Marcion, according to Theodoret, maintained the exiftence of four principles, or unbegotten fubftances, as his expreffion is: one the good God, and unknown, whom he alfo calls the father of our Lord Jefus Chrift; and the Creator, called by him juft, and fometimes evil; and, befides thefe, Matter, and the evil one that governs it. Some, as Epiphanius and Cyril of Jerufalem, afcribe to Marcion and his followers the doctrine of three principles; Auguftine fays, that he held two principles; and Tertullian often afferts, that Marcion believed two gods, though not both equal. Dr. Lardner apprehends, that Marcion believed in only two eternals; the Supreme God the Father, who was good, and Matter; for, according to him, the Creator was from the Father; and the Devil, fomehow or other, fprang out of Matter, which he thought to be eternal. After the example of the oriental doctors, fays Mofheim, the Marcionites held the exiftence of two principles; the one perfectly good, and the other perfectly evil: between thefe they imagined an intermediate kind of deity of a mixed nature, who was the creator of this inferior world, and the god and legiflator of the Jewifh nation, who wages perpetual war with the evil principle; and both the one and the other afpire to the place of the Supreme Being, and ambitioufly attempt to fubject to their authority all the inhabitants of the world. The Jews are the fubjects of that powerful genius who formed this globe: the other nations, who worfhipped a variety of gods, were fuppofed to be under the empire of the evil principle. Thefe two conflicting powers exercife oppreffions upon rational and immortal fouls; and, therefore, the fupreme God the Father, who had alfo a world of his own making, but better than this, immaterial and invifible, in order to deliver them from bondage, fent to the Jews a being moft like unto himfelf, even his fon Jefus Chrift, clothed with a certain fhadowy refemblance of body, that he might be vifible to mortal eyes; whofe commiffion was to deftroy the empire of the evil principle, and of the author of this world, and to bring back wandering fouls to God. This celeftial meffenger was attacked by the prince of darknefs, and by the god of the Jews, but without effect; fince, having a body only in appearance, he was thereby rendered incapable of fuffering. Thofe who follow the directions of this celeftial conductor, mortify the body by faftings and aufterities, and renounce the precepts of the god of the Jews, and of the prince of darknefs, fhall, after death, afcend to the manfions of felicity and perfection. The rule of manners which Marcion prefcribed to his followers was exceffively auftere, containing an exprefs prohibition of wedlock, wine, flefh, and all the external comforts of life. See MANICHÆANS.

Marcion denied the real birth, incarnation, and paffion of Jefus Chrift, and held them to be all apparent only. He denied the refurrection of the body; and allowed none to be baptized but thofe who preferved their continence; but thefe, he granted, might be baptized three times.

In many things, he followed the fentiments of the heretic Cerdon, and rejected the law and the prophets. He pretended the gofpel had been corrupted by falfe prophets, and allowed none of the evangelifts but St. Luke, whom alfo he altered in many places, as well as the Epiftles of St. Paul, a great many things in which he threw out. In his own copy of St. Luke, he threw out the two firft chapters entire.

Some ancient writers fay, that the Marcionites held, as above ftated, two gods, one good, the other evil; but, as at other times they reprefent them, calling one good, the other a judge, or fevere: this muft be their meaning. Jerom fays, that Marcion taught Jefus to be the fon of the good God, that is, not of the fame God fpoken of in the prophets, who is there reprefented as cruel, righteous, juft, a judge, and the like. To the fame purpofe is the reprefentation of Clement of Alexandria, upon whofe teftimony we may rely. The Marcionites fay, that nature, or the world, is evil, becaufe it is made of matter, which is evil in itfelf; and that the world was made by the Creator, who is juft. They are, therefore, fpoken of as having but low thoughts of this world on account of its being very imperfect, and not worthy of the Supreme Deity; and yet, as Tertullian fays, they refpected the Creator. The Marcionites feem to have been led into their erroneous notion of dividing the Deity from refpect to his attributes. For they thought, if a good God had made the world, he would have excluded from it fin and mifery, and that all men would have been both holy and happy. Their reafonings upon this point are given by Tertullian, as well as fome other arguments, deduced from the law, and other parts of the Old Teftament, to prove the being from whom that was derived, different from the fupreme or good God. Although, in fome inftances, they feem to blame juftice, denominating it feverity, and reprefenting it as inconfiftent with the character of goodnefs in God; and for this reafon feigning to themfelves another God, different from the Creator, a God of unmixed goodnefs; yet they allowed there would be a future judgment. But then the Creator was to be the judge, whofe juftice they reprefented to be fo ftrict as to approach near to feverity. It feems alfo to appear from the teftimony of Tertullian, and fome other evidence, that the Marcionites did not allow the freedom of human actions, but were believers in a kind of neceffity. They thought that the virtuous would be put into poffeffion of eternal happinefs after their departure out of this world, and that the place of their enjoyment would be where the prefence of the good God was, and where Chrift their faviour fhould alfo refide; but they did not allow that the body would be a partaker of this happinefs, or at leaft they denied the refurrection of the fame body; for which reafon they are cenfured by Tertullian. According to the account given by

Epiphanius,

Epiphanius, if we may depend upon it, Marcion taught the tranfmigration of fouls from one body to the other; but this is contradicted by a paffage in Clemens Alexandrinus, which implies that this was not the opinion of the Marcionites. According to Irenæus, Marcion taught that when Chrift defcended into hell, he delivered many wicked people, but left there the patriarchs, and many other good men of the Old Teftament. Upon this ftatement Beaufobre has made many pertinent and juft obfervations.

Marcion was fo far from believing that our Saviour was born of a virgin, that he did not allow he was born at all. He thought the Son of God affumed the exterior form of a man, and appeared as a man; and that, without being born, or gradually growing up to the full ftature of a man, he fhewed himfelf at once in Galilee, as a man grown. His gofpel of St. Luke, it is thought, began with thefe words, "In the 15th year of Tiberius, God defcended into Capernaum, a city of Galilee." And the Marcionites alfo fuppofed, that at the firft moment of his appearance in this world, he was completely fitted for entering on his great work, and that he immediately affumed the character of a Saviour. Although Marcion acknowledged Jefus to be Chrift, he denied his being the Chrift foretold by the Jewifh prophets. The deliverer promifed to the Jewifh nation was not, as he pretended, the Son of God; nor did the oracles of the Old Teftament agree to Jefus Chrift. Marcion, fays Tertullian, was a believer in two Chrifts, one who appeared in the time of Tiberius, for the falvation of all nations; and another the reftorer of the Jewifh ftate, who is yet to come. Marcion allowed the truth of our Saviour's miracles, and thought them a fufficient foundation for believing in him. His doctrine concerning our Saviour was, that, from love to the human race, and for their fake he defcended into this world, and fubmitted to great humiliations. Although, as his followers did not acknowledge him to have had real flefh, it may be fuppofed that they did not allow him to have really fuffered, yet they believed that he was betrayed by the Jews, at the inftigation of their God the Creator, and that he died and was buried. They even faid that the death of the Meffiah was neceffary for the falvation of man, though they did not fuppofe it to be an expiatory facrifice. They muft, likewife, have believed our Lord's refurrection. From various teftimonies, and from the arguments alleged by Tertullian, it appears that the Marcionites believed the whole hiftory of our Saviour's appearance in a human form, and of his death on the crofs. They alfo believed that he was crucified between two malefactors: they moreover allowed the truth of the miraculous earthquake and darknefs at the time of his crucifixion. They acknowledged his having twelve apoftles, and that one of them was a traitor. They alfo admitted the reality of the appearance of Mofes and Elias on the mount, and of that voice from heaven which faid, "This is my beloved Son, hear him."

Their manners, as we have already faid, were ftrictly virtuous. Tertullian hints, that none were admitted by them to baptifm and the eucharift, the obligation of which inftitutions they allowed, unlefs they had taken an oath againft having any children, as if they meant it againft the Creator; and Clement fuppofes that they abftained from marriage, that they might not people the world of the Creator, and that they offered themfelves voluntarily to martyrdom out of hatred to the Creator. On the fabbath, or feventh day, they fafted, becaufe it had been a day of reft to the Creator, or God of the Jews, whom they defpifed. They permitted women to baptize, and they repeated baptifm feveral times upon the fame perfon, if he happened to commit any fin after this rite had been adminiftered to him; and at the eucharift they ufed only water in the cup. They had among them churches for the ftated performance of public worfhip.

The Old Teftament was altogether fet afide by Marcion, under the notion that it proceeded from the Creator, who, in his eftimation, was deftitute of goodnefs, and the author of all that fin and mifery which fubfift in the world: and his followers agreed, that the law and the gofpel could not come from the fame being, becaufe there are, in their opinion, feveral things contained in the former inconfiftent with many in the latter. They objected to the appointment of facrifices, and to the diftinction of meats into clean and unclean; and they were difpleafed with the order given to the Jews, to fpoil the Egyptians. Tertullian fays, that they alleged fuch and fo many objections againft the law and the prophets, that they feemed more like the objections of Heathens than of perfons who embraced Chriftianity, though ever fo heretical in their notions. Their averfion to the Old Teftament was fo great, that on this account they mutilated many paffages in the New, even in thofe books which they admitted; rejecting all which related to the law and the prophets, or which were quoted from them, as plainly foretelling the coming of Jefus Chrift, and which fpoke of his Father as the Creator of the world. Confidering this Creator, or God of the Jews, as of a character very different from the good God or Father of our Lord Jefus Chrift, they afferted that Chrift came to deftroy the law given by him, becaufe it was oppofite to the gofpel.

Marcion received but eleven books of the New Teftament, and thofe were ftrangely curtailed and altered. He divided them into two parts, calling the one the Gofpel, and the other the Apoftolicon. The former contained only one of the four gofpels, *viz.* that of St. Luke, and this was mutilated and altered, and interpolated in a great variety of places. Not allowing it to be called the gofpel of St. Luke, he retrenched the firft and fecond chapters entirely, and began his gofpel at the firft verfe of the third chapter, and this verfe he read in a different manner from our copies, as we have already obferved. He rejected the genealogy and baptifm of our Saviour; and it, therefore, feems not unlikely that he connected that part of the firft and fecond verfes of the third chapter which he retained, with the 31ft verfe of the fourth chapter. He alfo rejected the hiftory of the Temptation, becaufe he would not attribute too much of human weaknefs to our Saviour; and the other ftory contained in the fourth chapter of Chrift's going into the fynagogue, at Nazareth, and reading out of the prophet Efaias, was alfo rejected. This they expunged with the whole that follows it to the end of the 30th verfe. But it would be tedious to enumerate all the alterations, or omiffions, or interpolations, which Marcion and his followers made in the gofpel of St. Luke. They are recited from Epiphanius by Dr. Lardner. We may obferve, however, that a fufficient number of paffages remain even in the copies of the Marcionites, to eftablifh the reality of the flefh and blood of Chrift, and to prove that the God of the Jews was his Father, and a being of confummate goodnefs. Marcion rejected the Acts of the Apoftles from his canon of the New Teftament; his Apoftolicon confifting of ten of the epiftles of St. Paul. The reafon why he rejected this book is very obvious, according to Tertullian, becaufe from it we can plainly fhew, that the God of the Chriftians, and the Creator, or God of the Jews, were the fame being; and that Chrift was fent by him, and by no other. The ten epiftles of St. Paul, admitted by Marcion, are much altered. Thofe which he receives, in a very

mutilated

mutilated ſtate, are the epiſtles to the Galatians, the firſt and ſecond to the Corinthians, that to the Romans, the firſt and ſecond to the Theſſalonians, and that to the Epheſians, which he calls the epiſtle to the Laodiceans, and thoſe to the Coloſſians, to Philemon, and to the Philippians. After all it is juſtly obſerved by Lardner, that the teſtimony even thus afforded in favour of the books of the New Teſtament is very ſtrong. "By means of this heretic's rejecting ſome books entirely, and mutilating others, the ancient Chriſtians were led to examine into the evidence for theſe ſacred writings, and to compare copies together, and on this account to ſpeak of whole books, and particular paſſages, very frequently in their works; which hath enabled us of later ages to authenticate theſe books, and to come at the genuine reading of many texts, in a better manner than we could otherwiſe have done." Lardner's Works, vol. ix. Moſheim's Eccl. Hiſt. vol. i.

MARCITES, Marcitæ, a ſect of heretics in the ſecond century, who alſo called themſelves the *perfecti*, and made profeſſion of doing every thing with a great deal of liberty, and without any fear.

This doctrine they borrowed from Simon Magus, who, however, was not their chief; for they were called Marcites, from one Marcus, who conferred the prieſthood, and the adminiſtration of the ſacraments, on women.

MARCK, in *Geography*, a town of Pruſſia, in Pomerelia; 12 miles S.E. of Marienburg.

MARCKLOE, a town of Pruſſia, in the province of Bartenland; ſix miles N. of Raſtenburg.

MARCKOLSHEIM, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diſtrict of Barr; 23 miles S. of Straſburg. The place contains 3996, and the canton 15,644 inhabitants, on a territory of 92½ kiliometres, in 13 communes. N. lat. 48° 11'. E. long. 7° 33'.

MARC-LAJAILLE, St., a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Ancenis. The place contains 1509, and the canton 5235 inhabitants, on a territory of 160 kiliometres, in ſeven communes.

MARCLISSA, a town of Luſatia, near the confines of Sileſia; 15 miles S.E. of Gorlitz.

MARCO, St., a town of Naples, in the province of Otranto; five miles N. of Lecce.—Alſo, a town of Naples, in Principato Citra; 12 miles N.N.E. of Benevento.—Alſo, a town of Naples, in Capitanata; eight miles N. of Monte St. Angelo.—Alſo, a town of Naples, in Calabria Citra, the ſee of a biſhop, eight miles W.N.W. of Biſignano.—Alſo, a town of Spain, in Galicia; 30 miles N.N.W. of Mondonedo.—Alſo, a town of New Navarre; 45 miles S.E. of Caſa Grande.—Alſo, a town of Italy, in Friuli; nine miles W. of Udina.—Alſo, a town of Sicily, in the valley of Demona; 15 miles W. of Patti.—Alſo, a ſmall iſland near the coaſt of Iſtria. N. lat. 44° 4'. E. long. 13° 53'.—Alſo, a river of Eaſt Florida which runs into the Atlantic, N. lat. 30° 3'. W. long. 81° 40'.

MARCOING, a town of France, in the department of the North, and chief place of a canton, in the diſtrict of Cambray. The place contains 1175, and the canton 14,957 inhabitants, on a territory of 212½ kiliometres, in 20 communes.

MARCOSIANS, or Colarbasians, an ancient ſect in the church, making a branch of the Valentinians.

St. Irenæus ſpeaks at large of the leader of this ſect, Marcus, who, it ſeems, was reputed a great magician. Maſſuet computes that Marc appeared about the year 160. Baſnage, on the authority of Euſebius, who underſtood Irenæus to ſay that Marc appeared about the ſame time with Valentinus, ſpeaks of him at the year 127. Many learned moderns are of opinion, that Marc belonged to the Valentinian ſchool, and they formed this opinion on the teſtimonies of Irenæus and Tertullian. Nevertheleſs Rhenford and Beauſobre ſay, that the Marcoſians were Jews, or judaizing Chriſtians; and Grabe likewiſe owns that they were of Jewiſh extract. Irenæus leads us to imagine that Marc, who was an Aſiatic, had come into Gaul, and made many converts there. Nevertheleſs, learned moderns think, that they were only diſciples of Marc, who came into that country where Irenæus reſided, of whom, in one place, he makes particular mention. Irenæus repreſents him as exceedingly ſkilful in all magical arts, by means of which he had great ſucceſs. Tertullian and Theodoret concur in calling Marc a magician. Irenæus, after giving an account of the magical arts of Marc, adds, that he had, probably, an aſſiſting demon, by which he himſelf appears to propheſy, and which enabled others, eſpecially women, to propheſy likewiſe; this practice favoured his ſeduction of many females, both in body and mind, which gained him much wealth. He is alſo ſaid to have made uſe of philters and love-potions, in order to gain the affections of women, and his diſciples are charged with doing the ſame. Dr. Lardner, with his uſual candour and impartiality, ſuggeſts ſome doubts as to the juſtice of theſe accuſations, with his reaſons for queſtioning their truth.

The Marcoſians are ſaid to have placed a great deal of myſtery in the letters of the alphabet, and thought that they were very uſeful in finding out the truth. They are charged unjuſtly with holding two principles, and as if they were Docetæ, and denied the reſurrection of the dead; for which there is no ſufficient evidence. They perſiſted in the practice of baptiſm and the euchariſt. As to their opinion concerning Jeſus Chriſt, they ſeem to have had a notion of the great dignity and excellence of his perſon, or his ineffable generation: and, according to them, he was born of Mary, a virgin, and the word was in him. When he came to the water, the ſupreme power deſcended upon him; and he had in him all fulneſs; for in him was the word, the father, truth, the church, and life. They ſaid that the Chriſt, or the Spirit, came down upon the man Jeſus. He made known the Father, and deſtroyed death, and called himſelf the Son of Man; for it was the good pleaſure of the Father of all that he ſhould baniſh ignorance and deſtroy death: and the acknowledgment of him is the overthrow of ignorance. From the account of Irenæus, we may infer that the Marcoſians believed the facts recorded in the goſpels, and that they received moſt, or all the ſcriptures of the Old and New Teſtament. Irenæus alſo ſays, that they had an innumerable multitude of apocryphal and ſpurious writings, which they had forged: and that they made uſe of that fiction concerning the child Jeſus, that when his maſter bade him ſay, alpha, the Lord did ſo: but when the maſter called him to ſay beta, he anſwered, "Do you firſt tell me what is alpha, and then I will tell you what beta is." As this ſtory concerning alpha and beta is found in the goſpel of the infancy of Jeſus Chriſt, ſtill in being, ſome are of opinion, that this goſpel was compoſed by the Marcoſians. Lardner's Works, vol. ix.

MARCOTZI, in *Geography*, a town of Sclavonia; 20 miles N.E. of Kralovavelika.

MARCOUF, St., two rocky iſlands in the Engliſh Channel, near the coaſt of France, about nine miles S.E. of La Hogue. The ſurface of each iſland, which is 18 or 20 feet above the ſurface of the ſea at high water, compriſes about an acre. They were taken poſſeſſion of in 1795, 1795, by fir Sidney Smith; and, in the following year, block-houfes, with detachments of marines, invalids, and 12 artillery men, were ordered out by government. In the year 1798, the French difpatched a very numerous body of troops on board 52 gun-veffels, in order to recover thefe iflands; but after having made a vigorous attack, they were compelled to retreat to La Hogue, with the lofs of 1100 killed, drowned, and wounded; but on the fide of the Britifh only one killed, and two wounded. N. lat. 49° 31′. W. long. 1° 4′.

MARCOUSSIS, a town of France, in the department of the Seine and Oife; 15 miles S. of Paris.

MARCULUS, among the Romans, a knocker, or inftrument of iron to knock at the doors with.

MARCUS HOOK, in *Geography*, a place of America, in Chefter county, Pennfylvania, on the W. fide of Delaware river; 20 miles below Philadelphia, containing about 30 families. Here are two rows of piers, or long wharfs, for defending veffels from the driving of ice in winter.

MARCZA, a town of Auftrian Poland; 16 miles S. of Halicz.

MARD LE BLANC, ST., a town of France, in the department of the Ille and Vilaine; feven miles W. of Fougeres.

MARD, *St.*, or *St. Medard*, a town of France, in the department of the Forefts; 33 miles W. of Luxemburg.

MARD *fur le Mont, St.*, a town of France, in the department of the Marne; 12 miles S. of St. Menehould.

MARDS *en Othe*, a town of France, in the department of the Aube; 13 miles S.W. of Troyes.

MARDAC, in the *Materia Medica of the Ancients*, a name given by fome to litharge. The Arabian writers have fometimes called it by this name, and fometimes by that of *mardefengi*. Many of their commentators have thought that they meant two different fubftances by thefe two names; but it does not appear to be truly the cafe, the two words ftanding, in different writers, for the fame thing. Avicenna has given us a chapter on *mardus*, in which he has tranflated the chapter of Diofcorides on litharge: and Serapion has given us a chapter on the *mardefengi*, in which he has given us an account of the fame fubftance, under the terms that Galen ufes for the defcription of litharge, and even quotes him for the account.

MARDAITES, in *Ecclefiaftical Hiftory*. See MARONITES.

MARDICK, in *Geography*, a fmall town, or rather village, of France, in the department of the North, fituated near the coaft of the Englifh Channel; three miles S.W. of Dunkirk. This place was once famous for its canal, conftructed after the peace of Utrecht, by order of Louis XIV. This canal, 3338 toifes and two feet in length, commenced at the canal of Bergues, near Dunkirk, and extended with a breadth of between 25 and 30 toifes, no lefs than 1500 toifes from E. to W. in length, and then winded from S. to N., and at the diftance of 300 toifes farther it had a fluice with two bafins in it, one of which was 44 feet broad, for the reception of large veffels, and the other 26 feet broad, for the accommodation of thofe that were fmall. It afterwards extended ftill farther to the main fea. Many of the works conftructed in this canal were deftroyed in confequence of a treaty with England in the year 1717, and no others were to be erected on that coaft within fix miles of Dunkirk and Mardick.

MARDJE, a town of Egypt, fituated on a fpot abounding with palm trees; fix miles N.E. of Cairo.

MARDIKERS, or TOPASSES, a breed of Dutch, Portuguefe, Indians, and other natives, incorporated with the Dutch, at Batavia, probably deriving their name from Mardick, or Mardika, the fubject of the above article. As the Dutch adventurers formed the leading party when Batavia was taken poffeffion of, the natives attached the appellation to all perfons of European defcent or connection.

MARDIN. See MERDIN.

MARE, NICHOLAS DE LA, in *Biography*, was born about the year 1641, and was, in after life, a commiffioner of the Chatelet during the fpace of forty years. In confideration of his great zeal in the king's fervice, he was made fteward of the houfhold of the count of Vermandois, and after the death of that prince, he had a penfion for his life. He was employed in various important commiffions relative to the revenue, and made feveral journies to the provinces on public occafions, in which he acquitted himfelf to general fatisfaction. He died in 1723, and was author of a work of high merit, entitled "Traitè de la Police," 3 vols. folio, 1705—19. This contains a detailed account of the eftablifhment of the police in France; the functions and prerogatives of its magiftrates, its regulations, &c. A fourth volume was added in 1738, by M. le Clerc de Brillet. Moreri.

MARE, PHILIBERT DE LA, a literary character, and counfellor of the parliament of Dijon, who flourifhed in the 17th century. He was author of feveral works in the Latin language, taking that of De Thou as an example, which were well received by the public. The chief of thefe is entitled "Commentarius de Bello Burgundico apud Sequanos," containing a relation of the war of 1636. In a fecond edition by his fon Philip, in 1689, is given a catalogue of writers on the hiftory of Burgundy. M. Mare compofed a number of biographical fketches, chiefly of literary characters, and he left in MS. Memoirs of the public tranfactions from the year 1673, to his death. Moreri.

MARE, in *Rural Economy*, the female of the horfe kind of animal. Mares intended for the purpofe of breeding, fhould be felected with great care and attention, fo as to be as free as poffible from faults or imperfections in their forms, and be well fuited in their kind to the purpofes for which they are defigned. The practice of making ufe of fuch mares as may happen to be on the farm fhould never be adopted, as it is prejudicial to the raifing of good horfe ftock. The particular directions regarding the kinds of horfes to be bred, are thefe: if for the manege, or pads, the mares fhould have their heads well fet on, and their breafts broad; their legs not too long, their eyes bright and fparkling, and bodies large enough, that the foal may have room to lie in their belly. They fhould be of a good and gentle difpofition, and their motions eafy and graceful: the more good qualities the mares have, the better, in general, the colts will prove.

If the owner would breed for racing, or for hunting, the mares muft be chofen lighter, with fhort backs and long fides; their legs muft be longer, and the breaft not fo broad; and fuch fhould always be chofen as have good blood in their veins. If the fpeed and wind of any particular mare have been tried, and found good, there is the more certainty of a good colt from her: but fhe fhould be in full health and vigour at the time, and not above feven years old, or eight at the utmoft. The younger the breeders are, the better, in general, the colts will be.

Mares may be put to the horfe when three years old, but it is a better practice to defer it a year longer, where it can be done with convenience. Some advife mares to be kept in the

the houfe fome time before they are put to the horfe, but this feems of little confequence when they are in proper health.

The beft feafon for putting mares to the horfes is in the fpring, about April or May, in order that the foals may be dropped fufficiently early, which is of confequence in their rearing afterwards.

The length of time that they ufually go with foal is about eleven months, which is a circumftance that fhould be kept in the mind of the breeder, though there are often confiderable deviations. Mares fhould always be kept well while in foal, in order to have a fine healthy offspring.

The cuftom of performing much work with the mares while in foal is improper, as being attended with danger, as well as liable to check the growth of the foals: when this is practifed with farm mares, they fhould only be gently wrought, and that with great care and attention. See Horse.

Mare, in *Geography*, a fmall ifland near the W. coaft of Scotland. N. lat. 56° 14'. W. long. 5° 45'.

MAREB, a river of Africa, which rifes in Abyffinia, about fixty miles N.E. of Axum, and joins the Tecazzé, in the country of Nubia, 100 miles before its junction with the Nile.

Mareb, a town of Arabia, in the province of Yemen, and capital of the diftrict of Bellad es Scheref. Its fheriff poffeffes this town with fome adjacent villages. The town confifts of only about 300 poor houfes; fituated 16 leagues N.E. of Sana. It was known to the ancients by the name of "Mariaba," as the capital of the Sabæans; and in its vicinity are ruins, pretended to be the remains of the palace of queen Balkis. The Sabæans had a famous refervoir for water, called by the Arabs "Sitte Mareb," which was a narrow valley between two ranges of hills, and a day's journey in length. Six or feven fmall rivers meet in that valley, fome of which contain fifh, and their waters flow through the year; but others are dry, except in the rainy feafon. For confining the waters in this feafon, the entrance into the valley was fhut up by a high and thick wall, and as outlets through which the water thus collected might be conveyed, in the time of drought, for watering the neighbouring fields, three large flood-gates were formed in the wall, one above another. The wall was 50 feet high, and built of large hewn ftones. Its ruins are ftill vifible. The tradition that the city of Mareb was deftroyed by a deluge, occafioned by the fudden burfting of the wall, is fabulous. This accident, however, proved fatal to the city, by rendering the neighbouring fields wafte and barren, fo that it was thus left without the means of fubfiftence. The prince who formerly reigned over Mariaba was a powerful prince; but Mareb is now the abode of a poor fheriff, who is hardly able to withftand the encroachments of feeble neighbours. Niebuhr.

MARECA, in *Ornithology*, the name of a Brafilian fpecies of duck, much valued there at table. It is of the fhape of our duck; its head is grey, but has a beautiful red fpot on each fide, at the infertion of the beak, and a whitenefs in the lower part under the eyes; its breaft and belly are of the colour of frefh-cut oak, variegated with black fpots; its legs and feet are black; its tail grey; and its wings elegantly variegated with grey and brown; but they have in the middle a large mixture of that gloffy green, which we fee in the necks of our drakes. There is, befides this, another fpecies of the mareca, which is of a dufky olive-coloured brown on the back, white on the throat, and grey on the breaft and belly, and very remarkable for the fine bright red colour of its feet. See Duck.

MARECHAL. See Marshal.

MARECHAUX, Cape, in *Geography*, a cape which forms the north-eaft fide of the bay of Jacmel in St. Domingo. N lat. 18 18'.

MARECHITES, a denomination of Indians, who inhabit the banks of the river St. John, and around Paffamaquaddy bay, in North America. To this clafs of Indians belong about 140 fighting men.

MARECKAN, one of the fouthern Kurile iflands, in the North Pacific ocean, about 30 miles long, called by the Ruffians "Chimouchis." N. lat. 47 5'. E. long. 152° 50'.

MAREGORIAN, one of the Molucca iflands, about 15 miles long and 5 broad. S. lat. 0° 36'. E. long. 127° 18'.

MAREILLAC, a town of France, in the department of Aveyron, and chief place of a canton, in the diftrict of Rodès. The place contains 1216, and the canton 10.453 inhabitants, on a territory of $252\frac{1}{2}$ kiliometres, in 18 communes.

MARELLA, a town of Hindooftan, in the Carnatic; 21 miles S.S.W. of Ongole.

MAREMMES, Les, a diftrict of the Sienna, in Etruria, divided into Maremma di qua, and Maremma di la; the former on the eaft, the latter on the weft fide of the river Ombrone; both bounded by the fea on the fouth. The foil is fertile, but the air is reckoned unwholefome.

MARENA, in *Ichthyology*. See Salmo *Marænula*.

MARENGO, in *Geography*, one of the fix departments into which Piedmont was divided, after it was united to the French republic, Aug. 26, 1802: it is compofed of Montferrat, Alexandria, Tortoneze, and Laumelline, and is bounded on the north by a part of Italy and the department of the Sefia, on the eaft by Parma, on the fouth by Genoa, and on the weft by the departments of the Tanaro and Doire. This department lies in N. lat. 44 50', and contains 181 fquare leagues, and 231,954 inhabitants. It is divided into five circles or diftricts, *viz.* Cafal, containing 108,926 inhabitants; Alexandria, 76,081; Voghere, 67,293; Bobbio, 21,288; and Tortone, 48,366. This department, lying between the Po and the Ligurian republic, is hilly, but fertile, yielding all forts of grain, fruits, wine, and excellent paftures. There are iron mines in the vicinity of Serravalle. This department derives its name from that of a village, four miles eaft of Alexandria, which was rendered famous by a fevere and fanguinary battle fought there June 14th 1800, that terminated in fubjecting Piedmont and Lombardy to the dominion of the French. This battle was commenced by the Auftrians, who compelled the centre of the French army, though ably fupported, to fall back. The Auftrians advanced upon Marengo with a movement that produced dreadful carnage, and gaining frefh reinforcements, they took poffeffion of the village; part of the centre of the French having given way, and fled in diforder from the field of battle. The right wing, thus infulated, was attacked by two lines of infantry, which marched againft it with a formidable artillery; and the retreat of the centre obliged it, after vigorous refiftance, to follow the fame movement. Nothing could fave the French army, in thefe defperate circumftances, but the body of referve under general Defaix, which was not yet ready for action; Buonaparte, in order to gain time, having retarded its movement. The retreat of the French was made under the fire of 80 pieces of artillery; and though the

carnage

carnage was horrible, they kept their ranks, and inftantly replaced thofe who fell with frefh troops.

Victory now feemed to declare in favour of the Auftrians, whofe numerous and excellent cavalry covered the plain, fupported by feveral fquadrons of light artillery, and threatened to turn the army. At this critical moment, the grenadiers of the confular guard marched to fupport the right, which was the only column that had held firm. They advanced, and like a wall of granite, as they were called at the time, fuftained three fucceffive charges. At the fame inftant, Monnier's divifion, which formed part of the corps de referve, was ordered to attack the battalions which protected the Auftrian cavalry, part of which was purfuing the centre and left of the French. On the plain of St. Juliano, the referve under Defaix was drawn up in two lines, fupported on the right and left by the artillery under Marmont, and by the cavalry under Kellerman. Behind this corps the fugitives of the centre and left formed : and the prefence of Buonaparte, who flew from rank to rank, reanimated the foldiers, and at four in the afternoon, the battle which had raged for feven hours was about to recommence. The Auftrians, apprehending themfelves fure of victory, after having routed two-thirds of the French army and ready to furround the remainder, had not taken any account of a divifion that had not yet been attacked. They had therefore improvidently wafted their ftrength, and fcattered their battalions in the ardour of purfuit. Buonaparte perceived the advantages which this ardour on the part of the enemy had given him. Defaix, at the head of his legion, rufhed forward with impetuofity among the victorious battalions, charging them with the bayonet ; the remainder of the divifion followed this movement, and the whole army, catching the enthufiafm, advanced at the pas-de-charge. The Auftrians, overwhelmed with aftonifhment at this fudden explofion, withdrew their artillery, and the infantry began to give way. At this critical moment Defaix fell ; but the lofs of this brave officer, inftead of difconcerting, roufed the ardour of the troops into a fury, in order to avenge his death ; but the bayonet, which had driven back the firft line of the Auftrians, could not pierce the fecond. The refiftance of the Auftrians ftopping the French in their career, rendered the event of the day ftill doubtful ; but its fate was decided by Gen. Kellerman, who, ordering a charge of cavalry, threw the Auftrians into diforder, and made a whole divifion prifoners, to the number of 6000 men, among whom were feveral generals, and almoft all the officers of the ftaff. A third line of infantry yet remained as a corps de referve, fupported by the reft of the artillery, and the whole of the cavalry. Againft this laft divifion the right wing of the French advanced with the grenadiers of the confular guard, and part of the referve under Baudet, and fupported by the artillery under the command of Marmont. The Auftrian line ftill maintained its ground ; but the French cavalry under Murat, having charged the Auftrian cavalry, this latter gave way precipitately, and was completely routed ; fo that night fcarcely put a ftop to the purfuit and carnage. The French boaft of having wounded, killed, and taken prifoners, 15,000 men ; the victory on their part, it muft be acknowledged, was fignal, but their lofs was probably equal to that of the army with which they contended. Many traits of heroifm were exhibited on occafion of this battle, and many confequences refulted from it which will render it memorable in the page of hiftory. Cruttwell.

MARENNE, a town of France, in the department of the Stura ; 4 miles N.N.E. of Savigliano.

MARENNES, a town of France, and principal place of a diftrict, in the department of the Lower Charente, at the mouth of the Seudre ; 9 miles S.S.W. of Rochefort. The place contains 4633, and the canton 9950 inhabitants, on a territory of 215 kiliometres, in fix communes. The principal article of its trade is falt. N. lat. 45° 49'. W. long. 1° 1'.

MARENZIO, Luca, in *Biography*, an eminent and favourite Italian mufical compofer, who flourifhed during the latter end of the fixteenth century. This ingenious and fertile author, who diftinguifhed himfelf chiefly as a madrigalift, was born at Concaglia, in the diocefe of Brefcia, and the fcholar of Giovanni Contini, who was himfelf a voluminous compofer: having, in 1565, publifhed Cantiones, 6 vocum ; Introitus et Halleluja, 5 vocum, for feftivals : Hymnos, 4 vocum ; Threnos Hieremiæ, 4 vocum, for Paffion-week ; and a Miferere, in four parts.

The inclination of his difciple Marenzio leading him very early to the compofition of madrigals, he cultivated that ftyle more fuccefsfully than any of his predeceffors, and the number he compofed is prodigious. At Venice, between the years 1587 and 1601, were printed nine books of his madrigals, for five voices ; the two laft were pofthumous. Befides thefe, this author compofed fix books of madrigals, in fix parts. Madrigals for three voices ; another fet for five, and ftill another for fix voices, different from all the former. Canzonets for the lute. Motetti, a 4, & Sacras Cantiones, 5, 6, ac 7 Vocibus modulandus. All thefe works were firft printed at Venice ; and afterwards at Antwerp, and many of them in London, to Englifh words ; fee "Mufica Tranfalpina," two books, and a collection of Italian madrigals, with Englifh words, publifhed in 1589, by Thomas Watfon. Quadrio, t. ii. p. ii. p. 324, gives a long lift of his Villanelle, a 3 voci ; and Draudius, p. 1614, of his motets, a 4, for all the feftivals throughout the year. Ven. 1588. Et ejufd. Completorium & Antiphone, a 6, 1595.

Of the madrigal ftyle he was called in Italy, *il piu dolce Cigno;* and the proud antagonift of Nanino, Sebaftian Raval, the Spaniard, who was editor of fome of his works, ftyles him a *divine compofer*. He was fome time maeftro di capella to cardinal Luigi d'Efte ; and, according to Adami and others, careffed and patronifed by many princes and great perfonages, particularly the king of Poland and cardinal Cinthio Aldobrandini, nephew to pope Clement VIII. Upon his return to Rome, after quitting Poland, he was admitted into the pope's chapel, and dying in that city, 1599, he was buried in the church of St. Lorenzo, in Lucina. Adami Offerv. per ben regolar il Coro Pontif.

Our countryman, Peacham, in his Complete Gentleman, fpeaks of his delicious *aire* and fweet invention in madrigals ; and fays, "that he excelled all other whatfoever, having publifhed more fets than any author elfe, and hath not an ill fong." Adding, that "his firft, fecond, and third parts of Thyrfis, 'Veggio dolce il mio ben, &c.' are fongs the Mufes themfelves might not have been afhamed to have compofed." To all this we can readily fubfcribe, and will not difpute his ftature, or the colour of his hair, when he further tells us, that "he was a little black man," but where he afferts that "he was organift of the pope's chapel at Rome a good while," he lofes all credence with us ; as there never yet was an organ in the papal chapel ; nor is it likely, however great his mufical merit may have been, that the niece of any reigning pope could have been fent for to Poland, with fo little ceremony, as he tells us, in the character of a lutenift and finger, in order to gratify the curiofity of his

his Polish majesty, and the affection of Luca Marenzio. Indeed, the whole account favours of hear-say evidence and absurdity; and is so much the more incredible, as no other musical writers, who were eager to record every memorial they could procure concerning Luca Marenzio, have ventured to relate these circumstances.

There are no madrigals so agreeable to the ear, or amusing to the eye, as those of this ingenious and fertile composer. The subjects of fugue, imitation, and attack, are traits of elegant and pleasing melody; which, though they seem selected with the utmost care for the sake of the words they are to express, yet so artful are the texture and disposition of the parts, that the general harmony and effect of the whole are as complete and unembarrassed as if he had been writing in plain counterpoint, without poetry or contrivance.

The first set of his madrigals for five voices, however, seems the most elaborate; the fugues and imitations here are more ingenious and frequent than in his other works. He has, indeed, in those of later date more melody; but as yet there was too little to compensate for the want of contrivance. Whoever takes the trouble to score and examine this set, will discover marks of real genius with respect to harmony and modulation, with many attempts at melody of a more graceful kind than is to be found in the works of his contemporaries: as we may reasonably conclude this to have been one of his early productions, of nearly the middle of the sixteenth century.

We have never met with more than one entire movement, in *triple time*, among all the works of this excellent composer; and that is in the eighth set for five voices, "La mia Clori e brunetta." In a collection of his madrigals for six voices, published at Antwerp, 1594, some of the movements are gay and spirited, and contain passages that continued in fashion more than a hundred years after publication, as appears by the use that Purcell and Handel have made of them; and indeed there are others which modern Italians have not disdained to adopt.

The words of his ninth book of five-part madrigals are all from the Canzoniere of Petrarca, and of these the composition seems the most free and fanciful of all his works.

Though the madrigals of the sixteenth century appear now so grave as to be scarcely distinguishable from the music of the church, yet the masters of that period had very distinct and characteristic rules for composing in both styles. Pietro Pontio, who had himself produced many that were excellent, in giving instructions for composing madrigals, says, that "the subjects of fugue and imitation in them should be short, and the notes of a quicker kind, and more syncopated than in church music; otherwise they would not be madrigals. The parts likewise should frequently move together; but the greatest care should be taken to express the sense of the words as exactly as musical imitation will allow, not only by quick and slow passages, or notes ascending and descending occasionally, but by modulation, which, when the sentiment of the poet implies harshness, cruelty, pain, sorrow, or even joy, pleasure, or the like, will assist the expression more than single notes." Here he refers to the fourth madrigal of Orlando di Lasso (book i) for an example of the happy expression of words. Though composers were now very timid in the use of flats, sharps, and transposed keys, yet licences were taken in madrigals which were inadmissible in music *à capella*. In the eighth madrigal of Luca Marenzio's ninth book, *a 5*, *Solo e pensoso*, a bold and curious composition, the upper part ascends from the key-note G to A, the ninth above by a series of fifteen semitones, and then descends from A to D by the same intervals. The answer to subjects proposed in madrigals were more imitations than regular replies, according to the strict laws of fugue; yet, with respect to the melody of the short passages or musical sentences which were used, and the harmony with which they are accompanied, great pains seem to have been taken in polishing both. Indeed, as this was the chief music of the chamber, where it is probable the critics and lovers of music attended, for neither public concerts nor operas had as yet existence, there can be no doubt but that every refinement was bestowed on this species of composition, which the ideas of musical perfection could then suggest.

MAREOTIS, in *Geography*, a lake of Egypt, S. of Alexandria, which is become almost dry, though occasionally, as it is said, moistened by inlets from the sea. This lake, says Savary, whose banks were covered with papyrus and date-trees, is no longer in existence, because the Turks have neglected to preserve the canals which conveyed the waters of the Nile. Belon, who travelled in Egypt some years after the conquest of the Ottomans, assures us, that in his time lake Mareotis was only at half a league's distance from the walls of Alexandria, and that it was surrounded by forests of palm-trees. "At the moment of my writing, (says the same traveller,) it is entirely occupied by the sands of Lybia. These deplorable changes must be attributed to the destructive government of the Turks." See ALEXANDRIA.

MARESIGO, a town of Istria; four miles S. of Capo d'Istria.

MARETIMO, an island of the Mediterranean, near the W. coast of Sicily, about 22 miles in circumference, containing a chateau and some farms, 15 miles W. of Trapani. N. lat. 38° 4'. E. long. 12° 15'. In this island, as well as Favoyanna, both belonging to the king of Naples, he used to banish his state-prisoners.

MARETS, ROLAND DES, in *Biography*, a native of Paris, was born in 1594: he pleaded some time as an advocate at the French bar, till, disgusted with the contentions of the profession, he retired to a life of literary repose, and died in 1653. He was celebrated for an excellent skill in criticism, and for his knowledge in the Latin tongue. He wrote a number of Latin letters on literary topics, which were published after his death by M. de Launoy, under the title of "Rolandi Maresii Epistolarum philologicarum, Lib. ii." Moreri. Bayle.

MARETS DE ST. SORLIN, JOHN DES, brother of the preceding, a man of letters of a singular character, was born at Paris in 1595. He very early distinguished himself by the liveliness of his parts, and was in great favour with cardinal Richelieu, whom he used to assist in his literary productions. In recompence for his labours he had conferred on him the posts of comptroller-general of the war extraordinaries, and secretary-general of the marine of the Levant. He was one of the first members of the French Academy, and made himself known by a variety of compositions in poetry and romance. He was likewise a writer, and his most popular piece is the comedy of "Les Visionnaires." He led a very licentious life, but in old age he became a devotee and fanatic, and was a bitter enemy of the Jansenists, whom he attacked in writings full of extravagance. He applied the prophecies in the book of Revelations to Lewis XIV., who, according to his account of the matter, was at the head of 144,000 men to destroy heresy and Mahometanism, and bring the whole world to the profession of the true faith. He died in 1676, at the age of eighty-one. Bayle.

MAREUIL, in *Geography*, a town of France, in the department

partment of the Dordogne, and chief place of a canton, in the diftrict of Montron; 21 miles N.W. of Perigueux. The place contains 755, and the canton 9320 inhabitants, on a territory of 210 kiliometres, in 18 communes.—Alfo, a town of France, in the department of the Vendée, and chief place of a canton, in the diftrict of Fontenay-le-Comte; five miles N. of Luçon. The place contains 240, and the canton 4239 inhabitants, on a territory of 160 kiliometres, in 17 communes.

MARGA, Marle. See Marle.

Marga, *St.*, in *Geography*, a fmall ifland of Hungary, in the Danube; 10 miles S. of Buda.

MARGAB, or Margus, a river of Perfia, which rifes about 30 miles E. from Herat, and lofes itfelf in the earth near Hamadan.

MARGAMARGA, a river of Chili, which runs into the Pacific ocean, S. lat. 33°.

MARGAMI, a town of Japan, in the ifland of Xicoco; 8 miles N. of Ovitfi.

MARGARET, in *Biography*, queen of Denmark, Norway, and Sweden, daughter of Waldemar III., king of Denmark, was born in 1353: fhe was married, while very young, to Haquin, king of Norway, and fon of Magnus, king of Sweden. At her father's death, in 1375, fhe was a widow, and her fon Olaus, then only nine years of age, was chofen king of Denmark and Norway, fhe being appointed the regent. In 1387, Olaus died, leaving the male line of the three northern crowns extinct. Margaret was unanimoufly elected to the crown of Denmark, and afterwards to that of Norway. The States urged her to enter into the matrimonial connection a fecond time, in order to prevent any difputes with regard to the fucceffion of the crown, but fhe declined the propofal, and nominated for her fucceffor apparent, the neareft of blood of the royal family, *viz.* Henry of Pomerania, from that time called Eric. Henry, duke of Mecklenburg, brother to Albert, king of Sweden, declared himfelf a competitor with Margaret, and engaged Albert in his caufe. Preparations for war were made on both fides; a decifive battle was fought, in which Albert was defeated and made prifoner, and Margaret was prefented with the crown of Sweden. In 1395 fhe was folemnly crowned queen of the three northern kingdoms. She caufed Eric to be confirmed and acknowleged as her fucceffor, procured a redemption of the crown land alienated by Albert in Sweden, and adopted a number of prudent regulations for the confirmation of her authority, and the healing of animofities. She was particularly attentive to the adminiftration of juftice in her dominions, and to the enforcement of the laws upon all ranks of her fubjects. She protected and encouraged commerce, by providing for the fecurity and good treatment of foreign merchants reforting to her ports, and employed the moft vigorous means of fuppreffing piracy. In 1397 was concluded the famous union of Calmar, by which the three northern kingdoms were declared to be indiffolubly united under one head, who fhould be chofen fucceffively by each of the three, and then confirmed at an affembly of the whole, and fhould fpend his time equally between them, applying the revenue of each to its own expenditure. Other regulations alfo were enacted for the maintenance of the equal rights and privileges of the three kingdoms, and the prevention of difputes. Notwithftanding, however, all the care that was taken on the fubject, this treaty proved the fruitful fource of wars and diffentions for feveral centuries. An attempt was foon after made to recover the ifle of Gothland from the Teutonic knights. There were likewife difputes with the houfe of Holftein, which had been fuffered to gain poffeffion of Slefwick, and thefe continued, with little intermiffion, during the remainder of the reign. Margaret, by the vigour of her adminiftration, retained her full authority at home, and made herfelf refpected abroad. She was lefs friendly to her Swedifh fubjects than to thofe of Denmark, on which account the nobles of Sweden, in a body, prefented a remonftrance on the violations of their rights, to which fhe haughtily and imprudently replied, that "they might guard them with as much vigilance as fhe would keep the fortreffes of the kingdom." She died in 1412, after a reign, including the regency, of thirty-fix years. From the extent of her dominion, the policy of her adminiftration, and perhaps from a fufpicion of irregularity in her morals, fhe obtained the title of the "Semiramis of the North." That fhe poffeffed the qualities of induftry, activity, fteadinefs, and refolution, there can be no doubt, and it is faid fhe had a natural eloquence fitted to imprefs a public affembly. Univer. Hift.

Margaret *of Anjou*, celebrated in the hiftory of England, was the daughter of René, titular king of Sicily, Naples, and Jerufalem, defcended from the count of Anjou, brother of Charles V. of France. Brought up in a court without power or rule, her natural ftrength of mind was not enfeebled by early indulgence, and fhe became diftinguifhed as the moft accomplifhed young princefs of her time, when fhe was fixed upon by cardinal Beaufort and his friends as wife of Henry VI. of England. Upon her marriage fhe threw herfelf into the hands of that party which had been the means of her elevation, and to her difgrace it has been charged upon her that fhe was actually privy to the murder of Humphrey, duke of Gloucefter. The reign of Henry VI., at this time, was difquieted by rancorous and contending factions, and in 1454, while the national difcontents were rifing to a crifis, Margaret was delivered of a fon, and fhe was, almoft immediately upon her recovery, called upon to exert herfelf in refifting the Yorkifts, who had gained the victory of St. Alban's. Henry was made prifoner, but his confo t was n t d fp rited; fhe raifed troops, and fupported the royal caufe with fo much fpirit, that fhe was able to reftore her hufband to a nominal fovereignty, and effect a favourable compromife. In 1459, the war was renewed, when Henry fell again into the power of his enemies, and the queen, with her infant, was glad to efcape firft to Durham, and then into Scotland, whence returning to the north of England, fhe engaged the nobles and great men who lived in that part in her caufe, and foon by their means collected a powerful army. With this fhe met the duke of York at Wakefield in the month of December 1460, and gave him a total defeat. The duke was flain, and his head, by the exprefs command of the queen, was cut off, and placed on the gates of the city of York, being firft crowned, in derifion, with a paper diadem. After this fhe was again victorious in feveral actions, and in 1461 recovered the perfon of the king. In every inftance fhe difplayed a fanguinary and revengeful difpofition towards thofe who fell into her hands, and againft whom fhe bore any ill-will. The approach of Edward with a fuperior force obliged her again to retreat to the north, and that prince was elevated to the throne by the people of London, an event which feemed to give a fatal blow to the hopes of the houfe of Lancafter. In the month of March, the moft bloody of all thefe battles was fought at Towton, in Yorkfhire, in which the Lancaftrians were totally defeated, and Margaret and Henry made a hafty retreat into Scotland. After this fhe went over to France, to feek that affiftance from the French which fhe had in vain folicited from her nearer neighbours the Scotch. For this purpofe

pofe fhe propofed to deliver Calais to the French king on the event of Henry's being reftored to the crown, and on this condition fhe obtained two thoufand men at arms, with which fhe was allowed to land in Scotland. Here fhe was joined by others in her own intereft, and proceeded to Hexham, in Northumberland, where fhe was met by a force under lord Montacute, who routed and totally difperfed her troops. Margaret with her fon fled into a foreft, where fhe was defcried by a band of robbers, who ftripped her of her jewels, and treated her perfon with great indignity. Fortunately fhe efcaped while her plunderers were quarrelling about the booty, and penetrating into the depth of the foreft, fhe wandered about till fhe was exhaufted with fatigue and terror. At length, feeing a man approach with a drawn fword, fhe fummoned refolution enough to go out to meet him, faying, "here friend, I commit to you the fon of your king, for that protection which I am unable to afford him." The man, though a robber, was difarmed of every ill intention by the confidence which was repofed in him, and devoted himfelf to their fervice. After concealing them fome time in the woods, and providing for their fupport, he conducted them in fafety to the fea-coaft, whence they took an opportunity of efcaping into Flanders. She lived feveral years in retirement, while her hufband continued a prifoner in the Tower of London. At length, in 1470, fhe was encouraged to join the earl of Warwick, who had commenced a rebellion againft Edward, which ended in that change of affairs which obliged the king to quit his country, and take refuge in Flanders. Margaret, with the view of feconding his efforts, landed at Weymouth with a fmall body of French troops, and on that day, the 14th of April 1471, the battle fought at Barnet put an end to the life of Warwick and the hopes of the confederacy. Margaret, relying ftill on her good fortune, once more encountered the victorious Edward at Tewkefbury, where fhe fuffered a total defeat, and was with her fon taken prifoner; the latter was flain in cold blood by the merciless conquerors. Margaret was thrown into the Tower of London, in which her hufband about that time perifhed; fhe was afterwards ranfomed by Lewis XI., and retired into France, where fhe died in 1482. She underwent more changes of fortune, and fuffered a larger portion of calamities, than can fcarcely be parallelled in the hiftory of crowned females. Her great talents and unfubdued fpirit excited general admiration, while her fanguinary and ferocious difpofition, and the preference which fhe was inclined at all times to give to her native country, rendered her an object of abhorrence to the greater part of the Englifh nation. Shakfpeare, whofe hiftorical plays are the echo of popular opinion, defcribes her in very dark colours, and as deftitute of all the tendernefs and modefty of her fex. Hume's Hift. of England.

Margaret *of Valois*, queen of Navarre, fifter to Francis I., king of France, was born at Angoulême in the year 1492. She married the duke of Alençon in 1509, and became a widow in 1525. When her brother was prifoner in Spain, and extremely ill through the treatment to which he was expofed, fhe paid him a vifit, and reftored him to health by her kind offices, in return for which he promoted her marriage with Henry d'Albret, king of Navarre, upon very advantageous conditions. As foon as fhe was feated on the throne of this fmall kingdom, fhe united with her hufband in every effort to make it flourifh, by encouraging agriculture and the ufeful arts, improving the adminiftration of juftice, and promoting knowledge and civilization. She was herfelf of an inquifitive turn of mind, and in contemplating the principles of the reformers, it was fuppofed fhe had become a convert to their opinions; at any rate fhe afforded protection to feveral divines who were perfecuted for their opinions, and even interceded with her brother in favour of the reformed in his territories. She was fond of the bible, of which fhe got a rude tranflation in the French language, and from this fhe felected parts which fhe formed into fcenes that were reprefented in her court. She wrote a work intitled "Le Miroir de l'Ame pechereffe," which was printed in 1533, and which incurred the cenfure of the Sorbonne. On account of her attachment to the new opinions, fhe underwent fome ill treatment from her hufband, who would probably have been more fevere with her had not her brother interpofed to ftop his hand. His affection for her continued even after he himfelf had become a violent perfecutor of the reformed in his own kingdom; but it muft be obferved that fhe never threw off the exterior profeffion of the Catholic religion, and became more affiduous in her compliance with its ceremonials as fhe advanced in years, and is even fuppofed finally to have returned to the faith in which fhe had been educated. "It will appear remarkable," fays one of her biographers, "that a lady fo much addicted to ferious and pious contemplations, and certainly of unfufpected virtue, fhould have compofed a fet of tales as licentious as thofe of Boccacio; but fuch contradictions were not uncommon at a time when the general manners were grofs, and decorum was little underftood." This work was entitled "L'Heptameron, ou fept Journèes de la Reyne de Navarre." It was written while fhe was young, and was not printed till after her deceafe, which happened in 1549, leaving only one child, Joan d'Albret, queen of Navarre, and mother to Henry IV. The ftyle of the L'Heptameron, &c. was lively and fimple, and the ftories well invented. It has been very frequently reprinted. A collection of her poems and other pieces was publifhed in 1547, by her valet-de chambre, John de la Haye, with the title of "Marguerites de la Marguerite des Princefes." Univer. Hift. Bayle.

Margaret, *St.* in *Geography*, a river of Canada, which runs into the Jagueray, N. lat. 48° 20′. W. long. 69° 36′.

Margaret's *Bay St.*, a port on the S. coaft of Nova Scotia, between Profpect harbour and Mahon bay; from which laft it is feparated by a promontory, on which is the high land of Afpotagoen.—Alfo, a bay in the Englifh Channel, on the E. coaft of Kent; five miles N N E. of Dover.

Margaret's *Iflands*, iflands in the North Pacific ocean, difcovered by Capt. Magee, in the fhip Margaret of Bofton, in his voyage from Kamtfchatka in 1780. N. lat. 24° 40′. E. long. 141° 12′.

Margaret's, *St.*, *Ifland*, an ifland near the S. coaft of Wales; three miles W. of Tenby.

MARGARICARPUS, in *Botany*, fo called, as it appears, from μαργαρον, *a pearl*, and καρπος, *fruit*, becaufe of its white round drupa. Vahl indeed, and the authors he quotes, write it *Margyricarpus*, which may furely be corrected without offence. Vahl. Enum. v. 1. 307. Clafs and order, *Diandria Monogynia*. Nat. Ord. *Senticofæ*, Linn. *Rofaceæ*, *fect.* 3, *Sanguiforbæ*, Juff.

Gen. Ch. *Cal.* Perianth fuperior, in four or five deep, ovate, equal fegments. *Cor.* Petals four or five, ovate, fmaller than the fegments of the calyx; fometimes wanting. *Stam.* Filaments two, fometimes three, thread-fhaped, longer than the calyx; anthers roundifh, in two deeply divided lobes. *Pift.* Germen inferior, ovate, compreffed; ftyle thread-fhaped, the length of the ftamens; ftigma peltate. *Peric.* Drupa roundifh, fomewhat flefhy, umbilicated, of one cell. *Seed.* Nut quadrangular, of one cell.

Obf. The flowers are faid to be fometimes dioecious, in which

which cafe the males, at leaft, are furnifhed with petals. Vahl characterizes the genus as deftitute of a corolla. The permanent leaves of the calyx have, by fome perfons, been taken for leaf-like ftyles or ftigmas.

Eff. Ch. Calyx in four or five deep fegments, fuperior. Petals fmaller than the calyx. Stigma peltate. Drupa with one feed.

1. M. *fetofus*. Briftly Pearl-berry. Fl. Peruv. v. 1. 28. t. 8. f. *d. Vahl.* (Empetrum pinnatum; Lamarck Dict. v. 1. 567. Anciftrum barbatum; Lamarck Illuftr. v. 1. 77.)—Native of Brafil, Peru, and the dry hills of Chili. Our fpecimen was gathered by Commerfon at Monte Video, in fandy ground. The *ftem* is fhrubby, round, fmooth, with a deciduous fcaly bark, and numerous fcattered leafy *branches*, clothed with the permanent, rigid, briftle-like *footftalks*, dilated at their bafe. *Leaves* oppofite, crowded, pinnate, near an inch long, of three or four pair, with an odd one, of equal, linear, pointed, entire, revolute leaflets, fmooth, except fome deciduous hairs at the point. *Flowers* axillary, nearly feffile, fmall. We find *ftamens* and *piftil* in the fame flower, the former being permanent till the *fruit* is ripe, as is alfo the *ftyle*, which is curved, tipped with its white peltate *ftigma*.

MARGARITA, Francesca, de l'Epine, in *Biography*, an Italian finger, born in Tufcany, who came to England at the beginning of the laft century with a German mufician of the name of Greber, feems to have been one of the firft female Italian fingers who appeared on our ftage, before any attempt had been made at an Italian opera. June 1, 1703, in the theatrical advertifement for Lincolns-Inn-Fields, when the "Rival Queens" was promifed; it is faid that "Signora Francefca Margarita de l'Epine would fing, being pofitively the laft time of her finging on the ftage during her ftay in Enland." She continued, however, finging more *laft* and *pofitively laft times* during that whole month, and never quitted England, but remained here to the end of her life. In moft of the firft attempts at opera in England, fhe performed a capital part, till the year 1708, when, retiring from the ftage, fhe married Dr. Pepufch.

In 1704, fignora Margarita fings, for the firft time, at Drury-lane. At her fecond appearance there was a difturbance in the theatre while fhe was finging, which, from the natural and uncommon effects of rival malice, was fufpected to have been created by the emiffaries of Mrs. Tofts; an idea the more difficult to eradicate, as the principal agent had happened to live with that lady as a fervant. But as the law of retaliation is frequently practifed on the like occafions by the injured party, it was thought neceffary, a few days after, to infert the following paragraph and letter in the Daily Courant, Feb. 8, 1704: "Ann Barwick having occafioned a difturbance at the theatre-royal Drury-lane, on Saturday night laft, the fifth of February, and being thereupon taken into cuftody, Mrs. Tofts, in vindication of her innocency, fent a letter to Mr. Rich, mafter of the faid theatre, which is as followeth: Sir, I was very much furprifed when I was informed that Ann Barwick, who was lately my fervant, had committed a rudenefs laft night at the playhoufe, by throwing of oranges, and hiffing when Mrs. l'Epine, the Italian gentlewoman, fung. I hope no one can think that it was in the leaft with my privity, as I affure you it was not. I abhor fuch practices; and I hope you will caufe her to be profecuted, that fhe may be punifhed as fhe deferves. I am, fir, your humble fervant, Katharine Tofts.—To Chriftopher Rich, efq. at the theatre-royal, Feb. 6, 1704."

The rivalry of Mrs. Tofts, the favourite Englifh finger, at the beginning of the laft century, and the Margarita, and the zeal of their feveral friends, gave rife to the firft mufical feud which we hear of in this country. According to Hughes, author of the Siege of Damafcus, their abilities were difputed by the firft people in the kingdom.

"Mufic has learn'd the difcords of the ftate,
And concerts jar with Whig and Tory hate.
Here Somerfet and Devonfhire attend
The Britifh Tofts, and ev'ry note commend;
To native merit juft, and pleas'd to fee
We've Roman arts, from Roman bondage free.
There fam'd l'Epine does equal fkill employ,
While lift'ning peers croud to th' ecftatic joy:
Bedford to hear her fong his dice forfakes,
And Nottingham is raptur'd when fhe fhakes.
Lull'd ftatefmen melt away their drowfy cares
Of England's fafety, in Italian airs.
Who would not fend each year blank paffes o'er,
Rather than keep fuch ftrangers from our fhore."

From the connection between the Margarita and Greber, with whom fhe arrived in England, fhe became diftinguifhed by the title of *Greber's Peg*. When fhe quitted Greber, fhe commenced another connection with Daniel earl of Nottingham, to which Rowe alludes in an imitation of an ode of Horace, "Ne fit ancillæ tibi amor pudori."

"Did not bafe Greber's Peg inflame
The fober earl of Nottingham,
Of fober fire defcended?
That carelefs of his foul and fame,
To play-houfes he nightly came,
And left church undefended."

The earl had written againft Whifton on the doctrine of the Trinity.

An epigram, written by the earl of Halifax, is extant on the fame fubject.

On Orpheus and Signora Francefca Margarita.

"Hail, tuneful pair! fay by what wond'rous charms,
One 'fcap'd from hell, and one from Greber's arms?
When the foft Thracian touch'd the trembling ftrings,
The winds were hufh'd, and curl'd their airy wings;
And when the tawny Tufcan rais'd her ftrain,
Rook furls the fails, and dares it on the main.
Treaties unfinifh'd in the office fleep,
And Shovel yawns for orders on the deep.
Thus equal charms and equal conquefts claim,
To him high woods and bending timber came,
To her fhrub-hedges, and tall Nottingham."

The applaufe of the public, and admiration of individual partifans, were pretty equally beftowed on the two Sirens of the time, Mrs. Tofts and the Margarita.

The vocal merit of the Margarita muft have been very confiderable to have kept her fo long in favour as a finger on the Englifh ftage, where, till fhe was employed at the opera, fhe fung either in mufical entertainments, or between the acts, almoft every night. Befides being *out-landifh*, fhe was fo fwarthy and ill-favoured, that her hufband, Dr. Pepufch, ufed to call her *Hecate*, a name to which fhe anfwered with as much good humour as if he had called her Helen. But with fuch a total abfence of perfonal charms, our galleries would have made her fongs very fhort, had they not been executed in fuch a manner as to filence theatrical fnakes, and command applaufe.

Dean Swift, who was no refpecter of perfons, particularly mufical,

mufical, in his "Journal to Stella," letter xxiv. Auguft 6, 1711, being at Windfor, fays, "We have a mufic-meeting in our town to-night. I went to the rehearfal of it, and there was Margarita, and her fifter, and another drab, and a parcel of fiddlers; I was weary and would not go to the meeting, which I am forry for, becaufe I heard it was a great affembly." He talks frequently of the mufic-meeting this fummer and autumn at Windfor, but always with contempt—as, "in half an hour I was tired of their *fine fluff.*"

When the Margarita retired from the ftage, fhe is faid to have accumulated a fortune of 10,000*l.* After her marriage, fhe applied clofely to the practice of the harpfichord, upon which inftrument fhe became a great proficient; yet never could conquer Dr. Bull's variations to an old tune called "Walfingham," in queen Elizabeth's Virginal book, which was divided and fubdivided in a moft full and complicated manner thirty different ways; and feveral of Dr. Pepufch's friends and pupils, who went frequently to her apartments at the Charter-houfe, have affured us, that though this curious MS. was conftantly open upon Mrs. Pepufch's harpfichord-defk, fhe never advanced to the end of the variations; as feems likewife manifeft from the colour as well as wear and tear of the leaves, which are much more clean and entire in every other part of the book than at the firft ftrain of this compofition. This lady, who had made fo much noife in the world, left it very quietly in 1740.

MARGARITA *Philofophica*, the title of a mufical tract. See REISCHUSI.

MARGARITA, or *Margaretta*, in *Geography*, an ifland in the Caribbean fea, near the coaft of Terra Firma, difcovered by Columbus about the year 1498. It now forms one of the provinces belonging to the royal audience of Caraccas, eftablifhed in 1786; the other provinces being Venezuela, Maracaibo, Cumana, Varinas, and Guiana. The governor of Caraccas reprefents the monarch throughout thefe provinces; all the military departments being completely fubject to his orders, though on great occafions he confults a "Junta de Guerra," or council of war, compofed of the chief officers. Governors, however, are delegated for each province, who are appointed for five years, with a lawyer as an affeffor. The ifland poffeffes but few attractions; the foil is poor and produces only cotton. It has, however, a fmall garrifon, confifting of one company of regular troops, four of white militia infantry, one of artillery, one of cavalry, and four infantry companies of people of colour. On the firft difcovery of Terra Firma, a pearl-fifhery, which was the principal fource of the riches of the country, and of the revenues of the king, was carried on between the iflands of *Cubagua* (which fee) and Margarita, at the expence of the lives of a great number of Spaniards and Indians who perifhed in the bufinefs. The ifland is, perhaps, defirable as a military and commercial ftation; becaufe, as it is feparated from Terra Firma by a diftance of only eight leagues, and to windward of all her provinces, it might become under a fyftem of free commerce the general entrepot of Cumana, Barcelona, Caraccas, Guayra, and all the cities of the interior. This ifland alfo ferves to form the channel, that feparates it from Terra Firma, fometimes called "the Straits of Margarita." This channel is not navigable for the whole eight leagues of its width. The ifland of Coche, fituated in the middle, leaves the navigator a very narrow paffage two leagues from Margarita, through which he muft indifpenfibly pafs. Every veffel coming from windward, or from Europe to Cumana, to Barcelona, and even to Guayra, is obliged to run down the S. fide of Margarita. If this ifland were in the power of the enemies of Spain, all the commerce with Europe, all intercourfe with the neighbouring iflands would be fo much the more eafily intercepted, as thofe which endeavoured to avoid the channel would be taken by privateers, when Margarita would ferve as an arfenal. Befides, an enterprizing enemy would find in the fituation of Margarita means of eafily diverting expeditions againft any part of Terra Firma which he might wifh to invade. Through the whole coaft of this ifland there are but three ports; the firft and principal is "Pampatar" to the E.S.E.; the fecond, called "Pueblo de la Mar," is one league leeward of the preceding; and the third is on the N. fide, and therefore called "Pueblo del Norte" the village of the North. The capital city is "Affumption," built almoft in the centre of the ifland. The whole population of the ifland is 14,000 perfons, confifting of 5500 whites, 2000 Indians, and 6500 flaves and freed perfons. The principal riches of the inhabitants are derived from the pearl-fifheries eftablifhed in the ifland of Coche, in the middle of the channel. Thefe fifheries are carried on by the Indians of the ifland, who alfo take a number of turtles and an immenfe quantity of fifh, which they falt, and fell throughout the continent and neighbouring iflands. They fabricate at Margaretta thofe hammocks of cotton, whofe web is fo much fuperior to the hammocks manufactured in any other place. They alfo make very fine cotton ftockings, which are fold at a very dear rate. This ifland has alfo fo many parrots and curious birds, that no veffel leaves the ports of Margaretta without having a fmall cargo of them on board. The poultry raifed here becomes a refource for the poor, who fell their fowls and turkies to the foreign iflands. N. lat. 10° 56'. W. long. from Paris between 66 and 67°.

MARGARITA, (a rabbinical term), a white fpeck on the eye. See LEUCOMA.

MARGARITÆ. See PEARLS.

MARGARITARIA, in *Botany*, was fo named by Linnæus from the kernels of its berries being of a fhining white colour, and refembling pearls, margaritæ. Linn. Suppl. 66. Schreb. 694. Juff. 430. Mart. Mill. Dict. v. 3.—Clafs and order, *Dioecia Octandria*. Nat. Ord. uncertain, Juff.

Gen. Ch. Male, *Cal.* Perianth inferior, of one leaf, four-cleft, fmall, permanent. *Cor.* Petals four, roundifh, inferted into the calyx. *Stam.* Filaments eight, briftle-fhaped, fpreading, rather long, inferted into the receptacle; anthers roundifh, fmall. *Pift.* Germen fuperior, roundifh; ftyle briftle-fhaped, the length of the ftamens; ftigma obtufe.—Female, on a diftinct plant. *Cal.* Perianth as in the male, permanent. *Cor.* as in the male? *Pift.* Germen fuperior, globofe; ftyles four or five, thread-fhaped; ftigmas fimple, permanent. *Peric.* Berry globular, crowned with fpreading, fhort ftyles. *Seeds* ovate, compreffed on the inner fide, inclofed in a tunic of four or five lobes and as many cells, which is cartilaginous and highly polifhed.

Eff. Ch. Male, Calyx four-toothed. Petals four.

Female, Calyx and Corolla like the male. Styles four or five. Berry four or five-feeded, inclofed in a cartilaginous tunic.

1. *M. nobilis.* Linn. Suppl. 428. Syft Veg. ed. 14. 890. (Euonymus margaritifera pentacoccos americana; Pluk. Phyt. t. 176. f. 4)—Linnæus had feveral fpecimens of this plant, at different periods of its growth, fent by Dalberg from Surinam.— The *ftem* is fhrubby. What Linnæus conceives to be the male has oppofite, oval, large, veined, entire *leaves*, on footftalks. *Panicles* formed by compound clufters of fmall *flowers*. In the Female, the *branches* and *leaves* are alternate. *Stalks* fingle-flowered.

The

The *kernel* of the *berry* four or five-grained, remarkably ſhining and pearl-coloured.—There ſeems to be great reaſon for ſuppoſing that under theſe two ſexes of *Margaritaria*, very different plants are deſcribed, though ſent to Linnæus as different ſexes of the ſame ſpecies. At the end of his account of *M. nobilis*, as deſcribed in the *Supplementum Plantarum*, he appears ſomewhat to doubt whether their union be correct.

MARGARITIMA, in *Geography*, a town of European Turkey, in Albania; 34 miles W. of Arta.

MARGARITINI are glaſs ornaments, made at Venice of ſmall glaſs tubes of different colours, which are blown at Murano, and which the women of the lower claſs wear about their arms and necks. The larger ſort are uſed for making roſaries. This work is performed with great diſpatch, the artiſan taking a whole handful of thoſe tubes at once, and breaking them off one after another with an iron tool. Theſe ſhort cylinders are mixed with a kind of aſhes, and put over the fire in an iron pan; and when the two ends begin to melt, by ſtirring them about with an iron wire, they are brought to a round figure; but care is taken not to leave them too long over the fire, leſt the hole through which they are to be ſtrung, ſhould be entirely cloſed by the melting of the glaſs. There are ſeveral ſtreets at Franceſco di Vigna, entirely inhabited by people whoſe ſole occupation is to make and ſtring theſe margaritini. Keyſler's Travels, vol. iii. p. 301.

MARGATE, in *Geography*, a market-town in the juriſdiction of the liberties of Dover, and county of Kent, England, is ſituated on the ſea-coaſt, at the northern extremity of the Iſle of Thanet, 16 miles diſtant from Canterbury, and 72 N.E. of London. Though now one of the moſt faſhionable and beſt frequented watering-places in the kingdom, it has only obtained its principal celebrity within the laſt fifty years, before which it was a ſmall fiſhing-town, irregularly built, and the houſes generally old and low. Its antiquity, however, is much more conſiderable: it has been a member of the port and town of Dover from a remote period; in Leland's time there was a pier "here for ſhyppes, but ſore decayed." When the ſurvey of maritime places in Kent was made in the eighth year of queen Elizabeth's reign, the number of houſes in "Margate was 108; boats and other veſſels, fifteen of various burthens, from one ton to eighteen; the perſons belonging to theſe veſſels, occupied in carrying grain and fiſhing, ſixty." Where the pier is now built, there was anciently a ſmall creek, which probably gave origin to the town, from the ſhelter it afforded to fiſhing-veſſels and other craft. The land on each ſide of the creek was progreſſively waſhed away by the ſea; and the inhabitants were obliged to conſtruct a pier to prevent the town from being overflowed, and to defend that part of it which lies next the water. This pier was at firſt very ſmall, and extended but a little way from the land; but the encroachments of the ſea rendered it neceſſary to enlarge it. In queen Elizabeth's time it was maintained by certain rates paid on corn and other merchandize, which were either ſhipped or landed here: but, through the neglect of the perſons employed, theſe rates were neither duly collected nor applied, and the pier went gradually to decay. By an act of parliament, (11 Geo. I.) theſe payments, and the application of them, were enforced, and the pier maintained till the year 1787, when another act was obtained, under which the pier has been re-built with ſtone, and extended ſo as to enlarge the harbour, and form a more complete ſecurity for ſhipping. To provide ſecurity to this harbour, and conſtruct a pier in a permanent manner, have frequently been but unſucceſsfully attempted: it is confidently expected that theſe important ends will be at length accompliſhed under the able and ſcientific direction of John Rennie, eſq. engineer.

The improvement of the harbour, and the great reſort of company to this coaſt, have occaſioned a conſiderable increaſe in the number of fiſhing and other craft belonging to this port; ſo that the town is not only ſupplied with fiſh for its own conſumption, but great quantities are continually ſent to the metropolis. The whole number of packets, hoys, boats, &c. which now belong to Margate, is about ſeventy. Among the articles imported, are coals from Newcaſtle and Sunderland, and deals, hemp, tin, iron, &c. from Memel and Riga.

Margate is a large and ſcattered place; it is built on irregular ground; part of it being very elevated, while the other part is ſituated in a bottom, cloſe to the ſea-ſhore. The houſes are principally of brick, and many of them are large and commodious. The general recommendation given by medical men to ſea-air and ſea-bathing, and alſo the faſhionable propenſity of ſpending ſome portion of the year at a watering-place, have been the grand cauſes of the extenſion and progreſſive improvements of the town. As the number of viſitors increaſed, the buildings for their accommodation were rapidly augmented, the landholders rightly judging that the ſpeculation would be ſucceſsful. Two handſome ſquares have been formed; various new ſtreets and ranges of houſes have been raiſed, and ſcarcely a year paſſes without ſome additions being made. The amuſement as well as the accommodation of the viſitors have been provided for by the erection of hotels, lodging-houſes, &c. At the ſouth corner of Cecil-ſquare are the aſſembly rooms, which form a ſpacious building of the Ionic order, with Venetian windows, entablature, and cornice; on the ground-floor are a billiard-room and a coffee-room, ſeveral dining-parlours, and a piazza ſupported by a range of duplicated Doric columns. On the firſt-floor are the tea, card, and ball-rooms; the latter is a very elegant apartment, eighty-ſeven feet in length, and forty-three in breadth: five large elegant glaſs chandeliers are ſuſpended from the cieling. Near the eaſt corner of Hawley-ſquare is the theatre-royal, a ſpacious ſtructure, erected in the year 1787, at the expence of 4000*l.* The exterior is plain; but the interior is highly ornamented: the time of acting is reſtricted to the ſeaſon. Other ſources of amuſement are found in ſeveral handſome and reſpectable libraries.

The bathing-rooms are ſituated on the weſtern ſide of the High-ſtreet, near the harbour. The bathing-place is a level ſandy ſhore, extending under the cliffs for ſeveral miles, and forming, at proper times of tide, a pleaſant walk. But the moſt faſhionable promenade is the pier, which, being finiſhed by a parapet breaſt high, is perfectly ſafe, and is the general reſort of the company.

Margate was anciently a chapelry to Minſter, but was made parochial in the year 1290. The church, a ſpacious edifice, ſtands on an elevated ſpot at the ſouth-eaſt ſide of the town; it conſiſts of a nave, chancel, and aiſles, with a ſquare tower at the north-weſt angle. The nave is divided from the aiſles by eight arches, ſpringing from octagonal and round columns; the latter have ornamented capitals in the Norman ſtyle. The monuments and braſſes within the walls are numerous, and ſeveral of them are of conſiderable antiquity. Beſides the church, here are four places of religious worſhip; one for Baptiſts, one for Roman Catholics, a third for the followers of Mr. Weſley, and the fourth, called Zion-chapel, on the eſtabliſhment of the late counteſs of Huntingdon. The principal charitable inſtitutions are a general ſea-bathing infirmary, eſtabliſhed in 1792; Draper's hoſpital, or alms-houſes for widows, erected in 1709, purſuant to the will of Michael Yoakley, a Quaker; and a charity-

charity-school, built in 1787, for forty boys and forty girls.

There appears to have been a market kept here in the time of Charles I., of which a monthly return was made to Dover; but this was soon discontinued. Well-supplied markets are now held on Wednesdays and Saturdays, under a grant made in the year 1777 to Francis Cobb and John Baker, then wardens of the pier, and their successors. Under the population act of 1800, the number of inhabitants of this parish was 4766, occupying 1115 houses: whereby it appears that the population has been nearly doubled since Lewis wrote his History of the Isle of Thanet, in 1723. A Picture of Margate, &c. 12mo. 1809. Hasted's History of Kent, 12 vols. 8vo. Brayley's Beauties of England, &c. vol. viii. 8vo. 1807.

About a mile distant from Margate is situated Dandelion, so named from the original possessor, Dent de Lyon, who came to England with William the Conqueror. There still remain four towers, and a fine antique gate-house, of the original building, composed of alternate layers of brick and flint. On a scutcheon the armorial bearing and name of the founder may still be seen. Here are a fine garden and bowling-green, whence there is a beautiful and extensive view of Margate roads, the sea, and shipping. In this garden public breakfasts, with music and dancing, are given twice a week during the season. They are under the regulation of the master of the ceremonies, and constitute one of the most agreeable and rational amusements of this place.

The country around Margate is very fertile, and peculiarly healthy. The probable reasons of the salubrity of the Isle of Thanet are detailed in the preface to Dr. Buchan's "Treatise on Sea-Bathing," which will be found an useful companion to all persons resorting to the sea-coast on account of their health.

MARGEN, in the *Materia Medica*, a name used by some of the later Greek writers to express red coral. It is founded on an error, however; the word *margen* being made from the Arabian *margian*, which does not signify coral, but a purple seawrack, or fucus, used in dyeing. See MARGIAN.

MARGENFELT, in *Geography*, a town of Prussia, in the province of Oberland; 11 miles S. of Olterrod.

MARGENGAW, a town of Prussia, in the province of Pomerelia; six miles N. of Marienburg.

MARGENSTEIN, in *Natural History*, a name given by the German writers to a sort of indurated marle, which, while in the strata, is nearly of the hardness of stone; but when laid on the surface of the earth, and exposed to the wind and rain, soon dissolves, and enters the pores of the ground, enriching the soil to a very great degree.

We have the same sort of stony marle in some parts of England, only that our's is less hard, and yet takes more time to break and dissolve in the air. They are both most proper for lands of a loose loamy nature, and keep them in heart a long time.

MARGGRABOWA, in *Geography*, a town of Prussia, in the Lithuanian department; 80 miles S.E. of Königsberg. N. lat. 53° 54'. E. long. 22° 47'.

MARGGRAF, ANDREW SIGISMOND, in *Biography*, a celebrated chemist, was born at Berlin in the year 1709, where his father was apothecary to the court, and assessor of the college of medicine. Thus situated from his early years, his attention was naturally turned to the pursuits of chemistry and pharmacy, for which he imbibed a taste, which he afterwards cultivated with great industry under the celebrated professor Neumann, during a period of five years, and subsequently under professor Spielmann, at Strasburg. In 1733, he went to the university of Halle, where he became a pupil of Hoffmann in the study of medicine, and continued his chemical pursuits under the direction of Juncker, to which last science he ultimately devoted his sole attention. For the purpose of obtaining practical information on the subject of mineralogy, he resorted to Freyberg, in Saxony, in 1734, where Dr. Henckel was then in high reputation in that department of natural history; and he practised the art of assaying under Susmilch. In the following year he visited the Hartz mines, and then returned to Berlin, where, by a close and incessant application to his chemical labours, he so materially injured his health, that it was never afterwards vigorous. He passed the remainder of his life in his native city, notwithstanding an offer of the place of ducal apothecary to the duke of Brunswick, with a department in the mines, which was made to him in 1737 by that prince, but which he did not deem sufficiently advantageous to induce him to leave Berlin. In 1738, he was received into the Society of Sciences, and furnished some memoirs for the "Miscellanea Berolinensia;" and when this society was renovated in 1744, as the Royal Academy of Sciences and Belles Lettres, he was placed in the class of experimental philosophy, of which he was chosen director in 1760. He had also the high gratification of being entrusted with the laboratory of the academy in 1754, in which he almost lived, absorbed in the study or practice of his favourite art. He was, nevertheless, a man of great amenity of temper and considerable conviviality, when mixing in the society of his friends. He had been for some years liable to spasmodic affections, and, in 1774, was attacked with apoplexy, which left a paralysis behind it. He continued, however, to attend the meetings of the academy till the autumn of 1776; after which his mental and bodily powers gradually declined, and he died in August, 1782.

Marggraf was held in considerable estimation as a chemist throughout Europe, and had the honour of being elected a member of several learned bodies. All the writings which he produced were published in the Memoirs of the Literary Society of Berlin, before and after its renovation; but they have been collected and published both in German and French. They contain the details of a great number of processes and analyses, described in clear and simple language. Some of the most important of his discoveries relate to phosphorus and its acid; to the reduction of zinc from calamine; to the fixed and volatile alkalies; to manganese, the Bolognian stone, platina, and the acid of sugar. In short, he is entitled to rank among the more accurate experimentalists, who contributed to the advancement of the science of chemistry, before the recent luminous improvements which it has gained. Gen. Biog. See also his Eloge in the Mem. de l'Acad. Roy. de Berlin.

MARG-GRAVE. See MARGGRAVE.

MARGIAN, in *Botany*, a name given by some of the ancient writers, particularly the Arabian physicians, to the plant called by others *argina*, or *arginem*. This is described to be a purple sea-plant. Some have supposed that cochineal was meant by this word, but that is an error. Others have come somewhat nearer, in supposing it to be the name of coral; but as the ancients have said that it was used in dyeing, it could not be coral; and indeed there is no other plant that it can mean, but that fucus used by the Greeks in dyeing, and called *fucus porphyrizon*, or the purple-dyeing sea-plant.

MARGIANA, in *Ancient Geography*, a country of Asia, along the river Margus, from which it derives its name. According to Ptolemy, it had Hyrcania on the W., on the N. Oxus, on the E. Bactriana, and on the S. Aria. The people who inhabited it were the Derbicæ, the Massagetæ, the Tassoni, the Parni, and the Daæ. Its towns were Ariaca,

Ariaca, Sina, Aratha, Argadris, Jafonium, Rhea, Antiochia, Guriano, and Niceai. Pliny gives us a very favourable notion of the fituation and fertility of this country. It now forms a part of *Khorafan*, which fee.

MARGIANI, in *Geography*, a town of Perfia, in the province of Comis; 25 miles N. of Biftan.

MARGIDUNUM, in *Ancient Geography*, a place of Great Britain, fituated, according to the fixth Iter of Antonine, between Verometum (near Willoughby) and Ad Pontum (near Southwell.) Dr. Stukeley places it at Bridgeford, but Mr. Horfley, and fome other antiquaries, fix it near Eaft Bridgeford.

MARGLINAN, in *Geography*, a town of Turkeftan, at the union of a river of the fame name with the Sirr; eight miles S. of Tafchkund.

MARGOT, a river and heights of America, fituated on the E. fide of the Miffifippi. The courfe of the river is wefterly, and it is faid to be navigable for batteaux for a number of miles. The ground below its junction with the Miffifippi, in N. lat. 35° 28′, affords a commanding, airy, pleafant, and extenfive fituation for fettlements: the foil is remarkably fertile.

MARGOT *Port*, a maritime village on the N. fide of the ifland of St. Domingo, in N. lat. 19° 48′, nine leagues W. of cape François.

MARGOZZA, a town of Italy, giving name to a lake near it; 40 miles N.W. of Milan.

MARGUARSTEIN, a town of Bavaria, on the Acha; 25 miles W. of Salzburg.

MARGUERITAS, ISLES *of*, iflands in the Mediterranean, near Ivica, one of which is large and near Pic Nono, which advances into the fea, in the form of a cone, covered with trees.

MARGUERITE, ST., an ifland in the Mediterranean, near the coaft of France, nine miles from Antibes. N. lat. 43° 31′. E. long. 7° 7′.

MARGUERITE, a river of America, which runs into lake Michigan, N. lat. 44° 2′. W. long. 85° 34′.

MARGUERITES, a town of France, in the department of the Gard, and chief place of a canton, in the diftrict of Nimes; four miles N.E. of Nimes. The place contains 2057, and the canton 6359 inhabitants, on a territory of $157\frac{1}{2}$ kiliometres, in eight communes.

MARIA, AVE. See AVE MARIA.

MARIA THERESA, in *Biography*, emprefs of Germany, and queen of Hungary, daughter of the emperor Charles VI. was born at Vienna in 1717, and married Francis of Lorraine, grand duke of Tufcany, in the year 1736. At the death of her father in 1740, fhe remained fole heirefs of the dominions of the houfe of Auftria, which had been affured to her by the Pragmatic fanction, guarranteed by almoft all the powers of Europe. The hope of defpoiling an unprotected female was, however, too great a temptation to be overcome by mere treaties, and claims were made on all fides to part or the whole of the inheritance. She, however, took quiet poffeffion of it, and ingratiated herfelf with all her fubjects. The ftorm firft broke upon Silefia, which Frederic II. of Pruffia feized. He foon fecured to himfelf the poffeffion of this rich province by a victory, and his fuccefs induced the court of France, in conjunction with the elector of Bavaria, to enter into the war. Unable to contend effectually with the combined forces, Maria Therefa haftily retired to Prefburg, where, affembling the ftates of the kingdom, fhe appeared with her infant fon in her arms, and made fuch an animating and affecting addrefs, that the nobles all drew their fabres, and folemnly fwore they would die in defence of the rights of their fovereign. A powerful army was raifed, which marched to Vienna, and fecured it from affault, fo that the enemy could only boaft of the capture of Prague, and of having been the means of crowning the elector of Bavaria king of Bohemia. He was, fhortly after this, by the influence of the French, elected emperor of Germany. England felt an intereft in behalf of the queen, and joined her as an ally, while individuals of almoft every rank opened their purfes in aid of her caufe. She prudently detached from the confederacy the king of Pruffia, by ceding to him Silefia, and fhe contrived likewife by other ceffions to detach the king of Poland, elector of Saxony, from the number of her enemies. Without attempting to detail the occurrences of this war, which involved moft of the powers of Europe, we may obferve, that Maria Therefa difplayed, through the whole of the conteft, a degree of firmnefs and vigour, which would have done honour to any fovereign; that fhe was crowned queen of Bohemia at Prague, in 1743, that fhe placed the imperial crown upon the head of her hufband in 1745, and that by the peace of Aix-la-Chapelle, in 1748, fhe was confirmed in the poffeffion of all her dominions, excepting Silefia, which remained in the hands of the king of Pruffia. On the reftoration of peace, the emprefs queen, the title by which fhe was ufually known, turned her attention to the improvement of her dominions, by encouraging commerce and the ufeful arts. New ports were opened, and new fources of trade explored; canals were formed and manufactures eftablifhed; fchools and public libraries were founded, and a college for the fciences was inftituted at Vienna. This and a multitude of other acts bore witnefs to the zeal and intelligence with which this fovereign and her minifters purfued the great objects of public good. People are always grateful for the beneficent acts of their governors, and it was impoffible for love and veneration to be carried farther than thofe which were infpired by a fovereign, who, to female beauty and gentlenefs, added mafculine dignity and excellence. The court of Vienna could not brook the lofs of Silefia, and, in revenge, it inftigated a confederacy againft Frederic, with the view of depriving him of his conquefts, and perhaps of defpoiling him of a part of his hereditary dominions. For this purpofe an alliance was formed of the emprefs-queen, the emprefs of Ruffia, and the king of Poland as elector of Saxony; Frederic difcovered their plan and thwarted it. Soon after this the houfe of Auftria joined France in an attack upon the king of Pruffia, who was able to make a treaty with England. Frederic ftruck the firft blow and carried his arms into Bohemia, which was the commencement of what is generally called the feven years' war. The junction of Ruffia with his other enemies brought Frederic to the brink of ruin. He was, however, faved by his own great and almoft unparalleled efforts, and the treaty of 1763 confirmed him in the poffeffion of Silefia, and reftored Germany to its former political ftate. The only advantage gained by the emprefs-queen, was the election of her fon Jofeph to the fucceffion of the empire as king of the Romans. In 1765, fhe loft her hufband, the emperor Francis, with whom fhe had lived in conftant and affectionate union thirty years. So ftrong was her attachment to the memory, as it had been to the perfon of her hufband, that fhe ever after wore mourning, and paid frequent vifits to his tomb. In 1772, a plan was laid for the firft difmemberment of Poland, to which it was with the utmoft difficulty that the confent of Maria Therefa could be obtained. Her fon Jofeph, fixed on the object, and knowing her failings, addreffed to her the argument of religion, which fubdued her fcruples, that were unqueftionably founded in rectitude, and ought not

 to

to have been ſubverted. From this period ſhe did not interfere much in the management of public affairs, though ſhe did not heſitate to check the innovations of her ſon, eſpecially thoſe which went to the abolition of convents, and other changes in the church eſtabliſhment. She died at Vienna, in the autumn of the year 1780, at the age of ſixty-three, conſoling herſelf in her laſt moments with the purity of her intentions in all her conduct, and with the idea of having merited the honourable title of the "mother of her people." She left a numerous progeny, of whom one ſon Joſeph II. was emperor; another the grand-duke of Tuſcany; one daughter queen of France, another of Naples; "happy" ſays Dr. Aikin "that ſhe could not look into the awful ſecrets of futurity." A warm attachment to the duties of her religion was a prominent feature in her character; in ſome inſtances, perhaps, her zeal approached the borders of bigotry and intolerance; it muſt, however, be allowed, that her conduct in general diſplayed all the ſalutary influence of religious principles, and that as a wife, a mother, and a ſovereign, ſhe has had few equals upon the throne. Hiſt. of France. Gen. Biog. London 1790.

Maria, in *Ancient Geography*, a town of Italy, in Venetia; ſituated on the Padus, towards the S.E., and very near Hadria.

Maria, in *Geography*, a river of America, which runs into the Miſſiſippi, N. lat. 37° 37'. W. long. 90° 33'.—Alſo, a town of South America, in the province of Carthagena; 32 miles W. of Carthagena.—Alſo, a river of Honduras, which runs into the bay, N. lat. 15° 40'. W. long. 87° 15'.

Maria *Bay*, a bay on the N. coaſt of Tongataboo; ſeven miles W. of Obſervatory Point.

Maria, *St.*, a town of Tranſilvania; 12 miles S.E. of Hunyads.—Alſo, a town of Naples, in Lavora; 37 miles W. of Naples.—Alſo, a town of Iſtria; four miles N. of Monfalcone.—Alſo, a town with a convent of Hungary; ſix miles N. of Roſenburg.—Alſo, one of the Tremiti iſlands, now called "St. Nicolo."—Alſo, a ſea-port of the Ligurian Republic, in the gulf of Spezza; four miles S. of Spezza. N. lat. 44° 6'. E. long. 9° 42'.—Alſo, a ſmall iſland near the coaſt of Chili. S. lat. 37° 10'.—Alſo, a town of Braſil, in the government of Maranhao; eight miles N.E. of St. Felipe.—Alſo, a town of Mexico, in the province of Mechoacan; 32 miles S. of St. Luis de Potoſi.—Alſo, a town on the W. coaſt of the iſland of Mindanao. N. lat. 7° 33'. E. long. 122° 18'.—Alſo, a ſmall iſland in the Grecian Archipelago, near the N.E. coaſt of Paros.—Alſo, a town of New Mexico; 40 miles S. of Santa Fé.—Alſo, a town of New Navarre; 210 miles S.S.E. of Caſa Grande.

Maria *della Alizza*, a town of Naples, in the province of Otranto; four miles E. of Gallipoli.

Maria *di Camarana*, *St.*, a town of Sicily, in the valley of Noto, at the mouth of a river on the S. coaſt; the remains of a city called "Camarana;" 28 miles S.E. of Alicete.

Maria *del Alto*, a town of Naples, in Otranto; two miles S.S.W. of Nardo.

Maria *Apolſano*, *St.*, a town of Naples, in Capitanata; three miles S. of Monte St. Angelo.

Maria *di Dotoli*, *St.*, a town of Naples, in Otranto; 15 miles S.E. of Motera.

Maria *della Gratia*, a town of Italy, in the department of the Mincio; five miles W. of Mantua.

Maria *la Garta*, *St.*, a ſmall iſland in the N. Pacific ocean. N. lat. 27° 50'. W. long. 149°.

Maria *della Gratice*, a town of Naples, in Calabria Citra; ſix miles N. of Scalea.

Maria *dell' Iſola*, a town of Naples, in the province of Bari; three miles N. of Converſano.

Maria *di Leuca*, *St.*, a town of Naples, in Otranto, on the ſea-coaſt near cape Leuca; the ſee of a biſhop; 18 miles S. of Otranto.

Maria *Palomba*, *St.*, a town of Naples, in Otranto; five miles E.N.E. of Matera.

Maria *della Serra*, *St.*, a town of Naples, in Calabria Ultra; 11 miles E. of Nicaſtro.

Maria *de Iguazu*, *St.*, a town of Paraguay; 200 miles E. of Aſſumption.

Maria *de Iſquaude*, *St.*, a town of South America, in Popayan; eight miles N.W. of Barbacoa.

Maria *de Monte*, *St.*, a town of Italy; three miles E. of Friuli.

Maria *de Matamba*, *St.*, a town of Africa, capital of Matamba. S. lat. 9° 35'. E. long. 18° 34'.

Maria *de Darien*, *St.*, a town of South America, and capital of the province of Darien, on a river which runs into the bay of Panama. N. lat. 8° 4'. W. long. 78°.

Maria *del Gracia*, a town of Etruria; 31 miles E. of Florence.

Maria *Creek*, a river of the weſtern territory of America, which runs into the Wabaſh, N. lat. 38° 48'. W. long. 88°.

Maria, *Van Diemen*, *Cape*, the N.W. point of New Zealand. S. lat. 34° 30'. W. long. 187° 18'.

Maria *Zell*, a town of the duchy of Stiria; 12 miles N. of Pruck.

Maria's *Iſlands*, a cluſter of iſlands, near the ſouth part of New Holland, ſomewhat N.E. of Tannan's Head. S. lat. 43° 15'. E. long. 147° 46' to 148° 10'.

Maria, *Santa*, *Cape*, the N. cape at the mouth of La Plata river, in South America; 9 leagues from the bay of Maldonado, and 20 from Montevideo, a bay ſo called from a mountain which overlooks it.

Maria *Thereſa*, *Order of*, in *Heraldry*, a military order, which was inſtituted by the empreſs queen on the 18th of June, 1757, and compoſed of two claſſes, *viz.* Grand Croſſes and Knights. To theſe the emperor Joſeph II. in the year 1765 added an intermediate claſs, under the appellation of Commanders. The number of knights is not fixed, and the emperor is grand maſter. The badge of the order is a croſs of gold, enamelled white, edged with gold; on the centre are the arms of Auſtria, *viz.* gules, a feſſe argent encircled with the word Fortitudini; on the reverſe is a cypher of the letters M. T. F. in gold, on an enamelled green ground. The badge is worn pendent to a ſtriped crimſon and white ribbon.

MARIAGALANTE, in *Geography*. See Marie-galante.

MARIAGER, a ſea-port town of Denmark, in North Jutland, ſituated on a gulf which communicates with the Cattegat, called "Mariagerfiord." Its principal trade conſiſts in ſtone and lime; 22 miles E.N.E. of Wiborg. N. lat. 56° 43'. E. long 9° 53'.

MARIALVA, a town of Portugal, in the province of Beira; 16 miles N.E. of Pinhel.

MARIAM, a town of Abyſſinia; 100 miles E.S.E. of Gondar. N. lat. 11° 2'. E. long. 33° 34'.

MARIAME, in *Ancient Geography*, an epiſcopal town of Phœnicia, the ſovereignty of which was confirmed by Alexander the Great to Garaloſtratus, king of Arad.

MARIAN, or Marianne, *Iſlands*, in *Geography*. See Ladrones.

MARIANA,

MARIANA, Juan de, in *Biography*, a celebrated historian, was born at Talavera in 1536. He was an illegitimate child of Juan Martinez de Mariana, afterwards canon and dean of the collegiate in that town. He received an excellent introductory education, and was ſent at a proper age to Alcala, an univerſity of conſiderable reputation. Soon after this Ignatius Loyola ſent miſſionaries into Caſtile to eſtabliſh his order there, and Mariana, who was only in his ſeventeenth year, joined them. At the age of twenty-four he was appointed to the profeſſorſhip of theology at the great college lately eſtabliſhed at Rome. Here he lectured four years, and had among others the famous Bellarmine as one of his pupils. From Rome he went to Sicily to open a courſe of theology which the company had begun there. After a reſidence of two years in that iſland, he was ſent to Paris in the ſame capacity, where for five years he publicly expounded Aquinas, and the degree of doctor was, on account of his great learning, conferred upon him. Not having his health at Paris, he obtained permiſſion to reſign his chair and retire to Toledo, where he was elected to various high offices in the church, and was employed by the archbiſhop in forming a catalogue of prohibited books, and the Index Expurgatorius, which was publiſhed in 1584. About this time he bore a part in the edition of St. Iſidore's works, and incurred ſome ſuſpicion by the freedom with which he eſpouſed the cauſe of Arias Montanus. Mariana had long aſpired to be the hiſtorian of his own country, and in the little leiſure which his ſuperiors left him, he followed the indications of his genius. "Nature," ſays his biographer, "had deſigned him for ſomething better than to expound Thomas Aquinas, and to emaſculate books for the inquiſition. The reſult of his labours appeared in 1592, in a work under the title of "Hiſtoriæ de Rebus Hiſpaniæ Libri xx." It was afterwards extended to thirty books: the moſt complete edition is that of Mentz. The hiſtory comes down to the end of Fernando's reign, the author being fearful of coming nearer to his own times, leſt he ſhould give offence by ſpeaking the truth. The work is in high eſtimation, and it is ſaid that they who read the hiſtory of Spain for entertainment will always read it in Mariana; he is the hiſtorical claſſic of his country. In 1509 he publiſhed his treatiſe "De Rege et Regis Inſtitutione," which was burnt by order of the parliament of Paris. He was author of many other works, the titles of ſeveral of which are enumerated in the "General Biography," ſome of theſe, *viz.* "De Morte et Immortalitate;" and "De Monetæ Mutatione," expoſed him to perſecution, impriſonment, and to thoſe evils that ever attach to a man, whom the higher powers, whether juſtly or unjuſtly, chooſe to ſuſpect. Mariana had, however, a mind not to be borne down by the weight of authority, and could in that privacy and retirement into which he was driven, give up all his powers in the purſuit of ſcience and literature. His laſt publication conſiſted of Scholia upon the Old and New Teſtament, with an elegiac verſion of the Proverbs, Eccleſiaſtes, and Solomon's Song. He died at Toledo on the 16th of February, 1623. "The Jeſuits," ſays Mr. Southey, "have often maintained the rights of the people for the ſake of their own order: this was not Mariana's caſe: his views were of a wider range; he thought of mankind, not of the company."

Mariana, in *Ancient Geography*, a town and Roman colony of Corſica, eſtabliſhed by Marius: it was epiſcopal, and its ruins now bear its name. It is now the ſee of a biſhop; 16 miles S. of Baſtia.

Mariana, in *Geography*, a town of Italy, in the Veroneſe; 8 miles N.N.W. of Verona.—Alſo, a town of Italy, in the department of the Mincio; 15 miles S.W. of Mantua.

MARIANDYNI, in *Ancient Geography*, a people of Aſia, in Bithynia, or extending from Bithynia to Paphlagonia, on the banks of the gulf of Sangarus. Herodotus (l. i. c. 28.) reckons them among the nations ſubdued by Crœſus.

MARIANKA, in *Geography*, a town of Poland, in Volhynia; 44 miles N.N.W. of Zytomiers.

MARIANNA, the name given to a diſtrict of America, granted by the Plymouth council to Capt. John Maſon in 1621. It extended from the river Naumkeag, now Salem, round cape Ann to Merrimack river, and from the ſea to the heads of theſe rivers, with the iſlands lying within three miles of the coaſt.

MARIANO, a town of Italy, in the department of the Olona; 12 miles N. of Milan.

MARIANOPOLI, or Mariupol, a ſea-port town of Ruſſia, on the borders of the ſea of Azof, between the rivers Myus and Calmius. This town, as well as Kherſon or Cherſon, and Catharinenoluf, together with the numerous villages, which have riſen into ſome degree of importance in a country formerly inhabited only by lawleſs banditti, or traverſed by roving hordes, are filled with Ruſſians, with Tartars reclaimed from their wandering life, and with numerous coloniſts, particularly Greeks and Armenians, who migrated from the adjacent provinces of the Turkiſh empire. N. lat. 47°. E. long. 37° 44′.

MARIANOU, a town of Poland, in the palatinate of Braclaw; 48 miles W. of Braclaw.

MARIAQUACO, a town of Braſil, on the river of the Amazons; 36 miles W. of Pauxis.

MARIAS Islands, three iſlands in the North Pacific ocean, occupying a ſpace of about 42 miles. The moſt northern, which is the largeſt of the group, is about 13 miles long in a S.E. by E. and N.W by W. direction, the direction in which the iſlands lie from one another, and about 9 miles broad. It is higheſt towards the S., and gradually deſcends, terminating in a long low point at its N.W. extremity. Its ſhores are compoſed, particularly on the S.W. ſide, of ſteep white rocky cliffs, which kind of ſubſtance forms its principal component part. Notwithſtanding a low kind of ſhrub, with which it is partially covered, it preſents but a dreary and unproductive ſcene. Its S.E extremity terminates alſo, after a deſcent from the ſummit of the iſland, in a low projecting point, with rocks lying from it, as on the oppoſite extremity. On either ſide is a ſmall bay, that on the E. ſide being bounded by a beach, compoſed alternately of rocks and ſand, and affording, by Capt. Vancouver's ſoundings in its vicinity, good anchorage, and protected againſt the general prevailing winds. Between this iſland and the ſecond of the group, called by Dampier "Prince George's iſland," is a paſſage about ſix miles wide, with ſoundings of 20 to 30 fathoms, and ſandy bottom. The S.W. ſide of this latter iſland is bounded by detached rocks, ſome of which deſcend from the centre of the iſland and terminate at the water ſide, in a fine ſandy beach. This iſland abounds more with vegetable productions than the other, but it did not ſeem to afford any ſtreams of freſh water. In ſize and direction Prince George's iſland is next to the former, being about 24 miles in circuit; and the third, or ſouthernmoſt, is about nine miles in compaſs. The moſt valuable production of Prince George's iſland is lignum vitæ, which it yields in great abundance, beſides ſome plants of the orange and lemon kind, and other thorny plants, which reach nearly to the edge of the water. Of birds this iſland

island has great variety, such as hawks, green parrots with yellow heads, parroquets, pigeons, and doves, and small birds of beautiful plumage; but no quadrupeds were seen. On the shores great numbers of fish were observed, and among them some very bold and daring sharks. A few snakes and guanoes were seen; but no traces of human visitors were perceived; though on shore some drift wood was found, which appeared to have been wrought with European tools. Capt. Vancouver's anchoring place lay in N. lat. 21° 28'. E. long. 253° 54'.

MARIASTAIN, a town of Austria; 14 miles S S.W. of Steyr.

MARICA, in *Botany*, an old name for something of the *Iris* kind. Ambrosinus thinks it a corruption of *Naronica*, which was derived from the Naro, a Dalmatian river, about whose banks the best Iris or Orris roots were plentifully produced. The name is retained by Schreber for the *Cipura* of Aublet. Mr. Gawler, now Ker, who has referred to this same genus some additional species, separated from *Iris*, *Moræa* and *Sisyrinchium*, properly follows Schreber in the name; but enquires, in Curt. Mag. p. 646, why *Cipura* was rejected. We presume that as Aublet has given no explanation of its meaning, and nothing is to be guessed from any part of his description, Schreber judged it, at any rate, a hybrid, if not a barbarous, name; and he was too critical a scholar, as well as too faithful a Linnæan, to admit such in general. How he would justify his own barbarous and uncouth *Bambusa*, for what Jussieu has properly called *Nastus*, we will not venture to guess. See BAMBUSA, NASTUS and CIPURA.—Schreb. 37. Willd. Sp. Pl. v. 1. 246. Mart. Mill. Dict. v. 3. Gawl. in Sims and Kon Annals of Bot. v. 1. 244. Curt. Mag. 654. Ait. Hort. Kew. ed. 2. v. 1. 122. (Cipura; Aubl. Guian. 38. Juss. 58. Lamarck Illustr. t. 30) Class and order, *Triandria Monogynia*. Nat. Ord. *Ensatæ*, Linn. *Irides*, Juss.

Gen. Ch. *Cal.* Spathas of one or two valves, single-flowered, enclosed in a common involucrum of two valves. *Cor.* superior, regular, in six deep spreading segments, united into a tube; the three inner alternate ones smaller. *Stam.* Filaments three, distinct, inserted into the mouth of the tube, very short; anthers oblong, erect, longer than the filaments. *Pist.* Germen inferior, oblong, obscurely triangular; style simple, triangular, its angles opposite to the stamens; stigmas three, longer than the style, variously shaped, more or less cohering in a triangular figure. *Peric.* Capsule oblong, bluntly triangular, coriaceous, of three cells and three valves, as if peeled at the top. *Seeds* numerous, in two rows, roundish, somewhat angular.

Eff. Ch. Corolla superior, in six deep segments; the three inner ones smallest. Stamens opposite to the three angles of the style.

Obs. Mr. Ker now includes in this genus some species with united filaments, which we agree with our late friend Mr. Dryander (in *Ait. Hort. Kew.*) in referring to *Sisyrinchium*; a measure justified, if we mistake not, by the habit of their flowers.

1. M. *Northiana*. Broad-stemmed Marica. Ker in Curt. Mag. t. 654. (Moræa Northiana; Andr. Repos. t. 255. M. vaginata; Redout. Liliac. t. 56.)—Stalk sword-shaped, winged.—Native of the Brazils. It was first known here in the collection of the Hon. Mrs. North, at Farnham castle, who procured it in 1789. The plant is now frequent in hothouses, flowering in spring and summer, being much admired for the beauty of its short-lived petals, whose bases are all elegantly mottled with yellow and deep brownish orange, while the limb of the larger ones is white, of the smaller blue. The *root* is tuberous, with many fibres, and perennial. *Leaves* radical, sword-shaped, dark green, ribbed, two or three feet high. *Flower-stalk* much resembling the leaves, about as tall, though rather narrower, oblique, bearing several successive fragrant *flowers*, about two inches in diameter, from a lateral sheath near the top, sometimes viviparous.

2. M. *martinicensis*. Yellow Martinico Marica. (Iris martinicensis; Linn. Sp. Pl. 58. Jacq. Amer. t. 7. Willd. Sp. Pl. v. 1. 238. Curt. Mag. t. 416. Redout. Liliac. t. 172.)—Stalk round. Leaves linear, flat.—Jacquin found this species in moist meadows among the hills of Martinico, flowering in November and December. Mr. Alexander Anderson sent it from St. Lucia to Kew in 1782. It blooms in the stove with us about May or June, and is perennial; but bearing only small flowers, of an uniform yellow, is not particularly esteemed. The late Mr. Curtis has justly remarked its ill agreement with the character of an *Iris*, and its generic affinity to the foregoing. The *leaves*, however, are narrower, flat, and single-ribbed. *Stalk* slender, round, 12 or 18 inches high, with one or two concave distant *bracteas*. *Flowers* few, successive, very transient, inodorous, about an inch wide. It ripens seeds abundantly, which *M. Northiana* does not.

3. M. *paludosa*. Dwarf Marsh Marica. Willd. Sp. Pl. v. 1. 246. Curt. Mag. t. 646. (Cipura paludosa; Aubl. Guian. 38. t. 13.)—Leaves lanceolate, tapering at each end, plaited. Stalk round. Inner segments of the corolla erect, concave, half the length of the outer.—Native of moist meadows, called savannahs, at the foot of the mountains in Guiana. Mr. A. Anderson sent it from St. Lucia to Kew in 1792. The plant is perennial, flowering in the stove from June to August. Its *leaves* are about a foot high, deep green, lanceolate, tapering much at each end, strongly plaited on each side the midrib. *Flower-stalk* radical, very short, simple, bearing a small tuft of successive, short-lived, white *flowers*, accompanied by a few sheathing scales, and surmounted by a long leafy *bractea* equal to the leaves. The three inner segments of the *corolla* are erect or convoluted, but half the length of the rest, concave, a little recurved at their summits, and tipped with green, so that the whole flower recals the idea of a Snowdrop.

4. M. *plicata*. Small-flowered Marica. Ker in Curt. Mag. t. 655. (Moræa plicata; Willd. Sp. Pl. v. 1. 243. Swartz. Ind. Occ. 82. M. palmifolia; Jacq. Ic. Rar. t. 227. Sisyrinchium palmifolium; Cavan. Diss. 348. t. 19. f. 1. Bermudiana palmæ folio, radice bulbosa; Plum. Ic. 35. t. 46. f. 2.)—Leaves elliptic-lanceolate, with numerous ribs and plaits. Stalk round. Segments of the corolla all nearly equal in length.—Native of Cayenne and the West Indies. Miller is said, in Hort. Kew. ed. 1. v. 3. 305, to have cultivated it at Chelsea, in 1739. Linnæus had specimens, which he confounded with his true *Sisyrinchium palmifolium*, which has a winged stalk, and a dense corymbose tuft of many flowers. We have it not in any of our gardens. *M. plicata* is a tender stove plant, with much broader and more elliptical *leaves*, whose ribs and plaits are much more numerous than *M. paludosa*. The *stalk*, moreover, is almost as tall as the leaves, and the *bractea* proportionably smaller. The *flowers* are small and white, distinguished by all their segments being nearly of equal length, and obovate, though the three innermost are rather the narrowest. They have little beauty to attract general admiration or care.

Mr. Ker comprehends under this genus of *Marica*, besides the above, the *Sisyrinchium palmifolium*, Linn. Mant. 122. Willd.

Willd. Sp. Pl. v. 3. 579, of which no figure, as far as we know, exifts; and the *S. ftriatum*, Sm. Ic. Pict. t. 9. Willd. ibid. 580; though he obferves, in the Annals of Botany, v. 1. 246, that *Sifyrinchium* differs from *Marica* in having united filaments and nearly round (or globofe) capfules. Now we can pofitively affert that the latter fpecies anfwers to this character, befides having the corolla of a *Sifyrinchium*. Its filaments compofe a firm columnar tube, nearly to their very top. As far as we can judge by the fpecimen of *S. palmifolium*, its germen and corolla agree exactly with the *ftriatum*, and we cannot doubt its belonging, as Willdenow obferves, Sp. Pl. v. 1. 244, to the fame genus. A winged or two-edged ftalk feems proper to *Sifyrinchium*. S.

MARICA *Silva*, in *Ancient Geography*, a foreft of Italy, in Campania, which was fituated in the vicinity of the town of Minternæ, towards the mouth of the river Liris.

MARICABAN, in *Geography*, one of the fmaller Philippine iflands, near the S. coaft of Luçon. N. lat. 13° 52'. E long. 120° 56'.

MARICELLO, a town of Naples, in the province of Bari; 6 miles N.W. of Gravina.

MARICHI, in *Hindoo Mythology*, is deemed by fir William Jones, in his differtation on the chronology of the Hindoos, Afiatic Refearches, vol. ii. to be a perfonification of *light*. In the wild theogonies of that poetical race he is made the offspring of Brahma, and father of Kafyapa, the prolific parent of Surya, or the fun, and many other divinities. See KASYAPA, in the feventh line of which article for *all* read *ufe*.

MARICI, in *Ancient Geography*, a people of Italy, in the vicinity of the *Loevi* (which fee), who inhabited a tract now called "Pavefan," watered by the Tefino and the Po.

MARICOLAM, in *Geography*, a town of Hindooftan, in Cochin; 20 miles N.N.E. of Cranganore.

MARI-DSAKE', a lake of Thibet, about 30 miles in circuit. N. lat. 34° 22'. E. long. 88° 50'.

MARIDUNUM, in *Ancient Geography*, a town of the ifle of Albion, belonging to the Demetæ, and fuppofed to have been fituated where Caermarthen, in South Wales, now ftands.

MARIE, STRAITS *of*, in *Geography*, connect lakes Superior and Huron. Near the upper end of thefe ftraits, which are 40 miles long, is a canal navigable by boats. The ftraits afford a pleafing view of various iflands.

MARIE, *St.*, a town of France, in the department of the Lower Pyrenees, feparated from Oleron by a river, and connected with it, at the diftance of two miles, by a bridge of ftone.

MARIE, *St.*, a town on the N.W. coaft of the ifland of Martinico.

MARIE *d'Arnci*, *St.*, a town of France, in the department of Mont Blanc; 15 miles N.W. of Chambery.

MARIE *de la Mer*, *St.*, a town of France, in the department of the Eaftern Pyrenees, near the coaft of the Mediterranean; nine miles E.N.E. of Perpignan.

MARIE *aux Mines*, a town of France, in the department of the Upper Rhine, near which are mines of filver and lead; four miles N.W. of Colmar.

MARIE *du Mont*, a town of France, in the department of the Channel; four miles N. of Carentan.

MARIE, *Cape Dame*, the W. point of the ifland of St. Domingo, which, with Cape Nicholas, forms the entrance of the bay of Leogane. N. lat. 18° 38'. W. long. from Paris 76° 51'. The town of this name, fituated on the Cape, is on the N.W. part of the S. peninfula; 8 leagues W. of Jeremies, and 60 W. of Port au Prince.

MARIE, a town of Hindooftan, in Malwa; 12 miles E. of Seronge.

MARIEBOE, a town of Denmark, in the ifland of Laaland, fituated near a lake abounding in fifh; 12 miles E. of Nafcow. N. lat. 54° 51'. E. long. 11° 32'.

MARIEFRED, a town of Sweden, in the province of Sudermanland, on a bay of the Mælar lake; 25 miles W. of Stockholm.

MARIE-GALANTE, an ifland in the Weft Indies, difcovered by Columbus in the year 1493, of a circular figure and about 42 miles in circumference. It was firft fettled by the French in 1647; and has fince been taken by the Dutch and by the Englifh, but reftored to the French by the Englifh in 1763. This ifland affords a confiderable quantity of tobacco; and contains many grottoes in which are found large crabs, and alfo feveral rivers as well as ponds of frefh water. It is flat on the weftern fhore, and the foil is fit for cultivation. At the time of its laft reduction by the Englifh the annual manufacture of fugar amounted to 1000 hogfheads. N. lat. 16°. W. long. 61° 6'.

MARIENBERG, a town of Saxony, in the circle of Erzgeberg, which has in its vicinity mines of filver, cobalt, iron, vitriol and fulphur. It has a manufacture of fine lace, and a medicinal bath; 34 miles S.W. of Drefden. N. lat. 50° 36'. E. long. 13° 0'.

MARIENBURG, a town of Ruffia, in the government of Riga; 28 miles S. of Verro.—Alfo, a town of Tranfilvania, called alfo *Foldmar*; fix miles N. of Cronftadt. N. lat. 46° 2'. E. long. 45° 14'.—Alfo, a town of Pruffia, denominated alfo *Mallorg*, which is the capital of a prefecturate fituated on the Viftula. It was formerly the chief place belonging to the Teutonic knights. It was once and again taken by the Swedes; 24 miles S.E. of Dantzic. N. lat. 54° 3'. E. long. 18° 55'.—Alfo, a town of the bifhopric of Hildefheim; five miles S.E. of Hildefheim.

MARIENFELD, a town of Germany, in the bifhopric of Munfter; 11 miles E. of Warendorf.

MARIENGAUL, a town and lake of Ruffia, in the government of Polotfk; 40 miles N.E. of Rezitfa.

MARIENHAVE, a town of Eaft Friefland; nine miles N. of Embden.

MARIENSTERN, a town of Upper Lufatia; nine miles W. of Budiffen.

MARIENWALDE, a town of Brandenburg, in the New Mark; fix miles N.W. of Woldenberg.

MARIENWERDER, a town of Pruffia, in the province of Oberland, fituated on the fmall river called the *Leibe*, not far from the Viftula. This town, which was firft built in the year 1233 on a werder, or fmall ifland, called "Quidzin," but foon after rebuilt in its prefent fituation, was occupied by fome grand mafters of the Teutonic order. The cathedral, erected in the 13th century, is the largeft church in the kingdom of Pruffia, and feems by its ftrong breaft-works to have been intended for a fortrefs. The palace is a fpacious edifice, conftructed in the Gothic ftyle, and is furrounded by a pleafant country of varied furface. The inhabitants of this town carry on a confiderable trade with their neighbours. It has been often damaged by inundations, fire, and war. The famous league formed againft the knights of the Teutonic order was concluded here in 1440; 35 miles S. of Dantzic. N. lat. 53° 43'. E. long. 18° 42'.

MARIENZELL, a town with a convent in the archduchy of Auftria; the convent has a celebrated image of the Virgin; fix miles W.S.W. of Baden.

MARIES, St., La, a town of France, in the department of the Mouths of the Rhone, on an ifland formed by the divided ftream of the Rhone, near the fea; 16 miles S. of Arles. N. lat. 43° 27′. E. long. 5° 31′.

Maries, *Three*, three defert iflands in the Pacific ocean, near the weft coaft of Mexico; the largeft of which is about 21 miles in circumference. They abound in hares, guanocs, pigeons, &c., and the coafts with turtles and fifh. N. lat. 21° 30′.

MARIESTADT, a town of Sweden, in Weft Gothland, built by Charles IX. on the rivulet Tidla, where it falls into the Wenner lake. The houfes are moftly built of wood, and painted of a red colour; 80 miles N.E. of Gotheborg. N. lat. 58° 27′. E. long. 13° 38′.

MARIETTA, a town of America, in the ftate of Ohio and county of Wafhington, fituated at the confluence of the Mufkingum with the Ohio. It is laid out, on a delightful plain formed by the banks of the two rivers, into 1000 houfe-lots, with 90 feet in front by 180 feet in the rear, with fuitable open fquares, referved for ufe, ornament and pleafure. Its ftreets interfect one another at right angles. It derives its name from Marie Antoniette, the late queen of France, and was fettled in April 1788, and incorporated in 1800. In 1803 it contained 550 inhabitants and 91 dwelling-houfes, befides eight merchants' ftores, 19 buildings occupied by public officers and mechanics, three rope walks, a gaol, a court-houfe, and an academy ufed as a place of worfhip. This town is rapidly increafing in population, wealth, and elegance. Its fituation is delightful; it is environed by high hills, fome of which are covered with trees, and others afford excellent ftone for building. The vales and lower grounds are extenfive and very fertile. Within the limits of the town are thofe ancient forts, on the bank of the Mufkingum, which have furnifhed the curious with fubjects of diligent inveftigation. N. lat. 39° 25′. W. long. 81° 30′. Harris's Tour.

MARIGNANO, a town of Italy, in the department of the Olona; 11 miles S.E. of Milan.

MARIGNIA, in *Botany*, a name given by Commerfon to a fort of baftard rofin tree, of the Mauritius, which Juffieu reduces to *Burfera*, though it has five petals and ten ftamens, with a coriaceous, not pulpy, fruit. See Bursera.

MARIGNY, in *Geography*, a town of France, in the department of the Channel, and chief place of a canton, in the diftrict of St. Lô; fix miles W. of St. Lô. The place contains 1260, and the canton 7918 inhabitants, on a territory of 102½ kiliometres, in 12 communes.—Alfo, a town of France, in the department of the Indre and Loire; 15 miles S.W. of Chinon.—Alfo, a town of France, in the department of Mont Blanc; 20 miles S.S.E. of Geneva.

MARIGONDON, a town fituated on the W. coaft of the ifland of Luçon. N. lat. 13° 8′. E. long. 123° 20′.

MARIGOT, a town of the ifland of Martinico; nine miles N.W. of Cul de Sac de la Trinité.

MARIHABAG, a town on the E. coaft of Mindanao. N. lat. 8° 48′. E. long. 126° 12′.

MARIKINA, in *Zoology*, the name given by Buffon to the Simia *Rofalia*; which fee.

MARILA, in *Botany*, Swartz. Prod. 84. Schreb. 806. Mart. Mill. Dict. v. 3. This genus, confifting of a fingle fpecies only, *M. racemofa*, a Weft Indian fhrub, was adopted by Swartz from the manufcripts of Solander. The name feems taken from μαριλη, *live embers* or *fparks*; but we cannot tell whether it alludes to the "elegantly tranfparent" dots and lines in the foliage, or to the fparkling yellow pellicle and fringe which is faid to accompany the feeds. We are moft inclined to fuppofe the former; but the matter is of little importance, as this genus is reduced by Dr. Swartz himfelf, in his Fl. Ind. Occid. 963, to the *Bonnetia* of Schreber, which is Aublet's *Mahurea paluftris*. We think it not advifable to change the fpecific name of this laft, to the far lefs eligible one of *meridionalis*, though the other fpecies is likewife found in wet fituations.

Bonnetia being omitted in its proper place, we fubjoin its characters. This genus was fo called by Schreber, in honour of the celebrated Charles Bonnet of Geneva, who died in 1793, aged 73, and who has diftinguifhed himfelf by various phyfiological and fpeculative works in natural hiftory. His enquiries concerning the ufe of leaves entitle him to botanical commemoration, though he was no adept in the practical or fyftematic departments of the fcience. Schreb. 363. Willd. Sp. Pl. v. 2. 1213. Mart. Mill. Dict. v. 1. Swartz Ind. Occ. 963. (Marila, as above. Mahurea, fee that article.) Clafs and order, *Polyandria Monogynia*. Nat. Ord. *Columniferæ*, Swartz; uncertain, Juff.

Gen. Ch. *Cal.* Perianth inferior, of five oblong, concave, rather unequal leaves. *Cor.* Petals five, ovate, obtufe, concave, longer than the calyx, two of them rather larger and more fpreading than the reft. *Stam.* Filaments very numerous, inferted into the receptacle, fhorter than the corolla, thread-fhaped, a little dilated upwards; anthers oblong. *Pift.* Germen fuperior, oblong; ftyle thickifh, incurved, the length of the germen; ftigma obtufe, fomewhat capitate. *Peric.* Capfule oblong, columnar, of three or four cells, and three or four acute valves, whofe inflexed margins are inferted into the angles of the central column. *Seeds* very numerous, imbricated, minute, oblong, each enveloped in a fringed coloured membranous tunic.

Eff. Ch. Calyx of five leaves. Petals five. Capfule fuperior, of three or four valves, and as many cells. Seeds numerous, imbricated, each in a membranous coloured tunic.

1. B. *paluftris*. Vahl. Eclog. v. 2. 42. (B. meridionalis; Sw. Ind. Occ. 967. Mahurea paluftris; Aubl. Guian. v. 1. 558. t. 222.)—Leaves alternate Clufters terminal.—Native of marfhes in Cayenne and Guiana, flowering in Auguft, and bearing fruit in October. A *tree* of moderate fize, with a foft white wood. *Leaves* alternate, ftalked, oval, three or four inches long, entire, fmooth, veiny. *Flowers* racemofe, purplifh.

2. B. *racemofa*. Swartz Ind. Occ. 965. (Marila racemofa; Prod. 84.)—Leaves oppofite. Clufters axillary.—Native of the banks of rivers in the Weft Indies. A tall *fhrub*, with many *ftems*. *Leaves* eight or ten inches long, lanceolate, acute, finely veined, and full of pellucid dots and lines, which are beautifully confpicuous when feen againft the light. *Footftalks* half an inch long. *Stipulas* none. *Flowers* greenifh-white, in fimple axillary clufters, half as long as the leaves. *Petals* very fhort-lived. *Capfule* an inch long.

MARILHOSA, in *Geography*, a town of Portugal, in the province of Alentejo; 18 miles E N.E. of Mourao.

MARIM, a river of Brazil, which difcharges itfelf into the Atlantic, S. lat. 2° 25′. W. long. 44° 46′.

MARIMATA, a town of Arabia, in the province of Oman; 90 miles S.W. of Mafkat.

MARIN Fabrice, in *Biography*, a French compofer, who fet the fongs of Ronfard, Baif, Jamier, and Defpertes, in in four parts, which were printed and publifhed at Paris in 1578, by Adrian le Roy.

MARIN, *Monfieur, ci-devant compte*, a great dilettante mufician, and a performer on the Pedal-harp, in the moft fingular and mafterly ftyle, perhaps, at which any other performer on that inftrument ever arrived. His modulation, paffages, and ftrokes of genius in the mufic which he plays, whether written or extempore, feem the effufions of a bard infpired;

> "Who with a mafter's hand and prophet's fire,
> Strikes the majeftic concords of his lyre."

The whole of his performance is unlike any other mufic but the voluntaries of a great organift. It can only therefore be truly enjoyed by mafters and deep muficians. It may furprize, but cannot delight the public. It is not fo amiable, or indeed fo fit, for a female to attempt as the exquifite performance of madame Krumpholtz. But it fhews the extent of the inftrument's powers, as well as the performer's abilities, greatly to furpafs whatever was heard before, or thought poffible for genius and diligence to attain.

M. Marin, we believe, was the firft who accompanied his elèves on the fame inftrument, after the manner of a duet on one piano-forte, by ftanding behind them and picking out notes in fuch parts of the clavier as are unoccupied by the principal performer. This expedient was not put in practice for want of abilities to accompany them on any other inftrument; as, if he was not fuperior to all other performers on the harp, he would be called an exquifite player on the violin, upon which inftrument, though many may exceed him in execution, there are very few that are equal to him in expreffion. Almoft every year produces a mufical phenomenon of fome kind or other; and M. Marin was certainly the phenomenon of his time among harpifts wherever he went.

MARIN, in *Geography*, a fmall ifland of Ruffia, in the Baltic; 72 miles N. of Riga. N. lat. 58° 10'. E. long. 24°.

MARINA, a town of Africa, in Kaarta; 15 miles N. of Kemmoo.—Alfo, a town of the ifland of Cyprus, on the S. coaft; four miles S. of Lernica.

MARINDUGERA, or MARINDIQUE, one of the Philippine iflands, near the S. coaft of Luçon, about 60 miles in circumference; 30 miles N.E. of Mindoro. N. lat. 13° 29'. E. long. 12 51'.

MARINE CHAIR, is a contrivance of Mr. Irwin, for facilitating the neceffary obfervations, in order to determine the longitude at fea. It is faid that Mr. Irwin, on a trial of this machine, found the longitude within twenty-three miles, or about one-third of a degree. See LONGITUDE.

MARINE *Clothing Room*, in a *Ship*, an apartment built in the after platform on the larboard fide, to receive the clothing ufed by the marines.

MARINE *Infurances*. See *Marine* INSURANCES.

MARINE *Law* See LAW.

MARINE *Remains*, a term ufed by many authors to exprefs the fhells of fea-fifhes, and parts of cruftaceous and other fea-animals, found in digging at great depths in the earth, or on the tops of high mountains. Their being lodged in thefe places, is an evident and unqueftionable proof of the fea's having once been there, fince it muft have covered thofe places where it has left its productions It has been a favourite fyftem with many, and particularly with the late Dr. Woodward, that all thefe marine bodies were brought to the places where they now lie, by the waters of the univerfal deluge; which, as we are informed by holy writ, covered the whole furface of the globe, and even the higheft mountains. (See DELUGE.) But though this is a very ready expedient to account for many of the natural phenomena, yet there are evident proofs that it cannot have been the caufe of all that is attributed to it; and there muft neceffarily have been fome other caufe of many of thefe remains having been placed where we now find them. Neither does the opinion of fome particular authors, that partial inundations of different places have left thefe marine bodies behind them at the recefs of the waters, feem fufficient to account for the multitudes of thefe remains, many of which we find thrown upon places inacceffible to fuch floods. Moro, de Cruftaceis in Montib. deprehenf.

Signior Moro has attempted to account for thefe phenomena on a new plan of reafoning. He obferves that it is the beft bafis of argument to begin from facts: and that if we can certainly find how fome part of thefe animal remains come to be depofited at fuch great diftances from their natural refidence, we may very rationally conclude, that by the fame means, be they what they will, all the reft were alfo brought thither. He adds, that the earth, once the bottom of the fea, or the level furface of a plain, may be, and frequently has been, in the memory of man, raifed up into a mountain by fubterranean fires, earthquakes, and volcanoes. He mentions the famous inftance of the new ifland raifed out of the bottom of the fea near Santorini in the year 1707, which became of a circumference not lefs than fix miles, and of the new mountain raifed near Puzzoli in 1538.

Thefe, and many other like facts, prove that the origin of mountains and iflands may have been fuch, and that the matter they confift of may have been the fame with what was once the bottom of the fea; and that the marine bodies found in thefe mountains, were fuch as were living, or remaining of living fifh at the time when the ifland or mountain were fo raifed above the furface of the water which before covered it.

This is no new opinion; but this author has fet it in a new and much ftronger light than ever it had appeared in before, by the inftances and examples he has brought in proof of it. Some have been fond of believing that the bodies we call marine remains, were never indeed any parts of living animals, but that they are merely *lufi naturæ* formed in the places where they are found; but Fabius Columna proved this to be an error, fhewing that the fhark's teeth, or gloffopetræ of the ifland of Malta, when calcined by a ftrong fire, yielded afhes the fame with thofe from animal bodies, and by no means of the fame nature with thofe produced from calcined ftones.

That changes of parts of the bottom of the fea into dry land, have often been made, is proved not only from the late known inftances, but from the teftimonies of Strabo, Pliny, and other writers of credit: and nothing is more obvious to reafon, than that in the fudden rife of fuch parts of the bottom of the fea, all its contents, all the fhells, and other hard parts of fifhes lying there, would be carried up with it.

As fome mountains and fome iflands muft have certainly been produced in this manner, it is not impoffible but that all of them may have been fo; and there is no more than this required to account clearly and evidently for all the vaft profufion of marine bodies at land as we find them, without having recourfe to the improbable means of the univerfal deluge, which, for many plain reafons, cannot have been the caufe; or to the effects of particular inundations, which muft have been wholly incapable of lodging many of them there. The lodgment of fhells in the folid ftrata of mountains, is better accounted for by this fyftem of fignior Moro than any other; and if it be afked why fome mountains afford them in great plenty,

plenty, and others not at all, it will be not difficult to anſwer, by obſerving, that among the mountains of the more known parts of the world, ſome conſiſt of mere ſolid rock, and others of various ſtrata of earthy and other matter; that the firſt of theſe may be ſuppoſed primary or natural mountains, and the other ſecondary or accidental ones: and that theſe marine remains are always wanting in the former, and uſually are found in the latter, which is a fact greatly favourable to this ſyſtem.

There are many difficulties attending the accounts of all authors of the formation of the earth, and the lodging of theſe bodies in it; nor is this laſt ſyſtem without difficulty. The cauſes here aſſigned as to the origin of mountains and iſlands, doubtleſs have been ſo in regard to ſome, but ſcarcely to all; and the bodies here treated of are ſo numerous, in ſome particular places, that ſcarcely any account can ſolve the difficulty of their being collected together in ſo ſtrange a manner. See *Adventitious* Fossils, and *Theory of the* Earth.

Marine *Salt.* See Salt.

Marine *Surveyor*, is the name of a machine contrived by Mr. H. de Saumarez, for meaſuring the way of a ſhip in the ſea. This machine is in the form of the letter Y, and is made of iron or any other metal. At each end of the lines which conſtitute the angle or upper part of that letter, are two pallets, not much unlike the figure of the log; one of which falls in the ſame proportion as the other riſes. The falling or pendent pallet meeting a reſiſtance from the water, as the ſhip moves, has, by that means, a circular motion under water, which is faſter or ſlower, according as the veſſel moves. This motion is communicated to a dial within the ſhip, by means of a rope faſtened to the tail of the Y, and carried to the dial. The motion being thus communicated to the dial, which has a bell in it, it ſtrikes exactly the number of geometrical paces, miles, or leagues, which the ſhip has run. Thus the ſhip's diſtance is attained; and the forces of tides and currents may alſo be diſcovered by this inſtrument; which, however, has been very little uſed. See a large account of it in the Abr. Phil. Tranſ. vol. vi. p. 444, &c.

MARINES, in *Geography*, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Pontoiſe; ſeven miles N.W. of Pontoiſe. The place contains 1232, and the canton 13,814 inhabitants, on a territory of 295 kiliometres, in 39 communes.

Marines, or *Marine Forces*, a body of troops employed in the ſea-ſervice, under the direction of the lords of the admiralty. Theſe marines compoſe certain regiments trained to the different modes of ſea-fighting, and made uſeful alſo in ſome of thoſe manœuvres of a ſhip, where a great number of hands is required. The preciſe time when this inſtitution firſt took place, is, like many other parts of military hiſtory, involved in obſcurity. The oldeſt corps of this kind, which Groſe has been able to diſcover, was the third regiment of infantry in the liſt of the army for the year 1684. It then conſiſted of 12 companies, without grenadiers. The men were clothed in yellow coats, lined with red; their colours were a red croſs, with rays of the ſun iſſuing from each of its angles. This was not the preſent third regiment, now diſtinguiſhed by the name of the old buffs, which then ſtood the fourth on the liſt. In the reign of king William III. there were ſeveral marine regiments. In the beginning of the reign of queen Anne ſix regiments of marines were raiſed: theſe regiments have been very uſeful, more eſpecially upon fitting out ſquadrons of ſhips for an immediate expedition; for as they are conſtantly quartered, when not at ſea, as near the principal ports as poſſible, *viz.* Plymouth, Portſmouth, and Chatham, they were very eaſily put on board ſuch ſhips as had moſt occaſion for them: for they were under the immediate direction of the admiralty: and rules and inſtructions for their better government were ſettled by his majeſty in council, July 1, 1702. In the war preceding the peace of 1748 there were 10 regiments of marines, which were diſbanded about the year 1749: theſe were under the direction of the lords of the admiralty, and when aſhore were quartered in the neighbourhood of the docks and ſea-ports. In 1755 a number of companies of marines were raiſed, under the direction of the ſecretary of war; they were afterwards formed into three diviſions, and ſtationed at the towns of Plymouth, Portſmouth, and Chatham; and at each of theſe places have now convenient barracks. Theſe companies, A. D. 1761, being 130 in number, were, from the time of their eſtabliſhment, put under the immediate direction of the lords of the admiralty. At the peace many of them were reduced; and in 1770 there remained only 70 companies; but in the year 1782, they were increaſed to 150. The marines are clothed and armed in the ſame manner as his majeſty's other corps of infantry. Their uniform is ſcarlet, faced with white, white linings, waiſtcoats and breeches; they alſo wear caps, like thoſe of the fuſileer regiments. Their pay is the ſame with that of the marching regiments of foot. There are annual acts for the better governing of his majeſty's royal marine forces whilſt on ſhore; which are much the ſame with thoſe that reſpect the land-forces, only with ſome variations on account of their being ſubject to the juriſdiction of the admiralty. Thus, the lord high admiral, or three commiſſioners of the admiralty, are to form articles of war, and grant commiſſions for holding courts-martials. Notice of a deſerter being apprehended is to be ſent to the ſecretary of the admiralty. The billeting, and carriages, are to be in purſuance of orders from the admiralty.

MARINER, the ſame with ſeaman or ſailor.

The mariners of a ſhip are accountable to the maſter; the maſter to the owners; and the owners to the merchant, for all damages by negligence, or otherwiſe. If a mariner be hired, and he deſerts the ſervice before the voyage is ended, by the law marine, and by common law, he ſhall loſe his wages; and if a ſhip is loſt by tempeſt, &c. the mariners loſe their wages, as well as the owners their freight; and this is to oblige them to uſe their utmoſt endeavours to preſerve the ſhip.

Perſonating mariners, and receiving their wages, and forging letters of attorney, &c. or falſely taking out letters of adminiſtration for the receipt of ſeamen's wages, is felony without benefit of clergy. See Forgery and *Greenwich* Hospital.

Concerning ſeamen in the merchant ſervice, it is enacted by 2 Geo. II. c. 36. that no maſter of a ſhip ſhall proceed on a voyage, without agreeing in writing with ſuch mariner (apprentices excepted), to be ſigned by ſuch mariner, for wages; and by 31 Geo. III. c. 39 the ſame is extended to ſeamen employed in the coaſting trade, on pain of 5*l.* for each mariner, on conviction before one juſtice, by the oath of one witneſs, to be levied by diſtreſs. (See alſo 37 Geo. III. c. 73.) If the mariner deſert after he hath ſigned the agreement, he ſhall forfeit the wages due to him at the time of deſerting; and on application from the maſter, owner, or commander of the ſhip, ſuch juſtice may cauſe him to be apprehended; and if he ſhall refuſe to proceed on the voyage, without ſufficient reaſon to the ſatisfaction of the juſtice, the ſaid juſtice ſhall commit him to the houſe of correction, for not exceeding 30 nor leſs than 14 days. (2 Geo. II. c. 36.

c. 36. 31 Geo. III. c. 39. 45 Geo. III. c. 31.) For forfeitures to *Greenwich* Hospital, and privilege of admiſſion, ſee that article. The maſter of the ſhip ſhall pay the ſeaman's wages, if demanded, in 30 days after the ſhip is entered in the cuſtom-houſe, or at the time of diſcharge, which ſhall firſt happen, deducting out of ſuch wages the aforeſaid forfeiture; on pain of 20*s.* to ſuch ſeaman, to be recovered in like manner as his wages. (2 Geo. II. c. 36. 31 Geo III. c. 39.) By 44 Geo. III. c. 13. it is enacted that petty officers or ſeamen, arreſted by ſheriffs or other officers, ſhall be kept in cuſtody after being entitled to a diſcharge from any proceſs; and be conveyed to the commander-in-chief, or ſome commiſſioned officer, to ſerve on board his majeſty's fleet. And the ſheriff, gaoler, or other officer, ſhall be paid by the treaſurer of the navy, upon producing a certificate for conducting ſuch ſeaman at the rate of 2*s. per* mile. The transfer of ſuch ſeaman ſhall be certified upon the back of the proceſs. If any ſheriff, &c. ſhall neglect ſo to convey ſuch ſeaman, he ſhall be liable to an action of treſpaſs at the ſuit of ſuch petty officer, &c. or ſeaman. If any ſheriff, &c. ſhall ſuffer any ſuch ſeaman, &c. to eſcape, he ſhall be liable to the penalty of 100*l* recoverable in any of the courts of record at Weſtminſter; one moiety to the king, and the other to the party ſuing. Any action by virtue of this act, muſt be brought within three months after the ſuit; and if the plaintiff fail in ſuch action, the defendant ſhall have treble coſts. By 37 Geo. III. c. 73. to prevent the deſertion of ſeamen from merchant ſhips, every ſeaman who ſhall deſert during the voyage, either out or home, from any Britiſh merchant ſhip, trading to or from his majeſty's colonies in the Weſt Indies, ſhall, over and above all puniſhment, penalties, and forfeitures, to which he is now ſubject, forfeit all the wages he may be entitled to from the maſter or owner of the ſhip, on board of which he ſhall enter immediately after ſuch deſertion. And every maſter or commander of any ſhip, who ſhall engage any ſuch perſon, knowing him to have deſerted from any other ſhip, ſhall forfeit 100*l.* In the act above cited there are ſeveral other proviſions and regulations relating to ſeamen in the merchant ſervice. By 35 Geo. III. c. 28. c. 95. petty officers, ſeamen, boatſwain, gunners, &c. may allot a certain part of their monthly pay for the maintenance of wives and children, or mothers. And by 37 Geo. III. c. 53. an increaſe of wages is made to ſuch perſons, and they are empowered to allot a part of ſuch pay, to be calculated as nearly as may be to equal one half of it. All petty officers, ſeamen, marines, &c. who may be wounded in action with the enemy, ſhall receive their full wages until their wounds are healed; or until (being declared incurable) they ſhall receive a penſion from the cheſt at Chatham, or be admitted into Greenwich hoſpital. (See alſo 46 Geo. III. c. 127.) All allotments of wages are to be paid without deductions, on penalty of 20*l.*

Mariners wandering up and down, and who ſhall not ſettle themſelves to work, or have not a teſtimonial under the hand of a juſtice, ſhewing where they landed, and whither to go, &c. or having ſuch teſtimonial, if they exceed the time limited more than fourteen days, not being ſick in their paſſage home, &c. are guilty of felony by 39 Eliz. cap. 17. This ſanguinary law, though in practice deſervedly antiquated, ſtill remains a diſgrace to our ſtatute-book; yet attended with this mitigation, that the offender may be delivered, if any honeſt freeholder, or other perſon of ſubſtance, will take him into his ſervice, and he abides in the ſame for one year; unleſs licenſed to depart by his employer, who, in ſuch caſe, ſhall forfeit 10*l.* But if they cannot work, for want thereof, the two next juſtices, upon their complaint, ſhall take order that they may be provided of work; or otherwiſe may tax the whole hundred, till relief ſhall be had. (Stat. ibid.) And every pariſh may be charged for relieving mariners, as for maimed ſoldiers; and they ſhall be relieved by the treaſurer of the county, &c. (43 Eliz. cap. 3.) The probate of the will, or letters of adminiſtration, of any common ſoldier, or ſeaman, who ſhall be ſlain or die in the ſervice, ſhall be exempted from the ſtamp duties; a certificate being produced from the captain under whom he ſerved, at the time of his death, and oath made of the truth thereof, before the proper judge or officer, for which oath no fee ſhall be taken. 5 Will. c. 21.

In order to facilitate the returns of marines and ſailors, as well as ſoldiers, when diſcharged, to their reſpective places of legal ſettlement in England, and to prevent their being deemed rogues and vagabonds, and puniſhed as vagrants, it is provided by the 43 Geo. III. c. 61, that, carrying their diſcharge, within three days from its date, to the mayor or chief magiſtrate of the city, town, port, or corporate place neareſt to, or within 15 miles from, the place of their diſcharge, they ſhall receive from ſuch magiſtrate a certificate ſtating the place to which the perſons ſo diſcharged are deſirous of going, being their home or legal place of ſettlement, together with the time to be fixed, not exceeding ten days for every 100 miles, and ſo in proportion, except for a reaſonable cauſe to be expreſſed in ſuch certificate; and ſuch perſon producing ſuch diſcharge and ſuch certificate, when lawfully demanded, and being in his route accordingly as to time and road, ſhall not, by reaſon of aſking relief, be deemed to be a rogue or vagabond; provided ſuch diſcharge bear the true date, both as to the time when, and place where it was given, and ſhall expreſs the ſum or ſums, if any, which were paid to ſuch ſoldier or ſailor at ſuch time and place. New certificates are to be affixed to the former in caſe of delay from accident or ſickneſs. And all certificates or paſſes granted as heretofore from the office of admiralty, or war-office, to diſcharged ſailors, ſoldiers, or marines, or to the families of ſuch, ſerving abroad, or lately deceaſed, to carry them to their reſpective homes, ſhall have the ſame effect and force to all intents and purpoſes whatſoever as the certificates herein permitted to be given by the magiſtrate as aforeſaid; and the terms of the ſame may be extended, &c.

By the 22 Geo. II. c. 44. all officers, marines, and ſoldiers, who have been employed in his majeſty's ſervice, and not deſerted, may ſet up and exerciſe ſuch trades as they are fit for in any town or place within Great Britain or Ireland, (except Oxford and Cambridge), and if they ſhall be ſued thereupon they ſhall have double coſts.

By 31 Geo. II. cap 10. no ſeaman aboard his majeſty's ſhip can be arreſted for any debt, unleſs the ſame be ſworn to amount to at leaſt 20*l.*

The method of ordering ſeamen in the royal fleet, and keeping up a regular diſcipline there, is directed by certain expreſs rules, articles, and orders, firſt enacted by the authority of parliament, ſoon after the Reſtoration (13 Car. II. ſtat. 1. cap. 9.); but ſince new-modelled and altered, after the peace of Aix-la-Chapelle, (22 Geo. II. cap. 23, amended by 19 Geo. III. c. 17.) to remedy ſome defects, which were of fatal conſequence in conducting the preceding war. In theſe articles of the navy, almoſt every poſſible offence is ſet down, and the puniſhment thereof annexed: in which reſpect the ſeamen have much the advantage over their brethren in the land-ſervice; whoſe articles of war are not enacted by parliament, but framed from time to time at the pleaſure of the crown. For theſe articles, ſee Navy.

Mariners'-*Compaſs.* See Compass.

MARING, in *Geography*, a town of Pruffia, in the province of Ermeland; 10 miles W.S.W. of Allenftein.

MARINGANDO, a town on the W. coaft of Madagafcar. S. lat. 13° 50'. E. long. 48° 30'.

MARINGUES, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the diftrict of Thiers; 14 miles N.W. of Clermont. The place contains 3800, and the canton 7586 inhabitants, on a territory of 82½ kiliometres, in four communes.

MARINHA, St., a town of Portugal, in the province of Beira; 23 miles S.E. of Oporto.

MARINI, Giambattista, in *Biography*, known generally by the name of *Il Cavaliere Marini*, an Italian poet, was born at Naples in 1569. His father was a counfellor of eminence, and was defirous of bringing up the young man to his own profeffion, but was unable to overcome the repugnance to legal ftudies, which an early attachment to poetry produced in him, as it has done in fo many others. His father would not be appeafed at the difappointment which he felt in the fon's refufal to acquiefce in his wifhes, and expelled him from his houfe. For a fhort time he obtained an afylum with a perfon of rank, till a juvenile mifdemeanor caufed him to be committed to prifon. On recovering his liberty, he went to Rome, and was introduced to cardinal Peter Aldobrandini, with whom he lived fome years, and whom he accompanied to Ravenna and Turin. At the laft city he rendered himfelf confpicuous by his talents and learned warfare with feveral literary antagonifts; of thefe, the one moft noted was Gafpar Murtola, a Genoefe, who, jealous of Marini's reputation, and of his having been honoured with knighthood, attacked him in fonnets and lampoons. Marini was not behind hand in taking his revenge, and was fo fevere in his "Murtoleide," that the enraged poet attempted to affaffinate him in the ftreets of Turin: he miffed his rival, and wounded a favourite of the duke, who ftood by his fide. For this act Murtola would have been hanged, had not Marini interceded with the duke for his life. After this, Marini's enemies gained the advantage over him, and obtained an order for his imprifonment. Upon his liberation, he went to France in 1615, whither he had been invited by queen Margaret. Before he arrived, his patronefs was dead, but he met with a fteady friend in queen Mary of Medicis, who fettled upon him a liberal penfion. In France, he publifhed his moft famous poem, the "Adone," firft printed in 1623. He returned to Rome, and was elected prefident of the academy Degli Umorifti. He afterwards went to Naples, where he was favourably received by the viceroy, duke of Alva. He died in 1625, at the age of fifty-fix. Befides his "Adone," of which there were many editions, he publifhed, among many other things, "La Strage degli Innocenti;" "La Sampogna;" and a collection of "Letters." He had a lively imagination, and very fertile invention; but is not celebrated for a good tafte; and many of his pieces contain licentious paffages, which, however, when he was near his end, he begged might be expunged in all future editions; but they were too much in the tafte of the age for fuch a facrifice. Moreri.

Marini, in *Geography*, a town of Spain, in New Caftile; 4 miles N.W. of Alarçon.

MARINO, St., a fmall republic of Italy, near the coaft of the Adriatic fea, between Romagna and Urbino, in N. lat. 43° 55'; the territory of which is confined to a mountain, with a diminutive tract at the foot of it. The number of inhabitants is eftimated at between five and fix thoufand; and it has been their happy lot to enjoy freedom and tranquillity for more than thirteen centuries with little interruption. Surrounded by the dominions of the pope, they have claimed his protection. The founder of this inconfiderable ftate was St. Marino, a Dalmatian by birth, and a mafon by trade. Having finifhed fome repairs of Rimini, in the ninth century, he retired to this fequeftered mountain, where he led the life of a hermit, and fubjected himfelf to all the aufterities of religion. The princefs of the country, it is faid, obferving his extraordinary fanctity, made him a prefent of the mountain; and a number of inhabitants reforting hither, he eftablifhed the republic that has ever fince been diftinguifhed by his name. Their whole hiftory is comprifed in two purchafes made of a neighbouring prince, one the caftle of Pennuenta in 1100, and another, called Cafala, in 1170, and in the affiftance afforded to the pope, Pius II., about 290 years after againft Malatefta, lord of Rimini. In return for this fervice he transferred to them four fmall caftles, together with the village of Piagge. This was the epocha of its higheft grandeur, but now it is reduced to its primary limits. In 1739, the miferable ambition of cardinal Alberoni, difappointed in confiderable projects and embroiling larger ftates, was directed againft this republic, and he fubjected it to the fee of Rome; but on complaints of its council, the pope reftored to it its former freedom and privileges. The government of this ftate confifts of a council of 40, half nobles and half commoners. On very important occafions an arengo, or great council, is convened, to which every family has the privilege of deputing a reprefentative. The principal officers are two captains, who are changed every half year; a commiffioner, who is a foreigner, and who tries civil and criminal caufes; a doctor of laws, whofe office is triennial; and a phyfician, who muft be a foreigner, and who is chofen for three years to attend the fick, and to infpect the fhops of apothecaries. In this republic are three caftles, three convents, and five churches.

Marino, *St.*, the capital of the above defcribed republic, which is an indifferently built town or rather a village, fituated on a rugged hill of difficult accefs, formerly called "Mons Sacer," and well fortified, with only one avenue to it; 10 miles S.W. of Rimini, and as far from the fea-coaft. N. lat. 42° 56'. E. long. 12° 24'.—Alfo, a town of Naples, in Bafilicata; 9 miles S. of Turfi.

MARINONI, John James, in *Biography*, a celebrated mathematician and aftronomer, was born at Udina, in the Frioul, in 1676. He made a rapid progrefs in his education, outftript his contemporaries, and fhewed a decided turn for mathematical ftudies. In 1696, he repaired to the univerfity of Vienna, and obtained the degree of doctor in philofophy. He was foon after this appointed by the emperor Leopold mathematician to the court: in which capacity he fortified the city fo as completely to prevent the incurfions of the rebels, and to put a ftop likewife to the practice of fmuggling, which at that time prevailed. After the death of the emperor, he was taken under the protection of his fucceffor; and by his orders, in 1706, made a furvey of the capital, and its environs, which was engraved, the fame year, in four large fheets. In 1709, Marinoni was appointed engineer of Lower Auftria: in 1714 he invented an inftrument for meafuring fuperficies in an eafy manner, and without the neceffity of calculation. This inftrument he called the planimetre balance, and he dedicated the work, in which its principles were explained and illuftrated, to the emperor Charles VI., which, however, was never printed. In 1717, he formed a plan for the eftablifhment of an academy deftined to teach geometry and the military fciences, which, being approved by the emperor, was immediately carried into execution, and in the following year Marinoni was appointed fub-

fub-director of the new eftablifhment, and in 1719 he received a patent as firft mathematician to his majefty, and in that quality he was fent to the Milanefe to make a furvey of the duchy: a labour on which he was employed three years, and which he accomplifhed to the fatisfaction of his fovereign. In 1726, he was admitted into the clafs of the nobility of the empire, and appointed chief director of the military of the academy. Owing to fome difputes refpecting the limits of the different ftates in confequence of changes which had taken place in the courfes of the rivers, Marinoni was requefted, in 1729, as well by his imperial majefty, as by feveral Italian princes, to refume the difcuffions entered into on that fubject, with the view of bringing them to a conclufion. This undertaking, which required very fine talents, in order to reconcile a multitude of complex interefts, Marinoni completed to the perfect fatisfaction of every perfon concerned. In 1730, he eftablifhed what he called "Specula Domeftica," caufing all the inftruments that he intended to ufe to be conftructed under his own infpection: he was accuftomed to conftruct every thing he ufed, and kept in conftant employment, in his own premifes, artifans of almoft every kind, as printers, engravers, book-binders, &c. By this mode of conduct, he was enabled to form one of the moft complete obfervatories in Europe, and he made obfervations which may be placed in the fame clafs with thofe of the ableft aftronomers. In 1745 he publifhed, and prefented to the fon of Charles VI., a very magnificent work, entitled "De Specula Domeftica." In the following year he was elected a member of the Royal Academy of Sciences at Berlin, on the recommendation of Maupertuis, then prefident; and in 1751, he publifhed a new work, entitled "De Re Ichnographica." He intended to have proceeded with other works which he had planned for himfelf, but death put a clofe to his labours. He died on the 10th of January, 1755. He left behind him thirty-fix volumes of aftronomical obfervations arranged in the beft order. He is faid, during the laft twenty years of his life, to have loft fcarcely a moment of his time. He bequeathed his aftronomical inftruments to the emprefs-queen, who accepted the legacy, and to render it of the greateft utility, prefented it to the univerfity. Gen. Biog.

MARINUM, in *Ancient Geography*, a town of Italy, placed by Strabo in Umbria.

MARIO, in *Ichthyology*, a name given by Pliny, and other of the old Roman authors, to a large fifh allied to the acipenfer or fturgeon. There feems, from all that they have faid of it, great reafon to believe that it was the fifh we at prefent call *hufo*, or the ichthyocolla-fifh, from ifinglafs being made of it. Artedi makes this a fpecies of the acipenfer or fturgeon, and diftinguifhes it by the name of the acipenfer without tubercles.

MARION, in *Geography*, a diftrict of South Carolina, containing 6914 inhabitants, of whom 2155 are flaves.

Marion's and *Crozet's Iflands*, four iflands of the Indian ocean, difcovered by captains Marion and Crozet, French navigators, in the year 1772, and named by captain Cook in 1776. S. lat. 48°. E. long. 47°.

MARIOS, in *Ancient Geography*, a town of Laconia, N. of Geronthræ, pleafantly fituated near a wood, and amidft fountains; and having in its vicinity a temple called Pantheon, from its being dedicated to all the gods. In the town was alfo a temple of Diana, in which were fountains.

MARIOTTE, Edme, in *Biography*, an eminent French philofopher who flourifhed about the middle of the 17th century, was a native of the province of Burgundy. He was brought up to the church, and obtained the priory of St. Martin fous Beaume, at fome diftance from Dijon. He was admitted a member of the French Academy of Sciences in 1666, and died in 1684. He was an excellent mathematician, and one of the earlieft French philofophers who applied to experimental refearches. His principal works are "A Treatife on the Shock or Collifion of Bodies;" "An Effay on Phyfics;" "A Treatife on the Preffure and Motion of Fluids;" "New Difcoveries relating to Vifion;" "A Treatife on Levelling;" "A Treatife on the Motion of Pendulums," and "Experiments on Colours." He alfo communicated many curious and valuable papers to the academy, which were inferted in their Memoirs, from vol. i. to x. A collection of all his pieces was publifhed at Leyden in 1717, in 2 vols. 4to.

MARIOUA, in *Geography*, a town of Brafil, on the Rio Negro; 125 miles W. of Fort Rio Negro.

MARJORAM, in *Botany* and *Gardening*. See Origanum.

Marjoram, in the *Materia Medica*. The *fweet* marjoram has been thought to be the Σαμψυχον or Amaracus of the ancients. It has been long cultivated in our gardens, and is in frequent ufe for culinary purpofes. The leaves and tops have a pleafant fmell, and a moderately warm, aromatic bitterifh tafte. They yield their virtues both to aqueous and fpirituous liquors by infufion, and to water in diftillation; affording a confiderable quantity of effential oil, amounting, according to Beaumé, to 15 ounces from 150 pounds of the recent plant. On being long kept this oil affumes a folid form. When carefully drawn it is of a pale yellow colour, and of a hot penetrating tafte. This plant has been chiefly recommended in diforders of the head and nerves, in uterine obftructions and mucous difcharges, proceeding from a laxity and debility of the folids, and a fluggifh ftate of the juices, and in the humoural afthmas and catarrhs of old people. The powder of the leaves, their diftilled water, and the effential oil properly diluted, are agreeable errhines, and accounted particularly ufeful in pituitous obftructions of the noftrils, and diforders of the olfactory organs. Its medicinal qualities agree with thofe of the wild marjoram; but being much more fragrant, it is deemed to be more cephalic, and better adapted to the complaints denominated nervous; it may, therefore, be employed with the fame intentions as lavender. It is directed in the compofition of the pulvis fternutatorius in the Pharmacopeias, with a view to the agreeable odour which it diffufes to the afarabacca, rather than to its errhine power, which is very confiderable. In its recent ftate, it is faid to have been fuccefsfully applied to fcirrhous tumours of the breaft. Lewis and Woodville.

The leaves and flowery tops of the common *wild* marjoram, which grows on dry chalky hills and gravelly grounds in feveral parts of England, and flowers in July and Auguft, have an agreeable aromatic fmell, and a pungent tafte, approaching to that of the garden marjoram, and much refembling thyme; with which they appear to agree in medicinal virtue, being deemed emmenagogue, tonic, ftomachic, &c.; effects which can only be afcribed to the aromatic and ftimulant powers which all the herbs of this natural order feem to poffefs in common. Infufions of them are fometimes drank as tea, in weaknefs of the ftomach, diforders of the breaft, for promoting perfpiration of the fluid fecretions in general; they are fometimes ufed alfo in nervine and anti-rheumatic baths; and the powder of the dried herbs as an errhine. Diftilled with water, they yield a moderate quantity of a very acrid, penetrating, effential oil, fmelling ftrongly of the marjoram, but lefs agreeable than the herb itfelf; this oil is applied, on a little cotton, for eafing the pains of carious teeth; and fometimes diluted and rubbed on the noftrils, or fnuffed up the nofe, for attenuating and evacuating mucous humours. The country people ufe the tops of the plants to dye purple. Lewis and Woodville.

