.5–4.5 mm. long: berry not seen mature, but evidently much smaller than in the next preceding species.—Pinelands, in the Coastal Plain of Ala.

8. *P. depressum* Small. Stem 1–3 dm. tall, with finely pubescent branchlets: leaf-blades elliptic or nearly so, or individually broadly elliptic, 2–5.5 mm. long, closely pubescent: pedicels pubescent with curved hairs: hypanthium bristly-pubescent: sepals pubescent: corolla about 4 mm. long: stamens about 7 mm. long: berry not seen.—Pinelands, Coastal Plain, W Fla. to S La.

9. *P. leptosepalum* Small. Stem up to 1 m. tall, with minutely pubescent branchlets: leaf-blades elliptic or slightly broadened upward, 3–6.5 cm. long, somewhat acuminate, finely reticulate beneath, minutely pubescent on the veins on both sides: pedicels pubescent: hypanthium glabrous: sepals lanceolate, more or less pubescent, shaggy-ciliate: corolla about 4 mm. long, the lobes longer than the tube: stamens 5–6 mm. long: berry not seen.—Rich woods, Miss.

*Note:* Since the above matter was in type species additional to those described here have been proposed by William Willard Ashe in Jour. Elisha Mitchell Sci. Soc. 46: 196–213, 1931.

6. **CYANOCOCCUS** Rydb. Shrubs often with underground stems and erect branches, or small trees, the foliage glabrous or pubescent. Leaves evergreen or deciduous, sometimes tardily so: blades coriaceous or firm-membranous, entire or toothed. Flowers in bracted racemes or panicles, more or less fascicled. Sepals broad, persistent. Corolla urceolate, campanulate-urceolate, or cylindrical, white to red. Stamens included: filaments pubescent: anthers awnless, with apical tubes. Berry blue or black and glaucous, or rarely red, many-seeded.—About 150 species, widely distributed.—Spr.—very early sum.—BLUEBERRIES. HUCKLEBERRIES.—Herbarium material is yet too meagre for a good interpretation of the species. The plants flowering and fruiting at widely different seasons usually results in the collection of incomplete specimens.—The berries of many species are gathered for the market. Several kinds are cultivated in order to supply the demand. The following species were heretofore included in *Vaccinium*.

Leaves evergreen: blades fleshy-coriaceous.

I. NITIDI.

Leaves deciduous, sometimes partly persistent, with the blades membranous or thin-coriaceous southward.

Hypanthium and calyx glabrous, often glaucous.

II. CORYMBOSI.

Hypanthium and calyx glandular-pubescent.

III. HIRSUTI.

#### I. NITIDI

Shrub with numerous small green or sometimes glaucous leaves, white or pink corollas, and black or sometimes glaucous fruits.

1. *C. Myrsinites*.

## II. CORYMBOSI

Corolla cylindric or cylindraceous, approximately twice as long as thick.

Leaf-blades more or less pubescent beneath, serrulate or individually entire and ciliate.

Leaf-blades thin-coriaceous: corolla red or reddish.

Leaf-blades membranous, but often firm in age: corolla usually white or pinkish.

Low plant (2-3 dm. or rarely more): leaf-blades decidedly broadened upward.

Taller plants: leaf-blades of an elliptic or oval type, a few, or rarely many, broadened upward: plants widely branched.

Corolla 5-6 mm. long: leaf-blades not over 2.5 cm. long: the branches slender.

Corolla 7-10 mm. long: leaf-blades usually over 3-8 cm. long: the branches stout.

Leaf-blades glabrous, entire, eciliate.

Corolla urceolate or campanulate, mostly less than twice as long as thick.

Leaf-surfaces pubescent, sometimes mainly or only on the midrib above or beneath.

Tall shrubs, exceeding 1 m. tall: leaf-blades predominantly of an elliptic type.

Peduncle glabrous: juvenile leaf-blades more or less pubescent, but not downy.

Leaf-blades ciliate or serrulate.

Leaf-blades ciliate.

Berry black: branches light-green.

Berry blue: branches dark-green.

Leaf-blades serrulate, the teeth often hair-tipped.

Leaf-blades pale or glaucescent beneath and finely pubescent: seeds about 1 mm. wide.

Leaf-blades green beneath, with scattered spine-like hairs on the midrib and veins: seeds about 0.5 mm. wide.

Leaf-blades entire and eciliate, brownish-pubescent beneath: leaves semi-persistent.

Peduncle closely pubescent: juvenile leaves downy.

Low shrubs, mostly less than 0.5 m. tall: leaf-blades predominantly oval.

Leaf-blades glabrous on both sides or pubescent on the midrib above.

Leaf-blades pubescent on the midrib above, glabrous beneath.

Leaf-blades ciliate-serrulate: branchlets dark-green.

Leaf-blades entire: branchlets pale-green.

Leaf-blades glabrous on both sides.

Leaf-blades narrowed at the base, often cuneate.

Leaf-blades rounded to cordate at the base.

2. *C. fuscatus*.

3. *C. tenellus*.

4. *C. Elliottii*.

5. *C. amoenus*.

6. *C. virgatus*.

7. *C. atrococcus*.

8. *C. corymbosus*.

9. *C. simulatus*.

10. *C. Cuthbertii*.

11. *C. holophyllus*.

12. *C. Margarettae*.

13. *C. vacillans*.

14. *C. pallidus*.

15. *C. liparus*.

16. *C. tallapusae*.

17. *C. subcordatus*.

## III. HIRSUTI

Shrub with copiously pubescent foliage and flowers: bracts somewhat foliaceous, persistent.

18. *C. hirsutus*.

1. *C. Myrsinites* (Lam.) Small. Stem 2-6 dm. tall, much-branched: leaf-blades obovate, oblanceolate, oval, elliptic, or ovate, 6-20 mm. long with bristly and glandular shallow teeth, green above, paler, veined, and sparingly pubescent beneath (or glaucous and essentially glabrous, and with glaucous berries in *Vaccinium Myrsinites glaucum*): flowers in umbel-like clusters: sepals broadly ovate to deltoid: corolla 6-7 mm. long or smaller: anthers about 5 mm. long: berry globular, 5-8 mm. in diameter. [*V. nitidum* Andr.]—Pinelands, scrub, prairies, and open woods, in acid soil, Coastal Plain, Fla. to La. and N. C. (or Va.?).—Recent collections indicate that *V. nitidum*, maintained in Fl. SE. U. S., is not specifically distinct.

2. *C. fuscatus* (Ait.) Small. Stem 1-2.5 m. tall, irregularly branched, the branchlets finely pubescent: leaf-blades ovate, oval, or elliptic, varying to

lanceolate or oblanceolate, 3-7 cm. long, or some 12 cm., firm in age, finely pubescent at least beneath, finely and shallowly toothed, or individually entire: sepals ovate to deltoid, or half-orbicular, obtuse: corolla red or reddish, 7-9 mm. long: stamens 6-8 mm. long: berry subglobose, 5-7 mm. in diameter.—Swamp margins, low pinelands, sandhills, and ancient dunes, Coastal Plain, Fla. to La., Ark., and Ga.—Characterized by its erratic branching and irregular leaves with subcoriaceous blades.

3. *C. tenellus* (Ait.) Small. Stem 2-3 dm. tall or rarely more, from underground main stems, the branchlets copiously pubescent: leaf-blades oblanceolate, obovate-oblanceolate, or spatulate, 1-2.5 cm. long, mostly obscurely toothed: sepals ovate to deltoid, corolla ellipsoid-conic, 5-7 mm. long: stamens about 5 mm. long: berry 6-8 mm. in diameter, black beneath the bloom.—Pinelands, open woods and acid swamp-margins, Coastal Plain and adj. provinces, Fla. to Miss., Tenn., and S Va. Often growing in large colonies. The flowers, usually pink or whitish, are sometimes tinged with green.

4. *C. Elliottii* (Chapm.) Small. Stem 1-2.5 m. tall, branched, the branchlets pubescent: leaf-blades ovate, oval, or elliptic, 1-2.5 cm. long, or rarely longer, often conspicuously uniform in size, acute or obtuse, serrulate-ciliate or crenulate, finely pubescent on both sides, or sometimes above only on the midribs: sepals ovate, deltoid, or wider than long, obtuse: corolla pink or pinkish, 5-6 mm. long: stamens 4.5-5.5 mm. long: berry subglobose, 7-8 mm. in diameter, black to bluish-black, but without bloom.—Low pinelands, acid swamps, stream-banks, and thickets, Coastal Plain and adj. provinces, N Fla. to Tex., Ark., and Va.—The leaves often suggest those of *cassena* (*Ilex vomitoria*.)

5. *C. amoenus* (Ait.) Small. Stem 1-5 m. tall, the branches spreading, finely pubescent: leaf-blades variously elliptic, 3-8 cm. long, acute or sometimes short-acuminate, serrulate or serrulate-ciliate, more or less pubescent, especially beneath, usually only on the veins above, the pubescence becoming sparse with age: hypanthium and calyx usually glaucous: sepals deltoid-ovate, ovate or rarely reniform-ovate, usually about as broad as long, mostly acutish: corolla white to pinkish, 7-10 mm. long, cylindraceous-campanulate: stamens 6-9 mm. long: berry globular, 6-10 mm. in diameter, black with a bloom causing it to appear blue. [*V. corymbosum* in part (Fl. SE U. S.)]—Acid bogs, meadows, woods and thickets, various provinces, Fla. to Ark., Mich., and N. S.—Long confused with *C. corymbosus* from which it differs in its serrulate leaves, and its more narrow and differently shaped corolla. A form with non-glaucous hypanthium, calyx and fruit and with the leaf-blades broadest beyond the middle may be a distinct species. A form with glaucous foliage occurs in W Fla., where various forms are cultivated under the name rabbiteye blueberry. *Vaccinium Ashei* Read seems to belong here.

6. *C. virgatus* (Ait.) Small. Stem 1-3 m. tall, branched, with glabrous branchlets: leaf-blades elliptic or oval, or some slightly ovate or obovate, mostly 4-8 cm. long, deep-green above, more or less glaucous beneath, glabrous: sepals deltoid or nearly so, corolla white or whitish, 8-10 mm. long: stamens 8-9 mm. long: berry 7-9 mm. in diameter, glaucous. [*V. australe* Small.]—Rich woods near streams, swamps, and lake shores, Coastal Plain, Fla. to Ala. and S. C.—Flowering before the leaves appear or with their appearance, and characterized by the total absence of hairs on the foliage.

7. *C. atrocoecus* (A. Gray) Small. Stem 1-2.5 m. tall, with irregular branches and sparingly pubescent branchlets: leaf-blades elliptic or oval, or slightly broadened upward, 3-7 cm. long, entire, mostly acute or short-acuminate, dark-green above, paler and more or less pubescent beneath: hypanthium and

calyx green: sepals broader than long, obtuse: corolla yellowish-white or pinkish, campanulate or somewhat ovoid, 7–8 mm. long (rarely 5 mm.): stamens 5–8 mm. long: berry globular, 6–10 mm. in diameter, not glaucous.—Swamps and woods, various provinces, Ga. to Ark., Ont., and N. B.—Flowering before the leaves expand, and also fruiting earlier than *C. corymbosus*.

8. *C. corymbosus* (L.) Rydb. Stem 1–4 m. tall, widely branched, the branchlets finely pubescent: leaf-blades elliptic, oval, or elliptic-lanceolate, 4–8 cm. long, mostly acute or short-acuminate, deep-green above, more or less pubescent, sparingly so in age, beneath, entire: hypanthium and calyx glaucous: sepals broader than long, obtuse or broadly rounded: corolla white to pinkish, 6–10 mm. long, ovoid to open-campanulate: stamens 6–9 mm. long: berry globular, 7–10 mm. in diameter, black, but very glaucous.—Acid bogs, meadows and moist and occasionally rocky woods, various provinces, Ga. to La., Minn., and Newf.—Flowering with the leaves half grown; also readily distinguishable from the next preceding species by the fruit.

9. *C. simulatus* Small. Stem 1–2 m. tall, with irregular branches and minutely pubescent branchlets: leaf-blades elliptic to oval, varying to elliptic-lanceolate or obovate, 2.5–7 cm. long, acuminate or merely acute, serrulate, bright-green above, glabrous or glabrate and pale or glaucescent beneath: hypanthium and calyx green or glaucescent: sepals reniform, often repand: corolla urceolate, 3.5–4.5 mm. long, white to pinkish-green: stamens 4–5 mm. long: berry globular, 5–7 mm. in diameter, somewhat glaucous.—Acid woods, Blue Ridge to Appalachian Plateau, Ga. to Ala. and S. N. Y.—Flowering with the leaves partly grown.

10. *C. Cuthbertii* Small. Stem up to 2.5 m. tall, widely branched, the branchlets glabrous: leaf-blades elliptic-obovate to oval, 1.5–3.5 cm. long, acute, serrulate, nearly glabrous, with few scattered minute spine-like hairs on the veins beneath, lightly reticulate-veiny beneath: hypanthium and calyx light-green: sepals half-orbicular to orbicular-reniform: corolla white to pink, about 5 mm. long, urceolate: stamens 3–4 mm. long, the filaments short and broad: berry globose, 4–6 mm. in diameter, black.—Swamps, Coastal Plain, Ga. to S. C.—Flowering with the appearance of the leaves.

11. *C. holophyllus* Small. Stem up to 1.5 m. tall, much-branched, the branchlets softly pubescent: leaf-blades oval to elliptic, or individually broadest above or below the middle, 1–3.5 cm. long, acute, entire, brownish-pubescent on both sides when young, softly and closely pubescent beneath: hypanthium and calyx somewhat glaucous: sepals triangular-ovate to half-orbicular, obtuse: corolla white or pinkish, 6–7 mm. long, cylindraceous: stamens 5–6 mm. long: berry globose, 4–6 mm. in diameter, glaucous.—About river-swamps, Coastal Plain, Fla. and Ga.—Flowering with the appearance of the leaves, which, however, are sometimes partly persistent. The entire leaf-blades are diagnostic.

12. *C. Margarettae* (Ashe) Small. Stem up to 2 m. tall, with spreading branches, the branchlets closely soft-pubescent: leaf-blades elliptic to oval or ovate, 2–3.5 cm. long, acute or slightly acuminate, entire, closely soft-pubescent beneath, acute or rounded at the base: hypanthium and calyx glaucous: sepals broadly ovate to reniform-ovate: corolla greenish-yellow, more or less striped with red, 5–6 mm. long, or rarely 7 mm., campanulate-urceolate: stamens 4.5–5.5 mm. long: berry globose, 5–6 mm. in diameter, black, shining.—Woods, Piedmont and Blue Ridge, Ga. to Ala. and S. C.—Flowering with the leaves half grown. Plants spread by underground stems.

13. *C. vacillans* (Kalm) Rydb. Stem less than 0.5 m. tall, widely branched, the branchlets glabrous, or with minute hairs when young: leaf-blades oval,

varying to ovate or obovate, 2-3 cm. long, apiculate to acute, ciliate-serrulate to serrulate, light-green, glabrous or with scattered hairs and more or less glaucous beneath: hypanthium and calyx glaucous: sepals deltoid or deltoid-reniform, obtuse: corolla 4-6 mm. long, reddish-green: stamens 3-5 mm. long: berry globose, 4-7 mm. in diameter, very glaucous.—Woods, usually in dry and moderately acid soil, various provinces, Ga. to Miss., Ark., Mo., Mich., and Me.—Flowering while the leaves are appearing; grows in large patches from underground stems, often conspicuous by the numerous uniform leaves.

14. *C. pallidus* (Ait.) Small. Stems 1-2.5 m. tall, irregularly branched, the branchlets minutely pubescent: leaf-blades oval or elliptic, varying to ovate or obovate, 2.5-7 cm. long, mostly acute or slightly acuminate, glabrous except on the midrib above, and along the ciliate-serrulate margin, bright-green above, pale or glaucescent beneath: hypanthium and calyx glaucescent: sepals ovate, sometimes broadly so, to triangular: corolla greenish-pink, campanulate-urceolate, 4-5 mm. long: stamens 3.5-4.5 mm. long: berry subglobose, 8-12 mm. in diameter, very glaucous.—Acid woods, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., and Va.—Flowering with the leaves well developed. Most luxuriant and fruitful at high altitudes.—*V. carolinianum* Ashe, known only from scant material, seems to be a form of this species.

15. *C. liparus* Small. Stem up to 1 m. tall, irregularly branched, the branchlets glabrous or finely pubescent: leaf-blades narrowly obovate or elliptic, 3-7 cm. long, acute, sometimes abruptly pointed, glabrous, except on the midrib above, pale-green or glaucous beneath: hypanthium and calyx glaucous: sepals deltoid or wider than long, obtuse: corolla white to pink, 7-8 mm. long, campanulate-urceolate: stamens 6-7 mm. long: berry globose, 5-7 mm. long, glaucous.—Acid woods, and sometimes in pinelands, Appalachian and New England provinces, E Tenn. to S N. Y. and N. H.—Flowering with the leaves half developed; flowers much larger than those of *C. pallidus*.

16. *C. tallapusae* Coville. Stem 15-60 dm. tall, from a thick rootstock, glabrous, or the branches sparingly pubescent in lines: leaf-blades elliptic-lanceolate to ovate-lanceolate, 2-5 cm. long, acute, entire, glabrous or sometimes pubescent above along the midrib or even ciliate at maturity: sepals oval, sometimes broadly so, obtuse or acutish, entire: corolla greenish-white, sometimes with a blush of pink, campanulate-urceolate, 5-5.5 mm. long: stamens 4.5-5 mm. long: berry globose, 7-10 mm. in diameter or rarely larger, blue.—Oak woods, Piedmont and adj. provinces, W Ga., especially in the vicinity of Tallapoosa, and E Ala.—Flowering as the leaves appear.

17. *C. subcordatus* Small. Stem apparently less than 1 m. tall, widely branched, the branchlets glabrous or sometimes with few minute hairs: leaf-blades ovate or oval-ovate, 1-3 cm. long, mucronate or acute, bright-green above, glaucous beneath, glabrous, sparingly ciliate-serrulate, rounded to cordate at the base: hypanthium and calyx glaucous: sepals ovate to deltoid: corolla not seen: berry globose, 6-8 mm. in diameter, very glaucous.—Open woods, near Knoxville, Appalachian valley, Tenn.—Distinguished from our other blueberries by the more or less cordate leaf-blades.

18. *C. hirsutus* (Buckl.) Small. Stem up to 1 m. tall, irregularly branched, the branchlets copiously soft-pubescent: leaf-blades elliptic to ovate, 2-5 cm. long, mostly acute, entire, softly pubescent on both sides: bracts shaped like the leaves but much smaller: hypanthium and calyx copiously and softly glandular-pubescent: sepals ovate: corolla greenish-white to reddish, 8-9 mm. long, or rarely 7 mm.: filaments with long hairs: berry subglobose, 6-7 mm. in diame-

ter, pubescent, purplish-black.—Open woods, in acid soil, Blue Ridge, N. C. and Tenn.—Distinguished from all our other blueberries by the pubescent fruits.

7. **HERPOTHAMNUS** Small. Shrubs with trailing, creeping stems and branches. Leaves evergreen: blades coriaceous, obscurely toothed. Flowers in cluster-like racemes with scale-like bracts. Hypanthium cup-shaped. Sepals very broad, acute. Corolla depressed-urceolate, 5-lobed. Stamens included. Filaments longer than the anthers. Anthers awnless, with short apical tubes. Berry globose, black.—One species.

1. **H. crassifolius** (Andr.) Small. Stem and branches up to 1 m. long, glabrous: leaves numerous; blades oval or elliptic, or sometimes ovate or suborbicular, 3–10 mm. long or sometimes 12 mm., obtuse or acutish, glandular-crenate: flower-clusters not exceeding the leaves: sepals deltoid or broadly triangular, acute: corolla pink, about 3 mm. long, the lobes broadly rounded: stamens 2.5 mm. long: filaments pubescent: berry 3.5 mm. in diameter. [*Vaccinium crassifolium* Andr.]—(CREEPING-BLUEBERRY.)—Pinelands, Coastal Plain, Ga. to N. C.—Spr.

8. **HUGERIA** Small. Shrubs with rigid branches. Leaves deciduous: blades membranous, finely toothed, flat. Flowers solitary on slender pedicels arising from a short peduncle and a pair of bracts. Hypanthium obconic. Sepals of a deltoid type. Corolla rotate, pink or white, with the 4 long lobes curled backward. Stamens conspicuously exserted. Anthers awnless, with very slender apical tubes. Berry globose, red, sometimes turning purple, insipid or sometimes sweet and pleasant tasting.—The following species and one or two others in eastern Asia.

1. **H. erythrocarpa** (Michx.) Small. Stem 1–2.5 m. tall, the twigs mostly pubescent: leaf-blades lanceolate to ovate, 2.5–7.5 cm. long, acuminate, the teeth bristle-tipped: flowers nodding: sepals ciliate, acute: corolla 10–13 mm. long, the lanceolate lobes 4 or 5 times longer than the tube: stamens 10–12 mm. long: berry 5–9 mm. in diameter. [*Vaccinium erythrocarpum* Michx.]—(MOUNTAIN-CRANBERRY. BEAR-BERRY.)—Cliffs, slopes, and summits, in acid soil, Blue Ridge to Appalachian Plateau, Ga. to Tenn., W. Va., and Va.—Spr.—sum.—The flavor and acidity of the fruit is variable. The fruit from different mountains is often quite different in flavor. The better kinds make a delicious jelly. In cultivation the better kinds would doubtless furnish an additional desirable berry.

9. **OXYCOCCUS** Hill. Shrubs with slender trailing and creeping stems and branches. Leaves evergreen: blades coriaceous, entire, revolute. Flowers

terminating slender stalks with one or two small bractlets, 1-4 of which arise from terminal scaly buds. Hypanthium cup-shaped. Sepals 4, often of a deltoid type. Corolla white or pinkish, of 4 narrow petals with one or more curled back. Stamens conspicuously exerted. Anthers awnless, with long slender apical tubes. Berry globose or somewhat elongate, red, acid.—About 6 species, natives of the Northern Hemisphere.

1. *O. macrocarpus* (Ait.) Pursh. Stem up to 1 m. long, often finely pubescent, with erect or ascending flowering branches: leaves numerous: blades elliptic to linear-elliptic, varying to ovate or suborbicular, 6-14 mm. long, pale or whitish beneath: sepals acute, ciliolate: corolla nodding: petals lanceolate to elliptic-lanceolate, 7-10 mm. long: stamens about 6 mm. long: berry 1-2 cm. in diameter. [*Vaccinium macrocarpon* Ait.]—(CRANBERRY.)—Bogs, acid meadows, low sandy woods, and sandy banks, various provinces, in Coastal Plain only N. N. C. to Ark., Ind., Ont., and Newf.—Sum.—The commercial cranberry.

10. *CHIOGENES* Salisb. Slightly woody plants with slender creeping stems and branches. Leaves evergreen: blades coriaceous, entire. Flowers solitary and sessile in a pair of bractlets terminating a very short axillary peduncle. Hypanthium saucer-shaped. Sepals 4, as wide as long. Corolla greenish-white, campanulate. Stamens included. Filaments and anthers about equal in length, the anther-sacs separate, awnless, each 2-horned at the apex. Berry globose, white.—One species.

1. *C. hispidula* (L.) T. & G. Stem branched at the base, the branches often numerous, slightly woody: leaves numerous; blades oval to suborbicular, 3-13 mm. long, ciliate and with scattered hairs on the lower surface: hypanthium pubescent: sepals obtuse: corolla about 2 mm. long, the 4 lobes obtuse: stamens about 1 mm. long: berry 5-7 mm. in diameter, with scattered hairs, slightly acid and aromatic.—(CREEPING-SNOWBERRY. CAPILLAIRE. MOXIE-PLUM.)—Damp woods and bogs, in strongly acid humus or acid moss, Blue Ridge and more northern provinces, N. C. to Mich., B. C., Ont., and Newf.—Spr.

#### FAMILY 6. DIAPENSIACEAE — PYXIE FAMILY

Undershrubs. Leaves alternate, often numerous: blades entire, leathery. Flowers solitary. Calyx of 5 partly united persistent sepals. Corolla of 5 partly united petals. Androecium of 5 stamens, the filaments partly united to the corolla-tube. Gynoecium of 3 united carpels. Fruit a 3-valved capsule.—Two genera and about 6 species, natives of the Northern Hemisphere.

1. **PYXIDANTHERA** Michx. Evergreen plants with creeping stems and branches. Leaves numerous. Calyx-lobes broad and imbricate. Corolla white, persistent: lobes 5, rounded, spreading. Anthers in the sinuses of the corolla. Capsule subglobose.—Two species.—Spr.—PYXIE. FLOWERING-MOSS.

Leaves bright-green: calyx-lobes obscurely ciliate: corolla-lobes with suborbicular tips.  
 Leaves lanate, hence hoary: calyx-lobes ciliate: corolla-lobes cuneate.

1. *P. barbulata*.

2. *P. brevifolia*.

1. *P. barbulata* Michx. Plant forming a mat: leaf-blades linear, linear-ob-lanceolate, linear-elliptic, or linear-lanceolate, 5–8 mm. long, pubescent and ciliate at the base: bracts ciliate: calyx-lobes 3.5–4 mm. long, green or pink at the tip, ciliate: corolla 6–7 mm. wide; lobes with suborbicular blades: capsule about 2.5 mm. in diameter.—Pinelands, Coastal Plain, S. C. to N. J.

2. *P. brevifolia* Wells. Similar to *P. barbulata* in habit, but with the hoary clusters of leaves smaller: leaf-blades linear-elliptic, linear, or linear-lanceolate, 2–4 mm. long, lanate: bracts copiously lanate: calyx-lobes about 3 mm. long, pink, ciliate: corolla 5–6 mm. wide; lobes with cuneate blades: capsule slightly smaller than that of *P. barbulata*.—Sandhills, interior Coastal Plain, N. C.

## FAMILY 7. GALACACEAE — GALAXY FAMILY

Perennial, evergreen, scapose herbs. Leaves alternate, but few and all basal: blades leathery, toothed. Flowers solitary or in a raceme. Calyx of 5 partly united persistent sepals. Corolla of 5 partly united petals. Androecium of 5 stamens alternating with 5 staminodia, all sometimes partly united into a tube. Gynoecium of 3 united carpels. Fruit a 3-valved capsule.—Four genera, North American and Asiatic.

Flowers large, solitary: anthers surpassing the staminodia.  
 Flowers small, in a long raceme: anthers surpassed by the staminodia.

1. *SHERWOODIA*.

2. *GALAX*.

1. *SHERWOODIA* House. Herbs with short caudices bearing few leaves, with broad long-petioled blades. Flower-stalks bearing few scales and a single flower. Staminodia very short. Style elongate.  
 [*Shortia* T. & G. not Raf.]—Two species, the following and one Asiatic.

1. *S. galacifolia* (T. & G.) House. Plant gregarious: leaf-blades oval or suborbicular, 2–7 cm. long, crenate-dentate with mucronate teeth, truncate or subcordate at the base: flower-stalk 5–15 cm. tall: calyx-lobes 7–10 mm. long: corolla white, 2–3 cm. wide: capsule 5–6 mm. long, shorter than the calyx.  
 [*Shortia galacifolia* T. & G.]—(SHORTIA. OONEE-BELLS. ONE-FLOWER COLTSFOOT.)—Ravines and stream-banks, in acid humus, inner Piedmont and Blue Ridge, S. C. and N. C.—Rare.—Spr.

2. **GALAX** L. Herbs with a short caudex bearing few leaves with broad long-petioled blades. Flowers in an elongate spike-like raceme. Staminnodia exceeding the anthers. Style very short.—  
One species.

1. **G. aphylla** L. Plant gregarious: leaf-blades suborbicular, 4–10 cm. in diameter, crenate, with apiculate teeth, deeply cordate: flower-stalk 2–7 dm. tall: calyx-lobes 1.5 mm. long: corolla white, 4–5 mm. wide: capsule about twice as long as the calyx.—(GALAX. GALAXY. WAND-FLOWER. COLT'S FOOT. BEETLE-WEED.)—Open woods, in dry acid soil, Piedmont to Appalachian Plateau, Ga. to Ala. and W. Va., extending into Coastal Plain in N. C. and Va.—Sum.—The leaves are gathered in great quantities for use by florists.

### ORDER PRIMULALES—PRIMULAL ORDER

Herbs, shrubs, trees, or vines. Leaves alternate or opposite, sometimes all basal. Flowers perfect or polygamo-dioecious, variously disposed. Calyx of 2–several partially united sepals. Corolla of 2–several distinct or partially united petals. Androecium of as many stamens as there are sepals or petals, and sometimes accompanied by staminodia. Gynoeceum of 4–6 united carpels, or rarely more. Fruit capsular or drupaceous, or rarely an achene or a utricle.

Styles and stigmas distinct, slender: fruit an achene or an utricle: ovule solitary.  
Fam. 1. ARMERIACEAE.

Styles united: fruit capsular or drupe-like: ovules several.

Herbs: ovules and seeds not immersed: fruit capsular.

Fam. 2. PRIMULACEAE.

Shrubs or trees: ovules and seeds immersed: fruit drupe-like.

Staminodia at the sinuses of the corolla: fruit containing few to many seeds.

Fam. 3. THEOPHRASTACEAE.

Staminodia wanting: fruit containing a single seed.

Fam. 4. ARDISIACEAE.

### FAMILY 1. ARMERIACEAE — LEADWORT FAMILY

Perennial or rarely annual, often partly woody plants with leafy stems or with caudices. Leaves alternate: blades entire. Flowers perfect, in heads, spikes, panicles, or cymes. Calyx of 4 or 5 partly united sepals, the tube ribbed, the limb sometimes corolloid. Corolla of 4 or 5 petals, with the claws nearly distinct or united into a tube. Androecium of 4 or 5 stamens opposite the petals. Gynoeceum of 4 or 5 carpels with the bodies at least united. Stigmas distinct. Fruit an achene or utricle, wholly or partly included in the persistent calyx.—Ten genera and 350 species, widely distributed.

Acaulescent plants with a leafy caudex, the leaves basal: petals with the claws nearly distinct; filaments partly adnate to the petals; anthers broad: styles distinct.  
1. LIMONIUM.

Cauliscent plants with alternate leaves: petals with the claws united into a slender tube: filaments free: anthers narrow: styles united.

2. PLUMBAGO.

1. **LIMONIUM** [Tourn.] Hill. Perennial seaside herbs with woody roots and a short leafy caudex which supports several leaves with thick entire blades. Flower-stem erect, nearly naked, branched. Flowers violet or lavender, solitary or 2 or 3 together subtended by several scale-like bracts. Calyx funnelform or trumpet-shaped, persistent, 5-lobed, with teeth in the sinuses. Corolla 5-lobed, the tube very short. Utricle exserted from the calyx. [*Statice* Willd. not L.]—About 120 species, widely distributed.—Spr.-sum. or all year S.—SEA-LAVENDERS. MARSH-ROSEMARYS. CANKER-ROOTS.

Calyx-tube pubescent, at least at the base.

Calyx 6-6.8 mm. long; lobes ovate-lanceolate, acuminate: panicle much-branched.

1. *L. Nashii*.

Calyx 4-4.7 mm. long; lobes deltoid-ovate, obtuse: panicle sparingly branched.

2. *L. obtusilobum*.

Calyx-tube glabrous, or rarely with 1 or 2 hairs.

Calyx-lobes broadly ovate-deltoid, obtuse: innermost bractlet obtuse.

3. *L. carolinianum*.

Calyx-lobes ovate-lanceolate to deltoid, acute: innermost bractlet acute.

4. *L. angustatum*.

1. *L. Nashii* Small. Flowering stem 2-8.5 dm. tall, usually branched from near the middle, the branches slightly zigzag: leaf-blades elliptic, elliptic-spatulate, or obovate, 5-18 cm. long, obtuse to retuse: panicle-branches ascending-spreading: outermost bractlet 2 mm. long or nearly so: calyx pubescent at the base and often on 1 or 2 of the ribs up to the middle, the teeth between the lobes deltoid, entire, lobed, or obsolete: corolla violet: capsule about 4 mm. long.—Beaches and coastal salt-marshes, Fla. to Tex. and S. C.—(*Mex.*)

2. *L. obtusilobum* Blake. Flowering stem about 3 dm. tall, mostly branched near the top: leaf-blades oblanceolate-spatulate, 3.5-4.5 cm. long, mucronate and acute: panicle-branches ascending: outermost bractlet about 1 mm. long: calyx pubescent on the ribs up to the middle; the teeth between the lobes ovate-deltoid, entire: corolla pale-violet: capsule about 3 mm. long.—Salt-marshes, N Fla.

3. *L. carolinianum* (Walt.) Britton. Flowering stem 2-6 dm. tall: leaf-blades spatulate to elliptic or obovate-elliptic, 5-17.5 cm. long, retuse or obtuse, sometimes mucronate: panicle-branches ascending: outermost bractlet rhombic-ovate, mostly 1.5-2 mm. long: calyx 4.5-5.5 mm. long, the teeth between the lobes ovate to lanceolate, about half as long as the lobes: corolla lavender: capsule mostly 5-6 mm. long. [*S. brasiliensis* A. Gray not Boiss. *L. brasiliense* Small]—Salt-marshes, meadows, and dunes, near the coast, Fla. to N. C.—(*Mex.?*)

4. *L. angustatum* (A. Gray) Small. Flowering stem 2-6 dm. tall: leaf-blades linear, narrowly spatulate to narrowly elliptic, 5-8.5 cm. long, obtuse or sometimes cuspidate: panicle-branches ascending: outermost bractlet ovate: calyx 5.5-6.5 mm. long, the teeth between the lobes minute: corolla lavender: capsule about 7 mm. long. [*S. brasiliensis* (Chapm. Fl.)]—Salt-marshes along the coast, Fla. to Tex. and N. C.

2. **PLUMBAGO** L. Perennial caulescent hammock herbs with somewhat woody, often greatly elongate stems and alternate leaves. Flowers in terminal

spike-like panicles. Calyx tubular, with stalked glands, unevenly 5-lobed, with merely hyaline sinuses. Corolla salverform: tube elongate: lobes broad: capsule included.—LEADWORTS.—About 12 species, widely distributed in warm regions.

Corolla white; tube less than twice as long as the calyx: calyx merely glandular all over. 1. *P. scandens*.

Corolla blue; tube over twice as long as the calyx: calyx finely pubescent and glandular except near the base. 2. *P. capensis*.

1. *P. scandens* L. Stem erect, decumbent, or climbing, somewhat woody: leaf-blades elliptic, elliptic-lanceolate, or ovate, 2–10 cm. long, acute or short-acuminate: panicles elongate, interrupted: bracts acuminate: calyx scarcely 1 cm. long in anthesis, more than one third the length of the corolla: corolla mostly 3–4 cm. long: capsule linear-prismatic, about 7 mm. long, beaked.—Hammocks, S Fla. and kitchen-middens N along the coasts.—(*W. I., Mex., C. A., S. A.*)—All year.

2. *P. capensis* Thumb. Stem erect, often diffusely branched or bushy: leaf-blades elliptic, varying to elliptic-spatulate or elliptic-ovate, 3–9 cm. long, obtuse or acutish: panicles compact, short: bracts mucronate: calyx fully 1 cm. long in anthesis, less than one-third the length of the corolla: corolla mostly 4–5 cm. long.—Roadsides and waste-places, S Fla. Nat. of S Afr. and cult.—(*W. I., Mex., C. A., S. A.*)—All year.

## FAMILY 2. PRIMULACEAE — PRIMROSE FAMILY

Herbs, various in habit. Leaves alternate, opposite, or whorled, sometimes all basal: blades entire, toothed, or rarely dissected. Flowers perfect. Calyx of 4–9 partially united sepals, commonly persistent. Corolla of 4–9 partially united petals, or rarely wanting. Androecium of as many stamens as there are sepals and alternate with them, sometimes with staminodia. Gynoecium a single pistil, with a central placenta: style single. Fruit a 1-celled, 2–8-valved capsule.—Twenty-eight genera and 400 species, widely distributed in the Northern Hemisphere.

Ovary superior.

Lobes of the corolla imbricate: ovules attached at the base: leaf-blades dissected. Tribe I. HOTTONIEAE.

Lobes of the corolla valvate or convolute: ovules attached at the middle: leaf-blades entire or toothed.

Ovary half-inferior.

II. PRIMULEAE.  
III. SAMOLEAE.

### I. HOTTONIEAE

Aquatic, rooting, and floating herb: stems and peduncles swollen and inflated: corolla salverform.

1. HOTTONIA.

### II. PRIMULEAE

Corolla-lobes erect or merely spreading: anthers not sagittate. Capsule opening lengthwise.

Filaments united below the middle: anthers ovoid.

2. LYSIMACHIA.

Filaments distinct or essentially so: anthers linear.

3. STEIRONEMA.

Capsule circumscissile.

Corolla longer than the calyx: style longer than the ovary.

Corolla shorter than the calyx: style shorter than the ovary.

Corolla-tube very short: filaments united at the base.

Corolla-tube globular, about as long as the lobes: filaments united to above the middle.

Corolla-lobes reflexed: anthers sagittate.

4. *ANAGALLIS*.

5. *MICROPYXIS*.

6. *CENTUNCULUS*.

7. *DODECATHEON*.

### III. SAMOLEAE

Staminodia present: corolla-lobes longer than the tube.

Staminodia wanting: corolla-lobes shorter than the tube.

8. *SAMOLUS*.

9. *SAMODIA*.

1. **HOTTONIA** L. Aquatic herbs. Leaves crowded: blades pinnately dissected: petioles inflated. Flowers whorled. Calyx-lobes 5, narrow, persistent. Corolla white, salverform: lobes shorter than the tube. Filaments adnate to the lower part of the corolla-tube. Capsule subglobose.—Two species, the following and an Eurasian.

1. *H. inflata* Ell. Stem 2-6 dm. long, fistulous: leaf-blades ovate to elliptic in outline, the segments filiform. Calyx-lobes linear, 3-3.5 mm. long, or longer at maturity, glandular-ciliate below: corolla about 3 mm. long: capsule 3 mm. in diameter.—(FEATHERFOIL.)—Ponds, pools, and ditches, Coastal Plain and New England Coast, Fla. to La., Mo., and Me.; and Great Lake Lowland, Ohio and Ind.—Rare.—Spr.-sum.

2. **LYSIMACHIA** [Tourn.] L. Perennial or rarely annual herbs, the foliage glandular-punctate. Leaves opposite or apparently whorled. Corolla yellow, rotate or nearly so: lobes entire, acute or obtuse. Filaments partially united. Staminodia wanting. Anthers ovoid.—About 70 species, mostly natives of the Northern Hemisphere.—Sum.—LOOSESTRIFES.

Calyx-lobes ovate: stem and branches creeping. Calyx-lobes lanceolate, elliptic-lanceolate or linear: stems erect.

Flowers in a terminal raceme, the raceme sometimes leafy-bracted: corolla streaked.

Inflorescence extending nearly the length of the plant: flowers axillary to leaf-like bracts.

Inflorescence a terminal virgate raceme: flowers axillary to small bracts.

Staminodia manifest, but minute.

Pedicels shorter than the bracts: corolla-lobes 6-7 mm. long.

Pedicels longer than the bracts: corolla-lobes 8-9 mm. long.

Staminodia wanting.

Corolla-lobes 5-6 mm. long: pedicels longer than the bracts.

Corolla-lobes 10-11 mm. long: pedicels shorter than the bracts.

Flowers in a terminal panicle: corolla without dots or streaks.

1. *L. Nummularia*.

2. *L. quadrifolia*.

3. *L. producta*.

4. *L. terrestris*.

5. *L. Loomisii*.

6. *L. asperulaefolia*.

7. *L. Fraseri*.

1. **L. Nummularia** L. Stem and branches 1-7 dm. long: leaf-blades sub-orbicular, 0.8-3 cm. long: calyx-lobes ovate, 8-9 mm. long, cordate at the base:

corolla-lobes 11–14 mm. long, obovate to ovate: capsule about 4 mm. thick.—(MONEY-WORT.)—Moist banks and about gardens, various provinces, Ga. to Mich. and Newf.—Nat. of Eu. and cult.

2. *L. quadrifolia* L. Stem 2–9 dm. tall: leaf-blades lanceolate to oval, 1.5–9 cm. long: pedicels shorter than the bracts: calyx-lobes lanceolate, 5–6 mm. long, acuminate: corolla-lobes elliptic to ovate-elliptic, exceeding the calyx: capsule 2.5–3 mm. thick.—(CROSS-WORT. WHORLED-LOOSESTRIFE.)—Thickets and woods, various provinces, Ga., to Ala., Ont., and N. B.

3. *L. producta* (A. Gray) Fernald. Stem 3–6 dm. tall: blades lanceolate or elliptic-lanceolate, 2–8 cm. long: pedicels shorter than the bracts: calyx-lobes narrowly elliptic-lanceolate, 3 mm. long, acute or acutish: corolla-lobes ovate to elliptic-ovate, more or less notched at the apex: capsule subglobose, about 2 mm. thick. [*L. foliosa* Small]—Damp woods and stream-banks, various provinces, N. C. to Mich. and Me.

4. *L. terrestris* (L.) B. S. P. Stem 5–8 dm. tall: leaf-blades lanceolate, elliptic-lanceolate, or narrowly elliptic, 2–6 cm. long, abruptly smaller near the inflorescence: pedicels longer than the bracts: calyx-lobes elliptic-lanceolate, about 2 mm. long: corolla-lobes elliptic-lanceolate: capsule about 2 mm. thick.—(SWAMP-CANDLES.)—Wet, sandy soil and swamps, various provinces, Ga. to Ark., Man., and Newf.

5. *L. Loomisii* Torr. Stem 3–8 dm. tall: leaf-blades linear, 1–3 cm. long, blunt: pedicels longer than the bracts: calyx-lobes lanceolate, 2.5–3 mm. long: corolla-lobes elliptic to ovate-elliptic, eciliate: capsule about 2.5 mm. thick. [*L. angustifolia* Michx. not Lam.]—Low grounds, Coastal Plain and Piedmont, Ga. to N. C.

6. *L. asperulaefolia* Poir. Stem 2–6 dm. long: leaf-blades lanceolate, 2–5 cm. long, acute or acuminate: pedicels shorter than the bracts: calyx-lobes lanceolate, 4–5 mm. long: corolla-lobes lanceolate to elliptic-lanceolate, ciliolate: capsule 3.5–4.5 mm. thick.—Pinelands, Coastal Plain, Ga. to N. C.

7. *L. Fraseri* Duby. Stem 8–20 dm. tall, glandular near the nodes: leaf-blades lanceolate, narrowly elliptic or oblanceolate, or sometimes ovate-lanceolate, 6–15 cm. long: panicle broad: calyx-lobes lanceolate, about 5 mm. long: corolla-lobes elliptic to ovate, 7–8 mm. long: capsule 3–4 mm. thick.—Woods and slopes, over non-calcareous rocks, Blue Ridge to Appalachian Plateau, Ga. (and Ala.?) to Tenn. and S. C.

3. **STEIRONEMA** Raf. Perennial herbs, the foliage not glandular-punctate. Leaves opposite. Corolla yellow, rotate: lobes erose or erose-ciliate, mucronate. Filaments distinct or nearly so, alternating with manifest staminodia. Anthers linear. Six species, North American.—Sum.—LOOSESTRIFES.

Bracts with ovate or broadly lanceolate blades.

Calyx-lobes less than 5 mm. long: corolla 8–10 mm. wide. 1. *S. radicans*.

Calyx-lobes over 5 mm. long: corolla 15–25 mm. wide.

Staminodia ovate: corolla-lobes 7–8 mm. long.

2. *S. tonsum*.

Staminodia subulate: corolla-lobes 10-12 mm. long.

3. *S. ciliatum*.

Bracts with linear, elliptic or narrowly lanceolate blades.

Staminodia ovate: capsule 2.5-3 mm. thick.

4. *S. lanceolatum*.

Staminodia lanceolate to subulate: capsule 3.5-4.5 mm. thick.

Cauline leaves not narrowed into petioles, the blades of the upper ones mostly narrower than those of the lower.

5. *S. heterophyllum*.

Cauline leaves narrowed into petioles, the blades of the upper ones not much narrower than those of the lower.

6. *S. hybridum*.

1. *S. radicans* (Hook.) A. Gray. Stem 3-8 dm. long, ultimately reclining or creeping: leaf-blades ovate to lanceolate, 2-8 cm. long: calyx-lobes lanceolate, 3.5-4 mm. long: corolla-lobes obovate or orbicular-obovate, 4.5-5.5 mm. long, truncate or emarginate at the apex: capsule about 3 mm. thick.—Swamps and wet river banks, Coastal Plain and occasionally other provinces, Miss. to Tex., Mo., and Va.—Sum.

2. *S. tonsum* (Wood) Bicknell. Stem 2-7 dm. tall: leaf-blades ovate to ovate-lanceolate, 1.5-8 cm. long, like the petioles eciliate: calyx-lobes broadly lanceolate, 5.5-6 mm. long: corolla-lobes suborbicular, erose-lacerate: capsule about 4 mm. thick. [*S. tonsum simplex* Kearney]—Dry woods, cliffs, and bluffs, various provinces, rarely Coastal Plain, Ga. to Ark., Tenn., and Va.—Spr.-sum.

3. *S. ciliatum* (L.) Raf. Stem 2-15 dm. tall: leaf-blades ovate, elliptic-ovate, or broadly lanceolate, 4-12 cm. long, like the petioles ciliate: calyx-lobes narrowly lanceolate, 6-7 mm. long: corolla-lobes ovate or obovate, erose-ciliate: capsule about 5 mm. thick.—Stream-banks and damp thickets, various provinces, Fla. to Tex., Ariz., B. C., Ont., and N. S.—Spr.-sum.

4. *S. lanceolatum* (Walt.) A. Gray. Stem 2-6 dm. tall: lower cauline leaves with elliptic or lanceolate blades; upper cauline leaves much longer than the lower ones, the blades mainly linear, 3-10 cm. long, the petiole-like bases only or mainly ciliate near the stem: calyx-lobes 4-5 mm. long: corolla-lobes 5-8 mm. long: staminodia ovate: capsule 2.5-3 mm. thick.—Thickets, borders of woods, and low grounds, various provinces, Ga., to Miss., Ont., and Me.—Sum.

5. *S. heterophyllum* (Michx.) Raf. Stem 0.5-5 dm. tall: lower cauline leaves with oval, obovate, or spatulate blades; upper cauline leaves conspicuously longer than the lower ones: blades narrowly elliptic to linear, 4-15 cm. long, not narrowed to petioles: calyx-lobes 5-6 mm. long: corolla-lobes 5-8 mm. long: staminodia lanceolate to subulate: capsule 3.5-4 mm. thick.—Woods, meadows, and shaded banks, Coastal Plain and adj. provinces, Fla. to Miss., Ark., and Va.—Spr.-fall.

6. *S. hybridum* (Michx.) Raf. Stem 1-9 dm. tall: leaf-blades lanceolate to linear-lanceolate, or sometimes broader near the base of the stem, 3-7.5 cm. long, each more or less abruptly narrowed into a copiously ciliate petiole: calyx-lobes 6-7 mm. long: corolla-lobes 6-9 mm. long: staminodia lanceolate to subulate: capsule 4-4.5 mm. thick.—Thickets and moist soil, various provinces, Fla. to Tex., Ariz., Minn., and Me.—Spr.-sum.

4. *ANAGALLIS* [Tourn.] L. Annual or rarely perennial herbs of cultivated or waste-places. Leaves mostly opposite: blades thinnish. Corolla

rotate, longer than the calyx; lobes dilated. Filaments pubescent: anthers ellipsoid.—About 15 species, mostly natives of the Old World.

✓ 1. **A. arvensis** L. Stem and branches 5–30 cm. long: leaf-blades ovate, or oval, 5–20 mm. long, entire, sessile: calyx-lobes lanceolate, about 2 mm. long: corolla scarlet or rarely white (blue in *A. arvensis coerulea*), 5–7 mm. wide; lobes glandular-ciliate: capsules about 4 mm. in diameter, on recurved pedicels. — (POOR-MAN'S WEATHER-GLASS. SHEPHERD'S WEATHER-GLASS. PIMPERNEL.)

—Waste-places, fields, and roadsides, various provinces, Fla. to Tex., Minn., and Newf.; also Pacif. States. Nat. of Eurasia.—Spr.—sum.

5. **MICROPYXIS** Duby. Annual small herbs. Leaves alternate or some of the lower ones opposite: blades thickish. Corolla inconspicuous, rotate shorter than the calyx: tube very short: lobes narrowed upward. Filaments united only at the base. Anthers didymous.—One species.

1. **M. pumila** (Sw.) Duby. Stem 5–20 cm. tall: leaf-blades oval to suborbicular, 3–10 mm. long, apiculate: flowers slender-pedicelled: calyx-lobes elliptic-ovate, abruptly pointed: corolla white or greenish: capsule less than 2 mm. in diameter. [*Centunculus pentandrus* R Br.]—(FALSE-PIMPERNEL.)—Low grounds, pen. Fla.—(W. I., Mex., C. A., S. A., O. W.)—Spr.—fall.

6. **CENTUNCULUS** L. Annual small herbs of low grounds. Leaves alternate, or some of the lower ones opposite: blades thickish. Corolla inconspicuous, not exceeding the calyx, with a globular tube and 5 narrow spreading lobes. Filaments united above the middle. Anthers didymous.—Two species, widely distributed.

1. **C. minimus** L. Stem 2–15 cm. tall: leaf-blades spatulate, elliptic, or obovate, 3–8 mm. long, acute or obtuse: flowers sessile or nearly so: calyx-lobes narrowly lanceolate, 2–2.5 mm. long: corolla pink or nearly white; lobes lanceolate, acuminate: capsule usually fully 2 mm. in diameter.—(CHAFF-WEED. FALSE-PIMPERNEL.)—Low grounds and moist soil, various provinces, Fla. to Tex., B. C., Minn., and Ill.—(W. I., Mex., C. A., S. A., O. W.)—Spr.—fall

7. **DODECATHEON** L. Perennial scapose herbs with erect flower-stalks. Leaves on a short caudex: blades entire to coarsely toothed. Flowers showy

in a terminal umbel, nodding. Calyx-lobes reflexed in anthesis. Corolla with a very short tube and reflexed elongate lobes. Stamens erect.—About 30 species, North American and Asiatic.—**MEDIAS. SHOOTING-STARS. AMERICAN-COWSLIPS.**

Anthers slender (mostly over 7 mm. long); connective-body broader than the anther-sacs: capsule elongate, much exceeding the calyx.

Connective-body lanceolate: corolla typically pink-purple.

Connective-body ovate: corolla typically white.

Anthers stout (mostly less than 7 mm. long); connective-body narrower than the anther-sacs: capsule short, about equaling the calyx.

1. *D. Meadia*.

2. *D. Hugerii*.

3. *D. brachycarpa*.

1. *D. Meadia* L. Leaf-blades spatulate to elliptic, 5–20 cm. long, entire to coarsely crenate: scapes overtopping the leaves: calyx-lobes linear to linear-lanceolate, much longer than the tube: corolla pink-purple; lobes 1–1.5 cm. long: capsule ellipsoid-cylindric, 1.2–1.5 cm. long; much longer than the calyx.—Gravelly fields, open woods, bluffs, cliffs, and rocky river-banks, often in rich or calcareous soil, various provinces, rarely Coastal Plain, Ga. to Tex., Wis., and Pa.—Spr.-sum.—Sometimes cultivated in gardens.

2. *D. Hugerii* Small. Leaf-blades spatulate, elliptic, or elliptic-lanceolate, 5–40 cm. long, often undulate or repand-crenate: scapes mostly 2–4 dm. tall: calyx-lobes lanceolate: corolla white, or sometimes purple-tinged; lobes 1.5–2 cm. long: anthers slender-subulate, 7.5–8.5 mm. long; connective-body abruptly narrowed at the apex: capsule ellipsoid-conic, 1–1.5 cm. long.—Woods, bluffs, and cliffs, various provinces N of Coastal Plain, Ga. to Ala., Ohio, and Md.—Spr.

3. *D. brachycarpa* Small. Leaf-blades spatulate or elliptic, entire or undulate: scapes 2–4 dm. tall: calyx-lobes lanceolate to triangular-lanceolate: corolla pink-purple; lobes linear or nearly so, 1–1.5 cm. long: anthers stout-subulate, 5.5–6.5 mm. long; connective-body lanceolate: ovary-apex flattened: capsule ovoid, less than 1 cm. long.—Plains and prairies, various provinces, Ala. to Ark.—Spr.-sum.

8. **SAMOLUS** [Tourn.] L. Caulescent herbs. Leaves alternate: blades entire. Flowers in simple or branched, sessile or nearly sessile racemes. Calyx perigynous: lobes 5. Corolla perigynous: lobes 5, with staminodia at the sinuses. Stamens 5: filaments very short, adnate to the base of the very short corolla-tube. Ovary and capsule  $\frac{1}{2}$  inferior.—About 4 species, widely distributed.

• *S. floribundus* H.B.K. Plant glabrous, 6 dm. tall: leaf-blades spatulate to oval or ovate, mainly 3–15 cm. long: sepals ovate or triangular-ovate, barely 1 mm. long, white: corolla white, 3 mm. wide; lobes elliptic: capsule 2.5–3 mm. in diameter.—**WATER-PIMPERNEL. BROOK-WEED.**—Wet

soil, swamps, and streams, various provinces, Fla. to Tex., Calif., B. C., Ont., and Newf.—(*W. I., Mex., C. A., S. A.*)—Spr.-sum.

9. **SAMODIA** Baudo. Caulescent herbs, of low grounds. Leaves alternate: blades entire. Flowers in simple or branched long-peduncled racemes. Calyx perigynous: lobes 5. Corolla white or pink, perigynous, without staminodia: lobes 5. Stamens 5: filaments adnate to above the middle of the relatively long corolla-tube. Ovary and capsules  $\frac{1}{2}$  inferior.—About 6 species, widely distributed.

1. **S. ebracteata** (H.B.K.) Baudo. Plant 1-3 dm. tall: leaf-blades spatulate or obovate, 3-10 cm. long, obtuse or apiculate: corolla 6-7 mm. wide; lobes more or less retuse at the apex. [*Samolus ebracteatus* H.B.K.]—Low pinelands, swamps, prairies and edges of salt marshes, Coastal Plain, Fla. to Texas.—(*W. I., Mex.*)

### FAMILY 3. THEOPHRASTACEAE — JOE-WOOD FAMILY

Shrubs or trees. Leaves opposite, persistent: blades leathery, entire. Flowers perfect, in racemes, corymbs, or panicles. Calyx of 5 imbricate sepals. Corolla campanulate or rotate-salverform, of 5 partly united petals. Androecium of 5 stamens partly adnate to the corolla-tube, and 5 staminodia. Gynoecium of 5 united carpels. Fruit a drupe-like berry.—Five genera and about 50 species, of tropical distribution.

1. **JACQUINIA** L. Leaves usually numerous: blades entire, thick and very brittle. Flowers erect. Calyx persistent. Corolla deciduous. Anthers extrorse. Staminodia very broad. Berry erect.—About 25 species, tropical American.

1. **J. keyensis** Mez. Shrub, or tree becoming 5 m. tall, the bark pale, the twigs very brittle: leaf-blades cuneate-spatulate or elliptic-obovate, 1-5 cm. long, shining: calyx-lobes 2-3 mm. long, orbicular-ovate: corolla straw-colored; lobes longer than the tube: staminodia elliptic, erose: berry subglobose, 8-10 mm. in diameter.—(JOE-WOOD. CUDJOE-WOOD.)—Hammocks along the coast, S pen. Fla., Everglade Keys, Fla. and Florida Keys.—(*W. I.*)—All year.—The wood is brown, hard, and very close-grained. The flowers are very fragrant.

### FAMILY 4. ARDISIACEAE — MYRSINE FAMILY

Shrubs or trees. Leaves mostly alternate, ours persistent: blades leathery, entire. Flowers perfect or polygamo-dioecious, in racemes corymbs, or cymes, sometimes clustered on scaly spurs. Calyx of usually

4-6 sepals. Corolla of usually 4-6 partly united petals, short-salverform or rotate, often streaked or dotted. Androecium of mostly 4-6 stamens, partly adnate to the corolla-tube. Gynoecium of mostly 4-6 united carpels. Fruit a drupe-like berry.—Twenty genera and 450 species, mostly of tropical distribution.

Flowers on scattered spurs: corolla-lobes not reflexed: stigma lobed. 1. RAPANEA.  
Flowers in terminal panicles: corolla-lobes reflexed: stigma entire. 2. ICACOREA.

**1. RAPANEA** Aubl. Shrubs or small trees. Flowers inconspicuous, clustered on scaly spurs, stout-pedicelled. Corolla white or nearly so: lobes ascending or spreading. Stamens with ascending or spreading anthers. Style very short: stigma lobed.—More than 80 species, mostly tropical.

**1. R. guayanensis** Aubl. Shrub or small tree, with grayish bark: leaves mostly near the ends of the branchlets: blades obovate-elliptic or nearly elliptic, 4-10 cm. long: flower-clusters scattered along the branchlets: sepals broadly ovate: corolla-lobes elliptic, unequal: berry about 4 mm. in diameter. [*Myrsine Rapanea* R. & S.]—(MYRSINE.)—Coastal hammocks, pen. Fla., hammock islands in the Everglades, and Everglade Keys, and Florida Keys.—(W. I., C. A., S. A.)—All year.

*Ardisia polycephala* Wall., native of the East Indies, is an evergreen shrub up to six or eight feet tall, with oblanceolate spatulate or somewhat elliptic coriaceous leaf-blades: flowers in axillary cluster-like cymes: corolla white or pinkish, with ovate or elliptic-ovate pointed lobes: stamens erect, yellowish: berry depressed-globose, about 1 cm. in diameter, purple-black or almost black, shining.—Hammocks and old homesteads, pen. Fla.—*Ardisia* differs from *Rapanea* in the contorted corolla-lobes and the slender-tipped anthers.

**2. ICACOREA** Aubl. Shrubs or trees. Flowers conspicuous, in panicles, cymes, or clusters, slender-pedicelled. Corolla white or pink, and often purple-streaked: lobes recurved. Stamens with converging anthers. Style elongate: stigma minute, entire.—More than 200 species, of tropical and subtropical regions.

**1. paniculata** (Nutt.) Sudw. Shrub or small tree, with white or whitish bark: leaves scattered; blades oblanceolate to elliptic, 4-18 cm. long: panicles terminal: calyx-lobes ovate to obovate: corolla-lobes elliptic: berry 7-8 mm. in diameter. [*Ardisia Pickeringia* T. & G.]—(MARLBERRY. CHERRY.)—Coastal hammocks, pen. Fla., pinelands, and hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I., Mex.)—All year.

## ORDER EBENALES—EBENAL ORDER

Shrubs or trees. Leaves alternate, opposite, or whorled: blades simple. Flowers perfect, monoecious, or dioecious. Calyx of 3–12 partly united sepals. Corolla of 3–12 partly united petals. Androecium of as many stamens as there are corolla-lobes or twice as many or more, sometimes accompanied by staminodia. Gynoecium of 3–several united carpels. Fruit capsular or baccate.

Styles or stigmas distinct: flowers mostly monoecious or dioecious.

Fam. 1. EBENACEAE.

Styles and stigmas united: flowers mostly perfect.

Stamens as many as the corolla-lobes, at least in our representatives.

Fam. 2. SAPOTACEAE.

Stamens twice as many as the corolla-lobes or more.

Fam. 3. SYMPLOCACEAE.

Stamens in several series.

Fam. 4. STYRACACEAE.

Stamens in 1 series.

## FAMILY 1. EBENACEAE—EBONY FAMILY

Shrubs or trees. Leaves mostly alternate: blades entire. Flowers solitary or in cymes. Calyx of 3–7 partly united sepals, persistent, accrescent. Corolla of 3–7 partially united petals, often urceolate. Androecium of 3 or 4 times as many stamens as there are corolla-lobes. Gynoecium of 3–several united carpels. Fruit a berry or sometimes capsular.—Six genera and about 275 species, mostly of tropical regions.

1. **DIOSPYROS** L. Shrubs or trees. Leaves scattered: blades entire. Calyx 3–7 lobed. Corolla urceolate, white. Stamens with pubescent filaments: anthers opening lengthwise. Berry spheroidal or elongate. Seeds oblique.—About 160 species, mostly Asiatic.—PERSIMMONS. DATE-PLUMS. SIMMONS. POSSUMWOODS.—Spr.

Larger anthers slender-subulate, 6–7 mm. long: seeds much longer than wide.

1. *D. virginiana*.

Larger anthers stout-subulate, 4–5 mm. long: seeds slightly longer than wide.

2. *D. Mosieri*.

1. ***D. virginiana*** L. Tree becoming 35 m. tall, with dark furrowed bark, or sometimes a shrub: leaf-blades ovate, oval, or elliptic, 8–20 cm. long, acute or acuminate, glabrous or sometimes pubescent, especially beneath: staminate flower with lanceolate or triangular-lanceolate calyx-lobes and a corolla 9–11 mm. long: berry subglobose, varying to depressed or elongate, 3–4 cm. in diameter, thin-skinned: seed flat, elliptic.—Woods, fields, road-sides, oak-ridges, and hammocks, various provinces, Fla. to Tex., Ia., and Conn.—The dark-brown or nearly black heart-wood is used for various tools and utensils. The fruit is edible when ripe.

2. ***D. Mosieri*** Small. Tree nearly similar to that of *D. virginiana*, but usually smaller, or a shrub: staminate flower with ovate or deltoid-ovate calyx-lobes and a corolla 6–8 mm. long: berry depressed

globose, 2.5–3.5 cm. in diameter, thick-skinned: seed turgid, oval and somewhat rhombic.—Hammocks and pinelands, pen. Fla.

## FAMILY 2. SAPOTACEAE — SAPODILLA FAMILY

Shrubs or trees, with milky sap, sometimes thorny. Leaves mostly alternate; blades entire. Flowers perfect or rarely polygamous, clustered. Calyx of 4–12 slightly united sepals. Corolla of 4–12 partially united petals, with or without appendages at the sinuses of the lobes. Androeium of usually as many stamens as there are corolla-lobes, commonly accompanied by staminodia. Gynoeceium of several united carpels. Fruit a several-celled berry, or by suppression 1-celled.—About 35 genera and 425 species, most abundant in the tropics.

Corolla-lobes without dorsal appendages.

Staminodia wanting.

Staminodia present.

Corolla-lobes with dorsal appendages.

Tribe I. CHRYSOPHYLLEAE.

Tribe II. SIDEROXYLEAE.

Tribe III. MIMUSOPEAE.

### I. CHRYSOPHYLLEAE

Shrubs or trees with leaves green above and copiously pubescent with golden, copper-colored or silvery hairs beneath.

#### 1. CHRYSOPHYLLUM.

### II. SIDEROXYLEAE

Ovary 10–12-celled: staminodia broad, petal-like.

#### 2. SAPOTA.

Ovary 2–5-celled.

Corolla-lobes entire: staminodia scale-like or filament-like.

Seeds with endosperm: staminodia scale-like.

Seeds without endosperm: staminodia filament-like.

Corolla-lobes with a large median lobe and 2 smaller lateral lobes: staminodia petal-like.

#### 3. SIDEROXYLON.

#### 4. LUCUMA.

Ovary glabrous: endosperm copious.

#### 5. DIPHOLIS.

Ovary pubescent: endosperm wanting or scant.

#### 6. BUMELIA.

### III. MIMUSOPEAE

Shrubs or trees with broad many-veined leaf-blades: the young fruits conspicuously tipped with the style.

#### 7. MIMUSOPS.

**1. CHRYSOPHYLLUM L.** Shrubs or trees. Leaf-blades commonly lustrous-pubescent beneath. Calyx-lobes mostly 5. Corolla, like the calyx, often pubescent: lobes mostly 5, entire. Anthers emarginate and apiculate. Style wanting: stigma lobed.—More than 60 species, mostly tropical American.

**1. C. olivaeforme L.** Evergreen shrub, or tree becoming 10 m. tall, the twigs pubescent: leaf-blades coriaceous, elliptic or oval, 3–10 cm. long, shining above, lustrous-pubescent beneath: calyx-lobes suborbicular, 1.5 mm. long: corolla white, about 5 mm. wide; lobes suborbicular: berry oval, about 2 cm. long, dark-purple. [*C. monopyrenum* Sw.]—(SATINLEAF.)—Hammocks, S pen. Fla.; pinelands and hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—All year.—The light-brown, hard, and close-grained heart-wood is used locally in cabinet-work.

**2. SAPOTA Mill.** Trees. Leaf-blades glabrous. Calyx-lobes 6, or rarely 5, pubescent. Corolla glabrous: lobes 6, or rarely 5, toothed. Anthers blunt.

Staminodia nearly as long as the corolla-lobes. Style elongate: stigma minute. Berry spheroidal, rough.—One species.

1. *S. Achras* Mill. Tree with rusty-tomentose twigs: leaves and flowers approximately at the ends of the branchlets; blades elliptic, varying to broadest above or below the middle, 5–12 cm. long: pedicels rusty-tomentose, about as long as the petioles: calyx-lobes 8–10 mm. long: corolla white, 8–10 mm. long; lobes about  $\frac{1}{2}$  as long as the tube: berry 4–8 cm. in diameter.—(SAPODILLA. DILLY.)—Hammocks, old fields, and cult. grounds, Everglade Keys, Fla. and Florida Keys.—Nat. of W. I., and cult.—(Mex., C. A., S. A.)—All year.

3. *SIDEROXYLON* [Dill.] L. Shrubs or trees. Leaf-blades not lustrous-pubescent. Calyx-lobes 5 or 6. Corolla glabrous: lobes 5 or 6, entire. Anthers notched. Staminodia much shorter than the corolla-lobes. Style columnar: stigma truncate.—About 75 species, of warm and tropical regions.

1. *S. foetidissimum* Jacq. Evergreen tree becoming 25 m. tall: leaf-blades thin-coriaceous, elliptic to oval or rarely ovate, 4–15 cm. long, glabrous at maturity: calyx-lobes suborbicular, about 2 mm. long: corolla light-yellow, 6–7 mm. wide; lobes elliptic to ovate-elliptic: staminodia lanceolate: berry oval or globose, 2–2.5 cm. long, yellow. [*S. mastichodendron* Jacq.]—(MASTIC. WILD-OLIVE.)—Hammocks, S pen. Fla. and the Keys.—(W. I.)—Spr.-sum. or all year.—The orange-colored, heavy, and strong heart-wood is used locally for cabinet-work and boat-building.

4. *LUCUMA* Juss. Trees. Leaf-blades more or less elongate, usually broadened upward. Calyx-lobes 5, in 1 or 2 series. Corolla white or pale: lobes 5, entire or nearly so. Staminodia slender, shorter than the corolla-lobes. Ovary 5-celled, or sometimes 4–6-celled: style columnar: stigma slightly dilated. Berry globular, or slightly elongate, smooth.—Fifty species or more, mostly of tropical America.

1. *L. nervosa* A. DC. Leaf-blades elliptic, 10–20 cm. long, acute or acutish: calyx-lobes 5, the inner ones rounded at the apex: corolla 7–9 mm. long; lobes ovate: staminodia subulate: berry globose-ovoid, 5–7 cm. long, smooth, usually 2- or 3-seeded.—(EGG-FRUIT.)—Hammocks, Florida Keys. Nat. of S. A. and cult.—(W. I.)—The name egg-fruit refers to the resemblance of the flesh of the fruit to the yolk of a hard-boiled egg.

5. **DIPHOLIS** A. DC. Shrubs or small trees. Leaf-blades mostly glabrous. Calyx-lobes 5, pubescent. Corolla-lobes 5, each 3-lobed, shorter than the tube. Staminodia petaloid. Endosperm copious.—About 10 species, West Indian.

1. **D. salicifolia** (L.) A. DC. Evergreen shrub, or tree becoming 16 m. tall: leaf-blades elliptic or elliptic-oblongate, 5–12 cm. long: calyx-lobes ovate to elliptic, 1.5 mm. long: corolla white, 4 mm. wide; lobes elliptic or oval: staminodia ovate to ovate-lanceolate, lacinate-toothed: berry oval or subglobose, about 8 mm. in diameter, black.—(BUSTIC. CASSADA.)—Hammocks and pinelands, Everglade Keys, Fla., and Florida Keys.—(W. I., Mex.)—All year.—Flowers very fragrant.—The red or dark-brown, very heavy heart-wood is used in cabinet-work.

6. **BUMELIA** Sw. Shrubs or trees, usually with thorny branches. Leaf-blades often pubescent beneath. Calyx-lobes 5. Corolla white: lobes 5, each 3-lobed, the middle lobe suborbicular, longer than the tube. Staminodia petaloid. Endosperm wanting or very scant.—About 35 species, American.—BUCKTHORNS.

Leaf-blades glabrous, or merely with scattered hairs or slight cobwebby beneath.

Fruit ellipsoid-cylindric.

Fruit subglobose or oval.

Leaf-blades of an obovate or spatulate type, mainly broadest above the middle.

Twigs copiously pubescent with deep-red hairs.

Twigs glabrous or soon becoming so.

Fruit less than 8 mm. long.

Corolla-lobes about 1.5 mm. long: leaf-blades blunt: fruit 5 mm. long.

Corolla-lobes about 2 mm. long: leaf-blades retuse: fruit 6–7 mm. long.

Fruit over 9 mm. long.

Leaf-blades of an elliptic type broadest at the middle.

Leaf-blades manifestly or copiously pubescent beneath.

Pubescence woolly, not at all lustrous.

Pubescence lustrous, white, becoming tawny or coppery.

Pedicle longer than the berry, slender: calyx-lobes of a suborbicular type.

Pedicle shorter than the berry, stout: calyx-lobes of an ovate type.

1. *B. angustifolia*.

2. *B. rufotomentosa*.

3. *B. microcarpa*.

4. *B. reclinata*.

5. *B. megacocca*.

6. *B. lycioides*.

7. *B. lanuginosa*.

8. *B. tenax*.

9. *B. lacuum*.

1. **B. angustifolia** Nutt. Evergreen shrub, or tree becoming 8 m. tall, the twigs glabrous: leaves relatively few and not crowded; blades oblanceolate to oblanceolate-spatulate, 2–4 cm. long, smooth and glabrous: calyx-lobes ovate, 2 mm. long: corolla about 4 mm. wide; lateral divisions of the lobes narrowly lanceolate, irregularly toothed: staminodia 2.5 mm. long, lacerate: berry 17–20 mm. long.—(SAFFRON-PLUM. ANTS-WOOD. DOWNWARD-PLUM.)—Coastal hammocks, S pen. Fla., hammocks, Everglade Keys, Fla., and Florida Keys.—(W. I.)—All year.—The light-brown, hard, heart-wood is used for cabinet-work. The flowers are fragrant.

2. **B. rufotomentosa** Small. Evergreen shrub, the twigs red-tomentose: leaf-blades

obovate or oval, 1.5–2 cm. long, reticulate and sparingly pubescent beneath with red hairs: calyx-lobes suborbicular, nearly 1.5 mm. long: corolla about 3 mm. wide: lateral divisions of the lobes ovate or ovate-lanceolate, acutish; staminodia slightly over 1 mm. long: berry about 5 mm. in diameter.—Pine-lands, pen. Fla.—Spr.—sum.

3. *B. microcarpa* Small. Evergreen shrub, the twigs becoming glabrous: leaf-blades spatulate, oblanceolate, or rarely oblong-obovate, 1–3.5 cm. long, cobwebby pubescent beneath: calyx-lobes suborbicular, about 1.5 mm. long: corolla about 2.5 mm. wide; lateral divisions of the lobes ovate-lanceolate, almost 1 mm. long: staminodia 1.5 mm. long, erose: berry subglobose, 5 mm. in diameter.—Sandy woods, pen. Fla.—Spr.—sum.

4. *B. reclinata* Vent. Evergreen erect, diffuse, or depressed, shrub, the twigs glabrous: leaf-blades thinnish, oblanceolate, varying to spatulate, obovate, or ovate, 2–5 cm. long, somewhat reticulate and glabrous beneath: calyx-lobes broadly ovate or orbicular-ovate, 1.8 mm. long: corolla about 4 mm. wide; lateral divisions of the lobes broadly lanceolate, fully 1.5 cm. long: staminodia ovate, 2 mm. long, erose: berry oval, 6–7 mm. long.—Pinelands, hammocks, and sandhills, Coastal Plain, Fla. to La. and Ga.—Spr.—sum. or all year S.

5. *B. megacocca* Small. Evergreen shrub, the twigs glabrous: leaf-blades thick, obovate to elliptic-oblanceolate, 1–3.5 cm. long, reticulate and glabrous beneath: flowers not seen: berry globose to broadly oval, 11–13 mm. long.—Sandy woods, pen. Fla.—Spr.—sum.

6. *B. lycioides* (L.) Gaertn. Deciduous-leaved or partly evergreen shrub or small tree, the twigs glabrous: leaf-blades elliptic or rarely oblanceolate, 4–12 cm. long, dull and prominently reticulate on both sides: calyx-lobes oval or orbicular-ovate, 2 mm. long: corolla about 5 mm. wide; lateral divisions of the lobes lanceolate or broadly lanceolate, 1.5 mm. long, entire: staminodia ovate, 2–2.5 mm. long, entire: berry oval, fully 10 mm. long.—(BUCKTHORN. MOCK-ORANGE. IRONWOOD. SHITTIMWOOD.)—Rich open woods and riverbanks, various provinces, rarely Blue Ridge, Fla. to Tex., Ark., Ill., and S. Va.—Spr.—The yellow or light-brown heart-wood is close-grained, heavy, and hard.

7. *B. lanuginosa* (Michx.) Pers. Evergreen (or deciduous-leaved northward) shrub, or tree becoming 20 m. tall, the twigs dull-tomentose: leaf-blades elliptic-oblanceolate, elliptic-obovate, or elliptic, 3–8 cm. long, dull-tomentose beneath: calyx-lobes suborbicular or orbicular-ovate, about 3 mm. long: corolla about 5 mm. wide; lateral divisions of the lobes lanceolate, fully 1.5 mm. long: undulate: staminodia ovate, 2 mm. long, acute or acutish: berry oval or obovoid-ellipsoid, 10–15 mm. long.—(GUM-ELASTIC. BLACK-HAW. SHITTIMWOOD.)—Rocky, gravelly, and sandy woods, Coastal Plain and occasionally other provinces, Fla., to Tex., Kans., Ill., and Ga.—Sum.—The yellow or light-brown heart-wood is close-grained, but rather soft.

8. *B. tenax* (L.) Willd. Evergreen (or deciduous-leaved northward) shrub, or tree becoming 9 m. tall, the twigs lustrous-silky, the hairs white, becoming tawny or copper-colored: leaf-blades oblanceolate, obovate-spatulate, or obovate, 2–7 cm. long, lustrous-silky beneath: calyx-lobes suborbicular to orbicular-ovate, about 2 mm. long at maturity: corolla about 5 mm. wide; lateral divisions of the lobes ovate or ovate, fully 1.5 mm. long, undulate: staminodia ovate-deltoid, 2 mm. long, obtuse: berry obovoid or ellipsoid-obovoid, 11–14 mm. long.—(TOUGH-BUCKTHORN. IRONWOOD. BLACK-HAW.)—Sandy woods and hammocks, Coastal Plain, Fla. to N. C.—Spr.—The light-brown and white-streaked heart-wood is hard and close-grained.

9. *B. lacuum* Small. Evergreen shrub, 0.5–3 m. tall, the twigs copper-colored or dark-tawny: leaf-blades cuneate to spatulate, 1–2.5 cm. long, or larger on

shoots, lustrous-silky beneath, often becoming brown: calyx-lobes elliptic-ovate to ovate, about 2 mm. long at maturity: corolla about 4 mm. wide; lateral divisions of each lobe lanceolate, about 1.5 mm. long, toothed at the apex: staminodia ovate, about 1.5 mm. long, obtuse: berry oval, 8–10 mm. long.—(SANDHILL-BUCKTHORN.)—Sandhills, usually in scrub, C. pen. Fla.—Spr.

**7. MIMUSOPS L.** Shrubs or trees. Leaf-blades leathery, finely many-veined. Calyx-lobes 6 or 8, the outer ones valvate. Corolla with dorsal appendages; lobes 6 or 8, each with 2 very small lateral lobes. Staminodia petaloid.—About 40 species, mostly of tropical regions.

**1. M. emarginata (L.) Britton.** Evergreen shrub or small tree: leaves clustered at the ends of the branchlets; blades elliptic, 3–10 cm. long: calyx, like the pedicels, red-tomentose; lobes lanceolate to ovate-lanceolate: corolla light-yellow, 1.5–2 cm. wide: staminodia triangular: berry spheroidal, nearly 3 cm. thick. [*M. Sieberi* A. DC.]—(WILD-DILLY. WILD-SAPODILLA.)—Hammocks, Florida Keys.—(*W. I.*)—Wint.-spr. The dark-brown heart-wood is close-grained.

### FAMILY 3. SYMPLOCACEAE—SWEETLEAF FAMILY

Shrubs or trees, the hairs, when present, simple. Leaves alternate: blades usually leathery, entire or toothed. Flowers polygamo-dioecious or perfect, in close or open clusters. Calyx of 5 partly united sepals. Corolla of 5 more or less united petals. Androecium of numerous stamens in several series, partly adnate to the corolla-tube. Gynoecium of 2–5 carpels, the ovary superior. Fruit baccate or drupaceous.—Consists of the following genus and 200 species, most abundant in South America.

**1. SYMPLOCOS Jacq.** Leaves often persistent: blades thick. Inflorescence congested or open. Calyx often persistent. Corolla deciduous, yellow or yellowish. Stamens conspicuous. Style columnar. Fruits, often crowned with the calyx, drupe-like or nut-like.

**1. S. tinctoria (L.) L'Her.** Evergreen or partly evergreen shrub or small tree: leaf-blades elliptic or elliptic-oblongate, 4–15 cm. long, undulate or shallowly toothed, tomentose beneath: flowers densely clustered: calyx 2–2.5 mm. long; lobes shorter than the tube: corolla yellowish; lobes obovate or obovate-spatulate, 6–8 mm. long: stamens exserted: drupe 10–14 mm. long.—(SWEETLEAF. HORSE-SUGAR. WILD-LAUREL. YELLOW-WOOD.)—Hammocks, bluffs, cliffs, and rock outcrops, Coastal Plain to Blue Ridge, Fla. to La., Ark., and Del.—Spr.—The brown or red heart-wood is close-grained, but light and soft. The sweet leaves are eaten by horses and cattle, and, like the bark, yield a yellow dye.—Further study may show the coastal and mountain plants to represent two species instead of one.

## FAMILY 4. STYRACACEAE — STYRAX FAMILY

Shrubs or trees, the hairs when present branched or scurfy. Leaves alternate: blades entire or shallowly toothed. Flowers perfect, in racemes, panicles, cymes, or clusters. Calyx of 5, or 4-8, partly united sepals. Corolla of 5, or 4-8, distinct or partly united petals. Androecium of 8-16 stamens in one series, partly adnate to the corolla. Gynoecium of 2-5 carpels, the ovary sometimes inferior. Fruit drupaceous or capsular.—Seven genera and about 75 species, mostly of tropical regions, but most abundant in South America.

Ovary inferior: fruits nut-like, elongate, winged.  
Ovary superior: fruits drupaceous, subglobose.

1. HALEZIA.  
2. STYRAX.

1. **HALESIA** Ellis. Shrubs or trees. Leaves with thinnish blades, deciduous. Inflorescence not leafy-bracted. Calyx with relatively large lobes. Corolla white, with nearly erect lobes. Anthers elliptic. Ovules 4 in each cavity, 1 pair ascending, 1 pair drooping. [*Mohrodendron* Britton].—Three species, as follows.—Spr.—SILVERBELL-TREES. BELL-TREES.

Corolla-lobes shorter than the tube: fruit 4-winged.

Fruit ellipsoid or somewhat obovoid: corolla 1-2.5 cm. long.

Fruit clavate: corolla less than 1 cm. long.

Corolla-lobes longer than the tube: fruit 2-winged.

1. *H. carolina*.  
2. *H. parviflora*.  
3. *H. diptera*.

1. **H. carolina** L. Small tree with a reddish-brown, ridged and scaly bark, or shrub, the winter-buds acute: leaf-blades oval, elliptic, or obovate, 7-15 cm. long, or longer on shoots, serrate: calyx 5-6 mm. long; corolla 15-20 mm. long: filaments and style glabrous: fruit ellipsoid to ellipsoid-obovoid, 3.5-4.5 cm. long, 4-winged, short-beaked. [*H. tetraptera* L. *M. carolinum* Britton]—(WILD-OLIVE TREE. OPOS-SUM-WOOD. RATTLEBOX. CALICOWOOD. TISSWOOD.)—Woods and stream-banks, various provinces, Fla. to Tex., Ill., and S W Va.—Spr.—The plant of the Blue Ridge and the Appalachian Highlands, with usually larger corollas, has been described as *H. monticola* (Rehder) Sarg.—The light-brown heart-wood is close-grained, but light and soft.

2. **H. parviflora** Michx. Small tree with dark-brown or nearly black bark, or a shrub, the winter-buds obtuse: leaf-blades elliptic, elliptic-ovate, or slightly obovate, 3-7 cm. long, finely serrate: calyx 2.5-3 mm. long, pubescent: corolla 10-12 mm. long: fruit clavate, mostly 1.5-3 cm. long, narrowly winged. [*M. parviflorum* Britton]—Woods and hillsides, Coastal Plain and adj. provinces, N Fla. to Miss., Okla., and S Ga.—Early spr.

3. **H. diptera** Ellis. Small tree with brown, fissured and scaly bark, the winter-buds obtuse, or a shrub: leaf-blades oval, elliptic, or obovate, or sometimes ovate, 4-15 cm. long, rather coarsely toothed: calyx 3-4 mm. long, pubescent: corolla about 2.5 cm. long, copiously pubescent without: filaments and style pubescent: fruit narrowly ellipsoid, 4-5 cm. long, 2-winged, scarcely beaked. [*M. dipterum* Britton].—(SNOWDROP-TREE. COW-LICKS.)—Hammocks and stream-banks, Coastal Plain and adj. provinces, N Fla. to Tex., Ark., and S. C.—Spr.—The wood is similar to that of *H. carolina*.

2. **STYRAX** [Tourn.] L. Shrubs or trees. Leaves with thickish blades, but deciduous. Inflorescence leafy-bracted. Calyx with minute lobes. Corolla white, with recurved petals or lobes. Anthers linear. Ovules several, ascending. —About 75 species, American and Eurasian. —Spr. —STORAXES.

Corolla-lobes valvate in the bud.

Corolla-lobes manifestly imbricate or convolute in the bud.

Bracts of the inflorescence mostly leaf-like: leaf-blades slightly pubescent beneath.

Bracts of the inflorescence only leaf-like at the base of the panicle or raceme: leaf-blades densely pubescent beneath.

1. *S. americana*.

2. *S. pulverulenta*.

3. *S. grandifolia*.

1. *S. americana* Lam. Shrub with sparingly stellate twigs: leaf-blades oval or elliptic, varying to ovate or obovate, 2–10 cm. long, entire or distinctly and shallowly toothed: pedicels glabrous or nearly so: calyx much shorter than the pedicel: corolla-lobes elliptic or lanceolate-elliptic, acute: drupe 6–8 mm. in diameter. —Swamps and stream-banks, Coastal Plain and adj. provinces, Fla. to La., Ill., and S Va. —The flowers are fragrant.

2. *S. pulverulenta* Michx. Shrub with densely stellate twigs: leaf-blades ovate, oval, or obovate, 2–8 cm. long, sharply serrate or undulate: pedicels canescent or hoary: calyx about as long as the pedicel: corolla-lobes elliptic or elliptic-lanceolate, rather obtuse: drupe 7–9 mm. in diameter. —Wet pinelands about swamps and streams, Coastal Plain, Fla. to Tex., Ark., and S Va.

3. *S. grandifolia* Ait. Shrub or small tree, with densely stellate twigs: leaf-blades ovate, oval, or sometimes elliptic, 9–20 cm. long, coarsely toothed or nearly entire: pedicels canescent: corolla-lobes elliptic: drupes 8–10 mm. in diameter. —Woods, sandy river-banks, and hammocks, Coastal Plain and adj. provinces, Fla. to La. and S Va.

#### ORDER OLEALES—OLEAL ORDER

Shrubs, trees, undershrubs, or partially herbaceous plants. Leaves opposite, or rarely alternate or whorled: blades simple or compound. Flowers perfect, polygamous, or dioecious. Calyx of 4 or more partially united sepals, or wanting. Corolla of 2–6 distinct or partially united petals, or wanting. Androecium of 2–4 stamens partially adnate to the corolla when it is present. Gynoecium of 2 united carpels, the ovary superior. Fruit a capsule, a samara, or a berry, usually 1-celled by suppression.

#### FAMILY 1. OLEACEAE — OLIVE FAMILY

Woody or partially woody plants with erect or climbing stems. Leaves predominantly opposite: blades simple and entire or toothed, or pinnately compound. —About 22 genera and 525 species, widely distributed in temperate and tropical regions.

Shrubs or trees: fruits not didymous.

Fruit dry, an indehiscent or dehiscent capsule.

Fruit a loculicidal capsule: leaf-blades simple.

Fruit indehiscent, a samara: leaf-blades pinnate.

Fruit fleshy, a drupe or a berry.

Woody vines, with compound leaf-blades: fruits didymous.

Tribe I. SYRINGEAE.

Tribe II. FRAXINEAE.

Tribe III. OLEAE.

Tribe IV. JASMINEAE.

#### I. SYRINGEAE

Shrubs: flowers conspicuous, numerous in ovoid or pyramidal thyrsoid panicles.

1. SYRINGA.

#### II. FRAXINEAE

Shrubs or trees: flowers mostly inconspicuous, apetalous, in dense racemes or panicles from the axils of last year's leaves.

2. FRAXINUS.

#### III. OLEAE

Flowers apetalous or sometimes with 1 or 2 small petals, mainly polygamo-dioecious: styles slender.

3. FORESTIERA.

Flowers with a corolla, perfect or polygamous: styles short or stout.

Corolla rotate, with elongate strap-like nearly distinct petals: leaves deciduous.

4. CHIONANTHUS.

Corolla funnelform or salverform, with short lobes: leaves mostly persistent.

Corolla funnelform, white; lobes induplicate-valvate.

5. LIGUSTRUM.

Corolla salverform, greenish; lobes imbricate.

6. AMAROLEA.

#### IV. JASMINEAE

Leaf-blades pinnate, sometimes 1-foliolate: calyx-lobes and corolla-lobes 5 or more.

7. JASMINUM.

1. **SYRINGA** L. Shrubs. Leaves opposite: blades broad, entire. Flowers in terminal panicles. Calyx-lobes broad, shorter than the tube. Corolla white or purple: tube longer than the lobes. Stigma 2-lobed. Capsule longer than wide.—Twelve species, Eurasian.

1. **S. vulgaris** L. Stems commonly 2-3 m. tall, usually clustered: leaf-blades ovate, 4-10 cm. long, acuminate: panicles 1-3 dm. long: calyx 2-2.5 mm. long; lobes ovate or triangular: corolla 9-11 mm. long; lobes ovate to obovate: capsule ellipsoid, 14-16 mm. long.—(LILAC. COMMON-LILAC.)—Waste-places, thickets, and gardens, various provinces, E U. S. Nat. of Eu. and cult.—Spr.

2. **FRAXINUS** [Tourn.] L. Shrubs or trees. Leaves opposite: blades unequally pinnate. Flowers polygamous, dioecious, or rarely perfect, in clusters or panicles. Calyx unequally 4-lobed or obsolete. Corolla greenish, of 2-4 petals, or wanting. Stamens 2 or rarely 3 or 4. Stigma 2-lobed. Samara winged at the tip or all around.—About 50 species, mostly of the north temperate zone.—Spr.—ASHES.

Body of the samara flat, the wing extending to its base or around it.

Leaflets 7-11: twigs 4-sided: samara rounded or obtuse at the base.

1. *F. quadrangulata*.

Leaflets 5-7: twigs terete: samara narrowed or acute at the base.

Samara spatulate or elliptic-spatulate.

2. *F. pauciflora*.

Samara elliptic to ovate or obovate.

3. *F. caroliniana*.

Body of the samara terete or slightly compressed, the wing terminal or slightly decurrent.

Wing of the samara decurrent on the sides of the body.

Samara-wing linear, sometimes elongate-linear.

Samara-wing spatulate to elliptic.

Samara-body terete.

Body of the samara narrow.

Samara broadly spatulate: blades of the leaflets thick, entire.

Samara narrowly linear: blades of the leaflets thin, serrate.

Body of the samara stout, ellipsoid.

Samara-body compressed.

Wing of the samara terminal or nearly so.

Twigs and leaves glabrous or nearly so.

Twigs and leaves densely pubescent.

4. *F. Darlingtonii*.

5. *F. Michauxii*.

6. *F. pennsylvanica*.

7. *F. Smallii*.

8. *F. profunda*.

9. *F. americana*.

10. *F. biltmoreana*.

1. *F. quadrangulata* Michx. Tree, rarely becoming 36 m. tall, the twigs glabrous: leaflets 7-11; blades of the lateral ones lanceolate, elliptic, or ovate, 5-15 cm. long, serrate, short-petioluled: samaras 3-4 cm. long, the wing linear-elliptic or elliptic-cuneate.—(BLUE-ASH.)—Rich woods, often in calcareous soil, various provinces, rarely Coastal Plain, Ala. to Miss., Ark., Minn., Ont., and Ohio.—The light-yellow and brown-streaked heart-wood is used in construction and wagon-building. The inner bark yields a blue dye.

2. *F. pauciflora* Nutt. Tree becoming 10 m. tall or shrub, the twigs glabrous: leaflets 5-7; blades of the lateral ones lanceolate, elliptic, or some of them ovate, 4-15 cm. long, undulate or repand: samaras 4-6 cm. long, the wing elliptic to spatulate, longitudinally veined.—(SWAMP-ASH.)—Swamps, Coastal Plain, Fla. to La., and Ga.—The wood is nearly similar to that of the next following species.

3. *F. caroliniana* Mill. Tree sometimes 12 m. tall or shrub, the twigs often pubescent: leaflets 5-9, usually 5-7; blades of the lateral ones elliptic-lanceolate, 4-12 cm. long, shallowly serrate or nearly entire: samaras 4-5 cm. long, the wings elliptic, or nearly so, varying to ovate or obovate, pinnately veined.—(WATER-ASH. POP-ASH.)—Swamps, and low grounds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and S Va.—The white or yellow-tinged heart-wood is close-grained but soft and weak.

4. *F. Darlingtonii* Britton. Tree up to 20 m. tall, the twigs glabrous, or pubescent in more northern forms: leaflets 5-7; blades thin, lanceolate to oblong-lanceolate or ovate-elliptic, 11 cm. long or less, usually acuminate, entire, bright green, often pubescent beneath: samaras 5-7.5 cm. long, each with a narrowly elongate-linear wing which is decurrent on the upper part of the slender fruit-body.—Swamps, woods, and stream-banks, various provinces, Ala. to La., Kans., Ill., Pa., N. Y., Mass., and N. C.

5. *F. Michauxii* Britton. Tree up to 12 m. tall, the twigs velvety or glabrous: leaflets 5-7; blades thick, ovate, oval, ovate-lanceolate, or elliptic-lanceolate, 15 cm. long or less, usually acuminate, entire, deep-green above, paler and pubescent beneath: samaras 3.5-5 cm. long, each with a spatulate, usually broadly spatulate wing which is decurrent on the stoutish fruit-body.—Swamps, meadows, and stream-banks, various provinces, La. to Md., N. Y., and N. J.

6. *F. pennsylvanica* Marsh. Tree sometimes 20 m. tall, the twigs velvety pubescent (or glabrous in *F. pennsylvanica lanceolata*): leaflets 5-7; blades of the lateral ones lanceolate or sometimes elliptic, 5-20 cm. long, entire, or ser-

rate, especially near the apex: samaras 3.5–6 cm. long, the wing spatulate, decurrent to the middle of the linear body or near it.—(RED-ASH. GREEN-ASH.)—Low woods and stream-banks, various provinces, N. C. to Ala., Kans., S. Dak., and N. B.; reported also from Miss.—The light-brown, coarse-grained heartwood, hard and heavy, is used in a variety of ways.

7. **F. Smallii** Britton. Tree becoming 16 m. tall, the twigs glabrous: leaflets 5–7; blades thinnish, elliptic-lanceolate, ovate-lanceolate, ovate, or elliptic-ovate, 15 cm. long or less, acuminate, entire or nearly so, bright-green above, pale and more or less pubescent beneath, slender-petioled: samaras 3–5 cm. long, each with an elliptic or linear-elliptic, usually acute wing which is decurrent on the upper half of the stout seed-body.—River-banks, bottoms, and swamps, Coastal Plain and adj. provinces, N. Fla., to La., Mo., and N. C.

8. **F. profunda** Bush. Tree sometimes 35 m. tall, the twigs pubescent: leaflets 7–9; blades of the lateral ones lanceolate-ovate or elliptic, 6–12 cm. long, entire or undulate: samaras 4–5 cm. long, the wing linear-elliptic or elliptic-spatulate.—(PUMPKIN-ASH.)—Swamps and river-banks, various provinces N of Coastal Plain, Ga. to Ala., Mo., and W. N. Y.—A plant closely related to *F. profunda*, but with thinner and relatively broader leaflets and smaller fruits (3–3.5 cm.) has been described as *F. catawbiensis* Ashe. It occurs in the Piedmont of Ga. and the Carolinas.

9. **F. americana** L. Tree becoming 40 m. tall, the twigs glabrous: leaflets 5–9; blades of the lateral ones lanceolate or elliptic, 5–15 cm. long, relatively thin, entire or shallowly toothed: samaras 2.5–3.5 cm. long, (less than 2 cm. long and seedless in *F. americana Curtissii*), the wing linear-spatulate or elliptic-spatulate, terminal or nearly so on the ellipsoid-cylindric body.—(WHITE-ASH.)—Rich or moist woods, various provinces, Fla. to Tex., Minn., and N. S.—The brown heartwood, close-grained, tough and strong, is used in a great variety of ways. Our most valuable ash.

10. **F. biltmoreana** Beadle. Tree becoming 18 m. tall, the twigs densely soft-pubescent: leaflets 7–9; blades of the lateral ones ovate to elliptic-lanceolate, 7–14 cm. long, relatively thick, entire or obscurely toothed: samaras 3.5–5 cm. long, the wing linear or nearly so, terminal or nearly so on the stout elliptic body.—Woods on river-banks, Blue Ridge to Appalachian Plateau, Ga. to Ala. and Pa.

3. **FORESTIERA** Poir. Shrubs or trees. Leaves opposite: blades simple. Flowers mostly polygamo-dioecious, in lateral clusters, green or whitish. Calyx minute, 4–6-lobed, or obsolete. Corolla wanting, or rarely of 1–2 deciduous petals. Stamens 2–4. Stigma 2-lobed. Drupe ellipsoid to globular. [*Adelia* P. Br.]—About 15 species, American.

Leaf-blades acuminate at both ends: drupe much longer than thick, narrowly ellipsoid. 1. *F. acuminata*.

Leaf-blades obtuse: drupe as thick as long or slightly longer than thick, globose to oval.

Leaves deciduous; blades toothed, membranous, not punctate. Leaf-blades pubescent on the veins beneath and often with scattered hairs between: pistillate flowers and drupes very short-pedicelled or sessile.

Leaf-blades copiously pubescent beneath: pistillate flowers and drupes markedly pedicelled.

Leaves persistent; blades entire, coriaceous, punctate. Drupe oval or ovoid.

Leaf-blades elliptic or elliptic-spatulate.

Leaf-blades linear, linear-elliptic, or oblanceolate.

Drupe globular.

2. *F. ligustrina*.

3. *F. pubescens*.

4. *F. porulosa*.

5. *F. pinetorum*.

6. *F. globularis*.

1. *F. acuminata* (Michx.) Poir. Tree sometimes 10 m. tall or shrub, the twigs glabrous: leaf-blades 3–10 cm. long, elliptic-oval to ovate-elliptic, slightly serrate: bracts rhombic, 5–6 cm. long: drupe narrowly ellipsoid, 12–15 mm. long; stone tapering to the apex.—(FORESTIERA.)—River-swamps, stream-banks, and ponds, various provinces, Fla. to Tex., Ill., and S. C.—Spr.

2. *F. ligustrina* (Michx.) Poir. Shrub 1–3 m. tall, the twigs usually brown or purplish, glabrous or nearly so: leaf-blades 1–4 cm. long, elliptic oval or approaching obovate, finely serrate: bracts ovate or rhombic, about 2.5 mm. long, eciliate: drupe broadly globose-oval, 7–8 mm. long; stone oval.—Sandy or rocky soil and river-banks, various provinces, Fla. to Tenn. and Ga.—Sum.

3. *F. pubescens* Nutt. Shrub mainly 1–2 m. tall, the twigs yellowish, pubescent: leaf-blades 1–4 cm. long, elliptic-oval or elliptic-obovate, somewhat serrate: bracts obovate, 2–2.5 mm. long, or rarely longer, ciliate: drupe ellipsoid, 6–7 mm. long; stone narrowly ellipsoid.—River-banks, Coastal Plain, Fla. to Tex. and Ark.—Spr.

4. *F. porulosa* (Michx.) Poir. Small tree or shrub 1–3 m. tall, the twigs glabrous or nearly so: leaf-blades 1.5–5 cm. long, elliptic to elliptic-spatulate, mostly 2.5–6 cm. long, entire: bracts oval or sub-orbicular, about 1.5 mm. long, ciliate: drupe ellipsoid, 7–8 mm. long. [*Adelia segregata* (Fl. SE. U. S.)]—(FLORIDA-PRIVET.)—Hammocks and sand-dunes, S Fla.—Spr.

5. *F. pinetorum* Small. Shrub with short rigid, sometimes virgate branches 0.2–1 m. tall, the twigs puberulent, gray: leaf-blades 1–2.5 cm. long, linear-elliptic or oblanceolate, entire, thin-coriaceous: bracts obovate to orbicular-cuneate, 1.5–2 mm. long, ciliate: drupe oval, 5–7 mm. long, equilateral, black: stone ellipsoid.—(WILD-OLIVE.)—Pinelands, S pen. Fla.—Fall–Spr.

6. *F. globularis* Small. Shrub with intricately branched stems, 1–3 m. tall, the twigs pale-gray and striate, glabrous: leaf-blades elliptic or slightly broadened upward, coriaceous-fleshy, mainly 1–2 cm. long, paler beneath than above: flowers few, nearly sessile: bracts oval to suborbicular, 2–2.5 mm. long, ciliate: drupe globular, 7–9 mm. in diameter, blue; stone globose or oval-globose.—Dune-hammocks, E Fla.—Spr.

4. **CHIONANTHUS** L. Shrubs or trees. Leaves opposite, deciduous: blades simple. Flowers perfect or polygamous, in drooping festoon-like panicles. Calyx deeply 4-lobed. Corolla white: lobes narrow, many times longer than the tube. Stamens 2; filaments adnate to the corolla-tube. Stigma notched or 2-lobed. Drupe oval to subglobose.—Two species, American.—FRINGE-TREES. OLD-MAN'S BEARDS. FLOWERING-ASHES. GRANDSIR-GRAYBEARDS.—Spr.

Corolla-lobes 2–3 cm. long: anthers acuminate; drupe 1–1.5 cm. long.

1. *C. virginica*.

Corolla-lobes about 1 cm. long: anthers abruptly blunt-tipped: drupe 2–2.5 cm. long.

2. *C. pygmaea*.

1. *C. virginica* L. Tree up to 10 m. tall or a tall shrub with a taproot: leaf-blades oval to elliptic, varying to obovate, mostly 8–18 cm. long, becoming thick-membranous, rather long-petioled: panicles with persistent bracts which are often 2–4 cm. long: anthers fully 2 mm. long: drupe ellipsoid.—Swampy woods, rocky bluffs, and stream-banks, often in acid soil, various provinces, Fla. to Tex., Mo., and N. J.—The light-brown heart-wood is close-grained and hard.

2. *C. pygmaea* Small. Shrub with underground stems, the branches 2–4 dm. tall, simple below, sparingly branched throughout: leaf-blades elliptic or nearly so, 3–9 cm. long, becoming thin-coriaceous, short-petioled: panicles with very small deciduous bracts: anthers less than 2 mm. long: drupe oval.—Scrub, inland sandhills, S end of lake region, Fla.

5. **LIGUSTRUM** [Tourn.] L. Shrubs or trees. Leaves opposite: blades simple, entire. Flowers perfect, in erect panicles. Calyx shallowly 4-lobed or nearly truncate. Corolla white or greenish, funnellform: lobes broad, about as long as the tube or much shorter. Stamens 2: filaments adnate to the corolla-tube. Stigma 2-lobed. Drupe mostly subglobose.—About 35 species, natives of the Old World.

Corolla-lobes as long as the tube or nearly so: anthers oval. Corolla-lobes much shorter than the tube: anthers linear.

1. *L. vulgare*.  
2. *L. ovalifolium*.

1. *L. vulgare* L. Shrub becoming 3 m. tall: leaves tardily deciduous; blades elliptic, elliptic-lanceolate, lanceolate, or individually broadest above the middle, 1–5 cm. long, or rarely larger, obtuse or acutish, slender-petioled: panicles many-flowered, compact: bracts somewhat persistent: calyx-lobes minute, acute: corolla 5–6 mm. long; lobes broadly ovate: anthers less than 2 mm. long: drupes subglobose, 6–8 mm. in diameter, black.—(PRIVET. PRIM.)—Roadsides, old-fields, and thickets, various provinces, N. C. to Tex., Ont. and Me. Nat. of O. W., and cult.—Spr.-sum.

2. *L. ovalifolium* Hassk. Shrub or small tree: leaves very tardily deciduous or evergreen; blades ovate, elliptic or oval, 3–7 cm. long, mostly acute or acutish; stout-petioled: panicle many-flowered, open: bracts caducous: calyx-lobes obsolete: corolla 7–8 mm. long: lobes narrowly ovate: anthers over 2 mm. long: drupes mostly oval to ovoid, 6–8 mm. long, nearly black.—(CALIFORNIA PRIVET.)—Cult. grounds, waste-places, and fence-rows, Coastal Plain, Fla. to Tex. Nat. of Japan, and cult.—Sum.

*Ligustrum sinense* Lour. A shrub differing from *L. vulgare* in the densely pubescent young branches and inflorescence, and with the midrib of the leaves pubescent beneath and the stamens much longer than the corolla-lobes, occurs as an escape in S Ia.

*Ligustrum lucidum* Ait., a shrub or small tree, with large, ovate or ovate-lanceolate leaf-blades, often 6–12 cm. long, large erect panicles of sessile flow-

ers, and drooping clusters of bluish-black fruits, is widely cultivated in southern coastal regions. It is a native of China and Japan, and is occasionally spontaneous about towns where it is grown on the coasts of North Carolina and Louisiana.

**6. AMAROLEA** Small. Shrubs or small trees. Leaves opposite, persistent: blades simple, entire. Flowers polygamous, in small axillary scaly-bracted panicles. Calyx prominently 4-lobed. Corolla funnelform, greenish-white or white: lobes broad, nearly as long as the tube. Stamens 2: filaments partly adnate to the corolla-tube: anthers notched. Stigma capitate. Drupe oval or globose, very bitter.—Only the following 2 species.—Spr.—WILD-OLIVES. DEVIL-WOODS.—Differs from *Osmanthus* by the coralloid inflorescence, the sessile flowers, the introrse anthers, and the capitate stigma.

Drupe oval or ellipsoid, 1 cm. in diameter or less: stone acute at both ends. (See note.)  
Drupe globose, 2-2.5 cm. in diameter: stone acute at the base.

1. *A. americana*.
2. *A. megacarpa*.

1. *A. americana* (L.) Small. Tree becoming 15 m. tall or shrub, the bark pale: leaf-blades narrowly elliptic, varying to oblanceolate or lanceolate, 5-15 cm. long, entire, lustrous above: inflorescence-branches and calyx usually finely pubescent: corolla 3-4 mm. long: drupe 10-15 mm. long, dark-purple; stone ellipsoid, less than 1 cm. in diameter. [*Osmanthus americana* B. & H.]—Hammocks, wooded bluffs, and swamps, Coastal Plain, Fla. to La. and N. C.—The dark-brown heart-wood is close-grained and hard.—*Osmanthus floridana* Chapm. is said to differ from this species in its yellowish-green fruit.—A plant of the coastal region of NE Florida with a small globose drupe, about a centimeter in diameter and a stone scarcely pointed at the base, may represent another species.