The dittany of Crete, which is a fpecies of origanum, is a very warm aromatic, of an agreeable fmell, and hot biting tafte: the leaves, which impart their virtues both to water and rectified fpirit, tinging the former of a yellowifh, and the latter of a greenifh colour, have been chiefly recommended as emmenagogue, alexipharmic, and vulnerary. When diftilled with water, if the quantity of dittany be large, there feparates, fays Neumann, a fmall portion of a yellowifh effential oil, of a highly pungent aromatic tafte and fmell, and which congeals in the cold into the appearance of camphor. This fort was much valued among the ancients, and applauded by their poets.

Thus Virgil defcribes it:

> "Hic Venus, indigno nati concuffa dolore,
> Dictamnum genitrix Cretæâ carpit ab Idâ,
> Puberibus caulem foliis, et flore comantem
> Purpureo: non illa feris incognita capris
> Gramina, cùm tergo volucres hæfere fagittæ"
> Æn. l. xii. 411.

It was efteemed a fpecific for wounds of arrows, which it drew out with wonderful eafe, and according to them only grew in the ifland of Crete, and only in a little obfcure corner of it, whence it obtained its name *dictamnus Creticus*. It ftill grows in that ifland. M. Tournefort, who was in Crete, defcribes the place where it grows, and fays it flourifhes there almoft all the year.

This is a perennial plant, and though a native of ftony grounds in Greece, and the ifland of Candy, bears the ordinary winters of our own climate. The fhops are generally fupplied from Italy with the leaves tied up in bundles, which are often damaged or decayed, and at beft not fuperior to thofe of our own growth. Although rarely ufed at this day, this plant certainly poffeffes, in a very confiderable degree, the ftimulant and aromatic qualities which characterife this clafs of plants. Lewis and Woodville.

MARIOUT, in *Geography*, a town of Egypt, on the W. coaft of Birk Mariout; 15 miles S.S.W. of Alexandria.

MARIPA, in *Botany*, a barbarous Caribean name, adopted by Juffieu from Aublet, but, according to his own principles, retained only till the genus is either better eftablifhed, or entirely fet afide. Aubl. Guian. 230. Juff. 133. Lamarck Illuftr t. 110.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Convolvuli*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, roundifh, concave fegments, folding over each other. *Cor.* of one petal, tubular; tube twice as long as the calyx, dilated at the bafe, as well as at the mouth; limb in five equal, roundifh, crenate, fpreading lobes. *Stam.* Filaments five, fhort, thread-fhaped, inferted into the lower part of the tube, oppofite to the fegments of the limb; anthers vertical, oblong, cloven at the bafe, of two cells, fhorter than the limb. *Pift.* Germen fuperior, ovate; ftyle thread-fhaped, declining, longer than the corolla; ftigma peltate, convex. *Peric.* Capfule? of two cells. *Seeds* two in each cell, erect, parallel, convex externally, angular on the infide.

Eff. Ch. Corolla tubular, its limb in five equal fpreading fegments. Anthers long, arrow-fhaped. Stigma peltate, convex. Capfule? of two cells. Seeds in pairs, erect, parallel.

1. M. *fcandens*. Aubl. Guian. t. 91.—Found by Aublet in Guiana, on the banks of the river Sinémari, eight leagues from its mouth, flowering in November. The *ftem* is twining, fomewhat woody, fupporting itfelf, by means of tendrils, upon the neighbouring trees. *Leaves* alternate, ftalked, ovate, entire, pointed, fmooth, firm and fhining, fix inches long at moft. *Panicles* terminal, branched and forked, with a pair of fmall ovate *bracteas* at each fubdivifion. *Flowers* white, about the fize of the common White Jafmine.

MARIPIPI, in *Geography*, one of the fmaller Philippine iflands; 20 miles S.E. of Mafbate.

MARIPONDY, a town of Hindooftan, in the Carnatic; 15 miles S.W. of Ongole.

MARIQUITA, a town of South America, in the viceroyalty of New Granada, and province of Santa Fé, formerly celebrated for the rich mines of gold in its vicinity; on the W. are thofe of the Bocaneme, and San Juan de Cordova, bordering on thefe of Hervi, Malpafo, Guarino, and Puano; and on the E. the filver mines of St. Anna, Lojas, and Frias; the filver, however, being mingled with the pureft gold, but of difficult feparation. This city, which was formerly opulent, is reduced to 300 inhabitants, a decline owing to the failure of the mines, fo that thofe who have been engaged in them are unaccuftomed to other branches of induftry. Quefada, the conqueror of New Granada, died at Mariquita in 1597, but his body has been removed to the cathedral of Santa Fé. This city is diftant 80 miles S. of Santa Fé de Bogota. N. lat. 5° 16′. W. long. 74° 6′.

MARIS, in *Ichthyology*, a name given by Charleton and fome others to a fifh called by the generality of both the ancient and modern writers, *fmaris*, and by fome *lucomenides*, from its whitifh colour, and its external refemblance to the fifh called *mænis* and *mæna*; it is, like that fifh, a fpecies of the fparus; and is diftinguifhed by having a black fpot on each fide, and the tail and belly-fins red. See SPARUS *Smaris*.

MARISCA, in *Surgery*, an excrefcence near the anus, fo named from its refemblance to a fig.

MARISCH, in *Geography*, a town of Moravia, in the circle of Prerau; 12 miles N. of Freyberg.

MARISCUS, in *Botany*, a Latin word ufed by Pliny for fome kind of bulrufh, and fuppofed to be derived from *mare*, the fea, near which the plant naturally grows. Haller adopted this name for the *Schoenus* of Linnæus, becaufe he thought the latter too near *Schinus*, and becaufe it was merely the Greek fynonym of *Juncus*. This laft reafon is futile, and fet afide by innumerable examples. Gærtner however follows Haller; but they have not been imitated. As the *Schoenus Marifcus* of Linnæus is probably a good diftinct genus, having only two ftamens, and a drupa containing one feed, fee Engl. Bot. t. 950, it is much to be wifhed that the name in queftion had been referved for that genus. It is, neverthelefs, now otherwife appropriated, by Vahl and Brown, whofe peculiarly great authority in this tribe induces us, without hefitation, to concur with them. Vahl Enum. v. 2. 372. Brown Prod. Nov. Holl. v. 1. 218. —Clafs and order, *Triandria Monogynia*. Nat. Ord. *Calamariæ*, Linn. *Cyperoideæ*, Juff.

Gen. Ch. *Cal.* a glume of two unequal membranous valves, containing two or three florets. *Cor.* a fingle glume, ribbed, that of the lower floret embracing the bafe of the upper. *Stam.* Filaments three; anthers linear. *Pift.* Germen fuperior, angular; ftyle three-cleft, deciduous; ftigmas fimple. *Seed* fingle, naked, triangular, without any briftles at its bafe.

Eff. Ch. Calyx of two valves, two or three-flowered. Glumes

Glumes of the corolla imbricated, ribbed. Style three-cleft, deciduous. Seed triangular, without briftles at its bafe.

Obf. Mr. Brown remarks that this genus differs from *Cyperus*, with which it agrees in habit, only in the fewnefs of its florets. Profeffor Vahl defcribes its habit thus.

"*Root* throwing out fcyons. *Stems* erect, acutely triangular, fomewhat bulbous at the bafe, leafy in their lower part. *Leaves* linear, differing in breadth in different fpecies, keeled, fheathing and purple at the bafe, rough with minute ferratures at the edges and keel. *Involucral leaves* like the others. *Spikes* in a terminal umbel, one upon each ftalk, with a feffile fpike in the centre. *Spikelets* alternate, rather diftant, cylindrical, imbricated. *Bractea* folitary at the bafe of each fpike, gradually tapering upwards. Glumes of the *corolla* ftriated. *Receptacle* of the fpikelets angular, toothed."—The fame author adds, that he has "feparated the plants compofing this genus from Kyllingia, (fee that article and Cyperus,) becaufe their habit, as well as fructification, is different. The fpikelets are round and awl-fhaped, not ovate and compreffed. The calyx does not contain a folitary floret, but at leaft two, for the moft part three. The glumes of the corolla are difpofed in a different manner, not being parallel, but one above the other, fo that the lowermoft includes the lower half, or thereabouts, of that above it, each glume being furnifhed with a piftil, as may readily be perceived, even in dried fpecimens. While the lower glume is in full flower, the upper is convoluted, they having nothing in common but their receptacle. There are therefore as many florets as glumes. The ftyle is always in three, not two, divifions. If there be three florets, the fecond is always raifed on a partial ftalk. A feed is found at the bottom of each glume. Thefe plants feem more akin to *Cyperus*, and might, perhaps without great impropriety, be referred to that genus, as their glumes are two-ranked, and the fmall number of florets conftitutes the only difference. That the two lowermoft fcales of the fpikelet are barren, and therefore confidered as a calyx, is no objection, the fame being the cafe with many fpecies of *Cyperus*. If however the prefent genus be allowed to remain, either on account of the fewnefs of its florets, or becaufe *Cyperus* is already fufficiently extenfive, the characters above given will diftinguifh it."

Vahl defines eleven fpecies of *Marifcus*, to which four more are added in Mr. Brown's *Prodromus*.

1. M. *capillaris*. Vahl n. 1. (Schoenus capillaris; Swartz Ind. Occ. 106. Cyperus nanus; Willd. Sp. Pl. v. 1. 272, excluding Plukenet's fynonym.)—Spike oblong, crowded. Spikelets deflexed. Involucrum of two leaves. Stem and foliage almoft capillary.—Native of the Weft Indies. From fix to twelve inches high, very flender, refembling a fmall capitate *Carex*. The *fpikelets* are three-flowered, oblong, tawny, ftrongly deflexed, crowded into a round head the fize of a large pea.—Willdenow has this plant alfo at p. 268. See Vahl.

2. M. *gracilis*. Vahl n. 2.—Leaf folitary. Spike feffile, nearly globofe. Involucrum of two fetaceous leaves.—Found by Richard in South America. *Stems* a foot high or more, very flender, clothed at the bafe with two fheaths, one of which only bears a narrow *leaf*, two or three inches long. *Involucrum* of three leaves, two of which are two or three inches in length, the third but half an inch. *Spike* fcarcely larger than a coriander feed, yellow. *Spikelets* ovate, acute, triangular when in feed. *Stamens* but two. *Richard*.

3. M. *aphyllus*. Vahl n. 3. (Juncus cyperoides, culmo compreffo ftriato, radice odorata tuberofa, capitulo rotundo compacto; Sloane Jam. v. 1. 121. t. 81. f. 2.)—Leaflefs. Spike globofe, feffile. Involucrum of a few broad leaves, fhorter than the fpike.—Native of fandy ground in the bay of Honduras. *Sloane*. *Root* knotty, creeping, red, fragrant like the fweet *Cyperus*, much efteemed by the Indians for curing the cholic. *Stems* a foot high, or more, rather ftout, triangular, and compreffed, clothed at the bafe with feveral clofe fheaths, but deftitute of leaves. *Involucrum* of three, four, or five fpreading ovate leaves, fhorter than the head or *fpike*, which is twice as big as a pea, compofed of very numerous little *fpikelets*, whofe glumes are dotted with purple. *Stamens* three.—Vahl had a fpecimen from Senegal, which he judged the fame fpecies, though twice as large as the American plant.

4. M. *paniceus*. Vahl n. 4. (Kyllingia panicea; Linn. Suppl. 105. Rottb. Gram. 15. t. 4. f. 1. Gærtn. v. 1. 12. t. 2. f. 8. Marifcus biglumis.)—Spikes cylindrical. Spikelets oblong, imbricated, accompanied by fmall fetaceous bracteas.—Native of Arabia Felix and of Tranquebar. A foot high, with numerous *leaves*, as tall as the ftem, and a quarter of an inch broad. *Involucrum* of two long leaves, and two or three much fmaller. *Spikes* five or fix, half an inch long, on fpreading ftalks of various lengths. *Spikelets* numerous, fpreading, fomewhat imbricated, their glumes with a green keel and white edges. *Seed* three-ribbed, dotted with purple.

5. M. *flavus*. Vahl. n. 5—Spikes cylindrical. Spikelets oblong, accompanied by fetaceous finely ferrated bracteas, of their own length.—Gathered in South America by Von Rohr and Richard. Akin to the laft, but differing in its *bracteas*, as well as in its broader more ftriated *glumes*. *Vahl*.

6. M. *ovularis*. Vahl n. 6. (Kyllingia ovularis; Michaux Boreali-Amer. v. 1. 29. Schoenus umbellatus; Jacq. Ic. Rar. t. 10. Scirpus echinatus; Linn. Sp. Pl. 74. Herb. Linn.)—Spikes roundifh-ovate. Spikelets fpreading every way. Involucrum of many leaves.—Native of North America; whether of the Eaft Indies alfo we cannot determine. It is akin to the two laft, but diftinguifhed by the very numerous *involucral leaves*, and globofe *fpikes*, compofed of *fpikelets* that fpread in all directions, refembling the head of a *Sparganium*, as Plukenet, who figures it in his t. 91. f. 4, well obferves. Vahl has rightly brought together the above fynonyms, as belonging to one fpecies.

7. M. *retrofractus*. Vahl n. 7. Gærtn. t. 2. f. 5 (Scirpus retrofractus; Linn. Sp. Pl. 74 Cyperi genus indianum, &c.; Pluk. Phyt. t. 415. f 4.)—Spikes loofely imbricated downward. Spikelets awl-fhaped, reflexed. Involucrum of few leaves.—Native of Virginia. The whole *plant* has a glaucous hue. Its habit is not unlike the laft, but the flender taper-pointed *fpikelets* are all remarkably drooping, or bent downward, and but loofely imbricated.

8. M. *umbellatus*. Vahl n. 8. (Kyllingia umbellata; Linn. Suppl. 105. Rottb. Gram. 15. t. 4. f. 1. Scirpus cyperoides; Linn. Mant. 181. Koll pullu; Rheede Malab. v. 12. 119. t. 63.)—Spikes cylindrical, clofely imbricated downward. Spikelets awl-fhaped, reflexed. Involucrum of many leaves.—Native of the Eaft Indies. The *fpikelets* are not one-third the fize of the laft, much more numerous and crowded, but not fo taper-pointed.

9. M. *alternifolius*. Vahl n. 9.—Spikes cylindrical, imbricated downward. Involucral leaves, as well as the flower-ftalks, alternate.—Native of Guinea. *Stems* a foot high or more, as thick as a pidgeon's quill, taller than the foliage. *Involucrum* of ten alternate crowded leaves, fome of them as long as the ftem, each accompanied by an axillary *flower-ftalk*, full two inches long, invefted with a pur-

ple-

ple-dotted fheath, hardly an inch in length. *Spikes* half an inch long, green. *Vahl.*

10. M. *cyperinus.* Vahl n. 10. (Kyllingia cyperina; Retz. Obf. fafc. 6. 21)—Spikes cylindrical. Spikelets erect, accompanied by bracteas fhorter than themfelves.—Native of the Eaft Indies and Guinea. *Stems* about a foot high. *Leaves* few, moftly taller than the ftem. *Involucrum* of fix or feven very long leaves. *Spikes* fix or feven, feffile or ftalked, an inch long, imbricated upwards. *Spikelets* awl-fhaped, accompanied by briftle-fhaped rough *bracteas,* about half their own length, or rather more. Glumes of the *calyx* longer than ufual; thofe of the *corolla* twice as long as the calyx, deeply furrowed, with a green keel, and pale tawny edge.

11. M. *elatus.* Vahl n. 11. (Kyllingia incompleta; Willd. Sp. Pl. v. 1. 258. Jacq. Ic. Rar. t. 300.)—See Kyllingia, from whence this fpecies fhould be removed hither, with the following character.—Spikes cylindrical. Spikelets erect, with bracteas about their own length.

To thefe we fubjoin Mr. Brown's four fpecies, which not having feen, we could not otherwife arrange, for want of knowing their affinities.

12. M. *lævis.* Brown n. 1.—Spikelets awl-fhaped, round, curved, of two or three florets. Umbel fimple. Involucrum of three leaves. Stem fmooth.—Native of the country near Port Jackfon, New South Wales.

13. M. *fcaber.* Br. n. 2.—Spikelets awl-fhaped, round, curved, two-flowered. Umbel compound. Involucrum of many leaves. Stem rough.—Native of the tropical part of New Holland.

14. M. *decompofitus.* Br. n. 3.—Spikelets ftraight, ovato-lanceolate, roundifh, two-flowered. Umbel once or twice compound. Spikes fomewhat capitate. Involucrum and leaves rough.—From the fame country.

15. M. *conicus.* Br. n. 4.—Spikelets fingle-flowered. Umbel fimple. Spikes conical, fomewhat three-lobed. Involucrum and leaves rough.—From the fame country.

MARISFELD, in *Geography*, a town of Germany, in the county of Henneberg; fix miles E. of Meinungen.

MARITACACA, in *Zoology*, the name of a very remarkable American animal, more ufually known by the name of the opoffum.

MARITAGIUM, in *Law*, contradiftinguifhed from *Matrimonium*, or right of marriage, denoted, in its feodal fenfe, the power which the lord, or guardian in chivalry had of difpofing of his infant ward in matrimony. While the infant was in ward, the guardian had the power of tendering him or her a fuitable match, without difparagement or inequality; which, if the infant refufed, they forfeited the value of the marriage, "valorem maritagii" to their guardian; that is, fo much as a jury would affefs, or any one would *bonâ fide* give to the guardian for fuch an alliance; and if the infants married themfelves without the guardian's confent, they forfeited double the value, "duplicem valorem maritagii." This, fays judge Blackftone, feems to have been one of the greateft hardfhips of our ancient tenures.

MARITICO, in *Geography*, a river of South America, in the province of Carthagena, which runs into the Spanifh Mai, N. lat. 8° 5'. W. long. 76° 42'.

MARITIME, of *mare*, *fea*, denotes any thing belonging to the fea.

Maritime *Caufes* and *Court.* See Court *of Admiralty*.

Maritime *Eftate*, is ufed in contradiction to the civil and military eftate, to exprefs that part of his majefty's lay fubjects, that are occupied in naval or fea fervice. See Marines and Navy.

MARITUS, in the chemical jargon, a word ufed to exprefs the fulphur of metals. The writers on the fubject of the philofopher's ftone ufually exprefs themfelves in this enigmatical manner, calling fulphur the hufband, and mercury the wife in all metals; which, as they are more or lefs perfectly combined, make the metal more or lefs pure, and approaching to perfection.

MARIVAUX, Peter Carlet de Chamblain de, in *Biography*, a diftinguifhed dramatical writer, was born at Paris in 1688. He enjoyed the advantages of a flight claffical education only, but was regarded as a youth of parts, and the ambition of becoming an original writer was his ruling paffion. One of his firft attempts was a traveftie of Homer, on the model of Scarron's Virgil, for the direct purpofe of throwing ridicule on the father of ancient poetry. At the age of eighteen he produced, within a few days, in confequence of a wager, a comedy entitled "Le Père Prudent." This was not acted in public; and it was not till he had attained to his thirty-fecond year that he ventured to prefent upon the theatre his tragedy of "The Death of Hannibal:" the reception of this piece was far from favourable, and he thenceforth confined himfelf to comedy, in which he ftruck out a new path. This was that of a delicate and refined fentiment in the developement of paffion and character, which, in general, fucceeded very well with a people who pride themfelves on a nice perception of all the fhades and diverfities in the human mind. He brought out the greateft number of his pieces on the Italian theatre, which is accounted lefs critical than the French theatre. He produced about thirty pieces, many of which are ftill occafionally reprefented on the ftage, and are popular. Marivaux has obtained a greater reputation by his novels than by his dramas. The firft novel which he compofed was entitled "Pharfamon, ou les nouvelles folies romanefque," a kind of imitation of Don Quixote: this is lefs efteemed, and, indeed, lefs known than his two others, "Marianne," and "Le Payfan Parvenu." The "Marianne" is reckoned the principal, and it is thought, by competent judges, that few works of the clafs rank higher. It difplays an intimate acquaintance with the humam heart, and prefents many truly interefting fituations, and many juft and elevated fentiments. The "Payfan Parvenu" is preferred by fome as poffeffing more gaiety and variety, and a more direct moral purpofe. Another work of this author deferving of notice is his "Spectateur François," which abounds in acute remarks and lively portraitures, and in wit and variety is reckoned to furpafs all his other pieces. He publifhed only two volumes for want of proper encouragement. When he had attained to his fifty-fifth year he obtained admiffion in the French academy. He died at the age of feventy-five, in the year 1763. He was mild, friendly, and philanthropical: full of fympathy towards the indigent and afflicted, towards whom he exercifed a liberality often beyond the bounds of prudence. He was upright and difinterefted, carelefs of fortune, and contented to live in obfcurity: he was fincerely attached to religion, as the great refource of the wretched, but without any affectation of extraordinary devotion.

MARIVELAS, in *Geography*, one of the fmaller Philippine iflands, with a village, the houfes of which were conftructed of bamboo, and afcended by a ladder. One of thefe houfes, including the roof and frame, hardly weighed, according to Peroufe, 200 lbs: but the habitation of the officiating clergyman was of ftone. In the year 1780, the Moors from the iflands S. of the Philippines, invaded this ifland,

ifland, burnt the village, deftroyed the fort, the church, and the rector's houfe, and made flaves of all the Indians they could feize.

MARIVELAS *Bay*, a bay on the W. coaft of the ifland of Luçon, fheltered from all winds except thofe from S. to S.E.; with a clean bottom of ftiff mud or clay, and fufficient depth of water for veffels of any fize. It takes its name from that of the above-mentioned ifland. N. lat. 14° 30'. E. long. 120° 24'.

MARIUM, in *Ancient Geography*, a town of the ifle of Cyprus, upon the fouthern coaft, very near the fea, between Amathus to the W. and Citium to the N.E.

MARIUPOL, in *Geography*. See MARIANOPOLI.

MARITZ, or MARISEA, in *Ancient Geography*, a river of European Turkey, which rifes in a chain of mountains, called Balken (the ancient Hæmus,) and paffing by Philopopoli in a direction towards the E. and S. falls into the Ægean fea in the gulf of Enos, after a courfe of 200 miles. This river was the ancient *Hebrus;* which fee.

MARIUS CAIUS, in *Biography*, a famous Roman commander and head of a party, was born of an obfcure family in the diftrict of Arpinum. In early youth he was diftinguifhed by fize and ftrength of body, and roughnefs of manners. Having entered into the army at the military age, he foon gave proofs of great valour, and by his conduct on various occafions, attracted the notice of his general, Scipio, who foretold his future greatnefs. In the confulfhip of Metellus and Cotta, in the year 119 B.C. he became a candidate for civil honours, and obtained the office of tribune of the people. In performing the duties of this office he obtained great reputation, and was regarded by the people as their moft determined protector againft patrician tyranny. He had many antagonifts, and was unfuccefsful in his application for the edilefhip; but in the year B.C. 116, he acquired the office of prætor. In the following year he was appointed to the government of the Farther Spain. In this ftation he conducted himfelf with great equity, and, by his vigour, cleared the province of the banditti who infefted it. At the expiration of his office he returned to Rome, where his want of birth, of fortune, and eloquence, checked his farther advancement, and, for fome years, he remained idle and undiftinguifhed. At length, in the year 109 B.C., when the conful Metellus was fent into Africa to conduct the war againft Jugurtha, he offered Marius the poft of one of his lieutenants, which the latter gladly accepted. The field of ambition was now open before him, and he refolved to cultivate it by all the means in his power. He ingratiated himfelf with the foldiery by partaking of all their hardfhips and dangers, and he felt neither the principles of duty or gratitude operate upon him fo as to reftrain him from injuring his patron Metellus in the public eftimation. His fuccefs in repulfing Jugurtha, who had made an unexpected attack upon him, gave him luftre in the eyes of the army, and he did not fail to make invidious comparifons between his commander and himfelf. What he faid was communicated by the foldiers to their friends at Rome; this prepared the way for thofe exertions in his favour upon which he relied for the attainment of his objects. Being determined to ftand candidate for the confulfhip, he publicly afked leave of abfence of Metellus for that purpofe, who haughtily faid to him, "It will be time enough for you to think of that honour when my fon fhall be old enough to be your colleague." After fome time he was allowed to leave the army for Rome, and by his great activity and vaft exertions obtained the confulate by a great majority. This was in the year 107, and the next object of his ambition was to fupplant Metellus in the command, for which purpofe he did not fcruple to make ufe of the bafeft means that a fervile mind could invent. He obtained his object, and on his arrival in Africa with the fupreme command, Metellus declined an interview, and leaving his army to be delivered up by a lieutenant, embarked for Italy. Marius fpent the fummer in difciplining his new levies, and in watching the motions of the two kings, Jugurtha and Bocchus. At length his gloomy heart fuggefted to him that the city of Capfa might afford him a fit object of enterprize: he fuddenly marched and furrounded it, and having forced it to furrender, he cruelly put to death all the adult males, felling the other inhabitants for flaves, and then levelling the place with the ground. This unfortunate city was fituated in the African defert, and its almoft inftant deftruction ftruck fuch terror into every place to which the knowledge of the fact could extend, that deputies came in from all fides making fubmiffion and offering him thofe fupplies for his army which the country afforded. He next invefted Mulucha, a fortrefs fituated upon a high and infulated rock that had been deemed impregnable: after much time being fpent, and various attempts to ftorm it had failed, he had given orders to abandon the enterprize, when a Ligurian foldier accidentally difcovered an acceffible part in a cleft of the rocks: by this they made themfelves mafters of the place, and found in it an immenfe quantity of treafure, fo that the army were enabled to march back to the fea-coaft laden with booty. On their return they were furprized by the united forces of the two kings, and brought into imminent danger, from which they were extricated by the fkill and exertions of Marius, and his quæftor Sylla, who now began to diftinguifh himfelf. The Numidians, in repeated attacks, were repulfed with great flaughter, and the Roman army gained their winter-quarters in fafety. In the following year overtures of peace were made by Bocchus, who agreed, as part of the conditions, to betray Jugurtha into the hands of the Romans, which was effected by the management of Sylla. By this event the war was brought to a conclufion, with no lefs honour to Sylla than to Marius. Owing to fome fudden and unexpected danger which threatened the city Marius returned, was a fecond time elected conful, and obtained a triumph in confequence of his fucceffes, at which Jugurtha and his two fons were led chained before his chariot. The war againft the Gauls and Cimbri was entrufted to him, and he continued in his career of fuccefs: he was a ftrict difciplinarian, kept his foldiers in the moft perfect obedience, and did himfelf honour by the equity with which he adminiftered juftice among them. An inftance of this kind is mentioned, in which he not only pardoned, but rewarded a youthful foldier who had killed his nephew for an infamous attempt on his perfon. Thus preferving his reputation entire, and alfo on account of the fervices which he yielded his country, he was elected a third and a fourth time conful. When it was propofed to confer that high honour upon him a fifth time, he accepted it only as an obligation to free the republic from its remaining foe, and declined a triumph till his victory fhould be complete. In the mean time the Cimbri had poured into Italy fuch immenfe numbers of troops, that an univerfal panic and conflernation were experienced, till Marius with his army made a junction with them, and he himfelf took the fupreme command. A moft bloody battle fucceeded, and the Romans, by the fuperior fkill of their generals, rendered the field of battle a fcene of mere carnage. Almoft the whole nation of the Cimbri, with their wives and children, fell in the action, or were made prifoners, while the lofs of the Romans was ſo ſmall, as ſcarcely to be credited. The Roman ſoldiers were diſpoſed to give their plebeian hero all the honour of the day, yet it was not poſſible to deprive Catullus of his ſhare of the victory. Each chief built a temple which he had vowed during the action; that of Marius was conſecrated to Virtue and Honour, and on the day of its dedication he gave games to the people after the Grecian manner; but being himſelf ignorant in ſuch ſports, he wiſely withdrew as ſoon as they were commenced. He was now too much habituated to power to acquieſce in the condition of a private citizen, and declared himſelf a candidate for a ſixth conſulate: being, though not without the groſſeſt corruption, elected to the office on which he had ſet his heart, he ſought that employment for his talents at home which the reduction of foreign enemies left him no opportunity of exerciſing abroad. He determined to oppoſe himſelf to the riſing power of Sylla, which was the foundation of the civil war. Sylla refuſed to deliver up the command of the forces with which he was empowered to proſecute the Mithridatic war, and he reſolved to oppoſe the authors of the demand, which he conſidered as arbitrary and improper. He advanced to Rome, and Marius was obliged to ſave his life by flight. Unfavourable winds prevented him from ſeeking a ſafer retreat in Africa, and he was left on the coaſts of Campania, where he was ſoon diſcovered, hidden in a marſh, by the emiſſaries of the enemy. He was violently dragged from his vile retreat, and hurried to the neighbouring town, and before magiſtrates entirely devoted to the intereſts of Sylla, who, without the ſmalleſt heſitation, paſſed ſentence of death on their priſoner. A ſoldier was ſent to put him to death: the man entered the apartment with a drawn ſword, when he ſaw a light beam from the ſtern countenance of the illuſtrious captive, and heard a voice exclaiming "Tune, homo, audes occidere Caium Marium? Dareſt thou, man, to kill Caius Marius?" Overcome with terror, he ruſhed out, dropped his ſword and declared himſelf incapable of ſo baſe an action. An adventure ſo uncommon awakened the compaſſion of the people, who conſidered it as a divine interference in behalf of Marius, and they accordingly not only releaſed Marius from priſon, but favoured his eſcape into Africa. Here he joined his ſon Marius, who had been exciting and arming the princes of the country in his cauſe. Marius landed near the walls of Carthage, and received ſome conſolation at the ſight of the venerable ruins of a once powerful city, which, like himſelf, had been expoſed to calamity, and felt the cruel viciſſitude of fortune. This place of his retreat was ſoon known, and the Roman governor, willing to conciliate the favour of the proſperous Sylla, ſent an officer to warn him to leave the province. The noble minded exile replied to the man, "Go tell thy maſter, that thou haſt ſeen the baniſhed Marius ſitting on the ruins of Carthage." He ſoon found it neceſſary to ſeek a place of ſafety in a neighbouring iſland, where he heard that Cinna had embraced his cauſe at Rome; animated with this intelligence, he ſet ſail to aſſiſt his friend and advocate, at the head of a thouſand men only. His army gradually increaſed after he had landed in Tuſcany, and he was enabled to march into Rome like a conqueror. Cinna, by his own authority, inveſted Marius with the title of proconſul, and would willingly have aſſigned him attendants belonging to that dignity; but Marius, affecting the humility of an exile worn down by age and grief, declined the honour, and appeared in ſqualid attire, unaccompanied, and walking ſlowly, with downcaſt looks, while a ſullen ferocity broke through and ſtruck the beholders with terror. After various actions the ſenate thought it neceſſary to treat with Cinna; he was reſtored to the conſular dignity and invited into the city. The chiefs began their march, but Marius halted at the gate, obſerving, that he was a baniſhed man, and prevented, by the laws, from entering till the ſentence againſt him was repealed. This was ſpeedily done, but ſcarcely was the decree reverſed, before he began to take a moſt ſignal revenge on his enemies. Rome was filled with blood, and he who had once been called the father of his country, marched through the ſtreets of the city, attended by a number of aſſaſſins, who ſlaughtered all thoſe whoſe ſalutations were not anſwered by their leader. Such was the ſignal for murder. When Marius and Cinna had ſufficiently gratified their reſentment, they made themſelves conſuls; but Marius was already worn out with old age and infirmities, and lived but ſixteen days in poſſeſſion of the conſular dignity with which he had been inveſted for the ſeventh time. He died in the year 86 B.C., and was thus ſaved from the diſgrace and ſufferings which awaited his party from the hand of the victorious Sylla. Marius had rendered himſelf conſpicuous by his conqueſts, and infamous by his cruelties. He was unqueſtionably one of the greateſt, and moſt fortunate of the Roman generals, and had, in his character, ſome features of rude grandeur. Rome ſeemed to rejoice at the fall of a man whoſe ambition had proved fatal to ſo many citizens. His chief qualifications were thoſe of a great general, and with theſe he rendered himſelf the moſt illuſtrious and powerful of the Romans, becauſe he was the only one whoſe ferocity ſeemed capable of oppoſing the barbarians that would have laid waſte the empire. His ſon Caius Marius was as cruel as himſelf, and ſhared his good and his adverſe fortune: at the death of his father and Cinna, he became the leader of the party: he made himſelf conſul when he was but twenty-five years of age, and he murdered all the ſenators who oppoſed his ambitious views. He was defeated by Sylla, and fled to Præneſte, where he killed himſelf. Plutarch. Univer. Hiſt.

MARIUS, LEONARD, a Dutch theologian, who flouriſhed in the 17th century, was born at Goes, in Zealand, but in what year is not known; nor have we any material facts relating to him till we find him created a doctor of divinity at Cologne. He was elected profeſſor of theology in that univerſity, and was afterwards choſen preſident of the Dutch college in that city. He was afterwards appointed vicar-general of the chapter of Haarlem, and paſtor at Amſterdam. He died in the year 1628, leaving behind him a conſiderable character for talents and learning. He was profoundly ſkilled in the Greek and Hebrew languages, and in the knowledge of the ſacred ſcriptures. He was author of "Commentarius in Pentateuchum," which is regarded as a work of great merit: "Hierarchiæ Eccleſiaſticæ Catholica aſſertio," intended as a refutation of the famous treatiſe of Mark Antony de Dominis "De Republica Eccleſiaſtica;" and of a variety of controverſial pieces in the Dutch language. Moreri.

MARK, POPE, and a ſaint in the Roman calendar, probably a native of Rome, and ſucceſſor to pope Sylveſter in the year 336. There is nothing recorded of him or of his pontifical acts that can claim the attention of our readers. Some authors ſay that he occupied the papal chair between two and three years, but others, and thoſe the moſt worthy of credit, ſtate that he died within nine months of his election. Moreri. Bower.

MARK, among *Bowlers*. See BOWLING.

MARK, in *Matters of Commerce and Manufacture*, a certain character ſtruck, or impreſſed, on various kinds of commodities, either to ſhew the place where they were made, and the perſons who made them; or to witneſs they have been viewed

viewed and examined by the officers or magiftrates charged with the infpection of that manufacture; or, laftly, to fhew that the duties impofed thereon have been regularly acquitted.

Thus are cloths, leathers, cutlery-ware, paper, plate, weights, meafures, &c. to be *marked*.

The mark on goods alfo is what afcertains the property or goodnefs thereof, &c. And if one man fhall ufe the mark of another, to the intent to do him damage, action upon the cafe lieth. A penalty is inflicted in this cafe, by the ftat. 23 Eliz. cap. 8.

Mark is alfo a particular fign or character, known only to the trader who pitches on it; whereby, being fixed to any commodity, he recollects the price it coft him.

Thefe marks, otherwife called *numeros*, are taken according to the fancy of thofe who ufe them; but, ordinarily, they are chofen from among the letters of the alphabet, each having a relation to fome particular number of figures. They are of fo much ufe in trade, that the reader will not take it amifs, if we infert a little table to ferve as a model for their conftruction:

A	B	C	D	E	F	G	H	I	K	L	M
0	1	2	3	4	5	6	7	8	9	10	20

One example will give the whole ufe of this table. Suppofe, *v. g.* I would put on a piece of ftuff, that it coft 37*s.* 6*d. per* ell. I put an M for 20*s.* an L for 10*s.* an H for 7*s.* and a G for 6*d.* fo that the feveral letters written after each other (obferving always to feparate fhillings from pounds, and from pence, by points) will make this mark M. LH. G. equal to 37*s.* 6*d.*

Note, the mark may be diverfified infinitely, by adding other figures to the letters, in lieu of thefe.

Ordinarily fome word of a proper number of letters, all different ones, is chofen, that no relation may be traced among the letters, which may be done in the table here given.

Mark, *Marc*, or *Marco*, alfo denotes a weight ufed in feveral ftates of Europe, and for feveral commodities, efpecially gold and filver in France; where it was introduced under Philip I about the year 1080.

The mark is divided into eight ounces, called the "poids de marc;" the ounce being fubdivided into eight gros, 20 efterlins, 24 deniers, 40 mailles, and 80 felins, or 576 grains. A French mark weighs 5094 Dutch afes, or 3778 Englifh grains. Thus 60 oz. poids de marc are nearly equal to 59 oz. troy: or more accurately, 4608 French grains = 3778 Englifh grains. Diamonds are weighed by the ounce of 144 carats, each carat weighing four grains, poids de marc, or 3.279 Englifh grains.

The poids de marc was likewife, till the revolution, the legal weight for merchandize at Paris, and in moft other parts of France; the livre or pound being divided into two marks, or 16 ounces; and the ounce into eight gros, 24 deniers, or 576 grains; a quintal = 100 lb.; and a charge, three quintals; 100 lbs. poids de marc = 108 lb. avoirdupois. The apothecaries' weight in Paris was the common poids de marc, and the pound contained 16 ounces; but the ounce was divided into three duelles, four feiliques, fix fextules, eight drachms, 24 fcruples, or 576 grains. In other parts of France, the pound of apothecaries' weight was 12 ounces, and was therefore three quarters of the Paris apothecaries' pound.

At Amfterdam, the finenefs of gold under the old fyftem is expreffed in carats and grains; the mark being divided into 24 carats, and the carat fub-divided into 32 parts. The finenefs of filver is expreffed in deniers and grains, the mark fine being 12 deniers, the denier 24 grains. According to the new fyftem, the finenefs of gold and filver is expreffed by fuppofing it to be divided into 1000 parts, called milliemes; thus $41\frac{2}{3}$ milliemes anfwer to a carat of gold, that is the 24th part; and $83\frac{1}{3}$ milliemes to a denier of filver, or the 12th part. (See Money.) Nineteen marks Dutch troy weight of fine gold anfwer to 164 ounces of ftandard gold in London; and 37 marks troy of fine gold in Amfterdam are equal to 2665 ducats of gold in Hamburgh. The finenefs of filver is expreffed in pennyweights and grains; the mark being divided into 12 pennyweights, and the pennyweight into 24 grains. A mark of fine filver, in bars, is worth 25 florins 16 ftivers current, more or lefs; a mark of Englifh filver coin is worth 25 fl. 12 ft. current, more or lefs; a mark of French filver, about 10 dwts. 21 gr. fine, is worth 23 fl. 8 ft., more or lefs. Wrought filver muft be $10\frac{1}{2}$ dwts. fine, and is ftamped with two croffes and a crown. Gold, filver, and coins, are weighed by the mark troy; a mark troy being divided into eight ounces, and the ounce into 20 engels, or 640 afes. This weight is the fame in all parts of Holland; 10,000 afes are equal to 7417 grains, Englifh troy weight; hence, two marks, or a pound, Dutch troy weight = 15 ounces, 16 pennyweights, 11 grains, Englifh troy weight, or 7595 grains; and 90 ounces, Dutch troy, weigh 89 ounces, Englifh troy; or 135 lbs. Dutch troy, 178 lbs. Englifh troy weight. In weighing pearls and diamonds, the mark troy is divided into 1200 carats, fo that one engel, or 32 afes, is then equal to $7\frac{1}{2}$ carats; thefe are fubdivided into halves, 4ths, 8ths, 16ths, 32ds, and 64th parts. The affaying weight contains 12 pennyweights, of 24 grains each, to the mark; and at the mint, one engel is divided into four vierlings, eight troykens, or 16 duefkens. In the commercial weight, 1 lb. contains 2 marks, 16 ounces, 32 loots, or 128 drams, and weighs 10,280 afes, Dutch troy weight, or 7625 Englifh grains.

At Cologne the pound is divided into 2 marks, 16 ounces, 32 loths, 128 quints, or 256 pfenings. This weight is the fame as that with which gold and filver are weighed in Hamburgh, particularly at the bank; and, by an edict of the emperor Charles V. of 1524, the Cologne mark was made the ftandard weight for coin all over the empire, and ftill continues the fame. The Cologne mark muft weigh 3608 Englifh grains, 4400 French grains, 4352 Cologne efchen (a divifion ufed in Hamburgh) or 4864 Dutch afes; and in the valuation of coins, it is divided into 65,536 parts, called richtpfenings, each Cologne pfening containing 256 fuch parts; 480 marks Cologne weight = 451 ounces Englifh troy; and 100 lbs. Cologne weight = 103 lbs. avoirdupois.

At Dantzic, the mark of fine gold is divided into 24 carats, and each carat into 12 grains; the mark of fine filver into 16 loths, each of 16 pfenings; wrought filver is from 12 loths 12 pfenings, to 13 loths fine; a mark, gold and filver weight, is divided into 8 ounces, 16 loths, 24 fchotts or carats, 64 quintlins, or 256 pfenings; and weighs 3974 Dutch afes, or $2947\frac{1}{4}$ Englifh grains. Hence 30 oz. of Dantzic gold and filver weight = 23 oz. Englifh troy nearly; or 45 marks of Dantzic = 23 lbs. troy.

At Geneva, the ounce of fine gold is reckoned at 24 carats, fubdivided by fome into 32, by others into 24 parts. The mark of fine filver is reckoned at 12 deniers; and the denier subdivided into 24 grains. The carat of fine gold is worth $48\frac{1}{3}$ sous current, or the ounce, 58 livres 4 sous, more or less; the denier of fine silver, $54\frac{1}{4}$ sous; or the mark, 32 livres 14 sous, more or less.

The mark with which gold and silver are weighed is generally considered the same as the French mark; some writers, however, state that 100 marks of Geneva are equal to 100 marks 1 oz. 13 deniers 22 grains, French poids de marc, the difference being $\frac{2}{9}$ *per cent.* In this case, 450 ounces of Geneva gold and silver weight answer to 451 ounces French, or $443\frac{1}{4}$ ounces English troy weight.

At Hamburgh, the fineness of gold is expressed in carats and grains; the mark fine (that is, the mark of fine gold) being reckoned at 24 carats, or 288 grains. Gold is sold by ducats; and $23\frac{1}{2}$ carats, or 282 grains of the Cologne mark of fine gold, are valued at 67 such ducats: hence 47 Cologne marks (or 353 ounces 5 dwt. 16 gr. English troy) weigh 3216 ducats, each valued at 96 shillings banco, more or less; 47 Cologne marks of Portugal gold, 22 carats fine, are reckoned at 2948 ducats; and 43 such marks of gold, $21\frac{1}{2}\frac{3}{4}$ carats fine, at 2692 ducats. Light ducats are sold by the mark; and for each full ducat weight, about $96\frac{1}{4}$ shillings banco are given. The fineness of silver is expressed in loths and grains; the mark fine being reckoned at 16 loths, or 288 grains. The Cologne mark of fine silver, in bars, is sold at about 27 marks 10 or 12 shillings banco; the mark of fine silver, in pieces of eight, that is, Spanish dollars, valued at $14\frac{5}{9}$ loths fine, is commonly a few shillings lower. But as the dollars coined since 1772 are at most only $14\frac{1}{2}$ loths (that is, 10 oz. $17\frac{1}{4}$ dwt.) fine, it occasions a difference in the price; because 88 marks of fine silver, in dollars valued at $14\frac{5}{9}$ loths fine, contain, in reality, only 87 marks of fine silver. In former times, for 2 marks of old but not worn-out dollars, 17 pieces were reckoned; and such a piece was sold for 48 shillings banco, more or less: whereas 1000 new rix-dollars now weigh 115 marks 4 to 8 loths; and 12 such marks are reckoned for 11 marks of fine silver.

Gold, silver, and coins, are weighed with the Cologne weight. The pound contains 2 marks, 16 ounces, or 32 loths; the ounce, 2 loths, 8 quentins, 32 pfenings, 544 eschen, or 8192 richt-pfenings. The Cologne mark weighs 3608 English grains; so that 480 ounces, Cologne weight, are equal to 451 ounces English troy weight. Pearls and diamonds are weighed by the carat of 4 grains; the carat being divided into 8, 16, 32, and 64 parts: 71 such carats weigh half an ounce, Cologne weight; hence a carat = 3.176 English grains. In the commercial weight, the pound is divided into 2 marks, 16 ounces, or 32 loths; the ounce into 2 loths, 8 quentins, 32 pfenings, or 630 ases. This pound answers to 33 loths $2\frac{1}{2}$ pfenings, Cologne weight; that is, $96\frac{1}{4}$ pounds Hamburgh weight answer to 100 pounds Cologne weight; and 103 pounds Hamburgh weight = 110 pounds avoirdupois weight.

At Leipsic, gold and silver are weighed with the Cologne mark. The mark of light ducats is worth about 190 rix-dollars current; the mark of light louis-d'ors, or pistoles, 172 rix-dollars, more or less; and the mark of fine silver, 13 rix-dollars, more or less, all in the new Saxon currency. The mark of wrought silver, in Saxony, is 12 loths (or $\frac{12}{16}$ths) fine. In the commercial weight, the pound is 2 marks, 16 ounces, or 32 loths; and the loth, 4 quintlins, 16 pfenings, 32 hellers, or 240 grains: 102 pounds of the Leipsic heavy weight, or a centner of 110 pounds of the common weight, answer to 113 pounds avoirdupois nearly; or 35 pounds of Leipsic common weight = 36 pounds avoirdupois. The commercial weight of Leipsic is the standard weight all over Saxony.

At Milan, gold and silver are weighed by the mark of 8 ounces; the ounce being 24 denari, or 576 grani. The mark of Milan weighs 7 ounces 16 deniers 10 grains, French poids de marc, or 3629 English grains: hence 192 marks of Milan answer to 121 pounds English troy, or 128 ounces of Milan to 121 ounces English troy.

At Mantua, the weight for gold and silver is the same as in Milan; but the commercial weight of Mantua is about 2 *per cent.* lighter, or 100 pounds of Mantua = $63\frac{1}{2}$ pounds avoirdupois.

For further particulars, see the names of the several countries and principal towns in this dictionary; and for a fuller account, see Kelly's Universal Cambist., vol. i.

Mark is also used among us for a money of account; and, in some other countries, for a coin.

The English mark, formerly in circulation, is two-thirds of a pound sterling, or 13*s.* 4*d.*; and Matthew Paris observes, it was of the same value in 1194. The ancient Saxons, as many antiquarians have supposed, called the marc *mancus*, or *mancusa*, and *mearc*; among them it was equivalent to thirty pence, *i. e.* to seven shillings and sixpence of our money. But Dr. Milles, dean of Exeter, has lately suggested that the mancus and mark were not the same. Mr. Clarke observes, that the Danish silver mark was 20*s.*, or one hundred Saxon pennies; and that the gold mark was twelve times as much; whereas the French mark was 13*s.* 4*d.* or one hundred and sixty pence: and he has shewn, that the method of computing by the silver mark was introduced later into France, where it commenced between A.D. 1075 and 1093, than into England. He discovers traces of it in England from the Danish kings till after the time of Henry II. The gold coin struck from Edward III. to Edward IV. were divisions of the mark, as half-marks, quarter-marks, and half-quarter-marks, at 6*s.* 8*d.*, 3*s.* 4*d.*, 20*d.* each: but from Edward IV., when our connections with France ceased, the old way of computing by the pound came again into fashion; but, as that by marks was jointly used, angels, and angelots, or half angels at 6*s.* 8*d.* and 3*s.* 4*d.* each, passed sometimes as parts of them. However, about 40 years afterwards, this regard to the marks in our coins was quite laid aside, and all the principal gold coins were struck in proportion to the pound sterling. Connexion of the Roman, Saxon, and English Coins, &c. p. 307, &c.

The mark-lubs, or Lubec-mark, used at Hamburgh, is also a money of account, equal to $2\frac{2}{3}$ shillings Flemish, or 32 grotes; consequently the shilling or sol-lubs is 2 grotes or pence Flemish. The rix-dollar is 3 marks, 48 shillings, or 576 pfenings. The rix-dollar of exchange is 2 marks, 32 shillings, or 384 pfenings. The pound Flemish is $2\frac{1}{2}$ rix-dollars, $7\frac{1}{2}$ marks, 20 shillings Flemish, 120 shillings lubs, 240 grotes Flemish, 720 dreylings, or 1440 pfenings. Each mark is divided into sixteen sols lubs.

At Copenhagen, accounts are kept in rix-dollars of 6 marks, or 96 shillings Dansk or Danish; and this is the general way of keeping accounts throughout Denmark, except in the duchies of Holstein and Sleswick, where they are kept in rix-dollars of 3 marks, or 48 shillings lubs; and at Elsineur on the Sound, where they are kept in rix-dollars of 4 orts, or 96 skillings Danish. The base rix-dollar (slet-daler), an imaginary coin, is reckoned at 4 marks, or 64 skillings Danish. A mark is divided into 16 skillings or shillings; and a skilling into 2 fyrkes, 3 wittens, or 12 pfenings Danish. The Danish denominations of marks and shillings

ſhillings have only half the value of the ſame denomination in lubs or Hamburgh money: thus, 2 marks Daniſh are worth 1 mark Hamburgh, &c. In coins, the effective rix-dollar, in which the bank of Altona keeps its accounts, is reckoned at 6 marks Daniſh: in the Sundiſh ſpecie, in which the tolls are paid by ſhips ſailing through the Sound, this coin is about $2\frac{5}{6}$ *per cent.* worſe than the former; or, more correctly, 472 rix-dollars Sundiſh ſpecie = 459 rix-dollars ſpecie: crown money is $15\frac{35}{81}$ *per cent.* lower than ſpecie; Daniſh currency, in which the books of merchants and tradeſmen are kept, which is $6\frac{1}{4}$ *per cent.* worſe than crown money, and $22\frac{11}{12}$ *per cent.* worſe than ſpecie; and Holſtein currency, in which accounts are kept in Holſtein and Sleſwick, is 25 *per cent.* below ſpecie. The coins of Denmark are, in gold, ducats ſpecie, which, as well as Dutch ducats, are worth 14 marks 12 ſhillings Daniſh currency, more or leſs; current ducats coined ſince 1757, at 12 marks Daniſh currency; Chriſtian-d'ors, coined in Holſtein ſince 1775, which are worth about 13 marks lubs, or 26 marks Daniſh currency. In ſilver, the ſpecie rix-dollars paſs for 7 marks 6 ſkillings Daniſh currency, and are commonly reckoned at 6 marks 12 ſkillings crown money, at the toll on the Sound; double, ſingle, and half crowns, at 8, 4, and 2 marks crown money, or 8 marks 8 ſkillings, 4 marks 4 ſkillings, and 2 marks 2 ſkillings current; double and ſingle pieces called Ebrœers or Juſtus Judex, at 28 and 14 ſkillings; rykforts at 24 ſkillings, and pieces of 15, 10, 8, 4, and 2 ſkillings currency. In copper, pieces of 1 ſkilling Daniſh; fyrkes or $\frac{1}{4}$ ſkillings; and dreylings or $\frac{1}{4}$ ſkillings. The new Holſtein currency, coined ſince the year 1788, conſiſts of ſpecie rix-dollars, at 48 ſkillings ſpecie, or 60 ſkillings Holſtein currency; and pieces of 32, 16, 8, 4, and 2 ſkillings ſpecie, or 40, 20, 20, 5, and $2\frac{1}{2}$ ſkillings Holſtein currency. In this money, the Cologne mark of fine ſilver is coined into $9\frac{1}{4}$ rix-dollars ſpecie, or $11\frac{9}{16}$ rix-dollars currency. Silver in bars is taken at the Daniſh banks at the rate of $9\frac{1}{4}$ rix-dollars *per* mark fine, provided it is not under 13 loths fine. Foreign gold coins in Denmark paſs as follow: piſtoles, Fredericks, and ſuch like coins, for 12 marks 11 ſkillings lubs; carolins for 15 marks 9 ſkillings ditto; guineas for 15 marks 12 ſkillings ditto; old French louis-d'ors for 15 marks 7 ſkillings ditto; Portugal pieces of 6400 rees for 27 marks ditto; ducats for 7 marks 3 ſkillings ditto, or double the value in marks and ſkillings Daniſh: 67 of the ducats ſpecie, coined by the king of Denmark as duke of Holſtein, being of the ſame weight and fineneſs as thoſe of the empire, ſhould weigh a Cologne mark, $23\frac{2}{3}$ carats fine; $85\frac{3}{8}$ ducats currency muſt contain a Cologne mark of fine gold, and they are little more than 21 carats fine. From a Cologne mark of fine ſilver, $62\frac{1}{2}$ marks in crowns, or 68 marks in ſilver currency ſhould be coined; and by a royal edict of 1776, $9\frac{1}{4}$ rix-dollars ſpecie are to contain a mark of fine ſilver, each piece weighing 537,69 eſchen, Cologne weight, or 447.9 Engliſh grains, and being 14 loths or $\frac{14}{16}$ths fine; ſo that it contains 391.9 Engliſh grains of fine ſilver. The rix-dollar Daniſh currency, in current ducats or 12 mark-pieces, is equivalent to 28.48 German aſes, or $21\frac{1}{8}$ Engliſh grains of fine gold; and the ſame rix-dollar, in ſilver currency, contains 429 aſes, or 318 grains of fine ſilver: the rix-dollar in crowns may be valued at 467 aſes, or $346\frac{1}{2}$ grains of fine ſilver; thus the proportion of gold to ſilver is as $15\frac{9}{69}$ to 1. See Rix-dollar.

The pound, gold and ſilver weight, contains 2 marks, 16 ounces, or 32 lods; the lod, four quintins, 16 orts or pfenings, or 272 eſchen. This is called Cologne weight, but it is ſomewhat heavier, 608 marks of the Daniſh weight being equal to 611 marks of the Cologne weight; ſo that the Daniſh mark weighs 3625 Engliſh grains; 160 ounces Daniſh ſilver weight are equivalent to 151 ounces Engliſh troy weight; and 240 marks, or 120lbs. Daniſh ſilver weight = 151lbs. troy. The commercial weight is to the gold and ſilver weight as 17 to 16, and the pound has the ſame diviſions; it weighs 7703 Engliſh grains; and 100lbs. of Copenhagen = 110lbs. avoirdupois. Kelly's Univerſal Cambiſt. vol. i.

Mark, *County of*, in *Geography*, a principality of Germany, bounded on the N. by the county of Recklinghauſen, and biſhopric of Munſter, on the E. by the duchy of Weſtphalia, on the S. by the duchy of Berg, and on the W. by the duchies of Berg and Cleves. The ſoil of this county is fertile; it has good meadows, and alſo arable land, which produces wheat, rye, barley, oats, buckwheat, peas, beans, rape, turnip ſeed, flax, and hemp, in ſuch plenty as to ſupply neighbouring countries. It furniſhes alſo all kinds of fruits and legumes. Its mountains yield coal, iron, lead, copper, and ſilver ores, and quarries of ſtone. It contains more than 20 towns; its inhabitants are partly Roman Catholics and partly Proteſtants, all of whom enjoy the free exerciſe of their religion. The manufactures of the country furniſh commodities for exportation; and eſpecially articles of wrought iron and ſteel. The ancient counts of Mark derived their origin from the counts of Altona; and this territory was transferred, after having been poſſeſſed by Adolphus V. count of Mark and of Cleve, together with Cleve, to the electoral houſe of Brandenburg. The capital is Hamm.

Mark *Burgel*, a town of Germany, in the principality of Culmbach; 13 miles N.W. of Anſpach.

Mark *Lenkarſheim*, a town of Germany, in the principality of Culmbach; 14 miles N. of Anſpach.

Mark *Manſee*, a town of Auſtria; 10 miles N. of St. Wolfgang.

Mark *Maſſareen*, a town of Syria, in the pachalic of Aleppo, containing about 150 houſes; it is generally the halting place for the caravans between Scanderoon and Aleppo.

Mark *Oldendorf*, a town of Weſtphalia, in the biſhopric of Hildeſheim; ſix miles W. of Eimbeck.

Mark *Schelken*, a town of Tranſylvania; four miles N. of Stoltzenberg.

Mark, *St.*, a town of the iſland of Hiſpaniola, ſituated on a bay, on the W. coaſt, to which it gives name. The chief productions of the vicinity are ſugar, indigo, coffee, and cotton; 48 miles from Port Paix. N. lat. 19° 18'. W. long. 72° 42'.—Alſo, a river of Eaſt Florida, which runs into Apalache bay, a little below the town of St. Mark. —Alſo, a ſea-port town of Eaſt Florida, near the mouth of the river juſt mentioned. N. lat. 30° 10'. W. long. 84° 36'.

Mark, *Goſpel of St.*, in *Biblical Hiſtory*, a canonical book of the New Teſtament, being one of the four goſpels. Mark the evangeliſt is mentioned in 1 Pet. v. 13, and Dr. Lardner ſuppoſes, for reaſons which he has adduced, that he was the ſame with John Mark, whoſe name occurs in the Acts and in ſome of St. Paul's epiſtles, and accordingly that he was the fellow labourer of Paul, and Barnabas, and Peter. He was the ſon of Mary, a pious woman at Jeruſalem, and an early believer, at whoſe houſe the diſciples uſed to meet, and to which Peter frequently reſorted. (Acts, xii. 12.) The deliverance of Peter recorded in this paſſage, happened in the year 44. At this time Mark, called in

Col.

Col. iv. 10, "fifter's fon to Barnabas," went from Jerufalem to Antioch with Paul and Barnabas; and foon after, he accompanied them to other countries as their minifter (Acts, xiii. 5.); but declining to attend them during their whole progrefs, he returned to Jerufalem, and kept up an intercourfe with Peter and the other apoftles. When Paul and Barnabas fettled at Antioch, after the termination of their journey, we find Mark with them, and difpofed to attend them in their journies. At this time he went with Barnabas to Cyprus; and afterwards he accompanied Timothy to Rome, in confequence of the particular requeft of the apoftle Paul, during his confinement in that city. (2 Tim. iv. 11.) From Rome he probably went to Afia, where he met with St. Peter, with whom he returned to this city, and where he is fuppofed to have written and publifhed his gofpel. Such are the outlines of the hiftory of this evangelift, furnifhed by the New Teftament. From Eufebius, Epiphanius, and Jerom we learn, that Mark, after he had written his gofpel, went to Egypt, and founded a church at Alexandria, where, according to the laft of thefe ancient writers, he died in the eighth year of Nero, and was buried. Some authors have afferted, that he died a martyr; but this fact is not mentioned by Eufebius, or other more ancient writers; and the expreffions of Jerom feem to imply a natural death. Fabricius, in his account of St. Mark, fays nothing of his having been a martyr. From various authorities cited by Dr. Lardner, it appears that the evangelift Mark was a companion of Peter in the latter part of his life, and that he had great advantages from that apoftle's preaching for compofing a gofpel; and that he was well acquainted with Barnabas and Paul, and other apoftles and difciples, who had been eye-witneffes of Jefus, befides Peter. Some have fuppofed, that he was one of Chrift's 70 difciples; but whether this was the cafe or not, of which there is no decifive evidence, he was an early believer, and an early difciple and companion of the apoftles, and intimately converfant with them, and thus, as well as by hearing Peter preaching in Judea, and other places, and laftly at Rome, he was well qualified for writing a gofpel.

St. Mark wrote his gofpel at Rome, where he accompanied St. Peter, in the year of Chrift 64 or 65. Many of the moft ancient writers affert, that St Mark was no more than an amanuenfis or interpreter to St. Peter, who dictated this gofpel to him; others affirm that he wrote it after St. Peter's death. It is probable that it was compofed long before Peter's death, and that it was not publifhed, or did not become generally known, till after the death of Peter and Paul. This gofpel appears, from the accounts given of it by the ancients, to contain the fubftance of Peter's preaching: and the gofpel itfelf affords evidences of its being written according to that apoftle's difcourfes, or according to information and directions given by him to this evangelift. Many circumftances tending to Peter's honour, and recorded by the other evangelifts, are not mentioned in this gofpel. (See Matt. xvi. 16—20. compared with Mark, viii. 29, 30. Matt. xvii. 24—28. compared with Mark, ix. 30—33. Luke, xxii. 31, 32. John, xiii. 6, &c John, xviii. 10. compared with Mark, xiv. 47. John. xxi. 7. John, xxi. 15. John, xxi 18, 19) However, there are many things that occur in this gofpel, which are omitted by the other evangelifts, fee Mark, i. 13. 20. 29. 33. 35, 36, 37. 45. ii. 2. iii. 5, 6. 17. 19. iv. 26—29 34. 36. 38. v. 1. 19. vi. 13. vii. 2, 3, 4. 21, 22. 31. 37. viii. 22—26. x. 46. 52. xi. 13. xii. 41. 44. xiii. 3, 4. xiv. 51, 52. xv. 21. xvi. 7.; and this fact proves, that Mark was not an epitomizer of Matthew, as fome have fuppofed, nor of any other author, and that he was well acquainted with the things of which he undertook to write a hiftory. He writes as an eye-witnefs, or as one who had full and authentic information at the firft hand. Hence Lardner juftly concludes, that St. Mark's gofpel, though fhort, is a very valuable and mafterly performance. The learned have been divided as to the language this gofpel was wrote in, fome affirming it was compofed in Greek, which is the more general and probable opinion, others in Latin. Several of the ancient heretics received only the gofpel of St. Mark: others, among the Catholics, rejected the twelve laft verfes of this gofpel. But Dr. Lardner refers thofe who doubt the genuinenefs of this part of the gofpel, for fatisfaction, to Dr. Mill, and to the obfervations of Grotius, at the beginning of that chapter, and to Beza upon the ninth verfe; and for explaining thofe twelve verfes, and reconciling them with other evangelifts, he refers to Grotius and other commentators. Lardner's Works, vol. vi.

Mark, *St.*, *Canons of*, a congregation of regular canons, founded at Mantua, by Albert Spinola, a prieft, towards the end of the twelfth century.

Spinola made a rule for them, which was approved, corrected and confirmed, by feveral fucceeding popes. About the year 1450 they were reformed, and followed only the rule of St. Auguftine.

This congregation, which at firft confifted of eighteen or twenty houfes of men, and of fome for women, fituate in Lombardy, and the ftate of Venice, having flourifhed for the fpace of four hundred years, declined by little and little, and was at length reduced to two convents; and in 1584, that of St. Mark, at Mantua, which was the chief, was given, by the confent of pope Gregory XIII. to the Camaldulians; and fo the congregation became extinct.

Mark, *St*, *Knights of*, an order of knighthood in the republic of Venice, under the protection of St. Mark the Evangelift.

This order was inftituted in the year 737, the reigning doge being always grand mafter: it was always in great efteem, being only conferred on thofe who had performed fignal fervices to the commonwealth The badge of the order is a medallion of gold richly chafed, with a winged lion fejant, the wings elevated, holding in his finifter paw a fword erect, the dexter refting upon a book open; upon it are thefe words, "Pax tibi, Marce, Evangelista meus:" on the reverfe, the portrait of the reigning doge, with the image of St. Mark, delivering a ftandard to him. The medal is worn at the breaft, pendant to a chain of gold.

Mark, in *Law*, is the fign of the crofs affixed by the illiterate vulgar, to deeds, &c. when unable to write their names. See Seal.

Mark, in the *Manege*. A horfe marks, that is, he fhews his age by a black fpot, called the bud or eye of a bean, which appears, when he is five and a half, in the cavity of the corner teeth, and is gone when the horfe is eight years old. After that age he ceafes to mark, and is faid to have razed. See Age in *Horfemanfhip*, and Eye *of a Bean*.

Mark, in *Rural Economy*. See Land-*mark*.

Mark, *Sea*, in reference to *Navigation*, &c. See Beacons.

Mark, *Letters of*. See Letters and Marque.

Mark-*Statutes*, are graduated ftakes or pofts to fhew the rife or fall of water in a river, canal, or refervoir.

MARKAN, or Markhan, in *Geography*, a town of Grand Bucharia; 70 miles N.W. of Balk.

MARKARYD, a town of Sweden, in the province of Smaland; 50 miles S.W. of Wexio.

MARKDORF, or MARCHDORF, a town of the duchy of Baden; nine miles N.E. of Conftance. N. lat. 47° 45. E. long. 9° 22.

MARKEN, a fmall ifland on the weft fide of the Zuyder fee, near the coaft of Holland; two miles E. of Monikedam.

MARKERSDORF, a town of Saxony, in the circle of Neuftadt; fix miles E. of Weyda.

MARKESDORF, a town of Bohemia, in the circle of Leitmeritz; four miles S. of Kaunitz.

MARKET, a public place in a city or town, where provifions are expofed to fale.

The word is formed from the French, *marché*, which fignifies the fame.

MARKET is alfo ufed for a liberty or privilege, either by the king's grant, or by long and immemorial ufage and prefcription, which prefuppofes fuch a grant, whereby a town is enabled to keep a market.

If any perfon fet up a fair or market fo near mine that he does me a prejudice, it is a nuifance to the freehold which I have in any market or fair; but in order to its being a nuifance, it is neceffary, 1. That my market or fair be the elder, otherwife the nuifance lies at my own door; 2. That the market be erected within the third part of 20 miles from mine. For fir Matthew Hale (on F. N. B. 184.) conftrues the *dieta*, or reafonable day's journey, mentioned by Bracton (l. 3. c. 16.) to be 20 miles; as it is ufually underftood, not only in our own law (2 Inft. 567.), but alfo in the civil (Ff. 2. 11. 1.) from which we probably borrowed it. So that if the new market be not within feven miles of the old one, it is no nuifance; for it is held reafonable, that every man fhould have a market within one-third of a day's journey from his own home; that, the day being divided into three parts, he may fpend one part in going, another in returning, and the third in tranfacting his neceffary bufinefs there. If fuch market or fair be on the fame day with mine, it is *prima facie* a nuifance to mine, and there needs no proof of it, but the law will intend it to be fo; but if it be on any other day, it may be a nuifance; though whether it is fo or not, cannot be intended or prefumed, but I muft make proof of it to the jury. Blackft. Com. book iii. See FAIR.

In former times, it was cuftomary to have moft fairs and markets kept on Sundays, and in the church-yard, fo that matters of bufinefs and devotion were tranfacted all at the fame place and time; which cuftom, though prohibited by feveral kings, particularly 13 Ed I. ftat. 2. cap. 6. was yet held up till the reign of king Hen. VI. when it was effectually fuppreffed, 27 Hen. VI. cap. 5. In many places they are ftill kept in the church-yard.

In the country, things fold in the markets, are to be in the ufual place appointed for the fale; and market overt is only held on the fpecial days, provided for particular times by charter or prefcription; but in London every day, except Sunday, is market-day (Cro. Jac. 68.), and every fhop is a market overt, for fuch goods as are put there, to be fold by the trade of the owner (5 Rep. 83. 12 Mod. 521.); though if the fale be in a warehoufe, and not publicly in the fhop, the property is not altered. Sale upon a Sunday, though in a fair market, will not alter the properties of the thing fold. If my goods are ftolen from me, and fold, out of market overt, my property is not altered, and I may take them wherever I find them.

Perfons that dwell in the country, may not fell wares by retail in a market-town, except in open fairs; but countrymen may fell goods in grofs there. (1 and 2 P. and M. cap. 7.) All contracts for any thing vendible in fairs or markets overt fhall be binding, and fales alter the property, if made according to the following rules. 1. The fale is to be in a place that is open, fo that any one who paffeth by may fee it, and be in a proper place for fuch goods. 2. It muft be an actual fale, for a valuable confideration. 3. The buyer is not to know that the feller hath a wrongful poffeffion for the goods fold. 4. The fale muft not be fraudulent, betwixt two, to bar a third perfon of his right. 5. There is to be a fale and a contract, by perfons able to contract. 6. The contract muft be originally and wholly in the market overt. 7. Toll ought to be paid, where required by ftatute. The Mirror informs us (c. 1. § 3.), that tolls were eftablifhed in order to teftify the making of contracts, for every private contract was difcountenanced by law; infomuch that our Saxon anceftors prohibited the fale of any thing above the value of 20 pence, unlefs in open market, and directed every bargain and fale to be contracted in the prefence of credible witneffes. 8. The fale ought not to be in the night, but between fun and fun; though if the fale be made in the night, it may bind the parties. Sale of goods ftolen in London, or within two miles thereof, to brokers, &c. alters not the property. 1 Jac. I. cap. 21.

In market overt, if the goods be the property of the king, fuch fale (though regular in all other refpects) will in no cafe bind him; though it binds infants, feme coverts, idiots, or lunatics, and men beyond fea or in prifon; or if the goods be ftolen from a common perfon, and then taken by the king's officer from the felon, and fold in open market; ftill if the owner has ufed due diligence in profecuting the thief to conviction, he lofes not his property in the goods. (Bacon's Ufe of the Law, 158.) So likewife, if the buyer knoweth the property not to be in the feller, or there be any other fraud in the tranfaction; if he knoweth the feller to be an infant or feme covert not ufually trading for herfelf; if the fale be not originally and wholly made in the fair or market, or not at the ufual hours (according to the rules above fpecified); the owner's property is not bound thereby. (2 Inft. 713, 714.) If a man buys his own goods in a fair or market, the contract of fale fhall not bind him, fo that he fhall render the price; unlefs the property had been previoufly altered by a former fale. (Park. § 93.) And, notwithftanding any number of intervening fales, if the original vendor, who fold without having the property, comes again into poffeffion of the goods, the original owner may take them, when found in his hands who was guilty of the firft breach of juftice. (2 Inft. 713.) By which wife regulations, the common law has fecured the right of the proprietor in perfonal chattels from being devefted, fo far as was confiftent with that other neceffary policy, that purchafers, *bonâ fide*, in a fair, open, and regular manner, fhould not be afterwards put to difficulties by reafon of the previous knavery of the feller. But there is one fpecies of perfonal chattels, in which the property is not eafily altered by fale, without the exprefs confent of the owner, and thofe are horfes. (2 Inft. 719.) For a purchafer gains no property in a horfe that has been ftolen, unlefs it be bought in a fair or market overt, according to the directions of the ftatutes 2 P. and M. c. 7. and 31 Eliz. c. 12. See HORSE.

A piepowder court is incidental to a market, as well as a fair. (See COURT.) Keeping a fair or market, otherwife than it is granted, as on two days, when only one is granted, or on any other day than that appointed, &c. is caufe of forfeiture. And if a perfon erects ftalls in a market, and does not leave room for the people to ftand and fell their wares, fo that they are thereby forced to hire fuch ftalls, taking money for the ufe of them is extortion.

Market, *Court of the Clerk of the.* See Clerk *of the Market.*

Market, *Clerk of the*, in the king's houſhold. See Clerk.

Market-*towns.* See Towns.

Market, in *Rural Economy*, the town or place where any kind of articles, whether for the purpoſe of conſumption as food, or other means, are expoſed to ſale. The advantages of having theſe near and convenient, are of vaſt importance to the farmer in the diſpoſal of his different products. And in this view it becomes the duty of every farmer, before renting a farm, to carefully aſcertain its ſituation in regard to markets for the ſale of agricultural productions. The markets in the more fertile and populous parts of this country, are in general, a late writer ſuppoſes, good, and by means of turnpike-roads, inland navigations, or ſea-carriage, eaſy of acceſs; but were the regulations which have been propoſed to be adopted by government, reſpecting the ſale of grain eſtabliſhed, and one general ſtandard for weights and meaſures fixed upon, they would be ſtill more improved. The ſtate of the markets in the remote parts of this part of the iſland, as well as Scotland, is very materially different; and while the proprietors of theſe diſtricts remain ſo inattentive to their own intereſts, it is not probable that any material alteration will take place for the better. The loſs and inconvenience which the Welſh and Highland farmers are often ſubjected to, by being obliged to diſpoſe of their cattle on credit, are very great, and require the exertion of the chief proprietors in the particular diſtricts, to apply with effect in order to remove them. In theſe diſtricts, it is ſuppoſed, the cultivators of grain are as ill ſituated, in regard to markets, for the ſale of the produce of their farms, as thoſe who keep breeding ſtocks of cattle and ſheep. The effects of the want of markets, as deſcribed in the Report of Pembrokeſhire, applies very particularly to them. "The number of inhabitants, who live by handicraft buſineſs, or who buy their proviſions, is but ſmall in proportion to thoſe employed in agriculture, which occaſions the demand for corn and butcher's-meat in our markets to be ſmall. Hence, thoſe who grow a large quantity of corn, find a great difficulty in ſelling it. We have corn-dealers at the ports, who purchaſe corn during the autumn and winter months, at a price always much below what is ſold at the ſame time in the open markets. When wheat is ſix ſhillings the buſhel in the market, the dealers will hardly give five, and other grain in proportion. The reaſons for this difference between the dealer's price and the market price are theſe; he buys with a deſign to export his corn to Briſtol, or ſome other Engliſh port; he muſt take care in buying, to provide for ſtore-houſe rent, porterage, freight, inſurance by ſea, commiſſion on ſales at the port he ſends it to; and, laſtly, for his own trouble and capital employed. Beſides all theſe expences, he runs another material riſk: our corn is generally ſo damp, that it will not keep in the lofts without being laid thin, and turned at leaſt once a-week. If, in going to a port, a veſſel meets with contrary winds, and is delayed on her voyage, the cargo frequently heats to ſuch a degree, as to reduce its price below prime coſt, and then the dealers ſuffer a great loſs by the venture." From this acconnt of the ſtate of the markets in the remote parts of this country, it is ſuppoſed, "may be inferred, the advantages which the proprietors of ſuch diſtricts would derive by eſtabliſhing manufactures, whereby markets would be brought home, as it were, to every farm. Where that cannot be effected, inland navigations, where practicable, as being infinitely preferable to turnpike-roads for the carriage of corn to market, and for bringing manures in return, ought to become the next object of the proprietor's attention. By theſe the poſſeſſors of diſtant corn farms, are often put nearly upon a footing with thoſe in the more immediate neighbourhood of the beſt markets in the country. But it may frequently happen, that it would be impracticable to eſtabliſh extenſive manufactures, ſuch as would have the effect of creating a market for the ſurplus produce of a diſtrict, and phyſically impoſſible to form canals, ſo as to open a communication with other diſtant markets; in ſuch caſes, good level well made roads are the only alternative. Theſe, although an expenſive mode of conveyance, are highly beneficial, particularly in inland diſtricts remote from markets, and where it is impoſſible to form canals. Corn and meal are frequently carried in very great quantities from the ſouthern counties of Scotland, to the Edinburgh and Glaſgow markets, which, without turnpike-roads, would ſcarcely be practicable, at leaſt the expence to the farmers would be ſo great as to amount almoſt to a prohibition, and would neceſſarily compel them to turn their attention to breeding and grazing, rather than the tillage ſyſtem of huſbandry, which, under ſuch circumſtances, would certainly turn out the moſt profitable." The degree in which the ſituation of a farm is, in regard to markets, muſt obviouſly influence both proprietors and tenants, in making choice of particular rotations or modes of cropping in preference to others. Where no exertions can approximate markets to a farm, which would otherwiſe be well adapted to the cultivation of grain, breeding and grazing cattle, or other ſpecies of live ſtock, is, it is ſuppoſed, the beſt method in which ſuch farm can be occupied. Theſe, if not ſold in the diſtrict, can be carried to diſtant markets almoſt without roads, and at a comparatively trifling expence. Were the markets for the ſale of cattle in the north of Scotland and in Wales, as well regulated as in other parts of this kingdom, the moſt beneficial conſequences would enſue, as, except in theſe diſtricts, ſcarcely any improvement can be ſuggeſted. The dealers in cattle reſiding in the various diſtricts of Scotland, except thoſe in the ſouth and ſouth-weſt, generally move their cattle ſouthward at two ſeaſons, Auguſt and October; at which periods, what may be called the two great national markets for the ſale of black cattle are held at Falkirk in Stirlingſhire. There it is not uncommon to ſee 30 or 40,000 black cattle exhibited for ſale in one day; theſe being either purchaſed by dealers from England, or by ſome of the principal people in that line in Scotland, and thence driven forward to markets in the former part of the country. Probably nineteen out of twenty of the Scotch cattle enter this country by the way of Carliſle; and matters are ſo contrived, that there are cattle fairs, one ſucceeding another at proper intervals, during the whole courſe of the journey from the laſt place to the ſouthern parts of Surry. From Carliſle to the ſouthern parts of Yorkſhire, the droves are conducted along the ſame line of road. They are then branched off from the great London road in different directions; ſome going through the eaſtern parts of the country towards Norfolk, Suffolk, and Eſſex; and the remainder through the weſtern part of Nottinghamſhire, Leiceſterſhire, Northamptonſhire, Buckinghamſhire, &c.; and ſuch as are not ſold in theſe diſtricts, are ſent to Barnet in Middleſex, as a centre, and are there expoſed to ſale. When any of them remain unſold after Barnet fair, which, owing to a combination of unfavourable circumſtances, ſometimes happens, they are ſent forward to markets in Surry, Dorſet, &c. which alſo ſucceed each other in the ſame manner. "From this arrangement, were the farmers in the remote diſtricts to receive ready money for their cattle when ſold, it is preſumable, that from the competition

competition which generally takes place among the dealers at the provincial fairs, they would receive a fair adequate price, confidering the rifk of lamenefs or death, bad fales, and the great expence attending driving cattle to fuch diftant markets."

In the Agricultural Report of the Weft-Riding of Yorkfhire, it is obferved, that a "very confiderable corn-market is held at Knarefborough in that county, where dealers from the weftern parts of the riding attend, and purchafe grain from the farmers in that neighbourhood; a great part of which is re-fold at Shipton-market, in Craven, and carried ftill farther weftward, where corn is fcarce, and gives employment to a number of people who are concerned in this traffic. It is under circumftances of this kind that public markets for grain can be confidered as advantageous to the growers or purchafers of corn. The firft cannot get his commodity difpofed of at home, hence willingly goes a ftage to meet his merchant; and the latter being fure to meet with a fupply, attends upon market day, with his horfes and carts, for conveying it to the place where he is to ufe it, or difpofe of it again. By this mode no time is loft, no unneceffary labour incurred; whereas, were all the grain in the kingdom to be fold in the public market, as fome wild imaginations recently propofed, a great wafte of both muft neceffarily happen. Let us juft fuppofe, that fuch a law had been paffed, and that the grain fold at Knarefborough was not to be drove to the weft bounds of the riding, but that it was wholly to be confumed in the neighbourhood of that place; and fay where would be the advantage arifing from fetting down the facks in the market? It might happen that a baker or maltfter purchafed the very wheat or barley which was grown by his next door neighbour, but which, in confequence of fuch miftaken law, could not be fold without being firft offered to fale in this public manner. Would not the trouble of driving it to market by the farmer, and of driving it back again by the baker or maltfter, be juft fo much loft labour to them, without affording the fmalleft advantage, nay, rather occafioning a pofitive lofs to the public confumer, upon whom every expence of this kind muft neceffarily fall in the end?" And Mr. Donaldfon very juftly concludes on the fubject of grain, from what has happened in the fcarcities of this article in France during the adminiftration of M. Neckar, and more recently in this country, that "while every perfon muft agree, that the regulation of the public markets of the country falls naturally and properly under the direction of the legiflature, it is believed there are none who fuppofe that, during an impending fcarcity in this ifland, it is either a prudent meafure, or one likely to alleviate the evil, that the fervants of the crown fhould become the national importers. The unfettered fpeculations of the merchant are the only refource to be depended upon, under fuch circumftances, for an abundant fupply of the markets. See CORN *Laws*, and BOUNTY.

Mr. Middleton remarks, in refpect to the caufes that increafe the price of animal food in the markets, that "a fcarcity of vegetable food for the fattening of cattle, from whatever caufe it may arife, whether from a droughty fummer, or a fevere winter, uniformly produces full markets, and a confequent fall in the price of the cattle thus prematurely forced to them;" but that "this temporary great fupply and low price is, as certainly, quickly followed by a correfponding dearth of fat cattle, and confiderable advance in the price of animal food. This circumftance, therefore, though it firft lowers the price to below, and then advances it to above par, has a tendency, *on the whole*, to augment the prices, becaufe, at fuch a time, the beafts and fheep are fent to market with much lefs beef and mutton on their bones than they ought to have. Hence a dry burning fummer gluts the market with cattle lefs than half fat; four or five months later the markets are very thinly fupplied, and then, of courfe, the prices rife to an extraordinary height. Every fudden and great advance in the rate of animal food may primarily be traced to this caufe. There are, of courfe, other caufes which tend to produce this effect, but they are of flow operation; fuch as the increafing profperity and opulence, which enables a greater number of individuals to live on butcher's meat than formerly; while, in the opinion of fome people, the prefent war has greatly increafed the number of perfons who fubfift principally on animal food. But that a profperous peace would have advanced the price much more, by means of general induftry, and the confequent increafe of wealth, by fuch means.

Mr. Marfhall, in his excellent work on the landed property of England, ftates, that "when we confider how much the value of farm lands depends on their locality with refpect to markets, it becomes an object of high importance to their proprietors to meliorate their fituation in this refpect. And he fuggefts, that there are three methods of improving the value of them in what refpects markets, as by the facilitating the conveyance of the produce to diftant markets; through the means of roads, railways, or water-carriage; by eftablifhing new markets, in fituations where inhabitants have increafed, fince the eftablifhment of thofe which are now frequented; and by an artificial increafe of inhabitants; by drawing together the confumers of produce; by encouraging manufactures upon, or in the vicinity of them. For while a manufactory continues to flourifh, the value of the lands around it cannot fail to be increafed." But that, "before an adventurous fcheme of this kind can be prudently carried into effect, the evil as well as the good which it may bring to the eftate requires to be calculated. A populous manufactory, even while it flourifhes, operates mifchievoufly in an agricultural diftrict: by propagating habits of extravagance and immorality among the lower order of tenantry; as well as by rendering farm-labourers and fervants diffatisfied with their condition in life. And the more it flourifhes, and the higher the wages it pays, the more mifchievous it becomes in this refpect. Moreover, lands bear a rental value in proportion to the rate of living, in the diftrict in which they lie; fo that while a temporary advantage is reaped by an increafed price of market produce, the foundation of a permanent difadvantage is laid. And whenever the manufactory declines, the lands of its neighbourhood have not only its vices and extravagance entailed upon them; but have the vicious, extravagant, helplefs manufacturers themfelves to provide for. This, however, only applies to particular kinds of manufactories." In this country, we have "inftances of manufactures being highly beneficial to agriculture. The linen manufacture of Yorkfhire, and the woollen manufacture of Devonfhire are fo; and have been fo during a length of time. And "the moft intimate connection between them is, where the grower manufactures his own produce. And this priftine connection is ftill found in the ifland. In North Wales, the character or callings of fheep-farmer and woollen manufacturer are joined in the fame perfon. The wool is carded and fpun, and the yarn woven, under the roof of the grower. If the farmer himfelf does not throw the fhuttle, he employs a labourer or labourers, who affift alternately, and, as the feafons or circumftances require, in the works of agriculture and manufacture." And that "a fimilar kind of reciprocal benefit arifes from the cotton manufactures of this country, where not only the fpinners, but the weavers, affift occafionally in the works of hufbandry;—in weeding, hay-making, and harveft-works: an advantage which, in an hazardous feafon, is at once a private and a public good. And add to this another advantage of village manufacturers. When, in the uncertainty of commercial concerns, the demand flags for a time, the country finds, that, inftead of having a load of enfeebled artificers, mere manufacturers, to fupport in idlenefs, it thereby acquires an additional fupply of ufeful hands, enured to the works of the field, to forward its cultivation, and affift in its improvements. While at all times the increafe of inhabitants which this valuable fpecies of manufactory fupplies, increafes the demand for marketable produce in the immediate neighbourhood of its growth." This can, however, only be the cafe of a few inftances, as manufacturing labourers are feldom ufeful for farm-bufinefs. This is much the cafe in Lancafhire, and other large manufacturing diftricts.

In the Rural Economy of the Midland Diftrict, it is ftated, "that markets ought to be adapted to the mutual advantage of the producers and confumers at large, but particularly to thofe of the peculiar town or neighbourhood. And, therefore, that hucksters may be injurious to fuch markets, both by being too freely admitted, as well as by being wholly excluded, as mere market towns moftly depend for their fupplies upon the market day, when, in a time of fcarcity, fuch dealers may in a very fhort time clear the market, and leave the inhabitants deftitute of the week's provifions; while, on the contrary, when totally precluded from even purchafing the furplus, the market itfelf, as well as the inhabitants, muft be injured, as the producer will, of courfe, endeavour to find another market where he can fell his produce with certainty, without the rifk of having it to bring home again, or difpofing of it at an under price to the monopolizers of the town; in confequence of which, the market becomes indifferently fupplied, and the articles of inferior quality and more expenfive." It would, therefore, it is fuppofed, be a regulation of great utility, as has been found in actual practice in this diftrict, for the market to open at a ftated time, and to permit no huckfter to become a buyer till an hour afterwards; as by fuch means the inhabitants are certain of a fupply, without the market fuftaining any injury. And Mr. Middleton ftates, in his Report of the State of Agriculture in the County of Middlefex, that, "in regard to the markets, there are in the country part of the diftrict nine weekly ones held, namely, at Barnet, on Monday morning; at Brentford, on Tuefday; at Southall and Finchley, on Wednefday; at Uxbridge, Hounflow, and Edgware, on Thurfday; at Staines, on Friday; and at Enfield on Saturday. That at Uxbridge market a great deal of corn is fold, and there is a large public granary over the market-place, for the purpofe of depofiting it from one week to another. And at Hounflow market there is a confiderable fhow of fat cattle; fuch of which as are not difpofed of there are fent on to Smithfield-market, in the city of London, which is famous for the fale of bullocks, fheep, lambs, calves, and hogs, every Monday; and again, though in a lefs degree, on Friday. On the latter day there is alfo a market for ordinary horfes." And "that this is the only public market within the bills of mortality for the fale of live cattle." He gives the following ftatement of the number of black, or neat cattle, and fheep, annually brought for fale to this market, from the year 1731 to 1795, being 63 years, which he has divided into feven averages of nine years each, namely,

Years.	Cattle.		Sheep.	
1732	76,210		514,700	
1733	80,169		555,050	
1734	78,810		566,919	
1735	83,894		590,970	
1736	87,606		587,420

1790	113,708		729,660	

Years.

Years.	Cattle.	Sheep.
1791	99,838	729,800
1792	107,263	752,569
1793	116,488	729,810
1794	109,064	717,990
Average	——— 101,075	——— 707,456

The writer, however, "has not been able to procure an account of the number brought to Smithfield in 1795 and 6, but he is pretty fure it muft be greater than that of the preceding year, on account of the unufual advance in the price of animal food having occafioned a very large quantity of lean cattle to be prematurely fent to market." But "in the above account it may be feen, that the fupply has been advancing with fome degree of regularity both in the number of cattle and fheep during the laft forty-five years. The number of cattle now fent to market is more, by 26,881, than it was twenty-five years ago; and of fheep 147,565. And as it is a matter of general notoriety, that the cattle and fheep of England have alfo been gradually and progreffively increafing in their individual weight, owing partly to the attention paid of late years to the improvement of the breed, and partly to their being much better fed now than formerly, and indeed much better than they could poffibly have been before the introduction of turnips and clover; it is not perhaps an unreafonable, or unfounded conjecture, to fuppofe that the increafe, in point of weight, has kept pace with the advance in refpect to numbers, during the aforefaid period. If fo, it will follow," it is conceived, "that, including number and weight, the annual increafe in forty-five years is, in neat cattle, upwards of 72 *per cent.* and in fheep near 53. Upon the whole, he can fafely affirm, that including all the other fupplies of animal food, and confidering that they alfo, as well as cattle and fheep, come to market much better fed, and confequently much increafed in weight, above what they were forty-five years ago, the confumption of the metropolis is at this time full one-half more than it was then." And fince this laft period the increafe has gone on in a progreffive manner.

The following is given as a comparifon between the weight of bullocks, &c. as it was one hundred years ago, and as it is at the prefent time, *viz.*

Animals.		100 years ago.	Now, clofe of 1794.
Bullocks, average, weight of		370 lbs.	800 lbs.
Calves,	ditto	50	140
Sheep,	ditto	28	80
Lambs,	ditto	18	50

It is therefore concluded, that at the end of the above year the annual confumption of London was fomewhere about 110,000 head of neat cattle and 777,000 fheep: and "that any perfon, poffeffing fome degree of judgment in cattle, and at the fame time the defire of looking at a great variety of live ftock, cannot perhaps fpend a few hours more fatisfactorily, than in examining the market at Smithfield. He will there very foon difcover, that, for want of a greater attention to the excellence of breed, both in neat cattle and fheep, a very large proportion of the produce of the foil of this kingdom is wafted in producing bones and offal, inftead of meat." It is indeed aftonifhing, "that men, at leaft in the prefent day, fhould with fo much difficulty be prevailed on to breed beef and mutton, in preference to horns, fkins, and bones." Since this ftatement was made much correction in this refpect has taken place.

But befides thefe markets there are others, as Leadenhall-market, which is the greateft in London, for the fale of country-killed meat, and is the only fkin and leather market within the bills of mortality: and Newgate-market, which is the fecond great place for country-killed meat; and at both thefe markets pigs and poultry killed in the country are fold, together with frefh butter, eggs, &c. to an aftonifhing amount. Thefe laft and many other markets are held daily, and almoft conftantly well fupplied with moft forts of animal food, &c.

And "the three markets of Smithfield, Newgate, and Leadenhall, fupply the butchers round London almoft entirely, and to the diftance of twelve miles; partly indeed to twenty miles. It is a general opinion among the butchers, that they can buy live cattle in Smithfield cheaper than at any other place. The cattle expofed for fale at this market have been drove until they are empty, weary, wafted, and foot-fore, and confequently fhew to a great difadvantage; fo much fo, that graziers who have followed their cattle, efpecially fheep, to Smithfield, frequently do not know their own ftock, and when they have been fhewn to them, they were fhocked at their deteriorated appearance. If they fhould not then be fold and flaughtered, the wafting would continue fo much, that it would require feveral weeks of rich food to raife them to their former fatnefs." And "the bullocks and fheep drove to thefe markets are not only over-heated by the journey, but they are alfo often moft favagely beaten with bludgeons, goaded with darts, and hocked about their legs in the market during, perhaps, ten hours, and then drove to the flaughter-houfe (if they have the good luck to efcape thieves in the characters of bullock-hunters), and knocked down while their blood is yet in that inflamed ftate, and their flefh bruifed. Such meat muft, it is conceived, be very detrimental to the health and longevity of man. Much better is that which is killed in the country without driving, when the animal is in full health, and fent to Newgate and Leadenhall in clean and cool packages. If this could be done by all, it would remove a great nuifance from London, would probably improve the health of its inhabitants, and certainly prevent many, and fometimes fatal, accidents." Befides, there is a fifh-market, which is held every morning at Billinfgate, where all the dealers are ferved very early: firft, thofe who keep fhops in various parts of the town; and next, the hawkers, who, during the forenoon, cry them through the ftreets. This market receives a confiderable portion of its fupply of frefh fifh by land-carriage, from every diftance within the limits of England and parts of Wales. Much is alfo brought from the fea up the Thames in boats, fome even from Norway and Newfoundland, as well as intermediate diftances, packed up in ice. The quantity of dried and pickled falmon, of cod, herrings, and fhell-fifh, is alfo very great. The whole, probably, amounts to about one-fixteenth of the beef and mutton.

And there is likewife one corn-market, which is held at the corn-exchange, in Mark-lane, principally every Monday, but in a lefs degree every Wednefday and Friday. In this market an immenfe quantity of grain is difpofed of, but no ftatement of the exact amount has been hitherto given. The whole feems a fort of monopoly of a moft important and neceffary article, which fhould not, by any means, be fuffered to continue.

And in addition to thefe there are alfo three public markets for hay and ftraw in this county, namely, Whitechapel, Smithfield, and St. James's; all of which are held every Tuefday, Thurfday, and Saturday. And London is likewife in part fupplied with the fame articles from a market held every Monday, Wednefday, and Friday, in Southwark

And "the barracks on Hounflow-heath furnifh a ready market to the farmers in that neighbourhood for their hay, ftraw, and oats, as well as a fund from which to obtain a fupply of manure. In this neighbourhood, fome farmers fell their hay and ftraw to jobbers, who take it at the barn door, alter the weight of the truffes, draw it away in their carts, and re-fell it." In thefe markets "hay is all fold by the load of 36 truffes, each trufs weighing 56 lbs. except new hay which weighs 60 lbs. till the 4th day of September, and afterwards 56 lbs. only; by which regulation a load of new hay, till the 4th of September, yearly, weighs a ton, and after that day only 18 cwt. It is fold daily in large quantities at the different hay-markets, and a regular book kept by the clerk of each market, for the infpection of the public, mentioning the names of the feller, the buyer, the falefman, and the price of each load. This feems to have been intended to fecure a fair and honeft dealing; but it fails, almoft entirely, in effecting fo good a purpofe; great impofitions being practifed.

"The beft meadow hay, is principally bought for the feeding of gentlemen's faddle and coach horfes at from four to fix guineas *per* load; the more ordinary, by the livery-ftable keepers, coach-mafters, and retailers, at from three to five guineas. And the hay of rye-grafs and clover, mixed, is generally bought by coach-mafters, &c. for ordinary draught horfes. The fainfoin and clover hay is generally bought for the brewers, diftillers, and carmen's horfes, for the rack, and for cutting into chaff, at from five to fix guineas and a half the load.

The ftraw from different kinds of grain brought to the London markets, is likewife fold by the load, which confifts of 36 truffes, of 36 lbs. each. Wheat ftraw is generally ufed in the ftables, for bedding of horfes. The rye ftraw is ufed by brick-makers, to cover their bricks, by collar-makers, and for packing. The barley ftraw for packing, and by gardeners. The oat ftraw is alfo ufed for packing, and the winter fupport of cattle, as faddle horfes in ftraw yards, &c. The bean ftraw ferves to litter farm-yards, and farmer's ftables. And the pea ftraw and tare ftraw to feed farmers' horfes in the ftables, and faddle-horfes in ftraw-yards. There are the fame regulations at the different markets with refpect to ftraw as hay, and the price of each fort for fome time paft, has been from 25*s.* to 45*s.* *per* load of $11\frac{1}{2}$ cwt. and 9 lbs. It has been lately confiderably higher in general.

The coal-exchange or market is in Thames-ftreet, "where the dealers buy and fell. But the confumers are not permitted to buy there, owing to the dealers having obtained a completely infamous monopoly of the market. The annual quantity fold is about 600,000 chaldrons. A chaldron of coals, as delivered to the confumer, is thirty-fix heaped bufhels, but it is much larger meafure between the fhip owner and the dealer, and even to fuch confumers as buy five or more chaldrons at a time; an allowance is then made in the term *ingrain*, which increafes the chaldron to full forty bufhels."

It muft be extremely evident that the due regulation and eftablifhment of fuitable and convenient markets muft be of the greateft importance to the fuccefs and improvement of the agriculture of the kingdom, as by fuch means a proper ftimulus or encouragement can only be held out to the farmer to extend his means of cultivation. The inconvenience of the want of markets, may in many inftances be confiderably leffened by the forming of canals and the conftructing of railways. See CANAL and RAILWAY.

MARKET *Bofworth*. See BOSWORTH.

MARKET *Deeping*. See DEEPING.

MARKET *Harborough*. See HARBOROUGH

MARKET *Hill*, a poft-town of the county of Armagh, Ireland. It is a thriving town, the neighbourhood of which may be confidered as claffical ground. Gosford caftle, the refidence of fir A. Acheron, the friend of Swift, (whofe defcendant is now lord Gosford,) adjoins the town, and near this is Draper's hill, a name given to a farm taken by the dean, on which he intended to build, and which was fo called that

"When none the *Draper's* praife fhall fing,
His figns aloft no longer fwing;
His famous letters made wafte paper,
This hill may keep the name of DRAPER;
In fpite of envy flourifh ftill,
And DRAPER's vie with COOPER's hill." Swift.

Market hill is 58 miles N. by W. from Dublin.

MARKET *Lavington*. See LAVINGTON, *Eaft*.

MARKET *Raifin*. See RAISIN.

MARKET *Weighton*. See WEIGHTON.

MARKHL, a town of Bavaria; feven miles N. of Burkhaufen.

MARKING-YARN, in fhips of war, is white yarn fpun the wrong way, and put into all cordage of three inches and upwards, as the king's work. Blankl. Nav. Expof. p. 103.

MARKLAND, JEREMIAH, in *Biography*, a learned critic, fon of the Rev. Ralph Markland, known as author of a work entitled "The Art of Shooting Flying," was born in 1693. He received his early education in Chrift's hofpital, from whence he was elected to Peter-houfe, Cambridge, of which, in due time, he became a fellow, and a tutor, but refufed to enter into holy orders. He lived much in retirement, and his courfe is diftinguifhed by few events. In the year 1743 he refided at Twyford, and in the following year he went to Uckfield in Suffex, where he refided till 1752, when he removed to a farm-houfe at Milton near Dorking, in which he lived till his death in 1776, when he had attained to the great age of eighty-three. He fhunned company, and was feldom feen beyond his garden. His circumftances were narrow, but his heart was liberal, and his hand at all times ready to afford affiftance to the needy, to the utmoft extent of his means. By efpoufing the caufe of an oppreffed widow with whom he lodged at Milton, he involved himfelf in an expenfive lawfuit, which reduced him almoft to indigence. His works are as follow: "Epiftola Critica," addreffed to bifhop Hare, and publifhed in 1723. In 1728 he publifhed an edition of the "Sylvæ" of Statius; and in 1740 "Notes on Maximus Tyrius," which are faid to have done great credit to his critical powers. He difplayed great fagacity likewife in his "Remarks on the Epiftles of Cicero to Brutus; with a differtation upon four orations afcribed to Cicero." In 1761 he publifhed an excellent grammatical tract "De Græcorum quinta declinatione imparifyllabica, et inde formata Latinorum tertia," which was annexed to an edition of the "Supplices Mulieres" of Euripides; publifhed in 1763, and reprinted in 1775. He affifted Dr. Taylor in his editions of Lyfias and Demofthenes; Dr. Mufgrave in his Hippolytus, and Mr. Bowyer in an edition of Sophocles, and alfo in his conjectures on the New Teftament, in which the paffages illuftrated by this critic are marked with an R. Gen. Biog.

MARKOV, in *Geography*, a fmall ifland of Ruffia, in the Frozen fea. N. lat. 71° 50′. E. long. 138° 14′.

MARKOVO, a town of Ruffia, in the government of Irkutfk; 56 miles S.W. of Kirenfk.

MARKOW, a town of Lithuania, in the palatinate of Wilna; 60 miles E.S E. of Wilna.

MARKOWISKA, a town of Poland, in Volhynia; 24 miles E. of Lucko.

MARKOWITZ, a town of Moravia, in the circle of Olmutz; 18 miles S. of Olmutz.

MARKS, LAKE OF, called also *Shibkah el Low-deah*, a large lake of Africa in Biledulgerid, reaching near 60 miles from E. to W. and about 18 miles broad, interspersed with several small islands, one of which, however, is large, and though uninhabited, well stocked with date trees. These trees are, by a fabulous tradition of the Arabs, ascribed to the stones of dates, which the Egyptians brought with them for sustenance, when they invaded this country; whence the circumjacent territory is denominated "Babyra Pharaoune," or the Plains of Pharoah. The situation of this lake, with regard to the sea, the Syrtes, and the river Triton, has induced some writers to take it for the "Palus Tritonis" of the ancients, and to consider the above-mentioned island as the Chersonesus of Diodorus Siculus and the Phla of Herodotus. Moreover, Pallas, who, with Libyan women, attended Sesostris in his Asiatic expedition, and who was supposed to have owed her origin to this lake, might have resided in this island. N. lat. 33° 50'. E. long. 8° 50'.

MARKT BIBART, a town of the duchy of Wurzburg; 24 miles S.W. of Bamberg.

MARKT *Hohenluhen*, a town of Saxony, in the county of Reuss; eight miles N.W. of Greitz.

MARKT *Offingen*, a town of Bavaria, in the principality of Oettingen Wallerstein; eight miles W.S.W. of Oettingen.

MARKT *Einersheim*, a town of Germany, in the lordship of Limburg; 16 miles E.S.E. of Wurzburg.

MARKTL, a town of Austria, on the Trasen; 12 miles S. of St. Polten.

MARKUTCHOE, a town of Bengal; 42 miles N.N.E. of Ramgur.

MARKUWKA, a town of Poland, in the palatinate of Braclaw; 36 miles S.E. of Braclaw.

MARKWOTIZ, a town of Bohemia, in the circle of Boleslaw; 12 miles E. of Jung Buntzel.

MARLBOROUGH, a market town and borough, consisting of two parishes, situated in the hundred of Selkey, and county of Wilts, England. Its name is supposed to be descriptive of its position; being seated at the foot of a chalk hill, the term marle having been anciently used to denote that earth, as well as the peculiar species of clay, to which it is now distinctively applied. The origin of this town is wholly involved in obscurity, for the opinion that it was the Roman station, Cunetio, is certainly erroneous. Whether it was known in the time of the Saxons is equally doubtful, as no vestiges of antiquity, calculated to induce such a belief, can at present be discovered; and Domesday-book mentions it in so slight and cursory a manner, that it is impossible to determine from that work any thing concerning its extent or condition. Probably, however, it was then merely a trifling village, and of course did not become of importance till some time after the Norman conquest; when a castle was built, some remains of which are still visible, near the inn originally erected by lord Hertford, and from its situation denominated "the castle." The great mount which appears in the gardens behind this house has been regarded by some as an immense tumulus or barrow, but that idea is successfully combated by Mr. King, who shews it to have been the foundation of the principal keep of the castle; such works being found to constitute part of the construction of all similar edifices, raised by the early Normans. In the reign of Richard I. this castle was of great strength, and was one of those seized by his brother John, (who afterwards ascended the English throne,) with the view of obtaining possession of the kingdom during that monarch's unfortunate captivity in Austria. Having failed, however, in his ambitious project, chiefly through the firmness of his mother, he was compelled to fly to the continent, leaving Marlborough castle to be defended by one of his adherents, but after the return of Richard, it was quickly reduced by Hubert, archbishop of Canterbury.

From this period to the year 1267, no transaction of moment seems to have taken place here. In that year, being the 52d of Henry III. a parliament was held in the castle, when a number of laws were enacted for the suppression of tumults, &c. and these acts are still known under the appellation of "the statutes of Marlbridge."

Marlborough was first incorporated by charter in the reign of king John, about the year 1204, but it also claims the privilege of having been a borough by prescription for a century previous to that era. Several other charters have been granted by succeeding monarchs confirming and extending the various rights and immunities of the corporation. The government of the town is confided to a mayor and two justices, assisted by a council, and an indeterminate number of burgesses. The mayor and justices are empowered to hold quarterly sessions of the peace. An annual court for the county is likewise held in the court room over the market place, where are also a council chamber and an assembly room. This edifice stands at the east end of the principal street, which runs from east to west, and constitutes the chief part of the town. The buildings are in general irregular, and present an appearance of great antiquity; some of them being constructed of wood, and having their fronts very curiously carved. Part of one side of this street is adorned with piazzas, which project from the houses forming an agreeable promenade for the inhabitants, and afford them shelter from the effects of rain. At the same end with the market house, or town hall, is the old church of St. Mary. The door way to the belfry is decorated with zigzag ornaments in the Saxon style. The tower is built of free-stone. A plot of ground near this church is supposed, by Dr. Stukeley, to have a strong resemblance to the scite of an ancient temple. A short way to the south stood an hospital, or priory, dedicated to St. John the Baptist, and said to have been founded by John Goodwin and William Ramsbeck. The meat market is placed about the middle of this principal street, and on the south side, at some little distance, is a private house, which formerly was part of a priory, belonging to some regular canons of St. Augustine, and conjectured by Gough to have been first erected in the reign of king John. St. Peter's church forms the chief ornament of the west division of the town. It has a lofty square tower surmounted with battlements and pinnacles: the roof is supported by light columns.

The manufactures carried on in this town are comparatively inconsiderable: indeed it may justly be regarded as deriving its main support from its advantageous situation on the high western road, and the consequent extent and superiority of its market, which is held on Saturday, and has been long celebrated for the excellence of its corn, butchers' meat, and cheese. The population, according to the parliamentary returns of 1801, was estimated at 2367 persons, who inhabited 464 houses.

To the south of Marlborough, at the distance of a mile, lies the extensive forest of Savernake, the property of the earl of Ailesbury. This forest contains a vast profusion of noble trees, some of which are exceedingly large and majestic: one, called by way of pre-eminence the *king ock*, overspreads an area of at least 60 yards in diameter. A

variety

variety of charming walks is difpofed in different directions, eight of which diverge like rays from a common centre, placed in a fpacious opening near the middle of the foreft. No natural fcenery can be imagined more picturefque or beautiful than that difplayed in various parts of this umbrageous diftrict, where the diverfity of hill and dale, wood and lawn, frequently prefents to the eye of the painter various interefting views.

In this foreft ftands a modern manfion, called Savernake-lodge, appropriated for the temporary refidence of lord Bruce, fon to the earl of Ailefbury; and immediately adjoining to its eaftern boundary is Tottenham-park, the feat of the noble owner himfelf. The houfe, a fquare building of brick, with two wings at each end, ftands on the fcite of the ancient palace of the duke of Somerfet, who fo much diftinguifhed himfelf in the caufe of the houfe of Stuart. In the ftate rooms are feveral very excellent pictures; and the library contains a very "curious horn, or elephant's tufk in the fhape of a horn," which is particularly defcribed in the third volume of the Archæologia. Oppofite to the north front of the houfe ftands a lofty column, one fide bearing an infcription in commemoration of the recovery of his majefty in 1789. The remains of Wolf-hall are the feat of fir John Seymour, whofe daughter lady Jane, unhappily for herfelf, attracted the notice of king Henry VIII., who put to death his former queen Ann Boleyn, and efpoufed this new favourite, who was deftined to fuffer the fate of her predeceffor. It is faid that the marriage was folemnized, and the fupper ferved up in a detached building, which is now ufed as a barn. The town of Great Bedwin, fituated in this neighbourhood, was diftinguifhed as the fcene of a battle between Wulfhere, king of Mercia, and Æfcuin, a Saxon nobleman, in the year 675. (See Bedwin, *Great.*) Littlecott-park, which lies on the fouth bank of the Kennet, about eight miles from Marlborough, would feem, more probably than that town, to have been the pofition of the Roman ftation, Cunetio. This fuggeftion is founded upon the fact, that this fpot agrees better with the relative fituation in which Cunetio is faid by Antoninus to have ftood, with regard to Verlucio (Heddington) and Spinis (Speen). It further derives fupport from the circumftance of a Roman teffellated pavement having been difcovered within the park which furrounds the houfe. Here, alfo, it is known that two Roman ways interfect each other at a point called Crofs-ford. The entrenchment named Chifbury-caftle, lies fomewhat more than two miles to the fouth-eaft of this interfection. On Martinfall-hill, at nearly the fame diftance fouth of Marlborough, is another extenfive fortification. Barbury-caftle is placed feveral miles to the north; and at Avebury are the remains of a very large and fingular Britifh ftructure, which has been already defcribed under that article. (See Avebury.) Britton's Beauties of Wiltfhire, vol. ii.

Marlborough, a townfhip of America, in Grenville county, Upper Canada, north of Oxford, watered by the Radeau.—Alfo, a diftrict on the Great Pedee river, South Carolina; 25 miles long and 19 broad.—Alfo, a poft-town, both ancient and wealthy, in Middlefex county, Maffachufetts, (the "Okommakamefit" of the Indians,) incorporated in 1660, and containing 1735 inhabitants; 28 miles W. of Bofton. A mode of manufacturing Spanifh brown, from a kind of earth or loam refembling bed ore, but not impregnated with particles of iron, has been lately difcovered in this town.—Alfo, a poft-town in Windham county, Vermont, containing, in 1790, 629 inhabitants.—Alfo, a poft-town in New Hampfhire, incorporated in 1776, and containing 1185 inhabitants; 26 miles from Afhburnham, in Maffachufetts.—Alfo, the name of three townfhips in Pennfylvania, the one in Marlborough county, and Eaft and Weft Marlborough in Chefter county.

Marlborough, *New*, a townfhip of Berkfhire county, Maffachufetts, on the Connecticut line, containing 1848 inhabitants; incorporated in 1759; 135 miles W. of Bofton.—Alfo, a townfhip in Ulfter county, New York, on the weft fide of Hudfon's river, north of Newburgh; containing 1848 inhabitants.

Marlborough, *Lower*, a town of Maryland, in Calvert county, on the eaft fide of Patuxent river; 24 miles S.E. of Wafhington; containing about 60 houfes. The river is navigable for fome miles above the town for fhips of burthen.

Marlborough, *Upper*, the chief town of Prince George's county, in Maryland, on the fouth-weft fide of Hatavifit, one of the two chief branches of Patuxent river, containing about 120 houfes; 47 miles S.S.W. of Baltimore.

MARLE, in *Mineralogy*, an intimate mixture of lime and clay, which having all the characters of a fimple foffil, is properly confidered as an object of oryctognofy. It is, by Werner and moft other mineralogifts, fubdivided into 1. Earthy, and 2. Indurated marle.

1. *Earthy marle; Erdiger mergel*, Wern.; *Mergel-erde*, Wiedenm. &c.; *Marne terreufe*, Broch.; *Mergel-lera*, aut. Suec.

Its colour is yellowifh-grey, paffing fometimes into ifabel yellow; alfo greyifh and yellowifh-white. On the whole it may be faid that its colours are lighter than thofe of the indurated marle. It is compofed of dull duft-like particles, either loofe or cohering, which foil a little, and are rather rough and meagre to the feel.

Spec. grav. 1.600—2.400, Kirwan.

It is found in Thuringia, near Eifleben, and Sangerfhaufen; alfo in Auftria, near Vienna; in Bohemia and Saltzburg; in Denmark, on Dronninggard, in Zealand, as alfo on Fühnen, in Jutland, &c.

It occurs as ftrata in fletz limeftone and in fandftone, fometimes immediately under the vegetable earth.

The earthy and the indurated marles pafs into each other; and the former is confidered by many mineralogifts as the product of decompofition of the latter: but the earthy kind is not always found accompanied with the indurated.

In Thuringia it is known under the name of the Afchengebirge.

2. *Indurated marle; Verhärteter mergel*, Wern.; *Argile calcarifère ou marne*, Haüy; *Steen-mergel*, Swed.

It is moftly fmoke-grey, blueifh and yellowifh-grey, and prefents in general all the colours of common compact limeftone. It occurs maffive, and fometimes, according to fome authors, alfo in fuppofititious cryftals of cubic and pyramidal forms.

Internally dull, fometimes glimmering, which is generally owing to admixed particles of fand or mica.

Fracture fometimes earthy, paffing into uneven and fplintery; fometimes flaty, particularly in thofe kinds that have but a fmall proportion of clay. Fragments indeterminately angular, blunt-edged, and fometimes laminar or flaty. It is generally without diftinct feparation, but alfo exhibits imperfectly cubic or columnar and globular concretions; which latter are fometimes compofed of concentric layers.

It is opaque, fometimes faintly tranflucent at the edges of thin fragments.

It is foft enough to yield to the nail; ftreak greyifh-white.

Not

Not particularly brittle; eafily frangible.

Spec. grav. 2.300—2.700, Kirwan.

The chemical and phyfical characters of marle (which, according as lime or clay preponderates, receives the name of calcareous or argillaceous marle) are the following: 1. When frefh it effervefces brifkly with all acids; but the argillaceous marle with greatly predominating clay, is often very little affected by acids. 2. After burning it ceafes to effervefce. 3. The argillaceous marle is apt to harden in the fire: the calcareous marle becomes more friable. 4. All kinds of marle are eafily vitrified. 5. When burnt they attract moifture and crumble. 6. They generally feel meagre, and the indurated kind are rough to the feel. When rather greafy to the touch, this property is caufed by very minute particles of mica. 7. In the bofom of the earth the marle is always rather moift, efpecially the argillaceous marle. 8. All forts of marle, when expofed to the air, crumble fooner or later in proportion to the degree of their folidity; indeed there are fome kinds that are not affected in this manner within the fpace of three or five years; but the generality are found to crumble, within a year or two, into a loofe earth ready for ufe.

The principal localities of indurated marle are; Saxony, Drefden, Wehrau, Meiffen, &c.; Auftria; Bilin, Luftritz, Meronitz, and feveral other places of Bohemia; Bavaria; Moravia; the Palatinate; Thuringia; Heffia; England; Italy; France; and other countries where the fletz-trapp and coal formations occur.

It is chiefly found fubordinate to fletz limeftone, in which it fometimes forms confiderable beds, alternating with compact limeftone; it alfo occurs in coal countries, fometimes in entire beds; and it conftitutes the cement of fome fandftones. The circumftances under which it occurs in the fletz-trapp formation, have not yet been afcertained. That in Bohemia it paffes into bafalt, as has been affirmed by Reufs, is doubted by other mineralogifts; but a tranfition of marle into limeftone on one fide, and into indurated clay on the other, is far from being a rare occurrence.

Indurated marle often contains iron pyrites, garnets (that of the Hiffelberg, at Meronitz, in Bohemia), copper azure, malachite (that of Thalitter), &c. Nor are petrifactions lefs frequently obferved in it, fuch as gryphitæ, belemnites, pectinites, chamites, ammonites, &c.; and fometimes alfo vegetable impreffions.

A remarkable and beautiful variety of indurated marle, which by fome writers is confidered as a kind of compact limeftone, is that known under the name of *Florence marble*, or *Ruin marble*, of which the following defcription is given by Brard. It prefents angular figures of a yellowifh-brown, on a bafe of a lighter tint, and which paffes, in diminifhing, to a whitifh-grey. Seen at a certain diftance, flabs of this ftone refemble drawings done in biftre. One is amufed to obferve in it kinds of ruins; there it is a Gothic caftle half deftroyed, here it prefents ruined walls; in another place old baftions; and what ftill adds to the illufion is, that in thefe forts of natural paintings there exifts a kind of aerial perfpective, which is very fenfibly perceived. The lower part, or what forms the firft plane, has a warm and bold tone; the fecond follows it, and weakens as it increafes its diftance; the third becomes ftill fainter, while the upper part, agreeing with the firft, prefents in the diftance a whitifh zone, which terminates the horizon, then blends itfelf more and more as it rifes, and at length reaches the top, where it fometimes forms, as it were, clouds. But approach clofe to it, all vanifhes immediately, and thofe pretended figures, which, at a diftance, feemed fo well drawn, are converted into irregular fpots, which prefent nothing to the eye. This play of nature is owing to ferruginous infiltrations in the fiffures of this marble, which otherwife is of dull fracture and very argillaceous; whence it is never ufed in architecture; they merely make flabs of it, which are framed like little pictures, and which are much efteemed in commerce when of certain dimenfions. It fometimes occurs that the fame flab is fawed in two, and the parts are fet together in the fame frame, fo as to appear but as one piece; and the drawings on the right and left bear a refemblance which ftill further helps the illufion. There are fome who, to outdo Nature, put painted figures at the bottom of thefe pictures; but this is an exuberance of the wonderful, which finifhes by fpoiling all.

Mr. Brard fhould have alfo mentioned the variety of the fame Florentine marble, which, inftead of the ruins, exhibits fine black dendritæ, arranged in fuch a manner as to reprefent, in the moft deceptive manner, groups of trees, fhrubs, &c. This is called *Landfcape marble.*

To this indurated marle muft alfo be referred the fine variety called *Cottam marble*, from being found at Cottam, near Briftol. It refembles, in many refpects, the laft mentioned variety of Florentine marble; its ground is afh-coloured or blueifh-grey, with blackifh-brown fpots and veins, moft of which have a dendritic form, reprefenting affemblages of fhrubs and trees, grottoes, &c. It is found in large oblong pieces.

The fingular balls, known by the name of *Ludus Helmontii*, belong likewife to indurated marle. They are of various fizes, from one inch to nearly one foot and a half in diameter, and generally difpofed in a regular manner in beds of marle. When broken in a direction parallel to one of the largeft furfaces, their interior exhibits a number of fiffures by which the whole mafs is divided into perfectly diftinct, and more or lefs regular prifms of from three to fix or more fides; the fiffures themfelves being fometimes empty, but oftener filled up with another fubftance, which is generally granular limeftone in a cryftalline ftate. There can be no doubt that the fingular conformation of the interior of thefe balls is the refult of a kind of contraction produced by exficcation; but it is difficult to account for the regularity of the fiffures, their not extending to the furface of the balls, and their being ftill filled with fubftances, which it would be moft natural to fuppofe injected from without. Thefe balls are found in almoft all countries where marle is not unfrequent. Thofe of Franconia and of Antwerpen are very regular in their internal ftructure; but the ifle of Sheppey, in the county of Kent, produces the largeft and fineft of them. They are alfo found of confiderable fize, and of a blueifh-grey colour, in Derbyfhire. Thofe of Durham are divided into fmall hexahedral columns of a very regular form and equal fize, while the narrow fiffures feparating the prifms from each other are filled with quartz. When the marle is difengaged from the quartzy fepta, thefe latter more or lefs reprefent the figure of a honey-comb.

The name of Ludus Helmontii is alfo given to thofe imitative figures, which folid pieces of indurated marle frequently affume; and which have received feveral other denominations, fuch as zingibritæ, or ginger ftones, priapolites, &c.

There are alfo geodes of marle, which generally owe their origin to the decompofition of a nucleus originally lodged in their centre; they are either empty or drufed over with cryftals moftly of calcareous fpar and quartz. They are found in Milan, and in various parts of France.

Ufe.—Some kinds of marle that contain but a fmall proportion

portion of lime have been employed in pottery; but the moſt important uſe of marle in general is in agriculture.

Marle, or *Marl*, in *Agriculture*, a ſoft, unctuous, heavy ſubſtance of the calcareous kind, found extenſively in ſome ſituations, at different depths under the ground. It is found in different forms in different places, and diſtinguiſhed, from its appearances, into *ſhell*, *clay*, and *ſtone* marle. The firſt is ſuppoſed to have had an animal origin, as being conſtituted of teſtaceous matters, in greater or leſs degrees of fineneſs, from the ſlow decompoſition and attrition which they have undergone for a ſucceſſion of ages, intermixed with a portion of earthy ſubſtances. This is generally found in ſuch places as have at ſome time been covered with water, conſequently are more or leſs pure, and contain greater or ſmaller proportions of the calcareous principle, according to the differences in the nature of the depoſitions of the muddy or other earthy matters, with which they are blended by the ſediments of ſuch waters. But in common they are found to contain a larger proportion than the ordinary kinds of lime.

In reſpect to the ſecond ſort, it has, in general, a large quantity of clay in union with the calcareous material; on which account, it has a greater power of abſorbing and retaining moiſture than moſt of the other ſorts. Marle of this nature varies greatly in regard to its colour, being found of a brown, blue, red, and yellowiſh appearance. And the third ſort is met with combined with ſand, in different proportions to the calcareous and clayey materials, upon which the difference in its hardneſs depends. But when it has a thin, flaky, or laminated ſtructure and appearance, it is termed *ſlate* marle. On account of the portion of clay that enters into the compoſition of theſe marles, they are capable of being ſoftened in a gradual manner, by the operation of water upon them, and at laſt to fall down into a powdery form. Dr. Ainſley long ſince remarked, that all marles contained ſome portion or other of clay, in combination with their calcareous matter; while in lime, it is generally ſand that is united with it.

It is ſtated, on the authority of Dr. Black, in the 21ſt volume of the "Annals of Agriculture," that "all marles effervefce or raiſe up frothy bubbles, when acids are applied to them; and as water alone frequently produces the ſame effects, when poured on dry clay, it may be neceſſary, in order to guard againſt miſtake, in making trials upon ſubſtances ſuſpected to be marles, to let them remain a little time in mixture with water, previous to their being ſubjected to the teſt of acids. The beſt or richeſt marles being ſuch as contain the largeſt proportion of calcareous earth, it frequently becomes a matter of importance to farmers to be able to aſcertain the quantities, (ſome being found ſo poor in this material as to have only a twentieth or thirtieth of their weight,) in order to decide on their advantage in preference to lime, chalk, or other ſubſtances to be brought from a diſtance. A ſimple and eaſy method, founded on the knowledge that this earth commonly contains about 40 *per cent.* of its weight of fixed air or carbonic acid, is propoſed by the profeſſor. It is merely by ſaturating the marle with muriatic, or ſome other acid, and marking correctly the loſs of weight which it ſuſtains by the extrication of the fixed air. Thus, if two hundred grains of marle be introduced into a veſſel with a little water, and muriatic acid poured upon them until the bubbles ceaſe to riſe, the loſs of weight being then found to amount to forty grains, the marle contains one hundred grains of calcareous earth. The proportion of calcareous earth contained in different marles may alſo be determined by diſſolving it by means of the muriatic acid, diluting the liquor with water, paſſing it through a filtering paper, and then precipitating the calcareous earth from the clear liquid by a ſolution of ſome fixed alkaline ſalt."

And the following ſimple methods have been ſuggeſted by Mr. Donaldſon, tending to ſhew that ſuch ſubſtances as are examined are marle; but they are not by any means ſo correct as the above.

Firſt, by Air.—"If a lump of true ſtone or clay marle be expoſed to the air, it will, in a ſhort time, break into ſmall pieces."

Secondly, by Fire.—"When a piece of real marle is dry, break it into as ſmall particles as poſſible, and put a handful into a hot coal-fire: it will crackle in the ſame manner as if ſalt had been thrown therein."

Thirdly, by Water.—"Put a piece of dried marle into a wine glaſs, and pour gently as much water thereon as will cover it: if true marle, it will gradually diſſolve into a liquid or ſoapy ſubſtance, and at the ſame time ſhoot up many ſparkles to the ſurface of the water." But "the moſt certain criterion, by which to prove marle of all kinds, is to put a little in a wine-glaſs, and pour over it a ſmall quantity of aquafortis, or ſome other ſtrong acid: if it effervefce, it is a ſufficient proof of its being marle; and the degree of the effervefcence, at the ſame time, aſcertains its quality."

It is obvious, however, that theſe ſimple, but imperfect, modes ſhould only be had recourſe to, when the means of a complete analyſis are not capable of being put in execution, for want of proper convenience.

Though there are the above differences in the natural appearances of marles, they agree in being all capable of being reduced into a fine powdery ſtate, by being expoſed for ſome time to the effects of the atmoſphere. By this means, they become ultimately capable of being blended minutely with the different materials of the ſoils upon which they are laid. But as this common property of falling down into powder, in conſequence of the abſorption of moiſture and carbonic acid or fixed air from the ſurrounding atmoſphere, is much greater in ſome ſorts of marle than others, it may afford ſome difference in their utility when applied to lands as manures. See Manure.

In the Farmer's Magazine, ſome moſs-ſhell marles are ſtated to have been found to contain 84 *per centum* of pure chalk, or carbonat of lime, which is more than lime generally poſſeſſes, the refuſe being chiefly peaty ſubſtances, which is a circumſtance, it is ſaid, that makes the refuſe of them the more uſeful as a manure, than that of limeſtone, which is moſtly ſand or clay. Theſe marles are alſo capable of being converted into quick-lime, by burning; and their ſolutions change vegetable colours to green, poſſeſſing all the other properties of cauſtic lime.

Marle is likewiſe further diſtinguiſhed by its feeling fat and unctuous; and its looking, when dry, after having been expoſed to the weather for ſome time, as if it was covered with a hoar-froſt, or ſprinkled with fine ſalt, and even when mixed with the land intended to be manured by it, the whole ſurface having a whitiſh appearance. The more marles effervefce with acids the more valuable they are as manures. In hot weather, good marle will ſlake with the heat of the ſun like lime; eſpecially when rain follows a hot day or two.

Good marles of different kinds abound in moſt parts of Lancaſhire, and are in very extenſive uſe in many places, having been found to anſwer well in different proportions and different kinds of land. See Marling *of Land.*

The

The farmers in Staffordſhire conſider the ſoft blue marle, which is commonly found under clay, or low black ground, at the depth of ſeven or eight feet, the beſt for arable land, and the grey ſort the beſt for paſtures. But that which is of a browniſh colour, with blue veins in it, and little lumps of chalk or limeſtone, generally lying under ſtiff clays, and very hard to dig, is moſt eſteemed in Cheſhire. The marle which is uſually found at the depth of about two feet, or a yard, on the ſides of hills, and in wet boggy grounds, which have a light ſand in their compoſition, is very fat and cloſe, and reckoned the ſtrongeſt; for which reaſon it is particularly uſeful on ſandy lands. It is often called peat-marle or delving-marle. What is ſometimes called paper-marle frequently lies near coals, and flakes like leaves or pieces of brown paper, being of a ſomewhat lighter colour. That which ſome call clay-marle is very fat, and ſometimes mixed with chalk-ſtones. There is another ſort of marle which breaks of itſelf into ſquare cubical bits. Theſe two laſt kinds generally lie under ſand or clay; ſometimes about a yard deep under the former, but often much deeper under the latter. The ſtone, ſlate, or flag marle, which is a kind of ſoft ſtone, or rather ſlate of a blueiſh colour, is generally allowed very good. It eaſily breaks down and diſſolves with froſt or rain, is found near rivers and on the ſides of hills, and is a very laſting ſort when uſed as manure.

In a variety of diſtricts of this kingdom marle diſcovers itſelf to the moſt negligent eye; particularly on the ſides of broken hills, or deep hollow roads. Many rivers are bordered with a vaſt treaſure of this ſort, which is plundered by every flood. Boggy lands frequently cover it; and in them it ſeldom lies above three feet deep. It is ſomewhat lower under ſtiff clays, and marſhy level grounds. The loweſt parts of moſt ſandy lands abound with it ſometimes at the depth of three feet, and ſometimes at ſeven, nine, or more. The depth of the marle itſelf can ſeldom be found; for when the upper cruſt of the earth is removed, all that can be ſeen or dug, is marle, to ſo great a depth, that there are few if any inſtances of a pit's having been exhauſted of it.

But the manner in which this earthy material is found, is probably different in different ſorts and ſituations.

In the Perthſhire Report, ſhell-marle is ſtated to be found for the moſt part in ſmall lakes, or in land-locked bogs and moſſes, where there had been formerly a lake or pond, during the multiplication of the animals. The wilks, which produce the marle, it is ſaid, live only one year, and multiply prodigiouſly. They are often found to adhere to the long graſs, which grows in pools, where they breed; and when the graſs decays, it is laid in horizontal lamina on the marle bed, by the weight of the animals. Theſe lamina aſcertain the number of years in which the marle bed has been forming, in the ſame manner as rings of trees denote their age. When the wilks happen to generate in ſprings or other ſmall collections of water, which are in moors or other high ground, they are frequently carried down in the wet ſeaſon, to the firſt ſtill water; but if the ſtream is not able to carry them to a pond, they are ſometimes left in the face of the hills, and form beds of marle in that ſituation. In Glentilt, a property belonging to the duke of Athol, there is, it is added, marle collected in this manner, on the declivity of a hill, to the depth of thirty feet, which, at a diſtance, has the appearance of a white rock. And according to ſome, not only wilks but bivalves produce ſhell marle. Theſe wilks are of a blackiſh colour, and about the ſize of a pea; and are found in rills or ſprings in the months of May and June, ſticking to ſtones and graſs. Wherever the wilks are obſerved in lakes, bogs, or meadows, it will be proper to bore for marle; or if they be found in ſpouty land, or in rills of water that flow into lakes or into marſhes that ſtagnate, it may alſo be proper to bore for marle in theſe lakes or ſtagnant water. Marle is found under moſt ſorts of ſubſtances, but more commonly under moſs, ſoft mud, and ſand; more rarely under clayey ſtrata.

Diſcovering of Marle.—This material is commonly ſought for and diſcovered by means of boring with a tool for the purpoſe, ſomewhat in the manner employed for coal and other ſimilar ſubſtances. A boring rod for this purpoſe is thus deſcribed in the Perthſhire Survey. "It is made of iron, in pieces of about four feet long, which ſcrew into each other. In the undermoſt or firſt piece is a kind of tube, about two and a half feet long, pointed ſharp, open on one ſide, and one of the edges raiſed higher than the other, like a gimblet; ſo that when turned round, it may fill itſelf with the ſubſtance which ſurrounds it. Into this tube, which is open at the top, is put a piece of wood, as long as the tube itſelf, and of a conical ſhape, correſponding exactly to its figure. To this piece of wood is faſtened a rope, of the ſize of one's little finger, and longer than the whole rod when all the pieces are put together. This piece of wood muſt ſtick ſo faſt as not to come out, when the rod is puſhed down into the earth or moſs, below which marle is expected to be found; but muſt not be ſo firmly faſtened, as not to be eaſily drawn out by the rope to which it is fixed." When it is wiſhed to bore, the piece of wood is put into the tube; ſcrewing "the piece of the rod which is fitted to the ſcrew on the top of the iron in which the tube is formed; then puſhing down the rod into the earth or moſs, allowing the rope to go down with the rod, without twiſting round it: and when the two firſt pieces of the rod are puſhed down their full length, ſcrew on the upper piece of the rod, which ought to fit the ſcrews of all the other pieces, and muſt have a hole in the top of it, large enough to admit of a piece of timber, two inches diameter and four feet long, with which you are to turn round the rod three or four times, having previouſly drawn up with the rope the piece of wood which had been put into the tube. When the tube is thus turned round, it will be filled with the ſubſtance next it; and when drawn up, will ſhew what that ſubſtance is. You can bore deeper and deeper, by ſcrewing on more pieces of the rod, below the piece into which the handle is received that turns it round; but for facility in unſcrewing, there ſhould be a hole in every piece of the rod, that will admit of a piece of iron, of the thickneſs of a man's thumb and eighteen inches long. It will be neceſſary to have two of theſe pieces of iron, ſo as to hold the rod ſteady with the one, while you ſcrew or unſcrew any of the pieces with the other; and this muſt always be done, in putting down and taking up, when a great length of the rod is required, as it cannot be managed in either of theſe caſes, all in one piece." See Boring *Augre*.

Marle is very common in Ireland, where it often lies not above a foot or two below the ſurface of the ſoil. But in France, though they have marle in many places, they are often obliged to dig very deep for it. In many diſtricts of this country there are alſo pits of this ſort of great depths. But where the marle lies at ſuch great depths, it can in very few caſes be raiſed for the purpoſes of manure. In moſt ſituations where it is employed in this intention, it is found only a few feet or yards below the ſurface, and it is uſually raiſed by digging pits, and where there is much water draining them either in the common way, or by the uſe of pumps. When they are not very deep, the beſt and moſt ready method for getting out the marle is to open a ſloping mouth, ſinking the pit gradually, wide enough for a cart to drive in and out; and to work the marle away circularly, keeping the pit ten or fifteen feet deep, by which means the expence of filling the carts will be much leſſened. And in caſes where it is raiſed from below loughs or ponds, it may ſometimes be neceſſary to have recourſe to boats for conveying it to their borders, in order to its being conveyed upon the lands.

In firſt opening the pits upon the land, it will be neceſſary that they be made as convenient as poſſible for carriage and draught, and that the leaſt poſſible injury be done by them to the grounds. Attention ſhould likewiſe be paid to the facility of laying them dry. When large pits are dug, maſſes of conſiderable ſize are often let down by undermining, and forcing large piles in above them. In theſe caſes great care ſhould be taken, as they are very apt to give way ſuddenly, and cauſe accidents.

Marle is a ſubſtance that may be made uſe of on moſt ſorts of ſoil, that are of a ſufficiently dry quality to admit of its being applied. It has been found highly uſeful on thoſe of the ſandy, gravelly, and moory kind; upon the more heavy ſorts it may likewiſe be found beneficial in many caſes, where the calcareous principles are wanting. This would at leaſt ſeem to be the caſe with ſhell-marle, which Dr. Robinſon ſays, of all others, abounds moſt in his diſtrict, containing more oil than any of the other kinds. In common with them, all he ſuppoſes pulverizes the ſoil, and prepares the vegetable food for being abſorbed by the roots of plants: in common with them alſo, it communicates to the ſoil the power of attracting the fertilizing influence of the air; but it ſurpaſſes them, by adding mucilaginous matter of its own to the ſoil, being the *exuviæ* of animals, and thereby increaſes in no ſmall degree the quantity of vegetable food. Moſt of the common marles, however, ſeem to act more in a mechanical manner upon the ſoils, than by adding any thing of a nutrient principle to them.

In digging for the marle they uſe in manuring their lands in Ireland, they meet with foſſile horns, and other curious foſſils. The marle always lies in the bottoms of low bogs. It is never met with in any other places, and is found by boring with augres made for that purpoſe. It uſually lies at five, ſeven, or nine feet depth. The obtaining it in many places is attended with very conſiderable expences, in draining off the water. The manner of digging it is this: they employ ſix able labourers, and a ſupernumerary; and theſe cut up a hole of twelve feet ſquare, which is ſuppoſed a pit that this number of men can manage in one day. Two men dig, two throw it up, and two throw it by, and the ſupernumerary man ſupplies defects on all occaſions. For the firſt three feet they dig through a furzy earth, fit for making of turf or fuel. Under this lies a ſtratum of gravel, of about half a foot. Under this often, for three feet more, there is a more kindly moſs, which would make better fuel. This lower ſtratum of turf is always full of foſſile wood, which is uſually ſo ſoft, that the ſpade cuts as eaſily through it, as through the earth it lies in. Under this, for about three inches, is found a ſeries of leaves, principally of the oak; theſe appear very fair to the eye, but fall to pieces on touching; and this ſtratum is ſometimes interrupted with vaſt heaps of ſeed, which ſeem to be broom or furze-ſeed. In ſome places there appear berries of different kinds; and in others, ſeveral pieces of ſea-plants, all lying in the ſame confuſed manner as the oak-leaves. Under this vegetable ſtratum there lies one of blue clay, half a foot thick, and uſually full of ſea-ſhells. This blue clay is not ſo tough as common clay, but is thrown carefully up, and uſed as marle in ſome places. Under this always appears the right marle; the ſtratum of this is uſually from two to four feet thick, and ſometimes much more. Phil. Tranſ. N 394, p. 122.

This marle looks like buried lime, and is full of ſhells, which are uſually of a ſmall ſize, and of the perriwinkle kind; but there are ſeveral other ſorts, at times, found among them. Among this marle, and often at the very bottom of it, are found great numbers of very large horns of the deer-kind, which are vulgarly called elks' horns. Theſe, where they join to the head, are thick and round; and at that joining there grows out a branch, which is about a foot long, and ſeems to have hung juſt over the creature's eyes; it grows ſtill round for about a foot above this, and then ſpreads broad, and terminates in branches, long and round, turning with a ſmall bend.

The labourers are obliged to work in a hurry in all theſe pits, ſo that they ſeldom bring them out whole. There are alſo at times found the leg-bones, and other parts of the ſkeletons of the ſame beaſts: but theſe are more rarely only a few together, and but in few places.

Marle, in *Gardening*, a ſort of foſſile earthy ſubſtance, which is ſometimes made uſe of for rendering ſtiff adheſive garden lands more open and light in their qualities.

This material varies much in its nature, ſome being nearly of the nature of fuller's-earth, and of a fat enriching quality, of which there are blue, grey, yellow, and red coloured; but the blue is eſteemed the beſt in this intention. In other caſes, it has the appearance of a kind of ſoft ſtone, or rather ſlate, of a blueiſh or grey colour, called ſtone or ſlate marle, being found commonly near river ſides, and the ſides of hills, &c. and though hard when dug, eaſily diſſolves by rain and froſt. There are likewiſe calcareous, or ſhell and clay marles, the latter reſembling a fat ſort of clay or loam. The laſt ſort is accounted good manure for improving light, looſe, ſandy, garden lands. See Manure, and Marle, in *Agriculture*.

Marle, in *Geography*, a town of France, in the department of the Aiſne, and chief place of a canton, in the diſtrict of Laon; 13 miles N.N.E. of Laon. The place contains 1616, and the canton 9967 inhabitants, on a territory of 257½ kiliometres, in 23 communes.

Marle *Dice*, in *Huſbandry*, a name given by the people of Staffordſhire to a reddiſh marle, that breaks into ſmall ſquare pieces like dice, or elſe into thin flakes, in the manner of lead-ore, and looks ſmooth on the ſurface. This is a good manure, and the way of judging which of it is beſt, is to expoſe it to the air in rainy weather, or to put it in water. That which moulders ſooneſt to powder in the air, and breaks quickeſt in the water, is ſure to be the beſt, and proves very beneficial to land.

Marle-*Slate, Bituminous;—Bituminous marlite*, Kirw.; *Bituminöſer mergel-ſchiefer*, Wern.; *Schiſte marno-bitumineux*, Broch.; *Koppar ſkifwer*, Swed.

Its colour is partly greyiſh, partly browniſh-black, and alſo of an intermediate colour; ſeldom blueiſh-black.

Occurs maſſive, and is frequently marked with impreſſions of fiſhes and marine plants.

Fracture ſlaty (ſometimes rather indiſtinctly ſo), partly ſtraight, partly undulated ſlaty.

The planes of ſeparation always ſhining; the planes of fracture of the ſtraight are ſlaty, rough, and generally dull, or at beſt, glimmering; thoſe of the curved ſlaty are ſmooth and gliſtening.

Fragments generally ſlaty.

Retains its colour in the ſtreak, which is gliſtening.

It is opaque; soft; rather mild; easily frangible.

In large flat pieces it is rather sonorous.

It is meagre to the feel; and moderately heavy.

Spec. grav. 2.361—2.442, Kirw.

It effervesces with acids. Before the blowpipe it first burns with a small flame, giving out a bituminous odour, and afterwards fuses into a black slag.

It is found at Eisleben, Sangershausen, &c. in Thuringia; at Riegelsdorf, in Hessia; in the county of Mansfeld; in Switzerland, at Aigle and Bex, &c.

The varieties rich in copper are often regularly wrought as ores of this metal: no other use is made of bituminous marle slate, which, when decomposing in the air, forms an earth injurious to vegetation.

Bituminous marle slate is subordinate to the fletz limestone formation, in which beds are sometimes formed by it. Its lowermost stratum, which rests on the old sandstone, is generally rich in copper ores, whence it has received the name of copper slate: these ores are copper pyrites, vitreous copper ore, variegated copper ore, more seldom copper azure, copper green, malachite, and still more rarely native copper. Besides these also some galena and carbonated iron is found in it; and its rifts are sometimes coated with selenite.

In this slate are frequently found the impressions and remains of fishes converted into coal, and which, by the convulsed and contorted attitudes in which they are seen, appear to indicate a sudden catastrophe, by which whole shoals of them perished. Nor is it less singular that impressions of the same species are generally found together. Of this description is, among others, the well known marle slate from Monte Bolca, of which, and the impressions contained in it, a detailed account has been given under the article ICHTHYOLITE. The quantity of fishes in the marle slate of Thuringia, is generally proportionate to the quantity of copper it contains; sometimes the whole of these remains is converted into copper pyrites. In the bituminous marle slate of Richelsdorf, in Hessia, Mr. Ries has discovered some remarkable impressions which he considers as produced by the bones of a child's hand; but, according to professor Blumenbach, the bones belonged to animals of another order of mammalia.

The bituminous marle slate passes into indurated marle; sometimes also into stinkstone.

MARLHEIM, in *Geography*, a town of France, in the department of the Lower Rhine; nine miles W. of Strasburg.

MARLHES, a town of France, in the department of the Rhone and Loire; 10 miles S. of St. Etienne.

MARLIEUX, a town of France, in the department of the Ain; 10 miles S.S.W of Bourg en Bresse.

MARLINE, on board a *Ship*, is a small line made of hemp untwisted, that it may be the more gentle and pliable: its use is to seize the ends of ropes from farcing out. They use it also to seize the straps at the arse (as they call it) or lower end of the block. See HOUSING.

MARLING, in *Sea Language*, denotes the art of winding any small line, as marline, spun-yarn, pack-thread, &c. about a rope, so that every turn is secured by a sort of knot, so as to remain fixed in case all the rest should be cut through by friction, &c.

Marline is commonly used to fasten slips of canvas, called parsling or parcelling, upon the surface of a rope, to prevent it from being galled by another rope that rubs against it, to attach the foot of a sail to its bolt-rope, &c.

MARLING *a Sail*, is when being so ript out of the bolt-rope, that it cannot be sowed in again, the sail is fastened by a marline, put through the eye-let holes, made in it for that purpose, under the bolt-rope.

MARLING-*Spike*, is an iron pin, tapered to a point, and furnished with a large round head. It is principally used to penetrate the twists or strands of a rope, in order to introduce the ends of some other through the intervals, in the art of knotting or splicing. It is also used as a lever on any other occasions, about the rigging, particularly in fixing the seizings upon the shrouds, blockstrops, clues of the sails, &c. Falconer.

MARLING *of Land*, in *Agriculture*, the operation of digging up and putting marle or some sort of material of this nature upon the ground, so as to effect its amelioration and improvement. In the application of all sorts of manures, the farmer must be regulated in a great measure by the quality of the soil, and the strength of the manure, in which experience is the surest guide. In marling, it is particularly necessary to find the true proportion which the land requires, and much better to err in laying on too little, than too much, as more may be added at pleasure; whereas by overdoing it, the first year's crop often fails, from the body of the marle not being sufficiently opened; and in that case, it will sometimes be three years before the ground comes to a proper state. The best directions that can be given the farmer in the application of this manure to light soils, is to lay on the quantity which will give the degree of cohesion wanted in those soils. A general rule cannot be laid down in this respect, as the quantity of marle requisite to effect the desired end must be different in proportion to the degree of lightness of the soil. But the quantities most commonly employed are from seventy to eighty loads. In Lancashire they have lately reduced the proportions of the sets, and found them to answer much better than the former larger ones. Upon lands of the sandy kinds, Mr. Young advises from fifty to sixty cubical yards *per* acre; but on those of the loose, wet, loamy sort, upon which this kind of manure produces great improvement, it should, it is suggested, be laid on to the amount of a hundred yards.

And in regard to the most economical method of doing this sort of work, it is, he imagines, that of contracting "for the whole job with some little farmer or horse keeper who works for hire." It is not uncommon in Suffolk to give 8*d.* a cubical yard for all expences whatever, except that of spreading, which those farmers that have attention to correct management do by the day, as it is of much importance to have it well performed; for where this is not the case, some parts of the field will have it in the proportion of two hundred loads, while others have not more than fifty. In the same county even 9*d.* and 10*d.* *per* yard, it is said, has lately been given to such small farmers for teams sufficiently strong for this sort of business.

The practice and success of Mr. Rodwell in this sort of work, as detailed in the second volume of Communications to the Board, hold out much encouragement.

On obtaining a lease of a farm, of 1400 acres, at 150*l.* a-year, of the poor, dry, heathy kind of land, abounding with fern, gorse, and more particularly ling, of little value, and affording only a scanty support to ill fed sheep; his "operations were to inclose with thorn hedges, marle, or clay, and break up 300 acres of the heath; and in the first seven years of the lease he finished what he meant to improve in that term; he marled or clayed 600 acres, at 70 loads an acre, being 42,000 large tumbril loads. In this work he employed three teams, two of his own, and one he hired, for several years. It is severe work, and the second year he lost nine horses, attributed to feeding on pea ſtraw from the new broken heath, a circumſtance that deſerves the attention of improvers. In the 11th year of his leaſe he applied to his landlord for a renewal; on which the farm was valued again, and he took a freſh leaſe of 15 years to commence at the termination of his old one, at the rent of 400*l*. He immediately clayed and broke up 200 acres more, at 100 loads an acre, 40 buſhels *per* load, incloſing all with quick hedges and ditches five feet wide and four deep; after this, he improved 300 acres more in the ſame manner. In the two leaſes of 28 years, he clayed or marled 820 acres; and he has clayed or marled ſo much over the ſecond time, at 70 loads an acre, that the quantity he has carried in all, is very little ſhort of 140,000 loads. Upon taking a third leaſe, he was, in 1798—9, particularly ſteady to this work, and in 49 weeks and three days carried 11,275 cubical yards, paying by meaſure of pits, and not by loads, which were filled and ſpread by four men and a boy, and carried by ſix horſes and two tumbrils."

And "in this buſineſs of carrying clay or marle he has practiſed hand-barrowing; the men can make good earnings at 10*d*. a yard, wheeling it 30 rod; and down to 7*d*. a yard at ſhorter diſtances; and he is much inclined to think, that if we had workmen uſed to the operation, and handy at it, like thoſe employed in navigations, that this method would be of all others the cheapeſt, eſpecially on the heavier ſoils. But by far the greateſt part he has done by tumbrils, the expence of which put out is 5*d*. a yard for team, and 2¼*d*. a yard for labour, and paying for laying picks, wedges, &c. alſo for ſtones that riſe, increaſe the whole expence to 8*d*. *per* yard, which is at leaſt 2½*d*. *per* yard cheaper than he can do it with his own teams: the reaſon of which is, that the man who contracts with him drives his own horſes, and looks after them; at 8½*d*. *per* yard, 140,000 yards have coſt him 4958*l*. excepting the ſmall proportion hired at ½*d*. *per* yard lower."

Here a few circumſtances are mentioned which he hopes may tend to render this communication uſeful to others, not having the experience which he has acquired. He ſays, he ſhall uſe but few words, but they ſhall be founded on poſitive experiment or attentive obſervation. Clay is much to be preferred to marle on theſe ſandy ſoils, ſome of which are looſe, poor, and even a black ſand. By clay is to be underſtood a grey clayey loam, ſome of it brick earth, and all has with vinegar a ſmall efferveſcence. Marle is a white, greaſy, chalky ſubſtance, that efferveſces ſtrongly with acids. He makes a univerſal rule, on a ſecond improvement, to lay clay on the fields marled before, ſometimes marle where clay was ſpread before; but this is not general, as clay anſwers beſt on the whole. On 90 acres, clayed 100 loads an acre, he has had after two crops, the one turnips, the other barley, cole-ſeed, and fold it on the ground for 1000 guineas; then turnips, a famous crop, followed by barley, on 75 acres, 16 coombs an acre; and by oats on 15 acres (poorer land), 10 coombs an acre. Theſe crops are for the ſoil *great;* but in general his products have been highly to his ſatisfaction.

It is ſtated by Mr. Young, that the expence of this ſort of work, where it is thrown from the mouths of ſloping pits into the carts, will be, "upon an average, three-pence to three-pence halfpenny *per* cubical yard, the filling and ſpreading, and about four-pence halfpenny for the teams, carts, and drivers; in all eight pence *per* load, or cubical yard, or 3*l*. 6*s*. 8*d*. *per* hundred loads; which will be a proper quantity for an acre of land: the benefit will laſt for twenty years, and the land always be the better for it."

It is ſufficiently obvious, that there muſt be conſiderable variations in the expence, from the circumſtances of conveying it from different diſtances, as is ſhewn in the Survey of Lancaſhire.

The expence of marling upon marſh land, near Liverpool, about the year 1780, is ſtated as follows:

Expences.	£	s.	d.
Getting and filling, *per* rod of 64 cubic yards	0	10	0
Spreading - - - - -	0	2	2
Carting, the average diſtance from the middle of the pit to the middle of the land, 60 rods	1	9	0
	2	1	2

In this eſtimate, there were ſix carts, five in motion, each going the diſtance of twelve rods, while one ſtood in the pit to be filled. The ſize of each cart was 20,736 inches (cubical), uſually drawn by three horſes; the weight of the load about 15 cwt. and two cubical yards of marle made about three loads. The number of workmen were ſix fillers and getters; uſually two right-handed men at one wheel, and two left-handed at the other, with one filler behind: one getter is generally ſufficient for the whole.

Expences.	£	s.	d.
Getting, filling, and ſpreading, to the acre of 64 yards to the rod, was - -	3	19	1
Cartage - - - -	9	8	0
Digging for the marle, clearing the head, expences at finiſhing, &c. *per* acre -	2	7	0
	15	14	1

There were about 6½ rods laid upon the acre on this occaſion. The men got 2*s*. 6*d*. and the carts 7*s*. 6*d*. *per* day. Getting and filling marle, it is ſaid, is very laborious work, and requires the utmoſt exertion to obtain theſe wages; and that this work, after all, can only be effected by young men in their prime, cheered by the company of fellow-labourers, and frequent refreſhments. Five working-days are reckoned equal to ſix at other work, for they uſually begin at half-paſt four in the morning, and reſt one hour at breakfaſt, from eight to nine; reſt again from twelve till two, and then work till ſix; and generally get out nine rods *per* week.

The preſent price (1795) is—	£	s.	d.
For getting and filling, *per* rod - -	0	12	0
Spreading - - - - -	0	2	6
Carting - - - - -	1	13	0
	2	7	6

Since this period the expences have been very greatly increaſed, ſo as to render marling a very heavy charge to the farmer.

In the Middleſex Report it is ſtated to be this: "Four men digging and filling eighty cart loads, at 4*s*. a ſcore, ſpreading included, is 16*s*. One man and four horſes, two days, at 12*s*.—1*l*. 4*s*. Total expence *per* acre, 2*l*.

An intelligent farmer, who has had conſiderable experience on a farm of twelve hundred acres, remarks, that, "from different trials of his own, at a very great expence, and the obſervations he has made on his neighbours' and the Norfolk farmers' manner of improving light ſandy lands, by clay and marle, he is clearly convinced, that about ſeventy ſquare yards, each of which contains about a cart load, is the propereſt quantity to be laid upon an acre of land, pole meaſure. If more be laid on, the longer it will be before it incorporate with the ſoil, and, of courſe, the longer before any benefit can be received from it. He once ſaw an inſtance, where a farmer laid 120 loads, or ſquare yards *per* acre, and gave this reaſon for it, that the land was ſo poor he was ſure he could not hurt it. But the conſequence of it was, that after an expence that would have purchaſed the fee ſimple of the land, he could not ſee, for many years, that he had done it any good, as it produced no better (if ſo good) crops, as land by the ſide of it that had not been clayed at all, but otherwiſe farmed the ſame. It has now, however, evidently the advantage of the other lands, having been done above twenty years. This trial was in the middle of a ſhiftable field, where, by the courſe of huſbandry, two crops are taken to one ſummer tilth; and where this is the caſe, claying, &c. ſeldom (or never he might ſay) anſwers the expence; for claying and marling being only a firſt, or beginning of improvement, by going on directly with a courſe of ploughing, which cannot well be avoided in ſhiftable fields, it is often buried and loſt before it mix properly with the ſoil, eſpecially if turned in too deep by the firſt earth, of which great care ſhould be taken. He would therefore recommend claying or marling only upon incloſed lands, unleſs where large breadths lie together, that can be farmed in any manner the occupier pleaſes; and in that caſe (as well as in incloſures) he would adviſe that the lands ſhould be laid down with clover, rye-graſs, and trefoil, the ſpring twelvemonth before laying on the clay or marle, and to remain at leaſt ſix months after it, that it may have time to ſink and eat itſelf into the flag before it is ploughed up, and then there will be little or no danger of loſing it, as it will already be in ſome meaſure incorporated with the ſoil." And, "no pains ſhould be ſpared to break all the lumps, and get it fine by repeated harrowings and rollings, and having all the ſtones picked and carried away, that the graſs may get through as ſoon as poſſible, for ſtock to be grazing upon it, which is the great and finiſhing improvement; for, as he obſerved above, claying or marling ſeldom or never anſwers where you go on immediately with a courſe of ploughing in the common way." Beſides, "in his opinion, as much, or more, depends on the management of lands after claying or marling, as in the mere laying it on, which, however, is very expenſive, and therefore a very perſuaſive argument in favour of that ſort of management that will be the moſt likely to make it laſting." But "little need be ſaid about the different quality of clay or marle, as every one muſt be content to uſe ſuch as is found on his own premiſes, for he never heard of any in the counties of Norfolk or Suffolk that would anſwer long carriage. He has ſeen, however, in the county of Kent, a ſort of marle that the Eſſex farmers buy, which, after being ſent many miles by water, he is informed they find anſwers carrying five or ſix miles by land. Clay that is freeſt from ſand, and marle that is ſoft and greaſy, are certainly, in his opinion, the moſt valuable; and even blue clay, that is condemned by moſt farmers, he has found to anſwer very well on light ſands, but they generally lie at too great a diſtance from each other to be prudently got together." However, "where there are different ſorts of manure equally convenient upon the ſame premiſes, which is ſometimes the caſe, *viz.* pure clay, white ſoapy clay marle, clay with much marle in it, loamy clay and cork; he ſhould certainly prefer the former for light ſandy lands; on ſands of a ſtronger nature, that have a mixture of loam with them, he ſhould chooſe the ſoapy-marle, or that mixed with clay-marle, whichever was moſt convenient; but any of the inferior ones muſt be uſed, rather than ſubmit to long carriage, eſpecially on a large ſcale."

With regard to the expences, "the firſt is the *filling*, which, including ſpreading, is 25*s.* a hundred, or $2\frac{1}{2}d.$ a load, with an allowance by ſome farmers of 2*s.* 6*d.*, by others of 5*s.* for opening the pit, and 1*s.* a load for all the large ſtones they throw out at the time of filling; the farmer to find drifts and ſtakes for letting down what they call the *falls*." And with reſpect to "the team, it muſt conſiſt of four ſtrong trace horſes, and two ſhaft horſes, which, for ſuch ſtrong work, muſt have very high keeping. He cannot, therefore, lay their labour at leſs than 2*s.* a day each, and the carter 1*s.* 6*d* a day, which, ſuppoſing they carry, one day with another (allowing for wet weather and hindrance by accidents, &c.), 30 loads a day, will be about $5\frac{1}{4}d.$ *per* load more, making in the whole $7\frac{3}{4}d.$ a load for filling, carting, and ſpreading." Therefore, taking the quantity of marle which is neceſſary on a medium, at 75 loads *per* acre, the ſtatement of the expences of this ſort of work will ſtand thus:

Expences.	£	s.	d.
Seventy-five loads, which, at $7\frac{1}{4}d.$ a load, is, *per* acre - - - - -	2	8	$5\frac{1}{4}$
Harrowing and rolling ſeveral times, to pulverize and ſpread it equally on the ſurface, *per* acre - - - -	0	1	6
Wear and tear of carts and harneſs, including accidents, at a farthing *per* load, *per* acre	0	1	$6\frac{1}{4}$
Loſs of ſeed, as it ſhould always be laid upon a layer, and be ſome months before it is ploughed in, *per* acre - - -	0	1	0
	2	12	$5\frac{1}{2}$

See Annals of Agriculture.

A late author ſtates, that "in Lancaſhire they have abundance both of ſtone and clay marle: the former is applied to the ſtrong clay ſoils, the latter to the light, loamy, and ſandy lands. The medium quantity laid on the acre is about three cubic roods, of eight yards to the rood. The expence in a great meaſure depends on the diſtance of carriage; but generally runs between ſix and ten pounds the acre. It is commonly laid on graſs lands, a year or two before they are broken up, although ſometimes on lands in a courſe of tillage. In either caſe, great care is taken to ſpread it as equally as poſſible on the ſurface, and to break any lumps on which the weather has not had ſufficient influence." And "the application of clay-marle to the light ſandy ſoils in Suffolk, has been the means of greatly improving thoſe ſoils; and the crops which they produce, after being marled, if the lands be not too ſeverely cropped, are ſo ſuperior, as fully to warrant the expence. The quantity laid on the acre is about eight loads, or nearly 2500 buſhels; this has been fully ſhewn above. And in the Iſle of Man, they lay on clay marle at the rate of nearly two hundred tons the acre."

But "it is to the county of Norfolk that we are to look for the wonderful effects produced by marle. Theſe are ſo great, that lands which, forty or fifty years ago, did not rent at eighteen pence the acre, now give upwards of twenty ſhillings. There are two kinds of marle in that county; the one of a white, or rather yellow colour, conſiſting almoſt entirely of calcareous earth; the other may properly be denominated clay marle, but from the ſmall quantity applied to the acre, it muſt be of a very rich quality, compared to to other marles; otherwife it could not operate fo powerfully on the foil. Of the firft, from ten to fourteen loads are fufficient for the acre; and of the laft, from thirty to forty. The mode of application varies. Sometimes it is ufed as a preparation for a crop of barley, or turnip; and is frequently laid on clover-ley, before being broken up for wheat; its ufe in this diftrict will be more fully feen below."

Yet it is fuggefted that, "if the above county has been benefited by the marles above-mentioned, that of Forfar, in Scotland, has reaped as great advantages from fhell-marle. Shell-marle, of a moft excellent quality, has been for a good many years difcovered in various parts of that county, and the improvements that have taken place, in confequence of the general and judicious ufe of that valuable manure, exceed perhaps any thing of the kind that ever happened in the fame period in any other county in the kingdom. The average quantity laid on the acre, is about four hundred cubic feet; and in refpect to the mode of application, it is in every refpect fimilar to that mentioned above, as the practice in Norfolk. Great caution is, he thinks, neceffary in ufing marle, and in adopting proper rotations of cropping after it is applied. If a large quantity be laid on at once, efpecially on light lands, or if the marle be laid on a fecond time in the courfe of a few years, and a number of fevere crops afterwards taken, the lands will be greatly exhaufted. This was experienced in many inftances, when marle was firft ufed as manure in Forfarfhire; the tenants, for the moft part, ignorant of the effects it would produce, laid on large quantities; which creating a great fertility, they went on fowing oats, and other fevere crops, till the foil became little better than a dead fubftance. This alarmed the proprietors, and induced them to include certain covenants in their leafes, fo as to prevent any prejudicial confequences in future. Thefe have been the means of eftablifhing a more regular fyftem of marling hufbandry in that county, than perhaps is to be found in any other part of the ifland. When a field is marled, the tenant is bound to lay it out in grafs, with the next or fucceeding crop, and allow it to remain three or four years in pafture. When broken up for corn, a certain fpecific number of crops only are to be taken, before it is again laid out to grafs; and fo on, during the currency of the leafe. The tenants are alfo debarred from laying on marle a fecond time on the fame field, in the courfe of one leafe, which is commonly for nineteen years, unlefs it be properly mixed with dung, or other fubftances. Thus the improper practice of overcropping the land after marling, and the no lefs injudicious cuftom of repeated marlings at fhort intervals, are both prevented; and under thefe reftrictions, which are in general very fteadily adhered to, marle is found in that diftrict a moft beneficial manure, and the lands continue in a progreffive ftate of improvement. Although it appears doubtful whether marle, unlefs laid on in large quantities, be advantageoufly applied to ftrong clays, yet it feems univerfally agreed, that for all light, dry, fandy, and gravelly foils, it is the beft manure yet difcovered. That being the cafe, every occupier of fuch lands ought to be extremely attentive in fearching for marle; and the proprietors and farmers in thofe diftricts where it has been lately difcovered, will effentially promote their own interefts, by bringing into general ufe a manure, which has been found in fo many other diftricts a fource of real wealth, and a means of fubftantial and extenfive improvement."

It is ftated in the furvey, that "this fubftance, in Strathern, in Perthfhire, is fold from eight to ten-pence the boll, being eight cubical feet. The ordinary allowance for an acre is from forty to fixty bolls. A gentleman on the Nairn eftate, betwixt Perth and Dunkeld, told the writer that the farmers in that diftrict go even the length of one hundred bolls to the acre: but moft of the land in that county is a deep ftrong loam. The moft experienced improvers allow forty bolls for a fecond marling, after an interval of fourteen years. The interval now adopted in the Stormont is nineteen years, efpecially on the eftate of Balharry and the country adjacent. On all light land its effects are powerful and immediate; but it requires to be managed with caution. Many places of the Stormont, and indeed in all Strathmore, have been almoft laid wafte by the exceffive application of this ftimulating manure and over-cropping the ground. At Braditton the foil loft all the power of cohefion, and became fo light by this caufe, that it has no fward; the furface and the foil were blown away with the winds, in the fame manner as duft is raifed from the roads; and dens were made in fome inftances to the depth of five or fix feet. About Bakie, along the road from Coupar to Meigle, and in many other places, the fame injury has been done to the foil, by the injudicious ufe of marle. He faw one field weft of Blairgowrie, which had been fo reduced, that after it had lain fourteen years or more in grafs, it had fcarcely gathered a decent fward. Mr. Smyth of Balharry, to whom he owes much of his information relative to that country, told him that the land of Fullarton had been marled every fecond year for a fucceffion of ten or twelve years, which at length put the ground from carrying oats, but not from barley; which management and effect ftill continued in 1795. This fact feems to indicate that oats will exhauft marled land more than barley; or that the dung given to the barley crop, corrects the exhaufting quality of the marle.

"But the marle difcovered in Strathern has been applied very fuccefsfully to the lands in that neighbourhood, for a long time, becaufe a fucceffion of fcourging crops is not allowed. No fuch confequences have followed as thefe in the Stormont. The expence of dragging it out of the loch amounts to three-pence the boll, and a ftratum of mofs, from nine to fixteen feet, muft be removed, before the bed of marle in one end of the lake can be wrought. Sir William Murray fhewed him a field of thin gravelly moor laid down with marle alone, every acre of which, by fuch a dreffing, was equal to the maintenance of four fheep. In fome parts of the fame moor which had not been ploughed at all, the heath was banifhed in three years by a top-dreffing of marle, and fucceeded by a fine clofe grafs."

However, in the trials of Mr. Chatterton, made on a farm that had been marled at fome very diftant unknown period before, and had, in confequence, been altered in its foil from a weak fandy gravel to a rich loamy gravel, to the depth of ten or twelve inches, or fuch a depth as had been moved by the plough; on difcovering a pond from which marle had been taken, the year after his entering upon the farm he began with the marle. The firft piece to which he applied it was that of fome old mowing ground, which was fituated high, and was near a fharp gravel; it had but a very dry poor fward, producing only a fmall proportion of ordinary hay. He covered five or fix acres with marle, laying about forty loads upon the acre, and after it was fpread, was extremely attentive to feize a proper opportunity to harrow it fmall or fine, as it is feldom in a fit ftate for that work except upon a change of weather. The firft year, the improvement did not make make much appearance, but in the year following it was aftonifhingly great, both in the quantity and quality of the hay, and continued fo as long as he remained upon the farm, which was about fix years, being greatly increafed in value. In the following year he applied the fame quantity *per* acre, to a few acres in the middle of a

field

field that was under the plough, which was ſpread and ploughed in; after which oats were ſown, and the crop upon the marled part was ſuperior in ſtrength and richneſs to the other part of the field: but it did not ſeem to have undergone ſo great a change as the portion of graſs land juſt noticed. It is probable that the reaſon might be, that the piece ſown with oats had never been marled before; while the other, from the ſtrength and firmneſs of the ſoil, ſeemed to have had marle laid upon it at ſome time, as the top ſoil was much more free from pebbles, though underneath there was a very ſtrong gravel. When the field was in the ſtate of graſs-ſeeds, after the oats, the colour of the graſs was obſerved to be the ſtrongeſt and richeſt in the place where the marle had been applied; but as the whole was paſtured together, the difference in the quantity of produce could not be aſcertained. It is added that ſeveral other fields were marled while in the ſtate of tillage, with about the ſame number of loads *per* acre, all of which anſwered very well under the plough, were feeded well with graſs, and became rich paſtures; but that where the land was the moſt gravelly and ſharp, the greateſt change was produced. Vide Communications to the Board of Agriculture, vol. iv.

And in the practice of Mr. Kiddle, as ſtated in the ſame work, a vaſt ſuperiority was found in the uſe of clay marle, in the proportion of ſixty loads to the acre, over that of the chalky kind, on land of the new broken-up heathy kind, both in the turnips and crops which ſucceeded them, being nearly better by one half; which ſtrongly ſhews the neceſſity of procuring, if poſſible, clay or marle of the clayey kind, for ſuch ſorts of ſoil, even if brought from ſome diſtance, as the land is by ſuch means doubled in value; but that if it cannot be procured, and that of the chalky deſcription preſents itſelf, it muſt at all events be employed, "as without a ſtaple manure ſuch land will never admit of being converted into tillage with any advantage to the cultivator; without clay or marle, land of ſuch quality acquires no firmneſs, and no turnips can be grown upon them, as in the early part of autumn they will be ſubject to the "angerberry," and after being infected with it, they never make any progreſs in their growth, or are of any uſe for the cattle, particularly thoſe that are in a forward ſtate."

Mr. Marſhall, in his Rural Economy of Norfolk, ſtates, that "marle has been ſo long in uſe in that diſtrict, that there are few farms without marle-pits upon, or near them; ſo that ſearching for marle is at preſent ſeldom requiſite, and the art of diſcovering it not much ſtudied. The herb colts-foot (*tuſſilago farfara*) abounding on the ſoil, is conſidered as an indication of a jam of marle being ſituated near the ſurface. But, whether this is, or is not, an infallible guide, time and accidents or intentional reſearches have not failed to diſcover beds of marle in almoſt every eſtate, and, in ſome places, on almoſt every farm, ſituated ſufficiently near the ſurface to be worked with advantage. Of the quality of marles, the farmers in this diſtrict are, in a great meaſure, uninformed. That which falls moſt readily, and 'gets to work' the ſooneſt, is in the beſt eſteem; but, in general, the quantity of 'uncallow' (namely, the coping, or covering of earth, which lies upon the head, or jam) is more attended to than the intrinſic value of the marle. The depth of uncallow is generally very unequal; perhaps on the ſame jam of marle it will vary from one or two to ſix or eight feet deep, the ſurface of the jam uſually riſing into inequalities, termed heads." And "the depth of the jam is equally uncertain; he has ſeen one worked twenty feet deep; but in general, he believes, ten or twelve feet may be reckoned a middling depth. The bottom of the jam being generally a white abſorbent ſand, no pump or artificial drain is requiſite to free a Norfolk marle-pit from water, which no ſooner touches the ſand than it vaniſhes, as through the grate of an open drain."

It is ſuggeſted that in this county, "in working a marle-pit, the top ſoil is thrown back for manure; the remainder of the uncallow thrown to the bottom of the pit, and levelled for the carts to ſtand upon. When the jam is low, the marle is thrown immediately from it into the carts; but if it be too high for this operation, piles are driven in a row a few feet from the face of the jam; and, as ſoon as a crack is formed, water is poured into it, more eſpecially when the marle is dry and ſtubborn; and by this means many loads are thrown down at once; either to the bottom of the pit, or on to a platform level with the body of the cart; into which the marle, in this caſe, is thrown with great eaſe. Taking up the bottom of the jam is the moſt difficult part of the operation; the marle being firſt to be caſt up on to the bottom of the pit, and afterwards to be thrown into the carts. But by thus bringing up the bottom, two valuable things are obtained; a drain for the water, and a moſt convenient receptacle for the next line of uncallow. The labour beſtowed on marle previous to its being put into the cart, whether it be incurred by throwing down, looſening by pecks, crows, &c. or fetching up the bottom, is termed 'caſting'—the act of throwing it into the cart being called 'filling.'—The price of caſting was then three-pence to ſixpence a load, according to the circumſtances of the pit (the uncallowing being generally done by the day); and the price for filling two-pence or two-pence halfpenny, according to the ſize of the loads carried. He has known three-pence a load given for filling and ſpreading large loads: the price of ſpreading, alone, is about one ſhilling an acre. The number of loads carried out in a day by one team, varies, of courſe, with the diſtance to be carried; when the pit happens to lie in or contiguous to the ground to be marled, thirty loads have been carried; but five and twenty is, he believes, conſidered as a good day's work." But theſe prices are nearly doubled at the preſent period.

The quantity ſet upon an acre here is "equally various; depending upon two things: upon the judgment of the perſon who marles, and upon whether the land has, or has not, been marled heretofore. It is known, from common experience, that land which has been recently marled, receives no apparent benefit from a ſecond dreſſing of the ſame manure; but it is equally well known that, after ſome length of time has elapſed, a repetition of marling will generally anſwer. It is a notion pretty generally adopted, that, in this caſe, the quantity ought to be greater than it was the firſt or preceding time: and it being formerly the practice to ſet on a great quantity at once, ſeldom, perhaps, leſs than forty loads an acre, this notion has, probably, deterred many perſons from doing that which would have been ſerviceable to themſelves and their country. But there is not, it is believed, any general rule known, reſpecting either time or quantity: he has had frequent opportunities of making obſervations on a farm which affords a ſtriking inſtance on this ſubject. Two or three different tenants had failed ſucceſſively on this farm; though by no means high rented. The greateſt part of it had within the memory of man been marled with not leſs, in all human probability, than forty loads an acre; and the tenants who failed deſpaired of reaping any benefit from a ſecond marling after ſo ſhort an interval of time; but this farm falling into the hands of a more judicious tenant, he has, by marling, (and by other good management) accumulated, in little more than twenty years, a farmer's fortune; during which time he marled upwards of one hundred acres; and has found, from long experience, that twenty-five loads an acre,

acre, notwithftanding the recent marling, a fufficient quantity. He does not mean to intimate that the fame management would every where produce the fame effect; but he will venture to fay, that no man having marle upon his premifes ought to neglect to try its effect, by accurate and repeated experiments, upon every piece of land in his poffeffion, without being led away by any received notion, or general rule. The quantity fet on, upon land which is not known to have been marled, or out of which the marle is worn, is, at prefent, lefs than formerly." But in the fouthern hundreds, to which marle is obliged to be fetched a great diftance, ten or twelve loads are confidered as a dreffing; fix or eight are frequently fet on; while in the more central and northern parts of the diftrict, where marle is common on almoft every farm, twenty or thirty loads an acre are generally allowed, and fometimes forty loads. "And when it is known, from experience, or taken for granted without proof, that land, either through a recent marling, or other caufe, is not improveable by marle alone, a fmall quantity is mixed up with dung; either by bottoming the farm-yard, or the muck-heaps, with it; or by mixing it layer for layer with the dung in the heaps. In either cafe, they are afterward turned up, and thereby mixed more intimately together. With this preparation, marle has been found to anfwer, where, in its natural ftate, it had no effect."

It is ftated, in regard to the neceffity of marling, that "the fymptom, or indication, of a piece of land requiring to be marled, is taken from the plants which prevail upon it. 'Buddle' (*chryfanthemum fegetum*, corn-marigold) is confidered as a certain intimation that the land it abounds upon requires to be marled. 'Smart-weed' (*polygonum Pennfylvanicum*, pale flowered perficari) is likewife an obfervable fymptom. It is, it is believed, an undoubted fact, that marle, in a manner, extirpates thefe plants from the foil; and that 'quicks' (*triticum repens*) are confiderably checked by it."

It may be noticed that in this work three-wheeled carts are of vaft utility, from their great eafe and convenience to the cattle or teams, that are made ufe of in performing it. See Manure.

MARLINS, in *Artillery*, tarred white fkains, or long wreaths or lines of untwifted hemp, dipped in pitch or tar, with which cables and other ropes are wrapped round to prevent their fretting and rubbing in the blocks or pullies through which they pafs. The fame ferve in artillery upon ropes ufed for rigging gins, ufually put up in fmall parcels, called *fkains*. See Marline.

MARLITE, Bituminous. See Marle-*Slate*, *Bituminous*.

MARLO, in *Geography*, a town of Mecklenburg, on the Trebel; four miles E. of Roftock. N. lat. 54° 12′. E. long. 12° 42′.

MARLOE, Christopher, in *Biography*, an early Englifh poet, was born in the reign of Edward VI. and educated at Cambridge. He appeared upon the ftage in the reigns of Elizabeth and James I., and was, like his contemporary Shakfpeare, both an actor and a writer of plays. He compofed feven tragedies, which were highly applauded, and which, according to Mr. Warton, manifeft traces of a juft conception, but they abound in tedious and uninterefting fcenes, or with fuch extravagances as proceeded from a want of judgment and the barbarous ideas of the times. He tranflated many claffical pieces, among which were fome of "Ovid's Elegies;" and the firft book of "Lucan's Pharfalia." He is the author of an elegant fonnet entitled the "Paffionate Shepherd to his Love," printed in Percy's reliques. Marloe poffeffed much fancy, and fometimes writes in a vein of pure poetry, with fmooth verfification. He is charged with irreligion and infidelity, and was licentious in his manners. His end was tragical; having quarrelled with a footman about a young woman of no reputation, he was ftabbed with his own fword, that he had drawn upon his rival. This was about the year 1593. Moreri.

MARLOW, Great, in *Geography*, a borough, market-town, and parifh in the hundred of Defborough, Buckinghamfhire, England, is fituated near the banks of the river Thames, 17 miles diftant from Aylefbury, and 31 from London. The manor, called in Domefday book Merlaw, belonged, previous to the Norman conqueft, to the earls of Mercia, but, being feized by king William, was given by him to his queen Matilda. Henry I. who inherited it from his mother, beftowed it on his natural fon Robert de Melhent, afterwards earl of Gloucefter, from whom it paffed with that title to the Clares and Defpencers, and from the latter, by female heirs, to the Beauchamps and Nevilles, earls of Warwick. It continued in the crown from the time of Richard III's marriage with Anne Neville, till queen Mary granted it to William lord Paget, in whofe family it remained more than a century. From the Pagets it paffed through feveral intermediate poffeffors to fir William Clayton, who purchafed it in the year 1736. It is now the property of his defcendant fir William Clayton, bart. who has a handfome feat, called Harleyford, at a fhort diftance from Marlow.

The town of Great Marlow has been fuppofed, from the denomination Chipping Marlow, which occurs in ancient records, to have been a market-town in the time of the Saxons. It now confifts of two principal ftreets, and three fmaller. The High ftreet is fpacious, on a gradual defcent, and contains many good houfes. The whole town has been recently much improved. Its profperity has been increafed by the department of the Royal Military college, which has been provifionally eftablifhed here. The college confifts of two departments refpectively appropriated to the fenior and junior claffes of pupils. The firft clafs is fettled at Wycomb, and is for the inftruction of officers in the duties of the general ftaff; the fecond, at Marlow, for thofe who, from early life, are intended for the military profeffion, and who, by thefe means, may be grounded in the fcience previous to their attaining the age that enables them to hold commiffions. The whole college will fhortly be removed to Blackwater, where extenfive and appropriate buildings are now erecting from defigns of John Sanders, efq. architect.

The church of Marlow, which is a fpacious and ancient ftructure, confifts of a body and two aifles, with a tranfept dividing it from the chancel. From the tower rifes a wooden fpire, erected in the year 1627. The nave is feparated from the chancel by a fcreen of chalk decorated with tracery. The altar is of oak, curioufly carved. The old bridge, which croffed the Thames at Marlow, is of very remote origin; among the patent rolls in the Tower are grants from Edward III. and two fucceeding monarchs, allowing the bailiffs to take toll of all goods and merchandize paffing over or under the bridge; the receipts to be expended in repairs. This ftructure becoming ruinous and unfafe, the prefent bridge was erected by private fubfcription in the year 1789. The principal charitable inftitutions in the town are two free-fchools, one for twenty-four boys, and the other for the fame number of girls, founded by fir William Borlafe about the year 1624; and alms-houfes for poor widows, endowed purfuant to a deed of truft from John Brinkhurft, efq. dated July 20th, 1608. The rents of the eftates appropriated to their fupport now amount to forty-two pounds yearly; which have enabled the truftees to add two perfons to the eftablifhment, bliſhment, which originally conſiſted of only four. Some faint traces of a corporation are diſcovered in the records concerning the town, but it does not appear that any charter for its government was ever obtained; the laſt mention of the mayor and burgeſſes occurs about the end of the fourteenth century. The firſt return for the borough was in the twenty-eighth year of Edward I. when Richard le Mouner and Richard le Veel were choſen as its repreſentatives in the parliament held at Lincoln. It continued to ſend members till the ſecond of Edward II. after which no returns were made for 314 years, till the twenty-firſt of James I., when, on a petition to the houſe of commons, the privilege was reſtored. The right of election is in the inhabitants paying ſcot and lot; the number of voters being about 200. A market is held on Saturdays, and two fairs annually. The population ſurvey in 1801 ſtated the pariſh to contain 643 houſes, occupied by 3236 perſons. At a ſhort diſtance from the town are the Temple mills, where extenſive works are carried on in copper and braſs.

About two miles eaſtward is the village of Little Marlow, which contains 128 houſes, and 728 inhabitants. A benedictine nunnery was founded here about the time of Henry II.; but ſcarcely any part of the conventual buildings is now ſtanding, the principal materials having been uſed in the conſtruction of a farm-houſe.

On the ſouth ſide of the Thames, nearly oppoſite to Great Marlow, is Biſham abbey, which appears to have been erected by William Montacute, earl of Saliſbury, in the year 1338, for canons of the order of St. Auguſtine. It is now the ſeat of N. Vanſittart, eſq. M. P. Lyſons's Magna Britannia, vol. i. 4to. Beauties of England, vol. i.

Marlow, a town of America, in Cheſhire county, North Hampſhire, containing 543 inhabitants.

MARLSHAND, an iſland of Sweden, near the W. coaſt, in the North ſea. N. lat. 57° 53′. E. long. 11° 29′.

MARLY, *Machine of*, in *Hydraulics*, is a very complex machine for raiſing water at Marly, about ten miles N.W. of Paris, the primum mobile whereof is an arm of the river Seine, which, by its ſtream, furniſhing a fall of water of three feet, turns fourteen large wheels, which work the handles, and theſe with piſtons raiſe the water into the pumps, and with other piſtons force it up in pipes againſt the aſcent of a hill to a reſervoir in a ſtone tower. The baſin of the tower, which receives the water raiſed from the river, is 610 fathoms diſtant from the river, and 500 feet higher than the lower end of the ſucking pipes of the lower engines of the machine. The baſin ſupplies an aqueduct of thirty-ſix arches; whence the water is ſeparated into different conduits which lead it to Marly, and formerly led it to Verſailles and Trianon. The number of pipes in this machine is 253; and the quantity of water raiſed by it amounts to 5258 tons in twenty-four hours, or near 220 tons *per* hour, or $3\frac{1}{2}$ tons *per* minute; but the London-bridge water-works, with four wheels only, raiſe 11,724 tons in twenty-four hours, which is almoſt twice and a quarter as much. Some of the largeſt of our fire or ſteam-engines uſed in England, will raiſe as much water as that of Marly to the ſame height, and not coſt above 10,000*l.*

This machine, which began to work in 1682, and is ſaid to have coſt above four millions of pounds ſterling, was made by one Rannequin, a common mechanic of Liege, and has a great many excellent contrivances; but yet does not raiſe all the water that it might have done, becauſe the maker did not know how to give the river Seine all the advantages of which it was capable. Hence appears the neceſſity of a mechanic's being well acquainted with mathematics; or that able mathematicians ſhould apply themſelves to mechanics more than they do, and not think it below them to direct workmen. See Deſagul. Exper. Philoſ. vol. ii. p. 442 to 449.

According to Dan. Bernouilli's computation, the effect of the machine of Marly is not more than $\frac{1}{16}$ of its abſolute force; that is, there is a loſs of $\frac{15}{16}$ of that force. Dan. Bernouil. Hydrodyn. p. 182.

MARLY-LA-MACHINE, in *Geography*, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Verſailles, ſituated near the Seine, and celebrated for its water-works; four miles N. of Verſailles. The place contains 1227, and the canton 12,397 inhabitants, on a territory of 90 kiliometres in 17 communes.

MARMAGNE, a town of France, in the department of the Cher; four miles W. of Bourges.

MARMALADE, a confection made of the juice or pulp of ſome fruit, as plums, apricots, quinces, boiled with ſugar to a conſiſtence.

The marmalade of quinces is the moſt frequent: it is ſub-aſtringent, and grateful to the ſtomach.

MARMANDA, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Lot and Garonne; ſituated on the Garonne. The place contains 5598, and the canton 14.385 inhabitants, on a territory of $172\frac{1}{2}$ kiliometres, in 15 communes. The trade of the town, which is conſiderable, conſiſts in corn, wine, and brandy. N. lat. 44° 30′. E. long. 0° 15′.

MARMARICA, in *Ancient Geography*, an extenſive country of Africa, bounded on the E. and W. by Egypt and Cyrenaica; on the S. by the Sahara, or deſerts of Libya interior, and on the N. by the Mediterranean. After paſſing the Glaucum Promontorium, Cape Deris, the port Leucaſpis, and other inconſiderable promontories and harbours, we come to Parætonium, called by Strabo Ammonia, a city of conſiderable note. Florus ſtyles this city and Peluſium the two horns of Egypt; whence it appears that he conſidered Marmarica as part of Egypt, and Parætonium as a fortreſs of great ſtrength. At ſome diſtance from Parætonium, towards the frontiers of Cyrenaica, ſtood Apis, a town ſo denominated from the Egyptian deity of that name. Triſerchis, Zagylis, and other places on the ſea-coaſts, enumerated by Ptolemy, are ſo inconſiderable as not to merit attention. The principal Libyan nations inhabiting this region were the Adyrmachidæ and Ammonii. Some authors ſeem to make the Marmaridæ a nation inhabiting a particular territory contiguous to the greater Catabathmus; but others incline to the opinion, that all the Libyans of Marmarica were comprehended under this appellation. Father Calmet thinks that Marmarica was firſt peopled by the deſcendants of Lehabim, the ſon of Mizraim, mentioned by Moſes. Herodotus aſſures us that there was a great affinity betwixt them and the Egyptians, in the moſt important points.

MARMARIUM, a town of Greece, in the iſland of Eubœa.

MARMARO-PROSERA, in *Natural Hiſtory*, is a ſpecies of ſtones forming continued ſtrata, bright and beautiful, of very lively colours, and of a conſtitution ſo fine, that they will take a good poliſh; in all which particulars they agree with the genus of marbles, but differ from them in that they are never calcareous, nor do they ferment with acids. To the ſame claſs belong the granites and the porphyries.

The marmaro-proſera are ſtones of a compact, uniform texture, like that of marbles; ſome of them are vitrifiable, others not and ſome are of ſuch hardneſs as to ſtrike fire with

with fteel. Of this kind is the bafaltes. Da Cofta's Hift. Foff p. 252, &c.

MARMARUOLO, in *Geography*, a town of Italy, in the department of the Mincio; eight miles N. of Mantua.

MARMARYGÆ, a word ufed by the old writers in medicine, to exprefs fparks of fire, or the appearance of fuch flafhing before the eyes in fome diforders.

MARMIGNAC, in *Geography*, a town of France, in the department of the Lot; nine miles S.W. of Gourdon.

MARMOL CARAVAJAL, LUIS DE, in *Biography*, born in the fixteenth century, at Granada, was taken prifoner by the Moors of Barbary, and carried to Morocco. Here he collected all the materials he could get for an account of the country, which, when he efcaped from the houfe of bondage, he publifhed under the title of "La Defcripcion General de Africa." The French tranflation of this work by M. D'Ablancourt is very highly efteemed. Gen. Biog.

MARMONTEL, JOHN-FRANCIS, a diftinguifhed French writer, was born in 1723. His father was in low circumftances, and obliged to exercife great frugality in bringing up his children. His early education prefented him with few literary advantages, but from his mother, whofe language and fentiments were much fuperior to her ftation, he derived much benefit with refpect to mental cultivation, by which he foon diftinguifhed himfelf among his contemporaries. Through her influence he was fent to the Jefuits' college of Mauriac, where, with the practice of ftrict economy, he was enabled to go through the ftudies of the place. At the age of fifteen his father placed him with a merchant at Clermont; but he had a mind ill adapted to trade, and took the firft opportunity of quitting it after his arrival, and hiring a garret, with a few livres that he took with him, wrote to his father that he felt a vocation for the ecclefiaftical profeffion. He was allowed to follow the bent of his inclination, and was admitted at once into the philofophical clafs in the college of Clermont. His wants were few, and thefe he readily fupplied by undertaking the office of inftructing others in their earlier ftudies. The death of an affectionate father, in the fecond year of this occupation, was a very fevere ftroke upon him, but his heart was adapted to the exigency, and he inftantly took upon himfelf the paternal charge with refpect to an almoft deftitute family. He engaged as teacher of philofophy in a feminary of the Bernardines, and his talents almoft immediately gave him a marked diftinction in the fociety of monks, and profpects of greater celebrity foon opened upon him. He wrote an ode as one of the competitors for the prize given by the academy of "Floral Games" at Touloufe. The award was given againft him, but being diffatisfied with the decifion he fent his performance to Voltaire, who returned it with many commendations, and at the fame time prefented him with a copy of his works. He regarded this teftimony of regard from fo great a man as much fuperior to the prize for which he had been ftriving, proceeded with ardour in his career of ftudies, and obtained the prizes of feveral fucceffive years. His fcholars rapidly increafed, and in the fame proportion his gains were augmented, which he applied to the fupport of the family chiefly dependant on his labours. He fent for one of his brothers to be educated at his own expence and under his own eye. About this period he formed a refolution to quit his ftudies that he had been purfuing to fit him for the ecclefiaftical profeffion, and by the advice of Voltaire he determined to try his fortune at Paris as a man of letters: he obtained as an introduction the patronage and protection of M. Orri, the comptroller-general of the finances. Scarcely, however, had he reached the great city, when he found that his friend had been difmiffed from the miniftry. He was now encouraged by Voltaire to write for the ftage; he made the attempt, but in this and other efforts of a different nature he was completely unfuccefsful, nor could with all the application of which he was mafter fave himfelf from a ftate of indigence, and he was glad to undertake the education of a youth to improve his circumftances. This gave him admiffion to a felect and agreeable fociety, and by putting him out of the reach of want his mind was free for any exertion. He accordingly fet about a tragedy, which he finifhed, under the title of "Denis le Tiran:" it was acted in 1748, and obtained very general applaufe. From this moment money and fame poured in upon him: he attracted general notice, "was feafted and complimented, and at once fell into the vortex of Parifian fafhion." He did not, however, neglect the art to which he was indebted for his reputation, and in 1749 he brought forward a fecond tragedy, entitled "Ariftomene." Voltaire fat with him in his box, and cordially joined in the applaufe which it received. His next piece was the tragedy of "Cleopatra," which was finifhed and acted in 1750: this was probably written in a hurry, and its fuccefs was very indifferent; and the "Heraclides" which foon followed abfolutely failed. This difappointment feemed to roufe him into action, and made him attentive to future fortune. He obtained the place of fecretary of the royal buildings by the influence of Madame Pompadour, and under her brother M. de Marigny. He immediately took apartments at Verfailles, and "here," fays he, "thank heaven terminate the errors and deviations of my youth." In his literary capacity he was connected with d'Alembert and Diderot, and was their coadjutor in the Encyclopédie. His fervices to perfons in power procured him a penfion upon the privileged work called the Mercure François." In this he publifhed his "Alcibiades," compofed at a fingle fitting, and which was received with fo much applaufe that he followed it with "Soliman II." the "Scruple," and others; this was the origin of the "Contes Moraux," which became fo popular throughout Europe. In 1758, he quitted his office at Verfailles, and went to Paris, where he became an affociate with all the men of letters and artifts in that capital. His happinefs was, however, foon interrupted, by refufing to give up the author of fome fevere verfes which he had imprudently repeated in company. They were accordingly attributed to him, and he was committed to the Baftile. His confinement was fhort, and his treatment in it was of the mildeft kind. After his liberation, he made a tour through the fouthern provinces of France, in which he paid a vifit to Voltaire, and then wrote his "Epitre aux Poëtes," for the prize offered by the French Academy, and obtained the object of his ambition. In 1763 he was admitted a member of that body. His next literary production, and that which has conferred the greateft celebrity on his name, was his "Belifaire." The liberal fentiments which he had put into his hero's mouth concerning religious toleration, and the unimportance of controverted theological tenets, excited the refentment of the Sorbonne, which proceeded to a cenfure of the whole work, but it could not ftop its career; very large impreffions were difperfed over France and all Europe. On the death of Duclos, in 1772, Marmontel was appointed, without any folicitation on his part, to fucceed him as hiftoriographer of France. He prepared himfelf to exercife the duties of his new office by collecting materials for the reign of Louis XV.; he alfo engaged in the compofition of the Supplement to the Encyclopédie. After he had attained to the age of fifty-four he married a young lady of eighteen,

eighteen, and it is faid that this union, fo very unfuitable in point of years, was the fource of much real felicity. About the fame period he publifhed another work, entitled "Les Incas, or the Deftruction of the Empire of Peru," which united hiftory and fiction, and which was evidently, like the Belifaire, for the purpofe of inculcating liberal principles and enlightened fentiments. In 1783 he was, on the death of d'Alembert, elected to the poft of perpetual fecretary of the French Academy, and from this period his compofitions were chiefly confined to eloges and other pieces read before the academy, as well in verfe as in profe. He alfo employed himfelf in a complete edition of his works, now become very voluminous. During the latter years of his life he had to witnefs the ftormy fcenes of the French revolution: his ideas of reformation went no farther than the conceffions offered by the crown in 1788, and he contemplated with horror thofe conftitutional changes which he faw meditated by the popular party. He was, neverthelefs, chofen a member of the electoral affembly: but foon loft the confidence of his conftituents, by oppofing an unlimited liberty of the prefs, and he gladly retired to his country-houfe to remain a fpectator rather than actor in the great revolutionary drama. In his retreat from the bufy and noify world, he employed himfelf in writing fome additional "Contes Moraux;" and a "Cours Elementaire" for the inftruction of young perfons, confifting of fhort treatifes on grammar, logic, metaphyfics, and morals. He alfo drew up memoirs of his own life, addreffed to his children. In 1797 he was brought forward again into public life, and chofen a reprefentative of the department of Eure, and was, in the national affembly, particularly charged with the defence of the Catholic religion. He pronounced before the legiflative body a difcourfe "On the free exercife of public worfhip," and he continued to difcharge the functions of his office, till the decifion which rendered null the elections of his department, with thofe of many others. He died, almoft in indigence, in December, 1799, in the feventy-feventh year of his age; leaving a widow and two young children without fupport. As an author, Marmontel is characterized as warm and eloquent on grave and elevated topics, eafy and lively on light ones, ingenious, inventive, and varied, full of good fenfe and animated with fentiment: he is almoft equally fuccefsful in his addreffes to the heart, the imagination, and the judgment. His "Contes Moraux" contain many fine ftories, delightfully told, and fcarcely has any work of the age been more popular: the morality of fome of them is very doubtful, and hence the title "Moral Tales," as tranflated in our language, is not in all cafes proper. They are fictitious narratives relative to life and manners, and in general they inculcate valuable and ufeful leffons. Since his death his own memoirs have appeared, and alfo "Memoirs of the Regency of the Duke of Orleans," printed from his manufcript, in 2 vols. 12mo.

Marmontel, after hearing the "Serva Padrona" of Pergolefi performed in 1751 at Paris, in Italian, and by Italians, was one of the firft converts to the mufic of Italy in France.

This natural, eafy, graceful, and pleafing intermezzio, which produced Rouffeau's famous "Lettre fur la Mufique Françoife," likewife opened the ears of Diderot and d'Alembert, the abbés Annauld and Morillet, Meffrs. Suard and Grimn, who ever after continued hoftile to the old ftyle of French mufic.

Gretry, returning from Italy in 1767, new fet, at Geneva, Favart's comic opera of "Ifabelle et Gertrude," which fucceeded fo well, that, on the young compofer's arrival at Paris, Marmontel furnifhed him with other mufical dramas: and they feem to have been conftantly attached to each other ever after.

When Piccini arrived at Paris in 1778, Marmontel inftantly became a Piccinift, and wrote a pamphlet "On the Revolutions of Mufic in France," which gave great offence to the Gluckifts.

We have often obferved, that the French talk and write on the fubject of mufic better than the Italians; but it is all declamation. There is no part of mufic, vocal or inftrumental, in which they are comparable to the Italians.

Marmontel's ideas about dramatic mufic are fcattered through the Encyclopédie, which M. Laborde has collected and drawn to a focus, in his "Effai fur la Mufique," publifhed in 1780; and in Marmontel's "Revolutions," we have his *profeffion de foi muficale*, drawn up by himfelf.

But of all the reformers of French mufic, and partizans of the Italian, Diderot and Marmontel were perhaps the only two that were in earneft, and who feem to fpeak from feeling, not from fyftem. "Woe to thofe," fays Marmontel, "whofe tafte and ideas furpafs their means of gratification! The partizans of Lulli and Rameau forgot their quarrels, and united in defending French mufic of every kind againft the Italian." Marmontel fought ftoutly for melody; for the fimple, elegant, and graceful melody of Italy. "Gluck," he fays, "not only gives lefs melody, but melody of a more vulgar and common kind, than Piccini, Sacchini, and Pergolefi."

The Greeks did not allow that any pain or grief fhould diftort and deform the features in any one of the arts. In finging, Haffe tried his moft difficult paffages in a mirror; and the dying gladiator, the Niobe, and the Laocoon, make no frightful faces. A pathetic and paffionate air in mufic is not to fcream or howl. No paffion fhould be expreffed in mufic, that is not foftened into pleafure by the found, by exquifite mufical tones and chords. "Melody without expreffion is of little effect: expreffion without melody is fomething, but not all we want. The union of melody and expreffion of the moft perfect kind is the problem to be folved; and the melodies of Piccini, Sacchini, and Paefiello, fung by a Pacchierotti or a Marchefi, is the folution. Vinci firft revealed the myftery, by his natural, graceful, and flowing melodies, undeformed by complication in the accompaniments. Gluck has certainly not invented a new *genre*. He has, indeed, improved that of Lulli and Rameau by more movement and fire; but he has injured the Italian recitative, by loading it with harmony."

All Marmontel has faid is true and reafonable; but he has not faid enough. The root of the evil,—the grand, and, we fear, the invincible impediment to the introducing Italian melody on the French ftage, is the *finging*. Gluck faid to the complainants of want of air, of graceful, paffionate, or fpirited melody in his operas, that "they had no fingers to perform them." If the French themfelves would allow this as an excufe for Gluck, and place his trivial airs to neceffity, we fhould honour their tafte and candour, and lament their privation of the delight which fine airs, well fung, afford true lovers and judges of mufic. But when we are told that thefe ballad airs are models for the reft of Europe, where good fingers can be found, we think it borders upon arrogance, very unbecoming a nation juft emerging from barbarifm in vocal mufic.

The ferious dramas, written for mufic by Quinault, have increafed in favour, as poetry, in fpite of Boileau's four cenfures, ever fince the death of the author. The airs, however, could not be fet to modern melody in their original ftate. And when Piccini arrived in France, and requefted to to be furnifhed with dramas to fet, in which the fongs were phrafed and polifhed like thofe in the operas of Metaftafio, the true models of lyric poetry, Marmontel, in order to preferve the admirable lyric tragedies of Quinault, modernized the airs, and retained all the original beauties of the dialogue. Encouraged to this undertaking by the moft enlightened men of letters, to whofe judgment he fubmitted his labours, he prepared for Italian mufic the poems of Amadis, Roland, Perfeus, Proferpine, Atys, Phaeton, Ifis, Thefeus, and Armide; and on being applied to by the directors of the opera to let Piccini have one of them to fet, he gave them their choice, which fell upon Roland, of which the fable was taken from the "Orlando Furiofo" of Ariofto. Piccini was unacquainted with the French language: it was therefore neceffary, in explaining the poem, to accompany him in his labour ftep by ftep; and Marmontel performed this tafk with as much zeal and folicitude as Quinault himfelf could have done. The Italian compofer, from thefe inftructions, became in a fhort time fo well acquainted with the accentuation and mufical expreffion of French words, that the moft fevere critics were unable to point out a fingle fault which he had committed againft the profody and genius of the language. "It is well known," fays M. Laborde, "how complete was the fuccefs of this undertaking: he amply fulfilled the wifh of Marmontel, and refolved the problem, whether the French language was capable of receiving Italian mufic." We ftill think it is not; as the mufic which Piccini and Sacchini have fet to French words is very inferior to that which they have fet to their own language.

The number of operas, ferious and comic, which Marmontel produced for the feveral theatres of France, between the years 1747 and 1778, is prodigious. Very early in his life he furnifhed Rameau with operas for the Academie Royale de Mufique; and befides his dramas that were fet by others, he was author of the words of almoft all the comic operas which were fet by Gretry, during his long and fuccefsful career.

MARMOR, Marble. See Marble.

MARMORA, in *Geography*, a river of European Turkey, which runs into the Strimon, 6 miles N.W. of Emboli, in the province of Macedonia.—Alfo, a town of European Turkey, in Macedonia; 34 miles E.N.E. of Saloniki.—Alfo, an ifland in the ftraits of Conftantinople, or fea of Marmora, about 12 leagues in circuit. It is lofty, mountainous, and tolerably fertile: it contains feveral towns or villages, rather populous; it has two harbours, which are by no means extenfive, fituated towards the fouth. Veffels furprifed by a northerly wind, fomewhat ftrong, repair hither for fhelter. The inhabitants have a few flocks of fheep: they cultivate the vine, the olive-tree, and cotton, and gather various fpecies of grain. Marmora formerly bore the names of Nevris, from νεβρος, the fawn of a doe; Elaphonnefus, from ελαφος, a ftag, and νησος, ifland; and Proconnefus, from πρoξ, προκος, fignifying a young ftag, and νησος, ifland. Thefe latter names were given to it from the number of ftags which were met with in it. But Olivier thinks that none exift there at this day, as the woods are deftroyed, and the mountains are almoft naked. This ifland has received its name Marmora from a white marble, a little veined with grey and blueifh, which is furnifhed by it in great quantities. Although the grain of this marble is not fine, nor its colours beautiful and mixed, the Greeks efteemed it formerly, and made frequent ufe of it: they diftinguifhed it by the name of "Cyzicus" marble, becaufe that peninfula afforded fome, probably, of the fame quality, or becaufe the town of the fame name ferved as an emporium for it. Fragments of it are found among the ruins of almoft all the ancient cities: pillars of it are feen in various places, and particularly in the mofques of Conftantinople. It is faid, that the ftately palace of Maufolus, at Halicarnaffus, was lined with this marble. At the prefent day, it is only wrought for the fepulchral ftones made ufe of by the Turks, the Armenians, and the Europeans: it is feldom employed in the conftruction of houfes. N. lat. 40° 30'. E. long. 27° 33'.

Marmora, *Sea of*, or *White Sea*, a gulf between the ftraits of Conftantinople and the ftraits of Gallipoli; about 90 miles from eaft to weft, and 33 from north to fouth. It takes its name from that of the ifland above mentioned.

Marmora, a town of Afiatic Turkey, in Natolia; 33 miles E. of Magnifa. N. lat. 38° 43'. E. long. 28°.

Marmora, *La*, a town of Naples, in Calabria Ultra; 16 miles W. of St. Severin.—Alfo, a town of France, in the department of the Stura; 19 miles W. of Coni.

MARMORICE, a town of Afiatic Turkey, on the fouth coaft of the province of Natolia. The town is fmall, but fituated in a bay with a narrow entrance, which is reprefented as one of the fineft harbours in the world. N. lat. 36° 52'. E. long. 28° 30'.

MARMOROIDÆ, in *Natural Hiftory*, are ftones, which in their nature, texture, appearance, and other properties, refemble marbles; and only differ from them, in that the bodies of this genus never form continued ftrata, but are only found in loofe independent maffes, lodged in ftrata of other fubftances. M. Da Cofta fubdivides thefe into marmoroidæ of a plain ftructure, and thofe which contain fhells, corals, and other extraneous bodies. Hift. Foffils, p. 241, &c.

MARMOSA, in *Zoology*. See Didelphis *Murina*.

MARMOSETS, in *Geography*, a harbour in the ifland of St. Domingo, lying between cape Rouge and Grand Port Berhagne.

MARMOT, Arctomys, in *Zoology*, a genus of Glires in the clafs of Mammalia: the characters of which are, that the animals of this genus have two cutting teeth in each jaw, five grinders above and four below, on each fide, and that they have collar bones. This genus is very properly feparated from that of *Mus* by Dr. Gmelin, in imitation of Mr. Pennant. Moft, if not all the fpecies, hybernate, or become torpid, during winter: they wander in queft of food, and for other purpofes, during the day, feeding on roots and grain: they are capable of climbing, and dig burrows in the earth for their habitation; their heads are generally round and convex, having either very fhort ears, or none; their bodies are thick, with fhort hairy tails; the fore-feet have each four toes, and a very fhort thumb, or fifth inner toe; and the hind-feet have each five toes. The cæcum, or blind gut, is generally very large.

The fpecies are as follows:

A. Marmota, Mus Marmota of Linnæus, Alpine or Mountain Moufe, Alpine Marmot of Pennant, and Marmotte of Buffon. It has fhort round ears; the upper parts of the body are dufky brown, and the lower parts reddifh. The body is thick and fhort; the head large and thick, flattened at the top; the nofe thick and blunt, often carried erect when the animal fits; the two bones of the lower jaw are moveable on each other; the cheeks are covered and furrounded with long hairs; the muzzle has feven rows of whifkers; above and below each eye is placed a black wart, on which are hairs; the legs are fhort; the tail is ftraight, and covered with long hairs; the tip of the tail is very dark brown,

brown, almoſt black; the body and head meaſure ſixteen inches, and weigh nine pounds; the tail is about ſix inches long. Theſe animals inhabit the higheſt ſummits of the Alps and Pyrenæan mountains, in dry places where are no trees; feed on inſects, roots, and vegetables; are fond of milk, which they take by lapping with a murmuring noiſe; and drink very little. The Alpine marmots live in ſocieties of from five to fourteen, baſk in the ſun, and place a centinel, which whiſtles on the approach of danger, when they retire into their holes; and if they cannot eſcape, defend themſelves boldly, and bite with great fury. They form burrows with numerous paſſages and entrances: at the end of September they reſort to their ſubterraneous chambers, which are well lined with moſs and dry graſs, and ſtopping the entrance with earth, they remain here in a torpid ſtate of hybernation till the month of March. If they chance to be dug up, and are brought into a warm atmoſphere, they gradually revive. They are able to walk on their hind feet, and ſit up on their haunches, carrying food to their mouths with their fore-feet. They are eaſily caught on plain ground, but with difficulty in their holes, as they dig deeper when in danger of being taken, except during their torpid ſtate in winter. At this time, many of them are caught for the ſake of their fleſh, which is tender and delicate; partly for their ſkins; and partly for their fat, which the inhabitants of the Alps eſteem to be medicinal: but they are chiefly taken by the Savoyards, with a view of expoſing them as ſhows through various parts of Europe. In a tame ſtate, they are very deſtructive to all kinds of proviſions, clothes, linen, or furniture; and can hardly be prevented, even in warm climates, from falling into a ſtate of torpidity in winter. They procreate in April or May; and the female, after ſix or ſeven weeks, produces, two, three, or four young ones.

A. Monax, Mus griſeus of Pallas, Glis fuſcus, Marmota Americana or American Marmot, Monax of Edwards and Buffon, and Maryland Marmot of Pennant, has ſhort rounded ears, blueiſh noſe and cheeks, body of a deep brown colour, and longiſh tail, which is very hairy. The eyes are black and prominent; the feet and legs are black, with long ſharp claws; the tail is half the length of the body. This animal is about the ſize of a rabbit, and feeds on vegetables: its fleſh is very good, reſembling that of a pig. It inhabits the warmer ſtates of North America, and the Bahamas. In America, it forms holes in the clefts of rocks, and under the roots of trees, in which it paſſes the winter in a torpid ſtate; but it is not certain that they hybernate in the Bahamas, where the climate is very mild.

A. Bobac. See Bobac.

A. Empetra of Pallas, Canadian Marmot, Quebec Marmot of Pennant, of a mixed grey colour on the upper parts of the body, the lower parts orange; with ſhort rounded ears, and a hairy tail. This animal inhabits Canada, Hudſon's Bay, and the other northern parts of America. It is rather larger than a rabbit, and the tail is about two inches and a half long. The cheeks are grey; the face duſky, and not black; on the back the hair is grey at the roots, black in the middle, and whitiſh at the tips; the belly and legs are of an orange colour; the tail is ſhort, buſhy, and of a duſky colour; the feet are black and naked, with four long, ſlender, divided toes, and the rudiments of a thumb on each fore-foot, and five ſimilar on each behind, all armed with pretty ſtrong claws.

A. Pruinosa, Hoary Marmot, with very coarſe, long, hoary fur, whitiſh cheeks, a black noſe, and black legs; having ſhort oval ears. Inhabits the northern parts of America; is about the ſize of a rabbit; with noſe black at the tip; the tail is black, mixed with ruſt colour; with four toes on each fore-foot, and five behind, all armed with duſky claws.

A. Suslica, Souſlik of Buffon, Caſan Marmot of Pennant, has the upper parts of the body of a yellowiſh-brown colour interſperſed with numerous ſmall white ſpots, very ſhort ears, hairy tail about the length of the thighs. Inhabits Caſan as far as Auſtria, dwells in the deſert, digging holes in the black ſoil of the declivities of the mountains; which burrows are ſeven or eight feet long, winding, with ſeveral entries, having at the bottom ſeveral apartments, ſtored with corn, peas, linſeed, hempſeed, and other grains and ſeeds, in ſeparate cells, and ſeparate holes in which they live. This animal is about the ſize of a large rat: the tail is covered with ſhort yellowiſh-brown hair; the fore-feet have four toes, armed with long claws, and a ſhort thumb, or rudiment of a fifth toe; the hind-feet have five toes each, the two outer ones ſhort, and the other three long.

A. Citillus, Ziſel of Buffon, earleſs Marmot of Pennant, is of an uniform dark cinereous grey colour, has no external ears, a blunt noſe, a long ſlender body, and a very ſhort tail; inhabits Hungary, Auſtria, and Poland; burrows like the former, and is rather larger, being nearly a foot in length.

A. Zemni, Zemni of Buffon, Podolian Marmot of Pennant, Zits-jan of Le Brun, and little Earth-dog of Rzaczinſki, is of a mouſe-grey colour, has ſhort rounded ears, five toes on all the feet, and very minute eyes concealed beneath the fur. Inhabits Ruſſia and Poland; is larger, ſtronger, and more miſchievous than the former. Its body is ſlender, covered with ſhort, ſoft fur; the tail of a moderate ſize; the fore-teeth very large, projecting much from the mouth, the under ones being much longer than the upper; the feet are all divided into five toes, armed with crooked claws; about the ſize of a ſquirrel, and in diſpoſition and manners reſembling the Ziſel. It bites cruelly, and feeds voraciouſly on grains, fruits, and pot-herbs, laying up magazines of proviſions in its burrows, where it paſſes the winter. Gmelin includes the three laſt deſcribed animals under one deſcription, ſuppoſing them to be of the ſame ſpecies; but they are ſeparated by Buffon and Pennant. This ſpecies is repreſented as inhabiting the ſouthern parts of Ruſſia, as far as Kamtſchatka, and the iſlands between Aſia and America, in Perſia and China, but rarely found in the reſt of Europe. The male is eaſily tamed, but the female is fiercer; goes with young between three or four weeks, and brings forth from three to eight young ones about the beginning of May. The fur is very good in the ſpring, and the fleſh is reckoned tolerable These animals are preyed on by polecats, weaſels, hawks, carrion-crows, and cranes. They vary conſiderably both in ſize and colour. Gmelin ſuggeſts that this animal may be the ſame with the "Mus Ponticus" of Ariſtotle and Pliny.

A. Gundi, Gundi of Pennant, is of a brick-duſt red colour, with wide open ears, which appear as if cropt, or cut off. Inhabits Barbary, near Maſſuſin, towards mount Atlas. Its ſize is about that of a ſmall rabbit; the tail is ſhort; the upper fore-teeth are large and truncated, the lower ones ſlender and pointed; it has four toes, armed with claws, on all the feet, and uſes the ſole in walking as far as the heel.

A. Hudsonia, Hudſon's Marmot, tailleſs Marmot of Pennant; is of a brown-aſh colour, with ſhort external ears and no tail. Inhabits Hudſon's Bay. It has two cutting teeth above, and four in the lower jaw; the hairs are tipt with white.

A. Maulina, Chileſe Marmot, is of a reddiſh-brown colour, with ſharp ears, having five toes on all the feet.

Inhabits the woods of the province of Maule, in Chili. This animal agrees with the common marmot in the colour and length of the hair, but is nearly twice as large; the fnout is long-fhaped, having four rows of whifkers; the feet have all five claws; and the tail is furnifhed rather thinly with hair.

MARMOTTE Volant. See Vespertilio *Nigrita.*

Marmotte. See Hyrax *Capenfis.*

MARMOUTIER, in *Geography*, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diftrict of Saverne; three miles S. of Saverne. The place contains 1990, and the canton 10,395 inhabitants, on a territory of 105 kiliometres, in 25 communes.

MARNAY le Bourg, a town of France, in the department of the Upper Saône; 11 miles W. of Befançon.

MARNE, a river of France, which rifes in the department of the Upper Marne, about three miles to the E. of Langres, and after purfuing a courfe by feveral towns, joins the Seine at Charenton.

Marne, a town of Perfia, in the province of Khorafan; 210 miles N. of Herat.

Marne, one of the ten departments of the N.E. region of France, compofed of Remois and Perthois, with a part of Brie, bounded on the N. by the departments of the Aifne and Ardennes, on the E. by the department of the Meufe, on the S. by that of the Aube, on the S.W. by that of the Upper Marne, and on the W. by the departments of the Seine and Marne; about 33 French leagues in length and 30 in breadth; in N. lat. 49°. Its territorial extent is 8480 kiliometres, or 405 fquare leagues, and it contains 310,493, or, according to Haffenfratz, 348,885 inhabitants. It is divided into five circles, 32 cantons, and 499 communes. The circles are Reims, including 105,472 inhabitants; St. Menehould, 30,840; Vitry-fur-Marne, 49,706; Chalons-fur-Marne, 37,062; and Epernay, 87,413. Its capital is Chalons-fur-Marne. Its contributions amount to 4,115,188 fr. and its expences for adminiftration, juftice, and public inftruction, amounted in the 11th year of the French era to 320,103 fr. 33 cents. The foil of this department is indifferently fertile in grain, and yields good wine and paftures. There are fome forefts near the extremities of the department.

Marne, *Upper*, one of the ten departments of the N.E. region of France, formerly Vallage and Baffigny, bounded on the N.W. by the department of the Marne, on the N.E. by the departments of the Meufe and the Vofges, on the S.W. by the department of the Upper Saône, on the S. and S.W. by the Côte d'Or, and on the W. by that of the Aube; 29 French leagues in length and 19 in breadth; containing in territorial extent 6540 kiliometres, or 315 fquare leagues, and 225,350, or, according to Haffenfratz, 225,010 inhabitants. It is divided into three circles, 28 cantons, and 552 communes. The circles are Waffy, including 60,392 inhabitants, Chaumont, 75,134, and Langres, 89,824. Its capital is Chaumont. Its contributions in the 11th year of the French era, amounted to 2,315,762 fr., and its expences to 209,023 fr. 33 cents. In this department are many pleafant vallies, which yield grain, wine, and good paftures. The wooded hills contain iron mines and mineral fprings.

MARO, or Marro, a town of the principality of Oneglia; 9 miles N.W. of Oneglia.—Alfo, a town of Pegu, fituated on an ifland formed by the mouths of the Ava; 120 miles S.S.W. of Pegu.—Alfo, a mountain of Portugal, in the province of Alentejo; 6 miles N.W. of Evora.

MAROBUDUM, in *Ancient Geography*, a town of Germany, which belonged to the Marcomani. Ptolemy.

MAROELAT, in *Geography*, a town on the N. coaft of the ifland of Bouro. S. lat. 3° 10′. E. long. 127° 7′.

MAROGGIO, a town of Naples, in the province of Otranto; 17 miles S.E. of Tarento.

MAROGLIO, a river of Sicily, which runs into the fea, near Terra Nuovo, in the valley of Noto.

MAROGNA, a town of European Turkey, in Romania, near the Archipelago; 64 miles E. of Emboli.

MAROLLES, Michael, in *Biography*, fon of Claude de Marolles, famous as a champion of the league, in defence of which he killed Marivaut, the royalift champion, in fingle combat. The fon had an extraordinary paffion for ftudy, and at the age of nineteen publifhed a tranflation of Lucan. He was too eager in the purfuit of fame as an author, to attend much to elevation in the church. He applied himfelf chiefly to tranflation, and gave verfions of Plautus, Terence, Lucretius, Catullus, Tibullus, Virgil, Horace, Juvenal, Perfius, Martial, Statius, and the Auguftan hiftorians, Ammianus, Athenæus, &c. He began a tranflation of the bible; and he compofed his own "Memoirs," which contain a vaft number of anecdotes. An edition of them was publifhed by the abbé Goujet, in three vols. 12mo. His laft work was a "Hiftory of the Counts of Anjou," publifhed in 4to. in 1681, the year in which he died at the age of eighty-one. Marolles was one of the firft who collected prints: his collection amounted to 10,000, and his catalogues of them are much valued by the curious in that walk. Moreri.

Marolles, in *Geography*, a town of France, in the department of the Aube; 6 miles N. of Bar.—Alfo, a town of France, in the department of the North; 6 miles W. of Avefnes.—Alfo, a town of France, in the department of the Loir and Cher; 6 miles N. of Blois.

Marolles-*les-Braux*, a town of France, in the department of the Sarthe, and chief place of a canton, in the diftrict of Mamers; 7 miles S. of Mamers. The place contains 1808, and the canton 13,993 inhabitants, on a territory of 160 kiliometres, in 18 communes.

MAROMMES, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diftrict of Rouen. The place contains 1455, and the canton 14,760 inhabitants, on a territory of 142½ kiliometres, in 19 communes.

MARONEA, Marogna, in *Ancient Geography*, a town of Ciconia, in Thrace, near the lake Ifmaris; it is mentioned as the place of the retreat of the 10,000. Mela places this town on the bank of the Neftus; but Steph. Byz. erroneoufly near the Cherfonefus. M. d'Anville properly fixes its fituation on the coaft N.W. of Stryma. According to Pliny it had formerly been denominated Ortagurea. As its territory produced excellent wine, it was regarded as being under the protection of Bacchus; and according to traditionary report, this wine had the perfume of nectar.

MARONI, in *Geography*, a river of Guiana, which runs into the Atlantic, N. lat. 5° 52′. W. long. 55° 14′.

MARONIA, in *Ancient Geography*, a town of Syria, placed by Ptolemy in Chalcidia, between Tolmideffa and Coara.

MARONITES, in *Ecclefiaftical Hiftory*, a fect of eaftern Chriftians, who follow the Syrian rite, and are fubject to the pope; their principal habitation being on mount Libanus, or between the Anfarians to the north and the Druzes to the fouth.

Mofheim informs us, that the doctrine of the Monothelites, condemned and exploded by the council of Conftantinople,

nople, found a place of refuge among the *Mardaites*, fignifying in Syriac rebels, a people who took poffeffion of Lebanon, A. D. 676, which became the afylum of vagabonds, flaves, and all forts of rabble (fee MELKITES); and about the conclufion of the feventh century they were called Maronites, after *Maro*, their firft bifhop; a name which they ftill retain. None, he fays, of the ancient writers, give any certain account of the firft perfon who inftructed thefe mountaineers in the doctrine of the Monothelites: it is probable, however, from feveral circumftances, that it was John Maro, whofe name they had adopted; and that this ecclefiaftic received the name of Maro, from his having lived in the character of a monk, in the famous convent of St. Maro, upon the borders of the Orontes, before his fettlement among the Mardaites of mount Libanus. One thing is certain, from the teftimony of Tyrius, and other unexceptionable witneffes, as alfo from the moft authentic records, *viz.* that the Maronites retained the opinions of the Monothelites until the twelfth century, when abandoning and renouncing the doctrine of one will in Chrift, they were re-admitted to the communion of the Roman church. The moft learned of the modern Maronites have left no method unemployed to defend their church againft this accufation; they have laboured to prove, by a variety of teftimonies, that their anceftors always perfevered in the Catholic faith, in their attachment to the Roman pontiff, without ever adopting the doctrine of the Monophyfites or Monothelites. But all their efforts are infufficient to prove the truth of thefe affertions to fuch as have any acquaintance with the hiftory of the church, and the records of ancient times; for to all fuch, the teftimonies they allege will appear abfolutely fictitious and deftitute of authority. Eccl. Hift. vol. ii.

Fauftus Nairon, a Maronite, fettled at Rome, has publifhed an apology for Maron, and the reft of his nation. His tenet is, that they really took their name from the Maron who lived about the year 400, and of whom mention is made in Chryfoftom, Theodoret, and the Menologium of the Greeks. He adds, that the difciples of this Maron fpread themfelves throughout all Syria; that they built feveral monafteries, and, among others, one that bore the name of their leader; that all the Syrians, who were not tainted with herefy, took refuge among them; and that, for this reafon, the heretics of thofe times called them Maronites.

Volney traces the origin of the Maronites, called alfo *Mawarna*, at the end of the fixth age of the church, to a hermit named Maroun, who lived on the banks of the Orontes, and who, by his fafting, his reclufe mode of life, and his aufterities, became much refpected by the neighbouring people. It feems that, in the difputes which at that time arofe between Rome and Conftantinople, he employed his credit in favour of the weftern Chriftians. His death gave new energy to the zeal of his followers; and it was reported that miracles were wrought by his remains; hence many perfons affembled from Kinefrin, Awafem, and other places, who built at Hama a chapel and a tomb, whence foon arofe a convent, very celebrated in that part of Syria. As quarrels between the two metropolitan churches increafed, a monk, named John the Maronite, about the end of the feventh century, obtained, by his talents for preaching, the reputation of being one of the moft powerful fupporters of the caufe of the Latins, or partifans of the pope. Their opponents, who efpoufed the caufe of the emperor, and were on this account called Melkites, or royalifts, made at that time great progrefs in Lebanon. In order fuccefsfully to counteract them, the Latins fent among them John the Maronite, who, having been prefented to the agent of the pope at Antioch, and duly confecrated bifhop of Djebail, was fent to preach in thofe countries. John, collecting his partifans, and augmenting their number, found it neceffary to refift the force of the Melkites by force; and having affembled all the Latins, he fettled with them at Lebanon, and there formed a fociety independent with refpect to both its civil and religious government. John, having eftablifhed order and military difcipline among the mountaineers, and having provided them with arms and leaders, they employed their liberty in combating the common enemies of the empire and of their little ftate; and prefently became mafters of almoft all the mountains as far as Jerufalem. A fchifm likewife took place among the Mahometans, which facilitated their conquefts. After a variety of events, partly propitious and partly difaftrous, about the year 1215 the Maronites effected a re-union with Rome, from which they were never widely feparated, and which ftill fubfifts. William of Tyre, who gives this relation, obferves that they had 40,000 men able to bear arms. The peace they enjoyed under the Mamlouks was difturbed by Selim II., but the time and attention of this prince being occupied about other objects, they joined the Druzes and their emir in making encroachments on the Ottomans; but thefe commotions iffued unfortunately; for Amurath III., fending againft them Ibrahim, pacha of Cairo, that general reduced them to obedience in 1588, and fubjected them to the annual tribute which they ftill pay. Since that period, the pachas, defirous of extending their authority and extortions, have frequently attempted to introduce their garrifons and agas into the mountains of the Maronites; but being conftantly repulfed, they have been compelled to abide by their treaties. The fubjection of the Maronites, therefore, only confifts in the payment of a tribute to the pacha of Tripoli, of whom they hold their country, which he annually farms out to one or more fhaiks, that is, perfons of eminence and property, who affign their refpective fhares to the diftricts and villages. This impoft is levied chiefly on the mulberry-trees and vineyards, which are the principal, and almoft the fole objects of culture. The form of government is founded, not on any exprefs convention, but merely on ufages and cuftoms. This inconvenience would long ere this have produced difagreeable effects, if they had not been prevented by many fortunate circumftances. The principal of thefe is religion, which, placing an infurmountable barrier between the Maronites and the Mahometans, has precluded ambitious men from leaguing themfelves with foreigners to enflave their countrymen. The fecond is the nature of the country, which every where affording ftrong defences, enables every village, and almoft every family, to oppofe, by its fingle force, all ufurpation of fovereign power. A third reafon may be derived even from the weaknefs of this fociety, which having been always furrounded by powerful enemies, has only been able to refift them by maintaining union among its members, which union can only fubfift by abftaining from oppreffing each other, and by reciprocally guarding the fafety of each others perfon and property. Thus the government preferves a natural equilibrium, and, cuftoms fupplying the place of laws, the Maronites are, to this day, equally ftrangers to the oppreffions of defpotifm and the diforders of anarchy.

The nation may be confidered as divided into two claffes, the common people and the fhaiks; by which muft be underftood the moft eminent of the inhabitants, who, from the antiquity of their families, and the opulence of their fortunes, are fuperior to the ordinary clafs. They all live difperfed in the mountains, in villages, hamlets, and even detached

tached houfes; which is never the cafe in the plains. The whole nation confifts of cultivators. Every man improves the little domain he poffeffes, or farms, with his own hands. Even the fhaiks live in the fame manner, and are only diftinguifhed from the reft by a bad pelifs, a horfe, and a few flight advantages in food and lodging: they all live frugally, without many enjoyments, but alfo with few wants, as they are little acquainted with the inventions of luxury. In general, the nation is poor, but no one wants neceffaries; and if beggars are fometimes feen, they come rather from the fea-coaft than the country itfelf. Property is as facred among them as in Europe, nor do we fee there thofe robberies and extortions fo frequent with the Turks. Travellers may journey there, either by night or day, with a fecurity unknown in any other part of the empire, and the ftranger is received with hofpitality, as among the Arabs; it muft be owned, however, that the Maronites are lefs generous, and rather inclined to the vice of parfimony. Conformably to the doctrines of Chriftianity, they have only one wife, whom they efpoufe frequently, without having feen, and, always without having been much in her company. Contrary to the precepts of that fame religion, however, they have admitted, or retained, the Arab cuftom of retaliation, and the neareft relation of a murdered perfon is bound to avenge him. From a habit founded on diftruft, and the political ftate of the country, every one, whether fhaik or peafant, walks continually armed with a mufket and poniards. This is, perhaps, an inconvenience; but this advantage refults from it, that they have no novices in the ufe of arms among them, when it is neceffary to employ them againft the Turks. As the country maintains no regular troops, every man is obliged to join the army in time of war, and if this militia were well conducted, it would be fuperior to many European armies. From accounts taken in late years, the number of men, fit to bear arms, amounts to thirty-five thoufand. According to the ufual mode of computation, this would imply a population of about a hundred and five thoufand fouls; and, if we add the priefts, monks, and nuns, difperfed in upwards of two hundred convents, and the inhabitants of the maritime towns, fuch as Djebail, Batroun, &c. we cannot fuppofe it lefs than a hundred and fifteen thoufand.

This number, compared with the extent of the country, which is about a hundred and fifty leagues fquare, gives feven hundred and fixty inhabitants for each fquare league; which will not appear a fmall population, when we confider that great part of Lebanon confifts only of barren rocks, and that the foil, even where it can be cultivated, produces very little.

In religious matters, the Maronites are dependent on Rome. Though they acknowledge the fupremacy of the pope, their clergy continue, as heretofore, to elect a head, with the title of Batrak, or patriarch of Antioch. Their priefts marry, as in the firft ages of the church; but their wives muft be maidens, and not widows, nor can they marry a fecond time. They celebrate mafs in Syriac, of which the greateft part of them comprehend not a word. The gofpel, alone, is read aloud in Arabic, that it may be underftood by the people. The communion is adminiftered in both kinds. The Hoft is a fmall round loaf, unleavened, of the thicknefs of a finger, and fomething larger than a crown piece. On it is the impreffion of a feal, which is eaten by the prieft, who cuts the remainder into fmall pieces, and, putting them into the cup, adminifters to each perfon with a fpoon which ferves every body. Thefe priefts have not, as among us, benefices or ftated revenues; but they fubfift on the produce of their maffes, the bounty of their hearers, and the labour of their hands. Some of them exercife trades, others cultivate a fmall piece of land, and all are induftriouſly employed, for the maintenance of their families, and the edification of their flock. Their poverty is recompenfed by the great refpect which is paid them; their vanity is inceffantly flattered; whoever approaches them, whether rich or poor, great or fmall, is anxious to kifs their hands, which they fail not to prefent; nor are they pleafed that the Europeans withhold this mark of reverence, fo repugnant to our manners, though not thought humiliating by the natives, who are accuftomed to it from their infancy. In other refpects, the ceremonies of the Catholic religion are not performed more publicly, or with lefs reftraint, in Europe than in the Kefraouan. Each village has its chapel and its prieft, and each chapel its bell: a thing unheard of in any other part of Turkey. The Maronites are vain of this privilege, and that they may not be deprived of it, will not fuffer a Mahometan to live among them. They affume to themfelves, alfo, the privilege of wearing the green turban, which, except in their territories, would coft a Chriftian his life.

In the fmall country of the Maronites there are reckoned upwards of two hundred convents for men and women. Thefe religious are of the order of St. Anthony, whofe rules they obferve with an exactnefs which reminds us of earlier times. The drefs of the monks is made of brown coarfe woollen ftuff, and refembles that of the Capuchin friars in Europe. Their food is the fame as that of the peafants, with this exception, that they never eat flefh. They obferve frequent fafts, and make long prayers at ftated hours in the night as well as the day; the remainder of their time is employed in cultivating the earth, or breaking the rocks to form the walls of the terraces which fupport their vineyards and mulberry plantations. Each convent has a brother fhoemaker, a brother taylor, a brother weaver, a brother baker; in a word, an artift of every neceffary trade. We almoft always find a convent of women clofe to one of men; yet it is rare to hear of any fcandalous report. Thefe women themfelves lead a very laborious life, and it is this activity, doubtlefs, which fecures them againft all the mifchiefs attendant on idlenefs. So far, therefore, from being injurious to population, we may affirm that thefe convents have contributed to promote it, by increafing by culture every article in a proportion greater than its confumption. The moft remarkable of the houfes of the Maronite monks is Kozhaia, fix hours journey to the eaft of Tripoli. There they exorcife, as in the firft ages of the church, thofe who are ftill poffeffed with devils; for fuch perfons are ftill to be found in thefe countries. From the account, fays Volney, given me by intelligent obfervers, it appears that thofe poffeffed are no other than perfons afflicted with idiocy, madnefs and epilepfies; and it is worth remarking, that poffeffion and epilepfy are denoted by the fame Arabic word, *kabal* and *kabat*.

The court of Rome, in affiliating the Maronites, has granted them an hofpitium, at Rome, to which they may fend feveral of their youth, to receive a gratuitous education. It fhould feem that this inftitution might introduce among them the ideas and arts of Europe; but the pupils of this fchool, limited to an education purely monaftic, bring home nothing but the Italian language, which is of no ufe, and a ftock of theological learning, from which as little advantage can be derived; they accordingly foon affimilate with the reft. Nor has a greater change been operated by the three or four miffionaries maintained by the French capuchins at Gazir, Tripoli, and Bairout. Their labours confift in preaching in their church, in inftructing children in the catechifm, Thomas à Kempis, and the Pfalms, and in teaching them to read and write. Formerly the Jefuits had

had two miffionaries at their houfe at Antoura, and the Lazarites have now fucceeded them in their miffion. The moft valuable advantage that has refulted from thefe apoftolical labours is, that the art of writing has become more common among the Maronites, and rendered them, in this country, what the Copts are in Egypt; that is, they are in poffeffion of all the pofts of writers, intendants, and kiayas among the Turks, and efpecially of thofe among their allies and neighbours, the Druzes. Volney's Travels in Egypt and Syria, vol. ii.

Mofheim obferves, that the fubjection of the Maronites to the fpiritual jurifdiction of the Roman pontiff, was agreed to with this exprefs condition, that neither the popes nor their emiffaries fhould pretend to change or abolifh any thing that related to the ancient rites, moral precepts, or religious opinions of this people: fo that, in reality, there is nothing to be found among the Maronites that favours of popery, if we except their attachment to the Roman pontiff, who is obliged to pay very dear for their friendfhip. For, as the Maronites live in the utmoft diftrefs of poverty, under the tyrannical yoke of the Mahometans, the bifhop of Rome is under the neceffity of furnifhing them with fuch fubfidies as may appeafe their oppreffors, procure a fubfiftence for their bifhop and clergy, provide all things requifite for the fupport of their churches, and the uninterrupted exercife of public worfhip, and contribute in general to leffen their mifery. It is certain that there are Maronites in Syria, who ftill behold the church of Rome with the greateft averfion and abhorrence; nay, what is ftill more remarkable, great numbers of that nation refiding in Italy, even under the eye of the pontiff, oppofed his authority during the 17th century, and threw the court of Rome into great perplexity. One body of thefe non-conforming Maronites retired into the vallies of Piedmont, where they joined the Waldenfes; another, above fix hundred in number, with a bifhop, and feveral ecclefiaftics at their head, flew into Corfica, and implored the protection of the republic of Genoa, againft the violence of the inquifitors. Eccl. Hift. vol. iii.

The Maronites have a patriarch, who refides in the monaftery of Cannubin, on mount Libanus, and affumes the title of patriarch of Antioch, and the name of Peter, as if he feemed defirous of being confidered as the fucceffor of that apoftle. He is elected by the clergy and the people, according to the ancient cuftom; but, fince their re-union with the church of Rome, he is obliged to have a bull of confirmation from the pope. He keeps a perpetual celibacy, as well as the reft of the bifhops his fuffragans: as to the reft of the ecclefiaftics, they are allowed to marry before ordination; and yet the monaftic life is in great efteem among them. The monks are of the order of St. Anthony, and live in the moft obfcure places in the mountains, far from the commerce of the world.

As to their faith, they agree in the main with the reft of the Eaftern church. Their priefts do not fay mafs fingly; but all fay it together, ftanding round the altar. They communicate in unleavened bread; and the laity have hitherto partaken in both kinds, though the practice of communicating in one has of late been getting footing, having been introduced by little and little. In Lent they eat nothing, unlefs it be two or three hours before fun-rifing: their other faftings are very numerous.

MAROO, in *Geography*, a town of Hindooftan, in the circar of Ruttunpour; 18 miles N.W. of Ruttunpour.

MAROON, *To*, in *Sea Language*, is to put one or more failors afhore upon a defolate ifland, under the pretence of their having committed fome great crime. This deteftable expedient has been repeatedly practifed by fome inhuman commanders of merchant-fhips, particularly in the Weft Indies.

MAROONGAS, in *Geography*, a fmall ifland in the Sooloo Archipelago. N. lat 6° 3′. E. long. 120° 58′.

MAROONS. See JAMAICA.

MAROOTS, ORAN IDAANS, or *Idahans*, people who inhabit the N. part of the ifland of Borneo, near and upon the fkirts of the high mountain of Keneebaloo; called, in old maps, "St. Peter's Mount." Thefe people believe that the deity is pleafed with human victims. An Idaan or Maroot muft, once at leaft in his life, have imbrued his hands in a fellow-creature's blood. The rich are faid to do it often, adorning their houfes with fkulls and teeth, to fhew how much they have honoured their author, and laboured to avert his chaftifement. Several in low circumftances will club to buy a Bifayan Chriftian flave, or any one that is to be fold cheap; that all may partake the benefit of the execution. Some alfo believe that thofe, whom they kill in this world, will ferve them in the next. They are acquainted with a fubtle poifon, called *ippoo*, the juice of a tree, in which they dip fmall darts; and thefe they fhoot through a hollow piece of wood, called by the Sooloos "Sampit," from which iffues inftant death, to any one who is wounded by them. The Idaans pen hogs, and eat pork. They carry their rice, fruits, &c. to the fea-fide, and buy falt from the Badjoos, who often manufacture it by gathering fea-weeds and burning them, making a ley of afhes, filtering it, and forming a better kind of falt in fquare pieces, by boiling it in pans made of the bark of the aneabong. Thefe pieces of falt are carried to market, whither both the Idaans and Muffulmen refort, and pafs as a currency for money. The Mahometans preclude Europeans, as much as they can, from having intercourfe with the Idaans and Maroots; but at Balambangan, and on the ifland Labuan, near Borneo, the Idaans in their boats bring hogs, fruits, &c. and are glad to fee the Englifh eat pork like themfelves. Foreft's Voyage.

MAROS, a town on the W. coaft of the ifland of Celebes. N. lat. 4° 47′. E. long. 120° 6′.

MAROS, a river of Hungary, which rifes on the borders of Moldavia, and runs into the Theyffe, near Zegedin.

MAROSTICA, a town of Italy, in the Vicentin, encompaffed with walls, and containing feveral churches; 11 miles N. of Vicenza.

MAROTIC STYLE, in the *French Poetry*, denotes a peculiarly gay, pleafant, yet fimple and natural manner of writing, introduced by Clement Marot, and fince imitated by other authors, but with moft fuccefs by De la Fontaine and Rouffeau.

The difference between the Marotic and the burlefque ftyle is thus affigned: the Marotic makes a choice; the burlefque admits of all. The firft is the moft fimple; but its fimplicity has its noblenefs; and, where its own age will not furnifh natural expreffions, it borrows them from former times: the latter is low and grovelling, and borrows falfe and fulfome ornaments from the crowd, which people of tafte defpife. The one refigns itfelf to Nature; but examines, firft of all, whether the objects fhe prefents be fit for its paintings, and takes nothing but what carries with it fomewhat of delicacy and mirth: the other runs headlong into buffoonery, and affects every thing that is extravagant and grotefque. See BURLESQUE.

MAROTTI, in *Botany*, is a tall tree growing in Malabar, with leaves like thofe of the bay, bearing a round oblong fruit, including a very large, hard, and yellowifh ftone, containing ten or eleven kernels. The oil extracted from the feeds or kernels of the fruit, eafes pains, and cures the ſcabies and itchings, being rubbed on the parts: it is good alſo for eyes infeſted with ſalt humours; and, mixed with aſhes, it is ſucceſsfully applied to impoſthumes and abſceſſes in cows, and other cattle and beaſts of burden. Rai Hiſt. Plant.

MAROUPOLE, in *Geography*, a town of Auſtrian Poland, in Galicia; 60 miles E.N.E. of Lemberg.

MAROWLY, a town of Hindooſtan, in the circar of Gohud; 15 miles S. of Narwa.

MAROZZO, a town of Naples, in Abruzzo Citra; 20 miles S.E. of Lenciano.

MARPACH, a town of Auſtria; 6 miles E. of Steyragg.—Alſo, a town of Wurtemberg, on the Neckar; 8 miles N.N.E. of Stuttgard. N. lat. 48° 58'. E. long. 9° 21'.

MARPESUS, the moſt lofty mountain in the iſland of Paros, ſituated W. of the harbour of Marmora, which furniſhed more particularly the marble obtained by the Greeks from Paros.

MARPESSUS, in *Ancient Geography*, a town of Phrygia, on mount Ida. Pauſanias (l. x. c. 12.) places it among the Phocæans, at 240 ſtadia from Alexandria of the Troade, in the vicinity of the river Ladon.

MARPURG, Frederic Wilhelm, in *Biography*, an eminent and voluminous writer on muſic, and a compoſer, at Berlin, whoſe works on the theory and practice of the art may be juſtly ſaid to ſurpaſs in number and utility thoſe of any other author who has treated on the ſubject. He was, perhaps, the firſt German theoriſt who could patiently be read by perſons of taſte, ſo addicted were former writers to prolixity and pedantry.

This author's *coup d'eſſai*, as a muſical writer, was a periodical work, entitled "The Muſical Critic on the Spree, 1747." Then followed his "Art of playing the Harpſichord, in Three Parts," from 1750 to 1755. After which "A Treatiſe upon Fugue and Counterpoint," in German, 1753, and in French, 1756. This is the beſt book of the kind that is extant, except Padre Martini's "Saggio di Contrappunto," which, for vocal fugues, is perhaps ſuperior; but for inſtrumental, M. Marpurg's work is ſtill more uſeful. The hiſtorical part, however, is ſcanty and inaccurate: for, in the enumeration of organiſts of different countries, though M. Marpurg, who had been in France and civilly treated there, is very grateful, yet he mentions no Engliſh compoſer of any kind but the feeble and flimſy Felting, who, though a worthy man and much eſteemed by his friends, was far from a great player or good compoſer. Among organiſts, he juſt mentions Stanley and Keeble; but of Handel's ſublime oratorio choruſes and manner of playing the organ he is wholly ſilent; nor does he ever ſeem to have heard of our Roſeingrave, Magnus, J. James, Kelway, or Worgan, who, in 1756, was an excellent extempore fughiſt. And the examples of canon and fugue are too indiſcriminately given to ſerve as models of excellence to young ſtudents. Indeed, M. Marpurg was ſo ingenuous as to confeſs to us, at Berlin, that he had injured his work by partiality to friends, whoſe productions he had frequently cited, againſt his judgment. About this time, 1756, fugues began to loſe their favour, even in Germany, where their reign had been long and glorious; but Rouſſeau's "Lettre ſur la Muſique Françoiſe," and the beautiful melody, taſte, expreſſion, and effects of theatrical compoſitions, ſo much cultivated in Italy and in all the German courts, brought about a general revolution in muſic, which Vinci, Haſſe, and Porpora began, and Pergoleſi finiſhed. In 1754, M. Marpurg began the publication of his "Hiſtorical and Critical Eſſays towards the Advancement of Muſic;" this work was cloſed in 1762, and conſiſts of five volumes octavo. Theſe eſſays, with his "Critical Letters on the Art of Muſic," from 1760 to 1762, called the attention of Germany to muſical criticiſm; which Hiller's weekly eſſays on the ſame ſubject continued from 1764 to 1770. The chief of M. Marpurg's works, theoretical and practical, which are very numerous, were publiſhed between 1749 and 1763, about which time he was appointed by the king of Pruſſia ſecretary of aſſize. After this he devoted his whole time to political calculations, except what he beſtowed on muſical ratios in an "Eſſay on Temperament," to which he added an appendix on Rameau's and Kirnberger's rules for accompaniment or thorough-baſe, 1770, 8vo.

Of M. Marpurg's compoſitions in muſic, though much original genius may not be diſcoverable in them, they are clear and correct; and if they do not excite rapture by ſtrokes of novelty, fire, or pathos, they can never offend. But he was ſurrounded at Berlin by muſicians of the higheſt order; by the Grauns, the Bendas, Emanuel Bach, &c. and he had no chance of rivalling them in point of genius; but as a writer on muſical ſubjects, he certainly ſurpaſſed all his predeceſſors and contemporaries in the German language, in clearneſs, elegance, and extenſive acquaintance with the hiſtory and rules of the art.

Marpurg, in *Geography*. See Marburg.

MARQUARTSBURG, a town of Germany, in the territory of Nuremberg; 9 miles N.N.E. of Nuremberg.

MARQUARTSTEIN, a town of Bavaria, on the Ache; 25 miles W. of Salzburg.

MARQUE, La, a town of France, in the department of the Gironde; 18 miles N.N.W. of Bourdeaux.

Marque, *Law of*. See Law.

Marque, *Letters of*, are letters of repriſal granted by a king or ſtate, whereby the ſubjects of one country are licenſed to make repriſals on thoſe of another; by reaſon application has been made for redreſs to the government to which the aggreſſor belongs, three times without effect.

The firſt letter of marque, of which we have any account in the hiſtory of this country, was iſſued by Edward I. in 1295, againſt the ſubjects of Portugal.

Theſe letters are grantable by the law of nations, whenever the ſubjects of one ſtate are oppreſſed and injured by thoſe of another; and juſtice is denied by that ſtate to which the oppreſſor belongs: and with us it is declared by ſtat. 4 Hen. V. cap. 7, that if any ſubjects of the realm are oppreſſed in time of truce by any foreigners, the king will grant marque in due form, to all that feel themſelves aggrieved. Which form is thus directed to be obſerved: the ſufferer muſt firſt apply to the lord privy-ſeal, and he ſhall make out letters of requeſt under the privy-ſeal: and if, after ſuch requeſt of ſatisfaction made, the party required do not, within convenient time, make due ſatisfaction or reſtitution to the party grieved, the lord chancellor ſhall make him out letters of marque, under the great ſeal: and by virtue of theſe he may attack and ſeize the property of the aggreſſor nation, without hazard of being condemned as a robber or pirate. Blackſt. Com. vol. i.

They are ſo called from the German *marcke, limit, frontier*; as being *jus conceſſum in alterius principis marcas ſeu limites tranſeundi, ſibique jus faciendi*; as being a right of paſſing the limits or frontiers of another prince, and doing oneſelf juſtice. See Letters and Repriſals.

In matters of inſurance, if, after a policy is effected on a merchant-ſhip, letters of marque be put on board, and from a mere private trader, ſhe is changed into a ſhip of war, with

 power

power not only to defend herfelf, but to cruife and take prizes; this is fuch an alteration of the condition of the fhip, that the rifk muft be materially changed from that which the underwriter took upon himfelf, and confequently the contract is thereby determined. Thus, a cafe occurs, in which a fhip, infured as a private trader, afterwards takes letters of marque, without the confent of the underwriters, this difcharges the underwriters, though no ufe be made of the letters of marque. In another cafe, letters of marque were taken out, but without the proper certificate, and only to entice feamen to enter, without any intention of cruifing; this did not vary the rifk, fo as to avoid the policy, even though the captain, againft his inftructions, cruifed and took prizes. When the feamen were procured, thefe letters of marque could have no legal effect, and thus it was the fame as if no letters of marque had been on board. When no certificate of clearance is taken out, in purfuance of the ftat. 33 Geo. III. c. 66, the letters of marque are declared void; and the captain is fubjected to a penalty for departing without it.

MARQUESAS, Les Marquisses, or *Marquis of Mendoça's Iflands*, a group of iflands in the South Pacific ocean, firft difcovered in 1595 by Alvaro Mendāna de Neyrā; and vifited by Capt. Cook in the year 1774, by Marchand in 1791, and by the Miffionaries in 1797; of which we have an account by thefe feveral navigators, and alfo by Mr. George Forfter, Mr. Reinhold Forfter, Capt. Chanal, and furgeon Roblet. Thefe iflands are five in number, *viz.* La Magdalena or Madalena, at the diftance of eight leagues to the fouth by eaft from the middle of the group, nearly in the latitude of 10° 25′, long. 138° 50′; St. Pedro or O-Niteio, about three leagues in circuit, and of a good height, lying fouth, 4½ leagues from the E. end of La Dominica, not known by Capt. Cook to be inhabited; La Dominica or O-Hivahōa. (See La Dominica.) Figueroa, in his account of Mendana's voyage, reprefents this ifland as exhibiting an enchanting afpect: according to him, vaft plains difplayed a fmiling verdure, and divided hills, which rofe with a gentle acclivity, and were crowned by tufted woods; while a numerous population announced the richnefs and fertility of the foil. However, after an interval of two centuries, that elapfed between the two voyages of Mendana and Cook, this ifland prefented to Mr. G. Forfter a very different appearance. He defcribes it as a high and mountainous ifland, of which the N.E. point is very fteep and barren; but farther to the N. he obferved fome vallies filled with trees, among which was now and then difcovered a hut. As the haze cleared away, "we faw," fays this writer, "many craggy rocks like fpires, and feveral hollow fummits piled up in the centre of the ifland, which proves that volcanoes and earthquakes had been active there in changing the face of the country. All its eaftern part is a prodigious fteep and moft perpendicular wall, of a great height, which forms a fharp ridge, fhattered into fpires and precipices." This difference of appearance, according to the defcriptions of two writers, is afcribed by Marchand to the terrible effect of one of thofe great convulfions of nature, which totally disfigure the parts of the furface of the globe on which their ravage is exercifed. The next ifland is Santa Chriftina, or *Chriftiana*, which fee; and Hood's ifland, which is the northernmoft, fituated in S. lat. 9° 26′, and N. 13° W., 5½ leagues diftant from the E. point of La Dominica. (See Hood's *Ifland*.) Thefe ifles occupy one degree in latitude; and near half a degree in longitude, *viz.* from 138° 47′, to 139° 13′ W., which is the longitude of the W. end of La Dominica. The trees, plants, and other productions of thefe ifles, fays Capt. Cook, fo far as we know, are nearly the fame as at Otaheite, and the Society Ifles. The refrefhments they afford are hogs, fowls, plantains, yams, and fome other roots; likewife bread-fruit and cocoa-nuts, but of thefe not many. At firft thefe articles were purchafed with nails, beads, looking-glaffes, and fuch trifles, which were fo highly valued at the Society Ifles, but were in no efteem here; and even nails, at laft, loft their value for other articles far lefs ufeful. The inhabitants of thefe iflands, collectively, are without exception the fineft race of people in this fea. For fine fhape and regular features, they perhaps furpafs all other nations. Neverthelefs, the affinity of their language to that fpoken in Otaheite and the Society Ifles, fhews that they are of the fame nation. The men are punctured, or curioufly *tattooed*, from head to foot. The figures are various, and feem to be directed more by fancy than cuftom. Thefe punctures make them appear dark; but the women, who are but little punctured, youths, and young children who are not at all, are as fair as fome Europeans. The men are, in general, tall; that is, about five feet ten inches, or fix feet; but none were obferved fat and lufty like the "Earees" of Otaheite, nor were any feen that could be called meagre. Their teeth are not fo good, nor are their eyes fo full and lively as thofe of many other nations. Their hair, like ours, is of many colours, except red, of which Capt. Cook faw none. Some have it long, but the more general cuftom is to wear it fhort, except a bunch on each fide of the crown, which they tie in a knot. They obferve different modes in trimming the beard, which is, in general, long. Some part it, and tie it in two bunches under the chin; others plait it; fome wear it loofe, and others quite fhort.

Their clothing is the fame as at Otaheite, and made of the fame materials; they are neither fo plentiful nor fo good. The men have, for the moft part, nothing to cover their nakednefs, except the "Marra," as it is called at Otaheite; which is a flip of cloth paffed round the waift and betwixt the legs. This fimple drefs is fufficient for the climate, and anfwers every purpofe which modefty requires. The drefs of the women is a piece of cloth, wrapped round the loins like a petticoat, which reaches down below the middle of the leg, and a loofe mantle over the fhoulders. Their principal head-drefs, which appears to be their chief ornament, is a fort of broad fillet, curioufly wrought of the fibres of the hufk of cocoa-nuts. In the front is fixed a mother-of-pearl fhell, wrought round to the fize of a tea-faucer. Before that, another, fmaller, of very fine tortoife-fhell, perforated into curious figures. Alfo before, and in the centre of that, is another round piece of mother-of-pearl, about the fize of half a crown; and before this another piece of perforated tortoife-fhell, the fize of a fhilling. Befides this decoration in front, fome have it alfo on each fide, but in fmaller pieces; and all have fixed to them the tail-feathers of cocks or tropic-birds, which, when the fillet is tied on, ftand upright; fo that the whole together makes a very fightly ornament. They wear round the neck a kind of ruff or necklace, made of light wood, the outer and upper fide being covered with fmall red peas, which are fixed on with gum. They alfo wear fmall bunches of human hair, faftened to a ftring, and tied round the legs and arms. Sometimes, inftead of hair, they make ufe of fhort feathers; but all the above-mentioned ornaments are feldom feen on the fame perfon. Their ordinary ornaments are necklaces and amulets made of fhells, &c. None were obferved with ear-rings, and yet all had their ears pierced. Their dwellings are in the vallies, and on the fides of the hills, near their plantations. They are built like thofe of Otaheite; but much meaner, and only covered with the leaves of the bread-tree. Moft of them are built on a fquare, or oblong pavement of ftone, raifed fome height above the level of the ground. They have alfo fuch pavements near their houfes, on which they fit to eat and amufe themfelves. In their mode of eating, thefe people, fays Capt. Cook, are not fo cleanly as the Otaheiteans. In their cookery they were alfo dirty. Pork and fowls are dreffed in an oven of hot ftones, as at Otaheite; but fruit and roots they roaft on the fire, and after taking off the rind or fkin, put them into a platter or trough with water, out of which men and hogs eat at the fame time. Capt. Cook could not fay, whether it was the cuftom for men and women to have feparate meffes.

They feemed to have dwellings, or ftrong holds, on the fummits of the higheft hills. Their weapons are clubs and fpears, refembling thofe of Otaheite, but fomewhat neater. They have alfo flings, with which they throw ftones with great velocity, and to a great diftance, but not with a good aim. Their canoes are made of wood, and pieces of the bark of a foft tree, which grows plentifully near the fea, and is very tough and proper for the purpofe. They are from 16 to 20 feet long, and about 15 inches broad; the head and ftern are made of two folid pieces of wood; the ftern rifes or curves a little, but in an irregular direction, and ends in a point; the head projects out horizontally, and is carved into fome rude refemblance of a human face. They are rowed by paddles, and fome have a fort of latteen fail made of matting. Hogs were the only quadruped feen by our navigators; and cocks and hens the only tame fowls. However, the woods feemed to abound with fmall birds of a very beautiful plumage, and fine notes; but the fear of alarming the natives hindered their fhooting fo many of them as they might otherwife have done. For further particulars relating to the difpofition and manners, &c. of the Mendoçans, we refer to captain Marchand's account, given under the article *Santa* CHRISTIANA. We fhall here add fome relations, that ferve to correct or to enlarge the account of thefe people furnifhed by Capt. Cook. Capt. Chanal, cited by Marchand, is very far from confirming the reproach of filthinefs, which Capt. Cook has applied to thefe iflanders; he fays, on the contrary, that, having repeatedly been prefent at their meals, for which men, women, and children of the fame houfe affemble twice a day, at noon and before night-fall, he was furprifed at the great cleanlinefs which prevailed, and which is obfervable in their whole habitation; he adds, that he has feen the inhabitants of La Madre de Dios, in the ifland of Santa Chriftiana, make very frequent ufe of water for wafhing themfelves. Surgeon Roblet alfo fays, that both men and women pafs whole days in the water. To their frequent ufe of water, is afcribed their freedom from cutaneous difeafes, pimples, ulcers, &c. which are common in the burning climates of the torrid zone. It is affirmed, that in various refpects they are more cleanly than the inhabitants of Otaheite, extolled by Capt. Cook. Their diet, it is obferved, is more vegetable than animal. From the cocoa-nut they extract an oil, which is probably employed in the feafoning of their difhes; and which is principally ufed to anoint their whole body; and the women efpecially confume a great quantity of it for maintaining the glofs and beauty of their hair. Their common drink is pure water, and, occafionally, cocoa-nut milk. As they have the pepper-root, and make ufe of it as a fign of peace, it is fuppofed, that they may alfo prepare the fame dainty beverage from it, with which the other iflanders intoxicate themfelves. Capt. Chanal prefumes, not without reafon, that they procure a ftrong liquor from the root of ginger, rather than from that of pepper. This beverage, however, they ufe with moderation, for Marchand fays, that no individual was feen here, who manifefted the flighteft appearance of intoxication. Their mode of building their houfes on ftone platforms, and their ufe of ftilts, the ftructure of which is particularly defcribed by Marchand, indicate that the ifland of Chriftina muft be expofed to inundations. Of thefe ftilts, curioufly conftructed, the natives of this ifland make a very dextrous ufe; and it is faid, that in a race, they would difpute the palm with the moft experienced herdfman of France.

It does not appear that in Santa Chriftina, they have either laws or chiefs; ftrength being every thing, and the weak obeying the ftrong. Of their religion, we have no better information than of their government. During the ftay which the French made in this ifland, they faw nothing which could make them think, that its inhabitants paid any worfhip to a fupreme being; pleafure, fays Marchand, is the divinity of the country; no fuperftition, no ceremony, no prieft or juggler. In the Miffionary voyage, we have the following account of the cuftoms and manners of the people about Refolution bay, more efpecially as they relate to religion, and they are different from the account given by the French voyagers. "Their religious ceremonies refemble thofe of the Society iflands. They have a Morai in each diftrict, where the dead are buried beneath a pavement of large ftones, but with fuch exceptions, as in the cafe of the chief Hōnoo. They have a multitude of deities. Thofe moft frequently mentioned are Opooamanue, Okeco, Oenamoe, Opeepeetye, Onooko, Oetanow, Fatu-ait-poo, Onoetye; but none who feem fuperior to the reft, though the extent of my information (fays the Miffionary) is fmall on this head. They only offer hogs in facrifices, and never men. The chief Tēnae prefides over four diftricts, Ohitahoo, Takeway, and Innamei, all opening into Refolution bay, and Onopoho, the adjoining valley to the fouthward. He has four brothers; but none of them feem invefted with any authority; and Tēnae himfelf with lefs than the Otaheitean chiefs. There is no regular government, eftablifhed law, or punifhment; but cuftom is the general rule."

As to their food, we are informed that they have no regular meals, but eat when they are hungry. When they have a hog, they eat of it five or fix times a day; and when without animal food, they ufe the roafted bread-fruit, fifh, mahie, pudding made of it and other vegetables, ahee-nuts, and a pafte made of a root refembling the yam; and this they often do through the day. The women are not allowed to eat hog, and are probably reftrained by other prohibitions as at Otaheite, and feem much more fervile to the men, and harfhly treated. They are employed in making cloth and matting, but not in cookery, except for themfelves. "I have never obferved (fays one of the miffionaries) any of the men, from the chief to the touteu, at work, except a few old perfons making cords and nets: the reft idle about, and bafk in the fun, telling their ftories, and beguiling the time." As far as concerns the perfons, drefs, canoes, &c. of thefe people, the miffionaries found them exactly as they are defcribed in Cook's fecond voyage.

As to the population of thefe iflands, we have no fatisfactory account. The number of inhabitants, fays Mr. G. Forfter, cannot be very confiderable, on account of the fmall fize of the iflands which they occupy. Such fpots as are fit for culture in thefe iflands are very populous; but as they are all very mountainous, and have many inacceffible and barren rocks, it is to be doubted whether the whole population of this group amounts to 50,000 perfons. From Marchand's voyage, and the ftatement which it contains, it appears that it would be granting much to the ifland of Santa Chriftina to give it 1000 inhabitants for every league of coaft, and in all, 7000; to fuppofe 6000 in La Dominica, which Mr. Forfter, on account of the fterility of the greater part of its foil, rightly prefumes not likely to prefent a population fo numerous as that of S. Chriftina: and to admit 6000 for La Madalena, whofe circuit is fix leagues: the total number of the inhabitants of the three large iflands might then amount to 19,000 individuals, which might be extended to 20,000, if we allow a few inhabitants to the fmall iflands San Pedro and Hood's ifland. This refult is very wide of that of 50,000 individuals according to Mr. Forfter's ftatement; and yet this is fuppofed by the French voyager to be exaggerated. Cook's Second Voyage, vol. i. Marchand's Voyage, vol. i. Miffionary Voyage.

MARQUETRY, *Inlaid Work;* a curious kind of work, compofed of pieces of hard fine wood of different colours, faftened, in thin flices, on a ground, and fometimes enriched with other matters, as tortoife-fhell, ivory, tin, and brafs.

There is another kind of marquetry made, inftead of wood, of glaffes of various colours; and a third, where nothing but precious ftones, and the richeft marbles, are ufed: but thefe are more properly called *mofaic* work. The art of inlaying is very ancient, and is fuppofed to have paffed from the eaft to the weft, as one of the fpoils brought by the Romans from Afia. Indeed, it was then but a fimple thing; nor did it arrive at any tolerable perfection till the fifteenth century, among the Italians. It feems finally to have arrived at its height in the feventeenth century, among the French.

Till John of Verona, contemporary with Raphael, the fineft works of this kind were only black and white, which are what we now call *morefcoes;* but that religious, who had a genius for painting, ftained his woods with dyes, or boiled oils, which penetrated them. But he went no farther than the reprefenting of buildings and perfpectives, which require no great variety of colours. Thofe who fucceeded him, not only improved on the invention of dyeing the woods, by a fecret which they found of burning them without confuming, which ferved exceedingly well for the fhadows; but they had alfo the advantage of a number of fine new woods of naturally bright colours, by the difcovery of America. With thefe affiftances, the art is now capable of imitating any thing; whence fome call it, the *art of painting in wood.* The ground, whereon the pieces are to be arranged and glued, is ordinarily of oak or fir, well dried; and, to prevent warping, it is compofed of feveral pieces glued together. The wood to be ufed, being reduced into leaves of the thicknefs of a line, is either ftained with fome colour, or made black for fhadow: which fome effect by putting it in fand extremely heated over the fire; others by fteeping it in lime-water and fublimate; and others, in oil of fulphur. Thus coloured, the contours of the pieces are formed according to the parts of the defign they are to prefent.

The laft is the moft difficult part of marquetry, and that wherein moft patience and attention are required. The two chief inftruments ufed herein are the faw and the vice; the one to hold the matters to be formed: the other to take off from the extremes, according to occafion. This vice is of wood, having one of the chaps fixed, the other moveable, and is opened and fhut by the foot, by means of a cord faftened to a treadle. Its ftructure is very ingenious, yet fimple enough, and will be eafily conceived from the figure, *Plate* XXIII. *Mifcellany, fig.* 3. The leaves to be formed (for there are frequently three or four of the fame kind formed together) are put within the chaps of the vice, after being glued on the outermoft part of the defign, whofe profile they are to follow: then the workman, preffing the treadle, and thus holding faft the piece, with his faw runs over all the outlines of the defign. By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewife the better enabled to fuftain the effort of the faw; which, how delicate foever it may be, and how lightly foever the workman may conduct it, without fuch a precaution, would be apt to raife fplinters, to the ruin of the beauty of the work.

When the work is to confift of one fingle kind of wood, or of tortoife-fhell, on a copper or tin ground, or *vice verfa*, they only form two leaves on one another, *i. e.* a leaf of metal, and a leaf of wood or fhell: this they call fawing in counter-parts; for by filling the vacuities of one of the leaves by the pieces coming out of the other, the metal may ferve as a ground to the wood, and the wood to the metal.

All the pieces, thus formed with the faw, are marked, to know them again; and the fhadow being given in the manner already mentioned; they veneer or faften each in its place on the common ground; ufing for that purpofe the beft Englifh glue. The whole is then put in a prefs to dry, planed over, and polifhed with the fkin of the fea-dog, wax, and fhave-grafs, as in fimple veneering; with this difference, however, that in marquetry, the fine branches, and feveral of the moft delicate parts of the figures, are touched up, and finifhed with a graver.

They are the cabinet-makers, joiners, and toy-men, among us, who work in marquetry; and the enamellers and ftone-cutters who deal in mofaic work: the inftruments ufed in the former are moftly the fame with thofe ufed by the ebonifts. See Ebony.

MARQUIE, or Marquée, Fr. corrupted from *Marquife*, fignifies a tent or cover made of ftrong canvas or Ruffia-duck, which is thrown over another tent, and ferves to keep out rain.

MARQUION, in *Geography*, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diftrict of Arras. The place contains 608, and the canton 14,293 inhabitants, on a territory of $137\frac{1}{2}$ kiliometres, in 17 communes.

MARQUIS, or Marquess, *Marchio*, a title given to a perfon in poffeffion of a confiderable demefne erected into a marquifate by letters patent; holding a middle place between the dignity of a duke and that of an earl or count.

The word, according to fome authors, comes from the *Marcomanni*, an ancient people, who inhabited the marches of Brandenburgh. Others derive it from the German *marche*, *limit;* and others from *marcifia*, which, in the Celtic language, fignified *a wing of cavalry*. Nicod derives it from the corrupt Greek *νομαρχια*, *province*. Alciat and Pauchet bring it from *marc*, *horfe*, taking a marquis to be properly an officer of horfe. Menage derives it from *marca*, *frontier;* and Selden, Krantzius, and Hottoman, do the fame. Laftly, Pafquier fetches marquis from the old French *marche*, *limit;* or from *marchir, to confine;* the guard of the frontiers being committed to them. Marquifes were anciently governors of frontier cities or provinces, called *marches*. Such as, in particular, were the marches of Wales and Scotland, while each continued to be an enemy's country. In Germany, they are called *margraves*.

The perfons, who had command there, were called lords marchers, or marquifes; whofe authority was abolifhed by ftatute 27 Hen. VIII. c. 27; though the title had long before been made a mere enfign of honour; Robert Vere, earl of Oxford, being created marquis of Dublin by Richard

chard II. in the eighth year of his reign. 2 Inft. 5. Selden's Titles of Honour, p. 216.

Marquis is originally a French title: the Romans were unacquainted with it. In the Notitia Imperii, they were called *comitatus limitanei*. The firft time we hear of *marquifes*, *marchiones*, is under Charlemagne, who created governors in Gafcony under this denomination.

Alciat has ftarted a queftion, whether a marquis or count fhould have the precedence? To decide it he goes back to the ancient function of counts; and obferves, that counts, who are governors of provinces, are above marquifes, who are only governors of frontiers; and that marquifes, who are governors of frontier cities, are above thofe counts who are governors of fmall towns. He adds, that, in confequence of this diftinction, the book of fiefs fometimes places marquifes above counts, and fometimes counts above marquifes.

Froiffart obferves, that the marquifate of Juliers was erected into a county: but now-a-days, neither marquifes nor counts are any longer governors; and as they are mere titles of honour, the counts make no fcruple of refigning the precedency.

Marquis's *Coronet*. See Crown.

Marquis, *Grand*, in *Geography*, a town on the E. fide of the ifland of Grenada. N. lat. 12° 9'. W. long. 61° 1'.

Marquis, *Cape*, a cape on the N. coaft of the ifland of St. Lucia. N lat. 13° 50'. W. long. 6° 42'.

Marquis *Iflands*, a clufter of fmall iflands in the Florida ftream. N. lat. 24 35'. W. long. 82° 30'.

MARQUISE, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diftrict of Boulogne. The place contains 1400, and the canton 9262 inhabitants, on a territory of 232½ kiliometres, in 21 communes.

MARR, a divifion of the county of Aberdeen, in Scotland, towards the fouth, between the rivers Dee and Don.

MARRA, in *Ancient Geography*, a town of Afia, in Syria, fituated on an extenfive plain, to the E. of the river Orontes, N.E. of Apamea, and S. of Chalcis. Marra ftill retains its ancient name, and is held by the pacha of Damafcus, as an appanage deriving immediately from the fultan. Homs, Hama, and Marra pay 400 purfes, or about 20,000*l.*; 30 miles N. of Hama.

MARRABOO, a town of Africa, in the kingdom of Bambarra, on the Niger: this town is a confiderable mart for falt, which is brought by the Moors for fale to the Negroes; 150 miles S.W. of Sego. N. lat. 12° 50'. W. long. 5° 10'.

MARRADI, a town of Etruria; N.N.E. of Florence.

MARRAT, a town of France, in the department of the Puy de Dome; nine miles S. of Thiers.

MARRIAGE, a civil and religious contract, whereby a man is joined and united to a woman, for the ends of procreation.

The effence of marriage confifts in the mutual confent of the parties. Marriage is a part of the law of nations, and is in ufe among all people. The Romanifts account it a facrament.

The public ufe of marriage inftitutions confifts, according to archdeacon Paley (Philof. vol. i.), in their promoting the following beneficial effects: 1. The private comfort of individuals: 2. The production of the greateft number of healthy children, their better education, and the making of due provifion for their fettlement in life: 3. The peace of human fociety, in cutting off a principal fource of contention, by affigning one or more women to one man, and protecting his exclufive right by fanctions of morality and law: 4. The better government of fociety, by diftributing the community into feparate families, and appointing over each the authority of a mafter of a family, which has more actual influence than all civil authority put together: 5. The additional fecurity which the ftate receives for the good behaviour of its citizens, from the folicitude they feel for the welfare of their children, and from their being confined to permanent habitations: 6. The encouragement of induftry.

The woman, with all her moveable goods, immediately upon marriage, paffes wholly, *in poteftatem viri*, into the power and difpofal of her hufband.

The firft inhabitants of Greece lived together without marriage. Cecrops, king of Athens, is faid to have been the firft author of this honourable inftitution among that people. After the commonwealths of Greece were fettled, marriage was very much encouraged by their laws, and the abftaining from it was difcountenanced, and in many places punifhed. The Lacedæmonians were very remarkable for their feverity towards thofe who deferred marriage beyond a limited time, as well as to thofe who wholly abftained from it. (See Lacedæmonians.) The Athenians had an exprefs law, that all commanders, orators, and perfons entrufted with any public affair, fhould be married men. Polygamy was not commonly tolerated in Greece. The time of marriage was not the fame in all places; the Spartans were not permitted to marry till they arrived at their full ftrength: the reafon affigned for this cuftom by Lycurgus was, that the Spartan children might be ftrong and vigorous; and the Athenian laws are faid to have once ordered, that men fhould not marry till thirty-five years of age. The feafon of the year which they preferred for this purpofe was the winter, and particularly the month of January, called Gamelion. The Greeks thought it fcandalous to contract marriage within certain degrees of confanguinity; whilft moft of the barbarous nations allowed inceftuous mixtures.

Moft of the Grecian ftates, efpecially fuch as made any figure, required their citizens fhould match with none but citizens, and the children were not allowed to marry without the confent of their parents. The ufual ceremonies in promifing fidelity was kiffing each other, or giving their right hands, which was a general form of ratifying all agreements. Before the marriage could be folemnized, the gods were to be confulted, and their affiftance implored by prayers and facrifices, which were offered to fome of the deities that fuperintended thefe affairs, by the parents, or neareft relations of the perfons to be married. When the victim was opened, the gall was taken out and thrown behind the altar, as being the feat of anger and malice, and therefore the averfion of all the deities who had the care of love, as well as thofe who became their votaries. For the particulars relating to the bride and bridegroom, fee Bride and Bridegroom.

The ceremonies of the Spartan marriages being different from all others, deferve to be mentioned at length, as related by Plutarch. "When the Spartans had a mind to marry, their courtfhip was a fort of rape upon the perfons they had a fancy for; and thofe they chofe not tender and half-children, but in the flower of their age, and full ripe for a hufband. Matters being agreed between them, the νυμφευτρια, or woman that contrived and managed the plot, fhaved off the bride's hair clofe to her fkin, dreffed her up in man's clothes, and left her upon a mattrefs: this done, the bridegroom entered in his common clothes, fober and compofed, as having fupped at his ordinary in the common hall, and ftole as privately as he could into the room where the bride lay, untied her virgin girdle, whence λυειν ζωνην, is *to deflower*, and took her into his embraces. Having ftayed a fhort a ſhort time with her, he returned to his comrades, with whom he continued to ſpend his life, remaining with them as well by night as by day, unleſs when he ſtole a ſhort viſit to his bride; and that could not be done without a great deal of circumſpection, and fear of being diſcovered. Nor was ſhe wanting (as may be ſuppoſed) on her part, to uſe her wit in watching the moſt favourable opportunities for their meeting, and making appointments when company was out of the way. In this manner they lived a long time, inſomuch that they frequently had children by their wives before they ſaw their faces by day-light. The interview being thus difficult and rare, ſerved not only for a continual exerciſe of their temperance, and farthered very much the ends and intentions of marriage, but was a means to keep their paſſion ſtill alive, which flags and decays, and dies at laſt by too eaſy acceſs, and long continuance with the beloved object." Potter, Archæol. book iv. c. xi. p. 295, ſeq.

The Romans, as well as the Greeks, diſallowed of polygamy; and they encouraged marriage by the "jus trium liberorum." A man who had no child was entitled by the Roman law only to one-half of any legacy that ſhould be left him, that is, at the moſt, could receive only one-half of the teſtator's fortune. A Roman might not marry any woman who was not a Roman. Among the Romans, the kalends, nones, and ides of every month, were deemed unlucky for the celebration of marriage, as was alſo the feaſt of the Parentalia, and the whole month of May. The moſt happy ſeaſon in every reſpect was that which followed the ides of June.

The Roman laws ſpeak of ſecond marriages in very hard and odious terms: "Matre jam ſecundis nuptiis funeſtata, L. iii. C. de ſec. nuptiis." By theſe laws it was enacted, that the effects of the huſband or wife deceaſed ſhould paſs over to the children, if the ſurvivor ſhould marry a ſecond time. By the law *Hac edictali*, Cod. de ſec. nupt. the ſurvivor, upon marrying a ſecond time, could not give the perſon he married a portion more than equal to that of each of the children. In the primitive church, the reſpect to chaſtity was carried ſo high, that a ſecond marriage was accounted no other than a lawful whoredom, or a ſpecies of bigamy; and there are ſome ancient canons, which forbid the eccleſiaſtics from being preſent at ſecond marriages.

Marriage, by the Moſaic law, was ſubject to ſeveral reſtrictions: thus by Levit. chap. xviii. ver. 16, a man was forbid to marry his brother's widow, unleſs he died without iſſue; in which caſe, it became enjoined as a duty. So he was forbid to marry his wife's ſiſter, while ſhe was living, ver. 18, which was not forbidden before the law, as appears from the inſtance of Jacob.

The ancient Roman law is ſilent on this head; and Papinian is the firſt who mentions it, on occaſion of the marriage of Caracalla. The lawyers who came after him ſtretched the bonds of affinity ſo far, that they placed adoption on the ſame foot with nature.

Affinity, according to the modern canoniſts, renders marriage unlawful to the fourth generation, incluſive; but this is to be underſtood of direct affinity, and not of that which is ſecondary or collateral. "Affinis mei affinis, non eſt affinis meus." It is farther to be obſerved, that this impediment of marriage does not only follow an affinity contracted by lawful matrimony, but alſo that contracted by a criminal commerce; with this difference, that this laſt does not extend beyond the ſecond generation; whereas the other, as has been obſerved, reaches to the fourth.

In Germany, they have a kind of marriage called *morganatic*, wherein a man of quality contracting with a woman of inferior rank, he gives her the left hand in lieu of the right; and ſtipulates in the contract, that the wife ſhall continue in her former rank or condition, and that the children born of them ſhall be of the ſame; ſo that they become baſtards as to matters of inheritance, though they are legitimate in effect. They cannot bear the name or arms of the family.

None but princes, and great lords of Germany, are allowed this kind of marriage. The univerſities of Leipſic and Jena have declared againſt the validity of ſuch contracts; maintaining, that they cannot prejudice the children, eſpecially when the emperor's conſent intervenes in the marriage.

The Turks have three kinds of marriages, and three ſorts of wives; *legitimate, wives in kebin*, and *ſlaves*. They marry the firſt, hire the ſecond, and buy the third. See TURKEY.

The people in Java marry and have children at nine or ten years old, and the women leave child-bearing before they are thirty; and at Tonquin there are women common to any that will hire them, at eight or nine years of age. See JAVA and TONQUIN.

Among the Hindoos polygamy is practiſed, but one wife is acknowledged as ſupreme. The ceremony of marriage is accompanied with many idolatrous forms. For an account of the ſingular mode of courtſhip and marriage ceremony in *New* HOLLAND, ſee that article.

In Ruſſia, when a marriage is propoſed, the lover, accompanied by a friend, goes to the houſe of the bride, and ſays to her mother, "Shew us your merchandiſe, we have got money;" referring, probably by this expreſſion, to the ancient cuſtom of buying a wife. The other ceremonies are equally curious. See RUSSIA.

Among the Perſians, marriages are conducted by female mediation; and the pomp and ceremonies ſomewhat reſemble the Ruſſian. Polygamy is allowed, but the firſt married is the chief wife. See PERSIA.

In Siam, the eſpouſals are concluded by female mediation. On the third viſit the parties are conſidered as wedded, after the exchange of a few preſents, and without any further ceremony, civil or ſacred. Although polygamy is allowed, more from oſtentation than from any other motive, one wife is always acknowledged as ſupreme. From pride the royal marriages are ſometimes inceſtuous, and the king does not heſitate to eſpouſe his own ſiſter. (See SIAM.) The celebration of marriage in Sumatra is commonly performed in the balli or village-hall, and is accompanied with dances and ſongs. Polygamy is practiſed, ſeeming to be connected, as Mr. Marſden has obſerved, with the idea of purchaſing a wife, inſtead of receiving a dower with her. See SUMATRA.

For an account of the marriage ceremonies of Thibet, ſee THIBET.

Among all the ſavage nations, whether in Aſia, Africa, or America, the wife is commonly bought by the huſband from her father, or thoſe other relations who have an authority over her; and the concluſion of a bargain for this purpoſe, together with the payment of the price, has, therefore, become the uſual form or ſolemnity in the celebration of their marriages.

Among the Abiponians, the price varies from four horſes down to a bottle of brandy. The Araucans may buy as many wives as they can afford to maintain. See CHILI.

Among the Chineſe, the bride is purchaſed by a preſent to her parents, and is never ſeen by her huſband till after the ceremony. In Circaſſia (which ſee), the bridegroom

pays

pays for his bride a marriage present, or "kalym," consisting of arms or a coat of mail; but he must not see her, nor cohabit with her, without the greatest mystery. That reserve continues during life. The father makes the bride a present on the wedding-day, but reserves the greater part of what he intends to give her till the birth of her first child. On this occasion she pays him a visit, receives from him the remainder of her portion, and is clothed by him in the dress of a matron, of which the principal distinction is a veil.

The Hebrews also purchased their wives, by paying down a competent dowry for them: and Aristotle makes it one argument to prove that the ancient Grecians were an uncivilized people, because they used to buy their wives: and in proportion as they laid aside their barbarous manners, they left off this practice.

The ancient Assyrians sold their beauties by an annual auction. The prices were applied by way of portion to the more homely. By this contrivance, all of both sorts were disposed of in marriage. Among the old inhabitants of Germany, as well as the Jewish patriarchs, and the Grecians, the husband paid money to the family of the wife, whereas now the wife brings money to her husband. This alteration, says Paley, has proved of no small advantage to the female sex, for their importance in point of fortune procures for them, in modern times, that assiduity and respect which are always wanted to compensate for the inferiority of their strength, but which their personal attractions would not always secure.

The English law considers marriage in no other light than as a civil contract: the holiness of the matrimonial state being left entirely to the ecclesiastical law, to which it pertains to punish or annul incestuous or other unscriptural marriages. The law allows marriage to be good and valid, where the parties at the time of making it were willing and able to contract, and actually did contract, in the proper forms and solemnities required by law. As to their being willing to contract, "consensus, non concubitus, facit nuptias," is the maxim of the civil law in this case; and it is adopted by the common lawyers. (Co. Litt. 33.) The disabilities or incapacities for contracting are of two sorts: first, such as are canonical, and, therefore, sufficient by the ecclesiastical laws to avoid the marriage in the spiritual court; such as pre-contract, consanguinity, or relation by blood; and affinity, or relation by marriage, and some particular corporeal infirmities. But these disabilities in our law do not make the marriage *ipso facto* void, but voidable only by sentence of separation; and marriages are esteemed valid to all civil purposes, unless such separation is actually made during the life of the parties. Thus, when a man had married his first wife's sister, and after her death the bishop's court was proceeding to annul the marriage, and bastardize the issue, the court of king's bench granted a prohibition *quoad hoc;* but permitted them to proceed to punish the husband for incest. Salk. 548.

By 32 Hen. VIII. c. 38. it is declared, that all persons may lawfully marry, but such as are prohibited by God's law, &c. And that nothing (God's law excepted) shall impeach any marriage but within the Levitical degrees: these are enumerated in the eighteenth chapter of Leviticus, and are illustrated by lord Coke in this manner: a man may not marry his mother, father's sister, mother's sister, sister, daughter, daughter of his son or daughter, father's wife, uncle's wife, father's wife's daughter, brother's wife, wife's sister, son's wife or wife's daughter, and daughter of his wife's son or daughter. And a woman may not marry her father, father's brother, mother's brother, brother, son of her son or daughter, mother's husband, aunt's husband, sister's husband, husband's brother, and son of her husband's son or daughter. Accordingly, a table was set forth in the year 1563, specifying at large the prohibited degrees. It is observed, that the degrees prohibited by the Levitical law are all within the fourth degree of consanguinity, as established by the computation of the civilians; all collaterals, therefore, in that degree, or beyond it, may marry. By the civil law first cousins are allowed to marry; but by the canon law both first and second cousins are prohibited. Therefore, when it is vulgarly said, that first cousins may marry, but second cousins cannot, this probably arose by confounding these two laws; for first cousins may marry by the civil law, and second cousins cannot by the canon law. But by the foresaid stat. 32 Henry VIII. c. 38, it is clear that both first and second cousins may marry. By the same statute all impediments arising from pre-contracts to other persons were abolished, and declared of none effect, unless they had been consummated with bodily knowledge; in which case the canon law holds such contract to be a marriage *de facto*. But this branch of the statute was repealed by 2 and 3 Ed. VI. c. 23. How far the act of 26 Geo. II. c. 33. (which prohibits all suits in ecclesiastical courts to compel a marriage, in consequence of any contract) may collaterally extend to revive this clause of Henry VIII.th's statute, and abolish the impediment of pre-contract, judge Blackstone leaves to be considered by the canonists. We shall here observe, that on a promise of marriage, if it be mutual on both sides, damages may be recovered, in case either party refuses to marry; and though no time for the marriage is agreed on, if the plaintiff avers that he offered to marry the defendant, who refused it, an action is maintainable for the damages; but no action shall be brought upon any agreement except it is in writing, and signed by the party to be charged. The canonical hours for celebrating marriage are from eight till twelve in the forenoon.

Disabilities of another sort are those which are created, or at least enforced, by the municipal laws. These civil disabilities make the contract void *ab initio*, and not merely voidable, by rendering the parties incapable of forming any contract at all. The first legal disability is a prior marriage, or having another husband or wife living; in which case, besides the penalties consequent upon it as a felony, the second marriage is to all intents and purposes void. See BIGAMY, and POLYGAMY.

The next legal disability is want of age: therefore, if a boy under fourteen, or a girl under twelve years of age, marries, when either of them comes to the age of consent they may disagree, and declare the marriage void, without any divorce or sentence in the spiritual court. This is founded on the civil law: but the canon law pays a greater regard to the constitution than the age of the parties; for if they are "habiles ad matrimonium," it is a good marriage, whatever their age may be. And in our law it is so far a marriage, that, if at the age of consent they agree to continue together, they need not be married again. (Co. Litt. 79.) If the husband be of years of discretion, and the wife under twelve, when she comes to years of discretion he may disagree as well as she may; for in contracts the obligation must be mutual; both must be bound or neither: and so it is, *vice versa*, when the wife is of years of discretion, and the husband under. (Ibid.) However, in our law it is so far a marriage, that if at the age of consent they agree to continue together, they need not be married again. Another incapacity arises from want of consent of parents or guardians. By the common law, if the parties themselves were of the age of consent, no other concurrence was necessary to make the marriage valid; and this was agreeable to the canon law. But by several statutes

ſtatutes, *viz.* 6 and 7 W. III. c. 6. 7 and 8 W III. c. 35. 10 Ann. c. 19. penalties of 100*l.* are laid on every clergyman who marries a couple, either without publication of banns, which may give notice to parents or guardians, or without a licence, to obtain which the conſent of parents or guardians muſt be ſworn to. And by 4 and 5 Ph. and M. c. 8. whoſoever marries any woman-child under the age of ſixteen years, without conſent of parents or guardians, ſhall be ſubject to fine, or five years impriſonment; and her eſtate, during the huſband's life, ſhall be enjoyed by the next heir. Thus alſo in France, under the old conſtitution, the ſons cannot marry without conſent of parents till thirty years of age, nor the daughters till twenty-five; and in Holland, the ſons are at their own diſpoſal at twenty-five, and the daughters at twenty. And by the marriage act, *viz.* 26 Geo. II. c. 33, it is enacted, that all marriages celebrated by licence (for banns ſuppoſe notice) where either of the parties is under twenty-one, not being a widow or widower, who are ſuppoſed emancipated, without the conſent of the father, or, if he be not living, of the mother or guardians, ſhall be abſolutely void. However, proviſion is made, where the mother or guardian is non compos, beyond ſea, or unreaſonably froward, to diſpenſe with ſuch conſent, at the diſcretion of the lord chancellor; but no proviſion is made, in caſe the father ſhould labour under any mental, or other incapacity. A fourth incapacity is want of reaſon. It is provided by 15 Geo. II. cap. 30. that the marriage of lunatics, and perſons under phrenzies (if found lunatics under a commiſſion, or committed to the care of truſtees by any act of parliament) before they are declared of ſound mind by the lord chancellor, or the majority of ſuch truſtees, ſhall be totally void.

By the ancient law of England, if any Chriſtian man did marry with a woman that was a Jew, or a Chriſtian woman did marry with a Jew, it was felony, and the party ſo offending ſhould be burnt alive (3 Inſt. 89); or as the author of Fleta ſays, buried alive. But when both parties are Jews, they are allowed to marry; and are not under the reſtraints of the ſtatute of 26 Geo. II. c. 33. By the civil law the woman is forbidden to marry again within the year of mourning, unleſs with a ſpecial diſpenſation from the prince; by reaſon of the uncertainty to which huſband the iſſue may belong, and becauſe a reverential mourning and pious regard to the memory of her deceaſed huſband, are in decency expected. (Wood. Civ. L. 124. 2 Domat. 126.) And lord Coke ſays, for the avoiding of ſuch like inconveniences, this was the law before the conqueſt; let every widow continue unmarried for twelve months; and if ſhe ſhall marry, let her loſe her dower. (1 Inſt. 8.) But the divine and the canon law leaves no ſuch injunctions. (Wood. Civ. L. 122.) Alſo, by the common law of England, a widow is not prohibited from marrying at any time after her huſband's death. If a woman marry ſo ſoon after the death of her huſband that the child may belong to either father, it is ſaid the child may chooſe his father. Co. Litt. 8 *a*.

Laſtly, the parties muſt not only be willing and able to contract, but muſt actually contract themſelves in due form of law, to make it a good civil marriage. Any contract made, *per verba de præſenti*, or in words of the preſent tenſe, and in caſe of cohabitation *per verba de futuro* alſo, between perſons able to contract, was before the marriage act deemed a valid marriage to many purpoſes, and the parties might be compelled in the ſpiritual courts to celebrate it *in facie eccleſiæ*. But theſe verbal contracts are now of no force, to compel a future marriage. Nor is any marriage at preſent valid that is not celebrated in ſome pariſh-church or public chapel, unleſs by diſpenſation from the archbiſhop of Canterbury. It muſt alſo be preceded by publication of banns, or by licence from the ſpiritual judge. No parſon, vicar, &c. ſhall be obliged to publiſh banns of matrimony, unleſs the perſons to be married ſhall, ſeven days before the time required for the firſt publication, deliver to him a notice in writing of their true names, and of the houſe or houſes of their reſpective abode, within ſuch pariſh, &c. and of the time that they have dwelt in ſuch houſe or houſes. And the ſaid banns ſhall be publiſhed upon three Sundays preceding the ſolemnization of marriage, during the time of public ſervice. In caſe the parents or guardians of either of the parties, who ſhall be under the age of twenty-one years, ſhall openly and publicly declare, or cauſe to be declared in the church or chapel, where the banns ſhall be ſo publiſhed, at the time of ſuch publication, their diſſent to ſuch marriage, ſuch publication of banns ſhall be void. And when the parties dwell in divers pariſhes, the curate of the one pariſh ſhall not ſolemnize matrimony betwixt them, without a certificate of the banns being thrice aſked, from the curate of the other pariſh. In all caſes where banns have been publiſhed, the marriage ſhall be ſolemnized in one of the pariſh churches or chapels where ſuch banns have been publiſhed, and in no other place. A marriage in purſuance of a licence (except a ſpecial licence) muſt be ſolemnized in ſuch church or chapel where the licence is granted; and no licence of marriage ſhall be granted by any archbiſhop, biſhop, &c. to ſolemnize any marriage in any other church, &c. than in the pariſh church, &c. within which the uſual place of abode of one of the parties ſhall have been for four weeks immediately before the granting ſuch licence. By the ſame ſtatute, all marriages ſhall be ſolemnized in the preſence of two credible witneſſes at the leaſt, beſides the miniſter, who ſhall ſign their atteſtation thereof; and immediately after the celebration of every marriage, an entry thereof ſhall be made in the pariſh-regiſter, expreſſing that the ſaid marriage was celebrated by banns or licence; and if both or either of the parties be under age, with conſent of the parents or guardians, as the caſe ſhall be, ſigned by the miniſter, and alſo by the parties married, and atteſted by the two witneſſes preſent. It is held to be alſo eſſential to a marriage, that it be performed by a perſon in orders (Salk. 119.); though the intervention of a prieſt to ſolemnize this contract is merely *juris poſitivi*, and not *juris naturalis aut divini*; it being ſaid that pope Innocent III. was the firſt who ordained the celebration of marriage in the church (Moor. 170.), before which it was totally a civil contract. And in the times of the grand rebellion, all marriages were performed by the juſtices of the peace; and theſe marriages were declared valid, without any freſh ſolemnization, by 12 Car. II. c. 33. But as the law now ſtands, we may upon the whole collect, that no marriage by the temporal law is *ipſo facto* void, that is celebrated by a perſon in orders; in a pariſh-church, a public chapel, or elſewhere by ſpecial diſpenſation; in purſuance of banns or a licence; between ſingle perſons; conſenting; of ſound mind; and of the age of twenty-one years; or of the age of fourteen in males, and twelve in females, with conſent of parents or guardians, or without it in caſe of widowhood. And no marriage is voidable by the eccleſiaſtical law, after the death of either of the parties; nor during their lives, unleſs for the canonical impediments of precontract, if that indeed ſtill exiſts; of conſanguinity, and of affinity, or corporal imbecility, ſubſiſting previous to the marriage. Blackſt. Com. vol. i.

 By

By 26 Geo. II. c. 33. the fubftance of which has been already recited, if any perfon fhall folemnize matrimony in any other place than a church, &c. where banns have been ufually publifhed, unlefs by a fpecial licence, or without publication of banns, unlefs licence of marriage be firft obtained from fome perfon having authority to grant the fame, every fuch perfon knowingly fo offending, fhall be guilty of felony, and tranfported for fourteen years; the profecution to be within three years. By the fame ftatute, to make a falfe entry into a marriage-regifter; to alter it when made; to forge or counterfeit fuch entry, or a marriage licence, or aid and abet fuch forgery, to utter the fame as true, knowing it to be counterfeit; or to deftroy or procure the deftruction of any regifter, in order to vacate any marriage, or fubject any perfon to the penalties of this act: all thefe offences, knowingly and wilfully committed, fubject the party to the guilt of felony without benefit of clergy. But this act doth not extend to the marriages of the royal family; nor to Scotland; nor to any marriages among the people called Quakers, or among perfons profeffing the Jewifh religion, where both the parties are Quakers or Jews refpectively; nor to any marriages beyond the feas.

As the paffage into Scotland is left open by the marriage act, many perfons have found their way thither to be married, in a clandeftine and irregular manner; and there has been a diverfity of opinions concerning the validity of fuch marriages. Lord Stair, in his "Inftitutions of the Laws of Scotland," fays, the public folemnity of marriage is a matter of order. juftly introduced by pofitive law, for the certainty of fo important a contract; but not effential to marriage. Thence arifes the diftinction of public or folemn, and private or clandeftine marriages. And though perfons, who act contrary thereto, may be juftly punifhed, (as in fome nations by the exclufion of the iffue of fuch marriages from fucceffion,) yet the marriage cannot be declared void and annulled; and fuch exclufions feem very unequal againft the innocent children. But by the cuftom of Scotland, cohabitation, and being commonly reputed man and wife, validate the marriage, give the wife a right to her thirds, who cannot be excluded therefrom, if fhe was reputed lawful wife, and not queftioned during the hufband's life, till the contrary be clearly proved. Mr. Erfkine, in his "Principles of the Law of Scotland," fays, it is not neceffary that marriage be celebrated by a clergyman: the confent of parties may be declared before any magiftrate, or fimply before witneffes. When the order of the church is obferved, the marriage is called regular; when otherwife, clandeftine. Towards a regular marriage, the church requires proclamation of banns in the churches, where the bride and bridegroom refide: formerly, not only bifhops, but prefbyteries, affumed a power of difpenfing with proclamation of banns, on extraordinary occafions; but this hath not been exercifed fince the revolution But whether clandeftine marriages in Scotland, of Englifh parties, who refort thither to evade the Englifh law, fhall be fuftained in England, hath been doubted; and very learned men have queftioned, notwithftanding fuch marriages are valid by the law of Scotland, whether they are effective in England. Where parties are bound, by the laws of their country, to execute any important act or contract with certain folemnities; it is doubted whether they can elude their own law, by going purpofely to another country, where fuch folemnities are not effential, and then returning immediately, when the act is done. It is a queftion of public law; and the moft celebrated writers on public law have holden, that fuch an act is fraudulent: it is *fraudem facere lege*, which the laws of all nations difallow. In a cafe that occurs in "Buller's Law of Nifi Prius," an appeal was made to the delegates: the appellant and refpondent both Englifh fubjects, the appellant, being under age, ran away without the confent of her guardian, and were married in Scotland; and on a fuit brought in the fpiritual court to annul the marriage, it was holden that the marriage was good.

So, it has been fince taken as an undoubted propofition, that a marriage celebrated in Scotland is fuch a marriage as would entitle the woman to dower in England.

By 35 Geo. III. c. 67. after reciting that the punifhment of perfons convicted of felony by virtue of 1 Jac. I. c. 11. "for reftraining perfons from marriage until their former wives or hufbands be dead," has not proved effectual to deter wicked perfons from being guilty of the faid offence, it is enacted, that if any perfon being married, or who hereafter fhall marry, do, after the 15th of May 1795, marry any perfon, the former hufband or wife being alive, and fhall be in due manner convicted thereof under the faid act, fhall be fubject and liable to the fame penalties, pains, and punifhments, as by the laws now in force perfons are liable to, who are convicted of grand or petit larceny.

For the proportions which marriages bear to births, and births to burials, in feveral parts of Europe, Mr. Derham gives us the following table:

Names of Places.	Marriages to Births, as	Births to Burials, as
England in general	1 to 4.63	1.12 to 1
London	1 to 4	1 to 1.1
Hantfhire, from 1569 to 1658	1 to 4	1.2 to 1
Tiverton in Devonfhire, from 1656 to 1664	1 to 3.7	1.26 to 1
Cranbrook in Kent, from 1560 to 1649	1 to 3.9	1.6 to 1
Aynho in Northamptonfhire, for 118 years	1 to 6	1.6 to 1
Upminfter in Effex, for 100 years	1 to 4.6	1.8 to 1
Frankfort on the Maine, in 1695	1 to 3.7	1.2 to 1
Old, Middle, and Lower Marck, in 1698	1 to 3.7	1.9 to 1
Dominions of the Elector of Brandenburgh, in 1698	1 to 3.7	1.5 to 1
Breflaw in Silefia, from 1687 to 1691	———	1.6 to 1
Paris, in 1670, 1671, 1672	1 to 4.7	1.6 to 1

The

The Editor has formed the following Table, fimilar to the preceding, from the obfervations collected and referred to by Dr. Price.

Names of Places.	Marriages to Births, as	Births to Burials, as
London, annual medium from 1716 to 1736	———	18000 to 26529, or 1 to 1.4, &c.
——— from 1759 to 1768	———	15710 to 22956, or 1 to 1.4, &c.
Northampton, ditto, from 1741 to 1770	———	155 to 191, or 1 to 1.2, &c.
Norwich, ditto, from 1740 to 1769	———	1057 chriftenings to 1206, or 1 to 1.1, &c.
Shrewfbury, ditto, from 1762 to 1768	———	301 to 329 or 1 to 1.09, &c.
Manchefter and Salford, exclufive of Diffenters, ditto, from 1755 to 1759	———	756 to 743.
Ditto, ditto, including Diffenters, from 1768 to 1772	———	1098 to 958, or 1.14, &c. to 1.
Gainfborough in Lincolnfhire, ditto, from 1752 to 1771	1 to 3.7	126 to 105, or 1.2 to 1.
Madeira, ditto, from 1759 to 1766	1 to 4.88	2201 to 1203, or 1.7 to 1.
Bofton in New England, from 1731 to 1752	———	538 to 608, or 1 to 1.13, &c.
Chriftiana in Norway, in 1761	———	11024 to 6929, or 1.5 to 1.
Paris, mean of fome of the laft years, before 1772	1 to 4.3	19100 to 19400, or 1 to 1.01, &c.
Vienna, annual medium, from 1757 to 1769	———	5800 to 6600, or 1 to 1.1, &c.
Amfterdam, ditto, from 1761 to 1770	1 to 1.9, &c.	4600 to 7922 or 1 to 1.7, &c.
Copenhagen, ditto	1 to 3.04, &c.	2700 to 3300, or 1 to 1.2, &c.
Stockholm, ditto, for nine years, ending in 1763	———	2535 to 3781.
Berlin, ditto, for five years, ending at 1759	1 to 3.9, &c.	3855 to 5054, or 1 to 1.3, &c.
Breflaw, ditto, from 1633 to 1734	———	1089 to 1256, or 1 to 1.15, &c.
———, ditto, from 1717 to 1725	———	1252 to 1507, or 1 to 1.2, &c.
Rome, ditto, from 1759 to 1761	———	5167 to 7153, or 1 to 1.3, &c.
Vaud, in Switzerland, ditto, for ten years before 1766	1 to 3.9	3155 to 2504, or 1.2, &c. to 1.
In all Sweden, for nine years to 1763	———	130 to 100.
In the kingdom of Naples, for five years to 1777	———	144 to 100.
In all France, for five years to 1774	———	117 to 100.
In Breflaw, Glogaw, and other towns of Silefia, for four years to 1778	10 to 45	996 to 1000.
In the country parifhes and villages of Silefia, ditto	10 to 45	125 to 100.
In the kingdom of Pruffia and dukedom of Lithuania, ten years to 1702	10 to 37	150 to 100.
five years to 1716	10 to 39	180 to 100.
five years to 1756	10 to 50	148 to 100.
In the Churmark of Brandenburgh, five years to 1702	10 to 37	176 to 100.
———, four years to 1756	10 to 38	124 to 100.
In the duchy of Pomerania, fix years to 1702	10 to 36	140 to 100.
———, fix years to 1706	10 to 39	177 to 100.
———, fix years to 1726	10 to 39	150 to 100.
———, four years to 1756	10 to 43	137 to 100:
In the Neumark of Brandenburgh, five years to 1701	10 to 37	155 to 100.

For an account of the numbers of male and female ftillborn children and chryfoms, and of boys and girls under ten, of married men and married women, and of widows and widowers, who died for a courfe of years at Vienna, Breflaw, Drefden, Leipfic, Ratifbon, and fome other towns in Germany, fee Phil. Tranf. Abr. vol. vii. part iv. p. 46, &c.

The reader may find many curious calculations and remarks relating to this fubject in Dr. Price's excellent work, entitled "Obfervations on Reverfionary Payments." From the preceding table it appears, that marriages, one with another, do each produce about four births, both in England, and other parts of Europe. Dr. Price obferves, that the births at Paris, as may be feen in the table, are above four times the weddings; and therefore it may feem, that in the moft healthy country fituations, every wedding produces above four children; and though this be the cafe in Paris, for reafons which he has given, he has obferved nothing like it in any other great town. He adds, that from comparing the births and weddings, in countries and towns where regifters of them have been kept, it appears, that in the former, marriages, one with another, feldom produce lefs than four children each; generally between four and five, and fometimes above five: but in towns feldom above four, generally between three and four, and fometimes under three. It is neceffary to be obferved here, that though the proportion of annual births to weddings has been confidered as giving the true number of children derived from each marriage, taking all marriages one with another; yet this is only true, when, for many years, the births and burials have kept nearly equal. Where there is an excefs of the births occafioning an increafe, the proportion of annual births to weddings muft be lefs than the proportion of children derived from each marriage; and the contrary muft take place, where there is a decreafe; and by Mr. King's computation, about one in an hundred and four perfons marry; the number of people in England being eftimated at five millions and a half, whereof about forty-one thoufand annually marry.

In the diftrict of Vaud in Switzerland, the married are very nearly a third part of the inhabitants.

Major Graunt and Mr. King difagree in the proportions between males and females, the latter making ten males to thirteen females in London; in other cities and towns, and in the villages and hamlets, a hundred males to ninety-nine females; but major Graunt, both from the London and country bills, computes that there are in England fourteen males to thirteen females; whence he juftly infers, that the Chriftian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahometanifm, and others that allow it.

This proportion of males to females Mr. Derham thinks pretty juft, being agreeable to what he had obferved himfelf. In the hundred years, for inftance, of his own parifh-regifter of Upminfter, though the burials of males and females were nearly equal, being fix hundred and thirty-three males, and fix hundred and twenty-three females, in all that time; yet there were baptized feven hundred and nine males, and but fix hundred and feventy-five females, which is 13 females to 13.7 males. From a table formed by Dr. Price, he concludes that this proportion fhould have been ftated at 19 to 20.

From a regifter kept at Northampton for twenty-eight years, from 174 to 1770, it appears, that the proportion of males to females that were born in that period is 2361 to 2288, or nearly 13.4 to 13. However, though more males are born than females, Dr. Price has fufficiently fhewn, that there is a confiderable difference between the probabilities of life among males and females, in favour of the latter; fo that males are more fhort-lived than females; and as the greater mortality of males takes place among children, as well as among males at all ages, the fact cannot be accounted for merely by their being more fubject to untimely deaths by various accidents, and by their being addicted to the exceffes and irregularities which fhorten life. Mr. Kerfleboom informs us, that, during the courfe of 125 years in Holland, females have, in all accidents of age, lived about three or four years longer than the fame number of males. In feveral towns of Germany, &c. it appears, that of 7270 married perfons who had died, the proportion of married men who died to the married women, was 3 to 2; and in Breflaw for eight years, as 5 to 3. In all Pomerania, during nine years, from 1748 to 1756, this proportion was nearly 15 to 11. Among the minifters and profeffors in Scotland, twenty married men die to twelve married women, at a medium of twenty-feven years, or in the proportion of 5 to 3; fo that there is the chance of 3 to 2, and in fome circumftances even a greater chance, that the woman fhall be the furvivor of a marriage, and not a man; and this difference cannot be accounted for merely by the difference of age between men and their wives, without admitting the greater mortality of males. In the diftrict of Vaud in Switzerland, it appears, that half the females do not die till the age of forty-fix and upwards, though half the males die under thirty-fix. It is likewife an indifputable fact, that, in the beginning of life, the rate of mortality among males is much greater than among females.

From

From a table formed by Dr. Price, from a regifter kept for twenty years at Gainfborough, it appears, that of thofe who live to eighty, the major part, in the proportion of 49 to 32, are females. Mr. Deparcieux at Paris, and Mr. Wargentin in Sweden, have further obferved, that not only women live longer than men, but that married women live longer than fingle women. From fome regifters examined by Mr. Muret in Switzerland, it appears, that of equal numbers of fingle and married women between fifteen and twenty-five, more of the former died than of the latter, in the proportion of 2 to 1. With refpect to the difference between the mortality of males and females, it is found to be much lefs in country parifhes and villages than in towns; and hence it is inferred, that human life in males is more brittle than in females, only in confequence of adventitious caufes, or of fome particular debility, that takes place in polifhed and luxurious focieties, and efpecially in great towns.

From the inequality, above ftated, between the males and females that are born, it is reafonable to infer, that one man ought to have but one wife; and yet that every woman, without polygamy, may have a hufband; this furplufage of males above females being fpent in the fupplies of war, the feas, &c. from which the women are exempt. Perhaps, fays Dr. Price, it might have been obferved with more reafon, that this provifion had in view that particular weaknefs or delicacy in the conftitution of males, which makes them more fubject to mortality; and which confequently renders it neceffary that more of them fhould be produced, in order to preferve in the world a due proportion between the two fexes. See EXPECTATION *of life*, and MORTALITY.

That this is a work of Providence, and not of chance, is well made out by the very laws of chance, by Dr. Arbuthnot; who fuppofes Thomas to lay againft John, that for eighty-two years running, more males fhall be born than females; and, giving all allowances in the computation to Thomas's fide, he makes the odds againft Thomas, that it does not fo happen, to be near five millions of millions of millions of millions to one; bu for ages of ages, according to the world's age, to be near an infinite number to one.

According to Mr. Kerffeboom's obfervations, there are about 325 children born from 100 marriages.

Mr. Kerffeboom, from his obfervations, eftimates the duration of marriages, one with another, as in the following table:

Thofe whofe ages, taken together, make

40 live together between	24	and 25	years.
50	22	23	
60	23	21	
70	19	20	
80	17	18	
90	14	15	
100	12	13	

Phil. Tranf. N° 468. fect. iii. p. 319.

Dr. Price has fhewn, that on De Moivre's hypothefis, or that the probabilities of life decreafe uniformly (fee COMPLEMENT *of life*) the duration of furvivorfhip is equal to the duration of marriage, when the ages are equal; or, in other words, that the expectation of two joint lives, the ages being equal, is the fame with the expectation of furvivorfhip; and, confequently, the number of furvivors, or (which is the fame, fuppofing no fecond marriages) of widows and widowers, alive together, which will arife from any given fet of fuch marriages conftantly kept up, will be equal to the whole number of marriages; or half of them (the number of widows in particular) equal to half the number of marriages. Thus, the expectation of two joint lives, both 40, is the third of 46 years, or their complement, *i. e.* 15 years and 4 months; and this is alfo the expectation of the furvivor. That is, fuppofing a fet of marriages, between perfons all 40, they will, one with another, laft juft this time, and the furvivors will laft the fame time. In adding together the years which any great number of fuch marriages, and their furvivorfhips, have lafted, the fums would be found to be equal. It is obferved farther, that if the number expreffing the expectation of fingle or joint lives, multiplied by the number of fingle or joint lives whofe expectation it is, be added annually to a fociety or town, the fum gives the whole number living together, to which fuch an annual addition would in time grow: thus, fince 19, or the third of 57, is the expectation of two joint lives, whofe common age is 29, or common complement 57, twenty marriages every year between perfons of this age would, in fifty-feven years, grow to 20 times 19, or 380 marriages always exifting together. The number of furvivors alfo arifing from thefe marriages, and always living together, would, in twice 57 years, increafe to the fame number. Moreover, the particular proportion that becomes extinct every year, out of the whole number conftantly exifting together of fingle or joint lives, muft, wherever this number undergoes no variation, be exactly the fame with the expectation of thofe lives, at the time when their exiftence commenced. Thus, if it were found that a nineteenth part of all the marriages among any body of men, whofe numbers do not vary, are diffolved every year by the deaths of either the hufband or wife, it would appear, that 19 was, at the time they were contracted, the expectation of thefe marriages. Dr. Price obferves, that the annual average of weddings among the minifters and profeffors in Scotland, for the laft twenty-feven years, has been thirty-one; and the average of married perfons, for feventeen years, ending in 1767, had been 667. This number, divided by 31, gives $21\frac{1}{2}$, the expectation of marriage among them; which, he fays, is above $2\frac{1}{2}$ years more than the expectation of marriage would be, by Dr. Halley's table, on the fuppofition, that all firft, fecond, and third marriages may be juftly confidered as commencing, one with another, fo early as the age of thirty; and he has proved, that the expectation of two equal joint lives is to the expectation of a fingle life of the fame age as 2 to 3: confequently, the expectation of a fingle life at 30, among the minifters in Scotland, cannot be lefs than 32.25. If we fuppofe the mean ages, of all who marry annually to be 33 and 25, the expectation of every marriage would be 19 years; or one with another they would be all extinct in 19 years; the marriages which continue beyond this term, though fewer in number, enjoying among them juft as much more duration, as thofe that fall fhort of it enjoy lefs. But it appears from the obfervations and tables of Mr. Muret, that, in the diftrict of Vaud (dividing half the number of married perfons, *viz.* 38.328. by the annual medium of weddings, *viz.* 808) the expectation of marriage is only $23\frac{1}{2}$ years: fo much higher are the probabilities of life in the country than in towns, or than they ought to be, according to De Moivre's hypothefis. Price's Obf. &c. See EXPECTATION *of life*, LIFE-*annuities*, and SURVIVORSHIP.

MARRIAGE, in *Chivalry*. See MARITAGIUM.

MARRIAGE, *Certificate of*. By 5 W. c. 21 and 38 Geo. III. c. 149: for every piece of vellum, parchment, or paper, upon which any certificate of marriage (except of the marriage of a feaman's widow) fhall be ingroffed or written, fhall be paid a ftamp duty of 5*s.*; and writing fuch certificate upon the fame before it be ftamped incurs a forfeiture of 5*l.*

MARRIAGE, *Clandeftine* or *Irregular*. See MARRIAGE, *fupra*.

MARRIAGE, *Contract of*. See CONTRACT, and MARRIAGE, *supra*.

This contract formerly furnished one species of matrimonial causes, in which a party contracted to another brought a suit in the ecclesiastical court to compel a celebration of the marriage, in pursuance of such contract; but this branch of causes is now cut off entirely by the act for preventing clandestine marriages, 26 Geo. II. c. 33, which enacts that for the future no suit shall be had in any ecclesiastical court, to compel a celebration of marriage in *facie ecclesiæ*, for or because of any contract of matrimony whatsoever.

MARRIAGE, *Dissolution of*. See DIVORCE.

MARRIAGE, *Duty of*, is a term used in some ancient customs, signifying an obligation on women to marry.

To understand this, it must be observed, that old maids, and widows about sixty, who held fees in body, or were charged with any personal or military services, were anciently obliged to marry, to render those services to the lord by their husbands, or to indemnify the lord for what they could not do in person. And this was called *duty* or *service of marriage*.

MARRIAGE, *Forcible*. See FORCIBLE *Marriage*.

MARRIAGE, *Frank*. See FRANK.

MARRIAGE, *Jactitation of*, in *Law*, is one of the first and principal matrimonial causes, when one of the parties boasts or gives out, that he or she is married to the other, whereby a common reputation of their matrimony may ensue. On this ground the party injured may libel the other in the spiritual court; and unless the defendant undertakes and makes out a proof of the actual marriage, he or she is enjoined perpetual silence on that head; which is the only remedy the ecclesiastical courts can give for this injury. Blackst. Com. vol. ii.

Dr. Godolphin says, that marriage was at first tried in the temporal courts; but afterwards, by the concession of princes, such causes were determined in the spiritual courts. The reasons why the cognizance thereof hath been permitted to the ecclesiastical judge are divers: especially because matrimony was heretofore a sacrament of the church; and the office being performed by clergymen, this of consequence brings the performance under the diocesan's inspection; and in the case of the Levitical degrees in particular, ecclesiastics are presumed to be the best judges of what is prohibited by God's law. The lawfulness of marriage is to be tried by the bishop's certificate (see CERTIFICATE), upon an issue "accoupled in lawful matrimony or not;" as in a writ of dower, appeal, bastardy, or the like. (1 Inst. 134.) And the bishop's certificate in this case is conclusive against all the world, and is the only mode of trying the issue on the plea of "ne unques accouple in loial matrimonie;" for to such a plea a mere *sentence* in the ecclesiastical court is not a good replication, because that would be to plead evidence, which, if it is any thing, amounts to the general issue, contrary to the rule (see 4 Bac. Abr. 60.), and to bind the court by what does not bind the bishop, who, if he see cause, may revoke the sentence. But such a sentenc, unrepealed and unappealed from, is evidence to a jury; and may be pleaded in chancery. Whether a woman is a feme covert, or whether she is the wife of such a person, is triable by a jury upon the above-mentioned issue. Therefore a marriage *de facto*, or in reputation (as amongst the Quakers) hath been allowed by the temporal courts to be sufficient for giving title to a personal estate, because the lawfulness of the marriage is not in issue, or the point to be tried. For the issue is whether a marriage was contracted between the parties or not, or whether the parties lived in a married state where the legality of it doth not come in question. Wood. b. i. c. 6.

In the act of 6 and 7 W. c. 6. laying a duty upon marriages, Quakers and Jews, cohabiting as man and wife, were required to pay the said duty, although not married "according to the law of England;" and there was a proviso, that nothing therein contained should be construed to make good or effectual in law any such marriage or pretended marriage; but that they should be of the same force, and no other, as if the said act had not been made. But in the act of 26 Geo. II. c. 33. there is no proviso of the like purport; but rather the act proceeds upon a supposition that such marriages are good and valid.

In writs of dower, or other suits brought in the king's temporal courts, if issue be joined upon "not accoupled in lawful matrimony," this being a cause which is merely ecclesiastical, the trial thereof must be by the bishop or ordinary, upon an inquisition taken before him as judge.

The proof of a marriage may be by witnesses who were present at the solemnization; by cohabitation of the parties; by public fame and reputation; by confession of the married persons themselves, although their acknowledgment might only be to avoid the punishment of fornication; and by divers other circumstances; which, if they amount to half-proof, ought to be extended in favour of marriage rather than contrary to it. (Wood Civ. L. 122.) But now, since the 26 Geo. II. c. 33, the register-book seems to be intended as the proper, although not the only evidence in this matter; for if there shall be any doubt as to the identity of the persons, or the like, the register in this respect can be no evidence at all. However, the act does not take away the evidence of presumption from cohabitation; but if the evidence be clear that the marriage was not celebrated according to the requisitions of the act, it is totally void, and no declaratory sentence in the ecclesiastical court is necessary. But in some cases an actual marriage must be proved. See Burn's Eccl. Law. vol. ii art. MARRIAGE.

MARRIAGE, *Proof of* See the preceding article.

MARRIAGE, *Property by*, is a property in goods and chattels acquired by marriage; whereby those chattels, which belonged formerly to the wife, are by act of law vested in the husband, with the same degree of property, and with the same powers, as the wife, when sole, had over them. This depends entirely on the notion of an unity of person between the husband and wife; it being held that they are one person in law; so that the very being and existence of the woman is suspended during the coverture, or entirely merged or incorporated in that of the husband. (See COVERTURE.) Hence it follows, that whatever personal property belonged to the wife before marriage, is, by marriage, absolutely vested in the husband. In a real estate, he only gains a title to the writs and profits during coverture; for that, depending upon feodal principles, remains entire to the wife, after the death of her husband, or to her heirs, if she dies before him; unless, by the birth of a child, he becomes tenant for life by the curtesy. But, in chattel interests, the sole and absolute property vests in the husband, to be disposed of at his pleasure, if he chuses to take possession of them; for unless he reduces them to possession, by exercising some act of ownership upon them, no property vests in him, but they shall remain to the wife, or her representatives, after the coverture is determined.

There is therefore a very considerable difference in the acquisition of this species of property by the husband, according to the subject matter; *viz.* whether it be a chattel *real*, or a chattel *personal*; and, of chattels personal, whether it be in *possession*, or in *action* only. A *chattel real* vests in the husband,

husband, not absolutely, but *sub modo*. As, in case of a lease for years, the husband shall receive all the rents and profits of it, and may, if he pleases, sell, surrender, or dispose of it during the coverture (Co. Litt. 46.): if he be outlawed or attainted, it shall be forfeited to the king (Plowd. 263.); it is liable to execution for his debts (Co. Litt. 351.): and, if he survives his wife, it is to all intents and purposes his own. (Co. Litt. 300.) Yet, if he has made no disposition thereof in his life-time, and dies before his wife, he cannot dispose of it by will (Poph. 5. Co. Litt. 351.): for, the husband having made no alteration in the property during his life, it never was transferred from the wife; but after his death she shall remain in her ancient possession, and it shall not go to his executors. So it is also of chattels personal (or *choses*) in *action;* as debts upon bond, contracts, and the like: these the husband may have if he pleases; that is, if he reduces them into possession by receiving or recovering them at law. And, upon such receipt or recovery, they are absolutely and entirely his own; and shall go to his executors or administrators, or as he shall bequeath them by will, and shall not revest in the wife. But, if he dies before he has recovered or reduced them into possession, so that at his death they still continue *choses in action*, they shall survive to the wife; for the husband never exerted the power he had of obtaining an exclusive property in them. (Co. Litt. 351.) And so, if an estray comes into the wife's franchise, and the husband seises it, it is absolutely his property: but, if he dies without seising it, his executors are not now at liberty to seise it, but the wife or her heirs (Co. Litt. 351.); for the husband never exerted the right he had, which right determined with the coverture. Thus in both these species of property the law is the same, in case the wife survives the husband; but, in case the husband survives the wife, the law is very different with respect to *chattels real* and *choses in action:* for he shall have the *chattel real* by survivorship, but not the *chose in action* (3 Mod. 186.); except in the case of arrears of rent, due to the wife before her coverture, which, in case of her death, are given to the husband by statute 32 Hen. VIII. c. 37. And the reason for the general law is this: that the husband is in absolute possession of the *chattel real* during the coverture, by a kind of joint-tenancy with his wife; wherefore the law will not wrest it out of his hands, and give it to her representatives; though, in case he had died first, it would have survived to the wife, unless he thought proper in his life-time to alter the possession. But a *chose in action* shall not survive to him, because he never was in possession of it at all, during the coverture; and the only method he had to gain possession of it, was by suing in his wife's right: but as, after her death, he cannot (as husband) bring an action in her right, because they are no longer one and the same person in law, therefore he can never (as such) recover the possession. But he still will be entitled to be her administrator; and may, in that capacity, recover such things in action as became due to her before or during the coverture.

Thus, and upon these reasons, stands the law between husband and wife, with regard to *chattels real* and *choses in action:* but as to *chattels personal* (or *choses*) *in possession*, which the wife hath in her own right, as ready money, jewels, household goods, and the like, the husband hath therein an immediate and absolute property, devolved to him by the marriage, not only potentially but in fact, which never can again revest in the wife or her representatives. Co. Litt. 351.

And, as the husband may thus generally acquire a property in all the personal substance of the wife, so in one particular instance the wife may acquire a property in some of her husband's goods; which shall remain to her after his death, and not go to his executors. These are called her *paraphernalia;* which see. Blackst. Com. b. ii.

MARRIAGE *of the Royal Family* is excepted from the act 26 Geo. II. c. 33. (See MARRIAGE.) But by the 12 Geo. III. c. 11. no descendant of his late majesty Geo. II. (other than the issue of princesses married or who may marry into foreign families) shall be capable of contracting matrimony, without the previous consent of his majesty, his heirs, &c. signified under the great seal, declared in council, and entered in the privy-council books: and every marriage of any such descendant, without such consent, shall be null and void But in case any descendant of Geo. II., being above 25 years old, shall persist to contract a marriage disapproved of by his majesty, such descendant, after giving 12 months notice to the privy council, may contract such marriage, and the same may be duly solemnized, without the previous consent of his majesty. And such marriage shall be good except both houses of parliament shall, before the expiration of the said 12 months, declare their disapprobation of such intended marriage. And persons who shall wilfully solemnize, or assist at the celebration of such prohibited marriage, shall, on conviction, incur the penalties of the statute of *præmunire*, 16 R. II.

MARRIAGE *Settlement*, is a legal act, previous to marriage, whereby a jointure is secured to the wife after the death of the husband. (See JOINTURE.) These settlements seem to have been in use among the ancient Germans, and their kindred nation the Gauls. Of the former Tacitus gives us this account: "Dotem non uxor marito, sed uxori maritus, affert: intersunt parentes et propinqui, et munera probant." De Mor. Germ. c. 18. And Cæsar, De Bell. Gallic. lib. vi. c. 18. has given us the terms of a marriage settlement among the Gauls, as nicely calculated as any modern jointure. "Viri, quantas pecunias ab uxoribus dotis nomine acceperunt, tantas ex suis bonis, æstimatione facta, cum dotibus communicant. Hujus omnis pecuniæ conjunctim ratio habetur, fructusque servantur. Uter eorum vita superavit, ad eum pars utriusque cum fructibus superiorum temporum pervenit." The dauphin's commentator supposes that this Gaulish custom was the ground of the new regulations made by Justinian, Nov. 97. with regard to the provision for widows among the Romans; but surely there is as much reason to suppose, says judge Blackstone, that it gave the hint for our statutable jointures. Comm. vol. ii. p. 138.