2. *A. megacarpa* Small. Shrub or small tree with a trunk-diameter usually less than 1 dm., the bark pale-green: leaf-blades elliptic or slightly broader above the middle, mostly 9-15 cm. long, very coriaceous: drupe globose, 2-2.5 cm. long, dull-purple; stone globose-obovoid, more than 1 cm. in diameter. [*Osmanthus megacarpa* Small.]—Scrub, S end of the lake region, pen. Fla.

**7. JASMINUM** [Tourn.] L. Shrubs or woody vines. Leaf-blades 3-7-foliolate or sometimes 1-foliolate. Flowers mostly in terminal compound cymes. Calyx with 4-9 short or elongate, often narrow, lobes. Corolla salverform, the limb 4-12-lobed. Filaments adnate to the corolla-tube. Fruit didymous.—About 100 species, natives of the Old World.

Leaves with 3 or more leaflets, usually 5-7-foliolate: anthers slender, long-tipped.

1. *J. grandiflorum*.

Leaves reduced to a single leaflet, thus 1-foliolate: anthers stout, short-tipped.

Calyx much less than half the length of the corolla-tube:

corolla-lobes narrowly elliptic, acute or short-acuminate.

2. *J. undulatum*.

Calyx about half the length of the corolla-tube or more:

corolla-lobes oval, ovate, or orbicular, obtuse.

3. *J. Sambac*.

1. *J. grandiflorum* L. Plant partly erect or diffusely reclining, glabrous or nearly so: leaflets mostly 5-7; blades ovate to oval, mucronate, except the

usually ovate-lanceolate or narrowly ovate, acute or acuminate terminal one: calyx 4-8 mm. long; lobes subulate, often unequal: corolla white; tube 17-21 mm. long; lobes mostly elliptic to oval, obtuse.—(ITALIAN-JESSAMINE. CATALONIA-JESSAMINE. ROYAL-JESSAMINE. SPANISH-JESSAMINE.)—Pine-lands, thickets, and waste-places, S pen. Fla. Nat. of E. I., and cult.—(*W. I., Mex., C. A., S. A.*)—All year.

2. *J. undulatum* Ker. Plant climbing, the stems and branches closely fine-pubescent: leaflets 2-8 cm. long; blades ovate to ovate-lanceolate, acute or acuminate at the apex, rounded, truncate, or subcordate at the base: cymes few-several-flowered: calyx-lobes 5 or 6, filiform-subulate, much longer than the tube: corolla white; tube 15-20 mm. long; lobes narrowly elliptic or nearly so, acute or short-acuminate.—Roadsides and thickets, N Fla. Nat. of E. I., and cult.—Sum.-fall.

3. *J. Sambac* (L.) Soland. Plant climbing, the stems and branches finely pubescent: leaflets 4-13 cm. long; blades oval to ovate or elliptic, mostly acute at the apex, obtuse or rounded at the base: cymes few-several-flowered: calyx-lobes 7-many, longer than the tube, very narrowly linear: corolla white; tube 10-15 mm. long; lobes oval, ovate, or orbicular, mostly obtuse.—(ARABIAN-JESSAMINE. NASSAU-JESSAMINE.)—Woods and thickets, S pen. Fla. Nat. of E. I., and cult.—(*W. I.*)—All year.

#### ORDER GENTIANALES — GENTIANAL ORDER

Herbs, shrubs, or trees, sometimes aquatic or humus plants or vines. Leaves mainly opposite: blades simple. Flowers mostly perfect, solitary or in cymes. Calyx of 5 partially united sepals, or fewer. Corolla of 5 partially united petals, or fewer. Androecium of as many stamens as there are corolla-lobes: filaments often partially adnate to the corolla-tube. Gynoecium of 2 more or less united carpels. Fruit capsular, baccate or drupaceous.

Ovary 2-celled: leaves stipulate or with stipular lines.

Fam. 1. SPIGELIACEAE.

Ovary 1-celled: leaves not stipulate.

Corolla-lobes convolute or imbricated in the bud.

Fam. 2. GENTIANACEAE.

Corolla-lobes induplicate-valvate in the bud.

Fam. 3. MENYANTHACEAE.

#### FAMILY 1. SPIGELIACEAE — LOGANIA FAMILY

Herbs, vines, or woody plants. Leaves typically opposite. Flowers in open or compact clusters. Calyx of 4 or 5 partially united sepals. Corolla of 4 or 5 partially united petals. Androecium of 4 or 5 stamens. Gynoecium of 2 united carpels, or rarely more: ovary 2-celled or rarely 4-celled. Fruit capsular and 2-valved, or baccate or drupaceous.—Thirty genera and about 400 species, most abundant in warm and tropical regions.

Woody vines: stigmas 4: corolla yellow.

Tribe I. GELSEMIEAE.

Herbs or erect shrubs: stigma entire or slightly 2-lobed: corolla not yellow, at least without.

II. SPIGELIEAE.

I. GELSEMIEAE

Stem diffusely twining: leaves persistent.

1. GELSEMIUM.

## II. SPIGELIEAE

Corolla-lobes valvate.

Corolla funnelform or salverform: styles permanently united.

Flowers in the forks of leafy branches: style jointed near the middle.

Flowers in terminal spikes or spike-like racemes: style jointed near the base.

Corolla urn-shaped: styles soon distinct.

Corolla-lobes imbricate.

Annual herb: sepals nearly distinct: capsule loculicidal.

Shrubs, or partly woody herbs: sepals chiefly united: capsule septicidal.

2. COELOSTYLIS.

3. SPIGELIA.

4. CYNOCOTONUM.

5. POLYPREMUM.

6. ADENOPLEA.

1. **GELSEMIUM** Juss. Evergreen vines. Flowers dimorphous, in axillary cymes, or solitary. Calyx 5-lobed. Corolla funnelform, straight. Filaments with the free portion much longer than the adnate portion. Stigmas 4. Capsule flattened contrary to the septum, septicidal. Seeds winged.—Three species, the following and 1 Asiatic.—Wint.-spr.—YELLOW-JESSAMINE. EVENING TRUMPET-FLOWER.

Leaf-blades narrowed at the base: calyx-lobes obtuse: anthers elliptic-ovate: capsule short-beaked: seed winged.

Leaf-blades rounded at the base: calyx-lobes acuminate: 1. *G. sempervirens*.

anthers lanceolate: capsule long-beaked: seed wingless.

2. *G. Rankinii*.

1. *G. sempervirens* (L.) Ait. f. Stem and branches often tangled and matted, the flowering shoots reddish-brown: leaf-blades lanceolate to elliptic-lanceolate, 1.5-7 cm. long, entire: pedicels scaly throughout: calyx-lobes 3-4 mm. long, elliptic to ovate-elliptic: bud blunt: corolla deep-yellow, 3-4 cm. long; tube gradually dilated: capsule-body veiny, 19-22 mm. long, the beak 1-1.5 mm. long: seed 8-9 mm. long, the body about as long as the wing.—Hammocks, thickets, bluffs, and swamps, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Va.—Wint.-spr.—The flowers are very fragrant.

2. *G. Rankinii* Small. Plant with the same habit as *G. sempervirens*, the flowering shoots green: leaf-blades lanceolate to ovate, 1.5-7 cm. long, entire: pedicels scaly at the base: calyx-lobes about 4 mm. long, lanceolate: bud acute: corolla deep-yellow, 2.5-3 cm. long; tube abruptly dilated: capsule-body veinless, 10-11 mm. long, the beak 3-4 mm. long: seed 3-4 mm. long.—Swamps and river banks, Coastal Plain, N Fla. to La. and N. C.—Wint.-spr.—The flowers are not fragrant.

2. **COELOSTYLIS** T. & G. Annual erect herbs. Flowers in the forks of leafy branches, or in the leaf axils. Calyx-lobes narrow. Corolla white or whitish, narrowly funnelform, plicate in the bud. Filaments adnate to about the middle of the corolla-tube.—Two species, North American.

1. *C. loganioides* T. & G. Plant 1-3 dm. tall, glabrous: leaf-blades oval to elliptic or lanceolate, 1.5-3.5 cm. long: calyx-lobes narrowly linear, about  $\frac{1}{2}$  as long as the corolla, denticulate: corolla-lobes lanceolate: capsule about 6 mm. wide.—Pinelands, E Fla.

3. **SPIGELIA** L. Erect herbs. Flowers in solitary or clustered spikes or spike-like racemes. Calyx-lobes narrow. Corolla colored, rarely pale, tubular-funnelform, scarcely if at all plicate in the bud. Filaments adnate to above the middle of the corolla-tube or to near the top.—About 35 species, American.

Plant perennial; inflorescence not subtended by a whorl of bracts.

Corolla scarlet without, 4–5 cm. long; anthers exserted.

1. *S. marylandica*.

Corolla purplish without, 1.5–2.5 cm. long; anthers included.

2. *S. gentianoides*.

Plant annual; inflorescence subtended by a whorl of bracts.

3. *S. Anthelmia*.

1. ***S. marylandica*** L. Plant 2–6 dm. tall: leaf-blades ovate to lanceolate, or sometimes elliptic, 3–10 cm. long; calyx-lobes 10–11 mm. long; corolla red without, yellow within; lobes lanceolate: capsule about 9 mm. wide.—(INDIAN-PINK. CAROLINA-PINK. PINK-ROOT. WORM-GRASS.)—Rich woods and hillsides, Fla. to Tex., Ind. and Md. (or N. J.)—Spr.

2. ***S. gentianoides*** Chapm. Plant 2–3 dm. tall: leaf-blades ovate, or sometimes oval-lanceolate near the base of the stem or almost orbicular, 1.5–5 cm. long; calyx-lobes 7–9 mm. long; corolla pink; lobes deltoid or ovate-deltoid.—Dry soil, W Fla.—Spr.

3. ***S. Anthelmia*** L. Plant 1–4 dm. tall: leaf-blades lanceolate, 3–12 cm. long; inflorescence subtended by a whorl of large bracts: calyx-lobes 1.5–2 mm. long; corolla 6–10 mm. long, purplish, often pale: capsule 5–6 mm. wide, tuberculate.—(WEST-INDIAN PINK-ROOT. WORM-GRASS.)—Hammocks and cult. grounds, Florida Keys.—(*W. I., Mex., C. A., S. A.*)

4. **CYNOCOTONUM** J. F. Gmel. Annual (ours) erect herbs. Flowers in terminal cymes, secund. Calyx usually 5-lobed. Corolla white or pink, urceolate, somewhat longer than the calyx. Filaments almost completely adnate to the corolla-tube. Styles united by their tips in anthesis, ultimately distinct. Capsule miter-shaped.—About 5 species, of warm regions.—MITERWORTS.

Leaf-blades narrowed into petiole-like bases; inflorescence lax.

1. *C. Mitreola*.

Leaf-blades sessile; inflorescence dense.

Leaf-blades ovate to orbicular: corolla-lobes ovate.

2. *C. sessilifolium*.

Leaf-blades narrowly elliptic to almost linear: corolla-lobes lanceolate to linear-lanceolate.

3. *C. angustifolium*.

1. ***C. Mitreola*** (L.) Britton. Stem 1–7 dm. tall: leaf-blades thin, elliptic, lanceolate, or ovate, or sometimes narrower, 1.5–8 cm. long, acute or acuminate: corolla-lobes ovate to elliptic-lanceolate: capsule 2–2.5 mm. long.—Damp soil, muddy banks, low pinelands and lime-sinks, Coastal Plain, and rarely adj. provinces, Fla. to Tex., Ark., and S Va.—(*W. I., Mex., C. A., S. A.*)—Sum, or all year S.

2. ***C. sessilifolium*** (Walt.) J. F. Gmel. Stem 1–5 dm. tall: leaf-blades thick, ovate to orbicular, 1–5 cm. long, obtuse or apiculate: corolla-lobes ovate, mainly shorter than the tube: capsule about 4 mm. long.—Pinelands and wet places, Coastal Plain, Fla. to La.—Sum.

3. ***C. angustifolium*** (T. & G.) Small.

Stem 2-6 dm. tall: leaf-blades thick, narrowly elliptic to lanceolate or nearly linear, 2-4 cm. long, obtuse or acutish: corolla-lobes lanceolate or linear-lanceolate, mainly longer than the tube: capsule about 4 mm. long.—Wet places, Coastal Plain, Fla. and S Ga.

**5. POLYPREMUM L.** Annual diffuse herbs. Flowers solitary in the forks of the branches and in the leaf-axils. Calyx-lobes 4 or 5, narrow. Corolla white, campanulate, shorter than the calyx. Filaments adnate to the corolla-tube for about  $\frac{1}{2}$  their length. Styles very short, permanently united. Capsule obovoid or subglobose.—One species.

**1. P. procumbens L.** Stem and branches 1-3 dm. long: leaf-blades narrowly linear to subulate, scabrous-margined: calyx-lobes narrowly lanceolate, about 3 mm. long: corolla-lobes suborbicular, slightly shorter than the tube: capsule about 2 mm. long.—Waste-places, roadsides, fields, and pond-margins, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Pa.—(*W. I., Mex., C. A., S. A.*)—Spr.-fall.

**6. ADENOPIEA Radlk.** Shrubs or partly woody plants. Flowers in lax or dense cymes borne in racemes or panicles. Calyx-lobes 4, shorter than the tube. Corolla trumpet-shaped, curved. Filaments adnate to below the middle of the corolla-tube. Capsule thick, septicidal.—Few species, of tropical regions.

**1. A. Lindleyana (Fort.)** Small. Stem diffusely branched, 1-2 m. tall, the branches angled: leaf-blades ovate to lanceolate, 3-9 cm. long, entire, glabrous: panicles 1-3 dm. long, often partly drooping: calyx about 2.5 mm. long: corolla purplish, violet, or reddish, 12-16 mm. long, the tube curved: capsule 4-5 mm. long. [*Buddleia Lindleyana* Fort.]—Roadsides, cult. grounds, and waste-places, Coastal Plain, Fla. to Tex. and Ga. Nat. of China, and cult.—(*W. I.*)—Sum.-fall.

## FAMILY 2. GENTIANACEAE — GENTIAN FAMILY

Annual or perennial caulescent herbs or rarely shrubs. Leaves typically opposite: blades entire, sometimes connate. Flowers perfect, solitary or variously clustered. Calyx of 2, 4 or 5, or more, partially united sepals, persistent. Corolla of 4 or 5 or more, partially united petals, varying from rotate to tubular. Androecium of as many stamens as there are corolla-lobes, the filaments partially adnate to the corolla-tube. Gynoecium of two united carpels. Fruit a capsule.—Seventy genera and 700 species, most abundant in temperate regions.

Corolla-lobes convolute in the bud: leaves not scale-like.

Tribe I. GENTIANEAE.

Corolla-lobes imbricate in the bud: leaves mere scales.

Tribe II. OBOLARIEAE.

Stigmas 2, distinct: plant green or purple-tinged.

Tribe III. LEIPHAIMEAE.

Stigmas united, dilated: plant white, not green.

## I. GENTIANEAE

Style filiform, mostly deciduous: anthers recurving or twisting at maturity.

Stigmas roundish, much shorter than the style.

Corolla-tube surpassing the calyx.

Corolla-tube much shorter than the calyx.

Stigmas linear or nearly so, about as long as the style.

Flowers pedicelled, when more than one, paniculate: anthers coiled.

Flowers sessile, when more than one, capitate: anthers curved.

Style stout, short or wanting: anthers straight at maturity.

Corolla not furnished with nectariferous structures.

Corolla without plaits in the sinuses of the lobes: calyx without an interior membrane.

Sepals unequal, the inner much broader than the outer and thin-margined: corolla-lobes fimbriate or erose.

Sepals essentially equal, or if unequal the inner narrower than the outer: corolla-lobes entire or merely toothed.

Corolla with plaits in the sinuses of the lobes: calyx with an interior membrane.

Corolla furnished with nectariferous pits, glands, or scales, 1 or 2 for each lobe.

1. CENTAURIUM.

2. EUSTOMA.

3. SABBATIA.

4. LAPITHEA.

5. ANTHOPOGON.

6. GENTIANELLA.

7. DASYSTEPHANA.

8. FRASERA.

## II. OBOLARIEAE

Calyx-lobes 4, narrowed upward: petals slightly united.

Calyx-lobes 2, broadened upward: petals well united.

9. BARTONIA.

10. OBOLARIA.

## III. LEIPHAIMEAE

Humus plant with slender stems and small, colored flowers.

11. LEIPHAIMOS.

1. **CENTAURIUM** Hill. Annual, biennial, or sometimes perennial, relatively small herbs. Flowers in terminal cymes. Calyx-lobes 4 or 5, keeled. Corolla white, or commonly deep-pink or rose-purple, salverform: lobes 4 or 5, shorter than the tube, often strongly involute, acuminate.—About 25 species, widely distributed.

1. **C. pulchellum** (Sw.) Druce. Stem 3–25 cm. tall: blades of the upper leaves elliptic to ovate, 5–20 mm. long, obtuse: calyx 6–8 mm. long: corolla 9–10 mm. long; lobes elliptic-ovate, obtuse: capsule 7.5–8 mm. long. [*Erythraea pulchella* (Sw.) Fries.]—(CENTAURY).—Fields and waste-places, various provinces, Miss. to La., Ill., and N. Y. Nat. of Eu.—(W. I.)—Sum.—fall.

2. **EUSTOMA** Salisb. Annual relatively large herbs. Flowers solitary or in open panicles. Calyx-lobes 5 or 6, narrow. Corolla white, pink, violet, or purple, campanulate-funnelform: lobes 5 or 6, usually erose-denticulate, longer than the tube.—Five species, North American.

1. **E. exaltatum** (L.) Griseb. Stem 1–9 dm. tall: blades of the upper leaves elliptic to elliptic-lanceolate, 1.5–7 cm. long: calyx-lobes 10–12 mm. long: corolla rose-purple; lobes elliptic or oval, 17–20 mm. long: capsule 2–2.5 cm. long.—Pinelands, coastal sand-dunes, and hammocks, pen. Fla. and Florida Keys.—(W. I.)—All year.—Albino forms occur.

3. **SABBATIA** Adans. Annual or biennial, relatively slender herbs. Flowers solitary or in cymes. Calyx-lobes 4–12, narrow. Corolla white, or pink to lilac, or magenta, often with a distinct eye, rotate: lobes entire, longer than the tube.—About 20 species, North American.

Calyx-lobes and corolla-lobes usually 4 or 5.  
Calyx-lobes and corolla-lobes 8–12.

I. ANGULARES.  
II. DODECANDRES.

#### I. ANGULARES

Upper part of the stem with opposite branches.

Stem and branches terete.

Calyx-lobes shorter than the tube, erect: style and stigmas about equal in length.

Calyx-lobes longer than the tube, recurved: style much shorter than the stigmas.

Stem and branches 4-ridged or 4-winged.

Corolla-lobes elliptic to spatulate: upper leaves with narrow blades.

Corolla white.

Leaf-blades rounded at the base.

Leaf-blades truncate and somewhat auricled at the base.

Corolla rose.

Corolla-lobes oval to obovate: upper leaves with broad blades.

Upper part of the stem with alternate branches.

Corolla-lobes of a spatulate or oblanceolate type.

Calyx-lobes foliaceous, mostly broadened upward.

Calyx-lobes not foliaceous, narrowed upward.

Corolla-lobes of an elliptic or oval type.

Calyx-lobes typically about as long as the corolla-lobes: corolla mainly less than 3 cm. broad.

Calyx-lobes typically much shorter than the corolla-lobes: corolla mainly over 3.5 cm. broad.

1. *S. macrophylla*.

2. *S. recurvans*.

3. *S. difformis*.

4. *S. paniculata*.

5. *S. brachiata*.

6. *S. angularis*.

7. *S. calycina*.

8. *S. Elliottii*.

9. *S. campanulata*.

10. *S. grandiflora*.

#### II. DODECANDRES

Corolla-lobes elliptic-spatulate to oblanceolate, less than 25 mm. long, usually acutish at the tip.

Calyx-lobes much shorter than the corolla.

Calyx-lobes linear or slightly narrowed upward.

Calyx-lobes linear-spatulate.

Calyx-lobes as long as the corolla or nearly so.

Corolla-lobes obovate-spatulate, over 25 mm. long, usually rounded at the tip.

11. *S. dodecandra*.

12. *S. Harperi*.

13. *S. foliosa*.

14. *S. decandra*.

1. ***S. macrophylla*** Hook. Stem 6–10 dm. tall: blades of the upper leaves elliptic to elliptic-lanceolate or ovate-lanceolate, 2–6 cm. long, acute: calyx 2–3 mm. long; lobes shorter than the tube: corolla white; lobes 6–8 mm. long: capsule 3–4 mm. long.—Wet pinelands or acid bogs, Coastal Plain, Fla. to La. and Ga.—Sum.

2. ***S. recurvans*** Small. Similar to *S. macrophylla* in habit: calyx 4–5 mm. long; lobes longer than the tube: corolla white; lobes 5–6.5 mm. long: capsule 3.5–4.5 mm. long.—Low or moist pinelands, Coastal Plain, Fla. and Ga.—Sum.

3. ***S. difformis*** (L.) Druce. Stem 4–9 dm. tall: blades of the upper leaves ovate to lanceolate or linear-lanceolate, 1–4 cm. long, apiculate or acute: calyx 7–9.5 mm. long; lobes much longer than the tube: corolla white, drying yellowish; lobes 12–18 mm. long: capsule 5–6 mm. long. [*S. lanceolata* (Walt.) T. & G.]—Wet pinelands, and acid bogs, Coastal Plain, Fla. to Tenn. and N. J.—Spr.-sum.

4. *S. paniculata* (Michx.) Pursh. Stem 1-4 dm. tall: blades of the upper leaves elliptic to elliptic-lanceolate or nearly linear, 1-3 cm. long: calyx 6.5-7.5 mm. long; lobes somewhat longer than the tube: corolla white; lobes 10-14 mm. long; capsule 7-9 mm. long.—Acid meadows and pinelands, Coastal Plain, Fla. to Ala. and S Va.—Spr.-sum.
5. *S. brachiata* Ell. Stem 1-4 dm. tall: blades of the upper leaves elliptic to linear-lanceolate, 1.2-3.5 cm. long: calyx 7-8 mm. long; lobes much longer than the tube: corolla rose to white; lobes 11-15 mm. long: capsule 5-7 mm. long. [*S. angustifolia* (Michx.) Britton]—Moist soil, often in pinelands, Coastal Plain, and adj. provinces, Fla. to La., Mo., and N. C.—Spr.-sum.
6. *S. angularis* (L.) Pursh. Stem 3-8 dm. tall: blades of the upper leaves ovate to ovate-lanceolate, 1.5-3 cm. long: flowers fragrant; calyx 7-8 mm. long; lobes much longer than the tube: corolla typically deep-pink; lobes 10-13 mm. long: capsule 4.5-5.5 mm. long.—(ROSE-PINK. BITTER-BLOOM.)—Sterile woods, thickets, and meadows, various provinces, Fla. to La., Okla., Ont., and N. J.—Sum.
7. *S. calycina* (Lam.) Heller. Stem 1-4 dm. tall: blades of the upper leaves elliptic to elliptic-lanceolate, 2-6 cm. long: calyx 15-25 mm. long; lobes linear-ob lanceolate or some of them merely linear, much longer than the tube: corolla rose or nearly white; lobes spatulate to elliptic-spatulate, mostly shorter than the calyx lobes: capsule 7-8 mm. long.—River-swamps and low hammocks, Coastal Plain, Fla. to Tex., Ark. and Va.—Spr.-sum.
8. *S. Elliottii* Steud. Stem 2-7 dm. tall: blades of the upper leaves elliptic to linear, 0.5-2 cm. long: calyx 7-8 mm. long; lobes about twice as long as the tube: corolla white or cream; lobes spatulate to oblanceolate, 10-13 mm. long, much longer than the calyx-lobes: capsule 4-5 mm. long.—Pinelands, Coastal Plain, Fla. to Ala., and Va.—Sum.-fall.
9. *S. campanulata* (L.) Torr. Stem 1-4 dm. tall: blades of the upper leaves narrow, but typically broader than the diameter of the stem or branches: calyx with filiform or nearly filiform lobes, typically about as long as the corolla: corolla deep-rose or magenta, with a yellow eye; lobes elliptic to spatulate-elliptic: capsule 6-8 mm. long.—Pinelands, sandy places, swamps, and meadows, various provinces, Fla., to La., Tenn., and Mass.—Sum.-fall.—A foliose variety with the blades of the lower leaves obovate to spatulate and of the upper leaves lance-elliptic varying to linear and with calyx lobes much shorter than the corolla occurs at various localities in the Coastal Plain from Fla. to La. and S N. C. This has sometimes been included in *S. stellaris* Pursh.
10. *S. grandiflora* (A. Gray) Small. Stem 8-12 dm. tall: blades of the upper leaves typically stout-filiform or nearly so, mainly narrower than the diameter of the stem and the branches, 3-10 cm. long: calyx with filiform or very narrow lobes much shorter than the corolla: corolla deep-rose or magenta, the eye yellow; lobes oval or elliptic-oval to rhombic-obovate: capsule 8-10 mm. long.—Everglades, low pinelands, and prairies, pen. Fla.—All year.
11. *S. dodecandra* (L.) B. S. P. Stem 2-4 dm. tall: blades of the upper leaves narrowly lanceolate to linear, 2-4 cm. long: calyx-lobes linear or nearly so: corolla rose-purple or white, the eye yellow; lobes spatulate to elliptic-spatulate, 2-2.5 cm. long: capsule 8-9 mm. long.—Pinelands, Coastal Plain, Fla. to La. and S N. Y.—Sum.-fall.
12. *S. Harperi* Small. Stem 2-6 dm. tall: blades of the upper leaves elliptic-lanceolate to lanceolate, 1.5-3.5 cm. long: calyx-lobes linear-spatulate: corolla bright-pink or whitish, the eye yellow; lobes spatulate to elliptic-spatulate, much longer than the calyx-lobes: capsule 5-7.5 mm. long.—Swamps or pond-margins in pinelands, Coastal Plain, N Fla. and Ala. to S. C.—Spr.

13. *S. foliosa* Fernald. Stem 1-5 dm. tall: blades of the upper leaves linear-elliptic to linear-lanceolate or almost linear, 2-6.5 cm. long: calyx-lobes linear: corolla rose, the eye yellow; lobes oblanceolate to elliptic-spatulate, about as long as the calyx-lobes: capsule 5-7 mm. long.—Low grounds, Coastal Plain, Fla. and Ala.—Spr.—fall.

14. *S. decandra* (Walt.) Harper. Stem 6-9 dm. tall: blades of the upper leaves linear-subulate, 3-10 cm. long, lower leaves spatulate: calyx-lobes subulate: corolla deep-rose to white, the eye yellow: lobes obovate-spatulate, 2.5-3.5 cm. long: capsule about 10 mm. long.—Shallow pineland ponds, Coastal Plain, Fla. to Ala. and S. C.—Sum.—fall.

4. **LAPITHEA** Griseb. Annual or biennial herbs. Flowers solitary or in a congested cyme. Calyx-lobes mostly 7-10, narrow, unequal. Corolla red, purple, or pink, rotate: lobes mostly 7-10, longer than the tube.—Only the following species:

Blades of the cauline leaves above the lower part of the stem elliptic to elliptic-lanceolate: bracts of the involucre linear-elliptic to lanceolate. 1. *L. capitata*.  
Blades of the cauline leaves above the lower part of the stem narrowly lanceolate: bracts of the involucre narrowly linear-attenuate. 2. *L. gentianoides*.

1. *L. capitata* (Raf.) Small. Stem 2-4 dm. tall: blades of the upper leaves elliptic to elliptic-lanceolate, 1.5-4 cm. long: bracts oval or elliptic: calyx-lobes linear or linear-lanceolate: corolla pink or whitish; lobes broadly spatulate, 15-20 mm. long. [*Pleienta capitata* Raf. *Sabbatia Boykinii* A. Gray *L. Boykinii* Small]—Rich woods, Blue Ridge to Appalachian Plateau, Ga. and Ala.—Sum.—fall.

2. *L. gentianoides* (Ell.) Griseb. Stem 2-7 dm. tall: blades of the upper leaves linear, 3-10 cm. long: bracts linear: calyx-lobes linear-subulate: corolla reddish, lilac or pink-purple; lobes spatulate or elliptic-spatulate, 20-25 mm. long. [*Sabbatia gentianoides* Ell.]—Low pinelands, Coastal Plain, Fla. to Tex. and Ga.—Sum.

5. **ANTHOPOGON** Neck. Annual, biennial, or rarely perennial herbs. Flowers solitary at the ends of the stem and its branches, the whorls mostly of 4 parts each. Calyx relatively large: lobes keeled, unequal, the inner ones broader than the outer and hyaline or scarious-margined. Corolla salverform to funnelform: lobes shorter than the tube, without plaits in the sinuses. Stigmas very broad.—About 50 species, widely distributed.

1. *A. crinitum* (Froel.) Raf. Stem 2-5 dm. tall, mostly branched: leaf-blades ovate to lanceolate, mainly 2-5 cm. long, partly clasping: calyx 25-30 mm. long: corolla sky-blue, 4-5 cm. long lobes fimbriate; capsule about 3 cm. long. [*Gentiana crinata* Froel.]—(FRINGED-GENTIAN.)—Swamps, moist

thickets, and meadows, various provinces, Coastal Plain only N, Ga. to N. D. and Que.—Fall.

6. **GENTIANELLA** Moench. Annual, biennial, or perennial herbs. Flowers solitary or in open or contracted cymes, the whorls of 4 parts each, or sometimes of 5 parts. Calyx relatively small: lobes essentially equal or the outer ones broader than the inner. Corolla blue or pale bluish-purple, funnelform or salverform: lobes shorter than the tube, with plaits in the sinuses, but often filamentose at the base.—Numerous species of wide geographic distribution.

Calyx-lobes shorter than the tube: corolla-lobes ovate.  
Calyx-lobes longer than the tube: corolla-lobes lanceolate.

1. *G. quinquefolia*.  
2. *G. occidentalis*.

1. ***G. quinquefolia*** (L.) Small. Stem 1–11 dm. tall, mostly branched, 4-winged; leaf-blades ovate to lanceolate, 2–3 cm. long, partly clasping; calyx-lobes spatulate, 2–3 mm. long: corolla blue or purplish-blue, 18–20 mm. long: capsule about 14 mm. long. [*Gentiana quinqueflora* Lam.] — (AGUE-WEED. STIFF-GENTIAN.) — Rich woods or moist calcareous soil, various provinces, rarely Coastal Plain, Fla. to Mo., Mich., Ont., and Me.—Sum. & fall.

2. ***G. occidentalis*** (A. Gray) Small. Similar to the preceding species in habit: flowers larger: calyx-lobes linear or linear-lanceolate, 8–11 mm. long: corolla 22–24 mm. long, pale-blue: capsule fully 15 mm. long. —Moist soil, various provinces, Miss. to La., Minn., and Ohio.—Sum.—fall.

7. **DASYSTEPHANA** Adans. Annual, biennial, or perennial herbs. Flowers in a compact terminal cyme and axillary cymes or solitary, the whorls mainly of 5 parts each. Calyx persistent: lobes minute or foliaceous, more or less unequal. Corolla funnelform or clavate, with neither glands at the base of the tube nor filaments at the base of the lobes: lobes much shorter than the tube, with plaits at the sinuses. Stigmas narrow. Capsule stipitate.—About 75 species, natives of the north temperate zone.—Fall.—GENTIANAS.

Flowers sessile, clustered: corolla-lobes shorter than the plaits in their sinuses or decidedly longer, erect, ascending, or converging. I. LATIFOLIAE.  
Flowers pedicelled, solitary: corolla-lobes much longer than the plaits, spreading, or reflexed. II. ANGUSTIFOLIAE.

#### I. LATIFOLIAE

Corolla open funnelform: anthers separate.

Corolla campanulate-funnelform to clavate: anthers cohering in a tube or a ring.

Corolla blue.

Corolla-lobes larger and longer (only slightly so in *D. Saponaria*) than the plaits.

Corolla-lobes decidedly longer than the plaits: stem pubescent.

Calyx-tube glabrous.

Leaf-blades rounded or subcordate at the base: corolla-plaits with 2 unequal fimbriate lobes.

Leaf-blades narrowed at the base: corolla-plaits with 2 equal, nearly entire lobes.

Calyx-tube pubescent.

Corolla-lobes slightly longer than the plaits: stem glabrous.

Corolla-lobes very small, mostly smaller and shorter than the plaits.

1. *D. puberula*.

2. *D. parvifolia*.

3. *D. latifolia*.

4. *D. decora*.

5. *D. Saponaria*.

6. *D. Andrewsii*.

Corolla white, more or less tinged with green or yellow, or greenish-white or purplish-green.

Calyx-lobes shorter than the tube: leaf-blades broad at the base and more or less clasping: seeds winged.

Calyx-lobes longer than the tube: leaf-blades narrowed at the base: seeds wingless.

7. *D. flavida*.

8. *D. villosa*.

## II. ANGUSTIFOLIAE

Corolla-limb deep-blue: free portions of the filaments lanceolate.

Corolla-limb white: free portions of the filaments subulate.

9. *D. Porphyrio*.

10. *D. tenuifolia*.

1. *D. puberula* (Michx.) Small. Plant 2-4.5 dm. tall, finely pubescent or puberulent: blades of the upper leaves lanceolate or elliptic-lanceolate: calyx 18-26 mm. long; lobes linear to narrowly linear-lanceolate, about as long as the tube: corolla rose-purple, 3.5-5 cm. long; lobes broadly ovate, ascending; plaits cleft and laciniate, much shorter than the lobes: capsule-body about 2 cm. long.—Dry prairies and stony soil, various provinces N of Coastal Plain, Ga. to Kans., S. Dak., and Md.—Differs from our other blue-flowered species in the widely open corolla-throat and large ascending lobes which conspicuously exceed the narrow deeply-lobed plaits.

2. *D. parvifolia* (Chapm.) Small. Plant 2-7 dm. tall, finely pubescent: blades of the upper leaves ovate to lanceolate or elliptic-lanceolate, 1.5-4 cm. long: calyx 25-30 mm. long; lobes linear to linear-elliptic, much longer than the tube: corolla rose-purple or blue, 4.5 cm. long; plaits cleft and erose-toothed: lobes rounded: capsule-body about 2.5 cm. long. [*Gentiana Elliottii* Chapm.]—River-banks, wet woods, and ditches, Coastal Plain, Fla. to Ala. and Va.—Somewhat resembles the preceding in the shape of the corolla; but differs in the small narrow slightly lobed and decidedly toothed plaits.

3. *D. latifolia* (Chapm.) Small. Plant 3-8 dm. tall, finely pubescent: blades of the upper leaves elliptic to broadly elliptic or sometimes nearly linear, 2-8 cm. long: calyx 15-25 mm. long; lobes linear to linear-lanceolate, commonly shorter than the tube or fully as long: corolla rose-purple, 4-5 cm. long; lobes acute; plaits cleft and somewhat erose: capsule-body nearly 2.5 cm. long. [*Gentiana Elliottii latifolia* Chapm.]—Moist soil, Coastal Plain, Fla. to Ala. and S Va.—Larger than the next preceding, with more typically elliptic leaf-blades, and with larger scarcely toothed corolla-plaits.

4. *D. decora* (Pollard) Small. Plant similar to that of *D. latifolia* in habit: leaf-blades thinner, more decidedly acuminate: calyx less than 15 mm. long; lobes subulate to linear-subulate or lanceolate, shorter than the tube: corolla purple, 2.5-3 cm. long; lobes longer than the plaits: plaits very broad, rather truncate and erose: capsule-body about 2 cm. long.—Moist mt. woods, Blue Ridge, Ga. to Va.—Differs from all the preceding species and from the next following in the small calyx-lobes and from all related species in the small corolla-lobes which are separated by wide broadly 2-lobed erose plaits.

5. *D. Saponaria* (L.) Small. Plant 3-8 dm. tall, glabrous: blades of the upper leaves lanceolate to ovate-lanceolate or elliptic, 2.5-7.5 cm. long: calyx 15-22 mm. long; lobes spatulate to linear-spatulate, as long as the tube or shorter: corolla blue or purplish-blue, 3.5-4 cm. long; lobes mainly shorter than the plaits: plaits narrow, cleft and incised-laciniate: capsule-body fully 1.5 cm. long. [*Gentiana Saponaria* L.]—(SOAPWORT-GENTIAN.)—Moist shaded banks

and woods, often in acid soil, various provinces, Ga. (or Fla.?), to La., Minn., Ont., and Conn.—Readily distinguished from related species by the large lobed and somewhat laciniate corolla-plaits which about equal the corolla-lobes.

6. **D. Andrewsii** (Griseb.) Small. Plants 3–10 dm. tall, glabrous; blades of the upper leaves lanceolate, elliptic-lanceolate, ovate-lanceolate or ovate, mainly 4–9 cm. long; calyx mostly 11–19 mm. long; lobes elliptic, oval, or ovate, shorter than the tube, rather loosely spreading: corolla blue or purplish-blue or exceptionally white, 2.5–4 cm. long; lobes inconspicuous, very short, much broader than long, abruptly pointed, much exceeded by the broad, somewhat truncate unequally 2-lobed and erose toothed plaits: capsule-body 2–2.5 cm. long. [*Gentiana Andrewsii* Griseb.]—Moist woods, meadows, prairies and swampy thickets, often in calcareous soil, various provinces, in Coastal Plain only northward, Ga. to Ark. (Kans.?), N. Dak., and Me.—Easily distinguished from all our other species by the small inconspicuous corolla-lobes which are much exceeded by the large broad-topped plaits.

7. **D. flavida** (A. Gray) Britton. Plants 2–9 dm. tall, glabrous: blades of the upper leaves lanceolate to ovate, not of an obovate type, 5–11 cm. long; calyx 11–20 mm. long; lobes ovate to orbicular-ovate, shorter than the tube, reflexed-spreading: corolla white, or sometimes tinged with yellow, 3–4 cm. long; lobes deltoid-ovate to reniform-ovate, longer than the coarsely and irregularly few-toothed plaits: capsule-body about 2 cm. long.—Woods, prairies, moist banks and somewhat acid meadows, various provinces N of Coastal Plain, N. C. to Ark., Mo., Ont., and W Pa.—May be distinguished from our other species by the white or yellow-tinged corolla and the short and broad calyx-lobes.

8. **D. villosa** (L.) Small. Plant 1–6 dm. tall, glabrous: blades of the upper leaves elliptic, oval, cuneate-obovate, or obovate, not of an ovate type, 2–8 cm. long; calyx 25–40 mm. long; lobes linear to linear-spatulate, longer than the tube, erect or nearly so: corolla greenish-white or purplish-green, 4–5 cm. long; lobes ovate to deltoid-ovate, much longer than the entire or merely 2-lobed plaits: capsule-body 2.5–3 cm. long. [*Gentiana ochroleuca* Froel.]—Grassy thickets, acid open woods, and pinelands, various provinces, Fla. to La., Tenn., and N. J.—Differs from our other species in the mainly greenish-white corolla and narrow calyx-lobes.

9. **D. Porphyrio** (J. F. Gmel.) Small. Plant mostly 2–4.5 dm. tall, the stem simple or rarely branched: leaf-blades narrow, those of the lower leaves spatulate, those of the upper linear-spatulate to linear: calyx-lobes linear-subulate: corolla deeply colored, the limb deep-blue; lobes ovate, entire or obscurely erose: plaits rather sparingly laciniate: capsule-body 1.5–2 cm. long.—Pinelands, and margins of acid pools, Coastal Plain, S. C. to N. J.—This and the following species differ from all the preceding in the funnel-form corolla and laciniate plaits.

10. **D. tenuifolia** (Raf.) Pennell. Plant mostly 1–2 dm. tall, the stem usually simple: leaf-blades very narrow, those of the lower leaves linear-spatulate, those of the upper narrowly linear: calyx-lobes linear-subulate: corolla white or greenish-white, the limb white; lobes ovate, evidently erose-toothed: plaits rather copiously laciniate: capsule-body about 1.5 cm. long.—Low pinelands, M Fla.—Most readily separated from the next preceding species by its low stature and white or greenish-white corolla-limb.

8. **FRASERA** Walt. Biennial or perennial herbs, usually coarse and with hollow stems. Flowers in panicle cymes. Calyx-lobes 4, narrow. Corolla

white, yellowish, or bluish, rotate: lobes 4, longer than the tube, each with 1 or 2 glands.—Five species, North American.

1. *F. carolinensis* Walt. Stem 1–2.5 m. tall: leaves usually in whorls of 4; blades spatulate to elliptic or elliptic-lanceolate, 1–3 dm. long: calyx-lobes linear to linear-lanceolate, acuminate: corolla ochroleucous and purple-dotted; lobes broadly elliptic to oval, 13–16 mm. long, each with a fringed gland below the middle: capsule ovoid, about 2 cm. long.—Rich woods, and dry, calcareous slopes, various provinces, Ga. to La., Ont., and W N. Y.—Spr.—sum.—This plant is usually triennial, blooming the second year after the seed germinates, and dying as soon as the new seed is perfected.

9. *BARTONIA* Muhl. Annual or biennial, slender wiry herbs. Leaves mere narrow scales. Flowers in racemose or paniced cymes, or solitary, each subtended by a narrow bract. Calyx-lobes 4, keeled, narrowed upward. Corolla white or yellowish, rotate: lobes 4, longer than the tube.—Four species, of eastern North America.—Sum.—fall.

Corolla 6 mm. long or more; lobes spatulate to obovate-spatulate.  
Corolla 5 mm. long or less; lobes lanceolate to elliptic.

Corolla-lobes elliptic, more or less erose, abruptly pointed: branches and pedicels stiff.

Corolla-lobes lanceolate, entire, acute or acuminate: branches and pedicels lax.

1. *B. verna*.

2. *B. virginica*.

3. *B. lanceolata*.

1. *B. verna* (Michx.) Muhl. Plant 0.5–3 dm. tall: leaves (scales) opposite, 1–2 mm. long: calyx-lobes linear-lanceolate: corolla white: lobes 7–10 mm. long: capsule 5–6 mm. long.—Moist pine-lands, prairies, and lake shores, Coastal Plain, Fla. to La. and Va.—Wint.—spr.

2. *B. virginica* (L.) B. S. P. Plant 1–4 dm. tall: leaves (scales) opposite, or alternate on small plants: calyx-lobes subulate or lanceolate-subulate: corolla yellowish-white; lobes mostly 2–2.5 mm. long: capsule 3–5 mm. long.—Open woods, swamps, and grassy banks, in acid soil, various provinces, Fla. to La., Minn., and Newf.

3. *B. lanceolata* Small. Plant 2–6 dm. tall: leaves (scales) opposite or alternate: calyx-lobes similar to those of *B. virginica*: corolla greenish-white; lobes mostly 2.5–3 mm. long: capsule 4–5 mm. long.—Wet pinelands and swamps, Coastal Plain and rarely adj. provinces, Fla. to Ark. and N. Y.—In this and the next preceding species the plants are often yellowish, containing little chlorophyll and apparently living, at least in part, as saprophytes in decaying organic matter.

10. *OBOLARIA* L. Perennial small, but stout succulent herbs. Leaves mere dilated scales. Flowers in spike-like cymes, each subtended by a dilated

bract. Calyx-lobes 2, dilated upward. Corolla white, pinkish, or purplish, broadly funnelform: lobes 4, about as long as the tube.—One species.

1. *O. virginica* L. Plant purplish-green, 5–20 cm. tall: leaves (scales) 5–10 mm. long, the upper ones broadened upward, longer than the lower ones: calyx-lobes spatulate or elliptic-spatulate: corolla 7–10 mm. long: lobes nearly as long as the tube, acute: capsule 5–6 mm. long.—(PENNYWORT.)—Moist thickets and rich woods, various provinces, Fla. to Tex., Ill., and N. J.—Spr.

11. *LEIPHAIMOS* Schlecht. & Cham. Annual or perennial humus-plants. Leaves mere scales. Flowers solitary or in cymes. Calyx-lobes 4 or 5, narrow, commonly about as long as the tube. Corolla white or variously colored, salverform: lobes 4 or 5, much shorter than the tube.—About 20 species, mostly tropical American.

1. *L. parasitica* Schlecht. & Cham. Plant pale, 1–4 dm. tall: leaves (scales) opposite, 3–5 mm. long: calyx-lobes lanceolate, acute: corolla white or pink, 6–8 mm. long, about twice as long as the calyx; lobes triangular to lanceolate: capsule 5–6 mm. long. [*Voyria mexicana* Griseb.]—Hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—All year.

### FAMILY 3. MENYANTHACEAE — BOGBEAN FAMILY

Perennial aquatic or bog herbs. Leaves alternate; blades simple or 3-foliolate. Flowers perfect, solitary, or in clusters or racemes. Calyx of 5 partly united sepals. Corolla white or colored, rotate or funnelform. Androecium of 5 stamens, with the filaments partly adnate to the corolla-tube. Gynoecium of 2 united carpels. Style very short. Fruit a capsule, sometimes indehiscent.—Five genera and about 35 species, widely distributed.

1. *NYMPHOIDES* [Tourn.] Hill. Aquatic herbs. Leaves with elongate petioles and broad blades with a deep basal sinus. Flower-clusters sometimes tuber-bearing, borne on a petiole-like stalk. Calyx-lobes narrow. Corolla rotate. Filaments adnate to near the middle of the corolla-tube or above it. Capsule ellipsoid to ovoid. [*Limnanthemum* J. F. Gmel.]—About 20 species, widely distributed in temperate and tropical regions.—FLOATING-HEARTS.

Leaf-blades relatively small: corolla about twice as long as the calyx: capsule slightly longer than the calyx: seed smooth. 1. *N. lacunosum*.  
 Leaf-blades relatively large: corolla about thrice as long as the calyx: capsule about twice as long as the calyx: seed tuberculate. 2. *N. aquaticum*.

1. *N. lacunosum* (Vent.) Kuntze. Leaf-blades ovate or orbicular-ovate, 2–4.5 cm. long; flower-clusters usually with tubers: corolla white: filaments adnate to above the middle of the corolla-tube, the free portion longer than the anther: capsule about 4 mm. long. [*L. lacunosum* Griseb.]—Shallow water, various provinces, Fla. to La., Minn., Ont., and Me.—Spr.—fall.

2. *N. aquaticum* (Walt.) Kuntze. Leaf-blades suborbicular to reniform, 5–15 cm. in diameter: flower-clusters usually without tubers: corolla white: filaments adnate to below the middle of the corolla-tube, the free portion shorter than the anther: capsule about 6 mm. long. [*L. trachyspermum* A. Gray]—Ponds and slow streams, Coastal Plain, Fla. to Tex. and N. J.—Spr.—sum.

### ORDER ASCLEPIADALES—ASCLEPIADAL ORDER

Herbs, shrubs or trees, commonly with a milky juice. Leaves alternate or opposite: blades entire. Inflorescence cymose, sometimes umbellate. Calyx of usually 5, partially united, sepals. Corolla of usually 5 partially united petals. Androeceum of 5 distinct or monadelphous stamens. Pollen granular, or in waxy masses. Gynoeceum of usually 2 carpels sometimes only united at the apex. Stigma terminal. Fruit a pair of follicles, or drupaceous.

Styles united: stamens distinct: pollen loosely granular. Fam. 1. APOCYNACEAE.

Styles distinct: stamens monadelphous: pollen united into waxy masses.

Fam. 2. ASCLEPIADACEAE.

### FAMILY 1. APOCYNACEAE—DOGBANE FAMILY

Perennial herbs, vines, shrubs or trees, mostly with a milky acrid juice. Leaf-blades simple. Androeceum of 5 stamens with the anthers converging around the stigma or partly adhering to it. Filaments partially adnate to the corolla-tube. Pollen-grains simple. Gynoeceum of 2 distinct carpels or 2 united carpels. Styles united. Stigmas simple. Fruit usually of 2 follicles or drupes. Seed often appendaged.—About 130 genera and 1,100 species, widely distributed but mostly tropical.

Carpels distinct: fruit a pair of follicles or drupes, sometimes single by abortion. Anthers unappendaged at the base, not connected with the stigma: corolla-lobes sinistrorsely convolute.

I. VINCEAE.

Anthers appendaged at the base, converging around the stigma and partially adherent to it: corolla-lobes dextrorsely convolute.

II. ECHITIDEAE.

Carpels united: fruit a 1-celled capsule.

III. ALLAMANDAE.

#### I. VINCEAE

Fruit drupaceous: shrubs or trees.

Corolla salverform, relatively small; lobes equilateral, shorter than the tube.

Corolla funnelform, relatively large; lobes inequilateral, longer than the tube.

Fruit a pair of follicles: herbs, sometimes partially shrubby.

Flower without a disk: leaves alternate.

Flower with a 2-lobed disk: leaves opposite.

1. VALLESIA.

2. CERBERA.

3. AMSONIA.

Anther with a foliaceous connective; carpels 6-8-ovuled; stigma glabrous; corolla funnelform.

Anther with an inconspicuous connective; carpels several-ovuled; stigma pubescent; corolla salverform.

## II. ECHITIDEAE

Shrubs or trees.

Herbs or vines.

Corolla appendaged within; calyx-tube partially attached to the gynoeceum by the thick disk: upright herbs.

Corolla unappendaged; calyx-tube wholly free: vines.

Stigmas appendaged with a reversed cup or 5 lobes.

Corolla funnelform, the throat widened upward.

Calyx-lobes relatively long and narrow: scale-like glands borne at the base of the calyx within.

Calyx-lobes relatively broad and short: scale-like glands wanting.

Corolla salverform, the throat narrowed upward.

Stigma merely thickened.

## III. ALLAMANDAE

Shrub with opposite, sometimes whorled leaves, yellow funnelform corollas, and echinate capsules.

4. VINCA.

5. CATHARANTHUS.

6. NERIUM.

7. APOCYNUM.

8. URECHITES.

9. RHABDADENIA.

10. ECHITES.

11. TRACHELOSPERMUM.

12. ALLAMANDA.

1. **VALLESIA** R. & P. Shrubs. Leaves alternate: blades relatively broad. Calyx-lobes short. Corolla salverform, the throat contracted at the mouth: lobes shorter than the tube, equilateral. Stamens adnate up to the throat of the corolla: anthers cordate: disk wanting. Carpels 2. Drupe narrow. Seeds clavate, unappendaged.—Two species tropical American.

1. **V. glabra** Cav. Shrub 3 m. tall or less, the branches sometimes elongate and vine-like: leaves remote; blades elliptic to elliptic-lanceolate, 4-7 cm. long: calyx-lobes deltoid to ovate-deltoid, less than 1 cm. long: corolla white; tube 5-6 mm. long; lobes linear-elliptic, 3-4 mm. long; drupe 10-14 mm. long.—Hammocks, Florida Keys.—(W. I.) *Mex., C. A., S. A.*—Spr.—fall.

2. **CERBERA** L. Shrubs or trees. Leaves alternate: blades relatively narrow. Calyx-lobes long. Corolla funnelform, the throat not constricted at the mouth. Drupe broad. Seeds angular. [*Thevetia* L.]—About 7 species, tropical American.

1. **C. Thevetia** L. Shrub: leaves approximate; blades narrowly linear, 8-16 cm. long: calyx-lobes lanceolate, 5-7 mm. long: corolla saffron-colored or rarely yellow or white; tube 2-2.5 cm. long; lobes very broad, 3-4 cm. long: drupe depressed, 3-4 cm. broad.—(TRUMPET-FLOWER. YELLOW-OLEANDER.)—Pinelands, cult. grounds, and waste-places, S. pen. Fla. and Florida Keys. Nat. of Trop. Am.—(W. I., *Mex., C. A., S. A.*)—All year.—Known as lucky-nut in the West Indies and in southern Florida.

3. **AMSONIA** Walt. Herbs. Leaves alternate: blades various. Calyx-lobes deltoid to lanceolate. Corolla mainly salverform, blue or purple-blue; lobes narrow.—About 8 species, North American and Asiatic.—BLUE-DOGBANES. BLUE-STARS.

Corolla pubescent without.

Leaf-blades glabrous or nearly so, at least at maturity: follicles glabrous.

Leaf-blades broad, ovate, oval, or broadly elliptic-lanceolate.

Leaf-blades narrow, elliptic, elliptic-lanceolate, lanceolate, or linear-lanceolate.

Leaf-blades tomentose beneath, permanently pubescent beneath: follicles pubescent, at least on the upper part.

Corolla glabrous without.

Leaves elongate; blades elliptic-lanceolate, linear-lanceolate, linear, or linear-filiform, those of the upper ones at least sessile.

Leaves short; blades elliptic, oval, or ovate, distinctly petioled.

1. *A. Amsonia*.

2. *A. salicifolia*.

3. *A. ludoviciana*.

4. *A. ciliata*.

5. *A. rigida*.

1. **A. Amsonia** (L.) Britton. Plant 6–13 dm. tall, glabrous or nearly so: leaves relatively few; blades relatively broad, oval to broadly elliptic-lanceolate, 6.5–13 cm. long: corolla purplish-blue; tube 6–8 mm. long; lobes shorter than the tube; follicles 9–12 cm. long. [*A. Tabernaemontana* Walt.].—(TEXAS-STAR.)—River banks and rich woods, various provinces, Fla. to Tex., Kans., and S. C., naturalized as far N as Mass.—Spr.—sum.

2. **A. salicifolia** Pursh. Plant 6–12 dm. tall, glabrous: leaf-blades relatively narrow, lanceolate to linear-lanceolate, 7–16 cm. long; corolla purplish-blue; lobes as long as the tube or longer; follicles 8–12 cm. long.—Low grounds and thickets, in somewhat acid soil, various provinces, Fla. to Tex., Kans., and Va.—Spr.—sum.

3. **A. ludoviciana** Vail. Plant 5–11 dm. tall, pubescent at least when young: leaves relatively few; blades broadly elliptic to oval-elliptic, 6–9 cm. long, white-tomentose beneath: corolla bluish; tube 6–7 mm. long; lobes about as long as the tube: follicles 8–10 cm. long.—Moist grounds, often in open woods, Coastal Plain and adj. provinces, Miss. to La. and Ark.—Spr.—The flowers are very fragrant.

4. **A. ciliata** Walt. Plant 2–8 dm. tall, often much-branched, pubescent: leaves numerous; blades linear to linear-filiform on the upper part of the plant (almost filiform in *A. ciliata filifolia*), 4–7 cm. long: corolla purplish-blue, tube 6–8 mm. long, the lobes ovate to elliptic-ovate, mostly shorter than the tube: follicles 8–16 cm. long.—Dry pinelands, Coastal Plain, and adj. Piedmont, Fla. to Tex., Ark., and N. C.—Spr.—sum.

5. **A. rigida** Shuttlw. Plant 8–13 dm. tall, glabrous: leaves very numerous; blades elliptic, oval, or ovate, 2.5–5 cm. long: calyx-lobes about 1 mm. long: corolla purplish-blue; tube 4–6 mm. long; lobes as long as the tube or longer: follicles 7–12 cm. long.—Moist pinelands and shallow ponds, Coastal Plain, Fla. and Ga.—Spr.—sum.

4. **VINCA** L. Trailing or creeping herbs. Leaves opposite. Corolla blue, or rarely white: tube dilated at the mouth.—About 12 species, natives of the Old World.—Spr.—sum.—PERIWINKLES. MYRTLES.

Leaf-blades elliptic to elliptic-ovate, eciliate: calyx-lobes eciliate: follicles beakless  
 1. *V. minor*.  
 Leaf-blades ovate to deltoid-ovate, ciliate: calyx-lobes ciliate: follicles beaked.  
 2. *V. major*.

1. *V. minor* L. Leaf-blades subcoriaceous, 1-5 cm. long, narrowed to a short petiole: calyx-lobes lanceolate, 3-4 mm. long, glabrous: corolla 1.5-2 cm. wide: follicle 2.5 cm. long or less.—Roadsides, shaded banks, and cult. grounds, various provinces, Ga. to Ark. and Ont.—Nat. of Eu.

2. *V. major* L. Leaf-blades membranous, 4-7 cm. long, manifestly petioled: calyx-lobes subulate, 9-15 mm. long, bearded at the tip: corolla 4-5 cm. wide: follicle 3 cm. long or more.—Woods and roadsides, Coastal Plain, Ga. and S. C.—Nat. of Eu.—These periwinkles were brought to America from Europe by the early settlers in the eastern United States. By means of the creeping stems, plants soon spread from gardens to roadsides and even into woodlands.

5. *CATHARANTHUS* G. Don. Erect herbs. Leaves opposite. Corolla variously colored or white: tube with a contracted mouth. Follicle narrow.—Three species, the following and two in the Old World tropics.

1. *C. roseus* (L.) G. Don. Stems 2-7 dm. tall: leaf-blades oblong to oblong-cuneate, 4-8 cm. long: calyx-lobes linear-subulate, 3-4 mm. long: corolla white, pink, or rose-purple, with an eye; tube 27-34 mm. long: lobes abruptly pointed: follicle 2-3 cm. long. [*Finca rosea* L. *Ammocallis rosea* Small]—(PERIWINKLE. OLD-MAID.)—Pine-lands, hammocks, waste-places, roadsides, and cult. grounds, pen. Fla. and the Keys. Nat. of Madagascar (?).—(*W. I., Mex., C. A., S. A.*)—This showy plant has taken possession of acres of scrub land in southern peninsular Florida.

6. *NERIUM* [Tourn.] L. Shrubs or trees. Leaves opposite: blades relatively narrow. Corolla salverform, the throat campanulate, with toothed scales at the mouth: the lobes spreading, broad. Follicles elongate.—Three species, Eurasian.

1. *N. Oleander* L. Tree becoming 10 m. tall, or shrub: leaf-blades narrowly elliptic to linear-elliptic, 6-15 cm. long, many-veined: calyx-lobes lanceolate, 4.5-6 mm. long: corolla white to rose-purple or crimson: limb 3-4.5 cm. wide, the lobes obliquely apiculate: follicles 1-2 dm. long.—(OLEANDER.)—Roadsides, fields, and edges of woods, Coastal Plain, Fla. to La. Nat. of the Levants and cult.—(*W. I.*)—All year.—The sap is exceedingly poisonous. In some varieties the leaves contain a good percentage of rubber, in others practically none.

7. **APOCYNUM** [Tourn.] L. Upright herbs. Leaves opposite: blades relatively broad. Corolla campanulate to urceolate, with entire appendages near the base, the lobes erect or recurved, narrow.—About 12 species, in the north temperate zone.—Sum.—DOGBANES. INDIAN-HEMPS.

Corolla white, or pink within, 5-9 mm. long.

Corolla-lobes revolute: flowers nodding: corolla pink within: leaves spreading.

Corolla-lobes spreading: flowers slightly or not at all nodding: corolla usually white: leaves erect.

Corolla white or greenish, 2.5-4 mm. long: lobes usually erect: leaves and branches erect.

1. *A. androsaemifolium*.

2. *A. medium*.

3. *A. cannabinum*.

1. ***A. androsaemifolium*** L. Plant 3-15 dm. tall: leaf-blades ovate, elliptic, or oval, 4-11 cm. long: cymes rather long: calyx-lobes ovate to ovate-lanceolate, 2-2.5 mm. long: corolla-lobes nearly as long as the tube: follicles 10-17 cm. long.—Thickets, fields, and fence-rows, various provinces, in Coastal Plain only northward, Ga. to Tex., B. C., Ont., and N. B.

2. ***A. medium*** Greene. Plant intermediate between the preceding and the following species: leaf-blades elliptic to ovate-elliptic, 4-9 cm. long: cymes somewhat dense: calyx-lobes lanceolate, 2-2.5 mm. long: corolla-lobes nearly as long as the tube: follicles 8-13 cm. long.—Thickets, fields, fencerows, and low grounds, various provinces, in Coastal Plain only northward, N. C. to Mo., Minn., and Newf.

3. ***A. cannabinum*** L. Plant 8-18 dm. tall: leaf-blades elliptic to elliptic-ovate or elliptic-lanceolate, 5-12 cm. long: cymes rather dense: calyx-lobes lanceolate, 2.5-3 mm. long: corolla-lobes about half as long as the tube: follicles 12-20 cm. long.—Thickets, open woods, and stream-banks, various provinces, Fla. to Tex., B. C., Ont., and N. B.—The several proposed segregates of this species do not prove to be definitely distinct, all variations being found between the several segregates.

8. **URECHITES** Muell.-Arg. Vines, or erect woody plants. Leaves opposite: blades flat, entire. Calyx-lobes 5, relatively long and narrow. Corolla showy, large, the short tube dilated into a longer campanulate throat, the limb prominently lobed. Anthers sagittate, longer than the filaments, each usually with a much elongate narrow apical appendage. Follicles elongate, very slender, more or less incurved. Seeds numerous, slender-beaked.—About 6 species, tropical American.

Calyx permanently copiously pubescent: corolla pubescent without: basal lobes of the anther over 1 cm. long.

1. *U. pinetorum*.

Calyx glabrous, at least ultimately so: corolla glabrous without: basal lobes of the anther less than 1 cm. long.

2. *U. lutea*.

1. ***U. pinetorum*** Small. Plant gray-green, the stem underground, the branches erect, or when more elongate reclining, simple or nearly so, copiously fine-pubescent: leaf-blades obovate, oval, or elliptic, 3-7.5 cm. long, dull above, copiously fine-pubescent beneath: cymes usually solitary, 1-few-flowered, with very narrow bracts: calyx-lobes lanceolate-subulate, 8-10 mm. long, acuminate: corolla deep-yellow, mostly 6-9 cm. wide: anthers about 6 mm. long, the basal lobes slender:

follicles 9-19 cm. long. — (WILD-ALLAMANDA.)—Pinelands, Everglade Keys, Fla.—Spr.-sum.

2. *U. lutea* (L.) Britton. Plant bright-green, the stem and branches high-twining, glabrous or inconspicuously pubescent: leaf-blades obovate, elliptic, oval, or ovate, or sometimes suborbicular, mostly 4-7 cm. long, shining above, sometimes inconspicuously pubescent beneath: cymes several or numerous, several- to many-flowered, with foliaceous bracts: calyx-lobes subulate or lanceolate, 9-11 mm. long, acuminate: corolla bright-yellow, mostly 4-5 cm. wide: anthers 4-5 mm. long, the basal lobes stout: follicles 12-

15 cm. long. [*Echites Andrewsii* Chapm.]—Hammocks, S pen. Florida and the Keys.—(W. I.)—All year.—An imperfect specimen collected many years ago and recorded as coming from Key West represents an extremely pubescent form of this plant, or another species. Several forms of this plant, or perhaps species occur in our range: In one the plant leaves and inflorescence are essentially glabrous; in another the leaf-blades are sparingly pubescent beneath and the inflorescence bristly pubescent; in a third form the leaf-blades are closely often velvety pubescent beneath and the inflorescence is softly fine-pubescent.

9. *RHABDADENIA* Muell.-Arg. Vines, sometimes nearly erect. Leaves opposite. Calyx-lobes relatively broad and short. Corolla-tube gradually dilated into the funnellform throat.—About 10 species, tropical American.

Corolla-limb white, 4.5-5 cm. wide: twining vine, the branches glabrous.

Corolla-limb yellow, 2.5-3 cm. wide: erect herb, the branches pubescent.

1. *R. biflora*.

2. *R. corallicola*.

1. *R. biflora* (Jacq.) Muell.-Arg. Stem greatly elongate: leaf-blades elliptic or elliptic-lanceolate, 4-9 cm. long, apiculate: calyx-lobes elliptic or nearly so, 4-5 mm. long: corolla 5-6 cm. long, white, except the yellow tube within; lobes 2.5-3 cm. wide: follicles 12-15 cm. long.—(RUBBER-VINE.)—Coastal hammocks, S pen. Fla. and the Keys.—(W. I.)—All year.

2. *R. corallicola* Small. Stem 3-11 dm. long: leaf-blades elliptic or nearly so, 1-3 cm. long, more or less revolute: calyx-lobes deltoid ovate, 2-2.5 mm. long: corolla 2.5-3 cm. long, yellow; lobes 1-1.5 cm. wide: follicles 8-11 cm. long.—Pinelands, Everglade Keys and Big Cypress swamp region, Fla. and lower Florida Keys.—All year.—Fragmentary specimens apparently of a related species, *R. Sagræi*, of the Bahamas and Cuba, were collected on "Pine Key" many years ago by Dr. Blodgett. It differs from *R. corallicola* in the twining stem, the broader calyx-lobes, the shorter free portions of the filaments, and the stout-beaked seeds.

10. *ECHITES* P. Br. Vines. Leaves opposite. Flowers relatively large. Calyx with glands within. Corolla salverform, the throat narrowed to the

mouth.—About 40 species, tropical American.

1. **E. Echites** (L.) Britton. Stem from a tuber-like root, widely twining: leaf-blades ovate to oval, 4–9 cm. long: calyx-lobes triangular, 2.5–3.5 mm. long: corolla white or greenish-white; tube 5–6 cm. long; lobes 1.5–2.5 cm. long: follicles 15–20 cm. long. [*Echites umbellata* Jacq.]—(DEVIL'S-POTATO. RUBBER-VINE.)—Pinelands, Everglade Keys, Fla., and hammocks and pinelands, Florida Keys.—(W. I.)—All year. This vine, particularly in the pinelands, is often very vigorous. Its stems and numerous branches are intricately intertwined.

11. **TRACHELOSPERMUM** Lemaire. Vines with slender woody stems. Leaves opposite. Flowers relatively small. Calyx with glands within. Corolla funnelform.—About 6 species, North American and Asiatic.

1. **T. difforme** (Walt.) A. Gray. Stem extensively twining: leaf-blades ovate or oval to elliptic or lanceolate, 3–9 cm. long: calyx-lobes lanceolate-subulate, 3–4 cm. long; corolla greenish; tube 5–6 mm. long; lobes ovate, shorter than the tube: follicles 15–22 cm. long. [*Forsteronia difformis* A. DC.]—River-banks, low grounds, and swamps, Coastal Plain, and adj. provinces, Fla. to Tex., Ark., Ind., and Del.—(Mex.)—Spr. sum. The true relationships of this vine are uncertain. It has no close relatives geographically. Its associates in the present genus are in eastern Asia; the species of *Secondatia*, a genus in which it is sometimes included are South American.

12. **ALLAMANDA** L. Shrubs, trees, or woody vines. Leaves opposite, sometimes whorled. Flowers large, often showy. Calyx-lobes rather narrow. Corolla funnelform, with a cylindric tube, a campanulate throat, and broad lobes. Capsule subglobose, more or less compressed, echinate.—About 12 species, tropical.

1. **A. cathartica** L. Shrub mostly 1–3 m. tall, the twigs finely pubescent: leaf-blades oblanceolate to elliptic, 5–12 cm. long, mostly abruptly short-acuminate, glabrous except the veins beneath: flowers short-pedicelled: calyx-lobes lanceolate to elliptic-lanceolate: corolla yellow, 7–10 cm. long, the tube and throat about equal in length: the limb 6–8 cm. wide: capsule 4–6 cm. in diameter, densely prickly.—(ALLAMANDA.)—Roadsides and hammocks, pen. Fla. Nat. of S. Am. and cult.—(W. I., Mex., C. A.)—All year.

## FAMILY 2. ASCLEPIADACEAE—MILKWEED FAMILY

Perennial herbaceous or woody plants, with usually umbel-like cymes. Androeium of usually 5 stamens, with the anthers more adherent to the stigma than in *Apocynaceae*, the filament-appendages forming a crown with 5 lobes. Gynoeium of 2 carpels with the stigmas united; only one carpel usually maturing.—About 240 genera and 2,000 species, widely distributed.

Pollen granular, the grains grouped in 4's: caudicles spoon-shaped, without a corpuscle.

Pollen united in 2 waxy masses (pollinia): caudicles united by a corpuscle.

Pollinia pendulous: stigma not saucer-shaped nor cup-like: anthers tipped with a scarious membrane, the sacs lower than the top of the stigma.

Pollinia horizontal or nearly so: stigma saucer-shaped or cup-like: anthers scarcely or not at all tipped with a scarious membrane, the sacs on the margin of or close under the stigma.

## I. PERIPLOCEAE

Corolla rotate: follicles long-subulate, nearly terete, erect: cymes several-many-flowered.

Corolla funnelform: follicles short and stout, irregularly angled, divergent: cymes few-flowered.

## II. ASCLEPIADEAE

Crown double, the outer a shallow ring, the inner consisting of 5 fleshy hook-like scales.

Crown single.

Erect, ascending, or spreading herbs.

Corolla ellipsoid-campanulate: lobes erect.

Corolla rotate, the lobes spreading or reflexed in anthesis.

Corolla-lobes reflexed during anthesis: hoods of the crown crestless or each with a horn-like process.

Anther-wings corneous: pollinia longer than the caudicles.

Hoods of the crown without horns or crests.

Hoods of the crown each with an internal projecting horn.

Hoods scoop-like or trowel-like, with free edges, the horn free or partly adnate to the hood: flower-buds not flat-topped.

Hoods saccate or with the sides conduplicate and thus dorso-ventrally flattened, the tip of the horn protruding from the groove or slit on the inner side of the hood.

Hoods subglobose, inflated, the horn protruding from the groove between the 2 sacs: flower-buds flat-topped.

Hoods elongate, dorso-ventrally flattened, the horn protruding from the slit between the conduplicate edges: flower-buds not flat-topped.

Anther-wings membranous or papery: hoods of the crown ellipsoid-clavate, ascending and incurved over the anthers, each with a lamelliform crest within: pollinia shorter than the caudicles.

Corolla-lobes erect-spreading during anthesis: hoods of the crown pendulous or saccate at the base, curved upwards, obtuse, crested within, at least in the upper part.

Hoods of the crown involute, and hooded at the apex, crested above the middle: anthers rounded at the base.

Hoods of the crown concave, open at the apex: anthers sagittate at the base.

## I. PERIPLOCEAE.

## II. ASCLEPIADEAE.

## III. VINCETOXICEAE.

## 1. PERIPLOCA.

## 2. CRYPTOSTEGIA.

## 3. FUNASTRUM.

## 4. PODOSTIGMA.

## 5. ACERATES.

## 6. ASCLEPIAS.

## 7. BIVENTRARIA.

## 8. ONYPTERYX.

## 9. ANANTHERIX.

## 10. ASCLEPIODORA.

## 11. ASCLEPIODELLA.

Twining vines.

Petals slightly united at the base: column not elongate.

Crown-lobes each with an entire or cleft terminal appendage.

Crown-lobes entire or lobed.

Corolla-lobes glabrous within: crown-lobes broad.

Stigma flat: crown-lobes not notched.

Stigma conic: crown-lobes notched at the apex.

Corolla-lobes pubescent within: crown-lobes narrow.

Petals united to about the middle: column elongate.

12. GONOLOBUS.

13. AMPHISTELMA.

14. LYONIA.

15. METASTELMA.

16. EPICION.

### III. VINCETOXICEAE

Crown disk-like or saucer-shaped, obscurely, if at all ridged.

Corolla reticulate: column distinct, appendaged at the base or ridged.

Corolla not reticulate: column nearly obsolete, neither appendaged nor ridged.

Crown cup-shaped or incurved at the tip, usually crested or appendaged on the inner side.

Cymes long-peduncled, many-flowered: leaves large.

Cymes sessile, 1-5-flowered: leaves small.

17. CYCLODON.

18. VINCETOXICUM.

19. ODONTOSTEPHANA.

20. EDISONIA.

1. **PERIPLOCA** L. Slender twining, partly woody, vines. Leaf-blades broad, membranous. Cymes broad. Calyx-lobes spreading. Corolla rotate, inconspicuous, lobes pubescent within. Crown with lobed scales, each slender-appendaged, adnate to the corolla. Anthers merely connected at the apex, pubescent. Follicles slender.—About 12 species, Eurasian and African.

1. **P. graeca** L. Stem slender: leaf-blades elliptic to ovate, 6-10 cm. long, acuminate: Calyx-lobes ovate to deltoid: corolla-lobes broadly linear, 9-11 mm. long, brownish-purple and green-margined within: crown-appendages nearly as long as the corolla-lobes: follicles curved: seed fusiform, 9-11 mm. long.—(SILK-VINE).—Waste-places, fence-rows, and cult. grounds, various provinces, Fla. to Okla., Kans., and Mass. Nat. of Eu.—Sum.

2. **CRYPTOSTEGIA** R. Br. Stout woody sprawling vines. Leaf-blades broad, coriaceous. Cymes narrow. Calyx-lobes erect. Corolla funnelform, showy: lobes glabrous within. Crown with 5 entire or 2-lobed scales attached to the corolla. Anthers connate around the stigma, glabrous. Follicles stout.—Two species, in the Old World tropics.

1. **C. grandiflora** R. Br. Stem stout: leaf-blades oval, elliptic, or ovate, 5-10 cm. long, blunt: calyx-lobes lanceolate to ovate, acuminate: corolla-lobes broad, often ovate, 2-3 cm. long, about as long as the throat, white, pink, or rose-purple: crown-appendages shorter than the corolla-throat: follicles straight, 10-15 cm. long: seeds bottle-shaped,

7-8 mm. long.—(PINK-ALLAMANDA. RUBBER-VINE.)—Hammocks, roadsides, and waste-places, S Fla. Nat. of Africa?—(W. I.)

3. **FUNASTRUM** Fourn. Vines with narrow or broad leaf-blades. Calyx 5-lobed. Corolla rotate: lobes broad, glabrous within. Anthers coherent. [*Philibertia* B. & H. not H.B.K. *Philibertella* Vail.]—About 30 species, of tropical and subtropical America.

1. **F. clausum** (Jacq.) Schlecht. Leaf-blades 3-8 cm. long, ovate-elliptic to elliptic-lanceolate, rounded or subcordate at the base: peduncles twice as long as the leaves or more: calyx-lobes elliptic-lanceolate: corolla white; lobes elliptic to ovate, 4-5 mm. long: follicles 5-7 cm. long: seeds about 3 mm. long. [*Philibertia viminalis* A. Gray *Philibertella clausa* Vail]—Coastal hammocks and lake regions, pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—All year.

4. **PODOSTIGMA** Ell. Erect herbs, with narrow leaf-blades. Calyx-lobes 5. Corolla campanulate. Hoods incurved; blades remote from the anthers which are elevated on a slender column.—One species.

1. **P. pedicellata** (Walt.) Vail. Stem usually simple, 2-4 dm. tall; leaf-blades linear, lanceolate, or linear-elliptic, 2-6 cm. long: calyx-lobes lanceolate or elliptic-lanceolate, 2-2.5 mm. long: corolla yellowish or greenish-yellow; lobes linear-elliptic 7-8 mm. long: hoods 2.5-3 mm. long: follicles 11-15 cm. long.—Low pinelands, Coastal Plain, Fla. to N. C.—Spr.—fall.—A peculiar plant in our flora, the erect cylindraceous yellow or greenish-yellow corollas being unlike those of the other genera. The plants grow in pineland submerged parts of the year and send their elongate roots far down in the wet sand.

5. **ACERATES** Ell. Erect or spreading herbs, with narrow or relatively narrow leaf-blades. Calyx-lobes 5. Corolla rotate, green: lobes reflexed. Hoods approximate to the anthers, the column very short and stout, or slender, or wanting: follicles fusiform.—About 8 species, North American.—GREEN-MILKWEEDS.

Crown stalked; hoods oval or obovate: pollinia with short thick bases.

Hoods with erect tips: pedicels with curved-appressed hairs.

Crown ellipsoid: androecium much exceeding the crown.

Crown globose or depressed: androecium slightly exceeding the crown.

Hoods with spreading tips: pedicels with spreading hairs.

Crown not stalked; hoods elliptic to lanceolate: pollinia with slender stalk-like bases.

1. *A. floridana*.

2. *A. delticola*.

3. *A. hirtella*.

4. *A. viridiflora*.

1. *A. floridana* (Lam.) A. Hitchc. Plant 2-7 dm. tall, finely cinereous: leaf-blades narrowly linear, often elongate, to rarely narrowly linear-lanceolate: umbels usually slender-peduncled: pedicels strigillose: calyx-lobes triangular-ovate: corolla-lobes about 5 mm. long, or sometimes shorter, elliptic; crown about 2.5 mm. in diameter: follicles 9-11 cm. long: seed 10-11 mm. long. [*A. longifolia* Ell.]—Damp pinelands and prairies, Coastal Plain, and rarely adj. provinces, Fla. to Tex., Ark., and Del.—Spr.-sum. or all year S.

2. *A. delticola* Small. Plant similar to *A. floridana* in habit: leaf-blades lanceolate: umbels rather slender-peduncled: pedicels sparingly strigillose: calyx-lobes deltoid-ovate: corolla-lobes broader than in *A. floridana*: crown about 3.5 mm. in diameter: follicles not seen.—Low grounds, New Orleans, La.—Spr.-sum.

3. *A. hirtella* Pennell. Plant 6-10 dm. tall, densely cinereous: leaf-blades narrowly linear-lanceolate to linear, often numerous and elongate: umbels stout-peduncled: pedicels hirsutulous: calyx-lobes ovate-lanceolate: corolla-lobes fully twice the length of the calyx-lobes: crown somewhat more than half the length of the androecium: follicles 9-10 mm. long: seeds about 8 mm. long.—Prairies and roadsides, various provinces, Ala. to Okla., Ill., and Mich.—Sum.

4. *A. viridiflora* (Raf.) Eaton. Plant 2-6 dm. tall: leaf-blades lanceolate to ovate, elliptic, or oval, 4-12 cm. long: calyx-lobes lanceolate: corolla-lobes 5-6 mm. long: hoods 3-4 mm. long: anther-wings about 4 mm. long: follicles 8-12 cm. long: seed 7-8 mm. long.—Dry sterile soil, various provinces, Fla. to Tex., N. Mex., Sask., and Mass.—Spr.-sum.

6. **ASCLEPIAS** [Tourn.] L. Erect or spreading herbs, with narrow or broad leaf-blades. Calyx-lobes 5. Corolla rotate: lobes reflexed. Hoods of the crown trowel-like or scoop-like, erect or spreading, not adnate to the anther-column, the horn free, or partly adnate to the hood. Anther-wings salient at the base. Follicles ovoid or fusiform.—About 95 species, mostly American.—Sum.—MILKWEEDS. SILKWEEDS.

Crown longer than the androecium or slightly shorter; hoods rounded, obtuse, or truncate at the apex.

Corolla bright-colored, rarely white: crown white, maroon, or bright-colored, not green.

Follicles erect on deflexed pedicels.

Follicles smooth, glabrous or pubescent.

Leaves mostly scattered, not opposite: plant copiously pubescent.

Leaves mostly opposite or whorled.

Corolla orange-scarlet, red, or purple.

Corolla white or greenish-red.

Umbel solitary on an elongate terminal peduncle, or an accessory umbel sometimes present: hoods maroon.

Umbels usually several, axillary and terminal: hoods pale.

Stem prostrate: leaves vertical; blades sessile and cordate-clasping.

Stem erect: leaves not vertical; blades petioled and tapering at the base.

I. TUBEROSAE.

II. RUBRAE.

III. AMPLEXICAULES.

IV. HUMISTRATAE.

V. EXALTATAE.

Follicles echinate-warty, sometimes only near the tip.

Follicles erect on erect pedicels.

Flowers scarlet and yellow.

Flowers purplish, pink, or white.

Leaves merely opposite, not whorled.

Leaves, at least at some of the nodes, whorled in 4's or 6's.

Corolla green: crown green, greenish-white or yellow-tinged.

Follicles erect on deflexed pedicels.

Follicles erect on erect pedicels.

Crown about half as long as the androecium: hoods deeply sinuate by the projection of 2 acuminate lateral lobes: column none.

#### I. TUBEROSAE

Leaf-blades acute or acutish, lanceolate or lance-elliptic: horn very slender.

Calyx-lobes  $\frac{1}{3}$  the length of the corolla-lobes or less: hood narrowly elliptic.

Calyx-lobes nearly as long as the corolla-lobes: hoods obovate.

Leaf-blades obtuse and broadly rounded, pandurate: horn very stout.

#### II. RUBRAE

Corolla and crown orange-scarlet.

Corolla and crown red or purple.

Leaf-blades glabrate, or least beneath.

Leaf-blades ovate, ovate-lanceolate, or elliptic-lanceolate, acuminate, distinctly petioled.

Leaf-blades lanceolate to linear-lanceolate, attenuate, truncate or nearly cordate-clasping at the base.

Leaf-blades densely and softly pubescent beneath.

#### III. AMPLEXICAULES

A stiffly erect plant with spreading glossy leaves, the blades with crisped margins.

#### IV. HUMISTRATAE

Plant with one or several prostrate stems, the vertically placed leaves with white veins.

#### V. EXALTATAE

Umbel loosely flowered, the pedicels more or less nodding: flowers greenish-red.

#### VI. SYRIACAE

Tall herb with broad spreading leaves and with many-flowered umbels in the axils of some of them.

#### VII. CURASSAVICAE

Tall plant with bright-green leaves and showy flowers, the scarlet corolla and yellow crown very conspicuous.

#### VIII. INCARNATAE

Flowers pink or purplish: leaf-blades abruptly narrowed at the base, short-petioled or nearly sessile.

Plant nearly glabrous: leaf-blades narrow, lanceolate to lance-elliptic or nearly linear.

Plant softly and copiously hirsute: leaf-blades rather broad, broadly lanceolate to elliptic or ovate-lanceolate.

Flowers white: leaf-blades tapering to a long petiole.

#### IX. QUADRIFOLIAE

Slender plant with few leaves, the relatively few-flowered umbels with very slender pedicels.

#### X. TOMENTOSAE

Hoods much exceeding the androecium, the projecting tip slightly recurved: horn at about the middle of the hood.

Hoods about equalling the androecium, turgid, truncate and slightly fornicate; horn at the top of the hood.

Horn with the triangular or triangular-lanceolate tip only slightly exserted.

Horn with the subulate tip much exserted.

#### VI. SYRIACAE.

#### VII. CURASSAVICAE.

#### VIII. INCARNATAE.

#### IX. QUADRIFOLIAE.

#### X. TOMENTOSAE.

#### XI. VERTICILLATAE.

#### XII. CINEREA.

1. *A. decumbens*.

2. *A. tuberosa*.

3. *A. Rolfsii*.

4. *A. lanceolata*.

5. *A. rubra*.

6. *A. laurifolia*.

7. *A. purpurascens*.

8. *A. amplexicaulis*.

9. *A. humistrata*.

10. *A. exaltata*.

11. *A. syriaca*.

12. *A. curassavica*.

13. *A. incarnata*.

14. *A. pulchra*.

15. *A. perennis*.

16. *A. quadrifolia*.

17. *A. obovata*.

18. *A. aceratoides*.

19. *A. tomentosa*.

## XI. VERTICILLATAE

Hoods nearly equalling the androecium, the much exerted slender horns converging over its top: column about 1 mm. long.

20. *A. linearis*.

Upper leaves predominantly opposite; blades flat. Upper leaves predominantly whorled in 3's to 6's; blades revolute.

21. *A. verticillata*.

Hoods much exceeding the androecium, the horns not much exerted, flattened: column scarcely 0.5 mm. long.

22. *A. viridula*.

Umbels usually several in the upper leaf-axils: hoods erect or nearly so.

23. *A. Michauxii*.

Umbels usually terminal and solitary: hoods somewhat spreading.

## XII. CINEREA

Slender-stemmed plant with few pairs of leaves and few-flowered umbels: corolla-lobes tardily reflexed.

24. *A. cinerea*.

1. *A. decumbens* L. Stem decumbent or procumbent, 3-6 dm. long, hirsute or hispid: leaf-blades mainly elliptic to lanceolate with more or less hastate base, 3-19 cm. long, acutish: corolla-lobes 6-7 mm. long: horn arising above the hood-auricles, included only near the base: follicles mostly over 10 cm. long.—Dry fields, various provinces, Fla. to Tex., Ill., and N. Y., probably also further north.—Sum.—Corolla orange or nearly so.

2. *A. tuberosa* L. Stem mostly erect or ascending, 3-6 dm. tall, hirsute: leaf-blades usually lanceolate, varying to lanceolate-elliptic to linear-lanceolate, 3-9 cm. long, acute: corolla-lobes 5-6 mm. long: horn arising opposite the hood-auricles, about  $\frac{1}{2}$  included: follicles mostly less than 10 cm. long.—(BUTTERFLY-WEED. PLEURISY-ROOT.)—Dry fields, various provinces, Fla. to Tex., Ariz., Minn., Ont., and Me.—Sum.—fall.—Corolla bright-orange or yellow.

3. *A. Rolfsii* Britton. Stem erect or ascending, 1-3 dm. tall, hirsute: leaf-blades mainly broadly or narrowly pandurate, 3-7 cm. long, truncate or cordate at the base: corolla-lobes elliptic, 6-7 mm. long: horn arising below the hood-auricles, very stout, about  $\frac{1}{2}$  included: follicles 9-14 cm. long.—Pinelands, Coastal Plain, Fla. to S. C.—Spr.—sum. or all year S.—Corolla orange.

4. *A. lanceolata* Walt. Stem 4-11 dm. tall, glabrous or nearly so: leaves few, distant; blades elongate-linear, linear-lanceolate, or narrowly lanceolate, mostly 1-2.5 dm. long, tapering to the base: corolla-lobes elliptic, 8-9 mm. long, red: hoods ovate, less than twice as long as the androecium, orange-red, rounded at the apex: horn narrowly lanceolate, much shorter than the hood: follicles 7-10 cm. long.—In acid swamps, Coastal Plain, Fla. to Tex. and N. J.—Sum.

5. *A. rubra* L. Stem 3-12 dm. tall, glabrous: leaf-blades ovate, ovate-lanceolate, or elliptic-lanceolate, 7-20 cm. long: corolla-lobes purple-red or rarely purplish-green, 7-8 mm. long: hoods lanceolate, about 6 mm. long, orange-tinged, about twice as long as the androecium: horn slender-subulate, nearly as long as the hood: follicles 9-11 cm. long.—Acid swamps and moist grounds, Coastal Plain and rarely inland provinces, Fla. to Tex., W. Va., and N. J.

6. *A. laurifolia* Michx. Stem 8-11 dm. tall, almost glabrous: leaf-blades lanceolate to linear-lanceolate, mostly 1-3 dm. long: corolla-lobes reddish-purple, 9-10.5 mm. long: hoods 4-4.5 mm. long, purplish, much exceeding the androe-

cium, rounded at the apex; horn subulate, much shorter than the hood: follicles 8-11 cm. long.—Swamps and low pinelands, Coastal Plain, Fla. to Tex. and Ga.—Spr.—sum.

7. *A. purpurascens* L. Stem 3-12 dm. tall, pubescent in lines or becoming glabrous: leaf-blades mainly ovate or elliptic-ovate, 9-20 cm. long: corolla-lobes purple, 8-10 mm. long: hoods 4.5-5 mm. long, fully twice as long as the androecium, ovate at the entire apex; horn much shorter than the hood, with a horizontal subulate tip: follicles 10-12 cm. long.—(PURPLE-MILKWEED.)—Dry grounds, various provinces, N. C. to Okla., Kans., Minn., and N. H.; reported also from Miss.—Sum.

8. *A. amplexicaulis* J. E. Smith. Stem erect, 3-10 dm. tall, glaucous: leaf-blades horizontal, elliptic, 6-12 cm. long, sessile and clasping: corolla-lobes greenish-red or greenish-purple, 7-9.5 mm. long: hoods about 4 mm. long, maroon, exceeding the androecium, shallowly several lobed at the truncate apex: horn subulate, much exserted; follicles 8-16 cm. long. [*A. obtusifolia* Michx.]—In dry or sandy soil, various provinces, Fla. to Tex., Nebr., and N. H.

9. *A. humistrata* Walt. Stem prostrate, 3-9 dm. long, glaucous: leaf-blades vertical, alike on both sides, ovate, 5-13 cm. long, glaucous, white-veined: corolla-lobes gray or greenish-purple, 6-7 mm. long: hoods about 3.5 mm. long, white, much exceeding the androecium, broadly rounded; horn broad and flat, scarcely exserted: follicles 8-15 cm. long.—Pinelands, scrub and sandhills, Coastal Plain, Fla. to Miss. and N. C.—Spr.—sum.

10. *A. exaltata* (L.) Muhl. Stem 9-15 dm. tall, sometimes pubescent in lines above: leaf-blades ovate, oval, elliptic or elliptic-lanceolate, 1-2.5 cm. long: corolla-lobes greenish or greenish-purple, 7-10 mm. long: hoods 3.5-4 mm. long, white or flushed with pink, about equalling the androecium, truncate, the broad top irregularly lobed, the lateral lobes the longest; horn with a much exserted subulate incurved tip: follicles 10-16 cm. long.—(POKE-MILKWEED.)—In thickets and moist woods, various provinces, Ga. to Miss., Minn., and Me.

11. *A. syriaca* L. Stem 5-15 dm. tall, usually sparingly pubescent: leaf-blades elliptic or elliptic-ovate, 9-25 cm. long: corolla-lobes pinkish-purple, 6-8 mm. long: hoods usually white, sometimes pink-tinged, 3-4 mm. long, exceeding the androecium, obtuse; horn subulate, shorter than the hood: anther-wings much longer than wide; follicles 7-9 cm. long, echinate.—(COMMON-MILKWEED.)—Fields and waste-places, various provinces, Ga. to Kans., Sask., and N. B.

12. *A. curassavica* L. Stem 3-19 dm. tall, sometimes minutely pubescent above: leaf-blades elliptic to elliptic-lanceolate, 5-12 cm. long or more, glabrous or nearly so: corolla-lobes scarlet, 6-8 mm. long: column 1-1.5 mm. long: hoods ovate, 3.5-4 mm. long, yellow, exceeding the androecium; horn stout, incurved, exceeding the hood: follicles 6-10 cm. long.—In sandy soil, Coastal Plain, W. Fla. and La.—All year.

13. *A. incarnata* L. Stem 6-11 dm. tall, glabrous or nearly so: leaf-blades mainly elliptic-lanceolate, lanceolate, or linear-lanceolate, 4-17 cm. long, glabrous or nearly so: corolla-lobes pink or rarely white, 4-6 mm. long: hoods ovate, purplish-pink, 2.5-3 mm. long, somewhat exceeding the androecium; horn slender, much longer than the hood: follicles 7-9 cm. long.—(SWAMP-MILKWEED.)—Swamps, various provinces, N. C. to La., N. W. Terr., Ont., and N. B.—Sum.

14. *A. pulchra* Ehrh. Stem 5-15 dm. tall, closely pubescent: leaf-blades broadly lanceolate to elliptic, 6-12 cm. long, pubescent: corolla-lobes bright-pink to purple or rarely white, 5-6 mm. long: hoods ovate, deep-pink, about 2.5 mm. long, slightly exceeding the androecium; horn slender, much longer than the hood: follicles 5-8 cm. long.—In moist fields and swamps, various provinces, Ga. to Minn. and Me.—Sum.—fall.

15. *A. perennis* Walt. Stem 3-9 dm. tall, often branched, puberulent in lines above: leaves opposite; blades elliptic, elliptic-lanceolate, or lanceolate, 5-15 cm. long, glabrous or nearly so: umbels solitary or few in a terminal corymb, the pedicels glabrous: corolla-lobes mainly white, 2.5-3.5 mm. long: hoods about 2 mm. long, scarcely exceeding the androecium; horn very slender, much exceeding the hood: column nearly 1 mm. long: follicles 5-8 cm. long: seeds 9-12 mm. long.—Moist woods and swamps, often in clayey soil, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Ind.—Spr.-sum.

16. *A. quadrifolia* Jacq. Stem 3-6 dm. tall, simple, sometimes puberulent in lines: leaves opposite, or whorled in 3's or 4's at one or more nodes; blades ovate-elliptic or lanceolate, 4-10 cm. long: umbels solitary or 2 or 3, the pedicels mostly 1.5-2 cm. long: corolla-lobes pink or nearly white, 5-6 mm. long: hoods 3.5-4 mm. long, about twice as long as the androecium; horn slender, much shorter than the hood: follicles 10-12 cm. long: seeds 5-6 mm. long.—Dry soil, woods and thickets, various provinces, N. C. to N Ala., Ark., Minn., Ont., and Me.—Spr.

17. *A. obovata* Ell. Stem 4-11 dm. tall, softly pubescent: leaf-blades obovate to oval or elliptic, 3-10 cm. long, closely pubescent: umbels terminal and in the upper leaf-axils, the densely hairy pedicels up to 1 cm. long: corolla-lobes greenish-yellow, 9-10 mm. long: hoods 5-6 mm. long, nearly twice as long as the androecium; horn falcate or lanceolate, arising about the middle of the hood, horizontally spreading: anthers about 2.5 mm. long: follicles 8-12 cm. long.—Dry grounds, Coastal Plain, Fla. to Tex. and S. C.—Sum.

18. *A. aceratoides* M. A. Curtis. Stem 3-5 dm. tall, tomentulose: leaf-blades oblanceolate to elliptic or elliptic-ovate, 7-12 cm. long: umbels few-flowered, very lax: corolla-lobes greenish, 8-10 mm. long: hoods truncate, about 4 mm. long, scarcely equalling the androecium; horn very broad, horizontally incurved: follicles not seen.—Sandy pine woods, Coastal Plain, S. C. and N. C.—Spr.

19. *A. tomentosa* Ell. Stem 3-12 dm. tall, softly pubescent: leaf-blades mainly elliptic to ovate, 5-8 cm. long: umbels several-many-flowered, rather lax: corolla-lobes greenish, 9-11 mm. long: hoods about 4 mm. long, truncate, about equalling the androecium; horn broad, horizontal and slightly incurved: follicles 10-13 cm. long.—Dry sandy soil and high pinelands, Coastal Plain, Fla. and Ga.—Spr.-sum.

20. *A. linearis* Scheele. Stem solitary or few together, 2-8 dm. tall, minutely pubescent in lines: leaf-blades narrowly elongate-linear, 4-12 cm. long: umbels usually several in the upper leaf-axils, the pedicels about 1 cm. long: corolla-lobes greenish-white, elliptic, 3-3.5 mm. long: hoods nearly 1.5 mm. long, about equalling the androecium; horn about twice as long as the hood: column about 1 mm. long: follicles 7-9 cm. long. [*A. galioides* (Fl. SE. U. S.)]—In damp clay soil, Coastal Plain, Ala. to Tex.—Sum.-fall.

21. *A. verticillata* L. Stem 3-8 dm. tall, commonly pubescent in lines: leaf-blades very narrowly linear to linear-filiform, 2-6 cm. long: umbels few to several in the upper leaf-axils: corolla-lobes greenish-white, 3-4 mm. long: hoods about 1 mm. long, about equalling the androecium or shorter; horn slender, about twice as long as the hood: follicles 7-12 cm. long.—In dry and sterile soil, various provinces, Fla. to Tex., Nebr., Sask., Ont., and Mass.—Spr.-sum. or all year S.

22. *A. viridula* Chapm. Stems often solitary, 3-7 dm. tall, pubescent in lines, at least above: leaf-blades narrowly linear, 2.5-10 cm. long: umbels usually 3 or more in the upper axils, few-flowered, the pedicels up to 1 cm. long: corolla-lobes greenish, elliptic or obovate-elliptic, 3-4 mm. long: hoods 2.5-3 mm. long, exceeding the androecium; horn flat, equalling the hood: follicles 8-10 cm. long.—Wet pinelands, Appalachicola region, Fla.—Sum.-fall.

23. *A. Michauxii* Deene. Stems usually several together, 1-13 dm. tall, minutely pubescent: leaf-blades linear, often narrowly so, 4-9 dm. long: umbels many-flowered, the pedicels 1-1.5 cm. long: corolla-lobes greenish, elliptic, 5-6 mm. long: hoods 3-3.5 mm. long, exceeding the androecium; horn stoutish, shorter than the hood: column about 0.5 mm. long: follicles 8-14 cm. long.—Pinelands and sandhills, Coastal Plain, Fla. to Miss. and S. C.—Spr.

24. *A. cinerea* Walt. Stem 3-5 dm. tall, sometimes slightly pubescent in lines: leaf-blades narrowly linear or filiform, 3-9 cm. long: umbels usually paired at the top of the stem and additional ones often in the upper axils, the pedicels mostly 1.5-2 cm. long: corolla-lobes purplish, 5-7 mm. long: hoods about 3 mm. high, much shorter than the androecium, each with 2 lateral acute lobes which exceed the broad horn: anthers about 2 mm. long: follicles 8-10 cm. long.—Rather dry pinelands, Coastal Plain, Fla. to Miss. and S. C.—Spr.—sum.

7. **BIVENTRARIA** Small. Erect herbs with broad leaf-blades. Umbels solitary or paired, or sometimes 3 or 4 at the top of the stem. Calyx-lobes 5. Corolla rotate: lobes reflexed. Hoods erect, free, saccate, the two inflated sacs flat on the back, with a groove on the inner side from which the flat horn projects horizontally. Anther-wings curved upward from the base and salient just below the middle. Follicles fusiform. Seed with a coma.—One species.

1. *B. variegata* (L.) Small. Stem 3-9 dm. tall, glaucous, sometimes pubescent above: leaf-blades typically oval, varying to ovate or obovate, 6-14 cm. long: corolla-lobes white, 6-8 mm. long: hoods about 3 mm. long, inflated, at the broadly rounded apex, much exceeding the androecium; horn very broad, protruding horizontally: follicles 8-14 cm. long. [*Asclepias variegata* L.]—Dry shaded grounds, in rather acid soil, various provinces, Fla. to Tex., Ill., and Conn.—Spr.—sum.

8. **OXYPTERYX** Greene. Erect herbs with the habit of *Acerates*, the leaf-blades broad. Umbels mostly lateral. Calyx-lobes 5. Corolla rotate: lobes reflexed. Hoods erect, elongate, free, distinctly stalked, with the sides conduplicate, the body thus dorsiventrally flattened, the free tip of the horn which is adnate to the midrib of the hood up to the middle, horizontally protruding from the slit between the edges of the hood and curved upward near the apex. Anther wings deltoid, protruding between the hood-claws. Follicles erect, fusiform. Seed with a coma.—One species.

1. *O. Curtissii* (A. Gray) Small. Stem decumbent or ascending, 5-7 dm. long, minutely pubescent, sometimes widely branched: leaf-blades broadly elliptic to oval, varying to broadest above the middle or below it, 3-5 cm. long, glabrous or

nearly so: umbels many-flowered, the pedicels slender, sparingly pubescent: corolla-lobes greenish-white, lanceolate, 5.5–6 mm. long: hood lanceolate, 4–4.5 mm. long, fully twice as long as the androecium: anthers about 1.5 mm. long: follicles 8–11 cm. long. [*Asclepias Curtissii* A. Gray *A. aceratoides* Nash *A. arenicola* Nash]—Sandhills and scrub, pen. Fla.—Spr.–fall.

9. **ANANTHERIX** Nutt. Upright herbs, with relatively narrow leaf-blades. Calyx-lobes 5. Corolla rotate: lobes reflexed. Hoods relatively long, the tips converging high over the stigma. Pollinia shorter than the caudicles. Follicles fusiform.—One species.

1. **A. connivens** (Baldw.) Feay. Plant 3–6 dm. tall: leaf-blades elliptic to lanceolate, 3–8 cm. long, fleshy: peduncles longer than the pedicels: umbels 2–6, borne along the naked or nearly naked upper part of the stem: corolla greenish; lobes 9–10.5 mm. long: hoods white, incurved, 8 mm. long: anthers 3.5 mm. long; follicles 8–9 cm. long.—Moist pinelands and bogs, Coastal Plain, Fla. to Miss. and Ga.—Sum.—The perpendicular root is deep-seated in wet sand.

10. **ASCLEPIODORA** A. Gray. Spreading herbs with alternate leaves. Calyx-lobes 4. Corolla rotate: lobes spreading. Hoods involute and hooded at the apex, with an internal ridge above the middle. Anthers equaling the gynostegium: wings rounded at the base.—About 6 species, North American.

1. **A. viridis** (Walt.) A. Gray. Stem 2–6 dm. long, stout: leaf-blades elliptic to lanceolate, 6–10 cm. long, rather thin: calyx-lobes about 4 mm. long, ciliolate: corolla-lobes greenish, 10–11 mm. long: hoods about 4.5 mm. long, purplish or violet: anther-wings 2.5 mm. long: follicles 6–11 cm. long.—Pinelands, open woods, and fields, various provinces, Fla. to Tex., Kans., Tenn., and S. C.—Spr.–sum.

11. **ASCLEPIODELLA** Small. Upright herbs, with opposite leaves. Calyx-lobes 5. Corolla rotate: lobes spreading. Hoods concave, open at the apex, ridged within mainly below the middle. Anthers curving over the top of the gynostegium: wings sagittate at the base.—One species.

1. **A. Feayi** (Chapm.) Small. Stem 2–4 dm. tall, slender: leaf-blades linear-filiform, 3–10 cm. long: calyx-lobes 1.5–2 mm. long: corolla-lobes white, 6–7 mm. long: hoods 2.5–3 mm. long, white: anther-wings barely 3 mm. long: follicles 3–4.5 cm. long. [*Asclepiodora Feayi* Chapm.]—Pinelands, Fla.—Spr.–fall.—This small milkweed is nowhere plentiful, but occurs as scattered plants in the open pinewoods. The slender stem and very slender leaves are out of proportion to the rather large pale flowers.

**12. GONOLOBUS** Michx. Vines, with broad leaf-blades. Calyx-lobes longer than the corolla-tube. Corolla campanulate: lobes spreading or reflexed at the tip. Crown borne near the base of the anthers: lobes each terminating in an entire or cleft appendage. Anther-wings salient at the base. Stigma with an elevated lobed top. Follicles wing-angled.—Three species, North American.

**1. G. laevis** Michx. Leaf-blades ovate, 4–15 cm. long, acuminate at the apex, cordate at the base: calyx-lobes 2–2.5 mm. long: corolla whitish; lobes 4–4.5 mm. long, linear-lanceolate: crown-lobes about 4 mm. long, the slender appendages quite as long as the body: anther-wings barely 1 mm. long: follicles 9–10 cm. long. [*Enslenia albida* Nutt.].—Thickets and river-banks, various provinces, Fla. to Tex., Kans., and Pa.—Sum.

**13. AMPHISTELMA** Griseb. Slender vines, with narrow leaf-blades. Calyx-lobes longer than the corolla-tube. Corolla rotate-campanulate: lobes glabrous within. Crown adnate to the column, sessile on the base of the corolla, cup-like: lobes very broad, surpassed by the androeceum. Stigma flat.—About 25 species, tropical American.

**1. A. scoparia** (Nutt.) Small. Diffuse vine: leaf-blades narrowly linear, 2–5 cm. long: calyx-lobes about 1 mm. long, deltoid, corolla-lobes greenish, 1.5–2 mm. long: crown-lobes about 0.5 mm. long: follicles 3.5–4.5 cm. long.—Hammocks, Coastal Plain, Fla. to S. C.—Spr.—fall.—This plant is often quite leafy when young, but as it develops and makes myriad branches, the leaves fall off or fail to develop. The ultimate growth is sometimes sufficiently abundant to smother a host.

**14. LYONIA** Ell. Slender vines, with narrow leaf-blades. Calyx-lobes longer than the corolla-tube. Corolla rotate-campanulate: lobes spreading at the tip, glabrous within. Crown adnate to the short column: lobes naked at the apex, longer than the androeceum. Stigma conic.—One species.

**1. L. palustris** (Pursh) Small. Leaf-blades linear, 2–7 cm. long, acute, pendent: calyx-lobes lanceolate, about 2.5 mm. long: corolla-lobes purplish or greenish-white, 3–4 mm. long: crown-lobes 1.5–2 mm. long, retuse or emarginate at the apex: anther-wings about 1 mm. long: follicles 4.5–5.5 cm. long. [*Seutera maritima* Deene. *S. palustris* Vail].—Hammocks and salt-marshes, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)—Spr.—fall.

15. **METASTELMA** R. Br. Slender vines, with narrow leaf-blades. Calyx-lobes longer than the corolla-tube. Corolla rotate-campanulate: lobes pubescent within. Crown adnate to the base of the corolla-tube: lobes slender, curved over the anthers. Stigma flat.—About 25 species, mostly tropical American.

1. **M. Blodgettii** A. Gray. Leaf-blades linear or linear-lanceolate, 8-27 mm. long: calyx-lobes broadly ovate about 1 mm. long: corolla whitish; lobes 2-2.5 mm. long, penicillate-bearded within: crown-lobes subulate: follicles 4-5 cm. long.—Hammocks and sand-dunes, S Fla. and S Tex.—Spr.-fall.—As in the case of *Amphistelma* this plant often makes copious growth over bushes, but it generally holds its leaves.

16. **EPICION** Small. Slender vines, with relatively broad leaf-blades. Calyx-lobes shorter than the corolla-tube. Corolla campanulate: lobes pubescent within. Crown adnate to the top of the elongate column: lobes narrow. Stigma flat or depressed.—Three or four species, tropical American.