See an excellent marriage settlement by Blackstone, in the Appendix to the second volume of his Commentaries.

MARRIAGE, in *Socage-tenure*, or *valor maritagii*, was not any perquisite or advantage to the guardian, but rather the reverse. For, if the guardian married his ward under the age of 14, he was bound to account to the ward for the value of the marriage, even though he took nothing for it, unless he married him to advantage. (Litt. § 123.) For the law, in favour of infants, is always jealous of guardians, and therefore in this case it made them account, not only for what they *did*, but also what they *might*, receive on the infant's behalf; but by some collusion the guardian should have received the value, and not brought it to account; but the statute (12 Car. II. c. 24.) having destroyed all values of marriages, this doctrine of course has ceased with them. At 14 years of age the ward might have disposed of himself in marriage, without any consent of his guardian, till the act (26 Geo. II. c. 33.) for preventing clandestine marriages. These doctrines of wardship and marriage in socage-tenure were so diametrically opposite to those in knight-service, and so entirely agree with those

parts

parts of king Edward's laws, that were reftored by the charter of Henry I., as might alone convince us that focage was of a higher original than the Norman conqueft. See GUARDIAN. SOCAGE, and WARDSHIP.

MARRIAGE *Vow* denotes the mutual promife made to one another by the hufband and wife at the time of the folemnization of marriage. The hufband promifes on his part "to love, comfort, honour, and keep his wife;" the wife on her's "to obey, ferve, love, honour, and keep her hufband;" in every variety of health, fortune, and condition; and both ftipulate "to forfake all others, and to keep only to one another, fo long as they both fhall live." This promife is witneffed before God and the congregation; accompanied with prayers to Almighty God for his bleffing upon it; and attended, according to the form eftablifhed in this country, with fuch circumftances of devotion and folemnity as place the obligation of it, and the guilt of violating it, nearly upon the fame foundation with that of oaths. The Chriftian Scriptures enjoin upon the wife, that obedience which fhe here promifes, and in terms fo peremptory and abfolute, that it feems to extend to every thing not criminal, or not entirely inconfiftent with the woman's happinefs. "Let the wife," fays St. Paul, "be fubject to her own hufband in every thing." "The ornament of a meek and quiet fpirit (fays the fame apoftle, fpeaking of the duty of wives) is in the fight of God of great price." No words ever expreffed the true merit of the female character fo well as thefe. The man who does not duly regard the end of the inftitution, and who is confcious at the time of his marriage, of fuch a diflike to the woman he is about to marry, or of fuch a fubfifting attachment to fome other woman, that he cannot reafonably ever hope to entertain an affection for his future wife, is guilty, when he pronounces the marriage vow, of a direct and deliberate prevarication; aggravated by thofe ideas of religion and of the fupreme being, which the place, the ritual, and the folemnity of the occafion cannot fail of fuggefting. The fame is true likewife with refpect to the woman. The charge, fays Paley, muft be imputed to all, who, from mercenary motives, marry the objects of their averfion and difguft; and likewife to thofe who defert, from any motive whatever, the object of their affection, and, without being able to fubdue that affection, marry another. The crime of falfehood is alfo incurred by the man who intends, at the time of his marriage, to commence, renew, or continue a perfonal amour with any other woman; and if a wife be capable of fo much guilt, the parity of reafon extends to her. The marriage vow is violated by adultery, and alfo by any behaviour which, knowingly, renders the life of the other miferable; as defertion, neglect, prodigality, drunkennefs, peevifhnefs, penurioufnefs, jealoufy, or any levity of conduct, which adminifters occafion of jealoufy. Paley's Principles of Mor. and Pol. Philof. vol. i.

MARRIAGE, *Maritagium*, in *Law*, fignifies not only the lawful joining of man and wife, but alfo the right of beftowing a ward, or widow, in marriage; as well as the land given in marriage. See MARITAGIUM.

MARRICA, CAPE, in *Geography*, a cape on the S.E. coaft of Arabia. N. lat. 18° 30'. E. long. 56° 25'.

MARRIONA, a bay of the ifland of Antigua; two miles S. of Willoughby bay.

MARRO, a river of Naples, which runs into the fea; eight miles S. of Nicotera.

MARROQUIN, vulgarly *Morocco leather*. See MOROCCO.

MARROSSE, in *Geography*, an ifland in the Eaft Indian fea, near Antongil bay, in the ifland of Madagafcar. This ifland affords plenty of lemons and pine apples, with an ample fupply of fruit, fowls, and frefh meat.

MARROW, a foft oleaginous fubftance contained in the cavities of the bones. See BONE and MEDULLA.

MARROW, *Spinal*. See MEDULLA *Spinalis*.

MARROWS, in *Agriculture*, a provincial word ufed to fignify fellows in fpeaking of cattle, as oxen, &c.

MARRUBIASTRUM, in *Botany*. See BALLOTA, LEONURUS, and STACHYS.

MARRUBIUM is fuppofed to have been fo called by the ancients from its having been originally found in the neighbourhood of *Marrubium*, a town of the Marfyans in Italy, eaftward of the lake Fucinus. Ambrofinus records various other conjectures as to the origin of this name. Some authors having fuppofed it derived from *mare*, the fea, becaufe a native of maritime fituations; fome have thought it was named from its bitter properties; *amarus*, bitter; and others have imagined its name to have been fuggefted by the withered appearance of its leaves, which feem as if they were corroded with ruft, *rubigo*.—Thefe ideas afford rather a prefumption that nothing is really known about the matter.—Horehound. Linn. Gen. 294. Schreb. 391. Willd. Sp. Pl. v. 3. 109. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 636. Ait. Hort. Kew. ed. 2 v. 3. 402. Tournef. t. 91. Juff. 114. Lamarck Illuftr. t. 508 (Pfeudodictamnus; Tournef. t. 89) Clafs and order, *Didynamia Gymnofpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Tournef. and Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, falver-fhaped, rigid, ten-ftreaked; its mouth equal, fpreading, moftly ten-toothed; the teeth alternately fmaller. *Cor.* of one petal, ringent; tube cylindrical; limb gaping; throat long, tubular: upper lip erect, linear, cloven, acute, lower lip reflexed, broader, cloven half way down into three fegments, of which the middle one is broader and emarginate, the others acute. *Stam.* Filaments four, fhorter than the corolla, concealed under the upper lip, two of them longer; anthers fimple. *Pift.* Germen fuperior, four-cleft; ftyle thread-fhaped, in length and pofition like the ftamens; ftigma cloven. *Peric.* none, except the calyx, which is contracted at the neck, expanded at the mouth, including the feeds. *Seeds* four, rather oblong.

Eff. Ch. Calyx falver-fhaped, rigid, with ten furrows. Upper lip of the corolla cloven, linear, ftraight.

Obf. The following variations in the generic character of *Marrubium* are noticed by Linnæus and Schreber; thefe authors obferve that the *Marrubium* of Tournefort and *Pfeudodictamnus* of the fame author differ from each other in this refpect, the former having the upper lip of its corolla *erect*, and the latter *vaulted*. Some fpecies of this genus have only five calyx-teeth. *M. crifpum* has an entire upper lip, whilft *M. hifpanicum* has the upper lip of its corolla three or four-cleft.

A very natural divifion of *Marrubium* into two fections is afforded from the number of calyx-teeth being either five or ten. Linnæus defcribed eleven fpecies in the fourteenth edition of his *Syftema Vegetabilium*, and Willdenow has added three more; namely, *M. creticum*, which Linnæus confidered a variety of *peregrinum*, *M. catariæfolium*, and *hirfutum*. There is alfo a beautiful new fpecies in the *Flora Græca* called *velutinum*.

Sect. 1. Calyx with five teeth.

1. M. *Alyffum*. Galen's Madwort. Plaited-leaved White-Horehound. Linn. Sp. Pl. 815. (Alyffum Galeni; Ger. em. 465.)—Leaves wedge-fhaped, five-toothed, plaited. Whorls without an involucrum.—Native of Spain and Italy, flowering in July and Auguft.—*Root* perennial. *Stem* branched,

branched, rigid. *Leaves* oppoſite, hoary, bluntly toothed. *Flowers* purple, in ſmall, looſe whorls. The ſegments of the calyx ſpreading, and ending in very ſtiff prickles.—Linnæus ſays that there are three ſmall purple flowers on each ſide, and that the calyx is acute, with ſpreading teeth. Willdenow quotes *M. plicatum* of Forſkhal as a ſynonym of *M. Alyſſum*, and Vahl ſays it ſcarcely differs from it, except that the former has ten-flowered whorls, (which is ſometimes the caſe with the latter) the herbage is white with wool, and the leaves leſs wedge-ſhaped and rounder.

2. M. *aſtracanicum*. Aſtracan White-Horehound. Linn. Syſt. Veg. ed. 14. 537. Jacq. Ic. Rar. v. 1. t. 109.—Leaves ovate, crenate, downy, very rugoſe. Calyx-teeth awl-ſhaped. Upper ſegments of the corolla lanceolate and acute. Found at Aſtracan and in the Eaſt.—It flowers in May.—*Primary ſtems* perennial, numerous, half a foot in length, branched and decumbent; from theſe ſpring other *ſtems* annually, which are herbaceous, erect, a foot high, woolly and hoary. *Leaves* on ſtalks, wrinkled on both ſides, ſoft and bitter, the younger ones extremely woolly. *Flowers* ſeſſile, in whorls, of a beautiful blue colour.

3. M. *peregrinum*. Sicilian White-Horehound. Linn. Sp. Pl. 815. Jacq. Auſtr. v. 2. t. 160.—Leaves ovate-lanceolate, ſerrated. Calyx-teeth briſtle-ſhaped.—A native of Sicily, Germany, and the Levant, flowering through the ſummer.—*Root* perennial, woody, branched. *Stems* near two feet high, erect or aſcending, quadrangular, woolly below. *Leaves* oppoſite, on ſtalks, acute, veined, ſerrated, ſome of the upper ones entire. *Flowers* white, rather villoſe. *Seeds* black, furniſhed with white hairs. The plant has not much ſmell, but a bitter and ſomewhat acrid taſte. It is called Σάρομα by the modern Greeks.

4. M. *Creticum*. Cretan White-Horehound. Willd. n. 4. Sm. Prod. Fl. Græc. p. 2. 412. Dalech. Hiſt. 962.—Leaves lanceolate, whitiſh, rugoſely veined, toothed at the top. Calyx-leaves briſtle-ſhaped. Stem branched, divaricated.—A native of the Levant, flowering from July to September.—Linnæus conſidered this ſpecies merely as a variety of the laſt, calling it *peregrinum* β, and profeſſor Martyn has done the ſame.—We are however inclined to follow Dr. Smith in conſidering it as a diſtinct ſpecies. *Stems* ſlender, hoary, near three feet high. *Leaves* very hoary, much longer and narrower than thoſe of the preceding: the *whorls of flowers* are ſmaller; and the briſtly indentures of the calyx longer and erect. The whole plant has an agreeable flavour.

5. M. *candidiſſimum*. Woolly White Horehound. Linn. Sp. Pl. 816. (M. folio rotundo candidiſſimo; Dill. Elth. 218. t. 174. f. 214.)—Leaves ovate, obtuſe, toothed, rugoſely veined. Calyx-teeth awl-ſhaped. Stem ſomewhat branched at the baſe.—A native of the Levant, flowering from June to September.—*Stems* from twelve to eighteen inches in length, procumbent below, obtuſely ſquare, and villoſe. *Leaves* thick, pale-green, and hoary. *Flowers* terminal, white, in cloſe whorls.

6. M. *ſupinum*. Procumbent White Horehound. Linn. Sp. Pl. 816. (M. album, ſericeo parvo et rotundo folio; Boccon. Muſ. 78. t. 96.)—Leaves roundiſh, rather heart-ſhaped, notched. Calyx-teeth briſtly, ſtraight, woolly.—A native of Spain and the ſouth of France. It flowers from Auguſt to October.—*Stems* about eight or nine inches long, covered with a ſoft hoary down. *Leaves* ſmall, roundiſh, very ſoft, and hoary. *Flowers* white, in ſmall downy whorls.

7. M. *catariæfolium*. Cat-Mint White Horehound. Willd. Sp. Pl. v. 3. 110. Lamarck Dict. v. 3. 771. (M. orientale catariæ folio flore albo; Tourn. Cor. 12.)—Leaves ovate, deeply notched. Calyx-teeth awl-ſhaped, ſmooth, ſpreading.—A native of the Eaſt. *Stem* branched, erect, one or two feet high, ſquare, rather downy. *Leaves* much reſembling thoſe of *Nepeta Cataria*, oppoſite, on ſtalks, green above, paler beneath. *Flowers* white, many in a whorl.

8. M. *velutinum*. Velvet-White Horehound. Sm. Prod. Fl. Græc. p. 2. 412. Fl. Græc. t. 561.—Leaves roundiſh, retuſe, ſilky, rugoſe, crenate. Calyx-teeth ſpreading. Stem branched. Found by Dr. Sibthorp on Mount Parnaſſus.—The habit of this new ſpecies is very ſimilar to that of M. *vulgare*, next to be deſcribed. *Stems* about two feet high, woolly, erect, and ſtraight. *Leaves* oppoſite, on ſhort ſtalks. *Flowers* very numerous, in cloſe whorls, their tube whitiſh; upper lip pale; lower of a tawny yellow, bordered with brown.

Sect. 2. Calyx with ten teeth.

9. M. *vulgare*. White Horehound. Linn. Sp. Pl. 816. Engl. Bot. t. 410. Woodv. Med. Bot. t. 97.—Teeth of the calyx ten, briſtle-ſhaped, hooked.—Common in various parts of England, on waſte ground, and among rubbiſh, in hot, dry, duſty ſituations; flowering late in the ſummer.—*Root* perennial and woody. *Stems* a foot and half high, covered with thick wool. *Leaves* oppoſite, on footſtalks, rounded, notched, rugoſe, whitiſh, very woolly on the lower ſide. *Flowers* white, in numerous, ſeſſile whorls, which are extremely hairy. *Bracteas* briſtle-ſhaped, bearded, hooked. The whole herb is aromatic and bitter.

10. M. *africanum*. African White Horehound. Linn. Sp. Pl. 816. (Pſeudo-Dictamnus africanus, foliis ſubrotundis ſubtùs incanis; Commel. Hort. v. 2. 179. t. 90.)—Leaves heart-ſhaped, roundiſh, deeply crenate.—A native of the Cape of Good Hope, flowering from July to September.—*Root* perennial. *Stem* two feet high, upright, branched, rather downy, grooved. *Leaves* wrinkled, downy. *Flowers* whorled, white, ſhorter than the calyx; whorls remote.

11. M. *criſpum*. Curl-leaved White Horehound. Linn. Sp. Pl. 1674. (Marrubium dictamni ſpurii foliis et facie; Herm. Parad. t. 200.)—Leaves heart-ſhaped, roundiſh, notched, or rather toothed. Calyx-teeth beardleſs.—Native of the ſouth of Europe, Italy, Sicily, and Spain, flowering through the ſummer.—*Stem* rather ſhrubby, upright, rough with hairs. *Leaves* on ſtalks, much wrinkled, downy, hairy beneath. *Corolla* purpliſh, not hairy.—Willdenow obſerves that M. *criſpum* does not exactly agree with the ſynonym of Hermann, his plant having the upper lip of its corolla lanceolate and bearded, as well as its ſtamens of an equal length with the lip.—The laſt ſpecies (M. *africanum*) differs from the preſent by the helmet or upper lip of its corolla being emarginate and hairy.

12. M. *hirſutum*. Hairy White Horehound. Willd. n. 11.—Leaves heart-ſhaped, ovate, notched. Teeth of the calyx ſpreading and lanceolate. Bracteas awl-ſhaped.—We know nothing of this ſpecies but from Willdenow, who has ſeen a living ſpecimen, and ſays that it is very cloſely allied to the following in foliage and habit, but different as to the *calyx* and *bracteas*.

13. M. *hiſpanicum*. Spaniſh White Horehound. (Linn. Sp. Pl. 816. M. album rotundifolium hiſpanicum; Herm. Parad. t. 201.)—Leaves heart-ſhaped, notched, ovate. Border of the calyx ſpreading; teeth ovate, pointed. Bracteas oblong.—A native of Spain, where it flowers in the ſummer.—*Stems* erect, downy. *Leaves* wrinkled and downy, more round and ſerrated than in M. *vulgare*. The whole plant is extremely hoary. Linnæus remarks that the *leaves* are roundiſh, flat, and crenate; the upper lip of the *corolla*

corolla trifid or quadrifid; the teeth of the *calyx* alternately larger and fmaller.

14. M. *Pfeudo-Dictamnus.* Shrubby White Horehound. Linn. Sp. 817. (Pfeudo-Dictamnum; Dod. Pempt. 281.)—Calyx-border flat and hairy. Leaves heart-fhaped, concave. Stem fhrubby. A native of the ifland of Candia. Found alfo by Dr. Sibthorp in other iflands of the Archipelago.—It flowers from June to Auguft.—*Stem* two or three feet high, divided into many branches. *Leaves* fmall, growing very clofe to the ftalks. *Flowers* whorled, of a white colour; whorls refembling thofe of M. *crifpum*, but not fo large. The whole plant very hoary, covered with a fort of denfe compact cottony fubftance.—This fpecies is the Ψευδοδικταμνος of Diofcorides, and is called in Englifh the falfe Dittany of Crete, from its general refemblance to *Origanum Dictamnus.*

15. M. *acetabulofum.* Saucer-like White Horehound. Linn. Sp. Pl. 817. (Dictamnus falfus verticillatus, pericarpio conoide, bæticus; Barrel. It. t. 129.)—Calyx-border longer than the tube, membranaceous, the greater angles rounded.—A native of Crete, introduced by fir George Wheeler into this country in 1676. Its time of flowering exactly coincides with the laft.—*Stems* about two feet high, hairy. *Leaves* heart-fhaped, ferrated, rough on their upper fide, downy beneath. *Flowers* fmall, of a pale purple, in large whorls.—Dr. Sibthorp found this fpecies in Crete, but not in any other of the Grecian iflands. It was known to Diofcorides, who called it Ἑτερος απο Κρητης δικταμνος.

The genus now defcribed is compofed of many curious and interefting fpecies to the botanift, though only a few of them find a place in our gardens. Thofe which are cultivated as fhrubs, efpecially the two laft, from the hoarinefs of their foliage, make a pretty variety when intermixed with other plants.—M. *velutinum*, which is one day to appear in the *Flora Græca*, is entirely new, and we have adopted it from the Prodromus to that work.

Marrubium, in *Gardening*, comprifes plants of the fhrubby kind, of which the fpecies cultivated are, the fhrubby white horehound (M. Pfeudo-Dictamnus); and the faucer-leaved white horehound (M. acetabulofum).

Method of Culture.—Thefe forts of plants are capable of being increafed by planting cuttings of the young fhoots or branches in a fhady border in the early fpring, as about April. When the plants are well rooted, they may be removed into the places where they are to grow: when they grow ftrongly, they fhould be fcreened from hard frofts in winter.

They continue the longeft in poor dry foils, from their having a lefs luxuriant growth in fuch cafes.

Thefe plants afford variety in the borders, clumps, &c. of pleafure-grounds, and other fituations.

Marrubium, in *Ancient Geography*, a town of Italy, and capital of the Marfi; feated on the E. bank of the lake Fucinus. The inhabitants of this town, as well as the Marfi, in general, were famous for difregarding and healing the bites of ferpents, and for being excellent fwimmers. Its ruins at St. Benedotto, prefent to the inveftigation of the curious an arena, and traces of the circuit of a fpacious amphitheatre.

Marrubium, in the *Materia Medica.* See Horehound.

MARRUCINI, in *Ancient Geography*, a people of Italy, in the Adriatic gulf, between the Veftini and the Frentani. Their country was watered by the Aternus. In their origin they were Sabines. Their principal town was Teate, feated on a mountain.

MARS, in *Aftronomy*, one of the primary planets in our folar fyftem; its orbit is fituated between thofe of the Earth and Jupiter. It evidently owes its name to its fiery appearance, which is fuppofed, with much probability, to be derived from its own atmofphere, the exiftence of which is indicated with more certainty than in any other planet.

Befides the ruddy colour of Mars, we have another argument of his being encompaffed with an atmofphere; and it is this: that, when any of the fixed ftars are feen near his body, they appear extremely obfcured, and almoft extinct. If this be the cafe, an eye placed in Mars would fcarcely ever fee Mercury, unlefs, perhaps, in the fun at the time of conjunction, when Mercury paffes over his difk, as he fometimes appears to us, in form of a fpot. A fpectator in Mars will fee Venus about the fame diftance from the fun as Mercury appears to us; and the Earth as big as Venus appears to us, and never above 48 degrees from the fun: and when the Earth is found in conjunction with, and very near the fun, he will fee the Earth appear horned, or falcated, and its attendant the moon of the fame figure, and, at its utmoft diftance from the Earth, not above 15 minutes of a degree, though they are really two hundred and forty thoufand miles afunder. This planet being but a fifth part fo big as the Earth, if any moon attends him, fhe muft be very fmall, and has not yet been difcovered by our beft telefcopes.

The telefcopic appearance of Mars is very variable; but the predominant brightnefs of the polar regions leads to the fuppofition that its poles, like thofe of the Earth, are covered with perpetual fnow; and Dr. Herfchel imagines that the changes in brightnefs are connected with the fummer and winter feafons on that planet. In the year 1784, he publifhed in the Philofophical Tranfactions, vol. lxxiv., an account of a very laborious inveftigation of all the circumftances relating to the telefcopic phenomena of this planet, and concludes by giving the following refult:

1. The axis of Mars is inclined to the ecliptic 59° 42′.
2. The node of its axis is in 17° 47′ of Pifces.
3. The obliquity of the ecliptic on the globe of Mars is 28° 42′.
4. The point Aries of the ecliptic of Mars anfwers to our 19° 28′ of Sagittarius.
5. The figure of Mars is that of an oblate fpheroid, whofe equatorial diameter is to the polar one as 1355 to 1272, or as 16 to 15 nearly.
6. The equatorial diameter of Mars reduced to the mean diftance of the earth from the fun, is 9″ 8‴.
7. This planet has a confiderable, but moderate atmofphere, fo that its inhabitants probably enjoy a fituation in many refpects fimilar to ours.

Dr. Hook, in 1665, obferved feveral fpots in Mars; which, having a motion, he concluded the planet to turn round its centre. In 1666, M. Caffini obferved feveral fpots in the two faces or hemifpheres of Mars, which, by continuing his different obfervations very diligently, he found to move by little and little from eaft to weft, and to return, in the fpace of 24 hours 40 minutes, to their former fituation. Thefe obfervations were repeated in 1670, and confirmed by Maraldi, 1704 and 1719. Whence both the motion and period, or natural day, of that planet, were determined.

Plate XVII. *Aftronomy, fig.* 2, reprefents the appearance of the two luminous fpots, which, by an optical illufion, feem to project beyond the circumference of the difk. Mars feems to move from weft to eaft round the earth: the mean length of a fiderial revolution is 1ʸ 321ᵈ 23ʰ 30′ 35″.6. Its motion is very unequal: when it begins to be vifible in the morning, it is direct and moft rapid; it becomes gradually flower, and when the planet arrives at about 136° 48′ from the fun, it is ftationary; the motion then becomes retrograde, increasing in velocity till the moment of opposition of the planet with the sun.

This velocity then becomes a maximum, diminishes and again becomes nothing when Mars approaching the sun is distant from it 136° 48′. Its motion then becomes again direct, after having been retrograde during 73 days, and in this interval the planet describes an arc of retrogradation of about 16° 12′. Continuing to approach the sun, it finishes by immerging in the evening in its rays. These singular phenomena are renewed at every opposition of Mars, but with a considerable difference as to the extent and duration of these retrogradations.

Mars does not move exactly in the plane of the ecliptic, but deviates occasionally several degrees. The variations in its apparent diameter are very great. It is about 10″ in its mean state, and augments to 29″1. as the planet approaches its opposition. At this time the parallax of Mars becomes sensible, and is nearly double that of the sun. The same law which exists between the parallaxes of the sun and Venus, exists likewise between the sun and Mars, and the observation of this last parallax had given a very near approximation of the solar parallax before the transit of Venus had ascertained it with greater precision.

The disk of Mars changes its form, and becomes sensibly oval according to the relative position of the sun. These phases shew that it is from the sun it receives its light. From the observation of spots distinctly seen on its surface, it is inferred that it moves on itself from west to east, in a period of $1^d\ 0^h\ 44'\ 45''.3$. From observations made by Dr. Herschel in 1779, he concludes that the sidereal revolution of Mars cannot well be less than $24^h\ 39'\ 5''$, nor more than $24^h\ 39'\ 22''$.

The mean diameter of Mars is about 4000 miles, or nearly half that of the earth.

Its character is ♂. Its mean distance from the sun is 1.52369 of those parts, whereof the distance of the sun from the earth is 1.00000; its excentricity 14,218; and its real distance 145,014,148 miles; its mean distance from the sun in semi-diameters of the earth 36,262: the periodical time, in which it makes its revolutions round the sun, is 686 days 23 hours; which is the length of his year, and contains $667\frac{3}{4}$ of his days; every day and night together being 40 minutes longer than with us; and its revolution about its own axis is performed in 24 hours 40 minutes nearly. Its proportion of light, that of the earth being 1, is .43; proportion of bulk, that of the sun being 1,380,000, is $\frac{7}{24}$; and of density, that of the sun being $\frac{1}{4}$, is $\frac{7}{16}$.

In the acronical rising of this planet, that is, when it is in opposition to the sun, it is found five times nearer to us than when in conjunction with him; and, therefore, he appears so much bigger and brighter at one time than another.

Mars, having his light from the sun, and revolving round it, has an increase and decrease like the moon: it may also be observed almost bisected, when in its quadratures with the sun, or in his perigæon; but never is seen corniculated, or falcated, as the inferior planets; which both shews that his orbit includes the earth's within it, and that he shines not by his own light. The phases of Mars were first discovered by Galileo.

This planet's distance from the sun is to the distance of the earth and sun, as $1\frac{1}{2}$ to 1; so that a man, placed in Mars, would see the sun's diameter less by one-third than it appears to us; and, consequently, the degree of light and heat, which Mars receives from the sun, is less than that received by the earth, in the proportion of 4 to 9. This proportion, however, will admit of a sensible variation, on account of the great excentricity of this planet.

For the other elements of the orbit of this planet, the reader is referred to the article PLANET.

Mars, among *Alchemists*, signifies iron; because imagined to be under the influence of that planet. See Iron.

Mars *Saccharatus*. See Iron.

Mars *Sulphuratus*. See Iron.

Crocus Martis, rust of iron. See Crocus *martis*, and Iron.

Mars, *Crystals of*. See *Sulphat of* Iron.

Mars, called *Ares* by the Greeks, in *Mythology*, the god of war, the son of Jupiter and Juno, according to Homer and the other Greek poets, or, as Ovid tells the story, of Juno alone; she being displeased that Jupiter should have a daughter Minerva, without female aid: being therefore a son of discontent, he was made the god of war and strife. He had a sister called Bellona, the goddess of war.

Among the ancients, there were several princes of this name. The first, to whom Diodorus attributes the invention of arms, and the art of marshalling troops in battle, was the Belus, whom the scripture calls Nimrod, the mighty hunter (Gen. v.), who, after having practised his skill upon wild beasts, turned it against men; and having subdued a great number of them, declared himself their king. The second Mars was an ancient king of Egypt. The third was king of Thrace, called Odin, distinguished by his valour and conquests, and promoted to the honour of god of war, and called the Hyperborean Mars. The fourth is called the Mars of Greece, surnamed Ares. The fifth, and last, is the Mars of the Latins, who entered into the prison of Rhea Sylvia, and begat upon her Romulus and Remus. In fine, the name of Mars was given to most warlike princes, and every country valued itself on having one, as well as a Hercules. Accordingly we find one among the Gauls under the name of Hesus; and, it is said by Lucian and Lactantius, that these ancient people sacrificed to him human victims. We find a Mars also among the Scythians. The Greeks threw into the history of their Mars the adventures of all that have been now named. Arnobius represents the Mars of Greece as merely a deified man.

Although Mars was worshipped in several places, yet he was no where in such high veneration as at Rome, where he had several temples; among which, that dedicated to him by Augustus after the battle of Philippi, under the name of Mars the Avenger, was one of the most celebrated.

He had for his priests the *salii* and *flamines*, who from him were called *Martiales*. They sacrificed asses to him, on account of the harsh dissonance of their voice. The vulture was a bird sacred to him, from their always flying to those places where armies are going to engage, and bloodshed is to be expected. The usual attributes of Mars are the helmet and spear, which he does not lay aside, even when he is going on his amours. Several of the old Roman poets of the first age speak of a wife of Mars, called Neriene, signifying, according to some, *mildness*, and given to him in order to soften and humanize the roughness of his temper; but we find no traces of her in their later poets. The temples of Mars were of the Doric order, and usually placed without the walls; hereby denoting that this deity was to preserve the walls from the perils of war.

Mars, *Games of*, *ludi Martiales*, were combats instituted at Rome in honour of the god Mars.

They were held twice in the year; once in the Circus, on the fourth of the ides of May; and a second time on the first of August. These latter were established some time after the other, in memory of the dedication of the temple of Mars on that day. These games consisted in courses of horses, and combats with wild beasts. Germanicus is said to have killed two hundred lions in the Circus, on these occasions. See Field *of Mars*.

Mars *Diep*, in *Geography*, a road for shipping, at the entrance of the Zuyder see from the German ocean, between the coast of Holland and the Texel.

Mars *la Tour*, a town of France, in the department of the Moselle; 11 miles W.S.W. of Metz.

MARSA, in *Ancient Geography*, a town of Pannonia, near which the emperor Constantius gave battle to Magnentius, who had assumed the title of emperor of the Gauls.

Marsa, in *Geography*, a town of Africa, in the kingdom of Tunis; 10 miles N.E. of Tunis.

MARSAC, a town of France, in the department of the Puy de Dome; 30 miles N. of Le Puy.

MARSAGLIA, a town of France, in the department of the Stura; six miles N.E. of Mendovi.

MARSAL, a town of France, in the department of the Meurte; 17 miles E.N.E. of Nancy. N. lat. 48° 48'. E. long. 6° 41'.

MARSALA, a sea-port town on the W. coast of the island of Sicily, erected on the scite of the ancient *Lilybæum*, which see.—Also, the name of a river, which runs into the sea, about a mile S. from the town of Marsala.

MARSAN, a small country of France, before the revolution, of which Monte de Marsan was the capital: now a part of the department of the Landes.

MARSANA Buxifolia, in *Botany*, Sonnerat Voy. aux Ind. Orient. v. 2. 245. t. 139, so named by that author as a compliment to the *Princesse de Marsan*, governess of the royal children of France, is no other than *Murraya exotica* of Linnæus. See Murraya.

MARSANNE, in *Geography*, a town of France, in the department of the Drome, and chief place of a canton, in the district of Montelimart; eight miles N.N.E. of Montelimart. The place contains 1075, and the canton 6177 inhabitants, on a territory of 212½ kiliometres, in 14 communes.

MARSAQUIVER, or Marsalquiver, a sea-port of Algiers, on the coast of the Mediterranean, belonging to the Spaniards, who took it in the year 1732; three miles from Oran.

MARSCH, or Mark, a river which rises in the S. part of the county of Glatz, soon after enters Moravia, passes by Littau, Olmutz, Hradisch, &c. and runs into the Danube, at the boundaries of Austria and Hungary, six miles above Presburg, and 32 below Vienna.

MARSCIANO, a town of Italy, in the Perugiano; 22 miles S.S.W. of Perugia.

MARSDENIA, in *Botany*, received its name from the pen of Mr. R. Brown, in honour of William Marsden, esq. F.R.S. late secretary to the Admiralty, the learned author of the History of Sumatra; who, if not a practical botanist, has illustrated so many subjects connected with the science, and is on all occasions so liberal in his communications, that no one, who knows him or his works, can think the compliment misapplied.—Brown in Mem. of the Wernerian Society, v. 1. 28. Prod. Nov. Holl. v. 1. 460. Ait. Hort. Kew. ed. 2. v. 2. 84.—Class and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocyneæ*, Juss. *Asclepiadeæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five acute equal segments, rather small, permanent. *Cor.* of one petal, pitcher-shaped, or nearly wheel-shaped, in five bluntish segments. Crown of the stamens of five compressed, simple, undivided leaves, without any internal teeth. *Stam.* Filaments five, broad, flat, cloven at the top; anthers sessile on the inside of the filament, of two separate cells, terminated by a common membrane; masses of pollen projected from the

the anthers upon the ſtigma in pairs, erect, ſticking by their baſe. *Piſt.* Germens two, ſuperior, ovate; ſtyles combined, very ſhort; ſtigma ſingle, generally ſimple, ſometimes beaked, the beak either ſimple or divided. *Peric.* Follicles two, ovate-oblong, ſmooth. *Seeds* numerous, imbricated, comoſe.

Eſſ. Ch. Corolla nearly wheel-ſhaped, five-cleft. Crown of the ſtamens of five compreſſed undivided leaves, without teeth. Anthers terminated by a membrane; maſſes of pollen ten, ſmooth, erect. Follicles ſmooth. Seeds comoſe.

The ſtem in this genus is rather ſhrubby, generally twining, round, ſcarcely angular. Leaves oppoſite, ſtalked, broadiſh, flat. Cymes or tufts lateral, between the footſtalks. It is very nearly related to *Pergularia*; from which, according to Mr. Brown himſelf, it differs merely in the want of a tooth, or appendage, at the inſide of each leaf of the crown. There appears however to be more of a tube in *Pergularia*, the corolla of which is truly ſalver-ſhaped.

Eight ſpecies are deſcribed by the author of the genus.

1. M. *velutina.* Soft-leaved Marſdenia.—Stem twining. Leaves heart-ſhaped, broadly ovate, pointed, downy and ſoft. Cymes umbel-ſhaped. Mouth of the flower naked.—Gathered by Mr. Brown in the tropical part of New Holland.

2. M. *tinctoria.* Indigo Marſdenia (Tarram akkar; Marſd. Sumatr. 78.)—Stem twining. Leaves heart-ſhaped, ovate-oblong, pointed, nearly ſmooth, glandular in their forepart. Tufts lateral. Mouth of the flower bearded.—Native of Sumatra. Seen by Mr. Brown in the Bankſian herbarium. This plant is ſaid to afford the beſt indigo in Sumatra, and as Mr. Marſden appears to be the firſt perſon who has given any account of it, there is the more propriety in its bearing his name. For the indigo in general uſe, ſee Indigo and Indigofera.

3. M. *viridiflora.* Green-flowered Marſdenia.—Stem twining. Leaves oblong-lanceolate, ſmoothiſh, obtuſe at the baſe. Tube of the flower ſlightly hairy within.—Gathered by Mr. Brown in New Holland, within the tropic.

4. M. *clauſa.* Hairy-mouthed Marſdenia. Stem twining. Leaves lanceolate, acute at each end, ſmooth; ſlightly rugoſe on the upper ſide. Mouth of the flower denſely bearded.—Gathered in Jamaica, by profeſſor Swartz, who gave it to ſir Joſeph Banks, but does not appear to have mentioned it in any of his works.

5. M. *ſuaveolens.* Sweet-ſcented Marſdenia.—Stem nearly erect. Leaves oval-lanceolate, ſmooth, veinleſs. Tube of the flower ſwelling; mouth bearded.—Native of New South Wales, about Port Jackſon, where it was gathered by Mr. Brown, as well as by Dr. White. The character of the tube in this ſpecies ſeems, in that reſpect, to invalidate the above-mentioned diſtinction between *Marſdenia* and *Pergularia*.

6. M. *cineraſcens.* Aſh-coloured Marſdenia.—Stem erect. Leaves ovate, bluntiſh, veiny, ſlightly downy. Footſtalks half an inch long. Corolla nearly wheel-ſhaped.—Found by Mr. Brown in the tropical part of New Holland.

All the above have a ſimple pointleſs ſtigma, and are conſidered by the author juſt mentioned as the moſt true and genuine *Marſdeniæ.* The two following have a beaked ſtigma.

7. M. *erecta.* Upright Marſdenia. Hort. Kew. as above. (Cynanchum erectum; Linn. Sp. Pl. 311. Willd. Sp. Pl. v. 1. 1258. Jacq. Hort. Vind. v. 1. 14. t. 38. Apocynum primum latifolium; Cluſ. Hiſt. v. 1. 124. Periploca latifolia; Ger. Em. 902.)—Stem erect. Leaves heart-ſhaped, ovate, acute. Cymes umbel-like. Segments of the limb beardleſs, four times as long as the tube.—Native of Syria. Gerarde had it in his garden, having received it, as he informs us, from "his loving friend John Robin, herbariſt in Paris." (See Robinia.) It is marked by Mr. Aiton as a ſtove plant. Jacquin ſays it requires the ſhelter of a greenhouſe at Vienna in winter, but flowers in the open air in June and July, though without bearing fruit. This is a ſmooth, upright, but weak, *ſhrub*, irregularly branched, five or ſix feet high, with pliant leafy twigs, ſomewhat diſpoſed to twine round their neighbours. When wounded they are, according to Jacquin, not milky. *Leaves* imperfectly oppoſite, heart-ſhaped, acute, entire, glaucous, milky, an inch and half long, and an inch wide, on round *footſtalks* half an inch in length. *Cymes* lateral, of numerous, white, fragrant *flowers*, ſmaller than hawthorn bloſſoms.

8. M. *roſtrata.* Beaked Twining Marſdenia.—Stem twining. Leaves ovate, ſomewhat heart-ſhaped, pointed, ſmooth. Umbels many-flowered. Limb bearded.—Gathered by Mr. Brown in New South Wales. This ſpecies is ſaid in his *Prodromus* to differ from its congeners, in having the maſſes of pollen kidney-ſhaped, and ſomewhat tranſverſe, ſticking upon the extremity of the ſtigma, at ſome diſtance from its glandular part. Hence the name *Nephrandra*, (from νεφρος, *the kidney*, and ανηρ, *a man*,) alluding to the form of the impregnating ſubſtance, is ſuggeſted in that work, apparently under ſome idea of the plant's poſſibly conſtituting a genus by itſelf.

MARSEILLE, in *Geography*, a town of France, in the department of the Oiſe, and chief place of a canton, in the diſtrict of Beauvais; 11 miles N.W. of Beauvais. The place contains 700, and the canton 10,838 inhabitants, on a territory of 155 kiliometres, in 18 communes.

Marseilles, a city of France, and principal place of a diſtrict, in the department of the Mouths of the Rhone, near the coaſt of the Mediterranean. For an account of its foundation and ancient ſtate; ſee Massilia. This ancient city was for a long time an independent commercial republic, till at length, in the progreſs of the Roman conqueſts in Gaul, it was ſubdued by their arms; and under their government, it flouriſhed in commerce, arts, and elegant literature. However, its opulence and glory periſhed in the common ruin of the Roman empire. The advantages of its ſituation at the foot of a rocky mountain, near the ſea, cauſed its trade to revive, even in the ages of Gothic barbariſm; nevertheleſs it languiſhed under the government of the counts of Provence. Since its union with the other dominions of the kings of France, Marſeilles has enjoyed a diſtinct municipal government and juriſdiction, under magiſtrates elected by the citizens. The ſubſidies which it formerly paid for the ſupport of the French government were impoſed by the king's edicts, and amounted to nearly one-third of the whole revenue paid by Provence. Marſeilles is divided into the Old and New Town; the former lies on an eminence, conſiſts of narrow crooked ſtreets with mean houſes, and is inhabited chiefly by fiſhermen and other poor people; the public ſtreets are ſpacious and extenſive, and the houſes regularly built, elegant and commodious, which are occupied by opulent families, and by thriving merchants, tradeſmen, and manufacturers. The port exhibits a noble ſpectacle of commercial induſtry, and the quay, in its proſperous ſtate, was crowded with a buſy multitude, conſiſting of people of all nations and languages; the neighbouring territory is thickſet with villas belonging to the wealthy inhabitants of the city; its trade extended to various parts of the globe, and its manufactures were various and extenſive.

Before the revolution, this city was the reſidence of a bailiwic, and the ſee of a biſhop; it had alſo four pariſh

churches,

churches, including the cathedral, and two collegiate ones, with two abbies, an academy of the fine arts, an obſervatory, and a mintage. Its arſenal was ſtored with all implements neceſſary for fitting out the gallies; its armoury, conſiſting of four walks interſecting one another, was reckoned the fineſt in the kingdom, and contained arms for 40,000 men. In the arſenal is a dock for building the gallies, which, being roofed over, and communicating with the harbour, is of a parallellogrammic form, having public and private buildings on the two long ſides, and on one of the ſhorter, the other ſide affording an opening into the Mediterranean, and being defended on each point by a ſtrong fort. The entrance into the harbour is rendered difficult by a rocky cape that is contiguous, nor has it depth of water ſufficient for men of war. This port was frequented, before the revolution, by upwards of 4500 veſſels in the courſe of a year. The number of inhabitants in the city, is reckoned at 111,130, and in the canton 115,394, on a territory of 310 kiliometres, in two communes. N. lat. 43° 17′ 43″. E. long. 5° 22′ 12″.

MARSH, in *Agriculture*, a term applied to a tract of land lying on the borders of the ſea, or any large river into which it flows. Theſe tracts of land are moſtly level, and converted to the purpoſes of grazing either with ſheep or other animals. And in ſome diſtricts, lands of this nature are ſubdivided or diſtinguiſhed into two kinds, *ſalt marſhes* and *freſh marſhes*. The former are ſometimes ſimply termed *ſalts* or *ſaltings*. They are the parts or portions of marſh grounds, which lie without the walls or embankments where ſuch defences exiſt.

Marſhes are for the moſt part of a rich deep alluvial nature in the qualities of their ſoils.

It is ſtated by the author of the Synopſis of Huſbandry, in ſpeaking of the marſhes in the ſouthern parts of the iſland, that they are ſubject to be overflown at every ſpring tide, or at other times, when, by the violence of the wind, or the impetuoſity of the tide, the water flows beyond its uſual limits. "The goodneſs of the ſalts is in a great meaſure analogous to the fertility of the adjoining marſhes; and the extent of them differs according to the ſituation, as in ſome places the tide beats directly againſt the wall, whilſt in others the ſalts or forelands are of a conſiderable breadth." It is likewiſe added, that "in ſome places the graſs from ſalts is annually mown, and yields a ſhort, delicate hay, that proves a very ſalubrious provender for ſheep; but care muſt be taken to prevent its being carried off by the tide, for which reaſon it is often found neceſſary to bring it into the incloſures for making." It is added, that "theſe ſalt marſhes are very efficacious in relieving many complaints incident to cattle, and are likewiſe uſeful in furniſhing a conſiderable range for young ſheep. In feeding them, however, ſome caution is to be uſed, and it will be neceſſary to remove the ſtock over the wall on the apprehenſion of a high tide, but more eſpecially on the approach of ſpring tides, when the ſalts are uſually overflowed. As the return of theſe latter is periodical, and a high tide may generally be before ſeen by thoſe who are converſant in theſe matters, it rarely happens that any miſchief enſues when there is no breach made in the wall; though there have been inſtances where ſheep have been drowned on the ſalts, from a ſudden and unexpected high tide, and others, where this misfortune has been the conſequence of neglect, in not bringing the ſtock over the wall; or, as it is termed by the graziers, locking them on ſuch occaſions."

But the latter are thoſe tracts of land that lie within the wall, and are very extenſive in many parts of the kingdom. It is obſerved in the work juſt mentioned, that "Romney marſh is by far the moſt extenſive, and withal the moſt fertile of any level which comes under this denomination. It contains near 24,000 acres; beſides which are Walland marſh and Dinge marſh, which are compriſed within the walls, the former 12,000, and the latter 8000 acres." And it is ſtated, that "the internal regulations of theſe marſhes are committed to the ſuperintendance of expenditors. Theſe are appointed by the Commiſſioners of Sewers, and are to take care that the repairs of the walls are maintained in due order, and that the coſts attending the ſame be levied on each tenant, according to the number of acres occupied by him; for which purpoſe they are to cauſe aſſeſſments to be made out, with the names of the occupiers, and the rateable proportions to be borne by them reſpectively; and theſe rates, which muſt be confirmed by the commiſſioners, are termed ſcots; and that when any occupier refuſes to pay his ſcot, the expenditors can obtain a warrant from the commiſſioners empowering him to diſtrain for the ſame, as for any other tax." Theſe marſhes are both appropriated to the purpoſes of breeding and feeding. Beſides theſe marſhes, there are vaſt tracts of them in various other parts of the kingdom. See Grazing.

It is further ſuggeſted by the writer juſt noticed, that "the naked and expoſed ſituations of marſhes render them exceſſively cold in the winter, and no leſs ſubject them to the inconvenience of the parching heat of the ſun in the ſummer months. To guard againſt theſe two extremes, it might, perhaps, be no unprofitable undertaking to form plantations of trees in different parts, which would operate as well for a ſhade againſt the ſun's rays, as a defence to break off the winter blaſts. Many trees might be fixed on for this purpoſe, which, delighting in a moiſt ſituation, ſeem in a very peculiar manner adapted to this uſe. Of this kind are the alder, the ſycamore, the willow, and the poplar. Clumps of one or other of theſe trees being planted in different parts, would, it is ſuppoſed, be found very beneficial, and completely anſwer the purpoſes before mentioned. To every one who hath been converſant in huſbandry, it is evident with what avidity cattle of every kind fly to the ſhade in the ſummer ſeaſon; at which time they will even neglect their food to avoid the ſcorching heat of the ſun, and the more intolerable ſtings of the inſect tribe; ſo that in the middle of a ſummer's day, it is in vain to ſearch for a flock of ſheep in the uplands. At that time the hedges afford them a ſecure aſylum; but in marſhes, where this protection is wanting, it ſurely would be worth the trial to ſet about raiſing a ſhelter, which may anſwer in ſome reſpects the purpoſes of hedges in incloſures. Beſides, as theſe aquatics are all of them quick in forming their ſhoots, a few years, in a ſoil propitious to their growth, will furniſh a conſtant ſupply of poles adapted to cutting into rails, for which there is always a perpetual demand, and which will be no inconſiderable ſaving, not only in the original purchaſe of theſe articles, but in the carriage or conveyance of them likewiſe."

And it is aſſerted that "great profit is made by the renters of marſhes in the neighbourhood of London bordering on the Thames, from joiſting of horſes, the paſture being deſervedly accounted ſalubrious to that uſeful animal; for which reaſon, ſuch horſes as have been worn down by hard travel, or long afflicted with the farcy, lameneſs, &c. have frequently been reſtored to their priſtine health and vigour, by a few months run in the marſhes, eſpecially on the ſaltings; but as every piece of marſh land in ſome meaſure participates of this ſaline diſpoſition, ſo do they all of them poſſeſs, in a comparative degree, the virtues above-mentioned; and for this reaſon the Londoners are happy to procure a run for their horses, at four or five shillings *per* week." And "another method practised by the graziers in the vicinity of London is, to purchase sheep or bullocks in Smithfield at a hanging market, which being turned into the marshes, in the lapse of a few weeks, are not only much improved in flesh, but go off at a time when the markets, being less crowded, have considerably advanced in price; and thus a two-fold gain is made from this traffic: and as many of the wealthy butchers of the metropolis are possessed of a tract of this marsh land, they have, from their constant attendance at Smithfield, a perfect knowledge of the rise and fall in the markets, and consequently are enabled to judge with certainty, when will be the proper time to buy in their stock, and at what period to dispose of them." These advantageous modes of traffic are confined solely to those graziers who reside in the vicinity of London. "In the Isle of Sheppey, where they proceed on different principles, the graziers never wish to depasture any horses; this animal being thought by them to do much injury to the marshes, especially in wet seasons, by trampling with his feet, and is moreover very apt to wade through the ditches, and to break down the dry fences. These are arguments sufficiently cogent to induce those graziers to reject the joisting of horses; whilst those who reside in the vicinity of the metropolis, where the weekly pay is larger, and they depend greatly on this method, are justified in adhering to a custom which they find turns out so considerably to their profit and advantage."

In many districts of the island that are situated on the borders of the sea, or near the mouths of large rivers, there are very extensive tracts of this description of land, which by proper drainage and inclosure may be rendered highly valuable and productive. This is particularly the case in Somersetshire and Lincolnshire, as well as that mentioned above, and others more to the north of the kingdom. In the former of these counties, vast improvements have, according to Mr. Billingsley, as stated in his Survey, been effected by the cutting rhynes and ditches, for the purpose of dividing the property, and the deepening of the general outlets, to discharge the superfluous water. Many thousand acres which were formerly overflown for months together, and consequently of little or no value, are now become fine grazing and dairy lands.

The quantity that has been thus improved under the authority of parliament on Brent marsh, within these twenty years, is thus stated:

Names.			Acres.	
Westmore and Meare			4400	with 1000 acres of turf-bog not yet improved.
Compton Bishop		-	300	
Glastonbury		-	1500	ditto 300 ditto.
Westhay, &c.		-	1700	ditto 1000 ditto.
Mark	-	-	2000	
Buntspil	-	-	1200	
Shapwick	-	-	100	
Blackford	-	-	900	
Wookey	-	-	900	
Westbury	-	-	450	
Bleadon	-	-	400	
West Pennard		-	250	
Eddington	-	-	1000	ditto 400 ditto.
Stoke and Draycot			800	
Nyland	-	-	350	
Wells	-	-	1150	
			17,400	

And that of these 17,400 acres, six parts of seven are cleared of stagnant water, and rendered highly productive; while the turf-bogs have been little improved. It is likewise added, that in the parish of Mark alone, 10,000 sheep have been rotted in one year, before the inclosing and draining were attempted.

And the same writer states, that the probable expence and subsequent improvement of the complete drainage of the above-named marsh and the river Axe, would stand thus:

Brent Marsh.

Dr.

To act of parliament gaining consent, &c.		£ 400
——— Sluice near the river Perrot	-	6
——— Twelve miles of new drain, average depth fifteen feet	- -	12,000
——— Lowering river Brue three miles	-	1500
——— Purchase of land - -	-	2000
——— Bridges, hatches, &c. -	-	2000
——— Sluice on Axe, near Hobbs Boat	-	500
——— One mile and a half new drain	-	1500
——— Lowering river Axe six miles	-	1000
——— Purchase of land -	-	1000
——— Commissioners, surveyors, &c.	-	2500
		24,406
To balance of profit	-	331,844

Cr.

By 9000 acres of turf-bog improved at the most moderate computation 15*s. per* acre, making 6750*l. per annum*, twenty-five years purchase - - - -	168,750
By 15,000 acres of marsh flooded land 10*s. per* acre, or 7500*l. per annum*, twenty-five years purchase - - -	187,500
	356,250

The view and statements which are here given fully shew the vast benefits that may be derived to individuals as well as the nation at large, by improving lands of the marsh kind by judicious draining, embanking, and other means. Yet, notwithstanding this, immense tracts of ground of this sort remain without improvement, and of course of very little value.

Marsh *Land*, a sort of rich pasture or grazing ground lying near the sea, or large rivers. In some places it is termed fen, but very improperly. See Fen.

Where marsh land lies flat, it is necessary for the owner to keep all the water he can from it. The sea-water in particular is to be kept from it as much as possible; and this is usually done at a very great expence, by high banks and walls. There are two things greatly wanting in these lands, in general, which are good shelter for the cattle, and fresh water. The careful farmer may, however, in a great measure obviate these by digging, in proper places, large ponds to receive the water, and by planting trees and hedges in certain places towards the sea, where they may not only afford shelter for the cattle, but keep off the sea breezes, which will often cut off the tops of all the grass in these places, and make it look as if mown with a scythe.

Experience hath shewn, that these sorts of lands fatten cattle the soonest of any, and that they preserve sheep from the rot. It would be of great advantage to them, if there were

were raifed, in the middle of every large marfh, banks of earth in a crofs, or in the form of two femicircles, and thefe planted with trees; thefe would ferve as a fhelter for cattle, let the wind blow from what quarter it would, and would foon repay the expence of making the improvement.

In different parts of the kingdom there are very large quantities of land upon the fea-coafts that would be worth taking in, though little has yet been done in that way. The coafts about Bofton, Spalding, and many other parts of Lincolnfhire, give frequent inftances of this, where the fea falls from the land, fo that on the outfide of the fea walls, on the owfe, where every tide the falt water comes, there grows a great deal of good grafs, and the owfe is firm to ride upon when the water is upon it. This owfe, when taken, hardly finks any thing at all, and they dig the walls from the outfide of it, all the earth they are made of being taken thence, the fea, in a few tides, filling it up again: and though the fea, at high water, comes only to the foot of the bank, yet once in a year or two, fome extraordinary tide goes over the banks, though they are ten feet high. Thefe banks are fifty feet broad at the bottom, and three feet at the top; the earth being all carried in wheelbarrows, and the face towards the fea, where the greateft flope is turfed.

In fpeaking of the Romney marfh lands, Mr. Bannifter ftates, that "the natural fituation of marfh land, fo much beneath the furface of the uplands, renders it fubject to be frequently covered with water in the winter time; and as this circumftance proves highly detrimental to the land, by protracting the growth of the grafs, and in caufing it to be four and ill tafted, no pains fhould be fpared to refift the calamity, as well by keeping the ditches fufficiently cleanfed, as by cutting drains in different parts of the marfh to carry off the fuperfluous water."

And alfo, "as the gate-ways in the marfhes are apt to be very miry in the winter feafon, care fhould be taken to heighten the ground with ftones, gravel, or chalk, which will render thefe paffages much more comfortable to the drivers, no lefs than to the ftock, efpecially milch cows, which being brought twice a day into the yard, would, but for this precaution, caufe the gate-ways to be impervious in wet weather."

Befides, "when the fummer turns out moift and growing, the herbage often fhoots fafter than the ftock can eat it down. In this cafe it is common to brufh over the marfhes at the mowing feafon, though they had not originally laid in for that purpofe; by which economy the farmer becomes poffeffed of a much larger portion of hay than he had before formed an expectation of, and which, in counties where this commodity fetches a good price, is an advantage whereof he has a right to avail himfelf; for thefe cafual brufhings may probably furnifh him with a quantity of winter provender, fufficient to his own ufe; whilft thofe marfhes which were primarily intended to be mown, and have been defignedly laid in with that view, will produce a commodity of a better quality and more faleable, that may be difpofed of at market. Thofe graziers, on the contrary, who live at a diftance from the market, and are on account of their local fituation obliged to pay larger wages to their workmen, flight the opportunity of increafing their ftock of hay; and in cafes where the humidity of the fummer hath rendered it neceffary to mow the bullock paftures, in order that the fucceeding fhoot of grafs may be more fweet and toothfome, have made a free gift of the fame to thofe who have engaged to clear it off the ground." On the removal of this old grafs, the ground is left at liberty to fend forth a more vigorous fhoot in the autumn, fo that thefe rouens at that time produce a fweet and wholefome pafturage, which would otherwife have been choaked up with the rotten tore of the laft year: yet there are cafes where it may be neceffary to fuffer this old grafs to remain on the ground, as where a portion of food is required for the cows or other horned beafts in the winter. Then this old tore, having been fweetened by the frofts, will be found exceedingly ufeful, and the cattle will at that time greedily devour, what in the fummer months they turned from with difguft and indifference.

This fort of management is only required in particular cafes; in others the grafs never becomes coarfe and rank, but, on the contrary, remains clofe and fine in the marfhy paftures.

Marsh *Mallow*, in *Botany*. See Althæa.

Marsh *Trefoil*. See Menyanthes.

Marsh, Nicholas, in *Biography*, an eminent Irifh prelate, was born at Hannington, in Wiltfhire, in the year 1638. He finifhed his education at Magdalen college, Oxford, where he took the degree of B. A. in 1657. In the following year he was elected fellow of Exeter college, and proceeded as a member of that college M. A. in 1760, D. D. in 1671. During thefe periods he was made chaplain to Dr. Ward, bifhop of Exeter, and afterwards to the earl of Clarendon, lord chancellor. He obtained fome other preferment, and in 1678 he was nominated to the vacant provoftfhip of Dublin college, where he difcharged the duties of his high truft with fuch fidelity and regularity, that his conduct has been held up as a pattern to all his fucceffors. In 1682-3, he was promoted to the fees of Leighlin and Ferns, and in 1690 he was tranflated to the archbifhopric of Cafhel, from thence to Dublin, and from Dublin to Armagh. While he filled the fee of Dublin, he built a noble library, which he enlarged after he became primate, and furnifhed with a choice collection of books. He endowed an hofpital at Drogheda for the reception of twelve widows of decayed clergymen, to each of whom he affigned an apartment, and twenty pounds a year for maintenance. He extended his bounty to the encouragement of the propagation of the Gofpel, and to other munificent and charitable inftitutions; prefenting a number of oriental MSS. to the Bodleian library at Oxford. After having lived many years in great honour and reputation, and been feven times appointed one of the lords-juftices of Ireland, he died, in the 75th year of his age, in 1713. He was a man of extenfive and deep learning; and in his perfonal character he was pious, amiable, and exemplary. As an author, his principal piece was "An introductory Effay to the Doctrine of Sounds," containing fome propofals for the improvement of Acouftics, printed in the Philofophical Tranfactions of the Royal Society of London. Biog. Brit.

Marsh, *Cape*, in *Geography*, a cape on the fouth coaft of New Georgia. S. lat. 9° 21′. E. long. 150° 56′.

Marsh *Creek*, a river of North America, which runs through Malden townfhip, in Upper Canada, and difcharges itfelf into lake Erie.

Marsh's *Ifland*, the largeft of a group of 13 iflands at the Great Falls in Penobfcot river, all lying within feven miles of one another. Marfh's ifland is about five miles long and two and a half wide, and eftimated to contain about 5000 acres. Round this ifland are five falls, one of which is diftinguifhed by the name of "The Great Falls," or "Old Town Falls."

Marsh-*Effluvia*, or *Miafmata*, in *Medicine*. See Effluvia and Miasma.

Marsh-

Marsh-*Fever*, the fever occafioned by refpiring the miafms, which exhale from fwampy ground. This is various under the different circumftances which produce it; but it is always a fever of paroxyfms, occurring at regular intervals. In temperate climates and cool feafons, it is an intermittent, or ague; in warm countries, in hot autumnal weather, it is a remittent, of tedious and difficult cure; and in the hot feafons of hot climates, it is the bilious remittent, or yellow fever, fo fatal to ftrangers recently arrived from colder latitudes. In an able treatife on yellow fever, lately publifhed by Dr. Bancroft (in 1810), it is fatisfactorily fhewn, that thefe different forms of fever are the offspring of the fame caufe; and that in proportion to the heat of the climate and feafon, to the comparative cold of the climate from which the patient has come, or of the feafon which has preceded, to the concentrated ftate of the miafmata, and to the full expofure which has been undergone, in the fame proportion will the fever commence more fpeedily, be more violent in its attack, and more rapid and dangerous in its courfe, and from thefe circumftances alone, all the varieties of periodic fevers, from the yellow fever, which commences within twelve hours, to the mild vernal ague, which lies dormant from autumn to the enfuing fpring, are produced. See Effluvia, Heat, Miasma, Remittent.

Marsh *Landers*, in *Rural Economy*, a term provincially applied to neat cattle of the fhort-horned breed, or fuch as are bred on lands of the marfh kind, in different places.

MARSHAL, or Mareschal, *Marefcallus*, primarily denotes an officer, who has the care or the command of horfes.

Nicod derives the word from *polemarchus*, *mafter of the camp;* Matthew Paris from *Martis fenefcallus*. In the old Gaulifh language, *march* fignified *horfe;* whence *marefchal* might fignify him who commanded the cavalry. Spelman, Skinner, and Menage, derive it from the German *maer*, *marre*, a *mare*, or even a *horfe*, and *fchalk*, *fervant;* which makes fome imagine the title was firft given to farriers, or thofe who fhod and bled horfes; and that, in fucceffion of time, it paffed to thofe who commanded them. Pafquier makes four feveral derivations for the four feveral kinds of marfhals in ufe among the French; *viz marfhals* of France, *marfhals de camp*, *marfhals de logis*, or quarter-mafters, and farriers, who are alfo called by the name of marfhals. The third he derives from *marche*, or *marchir*, *to mark*, *limit;* and the laft from *maire*, *mafter*, and *chal*, *horfe*.

That the marfhal was an officer of confiderable note in Germany, France, and elfewhere, muft incontrovertibly be acknowledged; but the exact time of the firft inftitution of his office cannot now be fo well afcertained. At firft, the marfhal or marefcallus was, probably, an officer of inferior rank, to whofe direction and management fovereign princes confided the care of their horfes. Some have fuppofed the marefcallus and the "Comes Stabuli" to have been the fame officer under different titles; whilft others, allowing the functions of thefe officers to have been originally different, contend that they were united in, and for a long time after their inftitution continued to be exercifed by, one and the fame perfon. This contrariety of opinion feems to have arifen from confounding the officers of the Weftern empire in its early ftate with thofe eftablifhed in it at a fubfequent period, as well as with thofe of France, Italy, and of the Eaftern empire. In the early times of the Weftern empire, whilft the "Comes Stabuli" remained a mere officer of the houfhold, and uninvefted with a military employment, no mention of a marefcallus occurs among the officers of the crown. In thofe times the "Marefcalli" were only minifterial to the "Comes Stabuli," and the fame difference fubfifted between them as between menial fervants and their mafters. The "Comes Stabuli" was a high officer of the emperor, who appointed him to that office, and committed to him the fuperintendency of the imperial ftables and ftud: whereas the "Marefcalli" were perfons acting under him in a fervile ftation, and employed in dreffing, feeding, and training a limited number of the emperor's horfes. Afterwards the promotion of the "Comes Stabuli" to the military dignity of commander-in-chief of the army, opened the way for the "Marefcalli" to emerge out of their obfcurity, and to rife to a more exalted ftation than they had before enjoyed: for on account of their fkill in the feveral branches of horfemanfhip and the management of cavalry, the "Comes Stabuli" felected one of them to reconnoitre the pofition and to watch the motions of the enemy; to affign the quarters and lodging for the foldiery; to ftation the piquets, and direct the foragers. The office of "Marefcallus," thus raifed from fervility, foon attained to great dignity and power; infomuch that the leading of the van of the army, the command of the cavalry, and the making of the firft attack on the enemy, were annexed to it. After the decline, and upon the new-modelling of the empire, the office of the "Comes Stabuli" was funk into that of the "Marefcallus," who from that time exercifed the functions of each, and became the moft confiderable officer in the ftate. The French, from almoft the earlieft times of their monarchy, had both Conftable and Marfhal. (See Constable.) The Marfhal is mentioned in the "Leges Salicæ," in the capitularies of Charlemagne, and by feveral of the contemporary writers of that age. The "Marefcallus," from his firft inftitution in France, was confidered as fubordinate to the Conftable, whofe minifter he was both in war and peace. His authority, however, was great, and in many refpects fo nearly equal to that of his principal, that his office was ever perfonal, and granted for life only. The French were fo jealous of the power of their marfhals, which became important from their prerogative of leading the van of the army, that they ufed every precaution for preventing the office from becoming hereditary in one family.

Among our Anglo-Saxon anceftors there was an officer, diftinguifhed by the appellation of "Heretog," or "Heretoche," (derived from hepe, *exercitus*, and togen, *ducere*,) who, according to the additions to the laws of king Edward the Confeffor, was the fame officer as the French ftyled either "Conftable," or "Marfhal." The identity of thefe officers has, however, been queftioned, and it has been alleged, that there were effential differences, as well in the conftitution as in the functions of thefe officers. Each county or fhire in England had its peculiar "Heretoche:" but in that age the French had only one "Conftable," or "Marfhal," in their kingdom in commiffion at the fame time. The "Heretochii" were military officers of the public, and each of them was annually elected by the common fuffrage of the people of his own county: whereas the "Conftable" and "Marfhal" of France were civil as well as military officers of the crown, appointed by the fovereign only, and generally for life. The power of the "Heretoche" extended no farther than to the leading of the forces of that particular county, by which he was chofen to be their military chief; but the authority of the "Conftable," and under him of the "Marfhal," extended over the whole national army. The "Conftable" of France was the third perfon in the kingdom in point of rank, and next to him was the "Marfhal;" but the "Heretoche," even in his own county court, was placed next below the fheriff, and

and immediately before the "Trithingreve." When the "Heretoche" had conducted the forces of his own county to that part of the kingdom where the king thought proper to assemble his army, and they had joined the main body, his command was superseded, and he himself became subject to the orders of the commander-in-chief; whereas the "Constable" and "Marshal" had the management and direction of the campaign, and the various operations of the war, acknowledging no superior in command except the king, when he was personally present. In time, the "Heretoche" was no other than a colonel of a county militia, acting under the commander-in-chief of the king's forces. Duke William, even before his invasion, and more especially afterwards, must have known the great difference between the officers of the Anglo-Saxons and those of the French and Normans too well to have interpreted the "Heretoche" by either "Constable" or "Marshal:" and if so, he cannot have been author of the additions to the Confessor's laws. These additions, it is supposed, were not formed till the latter part at least of the reign of king Henry II. and probably not till after his death; about which time the Germans and Italians, confounding together the two offices of "Constable" and "Marshal," not only used the words "Constabularius" and "Marescallus" as synonimous, but constantly gave the appellation "Constabilis" to the leader of every party and detachment of the soldiery.

We find the term "Marshal" used in the duchy of Normandy for an officer vested both with authority and jurisdiction, and that officer grown up there to the meridian of his dignity and power, before William's invasion of our island, and therefore, if we had not any positive evidence of the fact, yet it would be highly probable that he brought the name and office into England at the time of the conquest, in the same manner as the princes of the Norman lineage carried both to Sicily and Naples: and of this we are assured by the chronicle of Normandy, which expressly tells us, that the Conqueror made Roger de Montgomery and William Fitz-Osborne "Marshals" in England. This office, next to that of the "Constable," was conferred for several generations, in the family of the Clares, earls of Pembroke; after which, reverting to the crown, it was held by different great personages, till the 25th of Henry VIII, when it was granted to Thomas Howard, duke of Norfolk, and his heirs male for ever, with power to exercise it by deputy; since which time, it hath, with some interruptions arising from attainders, and other consequences of civil dissentions, continued in that family.

Mr. Madox (Hist. Excheq. c 2.), describing the office of the king's mareschal, or mareschal of England, says it was executed partly in the king's army, in time of war, and partly in his court, in time of peace. Of the military functions of this office he merely says, that he and the constable were to give certificates to the barons of their having duly performed the service required of them in the king's armies; which seems to shew that these officers had a legal superintendency over those armies. But from other accounts, it appears, that in the reign of Edward I., the mareschal's post was in the van-guard, and that it was his duty, and that of the constable, to muster the forces. (See Rymer, vol. ii. p. 783.) His civil duties were (as Madox has collected them from ancient records), to provide for the security of the king's person in his palace, to distribute the lodgings there, to preserve peace and order in the king's houshold, and to assist in determining controversies among them. He also performed certain acts, by himself or his substitutes, at the king's coronation, at the marriage and interments of the royal family, at the creation of barons and knights, and at other great and ceremonious assemblies in the king's court. It is said in the dialogue "De Scaccario," (already cited) that no business of importance ought to be done without his being consulted. See Earl-*Marshal*.

Besides the earl-marshal, there were, during the reigns of our Norman race of sovereigns, and also in subsequent and still later times, marshals, whose employments, or marshalseas, were different from, and subordinate to, those of that great officer. Our ancient records take notice of some officers by the name of marshals, who are mentioned only in general to have been servants of the king's houshold; and we find by the patent-rolls, that king Henry III. had no less a number of marshals than seven continually attending upon him in his court; for which service, each of them was paid by the keeper of the wardrobe, the yearly wages of twenty marks. This, indeed, will not seem extraordinary, when it is considered, that the being "marshal," or having the "marshalsea" of a thing, meant no more than being the director, or having the oversight, charge, or ordering of it. Accordingly, Mr. Madox specifies several officers of the king's houshold under the several denominations of marshals of his *horses*, of his *birds*, and of his *measures*.

The marshal, as well as the *Constable* (see that article), in consideration of the services which his office required, had various fees and emoluments, as well as certain rights and privileges; which belonged to him, partly as a military officer, and partly on account of his attendance about the king's court. They are specified by Grose in his "Military Antiquities," vol. i. p. 194, &c. and by Edmondson in his "Complete Body of Heraldry," vol. i. p. 66. It is hardly necessary to add, that at present the earl-marshal is not considered as a military officer.

Marshal *of England, Earl.* See Earl-*Marshal*.

Marshal, *Knight*, or *Marshal of the King's House*, is an officer, whose business, according to Fleta, is to execute the commands and decrees of the lord steward, and to have the custody of prisoners committed by the court of verge. Under him are six marshal's men, who are properly the king's bailiffs, and arrest in the verge of the court, when a warrant is backed by the board of green-cloth. The court where causes of this kind between man and man are tried, is called the *Marshalsea*, and is under the knight-marshal. See Court.

This is also the name of the prison in Southwark; the reason of which may probably be, that the marshal of the king's house was wont to sit there in judgment, or keep his prison.

There are some other inferior officers of this name; as

Marshal of the justices in eyre.

Marshal of the king's bench, who has custody of the prison called the king's bench in Southwark.

This officer gives attendance upon the court, and takes into his custody all prisoners committed by the court; he is fineable for his absence, and non-attendance incurs a forfeiture of his office. The power of appointing the marshal of the king's bench is in the crown. 27 Geo. II. c. 17. See Court *of King's Bench*.

In Fleta, mention is also made of a *marshal of the exchequer*, to whom the court commits the custody of the king's debtors, &c.

Marshal, or *Mareschal*, of France, was, during the monarchy, the highest dignity of preferment in the French armies. This dignity was for life, though, at its first institution, it was otherwise. They were then only the king's first ecuyers under the constable, but in time they became the constable's lieutenants in the command of the army,

army, the conſtable himſelf being then become captain-general. At firſt they were but two in number, and their allowance was but five hundred livres *per annum* in time of war, and nothing in time of peace; but in the reign of Francis I a third was added; Henry II. created a fourth. Since it has been various: Lewis XIV increaſed it to twenty. Their office at firſt was to marſhal the army under the conſtable, and to command in his abſence.

They did then what the *marſhals de camp* did afterwards; to which laſt they transferred their title, and the leaſt conſiderable part of their authority.

The firſt marſhal performed the office of conſtable in an aſſembly of the marſhals.

MARSHAL, *Arch.* See ARCH-*Marſhal.*

MARSHAL, *Clerk.* See CLERK-*Marſhal.*

MARSHAL, *Field.* See FIELD-*Marſhal.* This denomination is likewiſe given as an honorary rank to general officers who have no immediate command.

MARSHAL, *Provoſt.* See PROVOST.

MARSHAL, *Sub* See SUB-*Marſhal.*

MARSHALS *of Arms*, in *Heraldry*, have been ranged by ſome authors as a different order of officers of arms; and whilſt ſome have attributed this title to Purſuivants, others have aſſerted, that there are belonging to, and depending upon, the office and officers of arms, certain miniſters, whom they call marſhals to heralds. The word "marſhal," in this caſe however, ſignifies no other than a deputy to a king of arms, of a whole realm, or of any province or march within it, ſubſtituted and appointed to perform the duties of ſuch king of arms in his abſence, or when he happens to be employed in other offices of the public; and to be a ſort of coadjutor, or aſſiſtant to him, when he thinks proper to uſe him in that capacity. The denomination of marſhal is undoubtedly very ancient, in this country as well as in foreign parts; of which Edmondſon mentions many inſtances. Complete Body of Heraldry, vol. i.

MARSHALL, THOMAS, in *Biography*, was born at Barkby, in Leiceſterſhire, about the year 1621. He was inſtructed in grammar-learning by the vicar of his native town, and was, in 1640, entered at Lincoln college, Oxford, where, in the following year, he was elected a ſcholar on Trapp's foundation. When the civil wars broke out, he bore arms in defence of the king at his own coſt; and upon the approach of the parliamentary viſitors in 1647, he left the univerſity, went to the continent, and became preacher to the company of Engliſh merchants at Rotterdam and Dort. While he was abroad, he was, without his knowledge, elected fellow of his college, and made doctor of divinity. Theſe honours recalled him to his native country, and to Oxford, where he was elected rector of his college in the year 1672. He was afterwards appointed chaplain in ordinary to his majeſty; in 1680, he was preſented to the rectory of Bladon, near Woodſtock, in Oxfordſhire, and in the following year he was made dean of Gloceſter. He died at Lincoln college in 1685, and left all his books and MSS. to the public library, which did not already form a part of it, and the remainder he gave to Lincoln college. He likewiſe founded three ſcholarſhips, ſupported by rent-charges on different eſtates. He was a very learned man, and deeply ſkilled in the Saxon and Eaſtern tongues, and was eminent for his ſtrict piety, profound learning, and other valuable qualifications. He was author of "Obſervationes in Evangeliorum Verſiones perantiquas duas, Gothica ſcilicet et Anglo-Saxonica, &c." 4to. 1665. "An Epiſtle prefixed to Dr. Hyde's Tranſlation into the Malayan Language of the Four Goſpels;" and other pieces.

MARSHALLIA, in *Botany*, is a ſpecies adopted by profeſſor Martyn from Schreber, who named it in honour of Mr. Humphrey Marſhall, author of *Arbuſtum Americanum*, the American grove, or an alphabetical catalogue of foreſt trees and ſhrubs, natives of the American United States."—This work was publiſhed at Philadelphia, in 8vo. in 1785; and a French tranſlation appeared at Paris in 1788.—Nothing is known of *Marſhallia*, but from Schreber, and according to his generic character, it ſhould be placed between *Serratula* and *Pteronia*. Schreb. 810. Mart. Mill. Dict. v. 3.—Claſs and order, *Syngeneſia Polygamia Æqualis*. Nat. Ord. *Compoſitæ Capitatæ*, Linn. *Cinarocephalæ*, Juſſ.

Gen. Ch. *Common calyx* ſpreading, of numerous, linear-lanceolate, obtuſe, concave, nearly equal, permanent ſcales. *Cor.* compound, uniform, longer than the calyx; the florets hermaphrodite, equal, numerous, of one petal, funnel-ſhaped, villoſe; tube the length of the calyx; limb ſomewhat ventricoſe, divided into five, linear, rather erect ſegments, two of them more deeply ſeparated. *Stam.* Filaments five, capillary; anthers cylindrical, tubular, as long as the limb. *Piſt.* Germen ovate; ſtyle thread-ſhaped, a little longer than the ſtamens; ſtigmas two, recurved. *Peric.* none, except the permanent calyx. *Seeds* ſolitary, ovate, five-ſided, downy, with a crown of five ſmall, ovate, pointed, erect, membranous leaves. *Recept.* flat, chaffy; ſcales linear, a little dilated, and obtuſe at the top, green, the length of the calyx.

We are not aware that any ſpecies of this genus has been yet deſcribed. Willdenow has not enumerated any in his extenſive work, ſo that the above character is all that is at preſent known relative to the matter.

MARSHALLING *a Coat of Arms*, in *Heraldry*, ſignifies the due and proper joining of ſeveral coats of arms belonging to diſtinct families in one and the ſame ſhield, or eſcutcheon; by *impaling* and *quartering* (which ſee); or, according to Niſbet, marſhalling of arms is when enſigns of honour, or the entire arms of other families, are joined with the paternal ones of the bearer by partition lines, making diſtinct arms or compartments in one ſhield.

Marſhalling is alſo to be extended to the diſpoſition of the appurtenances of ſuch arms, in proper places without the eſcutcheon.

MARSHALLSVILLE, in *Geography*, a place of America, in Muhlenburg county, Virginia; in which is a poſt-office; 258 miles from Waſhington.

MARSHALSEA. See COURT *of Marſhalſea*.

MARSHAM, *Sir* JOHN, in *Biography*, a well known writer, born in 1602, at London, received his early education at Weſtminſter ſchool, from which place he was ſent to St. John's college, Oxford, where he took his degree of M.A. in 1625. He now made a tour on the continent, and returning to London, entered at the Middle Temple for the ſtudy of the law. In 1629 he viſited the Low Countries and Paris, in the ſuite of ſir Thomas Edmondes, embaſſador extraordinary to Lewis XIII. Reſuming his legal ſtudies after his return, he was appointed one of the ſix clerks in chancery in 1638. In the civil wars he adhered to the royal ſide, and was plundered of a conſiderable part of his eſtate, but on the reſtoration he was elected one of the repreſentatives in parliament for the city of Rocheſter, was reſtored to his place in chancery, and received the honour of knighthood; and in the courſe of two or three years after this he was created a baronet. He died in 1685, leaving behind him a character for great learning in the languages, hiſtory, and chronology. The firſt fruit of his ſtudies was "Diatriba Chronologica," in which he examines the principal difficulties occurring in the chronology of the Old Teſtament. He wrote the preface to the firſt volume of of the "Monafticon Anglicanum," but his principal performance is entitled "Canon Chronicus Ægyptiacus, Ebraicus, Græcus, et Difquifitiones." In this he propofed to the learned world the hypothefis of four collateral dynafties of Egyptian kings, reigning at the fame time over different diftricts of that country, in order to reduce the chronology of the Egyptian records to a conformity with that of the Hebrew fcriptures. Sir John fuppofes that the Jews derived their feveral rites from the Egyptians, and limits the prophecy of Daniel's weeks to the reign of Antiochus Epiphanes. He left at his death, in an unfinifhed ftate, a fifth book of his "Canon Chronicus," containing the Perfian empire. Biog. Brit.

MARSHFIELD, anciently *Meresfield*, in *Geography*, a market-town and parifh in the hundred of Thornbury, Gloucefterfhire, England, is fituated on the borders of Somerfetfhire and Wiltfhire, feven miles diftant from Bath, 13 from Briftol, and 102 from London. The manor was anciently part of the demefnes of the crown, but foon after the conqueft was given to the fee of Wells to be holden as of the honour of Gloucefter. It afterwards came to the earls of Gloucefter; William, the fecond earl, gave it to the abbey of Keynfham, which he had founded for Black canons, in the reign of Henry II. In this abbey the manor continued till the diffolution; fince which period it has paffed, by grants, defcent, and purchafe, to various poffeffors, and is now the property of Chriftopher Codrington, efq. The parifh of Marfhfield is fixteen miles in circumference; the town, which ftands in the centre, confifts principally of one ftreet, of a mile in length. It is governed by a bailiff, annually elected at a court-baron, whofe power, however, though he is attended by a ferjeant at mace, extends but little farther than the examination of weights and meafures. A weekly market is held on Thurfdays, which, with the two annual fairs, were firft granted to the abbot of Keynfham in the year 1262, renewed at various times, and finally confirmed by James I. In the population furvey, under the act of 1800, Marfhfield was ftated to contain 265 houfes, occupied by 1246 perfons. The chief trade of the inhabitants is malt-making, which is carried on to a confiderable extent. The parifh church is a fpacious ftructure, confifting of a lofty nave, two aifles, and a well finifhed tower. The whole building is in the ftyle of the age of Henry IV., and was probably erected by the abbot of Tewkfbury, to whom, at that period, the impropriation belonged. On the left hand of the high altar are three fubfellia, or ftone ftalls, with light canopies and finials, where the officiating priefts ufed to be feated.

Upon a great common, called the Downs, are the evident remains of ancient intrenchments; near which are five tumuli, or barrows; the largeft is called Ofwald's tomb. The traditional account of this being the grave of Ofwald, king of the Northumbrians, is not fupported by hiftory.

At a place called the Rocks, near the town, are three ftones fet up to mark the limits of the three counties of Gloucefter, Wilts, and Somerfet, which meet here in a point. Rudge thinks that from this circumftance originated the ancient name of the parifh, *meare* being an Anglo-Saxon word for limit or boundary. Rudge's Hiftory of the County of Gloucefter, 2 vols. 8vo. 1803.

Marshfield, a poft-town of America, in Plymouth county, Maffachufetts, bounded S. by Duxborough, and 36 miles S.E. of Bofton; incorporated in 1640, and containing 1266 inhabitants.—Alfo, a townfhip in Caledonia county, Vermont, adjoining to Calais on the N.W., and Peacham on the N.E.; containing 170 inhabitants.

MARSHPEE, or Mashpee, an ancient Indian town of America, in Barnftaple county, Maffachufetts, containing 155 inhabitants. In this town is an Indian church, but the number of Indians does not exceed 40 or 50 perfons.

MARSHY Hope, the N.W. branch of Nanticoke river, in Maryland.

Marshy *Lands*, in *Agriculture*. See Marsh-*Land*.

MARSICO Nuovo, in *Geography*, a town of Naples, in Principato Citra, the fee of a bifhop, fuffragan of Salerno; 18 miles N. of Policaftro.

Marsico *Vetere*, a town of Naples, in the Bafilicata; 14 miles S. of Potenza.

MARSIGLI, Lewis-Ferdinand, *Count*, in *Biography*, a foldier and philofopher, was born in 1658, of a good family, at Bologna. He was brought up from his earlieft youth in manly exercifes, but was, at the fame time, extremely attentive to his ftudies, particularly in mathematics and natural hiftory. In 1679, he accompanied a Venetian envoy to Conftantinople, where he employed himfelf in procuring information of all kinds relative to the Turkifh empire. The refult of his enquiries, he publifhed in "Obfervations concerning the Thracian Bofphorus," which he addreffed to Chriftina of Sweden: this work was publifhed at Rome in 1681. The remarks which he collected refpecting the civil and military ftate of the Ottoman empire, and the rife, progrefs, and decline of that power, did not appear till after his death. He remained at Conftantinople eleven months; and after his return he went to Vienna, and offered his fervices to the emperor Leopold. They were accepted, and his fkill in fortification was employed in conftructing works for the defence of the river and ifland Raab. He was rewarded with a company of infantry, but in a fhort time he fell into the hands of the Tartars, who fold him for a trifling fum to the governor of Temefwar, by whom he was carried as a flave to the fiege of Vienna, where he was again fold, and endured incredible hardfhips, till his friends found means of redeeming him. He was foon after this employed to fuperintend the cannon foundery at Vienna; and in the courfe of the employment, he made many experiments on the ftrength and action of gunpowder, which he communicated to the celebrated Viviani. He was entrufted with important commands in the army, and had a large fhare in the capture of Buda, from the plunder of which he fecured for his fhare feveral oriental manufcripts. He was raifed to the rank of colonel in 1688, and was deputed by the emperor to the pope for fome political negociations, which he conducted with great dexterity. During the remainder of the war he ferved in Hungary, where he was employed in conftructing bridges over the Danube and other rivers, and in protecting the encampments. From the variety of his talents, civil and military, he was in great efteem with the imperial commanders, and was frequently confulted on important occafions, and was at length appointed the imperial commiffioner for fixing the boundaries between the two empires in Hungary and Dalmatia. When the fucceffion war between the emperor and his allies broke out in 1702, he accompanied the king of the Romans to the fiege of Landau. He was afterwards fent with his regiment to garrifon the important fortrefs of Brifac, and acted as fecond in command under the count of Arco. Great diffentions prevailed between the two generals, and the place furrendered after a fhort refiftance. The court of Vienna inftituted a legal enquiry into the facts, in confequence of which Arco was beheaded, and Marfigli deprived of all his honours and employments. He attempted to procure a revifion of the fentence from the emperor, but being unfuccefsful in his efforts, he retired to Switzerland, and wrote a juftification of his conduct, and then applied his mind

mind with redoubled ardour to fcientific purfuits. Having fpent a good deal of time in admiring the wonders of nature in Switzerland, he vifited France, and took up his refidence near Marfeilles, where he cultivated his garden, and particularly examined all the productions of the fea-fhore. In 1709, count Marfigli was called from his retreat by pope Clement XI. to be placed at the head of his troops, but he foon found that he fhould gain no reputation in the papal fervice, and withdrew altogether from military life. He appeared now in a new character, and founded the "Inftitute of Bologna." His object was principally to promote the improvement of various branches of fcience, *viz.* aftronomy, chemiftry, natural hiftory, phyfics, and military architecture. He fpared no pains nor expence in obtaining inftruments adapted to the illuftration and advancement of fcience, and having the pope's confent to a new foundation, and fixed its laws and regulations, he folemnly confirmed the gift in 1712. The fenate of Bologna purchafed the principal palace in the city for its accommodation, an obfervatory was erected in it, profeffors were appointed, and the Inftitute took its proper form. The gratitude of his fellow citizens for this and other liberal acts performed for them, was expreffed in a decree for placing his ftatue in fome confpicuous fituation, but he fteadily refufed the honour. To avoid the confequences of fome litigious difputes, he accepted the employment offered by the pope of furveying the fea-coaft of the territories of the church, in order to fortify it againft the incurfions of the African corfairs. He made ufe of this opportunity to augment the materials for his natural hiftory, an object which he purfued in a tour through the whole mountainous tract of the diftricts of Bologna and Modena. After this he vifited Holland and England, and in the courfe of his journey formed an acquaintance with Newton and Halley, Boerhaave and Mufchenbroeck; he became a member of the Royal Society of London, and returned laden with books and fpecimens of natural hiftory for the Inftitute. At Amfterdam the bookfellers agreed to print the work which he had been preparing feveral years, and which was publifhed under the title of "Hiftoire Phyfique de la Mer," in the year 1725. In the following year he printed another great work, which was regarded as the moft valuable of all his pubications, entitled "Danubius Pannonico Myficus," in fix volumes folio. This is a defcription of the Danube in its Hungarian and Turkifh courfe. It commences with geographical and hydrographical obfervations; from thence it proceeds to the hiftory and antiquities of all the places wafhed by its ftream; to the mineralogy, zoology, and botany of its borders, and concludes with meteorological and phyfical remarks. In 1727, Marfigli prefented his Inftitute with the fcientific treafures that he had acquired in his laft travels, and in the following year fought a peaceful retreat in Provence, but a flight apoplectic attack induced him to return to his native city, where certain domeftic vexations to which he had been fubject through life, were now terminated by the death of his brother. One of the motives for his return was to attend to the education of that brother's fon, to which he thought himfelf bound by the obligations of duty, notwithftanding paft diffentions. A temporary amendment in his health proved but of very fhort duration, and he died November 1ft, 1730, at the age of feventy-two. The count was, according to the religion of his country, remarkably devout, and had a particular veneration for the Holy Virgin, to whofe efpecial care he attributed all the profperous events of his life. He was author of many other works, befides thofe that have been already referred to, among which may be mentioned "A Differtation on the Bolognian Phofphorus;" "Memoir concerning the Flowers of Coral;" "Differtation on the Generation of Fungi;" "On Trajan's Bridge," &c. Gen. Biog.

MARSILEA, in *Botany*, fo named by Linnæus, in commemoration of count Lewis Ferdinand Marfigli, founder of the Academy of Sciences at Bologna. (See MARSIGLI and LEMMA.) An error of the printer's in the latter requires correction; for *corolline* read *coralline.* Linn. Gen. 560. Schreb. 754. Mart. Mill. Dict. v. 3. Brown. Prodr. Nov. Holl. v. 1. 167. Spreng. Crypt. 207. t. 5. f. 42. Lamarck Illuftr. t. 863. (Lemma; Juff. 16.) Clafs and order, *Cryptogamia Filices*, Linn. *Cryptogamia Mifcellaneæ*, Schreb. Nat. Ord. *Filices*, Linn. Juff. *Marfileaceæ*, Brown.

Eff. Ch. Involucrum ovate, clofed, of many androgynous cells, in two rows. Anthers numerous, clustered round the bafe of the piftils, of one cell, with globofe pollen. Germens in two rows, feffile, oval.

Obf. Mr. Brown, who has moft recently inveftigated this genus, is by no means certain about its parts of fructification. He obferves that the reputed germens are full of a granular matter, whofe particles are nearly oval, pellucid, very eafily feparable, but not foluble in warm water. He has often remarked, in the centre of the germen, an oblong body of a larger fize, at firft fight homogeneous; but on being immerfed in water, it quickly diffolved into particles fimilar to the above. What is prefumed to be pollen, confifts of grains larger and more opaque than thofe found in the germen.

The ftem is creeping, throwing out tufts of fibrous roots here and there, and from the fame parts bearing numerous quaternate leaves, on long upright footftalks, about the bafes of which the fructification grows, clustered from the main ftem.

The *Salvinia* of Micheli, referred to *Marfilea* by Linnæus, is now by common confent feparated from it. See SALVINIA.

The fpecies of *Marfilea* are,

1. M. *quadrifolia.* Linn. Sp. Pl. 1563. Brown n. 1. (Lenticula paluftris quadrifolia; Mapp. Alfat. 166. t. 166. Lens paluftris altera; Camer. Epit. 853.)—Leaflets wedge-fhaped, fomewhat obovate, rounded, entire; fmooth, as well as the footftalks. Fruit fhorter than its ftalk. Native of various parts of the fouth of Europe, as well as in New South Wales, in watery places, creeping to a confiderable extent. The *footftalks* are from two to fix inches long. *Leaves* not unlike thofe of a Trefoil or *Oxalis*, except in confifting of four leaflets, which are fmooth, fpotlefs, and entire, with numerous fine parallel nerves; their bafe brown or purplifh. *Fruit-ftalks* either axillary, or united with the bottom of the footftalks, folitary or in pairs, firm, rigid and fmooth, half an inch to an inch long. *Involucrum* the fize of a fmall pea, ovate, oblique, with a fmall point, clothed with fhaggy deciduous hairs.

2. M. *hirfuta.* Brown n. 2.—"Leaflets wedge-fhaped, fomewhat obovate, rounded, nearly entire; hairy, as well as the footftalks. Fruit nearly feffile."—Gathered by Mr. Brown in the tropical part of New Holland, as well as near Port Jackfon. We have, from the ifles of Mauritius and Bourbon, fpecimens nearly anfwering to this definition, inafmuch as their *leaflets* are not quite entire, and are fomewhat hairy, as well as their *footftalks*; but the *fruit-ftalks* do not differ in proportion from the former, of which we rather fuppofe thefe fpecimens to be a variety.

3. M. *minuta.* Linn. Mant. 308. Syft. Veg. ed. 14. 902. (M. emarginata; Delile Ægypt. cum ic. nondum edit.)—

Leaflets

Leaflets wedge-ſhaped, deeply toothed at the ſummit. Fruit roundiſh, with two teeth at the baſe. Fruit-ſtalks rigid, ſcarcely longer than the fruit.—Native of Egypt. Very much ſmaller than M. *quadrifolia*, and remarkable for the deep inciſions, or teeth of its exactly wedge-ſhaped *leaflets*, which reſemble ſome *Medicago* or *Trigonella*. Theſe are paler beneath, and ſomewhat hairy, as well as their *footſtalks*. About four axillary rigid *fruit-ſtalks*, very little longer than the fruit itſelf, and ſlightly hairy, grow together, more or leſs combined at their baſe. The *fruit* is lateral, or oblique, at the end of each ſtalk, roundiſh, compreſſed, corrugated and hairy, with two teeth at the outermoſt angle of its baſe, where the ſtalk terminates; rounded at the other end, and not pointed there as in the firſt ſpecies. M. Delile has ſupplied us with a wild ſpecimen from Egypt, under the name of M. *emarginata*, by which this plant is deſtined to appear in the great work on that country, now publiſhing at Paris. We find no difference between this ſpecimen and the authentic ones of Linnæus, the native country of which is not marked upon them.

4. M. *coromandeliana*. Burm. Ind. t. 62. f. 2. (M. minuta β; Linn. Mant. 308.)—Leaflets wedge-ſhaped, ſomewhat obovate, nearly entire, ſmooth. Fruit elliptical, vertical, with two teeth at the baſe. Fruit-ſtalks capillary, thrice as long as the fruit. Native of Coromandel and Tranquebar, communicated by the Rev. Dr. Rottler. Nothing can be more diſtinct than this ſpecies from the preceding, with which it is confounded by Linnæus. Poſſibly the miſtake of the learned Swede, and the figure of Burrmann, may have led M. Delile to ſuppoſe his *emarginata* different from the *minuta*. The preſent is very much ſmaller, even than that, with capillary *fruit-ſtalks* equal in length to the *footſtalks*. The *fruit* too is eſſentially different, ſtanding vertically, not laterally, at the end of the ſtalk, and being elliptical, very ſtrongly corrugated. The *leaflets* are rounded at the end, and for the moſt part quite entire. They ſpread in the form of a croſs, as in the other ſpecies.

5. M. *anguſtifolia*. Brown n. 3.—"Leaflets lanceolate, ſomewhat toothed at the extremity; ſmooth when full grown."—Found by Mr. Brown in New Holland, within the tropic. Of this we have ſeen no ſpecimen.

MARSILLAC, in *Geography*, a town of France, in the department of Allier; 12 miles S. of Montluçon.

MARSILLY, a town of France, in the department of the Marne; 10 miles S. of Sezanne.

MARSOLLIER, James, in *Biography*, a writer of hiſtory, born at Paris in 1647, was brought up to the church, and took the habit of a canon-regular of St. Genevieve, and was ſent with others to Uſez, to reſtore order in the chapter of that city. He fixed his abode there, and was elected provoſt of the cathedral, a dignity which he ſoon reſigned in favour of Poncet, afterwards biſhop of Angers, and was then made archdeacon. He died in Uſez, in the ſeventy-eighth year of his age. His principal works were "L'Hiſtoire du Cardinal Ximenes," two volumes; "L'Hiſtoire de Henri VII. Roi d'Angleterre;" "Hiſtoire de l'Inquiſition et de ſon Origine:" this, which was firſt printed in one volume, 12mo., has been ſince reprinted with conſiderable additions in two volumes: "Hiſtoire de l'Origine des dixmes et autres Biens temporals de l'Egliſe;" "La Vie de St. Francois de Sales;" "Entretiens ſur pluſieurs Devoirs de la civile;" "Apologie d'Eraſme:" this laſt is an attempt to prove the attachment of Eraſmus to the Roman Catholic religion. The ſtyle of Marſollier is free and flowing, but not in the beſt taſte; his works are, however, ſtill read with pleaſure. Moreri.

MARSOM's Key, in *Geography*, a ſmall iſland in the Spaniſh Main. N. lat. 12° 5′. W. long. 82° 58′.

MARSON, a town of France, in the department of the Marne, and chief place of a canton, in the diſtrict of Chalons-ſur-Marne. The place contains 400, and the canton 7608 inhabitants, on a territory of 297½ kiliometres, in 18 communes.

MARSTA, a town of Sweden, in the province of Upland; 16 miles S. of Upſal.—Alſo, a ſmall iſland near the W. coaſt of Sweden, in the North ſea, N. lat. 56 47. E. long. 12° 31′.

MARSTON Moor, a place of England, in the county of York, memorable for a battle fought here in 1644, with which commenced the miſfortunes of king Charles. The Scottiſh and parliamentarian armies, having joined, laid ſiege to York, and prince Rupert, reinforced by the duke of Newcaſtle, determined to raiſe the ſiege. Both parties drew up on Marſton Moor to the number of 50,000, and victory was long in a ſtate of ſuſpence. Rupert, who commanded the right wing of the royaliſts, was oppoſed to Oliver Cromwell, who now firſt preſented himſelf to notice at the head of a body of troops, diſciplined by himſelf. After a ſharp conflict the cavalry of the royaliſts gave way, and thoſe of the infantry who ſtood next to them were alſo put to flight. Cromwell having driven his opponent from the field, returned to a ſecond engagement, which proved equally ſucceſsful. The prince's whole train of artillery was taken, and the royaliſts never afterwards recovered this defeat.

MARSTRAND, one of the moſt extreme among that cluſter of iſlands, which extends from the coaſt of Sweden. Marſtrand, from its ſtrength called the "Gibraltar of Sweden," is a rocky iſland in the Cattegate, about two miles in circumference. The town, which lies on the eaſtern ſide, contains 160 houſes, and 1200 inhabitants. It was declared a free port in 1776, and was the great reſort for the American veſſels, which were not permitted to enter into any other port of Sweden. This traffic enriched the town, particularly in 1780 and 1781. Since the peace, the commerce has greatly diminiſhed, and the inhabitants have derived their chief ſubſiſtence from the herring fiſhery, by means of the number of ſhips which, in bad weather, take refuge in the harbour, and by a contraband trade. Marſtrand is called a free port, but the exemption is imaginary: for although all goods are admitted into the town free of duty, yet they cannot be exported without paying the uſual cuſtoms: and they are ſubject to a very ſtrict ſearch. The harbour is ſecure and commodious, but of difficult entrance, and in tempeſtuous weather dangerous without a pilot. Each of the two entrances is commanded by two new batteries. The place is ſtill further fortified by the ſtrong citadel of Carlſtein, which ſtands on an eminence in the middle of the iſland. It was built, in 1682, by Charles XI., and taken by the Danes in 1719: but the fortifications have been ſince conſiderably ſtrengthened; and it is now deemed impregnable. On the top of the higheſt tower is a light-houſe, which commands an extenſive view of the Cattegate, ſprinkled with an aſtoniſhing number of rocks and iſlands. It is ſaid, that on account of the numerous rocks and ſhoals, that render this ſea dangerous, above 300 veſſels have been accuſtomed to take refuge annually in the harbour of Marſtrand. This place has of late very much declined in the number of houſes and of inhabitants: 18 miles N.W. of Gotheborg. N. lat. 57 54′. E. long. 11° 30′.

MARSUIN,

MARSUIN, in *Ichthyology*, a name by which many have called the phocæna, or porpesse, a fish too often confounded with the dolphin.

MARSUPIALE, in *Natural History*, a name given by Tyson to the creature commonly called the possum, or opossum. The peculiar distinction of this creature from all others, is its having a pouch, or marsupium, under its belly, into which it receives its young in time of danger: whence the name.

MARSUPIALIS Musculus, in *Anatomy*, a name given by Cowper, and some others, to a muscle on the thigh, called also by some, bursalis. It is that muscle, called by Albinus, Winslow, and the generality of modern authors, obturator internus.

MARSUPIUM Corneum, a name given by Spigelius, Cowper, and some other authors, to certain muscles, of the thigh, called by the French writers, les petits jumeaux, and by Albinus, gemini. Vesalius does not esteem them separate muscles, but calls them only carneæ portiones decimo femur moventium musculo attensæ, fleshy portions affixed to the tenth muscle of the thigh.

Riolan, who calls the pyriformis, or pyramidal muscle of the thigh, the quadrigeminus, or quadrigeminus prior, calls these the quadrigemini secundi & tertii. They are sometimes distinct, sometimes they grow together.

MARSY, François-Marie de, in *Biography*, a modern Latin poet, was born at Paris, and entered at an early period into the society of the Jesuits, where he cultivated his literary talents so successfully, that at the age of twenty he had acquired considerable reputation by his Latin poetry. His chief work in this department was entitled "Pictura," published in 1736. In this poem he passes over the mechanical part of the art of painting, and gives, as it were, a gallery of pictures, several of which are touched with much descriptive force. Some circumstances obliged him to quit the habit of the order, and he employed himself as a man of letters, and composed several useful works, among which were "L'Histoire de Marie Stuart," in three vols.: a translation of "Melville's Memoirs:" "Dictionnaire abregè de Peinture et d'Architecture:" "L'Histoire Moderne," being intended as a sequel to Rollin's Ancient History: of this he finished eleven volumes, and it was afterwards continued to twenty-six. In 1752 he published "Rabelais moderne, ou les Œuvres de Rabelais mise a la portée de la plupart des Lecteurs," eight vols. He has been much and deservedly blamed for not suppressing the indelicacies and obscenities of the author, as he undertook to abridge him by omitting the obscure and less interesting passages of his works. He was liable to a heavier censure for publishing, in 1754, "L'Analyse de Bayle," in four vols. 12mo., since reprinted in Holland. On account of this Marsy was, for a time, imprisoned in the Bastile. He died in 1763, while employed in writing the 12th vol. of his Modern History.

Marsy, Gaspard, an excellent sculptor, born at Cambray in 1624, where he acquired the principles of his art under his father, and in 1648 he went to Paris to perfect himself. In this journey he was accompanied by his brother Balthasar; they worked together some years, till at length they attracted the notice of M. de la Vrilliere, secretary of state, who employed them in the decorations of the hotel de Toulouse. After this they were engaged in the works carrying on at Versailles; their most celebrated performance was a group of tritons watering the horses of the sun in the baths of Apollo. Their last work in conjunction, was the tomb of John Casimir, king of Poland. After this Balthasar laid aside his profession, but Gaspard finished several other works that did honour to his reputation. In 1657 he was received into the Academy of Painting and Sculpture, was nominated professor in 1659, and chosen rector in 1675. He died in 1681, having survived his brother seven years. Gen. Biog.

MARSYAS, in *Ancient Mythology*, a native of Celænæ, a town in Phrygia, and son of Hyagnis, who flourished, according to the Oxford Marbles, 1506 years B.C. Marsyas was a famous performer on the flute, of which his father was said to be the inventor. He is represented by Diodorus Siculus (lib. iii. cap. 10.) as a man commendable for his wisdom and temperance. Having engaged in a musical contention with Apollo, he chose the people of Nysa, at that time the residence of Bacchus or Osiris, for judges. Apollo played at first a simple air upon his instrument; but Marsyas taking up his pipe, struck the audience so much by the novelty of its tone, and the art of his performance, that he seemed to be heard with more pleasure than his rival. Having agreed upon a second trial of skill, it is said that the performance of Apollo, by accompanying the lyre with his voice, was allowed greatly to excel that of Marsyas upon the flute alone. Marsyas, with indignation, protested against the decision of his judges, urging, that he had not been fairly vanquished according to the rules stipulated, because the dispute was concerning the excellence of their several instruments, not their voices; and that it was wholly unjust to employ two arts against one.

Apollo denied that he had taken any unfair advantage of his antagonist, since Marsyas had employed both his mouth and fingers in performing upon his instrument; so that if he was denied the use of his mouth, he would be still more disqualified for the contention. The judges approved of Apollo's reasoning, and ordered a third trial. Marsyas was again vanquished; and Apollo, inflamed by the violence of the dispute, flead him alive for his presumption.

Pausanias relates a circumstance concerning this contest, that had been omitted by Diodorus, which is, that Apollo accepted the challenge from Marsyas, upon condition that the victor should use the vanquished as he pleased.

It is natural to suppose that great provocation had been given on both sides, previous to a trial of skill, big with such serious consequences. And it appears from a passage in Apuleius, that the champions had tried their strength at invective and sarcasm, before the musical contest began. According to this writer, Marsyas was so foolish as to irritate the god, by opposing his own entangled hair, his frightful and shaggy beard, to the flowing locks, the finical effeminacy, and dainty cleanliness of his rival; for which he was hissed by all the muses and company present.

It is difficult to acquire a true idea of the character of this musician, as some ancient writers, in speaking of him, tell us that he was a man of talents and wisdom, while others represent him as an ignorant clown; just as Polonius, in our Shakspeare's Hamlet, is in some scenes a wise man, and in others an ideot.

Plato tells us that we are indebted to Marsyas and Olympus for wind-music; and to these two musicians is likewise attributed the invention of the Phrygian and Lydian measure. Marsyas is also said by some to have been the inventor of the double flute, though others give it to his father Hyagnis.

Antiquity has furnished us with several monuments of the punishment inflicted upon him by Apollo. He may be seen in Berger, in Maffei, and in Du Choul. The story is likewise well and fully represented in one of the ancient pictures dug out of Herculaneum. Here the vanquished musician is bound to a tree, the executioner standing by with a knife

knife in his hand, only waits for orders from the victor to flay him alive. Apollo is seated at a distance, with a lyre in one hand, and a plectrum in the other, and a muse by his side, preparing a garland for him in token of victory. A young man, on his knees, appears to implore his mercy; this is thought to be Olympus, the scholar of Marsyas, asking pardon for his master, or, perhaps permission to give him funeral obsequies, which, as we learn from Hyginus, he obtained.

And Diodorus informs us, that Apollo, soon repenting of the cruelty with which he had treated Marsyas, broke the strings of the lyre, and by that means put a stop, for a time, to any further progress in the practice of that instrument.

MART, denotes a great fair or market, for selling of goods, holden every year. See FAIR and MARKET.

MART, *Letters of*. See LETTERS and MARQUE.

MARTA, in *Geography*, a town in the duchy of Castro, on a river of the same name, where it issues from the lake of Bolsena; 11 miles E. of Castro.

MARTA, or *Martena*, a town of Hindoostan, on the coast of Malabar; 10 miles S. of Cochin.

MARTA, *St.*, a branch of the *Andes*; which see.

MARTA, *Santa*, or *St. Martha*, a province of South America, in the viceroyalty of New Granada, bounded on the N. by the Spanish Main, on the E. by Rio de la Hache and Maracaibo, on the S. by Santa Fé, and on the W. by Carthagena. This is a mountainous and very high country, extending in length about 300 miles, and in breadth about 200. The climate is hot and sultry, but the heat is mitigated by the winds which blow over the mountains covered with snow. The chief town is

MARTA, *Santa*, or *St. Martha*, which is a sea-port on the Spanish Main, founded in 1555; with a good haven defended by two forts, but of late considerably declined; the houses being now mostly constructed of wood and covered with straw. This was the place of arms of Quesada, the conqueror of New Granada; and was reduced to ashes, in 1596, by sir Francis Drake. It is now a bishop's see. The port is large and convenient, protected by lofty ridges, and has in front a round hill, which defends the city on the side of the snowy mountains, at the distance of three leagues. These mountains may be regarded as the termination of the main chain of the *Andes*; which see. The climate is less hot and more healthy than that of Carthagena; and the city is supplied with excellent water from the river Goegaira, or Guayra, which passes near it: the banks of the river being covered with beautiful groves of trees, and among others, some whose leaves bear an unctuous appearance, and are used as soap. The environs produce cotton, tobacco, some wine, cacao, Brazil wood, sugar, vanilla, and some wheat. Here is also abundance of cattle, and some mules are bred. The population of Santa Marta is not ascertained. At Carrizal, on the S. of Cape Vela, 16 leagues E. of the city of Santa Marta, there is a pearl fishery, which, under bad conduct, yields only about 30,000 dollars. At Ocana there are copper mines, and gold mines near the river Ariguana, 30 leagues from the city. Ornaments of tombac have been found in the tombs of the Indians. Estella, who has given a minute and interesting description of this province, says, that it only contains betwixt 25 and 30,000 souls, the population of a mere European town; 100 miles N.E. of Carthagena. N. lat. 11° 19′ 2″. W. long. 74° 4′ 30″. See NEW GRANADA.

MARTABAN, a sea-port town in a province of the same name, in the Birman empire. It was formerly a port of considerable eminence; but it has lost its distinguishing importance by the plunder and devastation of the Peguers and Siamese, and by the obstruction of the navigation into its harbour, occasioned by ships that were sunk in the river by order of the Birman sovereigns. N. lat. 16° 38′. E. long 98° 2′. See ARRACAN, AVA, BIRMAN *Empire*, PEGU, and SIAM.

MARTAGO, a town of Spain, in the province of Leon; 10 miles S.S.E. of Civdad Rodrigo.

MARTAGON, in *Botany*, a name given to several species of lily.

MARTANO, in *Geography*, a town of Naples, in the province of Otranto; 10 miles N.W. of Otranto.

MARTAWAN, a village of Syria, that lies on the road from Alexandretta to Aleppo, celebrated among the Turks and Europeans, on account of an extraordinary practice of the inhabitants, who let out their wives and daughters for a trifling sum. "This prostitution, held in abhorrence by the Arabs, seems to me," says Volney, (Trav. in Egypt, &c. vol. ii.) "to have originated in some religious custom, which ought perhaps to be sought for in the ancient worship of the goddess Venus, or to be attributed to the community of women permitted by the Ansarians, to which tribe the inhabitants of Martawan belong."

MARTEAU, in *Conchology*, the name given by French naturalists to a peculiar species of oyster, called also *malleum* by others. It is one of the most curious shells in the world. Its figure is that of a hammer, with a very long head, or rather of a pick-ax. It has a body of moderate thickness, and two long arms. It is of a brownish colour, with a beautiful tinge of a violet-blue. Notwithstanding the strange shape of these shells, they close very exactly.

MARTEAU, in *Ichthyology*. See SQUALUS *Zygæna*.

MARTEL, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Gourdon; 29 miles N. of Cahors. The place contains 2711, and the canton 9952 inhabitants, on a territory of 187½ kiliometres, in 14 communes.

MARTELLI, LODOVICO, in *Biography*, was born at Florence in 1409, and became distinguished by his poetical genius, and, but for an early death, would have had a high rank among the literary characters of his age and country. He was author of many verses, as well in the burlesque as in the serious style; but is chiefly known for a tragedy, entitled "Tullia," which is much esteemed among the early productions of the Italian drama. He had a brother, Vicenzo, who was patronized by the prince of Salerno. On some account he was thrown into prison; on which occasion he made a vow to undertake a pilgrimage to Jerusalem, should he regain his liberty. This event took place; and he finally retired to a tranquil life, and died in 1556. A volume of his poems and letters was published in 1607: many of his letters also are to be met with in the collection of letters of illustrious men, published at Venice in 1564.

MARTELLI, PIETRO-JACOPO, an eminent Italian poet, born at Bologna in 1665, was educated first at the Jesuits' school, and afterwards at the university of his native city. His father would willingly have brought him up to the profession of physic; but the young man could not endure the practice, and was permitted to devote himself to the study of classical literature. When he was about thirty-two years of age, he obtained the post of one of the secretaries to the senate of Bologna. He published a serious poem, entitled "Gli Ocche di Gesu," *the Eyes of Jesus*. He next applied himself to tragedy, and having carefully perused the Greek and the French tragedians, he published "La Morte di Nerone." This and several of his other pieces were acted upon

upon different theatres, with great applaufe. In 1707 he was appointed profeffor of the belles lettres in the univerfity of Bologna, and foon after was made private fecretary to Aldrovandi, who had been nominated delegate to pope Clement XI. At Rome he contracted an intimacy with many men of high literary reputation, and was the means of renewing the affemblies of the academy of Arcadi. He publifhed about this period feveral tragedies, and a fingular dialogue, "Del Volo," *On Flying*, in which he endeavoured to prove that men and heavy bodies might be fupported in the air; and in the fame work he gave a defcription of a flying fhip, which he projected. He alfo wrote feveral difcourfes in verfe concerning the art of poetry. He next went to Paris with Aldrovandi, who was appointed the pope's legate at the courts of France and Spain, and became acquainted with the moft diftinguifhed men of letters, at whofe requeft he ftated at length his opinions "On ancient and modern Tragedy," in the form of dialogues, which were publifhed by his friends before he had revifed them for the prefs. On his return to Rome, in the courfe of nine months, he publifhed his tragedies in three volumes, and was reckoned to have conferred, by the work, a great benefit on Italian literature, by reviving a true tafte for this fpecies of compofition. In 1716 he was diligently occupied at Rome with a difpute between the cities of Bologna and Ferrara, concerning the derivation of the waters of the Reno and Po. His zeal in this bufinefs caufed him, in 1718, to be promoted to the vacant place of firft fecretary to the fenate. He wrote feveral other pieces befides thofe that have been referred to, and began a poem "On the Arrival of Charlemagne in Italy, and his Acceffion to the weftern Empire," which he never finifhed. He died in 1727, at the age of fixty-two. As a man, he was beloved for the fuavity of his manners and his focial qualities. As a poet, he was elevated and fplendid rather than eafy and natural, and a great admirer of his own productions. His principal works in profe and verfe were printed in nine volumes, 8vo., in the year 1729. Gen. Biog.

MARTELLIERE, Peter de le, who rendered his name celebrated as an advocate at the French bar, was the fon of a lieutenant-general. He came to Tours at the time that the parliament of Paris held its fittings there, and entering himfelf at the bar, followed the profeffion of a pleader during forty-five years, with a celebrity that placed him among the moft eminent advocates of his time. In 1611 he pleaded the caufe of the univerfity of Paris againft the Jefuits, and pronounced a moft bitter philippic on the fociety, which was much admired as well in print as on the delivery. It went through feveral editions, and was anfwered by fome perfon on the part of the fociety. Martelliere was afterwards created a counfellor of ftate. He died in 1631. He is ftyled, in his epitaph, "Princeps Patronorum, et Patronus Principum." Moreri.

MARTELLO, Cape, in *Geography*, the fouth point of the ifland of Negropont. N. lat. 38°. E. long. 24° 39′.

MARTENNE, Edmund, in *Biography*, a learned French Benedictine monk, was born in the year 1654. At the age of eighteen he took the vows in the abbey of St. Remi at Rheims, where he was greatly diftinguifhed among his contemporaries by the diligence of his application, and his profound laborious refearches. As an author he firft appeared in 1690, with a work, entitled "Commentarius in Regulam fancti Benedicti literalis, moralis, hiftoricus," which is a compilation of what the beft writers have faid on the fubject, and contains differtations on different queftions, which difplay the erudition of the author. He publifhed "De antiquis Monachorum Ritibus," in two volumes, 4to., which furnifhes much curious matter, illuftrative of ancient ecclefiaftical and profane hiftory. From this period he was frequently before the public by works of various merit; but his fame with pofterity is chiefly fecured by the part which he took in new-modelling the work, entitled "Gallia Chriftiana." To enable him to do this, it was determined that he fhould vifit the public archives, and the libraries of the churches and monuments throughout the kingdom, to fearch for fuch documents as had efcaped the knowledge and inveftigation of the original authors. On this literary miffion he fet out, and traverfed, alone, Poitou, Berry, Nivernois, and part of Burgundy. He fpent fix years in thefe travels, the refult of which was a rich harveft of materials, which, exclufive of more than two thoufand pieces illuftrative of the "Gallia Chriftiana," compofe the greater part of five volumes in folio, publifhed in 1717, under the title of "Thefaurus novus Anecdotorum," &c. In the fame year he publifhed, conjointly with his fellow-labourer, D. Urfin Durand, a particular account of their journey, entitled "Literary Travels of two Monks of the Congregation of St. Maur." Two years after, they took another journey by order of their fuperiors, and publifhed an account of it, under the fame title with the preceding. The refult of this fecond journey was an immenfe collection of documents, in nine volumes, folio, under the title of "Veterum Scriptorum et Monumentorum Hiftoricorum, et Dogmaticorum ampliffima Collectio:" of thefe the firft three appeared in 1724, and the fix laft in 1733. He was concerned in many other publications, particularly in father Mabillon's fixth volume of his "Annales Ordinis S. Benedicti;" and in the new edition of father d'Achery's "Spicilegium." He died in 1739, at the great age of eighty-five. He was refpected and beloved by his literary contemporaries, as well on account of the fimplicity of his manners as of the vaft extent of his learning, and his indefatigable induftry. Moreri.

MARTENS, Thierry, in Latin, *Martinus*, a native of Aloft, in Flanders, celebrated as the perfon who firft introduced the art of printing into the Netherlands; having exercifed this ufeful and noble art nearly fixty years at Aloft, Louvain, and Antwerp. He died at the laft-named place in 1553, at the age of four-fcore. He was an author as well as a printer; but it is faid his own productions were the leaft valuable of thofe that iffued from his prefs. He was highly efteemed by the learned men of the period in which he lived, and enjoyed the friendfhip of Erafmus, who lodged in his houfe. He employed the double anchor as a fign of the books that were printed at his office. Gen. Biog.

MARTHA Brae, in *Geography*, a harbour and village in Jamaica. N. lat. 18° 31′. W. long. 77° 32′. See Falmouth.

Martha, *St.* See *Santa* Marta.

Martha, *St.*, *Bay*, a bay on the W. coaft of the ifland of Curaçoa.

Martha's *Vineyard*, an ifland in the Atlantic, near the coaft of New England, belonging to Duke's county, Maffachufetts, called by the Indians "Nope," or "Capawock," lying between 40° 17′ and 41° 29′ N. lat, and between 70° 22′ and 70° 50′ W. long. W. of Nantucket; about 21 miles in length, and fix in breadth.

Martha's Vineyard, Chabaquiddick, Noman's ifland, and the Elizabeth iflands, which contain about 16,500 acres of valuable land, conftitute Duke's county, containing 3118 white inhabitants, and between 400 and 500 Indians and mulattoes; who fubfift by agriculture and fifhing. Cattle and fheep are raifed here in great numbers; and rye, corn,

 and

and oats are the chief produce of the island. White pipe-clay and yellow and red ochre are found in Martha's Vineyard.

MARTHALON, a town of Switzerland, in the canton of Zurich; 5 miles S. of Schaffhausen.

MARTIAGO, a town of Spain, in the province of Leon; 10 miles S. of Civdad Rodrigo.

MARTIAL, or MARTIALIS, MARCUS VALERIUS, in *Biography*, a native of Bilbilis, in Spain, where he was educated, and remained till he had arrived at man's estate, when he came to Rome. He was sent thither to study the law, but he was too much addicted to poetry to settle to a profession that requires great labour and severe study. His fine talents and taste for polite literature ingratiated him with the principal literary characters then in Rome, and even procured for him imperial patronage. Flattered with the notice taken of him, he became the panegyrist of the emperors, and in his turn gained the greatest honours, and was rewarded in the most liberal manner. Domitian gave him the tribuneship, but the poet, unmindful of the favours which he had received, after the death of his benefactor, exposed to ridicule the vices and cruelties of a monster, whom, in his lifetime, he had extolled as the pattern of virtue, goodness, and excellence. Trajan treated the poet with coldness; and Martial, after he had passed thirty-five years in the capital of the world, in the greatest splendour and affluence, retired to his native country, where he had the mortification to be the object of malevolence, satire, and ridicule. He received some favours from his friends, and his poverty was alleviated by the liberality of Pliny the younger, whom he had immortalized in his poems. Martial died in the 104th year of the Christian era, and in the 75th year of his age. He is unquestionably the most eminent of the epigrammatists, and is looked to as the sole model of that species of composition. He wrote fourteen books of epigrams, which are described by himself as "some good, some middling, and more bad;"

"Sunt bona, sunt quædam mediocria, sunt mala plura:"

this is thought by the best judges of compositions of the kind as sufficiently modest. The licentiousness of many of his epigrams deserves the strongest censure: the poet has in many instances shewn himself a declared enemy to decency, and the book is to be read by young persons with the utmost caution, as its tendency is often to corrupt the purity of morals, and initiate the votaries of virtue into the mysteries of vice. The best editions of Martial are those of Paris 1617, folio; Scriverii. 12mo. Lug. Bat. 1619; Schrevelii, 8vo. 1670. There are, as there ought to be, several castigated editions and selections for the use of schools.

MARTIAL, *St.*, in *Geography*, a town of New Mexico, in the province of Sonora; 48 miles S. of Pitquin.

MARTIAL is sometimes used to express preparations of iron, or such as are impregnated therewith; as the martial regulus of antimony, &c.

MARTIAL, *Court.* See COURT-*Martial*.

MARTIAL *Law*, is the law of war, depending upon the arbitrary, but just power and pleasure of the king, or his lieutenants. The king, though in times of peace he makes no laws but by the consent of his parliament; yet, in war, uses absolute power over the soldiery; though even this power hath been vested, of late years, in the king, or his generals of the army, by act of parliament, and under particular restrictions too.

Martial law, says sir Matthew Hale, is in reality no law, but something indulged rather than allowed as law. The necessity of order and discipline in an army is the only thing that can give it countenance; and therefore it ought not to be permitted in time of peace, when the king's courts are open for all persons to receive justice according to the laws of the land. The petition of *right* (which see) enacts that no soldier shall be quartered on the subject without his own consent; and that no commission shall issue to proceed within this land according to martial law. See *Martial* COURT.

MARTIALES FLORES. See FLORES *Martiales*.

MARTIANAY, JOHN, in *Biography*, a learned French Benedictine monk, was born at St. Sever, in Gascony, in the year 1647. Having entered into the order at Toulouse, in 1668 he applied with great diligence to the study of the Greek and Hebrew languages, with the view of obtaining a critical acquaintance with the sacred scriptures. When he had attained to that degree of competency in the pursuit which gave him confidence in his own powers, he perfected himself by reading lectures in different monasteries belonging to his order, and spent a considerable part of his life in endeavouring to illustrate them by various and very erudite publications. He was engaged jointly with father Pouget, in publishing a new edition of the works of St. Jerome, in five vols. folio, after which he gave the world a life of the saint. He was likewise author of "Historical Treatises on the Truth of the Inspiration of the Sacred Books;" a treatise "On the Canon of the Books of Scripture;" of one "On the Manner of explaining the Sacred Scripture:" he published also the "New Testament, with Notes taken entirely from the Scripture," and of a "Commentary on the Whole of the Scriptures." He died in 1717, about the age of seventy. Moreri.

MARTIANO, in *Geography*, a town of France, in the department of the Tanaro; 12 miles S.E. of Asti.

MARTIANUS CAPELLA. See CAPELLA, MARTIANUS.

MARTICHORA, in *Natural History*, the name given by the ancient Greeks to the animal which we call the manticora, or man-tiger.

MARTICK, in *Geography*, a township of America, in Lancaster county, Pennsylvania, having 1248 inhabitants.

MARTIGAO, a town of Portugal, in the province of Beira; 21 miles N.E. of Coimbra.

MARTIGNANA, a town of France, in the department of the Stura, near the Po; five miles W. of Saluzzo.

MARTIGNANO, a town of Italy, in the Trevisan; seven miles N.W. of Trevigio.

MARTIGNE', a town of France, in the department of the Ille and Vilaine; eight miles S S W. of La Guerche.—Also, a town in the department of the Mayenne; seven miles N.N.W. of Laval.

MARTIGNÉ *Briand*, a town of France, in the department of the Mayne and Loire; 15 miles S. of Angers.

MARTIGNÉ *la Comte*, a town of France, in the department of the Saône and Loire; 6 miles N. of Charolles.

MARTIGNY, which, according to antiquaries, was the ancient *Octodarum*, a village of Switzerland, in the Vallais, situated on a small plain, encircled by high mountains, and divided by the Dranse, that falls into the Rhone. This is a place much frequented by travellers; it leads to the Valley of Chamouny, to St. Maurice, and the lake of Geneva, and is the passage of the merchandize which is conveyed over the great St. Bernard into Italy. Near Martigny, are the majestic ruins of Le Bathin, an old episcopal castle, crowning the summit of a craggy rock, and impending over the impetuous Dranse.

MARTIGUES, LES, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton, in the district of Aix; situated on an island at the mouth

mouth of a lake, to which it gives name, near the fea; the lake is near 20 miles long, and 12 broad; 14 miles S.S.W. of Salon. The place contains 7079, and the canton 10,947 inhabitants, on a territory of 297½ kiliometres, in fix communes.

MARTIN, BERNARD, in *Biography*, was born at Dijon, in 1574. He was educated for the profeffion of the law, and was admitted an advocate in the parliament of Burgundy, where he diftinguifhed himfelf by the erudition and eloquence of his pleadings. In 1605 he was called to the capital on an affair of fome confequence. Here he publifhed the refult of feveral years critical refearches into different ancient authors, under the title of Bernardi Martini Variarum Lectionum, lib. iv. After this he applied himfelf folely to his profeffional ftudies, and made large collections for a commentary on the cuftom of Burgundy, which he had juft put to the prefs when he died in 1639. Moreri.

MARTIN, faint, was born at Sabaria, in Pannonia, now denominated Hungary, about the year 316. He ferved in the army fome years, but being converted to Chriftianity he embraced a religious life, and was the means of converting his mother from the pagan doctrines. In 374 he had obtained fuch a reputation in the church that he was appointed bifhop of Tours, but his elevation to this high dignity did not lead him to banifh the original fimplicity, and even aufterity of the monk. He erected the monaftery of Marmontier, and is confidered as the apoftle of the Gauls. He died in the year 397. Under his name there is extant a confeffion of faith on the doctrine of the Trinity.

MARTIN I., pope, who obtained likewife the honour of the titles of faint and martyr in the Romifh church, was a native of Todi in Umbria, became prefbyter of the church of Rome, in 649, and was elected to the papal throne on the death of Theodore. It is not our bufinefs, in this place, to enter at large into the contefts which agitated the church at this period; they relate chiefly to the number of wills and operations in Chrift, one party maintaining the doctrine of one will and one operation, and the other, that of two wills and two operations. See MONOTHELITES.

As foon as Martin had taken poffeffion of his fee, he directed a council of bifhops to be affembled at Rome, who met at Rome to the number of one hundred and five. The debates were violent and protracted through five feffions, when by the influence of the pope it was decreed that the doctrine of two wills was the true Catholic doctrine, and that, of one will, plainly heretical. Martin next endeavoured to conciliate the emperor, and by a moft fubmiffive and flattering letter, endeavoured to convince him that the doctrine of one will was repugnant to the decrees of the councils, to the doctrine of the fathers, and to the belief of the church; and that therefore it had been of neceffity condemned. Conftans was not, however, fo eafily won over; he was enraged at the conduct of the pope, and determined to revenge the infult offered to the imperial laws, and without hefitation ordered the exarch of Italy, at all events, to feize and depofe Martin, and to fend him away prifoner. The officer performed the duty enjoined upon him with the utmoft promptitude. The pope, notwithftanding the remonftrances of the clergy, who offered to vindicate his authority, and to ftand by him to the laft, furrendered to the civil power, and was carried privately, with a few domeftics, on board a veffel in the Tyber, which was immediately difpatched to the Eaft. During a tedious voyage of three months, they touched at different places, at which the pope was not permitted to go on fhore, notwithftanding his fufferings from fea-ficknefs, the gout, and other diftreffing maladies. He was, moreover, cruelly deprived of fuch comforts and refrefhments as were brought to him by the clergy and others, who were driven away, and fometimes grofsly infulted as enemies of the ftate, and rebels to the emperor. When he had arrived at the ifland of Naxos, in the Archipelago, he was confined there a whole year, and then ordered to be brought to Conftantinople, where he arrived in the autumn of 654. Here he was clofely imprifoned and feverely maltreated for more than three months. He was at length brought to trial on a charge of high treafon, of which he was found guilty, without much regard to the nature of the evidence adduced; the verdict was however no fooner delivered than the high treafurer, who prefided as judge, ordered the guards to ftrip him, and the people to anathematize him; he was then delivered to the governor of Conftantinople, who directed an iron collar to be put about his neck, and to have him dragged through the ftreets of the city, loaded with chains, and then fhut up in prifon, till he fhould be led out to execution. Here he was treated with great barbarity, and would probably have died under his fufferings, had not the emperor been perfuaded to fpare his life. He accordingly banifhed him to the Sarmatian Cherfonefus, where he arrived in the fpring of 655. In this inhofpitable country, and in the midft of a pagan people, he had the mortification of finding himfelf entirely neglected by his friends in Italy, and fuffered even to want the common neceffaries of life. He died in the following September. There are ftill extant feventeen of his "Letters," in the fifteenth volume of the Collect. Conciliorum, which are faid to exhibit fuperior talents and an enlarged mind. Bower.

MARTIN II., pope, fometimes called Marinus I., the fon of a prefbyter, and a native of Gallefium in Tufcany, recommended himfelf to different popes by his great talents for bufinefs, and thus he rofe to the dignity of archdeacon of the Roman church. In 866 he was deputed by pope Nicholas to Bulgaria and Conftantinople, for the purpofe of excommunicating the patriarch Photius; and again in 869 by pope Adrian II. to fit in the general council convened in oppofition to that patriarch. Ten years afterwards he was fent legate to Conftantinople, a third time, by pope John VIII. to renew the act of excommunication. By the laft named pontiff he was probably ordained bifhop, but without a fee. Upon the death of John, in 882, he was elected his fucceffor; and Platina fays that he was indebted for his elevation to wicked practices, of which there is certainly no mention made by any of the more ancient writers. One of the firft meafures of his adminiftration was to declare the acts of the late council of Conftantinople null and void, and to anathematize all who fhould communicate with Photius, or acknowledge him as lawful patriarch. Thefe proceedings gave fo great offence to the emperor Bafilius, that he would not own him for lawful pope. Another meafure of pope Martin's government, was his reftoration of Formofus, bifhop of Porto, to his fee, though he had been repeatedly excommunicated by his predeceffors, and even obliged to fwear that he would never refume the epifcopal functions. Martin abfolved him from the obligation of his oath, declaring him innocent of the crimes laid to his charge, and replaced him in his bifhopric. Nothing more of moment is recorded of this pontiff. He died before he had prefided over the holy fee eighteen months. We have remaining of his works "A Conftitution for the Benedictine Monaftery in the Diocefe of Limoges," which may be found in the ninth vol of the Collect. Concil. Bower.

MARTIN III., pope, fometimes known by the name of Marinus II., probably a Roman by birth, fucceeded to the papal dignity on the death of the eighth, or, as others affirm, the ninth Stephen, in the year 942. Little is known of this pope, except that he was too much attached to the fyftem of monkery,

monkery, and granted very extraordinary privileges and exemptions to what were called religious men and houfes. He died in 946, after a pontificate of about three years and a half. He was a great friend to the poor, and was liberal in building, repairing, and adorning churches; and is defervedly praifed for his endeavouring to reconcile the Chriftian princes who were engaged in bloody wars. Bower.

Martin IV., pope, whofe original name was Simon de Brie, or de Brion, was defcended from an illuftrious family, and born at Montpenfier, in the Touraine. He many years held diftinguifhed offices in the church, and in 1260 was appointed keeper of the feals to Lewis IX.: in the following year he was created cardinal by pope Urban IV., after which he fuftained the character of papal legate in France, both under that pope, and under Gregory X. After the death of Nicholas III., and when the Roman fee had been vacant more than fix months, he was elected to fill it in February 1281, and upon his promotion to this high honour he affumed the name of Martin, avowedly in honour of St. Martin of Tours, of which church he had been canon. From the moment of his acceffion, his whole attention was directed to the promotion of the Roman hierarchy. With the defign of favouring the views of Charles, king of Sicily, on the Greek empire, and the city of Conftantinople, and with the view of rendering the influence of the papal fee triumphant in the Eaft, he excommunicated the emperor Michael Palæologus, under a very flight and flimfy pretext, of his having broken the peace which had been concluded between the Greek and Latin churches, at the council of Lyons, in the pontificate of Gregory X. This defign was entirely defeated by the famous confpiracy known by the name of the Sicilian *Vefpers*, (which fee,) by which all the French in the ifland were butchered, and the revolution effected that feated Peter, king of Arragon, on the throne of Sicily. The pope immediately thundered out the moft dreadful anathemas againft all the perfons concerned in this atrocious deed, and when Peter landed in the ifland, and was crowned king, he wrote feveral threatening letters to him, demanding that he fhould inftantly refign his pretenfions, and withdraw from a country which belonged to the apoftolical fee, upon pain of excommunication, and the forfeiture of his own kingdom. The king fet his holinefs at defiance, and avowed his determination to keep poffeffion of Sicily, as the inheritance of his wife, and he was readily obeyed by the clergy in both his kingdoms, whom he commanded to continue in the regular exercife of their functions, notwithftanding the interdict. Irritated at Peter's refiftance, the pope, by a bull. deprived him of the kingdom of Arragon, and his other dominions in Spain, which he declared to be forfeited, and that they fhould be the property of any prince who would feize them. In derifion of the pope's pretended power to deprive him of the regal title, the king of Arragon ftyled himfelf "Peter, a gentleman of Arragon, the father of two kings, and lord of the fea." Martin, anxious for revenge, offered the dominions of Peter to Philip of France, and to affift him in the feizure, his holinefs granted him the tenth of the ecclefiaftical revenues, and encouraged his fubjects to flock to his banner, by granting indulgences to all who fhould engage in that holy war. While he was meditating other projects, as well for the humiliation of the rebellious monarch as for the glory of the Roman hierarchy, he was cut off by a fudden death in 1285, after a pontificate of four years. There are five of his "Letters," and the fentence which he pronounced againft Peter of Arragon, in the 11th vol. of the Collect. Conciliorum. Befides thefe, there are thirteen of his letters in Waddingi Annal., and in the appendix to this work. Moreri. Bower.

Martin V., pope, whofe former name was Otho, or Eudes Columna or Colonna, was a defcendant from a branch of an ancient and well-known family of that name. He ftudied canon law at Perugia, and was created prothonotary and referendary by pope Urban VI. He was appointed nuncio to the Italian ftates by Boniface IX., and raifed to the purple by Innocent VII. He adhered to the interefts of Gregory XII. till he was depofed by the council of Pifa. He was appointed apoftolical legate for the patrimony of St. Peter, and vicar general of the apoftolical fee in Umbria; in which employments he gave the moft perfect fatisfaction to his employers. Upon the depofition of pope John by the council of Conftance, in 1417, he was elected to the papal dignity, and took the name of Martin V. On his coronation he was conducted on horfeback through the city in pontifical attire, by the emperor on foot, holding his bridle, on the right hand, and the elector of Brandenburg on the left, and followed by a crowd of princes and the whole council. After diffolving the council of Conftance, in the year 1418, Martin fet out on his return to Italy, with the view of endeavouring to terminate the civil war in which the city of Rome and the whole patrimony of St. Peter had been fome time involved. In his progrefs he fpent fome time at Geneva, where he received the ambaffadors of the city of Avignon, and from that city he difpatched a legate into Bohemia, who made a fruitlefs effort to quell the difturbances in that kingdom, which had been excited by the denial of the cup in the facrament to the laity, and the execution of Hufs and Jerome of Prague. Martin next went to Milan, where he was received with extraordinary marks of honour. After this he vifited Mantua, Ferrara, Ravenna, and came to Florence in the beginning of the year 1419. Here he continued about two years, which were fpent in reducing the tyrants who had feized the cities in the ecclefiaftical ftate, or fuch places as had revolted againft the papal authority. In a fhort time after, he had the fatisfaction of feeing Balthafar Coffa, formerly John XXIII., throwing himfelf on his mercy, and his fubmiffion was followed by a fplendid embaffy from Joan II., queen of Naples, to do him homage in her name, and to requeft that his holinefs would fend a legate to perform the ceremony of her coronation. Immediately after this ceremony, Joan caufed all the places which her predeceffor Ladiflaus had feized in the ecclefiaftical ftate to be reftored, and alfo fent James Sforza, a foldier of fortune, with the flower of her army, againft Braccio of Perugia, who had made himfelf mafter of many cities belonging to the church, and of Rome itfelf, which he governed under the title of "Defender of the City of Rome." Sforza was defeated, and purfued with great flaughter to the borders of the kingdom of Naples. The pope inftantly excommunicated the conqueror, who, to fhew his contempt for fuch kind of hoftility, in his turn excommunicated the pope and all who adhered to him. Through the mediation of the Florentines, an agreement was foon concluded between Braccio and the pope, the former confenting to deliver up Rome, and fome other cities to the pope. Martin refolved to go to Rome, which he entered in September, 1420, and was received with the loudeft acclamations of joy by the clergy, the fenate, and the people, who hailed his approach as their deliverance from abfolute deftruction. At this period, the city was but little better than a heap of ruins, and the inhabitants almoft ftarving. To remedy thefe evils, Martin applied himfelf with the utmoft zeal and vigour, and in lefs than two years he acquired the title of Romulus II., by his exertions to to promote order and regularity, and to restore the city to its ancient splendour and beauty. In the mean time Peter de Luna, under the name of Benedict XIII., continued to act the part of sovereign pontiff, and at his death, in 1424, Giles de Munion was elected his successor, by the name of Clement VIII., who was supported by Alphonso of Naples. When Martin sent a legate to this prince, in 1426, to remonstrate with him on his being the only Christian prince who upheld the schism in the church, Alphonso prohibited the legate from entering his dominions, and likewise forbad the bishops, and other ecclesiastics, to receive any letters from the pope on pain of forfeiting their dignities and revenues. Alphonso, after this, was glad to come to an accommodation with his holiness, which, after protracted negociations, was effected in the year 1429. It was agreed that the anti-pope and his cardinals should resign their dignity, submit to Martin, receive absolution from the legate, and be provided for with considerable benefices. Thus terminated the schism, known by the name of the "Great Western Schism," after it had lasted more than half a century. Martin was now left without a rival, and he immediately turned his attention to promote crusades against the Hussites of Bohemia. He died of a stroke of apoplexy in 1431, having been at the head of the church more than thirteen years. Martin was a decided enemy to reformation in the church, and disposed, generally, of lucrative employments to his relations, in preference to all others, however deserving. Fifteen of his "Letters," "Bulls," and "Constitutions," are to be met with in the twelfth volume of father Labbe's Concil. Maxim. Others are also to be found in "Bzovii Annal." and in the first volume of Laertius Cherubini's "Magnum Bullarium," &c. Bower.

Martin, a Catholic prelate in the sixth century, was by birth a Pannonian, or Hungarian, who quitted his native country when he was very young, and travelled into the East, for the purpose of visiting Jerusalem and the holy places. From Palestine he went into Spain, where he converted great numbers of people to what was called the Christian faith, and founded many monasteries. He was present at the second council of Braga, in 563, and presided at the third council in the year 572. He died in 572, and left behind him many very learned works, of which the most important is entitled "Collectio Canonum Orientalium," consisting of eighty-five canons of the Greek church, translated into Latin by himself. They are to be met with in all the collections of the councils, and in them the pretended "Apostolical Constitutions" are never cited. Moreri

Martin, Benjamin, a celebrated optician and experimental philosopher, was born in the year 1704. He was the son of a farmer, and became in early life a school-master at Chichester, where he wrote some excellent books on mathematical subjects. The profits of his profession probably enabled him to procure, by degrees, a good apparatus of philosophical instruments, with which he commenced lecturer in experimental philosophy, and travelled for some time in that character through different parts of the kingdom. He next appeared in the same profession in London, and delivered his courses to crowded audiences for many years. He finally settled in Fleet-street, London, as an optician, and made several important improvements on mathematical and philosophical instruments. The growing infirmities of age, obliged him to quit the active part of his business, and, trusting too much to others, his affairs became embarrassed, and he was made a bankrupt, though it was found his effects were more than sufficient to discharge all his debts. His mind was not equal to the shocks of adversity, and in the moment of despondency he attempted to destroy himself. He did not succeed in the effort, but the wound which he inflicted hastened his death, which took place in 1782, when he had attained the age of seventy-eight. His works are numerous, and were exceedingly valuable at the time of their publication. Some of them retained a large share of popularity till within the last twenty years, particularly his "Philosophical Grammar;" "The young Trigonometer's Complete Guide," in two vols. octavo; "The Philosophia Britannica," or "System of the Newtonian Philosophy," in three vols. octavo. He had, during his long life, formed a capital collection of fossils and other curiosities, which were sold after his death. "As an artist," says his biographer, "he was industrious and ingenious; and, as a writer, he possessed the happy method of explaining his subject; he wrote with perspicuity and even elegance."

Martin, David, a French Protestant divine in the 17th and the early part of the 18th centuries, was born at Revel, in the diocese of Lavaur, in the year 1639. Having passed through his academic studies with credit and applause, he was admitted M. A. and doctor of philosophy in the year 1659. After this, he applied himself to the study of divinity; to that of the sacred scriptures, the oriental languages, ecclesiastical history, and the different branches of profane as well as sacred literature. In 1663, he settled as pastor, and officiated in the ministry till the revocation of the edict of Nantes in 1685. After this, and the demolition of his place of worship, it being discovered that he still maintained a private connection with his church, he narrowly escaped an arrest, and withdrew to Holland. In 1686, he was invited to become professor of divinity, and pastor of the Walloon church in Deventer; but the regency of Utrecht, where he had taken up his residence, prevailed upon him to accept the office of pastor in their city. He afterwards received invitations from several other churches, both in the republic and abroad, and particularly from that of the Hague, which he declined. He now employed himself in giving lectures in philosophy and divinity, and acquired so high a reputation by his successful manner of instructing his pupils, that young persons of high rank, and even the sons of sovereign princes, were placed under his tuition. He had deeply studied the nature and genius of his own language, and when the French academy was about to publish the second edition of their Dictionary, he sent them remarks and observations, of which they availed themselves, with polite acknowledgments to the author. He died in 1731, having completed his eighty-second year. He was author of many learned works, among which is an edition of "The New Testament, according to the Geneva Version, with Corrections, Notes, New Prefaces, &c.;" "A History of the Old and New Testament," in two vols. folio, embellished with upwards of 400 engravings; "A Treatise on Natural Religion;" and one on "Revealed Religion," in two volumes octavo. This was his last work, the second edition of which bears the date 1720. Moreri.

Martin, Claude, an officer in the British military service in India, was by birth a Frenchman, of rather a mean descent. He had sufficient interest to get a good mathematical education at a public school, and at the age of 20 entered into the army. His regiment was sent to India with general Lally, and, in the war of 1756, he behaved with great gallantry, but being ill-treated, he enlisted into the English service, in which he rose to the rank of colonel. Being employed to make a map of the estates of the nabob of Oude, he recommended himself to his patronage. Martin was enabled, under the protection of the nabob, to open a profitable bank, and to embark in other commercial speculations, by which he gained a deal of wealth. At Lucknow he built a curious manfion in a ftyle of his own, in which he could enjoy all the mildnefs and coolnefs of an European climate with the fervour of the Afiatic. He erected another of the fame kind on the banks of the Ganges, which he fortified in the European manner. He formed a large mufeum of natural hiftory; conftructed an immenfe garden, which he ftocked with a prodigious variety of plants; and built an obfervatory, which he furnifhed with the beft aftronomical inftruments he could obtain. He died in the year 1799, bequeathing the great wealth which he had amaffed principally in charity.

Martin, in *Geography*, a fmall ifland near the W. coaft of Scotland, at the entrance of Loch Broom. N. lat. 57° 55'. W. long. 5° 5'.

Martin, a county of Halifax diftrict, North Carolina, adjoining Tyrrel, Halifax, Bertie, and Pitt counties, containing 5312 inhabitants, of whom 1646 are flaves.

Martin, *Cape*, a cape of Spain, on the coaft of Valencia. N. lat. 38° 47'. E. long. 0° 3'.

Martin, *St.*, *Cape*, a cape on the N. coaft of New Spain, in the North fea.

Martin, *St.*, one of the northernmoft of the Caribbee iflands in the Weft Indies, fituated between Anguilla on the N. at the diftance of 1½ league, and St. Bartholomew on the S.E. at the diftance of 15 miles. This ifland is chiefly valuable for its falt-pits and falt-water lakes, which were held in fuch eftimation by the Spaniards, that they erected a fort upon the ifland to protect them, and to prevent other nations from making a fettlement. The falt-lakes abound in good fifh and turtle; and the falt-water pools are the haunts of birds in great number. In this ifland there is no frefh water, except that which falls from the clouds and is preferved in cifterns. In the woods are wild hogs, turtle-doves, and an innumerable multitude of parrots. Here are alfo various trees producing gums, and plenty of the candle-tree, fplinters of which, when dried and lighted, emit a very fragrant fmell. Its tobacco, which is the chief commodity that is cultivated, is reckoned the beft in the Caribbee iflands.

In 1659 the Spaniards abandoned this ifland, blew up its fort, and deftroyed all the houfes and cifterns of the occupiers. The French and Dutch afterwards fhared the ifland between them; but in the year 1689 they were attacked and plundered by fir Timothy Thornhill, and in 1744 the French were driven out by the Britifh forces, and did not return till after the peace of 1763. The two colonies breed poultry and fheep, which they fell to the other iflands; and they alfo cultivate a little cotton and coffee. About forty years ago the French part contained 400 white families, and 10,000 flaves. The Dutch part comprehends fixty families, and about 200 flaves. In March 1801, this ifland was taken by the Britifh. On the N.W. fide it has commodious harbours and bays. N. lat. 18° 5'. W. long. 62° 55'.

Martin, *St.*, a town of Hungary, on a fmall river which runs into the Waag; 10 miles W. of Rofenburg.—Alfo, a town of Mexico, in the province of Zacatecas; 95 miles S.W. of Zacatecas.—Alfo, a town of Naples, in Capitanata; 10 miles S. of Termola.—Alfo, a town of Spain, in Afturia; 44 miles W. of Oviedo.—Alfo, a town of Spain, in Old Caftile, on the Duero; 42 miles S.S.W. of Burgos.—Alfo, one of the Scilly iflands. N. lat. 50°. W. long. 6° 14'. (See Scilly *Iflands*.)—Alfo, a town of the ifland of Cuba; 130 miles S.W. of Havannah.—Alfo, a town of France, in the department of the Po; nine miles N.W. of Pinerola.—Alfo, a town of France, in the department of the Dora; 18 miles S.E. of Aofta.—Alfo, a town of France, in the department of the Maritime Alps; 19 miles N. Nice.—Alfo, a town of Sweden, in South Finland; 30 miles N.E. of Abo.—Alfo, a town of South America, in the government of Moxes; 180 miles N.N.E. of Trinidad.—Alfo, a fmall ifland in the Pacific ocean, near the coaft of Peru. S. lat. 11°.

Martin *d'Auxigny*, *St.*, a town of France, in the department of the Cher; fix miles N. of Bourges.

Martin *d'Auxy*, *St.*, a town of France, in the department of the Saône and Loire; 12 miles S.W. of Chalons fur Saône.

Martin *le Beaux*, *St.*, a town of France, in the department of the Indre and Loire, near the Cher; nine miles E.S.E. of Tours.

Martin *le Chapelle*, *St.*, a town of France, in the department of the Lozere; 12 miles S.W. of Mende.

Martin *de Cleles*, *St.*, a town of France, in the department of the Ifere; 21 miles S. of Grenoble.

Martin *de Courtifols*, *St.*, a town of France, in the department of the Marne; fix miles E.N.E. of Chalons fur Marne.

Martin *d'Euriage*, *St.*, a town of France, in the department of the Ifere; five miles S.E. of Grenoble.

Martin *de Fontenay*, *St.*, a town of France, in the department of the Calvados; four miles S. of Caen.

Martin *de Londres*, *St.*, a town of France, in the department of the Herault; 12 miles N.N.W. of Montpellier.

Martin *de Palières*, *St.*, a town of France, in the department of the Var; nine miles N. of St. Maximin.

Martin *de Ré*, *St.*, a town of France, in the department of the Lower Charente, on the N. coaft of the ifle of Ré; nine miles W.N.W. of La Rochelle. N. lat. 46° 12'. W. long. 1° 38'.

Martin *de Tournon*, *St.*, a town of France, in the department of the Indre; feven miles N.W. of Le Blanc en Berry.

Martin *de Trebejo*, *St.*, a town of Spain, in the province of Leon; 41 miles S. of Cindad Rodrigo.

Martin *de Vallamas*, *St.*, a town of France, in the department of the Ardèche; 21 miles S.W. of Tournon.

Martin *Var*, *Iflands of*, three fmall rocky iflands, which, according to Peroufe, are mere rocks in the Atlantic ocean; the largeft being about a quarter of a league in circumference. At a diftance they appear like five heads of land. S. lat. of the largeft 20° 31'. W. long. 28° 8' from Paris.

Martin's, *St.*, *Bay*, a bay on the S. coaft of the ifland of Guernfey.

Martin's, *St.*, *Point*, a cape on the S.E. coaft of Guernfey, two miles S. of St. Peter.—Alfo, a cape on the W. coaft of Africa. S. lat. 32° 40'.

Martin's, *St.*, *Iflands*, a clufter of fmall iflands in lake Huron. N. lat. 45° 33'. W. long. 84° 20'.

Martin, *Martlet*, or *Martinet*, in *Ornithology*. See Hirundo *Urbica*.

Martin, or *Martlet*, in *Zoology*, the name of a creature of the weafel kind, being the *muftela martes* of Linnæus, with cloven feet, body of a deep yellow colour, approaching to black, and whitifh throat. There are two fpecies of this creature, the one called the *martes abietum*, or fir-martin; the other the *martes fagorum*, or beech-martin. The beech-martin is diftinguifhed from the other by having a larger and blacker tail, and being all over of a darker colour, and by by being white on the throat; whereas the others are yellow; but the ſpecies are ſcarcely kept up diſtinct, the creatures mixing with one another in the breed. When diſtinct, the beech-martin is found to be a much tamer creature than the other, and may be kept about houſes like a cat; and often lives of its own accord about houſes, and among old walls. Their ſkins make a valuable fur; and that of the fir-martin, or yellow kind, is much the moſt valuable: prodigious numbers of their ſkins being annually imported from Hudſon's Bay and Canada.

The martin is of the ſize of a cat, but long-bodied; its legs are alſo ſhorter, and its claws leſs ſharp and ſhorter. Its whole body is covered with hair of a yellowiſh-black, except only the throat, which, in the beech-martin, or tame kind, is white; and in the wild kind, or fir-martin, yellow: its teeth are ſharp and ſtrong, and the dog-teeth, in particular, ſtand out a great way.

The beech-martin, with us, inhabits woods, makes its lodge in the hollows of trees, and brings from four to ſix young at a time. It makes great havock among poultry, game, &c. and will eat mice, rats, and moles. The pine, or fir-martin, inhabits the north of Europe, Aſia, and America; and is found alſo in Great Britain, particularly in Scotland; where it lodges in the fir-foreſts, building its neſt at the top of the trees.

The martin leaves ſo ſtrong a ſcent, that the hounds, when out in a morning, will often take it, and make a noble cry. The chace in this caſe is very good while it laſts, but it is very perplexed; for the creature is not able to run long, and when ſhe is tired, ſhe gets up into a tree; the hounds often loſe her on this occaſion; but if ſhe is ſpied up in the tree, ſhe is to be hunted down with ſticks, &c. When killed, the hounds are not ſuffered to eat her fleſh, for it is unwholeſome.

Martin, *Free*, is a name given in this country to a cow-calf, caſt at the ſame time with a bull-calf, which is a kind of hermaphrodite; that is never known to breed, nor to diſcover the leaſt inclination for the bull: nor does the bull ever take the leaſt notice of this animal. It has all the external marks of a cow-calf, *viz.* the teats, and the external female parts, called by farmers the bearing. When theſe animals are preſerved, it is not for propagation, but for all the purpoſes of an ox or ſpayed heifer, *viz.* to yoke with the oxen, and to fatten for the table. They are much larger than either the bull or the cow, and the horns grow larger, being very ſimilar to the horns of an ox. The bellow of the free martin is like that of an ox; and the meat reſembles that of the ox or ſpayed heifer; being generally finer than that of the bull or cow; and is more ſuſceptible of growing fat with good food. Mr. Hunter has anatomically deſcribed three animals of this kind, in the Phil. Tranſ. vol. lxix. part i. p. 289, &c.

Martin's, *St.*, *Cope*, in *Church Hiſtory*. See Cope.

MARTINAZZO, in *Ornithology*, the name of a ſpecies of water-fowl, of the larus or gull kind, the *larus nævius* of Linnæus, and called by the Dutch, the burgomaſter of Greenland; by the Corniſh people, the *waggell*, or the *great grey-gull*. See Larus *Nævius*.

MARTINDALE, Adam, in *Biography*, refuſing to conform to principles that he did not believe, was deprived of his living at Roſthorn in Cheſhire, in the year 1662, after which he acted as chaplain in the family of lord Delamere. He died about the year 1660, and is known as an author, by a uſeful tract on ſurveying, called the Land-meters Vade Mecum. He wrote likewiſe twelve problems on the ſubject of intereſt, and two almanacs. He kept a mathematical ſchool at Warrington, and afterwards at Dunham, in Cheſhire. In theology he was the author of "Divinity Knots unlooſed," and "Truth and Peace reſtored."

MARTINENGO, in *Geography*, a town of Italy, in the department of the Adda and Oglio; nine miles S. of Bergamo.

MARTINESL, a town of Tranſylvania; 16 miles S. of Millenbach.

MARTINET, in *Military Language*, denotes a ſtrict diſciplinarian, who, in matters of inferior moment, gives officers and ſoldiers needleſs trouble. Some ſay that the term is derived from an adjutant of that name, who was in high repute as a drill officer in the reign of Lewis XIV; but others deduce it from the French "Martinet," which is uſed to denominate a ſmall cat-o'-nine tails, fixed to the end of a wooden handle, with which ſchoolmaſters puniſh refractory or idle boys.

MARTINGALE, invented by Evangeliſta, an eminent horſeman of Milan, in the *Manege*, a thong of leather faſtened at one end to the girths under the belly of a horſe, and at the other end to the bitt, or, which is the better way, to a thin mouth-piece of its own, to hinder him from rearing, or toſſing up his head. It is alſo of ſervice when the horſe bears upon the hand, and his head is uncertain and inconſtant; when his jaws are too tight, and when he is ſtag-necked. If the ſnaffle is uſed with the reins faſtened low, it becomes a martingale, or anſwers the purpoſe better; becauſe the hand can make it ſtrict or eaſy, or both by turns, as the rider pleaſes, and the horſe requires.

MARTINHO, St., in *Geography*, a town of Portugal, in Eſtramadura, on the N. ſide of the Donao; 12 miles N.E. of Peniche.

Martinho *de Mouras*, *St.*, a town of Portugal, in the province of Beira; ſix miles N.W. of Lamego.

MARTINI, Martin, in *Biography*, a Jeſuit who reſided many years in China, concerning which country he wrote ſome curious memoirs. He returned to Europe in 1651, but probably viſited China a ſecond time, where he is thought to have died at about the age of 74; his principal works are "De Bello Tartaros inter et Chinenſes;" "Sinicæ Hiſtoriæ Decas prima a Gentis origine ad Chriſtum natum;" "China illuſtrata," being a geographical deſcription of that country illuſtrated by maps of each province: "A Relation of the Number and Quality of the Chriſtians in China." Moreri.

Martini, Fr. Giambatista, minor conventuale of the order of St. Francis, member of the Inſtitute and Philharmonic Society at Bologna. This worthy and learned father was well known all over Europe by the title of Padre Martini, and regarded, during the laſt fifty years of his life, as the moſt profound harmoniſt, and the beſt acquainted with the hiſtory and progreſs of the art and ſcience of muſic in Italy. All the great maſters of his time were ambitious of becoming his diſciples, and proud of his approbation. And young profeſſors within his reach never thought themſelves, or were thought by others ſufficiently ſkilled in counterpoint, till they had received leſſons from this deep theoriſt, and moſt intelligent and communicative inſtructor.

No hiſtory of muſic had been attempted in Italy, ſince that of Bontempi appeared in 1695, till Padre Martini, in 1757, publiſhed in 4to. the firſt volume of his "Storia Muſica," upon ſo large a ſcale, that though the chief part of his life ſeems to have been dedicated to it, only three volumes were publiſhed before his deceaſe in 1783.

The firſt volume of this elaborate work only contains 61 pages of hiſtory, which advance no further in the progreſs of the art, than what the ſacred writings have told us concerning its uſe and cultivation among the Hebrews, Chaldeans, and Egyptians. The reſt of the volume is filled with diſſertations. The firſt is an enquiry what kind of melody mankind is inclined to by nature, untaught by rules or example. Here the ancient Greek ſyſtems, tetrachords, ſcales, and genera are conſidered, and their numerical proportions given. Much muſical erudition is manifeſted in this diſſertation concerning the muſic of the ancients.

Diſſertation II. On what kind of conſonance was uſed by the ancients, or, in other words, whether they had ſimultaneous harmony, or that kind of *harmony*, or muſic in parts, which the moderns call *counterpoint*. This ſubject is well diſcuſſed, the opinions pro and contra fairly given, with ſpecimens of early attempts at harmony, and progreſſive improvements in counterpoint from the time of Guido. Infinite pains have been taken in this profound enquiry. No writer was ever more timid in aſſertion than the worthy Padre Martini. Not a ſentiment has eſcaped him on the authority of his own opinion or conjecture, all is confirmed by the moſt curious ſpecimens and citations from the moſt ancient and reſpectable writers on the ſubject.

Diſſertation III. Of the melody and muſical inſtruments uſed by the Hebrews in the Temple. The ſacred writings and the fathers have been ſtudiouſly conſulted and quoted in this inquiry, as well as Rabins, and the ſervice of the ſynagogues, whence ſeveral Hebrew chants have been drawn, as well as from the Pſalmody of the firſt reformers, and the canto-fermo of the Miſſal.

This volume, beſides plates of ancient inſtruments, and muſical examples printed with types, has head and tail-pieces in the form of vignettes to each chapter and diſſertation, on which are engraved canons by the author in every kind of conſtruction; which being only given in a ſingle part, without bars, and often wrapt up in myſtery, their ſolution will be an excellent ſtudy for Tyros in the art of compoſition.

"Storia della Muſica," tomo ſecondo da F. Giambatiſta Martini, in Bologna, 1770, 4to. Though thirteen years had elapſed between the publication of the firſt volume and this, the learned and laborious author has advanced but a little way in the hiſtory even of ancient muſic. The firſt volume adheres more cloſely to the ſubject of his hiſtory than this, which is more miſcellaneous. Chronologically, the author advances no further in this volume, which is wholly confined to Greek muſic, than the inſtitution of the Olympic games. So that the period which he deſcribes is limited to fabulous times. Indeed he deſcribes the cuſtoms, manners, and uſes to which muſic was applied by the moſt ancient inhabitants of Greece, more than the muſic itſelf, of which there are no remains to give evidence to the wonderful powers aſcribed to it He has a chapter on the origin of muſic in Greece, chiefly on the word of the poets; and another chapter on the univerſal uſe of muſic among that refined people. In this volume we have, likewiſe, learned diſſertations; one on the ſingular qualities aſcribed to muſic by the Greeks; and another on the reſpect which they had for this art, and the wonderful effects ſaid to have been produced by it.

In this volume, beſides a number of learned and elaborate canons, placed in a ſimilar manner to thoſe of the firſt volume, we have a map of ancient Greece and Aſia Minor; and in the preface a ſketch of the hiſtory of the early inhabitants of thoſe countries, who firſt cultivated the fine arts.

"Storia della Muſica," tomo terzo da F. Giambatiſta Martini, in Bologna, 1781, 4to.

It is much to be lamented that this was the laſt volume of his elaborate work, which the learned author lived to publiſh! It is the more to be lamented, as this indefatigable eccleſiaſtic had, with incredible pains and conſiderable expence, collected materials ſufficient for the completion of his whole plan. And this third volume advances no further in the hiſtory of ancient muſic, than the period between the eſtabliſhment of the Olympic games of Greece to the time of Alexander the Great. The hiſtory of Roman muſic only was to have occupied the fourth volume. From the materials of which P. Martini was in poſſeſſion, there is reaſon to believe that the hiſtory of muſic in Italy, where the preſent ſyſtem throughout Europe had its riſe during the middle ages, and from the time of Guido to the preſent period, would have been the moſt valuable preſent to all Europe which the good father could make; but in writing the hiſtory of ancient Greece and Roman muſic, he had no other means of information than thoſe of which others were in poſſeſſion; the claſſical writers and their commentators. Of theſe, indeed, P. Martini has availed himſelf, it will perhaps be ſaid, to an exceſſive degree. In the volume now before us, we have a long preface, and canons, as before. And beſides the hiſtory of muſic from the firſt Olympiad, we have the hiſtory of every ſpecies of poetry that was connected with muſic, with the hiſtory of its profeſſors, as well as of the ſtage, tragic and comic, and of all the poets and philoſophers who cultivated muſic, and wrote upon the ſubject. The volume is terminated with another diſſertation on the miraculous effects aſcribed to the muſic of the ancient Greeks, with new facts and reaſoning. This volume will probably be thought tedious by thoſe who have read, or are able to read, the original authors whence its materials are derived; to others it is a valuable Theſaurus of all that can be extracted concerning muſic, from the chief writers of high antiquity and authority, that are come down to the preſent times.

It is but juſtice to extend the account of this important work beyond the general limits of the ſhort analyſis given of other literary muſical articles. The ſtyle has been ſaid to be dry and prolix. It is indeed enlivened by no extraneous matter, or ingenious reflections; but each page is replete with information on the ſubject in queſtion: and the notes abound in curious paſſages from ſcarce books. The road through which the good father leads us, if not ſtrewed with flowers, is not barren, but frequently affords a glimpſe, at leaſt, of incipient cultivation, which excites a wiſh and eagerneſs to advance out of twilight, into regions where the ſun of ſcience ſhines with more luſtre, to which, alas! the author did not live to lead us.

Between the publication of the ſecond and third volumes of his "Storia Muſica," P. Martini publiſhed a work, entitled "Eſſemplare o ſia Saggio di Contrappunto," Bologna, two volumes, folio, 1774.

This excellent treatiſe, though written in defence of a method of compoſing for the church upon canto-fermo, now on the decline, yet has given the learned author an opportunity of writing its hiſtory, explaining its rules, defending the practice, and of inſerting ſuch a number of venerable compoſitions for the church by the greateſt maſters of choral harmony in Italy, from the beginning of the ſixteenth century to the middle of the laſt, that we know of no book ſo full of information concerning learned counterpoint, ſo rich in ancient and ſcarce compoſitions, nor ſo abundant in inſtructive and critical remarks, as this.

The work is divided into two parts or volumes. In the firſt, after a candid and fair explanation of his deſign, and a wiſh to keep ſacred muſic ſeparate from ſecular, we have "a ſhort compendium of the elements and rules of counterpoint." The laws of harmony are here compriſed in ten rules, which are extremely well explained and illuſtrated. We

We then have a fundamental and practical eſſay on counterpoint conſtructed upon canto-fermo. This is followed by upwards of ſixty admirable compoſitions in all the eccleſiaſtical tones by the greateſt maſters of the old ſchool of counterpoint in Italy; ſuch as Animuccia, Cifra, Morales, Paleſtrina, Pontio, Porta, Willaert, his ſcholar Zarlino, and others.

The ſecond part contains examples of compoſition, or a fundamental and practical eſſay on *contrappunto fugato*, implying the art of fugue. Here all the terms of this art are explained; as ſubject, anſwer, point, regular fugue, and imitation. Canon is defined, and indications and ſigns are given for the commencement of the ſeveral parts in Italian, Latin, and Greek, with explanations of other technica placed at the beginning of canons, where *ſeveral parts are to be.*

There are prefixed to many ancient canons, certain mottoes and enigmas of very difficult ſolution. The author has collected and explained a ſeries of theſe. Other technical terms occur, ſuch as *propoſta*, *riſpoſta*, *antecedente*, *conſequente*, *contraſoggetto*, *roveſcia*, &c. All theſe rules and terms are illuſtrated with examples of compoſition by P. Martini himſelf. After which we have near fifty compoſitions in fugue and canon of the moſt curious kind, from the works of Paleſtrina, Agoſtini, Benevoli, Bernabei, Luca Marenzio, Monteverde, Clari, Lotti, Marcello, Perti, Stradella, Steffani, Aleſſandro Scarlatti, &c. in 2, 3, 4, 5, 6, 7, and 8 parts.

The compoſitions of theſe maſters are not more admirable than the hiſtorical and critical notes of the editor, which young ſtudents will find no leſs inſtructive than amuſing.

In 1769 Padre Martini drew up and gave to his diſciples a very ſhort tract, entitled "Compendio della Theoria de numeri per Uſo del Muſico di F. Giambatiſta Martini. Minor Conventuale." In this tract, the good father defines the three principal calculations, ratios, and proportions neceſſary for a muſician to know in the diviſion of the monochord and in temperament:

The *arithmetical progreſſion*, in which the intervals are equidiſtant.

The *geometrical progreſſion*, or ſeries of numbers in a duplicate ratio.

The *harmonical progreſſion*, conſiſting of a ſeries of numbers.

See Progression and Proportion, where the Engliſh reader will find the ſeveral progreſſions and proportions uſed in harmonics more clearly explained than in this ſmall tract of Padre Martini, in Italian, or even in a tranſlation of it.

But Padre Martini was attacked in a more rude and formidable manner by Eximeno, in a publication ſubſequent to his treatiſe "Dell' origine e delle Rigole della Muſica," in a publication under the title of "Dubbio di D. Antonio Eximeno ſopra il Saggio di Contrappunto del Giambattiſta Martini," printed at Rome 1775. In this work, as a defence of his own flimſy ſyſtem, he tries to overturn all other ſyſtems, particularly that which Padre Martini is endeavouring to explain and defend in his "Saggio di Contrappunto." It is the method of teaching counterpoint by writing upon *canto fermo*, which has been eſtabliſhed in the conſervatories of Naples more than a hundred years. And when we recollect the great compoſers, not only of church-muſic, but theatrical, which the Neapolitan ſchool has produced, we cannot help regarding its method with reverence, particularly as far as regards eccleſiaſtical compoſition, alla Paleſtrina, which is that of our ſervices and full anthems on the venerable models of Tallis and Bird; nor can that reverence be diminiſhed by the writings of any of its foes, till a better method is diſcovered, which has not yet been done by ſignior Eximeno; who is a lively writer, an able logician, and ſeemingly better ſkilled in every other art and ſcience than that of muſic, if we may be allowed to judge by the ſpecimens which he has given in illuſtration of his own rules of compoſition, which were intended to ſuperſede all former laws of harmony throughout Europe.

The Neapolitans, whoſe ſchool and method of teaching counterpoint by writing upon canto fermo P. Martini had ſo well defended in his "Saggio di Contrappunto," publiſhed, without name or date, a pamphlet entitled "Giudicio di Apollo." A certain Andrea Manini, of Udini, having, in a work entitled "Trattato in Genere Teorico," publiſhed in 1761, treated with diſreſpect, not only P. Martini, but his excellent maſter, Jacopo Perti; all the venerable harmoniſts of the 16th and 17th centuries appear before Apollo in defence of the perſons traduced; and Manini, the author of that libel, is ſentenced, not only to perpetual baniſhment from Parnaſſus, and from all intercourſe with the muſes and their votaries, but prohibited, in future, from all further uſe of his pen. This pamphlet iſſued from the Neapolitan preſs, was circulated all over Italy, no body knew by whom or by what means.

Martini, Giuseppe san, an exquiſite performer on the hautbois, and an original and excellent compoſer, was a native of Milan; but beſt known in England by the title of Martini of London, where he arrived in 1723. His firſt public performance there was at a benefit concert, at the little theatre in the Hay-market, then called the French theatre, from a company of French comedians being allowed to act plays there in the French language, to which George I. frequently went, as his majeſty was not ſufficiently acquainted with our language to be much amuſed at our national theatres. The benefit concert at which Martini was firſt heard, was for a ſignior Piero; in the advertiſement for which, Martini is called "an Italian maſter, juſt arrived." But in this performance the applauſe he received was ſuch, that he was immediately engaged as principal hautbois at the Royal Academy of Muſic, or Opera, where he continued to perform during the whole time of Handel's regency.

His firſt publication in England was advertiſed October 6, 1730; conſiſting of "Twelve ſonatas for two flutes and a baſe, *being exceeding fine harmony*." Such previous praiſe is ſeldom given to compoſitions that deſerve it; but the public ſoon found that a newſpaper eulogium, for once, ſpoke the truth.

About the year 1740, he was taken into the ſervice of his royal highneſs Frederic prince of Wales, was muſic-maſter to the princeſſes, and gave leſſons in ſinging to ſeveral ladies, who had the good taſte to be ſenſible of his merit, and the good fortune to prevail on him to attend them; but he performed no more in public after he quitted the opera.

We never heard him play; but the concertos which Tommy Vincent, his ſcholar, uſed to perform on the hautbois, and which he had compoſed for himſelf, were admirable; full of fire, and new and elegant paſſages, in the true genius of the inſtrument; and the beſt judges who had often heard him at the opera and in private parties, would allow of no parallel in his tone and execution, with thoſe of any other hautbois player upon earth.

He died about the year 1750. And as a proof of the high admiration with which the public was impreſſed by his performance, when his books and inſtruments were ſold by auction after his deceaſe, a hautbois on which he uſed to

perform,

perform, which originally only coſt five-and-twenty ſhillings, ſold for eighteen guineas, to ſomebody, who perhaps imagined, that an inſtrument on which Martini uſed to play ſo delightfully, would almoſt play itſelf.

As a compoſer, Martini was poſſeſſed of all the learning of the old ſchool, with infinitely more invention, taſte, and grace than any other Italian of his time.

His twelve ſonatas for two violins and a baſe, dedicated to the princeſs of Wales, were very long in high favour with the public; and his full concertos, when performed at the concert of ancient muſic, ſtill excite the attention and admiration of all true judges of inſtrumental muſic. Indeed San Martini was the only compoſer of whoſe productions the excluſive admirers of Corelli, Geminiani, and Handel ever ſpoke without the ſarcaſtic epithet of *new*, or the more broad cenſure of *modern flimſy ſtuff*. But Martini ſtill wrote fugues; in ſpite of which his muſic ſtood its ground among the moderns, better than any other inſtrumental compoſitions with which we are acquainted.

Martini, Giovanni Batista san, a younger brother of San Martini of London, in 1770, was organiſt and maeſtro di cappella to ſo many churches at Milan, and wrote ſo faſt, that his eccleſiaſtical compoſitions were too ſlight and flimſy. The late viſcount Dudley and Ward, when on his travels, took leſſons of him in muſic, and his lordſhip, then the honourable Mr. Ward, having collected all the curious compoſitions of the time, in his progreſs through Italy, Martini eagerly borrowed of his elève all the new muſic which he could poſſibly ſpare, and honeſtly confeſſed that it was with a view to feed his own fancy, which, by writing ſo much and ſo faſt, was a little exhauſted. There was ſcarcely a clown in Italy who did not know good muſic from bad. And we ourſelves, on a day of feſtival, in a church, heard two peaſants, after liſtening a little while to one of Martini's maſſes, cry out, "Quita muſica è ſcelerata-audire," and haſtened away to another church.

The violin muſic, however, of this Martini, particularly his ſymphonies, concertos, and notturni, compoſed about the middle of the laſt century, was full of fire, invention, and beautiful melodies. He was one of Giardini's maſters on the violin; and the firſt piece he played in public, after his arrival in England, was a ſolo at the benefit of Cuzzoni, compoſed by San Martini of Milan.

Some of his ſymphonies and full pieces were played at Vauxhall, Ranelagh, Mary-bone, and Cuper's gardens, with great applauſe, during many years.

Martini, *Abate*, a learned Venetian dilettante, and an excellent judge of every ſpecies of muſic, ancient and modern; was an able mathematician, compoſer, and performer. He had travelled into Greece, in order to make obſervations in geography, agriculture, and natural hiſtory, but being unable to ſatiſfy himſelf as he expected, his pride was ſo hurt by the diſappointment, that he would not publiſh any of his remarks or diſcoveries. Among other curious enquiries, he made many concerning the muſic of the modern Greeks, in hopes it would throw ſome light upon that of the ancient. He knew as much, we believe, as any one elſe, about the ſyſtems of Pythagoras, Ptolemy, and the Greek writers collected by Meibomius, as well as of Rameau and Tartini. He was a great admirer of the works of Marcello, and ſung, by heart, all his cantatas and beſt melodies; and was the founder of an academy for the performance of his muſic, excluſively.

When he viſited the Greek iſles, beſides enquiries after ancient muſic, his curioſity extended to the preſent ſtate of muſic among the modern Greeks, of which we have ſpoken elſewhere. See Music *of the Greek Church*, and *Ruſſian* Music.

Martini *of Madrid*, a lively and ſpirited compoſer, who has furniſhed the theatre Italien, at Paris, with the muſic of ſeveral ſucceſsful comic operas. We are not much acquainted with the vocal muſic of this author; but have ſometimes thought his inſtrumental too turbulent and clamorous.

Martini, in *Geography*, a town of Naples, in the province of Otranto; 16 miles W. of Oſtuni.

MARTINICO, one of the largeſt of the Caribbee iſlands in the Weſt Indies, being about 60 miles in length, and 30 in breadth, and containing about 260 ſquare miles. The interior part is hilly, abounding with hillocks or ſmall eminences, above which are elevated three mountains of conſiderable height. The higheſt of theſe, called Pelée, exhibits appearances of an extinct volcano, and is covered with woods that attract the clouds, and occaſion noxious damps, which render it in a great meaſure inacceſſible. The other two mountains are in moſt parts cultivated. Theſe mountains, and particularly the firſt, furniſh ſprings, from which iſſue the ſtreams that water the iſland: theſe are naturally of gentle current, but, with the ſlighteſt ſtorm, are changed into torrents. The chief river is called Galion, and waters the N.E. part of the iſland. The water which they ſupply, partaking of the nature of the ſoil over which they paſs, is in ſome caſes excellent, and in others ſo bad, that the inhabitants are under a neceſſity of drinking the water which they have collected in the rainy ſeaſon. The produce of the ſoil, fertilized by its rivers, is ſugar, cotton, indigo, cocoa, ginger, and ſuch other commodities as are found in the neighbouring iſlands; and as its bays and harbours are numerous, ſafe, commodious, and well fortified, it is favourably adapted for trade. The iſland is divided into twenty-eight pariſhes, which contain about the ſame number of towns and villages, and two principal towns, *viz.* Fort Royal and St. Pierre. The firſt Europeans, who formed a ſettlement in this iſland, were the French, under the conduct of M Deſnambuc, accompanied by about 100 perſons from St. Chriſtopher's in the year 1635: and after having obtained land from the Caribbs, they at length expelled the natives. The French being thus maſters of the iſland, and living without moleſtation, reſtricted themſelves for ſome time to the cultivation of cotton, ſoon adding that of annotto and indigo. About the year 1650, they commenced the culture of ſugar; and ten years afterwards, Benjamin Da Coſta planted ſome cocoa-trees. His example was followed in 1684, when the demand for chocolate in France became more common. Cocoa continued for ſome time to be the principal object of cultivation till the year 1718, when all the cocoa-trees were deſtroyed. The coffee-tree was then introduced, as a kind of ſuccedaneum to the cocoa which had failed. Martinico promiſed great advantages to the French; and accordingly it was made the ſeat of their government, and the object of their particular attention. Nevertheleſs, at the end of the 17th century, its progreſs had not been very conſiderable. In 1700, the whole population, reckoning white men, free negroes, and ſlaves, amounted to no more than 21,640 perſons. The cattle conſiſted of 3668 horſes or mules, and 9217 head of horned cattle. The inhabitants cultivated a great quantity of cocoa, tobacco, and cotton; they had nine indigo houſes, and 183 ſmall ſugar plantations. In 1736, there were 447 ſugar-works; 11,953,232 coffee-trees; 193,870 of cocoa; 2,068,480 of cotton; 39,400 of tobacco; and 6750 of annotto. The population amounted to 72,000 blacks, men, women, and children; and their ſupplies for proviſion conſiſted fifted of banana-trees, caffava, potatoes, and yams. At this time the annual exportation amounted to 700,000*l.* fterling. The export trade was very extenfive. However, the war of 1744 checked this profperity. By a feries of misfortunes and loffes, Martinico fell into the hands of the Englifh in 1762; but in the following year, at the conclufion of the war, it was reftored to its original proprietors. In the year 1770, this ifland contained 11,588 white people; 2524 free people of colour; 71,142 flaves. It was then thought that the flaves were too few for the cultivation, which was chiefly that of fugar-canes; with fome cacao, indigo, cotton, and coffee. The noted fnuff, called "Macouba," is made of tobacco raifed in the parifh of that name in the north of Martinico. About this time its products were computed at 23,000,000lbs. of fugar, 3,000,000lbs. of coffee, 600,000lbs. of cotton, and 40,000lbs. of cocoa. In the ftatiftical account of France, publifhed by Herbin, the population of Martinico in 1788 is faid to confift of 10,603 whites, 4851 free mulattoes, and 73,416 flaves. The exports at that time amounted to 25,640,000 francs; while the imports from France amounted to 15,133,000 francs of French produce, and 9,198,000 francs of foreign trade. Martinico is celebrated for a diftillery of liquors. Quarries of free-ftone are rare in this ifland, and blocks of lava are ufed. Lime is made with the madrepores and fea-fhells. No mines have been difcovered; but a ferruginous fand, after a volcanic production, had been obferved on the fhore near mount Pelée. The inhabitants of Martinico are pale, and deftitute of that bloom which is obfervable in the people of France. Moft of the native quadrupeds have been deftroyed; but rats and mice unhappily abound. In this ifland there is a bird called the whiftler of the mountain, from the refemblance of his cry to that of a man whiftling. The red ant was very deftructive till it was deftroyed by putting arfenic into its nefts, or ftrewing it over its path. The hurricanes in Martinico are very violent and deftructive. The rain defcends in large drops refembling the found of hail. In the year 1794, Martinico was taken by the Britifh under the command of fir John Jervis and fir Charles Grey; the attack commenced Feb. 3, and the ifland furrendered March 16. N. lat. 14° 24′ to 14° 52′. W. long. 61° 2′ to 61° 26′.

Martinico, *Little*, one of the Grenadine iflands in the Weft Indies. N. lat. 13° 38′. W. long. 61° 18′. See Bekia.

MARTINIUS, Matthias, in *Biography*, a learned German Proteftant divine and philologift, was born in the county of Waldec in the year 1572. He was educated under the celebrated Pifcator. When he had attained the age of twenty-three, he was appointed preacher to the court of Naffau-Dillembourg, and in 1596 he was nominated one of the profeffors of the college of Herborn. He particularly excelled in his philological lectures, and in initiating his pupils in the oriental languages. About the year 1607 or 8, he became paftor of Embden, where he remained three years, much refpected and efteemed as a minifter and a man. He was now offered the rectorfhip of the college of Bremen, which he accepted, to the great benefit of that inftitution. In 1618, Martinius was one of the deputies appointed by the city of Bremen to the fynod of Dort, where he enlifted among the combatants againft the fupralapfarians. He died at the age of 58, in the year 1630. His works are very numerous; but the moft important, and that on which his fame is chiefly built, is "Lexicon Philologicum, præcipue Etymologicum et Sacrum," in two large volumes, folio. Moreri.

MARTINO, St., in *Geography*, a town of Italy, in the department of the Adda and Oglio; 8 miles W. of Bergamo.—Alfo, a town of France, in the department of the Po, in the diftrict of the Four Vallies, to which it gives name; 9 miles N.W. of Pinerola.—Alfo, a town of France, in the department of the Sefia; 19 miles N. of Turin.—Alfo, a town of France, in the department of the Dora, near the Dora Baltea; 17 miles S.E. of Aofta.—Alfo, a town of France, in the department of the Maritime Alps; 12 miles W. of Tenda.—Alfo, a town of Italy, in the Veronefe; 15 miles N.W. of Verona.—Alfo, a town of Italy, in the department of the Reno; 12 miles N.E. of Bologna.—Alfo, a town of Italy, 13 miles N. of Modena.—Alfo, a town of Naples, in Calabria Ultra; 5 miles N.W. of Oppido.—Alfo, a town of Naples, in Bafilicata; 24 miles S.S.E. of Potenza.—Alfo, a town of Corfica; 4 miles N. of Baftia.—Alfo, a town of Italy, in Friuli; 7 miles S.E. of Friuli.

Martino *Pefcatore*, in *Ichthyology*, a name given by Salvian, and fome others, to the rana pifcatrix of authors, the lophius of Artedi.

MARTINOWA, in *Geography*, a town of Auftrian Poland; 6 miles N. of Halicz.

MARTINSBERG, St., a town of Hungary; 10 miles S.E. of Raab.

MARTINSBOROUGH, a town of America, in North Carolina, on the S. fide of Tar river; 20 miles above Wafhington.

MARTINSBURG, a poft-town of Virginia, and capital of Berkley county, about 8 miles S. of the Patowmac, in the midft of a fertile and well cultivated country; 25 miles from the mineral fprings at Bath. It contains more than 70 houfes, a court-houfe, gaol, and epifcopal church, and another near the town is appropriated to the Prefbyterians; 22 miles N.E. of Winchefter, and 88 N.N.W. of Alexandria.

MARTINSDYCK, St., a town of Holland, in the ifland of Tolen; 5 miles W. of Tolen.

MARTINSPERG, a town of Auftria; 6 miles S.S.W. of Zwetl.

MARTINVAST, a town of France, in the department of the Channel; 3 miles S. of Cherbourg.

MARTINVILLE, a poft-town of America, and the capital of Guilford county, in North Carolina, pleafantly fituated on the E. fide of Buffaloe creek, and containing about 40 houfes, a court-houfe, and gaol.

MARTIOBARBULI, among the *Romans*, a defignation given to foldiers who carried leaden balls to annoy the enemy with.

MARTIORA, or Marticora, in *Natural Hiftory*, the name which the ancient Greeks gave to the animal which the Romans called *mantichora*.

MARTIZAY, in *Geography*, a town of France, in the department of the Indre; 11 miles S. of Chatillon fur Indre.

MARTLET, in *Heraldry*, a little bird reprefented without feet, and properly alfo without a beak.

It is ufed as a difference, or mark of diftinction, of a younger brother; fome fay, more peculiarly of the fourth brother, or family. See Differences.

MARTNETS, in a *Ship*, fmall lines faftened to the leetch of a fail, being reeved through a block on the topmaft-head, and coming down by the maft to the deck. Thofe martnets which belong to the top-fails are faftened after the fame way to the heads of the top-gallant-mafts, but their fall comes down no farther than the top, when it is haled. The word is, *top the martnets*, *i. e.* hale them up. Their defign is, in furling the fail, to bring that part of the leetch

leetch which is next the yard-arm clofe to the yard, fo that the fail may furl up the clofer.

MARTO, in *Geography*, a town of European Turkey, in Romania; 20 miles S.S.W. of Gallipoli.

MARTOCK, a market town and parifh in the hundred of that name, and county of Somerfet, England. It chiefly deferves notice on account of its church, which is a large and elegant edifice, confifting of a nave, chancel, north and fouth aifles, and a porch. The interior is finely ornamented with carved work, and fome paintings of the apoftles. An altar-piece in ftucco, erected by John Butler, efq. particularly attracts admiration. The market is held twice a week, on Wednefday and Saturday, and is ufually well fupplied with provifions of every defcription. Near the market-houfe, which is a neat modern building, erected at the junction of three turnpike roads, in the middle of the town, ftands a very handfome fluted column, being a model of the famous pillar of Trajan. The parifh is of great extent, and is divided into nine tythings, containing, according to the parliamentary returns of the year 1801, 376 houfes, occupied by 2102 perfons. The town is watered on the fouth-weft by the river Parret, and on the north by the Yeo. The manor was poffeffed by Edith, queen of Edward the Confeffor, at the time of the Norman conqueft. The Hiftory of Somerfetfhire, 3 vols. 4to. 1791.

MARTON, St., a town of Hungary; 10 miles W. of Rofenburg.

MARTORANO, a town of Naples, in Calabria Citra, the fee of a bifhop, fuffragan of Cofenza; 13 miles S. of Cofenza. N. lat. 30° 8′. E. long. 16° 28′.

MARTOREL, a town of Spain, in Catalonia, fituated on the Noya, at its confluence with the Llobregal. This is a fmall, dirty, clofe, and ill-built town; it has a parifh church, a convent of monks, and fome barracks; the inhabitants are laborious; the women make lace and blonds. Near this town is a triumphal arch, faid to have been erected by Hannibal in honour of his father; fituated at the north end of a bridge originally built by his order when he croffed the river in his way to Italy, and repaired in 1768; 20 miles N.W. of Barcelona.

MARTORY, St., a town of France, in the department of the Upper Garonne, on the Garonne; 10 miles N.E. of St Gaudens.

MARTOS, a town of Spain, in the province of Jaen, fuppofed to be the ancient *Tucci*, afterwards called *Augufta gemella*; fituated on the fide of a lofty mountain, on the top of which is a caftle. The town belongs to the order of Calatrava, by which a civil and military governor are kept there, and an alcade mayor for the adminiftration of juftice. It was once an epifcopal fee, which was deftroyed under the Moors. Its prefent population amounts to 15,000 perfons. The top of the rock on which the caftle ftands is famous for the death of the two brothers of Carvejal, commanders of the order of Calatrava, who under an unfounded charge of murder were precipitated from the rock by order of Ferdinand, king of Caftile; 10 miles W. of Jaen.

MARTRAGNY, a town of France, in the department of the Calvados; nine miles N N.W. of Caen.

MARTRES, a town of France, in the department of the Upper Garonne; 15 miles N.E. of St. Gaudens.

MARTRES *de Veyre, Les*, a town of France, in the department of the Puy de Dôme; feven miles S.S.E. of Clermont.

MARTYN, JOHN, in *Biography*, late profeffor of botany at Cambridge, was born Sept. 12. 1699, in Queen ftreet, London, where his father Thomas, a very worthy and refpectable man, lived in a mercantile ftation. His mother, whofe maiden name was Catharine Weedon, died Nov. 1, 1700. After being educated at a private fchool in the neighbourhood, he was taken, at the age of 16, into the compting-houfe of his father; nor does it appear that he neglected or defpifed the duties of the ftation to which he was then deftined, though he had already imbibed fo ftrong a tafte for literature, that he conftantly devoted much of the night to ftudy, allowing himfelf, for many years, no more than four of the 24 hours for fleep. In the fummer of 1718 he firft acquired a tafte for botany, in confequence of his acquaintance with Mr. Wilmer, an apothecary, who afterwards became demonftrator in the Chelfea Garden. He was in the following year introduced to Dr. Patric Blair, and the juftly celebrated Dr. William Sherard, the moft liberal and intelligent promoter of this fcience that his country could then boaft. With fuch inftructors and counfellors, his progrefs was rapid. He foon became defirous of commencing author, and it is fortunate that this was not prevented, by his imbibing the diffidence of Sherard along with a portion of his knowledge. Mr. Martyn tranflated Tournefort's hiftory of the plants growing about Paris, from the French into Englifh, in 1720; which however he did not print till twelve years afterwards, when it appeared, dedicated to lord Petre, and improved in many refpects, being accommodated to this country by the addition of Englifh names, and the mention of particular places of growth. Nor were his ftudies merely fpeculative, or confined to books. He undertook various botanical excurfions, which were chiefly performed on foot, that he might obferve plants in their natural fituations, as well as infects, which had now likewife excited his attention. When at home, he bufied himfelf in fowing feeds, that he might fpeculate upon their germination, and the ftructure of their cotyledons, and was eager in collecting, not only dried fpecimens of plants, but their feeds and fruits. His attention to thefe fubjects, prove him to have been no fuperficial enquirer, and his letters to Blair fhew that he ftudied both nature and Cæfalpinus with advantage. The leading character of his mind feems to have been a tafte for enquiry, which prompted him to examine every thing for himfelf. His obfervation of the works of God directed his thoughts to the divine origin of all things, and his perufal of fome of the moft famous adverfaries of revealed religion, ferved but to confirm him in its truth. About the year 1721 he became acquainted with the celebrated Dillenius, and in conjunction with him and feveral others, amongft whom we find the names of Deering, Thomas Dale, and Philip Miller, eftablifhed a botanical fociety, which met every Saturday evening. Dillenius was prefident, and Martyn fecretary. The latter, ever foremoft in activity, read before this fociety a courfe of lectures, upon the technical terms of the fcience, the foundation, as it is prefumed, of what he afterwards publifhed. Thefe meetings were continued for about five years only.

We are not informed of the period at which Mr. Martyn changed his mercantile occupation for the medical profeffion, to which he was, doubtlefs, led by the general tenour of his purfuits. In 1723 he was offered admiffion into the Royal Society, which he declined, as it appears by one of his letters to Dr. Blair, from pure modefty. His objections however were overcome the next year; and he foon proved himfelf an active and worthy member, by his various communications, to be found in the Tranfactions of that learned body; of which publication he fubfequently took a part in the abridgment, though he was an unfuccefsful candidate for the place of Secretary to the fociety, obtained by Dr. Cromwell Mortimer. In 1726 he publifhed his tables of Officinal Plants, in 20 pages folio,

folio, difpofed according to Ray's fyftem.' He had given a public courfe of lectures in Botany the preceding year, and had, with the affiftance of Dr. Blair, undertaken to make a collection of birds. His herborizing excurfions were from time to time continued, notwithftanding his various labours and engagements in town. His fecond courfe of lectures there, in 1726, being much approved, he was recommended by Dr. Sherard and fir Hans Sloane as fit to teach the fcience in which he excelled, to the Univerfity of Cambridge. He gave, in 1727, in the anatomy fchools, the firft botanical courfe ever read in that Univerfity, though Ray had ftudied there, and done all that he could to excite a love of natural knowledge. For the ufe of his pupils he reduced the alphabetical catalogue of Cambridge Plants, printed by that great man, into a fyftematic form, according to the principles of its author. As he excelled in the knowledge of Cryptogamous vegetables, he improved the work in that department; and he now very judicioufly laid afide the old fyftematic practice, of feparating trees and fhrubs from herbs, in his claffification. When we confider what Mr. Martyn meditated, and what he accomplifhed, in the technical and fyftematic departments of Botany, he will be found to deferve a high rank amongft the philofophers, even of the age in which he lived; nor did he leave any walk of his beloved fcience unexplored. In 1728 he publifhed the firft Decade of a fumptuous work, entitled *Hiftoria Plantarum Rariorum*, in imperial folio, in which his merit in the defcriptive line is confpicuous. The plates were drawn by that great artift Van Huyfum, engraved in mezzotinto by Kirkall, and printed in colours. In the latter part of their execution they fail very much, that mode of colouring plates having fcarcely ever been found to anfwer, though at prefent carried in France to a higher degree of perfection than heretofore. (See FIGURES *of Plants.*) Four more Decades of this work appeared in the courfe of nine years, after which it ceafed, on account of the great expence of the undertaking.

When this publication commenced, its author is faid to have "fedulouſly applied himfelf to the practice of phyfic." We prefume this muft have been as an apothecary, for he was not, by any medical degree, authorized to practife as a phyfician.

In 1729 he had a defign of reading botanical lectures at Oxford, and it is not known what prevented this fcheme. Probably the recent eftablifhment of the Sherardian profefforfhip there, in favour of his friend Dillenius, might very juftly deter Mr. Martyn from what could not but feem an unneceffary, if not an unfair, intrufion.

In the following year we find him projecting, in conjunction with Dr. Ruffel, the Herculean labour of a new edition of Stephens's Latin *Thefaurus;* but this defign was dropped. Inftead of it, he affociated himfelf with the fame friend, and fome others, in a critical work, entitled the Grub-ftreet Journal, a periodical publication, which had a large fale. In what ftyle or temper it was executed we have not had an opportunity to inquire; but the critical differtations of our author, publifhed by his fon, difplay his critical learning and acutenefs in no ordinary degree.

On the 26th of May, 1730, Mr. Martyn was admitted of Emanuel College, Cambridge, with an intention of taking his degrees in phyfic; but after keeping five terms, his marriage, and the neceffary attendance to his profeffion, caufed him to relinquifh this defign. He had refided for three years in Great St. Helen's, but the town air difagreeing with his conftitution, which was afthmatic, he removed to Chelfea, where he married, on the 20th of Auguft 1732, Eulalia, youngeft daughter of John King, D.D. rector of Chelfea and prebendary of York, by whom he had three fons and five daughters. Four of the latter died young, but the other children furvived him.

At the clofe of this year the Profefforfhip of Botany at Cambridge became vacant, by the death of Mr. Bradley, who had for fome years, not very worthily, filled it. All eyes were directed towards Mr. Martyn as the propereft perfon for this fituation, and his opponents, who wifhed to obtain it for themfelves or their friends, confcious of his fuperior merit, had no other refource than to reprefent him as a Nonjuror. Whatever effect this might have had was defeated, by his taking the requifite oaths, and his unanimous election took place on the 8th of February 1733. It is remarkable that in two or three years after obtaining the appointment, he finally ceafed to lecture. This is attributed to the want of encouragement, and efpecially of a botanic garden, at Cambridge. There had been hopes of the latter being eftablifhed in 1731, through the liberality and zeal of a Mr. Brownell of Willingham; but the fcheme fell to the ground, nor was it revived with effect till many years afterwards.

Neverthelefs, our indefatigable botanift and fcholar was not idle. The work on which his literary fame chiefly and firmly refts is his fplendid quarto edition of Virgil's Georgics, which appeared in 1741, dedicated to Dr. Mead. Here his abilities and his acquifitions had their full fcope. The text was accompanied by an Englifh tranflation, and ample notes in the fame language. In thefe the editor was enabled, by his peculiar line of ftudy, to throw more light upon the natural hiftory of his author, than any one before him had done, nor is it eafy to improve upon his performance. He was affifted in the aftronomical part by his friend the celebrated Halley, to whofe worth he has given a juft and feeling tribute in the preface. In 1749 he publifhed the Bucolics on the fame plan, and intended to have gone through the whole of the Roman poet; but growing infirmities, and the lofs of his wife, who died of a cancer in the breaft this year, for a while damped his ardour. The labours of his profeffion, too, were becoming burthenfome. He fpeedily indeed repaired his domeftic lofs, marrying, in July 1750, Mary Anne, daughter of Claude Fonnereau, Efq. of London, merchant. This lady bore him one fon, and furvived him.

In the fpring of the year 1752 he retired from practice, and devoted himfelf to that rural feclufion, which his acquirements were fo well calculated to render both profitable and delightful. He took a farm in a moft beautiful fituation at Streatham, and, but for occafional attacks of the gout, enjoyed feveral years of learned leifure united with fcientific experience, in attention to the bufinefs of his farm, and the care of his family. On the 30th of January 1761, he refigned his profefforfhip of botany in favour of his fon the Rev. Thomas Martyn, who was elected in his ftead, and who has ever fince filled that ftation with honour to himfelf and to his parent. In gratitude for this election, fo confonant to his own wifhes, Mr. Martyn, fome time afterwards, gave his botanical library, of above 200 volumes, with his drawings, herbarium, and collections of feeds and *Materia Medica*, to the univerfity, for which the thanks of that body were very handfomely returned him in 1765.

This worthy man died at Chelfea, to which place his increafing infirmities had induced him, about a year previous, to return, on the 29th of January 1768, in the fixty-ninth year of his age, and was interred in the burying-ground there, near his firft wife; where alfo the relics of Miller, Ehret, and, if we miftake not, of feveral other botanifts, repofe. Our account of him is chiefly taken from a fmall volume,

volume, published in 1770, by his amiable son and successor, who commemorates, in the highest terms, his religious, liberal, benevolent, and affectionate character. This volume contains some of his epistolary correspondence, and several learned dissertations, preparatory to his intended edition of the *Æneid*. The present Professor Martyn is known by several ingenious works, especially by his greatly enlarged edition of Miller's Gardener's Dictionary, to the botanical part of which we have occasion, in the course of our labours, perpetually to refer. S.

MARTYNIA, in *Botany*, was so called by Dr. Houstoun, after his friend Mr. John Martyn, professor of Botany at Cambridge, father of the present professor; see the last article.—Linn. Gen. 310. Schreb. 406. Willd. Sp. Pl. v. 3. 263. Mart. Mill. Dict. v. 3. Red. Houst. 5. t. 10. Ait. Hort. Kew. ed. 1. v. 2. 339. Juss. 140. Lamarck Illustr. t. 537. Gærtn. t. 110. (Craniolaria; Linn. Gen. 310. Juss. 140.)—Class and order, *Didynamia Angiospermia*. Nat. Ord. *Personatæ*, Linn. *Bignoniæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in five unequal segments, withering. *Cor.* of one petal, bell-shaped; tube inflated; spreading upwards, gibbous, and bearing honey, on one side at the base; limb in five obtuse, nearly equal segments, the lowermost rather the largest and most erect, slightly concave and crenate. *Stam.* Filaments four, thread-shaped, incurved, with the short pointed rudiment of a fifth between the upper pair; anthers two-lobed, converging, the two uppermost sometimes abortive. *Pist.* Germen superior, oblong; style thread-shaped, simple, as long as the stamens; stigma two-lobed. *Peric.* Capsule woody, oblong, gibbous, quadrangular, with two furrows at each side, pointed and recurved at the summit, separating into two parts, enclosing an internal nucleus of four cells. *Seeds* several, ovate, tuberculated with a pulpy coat.

Eff. Ch. Calyx five-cleft, inferior. Corolla ringent. Capsule woody, coated, with a hooked point, two valves and four cells. Seeds several, ovate, pulpy.

Obs. The *Martynia perennis* of Linnæus, having an inferior germen, and very different fruit, is now made a distinct genus. See GLOXINIA.

1. M. *diandra*. Diandrous Martynia. Gloxin. Obs. 14. t. 1. Willd. n. 1. Jacq. Hort. Schoenbr. v. 3. 21. t. 289. (M. annua, villosa et viscosa, folio subrotundo, flore magno rubro; Houst. in Mart. Decad. 42. t. 42.)—Stem branched. Leaves heart-shaped, toothed. Two stamens abortive. Beak of the capsule very short.—Discovered at Vera Cruz in South America, by Dr. Houstoun, who sent seeds to Chelsea garden in 1731, which being sown in a hot-bed, the plants flowered after midsummer. The *root* is annual. The whole *plant* downy, viscid, soft, juicy, and fœtid, of luxuriant growth. *Stem* a yard high, as thick as the finger, round, hollow, leafy; branched and purplish above. *Leaves* opposite, heart-shaped, acute, toothed, pliable, six or eight inches in diameter, on long, round, purplish, spreading *footstalks*, without *stipulas*. *Clusters* from the forks of the stem, of several pendulous handsome *flowers*, the size and shape nearly of the Purple Foxglove, but their tube is nearly whole and downy, their limb of a rich crimson. Each *flower* has a pair of ovate purplish downy *bracteas*, at the base of its calyx, and equal to that part in length. *Capsule* ovate, about an inch long, with a very short recurved beak.

2. M. *Craniolaria*. Five-lobed Martynia. Gloxin. Obs. 14. Swartz Obs. 230. (M. spathacea; Lamarck Dict. v. 2. 112. M. annua, villosa et viscosa, aceris folio, flore albo, tubo longissimo; Ehrh. Pict. t. 1. f. 2. Craniolaria annua; Linn. Sp. Pl. 862. Mant. 417. Jacq. Amer. 173. t. 110.)—Stem branched. Leaves five-lobed, toothed. Beak of the capsule very short. Tube of the corolla thread-shaped, very long. Calyx sheath-like.—Found by Jacquin in cultivated fields, and ground lately cleared from wood, at Carthagena in South America, flowering in June and July, and ripening seed in October. We have not heard of this species having ever been brough to Europe. It has the viscid downy habit, and rank growth, of the rest of the genus. *Root* annual. *Stem* branched from the very bottom, widely spreading. *Leaves* opposite, stalked, large, divided half-way down into five acute toothed lobes; heart-shaped and three-nerved at the base. *Clusters* chiefly from the forks of the stem, lax, erect, almost a foot long, about ten-flowered. The *flowers* are inodorous, white, remarkable for their slender tube, which is five times as long as their broad rounded limb, and swells suddenly at the top into a globose or ovate figure. The *calyx* is ovate, tumid, split down on one side only, its border very slightly cloven. All the *stamens* are fertile. *Capsule* much like the preceding.

3. M. *Proboscidea*. Long-beaked Martynia. Ait. Hort. Kew. n. 1. Gloxin. Obs. 14. (M. annua; Linn. Sp. Pl. 862. Swartz Obs. 230. Gærtn. v. 2. 131. t. 110. M. caule ramoso, foliis cordato-ovatis pilosis; Mill. Ic. 191. t. 286. Proboscidea Jussieui; Schmid. Ic. 49. t. 12, 13.)—Stem branched. Leaves heart-shaped, wavy. Beak longer than the capsule. Tube of the corolla scarcely longer than the limb.—Native of the country about the Mississippi, from whence seeds were brought to the Paris gardens. Miller had some of the produce, and the plants flowered with him at Chelsea, before the year 1759, when he published his very excellent figure of this species, surpassed only by the elaborate and exquisite delineations of Schmidel. Linnæus had this plant also in the Upsal garden; and it is doubtless what he intended by M. *annua*, though he confounded the first species, if not the second also, with it. As the whole genus is annual, the above expressive name has been preferred. The *leaves* are heart-shaped, obtuse, undivided, and nearly entire, sometimes, but not invariably, alternate; their footstalks and ribs very hairy. *Clusters* terminal, many-flowered, lax, and hairy. *Calyx* bell-shaped, very unequally five-lobed. *Bracteas* at its base linear. *Corolla* pale flesh-coloured, internally dotted with purple; its tube declining, an inch long, and about half as much in diameter; limb in five broad, obtuse, wavy segments, almost as long as the tube, at least if their combined base be reckoned as a part of the limb; there are about five longitudinal orange stripes, within the tube, along its lower side. The *capsule* is remarkable for its long beak, and for a longitudinal crest-like internal ridge, connecting the nucleus with the coat. The *stigma* consists of two flat obovate valves, which Turra observed to be irritable, closing when touched.

4. M. *longiflora*. Long-flowered Cape Martynia. Linn. Syst. Veg. ed. 14. 559. Ait. Hort. Kew. n. 2. Meerburgh Ic. t. 7. (M. capensis; Gloxin. Obs. 13.)—Stem nearly simple. Leaves roundish, wavy. Capsule with two teeth at the base, and a very short abrupt beak. Tube of the corolla thrice as long as the limb.—Native of the Cape of Good Hope. Professor David van Royen sent its seeds to Linnæus, by the name of a new *Pedalium*. These vegetated and produced flowers in the Upsal garden. A sketch, which appears to be the prototype of Meerburgh's rude but expressive plate, was sent with the seeds. This is the least beautiful of the genus. It is annual like the rest, but more hardy, flowering in the greenhouse in July and August. The *stem* bears only short axillary branches. The *leaves* are rounded, and wavy, or bluntly toothed, nearly smooth.

Flowers

Flowers axillary, solitary, on shortish stalks, at whose base is a pair of glands. *Calyx* very small and short, with five teeth. *Corolla* white; tube declining, two inches long, slender, but less so than that of M. *Craniolaria;* limb in five irregular roundish lobes. *Capsule* oblong, with a pair of recurved teeth above, near the base, and an oblique, abrupt, scarcely hooked, very short beak. The *stigma* is linear and revolute.—There are considerable aberrations in various parts of the fructification in the different species, and yet the whole undoubtedly constitute a most natural genus, well defined by its fruit.

MARTYNIA, in *Gardening*, contains plants of the tender, herbaceous, flowery kind, of which the species mostly cultivated are, the two-stamened Martynia (M. diandra); the hairy Martynia (M. proboscidea); and the perennial Martynia (M. perennis).

But there are other species which may be cultivated.

Method of Culture.—The two first sorts of these plants may be increased by sowing the seeds in pots filled with light rich mould, in the spring, plunging them in a bark-hot-bed, giving water frequently. When the plants have attained a little growth, they should be removed into separate pots of the same sort of earth, replunging them in the bark-bed, giving due water and shade, till they become properly rooted, when they must have free air in fine weather: after they are a little advanced in their growth, they should be removed into larger pots, and be replaced in the bark-bed in the stove, due room being allowed them. They should constantly be kept in this situation, and be duly watered and supplied with fresh air in warm weather.

And the third sort may be raised by dividing the roots, and planting them in the spring, as about the middle of March, in pots of light rich earth, being plunged in the bark-bed of the stove. When the plants are up, they should be duly watered in a slight manner, and in warm weather fresh air be freely admitted, keeping them from being shaded by other plants. Even the cuttings of the shoots of the young stems planted in pots, and managed in the above manner, will also take root and form plants.

These afford ornament and variety among other stove plants.

MARTYR, JUSTIN, in *Biography*, a Christian father, who flourished about the year 140 of the Christian era, was the son of Priscus, and born in Flavia Neapolis, anciently called Sichem, a city of Samaria, in Palestine. He was born, according to Tillemont, in 103, but, according to Fabricius and Grabe, in 89. In his youth, he was a lover of truth, and studied philosophy under several masters; first under a Stoic, next a Peripatetic, then a Pythagorean, and lastly, a Platonic, whose principles he preferred above all other, till he became acquainted with the Christian religion, which he embraced as the only certain and useful philosophy. The time of his conversion to Christianity is uncertain: Cave and Tillemont conjecture, that it happened about the year 132 or 133. The first of these writers gives the following account of the course of his life, after his conversion. In the beginning of the reign of Antoninus the Pious, he came to Rome; and in the year 140 presented his First Apology to that emperor. Afterwards he went into Asia, where he had the celebrated conference with Trypho the Jew; and then returned again to Rome, where he wrote his Second Apology, inscribed to Marcus Antoninus, the philosopher, and suffered martyrdom about the year 164. Tillemont is inclined to place his death in 167 or 168. Fabricius supposes that he suffered martyrdom in the 74th year of his age, A.D 163; but Grabe refers his martyrdom to the year 163 or 165, in the 74th or 76th year of his age.

Justin is mentioned by many ancient Christian writers, who bear honourable testimony to his memory.

Eusebius, besides the accounts he had before given of Justin's books against Marcion, and all heresies, and his apologies, gives also this distinct enumeration of his works. He says, that Justin left behind him a great number of very useful works; as his Apology to Antoninus the Pious, and his sons, and the Roman senate, and another to his successor; a book against the Greeks (or Gentiles); another book against the Gentiles, called Elenchus (or a Confutation); another of the Monarchy of God; another, entitled Psalter; of the Soul; a Dialogue against the Jews, which he had at Ephesus with Trypho. There are also, says Eusebius, many other books of his, which are in the hands of the brethren. Jerom's account of Justin's works agrees with that of Eusebius.

However, the principal works of Justin are his two Apologies, and his Dialogue with Trypho the Jew, in two parts. According to Tillemont, with whom Grabe and the Benedictine editors of Justin's works agree, the first and larger apology was not presented to the emperor before the year 170 Cave says that it was presented in 140; Pagi and Basnage refer it to the year 139, and Massuet to about 145. The Dialogue with Trypho was written, according to Pagi and Basnage, in the year 139; and according to Massuet and the Benedictines, about the year 155. The Second Apology seems to have been presented to Marcus Antoninus in the beginning of his reign, or about the year 162. The larger Apology is still extant entire: the beginning of the second apology is wanting; and so is the conclusion of the first and beginning of the second part of the Dialogue with Trypho. Besides these, there are two Discourses to the Gentiles, generally allowed to be Justin's; one called an Oration to the Gentiles, the other παραινεσις, or an exhortation to the Gentiles, supposed to be the Elenchus mentioned by Eusebius. The piece now extant of the Monarchy of God, seems to be a fragment of that work of Justin. The epistle to Zeno and Serenus is at best doubtful, and thought by Lardner not to be Justin's. The epistle to Diognetus is generally supposed to be Justin's, though some have doubted it, on account of the style, which is more elegant than that of Justin's other pieces. The Questiones et Responsiones ad Orthodoxos, and some other pieces usually joined with Justin's works, are allowed to bear the marks of a later time.

In Justin's works there are numerous quotations of our gospels, except that of St. Mark, which he has seldom quoted: and he quotes them, as containing authentic accounts of Jesus Christ and his doctrines. These gospels were read and expounded in the solemn assemblies of the Christians, as the books of the Old Testament were; and as they had been before in the Jewish synagogues. This reading of the gospels Justin mentions in his first apology to Antoninus the Pious. This general reading of the gospels, as a part of divine worship at that time, about the year 140, or not very long after, is not only a proof that they were well known, and allowed to be genuine, but also that they were in the highest esteem. Other passages alleged by Dr. Lardner, relate to the Acts of the Apostles, the Epistle to the Romans, the first to the Corinthians, the Epistles to the Galatians, Ephesians, Philippians, and Colossians, the second to the Thessalonians, the Epistle to the Hebrews, the second of Peter, and the book of the Revelations.

Of Justin's works there have been numerous impressions; but that of Prudent Marand, a learned Benedictine, printed at Paris in 1742, fol. and Styan's Thirlby's edition of the two Apologies, and Dialogue with Trypho, printed at London-

 don-

don in 1722, fol. are the beſt. Fabr. Bibl. Eccl. ad Hieron. c. xxiii. Cave's Hiſt. Lit. vol. i. Lardner's Works, vol. ii. Brucker's Hiſt. Phil. by Enf. vol. ii.

Martyr, or Martire, Peter, a native of Anghierra, in the Milaneſe, was born in 1455. He is diſtinguiſhed in hiſtory as an able negociator, and was employed by Ferdinand V., king of Caſtile and Arragon, in the education of his children. He obtained ſome eccleſiaſtical benefices, and died in 1525. He wrote a hiſtory of the diſcovery of America, under the title of "De Rebus Oceanicis et Orbe novo:" an account of his embaſſy, which he undertook at the deſire of Ferdinand, with a deſcription of the countries through which he paſſed, entitled "De Legatione Babylonica;" and a work entitled "Epiſtolæ de Rebus Hiſpanicis," containing a hiſtory of the moſt memorable events in his time, from 1488 to 1525. After his return from Egypt, he was rewarded with eccleſiaſtical preferment, and received many favours from pope Adrian VI., who would have taken him to Rome, had he not excuſed himſelf on account of his advanced age. He died about the year 1526, and was buried in the cathedral of Grenada, of which he was canon and prior. Gen. Biog.

Martyr, Peter, a diſtinguiſhed reformer in the ſixteenth century, was born at Florence in the year 1500. He was initiated into the principles of the Latin language by his mother, who was ſo well ſkilled in that tongue, as to be able to interpret the comedies of Terence from the original. He was afterwards placed under the tuition of a very able maſter, who taught the children of the principal families in the republic, among whom Peter diſtinguiſhed himſelf by the avidity which he diſcovered for learning, his inceſſant application, and his rapid progreſs. When he was ſixteen years of age, he conceived an inclination for the monaſtic life, and took the habit among the regular canons of St. Auguſtine, at the monaſtery of Fieſoli, near Florence. This ſtep was taken without the conſent or knowledge of his father, who on that account left the bulk of his property, at his death, to an hoſpital, reſerving only a ſmall annuity for his ſon. In the monaſtery he went through the different branches of ſcience uſually taught there, and acquired the character of the firſt ſcholar in his order, and he was as eloquent as he was learned. At the age of twenty-ſix he was appointed to the ſervice of the pulpit, and preached to very crowded auditories, with univerſal applauſe, in ſeveral of the principal cities of Italy. Notwithſtanding his great popularity, and his preferments in the church, particularly that of principal of the college of St. Peter at the altar in Naples, a poſt of great dignity, and ſupported by ample revenues, he cheerfully relinquiſhed all, on account of the conviction which he felt upon the peruſal of the writings of Luther, Zuingle, and Bucer. His ſentiments having undergone a complete change he did not ſcruple privately to make converts to the new doctrines; at length his zeal carried him ſo far as to lead him to avow his ſentiments in his public diſcourſes. This kind of freedom quickly excited a hoſt of enemies againſt him, and he was ſummoned to give an account of his conduct before a general meeting of the order at Genoa. Peter, however, knew what ſort of a tribunal it was before which he was commanded to appear, and accordingly withdrew privately to Piſa, where he wrote letters in juſtification of his ſudden departure, and where he celebrated the Lord's-ſupper according to the manner of the reformed. From Piſa he went to Florence, where he met with the celebrated Bernard Ochinus, who, like himſelf, had embraced the Proteſtant faith, and determined to renounce his country rather than ſhrink from the conſcientious diſcharge of his duty. Quitting Florence, he paſſed through the northern parts of Italy without being diſcovered, and arrived ſafe in Switzerland, where he was received with the greateſt hoſpitality by the miniſters of Zurich in the year 1542. He was ſhortly after this invited to Straſburg, at which city he filled, for the ſpace of five years, the theological chair, and maintained the utmoſt harmony with Bucer, who was his colleague in the miniſterial office. In 1546, he married a nun who had eſcaped from a convent and become a Proteſtant; and in the following year he was invited by king Edward VI. into England, together with Bucer, Fagius, and other learned reformers. He gladly embraced the offer thus made him, and was, in 1549, appointed profeſſor of divinity at the univerſity of Oxford. He was promoted by the king to a canonry of Chriſtchurch, and admitted to the degree of doctor of divinity in this univerſity. In this ſituation Peter Martyr continued faithfully and diligently occupied in diſſeminating ſcriptural knowledge, till the death of the king, and the acceſſion of queen Mary, when the kingdom was once more brought under the yoke of Rome. On this event, Peter Martyr was obliged to leave the kingdom. He had the good fortune to arrive ſafely at Straſburg, when he was very ſoon replaced in the divinity chair, from whence he removed to Zurich in 1556, to undertake the profeſſorſhip of divinity, which had juſt become vacant. Here he ſpent ſeven of the happieſt years of his life, in high reputation as a profeſſor and miniſter, greatly reſpected by all ranks of people, and in habits of intimate friendſhip with Bullinger and other learned men. Upon the acceſſion of Elizabeth to the crown of England, and the re-eſtabliſhment of the Proteſtant religion, great pains were uſed to bring him back again to the profeſſorſhip of Oxford, but without ſucceſs. In 1561, he was earneſtly requeſted by the queen-mother of France, the king of Navarre, the prince of Conde, and many of the moſt diſtinguiſhed peers of France, to attend and aſſiſt at the famous conference at Poiſſy: here he was diſtinguiſhed by his ſkill in diſputation, as well as by the temper and prudence with which he conducted himſelf, and by his great zeal in juſtifying the ſufficiency of the ſcriptures, as a teſt of truth as well as the rule of life. He died at Zurich in the year 1562, ſoon after he had completed the ſixty-ſecond year of his age. He was author of many learned works, eſpecially of "Commentaries on moſt of the Books of the Old Teſtament, and on the Epiſtle of St. Paul to the Romans, and the firſt Epiſtle to the Corinthians." Of the firſt reformers no one, excepting Calvin, wrote better than Peter Martyr, and he even ſurpaſſed Calvin in erudition and the knowledge of the languages. He was thoroughly acquainted with the writings of the fathers, and applied himſelf moſt diligently to the ſtudy of the ancient diſcipline of the church. His theſes were ſaid to be extremely judicious, and his ſermons eloquent and abounding in good maxims. After his death was publiſhed a poſthumous work entitled "Petri Martyris Vermilii, &c. Loci communes," conſiſting of ſelections from his works, digeſted into an uniform treatiſe, and ſyſtematically arranged after a ſimilar manner with Calvin's Inſtitutions. Moreri.

Martyr, a perſon who ſuffers torments, and even death, in defence of the truth of the goſpel: and thus they are diſtinguiſhed from confeſſors. See Confessor.

The word is Greek, μαρτυς, and properly ſignifies a *witneſs*. It is applied, by way of eminence, to thoſe who ſuffer in teſtimony to the truth of the goſpel.

Anciently thoſe who were baniſhed for the faith, were called martyrs, and alſo thoſe who periſhed in the holy wars. In the time of St. Auguſtine, the title of martyr was

was given to confeffors, or thofe who were tortured for the faith, without lofing their lives. It is Tertullian's thought in his Apologetic: "Plures efficimur, quoties metimur; femen ecclefiæ eft fanguis Chriftianus."

St. Stephen is called the *proto-martyr*, or firft martyr.— The firft three or four ages of the church were ftained with the blood of martyrs, who fuffered for the name of Jefus. The greatnefs of their number is acknowledged by all who have a competent acquaintance with ancient hiftory, and who have examined that matter with any degree of impartiality. Accordingly, 19,700 are computed to have fuffered martyrdom with St. Irenæus at Lyons, under the empire of Severus: 6666 foldiers of the Theban legion are faid to have been martyred in Gaul: father Papebroch reckons 16,000 Abyffinian martyrs, and 150,000 others under Dioclefian alone.

Mr. Dodwell, however, endeavours to invalidate the unanimous decifions of the ancient hiftorians, and to prove in a differtation (De Paucitate Martyrum), that the number of martyrs who fuffered under the Roman emperors was very moderate; alleging, that thofe of whom we have accounts in the fathers, are comprehended within a very fmall compafs; and that, excepting Nero and Domitian, the reft of the emperors made fcarcely any.

After Dodwell, feveral writers have maintained his opinion, and afferted, that whatever may have been the calamities which the Chriftians, in general, fuffered for their attachment to the gofpel, very few were put to death on that account. In this number we may include Mr. Gibbon, the celebrated hiftorian of "The Decline and Fall of the Roman Empire," who, after obferving that "the deaths of a few eminent martyrs have been recorded with care," profeffes "to feparate (if it be poffible) a few authentic as well as interefting facts from an indigefted mafs of fiction and error, and to relate, in a clear aad rational manner, the caufes, the extent, the duration, and the moft important circumftances of the perfecutions to which the firft Chriftians were expofed." Of thefe perfecutions we propofe to give an account under the article PERSECUTION; and we fhall leave it to the attentive and candid readers of the 16th chapter of our author's fecond volume to judge, how far he has acquitted himfelf with impartiality, and with juftice to the fuffering Chriftians or their unrelenting perfecutors. "Hiftory," the ingenious hiftorian very properly obferves, "which undertakes to record the tranfactions of the paft, for the inftruction of future ages, would ill deferve that honourable office, if fhe condefcended to plead the caufe of tyrants, or to juftify the maxims of perfecution."—"It muft, however," he fays, "be acknowledged, that the conduct of the emperors who appeared the leaft favourable to the primitive church, is by no means fo criminal as that of modern fovereigns, who have employed the arm of violence and terror againft the religious opinions of any part of their fubjects. From thefe reflections, or even from their own feelings, a Charles V. or a Louis XIV. might have acquired a juft knowledge of the rights of confcience, of the obligations of faith, and of the innocence of error. But the princes and magiftrates of ancient Rome were ftrangers to thofe principles which infpired and authorifed the inflexible obftinacy of the Chriftians in the caufe of truth, nor could they themfelves difcover in their own breafts any motive which would have prompted them to refufe a legal, and as it were, a natural fubmiffion to the facred inftitutions of their country. The fame reafon which contributes to alleviate the guilt, muft have tended to abate the rigour, of their perfecutions. As they were actuated, not by the furious zeal of bigots, but by the temperate policy of legiflators, contempt muft often have relaxed, and humanity muft frequently have fufpended, the execution of thofe laws, which they enacted againft the humble and obfcure followers of Chrift." After this general apology for the ancient perfecutors of the Chriftians, our author proceeds to deduce, from a general view of their character and motives, the following conclufions in their favour: "1. That a confiderable time elapfed before they confidered the new fectaries as an object deferving the attention of government. 2. That in the conviction of any of their fubjects who were accufed of fo very fingular a crime, they proceeded with caution and reluctance. 3. That they were moderate in the ufe of punifhments; and 4. That the afflicted church enjoyed many intervals of peace and tranquillity." How far thefe conclufions are juftified by the facts which our author adduces, we leave for the prefent to the judgment of the reader, and refer him to the article PERSECUTION. To the humanity of the Roman magiftrates he afcribes the inconfiderable number of Chriftian martyrs. "The martyrs," he fays, "devoted to immediate execution by the Roman magiftrates, appear to have been felected from the moft oppofite extremes. They were either bifhops and prefbyters, the perfons the moft diftinguifhed among the Chriftians by their rank and influence, and whofe example might ftrike terror into the whole fect; or elfe they were the meaneft and moft abject among them, particularly thofe of the fervile condition, whofe lives were efteemed of little value, and whofe fufferings were viewed by the ancients with too carelefs an indifference. The learned Origen, who, from his experience as well as reading, was intimately acquainted with the hiftory of the Chriftians, declares, in the moft exprefs terms, that the number of martyrs was very inconfiderable. His authority alone would be fufficient to annihilate that formidable army of martyrs, whofe relics, drawn for the moft part from the catacombs of Rome, have replenifhed fo many churches, and whofe marvellous achievements have been the fubject of fo many volumes of Holy Romance." Our author adds, "that the general affertion of Origen may be explained and confirmed by the particular teftimony of his friend Dionyfius, who, in the immenfe city of Alexandria, and under the rigorous perfecution of Decius, reckons only ten men and feven women, who fuffered for the profeffion of the Chriftian name." The number of martyrs, according to our author, was owing in a great degree to the diftinctions that were conferred on their remains and on their memory by furvivors. "The fober difcretion of the prefent age, will more readily cenfure than admire, but can more eafily admire than imitate, the fervour of the firft Chriftians, who, according to the lively expreffion of Sulpicius Severus, demand martyrdom with more eagernefs than his own contemporaries folicited a bifhopric." "The Chriftians fometimes fupplied by their voluntary declaration the want of an accufer, rudely difturbed the public fervice of Paganifm, and rufhing in crowds round the tribunal of the magiftrates, called upon them to pronounce, and to inflict the fentence of the law." And it is added, that "the more prudent rulers of the church found themfelves obliged to reftrain the indecent ardour of their followers, and to diftruft a conftancy which too often abandoned them in the hour of trial." In forming an eftimate of thofe who fuffered death in confequence of the edicts publifhed by Dioclefian, his affociates, and fucceffors, our author, deriving his data from the hiftory of Eufebius, who enumerates the martyrs of Paleftine at 92, confiders Paleftine as the 16th part of the eaftern empire; and fuppofing that the country which had given birth to Chriftianity produced at leaft the 16th part of the martyrs, who fuffered

 death

death within the dominions of Galerius and Maximin; he infers, that the whole might consequently amount to about 1500: a number which, if it be equally divided between the 10 years of the persecution, will allow an annual consumption of 150 martyrs. "Allotting the same proportion to the provinces of Italy, Africa, and perhaps Spain, where, at the end of two or three years, the rigour of the penal laws was either suspended or abolished, the multitude of Christians in the Roman empire, on whom a capital punishment was inflicted by a judicial sentence, will be reduced to somewhat less than 2000 persons, since it cannot be doubted that the Christians were more numerous, and their enemies more exasperated, in the time of Diocletian, than they had ever been in any former persecution. This probable and moderate computation may teach us to estimate the number of primitive saints and martyrs, who sacrificed their lives for the important purpose of introducing Christianity into the world." Our author concludes his remarks upon this subject, with suggesting a melancholy truth, which, whatever may be thought of his general reasoning, will be both allowed and lamented. "Admitting," he says, "all that history has recorded, or devotion has figured, on the subject of martyrdoms, it must still be acknowledged, that the Christians, in the course of their intestine divisions, have inflicted far greater severities on each other, than they had experienced from the zeal of infidels."—"In the Netherlands alone, more than 100,000 of the subjects of Charles V. are said to have suffered by the hand of the executioner; and this extraordinary number is attested by Grotius." (Annal. de Rebus Belgicis, l. i. p. 12. fol. ed.) If this be admitted as true, it must follow, that the number of Protestants who were executed in a single province, and a single reign, far exceeded that of the primitive martyrs in the space of three centuries, and of the Roman empire."

Whilst some have diminished the number of Christian martyrs far below the standard of truth; others have probably erred as much in the other extreme.

F. Ruinart, (in the preface to his "Selecta et Sincera Martyrum Acta. Amst. 1713,) endeavours to prove, that the catalogue of martyrs is not at all swelled; that the carnage was immense under the first emperors, and especially in the time of Diocletian. F. Papebroch, in his "Acta Sanctorum," also makes the number of martyrs immense. The truth lies probably between the extremes.

The martyrs were less in number than several of the ancient and modern writers have supposed them to be, but much more numerous than Dodwell and his followers are willing to believe; and this medium will be easily admitted by such as have learned from the ancient writers, that, in the darkest and most calamitous times of the church, all Christians were not equally or promiscuously disturbed, or called before the public tribunals. Those who were of the lowest rank of the people escaped the best; their obscurity, in some measure, screened them from the fury of persecution. The learned and eloquent, the doctors and ministers, and chiefly the rich, for the confiscation of whose fortunes the rapacious magistrates were perpetually gaping, were the persons most exposed to the dangers of the times. Mosheim's Eccl. Hist. vol. i.

There is scarcely any faith or religion that does not pretend to its martyrs: Mahometans, heathens, idolaters, &c. all have their martyrs.

In the ancient church, the acts, sayings, sufferings, and deaths of the martyrs, were preserved with great care, in order to be read on certain days, and thus proposed as models to future ages: and yet, notwithstanding all this diligence, we have but very little left of them: the greatest part of them having been destroyed, during that dreadful persecution, which Dioclesian carried on for ten years, with fresh fury, against the Christians: for a most diligent search was then made after all their books and papers; and all of them that were found were committed to the flames. Eusebius, indeed, composed a martyrology, but it never reached down to us; and those since compiled are extremely suspected.

From the eighth century downwards, several Greek and Latin writers endeavoured to make up the loss, by compiling, with vast labour, accounts of the lives and actions of the ancient martyrs: but most of them have given us little else than a series of fables, adorned with profusion of rhetorical flowers, and striking images, as the wiser, even among the Romish doctors, frankly acknowledge. Nor are those records, that pass under the name of Martyrology, worthy of superior credit, since they bear the most evident marks both of ignorance and falshood.

Martyrs, *Era of*, is an era followed in Egypt and Abyssinia, and which even the Mahometans, since their becoming masters of Egypt, frequently observe. See Epocha.

The era of martyrs is also called the era of Dioclesian.

Martyrs, *Knights of the*, in Palestine and Jerusalem, or of St. Cosmo and Damian, an order which, according to Giustiniani, was instituted in the 10th century, and afterwards approved and confirmed by pope Jean XX. in the year 1024. The badge of this order is said to have been a red cross, formed of four equal shafts, the centre thereof charged with the figures of the saints Cosmo and Damian, placed within a circle. But Giustiniani is charged with having converted the religious order of canons regular of the Penitence of the Martyrs, who wear a red cross on their white habit, into an order of knighthood.

Martyr's *Reef* and *Shoals*, in *Geography*, a rocky shoal between the gulf of Mexico, on the N. side of the Florida stream. N. lat. 24° 5'. W. long. 81°.

MARTYROLOGY, from μαρτυρ, *witness*; and λεγω, *dico*, *I speak*, or λεγω, *colligo*, *I gather*; a register or catalogue of martyrs.

A martyrology, properly speaking, should contain no more than the name, place, and day of martyrdom of each saint; but the term is frequently extended to the histories of martyrs. The custom of collecting martyrologies is borrowed from the heathens, who inserted the names of their heroes in their Fasti, to preserve to posterity the memory and example of their noble actions. Baronius gives pope Clement the credit of being the first who introduced the custom of collecting the acts of the martyrs.

The martyrology of Eusebius of Cæsarea was the most celebrated in the ancient church. It was translated into Latin by St. Jerom; but the learned agree that it is not now extant. That attributed to Beda, in the eighth century, is of very doubtful authority; the names of several saints being there found, who did not live till after the time of Beda. The ninth century was very fertile in martyrologies; then appeared that of Florus, subdeacon of the church at Lyons; who, however, only filled up the chasms of Beda. This was published about the year 830, and was followed by that of Waldenburtus, monk of the diocese of Treves, written in verse about the year 848, and this by that of Usuard, a French monk, and written by the command of Charles the Bald, in 875, which last is the martyrology now ordinarily used in the Romish church. That of Rabanus Maurus is an improvement on Beda and Florus, written about the year 845; that of Notker, monk of St. Gal, was written about the year 894.

The martyrology of Ado, monk of Ferrieres, in the diocese of Treves, afterwards archbishop of Vienne, is a defcendant of the Roman, if we may fo call it; for Du Sollier gives its genealogy thus: the martyrology of St. Jerom is the great Roman martyrology; from this was made the little Roman one, printed by Rofweyd; of this little Roman martyrology was formed that of Beda, augmented by Florus. Ado compiled his in the year 858. The martyrology of Nevelon, monk of Corbie, written about the year 1089, is little more than an abridgment of that of Ado; father Kircher alfo makes mention of a Coptic martyrology, preferved by the Maronites at Rome. We have alfo feveral Proteftant martyrologies, containing the fufferings of the Reformed under the Papifts; *viz.* an Englifh martyrology, by J. Fox; with others by Clark, Bray, &c.

MARTYROLOGY is alfo ufed, in the *Romifh Church*, for a roll or regifter kept in the veftry of each church, containing the names of all the faints and martyrs, both of the univerfal church, and of the particular ones of that city or monaftery.

MARTYROLOGY is alfo applied to the painted or written catalogues in the Romifh churches, containing the foundations, obits, prayers, and maffes to be faid each day.

MARTZIAN, in the *Materia Medica*, a word formed by the modern Greek writers, to exprefs a fort of fea-plant, growing upon the rocks, and ufed in painting, dyeing, &c.

The word is formed of the Arabian name *margian*, by changing the *g* into *tz*.

MARU, in *Botany*, a name by which Dodonæus, and fome others, have called the *cerinthe*, or *honey-wort*.

MARU, or MARU-*Shah-Jan*, in *Geography*, a town of Perfia, in the province of Khorafan, on the river Morga; formerly a magnificent city, and the refidence of many fultans; but defolated by the Turcomans in the twelfth century; 200 miles N. of Herat. N. lat. 38 42′. E. long. 61° 12′.

MARU-*errud*, or MARU *el Roud*, a town of Perfia, in the province of Khorafan, on the Morga, founded, as fome fay, by Alexander the Great; 125 miles N.E. of Herat. N. lat. 37° 36′. E. long. 61 18′.

MARVAGLIA, a town of Italy, in the bailiwick of Bellinzona.

MARVAO, a town of Portugal, in Alentejo; fix miles S.E. of Caftello de Vide. N. lat. 39° 13′. W. long. 7 2′.

MARUBIUM, in *Botany*, &c. See MARRUBIUM and HOREHOUND.

MARUDO, in *Geography*, a country of the ifland of Borneo, which advances towards the north between four great points, of which the firft, called Sanfaon, is at the diftance of 11 Dutch miles from the fecond, denominated Tandjong Mater; after which follows the bay of Marudo, with a town of the fame name fituated at its bottom. At fome diftance from the fhore are difcovered four large ifles, and fome fmaller. The two other points on the E. of the bay are Pulo Avigo and Punta Corpaon, between which there are fome little ifles. From this laft point the coaft bends to the eaft, and forms a large bay, called that of St. Ann. The country of Marudo is remarkable for forefts and mountains; one of the latter, on the S. of the town of Marudo, called by the Portuguefe and Dutch the mountain of St. Peter, is of prodigious height. In thefe wild countries monkies are very numerous, befides the "orang-outang;" and in the bodies of thefe monkies are found the beft bezoar.

MARVEJOLS, a town of France, and principal place of a diftrict, in the department of the Lozère; nine miles W. of Mende. The place contains 3611, and the canton 8823 inhabitants, on a territory of 222½ kiliometres, in ten communes. N. lat. 44° 33′. E. long. 3° 22′.

MARVEL *of* PERU, or *Four-o'clock Flower*. See MIRABILIS.

MARVELL, ANDREW, in *Biography*, a political writer of confiderable eminence, was the fon of a clergyman, and born at Kingfton-upon-Hull, in the year 1620. He was fent to Cambridge at the expence of the corporation of Hull, and was entered a ftudent of Trinity college in 1635. His fine talents rendered him an object for the tempting arts of the Jefuit emiffaries, then perpetually lurking about our univerfities, and they fo far fucceeded in their profelyting attempts as to induce him to quit his college and go to London, where he was accidentally found by his father in a bookfeller's fhop. He was perfuaded by his parent to return to Cambridge, and ferious reflection upon the dangers which he had thus efcaped, feems to have left upon his mind a rooted averfion from that fyftem of religion which could make ufe of fuch vile arts to extend its progrefs. His father was unfortunately drowned as he was croffing the Humber, in 1640, and Andrew took poffeffion of his fmall inheritance. This might be the occafion of fome inattention, on his part, to the duties of academical life, for it appears that in the following year he, with fome other young men, were excluded from their college for non-attendance. Perhaps, however, he had then begun the courfe of travels which he purfued through Holland, France, and Italy. He had ever a great propenfity to ridicule, and it was firft publicly difplayed by a fatire upon Flecknoe, an Englifh prieft and poetafter at Rome; and next in a burlefque poem addreffed to an abbot de Maniban, at Paris, a pretender to fortune-telling. Of the refidence and purfuits of Andrew Marvell, for many fubfequent years, little is known. In 1653, he was engaged by the protector Oliver Cromwell, to fuperintend the education of a Mr. Dutton. It was not till four years after this, that he took any part in public affairs, when, he fays, he entered into an employment for which he was not altogether unfit, and which he confidered to be the moft inoffenfive towards his majefty's concerns, of any in that ufurped and irregular government. This alluded to the poft of affiftant to Milton in the office of Latin fecretary, which he held till the death of Cromwell. In the parliament of 1660, Marvell fat as one of the reprefentatives of the borough of Hull, an honour which was conferred upon him to the end of his life. He is fuppofed to have been one of the laft perfons who received a penfion from his conftituents, which he earned by the diligence, firmnefs, and integrity with which he difcharged his duty. At the beginning of the new reign he paid little or no attention to the duties of parliament, and in 1661, and the following years, he was abfent in Holland and Germany, and upon his return he accompanied lord Carlifle, the ambaffador-extraordinary to the northern courts, as his fecretary. In 1665, he renewed a conftant and uniform attendance on parliament, and from this period to 1674, he made a regular report of the proceedings of both houfes to the mayor and corporation of Hull. The whole efforts of Andrew Marvell, in and out of parliament, were directed to the prefervation of civil and religious liberty. He was not a powerful nor a frequent fpeaker, but his influence over the members of both houfes was confiderable. By his writings he obtained the character of the wittieft man of his time, and was of great fervice to the caufe which he efpoufed. In 1672, Dr. Parker, afterwards bifhop of Oxford, publifhed a work of bifhop Bramhall's, to which he prefixed a preface of his own, maintaining the moft extravagant pofitions concerning the rights of fovereigns over the confciences of their fubjects. Marvell immediately attacked him in a work, entitled "The Rehearfal Tranfpofed," which, with a profufion of witty farcafm, contains much folid argument, and may be reckoned one of the ableft expofures of the maxims of religious tyranny. Marvell was author of feveral other works, of which we may notice "A feafonable Argument to the Grand Juries of England to petition for a New Parliament." His laft piece was entitled "An Account of the Growth of Popery and arbitrary Power in England." This was fo very offenfive to the perfons in power, that an advertifement was iffued in the Gazette, offering a reward for the difcovery of the printer, publifher, and author of it. Notwithftanding the acrimony with which our patriot attacked the court and its plans, Charles II. delighted in his converfation, and his minifters took every means in their power either to gain him over to their party, or at leaft to filence him. A remarkable anecdote on this fubject is related. One morning, after he had been the preceding evening familiarly entertained by his majefty, the door of his apartment, up two pair of ftairs, in a court in the Strand, was fuddenly opened by the lord-treafurer Danby. Marvell, who was writing, being furprized, afked his lordfhip if he had not miftaken his way. "No," replied the courtier, "now I have found Mr. Marvell;" and he proceeded to fay he had been fent by his majefty to know in what manner he could ferve him. Marvell rejected every offer, though his lordfhip was commiffioned to prefent him with a thoufand pounds. At the moment that he thus nobly afferted his independence, he was fo deftitute as to be obliged to borrow a guinea of a friend to fupply the neceffary demands of life. Well might his biographer fay, that "of all men in his ftation, he is the perfon who ought to be felected as an example of genuine independence produced by the philofophical limitation of wants and defires. He was not to be purchafed, becaufe he wanted nothing that money could buy, and held cheap all titular honours in comparifon with the approbation of his confcience, and the efteem of the virtuous." He died in 1678, and was buried in the church of St. Giles's-in-the-Fields; and the corporation of Hull, in gratitude for his fervices, defrayed the expences of his funeral, and raifed a monument to his memory. His works were publifhed in two volumes, 12mo., in 1726, and a more complete edition was given to the public in 1776, with a new life of the author, by Capt. Edward Thompfon, in three volumes, quarto, to which our readers are referred.

MARVELLA, in *Geography*, a town of Spain, fituated in a bay on the fea-fhore, three leagues from Malaga, at the foot of fome arid mountains, and containing 1100 inhabitants. From the number of houfes fallen into ruins, and the extent of the walls, part of which ftill remain, and are more than a mile in circumference, we might infer that the population has been much greater. The fea is on the S., and on the N. the mountains of Marvella, on which a few vines are planted. This town has one parifh-church, two monafteries, a hofpital, two fchools, a manfion-houfe, and a prifon. On the fhore a baftion, mounted with two pieces of ordnance, is erected for the defence of the bay, where no large fhip can caft anchor; on the E. and W. fides of the town are fome kitchen-gardens. The inhabitants derive their fubfiftence from fifhing, and the produce of a limited agriculture. They alfo employ twenty barks in conveying leather, charcoal, wood, wine, dried raifins, and black-ftone, &c. to Cadiz, Malaga, and Ceuta. To thefe they may fometimes add the juniper-berries, which the mountains furnifh in great profufion, and of which the Englifh confume great quantities in their dyes.

MARUGGIO, a town of Naples, in the province of Otranto; ten miles S.S.W. of Oria.

MARVILLE, a town of France, in the department of the Meufe; fix miles S.E. of Montmedy.

MARULLUS, Michael Tarchaniotes, in *Biography*, a learned modern Greek, a native of Conftantinople, which city he abandoned at its capture by the Turks in 1453, and retired to Italy. He was engaged in the military fervice, though a fteady adherent to polite literature. He enjoyed the patronage of feveral perfons of high rank, and was for a time liberally entertained by Lorenzo de Medici. He married the learned Alexandra Scala, of Florence, a circumftance that involved him in a bitter quarrel with Politian, who was her admirer. Marullus was engaged in feveral other controverfies with men of learning, which he brought on himfelf by his cenfures of the ancient Latin poets, and his high notions of his own merits. He loft his life in the year 1500, while attempting to crofs the little river Cecina, in Tufcany. His "Latin Poems," which have been frequently republifhed, confift of four books of Epigrams, and four of Hymns, with a fragment of a Poem on the education of princes. He was reckoned a good imitator of Lucretius, who was the principal object of his admiration among the ancients, and of whom he gave an edition. There was another poet of Calabria of this name, in the fifth century, who wrote a panegyric on Attila, king of the Huns, which the barbarian requited by caufing the poet and his poem to be burnt together. Moreri.

MARUM, in *Botany*. See Origanum, Salvia, Teucrium, and Thymus.

MARUT, in *Hindoo Mythology*, is a perfonification of the wind, more commonly called *Pavana*, under which article we fhall more particularly defcribe this potent deity. The Maruts are frequently alluded to in Hindoo books, as the genii or regents of the winds, of whom Pavana is the chief. Eight are ufually fpoken of, and they then feem to correfpond with the guardians of the cardinal and intermediate points, into which the Brahmins have arranged the heavens; reminding us, under this divifion, of the octagonal temple of the winds at Athens. Thefe eight guardians or regents are, 1. Indra, who being efteemed as the firft of firmamental deities, and ruler of the eaft, that point is reckoned firft; and proceeding: 2d. Pavaka, the god of fire, rules the fouth-eaft: 3. Yama, king of death and judge of hell, over the fouth or lower region: 4. Nirit or Nairit, fouth-weft: 5. Varuna, regent of waters, weft: 6. Pavana, otherwife called Vayu, north-weft: 7. Kuvera, the god of wealth, the north: and 8. Ifani, a name and form of Siva, rules the north-eaft. Some mention is made of thefe feveral deities and powers, under their refpective names. Female divinities feem alfo to have dominion over the points of the heavens, as noticed under Matri.

It is not always, however, that we find this arrangement, although it be the moft ufual, followed by Hindoo writers. Other deities are fometimes fubftituted, and their guardianfhips altered. Sir William Jones has addreffed a fpirited hymn to Indra, in which a ftanza is introduced defcriptive of a poetical co-operation of thefe powers, in aid of their chief Indra, the god of fhowers. (See Indra.) It is borrowed from the popular mythology of Nepaul and Thibet, and we will extract the ftanza, as defcriptive of Hindoo mythological poetics; premifing that it relates to a freak of Indra, who is fabled to have affumed the form of a fhepherd's boy, that he might the eafier fteal from a garden fome pomegranate bloffoms, to deck the dark treffes of his virtuous confort *Indrani*; which fee.

"—— The

"—— The recklefs peafant, who thefe glowing flowers,
Hopeful of rubied fruit, had fofter'd long,
Seiz'd, and with cordage ftrong,
Shackled the god who gave him fhowers.
Straight from feven winds immortal genii flew—
Varuna green, whom foamy waves obey;
Bright Vahni, flaming like the lamp of day;
Kuvera, fought by all, enjoy'd by few;
Marut, who bids the winged breezes play;
Stern Yama, ruthlefs judge! and Ifa cold;
With Nairit, mildly bold:
They, with the ruddy flafh that points his thunder,
Rend his vain bands afunder.
Th' exulting god refumes his thoufand eyes,
Four arms divine, and robes of changing dyes."

MARUTY is a name of Hanuman, who, although an ape only in appearance, is yet, in the facred romances of the poetical people of the Eaft, a very important perfonage; and of whom almoft if not fully as much is faid and fung as of any deity in their monftrous, although certainly curious, Pantheon. In their theogonies he is called the fon of Siva, who miraculoufly impregnated the mother in a manner correfponding with the ufual whimficality of thefe tales, if literally received: but popularly he is deemed the offspring of Pavana, the regent of the wind, otherwife called *Marut*, which fee, and hence his name, which means windy. Hanuman means with bloated cheeks.

This fimian hero was produced with a vaft number of others by the celeftials for the purpofe of affifting Rama in his conqueft of Lanka from the tyrant Ravena; which conqueft is the theme of that fingular poem the Ramayana, as noticed under thofe feveral articles. Sir William Jones, hinting at the fimilarity of the Indian conquefts of Dionyfos and Rama, whofe armies of Satyrs were refpectively led by Pan, and the fon of Pavan, finds farther coincidences of character, both in the principals and their general. Pan improved the pipe by additional reeds; Hanuman was alfo a mufical genius, and one of the four fyftems of Hindoo mufic is named after him. In the peninfula of India, and on Ceylon, or Lanka, ftatues, pictures, legends and romances of Hanuman are very common. He is alfo feen on very ancient coins and medals, of which exact reprefentations are given in plate 104 of Moor's Hindoo Pantheon; and many, in other plates of the fubject of this article, with fundry legends refpecting him and his hiftory, that however admiffible in fuch a work, would be evidently mifplaced in this. His building of Rama's bridge between the continent and Ceylon, and fome other points concerning him, are noticed under LANKA. Maruti or Hanuman is reprefented fometimes wholly as a monkey; at others as a man with a monkey's head, and perhaps tail; and with from one to four pair of arms, holding divers weapons, or as a refpectful attendant on Rama, who is feldom feen without him.

MARWICK HEAD, in *Geography*, a cape of Scotland, on the W. coaft of the ifland of Pomona. N. lat. 52° 58'. W. long. 3° 10'.

MARY, the mother of our Saviour Jefus Chrift, in *Scripture Biography*, was the daughter of Joachim and Anna, and efpoufed to Jofeph before the conception and birth of Chrift; fo that our bleffed Lord was by his mother of the tribe of Levi, and by his legal and reputed father Jofeph, of the tribe of Judah.

Of the parents of Mary, we have no information in fcripture, not fo much as of their names, unlefs Heli, mentioned by St. Luke iii. 23, be the fame with Joachim; and, therefore, for the birth of Mary, and for an account of her parents, we are under a neceffity of having recourfe to fome ancient apocryphal writings. It is of principal importance to know, that fhe was of the royal race of David, and fhe was alfo akin to the race of Aaron, fince Elizabeth, the wife of Zacharias, was her coufin. See Luke i. 27. 32, 33. 36.

As the time of Mary's delivery approached, Cæfar Auguftus iffued an edict, commanding the fubjects of the empire to regifter their names, according to their families, in their refpective cities. Jofeph, though he was not rich, and though he lived in Galilee, might have fome fmall inheritance in or near Bethlehem, and might be obliged to go thither upon that account. St. Luke gives us this reafon of his going to Bethlehem, "becaufe he was of the houfe and lineage of David," (ch. ii. v. 4.) It is probable, fays Lardner, that this journey was owing to the cuftom of the Jews; who, whenever they were numbered, entered themfelves according to their tribes and families. Mary accompanied him on this occafion, more perhaps from choice than from any legal neceffity; or for fome fufficient reafons with which we are not acquainted. Whilft they remained at Bethlehem, our Saviour was born in the circumftances recited by the evangelifts. (Luke ii Matt. ii.) Of her vifit to Jerufalem, at the time of her purification and of her prefentation of Jefus in the temple, and of other incidents that occurred in the early period of our Saviour's life, it is fufficient to refer to the evangelical hiftory. We find that Mary was prefent at the marriage of Cana, in Galilee, where our Lord performed his firft public miracle (John ii. 1, 2, &c.), and that fhe accompanied her fon to Capernaum, where fhe feems to have chiefly refided. Epiphanius, however, intimates, that fhe followed him every where during the whole courfe of his public miniftry; but if that was the cafe, it is not recorded by the evangelifts. We find her at Jerufalem at the laft paffover which our Saviour attended; and fhe followed him to Calvary, where fhe ftood at the foot of his crofs, and where fhe was recommended by him, with an attention highly worthy of the dignity of his perfon, and excellence of his character, to the care of his beloved difciple, who from that hour took her to his own houfe. Our Saviour appeared to her after his refurrection, and fhe was one of the firft to whom he vouchfafed this honour and confolation; fhe was alfo with the apoftles at the time of his afcenfion, and continued with them at Jerufalem. (Acts i. 14.) After this, fhe dwelt in the houfe of St. John the Evangelift, who took care of her as of his own mother. As St. John ftaid for a confiderable time in Paleftine, it may be reafonably concluded, that Mary, our Lord's mother, did not go with him to Ephefus, as Baronius and fome others have thought, but died before he went thither, according to the opinion of Cave and Bafnage; and was buried at Jerufalem.

Theophylact fays, that Jofeph had by the widow of his brother Cleophas, who died without iffue, fix children, four fons and two daughters, named Mary, and he fuppofes Mary, mother of our Lord, to be the fame as Mary the mother of James and Jofes, who were Jofeph's children by a former wife; as was alfo Salome, the mother of Zebedee's children. And whereas, in John xix. 25, mention is made of Mary wife or daughter of Cleophas, and fifter to our Lord's mother, he fays, that by "fifter" muft be there underftood "relation," for that Mary is fuppofed to be daughter of Cleophas, brother of Jofeph, whofe widow he had married. He fays, that there are four Maries mentioned in the gofpels; *viz.* our Lord's mother, Mary Magdalene, Mary daughter of Cleophas, and the fifter of Lazarus. Gregory Nyffen fays, that three Maries are mentioned as ftanding at the foot of the crofs of Jefus, Mary our Lord's

Lord's mother, Mary wife of Cleophas, and Mary Magdalene. (John, ubi fupra.) For Mary mother of James, or mother of James and Jofes, as mentioned by the other evangelifts, he cannot but think to be the fame with our Lord's mother; James and Jofes, he fuppofes, to be children of Jofeph, whom he had by a former marriage. Lardner's Works, vols. iv. v.

MARY *Magdalene* has been fuppofed by many to be the perfon called a "Sinner" in the feventh chapter of St. Luke's gofpel; but Dr. Lardner has adduced a variety of circumftances in his "Letter to Jonas Hanway, efq." which make it very probable, that Mary Magdalene was not the perfon to whom the evangelift there refers; and he therefore objects to the appellation Magdalen Houfe, as appropriated to an afylum for penitent proftitutes. Mary Magdalene was fo called, probably from Magdala, the place of her nativity, a town fituated fomewhere befide the lake, and mentioned Matt. xv. 29; whereas it appears from the hiftory in Luke (verfe 27.) that the woman there mentioned was of the city, in which our Lord then was; which city was Capernaum or Naim; and there is no reafon for believing that Mary Magdalene refided at either of thofe places. Another paffage (Luke viii. 1, 2, 3.) affords additional reafons for fuppofing that Mary Magdalene is not the woman intended in the preceding chapter. This Mary appears to have been a woman of high ftation and opulent fortune, not likely to have been defignated under the defcription of "a woman in the city which was a finner;" fhe is mentioned by St. Luke before Joanna, the wife of Herod's fteward; and, befides, when the other evangelifts have occafion to fpeak of our Lord's female friends, they commonly affign the firft place to Mary Magdalene. (See Matt. xxvii. 56. 61. xxviii. 2. Mark xv. 40. 47. Luke xxiv. 10.) Grotius thinks, that it was at her expence the fpices were bought for embalming the body of Jefus. This precedence, as Lardner fuggefts, might have been, partly, owing to her age. Mary Magdalene is mentioned as a perfon who belonged to thofe who were called dæmoniacs. She is alfo mentioned with divers other honourable women, who attended our Lord in his journies, and miniftered to him of their fubftance. And it is juftly queftioned, whether our Lord would have allowed of that, if Mary's conduct had been difreputable in the former part of her life; nor can we reafonably imagine, that any women of diftinction and good credit would admit into their fociety one who had been under the reproach of a diforderly life. Among thefe women was our Lord's mother; and undoubtedly an exact decorum was obferved, according to the Jewifh cuftom. Moreover, Mary Magdalene feems to have prefided in the direction of the affairs, which were under their care. On the other hand, the woman called a "Sinner," was abfolutely excluded from having any part in that company. (Luke vii. 47, 48. 50.) "I conceive of her," fays the judicious and candid Lardner, "as a woman of a fine underftanding, and known virtue and difcretion, with a dignity of behaviour becoming her age, her wifdom, and her high ftation; by all which fhe was a credit to him whom fhe followed as her mafter and benefactor. She fhewed our Lord great refpect in his life, at his death, and after it; and fhe was one of thofe to whom he firft fhewed himfelf after his refurrection. See Matt. xxviii. 1—10. Mark xvi. 9. John xx. 1—18.

Some have fuppofed, that Mary, fifter of Martha and Lazarus, was the fame as Mary Magdalene. Dr. Lardner refutes this opinion, by alleging, that Mary Magdalene derived her name from a place in Galilee; whereas Lazarus and his fifters were inhabitants of Bethany near Jerufalem; Mary Magdalene is frequently named with other women, who attended our Lord in his journies, and came up with him from Galilee to Jerufalem, at the times of the great feafts; whereas Lazarus and his fifters refided at Bethany; and Mary Magdalene is particularly mentioned with others, whom our Lord had miraculoufly healed of infirmities; but nothing of a like kind is ever faid, or hinted of Mary, fifter of Lazarus. We fhall here add, that Mary, fifter of Lazarus, does not feem to have been the woman defcribed by St. Luke as a "Sinner." Lardner's Works, vol. xi.

MARY I. queen of England, in *Biography*, daughter of Henry VIII., by Catharine of Arragon, was born in 1516. In her infancy fhe was betrothed to three different perfons, firft, to the dauphin of France; next, to the emperor Charles V., and afterwards, to the duke of Orleans. Thefe alliances did not take place, and after her mother's death Mary was excluded from the fucceffion to the crown, as illegitimate. In 1544 fhe was reftored to her right, but her illegitimacy was not reverfed; and Henry, though by this act he opened the way for the princeffes to mount the throne, would not allow the former acts to be reverfed; he even obliged his parliament to confer upon him a power of ftill excluding the two fifters, Mary and Elizabeth, if they refufed to fubmit to any conditions which he, at any time, fhould be pleafed to impofe: and he farther required them to enact, that, in default of his own iffue, he might difpofe of the crown as he pleafed, either by will or letters patent. Mary, bred up by her mother in a zealous adherence to the Roman Catholic faith, reluctantly fubfcribed to her father's fupremacy on his breach with the papal fee; and when, upon the acceffion of her brother Edward VI., the reformation was introduced into the Englifh church, fhe refufed, though ftrongly urged and menaced, to comply with the new worfhip, and obtained a connivance through the interference of her kinfman the emperor. "As intolerance," fays one of this princefs's biographers, "was no lefs the character of the new than it had been of the ancient religion, Mary was again molefted; her chaplains were thrown into prifon; urgent remonftrances were made to her without fhaking her firmnefs; and finally, her brother was, with great difficulty, perfuaded ftill to indulge her in her nonconformity."

On the death of Edward in 1553, we have already feen, in the feveral articles relating to this period of our hiftory, that an attempt was made to exclude both Mary and Elizabeth from the crown, by fetting up lady Jane Grey, the failure of which effort has been before noticed. Mary now, by the loyalty of her fubjects, was, without a conteft, placed upon the throne, and her title univerfally recognized. She foon difplayed a paffionate zeal for the reftoration of the Catholic religion: her temper was four and gloomy, and fhe inherited too much the wilfulnefs and defpotic humour of her father. She almoft immediately re-inftated thofe bifhops who, in the late reign, had been deprived of their fees for their adherence to popery, while Cranmer was indicted for the crime of high-treafon, and feveral Proteftant bifhops were thrown into prifon. The next ftep that outraged the feelings, and caft down the fpirits of thofe who adhered to the Proteftant faith, was her marriage to the archduke Philip, fon of the emperor Charles V. Previoufly to this a complete reftoration of the Catholic worfhip took place throughout the kingdom, and all the clergy who refufed to comply with it were ejected from their livings. Thefe changes, which were regarded as preludes to ftill more arbitrary and cruel meafures, occafioned a vaft number of difcontents, that broke out into infurrections in Devonfhire and Kent. In the former, Carew was the leader, in the latter

latter Wyatt: thefe were foon fuppreffed, and they only ferved as pretexts for new feverities. The princefs Elizabeth, who was an object of peculiar hatred to her fifter, on account of her attachment to the principles of the reformers, was thrown into the Tower, and lady Jane Grey, with her unfortunate hufband, whofe lives had hitherto been fpared, were executed. Philip, who had long been expected by the queen, arrived in England in July 1554, and the nuptials were confummated. The ruling paffion of this prince was ambition, which his confort was defirous of gratifying. She had, at this period, another object in view, in the purfuance of which fhe was quite fuccefsful; this was that of reconciling the kingdom to the pope, which was effected in great form by means of the legate, cardinal Pole. The fanguinary laws againft heretics were renewed, and it was determined, in council, to put them into execution. The mercilefs fcenes of cruelty which followed this refolution, have defervedly ftamped the peculiar character of this reign, and indelibly fixed upon the fovereign, the hateful, but well-merited epithet, of *bloody* queen Mary. From various difappointments which fhe met with, as well in the want of a family, as in her hufband's inattention, and in the difcontents of her fubjects, it has been queftioned whether the period of her fhort reign was more afflictive to herfelf, or difaftrous to the nation. It is to the honour of the legate Pole, that he totally difapproved of the feverity of perfecution, but the arguments of Gardiner and others in its favour were fo conformable to the queen's difpofition, that the flames foon began to be kindled in the metropolis and other parts of the kingdom. Proteftants, illuftrious for their talents, and of the pureft moral character, were called upon to feal their faith at the ftake. For an account of the fufferings which this cruel woman inflicted, and of the martyrs which fhe fent to prifon, to exile, and death, we refer to the feveral articles in the work, which have been devoted, as far as the writers have been able, in a fhort compafs, to keep them in "everlafting remembrance." In the fpace of lefs than four years, 277 perfons were committed to the flames, including prelates and beneficed clergymen, laymen of all ranks, women, and even children. It is believed, that neither fhame nor compaffion, nor a regard to her future reputation, ever touched the heart of queen Mary. It might not, perhaps, occur to her that by her dark deeds fhe was raifing a name, that fhould, to the laft records of her country, be held in abhorrence by perfons of all ranks and parties; and that the lifping infant fhould, in almoft their earlieft leffons, learn to dread the found of "the bloody queen." The fincerity of her zeal has been referred to as an extenuation of her crimes, and we would not withhold from her any trait that might tend to make her a lefs hateful object with pofterity: fhe evidenced that fincerity by the facrifices which fhe was ever ready to make of the revenues of the crown, in reftitution of the goods of the church, and more than once, to the remonftrances on this head, fhe replied, in words to the following effect, "that fhe preferred the falvation of her foul, to ten fuch kingdoms." To gratify Philip, fhe warmly promoted a war with France, in conjunction with him, though contrary to the terms of the marriage articles, and the manifeft interefts of the Englifh nation. War was declared in 1557, and the affiftance of the Englifh troops contributed to the victory over the French at St. Quintin. In the following year, the lofs of Calais more than overbalanced any fucceffes that might be achieved in other parts. This town was taken by the duke of Guife in the winter of 1558, after it had been more than 200 years in the poffeffion of England. The difgrace of this circumftance funk deep into the heart of the queen, who had been, fome time before, in a declining ftate of health, occafioned by a dropfical complaint: and fhe expired in the month of November 1588, in the forty-fecond year of her age, and the fixth of her reign. With her expired the dominion of popery in this kingdom, which could never overcome the horror and deteftation which her cruelties had infpired. "It is not neceffary," fays the hiftorian, "to employ many words in drawing the character of this princefs. She poffeffed few qualities either eftimable or amiable, and her perfon was as little engaging, as her behaviour and addrefs. Obftinacy, bigotry, violence, cruelty, malignity, revenge, tyranny; every circumftance of her character took a tincture from her bad temper and narrow underftanding. And amidft that complication of vices, which entered into her compofition, we fhall fcarcely find any virtue but fincerity; a quality which fhe feems to have maintained throughout her whole life; except in the beginning of her reign, when the neceffity of her affairs obliged her to make fome promifes to the Proteftants which fhe certainly never intended to perform. But in thefe cafes a weak bigotted woman, under the government of priefts, eafily finds cafuiftry fufficient to juftify to herfelf the violation of a promife. She appears alfo, as well as her father, to have been fufceptible of fome attachments of friendfhip; and even without the caprice and inconftancy which were fo remarkable in the conduct of that monarch. To which we may add, that in many circumftances of her life fhe gave indications of refolution and vigour of mind, a quality which feems to have been inherent in her family." Hume's Hift. 8vo. vol. iv.

Mary de Medicis, daughter of Francis II., grand duke of Tufcany, and wife of Henry IV. of France, was born at Florence in 1573. On the death of her hufband, in 1610, fhe was appointed regent of the kingdom, in which character fhe difplayed great political intrigue, and planned projects of unbounded ambition. Differences arofe between her and Lewis, which were compromifed by means of Richelieu, whom fhe introduced to the favour of the monarch. But afterwards a violent breach occurred between her and the cardinal, who was fupported by the king. By her intrigues, the nation loft all its influence abroad, and was torn to pieces at home by contending factions. After feveral viciffitudes of fortune, fhe was abandoned by her fon, Lewis XIII. whofe reign had been conftantly difturbed by the civil commotions that fhe had occafioned, was exiled to Bruffels, and all her favourites, even her phyfician, were either banifhed or fent to the Baftile. She died in poverty in the year 1642. She built the fuperb palace of Luxembourg at Paris, and embellifhed that city with aqueducts and other ornaments. Hift. of France, 8vo. 1790.

Mary, queen of Scotland, daughter of James V., was born in the royal palace of Linlithgow, on the 8th of December, 1542. Her mother was Mary, the eldeft daughter of Claude, duke of Guife, and widow of Louis, duke of Longueville. Her father dying a few days after her birth, fhe fcarcely exifted before fhe was hailed queen. After the rejection of a propofal made by Henry VIII. of England to contract her to his fon Edward, an offer was made by the Scots to marry her to Francis, the dauphin fon of Henry II. of France, and in her fixth year fhe was fent into that country for education. She difplayed, on advancing to maturity, a degree of perfonal beauty which was the admiration of a gay and galant court. The opening powers of her mind alfo, and her natural difpofition, afforded early hopes of capacity and merit. After being taught to work with her needle, fhe was inftructed in the Latin language; and is faid to have read and fpoke it with accuracy and fluency.

In

In the feveral modern languages her proficiency was ftill greater, and fhe fpoke the French, the Italian, and the Spanifh tongues, with eafe and propriety. She walked, danced, and rode with enchanting gracefulnefs, and fhe was qualified by nature, as well as by art, to attain to diftinction in painting, poetry, and mufic. When fhe had completed her fifteenth year, the negociations for her marriage were entered upon. It was the object of the French court to obtain by this union that afcendancy over Scotland which the prudent jealoufy of the Scots attempted to guard againft. Her nuptials with the dauphin were celebrated with great pomp in 1558, and her hufband received the "crown matrimonial" of Scotland. On the acceffion of Elizabeth to the throne of England, Mary was obliged by her minifters to put in her claim to that dignity, on the plea of Elizabeth's illegitimacy, and fhe and the dauphin openly, and for a fhort time, affumed the title and arms of king and queen of England. This fatal ftep entailed upon her the perpetual hatred of her rival, queen Elizabeth, and was the principal caufe of all her misfortunes. In 1559, the death of Henry II. raifed his fon, Francis II., to the throne of France, and conferred upon Mary the crown of a queen-confort of that powerful kingdom. Her mother, who had acted as regent, died in 1560, while that country was involved in a war between the Proteftants, fupported by queen Elizabeth, and the Catholics, aided by France. Peace between England and France fucceeded her death, by an article of which Francis and Mary were bound to recognize Elizabeth's title to the Englifh crown, and renounce their own. In a very few months Francis died, leaving his widow overwhelmed with forrow for the lofs of that influence which fhe poffeffed as his queen. Her humiliation, the difgrace of her uncles, the princes of Lorraine, which inftantly followed, and the coldnefs of Catharine of Medicis, the queen-mother, who governed her fon Charles IX., plunged Mary into inexpreffible forrow. She was invited to return to her own kingdom, and fhe endeavoured to reconcile herfelf to her fate. She was now to pafs from a fituation of elegance and fplendour to the very reign of uncivilization and turbulence, where moft of her accomplifhments would be loft, and none of them could be properly appreciated. Among the Scots of that period, elegance of tafte was but little known: the generality of the people were funk in ignorance and barbarifm, and what was denominated religion, dictated to all a petulant rudenefs of fpeech and conduct to which the queen of France was wholly unaccuftomed. At length, however, though much againft her inclination, fhe embarked, bidding farewel, with fighs and tears, to the beloved land which had fo long foftered her, nor could fhe be prevailed on to quit the deck till its coafts were quite out of view. She arrived in Scotland in Auguft 1561, after an abfence of almoft thirteen years.

It cannot be expected, that in the limits to which this article muft neceffarily be kept, that we can enter into all the controverfy to which the hiftory of this queen has given rife. It will be fufficient for the readers of the Cyclopædia, if we give a concife narrative of undifputed and indifputable facts, following, in a great meafure, Dr. Robertfon as our guide.

When the queen arrived, the Proteftant caufe in Scotland was efpoufed by the majority of the people, but had not as yet obtained an eftablifhment, and its adherents were full of fufpicions of the machinations of the popifh party, fupported by the court of France, and by the fecret attachment of Mary, who was zealoufly devoted to the Catholic religion. The Proteftant leaders looked to Elizabeth as the great protectrefs of their principles, and fhe took every opportunity to undermine the influence of Mary, and involve her in difficulties; not only on account of her predilection for the French alliance with her country, but becaufe Elizabeth regarded her as a perfonal rival and a claimant of her crown. On this and on various other accounts, though the reception of Mary was for the moment highly flattering, and feemed to denote an univerfal fpirit of loyalty, abundant fources exifted of impending difturbances. The commencement of her adminiftration was prudent and moderate. Although the zeal of the reformers infulted her religion, fhe would not liften to the violent counfels of the popifh faction, but gave her confidence entirely to the Proteftants. She repreffed the outrages of the banditti of the borders, and made a progrefs into the north, with the view of remedying the diforders there. Her appearance gave fo much alarm to the powerful earl of Huntley, that he took up arms, and Mary, with her minifters who attended her, was brought into great danger, from which fhe was refcued by the loyalty of fome Highland clans. The earl was afterwards defeated and flain by Mary's natural brother, the earl of Murray. Her people were now anxious that fhe fhould enter upon a fecond marriage, and various matches were propofed to her by foreign potentates. Her choice fell upon her kinfman Henry Stuart, lord Darnley, fon of the earl of Lennox, a youth who, befides a fine perfon, did not poffefs a fingle valuable qualification. This match was oppofed by many of her powerful nobles, but through the addrefs of the queen, the confent of the nation in general was obtained, and the union took place in 1565. She proclaimed her hufband king, and commanded that all writs fhould run in their joint names, and fhe began to devife means to revenge herfelf on thofe who had oppofed her marriage. Thefe were the chiefs of the Proteftant party; in her own mind fhe would have exercifed clemency towards them, but the folicitations of the French court, then engaged in a league with Spain to extirpate herefy, induced her to change her intentions. She called a parliament, in which their attainder, and fome meafures in favour of the Catholic religion in Scotland, were to be propofed, when a circumftance occurred, which for a time took the whole poffeffion of her mind. David Rizzio, the fon of an Italian mufician, had accompanied the Piedmontefe ambaffador to Scotland, and gained admiffion into the queen's family by his mufical talents. He foon fhared much of her favour, and was raifed to the office of her French fecretary. This good fortune rendered him fo arrogant and infolent, that he was regarded by the nobles with all the ill-will ufually attending a worthlefs favourite. Rizzio affifted Darnley in engaging the affections of the queen; and very foon after the marriage he became his rival, and took fuch liberties with the queen, as paffed all bounds of prudence and decorum, and Darnley refolved to get rid of him. At the fame moment, fome men of rank, who imputed to Rizzio the queen's enmity to the exiled nobles, concurred in the project for his deftruction. A confpiracy was formed for effecting the purpofe, and a band of armed ruffians took poffeffion of the gates of the palace of Holyrood houfe, while the king, with fome other perfons, and lord Ruthven in complete armour, entered the chamber where Mary was at fupper with the countefs of Argyle and Rizzio. The unhappy victim clung to the queen for protection; but her entreaties and fupplications were of no avail; he was dragged from her prefence, and murdered in the next apartment. This favage deed, aggravated by the queen's fituation, who was far advanced in pregnancy, could not be forgiven. From this hour, Mary took no pains to conceal her hatred of her hufband, whom fhe treated with every mark of averfion and contempt, nor

nor did the birth of a ſon, afterwards James VI. of Scotland, and the firſt of that name in England, produce a reconciliation. She, however, ſoon transferred her affection from Rizzio to Hepburn, earl of Bothwell, a potent nobleman, who had ever evinced an attachment to her cauſe, and had been a principal inſtrument of reſcuing her from the power of the conſpirators, who would willingly have ſacrificed her as well as her paramour. He, neglected and deſpiſed by every one, was glad to live in ſolitude; and in the beginning of 1567, he was ſeized with a diſorder, which brought his life into danger, and which was attributed by ſome perſons to poiſon. When he was getting better, Mary paid him a viſit at Glaſgow, in which ſhe put on an appearance of the greateſt kindneſs and affection, and he conſented to accompany her to Edinburgh. Here ſhe attended him with the aſſiduity of a tender wife, and ſlept two nights in the chamber under his apartment. But on the next day ſhe left him to be preſent at a maſque in her palace, and at two o'clock the following morning the houſe was blown up with gunpowder, and the king's dead body was found in an adjacent field. To Bothwell and the queen this foul deed was imputed, and the late king's father inſiſted that the former ſhould be brought to trial, but no perſon appearing as his accuſer on the day appointed, he was acquitted. Within a week from this acquittal, Bothwell, at a public entertainment, openly avowed his intention of marrying the queen; the perſons preſent, people of the higheſt rank in the country, applauded his determination, and ſubſcribed a paper expreſsing their conviction of his innocence with reſpect to the murder, and recommending him as huſband to the queen. The ſentiments of the nation by no means correſponded with the declaration of theſe mean ſpirited nobles, and the projected union was generally looked upon with deteſtation. Bothwell reſolved to bring it to effect with violence. As the queen was proceeding from Edinburgh to Stirling, to viſit her infant ſon, he ſuddenly appeared on the road with a large body of horſe, diſperſed her ſlender train, and ſeizing her perſon with a few courtiers, conveyed them to his caſtle at Dunbar. That this was a preconcerted plan, done with the conſent of the queen, there never was a doubt in any one's mind. On the 5th of May, and within a few weeks of her huſband's murder, the marriage was conſummated; and from this period, Bothwell, without the title of king, poſſeſſed the whole power of the crown; no acceſs was permitted to the queen except through his creatures, and he made a deſperate attempt to get the perſon of the young prince into his hands, but without ſucceſs. Theſe tranſactions excited a general indignation in foreign countries, and rendered the Scottiſh name odious, till at length the nobles of the land redeemed their credit by a determined and practical patriotiſm in defending the prince. They collected an army, and declared againſt Bothwell, who, with the queen, retired to Dunbar, and alſo raiſed troops. To avoid the conſequences of a battle, Mary was obliged to accept the condition of diſmiſſing Bothwell from her preſence, and ſurrendering herſelf to the confederates. Bothwell took his leave, and rode from the field, juſt one month after his marriage, and ſhe never ſaw him afterwards. She was, after this, received with reſpect by the nobles; but the ſoldiers and common people could not be prevented from expreſſing their feelings in the moſt opprobrious terms. A ſtandard was held before her, on which was painted the corpſe of the late king, with the infant prince kneeling, and uttering the words "Judge and revenge my cauſe, O Lord." She was conducted to Edinburgh, as a ſpectacle of ſhame through the ſtreets, aud ſympathy for her condition was loſt, in horror of her real or imputed crimes. She was ſoon after obliged to reſign the crown, which was placed on the head of the prince, Murray being appointed regent during the minority. Mary was now thrown into priſon, from which ſhe contrived to make her eſcape, and after an unſucceſsful attempt to regain her power, ſhe reſolved to throw herſelf upon the generoſity of her rival, Elizabeth, and haſtily embarking in a fiſhing-boat, ſhe landed at Workington in Cumberland, whence ſhe was reſpectfully conducted to Carliſle. The queen of England was at a loſs to know how to treat a foreign princeſs expelled from her country, and accuſed by her own ſubjects, who was likewiſe regarded by the Catholic party as the rightful claimant of the Engliſh crown. She determined, however, to take advantage of the incident, and at leaſt to detain her as a ſort of ſtate priſoner. Mary propoſed to ſubmit her cauſe to the cognizance of her ſiſter-queen; the offer was accepted, as implying a kind of judicial ſuperiority in the latter, and affording the occaſion of keeping Mary in a diſtant confinement for an indefinite period. By the requiſition of Elizabeth, the regent Murray was induced to appoint commiſſioners to ſupport his cauſe, Mary did the ſame on her part; and Elizabeth nominated three perſons of diſtinction to hear both parties. The conferences were opened at York, whence, after a time, they were removed to Weſtminſter. The regent directly accuſed Mary of being acceſſory to the murder of her huſband, of which, it was ſaid, proofs were adduced in her own hand-writing; but after a variety of delays and ſubterfuges, by which both queens ſeemed inclined to ſtifle inquiry, the regent, who had come in perſon to England, was diſmiſſed without either approbation or cenſure, while Elizabeth determined to ſupport his party in Scotland, and Mary remained in cuſtody. She hoped to regain her liberty by means of a marriage with the duke of Norfolk. Elizabeth was kept in ignorance of the deſign, while it was communicated to the courts of France and Spain, who highly approved it. When the fact was diſcovered by the vigilance of her miniſters, ſhe, without heſitation, committed the duke to the Tower. A rebellion in behalf of Mary's cauſe broke out in the north of England, which, though ſpeedily ſuppreſſed, excited in the mind of Elizabeth ſuch apprehenſions, that in 1570 ſhe had come to the determination of ſending back the captive to her own country, under the cuſtody of the regent. This plan was defeated by the murder of that nobleman, an event that revived the hopes of Mary's friends and adherents in Scotland, and cauſed great confuſion in that country. The duke of Norfolk was liberated from confinement, and, carrying on a correſpondence with Mary, was ſeduced, in 1571, into a conſpiracy, which coſt him his life. Mary, whoſe place of confinement had been the caſtle of Tutbury, was, on account of ill health, ſuffered to go to Buxton. About this period the earl of Morton fell into the power of his enemies in Scotland, and was tried and convicted of having a ſhare in the late king's death. By his dying confeſſion, he admitted that he had been informed by Bothwell of the conſpiracy, but that finding the queen was the author of it, he forebore to take any ſteps to reveal it. In 1584, there were other plots contrived to effect Mary's eſcape, by one of which the Engliſh nation was thrown into ſuch alarms for the ſafety of the queen and the Proteſtant religion, that a meaſure was adopted which may be conſidered as the fore-runner of Mary's fate. This was an aſſociation, by which the ſubſcribers bound themſelves, by the moſt ſolemn oaths, to defend queen Elizabeth from all enemies, foreign and domeſtic. The unanimity with which this aſſociation was entered into by all ranks of people alarmed Mary, who ſubmitted herſelf, with great apparent humility, to the queen's diſpoſal, though ſhe was almoſt at the ſame inſtant detected in ſecret correſpondence with the Engliſh Catholics. She had hitherto been under the care of the earl of Shrewſbury, who had diſcharged the truſt repoſed in him during fifteen years with reſpect and lenity towards the unfortunate captive, and with great integrity towards his employers. She was now committed to the cuſtody of two keepers of inferior rank and harſh diſpoſitions, *viz.* ſir Drue Drury, and ſir Amias Paulet. Elizabeth, in the mean time, obtained an aſcendancy over the councils of the young king of Scotland, and engaged him in a league for the protection of the Proteſtant religion, now endangered by the power and bigotry of Philip II. of Spain.

A new conſpiracy againſt the life of the queen of England afforded her miniſters an opportunity of involving Mary as an accomplice in it, and letters aſſerted to be her's were produced, which proved, or which were thought to prove, her participation in the deſign of aſſaſſinating Elizabeth. The circumſtances, if founded in fact, were no doubt greatly exaggerated, the zeal of the nation was inflamed to the higheſt degree, and the puniſhment of the great culprit was loudly called for. The court, being backed by the people at large, reſolved to proceed to the extremity it had long meditated. The papers of the Scottiſh queen and her domeſtics were ſeized, and ſhe herſelf was conveyed a *cloſe* priſoner to Fotheringay-caſtle. Under the cover of that phraſe, "cloſe impriſonment," there is no treatment, however ſevere, that has not been practiſed by gaolers, and ſanctioned by their employers. Preparations were made for trying her publicly, and in October, 1586, a commiſſion was opened for the purpoſe. At firſt ſhe refuſed to plead, uſing the obvious and valid arguments, that ſhe was a foreigner, and a ſovereign in her own right: that ſhe owed no allegiance to the laws of a kingdom in which ſhe had been treated only as a captive, and from which ſhe had received no protection. Her objections being over-ruled, ſhe was perſuaded or threatened into a conſent to plead. She made her defence with great dignity of mind, and ſolemnly diſclaimed the leaſt concurrence in any deſign to take away the queen's life; ſhe was, however, declared guilty of being an acceſſary to Babington's conſpiracy. Though the trial was conducted in a manner which would have been illegal, even if ſhe had been a ſubject of England, and though no certain proof could be made out againſt her, ſhe was, to the aſtoniſhment of Europe, condemned to ſuffer death. The fair heroine received her ſentence with fortitude and compoſure, and when the earls of Shrewſbury and Kent were introduced to inform her that ſhe muſt prepare for death next morning at eight o'clock, ſhe ſeemed in nowiſe terrified, though ſomewhat ſurpriſed with the intelligence. She ſaid with a cheerful and ſmiling countenance, that ſhe did not think the queen would have conſented to her death, or have executed the ſentence againſt a perſon not ſubject to the laws and juriſdiction of England: "But as ſuch is her will," ſaid ſhe, "death, which puts an end to all my miſeries, ſhall be to me moſt welcome; nor can I eſteem that ſoul worthy the felicities of heaven, which cannot ſupport the body under the horrors of the laſt paſſage to theſe bliſsful manſions." On the evening before her execution on the ſucceeding morning, ſhe prepared herſelf with religious ſolemnity and perfect reſignation. She called in all her ſervants and drank to them: they pledged her, in order, on their knees; and craved her pardon for any paſt neglect of their duty: ſhe even deigned, in return, to aſk pardon for her offences towards them, and a plentiful effuſion of tears attended this laſt ſolemn farewel and exchange of mutual forgiveneſs. She then diſtributed among them her money, her jewels, and her clothes, according to their rank and merit. She wrote her will with her own hand, conſtituting the duke of Guiſe her principal executor, and to the king and queen of France ſhe recommended her ſon, provided he ſhould prove worthy of their eſteem. At her uſual time ſhe went to bed, ſlept ſome hours, and then riſing, ſpent the reſt of the night in prayer. Having foreſeen the difficulty of exerciſing the rites of her religion, ſhe had taken the precaution to obtain a conſecrated hoſt from the hands of pope Pius, and ſhe had reſerved the uſe of it for this laſt period of her life. By this expedient, ſhe ſupplied, as much as ſhe could, the want of a prieſt and confeſſor, which was refuſed her by the bigotry of the earls of Shrewſbury and Kent, who would have forced upon her the dean of Peterborough, rather to enter upon controverſial topics, than to afford her the conſolation that her ſituation required. Towards the morning ſhe dreſſed herſelf in very elegant attire, and met the awful ceremony with a dignity and mildneſs of diſpoſition that affected every beholder, except, perhaps, the dean of Peterborough, who inſulted her with his exhortations, and the two noble earls, who ſeemed deſirous of refuſing every requeſt, however reaſonable for her to aſk, and for them to grant. Her behaviour at this awful criſis has furniſhed matter for all the deſcriptive eloquence of hiſtory: it was indeed calm, magnanimous, and pathetic, in a ſupreme degree. After due preparations, ſhe laid her head on the block, and firmly received the fatal ſtroke. She died in her forty-fifth year, after a captivity of almoſt nineteen years. She was a woman of great accompliſhments both of body and mind, natural as well as acquired, but unfortunate in her life, and, during one period, very unhappy in her conduct. An enumeration of her qualities might carry the appearance of panegyric; an account of her conduct muſt, in ſome parts, wear the aſpect of ſevere ſatire and invective. Her misfortunes, the ſolitude of her long and tedious captivity, and the perſecutions to which ſhe had been expoſed on account of her religion, had wrought her up to a degree of bigotry during her later years, and ſuch were the prevalent ſpirit and principles of the age, that it is the leſs wonder if her zeal, her reſentment, and her intereſt uniting, induced her to give conſent to a deſign which conſpirators, actuated only by the firſt of theſe motives, had formed againſt the life of Elizabeth. Mary wrote "Poems on various occaſions, in the Latin, French, and Scotch languages:" "Conſolations of her long impriſonment, and royal advice to her ſon:" "A Copy of Verſes, in French, ſent with a diamond ring to queen Elizabeth:" "Genuine Letters of Mary, queen of Scots, to James, earl of Bothwell." Beſides theſe, there are many other of her epiſtles to queen Elizabeth, Cecil, and other diſtinguiſhed characters preſerved in the Cottonian and Aſhmolean libraries. Robertſon's Hiſt. of Scotland. Hume's Hiſt. of England.

Mary, *St.*, in *Geography*, an iſland in the Eaſt Indian ſea, near the N.W. coaſt of the iſland of Borneo. N lat. 6° 30′. E. long. 114° 30′.—Alſo, one of the Scilly iſlands. N. lat. 49 57′. W. long. 6° 17′. See Scilly *Iſlands.*—Alſo, an iſland in the Indian ſea, ſeparated from the E. coaſt of Madagaſcar, by a ſtrait about three leagues wide; the iſland is about 15 leagues long, and from two to three wide, amidſt rocks, on which is found ſome beautiful white coral; on the E. coaſt is found ambergris, uſed by the inhabitants in their ſacrifices to the memory of their anceſtors. The interior abounds with gentle hills, innumerable brooks, and ſprings of freſh water The inhabitants, who pretend to be the deſcendants of Abraham, call the iſland "Noſſi Ibrahim." The ſoil is fertile, and produces rice, ſugar-canes, legumes of different kinds, pine-apples, tobacco, &c. The air is inſalubrious, and rain frequently occurs and ſometimes

times continues, without intermiffion, for a fortnight. S. lat. 16° 40′. E. long. 50° 30′.—Alfo, one of the Shiant iflands, among the Weftern iflands, near the S.E. coaft of Lewis, in Scotland, about feven miles in circumference; 22 miles S. of Stornaway.—Alfo, one of the Azores iflands. N. lat. 37°. W. long. 25° 6′.—Alfo, a county of Maryland, on the peninfula between Patowmac and Patuxent rivers, 39 miles long, and 15 broad, containing 13,699 inhabitants, of whom 6399 are flaves.—Alfo, a poft-town and port of entry of Georgia, fituated on St. Mary river, a few miles from its mouth. The town is fmall, and its trade is inconfiderable; 129 miles S. of Savannah. N. lat. 30° 45′. W. long. 79° 12′.—Alfo, a river which forms part of the fouthern boundary line of the Upper States; and in part divides Georgia from Eaft Florida. It rifes in the great Okafonoka or Ekaufanoga fwamp, which extends S. into E. Florida. It is thought to be that which is called May river, difcovered by John Ribalt in 1562. Between this and Naffau river lies the low even coaft of Amelia ifland. The harbours of both rivers are fpacious, but St. Mary's is the fafeft; it has nine feet of water at low fpring tides, runs a courfe of 150 miles, enters the ocean between the points of Amelia and Talbert's iflands, in N. lat. 30° 44′, and is navigable for veffels of confiderable burden for 90 miles. Its banks afford immenfe quantities of fine timber, fuited to the Weft India market.—Alfo, a branch of the Miami, which runs into lake Erie.—Alfo, a river of Nova Scotia, which runs into the fea, N. lat. 45° 5′. W. long. 61 .—Alfo, a river of America, which runs from lake Superior to lake Huron; on which are two forts. N. lat. 46° 22′. W. long. 84° 24′.—Alfo, a port on the S. fide of the bay of Fundy.—Alfo, a fmall ifland, called "Bates Ifland," in the German fea, near the E. coaft of England, and county of Northumberland; fix miles N.N.W. of Tynemouth. N. lat. 55° 6′. W. long. 1° 11′.

Mary's, *St.*, *Bay*, a bay on the S. coaft of Newfoundland. N. lat. 57°. W. long. 54° 20′.—Alfo, a bay of the Atlantic, on the coaft of Africa. S. lat. 13° 12′.—Alfo, a bay on the W. coaft of Nova Scotia, E. of the bay of Fundy.

Mary, *St.*, *Cape*, the moft fouthern promontory of Brazil.—Alfo, the point of land which forms the N. fide of the mouth of La Plata river, in Paraguay, or La Plata, in South America. S. lat. 35° 14′. W. long. 55° 32′.—Alfo, the S.E. headland at the mouth of Placentia bay, Newfoundland.

Mary, *St.*, *Falls of*, a cataract in St. Mary's river, between lake Superior and lake Huron, confifting not of a perpendicular defcent of water, but of a rapid, which continues near three quarters of a mile, over which canoes, well-piloted, might pafs. Thefe falls fupply immenfe quantities of fifh, which are commodioufly caught by dipping nets at the bottom of the falls.

Mary's, *St.*, *Inlet*, a bay on the coaft of Georgia, at the mouth of the river St. Mary. N. lat. 30° 56′. W. long. 81° 40′.

Mary's, *St.*, *Iflands*, a clufter of fmall iflands in the gulf of St. Lawrence, near the S. coaft of Labrador. N. lat. 50° 20′. W. long. 60°.

Mary's, *St.*, *Keys*, rocks on the S. coaft of Newfoundland. N. lat. 46 47′. W. long. 53° 55′.

Mary's, *St.*, *Key*, a fmall ifland in the gulf of Mexico, near the coaft of Florida. N. lat. 30° 11′. W. long. 89° 12′.

Mary, in *Heraldry*, *Knights of St. Mary*, is a name by which feveral orders of knighthood are diftinguifhed. As, the *Virgin Mary* and St. Blaife. See St. Blaise. *St. Mary* of the Thiftle. See Thistle. *St. Mary* of the Conception. See Conception. *St. Mary* of the Elephant. See Elephant. *St. Mary* and Jefus. See Jesus. *St. Mary* of Loretto. See Loretto. *St. Mary* of Mount Carmel. See Carmel. *St. Mary* of the Teutonics. See Teutonic, &c.

MARYBONE, or St. Mary le Bone, a large parifh at the north-weftern extremity of London, and now conftituting a populous portion of this capital. It was anciently called Tiburn, from its fituation near a fmall bourn or rivulet, which was formerly named Aye-brook or Eye-brook. When the feite of the church was changed to a place near the brook, it appears to have gained the appellation of St. Mary-at-the-Bourn, of which its prefent name is a corruption. The parifh is fituated in the hundred of Offulfton, and county of Middlefex; is eight miles and a quarter in circumference; and contains about 2500 acres, whereof nearly half is occupied by buildings, and the remainder, extending weftward to Kilbourn turnpike, and northward to Primrofe-hill, is grafsland, except a few acres appropriated to market gardeners. The foil on the north fide of the parifh is clay, and on the fouth a fine gravel. The manor of Tybourn was an ancient demefne of the crown; and the manor-houfe was ufed as a palace: this manfion was pulled down in the year 1791, and Devonfhire Mews built on the feite. In the vicinity was a well known place of entertainment called Marybone-gardens, which were opened before the year 1737, for public breakfafts, and evening concerts with exhibitions of fire-works, &c. The gardens were fhut up in 1778; and the feite is now occupied by Beaumont-ftreet, and part of Devonfhire-ftreet and Devonfhire-place. Marybone-park, a part of the ancient royal demefne, and fince called Marybone-park farm, contains 543 acres, according to an actual furvey made in the year 1794, under the direction of John Fordyce, efq. furveyor-general of the crown lands. About two-thirds of this diftrict are in the parifh of Marybone, and the remainder in that of Pancras. A new fcheme has been recently propofed to lay it out for villas, rides, ftreets, &c. A canal, (called the Regent's) from Paddington to the Thames, is to pafs through it. An act of parliament for this purpofe was obtained in the year 1812. It was alfo defigned to build extenfive barracks here; but this fcheme having been feverely and juftly reprobated in fome of the public journals, it is relinquifhed. Since Marybone has been in fome degree incorporated with London, feveral fplendid manfions have been erected by the nobility, and other perfons of opulence within this parifh. The moft remarkable are, the earl of Aldborough's in Stratford place; Montague houfe, in Portman fquare; Manchefter-houfe; Harcourt-houfe; Chandos-houfe; Foley-houfe, which might have been added to the lift, is now taken down, and the ground let to build a wide ftreet from Portland-place fouthward. In Duchefs-ftreet, Thomas Hope, efq. has a fplendid manfion, containing a large and valuable collection of ancient vafes, fculpture, paintings, &c. The late fir Francis Bourgeois had a handfome houfe in Charlotte-ftreet, which was filled with a large and choice collection of pictures by the moft eminent mafters. The whole of thefe are bequeathed to Dulwich college, in Kent, where a large and appropriate gallery is now building for their reception, from the claffical defigns of John Soane, efq. profeffor of architecture to the Royal Academy. Attached to which is a maufoleum, to contain the remains of the late fir Francis, and alfo thofe of his friend Noel Defenfans, efq.

In the year 1400, bifhop Braybrooke granted a licence to take down the old church of Tybourn, and to build a new church of ftones or flints in a more eligible fituation. This edifice, called Marybone church, being, through length of time, in a ruinous condition, was taken down in the year 1741, when the prefent ftructure was erected on the feite; but it is very fmall and ill fuited to the prefent population. There are, however, eight private chapels in the parifh, belonging to the eftablifhment of the church of England; *viz.* Oxford chapel, built before 1739; Portland chapel, 1766; Bentinck chapel, 1772; Welbeck chapel, 1774; Portman chapel, 1779; Quebec chapel, 1788; Margaret-ftreet chapel, firft ufed as a place of worfhip of the eftablifhed church in 1789; Brunfwick chapel was built about the year 1795. The parifh alfo contains feveral chapels appropriated to perfons of different religious profeffion: among which are two for Roman Catholics; one belonging to the Greek church; and one for the Wefleyan Methodifts.

At the beginning of the laft century, Marybone was a fmall village, nearly a mile diftant from any part of the metropolis. In the year 1715, a plan was formed for building Cavendifh-fquare, and feveral ftreets on the north fide of Tybourn road. In 1718, the ground was laid out, the circle for the centre inclofed, and furrounded with a parapet-wall and palifadoes. The duke of Chandos took the whole north fide, intending to build a magnificent manfion, of which the houfes belonging to the earls of Hopetown and Gainfborough were to have been the wings. Lord Harcourt and lord Bingley took fome ground on the eaft and weft fides, and the reft was let to builders; but the failures of the South-fea year put a ftop to the improvements, and the fquare was not completed for feveral years. As an inducement to the builders to perfevere, a chapel and market were projected; and they were both finifhed in 1724, though the market was not opened till 1732. The houfes on the north fide of Tybourn road were completed in 1729, and it was then called Oxford-ftreet. Maitland, whofe work was publifhed in 1739, fays, there were in his time 577 houfes in Marybone parifh. Portman-fquare was begun about 1764, and Portland-place about 1770. Manchefter-fquare, which had been begun in 1776, by the building of Manchefter-houfe, was finifhed in 1788. From that time to the commencement of the prefent war, the buildings rapidly increafed. In the return under the population act of 1800, this parifh is ftated to contain 7764 houfes, occupied by 63,982 perfons. The prefent number of houfes muft exceed 8330. The progreffive increafe in the population appears in the regifters of baptifms and burials, which were, on an average,

Years.		Average of Baptifms.		Average of Burials.

Among the many eminent perfons buried in this parifh, we fpecify the following names: Humphrey Wanley, antiquary; James Figg, the celebrated prize-fighter, rendered famous by being a fubject for Hogarth's pencil; James Gibbs, architect; Archibald Bower, hiftorian, &c.; Edmund Hoyle, author of the treatife on Whift; John Michael Ryfbrack, ftatuary; William Guthrie, hiftorian and geographer; James Fergufon, aftronomer; Allan Ramfay, portrait-painter; Mark Anthony Jofeph Baretti, linguift; John Dominick Serres, marine-painter; Stephen Storace, an eminent mufical compofer; William Cramer, mufician; Francis Wheatley, artift; George Stubbs, artift; admiral fir Richard King, baronet; Alexander Dalrymple, geographer, &c.; Thomas Holcroft, author of various works; William Henry Cavendifh, duke of Portland. Very numerous entries occur in the regifters of marriages, baptifms, and burials, relating to families of the firft rank. A charity-fchool was inftituted in this parifh in 1750, for clothing, inftructing, and apprenticing the children of the induftrious poor. On the north fide of Oxford-road, near Stratford-place, were fome ancient conduits belonging to the city of London: near them ftood the lord mayor's banqueting-houfe, where the city officers were accommodated when they went to view the conduits; it was pulled down in 1737, and the fprings were arched over.

This parifh is governed by a felect veftry, and is extremely well regulated, for which it is much indebted to the late bifhop Harley, who was many years curate here, and exerted his intereft in procuring the acts of parliament by which the regulations are confirmed.

The public place of execution for criminals convicted in the city of London and county of Middlefex, was formerly in this parifh, at the end of Park-lane, near Tybourn-turnpike. For further particulars refpecting this part of London, fee PADDINGTON and PANCRAS. Lyfons's Environs of London, vol. iii. and Supplement to ditto, 1812, 4to. Malcolm's "Londinium Redivivum," vol. iv. 4to.

MARYBOROUGH, a poft-town of Ireland, in the Queen's county and province of Leinfter. It is fituated on the river Barrow, and is the affizes town of the county. It is not large; but in its neighbourhood is manufactured a great quantity of ftuffs, ferges, druggets, and other woollen goods. Maryborough received its name from queen Mary I. in whofe reign the county was made fhire ground: it had, before the Union, the privilege of being reprefented in parliament; and it ftill retains its peculiar magiftrates. It is 40 miles S.W. from Dublin. Carlifle. Beaufort.

MARYGOLD, in *Botany*. See CALENDULA.

The leaves of this plant appear to be of greater virtue than the flowers, to which many exploded virtues have been afcribed: their expreffed juice has been given in dofes of two or three ounces, or more, as an aperient; and is faid to loofen the belly, and promote the natural fecretions in general. Lewis.

MARYGOLD, *African*. See TAGETES.

MARYGOLD, *Corn*. See CHRYSANTHEMUM.

MARYGOLD, *Fig*. See MESEMBRYANTHEMUM.

MARYGOLD, *French*. See TAGETES.

MARYGOLD, *Marfh*. See CALTHA.

MARYGOLD, *Zoophyte*, in *Natural Hiftory*, the name of a fpecies of fea-animal, of a very beautiful kind, and of the nature of thofe commonly called *zoophytes*, or plant-animals, by the old naturalifts. In St. Lucy's parifh, in Barbadoes, there is a cave, in which is a bafon of very clear falt water: and in the midft of this bafon lies a ftone, which has been for many years found to be the habitation of a great number of animals of this fpecies.

The ftone is always covered with water; and from fmall holes in its fides, in feveral parts, there appears at all times of the year a number of creatures reprefenting the flowers of fome of the radiated plants, and particularly of the common marygold: they are yellow, and feem compofed of a very great number of petals. Thefe, in their natural ftate, are all regularly and beautifully expanded; but as foon as any thing difturbs them, if it be only the motion of of a ftick, that comes within three or four inches of them, they in an inftant clofe all the leaves up together, and the whole body, flower, ftalk and all, is retracted back into the hole of the ftone; but if the water be left a few minutes undifturbed again, they will appear, and expand themfelves in the former manner.

When they are nicely obferved, there is a yet farther refemblance of a flower in their ftructure; for there arife from the centre of the body certain oblong bodies, which very naturally refemble the ftamina arifing from the centre of a flower; but thefe have evidently the powers of animal limbs; for they no fooner appear, but they dart themfelves about to the verge of the flower in feveral directions, and are plainly bufied in fearch of prey.—They are compofed of feveral joints, and the creature often makes them meet in the manner of a forceps, to lay hold of any thing it pleafes. Thefe parts, however, feldom appear thus exerted any long time together, but are, after a time, received back into the body.

Thefe arms may eafily be conceived to be of ufe to draw in the prey within the compafs of the body of the animal; and as foon as it is there, the fame contraction of the feveral rays which ferves them to efcape danger, and bury themfelves in the cavity of the ftone, will alfo ferve to hold faft the prey till the creature has fed on it.

Befide thefe large yellow radiated zoophytes, the top of the ftone ufually affords a number of others of a blue colour, which ftand among a fort of veficles of water-bladders, difpofed like clufters of grapes. Philof. Tranf. N° 470. p. 591.

MARY-GREY, in *Geography*, the name of a tolerably high mountain in the county of Tyrone, Ireland, between Omagh and Strabane. The road paffes between this mountain and Baffy Beil, another infulated mountain of confiderable height. Beaufort.

MARYKIRK, a town on the S. coaft of the ifland of Sanday. N. lat. 59° 6′. W. long. 2° 27′.

MARYLAND, one of the United States of America, lying between 37° 56′ and 39° 44′ N. lat. and 0° and 4° 30′ W. long. 134 miles in length and 110 in breadth, or 14,000 fquare miles in fuperficial meafure, one-fourth of which is water. This ftate is bounded N. by Pennfylvania, E. by Delaware ftate and the Atlantic ocean, and S. and W. by Virginia. It is divided into 19 counties, 11 on the weftern, and eight on the eaftern fhore of Chefapeak bay, as in the following table.

Counties.		No. Inhab. in 1790.	No. Inhab. in 1800.	No. Slaves in 1790.	No. Slaves in 1800.	Chief Towns.

Each of the counties fends four reprefentatives to the houfe of delegates, befides which the city of Annapolis and town of Baltimore fend each two. Annapolis is the capital of the ftate: but Baltimore is more populous and of greater commercial importance. The number of inhabitants in this latter town, according to the cenfus of 1800, was 26,514, of whom 2843 were flaves. The bank eftablifhed in Baltimore, with a capital of 300,000 dollars, is called "The Maryland Bank." There is, befides, a branch of the bank of the United States. In 1796 a new bank was eftablifhed by law, with a capital of 2,000,000 dollars, called "The Bank of Baltimore." The other principal towns of this ftate are Georgetown, in which a bank has been lately eftablifhed, called "The Bank of Columbia," and alfo a college for the accommodation of about 200 ftudents, endowed chiefly by Roman Catholics of the feveral ftates, but as to education unlimited by any particular fect;—Fredericktown; Elizabethtown;—and Elkton. See each place refpectively. Chefapeak bay, which feparates this ftate into the eaftern and weftern divifions, receives a number of large rivers; from the eaftern fhore in Maryland, among other fmaller ones, it receives Pokomoke, Nanticoke, Choptank, Chefter, and Elk rivers; from the north, the rapid Sufquehanna; and from the weft Patapfco, Severn, Patuxent, and Patowmac, half of which is in Maryland, and half in Virginia. The Sufquehanna and Patowmac excepted, thefe are fmall rivers. As to the face of the country, eaftern of the blue ridge of mountains, which ftretches acrofs the weftern part of of this state, the land is generally level and free from stones. The ground is uniformly level and low in most of the counties on the eastern shore, and consequently much covered with water, except where it is intercepted by numerous creeks. The large tracts of marsh render the close of the summer and fall seasons in this part of the state sickly; spring and summer are most healthy. The soil of the good land in Maryland produces from 12 to 16 bushels of wheat, or from 20 to 30 bushels of Indian corn, *per* acre. Ten bushels of wheat, and 15 bushels of corn *per* acre, are the annual average crops in the state at large. The staple commodities are wheat and tobacco. Some cotton of inferior quality is also raised in this state, and in the interior counties, as the Uplands, considerable quantities of hemp and flax are cultivated. Two articles are said to be peculiar to Maryland, *viz.* the genuine white wheat, which grows in Kent, Queen Ann's, and Talbot counties, on the eastern shore, and which degenerates in other places; and the bright *kite's foot* tobacoo, which is produced at Elkridge, on the Patuxent, on the western shore. Among other kinds of timber are the oak, of several kinds, made into staves for exportation, and the black walnut employed for furniture. The apples are large but mealy; the peaches plentiful and good. From these the inhabitants distil cyder, brandy, and peach-brandy. The forests abound with various kinds of nuts, collectively called "Mast," and used for fattening hogs, which run wild in the woods. As to the manners of the inhabitants, Mr. Morse says that the farmers of Maryland associate very much with each other; that their manners are as polished as those of the country gentlemen in England, their minds well informed, and their intercourse free and social; their sons generally receive a liberal education, and many of them engage in the study of the law, without pursuing it as a profession. The inhabitants of Maryland, however, are not exempt from that pride, which is too general among those who are connected with and accustomed to slaves; but with their pride they blend a great degree of hospitality. Many of their women possess all the amiable, and many of the elegant accomplishments of their sex. The mines of iron ore in this state abound, and it is of superior quality; furnaces and forges are also numerous. Coal has been lately found near Baltimore, and great quantities of rye-whiskey are manufactured in this state; grist-mills are common. The trade of Maryland is principally carried on from Baltimore, with the other states, with the West Indies, and with some parts of Europe. To these places the inhabitants send annually about 30,000 hogsheads of tobacco, besides large quantities of wheat flour, pig-iron, lumber, and corn; beans, pork, and flax-seed in smaller quantities; and receive, in return, clothing for themselves and negroes, and other dry goods, wines, spirits, sugar, and other West Indian commodities. The balance is generally in their favour. The value of exports from this state in 1801 was 9,151,939 dollars. The first settlers in Maryland were Roman Catholics; besides these, there are many Protestant Episcopalians, English, Scotch, and Irish Presbyterians, German Calvinists, German Lutherans, Friends, Baptists, Methodists, Mennonists, and Nicolites or New Quakers; all of whom enjoy liberty of conscience. For the seminaries of learning in Maryland; see College.

The revenue of Maryland arises chiefly from taxes on real and personal property; and the annual expences of government are estimated at about 20,000*l.* currency. The legislature is composed of a senate and house of delegates, which are styled "The General Assembly of Maryland." The senators are elected in the following manner. On the 1st of September, every fifth year, the freemen choose two men in each county, to be electors of the senate, and one elector for the city of Annapolis, and one for the town of Baltimore. These electors, possessing the qualifications necessary for county delegates, meet at Annapolis, or any other appointed place, on the third Monday in September, every fifth year, and elect by ballot fifteen senators out of their own body, or from the people at large: nine of them residents on the western, and six on the eastern shore; all more than twenty-five years of age; residents in the state more than three years before the election; and possessing a real and personal property above the value of 1000*l.* The senate may originate any bills, except money bills, to which they can only give their assent or dissent. The president of the senate is chosen by ballot. The house of delegates is composed of four members for each county, chosen annually the first Monday in October: the city of Annapolis and town of Baltimore, as we have already observed, send each of them two delegates. The qualifications of a delegate are, full age, one year's residence in the county where he is chosen, and real and personal property above the value of 500*l.* Both houses choose their own officers, and judge of the election of their members; a majority of each is a quorum. The election of senators and delegates is *vivâ voce*, and sheriffs the returning officers, except in Baltimore town, where the commissioners superintend the elections, and make returns. The stated session of the legislature is on the first Monday in November. The qualifications of a freeman are, full age, a freehold estate of fifty acres of land, and actual residence for a year in the county where he votes, and property in any part of the state to the value of 30*l.* The governor is appointed on the second Monday in November, annually, by the joint ballot of both houses; but cannot continue in office longer than three years successively, nor be re-elected until the expiration of four years after he has been out of office. The qualifications for the chief magistracy are twenty-five years of age, five years' residence in the state, next preceding the election, and real and personal estate above the value of 5000*l.*, 1000*l.* of which must be freehold estate. A council for assisting the governor in his office, consisting of five persons above twenty-five years of age, residents in the state three years next preceding the election, and possessing a freehold of lands and tenements above the value of 1000*l.* is chosen, annually, on the second Tuesday of November by joint ballot of senators and delegates. The governor, with the advice of his council, appoints the chancellor, all judges and justices, the attorney-general, naval and militia officers, and all others, except constables, assessors, and overseers of the roads. A court of appeals is established for the final determination of all causes, which may be brought from the general court of admiralty, or of chancery. This constitution was established by a convention of delegates at Annapolis, Aug. 14, 1776.

Maryland was granted by king Charles I. to George Calvert, baron of Baltimore, in Ireland, June 20, 1632. It was called Maryland in honour of the queen, Henrietta Maria, and was the first colony which was erected into a province of the English empire, and governed by laws enacted in a provincial legislature. The first emigration, consisting of about 200 gentlemen of considerable fortune and rank, with their adherents, chiefly Roman Catholics, sailed from England in November 1632, and landed near the mouth of Patowmac river in the beginning of the following year. Calvert purchased the rights of the aborigines for a satisfactory consideration; and, with their free consent, took possession in March, 1633, of the town, which he he called St. Mary's. The foundation of this province was laid by lord Baltimore, on the broad basis of security to property and liberty in religion; Christianity being established without allowing pre-eminence to any particular sect. This wise measure soon converted a dreary wilderness into a prosperous colony. The transportation of people and of stores, during the first two years, cost lord Baltimore upwards of 40,000*l.* The freemen of the province, as an expression of gratitude, granted him, at an early period, a subsidy of fifteen pounds of tobacco on every poll. The first assembly was convened in February, 1634-5. Successive assemblies were convened in January, 1637-8, and in February, 1638-9: at which latter meeting an act passed "for establishing the house of assembly." An attempt was made by the British parliament, in 1640, to annul the charter of Maryland; but the effort failed, and Maryland remained prosperous and happy, till the intrigues of one William Cleyborne disturbed its tranquillity. In 1645, a rebellion was raised in the province; nor were peace and order restored till August, 1646. The assembly at that time, though composed chiefly of Roman Catholics, passed an act, which indicates a spirit of liberality very uncommon at that period. It recited, that the enforcement of conscience had ever been of dangerous consequence in those countries in which it had been practised. And it was enacted, "that no persons professing to believe in Jesus Christ should be molested in respect of their religion, or in the free exercise thereof, or be compelled to the exercise of any other religion, against their consent; so that they be not unfaithful to the proprietary, or conspire against the civil government. That any person molesting another in respect of his religious tenets, should pay treble damages to the party aggrieved, and twenty shillings to the proprietary; that those reproaching any with opprobrious names of religious distinction, should forfeit ten shillings to the persons injured; that any one speaking reproachfully against the blessed virgin, or the apostles, should forfeit five pounds. But blasphemy against God should be punished with death." This act passed 1649, and was confirmed in 1676, among the perpetual laws of the province. The year 1650 is remarkable in the history of Maryland for the final establishment of that constitution, which continued, with some short interruption, till the present one was adopted in 1776. In 1692, the Protestant religion was established by law in this province. In 1716, the government was restored to Charles, lord Baltimore, the then proprietary, and continued in his hands, and those of his successors, till the late revolution; when, though a minor, the proprietary's property in the lands were confiscated and the government assumed by the freemen of the province, who framed the present constitution. Maryland was the last to sign the articles of confederation, published by congress after the declaration of independence. On the 1st of March, 1781, they signed these articles, and they were thus finally ratified. Morse's Geog. vol. i.

MARYLAND *Point*, a point in the state of Maryland, formed by a bend in the Patowmac river, W. of Fort Tobacco.

MARY-PORT, a market town in the parish of Cross-Canonby, Allerdale Ward, Cumberland, England, is situated six miles distant from Workington, and 309 from London, on the banks of the river Ellen, which divides it into two parts. It was first called Mary-port, in honour of the lady of the late Humphrey Senhouse, esq. whose family have long been proprietors of the manor: the small hamlet from which the town arose, was named Ellen or Elene-foot, from its situation. This town, like many on the western coast of Cumberland, derives its origin and consequence from the coal trade: about the middle of the last century, the beach was occupied by only one house, called Valencia, and about half a score miserable huts, that served to shelter a few fishermen; but so great has been the increase of population and building, that in the year 1801 the houses amounted to 520, and the number of inhabitants was 2932. The streets are wide, and the houses neatly built. Wooden piers, with quays, have been erected on each side of the river, for the conveniency of shipping. There are now belonging to the port between seventy and eighty vessels, from 30 to 250 tons burthen. They are chiefly employed in the exportation of coal to Ireland; and in the importing of timber, flax, and iron from the Baltic. An extensive cotton manufactory has been established here, which furnishes employment for nearly 500 people. A weekly market is held on Fridays. A chapel was erected in the year 1760, and consecrated in 1763, by bishop Lyttelton. On an eminence, called the Mote-hill, at the south end of the town, is an artificial mount, the base of which is one hundred yards in circumference. It is protected by a deep ditch, which almost surrounds it.

On the north side of the Ellen, near Maryport, are the remains of a considerable Roman station, generally called Ellenborough; though the village of that name stands on the opposite side of the river at some distance. This station, in the opinion of Horsley and Warburton, was the Virosidum of the Notitia. Camden supposed it to be the Volantium; and other writers have styled it Olenacum. The fort is on a high bank, overhanging the sea, and commanding an extensive prospect of the Scottish coast. The area is a square, with four entrances, and defended by a double ditch and rampart. The numerous vestiges of antiquity and variety of inscriptions found at this station are supposed not to be equalled by those discovered at any other in Britain. The principal of these remains is a Roman altar, about five feet high, of curious workmanship, and ornamented on every side with sculptures and inscriptions.

Near the port stands Nether-hall, the seat of the Senhouse family, where the relics found at the station are chiefly preserved. This mansion was formerly called Alneburgh-hall, and Ellenborough-hall. Hutchinson's History, &c. Cumberland. Beauties of England, vol. iii.

MARYSBURGH, a township of Upper Canada, in Prince Edward county, situated at the eastern end of the peninsula, which forms the bay of Quinto, and lies open to lake Ontario on the south.

MARYSVILLE, a post-town of America, in Knox county, Tenessee; 561 miles from Washington.

MARYTOWN, a town of Scotland, in the county of Angus; 5 miles E.S.E. of Brechin.

MARYVILLE, the county-town of Blount county, in the state of Tenessee.

MARZA, a town of Sicily, in the valley of Noto, where they manufacture salt; eight miles S.S.E. of Noto. —Also, a town of Africa, in the desert of Zanhaga, inhabited by Moors, who trade with Europeans for gum, of which there are three forests near.

MARZA *el Bir*, a town of Arabia; 10 miles W. of Hali.

MARZA *Eran*, a town of Arabia; 12 miles S. of Sockia.

MARZA *Ibrahim*, a town of Arabia; five miles S. of Serrain.

MARZA *Kouf*, a town of Arabia; 35 miles S. of Mecca.

MARZA *Susa*, a town of Africa, in the kingdom of Barca; six miles N. of Curen.

MARZAGLIA, a town of Italy, in the department of the Panaro; four miles W. of Modena.

MARZANO, St., a town of Naples, in the province of Otranto; 12 miles S of Tarento.

MARZILLA, a town of Spain, in the kingdom of Navarre; 30 miles S. of Pamplona.

MARZOAN, a mountain of Egypt, near the coast of the Red sea; 15 miles from Cosseir.

MAS BAY, a bay in the North sea, on the coast of Norway. N. lat. 60 50′. E. long. 5° 30′.

MAS *d'Agenois*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Marmande, situated on the Garonne; six miles E.S E. of Marmande. The place contains 1600, and the canton 6515 inhabitants, on a territory of 82½ kiliometres, in seven communes.

MAS *d'Azil*, a town of France, in the department of the Arriege, and chief place of a canton, in the district of Mirepoix, fortified by the Protestants, but since dismantled; 25 miles W. of Mirepoix. The place contains 2482, and the canton 9969 inhabitants, on a territory of 177½ kiliometres, in 15 communes.

MAS *Cabardes, Le*, a town of France, in the department of the Aude, and chief place of a canton, in the district of Carcassonne; one mile N. of Carcassonne. The place contains 670, and the canton 6093 inhabitants, on a territory of 175 kiliometres, in 16 communes.

MASA, a town of Congo; 20 miles N.E. of St. Salvador.

MASACCIO, or TOMASO DA SAN GIOVANNI, in *Biography*, was born at Castello di San Giovanni, nel Valdarno, in the duchy of Florence. Concerning the period of his birth there has been found considerable difference among the early biographers of artists; but Baldinucci, among other evidences, produces one most completely unanswerable, which proves that he was born in 1402. This decisive proof was found in the book of the fiscal chamber of Florence, concerning the taxes or customs paid by the inhabitants of the commune of Castel di San Giovanni in 1427; in which our Tomaso gives his portion, and describes himself as being in his twenty-sixth year, and his brother Giovanni in his twenty-first.

Masaccio (for by this name Tomaso is best known) appears to have attached himself very early to the art of painting: for, at the age of 19, he was matriculated at the city of Florence as a painter; which would hardly have occurred, if he had not been at that time advanced considerably in his profession. His parents were descended of a noble stock, and had the means of enabling their son to follow with advantage the chosen object of his mind; and happy was it for the art, and the world, that for a while nothing impeded the progress of a man, whose extraordinary powers enabled him to extend the regions of art, to re-animate its almost torpid spirit, and shew to future ages how far its aid, morally and intellectually, might be cultivated for the benefit of mankind.

His father's name was San Giovanni di Mone, of the family of the Guidi. He was by profession a notary of the city of Florence; an office which, at that time, entitled him to respect, and presupposed a qualification for filling higher stations in the magistracy of that place. Finding his son Tomaso intent upon the practice of painting, he placed him as a scholar under Masolino da Panicale, who was at that time engaged in painting the chapel of the Brancacci nel Carmine. At the same time, the arts of sculpture and architecture began to revive; the former in the hands of Donatello and Ghiberti, and the latter also in those of Filippo Brunelleschi. With the works of these men Tomaso was captivated; and recognising in them the revival of the true taste observable in the antique, he attempted to apply it in painting, the inseparable companion of the sister art of sculpture. How well he succeeded his works still testify, after a lapse of 400 years, or nearly. His is the glory of forming a new epoch in the art. One hundred and fifty years had passed from the time of Cimabue to Masaccio: in that period a very considerable advance was made in the practice of painting, particularly by Giotto, the disciple of Cimabue; but still much was imperfect in design, in colour, in the imitation of the natural actions of the figure, of attitudes, relievo, and the more subtle graces of the art. Most of these Masaccio filled up the want of, and gave a more perfect imitation, as well as a better choice of nature, than any of his predecessors; overcame many difficulties, which had been stumbling blocks to them; and opened the way to those great men who succeeded him, particularly to Raphael, who seems to have been born with a soul congenial to his, and who frequently imitated, and sometimes borrowed figures from him, which he was not always able to improve. He is said to have been the first who attained that most essential point, fore-shortening the feet properly, so as to make them appear to rest flat upon the ground, and which, till his time, had not been done; probably owing to the painters taking too near a view of their figures: when looking down upon the feet, and drawing them as so seen, they would of necessity make them appear almost perpendicular. Masaccio discovered the evil of this, and taking a proper distance for his view, and a just point of sight, gave their proper effect. For this he was indebted to perspective, the principles of which were imparted to him by Brunelleschi.

He attempted to compose and draw the nude or naked figure, in more varied actions than his predecessors had dared to attempt; and though his figures are frequently imperfect, and in a style tame and insipid, yet he sometimes wonderfully succeeded, particularly in the actions of the limbs: and in his heads, and the foldings of drapery, he still upholds his station with the best.

So much skill, and so great a novelty in the art of design, soon drew him into notice; and the city of Florence wished to employ his talents. His industry keeping pace with his powers, the productions of his pencil were of course very numerous: but, alas! few now remain to testify concerning him; and of these, the greater part disfigured by time, and by ignorance, which, pretending to secure, has only hastened their destruction. Baldinucci, who wrote in 1680-90, says, that in his time, though much had been destroyed, yet sufficient remained in Florence of the works of our artist, to prove the vast extent of his study and his labour; to which he applied so fervently, that he neglected every thing which did not appertain to his art, not even collecting the money owing to him for his pictures, and being entirely negligent of his person; so that from thence he acquired the name of Masaccio, and is by that so much better known than his own, that we have thought it proper to place our account of him under it, rather than that of Tomaso da San Giovanni. He was engaged to adorn the principal churches and convents in Florence; but, after having for some time employed himself there, he was stimulated by a desire either to see the works of the ancients, those of contemporary artists, or for the benefit of his health, to travel to Rome, where his high merit was also recognised, and was called into practice. Among other works he painted, in a chapel of the church of Santa Maria Maggiore, a picture of Santa Maria della Neve, with four saints; in which was the portrait of pope Martin, painted from life, with a spade in his hand, marking out the foundations of that church; and also that of the emperor Sigismundo II. Vasari says that Michael Angelo thought it worth while to study this picture,

ture, which he praifed highly. Whilft he was thus honourably employed at Rome, he heard that his friend and protector Cofmo di Medici was again ftationed at the head of affairs at Florence, and immediately returned there. Upon his arrival he found his mafter Mafolino dead, leaving incomplete feveral pictures in the chapel of the Brancacci, the finifhing of which was immediately entrufted to Mafaccio, who, to the defigns already began by Panicale, added many others, which ftill remain monuments of his fuperior ingenuity. While he was engaged in adorning the Chiefa del Carmine, a proceffion of the hoft occurred, which gave rife to a picture in frefco (in which ftyle all his works are executed) of the peculiarities of that ceremony. This he painted over a door which led to the adjoining convent, and which is now deftroyed. In it he reprefented a great number of citizens marching in proceffion, five or fix abreaft, with a propriety and variety of action, and in fo juft a perfpective gradation of form and colour, as perfectly aftonifhed the beholders. Among others, he introduced his friends Brunellefchi, Donatello, Mafolino, Antonio Brancacci, who endowed the chapel, &c.