1. **E. Northropiae** (Schlecht.) Small. Leaf-blades elliptic to oval, 1.5-2.5 cm. long, slender-petioled: calyx-lobes ovate, 1.5 mm. long: corolla white; lobes 2.5-3 mm. long, longer than the tube, obtuse: crown-lobes 1.5 mm. long: follicles 5-6.5 cm. long. [*Metastelma Northropiae* Schlecht.]—Hammocks and pinelands, Everglade Keys, Fla. and Florida Keys.—(W. I.)—All year.—*E. bahamense*, formerly recorded for Florida, is confined to the Bahamas and Cuba. *Northropiae*, with a short corolla-tube and a

It has smaller flowers than *E. Northropiae*, with a short corolla-tube and a very short gynostegium.

17. **CYCLODON** Small. Stout twining vines. Leaf-blades broad, with an open basal sinus. Cymes few-flowered, short-peduncled. Calyx-lobes 5, longer than the corolla-tube. Corolla rotate, glabrous within: lobes relatively wide. Crown an irregularly 5-lobed disk, the lobes erose. Column distinct, with 5 horn-like appendages free or adnate at its base. Follicles armed.—Several species, mainly tropical.

1. **C. alabamense** (Vail) Small. Stem short-pubescent: leaf-blades ovate to elliptic-ovate, 6-15 cm. long, the basal lobes not overlapping: calyx-lobes ovate, hirsute, the basal glands in pairs: corolla mainly greenish-yellow; lobes elliptic, 6-7 mm. long,

pubescent without, reticulate: follicles stout-fusiform, about 9 cm. long, covered with fleshy spines: seeds nearly 1 cm. long. [*Vincetoxicum alabamense* Vail]—Hillsides and thickets, Coastal Plain, Ala.—Sum.—fall.

**18. VINCETOXICUM** Walt.<sup>1</sup> Stout twining, usually pubescent vines. Leaves with broad cordate blades. Cymes usually peduncled. Calyx-lobes 5, usually glabrous, longer than the corolla-tube. Corolla rotate, glabrous or puberulent within: lobes relatively narrow. Crown a fleshy disk at the base of the gynostegium, 5-lobed, with an obscure rib dividing each lobe, thus making it appear 10-lobed. Follicles unarmed, wing-ridged toward the apex, glabrous.—Several species, mainly North American.—ANGLE-PODS.—Spr.—sum.

Corolla-lobes glabrous within, more than twice as long as the calyx-lobes.

1. *V. gonocarpos*.

Corolla-lobes pubescent within, twice as long as the calyx-lobes or less.

2. *V. suberosum*.

1. *V. gonocarpos* Walt. Leaf-blades broadly ovate to ovate-elliptic, 7–18 cm. long, the basal sinus sometimes broad or with the lobes overlapping; petioles pubescent: flowered-buds long-conic: calyx-lobes glabrous, rarely ciliate near the tip, 2–4 mm. long: corolla greenish; lobes glabrous, lance-linear, 9–14 mm. long: follicles smooth, 8–10 cm. long. [*Gonolobus macrophyllus* Michx.]—River-banks and thickets, various provinces, Ga. to Tex., Mo., and Ky.

2. *V. suberosum* (L.) Britton. Leaf-blades elliptic-ovate to elliptic-oval, 6–12 cm. long, the basal sinus shallow, the lobes not overlapping: petioles glabrate: flower-buds broadly conic: calyx-lobes 3–4.5 mm. long: corolla brown-purple or yellowish with a dark center; lobes pubescent within, lanceolate, 6–9 mm. long: follicles smooth, 10–14 cm. long. [*Gonolobus suberosus* R. Br.]—Thickets and river-banks, Coastal Plain, Fla. to La. and Va.

*Metalepis cubensis* (A. Rich.) Griseb. of Cuba, a vine with ovate to hastate leaf-blades, a single crown in the flower and ovoid, oval, or obovoid melon-like fruits 1–2 dm. long, has been found in Brickell Hammock, Miami, Fla.

**19. ODONTOSTEPHANA** Alexander.<sup>1</sup> Stout twining vines resembling *Vincetoxicum*, the stems usually pubescent. Leaves with broad, usually large, cordate blades. Cymes dense, peduncled. Calyx-lobes 5, pubescent, longer than the corolla-tube. Corolla rotate, pubescent without: lobes relatively narrow. Crown cup-shaped, usually appearing 10-lobed, the longer lobes usually erect and toothed with the shorter lobes usually incurved, toothed or entire, and also crested or appendaged on the inside, the appendage as broad as the lobe. Follicles armed with fleshy spines. [*Vincetoxicum* Walt. in part.]—Several species, American.—SPINY-PODS.—Sum. or spr. S.

Crown appearing 10-lobed, each lobe entire or 2-toothed.

Corolla purple, brownish or reddish; crown thick-fleshy, the lower lobes entire.

Narrower lobes of the crown prominently 2-toothed, markedly longer than the broader lobes.

Corolla-lobes usually 10–15 mm. long, lance-linear: buds ellipsoid-ovoid to conic.

1. *O. decipiens*.

<sup>1</sup> Contributed by Edward Johnston Alexander.

Corolla-lobes usually 7–10 mm. long, narrowly elliptic; buds short-ovoid.

Narrower lobes of the crown truncate or emarginate, not markedly longer than the broader lobes.

Crown undulate-lobed, the crest double.

Crown crenate-lobed, the crest if present, a narrow fold or ridge.

Corolla white or yellowish: crown-thin, the lower lobes 2-toothed.

Lower lobes only cleft to above the middle, the teeth of the slender lobes far surpassing them.

Lower lobes cleft well below the middle, surpassed by the broader bluntly toothed lobes.

Crown appearing 5-lobed, each lobe 4-toothed.

2. *O. carolinensis*.

3. *O. obliqua*.

4. *O. Shortii*.

5. *O. Baldwiniana*.

6. *O. flavidula*.

7. *O. floridana*.

1. *O. decipiens* Alexander. Leaf-blades ovate, 7–12 cm. long, the sinus narrow or closed: flower-buds ellipsoid-ovoid or conic: calyx-lobes about 3 mm. long: corolla brown-purple; lobes lance-linear, 10–15 mm. long: crown with the longer lobes usually 2-toothed, the broader lobes appendaged or crested; follicles 8–10 cm. long.—Woods and stream-banks, in rather acid soil, Coastal Plain and occasionally adj. provinces, S. C. to Okla., Mo., and Md.—The variability of the crown of this and the following species is most confusing, but the larger flowers and narrower corolla lobes of this species easily separate it.

2. *O. carolinensis* (Jacq.) Alexander. Leaf-blades ovate, 5–11 cm. long, the sinus open or closed: flower-buds short-ovoid: calyx-lobes about 3 mm. long: corolla reddish or rarely pale; lobes narrowly elliptic, 7–10 mm. long: crown with the longer lobes usually 2-toothed, the broader lobes entire, crested or appendaged within: follicles 9–11 cm. long. [*Cynanchum carolinense* Jacq. *Gonolobus carolinensis* R. Br. *G. hirsutus* Michx. *V. hirsutum* Britton *V. floridanum* Vail.]—Woods and thickets, various provinces, Fla. to Miss., Tenn., and Md.—The crown of this and the preceding species is extremely variable, from fleshy to thin, and with the crest of the shorter lobes, from a mere ridge to a ligule-like appendage, sometimes with a fringe-like appendage on the outside as well.

3. *O. obliqua* (Jacq.) Alexander. Leaf-blades broadly ovate to orbicular-ovate, 7–20 cm. long, the basal lobes mostly forming a closed sinus by the overlapping edges: calyx-lobes about 3 mm. long: corolla reddish-purple; lobes lance-linear, 9–1½ mm. long: crown with the longer lobes truncate or emarginate: follicles 7–9 cm. long: seeds about 7 mm. long. [*Gonolobus obliquus* R. Br. *Vincetoxicum obliquum* Britton]—Woods, thickets, and river-banks, in rich soil, various provinces, N of Coastal Plain, Tenn. to Ohio, Pa., and N. C.

4. *O. Shortii* (A. Gray) Alexander. Leaf-blades broadly ovate, 5–14 cm. long, the basal lobes often forming a narrow sinus: calyx-lobes about 4 mm. long: corolla greenish-purple; lobes lance-linear, 11–15 mm. long: crown with the longer lobes truncate or emarginate: follicles 8–10 cm. long: seeds about 8 mm. long. [*Gonolobus Shortii* A. Gray *Vincetoxicum Shortii* Britton]—Dry woods, Appalachian provinces, Ga. to Ky. and Pa.—The flowers are said to have the scent of *Calycanthus* flowers.

5. *O. Baldwiniana* (Sweet) Alexander. Leaf-blades broadly ovate, 6–14 cm. long, deeply and somewhat obliquely cordate at the base, the sinus open or the basal lobes of the larger leaves overlapping: flower-buds long-conic: calyx-lobes 2–3 mm. long: corolla white or yellowish: lobes thin, erect or barely spreading: oblong-linear, 9–11 mm. long: crown very thin, with the longer lobes divided into two very slender linear teeth fully double the length of the

rather quadrate shallowly toothed broader lobes: follicles about 8 cm. long: seeds about 9 mm. long. [*Gonolobus Baldwinianus* Sw. *Vincetoxicum Baldwinianum* Britton].—Thickets and open woods, various provinces, Ga. to Okla. and Mo.—Spr. and sum.

6. *O. flavidula* (Chapm.) Alexander. Leaf-blades broadly ovate, 9–16 cm. long, the basal lobes rarely overlapping: flower-buds ovoid: calyx-lobes about 3.5 mm. long: corolla greenish-yellow; lobes elliptic, 10–11 mm. long: crown with the longer lobes shallowly toothed: follicles 14–17 cm. long. [*Gonolobus flavidulus* Chapm. *Vincetoxicum flavidulum* Heller]—Rich soil, mostly in woods, Coastal Plain, Fla. to S. C.

7. *O. floridana* (Vail) Alexander. Leaf-blades ovate-cordate, 2–5 cm. long, the sinus open and somewhat oblique: calyx-lobes about 2 mm. long: flower-buds conic: corolla purplish or greenish-purple, about 5 mm. long, the lobes spreading, linear-lanceolate: crown with five broad lobes, each bidentate at the callous-thickened apex and with a smaller tooth on each side at about the middle: follicles not seen. [*Vincetoxicum floridanum* Vail].—Sandy soil, E Fla.—Sum.

20. **EDISONIA** Small. Slender prostrate vine-like herbs. Leaf-blades broad but small. Cymes sessile. Calyx-lobes 5, about as long as the corolla-tube. Corolla campanulate: lobes villous within, short. Crown 5-lobed, each lobe with an appendage which is decurrent on the inner side, each sinus folded as if to form another lobe. Column sunken in a cavity beneath the converging crown-lobes.—One species.

1. *E. pubiflora* (Decne.) Small. Leaf-blades broadly cordate or reniform, 2–4 cm. long, the sinus open: flower-buds oval or obovoid: calyx lobes 2–2.5 mm. long: corolla dull-purple; lobes about 2 mm. long: crown with 10 rounded undulations, each alternate one with an adnate beak or horn: follicle ovoid-fusiform, 4–5 cm. long. [*Chthamalia pubiflora* Decne. *Gonolobus pubiflorus* Engelm. *Vincetoxicum pubiflorum* Vail]—Sandhills and scrub, Coastal Plain, Fla. and Ga.—Spr.-sum.

## ORDER POLEMONIALES—POLEMONIAL ORDER

Herbs, sometimes parasitic, shrubs or trees. Flowers mainly perfect. Calyx of partially united sepals. Corolla, regular or irregular. Androeceum of as many stamens as there are corolla-lobes, or fewer. Gynoecium 2–several carpellary. Ovary superior. Fruit a capsule, a berry or a drupe, or a group of nutlets or utricle-like.

Stamens 5, usually equal; corolla regular or nearly so.

Gynoecium of 2 distinct carpels.

Gynoecium of 2 or more partially or wholly united carpels.

Fruit capsular or baccate: ovary not 4-lobed.

Styles or stigmas distinct.

Ovary 1–2-celled, or 4-celled: stigmas 2.

Ovary 2-celled or 4-celled.

Corolla unappendaged within: plants with normal leaves, at least if vines.

Corolla appendaged within: parasitic vines: leaves scale-like.

Fam. 1. DICHONDRACEAE.

Fam. 2. CONVULVACEAE.

Fam. 3. CUSCUTACEAE.

- Ovary 1-celled (2-celled in *Nama*).  
 Ovary 3-celled: stigmas 3.  
 Calyx-lobes imbricated: corolla mostly  
 plaited in the bud.  
 Calyx-lobes valvate: corolla merely  
 convolute in the bud.  
 Styles or stigmas wholly united.  
 Fruit drupaceous, or of 2 or 4 nutlets.  
 Style or stigmas without a glandular ring.  
 Fruit a group of 2 or 4 nutlets: style  
 arising from between the lobes of the  
 ovary.  
 Fruit drupaceous: style terminating the  
 lobeless ovary.  
 Style or stigmas with a glandular ring.  
 Stamens 4 and didynamous, or 1 or 2: corolla usually  
 irregular and bilabiate.  
 Carpels ripening into a group of 4 nutlets, an  
 achene or a drupe.  
 Style apical on the lobeless ovary.  
 Ovary 2-celled.  
 Fruit dry or drupaceous, with 2 or 4 nut-  
 lets.  
 Fruit fleshy-capsular, with a solitary seed.  
 Ovary 1-celled.  
 Style arising between the 4 lobes of the ovary.  
 Carpels ripening into a capsule.  
 Placentae of the ovary axile.  
 Ovary 2-celled, or rarely 3-5-celled.  
 Corolla-lobes imbricated: capsule not  
 elastically dehiscent.  
 Corolla-lobes convolute: capsules elasti-  
 cally dehiscent.  
 Ovary 1-celled.  
 Placentae of the ovary parietal.  
 Herbs parasitic on the roots of other plants:  
 leaves scale-like: foliage not green.  
 Trees, shrubs or woody vines, or herbs, but  
 not parasitic: leaves not scale-like:  
 foliage green.  
 Ovary and capsule 2-celled: trees, shrubs  
 or woody vines: seeds winged.  
 Ovary and capsule 1-celled or spuriously  
 2- or 4-celled: herbs, seeds wingless.  
 Anther-sacs parallel: fruit a colum-  
 nar, crestless dry capsule.  
 Anther-sacs divergent: fruit a ven-  
 tricose, fleshy coated capsule.
- Fam. 4. HYDROLEACEAE.  
 Fam. 2. CONVULVULACEAE.  
 Fam. 5. POLEMONIACEAE.  
 Fam. 6. SOLANACEAE.  
 Fam. 7. BORRAGINACEAE.  
 Fam. 8. EHRETIACEAE.  
 Fam. 9. HELIOTROPIACEAE.  
 Fam. 10. VERBENACEAE.  
 Fam. 11. AVICENNIACEAE.  
 Fam. 12. PHRYMACEAE.  
 Fam. 13. LAMIACEAE.  
 Fam. 14. RHINANTHACEAE.  
 Fam. 15. ACANTHACEAE.  
 Fam. 16. PINGICULACEAE.  
 Fam. 17. OROBANCHACEAE.  
 Fam. 18. BIGNONIACEAE.  
 Fam. 19. PEDALIACEAE.  
 Fam. 20. MARTYNIACEAE.

### FAMILY 1. DICHONDRACEAE — DICHONDRA FAMILY

Annual or perennial creeping herbs. Leaves alternate: blades broad, entire, long-petioled. Flowers axillary, solitary. Calyx of 5 slightly united sepals. Corolla rotate to campanulate, 5-lobed. Androecium of 5 stamens shorter than the corolla. Gynoecium of 2 distinct carpels. Styles basal. Capsules utricule-like, 2 together.—Only the following genus and 5 species, widely distributed.

1. **DICHONDRA** Forst. Stems much-branched, often densely matted. Flowers erect, greenish white.

1. **D. carolinensis** Michx. Plant inconspicuously pubescent: leaf-blades reniform to suborbicular, 5-20 mm. wide, deeply cordate: calyx-lobes 2-3 mm. long: corolla-lobes obtuse. [*D. repens* (Chapm. Fl.)—Hammocks, pinelands, roadsides, low grounds, and moist grassy banks, Coastal Plain, and adj. provinces, Fla. to Tex., Ark., and S. Va.—(*W. I.*)—This plant has two roles in southern latitudes: it may be a persistent weed in lawns or it may be a lawn plant itself, thriving where other lawn plants refuse to grow.

## FAMILY 2. CONVULVULACEAE — MORNING-GLORY FAMILY

Annual or perennial herbs, or vines, or rarely shrubs or trees. Leaves alternate, without stipules: blades various. Flowers perfect, regular, solitary or cymose. Calyx of 5, more or less united sepals, in one or two series. Corolla convolute in aestivation, its limb lobed or entire. Androeceum of 5 stamens, partially adnate to the corolla-tube, alternate with the lobes. Gynoeceum of 2 united carpels. Ovary 2-4-celled (rarely 5-celled, or 1-celled by the loss of the septum). Seeds 1 or 2 in each cavity, often pubescent.—Forty-five genera and 1,000 species, widely distributed.

Styles distinct or partly so.  
Styles united up to the stigmas.

I. EVOLVULEAE.  
II. CONVULVULEAE.

## I. EVOLVULEAE

Styles nearly distinct or partially united, entire: stigmas 2.  
Sepals leathery, 2 cm. long or longer: stems stout.  
Sepals herbaceous, 1 cm. long or less: stems slender.  
Styles distinct, each 2-cleft: stigmas 4.

1. BONAMIA.  
2. STYLISMA.  
3. EVOLVULUS.

## II. CONVULVULEAE

Capsules dehiscent and valvular.

Stigmas ovoid or subglobose.

Calyx urn-shaped: stamens spirally twisted: corolla broadly campanulate-funnelform.

Calyx campanulate: stamens straight.

Stamens and style included: corolla funnelform.

Sepals herbaceous, elongate, usually pilose: ovary usually 3-celled.

Sepals coriaceous or membranous, not elongate: ovary 2- or 4-celled.

Stamens and style exserted: corolla usually salverform.

Corolla large, showy, 10-20 cm. long, white.

Corolla smaller, 3-6 cm. long or less, rarely white.

Herbaceous vines: seeds smooth.

Woody vines: seeds woolly.

Stigmas somewhat flattened or linear.

Stigmas flattened.

Inflorescence densely capitate.

Inflorescence solitary or paniculate.

Stigmas filiform or oblong-cylindric.

Calyx enclosed in 2 broad bracts which subtend it: stigmas long-cylindric or broadly ellipsoid.

Calyx naked, without bracts at the base: stigmas filiform or nearly so.

Capsules or fruit indehiscent, dry or berry-like.

Carpels turbinate, 1-celled and usually 1-seeded by abortion: foliage glabrate.

Fruit berry-like: leaf-blades silvery beneath.

4. OPERCULINA.

5. PHARBITIS.

6. IPOMOEA.

7. CALONYCTION.

8. QUAMOCLIT.

9. EXOGONIUM.

10. THYELLA.

11. JACQUEMONTIA.

12. CONVULVULUS.

13. STROPHOCAULOS.

14. TURBINA.

15. ARGYREIA.

1. **BONAMIA** Thouars. Spreading, herbaceous or woody vines. Leaf-blades rarely cordate, usually entire. Corolla funnelform, blue or white, hirsute without. Filaments glandular-rilious at the base. Ovary 2-celled, 4-ovuled. Capsule chartaceous, 4-valved. Seeds smooth or pubescent. [*Breweria* R. Br.].—Four species, 2 in North America.

1. **B. grandiflora** (A. Gray) Heller. Stem 5-30 dm. long; leaf-blades leathery, broadly oval or ovate, 2.5-5 cm. long, rounded at the base; petioles 1-5 mm. long; peduncles 1-flowered: corolla blue, 7-10 cm. long: capsule ovoid or oval, about 1.5 cm. long. [*Breweria grandiflora* A. Gray].—Sandy soil, scrub pen. Fla.—Spr.—sum.

2. **STYLISMA** Raf. Herbaceous vines, often prostrate. Leaf-blades narrow or broad, not cordate. Flowers 1-3 on axillary peduncles. Sepals equal or nearly so, pointed. Corolla white or colored, rotate or subfunneliform. Capsule thin-walled. [*Breweria* (Chapm. Fl.) (Fl. SE. U. S.)]—Seven species, in the southeastern United States and Mexico.—Spr.-fall.

Sepals glabrous or merely ciliate, elliptic, acute.

Leaf-blades elliptic.

Leaf-blades narrowly linear.

Sepals distinctly pubescent.

Filaments densely pubescent.

Foliage sparingly villous-tomentulose: peduncles 1-3 cm. long: corolla 1.5 cm. long.

Foliage densely brown-tomentose: peduncles 4-6 cm. long: corolla 2 cm. long.

Filaments glabrous or nearly so.

Bracts shorter than the flowers: leaf-blades elliptic to narrowly lanceolate.

Bracts exceeding the flowers: leaf-blades linear.

1. *S. humistrata*.
2. *S. angustifolia*.

3. *S. trichosanthes*.

4. *S. villosa*.

5. *S. aquatica*.

6. *S. Pickeringii*.

1. ***S. humistrata*** (Walt.) Chapm. Stem and branches decumbent; leaf-blades elliptic and subcordate to elliptic-lanceolate, 2.5-5 cm. long, mucronate, sparingly pubescent; petioles 2-10 mm. long: peduncles 1-7-flowered: sepals 6-8 mm. long: corolla white, 15-18 mm. long: styles united at the base for about one-third their length. [*B. humistrata* A. Gray]—Pinelands, and dry sand, Coastal Plain, Fla. to La., Ark., and Va.

2. ***S. angustifolia*** (Nash) House. Stem and branches trailing, appressed-pubescent; leaf-blades 2.5-7 cm. long, pubescent or glabrate, acute; petioles 1-2 mm. long: peduncles 1-flowered: sepals ciliate, 7-10 mm. long: corolla white, 2 cm. long: styles distinct, nearly to the base. [*B. angustifolia* Nash]—High pinelands, pen. Fla.

3. ***S. trichosanthes*** (Michx.) House. Stem and branches decumbent; pubescent; leaf-blades elliptic or linear-lanceolate, 2.5-7 cm. long, apiculate, often somewhat viscid; petioles 1-3 mm. long: sepals strigillose, glabrate, elliptic or nearly so, 6-8 mm. long, bearded at the apex: corolla white, pubescent without, about 12 mm. broad. [*B. trichosanthes* Small]—Pinelands, Coastal Plain, Fla. to Ala. and N. C.

4. ***S. villosa*** (Nash) House. Stem and branches trailing, villous-pubescent; leaf-blades elliptic or elliptic-ovate, 2.5-7 cm. long, obtuse, apiculate, rounded at the base; petioles 2-8 mm. long: sepals ovate-lanceolate, 8-10 mm. long, acuminate, villous: corolla white, 15-20 mm. long: capsule 4-5 mm. in diameter, nearly as long as the calyx. [*B. villosa* Nash]—Dry sandy soil, pen. Fla.

5. ***S. aquatica*** (Walt.) Chapm. Stem and branches trailing, softly pubescent: leaf-blades 2.5-3 cm. long, obtuse: peduncles longer than the leaves, 1-3-flowered: sepals elliptic-lanceolate, acute, 4-6 cm. long: corolla rose-purple, 10-15 mm. long: capsule 6-8 mm. in diameter. [*B. aquatica* A. Gray]—Pinelands, and shallow ponds, Coastal Plain, and adj. provinces, Fla. to Tex., Mo., and S. Va.

6. ***S. Pickeringii*** (M. A. Curtis) A. Gray. Stem and branches prostrate or trailing, minutely pubescent: leaf-blades acute at both ends, sessile, 2-7 cm. long: peduncles rarely longer than the leaves: sepals ovate, obtuse, 4-5 mm. long, villous: corolla white, about 10 mm. long: capsule ovate-conoidal,

exceeding the calyx. [*B. Pickeringii* A. Gray]—Pinelands, in acid soil, various provinces, Fla. to Tex., Ia., and N. J.

**3. EVOLVULUS** L. Erect or diffuse herbs or partially woody plants. Leaf-blades entire. Flowers solitary and axillary or in terminal racemes or panicles. Calyx small: lobes nearly equal. Corolla white, pink, or blue, rotate or rotate-funnelform: limb 5-angled or 5-lobed. Capsule subglobose, 2-4-valved.—About 85 species, in warm and tropical regions.

Peduncles as long as the leaves or longer.

Leaf-blades glabrous or nearly so at maturity.

Leaf-blades copiously pubescent.

Peduncles wanting or very short: pedicels shorter than the leaves.

Plant more or less pubescent.

Leaf-blades glabrous above.

Leaf-blades copiously pubescent on both sides.

Plant glabrous.

1. *E. glaber*.

2. *E. alsinoides*.

3. *E. sericeus*.

4. *E. Wrightii*.

5. *E. macilentus*.

1. **E. glaber** Spreng. Stem and branches diffuse, prostrate, sometimes creeping, silky: leaf-blades oblong, oval, or obovate, mostly 1-1.5 cm. long, mucronate, glabrous at maturity: calyx-lobes oblong, oblong-lanceolate, or oblong-ovate, 3-4.5 mm. long, acute or slightly acuminate: corolla blue, pink, or white, about 1 cm. broad: capsule ovoid, 2.5-3.5 mm. in diameter. [*E. mucronatus* (Chapm. Fl., Fl. SE. U. S.)]—Hammocks and open sandy places, lower Florida Keys.—(W. I., S. A.)

2. **E. alsinoides** L. Stem and branches diffuse or prostrate, 1-6 dm. long, slender: leaf-blades oblong-oval to oblong-lanceolate, 1-2.5 mm. long, acute or acutish, permanently pubescent: calyx-lobes lanceolate, 2.5-3.5 mm. long, acute: corolla blue or white, 8-12 mm. broad: capsule 3-4 mm. in diameter. [*E. argenteus* (Chapm. Fl.)]—Hammocks, lower Florida Keys; also coast of Ala., perhaps introduced.—(W. I.)

3. **E. sericeus** Sw. Plants silky, the branches ascending or decumbent, 1-3 dm. long: leaf-blades linear to oblong, 1-2.5 cm. long, acute at both ends: calyx-lobes 4-6 mm. long, acute or acuminate: corolla white or blue, 8-10 mm. wide.—Low grounds and wet woods, various provinces, Fla. to Tex., Ariz., and Ga.—(W. I., Mex., C. A., S. A.)

4. **E. Wrightii** House. Stem and branches tufted, mostly less than 1 dm. long, villous-hirsute with silvery hairs: leaf-blades suborbicular to ovate, 3-8 mm. long, acute or abruptly pointed: calyx-lobes linear-lanceolate, 4-5 mm. long, acuminate: corolla blue or white, 7-9 mm. broad.—Pinelands and open sandy places, lower Florida Keys.—(W. I.)

5. **E. macilentus** Small. Stem and branches wiry-filiform, glabrous, diffuse: leaf-blades linear to linear-subulate, 0.5-2 cm. long, acuminate, glabrous: calyx-lobes linear-lanceolate, 4-5 mm. long, acuminate: corolla pale-blue or white, nearly 1 cm. broad: capsule subglobose, 3-4 mm. in diameter.—Pinelands, lower Florida Keys.

**4. OPERCULINA** S. Manso. Twining vines. Leaf-blades entire, palmately lobed, or divided. Calyx large, pear-shaped, constricted above in flower: lobes closely imbricate, membranaceous or chartaceous. Corolla cam-

panulate. Capsule globose, large, often operculate or irregularly dehiscent, sometimes valvate.—About 10 species, natives of tropical America and the East Indies.

Corolla yellow: sepals becoming 4–5 cm. long.  
Corolla white, purple throat: sepals becoming 1.5–2 cm. long.

1. *O. tuberosa*.
2. *O. dissecta*.

1. *O. tuberosa* (L.) Meisn. Leaf-blades 5–7-lobed; lobes elliptic-lanceolate, acuminate, 4–6 cm. long: corolla 3.5–4 cm. long; limb 5–6 cm. wide: capsule 3–4 cm. in diameter: seeds 20 x 15 mm., black-velvety.—(YELLOW MORNING-GLORY.) Pinelands, hammocks and waste-places, Coastal Plain, Fla. and Tex. Nat. of the Tropics, and cultivated.—(W. I.)

2. *O. dissecta* (Jacq.) House. Leaf-blades 5–7-parted; segments oval to oblong or lanceolate, 3–10 cm. long, coarsely toothed: corolla 2–3 cm. long; limb 3–5 cm. broad: capsule about 1.5 cm. in diameter: seeds glabrous. [*Ipomoea dissecta* Jacq. *I. sinuata* Ort.]—Pinelands, Coastal Plain, Fla. to Tex., and Ga.—(W. I.)

## 5. PHARBITIS Choisy. Annual

(ours), or perennial, climbing or trailing vines. Leaf-blades entire, lobed, or angled. Calyx-lobes equal or unequal, herbaceous, each with a pubescent base and a narrow tip. Corolla white, blue, pink, or purple, funnelform. Ovary 3–5-celled. Seeds smooth.—About 200 species, widely distributed.—Sum.–fall.—MORNING-GLORIES.

Calyx bristly pubescent, especially near the base.

Tips of sepals merely acute or acuminate.

Tips of sepals conspicuously elongate.

1. *P. purpurea*.

Leaf-blades densely appressed silky-pubescent and ciliate, often entire.

2. *P. barbiger*.

Leaf-blades hirsute-pubescent, lobed or angled.

Bases of sepals conspicuously broadened: lobes of blades contracted below: corolla 2.5–4 cm. long.

Sepals linear-lanceolate, not conspicuously broadened at the base: blades 3-lobed but the lobes rarely contracted below: corolla 4–6 cm. long.

3. *P. hederacea*.

4. *P. Nil*.

5. *P. cathartica*.

Calyx glabrous or nearly so, not bristly.

1. *P. purpurea* (L.) Voigt. Stem twining: leaf-blades ovate to orbicular-ovate, 6–18 cm. long, short-acuminate, cordate: calyx-lobes, 10–15 mm. long: corolla 5–7 cm. long; limb purple or sometimes pink, blue, white, or variegated, 4–6 cm. broad.—(COMMON MORNING-GLORY.)—Waste-places, various provinces, Fla. to Tex., Nebr., Ont., and N. S. Nat. of trop. Am., and cult.

2. *P. barbiger* (Sims) G. Don. Stem twining, several m. long: leaf-blades orbicular-ovate, 5–12 cm. long: peduncles shorter than the petioles: sepals 1.5–3 cm. long: corolla 3–3.5 cm. long; limb purple or partly so, 3–4 cm. broad.—(MORNING-GLORY.)—Thickets and cult. grounds, Coastal Plain and adj. provinces, Fla. to La. and Ga.

3. *P. hederacea* (L.) Choisy. Stem twining: leaf-blades 5–12 cm. long, deeply 3-lobed; lobes acuminate: peduncles usually shorter than the petioles: calyx-lobes 2–3 cm. long, the bases ovate or oval: corolla 2.5–4 cm. long, deep-blue, or the tube white; limb about 3 cm. broad.—Waste-places and cult. grounds, various provinces, Fla. to Tex., S. Dak., and Me.—(*W. I., Mex.,*)—Nat. of trop. Am., and cult.

4. *P. Nil* (L.) Choisy. Stem hispid or hirsute: leaf-blades broadly ovate to suborbicular in outline, 6–16 cm. long, 3-angled or 3-lobed, the lobes acute: sepals 2.5–4 cm. long: corolla-limb deep-blue, 4–6 cm. wide.—Hammocks and cult. grounds, Fla. and La. Nat. of Africa, and cult.

5. *P. cathartica* (Poir.) Choisy. Stem minutely strigillose or glabrate: leaf-blades broadly ovate, 5–9 cm. long, entire or 3-lobed: sepals ovate-lanceolate, 1–2 cm. long, acuminate: corolla-limb purple to white, 6–8 cm. wide.—Hammocks and thickets, along or near the coast, pen. Fla. and the Keys.—(*W. I.*)

6. *IPOMOEA* L. Annual or perennial climbing or trailing vines, or rarely upright plants. Leaf-blades entire, angled or divided. Flowers solitary on axillary peduncles or in cymes. Calyx-lobes coriaceous or membranous, rarely fleshy. Corolla funnelform, the limb usually spreading. Capsule mostly septifragally 2- or 4-valved. Seeds often pubescent.—About 200 species, widely distributed.—Sum.-fall or all year S.—MORNING-GLORIES

Stems and branches prostrate and creeping or climbing.  
Stems and branches erect or diffuse.

I. PANDURATAE.  
II. FISTULOSAE.

#### I. PANDURATAE

Stem creeping, perennial, glabrous, fleshy or succulent.

Corolla-limb white: leaf-blades elliptic to ovate in outline, mainly lobed.

Corolla-limb purple: leaf-blades suborbicular, notched at the apex.

Stem twining or rarely trailing, never creeping.

Leaf-blades entire or 3-lobed.

Leaf-blades sagittate or denticulate-hastate at the base: inner sepals less than 1 cm. long.

Leaf-blades denticulate-hastate at the base, linear or linear-lanceolate: corolla white.

Leaf-blades sagittate, sometimes broadly so: corolla-limb purple.

Sepals equal, 6 mm. long: corolla 3–4 cm. long.

Sepals unequal, 7–9 mm. long: corolla 5–6 cm. long.

Leaf-blades never sagittate: inner sepals often over 1 cm. long.

Sepals obtuse or mucronate.

Leaf-blades cordate, of an ovate type.

Pedicels thickened and fleshy, with the petioles and sepals densely setaceous.

Pedicels not fleshy, not setaceous.

Sepals tomentose: seeds with long wool all over.

Sepals glabrous: seeds with wool on the angles.

Sepals cuspidately pointed or acuminate.

Corolla yellow: inflorescence umbellate.

Corolla blue, purple, or white: inflorescence solitary or cymose.

Perennial: calyx glabrous.

Corolla 3 cm. long or less, pink or lilac-purple.

Corolla 4 cm. long, or longer.

Sepals 10–14 mm. long: stem usually glabrous and trailing.

1. *I. stolonifera*.

2. *I. Pes-Caprac*.

3. *I. angustifolia*.

4. *I. tenuissima*.

5. *I. sagittata*.

6. *I. setosa*.

7. *I. macrorrhiza*.

8. *I. pandurata*.

9. *I. polyanthes*.

10. *I. trifida*.

11. *I. Batatas*.

Sepals 8-10 mm. long: stem usually pubescent and twining.  
Annual: calyx pubescent, at least the sepals ciliate.

Corolla 3 cm. long, or longer.  
Corolla less than 3 cm. long.

Peduncles shorter than the petioles:  
corolla-tube white.

Peduncles longer than the petioles:  
corolla-tube purple.

Leaf-blades palmately 5-7-parted.

Peduncles stout, short, 1-9-flowered.

Peduncles filiform, sometimes tendril-like, 1-2-flowered.

12. *I. tiliacea*.

13. *I. trichocarpa*.

14. *I. lacunosa*.

15. *I. triloba*.

16. *I. cairica*.

17. *I. heptaphylla*.

## II. FISTULOSAE

Perennial plants; leaf-blades entire, ovate: corolla puberulent without: seeds shaggy-pubescent.

18. *I. fistulosa*.

1. *I. stolonifera* (Cyrill.) Poir. Leaf-blades 2-5 cm. long, the early ones ovate to elliptic, the later ones pandurate or more deeply lobed, mostly truncate or cordate at the base: sepals elliptic to oval, 1-1.5 cm. long, mucronate or acuminate: capsule subglobose, 1.5 cm. long. [*I. littoralis* (L.) Boiss. *I. acetosaeifolia* R. & S.]—Coastal sand-dunes, Fla. to Tex., and S. C.—(*W. I., Mex., C. A., S. A.*)

2. *I. Pes-Caprae* (L.) Sweet. Leaf-blades 6-10 cm. long and as broad, rounded or cordate at the base: sepals oval or suborbicular, obtuse: corolla 4-5 cm. long: capsule globose-ovoid, 1.5 cm. long.—(RAILROAD-VINE.)—Coastal sand-dunes, Fla. to Tex. and Ga.—(*W. I.*)

3. *I. angustifolia* Jacq. Leaf-blades linear or linear-lanceolate, 3-5 cm. long, acute: peduncles 1-2-flowered, 1-3 cm. long: sepals unequal, ovate, acute, 6-8 mm. long: corolla 1-2 cm. long: capsule globose, 8 mm. in diameter: seeds smooth.—Banks, thickets, and waste-places, Coastal Plain, Brunswick, Ga., and at other southern ports. Nat. of Africa.—(*W. I.*)

4. *I. tenuissima* Choisy. Stems twining: leaf-blades lanceolate or linear-lanceolate, 2-5 cm. long, obtuse and mucronulate: sepals ovate-lanceolate, obtuse, ciliate: corolla purple, 3-4 cm. long: capsule globose.—Pinelands, Everglade Keys, Fla. and Florida Keys.—(*W. I.*)—All year.

5. *I. sagittata* Cav. Leaf-blades 3-10 cm. long, sagittate or hastate-sagittate, the segments linear or lanceolate, the basal ones about half as long as the terminal one: sepals 6-9 mm. long: corolla 5-6 cm. long. [*I. speciosa* Walt.]—Low prairies, swamps, and low hammocks, Coastal Plain and adj. provinces, Fla. to Tex. and N. C.

6. *I. setosa* Ker. Leaf-blades orbicular-ovate, deeply 3-lobed; petioles, pedicels, and calyces bristly with spreading purplish setae: peduncles 3-9-flowered; pedicels thickened: sepals elliptic, 10-14 mm. long, accrescent in fruit: corolla purple, 5-6 cm. long: capsule 4-celled: seeds hairy on the angles.—(BRAZILIAN MORNING-GLORY.)—Waste-places, Coastal Plain, Fla. to La. Nat. of Brazil.

7. *I. macrorrhiza* Michx. Leaf-blades broadly ovate, 5-15 cm. long, erose-crenulate or lobed, truncate or subcordate at the base, tomentose beneath: sepals elliptic-lanceolate, obtuse, 1.5-2 cm. long: corolla white, 5-8 cm. long; limb 5-10 cm. broad: seeds with long silky-villous wool. [*I. jalapa* Pursh]—Sandy soil, on or near the coast, Fla. to Ala. and S. C.

8. *I. pandurata* (L.) G. F. W. Mey. Leaf-blades ovate, often fiddle-shaped, 3-10 cm. long: peduncles 5-10 cm. long, 1-5-flowered: calyx-lobes elliptic, 12-18 mm. long, obtuse, erect, imbricate and forming a tube: corolla 7-10 cm. broad; limb white, tube lavender within.—(WILD POTATO-VINE. MAN-OF-THE-EARTH.)—Dry soil, often in woods, various provinces, Fla. to Tex., Ont., and Conn.

9. *I. polyanthes* R. & S. Leaf-blades orbicular and cordate to oblong-lanceolate and cordate-sagittate, 5-10 cm. long; peduncles longer than the petioles, 5-many flowered in a dense umbel-like cyme: sepals oblong-lanceolate, 8-10 mm. long, glabrous, acute or acuminate: corolla bright yellow, 2-4 cm. long: seeds black, pubescent. [*I. umbellata* G. F. W. Mey. Not L.]—Florida Keys.—(*W. I.*)

10. *I. trifida* (H. B. K.) G. Don. Perennial, pubescent or glabrate, twining: leaf-blades 2-6 cm. long, lower ones often entire, upper 3-lobed, all cordate; peduncles 3-10-flowered; sepals glabrous, 10-12 mm. long, oblong to lanceolate or ovate-lanceolate, acuminate: corolla pink or lilac-purple, 2.5-4 cm. long; capsules more or less pubescent near the top.—Valleys and light soil, Coastal Plain, La. and Tex.—(*W. I., Mex., C. A., S. A.*) Represented in Florida by *I. trifida Torreyana* A. Gray, with glabrous stems and corolla 4 cm. long, a native of Tex.

11. *I. Batatas* (L.) Lam. Leaf-blades ovate, 5-11 cm. long, entire or angulately lobed, cordate: sepals unequal, ovate-lanceolate or lanceolate, acuminate: corolla 3-5 cm. long, white varying to shades of pink or purple.—(SWEET-POTATO.)—Pinelands, hammocks and waste-places, southern pen. Fla., and the Keys. Nat. of E. Indies, and cult.—(*W. I.*)

12. *I. tiliacea* (Willd.) Choisy. Leaf-blades ovate, cordate, acuminate, entire or 3-5-lobed: peduncles dichotomous at summit, several or many flowered: sepals elliptic-lanceolate, cuspidate-acuminate, unequal, the inner ones longest: corolla rose-purple or pink, 4-5 cm. long. [*I. fastigiata* (Roxb.) Sweet].—Sandy thickets, Florida Keys.

13. *I. trichocarpa* Ell. Leaf-blades ovate, entire or deeply 3-lobed, cordate: peduncles stout, 1-3-flowered: sepals hirsute, elliptic or elliptic-lanceolate, 9-12 mm. long: corolla pink or purple, 2.5-4 cm. long: capsule more or less pubescent: seeds glabrous. [*I. commutata* R. & S.]—Sandy soil, Coastal Plain, Fla. to Tex. and S. C.

14. *I. lacunosa* L. Leaf-blades ovate, entire or 3-lobed, 2-7 cm. long, deeply cordate: peduncles 1-3-flowered: calyx-lobes elliptic or ovate, 10-12 mm. long, acute or acuminate: corolla mainly white, 1.5-2 cm. long; limb often purple-margined.—River-banks, low grounds, and fields, various provinces, S. C. to Ala., Tex., Kans., and Pa.

15. *I. triloba* L. Leaf-blades ovate, 4-10 cm. long, entire or hastately 3-lobed, glabrate: sepals pubescent, oblong or suborbicular, 8-10 mm. long, acute or acuminate: corolla purple, 1.5 cm. long: capsule subglobose, 6-8 mm. in diameter, often pubescent: seeds glabrous.—Hammocks and sand-dunes, S. pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A., O. W.*)

16. *I. cairica* (L.) Sweet. Segments of the leaf-blades elliptic-lanceolate, acute or acuminate, 4-9 cm. long: sepals 4-8 mm. long, obtuse: corolla purplish, 5-6 cm. long: capsule ovoid, 10-12 mm. long; seeds finely pubescent.—Road-sides and waste-places, Fla. Nat. of Africa.—(*W. I., Mex., S. A.*)

17. *I. heptaphylla* (Rottb. & Willd.) Voigt. Leaf-segments linear-lanceolate, 1-5 cm. long, acute or acuminate at the ends, entire or undulately toothed:

peduncles filiform, often spirally twisted and used in climbing: sepals ovate, 4-5 mm. long, becoming 6-7 mm. long: corolla pale-violet, 18-30 mm. long: capsules 10 mm. long or less.—Near New Orleans, La. Nat. of trop. regions.

18. *I. fistulosa* Mart. Leaf-blades ovate, 5-9 cm. long, acute, cordate: peduncles usually several-flowered: sepals suborbicular, 5-7.5 mm. long: corolla rose-colored, 6-8 cm. long: capsule ovoid, about 1.5 cm. long: seeds shaggy pubescent. [*I. texana* Coulter].—Waste-places, Coastal Plain, Pensacola, Fla., S Tex., and James Is., S. C. Nat. of S. A.

7. **CALONYCTION** Choisy. High-twining vines. Leaf-blades broad. Flowers showy. Calyx-lobes herbaceous, becoming leathery, the outer ones sometimes horned at the apex. Corolla white, expanding in the evening, salverform: tube elongate, not dilated at the throat. Capsule large, longer than broad.—Four species, in tropical America.—MOON-FLOWERS. MOON-VINES.

Sepals, at least the outer, long-appendaged: seeds glabrous or essentially so.

Sepals unappendaged: seeds velvety and comose around the edges.

1. *C. aculeatum*.

2. *C. Tuba*.

1. *C. aculeatum* (L.) House. Leaf-blades ovate to orbicular-ovate, 5-15 cm. long, entire or frequently hastately 3-5-lobed, thin-textured, rather slenderly acuminate, the lobes, when present acute or acuminate: appendaged calyx-lobes 2-3 cm. long: corolla very showy; tube slender, 9-14 cm. long; limb 10-14 cm. wide: capsule much-depressed, 3-3.5 cm. wide, enveloped by the accrescent inner calyx-lobes, before these become reflexed, the supporting pedicel much thickened under the calyx. [*Ipomoea Bona-Nox* L.]—Hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A., O. W.*)—All year.—This plant is a "fire-weed," *par excellence*. The growth of vines over burned areas, especially in hammocks, is prodigious.

2. *C. Tuba* (Schlecht.) Colla. Leaf-blades broadly ovate to reniform-ovate, 8-15 cm. long, usually entire, thick-textured, usually broadly acuminate: calyx-lobes 1.5-2.5 cm. long: corolla showy; tube stoutish, 6-12 cm. long; limb 8-10 cm. wide: capsule ovoid or globose-ovoid, 2-2.5 cm. wide, short-pointed or somewhat acuminate, much exceeding the calyx-lobes, the supporting pedicel slightly thickened under the calyx.—Coastal hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A., O. W.*)—All year.—Unlike the preceding species, *C. Tuba* does not occur inland in Fla.; it grows only in saline and brackish situations.

8. **QUAMOCLIT** [Tourn.] Moench. Annual (ours) or perennial vines, with twining, glabrous stems. Blades entire, lobed, or divided. Flowers in axillary cymes or solitary. Calyx-lobes equal or nearly so. Corolla scarlet orange, yellow, or white, salverform: tube narrowly funnelform; limb spreading, shorter than the tube. Ovary 2- or falsely 4-celled. Capsule usually 4-celled and 4-seeded.—About 10 species, in warm and tropical regions.—Sum.-fall or all year S.

Leaf-blades pinnately parted, the segments narrow: calyx-lobes obtuse or mucronate.

Leaf-blades entire: calyx-lobes acuminate.

1. *Q. Quamoclit*.

2. *Q. coccinea*.

1. **Q. Quamoclit** (L.) Britton. Leaf-blades 2–10 cm. long; segments narrowly linear: pedicels clavate: calyx-lobes appressed to the corolla-tube: corolla-tube clavate, 2.5–3 cm. long; lobes ovate or triangular. [*Ipomoea Quamoclit* L.]—(CY-PRESS-VINE).—Waste-places and old fields, various provinces, Fla. to Tex., Kans., and Va. (Trop. Am.)

2. **Q. coccinea** (L.) Moench. Leaf-blades ovate, 3–10 cm. long, acuminate, angled or entire: peduncles usually stouter than the pedicels: calyx-lobes oblong: corolla scarlet or orange, rarely white; tube 2–4 cm. long; limb cup-like, 1.5–2 cm. broad. [*Ipomoea coccinea* L.]—In fields, and waste-places, various provinces, Fla. to Ariz., Mo., and Pa. Nat. of trop. Am. (Cent. Am.).

9. **EXOGONIUM** Choisy. Creeping, trailing or twining vines. Leaf-blades, entire, lobed, or divided, rarely cordate. Flowers in axillary cymes or solitary. Calyx-lobes leathery, unequal, obtuse. Corolla salverform, scarlet or white. Capsule thick-walled, 4-seeded.—About 25 species of tropical and subtropical America.

1. **E. microdactylum** (Griseb.) House. Leaf-blades elliptic, thickish, obtuse at base, entire or lobed, 3–8 cm. long: corolla crimson or scarlet; tube 4–5 cm. long; limb 4–5 cm. broad, slightly 5-lobed: capsule longer than the calyx. — (WILD-POTATO.) — Pinelands, Everglade Keys, Fla.—(W. I.)—This wild-potato, within our range, occurs only in the weathered surface of oölitic limestone. The roots, resembling sweet-potatoes, often fill the small erosion holes so completely that the rock must be broken in order to get them out.

10. **THYELLA** Raf. Annual or perennial twining vines. Leaf-blades entire or lobed. Flowers in dense capitate clusters interspersed with numerous enlarged foliaceous, pubescent or hirsute bracts. Sepals equal. Corolla blue, violet or white, funnelform. Ovary 2-celled. Styles united up to the 2 ovoid flattened stigmas. Capsule subglobose, 4-valved. Seeds minutely roughened.—About 10 species of warm and tropical America.

1. **T. tamnifolia** (L.) Raf. Annual, pubescent with tawny hairs; leaf-blades ovate or elliptic-ovate, 5–12 cm. long, undulate, rounded or cordate at the base: peduncles as long as the subtending leaves or longer: corolla violet or blue, 1.5–3 cm. broad.

[*Jacquemontia tamnifolia* (L.) Griseb.]—Fields and thickets, Coastal Plain, Fla. to Ark. and S. C.—(*W. I., Mex., C. A., S. A., O. W.*)

**11. JACQUEMONTIA** Choisy. Trailing or twining vines or upright shrubs or herbs. Leaf-blades entire or rarely toothed or lobed. Flowers in loose cymes without conspicuous bracts, or solitary. Calyx-lobes equal or unequal. Corolla white, or blue, limb plaited. Capsule subglobose, 4-valved or sub-8-valved.—About 30 species, in tropical and subtropical America.

Corolla white: plant perennial.

Corolla over 2 cm. wide: capsule obtuse.

Leaves fleshy: calyx becoming 2-3 mm. long.

Leaves herbaceous: calyx becoming 4-5 mm. long.

Corolla less than 1.5 cm. wide: capsule acute.

Corolla blue: plant annual.

1. *J. reclinata*.

2. *J. Curtissii*.

3. *J. jamaicensis*.

4. *J. pentantha*.

1. *J. reclinata* House. Stem tomentulose or glabrate, prostrate, reclining, or ascending, woody below, often 1-2.5 m. long: leaf-blades elliptic to ovate-orbicular, 1-3 cm. long, obtuse or retuse: peduncles usually shorter than the leaves: calyx-lobes ovate: corolla white, 2.5-3 cm. broad: capsule 4-5 mm. long. [*Convolvulus havanensis* (Chapm. Fl.)—Coastal sand-dunes and coastal hammocks, eastern shores of S pen. Fla.—(*W. I.*)—All year.

2. *J. Curtissii* Peter. Stem woody, prostrate spreading or erect, glabrous or slightly cobwebby-pubescent, 2-9 dm. long: leaf-blades elliptic or elliptic-spatulate, 1-2 cm. long, obtuse or abruptly pointed, slightly revolute: calyx-lobes orbicular-ovate or oval: corolla white, 2.5-3 cm. broad: capsule 5-6 mm. long.—Pinelands and adj. Everglades, S pen. Fla.

3. *J. jamaicensis* (Jacq.) Hall. Stem erect or ascending, finely pulverulent-pilose: leaf-blades ovate to elliptic, 5-15 mm. long, obtuse at the base, apex rounded or obtuse, rigid, revolute: peduncles 1-flowered, 6-9 mm. long; sepals obovate, 1.5-2 mm. long: corolla white. [*Convolvulus nodiflorus* (Chapm. Fl.)—Hammocks, Bahia Honda Key, Fla.—(*W. I.*)

4. *J. pentantha* (Jacq.) G. Don. Stem pubescent or glabrate, 3-10 dm. long; leaf-blades ovate or ovate-lanceolate, 2-5 cm. long, truncate or subcordate at the base: corolla about 2 cm. long, the slightly angular lobes acute. [*J. violacea* Chois.]—Hammocks, Florida Keys.—(*W. I.*)

**12. CONVOLVULUS** [Tourn.] L. Annual or (ours) perennial, erect, reclining, trailing, or twining vines. Leaf-blades usually hastate or cordate at the base. Flowers solitary, or clustered on axillary peduncles. Calyx subtended by bracts. Calyx-lobes equal or the outer longer. Corolla funnelform or campanulate. Ovary 1- or 2-celled. Ovules 4. Capsule globose or nearly so. Seeds glabrous.—About 150 species, in temperate and tropical regions.—Spr.-sum.—**BINDWEEDS.**

Stem trailing or climbing.

Mature stem and leaves glabrous or glabrate: leaf-blades ovate or hastate.

Leaf-blades with more or less angular spreading basal lobes. 1. *C. americanus*.

Leaf-blades with rounded or scarcely angled basal lobes which are not spreading. 2. *C. sepium*.

Mature stem and leaves copiously and softly pubescent: leaf-blades more or less sagittate.

Leaf-blades elliptic, basal lobes rounded.

Leaf-blades densely white-tomentulose beneath. 3. *C. sericatus*.

Leaf-blades green, softly pubescent. 4. *C. repens*.

Leaf-blades lanceolate, basal lobes half as long, spreading, acute.

5. *C. Nashii*.

Stem erect or ascending.

6. *C. spithameus*.

1. *C. americanus* (Sims) Greene. Stem twining, 1-3 m. long, glabrate. Leaf-blades broadly hastate or ovate-hastate, 5-12 cm. long, acuminate or apiculate: peduncles as long as the leaves or longer: bracts 2-3 cm. long: corolla pink or rose-purple, 5-7 cm. broad.—(HEDGE-BINDWEED.)—Thickets, various provinces, N of Coastal Plain, N. C. to Utah, Mont., and N. S.—*C. japonicus* Thunb. Similar to *C. americanus* in habit, but usually smaller: leaf-blades narrowly hastate: corolla double, pink, mostly 4-5.5 cm. wide, occurs locally in cult. grounds and waste-places.

2. *C. sepium* L. Similar to *C. americanus* in habit: leaf-blades relatively broader and more rounded at the apex, basal lobes directed backward, not spreading: corolla white or pink.—Thickets and waste-places, locally naturalized in N. Am., except the extreme north. Nat. of O. W.

3. *C. sericatus* House. Stem twining, 5-10 dm. long, tomentose: leaf-blades elliptic-ovate, acuminate, slightly hastate-cordate, white beneath with a dense silky-tomentulose indument, 6-8 cm. long: peduncles longer than the leaves: bracts 2.5-3 cm. long: corolla white, 5-6 cm. long.—Thickets, Blue Ridge, Ga.

4. *C. repens* L. Stem twining or trailing: leaf-blades narrowly or broadly sagittate, 5-8 cm. long, cordate at the base: peduncles as long as the leaves or longer: bracts 1.5-2.5 cm. long: corolla white or pinkish, 4-5 cm. long.—Dry soil and old fields, various provinces, Fla. to Tex., S. Dak., and Va.

5. *C. Nashii* House. Stem softly and finely sericeous-pubescent, twining, 1-2 m. long: leaf-blades lanceolate or the lower elliptic-lanceolate, 3-4 cm. long: basal lobes 1-2 cm. long, spreading or produced: peduncles 1-flowered, shorter than the leaves: bracts ovate, subacute, 14-18 mm. long: corolla white, or the limb bordered with pink, 4-5 cm. long.—Swampy places, Fla.

6. *C. spithameus* L. Stem finely pubescent, 1-7 dm. long: leaf-blades elliptic-ovate or fiddle-shaped, 4-10 cm. long, rounded or subcordate at the base: peduncles usually from the lower axils: bracts 1.5-3 cm. long: corolla white or pink, 4-6 cm. long.—(LOW-BINDWEED.)—Fields and roadsides, often in calcareous soil, various provinces, Fla. to Tenn., NW Terr., Ont., and N. S.

13. **STROPHOCAULOS** Small. Perennial procumbent or twining vines. Leaf-blades sagittate to hastate, petioled. Flowers solitary or few together

on peduncles. Calyx naked, not subtended by bracts. Calyx-lobes nearly equal. Corolla short-funnelform, white or pink, sometimes pubescent without. Ovary mostly 2-celled. Capsule globose or ovoid. Seeds glabrous.—About 40 species, widely distributed. One species.—**BINDWEEDS.**

1. *S. arvensis* (L.) Small. Stem branched at the base, the branches prostrate or low-twining: leaf-blades elliptic, ovate-sagittate, or linear-hastate, 1–5 cm. long: peduncles shorter than the leaves: calyx-lobes oval or suborbicular, 3–3.5 mm. long: corolla white or pink, 1.5–2 cm. long.—(**FIELD-BINDWEED.**)—Fields, waste-places, and roadsides, various provinces, Ala. to Ark., Calif., Ont., and N. S. Nat. of Eurasia.—Spr.-sum.

14. **TURBINA** Raf. Perennial, high climbing or trailing vines. Leaf-blades ovate, cordate, glabrate, entire. Flowers in many-flowered, corymbose, axillary, peduncled clusters, near the ends of branches. Sepals coriaceous. Corolla funnelform from the base. Ovary 2-celled, 2-ovuled. Capsules turbinate, twice as long as broad, acute, indehiscent, 1-celled and 1-seeded by abortion. Seeds oblong, finely pubescent.—About 20 species, in tropical regions.

1. *T. corymbosa* (L.) Raf. Stems trailing, several m. long. Sepals narrowly ovate or elliptic, subacute, 6–8 mm. long, dark-colored with whitish scarious margins: corolla white with green bands, 3–4 cm. long; sapsule 8–10 mm. long. [*Ipomoea sidaefolia* Choisy *I. antillana* Millsp.]—Hammocks, Coastal Plain Cape Sable region, Florida and the Keys and S Tex.—Fall-wint.

15. **ARGYREIA** Lour. Twining vines, the pubescence commonly sericeous. Leaf-blades broad, cordate, usually entire. Flowers in axillary peduncled cymes. Calyx often colored within: lobes leathery. Corolla showy, campanulate-funnelform. Ovary 2-celled. Stigma slightly 2-lobed. Fruit baccate, indehiscent.—About 25 species, in tropical Asia and Africa.

1. *A. speciosa* (L.) Sweet. Stem and branches tomentose: leaf-blades broadly ovate, 12–20 cm. long, glabrate above, silvery-pubescent beneath, the veins conspicuous: bracts ovate-elliptic, unequal, glabrous within: sepals 4–5 mm. long: corolla-tube inflated-cylindric, about 5 cm. long; limb purple.—Hammocks along Everglades, Fla. Nat. of trop. Asia, and cult.—(*W. I.*)

## FAMILY 3. CUSCUTACEAE — DODDER FAMILY

Herbaceous parasitic vines, with pale foliage. Leaves mere alternate scales. Flowers perfect, cymose. Calyx of 4 or 5 distinct or partly united sepals. Corolla regular, of 4 or 5 partly united petals, usually bearing fringed scales below the sinuses. Androecium of 4 or 5 stamens, the filaments partly adnate to the corolla-tube. Gynoecium of 2 partly united carpels, the styles distinct, or partly united: stigmas capitate. Capsule circumscissile or indehiscent.—Only the following genus, and about 160 species, widely distributed.

1. **CUSCUTA** [Tourn.] L. Annual, slender, yellow or reddish vines twining on herbs and shrubs and adhering to the bark by means of suckers. Flowers white, greenish, or yellowish. The plants arise from the ground, but later become wholly parasitic, the stems and branches often matted.—Sum.—fall or all year S.—DODDERS. LOVE-VINES. STRANGLE-WEEDS.

Styles distinct. (Subgenus GRAMMICA.)

Capsule remaining closed, a utricle.

Flowers subtended by several bracts: sepals nearly or quite distinct.

Flowers not subtended by bracts: sepals partly united.

Capsule circumscissile, a pyxis.

Styles more or less united. (Subgenus MONOGYNA.)

I. GLOMERATAE.

II. PLATYCARPAE.

III. UMBELLATAE.

IV. EXALTATAE.

## I. GLOMERATAE

Bracts subtending the calyx obtuse, with appressed tips.

Bracts subtending the calyx acute, with spreading tips.

1. *C. compacta*.

2. *C. glomerata*.

## II. PLATYCARPAE

Capsule subglobose, more or less depressed.

Calyx and corolla smooth, neither fleshy nor papillate.

Corolla persistent at the base of the capsule.

Corolla-lobes obtuse; scales reaching the filaments: flowers pentamerous.

Corolla-lobes acute.

Corolla-lobes triangular; scales with few processes at the apex: flowers mostly tetramerous.

Corolla-lobes ovate; scales with numerous processes: flowers pentamerous.

Corolla persistent at the apex of the capsule: flowers mostly tetramerous.

Calyx and corolla fleshy, papillate by the lens-like cells: corolla with inflexed tips.

Flowers mostly tetramerous: corolla-scales rudimentary, represented by toothed wings.

Flowers mostly pentamerous: corolla-scales copiously fringed.

Capsule ovoid, conic, or flask-shaped.

Corolla about 1 mm. long; lobes inflexed at the tip: flowers frequently tetramerous.

Corolla 2-6 mm. long; lobes not inflexed: flowers pentamerous.

Capsule flask-shaped, with a long neck: flowers 4-6 mm. long.

Capsule globose-conic or globose-ovoid: flowers 2-4 mm. long.

3. *C. glandulosa*.

4. *C. Polygonorum*.

5. *C. pentagona*.

6. *C. Cephalanthi*.

7. *C. Coryli*.

8. *C. indecora*.

9. *C. Harperi*.

10. *C. rostrata*.

11. *C. Gronovii*.

## III. UMBELLATAE

Corolla-lobes lanceolate as long as the tube: corolla-scales long and narrow, reaching the sinuses.

Corolla-lobes ovate, shorter than the tube: corolla-scales short and broad, not reaching the sinuses.

12. *C. umbellata*.

13. *C. americana*.

## IV. EXALTATAE

Plant with very coarse tangled stems, large flowers (corolla 4-5 mm. long) and large capsules, 6-9 mm. long.

14. *C. exaltata*.

1. *C. compacta* Juss. Branches stout or stoutish, often widely matted: calyx-lobes orbicular to oval, subtended by 3-5 appressed bracts: corolla-lobes elliptic, spreading or reflexed, much shorter than the tube: corolla-scales shorter than the corolla-tube or reaching the filaments, long-fringed: anthers oval: capsule globose-conic: seeds about 2.5 mm. long.—On shrubs mostly in swamps, various provinces, Fla. to Tex., Kans., Ont., and Mass.

2. *C. glomerata* Choisy. Branches rather slender, wound tightly around the stems of the host, and floriferous: calyx-lobes elliptic-oval, subtended by bracts with recurved tips: corolla-lobes elliptic to lanceolate, spreading or sometimes reflexed, shorter than the tube: corolla-scales shorter than the corolla-tube, most abundantly fringed at the apex: anthers elliptic: capsule globose-conic or flask-shaped: seeds about 1.7 mm. long. [*C. paradoxa* Raf. ?]—Mostly on tall herbs, various provinces, Miss. to Tex., S. Dak., Minn., and Ohio.

3. *C. glandulosa* (Engelm.) Small. Branches rather slender, commonly matted: flowers in globular compact clusters: calyx-lobes ovate: corolla-lobes ovate obtuse, shorter than the tube: corolla-scales as long as the corolla-tube, fimbriate: capsule depressed-globose: seeds oval. [*C. obtusiflora glandulosa* Engelm.]—On herbs, various provinces, Fla. to Tex., Calif., Tenn., and Ga.—(W. I., Mex.)

4. *C. Polygonorum* Engelm. Branches rather coarse to slender, often loosely matted: flowers in compact clusters: calyx-lobes triangular: corolla-lobes triangular, acute, longer than the tube: corolla-scales as long as the corolla-tube or nearly so, with few short processes on the upper part: capsule subglobose: seeds roundish.—On herbs in wet places, various provinces, Tenn., to Tex., Minn. and Md.

5. *C. pentagona* Engelm. Branches slender, loosely matted: calyx-lobes deltoid ovate to orbicular-ovate, obtuse: corolla-lobes as long as the tube or slightly longer, reflexed or spreading, the acute tips inflexed: corolla-scales longer than the corolla-tube, deeply fringed: anthers ellipsoid: capsule subglobose: seeds 1-1.2 mm. long. [*C. arvensis* Beyr.]—On herbs and low shrubs, various provinces, Fla. to Tex., Calif., Wash., and Mass.—(W. I., Mex.)

6. *C. Cephalanthi* Engelm. Branches rather coarse, seldom matted: calyx-lobes elliptic-ovate, obtuse: corolla-lobes much shorter than the tube, erect or spreading, obtuse: corolla-scales nearly or quite as long as the corolla-tube, with scattered processes: anthers oval to subglobose: capsule depressed-globose: seeds about 1.6 mm. long.—On shrubs and tall herbs, various provinces, Tenn. to Tex., Calif., Wash., Me., and Va.

7. *C. Coryli* Engelm. Branches slender or rather stout, sometimes loosely matted: calyx-lobes triangular, acute: corolla cylindric-campanulate in anthesis; lobes triangular-ovate: corolla-scales rudimentary, shorter than the corolla-tube, with few irregular processes on either side below the notched or truncate top: anthers oval or slightly ellipsoid: capsule depressed-globose. [*C. inflexa* Engelm.]—On shrubs or woody herbs, various provinces, N. C. to Tex., Ariz., Mont., Mich., and R. I.

8. *C. indecora* Choisy. Branches stout, loosely matted: calyx-lobes lanceolate to triangular-lanceolate, acute or obtusish: corolla campanulate in anthesis; lobes lanceolate or triangular-lanceolate: corolla-scales broad, as long as the corolla-tube or longer, copiously fringed: anthers broadly oval: capsule globose. [*C. decora pulcherrima* Engelm.]—On herbs and low shrubs, various provinces, Fla. to Tex., Calif., Ida., and Mich.—(*W. I., Mex.*)

9. *C. Harperi* Small. Branches very slender, rather loosely matted: flowers in loose clusters: calyx orbicular-ovate to reniform: corolla broadly campanulate, about 1 mm. long; lobes triangular-ovate, as long as the tube or slightly shorter, acute: corolla-scales exceeding the corolla-tube, with few short processes, especially above: anthers subglobose: capsule depressed-globose or globose-ovoid, depressed at the apex: seeds about 1 mm. long.—On low herbs, Appalachian Provinces, Ala.

10. *C. rostrata* Shuttlw. Branches rather coarse, sometimes loosely matted: flowers in compact clusters: calyx-lobes ovate: corolla campanulate, 4–6 mm. long; lobes ovate, much shorter than the tube, obtuse: corolla-scales shorter than the corolla-tube, with many long processes: anthers oval: capsule flask-shaped, beaked, seeds 2.5 mm. long or nearly so.—On herbs or rarely on shrubs; various provinces, Ga. to Tenn. and Md.—Very common on herbs and brambles above 5000 feet alt. in the Blue Ridge.

11. *C. Gronovii* Willd. Branches slender to rather coarse, more or less matted: flowers in lax or dense clusters: calyx shorter than the corolla; lobes broadly ovate, obtuse: corolla broadly campanulate; lobes ovate, shorter than the tube: corolla-scales nearly or quite as long as the tube, deeply fringed, the larger processes near the top: anthers oval: capsule globose-ovoid: seeds about 1.5 mm. long.—On herbs and low shrubs, often in wet grounds, various provinces, Fla. to Tex., Ariz., Man., and N. S.

12. *C. umbellata* H. B. K. Branches slender, sometimes filiform, loosely matted: flowers in unusually dense clusters: calyx fully as long as the corolla-tube; lobes triangular to ovate-triangular: corolla broadly campanulate; lobes lanceolate, as long as the tube or longer: corolla-scales as long as the corolla-tube or exceeding it, with numerous short processes: anthers oval or ellipsoid: capsule depressed-globose: seeds about 1 mm. long.—On herbs, Coastal Plain and southwestern provinces, Fla. to Ariz.—(*W. I., Mex.*)

13. *C. americana* L. Branches rather slender, in separate strands or sometimes matted: flowers in small (1 cm. in diameter) spaced or crowded clusters: calyx not as long as the corolla-tube; lobes somewhat reniform: corolla narrowly campanulate; lobes ovate, much shorter than the tube: corolla-scales shorter than the corolla-tube, with rather many very short processes: anthers subglobose: capsule ovoid: seeds about 1 mm. long.—Hammocks and pinelands, S Fla.—(*W. I., Mex., C. A., S. A.*)

14. *C. exaltata* Engelm. Branches very stout, copiously but sometimes loosely matted: flowers sessile or nearly so in spike-like panicles: calyx nearly or quite as long as the corolla-tube; lobes orbicular-ovate: corolla cylindric-campanulate: lobes ovate-orbicular, much shorter than the tube: corolla-scales 2-lobed, appearing as a wing on either side of the filament-attachment, toothed above: anthers ovoid: capsule oval-ovoid or cylindric-ovoid, 6–9 mm. long: seeds 3–5 mm. long.—On shrubs, especially scrub-oaks, coastal sand dunes, Fla.; also various provinces, Tex.

FAMILY 4. **HYDROLEACEAE** — WATER-LEAF FAMILY

Annual or perennial herbs, or shrubby plants. Leaves alternate or opposite: blades toothed, lobed, or dissected, or rarely entire. Flowers purple, blue, or white, rarely pink, in scorpioid racemes, or in cymes. Calyx of 5 partly united sepals. Corolla regular, of 5 partly united petals, the tube often appendaged within. Androeceum of 5 stamens, the filaments partly adnate to the corolla. Gynoeceum 2-carpellary. Fruit a capsule.—About 20 genera and 175 species, mostly natives of Western North America.

Styles wholly or partly united: ovary 1-celled: leaf-blades usually toothed or lobed.

Corolla-lobes convolute in the bud: placentae dilated.

I. **HYDROPHYLLEAE**.

Corolla-lobes imbricate in the bud: placentae narrow.

II. **PHACELIAE**.

Styles distinct: ovary 2-celled: leaf-blades entire.

Corolla funnelform or salverform: capsule loculicidal, the valves bearing the seeds.

III. **MARILAUNIDIEAE**.

Corolla rotate or campanulate: capsule septicidal, the axils bearing the seeds.

IV. **NAMEAE**.

I. **HYDROPHYLLEAE**

Calyx not conspicuously enlarged at maturity.

Calyx without reflexed appendages at the sinuses.

1. **HYDROPHYLLUM**.

Calyx with reflexed appendages at the sinuses.

Styles united to near the tips: stamens exserted.

2. **DECEMIUM**.

Styles united to about the middle: stamens included.

3. **NEMOPHILA**.

Calyx conspicuously enlarged at maturity.

4. **NYCTELEA**.

II. **PHACELIEAE**

Annual or rarely perennial herbs: flowers in scorpioid raceme-like cymes: corolla showy.

5. **PHACELIA**.

III. **MARILAUNIDIEAE**

Low, often prostrate herbs: flowers axillary: corolla small.

6. **MARILAUNIDIUM**.

IV. **NAMEAE**

Perennial erect herbs or partly woody plants: flowers in axillary or terminal cymes: corolla showy.

7. **NAMA**.

1. **HYDROPHYLLUM** [Tourn.] L. Perennial herbs. Leaf-blades lobed, pinnatifid, or pinnately divided. Cymes long-peduncled. Calyx but little changed in fruit. Corolla white or colored. Filaments surpassing the corolla-lobes, bearded at the middle. Seeds reticulate.—About 12 species, North American.—WATER-LEAF.

Leaf-blades pinnate or pinnatifid: inflorescence conspicuously hirsute.

Stems barely pubescent: calyx-lobes nearly distinct, linear.

1. *H. virginicum*.

Stems hispid or hirsute: calyx-lobes elliptic-lanceolate.

2. *H. macrophyllum*.

Leaf-blades palmately 5-7-lobed.

3. *H. canadense*.

1. *H. virginicum* L. Plant 2-7 dm. tall: leaf-segments coarsely toothed or incised: cymes open: calyx-lobes linear, about 5 mm. long, much longer than the tube: corolla white or purplish, 8.5-10 mm. long; lobes rounded at the apex.—Rich woods, various provinces, in Coastal Plain only northward, S. C. to Kans., Man., and Que.—Spr.-sum.

2. *H. macrophyllum* Nutt. Plant 2-6 dm. tall: leaf-segments coarsely serrate or incised: cymes compact: calyx-lobes lanceolate to elliptic lanceolate, somewhat longer than the tube: corolla white, 9-11 mm. long; lobes notched at the apex.—Rich woods, various provinces, N of Coastal Plain, Ga. to Ill. and Va.—Spr.

3. *H. canadense* L. Plant 2-7 dm. tall:

leaf-lobes coarsely toothed or again lobed: cymes open: calyx-lobes linear to linear-lanceolate, much longer than the tube: corolla white, 9–10 mm. long, the lobes notched at the apex.—Rich soil, woods and river-banks, various provinces N of Coastal Plain, N. C. to Ky., Ont., and Mass.

2. **DECEMIUM** Raf. Biennial upright herbs. Leaf-blades pinnately or palmately lobed or divided. Cymes long-peduncled. Calyx somewhat accrescent. Corolla violet or purple. Filaments surpassed by the corolla-lobes, beardless. Seeds minutely pitted.—One species.

1. **D. appendiculatum** (Michx.) Small. Plant 3–6 dm. tall: leaf-lobes coarsely toothed, acute or acuminate: cymes open: calyx-lobes narrowly lanceolate or subulate-lanceolate, much longer than the tube: corolla 9–11 mm. long; lobes rounded at the apex. [*Hydrophyllum appendiculatum* Michx.]—Rich soil, usually in damp woods, various provinces N of Coastal Plain, N. C. to Kans., and Ont.

3. **NEMOPHILA** Nutt. Annual diffuse herbs. Leaf-blades pinnately lobed or pinnatifid. Flowers solitary on axillary peduncles. Calyx not much enlarged at maturity. Corolla white or colored. Filaments included, glabrous. Styles partially united.—About 10 species, North American.

1. **N. microcalyx** (Nutt.) F. & M. Branches 0.5–4 dm. long: leaf-segments 3–5: pedicels 0.5–1.5 mm. long: calyx with minute appendages: corolla white or bluish, the appendages obsolete: capsule 4–5 mm. long.—Shaded banks and moist woods, various provinces, W Fla. to Tex., Ark., and Va.—Spr.—Another species, *N. phacelioides* Nutt., occurs west of the Mississippi River. It has a large corolla 2–2.5 cm. wide.

4. **NYCTELEA** Scop. Annual herbs. Leaf-blades pinnately divided or 1–3-pinnatifid. Flowers solitary in the axils. Calyx accrescent. Corolla white or bluish, commonly smaller than the calyx. Filaments included, often unequal, not dilated. Styles united.—About three species, North American.

1. **N. Nyctelea** (L.) Britton. Plant 0.5–3 dm. tall, ultimately diffusely branched: leaf-blades with spreading segments: pedicels 1–2 cm. long: calyx-lobes triangular-lanceolate, becoming 7–8 mm. long: corolla 4–6 mm. long: capsule 5–6 mm. in diameter.—Rich soil, woods and stream-banks, various provinces, N of Coastal Plain, N. C. to Kans., Sask. and Ont.—Spr.—sum.

5. **PHACELIA** Juss. Annual, biennial, or perennial herbs. Leaf-blades toothed or dissected. Flowers in scorpioid racemes or cymes. Calyx slightly accrescent. Corolla white or variously colored: lobes entire to fimbriate. Filaments not dilated at the base. Styles partly united.—About 90 species, American—Spr.

Corolla-lobes entire or merely crenulate.

Appendages of the corolla-tube between the stamens conspicuous.

I. BIPINNATIFIDAE.

Appendages of the corolla-tube between the stamens inconspicuous or obsolete.

II. DUBIAE.

Corolla-lobes fimbriate, lacinate, or fimbriate-dentate.

III. FIMBRIATAE.

I. BIPINNATIFIDAE

Stamens longer than the corolla: style over 8 mm. long.

1. *P. bipinnatifida*.

Stamens shorter than the corolla: style less than 5 mm. long.

2. *P. brevistyla*.

II. DUBIAE

Plant puberulent: corolla white or lilac, 8–10 mm. wide.

3. *P. dubia*.

Plant hirsute: corolla violet-purple, 12–15 mm. wide.

4. *P. hirsuta*.

III. FIMBRIATAE

Pedicels as long as the calyx-lobes or a little longer at maturity: style-branches longer than the united portion.

Calyx-lobes elliptic: corolla about 8 mm. broad; lobes lacinate toothed.

Calyx-lobes linear: corolla about 4 mm. broad; lobes irregularly toothed.

5. *P. Boykinii*.

Pedicels fully twice as long as the calyx-lobes at maturity: style-branches shorter than the united portion.

6. *P. Bicknellii*.

Corolla blue with white eye: stem erect.

7. *P. Purshii*.

Corolla white or pinkish: stem spreading or decumbent.

8. *P. fimbriata*.

1. *P. bipinnatifida* Michx. Plant 1–6 dm. tall, glandular-pubescent above: leaves 4–11 cm. long; blades pinnately divided, the segments incised or pinatifid: calyx-lobes narrowly linear to linear-subulate, 4–6 mm. long: corolla violet-blue, 9–11 mm. long; lobes mostly longer than the tube; appendages about  $\frac{1}{3}$  as long as the corolla: capsule 5–6 mm. long.—Damp slopes, calcareous cliffs, and thickets, various provinces N of Coastal Plain, Ga. to Ala., Ill., Ohio, and Va.—Spr.—sum.

2. *P. brevistyla* Buckl. Plant 1–4 dm. tall, glandular-pubescent above: leaves similar to those of *P. bipinnatifida*, but often smaller: calyx-lobes linear to linear-subulate, 4–5 mm. long: corolla bluish, 4–5.5 mm. long; lobes mostly shorter than the tube; appendages about  $\frac{1}{2}$  as long as the corolla: capsule 4–5 mm. long.—Shaded slopes, Blue Ridge to Appalachian Plateau, Ala. to N. C.—Spr.—sum.

3. *P. dubia* (L.) Small. Plant 0.5–4 dm. tall, often diffuse, strigillose, as well as glandular: stem-leaves with 3–5 oval, ovate, or obovate lobes: calyx-lobes narrowly elliptic or nearly so, 3–4 mm. long: corolla mainly pale-lilac, 5–6 mm. long; appendages obsolete: stamens longer than the corolla: ovary and style-base pubescent: capsule 2.5–3 mm. long. [*P. parviflora* Pursh]—Sterile hillsides and thickets, various provinces, N of Coastal Plain, Ga. to Tex., Kans., and W N. Y.—Spr.

4. *P. hirsuta* Nutt. Plant 0.5–3 dm. tall, sometimes sparingly branched, hirsute: stem-leaves with 5–7 lanceolate, elliptic, or ovate lobes: calyx-lobes

elliptic to linear-spatulate, 5-6 mm. long: corolla dark-purple or purplish-blue, 8.5-11 cm. long: stamens shorter than the corolla: ovary and style-base pubescent: capsule 3.5-4 mm. long.—Dry soil, rocks, and open woods, various provinces, N of Coastal Plain, Ga. to Kans. and Va.—Spr.

5. *P. Boykinii* (A. Gray) Small. Plant 1-2 dm. long, the branches becoming glabrous: stem-leaves with 5-7 broadly ovate lobes: calyx-lobes elliptic, 3-3.5 mm. long: corolla bluish, 3-4 mm. long; lobes laciniate-toothed: appendages less than  $\frac{1}{2}$  as long as the corolla: filaments sparingly pubescent: capsule 2.5 mm. long.—Dry soil, inner edge of Coastal Plain, Ga.—Spr.

6. *P. Bicknellii* Small. Plant 1-3 dm. tall, the branches strigose: stem-leaves with 5-7 mostly triangular lobes: calyx-lobes linear, 4-5 mm. long: corolla pale-blue, 3-4 mm. long; lobes irregularly toothed; appendages fully  $\frac{1}{2}$  as long as the corolla: filaments glabrous: capsule about 2 mm. long.—Barren soil, Interior Low Plateaus, Tenn.—Spr.

7. *P. Purshii* Buckl. Plant 1-3 dm. tall, with rather stiff stems; stem-leaves with 5-9 lanceolate or elliptic lobes: calyx-lobes linear to elliptic-spatulate, 4-5 mm. long: corolla light-blue with white eye, 6-7 mm. long; lobes short-fimbriate; appendages manifest: filaments about as long as the corolla: capsule about 4 mm. long.—Moist thickets and rich woods, various provinces, N of Coastal Plain, N. C. to Ala., Mo., Minn., and Pa.; locally becoming a field-weed.—Spr.

8. *P. fimbriata* Michx. Plant 1-4 dm. tall, with weak stem: stem-leaves with 5-7 triangular, lanceolate, or ovate, or partly elliptic lobes: calyx-lobes elliptic to elliptic-spatulate, 5-6 mm. long: corolla white or pinkish, 8-9 mm. long; appendages obsolete: filaments shorter than the corolla: capsule about 5 mm. long.—Wooded slopes, Blue Ridge to Appalachian Plateau, Ala. to Va.—Spr.

6. **MARILAUNIDIUM** Kuntze. Annual or perennial herbs. Leaf-blades entire. Flowers solitary in axils. Calyx slightly accrescent: lobes narrow. Corolla often blue, funnelform to nearly salverform: filaments often unequal, filiform. Styles distinct.—About 18 species, natives of warm and tropical regions.

1. *M. jamaicense* (L.) Kuntze. Branches 1-4 dm. long, spreading or prostrate: leaf-blades spatulate, often broadly so, 1-5 cm. long: calyx-lobes narrowly linear or nearly so, 5-8 mm long, ciliate: corolla white or purple, about as long as the calyx or slightly longer: capsule 8-10 mm. long. [*Nama jamaicensis* L.]—Hammoeks and waste-places, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A.)—Spr.-fall.

7. **NAMA** L. Perennial herbs, or shrubby plants, sometimes spiny. Leaf-blades entire. Flowers in axillary or terminal cymes. Calyx slightly accrescent: lobes broad. Corolla blue or rarely white, rotate to campanulate. Filaments widely dilated at the base. Styles distinct. [*Hydrolea* L.]—About 45 species, natives of warm and tropical regions.

Styles several times longer than the ovary: filaments nearly or quite as long as the corolla: top of the ovary and bases of the style glandular-pubescent.

Leaf-blades ovate to elliptic: calyx-lobes mostly less than 7 mm. long.

Leaf-blades elliptic to elliptic-lanceolate: calyx-lobes mostly over 7 mm. long.

Styles slightly longer than the ovary: filaments much shorter than the corolla: ovary and styles glabrous.

Calyx-lobes linear or linear-lanceolate, sparingly ciliate: stem villous-hirsute.

Calyx-lobes ovate to ovate-lanceolate, closely ciliate: stem glabrous or puberulent.

1. *N. ovatum*.

2. *N. corymbosum*.

3. *N. quadrivalve*.

4. *N. affine*.

1. *N. ovatum* (Nutt.) Britton. Plant 2-7 dm. tall, soft-pubescent, spine-armed, paniculate above: leaf-blades somewhat acuminate: calyx-lobes simply ciliate: corolla mainly purplish or white, 12-15 mm. long: capsule about 5 mm. long. [*H. ovata* Nutt.]—Swamps, ponds, and ditches, Coastal Plain, Ga. to Tex. and Mo.—Sum.

2. *N. corymbosum* (Macbride) Kuntze. Plant 2-7 dm. tall, unarmed or nearly so, corymbose above: leaf-blades elliptic to elliptic-lanceolate, acute: calyx-lobes glandular-ciliate: corolla mainly azure-blue, 11-15 mm. long: capsule 4-6 mm. long. [*H. corymbosa* Macbride]—Swamps, often calcareous, and stream-banks, Coastal Plain, Fla. to S. C.—Sum.

3. *N. quadrivalve* (Walt.) Kuntze. Plant 2-10 dm. long, often decumbent, spine-armed: leaf-blades narrowly elliptic or nearly so, 4-12 cm. long: calyx-lobes 6-8 mm. long: corolla blue or lilac, 7-8 mm. long: capsule 5-6 mm. long, surpassed by the calyx. [*H. quadrivalvis* Walt.]—Sandy places, swamps, ponds, and ditches, Coastal Plain, Fla. to La. and Va.—Sum.

4. *N. affine* (A. Gray) Kuntze. Plant 2-7 dm. long, often creeping, spine-armed: leaf-blades linear-elliptic or nearly so, 3-10 cm. long: calyx-lobes 4.5-5 mm. long: corolla violet, 9-10 mm. long: capsule 6-7 mm. long, surpassing the calyx. [*H. affinis* A. Gray]—Swampy places, Coastal Plain and adj. provinces, Miss. to Tex., Mo., and Ind.—Sum.—fall.

## FAMILY 5. POLEMONIACEAE — PHLOX FAMILY<sup>1</sup>

Plants of moderate size. Calyx of 5 partly united sepals, their free parts (lobes) deltoid to subulate. Corolla of 5 partly united petals, the free parts (lobes) conspicuous, convolute in bud. Androecium of 5 stamens, often unequal. Gynoecium of 3 united carpels, the styles united. Fruit a loculicidal capsule.—Comprises 20 genera and 200 species, most numerous in western North America; all but about 10 of the species are limited to the New World.

Corolla campanulate: stamens in part declined.

Corolla funnelform to salverform: stamens erect.

Leaf-blades pinnately parted: corolla funnelform: filaments equally adnate up to the corolla-throat (in our species).

Leaf-blades entire or nearly so: corolla salverform: filaments unequally adnate to the corolla-tube.

1. POLEMONIUM.

2. GILIA.

3. PHLOX.

<sup>1</sup> Contributed by Edgar Theodore Wherry.

1. **POLEMONIUM** L. Plants perennial with well-developed rootstocks, or in a few species annual. Leaves alternate: blades pinnately divided. Inflorescence primarily cymose, the cymes corymbose or paniculate. Calyx tubular: lobes broad. Corolla violet, yellow, or white, rotate to campanulate, with spreading lobes. Filaments equally adnate to the corolla-tube, two or more declined. Capsule ovoid to ellipsoid.—About 25 species, mostly North American, but at least 7, including the type of the genus, Eurasian.

1. **P. reptans** L. Tufted perennial, the ascending or erect stems up to 50 (exceptionally 75) cm. tall: leaves up to 20 cm. long and 7 cm. wide; segments variable in outline, but usually elliptic: corymb lax, some of the flowers nodding: calyx-tube 3–5 mm. long; lobes 2–4 mm. long during anthesis, doubling in size as the capsule ripens: corolla pale violet, exceptionally white, campanulate, the tube 5–7 mm. long; lobes obovate, as long as the tube: stamens normally included: style exserted. — (BLUE-BELL VALERIAN. GREEK-VALERIAN. SWEAT-ROOT.)—Rich woods and thickets, often in circumneutral soil, various provinces, though rare on the Coastal Plain, Ga. to Miss., E Kans., Minn., and N. Y.—Late spr.—A delicate plant, occasionally cultivated, though blooming for but a short period. A related species, *P. Van-Bruntiae* Britton, grows in S W. Va., and may enter our range in the Blue Ridge; it is taller and has a narrow panicle of larger flowers with the stamens exserted.

2. **GILIA** R. & P. Perennial, biennial, or annual plants. Leaves usually alternate, with numerous narrow segments, or in some species incised or entire. Calyx tubular to campanulate; lobes narrow, acute. Corolla red, yellow, blue, or white, exceptionally purple. Filaments unequally adnate to the corolla-tube, or equally adnate but unequally exserted. Capsule ellipsoid to ovoid.—About 100 species, all American and mostly in western United States.

1. **G. rubra** (L.) Heller. Plant biennial, forming a large rosette the first year and producing a stout stem up to 100 (exceptionally 175) cm. tall the second year: leaves numerous, pinnately-parted into linear-filiform divisions: panicle long, slender: flowers short-pedicelled: calyx-tube 3–4 mm. long; teeth 4–6 mm. long: corolla usually brilliant scarlet-red without and yellow streaked with red within; tube 20–23 mm. long; lobes elliptic-ovate, 9–11 mm. long, terminally undulate or mucronulate: stamens unequally exserted, extending 2–6 mm. beyond the corolla-throat: capsule 8–10 mm. long. [*G. coronopifolia* Pers.]—(SPANISH-LARKSPUR. STANDING-CYPRESS.)—Fields and margins of woods, usually in sandy or sterile soil, Coastal Plain and adj. provinces, Fla. to Tex., Okla., and N. C.; escaped from cultivation in various provinces as far N as

Mich. and Mass.—Sum.—A very showy plant. The flowers are adapted to cross-pollination by humming-birds.

**3. PHLOX** L. Dwarf-shrubby, perennial, or annual plants. Leaves mostly opposite, with their bases connected by stipular lines, in some species alternate, the blades entire. Inflorescence primarily cymose, the cymes often arranged in corymbs or panicles, bracted. Calyx tubular; lobes narrow, acute or awned. Corolla typically bright-purple, but ranging to rose-red, to blue-violet, or to white, the pale eye often striate with 5 groups of deeper-colored lines: lobes cuneate to broadly obovate. Capsule subglobose to ellipsoid, 4–6 mm. long.—About 50 species, all North American except that one extends from Alaska into Siberia. Several of these, as well as hybrids between them are in cultivation and have escaped locally. Many of the species are markedly variable.

Stems woody, trailing or decumbent; axillary latent shoots prominent: leaves mostly persistent: inflorescence a few-flowered cyme; pedicels often elongate.

Stems herbaceous, decumbent or erect; axillary latent shoots inconspicuous: leaves deciduous or a few persistent: inflorescence a few to many-flowered cyme, corymb, or panicle; pedicels rather short.

Calyx-lobes mostly longer than the tube, conspicuously awn-tipped: stamens and style much shorter than the corolla-tube.

Plant perennial: leaf-blades obtuse to acute with short awn-tips: inflorescence bilaterally symmetrical.

Plant annual: leaf-blades acute, with prominent awn-tips: inflorescence asymmetrical.

Calyx-lobes mostly shorter than the tube, obscurely awn-tipped: one or more stamens and style nearly or quite equalling the corolla-tube.

Leaves medium-sized, their margins roughish or ciliate with soft hairs, and their lateral veins obscure.

Leaves relatively large, their margins ciliate-serrulate with stiff bristles and their lateral veins prominent, areolate.

#### I. SUBULATAE.

#### II. DIVARICATAE.

#### III. DRUMMONDIANAE.

#### IV. OVATAE.

#### V. PANICULATAE.

#### I. SUBULATAE

Corolla-lobes entire, erose, or shallowly notched; stamens all included; style 1–3 mm. long.

Corolla-lobes conspicuously notched (exceptionally nearly entire); stamens partly exerted; style 4–12 mm. long.

Nodes numerous, crowded; lower leaves 8–20 mm. long; sinuses in corolla-lobes averaging 1 mm. deep.

Nodes few, more remote; lower leaves 20–60 mm. long; sinuses in the corolla-lobes averaging 3 mm. deep.

1. *P. nivalis*.

2. *P. subulata*.

3. *P. bifida*.

#### II. DIVARICATAE

Sterile shoots becoming decumbent, often rooting at nodes; leaves rather broad; inflorescence lax; corolla-tube glabrous. Sterile shoots erect or decumbent, not rooting at nodes; leaves mostly narrow; inflorescence more compact.

Leaves mostly linear to lanceolate, sparingly persistent; bracts spreading; inflorescence-hairs sometimes gland-tipped.

Nodes few; leaves pubescent or sometimes glabrous, the upper spreading, passing rather abruptly into the bracts.

Nodes numerous; leaves always glabrous, the upper ascending, passing gradually into glandular-pubescent bracts.

Leaves oblong elliptic to lanceolate, many of them persistent; bracts ascending; inflorescence-hairs coarse, eglandular.

4. *P. divaricata*.

5. *P. pilosa*.

6. *P. floridana*.

7. *P. amoena*.

## III. DRUMMONDIANAE

Plant a branching annual with the upper leaves alternate.

8. *P. Drummondii*.

## IV. OVATAE

Prostrate stems well-developed, rooting at nodes: lower leaves spatulate, many of them persistent.

Prostrate stems poorly developed: lower leaves never typically spatulate, sparingly if at all persistent.

9. *P. stolonifera*.

Flowering shoots mostly arising from the tip of a decumbent stem: nodes few: leaves elliptic to ovate: calyx averaging 10 mm. long.

10. *P. ovata*.

Flowering shoots mostly arising from the rootstocks: nodes numerous: calyx averaging less than 10 mm. long.

Cymes in a corymb or broad corymbose panicle.

Upper leaves lanceolate to ovate: calyx 6-11 mm. long.

11. *P. carolina*.

Upper leaves linear to lanceolate: calyx 5-8 mm. long.

12. *P. glaberrima*.

Cymes in a narrow-conical or cylindrical panicle.

13. *P. maculata*.

## V. PANICULATAE

Hairs on the few opposite leaves, when present, coarse, and those on the inflorescence mostly gland-tipped: corolla-tube glabrous: stamens all included.

14. *P. amplifolia*.

Hairs on the numerous sub-opposite leaves, when present, fine, those on the inflorescence pointed or rarely gland-tipped; corolla-tube pubescent: 1 or 2 stamens exserted.

15. *P. paniculata*.

1. *P. nivalis* Lodd. Low evergreen shrub, with erect pubescent and often glandular flowering shoots 10-20 cm. tall: leaf-blades sessile, up to 25 mm. long and to 4 mm. wide; blades linear-subulate to lanceolate-elliptic: calyx-tube about 5 mm. and lobes 4 mm. long: corolla light-purple to white, the eye often dark-striate; tube 11-19 mm. long; lobes cuneate to obovate, 8-15 mm. long, terminally entire or erose, or with a sinus to 0.5 (rarely 1 or 2) mm. deep. [*P. Hentzii* Nutt.]—(TRAILING-PHLOX.)—Open oak woods, pine woods, or scrub, in sterile and often rather acid gravelly or sandy soil, Coastal Plain and Piedmont, Fla. to Ala. (or Miss. acc. to Chapman) and S Va.—Spr., and occasionally fall.—This species probably represents the ancestor of the next following, with which it is often confused.

2. *P. subulata* L. Low matted evergreen shrub with numerous erect pubescent, and in our range usually glandular, flowering shoots 5-10 cm. tall: leaves much as in the preceding, but rarely exceeding 15 mm. in length and 2 mm. in width: calyx-tube about 4 mm. long; lobes somewhat shorter: corolla of various purple hues, rarely white, the eye often deep-purple striate; tube 9-15 mm. long; lobes cuneate to obovate, 6-11 mm. long, terminally sub-entire or usually with a sinus 0.5-3 mm. deep.—(MOSS-PHLOX. MOUNTAIN PINK.)—Bare gravelly or sandy slopes, often in circumneutral soil over calcareous or magnesian rocks, various provinces, in Coastal Plain only northward, N. C. and E Tenn. to S Mich., S Ont., and N. Y.—Spr., and occasionally fall.—Presumably a descendant from *P. nivalis*, exhibiting its greater specialization in the more densely matted stems, more consistently notched corolla-lobes, and more elongate stamens and style.—*P. Brittonii* Small, differing from typical *P. subulata* in the pale-lilac or white corolla with deeper sinuses in the lobes, was included in Fl. SE. U.S., but is not now regarded as specifically distinct, nor as growing within our area.

3. *P. bifida* Beck. Trailing subevergreen shrub, with long ascending flowering shoots; the young foliage glabrate to glandular-pubescent: leaf-blades sessile, up to 5 cm. long and to 5 mm. wide, linear to lanceolate: calyx-tube about 4 mm. long; lobes slightly shorter: corolla lavender to white, the eye faintly striate; tube 9–12 mm. long; lobes nearly as long, cuneate, with a sinus 2–6 mm. deep.—(SAND-PHLOX.)—Exposed slopes and cliffs in rocky or sandy, sterile soil, Central Lowland and occasionally adj. provinces, Tenn. to N Okla., E Kans., Iowa, and SW Mich.—Spr.—*P. Stellaria* A. Gray, with glabrate or simply puberulent young foliage, appears not to be specifically distinct.—The plant usually cultivated under the name *P. Stellaria* is a garden form of *P. subulata*.

4. *P. divaricata* L. Plant in an open-mat, with the lower leaves evergreen, the erect flowering shoots up to 50 cm. tall: leaf-blades sessile or nearly so, elliptic to elliptic-lanceolate or ovate, up to 5 cm. long and to 2 cm. wide: cymes corymbose-paniculate: calyx-tube about 4 mm. long; lobes somewhat longer: corolla of mauve to blue-violet hues, ranging to white, the eye faintly violet-striate; tube 10–16 mm. long, glabrous; lobes cuneate to obovate, varying greatly in length, entire, erose, apiculate, or with a sinus as much as 2 mm. deep.—(BLUE-PHLOX.)—Rich woods, often in circumneutral soil over calcareous rocks, various provinces, rarely Coastal Plain, N Fla. to E Tex., E Nebr., Minn., W Que., and N Vt.—Spr.—The flowers of this species are more consistently of a bluish color than those of any other *Phlox*.—Several showy garden forms and hybrids with other species are in cultivation.

5. *P. pilosa* L. Plant tufted, the stems up to 60 cm. tall, glabrous or pubescent: leaf-blades sessile, up to 10 cm. long and to 5 (rarely 10) mm. wide, opposite or alternate, linear to broadly lanceolate or ovate, somewhat ciliate, and more or less pubescent on both surfaces, deciduous or sometimes in part persistent: cymes in a terminal corymb: calyx-tube 3–4 mm. and lobes 4–7 mm. long: corolla bright-purple, pale violet, or white, the eye sometimes purple-striate; tube 10–18 mm. long, glabrous or pubescent; lobes obovate, variable in length, entire, erose, mucronulate or apiculate.—(DOWNY-PHLOX.)—Open woods, hammocks, barrens, thickets, and prairies, often in sterile soil, various provinces, Fla. to Tex., S Man., S Ont., and W Conn.—Spr.—early sum. or all year in pen. Fla.—Variable in extent and character of pubescence, on the basis of which a number of forms have been segregated.—*P. detonsa* (A. Gray) Small, with glabrous or glabrate foliage, grades too freely into *P. pilosa* to be maintained as specifically distinct. *P. glutinosa* Buckl. is regarded as a hybrid between this species and *P. divaricata*.

6. *P. floridana* Benth. Plant tufted, the stems up to 80 cm. tall, glabrous below the inflorescence; leaf-blades sessile, up to 10 cm. long and 7 mm. wide, linear to lanceolate, the upper gradually shortened and conspicuously appressed: cymes in a terminal corymb, glandular-pubescent; calyx-tube 4–5 mm. and lobes 4–6 mm. long: corolla bright-purple; tube 15–20 mm. long; lobes obovate, entire, often larger than in the next preceding species.—(FLORIDA PHLOX.)—Sterile woods, thickets, and swamp-margins, NW Fla. and adj. Ala. and Ga.—Blooms about a month later than *P. pilosa*, in early summer.—One of the most restricted in area of all our *Phloxes*. Sometimes seems to grade toward *P. pilosa*, but usually quite distinct in aspect.

7. *P. amoena* Sims. Plant in an open-mat, with the lower leaves evergreen, becoming purplish beneath, the flowering shoots up to 30 cm. tall: leaf-blades sessile, up to 5 cm. long and to 8 mm. wide, the lowermost spatulate but the majority linear-elliptic to elliptic-lanceolate: bracts conspicuous, lanceolate to elliptic: calyx-tube 4–5 mm. long; lobes of the same or a slightly greater length: corolla bright-purple, pale-violet, lilac, or white, the eye faintly

striate; tube 12–16 mm. long, glabrous or puberulent; lobes obovate, 8–11 mm. long, terminally entire, undulate, or mucronulate.—(HAIRY PHLOX.)—Open woods and pine barrens, in acid sandy or rocky soil, various provinces, Fla. to Miss., Ky., and N. C.—Spr.—The plant usually cultivated under the name *P. amoena* is a hybrid between *P. subulata* and *P. stolonifera*, with gland-tipped hairs and long stamens and style.—*P. Lighthipei* Small, with flowering shoots up to 50 cm. tall and often longer leaves may not be specifically distinct.

8. *P. Drummondii* Hook. Stem branching, up to 40 cm. tall, pubescent with gland-tipped hairs: leaf-blades up to 9 cm. long and to 15 mm. wide, sessile, the lower opposite and oblanceolate, and the upper alternate, and lanceolate to elliptic, conspicuously awn-tipped: cymes corymbosely compound: calyx-tube 4–5 mm. and lobes 4–7 mm. long: corolla rose-red to purple, ranging to white, the eye often strongly striate; tube 14–17 mm. long, pubescent; lobes obovate, 8–15 mm. long.—(ANNUAL GARDEN-PHLOX.)—Prairies, Coastal Plain and adj. provinces, Tex.; naturalized E to Fla. and Ga.—Spr.-sum.—Cultivation has produced in this species hundreds of forms, of varying types of corolla-lobing, and numerous different colors.

9. *P. stolonifera* Sims. Plant in a dense mat, with decumbent evergreen sterile shoots rooting freely at the nodes, and erect deciduous glandular-pubescent flowering shoots up to 30 cm. tall: leaf-blades up to 8 cm. long and 2 cm. wide, obovate-spatulate to elliptic-lanceolate: cyme simple or somewhat compound: calyx-tube about 5 mm. long; lobes as long or somewhat shorter: corolla bright-purple, violet, or rarely white, the eye purple-striate; tube 20–25 mm. long; lobes 10–12 mm. long. [*P. reptans* Michx.]—(CREEPING-PHLOX.)—Woods, in humus-rich and slightly acid soils, Blue Ridge, Appalachian Plateau and rarely adj. provinces, Ga. to Ohio and Pa.—Spr.—Rare, though occurring locally in large colonies formed by repeated rooting of the sterile shoots; having developed the ability to propagate itself in this manner, it produces seed only sparingly.

10. *P. ovata* L. Plant in an open-mat, with the lower leaves somewhat persistent, and the glabrate flowering-shoots up to 50 cm. tall; leaf-blades up to 10 cm. long and to 4 cm. wide, the lower and middle petioled, the upper sessile, elliptic to lanceolate or ovate: cyme simple or corymbosely compound: calyx-tube 6–8 mm. and lobes 3–5 mm. long: corolla bright-purple or rarely white, the eye slightly striate; tube 18–23 mm. long; lobes 10–15 mm. long.—(MOUNTAIN-PHLOX.)—Thickets and open woods, in rather acid soil, higher Piedmont to Central Lowland and to New England Upland, Ga. to E Ind. and E Pa.—Late spr.-sum.—Specimens lacking the decumbent stems tipped with petioled leaves are difficult to distinguish from the next-following species, to which this is probably ancestral.

11. *P. carolina* L. Plant tufted, puberulent or sometimes pubescent, the stems up to 100 (rarely 125) cm. tall, often purple-streaked: leaf-blades up to 12 cm. long and 35 mm. wide, the lower linear but the upper usually conspicuously broader, elliptic-lanceolate to ovate: cymes in a corymb or broad corymbose panicle, exceptionally conical: calyx-tube usually 4–6 mm. and lobes 2.5–4.5 mm. long: corolla deep- or sometimes pale-purple, the eye somewhat striate; tube 15–26 mm. long; lobes 7–15 mm. long.—(THICK-LEAF PHLOX.)—Open woods and occasionally meadows, in subacid soil, chiefly in the Blue Ridge and Appalachian provinces, but occasionally in Piedmont or even Coastal Plain, W Fla. to Miss., S Ind. and W Md.—Late spr.-fall.—Represents an apparent intermediate between Nos. 10, 12 and 13, and grades into them in some colonies.

12. *P. glaberrima* L. Plant tufted, glabrous or essentially so, the stems all erect, up to 60 (rarely 100) cm. tall: leaf-blades up to 15 cm. long and to 15

mm. wide, often numerous and crowded below, remote above, obscurely petioled, linear to lanceolate: cymes in a corymb or short, irregularly interrupted panicle: calyx-tube 3-4 mm. long, the lobes somewhat shorter: corolla purple, often pale though rarely white, the eye faintly striate: tube 18-24 mm. long: lobes variable in length.—(SMOOTH-PHLOX.)—Roadsides, prairies and open woods, various provinces, Fla. to E Tex., Wisc. and SE Va.—Late spr.—sum.

13. *P. maculata* L. Plant tufted, the erect stems up to 125 cm. tall, often purple-streaked: leaves numerous but scarcely crowded; blades subsessile, scabrous-ciliolate, up to 12 cm. long and to 25 (rarely 35) mm. wide, linear to ovate: cymes in a panicle 3-30 cm. long, its branches exceptionally exceeding the subtending leaves: calyx-tube 4-5 mm. and lobes 2.5-3.5 mm. long: corolla purple to white, the eye faintly striate; tube 18-24 mm. long; lobes 8-10 mm. long.—(MEADOW PHLOX.)—Damp thickets, meadows, and moist open woods, in circumneutral soil, various provinces, N. C. to E Mo., Minn., S. Que., and W Conn.—Late spr.—early fall.—The purple streaks on the stem, although often striking, are not diagnostic for this species. In some occurrences, especially those with white flowers, they are lacking while other species of the genus, and in particular *P. carolina*, of which *P. maculata* appears to be a direct descendant, may be similarly streaked. The non-recognition of this fact has led to many erroneous reports of the occurrence of this species in our region, whereas it seems to be one of the rarest.