Thus fuccefsfully and ufefully ran the courfe of Mafaccio's life till he arrived at the age of forty-one, when he was fuddenly fnatched from his honours and the world by the remorfelefs hand of death, not without fufpicion of poifon having been adminiftered by fome envious or malignant perfon. This unhappy event caufed univerfal grief throughout the city of Florence; and Brunellefchi obferved, that, in the death of Mafaccio, the profeffors of the art had fuftained the greateft lofs which could poffibly have befallen them. The works, however, which he had fo ingenioufly wrought, remained for their inftruction; and almoft all the enlightened artifts who then lived, and who immediately followed, to carry the art to its utmoft pitch, failed not to ftudy and benefit by the fuperior qualities of this extraordinary man. Amongft them were Lionardo da Vinci, Michael Angelo, and Raphael; and when fuch men as thefe three thought his labours worthy of their ftudy, little more need be added in their praife.

MASAFFRAN, in *Geography*, a river of Algiers, which forms the boundary towards the north between the provinces of Tremecen and Titterie. It is formed by the union of feveral fmaller ftreams, and runs into the Mediterranean. N. lat. 36° 40'. E. long. 3° 13'.

MASAFUERO, an ifland in the South Pacific ocean, firft feen in 1563, and fituated W. of Juan Fernandez, both being nearly in the fame latitude, and diftant, by the globe, about 31 leagues. It is very high and mountainous, and at a diftance appears like one hill or rock; its form is triangular, and its circumference about feven or eight leagues. The fouth part, firft feen by Capt. Carteret in May 1767, when he firft made the ifland, at the diftance of 23 leagues, is much the higheft: on the north end there are feveral fpots of clear ground, which, perhaps, might admit of cultivation. In the account of lord Anfon's Voyage it is faid, that only one part of this ifland affords anchorage, which is on the N. fide, and in deep water; but Capt. Carteret faw no part where there was not anchorage. On the W. fide, in particular, there is anchorage at about a mile from the fhore, in twenty fathom, and about two and a half miles, in forty and forty-five fathom, with a fine black fand at the bottom. In the fame voyage it is alfo faid, that there is a reef of rocks running off the eaftern point of the ifland about two miles in length, which may be feen by the fea breaking over them; but this, according to Capt. Carteret's account, is a miftake, as there is no reef of rocks or fhoal running off the eaftern point, but there is a reef of rocks and fand running off the weftern fide, near the S. end of it. The author of Anfon's Voyage is alfo miftaken as to the diftance of this ifland from Juan Fernandez, and its direction, for, he fays, the diftance is twenty-two leagues, and the direction W. by S.; but Capt. Carteret found the diftance nearly one-third more, and the direction is due W., the latitude of both iflands being nearly the fame. The goats formerly mentioned in Anfon's Voyage were found by our later navigators in great abundance, and equally eafy to be caught. On the S.W. point of the ifland there is a remarkable rock with a hole in it, which affords a good mark to come to an anchor on the weftern fide, where is the beft bank of any about the place. About a mile and a half to the northward of this hole, there is a low point of land, and from this point runs the reef juft mentioned, in the direction of W. by S. to the diftance of about three quarters of a mile, where the fea continually breaks upon it. To anchor, run in till the hole in the rock is fhut in, about a cable's length upon this low point of land then bearing S. by E. ½E., and anchor in twenty and twenty-two fathom, fine black fand and fhells. There is anchorage alfo at feveral places on the other fides of the ifland, particularly off the N. point, in fourteen and fifteen fathom, with fine fand. All round the ifland there is plenty of wood and water, but they cannot be procured without difficulty; as a great quantity of ftones, and large fragments of the rock have fallen from the high land every where round the ifland, and upon this the furf breaks to fuch a degree, that a boat cannot come with fafety within a cable's length of the fhore. Mafafuero is a good place for refrefhment, efpecially in the fummer feafon. We have already mentioned the goats, and there is round the ifland plenty of fifh, which may be eafily caught; fuch as excellent coal-fifh, cavallies, cod, hollibut, and cray-fifh. King-fifhers, fharks, and feals are numerous. The latter animals yield excellent train-oil, and their hearts and plucks are good food, fomewhat refembling in tafte the hog; and their fkins are covered with very fine fur. On this ifland are many birds, and fome very large hawks. S. lat. 33° 45'. W. long. 80° 46'. Hawkefworth's Voyages, vol. i.

MASAGRAN, or MASACHRAN, a town of Algiers, in the province of Tremecen, furrounded with mud walls, and feated on the declivity of a range of hills, within a furlong of the Mediterranean; 20 miles N. of Arzew. Shaw's Travels, p. 15.

MASAIBPET, a town of Hindooftan, in Golconda; 28 miles N.N.W. of Hydrabad.

MASAN, a town of Mocaumpour; 44 miles S.W. of Mocaumpour.

MASANET, a town of Spain, in Catalonia; 17 miles S. of Gerona.

MASANI, a town of Servia; 30 miles S. of Paffarowitz.

MASARA, a town of Algiers; 12 miles N. of Conftantina.

MASARINO, in *Ornithology*, a name given by the Portuguefe in the Brazils, to a large bird of the curlew kind, approaching to the goofe in fize; and more commonly known by its Brafilian name *curicaca*.

MASARUOLO, in *Geography*, a town of Italy, in Friuli; 5 miles N. of Friuli.

MASAYA, a town of Mexico, on the weft fide of the lake of Nicaragua; 10 miles N. of Granada.

MASBATE, one of the Philippine iflands, about 90 miles in circumference, the inhabitants of which are, for the moft part,

part, free and independent. Tribute is paid by about 250 families. The chief produce of this iſland is rice. It has ſome mines, but they are not wrought. N. lat. 12° 18′. E. long. 123° 20′.

MASBOTHÆI, or MESBOTHÆI, the name of a ſect, or rather of two ſects: for Euſebius, or rather Hegeſippus, whom he cites, makes mention of two different ſects of Maſbothæans. The firſt was one of the ſeven ſects that aroſe out of Judaiſm, and proved very troubleſome to the church; the other was one of the ſeven Jewiſh ſects before the coming of Jeſus Chriſt.

The word is derived from the Hebrew שבת, *ſchabat, to reſt*, or *repoſe*, and ſignifies idle, eaſy, indolent people. Euſebius ſpeaks of them, as if they had been ſo called from one Maſbotheus, their chief; but it is much more probable that their name is Hebrew, or at leaſt Chaldaic, ſignifying the ſame thing with a Sabbatarian in our language, that is, one who makes profeſſion of keeping Sabbath.

Valeſius will not allow the two ſects to be confounded together; the laſt being a ſect of Jews before, or at leaſt contemporary with Chriſt; and the former a ſect of heretics deſcended from them. Rufinus diſtinguiſhes them in their names; the Jewiſh ſect he calls *Maſbuthæi;* and the heretics *Maſbuthæani*. The Maſbuthæans were a branch of the Simonians.

MASCALAT, in *Geography*, a town of Arabia, in the province of Oman; 240 miles W.N.W. of Oman.

MASCALL, an iſland in the bay of Bengal, near the coaſt of Aracan, about 50 miles in circumference. N. lat. 21° 40′. E. long. 92°.

MASCAR, or MASCARA, formerly *Victoria*, a town of Algiers, and capital of a province of the ſame name, ſometimes called Tremecen, from the moſt conſiderable town in it. This town is the reſidence of the bey, and the only place in the whole kingdom which, under the domination of the Turks, flouriſhes and perceptibly increaſes in proſperity. It is indeed ſmaller than Tremecen and Sherſhel; but ſurpaſſes them in beauty, and the modern appearance of the houſes, and it is daily enlarging in extent. Maſcara is ſituated in the centre of a diſtrict abounding with corn-fields, and embelliſhed with numerous ſmall villages. So late as in the time of Shaw (1732) it was but an inconſiderable place; but at preſent it has a great number of good houſes, newly erected moſques, and a ſtrong caſtle, in which the bey reſides, and is attended by a numerous and ſplendid retinue. The Bedouins in its vicinity are exempt from taxes, and merely ſerve as volunteers in caſes of neceſſity; 40 miles E.S.E. of Oran.

MASCARAIB, or MASERIB, a town of Syria, belonging to a powerful Arabian prince; three days' journey S.S.E. from Damaſcus.

MASCARDI, AUGUSTIN, in *Biography*, an Italian, was born of a good family, at Sarzana, in the territory of Genoa, in the year 1591. In early life he entered himſelf among the Jeſuits, which ſociety he quitted upon the invitation from pope Urban VIII., who made him his chamberlain, and nominated him to the profeſſorſhip of eloquence in the college of Sapienza at Rome. He died at the age of 49, and he is ſpoken of by cardinal Bentivoglio, who was his moſt intimate friend, as one of the moſt learned and eloquent perſons of his time. He was author of many works, of which, the moſt valuable is on "The Art of writing Hiſtory," firſt publiſhed in 1636, and reprinted with additions by Pirani in 1646. He publiſhed an account of the conſpiracy of Fieſco in 1629, and the work of cardinal de Retz on the ſame ſubject is only a free tranſlation of that of Maſcardi. Moreri.

MASCARENHAS, in *Geography*, a town of Portugal, in the province of Tras-los-Montes; 4 miles N. of Mirandola. See alſo *Iſle of* BOURBON.

MASCARI, a town of Sicily, in the valley of Demona; 9 miles S.W. of Taormina.

MASCARIN, one of the Gallapagos iſlands in the Pacific ocean. S. lat. 1° 12′.

MASCAT, or MASKAT, a town of Arabia, in the territories of the Imam of Oman. This is the moſt important and beſt known city in theſe territories; and hence the Imam is, by many travellers, called "king of Maſkat." It ſtands at one end of a beautiful plain, near a ſmall gulf, encompaſſed with ſteep rocks, forming an excellent harbour, in which the largeſt veſſels may find ſhelter. This harbour is likewiſe protected by forts; ſo that the city is fortified both by art and nature. Arrian calls it "Moſca," and ſpeaks of it as being, even in his time, a great emporium of the trade of Arabia, Perſia, and India. Maſkat has ever enjoyed this advantage, and even at preſent poſſeſſes a conſiderable trade. The Portugueſe made themſelves maſters of it in 1508. Two churches, one of which is now a magazine, and the other the houſe of the "wali," or governor, ſtill remain to ſhew that they were once eſtabliſhed here. About 150 years after their conqueſt of Maſkat, the Portugueſe were expelled by the Arabs, through the treacherous aid of a Banian, who had been robbed of his daughter by the Portugueſe governor. The Banians are more numerous at Maſkat than in any other city; their number amounting to 1200. They are permitted to live according to their own laws, to bring their wives hither, to ſet up idols in their chambers, and to burn their dead. At Maſkat, Europeans pay 5 *per cent.* upon imports; Mahometans, 6½; and Jews and Banians 7 *per cent.* The Imam's natural ſubjects pay 6 *per cent.* in kind, upon dates exported; and theſe are the principal article which the country affords. Maſkat is diſtinguiſhed by the ſtrictneſs of its police; ſo that a ſtranger may walk in the ſtreets any hour of the night without moleſtation. Theft is never pardoned; every perſon caught in the act either ſuffers death, or the loſs of a hand; and therefore the merchandize lies at all times ſafe in the ſtreet; 220 miles S.S.E. of Gambron. N. lat. 23° 22′. E. long. 74° 50′. Niebuhr.

MASCATLAN, a town of Mexico; 60 miles from Acapulco.

MASCAU, a town of the duchy of Stiria; 8 miles S.E. of Windiſch Weiſtritz.

MASCAUTANS, an Indian nation, inhabiting near lake Michigan, and between that and the Miſſiſippi. The number of warriors is 400.

MASCHARADA, in the *Italian Muſic*, is applied to muſic compoſed for the geſtures of pantomimes, buffoons, mimics, and ſuch groteſque characters.

MASCHARSKA, in *Geography*, an iſland of Ruſſia, in the Frozen ſea, near the weſt coaſt of Nova Zembla. N. lat. 73°. E. long. 52° 14′.

MASCHERE SCENICHE, *Ital.*, dramatic maſks of the ancients. So immenſe was the ſize of the theatres of Greece and Italy, that we may naturally conclude a muſical declamation for the ſtage to have been a neceſſary conſequence of ſpeaking loud; for whoever ſhouts, halloos, or bawls, with ſufficient force to be heard further than common ſpeech can penetrate, makes uſe of fixed tones, which, if ſoftened, would become muſical: and it is well known that the tones of ſpeech are too tranſient and undetermined to be aſcer-

ascertained by those of music, or to be audible at a great distance, or in a wide space.

This want of natural power of voice sufficient to be heard in the open air, for the ancient theatres had no cover, and by a great multitude, gave rise not only to singing upon the stage, but perhaps to chanting in the church. The necessity of augmenting the force of a performer's voice by every possible means, first suggested the idea of dramatic masks, which were used by the actors upon the principle of speaking trumpets.

The mask was called by the Latins *persona*, from *personare, to sound through*; and delineations of such masks as were used in each piece were generally prefixed to it, as appears from the Vatican Terence. Hence *dramatis personæ, masks of the drama*; which words, after masks ceased to be used, were understood to mean *persons of the drama*.

Quintilian, lib. ii. gives a list of invariable masks appropriated to different characters, to which the public had for many ages been accustomed. And Julius Pollux is still more ample in his account of theatrical masks, used in tragedy, satire, and comedy. Niobe, weeping; Medea, furious; Ajax, astonished; and Hercules, enraged. In comedy, the slave, the parasite, the clown, the captain, the old woman, the harlot, the austere old man, the debauched young man, the prodigal, the prudent young woman, the matron, and the father of a family, were all constantly characterised by particular masks. This custom is, in some measure, still preserved in the Italian comedy, and in our pantomime entertainments, which originated from it.

MASCHIGIKA, in *Geography*, a bay on the N.W. coast of Nova Zembla. N. lat. 76° 25'. E. long. 59° 14'.

MASCITI, Michele, in *Biography*, an Italian performer on the violin at the beginning of the last century, and a voluminous composer for that instrument. In Le Cene's catalogue at Amsterdam for 1729, there is a list of seven of his works, engraved on copper, consisting of solos, duets, sonatas, and concertos.

MASCLE, or Macle, in *Heraldry*, a bearing which differs both from the lozenge and fusil in this respect, that according to the sentiments of all authors, it should be exactly square and voided.

According to Guillim, the mascle represents the mash of a net, and is an honourable bearing. It only differs from a lozenge, by being voided.

When any coat, in which one or more mascles are borne, is to be blazoned, it is necessary to mention their number, and how they are placed; and if they are conjoined, that circumstance must also be mentioned.

MASCLEF, Francis, in *Biography*, a learned French priest and orientalist, was born at Amiens about the year 1672. He was educated for the church, and while he was very young, applied himself most diligently to the study of the sacred scriptures, and with this view he made himself master, not only of the Greek and Hebrew languages, but also of the Syriac, the Chaldee, and the Arabic. He obtained considerable preferment in the church, and to assist the young clergy in their pursuits, he drew up "A Course of Philosophy," and "A Course of Divinity," which he intended for publicati..n, but was from various unforeseen circumstances obliged to relinquish his design. His application to study, and his abstemious manner of living, irreparably injured his health, and he died in 1728, at the age of sixty-six. He was the author of "Ecclesiastical Conferences in the Diocese of Amiens, on the Duties and Obligations of the Ecclesiastical State, and on the principal Truths of Religion;" and some controversial pieces. But his celebrity with posterity chiefly rests on his "Grammatica Hebraica," which is a work of great merit, and does high honour to the author's erudition and his latinity. This was first printed at Paris in 1716, and the author's attack upon vowel points involved him in a controversy with M. Guarin, a learned Benedictine monk. In 1730, Masclef, in conjunction with the abbé de la Bletterie, one of the fathers of the oratory, published the second edition of his grammar in two volumes, 12mo.; the first consisting of the original work greatly enlarged; and the second containing three other grammars, *viz.* the Chaldee, the Syriac, and the Samaritan, together with a reply to the objections of M. Guarin, entitled "Novæ Grammaticæ Argumenta ac Vindiciæ."

MASCOBU, in *Geography*, a town of New Mexico, in the province of Mayo; 110 miles N.E. of Santa Cruz.

MASCULINE, something belonging to the male, or the stronger of the two sexes.

Masculine is more ordinarily used, in *Grammar*, to signify the first and worthiest of the genders of nouns.

The masculine gender is that which belongs to the male kind, or something analogous to it.

Most substances are ranged under the heads of masculine or feminine. This, in some cases, is done with a shew of reason, but in others it is merely arbitrary; and on that account, is found to vary according to the languages, and even according to the words introduced from one language into another. Thus, the names of trees are generally feminine in Latin, and masculine in the French.

Farther, the genders of the same word are sometimes varied in the same language. Thus *alvus*, according to Priscian, was anciently masculine, but is now become feminine. And *navire*, a ship, in French, was anciently feminine, but is now masculine. See Gender.

Masculine *Rime*, in the *French Poetry*, is that made with a word which has a strong, open, and accented pronunciation; as all words have, excepting those which have an *e* feminine in their last syllable.

For instance, *amour* and *jour*, *mort* and *fort*, are masculine rimes; and *père* and *mère*, *gloire* and *memoire*, are feminine. Hence also verses ending with a masculine rime, are called masculine verses; and those ending with a feminine rime, feminine verses.

It is now a rule established among the French poets, never to use above two masculine, or two feminine verses successively, except in the looser kinds of poetry.

Marot was the first who introduced this mixture of masculine and feminine verses; and Ronsard was the first who practised it with success. The masculine verses in French, should always have a syllable less than the feminine ones.

Masculine *Signs*. Astrologers divide the signs, &c. into masculine and feminine; by reason of their qualities, which are either active, and hot, or cold, accounted masculine; or passive, dry, and moist, which are feminine.

On this principle they call the Sun, Jupiter, Saturn, and Mars, masculine; and Moon and Venus, feminine. Mercury, they suppose, partakes of the two. Among the signs, Aries, Libra, Gemini, Leo, Sagittarius, and Aquarius, are said to be masculine; Cancer, Capricornus, Taurus, Virgo, Scorpio, and Pisces, are feminine

MASDEVALLIA, in *Botany*, a word of whose derivation we have no account, but it should seem to be formed of some proper name. Prod. Fl. Peruv. et. Chil. tab. 26. Swartz Orchid. in Schrad. N. Tourn. v. 1.

99. Clafs and order, *Gynandria Monandria.* Nat. Ord. *Orchideæ.*

Gen. Ch. *Cal.* Perianth fuperior, of one leaf, bell-fhaped, three-cleft; its fegments ovate, terminating in two fmall horns, the upper one rather the fhorteft. *Cor.* Petals two, oblong, oblique, fmall, the foremoft angle at their bafe moft prominent, their inner margin approaching the ftyle. Lip ovate, entire, flightly keeled, fomewhat ftalked, enclofed within the calyx. *Stam.* Anther a terminal hemifpherical lid; maffes of pollen ovate, ftalked, in pairs. *Pift.* Germen inferior, oblong; ftyle fhort, gibbous, channelled in front; ftigma in the fore part, concave. *Peric* Capfule oblong.

Eff. Ch. Calyx of one leaf, bell-fhaped, three-cleft. Lip ovate, fomewhat ftalked, fhorter than the calyx. Anther a terminal lid, deciduous.

1. M. *uniflora.* Syft. Veg. Peruv. et Chil. 238. The Peruvian name is *Hwaffahwaffi.*

By the above generic defcription, taken from profeffor Swartz's work, it is eafy to fee the propriety of confidering, as we have always done, the two inner leaves of the flower in *Orchideæ* as petals, not as leaves of the calyx; the latter part being, in this inftance, of one piece, and fo diftinct from the leaves in queftion, that Dr. Swartz is obliged to term them an inner calyx. See our account of CYMBIDIUM, DENDROBIUM, DIURIS, EPIDENDRUM, LIMODORUM, &c.

MASEBA, in *Geography*, a town of Sweden, in Weft Gothland; 54 miles E.S.E. of Gotheborg.

MASELSKOI, a town of Ruffia, in the government of Archangel; 20 miles S. of Kola.

MASENO, a village of the Valteline, celebrated for its baths; eight miles E.S.E. of Chiavenna.—Alfo, a river which rifes in the Alps, and runs into the Adda; four miles E. of Morbegno.

MASERA, a town of Arabia, in the province of Oman, on the coaft; 70 miles S.S.E. of Kalhat. N. lat. 22°.

MASERATA, a town of the duchy of Piacenza; 18 miles S. of Piacenza.

MASH, the name of a drink given to horfes or cattle. It is made of half a peck of ground malt, put into a pail; on which is poured as much hot fcalding water as will wet it well; then ftirring it about half an hour, till it becomes lukewarm, and fweet like honey, it is to be given to the horfe.

A mafh is only given after a purge, to make it work better; after hard labour, or for drink in time of ficknefs.

MASHAM, in *Geography*, a market town and parifh, partly within the liberty of St. Peter of York, and partly in the wapentake of Hang-Eaft, in the North Riding of Yorkfhire, England. It is fituated on the river Ure, at the diftance of nine miles from Rippon and 224 from London; and contained, according to the population return in the year 1801, 152 houfes, occupied by 1022 perfons. In the church, which is a handfome ftructure with a fine fpire, is a monument for fir Marmaduke Wyvill; and in the church-yard the lower half of a crofs, adorned with compartments of men and animals in relief. Leland mentions this town as "Maffeham, a pratye quick market town and a fair church. Several of the Scropes of Mafham were buried in York Minfter. Wiville dwillith a litle above Mafham on the further ripe of Ure." A weekly market is held in this town on Tuefdays, and three fairs annually. In the vicinity of Mafham ftood Jervaux abbey, founded in 1145 for Ciftertians: at the diffolution, the fcite was granted to the earl of Lennox. From the fragments of ruins which are fcattered over a great extent of ground, the outward walls appear to have been a mile in circumference. At Swinton, near Mafham, is the feat of the Danby family. At Clifton, a fhort diftance from the town, are the remains of a large building of ancient architecture, which was formerly the manfion of the lords Scroop of Mafham. Camden's Britannia by Gough, vol. iii. Daye's Tour in Yorkfhire, 8vo.

MASHANGUR, a town of Candahar, in the province of Cabul, on the river Sewad; 48 miles N. of Attock. N. lat. 33° 54′. E. long. 71° 7′.

MASHELSON, in *Agriculture*, a term ufed to fignify a mixture of wheat and rye, or what is fometimes called meflin. See MESLIN.

MASHUK, in *Geography*, a town of the Arabian Irak; 5 miles N.W. of Samira.

MASIADY, a town of Samogitia; 36 miles N.N.W. of Medniki.

MASJAN, a river of Perfia, which runs into the Sihon, in the province of Khorafan.

MASIDE, a fmall town of Spain, in the province of Galicia; 12 miles N.W. of Orenfe.—Alfo, a fmall ifland in the Eaft Indian fea. S. lat. 7° 25′. E. long. 130° 35′.

MASIN, a town of France, in the department of the Dora; five miles S.E. of Ivrea.

MASINA, a kingdom of Africa, fituated on the upper fide of the river Niger, S.E. of Beero, N. of Bambarra, and adjoining to Tombuctoo, which lies to the N.E. This ftate belongs to the Foulahs, who are chiefly occupied in pafturage, and who pay an aunual tribute to the king of Bambarra N. lat. 14° 50′ to 16°. W. long. 0° 3′ to 3°.

MASINGA, a town of Cacongo. S. lat. 5° 10′. E. long. 12° 8′.

MASIVAN, or MERZIFON, a town of Afiatic Turkey, in the government of Sivas; 90 miles N.W. of Sivas.

MASIUS, ANDREW, in *Biography*, was born in a fmall village near Bruffels, but at what particular year is uncertain. He purfued his academical ftudies at the univerfity of Louvain, where he carried away the firft honours in the clafs of philofophy, in 1553, when he was ftill a boy. After this he applied himfelf to the ftudy of the civil and canon law, and was nominated counfellor to the duke of Cleves. He was a moft extraordinary linguift, and was deeply learned in the ancient and oriental languages, as well as in all modern European tongues. He filled feveral confiderable offices in the ftate, at Vienna and Conftantinople. By order of Philip II., king of Spain, he was fent to Antwerp, and affociated with Montanus and Fabricius, &c in publifhing the Bible Royal, or Antwerp Polyglot. He died in the territory of Cleves, in the year 1573. His works are numerous, chiefly grammatical and theological: of which we notice the "Grammatica Syriaca:" "Syrorum Peculum," or an explanation of peculiar words, which occur frequently in Syriac writers: "Lexicon Græcum, et Græcæ Linguæ Inftitutiones." Moreri.

MASK. See MASQUE and MASCHERE.

MASK-*Lough*, in *Geography*, the name of a large lake between the counties of Mayo and Galway, in Ireland. It has to the north a communication with lough Carrah; and there is fuppofed to be a fubterraneous channel, by which the fuperfluous waters of both are difcharged into lough Corrib, near the village of Cong. Beaufort.

MASKALWA, a town of Ruffia, in the government of Irkutfk, on the Angara; 24 miles N. of Balaganfkoi.

MASKELYNE, Nevil, in *Biography*, an eminent astronomer and mathematician, who filled the important office of astronomer royal of England for the long period of 46 years, with the highest credit to himself, and with great advantage as well as honour to his country. He was descended from a good family long settled in Wiltshire, and was born in London in the year 1732. At nine years of age he was placed at Westminster school, where he continued until he was fifteen, and where he made a distinguished progress in classical learning. He also paid due attention to English literature; but manifested a particular desire to understand astronomy, and the construction of optical instruments. This predilection, it is said, was considerably increased on seeing the memorable solar eclipse of 1748, exhibited through a large telescope in a camera obscura. It is, indeed, highly probable that so unusual a phenomenon might have made a strong impression on his susceptible mind, and stimulated him to those exertions which led to his future eminence. From this period he applied himself with ardour to the study of astronomy and optics; but soon experienced the necessity of laying a proper mathematical foundation for those sciences; and he therefore turned his attention to the elements of geometry and algebra, which he learned in a few months without the help of a master. Thus, like most other eminent mathematicians, he may be considered, in a great measure, as self-taught; but, contrary to the usual course of such studies, his early turn for astronomy led to his mathematical attainments.

In 1749, he was entered at the university of Cambridge: he was first placed at Catherine-hall, but soon after removed to Trinity-college, where he pursued his favourite studies with increased success; and, on taking his first degree, received distinguished honours from the university. He took his several degrees at the following periods, A. B. in 1754; A. M. in 1757; B. D. in 1768; and D. D. in 1777.

As soon as he was of age for holy orders, he was ordained to the curacy of Barnet, where he officiated for some time; and where he devoted most of his leisure hours to the study of practical astronomy.

In 1756, he became a fellow of his college, and though it was several years before he took his doctor's degree, we shall henceforward mention him under the title of doctor, as that by which he has been so long and so familiarly known to the scientific world.

In 1758, he was elected a fellow of the Royal Society, and he soon after became an important contributor to the Philosophical Transactions. This learned body, who at that time paid particular attention to astronomical and mathematical subjects, selected him to go to the island of St. Helena, to observe the transit of Venus over the sun's disk, which was to take place June 6, 1761. As this observation was to settle an important element in astronomy (the sun's parallax), it excited much attention, and preparations were made in different countries for observing it with accuracy. Two other astronomers, *viz.* Mr. Charles Mason, and Mr. Jeremiah Dixon, were sent for the same purpose to Bencoolen; and his majesty, George II., granted supplies for these expeditions. The French king likewise sent astronomers, to observe the transit, to Pondicherry, to the island of Roderigo, and to the north of Siberia.

Dr. Maskelyne sailed for St. Helena on board the Sea Horse frigate, captain Smith, and remained ten months on the island, making astronomical observations and philosophical experiments. His observation of the transit of Venus was not completely successful, owing to the cloudy state of the weather; but his voyage answered a more important purpose, and one far more useful to his country, than that originally intended: it afforded him an opportunity of taking lunar observations, which were now for the first time made with effect. This method of finding the longitude at sea had been long contemplated as a grand desideratum in navigation; and plans and preparations had been made for the purpose by Flamsteed, Newton, La Caille, Euler, Halley, Bradley, Mayer, and others: but the honour was reserved for Dr. Maskelyne to reduce their theories to successful practice. This he was enabled to do by means of Hadley's quadrant recently invented; and also by professor Mayer's lunar tables, for which a parliamentary reward of 3000*l.* was afterwards given on Dr. Maskelyne's report of their correctness. See our articles Greenwich, Longitude, and Lunar *Observations*.

During the voyage, both outward and homeward, he exercised the officers on board in taking lunar observations, and taught them to clear the distances from the effects of parallax and refraction, and thence to find the longitude within certain limits. While on the island he made accurate observations on the tides, the variation of the compass, and the comparative gravity of bodies there and at London. He also observed the annual parallax of Sirius, and the horary parallaxes of the moon. The chief results of these operations are inserted in the Philosophical Transactions of the above period.

Soon after his return from St. Helena, he published his well-known work, entitled "The British Mariner's Guide," which contained, among various new and practical illustrations and articles in nautical astronomy, rules and examples for working the lunar observations; but, in order to shorten and simplify these laborious operations, other tables and calculations were still wanted, which he afterwards supplied by his Nautical Almanac and Requisite Tables.

In 1763, he undertook another scientific voyage by appointment of the lords of the Admiralty and the Board of Longitude. He sailed for Barbadoes, on board the Princess Louisa, admiral Tyrrel, for the following purposes:—To find the longitude of that island by astronomical observations; to determine the rate of going of Mr. Harrison's new time-keeper; and to try Mr. Irwin's marine-chair, which was intended for making steady observations at sea, but which did not answer. He was, besides, in the course of his voyage, to take lunar observations with a curious new Hadley's sextant, and to determine the longitude by the eclipses of Jupiter's satellites, and the occultations of fixed stars by the moon. All these objects of the expedition he executed to the entire satisfaction of his employers; and he likewise officiated as chaplain to the ship during the voyage.

In 1764, the office of astronomer royal became vacant by the death of Mr. Bliss, who had survived his appointment, as successor to Dr. Bradley, only two years. Dr. Maskelyne's celebrity immediately pointed him out as the most competent person to fill the situation. His reputation stood very high in the Royal Society, both as a profound mathematician, and an able astronomer; while his experience at sea, and, above all, his success in establishing the lunar observations, seemed to render him peculiarly well qualified to carry into effect the purpose for which the Royal Observatory had been established—that of preparing tables for finding the longitude at sea. Through want of this knowledge, it was said, that not only single ships, but whole fleets had been lost, which induced government to offer immense rewards for practical methods of determining the problem. When Mr. Flamsteed, the first astronomer royal, was appointed to the office

office in 1675, he was directed by king Charles II. "to apply himself with all diligence to the rectifying the tables of the motions of the heavens, and the places of the fixed stars, in order to find out the much desired longitude at sea, for the perfecting the art of navigation." These were the words of his commission, which have been since continued to his successors. Thus, the office of astronomer royal was justly considered of great national importance, and Dr. Maskelyne's appointment to it, which was announced in the London Gazette, Feb. 16, 1765, gave universal satisfaction. It should be noticed, that the office includes a seat at the Board of Longitude, *i. e.* a board formed of commissioners, who are appointed "for examining, trying, and judging all proposals, experiments, and improvements relating to the longitude."

During the long period of Dr. Maskelyne's official services, his time may be considered as chiefly occupied either at the Observatory, the Board of Longitude, or the Royal Society. His biography, therefore, like that of most other scientific men, consists chiefly in a history of his labours; and as they are very numerous, and likewise well known to the astronomical world, we shall state them in a brief and summary manner, referring our readers occasionally to publications where they are more particularly detailed.

Soon after his appointment, he laid before the Board of Longitude the plan of an annual publication, to be entitled the "Nautical Almanac, and Astronomical Ephemeris." The first volume was for 1767, and it has been continued, under his direction, up to the year 1816, inclusive, making in the whole fifty volumes, a lasting monument of labour and profound learning. It is universally allowed to be the most useful work on practical astronomy ever published. In such high estimation has it been held by foreign astronomers, that they have generally and implicitly adopted its computations, and acknowledged its superior accuracy. M. Lalande, in giving an account of similar publications, says, "Le Nautical Almanac de Londres est l'Ephéméride la plus parfaite qu'il y ait jamais eu."

In 1767, he published an auxiliary work, entitled "Tables requisite to be used with the Nautical Almanac, in order to find the Latitude and Longitude at Sea." This performance, well known to seamen by the name of "The Requisite Tables," has passed through several editions, and has been successively enlarged, particularly by different methods of working the lunar observations, by Messrs. Lyons, Dunthorne, Witchell, Wales, and by Dr. Maskelyne himself; and it has been also improved by the latitudes and longitudes of places supplied by captain Cook, captain Huddart, Messrs. Bailey, Wales, and other scientific navigators. Some time after this, he published Mayer's Tables, with both Latin and English explanations, to which he added several tracts and tables of his own, and prefixed to the whole a Latin preface, with the title "Tabulæ motuum Solis et Lunæ, &c." It was published, like the foregoing works, by order of the commissioners of longitude, and the various other publications issued by that Board during his time were also printed under his inspection, and are too numerous to be here stated.

Another important and laborious duty that devolved on him in consequence of his office was, to examine the pretensions of the various candidates, who claimed the parliamentary rewards for new or improved methods of finding the longitude.

It may be observed, that his appointment took place at a period peculiarly interesting in the history of astronomy. His success in introducing and promoting the lunar observations greatly excited the public attention to the subject of the longitude, which was rendered still more interesting by the great rewards held out by parliament for further improvements in the problem, whether by astronomical or mechanical methods. These offers, united with the powerful motives of honour and emulation, called forth, during several years, many extraordinary efforts of genius, and produced useful inventions both in arts and sciences, and particularly in the construction of time-keepers. See Chronometer.

The parliamentary offers likewise encouraged numerous candidates of very slight pretensions, and even visionaries whose applications became very troublesome. The claims of all were referred by the Board of Longitude to the astronomer royal, by whom scientific plans were examined, and the rates of chronometers ascertained. Thus by his office he was constituted arbiter of the fame and fortune of a great number of anxious projectors; and it is easy to conceive how arduous as well as unpleasant such a duty must have been. It was not indeed to be expected that the sanguine hopes and self-love of such a variety of candidates could be gratified, with justice to the high trust and confidence thus reposed in him; and hence complaints were frequently heard, and pamphlets published, expressive of discontent and disappointment.—Appeals even were made to parliament; but whatever difference of opinion might have then existed, time and experience have since fully proved the truth and impartiality of Dr. Maskelyne's decisions.

In giving a general view of his labours at the Royal Observatory, we shall begin with his publication of the Greenwich observations, which were printed in 1774, by command of his majesty. The first volume began with the observations of 1765, and they have been continued annually since. M. Lalande, in mentioning this performance in 1792, calls it "le recueil le plus précieux que nous ayons." Since that period they have been considerably improved, and are universally allowed to possess an unrivalled degree of accuracy. His catalogue of the right ascensions and declinations of 36 principal fixed stars, with tables for their corrections, is a most useful and important performance, and is adopted in all observatories. It is mostly distinguished by the appellation of "Dr. Maskelyne's 36 Stars." His observations also of the sun, moon, and planets, are equally esteemed, and have been made the basis of the solar and lunar tables, lately computed in France according to the theory of M. Laplace; and which are republished in professor Vince's Astronomy, vol. iii. The solar tables were calculated by M. Delambre, and the lunar by M. Burg: copies of which have been transmitted to Dr. Maskelyne, by order of the French Board of Longitude, with the following grateful acknowledgment of the important assistance derived from his Greenwich observations. The letter is worthy of being recorded, as highly honourable to all parties, and as an interesting article in the history of astronomy. The following is a copy.

"Institut National, Classe des Sciences Physiques et Mathématiques, Paris, le 20 Fevrier, 1806. Le Secrétaire perpétuel pour les Sciences Mathématiques à Monsieur Maskelyne, Astronome Royal et Membre de la Société Royale de Londres.

"Monsieur, et respectable Confrère,

"Le Bureau des Longitudes me charge de vous offrir sept exemplaires des tables qu'il vient de publier. Cet hommage de sa haute estime et de sa réconnoissance étoit bien dû à l'auteur du plus grand et du plus précieux recueil d'observations qui existe. C'est à cette source que nous avons puisé Monsieur Burg et moi pour la plus exacte détermination des coefficiens des équations lunaires et solaires, c'est

là

là que nous avons trouvé la confirmation des inégalités que la théorie peut bien indiquer, mais dont la valeur ne pourroit être fixée que par des calculs qui sont encore au dessus des forces de l'analyse ; enfin, c'est à vous que nous devons la connoissance des mouvemens moyens et de toutes les constantes que l'observation seule peut donner. Recevez donc avec bienveillance, un ouvrage auquel vous avez si puissamment contribué. Nous serons très flattés si vous jugez nos tables dignes d'être employées aux calculs du Naùtical Almanac, suivant l'apparence que nous en donne votre derniere preface."—DELAMBRE.

Such is the testimony to the superior accuracy of the Greenwich observations given by the great astronomers of France ; and it is truly gratifying to observe, that the hostile state of the two countries did not prevent friendly communications on astronomy. War should never extend to the sciences ; and least of all to that sublime study which does the highest honour to the human intellect, and which has rendered the most essential services to mankind.

It would greatly exceed our limits to enumerate all the corrections and improvements effected by Dr. Maskelyne's observations, many of which will be found in professor Vince's Astronomy, and in the Philosophical Transactions.

His communications to the Royal Society are distinguished, like his other productions, for great attention to utility as well as accuracy. They consist chiefly of astronomical observations ;—improvements of mathematical and optical instruments ;—computations of the eclipses of the sun, moon, and Jupiter's satellites ;—articles on parallaxes, light, vision, refraction, weights, measures, gravitation, &c. with calculations and predictions of comets ; making in the whole above thirty communications. It should be noticed that, in 1774, he went to Shehallien, in Perthshire, in order to ascertain the lateral attraction of that hill ; by which the mean density of the earth was computed, and its central attraction according to the Newtonian theory first demonstrated. For this paper he was presented by the Council of the Royal Society with sir George Copley's gold medal.

In the history of science, few persons can be mentioned who have contributed more essentially to the diffusion astronomical knowledge than Dr. Maskelyne ; and perhaps no man has been so successful in promoting practical astronomy, both by land and sea. During his time private observatories became very general, though scarcely known before ; nor could such be made useful without his Nautical Almanac, and other tables, except by men of great science, and by very laborious calculations. Beside the assistance thus derived from his publications, he was always ready to give advice concerning any plans that were likely to promote the science. Among the observatories that were erected through his encouragement, may be mentioned that of the late Alexander Aubert, esq , whose excellent collection of instruments has been rarely equalled, even in national institutions. M. Lalande makes the following honourable mention of this gentleman and of his liberal pursuits.

" M. Alexandre Aubert, directeur des assurances, avoit fait un très joli observatoire qui étoit près de Greenwich, à Loam-pit-Hill, il a d'excellens instrumens de Bird, qui etoit son ami : il observe souvent et avec la plus grande exactitude. En 1788, il a transporté son observatoire à Highbury, une lieue au nord de Londres, au-delà d'Islington." Astronomie, par Lalande, tom. i. p. xxxv.

Several other instances might be adduced of observatories which were erected by the advice or direction of the astronomer royal. He was besides a great improver of instruments, and the inventor of some, among which may be noticed the prismatic micrometer ; but though profoundly skilled in optics, and ingenious in mechanical contrivances, he always paid great deference to the opinions of opticians, and other practical mechanists.

His plans were mostly directed to substantial objects, while a steady perseverance gave an efficiency to all his undertakings : and notwithstanding his profound knowledge of physical astronomy, his attention was chiefly directed to reduce the scientific theories of his predecessors to the practical purposes of life. In this he was eminently successful, particularly in his labours for the longitude, by which he essentially contributed to the advancement of navigation, the prosperity of commerce, and the wealth, honour, and power of his country.

Thus, from Dr. Maskelyne's important labours, his public character is well known, and his fame immoveably established : and, as to his private character, it was likewise truly estimable. He was, indeed, exemplary in the discharge of every duty. In his manners he was modest, simple, and unaffected. To strangers he appeared distant, or rather diffident ; but among his friends he was cheerful, unreserved, and occasionally convivial. He was fond of epigrammatic thoughts and classical allusions ; and even sometimes indulged in playful effusions of this kind, as appears by the following lines, which he composed on seeing Mr. Russell's selenographia, or map of the moon, executed with so much exactness.

He makes Luna thus speak ;

" Me prope viderunt Actæon, Endymionque ;
Hos memini solos ; ast ubi Russelius ?"

which he thus translated,

" Actæon and Endymion saw me near :
But when did I to Russell thus appear ?"

This epigram was composed extemporaneously when he was about seventy years of age, and is therefore the more worthy of being remembered as an instance of his lively and pleasant disposition at that advanced period. It also shews his passion for astronomy, which displayed itself so early in life, and which seemed to increase with his years.

Notwithstanding the doctor's numerous avocations he found time to maintain a regular correspondence with the principal astronomers of Europe. He was visited also by many illustrious foreigners, as well as eminent characters of his own country, but his warmest attachments were always manifested to the lovers of astronomy. Among his most intimate friends may be reckoned Dr. Herschel, Dr. Hutton, Messrs. Wollastons, Mr. Aubert, bishop Horsley, sir George Shuckburgh, baron Maseres, professor Robertson ; and also professor Vince, whose publications so ably illustrate Dr. Maskelyne's labours, and whom he appointed the depositary of his scientific papers.

Dr. Maskelyne had good church preferment from his college ; and his paternal estates (of which he was the last male heir), were also considerable. He married, when rather advanced in life, a young lady of large fortune, the sister and co-heiress of lady Booth of Northamptonshire, by whom he had one daughter, whose education he superintended with the fondest care. These ladies survive him, and also his sister Margaret, who was married to Robert, the late lord Clive.

Dr. Maskelyne died on the ninth of February 1811, in the 79th year of his age. His health previously declined for some months ; and he contemplated his approaching dissolution with pious resignation, and with a lively hope of being admitted into the presence of that Deity, whose works he had so long studied and so ardently admired. His favourite science tended the more strongly to confirm his religious principles, and he died, as he had lived, a sincere Christian.

MASKELYNE's *Islands*, in *Geography*, so called after Dr. Maskelyne, a cluster of small islands in the South Pacific ocean, lying off the south-east point of Mallicollo island. N. lat. 16° 32'. E. long. 167° 59'.

MASKINGIE, a river of Canada, which runs into lake Michigan, N. lat. 47° 25'. W. long. 86° 30'.

MASKO, a town of Sweden, in the government of Abo; 9 miles N.W. of Abo.

MASLACH, in the *Materia Medica* of the Turks, the name of a medicine greatly in use among those people, and called also *anfion* or *amphion*. It is prepared principally of opium. They take a dram of it at a time, and sometimes two or three: they always use it when going to battle, and very often as a provocative to venery, as they do the crude opium.

MASLAWSTANO, in *Geography*, a town of Poland, in the palatinate of Kiev; 36 miles E.S.E. of Bialacerkiev.

MASLEMA, a town of Asiatic Turkey, in the province of Diarbekir; 28 miles N.N.E. of Racca.

MASLIN. See BULLIMONY.

MASNED, in *Geography*, a small island of Denmark, near the S. coast of Zealand. N. lat. 54° 59'. E. long. 11° 54'.

MASOLINO DA PANICALE, in *Biography*, a painter, concerning the exact time of whose birth and death the biographers of the older artists differ exceedingly; one making him die at the age of 37, in the year 1415, another in 1418, and a third in 1440. It appears most probable, from a circumstance mentioned in the life of Masaccio, that the truth lies nearer the latter than the former periods; and that he must have lived somewhat longer than 37 years. In the first place, all agree that Masaccio, who was born in 1402, was taught the art of painting by Masolino, whom he saw executing his labours in the chapel of Brancacci, in the church of St. Pietro al Carmine at Florence, and again it is said by the same biographers, that Masaccio learnt for the first time the death of his master upon his return from Rome, at which time it is most probable he was 30 years of age, or thereabouts; and then was engaged to finish the pictures which Masolino had left incomplete, and not till then; which would hardly have been the case if Masolino had died in 1415, or 1418, since Masaccio was a reputed painter before he was 20 years old, and almost, if not quite, at the head of the profession before he was 25.

Panicale was in his early life employed as a goldsmith, and afterwards learnt under Lorenzo Ghiberti the arts of modelling and casting in bronze; and became one of Ghiberti's best workmen, particularly in clearing out the figures after casting. At the age of 19, he chose to study painting, and for that purpose engaged himself with Starnina. Few of the works of Masolino are now known. The principal ones are the hall of the Orsini palace at Rome; and his History of St. Peter in the church of St. Pietro, at Florence, above-mentioned. He seems to have greatly improved upon the style of the school of Giotto, and was probably led to it by having wrought with Ghiberti in sculpture. His style, though still dry and meagre, exhibited symptoms of a certain harmony and grandeur unknown before.

MASON, JOHN, an English nonconformist divine, was born at Dunmow, in Essex, in the year 1705-6. His father, who was a dissenting minister, sent him to pursue his academical studies under Mr. Jennings, of Kibworth, in Leicestershire. This was in the year 1722; and the first situation which Mr. Mason had after he had completed his academical course, was that of chaplain and private tutor in the family of Mr. Feaks, at his seat near Hatfield. In the year 1729 or 30, he accepted an invitation to become pastor to a congregation at Dorking, in Surrey, with which he continued about seventeen years, diligently discharging the duties of his function, highly esteemed both as a preacher and friend. In 1745 he published his treatise on "Self-Knowledge," which is unquestionably one of the most valuable works on practical religion in the English language. It is probable that not less than a hundred thousand copies of this work have been circulated in our own country; and it has been translated into almost all the European tongues. In the year 1746, Mr. Mason removed to Cheshunt, in Hertfordshire, where he spent the remainder of his days as a useful preacher, and continued to benefit, not only the village in which he lived by his public discourses and private exhortations, but to enlighten and improve the public by his writings. He died in February, 1763, in the fifty-eighth year of his age. As a divine, his most important publications are, 1. "The Lord's-day Evening Entertainment," in four volumes: 2. "The Student and Pastor; or Directions how to attain Eminence and Usefulness in those respective Characters:" 3. "Christian Morals," in two volumes: and "Fifteen Discourses, Devotional and Practical." Mr. Mason published, likewise, in the year 1750, "An Essay on Elocution," which was exceedingly well received, and went through three editions in a very short space of time, and may be considered as the foundation of many of our popular treatises on the same subject. Not long afterwards he published "An Essay on the Power and Harmony of Prosaic Numbers;" and "An Essay on the Power of Numbers, and the Principles of Harmony in Poetical Compositions." In 1761, the author reprinted these and the "Essay on Elocution," in one volume, octavo. Besides the articles already mentioned, Mr. Mason published some single sermons preached on particular occasions. As a preacher his sermons were correct, perspicuous, nervous, always illustrative of the text and doctrine which he had undertaken to explain; and they were ever adapted to promote the purposes of piety and charity. In the pulpit he was grave and solemn, his voice was clear, his delivery deliberate, distinct, and void of all affectation, and his manner was easy and natural. His personal character was an exemplification of the duties and virtues which it was the business of his life to enforce; in his intercourse with the world, he was free, easy, communicative, and pleasant in conversation, and much of the gentleman appeared in all his behaviour. Although it is now nearly half a century since this excellent man was taken from our world, there is still a member of his church at Cheshunt living, who cherishes, and will ever cherish, the recollection of the virtues of her pastor, so long as her life and faculties are continued. Life prefixed to the fifteenth edition of the treatise "On Self-Knowledge."

MASON, WILLIAM, an English poet of considerable celebrity, born in 1725, was the son of a clergyman who held the living of Hull. He was admitted of St. John's college, Cambridge, where he took his first degree in 1745. He removed to Pembroke college, and was elected a fellow in 1747; he obtained the degree of M.A. in 1749, and entered into holy orders in 1754. He obtained the patronage of the earl of Holderneffe, by whom he was presented to the rectory of Aston, in Yorkshire, and who procured for him the appointment of chaplain to his majesty. In 1749, he printed "An Ode on the Installation of the Duke of Newcastle," as chancellor of the university of Cambridge,

bridge, which gained him reputation. "A Monody to the Memory of Pope," and a poem, entitled "Isis, an Elegy," added to his fame, which was still farther increased, in 1752, by the dramatic poem of "Elfrida." In this, and in his "Caractacus," published in 1759, he attempted the restoration of the ancient Greek chorus in tragedy. Mr. Mason did not originally compose these pieces for the modern stage, which he considered as sunk beneath his level by the corrupt taste of the public; and though attempts were afterwards made to fit them for representation, and they were brought upon the theatre, they could obtain no permanent place there. In 1756, he published a small collection of new "Odes." He was in all his pieces an imitator of Gray, but they have been thought to display more of the artificial mechanism of poetry than of its genuine spirit. His "Elegies," published in 1763, are in general marked with the simplicity of language proper to this species of composition, and they breathe noble sentiments of freedom and virtue. In the year 1772, appeared the first book of his "English Garden," a descriptive poem in blank verse, of which the fourth and concluding book was printed in 1781. The main object of this work was to recommend, by the charms of poetry, the modern system of natural or landscape gardening. In 1775, as a tribute to the memory of his friend Gray, he published the poems of that distinguished genius, to which are prefixed "Memoirs of his Life and Writings." Mason's observations on the character and genius of his friend did honour to his taste and feelings. This work was originally published in one quarto volume, but another edition was given to the public in four thin volumes, crown octavo. Mason, as has already been observed, was warmly attached to the principles of liberty: during the contest with America, he strongly expressed his disapprobation of the hostilities carrying on against the transatlantic part of the community. He was a zealous member of the Yorkshire Association, for procuring a reform in parliament, which, notwithstanding the exertions of the wisest patriots, and most virtuous of our countrymen, is still, apparently, at a great distance. Mr. Mason, in 1783, published in a quarto volume a translation of Fresnoy's Latin poem on the "Art of Painting," which unites great elegance of language and versification, with a correct representation of the original. As a clergyman, he obtained the preferments of precentor and canon-residentiary of the cathedral of York; and at that church he preached, in 1788, an "Occasional Discourse," on the subject of the slave-trade, which was an animated declamation against the inhumanity of that traffic. In the same year he published the poems of the poet-laureate, Whitehead, to which he prefixed a memoir. The centenary commemoration of the revolution in that year, called forth a new exertion of his lyric powers in a "Secular Ode," which breathed the spirit of his muse of freedom. Without referring to the other publications of Mr. Mason, we may observe that he lived to witness the French revolution, the horrors of which wrought a complete change in his political principles. He died in April, 1797, at the age of 72. His character in private life was exemplary for worth and active benevolence; and a tablet has been placed to his memory in the Poet's Corner in Westminster Abbey. Gentleman's Magazine.

Mr. Mason was not only an excellent poet and able divine, but a dilettante painter and musician; and in these last capacities an acute critic. We did not, however, agree with him in his reforming schemes of church music. He had been himself a good performer on the harpsichord; had some knowledge of composition, a refined taste, and was a very good judge of modern music; but his ideas of reforming cathedral music would reduce it to Calvinistical psalmody. He wished for nothing but plain counterpoint in the services and full anthems, and dull and dry harmony in the voluntaries, without melody, accent, or measure; and he preferred the mechanical execution of a barrel organ in church music, to the most judicious accompaniment of a consummate organist.

We think organ-playing, in the sublime style of Handel and Sebastian Bach, is so precious a faculty, that it should be cultivated and cherished as sedulously for the sake of the art of music, as the innocent amusement of the congregation.

Mr. Mason, as precentor of the cathedral of York, it is to be feared, has stript music of all its ornaments, as Jack did religion, in the Tale of a Tub.

There are, however, many excellent reflections in his "Compendium of the History of our Church Music," and, in general, a just and discriminate character of our ecclesiastical composers, in his "Copious Collection of those Portions of the Psalms of David, Bible, and Liturgy, which have been set to Music, and sung as Anthems in the Cathedral and Collegiate Churches of England. To which is prefixed a critical and historical Essay on Cathedral Music." Printed at York in 1782.

Though this excellent scholar, and charming poet, honoured us with his friendship, of which we were always ambitious; and though, from his knowledge of music, we regarded him as the most intelligent and refined of our lyric bards, we never could subscribe to his reform of cathedral music, farther than in the accentuation of the words, and distinction of long and short syllables, in which our old cathedral composers, as well as psalmodists, are egregiously defective; nor could we ever flatter him in his high opinion of Henry Lawes, as a musician of superior genius and learning, or for his perfect accuracy in expressing words; though Milton tells us that his

> "——— *tuneful* and *well-measur'd* song,
> First taught our English music how to *span*
> Words with just *note* and *accent*, not to scan
> With Midas-ears, committing short and long."

And Waller joins with Milton in saying, that other composers admit the poet's sense but *faintly* and *dimly*, like the rays through a church-window of painted glass; while his favourite Lawes

> "——— could truly boast
> That not *A syllable is lost*.

See Henry Lawes, and Comus.

Mason, a person employed, usually under the direction of an architect, in the raising of a stone building.

The word comes from the French *maçon*, which signifies the same. Some derive this farther from the barbarous Latin *machio*, *a machinist*, because these artificers are obliged to use machines for raising walls. Du-Cange derives it from *maceria*, a name given to the long fence-walls which inclose vineyards, &c. in which masons are supposed to have been first employed: "Mason est maceriarum constructor." M. Huet derives it from *mas*, an old word signifying *house*; hence mason is a person who makes *masses*, that is, *houses*. In the corrupt Latin, a mason was called *magister comacinus*, which Lindenbroeck derives from Comacina, an island in Romania, where, in the time of the Lombards, the best architects were found.

The chief business of a mason is to prepare the mortar,

 raise

M A S

raiſe the walls from the foundation to the top, with the neceſſary retreats and perpendiculars, form the vaults, and employ the ſtones as delivered to him.

When the ſtones are large, the buſineſs of hewing or cutting them belongs to the ſtone-cutters; though theſe are frequently confounded with the maſons. The ornaments of ſculpture are performed by carvers in ſtone, or ſculptors. The tools or implements principally uſed by maſons are the ſquare, level, plumb-line, bevel, compaſs, hammer, chiſſel, mallet, ſaw, trowel, &c.

Beſide the common inſtruments uſed in the hand, they have likewiſe machines for the raiſing of great burdens, the conducting of large ſtones, &c. The principal of theſe are the lever, wheel, pulley, &c.

In the eſtimation of the value of maſons' work, walls, columns, blocks of ſtone or marble, &c. are meaſured by the cubic foot; and pavements, ſlabs, chimney-pieces, &c. by the ſuperficial or ſquare foot. Cubic or ſolid meaſure is uſed for the materials, and ſquare meaſure for the workmanſhip. In the ſolid meaſure, the true length, breadth, and thickneſs, are taken and multiplied conſtantly together; in the ſuperficial, there muſt be taken the length and breadth of every part of the projection, which is ſeen without the general upright face of the building.

Examples. 1. Required the ſolid content of a wall, 53 feet 6 inches long, 12 feet 3 inches high, and 2 feet thick. The product of $53.5 \times 12.25 \times 2 = 1310.75$, or 1310 feet 9 inches.

2. Required the value of a marble ſlab, at 8*s.* *per* foot; the length being 5 feet 7 inches, and breadth 1 foot 10 inches. Anſ. 4*l.* 1*s.* 10½*d.*

3. In a chimney-piece, ſuppoſe the length of the mantle and ſlab each - - - 4 f. 6 inch.

Breadth of both together	3	2
Length of each jamb	4	4
Breadth of both together	1	9

Required the ſuperficial content? Anſ. 21 feet 10 inches. Hutton's Menſuration, p. 610.

Masons, *Free* or *Accepted*, a very ancient ſociety, or body of men; ſo called, either from ſome extraordinary knowledge of maſonry or building, which they are ſuppoſed to be maſters of, or becauſe the firſt founders of the ſociety were perſons of that profeſſion.

They are now very conſiderable both for numbers and character; being found not only in every country in Europe, but in other parts of the globe, and conſiſting principally of perſons of merit and conſideration. As to antiquity, they lay claim to a ſtanding of ſome thouſand years; and, it is ſaid, can trace up their original as early as the building of Solomon's temple. It is very doubtful when they were firſt introduced into this country: ſome have traced the origin of maſonry in general to the year 674, when glaſs-making was introduced; and it is certain that, after this time, many of our public buildings, in the Gothic ſtyle, were erected by men in companies, who, as ſome ſay, called themſelves *free*, becauſe they were at liberty to work in any part of the kingdom. Others have derived the inſtitution of free maſons from a combination among the maſons not to work without an advance of wages, when they were ſummoned from ſeveral counties, by writs of Edward III., directed to the ſheriffs, to aſſiſt in rebuilding and enlarging the caſtle, together with the church and chapel of St. George, at Windſor: accordingly it is ſaid, that the maſons agreed on tokens, &c. by which they might know one another, and to aſſiſt one another againſt being impreſſed, and not to work unleſs *free*, and on their own terms.

Dr. Henry, in his "Hiſtory," attributes the origin of the free-maſon ſociety in Britain to the difficulty found in former times, of procuring a ſufficient number of workmen to build the multitude of churches, monaſteries, and other religious edifices which the ſuperſtition of thoſe ages prompted the people to raiſe. Hence the maſons were greatly favoured by the popes, and many indulgences were granted in order to augment their number. In times like thoſe we ſpeak of, it may well be ſuppoſed that ſuch encouragement from the ſupreme paſtors of the church muſt have been productive of the moſt beneficial effects to the fraternity: and hence the increaſe of the ſociety may naturally be deduced. The doctor quotes, in confirmation of this, the words of an author who was well acquainted with their hiſtory and conſtitution. "The Italians," ſays he, "with ſome Greek refugees, and with them French, Germans, and Flemings, joined into a fraternity of architects, procuring papal bulls for their encouragement and their particular privileges; they ſtyled themſelves free-maſons, and ranged from one nation to another, as they found churches to be built: their government was regular; and where they fixed near the building in hand, they made a camp of huts. A ſurveyor governed in chief; every tenth man was called a *warden*, and overlooked each nine. The gentlemen in the neighbourhood, either out of charity or commutation of penance, gave the materials and carriages. Thoſe who have ſeen the accounts in records of the charge of the fabrics of ſome of our cathedrals near 400 years old, cannot but have a great eſteem for their economy, and admire how ſoon they erected ſuch lofty ſtructures."

Mr. W. Preſton, paſt-maſter of the Lodge of Antiquity, in a treatiſe on Maſonry, publiſhed in 1792, tracing its origin from the creation, ſuppoſes its introduction into England to have been prior to the Roman invaſion. Accordingly he appeals to thoſe remains of ſtupendous works executed by the Britons, ſtill exiſting, and which muſt have been executed at a much earlier period than the time of the Romans; and it is ſaid, that the Druids had among them ſeveral cuſtoms ſimilar to thoſe of the maſons, and that they derived their government from Pythagoras: but it is difficult to aſcertain the reſemblance for which the advocates of the early origin of the ſociety of free-maſons contend. Although maſonry is ſaid to have been encouraged by Cæſar, and by many Roman generals, who were governors in Britain, and the fraternity of maſons was actually employed in the conſtruction of many magnificent fabrics, we have no exiſting records of their lodges and conventions; and of the cuſtoms that prevailed in their aſſemblies the accounts tranſmitted to us are very imperfect. In the time of Carauſius the art of maſonry revived; and among other artificers, he collected a number of ingenious maſons from many different countries, and appointed his ſteward Albanus as the ſuperintendant of their aſſemblies. At this time, lodges, or conventions of the fraternity, began to be introduced. Albanus obtained from Carauſius a charter to hold a general council, of which he was preſident, and in which many new members were admitted. This Albanus is ſaid to have been the famous St. Alban, who ſuffered martyrdom in Britain for the Chriſtian faith. In proof of this fact, Mr. Preſton refers to ſome ancient manuſcripts. By the departure of the Romans from Britain, the progreſs of maſonry was checked, and it was afterwards wholly neglected. After the introduction of Chriſtianity, however, maſonry, together with other arts, revived, and lodges were formed; but being under the direction of foreigners, they gained no permanent reputation. After the year 557, when St.

Auſtin with his companions arrived in England, maſonry was taken under his protection; and the Gothic ſtyle of building was introduced by thoſe foreigners, who about this time reſorted to the kingdom. Auſtin, it is ſaid, diſtinguiſhed himſelf by being the head of the fraternity, who founded the old cathedral of Canterbury in 600; that of Rocheſter in 602; St. Paul's in London in 604; St. Peter's in Weſtminſter in 605; as well as many others. The number of maſons in England was thus greatly increaſed, as well as by his other buildings of caſtles, &c. throughout the kingdom. In 640 ſome ingenious artiſts arrived from France, and formed themſelves into a lodge under the direction of Bennet, abbot of Wirral, whom Kenred, king of Mercia, ſoon after appointed inſpector of the lodges, and general ſuperintendant of the maſons. Maſonry, however, during the heptarchy, was in a low ſtate; but it began to revive under the patronage of St. Swithin, who was employed by Ethelwolf in repairing ſome religious houſes; and from that time the art was gradually improved till the year 872, when it found a zealous protector in Alfred the Great, who appropriated a ſeventh part of his revenue in employing a number of workmen for rebuilding the cities, caſtles, &c. ruined by the Danes. During the reign of his ſucceſſor Edward, the maſons continued to hold their lodges under the ſanction of Ethred, huſband to the king's ſiſter, and Ethelward his brother, to whoſe care the fraternity was intruſted. The true re-eſtabliſhment of maſonry in England, however, is dated from the reign of king Athelſtan; and there is ſtill exiſting an ancient lodge of maſons in York, which traces its origin to this period. This lodge, ſaid to be the moſt ancient in England, was founded in 926, under the patronage of Edwin, the king's brother, who obtained for it a charter from Athelſtan, and became himſelf grand-maſter. By virtue of this charter all the maſons in the kingdom were aſſembled, and in their aſſembly, as it is reported, they eſtabliſhed a general or grand lodge for their future government. Under the patronage and juriſdiction of this lodge it is alleged, that the fraternity very conſiderably increaſed; and kings, princes, and other eminent perſons, who had been initiated into the myſteries, paid due allegiance to the aſſembly.

On the deceaſe of prince Edwin and king Athelſtan, the maſons were diſperſed, and remained in an unſettled ſtate till the reign of Edgar, in 960. They were then collected by St. Dunſtan, and employed in works to which they had been accuſtomed; but for want of permanent encouragement, their lodges declined, and maſonry remained in a low ſtate for more than fifty years. It revived under Edward the Confeſſor, in 1041; and by the aſſiſtance of Leofrick, earl of Coventry, he rebuilt Weſtminſter Abbey, the earl being ſuperintendant of the maſons. After the conqueſt, in 1066, Gundulph, biſhop of Rocheſter, and Roger de Montgomery, earl of Shrewſbury, both of them excellent architects, became joint patrons of the maſons; and under their auſpices the Tower of London was begun, though finiſhed only in the reign of William Rufus, who likewiſe rebuilt London bridge with wood, and in 1087 firſt conſtructed the palace and hall of Weſtminſter. During the reigns of Henry I. and of Stephen, the maſonic lodges aſſembled, and the ſociety was employed in building a chapel at Weſtminſter, near the Houſe of Commons, and other works; the preſident of the lodges being Gilbert de Clare, the marquis of Pembroke. Under the reign of Henry II., the lodges were ſuperintended by the grand-maſter of the Knights Templars, who employed them in building their temple in Fleet-ſtreet, in the year 1155. Maſonry continued under the patronage of this order till the year 1199, when John ſucceeded Richard I. in the throne of England, and Peter de Colechurch was then appointed grand-maſter. He began to rebuild London bridge with ſtone, which was afterwards finiſhed by William Alcmain, in 1209. Peter de Rupibus ſucceeded Peter de Colechurch in the office of grand-maſter, and Geoffrey Fitz-Peter, chief ſurveyor of the king's works, acted as deputy under him; maſonry continued alſo to flouriſh under the auſpices of theſe two artiſts during this and the following reign. On the acceſſion of Edward I. in 1272, the ſuperintendence of the maſons was intruſted to Walter Giffard, archbiſhop of York, Gilbert de Clare, earl of Glouceſter, and Ralph, lord of Mount Hermer, the progenitor of the family of the Montagues; and by theſe architects the abbey of Weſtminſter was finiſhed, after having been begun in 1220, during the minority of Henry II. During the reign of Edward II. the fraternity were employed in building Exeter and Oriel colleges in Oxford, Clare-hall in Cambridge, &c. under the auſpices of Walter Stapleton, biſhop of Exeter, who had been appointed grand-maſter of the maſons in 1307.

In the reign of Edward III. the lodges under his patronage were numerous; and the fraternity held communications under the protection of the civil magiſtrates. William a Wykeham continued grand-maſter on the acceſſion of Richard II., and by him both the New college in Oxford, and Wincheſter college, were founded at his own expence. After the acceſſion of Henry IV., Thomas Fitz-Allan, earl of Surrey, was appointed grand-maſter, who, after the engagement at Shrewſbury, founded Battle-abbey and Fotheringay; the Guildhall at London being alſo built in this reign. On the acceſſion of Henry V., the fraternity were directed by Henry Chichely, archbiſhop of Canterbury, under whom the lodges and communications of the fraternity were frequent. In 1425, however, during the reign of Henry VI. an act was made againſt the meetings of the chapters and congregations of maſons, becauſe it was ſaid, that by ſuch meetings "the good courſe and effect of the ſtatutes of labourers were openly violated and broken, in ſubverſion of the law, and to the great damage of all the commons." But this act was not put in force, nor did the fraternity ceaſe to meet as uſual under the protection of archbiſhop Chichely, who ſtill continued to preſide over them.

Notwithſtanding a charge alleged at this time againſt the maſons, the duke of Glouceſter, protector and guardian of the kingdom, appriſed of their innocence, took them under his protection, and transferred the charge of ſedition againſt Henry, biſhop of Wincheſter, and his followers. Although the duke was afterwards impeached, impriſoned, and murdered, the maſons were not only permitted to meet without moleſtation, but were joined by the king himſelf. In that year (1442) he was initiated into maſonry, and from that time was aſſiduous in making himſelf complete maſter of the art. He reviſed the conſtitutions of the body, and honoured them with his ſanction; and his example was followed by many of the nobility. The king preſided over the lodges in perſon, nominating William Wanefleet, biſhop of Wincheſter, grand-maſter. The biſhop, at his own expence, built Magdalen college, Oxford, and ſeveral religious houſes. Eton college, near Windſor, and King's college, at Cambridge, were alſo founded during this reign. Henry himſelf founded Chriſt's college, Cambridge, as his queen, Margaret of Anjou, did Queen's college in the ſame univerſity. About this time, the maſons were protected and encouraged by James I. of Scotland, who honoured the lodges with his preſence,

presence, and settled an annual revenue of four pounds Scots (an English noble) to be paid by every master-mason in Scotland, to a grand-master, chosen by the grand lodge, and approved of by the crown.

The flourishing state of masonry was interrupted by the civil wars between the houses of York and Lancaster, which brought it almost totally into neglect. About 1471, however, it revived under the auspices of Robert Beauchamp, bishop of Sarum, who had been appointed grand-master by Edward IV. and honoured with the title of *Chancellor of the Garter*, for repairing the castle and chapel of Windsor. It again declined during the reigns of Edward V. and Richard III.; but came once more into repute on the accession of Henry VII. in 1485. It was now patronised by the master and fellows of the order of St. John at Rhodes (now Malta); who assembled their grand lodge in 1500, and chose Henry for their protector. On the 24th of June, 1502, a lodge of masons was formed in the palace, at which the king presided as grand-master; and having appointed John Islip, abbot of Westminster, and sir Reginald Bray, knight of the Garter, his wardens for the occasion, proceeded in great state to the east end of Westminster Abbey, where he laid the first stone of that excellent piece of Gothic architecture, called Henry the Seventh's chapel. The cape-stone of this building was celebrated in 1507. The palace of Richmond, as well as many other noble structures, were raised under the direction of sir Reginald Bray; and the colleges of Brazen-Nose, in Oxford, and Jesus and St. John's in Cambridge, were all finished in this reign.

On the accession of Henry VIII. cardinal Wolsey was appointed grand-master; who built Hampton-court, Whitehall, Christ-church college, Oxford, with several other noble edifices; all of which, upon the disgrace of that prelate, were forfeited to the crown in 1530. Wolsey was succeeded as grand-master in 1534 by Thomas Cromwell, earl of Essex; who employed the fraternity in building St. James's palace, Christ's hospital, and Greenwich castle. Cromwell being beheaded in 1540, John Touchet, lord Audley, succeeded to the office of grand-master, and built Magdalen college, in Cambridge, and many other structures. In 1547, the duke of Somerset, guardian of the king, and regent of the kingdom, became superintendant of the masons, and built Somerset-house in the Strand; which, on his being beheaded, was forfeited to the crown in 1552.

After the death of the duke of Somerset, John Poynet, bishop of Winchester, presided over the lodges till the death of the king, in 1553. From this time they continued without any patron till the reign of Elizabeth, when sir Thomas Sackville accepted of the office of grand-master. Lodges, however, had been held during this period in different parts of England; but the general or grand lodge assembled in the city of York, where it is said the fraternity were numerous and respectable.—Of the queen we have the following curious anecdote with regard to the masons: hearing that they were in possession of many secrets, which they refused to disclose, and being naturally jealous of all secret assemblies, she sent an armed force to York, to break up their annual grand-lodge. The queen, however, being afterwards thoroughly convinced that the fraternity of masons did not interfere in state affairs, became quite reconciled to their assemblies, and from this time masonry made a considerable progress; lodges were held in different parts of the kingdom, particularly in London and its neighbourhood, where the number of the brethren increased considerably. Several great works were carried on there under the auspices of sir Thomas Gresham, from whom the fraternity received every encouragement.

Sir Thomas was succeeded in the office of grand-master by Charles Howard, earl of Effingham, who continued to preside over the lodges in the south till the year 1588, when George Hastings, earl of Huntingdon, was chosen grand-master, and remained in the office till the decease of the queen in 1603.

On the accession of James I. to the crown of England, masonry flourished, and lodges were held, in both kingdoms. A number of gentlemen returned from their travels, with curious drawings of the old Greek and Roman architecture, as well as strong inclination to revive a knowledge of it. Among these was the celebrated Inigo Jones, who was appointed general surveyor to the king. He was named grand-master of England, and was deputed by the king to preside over the lodges. Several learned men were now initiated into the mysteries of masonry, and the society increased considerably in reputation and consequence. Ingenious artists resorted to England in great numbers; lodges were constituted as seminaries of instruction in the sciences and polite arts, after the model of the Italian schools; the communications of the fraternity were established, and the annual festivals regularly observed. Under the direction of this accomplished architect, many magnificent structures were raised; and among the rest, he was employed, by command of the sovereign, to plan a new palace at Whitehall, worthy of the residence of the kings of England. This was executed; but for want of a parliamentary fund, no more of the plan was ever finished than the banqueting-house. Inigo Jones continued in the office of grand-master till the year 1618, when he was succeeded by the earl of Pembroke; under whose auspices many eminent and wealthy men were initiated, and the mysteries of the order held in high estimation.

After Charles I. ascended the throne, earl Pembroke was continued in his office till the year 1630, when he resigned in favour of Henry Danvers, earl of Danby. This nobleman was succeeded, in 1633, by Thomas Howard, earl of Arundel, the ancestor of the Norfolk family. In 1635, Francis Russel, earl of Bedford, accepted the government of the society; but Inigo Jones having continued to patronize the lodges during his lordship's administration, he was re-elected the following year, and continued in office till the year of his death, 1646. The progress of masonry, however, was for some time obstructed by the breaking out of the civil wars; but it began to survive under the patronage of Charles II., who had been received into the order during his exile. Some lodges during this reign were constituted by leave of the several noble grand-masters, and many gentlemen and famous scholars requested at that time to be admitted into the fraternity. On the 27th of December, 1663, a general assembly was held, where Henry Jennyn, earl of St. Alban's, was elected grand-master; who appointed sir John Denham his deputy, and Mr. Christopher Wren, afterwards the celebrated sir Christopher Wren, and John Webb, his wardens. At this assembly several useful regulations were made, for the better government of the lodges; and the greatest harmony prevailed among the whole fraternity. The earl of St. Alban's was succeeded in his office of grand-master by earl Rivers, in the year 1666, when sir Christopher Wren was appointed deputy, and distinguished himself beyond any of his predecessors in promoting the prosperity of the lodges which remained at that time, particularly that of St. Paul's, now the Lodge of Antiquity, which he patronized upwards of eighteen yeare. At this time he attended

attended the meetings regularly; and during his prefidency made a prefent to the lodge of three mahogany candlefticks, which at that time were very valuable. They are ftill preferved, and highly valued as a teftimony of the efteem of the donor.

Whilft the city, after its deftruction by fire in 1666, was in building, lodges were held by the fraternity in different places, and many new ones conftituted, to which the beft architects reforted. In 1674, earl Rivers refigned the office of grand-mafter in favour of George Villiers, duke of Buckingham, who left the care of the fraternity to his wardens, and fir Chriftopher Wren, who ftill continued to act as deputy. In 1679, the duke refigned in favour of Henry Bennet, earl of Arlington: but this nobleman was too deeply engaged in ftate-affairs to attend to his duty as a mafon, though the lodges continued to meet under his fanction, and many refpectable gentlemen joined the fraternity. During the fhort reign of James II. the mafons were much neglected. In 1685, fir Chriftopher Wren was elected to the office of grand-mafter, who appointed Gabriel Cibber and Mr. Edward Strong his wardens: yet notwithftanding the great reputation and abilities of this celebrated architect, mafonry continued in a declining way for many years, and only a few lodges were held occafionally in different parts of the kingdom.

At the Revolution, the fociety was in fuch a low ftate in the fouth of England, that only feven regular lodges were held in London and its fuburbs; and of thefe only two, *viz.* that of St. Paul's and one at St. Thomas's hofpital, Southwark, were of any confequence. But in 1695, king William, having been initiated into the myfteries, honoured the lodges with his prefence, particularly one at Hampton-court, at which he is faid to have frequently prefided during the time that the new part of his palace was building. Many of the nobility alfo were prefent at a general affembly and feaft held in 1697; particularly Charles, duke of Richmond and Lenox, who was elected grand-mafter for that year; but in 1698, refigned his office to fir Chriftopher Wren, who continued at the head of the fraternity till king William's death in 1702.

During the reign of queen Anne, mafonry made no confiderable progrefs. Sir Chriftopher's age and infirmities drew off his attention from the duties of his office, the annual feftivals were entirely neglected, and the number of mafons confiderably diminifhed. It was therefore determined that the privileges of mafonry fhould not be confined to operative mafons, but that people of all profeffions fhould be admitted to participate in them, provided they were regularly approved and initiated into the order.

Thus the fociety once more rofe into efteem; and on the acceffion of George I. the mafons, now deprived of fir Chriftopher Wren, refolved to unite again under a grand-mafter, and revive the annual feftivals. With this view, the members of the only four lodges at that time exifting in London, met at the Apple-tree tavern in Charles-ftreet, Covent-Garden; and having voted the oldeft mafter-mafon then prefent into the chair, conftituted themfelves a grand lodge *pro tempore.* It was now refolved to renew the quarterly communications among the brethren; and at an annual meeting held on the 24th of June the fame year, Mr. Anthony Sayer was elected grand-mafter, invefted by the oldeft mafter-mafon there prefent, inftalled by the mafter of the oldeft lodge, and had due homage paid him by the fraternity. Before this time a fufficient number of mafons, met together within a certain diftrict, had ample power to make mafons without a warrant of conftitution; but it was now determined, that the privilege of affembling as mafons fhould be vefted in certain lodges or affemblies of mafons convened in certain places, and that every lodge to be afterwards convened, excepting the four old lodges then exifting, fhould be authorized to act by a warrant from the grand-mafter for the time, granted by petition from certain individuals, with the confent and approbation of the grand lodge in communication; and that without fuch warrant, no lodge fhould hereafter be deemed regular or conftitutional. The former privileges, however, were ftill allowed to remain to the four old lodges then extant. In confequence of this, the old mafons in the metropolis vefted all their inherent privileges, as individuals, in the four old lodges, in truft that they never would fuffer the ancient charges and land-marks to be infringed. The four old lodges, on their part, agreed to extend their patronage to every new lodge which fhould hereafter be conftituted according to the new regulations of the fociety; and while they acted in conformity to the ancient conftitutions of the order, to admit their mafters and wardens to fhare with them all the privileges of the grand lodge, that of precedence only excepted.

Matters being thus fettled, the brethren of the four old lodges confidered their attendance on the future communications of the fociety as unneceffary; and therefore trufted implicitly to their mafters and wardens, fatisfied that no meafure of importance would be adopted without their approbation. It was, however, foon difcovered, that the new lodges being equally reprefented with the old ones at the communications, would at length fo far outnumber them, that by a majority they might fubvert the privileges of the original mafons of England, which had been centered in the four old lodges; on which account a code of laws was, with the confent of the brethren at large, drawn up for the future government of the fociety. To this the following was annexed, binding the grand-mafter for the time being, his fucceffors, and the mafter of every lodge to be hereafter conftituted, to preferve it inviolably; "Every annual grand lodge has an inherent power and authority to make new regulations, or to alter thefe for the real benefit of this ancient fraternity, provided always that the old land-marks be carefully preferved: and that fuch alterations and new regulations be propofed and agreed to at the third quarterly communication preceding the annual grand feaft; and that they be offered alfo to the perufal of all the brethren before dinner, in writing, even of the youngeft apprentice; the approbation and confent of the majority of all the brethren prefent being abfolutely neceffary to make the fame binding and obligatory." To commemorate this circumftance, it has been cuftomary, ever fince that time, for the mafter of the oldeft lodge to attend every grand inftallation; and, taking precedence of all prefent, the grand-mafter only excepted, to deliver the book of the original conftitutions to the new inftalled grand-mafter, on his promifing obedience to the ancient charges and general regulations.

By this precaution, the original conftitutions were eftablifhed as the bafis of all fucceeding mafonic jurifdiction in the fouth of England; and the ancient land-marks, as they are called, or the boundaries fet up as checks againft innovation, were carefully fecured from the attacks of any future invaders.

In 1720 the fraternity fuftained an irreparable lofs by the burning of feveral valuable manufcripts, concerning the lodges, regulations, charges, fecrets, &c. (particularly one written by Mr. Nicholas Stone, the warden under Inigo Jones.) This was done by fome fcrupulous brethren, who were alarmed at the publication of the mafonic conftitutions. At a quarterly communication it was this year agreed, that, for

for the future, the new grand-maſter ſhall be named and propoſed to the grand lodge ſome time before the feaſt: and if approved and preſent, he ſhall be ſaluted as grand-maſter elect: and that every grand-maſter, when he is inſtalled, ſhall have the ſole power of appointing his deputy and wardens, according to ancient cuſtom.

In the mean time, maſonry continued to ſpread in the north as well as the ſouth of England. The general aſſembly, or grand lodge at York, continued to meet as uſual. Several lodges met in 1705, under the direction of ſir John Tempeſt, bart. then grand-maſter: and many perſons of worth and character were initiated into the myſteries of the fraternity. The greateſt harmony ſubſiſted between the two grand lodges, and private lodges were formed in both parts of the kingdom, under their ſeparate juriſdiction. The only diſtinction which the grand lodge in the north appears to have retained is in the title of the *Grand Lodge of all England*; while the other was only called the *Grand Lodge of England*. The latter, however, being encouraged by ſome of the principal nobility, ſoon acquired conſequence and reputation, while the other ſeemed gradually to decline: but, till within theſe few years, the authority of the grand lodge at York was never challenged: on the other hand, every maſon in the kingdom held that aſſembly in the higheſt veneration, and conſidered himſelf bound by the charges which originated from that aſſembly. It was the glory and boaſt of the brethren in almoſt every country where maſonry was eſtabliſhed, to be accounted deſcendants of the original York maſons; and from the univerſality of the idea that maſonry was firſt eſtabliſhed at York by charter, the maſons of England have received tribute from the firſt ſtates in Europe. At preſent, however, this ſocial intercourſe is aboliſhed, and the lodges in the north and ſouth are almoſt entirely unknown to one another; and neither the lodges of Scotland nor Ireland court the correſpondence of the grand lodge at London. This is ſaid to have been owing to the introduction of ſome innovations among the lodges in the ſouth; but for the coolneſs which ſubſiſts between the two grand lodges, another reaſon is aſſigned. A few brethren at York having, on ſome trivial occaſion, ſeceded from their ancient lodge, they applied to London for a warrant of conſtitution. Their application was honoured without any inquiry into the merits of the caſe; and thus, inſtead of being recommended to the mother lodge to be reſtored to favour, theſe brethren were encouraged to revolt, and permitted, under the ſanction of the grand lodge in London, to open a new lodge in the city of York itſelf. This illegal extenſion of power juſtly offended the grand lodge at York, and occaſioned a breach which has never yet been made up.

The duke of Buccleugh, who in 1723 ſucceeded the duke of Wharton as grand-maſter, firſt propoſed the ſcheme of raiſing a general fund for diſtreſſed maſons. The duke's motion was ſupported by lord Paiſley, colonel Houghton, and a few other brethren; and the grand lodge appointed a committee to conſider of the moſt effectual means of carrying the ſcheme into execution. The diſpoſal of the charity was firſt veſted in ſeven brethren; but this number being found too ſmall, nine more were added. It was afterwards reſolved that twelve maſters of contributing lodges, in rotation with the grand officers, ſhould form the committee; and by another regulation ſince made, it has been determined that all paſt and preſent grand officers, with the maſters of all regular lodges which ſhall have contributed within twelve months to the charity, ſhall be members of the committee. This committee meets four times in the year by virtue of a ſummons from the grand-maſter or his deputy. The petitions of the diſtreſſed brethren are conſidered at theſe meetings; and if the petitioner be conſidered as a deſerving object, he is immediately relieved with five pounds. If the circumſtances of the caſe are of a peculiar nature, his petition is referred to the next communication, where he is relieved with any ſum the committee may have ſpecified, not exceeding twenty guineas at one time. Thus the diſtreſſed have always found ready relief from this general charity, which is ſupported by the voluntary contributions of different lodges out of their private funds, without being burdenſome to any member in the ſociety. Thus has the committee of charity for freemaſons been eſtabliſhed; and ſo liberal have the contributions been, that though the ſums annually expended for the relief of the diſtreſſed brethren have for ſeveral years paſt amounted to many thouſand pounds, there ſtill remains a conſiderable ſurplus.

What the end of the inſtitution of maſonry is, ſeems ſtill, in ſome meaſure, a ſecret; though ſo much of it as is known appears laudable enough, as it tends to promote friendſhip, ſociety, mutual aſſiſtance, and good fellowſhip.

The members of this ſociety, among whom we may reckon a great number of illuſtrious perſons in various parts of the world, allege, that in the admiſſion of members, and the management of its concerns, a particular regard is paid to the principles of religion and morality; they ſay alſo, that in proportion as maſonry has prevailed, ſocieties and even nations have been civilized. However this be, it is certain, that its ſigns ſerve as a kind of univerſal language, ſo that by means of them people of the moſt diſtant nations may become acquainted, and enter into friendſhip with one another. This muſt be allowed to be a circumſtance of no ſmall importance and utility, to thoſe who traverſe diſtant regions, and wiſh to find aſſociates and friends even among ſtrangers.

The brothers of this family are ſaid to be poſſeſſed of a great number of ſecrets, which have been religiouſly obſerved from age to age.

The uninitiated, however, ridicule the notion that maſons poſſeſs any peculiar ſecrets, apprehending, that in ſome unguarded and convivial moment or other, they would be divulged; and that it would be dangerous to repoſe confidence in the number, as well as in the various diſpoſitions, of thoſe who are admitted into the ſociety. Secrecy and ſilence are undoubtedly on many occaſions deſirable and laudable attainments; and we find that among many of the philoſophers of antiquity, they were ſtrictly enjoined and ſeduloully cultivated. If the laws, charges, and regulations of the free and accepted maſons, as they are detailed in a work, entitled "The Conſtitution of Free-Maſonry, &c." by the late Laurence Dermott, eſq., and reviſed and corrected with conſiderable additions by Thomas Harper, D. G. M. 1807, are faithfully recorded, which we have no reaſon to queſtion, they are not only irreproachable, but deſerving of commendation.

The abbé Barruel, however, who in his "Memoirs illuſtrating the Hiſtory of Jacobiniſm," tranſlated into Engliſh by the Hon. Robert Clifford, F.R.S. and A.S., and publiſhed in 1798, aſcribes the French revolution, and the ſubſequent convulſions on the continent of Europe, to the principles and operations of the freemaſons, pronounces a panegyric on the Engliſh maſons, and repreſents them as diſtinguiſhed from the others by ties which only appear to unite them more cloſely in the bonds of charity and fraternal affection. At the time, he ſays, when the Illuminées of Germany, the moſt deteſtable of the Jacobin crew, were ſeeking to ſtrengthen their party by that of maſonry, they affected a contempt for the Engliſh lodges.

This

This zealous writer alfo allows, that for a confiderable length of time the generality of lodges both in France and Germany, might have been excepted from the charge which he adduces againft the objects of his cenfure and condemnation. The grand objects of the mafonry, which he criminates, were equality and liberty. The very name of free-mafon carries with it the idea of liberty; and as to *equality*, it was difguifed under the name of *fraternity*, which has nearly a fimilar fignification. The author feems to have been enrolled as a member of this fociety againft his own inclination; and he defcribes the manner in which he was admitted to the feveral degrees of "apprentice," "fellow-craft," and "mafter," in one evening. The grand object which he propofed to himfelf was to learn the famous fecret of mafonry. When the moment arrived that was deftined for this purpofe, he was ordered to approach nearer to the Venerable. Then the brethren who had been armed with fwords for the occafion, drawing up in two lines, held their fwords elevated, leaning the points toward each other, and formed what in mafonry is called the *arch of fteel*. The candidate paffes under this arch to a fort of altar elevated on two fteps, at the fartheft end of the lodge. The mafter, feated in an arm chair, or a fort of throne, behind this altar, pronounced a long difcourfe on the inviolability of the fecret which was to be imparted, and on the danger of breaking the oath which the candidate was going to take. He pointed to the naked fwords which were always ready to pierce the breaft of the traitor, and declared to him that it was impoffible to efcape their vengeance. The candidate then fwears, that rather than betray the fecret, he confents to have his head cut off, his heart and entrails torn out, and his afhes caft before the winds. Having taken the oath, the mafter faid the following words to him, which the reader (as he fays) may eafily conceive have not efcaped my memory, as I had expected them with fo much impatience, "My dear brother, the fecret of mafonry confifts in thefe words, *Equality and Liberty; all men are equal and free; all men are brethren*." The mafter did not utter another fyllable, and every body embraced the new *brother equal and free*. The lodge broke up, and we gaily adjourned to a mafonic repaft.

Under the defignation of occult lodges, or the higher degrees of mafonry, our author comprehends all free-mafons in general, who, after having paffed the firft three degrees of apprentice, fellow-craft, and mafter, are fufficiently zealous to be admitted into the higher degrees, where, as he fays, the veil is rent afunder, where emblematical and allegorical figures are thrown afide, and where the twofold principle of equality and liberty is unequivocally explained "by war againft Chrift and his altars, war againft kings and their thrones!!!" That fuch is the refult of the grand myfteries of the craft is what he undertakes to demonftrate; and we refer thofe who are defirous of knowing or examining his proofs to his own ftatement of them.

Mafonic writers in general, fays M. Barruel, divide free-mafonry into three claffes, the Hermetic, the Cabaliftic, (comprehending the Martinifts,) and the Eclectic mafonry; all of which agree in one point, *viz.* their hatred to Chriftianity and revelation. The Hermetic mafonry, or the Scotch degrees, who work in chemiftry, have adopted Pantheifm or the true Spinozifm. With thofe who belong to this clafs "every thing is God, and God is every thing." This is their grand myftery, engraved in one word "Jehovah," on the ftone brought by the Knights-Templars from the Holy Land. The Cabaliftic mafonry was found in the Pruffian lodges of the Rofricrucians, at leaft before their union with the Illuminées; and it was adopted, we are told, by certain lodges of Roficrucians in France, a few years before the revolution, and particularly at Bourdeaux. The Jehovah of this fect is no longer the God *whole*; but he is at once the God "Sifamoro," and the God "Senamira." The firft is joined by the genius "Sallak," and the fecond by the genius "Sokak." If thefe famous Cabaliftic words are inverted, we have "Oromafis," or the God *good*, and "Arimanes," the God *evil*, and the genii will become "Kallas" and "Kakos," good and bad. Thus in attributing to Oromafis a multitude of good genii or fpirits like himfelf, and to Arimanes evil genii participating of his own wickednefs, we have the "Jehovah" of Cabaliftic mafonry; that is, the *word* to be recovered in their lodges, or the tenets to be fubftituted to thofe of Chriftianity. According to the Martinift fyftem, the God good, the God evil, and every thinking being, or, in other words, God, man, and the devil, are of the fame nature, the fame effence, and the fame fpecies. The enlightened Martinift erafes the pains of hell from his moral code, and the tendency of his political fyftem is to reduce all fociety, all legitimate authority, to that of a father governing his children; to overturn every throne, and annihilate every law but that of the ancient patriarchs. This fect is faid to have made great progrefs in France and Germany, and to have even reached England; and every where their grand object is to reprefent the French revolution as the fire which is to purify the world.

The Eclectic mafons are reprefented as much more numerous than the Martinift mafons. Thefe, after having paffed through the different degrees of mafonry, attach themfelves to no particular fyftem, either political or religious, into which they have been initiated, but adopt from them whatever may beft fuit their political or religious views. They are what they pleafe, Deifts, Atheifts, Sceptics, an aggregate of all the errors of the philofophifm of the day; with refpect to religion, they admit that equality and liberty which deny every authority but their own reafon, and reject all revealed religion; and as to governments, they admit of no kings, unlefs fubfervient to the will of the people in right of its fovereignty. Thofe who belong to a fort of Eclectic mafonry, lately eftablifhed in Germany, affert that all are independent, and have a right of making their own laws. For this reafon, they have abolifhed the names of Grand Lodge and Scotch Lodge, fo that they may be faid to have improved upon mafonic equality and liberty. Such Eclectic mafons could not have been very numerous in France, as the major part of them was under the infpection of the Grand Parifian Lodge, called the "Grand Orient." The fentiment introduced into all the Eclectic lodges, is that of hating Chrift and his religion, and detefting all fovereignty and legiflative power, except that of the people. All claffes, and every code of mafonry, Hermetic, Cabaliftic or Martinifts, and Eclectic, have concurred in forwarding the revolution; and it little imported to the fect which ftruck the blow, provided that ruin enfued.

In tracing the origin of free-mafonry, M. Barruel rejects the opinion of thofe who afcribe it to the Perfian, Egyptian, Grecian, Roman, or Druid fages; but he attributes its commencement to the Knights Templars, who were either the authors of it, or borrowed it by tradition from the ancient myfteries of Paganifm, and of its fages. According to our author's ftatement, the depofitions of the Knights Templars declare, that on their reception into the order they denied Chrift, trampled on the crofs, and fpit upon it; that Good Friday was a day particularly confecrated to fuch outrages; that they promifed to proftitute themfelves to each other for the moft unnatural crimes; that every child begotten by a Templar was caft into the fire; that they bound themfelves by oath to obey, without exception, every order from the grand-

 mafter,

master, to spare neither sacred nor profane; to look upon every thing as lawful when the good of the order was in question; and, above all, never to violate the horrible secrets of their nocturnal mysteries, under pain of the most terrible chastisements. After having traced, in various particulars, the resemblance of the free-masons to these ancient knights, our author, as if he did not think this parentage sufficiently disgraceful, traces them farther back by several centuries to Manes and the Manichees; adopting several unfounded opinions, reflecting on the Albigenses, Waldenses, &c. in the south of France. It would lead us far beyond our limits to pursue our author's declamatory reasoning, and to detail those points of resemblance which he discovers between the free-masons of the continent and those ancient heretics. If the reader has curiosity, he may consult Barruel himself.

Our author closes his account of the free-masons, as to their origin, principles, and practices, with diverting the attention of his reader to a body of men, or rather, as he calls them, a band of conspirators, who had coalesced, under the name of "Illuminées," with the Encyclopédists and masons, far more dangerous in their tenets, more artful in their plots, and more extensive in their plans of devastation. They more silently prepared the explosions of the revolutionary volcano, not merely swearing hatred to the altar of Christ and the throne of kings, but swearing at once hatred to every god, to every law, to every government, to all society and social compact; and in order to destroy every plea, and every foundation of the social contract, they proscribed the terms *mine* and *thine*, acknowledging neither equality nor liberty, but in the "entire, absolute, and universal overthrow of all property whatever."

Mason, in *Geography*, a county of Kentucky, on the S. side of Ohio river, watered by a number of creeks, which fall into Sandy river and the Ohio, and containing 11,405 inhabitants, of whom 1603 are slaves.—Also, a township in Hillsborough county, New Hampshire, on the Massachusetts line, about 70 miles W. of Portsmouth, and 50 N.W. of Boston, containing 1179 inhabitants.

Mason's *Island*, a small island in the Patowmac. N. lat. 39°. W. long. 77° 13′.

MASONRY is the art of preparing and combining stones, so as to tooth or indent them into each other, and form regular surfaces, either for shelter, convenience, or defence; as the habitations of men, animals, the protection and shelter of goods, &c.

The tools employed by the mason are different in different countries, according to the quality of the stone.

In London, the value of stone occasions it to be cut into scantlings by a saw, and the operation is done by the labourer: in different parts of the country where stone abounds, it is divided into smaller scantlings by means of wedges. Hard stone and marble are reduced to a surface by a mallet and chissel.

The principal implements used in London for hewing stones are the mallet and tools. The form of masons' tools, which are used by the percussive blows of the mallet, is that of a wedge; the cutting edge is the vertical angle. The material out of which such tools are made is iron, except the end which enters the stone, which is of steel. The end of the tool which is struck by the mallet is a small portion of a spheric surface, and projects on all sides beyond the adjoining part or hand hold, which increases in magnitude towards the middle of the tool, and thence tapers forward, in the form of a wedge or pyramid, to the entering or cutting edge. The other tools used by the mason are, a level, a plumb rule, a square, a bevel, and rules both straight and circular, of various descriptions, for trying the surfaces in the progressive state of the work.

The tools used in London, in succession, to work the face of a stone, are, the point, the inch tool, the boaster, then the broad tool. The operation of working with the point is called *pointing*, and that with the boaster is called *boasting*. The operation of the point leaves the surface in narrow furrows, with rough ridges between them. The inch tool is used in cutting away the ridges, and the boaster in making the surface of the work nearly smooth. The point is in breadth, at the entering part, from $\frac{1}{4}$th to $\frac{3}{8}$ths of an inch, the boaster 2 inches wide, and the broad tool $3\frac{1}{2}$ inches at the cutting edge. In the use of the tool, the cutting edge is always perpendicular to the same side of the stone. There are two kinds of operations performed by it: suppose the impression made by the whole breadth of the tool, at the cutting edge, to be called a cavity. In one operation, the successive cavities follow one another in the same straight line, until the breadth or length of the stone is exhausted; then successive equidistant parallel lines are repeated in the same manner, until the whole surface of the stone has been gone over by the tool. This manner of hewing is called *stroking*, which is a kind of fluted surface. In the other operation, every successive cavity is repeated in new equidistant lines throughout the length or breadth of the stone, then a new series of cavities is again repeated throughout the length or breadth of the stone, and thus until the whole breadth or length of the stone is exhausted. This mode is called *tooling*.

Tools for working cylindrical and conical parts of mouldings are of all sizes, from $\frac{1}{4}$th part of an inch upwards; but those for working convex mouldings are generally half an inch broad, unless in confined spaces, where such breadth cannot be admitted.

A stone is taken, for the greater part, out of winding with points, and entirely with the inch tool.

In London, the facings of buildings made with squared stone, are either stroked, tooled, or rubbed.

In the country, where the saving of stone by the use of the saw is not a compensation for the loss of time taken up in sawing, the operation is entirely performed by the mallet and chissel.

When stones are very unshapely previous to the operation of hewing, a stone ax, jedding ax, scabbling hammer, or cavil, is used in order to bring the stone nearly to a shape: one end of the jedding ax is flat, and is used for knocking off the very protuberant angular parts when less than right angles, the other end is pointed for reducing the different surfaces nearly to the intended form.

In some parts of the country, different fancies of hewn surfaces are indulged, as herring-bone work: this is forming the surfaces of the stones by zig-zag lines parallel to each other.

In Scotland, besides what has already been noticed in hewn work, are other kinds denominated droved, broached, and striped. Droving is the same as that called random tooling in England, or boasting in London; and the chissel for broaching is called a punch, and is the same as that called a point in England. Broached work is first droved and then broached, as the work cannot be done regularly at once with the punch. Striped work must also be first droved and then striped. Hence, of these three kinds of surfaces, the droved is the cheapest. Though broaching is sometimes performed without droving, it is never so regular; and besides, the surface is generally full of inequalities. It must be observed, however, that workmen in general do not take the same pains to drove the face of a stone which is to be afterwards broached, as in that of which the droving is to remain the

 final

final finish: these should be noticed by the superintendant. Droving, broaching, and striping, are the terms used in Edinburgh and Glasgow, and in the south of Scotland. In Aberdeen, where the stone is very hard, being a kind of granite, the same operations cannot be employed. Instead of them they use a scabbling hammer, by which they pick the stone until the surface has nearly acquired its intended form. This manner of dressing the surface for the stone facing of a building is called *nidged work*, and the operation *nidging*. The term rubbed work is applied where the surface is smoothed by means of sand or grit stone.

Various curved rules, or templets and guages, are also employed in hewn work. The tools used in setting or building are, a line and line pins, the level, the plumb rule, and rules of various descriptions, as also templets for circular work.

Marbles are polished by first being rubbed with grit-stone, then with pumice-stone, and lastly with emery or calcined tin.

The chief stone used in London is Portland, which comes from the island of Portland in Dorsetshire. It is used for public edifices, not only in ornaments, mouldings, and strings, but in all the exterior parts. In private buildings, where brick-work predominates, it is used in strings, window sills, balusters, steps, copings, &c. It must be observed, however, that under a great pressure it is apt to splinter or flush at the joints, and for this reason the joints cannot be made so close as many other kinds of stone will admit of. When it is recently quarried it is soft, and works easily, but acquires great hardness in length of time. The cathedral of St. Paul, Westminster bridge, and almost every public edifice in London, are constructed wholly, or in part, of Portland stone.

Purbeck stone comes from the island of Purbeck, in Dorsetshire also. It is mostly employed in rough work, as steps and paving.

Yorkshire stone is used where strength and durability are requisite, as in paving and coping.

Ryegate stone is used for hearths, slabs, and copings.

In Edinburgh a very fine stone called Craigleith, brought from a village of the same name in the neighbourhood of this city, is that most commonly used in the construction of their edifices. They have also very good stone from the Hails quarry, but rather inferior in point of colour.

This Craigleith quarry produces two kinds of rock, one of a fine cream or buff colour, called the liver rock, which is almost unchangeable, even though exposed in a building to the weather.

The city of Glasgow is built of various kinds of stone, the best of which are, the Possel and the Lord President's quarry: most other kinds are not only perishable, but liable to change their colour.

In the north of England, stone fit for hewn work is chiefly of a reddish colour. There is a very good white stone, however, in the vicinity of Liverpool, of which several of the public buildings are constructed.

All the stone fit to be squared, or squared and rubbed smooth, for the use of building, is mostly composed of sand. The stone used for the same purpose in the south of England is, in some parts, entirely chalk, and in other parts limestone. The Bath and Oxfordshire stone has so little grit in its texture, as to be wrought into mouldings with planes, as in joinery, and the surfaces are finished with an instrument called a *drag*.

Marbles, with regard to their contexture and variegation of colour, are almost of infinite variety: some are black, some white, some of a dove colour, and others beautifully variegated with every kind of rich colour. The best kind of white marble is that called statuary, and when cut into thin slices becomes almost transparent, which property the others do not possess. The texture of marble, with regard to working, is not generally understood even by the best workmen, though upon sight they frequently know whether it will receive a polish or not. Some marbles are easily wrought, some are very hard, and other kinds resist the tools altogether.

Mortar is another principal material used in cementing the stones of a building. The reader who wishes to obtain a full knowledge in this department of masonry, may consult the article CEMENT, where he will receive satisfactory information

Wherever it is intended to build upon, the ground must be tried with an iron crow or with a rammer: if found to shake it must be pierced with a borer, such as is used by well diggers; and if the ground proves to be generally firm, the loose or soft parts, if not very deep, must be excavated until a solid bed appears.

If the ground proves soft in several places to a great depth under apertures, and firm upon the scite of the piers, turn inverted arches under the apertures, so that if the foundation sink, the arches will resist the re-action of the ground, then the whole wall will sink uniformly or descend in one body. Should the ground be even of an uniform texture, it is always eligible to turn inverted arches under apertures, wherever there is a part of a wall carried up from the foundation to the sill of that aperture: it is from neglecting this circumstance that the sills of windows in the ground stories of buildings are frequently broken; indeed it is seldom or never otherwise.

Arches adequate to this purpose should rather be of a parabolic form than circular, the figure of the parabola being better adapted to preserve an equilibrium than the arc of a circle, which is of uniform curvature. If unfortunately the soft parts of the ground prove to be the scite of the piers, and, consequently, the hard places under the apertures, build piers under the apertures, and suspend arches between the piers with their concave side towards the trench as usual.

For more information upon this subject, the reader will refer to the article FOUNDATION.

In walling, the bedding joints have most commonly a horizontal position in the face of the work, and this disposition ought always to take place when the top of the wall terminates in an horizontal plane or line. In bridge building, and in the masonry of fence walls upon inclined surfaces, the bedding joints on the face sometimes follow the upper surface of the wall or terminating line.

The footings of stone walls ought to be constructed of large stones, which, if not naturally nearly square, should be reduced by the hammer to that form, and to an equal thickness in the same course; for if the beds of the stones in the foundation taper, the superstructure will be apt to give way, by resting upon mere angles or points with inclined beds instead of horizontal. All the vertical joints of any upper course should break joint, that is, they should fall upon the solid part of the stones in the lower course, and not upon the joints.

When the walls of the superstructure are thin, the stones which compose the foundation may be so disposed that their length may reach across each course, from one side of the wall to the other. In thicker walls, where the difficulty is greater in procuring stones of sufficient length to reach across the foundation, every second stone in the course may be a whole stone in the breadth, and each interval may consist of two stones of equal breadth, that is, placing header and stretcher alternately. But when those stones cannot be had

 conveniently,

conveniently, from one ſide of the wall lay a header and ſtretcher alternately, and from the other ſide lay another ſeries of ſtones in the ſame manner, ſo that the length of each header may be two-thirds, and the breadth of each ſtretcher one-third of the breadth of the wall, and ſo that the back of each header may come in contact with the back of an oppoſite ſtretcher, and the ſide of that header to come in contact with the ſide of the header adjoining the ſaid ſtretcher. In broad foundations, where ſtones cannot be procured for a length equal to two-thirds of the breadth of the foundation, build the work ſo that the upright joints of any courſe may fall on the middle of the length of the ſtones in the courſe below, and ſo that the backs of each ſtone in any courſe may fall upon the ſolid of a ſtone or ſtones in the courſe below.

The foundation ſhould conſiſt of ſeveral courſes, of which each ſuperior courſe ſhould be of leſs breadth than the inferior one, ſay four inches on each ſide in ordinary caſes, and the upper courſe project four inches on each ſide of the wall. The number of courſes muſt be regulated by the weight of the wall, and by the ſize of the ſtones of which the foundation conſiſts.

A wall which is built of unhewn ſtone is called a *rubble* wall, whether with or without mortar. Rubble work is of two kinds, courſed and uncourſed. Courſed rubble is that of which the ſtones are guaged and dreſſed by the hammer, and thrown into different heaps, each heap containing ſtones of the ſame thickneſs; then the maſonry is laid in courſes or horizontal rows, which may be of different thickneſſes. The uncourſed rubble is that where the ſtones are laid promiſcuouſly in the wall, without any attention to placing them in rows. The only preparation which the ſtones undergo, is that of knocking off the ſharp angles with the thick end of the ſcabbling hammer.

Walls are moſt commonly built with an aſhler facing and backed with brick or rubble work. Brick backings are common in London where brick is cheaper, and ſtone backing in the north of England and in Scotland where ſtone is cheaper. Walls faced with aſhler, and backed with brick or uncourſed rubble, are liable to become convex on the outſide from the greater number of joints, and from the greater quantity of mortar placed in each joint, as the ſhrinking of the mortar will be in proportion to the quantity, and therefore a wall of this deſcription is much inferior to one of which the facing and backing are of the ſame kind, and built with equal care, even though both ſides were uncourſed rubble, which is the worſt of all walling. Where the outſide of a wall is an aſhler facing and the inſide courſed rubble, the courſes of the backing ſhould be as high as poſſible, and ſet with thin beds of mortar. In Scotland, where ſtone abounds, and where perhaps as good aſhler facings are conſtructed as any in Great Britain, the backing of their walls moſt commonly conſiſts of uncourſed rubble, built with very little care. In the north of England, where the aſhler facings of walls are done with leſs neatneſs, they are much more particular in courſing of their backings. Courſed rubble and brick backings are favourable for the inſertion of bond timbers: but in good maſonry wooden bonds ſhould never be in continued lengths, as in caſe of fire or rot the wood will periſh, and the maſonry, being reduced by the breadth of the timber, will be liable to bend at the place where it was inſerted. When it is neceſſary to have wall timber for the faſtening of battens for lath and plaſter, the pieces of timber ought to be built with the fibres of the wood perpendicular to the ſurface of the wall, or otherwiſe in unconnected ſhort pieces not exceeding nine inches in length.

In an aſhler facing the ſtones generally run from twenty-eight to thirty inches in length, twelve inches in height, and eight or nine inches in thickneſs. Although both the upper and lower beds of an aſhler, as well as the vertical joints, ſhould be at right angles to the face of the ſtone, and the face bed and vertical joints at right angles to the beds in an aſhler facing, where the ſtones run nearly of the ſame thickneſs, it is of ſome advantage, in reſpect of bond, that the back of the ſtone be inclined to the face, and that all the backs thus inclined ſhould run in the ſame direction, as this gives a ſmall degree of lap in the ſetting of the next courſe; whereas if the backs were parallel to the front, there could be no lap where the ſtones run of an equal depth in the thickneſs of the wall. It is of ſome advantage likewiſe to ſelect the ſtones, ſo that a thicker one and a thinner one may follow each other alternately. The diſpoſition of the ſtones in the next ſuperior courſe, ſhould follow the ſame order as in the inferior courſe, and every vertical joint ſhould fall as nearly as poſſible in the middle of the ſtone below.

In every courſe of aſhler facing, with brick or rubble backing, *through* ſtones (as they are technically termed) ſhould be introduced, and their number ſhould be proportioned to the length of the courſe, and every ſuch ſtone of a ſuperior courſe ſhould fall in the middle of every two like ſtones in the courſe below: this diſpoſition of bonds ſhould be ſtrictly attended to in all long courſes. Some wallers, in order to ſhew or demonſtrate that they have introduced ſufficient bonds in their work, chooſe their bond ſtones of greater length than the thickneſs of the wall, and knock or cut off their ends afterwards. This method is far from being eligible, as the wall is not only liable to be ſhaken by the force applied to break the end of the ſtone, but the ſtone itſelf is apt to be ſplit.

In every pier where the jambs are courſed with the aſhler in front, every alternate jamb ſtone ought to go through the wall with its beds perfectly level. If the jamb ſtones are of one entire height, as is frequently the caſe when architraves are wrought upon them, and upon the lentil crowning them, in the ſtones at the ends of the courſes of the pier which are to adjoin the architrave jamb, every alternate ſtone ought to be a through ſtone; and if the piers between the apertures be very narrow, no other bond ſtones will be neceſſary in ſuch ſhort courſes. But where the piers are wide, the number of bond ſtones muſt be proportioned to the ſpace: through ſtones muſt be particularly attended to in the long courſes below and above windows.

Bond ſtones ſhould have their ſides parallel and of courſe perpendicular to each other, and their horizontal dimenſion in the face of the work ſhould never be leſs than the vertical one. All the vertical joints, after receding about three quarters of an inch from the face with a cloſe joint, ſhould widen gradually to the back, and thereby form hollow wedge-like figures for the reception of mortar and packing. The adjoining ſtones ſhould have their beds and vertical joints filled with oil putty from the face to about three quarters of an inch inwards, and the remaining part, of the beds with well prepared mortar. Putty cement will ſtand longer than moſt ſtones, and will even remain prominent, when the ſtone itſelf is in a ſtate of dilapidation, by the influence of the corroding power of the atmoſphere. It is true that in all newly built walls cemented with oil putty, the firſt appearance of the aſhler work is rather unſightly, owing to the oil of the putty diſſeminating itſelf into the adjoining ſtones, which makes the joints appear dirty and irregular: but this diſagreeable effect is removed in a year, or leſs; and if care has been taken to make the colour of the putty ſuitable to that of the ſtone, the joints will hardly

 appear,

appear, and the whole work will seem as if one piece. This is the practice of Glasgow. In London and Edinburgh fine water putty is used instead of it.

All the stones of an ashler facing should be laid on their natural beds. From a neglect of this circumstance the stones frequently flush at the joints, and this disposition of the lamina sooner admits the corroding power of the atmosphere to take place.

In building walls or insulated pillars of very small horizontal dimensions, every stone should have its beds level and without any concavity in the middle: because if the beds are concave, when the pillars begin to sustain the weight of the fabric the joints will in all probability flush. It ought likewise to be observed that every course of masonry of such piers ought to consist of one stone.

Vitruvius has left us an account of the construction of the walls of the ancients, as follows. "The sorts of walls are the reticulated, *Plate* I. *fig.* 1, and the ancient, which is called the incertain, *fig.* 2. Of these the reticulated is the handsomest, but the joints are so ordered that all the parts of the courses have an infirm position; whereas in the incertain, the materials rest firmly one upon the other, and are interwoven together; so that they are much stronger than the reticulated, though not so handsome. Both sorts are formed of very small pieces, that the walls, being saturated with mortar, may endure the longer: for the stones, being of a porous and spungy nature, absorb the moisture from the mortar; and when there is an abundance of mortar, the wall, having more humidity, will not so soon decay, but will on that account be rendered more durable; for as soon as the humidity is extracted from the mortar by the suction of the stones, then the lime and sand separating the cement is dissolved, and the mortar no longer uniting the materials, the walls soon become ruinous. Th s may be observed in some tombs near the city, which are built with marble or hewn stone, and the internal parts rammed with rubble stones; the mortar being by length of time drained of its humidity by the suction of the stones, and the union of the joints being dissolved, they separate and fall to ruin.

"To avoid this error, the middle space (*fig.* 2.) must be strengthened with abutments of the red hewn stone or bricks, or common flints, built in walls two feet thick, and bound to the front with cramps of iron fixed with lead; for the work being thus built in a regular manner, and not laid in promiscuous heaps, will remain without defect; and being by the orderly arrangement of the courses and joints firmly united and bound together, it will not be liable to fractures, nor will the abutments suffer it to fall to decay. For this reason the walls of the Greeks are not to be despised; for though they do not use smooth or polished materials, yet where they discontinue the square stones, they lay the flints, or common hard stones, that they use, in the same manner as bricks are generally laid, bending the courses together with alternate joints, and thus make their works strong and durable.

"These walls they build in two manners; one is called *Isodomum* (*fig.* 3.), and the other *Pseudisodomum* (*fig.* 4.) Isodomum is when all the courses are of an equal thickness; and Pseudisodomum when they are unequal. Both these sorts are firm; first, because the stones themselves are of a compact and solid nature, and do not absorb the moisture from the mortar, but preserve its humidity to a great age; and, secondly, being situated in regular and level courses, the mortar is prevented from falling, and the whole thickness of the wall being united, it endures perpetually.

"Another sort is that which they call Emplecton, *fig.* 5 and 6.) which is also used by our villagers. The faces of the stones in this kind are smooth; the rest is left as it grows in the quarry, being secured with alternate joints and mortar; but our artificers, quickly raising a shell, which serves for the faces of the wall, fill the middle with rubble and mortar: the walls, therefore, consist of three coats, two being the faces, and one the rubble core in the middle, *figs.* 5 and 6. But the Greeks do not build in that manner; they not only build the facing courses regularly, but also use alternate joints throughout the whole thickness, not ramming the middle with rubble, but building it the same as the face, and of one united coat construct the wall: besides this, they dispose single pieces (A), which they call diatonos, in the thickness of the wall, extending from one face to the other, which bind and exceedingly strengthen the walls. Those, therefore, who would build works of long duration, must attend to these rules, and make use of such methods of building; for the smooth polish, and beautiful appearance of the stones, will not prevent the wall from being ruined by age."

An arch, in masonry, is a part of a building suspended over a given plan, supported only at the extremities, and concave towards the plan.

The supports of an arch are called the *spring walls*.

The whole of the under surface of the arch opposite to the plan is called the *intrados* of the arch, and the upper surface is called the *extrados*.

The boundary line, or lines of the intrados, or those common to the supports and the intrados, are called the *springing lines* of the arch.

A line extending from any point in the springing line on one side of the arch, to the springing line on the opposite side of the arch, is called the *chord* or *span* of the arch.

If a vertical plane be supposed to be contained by the span and the intrados of the arch, it is called the section of the hollow of the arch.

The vertical line drawn on the section from the middle of the spanning line to the intrados, is called the *height* of the arch, as also the middle line of the arch, and the part of the arch at the upper extremity of this line is called the *crown* of the arch.

Each of the curved parts on the top of the section, between the crown and each extremity of the spanning line, is called the *haunches* or *flanks* of the arch.

The section of almost every given arch used in building has the following properties: the upper part is one continued curve, concave towards the span, or two curves forming an interior angle at the crown, both concave towards the spanning line.

Every two vertical lines on the section equidistant from each extremity, and parallel to the middle line, are equal.

The above definitions and propositions not only apply to arches with level bases, but also to arches which stand upon inclined bases.

When the base of the section or spanning line is parallel to the horizon, the section will consist of two equal and similar parts, so that if one were conceived to be folded upon the other, the boundaries of both would coincide.

Arches, the intrados of which is the surface of a geometrical solid that would fill the void, are variously named, according to the figure of the section of that solid perpendicular to the axis, as *circular*, *elliptical*, *cycloidal*, *catenarian*, *parabolical*, &c.

Arches of the circular kind have two distinctions, *viz.* the semicircle, and those of segments less than a semicircle, are called *scheme* or *skene* arches.

There

There are alſo *pointed*, *compoſite*, *lancet*, or *Gothic* arches, which are formed in the face of the wall, or in ſections parallel thereto, with the intrados of the arch.

When the extremities of an arch riſe from ſupports at unequal heights, ſuch an arch is called a *rampant* arch.

When a vertical line is drawn upwards, through each extremity of the ſpanning line, ſo as to cut off equal and ſimilar parts of the intrados, the arch is called a *horſe-ſhoe* arch, or *Moreſque* arch. Hence, in this kind of arch, the ſpanning line is leſs than any other line or chord drawn parallel to the ſpan, but under the top of each ſaid vertical line.

When the upper line or ſide of an arch is parallel to the under line or ſide, the arch is called an *extradoſſed* arch.

A ſimple vault is an interior concavity extended over two parallel oppoſite walls, or over all the diametrically oppoſite parts of one circular wall. An arch or vault are frequently underſtood as ſynonimous; but the diſtinction which we ſhall here obſerve is, that an arch, though it may be extended over any ſpace, has a very narrow intrados, not exceeding four or five feet; whereas a vault may be extended to any limit more than four or five feet. Thus, we frequently ſay an arch in a wall, but we never ſay a vault in a wall; though nothing is more common than to ſay a vaulted apartment, a vaulted room, a vaulted cellar, &c. So that a vault, as ſir Henry Wotton has obſerved, is an extended arch; we ſhall therefore apply arch to the head of the aperture in a wall which ſhews curvilineal interſections with the faces of the wall, and the word vault to arched apartments. We frequently, however, call the ſtone-work ſuſpended over an apartment an arch as well as a vault, ſo that every vault is an arch, but every arch is not a vault.

The intrados of a ſimple vault is generally formed of the portion of a cylinder, cylindroid, ſphere, or ſpheroid, never greater than the half of the ſolid; and the ſpringing lines which terminate the walls, or where the vault begins to riſe, are generally ſtraight lines parallel to the axis of the cylinder or cylindroid, or the circumference of a circle or ellipſe.

A circular wall is generally terminated with a ſpherical vault, which is either hemiſpherical, or a portion of the ſphere leſs than a hemiſphere.

A vaulted apartment, ſurrounded by an elliptic wall, is generally covered with a ſpheroidal vault, which is either a hemiſpheroid, or a portion leſs than a hemiſpheroid.

A conic ſurface is ſeldom employed in vaulting; but when the vault is to have this kind of intrados, the intrados ſhould be the half of a cone with its axis in a horizontal poſition, or a whole cone with its axis in a vertical poſition.

All vaults which have a horizontal ſtraight axis are called ſtraight vaults.

Beſides what we have already denominated an arch, the concavities which two ſolids form at an angle are called an arch.

If one cylinder pierce another of a greater diameter, the arch is called a cylindro-cylindric arch; the cylindro being applied to the cylindric part which has the greater diameter, and the cylindric to that which has the leſs.

If a cylinder pierce a ſphere of greater diameter than the cylinder, the arch is called a ſphero-cylindric arch; and on the contrary, if a ſphere pierce a cylinder of greater diameter than the ſphere, the arch is denominated a cylindro-ſpheric arch.

If a cylinder pierce a cone ſo as to make a complete perforation through the cone, two complete arches will be formed, called cono-cylindric arches; and on the contrary, if a cone pierce a cylinder ſo as to make the interior concavity through the cylinder a complete conic ſurface, the arch is called a cylindro-conic arch.

If a ſtraight wall be pierced with a cylindric aperture quite through, two arches will be formed, called plano-cylindric arches.

Every ſpecies of arches is thus denoted by two preceding words; the former ending in *o*, ſignifying the principal vault or ſurface cut through, and the latter in *ic*, ſignifying the kind of aperture which pierces the wall or vault.

When two cylindric vaults, or two cylindroidic vaults, or a cylindric and cylindroidic vault pierce each other, and alſo their axes, ſo that the diameter of each hollow may be the ſame when meaſured perpendicular to a plane paſſing through the axis of both ſurfaces, the figure ſo formed is called a groin: but for more particular information on this point, ſee the article Groin.

The formation of ſtone arches, in various caſes, has always been looked upon as a moſt curious and uſeful acquiſition to the operative maſon, or to the architect, or other perſon who is appointed to ſuperintend the work. In order to remove the difficulties experienced in the conſtruction of cylindric or cylindroidic arches, both in ſtraight and circular walls, we ſhall here ſhew an example of each:

Firſt, let it be required to conſtruct a ſemi-cylindroidic arch cutting a ſtraight wall with its axis oblique to the ſurface of the wall, but parallel to the horizon.

Let A B C D (*Plate* II. *fig.* 1.) be the plan of the aperture, A D and B C being the plan of the jambs; and A B and D C the plan of the ſides of the wall: produce D A and C B to G and F: draw the ſtraight line I G M F E at right angles with A G and C F: biſect G F at M: draw M H K perpendicular to G F: make M H equal to the height of the intrados of the arch, and deſcribe the ſemi-ellipſis G H F, which is the ſection of the intrados of the arch: make G I, H K, and F E equal to the breadth of the beds of the arch ſtone, and deſcribe the ſemi-ellipſis I K E, which is the ſection of the extrados of the arch. Now ſuppoſe the diſtances between the joints around the intrados of the arch to be all equal, and all the joints to tend to the centre M; divide the ſemi-ellipſis into ſuch an odd number of equal parts, that each part may be in breadth equal to what is intended for the thickneſs of the ſtones at that part; produce E I to S, and extend the whole number of theſe parts from G to S; and through the points of diviſion draw lines perpendicular to G S, or parallel to A G. Through all the points of diviſion of the ellipſis G H F, draw lines parallel to G A to meet A B; then take the lengths of all the parts of the lines ſo drawn that are terminated by G F and A B as follows: *viz.* make the firſt line on the left of G A equal to the firſt on the right of G A, and the point *b* will be obtained; and the ſecond on the left of G A equal to the ſecond on the right of G A, and the point *c* will be obtained: proceed in this manner until all the other points are obtained; then a curve being drawn through all the points A, *b*, *c*, *d*, &c. to T, will give the one edge of the envelope of the intrados of the arch; and by producing the perpendiculars erected upon G S to the points *e*, *f*, *g*, &c. and making the ſeveral diſtances *b e*, *c f*, *d g*, &c. equal to A D or B C, the points D, *e*, *f*, *g*, &c. to U, will give the other edge of the envelope by tracing a curve through them; then A *b e d*, *b c f e*, *c d g f*, &c. are the ſoffits of the ſtones.

To

To find any bevel which the joints on the face of the arch makes with that on the intrados of the same. Let $p\,q$ be one of the joints tending to the centre M of the section of the arch: with the radius M G describe an arc G N O, cutting $p\,q$ at N: draw N P parallel to G A, cutting A B at P: draw P Q parallel to F G, cutting G A at Q: draw M L parallel to G A, cutting A B at L, and join L O; then Q L M is the bevel required: in the same manner may all the remaining bevels be found.

Again, let $p\,q\,r\,s$ be the section of an arch stone, then making two bevels, one to $q\,p\,s$ and the other to $r\,s\,p$, will be all the bevels that are necessary for that stone. Having obtained the several bevels, we shall now proceed to work the arch stone, whose section is $p\,q\,r\,s$: first work the lower bed of the stone corresponding to the joint $p\,q$, then draw a line for the soffit, which work also by means of the bevel $q\,p\,s$; then guage the soffit to its breadth, and work the upper bed of the stone by means of the bevel $r\,s\,p$; then take the soffit mould from the envelope, and draw the ends of the stone which coincides with the faces of the wall; then with the face bevels Q L M, and V L M, work the face of the stone.

Note, that finding the bevels for half the arch will be sufficient by reversing them.

The other arch standing upon D C shews the ends of the stones in the face of the wall; its boundaries are two ellipses of equal height to those of the section.

To construct a cylindro-cylindric arch, or a cylindric arch in a cylindric wall, the axis of the aperture being at right angles with the axis of the cylindric wall. Let A B C D be the half plan of the wall, B C being half of the convex curve, A D half of the concave curve, C D the middle line of the aperture tending to the centre of the concentric circles which form the plan, and A B parallel to C D, being the jamb. Through C draw E F perpendicular to C D: make C E and C F half the breadth of the aperture: from the centre C, with the radius C E or C F, describe the semicircle E G F, which will be the section of the intrados: produce C E and C F to H and I, making E H and F I each equal to the breadth of the beds, and describe the semicircle H K I: divide the intradossal curve E G F into the number of parts answering to the number of arch stones, and proceed to find the envelope, as described, for the straight wall, which will give the moulds for the soffits of the stones as before.

To find the curves of the ends of the beds upon the face of the arch. Let L M represent a joint: draw L N and M O perpendicular to H I, cutting the plan of the wall at N and O: draw N P parallel to C I, cutting M O at P: in L M take any number of points t and y, and draw $t\,s$ and $y\,w$ parallel to L N, cutting the plan at s and w, and N P at r and v: draw M Q, $t\,u$, $y\,x$, perpendicular to L N: make M Q, $t\,u$, $y\,z$, respectively equal to P O, $r\,s$, $v\,w$, and L x u Q will be the curve of the joint required, which gives the face line of the upper bed of the lower stone, and the face line of the lower bed of the upper stone. In the same manner all the other face lines of the beds are to be found. The templet must be cut in the shape of L M Q.

To form an arch stone. First make one of the beds, then make the soffit, then form the other bed, then form the face lines of each bed, then run a draught round the three face lines, then between these work the face of the stone in lines perpendicular to the horizon. This will be easily found by drawing a vertical line upon the section of each stone.

It is only necessary to draw the moulds for one half of the arch, as the reversing of them in their application gives the stones of the other half.

The joints of any arch whatever may be found in the same manner, provided that the planes of the beds intersect a vertical plane perpendicular to the curve in the middle of the aperture.

It is obvious, on finding the face lines of the beds, that the lowest face line is the quickest, and part of the plan of the wall itself; the next face line is flatter, or has less curvature, and thus each successive face line has less curvature as it comes nearer to the top, and if there were a joint in the top, the face line of the beds would be quite a straight line. Indeed, the face lines of two or three courses might be wrought with straight edges, as the difference could hardly be perceived.

MASORA, a term in the *Jewish Theology*, signifying a work on the bible, performed by several learned rabbins, to secure it from alterations which might otherwise happen.

Their work regards merely the letter of the Hebrew text; in which they have, first, fixed the true reading, as well as the right method of writing and pronouncing, by vowels, pauses, and accents: they have, secondly, numbered not only the chapters and sections, but the verses, words, and letters of the text: and they find in the Pentateuch 5245 verses, and in the whole bible 23,206. The masora is called, by the Jews, the hedge or fence of the law, because this enumeration of the verses, &c. is a means of preserving it from being corrupted and altered. They have, thirdly, marked whatever irregularities occur in any of the letters of the Hebrew text; such as the different size of the letters, their various positions and inversions, &c. and they have been fruitful in finding out reasons for these irregularities and mysteries in them. (See CABBALISTS.) They are, fourthly, supposed to be the authors of the Keri and Chetibh, or the marginal corrections of the text in our Hebrew bibles. See KERI-CHETIB.

The text of the sacred books, it is to be observed, was originally written without any breaks, or divisions into chapters or verses, or even into words; so that a whole book, in the ancient manner, was but one continued word; of this kind we have still several ancient manuscripts, both Greek and Latin. In regard, therefore, the sacred writings had undergone an infinite number of alterations, whence various readings had arisen, and the original was become much mangled and disguised, the Jews had recourse to a canon, which they judged infallible, to fix and ascertain the reading of the Hebrew text; and this rule they call *masora, tradition*, from מסר, *tradidit*, as if this critique were nothing but a tradition which they had received from their fore-fathers. Accordingly they say, that when God gave the law to Moses, at Mount Sinai, he taught him, first, the true reading of it, and, secondly, its true interpretation; and that both these were handed down by oral tradition, from generation to generation, till at length they were committed to writing. The former of these, *viz.* the true reading, is the subject of the masora; the latter, or true interpretation, that of the *mishna* and *gemara*; which see.

According to Elias Levita, they were the Jews of a famous school at Tiberias, about 500 years after Christ, who composed, or at least began, the masora; whence they are called masorites, and masoretic doctors. Aben Ezra makes them the authors of the points and accents in the Hebrew text, as we now find it; and which serve for vowels.

It is pretended by those who lay a great stress on the points, that the same word, being written with consonants only, as most of the Hebrew words are, has various significations, according to the vowels with which you read or pronounce

nounce it ; *e. g.* the three letters דבר, *d b r*, have at leaſt five different ſignifications, *viz.* he ſpake, ſpeaking, a word, a peſtilence, and a fold for ſheep or cattle. Whilſt the Hebrew was a living language, there is no doubt that the word compoſed of theſe three letters was underſtood in its different ſignifications by the different vowels that were uſed in it when they uttered it. Such vowel points, the Maſorites have now affixed to it, by which we may know when and where theſe three letters ſignify one thing and when another. When it ſignifies "he ſpake," they affix the points which denote *a* ſhort and *e* long, and ſay דבר, *daber*. When it is a participle, and ſignifies "ſpeaking," they read by their points דבר, *dober* ; when it is a noun, and ſignifies a "word," they put under it two *a*'s ſhort, and read דבר, *dabar*, when it ſignifies a peſtilence, they put two *e*'s under, and read דבר, *deber*, when it ſignifies a fold, they put the points which denote *a* and *e*, and read it דבר ; and ſo they have done with other words.

What has been done, in this caſe, by the Maſorites, would certainly be of great uſe for underſtanding the Hebrew text, if they had lived while the Hebrew was a living language, and theſe points had been then uſed, and we could have been aſſured of their knowledge of the true pronunciation of all words, according to their different ſignifications ; but as the Hebrew was a dead language many hundred years before this time, the true ancient pronunciation was as much unknown then as now. We have St. Jerome's teſtimony, that different vowels were uſed in the pronunciation of the ſame word in different countries ; and this was at leaſt 100 years before the Maſorites *began* the invention of their points, either for vowel, pauſe, or accent ; and they were improving for ſome centuries. It is alſo manifeſt, from the LXX, that the ancient Jews read with different vowels from thoſe which the Maſorites have affixed. This is amply evinced by Maſclef in his "Grammar." But if nothing more than the bare pronunciation of Hebrew words was concerned in the caſe, the matter would not be worth the leaſt diſpute. We know not how the ancient Greeks and Romans pronounced the Latin and Greek tongues. Every nation now gives the ſame ſound to the Latin and Greek letters, which they give to thoſe of their own language, which occaſions thoſe languages to be differently pronounced by different people. However, all write and interpret them in the ſame manner ; which difference in pronouncing or ſpeaking is of little conſequence, but the caſe is different with regard to the Hebrew ; moſt of the words in that language are written without vowels ; and the queſtion is, what vowels the words require to make the ſenſe underſtood ; not how the words are to be pronounced in ſpeaking, when vowels are affixed to them. Therefore we ſay, that as it appears from the LXX, that the Jews, before our Saviour's time, uſed other vowels, by which they ſpake their words, than thoſe which the Maſorites have uſed ; the conſequence is, that the points which the Maſorites have now affixed to every Hebrew letter, whether for vowel, pauſe, or accent, are of little or no authority, and deſerve not to be regarded by us ; and that the true ſenſe of an Hebrew word, written only with conſonants, is not to be filched from the points of the Maſora, and the rules given concerning them, but from the context and conſtruction, and the aſſiſtance of the LXX, and other ancient tranſlations. Although we cannot charge the Jews with wilful falſification of the Hebrew text, that is, they have not deſignedly changed the letters of their bibles, yet we cannot ſay that they have not in ſome places wilfully falſified the ſenſe by their points, of which Maſclef gives us an inſtance in his arguments for his "New Grammar," with regard to the famous prophecy in Gen. xlix The learned Mr. Johnſon of Cranbrook, in a poſthumous diſcourſe on Daniel's 70 weeks, has alſo obſerved how the Maſorites have endeavoured to marr that prophecy alſo, by their points ; putting a ſtop, which they call an "athnach," which anſwers to our ſemicolon, in the place where there ought to have been only a comma. And, as Mr. Johnſon obſerves, our Engliſh tranſlators took the preſent Hebrew text as it is printed by the Maſorites, to be the only ſenſe and meaning of the Old Teſtament. In Dan. ix. 25. they put their "athnach" or ſemicolon after the ſeven weeks, and thus cutting off the ſeven weeks from the three ſcore and two weeks, make the prophecy wholly unſerviceable to Chriſtians ; but if they had placed a comma after ſeven weeks, and their "athnach" or ſemicolon after three ſcore and two weeks, the number of years, *viz.* 483 (69 weeks) would exactly point out the time when the Chriſtian Meſſiah came. See Points, under which article this ſubject is farther diſcuſſed.

The age of the Maſorites has been much diſputed. Archbiſhop Uſher places them before Jerome ; Capel, at the end of the fifth century ; father Morin in the tenth century ; Dr. Kennicott about the year 800 ; Baſnage ſays, that they were not a ſociety, but a ſucceſſion of men ; and that the maſora is the work of many grammarians, who, without aſſociating and communicating their notions, compoſed this collection of criticiſms on the Hebrew text. It is urged, that there were Maſorites from the time of Ezra and the men of the great ſynagogue, to about the year of Chriſt 1030 ; and that Ben Aſcher of Tiberias, and Ben Naphtali at Babylon, who were the beſt of the profeſſion, and who, according to Baſnage, were the inventors of the maſora, flouriſhed at this time. Each of theſe publiſhed a copy of the whole Hebrew text, as correct, ſays Dr. Prideaux, as they could make it. The eaſtern Jews have followed that of Ben Naphtali, and the weſtern that of Ben Aſcher ; and all that has been done ſince is to copy after them, without making any more corrections or maſoretical criticiſms.

The learned Walton, in the appendix to his Polyglott, has given us all the various readings of Ben Aſcher and Ben Naphtali and the Oriental and Occidental Jews, and alſo of the Keri and Chetib ; but we are ſtill farther indebted to Dr. Kennicott for his admirable Hebrew bible and the Diſſertatio Generalis annexed to it. See Bible.

The Arabs have done the ſame thing by their Koran, that the Maſorites have done by the bible : nor do the Jews deny their having borrowed this expedient from the Arabs, who firſt put it in practice in the ſeventh century.

There is a *great* and a *little* maſora, printed at Venice, and at Baſil, with the Hebrew text, in a different character. Buxtorf has written a maſoretic commentary, which he calls Tiberias. See on this ſubject, Dr. Brett's Diſſertation on the ancient Verſions of the Bible, &c. Lond. 1760, or Biſhop Watſon's Collection of Theological Tracts, vol. iii. Kennicott, ubi ſupra, and Diſſertations ; and Jennings's Jewiſh Ant. vol. i. p. 400, &c. and the various authors there cited.

MASORITES, Jewiſh doctors, authors of the maſora.

MASOVIA, or Masunen, in *Geography*, a late palatinate of Poland, being one of the moſt ancient and one of the laſt that remained annexed to the crown. Maſovia properly conſiſted of two palatinates, *viz.* Czerſk or Maſovia Proper, and Polotſk. This palatinate was ſeized by Pruſſia in the general diviſion ; but at the peace of Tilſit, it was taken

taken from Pruſſia, and given to Saxony, forming a part of the duchy of Warſaw.

MASPA, a town of South America, in the audience of Quito; 40 miles N.W. of Archidona.

MASPALOMA, a town on the S.E. coaſt of Canary iſland; 12 miles S. of Palmas.

MASPHA, or MASPHE, in *Scripture Geography*, a country at the foot of mount Hermon, towards the ſprings of Jordan. Joſhua ſays it was inhabited by the Hivites.

MASPHA, or *Maſcpha*, a town of Judea, which belonged to the tribe of Gad, ſituated in the N. and E. part of the tribe of Gad. This town was taken and deſtroyed by Judas Maccabæus.

MASPHE, or MASPHAT, a town of Judea, in the tribe of Benjamin. In this town were ſometimes held the general aſſemblies of the Iſraelites. It was rebuilt by Aſa king of Judah. Here Judas Maccabæus and his brethren aſſembled, in order to fight with Lyſias, general of the army of Antiochus.

MASQUE, or MASK, a cover for the face, contrived with apertures for the eyes and mouth; originally worn chiefly by women of condition, either to preſerve their complexion from the weather, or out of modeſty to prevent their being known.

Poppæa, wife of Nero, is ſaid to be the firſt inventor of the maſque, which ſhe continued to guard her complexion from the ſun and weather, as being the moſt delicate woman, with regard to her perſon, that has been known. Theatrical maſques were in common uſe, both among the Greeks and Romans; Suidas and Athenæus aſcribe the invention of them to the poet Choerilus, a contemporary of Theſpis; Horace attributes them to Æſchylus; but Ariſtotle informs us, that the real inventor, and, conſequently, the time of their firſt introduction and uſe, were unknown. Brantome obſerves, that the common uſe of modern maſques was not introduced till towards the end of the ſixteenth century.

MASQUE is alſo uſed to ſignify any thing uſed to cover the face, and prevent a perſon's being known.

The penitents of Lyons and Avignon hide their faces with large white veils, which ſerve them for maſques.

MASQUE, or *Maſk*, a theatrical drama, much in favour in the courts of princes during the ſixteenth and ſeventeenth centuries, in the latter, particularly in England.

According to Hall's Chronicle, the firſt maſque performed in England was at Greenwich, 1512, "after the manner of Italy;" and Hollingſhed ſays, that "there was not only a maſque, but a good comedy of Plautus performed in 1520." In 1530, a maſque was performed at Whitehall, "conſiſting of muſic, dancing, and a banquet, with a diſplay of groteſque perſonages and fantaſtic dreſſes." This piece ſeems only to have wanted *machinery* to fulfil the idea of a complete maſque, ſuch as were afterwards written by Ben Jonſon and others, which, with a conſtant muſical declamation in *recitative* mixed with *air*, would have formed an opera exactly ſimilar to the muſical drama of Italy, in the enſuing century.

Shakſpeare and Beaumont and Fletcher, have frequently introduced maſques into their plays. Of the fourteen comedies of Shakſpeare, there are but two or three in which he has not introduced ſinging; even in moſt of his tragedies, this wonderful and exquiſite dramatiſt has manifeſted the ſame predilection for muſic.

The French and German writers on our muſical dramas, confound *maſque* with *maſquerade*, and *maſcherata* and *interlude* with the Italian *intermezzo;* but we had interludes long before the Italians had intermezzi, and our poems, or dramas, called maſques, bear no reſemblance to an Italian maſcherata. M. de Miſſy, who in the Bibl. Brit. 1740, has given a regular ſeries of our maſques, more eſpecially thoſe of the ſeventeenth century, is conſtantly miſtaken in theſe particulars.

Maſques were certainly the precurſors of operas in England, and belong to the chain of dramas which completed the union of poetry and muſic on our ſtage: and it does not appear, on examination, that the Italian *Maſcherate*, publiſhed by Laſca, which have been thought their prototypes, were dialogued or performed on any ſtage. They ſeem to have been only proceſſional ſongs, ſung through the ſtreet by the repreſentatives of different profeſſions and trades, *maſqued*, during carnival time. And the interludes which de Miſſy and Riccoboni, and their tranſlators, think we had from the Italian *intermezzi*, ſeem to want analogy: as *interlude*, with us, was a general name for every ſpecies of ſtage repreſentation, out of the church.

Maſques in England certainly bear ſome reſemblance to operas: as they are in dialogue; performed on a ſtage; ornamented with machinery, dances, and decorations; and have always muſic, vocal and inſtrumental. But then the eſſential and characteriſtic criterion, recitative, is wanting, without which the reſemblance is imperfect. Our muſical pieces, which are ſometimes honoured with the name of opera, differ in this particular ſo much, that they more reſemble maſques than the dramas which are entitled to that appellation; for, in Engliſh muſical dramas, the dialogue is all declaimed or ſpoken in the ſame manner as in our old maſques; and in Italy, whence we have both name and thing, an opera conſiſts of both recitatives and airs, and is ſung from the beginning to the end.

Riccoboni ſays, that James I., on coming to the crown in 1603, granted a licence to a company of players, in which patent interludes are included; but an interlude then was another word for a play, whether comedy, tragedy, or farce. Maſques are not mentioned in this patent; but as maſques, at this time, were court entertainments, or performed in the houſes of the nobility, on particular occaſions of feſtivity, the neceſſary machinery and decorations rendered ſuch exhibitions too expenſive for the ordinary public theatres. Indeed, the ſeveral parts in the maſques of the ſixteenth and ſeventeenth centuries were uſually repreſented by the firſt perſonages in the kingdom; if at court, the king, queen, and princes of the blood often performed in them.

Maſques appear to have been ſtill more the favourite amuſements of the court during the early and tranquil part of Charles I.'s reign than in that of James; and the queen, who ſeems to have brought with her from France at leaſt as great a love for dramatic exhibitions as ſhe found here, frequently repreſented the principal character in the piece herſelf. Moſt of the court maſques were written by Ben Jonſon, who, in his ſtation of poet-laureat, ſeems to have furniſhed more of theſe dramas, than birthday or new-years odes. And though the maſques of this reign are frequently ſaid, in the title-page, and dramatis perſonæ, to have been performed by the king, queen, and nobles of their court, yet it does not appear that theſe great perſonages often took part in the dialogue or ſongs of the piece; but generally appeared on the ſtage in the ſplendid ballets only, as dancers, repreſenting mythological or allegorical characters. Indeed, the queen, at the time of the firſt maſques of this reign, can hardly be ſuppoſed ſufficiently exerciſed in our language to undertake a part in which declamation was neceſſary.

In 1633, there were no leſs than five maſques performed at different places before the king and queen, and perſonages fonages of the court. A very circumftantial account of one of thefe has been left in a MS. by lord commiffioner Whitelock, written by himfelf. It was acted at Whitehall, and the whole expence defrayed by the gentlemen of the four inns of court. The whole narrative of this mafque is curious, and may be feen in Burney's General Hiftory of Mufic, vol. iii.

Masque, in *Architecture*, is applied to certain pieces of fculpture, reprefenting fome hideous forms, grotefque, or fatyr's faces, &c. ufed to fill up and adorn vacant places, as in friezes, the pannels of doors, keys of arches, &c but particularly in grottoes.

Masques *and Chilques*. See Chilques.

MASQUELONGE, or Kennoncheque, in *Geography*, a river of America, which runs into lake Michigan, N. lat. 43° 10′. W. long. 87 4′.

MASQUE-POCONA, a jurifdiction of Peru, in the audience of Chareas, extending about 30 leagues. The temperature is hot, but not in a degree too great for vineyards. The valley in which the city ftands is above eight leagues in circumference, and produces all kinds of grain and fruit; and the woods and uncultivated mountains afford great quantities of honey and wax, which conftitute a principal branch of its commerce. The city of the fame name, which is the ufual refidence of the bifhop, is 80 leagues from Santa Cruz de la Sierra; it is very thinly inhabited, though in other parts of the jurifdiction there are feveral populous towns. Juan and Ulloa's Voyages to S. America, vol. ii.

MASQUERADE, or Mascarade, an affembly of perfons mafqued or difguifed, meeting to dance or divert themfelves. This was much in ufe with us, and has been long a very common practice abroad, efpecially in carnival times.

The word comes from the Italian *mafcarata*, and that from the Arabic *mafcara*, which fignifies *raillery*, *buffoonery*. Granacci, who died in 1543, is faid to have been the firft inventor of mafquerades. Encyclopédie.

MASQUINONGE, in *Geography*, a lake of Canada; nine miles N.W. of Montreal. N. lat 47° 10′. W. long. 74° 10′.—Alfo, a river which runs into this lake.

MASRAKITHA, a pneumatic inftrument of mufic among the ancient Hebrews, compofed of pipes of various fizes, fitted into a kind of wooden cheft, open at the top, and ftopped at the bottom with wood covered with a fkin. Wind was conveyed to it from the lips, by means of a pipe fixed to the cheft; the pipes were of lengths mufically proportioned to each other, and the melody was varied at pleafure, by ftopping and unftopping with the fingers the apertures at the upper extremity.

MASRI, in *Geography*, a town of Perfia, in the province of Kerman; 160 miles E.N.E. of Sirgian.

MASS, Massa, in *Mechanics*, the matter of any body cohering with it; *i. e.* moving and gravitating along with it. In this fenfe, mafs is diftinguifhed from bulk or volume, which is the expanfion of a body in length, breadth, and thicknefs.

The mafs of any body is rightly eftimated by its weight. And the maffes of two bodies of the fame weight are in a reciprocal ratio of their bulks.

Mass, or *Meffe*, *Miffa*, in a *religious fenfe*, denotes the office, or public prayers made in the Romifh church, at the celebration of the euchariſt.

Nicod, after Baronius, obferves, that the word comes from the Hebrew, *miffach*, *oblatum*; or from the Latin, *miffa*, *profiorum*; becaufe, in former times, the catechumens and excommunicated were fent out of the church, when the deacon faid, *Ite, miffa eft*, after fermon, and the reading of the epiftle and gofpel; they not being allowed to affift at the confecration. Menage derives the word from *miffio*, *difmiffing*: others from *miffa*, *miffion*, *fending*: becaufe, in the mafs, the prayers of men on earth are fent up to heaven.

Romifh divines define the mafs, an oblation made to God, wherein, by the change of a fenfible object by virtue of a divine inftitution, the fovereign dominion of God over all things is acknowledged.

This they efteem the greateft and moft auguft ceremony in ufe in the church; as being the facrifice of the new law, wherein the body and blood of Jefus Chrift are offered up to God.

They are divided about the queftion, whether or no it be proper or allowable for the fame perfon to celebrate mafs feveral times in one day? Having the authority of pope Leo, in his letter to Diofcorus, for the affirmative fide of the queftion, and that of feveral of the councils for the negative.

There is a great variety of maffes in the Romifh church; the thing acquiring new titles and appellations, according to the different rites, intentions, and manners, in which it is performed, as well as other circumftances. Thus they have a

Mass, *Ambrofian*. celebrated according to the rite of St. Ambrofe; particularly ufed in Milan. See Ambrosian.

Mass, *Englifh*, was the form which anciently obtained in England.

Mass, *Gallican*, is the rite that formerly obtained in the churches of France.

Mass, *Greek*, is that rehearfed according to the Greek rites, in the Greek language, and by Greek priefts.

Mass, *Latin*, is that ufed in the Latin church, in the Latin tongue, and according to the rites of the Latin church.

Mass, *Mozarabic* or *Gothic*, is that which was formerly celebrated in Spain, the rites of which are ftill practifed in the churches of Toledo and Salamanca.

Mass, *High*, called alfo *grand* mafs, is that fung by the chorifters, and celebrated with the affiftance of a deacon and fubdeacon.

Mass, *Low*, is that wherein the prayers are all barely rehearfed, without any finging, and performed without much ceremony, or the affiftance of any deacon or fubdeacon.

Mass *of the Beata*, or *our Lady*, is that offered to God, by the means and through the interceffion of the Virgin.

Mass, *Beau*, is a mafs rehearfed every day, at which the ladies and beau-monde of the place attend. This is alfo called the *perfumed* mafs.

Mass, *Common*, or *mafs of the community*, in a monaftery, is that celebrated at certain hours, at which the whole body affifts.

Masses, *Solitary*, or *Private*, were thofe that were celebrated by the prieft alone, in behalf of the fouls detained in purgatory, as well as upon fome other particular occafions. Thefe maffes were prohibited by the laws of the church in the eighth century, but they were a rich fource of profit to the clergy. They were condemned by the canons of a fynod, affembled at Mentz, under Charlemagne, as criminal innovations, and as the fruits of avarice and floth.

Mass *of the Holy Ghoft*, is that celebrated at the beginning of any folemnity or church affembly, commencing with an invocation of the Holy Ghoft.

Mass,

Mass, *Holiday*, is that wherein certain prayers, or leſſons, are read, ſuitable to the day.

Mass *of judgment*, was that wherein a perſon cleared himſelf of any calumny, by ſome proof agreed upon.

Mass *for the death of our enemies*, was a form that obtained a long time in Spain; but it was at length aboliſhed, as inconſiſtent with Chriſtian charity.

Mass *of the dead*, or *requiem*, is that performed at the requeſt of the deceaſed: the introit whereof begins with Requiem. In the thirteenth century it was the cuſtom, before criminals were carried out to execution, to make them attend at a maſs of the dead, rehearſed for the repoſe of their ſouls.

Mass, *Pariſh*, or *great* maſs, is that which the parſon is obliged to rehearſe to his pariſhioners on Sundays and holidays.

Mass, *Little*, is that ſaid at private altars, with leſs ceremony. The firſt maſs is that ſaid at break of day.

Mass *of a ſaint*, is that wherein God is invoked by the interceſſion of ſome ſaint.

Thus there are alſo maſſes of apoſtles, martyrs, pontiffs, virgins, &c.

Mass *of ſcrutiny*, was formerly rehearſed at the examination of catechumens, when inquiry was made as to their diſpoſition for baptiſm.

Mass, *Silent*. See Messa *Baſſa*.

Mass, *Dry*, is that where there is no conſecration; as that, according to Durandus, where the prieſt cannot conſecrate, by reaſon of his having ſaid maſs before on the ſame day: or it is that uſed by the candidates of the prieſthood, in order to their becoming acquainted with the ceremonies; as Eckius will have it.

Mass, *Votive*, is an extraordinary maſs, beſides that of the day, rehearſed on ſome extraordinary occaſion.

Mass *of the preſanctified*, is that in which there is no conſecration of the elements; but after ſinging ſome hymns, the bread and wine which were before conſecrated are received. This maſs is performed among the Greeks, who conſecrate the euchariſt in Lent only on Saturdays and Sundays. Among the Latins, it is uſed only on Good Friday.

Mass-*books, importing or ſelling of*, and other popiſh books, incurs a penalty of 40*s*. by 3 Jac. I. cap. 5. ſec. 25.

Mass, *Candle*. See Candle-*maſs*.

Mass, *Childer*. See Childer-*maſs*.

Mass, *Chriſt*. See Christ-*maſs*.

Mass *of pope Julius* is a very celebrated picture of Raphael repreſenting the ceremony of the maſs in the Vatican, and diſtinguiſhed by its rich and excellent colouring.

Mass, in *Painting*, a technical term of the art, which implies an union of a variety of parts, ſo as to convey to the eye one undivided impreſſion. It likewiſe ſignifies, in its ordinary ſenſe, a large portion of one colour.

MASSA, in *Anatomy*, a name applied to one of the muſcles of the foot, the flexor acceſſorius digitorum pedis; which is called maſſa carnea Sylvii. See Flexor.

Massa, *Duchy of*, in *Geography*, a ſmall principality, ſituated near the Mediterranean, between Genoa and Tuſcany. This principality, and that of Carrara, were, before the French revolution, annexed to Modena, and were transferred with it to the Ciſalpine republic. On a ſubſequent change in 1806, they were given to Lucca.

Massa, a town of the republic of Lucca, and lately the capital of a duchy of the ſame name; ſituated on the river Frigida, near the ſea: the ſee of a biſhop, ſuffragan of Piſa; 53 miles S.S.W. of Modena. N. lat. 44° 2'. E. long. 10° 1'.—Alſo, a town of Etruria, in the ſtate of Sienna, the ſee of a biſhop, ſuffragan of Populonia. Borax and lapis lazuli are found in its vicinity; 24 miles S.W. of Sienna. N. lat. 43° 5'. E. long. 10° 53'.

Massa *di Sorento*, a ſea-port town of Naples, in the province of Lavora, having a harbour for ſmall veſſels. On the ſea-ſhore is an ancient temple adorned with marble columns, and a Moſaic pavement. It is now dedicated to St. Peter. It has a high watch-tower, like thoſe along the coaſt. A little farther is the cape or promontory of Minerva, deriving its name from a temple in honour of that goddeſs, on an eminence facing Sorento. Seneca calls this temple "Athenæum," as it had been built or conſecrated to Pallas, goddeſs of Athens. On the ſcite of its ruins is a watch-tower: from which medals and vaſes have been occaſionally dug. This cape was fatal to moſt of the ſhips of L. Junius's fleet, who, ſailing to join thoſe of P. Claudius Pulcher, his colleague, which had been defeated by Aſdrubal, admiral of the Carthaginians, was driven by a ſtorm againſt this promontory; and the loſſes ſuſtained by the two conſuls were ſo great, that the Carthaginians, in conſequence of them, became maſters of the ſea for five or ſix years; or, till the battle won by C. Lutatius over them, which terminated the firſt Punic war; ſix miles S.W. of Sorento.

Massa, a town of Italy, in the department of the Lower Po; 24 miles S.S.E. of Ferrara.

Massa, a town of Fez; eight miles S. of Salee.

MASSAC Creek, a river of America, in Kentucky, which runs into the Ohio, N. lat. 36° 47'. W. lat. 89° 25'.

Massac *Fort*, a fort built by the French on the W. bank of the Ohio, near its mouth in N. lat. 37° 15', 11 miles below the mouth of Teneſſee river. A conſiderable quantity of land above and below the fort is annually inundated.

MASSACCIO, a town of Italy, in the marquiſate of Ancona; 18 miles S.W. of Ancona.

MASSACHUSETTS Proper, conſtituting with the diſtrict of *Maine* (which ſee), one of the United States of America, is ſituated between 41° 13' and 43° 52' N. lat. and between 69° 50' and 73' 10' W. long. Its greateſt length is 190 miles, and its greateſt breadth 90 miles: in its whole extent it contains 6250 ſquare miles. On the N. it is bounded by Vermont and New Hampſhire; E. by the Atlantic ocean; S. by the Atlantic, Rhode iſland, and Connecticut; and W. by New York. This part of Maſſachuſetts is divided into twelve counties, which, with the number of houſes, inhabitants, and chief towns in each, are exhibited in the following table.

Counties.	No. Towns in 1790.	No. Towns in 1800.	No. Houſes in 1790.	No. Houſes in 1800.	No. Inhab. in 1790.	No. Inhab. in 1800.	Chief Towns.	No. Inhab. in 1790.	No. Inhab. in 1800.

The capital of this ſtate is *Boſton*, which ſee: its population is about ſixty perſons for every ſquare mile, and this is the only ſtate in the union in which there are no ſlaves. The weſtern part of this ſtate is ſomewhat mountainous and hilly, and its climate reſembles that of *New England*, to which we refer. By an admeaſurement made by the barometer at Princeton, in this ſtate, about 45 miles N.W. from Boſton, and at Cambridge, in the year 1777, it appears that Princeton is 1332 feet higher than the level of the ſea. The ſummit of Wachuſet mountain in Princeton was found to be 2989 feet above the ſame level, and may be ſeen at the diſtance of 60 miles.

In Maſſachuſetts are to be found all the varieties of ſoil, from very good to very bad, capable of yielding all the different productions common to the climate, ſuch as Indian corn, rye, wheat, barley, oats, hemp, flax, hops, potatoes, field beans and peas, apples, pears, peaches, plums, cherries, grapes, &c. That part of the ſtate which is diſtinguiſhed by the name of the *Old* or *Plymouth Colony*, including the counties of Barnſtable, Duke's, Nantucket, Briſtol, and Plymouth, in point of ſoil, is the pooreſt part of the ſtate, being generally ſandy and light, interſperſed, however, with many excellent tracts of land. The northern, middle, and weſtern parts of the ſtate, have, generally ſpeaking, a ſtrong good ſoil, adapted to grazing and grain; very ſimilar to the ſoil of New Hampſhire and Vermont on one ſide, and to that of Rhode iſland and Connecticut on the other. It has been obſerved that the effects of the eaſt winds extend farther inland than formerly, and injure the tender fruits, particularly the peach, and even the more hardy apple. The average produce of the good lands, well cultivated, has been eſtimated as follows: 30 buſhels of corn on an acre, 30 of barley, 20 of wheat, 15 of rye, 200 of potatoes. The beſt cultivated and moſt productive part of the ſtate lies in the vicinity of Boſton. Cambridge, Newton, Roxbury, Dorcheſter, and Dedham, are ſaid to be literally gardens, from which the inhabitants of the capital are principally ſupplied with the fineſt fruits, roots, and vegetables. The ſtaple commodities of this ſtate are fiſh, beef, lumber, &c. The chief towns of this ſtate, beſides Boſton the metropolis, are Salem, Newburyport, Charleſtown, Worceſter, Northampton, Springfield, Plymouth, Ipſwich, &c. The country is well watered by a number of ſmall rivers, ſome of which fall into Connecticut river, which paſſes ſoutherly through the W. part of the ſtate; others run northward to Merrimack river, which enters from New Hampſhire, and waters the N.E. corner of the ſtate: others paſs into Connecticut and Rhode iſland; Myſtick and Charles rivers fall into Boſton bay; and others fall into the Atlantic ocean in different parts of the ſea-coaſt. The only capes of conſiderable note on the coaſt of this ſtate, are cape Ann, on the N. ſide of Maſſachuſetts bay, and cape Cod on the ſouth. Beſides theſe, there are cape Malabar, or Sandy point, extending ten miles S. from Chatham towards Nantucket, cape Poge, the N. point of Chabaquiddick, and Gay Head, the weſt point of Martha's Vineyard. The chief bays on the coaſt are Ipſwich, Boſton, Plymouth, cape Cod or Barnſtable, and Buzzard's. The iſlands ſcattered along the coaſt are numerous; the principal of which are Plum iſland, Nantucket, Martha's Vineyard, Elizabeth iſland, and Edgarton, which includes the fertile iſland of Chabaquiddick; beſides which there are many ſmall iſles in Boſton bay. Within the ſtate are ſeveral light-houſes. Locks and canals in various parts of the ſtate have been objects of contemplation; ſuch as one between Barnſtaple bay and Buzzard's bay, another between Boſton and ſome part of Connecticut river; and ſome others, all of which remain to be completed. The locks and canals in Connecticut river were projected for the purpoſe of rendering this river paſſable for boats and rafts from the mouth of Chickapee river, northward, throughout the commonwealth. By a ſubſequent law, two ſeparate corporations have been formed; the one called the Upper Canals for improving the navigation of the river between the mouth of Deerfield river, and the head of the Miller's falls; the other, called the Lower Canals, for improving the navigation of the river between the head of the falls at South Hadley and the mouth of Chickapee river.