14. *P. amplifolia* Britton. Plant tufted, the stems up to 125 cm. tall, often purple-streaked: leaves up to 18 cm. long and 8 cm. wide, with short broad petioles widening abruptly into the ovate blades, glabrate or usually hirsute with coarse hairs above, and hirsute-pubescent beneath: cymes in a fairly large subcorymbose panicle, the leaves subtending its elongate branches much reduced and the bractlets very small: calyx-tube 3-4 mm. and lobes about as long: corolla pale-purple or rarely white; tube about 2 cm. long; lobes 9 mm. long.—(BROAD-LEAF PHLOX.)—Open woods and thickets, various provinces N of Coastal Plain, Ga. to E Mo., S Ind., and E Ky.—Sum.—early fall.—This species has been confused with the next following, and was no doubt derived from the same ancestor, but is quite distinct in aspect.

15. *P. paniculata* L. Plant tufted, the stems up to 150 cm. tall: leaves numerous, rather crowded, often subopposite: blades somewhat petioled, undulate-margined, glabrous or puberulent, up to 18 cm. long and 4 (rarely 5) cm. wide, elliptic: cymes in a corymbose panicle 5-35 cm. long, the branches often exceeding their subtending leaves, the bractlets rather conspicuous: calyx-tube 4-5 mm. and lobes 3-6 mm. long: corolla purple to white, the eye often distinct; tube 2-3 cm. long; lobes 9-11 mm. long.—(PERENNIAL GARDEN-PHLOX.)—Thickets along streams and damp woods, often in circumneutral soil, various provinces, N Ga. to Miss., E Nebr., and S N. Y.—Sum.—fall.—*P. paniculata* is extensively cultivated, the majority of the garden forms of perennial phlox having arisen from it or its hybrids with other species, and frequently escapes.—*P. acuminata* Pursh., with the leaves copiously soft-pubescent beneath and decurrent on the stem as angles, may not be specifically distinct.

## FAMILY 6. SOLANACEAE — POTATO FAMILY

Herbs, shrubs, trees, or vines. Leaves alternate: blades entire, toothed, or lobed. Calyx of 5, (4-6), more or less united sepals. Corolla of 5, (4-6), more or less united petals. Androecium of 5, (4-6), stamens, the filaments partially adnate to the corolla-tube. Gynoecium 2-carpellary or 3-5-carpellary. Fruit a berry or a capsule.—About 75 genera and 1,750 species, most abundant in the tropics.

Fruit a berry.

Corolla plicate; lobes usually induplicate.

Corolla little, if at all plicate; lobes imbricate, valvate, or valvate-induplicate.

Stamens adnate to the lower part of the corolla-tube: corolla rotate or urceolate.

Stamens adnate up to the upper part of the corolla-tube: corolla salverform to funnelform.

Seeds flattened: stamens exserted.

Seeds turgid: stamens included.

Fruit a capsule.

Capsule prickly-armed: calyx circumscissile at the base.

Capsule unarmed: calyx not circumscissile.

Flowers in racemes or panicles: filaments nearly equal in length.

Flowers solitary in the axils or opposite the leaves: filaments unequal in length.

#### I. SOLANAEAE

Berry enclosed in the accrescent calyx.

Calyx inflated in fruit: anthers not connected; sacs opening lengthwise.

Ovary 3-5-celled: sepals nearly distinct, auricled.

Ovary 2-celled: sepals united to near the tips.

Calyx not inflated, fitting close to the berry: anthers connected; sacs opening by terminal pores.

Berry seated in the little changed calyx (exceptionally enclosed in species of *Solanum*): anthers connate or converging.

Anther-sacs commonly opening by terminal pores or slits.

Anther-sacs opening lengthwise and introrsely.

#### II. CAPSICEAE

Anthers converging around the style: corolla urceolate.

Anthers not converging: corolla rotate.

#### III. ATROPEAE

Shrubs with herbaceous or succulent leaves.

#### IV. CESTREAE

Shrubs or trees: flowers in axillary clusters, sometimes aggregated in a terminal panicle or corymb.

#### V. DATUREAE

Herbs, shrubs, or trees, usually rank-smelling: flowers often fragrant, the corolla usually showy.

#### VI. NICOTIANAEAE

Herbs, heavy-scented, with usually clammy-pubescent stems and leaves: flowers few or many in the panicles or racemes.

#### VII. PETUNIEAE

Herbs with clammy-pubescent stem and leaves: corolla funnelform, showy.

I. SOLANAEAE.

II. CAPSICEAE.

III. ATROPEAE.

IV. CESTREAE.

V. DATUREAE.

VI. NICOTIANAEAE.

VII. PETUNIEAE.

1. PHYSALODES.

2. PHYSALIS.

3. ANDROCERA.

4. SOLANUM.

5. LYCOPERSICON.

6. PERIZOMA.

7. CAPSICUM.

8. LYCIUM.

9. CESTRUM.

10. DATURA.

11. NICOTIANA.

12. PETUNIA.

### 1. PHYSALODES Boehm. Annual herbs. Leaf-blades sinuate or lobed.

Flowers axillary, nodding. Calyx accrescent: lobes cordate or sagittate converging, inflated. Corolla open-campanulate, slightly 5-lobed. Ovary 3-5-celled. Berry surrounded by the calyx-lobes.—One species.

1. *P. Physalodes* (L.) Britton. Plant nearly glabrous, 3-9 dm. tall: leaf-blades ovate, oval, or elliptic, 5-15 cm. long, angulate-lobed or sinuate: calyx 1.5 cm. long, becoming 3.5 cm. long: lobes broadly ovate: corolla blue or violet, about 2.5 cm. wide: berry 1.5-2 cm. in diameter. [*Nicandra Physalodes* Pers.] — (APPLE-OF-PERU.)—Fence-rows, waste-grounds and roadsides, various provinces, Ala. to Miss. and S Can. Nat. of Peru.—Sum.

2. **PHYSALIS** L.<sup>1</sup> Annual or perennial branching, often diffuse herbs.

Leaf-blades entire or sinuate. Flowers axillary, nodding, mostly solitary. Calyx bladder-like at maturity: lobes short and converging. Corolla campanulate, mainly yellow or whitish, often dark in the center. Ovary 2-celled. Berry globular, enclosed in the papery calyx.—About 80 species, mostly American.—Sum. or all year S.—GROUND-CHERRIES. JERUSALEM-CHERRIES.

Annual plants, with much branched roots.

Fruiting calyx sharply 5-angled, deeply sunken at the base: calyx-lobes at flowering time fully as long as the tube.

Fruiting calyx obtusely or indistinctly 5- or 10-angled: calyx-lobes at flowering time shorter than the tube (except sometimes in *P. Carpenteri*).

Leaf-blades acute: flowers solitary in the axils.

II. ANGULATAE.

Leaf-blades acuminate: flowers often fascicled.

III. CARPENTERIANAE.

Perennial plants, with horizontal rootstocks.

Pubescence of simple hairs.

Pubescence sparse, seldom if at all glandular or viscid.

IV. LANCEOLATAE.

Pubescence dense, viscid or glandular, generally a mixture of fine short hairs and long flat-jointed ones.

V. HETEROPHYLLAE.

Pubescence mainly of stellate hairs.

VI. VISCOSAE.

## I. PUBESCENTES

Plants more or less viscid pubescent.

Fruiting calyx not long-acuminate: leaf-blades very oblique.

Leaf-blades ovate, subentire at the base: stem slender, diffuse, sharply angled.

1. *P. pubescens*.

Leaf-blades cordate, strongly sinuately toothed to the base: stem obtusely angled.

Leaves broadly rounded, cordate, 2-5 cm. long: stem weak, diffuse.

2. *P. floridana*.

Leaves elongated, cordate, 4-10 cm. long: stem stout.

3. *P. pruinosa*.

Fruiting calyx long-acuminate: leaf-blades scarcely oblique at the base, cordate, abruptly acuminate.

4. *P. barbadensis*.

Plants glabrous or puberulent when young.

5. *P. turbinata*.

## II. ANGULATAE

Plants pubescent and more or less viscid.

6. *P. missouriensis*.

Plants glabrous.

7. *P. angulata*.

## III. CARPENTERIANAE

Plants resembling that of *Solanum nigrum* in habit, the leaf-blades thin.

8. *P. Carpenteri*.

## IV. LANCEOLATAE

Leaves glabrous: upper part of the stem, calyx and veins of the leaves with few, if any, short appressed hairs.

9. *P. subglabrata*.

Leaves and stem sparingly hairy with longer, flat, spreading or reflexed, often jointed, hairs (some of the species are slightly viscid).

Fruiting calyx ovoid, scarcely angled and scarcely sunken at the base: leaf-blades thick, subentire.

10. *P. lanceolata*.

Fruiting calyx pyramidal, more or less 5-angled and deeply sunken at the base: leaf-blades thin.

Fruiting calyx ovoid-pyramidal: leaf-blades mostly ovate or lanceolate, tapering at the base.

Leaf-blades more or less sinuately dentate.

Calyx strigose or puberulent.

11. *P. virginiana*.

Calyx villous.

12. *P. monticola*.

Leaf-blades subentire or wavy margined.

Leaf-blades firm: plant not at all viscid.

Leaf-blades very thin: plant more or less viscid above when young.

13. *P. rigida*.

14. *P. intermedia*.

Fruiting calyx oblong-pyramidal or nearly cylindrical: leaf-blades broadly ovate, truncate or cordate at the base.

Leaf-blades rather firm, reticulate: stem and leaves puberulent.

15. *P. arenicola*.

<sup>1</sup> Contributed by the late Per Axel Rydberg.

Leaf-blades very thin, the veins not prominent: stem and leaves pilose.

16. *P. ciliosa*.

#### V. HETEROPHYLLAE

Leaf-blades generally over 5 cm. long, more or less cordate. Apex, and teeth of the leaves rounded.

Apex, and teeth (if any) of the leaves acutish to acuminate.

Stem densely and leaves more sparingly pubescent with very long (2 mm. or more) white hairs.

Stem erect: anthers purple: leaf-blades rounded or subcordate at the base.

Stem spreading: anthers yellow: leaf-blades usually cuneate or acute at the base.

Stem and leaves very densely pubescent with short, very viscid hairs: anthers yellow.

Leaf-blades generally 5 cm. long or less: stem with long hairs.

17. *P. sinuata*.

18. *P. ambigua*.

19. *P. nyctaginea*.

20. *P. heterophylla*.

16. *P. ciliosa*.

#### VI. VISCOSAE

Plants densely white-pubescent or grayish pubescent.

Hairs all stellate.

Leaf-blades cordate, reniform or round, angulately toothed.

Leaf-blades elliptic, sometimes cordate at the base, to oblanceolate, subentire or repand.

Hairs partly simple, partly stellate: leaf-blades elliptic, subentire.

Plants nearly glabrous, except on the margins of the calyx-lobes, rarely stellate all over when young.

Leaf-blades oblong, oblanceolate or spatulate, the lateral veins distinct.

Leaf-blades linear, thick; midrib prominent, the lateral veins obsolete.

21. *P. mollis*.

22. *P. viscosa*.

23. *P. fuscomaculata*.

24. *P. Elliottii*.

25. *P. angustifolia*.

1. *P. pubescens* L. Stem more or less villous and viscid: leaf-blades thin 2-6 cm. long, ovate, acute or acuminate, repand-denticulate or entire, pubescent, becoming nearly glabrous except along the nerves: calyx-lobes narrow, not subulate tipped: corolla 5-10 mm. broad, yellow with dark center: anthers purplish: fruiting calyx 2-3 cm. long, pyramidal-ovoid, acuminate, more or less retuse at the base.—Sandy soil, sand-dunes, fields, and pastures, various provinces, Fla. to Tex., Calif., and Pa. —(*W. I., Mex., C. A., S. A., O. W.*)

2. *P. floridana* Rydb. Stem densely villous with long white viscid hairs: leaf-blades rounded-cordate, 2-5 cm. long, coarsely sinuate-toothed, obtuse, sparingly viscid-pubescent on both sides: calyx densely viscid pubescent; lobes lanceolate, acuminate: corolla 6-8 mm. broad, yellow with purple spots: anthers purplish: fruiting calyx 2-2.5 cm. long, 5-angled, deeply retuse at the base.—Pinelands and hammocks, Fla.

3. *P. pruinosa* L. Stem more hairy and viscid than in the two preceding and the next following species, stout, generally erect or often ascending, finely villous or viscid: leaf-blades ovate-cordate 3-10 cm. long, finely pubescent, bluntly sinuate-toothed; calyx villous or viscid; lobes as long as the tube, narrow, but without subulate tips; corolla 3-8 mm. broad, yellow: anthers yellow or purplish: fruiting calyx of a little firmer texture and more pubescent than that of the two preceding species, reticulate, 2-3 cm. long, ovoid-cordate.—Rich soil and sandy woods, various provinces, Fla. to Ala., Ia., and Mass.

4. *P. barbadensis* Jacq. Stem generally pubescent and viscid, stouter than those of *P. pubescens*, tall and erect, or widely spreading: leaf-blades 3–6 cm. long, cordate, acute or generally abruptly acuminate, sharply repand-dentate, pubescent with short hairs: calyx generally densely viscid-hirsute; lobes lanceolate, acuminate, but not subulate-tipped: corolla 5–10 mm. broad, yellow: anthers purplish: fruiting calyx 2.5–3 cm. long, attenuate, almost conical, reticulate, retuse at the base.—Rich soil, often in open woods, and waste-places, various provinces, Fla., to Tex., Mo., and Pa. (*W. I., Mex., C. A., S. A.*)

5. *P. turbinata* Medic. Stem glabrous, or minutely puberulent when young rather stout: leaf-blades broadly ovate, obtuse or cordate and slightly oblique at the base, thin and dark-green, repand-dentate; short acuminate: calyx minutely ciliate on the margins and veins or glabrate: calyx-lobes lanceolate, acuminate: corolla 8–10 mm. broad, yellow with purplish spots: fruiting calyx 3–3.5 cm. long, long-attenuate, almost pyramidal, deeply retuse at the base.—Rich soil and thickets, various provinces, Fla. to Tex., Mo., and Pa.—(*W. I., Mex.*)

6. *P. missouriensis* Buch. Stem villous with short hairs, sometimes slightly viscid, spreading, often zigzag: leaf-blades 1–8 cm. long, ovate, acute, cuneate, obtuse or cordate at the base, repand or sinuately dentate, hairy at least on the nerves: calyx villous; lobes shorter than the tube, triangular: corolla 3–8 mm. broad, yellow, generally with a dark center: anthers generally yellow: fruiting calyx 1.5–2 cm. long, globose-ovoid, nearly filled with the berry, not sunken at the base. [*P. Lagascae* Rydb. not R. & S.]—Rich soil and open woods, Coastal Plain, Fla. and Ala.—(*W. I., Mex.*)

7. *P. angulata* L. Stem glabrous, often diffuse: leaf-blades ovate, 4–7 cm. long, with a more or less cuneate base, sharply sinuate, with acuminate teeth, thin: calyx glabrous; lobes triangular to lanceolate, generally shorter than the tube: corolla 5–10 cm. broad, yellow: anthers more or less purplish: fruiting calyx about 3 cm. long, ovoid, not prominently 5–10 angled, sometimes purple-nerved and at length nearly filled with the yellow berry.—Rich soil, fields, and pastures, various provinces, rarely Coastal Plain, Fla. to Tex., Minn., and Pa. (*W. I., Mex., C. A., S. A., O. W.*)—Forms occur in S Florida with linear to lanceolate sinuate leaf-blades.

8. *P. Carpenteri* Riddell. Stem rather closely and finely puberulent: leaf-blades very thin, oval or ovate, abruptly contracted into a long acumination, entire or slightly wavy, nearly glabrous or puberulent: corolla about 1 cm. broad, open-campanulate: fruiting calyx small, only 1 cm. in diameter, nearly globose, scarcely angled, faintly nerved, the lobes sometimes very unequal.—Sandy soil, Coastal Plain, N Fla. to La. and Ark.

9. *P. subglabrata* Mackenzie & Bush. Stem glabrous or sparingly hairy, especially above with short appressed hairs: leaf-blades ovate or ovate-lanceolate, 2.5–7.5 cm. long, undulate or entire, oblique and rounded or subcordate at the base, glabrous or with a few scattered hairs on the veins: calyx 6–8 mm. long, appressed-hairy on the veins and at the base; lobes triangular, about the length of the tube: corolla yellow, with a darker center, 10–15 mm. broad: fruiting calyx ovoid, slightly depressed at the base, slightly angled.—Loose soil roadsides, fields, and river-bottoms, various provinces N of Coastal Plain, Tenn. to Ark., Nebr., and Ont.

10. *P. lanceolata* Michx. Stem sparingly hirsute with flat hairs, at first erect, later spreading or diffuse: leaf-blades broadly oblanceolate or spatulate, tapering into the petiole, acute or obtuse, nearly always entire, rarely wavy, but not

sinuate-toothed, thickish, sparingly pubescent with short hairs: calyx strigose or villous, rarely glabrous; lobes triangular-lanceolate: corolla dullish-yellow with a brownish center, about 1.5 cm. broad: fruiting calyx round-ovoid, not sunken at the base, indistinctly 10-angled.—Prairies, bluffs, and sandy hillsides, various provinces, rarely Coastal Plain, S. C. to N. Mex., Wyo., and Ill.

11. *P. virginiana* Mill. Stem pubescent with appressed hairs, sometimes somewhat glandular, or in some forms nearly glabrous: leaf-blades ovate-lanceolate, tapering to both ends, 3–6 cm. long, generally more or less sinuately dentate, often yellowish-green: calyx strigose-hirsute, or at least puberulent; lobes triangular or broadly lanceolate, nearly equalling the tube in length: corolla sulphur-yellow with purplish spots, 1.5–2.5 cm. broad: anthers yellow: fruiting calyx pyramidal-ovoid, 5-angled and sunken at the base. [*P. lanceolata* Chapm. not Michx.]—Rich soil, fields, and borders of woods, various provinces, Fla. to La., Colo., Man., and Ont.

12. *P. monticola* C. Mohr. Stem strigose below, villous above with simple flat jointed hairs: leaf-blades ovate, oval, or elliptic, 2–6 cm. long, repand, with the teeth obtuse or rarely acutish, slender-petioled: calyx villous; lobes broadly lanceolate: corolla dingy-yellow, with a purplish center: anthers pale-yellow: fruiting calyx ovoid, acuminate, obtusely 5-angled, deeply sunken at the base.—Exposed gravelly or rocky places, Piedmont to Appalachian Plateau, Ala.

13. *P. rigida* Pollard & Ball. Stems strict, more or less branching, hispid-pubescent with flat hairs, especially above: leaf-blades firm, ovate-lanceolate, wavy-margined, densely pubescent when young, tapering at both ends: calyx pubescent with flat hairs, especially on the veins and at the base: lobes triangular: corolla 1–1.5 cm. wide, yellow with purple center: fruiting calyx ovoid, nearly glabrous, obscurely 10-angled, 2.5–3 cm. long, somewhat retuse at the base.—Roadsides and waste-places, Coastal Plain, Miss. to La., Ark., and Tenn.

14. *P. intermedia* Rydb. Stem with long hairs and somewhat viscid, especially on the upper parts: leaf-blades ovate or ovate-lanceolate, acute, 4–6 cm. long, often oblique at the base, slightly sinuate-toothed or nearly entire, very thin, light green, puberulent or glabrate: calyx puberulent or strigose; lobes broadly lanceolate, about equalling the tube: corolla sulphur-yellow with purplish spots, 1–2 cm. broad: anthers yellow: fruiting calyx ovoid, slightly 5-angled and slightly sunken at the base.—Thickets and dry hillsides, various provinces, Fla. to Tex., Ind., and Pa.

15. *P. arenicola* Kearney. Stem diffuse, light-green, puberulent, but sometimes a little glandular, with a few longer hairs on the nerves of the calyx: leaf-blades relatively small, 1.5–6 cm. long, but sometimes 8 cm., ovate-cordate, truncate or cuneate at the base, irregularly angulate-dentate, puberulent, mainly along the veins, which are generally prominent and conspicuous; calyx-lobes triangular-lanceolate, equalling the tube in length: corolla 1.5–2 cm. broad, light yellow: anthers yellow: fruiting calyx 3 cm. long, narrowly ovoid or rather ellipsoid pyramidal or nearly cylindric, conspicuously reticulated.—Pine-lands, scrub, sandhills, and cypress-heads, Fla.

16. *P. ciliosa* Rydb. Stem upright, 2–3 dm. tall, together with the pedicels and calyxes ciliate with long and white jointed hairs: leaf-blades 4–7 cm. long, ovate, truncate or slightly cordate at the base, nearly entire or with a few coarse teeth, sparsely hairy on the nerves, long-petioled, thin and not conspicuously veiny: calyx turbinate, resembling that of *P. arenicola* but more pilose: corolla funnelform-campanulate, yellow without dark markings: fruiting calyx ovoid-pyramidal, sunken at the base.—Thickets, hammocks, and borders of woods, Coastal Plain and adj. provinces, Fla. to Tenn. and Ga.

17. *P. sinuata* Rydb. Stem decumbent, villous with long flat hairs and very viscid; leaf-blades rounded ovate, very oblique at the base and often subcordate, pubescent with long flat hairs especially on the veins, obtuse, undulate-sinuate: calyx densely villous with flat hairs and viscid; lobes triangular-lanceolate, about equalling the tube: corolla yellow with darker spots: fruiting calyx and berry unknown.—Pinelands (?), Fla.

18. *P. ambigua* (A. Gray) Britton. Stem 3–8 dm. tall, light green, villous with long flat hairs: leaves with the finer pubescence sparse; blades over 5 cm. long, thin, light-green, round, scarcely at all viscid, ovate or cordate, somewhat sinuately toothed or nearly entire, acute, but rarely acuminate: calyx villous; lobes triangular, generally shorter than the tube: corolla 1.5–2 cm. broad, yellow with dark spots; anthers generally purple: fruiting calyx ovoid, somewhat sunken at the base.—Rich soil, especially in thickets, various provinces N of Coastal Plain, Tenn. to Ia., Vt., and Va.

19. *P. nyctaginea* Dunal. Stem puberulent and villous with long flat hairs and somewhat viscid, generally zigzag: leaf-blades dark-green, ovate, often oblique, but very rarely cordate at the base, more or less acuminate, mostly entire, or occasionally sinuately dentate and rather thick, sparingly hairy, not at all puberulent, the long hairs often confined to the veins of the lower surface: calyx villous; lobes triangular, shorter than the tube: corolla 1–1.5 cm. broad, yellow with darker spots: anthers yellow: fruiting calyx ovoid, 5-angled and sunken at the base.—Dry soil, often in pinelands, various provinces, Ga. to La., Ia., and R. I.

20. *P. heterophylla* Nees. Stem erect, or later generally decumbent and spreading, viscid and glandular, villous with moderately long, jointed flat hairs: leaf-blades generally over 5 cm. long, generally broadly cordate, often acute but very rarely with an acumination, thick, more or less sinuately toothed, or sometimes subentire, pubescent with short and fine and longer flat jointed hairs: calyx long-villous; lobes triangular, generally shorter than the tube: corolla 1–1.5 cm. broad, yellowish: anthers yellow: fruiting calyx 2.5–5 cm. long, ovoid to conic-ovoid, somewhat sunken at the base.—Woods, sandy fields, and alluvial banks, various provinces, Fla. to Tex., Sask., and N. B.—Plants with leaves up to 10 cm. in diameter sometimes occur on the Florida prairies.

21. *P. mollis* Nutt. Stem 3–6 cm. high, densely whitish- or grayish-tomentose with stellate pubescence: leaf-blades rounded cordate or the upper broadly ovate, coarsely sinuately toothed: calyx densely stellate; lobes triangular, generally a little shorter than the tube: corolla 1.5–2 cm. in diameter, bright-yellow and with a purplish center, more or less stellate-pubescent without: anthers yellow or tinged with purple: fruiting calyx 3–5 cm. long, ovoid, acuminate, slightly 5-angled and a little sunken at the base.—Thickets, stream-banks, and pinelands, various provinces, Fla. to Tex., Calif., and Ark.—(*Mex.*)

22. *P. viscosa* L. Stem slender, creeping, cinereous with a dense stellate pubescence or in age rarely glabrate: leaf-blades elliptic, oval, or ovate, obtuse, thinnish, entire or undulate: calyx stellate-pubescent; lobes triangular, generally shorter than the tube: corolla greenish-yellow, with a darker center, 1.5–2 cm. broad: fruiting calyx 2–2.3 cm. long, rounded-ovoid, scarcely sunken at the base.—Coastal sand-dunes, sandy woods near the coast, pinelands and prairies, Fla. to Tex. and Va.—(*W. I., Mex., C. A., S. A.*)

23. *P. fuscomaculata* De Rouv. Stem decumbent or ascending, terete, with decurrent ridges, a little pruinose-stellate: leaf-blades 2–4 cm. long, ovate, somewhat oblique at the base, entire or repand, the upper often opposite: calyx pruinose, a little stellate and stellate-ciliate; lobes triangular, shorter than the

tube: corolla yellow, with a dark eye: fruiting calyx subglobose, 10-angled, somewhat sunken at the base.—Waste-places and ballast, Mobile, Ala. Nat. of S. Am.

24. *P. Elliottii* Kunze. Stem ascending branched, slightly stellate or glabrate, 3-5 dm. tall sparingly stellate-pubescent when young: leaf-blades very thin and veiny, elliptic, spatulate, broadly oblanceolate, or in luxuriant specimens broadly oval, entire or wavy-margined, decurrent into a winged petiole: calyx generally glabrous except the margin which is stellate-ciliate; lobes triangular: corolla 1.5-2 cm. broad, yellow, with dark center: fruiting calyx generally a little shorter than in the next following species.—Coastal sand dunes and pinelands, Fla. to Tex.

25. *P. angustifolia* Nutt. Stem often glabrous, or sparsely stellate when young, diffusely branched: leaf-blades linear or linear-oblanceolate, tapering into the petiole, entire, thickish; the veins, except the midrib, generally obsolete: calyx glabrous, except the stellate-ciliate margins of the rounded triangular lobes: corolla about 2 cm. broad, yellow, with purple center: anthers yellow: fruiting calyx small, 1.5-2 cm. long, ovoid, obscurely angled and scarcely sunken at the base.—Sea-beaches and coastal sand-dunes, Fla. to La.

3. **ANDROCERA** Nutt. Annual herbs, usually prickly-armed. Leaf-blades once or twice pinnatifid. Flowers in erect cymes. Calyx spreading, accrescent, densely prickly. Corolla rotate, 5-lobed, yellow, purple, or violet. Stamens 5: anthers very unequal, the lowest one much the longest, all opening by terminal pores. Berry dry, closely invested by the calyx.—Three or 4 species, in western North America.

1. *A. rostrata* (Dunal) Rydb. Herbaceous annual, hoary-pubescent, or yellowish-pubescent, 2-7 dm. tall: leaf-blades mostly ovate or oval, 1-2-pinnatifid, 5-22 cm. long: calyx spinescent; lobes lanceolate or linear-lanceolate: corolla yellow, about 25 mm. wide; lobes ovate to lanceolate, shorter than the tube: berry enclosed. [*Solanum rostratum* Dunal.]—(BUFFALO-BUR.)—Waste-places, roadsides, and along railroads, various provinces, Miss. to N. Mex., Wyo., N. Dak., and Tenn.; Adv. eastward to Fla. and N. H.—(*Mer.*)—Spr.-fall.

4. **SOLANUM** [Tourn.] L. Annual or perennial herbs, or vines or trees. Leaf-blades entire, toothed, or lobed. Flowers variously clustered. Calyx sometimes slightly accrescent. Corolla rotate, of various colors: lobes longer than the tube. Anthers narrow, converging or united, much longer than the filaments. Berry exposed.—About 1,000 species, widely distributed, most abundant in tropical America.—NIGHTSHADES.

Woody, at least partly so, vine, with climbing often twining stem and branches.

I. **DULCAMARA.**

Herbs or erect shrubs or trees, rarely somewhat twining in *S. bahamense*.

Annual or perennial herbs.

Annuals.

Plants not prickly.

Plants prickly.

Corolla plicate in the bud: plant annual.

II. **NIGRA.**

III. **SISYMBRIIFOLIA.**

Corolla not plicate: plant perennial.

Perennials, prickly-armed.

Shrubs or trees.

Plants glabrous.

Plants pubescent.

Cymes on recurving peduncles: berries nodding: anthers tapering at the apex.

Cymes on erect peduncles or straight: berries erect: anthers blunt at the apex.

Cymes terminal: anthers short, ellipsoid.

Cymes lateral: anthers long, nearly linear.

IV. ACULEATISSIMA.

V. CAROLINENSIA.

VI. GLAUCA.

VII. BAHAMENSIA.

VIII. VERBASCIFOLIA.

IX. TORVA.

#### I. DULCAMARA

Leaf-blades entire and ovate to lanceolate or with 1 or 2 basal lobes or divisions: berries in drooping clusters.

1. *S. Dulcamara*.

#### II. NIGRA

Foliage glabrous or nearly so: corolla 6-8 mm. broad: calyx-lobes spreading at maturity.

Foliage puberulent or finely pubescent: corolla 8-10 mm. broad: calyx-lobes appressed to the berry.

Stem and branches sparingly appressed pubescent.

Stem and branches villous-tomentose.

2. *S. nigrum*.

3. *S. gracile*.

4. *S. alatum*.

#### III. SISYMBRIIFOLIA

Rather coarse plant: stem, branches, leaves, and calyx armed with flat yellow or yellowish prickles.

5. *S. sisymbriifolium*.

#### IV. ACULEATISSIMA

Leaf-lobes acute: corolla less than 3 cm. wide, glabrous or with few long hairs without: lobes lanceolate: calyx bristly-pubescent.

Leaf-lobes obtuse: corolla over 3 cm. wide, tomentulose without: lobes deltoid: calyx tomentulose.

6. *S. aculeatissimum*.

7. *S. Melongena*.

#### V. CAROLINENSIA

Foliage green or brown: leaf-blades broad: prickles stout, much flattened.

Corolla 2-2.5 cm. wide: pedicels and calyx prickly: berry 1-1.5 cm. in diameter.

Leaf-blades undulate or angulately lobed.

Leaf-blades pinnatifid.

Corolla 4-5 cm. wide: pedicel and calyx not prickly: berry 2.5-4 cm. in diameter.

Foliage silvery: leaf-blades narrow: prickles slender, not flattened.

8. *S. carolinense*.

9. *S. floridanum*.

10. *S. perplexum*.

11. *S. elaeagnifolium*.

#### VI. GLAUCA

Corolla 11-14 mm. wide: berry mainly over 1 cm. thick: leaf-blades with pale margins.

Corolla 25-30 mm. wide: berry mainly less than 1 cm. thick: leaf-blades without distinct margins.

12. *S. Pseudo-capsicum*.

13. *S. glaucum*.

#### VII. BAHAMENSIA

Shrub or rarely a vine, with prickly stems and branches, and often with prickles on the more or less harshly pubescent leaves.

14. *S. bahamense*.

#### VIII. VERBASCIFOLIA

Corolla-lobes ovate to oval-ovate: ovary pubescent: berry yellow.

Corolla-lobes linear to linear-lanceolate or lanceolate: ovary glabrous: berry red.

15. *S. verbascifolium*.

16. *S. Blodgettii*.

#### IX. TORVA

Corolla 15-20 mm. wide: leaf-blades manifestly petioled.

Corolla 8-14 mm. wide: leaf-blades nearly sessile by a cuneate base.

17. *S. torvum*.

18. *S. jamaicense*.

1. *S. Dulcamara* L. Partially woody climber: leaf-blades ovate, 3-10 cm. long, entire or with 1 or 2 basal lobes, thin: corolla white or purple, 8-10 mm. long; lobes lanceolate to elliptic-lanceolate: berry oval, 9-15 mm. long.—(BITTERSWEET.)—Roadsides, thickets, and waste-places, various provinces, rarely

Coastal Plain, Ga. to Kans., Minn., and N. B.  
—Nat. of Eu.—Sum.—fall.

2. *S. nigrum* L. Herbaceous annual, 1–12 dm. tall: leaf-blades ovate to elliptic-ovate, 2–8 cm. long, undulate or deeply repand: calyx-lobes fully 1 mm. long: corolla white; lobes lanceolate to oblong-lanceolate: berry subglobose, 4–8 mm. in diameter, black.—(COMMON-NIGHTSHADE.)—Fields, thickets, cult. grounds, and waste-places, various provinces, U. S. and S Canada.—(*W. I., Mex., C. A., S. A., O. W.*)—Spr.—fall.

3. *S. gracile* Link. Herbaceous annual, 1–14 dm. tall: leaf-blades lanceolate to ovate or elliptic-ovate, 2.5–11 cm. long, undulate or repand: calyx-lobes fully 1.5 mm. long: corolla white or bluish; lobes lanceolate to elliptic-lanceolate: berry subglobose, 6–10 mm. in diameter, black.—Pinelands, coastal sand-dunes, and waste-places, near the coast, Fla. to La., and N. C.—Spr.—fall, or all year southward.

4. *S. alatum* Moench. Annual, erect, villous-hirsute. Stems mostly 2–8 dm. tall, branched: leaf-blades ovate to suborbicular, 1–4 cm. long, obtuse or acute, coarsely toothed, rather long-petioled: calyx copiously pubescent; lobes ovate, about as long as the tube: corolla white, about 8 mm. wide; lobes ovate, ciliate: berry scarlet, 7–9 mm. in diameter.—Roadsides, cult. grounds, and waste-places, N Fla.—Nativity uncertain.

5. *S. sisymbriifolium* Lam. Herbaceous annual 3–7 dm. tall, villous: leaf-blades elliptic to oval in outline, 1–2-pinnatifid, 8–20 cm. long: calyx spinescent; lobes lanceolate, 5–8 mm. long: corolla white or light-blue, 3–4 cm. wide; lobes ovate: gynoecium pubescent: berry 15–20 mm. in diameter, red.—Waste-places, roadsides and river-banks, Coastal Plain, Fla. to La., and contiguous regions. Nat. of S. Am.—(*W. I.*)

6. *S. aculeatissimum* Jacq. Partially woody perennial 3–8 dm. tall, often sparingly pubescent: leaf-blades ovate to suborbicular in outline, angulately toothed or sinuate-pinnatifid, 6–12 cm. long: calyx copiously spinescent: lobes lanceolate to elliptic-ovate, or ovate, about 2 mm. long: corolla white, 12–18 mm. wide; lobes lanceolate: gynoecium glabrous: berry 3–6 cm. in diameter, yellow, orange, or scarlet.—(SODA-APPLE.)—Sandy soil, fields, thickets, and roadsides, Coastal Plain, Fla. to Tex., and N. C.—(*W. I., Mex., C. A., S. A.*)—Spr.—fall.

7. *S. Melongena* L. Partially woody annual or perennial, 3–9 dm. tall, felty-tomentose: leaf-blades oval to ovate, 8–30 cm. long, sinuate-lobed or shallowly pinnate-lobed: calyx-lobes ovate, abruptly pointed, 5.5–12 mm. long, pubescent: corolla purplish or violet, except the yellow eye, 40–50 mm. wide; lobes deltoid: berry ellipsoid or obovoid, 5–30 cm. long, purplish or whitish, edible.—(EGGPLANT.)—Cult. grounds, Coastal Plain, Fla. to Tex. Nat. of Old World trop.—Spr.—fall.

8. *S. carolinense* L. Herbaceous perennial, 2–7 dm. tall, hirsute or rough-pubescent: leaf-blades elliptic to ovate in outline, 5–12 cm. long, sinuate or pinnately sinuate-lobed, the lobes of a triangular type: calyx spinescent; lobes lanceolate, often narrowly so, acuminate: corolla violet or rarely white, 25–30 mm. wide; lobes ovate: berry globular, 10–15 mm. in diameter, orange-yellow.—(HORSE-NETTLE.)—Thickets, fields, and roadsides, various provinces, Fla. to Tex., and Ont.—Spr.—fall.

9. *S. floridanum* Shuttlw. Similar to *S. carolinense* in habit: leaf-blades deeply pinnatifid, the lobes of an oblong type: calyx pubescent; lobes lanceolate, abruptly acuminate: corolla violet, 20–25 mm. wide; lobes oblong to oblong-lanceolate: gynoeceium pubescent: berry globular, 15 mm. in diameter, orange.—Sandy soil, mostly in pinelands, Fla.—Spr.-fall.
10. *S. perplexum* Small. Herbaceous perennial, 5–8 dm. tall, villous-hirsutulous: leaf-blades ovate or oval in outline, prominently sinuate-lobed, mostly 5–20 cm. long, the lobes broadly ovate to triangular: calyx spineless; lobes ovate to triangular-lanceolate: corolla purplish or nearly white, 35–40 mm. wide; lobes ovate: berry depressed-globose, 30–40 mm. in diameter, yellow.—Pine-lands and cult. grounds, Coastal Plain, N Fla. and S Ga.—Spr.-sum.
11. *S. elaeagnifolium* Cav. Partially woody perennial, 3–11 dm. tall, silvery-canescenscent: leaf-blades broadly elliptic to linear-elliptic, 5–15 cm. long, undulate or repand: calyx-lobes linear-subulate from a broad base, 4–10 mm. long: corolla violet or white, 22–25 mm. wide; lobes undulate, each with a broad base and an ovate or triangular tip: berry globular, 10–15 mm. in diameter, yellow or black.—(WHITE HORSE-NETTLE.)—Roadsides, cult. grounds, and waste-places, various provinces, Tex. to Ariz., Kans., and Mo. Naturalized E to Fla.—Spr.-fall.
12. *S. Pseudo-capsicum* L. Shrub 8–19 dm. tall: leaf-blades elliptic to oblanceolate, 3–10 cm. long, undulate or repand: calyx-lobes lanceolate, about 2.5 mm. long, eciliate: corolla white, 11–14 mm. wide; lobes oval to ovate-oval, eciliate: anthers elliptic: berry globose, 10–15 mm. in diameter, scarlet, orange, or yellow.—(JERUSALEM-CHERRY.)—Roadsides, thickets, and open woods, Coastal Plain, Fla. to Tex. Nat. of Eu.
13. *S. glaucum* Dunal. Woody perennial, 9–25 dm. tall: leaf-blades narrowly elliptic to elliptic-lanceolate, 8–18 cm. long, glabrous, entire: calyx-lobes longer than wide, abruptly pointed, ciliate at the tip: corolla blue, 25–30 mm. wide; lobes broadly ovate, acute, ciliate at the tip: ovary glabrous: berry globose-ovoid, 6–8 mm. in diameter, glaucous.—Waste-places, Pensacola, Fla. Nat. of S. Am.
14. *S. bahamense* L. Shrub with much-branched stem, 5–20 dm. tall: leaf-blades elliptic to elliptic-lanceolate, 4–12 cm. long, thinly rough-pubescent, undulate: calyx-lobes ovate to elliptic-ovate, as long as the tube or shorter: corolla violet-blue, sometimes pale, 10–12 mm. wide; lobes linear or nearly so, acute or acutish: anthers linear: ovary glabrous: berry red, 6–8 mm. in diameter.—Hammocks and coastal sand-dunes, S pen. Fla. and Florida Keys.—(W. I.)—All year.
15. *S. verbascifolium* L. Shrub 4–30 dm. tall or small tree: leaf-blades elliptic to elliptic-ovate or ovate, 10–30 cm. long, velvety-tomentose, entire: calyx-lobes ovate, ciliate, obtuse: corolla white, 15–18 mm. wide; lobes ovate to oval-ovate, acutish, ciliate: anthers oblong: ovary pubescent: berry globular, 10–20 mm. in diameter, yellow.—(POTATO-TREE.)—Hammocks, pinelands, and roadsides, pen. Fla. and Florida Keys.—(W. I., Mex., C. A., S. A.)—All year.
16. *S. Blodgettii* Chapm. Shrub with simple or sparingly branched stems, 3–38 dm. tall: leaf-blades elliptic, often narrowly so, 5–15 cm. long, hoary-scurfy and tomentulose, undulate: calyx-lobes elliptic: corolla white or bluish, 14–17 mm. wide; lobes linear to linear-lanceolate or lanceolate, obtuse: anthers linear: ovary glabrous: berry red, 4–6 mm. in diameter.—Hammocks and lime-sinks in pinelands, Everglade Keys, adj. Everglades, Fla. and Florida Keys.—(W. I.)—All year.
17. *S. torvum* Sw. Shrub with widely branched stems, the prickles straight or nearly so: leaf-blades oval, varying to ovate or obovate, irregularly sinuate-lobed, 7–25 cm. long: cymes mostly 5–10 cm. wide: calyx-lobes ovate to lanceo-

late: corolla white, 10–20 mm. wide; lobes triangular or triangular-lanceolate: anthers 5–6 mm. long: ovary glabrous: berry yellow, 9–14 mm. in diameter.—(TURKEY-BERRY).—Roadsides, waste-places, and swamps, pen. Fla. Nat. of W. I.—(*Mex., C. A., S. A.*)—Spr.-fall.

18. *S. jamaicense* Mill. Shrub with a much-branched stem and diffuse branches, armed with flat somewhat curved prickles: leaf-blades ovate, oval, or obovate in outline, shallowly lobed and somewhat rhombic, mostly 8–14 cm. long: cymes 2–3.5 cm. wide: calyx-lobes lanceolate: corolla white, 8–12 mm. wide; lobes lanceolate: anthers about 4 mm. long: ovary glabrous: berry red or orange, 8–10 mm. in diameter.—Roadsides and woods, in pen. Fla. Nat. of W. I.—(*Mex., C. A., S. A.*)—Spr.-fall.

5. **LYCOPERSICON** Mill. Annual or perennial heavy-scented herbs. Leaf-blades 1–2-pinnately divided. Flowers in cymes. Calyx not accrescent. Corolla rotate, yellow: lobes longer than the tube.—Four species, tropical American.

Berry more or less depressed, several-celled.  
Berry globular, cherry-like, 2-celled.

1. *L. Lycopersicon*.
2. *L. cerasiforme*.

1. *L. Lycopersicon* (L.) Karst. Plants clammy-pubescent, 3–12 dm. tall: leaf-blades 1–4 dm. long, the divisions ovate to elliptic, coarsely toothed or incised: calyx-lobes narrow, acute: corolla mainly 1.5–2 cm. wide: berry depressed, mainly 5–15 cm. wide, red or yellow.—(TOMATO. LOVE-APPLE.)—Cult. grounds, fields, pinelands, and waste-places, Coastal Plain, Fla. to Tex. Nat. of trop. Am. and cult.—(*W. I.*)—Sum.

2. *L. cerasiforme* Dunal. Similar to the preceding species, but smaller and weaker: leaves with many small separated leaflets between the larger ones: berry about 1–2 cm. in diameter, bright red.—(CHERRY-TOMATO.)—Dry soil, hammocks and roadsides, Florida Keys and S Tex. Nat. of trop. Am.

6. **PERIZOMA** Miers. Herbs or shrubby plants. Leaf-blades entire. Flowers solitary in the axils. Sepals slightly united. Corolla white or yellow, urceolate or short-tubular: lobes much shorter than the tube. Filaments adnate up to near the middle of the corolla-tube: anthers much shorter than the filaments. Ovary depressed. Stigma dilated.—One species.

1. *P. rhomboidea* (Hook.) Small. Plants much branched: leaf-blades ovate, 1–2.5 cm. long: calyx-lobes lanceolate to subulate-lanceolate, 2.5–3 mm. long; corolla 6–8 mm. long; lobes lanceolate, spreading: filaments webby near the base: berry elliptic, 2–2.5 cm. long.—Waste-places, Fla. Nat. of S.

Am.—Sum.—fall.—A related plant, *Jaborosa integrifolia* Lam. with prostrate stems, long-petioled entire elliptic leaf-blades and greenish-white salverform corollas 7–10 cm. long, has been found on ballast at Mobile, Ala. It is native of S. Am.

**7. CAPSICUM** [Tourn.] L. Herbs or shrubs, unarmed. Leaf-blades flat, entire or repand. Flowers axillary or cymose. Calyx truncate or minutely lobed. Corolla usually white, nearly rotate: lobes nearly as long as the tube. Filaments adnate to the lower part of the corolla-tube, glabrous: anthers longer than the filaments. Ovary not depressed: stigma minute.—About 30 species, mostly in tropical America.—CAYENNE-PEPPERS.

Corolla 7–10 mm. long: anthers over 2 mm. long: annual introduced plant.

Corolla 4–5 mm. long: anthers less than 2 mm. long: perennial native hammock plants.

Calyx markedly toothed at maturity: berry subglobose.  
Calyx truncate at maturity: berry ellipsoid to conic.

1. *C. annuum*.

2. *C. baccatum*.

3. *C. frutescens*.

1. *C. annuum* L. Plants mostly 1 m. tall or less, with glabrous or nearly glabrous branches: leaf-blades ovate, oval or ovate-lanceolate, mostly 7–14 cm. long, acuminate, entire: pedicels clavate: calyx 3–4 mm. long, truncate: corolla white or pinkish, 7–10 mm. long: lobes ovate, sometimes longer than the tube: berry conic or ellipsoid, 2–3 cm. long, red; or variously shaped and larger in cultivation.—(RED-PEPPER. CAYENNE-PEPPER.)—Roadsides, old-fields, and waste-places, Fla. Nat. of S. A. and cult.—All year.

2. *C. baccatum* L. Stem 1–3 m. tall: leaf-blades ovate, elliptic-ovate to ovate-lanceolate, 2–5 cm. long: calyx mainly 2.5–3 mm. long: corolla about 5 mm. long: berry 5–10 mm. long, red.—(BIRD-PEPPER.)—Hammocks and thickets, pen. Fla. and the Keys. Also naturalized in cult. grounds and waste-places, W to Tex.—(W. I.)

3. *C. frutescens* L. Stem 0.5–2 m. tall: leaf-blades ovate to ovate-lanceolate, 1–3 cm. long: calyx mainly 1.5–2 mm. long: corolla about 4 mm. long: berry 8–12 mm. long or longer, red.—(BIRD-PEPPER.)—Hammocks, pen. Fla. and the Keys.—(W. I.)

**8. LYCIUM** L. Shrubs or woody vines, commonly spiny. Leaf-blades thick, sometimes terete, entire. Flowers axillary, sometimes clustered. Calyx markedly lobed. Corolla white or colored, funnellform, salverform, or nearly campanulate: lobes longer than the usually short tube, or shorter. Anthers shorter than the pubescent filaments. Stigma dilated.—About 75 species, widely distributed.—MATRIMONY-VINES.—The purple corollas of some species have the curious habit of fading to a greenish-yellow or greenish-tan after the pollen is shed from the anthers.

Leaf-blades flat: corolla-lobes shorter than the tube and throat.  
Leaf-blades clavate: corolla-lobes longer than the tube and throat.

1. *L. halimifolium*.

2. *L. carolinianum*.

1. *L. halimifolium* Mill. Shrub irregularly branched, sometimes vine-like: leaves herbaceous, 1.5-5 cm. long; blades elliptic, oval, ovate, lanceolate, or spatulate: calyx-lobes ovate to somewhat triangular, obtuse: corolla purplish or greenish; lobes 4-5 mm. long: berry oval or ovoid, orange or orange-red, 10-15 mm. long.—(MATRIMONY-VINE. BOX-THORN.)—Thickets, waste-places, and fence-rows, various provinces, Ga. to Kans., Minn., and Ont. Nat. of Eu.—Spr.—sum.

2. *L. carolinianum* Walt. Shrub 3-15 dm. tall, with recurving branches: leaves succulent, 0.5-2 cm. long: calyx-lobes deltoid or triangular-ovate, acute: corolla blue or lilac, or rarely white; lobes 3-6 mm. long: berry red, 8-12 mm. long.—(CHRISTMAS-BERRY.)—Coastal sand-dunes, shore-hammocks, shell-mounds, and salt-marshes, Fla. to Tex. and S. C.—(W. I.)—Spr.—fall, or all year S.

9. *CESTRUM* L. Shrubs or trees. Leaf-blades entire. Flowers in axillary clusters, sometimes aggregated in a panicle or corymb. Calyx markedly lobed. Corolla white or colored, funnelform or salverform: lobes much shorter than the tube. Filaments adnate to the middle of the corolla-tube or above it, glabrous: anthers globular. Stigma enlarged.—About 150 species, tropical American.

Corolla 15 mm. long or less: lobes as wide as long: filaments adnate to above the middle of the corolla-tube. 1. *C. diurnum*.

Corolla 20 mm. long or more: lobes longer than wide: filaments adnate to about the middle of the corolla-tube. 2. *C. Parqui*.

1. *C. diurnum* L. Plant minutely pubescent, 1-2.5 m. tall: leaf-blades elliptic to elliptic-lanceolate, 5-12 cm. long; petioles mostly less than 10 mm. long: calyx about 3 mm. long; tube campanulate; lobes broadly ovate: corolla white or greenish-white, 11-15 mm. long; lobes rounded.—(DAY-JESSAMINE.)—Hammocks and waste-places, Florida Keys and S. Tex.—Nat. of trop. Am.

2. *C. Parqui* L'Her. Plant nearly glabrous, 1-2 m. tall: leaf-blades elliptic to elliptic-lanceolate, 10-20 cm. long; petioles mostly over 10 mm. long: calyx 4-4.5 mm. long; tube nearly cylindric; lobes deltoid to triangulate-ovate: corolla greenish-white, 20-25 mm. long; lobes apiculate.—(NIGHT-BLOOMING JESSAMINE.)—Woods, thickets, waste-places, and roadsides, Coastal Plain, Fla. to Tex., and Ga. Nat. of W. I.

10. *DATURA* L. Herbs (ours annual), or shrubs or trees. Leaf-blades undulate or lobed. Flowers solitary in the axils. Calyx tubular, sometimes prismatic, more or less lobed. Corolla white or colored, funnelform. Filaments slightly unequal.—About 12 species, widely distributed.—Sum.—fall or all year S.

Capsule erect, dehiscent by 4 valves.  
Capsule inclined or nodding, opening irregularly.

I. STRAMONIA.  
II. DUTRA.

## I. STRAMONIA

Herb with white or lavender corollas and capsules with nearly equal spines.

1. *D. Stramonium*.

## II. DUTRA

Corolla, the outer one in double flowers, with a 5-toothed limb: fruiting pedicel curved to one side: capsule with stout-tubercle-like prickles which are often corrugated at the base.

2. *D. Metel*.

Corolla with a 10-angled limb: fruiting pedicel abruptly nodding: capsule with slender sharp prickles.

Corolla-limb 5-toothed: foliage glaucescent.

3. *D. meteloides*.

Corolla-limb 10-toothed: foliage softly-pubescent.

4. *D. innoxia*.

1. *D. Stramonium* L. Plant green or purple-tinged, 2-12 dm. tall: leaf-blades ovate to elliptic, 10-20 cm. long, sinuate, or laciniate-toothed: calyx 3-5 cm. long; lobes 5-7 mm. long, the persistent base ultimately turned downward and frilled: corolla white, violet, or lavender, 6-10 mm. long: capsule 4-6 cm. long, the prickles equal or the lower ones rather shorter than the upper.—(THORN-APPLE. JIMSON-WEED. JAMESTOWN-WEED. STRAMONIUM.)—Cult. grounds, roadsides, and waste-places, various provinces, Fla. to Tex., Ont., and N. B.; also W U. S. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A., O. W.*)—Sum.—The lavender-flowered variety is sometimes separated as *D. Tatula* L.

2. *D. Metel* L. Plant 1-2 m. tall, glabrous or nearly so: leaf-blades ovate-lanceolate, elliptic or oval, 5-15 cm. long, undulate or repand-dentate: calyx 5-6.5 cm. long; lobes ovate to triangular-ovate: corolla violet without, 14-18 cm. long: capsule oval or ovoid, 4-6 cm. long. [*D. fastuosa* L.]—Hammocks and waste-places, Coastal Plain, Fla. to Tex. Nat. of trop. Asia and Africa.—(*W. I., Mex., C. A., S. A.*)

3. *D. meteloides* Dunal. Plant 3-11 dm. tall, glaucescent: leaf-blades ovate to oval-ovate, 10-15 cm. long, sinuate-toothed: calyx 10-12 cm. long; lobes lanceolate: corolla white, suffused with lavender or violet, 15-20 cm. long: capsule subglobose, 4-6 cm. in diameter.—River valleys, dry hills, and plains, Tex. to Calif. and Colo. Naturalized on roadsides E to Fla.—(*Mex., C. A., S. A.*)

4. *D. innoxia* Mill. Plant 8-15 dm. tall, softly pubescent: leaf-blades ovate to elliptic-ovate, 10-20 cm. long, undulate or slightly angled: calyx 7-12 cm. long; lobes lanceolate or triangular-lanceolate: corolla white, 10-15 cm. long: capsule oval or globose-ovoid, about 3 cm. long. [*D. Metel* (Fl. SE U. S.)]—Roadsides and waste-places, Coastal Plain and New England coast, Fla. to R. I. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A., O. W.*)

11. *NICOTIANA* L. Herbs, shrubs, or trees, mostly clammy-pubescent. Leaf-blades entire or repand. Flowers in racemes or panicles. Calyx markedly lobed. Corolla white or colored, tubular, funnelform, or salverform. Filaments equal or nearly so.—About 50 species, mostly American.—TOBACCOS.

Herbs.

Corolla-tube stout, 2-5 times longer than the calyx.

I. RUSTICAE.

Corolla-tube very slender, many times longer than the calyx. shrubs or trees.

II. LONGIFLORAE.

III. GLAUCAE.

## I. RUSTICAE

Corolla 5-8 cm. long; limb becoming purplish: capsule 15-20 mm. long.

Corolla 1-2 cm. long; limb lurid yellow or greenish: capsule 8-10 mm. long.

1. *N. Tabacum*.

2. *N. rustica*.

## II. LONGIFLORAE

Leaf-blades sessile: calyx-lobes narrowed upward.

Leaf-blades clasping: calyx-lobes dilated upward.

3. *N. longiflora*.

4. *N. repanda*.

## III. GLAUCA

Branches and leaves very glaucous: flowers on slender stalks, the corolla nearly tubular.

5. *N. glauca*.

1. *N. Tabacum* L. Stem 3-30 dm. tall: leaf-blades elliptic or oval, varying to broadest above the middle or below it, acute or acuminate, those of the cauline leaves 1-3 dm. long, those of the basal leaves often much longer: calyx 1.5-2 cm. long; lobes lanceolate to triangular, shorter than the tube: corolla greenish-white or greenish-yellow; limb turning purplish, 3-4 cm. wide, the lobes somewhat reniform: capsule ovoid, 15-20 mm. long.—Fields, roadsides, and waste-places, various provinces, E U. S. Nat. of trop. Am. and widely cult.—Sum.

2. *N. rustica* L. Stem 5-12 dm. tall: leaf-blades ovate, 5-20 cm. long, entire: calyx 5-7 cm. long, or larger in age; lobes triangular to ovate-triangular, much shorter than the tube: corolla lurid yellow or greenish, 15-20 mm. long; limb 10-15 mm. wide, the lobes rounded: capsule ovoid to globose-ovoid, 8-10 mm. long.—Fields and waste-places, various provinces, Fla. to Minn., Ont., and N. Y. Nat. of trop. Am.

3. *N. longiflora* Cav. Stem 3-11 dm. tall: leaf-blades spatulate to elliptic, or lanceolate to linear on the upper part of the stem, 8-25 cm. long, undulate: calyx 10-12 mm. long, enlarging in age; lobes mainly shorter than the tube: corolla white or greenish-white, turning purplish, 7-10.5 cm. long; limb 2.5-3 cm. wide, the lobes ovate to ovate-lanceolate: capsule ellipsoid-ovoid, about 15 mm. long.—Waste-places, various provinces, E U. S. Nat. of S. Am. and cult.—Sum.—fall.—A shorter-flowered species *N. plumbaginifolia* Viv., with corollas only  $\frac{1}{2}$  or  $\frac{1}{3}$  as long as those of *N. longiflora* and with usually broader leaf-blades on the lower parts of the stem, has been found on Key West, Fla. It is native in tropical regions.

4. *N. repanda* Willd. Stem 3-7 dm. tall: leaf-blades suborbicular to oval-elliptic, 5-15 cm. long, repand: calyx 8-14 mm. long; lobes longer than the tube: corolla white or tinged with pink; limb 1.5-2.5 cm. wide, the lobes ovate: capsule ovoid, 8-10 mm. long.—Sandy soil, Coastal Plain, Tex., and in waste-places E to Fla.—(*W. I., Mex.*)—Spr.

5. *N. glauca* Graham. Shrub or small tree: leaf-blades ovate to elliptic-ovate: 5-30 cm. long or longer, undulate: calyx 11-15 mm. long; lobes lanceolate to triangular: corolla yellow or yellowish, 35-45 mm. long; limb about 10 mm. wide, the lobes very small: capsule ovoid to elliptic-ovoid, 10-12 mm. long.—Waste-places, and roadsides, Fla. to Calif. Nat. of S. Am.—(*W. I., Mex., O. W.*)

12. *PETUNIA* Juss. Herbs. Leaf-blades entire. Flowers solitary in the axils. Sepals united to below the middle. Corolla white or colored, funnel-

form or salverform. Filaments unequal, 4 of them didynamous.—About 12 species, South American.

Corolla small, the limb less than 1 cm. wide.

Corolla large, the limb over 2 cm. wide.

Corolla white; tube cylindric, 3 or 4 times as long as the calyx.

Corolla reddish-purple; tube campanulate, once or twice as long as the calyx.

1. *P. parviflora*.

2. *P. axillaris*.

3. *P. violacea*.

1. *P. parviflora* Juss. Annual, pubescent: stems 1–4 dm. tall: leaf-blades spatulate to elliptic, 0.5–1.5 cm. long: calyx glandular-pubescent; lobes linear to linear-spatulate, much longer than the tube: corolla about 5 mm. long; limb purple, 6–8 mm. wide, the larger lobes wider than long, abruptly pointed: capsules ovoid, 3–4 mm. long.—Dry soil, waste-places and cult. grounds, Coastal Plain, and Basin-and-range provinces, Fla. to Tex. and Calif.—(*W. I., Mex., C. A., S. A.*)—Spr.—fall.

2. *P. axillaris* (Lam.) B.S.P. Stem and branches rather stout, clammy-pubescent: leaf-blades elliptic to ovate-elliptic, 3–6 cm. long, those of the lower leaves with stout petiole-like bases: calyx 1.5–2 cm. long; lobes mostly elliptic: corolla white, almost salverform; limb mostly 4–6 cm. wide.—Cult. grounds and waste-places, E U. S. Nat. of Argentina.—Sum.

3. *P. violacea* Lindl. Stem and branches slender: leaf-blades elliptic or oval, varying to obovate or ovate, 2–5 cm. long, those of the lower ones with slender petiole-like bases: calyx about 1 cm. long; lobes linear to linear-spatulate: corolla reddish-purple, funnelform; limb 3–4 cm. wide.—Roadsides and waste-places, E U. S. Nat. of Argentina and cult.—Sum.—fall, or all year S.

## FAMILY 7. BORAGINACEAE — BORAGE FAMILY

Herbs or shrubby plants, the foliage usually bristly pubescent. Leaves alternate: blades mostly entire. Flowers typically perfect, the spikes or racemes often scorpioid. Calyx of 4 or 5 slightly united sepals. Corolla of 4 or 5 partly united petals. Androecium of 4 or 5 stamens, the filaments partly adnate to the corolla. Gynoecium of 4 nearly distinct carpels, the style arising from between the lobes. Fruit of 4 or fewer nutlets.—About 85 genera and 1,500 species, widely distributed.

Flowers regular: corolla with equal lobes.

I. BORAGEAE.

Flowers irregular: corolla with an oblique limb and unequal lobes.

II. ECHIEAE.

### I. BORAGEAE

Nutlets armed with barbed prickles.

Nutlets spreading, covered with prickles.

Nutlets erect or incurved, with prickles on the back of angles.

Nutlets unarmed.

Receptacle conic or elongate.

Receptacle flat or merely convex.

Nutlets attached obliquely to the receptacles: free portions of the filaments elongate.

Nutlets attached to the receptacle by their bases: free portions of the filaments very short.

1. CYNOGLOSSUM.

2. LAPPULA.

3. AMSINCKIA.

4. MERTENSIA.

Nutlets each with a small flat scar where attached: scales in the throat of the corolla broad.

Corolla funnelliform or salverform: lobes obtuse, spreading, broad.

Racemes without bracts: calyx-lobes about as long as the tube.

Racemes with bracts: calyx-lobes much longer than the tube.

Corolla slightly longer than the calyx: style as long as the ovary or longer.

Corolla much longer than the calyx: style much elongated.

Corolla tubular: lobes acute or acuminate, erect, narrow.

Nutlets each with a large hollow scar where attached: scales in the throat of the corolla narrow.

5. *MYOSOTIS*.

6. *LITHOSPERMUM*.

7. *BATSCHIA*.

8. *ONOSMODIUM*.

9. *SYMPHYTUM*.

## II. ECHIEAE

Stamens included: corolla-throat closed by scales.

Stamens exserted: corolla-throat dilated and open.

10. *LYCOPSIS*.

11. *ECHIU*.

1. **CYNOGLOSSUM** [Tourn.] L. Annual, biennial, or perennial pubescent herbs. Calyx manifestly accrescent. Corolla much longer than the calyx. Style relatively long. Fruit surpassing the calyx.—About 75 species, widely distributed.—Sum.

Stem copiously leafy to the top: corolla slightly longer than the calyx: nutlets flat.

Stem terminated by a long peduncle: corolla much longer than the calyx: nutlets convex.

1. *C. officinale*.

2. *C. virginicum*.

1. *C. officinale* L. Stem 2-6 dm. tall: leaf-blades elliptic to linear-elliptic or linear-lanceolate, 5-15 cm. long: calyx-lobes becoming 6-8 mm. long or more: corolla reddish-purple or rarely white, mostly 8-10 mm. wide; lobes reniform: nutlets smooth between the spines.—(HOUND'S-TONGUE.)—Dry soil, roadsides, fields, waste-places, and thickets, various provinces, rarely Coastal Plain, Ga. to Ark., Kans., Minn., and Que. Nat. of Eu.

2. *C. virginicum* L. Stem 2-11 dm. tall: leaf-blades oval to elliptic, 8-32 cm. long: calyx-lobes becoming 3-4 mm. long: corolla blue or sometimes white, 7-8 mm. wide; lobes ovate: nutlets coarsely wrinkled between the spines.—(WILD-COMFREY.)—Dry soil, woods, roadsides, and thickets, various provinces, Ga. to La., Kans., and N. J.

2. **LAPPULA** [Rivinius] Moench. Annual, biennial, or perennial, often hirsute or hispid, herbs. Calyx scarcely accrescent: lobes spreading at maturity. Corolla pale blue, or whitish, scarcely as long as, or a little longer than the calyx. Style relatively short. Fruit somewhat longer than the calyx.—About 40 species, mostly natives of the north temperate zone.

Scales of the corolla-tube remote from the base of the lobes: fruit erect, or ascending.

Scales of the corolla-tube at the base of the lobes: fruit drooping.

1. *L. Lappula*.

2. *L. virginiana*.

1. **L. Lappula** (L.) Karst. Plant 2-6 dm. tall: leaf-blades linear-spatulate to linear, 2-5 cm. long: calyx-lobes becoming 3-10 mm. long: corolla-lobes about

2 mm. long, the appendages broadly ovate: fruit about 3 mm. wide; nutlets granulose or tuberculate on the back.—(BUR-SEED.)—Dry soil and waste-places, various provinces, N of Coastal Plain, Tenn. to Tex., B. C., Ont., N. S. and N. J. Nat. of Eu.—Spr.—fall.

2. *L. virginiana* (L.) Greene. Plant 3–9 dm. tall: leaf-blades elliptic to elliptic-lanceolate, the lower ones 10–20 cm. long: calyx-lobes becoming 2–2.5 mm. long: corolla-tube about 1.5 mm. long, the appendages reniform: fruit about 4 mm. wide; nutlets papillose and spiny. [*Echinopspermum virginicum* Lehm.]—(BEGGAR'S-LICE. STICK-WEED. BUR-SEED.)—Woods, roadsides, and thickets, various provinces, Ga. to La., Kans., Minn., and N. B.—Sum.

3. *AMSINCKIA* Lehm. Annual hispid herbs. Sepals slightly united, persistent. Corolla yellow, slightly exceeding the calyx, salverform, or the tube somewhat funnelform near the throat. Stamens adnate high up on the corolla-tube. Style elongate. Nutlets crustaceous or coriaceous, attached above the base to an ellipsoid-pyramidal receptacle.—About 15 species, of western America.

1. *A. parviflora* A. Heller. Stems 5 dm. tall or less: leaves remote; blades linear-elliptic to linear, 5–6 cm. long, or shorter on the upper part of the stem; calyx-lobes linear to linear-lanceolate, about 4 mm., becoming 6–7 mm. long, both softly pubescent and hispid: corolla pale-yellow, about 5 mm. long; limb about 2.5 mm. wide: nutlets ovoid, 2–3 mm. long, sharply keeled on the back and transversely wrinkled, also sharply tuberculate.—Fields, lawns, and waste-places, Piedmont, N. C. Nat. of Calif.—Spr.—sum.

4. *MERTENSIA* Roth. Perennial glabrous (our) herbs. Calyx scarcely, if at all, accrescent. Corolla showy, conspicuously longer than the calyx. Style and free portion of the filaments elongate. Fruit barely longer than the calyx.—About 40 species, in the Northern Hemisphere.

1. *M. virginica* (L.) DC. Stems often clustered 2–6 dm. tall: leaves 5–20 cm. long; blades elliptic to oval: calyx 2–3 mm. long, becoming 5–6 mm. long; lobes oblong to lanceolate or ovate: corolla blue or rarely white, 2.5–3 cm. long, the cup-like limb 10–15 mm. wide, shallowly lobed: nutlets ovoid, 2.5 mm. long.—(LUNGWORT. BLUE-BELLS. VIRGINIA-COWSLIP.)—Rich woods, low grounds, and alluvial stream-banks, various provinces, rarely Coastal Plain, Ala. to Ark., Kans., Ont., and S. C.—Spr.

5. **MYOSOTIS** [Rupp.] L. Annual, biennial, or perennial, pubescent herbs, Calyx slightly accrescent. Corolla manifestly longer than the calyx. Style and free portions of the filaments short. Fruit surpassed by the calyx.—About 35 species, of wide geographic distribution.—Spr.—sum.—FORGET-ME-NOTS. SCORPION-GRASSES.

Calyx open at maturity, pubescent with straight hairs.

Calyx-lobes longer than the tube: corolla-limb mostly less than 6 mm. wide: style short.

Calyx-lobes shorter than the tube: corolla-limb mostly over 6 mm. wide: style elongate.

Calyx closed at maturity, pubescent with hooked hairs.

Pedicel longer than the calyx at maturity: style slender, about as long as the ovary.

Pedicel shorter than the calyx: style stout, very short.

Fruiting racemes with many approximate erect or ascending pedicels: calyx usually up to 5 mm. long at maturity: nutlets 1.5 mm. long.

Fruiting racemes with few more or less recurving pedicels: calyx over 5 mm. long at maturity: nutlets 2 mm. long.

1. *M. laxa*.

2. *M. palustris*.

3. *M. arvensis*.

4. *M. virginica*.

5. *M. macrosperma*.

1. *M. laxa* Lehm. Stem 1-5 dm. long: leaf-blades spatulate to elliptic-lanceolate: pedicels 5-10 mm. long: calyx-lobes triangular to triangular-lanceolate: corolla mainly pale-blue; lobes about 1 mm. long: nutlets about 1 mm. long.—Spring-runs and muddy places, various provinces, Ga. to Tenn., Ont., and N. S.

2. *M. palustris* (L.) Lam. Stem 2-6 dm. long: leaf-blades spatulate to elliptic or elliptic-lanceolate, 1-8 cm. long: pedicels 4-7 mm. long: calyx-lobes triangular: corolla sky-blue and with a yellow eye; lobes about 2 mm. long: nutlets about 1.5 mm. long.—Low grounds and brooks, various provinces, N of Coastal Plain, Ga. to W. Va., and N. S. Nat. of Eu.

3. *M. arvensis* (L.) Willd. Stem 1-3 dm.

tall: leaf-blades spatulate to elliptic or elliptic-lanceolate, 1-5 cm. long: calyx becoming 3-4 mm. long; lobes equal or nearly so: corolla blue or sometimes white; lobes over  $\frac{1}{2}$  as long as the tube: nutlets about 1.5 mm. long.—Low grounds, various provinces N of Coastal Plain, N. C. to W. Va., Minn., and N. B.

4. *M. virginica* (L.) B.S.P. Stem 1-4 dm. tall, with short, stiff, often numerous branches: leaf-blades spatulate to elliptic, 1-3 cm. long: mature raceme with numerous approximate fruiting calices: pedicels 1-3 mm. long: calyx becoming 6-7 mm. long; lobes slightly unequal: corolla white; lobes less than  $\frac{1}{3}$  as long as the tube: nutlets about 1.5 mm. long.—Dry hills and fields, various provinces, Fla. to Tex., Minn., Ont., and Me.

5. *M. macrosperma* Engelm. Stem 2-6 dm. tall, with few, elongate, virgate branches: leaf-blades similar to those of *M. arvensis* but larger: mature racemes with few widely separated fruiting calices: pedicels 3-6 mm. long: calyx becoming 6-8 mm. long; lobes very unequal: corolla white; lobes less than  $\frac{1}{3}$  as long as the tube: nutlets about 2 mm. long.—Hillsides, woods, and stream-banks, Coastal Plain and adj. provinces, Fla. to Tex., Ark., Ind., and Md.

6. **LITHOSPERMUM** [Tourn.] L. Annual, biennial, or perennial herbs. Calyx slightly enlarged at maturity. Corolla slightly longer than the calyx, white, greenish, or yellowish. Style as long as the ovary or somewhat longer. Fruit surpassed by the calyx.—About 30 species, in the Northern Hemisphere.—Spr.—sum.—GROMWELLS.

Annual plant: corolla white or whitish, slightly surpassing the calyx.

1. *L. arvense*.

Perennial plant: corolla yellow or sometimes greenish-white.

Pubescence of stem strictly appressed.

2. *L. latifolium*.

Pubescence of stem more or less spreading.

3. *L. tuberosum*.

1. **L. arvense** L. Stem and branches 1–8 dm. long: leaf-blades linear-oblongate to linear-lanceolate, 1.5–5 cm. long, acutish: calyx-lobes narrowly linear to linear-subulate, 8–10 mm. long, revolute: corolla white or pinkish; lobes  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the tube: nutlets about 3 mm. long, pitted and wrinkled.—(CORN-GROMWELL.)—Roadsides, fields, and dry hills, various provinces, Ala. to Miss., Kans., Ont., and Me.

2. **L. latifolium** Michx. Stem and branches 3–7 dm. tall: blades of the cauline leaves elliptic to elliptic-lanceolate, 4–12 cm. long, acuminate: calyx-lobes narrowly linear, becoming 8–10 mm. long, flat: corolla yellow-white or pale-yellow; lobes over  $\frac{1}{2}$  as long as the tube: nutlets ovoid, 3–3.5 mm. long, smooth.—Woods, fields, and roadsides, various provinces N of Coastal Plain, Tenn. to Ark., Minn., Ont., and Va.

3. **L. tuberosum** Rugel. Stems and branches 3–7 dm. tall: blades of the cauline leaves oblanceolate to elliptic or ovate-elliptic, 2–10 cm. long, acute or abruptly pointed: calyx-lobes broadly linear to linear-spatulate, becoming 4–6 mm. long: corolla yellowish white; lobes less than  $\frac{1}{2}$  as long as the tube: nutlets oval-obovoid, about 2 mm. long.—River-bluffs and hammocks, Coastal Plain and adj. provinces, Fla. to Tex., and Tenn.

7. **BATSCHIA** G. F. Gmel. Perennial herbs, with colored roots. Calyx nearly unchanged at maturity. Corolla much longer than the calyx (except in cleistogamous flowers), yellow. Style many times longer than the ovary. Fruit surpassed by the calyx, the nutlets mainly ovoid.—About 6 species, North American.

Corolla-lobes entire, the appendages remote from them: all flowers complete: stamens below the throat of the corolla.

Stem hirsute: corolla-tube beardless at the base within.

1. *B. canescens*.

Stem hispid: corolla-tube bearded at the base within.

2. *B. carolinensis*.

Corolla-lobes erose or laciniate: the appendages close to their bases: later flowers cleistogamous: stamens in the throat of the corolla.

3. *B. linearifolia*.

1. **B. canescens** Michx. Plant 1–4 dm. tall: leaf-blades linear to elliptic or ovate-elliptic, 9–21 mm. long: calyx-lobes linear or nearly so, becoming 3–5

mm. long: corolla orange-yellow: tube 9-11 mm. long: nutlets about 2.5 mm. long. [*Lithospermum canescens* Lehm.]—(Puccoon.)—Rich woods and open hillsides, various provinces N of Coastal Plain, Ga. to Tex., Sask., and Ont.—Sum.

2. *B. carolinensis* (Walt.) G. F. Gmel. Plant 1-5 dm. tall: leaf-blades linear to elliptic or lanceolate, 1-5 cm. long: calyx-lobes lanceolate to linear-lanceolate, becoming 7-10 mm. long: corolla orange; tube 12-16 mm. long: nutlets 3-3.5 mm. long. [*Lithospermum Gmelini* (Michx.) A. Hitchc.]—Dry soil or woods, various provinces, Fla. to N. M., Minn., and N. Y.—Spr.

3. *B. linearifolia* (Goldie) Small. Plant 1-3 dm. tall: leaf-blades linear-lanceolate to linear, 3-9 cm. long: earlier flowers clustered: calyx-lobes linear-tapering, becoming 7-10 mm. long: corolla light-yellow; tube slender, 25-30 mm. long: nutlets 3-4 mm. long. [*Lithospermum linearifolium* Goldie.]—Dry soil, hills and rock ledges, various provinces, W Fla., to Ariz., B. C. and Ill.—Spr.

8. **ONOSMODIUM** Michx. Perennial herbs with hard roots. Sepals nearly distinct. Corolla narrow, longer than the calyx, without appendages in the throat, the lobes relatively long.—About 10 species, North American.

Corolla yellow; lobes lanceolate, acuminate: tips of the anthers not reaching up to the sinuses of the corolla.

Corolla whitish, often green-tinged; lobes ovate, obtuse or abruptly pointed: tips of the anthers reaching up to the sinuses of the corolla.

Leaves, bracts, and calyx-lobes not shaggy-pubescent, the hairs relatively short and more or less appressed: nutlets markedly pitted: anthers with long slender tips.

Leaves, bracts, and calyx-lobes shaggy-pubescent, the hairs long and loosely spreading: nutlets little, if at all, pitted: anthers with short stout tips.

1. *O. virginianum*.

2. *O. molle*.

3. *O. hispidissimum*.

1. *O. virginianum* (L.) DC. Stem strigose (or hirsute in *O. virginianum hirsutum*), 2-7 dm. tall or more: leaf-blades, on the upper part of the stem oblanceolate, narrowly elliptic, elliptic, elliptic-obovate to ovate, 2.5-12 cm. long, usually sparingly strigose, sometimes quite copiously so: calyx-lobes becoming 6-8 mm. long: corolla yellow, 8-10 mm. long; lobes lanceolate, more than  $\frac{1}{2}$  as long as the tube: nutlets ovoid, about 2.5 mm. long, not constricted at the base.—Pinelands, dry woods, thickets, and sandy hillsides, Coastal Plain and adj. provinces, Fla. to La., and Mass., and Great Lake Lowland, W N. Y.—Spr.—sum.

2. *O. molle* Michx. Stem short-hirsute, or partly strigose, with white or whitish hairs, 8 dm. tall or less: leaf-blades, on the upper

part of the stem, elliptic, lanceolate or ovate-lanceolate, not shaggy-pubescent, but with longer spreading hairs especially on the veins, and more numerous, at least beneath, short-appressed hairs: inflorescence softly pubescent: calyx-lobes narrowly linear, about 6 mm. long: corolla 9–12 mm. long; lobes ovate, about  $\frac{1}{2}$  as long as the tube: anthers about 2.5 mm. long: nutlets ovoid, about 3 mm. long, copiously pitted, slightly if at all constricted at the base.—Dry ridges and cedar-barrens, Interior Low Plateaus, Tenn., and Ky.—Spr.

3. *O. hispidissimum* Mackenzie. Stem copiously hirsute, with whitish hairs, 12 dm. tall or less: leaf-blades, on the upper part of the stem, narrowly elliptic, elliptic, lanceolate or ovate, pubescent as in *O. molle*, but with coarser, stiffer, and longer hairs: inflorescence copiously hirsute: calyx-lobes linear, 4–6 mm. long: corolla 10–12 mm. long or longer in the earlier flowers; lobes ovate, less than  $\frac{1}{2}$  as long as the tube: anthers about 2 mm. long: nutlets ovoid, 3–3.5 mm. long, smooth or slightly pitted, decidedly constricted at the base. [*O. carolinianum* (Chapm. Fl.) (Fl. SE U. S.)]—Woods, bottoms, banks and dry hill-sides, various provinces N of Coastal Plain, N. C. to Tex., Minn., and Ont.—Spr.-sum.

9. *SYMPHYTUM* L. Perennial herbs with mucilaginous roots. Sepals manifestly united into a tube. Corolla much longer than the calyx, with long appendages in the throat, the lobes relatively short.—About 15 species, natives of the Old World.

1. *S. officinale* L. Stems and branches 3–10 dm. tall, hirsute: leaf-blades oblong, lanceolate, or ovate-lanceolate, or sometimes ovate, 8–30 cm. long: calyx-lobes acuminate, each with an ovate to lanceolate body: corolla yellowish or purplish, 10–15 mm. long; lobes ovate, obtuse, the appendages lanceolate: nutlets 3–4 mm. long.—(COMFREY. HEALING-HERB.)—Roadsides, old fields, and about gardens, various provinces N of Coastal Plain, N. C. to Tenn., Minn., and Newf. Nat. of Eu.—Sum.

10. *LYCOPSIS* L. Annual herbs. Corolla salverform, slightly irregular, the throat appendaged. Free portion of the filaments very short.—About four species, natives of the Old World.

1. *L. arvensis* L. Plants 3–7 dm. tall, bristly hispid: stems becoming widely or diffusely branched; branches often procumbent: leaf-blades oblanceolate below, to narrowly oblong or lanceolate above, 2.5–10 cm. long, undulate or sinuate, sessile or the lower ones on long petioles: racemes often 5–10 cm. long; calyx becoming 7–8 mm. long; sepals linear or linear-lanceolate, acute: corolla blue, 5–7 mm. long; tube curved: nutlets about 3 mm. long, coarsely wrinkled. — (BUGLOSS.) — Waste-places, pastures, and roadsides, various provinces N of Coastal Plain, Tenn. to Ont., N. J., and Va.—Nat. of Eurasia.—Spr.-fall.

11. **ECHIUM** [Tourn.] L. Biennial or perennial herbs. Corolla funnel-form, markedly irregular, the throat unappendaged. Free portion of the filaments elongate.—About 30 species, natives of the Old World.

1. **E. vulgare** L. Plants 3–7 dm. tall, bristly-pubescent: stems 3–7 dm. tall, simple or branched throughout; branches ascending: leaf-blades linear or linear-lanceolate, or linear-oblancoate below, acute or short-acuminate, 2–15 cm. long, undulate, sessile, bristly on both sides: spikes rather dense, becoming 2–10 cm. long: bracts obliquely lanceolate, acuminate: calyx bristly; lobes linear or linear-lanceolate, 6–12 mm. long, unequal: corolla pale blue or purplish, or rarely white, obliquely campanulate, 1.6–1.8 cm. long, narrowed into a short tube which is somewhat plaited; lobes ovate or triangular-ovate, ciliolate: filaments and style exserted, magenta: nutlets about 3 mm. long, wrinkled.—(VIPER'S-BUGLOSS. BLUE-DEVIL. BLUEWEED.)—Old fields and roadsides, often in calcareous soil, various provinces, Ga. to Nebr., Ont., and N. B. Nat. of Eu.—Sum.

#### FAMILY 8. EHRETIACEAE — EHRETIA FAMILY

Shrubs, trees, or sometimes herbs. Leaves mainly alternate: blades mostly entire. Flowers perfect, cymose. Calyx of 5 (4–6), partly united sepals. Corolla of 5 (4–6), partially united petals. Androecium of 5 (4–6), stamens, the filaments more or less adnate to the corolla-tube. Gynoecium 2–4-carpellary: styles 2 and distinct, or partially united, or united by pairs. Fruit drupaceous or of 4 nutlets.—About 20 genera and 350 species, in warm or tropical regions.

Styles, and stigmas, 4, unequally united by pairs: drupe with a 4-celled stone: cotyledons plaited or corrugated.

Corolla long-funnelform; limb deeply lobed: calyx-tube cylindric. 1. SEBESTEN.

Corolla short-funnelform; limb slightly lobed: calyx-tube campanulate.

2. VARRONIA.

Styles, and stigmas, 2: drupe with 2 or 4 stones: cotyledons flat.

3. BOURRERIA.

1. **SEBESTEN** Adans. Shrubs or trees. Flowers in open clusters. Sepals usually united to above the middle. Corolla bright-colored, shallowly or deeply lobed. Filaments adnate to above or below the middle of the corolla-tube. Fruits included, adnate to the accrescent calyx.—About 12 species, of tropical and subtropical America.

1. **S. Sebestena** (L.) Britton. Shrub or small tree, the twigs strigose: leaf-blades ovate or elliptic-ovate, 8–12 cm. long, undulate or repand: calyx 14–19 mm. long; tube cylindric: corolla-lobes bright-red, much shorter than the tube: fruits oval or ovoid, 2–3 cm. long. [*Cordia Sebestena* L.]—(GEIGER-TREE.)—Hammocks and sand-dunes, Everglade Keys, Fla., and Florida Keys.—(W. I.)

—All year.—This plant has a generic counterpart in Texas, in which the corolla is white with a yellow center.

2. **VARRONIA** Jacq. Shrubs, trees, or vines. Flowers in open clusters or in heads. Sepals usually united to above the middle. Corolla white or colored, shallowly or deeply lobed. Filaments adnate to above or below the middle of the corolla-tube.—About 70 species of tropical and subtropical America.

1. **V. globosa** Jacq. Branched shrub 1–3 m. tall: leaf-blades ovate to elliptic-ovate, 1–5 cm. long, serrate: calyx about 8 mm. long: corolla white, 5–7 mm. long. [*Cordia bulata* (Chapm. Fl.)]—Hammocks, Cape Sable region, Fla. and Florida Keys.—(W. I.)—All year.—This plant has a generic counterpart in Texas in which the calyx-lobes are shorter than the tube and its corolla is mostly 12–15 mm. long.

3. **BOURRERIA** Jacq. Shrubs or trees. Flowers in corymbose cymes. Sepals united to above the middle. Corolla white or colored, prominently lobed. Filaments adnate to above or below the middle of the corolla-tube.—About 25 species, of tropical America.

Antthers about as long as the free portion of the filaments: leaf-blades short-petioled.

Drupe 9–11 mm. wide: corolla-tube much exceeding the calyx.

Drupe 7–8 mm. wide: corolla-tube about equalling the calyx.

Antthers much shorter than the free portion of the filaments: leaf-blades slender-petioled.

1. *B. revoluta*.

2. *B. cassinifolia*.

3. *B. ovata*.

1. **B. revoluta** H.B.K. Small tree or shrub, with pubescent twigs: leaf-blades elliptic to obovate, mostly 2–7 cm. long, abruptly pointed, rounded or notched, permanently rough-pubescent and ciliate, or sometimes smooth: cymes several-flowered: calyx 6–7 mm. long; lobes ovate, mostly less than  $\frac{1}{3}$  as long as the tube: corolla white; tube much exceeding the calyx; larger lobes 5–6 mm. wide: anthers about 2.5 mm. long: drupe orange, slightly depressed, 9–11 mm. wide. [*B. Radula* (Chapm. Fl.) (Fl. SE U. S.)]—(ROUGH-STRONGBACK.)—Hammocks and pinelands, Everglade Keys, Fla., and Florida Keys.—(W. I.)—All year.

2. **B. cassinifolia** (A. Rich.) Griseb. Shrub: leaf-blades oval, elliptic, obovate, or cuneate, 1–2.5 cm. long, mostly obtuse or retuse, smooth, glabrous, and eciliate, at least at maturity, slightly veiny in age: cymes few-flowered: calyx 5–6 mm. long; lobes triangular to ovate-triangular,  $\frac{1}{3}$  as long as the tube: corolla white; tube about as long as the calyx or slightly exceeding it; larger lobes about 4 mm. wide: anthers about 2 mm. long: drupe much depressed, 7–8 mm. wide.—(SMOOTH-STRONGBACK.)—Pinelands, Everglade Keys, Fla.—(W. I.)—All year.

3. **B. ovata** Miers. Small tree or shrub, with glabrous twigs: leaf-blades obovate to elliptic-obovate or oval-obovate, 4–12 cm. long, smooth: calyx 6–7 cm.

long; lobes triangular, fully  $\frac{1}{2}$  as long as the tube: corolla white; tube rather short; lobes slightly shorter than the tube: stamens exserted; anthers about 2 mm. long: drupe orange, 1 cm. wide. [*B. havanensis* (Chapm. Fl.) (Fl. SE U. S.)]—(STRONGBACK.)—Hammocks, Florida Keys.—(W. I.)—All year.

### FAMILY 9. HELIOTROPIACEAE — HELIOTROPE FAMILY

Herbs, shrubs, or woody vines. Leaves alternate: blades entire, or rarely toothed. Flowers perfect, mostly in scorpioid spikes or racemes. Calyx of 5 more or less united sepals. Corolla various, of 5 partially united petals. Androecium of 5 stamens, the filaments more or less adnate to the corolla-tube. Gynoecium 2-4-carpellary. Stigma annular, surmounted by an appendage. Fruit drupaceous, or dry and of 2-4 nutlets.—About 10 genera and 300 species, widely distributed.

Shrubs or woody twiners: fruit drupaceous.

Tribe I. TOURNEFORTIEAE

Herbs, sometimes partly-woody: fruit dry, separating into nutlets.

II. HELIOTROPIEAE.

#### I. TOURNEFORTIEAE

Corolla-lobes broad: fruit not lobed, hollowed at the base: anthers minutely pointed.

Plant densely and conspicuously silky-tomentose: leaves very numerous and crowded: corolla-tube about as long as the calyx or shorter.

Plant hirsute-inconspicuously pubescent: leaves relatively few and distant: corolla-tube much exceeding the calyx.

Corolla-lobes narrow, often subulate: fruit lobed, usually 4-lobed, not hollowed at the base: anthers acuminate.

1. MALLOTONIA.
2. TOURNEFORTIA.
3. MYRIOPUS.

#### II. HELIOTROPIEAE

Fruit of 4 more or less readily separating nutlets.

Fruits 4-lobed, separating into 4 one-seeded nutlets.

Flowers in scorpioid spikes or racemes: calyx-lobes equal or nearly so.

Flowers axillary to narrow bracts: calyx-lobes very unequal.

Fruits 2-lobed, separating into 2 two-seeded nutlets.

Nutlets conic, ribbed: style obconic or turbinate.

Nutlets subglobose, rugose: style very short or wanting.

Fruit of 2 completely 2-celled nutlets, or sometimes 1-celled and 1-seeded.

4. HELIOTROPIMUM.
5. LITHOCOCCA.
6. TIARIDIUM.
7. SCHOBERA.
8. COCHRANEA.

1. **MALLOTONIA** Britton. Maritime shrubs with conspicuously pubescent foliage. Leaves numerous, crowded on the branchlets: blades narrow, succulent, sessile. Flowers in stalked scorpioid, corymbd spikes or racemes. Calyx-lobes broad, longer than the tube. Corolla white: lobes broad, spreading. Anthers ovoid, slightly cordate at the base. Stigma-appendage low-conic. Drupe not lobed, short or depressed, hollowed at the base, abruptly pointed.—Two species, in tropical and subtropical regions.

1. *M. gnaphalodes* (Jacq.) Britton. Fleshy shrub 2 m. tall or less, the pubescence pale or white: leaf-blades linear-spatulate, 4-11 cm. long, obtuse: calyx-lobes ovate: corolla much exceeding the calyx; tube pubescent; lobes ovate to orbicular-ovate, 2-3 mm. long: drupe ovoid or conic-ovoid, about 5 mm. long. [*Tournefortia gnaphalodes* R. Br.]—(SEA LAVENDER.)—Coastal sand-dunes, S pen. Fla. and the Keys.—(W. I.)—All year.

**2. TOURNEFORTIA** L. Hammock vines, with stout trailing or climbing stems. Leaves neither crowded nor numerous: blades broad, often coarsely or harshly pubescent, fleshy-herbaceous, petioled. Flowers in compound corymbose spikes. Calyx-lobes broad, longer than the tube. Corolla white: lobes broad, spreading, flat or crisped. Anthers lanceolate, cordate at the base. Stigma-appendage depressed. Drupe not lobed, hollow at the base.—About 100 species, of tropical and sub-tropical regions.

**1. T. hirsutissima** L. Woody or partly woody vine, the stem and branches pubescent: leaf-blades elliptic, often broadly so, varying to ovate or obovate, mostly 1-1.5 dm. long, more or less hirsute, acuminate: corymbs many-flowered: sepals ovate, acute, villous: corolla-lobes ovate to deltoid-ovate, 2-2.5 mm. long: drupes subglobose or ovoid-globose, 4-5 mm. long.—Hammocks, Everglade Keys, Fla.—(W. I., Mex., C. A., S. A.)—All year.

**3. MYRIOPUS** Small. Hammock vines with climbing, often twining stems. Leaves neither crowded nor numerous: blades broad, herbaceous, often finely pubescent, petioled. Flowers in corymbose, elongate, secund spikes or racemes. Calyx-lobes narrow or narrow-lipped. Corolla white or greenish: lobes very narrow, usually subulate. Anthers lanceolate, slightly cordate at the base. Style elongate: stigma-appendage long-conic. Drupe 2-4-lobed, with as many lobes as there are 1-seeded nutlets, usually depressed.—About 15 species, in tropical America.

Leaves glabrous or obscurely pubescent: calyx-lobes triangular or triangular-lanceolate in anthesis.  
Leaves densely white-pubescent beneath: calyx-lobes subulate or triangular-subulate in anthesis.

1. *M. volubilis*.  
2. *M. poliochros*.

**1. M. volubilis** (L.) Small. Woody vine, the fine pubescence usually rusty; leaf-blades ovate to elliptic-lanceolate, 2-8 cm. long, mostly acute or acuminate, green beneath: corymbs with sprawling branches: calyx-lobes much less than half as long as the corolla-tube: corolla-lobes much shorter than the tube: drupe 2-3 mm. wide, the lobes with black spots. [*Tournefortia volubilis* R. & S.]—Hammocks, S pen. Fla. and the Keys, and S Tex.—(W. I., S. A.)—All year.

**2. M. poliochros** (Spreng.) Small. Vine resembling *M. volubilis* in habit: leaf-blades ovate or elliptic, 3-6 cm. long, obtuse or abruptly pointed, pale or whitish beneath: corymbs usually copiously floriferous: calyx-lobes nearly or quite half as long as the corolla tube: corolla-lobes nearly or quite as long as the tube: drupe 3-4 mm. wide, the lobes with magenta spots. [*Tournefortia poliochros* Spreng.]—Hammocks on kitchenmiddens, E coast, Fla.—(W. I.)—All year.

4. **HELIOTROPIUM** [Tourn.] L. Shrubs or erect, diffuse, or prostrate herbs. Leaves few or many: blades broad or narrow. Calyx-lobes nearly equal. Stamens adnate to the lower part of the corolla-tube. Style very short. Fruit 4-lobed, an aggregate of 4 nutlets.—About 125 species, widely distributed.—**HELIOTROPES**.

Inflorescence bractless.

Calyx glabrous: nutlets finely wrinkled: leaf-blades narrow.

1. *H. curassavicum*.

2. *H. europaeum*.

Inflorescence bracted.

Corolla white.

Corolla with small puberulent swellings low down in the throat.

3. *H. phyllostachyum*.

Corolla with prominent deflexed appendages at the top of the throat.

4. *H. polyphyllum*.

Corolla yellow.

Plant with erect stem and branches.

5. *H. Leavenworthii*.

Plant with prostrate stem and branches.

6. *H. horizontale*.

1. *H. curassavicum* L. Plant perennial or mainly so, 1-4 dm. tall: leaf-blades spatulate, varying to obovate or linear, mainly 2-6 cm. long: calyx-lobes lanceolate to elliptic-lanceolate, 1.5-2 mm. long: corolla white, except the yellow eye, turning blue; tube about 2 mm. long: fruit 2-2.5 mm. wide.—(SEASIDE-HELIOTROPE).—Hammocks, shores, and waste-places, Coastal Plain and adj. provinces, Fla. to Tex. and Del.—(*W. I., Mex., C. A., S. A.*)

2. *H. europaeum* L. Plant annual, 1-5 dm. tall: leaf-blades elliptic to oval, varying to ovate or obovate, 2-6 cm. long: calyx-lobes elliptic to elliptic-lanceolate or linear-lanceolate, 2-2.5 mm. long: corolla white or bluish; tube fully 2 mm. long: fruit about 3 mm. wide.—Waste-places and roadsides, various provinces, Fla. to Ala. and Mass. Nat. of Eu.

3. *H. phyllostachyum* Torr. Plant annual, 0.5-2 dm. tall: leaf-blades elliptic, 1-2.5 cm. long: calyx-lobes lanceolate, or the larger one ovate-lanceolate, 2-3 mm. long: corolla white; tube 2-3 mm. long; lobes about 1 mm. long: fruit about 1.5 mm. wide.—Hammocks and waste-places, Key West, Fla.

4. *H. polyphyllum* Lehm. Perennial, 1-2 dm. tall: leaf-blades linear-spatulate to elliptic, 0.5-2 cm. long: calyx-lobes lanceolate to ovate-lanceolate, 2-2.5 mm. long: corolla white; tube 3-4 mm. long: fruit 1.5 mm. wide.—Coastal hammocks, Everglade Keys, Fla. and Florida Keys.—(*S. A.*)—All year.

5. *H. Leavenworthii* Torr. Plant with pale-pubescent erect stems, 2-11 dm. tall: leaf-blades linear to linear-elliptic, 1-2 cm. long: flowers inodorous: calyx-lobes lanceolate, 3-4 mm. long: corolla bright-yellow; lobes ovate, obtuse.—Low hammocks and wet places, mostly in Everglades, S pen. Fla. and Florida Keys.—All year.

6. *H. horizontale* Small. Plant with radially prostrate branches, 1-5 cm. long, often matted: leaf-blades linear or nearly so, 0.8-1.6 cm. long: flowers fragrant: calyx-lobes lanceolate, 4-5 mm. long: corolla golden-yellow.—Pine-lands, Everglade Keys, Fla.—All year.

5. **LITHOCOCCA** Small. Annual erect, wiry herbs. Leaves scattered: blades very narrow. Flowers scattered, axillary to narrow leaf-like bracts. Calyx-lobes very unequal in size and shape. Stamens adnate to the lower part of the corolla-tube. Style short. Fruit depressed, 4-lobed.—One species.

1. **L. tenellum** (Nutt.) Small. Stem 1-3 dm. tall, with several or many erect or ascending branches: leaf-blades linear to narrowly linear-lanceolate, 1.5-5 cm. long: calyx-lobes linear or nearly so, 2-6 mm. long; corolla white; tube about 4 mm. long: fruit 3-3.5 mm. wide, pubescent. [*Heliotropium tenellum* Torr.]—Dry soil, roadsides, and pastures, various provinces, Ala. to Tex., Kans., and Ky.—Sum.—fall.

6. **TIARIDIUM** Lehm. Annual erect herbs. Leaf-blades broad. Flowers in bractless scorpioid spikes. Sepals slightly united at the base. Corolla blue, with the anthers near the middle of the rather slender tube. Style obconic or turbinate. Fruit slightly depressed, the nutlets paired and mitriform.—One species.

1. **T. indicum** (L.) Lehm. Annual, 1-7 dm. tall: leaf-blades ovate, oval, or elliptic, 2-10 cm. long: calyx-lobes linear to linear-lanceolate, 1-2 mm. long: corolla blue; tube 2.5-3 mm. long: fruit 2-2.5 mm. wide. [*Heliotropium indicum* L.]—Waste-places, fields, and roadsides, various provinces, Fla. to Tex., Ill., and Va. Nat. of E. I.—(*W. I., Mex., C. A., S. A.*)—Sum.—fall, or all year S.

7. **SCHOBERA** Scop. Annual or perennial, erect herbs. Leaf-blades rather broad. Flowers in bractless scorpioid spikes. Sepals united at the base. Corolla white, with the anthers near the top of the very short tube. Style very short or wanting. Fruit much depressed, didymous by the nutlets uniting in pairs.—About 10 species, tropical American.

1. **S. angiosperma** (Murr.) Britton. Plant annual, 2-12 dm. tall: leaf-blades elliptic to elliptic-lanceolate, 2-7 cm. long, veiny: calyx-lobes lanceolate to linear, 1-1.5 mm. long: corolla white; tube 1-1.5 mm. long: fruit about 2 mm. wide. [*Heliotropium parviflorum* L.]—Hammocks and pinelands, S pen. Fla. and Florida Keys.—(*W. I., Mex., C. A., S. A.*)

8. **COCHRANEA** Miers. Perennial herbs, sometimes partially woody. Flowers in scorpioid cymose spikes. Sepals slightly united. Stamens adnate to the lower part of the corolla-tube. Style obsolete. Fruit 2-lobed, the typically 2-celled nutlets sometimes separating into 2 parts.—About 4 species, South American.

1. **C. anchusaefolia** (Poir.) Guerke. Plants often diffuse, 1–4 dm. tall: leaf-blades elliptic to linear-elliptic or oblanceolate, 2–8 cm. long, repand: calyx-lobes linear to linear-lanceolate, about 3 mm. long: corolla violet-blue or rose-purple; limb 4–6 mm. wide: fruits 2.5–3 mm. wide. [*Heliotropium anchusaefolium* Poir.]—Waste-places, roadsides, and cult. grounds, Coastal Plain, Fla. to Tex. and Ga. Nat. of S. Am.

## FAMILY 10. VERBENACEAE — VERVAIN FAMILY

Herbs, shrubs, or trees. Stems commonly angled. Leaves alternate, opposite, or whorled: blades simple or rarely compound. Calyx of 4 or 5 partially or wholly united sepals. Corolla of 4 or 5 partially united petals, sometimes 2-lipped. Androecium of 2 or 4 stamens, the filaments more or less adnate to the corolla-tube. Gynoecium 2–4-carpellary, the style terminal. Fruit baccate or drupaceous or an aggregate of 2 or 4 nutlets.—About 75 genera and 1,300 species, of wide geographic distribution.

Inflorescence centripetal, spicate, racemose, or paniculate: ovules erect.

Inflorescence centrifugal, cymose: ovules laterally attached.

Tribe I. VERBENEAE.  
II. VITICEAE.

### I. VERBENEAE

Flowers in heads, spikes or spike-like racemes.

Fruit of 2 or 4 nutlets, dry.

Stamens 4: fruit not imbedded in the rachis.

Fruit nut-like, with a broad cap-like beak.

Fruit of 2 or 4 nutlets, not beaked.

Nutlets 4, not flattened.

Anthers unappendaged: spikes elongate at anthesis.

Anthers of the larger stamens appendaged on the back: spikes flat-topped at anthesis, elongating in fruit.

Nutlets 2, more or less flattened.

Calyx not inflated at maturity.

Herbs with procumbent or creeping stems, sometimes partly woody below.  
Shrubs or shrubby plants, with upright stems.

Calyx inflated and inclosing the fruit.

Stamens 2: fruit imbedded in excavations of the thick rachis.

Fruit drupaceous.

Flowers in open racemes.

Drupe seated in the calyx: nutlets 2: stigma 2-lobed.

Drupe enclosed in the calyx: nutlets 4: stigma 4-lobed.

1. STYLODON.

2. VERBENA.

3. GLANDULARIA.

4. PHILA.

5. GONIOSTACHYUM.

6. PRIVA.

7. VALERIANOIDES.

8. LANTANA.

9. CITHAREXYLUM.

10. DURANTA.

### II. VITICEAE

Corolla regular: leaf-blades simple.

Corolla irregular.

11. CALLICARPA.

Drupe with 4 stones: leaf-blades simple.

Corolla short, the tube not much longer than the limb.  
Corolla elongate, the tube several times longer than the limb.

Drupe with a single 4-celled stone: leaf-blades compound.

12. CLERODENDRON.

13. SIPHONANTHUS.

14. VITEX.

1. **STYLODON** Raf. Perennial scabrous herbs. Leaf-blades serrate, sessile. Flowers in elongate, inconspicuously bracted spikes. Calyx tubular-campanulate, sharply 5-lobed. Corolla colored, rarely white, salverform: lobes 5, unequal. Anthers unappendaged. Fruit nut-like, ridged, with 4 broad plain surfaces at the top which form a cap.—One species.

1. **S. carolinensis** (Walt.) Small. Stem slightly decumbent, 2-8 dm. tall, rough-pubescent: leaves 2-10 cm. long; blades of the lower ones spatulate to obovate or elliptic, those of the upper narrowly elliptic to lanceolate: spikes interrupted: calyx becoming about 4 mm. long: corolla pink, purplish, or white; limb 5-6 mm. wide: fruit ovoid or oval, 3 mm. long. [*Phryma carolinensis* Walt. *Verbena caroliniana* Michx.]—Sandy soil, often in woods and thickets, Coastal Plain and adj. provinces, Fla. to Miss. (La.?) and N. C.—Spr.—fall.

2. **VERBENA** [Tourn.] L. Annual, biennial, or perennial herbs. Leaf-blades entire, toothed or parted. Flowers in elongate, often very slender spikes, the bracts narrow. Calyx mainly tubular, 5-lobed. Corolla white or colored, salverform: lobes 5, unequal. Anthers unappendaged. Fruit an aggregate of 4, often narrow, readily separable nutlets filling the calyx.—About 75 species, American.—Sum.—VERBENAS. VERVAINS.

Spikes slender, sometimes very slender, continuous or interrupted, often greatly elongate.

Leaf-blades toothed or incised.

Leaf-blades 1-2-pinnately cleft or parted.

Bracts shorter than the calyx: plants erect.

Bracts much longer than the calyx: plants prostrate or procumbent.

Spikes permanently short and stout.

Bracts shorter than the mature calyx: corolla-tube less than twice as long as the calyx.

Bracts longer than the mature calyx: corolla-tube over twice as long as the calyx.

I. HASTATAE.

II. OFFICINALES.

III. BRACTEOSAE.

IV. BONARIENSES.

V. VENOSAE.

#### I. HASTATAE

Spikes permanently continuous by the imbricate fruits.

Spikes sessile or nearly so: corolla-limb 8-9 mm. wide: plants densely soft-pubescent.

Spikes peduncled: corolla-limb 2.5-6 mm. wide: plants sparingly pubescent or glabrous.

Leaf-blades lanceolate to ovate-lanceolate: nutlets smooth or nearly so.

Leaf-blades linear-spatulate to linear: nutlets reticulate.

Spikes becoming interrupted, the fruits at least, not imbricate.

Leaf-blades sessile, a spatulate type predominating.

Leaf-blades petioled, an ovate type predominating.

Sepals little longer than the fruit, the tips not meeting over the top.

Sepals much longer than the fruit, the tips converging over its top and meeting.

2. *V. hastata*.

3. *V. angustifolia*.

4. *V. littoralis*.

5. *V. urticaefolia*.

6. *V. scabra*.

## II. OFFICINALES

Stem coarsely hirsute: flowers approximate in the spike: corolla-limb usually over 6 mm. wide: leaf-blades sessile or very short wing-petioled.

Stem glabrous or glabrate: flowers widely separated in the spike: corolla-limb usually 6 mm. wide or less: leaf-blades distinctly petioled.

Leaf-blades with blunt, rounded, or abruptly acute tips.

Corolla-limb about 5-6 mm. wide: nutlets fully thrice as long as thick.

Corolla-limb 3-4 mm. wide: nutlets twice as long as thick.

Leaf-blades with long-tapering acute tips.

7. *V. Xutha*.

8. *V. Halei*.

9. *V. officinalis*.

10. *V. riparia*.

## III. BRACTEOSAE

Annual plants, often forming mats: spikes leafy-bracted.

11. *V. bracteosa*.

## IV. BONARIENSES

Leaf-blades sessile: nutlets reticulate at the top.

12. *V. brasiliensis*.

Leaf-blades clasping: nutlets reticulate to below the middle.

13. *V. bonariensis*.

## V. VENOSAE

Stems rigid from horizontal rootstocks: leaf-blades saliently toothed, conspicuously veined.

14. *V. rigida*.

1. *V. stricta* Vent. Perennial, 2-12 dm. tall, densely pale-pubescent: leaves 3-10 cm. long; blades suborbicular, oval, or elliptic, serrate or incised: spikes compact and long: calyx becoming 5 mm. long: corolla deep-blue or purple; limb 8-9 mm. wide: nutlets ellipsoid, 2.5 mm. long, or sometimes longer.—(HOARY-VERBENA.)—Prairies, barrens, fields, and roadsides, various provinces, Tenn. to Tex., N. Mex., Wyo., and Ont. Introduced E.—Sum.—fall.

2. *V. hastata* L. Perennial, 4-15 dm. tall, roughish-pubescent: leaves 4-14 cm. long: blades lanceolate, elliptic-lanceolate, or ovate-lanceolate, sharply serrate and often incised or hastate at the base: spikes relatively slender and compact: calyx becoming 2.5 mm. long: corolla blue-violet; limb 2.5-3.5 mm. wide: nutlets linear, 1.5-2 mm. long.—(BLUE-VERBENA.)—Moist fields and meadows, various provinces, Fla. to N. M., B. C., Ont., and N. S.—Sum.

3. *V. angustifolia* Michx. Perennial, 1-5 dm. tall, puberulent or sparingly pubescent: leaves 2-12 cm. long; blades linear-spatulate to linear-elliptic or linear, distantly or coarsely serrate: spikes slender: calyx becoming 4 mm. long: corolla deep lavender or purple; limb 5-6 mm. wide: nutlets linear, 3 mm. long.—Woods, fields, and roadsides, various provinces, Fla. to Ark., Minn., and Mass.—Spr.—sum.

4. *V. littoralis* H.B.K. Perennial, 3-10 dm. tall, slightly rough-pubescent: leaves 2-8 cm. long; blades spatulate, or on shoots varying to narrowly elliptic to elliptic-lanceolate, serrate: spikes slender: calyx becoming 2 mm. long: corolla light-blue or purple; limb about 3 mm. wide: nutlets broadly linear, fully 1.5 mm. long.—Dry soil, along bayous and ditches, La. Nat. of S. A.—Spr.—sum.

5. *V. urticaefolia* L. Annual or perennial, 4-15 dm. tall, pubescent; leaves 8-21 cm. long; blades broadly lanceolate to ovate-lanceolate, or sometimes ovate to oval, coarsely crenate-serrate: spikes loosely-fruited: calyx becoming 2 mm.

long: corolla white: limb 3-4 mm. wide: nutlets ellipsoid, 1.5-2 mm. long.—(WHITE-VERBENA.)—Thickets, moist fields, and meadows, various provinces, Fla. to Tex., Minn., and N. B.—Sum.

6. *V. scabra* Vahl. Similar to *V. urticaefolia* in habit, the leaves relatively smaller, and blades thicker and commonly less gradually acute or acuminate: spikes closely fruited: calyx becoming 2 mm. long: corolla white or pinkish; limb 2-3 mm. wide: nutlets ellipsoid, about 1.5 mm. long.—Low grounds or sandy soil, Coastal Plain and Basin-and-Range Province, Fla. to Tex., and Calif.—(*W. I., Mex., C. A., S. A.*)—Spr.-fall.

7. *V. xutha* Lehm. Perennial, 5-15 dm. tall, coarsely hirsute: leaves 4-10 cm. long; blades incised-pinnatifid, or 3-parted on the lower part of the stem, the veins very prominent and hirsute beneath: spikes very long, not branched or but little so, proportionately slender: calyx becoming 4 mm. long; lobes converging over the nutlets: corolla purplish-lavender; limb 5-7 mm. wide: nutlets linear-cylindric, 2-2.25 mm. long.—Prairies, arroyos, stream banks, roadsides, waste-places, and bayou-banks, various provinces, Miss. to Tex. and Calif. Has been found on ballast at Mobile, Ala.—(*Mex.*)—Spr.-fall.

8. *V. Halei* Small. Biennial, 3-10 dm. tall, sparingly pubescent below: leaves 3-10 cm. long, pubescent, especially so beneath; blades of the lower leaves elliptic to ovate, deeply incised-pinnatifid, often 3-parted or incised-pinnate; those of the upper stem-leaves linear to linear-spatulate, sparingly toothed or entire: spikes slender, usually much-branched: calyx becoming 3-3.5 mm. long, strigillose: corolla deep-lavender; limb 4-5 mm. wide: nutlets linear-cylindric, about 2.5 mm. long.—Prairies, stream-banks, roadsides, waste-places and bayou-banks, various provinces, Miss. to Tex. and Okla.—Spr.-fall.

9. *V. officinalis* L. Annual, 2-6 dm. tall, glabrous or nearly so: leaves 2-6 cm. long; blades of the lower ones 1-2-pinnatifid and incised: spikes very slender: calyx 2 mm. long: corolla blue or purple; tube mostly less than 3 mm. long; lobes mainly rounded: nutlets broadly ellipsoid, about 1.5 mm. long.—(EUROPEAN-VERBENA.)—Roadsides, fields, and waste-places, various provinces, Fla. to Tex., Calif., and Tenn. Nat. of Eu.—(*W. I.*)—Spr.-fall.

10. *V. riparia* Raf. Annual, 6-15 dm. tall, sparingly pubescent: leaves 4-14 cm. long; blades of the lower ones 3-parted or 1-2-pinnatifid: spikes slender: calyx becoming 3 mm. long: corolla light blue; tube mostly over 3 mm. long; lobes emarginate or notched: nutlets ellipsoid, about 2 mm. long.—River banks, Piedmont, N. C. to N. J.—Spr.-sum.

11. *V. bracteosa* Michx. Annual, the prostrate or procumbent branches 1-5 dm. long, hirsute: leaves 1-6.5 cm. long; blades pinnatifid, 2-3 cm. long: spikes thick, sessile, continuous or mainly so: calyx becoming 3-4 mm. long: corolla purple or bluish; limb 2-2.5 mm. wide: nutlets linear, 2-2.5 mm. long.—Prairies, roadsides, fields, pastures, and waste-places, various provinces, Fla. to Tex., Calif., B. C., Minn., and Va.—Spr.-sum.—A verberna native in the Mediterranean region, *V. supina* L. with finely divided leaf-blades, short-bracts, and a calyx about equalling the very thick fruit, occurs on ballast at Mobile, Ala.

12. *V. brasiliensis* Vellozo. Annual, 6-25 dm. tall, finely pubescent above: leaves 3-8 cm. long; blades elliptic to linear-elliptic or lanceolate, sharply serrate at least above the middle: spikes not crowded: calyx becoming 3.5 mm. long or longer: corolla purple or lilac: limb about 2.5 mm. wide: nutlets narrowly ellipsoid, 1.5 mm. long.—Waste-places and dry sandy soil, Coastal Plain, La. Nat. of trop. Am.—Sum.

13. *V. bonariensis* L. Annual, 6-20 dm. tall, villous-hirsute above: leaves 4-10 cm. long; blades elliptic to elliptic-lanceolate, broadly serrate at least above

the middle: spikes crowded: calyx becoming 3.5 mm. long: corolla purplish, or rarely white: limb about 2 mm. wide: nutlets narrowly ellipsoid, 2 mm. long.—Waste-places, roadsides, and banks, Coastal Plain, Ala. to Ark. and S. C.—Nat. of S. Am.—Spr.—sum.—This and the following species are among the most conspicuous weeds of Louisiana.

14. *V. rigida* (L.) Spreng. Perennial, the stem and branches decumbent, 2–6 dm. tall, rough-pubescent: leaves 4–12 cm. long; blades obovate, oblanceolate, or spatulate at the base of the stem, elliptic to elliptic-lanceolate or lanceolate above, with flaring coarse teeth, prominently veined, sessile and partly clasping at the base: spikes stout, continuous: calyx becoming 4–5 mm. long: corolla deep-purple, rarely paler; tube fully twice as long as the calyx; limb 6–11 mm. wide: nutlets ellipsoid, 2 mm. long. [*V. venosa* Gillies & Hook.]—Waste-places, Coastal Plain, W Fla. to Tex. and N. C. Nat. of S. Am.—Spr.—sum.—This plant forms large, spreading patches of brilliant purple along roadsides and in waste-places in Louisiana and Texas.

3. *GLANDULARIA* J. F. Gmel. Annual or (ours) perennial herbs. Leaf-blades coarsely toothed to dissected. Flowers in depressed capitate spikes which elongate somewhat in age. Calyx tubular, 5-lobed. Corolla white or colored, salverform. Anthers of the longer stamens with an appendaged connective. Fruit an aggregate of 4 nutlets in the bottom of the calyx.—About 25 species, American.—VERBENAS.

Corolla rose-purple, pink, or white.

Leaf-blades toothed, incised, lobed, or pinnatifid, the segments broad.

Tip of the longer calyx-lobes subulate, 1 mm. long.

Tip of the longer calyx-lobes bristle-like, 2–3 mm. long.

Leaf-blades pinnatifid or incised-pinnatifid: nutlets 2.5–3 mm. long, stout, pitted from near the base to the apex.

Leaf-blades 1-pinnatifid: calyx 12 mm. long or more.

Leaf-blades lanceolate to ovate-lanceolate, cuneate at the base.

Leaf-blades broadly ovate to deltoid, cordate or broadly truncate at the base.

Leaf-blades 2-pinnatifid: calyx 10 mm. long or less.

Leaf-blades serrate or incised-serrate: nutlets about 4 mm. long, slender, pitted from about the middle to the apex.

Leaf-blades pinnatisect, the segments narrowly linear to subulate.

Corolla red.

1. *G. maritima*.

2. *G. Lambertii*.

3. *G. canadensis*.

4. *G. Drummondii*.

5. *G. tampensis*.

6. *G. tenuisecta*.

7. *G. peruviana*.

1. *G. maritima* Small. Stem and branches diffuse or widely creeping, 2–20 dm. long, often sparingly short-pubescent: leaf-blades cuneate to orbicular-obovate or ovate, 1–4 cm. long, incised, few-toothed, or lobed: calyx 10–12 mm. long, the larger lobes subulate-lanceolate: corolla rose-purple or bright-purple; tube 2 cm. long or nearly so: nutlets slender, about 4 mm. long.—Hammocks, pinelands, and Coastal sand-dunes, S pen. Fla.—All year.

2. *G. Lambertii* (Sims) Small. Stem and branches 3–6 dm. long, hirsute: leaf-blades typically lanceolate, sometimes ovate-lanceolate, 3–9 cm. long, incised-pinnatifid, acute or acuminate at the apex, cuneate at the base: calyx becoming 11–13 mm. long: corolla showy, rose-purple; tube about 1.5 cm. long; lobes rounded or slightly notched:

nutlets mostly 3 mm. long, evenly fine-pitted.—Open woods, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and S. C.—Spr.-sum.

3. *G. canadensis* (L.) Small. Stem and branches 3-6 dm. long, minutely pubescent: leaf-blades 3-8 cm. long, typically ovate or deltoid, incised-pinnatifid, rather rounded at the apex, truncate at the base: calyx becoming 13-16 mm. long: corolla showy, rose-purple; tube about 2 cm. long; lobes emarginate: nutlets about 3 mm. long, irregularly coarse-pitted. [*Verbena Aubletia* Jacq. *V. canadensis* Britton]—Prairies, roadsides, and thickets, various provinces, Fla. to Tex., Ill., and Va.—Spr.-sum.—Does not grow naturally in Canada.

4. *G. Drummondii* (Lindl.) Small. Stem and branches 2-4 dm. long, hirsute: leaf-blades 2-5 cm. long, ovate in outline, 2-pinnatifid, the segments typically narrow: calyx becoming 9-10 mm. long: corolla showy, rose-purple; tube about 1-1.5 cm. long; lobes commonly emarginate: nutlets about 3 mm. long, evenly fine-pitted. [*Verbena Drummondii* Bxt.]—Prairies, sandy bottoms, and woods, various provinces, La. to N. M., Kans., and Va.—Spr.-sum.

5. *G. tampensis* (Nash) Small. Stem and branches ascending or decumbent, 2-6 dm. long, usually minutely pubescent: leaf-blades lanceolate to elliptic or ovate, 2-8 cm. long, coarsely serrate or incised-serrate: calyx 12-15 mm. long, the longer lobes setaceous-subulate: corolla purple: tube fully 1.5 cm. long: nutlets 4 mm. long, coarsely pitted from the middle to the apex. [*Verbena tampensis* Nash]—Sandy hammocks, pen. Fla.—Spr.-fall.

6. *G. tenuisecta* (Briq.) Small. Stem and branches decumbent or procumbent, strigillose: leaf-segments narrowly linear to subulate, strigillose, diverging: calyx 9-10 mm. long; lobes short-setaceous: corolla small but showy, rose-purple, pink, or white; tube about 1 cm. long; lobes notched: nutlets 3.5 mm. long, pitted above the middle. [*Verbena tenuisecta* Briq.]—Sandy woods, clay soil and waste-places, Coastal Plain, Fla. and Ga. to La. Nat. of S. A.—Sum.-fall, or all year S.—This is the species commonly known as *Verbena erinoides* or MOSS VERBENA.

7. *G. peruviana* (L.) Small. Stem and branches decumbent and creeping, finely hirsute: leaf-blades ovate to elliptic-ovate, 1.5-5 cm. long, serrate, veiny: calyx about 1.5 cm. long, the larger lobes with short subulate tips: corolla red; tube about 2 cm. long; lobes notched: nutlets about 4 mm. long, striate-ribbed below the middle, cross-ribbed above it. [*Verbena chamaedrifolia* Juss.]—Hammocks and roadsides, pen. Fla. Nat. of S. Am.—(W. I., Mex., C. A.)—Spr.-fall.

4. **PHYLA** Lour. Perennial procumbent or creeping herbs. Leaf-blades toothed or lobed. Flowers in congested axillary spikes, the bracts cuneate to flabellate. Calyx short, flattened, 2-lobed. Corolla 2-lipped: tube slightly exceeding the calyx. Fruit as broad as long.—About 30 species, mostly in tropical America.—**FOG-FRUIT.** **FROG-FRUIT.**

Plant herbaceous: leaf-blades not rugose.

Leaf-blades mostly broadest above the middle, toothed from above the middle to the apex: calyx-lobes shorter than the tube: fruit pubescent at the apex.

1. *P. nodiflora*.

Leaf-blades mostly broadest below the middle, toothed from below the middle to the apex: calyx-lobes longer than the tube: fruit glabrous.

2. *P. lanceolata*.

Plant partly woody below: leaf-blades rugose.

3. *P. stoechadifolia*.

1. *P. nodiflora* (L.) Greene. Plants soft-strigillose, with creeping branches 2-13 dm. long: leaf-blades spatulate, 1-3 cm. long: spikes 10-30 mm. long:

calyx about 2 mm. long: corolla purplish or nearly white, about 2 mm. long: fruits about 1 mm. long. [*Lippia nodiflora* Michx.] — (CAPE-WEED.) — Hammocks and low sandy places, Coastal Plain, Fla. to Tex., Mo., and N. C. — (*W. I., Mex., C. A., S. A.*) — All year.

2. *P. lanceolata* (Michx.) Greene. Branches creeping, 1-4 dm. long: leaf-blades elliptic-lanceolate to lanceolate, 1.5-5 cm. long: spikes 9-15 mm. long; bracts erose-ciliolate: corolla bluish-white, about 3 mm. long. [*Lippia lanceolata* Michx.] — River-banks and shores, various provinces, Fla. to Tex., Minn., and N. J. — Spr.-sum.

3. *P. stoechadifolia* (L.) Small. Plant rough-strigillose, diffuse or with vine-like branches: leaf-blades thick, narrowly elliptic to lanceolate, 2-12 cm. long, acute, serrate, rugose, the veins impressed above, prominent beneath: heads globose or depressed, becoming cylindric, sometimes elongate: calyx 2-2.5 mm. long: corolla purplish, about 3 mm. long: fruit 1.5-2 mm. long. [*Lippia stoechadifolia* H.B.K.] — Prairies, Everglade Keys, Fla. — (*W. I.*) — All year.

5. **GONIOSTACHYUM** Small. Shrubs or shrubby plants. Leaf-blades mostly toothed. Flowers in congested axillary spikes, the bracts 4-ranked, of an ovate type, keeled. Calyx flattened, 2-lobed. Corolla 2-lipped: tube glabrous within, much longer than the calyx. — Six or 8 species, in tropical America.

1. *G. citrosum* Small. Stems pale-gray or whitish: leaf-blades lanceolate to elliptic-lanceolate, 2.5-6 cm. long, shallowly serrate, pubescent: spikes depressed, short-peduncled, 4-6 mm. long: bracts ovate: calyx about 1 mm. long: corolla white, about 4.5 mm. long; limb about 3 mm. broad: nutlets 1.5 mm. wide. — Hammocks, Everglade Keys, Fla. — (*W. I.*) — All year.

6. **PRIVA** Adans. Perennial herbs. Leaf-blades thin, toothed. Flowers in elongate slender spikes or racemes. Calyx 5-lobed. Corolla white or lavender, slightly 2-lipped. Stamens 4. Staminodia minute or obsolete. Nutlets tuberculate or spiny. — About 10 species, of tropical regions.

1. *P. lappulacea* (L.) Pers. Stems 2-6 dm. tall, pubescent: leaf-blades ovate, 2-10 cm. long, serrate: racemes loose-flowered: calyx with minute lobes: corolla-lobes rounded: fruit ovoid-pyramidal, included, the nutlets 3-4 mm. long, spiny-tuberculate. [*P. echinata* Juss.] — (VELVET-BUR.) — Hammocks and cult. grounds, Key West, Fla. — (*W. I., Mex., C. A., S. A.*)

*Bonchea prismatica* (Jacq.) Kuntze, an annual resembling *Valerianoides*, but with four perfect stamens, has been found on ballast at Mobile Bay.

7. **VALERIANOIDES** Boerh. Herbs, or shrubby plants. Leaf-blades toothed. Flowers sessile on a stout rachis or in excavations. Calyx often unequally 5-lobed, scarcely accrescent. Corolla white or colored, salverform, slightly 2-lipped. Stamens 2. Staminodia 2.—About 40 species, of tropic regions.

1. *V. jamaicensis* (L.) Kuntze. Plants with spreading or decumbent branches, 6–15 dm. long: leaf-blades elliptic, ovate, or oval, 2–8 cm. long: spikes virgate, quill-like: corolla blue-violet, 8–11 mm. long; limb 7–8.5 mm. wide. [*Stachytarpheta jamaicensis* (L.) Vahl]—Pinelands, coastal sand-dunes, and waste-places, S pen. Fla., Florida Keys, and S Ala.—(*W. I., Mex., C. A., S. A.*)

8. **LANTANA** L. Shrubs or rarely herbs, sometimes prickly-armed. Leaf-blades toothed. Flowers in congested, flat-topped spikes. Calyx shallowly 2–5-lobed or truncate. Corolla white or colored: tube slightly curved: limb irregular. Stamens 4. Drupes more or less juicy.—About 60 species, in warm and tropical regions.—Spr.-fall or all year S.—SHRUB-VERBENAS.

Flower-heads bracted, but not involucrate.

Stem and branches prickly-armed: leaf-blades strigose: corolla-tube over 12 mm. long.

Stems and branches sparingly armed with weak more or less curved prickles: corollas yellow to orange.

Stems and branches copiously armed with stout, rigid, hooked prickles: corollas yellow to purple.

Stem and branches not prickly-armed: leaf-blades not strigose: corolla-tube 10 mm. long or less.

Plants with prostrate stems and branches: drupes 2.5–3.5 mm. long.

Plants with erect stems and branches: drupes 4–5 mm. long.

Flower-heads decidedly involucrate.

Leaf-blades acute or acutish, coarsely toothed: corolla-tube about 10 mm. long.

Leaf-blades rounded or retuse at the apex, crenulate: corolla-tube 2–4 mm. long.

1. *L. Camara*.

2. *L. aculeata*.

3. *L. depressa*.

4. *L. ovatifolia*.

5. *L. Sellowiana*.

6. *L. involucrata*.

1. *L. Camara* L. Shrub with armed branches, 10–15 dm. tall: leaf-blades ovate to elliptic-ovate, 2–7 cm. long; corolla usually cream, yellow or pink, later changing to orange or scarlet; limb 6–8 mm. high.—Two forms of this species occur in Florida: one with acuminate leaf-blades, derived from plants commonly in cultivation apparently from the West Indies, the other a native plant with obtuse, relatively coarser-toothed leaf-blades.—In sandy soil, Coastal Plain, Fla. to Tex., and Ga.

2. *L. aculeata* L. Shrub with copiously and rigidly armed branches, 2.5 dm. tall or less: leaf-blades ovate, often broadly so, 3–6 cm. long: corolla yellow, changing to orange or purple; limb 7–9 mm. high.—Pinelands, and cult. grounds, pen. Fla. Nat. of W. I.

3. *L. depressa* Small. Shrub with unarmed prostrate branches, 2-11 dm. long: leaf-blades ovate to elliptic, 1-3.5 cm. long: spikes less than 2.5 cm. wide: corolla yellow; tube 5-6 mm. long; stone of the drupe globose, 2.5-3.5 mm. long, scarcely beaked.—Pinelands, Everglade Keys, Fla.

4. *L. ovatifolia* Britton. Shrub 2 m. tall or less: leaf-blades ovate, 3-7 cm. long, crenate-serrate: spikes over 2.5 cm. wide: corolla yellow; tube 9-10 mm. long: stone of the drupe ovoid, 4-5 mm. long, beaked.—Hammocks, S. pen. Fla.—(W. I.)

5. *L. Sellowiana* Link & Otto. Shrub 3-18 dm. tall, with tomentulose foliage: leaf-blades ovate, oval, or elliptic-ovate, 1-3 cm. long, abruptly narrowed or truncate at the base: corolla magenta or lilac; tube puberulent; limb 8-18 mm. high, the lower lobe elongate.—(POLECAT-GERANIUM. WEEPING-LANTANA.)—Roadsides, waste-places, pinelands, and woods, Fla. Nat. of S. A.—(W. I.)

6. *L. involucrata* L. Shrub 4-17 dm. tall, with puberulent or tomentulose foliage: leaf-blades oval, obovate, to suborbicular, 1-3 cm. long, usually cuneate at the base: outer bracts of the involucre 4-7 mm. long, ciliolate: calyx becoming 1.5 mm. long: corolla white or pale-purple; tube 2-4 mm. long; limb 2-4 mm. high. [*L. odorata* L.]—(SAGE.)—Pinelands, hammocks, sand dunes, S pen. Fla. and Florida Keys; S Tex.—(W. I., Mex., C. A., S. A.)

9. *CITHAREXYLUM* L. Shrubs or trees, sometimes spiny. Leaf-blades mainly entire. Flowers in clusters or long spikes. Calyx obscurely 5-lobed. Corolla mainly white: tube straight or nearly so: limb slightly oblique, nearly equally 5-lobed. Staminodium present. Stigma 2-lobed. Nutlets 2.—About 20 species, tropic American.

1. *C. fruticosum* L. Shrub or small tree, with softly pubescent twigs: leaves 5-15 cm. long; blades elliptic or oblong-obovate, veiny: flowers in spikes or racemes: fruit black, 9-10 mm. in diameter. [*C. villosum* Jacq.]—(FIDDLEWOOD.)—Hammocks and pinelands, S pen. Fla. and Florida Keys.—(W. I.)—All year.

10. *DURANTA* L. Shrubs or trees, often spine-armed. Leaf-blades entire or toothed. Flowers in racemes. Calyx more or less prominently but minutely 5-lobed, the tube plicate. Corolla salverform or funnellform: tube mainly curved: limb slightly unequally 5-lobed, Staminodium mostly obsolete. Stigma 4-lobed or capitate. Nutlets 4. — About 8 species, tropic American.

1. *D. repens* L. Shrub or small tree: leaf-blades ovate-elliptic, oval or obovate, 1.5-5 cm. long: racemes 5-15 cm. long, recurving: calyx 3-4 mm. long, angled: corolla lilac or white; limb 7-9 mm. wide, the lobes ciliate, the lower ones with magenta spots: fruit 7-11 mm. in diameter, enclosed in the

calyx. [*D. Plumieri* Jacq.].—(GOLDEN-DEWDROP.)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(*W. I., Mex., C. A., S. A.*)—The accrescent calyx becomes golden-yellow.

**11. CALLICARPA** L. Shrubs or trees. Leaf-blades simple. Flowers in axillary cymes. Calyx shallowly 4-lobed or nearly truncate. Corolla white or colored, rotate-funnelform or funnelform, typically 4-lobed, the tube straight. Filaments adnate to the corolla-tube, glabrous. Stigmas stout. Drupe very juicy.—About 35 species, American, Asiatic, and African.—**BEAUTY-BERRIES.**

**1. C. americana** L. Shrub 1-2 m. tall, or a vine, stellate-pubescent: leaf-blades ovate, elliptic or oval, serrate: calyx 1-1.5 mm. long: corolla bluish or pink; limb about 5 mm. wide, the rounded lobes apiculate: fruit violet or magenta, 4-5 mm. in diameter.—(FRENCH-MULBERRY.)—Woods, thickets, hammocks and pinelands, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and S Va.—Spr.-fall, or all year northward.—There are white-flowered forms.

**12. CLERODENDRON** [Burm.] L. Shrubs or trees, or half-shrubs. Leaves opposite: blades simple, toothed. Flowers in dense terminal cymes. Calyx prominently 5-lobed. Corolla white or highly colored, funnelform or salverform: tube slightly curved: limb 5-lobed. Filaments adnate to above the middle of the corolla-tube. Stigmas slender. Drupe lobed or ribbed.—About 100 species, in tropical regions.—**GLORYBOWERS.**—Spr.-fall, or all year S.

Corolla-tube slightly exceeding the calyx: calyx-lobes as long as the tube or longer. **1. C. fragrans.**  
Corolla-tube several times longer than the calyx: calyx-lobes shorter than the tube. **2. C. foetidum.**

**1. C. fragrans** Vent. Shrub 1-3 m. tall: leaf-blades ovate to deltoid, 9-25 cm. long, mostly abruptly pointed, coarsely and irregularly toothed, finely pubescent beneath, truncate or shallowly cordate at the base, long-petioled: cymes congested: calyx 15-19 mm. long; lobes subulate or subulate-lanceolate, acuminate, ciliate: corolla 22-28 mm. long; lobes nearly as long as the tube, or shorter, white or blue-tinged.—Mostly represented by the form with double-flowers.—Thickets, roadsides, and waste-places, Fla. Nat. of eastern Asia.—(*W. I.*)

**2. C. foetidum** Bunge. Shrub 1-2 m. tall: leaf-blades deltoid-ovate, 6-15 cm. long, acute or slightly acuminate, serrate or serrate-dentate, mostly truncate at the base, long-petioled: cymes rather compact: calyx 5-6 mm. long; lobes triangular-lanceolate,

shorter than the tube: corolla 18–22 mm. long; tube very slender; lobes lilac or red-purple.—Fields and roadsides, Coastal Plain, N Fla. to La. Nat. of China.

**13. SIPHONANTHUS L.** Shrubs or half-shrubs. Leaf-blades simple, entire. Flowers in axillary cymes, sometimes aggregated in a panicle. Calyx loosely spreading. Corolla white or nearly so, slender-funnelform, 5-lobed, the tube curved. Filaments adnate to the middle of the corolla-tube. Stigmas slender. Drupe lobed.—About 6 species, natives of the Old World tropics.

**1. S. indicus L.** Plant 1–4 m. tall, the twigs glabrous: leaf-blades oblanceolate or elliptic oblanceolate to elliptic, 5–16 cm. long, entire, glabrous, short-petioled: calyx 13–16 mm. long; lobes ovate, obtuse: corolla 12–14 cm. long; lobes 12–15 mm. long: drupe 8–10 mm. long.—(TURK'S-TURBAN.)—Waste-places, roadsides, and woods, Coastal Plain, Fla. to Tex. and S. C. Nat. of E. I. and cult.—(W. I., Mex., S. A.)—The black fruits are conspicuous.

**14. VITEX L.** Shrubs or trees. Leaf-blades digitately compound or rarely 1-foliolate. Flowers in open terminal compound cymes. Calyx shallowly 3-lobed or 5-lobed. Corolla white or colored, funnelform, 2-lipped, the tube slightly curved. Filaments adnate to about the middle of the corolla-tube, pubescent at the base.—About 60 species, widely distributed in warm regions.

**1. V. Agnus-Castus L.** Shrub 1–3 m. tall, pale-pubescent: leaf-blades 7-foliolate, the leaflets with linear to linear-elliptic blades 2–10 cm. long: flowers separated: calyx 2–2.5 mm. long, campanulate: corolla blue or purplish; limb 5–6 mm. broad: fruits 3.5–4 mm. long.—(CHASTE-TREE.)—Roadsides, waste-places, and about gardens, Coastal Plain, Fla. to Tex., and N. C. Nat. of Old World, and cult.—(W. I.)—Spr.-fall.

#### FAMILY 11. AVICENNIACEAE—BLACK-MANGROVE FAMILY

Shrubs or trees of maritime regions, the branches terete, nodose. Leaves opposite, persistent: blades entire. Flowers in axillary and terminal small, long-peduncled cymes. Calyx of 5 nearly distinct sepals. Corolla of 4 partially united petals, campanulate-rotate. Androecium of 4 stamens, the filaments adnate to the lower part of the corolla-tube. Gynoecium of 2 united carpels. Fruit a compressed oblique capsule.—Only the following genus and 3 species, in tropical regions.

1. **AVICENNIA** L. Leaf-blades thick. Cymes peduncled. Calyx subtended by small bracts. Corolla inconspicuous, the tube and spreading lobes about equal in length. Stamens erect. Stigmas 2. Capsule thick-walled.

1. **A. nitida** Jacq. Shrub, or tree sometimes 25 m. tall: leaf-blades leathery, elliptic or nearly so, 3–8 cm. long, dark-green above, pale, minutely canescent beneath: calyx 3–4 mm. long: corolla white; lobes longer than the tube, broadly rounded or retuse: fruit ellipsoid, 3–5 cm. long, acutish. —(BLACK-MANGROVE.)—Sandy shores and coastal hammocks, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A.)—All year.

## FAMILY 12. PHRYMACEAE — LOPSEED FAMILY

Perennial herbs, with angled stems. Leaves opposite: blades toothed. Flowers in slender spikes or spike-like racemes. Calyx of 5 partially united sepals, 2-lipped, the lower lip very short. Corolla white and magenta-tinged, of 5 partially united petals, 2-lipped, the lower lip 3-lobed. Androeium of 4 didynamous stamens. Gynoeium of 2 united carpels. Fruit an achene included in the deflexed accrescent calyx. Comprises only the following genus.

1. **PHRYMA** L. Caulescent herbs with spreading branches. Leaf-blades broad, coarsely toothed, petioled. Spikes or racemes elongate, the small flowers opposite. Achene in the bottom of the calyx. This genus is sometimes included in the Verbenaceae.

1. **P. leptostachya** L. Stems 3–10 dm. tall, sparingly branched above, reflexed-pubescent: leaf-blades ovate to elliptic-ovate or ovate-lanceolate, 3–15 cm. long: calyx 3–5 mm. long, accrescent; tube ribbed, little longer than the slender upper lobes during anthesis: corolla white and magenta-tinged, about 8 mm. long: achenes 4–5 mm. long. —(LOPSEED.)—Rich woods and thickets, various provinces, Fla., to Tex., Man., and N. B.—Sum.—fall. The same or a closely related species grows in eastern Asia.

## FAMILY 13. LAMIACEAE — MINT FAMILY

Herbs or woody plants, often aromatic. Stems 4-sided. Leaves opposite or whorled: blades simple, entire, toothed, or lobed. Flowers perfect, in open or compact cymes. Calyx of 5 partially united sepals, regular or 2-lipped. Corolla of 5 partially united sepals, 2-lipped or nearly regular. Androeium of 2–4 stamens, the pairs often irregular. Gynoeium 2-carpellary. Ovary 4-celled. Fruit of 4 nutlets included

in the calyx.—About 160 genera and 3,200 species, widely distributed in tropical and temperate regions. The foliage sometimes abounds in volatile oils.

Ovary of 4 united carpels, merely 4-lobed: style not basal: nutlets laterally or obliquely attached. Tribe I. AJUGEAE.

Ovary of 4 distinct or nearly distinct carpels: style basal: nutlets basally attached.

Calyx with a crest on the upper side or on the upper lip, the broad lips entire, closed in fruit.

Calyx without a crest on the upper side, the lips more or less lobed.

Stamens included.

Calyx with 10 narrow spreading or recurved lobes: corolla-tube included in the calyx: *Marrubium* in

Calyx 2-lipped, the upper lip truncate or with 3 broad lobes, the lower lip with 2 narrow lobes: corolla-tube exerted from the calyx. *Dicerandra odoratissima* in

Stamens exerted.

Corolla conspicuously 2-lipped: lips different, the upper concave.

Anther-bearing stamens 4.

Anther-bearing stamens 2.

Corolla nearly regular, or if 2-lipped, the upper lip flat.

Stamens 2 or 4; filaments straight and spreading, or converging under the upper lip of the corolla.

Stamens 4, didynamous; lower pair longer, lying on the lower lip of the corolla.

#### I. AJUGEAE

Corolla markedly irregular, the middle lobe of the lower lip quite different from the other lobes: calyx 2-lipped.

Corolla strongly bilateral, the upper lip split, very small, the lower lip large: stamens and style nearly straight.

Corolla slightly bilateral, the middle lobe of the lower lip strongly declined: stamens and style strongly curved or coiled.

Corolla slightly irregular, the lobes of both lips nearly equal, spreading: calyx nearly regular.

#### II. SCUTELLARIEAE

Perennial or rarely annual scentless herbs, with opposite leaves and more or less 1-sided racemes or panicles.

#### III. STACHYDEAE

Stamens included.

Stamens exerted.

Upper pair of filaments longer than the lower.

Anther-sacs parallel or nearly so.

Upper pair of stamens declined, lower pair ascending: erect herbs.

Upper and lower pair of stamens ascending: trailing herbs.

Anther-sacs diverging.

Flowers in terminal raceme-like panicles: erect herbs.

Flowers in axillary clusters: creeping herbs.

Upper pair of filaments shorter than the lower.

Calyx manifestly 2-lipped.

Upper lip of the calyx broad, with 3 lobes, the lower with 2 tooth-like lobes.

Upper lip of the calyx narrow, entire, the lower lip of 2 equal broad lobes.

Calyx not 2-lipped, often slightly irregular, but the lobes essentially similar.

Tube of the calyx faintly nerved, inflated at maturity.

Calyx-lobes 5.

Calyx-lobes 4.

#### 10. PRUNELLA. —

#### 11. MACBRIDEA.

#### 12. DRACOCEPHALUM. —

#### 13. SYNANDRA.

Tube of the calyx prominently 5-10-nerved, not inflated at maturity.

Anther-sacs transversely 2-valved.

Anther-sacs not transversely 2-valved.

Nutlets 3-sided, truncate above.

Calyx-lobes not spine-tipped.

Calyx-lobes spine-tipped.

Calyx-lobes 5.

Calyx-lobes 8-10.

Nutlets nearly terete, rounded above.

14. GALEOPSIS.

15. LAMIUM, —

16. LEONURUS.

17. LEONOTIS.

18. STACHYS, —

#### IV. MONARDEAE

Connective of the anther elongate, bearing a perfect sac at one end and a rudimentary one at the other: calyx-throat glabrous or merely ciliate at the base of the lobes.

Connective short: anther-sacs confluent.

Calyx not 2-lipped; tube 15-ribbed; teeth nearly equal.

Calyx 2-lipped; tube 13-ribbed; teeth unequal.

19. SALVIA.

20. MONARDA.

21. BLEPHILIA.

#### V. SATUREIEAE

Flowers in axillary whorls or clusters; these sometimes forming terminal spike-like racemes or panicles.

Corolla 2-lipped.

Filaments curved, converging under the upper lip of the corolla.

Anther-bearing stamens 2.

Calyx gibbous; throat closed by hairs: corolla without folds in the throat.

Calyx not gibbous; throat not closed by hairs: corolla with 2 folds in the throat.

Anther-bearing stamens 4.

Corolla-tube strongly bent.

Anther-sacs divergent.

Anther-sacs parallel.

Corolla-tube straight.

Calyx with 5 nearly equal lobes, not or scarcely 2-lipped.

Calyx-tube 10-ribbed.

Calyx-tube 13-ribbed.

Calyx 2-lipped.

Anther-sacs awnless.

Anther-sacs awned.

Filaments straight, often spreading.

Calyx-tube 15-nerved.

Calyx-tube 10-13-nerved.

Anther-bearing stamens 4.

Anther-sacs divergent.

Calyx equally 5-lobed: erect herbs.

Calyx 2-lipped: creeping herbs.

Anther-sacs parallel.

Anther-bearing stamens 2.

Corolla nearly regular, with 4-5 lobes.

Anther-bearing stamens 2: foliage barely aromatic.

Anther-bearing stamens 4: foliage strongly aromatic.

Flowers in loose terminal panicles.

Lower lip of the corolla fringed: native plants.

Anther-bearing stamens 4.

Anther-bearing stamens 2.

Lower lip of the corolla not fringed: naturalized plant.

35. LYCOPUS.

36. MENTHA.

37. MICHELIELLA.

38. COLLINSONIA.

39. PERILLA.

#### VI. OCIMEAE

Calyx with nearly equal lobes: corolla with a saccate drooping lower lip.

Calyx with a broad decurrent upper lobe: corolla-lips nearly equal in length.

40. HYPTIS.

41. OCIMUM.

1. TEUCRIUM [Tourn.] L. Perennial strict herbs. Leaf-blades toothed

Flowers in raceme-like panicles. Calyx 2-lipped. Corolla mainly pink, very irregular: upper lip minute, split: lower lip 3-lobed, projecting beyond the upper one: tube relatively long. Stamens lying against the upper side of the corolla.—More than 100 species, widely distributed.—WOOD-SAGES. GERMAN-ERS.

Leaf-blades mainly rounded at the base: stem closely canescent: broader calyx-lobes acute or acutish. 1. *T. canadense*.

Leaf-blades mainly narrowed at the base: stem downy-canescenscent: broader calyx-lobes obtuse.

Calyx prominently ribbed at maturity: corolla glandular-puberulent.

Calyx not ribbed at maturity: corolla pubescent.

2. *T. Nashii*.

3. *T. littorale*.

1. *T. canadense* L. Stem 2-12 dm. tall: leaf-blades relatively thin, ovate to elliptic-ovate, 6-14 cm. long, pubescent beneath: calyx becoming 6-8 mm. long; lower lobes acuminate: corolla purplish or pink, 15-20 mm. long: nutlets about 2.5 mm. long, wrinkled.—Low grounds, fields, river-banks, and roadsides, various provinces, Ga. to Tex., Minn., and Me.—Sum.

2. *T. Nashii* Kearney. Stem 3-14 dm. tall: leaf-blades narrowly elliptic to lanceolate, 4-14 cm. long, whitish-pubescent beneath: calyx becoming 6-7 mm. long; lower lobes blunt: corolla pink, 15-20 mm. long.—Hammocks, thickets, and wet grounds, often in calcareous soil, Coastal Plain, Fla. to Tex., and S. C.—Spr.—fall or all year S.

3. *T. littorale* Bicknell. Stem 3-5 dm. tall: leaf-blades narrowly elliptic to elliptic-lanceolate, 6-11 cm. long, pale or whitish-pubescent beneath: calyx becoming 5-6 mm. long; lower lobes acute: corolla pale-pink, 15-17 mm. long: nutlets 2 mm. long.—Low sandy soil, Coastal Plain and New England coast, Fla. to Me.—Sum.

2. **TRICHOSTEMA** L. Annual or perennial herbs or shrubby plants.

Leaf-blades entire or repand. Flowers in axillary cymes. Calyx very irregular, 2-lipped. Corolla somewhat 2-lipped, the upper arching, sometimes surpassing the lower lip. Stamens lying against the lower corolla-lip.—About 10 species, North American.—The calyx becomes inverted in fruit.

Annual plant: leaf-blades of a linear or elliptic type.

Foliage viscid-pubescent: leaf-blades elliptic or lanceolate.

Foliage glabrous or viscid-puberulent: leaf-blades linear.

Perennial or biennial plant: leaf-blades of an obovate type.

1. *T. dichotomum*.

2. *T. lineare*.

3. *T. suffrutescens*.

1. *T. dichotomum* L. Plant 1-20 dm. tall: leaf-blades elliptic to broad-lanceolate, 2-7 cm. long: calyx becoming 5-6 mm. long; lobes acuminate: corolla blue to white, about 5 mm. long: nutlets 1.5-2 mm. long.—(BASTARD-PENNY-ROYAL. BLUE-CURLS.)—Dry fields, thickets, hammocks and pinelands, various provinces, Fla. to Tex., Mo., and Me.—Sum., or all year S.

2. *T. lineare* Nutt. Plant 1-3 dm. tall: leaf-blades linear, 1-4 cm. long: calyx becoming 5-6 mm. long; corolla blue, sometimes pale, 6-10 mm. long: nutlets 1.5 mm. long.—Sandy soil, fields, thickets, Coastal Plain, and New England coast, Fla. to La., and Conn.—Sum.

3. *T. suffrutescens* Kearney. Plant 2-4 dm. tall: leaf-blades obovate to oblong-obovate,

0.5–1.5 cm. long; calyx becoming 5–6 mm. long; corolla deep-blue, 6–8 mm. long; nutlets 1.5 mm. long.—Scrub, Fla.—Spr.

**3. ISANTHUS** Michx. Annual herbs. Leaf-blades entire or sparingly toothed. Flowers in axillary cymes. Calyx nearly regular. Corolla nearly regular, the lobes spreading. Stamens slightly ascending.—One species.

**1. I. brachiatus** (L.) B.S.P. Plant 1–4 dm. tall, viscid-pubescent: leaf-blades elliptic to linear-elliptic, 1–4 cm. long; calyx becoming 5–6 mm. long; lobes lanceolate to triangular-lanceolate: corolla blue; lobes mainly ovate: nutlets 2–2.5 mm. long. [*I. caeruleus* Michx.]—FALSE-PENNYROYAL.—Sandy soil along streams, dry fields, and calcareous rocks, various provinces, Ga. to Tex., Minn., and Que.—Sum.—This plant often acts after the manner of a fire-weed, taking almost complete possession of recently abandoned fields, especially on stony hillsides.

**4. SCUTELLARIA** L.<sup>1</sup> Annual or perennial herbs or shrubby plants. Leaf-blades entire or toothed. Flowers axillary or in racemes, variously colored, blue, violet, or white in our species. Calyx 2-lipped, the upper lip crested. Corolla with a long curved tube, 2-lipped, the upper lip arching.—About 100 species, widely distributed.—SKULLCAPS. HELMET-FLOWERS.

Nutlets wingless, on a low gynobase.

Flowers in axillary, secund racemes.

Flowers solitary in the axils or in terminal panicles.

Flowers solitary in the axils of the upper leaves, appearing raceme-like, but each pedicel bearing two bractlets at its base.

Flowers in terminal or axillary panicles.

Leaf-blades above the middle of the stem cordate.

Leaf-blades above the middle of the stem abruptly or gradually narrowed at the base.

Leaves all with toothed blades.

Leaves all, or those above the middle of stem with entire blades.

Nutlets membranous-winged, on a slender gynobase.

#### I. LATERIFLORAE.

#### II. AMBIGUAE.

#### III. CORDATAE.

#### IV. SERRATAE.

#### V. INTEGRIFOLIAE.

#### VI. NERVOSAE.

#### I. LATERIFLORAE

Slender plant with long axillary racemes of very small flowers.

#### II. AMBIGUAE

Leaf-blades mainly toothed, lanceolate, cordate: corolla 1.5–2 cm. long.

Leaf-blades mainly entire, ovate or ovate-lanceolate: corolla less than 1.5 cm. long.

Leaf-blades all distinctly petioled: roots fibrous.

Leaf-blades (except basal ones) all sessile or nearly so: roots tuberous-thickened.

Stem glabrous or puberulent: leaf-blades often revolute.

Stem densely and softly glandular-pubescent: leaf-blades usually flat.

#### III. CORDATAE

Foliage, especially the internodes of the stem and inflorescence, copiously pubescent.

1. *S. lateriflora*.

2. *S. epilobifolia*.

3. *S. havanensis*.

4. *S. ambigua*.

5. *S. parvula*.

<sup>1</sup> Contributed by Edward Johnston Alexander.

Larger leaves with petioles less than  $\frac{1}{2}$  as long as the blades.

Leaf-blades suborbicular to broadly ovate: inflorescence pubescent with short close-set hairs.

Leaf-blades ovate to ovate-lanceolate, velvety: inflorescence pubescent with villous hairs.

Larger leaves with petioles over  $\frac{1}{2}$  as long as the blades.

Corolla less than 15 mm. long.

Corolla over 15 mm. long.

Foliage glabrous, or with scattered hairs at the nodes of the stem and in the inflorescence.

6. *S. Ocmulgee*.

7. *S. Cuthbertii*.

8. *S. arguta*.

9. *S. ovata*.

10. *S. saxatilis*.

#### IV. SERRATAE

Corolla less than 2 cm. long.

Leaf-blades glabrous above.

Corolla pubescent: calyx not glandular-pubescent.

Corolla glabrous or nearly so: calyx glandular-pubescent.

Leaf-blades pubescent above.

Leaf-blades usually acute, serrate.

Leaf-blades usually obtuse, coarsely crenate.

Corolla over 2 cm. long.

Foliage glabrous or nearly so: inflorescence not branched, appearing raceme-like.

Foliage, especially the stem, finely and closely pubescent: inflorescence branched, thus showing its paniculate character.

Corolla between 2 and 2.5 cm. long.

Corolla between 2.5 and 3 cm. long.

Leaf-blades acute, relatively large: corolla nearly glabrous.

Leaf-blades obtuse, relatively small: corolla pubescent.

18. *S. arenicola*.

#### V. INTEGRIFOLIAE

Upper lip of the corolla shorter than the throat.

Leaf-blades and corollas glabrous or nearly so.

Leaf-blades and corollas variously pubescent.

Upper lip of the corolla exceeding the lower.

Upper lip of the corolla exceeded by the lower.

Upper lip of the corolla longer than the throat.

19. *S. glabriuscula*.

20. *S. integrifolia*.

21. *S. multiglandulosa*.

22. *S. floridana*.

#### VI. NERVOSAE

Slender plant: blades of the lower leaves slender-petioled, those of the upper ones sessile: bracts nearly entire.

23. *S. nervosa*.

1. *S. lateriflora* L. Plant erect or reclining, 2-10 dm. long, glabrous or puberulent above: leaf-blades thinish, ovate to ovate-lanceolate, 2-6 cm. long, coarsely-serrate: flowers secund and crowded in lateral racemes: calyx becoming 3-4 mm. long: corolla 6-7 mm. long: nutlets about 1 mm. long.—(MAD-DOG SKULLCAP.)—Low thickets, stream-banks, and swamps, various provinces, Fla. to N. M., B. C., Ont., and Newf.—Sum.—fall.

2. *S. epilobifolia* Hamilt. Plant 2-9 dm. tall, sometimes finely pubescent: leaf-blades lanceolate to ovate-lanceolate, 2-6 cm. long, shallowly-serrate, very short petioled or sessile: calyx becoming 6-7 mm. long: corolla 15-20 mm. long; lower lip about 5 mm. wide: nutlets about 1.5-2 mm. long. [*S. galericulata* (Chapm. Fl. Fl. SE. U. S.)]—Wet thickets and swamps, Blue Ridge and more northern provinces, N. C. to Tenn., Nebr., N. M., Ariz., Alas., Ont., and Newf.—Sum.—fall.

3. *S. havanensis* Jacq. Plant 1-3 dm. tall, hoary-pubescent: leaf-blades orbicular-ovate to ovate, 3-6 mm. long, those of the lower ones sometimes shal-

lowly toothed: calyx becoming 3 mm. long: corolla 13–14 mm. long; lower lip 7–8 mm. wide: nutlets fully 1 mm. long. [*S. cubensis* A. Rich. *S. longiflora* Small.]—Pinelands, Everglade Keys, Fla.—(*W. I.*)—All year.

4. *S. ambigua* Nutt. Plant 0.5–4 dm. tall, glabrous or puberulent: leaf-blades broadly ovate to lanceolate, the margins revolute, entire or sometimes the lower remotely serrate, 1–2 cm. long: calyx becoming 5–6 mm. long: corolla about 11 mm. long; lower lip 4–4.5 mm. wide: nutlets fully 1 mm. long. [*S. parvula* (Fl. SE. U. S.)]—Dry soil, various provinces, Fla. to Tex., S. D., and Que.—Spr.–sum.

5. *S. parvula* Michx. Plant 0.5–4 dm. tall, densely and softly glandular-pubescent: leaf-blades suborbicular to ovate, or ovate-lanceolate on the upper part of the stem, 1–2 cm. long: calyx becoming 5–6 mm. long: corolla 6–10 mm. long; lower lip 3.5–4 mm. wide: nutlets barely 1 mm. long. [*S. campestris* Britton]—Dry or damp soil, various provinces, Ga. to Tex., Kans., Ia., and Que.—Spr.

6. *S. Ocmulgee* Small. Plant 4–8 dm. tall, softly-pubescent: leaf-blades thickish, suborbicular to ovate, 3–8 cm. long, crenate: corolla 20–25 mm. long; lower lip 6–7 mm. wide.—River-banks, in the Piedmont of Ga.—Sum.

7. *S. Cuthbertii* Alexander. Plant 2–6 dm. tall, softly-pubescent, especially above: leaf-blades firm, ovate to ovate-lanceolate, acute, soft, velvety-pubescent above and beneath, petioles and larger veins usually purplish, 2–7 cm. long, crenate: inflorescence villous with glandular hairs, conspicuously bracted, the bracts entire, cordate: calyx becoming 5–7 mm. long: corolla 16–20 mm. long; lower lip about 6 mm. long, 8 mm. wide.—Rich, sandy or clay woods, Piedmont and Appalachian Valley, Ga. and Ala.—Spr.–sum.

8. *S. arguta* Buckl. Plant 3–5 dm. tall, pubescent: leaf-blades ovate to elliptic-ovate, 2–5 cm. long, deeply crenate-dentate; calyx becoming 5 mm. long: corolla 12–14 mm. long; lower lip 5–6 mm. wide: nutlets 1 mm. long.—Hill-sides, Blue Ridge, Ga. to N. C.—Spr.–Sum.

9. *S. ovata* Hill. Plant 1–6 dm. tall, softly-pubescent: leaf-blades orbicular-ovate to lance-ovate, 3–10 cm. long, serrate: inflorescence inconspicuously bracted (conspicuously bracted and leaf-blades rugose beneath in *S. ovata bracteata*): calyx becoming 6–7 mm. long: corolla 19–21 mm. long; lower lip about 6 mm. long and 6 mm. wide, deeply notched at the apex: nutlets about 1.5 mm. long. [*S. cordifolia* Muhl. *S. versicolor* Nutt.]—Moist banks, various provinces, Fla. to Tex., Minn. and Pa.—Spr.–sum.

10. *S. saxatilis* Riddell. Plant 1–3 dm. tall, nearly glabrous, pubescent: leaf-blades suborbicular or ovate to ovate-lanceolate, 1–4 cm. long, coarsely crenate or serrate-crenate: calyx becoming 4–5 mm. long: corolla 12–18 mm. long; lower lip 5–6 mm. wide: nutlets 1 mm. long.—Sandy soil, various provinces, Ga. to Ark., Ohio, and Del.—Spr. & sum.

11. *S. incana* Muhl. Plant 5–12 dm. tall, finely-pubescent: leaf-blades 4–12 cm. long, serrate or crenate-serrate, usually pubescent beneath: calyx becoming 6–7 mm. long, canescent with white, eglandular hairs: corolla 15–20 mm. long; lower lip 6–8 mm. wide: nutlets about 1.5 mm. long. [*S. canescens* Nutt. *S. villosa* Ell.]—Woods, stream-banks, and thickets, various provinces N of Coastal Plain, Ga. to Ala., Mich., and Ont.—Sum.

12. *S. alabamensis* Alexander. Plant 4.5–7 cm. tall, finely short-pubescent below: leaf-blades ovate or ovate-lanceolate to elliptic, 4–5 cm. long, serrate-crenate, ciliate on the margin and veins beneath: inflorescence narrow and crowded, hirsute with eglandular hairs: calyx glandular pubescent: corolla glabrous or nearly so, 18–20 mm. long; upper lip as long as the throat or

slightly longer; lower lip 6-8 mm. wide.—Dry woods, Appalachian Valley, Ala.—Sum.

13. *S. Altamaha* Small. Plant 2-4 dm. tall, hirsute-canescens: leaf-blades ovate to elliptic, short-petioled, 1.5-5 mm. long, serrate, the terminal lobe usually acute: inflorescence very narrowly crowded: calyx becoming 4 mm. long: corolla 11-14 mm. long; lower lip 5-6 mm. wide.—Pinelands, Coastal Plain, Fla. and Ga.—Spr.—sum.

14. *S. ovalifolia* Pers. Plant 1-6 dm. tall, finely pubescent with long, spreading hairs: leaf-blades ovate or deltoid-ovate, 1.5-4.5 cm. long, coarsely crenate, the terminal lobe usually obtuse: calyx becoming about 5 mm. long: corolla 12-15 mm. long; lower lip 5-7 mm. wide: nutlets about 1 mm. long. [*S. pilosa* Michx.]—Dry banks, woods, and meadows, various provinces, Fla. to Tex., Mich., and N. Y.—Spr.

15. *S. serrata* Andr. Plant 2-7 dm. tall, sometimes puberulent: leaf-blades thin, oval, elliptic, or ovate, 4-10 cm. long, serrate or crenate-serrate: calyx becoming 6-7 mm. long: corolla 20-25 mm. long; lower lip 7-8 mm. wide: nutlets about 1.5 mm. long.—Woods, various provinces N of Coastal Plain, Ala. to Ill., N. Y., and S. C.—Spr.

16. *S. Mellichampii* Small. Plant 4-6 dm. tall, closely-pubescent: leaf-blades ovate to elliptic-oval, 3-6 cm. long, crenate: calyx becoming 4-5 mm. long: corolla 20-25 mm. long; lower lip 8-9 mm. wide.—Sandy soil, Coastal Plain, Ga. and S. C.—Sum.

17. *S. montana* Chapm. Plant 3-5 dm. tall, softly pubescent: leaf-blades ovate to ovate-lanceolate or elliptic, 2-8 cm. long, coarsely crenate-serrate, cuneate at the base: calyx becoming 7 mm. long: corolla 23-35 mm. long; lower lip 10-12 mm. wide.—Woods and thickets, Blue Ridge and Appalachian Valley, Ga. and Ala.—Sum.

18. *S. arenicola* Small. Plant 2-4 dm. tall, finely pubescent: leaf-blades ovate to elliptic, 1.5-3 cm. long, sharply serrate or crenate-serrate: calyx becoming 5 mm. long: corolla 20-26 mm. long; lower lip 9-10 mm. wide: nutlets 1-1.5 mm. long.—Sandy pinelands and scrub, pen. Fla.—Sum.

19. *S. glabriuscula* Fernald. Plant 3-6 dm. tall, puberulent: blades of the lower leaves elliptic, those of the upper linear-spatulate, entire: inflorescence short-branched: calyx becoming 5-5.5 mm. long: corolla nearly glabrous, 23-26 mm. long; lower lip 8-9 mm. wide, deeply notched.—Sandy soil, N Fla.—Spr.—fall.

20. *S. integrifolia* L. Plant 2-6 dm. tall, softly pubescent: blades of the lower leaves ovate to elliptic-ovate, coarsely crenate, those of the upper ones elliptic to elliptic-lanceolate or linear, entire: inflorescence branched or unbranched: calyx becoming 6-7 mm. long: corolla usually blue-violet, 21-25 mm. long; lower lip shallowly notched: nutlets fully 1 mm. long.—Woods, pastures, and thickets, various provinces, Fla. to Tex., Mo., and Mass.—Spr.—sum.

21. *S. multiglandulosa* (Kearney) Small. Plant 1-3.5 dm. tall, glandular-pubescent: leaf-blades various, those of the lower leaves oval to elliptic 1-2 cm. long, often coarsely crenate, those of the upper leaves elliptic to linear-spatulate, entire: inflorescence not branched; calyx becoming 5-6 mm. long: corolla pale-blue or often white, 20-25 mm. long; lower lip 4-lobed, 10-11 mm. wide: nutlets 1.5 mm. long.—Dry pinelands and sandy fields, Coastal Plain, Fla. and Ga.—Spr.

22. *S. floridana* Chapm. Plant 2-4 dm. tall, puberulent: leaf-blades narrowly linear, 1-2.5 cm. long, entire: inflorescence not branched; calyx becoming 7

mm. long: corolla blue-violet, 20–25 mm. long; lower lip 12–13 mm. wide, deeply notched.—Pineland swamps, Fla.—Sum.

**23. *S. nervosa*** Pursh. Plant 1–4 cm. tall, minutely pubescent: leaf-blades suborbicular to ovate or lanceolate above, 2–4 cm. long, undulate or coarsely serrate: calyx becoming about 5 mm. long: corolla 6–10 mm. long; lower lip about 5 mm. wide: nutlets 1–2 long.—Thickets and woods, various provinces N of Coastal Plain, N. C. to Mo. and Ont.—Spr.—sum.

**5. *MARRUBIUM*** [Tourn.] L. Perennial low or diffuse herbs. Leaf-blades toothed, often rugose. Flowers in dense axillary clusters. Calyx nearly regular, 10-lobed; lobes slender, spreading or recurved, sometimes unequal. Corolla 2-lipped: upper lip erect: lower lip spreading, the broad middle lobe much larger than the 2 lateral ones. Filaments somewhat longer than the anthers.—About 40 species, natives of the Old World.

**1. *M. vulgare*** L. Plant 2–9 dm. tall, white-woolly: leaf-blades suborbicular, oval, or ovate, 1–4 cm. long, crenate, rugose: calyx 4–5 mm. long; lobes hooked: corolla white, 5–6 mm. long; upper lip deeply notched: nutlets about 2 mm. long.—(HOARHOUND).—Pastures, waste-places, and on roadsides, various provinces, Fla. to Tex., Calif., B. C., and Me. Native of Eu.—(*Mex.*)—Spr.—sum.

**6. *AGASTACHE*** Clayt. Perennial tall herbs. Leaf-blades many-toothed, not rugose. Flowers many in dense panicles. Calyx nearly regular, scarcely ribbed, 5-lobed: lobes erect, the upper ones sometimes broader than the lower. Corolla 2-lipped: upper lip erect: lower lip with 2 small lateral lobes and a large spreading middle lobe. Filaments elongate. [*Lophanthus* Benth., in part.]—About 8 species, North American.—Sum.—GIANT HYSSOPS.

Calyx-lobes obtuse or acute: corolla greenish-yellow: bracts acute or acutish.

Calyx-lobes acuminate: corolla purplish: bracts acuminate. 1. *A. nepetoides*. 2. *A. scrophulariaefolia*.

**1. *A. nepetoides*** (L.) Kuntze. Stem glabrous or nearly so, 1–2 m. tall: leaf-blades ovate to ovate-lanceolate, 5–12 cm. long: calyx 5–6 mm. long; lobes ovate or elliptic-ovate: corolla 7–9 mm. long, slightly exceeding the calyx: nutlets minutely pubescent. [*L. nepetoides* Benth.]—Hill-sides, thickets and woods, various provinces, Ga. to Ky., Minn., Que., and Mass.

**2. *A. scrophulariaefolia*** (Willd.) Kuntze. Stem finely hirsute, 1–2 m. tall: leaf-blades ovate to ovate-lanceolate, or elliptic above: calyx 6–7 mm. long; lobes lanceolate: corolla 6–8 mm. long, much exceeding the calyx: nutlets hispidulous. [*L. scrophulariaefolius* Benth.]—Thickets, woods, and fence-rows, various provinces, rarely Coastal Plain, N. C., to Mo., Ont., and N. H.

7. **MEEHANIA** Britton. Perennial decumbent or creeping herbs. Leaf-blades few, crenate. Flowers few in a 1-sided raceme. Calyx nearly regular, 15-ribbed, 5-lobed; lobes erect. Corolla 2-lipped: upper lip arched: lower lip spreading, the middle lobe much broader, but scarcely longer than the 2 lateral ones. Filaments not exceeding the upper corolla-lip.—One species.

1. *M. cordata* (Nutt.) Britton. Stem and runners 1.5–11 dm. long, sparingly hirsute: leaf-blades ovate to orbicular-ovate, 2–7 cm. long, cordate: calyx 10–14 mm. long; lobes triangular to triangular-lanceolate: corolla blue or rarely white, 2.5–3 cm. long; nutlets about 2 mm. long. [*Cedronella cordata* Benth.]—Rich woods, various provinces N of Coastal Plain, N. C. to Tenn., Ky., and Pa.—Spr.-sum.

8. **NEPETA** L. Annual or perennial, erect, branching herbs. Leaf-blades toothed or incised. Flowers in axillary clusters which are sometimes borne in racemes. Calyx slightly irregular, 15-ribbed, 5-lobed: lobes relatively long, the upper lobes slightly longer than the lower. Corolla 2-lipped: upper lip erect: lower lip spreading, the larger middle lobe toothed. Filaments relatively slender, usually filiform.—Amount 150 species, Eurasian.

1. *N. Cataria* L. Plant pale-green, 3–11 dm. tall, closely-pubescent: leaf-blades ovate to triangular-ovate, 4–7 cm. long, crenate or serrate-crenate, mostly cordate: calyx 5–6 mm. long; lobes subulate or lanceolate-subulate: corolla pale, magenta-spotted, 6–7 mm. long; nutlets about 1 mm. long.—(CAT-MINT. CATNIP.)—Waste-places, fields, woods, and roadsides, various provinces, Ga. to La., Kans., Minn., and N. B. Nat. of Eu.—Sum.-fall.

9. **GLECOMA** L. Perennial creeping herbs. Leaf-blades toothed. Flowers in axillary clusters. Calyx slightly 2-lipped, 15-ribbed, 5-lobed: lobes unequal, relatively short. Corolla 2-lipped: upper lip erect: lower lip spreading, the large middle lobe notched. Filaments relatively slender.—About 6 species, Eurasian.

1. *G. hederacea* L. Plant dark-green, the branches 1–11 dm. long, hirsute: leaf-blades reniform to suborbicular, 2–4 cm. in diameter, coarsely crenate: calyx 5–7 mm. long; lobes subulate-tipped: corolla blue or white, 10–15 mm. long; nutlets about 1.5 mm. long. [*Nepeta Glechoma* Benth.]—GROUND-IVY. GILL-OVER-THE-GROUND.)—Banks and thickets, various provinces, Ga. to Kans., Ont., and Newf. Nat. of Eu.—Spr.

**10. PRUNELLA L.** Perennial erect or diffuse herbs. Leaf-blades toothed or lacinate. Flowers mostly in compact panicles. Calyx 2-lipped: upper lip with 3 broad lobes; lower lip with 2 narrow lobes. Corolla 2-lipped: upper lip arched: lower lip with the broad middle lobe generally toothed. Filaments relatively long, 2 of them forked at the apex. [*Brunella* L.]-About 5 species, widely distributed.—SELF-HEALS. HEALS-ALLS. BLUE-CURLS.

Leaf-blades entire or shallowly toothed: calyx 10–11 mm. long; lobes of the lower lip subulate tipped.

1. *P. vulgaris*.

Leaf-blades, at least the upper ones, pinnatifid: calyx 8–9 mm.

long; lobes of the lower lip lanceolate.

2. *P. laciniata*.

1. *P. vulgaris* L. Stem 0.5–4 dm. long: leaf-blades ovate, elliptic, or lanceolate, 2–7.5 cm. long, undulate: bracts mostly reniform: calyx 10–11 mm. long; lobes of the upper lip mucronate: corolla purple or white, mainly 14–18 mm. long: nutlets about 2 mm. long.—(CARPENTER-WEED.)—Fields, thickets, and waste-places, U. S. and S Can., Nat. of Eu.—Spr.—fall.—Also called SNAKEWEED from the belief that a snake hole is hidden under the plant.

2. *P. laciniata* L. Plant similar to *P. vulgaris* in habit, but often hoary-pubescent: blades of the stem-leaves more or less pinnatifid: corolla white or pale.—Roadsides, fields, and lawns, various provinces, N. C. to Mass. Nat. of Eu.—Sum.—The rôle of a weed through a long period has developed many forms in the above two species.

**11. MACBRIDEA Ell.** Perennial erect herbs. Leaf-blades entire or repand. Flowers in axillary clustered broad-leaved cymes. Calyx strongly 2-lipped, the upper lip of a narrow lobe, the lower lip of 2 broader lobes. Corolla 2-lipped: upper lip arching: lower lip 3-lobed. Stamens 4: anthers pubescent.—Two species.

Corolla white, the upper lip notched; lateral lobes of the lower lip as wide as the middle one.

1. *M. alba*.

Corolla rose-purple, streaked, the upper lip entire: lateral lobes of the lower lip much narrower than the middle one.

2. *M. pulchra*.

1. *M. alba* Chapm. Stem 3–5 dm. tall, simply or rarely branched: leaf-blades cuneate-spatulate to elliptic, rather fleshy, 2–8 cm. long, obtuse, undulate or repand, the lower ones with margined petioles, the upper sessile: panicles few flowered: bracts elliptic-ovate to orbicular, obtuse: pedicels very short: calyx becoming 10–12 mm. long, glabrous or nearly so; lobes about as long as the tube, the larger ones slightly notched: corolla white, 2.5–3 cm. long the upper lip hooded, nearly erect, the lower lip spreading, the lobes emarginate or nearly truncate.—Pineland swamps and low prairies, N Fla.—Sum.

2. *M. pulchra* Ell. Stem 3–6 dm. tall, usually simple: leaf-blades elliptic to linear-elliptic, 4–8 cm. long, acute or acuminate at both ends, undulate or repand-serrate, the

lower ones slender-petioled, the upper sessile: panicles few-flowered: bracts ovate or elliptic, mostly obtuse: pedicels very short: calyx becoming 9–10 mm. long; lobes shorter than the tube, entire or the larger ones emarginate: corolla rose-purple striped with white and purple, 3–3.5 cm. long; tube abruptly dilated near the middle, the upper lip suborbicular, 1 cm. in diameter, the lower lip with a notched middle lobe and truncate lateral lobes.—Swamps and marshes, Coastal Plain, Fla. to Ala. and N. C.—Sum.—fall.

**12. DRACOCEPHALUM** [Tourn.] L. Perennial, erect or reclining herbs. Leaf-blades typically narrow, usually toothed, at least near the apex. Flowers purplish-pink to white, in spike-like racemes. Calyx essentially regular: lobes 5, shorter than the tube. Corolla 2-lipped: upper lip arched, entire: lower lip 3-lobed. Stamens 4: filaments elongate, one pair sometimes glabrous. [*Physostegia* Benth.]—About 7 species, North American.—Sum.—FALSE DRAGON-HEADS. OBEDIENT PLANTS.

Corolla over 2 cm. long.

Leaf-blades entire or with blunt teeth.

Mature calyx short-tubular, 9–11 mm. long: upper leaves conspicuously reduced.

Mature calyx campanulate, 5–6.5 mm. long: upper leaves but slightly reduced.

Leaf-blades copiously toothed with very acute serrations. Corolla less than 2 cm. long: mature calyx tubular, 8–9 mm. long: stem copiously leafy up to the inflorescence.

1. *D. denticulatum*.
2. *D. leptophyllum*.
3. *D. virginianum*.
4. *D. veroniciformis*.

1. *D. denticulatum* Ait. Stems 3–9 dm. long: leaves few; blades spatulate to oblong, 2–14 cm. long, thick, repand-crenate, mostly obtuse: calyx-lobes deltoid: corolla 20–25 mm. long: nutlets about 2 mm. long. [*P. denticulata* Britton]—Swamps and river-banks, often in calcareous soil, various provinces, Fla. to Tex., Kans. and Md.—Sum.—fall.

2. *D. leptophyllum* Small. Stems 6–10 dm. long: leaf-blades thin, oblong or nearly so, mostly 3–7 cm. long, repand: calyx-lobes lanceolate to triangular-lanceolate: corolla 20–23 mm. long: nutlets 3–3.5 mm. long. [*P. leptophylla* Small]—River-banks and swamps, pen. Fla.—Spr.—fall.

3. *D. virginianum* L. Stems 3–15 dm. long: leaves many; blades narrowly oblong to linear-oblong or oblong-lanceolate, 3–12 cm. long, thickish, saliently serrate or incised-serrate, mostly acuminate or acute: calyx-lobes lanceolate to ovate-lanceolate: corolla 25–30 mm. long: nutlets about 3 mm. long. [*P. virginiana* Benth.]—Swamps, low woods, and thickets, often in somewhat acid soil, various provinces, Fla. to Tex., Kans., and Que.—Sum.

4. *D. veroniciformis* Small. Stems 5–7 dm. long: leaf-blades lanceolate to oblong-lanceolate on the lower part of the stem, narrowly pandurate to lanceolate above, 5–10 cm. long, undulate to crenate-undulate: calyx-lobes mainly lanceolate: corolla-lobes retuse: shorter filaments pubescent. [*P. veroniciformis* Small]—Low grounds, Coastal Plain, Ga.—Sum.

**13. SYNANDRA** Nutt. Annual or biennial erect herbs. Leaf-blades broad, toothed. Flowers in interrupted racemes. Calyx nearly regular: lobes

4, shorter than the tube, herbaceous. Corolla 2-lipped: upper lip arched, entire: lower lip 3-lobed. Stamens 4: filaments pubescent.—One species.

1. *S. hispidula* (Michx.) Britton. Stem 2-8 dm. long, hispid or somewhat villous: leaf-blades ovate to orbicular-ovate, 2-10 cm. long, crenate or serrate, cordate: calyx becoming 10 mm. long; lobes lanceolate: corolla white, 2.5-3 cm. long: nutlets about 4 mm. long. [*S. grandiflora* Nutt.]—Wet woods and stream-banks, Interior Low Plateaus and adj. provinces, Tenn. to Ill., Ohio, and Va.—Spr.

14. *GALEOPSIS* L. Annual often spreading herbs. Leaf-blades broad, toothed. Flowers in crowded cymes. Calyx nearly regular: lobes 5, narrow, spine-tipped. Corolla 2-lipped: upper lip notched or erose: lower lip 3-lobed, the lateral lobes often as large as the middle one, sometimes appendaged at the base. Stamens 4: filaments glabrous.—About 6 species, Eurasian.

1. *G. Tetrahit* L. Plant 2-5 dm. tall, hispid: stem swollen at the nodes: leaf-blades ovate to ovate-lanceolate or oblong-lanceolate, 2.5-7 cm. long, serrate: flower-clusters bristly: calyx becoming 10-13 mm. long; lobes about as long as the tube: corolla pink-purple or white, mostly 15-20 mm. long: nutlets about 3 mm. long.—(HEMP-NETTLE.)—Waste-places, fields and roadsides, various provinces, N. C. to Alas. and Newf. Nat. of Eu.—Sum.—fall.

15. *LAMIUM* L. Annual, biennial or perennial, diffuse herbs. Leaf-blades broad, toothed or incised. Flowers in axillary cymes. Calyx somewhat irregular: lobes 5, the upper ones usually the larger. Corolla blue, purple, or white, 2-lipped: upper lip entire or merely notched: lower lip 3-lobed, the middle lobe with a dilated blade, the lateral lobes with slender tips. Stamens 4: filaments pubescent.—About 40 species, natives of the Old World.—DEAD-NETTLES. MONKEY-FLOWERS.

Plant annual or biennial: corolla small, less than 2 cm. long: middle lobe of the lower corolla-lip less than 5 mm. wide; lateral lobes each with a short sharp tooth and a very broad one: nutlets about 2 mm. long.

Upper leaves with sessile or clasping blades: corolla-tube slender, longer than the throat and lower lip; middle lobe of the lower lip cuneate or reniform.

Upper leaves with petioled blades: corolla-tube stout, about as long as the throat and lower lip; middle lobe of the lower lip somewhat reniform.

Plant perennial: corolla mostly over 2 cm. long: middle lobe of the lower corolla-lip 1 cm. wide or nearly so; lateral lobes each with a caudate appendage and a broad lobe: nutlets about 3 mm. long.

1. *L. amplexicaule*.

2. *L. purpureum*.

3. *L. maculatum*.

1. **L. amplexicaule** L. Stem and branches decumbent, sparingly retrorse-pubescent: leaf-blades suborbicular to orbicular-reniform, 1-3.5 cm. wide, crenate-lobed: calyx becoming 5-6 mm. long: corolla purple, 13-17 mm. long; tube slender, the lower lip with mucronate lateral lobes and a cuneate or reniform middle lobe: nutlets about 2 mm. long.—(HENBIT.)—Roadsides, fields, thickets, cult. grounds, and waste-places, various provinces, Fla. to La., Ark., Calif., B. C., and N. B. Nat. of Eu.—(W. I.)—Wint.-spr.

2. **L. purpureum** L. Stem and branches decumbent, often creeping at the base, minutely retrorse-pubescent: leaf-blades orbicular-ovate to orbicular-reniform: calyx less than 9 mm. long at maturity, pubescent with short hairs: corolla purple or purplish, mostly less than 1.5 cm. long, the upper lip less than 5 mm. long: nutlets about 2 mm. long.—(DEAD-NETTLE.)—Cult. grounds, roadsides, and shaded places, various provinces, N. C. to Mo., and Newf. Nat. of Eu.—Spr.-sum.

3. **L. maculatum** L. Stem and branches more or less creeping, rather coarsely but sparingly retrorse-pubescent: leaf-blades ovate to triangular-ovate: calyx over 10 mm. long at maturity, pubescent with long hairs: corolla purple or white, mostly over 2 cm. long, the upper lip about 1 cm. long: nutlets about 3 mm. long.—Waste-places, roadsides, and thickets, various provinces, N. C. and Tenn. to Me. Nat. of Eu.—Spr.-sum.

16. **LEONURUS** L. Annual, biennial, or perennial, erect herbs. Leaf-blades broad, toothed or parted. Flowers in dense axillary cymes. Calyx somewhat irregular: lobes firm, slender. Corolla 2-lipped: upper lip nearly erect: lower lip 3-lobed, the middle lobe much larger than the lateral ones. Stamens 4: filaments pubescent.—About 10 species, Eurasian.—MOTHERWORTS.

Blades of the lower leaves lobed and incised: corolla twice as long as the calyx.

Upper corolla-lip hirsute: lower calyx-lobes spreading:

blades of the lower leaves coarsely lobed.

Upper corolla-lip puberulent: lower calyx-lobes erect:

blades of the lower leaves finely lobed.

Blades of the lower leaves coarsely toothed: corolla slightly longer than the calyx.

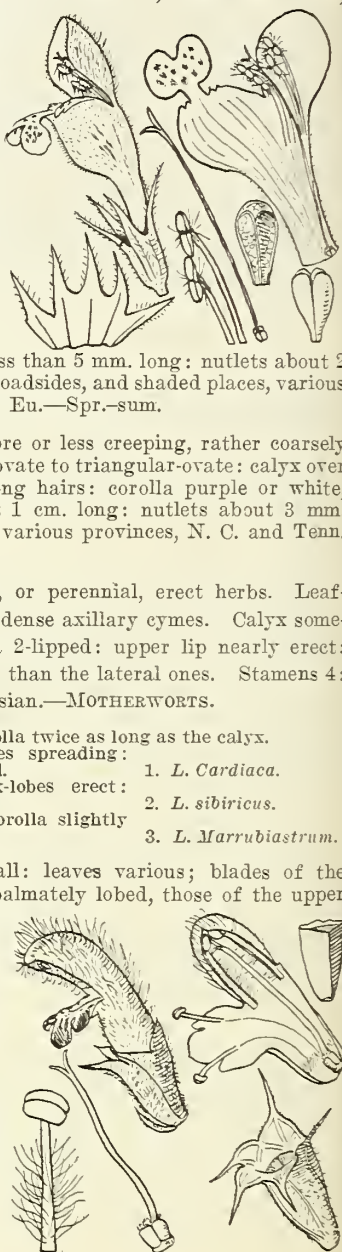

1. *L. Cardiaca*.

2. *L. sibiricus*.

3. *L. Marrubiastrum*.

1. **L. Cardiaca** L. Perennial, 3-12 dm. tall: leaves various; blades of the lower ones suborbicular in outline, coarsely palmately lobed, those of the upper leaves ovate to cuneate, mostly 3-lobed; calyx 6-6.5 mm. long; lobes short-subulate, half as long as the tube: corolla pale-purple, 9-10 mm. long; nutlets about 1.5 mm. long.—Roadsides, waste-places, and old fields, various provinces, N. C., to Ala., Tex., Utah, and S. Can. Nat. of Eu.—Spr.-fall.

2. **L. sibiricus** L. Biennial, 9-12 dm. tall: leaves various; blades of the lower ones suborbicular in outline, deeply and more finely lobed than in *L. Cardiaca*, those of the upper leaves, or their lobes, finely pin-natisect; calyx 6-7 mm. long; lobes triangular-subulate, erect, about  $\frac{1}{3}$  as long as the tube: corolla purplish, 10-12 mm. long:

nutlets about 2 mm. long.—Roadsides and waste-places, various provinces, Fla. to La., Pa., and Del. Nat. of Eurasia.—(*W. I., C. A., S. A.*)—Spr.—fall.

3. *L. Marrubiastrum* L. Biennial, 8–16 dm. tall: leaf-blades ovate to elliptic-ovate, coarsely toothed: calyx about 5 mm. long; lobes subulate, about half as long as the tube: corolla whitish, about 5 mm long: nutlets about 1.5 mm. long.—Waste-places, roadsides, and stream-banks, Fla. to Pa. and Del. Nat. of Eurasia.—Sum.—fall.

17. **LEONOTIS** L. Annual or perennial erect herbs or woody plants. Leaf-blades broad, toothed. Flowers in dense, globular, remote cymes. Calyx curved, 2-lipped, the 8–10 lobes unequal, bristle-tipped. Corolla 2-lipped, curved: upper lip erect, long: lower lip much shorter than the upper, with 3 small lobes. Stamens 4: filaments minutely pubescent.—About 12 species, African.

1. *L. nepetaefolia* R. Br. Annual, 3–20 dm. tall, soft-pubescent: leaf-blades ovate to ovate-deltoid, 4–12 cm. long, crenate: calyx becoming 2 cm. long; the upper lip longer than the tube: corolla orange-yellow or scarlet, 2–2.5 cm. long: nutlets about 3 mm. long.—(*LION'S-EARS.*)—Cult. grounds, roadsides, and waste-places, various provinces, Fla. to La., Tenn., and N. C. Nat. of S. Africa.—Sum.—fall.

18. **STACHYS** [Tourn.] L. Annual or (ours) perennial, erect or spreading herbs. Leaf-blades entire or toothed. Flowers in continuous or interrupted panicles. Calyx nearly regular: lobes 5, shorter than the tube. Corolla mainly purple, 2-lipped: upper lip erect: lower lip spreading, 3-lobed, the middle lobe somewhat larger than the lateral ones. Stamens 4, all anther-bearing: anthers short.—About 160 species, mostly in the north temperate zone. **HEDGE-NETTLES.**

Plants native in Tex., introduced eastward: leaf-blades not rugose: pubescence coarse and spreading.

Plant with annual or biennial roots.

Plant with perennial rootstocks.

Leaf-blades narrowed at the base.

Leaf-blades, all, or some of them cordate or truncate at the base.

Petioles less than one-fourth as long as the blades.

Petioles one-third to one-half as long as the blades.

Plants introduced from Old World: leaf-blades rugose: pubescence lanate-tomentose.

#### I. AGRARIAE

Slender plant: lower lip of the corolla little surpassing the calyx: mature calyx 2–4 mm. long.

#### II. HYSSOPIFOLIAE

Leaf-blades glabrous, entire or with shallow teeth.

glabrous at maturity.

Calyx-lobes subulate-tipped: leaf-blades entire or nearly so.

Calyx-lobes not subulate-tipped: leaf-blades markedly but shallowly toothed.

Leaf-blades pubescent, prominently serrate.

#### I. AGRARIAE.

#### II. HYSSOPIFOLIAE.

#### III. NUTTALLIANAE.

#### IV. CORDATAE.

#### V. ITALICAE.

#### 1. *S. agraria.*

#### 2. *S. hyssopifolia.*

#### 3. *S. lythroides.*

#### 4. *S. ambigua.*

## III. NUTTALLIANAE

Lower leaves with petioles but little longer than those of the upper.

Foliage copiously pubescent: corolla-tube slightly longer than the calyx.

Foliage glabrous or nearly so: corolla-tube much longer than the calyx.

Lower leaves with petioles several times longer than those of the upper.

Calyx-lobes merely acute or acuminate, not awn-tipped.

Foliage of the inflorescence glabrous or hristly pubescent.

Inflorescence glabrous or nearly so.

Inflorescence bristly-pubescent.

Foliage of the inflorescence puberulent or puberulent-pubescent.

Calyx-lobes awn-tipped.

5. *S. Nuttallii*.

6. *S. latidens*.

7. *S. tenuifolia*.

8. *S. aspera*.

9. *S. salvioides*.

10. *S. Clingmanii*.

## IV. CORDATAE

Leaf-blades acuminate, 6-15 cm. long: species Alleghenian.

Leaf-blades obtuse or merely acute, 1-4 cm. long: species Floridian.

11. *S. cordata*.

12. *S. floridana*.

## V. ITALICAE

Hoary-pubescent plant with obtuse, crenate leaf-blades.

13. *S. italica*.

1. *S. agraria* Cham. & Schlecht. Plant 1-3 dm. tall: leaf-blades elliptic to ovate, 1-4 cm. long, crenate: calyx 2-4 mm. long; lobes shorter than the tube: corolla lavender or pinkish, 5-6 mm. long: nutlets about 1 mm. long.—Shaded ground, La. to Tex.; introduced into the Coastal Plain of Ala.—Spr.-fall.

2. *S. hyssopifolia* Michx. Stem 2-4 dm. tall, glabrous or merely hirsute at the nodes: leaf-blades linear or nearly so, 1-5 cm. long: calyx 6-7 mm. long, generally glabrous; lobes about as long as the tube: corolla 11-13 mm. long: nutlets about 2 mm. long.—Swamps, meadows, and thickets, various provinces, Fla. to Mich., and Mass.—Sum.

3. *S. lythroides* Small. Stem 4-9 dm. tall, sparingly hirsute: leaf-blades broadly linear to elliptic-linear, 1.5-6 cm. long, smooth and glabrous: calyx 6-7 mm. long, mostly pubescent; lobes shorter than the tube: corolla about 10 mm. long: nutlets not seen.—Sandy soil, near Tallahassee, Fla.—Sum.

4. *S. ambigua* (A. Gray) Britton. Stem 3-10 dm. tall, hirsute: leaf-blades narrowly elliptic to elliptic-lanceolate, 3-6 cm. long, pubescent: calyx 6-8 mm. long; lobes lanceolate, as long as the tube or nearly so: corolla 11-13 mm. long: nutlets over 2 mm. long.—Moist sandy soil, various provinces, Ga. to Wisc., and Mass.—Sum.

5. *S. Nuttallii* Shuttlw. Stem 4-11 dm. tall, copiously hirsute: leaf-blades elliptic to elliptic-lanceolate, 5-10 cm. long, serrate-dentate: calyx 5-6 mm. long; lobes triangular-lanceolate, less than  $\frac{1}{2}$  as long as the tube: corolla 11-13 mm. long: nutlets about 2 mm. long.—Mt. slopes, Blue Ridge, Tenn. to Va.—Spr.

6. *S. latidens* Small. Stem 3-7 dm. tall, glabrous or nearly so: leaf-blades oval, ovate, or elliptic, and 4-10 cm. long on the lower part of stem, larger and narrower above, finely crenate-serrate: calyx 5-6 mm. long; lobes triangular, very short: corolla 11-13 mm. long: nutlets fully 2 mm. long.—Slopes and summits, Blue Ridge, N. C., and Tenn. to Va.—Sum.

7. *S. tenuifolia* Willd. Stem 3-9 dm. tall, glabrous or nearly so: leaf-blades mainly elliptic to elliptic-lanceolate, 3-10 cm. long, serrate: calyx 6-7 mm. long, sometimes sparingly pubescent; lobes lanceolate, as long as the tube or nearly so: corolla 10-12 mm. long: nutlets about 2 mm. long.—Roadsides, fields, and moist thickets, various provinces, Fla. to La., Kans., Ia., and N. Y.—Sum.

8. *S. aspera* Michx. Stem 5-12 dm. tall, hirsute: leaf-blades elliptic, elliptic lanceolate, or ovate-elliptic, 3-10 cm. long, crenate-serrate: calyx 6-8 mm. long, hirsute; lobes triangular-lanceolate, shorter than the tube: corolla mainly 12-15 mm. long: nutlets about 2 mm. long.—Woods and thickets, various provinces, Fla. to La., Ont., and Mass.—Sum.

9. *S. salvioides* Small. Stem 3-9 dm. tall, puberulent or puberulent-pubescent: leaf-blades elliptic to elliptic-ovate or rarely ovate, 6-12 cm. long, crenate: calyx 4-5 cm. long, hirsutulous and short pubescent; lobes triangular, acute: corolla 9-10 mm. long; lower lip shorter than the tube: nutlets nearly 2.5 mm. long.—Stony soil, Appalachian Plateau, Tenn. to W. Va., and Va.—Sum.

10. *S. Clingmanii* Small. Stem 5-9 dm. tall, hispid, hirsute: leaf-blades elliptic to elliptic-lanceolate, 6-12 cm. long, dentate: calyx 6-7 mm. long, villous; lobes lanceolate-subulate, at least  $\frac{1}{2}$  as long as the tube: corolla about 15 mm. long; lower lip about as long as the tube: nutlets 2 mm. long.—Open slopes, Clingman's Dome, in the Blue Ridge of N. C. and Tenn.—Sum.

11. *S. cordata* Riddell. Stem 3-10 dm. tall, hirsute: leaf-blades ovate, oval or elliptic, 6-15 cm. long, crenate: calyx 4-6 mm. long, hirsute; lobes deltoid: corolla 10-14 mm. long; lower lip shorter than the tube: nutlets about 2 mm. long.—Thickets and banks, various provinces, N. Ala. and N. C. to Ohio.—Sum.

12. *S. floridana* Shuttlw. Stem 1-4 dm. tall, hirsute: leaf-blades elliptic to ovate, 1-4 cm. long, serrate or dentate: calyx 5-7 mm. long, puberulent; lobes lanceolate: corolla 10-13 mm. long; lower lip as long as the tube: nutlets 1.5 mm. long or rarely smaller.—Sandy soil, Fla.—Spr.-fall.—The plant spreads by means of elongate, sometimes branching tubers.

13. *S. italica* Mill. Plant 1 m. tall or less, the stem simple or sparingly branched: leaf-blades elliptic, elliptic-ovate or ovate, 3-15 cm. long, obtuse, crenate, rugose, pubescent: flower-whorls dense: calyx 9-12 mm. long; lobes slender-tipped, much shorter than the tube: corolla 12-16 mm. long, pubescent: nutlets about 1 mm. long.—(MOUSE-EAR.)—Waste-places, cult. grounds, and roadsides, various provinces, Fla. to Tenn., and Ont. Nat. of Eu.—Sum.-fall.

19. **SALVIA** [Tourn.] L. Annual or perennial, herbs, or woody plants. Leaf-blades entire, toothed, or lobed. Flowers in interrupted or continuous panicles. Calyx short, 2-lipped: upper lip 3-lobed: lower lip 1-lobed. Corolla 2-lipped: lower lip 3-lobed, the middle lobe much larger than the lateral ones. Stamens 4, but only 2 anther-bearing, or only 2: each filament surmounted by a transverse connective, one end of which bears a long anther. Stigmas very unequal.—About 500 species, widely distributed.—SAGES.

Lower anther-sac wanting.

Anterior part of the connective linear or nearly so.

Anterior part of the connective abruptly dilated.

Lower anther-sac present.

I. AZUREAE.

II. VERBENACEAE.

III. LYRATAE.

#### I. AZUREAE

Corolla scarlet.

Corolla blue, purplish, or white.

Leaf-blades narrow, usually over 4 times as long as wide.

1. *S. coccinea*.

2. *S. azurea*.

Leaf-blades broad, mostly less than twice as long as wide.

Calyx over 5 mm. long at maturity.

Leaf-blades very slightly decurrent on the petioles.

Calyx-lobes merely acute: flower-clusters approximate or contiguous.

Calyx-lobes awn-tipped: flower-clusters widely separated.

Leaf-blades decurrent on the petioles to their bases.

Corolla over 1 cm. long: calyx-lobes nearly erect.

Corolla less than 1 cm. long: calyx-lobes spreading.

Calyx less than 5 mm. long at maturity.

Petioles filiform, wingless: stigmas subulate.

Petioles winged by the decurrent blades: stigmas broad.

3. *S. serotina*.

4. *S. privoides*.

5. *S. urticifolia*.

6. *S. Chapmannii*.

7. *S. Blodgettii*.

8. *S. occidentalis*.

## II. VERBENACEAE

Plant villous or villous-hirsute: leaf-blades incised to pinnatifid.

9. *S. verbenacea*.

## III. LYRATAE

Plant with the leaves mainly basal; blades lyrate-pinnatifid.

10. *S. lyrata*.

1. *S. coccinea* L. Stems 3-7 dm. tall, softly pubescent: leaf-blades ovate to deltoid-ovate, 3-6 cm. long, crenate-serrate: calyx 10-12 mm. long; corolla scarlet; lower lip with a notched middle lobe 7-8 mm. wide: nutlets 2.5 mm. long.—Sandy soil, hammocks, waste-places, and roadsides, Coastal Plain, Fla. to Tex., and S. C.—(Mex.)—Spr.-fall.

2. *S. azurea* Lam. Stems 3-12 dm. tall, puberulent above: leaf-blades oblong to lanceolate or linear, or rarely broader, 3-10 cm. long, undulate or shallowly serrate: calyx 7-9 mm. long; lower lobes ovate: corolla azure-blue or white, 13-15 mm. long: style pubescent at the top: nutlets about 3 mm. long.—Dry soil, pinelands, sand-hills and woods, Coastal Plain, Fla. to Tex., and S. C.—Spr.-fall.

3. *S. serotina* L. Stems 1-7 dm. tall, finely pubescent: leaf-blades ovate to orbicular-ovate, 1-4 cm. long, crenate-serrate: inflorescence usually rather shortened, sometimes elongate, but always densely flowered: calyx glandular-pubescent, 6-8 mm. long: corolla 6-10 mm. long: nutlets fully 2 mm. long.—Pinelands, hammocks, and cult. grounds, Fla.—Spr.-fall.

4. *S. privoides* Benth. Stem 5-18 dm. tall, pubescent: leaf-blades ovate, 1-3 cm. long, sharply serrate: inflorescence elongated and slender, the flowers scattered along the rachis: calyx glandular-pubescent, 5-7 mm. long; lower lobes awn-tipped: corolla 5.5-6 mm. long: nutlets barely 2 mm. long.—Sandy places, pen. Fla., and the Keys.—(W. I., Mex., C. A.)—Spr.-fall.

5. *S. urticifolia* L. Stem 2-7 dm. tall, finely pubescent: leaf-blades ovate to deltoid, 3-8 cm. long, dentate or crenate: calyx 6-8 mm. long; lower lobes cuspidate: corolla deep-blue, 11-13 mm. long, lower lip about 8 mm. wide: nutlets about 2 mm. long.—Woods and thickets, various provinces, Fla. to La., Ky., and N. C.—Spr.-sum.

6. *S. Chapmannii* A. Gray. Stem 10-20 dm. tall, closely pubescent: leaf-blades ovate to ovate-lanceolate, 2.5-8 cm. long, crenate-serrate: calyx 4-6 mm. long; lower lobes acute: corolla 8-9 mm. long; lower lip about 4 mm. wide: nutlets about 1.5 mm. long.—Sandy soil, Coastal Plain, Fla. and Ala.—Spr.

7. *S. Blodgettii* Chapm. Stem 1-7 dm. tall, minutely pubescent: leaf-blades ovate to suborbicular, 1-2 cm. long, shallowly toothed: calyx about 4 mm. long; lower lobes acute: corolla about 8 mm. long.—Hammocks, Key West, Fla.—All year.

8. *S. occidentalis* Sw. Stem 5-20 dm. tall, pubescent: leaf-blades ovate, 2-5 cm. long, serrate: calyx 3-3.5 mm. long; lower lobes acute: corolla about 5 mm. long: nutlets 2 mm. long.—Sandy soil, pen. Fla.—(*W. I., Mex., C. A., S. A.*)—Spr.—fall.

9. *S. verbenacea* L. Stem 1-6 dm. tall, hirsute or villous-hirsute; leaf-blades ovate to elliptic, 3-15 cm. long, incised or pinnatifid: calyx 6-8 mm. long, shaggy-pubescent; lower lobes lanceolate: corolla bluish, 8-10 mm. long: nutlets nearly smooth.—Sandy soil, various provinces, Ga., to Ala.; Ohio, and S. C. Nat. of Eu.—Sum.—*Salvia Sclarea*—CLARY—a native of Europe, with viscid foliage, large cordate, coarsely toothed leaf-blades and white and purple corollas, has been found in N. Car.

10. *S. lyrata* L. Stem 1-6 dm. tall, scape-like, pilose or hirsute: leaves mainly basal; blades spatulate, oblanceolate, elliptic, or oval, 5-20 cm. long, lyrate-pinnatifid: calyx 9-11 mm. long, hirsute; lower lobes lanceolate: corolla blue-purple, 20-25 mm. long: nutlets granular.—(LYRE-LEAVED SAGE.)—Woods, hammocks, pinelands, various provinces, Fla. to Tex., Mo., and Conn.—Early sum.

20. **MONARDA** L. Shrubs, or perennial erect herbs. Leaf-blades toothed. Flowers in remote or approximate dense cymes. Calyx elongate, nearly regular: lobes 5, slender, shorter than the tube. Corolla 2-lipped, elongate: upper lip narrow, erect or arched: lower lip 3-lobed, the middle lobe much longer than the lateral ones. Stamens 2: filaments elongate: anthers with divergent sacs. About 20 species, North American.—HORSE-MINTS.

Flower-clusters terminal and solitary: stamens exerted beyond the straight upper corolla-lip.

Subgenus I. **EUMONARDA**.

Flower-clusters mainly axillary, borne in spike-like interrupted panicles: stamens not exceeding the curved upper corolla-lip.

Subgenus II. **CHEILYCTIS**.

#### Subgenus I. **EUMONARDA**

Leaf-blades relatively long-petioled or manifestly petioled.

Corolla scarlet.

1. *M. didyma*.

Corolla white, pink, or purple.

Leaf-blades membranous, deep-green: corolla greenish or cream-colored.

2. *M. Clinopodia*.

Leaf-blades firmer, barely membranous, dull- or bright-green: corolla pink, purple, or purple-red.

Pubescence of spreading hairs.

Corolla, and often the bracts, lilac or purplish.

3. *M. fistulosa*.

Corolla, and the bracts, deep-purple or purple-red.

4. *M. media*.

Pubescence of very short appressed hairs.

Leaves on the upper part of the stem with petioles less than 5 mm. long.

5. *M. scabra*.

Leaves on the upper part of the stem with petioles over 5 mm. long.

6. *M. mollis*.

Leaf-blades sessile or nearly so: calyx pubescent at the mouth: lobes not glandular.

7. *M. Bradburiana*.

#### Subgenus II. **CHEILYCTIS**

Plants perennial: calyx-lobes acuminate: corolla yellowish, or rarely white.

8. *M. punctata*.

Plants annual or biennial: calyx-lobes setaceous: corolla pink or purplish.

9. *M. dispersa*.

11. *M. didyma* L. Stem 3-12 dm. tall, sometimes sparingly pubescent: leaf-blades lanceolate or elliptic-lanceolate to ovate, 8-15 cm. long, serrate: heads

showy: calyx 7–11 mm. long; lobes subulate: corolla 35–50 mm. long; middle lobe of the lower lip acute.—(BEE-BALM. OSWEGO-TEA).—Moist woods, stream-banks, thickets, and roadsides, Blue Ridge and more northern provinces, Ga. to Ala., Ont., and N. B.—Sum.—fall.

2. *M. Clinopodia* L. Stem 3–8 dm. tall, glabrous or sparingly pubescent: leaf-blades ovate to lanceolate, 3–12 cm. long, serrate: bracts pale: calyx 7–9 mm. long, somewhat bearded in the throat; lobes short-subulate: corolla 24–28 mm. long; lower lip with rounded lateral lobes: nutlets fully 1 mm. long.—Hillsides, woods, and moist thickets, various provinces, rarely Coastal Plain, Ga. to Ill., Ont., and N. Y.—Spr.—fall.

3. *M. fistulosa* L. Stem 5–12 dm. tall, villous or villous-hirsute: leaf-blades ovate to lanceolate, 2–12 cm. long, remotely sharp-serrate: bracts usually colored: calyx 8–12 mm. long, copiously bearded in the throat; lobes long-subulate: corolla 30–34 mm. long; lower lip with acute lateral lobes: nutlets fully 1.5 mm. long.—(HORSE-MINT. WILD-BERGAMOT).—Dry hillsides, fence-rows, rocky woods, and thickets, often in calcareous soil, various provinces, Fla. to La., Ont., and Me.—Sum.—fall.

4. *M. media* Willd. Stem 6–12 dm. tall, hirsute or glabrate: leaf-blades ovate, lanceolate, or elliptic, 8–12 cm. long, serrate: calyx 9–10 mm. long; lobes subulate: corolla 15–22 mm. long; lower lip with rounded lateral lobes.—Thickets and stream-banks, Blue Ridge, and more northern provinces, N. C. to Tenn., Pa., and Me.—Sum.

5. *M. scabra* Beck. Stem 2–10 dm. tall, velvety-pubescent: leaf-blades ovate to lanceolate, 2–8 cm. long, sharply, often remotely, serrate: calyx 7–9 mm. long; lobes subulate: corolla 20–25 mm. long, pale-purple; lower lip with rounded lateral lobes.—Dry soil, various provinces, rarely Coastal Plain, Ala. to Tex., Ariz., B. C., and Man.—Sum.

6. *M. mollis* L. Similar to *M. fistulosa* in habit and to *M. scabra* in pubescence: leaf-blades ovate to lanceolate, 5–11.5 cm. long, coarsely serrate: calyx 8–10 mm. long; lobes subulate: corolla 24–27 mm. long, pink to lilac.—Dry soil, Blue Ridge and more northern provinces, Ga. to Tenn., S. Dak., and Me.—Sum.

7. *M. Bradburiana* Beck. Stem 3–6 dm. tall, more or less villous-hirsute above: leaf-blades ovate to lanceolate, 3–10 cm. long, serrate or nearly entire: calyx 9–10 mm. long; lobes subulate: corolla pink or whitish, 20–27 mm. long.—Thickets and hillsides, various provinces N of Coastal Plain, Ala. to Kans. and Ill.—Spr.—sum.

8. *M. punctata* L. Stem 3–10 dm. tall, finely pubescent: leaf-blades linear-elliptic to lanceolate, 2–8 cm. long, serrate: calyx 8–10 mm. long; lobes short-acuminate, spreading: corolla yellowish and purple-spotted (white in *M. punctata leucantha*), 20–25 mm. long; upper lip mainly elliptic-ovate.—Sandy fields, pastures, woods and roadsides, in rather acid soil, various provinces, Fla. to Tex., Minn., and N. Y.—Sum.—fall.

9. *M. dispersa* Small. Stem 2-8 dm. tall, puberulent: leaf-blades elliptic to elliptic-spatulate or oblanceolate on the lower part of the stem, narrowly elliptic or linear above, 2-11 cm. long, shallowly serrate: calyx-tube 8-9 mm. long; lobes spreading: corolla pink or purplish, 20-25 mm. long; lower lip with an elliptic middle lobe.—Low grounds, various provinces, Fla. to Tex., N. M., Mo., and Ga.—(*Mex.*)—Native westward.—Spr.—sum.

21. *BLEPHILIA* Raf. Perennial erect herbs. Leaf-blades shallowly toothed. Flowers in dense axillary cymes. Calyx 2-lipped: upper lip 3-lobed: lower lip 2-lobed. Corolla 2-lipped: upper lip erect, entire: lower lip 3-lobed, the narrow middle lobe much longer than the others. Stamens 2, long-exserted.—Only the following species.—Sum.

Cauline and floral leaves with short-petioled or nearly sessile blades: bractlets acute or short-acuminate. 1. *B. ciliata*.  
Cauline and floral leaves with rather long-petioled blades: bractlets long-acuminate. 2. *B. hirsuta*.

1. *B. ciliata* (L.) Raf. Stem 3-6 dm. tall, softly villous-pubescent: leaf-blades lanceolate, 5-10 cm. long, shallowly toothed, short-petioled or nearly sessile: outer bractlets usually broadly ovate; all with acute or short acuminate tips; calyx 8-11 mm. long: corolla pink or purplish, 10-12 mm. long; middle lobe of the lower lip truncate or notched.—Thickets and dry woods, various provinces, Ga. to Tex., Wis., and Mass.

2. *B. hirsuta* (Pursh) Torr. Stem 3-10 dm. tall, hirsute or villous-hirsute: leaf-blades ovate to lanceolate, 5-12 cm. long serrate, rather long-petioled: outer bractlets usually ovate-lanceolate; all with long acuminate tips; calyx 6-8 mm. long: corolla pale or almost white, 10-11 mm. long; middle lobe of the lower lip rounded or slightly notched.—Shaded grounds, various provinces, Ga. to Tex., Wis., and Vt.

22. *HEDEOMA* Pers. Annual or perennial often diffuse herbs. Leaf-blades entire or sparingly toothed. Flowers in remote or contiguous axillary cymes. Calyx 2-lipped, sometimes obscurely so: lobes of the upper lip broader and shorter than those of the lower lip. Corolla 2-lipped: upper lip sometimes notched: lower lip 3-lobed, commonly broader than the lateral one. Stamens 2, accompanied by more or less reduced ones. One stigma obsolete.—About 15 species, American.

1. *H. pulegioides* (L.) Pers. Plant very fragrant: stem 1-4 dm. tall, finely pubescent: leaf-blades oval-elliptic to elliptic, 9-20 mm. long, sparingly serrate, mostly purple beneath: calyx becoming 4-5 mm. long; tubes strongly ribbed: corolla 4-5 mm. long, pale lilac, with a deep purple blotch on the lower lip.—(PENNYROYAL. MOCK-PENNYROYAL. AMERICAN-PENNY-

ROYAL.)—Dry fields and open woods, various provinces, Fla. to Nebr., Minn., and N. S.—Sum.

**23. STACHYDEOMA** Small. Perennial erect herbs. Leaf-blades toothed. Flowers pale-lilac, in long leafy-bracted spike-like panicles. Calyx strongly 2-lipped; lobes of the upper lip broad, those of the lower lip subulate. Corolla 2-lipped: upper lip entire: lower lip drooping, 3-lobed, the lateral lobes about equalling the terminal one. Stamens 2, exserted: anthers shorter than the filaments. Staminodia present. Style glabrous.—One species.

1. *S. graveolens* (Chapm.) Small. Stem 2–6 dm. tall, hirsute: leaf-blades suborbicular to ovate, 10–15 mm. long: calyx becoming 7–9 mm. long; upper lip ovate: nutlets 0.5 mm. long. [*Hedeoma graveolens* Chapm.]—Low pinelands, N Fla.—Sum.

**24. MELISSA** [Tourn.] L. Perennial, erect herbs. Leaf-blades broad, toothed. Flowers in axillary clusters. Calyx 2-lipped, the broad upper lip with 3 minute lobes, the 2 lobes of the lower lip slender. Corolla 2-lipped: upper lip mostly notched: lower lip 3-lobed, the middle lobe very broad. Stamens 4, exserted.—About 4 species, Eurasian.

1. *M. officinalis* L. Plant lemon-scented, 3–9 dm. tall: leaf-blades ovate to ovate-oblong, 2–8 cm. long, crenate-serrate: calyx ringent, 7–8 mm. long; upper lip curved upward: corolla white or cream-colored, about 10 mm. long: nutlets 1.5 mm. long.—(BEE-BALM. LEMON-BALM.)—Roadsides and waste-places, various provinces, Fla. to Ark., Mo., and Me. Nat. of Eu.—Sum.