Iron ore, in immenſe quantities, has been found in various parts of this ſtate, particularly in the old colony of Plymouth, which has become the ſeat of the iron manufactures. In the towns of Taunton, Bridgewater, Middleborough, &c. nails have been made in ſuch quantities as to prevent, in a great meaſure, the importation of them from Great Britain. The

The manufacture of nails has engaged particular attention, and machines have been conſtructed for facilitating and expediting it. Copper ore, black lead, white pipe-clay, yellow and red ochre, alum ſtone, ruddle or red earth, limeſtone, marble, aſbeſtos, and pyrites, are ſupplied in different parts of this ſtate. Several mineral ſprings have alſo been diſcovered. Manufactories of cotton and woollen have been attempted, with various ſucceſs, at Beverley, Worceſter, Boſton, and Newbury. There are in this ſtate upwards of twenty paper-mills, which make more than 70,000 reams of writing, printing, and wrapping-paper annually. At Boſton, Cambridge, Lynn, Ipſwich, Dedham, &c. are other manufactories for cotton and wool cards, playing cards, ſhoes, lace, wire, &c There are alſo ſeveral ſnuff, oil, chocolate, and powder-mills in different parts of the ſtate, and a variety of mills for ſawing lumber, grinding grain, and fulling cloth. In 1792 there were 62 diſtilleries in this ſtate, employed in diſtilling from foreign materials. The number of gallons diſtilled in one year has been 1,900,000, which at a duty of 11 cents a gallon, yields a revenue to the government of 209,000 dollars.

This ſtate is alſo famous for its literary, humane, and other ſocieties; ſuch are the American Academy of Arts and Sciences, incorporated May 4, 1780; the Maſſachuſetts Charitable Society, incorporated December 16, 1779; the Boſton Epiſcopal Charity Society, incorporated Feb. 12, 1784; the Maſſachuſetts Medical Society, incorporated Nov. 1, 1781; the Humane Society, incorporated in 1791; the Society for propagating the Goſpel among the Indians and others in North America, incorporated Nov. 19, 1787; the Maſſachuſetts Miſſionary Society, inſtituted in 1799; the Hampſhire Miſſionary Society, inſtituted about the year 1800; the Berkſhire and Columbia Miſſionary Society; the Maſſachuſetts Baptiſt Miſſionary Society, inſtituted in 1802; and the Maſſachuſetts Society for promoting Chriſtian Knowledge, founded in 1804. To theſe we may add, the Maſſachuſetts Society for promoting Agriculture, incorporated in 1792; the Hiſtorical Society, eſtabliſhed in 1791; a Marine Society; the Maſſachuſetts Congregational Society, incorporated for the relief of widows and children of deceaſed clergymen; the Middleſex Medical Society, founded in 1790; a Society for the Aid of Emigrants, inſtituted in 1793; the Maſſachuſetts Charitable Fire Society, inſtituted in 1794; the Boſton Mechanic Aſſociation, eſtabliſhed in 1795, &c. &c. Schools and academies are very numerous. See alſo College.

The commerce of Maſſachuſetts is extenſive and lucrative. Her ſhips viſit almoſt all parts of the world. Her principal exports, of her own productions, conſiſt of pot and pearl-aſhes, flax-ſeed, whale-oil, ſpermaceti, whale-bone, ſpermaceti candles, fiſh dried and pickled, beef, pork, cheeſe, butter, and various other kinds of proviſions, live ſtock, American rum, cotton and wool cards, men's and women's ſhoes, ſnuff and manufactured tobacco, houſehold furniture, various kinds of lumber, as boards, planks, oars and rafters, oak and pine timber, ſhingles, ſtaves and heading, ſhip-timber, &c Of theſe articles, and others, the produce or manufacture of the ſtates, together with articles of foreign growth, imported for exportation to other countries, were exported in the year ending September 30, 1791, to the amount of 2,445 975 dollars, 53 cents. Beſides ſhoes, cards, hats, ſaddlery, and various other manufactures, and ſeveral articles the produce of the country to a great amount, exported to the ſouthern and other ſtates, not included in this amount.

In the year ending September 30, 1793, the exports from this ſtate (with the ſame exceptions and qualifications as above) amounted to 3,676,412 dollars; in 1799, to 11,421,591 dollars; and in 1804 to 16,894.379.

This ſtate owns more than three times as many tons of ſhipping as any other of the ſtates, and more than one-third part of the whole that belongs to the United States. Upwards of 29,000 tons are employed in carrying on the fiſheries; 46,000 in the coaſting buſineſs, and 96,564 in trading with almoſt all parts of the world.

Pot and pearl-aſh, ſtaves, flax-ſeed, bees-wax, &c. are carried chiefly to Great Britain, in remittance for their manufactures; maſts and proviſions to the Eaſt Indies; fiſh, oil, beef, pork, lumber, candles, &c. are carried to the Weſt Indies, for their produce, and the two firſt articles, fiſh and oil, to France, Spain, and Portugal; roots, vegetables, fruits, and ſmall meats, to Nova Scotia and New Brunſwick; hats, ſaddlery, cabinet work, men's and women's ſhoes, nails, tow-cloth, barley, hops, butter, cheeſe, &c. to the ſouthern ſtates. The Negro trade was prohibited by law in 1788, and there is not a ſingle ſlave belonging to the commonwealth.

The principal ſources of revenue are land and poll taxes, and the ſales of new lands. Taxes are levied on all males upwards of ſixteen, except ſuch as are exempted by law; alſo on the number of acres of improved and unimproved land, on dwelling-houſes and barns, ware-houſes, ſtores, &c. Theſe are all valued, and upon this valuation taxes are laid, at the rate of ſo many pounds for every 1000*l.*

In January 1805, the funds and expenditures of the commonwealth, as received from the treaſurer, were as follows, *viz.*

		Dols. Cts.
Amount of public debt, funded and unfunded, neareſt - -		1,000,000 00

Funds of the commonwealth, as eſtimated January, 1805.

In United States Stocks, 6 per cents. 3 per cents. 6 per cents. deferred, at par value, dols. 761,225 $\frac{79}{100}$. Value at market prices, January 1805, as reported to the legiſlature - -	618,421 34

Dividends 7 to 8 per cent. per annum - -	———	1,718,421 34

Annual expence for the ſupport of government, eſtimated January, 1805, neareſt 175,000 dols.

The conſtitution of the commonwealth of Maſſachuſetts eſtabliſhed in 1780, contains a declaration of rights and a frame of government. The declaration aſſerts the natural freedom and equality of men—Liberty of conſcience—Freedom of the preſs—Trial by jury—Sovereignty and independence—that all power is in the people—that hereditary honours and emoluments are inadmiſſible—that every ſubject is entitled to protection of life, liberty and property—and, in return, muſt obey the laws and pay his proportion of the common expence—that he ſhall not be obliged to accuſe himſelf; but may be heard in his own defence—that he may keep arms; but ſtanding armies ſhall not be maintained in time of peace—that no tax ſhall be levied without the conſent confent of the people by their reprefentatives—that no *ex poft facto* law fhall be made—that the martial law fhall extend only to men in actual military fervice—that the legiflative, executive, and judiciary powers fhall be kept diftinct, &c. By the frame of government, the power of legiflation is lodged in a general court, confifting of two branches, *viz.* a fenate and a houfe of reprefentatives, each having a negative upon the other. They meet annually on the laft Wednefday in May. No act can be paffed without the approbation of the governor, unlefs two-thirds of both branches are in favour of it after a revifal. Either branch, or the governor and council, may require the opinion of the juftices of the fupreme judicial court, upon important queftions. Senators are chofen by diftricts, of which there cannot be lefs than thirteen. The number of counfellors and fenators for the whole commonwealth is forty; the number in each diftrict is in proportion to their public taxes; but no diftrict fhall be fo large, as to have more than fix. Sixteen fenators make a quorum. The reprefentatives are chofen by the feveral towns, according to their numbers of rateable polls. For 150 polls one is elected; and for every addition of 225, an additional one. Their travelling expences, to and from the general court, are defrayed by the public, but their wages for attendance are paid by their own towns. Impeachments, for mifconduct in office, are made by the reprefentatives, and tried by the fenate; but the judgment can go only to removal from office and future difqualification. Money bills originate in the houfe of reprefentatives, but may be altered by the fenate. Reprefentatives are privileged from arrefts on mefne procefs. Sixty members make a quorum. The fupreme executive authority is vefted in a governor, who is elected annually by the people, and has a council confifting of the lieutenant-governor, and nine gentlemen chofen out of the forty, who are returned for counfellors and fenators. Five counfellors make a quorum. The governor is commander of all the military force of the commonwealth. He may convene the general court, may adjourn them, when the two branches may difagree about the time, and in their recefs, may prorogue them from time to time, not exceeding ninety days—may pardon convicts, but the legiflature alone can grant pardons before conviction. He commiffions all officers, and with the advice of the council, appoints all judicial officers. Military officers are thus appointed; the refpective companies choofe their captain and fubalterns, who choofe their regimental officers, who choofe their brigadiers. The major-generals are appointed by the general court. Juftices of the peace are commiffioned for feven years; all other judicial, and all executive and military officers continue during good behaviour, yet are removable by the governor upon addrefs of the legiflature. The falaries of the governor and juftices of the fupreme court cannot be diminifhed, although they may be enlarged. Official qualifications are as follows: for a voter, twenty-one years of age, one year's refidence, a freehold of three pounds annual value, or fixty pounds of any other eftate—for a reprefentative, 100*l.* freehold, or 200*l.* other eftate, and one year's refidence in the town—for a fenator, 300*l.* freehold, or 600*l.* other eftate in the commonwealth, and five years refidence in the diftrict—for governor, or lieutenant-governor, 1000*l.* freehold, and feven years refidence. Every governor, lieutenant-governor, counfellor, fenator, or reprefentative, muft declare that he believes the Chriftian religion, and has the legal qualifications. A governor, lieutenant-governor, or juftice of the fupreme court, can hold no other office. No man fhall hold two of thefe offices, judge of probates, fheriff, regifter. No juftices of the fupreme court, fecretary, attorney-general, treafurer, judge of probate, inftructor of Harvard college, clerk, regifter, fheriff or cuftom officer, can have a feat in the legiflature. The privilege of Habeas Corpus cannot be fufpended more than a year at one time. In 1795, if two-thirds of the qualified voters defire it, a convention fhall be called to revife the conftitution. This period is now paft; a vote for a revifion could not be obtained; a convincing proof that the people feel themfelves happy under their prefent government.

The militia of Maffachufetts is compofed of all the able-bodied white male citizens from 18 to 45 years of age, excepting from the enrolment, within thofe ages, clergy, fchool-mafters, civil officers of importance, either under the ftate or federal government, and alfo thofe who have held any military commiffion whatever. The whole is formed into ten divifions, which, in January 1805, comprehended 58,879 infantry, 2679 cavalry, and 2581 artillery. Thefe divifions are fubdivided into 22 brigades, 90 regiments of infantry, 59 troops compofing 18 fquadrons or battalions of cavalry; and 54 companies of artillery: the latter are furnifhed each with two light brafs pieces attached to the brigades, with tumbrils and apparatus complete; and have charge of various other heavy field-pieces, ftationed all along the fea-coaft. There is an annual return made of the whole militia to the adjutant-general, who makes out duplicate abftracts for the governor, and for the prefident of the United States.

The religion of this ftate is eftablifhed by their conftitution on a liberal and tolerant plan. All perfons, of whatever religious profeffion or fentiments, may worfhip God agreeably to the dictates of their own confciences, unmolefted, provided they do not difturb the peace. The great body of the people are Congregationalifts, profeffing Calviniftic doctrines; but fome are avowedly Arminians, and fome Unitarians; and, as Morfe fays, the latter it is fuppofed are increafing. Morfe's Geog. vol. i.

MASSACHUSETTS *Fort*, a fort of America, on the borders of Vermont and New York; nine miles S. of Bennington.

MASSACHUSETTS *Sound*, on the N.W. coaft of America, is fituated on the fouthern fide of the Quadras ifle.

MASSACIACOLI, a town of the republic of Lucca; nine miles S.W. of Lucca.

MASSACRE ISLAND. See MAOUNA.

MASSACRE *River*, a river of Hifpaniola, which runs into the fea on the N. fide of the ifland, N. lat. 19° 45'. W. long. 72° 32'.

MASSADA, in *Ancient Geography*, a fortrefs of Paleftine, in the tribe of Judah, fituated on the mountain Achila, N. of the town of Ziph, was built by one of the Maccabees. At the time of the reduction of Judea, A. D. 73, Flavius Silva, governor of Judea, made an expedition againft this fortrefs. It was in the poffeffion of Eleazar, a commander of the Sicarii. He was a defcendant of Judas, who had perfuaded many of the Jews not to fubmit to the affeffment made by Cyrenius, when he came into Judea, after the removal of Archelaus. When there was no method of efcaping, Eleazar called together the principal perfons, and confulted with them what might be beft to be done; at which time he addreffed them with an oration, in order to induce them to kill themfelves rather than to fall into the hands of the Romans. This oration had great effect on many; fome ſome, however, heſitated ; but in the progreſs of his addreſs, all were perſuaded. They then choſe ten men of the number, by lot, to ſlay all the reſt. When theſe ten men had executed their commiſſion, and ſlain men, women, and children, they caſt lots upon themſelves, and he who had the firſt lot killed the other nine, and then himſelf. There remained, however, one ancient woman, and another woman related to Eleazar, who exceeded moſt women in knowledge and prudence, and five children, who had hid themſelves in a cavern under ground : they had carried water with them for their drink, and lay quiet there, while the reſt were intent upon the ſlaughtering of each other. The whole number of theſe people, the women and children juſt mentioned, was 960. This ſlaughter was made on the 15th day of April, A. D. 73. Joſephus.

MASSAFRA, in *Geography*, a town of Naples, in the province of Otranto ; 9 miles N.W. of Otranto.

MASSAGANO, a town of Angola, and capital of a province, to which it gives name, on the Coanza ; 100 miles E.S.E. of Loanda. S. lat. 9° 54′. E. long. 14° 40′.

MASSAGETES, in *Ancient Geography*, a people of Aſia, who inhabited the country on the weſt of the Caſpian ſea, and who imitated the free Scythians in their habit, manner of living, arms, and warlike genius ; but they uſed, beſides bows and arrows, javelins and ſcymetars. Braſs ſerved them inſtead of ſteel for making their offenſive weapons, and their defenſive armour was ornamented with gold. Their horſes were likewiſe fenced with a breaſt-plate of braſs, whilſt their bridles and other furniture were adorned with gold ; for ſilver and iron were not uſed by them, becauſe their country did not produce theſe metals. Although every man was obliged to marry a wife, yet they held them all in common ; ſo that when a man met with a woman to his liking, he took her into his chariot or waggon, and cohabited with her without any further ceremony, than hanging up his quiver at the head of it. This cuſtom, Herodotus tells us, was unjuſtly attributed to all the Scythians by the Greeks, whereas it was peculiar to the Maſſagetes only. A more inhuman cuſtom than this was adopted by them, according to this author, which was, that when a man had once attained to old age, which was not ſo much limited by law as inferred by concurring ſymptoms, all his relations met, and ſacrificed him, together with a number of cattle of ſeveral kinds, and having boiled the fleſh altogether, they ſit down to it as a feaſt. This kind of death was accounted by them the moſt happy, as that of dying by ſickneſs was reckoned unfortunate, becauſe thoſe who died in this way were buried, inſtead of acquiring the honour of being ſacrificed to their gods, and feaſted upon by their neareſt relations, and intimate friends. The ſun was the only deity they worſhipped, and to him they ſacrificed horſes, which, being reckoned the nobleſt and ſwifteſt of all creatures, they thought moſt proper to be offered to the nobleſt and ſwifteſt of all the gods. They neither ſowed nor planted ; but contented themſelves with the milk and fleſh of their cattle, and with fiſh, of which the Iaxartes afforded a very great plenty. Herodotus, lib. i. cap. ult. and lib. iv. cap. 172. Anc. Un. Hiſt. vol. iv.

MASSAGONG, in *Geography*, a ſmall iſland in the Eaſt Indian ſea, near the eaſt coaſt of Naſſau. S lat. 3° 8′. E. long. 100 5′.

MASSALAGEM, *New*, a ſea-port town of Madagaſcar, on the W. coaſt. S lat. 16° 30′. E. long. 63 10′.

MASSALAGEM, *Old*, a ſea-port town of Madagaſcar, on the W. coaſt ; 60 miles N. of New Maſſalagem.

MASSALIANS, MASSALIANI, in *Eccleſiaſtical Hiſtory*, certain ſectaries, ſo called from a Hebrew word, ſignifying *prayer* ; it being their diſtinguiſhing tenet, that a man is to be continually in prayer.

St. Epiphanius diſtinguiſhes two kinds of Maſſalians, the *ancient* and the *later*.

The *ancient*, according to him, were neither Jews, Chriſtians, nor Samaritans, but pure Gentiles ; who, owning ſeveral gods, adored only one, whom they called Almighty.

As to the *later* Maſſalians, who were by profeſſion Chriſtians, their riſe was not till about the time of St. Epiphanius. Their doctrine was, that prayer alone was ſufficient to ſalvation. Many monks, who loved a life of lazineſs, and were averſe from labour, at times, joined theſe Maſſalians. See EUCHITES.

MASSANDRA, in *Geography*, an iſland of Africa, on the river Coanza ; 24 miles from its mouth.

MASSANI, in *Ancient Geography*, a people of India, who, among others, were ſubdued by Alexander, according to Quintus Curtius. They inhabited a territory near the mouth of the river Indus.

MASSANIELLO, or ANELLO THOMAS, in *Biography*, a fiſherman of Naples, a remarkable leader of revolt, which was cauſed on account of ſome unreaſonable impoſitions in the ſhape of taxes. His father was a fiſherman, and he was brought up to the ſame buſineſs, and was at a very early period diſtinguiſhed among his companions by his courage, his activity, and integrity. From his perſon and manners he obtained the eſteem and love of all who knew him. At the time when this obnoxious tax was introduced, *viz.* in the year 1647, Maſſaniello was twenty-four years of age, and had a wife and ſeveral children. His wife had been detected in ſmuggling a ſmall quantity of meal for the ſupport of her infant offspring, and had not only been impriſoned for the offence, but condemned to pay a large fine, for the diſcharge of which they were obliged to ſell their furniture. Exaſperated both on his own, and the public account, Maſſaniello excited his friends to aſſiſt him in driving away the officers : they were ſoon joined by the populace, who demoliſhed all the tax-offices throughout the city, and then demanded the abolition of the tax itſelf. They not only carried their point, but obtained the offer to their leader, Maſſaniello, of a large penſion, which he nobly refuſed. Theſe conceſſions, inſtead of reſtoring order in the city, left it at the mercy of the mob ; and at the inſtigation of ſome of the malecontents, Maſſaniello was induced to iſſue a command for burning the houſes of all perſons concerned in levying the tax, which was very readily executed. He then required the viceroy to aboliſh all taxes of every kind. This, and other conceſſions being allowed, Maſſaniello ſoon found himſelf at the head of a vaſt body of men, and exerciſed uncontrolled ſway. He ſpent little time in refreſhment or repoſe, gave his orders with preciſion and judgment, and appeared free from all perſonal views of intereſt or ambition ; he began, however, to govern with more ſeverity, and put to death ſeveral perſons upon mere ſurmiſes. The viceroy, apprehending leſt the French ſhould take advantage of this confuſion, entered into a treaty with Maſſaniello, granting every thing that had been demanded, and agreeing that he ſhould retain his power, and the people their arms. This ſucceſs was his ruin : intoxicated with power, and diſordered by the conſtant agitation of his mind, he became frantic, and performed all ſorts of extravagant actions, to which an end was put by his aſſaſſination, on the 18th of July, only ten days after his extraordinary elevation. Every indignity was ſhewn to his body ; but in the courſe of a few days, the very rabble who had joined in throwing it into the common ſewer, upon a temporary riſe of proviſions, reclaimed it, it, and carried it through the ſtreets in ſolemn proceſſion, and gave it a magnificent burial. Mod. Univer. Hiſt.

MASSAPA, in *Geography*, a town of Africa, in the country of Mocaranga; 230 miles N.W. of Sofala. S. lat. 18° 10'. E. long. 32° 10'.

MASSARIA, Alexander, in *Biography*, a phyſician of celebrity in the ſixteenth century, was born at Vicenza, and graduated at Padua, where he ſtudied under Fallopio, and the other eminent profeſſors of that ſchool. He then returned to his native place, where he practiſed his profeſſion, with conſiderable reputation, for the ſpace of twenty-five years; when his fame had recommended him to the magiſtracy of Venice, whither he was invited; and he ſettled there in the year 1578. Nine years afterwards, when Hieron. Mercurialis quitted his profeſſorial chair, and removed to Bologna, Maſſaria was immediately appointed his ſucceſſor. He performed the functions of his new office with conſiderable eclat, and attracted a large concourſe of pupils; and at the ſame time was conſulted by the firſt people of the ſtate. He died ſuddenly in the year 1598, when upwards of ſeventy years of age. He was the author of ſeveral works; eſpecially a treatiſe on the plague, on the abuſe of bliſters, on the proper uſe of blood-letting and purging in fevers, (in which he oppoſed the indiſcriminate recommendation of that practice into which Botallus had fallen); and alſo on the diſeaſes of women, and on ſyphilis. The work, which has been moſt frequently reprinted, was his "Practica Medica, ſeu Prælectiones Academicæ," a ſyſtematic treatiſe on the diſeaſes of the whole body; firſt publiſhed at Francfort, in 1601. Eloy Dict. Hiſt. de la Méd.

MASSASYLIANS, in *Ancient Geography*, a people who inhabited the interior of Mauritania Cæſarienſis, on the mountains called Durdus.

MASSAT, in *Geography*, a town of France, in the department of the Arriege, and chief place of a canton, in the diſtrict of St. Girons; nine miles W. of Taraſcon. The place contains 7456, and the canton 12,157 inhabitants, on a territory of 157½ kiliometres, in four communes.

MASSEDAY Bay, a bay on the W. coaſt of Mexico, between Acapulco and Aquacara, a port near the cape of California, where ſir Thomas Cavendiſh lay after he had paſſed the ſtraits of Magellan.

MASSEL, a town of Sileſia, in the principality of Oels; three miles N.E. of Trebnitz, having near it an eminence called Topplesberg, which was once a famous Pagan burying ground.

MASSERANO, a town of France, in the department of the Seſia; lately the capital of a papal fief, inſulated in Piedmont; 43 miles N.N.E. of Turin. N. lat. 45° 39'. E. long. 8° 9'.

MASSETER, in *Anatomy*, a powerful muſcle belonging to the lower jaw: it is deſcribed in the article Deglutition.

MASSEUBE, in *Geography*, a town of France, in the department of the Gers, and chief place of a canton, in the diſtrict of Mirande; nine miles S.E. of Mirande. The place contains 1250, and the canton 11,215 inhabitants, on a territory of 220 kiliometres, in 36 communes. N. lat. 43° 25'. E. long. 0° 39'.

MASSEY's Island, a ſmall iſland in the Pacific ocean, diſcovered in 1790 by lieut. Ball; S.S.W. of Sirius iſland.

Massey's *Town* lies on the northern bank of Ohio river in America, between Little Miami and Scioto rivers.

MASSI, a people of Africa, on the banks of the lake Meravi.

MASSIA, a river of Mexico, which runs into the Pacific ocean. N. lat. 16° 30'.

MASSIAC, a town of France, in the department of the Cantal, and chief place of a canton, in the diſtrict of St. Flour; 14 miles N. of St. Flour. The place contains 2522, and the canton 9870 inhabitants, on a territory of 252½ kiliometres, in 15 communes.

MASSIANAC, a town on the E. coaſt of Madagaſcar. S. lat. 22° 50'. E. long. 47° 55'.

MASSICOT. See Masticot.

MASSIESBURG, in *Geography*, a town of America, in the ſtate of Ohio, and county of Adams, ſituated on the northern bank of the Ohio, 38 miles below the Scioto, or ſix miles above Limeſtone, in Kentucky, ſettled in 1790. About 10 miles above it is a thriving town, built on the N. bank of the Ohio, incorporated in 1802.

MASSIEU, William, in *Biography*, a man of letters, was born at Caen in 1665. When he had finiſhed his ſchool ſtudies, he was entered among the Jeſuits, but in a ſhort time he diſengaged himſelf from the trammels of the ſociety, and became a diſtinguiſhed member of the French Academy and the Academy of Inſcriptions and Belles Lettres. In 1710 he was nominated Greek profeſſor in the college royal, a poſt which he retained till his death in 1722. He was profoundly ſkilled in the ancient languages, of which he gave proof by his various publications: of theſe the chief were "Memoirs of the Academy of Inſcriptions," and "Hiſtoire de la Poeſie Françoiſe," which ranks very high, on account of its curious reſearches. Moreri.

MASSILLARGUES, in *Geography*, a town of France, in the department of the Herault; 12 miles E.N.E. of Montpellier.

MASSILIA, *Portus Græcorum* (*Marſeilles*), in *Ancient Geography*, a celebrated city of Gaul, in Gallia Narbonenſis, and denominated by Cicero the Athens of the Gauls. Livy ſays that it was as much poliſhed as if it had been in the midſt of Greece. It was as much diſtinguiſhed for its ſciences and arts as for its commerce, and alſo for the variety and eminence of its colonies. Cæſar ſays that it was almoſt ſurrounded on three ſides by the ſea, and on the other land ſide very ſtrong, partly by its ſituation, and partly by a deep ditch, which guarded its ramparts. Strabo ſays that it was large, encompaſſed by good walls, and ſituated on a hill in the form of an amphitheatre above its harbour. This town was founded by a colony from Phocæa, a celebrated city of Ionia. Two perſons were deputed for this purpoſe, who carried with them a number of perſons of both ſexes, together with various inſtruments adapted to the mechanic arts and to agriculture, and alſo the laws according to which the colony was to be governed. They were directed by the oracle to touch at Epheſus, and to put themſelves under the conduct of the perſon whom Diana ſhould point out to them. A female was warned by Diana of their arrival in a dream, and ordered to take with her one of her ſtatues, and to accompany theſe ſtrangers. She alſo took from the temple ſome of the ſacred fire, which was to be perpetuated in the new temple that was to be erected at Marſeilles in honour of the goddeſs by whom ſhe was deputed. The firſt object of attention to the Phocæans, when they entered the gulf where they were to build this city, was to gain the protection and favour of the prince who reigned in this country. On the day of their arrival the daughter of the prince was to be married: and, according to the cuſtom of the Gauls, ſhe preſented a cup of water to the object of her choice. One of the Phocæans engaged her affection and attachment, and to him ſhe preſented the ſignificative cup. Her father approved

proved her choice, and aſſigned to the Phocæans a portion of land, where they eſtabliſhed themſelves in the firſt year of the 45th olympiad, or the 600dth year B.C. Allowing for the mixture of fable and truth in this relation, we may deduce from it the time when the city of Marſeilles was eſtabliſhed, and the country from which its founders emigrated. Having encompaſſed the new city with walls, and conſtructed a citadel for its defence, they eſtabliſhed a government upon the baſis of thoſe laws which they had brought with them, and decreed to Diana of Epheſus, who became the tutelar divinity of Marſeilles, a particular worſhip in the temple which they built for her, and of which the female who conducted them thither was the firſt prieſteſs. Agriculture and fiſhery were the objects of their attention and the ſources of their ſubſiſtence: they cultivated the vine and the olive, which were probably the firſt productions which they tranſplanted into Gaul. Our limits will not allow our tracing the particulars of their hiſtory through the viciſſitudes of ſubſequent centuries. For many ages they are ſaid to have maintained their original ſimplicity and frugality, and to have diſtinguiſhed themſelves by their hoſpitality to ſtrangers, and their compaſſion to the indigent. About 320 years B.C., Pytheas, an ingenious aſtronomer of this city, undertook to perfect navigation, and to diſcover countries whither they might extend their commerce. With this view he navigated northwards, and on his return, entered into the Baltic ſea. About the ſame time another citizen of ſimilar talents and purſuits, called Euthymenes, examined the weſtern coaſts of Africa, and reconnoitred the mouth of the Senegal. Theſe two voyages were undertaken at the expence of the republic. Theſe voyages, and other circumſtances, ſerved to extend their commerce and to improve their maritime power. Before the ſiege of this city by Cæſar, it had ſent its ſhips to the Levant, Africa, Spain, and England; and it held a principal rank among republics. During the diſputes between Pompey and Cæſar, Marſeilles took part with the former, and refuſed to open its gates to the latter, though he appeared before it at the head of three legions. Cæſar proſecuted the ſiege of the city, which, after long reſiſtance, and much internal diſtreſs, was obliged to ſurrender at diſcretion. The victor, in conſideration of the antiquity of the city, and the celebrity which it had acquired by its culture of the ſciences and arts, abſtained from the horrors of pillage; but deprived it of its dependant towns and colonies, and deſtroyed its fortifications and warlike machines, and having demanded the ſurrender of its arms, veſſels, and money, placed in it a garriſon of two legions. Contenting himſelf, however, with diſarming the inhabitants, he allowed them to live under their own laws and to enjoy the advantages of commerce. From the capture of the city to the time when Auguſtus became ſole maſter of Rome, nothing particularly worthy of notice happened in this province. For about a century afterwards, this city was governed under the form of a republic, enjoying the protection and ſubject to the authority of the Roman empire. Marſeilles, having enriched itſelf by its induſtry and frugality, became, at length, the victim of luxury and extravagance, inſomuch, that in the ſecond century of the Chriſtian era, the inhabitants gave occaſion for the proverb, "Maſſiliam naviges," to expreſs a diſpoſition for a life of debauchery. About the year 150, the Chriſtian religion was introduced into this city. Maſſilia produced a number of perſons diſtinguiſhed by their proficiency in ſcience and literature. We have already mentioned Pytheas and Euthymenes. To theſe we may add Teron and Gyaræus, who flouriſhed about 75 years before our era, and were celebrated aſtronomers and mathematicians; Oſcus or Oſcius, born about 20 years B.C., a celebrated orator; Agrotas of the ſame character, and the contemporary of the former, who pleaded only in Greek; Pacatus, Petronius, Demoſthenes, Crinas and Charmis, of whom the three laſt mentioned were celebrated phyſicians: the firſt an orator, and the ſecond a poet.

In the cabinets of collectors are many medals of this city in ſilver and in bronze. The moſt common of the firſt ſort have the head of Diana on one ſide, and a lion on the reverſe. Thoſe which have the head of Apollo and the two letters M A, are very common. The medals of Marſeilles diſcovered in 1771, about four leagues from Aix, were of pure ſilver, and all of them had the head of Diana, with a lion on the reverſe. See MARSEILLES.

MASSILLON, JOHN BAPTIST, in *Biography*, a French prelate, of great celebrity as a preacher, was born in 1663. At the age of eighteen he entered into the congregation of the Oratory, where he diſtinguiſhed himſelf by his talents and agreeable manners. In proceſs of time, he was appointed divinity profeſſor at Vienne, and it was in this place that he made his firſt efforts in eloquence, on occaſion of the death of Henry de Villars, archbiſhop of that city, whoſe funeral oration he pronounced. Soon after this he removed to Paris, where he adopted a mode of preaching that was peculiarly his own: his ſtyle and language were ſimple, elegant, and perſpicuous; his imagination lively, his images ſtriking and natural; his thoughts juſt and delicate; and his repreſentations animated and forcible. His manner of delivery likewiſe was admirably adapted to give ſucceſs to the kind of eloquence to which his genius directed him. The fame of Maſſillon excited the curioſity of the king to hear him; he was appointed to preach a courſe of ſermons at Verſailles, and the church was crowded with auditors. It was on one of theſe occaſions that Lewis XIV. paid him this fine compliment: "My father," ſaid he, "I have often had my pulpit filled by celebrated orators, with whom I am greatly pleaſed, but whenever I hear you, I am much diſpleaſed with myſelf." In the year 1717, he was nominated to the biſhopric of Clermont, but before his conſecration he was called on to preach a courſe of Lent ſermons before the young king, Lewis XV.: theſe, being ten in number, are known by the name of *Le petit Carême*, and were compoſed by the author in leſs than ten months, and are ſaid by d'Alembert to exhibit a model of true pulpit eloquence. After having been called to ſome public ſervices, ſuch as pronouncing the funeral oration for Elizabeth Charlotte of Bavaria, ducheſs dowager of Orleans, and having obtained other church preferment, he ſpent the remainder of his life almoſt entirely in his dioceſe, diligently occupied in the diſcharge of his epiſcopal functions, and gaining the affections of all claſſes of the people. He died in 1742, about the age of ſeventy-nine, deeply lamented by the flock over which he preſided, and that had been accuſtomed to regard him with filial reverence and affection. His works were collected and publiſhed by his nephew, in the years 1745 and 1746, in 14 vols. 12mo. They contain a complete "Courſe of Sermons for Advent and Lent:" "The Petit Carême:" "Funeral Orations," &c. Moreri.

MASSIMA, Ital. *Maxima*, Lat. in *Muſic*, the longeſt note in the firſt time-table of the early contrapuntiſts. Its form is an oblong ſquare, with a tail to it, thus: It is equal in duration to two longs, four breves, and eight ſemi breves.

MASSINA, in *Geography*. See MASINA.

MASSING, in *Painting*, the art of producing an union of effect in the various parts of a picture.

Upon the ingenuity with which the fmaller parts are united together, either by blending their edges or merely approximating them, and thus forming the larger maffes of light, fhade, or colour, depends all the beauty of chiaro-fcuro, and it can only be agreeably effected by the hand of tafte. It has been generally agreed amongft artifts and connoiffeurs, that in order to make a picture agreeable it fhould have three diftinct maffes of light, one larger, and two fmaller ones. The arrangement and fcale of them are arbitrary.

The manner employed by fir Jofhua Reynolds to inform himfelf of the mode in which the great artifts of Italy had regulated their works with regard to the general maffes, is fimple, and fo completely effective, that nothing farther than a tranfcript of it need be added for the benefit of thofe who are purfuing the art. In note 39 to Mafon's tranflation of Frefnoy's poem on painting, he fays, "When I was at Venice, the method I took to avail myfelf of their principles was this. When I obferved any extraordinary effect of light and fhade in any picture, I took a leaf of my pocket-book, and darkened every part of it, in the fame gradation of light and fhade as the picture, leaving the white paper untouched to reprefent the light; and this without any attention to the figures. A few trials of this kind will be fufficient to give the method of their conduct in the management of their lights. After a few experiments I found the paper blotted nearly alike. Their general practice appeared to be, to allow not above a quarter of the picture for the light, including in this portion both the principal and fecondary lights, another quarter to be as dark as poffible, and the remaining half kept in mezzotint, or half-fhadow."—"By this means you may alfo remark the various forms and fhapes of thofe lights; what portion is ftrongly relieved, and how much united with the ground."—And in note 41 he adds, "the fame method may be ufed to acquire that harmonious effect of colours, by adding colours to the darkened paper, to afcertain the quantity of warm and the quantity of cold colours."—"The predominant colours of a picture ought to be of a warm mellow kind, as red or yellow, and no more cold colour introduced than will be juft enough to ferve as a ground, or foil to fet off, and give value to the mellow colours; and never fhould itfelf be a principal. For this purpofe a quarter of the picture will be fufficient; thofe cold colours, whether blue, grey, or green, are to be difperfed about the ground, or furrounding parts of the picture, wherever it has the appearance of wanting fuch a foil; but fparingly employed in the maffes of light." For further information on this point, fee the articles CLAIR-OBSCURE, and EFFECT.

MASSINGALES, in *Geography*, a place of America, in Sullivan's county, Teneffee, in which is a poft-office; 427 miles from Wafhington.

MASSINGER, PHILIP, in *Biography*, an Englifh poet and dramatic writer, was born in 1584 at Salifbury. His father, Arthur, was in the fervice of Henry, fecond earl of Pembroke, in whofe family Philip was probably educated. His college ftudies he purfued at St. Alban's hall, Oxford; but it is afferted by Anthony Wood, that in the univerfity he gave his mind more to poetry and romance, than to the ftudies of the place. He left his college without a degree, and his father being dead, he found no other means of fupport than the employment of his talents as a writer for the ftage. From 1606 to 1622, a fpace of 16 years, he was fcarcely known to the public in the profeffion he had embraced: he was during that period probably employed in giving affiftance to other writers of more celebrity, and there is good reafon for believing that he was a coadjutor to Fletcher in fome pieces that bore his name, though he was in fuch embarraffed circumftances, as to fupplicate the loan of almoft the fmalleft fum to prevent him from being fent to gaol. In the laft of the years above-mentioned, his firft printed play made its appearance under the title of the "Virgin-Martyr." There are few facts on record refpecting the life of Maffinger: it appears, however, that, in his circumftances, he never rofe above indigence, and that from his own dedications he would have found it difficult to fubfift, had he not received the aid of liberal benefactors. He died of a fudden indifpofition in the month of March 1640, and was buried by the fide of Fletcher, in the church-yard of St. Saviour's, Southwark. The lift given of plays compofed either wholly or in part by Maffinger amounts to thirty-eight, of which feventeen only are printed in the moft complete edition. They are but little known, nor have any of them the prefent poffeffion of the ftage, excepting his comedy of "A New Way to pay old Debts," which is fometimes acted. His chief excellence is in tragedy, and according to an approved critic, "it would not be eafy to name one of the early Englifh dramatifts who has furpaffed him in harmony of verfe and beauty of language, or in ftrength of character. His popularity was never equal to that of Shakfpeare, Jonfon, Beaumont, and Fletcher: his pieces have the irregularity of plot common at that period, with a mixture of low and grofs fcenes; the portraits are drawn more from general ideas of his own conception, than from the obfervation of real nature; and his knowledge of the human heart is much inferior to that of Shakfpeare, to whom, in fome refpects, there is a great fimilarity. His morality is generally pure, though his language is often grofs and indelicate." The beft edition of his works is that of Mr. Gifford, in four volumes, 8vo. 1805, to which the reader is referred for a more full account of the author.

MASSINISSA was an African prince of great fame; he was the fon of Gala, king of the Maffyli, one of the tribes compofing the Numidian nation. In the year 213, B. C. Maffiniffa, then about 17 years of age, was fent by his father, who had made a treaty with the Carthaginians, againft Syphax, king of another tribe of the Numidians, whom he twice defeated. After this he ferved at the head of the Numidian auxiliaries of the Carthaginians in Spain, and had a large fhare in the defeat and death of the two Scipios. When young Scipio had reftored the Roman fuperiority in that country, Maffiniffa privately entered into a negociation with him and became an ally of the Romans; and to his exertions they owed many of their victories in Africa. After the death of his father, his eldeft brother, and his nephew, Maffiniffa, who had been deprived of his inheritance, obtained fuccours from Bocchar, king of Mauritania, expelled his competitors, and placed himfelf on the Maffylian throne. Syphax, dreading his ambition and martial talents, attacked him with a numerous army, and, gaining a fignal victory over Maffiniffa, obliged him to take refuge on mount Balbus. From this place he made frequent incurfions on the adjacent Carthaginian territory, and proved fo troublefome, that Syphax fent againft him one of his moft active commanders, with orders to bring him either dead or alive. He was now under the neceffity of concealment, and actually lived for a time in a cave, fupported by the plunder of his two attendants. At length he refolved to make an attempt at recovering his kingdom, and being joined by a number of partifans, he not only recovered the throne of the Maffyli, but was able to make incurfions on the dominions of Syphax. In the battle of Zama, Maffiniffa greatly contributed to the defeat of the great Hannibal, and the Romans, who had been frequently the fpectators of his courage and valour, rewarded his fidelity with

with the kingdom of Syphax, and fome of the Carthaginian territories. At his death, Maffiniffa fhewed the confidence he had in the Romans, and the high eftimation in which he held the rifing talents of Scipio Æmilianus, by entrufting him with the care of his kingdom, and empowering him to divide it among his fons. He was more than ninety years of age when he died, and had reigned about fixty years. He experienced adverfity as well as profperity, and in the early periods of his reign he was expofed to the greateft danger, and was, as we have feen, often obliged to fave his life by feeking a retreat among his favage neighbours. His alliance with the Romans was the beginning of his greatnefs, and ever after this he lived in the higheft ftate of affluence. He is remarkable for the large fhare of health he enjoyed to the laft. Toward the clofe of his life he was feen at the head of armies, exerting himfelf with the moft indefatigable activity and ardour, and he often remained for many fucceffive days on horfeback without a faddle under him, or a covering for his head. He affigned the ftrength of his mind and the vigour of his body, chiefly to the great temperance which he obferved. He was feen eating brown bread at the door of his tent, like a private foldier, the day after he had obtained an immortal victory over the armies of Carthage. He left fifty-four fons, of whom three only were legitimate, *viz.* Micipfa, Gulaffa, and Manaftabal. At his death he was the moft powerful prince in Africa, his territories extending from Mauritania, to the weftern borders of Cyrenaica. His army at this time was numerous and well difciplined, and his treafury was full: he was undoubtedly one of the ableft fovereigns of his age, though little fcrupulous in the means which he reforted to for his aggrandizement. Univer. Hift.

MASSISA, in *Geography*, a town of Afiatic Turkey, in Aladulia; 12 miles E. of Adana.

MASSIVE, fomething heavy and folid; a term ufed in oppofition to tendernefs and delicacy.

Thus we fay, a building is too maffive, that is, its walls are too thick; a wall is maffive, that is, the lights and openings are too fmall in proportion.

MASSIVE *Column*. See COLUMN.

MASSON, M. in *Biography*, author of "A Treatife on Compofition" in French, publifhed in 1705, and much efteemed till that of Rameau appeared, in 1722. The author was maître de chapelle at Chalons, in Champagne. This work is divided into two parts; of which the firft treats of melody, the fecond of harmony. The firft part contains feven chapters, and the fecond ten; proceeding from two parts to four, and ending with inftructions for compofing a fugue.

MASSON, JOHN, a learned writer of the reformed church, was born in France, from which, on account of his religious opinions, he was obliged to make his efcape, and became a refugee in England. From thence he paffed into Holland. In 1708 he publifhed, at Leyden, the lives of Horace and Ovid, in Latin: after this he wrote the life of Pliny the younger, prefixed to a fplendid edition of his Epiftles, printed at Amfterdam in 1734. In the year 1712 he commenced a work, entitled "Hiftoire critique de la Republic des Lettres," which he carried to fixteen volumes, 12mo. Maffon is, likewife, fuppofed to be the author of the "Hiftory of Peter Bayle, and his Works."

MASSON, FRANCIS, a name which ranks very high among thofe who, by encountering perfonal difficulties and hardfhips, with the moft indefatigable and difinterefted zeal, have promoted botanical knowledge, was born at Aberdeen in Auguft 1741. Whether he was originally educated as a gardener, or at what time he found his way to London, we are not informed. It appears that, having been for fome time known to the late excellent fuperintendant of the Royal Garden at Kew, Mr. Aiton, and probably employed under him there, he was fixed upon as a fit perfon to undertake fome botanical expedition, for the purpofe of enriching that collection, when the return of the celebrated Banks and Solander from their voyage round the world, gave a popularity and a ftimulus to every exertion in favour of natural fcience. We believe the eftablifhment of a travelling botanift in the king's fervice, if not fuggefted by the firft-mentioned of thefe eminent men, was planned entirely under his advice and direction. In 1771 or 1772, Mr. Maffon was difpatched to the Cape of Good Hope. That country had been, for near a century, celebrated as a mine of botanical riches, which had fcarcely reached our gardens but through the medium of thofe of Holland. The works of Hermann, Commelin, Burmann, Breynius, and others, had fufficiently evinced the abundance of thefe treafures; but comparatively few of them had been procured in a living ftate, or cultivated with fuccefs, even by the Dutch themfelves; and of thofe but a very fmall portion had, from the time of the firft earl of Portland, when he came over with king William, to our days, come into general cultivation in England. The writer of this well recollects the pleafure which the novel fight of an African Geranium, in Yorkfhire and Norfolk, gave him about forty years ago. Now every garret and cottage-window is filled with numerous fpecies of that beautiful tribe, and every greenhoufe glows with the innumerable bulbous plants and fplendid heaths of the Cape. For all thefe we are principally indebted to Mr. Maffon, befides a multitude of rarities, more difficult of prefervation or propagation, confined to the more curious collections. Many of thefe perhaps have only furvived to bloom once or twice within the walls to which they were firft configned; to be defined and named by the fkill of a Solander, a Dryander, or of the younger Linnæus in his tranfient vifit among us, and have then difappeared. Such has unavoidably been the cafe with many of the Orchis tribe, for want of our knowledge of their requifite treatment; while many of the *Liliacei* have flowered on their arrival, but though their bulbs have continued to exift, they have feemed rather to languifh than to flourifh, for want of their native arid foil and burning fun. Such deficiencies and difappointments indeed were fcarcely felt while Mr. Maffon continued at the Cape, fo abundant and repeated were his fupplies. The Dutch appear not to have reftrained his inquiries or acquifitions. He was allowed to travel many hundred miles up the country, and we have often heard him recount his adventures. At length, his harveft having been judged, for the prefent, fufficiently abundant, he was, in 1776, ordered to explore the Canary iflands, the Azores, Madeira, and part of the Weft Indies, efpecially the ifland of St. Chriftopher. In this miffion he employed about five years more, and returned to England in 1781.

During his ftay at the Cape, he entered into correfpondence with the great Linnæus. Having difcovered a bulbous plant of a new genus, he was not only laudably ambitious of botanical commemoration in its name, but he was particularly anxious, as appears by one of his letters, to receive this honour from no lefs a hand than that of his illuftrious and venerable correfpondent. This indeed was the "*unicum premium*," the only reward to which he afpired for all his labours. That he fought no pecuniary advancement, the extreme flendernefs of the ftipend which could be obtained for him, and his difregard of fuch objects at all times, abundantly evinced. He obtained the honour to which he afpired. The fpecimen of *Maffonia* in the herbarium of Linnæus,

 named

named by his own trembling hand near the close of his life, proves that the name had his fanction, though it appears from the *Supplementum Plantarum*, p. 27, to have been originally fuggefted by Thunberg, in whofe company Maffon botanized for two years at the Cape. This juftice rendered to the merits of our botanical traveller, was finally crowned by the publication of plates of two fpecies of *Maffonia*, in the *Hortus Kewenfis* of his friend Aiton, a book which he had fo eminently contributed to enrich, by his difcoveries in various parts of the world. Before that book appeared however in 1789, he had, in 1783, vifited Portugal and Madeira, and had returned to the Cape of Good Hope in 1786. He now combined experience and forefight with zeal and activity. He was prepared to take advantage of different feafons; in fome to collect fpecimens, in others roots or feeds; fo as beft to make up for former deficiencies or loffes; and he had already made himfelf acquainted with the various fituations, or tracts of country, moft promifing for every purpofe. In confequence of this knowledge, it was fettled, in confultation with his able advifer, fir Jofeph Banks, that his travels fhould now be reftrained to within forty miles of the Cape town. That fpace of country was found to be as yet inexhaufted, and almoft perhaps inexhauftible, as to what it might afford for our gardens, and the expence as well as labour of the undertaking was, by this plan, greatly leffened.

Mr. Maffon returned to England again in 1795, and fpent two years there among his botanical friends, feeing the produce of his exertions every day blooming around him, at Kew and at Hammerfmith, his refidence at Kenfington placing him within reach of the principal botanic gardens, as well as at a moderate diftance from the great theatre of fcientific and literary information in Soho fquare.

A life of fo much leifure foon became irkfome, to a man who had been ufed to fo much bodily exertion, and mental recreation, amid the wild and novel fcenes of nature, and he folicited another miffion. This was obtained from his royal mafter, at the recommendation of his former friend and patron; and he was fent to explore fuch parts of North America, under the Britifh government, as appeared moft likely to produce new and valuable plants. This was truly a national project, worthy of thofe who planned it; the vegetable productions of that country, from the hardinefs of their conftitution, being not merely objects of curiofity, tafte, or luxury, but capable of being naturalized among us, for the probable benefit of our arts, our domeftic and rural economy, our kitchen gardens and farms, as well as of our fhrubberies and parterres. The fuccefs of our traveller was equal to the expectations that had been formed. New plants, of interefting characters and properties, fprung up under his fteps, and it feemed probable that much practical knowledge was likely to refult from his difcoveries, even through the experience and converfe of the wild inhabitants of thofe little explored regions. So others have found who have followed Mr. Maffon; for he furvived not to reap or to communicate more than a foretafte of thefe advantages. He died about Chriftmas, 1805, in the fixty-fifth year of his age, at Montreal, in Canada. What little property he left, fell into the hands of two of his nephews, and confifted chiefly of the journals of his various travels, drawings, and collections of dried plants or other natural productions. Some of thefe relics have been purchafed by the prefent Mr. Lee of Hammerfmith, a worthy friend of their original poffeffor. From him, or from our own perfonal knowledge, moft of the above particulars are derived; the dates only being taken from the fhort mention of our deceafed friend, communicated by the prefent Mr Aiton, to Sims and Konig's Annals of Botany, v. 2. 592. We cannot conclude better than in Mr. Lee's own words. "Maffon was of a mild temper, perfevering in his purfuits, even to a great enthufiafm. Of great induftry; which his fpecimens and drawings of fifh, animals, infects, plants, and views of the countries he paffed through, evince. And though he paffed a folitary life, in countries diftant from fociety, his love of natural hiftory never forfook him. Characters like him feem for the prefent dwindling in the world, but I truft they will revive. If a felection of his *memoranda* would be acceptable to the world, there is matter enough to carry it to a great extent."

Mr. Maffon publifhed, in 1796, a fplendid work on the genus *Stapelia*, confifting of a thin folio volume, with forty-one coloured plates of as many fpecies, almoft entirely nondefcript, accompanied by defcriptions. This volume is dedicated to the king, in the fame refpectful and feeling ftyle as the firft edition of Mr. Aiton's *Hortus Kewenfis*; and we think we perceive traces of the fame able and judicious pen in both. S.

MASSONIA, in *Botany*, fo called in honour of the late Mr. Francis Maffon; fee the preceding article. The younger Linnæus obferves in his *Supplementum*, where the prefent genus was firft publifhed, that he was indebted to Mr. Maffon for all the Canary plants defcribed in that work.—Linn. Suppl. 27. Thunb. Nov. Gen. 39. Schreb. 216. Willd. Sp. Pl. v. 2. 28. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 209. Juff. 53. Lamarck Illuftr. t. 223. —Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Spathaceæ*, Linn. *Afphodeli*, Juff.

Gen. Ch. *Cal.* none. *Cor.* Petals fix, inferted on the outfide of the nectary, lanceolate, ftraight, fpreading. Nectary inferior, cylindrical, membranous, of one leaf, with fix ftreaks, and as many teeth. *Stam.* Filaments fix, awl-fhaped, incurved, equal, rather longer than the petals, inferted into the teeth of the nectary; anthers ovate, incumbent. *Pift.* Germen fuperior, three-lobed; ftyle thread-fhaped, curved; ftigma nearly fimple. *Peric.* Capfule triangular, fmooth, of three cells and three valves, burfting at the angles, which are extended upwards into three fhort, rounded, erect wings. *Seeds* numerous, globofe, fomewhat angular, fmooth.

Eff. Ch. Nectary inferior, tubular. Petals fix, equal, inferted on the outfide of the nectary. Capfule with three wings, three cells, and many feeds.

1. M. *latifolia.* Broad-leaved Maffonia. Linn. Suppl. 193. Ait. Hort. Kew. ed. 1. v. 1. 405. t. 3. Thunb. Nov. Gen. 4 . Curt. Mag. t. 848.—Leaves nearly orbicular, depreffed, perfectly fmooth.—Native of the diftrict of Roggefeldt, at the Cape of Good Hope, where it bloffoms in September and October. In our greenhoufes the flowers are produced in March and April. It was fent to Kew in 1775. The *root* is a round bulb. *Stem* none. *Leaves* two, radical, depreffed, fpreading widely on the ground in oppofite directions, each from three to fix inches long, nearly orbicular but fomewhat pointed, entire, obfcurely ribbed, flefhy, quite fmooth; dark green above, with feveral purple fpots towards the extremity; paler and fpotlefs beneath. *Flowers* numerous, in a feffile radical head or tuft, between the leaves, each flower accompanied by an ovate leafy *bractea*, about equal to the nectary, or longer. The whole *corolla* is greenifh, its petals deflexed. *Stamens* much longer than the petals, ftout, purple, with yellow anthers.

2. M. *muricata.* Prickly leaved Maffonia. Ker in Curt. Mag. t. 559.—Leaves nearly orbicular, depreffed, prickly on the upper fide towards the point.—Native of the Cape; introduced by Mr. Maffon to Kew garden in 1790. It differs

fers from the laſt eſſentially in the prickles of the *leaves*. The *flowers* moreover are white in every part, except the anthers before they burſt, and the very tumid rim of the *nectary*, which are of a blueiſh green. The *nectary* itſelf is deſcribed by Mr. Ker as brimful of honey, which ſurely juſtifies its Linnæan and Thunbergian appellation, though the ingenious author we have quoted, prefers calling it merely the tube of a monopetalous corolla. To us the petals in this genus, as in *Narciſſus*, appear totally diſtinct in nature and ſubſtance, as they often are in colour, from the nectariferous tube.

3. M. *ſcabra*. Shagreen-leaved Maſſonia. Andr. Repoſ. t. 220. (M. puſtulata; Jacq. Coll. v. 4 177. Ker in Curt. Mag. t. 642. Redout. Liliac. t. 183.)—Leaves nearly orbicular, depreſſed, their upper ſide covered with prominent tubercles.—Sent by Mr. Maſſon from the Cape in 1790. It flowers here from January to April, and is ſaid in the Bot. Mag. to be as eaſy of culture as any other Cape bulb. This ſpecies has the habit and ſize of the two preceding, but differs in having the whole upper ſurface of the *leaves* beſprinkled with innumerable, ſmall, prominent puſtules, or tubercles. The *flowers* are of a greeniſh-white, the rim of the nectary being of a deeper green than the reſt. The *bracteas* are broad, and cloſely laid over each other. *Stamens* and *ſtyle* tall, ſlender and white; the *ſtigma* minutely three-cleft, fringed.

4. M. *echinata*. Rough-leaved Maſſonia. Linn. Suppl. 193. Thunb. Nov. Gen. 41. Ait. n. 4.—Leaves ovate or lanceolate, depreſſed, their upper ſide covered with hairy tubercles. Petals very narrow.—Sent from the Cape by Mr. Maſſon in 1790. It ſeems not yet to have found its way, even once, into our periodical publications. It is ſaid in the *Hortus Kewenſis* to flower in May. Thunberg deſcribes the *bulb* as ſcarcely ſo big as a hazle-nut. *Leaves* two, ovate, blunt with a point, ſmaller than any of the former, covered with prominent tubercles and white hairs.

5. M. *pauciflora*. Few-flowered Maſſonia. Ait. n. 5.—Leaves lanceolate or elliptical, veinleſs, covered with naked tubercles. Petals ovate.—Sent with the three laſt from the Cape, by Mr. Maſſon, in 1790. It is ſaid to flower in May.

6. M. *anguſtifolia*. Narrow-upright-leaved Maſſonia. Linn. Suppl. 193. Ait. Hort. Kew. ed. 1. v. 1. 405. t. 4. Ker in Curt. Mag. t. 736. (M. lanceolata; Thunb. Nov. Gen. 40.)—Leaves oblong-lanceolate, aſcending, ſmooth. Tube of the nectary long and cylindrical; mouth cloſed. Found by Thunberg on the ſummit of the Onderſte Roggefeldt mountain at the Cape, flowering in Auguſt, it being there a winter plant. This was ſent over with the firſt ſpecies, by Mr. Maſſon, in 1775, and flowers here from January to April, increaſing by offsets and ſeeds without difficulty. The *leaves* differ in their upright poſition from all the foregoing. They are ſmooth like *M. latifolia*, but much narrower, and not ſpotted. The *flowers* are fragrant like a hyacinth, white, with purple anthers, and a ſlender tube, twice or thrice as long as the petals, nearly cloſed at its mouth by the tumid baſes of the filaments.

7. M. *undulata*. Waved-leaved Maſſonia. Thunb. Nov. Gen. 41. Ait. n. 7. Willd. n. 3.—Leaves upright, lanceolate, waved, ſmooth.—Found by Thunberg in the inland country above the Cape of Good Hope, and ſent by Mr. Maſſon, in 1791, to Kew, where it flowers in April. *Bulb* the ſize of a hazle-nut. *Leaves* radical, three, four or five, very narrow in their lower part, lanceolate, waved, erect, about a finger's length. *Flowers* in a denſe umbel, raiſed upon a common ſtalk, rather ſhorter than the foliage.

8. M. *enſifolia*. Trumpet-flowered Maſſonia. Ker in Curt. Mag. t. 554. Ait. n. 8. (M. violacea; Andr. Repoſ. t. 46. Mauhlia enſifolia; Thunb. Prod. 60. t. 3. Agapanthus enſifolius; Willd. Sp. Pl. v. 2. 48. Polyanthes pygmæa; ibid. 165. Jacq. Ic. Rar. t. 380.)—Leaves lanceolate, ſpreading, ſmooth. Tube of the nectary five times longer than the recurved petals, ſwelling gradually upwards, open-mouthed. Three ſtamens ſhorter than the reſt.—Native of the Cape, where it was gathered by Thunberg and Maſſon, but introduced into this country by Mr. Williams of Turnham-Green, who is recorded to have raiſed it from Cape ſeeds in 1790 or 1791. It flowers from September to February. The *leaves* are two only, and moſt reſemble thoſe of *M. anguſtifolia*. The *flowers* grow in a rather denſe, ſhort-ſtalked cluſter, and are of a pale lilac hue, very remarkable for their long, ſlender, gently-ſwelling tube or nectary, their minute *bracteas*, and unequal *ſtamens*. Theſe circumſtances, and the habit of the plant, have cauſed much difference of opinion reſpecting its proper genus, and Cavanilles, it ſeems, has made it a *Hyacinthus*, to which the good ſenſe of Dr. Sims appears to have diſpoſed him to aſſent, and we confeſs ourſelves much of the ſame opinion. But Mr. Ker has thought otherwiſe, and he is followed by the editors of the Hort. Kew. Jacquin's excellent figure ſhews the capſule to be deficient in the dilatations or wings proper to *Maſſonia*, nor is there any line of diſtinction to be drawn between the nectary and petals; which Mr. Ker uſes as an argument for conſidering the nectary and petals as one in the real *Maſſoniæ*, where they appear to us to be very diſtinct. We propoſe our doubts merely for the ſake of truth, and by no means for controverſy.

MASSONIA, in *Gardening*, compriſes plants of the herbaceous bulbous-rooted flowery perennial kind, of which the ſpecies cultivated are, the broad-leaved Maſſonia (M. latifolia); and the narrow-leaved Maſſonia (M. anguſtifolia.)

Method of Culture.—Theſe plants may be increaſed by planting the offsets from the roots, when the leaves drop off, in pots of ſandy earth, plunging them in a hot-bed in the ſtove. And they are likewiſe capable of being raiſed from ſeeds, ſown in pots of the ſame ſort of earth, plunging them in a hot-bed in the houſe.

Afterwards the plants ſhould have a free air in the green-houſe, where they muſt be kept.

They are capable of affording variety in theſe collections.

MASSORAH, in *Geography*, a town of Hindooſtan, in Bahar; 23 miles E.S.E. of Bahar. N. lat. 53° 37′. E. long. 15° 5′.

MASSOUDI, in *Biography*, the ſurname of Aboul Haſſan Ali, a celebrated Arabian geographer and hiſtorian, deſcended from Maſſoud Ebn Maſſoud, one of the moſt confidential friends of Mahomet, flouriſhed in the tenth century. He was author of a work, entitled, according to our tranſlation, "Golden Meadows and Mines of precious Stones," which he wrote in the year 336 of the Hegira. It is an hiſtorical and geographical treatiſe, compriſed in two volumes: the firſt of which commences with the creation of the world, and comes down to the birth of Mahomet; and the ſecond continues the hiſtory from that date to the author's time. He is author of another hiſtory, entitled "A Regiſter of the Lands of Egypt." Other works are attributed to him, and, among theſe, the following is the principal: "A Hiſtory of Inſurgents at various Periods againſt lawful Authority, and particularly that of the Chaliphs." He died at Grand Cairo in Egypt, in the year 346 of the Hegira. There was another perſon of this name, who wrote a hiſtory of Syria and Damaſcus, entitled, according to the Engliſh verſion of it, "The Garden of Syria,"

Syria," and a treatife "On the Conjugation of the Arabic Verbs."

MASSOW, in *Geography*, a town of Hinder Pomerania; 9 miles N. of Stargard.

MASSOWAH, Masuah, or *Matfuah*, meaning, fays Bruce, the port or harbour of the fhepherds, a fmall ifland of the Red fea, near the coaft of Abyffinia, in a bay, with an excellent harbour, governed by a chief called the Naybe of *Arkeeko;* which fee. The water in the harbour is deep enough for fhips of any fize, which may ride in it fecure from any wind. It was called by the Greeks "Sebafticum Os," from the capacity of its port, which is diftributed into three divifions. The ifland itfelf is very fmall, fcarcely three-quarters of a mile in length, and about half that in breadth: one-third occupied by houfes; one by cifterns or tanks, of which there are about thirty, to receive the rain-water; and the laft referved for burying the dead. When Arabia Felix was conquered by the arms of Selim, emperor of Conftantinople, Mafuah was a place of great commerce, poffeffing a fhare of the Indian trade, in common with the other ports of the Red fea near the mouth of the Indian ocean. Its exports were brought to it from an inhofpitable and almoft inacceffible mountainous country behind it: thefe confifted of gold and ivory, elephants' and buffaloes' hides, and, above all, flaves. Along its coaft were found pearls, confiderable for fize, water, or colour. As long as commerce flourifhed, Mafuah continued to be a place of much refort; but it fell into obfcurity very fuddenly under the oppreffion of the Turks, who completed the ruin of the Indian trade in the Red fea, which had commenced fome years before by the difcovery of the Cape of Good Hope, and the fettlements made by the Portuguefe on the continent of India. The firft government of Mafuah under the Turks was by a bafhaw fent from Conftantinople; but when it ceafed to be a place of trade, it was not thought worth while to keep up the expenfive eftablifhment of a bafhalik. In reward for the affiftance given to the Turks, when they conquered this place, by a tribe of Mahometans called Belowee, fhepherds inhabiting the coaft of the Red fea, under the mountains of the Habah, about lat. 14°, the Turks gave their chief the civil government of Mafuah and its territory, under the title of Naybe of Mafuah; who held it, after the bafhaw was withdrawn, of the grand fignior, for an annual tribute, upon receiving a firman from the Ottoman Porte. The janizaries, eftablifhed there as a garrifon, intermarried with the women of the country; and in confequence of thefe intermarriages, Moors and natives of Mafuah became mutually related, and always fubject to the influence of the Naybe. From motives of policy, it was agreed that one-half of the cuftoms fhould be paid by the naybe to the king of Abyffinia. Having thus fecured the friendfhip of Abyffinia, the naybe declined paying tribute to the bafhaw of Jidda, to whofe government he had been fubjected by the porte; and he afterwards declined paying a fhare of the cuftoms to the king of Abyffinia.

Mafuah was found by Mr. Bruce and his companions, as the refult of various obfervations of the fun and ftars, to be in N. lat. 15° 35′ 5″; and by an obfervation of the fecond fatellite of Jupiter, September 22, 1769, its longitude was fixed at 39° 36′ 30″ E. of Greenwich; the variation of the compafs being 12° 48′ W. As Loheia is nearly oppofite, (N. lat. 15° 40′ 52″,) the breadth of the Red fea between Mafuah and Loheia is 4° 10′ 22″; and fuppofing a degree to be equal to 66 ftatute miles, this breadth, in round numbers, will be 276 miles. The height of the barometer, on the 4th of October, at 6 in the morning, was 25° 8′ 2″; at 2 P.M., 25° 3′ 2″; and half paft 6 P.M., 25° 3′ 7″; and the greateft height of Fahrenheit's thermometer, *viz.* October 22, at 2 P.M., was 93°. Mafuah is very infalubrious, as is the whole coaft of the Red fea from Suez to Babelmandeb, but more efpecially between the tropics, and fubject to violent fevers, generally terminating in death on the third day. Fevers generally end in intermittents, and dyfenteries, always tedious and often mortal. Another difeafe, endemial in this country, is called "hanzeer," the hogs or the fwine, and is a fwelling of the glands of the throat, and under the arms; and another complaint confifts of fmall fwellings all over the body, but thickeft in the thighs, arms, and legs. Another diforder, common in thefe countries, is called "Farenteit," fignifying the worm of Pharaoh, which afflicts thofe who are in the conftant habit of drinking ftagnant water. This plague appears indifcriminately in every part of the body, but moft frequently in the legs and arms. This worm is feized by the natives gently by the head, and then wrapped round a thin piece of filk, or fmall bird's feather. Every day, or feveral times a day, they try to wind it upon the quill as far as it comes readily; and, upon the fmalleft refiftance, they defift for fear of breaking it. When this operation, which fometimes lafts for three weeks, terminates, the hole or puncture difcharges, by preffure, a fmall quantity of lymph; and in about three days it is healed without a fcar. The elephantias is alfo one of the endemial difeafes of the country.

At Mafuah it is a general cuftom for people to burn myrrh and incenfe in their houfes, before they open the doors in the morning; and when they go out at night, or early in the day, they have always a fmall piece of rag highly fumigated with thefe two perfumes, which they ftuff into each noftril, to keep them from the unwholefome air.

The houfes in Mafuah are, in general, built of poles and bent grafs, as in the towns of Arabia; but, befides thefe, there are about twenty of ftone, fix or eight of which are two ftories each. At Mafuah all the neceffaries of life are fcarce and dear, and in quality indifferent. The fame fort of money is in ufe at Mafuah and the oppofite coaft of Arabia. It is valued by the Venetian fequin: but glafs beads, called "contaria," of all kinds and colours, perfect and broken, pafs for fmall money, and are called, in their language, "Borjooke."

Table of the relative value of money.

Venetian fequin	=	$2\frac{1}{4}$ Pataka.
Pataka, or imperial dollar	=	28 Harf.
1 Harf	=	4 Diwani.
10 Kibeer	=	1 Diwani.
1 Kibeer	=	3 Borjooke or grains

The harf is likewife called dahab, meaning in Arabia gold, and frequently a fequin. The harf is 120 grains of beads.

The trade carried on at Mafuah is confiderable, though the ifland is narrow and confined, and the government unjuft and violent. The goods imported from the Arabian fide are blue cotton, Surat cloths, and cochineal ditto, called Kermis, fine cloth from different markets in India; cotton unfpun from ditto in bales; Venetian beads, cryftal, drinking and looking-glaffes; and kohol, or crude antimony. The three laft articles come in great quantities from Cairo, firft in the coffee-fhips to Jidda, and then in fmall barks to this port. Old copper is alfo an article by which the gain is great, and a large quantity is imported. The Banians were once the principal merchants of Mafuah; but in Bruce's time they were reduced to fix. They are filver-fmiths, that make ear-rings and other ornaments for the women on the continent, and are affayers of gold; but they make only a poor livelihood. As there is no water in Mafuah, the number

ber of animals belonging to it can be but ſmall. Bruce's Travels, vol. iii.

MASSOWBA, a town of Congo; 10 miles N. of Bombi.

MASSUET René, in *Biography*, a learned French Benedictine of the congregation of St. Maur, was born at St. Owen de Maucelies, in the dioceſe of Evreux, in 1665. He became diſtinguiſhed for his proficiency in ancient literature, particularly in the writings of the fathers and eccleſiaſtical antiquities. In 1710 he publiſhed a new edition of the works of St. Irenæus, in folio, more correct than any preceding editions, and accompanied with new notes and prefaces: he alſo added to it fragments of ſuch pieces of Irenæus as are no longer extant; and prefixed to the whole are three diſſertations, which reflect credit on his erudition, induſtry, and judgment. The firſt contains an account of the heretics againſt whom Irenæus wrote, and of their opinions; the ſecond, a hiſtory of his own life, actions, and writings; and the third of his opinions. He was engaged after this, by his ſuperiors, on a continuation of "The Lives of the Saints," and "The Annals of the Benedictine Order." He died in 1716, at the age of fifty. Moreri.

MASSURA, in *Geography*, a town of Hindooſtan, in Bahar; 45 miles S.S.W. of Bahar.

MAST *of a Foreſt*, the fruit of that genus of trees called *glandiferous*, or *maſt-bearing*; as beech, oak, cheſnut, &c.

Mast, in *Ship Building*, a large pole, or long piece of round timber, raiſed in veſſels, to which are attached the yards, ſails, and rigging, in order to their receiving the wind neceſſary for navigation.

The word maſt ſignifies the ſame thing in French, High-Dutch, Flemiſh, and Engliſh; the Italians uſe the word *albero*, and the Spaniards *maſtil*.

Maſts are long fir trees, or ſeveral fir trees coaked or douelled and bolted together, and cylindrically rounded a great part of their length, and, arching ſideways, are ſimilar to truncated cones.

Their number depends upon the ſize and nature of the veſſel, ſome having three lower maſts, which are called ſhips; ſome have two lower maſts, ſuch are brigs and ſnows; others only one maſt, ſuch are cutters, ſloops, and other ſmall trading-veſſels. Beſides the lower maſt, each veſſel has a bowſprit; and to complete the neceſſary heights of the maſts, and convenience in many reſpects, there is attached to the head of the lower-maſt, the top-maſt, and to the head of the top-maſt, the top-gallant-maſt, and ſometimes to the head of the top-gallant-maſt, a ſmall one, called a royal-maſt. To theſe ſeveral maſts are confined their reſpective yards and ſails, and conſequently the rigging for their ſupport.

An attempt has been lately made to introduce four or more maſts in veſſels; but, upon a very liberal trial, it was found not to anſwer the purpoſes intended: for when the number of maſts are multiplied, the yards muſt be ſhortened, or they would entangle each other in working. By this, too, the ſails would be narrowed, and would receive too ſmall a portion of wind for the force required. If, on the contrary, there is not a ſufficient number of maſts, the yards would be unmanageable, from their length. Experience, therefore, has proved, that, in large veſſels, three lower-maſts and a bowſprit, in ſmaller veſſels, two lower-maſts and a bowſprit, and in the ſmalleſt, one maſt and a bowſprit, are the moſt advantageous number for nautical purpoſes.

All large maſts, previous to the American war, were made of New England white pine, having been found the higheſt, and in all reſpects beſt ſuited to the purpoſe; but ſince then maſts from Riga have been procured. As the largeſt trees from that country ſeldom exceed twenty-four inches in diameter, and more frequently from nineteen to twenty-one, a much larger number of pieces was of courſe uſed in conſtructing made-maſts. From this circumſtance, and the nature of the wood being conſiderably heavier than white pine, the maſts now in uſe exceed the former ones by nearly one quarter in weight: but Riga maſts are conſiderably ſtronger than thoſe of New England.

The choice of trees for making maſts, yards, &c. to the beſt advantage, is of great importance; otherwiſe much unneceſſary waſte and expence muſt occur: and the greater number of trees any maſt is compoſed of, the more judgment is required to ſuit each tree to the neareſt ſize. The beſt method to attain this, is to draw upon a board or paper the ſeveral pieces the maſt is compoſed of, ſimilar to the *Plate of Maſts*, &c. Every tree ſhould be carefully examined whether it be ſound, and ſhould it be not quite ſtraight, if ſufficiently large, it might be made ſtraight, in putting the maſt together.

The beſt poſition, and indeed the heights of the maſts, ſhould be duly conſidered and aſcertained by the conſtructor or ſhip-builder, as it is only the buſineſs of the maſt-maſter to make them agreeable to the length or heights beſt ſuitable for the veſſel to bear, of which the former is the beſt judge.

The lengths and diameter of the maſts, &c. being given, the preſent mode of making a main-maſt is as follows. For a ſhip of 74 guns:

From the butt ſet up the heights of the decks upon a ſtraight line ſtruck along the middle, and the given length, which is one hundred and eleven feet; from which ſet back ſix inches for every yard in the length, for the heading and ſtop, or reſt for the treſtle-trees; five inches for the mizen-maſt, which is the upper part of the hounds; from thence ſet back ſix-thirteenths of the length of the head for the length of the hounds; and from thence, to produce the curve ſideways, ſet off the following diameters: and, firſt, the given diameter, which is thirty-ſeven inches, muſt be ſet off at the partners, which is at the middle-deck of three-deck ſhips, and the main deck of all others, and thirty-eight inches at the upper deck, in order to give the hoops a quicker drift; and this equally from a ſtraight line along the middle: then divide the diſtance from the upper part of the hounds to the partners into four quarters or equal diſtances, terming that next the partners the firſt quarter, the next the ſecond, and ſo on.

Then ſet off, as before, at the firſt quarter, thirty-ſix inches and three-eighths, or ſixty ſixty-one parts of the given diameter; and at the ſecond quarter thirty-four inches and three-quarters, or fifteen-ſixteenths; at the third quarter thirty-two inches and a half, or ſeven-eighths; and at the lower part of the head, the thwart-ſhip way, thirty-two inches and a half, or ſeven-eighths; and the fore and aft-way twenty-ſeven inches and three-quarters, or three-fourths; and at the upper part of the head twenty-three inches and an eighth each way, or five-eighths of the given diameter. The interval from the lower deck to the heel is divided into two quarters, and the ſame dimenſions ſet off as at the firſt and ſecond quarters above; laſtly, the heel is thirty-one inches and three-quarters, or ſix-ſevenths of the given diameter.

Thus a curve paſſing through thoſe ſeveral diameters would give the ſhape of the maſt; and ſuppoſing it a ſingle tree, it would only be made circular to thoſe diameters. But large maſts now, as before obſerved, are made of various ſmaller trees, united ſtrongly together by douels, &c. and conſiſt of a ſpindle, ſide-trees, fiſhes, &c. The ſpindle is made of one or two trees, douelled and bolted together. (See *Plate of Maſts*.) Its length is five-ſevenths the given length of of the maſt; its breadth or ſiding two-thirds of the given diameters of the maſt, if the trees deſigned will admit, if not three-fifths, and ſo continued to the hance of the ſide-fiſhes, which is at the middle of the hounds, and above that to the ſize of the maſt at the head. The thwart-ſhip ſize of the ſpindle tapers from a middle line to half the diameter at the ſtop of the hounds, and is to hance in about three inches on each ſide, four feet below the butt of the ſide-trees, and from thence line ſtraight to half the diameters of the maſt at the ſecond quarter, and tapers to half the ſize of the ſtop at the butt, and above the butt of the ſide-trees, the upper part tapers to one-ſixth of the diameter at the head.

Side-trees.—Each ſide-tree is made of a ſingle-tree, or two trees douelled and bolted together: they are ſided to the ſize of the ſpindle the fore and aft-way. Their breadth athwart-ſhips, from the heel of the maſt to the butt of the ſpindle, is one-half the diameter of the maſt, and continues the ſame to the ſecond quarter, deducting the ſubſtance of the ſpindle. At the third-quarter ſpindle included, the breadth is three-ſevenths of the given diameter, and at the hance one-fourth of the breadth of the ſpindle at the ſtop of the hounds. Sometimes ſide-trees are aſſiſted in their length by working heel-pieces, ſcarfed underneath at their lower ends. The ſcarfs of the heel-pieces ſhould be one-half, or not leſs than one-third of their length. The ſide-trees are douelled and bolted to the ſpindle. The maſt, thus far completed, is hewn ſquare to its ſeveral diameters before-mentioned, and then eight-ſquared the thwart-ſhip way.

The *Side-fiſhes* are ſawn from one tree cut down the middle, and one-fourth the diameter of the maſt ſet off on each ſide for their thickneſs. The breadth of the fiſhes is two-thirds the diameter at the partners, and forty forty-one parts of that breadth at the firſt quarter, eleven-twelfths at the ſecond, five-ſixths at the third, and two-thirds at the upper end, and a parallel breadth from the partners to the heel, they are douelled, and faſtened with dumps to the ſide-trees and ſpindle. All the ſurfaces being firſt well payed with tar, they are ſet cloſe together.

When the ſpindle, ſide-trees, and ſide-fiſhes are douelled and bolted together, which is eaſier comprehended by frequently referring to the *Plate of Maſts*, it is hewn ſquare to its ſeveral diameters the fore and aft-way, then eight-ſquared, and any deficiencies in the angles made good by cant-pieces fayed therein; it is then ſixteen-ſquared, and rounded and planed ſmooth from the heel to the hounds, except the ſurface left for douelling on the cheeks, where it is flattened for one-third their length. The maſt, completed thus far, is hooped with iron, as ſhewn in the Plate.

The iron hoops are four inches and a half broad, and five-eighths of an inch thick, and the inner edges chamfered to prevent their bruiſing the maſt.

Maſts thus far finiſhed are ſo ſent to foreign ports, and hence called tranſportation maſts.

Maſts of a leſſer ſize may be conſtructed of two trees, called the upper and lower tree, douelled together in the middle, and bolted: theſe trees give the diameter, fore and aft, and the upper part, for the reception of the cheeks, is formed as the one above; then, with the addition of the ſide-fiſhes, this maſt may be ſo far completed as the former. Then to complete the maſt, the

Cheeks muſt be added: they faſhion the head of the maſt, and leave a ſtop for the ſupport of the treſtle-trees. The length of the cheeks for a main-maſt is nine-twentieths of the whole length of the maſt; for the fore-maſt three-ſevenths, and for a mizen-maſt two-fifths. The length for the head and hounds is agreeable to that firſt mentioned for the maſt. The breadth of the cheeks at the head is two-thirds of the given diameter of the maſt, and three-fourths at the ſtop; and the lower part of the hounds, in the middle between the hounds and lower end, eleven-twelfths of the breadth at the hounds, and at the lower end one-half of the given diameter. The thickneſs of the cheeks is ſet off from the inſide; thus the upper part above the ſtop to be one-fourth of the given diameter, and a ſtop left at the upper part of the hounds to project full half that thickneſs; the lower part of the hounds to be one inch more than the thickneſs at the upper part of the head, and from thence to line ſtraight to five-ninths of the head at the lower end.

The cheeks are each made of a ſingle tree, or two trees douelled together at the middle, and bolted; the inſide of the cheeks is next fayed to the upper part of the ſpindle, to which they are douelled and bolted, and further ſecured by iron hoops; the upper hoop to be its breadth below the under ſide of the cap, another juſt clear of the treſtle-trees, and four more equally between; and another hoop its breadth below the ſtop. Two bolts are to be driven under every hoop, ſix bolts in the hounds, and four more below; and the lower parts of the cheeks to be faſtened with dumps and nails.

On the fore-ſide of the maſt next below the cheek at the heel of the top-maſt is a front fiſh fayed and faſtened to the maſt. (See the ſections in the plate.) The whole is then ſtrongly woolded together with twelve or thirteen turns of rope between every hoop. And to make a fair ſurface, filings of fir are fayed under the wooldings next the edges of the front fiſh.

The *Treſtle-trees* for ſuſtaining the top, and confining the heel of the top-maſt, are made of oak, in length one-fourth the length of their reſpective top-maſt, deep half the given diameter of the lower-maſt, and in thickneſs two-thirds of the depth, fayed and bolted to the lower part of the maſt head, reſting on the ſtop, as ſhewn in the plate.

The *Croſs-trees* are oak, in length one-third the length of the top-maſt deducting ſix inches, breadth what the treſtle-trees are thick, and their depth two-thirds their breadth; the under ſides are tapered from the ends one-fourth their length, and are framed together at right angles, as ſhewn in the plate.

Bibs or *Brackets* are made of elm, three to five inches in thickneſs; in length five-ſixths the length of the hounds; and in breadth two-fifths of their length, fayed and bolted to the maſt, under the treſtle-trees for their ſupport, as in the plate.

Bolſters are pieces of fir fayed on the treſtle-trees, and againſt the ſides of the maſt, between the fid-hole and after-croſs-tree, to project the treſtle-trees one inch and a half, and the ſame in depth. The outer-ſides are rounded for the ſhrouds to lay eaſy thereon.

The *Cap* is made of elm, in one or two pieces, douelled together in the middle: the length of the main-cap is four times the diameter of its top-maſt, and three inches more; the breadth is half the length, and the depth half the breadth. Fore and mizen-caps are the ſame of their reſpective top-maſts, adding two inches to the fore, and one inch only to the mizen. The cap is fixed on the maſt-head by a ſquare tenon; the mortiſe or ſquare hole in the cap is made rather leſs than the tenon, to allow for its ſhrinking. Four eye-bolts are driven through the cap from the under-ſide, and well clenched on plates of one inch and three-quarters diameter, or leſs in proportion to the ſize of the cap, one on each ſide the ſquare hole, and the other by the ſide of the round hole which is before the ſquare hole, two-fifths of the diameter of the round hold, and half the tapering of the maſt-head

head in its length. The ſize of the hole is the given diameter of its top-maſt, and three-quarters of an inch more, as it is lined with leather.

Laſtly, a tenon is made at the heel of the maſt, by which it is fixed in the ſtep: its ſize fore and aft is one-half the given diameter, and athwart-ſhips two-thirds, and of ſufficient depth, as in the plate.

Maſts made of ſingle trees are finiſhed in a ſimilar manner, but having no cheeks the ſtop for the reſt of the treſſle-tree is made by the bibs or brackets. Merchant ſhips' maſts are ſeldom woolded, but hooped only.

Top-maſts have their ſeveral ſizes or diameters ſet equally from a ſtraight line along the middle of their length, which is for the 74-gun ſhips 66 feet. From the butt end ſet up once and a half the diameter, which is 20 inches, for the block below the heeling, and twice and a half the diameters above that for the heeling; and from the lower part of the ſaid heeling, the length of the lower maſt-head, or place of the cap, where the given diameter, 20 inches, is ſet off. Then from the whole length ſet back five inches for every yard in the length, for the length of the head and ſtop of the hounds, for main and fore-top-maſt, and four inches for mizen-top-maſts, and three-fifths that length below it for the hounds: then divide from the lower part of the head to the cap into four quarters; that next the cap is the firſt quarter; then ſet off, as before, 19 inches and five-eighths, or ſixty ſixty-ones of its given diameter; at the ſecond quarter, 18 inches and five-eighths, or fourteen-fifteenths; at the third quarter, 17 inches and one-eighth, or ſix-ſevenths; at the lower part of the hounds, 16 inches and one-quarter, or thirteen-ſixteenths; at the ſtop, 18 inches, or nine-tenths; at the lower part of the head, 14 inches ſquare, or ſeven-tenths; and at the upper part, 11 inches ſquare, or five-ninths.

The aft-ſides of top-maſts are lined ſtraight, the heeling to be ſquare, and large enough, if the tree will admit, to fill up the treſtle-trees at the lower maſt-head, and to hance from the upper part to the diameter of the cap, and to be eight-ſquare, or nearly ſo. The block below the heeling to be eight-ſquare, and of the ſame ſize as the diameter at the cap, with an iron hoop driven on the heel. The ſtop above the hounds on the fore and after-ſides to come up to the under-ſides of the croſs-trees; the hounds are left eight-ſquare, and all below the hounds to the under-ſide of the main-cap is to be ſmoothly rounded. Sheave-holes for the top-rope are mortiſed through, one in the heeling, and one in the block below it; their length rather more than the depth, and their thickneſs two inches for every foot in length. A groove to bury the top-rope is made in each angle, in the direction of the lower ſheave-hole.

The fid-hole is a ſquare mortiſe, cut through the middle of the heeling the ſize of the fid, which is in length once and a half the given diameter of the lower-maſt, its depth one-third the given diameter of the top-maſt, and its thickneſs two-thirds its depth, made of iron; but when made of wood, the depth is half the given diameter of its top-maſt. A hole is made through one end for a laniard, and the other is ſhaped.

Top-maſt treſtle-trees: their length is three inches and a half to every yard in the length of their top-maſt, in depth one inch and one-eighth to every foot in their length, and two-thirds their depth in thickneſs. Each croſs-tree is one-third longer than the treſtle-tree, their depth ſeven-eighths the depth of the treſtle-tree, and are framed and bolted together as in the plate; with a ſheave-hole mortiſed through the fore-end of the main, and two ſheave-holes in each end of the fore-top-maſt treſtle-trees.

The top-maſt cap is ſo ſimilar to its topmaſt as the lower cap to its reſpective maſt, that it needs only a reference to the plate.

Mizen-top-maſts differ but little from the former: they have no block, but the heeling is ſet up from the butt, and, inſtead of a ſquare head, have a long pole head about four times the length of the ſquare head. They have a ſheave-hole mortiſed through the hounds, fore and aft, for the top-ſail-tye; and one a little above the ſtop, for the ſtay-ſail-haliards; and one a little below the truck, for the mizen-top-gallant-tye.

Top-gallant-maſts are made ſimilar to mizen-top-maſts: if to carry royal maſts, the heads are ſquare like a main-top-maſt, but moſtly made with pole-heads; if a ſtump pole-head, the ſame as a ſquare head; if a common pole-head, its length is two-fifths the given length; and if a long pole-head, it is two-thirds the given length.

Royal maſts are made ſimilar to ſtump-head top-gallant-maſts.

Bowſprits are rarely made of one tree, but are made of many, ſimilar to made-maſts: if made of two trees, they are ſided to two-thirds the diameter of the bowſprit the thwart-ſhip way, and each tree is one-half the diameter fore and aft, and douelled together in the middle, and bolted, and the deficiency made good athwart-ſhips by ſide-fiſhes; conſequently each ſide-fiſh muſt be in thickneſs one-fourth the diameter, and are douelled and bolted to the ſides, as may be readily ſeen in the maſt-plate. Bowſprits made of ſingle trees have a line ſtraight along the middle, upon which ſet up the length from the butt, which is 68 for a 74-gun ſhip; next ſet off the bed, which is three-tenths of the length ſet up from the butt, and ſix inches added. Set back from the length four inches for every yard in the given length for the long ſquare on the upper ſide, and one-third that for the ſhort ſquare on the under ſide; then from the bed to the outer end divide it equally into four parts, and that next the bed is the firſt quarter, and ſo on. At the bed ſet off equally from the middle line the given diameter, which is 35 inches; and at the firſt quarter, 34 inches and one-quarter, or ſixty ſixty-ones of the given diameter; at the ſecond quarter, 32 inches and one-eighth, or eleven-twelfths; at the third quarter, 28 inches or four-fifths; at the outer end, 19 inches and a half, or five-ninths; and at the heel, 30 inches or ſix-ſevenths. It is then lined to theſe diameters with a fair curve, and ſawn ſquare, then eight-ſquared, next ſixteen-ſquared, and, laſtly, rounded from the heel to the ſquare at the outer end. At the heel is a tenon three-fifths the given diameter athwart-ſhips, and two-thirds up and down, tapering one inch in the length, which is one-third the given diameter.

The bowſprit-cap is made of elm, in length five diameters of the jib-boom, the breadth twice the diameter of the jib-boom, and half the diameter of the jack-ſtaff, and the thickneſs four-ninths the breadth. In the lower part of the cap is a mortiſe to fix on the tenon at the outer end of the bowſprit, and a hole at two-ſevenths the diameter of the bowſprit above it, for the jib-boom to ſlide through, leaving half the diameter of the jack-ſtaff on the ſtarboard ſide, where a groove is made to receive the ſame: bolts are then driven through the cap, as in the plate.

Bees are made of elm, about four inches thick, in breadth three-fifths of the given diameter of the bowſprit, and in length from the aft-ſide of the cap to the aft-part of the long ſquare. They are let in, one on each ſide, one-third their thickneſs, into the bowſprit; their upper ſides are kept fluſh with the upper ſide of the bowſprit, and the outer edges raiſed above the level three inches to every foot in breadth.

breadth, and are bolted through the bowfprit with four bolts. A block is fitted with a fheave-hole in each end, under each bee, as in the plate.

Saddles are pieces of elm faftened on the upper fide of the bowfprit: that for the jib-boom is half the given diameter in length, and one-fixth in thicknefs, fixed at one-third the length of the jib-boom within the outer end. Saddles for the fprit-fail-flings are one-eighth the given diameter in thicknefs, and nails on the bowfprit at one-fifth the length within the outer end. A faddle to lead in the running-rigging is fimilar to the latter, having holes the fize of the ropes bored through it, and nails on the bowfprit juft before the gammoning.

Bowfprits of fmall veffels have an iron hoop with an eye on each fide, and one on the upper fide; it is let on and faftened at the outer end. A fheave-hole is cut through at the heel, and one at the outer end.

The *Jib-boom* is prolonged from the bowfprit, has a ftraight line ftruck along the middle of its length, which is 50 feet 6 inches for a 74-gun fhip: one-third of that length is fet up from the butt, and at that place fet off 14 inches and a half, the given diameter; and from thence to the outward end divide into four equal parts, and at the firft quarter fet off 14 inches and one-eighth, or forty forty-ones of the given diameter; at the fecond quarter, 13 inches and one-quarter, or eleven-twelfths; at the third quarter, 12 inches and one-eighth, or five-fixths; and at the outer end, nine inches and three quarters, or two-thirds the given diameter. It is firft fquared to thofe diameters, then eight-fquared: then fet up from the heel three times and a half the given diameter, and from thence it is to be round to the outer end. Make a ftop at once and a half the diameter within the outer end, and cut a fheave-hole through from the upper fide half its length within the ftop, and another fheave-hole at once and a half the diameter from the heel, and through the middle of the ftarboard fquare, and a hole bored through between that and the heel, as in the plate.

Mafts of wrought-iron have lately been propofed thus: the cylinder to be half an inch thick, and the fame height and diameter as the fir maft, will not be fo heavy, will be confiderably ftronger, much more durable, lefs liable to be injured by fhot, and be eafily repaired even at fea. It will weigh only 12 tons, and, at 45*l.* *per* ton, will not coft more than 540*l.*; while its ftrength will be nearly 50 *per cent.* above that of a fir maft, that weighs 23 tons, and cofts nearly 1200*l.* This maft is made to ftrike nearly as low as the deck, to eafe the fhip in a heavy fea. Ships furnifhed with fir mafts are, in fuch circumftances, obliged to cut them away. Ships furnifhed with iron mafts will not, like others, be expofed to the rifk of receiving damage from lightning; the iron maft of itfelf being an excellent conductor. By ufing an iron bolt from the heel of the maft, through the keelfon and keel, the electric matter will be conducted through the bottom of the fhip into the water, without injury to the fhip. Bowfprits and yards may alfo be made of wrought-iron, at the fame proportion of ftrength and expence as the maft.

Mafts and yards, particularly the latter, by a patent of Mr. Smart's, were propofed to be made hollow, of wood fomewhat fimilar to the ftaves of a cafk.

Gordon, in his Naval Architecture, has recommended mafts to be made in a curious manner of feveral fmall trees to be united together by a fort of brackets at certain diftances. The former have been actually tried, but their not coming more into practice feems to make againft their utility.

Dimenfions of Mafts, Yards, &c. for the Plates of a 74-Gun Ship, Frigate of 40 Guns, and Eaft-India Ship of 1300 Tons. See SHIP-BUILDING.

Names of the Mafts and Yards, &c.	74-Gun Ship.				Frigate of 40 Guns.				Eaft-India Ship.

A Fractional

A Fractional Table of the Proportion that every Part of a Maſt, Yard, &c. bears towards the given Diameter, as in the preceding Table.

	Quarters. 1ſt.	2d.	3d.	Head. Low. part.	Upper part.	Heel.
Lower-maſts that are cheeked — fore and aft				$\frac{3}{4}$	$\frac{5}{6}$	
	$\frac{60}{61}$	$\frac{15}{16}$	$\frac{7}{8}$			$\frac{6}{7}$
Lower-maſts that are cheeked — athwart ſhips				$\frac{7}{8}$	$\frac{5}{8}$	
Lower-maſts that head themſelves	$\frac{60}{61}$	$\frac{14}{15}$	$\frac{5}{7}$	$\frac{3}{4}$	$\frac{5}{8}$	$\frac{5}{7}$
Top-maſts, gallant-maſts, and royal-maſts	$\frac{60}{61}$	$\frac{14}{15}$	$\frac{6}{7}$	$\frac{7}{10}$	$\frac{5}{9}$	
Bowſprit	$\frac{60}{61}$	$\frac{11}{12}$	$\frac{4}{5}$	$\frac{5}{9}$ outer end.		$\frac{6}{7}$
Heeling of lower-maſts	$\frac{2}{3}$ athwart ſhips.			$\frac{1}{2}$ fore and aft.		
Heeling of bowſprits	[illegible] athwart ſhips.			$\frac{2}{3}$ up and down.		
Yards in general, at the quarters	$\frac{30}{31}$	$\frac{7}{8}$	$\frac{7}{10}$	[illegible] arms.		
Mizen-yard — lower-arm ditto	$\frac{60}{61}$	$\frac{11}{12}$	$\frac{1}{2}$	$\frac{2}{3}$ arms.		
Mizen-yard — upper-arm ditto	$\frac{30}{31}$	$\frac{7}{8}$	$\frac{7}{10}$	$\frac{2}{3}$ arms.		
Gaffs	$\frac{40}{41}$	$\frac{11}{12}$	$\frac{4}{5}$		$\frac{5}{6}$ ends.	
Driver-booms and jib-booms	$\frac{40}{41}$	$\frac{11}{12}$	$\frac{5}{6}$		$\frac{2}{3}$ ends.	
Main-booms	$\frac{40}{41}$	$\frac{11}{12}$	$\frac{7}{8}$	$\frac{2}{3}$ fore and aft. $\frac{3}{4}$ do		$\frac{3}{4}$

By the above tables of lengths and diameters of maſts, yards, &c. may be eaſily aſcertained the relative lengths they bear to each other, and their diameter in inches to their reſpective yards in length.

The length of the main-maſt, in moſt ſhips, is governed by the length and breadth of the ſhip. Thus: let the length at the load-water line from the rabbit of the ſtern to the rabbit of the ſtern-poſt be added to the extreme breadth, and half that ſum is the length of the main-maſt. But for very ſharp-bodied ſhips take ſeventeen-twentieths of the above ſum for the length of the main-maſt. Then for the length of the fore-maſt take nine-tenths of the main-maſt, and in ſome ſhips full that. For the bow-ſprit take three-fifths of the main-maſt, and in ſome ſhips more, and ſo on of the others, as may be ſeen by inſpecting the table.

Mast, *Armed*, one that is made of more than one tree.

Mast *Carlings*, are large ſquare pieces of oak timber placed into the beams at the ſides of the maſt rooms, for the purpoſe of framing the partners.

Mast, *Heel of a*. See Heel.

Mast, *Jury*. See Jury.

Mast *Rooms*, the ſpaces between thoſe beams where the maſts are fixed.

Mast, *Spending a*, at *Sea*, is when it is broke by foul weather.

Mast, *Springing a*, is when it is cracked in any place.

Mast *Bay*, in *Geography*, a bay on the N. ſide of the iſland of Jamaica; E. of Montego bay and near Catlin's cliffs.

Mast *Iſland*, a ſmall iſland in the Indian ſea, near the coaſt of Africa. S. lat. 11° 28′.

Masts, in *Rural Economy*, a provincial term applied to acorns in ſome diſtricts, but improperly. It is ſometimes pronounced *meſs*.

MASTA, in *Geography*, a ſmall iſland in the Adriatic. N. lat. 44° 7′. E. long. 15° 23′.

MASTAI, a town of Japan, on the S. coaſt of Niphon; 10 miles S.W. of Meaco. N. lat. 34° 46′. E. long. 134° 30′.

MASTASA, a town of Fez; 40 miles W.N.W. of Velez de Gomera.

MASTASSIN Lake, a lake of North America, at the head of Rupert's river, which falls into James's bay; it is about 200 miles in circuit, and interſected by projections of land.

MASTED. A ſhip is ſaid to be maſted, when ſhe has all her maſts complete.

Masted, *Over*, or *Tautn-maſted*, is ſaid of a ſhip whoſe maſts are either too long or too big; which makes her lie too much down by the wind, and labour too much *a-hull*.

Masted, *Under*, or low-maſted ſhips, ſuch whoſe maſts are either too ſmall, or too ſhort; in which caſe ſhe cannot bear ſo great a ſail as ſhould give her true way.

MASTER, a title given to ſeveral officers and perſons of authority and command; particularly to the chiefs of the orders of knighthood, &c.

Thus we ſay, the grand-maſter of Malta; of St. Lazarus; of the Golden Fleece; of the Free Maſons, &c.

Master, *Magiſter*, was a title frequent among the Romans; they had their maſter of the people, *magiſter populi*, who was the dictator. Maſter of the cavalry, *magiſter equitum*, who held the ſecond poſt in an army, after the dictator. Under the later emperors there were alſo maſters of the infantry, *magiſtri peditum*. A maſter of the cenſus, *magiſter cenſus*, who had nothing of the charge of a cenſor, or ſubcenſor, as the names ſeem to intimate; but was the ſame with the *præpoſitus frumentariorum*.

Master *of the Militia*, *magiſter militiæ*, was an officer in the lower empire, created, as it is ſaid, by Diocleſian, who had the inſpection and government of all the forces, with power to puniſh, &c. ſomewhat like a conſtable of France.

At firſt there were two of theſe officers inſtituted, the one for the infantry, and the other for the cavalry; but the two were united into one under Conſtantine. Afterwards, as their power was increaſed, ſo was their number alſo; and there was one appointed for the court, another for Thrace, another for the Eaſt, and another for Illyria. They were afterwards called *comites*, *counts*, and *clariſſimi*. Their power was only a branch of that of the *præfectus prætorii*, who by that means became a civil officer.

Master *of Arms*, *magiſter armorum*, was an officer, or comptroller under the maſter of the militia.

Master *of the Offices*, *magiſter officiorum*, had the ſuperintendance of all the officers of the court; he was alſo called *magiſter officii palatini*; ſimply *magiſter*; and his poſt *magiſteria*.

This officer was the ſame in the weſtern empire, with the curopalates in the eaſtern.

Master, in the Roman hiſtory and laws, is uſed for every officer who is the chief of his kind; and has others of the ſame ſpecies, or that have the ſame functions, under him. In Latin, *magiſter*, and oftentimes *proximus*, or *primicerius*.

Master *of the Armory*, is an officer who has the care and overſight of his majeſty's arms and armory.

Master *at Arms*, is an officer appointed to teach the officers

officers and crew of a ship of war the exercise of small arms; to confine and plant centinels over the prisoners, and superintend whatever relates to them during their confinement. He is also to observe that the fire and lights are all extinguished as soon as the evening-gun is fired, except those which are permitted by proper authority, or under the inspection of the centinels. It is likewise his duty to attend the gangway, when any boats arrive aboard, and search them carefully, together with their rowers, that no spirituous liquor may be conveyed into the ship, unless by permission of the commanding officer. In these several duties he is assisted by proper attendants, called his corporals, who also relieve the centinels, and one another, at certain periods. Falconer.

Master *of Arts*, the first degree taken up in foreign universities, but the second in ours; candidates not being admitted to it till they have studied in the university seven years. See Degree.

Master-*Attendant*, is an officer in the royal dock-yards, appointed to hasten, and assist at, the fitting out or dismantling, removing, or securing vessels of war, &c. at the port where he resides. He is particularly to observe that his majesty's ships are securely moored, and for this purpose he is expected frequently to review the moorings, which are sunk in the harbour, and observe that they are kept in proper repair. It is also his duty to visit all the ships in ordinary, and see that they are frequently cleaned and kept in order; and to attend at the general musters in the dock-yards, taking care that all the officers, artificers, and labourers, registered at the navy-books, are present at their duty. Falconer.

Master, *Barrack*. See Barrack.

Master *of the Ceremonies*, an officer instituted by king James I. for the more solemn and honourable reception of ambassadors, and strangers of quality, whom he introduces into the presence.

The badge of this office is a gold chain and medal, having on one side an emblem of peace, with king James's motto; and on the reverse the emblem of war, with *Dieu & mon droit*. He is always supposed to be a person of good address, and master of languages, and has an appointment of 300*l*. a-year: he is constantly attending at court, and hath under him an assistant master or deputy, at 6*s*. 8*d*. a day; who holds his place during the king's pleasure.

There is also a third officer, called *marshal of the ceremonies*, with 100*l*. a-year, whose business is to receive and distribute the master's orders, or the deputy's, for the service: but, without their order, he can do nothing. This is the king's gift.

Masters *of Chancery* are usually chosen out of the barristers of the common law; and sit in chancery, or at the rolls, as assistants to the lord chancellor, and master of the rolls. All these, so late as the reign of queen Elizabeth, were commonly doctors of the civil law.

To them are also committed interlocutory reports, examination of bills in chancery, stating of accounts, taxing costs, &c. and sometimes, by way of reference, they are empowered to make a final determination of causes.

They have, time out of mind, had the honour to sit in the lords' house, though they have neither writs, nor patent to empower them; but they are received as assistants to the lord chancellor, and master of the rolls. They had anciently the care of inspecting all writs of summons, which is now performed by the clerk of the petty-bag. When any message is sent from the lords to the commons, it is carried by the masters of chancery. Before them also affidavits are made, and deeds and recognizances acknowledged. See Chancellor and Court *of Chancery*.

Besides these, who may be called masters of chancery *ordinary* (being twelve in number, whereof the master of the rolls is reputed the chief), there are also masters of chancery *extraordinary*, appointed to act in the several counties of England beyond ten miles distance from London, by taking affidavits, recognizances, &c. for the ease of the suitors of the court.

Master *of the Faculties*, an officer under the archbishop of Canterbury, who grants licenses and dispensations: he is mentioned in the statute 22 & 23 Car. II. See Court *of Faculties*.

Master-*Gunner of England*. See Gunner.

Master *of the Horse*, a great officer of the crown, to whom is committed the charge of ordering and disposing all matters relating to the king's stables, races, and breed of horses, with a salary of 1266*l*. 13*s*. 4*d*. a-year.

He hath a power of commanding the equerries, and all the other officers and tradesmen employed in the king's stables; to all which he gives by his warrant to the avenor, the oath of allegiance, &c. for the faithful discharge of their duty. He has the peculiar privilege of making use of any horses, pages, or footmen, belonging to the king's stables; so that his coaches, horses, and attendants are the king's, and have the king's arms and liveries.

There is also a master of the horse in the establishment of her majesty's houshold, with a salary of 800*l*. a-year.

Master *of the Houshold* is an officer under the lord steward of the houshold, in the king's gift; his business is to survey the accounts of the houshold. His salary is 500*l*. a-year.

Anciently the lord steward himself was called *grand-master of the houshold*.

Master *of the Jewel Office*, is an officer of the king's houshold, who has the charge of the gold and silver plate used at the king's table, or at that of any officer attending the court, and of all plate remaining in the Tower of London; as also of chains and loose jewels not fixed to any garment. See Jewel-*Office*.

Master *of the Mint*, was anciently the title of him who is now called *warden of the mint*; whose office is to receive the silver and bullion which comes to the mint to be coined, and to take care thereof.

The office of master and worker is now distinct; and this officer is allowed for himself 3000*l*. a-year, and for three clerks 205*l*. each. There is also the king's assay-master, allowed for himself and clerk 425*l*. a-year: and the master's assay-master, with a salary for himself and foreman of 125*l*. a-year.

Master *of the Ordnance*. See Ordnance.

Master *of the Revels*, an officer with an appointment of 100*l*. a-year, whose business is to order all things relating to the performance of plays, masques, balls, &c. at court. Formerly he had also a jurisdiction of granting licences to all who travel to act plays, puppet-shows, or the like diversions; neither could any new play be acted at either of the two houses till they had passed his perusal and licence; but these powers were afterwards much abridged, not to say annihilated, by a statute for regulating playhouses, till the licensing plays by the lord chamberlain was established. This officer was a yeoman, with 46*l*. 11*s*. 8*d*. *per annum*.

Master *of the Robes*. See Robes.

Master *of the Rolls*, a patent officer for life; who has the custody of the rolls and patents which pass the great seal; and of the records of the chancery.

In the absence of the lord chancellor, or keeper, he also sits as judge in the court of chancery; and is, by sir Edward Coke, called *his assistant*.

At other times he hears causes in the rolls-chapel, and makes orders and decrees. He is also the first of the masters of of chancery, and hath their affiftance at the rolls: but all hearings before him are appealable to the lord chancellor.

He hath alfo his writ of fummons to parliament, and fits next to the lord chief juftice of England, on the fecond wool-pack: he hath the keeping of the parliament-rolls, and has the rolls-houfe for his habitation; as alfo the cuftody of all charters, patents, commiffions, deeds, and recognizances, which being made of rolls of parchment, gave rife to the name. Anciently he was called *clerk of the rolls*.

Concerning the authority of the mafter of the rolls to hear and determine caufes, and his general power in the court of chancery, there were (not many years fince) divers queftions and difputes very warmly agitated; to quiet which, it was declared by ftat. 3 Geo. II. cap. 30. that all orders and decrees by him made, except fuch as by the courfe of the court were appropriated to the great feal alone, fhould be deemed to be valid; fubject neverthelefs to be difcharged or altered by the lord chancellor, and fo as they fhall not be inrolled, till the fame are figned by his lordfhip. Blackft. Com. vol. iii.

In his gift are the fix clerks in chancery, the examiners, three clerks of the petty-bag, and the fix clerks of the rolls-chapel, where the rolls are kept. See ROLLS, CLERK, &c.

MASTER *of a Ship*, an officer to whom is committed the direction of a merchant veffel, who commands it in chief, and is charged with the merchandizes abroad.

In the Mediterranean the mafter is frequently called *patron*, and in long voyages *captain*.

It is the proprietor of the veffel that appoints the mafter, and it is the mafter who provides the equipage, hires the pilots, failors, &c. The mafter is obliged to keep a regifter of the feamen and officers, the terms of their contract, the receipts and payments, and, in general, of every thing relating to his commiffion.

MASTER *of a Ship of War*, is an officer appointed by the commiffioners of the navy, to take charge of navigating a fhip from port to port, under the direction of the captain. The management and difpofition of the fails, the working of a fhip into her ftation in the order of battle, and the direction of her movements in the time of action, and in other circumftances of danger, are alfo more particularly under his infpection. It is likewife his duty to examine the provifions, and accordingly to admit none into the fhip but fuch as are found fweet, and wholefome. He is moreover charged with the ftowage; and for the performance of thefe fervices, he is allowed feveral affiftants, who are properly termed *mates* and *quarter-mafters*.

MASTER *of the Temple*. The founder of the order of the Templars, and all his fucceffors, were called *magni templi magiftri;* and ever fince the diffolution of the order, the fpiritual guide and director of the houfe is called by that name. See TEMPLE and TEMPLAR.

MASTER *or Keeper of the Wardrobe*, an officer in the lord chamberlain's department, who has the direction of all the royal robes, as thofe of the coronation, St. George's feaft, and the parliament-robes; as well as of the wearing apparel, collar of SS's, George and Garter, &c.

He has alfo the charge and cuftody of all former kings' and queens' robes, remaining in the Tower; all hangings, bedding, &c. for the king's houfe; and the charge and delivery of velvet and fcarlet allowed for liveries.

He has under him a groom and two clerks, a yeoman, &c. See WARDROBE.

There are alfo feveral other officers under this denomination, as the mafter and conductor of the band of mufic, whofe falary is 300*l.* a-year; mafter of mechanics, with a falary of 200*l.* a-year; mafter of the tennis-court, with a falary of 132*l.* a-year; mafter of the barges, with 100*l.* a-year; mafter of the harriers, with 2000*l.* a-year; mafter of the buck-hounds, with 2341*l.* a-year; mafter of the ftag-hounds, with 2000*l.* a-year; mafter-falconer, with 210*l.* a-year, &c.

MASTER, *Burgher*. See BURGHER.

MASTERS, *Burgher*. See BURGHERMASTERS.

MASTER, *Fire*. See FIRE.

MASTER, *Quarter*. See QUARTER.

MASTER-*arch*. See ARCH.

MASTER *Load*, in *Mining*, a term ufed to exprefs the larger vein of a metal, in places where there are feveral veins in the fame hill. See LODE.

MASTER-*piece*, an exquifite, or extraordinary work, or performance, in any art or fcience.

MASTER-*piece*, *chef d'œuvre*, is particularly ufed among the French, for a work which thofe who afpire to be admitted mafter of any art or trade, are to perform in prefence of the mafters, or jurands, of that company, by way of a fpecimen of their capacity.

MASTER-*vault*. See VAULT.

MASTER-*wort*, in *Botany*. See IMPERATORIA.

MASTER-*wort*, *Black*. See ASTRANTIA.

MASTER-*yaw*, a large yaw, fometimes remaining after falivation. See YAWS.

MASTICA *de Sobo*, in the *Materia Medica*, the name given by the Indians to the ftone commonly known among authors by the name of *pedro del porco*, a fort of bezoar taken out of the gall-bladder of an Indian boar. The Indians, and many of the European nations, efteem this one of the greateft medicines in the world in peftilential difeafes, and the fmall-pox.

MASTICATION, in *Phyfiology*, is the operation of chewing, in which, by the motion of the jaws and teeth, the food is brought into a ftate in which it can be fwallowed. The action of the teeth comminutes the harder kinds of food, and the fluids, poured into the mouth from the falivary glands, by their admixture, foften the food thus comminuted. This procefs, and the inftruments concerned in its performance, are defcribed in the article DEGLUTITION.

MASTICATORIES, MASTICATORIA, in *Medicine*, are fuch remedies as are taken in at the mouth, and chewed in order to promote the evacuation of the falival humour: as tobacco, ginger, pepper, fage, rofemary, thyme, maftich, &c.

MASTICH. See *Calcareous* CEMENT.

MASTICH-*Tree*, *Turpentine-tree*, or *Piftachia-nut-tree*, in *Botany*. See PISTACHIA *Lentifcus*.

MASTICH, in the *Materia Medica*, a refinous fubftance that is obtained from the Piftachia lentifcus, which is a native of the fouth of Europe and the Levant, and which appears by Evelyn's Kalendarium Hortenfe to have been cultivated in Britain in 1666. It is obtained, moft abundantly, according to Tournefort, by making tranfverfe incifions in the bark of the tree about the beginning of Auguft, from which the maftich refin, or gum, exudes in drops, which running down and concreting on the ground, are thence collected for ufe. The time chofen for making thefe incifions is the firft of Auguft, when the weather is very dry: in the following day the maftich begins to appear in drops, which continue to exude till the latter end of September. The tree is raifed alfo in feveral parts of Europe; but no refin has been obferved to iffue from it in thefe climates. It has its name maftich, from *mafticare, to chew*, becaufe it is thus ufed in Scio, and by the Turks, efpecially the women, for fweetening the breath, and ftrengthening the gums and teeth: and by producing a copious excretion

cretion of faliva, it proves ferviceable in catarrhous diforders.

According to Olivier, (Travels in the Ottoman Empire,) maftich is gathered in 21 villages of the ifland of Scio; and the incifions, he fays, are made from the 15th to the 20th of July, according to the Greek calendar. Cloths are frequently placed under the tree, fo that the maftich which trickles from it may not be impregnated with earth and filth. By the regulations made in the ifland, the firft gathering cannot take place before the 27th of Auguft. It lafts eight fucceffive days, after which frefh incifions are made in the trees till the 25th of September, and then the fecond gathering is made, which likewife lafts eight days. After this time the trees are cut no more, but the maftich which continues to run is gathered till the 19th of November on the Monday and Tuefday of every week. It is afterwards forbidden to gather this production. This production in the 21 villages of Scio, amounts, one year with another, to 50,000 okes, and even more. Twenty-one thoufand belong to the aga who farms this commodity, and are delivered by the cultivators in payment of their perfonal impoft. They are paid for the furplus at the rate of 50 parats per oke (nearly 16 fous the pound), and they are prohibited, under very fevere penalties, from felling or difpofing of it to any other than the aga who farms it. That of the beft and fineft quality is fent to Conftantinople, for the palace of the grand fignior. That of the fecond quality is intended for Cairo, and paffes into the harems of the Mamalukes. The merchants generally obtain a mixture of the fecond and third quality.

This refinous fubftance is brought to us in fmall yellowifh tranfparent brittle grains or tears. A piece recently broken is quite tranfparent, but by expofure to the air it becomes fuperficially fomewhat pulverulent, and hence femitranfparent. Its fpecific gravity is 1.074. By digeftion with alcohol it is feparated into two portions; the one foluble in this fluid, and the other infoluble: the former compofes about $\frac{4}{5}$ths of the whole, and is pure refin; the latter in moft of its properties clofely refembles caoutchouc. The prefence of this fubftance in maftich was firft remarked by Kunde, an apothecary of Berlin, whofe obfervations have fince been confirmed by Mr. Matthews. After folution of the refin in alcohol an inflammable refidue is left behind of a white colour, confiderably elaftic and adhefive; when heated it becomes brown, emitting an inflammable gas, and in this ftate greatly refembles common caoutchouc, except in being flightly glutinous. It is perfectly foluble in wafhed fulphuric ether, from which it is precipitable by alcohol in the form of a white curd. It is wholly infoluble in water. By digeftion with nitric acid it is converted into a yellow brittle porous mafs, nitrous gas being at the fame time given out; it is charred by fulphuric acid, to which it communicates a deep (fomewhat muddy) crimfon colour, with the evolution of fulphureous acid. Neither the muriatic nor oxymuriatic acids, nor the alkalies, whether cauftic or carbonated, have any action on it: in all which particulars it agrees with caoutchouc.

It has a light agreeable fmell, efpecially when rubbed or heated. It is almoft totally foluble in fpirit of wine, yielding a folution of a pale yellow colour, but not at all in water. Diftilled with water, it yields a fmall proportion of a limpid effential oil, in fmell very fragrant, and in tafte moderately pungent. Rectified fpirit alfo brings over in diftillation the more volatile odorous matter of the maftich. It becomes foft and tough like wax, by being chewed. Maftich is recommended in dofes from half a fcruple to half a drachm, as a mild corroborant and aftringent, in old coughs, hæmoptyfes, diarrhœas, weaknefs of the ftomach, &c. It is given either in fubftance, divided by other materials; or diffolved in fpirit and mixed with fyrups; or diffolved in water into an emulfion, by the intervention of gum arabic or almonds. It is alfo an ingredient in varnifhes. See Varnish.

The jewellers mix maftich with turpentine and ivory-black, and lay it under their diamonds, to give them a luftre.

The Lentifci lignum, or wood of this tree, is received into the Materia Medica of fome of the foreign pharmacopeias, and is highly extolled in dyfpeptic, gouty, hæmorrhagic, and dyfenteric affections. Lewis. Woodville.

The Arabian writers, Avicenna and Serapion, in their chapters of the turpentine-tree, often mention the lentifk and its refin, which they fay was very much like the refin of the common turpentine-tree. But befides this, Avicenna has a peculiar chapter on maftich; whence it fhould feem, that by the name lentifk they do not mean the tree which produces maftich, but fome peculiar fpecies of the turpentine-tree.

Avicenna diftinguifhes two kinds of maftich, the one called *rumi*, and the other *cupti*: the *rumi* came from the ifland of Scio, and was white; the *cupti* was of a blackifh colour, and brought from Egypt.

Mastich *Herb*, *mafter-thyme*, *marum vulgare*, in *Botany*, a name given to one of the fpecies of *Thymus*; which fee.

It is a plant that grows naturally in Spain, in dry gravelly grounds, and in the like foils bears the ordinary winters of our climate. It flowers in June, and its flowers are fmall, white, and ftanding in hairy briftly empalements: the whole plant has a grateful odour.

This plant is employed chiefly, like the Syrian maftich, as an errhine. It is confiderably pungent, though lefs fo than the other.

Mastich, *Indian*. See Schinus.

A decoction of the bark of this tree makes a fomentation of extraordinary efficacy in pains of the legs, and inflations. Of the fmall branches are made ferviceable toothpicks. Of the fruit boiled in water, according to the meafure of the decoction, they prepare either a wine, a very good fort of drink, vinegar, or honey. A decoction of the leaves gives relief in pains proceeding from cold caufes. Raii Hift. Plant.

Mastich, *Syrian herb*, *marum Syriacum*, is a fpecies of *Teucrium*; which fee.

Mastich, *Syrian herb*, in the *Materia Medica*. See Germander.

MASTICHE Terra, *maftich earth*, a name given by fome of the old writers on the materia medica to the Chio or Scio earth, or *terra Chia*. The reafon of this ftrange appellation feems to have been, that the fineft maftich coming from the ifland of Chio, had obtained the name of *Kio*, or *Chio*, and *maftich* and *Chia* being thus become, in one fenfe, fynonimous words, the ufe of them was, in this manner, carried much farther, and the earth of that ifland called by the name of the *gum*.

The Arabians feem to explain this very well, in their name of this earth; they not calling it *maftich earth*, but *thin beled almaftichi*, that is, *terra regionis maftichis*, the earth of the country where maftich is produced.

MASTICOT, Massicot, or *Yellow Lead*, is the yellow oxyd of lead. (See Lead.) It is fometimes ufed by painters, and it ferves medicinally as a drier in the compofition of ointments or plafters.

The mafticot which is ufed by the Dutch as the ground of their glazing, is prepared by calcining a mixture of one hundred weight of clean fand, forty-four pounds of foda,

fold

fold with us under the name of barilla, and thirty pounds of pearl-afhes.

MASTIFF-Dog, or *Band-dog*, *villaticus*, or *catenarius*, is a fpecies of great fize and ftrength, and a very loud barker. Maowood fays, that it derives its name from *mafe thefefe*, being fuppofed to frighten away robbers by its tremendous voice. Great Britain was formerly fo noted for its maftiffs, that the Roman emperors appointed an officer in this ifland with the title of *Procurator Cynegii*, whofe fole bufinefs was to breed and tranfmit from hence to the amphitheatre, fuch as would prove equal to the combats of the place. Strabo, lib. iv. tells us, that the maftiffs of Britain were trained for war, and ufed by the Gauls in their battles. See Dog.

MASTIGADOUR, or Slabbering-bit, in the *Manege*, is a fnaffle of iron, all fmooth, and of a piece, guarded with pater nofters, and compofed of three halves of great rings, made into demi-ovals of unequal bignefs, the leffer being inclofed within the greateft, which ought to be about half a foot high. A maftigadour is mounted with a head-ftall and two reins. A horfe by champing upon the maftigadour, keeps his mouth frefh and moift.

To put a horfe to the maftigadour, is to fet his croup to the manger, and his head between two pillars in the ftable. Horfes that ufe to hang out their tongues cannot do it when the maftigadour is on; for that keeps their tongue fo much in fubjection, that they cannot put it out.

MASTIGON, in *Geography*, a river of North America, which runs weftward into lake Michigan, about 11 miles N. of La Grande Rivière. At its mouth it is 150 yards wide.

MASTIGOPHORI, Μαστιγοφοροι, among the Greeks, certain officers appointed to preferve the peace, and correct fuch as were diforderly at the Olympic games.

MASTIH, in *Geography*, a town of Perfia, in the province of Kerman; 140 miles E.N.E. of Sirgian. N. lat. 29° 16'. E. long 59 40'.

MASTOIDES, Mastoideus, *Maftoid*, in *Anatomy*, epithets applied to a certain procefs of the temporal bone, and to parts fituated near, or connected with, it. In old writers, the bone altogether is fometimes called os maftoides. The large nipple-like procefs of the bone, behind the ear, is always diftinguifhed by that name; and the portion of the bone including it is called the maftoid portion. (See Cranium.) The cells by which it is excavated, are the maftoid cells. Maftoideus is the name given by Albinus and others to part of the mufcle defcribed in this work under the article Sterno-cleido-mastoideus.

MASTRE, La, in *Geography*, a town of France, in the department of the Ardeche, and chief place of a canton, in the diftrict of Tournon; 15 miles N. of Privas. The place contains 2090, and the canton 11,873 inhabitants, on a territory of 170 kiliometres, in nine communes.

MASTURA, a town of Arabia Petræa, on the borders of the Red fea; 92 miles S.W. of Medina. N. lat. 23° 5'.

MASVAUX, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diftrict of Befort; nine miles N. of Befort. The place contains 2181, and the canton 9404 inhabitants, on a territory of 192½ kiliometres, in 18 communes.

MASUCO, or Masacon, a town of Portugal, in the province of Tras los Montes; 27 miles S.S.W. of Miranda de Duero.

MASULA, a town of Perfia, in the province of Ghilan; 40 miles N.N.W. of Aftara.

MASULIPATAM, a city and fea-port of Hindooftan, in the circar of Condapilly, near the mouth of the Kiftna river, within the diftrict named "Mefolia" by Ptolemy. This is a place of confiderable trade for chintzes and printed linens. The air is deemed unwholefome; 65 miles S.S.W. of Rajamundry. N. lat. 16° 8' 30". E. long. 81° 12'.

MASURIEH, a town of the Arabian Irak, on the Euphrates; 50 miles W. of Korna.

MASZOW, a town of Hungary; fix miles W. of Rofenburg.

MAT, in *Agriculture*, a fort of covering material, prepared by weaving bafs or other fubftances of the fame fort together. They are moftly brought into this country with different forts of packages. Mats about Sandwich and Dover are ftated by Mr. Young to be made ufe of for covering the fhocks of wheat; by which practice, Mr. Boys affures him, the fample of wheat is improved, fo as that the Dover bakers give a decided preference to it. The mats coft about feven-pence each. They are too expenfive for general ufe.

Mat, *Garden*, a kind of coarfe mat or covering formed of bafs, which is much ufed in gardening, for fheltering various forts of plants in winter and fpring, in frofty and other cold weather; and in fummer for fhading many forts of young or tender kinds occafionally from the fun; and many other purpofes in the different garden departments. They are found to differ greatly in regard to fize and fubftance, there being fmall, middling, and large fizes; but for general ufe, thofe called Ruffia mats are fuperior, both in dimenfions, fubftance, and durability. It may alfo be proper to have fome of the fmaller or middling fizes for particular occafions, and fmall gardens, in which, for fome purpofes, they may be more convenient than large ones. They were formerly fold by moft of the principal nurfery and feedfmen, at from about fix or eight to twelve or fifteen fhillings the dozen, according to fize and ftrength, but for fome years paft the prices have been much higher.

Thefe mats are alfo of effential ufe in all hot-bed works, for covering or fpreading over the lights or glaffes of the frames in the nights, in winter and fpring, to exclude the external night cold; alfo occafionally in the day time in very fevere weather, and heavy falls of fnow or rain. And likewife for occafionally covering feveral forts of fmall young efculent plants in the full ground in beds and borders, in thefe feafons; as young lettuces, cauliflowers, fmall fallad herbs, early radifhes, &c. in the open beds, and under frames and hand-glaffes, to defend them from cutting frofts, fnow, and other inclement weather; and fometimes in raifing, tranfplanting, or pricking out fmall or moderate portions of particular forts of plants, both of the hardy and tender kinds, whether of the efculent or annual flowery kinds in the fpring, on beds or borders of natural earth, or in hot-beds, without frames, by being arched over with hoops or rods. They are likewife extremely ufeful in the fpring and fummer, in hot, dry, funny weather, in fhading feveral forts both in feed-beds before and after the young plants are come up, and in beds of pricked-out fmall young plants, to fhade them from the fun till they take frefh root; as alfo for fhading the glaffes of hot-beds occafionally, when the fun is too powerful for particular forts of plants in the heat of the day, as in cucumbers, melons, and various other kinds.

For kitchen and other garden diftricts furnifhed with wall-trees, they are of great ufe in fpring to cover the trees of particular forts when in bloffom, and when the young fruit is fetting and advancing in its early growth after the decay and fall of the bloom; by which affiftance, in cold winters and fprings, when fharp frofts fometimes prevail, a tolerable good crop is often faved, while in trees fully expofed, the whole is cut off by the feverity of the weather.

In the flower garden and pleafure-ground, they are alfo found useful on different occasions; in the former, in sheltering beds of curious sorts of choice flower-plants, both in their advancing growth, and to protect them from cold in winter and spring; and when in full bloom, to shade and screen the flowers from the sun and rain, to preserve their beauty more effectually, and to continue them longer in blow of a fine lively appearance: as well as to cover beds, &c. in raising various tender annual plants from seed in the spring; and in the latter occasionally in winter to defend some kinds of curious tender evergreens, &c. such as some of the magnolias, broad-leaved myrtle, olive, tea tree, &c. when standing detached and trained against walls, and other places.

And besides in nurseries, they are of considerable utility in the propagation and culture of numerous sorts of tender curious exotics, in defending them from cold, and shading from scorching sun, while they are in their minor growth, &c. They are necessary also for matting round bundles or baskets of tender or curious plants, when conveyed to a distance.

They are also occasionally of great use in severe winters on such glass works as green-houses, hot-houses, forcing-frames, &c. in covering the glasses externally in the nights, and occasionally in the day time.

In using them, when the ends are open or loose, they should be secured by tying the end-threads or strings of the bass close and firm, otherwise they soon ravel out loose in that part, and are spoiled. Where made use of in the work of covering and shading, &c. they should generally in uncovering, if rendered wet by rain or snow, be spread across some rail, hedge, or fence, &c. to dry, before folding them together, that they may be preserved from rotting, otherwise they will not last long.

These mats should never have any bass drawn out of them for tying up plants with, as is too commonly the practice, as by that means they soon become spoiled.

Mat-*grass*, a term applied to a particular sort of thick close grass.

Mat-*weed*, in *Botany*. See Lyceum.

Mat, in *Sea Language*. See Matts.

MATA, La, in *Geography*, a sea-port town of Spain, in the province of Valencia; 22 miles S.S.W. of Alicant.

Mata, a lake of Spain, in the province of Valencia, near the sea-side; which naturally produces an immense quantity of salt, that is the property of the king. The exports have amounted in some years to 100,000 tons weight, chiefly for Holland and the Baltic, as well as for Newfoundland and New England, in order to cure fish.—Also, a river of Africa, which crosses the country of Sabia, and runs into the East India sea, S. lat. 19° 30′.

MATABOON, a small island in the Sooloo Archipelago. N. lat. 5° 2′. E. long. 120° 11′.

MATACA, a bay on the N. coast of the island of Cuba; 36 miles from the Havanna.

MATAFUNDA, in *Antiquity*, a machine for throwing stones, probably by means of a sling. Some derive its name from the words *fund* and *mactare*, sometimes written *matare*, *i.e.* a murdering sling.

MATAGARA, in *Geography*, a town of Africa, in Sugulmessa.

MATAGOLA, a small island in the Pacific ocean, near the coast of Chili. S. lat. 31°.

MATAGUA, a town of the island of Cuba; 92 miles S.E. of Havanna.

MATAIA, a province of South America, towards the river Amazon, between the mouths of Madeira and Tapaise rivers.

MATAJA, a river of Peru, which runs into the Pacific ocean, N. lat. 1° 20′.

MATAIBA, in *Botany*, Aubl. Guian. t. 128. Juss. 249. See Epihielis.

MATAICHI, in *Geography*, a town of New Mexico, in the province of Mayo; 150 miles E.N.E. of Santa Cruz.

MATALA, a town of the island of Candy, anciently called "Metalia," or "Metallum," on the S. coast: which was one of the harbours of Gortynia; 30 miles S. of Candy. N. lat. 34° 36′. E. long. 24° 10′.

MATALI, in *Hindoo Mythology*, is the name given to the person who drives Iravat, the elephant of Indra, and is usually called his charioteer; but we do not recollect any other vehicle usually allotted to Indra than Iravati; see those articles.

MATALOE, in *Geography*, a small island in the Indian sea, near the coast of Africa. S. lat. 11° 40′.

MATALONA, a town of Naples, in Lavora; 13 miles N.N.E. of Naples.

MATAMAN, or Cimbeba, a large country of Africa, near the Atlantic, S. of Benguela, extending from S. lat. 16° to 24°, and from E. long. 13° to 18°.

MATAMBA, an extensive country in the interior part of Africa, bounded on the N. by Congo, on the E. by an unknown country, on the S. by Malamba and Benguela, and on the W. by Angola; about 150 miles from N.W. to S.E., and about the same from N.E. to S.W.: it is divided into five provinces, *viz.* Upper and Lower Umbé, Upper and Little Ganghelli, and Bondo. The capital is St. Maria de Matamba.

MATAMBO, a town of Peru, in the district of Abança; 12 miles N.W. of Cuzco.

MATAN, a town of the island of Borneo, near the W. coast, a little S. of the equinoctial line.—Also, a small island among the Philippines, near the port of Sibu, where the celebrated Magellan was killed in 1521, in an engagement with the natives.

MATANA, a town of Hindoostan, in Oude; 10 miles N.W. of Kairabad.

MATANCHEL, a sea-port on the W. coast of New Mexico, about 20 leagues to the N.E. of the rocks of Ponteque, over which may be seen, in clear weather, a very high hill, with a break on the top, called the hill of Xalisco, eight or nine leagues from the port.

MATANE, Great and Little, rivers in Lower Canada, which fall from the S. into the St. Lawrence near its mouth. The mouth of the Matane rivers is capable of admitting vessels of 200 tons burthen; and the coast near them for 20 leagues abounds in fine cod, fit for exportation. Great numbers of whales have also been seen floating on the water, which might prove a valuable fishery.

MATANZAS Bay, a bay on the N. coast of Cuba. N. lat. 23° 15′. W. long. 81° 2′.

MATAPE', a town of New Mexico, in the province of Sonora: 45 miles S.E. of Pitquin.

MATARAM, a town of the island of Java, and capital of a kingdom on the S. side, near the centre of the island. S. lat. 8° 20′. E. long. 110°. See Java.

MATAREA, or Mataria, a town of Egypt, on the scite of the ancient On, or Heliopolis, celebrated for its excellent water, and famous for a bloody battle fought between the French and the Turks, March 20, 1800, in which the Turks had 8000 men killed and wounded, besides those who perished in the desert; five miles N.E. of Cairo.

MATARIEH, a cluster of small islands in lake Menzaleh.

MATARO, an ancient town of Spain, in the province of of Catalonia; it exifted under the Romans, more within land on a fpot where veftiges of its buildings are ftill found, and was rebuilt by the Moors on its prefent fcite. It is fuppofed to be the ancient Illuro of Ptolemy and Mela. Under the Moors it took its prefent name. It is pleafantly fituated on the fea-fide, at the extremity of a fmall fertile plain, which terminates at the foot of a chain of woody mountains. The old town, built on an eminence, retains its inclofure, its walls, and its gates. Its ftreets are narrow, but the largeft, called "La Riera," which runs through the middle, is broad, ftraight, tolerably well built, and watered by a fmall ftream, with a row of trees by the fide of it. The new town, probably a fauxbourg to the preceding, is much larger, more open, and better conftructed. It has been lately built, and runs towards the eaft as far as the fea-fide: the ftreets are broad, long, and ftraight; the houfes are moftly ornamented with paintings in frefco. It is daily increafing in extent: the furrounding country is fertile and well cultivated, and the town has many fountains of excellent water. Mataro is become a confiderable town by its induftry and commerce; its population, which, about the year 1770, was from 4 to 5000 perfons, is now upwards of 25,000. It has a parifh-church, three convents of monks, two of nuns, and an hofpital. The adminiftration confifts of a military and civil governor, an alcade-major, a port-captain, a minifter, an auditor of the navy, and a garrifon of two fquadrons of cavalry. In the town are four manufactories of printed calicoes, two of calico, feven of lace, 17 of blonds, two of foap, 52 looms for filk-ftockings, 116 for cotton-ftockings, 48 for filk ftuffs and velvets, 89 for ribbons and filk galloons, fix diftilleries for brandy, five manufactories of fail-cloth, eight tan-yards, and 18 manufactories of filk twifts, which yearly make, on an average, about 20,000 pounds weight; 17 miles N.E. of Barcelona. N. lat. 41° 33′. E. long. 2° 19′.

MATATANA, a river of Africa, which runs into the India fea, S. lat. 22° 20′.

MATATANES, a town on the E. coaft of Madagafcar. S. lat. 22° 20′. E. long. 48°.

MATAVAI Bay, or *Port Royal Bay,* a bay near the N. part of the ifland of Otaheite, but opens to the N.W. and in the South Pacific ocean. The infide of the bay has good anchorage. S. lat. 17° 30′. W. long. 149° 13′.

MATAVAI *Point*, a cape of the ifland of Otaheite. S. lat. 17° 29′. E. long. 210° 22′.

MATCH, from the Saxon *maca*, a *companion*, becaufe, fays Johnfon, the match is companion to the gun; a kind of rope, flightly twifted, and prepared to retain fire, for the ufes of artillery, mines, fireworks, &c.

It is made of hempen tow, fpun on the wheel like cord, but very flack; and it is compofed of three twifts, which are afterwards again covered with tow, fo that the twifts do not appear; laftly, it is boiled in lees of old wines; whence its colour. This, when once lighted at the end, burns on gradually and regularly, without ever going out, till the whole is confumed.

It is neceffary, fays Walhuyfen (L'Art Militaire pour l'Infanterie, &c. p. 136, printed in 1653), that every mufketeer knows how to carry his match dry, in moift and rainy weather, that is, in his pocket; or in his hat, by putting the lighted match between his head and hat; or by fome other means to guard it from the weather. The mufketeer fhould alfo have a little tin-tube about a foot long, *viz.* enough to admit a match, and pierced full of little holes, that he may not be difcovered by his match, when he ftands centinel, or goes on any expedition. This was the origin of the match-boxes, worn, till of late, by our grenadiers.

Since fufees have been introduced in lieu of match-lock mufkets, the confumption of matches has been much lefs confiderable than before. See MUSKET.

MATCHADOSH BAY, in *Geography*, a bay on the E. coaft of lake Huron. N. lat. 44° 48′. W. long. 80° 10′.

MATCHAPUNGO, a fmall ifland near the coaft of Virginia. N. lat. 37° 28′. W. long. 75° 44′.

MATCHE, a fmall ifland near the coaft of China. N. lat. 26° 30′. E. long. 119° 54′.

MATCHGONG, a town of Bengal; 25 miles N. of Burdwan.

MATCHING, in the *Wine Trade*, the preparing veffels to preferve wines and other liquors, without their growing four or vapid. See WINE.

The method of doing it is this: melt brimftone in an iron ladle, and, when thoroughly melted, dip into it flips of coarfe linen cloth, take thefe out, and let them cool. This is what the wine-coopers call *match*. Take one of thefe matches, fet one end of it on fire, and put it into the bung-hole of a cafk; ftop it loofely, and thus fuffer the match to burn nearly out; then drive in the bung tight and fet the cafk afide for an hour or two. At the end of this time examine the cafk, and you will find that the fulphur has communicated a violently pungent and fuffocating fcent to the cafk, with a confiderable degree of acidity, which is the gas, and acid fpirit of the fulphur. The cafk may, after this, be filled with a fmall wine, which has fcarcely done its fermentation, and bunging it down tight, it will be kept good, and will foon clarify. This is a common and a very ufeful method; for poor wines would fcarcely be kept potable, even a few months, without it. Nor could ftums be prepared in large quantities without this help. Shaw's Lectures, p. 191.

MATCHOU, in *Geography*, a mountain of Thibet. N. lat. 31° 40′. E. long. 86° 29′.

MATCHTYGONG, a town of Hindooftan; 37 miles N.W. of Benares.

MATCUS, ST., a town of Brazil, in the government of Minas Geraes; 40 miles N.N.E. of Villa Rica.

MATE *of a Merchant Ship*, is an officer who commands in the abfence of the mafter, and fhares the duty with him at fea; being charged with every thing that regards the intended management of the fhip, the direction of her courfe, and the government of her crew.

MATE *of a Ship of War*, is an officer under the direction of the mafter, by whofe choice he is generally appointed, to affift him in the feveral branches of his duty.

Accordingly, he is to be particularly attentive to the navigation in his watch, &c. to keep the log regularly, and examine the line and glaffes by which the fhip's courfe is meafured, and to adjuft the fails to the wind in the fore-part of the fhip. He is alfo to attend diligently to the cables, feeing that they are well coiled and kept clean, when laid in the tier, and fufficiently ferved, when employed to ride the fhip. Finally, he is to fuperintend and affift at the ftowage of the hold, taking efpecial care that all the ballaft and provifions are properly ftowed therein. The number of mates allowed to fhips of war and merchantmen, is always in proportion to the fize of the veffel. Thus a firft-rate man of war has fix mates, and an Eaft Indiaman the fame number; a frigate of twenty guns and a fmall merchant-fhip have only one in each; and the intermediate fhips have a greater or fmaller number, according to their feveral fizes, or to the fervices on which they are employed. Falconer.

Other officers have alfo affiftants, called mates; as the furgeon, gunner, carpenter, boatfwain, cook, and corporal.

MATE *Creek*, in *Geography*, a river of Kentucky, which runs into the Licking, N. lat. 38° 4'. W. long. 83° 41'.

MATEGRIFFON, in the *Military Art*, a machine anciently ufed for throwing both darts and ftones. It was both the deftroyer and terror of the Greeks.

MATELEA, in *Botany*, apparently a barbarous name, for the toleration of which we have offered fome apology under the article HOSTEA. We fhall not attempt to legitimate it, as Linnæus in fome inftances has done, by any Greek pun, or forced derivation; which in this cafe might eafily be done, though it would ftill have no reference to the plant. Aubl. Guian. 277. Juff. 144. Lamarck Dict. v. 3. 726. Illuftr. t. 179. Brown Afclep. in Mem. of the Wernerian Society, v. 1. 36. (Hoftea; Willd. Sp. Pl. v. 1. 1274.) Clafs and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juff. *Afclepiadeæ*, Brown.

Gen. Ch. *Cal.* Perianth of one leaf, turbinate, inferior, in five deep, ovate, acute, equal fegments. *Cor.* of one petal, wheel-fhaped; tube very fhort; limb in five deep, roundifh, equal fegments, folding obliquely over each other. *Stam.* Filaments five, very fhort, inferted into the bafe of the tube; anthers united into a pentagonal head, each of two cells, burfting tranfverfely, and terminated by a membrane; maffes of pollen affixed to the outer extremity, with refpect to the cells, and covered with the ftigmas; crown of the ftamens fhield-like, lobed. *Pift.* Germens two, ovate, one of them abortive; ftyles two, fhort; ftigmas depreffed, flattifh, recurved. *Peric.* Follicle lanceolate-oblong, acute, ribbed. *Seeds* numerous, imbricated, elliptical, crenate, without wings.

Eff. Ch. Corolla wheel-fhaped, in five round oblique fegments. Crown of the ftamens fhield-like, lobed. Anthers burfting tranfverfely, tipped with a membrane. Stigmas depreffed. Follicle ribbed. Seeds crenate, without wings.

1. M. *paluftris*. Aubl. Guian. t. 109. Native of marfhes in Guiana. An upright *fhrub*, two feet high, or more, with oppofite, lanceolate, acute, entire, fmooth *leaves*, marked with two glands at their bafe, and fupported by fhortifh *footftalks*. *Flowers* green, rather fmall, in fhort, fimple, folitary, axillary clufters. *Follicles* pendulous, three or four inches long. Aublet defcribes a variety with broader, rather elliptical, leaves. Every part, when wounded, difcharges a milky juice.

MATELICA, in *Geography*, a town of Italy, in the marquifate of Ancona; 10 miles W. of Ancona.

MATELLES, LES, a town of France, in the department of the Herault, and chief place of a canton, in the diftrict of Montpelier; feven miles N. of Montpelier. The town contains 325, and the canton 2703 inhabitants, on a territory of 217½ kiliometres, in 14 communes.

MATEMBO, one of Querimba iflands, near the coaft of Africa. S. lat. 12°.

MATEO, ST., a town of Mexico, in the province of New Bifcay; 120 miles S.W. of Parral.—Alfo, a town of New Navarre; 130 miles S.W. of Cafa Grande.—Alfo, a town of Eaft Florida, on a river which runs into the gulf of Mexico; 120 miles W. of St. Auguftine.

MATER *Dura et Pia*, in *Anatomy*, two membranous coverings of the brain and medulla fpinalis. See BRAIN.

MATER *Metallorum*, in *Natural Hiftory*, a name given by the Saxon mineralogifts, and thofe of fome other places, to a peculiar kind of marcafite or mundic, which they fuppofe, according to the expreffion, to be the mother or parent of metals.

The marcafite they call by this name is the common yellow kind, but in a foul ftate, it being ufually mixed with fome poor ore of iron, or with fome ftony matter, which has made it concrete loofely and irregularly, and it is found fometimes formed into thin undulated plates, and fometimes into complex maffes; but is always cavernous or fpungy, or full of fmaller or larger holes. Thefe are often empty; but in fome pieces they contain parcels either of the pure native metals, or of rich ores. Pieces of native copper are found in fome, and ores of iron and tin in others. And it is faid in Saxony, that native filver, in thin plates, is found in fome few.

MATERA, in *Geography*, a city of Naples, in Bafilicata; the fee of an archbifhop; 27 miles S.S.W. of Bari. N. lat. 40° 50'. E. long. 16° 35'.

MATERATA, a town of Iftria; fix miles E.S.E. of Umago.

MATERFILON, in *Botany*, a name given by fome authors to the *jacea nigra*, or common knapweed. Our Englifh name *matfellen* feems a corruption of this. See CENTAUREA.

MATERIA CHEMICA, a term ufed by authors to exprefs fuch bodies as are the peculiar objects of chemical experiments. The materia chemica, in a large fenfe, takes in all the bodies of the globe, all thefe being the fubjects of chemiftry in its extenfive fenfe; but the curious in chemical refearches may be defirous of knowing, in general, what bodies they ought to procure, and have in readinefs for them. Dr. Shaw has given a lift of thefe for his Portable Laboratory; and the reader will find a lift according to more modern arrangement and nomenclature under our article LABORATORY.

Becher long ago advifed the young operator in chemiftry to procure to himfelf a fort of artificial alphabet of nature; and this will ferve the purpofe very well, where no more is meant than a mere materia chemica, to be put in fuch order, that it may be readily had recourfe to in all its parts. With this the young operator is to proceed regularly, as he would do in learning a language. Forming firft fyllables out of the joining of two or more letters of this alphabet; and then words, by combining thefe firft fets together; and finally, whole difcourfes; that is, forming thefe various fimple bodies into mixts, compounds, and decompounds. Becher's Phyf. Subter. p. 179.

To avoid mifcarriages, and prevent being impofed upon, it will be very proper to cultivate a knowledge of the productions of nature in their crude ftate, and peculiar places of growth, where being firft viewed and examined before they are gathered or dug up, an exact knowledge of them, as nature furnifhes them, may be procured. For want of this previous qualification, men, otherwife of great fagacity, have erred in their operations, and perhaps blamed the original author of a procefs, in which they mifcarry; while they are all the while ufing a wrong fubject, or an adulterated or imperfect one, inftead of the true. From this miftake alone, numberlefs complaints have arifen of failure and uncertain fuccefs in the proceffes and experiments recorded even by the beft authors.

The perfon who would work in chemiftry with pleafure and fuccefs, fhould make a fufficiently copious collection of a materia chemica of this kind, all the particulars of which he is well affured of, as to the genuinenefs and perfection of their kinds. Thefe being always ready, will prevent the neceffity

neceffity of fending to the druggift at every turn, where the things fent for are often either not to be had, or only in a fophifticated ftate; when this alphabet of nature, compofed of the feveral materials of chemical refearches, is like the letters in a printing-houfe, diftributed and lodged in proper cells, it may readily be drawn out for ufe as occafion requires. It is impoffible to exprefs with how little expence and trouble, yet with how great profit and pleafure, numerous experiments, and thofe of the moft difficult kind, may be made, when the operator has, in this manner, all his materials about him. Becher tells us, that he has, in this manner, gone through fifty experiments in a day; and, while writing on chemical fubjects, if any difficulty or uncertainty occurred, he immediately got up from his defk, made the neceffary experiment, and fat down again to write the certain fact: fo that he affirms, there was very little more trouble in making the experiment at the fire, than in defcribing the procefs by the pen.

Materia *Medica*, comprehends thofe fubftances, which, felected from the animal, vegetable, or mineral kingdom, and employed either in a fimple or combined ftate, are adapted to heal diforders; or, in other words, it is a collection of remedies. Among the ancients, this collection was very limited and imperfect, and yet formed in a fanciful and arbitrary manner, and frequently with a view to imaginary or fuperftitious virtues annexed to the fubftances which it contained. This is not to be wondered at, when we confider that all arts and fciences have been progreffive in their improvement, and that the urgency of difeafe would lead thofe who ftudied medicine for their own relief, or for the benefit of others, to feek and to multiply remedies. The number of thefe remedies would naturally be augmented from views of intereft; and as the priefts of Efculapius were the firft and chief practitioners of phyfic in Greece, whence the fcience originated, we may fuppofe that fuperftition would invent new remedies, or annex fome myfterious efficacy to thofe that had been already difcovered. Whilft the priefts of Efculapius, thus circumftanced, would endeavour to enlarge their knowledge of remedies adapted to the various diforders that occurred, the temples of their deity afforded peculiar means of preferving the knowledge of the Materia Medica, which they acquired: for it was then common for perfons, who had been cured of their difeafes by remedies prefcribed to them in the temple, to hang up their votive tablets, on which was infcribed fome account of their diforders, and of the remedies by which they had been relieved. The celebrated Hippocrates was one of the firft clinical practitioners, who diffeminated the knowledge acquired in thefe temples; but though his writings are numerous, they are intermixed with fo many additions by different perfons, and in different ages, that it is not poffible, with any fatisfaction, to determine what was the true ftate of the Materia Medica in his time. Although Ariftotle and Theophraftus, foon after the age of Hippocrates, by laying the foundation of natural hiftory, paved the way for a great improvement in the knowledge of the Materia Medica; yet for want of the means of accurately diftinguifhing fubftances from one another, this branch of phyfic remained in much uncertainty and confufion. The writings of the ancient phyficians of Greece, now extant, are few; and of courfe we obtain little information of the progrefs of the Materia Medica among them. We may prefume, however, that they were diligent in exploring more efficacious medicines, and that, upon the whole, they were increafing their number. Erafiftratus, it is faid, fimplified the practice of medicine, and thus retarded the progrefs of the Materia Medica, which was promoted by Herophilus, and by Philinus and Serapion, belonging to the fect of empirics. At Rome the knowledge of the Materia Medica was extended and improved, by the Greek phyficians who practifed at Rome. Among thefe we may reckon Afclepiades, who, indeed, like Erafiftratus, employed only a fmall number of medicines, Celfus, Scribonius Largus, and Andromachus the elder. Diofcorides, who lived in the time of the emperor Vefpafian, is commended by Galen as one of the beft and moft complete writers on the Materia Medica. He has given a long lift of medicines, with fome opinion refpecting each; but Dr. Cullen thinks, that, in feveral refpects, his judgment in general may be fufpected. About the fame time with Diofcorides lived the elder Pliny, who, though eminently learned, was merely a compiler, and often injudicious, particularly with refpect to the Materia Medica. Pliny, however, difcovered more judgment than many of his contemporaries, in condemning the very luxuriant compofitions which at that time were fo much affected. Soon after Pliny appeared the celebrated Galen, who, on the fubject of the Materia Medica, propofed a new fyftem; maintaining that the faculty or power of medicines depends chiefly upon their general qualities of heat and cold, drynefs and moifture. This doctrine, however unfounded and erroneous, was implicitly followed by all the phyficians of Greece who fucceeded Galen, as well as by all the phyficians of Afia, Africa, and Europe, for at leaft 1500 years. When the knowledge of phyfic had very much declined among the Greeks, it was transferred to the Saracens, who were almoft the only perfons in Afia and Africa that cultivated fcience. Several productions of their own climate were added to the Materia Medica of the Greeks: but though they made fome improvements, as, *e. g.* by fubftituting, in place of the more violent and draftic purgatives of the Greeks, feveral of a milder kind; they made no difcovery of any medicines of peculiar power; and as they had derived almoft the whole of their knowledge of phyfic from Greece, fo in every part of it they had adopted nearly entirely the fyftem of Galen. Upon the whole, it does not appear that they made any improvement, either in the general plan of the Materia Medica, or in afcertaining the virtues of particular medicines. One important innovation, indeed, they introduced, which laid the foundation of a confiderable change at a fubfequent period; and this was the application of chemical operations to the fubftances appropriated to medicine. As long as the phyficians of Europe continued to be the fervile followers of the Saracens or Arabians, nothing new occurred among them; but when Conftantinople was taken by the Turks, about the middle of the fifteenth century, many learned Greeks were driven into Italy, and thus the literature of the Greeks was tranfported to the weftern parts of Europe. The fyftem of Galen, however, was adopted by the contending parties both of the Greeks and Arabians: and the Materia Medica, with a few additions by the Arabians, remained as it had been tranfmitted from Galen; being every where explained by the cardinal qualities and their different degrees, with very little reference to any thing acquired by experience.

We have already obferved that chemiftry firft appeared among the Arabians; and there is reafon for believing, that metallic fubftances were the fubjects of fome of their firft operations. Thefe fubjects were principally mercury, and afterwards antimony; and of thefe fubftances we find a great variety of preparations in the "Currus Triumphalis Antimonii," publifhed under the name of Bafil Valentine, and fuppofed to have been written about the end of the fifteenth, or beginning of the fixteenth century. When the chemifts directed the employment of their art to the preparation

paration of medicines, they were foon mifled by the fanatical fpirit which prevailed among them, and indulged the idea of preparing an univerfal medicine, and one which fhould protract life to 1000 years. In the profecution of thefe vifionary fchemes they perfifted, when in the beginning of the fixteenth century Paracelfus appeared. From the chemical practitioners of thefe times he learned the ufe of mercury and antimony; and from fome empirics the ufe of opium. By the ufe of thefe remedies, he cured many difeafes which had baffled the inert remedies of the Galenifts: and thus eftablifhing his fame, he formed a fchool of phyficians, who appeared in oppofition to the eftablifhed fchools, then entirely followers of Galen. Hence the phyficians of Europe were divided into the two fects of chemifts and Galenifts. Early in the feventeenth century, fir Theodore Mayerne, a chemical phyfician, was called over into England, and diftinguifhed himfelf as a great favourer of chemical medicines, and particularly of antimony. His fame feems to have terminated in England all diftinction between the Galenic and chemical practitioners. Hence it merits particular attention, that in the courfe of the fixteenth century, the introduction of the more frequent ufe of chemical medicines, and of the more frequent application of chemiftry to the preparation of them, produced a very great change in the ftate of the Materia Medica. Foffil medicines, fome of which were entirely unknown to the ancients, formed a much greater part of it than formerly; and not only thofe of the metallic, but many of the faline kind, little known before, were now introduced. Diftilled waters alfo, effential oils, quinteffences, and extracts, were admitted by thofe who allowed of chemical remedies at all, to conftitute almoft the whole of the Materia Medica. While chemiftry was thus employed to modify the Materia Medica, it was accompanied by every fpecies of fanaticifm, by the doctrines of aftral influences, animal magnetifm; by pretenfions to alchemy, to panaceas, and to medicines capable of prolonging life. All thefe had fome influence on the Materia Medica; but none were more generally received than the doctrines of fignatures, which has retained its influence till very lately. The doctrines of chemiftry, though attended with many abfurdities, were, however, the moft promifing towards explaining that quality in medicines upon which their virtues depended; and accordingly have ever fince been more or lefs applied to that purpofe. It was about this time that certain phyficians, who prefumed to judge of the conftituent parts of medicines, partly from their chemical analyfis, partly from their fenfible qualities, formed plans of the Materia Medica. After all the fchemes that were formed for inveftigating the virtues of medicines, it muft be acknowledged, that the conclufions formed from any of them can hardly be trufted till they are confirmed by experience; and here it will be proper to take notice of two attempts which were made in England to confult experience with regard to the Materia Medica. The firft was that of Mr. John Ray, who, in his "Hiftory of Plants," thought proper to enumerate the virtues of thofe which were ufed in medicine. About the fame time Mr. Boyle endeavoured to engage the practitioners of phyfic in the ftudy of fpecific medicines, that is, of medicines whofe virtues are learned only from experience. Neverthelefs, from various circumftances, his collection has contributed very little towards the improvement of the knowledge of the Materia Medica. After this time phyficians and chemifts began to treat many vegetable fubftances, either by infufion and decoction in water, or by infufion in fpirituous menftruums, and obtaining extracts in confequence of thefe operations; and labours of this kind have been fince profecuted with diligence. By fuch labours the doctrines of the Materia Medica have been often corrected, and we have been frequently taught not only to diftinguifh the different degrees of the fame quality in different bodies, but they have been particularly ufeful in directing the moft proper pharmaceutical treatment of medicines, and have fometimes afforded an analogy for judging of the virtues of untried fubftances. At a period, which foon followed, a number of different theories prevailed in the fchools of phyfic; which varioufly affected the ftate of the Materia Medica. The Stahlians introduced archeal remedies, and many of a fuperftitious and inert kind; and, on the other hand, the mechanical phyficians, by introducing the Corpufcularian philofophy, or the notion that the fmall parts of bodies acted upon one another by their figure, fize, and denfity, endeavoured to explain the operation of medicines upon the fluids and folids of the human body, in a manner that countenanced many erroneous opinions concerning their virtues. Dr. Boerhaave, adopting this fyftem, contributed to extend its influence. Another circumftance that ferved to injure the writings on the Materia Medica was that of referring the operation of medicines to certain general indications; moft of which have arifen from defects both of phyfiology and pathology, and are neither fufficiently explained nor well underftood. Notwithftanding the imperfections that have been difcovered in the writers on the Materia Medica, and that have been fuggefted by Dr. Cullen, to whom we are indebted for the preceding hints on this fubject, he acknowledges, that, in modern times, and more efpecially during the courfe of the laft century and towards the clofe of it, the Materia Medica has received much correction and improvement. "The progrefs of philofophy has corrected many fuperftitious follies that were formerly intermixed with the doctrines of the Materia Medica. Chemiftry has given us many new medicines, entirely unknown in ancient times; and this fcience, in its progrefs, has not only gradually corrected its own errors, but has taught us to reject many inert medicines, which formerly made a part of the Materia Medica. It has taught us a greater accuracy in preparing all its peculiar productions, and to lay afide many of thofe operations with which it had amufed the phyfician, and had impofed much ufelefs labour upon the apothecary. In particular, it has inftructed us how to make the combinations of medicines with greater correctnefs and propriety; and in all thefe refpects has rendered the whole of the pharmaceutic treatment of medicines more fimple and accurate than it was before. Chemiftry has thus greatly improved the ftate of the Materia Medica, and has led phyficians to a difcernment that fhould reject that luxuriancy of compofition formerly fo frequent; and which, even at prefent, in moft parts of Europe, is far from being fufficiently corrected. The reformation in this refpect has not yet taken place to any remarkable degree, excepting in the northern countries of Europe, in Britain, Sweden, Denmark, and Ruffia."

Of the writers on the fubject of the Materia Medica, whofe names and works are enumerated by Dr. Cullen, the firft we fhall mention is John Schroeder, of the 17th century, an edition of whofe work in the German language was publifhed in 1746, and which has been literally quoted by Ray, Dale, and Alfton. The next writer is John Bauhin, who, in his "Hiftoria Plantarum," has written on the virtues of thofe plants which make a part of the Materia Medica. Of this author Dr. Cullen fays, that, exclufively of his botanical merit, "he did not deferve to be followed as he has been by Ray and others after him; and by no means deferves to be read now." Simon Pauli fucceeded Bauhin, and was himfelf followed by Georgius Wolfgangus Wedelius,

Wedelius, who was an abettor of the doctrine of ſignatures, as well as a believer in the power of amulets. Emanuel Koenig, towards the end of the 17th and ſoon after the beginning of the next century, publiſhed all the parts of the Materia Medica, in a manner which Cullen ſpeaks of in degrading terms. John Baptiſt Chomel publiſhed his "Abregé de l'Hiſtoire de Plantes uſuelles," in 1712, and has choſen, ſays Cullen, a proper plan of arranging the ſubjects of the Materia Medica, according to the ſimilarity of their virtues in anſwering the general indications of cure, but he has executed it very imperfectly. Stephen Francis Geoffroy, though a man of genius, and in many reſpects of good judgment, has not always manifeſted it in his writings on the Materia Medica. Mr. Lieutaud, in his "Synopſis Univerſæ Praxeos Medicæ," has diſtributed the ſubjects of the Materia Medica according to the general qualities by which they are adapted to the ſeveral indications ariſing in the practice of phyſic; but the indications marked are for the moſt part ill defined, too general as well as too complicated to convey any inſtruction to young practitioners. M. Ferrein has, ſince the time of M. Lieutaud, publiſhed at Paris a "Traité de Materie Medicale, &c." which Dr. Cullen pronounces to be ſuperficial and incorrect, and unworthy of the author, who was a man of learning and judgment. The "Precis de Materie Medicale" of M. Venel, publiſhed by M. Carrere, is, as Cullen thinks, the moſt judicious writing that had appeared in France on the ſubject before his time. Of the writers of Germany Dr. Cullen mentions Zorn, G. Henry Bahr, Buchner, Loeſeche, and J. Fred. Cartheuſer. The latter is author of the "Fundamenta Materiæ Medicæ," a work of deſerved reputation, in which the ſeveral ſubjects are diſtributed according to their ſenſible qualities, or to their more obvious chemical conſtitution, and many ſubſtances are very properly aſſociated by their natural affinities. But this author, ſays Cullen, often attempts to explain the virtues of medicines by their chemical conſtitution in a manner that is not ſatisfactory. He has alſo employed general terms, which are not only ill defined, but alſo very often complicated, and ſometimes altogether improper. In 1758, the learned and induſtrious Rud. Aug. Vogel publiſhed his "Hiſtoria Materiæ Medicæ," of which Dr. Cullen does not ſpeak in very high terms. Another German profeſſor, H. Jo. Nepam. Crantz, publiſhed a treatiſe of the "Materia Medica et Chirurgica," which has not contributed to advance the knowledge of the Materia Medica. Profeſſor Stielmen of Straſburg, in his "Inſtitutiones Materiæ Medicæ," has diſtributed medicines according to their indications, but with a brevity that often renders him obſcure. He has alſo publiſhed a "Pharmacopeia Generalis," which Dr. Cullen cenſures partly for its ſuperfluities, and partly on account of its being ſuperficial and incorrect. But the errors and defects of preceding writers have been corrected and ſupplied by the "Apparatus Medicaminum" of the very learned and ingenious profeſſor Murray of Gottingen; the moſt complete and perfect work, in Cullen's eſtimation, that has ever appeared upon the ſubject. "The author has, with great judgment and medical diſcernment, from former writers, and more eſpecially from thoſe of lateſt date, collected every thing which deſerved to be repeated. He every where diſcovers an intimate acquaintance with all the writers on the ſubject, and always makes a judicious ſelection of what they afford. By his diſtributing the vegetable ſubſtances according as they belong to the ſeveral natural orders marked by the botaniſts, he has aſſociated the ſubſtances of ſimilar qualities and virtues, in a manner that may be of great advantage to ſtudents." An improved edition of this work was publiſhed by Althof at Gottingen, in 1793, &c. in ſix volumes, 8vo. To the Apparatus, &c. by Murray, was added a work of the ſame kind, with the ſame title, comprehending the mineral kingdom, by profeſſor Gmelin, in two volumes, publiſhed at Gottingen in 1795.