**25. CONRADINA** A. Gray. Shrubs with virgate branches. Leaf-blades narrow, entire, revolute, fasciculate. Flowers 1–few together in axillary cymes which are sometimes approximate. Calyx 2-lipped; upper lip with 3 short and broad lobes; lower lip with 2 long and narrow lobes: corolla bluish or purplish, 2-lipped; upper lip erect, slightly concave; lower lip divergent, 3-lobed, usually dotted, the terminal lobe about the same size as the lateral ones or smaller. Stamens 4, exserted or lying under the upper corolla lip.—Four species, the following:

Lower corolla-lip 12–15 mm. long; lateral lobes wider than long.

Lower corolla-lip 8–10 mm. long; lateral lobes longer than wide.

Calyx-tube hirsute, villous-hirsute, or hirsutulous.

Leaf-blades pubescent on both sides: calyx-tube hirsute or villous-hirsute.

Leaf-blades glabrous above: calyx-tube hirsutulous.

Calyx-tube minutely canescent.

1. *C. grandiflora*.

2. *C. canescens*.

3. *C. montana*.

4. *C. puberula*.

1. *C. grandiflora* Small. Shrub 1 m. tall or less with few, virgate, often curved branches: leaf-blades narrowly spatulate, clavate on account of the revolute margins, mostly 10–25 mm. long, white-canescens beneath, otherwise glabrous or nearly so, at least at maturity, punctate: calyx becoming 6.5–7.5 mm. long, finely pubescent: upper lip of corolla 7–9 mm. long: nutlets nearly 1.5 mm. long.—Scrub, lower E coast region, Fla.—All year.

2. *C. canescens* (T. & G.) A. Gray. Shrub less than 0.5 m. tall, with numerous stiff branches: leaf-blades broadly spatulate, but tightly revolute and thus clavate, 5–9 mm. long, finely canescent: calyx becoming 4.5–5.5 mm. long: upper lip of corolla 4–5 mm. long: nutlets fully 1 mm. long.—Pinelands, upper Gulf coast region, Fla. and Ala.—Spr.

3. *C. montana* Small. Shrub less than 0.5 m. tall, with diffuse often decumbent branches: leaf-blades narrowly linear, tightly revolute, 5–16 mm. long, minutely canescent beneath: calyx becoming 6–7 mm. long; lobes hirsutulous: upper lip of corolla 3.5–4 mm. long: nutlets barely 1 mm. long.—Sandy woods and ravines, Appalachian Plateau, near Rugby, Tenn.—Late Spr.

4. *C. puberula* Small. Shrub about 0.5 m. tall, with rather numerous slender branches: leaf-blades narrowly spatulate, but revolute and slenderly clavate, mostly 12–20 mm. long, puberulent: calyx becoming 5–7 mm. long; lobes hirsute: upper lip of corolla 4–5 mm. long: nutlets fully 1 mm. long.—Pinelands, N Gulf coast region, Fla.—Spr.

A plant of this genus collected near Bristol, Fla., has the small flowers of *C. canescens* and *C. puberula*, but differs in the foliage and inflorescence being glabrous or nearly so, except the ciliate calyx-lobes, and in the abortive anthers.

26. **PYCNOTHYMUS** Small. Shrubs. Leaf-blades narrow, entire. Flowers in dense raceme-like panicles. Calyx slightly irregular, the upper lip with 3 narrow lobes, the lower lip with 2 longer lobes. Corolla 2-lipped: lower lip 3-lobed, the middle lobe slightly larger than the lateral ones.—One species.

1. *P. rigidus* (Bart.) Small. Plant 1–7 dm. tall or low and diffuse, hirsute: leaf-blades lanceolate, 5–12 mm. long: calyx 2.5–3 mm. long; lobes lanceolate to elliptic-lanceolate: corolla light-purple, 7–8 mm. long; lobes rounded.—(PENNYROYAL.)—Pinelands, pen. Fla.—All year.—This plant is rather wide-spread in southern pen. Florida. It is commonly used for making a tea. The plants of the eastern coastal region grow more erect and have lighter colored flowers than those of the western coastal region.

**27. MICROMERIA** Benth. Perennial, diffuse or creeping herbs. Leaf-blades entire or sparingly toothed. Flowers in axillary cymes, the cymes in ours one-flowered. Calyx with a fringe of hairs in the throat; almost equally 5-lobed, the lobes short. Corolla 2-lipped, pink, lavender-pink, or whitish: upper lip erect: lower lip 3-lobed, the middle lobe very broad. Stamens 4, more or less exserted.—About 60 species, widely distributed.

**1. M. pilosiuscula** (A. Gray) Small. Stem and branches sparingly pubescent or glabrate, the branches ascending or spreading, 1-4 dm. long: leaf-blades suborbicular to broadly ovate, 5-25 mm. long, sparingly pubescent: calyx glabrate or sparingly pilose, 4-5 mm. long, shorter than the pedicel or sometimes equalling it in length; lobes 1-1.5 mm. long, ovate-deltoid, those of the upper lip abruptly acute, acutish, or even acuminate; corolla 7-8 mm. long, pink, lavender-pink, or whitish; tube much dilated; middle lobe of the lower lip about as wide as long, notched.—Swamps, marshes, stream-banks, woods, and ditches. Coastal Plain, Fla. to Tex.—(Mex.)—Spr.—sum.

**M. Brownei** (Sw.) Benth., a West Indian species with which the above species has been confused, but which differs in the size of the calyx and the shape of the calyx-lobes, as well as in size of plant, leaf, and flower, is not known to occur in the continental U. S.

**28. CLINPODIUM** L. Shrubs or annual or perennial herbs. Leaf-blades entire or toothed. Flowers in sessile or peduncled axillary cymes. Calyx 2-lipped, the upper lip with 3 short lobes, the lower lip with 2 long, narrow lobes. Corolla 2-lipped: upper lip sometimes notched: lower lip 3-lobed. Stamens 4: anthers awnless.—Spr.—fall, or all year southward.—About 60 species, natives of the north temperate zone.—BASILS.

Flowers in dense axillary clusters, thus forming head-like whorls, accompanied by linear-filiform bractlets.

Flowers few together or solitary in the axils of the leaves, with minute bractlets.

Plants herbaceous.

Plants woody.

I. VULGARIA.

II. HERBACEA.

III. FRUTICOSA.

#### I. VULGARIA

Stem hirsute: calyx-lobes hirsute: corolla slightly exceeding the calyx.

1. *C. vulgare*.

#### II. HERBACEA

Stem and leaves pubescent: leaf-blades ovate, often broadly so.

2. *C. Nepeta*.

Stem and leaves glabrous or nearly so: leaf-blades linear to elliptic.

3. *C. glabellum*.

#### III. FRUTICOSA

Corolla over 2.5 cm. long, scarlet.

Calyx less than 1.5 cm. long: corolla 3-4 cm. long.

Calyx over 1.5 cm. long: corolla 4-5 cm. long.

4. *C. coccineum*.

Corolla less than 2 cm. long, white or purplish.

5. *C. macrocalyx*.

Leaf-blades toothed, broad and flat.

Clusters 5-6-flowered: leaf-blades sessile or nearly so.

6. *C. georgianum*.

Clusters 1-3-flowered: leaf-blades petioled.

7. *C. dentatum*.

Leaf-blades entire, narrow and strongly revolute.

8. *C. Ashei*.

**1. C. vulgare** L. Stem 1-5 dm. tall, hirsute: blades of the upper leaves ovate to ovate-lanceolate, 1-4 cm. long, undulate or crenate: calyx becoming 8-9

mm. long, villous-hirsute: corolla white or pink, 11–13 mm. long; middle lobe of the lower lip broadened upward: nutlets about 1 mm. long.—(WILD-BASIL. BASIL-WEED. DOG-MINT.)—Roadsides, old fields, and woods, various provinces, N. C. to Okla., Ariz., Man., and Newf.—(Eurasia.)—Sum.—fall.

2. *C. Nepeta* (L.) Kuntze. Plant 2–9 dm. tall, copiously pubescent: leaf-blades ovate to orbicular-ovate, 10–20 mm. long, slightly toothed: calyx becoming 5–6 mm. long: corolla light-purple or nearly white, 8–9 mm. long.—(FIELD-BALM. BASIL-THYME.)—Fields and waste-places, various provinces, Ga. to Ark., and Md. Nat. of Eu.—Sum.—fall.

3. *C. glabellum* (Michx.) Kuntze. Stem 1–4 dm. tall, glabrous or nearly so: blades of the upper leaves linear-elliptic or elliptic, sparingly serrate: calyx becoming 5–6 mm. long: corolla purplish, 8–12 mm. long.—Wet or damp banks, Interior Low Plateaus, Tenn. and Ky.—Spr.—sum.

4. *C. coccineum* (Nutt.) Kuntze. Shrub 3–9 dm. tall: leaf-blades obovate to spatulate, linear-spatulate or linear-elliptic, 0.5–2 cm. long, entire: calyx 8–11 mm. long; lateral lobes of the upper lip triangular: corolla scarlet, 3–4 cm. long; lobes of the upper lip shorter than those of the lower.—Sandy shores, sandhills, and hammocks, Coastal Plain, Fla. to Ala. and Ga.—All year.

5. *C. macrocalyx* Small. Similar to *C. coccineum* in habit: leaf-blades broadly spatulate, 1–1.5 mm. long: calyx 16–18 mm. long; lateral lobes of the upper lip lanceolate-subulate: corolla scarlet, 4–5 cm. long; lobes of the upper lip longer than those of the lower.—Pinelands, E pen. Fla.—All year.

6. *C. georgianum* Harper. Shrub 2–6 dm. tall: leaf-blades ovate, oval or elliptic, 10–30 mm. long, shallowly serrate: calyx 5–6 mm. long: corolla white or pink-purple, and purple-spotted, 11–13 mm. long; middle lobe of the lower lip quite similar to the lateral ones and scarcely longer. [*C. carolinianum* (Michx.) Heller.]—River-banks, dry woods, and hammocks, Coastal Plain, and rarely adj. provinces, Fla. to Miss. and N. C.—Sum.—fall.

7. *C. dentatum* (Chapm.) Kuntze. Shrub 3–7 dm. tall: leaf-blades obovate to elliptic-cuneate, 5–12 mm. long, mainly toothed at the apex: calyx 7–8 mm. long: corolla white or purplish, 11–13 mm. long; middle lobe of the lower lip broader than the lateral ones and extending beyond them.—Sand-ridges, middle Fla.—Spr.—fall.

8. *C. Ashei* (Weatherby) Small. Shrub 1–5 dm. tall: leaf-blades linear to narrowly linear-elliptic, 0.5–1 cm. long, entire, strongly revolute: calyx 6–8 mm. long; lobes of the upper lip completely fused, the tip merely shallowly tridentate: corolla pinkish-purple with darker spots, 12–15 mm. long; middle lobe of the lower lip broader and longer than the lateral lobes.—Scrub, Lake Region, Fla.—Spr.

29. *DICERANDRA* Benth. Annual erect herbs. Leaf-blades narrow, entire. Flowers in axillary cymes. Calyx 2-lipped, the upper lip entire or with 3 minute lobes, the lower lip with 2 broad lobes. Corolla 2-lipped: upper lip broad: lower lip 3-lobed, the middle lobe sometimes scarcely as wide as the lateral ones. Stamens 4: anthers awned.—Three species, as follows:

Corolla pink-purple: anthers exserted: calyx purple-tinged: lobes of the lower lip deltoid or triangular: style pubescent to below the middle.

Cymes nearly sessile: anther-horns blunt or acute.  
 Cymes markedly peduncled: anther-horns acuminate.  
 Corolla white: anthers included: calyx white above; lobes of  
 the lower lip subulate: style pubescent near the tip.

1. *D. densiflora*.
2. *D. linearifolia*.
3. *D. odoratissima*.

1. *D. densiflora* Benth. Stem 1-4 dm. tall: leaf-blades narrowly elliptic to linear-elliptic, 2-4 cm. long: calyx becoming 6-8 mm. long: corolla 11-14 mm. long. [*Ceranthera densiflora* A. Gray.]—Pinelands, Coastal Plain, E Fla. and Ga.—Sum.—fall.

2. *D. linearifolia* (Ell.) Benth. Stem 2-4 dm. tall: leaf-blades linear or lanceolate, 1-3 cm. long: calyx becoming 6-7 mm. long: corolla 14-16 mm. long. [*Ceranthera linearifolia* Ell.]—Pinelands and sandhills, Coastal Plain, Fla. to Ala. and Ga.—Fall.

3. *D. odoratissima* Harper. Stem 2-4 dm. tall: leaf-blades linear, 2-4 cm. long: calyx becoming 8-11 mm. long: corolla 14-17 mm. long.—Sandhills, Coastal Plain, S E Ga.—Fall.

30. *HYSSOPUS* L. Perennial erect herbs. Leaf-blades narrow, entire: flowers in axillary cymes or spike-like panicles. Calyx nearly regular, the lobes nearly equal, shorter than the tube. Corolla 2-lipped: upper lip notched: lower lip 3-lobed, the middle lobe very broad. Stamens 4. Stigmas very short.—One species.

1. *H. officinalis* L. Stem 2-9 dm. tall, puberulent: leaf-blades elliptic to elliptic-lanceolate or linear, 1-3 cm. long: calyx becoming about 7 mm. long; lobes ovate to lanceolate, ribbed: corolla blue or purplish, 8-10 mm. long.—(HYSSOP.)—Roadsides and waste-places, various provinces, N. C. to Ont. and Me., also on Pacific slope. Nat. of Eu.—Sum.

31. *ORIGANUM* [Tourn.] L. Perennial herbs, or partially woody plants. Leaf-blades broad, often notched. Cymes mostly borne in corymbs. Calyx stout, nearly equally 5-lobed. Corolla 2-lipped: upper lip broad, slightly lobed: lower lip with 3 rather broad lobes. Stamens 4. Stigmas short.—About 30 species, natives of the Old World.

1. *O. vulgare* L. Stem mostly simple below, sparingly branched above, villous-hirsute: leaf-blades ovate, mostly 1.5-2.5 cm. long, shallowly toothed or entire: calyx 2-2.5 mm. long; lobes ovate, shorter than the tube: corolla pale-magenta or rarely white, 6-7 mm. long; lobes of the upper lip rounded, the lateral lobes of the lower lip

rounded, the lateral lobes of the lower lip broadly ovate: nutlets less than 1 mm. long.—(WILD-MARJORAM.)—Thickets, roadsides, and fields, various provinces, N. C. to Ont., and Mass. Nat. of Eu.—Sum.—A related Old World plant and similar in habit, *Majorana Majorana*—the SWEET-MARJORAM of the gardens.—with a 2-lipped calyx, sometimes escapes from cultivation.

**32. THYMUS** [Tourn.] L. Perennial depressed or creeping herbs. Leaf-blades short, mostly entire. Flowers in axillary cymes or raceme-like panicles. Calyx 2-lipped, the upper lip with 3 short lobes, the lower lip with 2 longer lobes. Corolla 2-lipped: upper lip erect: lower lip 3-lobed, the middle lobe scarcely larger than the lateral ones. Stamens 4. Stigmas long. —About 50 species, mostly European.

**L. T. Serpyllum** L. Plant fragrant, forming depressed mats: leaf-blades elliptic to oval or ovate, 3–10 mm. long: calyx becoming 3.5–4 mm. long; lobes of the lower lip about as long as the tube: corolla purplish, about as long as the calyx: nutlets less than 1 mm. long.—(CREEPING-THYME. THYME.) Meadows, roadsides, and fields, various provinces N of Coastal Plain, N. C. to W. Va. and N. S. Nat of Eu.—Sum.

**33. KOELLIA** Moench. Perennial erect herbs. Leaf-blades entire or shallowly toothed, those of the upper leaves, like the bracts, often more or less whitened. Flowers in dense axillary and terminal cymes, pale with purplish spots. Calyx nearly regular or somewhat 2-lipped, the lobes short or elongate. Corolla 2-lipped: upper lip erect: lower lip 3-lobed, the middle lobe larger than the lateral ones. Stamens 4.—[*Pycnanthemum* Michx.]—Sum.—MOUNTAIN-MINTS. HORSE-MINTS. BASILS.—About 20 species, North American.

Flower-clusters apparently naked, the bracts small and inconspicuous.

Flower-clusters conspicuously bracted.

Calyx not 2-lipped, lobes equal or nearly so.

Corolla much exceeding the calyx: calyx-lobes not aristate.

Corolla about as long as the calyx: calyx-lobes aristate.

Calyx somewhat 2-lipped, the three upper lobes partly united.

I. NUDAE.

II. LANCEOLATAE.

III. ARISTATAE.

IV. INCANAE.

#### I. NUDAE

Stems strict, topped by a corymb-like cyme: flower-clusters permanently small.

#### II LANCEOLATAE

Flower-clusters ciliolate.

Calyx-lobes triangular or ovate-triangular.

Calyx-lobes subulate to lanceolate, triangular-lanceolate, or deltoid.

Leaf-blades or most of them over 3 times as long as broad.

Leaves with strictly entire blades.

Leaves, or the larger ones, with toothed blades.

Flower-clusters 1–2 cm. broad at maturity, compact.

Flower-clusters conspicuously woolly at maturity: stems copiously pubescent.

Calyx-lobes acute: leaf-blades firm; species campestrian.

1. *K. nuda*.

2. *K. virginiana*.

3. *K. flexuosa*.

4. *K. pilosa*.

- Calyx-lobes acuminate: leaf-blades thin: species Alleghenian.  
 Flower-clusters not woolly at maturity: stems minutely pubescent.  
 Flower-clusters 2-3 cm. broad at maturity, not crowded.  
 Leaf-blades or most of them less than 3 times as long as broad.  
 Bractlets copiously villous-ciliate.

## III. ARISTATAE

- Calyx-lobes, at least the lower ones, shorter than the tube: bracts with tips mostly shorter than the body: coastal species.  
 Calyx-lobes lanceolate to lanceolate-subulate, less than  $\frac{1}{2}$  as long as the tube: leaf-blades broad.  
 Calyx-lobes subulate-filiform, over  $\frac{1}{2}$  as long as the tube: leaf-blades narrow.  
 Calyx-lobes, at least the lower ones, longer than the tube: bracts with tips mostly longer than the body: Alleghenian species.

## IV. INCANAE

- Calyx-lobes minutely pubescent, without long hairs (except a rare form of 13): bractlets pubescent like the calyx and usually without long hairs.  
 Calyx-lobes ovate or lanceolate.  
 Calyx-lobes ovate, obtuse or acutish: mature calyx about 4 mm. long.  
 Calyx-lobes lanceolate, acuminate: mature calyx about 5 mm. long.  
 Calyx-lobes deltoid.  
 Corolla much exceeding the calyx: calyx-lobes mostly slightly longer than wide.  
 Corolla slightly exceeding the calyx: calyx-lobes mostly slightly wider than long.  
 Calyx with long hairs in addition to the minute ones, at least when young: bractlets finely bristly pubescent or plumose.  
 Leaf-blades mostly whitened, at least, beneath.  
 Calyx-lobes conspicuously long-hairy; the upper ones subulate.  
 Calyx-lobes inconspicuously long-hairy; the upper ones lanceolate.  
 Leaf-blades not whitened, glabrous or nearly so, or hirsutulous beneath.  
 Calyx-lobes copiously long-hairy, often plumose: leaf-blades hirsutulous beneath, usually cuneate at the base.  
 Calyx-lobes sparingly long-hairy, not plumose: leaf-blades glabrous or nearly so, rounded or subcordate at the base.

5. *K. leptodon*.  
 6. *K. verticillata*.  
 7. *K. clinopodioides*.  
 8. *K. mutica*.  
 9. *K. montana*.

10. *K. aristata*.  
 11. *K. hyssopifolia*.  
 12. *K. Hugerii*.

13. *K. albescens*.  
 14. *K. pauciflora*.  
 15. *K. multiflora*.  
 16. *K. curvipes*.  
 17. *K. pycnanthemoides*.  
 18. *K. incana*.  
 19. *K. dubia*.  
 20. *K. Beadlei*.

1. *K. nuda* (Nutt.) Kuntz. Stem 3-7 dm. tall, glabrous or nearly so: leaf-blades oval or elliptic, 1-2 cm. long, entire or nearly so: calyx 3-4 mm. long; lobes deltoid: corolla about 5 mm. long; upper lip obtuse.—Pinelands, Coastal Plain, Fla. to Ala. and N. C.—Sum.—fall.

2. *K. virginiana* (L.) Britton. Stem 4-9 dm. tall, minutely pubescent: leaf-blades lanceolate to linear-lanceolate, 2-5 cm. long, mostly entire: calyx 3.5-4 mm. long; lobes triangular to ovate-triangular: corolla 6-7 mm. long; upper lip notched; middle lobe of the lower lip slightly narrower than the lateral ones.—Woods, fields, and thickets, various provinces, rarely Coastal Plain, Ga. to Ala., Kans., N. D., and Que.—Sum.—fall.

3. *K. flexuosa* (Walt.) MacM. Stem 3-8

1m. tall, glabrous: leaf-blades narrowly linear to linear-filiform, 1-4 cm. long, entire: calyx about 3.5 mm. long; lobes lanceolate to triangular-lanceolate: corolla 6-7 mm. long; upper lip minutely notched; middle lobe of the lower lip much narrower than the lateral ones.—Meadows, fields, and thickets, various provinces, Fla. to Tex., Minn., and Me.—Sum.—fall.

4. *K. pilosa* (Nutt.) Britton. Stem 4-13 dm. tall, cinereous-pubescent: leaf-blades lanceolate to linear-lanceolate, 2-6 cm. long, entire or sparingly denticulate: calyx 4-5 mm. long, minutely pubescent; lobes broad-lanceolate: corolla 7-8 mm. long.—Prairies and dry woods, various provinces, rarely Coastal Plain, Ga. to Ark., Mo., and Pa.—Sum.—fall.

5. *K. leptodon* (A. Gray) Small. Stem 5-11 dm. tall, soft-pubescent. at least above: leaf-blades lanceolate to elliptic-lanceolate, 2-5 cm. long, serrate or entire: calyx 4.5-5.5 mm. long, rather villous; lobes narrow-lanceolate: corolla 6-7 mm. long.—Mt. woods, Blue Ridge, N. C.—Sum.

6. *K. verticillata* (Michx.) Kuntze. Stem 4-12 dm. tall, minutely pubescent: leaf-blades lanceolate to almost linear, 2-6 cm. long, remotely or shallowly serrate: calyx 4-5 mm. long; lobes subulate-lanceolate: corolla 6-7 mm. long, or rarely longer.—Fields, thickets, and woods, various provinces, Ga. to Mass. and Que.—Sum.—fall.

7. *K. clinopodioides* (T. & G.) Kuntze. Stem 4-12 dm. tall, softly-pubescent: leaf-blades lanceolate, narrowly elliptic, 2-8 cm. long, more or less serrate: calyx 4-4.5 mm. long; lobes lanceolate-subulate, nearly  $\frac{1}{2}$  as long as the tube: corolla about 6 mm. long.—Open woods and dry thickets, various provinces N of Coastal Plain, Tenn. to Pa., Conn., and Va.—Sum.

8. *K. mutica* (Michx.) Britton. Stem 6-10 dm. tall, finely pubescent: leaf-blades thick, ovate to lanceolate, 2-6 cm. long, serrate: calyx 3.5-4 mm. long; lobes deltoid to triangular-lanceolate, very short: corolla 6-8 mm. long: filaments short.—Sandy banks, open woods, and thickets, various provinces, Fla. to Mo. and Me.—Sum.—fall.

9. *K. montana* (Michx.) Kuntze. Stem 3-9 dm. tall, glabrous or nearly so: leaf-blades thin, lanceolate to elliptic-lanceolate or ovate-lanceolate, 7.5-12 cm. long, sharply serrate: calyx 4-5 mm. long, often villous above; lobes lanceolate: corolla 7-8 mm. long: filaments elongate.—Mt. woods, Blue Ridge to Appalachian Plateau, Ga. to Ala., W. Va., and Va.—Sum.

10. *K. aristata* (Michx.) Kuntze. Stem 4-9 dm. tall, puberulent: leaf-blades elliptic-lanceolate to ovate-lanceolate, 1.5-5 cm. long, sometimes shallowly serrate: calyx 5-6 mm. long; tube faintly ribbed; lobes lanceolate to subulate-lanceolate: corolla 6-7 mm. long.—Pinelands and sandy fields, Coastal Plain, Fla. to La. and N. J.—Sum.—fall.

11. *K. hyssopifolia* (Benth.) Britton. Stem 4-10 dm. tall, puberulent: leaf-blades narrowly elliptic to linear 1-3.5 cm. long, usually entire: calyx 5-6 mm. long; tube prominently ribbed: corolla much surpassing the calyx.—Low pine-lands, Coastal Plain, Fla. to La. and Va.—Sum.

12. *K. Hugerii* Small. Stem 5-9 dm. tall, cinereous-tomentulose: leaf-blades elliptic, 1.5-4 cm. long, entire or sparingly serrate: calyx 7-8 mm. long; tube prominently ribbed: corolla scarcely, if at all, longer than the calyx.—Mt. woods, Blue Ridge, N. C.—Sum.

13. *K. albescens* (T. & G.) Kuntze. Stem 4-10 dm. tall, more or less finely, often minutely, pubescent: leaf-blades ovate to elliptic or lanceolate, 2-7 cm.

long, serrate, usually greenish above, whitish beneath: calyx 3–4 mm. long; lobes ovate, obtuse or acutish, beardless: corolla 5–6 mm. long: nutlets ovoid, fully 1 mm. long.—Pinelands and woods, Coastal Plain, Fla. to Tex., Mo., and N. C.—Sum.—fall.

14. *K. pauciflora* Small. Stem mostly 12 dm. tall or less, minutely close-pubescent, at least above: leaf-blades lanceolate to elliptic-lanceolate, 2–5 cm. long, distantly serrate, acute or slightly acuminate, whitish or pale-green above, whitish beneath: calyx 4–5 mm. long; lobes lanceolate, acuminate, beardless: corolla about 6 mm. long: nutlets narrowly ovoid, fully 1 mm. long.—Pinelands and edges of hammocks, Albany, in the Coastal Plain of Ga.—Sum.

15. *K. multiflora* Small. Stem 15 dm. tall or less, closely and minutely soft-pubescent, at least above: leaf-blades ovate or elliptic-ovate, 2–8 cm. long, rather remotely serrate, acute or acutish, pale-green above, white or whitish beneath: flower-clusters becoming open at maturity, the branches somewhat elongate, each with many secund calyces: calyx 4–4.5 mm. long; lobes deltoid, mostly slightly longer than wide, beardless: corolla about 6 mm. long: nutlets ovoid, fully 1 mm. long.—Dry woods and open sunny slopes, various provinces, Ga. to Ala., N. C., and Pa.—Sum.

16. *K. curvipes* Greene. Stem mostly less than 10 dm. tall, closely and minutely pale-pubescent throughout: leaf-blades ovate, 1.5–3.5 cm. long, mostly obtuse, shallowly serrate, closely and densely fine-pubescent, greenish-white above, white and prominently veined beneath: flower-clusters permanently glomerate: calyx 3.5–4 mm. long; lobes deltoid, mostly wider than long: corolla about 4 mm. long: nutlets oval, about 1 mm. long.—Open woods, Stone Mt. in the Piedmont of Ga.—Sum.

17. *K. pycnanthemoides* (Leavenw.) Kuntze. Stem 6–16 dm. tall, minutely pale-pubescent, at least above, and sometimes finely hirsute: leaf-blades ovate, elliptic or elliptic-lanceolate, 2–10 cm. long, thin, shallowly and usually remotely serrate: flower-clusters rather dense and somewhat plumose when young, looser in age, the branches somewhat elongate and bearing the second calyces: bractlets conspicuously long and narrow: calyx 5–6 mm. long; lobes slender, the upper ones subulate, the lower ones often lanceolate-subulate: corolla 7–8 mm. long: nutlets ovoid, fully 1 mm. long.—Mt. woods and thickets, Blue Ridge to Appalachian Plateau, Ga. to Ala., Ky., and Va.—Sum.

18. *K. incana* (L.) Kuntze. Stem 5–12 dm. tall, softly and closely pubescent at least above, and often finely hirsute: leaf-blades ovate, elliptic, or lanceolate, 3–10 cm. long, thickish, shallowly, but rather prominently and remotely serrate: flower-clusters permanently compact, not conspicuously plumose: calyx 3.5–4 mm. long; lobes stout, the upper ones lanceolate, the lower ones triangular-lanceolate: corolla 6–7 mm. long: nutlets broadly ovoid, about 1 mm. long.—Hillsides, dry thickets, and open woods, various provinces, Fla. to Mo., Ont., and Me.—Sum.—fall.

19. *K. dubia* (A. Gray) Small. Stem 4–11 dm. tall, finely hirsute: leaf-blades lanceolate to linear-elliptic or linear-lanceolate, 2–9.5 cm. long, remotely serrate or nearly entire, green, except some of the upper ones, hirsutulous, especially beneath: calyx 4.5–5 mm. long, pubescent; lobes each with a triangular or lanceolate body and a subulate bearded tip: corolla 6–7 mm. long: tube pubescent within: nutlets broadly ellipsoid, 1.5 mm. long.—Mt. slopes, Blue Ridge, N. C.—Sum.

20. *K. Beadlei* Small. Stem 5–9 dm. tall, minutely pubescent with short hairs: leaf-blades elliptic-lanceolate to ovate-lanceolate, or those of the branches

lanceolate to ovate, 3-8 cm. long, shallowly serrate, glabrous or nearly so, and often prominently veined beneath: calyx 4-5 mm. long, puberulent; lobes triangular-lanceolate and subulate-tipped: corolla 6-7 mm. long; tube glabrous within: nutlets narrowly ovoid, about 1.5 mm. long.—Woods in the Blue Ridge, N. C. and Tenn.—Sum.—fall.

**34. MAPPIA** House. Perennial erect herbs, or woody plants. Leaf-blades broad, entire or toothed. Flowers in axillary cymes. Calyx nearly regular, the lobes shorter than the tube. Corolla 2-lipped: upper lip erect: lower lip 3-lobed. Stamens 2, long-exserted.—About 15 species, American.

1. *M. origanoides* (L.) House. Stem 2-4 dm. tall, wiry: leaf-blades ovate to ovate-lanceolate, 1.5-2.5 cm. long, serrate: calyx 2-2.5 mm. long; lobes ovate to deltoid: corolla purplish, 4-5 mm. long. [*Cunila mariana* L. *C. origanoides* (L.) Britton]—(DITTANY. STONE-MINT.)—Woods, thickets, and open hillsides, often in somewhat acid soil, N. Fla. to Tex., Mo., and N. Y.—Sum.—fall.—This aromatic plant found its way into the materia medica of both the American aborigines and of the early settlers from Europe. It was used in cases of "colds" and of fevers, and also for making a tea!

**35. LYCOPUS** [Tourn.] L. Perennial, erect or creeping, often stoloniferous herbs. Leaf-blades entire, toothed, or pinnatifid. Flowers whitish to lavender in dense axillary cymes. Calyx regular or nearly so: lobes longer than the tube or shorter. Corolla slightly 2-lipped: upper lip notched: lower lip nearly equally 3-lobed. Stamens 2.—About 15 species, natives of the north temperate zone.—Sum.—BUGLE-WEEDS. WATER-HOARHOUNDS.

Calyx-lobes ovate to elliptic or elliptic-lanceolate, 4 or 5: nutlets exceeding the calyx.

Calyx-lobes subulate to lanceolate (ovate, acuminate in No. 8), mostly 5: nutlets not exceeding the calyx.

Corolla twice as long as the calyx: bracts minute: blades of the lower leaves merely toothed.

Corolla but little longer than the calyx; blades of the lower leaves pinnatifid.

#### I. VIRGINICI.

#### II. RUBELLI.

#### III. PINNATIFIDI.

##### I. VIRGINICI

Corolla 1.5-2 mm. long: style included.

Corolla 2-3 mm. long: style exserted.

1. *L. virginicus*.

2. *L. uniflorus*.

##### II. RUBELLI

Leaf-blades manifestly petioled, or with petiole-like bases.

Stem glabrous or merely puberulent: calyx glabrous or nearly so; lobes straight.

Stem copiously pubescent: calyx closely pubescent; lobes, at least the upper ones, recurved.

Leaf-blades sessile or nearly so, sometimes partly clasping.

Stem glabrous, at least below: bracts subtending the cymes gradually narrowed at the base.

Stem densely puberulent or finely pubescent: bracts subtending the cymes truncate at the base.

3. *L. rubellus*.

4. *L. velutinus*.

5. *L. sessilifolius*.

6. *L. pubens*.

##### III. PINNATIFIDI

Stem and leaves usually glabrous or glabrate: calyx-lobes acute, short awn-tipped: leaf-blades with acute serrations.

7. *L. americanus*.

Stem and leaves usually pubescent, sometimes slightly so: calyx-lobes acuminate, long awn-tipped: leaf-blades with obtuse serrations.

8. *L. europaeus*.

- ✓ 1. *L. virginicus* L. Stem 1-8 dm. tall, purplish or greenish-purple, obtuse-angled, not usually tuberous at the base, but with tuber-bearing stolons: leaf-blades ovate to elliptic-ovate or elliptic, 2-14 cm. long, coarsely toothed, manifestly petioled: calyx about 2 mm. long; lobes narrow. —Common, in meadows and rather moist soil, various provinces, Ga. to Ark., Nebr., and N. H.—Sum.—fall.

- ✓ 2. *L. uniflorus* Michx. Stem 1-8 dm. tall, green or sometimes purplish, sharp-angled, tuberous at the base, the stolons rarely tuber-bearing: leaf-blades elliptic to elliptic-lanceolate, 2-8 cm. long, serrate, calyx about 1.5 mm. long; lobes wide. [*L. communis* Bicknell]—Low grounds, and thickets, various provinces, N. C. to Nebr., Ore., B. C., Ont., and Newf.—Sum.—fall.

- ✓ 3. *L. rubellus* Moench. Stem 5-10 dm. tall: leaf-blades elliptic, lanceolate, or ovate-elliptic, 3-15 cm. long, sharply serrate or dentate-serrate: calyx becoming fully 2.5 mm. long; lobes straight, about as long as the tube: corolla 3.5-4 mm. long.—Low grounds, borders of swamps and ditches, Coastal Plain and adj. provinces, Fla. to La., Mo., and N. Y.—Sum.—fall.

4. *L. velutinus* Rydb. Similar to *L. rubellus* in habit, but copiously pubescent, the branches often densely so: leaf-blades elliptic, sometimes broadly so, or elliptic-lanceolate, coarsely toothed: calyx becoming 2.5 mm. long; lobes curved, much longer than the tube: corolla 3-3.5 mm. long.—Low grounds, various provinces, Miss. to Tex. and Colo.—Sum.—fall.

✓ 5. *L. sessilifolius* A. Gray. Stem 2-6 dm. tall: leaf-blades ovate to elliptic or lanceolate, 1.5-6 cm. long, shallowly serrate: calyx 2-2.5 mm. long; lobes as long as the tube: lower corolla-lip with a reniform notched middle lobe: filaments pubescent at the base.—Wet soil and low grounds, Coastal Plain and New England Coast, Fla. to Miss. and Mass.—Sum.—fall.

6. *L. pubens* Britton. Stem 6-12 dm. tall: leaf-blades elliptic, elliptic-lanceolate or linear-elliptic, 4.5-10 cm. long, sharply serrate: calyx mainly 2.5-3 mm. long; lobes longer than the tube: lower corolla-lip with an ovate obtuse middle lobe: filaments glabrous—Low pinelands, Coastal Plain, Fla. to Miss. and S. C.—Sum.—fall.

- ✓ 7. *L. americanus* Muhl. Stem 1-9 dm. tall, often much-branched: leaf-blades lanceolate to ovate-lanceolate, 2-10 cm. long, those on the lower part of the stem pinnatifid, those near the top merely toothed: calyx 2.5-3 mm. long: corolla about as long as the calyx: staminodia thickened at the tip. [*L. sinuatus* Ell.]—Moist thickets and pastures, wet banks and meadows, various provinces, Fla. to Tex., Calif., B. C., Ont., and Newf.—Sum.—fall.

8. *L. europaeus* L. Stem 1 m. tall or less: leaf-blades ovate or elliptic-ovate, 2-8 cm. long, obtuse or acutish, coarsely toothed, and the lower ones, at least, incised or pinnatifid near the base: calyx 2.5-3 mm. long: corolla only slightly exceeding the calyx: nutlets scarcely exceeding the calyx-tube.—Waste-

places and roadsides, various provinces, Ala. to La. and Mass. Nat. of Eu.—Sum.—fall.

**36. MENTHA** [Tourn.] L. Perennial erect or diffuse herbs. Leaf-blades toothed or incised. Flowers in dense axillary cymes, these sometimes disposed in spike-like panicles. Calyx nearly regular, the lobes shorter than the tube. Corolla obscurely 2-lipped: upper lip mostly notched: lower lip of 3 nearly equal lobes. Stamens 4.—About 30 species, natives of the north temperate zone.—Sum.—MINTS.

Flower-clusters all axillary, not in terminal spikes.

Flower-clusters, at least most of them, aggregated in terminal spike-like panicles.

I. ARVENSES.

II. SPICATAE.

#### I. ARVENSES

Stem and branches glabrous or with short scattered hairs: calyx glabrous or nearly so, except for the ciliate lobes.

Stem and branches with retrorse or spreading hairs: calyx pubescent all over.

Stem and branches with short retrorse or retrorse-appressed hairs: larger calyx-lobes deltoid: calyx-tube closely pubescent with short hairs.

Stem and branches with long lax or spreading hairs: larger calyx-lobes typically lanceolate: calyx-tube loosely pubescent with long hairs.

1. *M. gentilis*.

2. *M. arvensis*.

3. *M. canadensis*.

#### II. SPICATAE

Flowers in short and stout raceme-like panicles, or clustered in the upper leaf-axils: longer calyx-lobes decidedly shorter than the tube: leaf-blades petioled.

Calyx, at least the lobes, pubescent.

Stem and leaves copiously pubescent: leaf-blades ovate or orbicular-ovate: calyx pubescent all over.

Stem and leaves glabrous: leaf-blades elliptic, or lanceolate: calyx with pubescent lobes.

Calyx glabrous.

Flowers in slender or relatively slender, often elongate spike-like panicles: longer calyx-lobes as long as the tube or nearly so: leaf-blades sessile.

Stem and inflorescence not canescent: calyx-tube glabrous or nearly so: corolla-tube not exceeding the calyx.

Stem and inflorescence canescent or villous-canescens: calyx-tube copiously pubescent: corolla-tube much exceeding the calyx.

4. *M. aquatica*.

5. *M. piperita*.

6. *M. citrata*.

7. *M. spicata*.

8. *M. rotundifolia*.

1. *M. gentilis* L. Stem 2–7 dm. tall, glabrous or nearly so: leaf-blades oval, ovate, obovate, or elliptic, 1.5–5 cm. long, serrate, the floral ones not conspicuously reduced, with petioles often longer than the flower-clusters: calyx 1.5–2 mm. long; tube glabrous or nearly so: corolla lavender or lilac; upper lip notched.—Stream-banks, waste-places, and roadsides, various provinces N of Coastal Plain, Ga. to Ia. and N. S. Nat. of Eu.—Sum.—fall.

2. *M. arvensis* L. Stem 4 dm. tall or less, often diffuse, copiously, often closely pale-pubescent: leaf-blades ovate, elliptic, or oval, 1.5–5 cm. long, coarsely serrate above the middle, copiously pubescent with short hairs, broad at the base: calyx 1.5–2 mm. long, minutely pubescent; lobes short-tipped: corolla usually lavender, mostly 3 mm. long, the upper lip mostly notched.—Stream-banks, waste-places, and about swamps,

various provinces, Fla. to Tex., Calif., Nebr., and Newf. Nat. of Eu.—(*Mex.*)—Sum.—fall.

3. *M. canadensis* L. Stem 2–6 dm. tall, loosely pubescent: leaf-blades lanceolate, elliptic, or elliptic-lanceolate, 2–7 cm. long, serrate, narrow-based, the floral ones with petioles as long as the flower-clusters: calyx about 2.5–3 mm. long; tube loosely pubescent: corolla lavender or white; upper lip mostly obtuse.—Thickets and low sandy places, various provinces, rarely Coastal Plain, N. C. to N. M., B. C., Man., and N. B.—Sum.—fall.

4. *M. aquatica* L. Stem 2–6 dm. long or more, pubescent with recurved hairs: leaf-blades broadly ovate, or orbicular-ovate, 1–4 cm. long, or rarely more, rather sharply serrate, those of the floral leaves reduced: calyx 3–3.5 mm. long; tube pubescent with short spreading hairs; lobes lanceolate, about  $\frac{1}{3}$  as long as the tube: corolla lavender, about 5 mm. long.—(WATER-MINT.)—Roadside ditches and wet places, various provinces, Ga. to N. S. Nat. of Eu.—Sum.—fall.

5. *M. piperita* L. Stem 2–7 dm. tall, glabrous: leaf-blades elliptic, elliptic-ovate, elliptic-lanceolate, or lanceolate, 1.5–5 cm. long, sharply serrate: calyx 2.5–3 mm. long; lobes subulate, much shorter than the cylindric-campanulate tube: corolla light-violet, 3.5–4 mm. long.—(PEPPERMINT.)—Waste-places, roadsides, and stream-banks, various provinces, Fla. to Ark., Calif., Ont., and N. S. Nat. of Eu.—(*W. I.*)—Sum.—fall.

6. *M. citrata* Ehrh. Stem 3–11 dm. long, glabrous or nearly so: leaf-blades ovate to orbicular-ovate, 1.5–4 cm. long, sharply serrate: calyx 3.5–4 mm. long; lobes subulate, shorter than the cylindric-turbinate tube: corolla lavender or whitish, about 4.5 mm. long.—Wet places, various provinces, Ga. to Mo. and Conn. Nat. of Eu.—(*W. I.*)—Sum.—fall.

7. *M. spicata* L. Stem 2–5 dm. tall, glabrous or nearly so: leaf-blades elliptic or elliptic-lanceolate, 3–6 cm. long, sharply serrate: calyx 1–1.5 mm. long; lobes about as long as the campanulate tube: corolla lavender, 2–2.5 mm. long. [*M. viridis* L.]—(SPEAR-MINT.)—Waste-places, fields, and roadsides, various provinces, Fla. to Kans., Ont., and N. B. Nat. of Eu.—(*W. I.*)—Sum.—fall.

8. *M. rotundifolia* (L.) Huds. Stem 3–9 dm. tall, canescent-tomentulose: leaf-blades elliptic, oval, or ovate, 2–9 cm. long, finely serrate, often partly clasping: calyx becoming about 1.5 mm. long; lobes slightly shorter than the campanulate tube: corolla lavender or pale-lilac, 2.5–3 mm. long.—Open grounds and thickets, various provinces, Fla. to Tex., Ark., and Me. Nat. of Eu.—(*W. I.*, *Mex.*, *S. A.*)—Sum.—fall.

37. **MICHELIELLA** Briq. Perennial erect herbs. Leaf-blades rather coarsely toothed. Flowers in panicles. Calyx 2-lipped: upper lip with 3 short lobes: lower lip with 2 narrow lobes. Corolla 2-lipped, middle lobe of the lower lip fringed. Stamens 4.—Two species.—STONE-ROOTS.

Leaves 4, or rarely 6, approximate, sometimes almost whorled at the top of the stem.  
Leaves several, in pairs along the stem.

1. *M. verticillata*.  
2. *M. anisata*.

1. *M. verticillata* (Baldw.) Briq. Stem 1–5 dm. tall, finely pubescent: leaf-blades thin, ovate to obovate or cuneate-obovate, 8–16 cm. long: calyx becoming

8 mm. long: corolla tawny, 11–13 mm. long. [*Collinsonia verticillata* Baldw.]—Rich woods, Blue Ridge and Piedmont, Ga. to Miss., Tenn., and N. C.—Spr.-sum.

2. *M. anisata* (Sims) Briq. Stem 3–6 dm. tall, glandular-pubescent: leaf-blades thickish, elliptic or broadly oval, 8–15 cm. long: calyx becoming 10 mm. long: corolla cream-colored, 8–12 mm. long. [*Collinsonia anisata* Sims]—Dry woods, Blue Ridge and Piedmont, Fla. to Ala. and S. C.—Sum.—The plants of this genus and of the following have long been used medicinally. The woody root and the leaves contain a number of principles, viz. starch, tannin, resin, wax, mucilage, and volatile oil. The plants are lemon-scented.

38. **COLLINSONIA** L. Perennial erect or reclining herbs. Leaf-blades toothed. Flowers in panicles. Calyx 2-lipped: upper lip with 3 short lobes: lower lip with 2 longer lobes. Corolla 2-lipped, elongate, middle lobe of the lower lip lacerate or fringed.—Three species as follows.—HORSE-BALMS.

Branches of the inflorescence puberulent.

Stem rigid: leaf-blades mostly over 10 cm. long, many-toothed: pedicels becoming 6–9 mm. long.

1. *C. canadensis*.

Stem reclining: leaf-blades mostly less than 8 cm. long, coarsely few-toothed: pedicels becoming 2–4 mm. long.

2. *C. tuberosa*.

Branches of the inflorescence glandular-pubescent.

3. *C. punctata*.

1. *C. canadensis* L. Stem erect, 3–9 dm. tall, from a thick hard root: leaf-blades thickish, elliptic or oval, 9–16 cm. long, rather coarsely dentate-serrate: calyx becoming 5–7 mm. long: corolla about 1.5 cm. long, yellowish: nutlets obscurely reticulate, nearly 2 mm. in diameter.—(HORSE-BALM. RICH-WEED. STONE-ROOT).—Rich, moist woods and thickets, various provinces, Fla. to Ark., Kans., Ont., and Me.—Sum.-fall.

2. *C. tuberosa* Michx. Stem spreading or reclining, 3–10 dm. long: leaf-blades thin, ovate, 5–8 cm. long, coarsely serrate.—Rich woods, various provinces, Ga. to La. and N. C.—The corolla of this species and that of the following are yellowish, either dark or pale.

3. *C. punctata* Ell. Stem 4–9 dm. tall: leaf-blades rhombic-ovate or ovate, or elliptic or ovate on the upper part of the stem, 2–8 cm. long, serrate: calyx becoming 6 mm. long.—Rich woods, various provinces, Ga. to Miss. (La.?) and N. C.

39. **PERILLA** L. Annual erect herbs. Leaf-blades often coarsely toothed. Flowers in spike-like panicles. Calyx 2-lipped: upper lip with 3 broad lobes: lower lip with 2 longer lobes. Corolla 2-lipped: upper lip broad: lower lip 3-lobed, the middle lobe largest. Stamens 4.—Two species, Asiatic.

1. *P. frutescens* (L.) Britton. Stem 2-6 dm. tall, minutely pubescent: leaves usually red or red-tinged; blades ovate or oval, 4-10 cm. long, serrate or crenate-serrate: calyx 2-2.5 mm., becoming 6 mm. long; lower lobes lanceolate: corolla 3-3.5 mm. long, white, with a ring of hairs within; lobes obtuse: nutlets prominently reticulate, nearly 1.5 mm. in diameter.—(BEEFSTEAK-PLANT.)—Waste-places, and roadsides, various provinces, Fla. to Tex., Mo., and Conn. Nat. of Asia.—Sum.—The plants, especially when bruised, give off a strong odor.

40. *HYPTIS* Jacq. Herbs or woody plants. Leaf-blades commonly toothed. Flowers in often dense axillary cymes. Calyx nearly regular, sometimes oblique, accrescent and ribbed or veiny at maturity. Corolla 2-lipped, white to purple: lower lip 3-lobed, the middle lobe saccate. [*Mesosphaerum* P. Br.]—About 300 species, mostly tropical American.

Flowers borne in few remote peduncled involucrate heads: bracts foliaceous.

#### I. RADIATAE.

Flowers borne in numerous axillary separated clusters or in contiguous or approximate glomerules which thus form terminal thyrsoid panicles: bracts minute.

Flowers in unilateral cymules which are aggregated into a thyrsus: mature calyx persistent.

#### II. SPICATAE.

Flowers in small separated axillary clusters: mature calyx deciduous.

#### III. VERTICILLATAE.

##### I. RADIATAE

Stem typically simple or branched at the base, leafy to the top. 1. *H. radiata*.

##### II. SPICATAE

Calyx-lobes short-subulate, at maturity less than  $\frac{1}{2}$  as long as the tube: terminal portion of the inflorescence composed of elongate slender interrupted thyrsi, open.

Calyx-lobes setaceous-subulate, at maturity much more than  $\frac{1}{2}$  as long as the tube: terminal portion of the inflorescence composed of short continuous thyrsi, compact.

2. *H. mutabilis*.

3. *H. pectinata*.

##### III. VERTICILLATAE

Tall plant with virgate stems and very slender branches, the flower-clusters inconspicuously bracted.

4. *H. verticillata*.

1. *H. radiata* Willd. Stem 2 m. tall or less, finely pubescent, simple or rarely branched: leaf-blades ovate to lanceolate or linear-lanceolate, 2-8 cm. long or more, coarsely and often irregularly serrate, cuneately narrowed into petiole-like bases: calyx becoming 6-8 mm. long: tube strongly cross-ribbed at maturity; lobes subulate-lanceolate, short-hairy: corolla 8-10 mm. long: nutlets oval, nearly 1.5 mm. long.—Low pinelands, hammocks, swamps, and marshes, Coastal Plain, Fla. to Tex. and N. C.—(W. I.)—Spr.—fall or all year S.

2. *H. mutabilis* (A. Rich.) Briq. Stem 2 m. tall or less, pubescent with short crisped hairs and more or less muricate: leaf-blades rhombic-ovate to deltoid, or orbicular-reniform, 2-7 cm. long or rarely more, crenate-serrate, broadly cuneate to truncate

at the base, slender-petioled: calyx becoming 6–7 mm. long; tube prominently cross-ribbed; lobes short-subulate, about 1 mm. long: corolla 3.5–4 mm. long; tube stout: nutlets oval, about 1.5 mm. long.—Woods, waste-places, cult.-grounds, and roadsides, Fla. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)

3. *H. pectinata* (L.) Poir. Stem 1.5 m. tall or less, sparingly pubescent with short crisped hairs and more or less muricate: leaf-blades ovate, 2–8 cm. long, irregularly serrate, cuneate to rounded at the base: calyx becoming 4–5 mm. long; tube faintly cross-ribbed; lobes setaceous-subulate, 1.5–2 mm. long: corolla about 4 mm. long; tube slender: nutlets ellipsoid, about 1 mm. long.—Hammocks, cult.-grounds, and roadsides, S pen. Fla. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.—Two related species included in Fl. SE. U. S., *H. spicata* Poir. and *H. spicigera* Lam., are not now definitely known from our range.

4. *H. verticillata* Jacq. Stem 1–2 m. tall, sparingly pubescent, leaf-blades lanceolate to linear-lanceolate, mostly 5–12 cm. long, rather sharply serrate, acuminate: calyx becoming 2–2.5 mm. long; tube slightly ribbed; lobes deltoid to triangular-lanceolate, shorter than the tube: corolla white, about twice as long as the calyx: nutlets ellipsoid, about 1.5 mm. long.—Hammocks and roadsides, pen. Fla. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

41. **OCIMUM** [Tourn.] L. Herbs or woody plants. Leaf-blades often of an ovate type and toothed. Flowers in raceme-like panicles. Calyx strongly 2-lipped, accrescent: upper lip a broad lobe decurrent as wings on the sides of the tube: lower lip of 2 broad lobes and 2 narrow lobes. Corolla 2-lipped: lower lip of 3 broad lobes.—About 40 species, widely distributed in warm and tropical regions.

Corolla slightly exceeding the calyx; lips obscurely fine-pubescent without, the lower lobe entire: nutlets about 1 mm. long. 1. *O. micranthum*.  
Corolla much exceeding the calyx; lips hirsutulous without, the lower lobe sharply toothed: nutlets about 1.5 mm. long. 2. *O. basilicum*.

1. *O. micranthum* Willd. Stem 2–5 dm. tall, minutely and obscurely pubescent: leaf-blades ovate, often narrowly so, evidently but shallowly toothed: panicles rather loosely flowered: calyx purple, 2–3 mm. long at anthesis: crest-like upper lobe oval-orbicular in fruit: corolla purple or paler, about 4 mm. long: posterior stamens without spurs: fruiting calyx narrowly campanulate, the lateral lobes with slender tips as long as the body.—(WILD-BASIL. MOSQUITO-PLANT.)—Hammocks, pine-lands, and waste-places, S Fla.—(*W. I., Mex., C. A., S. A.*)—Spr.-fall or all year.

2. *O. basilicum* L. Stem 2–5 dm. tall, finely pubescent: leaf-blades ovate, usually broadly so, obscurely toothed: panicles densely flowered: calyx green, about 5 mm. long at anthesis; crest-like upper lobe orbicular-reniform in fruit: corolla white, about 7 mm. long: posterior stamens with hairy spurs at the base of the filaments: fruiting calyx campanulate, the lateral lobes with stout tips much shorter than the body.—(BASIL.)—Hammocks, shell-mounds, and pinelands, pen. Fla. Nat. of Asia.—(*W. I.*)—Sum.-fall.

*Coleus pumilus* Blanco, with small, obtuse, deeply toothed leaf-blades, red along midrib and lateral veins, the stem somewhat prostrate and rooting along the lower portion, has been found as an escape in pen. Fla. Native of the Philippine Islands.

# FAMILY 14. RHINANTHACEAE<sup>1</sup>—FIGWORT FAMILY

Herbs or rarely shrubs or trees. Stems commonly terete. Leaves opposite, whorled or alternate: blades entire, toothed, or divided. Flowers perfect. axillary, racemose, or paniculate, the peduncles sometimes bearing a pair of bractlets. Calyx regular or irregular, of 4 or 5 distinct or united sepals. Corolla irregular, of 5 partly or wholly united petals. Androecium usually of 4 didynamous stamens, sometimes 2 or 5 or the fifth one represented by a staminodium. Gynoecium 2-carpellary. Ovary 2-celled, rarely becoming 1-celled. Fruit capsular or rarely baccate.—About 200 genera and 3000 species, of wide geographic distribution.

Corolla with the posterior lobes external—overlapping in the bud.—(*Antirrhinoideae*)  
Tree: calyx coriaceous: corolla large, about 5 cm. long: capsule woody.

Tribe I. PAULOWNIEAE.

Herbs: calyx membranous or herbaceous: corolla smaller: capsule membranous to coriaceous.

Stigmas distinct, flattened (scarcely so in *Capraria*, *Bramia*, and *Scoparia*): seeds reticulate or finely lined, wingless (except in *Ilysanthes grandiflora*): capsule-walls membranous: inflorescence simply racemose, with the bracts foliaceous, except in *Mazus*, and the flowers axillary: leaves opposite (except in *Capraria*).

Sepals distinct or nearly so (except in *Hemianthus*): corolla small (3–18 mm. long): leaves and capsule usually glandular-punctate.

II. GRATIOLEAE.

Sepals united over half their length: corolla large (25–35 mm. long): leaves and capsule not glandular-punctate.

III. MIMULEAE.

Stigmas wholly united, punctiform or capitate: seeds not simply reticulate, either smooth, tuberculate, ridged, alveolate, or winged: capsule-walls firm, chartaceous or coriaceous: inflorescence racemose or paniculate, the bracts usually much smaller than the leaves.

Filaments 5: capsule septicidal.

Corolla rotate, slightly zygomorphic, its lobes longer than the tube: filaments all antheriferous: leaves alternate.

IV. VERBASCEAE.

Corolla tubular-campanulate, strongly zygomorphic, its lobes shorter than the tube: posterior filament without an anther: leaves opposite.

V. CHELONEAE.

Filaments 4 (the posterior one present as a minute knob only in *Collinsia*): capsule loculicidal.

Corolla red, tubular: capsule filled with tortuous hairs between which are scattered roughened seeds: leaves mostly scale-like.

VI. RUSSELIEAE.

Corolla yellow, blue, violet, or white, saccate or spurred: capsule lacking hairs within: leaves with expanded blades.

Capsule loculicidal by a simple median slit: seed alveolate or smooth: corolla violet or blue, not pouched or spurred anteriorly: leaves opposite.

Corolla broadly saucer-shaped or dipper-shaped, with a fine horn-like appendage at the base of the anterior lobes: posterior stamen lacking: capsule globose: sepals distinct.

VII. ANGELONIEAE.

<sup>1</sup> Contributed by Francis Whittier Pennell.

Corolla seemingly papilionaceous, the tube gibbous at the base posteriorly: posterior stamen represented by a callose knob: capsule slightly flattened: sepals partly united.

Capsule opening by transverse loculicidal ruptures: seed angled, ridged, or winged: corolla yellow or violet-blue, bilabiate, with a narrow pouch or spur at the base anteriorly: leaves alternate.

Corolla with the anterior lobes external—overlapping in the bud: herbs.—(**Rhinanthoideae**)

Stamens 2, the postero-laterals alone present: corolla small (2-5 mm. long), the antero-lateral lobes external: plants not parasitic.

Stamens 4, the antero-lateral usually the longer: corolla larger, the mid-anterior lobes usually external: plants usually root-parasites.

Sepals 5, alike: corolla-lobes nearly equally distinct. Sepals unequal, the posterior one very short or lacking: corolla strongly bilabiate, the 2 posterior lobes united nearly to the apex.

#### I. PAULOWNIEAE

Tree, with cordate leaf-blades, large panicles of horizontal flowers, and erect pointed capsules.

#### II. GRATIOLEAE

Leaves alternate: stamens 5: corolla nearly regular, white. Leaves opposite: stamens 4 or 2 (the posterior one obsolete).

Leaf-blades entire or toothed: seeds brown or yellow.

Corolla with the ridges to the antero-lateral sinuses low and not projecting beyond those points (anterior filaments simple): posterior lobes of the corolla, little if at all, shorter than the anterior.

Leaves uniform: capsule turgid, longer than wide, acute or obtuse: stem elongate.

Sepals 4: corolla rotate, with recurved lobes much longer than the tube.

Sepals 5: corolla campanulate, tubular, or salverform, the lobes equalling or shorter than the tube.

Corolla campanulate, nearly regular: lobes equalling, or little shorter than the tube, the posterior united, little if at all higher than the others.

Pedicels not bracteolate: capsule obtuse.

Stamens 4: capsule globose or ovoid, nearly equalling the sepals: outer sepal oval.

Stamens 2: capsule ellipsoid-ovoid, much shorter than the sepals: outer sepal of an orbicular-cordate type.

Pedicels bibracteolate: capsule acute.

Corolla pubescent in the throat: ovary surrounded by a circle of bristles: outer sepal cordate: leaf-blades clasping: plant lemon-scented.

Corolla glabrous within: ovary not surrounded by bristles: outer sepal ovate: leaf-blades cuneate at the base: plant odorless.

Corolla narrower, decidedly zygomorphic, the lobes shorter than the tube, the posterior united over half their length or throughout.

Corolla tubular or tubular-campanulate, relatively broad at the throat, pubescent within at the base of the posterior lobes: capsule septicidal, or secondarily (in *Gratiola*) also loculicidal: leaf-blades toothed.

#### VIII. COLLINSIEAE.

#### IX. ANTIRRHINEAE.

#### X. VERONICEAE.

#### XI. BUCHNEREAE.

#### XII. RHINANTHEAE.

#### 1. PAULOWNIA.

#### 2. CAPRARIA.

#### 3. SCOPARIA.

#### 4. MACUILLAMIA.

#### 5. HERPESTIS.

#### 6. HYDROTRIDA.

#### 7. BRAMIA.

Pedicels bibracteolate at the base: outer sepals much wider than the inner: polleniferous stamens 4.

Pedicels bibracteolate at the apex (or in *Gratiola* bractlets occasionally one or lacking): sepals nearly even in width: polleniferous stamens 2.

Anther-sacs transverse across the tip of the filament, often somewhat separated on the expanded connective: corolla mostly over twice as long as the calyx: capsule broadly acute to globose, only slightly furrowed: sepals nearly or quite equal in length.

Anther-sacs vertical, contiguous: corolla slightly exceeding the calyx: capsule narrowly pyramidal, deeply furrowed: sepals very unequal in length.

Corolla salverform, very narrow at the throat and short-pubescent within on all sides: capsule loculicidal: leaf-blades entire.

Leaves dimorphic, several narrow submerged ones on the short caudex-like stem and a pair of broad ones (bracts), which serve as floats at the tip of the elongate scape: capsule wider than long, deeply notched.

Corolla with 2 raised ridges (each formed by the adherence of a filament) to the antero-lateral sinuses, and which project as knob-like processes beyond this point: posterior lobes of the corolla less than two-thirds the length of the anterior.

Corolla violet-blue, 6 mm. long or more: only the postero-lateral filaments with anthers: style with enlarged callose semi-persistent base: capsule 2 mm. long or more, ellipsoid to ovoid, permanently 2-celled, septicidal: sepals 5.

Corolla white, 2 mm. long or less: only the antero-lateral stamens present: style not enlarged at the base, wholly deciduous: capsule 1 mm. long or less, globose, 1-celled (by lack of septum distally), rupturing irregularly: sepals 4.

Sepals united only at the base: corolla with posterior lobes wholly united, about half the length of the anterior: styles united fully three-fourths their length: leaf-blades orbicular or nearly so.

Sepals united at least half their length, except on the anterior side: corolla open nearly to the base on the posterior side, the posterior lobe lacking: styles united half to two-thirds their length: leaf-blades obovate-elliptic.

Leaf-blades bipinnatifid: seeds pale greenish-yellow, or nearly colorless: corolla lavender.

### III. MIMULEAE

Tall glabrous perennial herbs: corolla personate, violet.

### IV. VERBASCEAE

Tall perennial or biennial herbs, with sessile or decurrent leaf-blades and yellow or white corollas.

### V. CHELONEAE

Flower-stalk bibracteolate, the simple inflorescence nearly spicate, the flowers crowded: bracts and bractlets broad: corolla with orifice closed by the lower lip: anthers lanose: seed flattened, winged.

Flower-stalk not bracteolate: inflorescence compound, paniculate or thyrsoïd, of axillary cymose flower-clusters:

8. MECARDONIA.

9. GRATIOLA.

10. TRAGIOLA.

11. SOPHRONANTHE.

12. AMPHIANTHUS.

13. ILYSANTHES.

14. GLOBIFERA.

15. HEMIANTHUS.

16. LEUCOSPORA.

17. MIMULUS.

18. VERBASCUM.

19. CHELONE.

bracts attenuate: corolla with orifice open: anthers barbate or glabrous: seeds turgid, wingless.

Corolla purple, violet-blue, or white: posterior filament slender, as long as the others: cauline leaves with clasping blades: stem terete.

Corolla greenish-purple or brownish: posterior filament scale-like, 2-lobed: cauline leaves with petioled blades: stem 4-angled.

20. *PENSTEMON*.21. *SCROPHULARIA*.VI. *RUSSELIEAE*

Tall diffuse perennial herb, with rush-like stems and scale-like leaves (except on shoots).

22. *RUSSELIA*.VII. *ANGELONIEAE*

Erect perennial herb with leafy stems: corolla violet.

23. *ANGELONIA*.VIII. *COLLINSIEAE*

Low annual herb with broad leaf-blades and axillary flowers, the corollas partly blue and partly white.

24. *COLLINSIA*.IX. *ANTIERRHINEAE*

Capsule dehiscent by irregular distal ruptures: corolla with the posterior lobes arched and distally spreading: filaments and anthers glabrous: flowers in terminal racemes: leaf-blades narrow, sessile: plants erect.

25. *LINARIA*.

Capsule dehiscent by a lid: corolla with the posterior lobes projecting: filaments and anthers pubescent: flowers axillary: leaf-blades broad, petioled: plant prostrate.

26. *KICKXIA*.X. *VERONICEAE*

Corolla with lobes much shorter than the tube: capsule ovoid, turgid, acute: sepals 5: leaves whorled.

27. *VERONICASTRUM*.

Corolla with lobes longer than the tube: capsule as wide as long or wider, flat: acutish to deeply notched: sepals 4: leaves opposite or alternate.

28. *VERONICA*.XI. *BUCHNERAE*

Stamens with both anther-sacs equally developed: corolla not salverform, the throat open: capsule partly exserted from the calyx: pedicel not bracteolate.

Corolla tubular, orange, fleshy, semi-persistent: anthers much exserted.

29. *MACRANTHERA*.

Corolla campanulate or rotate, yellow or rose-purple, membranous, early falling: anthers little or not at all exserted.

Anther-sacs glabrous (or in *Afzelia cassioides* with few bristle-like hairs at apex): corolla rotate: stigma punctiform or capitate.

Corolla densely pubescent within on all sides: filaments didynamous: anther-sacs somewhat cuspidate at the base, opening lengthwise: style persistent on the capsule.

30. *DASISTOMA*.

Corolla finely pubescent in a ring about the base of the filaments: filaments nearly or quite equal: anther-sacs obtuse at the base, opening by apical slits: style deciduous.

31. *AFZELIA*.

Anther-sacs lanose: corolla semi-campanulate: stigma somewhat elongate.

Corolla yellow: anther-sacs with rigid awns at the base: stigma ovoid-capitate.

32. *AUREOLARIA*.

Corolla purple or pink, nearly always with red-purple spots within: anther-sacs rounded or mucronate-setaceous at the base: stigma linguliform.

Leaf-blades of a filiform, linear, or spatulate type, entire: calyx-lobes shorter than the tube or about equalling it: anther-sacs of both pairs of stamens equal.

33. *AGALINIS*.

Leaf-blades of a lanceolate type, some, at least, auriculate-lobed at the base: calyx-lobes longer than the tube: anther-sacs of the posterior stamens smaller.

34. *TOMANTHERA*.

Stamens with only one anther-sac developed, the other wholly abortive: corolla salverform, the throat nearly closed: capsule nearly or quite included in the calyx-tube: pedicel bibracteolate.

35. *BUCHNERA*.

## XII. RHINANTHEAE

Pedice! bibracteolate: calyx-lobes 5: capsule turgid, septi-  
cidal, and tardily also slightly loculicidal: seeds narrow,  
winged.

Pedice! not bracted: calyx-lobes 4: capsule loculicidal:  
seeds broad, wingless.

Corolla yellowish-green, its posterior lobes long-project-  
ing, not hooded at the apex, its anterior lobes very  
short: capsule cylindric-ovoid, equally 2-celled: calyx  
and foliaceous bracts distally scarlet.

Corolla yellow, purplish, or white, its posterior lobes  
arched and hooded, its anterior lobes developed on  
a flat or ridged plane: capsule flattened, ensiform,  
unequally 2-celled: calyx and bracts green.

Anterior lip not raised into a palate: anthers  
glabrous: seeds flat: sepals of each side united to  
the apex: plant perennial.

Anterior lip raised into a yellow densely pubescent  
palate: anthers pubescent: seeds turgid: sepals of  
each side united at the base: plant annual.

36. SCHWALBEEA.

37. CASTILLEJA.

38. PEDICULARIS.

39. MELAMPYRUM.

1. **PAULOWNIA** Sieb. & Zucc. Trees resembling *Catalpa*. Leaves op-  
posite; blades ample, long-petioled. Flowers in a large panicle. Sepals 5,  
united half their length. Corolla violet-blue,  
zygomorphic, the throat broad and two-  
ridged within, the lips slightly spreading.  
Stamens 4, didynamous. Stigmas distinct,  
plate-like. Capsule ovoid, acute, loculicidal.  
Seeds flat, broadly winged.—Eight species,  
Asiatic.

1. **P. tomentosa** (Thunb.) Baill. Large  
tree with flaky bark: leaf-blades 15–40 cm.  
long, ovate, to suborbicular, cordate, entire  
or somewhat three-lobed, densely pubescent  
beneath with stellate hairs: calyx 10–15 mm.  
long; lobes triangular-ovate: corolla 45–55  
mm. long; capsule 30–40 mm. long.—(PRINCESS-TREE. KARRI-TREE.)—Road-  
sides and open woods, occasional throughout E U. S. Nat. of China.—Late Spr.

2. **CAPRARIA** L. Erect branched herb, the root perennial. Leaves  
alternate: blades sessile, serrate, not glandular-punctate. Flowers axillary to  
leaf-like bracts. Sepals 5, distinct, equal.  
Corolla white: tube campanulate, slightly  
pubescent anteriorly: lobes 5, nearly equal,  
spreading, longer than the tube. Stamens 5.  
Stigmas scarcely distinct, short. Capsule  
ovoid, acute, glandular-dotted, septicidal, the  
valves only slightly splitting loculicidally at  
apex. Seeds numerous, reticulate, wingless.  
—Two or three species, tropical American.

1. **C. biflora** L. Stem 3–15 dm. tall, gla-  
brous or pubescent: leaf-blades 2–7 cm. long,  
oblanceolate, cuneate, or elliptic: pedicels  
5–20 mm. long, slender, usually two to an  
axil: sepals 5–7 mm. long, linear: corolla about 10 mm. long, white or violet-  
tinged: capsule 4–6 mm. long: seeds ellipsoid, brown.—Sandy soil, on or near  
beaches, S Fla.—(W. I., Mex., C. A., S. A.)—All year.

3. **SCOPARIA** L. Erect, much-branched herb, the root perennial. Leaves opposite: blades petioled, serrate, glandular-punctate. Flowers axillary to leaf-like bracts. Sepals 4, equal. Corolla white, rotate, lanose-pubescent on all sides: lobes much longer than the tube, the posterior united throughout (so that lobes appear to be only four). Stamens 4. Stigmas minute, mainly united. Capsule ovoid, acute, septicidal, and only slightly loculicidal at apex. Seeds numerous, cylindric-ellipsoid, reticulate, wingless.—About 20 species, tropical and South American.

1. *S. dulcis* L. Stem 3–8 dm. tall, glabrous or slightly pubescent: leaf-blades 1–3 cm. long, ovate to lanceolate, cuneately narrowed to the short petiole: pedicels 3–9 mm. long, slender, one or two to an axil: sepals about 1.5 mm. long, elliptic to elliptic-ovate, three-nerved: corolla white, 4–10 mm. wide; lobes ovate: capsule 1.5–2.5 mm. long: seeds yellowish-brown. [*S. grandiflora* Nash]—(GOAT-WEED.)—Waste-places and cult. ground, Coastal Plain, S Fla. to La. and S Ga.—(*W. I., Mex., C. A., S. A.*)—All year.

4. **MACUILLAMIA** Raf. Creeping and floating succulent, odorless herbs. Leaves opposite: blades entire, palmately 7–9-veined, obscurely glandular-punctate, narrowed to a clasping base. Flowers axillary to leaf-like bracts. Sepals 5, unequal, the posterior one orbicular-oval to oval; the two lateral ovate; the two innermost lanceolate, as long as the others. Corolla white, nearly regular, campanulate: lobes slightly shorter than the tube, equally distinct or the posterior slightly united. Stamens 4. Stigmas peltately flattened. Capsule globose or ovoid, obtuse, nearly equalling the persistent calyx, septicidal or also loculicidal. Seeds numerous, cylindric, finely reticulate, wingless.—About 10 species, natives of tropical and temperate America.

Pedicels 10–15 mm. long, pubescent: corolla 6–8 mm. long: capsule 4–5 mm. long, both septicidal and loculicidal.

Pedicels 5–7 mm. long, nearly glabrous: corolla 3–4 mm. long: capsule 3 mm. long, apparently only loculicidal.

1. *M. rotundifolia*.

2. *M. repens*.

1. *M. rotundifolia* (Michx.) Raf. Stem and branches 2–6 dm. long, pubescent, especially above, forming dense mats in water: leaf-blades 1.5–3.5 cm. long, obovate to obovate-orbicular: pedicels 10–15 mm. long, shorter than the bracts: sepals becoming 4–6 mm. long: corolla 6–8 mm. long, with yellow throat: seeds 0.5 mm. long, yellowish-brown. [*Herpestis rotundifolia* (Michx.) Pursh *Monniera rotundifolia* Michx.]—Ponds, Interior Low Plateaus, Tenn., and more western provinces, Tex. to Colo., N. D., and Ind.—Sum.

2. *M. repens* (Sw.) Pennell. Stem and branches 2–4 dm. long, pubescent, especially above, forming mats in water: leaf-blades 1–2 cm. long, obovate: pedicels 5–7 mm. long, nearly glabrous, much shorter than the bracts: sepals becoming 3–4 mm. long:

corolla 3–4 mm. long. [*Gratiola repens* Sw.]—Pools, near the coast, Georgetown, S. C.—(*W. I.*)—Sum.

5. **HERPESTIS** Gaertn. f. Creeping succulent, odorless herbs. Leaves opposite: blades entire, palmately 3–5-veined, obscurely glandular-punctate, cordate-clasping. Flowers axillary to leaf-like bracts. Sepals 5, very dissimilar, the posterior one orbicular-cordate, the two lateral half-cordate; the two innermost linear-lanceolate, attenuate, slightly shorter than the others. Corolla white, nearly regular, campanulate: lobes shorter than the tube, the posterior united about half their length. Stamens 2. Stigmas distinct, peltately flattened and semi-capitate. Capsule ellipsoid-ovoid, obtuse, enclosed within and much shorter than the persistent calyx, both septicidal and loculicidal. Seeds numerous, ellipsoid-cylindric, finely ridged, wingless.—One species.

1. **H. rotundifolia** Gaertn. f. Stem much-branched, 0.5–2 dm. long, finely pubescent, especially above: leaf-blades 0.5–1.3 cm. long, oval or rounded-ovate: flower-stalks 2–8 mm. long, finely pubescent, shorter than the bracts: outer sepals becoming 3–5 mm. long: corolla 3–4 mm. long: capsule 2–2.5 mm. long: seeds dark-brown. [*H. repens* (Chapm. Fl.) *Septilia repens* (Fl. SE U. S.)].—Muddy and sandy shores, probably tidal, Coastal Plain, Fla. to Md.—(*W. I.*)—Sum.

6. **HYDROTRIDA** Small. Aromatic, succulent, creeping or floating herbs, the roots perennial. Stems distally erect. Leaves opposite: blades entire or obscurely crevate, with 5–7 longitudinal veins, punctate with resinous dots, rounded, clasping at base. Flowers axillary to leaf-like bracts. Bractlets two, borne just beneath the calyx. Sepals 5, very dissimilar, the posterior one cordate, the two lateral half-cordate; the two innermost lanceolate-attenuate, much shorter than the others. Corolla blue, nearly regular, campanulate: lobes slightly shorter than the tube and all pubescent within at base, the posterior lobes somewhat united. Stamens 4. Ovary surrounded by a circle of bristles. Stigmas distinct, lip-like. Capsule narrowly ovoid, acute, glabrous, included in the persistent calyx, septicidal and loculicidal. Seeds numerous, ellipsoid or oval, reticulate, wingless.—About 5 species, American.

1. **H. caroliniana** (Walt.) Small. Stem and branches 2–6 dm. long, distally lanose: leaf-blades 1–2.5 cm. long, ovate to suborbicular or nearly elliptic: pedicels 3–15 mm. long, shorter than the bracts: sepals all exceeding the minute, subulate bractlets, the outer becoming 6–11 mm. long: corolla 9–11 mm. long: capsule

4-5 mm. long: seeds grayish-brown. [*Herpestis amplexicaulis* Pursh *Septilia caroliniana* (Walt.) Small]—Ponds and ditches in pineland, Coastal Plain, S Fla. to E Tex. and Va.—Spr.-fall, or all year S.

7. **BRAMIA** Lam. Creeping, glabrous, succulent, odorless herbs, the root perennial. Stems distally ascending. Leaves opposite, blades entire or obscurely toothed, obscurely glandular-punctate, narrowed to a sessile base. Flowers axillary to leaf-like bracts. Bractlets two, just beneath the calyx. Sepals 5, dissimilar; the posterior one ovate; the two lateral narrower; the two innermost lanceolate, attenuate, slightly shorter than the others. Corolla nearly regular, campanulate, glabrous: lobes equaling the tube, all equally distinct. Stigmas flat, mainly united and semi-capitate. Capsule ovoid, acute, glabrous, more deeply loculicidal than septicidal. Seeds numerous, cylindric or ovoid, finely-ridged, wingless.—About 5 species, tropical.

1. **B. Monnieri** (L.) Pennell. Stem and branches 1-6 dm. long, often forming mats: leaf-blades 0.5-1.7 cm. long, cuneate to elliptic-cuneate: pedicels 5-25 mm. long, usually as long as or longer than the bracts: sepals becoming 5-7 mm. long, much exceeding the linear-attenuate, spreading bractlets: corolla 8-10 mm. long, white or pinkish-white: capsule 4-5 mm. long: seeds grayish-brown. [*Herpestis Monniera* (L.) H.B.K. *Monniera Monniera* (L.) Britton]—Sandy shores of rivers and ponds, most frequently within reach of tides, near the coast, Fla. to Tex., and Va.—(W. I., Mex., C. A., S. A., O. W.)—Spr.-fall, or all year S.

8. **MECARDONIA** R. & P. Erect or diffuse, much-branched, glabrous herbs, the roots perennial, the plant blackening in drying. Stems angled. Leaves opposite: blades toothed, glandular-punctate, narrowed to a sessile base. Flowers axillary to leaf-like bracts. Bractlets two, at the base of the slender pedicel and much shorter than the bracts. Sepals 5, unequal; the outer much wider than the inner. Corolla personate: lobes shorter than the tube, the posterior more or less united and pubescent within at base. Stigmas lip-like. Capsule cylindric or ovoid, acute, glabrous, septicidal, the valves only slightly loculicidal at apex. Seeds numerous, cylindric, reticulate, wingless.—About 20 species, of tropical and temperate America.

Corolla white, the posterior lobes united half to two-thirds their length: sepals unequal, the outer lanceolate, rarely more than twice the width of the inner: plant erect or diffuse.

Corolla yellow, the posterior lobes united nearly to apex: sepals nearly equal in length, the outer ovate, more than thrice the width of the inner: plant procumbent or ascending.

Outer sepals narrowly ovate to ovate, narrowed or slightly rounded at base: pedicels 2-4 times the length of the bracts.

Outer sepals ovate to widely ovate, broadly rounded or cordate at the base: pedicels 1-2 times the length of the bracts.

1. *M. acuminata*.

2. *M. tenuis*.

3. *M. procumbens*.

1. **M. acuminata** (Walt.) Small. Plant erect or nearly so, 1-6 dm. tall: (lower, diffuse, with leaf-blades 1.3-2 cm. long, outer sepals 5-6 mm. long, and

corolla usually 7–8 mm. long, in *M. acuminata peninsularis* of S Fla.; laxly ascending, with ovate leaf-blades only 1–1.7 cm. long and pedicels only 8–12 mm. long, in *M. acuminata microphylla* of longleaf pinelands from N Fla. to Tex. and S Ga.) leaf-blades 3–5 cm. long, spatulate-elliptic or nearly elliptic, serrate-dentate: pedicels 12–30 mm. long, usually exceeding the bracts: sepals 6.8 mm. long: corolla about 10 mm. long, white, with longitudinal purple veins on the posterior side: capsule 5–6 mm. long: seeds dark-gray. [*Herpestis nigrescens* Benth.]—Moist sand or loam, especially near streams, in partial shade, various provinces, Fla. to Tex., Mo., Ky., and Md.—Spr.-fall.

2. *M. tenuis* Small. Plant 0.5–4 dm. long, diffusely ascending or prostrate: leaf-blades 1–2 cm. long, oval, serrate: pedicels 15–35 mm. long, sepals 5–6 mm. long: corolla 7–8 mm. long, deep lemon-yellow, with longitudinal dark veins on the posterior side: capsule 5–6 mm. long.—Light loam or humus over limestone, hammocks and thickets, Everglade Keys, Fla., and lower Florida Keys.—(*W. I.*)—All year, but mostly in spr.

3. *M. procumbens* (Mill.) Small. Plant 0.5–4 dm. long, procumbent and somewhat ascending: leaf-blades 1–2 cm. long, oval or ovate, serrate: pedicels 7–25 mm. long, sepals 6–9 mm. long: corolla 6 mm. long, lemon-yellow, with longitudinal dark veins on the posterior side: capsule 4–6 mm. long.—Moist loam or sand, meadows and edges of hammocks, S Florida.—(*W. I., Mex., C. A., S. A.*)—All year.

9. *GRATIOLA* L. Erect or ascending, branching herbs, the roots perennial or annual. Leaves opposite: blades toothed to rarely entire, more or less glandular-punctate, sessile, or on young shoots petioled. Flowers axillary to leaf-like bracts. Bractlets usually present, borne just beneath the calyx. Sepals 5, nearly equal. Corolla yellow or white, personate: lobes shorter than the tube, the posterior united nearly or quite to apex and pubescent within at base. Two postero-lateral stamens perfect, the antero-lateral represented by rudimentary filaments or wholly lacking, the connective expanded to a pale membrane spreading beyond the anther-sacs, which are turned transversely to axis of flower. Stigmas lip-like. Capsule ovoid-pyramidal to globose, acute or rounded, glabrous, both septicidal and loculicidal nearly or quite to base. Seeds numerous, irregularly tetrahedral, reticulate, wingless.—About 30 species, widely distributed.—HEDGE-HYSSOPS.

Capsule 3–6 mm. long, equalling or slightly exceeding the sepals: stem-leaves narrowed to a sessile or scarcely clasping base: plant annual.

Pedicel slender, 10–45 mm. long: corolla within throat on posterior side pubescent with clavate hairs: capsule ovoid, equalled or exceeded by the sepals.

Corolla 8–10 mm. long: tube greenish-yellow, unlined: leaf-blades elliptic-lanceolate, acute to acuminate.

Corolla (at least of earlier flowers) 15–18 mm. long, the tube white and lined with purple: leaf-blades obovate to oval, obtuse or rounded.

Pedicel stout, 1–12 mm. long: corolla within throat on posterior side pubescent with filiform hairs: capsule globose, usually slightly exceeding the sepals.

Capsule 1–3 mm. long, much exceeded by the sepals: stem-leaves clasping by a wide base: plant perennial.

1. *G. neglecta*.

2. *G. floridana*.

3. *G. virginiana*.

Corolla golden-yellow: capsule 3 mm. long: leaf-blades entire or slightly toothed.

Corolla at least with white lobes; tube delicately lined with purple-brown: capsule 1-2 mm. long: leaf-blades with sharp salient teeth.

Leaf-blades linear-lanceolate to lanceolate, coarsely toothed towards the tip: sepals linear to linear-subulate: corolla-tube dull-yellow.

Capsule usually wider than long: sepals 5-7 mm. long, usually subtended by one or two sepal-like bractlets.

Capsule as long as wide or longer: sepals 3-5 mm. long, subtended by one small bractlet or none.

Leaf-blades elliptic-ovate to ovate, finely serrate throughout: sepals lanceolate to elliptic-lanceolate: corolla-tube white.

4. *G. aurea*.

5. *G. brevifolia*.

6. *G. ramosa*.

7. *G. viscidula*.

1. *G. neglecta* Torr. Stem 1-3 dm. tall, usually much-branched, glandular-pubescent especially above: leaf-blades 1-6 cm. long, elliptic-lanceolate, serrate-dentate, acute or acuminate: pedicels 10-30 mm. long, slender, glandular-pubescent: bractlets equaling or usually longer than the calyx: sepals 3-6 mm. long, linear to linear-lanceolate: corolla 8-10 mm. long; lobes white or pinkish-tinged; throat greenish-yellow: capsule 3-5 mm. long, pyramidal-ovoid, acute: seeds yellow, with longitudinal much more pronounced than transverse reticulations. [*G. virginiana* (Chapm. Fl. SE U. S.)].—Wet loam, usually in deciduous woodland, Piedmont and more northern provinces, Ga. to Tex., Calif., B. C., Ont., and Me.; north of our area more common.—Spr.-sum., then until fall fruiting cleistogamously.

2. *G. floridana* Nutt. Stem 1-4 dm. tall, simple or somewhat branched, finely glandular-pubescent above or glabrate throughout: leaf-blades 2-4 cm. long, obovate or oval, dentate to nearly entire, obtuse or rounded, obscurely glandular-punctate: pedicels mostly 20-45 mm. long, slender, finely glandular-pubescent to glabrate: bractlets equaling or usually longer than the calyx: sepals 3-6 mm. long, linear: corolla 15-18 mm. long, white; throat lined with purple, yellow posteriorly: capsule 3-5 mm. long, ovoid, acute: seeds cylindric, yellow, with longitudinal much more pronounced than transverse reticulations. [*G. macrantha* Chapm.].—Muddy banks and wet woods, Coastal Plain and adj. provinces, N Fla. to Ala. and Ga.—Spr.

3. *G. virginiana* L. Stem 1-4 dm. tall, stout, often much branched, glabrous or nearly so throughout: leaf-blades 2-5 cm. long, elliptic-lanceolate to oval, repand to dentate-serrate, acute or obtuse, obscurely glandular-punctate: pedicels 1-12 mm. long, stout, puberulent or glabrate: bractlets shorter or slightly longer than the calyx: sepals 4-6 mm. long, linear: corolla 9-14 mm. long, white; throat lined with purple on the upper side: capsule 4-7 mm. long, globose: seeds linear-cylindric, yellow, with longitudinal and transverse reticulations equally pronounced. [*G. sphaerocarpa* Ell.].—Wet shaded places, along streams and ponds, Coastal Plain from C pen. Fla. to E Tex., and N. J.; inland through the Blue Ridge and Appalachian Valley, and in the Mississippi Valley to Ia. and Ohio.—Spr., then until fall fruiting cleistogamously.

4. *G. aurea* Pursh. Stem 1-4 dm. long, erect or weakly ascending, usually branched, glandular-puberulent above: leaf-blades 1-2.5 cm. long, linear-lanceolate to lanceolate-ovate, conspicuously glandular-punctate, clasping at base: pedicels becoming 10-25 mm. long, slender, glandular-puberulent: bractlets

shorter than the calyx: sepals 4–7 mm. long, linear-lanceolate to lanceolate: corolla 10–15 mm. long, golden-yellow, unlined; capsule 3 mm. long: seeds strongly reticulate, brown. [*G. georgiana* Pennell]—Wet pine-barrens, occasional or rare, Coastal Plain, N Fla. to Ala. and N. C.; more abundant northward, to Que. and Newf.—Spr.–fall.

5. *G. brevifolia* Raf. Stem 2–4 dm. long, laxly ascending, simple or little branched, glandular-puberulent above: leaf-blades 1–2.5 mm. long, linear-lanceolate, clasping at base: pedicels becoming 12–20 mm. long, slender, glandular-puberulent: bractlets equalling the calyx: sepals 5–7 mm. long, linear: corolla 10–12 mm. long; lobes white, the throat yellow, lined with brown; capsule 1–2 mm. long, wider than long: seeds strongly reticulate, brown. [*G. Drummondii* Benth.]—Moist or wet sandy soil in pinelands, Coastal Plain from N Florida to E Texas and S Ga.; inland on sandstone ridges to northwestern Georgia and the Cumberland Plateau of E Tenn.—Spr.–fall.

6. *G. ramosa* Walt. Rootstock much branched: stem 1–3 dm. tall, simple or little branched, densely glandular-puberulent above: leaf-blades 0.7–1.5 cm. long, linear to lanceolate, clasping at base: pedicels becoming 6–17 mm. long, glandular-puberulent: bractlets vestigial or wholly lacking: sepals 3–5 mm. long, linear-subulate: corolla 10–14 mm. long; lobes white; throat yellow, lined with brown: capsule 1–2 mm. long, as long as or longer than wide: seeds finely reticulate, brown.—Moist or wet sandy soil in pinelands, Coastal Plain, S Fla. to La. and Md.—Spr.

7. *G. viscidula* Pennell. Rootstock short and nearly simple: stem 2–6 dm. tall, simple or little branched, viscid-puberulent or pubescent: leaf-blades 1–2 cm. long, oblong-ovate to ovate, widely clasping at base: pedicels 10–15 mm. long, glandular-pubescent: bractlets nearly equalling the calyx: sepals 5–7 mm. long, lanceolate to elliptic-lanceolate: corolla 8–11 mm. long, white; throat lined with purple: capsule 2 mm. long, globose-ovoid: seeds strongly reticulate, brown. [*G. viscosa* Schwein. not Hornem.]—Swales and along streams, Blue Ridge and Piedmont, C Ga. to E Tenn. and N Del.—Sum.

10. **TRAGIOLA** Small & Pennell. Erect herbs, from a short rootstock. Leaves opposite: blades serrate, glandular-punctate, the cauline rounded to a clasping base, the basal short-petioled, forming a winter-rosette. Flowers axillary to bracts. Bractlets two, just beneath the calyx. Sepals 5, unequal. Corolla white, personate, nearly tubular: lobes short, the posterior united nearly to apex and pubescent within at base. Two postero-lateral stamens polleniferous, the antero-laterals represented by rudimentary filaments. Connective not dilated. Stigmas lip-like. Capsule narrowly pyramidal, acuminate, deeply-sulcate, glabrous, septicidal, the valves only slightly loculicidal at apex. Seeds numerous, irregularly tetrahedral, obscurely lined, wingless.—One species.

1. *T. pilosa* (Michx.) Small & Pennell. Stem 2–6 dm. tall, hirsute (or nearly or quite glabrous and with shorter leaves and bracts in *T. pilosa epilis*, which occurs in S Fla.); leaf-blades 1–2 cm. long, ovate or oval, slightly serrate to nearly entire: pedicels less than 1 mm. long: sepals 5–7 mm. long, linear to linear-subulate, somewhat exceeded by the bractlets: corolla 5–9 mm. long, the throat with

faint bluish-purple lines: capsule 4–5 mm. long: seeds yellowish. [*Gratiola pilosa* Michx. *Sophranathe pilosa* (Michx.) Small]—Pinelands, Coastal Plain, C pen. Fla. to E Tex. and N. J.; inland through northern Ala. and northern Ga., reaching the mountain-valleys of E Tenn. and W N. C.—Sum.—fall.

**11. SOPHRONANTHE** Benth. Erect much branched herbs, with perennial roots, the plant covered nearly throughout with stiff white bristle-like hairs. Leaves opposite; blades entire, strongly revolute, obscurely glandular-punctate, sessile. Flowers sessile, axillary to leaf-like bracts. Bractlets two. Sepals 5, very unequal, the outer three longer than the inner two. Corolla white, salverform, slightly personate: tube very narrow, short-pubescent within on all sides; lobes shorter than the tube, the posterior united to apex. Two postero-lateral stamens polleniferous, the antero-laterals represented by rudimentary filaments or lacking. Connective not dilated. Stigmas lip-like. Capsule narrowly pyramidal, acuminate, deeply sulcate, glabrous, loculicidal. Seeds numerous, nearly rectangular, finely lined, wingless.—One species.

**1. S. hispida** Benth. Stem 0.5–2 dm. tall, hispid: leaf-blades 0.8–1.5 cm. long, firm, linear, glabrous and whitened as by an incrustation above, with hispid midrib beneath: sepals 3–6 mm. long, linear to linear-lanceolate, all exceeded by the bractlets: corolla 10–13 mm. long: capsule 4–5 mm. long: seeds nearly black. [*Gratiola subulata* Baldw.]—Dry pinelands, Coastal Plain, S Fla. to Miss. and S Ga.—Spr.—fall.

**12. AMPHIANTHUS** Torr. Delicate glabrous annual herb, from a caudex sending up several lax stems each buoyed to the surface of the water by the pair of leaves that act as floats. Leaves opposite; blades obscurely glandular-punctate, dimorphic; the basal immersed ones lanceolate, acute, widely sessile; the distal floating ones oval, rounded at apex, narrowed to a semi-petiole base. Flowers axillary to both types of leaves, although from the two floating leaves there is usually only one, seemingly terminal, the basal flowers probably cleistogamic. Bractlets none. Sepals 5, slightly united, somewhat unequal. Corolla of emerged flowers white or whitish, campanulate, slightly personate; lobes shorter than the tube: while not seen, the corollas of the basal flowers probably do not open. Stamens 2. Stigmas plate-like. Capsule wider than long, flattened contrary to septum, of two rounded cavities, loculicidal to base, even splitting the septum. Seeds numerous, cylindric, reticulate, wingless.—One species.

**1. A. pusillus** Torr. Stem filiform, 0.1–0.5 dm. long branched only at base: leaf-blades about 0.5 cm. long: pedicels 0.5–2 mm. long,

shorter than the bracts: sepals 1 mm. long: corolla (of emersed flowers) 6–8 mm. long: capsule 2 mm. long, 3 mm. wide: seeds 1–1.2 mm. long, those of the basal capsules smaller.—Aquatic in shallow depressions in granite rocks, Piedmont, Ga.—Spr.—The seeds of this plant apparently lie dormant during dry seasons, and germinate in years of heavy winter precipitation. It is accordingly to be found only at long or irregular intervals.

**13. ILYSANTHES** Raf. Erect, diffuse or creeping herbs, usually much-branched, with biennial or annual roots. Leaves opposite: blades toothed to entire, glandular-punctate, sessile or somewhat petioled. Flowers axillary to leaf-like bracts. Bractlets none. Sepals 5, distinct or united, linear, slightly unequal in length. Corolla blue-violet or paler, zygomorphic: lobes shorter than the tube, the two posterior arched and united over half their length, the three anterior projecting and with two conspicuous yellow pubescent ridges formed by the adnate proximal portions of the anterior filaments. Filaments four, didynamous, the two posterior shorter, anther-bearing; the two anterior projecting distally as two short yellow pubescent processes, at or near the apex of which a reflexed glabrous upcurving prolongation may be evident. Stigmas plate-like. Capsule narrowly ellipsoid to ovoid, somewhat oblique by the greater development of the anterior carpel and with the callose white style-base attached posteriorly; glabrous, septicidal throughout. Seeds numerous, yellowish, nearly ellipsoid, prismatic-angled or winged, with fine transverse lines.—About 70 species, widely distributed, especially in warm regions.—FALSE-PIMPERNELS.

Stem prostrate and extensively creeping: leaf-blades orbicular to ovate-orbicular, rounded at base, all closely sessile: seeds winged. I. BAZINA.

Stem erect or ascending: leaf-blades more or less elongate, at least the lowermost narrowed at the base: seeds not winged. II. EUILYSANTHES.

#### I. BAZINA

Matted plant, conspicuous when in flower by the numerous mottled corollas.

#### 1. *I. grandiflora*.

#### II. EUILYSANTHES

Seeds much longer than wide, truncate: basal leaves small or lacking, not tending to form a rosette: stem and pedicels slightly ridge-angled.

Seeds pale-yellow, mostly twice or thrice as long as wide: leaf-blades 1–3 cm. long, the lower obviously narrowed at base: pedicels shorter or longer than the bracts: later flowers cleistogamous.

#### 2. *I. dubia*.

Seeds brownish-yellow, mostly less than twice as long as wide: leaf-blades 0.5–1.5 cm. long, nearly all widest near base and rounded-clasping: pedicels much exceeding the bracts: corollas throughout the season all open.

#### 3. *I. inaequalis*.

Seeds as wide as long, apiculate: basal leaves usually larger, present most of the season and forming a winter-rosette: stem and pedicels prominently ridge-angled.

Stem 0.3–1 dm. tall, uniformly leafy, the cauline leaves being little smaller than the basal: pedicels 7–15 mm. long: capsule 1–2 mm. long.

#### 4. *I. saricola*.

Stem 1–3 dm. tall, nearly bare above, the upper leaves being reduced to subulate bracts: pedicels 15–50 mm. long: capsule 3–5 mm. long.

#### 5. *I. monticola*.

**1. *I. grandiflora*** (Nutt.) Benth. Stems 0.2–4 dm. long, much-branched, extensively creeping: leaf-blades 0.5–1 cm. long, orbicular or ovate-orbicular,

crenate-serrate to entire, finely glandular-punctate: pedicels 15–40 mm. long, erect, obscurely puberulent: sepals 2–4 mm. long, glabrate: corolla 8–10 mm. long, violet-blue, within paler, the posterior lobes pale and with violet-blue median streaks, the anterior lobes white, but with two violet-blue blotches near the bases of the lobes: capsule 4–6 mm. long: seeds brownish-yellow, cylindric, scarcely longer than wide, slightly curved, with 5 to 7 thin wings. [*Bazina nudiflora* Raf.].—Moist sandy soil, Coastal Plain, S Fla. to S Ga.—Spr.—fall or all year S.

2. *I. dubia* (L.) Barnhart. Stems 0.5–2.5 dm. tall, often much branched and diffusely spreading: leaf-blades dentate, serrate, or nearly entire: those of the lower leaves obovate or elliptic narrowed at base, 1–3 cm. long; the upper smaller and frequently ovate, with rounded clasping base: pedicels 3–20 mm. long: sepals 3–5 mm. long, usually finely pubescent: corolla 7–10 mm. long, pale-lavender, deeper in color near margin of lobes: capsule 3–5 mm. long: seeds nearly cylindric, pale-yellow. [*I. gratioloides* (L.) Benth. *I. attenuata* (Muhl.) Small.].—Swamps and stream-margins, usually loam, open or shaded, various provinces, N Fla. to Tex., Nebr., Wis., and N. B.—Sum.; in fall fruiting cleistogamously.

3. *I. inequalis* (Walt.) Pennell. Stems 0.3–2 dm. tall, much-branched and diffusely spreading: leaf-blades 0.5–1.5 cm. long, remotely toothed or usually entire, mostly ovate and rounded-clasping, only the lowermost sometimes narrowed at base: pedicels 10–20 mm. long: sepals 2–3 mm. long, glabrate or glabrous: corolla 6–8 mm. long, white or faintly tinged with lavender: capsule 2–4 mm. long: seeds cylindric-angled, brownish-yellow. [*I. gratioloides* (Fl. SE. U. S.)].—Wet sandy places, usually open, Coastal Plain and more northern provinces, Fla. to Tex., N. Dak., and N. H.—Sum.—fall.

4. *I. saxicola* (Curtis) Chapm. Stems 0.3–1 dm. tall, somewhat tufted, simple or sparingly branched: blades of the cauline leaves 0.3–0.7 mm. long, narrowly elliptic or somewhat spatulate, entire, obviously glandular-dotted, narrowed at base: pedicels 7–15 mm. long, obscurely glandular-puberulent: sepals 1–2 mm. long, glabrous: corolla 9–12 mm. long (not seen fresh): capsule 1–2 mm. long: seeds ovoid, brownish-yellow.—On rocks in rapid streams, Blue Ridge, Ga. to N. C.—Sum.—fall.

5. *I. monticola* (Nutt.) Raf. Stems 1–3 dm. tall, rising from out a rosette of leaves that persists most of the year, simple or laxly branched: basal leaf-blades elliptic-oval to oval, undulate-dentate to entire, obviously glandular-punctate, 15–23 mm. long, narrowed to short petiolar bases; blades of the cauline leaves smaller, rapidly diminishing above, the upper being slender subulate-linear scales only 2–3 mm. long: pedicels obscurely glandular-puberulent to glabrous: sepals 1.5–3 mm. long, glabrous: corolla 9–11 mm. long, violet-purple, within paler, streaked and blotched: capsule 3–5 mm. long: seeds globose-ovoid, brownish-yellow. [*I. refracta* (Ell.) Raf.].—Moist sandy open soil, various provinces, N Fla. to Ala., and N. C.—Spr.—fall.

14. **GLOBIFERA** J. F. Gmel. Creeping glabrous annual herbs, extensively branching and forming soft mats. Leaves opposite: blades entire, obscurely or not glandular-punctate, sessile or nearly so. Flowers axillary to leaf-like bracts. Bractlets none. Sepals 4, slightly united, elliptic, uniform.

Corolla white, glabrous, rotate, lobes longer than the tube, the 2 posterior united to apex, so appearing as one lobe which is smaller than the other 3. Filaments two (only the antero-lateral present), exserted, arising from swollen, but scarcely projecting bases. Stigmas lip-like, borne on the distinct style-tips. Capsule globose, glabrous, at maturity one-celled, rupturing irregularly by the break-down of the thin wall. Seeds numerous, yellowish, cylindric, prismatic-angled, with fine transverse lines.—Two or 3 species, American.

1. *G. umbrosa* (Walt.) J. F. Gmel. Stem 0.5–3 dm. long, slender: leaf-blades 0.3–1.1 cm. long, somewhat cuneately narrowed at base: pedicels 0.5–1 mm. long: sepals 1.5 mm. long: corolla 1.5 mm long: capsule 1 mm. long. [*Micranthemum orbiculatum* Michx.]—Wet shaded loam, often in shallow pools, Coastal Plain, C pen. Fla. to Tex., and N. C.—(W. I., S. A.)—Spr.–fall.—The suborbicular leaf-blades are usually much less than 1 cm. long.

15. **HEMIANTHUS** Nutt. Creeping glabrous annual herbs, extensively branching and forming small mats. Leaves opposite or in threes: blades entire, not glandular-punctate, sessile. Flowers axillary to leaf-like bracts. Bractlets none. Sepals 4, united at least half their length, but on the anterior side distinct nearly to base. Corolla 1-lipped, open nearly to base on the posterior side (the posterior lobes wholly lacking), the lip deflexed-spreading, 3-lobed, pubescent with short yellow hairs on the two ridges to the sinuses. Filaments two (only the antero-lateral present), projecting distally as two yellow-pubescent processes just below the bases of which upcurve the glabrous anther-bearing portion of the filament. Stigmas narrowly flattened, widely divaricate on the free style-tips. Capsule globose, glabrous, at maturity 1-celled, rupturing irregularly by the break-down of the thin wall. Seeds numerous, yellow, cylindric, prismatic-angled, with fine transverse lines.—About 7 species, mostly West Indian.

1. *H. glomeratus* (Chapm.) Pennell. Stem 0.2–0.5 dm. long (or, when submersed, occasionally 2 dm. long), slender: leaf-blades 0.2–0.3 cm. long (or, when submersed, reaching 0.7–0.8 cm. long), cuneately narrowed at base: pedicels very short, usually about 0.5 mm. long: calyx 1 mm. long: lobes acute, about  $\frac{1}{2}$  the length of the tube: corolla 1.5–2 mm. long, white, the anterior lobes short: capsule 0.7 mm. long. [*Micranthemum Nuttallii glomeratum* Chapm. *Hemianthus micranthemoides* (Fl. SE. U. S.)]—Sandy shores of lakes and rivers, Coastal Plain, pen. Fla.—Spr.–fall, or all year S.

16. **LEUCOSPORA** Nutt. Erect, hairy, annual, much branched herbs. Leaves opposite: blades deeply-pinnatifid, not punctate, petioled. Bractlets none. Sepals 5, distinct, linear-attenuate, uniform. Corolla personate: lobes shorter than the tube, the two posterior united nearly to apex, the anterior

spreading-projecting and slightly pubescent at base. Filaments four, didynamous. Stigmas plate-like. Capsule ovoid, glabrous, septicidal nearly to base, the valves only slightly loculicidal near apex. Seeds numerous, pale greenish-yellow or nearly colorless, ellipsoid-cylindric, ridged and with fine transverse lines.—One species.

1. *L. multifida* (Michx.) Nutt. Stem 1–3 dm. tall, glandular-pubescent: leaf-blades with two pairs of divaricately spreading segments that, like the terminal segment, are slightly dentate to sharply lobed, the larger leaf-blades 1–2 cm. long on ill-defined petioles 0.5–1 cm. long: pedicels 3–7 mm. long, pubescent: sepals 3–5 mm. long, finely pubescent: corolla 3–4 mm. long; lobes with violet-purple lines; tube within yellow and purplish: capsule 3–4 mm. long. [*Conoclea multifida* (Michx.) Benth.]—Sandy river-bars and stream-banks, various provinces, Ga. to Tex., Kans., and Ohio.—Sum.—fall.

17. *MIMULUS* L. Erect, glabrous, much branched herbs, with rootstocks. Leaves opposite: blades serrate, not punctate, petioled or sessile. Flowers axillary to leaf-like bracts. Bractlets none. Calyx-lobes 5, shorter than the tube, nearly uniform. Corolla violet or violet-purple, personate: lobes shorter than the tube, the two posterior united over half their length with their free portions sagittally erect, the anterior spreading; the throat with two ridges running to the antero-lateral sinuses, these ridges pubescent, mottled with yellow and also spotted with purple. Stamens 4, didynamous, glabrous. Stigmas plate-like, sensitive. Capsule cylindric, glabrous, enclosed within the persistent calyx, loculicidal. Seeds numerous, yellow, cylindric, minutely or obsoletely reticulate, wingless.—About 70 species, mostly American.—MONKEY-FLOWERS.

Leaf-blades petioled: angles of stem usually slightly winged: calyx-lobes setaceous-tipped, 0.5–2 mm. long.

Leaf-blades clasping (or rarely only sessile): angles of stem not winged: calyx-lobes lanceolate, 3–5 mm. long.

1. *M. alatus*.

2. *M. ringens*.

1. *M. alatus* Ait. Stem 4–12 dm. tall, simple or somewhat branched: leaf-blades 5–15 cm. long, elliptic-oval, oval, or ovate: pedicels 0.5–1.5 (–3) cm. long: calyx-lobes setaceous-tipped: corolla 25–35 mm. long, as in *M. ringens*, but frequently more purplish, with smaller spots and fainter brownish patches: capsule 10–12 mm. long.—Shaded swamps, Piedmont and more northern provinces, and along river-bottoms in the Coastal Plain, N Fla. to E Tex., Nebr., Mich., and Conn.—Sum.

2. *M. ringens* L. Stem 5–12 dm. tall, usually much branched: leaf-blades 5–12 cm. long, narrowly lanceolate to ovate-lanceolate: pedicels 3–6 cm. long: calyx-lobes lanceolate-attenuate: corolla 25–30 mm. long, pale hortense-violet, throat anteriorly with purple-red spots and proximally two yellow areas

mottled with faint brownish patches: capsule 10–12 mm. long. [*M. menthoides* Greene]—Swamps and swales, Piedmont and more northern provinces, C Ala. to Colo., Minn., and N. S.; descending along rivers into Coastal Plain as reported from Quincy, Fla.—Sum.

**18. VERBASCUM L.** Erect, simple or virgately branched herbs, with a perennial or biennial tap-root. Leaves alternate: blades toothed or entire, those of the cauline sessile, clasping, or sometimes decurrent. Flowers in spikes, racemes, or panicles, the bracts much smaller than the leaves. Bractlets none. Sepals 5, uniform. Corolla rotate, slightly zygomorphic: lobes longer than the tube, all equally distinct, the anterior larger than the posterior. Stamens 5, exserted, the filaments more or less lanose-pubescent. Stigma capitate. Capsule ellipsoid to subglobose, septicidal. Seeds numerous, gray, minutely tuberculate-lined, wingless.—About 250 species, natives of the Old World.—MULLENS.

Stem glabrous or with simple gland-tipped hairs above: leaves glabrous: filaments all densely lanose with knobbed purple hairs: capsule subglobose, glandular-puberulent.

Stem pubescent with stellate, glandless hairs: leaves pubescent, at least beneath: filaments lanose with filiform yellow hairs, the two anterior sparingly so or glabrous: capsule ovoid to ellipsoid, stellate-pubescent.

Leaf-blades crenate, glabrate above, the cauline sessile: pedicels usually several in an axil: sepals about half length of capsule: inflorescence not densely crowded.

Inflorescence a simple raceme, the pedicels one to five to an axil: capsule globose, 7–8 mm. long: leaves green and slightly pubescent beneath.

Inflorescence a panicle of racemes, the pedicels three to twelve to an axil: capsule oblong or oblong-ovoid, 4–5 mm. long: leaves white and densely stellate-tomentose beneath.

Leaf-blades entire or only obscurely crenate, densely pubescent above, the cauline decurrent: pedicels one to an axil: sepals as long as the capsule: inflorescence densely crowded.

1. *V. Blattaria*.

2. *V. virgatum*.

3. *V. Lychnitis*.

4. *V. Thapsus*.

**1. V. Blattaria L.** Stem 4–12 dm. tall, simple or slightly branched, glandular-pubescent above: cauline leaf-blades 2–12 cm. long, elliptic to ovate, doubly serrate-crenate, bright-green above and scarcely paler beneath: pedicels 10–15 mm. long, glandular-pubescent: sepals 5–8 mm. long, linear-lanceolate: corolla 25–30 mm. wide, yellow or white: capsule 6–8 mm. long, glandular-puberulent. — (MOTH-MULLEN.)—Old fields and roadsides, various provinces, C Fla. to Calif., B. C., and Que. Nat. of Eurasia.—Sum.—fall.

**2. V. virgatum With.** Stem 6–12 dm. tall, simple or slightly branched, stellate-pubescent: cauline leaf-blades 7–15 cm. long, lanceolate, crenate, deep-green above and scarcely paler beneath: pedicels 2–5 mm. long, pubescent: sepals 5–6 mm. long, lanceolate: corolla about 25 mm. wide, yellow: capsule 7–8 mm. long, stellate-pubescent.—Waste-places, Coastal Plain, S. C.; Calif.—Nat. of Eu.—Sum.

**3. V. Lychnitis L.** Stem 8–10 dm. tall, usually much branched especially above, floccose-tomentose with short stellate hairs: cauline leaf-blades 10–20 cm. long, elliptic-lanceolate to ovate-lanceolate, crenate, dark-green above, whitened beneath: pedicels 2–10 mm. long, stellate-tomentose: sepals 2–3 mm. long, lanceo-

late: corolla 10–15 mm. wide, yellow: capsule 3–4 mm. long, ovoid.—(WHITE-MULLEN.)—Old fields and roadsides, various provinces, N. C. to Ont., and N. J.—Nat. of Eurasia.—Sum.

4. **V. Thapsus** L. Stem 3–12 dm. tall, usually simple, densely tomentose with floccose stellate hairs: leaf-blades 5–30 cm. long, elliptic to elliptic-ovate, finely crenate to entire, densely stellate-tomentose: pedicels less than 2 mm. long, woolly: sepals 7–9 mm. long, lanceolate or ovate with caudate tip: corolla 15–20 mm. long, yellow: capsule 8 mm. long.—(GREAT-MULLEN. WOOLLY-MULLEN. VELVET-PLANT.)—Old fields, roadsides and thickets, various provinces, Fla. to Calif., S. Dak., and N. S.—Nat. of Eurasia.—Sum.—fall.

19. **CHELONE** L. Odorless glabrous herbs, the erect stems arising from a rootstock. Leaves all cauline, opposite: blades toothed, acuminate, not punctate. Flowers in spike-like racemes, the bracts, excepting the lower ones, sepal-like, broad, entire. Bractlets 2, similar to the bracts but smaller. Sepals 5 uniform, rounded. Corolla purple, greenish, or white, 2-lipped, externally glabrous, internally lanose on the margins of the palate: tube abruptly expanded into an inflated throat: lips shorter than the throat, the posterior lip arched, slightly lobed, the anterior lip projecting, slightly lobed. Polleniferous stamens 4, didynamous, included: anther-sacs divaricate, lanose. Sterile posterior filament (staminodium) shorter than the stamens, usually glabrous. Stigma capitate, capsule pyramidal-globose or pyramidal-cylindric, glabrous, distally septicidal. Seeds numerous, winged.—About 8 species, eastern North American.—SNAKE-HEADS. TURTLE-HEADS.

Leaf-blades widest at or near the middle, above the cuneately narrowed base: corolla purple to white, not or only faintly lined within throat on the anterior side, the beard of the anterior lip pale-yellow to white: sterile filament less than half the length of the polleniferous ones: blooming chiefly in September.

Leaf-blades widest near the rounded, truncate, or rarely slightly narrowed base: corolla purple to violet, with well-defined lines of deeper color within the throat on the anterior side, the beard of the anterior lip yellow: sterile filament over half the length of the polleniferous ones: blooming chiefly in August.

Petioles very short or lacking: flowers conspicuously 4-ranked, in nearly leafless, usually elongate spikes: bracts, bractlets, and sepals finely ciliate: corolla tending toward violet, the color-lines wide, the beard light-yellow: sterile filament purple.

Petioles mostly 1.5–3 cm. long: flowers obscurely ranked, in short spikes subtended by scarcely reduced leaves: bracts, bractlets, and sepals strongly ciliate: corolla tending toward purple, the color lines narrow, the beard deep-yellow: sterile filament white or pinkish-tipped.

#### I. EUCHELONE.

#### II. SESSILES.

#### III. PETIOLATAE.

#### I. EUCHELONE

Corolla white throughout, or distally purple or green: sterile filament green or greenish: sepals obscurely ciliate: leaf-blades rather thick and usually duller green.

Distal portion of corolla white or green, externally only faintly if at all purplish.

Leaf-blades 2–4 cm. wide, with ascending teeth, decidedly paler beneath, on petioles 0.2–0.6 cm. long: corolla rounded or slightly keeled posteriorly, distally often purplish, and with purple tinge internally.

Leaf-blades 3–6 cm. wide, with spreading teeth, only slightly paler beneath, on petioles 0.6–1.2 cm. long: corolla strongly keeled posteriorly, distally yellowish-green, without purple tinge even internally.

Distal portion of corolla purple: petioles 0.5–1.5 cm. long, and leaf-blades lanceolate to elliptic-oval, the larger 2–6 cm. wide.

1. *C. glabra*.

2. *C. chlorantha*.

3. *C. montana*.

Corolla purple throughout: sterile filament white or rarely greenish-tipped: sepals manifestly ciliolate: leaf-blades rather thin and deep-green.

4. *C. obliqua*.

## II. SESSILES

Tall plant with leaf-blades rounded to the stem.

5. *C. Cuthbertii*.

## III. PETIOLATAE

Low plant with wide-spreading ample leaf-blades.

6. *C. Lyoni*.

1. *C. glabra* L. Stem 8–16 dm. tall: leaf-blades 7–15 cm. long, lanceolate to elliptic-lanceolate (or linear-lanceolate and the spikes usually much elongate in *C. glabra elongata* of W Tenn. and S Ind.), slightly to moderately serrate, glaucous and glabrous or pubescent beneath, acuminate, at base cuneately narrowed: spike slightly or considerably elongate, the flowers obscurely ranked: bractlets 4–7 mm. long, oval or elliptic-oval, rounded: sepals 7–10 mm. long, elliptic or widely elliptic, rounded: bracts, bractlets, and sepals minutely ciliolate and scarious, the sepals somewhat erose: corolla 25–33 mm. long, rounded or slightly keeled posteriorly, white, sometimes distally faintly purplish and normally dull-purple within the lips (or with greenish-yellow corolla-tips that are only slightly or not at all purple within and a tendency to more elongate and laxer spikes, in *C. glabra ochroleuca*, of the Coastal Plain from N. C. to Md.), the anterior lip with white or faintly yellowish beard and with the lateral margins somewhat deflexed: sterile filament  $\frac{1}{3}$  to  $\frac{1}{2}$  the length of the polleniferous ones: capsule 10–12 mm. long.—Swamps and along streams, Piedmont and more northern provinces, Ga. to Minn. and Newf.—Fall.

2. *C. chlorantha* Pennell & Wherry. Stem 9–15 dm. tall: leaf-blades 9–18 cm. long, elliptic-lanceolate to elliptic-ovate, sharply dentate-serrate, glabrous and slightly glaucous beneath, long-acuminate, at base cuneately narrowed to the petiole: spike becoming elongate, the flowers obscurely ranked: bractlets 4–6 mm. long, oval or elliptic, obtuse or rounded: sepals 6–9 mm. long, elliptic, obtuse or rounded: bracts, bractlets, and sepals minutely ciliolate, the sepals with narrow scarious margin: corolla 23–28 mm. long, proximally white, the anterior lip with pale-yellow beard and with the lateral margins much deflexed: sterile filament  $\frac{1}{3}$  to  $\frac{1}{2}$  the length of the polleniferous ones: capsule not seen.—Swamps and along streams, Blue Ridge and adj. Piedmont, N. C.—Fall.

3. *C. montana* (Raf.) Pennell & Wherry. Stem 6–12 dm. tall: leaf-blades 9–18 cm. long, lanceolate (or elliptic or elliptic-oval and dentate-serrate borne on a larger plant; corolla usually 30–36 mm. long, and capsule 10–12 mm. long, in *C. montana elatior*, a plant of lower elevations and occurring as far south as N Ga.), sharply serrate, glabrous and slightly glaucous beneath, long-acuminate, at base cuneately narrowed: spike only slightly elongate, the flowers obscurely ranked: bracts acute to acuminate: bractlets 3–5 mm. long, broadly oval, rounded: sepals 8–10 mm. long, elliptic, rounded: bracts, bractlets, and sepals minutely ciliolate and somewhat erose, the margin somewhat scarious and purplish: corolla usually 25–30 mm. long, slightly keeled posteriorly, proximally white, the anterior lip with slightly yellowish beard and usually with spreading lateral margins: sterile filament  $\frac{1}{3}$  the length of the polleniferous

ones: capsule not seen.—Sphagnum bogs and stream-margins, at high elevations, Blue Ridge to Appalachian Plateau, N. C. to Ky. and Pa.—Sum.—fall.

4. *C. obliqua* L. Stem 8–15 dm. tall: leaf-blades 8–18 cm. long, elliptic to ovate-elliptic, irregularly serrate, slightly pubescent or glabrous, slightly paler beneath, acute to usually acuminate, at base cuneately narrowed to the petiole which is 0.5–1.5 cm. long: spike usually somewhat elongate, the flowers obscurely ranked: bracts 6–10 mm. long, broadly ovate, acute to acuminate: bractlets 5–7 mm. long, obtuse: sepals 6–10 mm. long, widely elliptic, rounded: bracts, bractlets, and sepals ciliate, and the sepals with pale or purplish scarious margins: corolla 25–32 mm. long, rounded and faintly keeled posteriorly, purple (paler and duller, with the sterile filament usually green-tipped, and leaf-blades decidedly paler beneath, in *C. obliqua Erwiniae* of the Blue Ridge, N. C.), the anterior lip with faintly yellowish or dull-yellow beard and with the lateral margins somewhat deflexed: sterile filament  $\frac{1}{2}$  to  $\frac{1}{2}$  the length of the polleniferous ones: capsule not seen.—Alluvial swamps, Coastal Plain and Mississippi Valley, Fla. to Ark., Iowa, and Md.—Fall.

5. *C. Cuthbertii* Small. Stem 4–15 dm. tall: leaf-blades 5–10 cm. long, lanceolate to ovate, finely to rather coarsely serrate, glabrous, pale and slightly lustrous beneath, attenuate-acuminate, rounded at base, nearly sessile to somewhat clasping: spike usually elongate, the flowers conspicuously 4-ranked: bractlets 3–5 mm. long, broadly oval, rounded: sepals 7–9 mm. long, elliptic or widely elliptic, rounded: bracts, bractlets, and sepals finely ciliate, with purple scarious margins: corolla 20–25 mm. long, slightly keeled posteriorly, violet-purple, broadly striped on the anterior side, the anterior lip with light yellow beard and with the lateral margins strongly deflexed: sterile filament purple,  $\frac{1}{2}$  to  $\frac{3}{4}$  the length of the polleniferous ones: capsule 10–12 mm. long: seeds 3 mm. long. [*C. Grimesii* Weatherby]—Boggy meadows and thickets, Piedmont and Blue Ridge, N. C.; and in the Coastal Plain of Va.—Sum.

6. *C. Lyoni* Pursh. Stem 6–10 dm. tall: leaf-blades 10–20 cm. long, ovate, evenly serrate, finely pubescent to glabrous, somewhat glaucous beneath, conspicuously acuminate, at base broadly rounded or somewhat narrowed to the slender petiole: spike short, the flowers obscurely ranked: bractlets 3–4 mm. long, broadly oval, rounded: sepals 7–9 mm. long, elliptic or widely elliptic, rounded: bracts, bractlets, and sepals strongly ciliate, sometimes with pale or purplish scarious margins: corolla 25–30 mm. long, sharply keeled posteriorly, purple, narrowly striped on the anterior side, the anterior lip with dark-yellow beard and with the lateral margins strongly deflexed: sterile filament white or pinkish-tipped, nearly as long as the polleniferous ones: capsule 10–12 mm. long, not seen mature. [*C. latifolia* Muhl.]—Moist mountain slopes in forest, Blue Ridge, N. C. and Tenn.—Sum.

20. **PENSTEMON** [Mitch.] Schmidel. Strong-scented herbs with erect solitary or several nearly terete stems arising from a short rootstock or caudex, the inflorescence usually glandular. Leaves dimorphic: those of the winter rosettes narrowed into petiole-like bases: cauline-leaves opposite, the blades entire or toothed, or rarely pinnatifid, the upper ones sessile and usually clasping. Flowers paniculate, often thyrsoid. Bractlets none. Sepals 5, uniform. Corolla often somewhat nodding, colored and mostly blue or purple or white, 2-lipped: tube rather abruptly expanded into a more or less inflated throat, whose orifice may remain open or be partly or wholly closed by the uparching of the anterior lip: lobes shorter than the tube. Polleniferous stamens 4, didynamous, included: anther-sacs usually divaricate. Sterile posterior fila-

ment (staminodium) equalling the fertile stamens or longer, with yellow hairs. Stigma capitate. Capsule conic-ovoid, glabrous, septicidal and secondarily slightly loculicidal. Seeds numerous, angled, wingless.—About 300 species, North American.—BEARD-TONGUES.

Leaf-blades of 2 types, the cauline bipinnatifid, those of the basal rosettes entire or few-toothed: staminodium conspicuously exserted. I. DISSECTI.

Leaf-blades all entire or toothed; those of the basal rosettes petioled: staminodium included or slightly exserted.

Anther-sacs dehiscent their entire length, not pouch-like: inflorescence-branches less elongate.

Corolla pubescent with glandless hairs within over the bases of the anterior lobes, the throat well inflated: leaf-blades more or less serrate.

Corolla glandular-pubescent within on all sides, the throat slightly inflated: leaf-blades entire or nearly so. II. GRACILES.

Anther-sacs dehiscent by short proximal slits, the distal part of each sac pouch-like: inflorescence-branches elongate. III. TUBIFLORI.

IV. MULTIFLORI.

#### I. DISSECTI

Plant puberulent: corolla purple and lined.

1. *P. dissectus*.

#### II. GRACILES

Corolla with throat much inflated, only slightly 2-ridged within: anterior lobes little exceeding the posterior: staminodium slightly or moderately bearded.

Anthers normally somewhat bearded: corolla-throat amply inflated, white or slightly tinged or lined with purple: sepals ovate and acuminate-tipped.

Corolla 23-30 mm. long: sepals evidently scarious-margined: inflorescence of 3-5 fascicles, markedly glandular-pubescent.

Corolla 17-23 mm. long: sepals scarcely scarious-margined: inflorescence of 5-7 fascicles, glabrous or sparsely glandular.

Anthers glabrous: corolla-throat less strongly inflated, more or less violet-purple: sepals ovate-lanceolate to linear-attenuate.

Sepals ovate-lanceolate, 3-6 mm. long: corolla 15-20 mm. long: blades of the cauline leaves lanceolate, sometimes narrowly so.

Sepals linear-lanceolate, long-attenuate, 5-12 mm. long: corolla 20-35 mm. long: blades of the cauline leaves broadly lanceolate to ovate.

Corolla with throat narrower, strongly 2-ridged within: anterior corolla-lobes projecting considerably beyond the posterior: staminodium densely bearded.

Corolla lined with deeper color: orifice to the throat open: anther-sacs longer than wide.

Lower bracts of inflorescence foliose, scarcely smaller than the leaves: cauline leaf-blades usually tapering from a wide base, evenly and sharply serrate: radical leaf-blades truncate to cordate at base: corolla 28-35 mm. long: capsule 8-10 mm. long.

Lower bracts of inflorescence much smaller than the leaves: cauline leaf-blades lanceolate or elliptic-lanceolate, more irregularly or less sharply serrate: radical leaf-blades narrowed to petiole: corolla usually smaller.

Throat of corolla moderately inflated, nearly cylindrical: corolla 20-32 mm. long.

Leaf-blades essentially glabrous, deep green above, the cauline rather sharply serrate: stem 2-5 dm. tall: corolla strongly purple.

Leaf-blades somewhat pubescent, dull green above, usually less sharply serrate: stem 3-8 dm. tall: corolla pale-purple or nearly white.

Throat of corolla slightly inflated, nearly tubular: corolla 15-25 mm. long.

Corolla white, merely lined with purple: leaves densely and softly pubescent, velvety to the touch.

Corolla purple or purplish: leaves finely pubescent or puberulent.

2. *P. Digitalis*.

3. *P. alluviorum*.

4. *P. Pentstemon*.

5. *P. calycosus*.

6. *P. Smallii*.

7. *P. Brittonorum*.

8. *P. canescens*.

9. *P. pallidus*.

Sepals less than half the length of the capsule: corolla pale violet-purple, anteriorly with nearly or quite distinct fine lines: primary peduncles ascending-spreading.

Capsule 5-7 mm. long: sepals 2-3 mm. long, obtusish to acute: blades of the cauline leaves elliptic-lanceolate to narrowly ovate, obtuse to acute.

Capsule 8-9 mm. long: sepals 3-6 mm. long, acute to acuminate: blades of the cauline leaves lanceolate, acute to acuminate.

Sepals half the length of the capsule or more: corolla reddish-purple, on all sides with lines that anastomose distally: primary peduncles strongly ascending or erect.

Corolla unlined; orifice to the throat closed by the up-arching lower lip: anther-sacs as wide as long.

Corolla-throat purplish to violet, the lobes white: sepals usually over half the length of the capsule: leaf-blades soon glabrous, except for coarse hairs beneath on midrib.

Corolla-throat and lobes white: sepals less than half the length of the capsule: leaf-blades pubescent on both surfaces, only in age becoming glabrate.

11. *P. pauciflorus*.

12. *P. australis*.

13. *P. hirsutus*.

14. *P. tenuiflorus*.

### III. TUBIFLORI

Plant glabrous: corolla white, unlined; lobes wide spreading.

15. *P. tubiflorus*.

### IV. MULTIFLORI

Plant glabrous: corolla white, unlined; throat campanulate; lobes slightly spreading.

16. *P. multiflorus*.

1. *P. dissectus* Ell. Stem 3-4 dm. tall, puberulent: blades of the cauline leaves bipinnatifid, the segments linear: panicle lax, of 1-3 fascicles: sepals 3-4 mm. long, broadly ovate, acute or abruptly acuminate, the scarious margins erose: corolla 20-25 mm. long, externally violet-purple and paler within, and lined with violet-purple, the throat much inflated; lobes of both lips widely spreading: capsule not seen.—Gravelly soil and rock-ledges, Altamaha Grit, Coastal Plain, Ga.—Sum.

2. *P. Digitalis* Nutt. Stem 7-15 dm. tall, glabrous, frequently purple, slightly shining: blades of the cauline leaves lanceolate, sharply serrate, acuminate: panicle lax, of 3-5 fascicles: sepals 5-8 mm. long, oval or ovate, caudate-acuminate, glandular-pubescent, the margins scarious and erose: corolla 23-30 mm. long, white or externally purplish, sometimes slightly lined with amparo-purple within: capsule 8-9 mm. long.—Fields and roadsides, various provinces, N Ala. to Kans. and Me. Adv. E.—Spr.

3. *P. alluviorum* Pennell. Stem 6-12 dm. tall, dull, finely pubescent or glabrous: blades of the cauline leaves lanceolate, slightly serrate, acuminate, clasping: panicle lax, of 5-7 fascicles: sepals 3-9 mm. long, ovate, caudate-acuminate, the margin slightly scarious: corolla 17-23 mm. long, externally white or slightly purplish, somewhat lined with purple within: capsule not seen mature.—Meadows, especially alluvial, Mississippi embayment of the Coastal Plain, and adj. provinces, Miss. to Ark., Mo., and S Ind.—Spr.

4. *P. Pentstemon* (L.) MacM. Stem 4-10 dm. tall, dull, puberulent to nearly glabrous, sometimes slightly purple: blades of the cauline leaves lanceolate, finely or obscurely serrate, acuminate: panicle lax, of 3-5 fascicles: sepals 3-6

mm. long, ovate-lanceolate, acute or short-attenuate, proximally with erose somewhat scarious margin: corolla 15–20 mm. long, externally violet-purple, within usually white, and faintly lined with purple: capsule 6–7 mm. long. [*P. laevigatus* (L.) Ait.]—Meadows and river-banks, various provinces, N Fla. to S Ala., E Tenn., and Pa.—Spr.

5. *P. calycosus* Small. Stem 6–12 dm. tall, finely pubescent to nearly glabrous, dull or slightly purple: blades of the cauline leaves broadly lanceolate to ovate, finely serrate, acute to acuminate: panicle lax, of 3–5 fascicles: sepals 5–12 mm. long, linear-lanceolate, long-attenuate, the margin sometimes slightly scarious: corolla 20–35 mm. long, externally more or less violet-purple, within paler and with more or less evident purple lines: capsule 7–8 mm. long.—Woods and meadows, limestone ledges and river-banks, Interior Low Plateaus and adj. provinces, N Ala. to Ill. and Ohio.—Spr.

6. *P. Smallii* Heller. Stem 4–8 dm. tall, finely puberulent: blades of the cauline leaves broadly lanceolate to triangular-ovate, sharply serrate: panicle lax, of 3–5 fascicles: sepals 5–7 mm. long, ovate-acuminate, the margins sometimes slightly scarious: corolla 28–35 mm. long, externally amparo-purple, within paler and with many sharply defined purple lines: capsule 8–10 mm. long.—Woods, Blue Ridge and Appalachian Valley, N. C. and Tenn.—Spr.

7. *P. Brittonorum* Pennell. Stem 2–5 dm. tall, finely pubescent or hirsute below, green or purplish: blades of the cauline leaves elliptic-lanceolate, sharply serrate, acute to acuminate: panicle lax, of 3–5 fascicles: sepals 4–5 mm. long, lanceolate or ovate-lanceolate, acuminate, the margin scarious proximally: corolla 25–30 mm. long, purple, paler than *P. Smallii*, and with the color-lines narrower: capsule 7–8 mm. long.—Woods, Blue Ridge, S. C. to Va.—Spr.

8. *P. canescens* Britton. Stem 3–8 dm. tall, pubescent: blades of the cauline leaves elliptic-lanceolate, irregularly serrate: panicle lax, of 3–6 fascicles: sepals 4–7 mm. long, ovate-lanceolate, acuminate to attenuate, the margin obscurely scarious: corolla 22–32 mm. long, externally pale amparo-purple, within white and with many sharply defined purple lines: capsule 6–8 mm. long.—Rocky or sandy woods, Blue Ridge and Appalachian provinces, Ala. to Ky., Pa., and N. C.; rarely in the Piedmont in S Va.—Spr.

9. *P. pallidus* Small. Stem 4–8 dm. tall, pubescent, hirsute below: blades of the cauline leaves lanceolate, serrate or serrate-dentate, acuminate: panicle of 4–7 fascicles: sepals 3–7 mm. long, ovate, acuminate, the margin slightly scarious: corolla 17–22 mm. long, white, within with violet-purple lines: capsule 6–7 mm. long.—Rocky or sandy woods and old fields, N. C. to Ark., Ia., and Vt. Adv. E.

10. *P. brevisepalus* Pennell. Stem 6–8 dm. tall, finely pubescent: blades of the cauline leaves elliptic-lanceolate to ovate-lanceolate, crenate-serrate or serrate, obtuse to somewhat acuminate: panicle lax, of 4–7 fascicles: sepals 2–3 mm. long, ovate, obtusish to acute, the margin slightly scarious: corolla 15–23 (–25) mm. long, externally pale lavender-violet or amparo-purple, within paler and with violet-purple lines: capsule 5–7 mm. long.—Sandy or rocky woods, Appalachian Plateau, Tenn. and Ky.—Spr.

11. *P. pauciflorus* Buckl. Stem 4–8 dm. tall, puberulent: blades of the cauline leaves narrowly lanceolate, sharply serrate, acute to attenuate-acuminate: panicle lax, of 3–6 fascicles: sepals 3–5 mm. long, ovate, acute to acuminate, the margin slightly scarious: corolla 20–25 mm. long, pale-purple, within with fine violet-purple lines: capsule 7–9 mm. long.—Sandy soil, open woodland and prairies, Coastal Plain and adj. provinces, N Fla. to Tex., Okla., and Ark.—Spr.

12. *P. australis* Small. Stem 3–8 dm. tall, finely pubescent, or at the base coarsely pubescent: blades of the cauline leaves lanceolate, usually narrowly

so, slightly serrate, attenuate-acuminate: panicle strict, of 3-7 fascicles: sepals 4-8 mm. long, ovate, acute to acuminate, the margin slightly scarios: corolla 20-25 mm. long, externally reddish-purple, within paler and with conspicuous red-purple lines which are most pronounced on the anterior side: capsule 8-9 mm. long.—Pinelands, granite hills and sandy fields, Coastal Plain and Piedmont, C Fla. to Miss. and S Va.—Spr.

13. *P. hirsutus* (L.) Willd. Stem 4-8 dm. tall, hirsute: blades of the cauline leaves lanceolate, serrate-dentate or sinuately serrate, acuminate, clasping: panicle lax, of 3-6 fascicles: sepals 3-8 mm. long, ovate, acuminate, the margin sometimes slightly scarios: corolla 23-28 mm. long, the tube externally amparo-purple to light-violet, the lobes white: capsule 8-9 mm. long. [*P. pubescens* Ait.]—Rocky bluffs and woods, various provinces, N of Coastal Plain, Tenn. to Wis., Que., and Me.—Spr.

14. *P. tenuiflorus* Pennell. Stem 4-8 dm. tall, hirsute: blades of the cauline leaves lanceolate to ovate, slightly serrate or undulate, acuminate: panicle lax, of 4-7 fascicles: sepals 2-5 mm. long, ovate, acute or short-acuminate, the margin sometimes slightly scarios: corolla 25-30 mm. long, externally glandular-pubescent and white: capsule 8-9 mm. long.—Stony or rocky soil, especially in cedar-glades, Interior Low Plateaus, Ala. to Ky.—Spr.

15. *P. tubiflorus* Nutt. Stem 5-10 dm. tall, glabrous: blades of the cauline leaves elliptic-lanceolate to lanceolate, entire or the upper occasionally finely serrate, acuminate: panicle (thyrsus) strict, of 4-7 fascicles: sepals 3-4 mm. long, triangular-ovate, acuminate, the margin scarios: corolla 20-25 mm. long, white, within glandular-pubescent; lobes of both lips spreading: capsule 7-8 mm. long.—Gravelly banks, mostly along the Mississippi River and tributaries and Ozark Plateau, Tenn. to Tex., Kans., and Ind.—Sum.

16. *P. multiflorus* Chapm. Stem 8-15 dm. tall, glabrous: blades of the cauline leaves oblanceolate, entire or slightly undulate-crenate, acute: panicle diffuse, of 5-8 fascicles: sepals 3-5 mm. long, ovate, obtuse or acutish, the margin slightly scarios: corolla 20-22 mm. long, white or faintly purplish, the throat much inflated; lobes of both lips projecting-spreading: capsule 7-9 mm. long.—Sandy soil, pinelands and scrub, S Fla. to S Ga.—Spr.-sum, or all year S.

21. **SCROPHULARIA** L. Erect strong-scented herbs. Stem arising from a stout rootstock, 4-angled. Leaves opposite: blades relatively broad, toothed, petioled. Flowers in panicles. Bractlets none. Calyx-lobes 5, much longer than the tube. Corolla greenish-purple or purplish-brown, two-lipped: tube cylindric; posterior lip as long as the tube, projecting and flattened, the lobes well united; anterior lip with the lateral lobes vertical, the middle lobe reflexed. Stamens 4, slightly didynamous, barely exerted: anther-sacs divergent. Sterile posterior filament (staminodium) scale-like. Stigma semi-capitate. Capsule conic-ovoid, septicial. Seeds numerous, plump, furrowed.—Over 100 species, native of the Northern Hemisphere.

1. *S. marilandica* L. Stem 8-15 dm. tall: leaf-blades 10-17 cm. long, ovate, often broadly so, serrate or rather finely dentate, rounded or cordate at the base, on nearly

wingless petioles: panicle usually ample and lax, of 4-10 fascicles, often with several pairs of the lower bracts foliaceous: calyx-lobes triangular-rounded, 2-3 mm. long: corolla 5-8 mm. long: staminodium purple: capsule 4-7 mm. long, globose-ovoid, acute.—(FIGWORT. HEAL-ALL.)—Rich woods, Blue Ridge and more northern provinces, Fla. and Ala. to Nebr., Ont., and Mass.—Sum.

22. **RUSSELLIA** Jacq. Erect-arching herbs or shrubby plants, with several or many striate-angled stems in a clump on the perennial root, and whorled branches. Leaves all cauline, whorled, with small or scale-like blades. Flowers in lateral cymes, the bracts minute. Bractlets none. Sepals 5, only slightly if at all united. Corolla red, 2-lipped: tube nearly cylindric: lips short, the posterior with partly united arched lobes, the anterior spreading. Stamens 4, slightly didynamous: anther-sacs explanate. Stigma punctiform-capitate. Capsule globose, mucronate, loculicidal, filled with slender or tortuous hairs among which are embedded the seeds. Seeds numerous, cylindric, reticulate-roughened, long-funicle.—About 30 species, tropical American.

1. **R. juncea** Zucc. Stem 8-25 dm. long, with many striations and 4-6 ridges, virgately branched: leaves scale-like or if developed the blades oval or elliptic, less than 1 cm. long, short-petioled: cymes lax or diffuse, 1-2-flowered: sepals ovate, 2 mm. long, acuminate: corolla 20-25 mm. long: capsule 5-6 mm. long, prominently caudate-mucronate.—(FOUNTAIN-PLANT. CORAL-PLANT.)—Waste-places and roadsides, pen. Fla. and cult. Nat. of Mex.—Spr.-sum. or all year S.

23. **ANGELONIA** H. & B. Herbs with erect stems arising from a root-stock. Leaves opposite: blades often toothed. Flowers in racemes, the bracts much smaller than the leaves. Bractlets none. Sepals 5, uniform. Corolla violet-blue, zygomorphic: anterior lip like a shallow cup or saucer: lobes spreading, the anterior the longer, with a yellow palate at the base and a projecting horn on the mid-anterior lobe. Stamens 4, scarcely didynamous: filaments pubescent: anthers glabrous; the sacs explanate. Stigma punctiform-capitate. Capsule globose, loculicidal. Seeds numerous, with raised wing-like reticulations.—About 30 species, tropical American.

1. **A. angustifolia** Benth. Plant 1-14 dm. tall, the stem and branches glabrous or sparsely pubescent; leaf-blades linear-lanceolate, 3-11 cm. long, rather remotely serrate: flowers slender-pedicelled: sepals ovate: corolla about 2 cm. long and wide, spotted within: capsule 6-7 mm. in diameter, nodding.—(ANGELON.)—Waste-places, cult. grounds, and rarely pinelands, S Fla. Nat. of Mex.—Spr.-fall.

**24. COLLINSIA** Nutt. Delicate annual herbs, the stem erect, much-branched. Leaves opposite: blades toothed, the upper ones sessile or clasping. Flowers in loose racemes, long-pedicelled, axillary to foliaceous bracts, sometimes in whorls of 3-6. Bractlets none. Calyx-lobes 5, uniform, half as long as the tube or more, acute. Corolla two-lipped: tube gibbous on the posterior side: posterior lip pale or white, shorter than the anterior, proximally with a concave-arched portion which abruptly terminates in a transverse-rounded, puberulent, palate-like ridge, beyond which the lip becomes upcurved-erect with free fan-like lobes; anterior lobes projecting, blue, the median one with margins upcurved, so that the petal is boat-like, slightly exceeded by the flat lateral lobes. Stamens 4, slightly didynamous: filaments slender: anthers scarcely exerted; sacs divaricate, glabrous. Posterior stamen represented by a callose knob. Stigma capitate. Capsule subglobose, somewhat flattened laterally, loculicidal and also slightly septicidal. Seeds few, smooth, wingless.—About 30 species, North American.

**1. C. verna** Nutt. Stem 1-5 dm. tall, pubescent chiefly in 2 lines: leaf-blades elliptic-ovate to ovate, crenately serrate-dentate, the upper rounded to a clasping base, the lower narrowed to a petiole-like base: pedicels slender, in fruit 10-45 mm. long: calyx 6-10 mm. long; lobes lanceolate, nearly twice as long as the tube: corolla 10-15 mm. long; lobes emarginate or shallowly notched: capsule 5-6 mm. long: seeds 2.5-3 mm. long, brown.—(INNOCENCE. BLUE-EYED MARY.)—Moist woods, especially in alluvial soil, Interior Low Plateaus and adj. provinces, Tenn. to Mo., Mich., and W. N. Y.—Spr.

**25. LINARIA** Mill. Erect annual or perennial herbs, the stem branched, sometimes with basal shoots. Leaves alternate, or opposite on the basal shoots: blades narrow, entire, sessile. Flowers in racemes, the bracts foliaceous, or much reduced. Bractlets none. Sepals 5, uniform. Corolla 2-lipped, yellow or violet: tube spurred at the base anteriorly: posterior lobes more or less united and arched: anterior lobes united and spreading, at times with a definite palate. Stamens 4, didynamous, included: filaments glabrous: anther-sacs divaricate. Stigma capitate. Capsule globose to cylindric, loculicidal by irregular ruptures. Seeds numerous, prismatic-angled and wingless, or flattened and broadly winged.—About 120 species, widely distributed, but most abundant in the old World.—SPURRED-SNAPDRAGON. TOADFLAXES.

Corolla violet or violet-purple; anterior lip with 2 rounded ridges, but no palate: capsule globose or nearly so: seeds less than 0.5 mm. long, wingless: plant annual, or perhaps biennial, with prostrate basal shoots.

I. LEPTOPLECTRON.

Corolla yellow; anterior lip with a prominent orange-colored palate: capsule ovoid: seeds about 1.5 mm. long, winged: plant perennial, all stems erect.

II. EULINARIA.

I. LEPTOPLECTRON

Pedicels nearly glabrous, shorter than the corolla: corolla 7-12 mm. long, the spur slender, decurved: capsule 2-3.5 mm. long.

1. *L. canadensis*.

Pedicels glandular-pubescent, longer than the corolla: corolla 5-6 mm. long, the spur very short; capsule 1.5-2 mm. long. 2. *L. floridana*.

## II. EULINARIA

Flowers in stiffly erect dense racemes: corolla strongly 2-lipped; the stout spur tapering. 3. *L. Linaria*.

1. *L. canadensis* (L.) Dum. Stems slender, 2-6 dm. tall: leaves scattered but usually numerous on the flowering stems, linear, 1.5-2.5 cm. long, those on the basal shoots opposite or in 3's and shorter and wider: raceme elongate, nearly glabrous: pedicels 1-5 mm. long: sepals 2-3 mm. long, lanceolate: corolla 7-10 mm. long, the spur decurved 2-6 mm. long, (corolla 10-12 mm. long with a slender spur 5-9 mm. long, and densely tuberculate seeds, in *L. canadensis texana* which predominates westward); posterior lip with erect lobes about as long as the body; anterior lip with a ridged body and 3 spreading lobes: capsule 2-3 mm. long.—(BLUE-TOADFLAX.)—Open sandy soil, often a weed in fields and on roadsides, various provinces, chiefly Coastal Plain, Fla. to Tex. and Mass.—(*Mex., C. A., S. A.*)—Spr.; in sum. ripening its fruit cleistogamously.—The species name is a misnomer, as it is not found in Canada.

2. *L. floridana* Chapm. Stems slender, 1-3 dm. tall: leaf-blades filiform, 1-2.5 cm. long, those on the basal shoots whorled in 3's: raceme zigzag, glandular-pubescent: pedicels 5-10 mm. long: sepals 1-2 mm. long, lanceolate: corolla 5-6 mm. long, the subulate spur about 0.5 mm. long; posterior lip with erect lobes about twice as long as the body; anterior lip with spreading lobes: capsule 1.5-2 mm. long.—Dry sandy soil, often in scrub or on sandhills, Coastal Plain, Fla. to Miss. and Ga.—Spr.

3. *L. Linaria* (L.) Karst. Stems 4-8 dm. tall, usually several together; leaf-blades 3-6 cm. long, linear to linear-lanceolate: raceme stout: pedicels 3-8 mm. long: sepals 3-4 mm. long, lanceolate-ovate: corolla 15-20 mm. long, the spur 10-15 mm. long; posterior lip with recurved lobes shorter than the body; lobes of the anterior lip deflexed-spreading: capsule 9-12 mm. long. [*L. vulgaris* Mill.]—(BUTTER-AND-EGGS. WILD-SNAPDRAGON. YELLOW-TOADFLAX.)—Fields, roadsides, and waste-places, various provinces, Ala. to Ark., N. Dak., Ont., and N. S. Nat. of Eurasia.—Sum.

26. **KICKXIA** Dumort. Pubescent perennial herbs, the stems prostrate, often matted. Leaves alternate: blades broad, entire, sometimes hastate at the base. Flowers axillary to leaf-like bracts, slender-pedicelled. Bractlets none. Sepals 5, uniform. Corolla 2-lipped, proximally yellow: tube with a deflexed spur: posterior lip with lobes shorter than the body, distally purple; anterior lip raised anteriorly into a prominent russet palate, the lobes mostly yellow. Stamens 4, didynamous, included: filaments pubescent: anthers horse-shoe-shaped, the sacs opening proximally, densely white-hairy. Stigmas somewhat united. Capsule globose, glandular-pubescent, loculicidal by the falling away as a lid of most of the wall of each carpel. Seeds few, with reticulations or convolutions.—About 25 species, natives of the Old World.—FLUEELINS.

Leaf-blades hastate-lobed at the base; sepals lanceolate: corolla 5 mm. long, with straight spur; anthers wholly cohering. 1. *K. Elatine*.

Leaf-blades rounded or cordate at base: sepals ovate: corolla 6-8 mm. long, with curved spur: anthers usually more or less cohering.

2. *K. spuria*.

1. *K. Elatine* (L.) Dumort. Stem 2-8 dm. long: leaf-blades 1-2 cm. long, ovate, hastate at the truncate or slightly cordate base, the petioles 2-4 mm. long: sepals 3-5 mm. long, triangular-lanceolate: corolla-spur 3-5 mm. long: capsule 3 mm. long, equalling or exceeding the calyx: seeds with strongly raised and wing-like convolutions. — (CANKER-ROOT.) — Waste-places, sandy fields, and roadsides, various provinces, Ga. to La., Mo., Mass., and Del. Nat. of Eurasia.—Sum.

2. *K. spuria* (L.) Dumort. Stem 2-8 dm. long or more: leaf-blades 1-4 cm. long, broadly oval, the petioles 1-4 mm. long: sepals 4-6 mm. long, ovate: corolla-spur 5 mm. long: capsule 3.5-4 mm. long, nearly concealed in the calyx: seeds with slightly raised reticulations and convolutions. — (FEMALE FLUELLIN.) — Waste-places and ballast, various provinces, Ala. to Mo., N. Y., and N. C. Nat. of Eu.—Sum.

27. *VERONICASTRUM* Fabr. Tall virgate herbs, the solitary stem erect from an elongate rootstock. Leaves whorled: blades narrow or relatively so, toothed, short-petioled. Flowers in a terminal spike-like raceme which is usually accompanied by several smaller racemes axillary to the upper leaf-whorl. Bracts very small. Bractlets none. Sepals 5, uniform. Corolla tubular, white or pinkish-white: lobes broad, less than half the length of the tube, the posterior ones wholly united. Stamens 2 (only the 2 postero-laterals present): filaments slender: anthers exserted, glabrous, the sacs parallel. Stigma capitate. Capsule ovoid, glabrous, septicidal and slightly loculicidal. Seeds numerous, obscurely reticulate.—Two species, the following and one Asiatic.

1. *V. virginicum* (L.) Farwell. Stem 10-20 dm. tall: leaves whorled in 3's-6's, usually in 5's: blades lanceolate to elliptic-ovate, 3-15 cm. long, finely serrate: racemes 20-30 cm. long, dense, the bracts setaceous-subulate, 2-3 mm. long: pedicels less than 1 mm. long: sepals ovate-attenuate, about 2 mm. long: corolla 5 mm. long, glabrous without, pubescent within: filaments nearly twice as long as the corolla: capsule 3 mm. long. [*Veronica virginica* L. *Leptandra virginica* (L.) Nutt.] — (BOWMAN'S-ROOT. CULVER'S-PHYSIC. BLACK-ROOT.) — Meadows and moist woods, various provinces, Ga. to Tex., Minn., and Ont.—Sum.

28. *VERONICA* L. Low creeping or spreading perennial or annual herbs. Leaves opposite or alternate above: blades linear to cordate, toothed or nearly entire. Flowers in terminal or axillary racemes or spikes. Bractlets

none. Sepals 4 (the posterior one lacking), uniform or the anterior longer. Corolla rotate, blue, violet, or white: lobes spreading, longer than the tube, the posterior ones wholly united to form one rounded lobe. Stamens 2 (only the 2 postero-laterals present): anthers slightly exserted, glabrous, the sacs parallel. Stigma capitate. Capsule flattened contrary to the septum, as wide as long or wider, deeply loculicidal. Seeds numerous or few, smooth.—About 250 species, widely distributed.—SPEEDWELLS.

Main stem terminating in an inflorescence, whose flowers are densely crowded or remote and axillary: bract-leaves alternate.

I. VERONICELLA.

Main stem not terminating in an inflorescence, leaves opposite throughout and flowers all in axillary racemes.

II. EUVERONICA.

#### I. VERONICELLA

Plant perennial: flowers in terminal racemes: corolla pale, with deep-blue lines only on the posterior side.

Plant annual: flowers axillary to most of the leaf-axils: corolla more uniformly colored.

1. *V. serpyllifolia*.

Pedicels shorter than the linear to lanceolate sepals: capsule strongly flattened: seeds many, less than 1 mm. long, flat, smooth: stem erect.

Leaf-blades, except the lowermost, sessile; those of the lower stem-leaves oblanceolate, nearly entire to dentate: corolla whitish throughout: capsule greenish, notched, the minute style hidden between the capsule-lobes: plant glabrous or with gland-tipped hairs.

2. *V. peregrina*.

Leaf-blades petioled or the upper ones sessile, those of the lower stem-leaves ovate, crenate-serrate: corolla deep violet-blue: capsule yellowish-brown, notched one-third its length or nearly so, the style reaching to about the capsule-lobes: plant pubescent with white glandless or obscurely gland-tipped hairs.

3. *V. arvensis*.

Pedicels longer than the ovate sepals: capsule relatively turgid: seeds few, 1.5–3 mm. long, turgid, rough: stem creeping.

Leaf-blades ovate: sepals short-ciliate, not accrescent: capsule slightly flattened, deeply notched, pubescent: seeds 1.5–2 mm. long, brown.

Corolla-lobes not exceeding the ovate sepals: capsule-lobes rounded, the distal point of each about midway between the style and the lateral margin: style shorter than the capsule.

4. *V. polita*.

Corolla-lobes much exceeding the sepals: capsule-lobes acutish in profile, the most distal point of each near the lateral margin: style as long as the capsule.

5. *V. persica*.

Leaf-blades broadly and shallowly cordate, 3–5-lobed: sepals conspicuously ciliate, accrescent: capsule turgid, scarcely notched, glabrous: seeds 2.5–3 mm. long, blackish.

6. *V. hederacifolia*.

#### II. EUVERONICA

Capsule pubescent, wider than long, the most distal point of each lobe near the lateral margin: pedicel shorter than the calyx: stem, leaves, pedicels, and calyx with glandless hairs: leaf-blades oval, with petiole-like bases: herbage pubescent: plant of dry soil.

7. *V. officinalis*.

Capsule glabrous or sparingly glandular-pubescent, as wide as long or narrower, the most distal point of each lobe about midway between the style and the lateral margin: pedicel longer than the calyx: leaf-blades rounded at the base, lanceolate or narrowly ovate: herbage glabrous or glandular: plant aquatic.

Leaf-blades all petioled: racemes usually 10–25-flowered: corolla 2.5–3 mm. long, violet-blue: style 2–3 mm. long: plant glabrous.

8. *V. americana*.

Leaf-blades of the flowering stem sessile and clasping: those of the autumnal shoots petioled: racemes usually 30–60-flowered: corolla 2 mm. long, pale-violet: style 1–1.5 mm. long: inflorescence with gland-tipped hairs.

9. *V. glandifera*.

1. *V. serpyllifolia* L. Stem 0.3–2 dm. long, finely pubescent with incurved hairs, creeping, distally erect and floriferous: leaf-blades elliptic-ovate or oval,

0.9–1.6 cm. long, obscurely crenate, obtuse: pedicels 2–3 mm. long, ascending: sepals 3 mm. long, elliptic-oval, glabrous: corolla about 2 mm. long: style 2 mm. long: capsule 3 mm. long, shallowly notched, slightly glandular-pubescent.—Fields, roadsides, and cult. grounds, Blue Ridge and more northern provinces, N. C. to Mo., Minn., Ont., and Newf.; also introduced on the Pacific slope.—Nat. of Eu.—Spr.-sum.

2. *V. peregrina* L. Stem 1–3 dm. tall, glabrous (glandular-pubescent throughout, even to the capsules, in *V. peregrina xalapensis*), much-branched, floriferous nearly throughout: leaf-blades oblanceolate to elliptic, 1.5–3.5 cm. long, obtuse, entire or the larger crenate-dentate: pedicels 0.5–1 mm. long: sepals 3–5 mm. long, linear-elliptic: corolla about 2 mm. long: style 0.1–0.2 mm. long: capsule about 3 mm. long, shallowly notched, glabrous.—(NECKWEED.)—Cult. grounds and moist fields, various provinces, Fla. to Tex., Ia., Mich., and N. B.—Spr.

3. *V. arvensis* L. Stem 1–3 dm. tall, pubescent with glandless or obscurely gland-tipped hairs, usually much-branched, floriferous nearly throughout: leaf-blades ovate, 0.5–1.5 cm. long, obtuse, crenate-serrate: pedicels 0.5–1 mm. long: sepals 3–4 mm. long, broadly linear: corolla about 2 mm. long, deep-blue, the lobes with deeper-blue lines: style 0.5 mm. long: capsule 2.5–3 mm. long, deeply notched, pubescent.—(WALL-SPEEDWELL.)—Fields, dry woods, and cult. grounds, various provinces, C. Ga. to Okla., Kans., Ont., and Newf.; also introduced on the Pacific slope. Nat. of Eurasia.—Spr.

4. *V. polita* Fries. Stem 1–2 dm. long, finely pubescent, much branched: leaf-blades ovate, 0.5–1.2 cm. long, acutish, with rounded teeth: pedicels 5–10 mm. long, recurving: sepals ovate, 3–4 mm. long, reticulate, obscurely ciliate: corolla 3 mm. long, violet-blue: style 1 mm. long: capsule 3–3.5 mm. long, deeply notched, minutely pubescent.—Fields and cult. grounds, various provinces, Fla. to Tex. and N. Y. Nat. of Eu.—Spr.

5. *V. persica* Poir. Stem 1–3 dm. long, pubescent, distally ascending: leaf-blades ovate, 1–2 cm. long, dentate: sepals ovate, 4–6 mm. long, finely ciliate: corolla 5 mm. long, blue, anteriorly paler, the lobes with deep-blue lines: style 3 mm. long: capsule 3–4 mm. long, broadly notched, pubescent.—Fields, roadsides, and waste-places, various provinces, Fla. to Calif., Alas., and Newf. Nat. of Eu.—(W. I.)—Spr.

6. *V. hederæfolia* L. Stem 0.5–3 dm. long, white-hirsute, much branched, distally ascending: leaf-blades broadly ovate, 0.5–1.5 cm. long, 3–5-lobed, the lobes rounded, entire: pedicels 7–18 mm. long: sepals broadly ovate, at anthesis 2–3 mm. long, becoming 5–7 mm. long, densely ciliate: corolla 2 mm. long, purplish: style 0.5 mm. long: capsule 3 mm. long, scarcely notched, glabrous.—(IVY-SPEEDWELL.)—Roadsides, orchards, and waste-places, various provinces, S. C. to N. Y. Nat. of Eu.—Spr.

7. *V. officinalis* L. Stem 1–4 dm. long, pubescent, much-branched: leaf-blades oval, 2–5 cm. long, crenate-serrate: racemes mostly 5–10 cm. long: pedicels 1–2 mm. long: sepals elliptic-lanceolate, 2 mm. long: corolla 3–4 mm. long, pale-lavender, on the posterior side with lavender-blue lines: style 2.5–3.5 mm. long: capsule 3–4 mm. long.—(GPSY-WEED.)—Fields and open woods, various provinces, in Coastal Plain only N, N. C. to Tenn., S. Dak., Ont., and N. S. Nat. of Eu.—Sum.

8. *V. americana* Schwein. Stem 2-8 dm. long, creeping at the base, glabrous: leaf-blades lanceolate to narrowly ovate, 2-8 cm. long, serrate with low teeth, acute or acutish: racemes mostly 5-10 cm. long: pedicels 5-8 mm. long: sepals elliptic-lanceolate, 2-3 mm. long, acuminate: corolla 2.5-3 mm. long, violet-blue, with deeper-blue lines: capsule 2.5-3 mm. long, slightly notched.—(BROOKLIME.)—Woodland streams and spring-heads, Blue Ridge and more N provinces, N. C. to Calif., Alas., Ont., and Newf.—(Mex.)—Sum.

9. *V. glandifera* Pennell. Stem 3-6 dm. long, creeping at the base, distally finely and sparsely glandular-pubescent: leaf-blades lanceolate, sometimes broadly so, 4-9 cm. long, sharply crenate-serrate, acuminate: racemes mostly 10-15 cm. long: pedicels 3-5 mm. long: sepals lanceolate to narrowly ovate, 2-3 mm. long, acuminate: corolla 2 mm. long, pale violet-blue, with few deeper-blue lines: style 1-1.5 mm. long: capsule 2.5-3 mm. long, rounded.—Shallow streams and stream-margins, various provinces, N. C. to Ind. and Pa.—Sum.

29. **MACRANTHERA** Torr. Tall annual or biennial herb, the stem retrorse-pubescent. Leaves opposite: blades pinnatifid. Flowers in terminal racemes, the pedicels reflexed in fruit, the bracts entire. Bractlets none. Calyx-lobes 5, uniform. Corolla tubular, orange, fleshy, semi-persistent: lobes shorter than the tube, the 2 posterior erect, the 3 anterior spreading. Stamens 4, equal: anthers conspicuously exserted on the elongate filaments, the sacs parallel. Stigma linear-clavate. Capsule ovoid, pubescent, loculicidal. Seeds angular-lunate, reticulate, winged.—One species.

1. *M. flammea* (Bartr.) Pennell. Stem 15-30 dm. tall, obtusely 4-angled: leaf-blades lanceolate to ovate in outline, the larger 8-10 cm. long, with 5-7 pairs of lateral lobes: pedicels 10-20 mm. long, upcurved at the apex: calyx-lobes, at anthesis, linear, becoming 10-15 mm. long and toothed: corolla 20-25 mm. long, rusty-tomentulose without, glabrous within above; lobes obtuse: filaments lanose: capsule broadly ovoid, 15-18 mm. long: seeds 3-4 mm. long, thick-winged. [*M. fuchsoides* (Nutt.) Benth. *M. LeContei* Torr.]—Borders of wet sandy thickets, Coastal Plain, N Fla. to E La. and Ga.—Sum.—fall.

30. **DASISTOMA** Raf. Tall annual herbs, the stem retrorse-pubescent. Leaves opposite: blades bipinnatifid-lobed. Flowers axillary to foliaceous narrow entire bracts, spicate. Bractlets none. Calyx-lobes 5, about as long as the tube. Corolla yellow, evanescent: tube pubescent all over within: lobes spreading, equally distinct, slightly shorter than the tube. Stamens 4, didynamous, included; anther-sacs slightly divaricate, glabrous. Stigmas 2, semi-capitate. Capsule globose-ovoid, loculicidal. Seeds winged.—One species.

1. *D. macrophylla* (Nutt.) Raf. Stem 15-20 dm. tall, obtusely 4-angled, much-branched: leaf-blades ovate to ovate-lanceo-

late, the larger 10–30 cm. long, with 7–12 pairs of lateral lobes: calyx-lobes triangular-ovate, ultimately longer than the tube: corolla 15–16 mm. long, externally glabrous; lobes ovate-reniform, about 7 mm. long: capsule 9–10 mm. long, glabrous, black: seeds 2 mm. long, short-winged. [*Seymeria macrophylla* Nutt. *Brachygyne macrophylla* (Nutt.) Small.]—(MULLEN-FOXGLOVE.)—Moist woodlands, Appalachian Valley and more N & W provinces, Ga. to NE Tex., Nebr., and Ohio.—Sum.—A root-parasite.

**31. AFZELIA** J. F. Gmel. Relatively low annual herbs, the stem more or less glandular-pubescent. Leaves opposite: blades pinnatifid or bipinnatifid. Flowers axillary to foliaceous pinnatifid or bipinnatifid bracts, loosely racemose. Bractlets none. Calyx-lobes 5, longer than the tube. Corolla rotate, yellow, evanescent, glabrous or nearly so within above the bases of the filaments; lobes longer than the tube, the 2 posterior partly united. Stamens 4, nearly equal, slightly exserted: anther-sacs parallel, glabrous or nearly so, dehiscing by short apical slits. Stigma punctiform or capitate. Capsule ovoid or urceolate. Seeds numerous, winged or wingless.—About 22 species, North American, mostly Mexican.

Capsule ovoid, brown-tomentose: seeds winged: corolla deep-yellow, externally pubescent: leaf-segments lanceolate or wider: stem viscid-pubescent.

Capsule urceolate-acuminate, glabrous: seeds wingless: corolla pale-yellow, externally glabrous: leaf-segments filiform: stem sparsely pubescent, obscurely glandular.

1. *A. pectinata*.

2. *A. cassioides*.

**1. A. pectinata** (Pursh) Kuntze. Stem 2–6 dm. tall, widely and stiffly branched, retrorsely pubescent (with ascending hairs and glandular-pubescent capsules, in *A. pectinata peninsularis* of S Fla.): leaf-blades mostly pinnatifid, the longer ones 1.5–3 cm. long, with 3 or 4 pairs of lateral segments: calyx glandular-pubescent; lobes 3–4.5 mm. long, lanceolate: corolla 10 mm. long; lobes ovate: filaments lanose at the apex: capsule 5–7 mm. long, rounded or acute: seeds with 3 or 4 wings.—Dry pinelands, Coastal Plain, Fla. to Miss. and S. C.—Sum.—fall.

**2. A. cassioides** (Walt.) J. F. Gmel. Stem 5–10 dm. tall, virgately branched, sparsely pubescent with ascending incurved hairs: leaf-blades pinnatifid, the larger ones 1–1.5 cm. long, with 4–7 pairs of lateral segments: calyx glabrous or nearly so: lobes 2–2.5 mm. long, linear: corolla 9 mm. long; lobes lanceolate: filaments glabrous: capsule 4–4.5 mm. long, acuminate: seeds furrowed. [*Seymeria tenuifolia* Pursh.]—Pinelands, Coastal Plain and adj. provinces, C pen. Fla. to La., Tenn., and N. C.—(W. I.)—Fall.

**32. AUREOLARIA** Raf. Perennial or annual herbs parasitic on the roots of oaks, the stem simple or branched. Leaves opposite: blades narrow or broad, entire, toothed, or pinnatifid. Flowers axillary to more or less foliaceous bracts, in spikes or racemes. Bractlets none. Calyx-lobes 5, uniform or nearly so, longer than the tube. Corolla yellow, the throat nearly campanulate, somewhat inflated anteriorly; lobes spreading. Stamens 4, didynamous: filaments flattened, lanose: anthers lanose on the valvular surfaces, the

sacs parallel. Stigma slightly elongate or semi-capitate. Capsule cylindric-ellipsoid to globose-ovoid, acute to acuminate, loculicidal. Seeds irregularly tetrahedral, reticulate, wingless or winged. [*Dasystoma* Benth. not Raf.]—About 11 species, in eastern North America.—YELLOW-FOXGLOVES. FALSE-FOXGLOVES.

Seeds wingless; capsule glandular-pubescent; corolla externally glandular-pubescent; calyx-lobes toothed or pectinate; leaf-blades bipinnatifid, more or less pectinately cut; plant annual.

## I. PANCTENIS.

Seeds winged; capsule glandless; corolla externally glabrous; calyx-lobes entire; leaf-blades entire to coarsely bipinnatifid; plant perennial.

## II. EUAUREOLARIA.

## I. PANCTENIS

Calyx-tube turbinate, glandular-puberulent; capsule ellipsoid, half enclosed in the calyx-tube; pedicels 1-3 cm. long; leaf-blades with mostly rounded teeth.

Calyx-tube hemispheric, glandular-hirsute or -lanose; capsule ovoid, only the base enclosed in the calyx-tube; pedicels 0.4-2 cm. long; leaf-blades with acute or acutish teeth.

1. *A. pedicularia*.2. *A. pectinata*.

## II. EUAUREOLARIA

Capsule pubescent; pedicels 1.5-3 mm. long; stem pubescent or puberulent, at least above.

Stem pubescent or puberulent throughout; leaf-blades permanently pubescent; capsule 12-15 mm. long.

3. *A. virginica*.

Stem glabrous below; leaf-blades becoming glabrous; capsule 9-12 mm. long.

4. *A. microcarpa*.

Capsule glabrous; pedicels 3-25 mm. long; stem glabrous or minutely puberulent.

Leaf-blades lanceolate to ovate-lanceolate, widest below the middle, long-acuminate; corolla 30-35 mm. long; capsule 10-12 mm. long.

5. *A. laevigata*.

Leaf-blades elliptic-ovate in outline, widest about the middle, less acuminate; corolla 35-60 mm. long; capsule 12-24 mm. long.

Stem glabrous, glaucous; pedicels and calyx externally glabrous.

6. *A. flava*.

Stem puberulent, not glaucous; pedicels and calyx externally puberulent.

Pedicels 4-10 mm. long; calyx-lobes 5-7 mm. long, triangular-lanceolate; corolla 40-50 mm. long.

7. *A. dispersa*.

Pedicels 10-25 mm. long; calyx-lobes 10-12 mm. long, linear; corolla 35-45 mm. long.

8. *A. patula*.

1. *A. pedicularia* (L.) Raf. Stem 4-12 dm. tall, glandular-hirsute below, but nearly or quite glandless above (glandular-pubescent throughout, calyx-lobes 10-16 mm. long, and capsule broadly ellipsoid, in *A. pedicularia austromontana*, Blue Ridge, Ga. to Va.): leaf-blades lanceolate to ovate-lanceolate, deeply bipinnatifid ( $\frac{2}{3}$  to the midrib), (less deeply cut and rather copiously glandular, but stem and pedicels less glandular or nearly glabrous, in *A. pedicularia carolinensis*, Piedmont and Coastal Plain, N. C.), the larger 3-6 cm. long, with 6-8 pairs of lateral lobes (or only 1.5-2.5 cm. long, stem less hirsute, and pedicels longer than bracts, in *A. pedicularia caesariensis*, Coastal Plain and Piedmont, N. C. to Mass.): calyx-lobes 8-10 mm. long, pinnately cut; corolla 30-40 mm. long; lobes depressed-orbicular: capsule 10-11 mm. long. [*D. pedicularia* (L.) Benth.]—Sandy and rocky woods, various provinces, Va. to Ont. and Me.; to be expected in N. C.—Sum.—Represented in our range by the subspecies as indicated above.

2. *A. pectinata* (Nutt.) Pennell. Stem 4–11 dm. tall, glandular-hirsute, diffusely branched (virgately branched, with the small upper leaves appressed to the branches, short pedicels and large corollas 38–45 mm. long, in *A. pectinata floridana*, Coastal Plain, C Fla. and S Ga.): leaf-blades lanceolate to lanceolate-ovate, deeply bipinnatifid, glandular-pubescent, the larger 2–4 cm. long (larger, 3–6 cm. long, with the capsule 13–16 mm. long on pedicels 8–16 mm. long, in *A. pectinata eurycarpa*, various provinces, Ga. to Ala., Tenn., and N. C.): pedicels 4–11 mm. long: calyx glandular-lanose (merely glandular-hirsute and with pedicels 10–20 mm. long in *A. pectinata transcendens*, sandhills, Coastal Plain, Ga. to N. C.); lobes 8–15 mm. long, pinnately cut: corolla 30–40 mm. long; lobes orbicular: capsule 11–13 mm. long. [*D. pectinata* (Nutt.) Benth.] Sandy oak woods, Coastal Plain, NW Fla. to La., Tenn., and N. C.; also adj. provinces, Ala. to C. Tenn.—Sum.—The stem is pubescent or puberulent.

3. *A. virginica* (L.) Pennell. Stem 8–12 dm. tall: leaf-blades lanceolate-ovate, rather coarsely sinuate with 2–4 rounded lobes, downy on both sides, the longer 9–15 cm. long: pedicels 1–3 mm. long: calyx-lobes 4–12 mm. long, lanceolate to ovate: corolla 30–45 mm. long; lobes 6–12 mm. long, ovate-orbicular: capsule 12–15 mm. long, ovoid to globose-ovoid. [*D. pubescens* Benth. *Gerardia flava* (Chapm. Fl.)]—Open, usually sandy oak woods, various provinces, N Fla. to La., Mich., and N. H.—Spr.—sum.—The stem is puberulent above.

4. *A. microcarpa* Pennell. Stem 6–10 dm. tall: leaf-blades lanceolate-ovate, rather coarsely sinuate-lobed, puberulent on both sides, the larger 6–11 cm. long: pedicels 1–3 mm. long: calyx-lobes 3.5–7 mm. long, lanceolate to spatulate-ovate: corolla 30–40 mm. long; lobes 5–10 mm. long, ovate-orbicular: capsule 9–12 mm. long, ovoid to globose-ovoid.—Dry oak woods, Appalachian provinces and rarely Coastal Plain, N Fla. to E Tenn.—Sum.

5. *A. laevigata* Raf. Stem 5–12 dm. tall, glabrous, green: leaf-blades lanceolate to ovate-lanceolate, entire or the lower ones somewhat pinnately lobed, glabrous or nearly so, the larger 5–12 cm. long: pedicels 1–4 mm. long, or in fruit 3–8 mm. long: calyx glabrous; tube 3–5 mm. long; lobes 4–6 mm. long, lanceolate: corolla 30–35 mm. long; lobes 9–11 mm. long, depressed-orbicular: capsule 10–12 mm. long, ovoid. [*D. laevigata* (Raf.) Chapm.]—Rocky woods, Blue Ridge and Appalachian provinces, Ga. to Ky., Ohio, and Pa.; rarely Piedmont, N. C. and Va.—Sum.

6. *A. flava* (L.) Farwell. Stem 15–25 dm. tall, glabrous, glaucous: leaf-blades ovate-lanceolate to ovate, rather deeply and coarsely lobed or incised (shallowly lobed in *A. flava reticulata*, Coastal Plain, C Fla. to Md.), glabrate or glabrous, the larger 10–14 cm. long, with 5–7 pairs of lateral lobes: pedicels 4–10 mm. long: calyx glabrous; tube 4–7 mm. long; lobes 2–5 mm. long (5–14 mm. long, corolla 35–60 mm. long, and capsule 15–20 mm. long, in *A. flava macrantha*, various provinces, Ala. to Ark., Ill., and Ont.), lanceolate: corolla 35–40 mm. long; lobes 11–13 mm. long, depressed-orbicular: capsule 12–16 mm. long, ovoid. [*D. quercifolia* (Pursh) Benth. *Gerardia virginica* Auth. not L.]—Rocky and sandy oak woods, Piedmont, and more northern provinces, Ala. to Mich. and Me.—Sum.—fall.

7. *A. dispersa* (Small) Pennell. Stem 10–12 dm. tall, sparsely puberulent: leaf-blades lanceolate-ovate to ovate, nearly entire or rather deeply and coarsely lobed, finely puberulent, the larger 7–12 cm. long, with 1–4 pairs of lateral lobes: pedicels 4–10 mm. long: calyx-lobes 5–7 mm. long, triangular-lanceolate: corolla 40–50 mm. long; lobes 10–13 mm. long, depressed orbicular: capsule 14–18 mm. long, ovoid. [*D. dispersa* Small]—Sandy oak-woods, Coastal Plain, Ala. to La.—Sum.

8. *A. patula* (Chapm.) Pennell. Stems 10–12 dm. tall, sparsely puberulent: leaf-blades ovate-lanceolate to narrowly ovate, deeply and coarsely lobed or incised, puberulent or glabrate, the larger 13–16 cm. long, with 4–8 pairs of lateral lobes: pedicels 10–16 mm. long, or in fruit 15–25 mm. long: calyx-lobes 10–12 mm. long, linear: corolla 35–45 mm. long; lobes 7–10 mm. long, depressed-orbicular: capsule 13–17 mm. long, ovoid. [*D. patula* Chapm.]—Wooded river bluffs, Appalachian Valley and Interior Low Plateaus, Ga. to Tenn.—Sum.—fall.

33. **AGALINIS** Raf. Annual or perennial root-parasitic herbs, the stem usually branched. Leaves usually opposite, often with leaf-clusters in their axils: blades linear or filiform, or rarely subulate or broadened upward, entire, sessile. Flowers in racemes, axillary to foliaceous bracts. Calyx-lobes 5, uniform, shorter than the tube. Corolla rose-purple or pink-purple, more or less purple-spotted and usually with 2 yellow lines on the anterior side: throat campanulate or horizontally flattened, somewhat inflated anteriorly: lobes much shorter than the tube, about equal in length, spreading or the posterior arched or flattened. Stamens 4, didynamous, included: filaments more or less lanose: anthers lanose. Stigma elongate. Capsule globose to globose-ellipsoid, mucronate, loculicidal. Seeds numerous, reticulate, wingless. [*Gerardia* L. in part.]—About 50 species, American.—FALSE-FOXGLOVES. GERARDIAS. FALSE PURPLE-FOXGLOVES.

Plant annual: pedicels ascending or spreading: corolla membranous, rose-purple or lavender-purple, or rarely pink, nearly always with spots and yellow lines within: parasitic on many plants.

Corolla with the posterior lobes spreading, pubescent within at their base.

Calyx-tube not strongly reticulate-veined: seeds dark-brown: plant tending to blacken in drying. I. PURPUREAE.

Calyx-tube evidently reticulate-veined: seeds yellowish-brown: plant not tending to blacken in drying. II. ERECTAE.

Corolla with the posterior lobes arched or flattened over stamens and style, glabrous within at their base. III. TENUIFOLIAE.

Plant with an elongate rootstock: pedicels erect: corolla pink, slightly fleshy, spotted, but without yellow lines in the throat: parasitic on pine roots. IV. LINIFOLIAE.

#### I. PURPUREAE

Leaf-blades all linear or filiform, not obviously dimorphic.

Racemes elongate, the pedicels less than 12 mm. long.

Leaf-blades and calyx-lobes acute to acuminate: anthers mucronate to caudate at the base: plant not fleshy.

Corolla purple, the two yellow lines and dark spots within evident: plant dull-green or purplish.

Stem smooth or minutely scabrellous: leaves without axillary fascicles or these small and shorter than the leaves.

Fruiting pedicels 3–6 mm. long: the areas between the reticulations of the seed relatively pale.

Plant relatively stiffly branched: stem sparingly scabrellous: calyx-lobes triangular-lanceolate to triangular-subulate: corolla 20–38 mm. long.

Plant virgately branched: stem smooth: calyx-lobes subulate or nearly so: corolla 20–25 mm. long.

Fruiting pedicels 1.5–3 mm. long: the areas between the reticulations of the seed nearly black.

Corolla 20–25 mm. long: stigmas 2–3 mm. long: stem usually much branched.

Corolla 15–18 mm. long: stigmas 1–1.5 mm. long: stem simple or slightly branched.

Stem more or less scabrous: leaves with usually conspicuously developed axillary fascicles.

1. *A. purpurea*.

2. *A. virgata*.

3. *A. pinetorum*.

4. *A. Harperi*.

5. *A. fasciculata*.

Corolla lavender-pink, destitute of spots and yellow lines; plant bright-green.

Leaf-blades and calyx-lobes obtuse or acutish; anther-sacs obtuse or acutish at the base; plant fleshy.

Racemes short, much broken or lax, or if somewhat elongate the pedicels over 10 mm. long.

Stem scabrous; corolla pubescent within in a narrow line below the posterior sinus; anthers densely lanose with pink hairs on the sides.

Stem smooth or nearly so; corolla pubescent within over the entire width of the basal portions of the posterior lobes; anthers glabrous over much of the dorsal surface.

Cauline leaves alternate; blades broadened distally slightly fleshy; axillary leaf-fascicles abundantly developed.

Cauline leaves opposite; blades neither broadened distally nor fleshy; axillary leaf-fascicles scarcely or not at all developed.

Branches very widely and laxly ascending; fruiting pedicels 25-50 mm. long, 4-5 times as long as the bracts; corolla 15-18 mm. long.

Branches more closely and stiffly ascending; fruiting pedicels less than twice as long as the bracts.

Leaf-blades 2-3.5 cm. long, equalling or exceeding the internodes, slightly scabrous to smooth on the upper surface.

Pedicels 15-40 mm. long, longer than the bracts; corolla 17-25 mm. long; capsule 3-4 mm. long.

Racemes somewhat developed so that only a few flowers appear as if terminal; pedicels 15-40 mm. long; corolla 18-25 mm. long; leaf-blades narrowly linear to filiform.

Racemes scarcely evident, most flowers appearing as if terminal to the branches; pedicels 15-20 mm. long; corolla 17-20 mm. long; leaf-blades filiform-setaceous.

Pedicels 5-10 (-15) mm. long, shorter than the bracts or equalling them; corolla 25-30 mm. long; capsule 4-5 mm. long; most flowers appearing as if terminal to the branches.

Leaf-blades 0.5-1.2 cm. long, shorter than the internodes, scabrous on the upper surface; corolla 15-22 mm. long.

Pedicels 4-6 mm. long, about equalling the bracts; calyx-lobes not becoming callose; leaf-blades filiform; stem smooth or slightly scabrellous.

Pedicels thrice to ten times the length of the bracts; calyx-lobes becoming callose; leaf-blades linear-subulate; stem ridged, minutely hispidulous-roughened.

Leaf-blades mostly minute, scale-like, appressed, those near the base of the stem oval or ovate and spreading, but frequently early deciduous; pedicels 1-3 mm. long.

## II. ERECTAE

Racemes well-developed, and flowers not appearing as if terminal; stigma 1-2 mm. long; leaf-blades linear to nearly filiform; stem evidently striate-angled.

Leaf-blades linear to nearly filiform, not widening distally, acutish to acuminate; corolla with yellow lines and dark spots within strongly defined; capsule globose to globose-ovoid, somewhat flattened at the base.

Corolla 10-15 mm. long; pedicels mostly twice to thrice the length of the bracts.

Corolla 15-20 mm. long; pedicels mostly thrice to eight times the length of the bracts.

Leaf-blades widening distally, acutish to obtuse; corolla with yellow lines and dark spots faint or obsolete; capsule globose-ovoid to ellipsoid, rounded at the base.

6. *A. georgiana*.

7. *A. maritima*.

8. *A. pulchella*.

9. *A. filifolia*.

10. *A. lara*.

11. *A. setacea*.

12. *A. stenophylla*.

13. *A. Plukenetii*.

14. *A. keyensis*.

15. *A. oligophylla*.

16. *A. aphylla*.

17. *A. decemloba*.

18. *A. tenella*.

19. *A. erecta*.

Racemes scarcely developed, many flowers appearing as if terminal to the branches: stigma 2-3 mm. long: leaf-blades narrowly linear: stem nearly terete.

20. *A. Gattingeri*.

### III. TENUIFOLIAE

Corolla pubescent externally, its posterior lobes about two-thirds the length of the anterior, concave-arched: pedicels, if exceeding the bracts, less than twice their length.

Corolla glabrous externally, its posterior lobes less than half the length of the anterior, flattened: pedicels at least thrice the length of the bracts.

21. *A. tenuifolia*.

Leaf-blades filiform, 1.5-2 cm. long: stem evenly and stiffly much-branched: racemes well developed, no flowers appearing as if terminal: pedicels 15-32 mm. long: corolla 15-18 mm. long.

22. *A. divaricata*.

Leaf-blades minute, triangular-subulate, 0.1-0.2 cm. long: stem sparingly very laxly branched: racemes scarcely developed, the flowers scattered and mostly appearing as if terminal to the branches: pedicels 5-10 mm. long: corolla 10-13 mm. long.

23. *A. filicaulis*.

### IV. LINIFOLIAE

Plant with a virgate, little branched stem, corollas 30-40 mm. long.

24. *A. linifolia*.

1. *A. purpurea* (L.) Pennell. Stem 4-12 dm. tall, striate-angled, sparingly scabrellous, much branched: leaf-blades 2.5-4 cm. long, linear, scabrous above: racemes elongate, 6-14-flowered: pedicels 2-5 mm. long: calyx-lobes triangular-lanceolate to subulate, 0.5-2 mm. long, much shorter than the tube: corolla 20-38 mm. long, purple; lobes spreading, the posterior ones pubescent at the base: capsule 4.5-7 mm. long, globose or nearly so. [*G. purpurea* L.]—Moist sandy soil, meadows and stream-banks, various provinces, Fla. to Tex., Minn., and Mass.—Sum.—fall.

2. *A. virgata* Raf. Stem 3-10 dm. tall, striate-angled, glabrous, virgately branched: leaf-blades 1.5-4 cm. long, narrowly linear to almost filiform, scabrous above: racemes elongate, 8-26-flowered: pedicels 2-6 mm. long: calyx-lobes triangular-subulate to subulate, 0.8-2 mm. long: corolla 20-25 mm. long, purple; lobes spreading, the posterior pubescent at the base: capsule 4.5-5 mm. long, globose.—Moist pinebarrens, Coastal Plain, S. C. to SE N. Y.—Fall.

3. *A. pinetorum* Pennell. Stem 6-8 dm. tall, slightly angled, nearly glabrous, much branched: leaf-blades 2-2.5 cm. long, narrowly linear (a more slender plant, *A. pinetorum delicatula*, with filiform curled leaf-blades, calyx-lobes 1.5-2 mm. long, and an unspotted corolla, occurs on the pinehills of W Fla.) somewhat scabrous above: racemes slightly elongate, 8-14-flowered: pedicels 1-3 mm. long: calyx-lobes triangular-subulate, 1-1.5 mm. long, shorter than the tube: corolla 20-25 mm. long, purple; lobes spreading, the posterior ones pubescent at the base: capsule 4.5-5 mm. long, globose.—Moist pinelands, Coastal Plain, N Fla. to La. and Ga.—Fall.

4. *A. Harperi* Pennell. Stem 4-8 dm. tall, striate-angled, nearly glabrous, simple or slightly branched: leaf-blades 2-3.5 cm. long, narrowly linear, scabrous above: racemes elongate, 8-20-flowered: pedicels 1-2 mm. long: calyx-lobes triangular-lanceolate to triangular-subulate, 0.7-1.5 mm. long, shorter than the tube: corolla 15-18 mm. long, pink; lobes spreading, the posterior lobes pubescent at the base: capsule 4-5 mm. long, globose.—Moist pinelands and marsh-borders, Coastal Plain, S Fla. to Ga.—(W. I.)—Fall or all year S.

5. *A. fasciculata* (Ell.) Raf. Stem 6–12 dm. tall, striate-angled, usually very scabrous, much branched: leaf-blades 1.5–4 cm. long, linear, scabrous above (or with the fascicles only slightly or moderately developed on a slender plant with merely scabrellous stems in *A. fasciculata peninsularis*, of the Everglades, Fla.): racemes elongate, 12–30-flowered: pedicels 2–6 mm. long: calyx-lobes triangular-lanceolate to subulate, 0.5–2 mm. long, much shorter than the tube: corolla mostly 25–35 mm. long; lobes spreading, the posterior lobes pubescent at the base: capsule 5–6 mm. long, ovoid-globose.—Sandy soil, near beaches and in cult. fields and prairies, Coastal Plain, Fla. to Tex. and S. C.; also in adj. provinces, Okla. to Mo.—(*W. I.*)—Sum.—fall, or all year S.

6. *A. georgiana* (Boynton) Pennell. Stem 3–8 dm. tall, striate-angled, nearly or quite glabrous, simple or branched: leaf-blades 1–1.5 cm. long, linear, somewhat scabrous above: racemes elongate, 12–20-flowered: pedicels 1–4 mm. long: calyx-lobes triangular-lanceolate, 0.5–1 mm. long: corolla 15–18 mm. long; lobes spreading, the posterior pubescent at the base: capsule 3.5–5 mm. long, ovoid-globose.—Dry pinelands, Coastal Plain, N Fla. to Ala. and Ga.—Fall.

7. *A. maritima* Raf. Stem 0.5–4 dm. tall, nearly terete, glabrous, often bushy-branched: leaf-blades 1.5–3 cm. long, broadly linear, somewhat scabrous above: racemes elongate, 4–10-flowered: pedicels 2–10 mm. long: calyx-lobes triangular, 0.5–1.5 mm. long, obtuse, shorter than the tube: corolla 12–17 mm. long, pink-purple; lobes spreading, somewhat pubescent below and adjacent to the posterior sinus: capsule 5–6 mm. long, globose to globose-ovoid. [*G. maritima* Raf.]—Saltmarshes, Va. to Me.—The species is represented in our range by *A. maritima grandiflora* (Benth.) Pennell (*G. spiciflora* Engelm.), larger plant up to 6 dm. tall, with leaves 2–4 cm. long and corolla 15–20 mm. long, ranging in salt marshes from S Fla. to Tex. and N. C.—(*W. I., Mex.*)

8. *A. pulchella* Pennell. Stem 6–10 dm. tall, striate-angled, scabrous, much branched: leaf-blades 2–3 cm. long, narrowly linear, very scabrous above: racemes slightly elongate, 4–6-flowered: pedicels 15–30 mm. long, much longer in fruit: calyx-lobes subulate, 0.1–0.5 mm. long: corolla 25–30 mm. long; lobes spreading: capsule 5–6 mm. long, globose.—Pinelands, Coastal Plain, N Fla. to La. and Ga.—Fall.

9. *A. filifolia* (Nutt.) Raf. Stem 3–8 dm. tall, terete, glabrous, much branched: leaf-blades 1–2 cm. long, narrowly linear to filiform, slightly scabrous above: racemes slightly elongate, 3–12-flowered: pedicels 10–30 mm. long or in fruit nearly twice this length: calyx-lobes linear-subulate, 0.5–1 mm. long: corolla 22–28 mm. long, purple; lobes spreading: capsule 4–5 mm. long, ovoid-globose. [*G. filifolia* Nutt.]—Pinelands, Coastal Plain, S Fla. to Ga.—Fall.

10. *A. laxa* Pennell. Stem 6–10 dm. tall, nearly terete, glabrous, widely and laxly branched: leaf-blades 2–3 cm. long, narrowly linear to nearly filiform, nearly or quite glabrous above: racemes slightly elongate, 3–8-flowered: pedicels 15–30 mm. long, or in fruit nearly twice as long: calyx-lobes subulate, 0.2–0.5 mm. long: corolla 15–18 mm. long; lobes spreading: capsule 4–5 mm. long, ovoid-globose.—River handhills and old dunes, Coastal Plain, C Fla. to S. C.—Fall.

11. *A. setacea* (Walt.) Raf. Stem 3–7 dm. tall, somewhat striate-angled, glabrous, much branched: leaf-blades 2.5–3.5 mm. long, narrowly linear to filiform, scabrellous to nearly glabrous above: racemes slightly elongate, 6–10-flowered: pedicels 15–40 mm. long: calyx-lobes triangular-subulate, 0.2–0.5 mm. long: corolla mostly 18–25 mm. long; lobes spreading: capsule 3–4 mm. long, globose-ovoid. [*G. Holmiana* Greene]—Dry pinelands, Coastal Plain and rarely adj. provinces, Ga. to SE N. Y.—Sum.—fall.

12. *A. stenophylla* Pennell. Stem 6-7 dm. tall, slightly striate-angled, glabrous, much-branched: leaf-blades 2-3 cm. long, filiform-setaceous, nearly or quite glabrous: racemes scarcely elongate, 1-6-flowered: pedicels 8-12 mm. long or in fruit nearly twice this length: calyx-lobes triangular-subulate, 0.1-0.3 mm. long: corolla 17-20 mm. long, not seen fresh; lobes spreading; capsule 3-4 mm. long, globose-ovoid.—Pinelands, C Fla.—Fall.

13. *A. Plukenetii* (Ell.) Raf. Stem 5-8 dm. tall, striate-angled, glabrous or nearly so, much-branched: leaf-blades 2-3.5 cm. long, setaceous-filiform, scabrellous above: racemes scarcely developed, 1-6-flowered: pedicels mostly 5-10 mm. long: calyx-lobes triangular-subulate to subulate, 0.3-0.5 mm. long; corolla mostly 25-30 mm. long, purple; lobes spreading: capsule 4-5 mm. long, globose. [*G. Plukenetii* Ell.]—Dry pinelands, Coastal Plain, N Fla. to E Miss. and Ga.; also adj. provinces, Ga. to Ala. and SE Tenn.—Fall.

14. *A. keyensis* Pennell. Stem at least 7 dm. tall, slightly striate-angled, glabrous or nearly so, much branched: leaf-blades (lowest not seen) 0.8-1.2 cm. long, filiform, scabrous above: racemes scarcely developed, only 1-4-flowered: pedicels in flower 3-4 mm. long, in fruit 4-6 mm. long: calyx-lobes triangular-subulate, 0.4-0.6 mm. long: corolla 18-20 mm. long, not seen fresh; lobes spreading: capsule 3-3.5 mm. long, globose.—Pinelands, Big Pine Key, Fla.

15. *A. oligophylla* Pennell. Stem 3-8 dm. tall, striate-angled, hispidulous, simple or branched: leaf-blades 0.5-1 cm. long, linear-filiform to subulate, scabrous above: racemes scarcely developed: pedicels in flower 5-15 mm. long (2-8 mm. long and calyx-lobes very callose, 0.2 mm. long, in *A. oligophylla pseudaphylla* of long-leaf pineland of S Miss.), in fruit not seen: calyx-lobes triangular-subulate, 0.4-0.6 mm. long; corolla 15-22 mm. long; lobes spreading: capsule not seen. [*G. microphylla* (A. Gray) Small, not *A. microphylla* Raf.]—Long-leaf pineland, Coastal Plain, S La. to E Tex.—Doubtfully E of the Mississippi River, except in above subspecies.

16. *A. aphylla* (Nutt.) Raf. Stem 5-12 dm. tall, striate-ridged and minutely hispidulous, or sometimes terete and hirsute at the base, simple or branched: leaf-blades appressed, 0.1-0.3 (-0.6) mm. long, triangular-subulate, glabrous above; those near the base with oval more or less pubescent blades: racemes somewhat elongate, 8-20-flowered: pedicels 1-3 mm. long: calyx-lobes subulate tips 0.05-0.2 mm. long; corolla 15-20 mm. long, pink; lobes spreading, the posterior ones pubescent at the base: capsule 3-4 mm. long, globose.—Moist pinelands, Coastal Plain, N Fla. to La. and N. C.—Fall.

17. *A. decemloba* (Greene) Pennell. Stem 2-5 dm. tall, striate-angled, glabrous, simple or somewhat branched: leaf-blades mostly 2-2.5 cm. long, filiform-linear, scabrous above: racemes somewhat elongate, 3-10-flowered: pedicels in flower 5-15 mm. long, in fruit 12-25 mm. long: calyx-lobes minute, 0.05-0.2 (-0.3) mm. long: corolla 10-15 mm. long, pink; lobes spreading, the posterior ones pubescent at the base: capsule 3.5-4 mm. long, globose-ovoid. [*G. decemloba* Greene]—Open sterile soil, Piedmont, Blue Ridge, and Appalachian Valley, Ala. to Pa.—Fall.

18. *A. tenella* Pennell. Stem 5-8 dm. tall, striate-angled, glabrous, branched: leaf-blades mostly 1-1.5 cm. long, linear-filiform to filiform, scabrellous above: racemes somewhat elongate, 8-12-flowered: pedicels 8-25 mm. long, calyx-lobes minute, 0.05-0.2 mm. long; corolla 15-20 mm. long, pink; lobes spreading, the posterior ones pubescent at the base: capsule 3-4 mm. long, globose-ovoid.—Dry pinelands, Coastal Plain, N Fla. to E Ala. and S. C.—Fall.

19. *A. erecta* (Walt.) Pennell. Stem 3-8 dm. tall, striate-angled, nearly glabrous, simple or branched: leaf-blades mostly 1-1.5 cm. long, linear-cuneate,

scabrous above: racemes slightly elongate, 6–14-flowered: pedicels 3–25 mm. long: calyx-lobes minute, subulate, 0.05–0.15 mm. long: corolla 12–16 mm. long; lobes spreading, the posterior ones pubescent at the base: capsule 3–4 mm. long, globose-ovoid to globose-ellipsoid. [*G. parvifolia* (Benth.) Chapm.]—Pinelands, Coastal Plain, Fla. to La. and Del.—Fall.

20. **A. Gattingeri** Small. Stem 2–5 dm. tall, nearly terete, nearly glabrous, much-branched: leaf-blades 2–3 cm. long, narrowly linear, scabrellous above: racemes scarcely developed, 1–5-flowered: pedicels in flower 2–25 mm. long, in fruit 8–30 mm. long; calyx-lobes triangular-lanceolate, 0.5–1.8 mm. long, much shorter than the tube: corolla 12–18 mm. long, pink; lobes spreading, the posterior ones pubescent at the base: capsule 4–5 mm. long, globose to globose-ovoid. [*G. Gattingeri* Small]—Open woods, in sterile soil, barrens, and bluffs, Appalachian Valley and more N and W provinces, Ala. to Tex., Minn., and Ont.—Sum.—fall.

21. **A. tenuifolia** (Vahl) Raf. Stem 1–8 dm. tall, striate-angled, nearly glabrous, much branched: leaf-blades 2–5 cm. long, narrowly linear (linear-filiform to filiform and corollas 9–12 mm. long, in *A. tenuifolia polyphylla* of the granite regions of Ga.; widely linear and 3–7 cm. long, calyx-lobes 1–2 mm. long, and capsules 5–7 mm. long, in *A. tenuifolia macrophylla* of the Miss. Valley), scabrous above: racemes much elongate, 6–34-flowered: pedicels in flower 7–20 mm. long, in fruit 12–27 mm. long: calyx-lobes triangular-subulate to subulate, 0.2–1 mm. long: corolla 10–15 mm. long (15–23 mm. long and capsule 5–7 mm. long, in *A. tenuifolia leucanthera* of the Coastal Plain, N Fla. to Tex. and Ga.), purple, the posterior lobes concave-arched, glabrous: capsule 3–4 (–7) mm. long, globose. [*G. tenuifolia* Vahl.]—Woodlands, various provinces, Ga. to La., Mo., Mich., and Me.—Sum.—fall.

22. **A. divaricata** (Chapm.) Pennell. Stem 3–8 dm. tall, striate-angled, glabrous, much-branched: leaf-blades 1.5–2 cm. long, filiform, scabrellous above: racemes elongate, 6–12-flowered: pedicels 15–32 mm. long: calyx-lobes subulate, 0.1–0.3 mm. long, much shorter than the tube: corolla 15–18 mm. long, the posterior lobes flattened-projecting and glabrous at the base: capsule 3–4 mm. long, globose to ovoid-globose, not seen mature. [*G. divaricata* Chapm.]—Dry pineland, NW Fla. and SE Ala.—Fall.

23. **A. filicaulis** (Benth.) Pennell. Stem 1–5 dm. tall, obscurely striate, glabrous, with a few lax branches: leaf-blades 0.1–0.2 cm. long, triangular-subulate, appressed, scabrellous above: racemes not developed, the flowers nearly always solitary: pedicels in flower 5–8 mm. long, in fruit 6–10 mm. long: calyx-lobes triangular-subulate, 0.1–0.3 mm. long: corolla 10–13 mm. long, the posterior lobes flattened-projecting and glabrous at the base: capsule about 3 mm. long, globose. [*G. filicaulis* Benth.]—Moist grassy pinelands, Coastal Plain, N Fla. to E La. and Ga.—Fall.

24. **A. linifolia** (Nutt.) Britton. Stem 8–15 dm. tall, terete, glabrous, simple or virgately branched: leaf-blades 3–5 cm. long, linear, glabrous: racemes elongate, 8–20-flowered: pedicels 5–25 mm. long: calyx-lobes minute, subulate: corolla 30–40 mm. long; lobes spreading, lanose on the basal portions of the posterior: capsule 6–7 mm. long, globose to globose-ovoid. [*G. linifolia* Nutt.]—Wet pinelands, Coastal Plain, S Fla. to La. and Del.—Sum.—fall.

34. **TOMANTHERA** Raf. Annual root-parasitic herbs, the stems simple or branched, pubescent. Leaves opposite, cauline: blades entire, lobed at the base, or pinnately parted, sessile. Flowers in spikes with foliaceous bracts. Calyx-lobes 5, unequal, longer than the tube. Corolla purple: throat campanulate, somewhat inflated anteriorly: lobes much shorter than the tube, the 2

posterior arched, the 3 anterior spreading. Stamens 4, didynamous, included: anthers lanose. Stigma elongate. Capsule short, glabrous, loculicidal. Seeds numerous, reticulate, wingless. [*Otophylla* Benth.]—Two species, eastern North American.

1. *T. auriculata* (Michx.) Raf. Stem 1.5–8 dm. tall, 4-angled, hispid: leaf-blades 2.5–5.5 cm. long, lanceolate to lanceolate-ovate, rough-pubescent above; calyx-tube 5–8 mm. long, retrorse-pubescent; lobes 9–12 mm. long, ovate-lanceolate; corolla 20–23 mm. long, externally pubescent; the throat spotted with deep-purple anteriorly: capsule broadly ovoid, 10–13 mm. long, mucronate. [*O. Michauxii* Benth. *O. auriculata* (Michx.) Small]—Prairies and old fields, various provinces; introduced, Ala. to Tenn. and Pa.; native from Ill. to Tex., Kans., and Minn.—Sum.

35. **BUCHNERA** L. Perennial mostly pubescent herbs with short root-stocks, the stem simple. Leaves opposite, the lower sessile or nearly so, the upper clasping, toothed, all rough-pubescent. Flowers in a slender terminal spike, each axillary to a bract and with 2 narrower bractlets. Calyx-lobes 5, short. Corolla violet or white, salverform: tube very slender, pubescent: lobes nearly uniform. Stamens 4, included, slightly didynamous: anthers 1-celled. Stigma linear-cylindric. Capsule ovoid, included, loculicidal. Seeds numerous, reticulate, wingless.—About 100 species, in warm regions.—BLUEHEARTS.

Leaf-blades obscurely, if at all, 3-veined, repand-dentate or entire: capsule usually about 5 mm. long; stem finely rough-pubescent or nearly glabrous.

Corolla-tube about twice as long as the calyx: calyx-lobes triangular-acute, the anterior sinus only slightly deeper than the others: bracts 1.5–3 mm. long.

Blades of the lower leaves lanceolate to linear-lanceolate, acute or acuminate: corolla-lobes usually 6–9 mm. long.

Blades of the lower leaves elliptic-lanceolate, obtuse: corolla-lobes 3–5 mm. long.

Corolla-tube little longer than the calyx: calyx-lobes lanceolate-acuminate, the anterior sinus much deeper than the others: bracts 3–4 mm. long.

Leaf-blades clearly 3-veined, sinuate-toothed or lacerate: capsule usually 6–7 mm. long: stem hirsute.

1. *B. elongata*.
2. *B. floridana*.
3. *B. breviflora*.
4. *B. americana*.

1. *B. elongata* Sw. Stem 3–7 dm. tall, sparsely pilose or glabrate: leaf-blades rough-pubescent, the larger lanceolate to linear-lanceolate, 3–8 cm. long: bracts 1.5–3 mm. long, spreading or ascending-appressed: calyx-lobes triangular-acute to triangular-acuminate, 0.5–1 mm. long, the anterior sinus scarcely deeper than the others: corolla violet or white; tube 7–10 mm. long; lobes 6–9 mm. long, oblanceolate to narrowly obovate: capsule 5 mm. long.—Prairies and pinelands, S Fla.—[W. I.]—All year.

2. *B. floridana* Gandoger. Stem 3–6 dm. tall, slightly pilose, or glabrate above: leaf-blades rough-pubescent, the larger elliptic-lanceolate, 2.5–5.5 cm. long: bracts 2–3 mm. long, spreading: calyx-lobes triangular-acute, 0.5–1 mm. long, the anterior

sinus the deeper: corolla violet or white; tube 7–8 mm. long; lobes 3–5 mm. long, triangular-obovate: capsule about 5 mm. long.—Pinelands, Coastal Plain, pen. Fla. to Tex. and N. C.—Spr.–fall.

3. *B. breviflora* Pennell. Stem 3–6 dm. tall, pilose below: leaf-blades rough-pubescent, the larger lanceolate to elliptic, 4–8 cm. long: bracts 3–4 mm. long, ascending-appressed: calyx-lobes lanceolate-acuminate, 1–2 mm. long: corolla violet; tube 6–7 mm. long, very densely pilose at the mouth; lobes 2–4 mm. long, triangular-obovate, rounded or slightly emarginate: capsule not seen mature.—Prairies and pinelands, Coastal Plain, C pen. Fla. to Tex. and S. C.—Spr.

4. *B. americana* L. Stem 3–8 dm. tall, most copiously hirsute below: leaf-blades hispid, the larger ovate-lanceolate or elliptic-lanceolate, 3–7 cm. long: bracts 2–4 mm. long, ascending or spreading: calyx-lobes acuminate-cuspidate, mostly 1–1.5 mm. long: corolla violet; tube 9–11 mm. long, strongly pilose at the mouth; lobes 5–8 mm. long, oblanceolate, rounded or emarginate: capsule usually 6–7 mm. long: seeds about 0.5 mm. long.—Sandy or sterile open soil, often in meadows, various provinces N of Coastal Plain, Ga. to Tex., Ill., Ont., and Pa.—Spr.–early sum.

36. **SCHWALBEA** L. Perennial pubescent herbs, the stem simple. Leaves alternate, all cauline: blades entire, rather broad, 3-veined, sessile. Flowers in a raceme, each pedicel subtended by 2 bractlets, the short stalks axillary to bracts which are shorter than the calyx. Calyx-lobes 5, unequal, the posterior one short, narrow, the anterior pair well united, broad. Corolla 2-lipped: posterior lip nearly entire: anterior lip 3-lobed, the throat with 2 slightly pubescent ridges. Stamens 4, included, didynamous: anthers nearly glabrous. Stigma capitate. Capsule stout, included in the calyx, septicidal and secondarily slightly loculicidal. Seeds narrow, flat, winged.—Two species, eastern North American.

1. *S. australis* Pennell. Stem 4–8 dm. tall, finely pubescent with ascending hairs: leaf-blades 3–4 cm. long, elliptic-oval, obscurely reticulate, strigillose; pedicels 3–5 mm. long: bractlets 5–8 mm. long: calyx-lobes acute or acuminate; posterior one 7–10 mm. long; anterior lip 20–22 mm. long: corolla about 30 mm. long, yellow, and distally purplish: capsule cylindric-ovoid or ellipsoid, 10–12 mm. long: seeds 2.5 mm. long, slightly curved.—(CHAFF-SEED.)—Sandy oak woods and pinelands, Coastal Plain, C Fla. to La. and S. C.; and adj. provinces, Ala. to E Tenn.—Spr.–sum.

37. **CASTILLEJA** Mutis. Annual pubescent herbs, the stem simple or branched. Leaves alternate, the basal ones forming a semi-persistent rosette: blades entire or pinnately cleft, sessile or nearly so. Flowers spicate. Bracts foliaceous, shorter and broader than the leaves, red or yellowish towards the ends. Bractlets none. Calyx-lobes 4 (the posterior sepal lacking), united sagittally about half their length, those of each side completely fused; distally

red or yellowish. Corolla 2-lipped, yellowish-green: posterior lip long and narrowly arched: anterior lip very short, of 3 thickened lobes. Stamens 4, included, didynamous: anthers coherent, glabrous. Stigma capitate. Capsule stout, the carpels equal, loculicidal. Seeds turgid, reticulate, wingless.—About 200 species, mostly American; 2 or 3 Asiatic.

1. *C. coccinea* (L.) Spreng. Stem 2–6 dm. tall, arising from a rosette of elliptic to ovate, nearly or quite entire leaf-blades: cauline leaves few; blades linear-lanceolate, with 1 or 2 pairs of divaricate lobes: bracts overlapping, ovate, 3-lobed, distally scarlet, or exceptionally yellow: calyx 18–23 mm. long: corolla 18–25 mm. long: capsule narrowly-ovoid, 11–13 mm. long.—(PAINTED-CUP. INDIAN PAINT-BRUSH.)—Grassy meadows and moist woods, various provinces, in Coastal Plain only northward, Ga. to Ark., Kans., Man., and Me.—Spr.

38. *PEDICULARIS* L. Perennial herbs, the stems often gregarious, glabrous or pubescent. Leaves opposite or alternate, all cauline or tufted on basal shoots: blades pinnately lobed, often thickish. Flowers closely spicate, usually leafy-bracted. Bractlets none. Calyx-lobes 4 (the posterior sepal lacking), shorter than the tube, those of each side completely fused. Corolla 2-lipped, yellow or purple: posterior lip arched and decurved: anterior lip 3-lobed, obliquely spreading. Stamens 4, included, slightly didynamous. Stigma capitate. Capsule ensiform-lanceolate, the carpels unequal, the posterior loculicidal. Seeds few, flat, wingless.—About 350 species, of the Northern Hemisphere, mainly in the Old World.—LOUSEWORTS. FERNLEAFS.

Stem hirsute: leaves alternate: blades deeply pinnatifid: calyx-lobes broadly acute, entire: capsule twice as long as the calyx. 1. *P. canadensis*.  
Stem glabrous: leaves opposite: blades shallowly pinnatifid: calyx-lobes with a slightly enlarged crenate tip: capsule scarcely exceeding the calyx. 2. *P. lanceolata*.

1. *P. canadensis* L. Stem 1–3 dm. tall: leaf-blades petioled, elliptic-oval, with long crenate lobes separated by deep broad sinuses: flower-rachis lanate: calyx 7–9 mm. long, hirsute, on each side entire: corolla 18–23 mm. long, yellow, or with the posterior lip purple, or purplish throughout, the anterior lip not close to the posterior one: capsule 13–16 mm. long, nearly beakless: seeds 1.5 mm. long, finely lined.—(WOOD-BETONY.)—Sandy or sterile soil, woods and knolls in meadows, various provinces, N Fla. to Tex., Man., and N. S.—Spr.

2. *P. lanceolata* Michx. Stem 4–8 dm. tall: leaf-blades sessile or nearly so, elliptic-lanceolate, with short crenulate lobes separated by shallow narrow sinuses: flower-rachis glabrous: calyx 9–11 mm. long, glabrous or nearly so, on each side terminating in a crenate leaf-like tip: corolla 18–23 mm.

long, yellow, the anterior lip appressed to or partly investing the posterior one: capsule 10–12 mm. long, obliquely pointed: seeds 2.5 mm. long.—(SWAMP-LOUSEWORT.)—Wet meadows and swales, Blue Ridge and more N provinces, N. C. to Nebr., Man., and Mass.—Sum.-fall.

**39. MELAMPYRUM L.** Annual herbs, the stem minutely pubescent. Leaves opposite, all cauline: blades usually entire, thin. Flowers loosely racemose, axillary to foliaceous, entire or basally fimbriate bracts. Bractlets none. Calyx-lobes 4 (the posterior sepal lacking), as long as the tube or longer, nearly equal, the posterior and anterior pairs divaricate. Corolla 2-lipped, mainly white: posterior lip arched and hooded: anterior lip slightly 3-lobed with a densely puberulent palate. Stamens 4, included, didynamous: filaments glabrous: anthers cohering, pubescent, mucronate at base. Stigma capitate. Capsule somewhat decurved, the carpels unequal, the posterior cavity loculicidal. Seeds 2 in each cavity, plump, smooth, wingless.—About 50 species, of the Northern Hemisphere.

**1. M. lineare** Desr. Stem 1–4 dm. tall: leaf-blades linear to lanceolate-linear: 2–6 cm. long: bracts conspicuously fimbriate: calyx-lobes ovate-caudate, 2–4 mm. long: corolla 7–10 mm. long: posterior lip yellowish-tipped, ciliolate; anterior lip flat, the palate egg-yellow: capsule ensiform-ovate, 5–7 mm. long: seeds ovoid, 2–3 mm. long, mostly brown. [*M. americanum* (Chapm. Fl.)]—(COW-WHEAT.)—Open woods, old fields, and pastures, Coastal Plain and adj. provinces, N. C. to N. Y.—*M. latifolium* Muhl. perhaps not specifically distinct, with larger leaf-blades varying from ovate to linear-lanceolate, shortly fimbriate or entire bracts, a broader capsule, and seeds 3–4 mm. long, ranges, in the Blue Ridge and adj. provinces, from Ga. to Wis., Que., and N. S.