In Sweden the celebrated Linnæus takes the lead, of whom we here need ſay nothing, but may content ourſelves with referring to his biographical article. According to Dr. Cullen, our attention, with reſpect to the whole that Linnæus has delivered on the Materia Medica from vegetables, is very much ſuperſeded by the work given us on the ſame ſubject by his ſcholar Bergius. The "Materia Medica ex Vegetabilibus," by Petrus Jonas Bergius, is a work of great value and deſerving peculiar notice.

Of Britiſh writers on the ſubject of the Materia Medica Dr. Cullen mentions Mr. Ray, Dr. Dale, Dr. Alſton, and alſo Dr. Hill, who publiſhed a compilation without ſelection or judgment. He ſpeaks with deſerved commendation of the "Materia Medica" of Dr. Lewis, more eſpecially as publiſhed and judiciouſly enlarged by Dr. Aikin. Dr. Rutty, of Dublin, after forty years labour in preparing it, has publiſhed his "Materia Medica Antiqua et Nova," which Dr. Cullen appretiates at a low rate. Dr. Cullen's "Treatiſe of the Materia Medica," in two volumes 4to. was publiſhed in 1789. Dr. Woodville's "Medical Botany," of which a ſecond edition was publiſhed in 1810, with his laſt corrections, is well known, and highly valued: and we may here add that in this year (1812) Dr. Stokes, well known for his botanical and medical attainments, has publiſhed a work of ſimilar title and deſign to that of Dr. Woodville.

Having given a compendious abſtract of the hiſtory of the Materia Medica, and an enumeration of ſome of the chief writers on the ſubject, we ſhall now proceed to detail, as briefly as poſſible, the different methods of claſſification or arrangement which have been adopted by various writers; premiſing in general that the means by which the remedial or medicinal characters of different ſubſtances are determined in the preſent day are their own ſenſible qualities, their botanical affinity, their chemical analyſis, and general experience. Of all the different modes of arrangement that have been adopted, the moſt ſimple is that of the alphabetic form, but from this we can derive no information with regard to the ſpecific virtues of various ſubſtances admitted into our catalogue of the Materia Medica. Another mode of arrangement is founded on the claſs of bodies, or kingdom, to which the different ſubſtances belong: and thus we obtain three general diviſions of animal, vegetable, and mineral ſubſtances. But this method of claſſification is liable to the ſame objection with the former, as it is too general, indiſcriminating, and uninſtructive. A more eligible and uſeful arrangement is that to which we are led by an inveſtigation of the ſenſible and moſt obvious qualities of medicinal ſubſtances: and accordingly we conſider them as acid, alkaline, acrid, aſtringent, aromatic, glutinous, unctuous, bitter, emetic or cathartic. This mode of diſtribution was ſuggeſted by Cartheuſer, though he was under a neceſſity of deviating from it in his actual arrangement of various ſubſtances; and, indeed, it is too vague and unappropriate to admit of general application: for ſome ſubſtances have no diſcriminating ſenſible quality; others poſſeſs ſeveral qualities ſo nearly ſimilar, that it is difficult to refer them to one claſs in preference to another: and others again reſemble one another in their ſenſible qualities, and yet are very different in their effects on the animal frame. Another mode of arrangement was adopted by Vogel, who claſſed his medical materials according to their effects on the human body.

These

Thefe are the general divifions (fays an anonymous writer in "Nicholfon's Britifh Cyclopædia," of whofe article we fhall here avail ourfelves as far as it is appropriate to our purpofe) or claffes into which fimple medicines are partitioned under this fyftem; but when we begin to confider their virtues more particularly, a variety of inferior divifions muft neceffarily enfue. Thus, of the relaxing medicines, fome, when externally applied, are fuppofed merely to foften the part; and in fuch cafe are called emollients; while others which are fuppofed to have a power of augmenting the difpofition of the fecernents of an inflamed part to the fecretion of pus, are called maturants or fuppuratives. Sedative medicines, that have the power of affuaging pain, are denominated paregorics; if they altogether remove or deftroy pain, they are called anodynes; if they take off fpafm, antifpafmodics; if they produce quiet fleep, hypnotics; if a very deep and unnatural fleep, together with confiderable ftupefaction of the fenfes, narcotics. Tonic medicines, in like manner, obtain the name of corroboratives, analeptics, or nervines, when they flightly increafe the contractile power of the folids; but of aftringents or adftringents, if they do this in a great degree. Some of this order of medicines have been fuppofed to promote the growth of flefh, to confolidate wounds, and reftrain hæmorrhages, and hence the names of farcotics and traumatics, or vulneraries, names, however, which may well be difpenfed with, as the quality is very queftionable, and perhaps altogether erroneoufly afcribed. Other aftringents, again, are denominated repellent, difcutient, ftimulant, or attractive, according to the refpective modes by which they are conceived to promote one common effect. Medicines of the inflammatory tribe, are, in like manner, divided into veficatories or blifters, if by their application they raife watery bladders on the fkin; cathæretics, efcharotics or corrofives, if they eat into and deftroy the fubftance of the folid parts themfelves; and rubefactive or rubefacient, if poffeffed of lefs power than the veficatories, they merely produce a rednefs on the part to which they are applied, by increafing the action of a part, and ftimulating the red particles of the blood, into veffels which do not naturally poffefs them. The alterant tribe is divided into abforbents, antifeptics, coagulants, refolvents, calefiants, and refrigerants, according to the peculiar mode by which the different individuals of this tribe are fuppofed to operate. The evacuants are generally fubdivided from the nature of the humour they are fuppofed to difcharge: emetics, if they evacuate the contents of the ftomach by vomiting; cathartics, if they induce purging; laxatives, if they produce a moderate difcharge of feces without pain or ficknefs; eccoprotics, if the difcharge be greater, but ftill confined to the common nature of the feces themfelves. Thus again they are named diaphoretics, if they promote the expulfion of humours through the pores of the fkin with a fmall increafe of action; fudorifics, if the increafe of action be greater, and the difcharge more copious. Such as excite urine are called diuretics; fuch as produce evacuation from the glands of the palate, mouth, and falivary ducts, falivating medicines; thofe that promote the difcharge of mucus from the throat, apophlegmatics; thofe that evacuate by the nofe, ptarmics, errhines, fternutatories; and thofe which promote the menftrual difcharge, emmenagogues. To this order alfo, fome writers reduce thofe medicines which expel any preternatural bodies, as worms, ftones, and flatus or confined air: of thefe the firft are called anthelmintics; the fecond, and efpecially when directed to the bladder, lithontriptics; and the third, carminatives.

This fyftem admits of various modifications; and authors have differed in the number and in the denominations of the claffes which they have adopted. Thus, Dr. Cullen has diftributed the various medicinal fubftances which he has introduced into the following twenty-three claffes:

Aftringents	Antacids
Tonics	Antalkalines
Emollients	Antifeptics
Corrofives	Errhines
Stimulants	Sialagogues
Narcotics	Expectorants
Refrigerants	Emetics
Antifpafmodics	Cathartics
Diluents	Diuretics
Attenuants	Diaphoretics
Infpiffants	Menagogues.
Demulcents	

Dr. Darwin comprehends all medical fubftances under feven claffes:

Nutrients	Invertents
Incitants	Revertents
Secernents	Torpents.
Abforbents	

Whilft Dr. Cullen's claffification has been thought too diffufe, and Dr. Darwin's much too contracted, and adapted merely to his own exceptionable fyftem of nofology, Dr. Kirby, in his fmall tract, entitled "Tables of the Materia Medica," has adopted eighteen claffes, which are, upon the whole, judicioufly felected, though his arrangement is not altogether unobjectionable. Independently of the general arrangement of medical fubftances, there is another circumftance which deferves attention, and that is the nomenclature by which they ought to be diftinguifhed. As the new nomenclature of Lavoifier is now generally adopted in the Pharmacopeias of different colleges of medicine, it will be followed in the annexed table. The compiler of the table has alfo been anxious to exhibit, in every inftance, a glance at the common dofe for adult age, as well as to fpecify in terms as abbreviated as poffible, the name of the country in which the different articles exift indigenoufly; the part or organ of the fubftance employed; and the difeafe in which it is fuppofed to be efficacious. The claffification is as follows, and every clafs is fubdivided, as far as poffible, into an animal, a vegetable, and a foffile fection.

Emetics	Refrigerants
Expectorants	Aftringents
Diaphoretics	Tonics
Diuretics	Stimulants
Cathartics	Antifpafmodics
Emmenagogues	Narcotics
Errhines	Anthelmintics
Sialagogues	Abforbents.

Humulus Lupulus *.

* We have inferted the hop among the articles of the Materia Medica, as it probably would have been received by the Edinburgh college, had their Pharmacopeia been publifhed fome months later. Within the laft year it has been frequently employed in the Edinburgh infirmary as a fubftitute for opium with great fuccefs, as it was found to produce fleep in cafes where opium was ineffectual or inadmiffible. It is ufually adminiftered in the form of a faturated tincture.—Vid. De Roches' "Differt. Inaug. de Humulo Lupulo. Edin. 1803."
Dr. Spens has adopted it in his edition of the Infirmary Pharmacopeia, and has given a formula of it under the title of "Pilulæ Humuli lupuli."

For an account of the medical properties and use of the several classes, in the preceding table, see EMETICS, EXPECTORANTS, &c. &c.

MATERIA *Subtilis*, denotes a fine subtile matter, which the Cartesians suppose to pervade and penetrate freely the pores of all bodies, and to fill up all the pores so as not to leave the least vacuity, or interstice, between them. See CARTESIANS.

This machine they have recourse to, to support the doctrine of an absolute plenum, and to make it consistent with the phenomena of motion, &c. and, accordingly, they make it act and move at pleasure, but in vain: for were there any such matter, in order for it to be able to fill up the vacuities of other bodies, it must, itself, be entirely void of any, *i. e.* it must be perfectly solid, vastly more solid than gold, and, therefore, more ponderous, and resist vastly more, which is inconsistent with phenomena. See VACUUM, and PLENUM.

Yet sir Isaac Newton allows of the existence of a subtile matter, or medium, much finer than air, penetrating the closest bodies, and contributing to the production of many of the phenomena of nature. The existence of such a matter he argues from the experiment of two thermometers, which being inclosed in glass vessels, "one of them, exhausted of its air, and both carried from a cold to a warm place, the thermometer *in vacuo* grows warm, and rises, almost as soon as that in the air; and, if returned into the cold place, both cool and fall about the same. Hence, says he, is not the heat of the warm room conveyed through the vacuum by the vibrations of a much subtiler medium than air, which remained *in vacuo* after the exhaustion of the air? And is not this medium the same whereby light is refracted, reflected, &c.?" See ÆTHER.

MATERIAL denotes something composed of *matter*. In which sense the word stands opposed to *immaterial*. The Epicureans, Spinosists, &c. own no other but material substances. (See SUBSTANCE.) Among causes, some are material, others are formal. See CAUSE.

Material causes, having no understanding or liberty, must always act in the same manner, when under the same circumstances. Philosophers and divines dispute, whether or no there be any material forms really distinct from matter? (See FORM.) The Valentinians formerly applied the term materia. to all people but those of their own sect; asserting that their souls perished with their bodies. Thus also the Stoics maintained, that none but the souls of their wise men survived the body.

MATERIAL *Circle*. See CIRCLE.

MATERIAL *Object*. See OBJECT.

MATERIALISTS, a sect in the ancient church, composed of persons, who, being prepossessed with that maxim in the ancient philosophy, *Ex nihilo nihil fit*, *Out of nothing nothing can arise*, had recourse to an internal matter, on which they supposed God wrought in the creation; instead of admitting God alone as the sole cause of the existence of all things.

Tertullian vigorously opposes the doctrine of the Materialists, in his treatise against Hermogenes, who was one of their number.

Materialists is also a name given to those who maintain that the soul of man is material; or that the principle of perception and thought is not a substance distinct from the body, but the result of corporeal organization. (See SOUL.) There are others, called by this name, who have maintained that there is nothing but matter in the universe; and that the Deity himself is material. See SPINOSISM.

MATESHOLM, in *Geography*, a small island in the North sea, near the coast of Lapland. N. lat. 68° 8'.

MATGAR, a town of Hindoostan, in the circar of Kotta; 15 miles S S.W. of Kotta.

MATHA, a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of St. Jean d'Angely; 14 miles N.W. of Saintes. The place contains 714, and the canton 14,940 inhabitants, on a territory of 295 kiliometres, in 26 communes.

MATHAN, a town of Africa, in the kingdom of Bornou, called a royal city. N. lat. 18° 30'. E. long. 21° 40'.

MATHANON PORT, a port in the S.E. part of the island of Cuba, between Cape Cruz and Cape Maizi, which affords good anchorage for ships.

MATHEMATICAL POINT. See POINT.

MATHEMATICAL *Sect*, in the *History of Learning*, is one of the two leading philosophical sects, which appeared towards the beginning of the seventeenth century: this sect directed its researches by the principles of Gassendi, and sought after truth by observation and experience. The disciples of this sect denied the possibility of erecting on the basis of metaphysical and abstract truths, a regular and solid system of philosophy, without the aid of assiduous observation and repeated experiments, which are the most natural and effectual means of philosophical progress and improvement. The advancement and reputation of this sect, and of natural knowledge in general, were much owing to the plan of philosophizing, proposed by lord Bacon, to the establishment of the Royal Society in London, to the genius and industry of Mr. Boyle, and to the unparallelled researches and discoveries of sir Isaac Newton. Barrow, Wallis, Locke, and many others, were of this sect. See CORPUSCULAR, EXPERIMENTAL, and NEWTONIAN *Philosophy*.

The other sect of philosophers was the metaphysical.

MATHEMATICS is that science which treats of the ratio and comparison of quantities, and is therefore defined the *science of ratios*; some writers call it the *science of quantities*, but this is inaccurate, since it is not quantities themselves which are the subject of mathematical investigation, but the ratio that such quantities bear to each other.

The

MATHEMATICS.

The term mathematics is derived from μαθησις, *matheſis*, diſcipline, ſcience, repreſenting with juſtneſs and preciſion the high idea that we ought to form of this branch of human knowledge. In fact, mathematics are a methodical concatenation of principles, reaſonings, and concluſions, always accompanied by certainty, as the truth is always evident, an advantage that particularly characteriſes accurate knowledge and the true ſciences, with which we muſt be careful not to aſſociate metaphyſical notions, conjectures, nor even the ſtrongeſt probabilities.

The ſubjects of mathematics are the compariſons of magnitude, as numbers, velocity, diſtance, &c. Thus, geometry conſiders the relative magnitude and extenſion of bodies; aſtronomy, the relative velocities and diſtances of the planets; mechanics, the relative powers and force of different machines, &c. &c. ſome determinate quantity being fixed upon in all caſes as a ſtandard of meaſure.

Mathematics are naturally divided into two claſſes; the one comprehending what we call *pure* and *abſtract;* and the other the *compound* or *mixed*. *Pure* mathematics relate to magnitudes generally, ſimply, and abſtractedly, and are therefore founded on the elementary ideas of quantity. Under this claſs are included *arithmetic*, or the art of computation; *geometry*, or the ſcience of menſuration and compariſon of extenſions of every kind; *analyſis*, or the compariſon of magnitudes in general; to which we may add *geometrical analyſis*, which is a combination of the two latter. *Mixed* mathematics are certain parts of phyſics, which are, by their nature, ſuſceptible of being ſubmitted to mathematical inveſtigation. We here borrow from inconteſtible experiments, or otherwiſe ſuppoſe bodies to poſſeſs ſome principal and neceſſary quality, and then, by a methodical and demonſtrative chain of reaſoning, deduce from the principles eſtabliſhed concluſions as evident and certain as thoſe which pure mathematics draw immediately from axioms and definitions, obſerving, that theſe reſults are always given with reference to the experiments on which they are founded, or the hypotheſis which furniſhed the firſt datum. Let us illuſtrate this by an example. Numberleſs experiments have ſhewn us, that all bodies near the earth's ſurface fall with an accelerated velocity, and that the ſpaces paſſed through are as the ſquares of the times they have been in falling. This, then, the mathematician conſiders as a neceſſary and eſſential quality of matter, and with this datum he proceeds to examine what will be the velocity of a body after any given time, in what time it will have acquired a given velocity, what time is neceſſary for it to have generated a given ſpace, &c. and in all theſe inveſtigations his concluſions are as certain and indiſputable as any of thoſe which geometry deduces from ſelf-evident truths and definitions. Again in optics, having eſtabliſhed it as a principle of light, that it is tranſmitted in right lines while no obſtacle is oppoſed to the paſſage of the rays; that when they become reflected, the angle of incidence is equal to the angle of reflection; that in paſſing from one medium to another, of different denſity, they fly off from their firſt direction, but ſtill follow a certain geometrical law; theſe principles, or qualities of light, being once admitted, whatever may be its nature, be it material, or be it immaterial, or whatever may be the medium through which it paſſes, or the ſurface by which it is reflected, are totally matters of indifference to the mathematician; he conſiders the rays only as right lines, the ſurfaces on which they impinge as geometrical planes, of which the form only enters into his inveſtigation: and from this point all his enquiries are purely geometrical, his inveſtigation clear and perſpicuous, his deduction evident and ſatisfactory. To this claſs of mathematics belong *mechanics*, or the ſcience of equilibrium and motion of ſolid bodies; *hydrodynamics*, in which the equilibrium and motion of fluids are conſidered; *aſtronomy*, which relates to the motion, maſſes, diſtance, and denſities, of the heavenly bodies; *optics*, or the theory and effects of light; and, laſtly, *acouſtics*, or theory of ſounds.

Such are the ſubjects that fall under the contemplation of the mathematician, and as far as a knowledge of theſe may be conſidered beneficial to mankind, ſo far, at leaſt, the utility of the ſcience on which they depend muſt be admitted. It is not, however, the application of mathematics to the various purpoſes of ſociety, that conſtitutes their particular excellency; it is their operation upon the mind, the vigour they impart to our intellectual faculties, and the diſcipline which they impoſe upon our wandering reaſon. "The mathematics," ſays Dr. Barrow, "effectually exerciſe, not vainly delude, nor vexatiouſly torment ſtudious minds, with obſcure ſubtilties, but plainly demonſtrate every thing within their reach, draw certain concluſions, inſtruct by profitable rules, and unfold pleaſant queſtions. Theſe diſciplines alſo inure and corroborate the mind to a conſtant diligence in ſtudy; they wholly deliver us from a credulous ſimplicity, and moſt ſtrongly fortify us againſt the vanity of ſcepticiſm; they effectually reſtrain us from a raſh preſumption, moſt eaſily incline us to a due aſſent, and perfectly ſubject us to the government of right reaſon. While the mind is abſtracted and elevated from ſenſible matter, it diſtinctly views pure forms, conceives the beauty of ideas, and inveſtigates the harmony of proportions; the manners themſelves are ſenſibly corrected and improved, the affections compoſed and rectified, the fancy calmed and ſettled, and the underſtanding raiſed and excited to more divine contemplations."

Many of our readers will probably not be diſpoſed to admit, to the full extent, the juſtneſs of Dr. Barrow's panegyric; they may think he has over-rated the value of mathematical acquiſition, and that ſome of his aſſertions are founded in ſelf-ſufficiency and pride. But thoſe who form the latter opinion, muſt be unacquainted with the true character of this celebrated author; and thoſe who entertain the former, are not probably initiated into the myſteries of theſe ſciences; and, therefore, are not competent judges of their value. We are aware, that mathematics have had calumniators, as well as eulogiſts; it has even been repreſented as a ſcience which blunts all the tender feelings of our nature; that it renders its profeſſors vain, arrogant, and preſumptuous; as deſtroying all reliſh for works of taſte and imagination; hardening the heart againſt every truth, but thoſe of the demonſtrative kind; and, conſequently, as having a tendency to lead us into infidelity and atheiſm.

The celebrated author of the Rambler indulged ſome of theſe notions. It was, he obſerved, "the great praiſe of Socrates, that he drew the wits of Greece, by his inſtruction and example, from the vain purſuits of natural philoſophy to moral enquiries; and turned their thoughts from ſtars and tides, and matter and motion, to the various modifications of virtue, and relations of life." He purſues this thought ſtill farther, and illuſtrates it by a ſtory which he tells of one Gelidus, a mathematician, who was ſo abſorbed in his ſpeculations, that when his ſervants came to acquaint him that a houſe was on fire, and the whole neighbourhood in danger of being burnt, he only replied, that it was very likely, for it was the nature of fire to act in a circle. He even diveſts this pſeudo-philoſopher of the common feelings of humanity, and makes him as inſenſible to the wants of

his

his family, as to the diftreffes of his neighbours. But fuch illiberal notions are a difgrace to their author, and fhew a narrownefs of mind, that one would not expect to have found affociated with fo much talent. "A great and comprehenfive genius excludes none of the fciences, they all contribute, by various means, to adorn and embellifh life; and for this reafon ought to be cultivated and improved. Happy is the mind that is not contracted by the ftudy of philofophy, nor enervated by the charms of the belles lettres; that can be ftrengthened by Locke, inftructed by Clarke and Newton; impaffioned by Cicero and Demofthenes; and elevated by the powers of Homer and Virgil." Bonnycaftle's Aftronomy.

That fome mathematicians may have been vain and prefumptuous, perhaps cannot be denied; but many, and thefe amongft the moft eminent, have been equally diftinguifhed for their modefty and unaffuming manners, of which our Newton furnifhes an illuftrious example. Admitting, therefore, that the charge is juft with refpect to certain individuals, unlefs it can be fhewn (and which we believe it cannot) that it applies to a greater proportion of the profeffors of this fcience than of any other, the injuftice of the accufation, as applied to the fcience itfelf, is evident. What fcience, or what fubject can be named, in which the fame charge will not apply to individuals; even that which above all might be fuppofed to have the greateft influence in checking thofe paffions, the great founder of which was a pattern of humility, meeknefs, and peace; even this facred caufe has been but too frequently difgraced by the bigotry and intolerance of its profeffors. The next objection to thefe purfuits is, that they deftroy all relifh for works of tafte, and that genius is unneceffary, and only great labour required, in order to attain the firft rank in the fciences. To this we will let Boffut reply: "Is it," fays the philofopher, "at all aftonifhing, that the ignorant and fuperficial many fhould confound the fruits of that knowledge, which is acquired by ftudy, with thofe new and original truths to which genius alone can give birth? To be juft, we muft weigh the great mathematicians of well eftablifhed reputation againft the great poets and great orators. Thus on the one fide, let us place Homer, Virgil, Racine, Pope, Demofthenes, Cicero, and Boffuet; and on the other, Archimedes, Hipparchus, Galileo, Defcartes, Huygens, Leibnitz, and Newton; and it will not then be fo eafily determined to which fide the balance, in point of genius, ought to incline." We might purfue this fubject to a much greater length, and enter into a formal defence of the other charges brought againft mathematics and mathematicians; but they may be all anfwered in a word. Their greateft calumniators, amongft whom we place Jofeph Scaliger, the abbé Desfontaines, and our countryman Hobbes, were men who coveted fame, and thought themfelves competent to acquire it in every branch of human knowledge; they, therefore, attempted the moft difficult problems, and their little knowledge of the fubject led them into errors which made them the ridicule of all fcientific men; thus exafperated and difappointed, they became the enemies of that fcience in which they had before fo vainly defired to fhine; and reproached it merely to gratify their pride and revenge.

The hiftory, illuftration, and application of the feveral branches of mathematics, have been treated of under their refpective heads in the prefent work; and it therefore only remains for us, in the prefent article, to give a brief fketch of the moft prominent parts of the hiftory of the whole, in order to trace their progrefs and mutual dependence, which are loft in the detached accounts. With this view of the fubject, we fhall nowhere enter into particulars, but where thefe are required, reference will be made to the feveral articles in which fuch information may be obtained. Neither fhall we offer any fpeculations concerning the origin of thefe fciences, which is rather calculated to amufe than to inftruct; but proceed at once to real hiftorical facts, obferving only, with regard to the Egyptians, that they undoubtedly poffeffed fome knowledge of geometry and aftronomy before thefe fciences were tranfplanted into Greece; but as we are totally unacquainted with the extent of their knowledge, all records of it having been loft or deftroyed, it will be fafeft to advance nothing on this head, and to begin our fketch with the earlieft authentic traces of it amongft the ancient Greeks.

It is generally fuppofed, that the Greeks derived their firft knowledge of the fciences from the magi of Egypt, and it was probably known in the former country long before the time of Thales, who is commonly ftiled the father of Grecian philofophy, only becaufe he is the firft of whom any decided account has been tranfmitted to us. Herodotus informs us, that Thales predicted a total eclipfe of the fun, and though no date is mentioned by this celebrated hiftorian, yet aftronomers have now afcertained that the only total eclipfe, (and it could be no other than total, from the circumftances attending it,) happened in the year 610 before Chrift. See Phil. Tranf. for 1810, in which is given an elaborate paper on this fubject, by F. Bailly, efq. At this period, therefore, it is obvious that aftronomy was confiderably advanced in Greece, as the prediction of an eclipfe is far from being an elementary problem; it neceffarily requires a vaft number of delicate obfervations, which could only be obtained after a long feries of years. Pythagoras, who is fuppofed to have been a pupil of Thales, and who flourifhed about the year 590 B.C., is the next of thofe celebrated Grecians whofe names are rendered immortal by their great and important difcoveries. This philofopher, it appears, made confiderable improvements in arithmetic, aftronomy, and geometry; in arithmetic he is faid to have invented the multiplication table, or the *abacus Pythagoricus;* in aftronomy, he fuggefted the idea of the true fyftem, placing the fun in the centre, and making the planets revolve about him; and in geometry he difcovered the 47th propofition of Euclid's firft book, which alone would have been fufficient to have ranked him with the firft of geometricians. At this period flourifhed Anaximander, and foon after Anaximenes, Anaxagoras, and Cleoftratus; thefe were all eminent in aftronomy and philofophy. Œnopidus, 480 B.C., was a learned geometer, author of feveral problems, and his contemporary Zenodorus is the firft of the ancients whofe works have been handed down to us; all before his time having been loft or deftroyed. About this time alfo flourifhed Hippocrates of Chios, who diftinguifhed himfelf by the celebrated quadrature of the lunes which bear his name, as well as by his difcoveries connected with the problem of *doubling the cube*, which excited great intereft amongft the ancient mathematicians of this period. (See DUPLICATION *of the Cube.*) This difcovery revived fome hopes of obtaining the required folution, but it foon appeared that the difficulty was merely changed, and not in the leaft diminifhed, and that it ftill prefented obftacles that were infurmountable. This did not, however, difcourage other mathematicians from following up the purfuit; and feveral curious geometrical properties were the refult of thefe inveftigations; the *conchoid* of Nicomedes, the *ciffoid* of Diocles, and the *quadratrix* of Dinoftratus, owe their origin to the fame fource.

Paffing over fome mathematicians and aftronomers of lefs note,

note, we come to Plato, who cultivated both aſtronomy and geometry with great aſſiduity, about 390 years B.C. The celebrated inſcription that he cauſed to be placed over the door of his ſchool, "Let no one enter here who is ignorant of geometry," is a proof of the high eſtimation in which he held the latter ſcience. To this philoſopher we owe the introduction of the conic ſections into geometry, and his diſciple Ariſteus is ſaid to have compoſed five books on theſe curves, of which the ancients have ſpoken with the greateſt commendations, but unfortunately they have not been tranſmitted down to our time. Beſides Ariſteus, Plato numbered amongſt his friends, or ſcholars, Eudoxus, Menechmus, and Dinoſtratus; the former of whom was very celebrated for his extenſive knowledge in aſtronomy and geometry; Menechmus, for his application of the conic ſections to various problems; and the latter for the invention of the *quadratrix*, as applicable to the problem of doubling the cube, which ſeems to have been the germ of what is now termed the geometrical analyſis.

It was about 90 years from the time of Plato to that of Euclid, during which period all the ſciences were conſiderably advanced and extended, and treatiſes on particular ſubjects appeared from time to time, in which all the propoſitions then known were collected and arranged in ſyſtematic order, which was the object of Euclid in his celebrated Elements, a work which has met with a ſucceſs incomparably ſurpaſſing that of any other book of ſcience that ever was publiſhed, having been taught excluſively for ſeveral centuries in every place of mathematical inſtruction, and is therefore too well known to need any particular deſcription. We are now arrived at that period when the Grecian ſciences were in their meridian ſplendour; Archimedes, one of the greateſt geometers that ever appeared in any age or country, followed ſoon after the time of Euclid. His univerſal genius led him to the contemplation of almoſt every ſpecies of human knowledge, and nearly every branch of mathematical ſcience is indebted to him for his numerous and important diſcoveries. Arithmetic, geometry, mechanics, optics, hydrodynamics, were alike the objects of his inveſtigation, and experienced alike the powerful effects of his ſuperior talents. We cannot in this place enter into a particular deſcription of theſe diſcoveries, and muſt therefore refer our readers to the article ARCHIMEDES, in which an abſtract of the moſt important of them will be found. After Archimedes, at the diſtance of about fifty years, another celebrated geometrician, Apollonius, cultivated the mathematical ſciences with the greateſt poſſible ſucceſs, for the particulars of whoſe diſcoveries and writings we muſt refer to the article APOLLONIUS. This period, as we before obſerved, (B.C. 250) was the moſt brilliant era of ancient geometry, for after theſe great men we meet with no other mathematician of the firſt order, yet there were ſeveral who cultivated both geometry and aſtronomy, and which nothing but the confined limits of this article would juſtify us in paſſing over in ſilence; ſuch, for inſtance, as Eratoſthenes, who firſt attempted to meaſure the circumference of the earth; Cteſibius, to whom we are indebted for the uſeful invention of water pumps; Hero of Alexandria, who was much celebrated for his application of geometry to the practical purpoſes of menſuration, and to whom we are indebted for the invention of clepſydræ, or water clocks. We might alſo enumerate many other eminent mathematicians and aſtronomers, but as we are under the neceſſity of limiting our obſervations to thoſe who are moſt pre-eminently diſtinguiſhed, we ſhall paſs at once to Hipparchus, the prince and father of aſtronomy, who flouriſhed about 142 B.C. To him we are indebted for the firſt effectual claſſification of the ſtars; for aſcertaining nearly the duration of the year; the diſcovery of what he called the *excentricity* of the ſolar orbit; the *preceſſion of the equinoxes*; and various other important diſcoveries and obſervations: beſides which Hipparchus had the merit of applying this ſcience to the purpoſes of geography; he reduced to certain and invariable principles the method of determining the ſituation of places on the earth, by means of their latitudes and longitudes, of which, however, ſome notions were entertained as early as the time of Alexander. The next mathematician of eminence was Theodoſius, who wrote an excellent work on the ſphere, which may be conſidered as an introduction to ſpherical trigonometry; and though many of the author's propoſitions are almoſt ſelf-evident, yet faithful to the views of the ancients, he has ſubmitted them all to the moſt rigorons demonſtrations, a taſk which he has performed with the greateſt elegance. After this author, we proceed for three or four hundred years without meeting with any geometrician who is much diſtinguiſhed for his diſcoveries or improvements. The ſciences had been for a long time in a declining ſtate, in the ſchool of Alexandria, when the celebrated Ptolemy began, in ſome meaſure, to revive them, at leaſt aſtronomy, by reducing all the parts of it into more order and conſiſtency, A.D. 140. His principal work, the "Almageſt," (a word derived from the Arabic, ſignifying *the great collection*,) contains all the ancient obſervations and theories, to which his own reſearches being added, he may be ſaid to have formed of the whole the moſt complete collection of ancient aſtronomy that ever appeared; a work which ſupplies, in ſome meaſure, the place of thoſe that preceded it, and for the compilation of which its author will be ever entitled to the gratitude of aſtronomers. It was ſome years after this period, (though the exact time has never yet been aſcertained,) that Diophantus, a celebrated mathematician alſo of the Alexandrian ſchool, made a new and remarkable ſtep in arithmetic, by the invention of the indeterminate analyſis; a ſpecies of algebra, and which is the firſt trace we have of this extenſive branch of mathematics. The work conſiſted of 13 books, of which however only ſix have ever reached us, unleſs a ſeventh, which is found in ſome editions of Diophantus, be his work, which is conſidered as doubtful. This treatiſe diſplays great talents and originality, and has ever been held in the greateſt eſteem by analyſts of all ages, and has accordingly been commented upon and explained by various writers, both ancient and modern, but moſt of thoſe of the former are loſt. Of theſe we regret the commentary of the celebrated Hypatia, daughter of Theon, who flouriſhed about the year 410 of the Chriſtian era. The talents, virtues, and misfortunes, of this illuſtrious victim of fanaticiſm, have a claim to the homage of poſterity, while the remembrance of the deed, and the perpetrators of it, will as deſervedly be execrated and abhorred by every friend of ſcience and admirer of female virtue. (See HYPATIA.) What was the diſtance of time between Diophantus and Theon is not diſtinctly known, it was however barren of any diſtinguiſhed authors. About this period we meet with Pappus and Diocles, the latter of whom has been already mentioned in ſpeaking of the duplication of the cube, and the former alſo made ſome ingenious advances, both with regard to this problem, and that of the triſection of an angle; but what he is more particularly diſtinguiſhed for, is his collections of the various works of his predeceſſors; theſe collections contain one of the moſt valuable monuments of ancient geometry: in them he has aſſembled together a number of excellent works, almoſt all of which are now loſt, and to them he has added ſeveral new, curious, and learned propoſitions propofitions of his own; an interefting account of which is given under the article Pappus in Dr. Hutton's "Mathematical Dictionary:" fee alfo the fame article in the prefent work. After Pappus we meet with Eutocius, A.D. 520, who was himfelf a great mathematician; and whofe commentaries on the works of Archimedes and Apollonius in particular are much efteemed. To the names already mentioned may be added thofe of Proclus, Marinus, and Hero *the younger;* to the former we are indebted for his commentary on fome of the books of Euclid, but more for the kindnefs, attention, and protection, which he afforded to thofe who purfued thofe ftudies in his time. Marinus and Ifidorus, his contemporaries, are celebrated for their architectural fkill, and to them it is faid we are indebted for the invention of domes; and Hero, who is furnamed the younger, to diftinguifh him from the learned author of the fame name *of Alexandria*, is equally celebrated as an engineer, and for his rule for finding the area of a triangle when the three fides only are given.

We are now arrived at that period fo fatal to the fciences. Thefe had for a long time taken refuge in the mufeum of Alexandria; where, deftitute of fupport and encouragement, they could not fail to degenerate. Still, however, they preferved, at leaft by tradition, or imitation, that ancient and ftrict character which had been impreffed upon them by the Greeks; but about the middle of the feventh century, a tremendous ftorm arofe, which threatened their total deftruction. Filled with all the enthufiafm a militant religion infpires, the fucceffors of Mohammed ravaged that vaft extent of country which ftretches from the eaft to the fouthern confines of Europe. All the cultivators of the arts and fciences, who from every natinn had affembled in Alexandria, were driven away with ignominy; fome fell beneath the fwords of the conquerors; others fled into remote countries, to drag out the remainder of their lives in obfcurity and diftrefs. The places and the inftruments which had been fo ufeful in making an immenfe number of aftronomical obfervations, were involved with the records in one common ruin. The whole of that precious library which contained the works of fo many eminent authors, and was the common depofitary of every fpecies of human knowledge, was entirely devoted to the flames by the Arabs; the caliph Omar obferving, that if they agreed with the koran they were ufelefs, and if they did not, they ought to be deftroyed; a fentiment worthy of fuch a leader, and of the caufe in which he was engaged.

Here followed feveral ages of the moft wretched barbarifm and ignorance, fo that it is even wonderful that the fciences fhould ever again have recovered this deadly blow; but as we before obferved, fome of the philofophers of Alexandria efcaped the vengeance of their barbarous conquerors, and thefe of courfe carried with them fome remnant of that general learning, for which this fchool was fo defervedly celebrated. Still, however, deftitute of books, of inftruments, and probably alfo of the means of exiftence without manual labour, very little farther knowledge could be accumulated, and ftill lefs propagated, fo that in a few years every fpecies of knowledge connected with philofophy and mathematics muft have become extinct, had not the Arabians themfelves, within lefs than two centuries from this fatal cataftrophe, become the admirers and fupports of thofe very fciences which they had before fo nearly annihilated. They ftudied the works of the Greeks with the greateft affiduity, and if they added little to the ftock of knowledge which thefe works contained, they became fufficient mafters of many of the fubjects to enable them to comment upon them, and to fet a due value upon thefe precious relics of ancient fcience; by which means they have been preferved, and handed down to the moderns. Of all the branches of mathematics, aftronomy was that which the Arabs held in the greateft eftimation, at the fame time however they did not totally neglect the other branches. Our prefent fyftem of arithmetic is derived from thefe people, though it does not appear that they were the inventors, but had acquired their knowledge of it from the Indians. Geometry alfo, and particularly trigonometry, owe much to the improvements of the Arabs. Mohammed Ben Mufa, and Geber Ben Alpha, who lived about the eleventh century, are both well known for their fcientific works. Amongft the Arabian princes and aftronomers, the moft celebrated are, Almanfor, who flourifhed about the year 754; Al. Maimon, who reigned from 813 to 833, in whofe time, in confequence of the great fupport and affiftance which he afforded to the fciences, we find them making very confiderable progrefs; Alfragan, Thebit Ibn Chora, and Albategni, were particularly diftinguifhed about this period. Thebit was an algebraift, geometrician, and aftronomer; Alfragan compofed elements of the latter fciences, of which feveral editions have been publifhed fince the invention of printing; and Albategni, in confequence of his numerous and important obfervations, and accurate knowledge, was furnamed the Arabian Ptolemy. The works of this author have been collected in one quarto volume, entitled "De Scientia Stellarum," of which there are two editions, one publifhed in 1537, and the other in 1646. We cannot here enumerate all the Arabian aftronomers and mathematicians who diftinguifhed themfelves for feveral centuries, an extenfive lift of whom, with their refpective works, is given by Montucla in his valuable Hiftory of Mathematics; we muft not however pafs over Alhazen, a very celebrated Arab, who fettled in Spain about the year 1100, and to whom we are indebted for a treatife on optics, and for the firft theory of refraction and twilight.

About this time the mathematical fcience began to be propagated in feveral European countries. So early as the year 1202, an Italian merchant, Leonardus de Pifa, had compofed a treatife on algebra, in which he fucceeded in the folution of equations of the third degree, and thofe of higher dimenfions, in certain cafes, where they would allow of reduction. Jordanus Nemorarius was another eminent author in his time (A.D. 1230); he wrote on arithmetic, geometry, and the planifphere; but his contemporary, John of Hallifax, commonly Sacrobofco, was much better known. This latter author was an Englifhman, but went and refided as profeffor of mathematics at Paris. We have a treatife of his on the fphere; which has been commented on by Clavius, the jefuit, and reprinted a great number of times; he likewife left us a treatife on the aftrolabe, on the calendar, and on the arithmetic of the Arabs. In 1250, Campanus Novara tranflated and commented on Euclid's Elements, and wrote a treatife on the fphere, and another on the theory of the planets, the object of which was to explain the ancient aftronomy, and the corrections introduced by the Arabs. We have another work of the fame period on optics, by Thomas Pecam, who from a fimple obfervantine monk became archbifhop of Canterbury; this treatife has been feveral times reprinted, and was long confidered as a claffical work. The fciences at this time found a zealous patron in the great emperor Frederic II., even amid the continual wars he had to fuftain againft the pope. This prince afcended the throne in 1219, and died in 1250 during, which period he founded the univerfity of Naples.

Another

Another celebrated philosopher of this period was Roger Bacon, an Englishman, who was born in 1214, and whose numerous works have been repeatedly reprinted. His treatise on optics is considered a very masterly performance for the time in which it was written. It has even been asserted, that he understood the use of spectacles, and was the inventor of gunpowder; but in fact neither of these discoveries can be properly attributed to him, though, with regard to the latter, he was certainly upon the verge of it, but he did not thoroughly explain it, nor was this done for many years after. Bacon was persecuted by the monks, being accused by them of magic, and was on this charge thrown into a dungeon, from which he was not liberated, till he had fully convinced his superiors, and the pope, *that he was no magician, nor had ever held any correspondence with the devil.* With regard to the invention of spectacles, it was not made till after the death of Bacon, by Alexander Spina, a Jacobin friar, who died in 1313.

The 14th century produced few scientific men of eminence; but some of those who, though they did not advance this subject, prevented it from being lost, deserve to be mentioned. Of these we may enumerate Peter of Albano, who wrote a treatise on the astrolabe; and Cecchi Ascoli, professor of mathematics at Bologna, who composed a commentary on the sphere of Sacrobosco, which was several times reprinted. Both these men acquired the reputation of sorcerers and heretics, in consequence of which the former was burnt in effigy, and the latter in person, in the year 1328, at the age of seventy. In Germany, John of Saxony, an Augustine friar, wrote on the Alphonsine tables, and on eclipses, and Henry of Hesse, professor at the newly founded university of Vienna, treated on the theory of the planets; but these works were never printed. We might mention some other names, as John de Muris, author of a system of music, and an astronomical work; John de Lignières, also an astronomer at Amiens, and a few others; but their works being now wholly forgotten, it would answer no purpose to lengthen this article, and fatigue the reader with uninteresting details. Some progress, however, was made in mechanics during this century; wheeled clocks were constructed, which exhibited, besides the hours, several of the planetary motions; paper-mills were invented or improved, and the useful article paper began to get into common use.

The 15th century, to which we are now arrived, was much more fruitful in men of science and genius than any we have met with since the time of the ancient Greeks. Amongst those who cultivated geometry and algebra at this time, is principally to be distinguished Lucas Paccioli, or Lucas de Burgo, who was a Franciscan monk, and flourished towards the end of this century. He composed several works, translated Euclid into Latin, to which he added some learned annotations; he also published a work entitled "Summa de Arithmetica Geometria, &c." in which we find the common rules in arithmetic, the rule of false position, and the resolution of simple and quadratic equations; we are likewise indebted to him for two other works, one entitled "De Divina," and the other on the regular bodies.

Astronomy also made considerable progress in this age. Its first benefactor was John Gmunden of Vienna, and Peter Dailli, who, in 1414, proposed to the council of Constance a reformation of the calendar, which was become very incorrect. The cardinal Nicholas de Cusa ought also to be particularly distinguished for his persevering through fruitless attempts to revive the Pythagorean system. To these may be added Purbach, and his pupil Regiomontanus, who were two of the greatest promoters of astronomy at this period. They observed the heavens together at Vienna for ten years, and after the death of Purbach, his pupil took a journey to Rome to learn the Greek language with more facility, in order that he might read the other Greek works; Ptolemy having been before his principal resource. Here his progress was very rapid; for in a short time he translated into Latin the Conics of Apollonius, the Cylindrics of Serenus, the mechanical questions of Aristotle, the Pneumatics of Hero, all the works of Ptolemy, &c. Besides these labours, he was author of several excellent works of his own, particularly one on trigonometry; he was also employed by pope Sixtus IV. in the reformation of the calendar, but died before it was completed, in 1476. In France, James Lefevre cultivated the mathematics with success, rendering them considerable service by his translations and other performances. In Italy, John Bianchini constructed astronomical tables, much esteemed in their time; James Angelo, a Florentine, translated Ptolemy's geography; and Dominic Maria Novera of Bologna initiated Copernicus into astronomy. In Germany, John Engel, a Bavarian, published ephemerides of celestial motions, and proposed a scheme for reforming the calendar. In Spain, Ferdinand of Cordova commented upon Ptolemy's Almagest, and Bernard of Granolachi published also ephemerides in 1488, and calculated as far as 1550. In this century also, the properties of the magnet began to be better understood; some considerable voyages were undertaken and successfully performed; sea-charts were invented by Henry duke of Visco; new lands and continents were discovered; in short, every thing seemed to promise a rapid progress in the cultivation of the sciences.

Early in the 16th century, we meet with several distinguished analysts and geometricians. Of these Cardan is perhaps the best known, though some of his contemporaries equally distinguished themselves: such was Tartaglia, the author of the solution of cubic equations, which is commonly, though falsely, ascribed to Cardan. (See IRREDUCIBLE *Case.*) A pupil of Cardan, Lewis Ferrari, also distinguished himself by his solution of biquadratic equations; the same was also done by Bombelli of Bologna, who likewise made several other important improvements and discoveries; amongst the rest, shewing that the two branches of the common expression for the root of a cubic equation of the irreducible case was a real quantity, and thus removing what had been before considered as an unaccountable paradox. We ought also to mention Maurolicus, a Sicilian abbot, who discovered a method of summing several series, as for instance series of squares, cubes, &c., as also the triangular and other figurate numbers. But during this century, no one has greater claim for his analytical discoveries than Vieta; to whom we owe a very important improvement in the algebraical notation. Before his time no solution of any but numerical equations had ever been attempted; the unknown quantity was represented by some letter or symbol, and all the other quantities were absolute numbers, and all particular rules were expressed in words at length as in arithmetic: but Vieta, by introducing letters as representatives of quantities, whether known or unknown, gave a generalization to the algorithm of this science, which is now one of its most important characteristics. To the same celebrated author we are indebted for the theory of angular sections, a branch of analytical trigonometry, which has been so fruitful in the hands of the Bernouillis and Euler; as we are also for the first general

 idea

idea of applying algebra to the folution of geometrical problems, an invention which is falfely afcribed to Defcartes. What is given above relates principally to analyfis, but geometry alfo made fome progrefs during the fame period, though no very important difcoveries were made in this fcience, except fo far as that which relates to the angular fections of Vieta above-mentioned; however, Tartaglia, Maurolicus, Commandin, and Ramus may be confidered as poffeffing a refpectable knowledge of this fubject, and as having by their works and tranflations rendered it confiderable fervice: befides thefe, we may mention Peter Metius, Hadrianus Romanus, and Ludolphus van Ceulen, each of them authors of different methods of approximation with regard to the ratio of the circumference to the diameter of the circle; the latter of whom, in particular, carried it to 36 places of decimals. Aftronomy alfo was confiderably advanced during this century; Copernicus very early in it made, or at leaft attempted to make, that important reformation of placing the fun in the centre of the fyftem, according to the ancient or Pythagorean doctrine, though his work "De Revolutionibus," in which it is contained, was not completely finifhed till the year 1543, the author dying on the very day on which he received the firft complete copy. This fyftem, which is now fo univerfally confided in, fo fimple in its mechanifm, fo conformable to all celeftial appearances, and fo worthy of the great and omnipotent architect, was, through the ignorance and fuperftition of a few contemptible bigots, declared to be heretical. To affert the mobility of the earth, or the fallibility of the pope, were confidered as crimes of the blackeft dye, and were accordingly vifited with the moft *ingenious* torture of the Inquifition; fortunately, however, for the caufe of truth, and the fciences, this inftitution has long fince been difarmed of its terror, and the true fyftem of aftronomy is now fupported upon a bafis, which no inquifitorial power will ever be able to deftroy. Of thofe who moft contributed to fupport the Copernican fyftem, muft be particularly diftinguifhed the celebrated Galileo, whofe important difcoveries in various branches of aftronomy, mechanics, and philofophy, are too numerous to admit of a minute detail in this place; we muft therefore refer the reader for particulars to the article GALILEO. We fhall, however, for the fake of connection, mention his difcovery of the law of falling bodies, and his invention, or at leaft important improvement in the ufe of the telefcope; whereby he firft difcovered the fatellites of Jupiter. Tycho Brahe, the Danifh aftronomer, alfo flourifhed about this time, and is defervedly celebrated for his numerous and accurate celeftial obfervations, which, aided by thofe made by himfelf, furnifhed Kepler with fufficient data to inveftigate the planetary motions, and finally led to the eftablifhment of thofe laws that bear his name; and which may be confidered as the firft ftep towards the true theory of phyfical aftronomy. See KEPLER's *Laws*.

Such was the ftate of the fciences at the commencement of the 17th century, when a moft important difcovery was made by baron Napier, of Merchefton, in Scotland, who in 1614 publifhed his "Logarithmorum Canonis Defcriptio, &c." a work which entitles its author to a rank amongft the firft-rate mathematicians. Previoufly to the invention of logarithms, all trigonometrical and aftronomical calculations were attended with immenfe labour, in confequence of the numerous operations in multiplication and divifion which entered into them, at the fame time that the refults were neceffarily attended with lefs certainty. But by this happy invention, all the moft tedious cafes were rendered extremely eafy, and confequently great facility given to aftronomical and trigonometrical computations. It was not, however, in the firft inftance, fo well calculated for general practice as the fyftem in prefent ufe; for which we are indebted to Henry Briggs, profeffor of mathematics in the univerfity of Oxford, who laboured with the greateft poffible zeal to bring them into their prefent ftate. We fhall not in this place enter into any defcription of the nature of thefe numbers, as this is already done under the article LOGARITHMS: it will therefore be fufficient for our purpofe to name thofe who, at this period, moft diftinguifhed themfelves in the advancement of this department of fcience; fuch were Gellibrand, Gunther, and Vlacq, all friends or pupils of Briggs: and to thefe we may add Juftus Byrge, a German, who printed a table conftructed according to the inverfe order of our common tables of logarithms. Inftead of confidering the numbers relative to the geometrical progreffion as the principal numbers, to which the logarithms ought to be fubordinate, he, on the contrary, confidered the logarithms as the principals, to which he made thofe depending on the geometrical progreffion correfpond. But this fyftem met with very little fuccefs, being in no refpect calculated for common ufe, in confequence of the immenfe tables which it required.

About this period, 1620, Harriot, a well-known Englifh analyft, enriched algebra by feveral important improvements, who firft fubftituted fmall letters inftead of the capitals ufed by Vieta; and proved that every equation has as many roots as there are units in the index of the higheft power, and that all equations may be confidered as produced by the multiplication of equations of the firft order. Defcartes alfo fhewed the method of expreffing curve lines by means of equations, and of diftributing them into different claffes, according to the different order of thefe equations. We are alfo indebted to the fame author for a method of drawing tangents, maximum et minimum, the theory of curves of double curvature, &c. problems which do their author more fubftantial honour than his more lofty, but hypothetical theory of vortices, and other of his philofophical fpeculations, which latter, however, are not materially connected with the prefent fubject. Fermat alfo contributed largely at this period to the improvement of analyfis, particularly in what relates to the Diophantine problems, and the theory of numbers; the latter of which branches may be faid to date its origin from this time: many elegant numerical theorems were difcovered by this author, moft of which were left without demonftration, and fome of them ftill remain to exercife the talents of the ableft analyfts of the prefent day. Several other mathematicians might here alfo be mentioned, who contributed to the advancement of the fciences at this period, but the limits of our article will not admit of fuch an enumeration; we muft not, however, pafs over Cavalerius, who firft left the beaten path of the ancients, and treated geometry in a manner totally different from what they had done, and thus facilitated the operations in a variety of difficult problems; but at the fame time it muft not be denied, that it wanted the accuracy and certainty which characterized the ancient method. His work, which contained the doctrine of Indivifibles, was publifhed in 1635, and may be confidered the firft link in the modern geometry. Mechanics and hydrodynamics were cultivated with equal fuccefs during this period. Torricelli, a pupil of Galileo, following the path of his mafter, made feveral important improvements; the moft celebrated of which was his determination of the gravitating power of the atmofphere. This difcovery led to that of the barometer, or rather perhaps the latter led to

 the

the former; for it was by an inftrument of this kind that he was enabled to determine the weight of this fluid. The refult obtained by this means was oppofed by various arguments, till the well-known experiment of the Puy-de-Dome fet the queftion at reft for ever. This experiment was projected by the celebrated Pafcal, to whom we are indebted for many important difcoveries in various branches of the mathematical fciences, particularly for the firft ideas of the doctrine of probabilities, which has become in latter times an extremely ufeful fcience, being that on which are founded all calculations connected with life-infurances and annuities. The fubject was but flightly touched upon by Pafcal, but was afterwards confiderably enlarged by Montmort, and finally completed by De Moivre.

At this period almoft every branch of fcience was cultivated with the happieft effect; problems were propofed by the mathematicians of one country as challenges to thofe of another; a lively emulation was excited between the contending parties; and each fupported the honour of his country with all the power he poffeffed. This was the means of producing many curious propofitions and interefting theories, but the limits of our article will not allow of entering upon this fubject, and we muft therefore reluctantly pafs over in filence many eminent writers of this time, whofe names would otherwife deferve to be recorded. We muft not, however, omit Dr. Wallis, who, in 1665, publifhed his Arithmetic of Infinites, a work abounding with genius, and of which the object was to determine the fums of various feries of numbers, the quadrature of certain curves, and many other fubjects, in which this author difcovered a profound knowledge of geometry and analyfis; to him we owe the method of denoting radical by fractional indices, as we do alfo the ufe of negative indices; Defcartes having employed exponents in pofitive and integral powers only. The theory of continued fractions alfo date their origin from this period, having been firft difcovered by lord Brounker, of Caftle Lyons, in Ireland, who was born in 1620, and died in 1684. Another eminent mathematician of this date deferves particular attention, the celebrated Huygens, a Dutchman, whofe extenfive and perfevering genius led him to the cultivation of every department of fcience; geometry, aftronomy, analyfis, and mechanics, are indebted to him for important improvements; in the former his theory of evolutes difplays the powers of his mind; in aftronomy his name will ever be remembered for his difcovery of what is now termed the fourth fatellite of Saturn, and the ring by which that planet is encompaffed; which difcoveries were made by means of a powerful telefcope which he had himfelf conftructed; the theory of pendulums, their vibrations, the centres of ofcillation, percuffion, and various other interefting and ufeful mechanical problems are due to this diftinguifhed author. (See HUYGENS.) It was alfo towards the conclufion of this century, at which we are now arrived, that the progreffive motion of light was difcovered by Roemer, a Danifh mathematician and aftronomer; before his time the propagation of light was fuppofed to be inftantaneous, but by obfervations of the eclipfes of Jupiter's fatellites, this was found to be erroneous, and not only its progreffive motion became obvious, but the velocity with which it moves was pretty accurately afcertained. Dr. Hooke, another celebrated Englifh philofopher of the fame date, here alfo claims our attention. To this diftinguifhed author we owe a variety of difcoveries and improvements in various branches of mechanics and aftronomy, but of all thefe, perhaps his ideas of univerfal gravitation, though they were not complete, are the moft deferving of notice. On this head he made the following fuppofitions: all the celeftial bodies have not only an attraction or gravitation towards their own centre, but they mutually attract each other in the fphere of their activity. All bodies which have a fimple and direct motion, would continue to move in a right line, if fome force were not inceffantly turning them out of it, and compelling them to defcribe a circle, ellipfis, or other curve. Attraction is fo much the more powerful, as the attracting body is more near. Thefe cafes all enter into the Newtonian fyftem, and only the law of attraction was wanting to render the theory complete.

We have not hitherto mentioned the name of Newton, though moft of his difcoveries were made prior to the beginning of the 18th century; becaufe we wifhed to confider this important epoch unconnected with any extraneous matter, and to bring together in this place only thofe diftinguifhed authors who contefted with each other that crown of glory, which by univerfal confent has been placed upon the brow of the Englifh philofopher. Under this clafs are included Leibnitz, and the brothers John and James Bernouilli, to whom muft alfo be added the marquis de l'Hôpital, a French nobleman, as much diftinguifhed for his amiable and upright difpofition as for his profound knowledge in analyfis and geometry. It does not enter into our plan to give a minute defcription of the labours of each of thefe authors, as that would far exceed the limits of this article; we muft therefore confine our obfervations to what may be confidered real difcoveries, and in thefe our illuftrious countryman will neceffarily form the moft prominent object; the Bernouillis undoubtedly poffeffed a moft powerful genius, and gave the folution of problems the moft refined that ever exercifed the mental faculties of man; ftill their works are not of that defcription which can properly form a part of a brief abftract of mathematical hiftory, though in a more extended account they would form a very confiderable part; the fame obfervation has place with regard to de l'Hôpital. To Leibnitz we are indebted for the difcovery of the differential calculus, at leaft it was he who firft publifhed it in the Leipfic Tranfactions for 1684, though his real claim to the original invention has been always a matter of difpute between the Englifh and foreign mathematicians; the former contending that he had derived his method from hints which he had received, and from letters that paffed between him and Newton and other Englifh analyfts. It is impoffible in this place to enter upon the merits of Leibnitz's claims to the priority of invention, we muft therefore refer the reader who wifhes to fee the matter fully inveftigated, to the "Commercium epiftolicum de Analyfi promota," publifhed by order of the Royal Society, in which the whole of this fubject is minutely inveftigated. Montucla has alfo given in his "Hiftoire des Mathematiques," an impartial inveftigation of thefe claims, but Boffut is evidently biaffed, and not only on this fubject, but in others relating to Newton is tardy in his acknowledgment of his fterling merit. With regard to Leibnitz and Newton, they were both rich in genius and invention, and it is not improbable that both arrived at the fame calculus by different routes. One is unwilling to attribute to fo celebrated a man as Leibnitz, fo mean an action as that of plagiarifm, and with regard to Newton it never was infinuated by any of his opponents that any charge of this kind attached to his doctrine of fluxions. In fact, when we confider the methods of *maxima et minima*, of Fermat, Roberval, and Hudde, and the differential triangle of Barrow, each of which were fo many advances towards the perfection of the new analyfis, it will not be at all furprifing that the fame general refults fhould be deduced by two fuch men as Leibnitz and Newton; where fo much had been already

ready prepared for their ufe, and which only wanted a great and comprehenfive genius to generalize and bring it to perfection. The invention of fluxions, though it will ever form a moft important era in the hiftory of the exact fciences, is ftill by no means the greateft of Newton's difcoveries. Phyfical aftronomy, chronology, and optics, are equally indebted to him, and fhew the power and extent of his univerfal genius. It would be ufelefs to attempt to enumerate in this place his difcoveries in thefe fciences, we muft therefore refer the reader to the articles ATTRACTION, GRAVITATION, FLUXIONS, OPTICS, &c. as alfo the biographical article NEWTON, where he will find a more ample detail of particulars than could with propriety be given in this general fketch, the object of which is not to enter into the minutiæ of the hiftory, but merely to trace the general outline of the progrefs of the fciences, and the connection and dependence of the feveral parts upon each other, which view of the fubject is loft in the detached hiftories of the feparate branches. We muft now pafs rapidly over the hiftory of the laft century, not that it is lefs prolific in events than the preceding, but becaufe the events are more recent, and many eminent authors of this period ftill exift, and are ftill enriching the fciences with their difcoveries. Of thofe that are no more, we ought particularly to diftinguifh Halley, Bradley, Taylor, d'Alembert, and Euler. Of thefe Halley will ever be remembered for his numerous and accurate aftronomical obfervations, and particularly for his being the firft and only aftronomer that ever truly predicted the return of a comet. The theory of the aberration of light will immortalize the name of Bradley; and the doctrine of increments will claim for its author, Dr. Taylor, a diftinguifhed place amongft modern geometers. D'Alembert is defervedly celebrated for his extenfive knowledge in elegant literature; while his theory of *partial differences*, and various other mathematical refearches, cannot fail of placing him in the firft rank of modern mathematicians. Euler's voluminous writings difplay in every part a fuperior and comprehenfive genius, and the clearnefs and perfpicuity with which he treated the various branches of analyfis and geometry, fhew the folidity and accuracy of his judgment: in fact, if we confider Euler as an analyft and geometrician, we cannot deny to him the honour which has been beftowed upon him by a celebrated author of the prefent day, *viz.* that he was one of the moft extraordinary men that any age or country ever produced. To thefe names we might add thofe of Cotes, Maclaurin, Simpfon, Cramer, Waring, and various others, but the limits of this article requires us to defift from any farther enumeration.

In the preceding pages, we have endeavoured to follow, as nearly as poffible, the order of time in which the feveral difcoveries and improvements were made, and, as far as we were able, to introduce all the moft prominent parts of the hiftory of mathematics, and the moft celebrated of its profeffors; but in the fhort fpace that this article occupies, it muft neceffarily have happened that many diftinguifhed names are omitted. To compenfate for this, in fome meafure, we have framed the following biographical chart, which exhibits, under one point of view, the dates, names, and difcoveries of all the moft eminent mathematicians from the earlieft period. Thofe who are more particularly celebrated are printed in Roman capitals, with the country in which they flourifhed, and that particular branch of mathematics in which they moft excelled, or which they have invented or improved. Where there is nothing of a particular nature whereby an author is diftinguifhed, his country only is given, and fome general term, as aftronomy, philofophy, mathematics, &c. to indicate to which branch of the fciences he more particularly directed his attention. But in the laft four centuries, in order to make more room, fuch remarks are omitted, and the name only retained. This table might have been much more extended had our limits admitted of it; but it is prefumed that few authors are omitted, who have contributed, in any confiderable degree, to the advancement of thofe fciences.

MATHEMATICS.

Chronological TABLE of the moſt eminent Mathematicians from the earlieſt Period to the preſent Time.

Cent.	Beginning.	Middle.	End.
B.C.	CONFUCIUS, 722 B.C.	Era of Nabonaſſar, 747 B.C.	CHIRON the Centeau, 960 B.C.
600	THALES, Gr. Predict. an Eclipſe. Anaximander, Gr. Celeſt. Globes.		
500	Cleoſtratus, Gr. Aſtronomy.	Anaxagoras, Gr. Philoſophy. Anaximenes, Gr. Sun Dial.	PYTHAGORAS, Gr. 47 Eu. Syſt. Aſt.
400	Euctemon, Gr. Aſtronomy. Meton, Gr. Metonic Cycle. PLATO, Gr. Geom. and Philoſ.	Hippocrates, Gr. Quad. of Lunes.	Œnopides, Gr. Geometry. Zonodorus, Gr. Geometry.
300	ARISTOTLE, Gr. Philoſophy. Calippus, Gr. Aſtronomy. Dinocrates, Gr. Architecture. Theophraſtus, Gr. Hiſt. and Math. Xenocrates, Gr. Architecture.	EUDOXUS, Gr. Geom. and Aſtron.	PYTHEAS, Gaul, Navig. & Aſtron. Archytas, Gr. Math. and Phil. Ariſtæus, Gr. Conic Sections. Dinoſtratus, Gr. Quadratix. Menechmus, Gr. Geometry.
200	APOLLONIUS, Gr. Geometry and Conic Sections.	*ARCHIMEDES.* Ariſtarchus, Gr. Aſtronomy. Eratoſthenes, Gr. Meaſ. a Degree.	EUCLID, Gr. Elem. Geo. & Optics. Aratus, Gr. Poet. and Aſtron. Ariſtillus, Gr. Phil. and Aſtron. Nichomedes, Gr. Conchoid.

MATHEO, St., in *Geography*, a town of Spain, in the province of Valencia; 27 miles S.S.W. of Tortoſa.

MATHEPOUR, a town of Hindooſtan, in Guzerat; 30 miles N.W. of Puttan-Sumnaut.

MATHER, Increase, in *Biography*, an eminent American divine, who flouriſhed in the 17th and 18th centuries, was born at Dorcheſter, in New England, in the year 1635. He purſued his academical courſe of ſtudies at Harvard college, in Cambridge, where he took his degree of B. A. in 1656. In the following year he made a voyage to England, and from thence he went to Ireland, and having a brother, miniſter to a congregation at Dublin, he entered himſelf of Trinity college, in which he proceeded M. A in 1658, having performed the neceſſary exerciſes with great applauſe. He was not more diſtinguiſhed for his talents than reſpected for the ſuavity of his manners and the rectitude of his deportment, and was offered a fellowſhip in that inſtitution; but finding the climate of the iſland unfavourable to his health, he returned to England, and officiated for ſome time as miniſter, in the place of Mr. Howe, at Great Torrington, in Devonſhire. Upon the return of the paſtor to his flock, in 1659, Mr. Mather accepted an invitation to become chaplain to colonel Bingham, governor of the iſland of Guernſey, and preached every Sunday, as well before the garriſon, as in the town of Peter le Port. When the time came that he was obliged to conform to the eſtabliſhed religion, or quit his ſituation, he readily ſubmitted to the latter, and returned to England. Here he might have had valuable church preferment, but he choſe a clear conſcience to any thing that the world could offer, and failed for New England, where he was choſen miniſter to the New Church at Boſton. Shortly after this, he married the daughter of Mr. John Cotton, a gentleman of conſiderable eminence in England, from whence he had been driven on account of his non-conformity. He had formerly been vicar of Boſton in Lincolnſhire, in England, and was now ſettled as miniſter at Boſton in America. In 1664, Mr. Mather was ordained to the paſtoral office, the duties of which he performed through life with credit to himſelf, and highly eſteemed by his people. In the year 1683, when king Charles II. required the inhabitants of New England to ſurrender their charter, Mr. Mather attended at a meeting of the freemen of Boſton, and by his zealous perſuaſions determined them to reject a motion for that purpoſe unanimouſly, and to leave the iſſue to Providence, rather than become the degraded inſtruments of voluntarily ſacrificing their liberties. This ſpirited meaſure had conſiderable influence in prevailing on the country in general to imitate the example ſet by the Boſtonians. Upon the publication of king James' ſecond declaration for liberty of conſcience, ſome of the miniſters of New England, and their churches, drew up addreſſes of thanks to him for the benefits which they enjoyed in conſequence of it, and Mr. Mather proceeded to England for the purpoſe of preſenting them. He was favourably received at court, and laid before the king the ſtate of the country. While he continued in England, the revolution took place, and he was conſulted by the new adminiſtration on many political topics, particularly on an attempt to obtain the reſettlement of the Maſſachuſetts colony, upon their chartered foundation, by an act of parliament, which was fruſtrated by its diſſolution. He at length obtained from his majeſty a new charter, containing the whole of the old one, with the addition of new and more ample privileges. Having rendered this important ſervice to his fellow citizens, he ſet ſail for America in 1692, and on his return he received the public thanks of the houſe of repreſentatives for his faithful and zealous endeavours to benefit his country. He now returned to his labours in the church, and at Harvard college, of which he was choſen preſident in 1684, and alſo created doctor of divinity. He died in 1723, at the age of 84. He was author of many theological tracts: of "A brief Hiſtory of the War with the Indians in New England;" of "An Eſſay for the recording of illuſtrious Providences, wherein an account is given of many remarkable and memorable events which have happened in this laſt age, eſpecially in New England;" of "A Diſcourſe on Comets;" "A Diſcourſe concerning Earthquakes, &c."

Mather, Cotton, ſon of the preceding, was born at Boſton in 1662-3, and was, while very young, diſtinguiſhed by his great proficiency in the learned languages. At twelve years of age he was thought to be well qualified, by his previous knowledge, for entering on academical ſtudies, and was accordingly admitted to Harvard college, where, in a very ſhort time, he ſurpaſſed his contemporaries in the different branches of literature and ſcience. Before he was twenty years of age he had taken his degrees of B. A. and M. A. He now undertook the office of tutor, which he retained with great reputation for the ſpace of about ſeven years, and he had, afterwards, the ſatisfaction of ſeeing ſeveral of his pupils become eminent characters in the church and the world. In early life he was afflicted with a ſtammering, or impediment in his ſpeech; but by great attention and care he overcame the defect, and engaged in the ſervices of the pulpit in the year 1680. He was firſt elected as aſſiſtant to his father in the church at Boſton; and in 1684 he was ordained as co-paſtor. He was indefatigable in every duty in which he engaged; and to render himſelf more extenſively uſeful, he applied to the ſtudy of the modern languages, and made himſelf maſter of the Iroquois Indian tongue, ſo that he was able to write and publiſh treatiſes in each of theſe languages. He was frequently conſulted on matters of ſtate by the magiſtrates, and more than once ſucceeded in quelling dangerous riots by the force of his perſuaſion. In one thing, however, he was ſtrangely miſguided by the prejudices of the times in which he lived; he believed in the powers of witchcraft, and joined in the perſecutions that were carried on in that country, againſt ſome poor creatures who had incurred the diſpleaſure of their neighbours on this head. He contributed to promote the phrenzy of the time by publiſhing the trials of the accuſed, and by ſome other writings in ſupport of the abſurd and pernicious doctrine of witchcraft. In every other reſpect he was uniformly influenced by a moſt diſintereſted regard for the public good: he planned and promoted ſeveral uſeful inſtitutions, and he was an active member of a ſociety whoſe profeſſed buſineſs was to compoſe differences and prevent law-ſuits. He was a commiſſioner for Indian affairs, and exerted all his powers to promote the inſtruction and happineſs of the native inhabitants. He was the firſt perſon that introduced the practice of inoculation for the ſmall-pox into America. His fame was not confined to his own country; but his merit was known and acknowledged in diſtant parts. In 1710, the univerſity of Glaſgow conferred on him the degree of doctor in divinity, and in 1714 the Royal Society of London elected him one of their body. He died in 1727-8, when he had completed his ſixty-fifth year, leaving behind him a character for great piety and benevolence; he was as a man and a member of ſociety, polite, friendly, and a moſt entertaining as well as inſtructive companion. He publiſhed nearly four hundred diſtinct pieces, many of which were, of courſe, very ſmall, ſuch as ſingle ſermons, eſſays, &c. Among theſe, we may notice "Magnalia Chriſti Americana; or, An Eccleſiaſtical Hiſtory of New

New England from its firft planting in 1620 to 1698;" "The Wonders of the Invifible World; being an account of the trials of feveral witches lately executed in New England, and of feveral remarkable curiofities therein occurring;" "Johannes in Eremo: or, The Lives of feveral famous Divines;" and "India Chriftiana; or, An Account of the Propagation of Chriftianity in the Eaft and Weft Indies." Our author, during a great part of his life, was honoured by an epiftolary correfpondence with feveral perfons of eminent character for piety and learning, and among others with that of lord chancellor King, lord Barrington, Mr. Whifton, M. Defaguliers, and the celebrated doctor Franke, profeffor of divinity in the univerfity of Halle in Saxony. Biog. Brit.

MATHIEU, St., in *Geography*, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the diftrict of Rochechouart; 12 miles S.S.W. of St. Junien. The place contains 1946, and the canton 9699 inhabitants, on a territory of 252½ kiliometres, in 10 communes.

MATHRAVEL, a village of North Wales, in the county of Montgomery; once the feat of the prince of Powis, and fuppofed to be the ancient city called "Mediolanum," now reduced to a farm-houfe; five miles N.W. of Welfhpool.

MATHURINS, in *Ecclefiaftical Hiftory*, a name given to the brethren of the Holy Trinity, from their having a monaftery at Paris, erected in the place where there is a chapel confecrated to St. Mathurin. See Trinitarians.

MATHUSEN, or Mauthausen, in *Geography*, a town of Auftria, fituated on the Danube; feven miles E. of Steyregg.

MATIANA, in *Ancient Geography*, a country of Afia, between Armenia and Media; called by Strabo the Martianane of Media.

MATIAS, St., in *Geography*, a town of New Navarre; 150 miles W. of Cafa Grande.

MATICA, St., a town of Ruffia, in the government of Revel, on the gulf of Finland; 20 miles N.E. of Revel.

MATICALAS, a river on the W. coaft of New Mexico; feven leagues from Cateltaftrand, or the port of Sanfonate, known by fome high but fmall hills that are oppofite to it, and much expofed to northerly winds.

MATIGNAN, a town of France, in the department of the North Coafts, and chief place of a canton, in the diftrict of Dinan; 14 miles N.W. of Dinan. The place contains 996, and the canton 8894 inhabitants, on a territory of 200 kiliometres, in 11 communes.

MATILDA, or Maud, in *Biography*, emprefs of Germany, and queen of England, daughter of Henry I. king of England, and Matilda of Scotland, was born in 1102. At eight years of age fhe was betrothed to Henry V., emperor of Germany, and was fent over to that country for education. The emperor dying, without iffue, in the year 1125, Matilda returned to the court of her father, who, having loft his only fon, caufed all the nobles, prelates, &c. to fwear fealty to her as his fucceffor, in cafe he fhould die without male iffue; and in 1127 he married her to Geoffrey, eldeft fon of Fulk, count of Anjou. She now went to refide in Normandy, and in 1132 fhe was delivered of a fon, afterwards Henry II.; and by the death of her father, in 1135, fhe became heirefs of all his dominions in England and France. She was then refiding at Anjou with her hufband, of which circumftance Stephen, earl of Blois, took advantage, and feized upon the crown of England. The barons of Normandy followed the example of the Englifh in fubmitting to Stephen, fo that Matilda was almoft inftantly deprived of the inheritance which her father had attempted to fecure for her. The government of Stephen was foon hated, and Matilda, in 1139, landed in England, and a number of the moft powerful barons, without hefitation, declared in her favour. A civil war enfued, and, in 1141, Stephen was taken prifoner, and Matilda was crowned queen of England in the cathedral of Winchefter. She was naturally of a haughty difpofition, and, overfet with her good fortune, fhe refufed to liften to the requefts of her nobles, and infolently rejected the petition of the Londoners for the reftoration of the laws of Edward the Confeffor. Confpiracies were formed to feize her perfon, but fhe efcaped the machinations of her fubjects, and withdrew to Normandy in the year 1148, where fhe fpent the remainder of her days. She died in 1167. Hume.

Matilda, countefs of Tufcany, the daughter of Boniface, marquis of Tufcany, celebrated for her attachment to the papal fee, was born, according to fome accounts, in 1039, and, according to others, in 1046. She firft married Godfrey le Boffu, fon of the duke of Lorraine, but lived almoft entirely apart from him, not chufing to follow him from Italy to a ruder climate. Godfrey died in 1076, and in the fame year, by the death of her mother Beatrice, fhe fucceeded to vaft poffeffions in Italy. She now put herfelf entirely under the direction of Gregory VII. efpoufed his caufe with all the zeal of a partizan, and in the year 1077 fhe made a reverfionary grant of all fhe poffeffed to the church, to the prejudice of the emperor, Henry IV., to whom they would have devolved on her death. She affifted the pope with all the forces fhe could raife, and feveral times appeared in perfon at their head. After the death of Gregory, in 1085, Matilda ftill continued to give her fupport to the Roman fee under his fucceffors, Victor III. and Urban II. In 1089, fhe married, a fecond time, Guelph, fon of the duke of Bavaria, a diftinguifhed leader in the party adverfe to the emperor. Matilda died in 1115, having folemnly confirmed her dominions to the holy fee. The popes, however, were not able quietly to take poffeffion of thofe vaft eftates; and the conteft for them was the fource of long continued wars between them and the emperors. A part only of the donation finally took effect; neverthelefs, Matilda is juftly regarded by the votaries of the holy fee as the greateft temporal benefactor it ever poffeffed. This circumftance has rendered her a fubject for extravagant panegyric with one party, and for very fcandalous imputations with the oppofite. Univer Hift.

Matilda, in *Geography*, a townfhip of Upper Canada, in the county of Dundas, being the fixth townfhip in afcending the river St. Laurence; a few miles N.W. of Ofwegetchie.

MATILLA, a town of Spain, in the province of Leon; 20 miles S.S.W. of Salamanca.

MATIN, a river of Canada, which runs into the St. Laurence; 150 miles below Quebec.

Matins. See Mattins.

MATINA, in *Geography*, a town of Mexico, in the province of Cofta Rica; 60 miles N.N.E. of Carthage.

MATINATA, *Ital.*, a lover's morning fong, under the window of his miftrefs. The Crufca dictionary defines it, "Compofizione da cantare e fonare, che fanno gli amanti in ful matino davanti alla cafa della inamorata; come ferenata quel che fanno la notte al fereno:" a compofition fung and played by a lover in a morning, under the window of his miftrefs; as a *ferenata* is performed in a fimilar manner in the evening. See Serenata.

MATINICUS Islands, in *Geography*, iflands of America, on the coaft of Maine. Matinicus lies in N. lat. 43° 56′. W. long. 68° 20′.

MATINO,

MATINO, a town of Naples, in the province of Otranto; 10 miles E. of Gallipoli.

MATISFALVA, a town of Tranfylvania; feven miles E.S.E. of Samofvivar.

MATITES, in *Natural Hiftory*, the name of a ftone defcribed by feveral authors. The characters they give of it are, that it is of a pale greyifh colour, and of the form of the nipples of a woman's breafts, feveral of thefe nipples appearing upon one ftone.

It is plain, that there needs no more to the formation of one of thefe matitæ than the petrifaction of a piece of the fhell of one of the *echini marini*, or fea-eggs, which have large papillæ, fuch as thofe of the Red fea, with fome of its papillæ upon it. As to the colour, it is not to be limited to grey alone, but may be various as the colours of ftones, fince any fpecies of ftone may have gone to the formation of it; and whatever colour the ftony matter was, of that will the matites be.

MATKNELTZEL, in *Ornithology*, the name of a bird approaching to the fnipe kind, and called by Gefner *gallinula erythra;* and by the common people of Germany, *mattkern.* It is common in watery places in many parts of Germany and Italy. See FULICA *maculata.*

MATLOCK, in *Geography*, a village and parifh in the wapentake of Wirkfworth, Derbyfhire, England, is fituated on the eaftern banks of the river Derwent, 17 miles diftant from Derby, and 143 from London. At the time of compiling the Domefday book, it was a hamlet of the manor of Metesford, which was part of the demefnes of the crown. It was afterwards held by William de Ferrers, earl of Derby, but on the attainder of his fon Robert reverted to the crown; and being granted by Edward I. to Edmund earl of Lancafter, continued a part of that earldom and duchy till the reign of Charles I., when it was fold to the copyholders of the manor, and is now divided into fmall fhares. According to the return made under the population act of 1800, this parifh contained 492 houfes, occupied by 2354 perfons. The inhabitants are chiefly employed in the neighbouring lead mines, and in the manufacture of cotton. The houfes are principally of ftone; and at the entrance of the village is a neat ftone bridge. The church, which ftands on the verge of a romantic rock, confifts of a nave, fide aifles, and a fmall chancel. On the eminence called Riber, are the remains of a druidical altar, or cromlech, called the *Hirft ftones.* It is compofed of four maffes of grit-ftone, one of which, apparently the fmalleft, is placed on the others, and is computed to weigh about two tons. On this upper ftone is a circular hole, fix inches deep, and nine in diameter, wherein, till about the middle of the laft century, ftood a ftone pillar.

About a mile and a half from the village is Matlock-bath; which, though few fituations can be more beautiful, was only occupied by fome rude cottages inhabited by miners, till its warm fprings began to attract notice, for their medicinal qualities, about the year 1698. At that period the original bath was built, and a houfe alfo built for the accommodation of vifitors. A fecond fpring having been difcovered, a new bath and lodging-houfe were erected. At a later period, a third fpring was found; another bath and houfe were confequently built; the latter, by various alterations, is become one of the moft commodious hotels in England. Thefe buildings are of ftone, and are refpectively named, the Old Bath, the New Bath, and the Hotel. In thefe, and two private lodging-houfes, five hundred perfons may at the fame time be accommodated. The Matlock feafon commences at the end of April, and continues till November.

The fcenery of Matlock dale is peculiarly romantic and picturefque; being diverfified with rugged rocks contrafted with the fineft verdure. Two of thefe rocks, the High Tor, and Maffon hill, are worthy of notice. The former is upwards of 350 feet in height; the lower part is covered with fmall trees and underwood of various foliage; but the upper part, for fifty or fixty yards, is one broad mafs of naked perpendicular rock. The fragments that have fallen from it form the bed of the river which flows immediately below. After heavy rains, the impetuofity of the current is greatly increafed, and the fublimity of the view proportionably augmented. Oppofite to the High Tor, but rifing with a gentler afcent, though to a greater elevation, is Maffon hill, which appears like a pile of immenfe craggs. The fummit of this mountain has been named the Heights of Abraham, and overlooks the country to a vaft extent, befides commanding a beautiful bird's-eye view of nearly the whole dale. The height of this ftupendous eminence is about 250 yards; the path to its fummit has been carried in a winding or rather zigzag direction. and in various places has been planted with rows of firs, which opening at convenient diftances, admit the eye to range over the fcenery beneath, from different points of view. Near the upper end of the dale is a fpacious building, erected for the manufacture of cotton, by the late fir Richard Arkwright, and now the property of his fon Richard Arkwright, efq., whofe elegant manfion, Willerfley caftle, ftands on the fouth fide of a commanding eminence, which terminates the extenfive range of rocks that forms the eaftern boundary of the Derwent, in its courfe through Matlock dale. The caftle confifts of a body, in the form of an oblong fquare, having a circular tower rifing from the centre of the roof, and a femicircular tower projecting from the front on each fide of the entrance, and two wings with a round tower at each angle; the whole ftructure is embattled, and the walls are of free-ftone. Beauties of England and Wales, vol. iii.

MATLOCK *Waters.* See *Matlock* WATERS.

MATMAI, one of the Kurile or Kurilfkoi iflands, the fouthernmoft and largeft, fubject to the Japanefe, and fortified and garrifoned on the fide toward the continent. The channel between this ifland and Japan is faid to be no more than 60 verfts wide, and full of rocks. The current is very rapid. On the fouthern promontory ftands the Japanefe town Matmai, where the fupreme commander refides. The hairy Kurils are in poffeffion of the inland parts of the ifland. The Japanefe and Chinefe refort hither in trading veffels for the purpofes of commerce, which confifts in bartering with the Kurils for fea-otters, feals, and various forts of furs; alfo fat, oil, and blubber of whales, and other marine animals; eagles' feathers for fledging their darts and arrows, and other articles, in exchange for filk and cotton pieces for garments, japanned veffels, rice, brandy, tobacco, fabres, knives, pots, and kettles, hatchets, and the like. In the region of the bay Atkis, the land extends northward in a great headland, where lofty mountains rife on all parts, tending eaftward in ridges: within land are fpacious vales between the mountains, and large rivers roll in currents to the fea. The coaft abounds in bays and bights, which might be made to ferve for harbours. The forefts confift of oaks, beech, elm, birch, willow, and other trees of unknown fpecies. The fields produce a multitude of unknown vegetables, among which are ftrawberries, cranberries, bilberries, and a large fort of hips and haws. Of animals, the forefts afford haunts to black bears, elks, roebucks, deer, fables, foxes, hares, and river-otters. The bays and inland lakes fwarm with all kinds of ducks and water-fowl; nor is the country deficient in frogs and fnakes.

MATO, in *Natural History*, the name of a tree growing both in the East and West Indies, and bearing a fruit of the size of an apple, and covered with a thick and tough red skin. This is called by some the wild mangoustan. Its fruit perfectly resembles that of the mangoustan in figure, but is not eatable. Mem. Acad. Par. 1699.

Mato *Dentoo*, in *Geography*, a town of Brasil, in the government of Minas Geraes; 45 miles N N.E. Villarica.

MATOBOLO, one of the smaller Philippine islands, near the N. coast of Panay. N. lat. 11° 56'. E. long. 122° 45'.

MATOCHNIK Scher, a strait which divides Nova Zembla, always filled with ice. N. lat 75°.

MATOGROSO, or Matto-grosso the most inland, and the most celebrated province of Brasil. According to Alcedo, the Portuguese first took possession of it in 1761, having discovered the richness of its gold mines, by means of the Missionaries, to whose pious and benevolent labours we are chiefly indebted for the discovery of the interior parts of Cabralia, or as it is called by the Portuguese, Land of the Amazons, though widely remote from the river idly so called. A town was erected, and a governor appointed. As in mining stations in general, the land is barren, and provisions scarce and dear. The climate is hot and moist. It was in vain attacked in 1766, by orders of the viceroy of Peru, the Spaniards being obliged to retreat by the difficulty of the route, and the valour of the Portuguese. S. lat. 10 to 23. W. long. 52 to 64.

MATOMKIN, Great and Little, two small islands in the Atlantic, near the coast of Virginia; the former in N. lat. 37° 42'. W. long. 75° 36', and the latter in N. lat. 37° 38'. W. long. 75° 42'.

MATONBACKRAPETTA, a town of Hindoostan, in the circar of Cuddapa; 32 miles S.S.E. of Cuddapa.

MATOON Harbour, a harbour on the southern coast of Nova Scotia. N. lat. 44°. W. long. 64° 45'.

MATOUR, a town of France, in the department of the Saône and Loire, and chief place of a canton, in the district of Macon; 13 miles W. of Macon. The place contains 2062, and the canton 6378 inhabitants, on a territory of 152½ kiliometres, in nine communes.

MATOUREA, in *Botany*, a plant so called by Aublet, and figured in his Guian. t. 259, appears to be properly referred by Schreber to Vandellia. It is known to the Creoles by the name of *Basilic sauvage*, or Wild Basil, having the foliage of an *Ocymum*, with a bitterish, somewhat aromatic, flavour, and is used, either bruised or in decoction, as a vulnerary, being considered very efficacious in that respect. It is a native of meadows in Cayenne and Guiana, flowering all the year round. The *root* is annual. *Stem* two feet high, much branched, square, leafy, slightly downy. *Leaves* opposite, an inch long, ovate, serrated, downy, paler beneath; elongated and entire at the base. *Flowers* axillary, blueish, generally solitary. We are not informed of the derivation of the above name, nor whether the French *Matouri* be the original or the translation.—This plant is the *Vandellia pratensis* of Vahl, as well as of Willd. Sp. Pl. v. 3. 343, and is said to be extremely common in South America, by road sides, from the island of Trinidad to the Brasils. See Vandellia.

MATRA, in *Geography*, a chain of mountains in Hungary, S W. of Erlau.

MATRAMODO, a town of Hindoostan, in the Carnatic; 27 miles W. of Vellore.

MATRASS, Matracium, or *Bolt-head*, a glass vessel, used by chemists in digestions, and other operations.

The matrass is made in form of a bottle somewhat bellied in the middle, with a long narrow neck; it is coated with earth, when it is to be placed on a very hot fire. And when it is required it should be stopped very close, they seal it hermetically.

The matrass, used in assaying, is a vessel of very pure and transparent glass, not too thick at the bottom, which would make it apt to burst in the fire. It is, for this use, to be about eight or ten inches high, and to have an orifice scarcely so much as half an inch wide, lest the matters contained in it, being in a violent state of ebullition, should either rise over the mouth of the vessel, or at least be partly thrown out in form of small drops, like a thin rain, which drops always carry some of the metal with them. The bottom is capacious enough when it will hold an ounce or two of aquafortis, and the height of the vessel is of a farther use in making a greater repercussion of the fumes. The mouth ought also to be turned backwards, in form of a broad lip, that the solutions, when poured out, may not run down the sides of the vessel. Cramer, Art of Ass. p. 68.

Matrasses are also used as receivers: as to their form, some are spherical, others flattened at the bottom, and others in the shape of an egg, called *philosophical eggs*. The most convenient of all, when only a small quantity of matter is used, are bottles of thin glass, called medical phials; because they are cheap, made of good glass, and may be quickly heated, so that the liquor contained in them shall boil without danger of being broken. See Laboratory.

MATRAY, in *Geography*, a town of the Tyrolese; 10 miles S. of Inspruck.

MATRI, among *Hindoo Mythologists*, is a term applied to several of their female divinities, or divine mothers, the meaning of the word. It seems nearly the same as Sakti, which, however, is generally stated to mean the active energy of a power, rather than a mother. (See Sakti.) In the eighth volume of the Asiatic Researches, Mr. Paterson enumerates eight of these Saktis, as follows:

1. Maheswari, the Sakti of Mahesa or Siva. 2. Saraswati; in this character, indeed, more correctly called Brahmi or Brahmani, Sakti of Brahma. 3. Narayani of Narayana. 4. Indrani, or Aindri, of Indra. 5. Kaumari of Kartikya. 6. Varahi of Vishnu, in the Varahavatara. 7. Narasinhi of Vishnu, in the Narasingavatara. (Of all these due mention is made under their several names.) 8. Aparajita, a form of Bhavani, the female principle. The last, Mr. Paterson remarks, may be the Aphrodite of the Greeks; and Maheswari, or a female Siva, riding on a white bull, may have given rise to the story of Europa's rape, while Brahmi, or the female Brahma, with the swan, may, in like manner, have occasioned the fable of Jupiter and Leda. These explanations were, perhaps, invented by the Greeks, to account for symbols, of the meaning of which they were ignorant. On the foregoing passage, Mr. Colebrooke, the worthy successor of sir William Jones in the chair of the Asiatic Society, gives, in a note, the following information. "The eight Saktis, or energies of as many deities, are also called Matris, or mothers. They are called Brahmi, &c. because they sprung from the bodies of Brahma, and the other gods respectively. In some places they are thus enumerated: Brahmi, Maheswari, Aindri, Varahi, Vaishnavi, Kaumari, Chamunda, and Charchika. Some reduce the number to seven; omitting the two latter, and adding Kauveri (which see.) Prayers are addressed to the Matris on various occasions, especially in the Cavachas, or defensive incantations. (See Mantra.) Two are cited by way of example, and an extract from the Marcandeya Purana, descriptive of these goddesses. "May Brahmani, conferring the benefit of all benedictions, protect me on the east;

eaft; and Narayani on the fouth-eaft, for the fake of realizing every wifh; Mahefwari too on the fouth, rendering every thing aufpicious; Chamunda on the fouth-weft, difcomfiting all enemies; and on the weft Kaumari, armed with her lance and flayer of foes; on the north-weft, Aparajita, the beauteous giver of victory; on the north Varahi, granter of boons; and on the north-eaft Narafinhi, the banifher of terror. May thefe mothers, being eight deities and active powers, defend me." Another incantation fimply enumerates the fame eight goddeffes, and proceeds thus: "May thefe, and all Matris, guard me with their refpective weapons on all quarters, and on every point." In the Devi Mahatmya, the affembling of the Matris to combat the demons is defcribed, and we fhall extract the paffage, with fome others, as defcriptive generally of the principal female divinities of the Hindoos, and throwing fome light on an obfcure, but interefting, branch of the mythology of that, and we may fafely fay of other, people. "The energy of each god, exactly like him, with the fame form, the fame decoration, and the fame vehicle, came to fight againft the demons. The Sakti of Brahma, girt with a white gourd, arrived on a car yoked with fwans; her title is Brahmani. Mahefwari came riding on a bull, and bearing a trident, with a vaft ferpent for a ring, a crefcent for a gem. Kaumari, bearing a lance in her hand and riding on a peacock. Vaifhnavi alfo arrived, fitting on an eagle, and bearing a conch, a difcus, a club, and a bow and a fword in her feveral hands. The energy of Hari, who affumed the unrivalled form of the holy boar, likewife came there, affuming the body of Varahi. Narafinhi too, embodied in a form precifely fimilar to that of Nrifinhi, with an erect mane reaching to the hoft of ftars. Aindri, came, bearing the thunder-bolt, and riding on the king of elephants, and in every refpect like Indra, with a hundred eyes. Laftly, came the dreadful energy named Chandika, who fprung from the body of Devi, horrible, howling like a hundred fhakals; fhe, furnamed Aparajita, the unconquered goddefs, thus addreffed Ifani, whofe head is encircled with his dufky-braided locks."—"Thus," continues the ftory, which is too long for infertion, "did the wrathful hoft of Matris flay the demons."

In the Uttara kalpa of the fame Purana, the Matris are thus defcribed: "Chamunda ftanding on a corpfe; Varahi fitting on a buffalo; Aindri mounted on an elephant; Vaifhnavi borne by an eagle; Mahefwari riding on a bull; Kaumari conveyed by a peacock; Brahmi carried by a fwan; and Aparajita revered by the univerfe, are all Matris endowed with every faculty."

The probability of thefe and fimilar Puranic legends having been the origin of thofe of Aphrodite, Europa, and Leda, is above hinted. A farther confideration of the paffages quoted might lead to a belief of greater identity in the mythology of the eaftern and weftern heathens. A virgin goddefs conveyed by a peacock, a hundred-eyed deity, and one borne by an eagle, are common to both. Other points of uniformity will occur to the claffical reader.

In the thirteenth fection of the firft book of the Ramayana (fee that article), the company affembled at an Afwamedha, or facrifice of a horfe, is enumerated; including, among many other of the heavenly hoft, "the four fupporters of the univerfe, and the divine mothers of all the celeftials." A note on this paffage informs us, that the former are "Indra, regent of the eaft; Yama, of the fouth; Varuna, of the weft; and Kuvera, of the north." (See hereon more particularly under MARUT.) And that the "divine mothers of the celeftials are feven: Brahmi, Mahefwari, Rudri, Kaumari, Vaifhnavi, Varahi, and Indrani."

MATRICARIA, in *Botany*, fo called from its reputed efficacy in difeafes of the matrix. Its Greek fynonym παρθενιον, from παρθενος, *a virgin*, feems to be founded in a fimilar opinion. Linn. Gen. 432. Schreb. 565. Willd. Sp. Pl. v. 3. 2161. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 902. Ait. Hort. Kew. ed. 2. v. 3. 233. Juff. 183. Lamarck Illuftr. t. 678. Gærtn. t. 168.—Clafs and order, *Syngenefia Polygamia Superflua*. Nat. Ord. *Compofitæ Difcoideæ*, Linn. *Corymbiferæ*, Juff.

Gen. Ch. *Common calyx* hemifpherical, compofed of linear, imbricated, nearly equal, membranous fcales. *Cor.* compound, radiated; florets of the difk all perfect, tubular, funnel-fhaped, five-cleft, fpreading; thofe of the radius female, oblong and three-toothed. *Stam.* (in the tubular florets) Filaments five, capillary, very fhort; anthers cylindrical, tubular. *Pift.* (in the tubular florets) Germen oblong, naked; ftyle thread-fhaped, the length of the ftamens; ftigma cloven, fpreading; the female or ligulate florets differ in having rather a fhorter ftyle, and two revolute ftigmas. *Peric.* none, except the permanent calyx. *Seeds* in all the florets folitary, oblong. *Down* none. *Recept.* naked, cylindrical or conical.

Obf. This genus differs from *Pyrethrum* in having no *crown* or *pappus* attached to the feed.

Eff. Ch. Receptacle naked, almoft cylindrical. Seeds without a crown. Calyx depreffed, imbricated with membranous bordered fcales.

1. M. *fuaveolens*. Sweet Feverfew. Linn. Sp. Pl. 1256. (M. recutita; Linn. Sp. Pl. ed. 1. 891. Fl. n. 701; Fl. Suec. ed. 1. 251, without the fynonyms.)—"Receptacle conical. Florets of the radius deflexed. Calyx-fcales equal at the margin."—Native of Sweden, but of what country befides is uncertain, this being a very obfcure fpecies, much miftaken by authors. The Linnæan herbarium throws no certain light upon it. What Ehrhart has given in his *Plantæ Officinales* 58, as *Matricaria Chamomilla*, feems rather to anfwer to the defcription of the fpecies in queftion.

2. M. *Chamomilla*. Corn Feverfew, or Wild Chamomile. Linn. Sp. Pl. 1256. Engl. Bot. t. 1232. Curt. Lond. fafc. 5. t. 63. Mart. Fl. Ruft. t. 74.—Leaves fmooth, pinnated; leaflets linear, fimple or divided. Radius fpreading. Scales of the calyx dilated.—Very common in the neighbourhood of London, in fields and on dunghills by the road fide, flowering from May to July.—*Root* annual, fibrous. *Stem* a foot high, erect, very much branched, leafy, ftriated, fmooth. *Leaves* feffile, pinnated, clafping the ftem, of a deep green, fmooth; leaflets linear, obtufe with a little point. *Flowers* numerous, terminal, folitary, refembling thofe of the Chamomile of the fhops (*Anthemis nobilis*) in fize, and, in a certain degree, in fmell. *Calyx* flattifh, fmooth; fcales dilated outwardly, membranous, whitifh. *Difk* yellow, conical. *Florets of the radius* fpreading, white, retufe, three-toothed, deflexed in the evening. *Seeds* angular, oblique, fmooth, altogether beardlefs. *Receptacle* conically cylindrical, acute, dotted, fmooth.

Hudfon and Lightfoot were of opinion that M. *fuaveolens* of Linnæus was only a variety of this fpecies, but Dr. Smith in his *Flora Britannica* fays they are diftinct, the former being never found in Britain, and having its flowers not more than half as large as in the latter.—Profeffor Martyn obferves that "according to the Swedifh obfervations, kine, goats and fheep eat this plant, horfes are not fond of it, and fwine refufe it. It feems to be rejected in general by all quadrupeds with us. It is fuppofed to poffefs the

the fame qualities with *Anthemis nobilis*, but in an inferior degree."

Willdenow has adopted a third fpecies, M. *capenfis*, on the authority of Thunberg's *Prodromus* and Linnæus's *Mantiffa*; but on referring to the Linnæan Herbarium, we find its feeds furnifhed with a crown, fo that it muft of courfe be removed to *Pyrethrum*. For the fame reafon M. *Parthenium*, and *maritimum* have been placed under that genus.

Matricaria, in *Gardening*, comprehends plants of the hardy, herbaceous, perennial kind, of which the fpecies cultivated is the common feverfew (M. parthenium).

It has feveral varieties, as with full double flowers, with double flowers, having the florets of the ray plane, of the difk fiftular; with very fmall rays; with very fhort fiftular florets; with naked heads, having no rays; with naked fulphur-coloured heads, and with elegant curled leaves.

Method of Culture.—The plants of this fpecies may be raifed from feeds, by parting the roots, and by cuttings.

In the firft mode the feeds fhould be fown in the fpring, as about March, upon a bed of light earth, and when they are come up, planted out into nurfery-beds, at about eight inches afunder, where they may remain till the middle of May; when they fhould be taken up, with a ball of earth to their roots, and planted in the middle of large borders, or other parts for flowering. But they fhould not be permitted to feed, as it often weakens and decays the roots; therefore, when their flowers are paft, their ftems fhould be cut down, which will caufe them to pufh out frefh heads, whereby the roots may be better preferved.

MATRICE, or Matrix. See Matrix.

Matrice, or *Matrix*, in *Dyeing*, is applied to the five fimple colours, whence all the reft are derived or compofed. Thefe are the black, white, blue, red, and yellow or root-colour. See Dyeing.

Matrice, or *Matrices*, ufed by the *Letter-founders*, are thofe little pieces of copper or brafs, at one end whereof are engraven, dent-wife, or *en creux*, the feveral characters ufed in the compofing of books.

Each character, virgula, and even each point, in a difcourfe, has its feveral matrix; and, of confequence, its feveral puncheon to ftrike it. They are the engravers on metal that cut or grave the matrices.

When types are to be caft, the matrice is faftened to the end of a mould, fo difpofed, as that when the metal is poured on it, it may fall into the creux or cavity of the matrice, and take the figure and impreffion thereof. See *Letter*-Foundery.

Matrices, ufed in *Coining*, are pieces of fteel, in form of dyes, whereon are engraven the feveral figures, arms, characters, legends, &c. wherewith the fpecies are to be ftamped.

The engraving is performed with feveral puncheons, which being formed in relievo, or prominent, when ftruck on the metal, make an indented impreffion, which the French call *en creux*. See the manner hereof under Engraving *on fteel*. See alfo Coining.

MATRICULA, a regifter kept of the admiffion of officers, and perfons entered into any body or fociety whereof a lift is made. Hence thofe who are admitted into our univerfities are faid to be matriculated.

Among ecclefiaftical authors, we find mention made of two kinds of matriculæ; the one containing a lift of the ecclefiaftics, called *matricula clericorum*; the other of the poor fubfifted at the expence of the church, called *matricula pauperum*.

Matricula was alfo applied to a kind of alms-houfe, where the poor were provided for. It had certain revenues appropriated to it, and was ufually built near the church; whence the name was alfo frequently given to the church itfelf.

MATRIMONY. See Espousals, and Marriage.

MATRIX, in *Anatomy*, the womb, or that part of the female of any kind, wherein the fœtus is conceived, and nourifhed till the time of its delivery. See Womb, Uterus, Fœtus, &c.

Matrix, *Bearing down of*, in *Surgery*. See Prolapsus.

Matrix, *Polypi of*. See Polypus.

Matrix, *Retroverfion of*. See Retroversion.

Matrix, *Suffocation of the*. See Suffocation.

Speculum Matricis. See Speculum.

Matrix is alfo applied to places proper for the generation of vegetables, minerals, and metals.

Thus, the earth is the matrix wherein feeds fprout; and marcafites are by many confidered as the matrices of metals.

The matrix of ores is the earthy and ftony fubftances in which thefe metallic metals are enveloped: thefe are very various, frequently fpar, quartz, fluors, or hornblende.

Matrix *Succini*, in *Natural Hiftory*, a name given by Hartman, and fome other authors, to a fort of fubftance refembling foffil wood, or the barks of trees, common in the cliffs of the fhores of the Baltic, and found in digging all over Pruffia. This is the bed in which the foffil amber of that kingdom is lodged, and it is fuppofed to have no fmall fhare in the production or formation of that foffil. The workmen who dig for amber always make this their guide, and follow the veins of it, never fearching any where elfe for the amber.

The foffil wood, which is truly fuch, and has been once vegetable matter, whatever part of the world it is found in, agrees in the fame general marks of diftinction; and knots, and other evident proofs of its having been once vegetable, are found in all of it; but this matrix of amber, whether found in Pruffia, Denmark, or elfewhere, is ftill of the fame kind, and fhews none of thefe characteriftic marks of wood. However, notwithftanding all this, it is faid, that on opening the ditches for the fortifications at Copenhagen, feveral large maffes of amber were found, all of them adhering to the fides of large bodies of trees, which were black as ebony. The pieces are preferved in the cabinet of the king of Denmark, in that place, and fome of them weigh forty or fifty ounces. This is an additional circumftance to the common obfervation of fomething refembling wood being always found where amber is, and deferves to be confidered, as it tends to overthrow the prefent received fyftem of amber being originally a mineral production.

Dr. Fothergill, in his Effay upon the Origin of Amber, maintains, that it is a vegetable refin, the product, perhaps, of the fir or pine kind; and that it is changed into its prefent form by a mineral acid. In proof of its refinous nature, he alleges its afpect, texture, and form: befides, the bodies inclofed in it are moftly animals of the flying kind, few reptiles, except fuch as ants, fpiders, &c. which are found in trees, and fcarcely ever any aquatics; and this could not happen in the fea, nor in the earth, but upon its furface. He apprehends, likewife, that this refin, with the trees which afforded it, were buried in the earth by the deluge, or fome violent convulfion of the fame kind: to which purpofe he obferves, that the fubftance of which the proper veins of amber confift, hath feveral genuine characteriftics of wood ftill remaining; the texture of amber, which is fibrous, and, when dried,

dried, capable of swimming in water, and burning like other wood, shews, he says, what it hath been. Nor is the amber disposed in these veins in one continued stratum; but lumps of it are irregularly disseminated through the whole of the supposed woody mass. The change which this wood undergoes, is produced partly by time, and completed by the vitriolic mineral acid of the earth. Such an acid, it is argued, is present wherever amber occurs in its proper matrix, and is sometimes found in the amber itself. The acid of the salt of amber is vitriolic; and common turpentine affords, by proper management with a vitriolic acid, a considerable portion of the same chemical principles that amber does; and those pieces of amber which have been found soft and imperfect, are nearly related to a vegetable resin. Phil. Transf. vol xlii. N 472. p. 21.

Matrix is also applied figuratively to several things wherein there appears a kind of generation, and where certain things seem to acquire a new being, or at least a new manner of being. Of which kind are the moulds wherein the printers' types, or letters, are cast; and those used in striking money and medals, in coining. See Matrice.

MATRON, Matrona, among the Romans, signified a married woman, and sometimes also the mother of a family. There was, however, some difference between *matrona* and *mater-familias*. Servius says, that some imagined the difference to lie in this, that *matrona* was a woman who had one child, and *mater-familias* one that had several. But others, particularly Aulus Gellius, take the name *matrona* to belong to a married woman, whether she had any children or not; the hope and expectation of having them being enough to warrant the title of mother, *matrona*, and for this reason it is, that marriage is called *matrimony*. This opinion is supported by Nonius.

Matron *of an Hospital*. See Hospital.

Matrons, *Jury of*, is a jury of twelve discreet women, directed by the judge to enquire into the fact when a woman is capitally convicted, and pleads her pregnancy. This plea, though it cannot be made in stay of judgment, may be urged in respite of execution. If the jury bring in their verdict quick with child, execution shall be staid generally to the next session; and so from session to session, till either the woman is delivered, or proves, by the course of nature, not to have been with child at all. But if she once hath had the benefit of this reprieve, and been delivered, and afterwards becomes pregnant again, she shall not be entitled to the benefit of farther respite for that cause; for she may now be executed before the child is quick in the womb, and shall not, by her own incontinence, evade the sentence of justice.

If a widow feigns herself with child, in order to exclude the next heir, and a supposititious birth is suspected to be intended, then upon the writ *de ventre inspiciendo*, a jury of women is to be impanelled to try the question; Whether with child or not?

MATRONALIA, feasts of the Roman ladies, or rather matrons, celebrated on the calends of March, in honour of the god Mars.

Ovid mentions many reasons for the institution of this feast; but the principal seems to have been the peace concluded between the Romans and Sabines, by the mediation of the women. The women granted to their servants on this occasion the same privileges which were granted to the slaves by their masters in the Saturnalia.

No men living in celibacy were allowed to assist at the feast.

MATROSSES, soldiers, in the train of artillery, next below the gunners, and properly apprentices or assistants to them: their duty is to assist the gunner in traversing, spunging, loading, and firing of guns, &c. They carry fire-locks, and march along with the guns and store-waggons, both as a guard, and to help in case of emergency.

MATRUNGA, in *Geography*, a town of Hindoostan; 37 miles N.E of Ruttunpour.

MATSCHACH, a town of the duchy of Carinthia; 10 miles S. of Luxemburg.

MATSCHEN, a town of Saxony, in the circle of Leipsic; 6 miles N. of Leissnich.

MATSCHEVIZ, a town of the duchy of Warsaw, memorable for a battle fought in 1794, between the confederate Poles, under Kosciusko, and the Russians, under general Fersan, in which the latter were victorious; 600 Poles fell, and 16,000 were made prisoners. All the artillery fell into the hands of the Russians, and only 1500 men escaped. Kosciusko, who was taken prisoner, was severely wounded, and very nearly lost his life: 32 miles E. of Warsaw.

MATSIMA, or Schilpads, an island of Japan, E. of Niphon. N. lat. 38 12'.

MATSINGLO, a town on the W. coast of the island of Luçon. N. lat 15 38' E long. 120° 12'.

MATSUAH See Masowah.

MATSUNAY, a sea-port of the island of Jedso, tributary to Japan. N. lat 40 40'. E. long. 138 44'.

MATSYAVATARA, in *Hindoo Mythology*, is the first of the ten chief incarnations of the god Vishnu. This *avatara* was in the form of a *fish*, which is the meaning of the words, and it has been proved to have immediate reference to the deluge, and to be the same history, disguised in oriental fiction, of that event, as related in our scriptures. Sir W. Jones (Asiatic Researches, vol. i.) assents to the opinion of Bochart, that the fable of Saturn was raised on the true history of Noah; he shews that the seventh Menu of the Hindoos, named Satyavrata, in whose days this avatara is related to have taken place, corresponds in station and character with our patriarch. (See Menu and Satyavrata.) In his reign the Hindoos believe the whole earth to have been destroyed by a flood, including all mankind, who had become corrupt, except the pious prince himself, the seven Rishis, and their several wives, who, by command of Vishnu, entered a spacious vessel, accompanied by pairs of all animals. (See Rishi.) Vishnu, assuming the form of a fish, commanded the ark to be fastened by a cable, formed of a vast serpent, to his stupendous horn; secured thereby till the flood subsided; when he and Brahma slew a monster named Hyagriva, or the horse-necked, who, while Brahma was reposing at the end of a kalpa (see Kalpa), stole the Vedas, and mankind had consequently fallen into the depths of ignorance and impiety. The Vedas having been recovered, (see Veda,) the world was progressively re-peopled with pious inhabitants, descendants of the devout Satyavrata and his favoured companions. As Nuh, the true name of our patriarch Noah, may be easily deduced from Menu, so Adam may from *adim*, meaning, in the Sanskrita language, *first*; tending, as is evidently sir W. Jones's opinion, to the conclusion that the first and last of the seven Menus can be no other than the great progenitor and restorer of our species. The history of the avatara under discussion is the subject of the first Purana, or sacred poem, consisting of 14,000 stanzas, (see Purana,) and is concisely told in the eighth book of the Sri Bhagavata, or life of Krishna. See those articles, also Kurmavatara, for a brief account of the second incarnation of Vishnu.

MATSYS, Quintin, in *Biography*, known by the name of the blacksmith of Antwerp, because he followed that employment till he was 20 years old, when he became a painter,

painter, and arrived at great perfection in the dry ftyle of the time in which he lived.

He was born in 1460, and is faid to have been excited by love to exchange his heavy iron labours for the fofter and more engaging charms of the pencil. Whatever were his motives, it was fortunate that he did devote his mind to that purfuit, as he poffeffed uncommon talents, and exerted them with great induftry. His exertions were confined to fubjects of common and vulgar life, to which he gave confiderable intereft, by his attention to expreffion, and his fkill in rendering it The beft inftance we have in this country is his excellent picture of the two mifers in Windfor caftle, of which there is a duplicate by him in poffeffion of lord Lyttelton at Hagley in Worcefterfhire. He died in 1529, aged 69.

MATT. The produce of the firft fufion of a fulphuretted ore is called a *matt*, a term probably adopted from the German miners; for the word in that language fignifies dull, without luftre, a character that is applicable with great juftice to moft of the half fulphurized regu i when compared to the fame metals in their pure ftate.

MATTA DE BRAZIL, in *Geography*, a populous town of Brazil, in the government of Pernambuco; 25 miles W. of Olinda: from its vicinity great quantities of Brazil wood are fent into Europe.

MATTADEQUN CREEK, a river of Virginia, which runs into York river, N. lat. 37° 40′. W. long. 77° 20′.

MATTADORE. See OMBRE.

MATTAGESS, in *Ornithology*, the Englifh name of the largeft fpecies of the *lanius*, or butcher-bird.

The word *mattagefs* is borrowed from the Savoyards, and fignifies the murdering pye; and has been given it from its favage difpofition, and its refemblance to the magpye in the fhape of its tail See LANIUS *Excubitor*.

MATTAPONY, in *Geography*, a river of Virginia, navigable 70 miles above its mouth; it rifes in Spotfylvania county, and purfuing a S.E. courfe, joins Pamunky below the town of Delawar, and forms with it York river.

MATTARELLA, a town of Italy, in the duchy of Spoleto; eight miles N.E. of Terni.

MATTATHIAS, in *Biography*, a Jewifh prieft, founder of the family of Maccabees, was defcended from one of the twenty-four appointed by David to officiate in the temple, and was of the branch of the Afmoneans. The perfecution of his countrymen, and profanation of their religion by Antiochus Ephiphanes, were fo grievous to him, that he retired from Jerufalem to his native place, to avoid the fight. One of the king's officers, named Apelles, coming thither to enforce his mafter's commands, affembled the people, with Mattathias and his five fons, and endeavoured to perfuade them to compliance, but the zealous and patriotic prieft loudly declared, that although the whole nation abandoned the religion of their fathers, he and his houfe would continue faithful to their God. His zeal carried him much farther than a mere affertion of his pious conftancy; he put in practice an injunction of the Mofaic law, by actually killing on the fpot a Jew who prefented himfelf to facrifice at the altar of an idol At the fame inftant, he fell upon, and flew the king's officer, and his attendants, overthrew the idol, and ran through the city, calling upon all who were attached to their law to follow them. They quickly found themfelves at the head of a confiderable body of men; and having confulted together as to the lawfulnefs of fighting on the fabbath-day, it was agreed not only to be lawful but obligatory to refift an attack from their enemies, and the enemies of their religion on the fabbath. They inftantly became aggreffors, and marched from city to city; overthrew the altars of idolatry, and reftored the worfhip of the true God, Mattathias caufed all the prifoners taken from the apoftates to be put to death without mercy or compunction. Thus fuccefsfully did he commence that revolt which was productive of fo many great events under his fons Simon, Judas, and Jonathan, and perceiving his own end approaching, he gave a moft folemn exhortation to his fons to live in unity, and purfue with zeal and courage the courfe they had entered upon. He died in 166 B.C., leaving behind him the character of a valiant and faithful afferter of the religion and liberties of his country. Univer. Hift. Prideaux. vol. ii.

MATTEI, SAVERIO, a Neapolitan lyric poet, and mufical critic; long in correfpondence with Metaftafio, an eminent Hebraift, and tranflator of the pfalms into Italian verfe; calculated for the reception of mufic in every form of cantata, duet, trio, and chorus. He was in clofe friendfhip with Jomelli, whofe famous Mifrere, for two voices, was compofed to his verfion. He manifefted his great regard for the admirable mufician Jomelli, by affifting Ginnaro Manna in the arrangement and execution of a plan for his public funeral. in 1774; furnifhing an example to pofterity of the gratitude due to great talents, and a ftimulus to young artifts to merit equal honours. The learned Mattei has given an account of this public funeral, and of the works of the great mufician, in his "Saggio di Poefie Latine ed Italiane," publifhed at Naples, immediately after the melancholy event.

MATTEIS, NICOLA, a Neapolitan performer on the violin, who arrived in England in the latter end of Charles II.'s reign, and was one of the firft great players upon that inftrument, who fettled in London.

A general paffion for the violin, and for pieces exprefsly compofed for it, as well as a tafte for Italian mufic, feem to have been excited in our country about this time, when French mufic and French politics became equally odious to a great part of the nation.

In MS. memoirs of mufic, by the Hon. Roger North, brother of the lord Keeper North, to which we have had accefs, there is a curious and characteriftic account of this mufician; in which we are told "that the decay of French mufic, to which Charles was fo partial, in favour of the Italian, came on by degrees Its beginning was accidental, and occafioned by the arrival of Nicola Matteis. He was an excellent mufician, and performed wonderfully on the violin. His manner was fingular; but he excelled, in one refpect, all that had been heard in England before: his *arcata*, or manner of bowing, his fhakes, divifions, and, indeed, his whole ftyle of performance, were furprifing, and every ftroke of his bow was a mouthful.

"All that he played was of his own compofition, which manifefted him to be a very exquifite harmonift, and of a boundlefs fancy and invention. And by all that I have been able to obferve of his abilities, or to hear concerning thofe of other performers on the violin, none but Corelli feems to have furpaffed him.

"When he firft came hither he was very poor, but not fo poor as proud; which prevented his being heard, or making ufeful acquaintance for a long time, except among a few merchants in the city, who patronized him. And fetting a high value on his condefcenfion, he made them indemnify him for the want of more general favour.

"By degrees, however, he was more noticed, and was introduced to perform at court. But his demeanor did not pleafe, and he was thought capricious and troublefome; as he took offence if any one whifpered while he played, which was a kind of attention that had not been much in fafhion at our court. It was faid that the duke of Richmond would

have

have settled a pension upon him, though he wished him to change his manner of playing, and would needs have one of his pages shew him a better. Matteis, for the sake of the jest, condescended to take lessons of the page, but learned so fast, that he soon out-ran him in his own way. But he continued so outrageous in his demands, particularly for his solos, that few would comply with them, and he remained in narrow circumstances and obscurity a long while.

"Nor would his superior talents ever have contributed to better his fortune, had it not been for the zeal and friendly offices of two or three dilettanti, his admirers. These were Dr. Walgrave, a prodigy on the arch-lute; sir Roger L'Estrange, an expert violist; and Mr. Bridgman, the under-secretary, who accompanied well on the harpsichord. These becoming acquainted with him, and courting him in his own way, had an opportunity of describing to him the temper of the English, who, if humoured, would be liberal; but if uncivilly treated, would be sulky and despise him and his talents. Assuring him that by a little complaisance he would neither want employment nor money.

"By advice so reasonable, they at length brought him into such good temper, that he became generally esteemed and sought after; and having many scholars, though on moderate terms, his purse filled apace, which confirmed his conversion.

"After this, he discovered a way of acquiring money, which was then perfectly new in this country. For observing how much his scholars admired the lessons he composed for them, which were all duos, and that most musical gentlemen who heard them, wished to have copies of them, he was at the expence of having them neatly engraved on copper-plates, in oblong octavo, which was the beginning of engraving music in England; and these he presented, well bound, to lovers of the art and admirers of his talents, for which he often received three, four, and five guineas. And so great were his encouragement and profits in this species of traffic, that he printed four several books of 'Ayres for the Violin,' in the same form and size."

He printed lessons likewise for the guitar, of which instrument he was a consummate master, and had so much force upon it, as to be able to contend with the harpsichord, in concert.

Another book of his writing was designed to teach composition, ayre, and thorough base. Of this work, though it was printed, but few copies are subsisting. His full pieces, concertos, and solos, were never published, and are very scarce, if at all to be found.

The two first of the four books mentioned above, of which many copies were dispersed, consist of preludes, allemands, sarabands, courants, gigues, divisions on grounds, and double compositions fitted to all hands and capacities. The third book has for title, Ayres for the Violin, to wit: preludes, fugues, allemands, sarabands, courants, gigues, fancies, divisions, and likewise other passages, introductions, and fugues, for single and double stops; with divisions somewhat more artificial for the improvement of the hand, upon the base-viol or harpsichord. The fourth book is entitled, Other Ayres and Pieces, for the violin, base-viol, and harpsichord, somewhat more difficult and artificial than the former; composed for the practice and service of greater masters upon those instruments.

Mr. North observes, that while the lovers of music were becoming acquainted with his manner of playing from his own books, which often happened in large assemblies, no one pretended to do the like; for none could command that fulness, grace, and truth, of which he was master. So that, in his own time, his compositions were thought impracticable from their difficulty; and since, as they were never thrown into the shops, they have been but little known. So that at present, now the instrument is so much advanced, no one can have the least idea of these pieces having ever been difficult, who was not a witness of his own manner of playing them. Indeed, his books, well studied, are a sufficient rudiment of artful composition.

Another observation of this speculative dilettante is, that "in a numerous assembly, when Matteis alone was to entertain the company, having his friends Walgrave, L'Estrange, and Bridgman about him, and flaming with good humour and enthusiasm, he has seized on the attention of the whole audience with such force and variety, as to prevent even a whisper for more than an hour together, however crowded the room."

After this, it is easy to imagine that his reputation and abilities would enable him to accumulate wealth, or to live in splendour: he chose the latter, took a great house, and indulging appetite, lived so luxuriously, that he brought on diseases which soon put an end to his existence.

He left a son, Nicola Matteis, whom he taught on the violin from his cradle. "I have seen the boy in coats," says Mr. North, "play to his father's guitar. When he grew up he became a celebrated master on the violin, in London, for several years. Being invited into Germany, he went to Vienna, and has continued there ever since, in full payment for all the masters we have received from those countries."

The younger Matteis must have returned to England soon after Mr. North's Memoirs of Music were written; as we remember to have seen him at Shrewsbury, where he was settled as a language-master as well as performer on the violin in 1737. We afterwards learned French and the violin of this master, who continued at Shrewsbury till his decease, about the year 1749. He played the solos of Corelli with more simplicity and elegance than any performer we ever heard.

According to Walther, his name appeared in the Vienna calendar, as one of the emperor's band of violins in 1721 and 1727. In Roger's Catal. of Music, five different works appear under the title of "Arie cantabile à Violino solo Violoncello e basso continuo." This seems to have been the younger Matteis, of whom the Hon. Mr. North speaks.

MATTELOY, in *Geography*, a town of Hindoostan, in Canara; two miles from Nelluram.

MATTER, a town of Tunis, anciently called "Oppidum Matterense;" 27 miles N.W. of Tunis.

MATTER, *materia*, *body*, or an extended, solid, divisible, moveable, and passive substance, the first principle of all natural things, from the various arrangements, and combinations whereof all bodies are formed.

Aristotle makes three principles, matter, form, and privation: which last the Cartesians throw out of the number, and others the two last.

The properties of matter we are pretty well acquainted with, and can reason about its divisibility, solidity, &c. but the subject in which these properties reside, or their substratum, is still a mystery. Aristotle speaks very darkly on the subject, defining matter to be *nec quid*, *nec quantum*, *nec quale*, nor any certain determinate thing at all; which many of his followers interpret so as to believe, that matter does not at all exist. The Cartesians make the essence of matter to consist in extension; arguing, that since the properties above-mentioned are all that are essential to matter, some of them must constitute its essence; and, since extension is conceived prior to all the rest, and is that without which none of the rest can be conceived, extension is that which constitutes

ſtitutes the eſſence of matter. But the concluſion here is unjuſt; for, on his principle, the exiſtence of matter, according to Dr. Clarke, would have the faireſt title to conſtitute its eſſence, the *exiſtere* being conceived prior to all properties, and even to extenſion. Since, then, the word extenſion appears to go farther, and to be more general, than matter, that impenetrable ſolidity, which is eſſential to all matter, and to matter alone, and from which all its properties manifeſtly flow, may, with more propriety, be called the *eſſence* of matter.

Again, if extenſion were the eſſence of matter, and ſo matter and ſpace the ſame thing, it would follow, that matter is infinite and eternal, that it is a neceſſary being, and could neither be created nor annihilated; which is abſurd. Beſides, it appears, both from the nature of gravity, the motions of comets, the vibrations of pendulums, &c. that ſpace is not matter; and therefore it is not extenſion, but ſolid, impenetrable extenſion, which has a power of reſiſting, that conſtitutes matter.

Many among the old philoſophers maintained the eternity of matter; out of which they ſuppoſed all things to be formed by the hands of nature; as being unable to conceive how any thing ſhould be formed out of nothing. Plato maintained, that matter had exiſted eternally, and concurred with God in the production of all things, as a paſſive principle, or a kind of collateral cauſe.

Matter and form, the two ſimple and original principles of all things, according to the ancients, compoſed ſome ſimple natures, which they called *elements;* out of the various combinations whereof all natural things were afterwards compoſed.

Dr. Woodward ſeems of an opinion not very unlike this, *viz.* that matter is originally and really very different, being at its firſt creation divided into ſeveral ranks, ſets, or kinds, of corpuſcles, differing in ſubſtance, gravity, hardneſs, flexibility, figure, ſize, &c. from the various compoſures and combinations of which, he thinks, ariſe all the varieties in bodies, as to colour, hardneſs, gravity, taſtes, &c. But ſir Iſaac Newton takes all thoſe differences to reſult from the various arrangements of the ſame matter; which he judges to be homogeneous and uniform in all bodies.

Beſides the properties of matter formerly known, ſir Iſaac Newton has diſcovered a new one; *viz.* "That of attraction, or that every particle of matter has an attractive power, or a tendency towards every other particle: which power is ſtrongeſt in the point of contact, and ſuddenly decreaſes, inſomuch that it acts no more at the leaſt ſenſible diſtance; and, at a greater diſtance, is converted into a repellent force, whereby the parts fly from each other." On this principle of attraction, he accounts for the cohefion of the particles of bodies, which is otherwiſe inexplicable.

For he takes occaſion to obſerve, "That all bodies ſeem to be compounded of hard particles, even light itſelf, and all other the moſt volatile of fluids; inſomuch that hardneſs may be eſteemed a property of all uncompounded matter; at leaſt, the hardneſs of matter ſtands on as good a footing as that of its impenetrability; all the bodies we know of being either hard themſelves, or capable of being hardened. Now, if compound bodies be ſo hard, as we find ſome of them, and yet if they are very porous, and conſiſt of parts which are only laid together, the ſimple particles, which are void of pores, and were never yet divided, muſt be much harder. Now, ſuch hard particles being heaped together, can ſcarce touch one another in more than a few points; and therefore they muſt be ſeparable with much leſs force than is requiſite to break a ſolid particle, whoſe parts touch in all the ſpace, without any pores or interſtices to weaken their cohefion. How then ſhould ſuch very hard particles, only laid together, and touching only in a few points, ſtick together, and that ſo firmly as they do, without the aſſiſtance of ſomething that cauſes them to be attracted or preſſed towards each other?"

The ſame great author obſerves farther, "That the ſmalleſt particles may cohere by the ſtrongeſt attractions, and compoſe bigger particles of weaker virtue; and many of theſe may cohere, and compoſe ſtill bigger particles, whoſe virtue is ſtill weaker, and ſo on for divers ſucceſſions, until the progreſſion end in the biggeſt particles; on which the operations in chemiſtry, and the colours of natural bodies depend, and which, by cohering, compoſe bodies of a ſenſible magnitude. If the body is compact, and bends or yields inward to preſſion, without any ſliding of its parts, it is *hard* and *elaſtic,* returning to its figure with a force ariſing from the mutual attraction of its parts. If the parts ſlide from one another, the body is *malleable* or ſoft. If they ſlip eaſily, and are of a fit ſize to be agitated by heat, and the natural heat is great enough to keep them in agitation, the body is *fluid;* and, if it be apt to ſtick to things, it is *humid.* And the drops of every fluid affect a round figure by the mutual attraction of their parts, as the globe of the earth and ſea affects a round figure, by the mutual attraction of the gravity of its parts."

Again, "Since metals, diſſolved in acids, attract but a ſmall quantity of the acid, their attractive force reaches but to a ſmall diſtance. Now, as in algebra, where affirmative quantities ceaſe, there negative ones begin; ſo in mechanics, where attraction ceaſes, there a repulſive virtue muſt ſucceed. That there really is ſuch a virtue, ſeems to follow from the reflections and inflections of the rays of light; the rays being repelled by bodies in both theſe caſes, without the immediate contact of the reflecting or inflecting body. The ſame thing ſeems alſo to follow from the emiſſion of light; a ray, as ſoon as ſhaken off from a ſhining body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force, which is ſufficient to turn it back in reflection, may be ſufficient to emit it. It ſeems alſo to follow, from the production of air and vapour; the particles, when they are ſhaken off from the body by heat or fermentation, ſo ſoon as they are beyond the reach of the attraction of the body, receding from it, and alſo from one another, with great ſtrength, and keeping at a diſtance, ſo as ſometimes to take up above a million of times more ſpace than they did before in the form of a denſe body; which vaſt contraction and expanſion ſeems unintelligible, by feigning the particles of air to be ſpringy and ramous, or rolled up like hoops, or by any other means than a repulſive power. The particles of fluids, which do not cohere too ſtrongly, and are of ſuch a ſmallneſs, as renders them moſt ſuſceptible of thoſe agitations which keep liquors in a fluor, are more eaſily ſeparated and rarefied into vapour, *i. e.* in the language of the chemiſts, they are *volatile;* rarefying with an eaſy heat, and condenſing again with cold. But thoſe which are groſſer, and ſo are leſs ſuſceptible of agitation, or which cohere by a ſtronger attraction, are not ſeparated without a ſtronger heat, or perhaps not without fermentation. And theſe laſt are the bodies which chemiſts called *fixed;* and yet theſe, being rarefied by fermentation, become true permanent air; thoſe particles receding with the greateſt force, and being moſt difficultly brought together, which, upon contact, cohere the moſt ſtrongly. And becauſe the particles of permanent air are groſſer, and ariſe from denſer ſubſtances than thoſe of vapours; thence it is, that true air is more ponderous

ponderous than vapour; and that a moist atmosphere is lighter than a dry one, quantity for quantity. From the same repelling power it seems to be, that flies walk upon the water without wetting their feet; and that the object-glasses of long telescopes lie upon one another without touching; and that dry powders are difficultly made to touch one another so as to stick together, unless by melting them, or wetting them with water, which, by exhaling, may bring them together; and that two polished marbles, which by immediate contact stick together, are yet difficultly brought so close together as to stick."

He farther observes, "That, all things considered, it seems probable, God, in the beginning, formed matter in solid, massy, hard, impenetrable, moveable particles, of such sizes, figures, and with such other properties, and in such proportion to space, as most conduced to the end for which he formed them; and that these primitive particles, being solid, are incomparably harder than any porous bodies compounded of them; even so very hard as never to wear, and break in pieces: no ordinary power being able to divide what God himself made one in the first creation. While the particles continue entire, they may compose bodies of one and the same nature and texture in all ages; but, should they wear away, or break in pieces, the nature of things depending on them would be changed. Water and earth, composed of old worn particles, and fragments of particles, would not be of the same nature and texture now with water and earth composed of entire particles in the beginning. And, therefore, that nature may be lasting, the changes of corporeal things are to be placed only in the various separations and new associations and motions, of these permanent particles; compound bodies being apt to break not in the midst of solid particles, but where those particles are laid together, and touch in a few points."

It seems farther, "That these particles have not only a *vis inertiæ*, accompanied with such passive laws of motion as naturally result from that force, but also that they are moved by certain active principles, such as is that of gravity, and that which causeth fermentation, and the cohesion of bodies. These principles are to be considered not as occult qualities, supposed to result from the specific forms of things, but as general laws of nature, by which the things themselves are formed; their truth appearing to us by phenomena, though their causes are not yet discovered."

Hobbes, Spinoza, &c. maintain all the beings in the universe to be material, and their differences to arise from their different modifications, motions, &c. Thus matter, extremely subtile, and in a brisk motion, they conceive, may think; and so they exclude all spirits out of the world. See HOBBISM and SPINOZISM.

Dr. Berkeley, on the contrary, argues against the existence of matter itself; and endeavours to prove, that it is a mere *ens rationis*, and has no existence out of the mind. See ABSTRACTION, BODY, and EXISTENCE.

Some late philosophers have advanced a new hypothesis concerning the nature and essential properties of matter. The first person who suggested, or at least published an account of this hypothesis, was M. Boscovich, in his "Theoria Philosophiæ Naturalis," printed at Vienna in the year 1758. He supposes that the whole mass of matter constituting the various bodies of the universe, consists of a very large, but finite number of simple, indivisible, unextended atoms. These atoms, which may be considered as physical points, are endued with repulsive and attractive powers, which operate variously at different distances. In other words, they are surrounded with various spheres of repulsion and retraction, in the same manner as *solid* matter is generally supposed to be. At the least and innermost distances they repel one another, and by diminishing the distances, these repulsive powers are augmented beyond all limits, so as to be sufficient for annihilating the greatest velocity, and for preventing the actual contact of the primary atoms of matter. At sensible distances the force, which was repulsive, becomes attractive, and decreases, sensibly, as the squares of the distances increase, so as to constitute universal gravity, and to extend beyond the sphere of the most distant limits. But between the supposed innermost repulsive force and the outermost attractive force, at insensible distances, many changes or varieties of force, and consequent determination to motion, occur; the repulsive force being diminished as the distance is augmented. The repulsive force becomes wholly extinct at a certain distance: but on increasing this distance, attraction begins, increases, becomes less, and vanishes; and when the distance is still greater, the force becomes repulsive, increases, lessens, and vanishes as before. Changes of the kind now mentioned occur at insensible distances, sometimes more rapidly, sometimes more slowly; and sometimes one kind of force may become extinct and recover its appropriate state without passing to the other kind. For all these variations the different distances, though insensible to us, afford sufficient scope, as the least part of space is divisible *in infinitum*. Our author's assumed atoms possess, besides these repulsive and attractive forces, that *vis inertiæ* which is admitted to belong to matter by almost all modern philosophers. Our author has illustrated his theory of repulsive and attractive forces by a geometrical curve, varying with a change of distances, which, at first view, appears to be a complicated irregular line; but which Boscovich shews to be regular and uniform, and capable of being expressed by an uniform algebraical equation. But for this part of the subject, the detail of which, so as to render it intelligible, would far exceed our prescribed limits, we must refer to his own work. Nor can we explain at large that law of continuity, by which variable quantities, passing from one magnitude to another, pass through all the intermediate magnitudes, without ever abruptly passing over any of them, and which our author first proves from induction, and then applies to the illustration and establishment of his system. From this law our author infers the impossibility of contact between bodies, and by means of it he explains the interior repulsive forces of his system. Again, from these repulsive forces he deduces the inextension of his atoms; for as this repulsion is common to all matter, it must cause a perfect simplicity in the first elements of body. If these elements were extended, and consequently compounded of particles of an inferior order, these particles might possibly be separated, and then they might meet, and thus an abrupt passage from one velocity to another might take place, which is inconsistent with the law of continuity, previously established. Besides, our author, by rejecting the extension of the first elements of matter, and reducing them, as we have before observed, to mere physical points of attraction and repulsion, precludes all the difficulties that result from continual extension in body, and which have never been satisfactorily obviated. If the elements of matter are extended, each of them may be divided *in infinitum*, and each part may still be divided *in infinitum*. Can this division, it may be questioned, be actually made by the power of God or not? Can there be one *infinite* in number greater than another? Can there be a *compound* without a *simple* of the same kind? These difficulties, it is alleged, do not regard space, which is no real being; but they would regard matter, if it had continued extension. All these perplexities are said to be removed by maintaining, with Bofcovich, that the firft elements of bodies are perfectly fimple, and therefore inextended. But if a particle of matter is not extended, in what refpect does it differ from a point of fpace? M. Bofcovich fays, it is endued with attractive and repulfive forces. But what is it before it is thus endued? Does it then differ from a point of fpace? It is next to impoffible to form any fatisfactory notion of fuch difference. A point of fpace, confidered as an individual, is diftinguifhed from another individual merely by its fituation; it is, therefore, immoveable, but matter is moveable. Have thefe forces, it is very properly afked, which make matter an object of fenfe, any fubftratum, any thing in which they are inherent as qualities? What are the things which thefe qualities diftinguifh from each other as individuals?

With regard to the exterior attractive forces of this fyftem, there can be no queftion; becaufe they conftitute univerfal gravity, the effects of which are conftantly perceptible. But between the interior repulfive and exterior attractive forces, we muft admit many tranfitions from repulfion to attraction, and *vice versâ*, at infenfible diftances, which are indicated to us by cohefion, fermentation, evaporation, and other phenomena of nature. Againft this fyftem, however ingenioufly devifed and ably fupported by the celebrated author, many objections have been urged. That there fhould be no contact between bodies, is an affumption which will not be readily admitted by thofe who have long entertained different ideas on the fubject; and yet Bofcovich himfelf allows, that bodies approach fo near to one another as to leave no fenfible diftance between them, and our fenfes, it muft be acknowledged, are impreffed in the fame manner by his repulfive forces as they would have been by folid bodies themfelves. It has been faid that M. Bofcovich, by denying the extenfion of atoms, annihilates matter; and to this objection we have met with no fatisfactory anfwer. It has been alfo faid, that upon this part of his fyftem, there would be no difference between body and fpirit. By others it has been alleged, that M. Bofcovich's repulfive and attractive forces are like the occult qualities of the Peripatetics; but a fimilar objection has been urged againft Newton's attraction; and it is equally groundlefs, becaufe powers of this kind are fufficiently afcertained by their effects. Some have been indifpofed to admit motion and collifion without immediate impulfe; and it muft be confeffed, that they are not eafily explained and clearly underftoood upon his fyftem. For our author's mode of explaining them, and of applying his fyftem to mechanics, &c. we muft refer to the fecond part of the work already cited. His next object, in the third part, is to account on his fyftem for the general properties of matter. Upon his theory matter is not impenetrable. Provided that any body move with a fufficient degree of velocity, or have fufficient momentum to overcome any power of repulfion that it may meet with, it will find no difficulty in making its way through any body whatever; for nothing will interfere, or penetrate another, but powers, fuch as we know do in fact exift in the fame place, and counterbalance and over-rule one another; a circumftance which never had the appearance of a contradiction, or even of a difficulty. If the momentum of fuch a body in motion be fufficiently great, M. Bofcovich demonftrates, that the particles of any body through which it paffes, will not even be moved out of their place by it. With a degree of velocity fomething lefs than this, they will be confiderably agitated, and ignition might, perhaps, be the confequence; though the progrefs of the body in motion would not be fenfibly interrupted; and with a ftill lefs momentum it might not pafs at all. This theory M. Bofcovich has taken great pains to illuftrate and confirm; fhewing, that it is by no means inconfiftent with any thing that we know concerning the laws of mechanics, or our difcoveries in natural philofophy; and that a great variety of phenomena, particularly thofe which relate to light, admit of a much eafier folution upon this hypothefis than upon any other. The moft obvious difficulty, fays Dr. Prieftley, and, indeed, the only one that attends this hypothefis, as it fuppofes the mutual penetrability of matter, arifes from the difficulty we meet with in attempting to force two bodies into the fame place. But it is demonftrable, that the firft obftruction arifes from no actual contact of matter, but from mere powers of repulfion. This difficulty we can overcome; and having got within one fphere of repulfion, we fancy that we are now impeded by the folid matter itfelf. But the very fame is the apprehenfion of the generality of mankind with refpect to the firft obftruction. Why, therefore, fays he, may not the next refiftance be only another fphere of repulfion, which may only require a greater force than we can apply to overcome it, without difordering the arrangement of the conftituent particles; but which may be overcome by a body moving with the amazing velocity of light?

This fcheme of the mutual penetration of matter firft occurred to Mr. Michell, independently of any communication with M. Bofcovich, on reading Baxter on the "Immateriality of the Soul." He found that this author's idea of matter was, that it confifted, as it were, of bricks cemented together by an immaterial mortar. Thefe bricks, if he would be confiftent in his reafoning, were again compofed of lefs bricks, cemented likewife by an immaterial mortar, and fo on *ad infinitum*. This putting Mr. Michell upon the confideration of the appearances of nature, he began to perceive that the bricks were fo covered with this immaterial mortar, that, if they had any exiftence at all, it could not poffibly be perceived; every effect being produced at leaft in nine inftances in ten certainly, and probably in the tenth alfo, by this immaterial, fpiritual, and penetrable matter. Mr. Michell, finding it neceffary, in order to folve the appearances of nature, to admit of extended and penetrable immaterial fubftance, if he maintained the impenetrability of matter; and obferving farther, that all we perceive by contact, &c. is this penetrable immaterial fubftance, and not the impenetrable one, began to think, that he might as well admit of penetrable material, as penetrable immaterial fubftance; efpecially as we know nothing more of the nature of fubftance than that it is fomething which fupports properties; which properties may be whatever we pleafe, provided they be not inconfiftent with each other, that is, do not imply the abfence of each other. This by no means feemed to be the cafe, in fuppofing two fubftances to be in the fame place at the fame time, without excluding each other; the objection to which is only derived from the refiftance we meet with to the touch, and is a prejudice that has taken its rife from that circumftance. Dr. Prieftley obferves, that if he were to make any alteration in this hypothefis, it would be to fuppofe the force of the fphere of repulfion next to any of the indivifible points, which conftitute what we call folid bodies, not to be abfolutely infinite, but fuch as may be overcome by the momentum of light. If, however, we confider that Mr. Bofcovich makes this neareft power of repulfion not to extend to any real fpace, but to be confined to the indivifible point itfelf, it may appear to be fufficient for the purpofe.

The theory of M. Bofcovich is eafily applicable to the cohefion of atoms, of more compounded particles, and of fenfible bodies. From the cohefion of particles he deduces the extenfion of bodies; becaufe there muft always be fpace between

between the particles. Extenfion, however, according to his fyftem, does not fuppofe the continuity of matter; though we cannot perceive the fmall interval that fubfifts between the conftituent parts of fome bodies, and much lefs the diftance between the fimple elements that compofe them. Figurability refults from extenfion; and denfity from the very different quantities of matter that may be contained under the fame figure and bulk; that body being the moft denfe, which contains in the fame fpace the greateft number of atoms, and *vice verfâ*. But if thefe atoms are mere unextended points, it is not eafy to conceive how any aggregate or combination of them can conftitute a body of any fuppofed denfity. However, our author fuppofes that denfity may be augmented by the nearer approach of the atoms to one another; and of courfe a body of any given magnitude may be divifible beyond any affigned limits. An effential part of mobility in this fyftem confifts in forces, which, at certain diftances, are determinations to motion. Univerfal gravity, which takes place in fenfible diftances, is perfectly intelligible in this fyftem; though our author feems to fuppofe that, when it has extended to the fphere of the limits moft diftant from the fun, it may pafs to repulfion, and again revert to attraction, and form limits of cohefion at the time the fun may be within fuch a limit with regard to the fixed ftars, and our planetary fyftem form only a fmall part of the whole univerfe.

But we are now advanced to the regions of mere conjecture and hypothefis. Our author has further extended his theory to the properties pertaining to diftinct claffes of bodies, fuch as fluidity, folidity, foftnefs and hardnefs, flexibility, elafticity, vifcofity; to the operations of chemiftry; and to the explication of the phenomena of light, electricity and magnetifm, and animal fenfation. Of his ample and various obfervations on thefe fubjects, we can only felect a few particulars. The parts of fluids are eafily feparated, and moved among one another, becaufe they are fpherical and very homogeneous, fo that their forces are directed more to their centre, than to one another, and, of courfe, lefs obftructed in their motions. Some particles are mutually attracted in a very fmall degree, and others more fenfibly, fuch as thofe of water and mercury. The particles of air are feparated by a ftrong force of repulfion, which accounts for the great rarefaction of this fluid. Solid bodies are formed of fubftances of fuch figures, which occafion a greater cohefion than thofe of fluids, fo that they are prevented from moving feparately or round one another: of thefe fome are harder, as their conftituent particles are placed in limits which have ftrong repulfive arches within them, and others, whofe particles have their arches of repulfion weaker, are fofter. Some are flexible, becaufe their particles are placed in limits that have weak arches of repulfion and attraction on each fide: and if thefe arches are fhort, the particles gain more limits of cohefion, and remain bent; but if the arches are longer, the former repulfion and attraction will continue to act and reftore the body to its former pofition; and in doing this with an accelerated velocity, the parts will pafs their former limits, and vibrate backwards and forwards, as is the cafe in a bended fpring: and thus our author accounts for elafticity. Vifcous bodies, having lefs cohefion than folid, and more than fluids, adhere to others in confequence of an attraction which their particles acquire from their compofition. Thus water itfelf adheres to fome bodies, and is repelled by others; which variety is afcribed to the various refpective forces derived from the different compofition of their conftituent particles. In explaining the compofition of organic bodies, the author confiders that particles may be fo formed as to repel fome and attract others, and thus accounts for vegetation, nutrition, and fecretion: and as one particle may attract another in one part only, and repel it in every other fituation, we may hence infer the orderly fituation of the particles in many cryftallizations. The procefs of various chemical operations and their effects are alfo explained by Bofcovich, agreeably to his general fyftem. Light he confiders as an effluvia, emitted with great velocity from luminous bodies by a ftrong repulfion: and he attributes the phenomena of electricity and magnetifm to various attractions and repulfions. Fire he fuppofes to differ from the electrical fluid merely in this circumftance, that fire is an actual fermentation, which is not the cafe with the electrical fluid. In explaining our bodily fenfations, he afcribes what other philofophers attribute to the immediate contact of bodies to attractions and repulfions, which are adapted to caufe that motion in our nerves, that is fuppofed to take place in the organs of fenfation, and to be thence communicated to the brain.

We are happy to be able to clofe this concife and imperfect account of Bofcovich's fyftem with announcing to the philofophers, who may admit or reject it, that he was fully convinced of the neceffity of admitting a felf-exiftent, all-powerful, and intelligent Being, to whom he afcribes the creation of thofe materials that compofe the univerfe, and the arrangements of them in their prefent beautiful form. Indeed, he expreffes his aftonifhment, that any perfon who pretends to the name of a philofopher fhould refift the evidence which the leaft parts of the vifible univerfe afforded in proof of the exiftence of God, as the firft caufe of all. Chance, to which fome have abfurdly attributed the origin of the univerfe, he very juftly confiders as a word without a meaning; nor can he allow that the world has exifted of itfelf in any form like its prefent from all eternity: God alone being eternal and actually infinite. He is alfo a ftrenuous advocate, not only for the principles and duties of natural religion, but for the excellence and benefits of that revelation which God has been pleafed, in great goodnefs, to communicate to mankind.

In conformity to the hypothefis of Bofcovich and Michell, Dr. Prieftley maintains, that matter is not that inert fubftance that it has been fuppofed to be; that powers of attraction or repulfion are neceffary to its very being, and that no part of it appears to be impenetrable to other parts. Accordingly, he defines matter to be a fubftance, poffeffed of the property of extenfion, and of powers of attraction or repulfion, which are not diftinct from matter, and foreign to it, as it has been generally imagined, but abfolutely effential to its very nature and being: fo that when bodies are divefted of thefe powers, they become nothing at all. However, though he fuppofes that thefe powers are effential to the being of matter, infomuch that it cannot exift without them as a material fubftance at all, he by no means maintains that they are felf-exiftent in it; but that from whatever fource thefe powers are derived, or by whatever being they are communicated, matter cannot exift without them; and if that fuperior power or being withdraws its influence, the fubftance itfelf neceffarily ceafes to exift, or is annihilated. Whatever folidity any body has, it is poffeffed of only in confequence of being endued with certain powers, and together with this caufe, folidity, being no more than an effect, muft ceafe. Dr. Prieftley, in another place, has given a fomewhat different account of matter; according to which it is only a number of centres of attraction and repulfion; or more properly of centres, not divifible, to to which divine agency is directed: and as sensation and thought are not incompatible with these powers, solidity, or impenetrability, and consequently a *vis inertiæ*, only, having been thought repugnant to them, he maintains, that we have no reason to suppose that there are in man two substances absolutely distinct from each other. Disquisitions on Matter and Spirit, 1777, passim. See Soul.

Dr. Price, in a correspondence with Dr. Priestley, published under the title of a "Free Discussion of the Doctrines of Materialism and Philosophical Necessity," 1778, has suggested a variety of objections, in our opinion unanswerable, against this hypothesis of the penetrability of matter, and against the conclusions which are drawn from it. The *vis inertiæ* of matter, he says, is the foundation of all that is demonstrated by natural philosophers concerning the laws of the collision of bodies. This, in particular, is the foundation of sir Isaac Newton's philosophy, and especially of his three laws of motion. Solid matter has the power of acting on other matter by impulse; but unsolid matter cannot act at all by impulse: and this is the only way in which it is capable of acting, by any action that is properly its own. If it be said, that one particle of matter can act upon another without contact and impulse, or that matter can, by its own proper agency, attract or repel other matter which is at a distance from it, then a maxim hitherto universally received must be false, that "nothing can act where it is not." Sir Isaac Newton, in his letters to Dr. Bentley, calls the notion, that matter possesses an innate power of attraction, or that it can act upon matter at a distance, and attract and repel by its own agency, an absurdity into which, he thought, no one could possibly fall. And in another place he expressly disclaims the notion of innate gravity, and has taken pains to shew that he did not take it to be an essential property of bodies. By the same kind of reasoning pursued, it must appear, that matter has not the power of attracting and repelling; that this power is the power of some foreign cause, acting upon matter according to stated laws; and that, consequently, attraction and repulsion; not being actions, much less inherent qualities of matter, as such, it ought not to be defined by them. And if matter has no other property, as Dr. Priestley asserts, than the power of attracting and repelling, it must be a non-entity; because this is a property that cannot belong to it. Besides, all power is the power of something; and yet if matter is nothing but this power, it must be the power of nothing; and the very idea of it is a contradiction. If matter is not solid extension, what can it be more than mere extension? Farther, matter that is not solid is the same with pore; it cannot, therefore, possess what natural philosophers mean by the momentum or force of bodies, which is always in proportion to the quantity of matter in bodies, void of pore. Momentum is the cause of resistance, and not *vice versâ*. Moreover, within the sphere of repulsion, the attraction of cohesion takes place; and this is the power which, according to Dr. Priestley, unites the parts of matter, and gives it existence. But, since matter is penetrable, will not this attraction drive all the parts of it into one another, and cause them to coalesce into nothing? This effect must follow, unless there exists, beyond the sphere of attraction, and nearer to matter, a second sphere of repulsion, which again prevents contact. Thus it appears evident, that if a power of attracting acts, it must contract itself into nothing; and that if a power of repulsion acts, it must dissipate itself into nothing. For a farther account of the arguments *pro* and *con* on this subject, we must refer to the work already cited.

Matter, *Ætherial*. See Ætherial.

Matter, *Subtile*. See Materia *Subtilis*.

Matter, *Quantity of*. See Quantity.

Matter *of Deed* signifies a truth to be proved, though not by any record: by which it stands contradistinguished from

Matter *of Record*, which is that which may be proved by some record.

If a man be sued to an exigent during the time he was in the king's wars, that is *matter in deed*, and not *matter of record;* and therefore he that will allege this for himself must come before the scire facias or execution be awarded against him; for, after that, nothing will serve but matter of record; that is, some error upon the process appearing upon record.

Matter, *Foreign*. See Foreign.

MATTEUCCI, Il Cavaliere, in *Biography*, a Neapolitan singer, possessed of a voice so extraordinary, and a manner of singing so perfect, that he was regarded at the head of his profession. After having been long in the service of the court of Spain, he returned to Naples, where he still lived in 1730. At fourscore years of age he had still a voice as firm, sweet, and flexible, as in his youth.

MATTHEIA, St., in *Geography*, a small island in the North Pacific ocean, about 140 miles from the south-east coast of Russia. N. lat. 60° 20'. E. long. 177° 10'.

MATTHESON, John, in *Biography*, a native of Hamburgh, was born in 1681. He was the son of a Lutheran clergyman, and seems to have been educated with great care. Among his early studies, at seven years old he was allowed a music-master, under whom he profited so rapidly, that at the age of nine he was able to sing to the organ, in the church at Hamburgh, anthems of his own composition.

But while he was so eagerly pursuing the study of music, he made himself master of modern languages, and applied part of his time to the study of the civil law, attending the public lectures by turns of two doctors learned in that faculty. But we shall chiefly confine ourselves to his progress in music, and the use he made of his attainments in that art; as his connection and conflict with Handel, early in their several lives, have rendered him an interesting personage to our readers of musical history.

At the age of eighteen he composed an opera in the German language, called the "Pleiades," and performed a principal part in it himself.

Handel, in 1703, at the age of nineteen, on the death of his father, in order to avoid being burthensome to his mother, went to Hamburgh, and engaged himself in the opera band of that city, as a second ripieno violin. He and Mattheson soon became acquainted, by accidentally meeting each other in an organ-loft, where Handel was practising at the time that Mattheson went thither for the same purpose. After this they studied and visited churches together, in order to exercise themselves on the organ.

As these young students lived much together, in great intimacy, they had frequent trials of skill, and, in friendly emulation, had frequent contentions in musical knowledge and talents: in the latter, it appearing that they excelled on different instruments, Handel on the organ and Mattheson on the harpsichord, they mutually agreed not to invade each other's province, and faithfully observed this compact during five or six years.

Mattheson tells us, that no one except himself knew that Handel could play on any other instrument than the violin; "but his superior abilities were soon discovered, when,

 upon

upon occafion of the harpfichord-player at the opera being abfent, he was perfuaded to take his place; for he then fhewed himfelf to be a great mafter, to the aftonifhment of every one except myfelf, who had frequently heard him before upon keyed-inftruments."

About this time an opera, called "Cleopatra," compofed by Matthefon, was performed on the Hamburgh ftage, in which he acted the part of Antony himfelf, and Handel played the harpfichord; but Matthefon being accuftomed, at the death of Antony, which happens early in the piece, to take the harpfichord in the character of the compofer, Handel refufed to indulge his vanity by relinquifhing to him that poft, which occafioned fo violent a quarrel between them, that, at going out of the theatre, Matthefon gave him a flap on the face; upon which, both immediately drew their fwords, and a duel enfued in the market-place, before the door of the opera-houfe: luckily the fword of Matthefon was broken againft a metal button upon Handel's coat, which put an end to the combat; and they were foon after reconciled.

This rencontre happened on the 5th of December 1704; and as a proof of their fpeedy reconciliation, Matthefon tells us that, on the 30th of the fame month, he accompanied the young compofer to the rehearfal of his firft opera of "Almira," at the theatre, and performed in it the principal part; and that afterwards they became better friends than ever.

On the 25th of February, in the next year, Handel produced his fecond opera, called "Nero," which had likewife a very favourable reception. It was at the end of the run of thefe two dramas that Matthefon, who performed the principal man's part in both, quitted the ftage, on being appointed fecretary of legation to fir Cyril Wych, refident at Hamburgh from the Englifh court.

Matthefon, with all his failings, was certainly a man of quick parts, diligent cultivation, and talents of various kinds; but, as a mufician, he had more knowledge than tafte. Many ftories were long in circulation at Hamburgh, concerning his pedantry, vanity, and eccentricities. Long after he had ceafed to play and compofe, he continued to write mufical treatifes, of which the names are now hardly to be found. All the mufic we have feen by Matthefon is fteril of ideas and uninterefting. It has been faid, that he was a great performer on the harpfichord, and that Handel often amufed himfelf in playing his pieces; in doing which, if ever he regarded Matthefon as a formidable rival, his triumph muft have been very complete in comparing them with his own, or with the inherent powers which he muft have felt of producing better whenever he pleafed. We are in poffeffion of twelve Leffons by Matthefon, engraved on copper by Fletcher, in tall folio of 18-ftaved paper, London, 1714, who, in a preface, fpeaks of them as "pieces which claim precedence to all others of this nature, as being compofed by one of the greateft mafters of the age, in a ftyle altogether pleafing and fublime."

They confift, like other fets of leffons of that period, of overtures, preludes, fugues, allemandes, courants, gigues, and aires; but notwithftanding the editor's eloge, they refemble all the harpfichord mufic which we ever faw, anterior to Handel's admirable "Suites de Pieces," firft fet in 1720; though, in good harmony, they imprefs the mind with no better idea of accent, grace, or paffion, than the jingling of triangles, or bells of a pack-horfe; and, indeed, are fuch as degrade the inftrument to the level of "founding brafs, and a tinkling cymbal."

There is a lift of Matthefon's works in Walther's Mufical Lexicon, as far as the year 1732, amounting to forty; but as he continued writing to the laft, and lived till 1764, it is probable that he kept his promife of printing as many works on the fubject of mufic as he had lived years, and ftill leaving to his executors as many more in manufcript for the ufe of pofterity.

Matthefon bequeathed at his deceafe all his poffeffions to the republic of Hamburgh, on condition that fuch an organ fhould be built for the great church as he defcribed in his will. It had not been long finifhed when we faw and heard it, in 1772; but we believe it to be the largeft and moft complete in Europe. It coft upwards of 4000*l.* fterling, was built by Hildebrand, is of 32 feet, has four fets of keys, long compafs, up to F in altiffimo, and, with the pedals, goes down to double double C. The keys are covered with mother-of-pearl and tortoife-fhell; the front is curioufly inlaid, and the cafe richly ornamented. There are 64 ftops in this organ; and a fwell attempted, but with little effect; only three ftops had been allowed to it, and the power of crefcendo et diminuendo was fo fmall, that if we had not been told there was a fwell, we fhould not have difcovered it.

Matthefon's picture is placed in the front of the organ gallery, and there is a Latin infcription under it recording the benefaction. This good man had more pedantry and nonfenfe about him than true genius. In one of his vocal compofitions for the church, in which the word *rainbow* occurred, he gave himfelf infinite trouble to make the notes of his fcore form an arch. What pity this arch was not reprefented in the front of his inftrument, where, upon the principle of Père Caftel's Clavecin Oculaire, his arch might have had all the colours as well as the curvature of the rainbow! See Pere Castel, and Clavecin Oculaire.

The rainbow ftory may ferve as a fpecimen of Matthefon's tafte and judgment with refpect to the propriety of mufical expreffion and imitation.

By his laft will and teftament, an anthem was performed at his funeral, which he had himfelf compofed for the occafion; but it excited more laughter than forrow, when heard in its old-fafhioned grace. Yet, in fpite of ridicule, he was certainly poffeffed of a great fhare of mufical erudition, and was of great ufe to his countrymen in his younger days, by bringing them acquainted with mufic of other parts of the world, and by introducing a better ftyle among them than their own. He was lefs fond of fugues than his contemporaries; but in his latter days he became a mere theorift, without tafte or feeling.