## FAMILY 15. ACANTHACEAE—ACANTHUS FAMILY

Herbs or shrubs. Leaves alternate, opposite, or whorled: blades simple. Flowers perfect, irregular. Calyx of usually 5 partly united sepals. Corolla of 5 partly united petals, 2-lipped or sometimes essentially regular. Androecium of 4 didynamous, or of 2 equal stamens, one pair being abortive or obsolete. Gynoecium of 2 united carpels. Ovary 2-celled. Ovules commonly 2 in each cavity. Fruit a capsule, often with a stipe-like base, the valves opening elastically.—About 175 genera and 2,000 species, widely distributed in temperate and tropical regions.

Vines: seeds globular.

Erect or diffuse herbs: seeds flat.

Leaves normal only at the base of the stem, those on the stem reduced to firm sheathing imbricate scales and passing into the inflorescence.

Leaves normal on the stem.

Corolla convolute in the bud.

Corolla conspicuously 2-lipped: capsule terete, not constricted at the base.

Corolla barely if at all 2-lipped: capsule constricted into a stipe-like base.

1. THUNBERGIA.

2. TUBIFLORA.

3. HYGROPHILA.

Anther-sacs mucronate or aristulate at the base: corolla with a short tube and a campanulate throat.

Anther-sacs rounded at the base: corolla with a long tube and a funnellform or campanulate throat.

Corolla imbricated in the bud.

Stamens 4: anthers 1-celled.

Stamens 2: anthers 2-celled.

Anther-sacs parallel, closely contiguous.

Corolla strongly 2-lipped.

Corolla slightly 2-lipped.

Anther-sacs separated on a dilated connective.

Anther-sacs nearly similar in size and shape, the lower sac short-stalked.

Anther-sacs dissimilar, more or less unequal, and the lateral one, at least, pointed at the base, sessile.

4. *DYSCHORISTE*.

5. *RUELLIA*.

6. *GERARDIA*.

7. *DIAPEDIUM*.

8. *YEATESIA*.

9. *DIANTHERA*.

10. *JUSTICIA*.

1. **THUNBERGIA** L. f. Climbing vines (ours). Leaf-blades more or less hastate or sagittate and toothed. Flowers on axillary peduncles, subtended by a pair of foliaceous bracts. Calyx persistent: lobes 10–16, narrow. Corolla salverform, with a short tube, a long throat, and a limb with 5 broad lobes. Stamens 4, didynamous. Capsule subtended by the persistent bracts, with a roundish body and a flat beak.—About 40 species, in the Old World tropics.—Sum. or all year S.

Petioles wing-margined: corolla yellow or ochroleucous, with a purple eye: capsule-beak somewhat longer than the body.

1. *T. alata*.

Petioles not wing-margined: corolla white: capsule-beak much longer than the body.

2. *T. fragrans*.

1. ***T. alata*** Bojer. Leaf-blades triangular-ovate to hastate, 3–11 cm. long, undulate or sinuate-toothed, cordate at the base: calyx-lobes subulate, mostly 10–12, longer than the tube: corolla-limb 2.5–3.5 cm. wide, the lobes rounded or undulate: capsule-beak somewhat longer than the diameter of the body.—(BLACK-EYED SUSAN.)—Prairies, roadsides, and waste-places, Fla. Nat. of Africa.

2. ***T. fragrans*** Roxb. Leaf-blades lanceolate to ovate, coarsely toothed near the base and more or less hastate, 4–11 cm. long, truncate to cordate at the base: calyx-lobes lanceolate, 12–16, unequal, about half as long as the tube or longer: corolla-limb 3.5–4.5 cm. wide, the lobes truncate: capsule-beak nearly twice as long as the body. — (WHITE-THUNBERGIA.) — Fencerows, roadsides, waste-places, and hammocks, Fla. Nat. of Asia.

2. **TUBIFLORA** J. F. Gmel. Rigid herbs with several basal leaves and flower stems with many rigid sheathing scales. Flowers in terminal spikes, subtended by bractlets somewhat shorter than the calyx. Calyx-lobes glumaceous, 4 or 5, the lateral ones the narrower. Corolla white or blue, slightly 2-lipped. [*Elytraria* Vahl.]—About 10 species, American.

Basal leaves more or less spreading: blades narrow and elongate. Basal leaves erect; blades broad and relatively short.

1. *T. angustifolia*.

2. *T. carolinensis*.

1. *T. angustifolia* (Fernald) Small. Stem 2-6 dm. tall: basal leaves 4-30 cm. long; blades linear, elongate linear-spatulate or narrowly oblanceolate: bracts ciliate: bractlets very narrow: calyx-lobes 6-7.5 mm. long, short-ciliate at the tip: corolla-lobes much shorter than the tube: capsule about equalling the calyx, the body 4-5 mm. long. Everglades, S Fla.—Spr.-fall.

2. *T. carolinensis* (Walt.) J. F. Gmel. Stem 2-5 dm. tall: basal leaves 5-20 cm. long; blades elliptic to spatulate: bracts ciliate: bractlets rather broad: calyx-lobes 8-9.5 mm. long, long-ciliate at the tip: corolla-lobes nearly as long as the tube: capsule often exerted at the tip, the body 5-7 mm. long. [*E. virgata* Michx.]—Low grounds, especially calcareous, Coastal Plain, Fla. to S. C.—Sum.

3. *HYGROPHILA* R. Br. Annual or perennial weak herbs. Flowers solitary or clustered in the axils. Calyx 5-lobed, the lobes nearly equal. Corolla mainly white, strongly 2-lipped. Stamens 4, didynamous. Capsule cylindric.—About 30 species, tropical.

1. *H. lacustris* (Schlecht.) Nees. Stem 3-9 dm. long: leaf-blades nearly linear or narrowly linear-lanceolate, 5-12 cm. long: calyx-lobes narrowly linear-subulate, 5-7 mm. long: corolla 7 mm. long; lobes of the lower lip ovate: capsule 7-8 mm. long.—Swamps and muddy banks, Coastal Plain, Fla. to Tex.—(*Mex.*)—Sum.-fall.—The score and a half species of this genus are all swamp or marsh inhabitants. The sole species in the continental United States inhabits the river-bottoms from western Florida to Texas. It reaches its greatest development in the lower Mississippi Delta.

4. *DYSCHORISTE* Nees. Herbs or woody plants: leaf-blades entire. Flowers solitary or clustered in the axils. Calyx-lobes 5, very slender. Corolla blue, purple, or rarely white, somewhat 2-lipped. Capsule 2-4-seeded. [*Calophanes* D. Don.]—About 30 species widely distributed in warm and tropical regions.

Calyx-lobes nearly as long as the corolla; corollas and the bractlets about equal in length.

Calyx-lobes less than  $\frac{1}{2}$  as long as the corolla; which is fully twice as long as the bractlets.

Corolla 1 cm. long or shorter; leaf-blades of a linear type.  
Corolla fully 2 cm. long; leaf-blades mainly of an elliptic type.

1. *D. humistrata*.

2. *D. angusta*.

3. *D. oblongifolia*.

1. *D. humistrata* (Michx.) Kuntze. Stem 1-4 dm. long: leaves few; blades 2-3 cm. long, elliptic to elliptic-ovate: calyx puberulent; lobes subulate-seta-

ceous from a lanceolate base, 6–8 mm. long; corolla about 1 cm. long; limb about 10 mm. wide; capsule 8–10 mm. long.—River-swamps, Coastal Plain, Fla. and Ga.—Spr.

2. *D. angusta* (A. Gray) Small. Stem 1–2 dm. tall; leaves numerous; blades 1–2.5 cm. long, spatulate below to linear-elliptic or linear above; calyx-lobes linear-subulate, 9–11 mm. long; corolla limb about 10 mm. wide; capsule 7–8 mm. long.—Pinelands and open sandy hammocks, S Fla.—All year.

3. *D. oblongifolia* (Michx.) Kuntze. Stem 1–3 dm. tall; leaves few; blades 1–3 cm. long, obovate to cuneate below, elliptic above; calyx-lobes 12–15 mm. long; corolla-limb 15 mm. wide; capsule 10–13 mm. long.—Sandhills and pinelands, Coastal Plain, Fla. to Va.—Spr.–fall.

5. **RUELLIA** [Plum.] L. Caulescent herbs. Leaf-blades entire or toothed. Flowers axillary or sometimes in terminal clusters. Calyx 5-lobed, the lobes narrow. Corolla nearly regular. Capsule 6–20 seeded.—About 200 species, mostly tropical American.

Flowers or flower-clusters sessile or essentially so.  
Flowers or flower-clusters peduncled.

I. PARVIFLORAE.

II. PEDUNCULATAE.

#### I. PARVIFLORAE

Calyx-lobes linear-filiform or with filiform tips, longer than the capsule.

Corolla 4–6 cm. long.

Stem less than 1 dm. tall.

Stem over 2 dm. tall.

Leaf-blades sessile or essentially so.

Leaf-blades manifestly petioled.

Plant green or purple-tinged; leaf-blades not conspicuously veined beneath.

Leaf-blades thick; stem succulent, fistulose.

Leaf-blades thin; stem woody, not fistulose.

Plant grayish-pubescent; leaf-blades prominently veined beneath.

Corolla 7–10 cm. long.

Calyx-lobes linear-lanceolate or broadly linear, scarcely longer than the capsule.

1. *R. humilis*.

2. *R. ciliosa*.

3. *R. succulenta*.

4. *R. parviflora*.

5. *R. hybrida*.

6. *R. noctiflora*.

7. *R. strepens*.

#### II. PEDUNCULATAE

Erect gregarious plant with narrow leaf-blades.

8. *R. malacosperma*.

1. *R. humilis* Nutt. Stem 1–3 cm. tall, hirsute or villous-hirsute, or almost wanting; leaf-blades spatulate to elliptic or oval, 3–10 cm. long; calyx hirsute; lobes linear-subulate, 15–20 mm. long; corolla blue or nearly white, 4–5 cm. long; tube 1–2 mm. thick; capsule 15–17 mm. long.—Sandy soil, Coastal Plain, Fla. to Miss. and Ga.—Spr.–fall.

2. *R. ciliosa* Pursh. Stem 2–6 dm. tall, hirsute; leaf-blades oval, ovate, or elliptic, 2–5 cm. long; calyx hirsute; lobes filiform-subulate, 15–20 mm. long; corolla blue, 5–7 cm. long; tube 1–2 mm. thick; capsule 10–15 mm. long.—Dry soil, various provinces, Fla. to Tex., Kans., Mich., and N. J.—Spr.–fall.

3. *R. succulenta* Small. Stem 1.5–5 dm. tall, inconspicuously puberulent; leaf-blades

narrowly elliptic to spatulate, 2.5–4.5 cm. long; calyx sparingly ciliate or glabrous; lobes linear-filiform, 13–16 mm. long; corolla deep purplish-blue, about 4 cm. long.—Everglades, Fla.—All year.

4. *R. parviflora* (Nees) Britton. Stem 2–6 dm. tall, sparingly pubescent but green: leaf-blades elliptic to elliptic-lanceolate, 3–10 cm. long; calyx hirsute; lobes linear-filiform, 15–20 mm. long; corolla blue, 4–5 cm. long; tube 1.5–2 mm. thick; capsule barely 15 mm. long.—Sandy soil, Coastal Plain and adj. provinces, Fla. to Tex., Ind., and N. J.—Spr.–fall.

5. *R. hybrida* Pursh. Stem 2–6 dm. long, often diffusely spreading, grayish pubescent: leaf-blades elliptic to elliptic-lanceolate, 3–10 cm. long; calyx hirsute; lobes linear-filiform, 15–20 mm. long; corolla light-blue, 4–5 cm. long; capsule 10–16 mm. long.—Pinelands, Fla.—Spr.–sum.

6. *R. noctiflora* (Nees) A. Gray. Stem 1–3 dm. tall, minutely pubescent: leaf-blades elliptic, sometimes narrowly so or elliptic-lanceolate, 4–7 cm. long; calyx softly pubescent; lobes linear-filiform, 25–35 mm. long; corolla blue or nearly white, about 9 cm. long; tube about 2 mm. thick; capsule about 25 mm. long.—Pinelands, Coastal Plain, Fla. to Miss. and Ga.—Spr.–sum.

7. *R. strepens* L. Stem 2–12 dm. tall, glabrous or finely pubescent; leaf-blades ovate to elliptic, 5–15 cm. long; corolla blue or nearly white, 5–6 cm. long; capsule 10–15 mm. long.—Dry soil, often calcareous, various provinces, Fla. to Tex., Wis., and Pa.—Spr.–sum.

8. *R. malacosperma* Greenm. Stem up to 1 m. tall, glabrous in age: leaf-blades linear-elliptic or linear-spatulate on the lower part of the stem, elongate-linear and attenuate above, mostly 1–2 dm. long; flowers in open cymes: calyx sparingly pubescent; lobes linear-subulate, about 1 cm. long; corolla bluish-purple, 3.5–4 cm. long; tube about 1 cm. long, shorter than the throat; capsule about 2.5 cm. long.—Roadsides, cult. grounds, and ditch-banks, Coastal Plain, Fla. to La. Nat. of C. A. and cult.—Spr.–fall.

**Blechnum** *Blechnum* (L.) Millsp., with conspicuously bracted epike-like panicles, has been found in Fla.; it is a native of S. A.

6. **GERARDIA** L. Mostly scapose herbs. Leaves mainly basal. Flowers in terminal spikes. Calyx-lobes 5, nearly equal. Corolla with slightly unequal broad spreading lobes. [*Stenandrium* Nees.]—About 25 species, of tropical America.

1. *G. floridana* (A. Gray) Small. Plant 2–6 cm. tall: leaf-blades ovate to elliptic or oval, 2–3 cm. long; calyx-lobes linear-subulate, becoming 9–11 mm. long; corolla rose-purple, 16–20 mm. long; capsule 9–12 mm. long. [*S. floridanum* (A. Gray) Small.]—Pinelands, S. pen. Fla.—All year.—The genus-name *Gerardia* has long been mistakenly applied to certain groups of the Figwort Family.

7. **DIAPEDIUM** Konig. Annual or usually perennial herbs. Leaf-blades entire. Flowers in conspicuously bracted spikes. Calyx 5-lobed, the lobes narrow, nearly equal. Corolla 2-lipped, the upper lip erect. Filaments elongate. Capsule with an ovoid or suborbicular body. [*Dieliptera* Juss.]—About 60 species of tropical and warm regions.

Corolla red or crimson, curved: tube longer than the lips.  
Corolla purple or pink, nearly straight: tube and lips about equal in length.

1. *D. assurgens*.

2. *D. brachiatum*.

1. *D. assurgens* (L.) Kuntze. Plant 3–11 dm. tall, often diffuse: leaf-blades ovate to elliptic or elliptic-lanceolate, 2–10 cm. long: calyx 3–4 mm. long; lobes lanceolate: corolla crimson or red, 2–2.5 cm. long: capsule 7–8 mm. long.—Hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A.*)—All year.

2. *D. brachiatum* (Pursh) Kuntze. Plant 3–8 dm. tall: leaf-blades ovate to elliptic-ovate, 2–10 cm. long, acute or somewhat acuminate: calyx 4–5 mm. long; lobes linear-subulate: corolla 15–20 mm. long: capsule about 5 mm. long.—River-banks and swamps, Coastal Plain, Fla. to Tex., Kans, Mo., and N. C.—Sum.—fall.—The two species in our range are as distinct in their habitats as in the color of their corollas. The first cited species thrives in saline habitats, while the second one inhabits fresh swamps and river-banks.

8. *YEATESIA* Small. Perennial herbs. Leaf-blades entire. Flowers in conspicuously bracted spikes. Calyx 5-lobed, the lobes slender. Corolla slightly 2-lipped: upper lip entire or nearly so: lower lip 3-lobed. Capsule with an ovoid body.—One species.

1. *Y. viridiflora* (Nees) Small. Plant 2–6 dm. tall: leaf-blades elliptic or elliptic-lanceolate, 5–15 cm. long: calyx 4–5 mm. long; lobes slender: corolla white, pale-purple, or pink, 12–15 mm. long: capsule about 1 cm. long, the body longer than the stipe-like base. [*Dicliptera Halei* Ridd.]—Shaded stream-banks, woods, and thickets, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and Ga.—Sum.

9. *DIANTHERA* [Gronov.] L. Perennial herbs. Leaf-blades entire or rarely toothed. Flowers in dense spikes on axillary peduncles. Calyx 4–5 lobed, the lobes narrow or slender. Corolla 2-lipped: upper lip slightly notched: lower lip 3-lobed. Anther-sacs borne obliquely, each at the tip of a fork of the connective. Capsule mostly 4-seeded.—One species.

1. *D. americana* L. Stem 3–10 dm. tall: leaf-blades linear to linear-lanceolate or narrowly elliptic, 5–15 cm. long: peduncles ascending, about as long as the leaves or longer: spikes 1–3 cm. long, continuous: calyx-lobes linear, 4–5 mm. long: corolla white, pink, or purplish: capsule 1.5–2 cm. long.—(*WATER-WILLOW.*)—Beds, shores, and banks of streams, various provinces, Ga. to Tex., Mich., and Que.—Spr.—sum.

10. **JUSTICIA** L. Perennial herbs. Leaf-blades entire. Flowers in more or less interrupted spikes on axillary peduncles. Calyx 5-lobed, the lobes narrow. Corolla 2-lipped: upper lip notched: lower lip 3-lobed. Anther-sacs unequal, one borne oblique or horizontal at the top of the connective, the other perpendicular or nearly so below it. Capsule 4-seeded.—About 100 species, mostly tropical American.

Corolla 2-2.5 cm. long.

Corolla 1 cm. long or shorter.

Flowers scattered along one side of the upper part of the peduncle.

Leaves remote, reflexed: corolla-tube 5-6 mm. long.

Leaves approximate, spreading or ascending: corolla-tube 8-10 mm. long.

Flowers in head-like spikes terminating the peduncles, or approximate at the end.

1. *J. crassifolia*.

2. *J. angusta*.

3. *J. lanceolata*.

4. *J. ovata*.

1. *J. crassifolia* Chapm. Stem 2-4 dm. tall: leaf-blades linear, usually narrowly so, or spatulate near the base of the stem, 3-15 cm. long, fleshy: calyx-lobes linear, 11-15 mm. long, acuminate: corolla bright-purple, 2-2.5 cm. long: capsule 2-2.5 cm. long.—Swamps, wet woods, and low pinelands, Fla.—Spr. or all year S.

2. *J. angusta* (Chapm.) Small. Stem 2-5 dm. tall: leaf-blades linear or narrowly linear-lanceolate, 2-7 cm. long, or elliptic-spatulate at the base of the stem, more or less reflexed: peduncles bearing 2-few flowers near the end: calyx-lobes linear, 5-7 mm. long: corolla pale-purple about 10 mm. long: capsule about 1.2 cm. long.—Pine-land ponds, Fla.—Spr.

3. *J. lanceolata* (Chapm.) Small. Stem 1-3 dm. tall: leaf-blades linear to linear-elliptic or elliptic-lanceolate, 3-10 cm. long, more or less acuminate, undulate, sessile or nearly so: spikes slender, 3-10 cm. long, interrupted along the peduncle: calyx-lobes narrowly linear, 5-7 mm. long: corolla purple, about 10 mm. long: capsule 1.5 cm. long.—Swampy ground and wet hammocks, Coastal Plain, Fla. to Tex. and Va.—Spr.-sum.

4. *J. ovata* Walt. Stem 1-3 dm. tall: leaf-blades elliptic, 3-11 cm. long; spike long-peduncled, 1-2 cm. long, continuous: calyx-lobes narrowly linear-acuminate, 6-12 mm. long: corolla pale-purple to violet, about 10 mm. long: capsule about 1 cm. long.—About pineland ponds, Coastal Plain, Fla. to Tex. and Va.—Spr.-sum.

# FAMILY 16. PINGUICULACEAE<sup>1</sup> — BLADDERWORT FAMILY

Herbs, growing in water or in wet places. Leaves submersed and dissected, sometimes resembling rootlets and often bladder-bearing, or aerial and entire, or rarely wanting. Scapes naked or minutely scaly, 1-many-flowered. Flowers irregular, perfect. Calyx 2-5-lobed, the lobes often nearly distinct. Corolla 2-lipped: tube spurred or saccate. Androecium of 2 stamens, adnate to the base of the corolla-tube on its upper side. Filaments flattened, twisted. Anthers 1-celled. Gynoecium a single 1-celled pistil, with a free-central, usually globose placenta. Style thick, very short. Ovules usually numerous but sometimes only two. Fruit a

<sup>1</sup> Contributed by John Hendley Barnhart.

capsule, 2-valved or irregularly dehiscent. Seeds numerous (in *Biovularia* only one).

- |   |                  |
|---|------------------|
| Calyx-lobes 5: scape without bracts, always 1-flowered.   | 1. PINGUICULA.   |
| Calyx-lobes 2: scape with 1 or more bracts, 1-many-flowered.  |                  |
| Calyx with a pair of bractlets resembling exterior lobes: scales, bracts, bractlets, and calyx-lobes fimbriate.                       | 2. ARANELLA.     |
| Calyx without bractlets; lobes not fimbriate.   |                  |
| Pedicels each with a bract and 2 bractlets at base.   |                  |
| Racemes spike-like, the pedicels rarely exceeding the bracts: bractlets free.   | 3. STOMOISIA.    |
| Racemes not spike-like, the pedicels longer, commonly many times longer than the bracts: bractlets more or less adnate to the bracts. | 4. CALPIDISCA.   |
| Pedicels each with a bract at base, but no bractlets.   |                  |
| Branches, if any, alternate: lateral lobes (if any) of lower corolla-lip not saccate.   |                  |
| Bracts peltate.   |                  |
| Bracts not peltate, attached by the base.   | 5. SETISCAPELLA. |
| Bracts tubular, solitary: corollas purple.  | 6. LECTICULA.    |
| Bracts not tubular, 1 or more: corollas yellow.   |                  |
| Scape below lowest bract well developed, with several scales; ovules and seeds numerous.  | 7. UTRICULARIA.  |
| Scape below lowest bract obsolete; ovules 2; seed 1.  |                  |
| Branches and branchlets whorled: lateral lobes of lower corolla-lip saccate.  | 8. BIOVULARIA.   |
|   | 9. VESICULINA.   |

1. **PINGUICULA** [Tourn.] L. Terrestrial scapose herbs. Leaves in a basal rosette: blades flat. Scapes usually several, 1-flowered, without scales or bracts. Calyx-lobes 5, more or less united. Corolla spurred at the base, the palate (in ours) subulate or clavate, included in the tube.—About 35 species, widely distributed.—BUTTERWORTS.

- |  |                           |
|--|---------------------------|
| Corolla, including spur, less than 2 cm. long.         | 1. <i>P. pumila</i> .     |
| Corolla, including spur, 2 cm. long, or longer.        |                           |
| Spur slender: plant glandular-pubescent.               |                           |
| Corolla golden-yellow: scape not villous.              | 2. <i>P. lutea</i> .      |
| Corolla violet: scape villous toward the base.         | 3. <i>P. caerulea</i> .   |
| Spur short and sac-like: plant almost wholly glabrous. | 4. <i>P. planifolia</i> . |

1. ***P. pumila*** Michx. Leaves 1-2.5 cm. long, clammy-pubescent: scapes very slender, 5-20 cm. tall: corolla white, pale violet, or pale rose, very rarely yellow, 1-2 cm. broad; spur subulate, about 3 mm. long, longer than the sac-like base of the corolla.—Low pinelands, Coastal Plain, Fla. to Tex. and S. C.—(W. I.)—Spr. or all year S.

2. ***P. lutea*** Walt. Leaves 1.5-6 cm. long, clammy-pubescent; scapes 1-3 dm. tall, pubescent: corolla golden-yellow, 2-3.5 cm. broad; lobes longer than the tube, usually obtusely 2-4-lobed; spur subulate or sub-cylindric, 5-10 mm. long.—Low pinelands, Coastal Plain, Fla. to La. and N. C.—Spr.

3. ***P. caerulea*** Walt. Leaves 1.5-6 cm. long, clammy-pubescent; scapes 1-3 dm. tall, pubescent, villous at the base; corolla violet, 2-2.5 cm. broad, the lobes obtusely 2-cleft; spur slender, subcylindric, 4-8 mm. long, obtuse. [*P. elatior* Michx.]—Low pinelands, Coastal Plain, Fla. to N. C.—Spr.

4. ***P. planifolia*** Chapm. Leaves 1.5-8 cm. long, glabrous or nearly so: scapes 1-3.5 dm. tall, nearly glabrous, not villous at the base: corolla violet, 1-2 cm.

broad, the lobes usually acutely 2-cleft; spur rather sac-like, only 1-3 mm. long, obtuse.—Shallow water, near the Gulf coast, Fla. to Miss.—Spr.

**2. ARANELLA** Barnh. Terrestrial herbs. Leaves in a basal rosette, often fugacious. Scapes 1-several-flowered: scales below the lowest pedicel numerous, peltate, fimbriate: bracts fimbriate: bractlets above the base of the very short pedicels, mimicking exterior calyxlobes, fimbriate. Calyxlobes 2, nearly distinct, fimbriate. Corolla 2-lipped. [*Cosmiza* Small, not Raf.]—Three or 4 species, tropical American.

**1. A. fimbriata** (H.B.K.) Barnh. Leaves linear, 5-6 mm. long: scapes 5-15 cm. tall: racemes 1-7-flowered, spike-like or subcapitate: corolla yellow, 6-8 mm. broad; spur subconic, about as long as the lower lip. [*Cosmiza longeciliata* Small.]—Low pinelands, especially along the Everglades, pen. Fla.—(W. I., S. A.)—All year.

**3. STOMOISIA** Raf. Terrestrial herbs. Stems delicate, root-like. Leaves delicate, rarely seen: blades linear. Bladders minute, beaked but without bristles. Scapes 1-many-flowered: scales below the lowest pedicel several, attached by the base: bracts each accompanied by a pair of bractlets. Calyxlobes 2, nearly distinct. Corolla 2-lipped, the lips nearly distinct, the upper one clawed, the lower consisting chiefly of the helmet-shaped, laterally compressed palate.—About 50 species, widely distributed.

Corolla much exceeding the calyx.

Lower lip of corolla 1.2 cm. long or more; spur about 12 mm. long.

Lower lip of corolla 1 cm. long or less; spur about 6 mm. long.

Corolla about as long as the calyx, or shorter.

1. *S. cornuta*.

2. *S. juncea*.

3. *S. virgatula*.

**1. S. cornuta** (Michx.) Raf. Scape rooting in mud, erect, 1-3 dm. tall: racemes spike-like, 2-5-flowered, the flowers approximate: corolla yellow, 1.2-1.6 cm. broad: lower lip much larger than the upper, abruptly pointed; spur horn-shaped, acute, slightly curved, pendent, 7-12 mm. long. [*Utricularia cornuta* Michx.]—Margins of ponds, various provinces, Fla. to Tex., Minn., and Newf.—(W. I.)—Sum.-fall.

**2. S. juncea** (Vahl.) Barnh. Scape rooting in mud, erect, 1-4 dm. tall: racemes spike-like, 3-12-flowered: corolla yellow, 0.8-1 cm. broad: lower lip larger than the upper, rather pointed; spur horn-shaped, acute, slightly curved, pendent, 5-7 mm. long. [*Utricularia juncea* Vahl.]—Margins of ponds, Coastal Plain and rarely adj. provinces, Fla. to Miss. and N. Y.—(W. I., S. A.)—Sum.-fall.

3. *S. virgatula* Barnh. Scape rooting in mud, erect, 0.3–2 dm. tall: racemes spike-like, 1–6-flowered: corolla yellow, 4 mm. broad, little if at all surpassing the calyx; spur conic, pendent, 2–3 mm. long. [*Utricularia simplex* Wright.]—Margins of ponds, Coastal Plain, Fla. to Miss. and N. Y.—(W. I.)—Fall.

4. *CALPIDISCA* Barnh. Terrestrial herbs. Leaves in a basal rosette, often fugacious. Scapes 1–several-flowered: scales below the lowest pedicel several, acute: bracts each accompanied by a pair of bractlets more or less adnate to it, making an apparently 3-lobed bract. Calyx-lobes 2, nearly distinct. Corolla 2-lipped, the lower lip abruptly reflexed from the aperture of the spur.—About 60 species, mostly tropical.

1. *C. Standleyae* Barnh. Leaves 1–6, subspatulate, 3–5 mm. long: scapes filiform, 1.5–15 cm. tall: racemes 1–6-flowered: pedicels filiform, ascending, 1.5–11 mm. long: corolla probably pale-purple; upper lip entire, 3 mm. long; spur compressed-conic, 4–5 mm. long, longer than the lower lip.—Low pinelands, pen. Fla.—Fall.

5. *SETISCAPELLA* Barnh. Terrestrial herbs, with short root-like branches from the base of the scape. Leaves delicate, evanescent and rarely seen: blades linear. Bladders minute, 2-horned. Scapes 1–many-flowered: scales below the lowest pedicel scarious, peltate: bracts scarious, peltate: bractlets none. Calyx-lobes 2, nearly distinct, scarious, ribbed. Corolla 2-lipped, the lower lip commonly stiff, divergently 3-lobed, with a 2-lobed palate.—About 12 species, mostly American.—Spr.–sum. or all year S.

Corolla yellow, 6–12 mm. long: capsule 2 mm. in diameter.

1. *S. subulata*.

Corolla white or purplish, subglobose, about 1 mm. in diameter: capsule 1 mm. in diameter.

2. *S. cleistogama*.

1. *S. subulata* (L.) Barnh. Scape rooting in mud, filiform, 3–20 cm. tall: racemes 1–12-flowered: rachis becoming zigzag when well-developed: pedicels ascending, 2–10 mm. long, surpassing the bracts: calyx becoming 2 mm. long: corolla yellow, 6–12 mm. long, 4–8 mm. broad, the lower lip much larger than the upper one, equally 3-lobed; spur flattened-conic, obtuse, appressed, nearly as long as the lower lip: capsule 2 mm. in diameter. [*Utricularia subulata* L.]—Wet sandy soil, Coastal Plain and New England coast, Fla. to Tex. and Mass.—Sum.

2. *S. cleistogama* (A. Gray) Barnh. Scape rooting in mud, filiform, stiff, 1–6 cm. tall: racemes 1–3-flowered: pedicels ascending 2–6 mm. long, surpassing the bracts: corolla dirty-white or purplish, not more than 1 mm. in diameter, consisting chiefly of

the large saccate spur, the tips minute: capsule 1 mm. in diameter.—Wet sandy soil, Coastal Plain and New England coast, Fla. to Miss. and Mass.—(*Cuba*.)

**6. LECTICULA** Barnh. Herbs. Stems radiating from the base of the scape, usually submerged. Leaves alternate, usually 3-parted, the segments linear. Scapes 1-flowered, the pedicel continuous with the scape: bract tubular, the free margin truncate, notched: bractlets none. Calyx-lobes 2, nearly distinct. Corolla transverse at the summit of the scape, 2-lipped, the palate a mere convexity.—Two species, the following and one in South America.

**1. L. resupinata** (B. D. Greene) Barnh. Stem short, root-like: leaves scattered; blades simple or forked near the base, the segments slender, capillary, often bladder-bearing: scape erect, 2–10 cm. tall: calyx 1.5–2 mm. long: corolla violet-purple, 8–12 mm. long; spur conic, obtuse, distant from the lower lip. [*Utricularia resupinata* B. D. Greene.]—Shallow water, various provinces, Fla. to Ont. and N. B.—Fall.

**7. UTRICULARIA** L. Aquatic herbs. Stems submersed, the branches alternate or from the base of the scapes. Leaves alternate, dissected. Bladders borne on the leaf-segments, the mouth with a pair of bristles. Scapes 1–many-flowered: scales below the lowest pedicel several: bractlets none. Calyx-lobes 2, nearly distinct. Corolla 2-lipped: lower lip flat, spreading, with a prominent 2-lobed palate.—About 75 species, very widely distributed.—BLADDERWORTS.

Scape without floats.

Stem creeping on the bottom in shallow water: some or all of the leaves root-like.

Spur slender, equalling or exceeding the lower lip.

Spur conic at base, linear above: leaves not all bladder-bearing: scapes 10–40 cm. tall.

1. *U. fibrosa*.

Spur tapering from base to apex: leaves all alike, bladder-bearing: scapes 5–12 cm. tall.

2. *U. pumila*.

Spur stout, conic, shorter than the lower lip.

3. *U. gibba*.

Stem free-floating, except for the single point of attachment.

Corolla 12–15 mm. broad: leaves forked, each fork twice or thrice dissected.

Scapes erect: pedicels recurving at maturity: capsule 3–4 mm. in diameter.

4. *U. macrorrhiza*.

Scapes flexuous: pedicels straight at maturity: capsule 5 mm. in diameter.

5. *U. floridana*.

Corolla 15–20 mm. broad: leaves forked, each fork 4–5 times dissected: pedicels recurving at maturity: capsule 5 mm. in diameter.

6. *U. foliosa*.

Scape with a whorl of conspicuous, inflated, more or less united floats.

Scape from floats to lowest pedicel 5 cm. long or less.

7. *U. radiata*.

Scape from floats to lowest pedicel 7.5 cm. long or more.

8. *U. inflata*.

**1. U. fibrosa** Walt. Stems radiating from the base of the scape or scapes, often 1–2 dm. long and free-swimming at the tip: leaves numerous; blades 2–3-

dichotomously dissected, or the bladder-bearing ones much reduced: scapes 1-4 dm. tall: raceme 2-6-flowered, usually 3-flowered: pedicels ascending, 5-20 mm. long: corolla yellow, about 15 mm. broad; spur conic at base, linear above, appressed, about as long as the lower lip, obtuse or emarginate at the apex.—Ponds, chiefly in pinelands, Coastal Plain, Fla. to Miss., (La.?) and N. Y.—Spr.-fall.

2. *U. pumila* Walt. Stems radiating from the base of the scape or scapes, short, root-like: leaves few; blades mostly bladder-bearing and much reduced: scapes 5-12 cm. tall: raceme 1-4-flowered, usually 2-flowered: pedicels ascending, 5-16 cm. long: corolla yellow, about 12 mm. broad; spur slenderly conic, appressed, usually longer than the lower lip, obtuse or emarginate at the apex. [*U. biflora* Lam. *U. macrorhyncha* Barnh.]—Shallow water, mostly Coastal Plain, and New England coast, Fla. to La. and Mass.—Spr.-fall.

3. *U. gibba* L. Stems radiating from the base of the scape or scapes, several cm. long, delicate, root-like: leaves scattered, sparingly divided; segments capillary, with few minute bladders: scapes 2-10 cm. tall: raceme 1-3-flowered, usually 2-flowered: pedicels very slender, erect or ascending, 2-10 mm. long: corolla yellow, 5-8 mm. broad; spur conic, very obtuse, shorter than the lower lip.—Shallow water, various provinces, Fla. to Tex., Mich., and Me.—Spr.-fall or all year S.

4. *U. macrorhiza* Le Conte. Stems submersed, leafy, 3-10 dm. long: leaves numerous, alternate, 1.5-5 cm. long: blades forked, each fork 2-3-pinnately dissected into filiform segments, usually bearing numerous bladders; bladders when fully developed 3-5 mm. long: scapes erect, 1-3 dm. tall: raceme 5-20-flowered: pedicels 0.5-2 cm. long, recurving at maturity: corolla yellow, 12-15 mm. broad, the lower lip slightly 3-lobed; spur not appressed, subulate, slightly curved, shorter than the lower lip: capsule 3-4 mm. in diameter, many-seeded. [*U. vulgaris americana* A. Gray.]—In water, various provinces, (N. C.?), Va. to Tex., Mo., Yukon, and Newf.—Sum.

5. *U. floridana* Nash. Stems submersed, leafy, 6-15 dm. long: leaves numerous, alternate, 3-5 cm. long; blades forked, each fork 2-3-pinnately dissected into very delicate capillary segments, the segments fewer, shorter, and stiffer when bladder-bearing; bladders 2 mm. long or less: scapes more or less flexuous, 1.5 dm. tall when the first flower expands, becoming 3-6 dm. tall: raceme very laxly 8-25-flowered: pedicels 0.5-1.5 cm. long, ascending or spreading at maturity: corolla yellow, 12-15 mm. broad, both lips nearly entire: spur not appressed, subulate, slightly curved, shorter than the lower lip: capsule about 5 mm. in diameter.—Ponds, Coastal Plain, Fla. and Ga.—Spr.-sum.

6. *U. foliosa* L. Stems submersed, leafy, 9-30 dm. long: leaves numerous, alternate, 3-10 cm. long; blades forked, each fork 4-5-pinnately dissected into very fine or capillary segments, the segments fewer when the bladders are more numerous: bladders 2 mm. long or less: scapes erect, 1-3 dm. tall: raceme rather closely 10-20-flowered: pedicels 1-2 cm. long, recurving at maturity: calyx becoming 4-5 mm. long: corolla yellow, 15-20 mm. broad, the upper lip erect, nearly entire, the lower lip spreading, slightly 3-lobed; spur not appressed, slenderly conic, slightly curved, shorter than the lower lip: capsule about 5 mm. in diameter, few-seeded. [*U. oligosperma* St. Hil.]—Ponds and brackish water, Coastal Plain, Fla. to La.—(W. I.)—Spr.-fall or all year S.

7. *U. radiata* Small. Stems elongate: leaves 6-10-dichotomously dissected, copiously bladder-bearing: scapes erect, 6-12 cm. tall, bearing near the middle a single whorl of 4-7 conspicuous inflated floats, which are more or less confluent at the base, less than 4 cm. long, and pinnately dissected near the tip: raceme 1-3-flowered: pedicels 8-20 mm. long, spreading or recurved in fruit: corolla yellow, about 1.5 cm. broad, the lower lip 3-lobed, about twice as long as the appressed conic emarginate spur.—Ponds, Coastal Plain and New England coast, Fla. to Tex. and Me.—Spr.—fall.

8. *U. inflata* Walt. Stems submersed, often stout, elongate: leaves 10-12-dichotomously dissected, copiously bladder-bearing: scapes erect, 2-6 dm. tall, bearing a whorl of 4-9 conspicuous inflated bracts, which are more or less confluent at the base, 5-7 cm. long, and pinnately dissected from near the middle: raceme 4-12-flowered: pedicels 16-32 mm. long, spreading or recurved in fruit: corolla yellow, about 2 cm. broad, the lower lip 3-lobed, about twice as long as the appressed conic emarginate spur.—Ponds and ditches, Coastal Plain, Fla. to Del.—Spr.—fall.

8. **BIOVULARIA** Kam. Minute aquatic herbs. Stems submerged. Leaves alternate, dissected. Bladders borne on the leaf-segments, the mouth 2-beaked. Scapes 1-3-flowered, the part below lowest bract obsolete, the lowest bract hence sessile on the main stem; bractlets none. Calyx-lobes 2, nearly distinct. Corolla 2-lipped, the lips entire, the palate not prominent. Ovules only 2. Fruit indehiscent, with a single seed.—One species, in tropical and subtropical America.

1. *B. olivacea* (Wright) Kam. Stems delicate, capillary, forming mats on or a little beneath the surface of the water: leaves mostly of a single segment, bearing one bladder; scape scarcely any, the bracts and pedicels, if more than one, approximate at its base; longest pedicel less than 1 cm. long; calyx about 0.5 mm. long; corolla yellowish, less than 2 mm. long; spur saccate. [*Utricularia olivacea* Wright.]—Shallow water, near Sanford, Seminole Co., Fla.—(W. I., S. A.) One of the smallest (perhaps the smallest by weight) of all flowering plants.

9. **VESICULINA** Raf. Aquatic herbs. Stems submersed, the branches whorled, decompound. Leaves none. Bladders terminal, the mouth (in ours) naked. Scapes 1-4-flowered: scales below the lowest pedicel none: bractlets none. Calyx-lobes 2, nearly distinct. Corolla 2-lipped: lower lip 3-lobed, the lateral lobes saccate, forming together a prominent divergently 2-lobed palate, the middle lobe short.—About 6 species, American.

1. *V. purpurea* (Walt.) Raf. Stems elongate, the branches numerous, whorled, verticillately decompound: bladders solitary, terminating many of the ultimate branchlets, the orifices without projecting processes: scapes erect, slender, spongy-

thickened below, 0.5–1.5 dm. tall: pedicels erect or ascending: calyx becoming 2.5–3 mm. long: corolla violet-purple, 12 mm. broad; spur conic, somewhat flattened, about  $\frac{1}{2}$  as long as the lower lip. [*Utricularia purpurea* Walt.]—Ponds, various provinces, Fla. to La., Minn., Ont., and Me.—(W. I.)—Sum.—fall.

## FAMILY 17. OROBANCHACEAE — BROOM-RAPE FAMILY

Parasitic, commonly perennial herbs, without green coloring matter. Leaves alternate, scale-like. Flowers perfect, or rarely dioecious, sometimes cleistogamous and complete on the same plant. Calyx of 4 or 5 partly united sepals, sometimes spathe-like. Corolla of 4 or 5 partially united petals, the limb irregular or 2-lipped. Androeceum of 4 didynamous stamens partially adnate to the corolla. Gynoeceum of 2, or rarely of 3, united carpels. Ovary 1-celled. Ovules mostly numerous. Fruit a capsule. Seeds wingless.—About 11 genera and more than 200 species, most abundant in the Northern Hemisphere.

Flowers perfect and complete throughout.

Calyx irregular, spathe-like, the lower side split, the upper with 3 or 4 tooth-like lobes: stamens exserted. 1. CONOPHOLIS.

Calyx regular or nearly so, with 2–5 equal or unequal lobes: stamens included.

Calyx with a deep sinus above and below.

Calyx nearly equally 5-lobed.

Flowers various, cleistogamous on lower part of spike, complete but mostly sterile above.

2. OROBANCHE.

3. THALESIA.

4. LEPTAMNIUM.

1. **CONOPHOLIS** Wallr. Yellow or brownish herbs, with very stout stems and inflorescence. Leaves numerous. Flowers sessile, yellowish, crowded in the spike.—Three species, North American.

1. *C. americana* (L. f.) Wallr. Plant clustered, 1–2 dm. tall: leaves (scales) ovate to lanceolate, 10–12 mm. long: calyx 7–9 mm. long, erose-toothed: corolla yellowish or pale-yellow, 10–12 mm. long: capsule ovoid, 10–15 mm. long.—(SQUAW-ROOT. CANCER-ROOTS.)—Rich woods, various provinces, Fla. to Mich. and Me.—Spr.—The squaw-root frequently grows in oak-woods. The young plant resembles a fir or spruce cone. It is pale, often creamy when young, but soon becomes brown.

2. **OROBANCHE** L. Whitish, yellowish, reddish, or violet herbs, with relatively slender stems. Leaves few. Flowers sessile, in a spike.—About 85 species, natives of the Old World.

1. *O. minor* J. E. Smith. Plant 1–5 dm. tall: leaves (scales) ovate to lanceolate, 6–20 mm. long: calyx about 10 mm. long; lobes lanceolate-subulate: corolla 11–15 mm. long; lips bluish, the lobes erose: filaments pubescent: capsule about 8 mm. long.—(BROOM-RAPE.)—Fields, various provinces N. C. to N. J. Nat. of Eu.—Spr.—sum.—Usually parasitic on clover roots. *Orobanche* is the most wide-spread genus of this family. The plants of some species are restricted to a

single host, while others are not particularly selective. Different hosts seem to influence variations in the parasite, a fact that may have led to too much multiplication of species.

3. **THALESIA** Raf. Pale, often pink herbs, with short, mostly subterranean stems. Leaves few. Flowers solitary on long pedicels, often more deeply colored than the foliage.—About 5 species, North American.

1. **T. uniflora** (L.) Britton. Plant 5–16 cm. tall: leaves (scales) ovate to obovate, 5–10 mm. long: calyx 4–11 mm. long; lobes lanceolate, about as long as the tube: corolla cream-colored and purple-tinged, 14–18 mm. long; lobes elliptic to obovate: capsule conic-ovoid, about 10 mm. long. [*Aphyllon uniflorum* T. & G.]—(BROOM-RAPE. CANCER-ROOT.)—Rich woods, various provinces, rarely Coastal Plain, Ga. to Tex., Calif., B. C., Ont., and Newf.—Spr.

4. **LEPTAMNIUM** Raf. Dark-purplish or yellowish-brown herbs, with branching stems. Leaves very few. Flowers racemose or paniculate, paler than the stem, separated.—One species.

1. **L. virginianum** (L.) Raf. Plant 1–4 dm. tall: leaves (scales) few at the base of the plant: complete flowers larger than the cleistogamous ones: calyx 2.5–3 mm. long; lobes triangular to ovate-triangular, shorter than the tube: corolla 10–13 mm. long; upper lip notched; lobes of the lower lip acute: capsule 3–5 mm. long. [*Epiphegus virginiana* Bart.]—(BEECH-DROPS. CANCER-ROOT.)—Under beech trees, various provinces, Fla. to La., Mich., and N. B.—Spr.

#### FAMILY 18. BIGNONIACEAE — TRUMPET-CREEPER FAMILY

Shrubs, trees, woody vines, or rarely herbs. Leaves opposite, or rarely alternate or whorled, often tendril-bearing: blades simple or pinnately compound. Flowers perfect, usually showy. Calyx of usually 2–5 more or less united sepals. Corolla 5-lobed, irregular, or 2-lipped. Androeium of 5 stamens with 1 or 3 of them reduced to staminodia, or of 4 didynamous stamens. Anthers with mostly divaricate saes. Gynoeium of 2 united carpels. Ovary 1-celled or 2-celled by the meeting of the placentae. Ovules numerous. Fruit a capsule. Seeds winged or appendaged.—About 60 genera and more than 500 species, mostly tropical.

Leaf-blades compound: vines or rarely herbaceous plants: calyx 5-lobed.

Calyx with an undulate margin: capsule flattened parallel with its partition.

Calyx with 5 lobes: capsule flattened at right angles with its partition.

1. **ANISOSTICHUS**.

- Erect plant: pod linear, not stipitate.  
 Climbing plant: pod clavate or fusiform, stipitate.  
 Leaf-blades simple: shrubs or trees: calyx 2-lobed.  
 Anther-bearing stamens 2: leaves opposite: fruit slender, dehiscent.  
 Anther-bearing stamens 4: leaves alternate or scattered: fruit thick, roundish, indehiscent.  
 Leaves clustered on spurs; blades of a spatulate or oblanceolate type: fruit rounded at the apex, with fleshy placentae.  
 Leaves alternate; blades of a broad type: fruit umbonate at the apex, with dry placentae.

2. *TECOMA*.  
 3. *BIGNONIA*.  
 4. *CATALPA*.  
 5. *CRESCENTIA*.  
 6. *ENALLAGMA*.

1. **ANISOSTICHUS** Bureau. Vines. Leaf-blades 2-foliolate or rarely 1-foliolate, often tendril-bearing: leaflets usually with entire blades. Calyx campanulate or cupulate. Corolla with a short tube abruptly expanded into a campanulate throat. Capsule narrow. Seeds winged.—One species.

1. **A. crucigera** (L.) Bureau. Glabrous vine: leaves prolonged into tendrils; leaflets mostly 2; blades elliptic to elliptic-lanceolate, 5–15 cm. long, cordate or auricled at the base: calyx 5–8 mm. long, shallowly lobed: corolla red-orange without, yellow within, 4–5 cm. long: filaments villous at the base: capsule linear, 10–17 cm. long. [*Bignonia capreolata* L.]—(CROSS-VINE. TRUMPET-FLOWER.)—Swamps, stream-banks, thickets, and woods, Coastal Plain and adj. provinces, Fla. to La., Ill., and Va. (or Md.?)—Spr.—Also called smoke vine, as sections of the stems which show a strikingly cross-shaped pith, are smoked as cigars.

2. **TECOMA** Juss. Shrubs or partly herbaceous plants. Leaf-blades unequally pinnate. Flowers clustered. Calyx tubular-campanulate, nearly equally 5-lobed. Corolla with the tube gradually enlarged into the funnellform throat. Seeds membranous-winged.—About 10 species, mostly tropical American.

1. **T. stans** (L.) Juss. Plant 1–8 m. tall: leaves 1–2.5 dm. long; leaflets 7–13, the blades lanceolate to elliptic, or narrower, 4–10 cm. long, coarsely serrate: calyx 3–5 mm. long; lobes often triangular: corolla yellow, 3.5–4.5 cm. long: capsule 10–20 cm. long.—(YELLOW TRUMPET-FLOWER. YELLOW-ELDER.)—Hammocks, woods, and thickets, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A.)—All year.

3. **BIGNONIA** [Tourn.] L. Vines. Leaf-blades unequally pinnate: leaflets with toothed blades. Flowers clustered. Calyx tubular-campanulate,

nearly equally 5-lobed. Corolla tubular-funnelform. Capsule stout, fusiform. Seeds membranous-winged.—Two species, the following and 1 in Japan.

1. *B. radicans* L. Stout vine: leaves many, 2–2.5 dm. long; leaflets 7–11, the blades oval, ovate, or elliptic, 2–6 cm. long, coarsely serrate: calyx 14–18 mm. long; lobes triangular to triangular-ovate: corolla red or orange, 5–9 cm. long: capsule fusiform, 10–18 cm. long. [*Tecoma radicans* Juss.]—(TRUMPET-CREEPER. COW-ITCH. TRUMPET.)—Woods, river-swamps, thickets, and fence-rows, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. J.—Sum.—fall.—The leaves of this plant are often mistaken for those of *Toxicodendron*, whence the name “cow-itch.” The bigonias, however, have no poisonous effect on the skin.

4. *CATALPA* L. Shrubs or trees, with scaly bark. Leaves deciduous: blades broad, membranous. Flowers panicate. Calyx 2-lobed. Corolla mainly white or yellow, the tube abruptly expanded into the throat. Capsule slender and elongate. Seeds fimbriate-winged. About 5 species, North American and Japanese.—INDIAN-BEANS. INDIAN-CIGARS. CIGAR-TREES. SMOKING-BEANS. CATALPAS. CATAWBAS.

Panicles many-flowered, crowded: corolla with a limb 4–5 × 5–6 cm. 1. *C. Catalpa*.  
Panicles few-flowered, lax: corolla with a limb 6–7 × 7–8 cm. 2. *C. speciosa*.

1. *C. Catalpa* (L.) Karst. Tree becoming 20 m. tall: leaf-blades ovate, 1–3 dm. long: calyx 8–12 mm. long; lobes abruptly pointed: corolla 3–4 cm. long, or sometimes larger; throat campanulate, channeled and keeled on the lower side, with yellow blotches along the ridges within and purple or magenta spots except on the top within; limb oblique, the lower lobe erect: capsule 1.5–4 dm. long.—Woods and stream-banks, various provinces, Fla. to Tex., and naturalized as far N as N. Y.—The dried capsules are frequently smoked by children wherever the tree is found.—Spr.—sum.

2. *C. speciosa* Warder. Tree becoming 40 m. tall: leaf-blades ovate to oblong-ovate, 1–3 dm. long: calyx 10–11 mm. long; lobes abruptly acuminate: corolla 3.5–5.5 cm. long, rather less copiously spotted within than *C. Catalpa*; throat conic-campanulate: capsule 3.5–5 dm. long.—(BOIS-PLANT.)—Damp soil or swamps, various provinces N of Coastal Plain, Tenn. to Tex., Mo., and Ind.—Spr.

5. *CRESCENTIA* L. Trees with scaly bark. Leaves clustered on spurs: blades of a spatulate or oblanceolate type. Flowers in clusters or solitary, on

the spurs, pediceled. Calyx 2-lobed, leathery. Corolla mainly yellowish-green and magenta-streaked, with a fold between the tube and the campanulate throat: lobes 5, unequal. Anthers mostly included. Fruit relatively large, rounded at the apex, with a thick, hard pericarp. Seeds flat, obcordate.—About 5 species, tropical American.

1. **C. Cujete** L. Tree becoming 12 m. tall: leaf-blades 8–15 cm. long, abruptly acuminate or obtuse, narrow-based: calyx 2–3 cm. long: corolla yellowish-green and magenta-streaked; lobes undulate: capsule subglobose, oval, or ellipsoid, 15–30 cm. long.—(CALABASH-TREE.)—Hammocks, Florida Keys. Nat. of tropical America.—Spr.—sum.

6. **ENALLAGMA** Baill. Trees with scaly bark. Leaves alternate: blades of an oblong, oval, or obovate type. Flowers solitary or clustered at the ends of the branchlets, long-pedicelled. Calyx 2-lobed, leathery. Corolla mainly whitish, purplish or greenish-yellow, with a fold between the tube and the campanulate throat: lobes 5, unequal. Anthers mostly exserted. Fruit relatively small, umbonate at the apex, with a thin brittle pericarp. Seeds convex, notched at both ends.—Four species, tropical American.

1. **E. latifolia** (Mill.) Small. Tree becoming 8 m. tall: leaf-blades 7–15 cm. long, abruptly pointed, broad-based: calyx 2.5–4 cm. long: corolla 5–6 cm. long, pale purple to yellowish-white; lobes toothed: capsule ellipsoid or oval, 5–11.5 cm. long. [*Crescentia ovata* Fl. SE. U. S.]—(BLACK-CALABASH.)—Hammocks, often along the coast, S pen. Fla. and Florida Keys.—(W. I.)—Spr.—sum.

#### FAMILY 19. PEDALIACEAE — BENNE FAMILY

Herbs or rarely shrubs. Leaves opposite or sometimes alternate: blades entire, toothed or lobed, usually petioled. Flowers perfect, in axillary or terminal clusters. Calyx of 5 partly united unequal sepals. Corolla irregular: tube long or short, rarely spurred at the base: limb 2-lipped, the 5 lobes usually broad. Androecium of 4 didynamous stamens and one staminodium. Gynoecium of usually 2 united carpels. Style elongate. Stigmas 2, often somewhat foliaceous. Fruit a capsule, unarmed or with simple or hooked spines.—About 14 genera and 45 species, in the Old World.

Ovary slightly 2-lobed at the apex: capsule abruptly pointed or short-beaked at the apex.

Ovary truncate at the apex: capsule truncate and with 2 lateral horns at the apex.

1. **SESAMUM.**

2. **CERATOTHECA.**

1. **SESAMUM** L. Herbs. Leaves opposite or partly alternate: blades broad or narrow. Flowers axillary. Calyx-lobes slightly unequal. Corolla horizontal: tube very short: throat campanulate: limb 2-lipped, the lower lip much larger than the upper one. Stamens included. Capsule angled or somewhat flattened. Seeds wingless.—About 12 species, in tropical Asia and Africa.

1. **S. indicum** L. Plant 1.5 m. tall or less, finely pubescent: leaf-blades ovate, toothed or lobed and long-petioled on the lower part of the stem, lanceolate to linear-lanceolate, undulate or entire and short-petioled above: calyx-lobes lanceolate or linear-lanceolate, 5–7 mm. long: corolla pink, yellowish, or white, 2–2.5 cm. long; lobes rounded: capsule ellipsoid, 2.5–3 cm. long, abruptly pointed.—(BENNE.)—Roadsides, cult. grounds, and waste-places, Coastal Plain, Fla. to Tex. Nat. of East Indies.—(W. I., Mex., C. A., S. A.)—All year.

2. **CERATOTHECA** Endl. Differs from Sesamum chiefly in the 2-horned capsule and in the case of our species in the broader leaf-blades. Leaves alternate on the upper part of the stem: blades toothed or lobed, petioled, subpalmately veined. Flowers axillary, opposite or alternate, subtended by bracts narrower than the leaves. Calyx-lobes unequal. Corolla nodding: tube mostly shorter than the calyx: throat subcampanulate: limb very oblique, the lower lip much longer than the upper one. Stamens included. Capsule somewhat flattened, truncate at the top. Seeds margined.—Five species, African.

1. **C. triloba** E. Meyer. Plant 1–2 m. tall, the stem 4-angled and with grooved sides: leaves clammy-pubescent: blades sub-orbicular or ovate-orbicular, mostly 1–5 cm. long, crenate, those of the lower leaves more or less 3-lobed, all petioled: calyx-lobes lanceolate to linear-lanceolate, 6–7 mm. long: corolla lavender or pale-violet, 4.5–6.5 cm. long; blades obtuse: capsule slightly broadened upward, 1.5–2 cm. long, the horns divergent, pubescent, the sides grooved.—High pinelands and roadsides, pen. Fla. Nat. of Africa.—Sum.—fall.

## FAMILY 20. MARTYNIACEAE — UNICORN-PLANT FAMILY

Annual or perennial, stocky herbs, with stout weak stems. Leaves opposite or rarely alternate: blades undulate or lobed. Flowers perfect, irregular, in racemes. Calyx of mostly 5 well-united sepals, oblique, the lobes short. Corolla of 5 partly united petals: tube often decurved: limb 5-lobed, oblique. Androeium of 4 didynamous stamens (or the posterior pair mere staminodia). Gynoeium 2-carpellary. Ovary 1-celled, the placentae parietal.—Three genera and 12 species, mostly tropical.

1. **MARTYNIA** L. Annual or perennial, very stout, herbs with clammy, strong-scented pubescence. Leaf-blades broad. Corolla declined, the limb oblique. Capsule 2-valved, the body crested, terminating in a curved or hooked beak.—About 8 species, American.

1. **M. louisiana** Mill. Annual, densely viscid-pubescent: leaf-blades sinuate, 0.5–3 dm. wide, petioled: flowers not fragrant: calyx-lobes ovate, obtuse: corolla-lobes undulate: capsule stout, 8–15 cm. long, curved, separating into 2 elastically spreading valves, the beak longer than the body.—(UNICORN-PLANT. RAM'S-HORN. PROBOSCIS-FLOWER.)—River-banks, fields, waste-places, and about gardens, various provinces, Ga. to N. M., Utah, Ia., and Pa. Nat. of the Miss. valley.—(Mex.)—Sum.—fall.

#### ORDER PLANTAGINALES — PLANTAGINAL ORDER

Annual or perennial herbs, or partially woody plants. Leaves wholly or mainly basal, or crowded on a simple or branched caudex: blades typically 1–several-ribbed. Flowers perfect, monoecious or dioecious, spicate. Calyx of 4 (3–5), partly united sepals. Corolla of 4 (3–5), partly united scarious and veinless petals. Androecium of 4 or 2 stamens, (or of 1 stamen). Gynoecium typically 2-carpellary. Ovary superior. Fruit capsular, usually a pyxis.

#### FAMILY 1. PLANTAGINACEAE — PLANTAIN FAMILY

Herbs. Leaf-blades typically 1–several-ribbed. Calyx-lobes, and corolla-lobes, 4. Style and stigma elongate.—Three genera and 225 species, widely distributed.

1. **PLANTAGO** [Tour.] L.<sup>1</sup> Acaulescent (ours) or caulescent herbs. Leaf-blades broad or narrow. Spikes usually elongate, green, or brown or grayish. Filaments partially adnate to the corolla-tube. More than 200 species, of wide geographical distribution.—PLANTAINS.

Flowers mainly dioecious: corolla lobes erect or closing over the capsule: plants annual or biennial.

Stamens 2: leaf-blades narrow, linear or filiform.

Stamens 4: leaf-blades relatively broad.

Flowers perfect: corolla-lobes spreading or reflexed on the top of the capsule.

Plants annual: flowers heterogonous, mostly cleistogamous.

Plants perennial: flowers protogynous.

Calyx-lobes various, the lower united, the upper distinct.

Calyx-lobes all essentially distinct.

I. PUSILLAE.

II. VIRGINICAE.

III. ARISTATAE.

IV. LANCEOLATAE.

V. MAJORES.

#### I. PUSILLAE

Capsule about twice as long as the calyx: seeds 10–30.

Capsule slightly surpassing the calyx: seeds 2–4.

1. *P. heterophylla*.

2. *P. pusilla*.

<sup>1</sup> Prepared from matter contributed by Edward Lyman Morris.

## II. VIRGINICAE

Plant with spatulate, obovate or elliptic, usually repand denticulate leaf-blades, and obtuse calyx-lobes.

3. *P. virginica*.

## III. ARISTATAE

Rigid plant with narrow entire leaf-blades and a stiff spike with long spreading bracts.

4. *P. aristata*.

## IV. LANCEOLATAE

Plant with narrow leaf-blades and short cylindric spikes which terminate wiry peduncles.

5. *P. lanceolata*.

## V. MAJORES

Lateral nerves of the leaf-blades free and remote from the midrib.

Spikes interrupted throughout: bracts much shorter than the calyx: seeds 2.

6. *P. sparsiflora*.

Spikes continuous at least above the base: bracts one half the length of the calyx or more: seeds 4-18.

Capsules conic or ellipsoid-conic, circumscissile below the middle.

Capsules ovoid, circumscissile at about the middle.

7. *P. Rugelii*.

8. *P. major*.

Lateral nerves of the leaf-blades partially confluent with the midrib.

9. *P. cordata*.

1. *P. heterophylla* Nutt. Leaves basal, 2-18 cm. long; blades linear or nearly filiform, acute, entire or with several remote teeth or spreading narrow lobes, narrowed to the dilated base: scapes usually numerous, 2-25 cm. long, equalling or surpassing the leaves: spike slender, 2-15 cm. long, loosely-flowered: bracts ovate, 1.5-2 mm. long, blunt: flowers dioecious or polygamous: calyx-lobes oval to rhombic-obovate, about 1.5 mm. long, obtuse, mostly shorter than the bracts: corolla glabrous; lobes erect, ovate, 0.5 mm. long, acute: capsule ellipsoid, 3-3.5 mm. long, circumscissile below the middle: seeds mainly 0.5-0.7 mm. long, dark-red.—Moist soil, fields and pastures, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and N. J.—Spr.-sum.

2. *P. pusilla* Nutt. Leaves basal, several 2-12 cm. long; blades linear or nearly filiform, blunt-tipped, entire, obscurely 1-nerved, sometimes early deciduous: scapes usually several together, nearly filiform, 5-25 cm. long, surpassing the leaves, often glabrate above: spike rather loosely-flowered, slender: bracts ovate, 1-1.3 mm. long, acutish: flowers dioecious or polygamous: calyx-lobes oval to obovate, 1.3-1.5 mm. long, obtuse, about equalling the bracts: corolla glabrous; lobes erect, lanceolate to ovate-lanceolate: capsule ellipsoid or ovoid-ellipsoid, about 2 mm. long, circumscissile below the middle: seeds 1-1.5 mm. long, dark-red.—Dry sandy soil, various provinces, Ga. to Tex., Kans., and Mass.—Spr.-sum.

3. *P. virginica* L. Leaves basal, spreading or ascending, 1-15 cm. long; blades spatulate to obovate or elliptic, obtuse or acutish, entire or repand-denticulate, 3-5-nerved, narrowed into margined petioles or nearly sessile: scapes erect or ascending, 0.5-20 dm. tall, much surpassing the leaves: spike dense, sometimes interrupted below: flowers dioecious: bracts linear-lanceolate to lanceolate: calyx-lobes elliptic or ovate, 2-2.5 mm. long, obtuse, surpassing the bracts: corolla various, those of staminate flowers with spreading lobes, those of pistillate flowers with lobes usually unequally erect after fertilization: capsule ovoid or oval-ovoid, 1.5-2 mm. long, circumscissile at about the middle: seeds 2-4, 1.3 mm. long, golden-yellow.—Dry soil, Fla. to Tex., Ariz., Mich., and R. I.—Spr.-sum.

4. *P. aristata* Michx. Leaves nearly basal, 5-25 cm. long; blades linear, acuminate, entire and callous-tipped, narrowed into margined petioles, 3-5-nerved; scapes erect, 10-50 cm. tall, rigid, surpassing the leaves: spike dense, 2-15 cm. long, pubescent but not woolly: bracts linear, puberulent, 1-3 cm. long, surpassing the flowers by several times their length: flowers perfect: calyx-lobes spatulate-elliptic or cuneate, 2-2.5 mm. long, obtuse, the outer herbaceous, the inner widely scarious-margined: corolla glabrous; lobes ovate or orbicular-ovate, 2 mm. long, obtuse, cordate: capsule slightly narrowed upward, 2.5-3 mm. long, slightly surpassing the calyx, circumscissile at the middle: seeds 2, 2-3 mm. long.—Dry plains and prairies, various provinces, La. to N. M., B. C., Alas., and Ill.; naturalized eastward to Fla. and Me.—Spr.—fall.

5. *P. lanceolata* L. Leaves basal, often numerous, 4-30 cm. long; blades linear-elliptic to broadly elliptic, acute and callous-tipped at the apex or acuminate at both ends, 3-7-nerved, entire or denticulate, narrowed into margined petioles; which are dilated and hairy at the base: scapes erect or nearly so, 1-7 dm. tall, ridged: spike cylindric, dense, 1-8 cm. long, 6-8 mm. thick: bracts rhombic, 4-5 mm. long, the tip bent: flowers perfect: calyx-lobes 2-3 mm. long, broadly elliptic to oval, obtuse, the 2 lower ones usually united, their midribs closely subparallel: corolla glabrous; lobes broadly lanceolate, 2-2.5 mm. long: capsule ellipsoid, 3 mm. long, slightly longer than the calyx, circumscissile at about the middle: seeds 2, fully 2 mm. long.—(RIB-GRASS. ENGLISH-PLANTAIN. RIPPLE-GRASS.)—Fields, roadsides, and waste-places, various provinces, Fla. to Tex., N. M., Alas., Sask., and N. B. Nat. of Eurasia.—(H. I.)—Spr.—fall.

6. *P. sparsiflora* Michx. Leaves basal, 8-30 cm. long; petioles shorter than the blades, margined; blades lanceolate to very narrowly elliptic-lanceolate, acute or acuminate, 5(-7)-nerved, entire or indistinctly denticulate: scapes erect, 2-7 dm. tall, slender, simple: spike slender, sometimes 3.8 dm. long, glabrous or nearly so, loosely-flowered: bracts ovate, very much shorter than the calyx: flowers perfect: calyx-lobes orbicular to obovate, about 2 mm. long, rounded, each with a green midrib and scarious margins: corolla with tube slightly surpassing the calyx, glabrous; lobes reflexed: capsule ellipsoid-cylindric, 3-4 mm. long, nearly twice as long as the calyx, circumscissile at the lower third: seeds 2, fully 2 mm. long.—Low marshy pinelands, Coastal Plain, Fla. to N. C.—Spr.—fall.

7. *P. Rugelii* Decne. Leaves basal, 5-40 cm. long; petioles usually purple at the base; blades broadly ovate to elliptic, longer than the petioles or sometimes shorter, 5-7-nerved, entire or shallowly toothed, cuneately or abruptly narrowed at the base: scapes often surpassing the leaves, 10-50 cm. tall: spike 2-30 cm. long, sometimes broadly bracted near the base: bracts fully one half as long as the calyx, acute: flowers perfect: sepals elliptic, acute 2-2.5 mm. long, keeled, often scarious-margined: corolla glabrous; tubes slightly surpassing the calyx; lobes spreading: capsule conic or ellipsoid-conic, 4-4.5 mm. long, circumscissile below the middle: seeds 4-9, 1.5-2 mm. long.—Roadsides, fields, waste-places and woods, various provinces, Fla. to Tex., N. D., and N. B.; naturalized further westward.—Spr.—fall.—The leaves are shining green.

8. *P. major* L. Leaves basal, 5-35 cm. long; petioles usually green at the base; blades ovate or oval, or rarely elliptic, obtuse or acutish, 5-7-nerved, entire or coarsely toothed, rounded or cordate at the base, longer than the petioles or shorter: scapes surpassing the leaves, 8-40 cm. tall: spikes 4-20 cm. long, dense: bracts ovate, barely equalling the calyx: flowers perfect:

calyx-lobes ovate to obovate, obtuse, not keeled, scarious-margined: corolla inconspicuous; tubes about as long as the calyx; lobes spreading or reflexed: capsule ovoid, about 3 mm. long, slightly surpassing the calyx-lobes, circumscissile at the middle: seeds 6-18, 0.7 mm. long.—Waste-places, roadsides, cult. grounds, and damp banks, various provinces, U. S. and S. Can. In part naturalized from Eu.—(*W. I., Mex.*)—Spr.-fall.—The leaves are dull-green.

9. *P. cordata* Lam. Leaves basal, 1-4.5 dm. long; blades ovate to suborbicular, 5-30 cm. long, acute or obtuse, 7-9-nerved, these confluent with the midrib below the middle of blade, entire or shallowly toothed, rounded or cordate at the base: scapes erect, surpassing the leaves, 15-50 cm. tall: spike loosely-flowered, sometimes interrupted: bracts orbicular-ovate or reniform, 1.5-3 mm. long: calyx-lobes ovate to suborbicular, 2.5-3 mm. long, obtuse or acutish: corolla surpassing the calyx; lobes ovate or orbicular-ovate, spreading or reflexed in age: capsule globose-ovoid, 4-5 mm. long, circumscissile at the middle or slightly below it: seeds 1-4, 3.5-4 mm. long.—Stream-banks, shaded swamps, various provinces, Ala. to La., Ont., and Va.—Spr.-sum.

#### ORDER SANTALALES — SANTALAL ORDER

Herbs, shrubs, or trees, mostly root- or tree-parasites. Leaves with expanded blades or scale-like. Flowers inconspicuous, perfect or imperfect. Calyx present, but often a mere border. Corolla present or wanting. Androecium of as many stamens as there are sepals, or petals, or twice as many. Gynoecium of several united carpels. Ovary more or less inferior. Fruit a drupe, a nut, or a berry.

Stamens as many as the petals or sepals: ovules not freely pendulous from an erect placenta.

Leaves opposite: fruit a berry: tree-parasites.

Fam. 1. LORANTHACEAE.

Leaves mainly alternate: fruit a drupe or a nut: root-parasites.

Fam. 2. SANTALACEAE.

Stamens twice as many as the petals, except in *Schoepfia*: ovules freely pendulous from the erect placenta.

Fam. 3. OLACACEAE.

#### FAMILY 1. LORANTHACEAE<sup>1</sup> — MISTLETOE FAMILY

Green or olive-brown shrubs or half-shrubs, with chlorophyll-bearing tissues, growing on woody plants from which they take sap through specialized roots (*haustoria*). Leaves opposite, sometimes scale-like. Flowers regular, minute, dioecious and seemingly apetalous in our species. Calyx of mostly 3 valvate sepals, each with a minute opposed stamen. Gynoecium compound, often 2-carpellary, but ovary inferior, 1-celled with a single little-differentiated ovule. Style single or wanting: stigma blunt or capitate. Fruit a berry or a drupe, the mesocarp very viscid.—About 21 genera and 500 species, most abundant in the tropics.

1. *PHORADENDRON* Nutt. Stem rather fleshy about a woody axis, brittle at the nodes. Leaves opposite, scale-like or fleshy-coriaceous. Inflorescence 1- to several-jointed. Spikes solitary or clustered in the axils. Flowers very small, apetalous, dioecious: staminate with a 3-lobed (rarely 2- to 5-lobed) calyx: anthers nearly sessile, 2-celled, dehiscing upwards: pistillate similar, the stigma nearly sessile. Berry subglobose, sessile, crowned with the per-

<sup>1</sup> Contributed by William Trelease.

sistent sepals. Seed solitary.—About 100 species, American.—AMERICAN-MISTLETOES. MISTLETOES.

Spikes permanently short (2-3 cm.), rather closely covered with berries.

Leaf-blades relatively broad, oblanceolate to obovate, or orbicular.

Leaf-blades relatively narrow, spatulate or elliptic-spatulate.

Spikes elongating (6-7 cm.) with the berries in separated whorls.

1. *P. flavescens*.

2. *P. Eatoni*.

3. *P. macrotomum*.

1. *P. flavescens* (Pursh) Nutt. Stem minutely puberulous, becoming glabrate: leaf-blades oblanceolate to obovate (or orbicular in the southwestern *P. flavescens orbiculatum*), obtuse, cuneately subpetioled, 20-50 mm. long: spikes short, mostly 10-15 mm. long, short-peduncled, with about 4 short joints, some joints 6-flowered when pistillate, others 12-flowered when staminate: berries white or slightly yellowish, 4 mm. in diameter, covering the spike, with inflexed sepals.—On many kinds of deciduous trees, various provinces, Fla. to E Tex., Okla., W. Va., and N. J.—Plants forming large rather compact tufts.

2. *P. Eatoni* Trelease. Stem slender, glabrescent: leaves elliptic-spatulate or spatulate, obtuse, gradually attenuate at base, 25-50 mm. long: spikes moderately short, 20-30 mm. long, short-peduncled, with 2 or 3 to 6 ellipsoid joints 6-12-flowered or even 30-flowered when staminate, and about 3 short joints some 6-flowered when pistillate: berries nearly white, broadly ellipsoid, 4×5 mm. in diameter, with inflexed sepals.—On ash trees or sometimes on oaks and other trees, S pen. Fla.—Plants in dense much-branched tufts.

3. *P. macrotomum* Trelease. Stem minutely puberulous or glabrescent: leaf-blades oblanceolate, obtuse, cuneately subpetioled, 50-70 mm. long: spikes rather long, 20-30 mm., reaching 60-70 mm. in fruit, short-peduncled, with about 5 rather short joints, some joints 6-flowered when pistillate, others 20-flowered when staminate: berries greenish-white, ellipsoid, 4 mm. in diameter, in separated whorls, with inflexed sepals.—On various deciduous trees, Fla.—Plants forming large rather open tufts.

## FAMILY 2. SANTALACEAE — SANDAL-WOOD FAMILY

Herbs, shrubs, or trees, parasitic on the roots of other plants. Leaves opposite or alternate: blades entire. Flowers perfect, polygamous, or dioecious, the staminate clustered, the pistillate often solitary. Calyx of 3-6 sepals. Corolla wanting. Androecium of 3-6 stamens opposite the sepals on the edge of the hypanthium. Gynoecium compound. Fruit mostly drupaceous.—About 26 genera and 250 species, mostly tropical.

Herbaceous perennials: flowers perfect: stigma capitate.

Shrubs: flowers dioecious or polygamous: stigma 2-4-lobed.

Staminate flowers in umbels or umbel-like clusters: leaves leaves opposite or nearly so.

Hypanthium of the staminate flowers turbinate: anthers connected with the sepals by a tuft of hairs.

Hypanthium of the staminate flowers flat: anthers not connected with the sepals.

Staminate flowers in racemes: leaves alternate.

1. COMANDRA.

2. NESTRONIA.

3. BUCKLEYA.

4. PYRULARIA.

1. **COMANDRA** Nutt. Herbs with long rootstocks. Leaves alternate: blades narrow. Flowers perfect, cymose. Style columnar: stigma capitate. Drupe crowned with the persistent calyx.—Five species, one of them European.

1. **C. umbellata** (L.) Nutt. Plant 2-4 dm. tall: leaf-blades elliptic, oval, or elliptic-lanceolate, 1-3.5 cm. long: sepals elliptic-ovate, 2-2.5 mm. long, white; stamens  $\frac{1}{2}$  as long as the sepals: drupe greenish-drab, about 5 mm. in diameter.—(BASTARD-TOAD-FLAX).—Dry ground, thickets, and banks, various provinces, Ga. to Ark., Alb., and N. B.—Spr.-sum.—This is the only santalaceous genus in North America with more than one species, three additional to the above occurring in western North America.

2. **NESTRONIA** Raf. Shrubs with spreading branches. Leaves opposite: blades broad. Flowers polygamo-dioecious, the staminate umbellate: sepals not veiny. Style conic; stigma 3-4-lobed. Drupe of an oval type.—One species.

1. **N. umbellula** Raf. Shrub 3-10 dm. tall, the branches glabrous: leaf-blades oval, varying to ovate or obovate, 2-7 cm. long: sepals broad at the base, greenish, those of the staminate flowers elliptic-ovate, 2-2.5 mm. long: stamens  $\frac{2}{3}$  as long as the sepals: drupes 10-13 mm. long.—Woods and stream-banks, Piedmont to Appalachian Plateau, Ga. to Ala. and Va.—Spr.—This shrub, unlike *Buckleya*, is, as far as we know, parasitic on the roots of the deciduous-leaved shrubs and trees with which it grows. Coniferous trees are often wanting there.

3. **BUCKLEYA** Torr. Shrubs with 2-ranked branches. Leaves opposite or nearly so, distichous: blades rather broad. Flowers dioecious, the staminate umbellate: sepals veiny. Style conic: stigma 4-lobed. Drupe of an ellipsoid type.—One species.

1. **B. distichophylla** (Nutt.) Torr. Shrub 2-4 m. tall, the branches pubescent: leaf-blades lanceolate to ovate-lanceolate, 2-7 cm. long: sepals rounded at the base, greenish, those of the staminate flowers ovate, 2.5-3 mm. long: drupe 2-2.5 cm. long.—River-banks, Blue Ridge, N. C. and Tenn.—Spr.-sum.—Parasitic on the roots of hemlock trees. The geographic range is very restricted, only three localities being definitely known at present, although others have been reported. The species is in danger of extermination.

4. **PYRULARIA** Michx. Shrubs or trees, with diffuse branches. Leaves alternate: blades broad. Flowers dioecious or polygamous, racemose. Style very short: stigma depressed. Drupe pyriform.—Three species, the following and 2 Asiatic.

1. **P. pubera** Michx. Shrub 1-3 m. tall, with pubescent branches: leaf-blades elliptic or commonly broadest above the middle, 4-15 cm. long: sepals ovate, green, 2-2.5 mm. long: drupe 2-2.5 cm. long.—(BUFFALONUT. OIL - NUT. MOUNTAIN - COCONUT.)—River-banks and woods, Blue Ridge to Appalachian Plateau, Ga. to Ala. and Pa.—Spr.—sum.—A curious shrub, inconspicuous in flower, but obvious in fruit by the dangling drupes, which are, at first light-green and later yellowish. An oil, resembling olive oil, but ill-scented and poisonous, has been pressed from the drupes.

### FAMILY 3. OLACACEAE — XIMENIA FAMILY

Shrubs, trees, or vines. Leaves usually alternate: blades entire or rarely toothed. Flowers perfect or polygamous, regular, in dichotomous or raceme-like cymes. Calyx of 4-6 small sepals, surmounting the hypanthium. Corolla of 4-6 distinct or united petals. Androecium of 4-12 stamens. Gynoecium 3-4-carpellary. Fruit a drupe.—About 25 genera and 140 species, mostly tropical.

Petals united to above the middle: stamens as many as the corolla-lobes and opposite them: drupe nearly enclosed in the disk. 1. **SCHOEPFIA**.  
 Petals nearly distinct: stamens twice as many as the petals: drupe naked. 2. **XIMENIA**.

1. **SCHOEPFIA** Schreb. Unarmed shrubs or trees. Leaf-blades entire. Hypanthium filled with an elevated disk. Sepals broad. Petals united to above the middle. Filaments adnate to about the middle of the corolla-tube. Anthers oval or ovoid. Ovary about  $\frac{1}{2}$  inferior.—About 15 species, tropical American and Asiatic.

1. **S. chrysophylloides** (A. Rich.) Planch. Shrub or small tree, with pale branches: leaf-blades ovate to oblong-ovate, 2-6 cm. long: corolla red or reddish, about 4 mm. long: lobes ovate, glabrous: drupes ovoid or oval-ovoid, 10-12 mm. long. [*S. Schreberi* (Fl. SE. U. S.)]—(WHITEWOOD.)—Coastal and inland hammocks, pen. Fla. and the Keys.—(W. I.)—All year.

2. **XIMENIA** [Plum.] L. Thorny shrubs or trees. Leaf-blades entire. Hypanthium without an elevated disk. Sepals minute. Petals nearly dis-

tinged. Anthers linear. Ovary nearly superior.—About 5 species, tropical.

1. *X. americana* L. Shrub or small tree, with dark branches: leaf-blades oblong to elliptic or nearly so, 3–7 cm. long: corolla yellow or yellowish-white, about 10 mm. long; lobes linear, densely pubescent within: drupes subglobose or broadly oval, 14–17 mm. long. — (TALLOW-WOOD.) — Hammocks, pen. Fla. and hammocks and pine-lands, Everglade Keys, Fla. and Fla. Keys.—(W. I.)—Spr.—fall, or all year southward.—The tallow tree has become accommodated to a variety of soils and habitats. These factors are reflected in its habits. In the sterile soil of the “scrub” it is a sprawling shrub often only knee high; in hammocks it is an erect shrub or small tree.

### ORDER RUBIALES — RUBIAL ORDER

Herbs, shrubs, or trees. Leaves opposite, sometimes whorled. Flowers perfect or polygamous, axillary or cymose. Hypanthium present. Calyx of 2 or more often small sepals. Corolla of 3 or more partially united petals. Androecium of as many stamens as there are petals or twice as many. Gynoecium 2–several-carpellary. Ovary wholly or partially inferior. Fruit a capsule, a berry, or a drupe.

Leaves with stipules adnate to the stem between the leaf-bases.

Fam. 1. RUBIACEAE.

Leaves without stipules, or if present these adnate to the petiole.

Fam. 2. CAPRIFOLIACEAE.

### FAMILY 1. RUBIACEAE — Madder Family

Herbs, shrubs, trees, or vines. Leaves opposite or whorled, with interpetiolar or foliaceous stipules. Flowers perfect or polygamous, regular or nearly so. Calyx of 2–6, or more, sepals surmounting the hypanthium, or obsolete. Corolla of 3–6, or more, more or less united petals. Androecium of as many stamens as there are petals and alternate with them. Gynoecium 2–several-carpellary. Fruit a capsule, a drupe, or a berry.—About 340 genera and 6,000 species, widely distributed; most abundant in the tropics.

Cavities of the ovary with several to many ovules each: seeds several to many.

Subfamily I. CINCHONOIDEAE.

Cavities of the ovary with a single ovule each: seed solitary.

Stipules not foliaceous, usually minute.

Subfamily II. COFFEEOIDEAE.

Stipules foliaceous, nearly or quite as large as the leaf-blades, thus making the leaves appear as in whorls.

Subfamily III. GALIOIDEAE.

#### Subfamily I. CINCHONOIDEAE

Fruit dry.

Seed wingless.

Ovules very numerous: shrubs or trees.

1. PINCKNEYA.

Ovules several: herbs, sometimes woody at the base.

Sepals and corolla-lobes 4.

Top of the capsule not extending beyond the hypanthium.

2. OLDENLANDIA.

Top of the capsule extending beyond the hypanthium.

3. HOUSTONIA.

- Sepals and corolla-lobes 5.
- Seed winged.
- Fruit pulpy.
- Fruit 2-celled.
- Flowers in cymes.
- Flowers solitary.
- Corolla-lobes 5, convolute.
- Corolla-lobes 4, valvate.
- Fruit 5-celled.

- 4. PENTODON.
- 5. EXOSTEMA.
- 6. CASASIA.
- 7. RANDIA.
- 8. CATESBAEA.
- 9. HAMELIA.

## Subfamily II. COFFEOIDEAE

- Flowers in dense heads.
- Flowers solitary or in open inflorescences.
- Ovule pendulous.
- Filaments wholly or partly adnate to the corolla-tube.
- Filaments not adnate to the corolla-tube.
- Inflorescence terminal.
- Inflorescence axillary.
- Ovule not pendulous.
- Corolla-lobes imbricate.
- Corolla-lobes valvate.
- Ovule or seed with a basal attachment.
- Flowers not paired, the ovaries distinct.
- Corolla funnelform: seed wingless; erect.
- Corolla campanulate: seed winged: vines.
- Flowers paired, the ovaries united.
- Ovule or seed with a lateral attachment.
- Shrubs or trees.
- Herbs.
- Ovary 3- or 4-celled.
- Ovary 2-celled.
- Fruit drupaceous, the carpels neither dehiscent nor separating.
- Fruit not drupaceous, the carpels dehiscent or separating.
- Mature carpels merely separating.
- Styles partly united: stigmas slender: corolla salverform.
- Styles united to the top: stigma capitate or 2-lobed: corolla funnelform.
- Mature carpels dehiscent.
- Fruit septicial, and both carpels ventrally dehiscent.
- Fruit separating into carpels, one of which opens through the ventral face, the other remaining closed.

- 10. CEPHALANTHUS.
- 11. GUETTARDIA.
- 12. ERITHALIS.
- 13. CHIOCOCCA.
- 14. STRUMPFIA.
- 15. PSYCHOTRIA.
- 16. PAEDERIA.
- 17. MITCHELLA.
- 18. MORINDA.
- 19. RICHARDIA.
- 20. ERNODEA.
- 21. DIODIA.
- 22. DIODELLA.
- 23. BORRERIA.
- 24. SPERMACOCE.

## Subfamily III. GALIOIDEAE

Stipules foliaceous, usually resembling the leaves.

- 25. GALIUM.

1. **PINCKNEYA** Michx. Shrubs or trees. Leaves with broad entire blades. Flowers in corymbose cymes. Sepals 5, 1 or 2 of them, at least in the outer flowers, transformed into leaf-like members. Corolla with a stout tube and 5 rather broad lobes. Stamens 5: filaments adnate to the lower part of the corolla-tube, glabrous: anthers ellipsoid, exserted. Capsule as wide as long. Seeds flat, wingless.—One species.

1. **P. pubens** Michx. Shrub or small tree, with pubescent foliage: leaf-blades elliptic, oval, or ovate, 5–20 cm. long, short-petioled: foliaceous sepals like the leaves in shape, but smaller and pink: unchanged sepals linear to linear-lanceolate, 1–1.5 cm. long: corolla

greenish, mottled with brown or purple: tube 1.5–2 cm. long; lobes as long as the tube or shorter: capsule subglobose or obovoid, nearly 2 cm. in diameter.—(FEVER-TREE.)—Sandy swamps, Coastal Plain, W Fla. to S. C.—Spr.-sum.—The numerous bright-pink foliaceous sepals make the plants conspicuous on the edges of swamps.

**2. OLDENLANDIA L.** Annual or perennial, often diffuse herbs, or woody plants. Leaf-blades mostly narrow. Flowers in axillary or terminal congested cymes. Sepals 4, broad. Corolla rotate, minute: tube very short: lobes broad. Stamens 4: filaments adnate to the base of the corolla-tube. Style very short or wanting. Capsule scarcely longer than the hypanthium, terete or angled.—About 175 species, most abundant in tropical Asia.

Flowers sessile or nearly so, solitary or glomerate.

Annual plants: sepals ciliate, acute.

Stem hirsute: leaf-blades short-petioled.

Stem glabrous: leaf-blades sessile.

Perennial plants: sepals eciliate, acuminate.

Flowers on filiform pedicels and peduncles.

1. *O. uniflora*.
2. *O. fasciculata*.
3. *O. Boscii*.
4. *O. corymbosa*.

1. ***O. uniflora* L.** Stem 1–4 dm. long, often much branched: leaf-blades ovate to elliptic, 0.5–2.5 cm. long: sepals about 1.5 mm. long: petals about  $\frac{1}{2}$  as long as the sepals, white or nearly so, ciliate at the tip: capsule 1–1.5 mm. long.—Moist sandy soil, Coastal Plain, Fla. to Tex. and N. Y.—Spr.-fall, or all year southward.

2. ***O. fasciculata* (Bertol.) Small.** Stem 1–5 dm. long, sometimes diffusely branched: leaf-blades elliptic to lanceolate or ovate-lanceolate, 0.5–2 cm. long: sepals about 1.5 mm. long: petals about  $\frac{1}{2}$  as long as the sepals, pearl-blue, ciliate: capsule 1.5–2 mm. long.—Sandy beaches, swamps, muddy banks about tide-water, Coastal Plain, Fla. to Miss.—Sum.-fall.

3. ***O. Boscii* (DC.) Chapm.** Stem weak, commonly diffusely branched, 1–3 dm. long: leaf-blades linear or attenuate to the bases, 1–2 cm. long: sepals barely 1.5 mm. long: petals triangular or ovate-triangular, about 0.5 mm. long, white or purplish: filaments finely pubescent: capsule about 2 mm. long.—Wet soil, borders of ponds, and ditches, Coastal Plain and adj. provinces, Fla. to Tex., Ark., Tenn., and S. C.—Spr.-fall.

4. ***O. corymbosa* L.** Stem erect or decumbent and diffuse, 2–5 dm. long: leaf-blades linear to linear-lanceolate, 1–4 cm. long: sepals about 1 mm. long: corolla white, about 2 mm. long; lobes ovate, pubescent within: filaments glabrous: capsule about 2 mm. long.—Roadsides and waste-places, S pen. Fla.—(*W. I., C. A., S. A., O. W.*)—Spr.-sum.

**3. HOUSTONIA L.** Annual or perennial, erect or creeping herbs. Leaf-blades narrow or broad. Flowers in open or compact cymes. Sepals 4, commonly narrow. Corolla funnelform or salverform: tube long: lobes mostly shorter than the tube. Stamens 4: filaments adnate to above the middle of the corolla-tube. Style slender. Capsule seated on or in the hypanthium, flattened.—About 35 species, North American.

Flowers solitary on terminal pedicels or also on pedicels axillary to leaf-like bracts, not aggregated into a terminal cyme.

Pedicels erect in fruit.

Pedicels recurved in fruit.

Flowers borne in terminal, more or less effuse cymes.

- I. CAERULEAE.  
II. ROTUNDIFOLIAE.  
III. ANGUSTIFOLIAE.

#### I. CAERULEAE

Plant perennial by slender horizontal rootstocks or creeping stems.

Plant erect: sepals lanceolate: corolla-tube glabrous within.

Plant diffusely creeping: sepals elliptic: corolla-tube pubescent within.

Plant annual, with slender roots.

Sepals much surpassed by the corolla-tube: capsule about equalling the sepals.

Sepals about equalling the corolla-tube: capsule much exceeded by the sepals.

1. *H. caerulea*.  
2. *H. serpyllifolia*.  
3. *H. pusilla*.  
4. *H. minima*.

#### II. ROTUNDIFOLIAE

Plant prostrate, usually in light-green mats: corolla bright-white, starry.

5. *H. procumbens*.

#### III. ANGUSTIFOLIAE

Sepals fully as long as the hypanthium.

Sepals conspicuously surpassing the capsule.

Corolla less than twice as long as the sepals: sepals 4-8 mm. long.

Corolla over twice as long as the sepals: sepals 2-3 mm. long.

Sepals subulate to linear-lanceolate during anthesis: corolla-tube 6-7 mm. long.

Sepals ovate to ovate-lanceolate during anthesis: corolla-tube 9-11 mm. long.

Sepals slightly surpassing the capsule.

Leaf-blades, especially those of basal leaves, conspicuously ciliate.

Leaf-blades perfectly glabrous, at least never ciliate.

Corolla 8-9 mm. long: mature hypanthium and calyx 3.5-4 mm. long.

Corolla 4-5.5 mm. long: mature hypanthium and calyx 2.5-3 mm. long.

Sepals shorter than the hypanthium.

Stem erect or ascending, sometimes diffusely branched at the base, the branches neither spreading nor prostrate.

Capsule much longer than broad, 2.5-3 mm. long.

Capsule fully as broad as long, 1-1.5 mm. long.

Stem branched at the base, the branches prostrate or spreading.

6. *H. lanceolata*.  
7. *H. purpurea*.  
8. *H. montana*.  
9. *H. canadensis*.  
10. *H. longifolia*.  
11. *H. tenuifolia*.  
12. *H. angustifolia*.  
13. *H. filifolia*.  
14. *H. pulvinata*.

1. *H. caerulea* L. Plant often matted, the stem slender, 2-15 cm. tall: leaf-blades oval, ovate, or spatulate, 2-5 mm. long: corolla lilac, blue, or white, except the yellow eye, lobes 5-7 mm. long: capsule 3-4 mm. wide.—(BLUETS. INNO-CENCE).—Damp grassy places and meadows, various provinces, Ga. to La., Ont., N. S., and Miquelon.—Spr.-sum.

2. *H. serpyllifolia* Michx. Plant matted, the stems creeping: leaf-blades ovate, oval, or suborbicular, 1-6 mm. long: corolla usually deep-blue, except the yellowish or white eye; lobes 5-7 mm. long: capsule 2-3 mm. wide.—Mt. tops and damp slopes, Blue Ridge to Appalachian Plateau, Ga. to W. Va. and Pa.—Spr.-sum.—Introduced locally into the Coastal Plain.

3. *H. pusilla* Schoepf. Plant 1-10 cm. tall, sometimes sparingly branched: leaf-blades oval, elliptic, or ovate, or sometimes narrowly spatulate to nearly

linear, 2–10 mm. long: sepals becoming 2–2.5 mm. long: corolla deep-blue; limb 6.5–8 mm. wide: capsule 4–5 mm. wide. [*H. minor* (Michx.) Britton.]—Sandy soil, Coastal Plain, and adj. provinces, Fla. to Tex., Ark., Ill., and Va.—Spr.

4. *H. minima* Beck. Plant more or less diffusely branched, the branches 1–10 cm. long: leaf-blades spatulate to obovate or ovate, 2–8 cm. long: sepals becoming 3–3.5 mm. long: corolla lilac or bluish; limb 7.5–9 mm. wide: capsule 3–4 mm. wide.—Dry hillsides, various provinces N of Coastal Plain, Tenn. to Tex. and Mo.—Spr.

5. *H. procumbens* (Walt.) Standley. Plant with prostrate, often creeping stems and branches 0.5–4 dm. long, sparingly pubescent or nearly glabrous: leaf-blades oval to suborbicular, 5–18 mm. long: sepals broadly elliptic to ovate, 1–1.5 mm. long: corolla white, glabrous within: capsule 4–4.5 mm. wide, sparingly pubescent. [*H. rotundifolia* Michx.]—Sandy soil, often in damp pine-lands. Coastal Plain, Fla. to La. and S. C.—Spr.—fall.

6. *H. lanceolata* (Poir.) Britton. Plant 1–3 dm. tall: blades of the stem-leaves elliptic-lanceolate to lanceolate, acute; sepals linear, 4–8 mm. long, recurved at the tip, fully twice as long as the hypanthium: corolla lilac or bluish; tube 5–6 mm. long: capsule 3 mm. thick.—Woods, Coastal Plain and adj. provinces, Ala. to Okla., Ill., and N. C.—Spr.

7. *H. purpurea* L. Plant 0.5–4 dm. tall: blades of the stem-leaves suborbicular to ovate or elliptic-ovate (elliptic to lanceolate and relatively small in *H. purpurea pubescens*), 2.5–4.5 cm. long: sepals subulate or linear-lanceolate, 2–3.5 mm. long, about as long as the hypanthium: corolla lilac, light-purple or white; tube 6–7 mm. long: capsule 2.5–3 mm. thick.—Moist soil, various provinces, rarely Coastal Plain, Ga. to Ark., Ia., and Md.—Spr.—fall.

8. *H. montana* (Chickering) Small. Similar to *H. purpurea* in habit, but typically smaller: blades of the stem-leaves ovate, 0.5–1.5 cm. long: sepals lanceolate to elliptic-lanceolate at maturity, about 2 mm. long, about as long as the hypanthium: corolla purple; tube 9–11 mm. long: capsule 3–3.5 mm. thick.—Cliffs, Roan Mt. and vicinity, in the Blue Ridge of N. C. and Tenn.—Sum.

9. *H. canadensis* Willd. Plant 0.5–2 dm. tall, with the leaves mainly approximate on a caudex: blades of the stem-leaves elliptic or spatulate, mainly 1–3 cm. long: sepals elliptic to elliptic-lanceolate, 2–3 mm. long, longer than the hypanthium: corolla blue; tube 7–9 mm. long: capsule 2–2.5 mm. thick. [*H. ciliolata* Torr.]—Woods or rocky soil, various provinces, Tenn. to Ark., Ont., and Me.—Spr.—sum.

10. *H. longifolia* Gaertn. Plant 1–4 dm. tall, often tufted; blades of the stem-leaves linear to linear-lanceolate or linear-elliptic, 1–3 cm. long: sepals linear-subulate to lanceolate-subulate, 1.5–2 mm. long, slightly longer than the hypanthium: corolla pinkish or bluish; tube about 4 mm. long: capsule 2–2.5 mm. thick.—Sandy soil and rocky banks, various provinces, Ga. to Miss., Mo., Man., and Me.—Sum.

11. *H. tenuifolia* Nutt. Plant 1–4 dm. tall, slender: blades of the stem-leaves linear to linear-filiform, 1–4 cm. long: sepals lanceolate to subulate-lanceolate, 1–1.5 mm. long, slightly longer than the hypanthium: corolla pale-blue or whitish; tube 4–5.5 mm. long: capsule 1.5–2 mm. thick.—Dry soil and rocky banks Blue Ridge to Appalachian Plateau, Ga. to Ala., Ohio, and Va.—Spr.—sum.

12. *H. angustifolia* Michx. Plant 0.5–3 dm. tall, tufted or diffuse: blades of the stem-leaves narrowly linear to linear-filiform, 4 cm. long: sepals lanceolate, 1–1.5 mm. long, much shorter than the hypanthium at maturity: corolla white or purple-tinged; tube about 3 mm. long: capsule 2.5–3 mm. long, nearly ellipsoid, nearly equalling the sepals.—Dry soil, limestone rocks, barrens, and prairies, various provinces, Fla. to Tex., Kans., and Ill.—Spr.-sum.

13. *H. filifolia* (A. Gray) Small. Plant loosely or diffusely branched, 0.5–2 dm. tall: blades of the stem-leaves narrowly linear to subulate, 0.5–3 cm. long: sepals lanceolate, becoming deltoid, scarcely 1 mm. long: corolla white or purplish; tube about 3 mm. long, sparingly pubescent within: capsule globose-obovoid, about 1.5 mm. long.—Pinelands and sandy places, Everglade Keys, Fla. and Fla. Keys.—All year.

14. *H. pulvinata* Small. Plant compactly much branched, 0.8–1.2 dm. tall, the branches angled: blades of the stem-leaves linear or nearly so, mainly 1–1.5 cm. long, often curved: sepals ovate to elliptic-ovate, fully 1 mm. long: corolla bluish; tube about 3 mm. long, copiously pubescent within: capsule obovoid, about 2.5 mm. long.—Sand-dunes, pen. Fla.—Spr.-fall.

4. **PENTODON** Hochst. Annual tender herbs. Leaf-blades broad. Flowers in axillary or terminal cymes. Sepals 5, rather long. Corolla funnel-form: tube short: lobes somewhat shorter than the tube. Stamens 5: filaments adnate to above the middle of the corolla-tube. Style columnar. Capsule included in the hypanthium, 2-lobed.—Two species, the following and 1 African.

1. *P. Halei* (T. & G.) A. Gray. Plant glabrous, often diffusely branched and partly creeping: leaf-blades elliptic to oval or elliptic-lanceolate, 1–5 cm. long, entire: hypanthium clavate: sepals triangular-lanceolate or lanceolate, about 2.5 mm. long: corolla white; tube 3 mm. long: lobes ovate to ovate-lanceolate: capsule 3–4 mm. long.—Swampy grounds, Coastal Plain, Fla. to La.—Spr.-fall.

5. **EXOSTEMA** L. C. Rich. Shrubs or trees. Leaf-blades leathery. Flowers axillary or in paniculate cymes. Sepals 5, short. Corolla with slender tube and 5 narrow lobes. Stamens 5: filaments adnate to the base of the corolla-tube, pubescent below: anthers narrowly linear, exserted. Capsule elongate. Seeds winged.—About 30 species, tropical America.

1. *E. caribaeum* (Jacq.) R. & S. Shrub or small tree, the foliage glabrous: leaf-blades elliptic, 2–6 cm. long: sepals 1–2 mm. long: corolla white or rose-tinged, the tube 3.5–4 cm. long; lobes narrowly linear: capsule ellipsoid, 10–12 mm. long.—(PRINCETON.)—Hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—Spr.-sum.

6. **CASASIA** A. Rich. Unarmed shrubs or trees. Leaf-blades leathery. Flowers in axillary cymes. Sepals 5, broad or narrow. Corolla with a stout tube and 5 relatively broad lobes. Stamens 5: filaments adnate to the lower part of the corolla-tube: anthers elongate, linear-sagittate, included. Berry thick. Seeds angled. —About 8 species, West Indian.

1. **C. clusiifolia** (Jacq.) Urban. Shrub or small tree, the bark pale: leaves clustered at the branch-tips; blades cuneate to obovate, 5–15 cm. long: hypanthium turbinate: sepals subulate: corolla white; tube 16–20 mm. long; lobes acuminate, shorter than the tube: berry mainly obovoid, 5–7 cm. long. [*Genipa clusiifolia* Jacq.] —SEVEN-YEAR APPLE.)—Coastal sand-dunes and hammocks, near the coast, S pen. Fla. and Florida Keys.—(W. I.)—All year.

7. **RANDIA** [Houst.] L. Armed shrubs or trees. Leaves relatively few: blades leathery. Flowers axillary. Sepals 4–5, short. Corolla with a short tube and 5 often very broad lobes. Stamens 4 or 5: filaments adnate to near the top of the corolla-tube: anthers ellipsoid or linear, partly exserted or included. Berry globular or elongate.—About 100 species, tropical.

1. **R. aculeata** L. Shrub 0.3–3 m. tall: leaves 1.5–5 cm. long; blades spatulate to oval, elliptic, or suborbicular: sepals triangular to ovate, about 1 mm. long: corolla white; tube 5–7 mm. long; lobes elliptic to ovate: berry oval to subglobose, 8–10 mm. long, greenish-white.—Hammocks and pine-lands, S pen. Fla., and Florida Keys.—(W. I.)—All year.

8. **CATESBAEA** L. Armed shrubs. Leaves very numerous: blades leathery. Flowers axillary. Sepals 4, short. Corolla with a long tube and 4 short lobes. Stamens 4: filaments adnate to the base of the corolla-tube: anthers narrow or linear. Berry thick.—About 8 species, West Indian.

1. **C. parviflora** Sw. Shrub 1–3 m. tall: leaves 5–15 mm. long; blades spatulate, obovate or suborbicular, lustrous: sepals triangular to triangular-lanceolate, 1–1.5 mm. long: corolla white; tube campanulate, 3.5–4 mm. long; lobes deltoid, acutish: berry subglobose, 6–18 mm. long, blue or black.—Hammocks and dunes, Florida Keys.—(W. I.)—All year.—Fires and storms have greatly depleted the naturally rather limited growth of this shrub. The most extensive

growth now extant is on the sand-dunes behind the barrier dune on Bahia Honda Key.

9. **HAMELIA** Jacq. Unarmed shrubs or trees. Leaf-blades membranous. Flowers in dichotomous cymes. Sepals 5, minute. Corolla with a narrow fluted tube and 5 very short lobes. Stamens 5: filaments adnate to the base of the corolla-tube: anthers linear, included. Berry thick. —About 25 species tropical American.

1. **H. patens** Jacq. Shrub or small tree: leaf-blades elliptic, or elliptic-ovate, 8–15 cm. long: hypanthium turbinate: sepals about 1 mm. long: corolla crimson, 1.5–2.3 cm. long; lobes 2–3 mm. long: berry oval or ovoid, 5–7 mm. long, black. [*H. erecta* Jacq.?]—(**HAMELIA**).—Hammocks, S. pen. Fla. and Fla. Keys.—(*W. I.*)—All year.—Sometimes popularly known as fire-bush on account of the red inflorescence. This shrub or small tree is most conspicuous on the edges of hammocks. Not only are the calyx and corolla red, but also the inflorescence branches and the hypanthium.

10. **CEPHALANTHUS** L. Shrubs or trees. Leaf-blades thinnish. Flowers in capitate cymes. Sepals usually 4, rounded. Corolla with a long tube and usually 4 short lobes. Stamens usually 4: filaments adnate to the throat of the corolla: anthers ellipsoid or nearly so. Nut-like fruit obpyramidal.—About 6 species, American and Asiatic.

1. **C. occidentalis** L. Shrub or small tree: leaf-blades elliptic-lanceolate, or ovate-lanceolate, 5–20 cm. long, short-petioled: flower-heads globose, 2.5–3.5 cm. thick: sepals about 0.5 mm. long: corolla white, about 10 mm. long; lobes ovate to elliptic ovate: nutlets 7–8 mm. long.—(**BUTTONBUSH**).—Swamps, ponds, low hammocks, and stream-banks, various provinces, Fla. to Tex., Calif., Ont., and N. B.—(*W. I., Mex.*)—Sum.—fall, or all year southward.

11. **GUETTARDA** L. Shrubs or trees. Leaf-blades thin or thickish. Flowers in axillary peduncled cymes. Sepals 2–4 or more, short, or obsolete. Corolla with a long tube and 4, or more, shorter lobes. Stamens 4–9: filaments adnate to near the top of the corolla-tube: anthers narrow, but short. Drupe globular, pubescent.—About 65 species, mostly tropical American.—All year.

Corolla 6–8 mm. long: leaf-blades strigillose or glabrate, not rugose. 1. *G. elliptica*.  
Corolla 20–25 mm. long: leaf-blades scabro-pubescent, rugose. 2. *G. scabra*.

1. **G. elliptica** Sw. Shrub or small tree: leaf-blades thin, mainly elliptic, oval, or obovate, 2–4 cm. long: corolla pink or reddish; lobes mostly 4: style
