INDEX OF CONTENTS.

JANUARY TO JUNE, 1875.

A

ABIES balsamea, an insect attacking, 759
 Abies commutata, 106; Douglas's, 106,
 409, 440; (Picea) bifolia, 465
 Abraxis grossularia, 110
 Abutilon Thompsonii, 51
 Acacias at Kew, notes on the, 814
 Academy, notes at the Royal, 569, 619, 651
 Adders, loads and snakes, 463, 568
 Adelaide Botanic Gardens, the, 656, 759;
 a new conservatory for the, 693
 Adiantum gracillimum, 171; Hendersoni,
 796; Seemannii, 396; macrophyllum
 glaucum, 620
 Adulteration of Seeds Bill, 81
 Aeries cylindricum, 636; Vandarum,
 591
 Agaricus ascophorus, 503
 Agaves, a group of, in M. Thuret's gar-
 dens, 502
 Agave americana, 594, 662; Celsiana,
 759
 Agricultural statistics, 240
 Alantus excelsa, 471
 Albert Hall, floral decorations at the, 567
 Albuca (Euaibulca) glandulosa, 814
 Algeria, the Tobacco harvest in, 595
 Also ferax and other succulents in M.
 Thuret's garden, 243
 Aloe (Faschidendron) drepanophylla, 814
 Aloysia citrodora, old plants of, 629
 Alpine plants, dealing, 759
 Alsace Cucumber, 493
 Alströméria, notes on, 239
 Amalfi, South Italy, notes from, 86
 Amaryllids, bulb-like seeds of some, 594
 Amaryllis at Meadowbank, 662
 American blight insect, the, 789
 American plants at Knappbill, the, 717
 American Potatoes, 754
 American swam signal, the, 787
 Amorphophallus Rivieri, explanation of
 water from the leaves of, 79
 Anderson, Mr. James, presentation to,
 311
 Anemones on the Mediterranean coast,
 144
 Anemopsis californica, 114
 Angreum Ellissi, 278
 Animals, plants that eat, 303, 340, 405,
 577, 790
 Annals for early flowering, 89; hardy,
 50
 Anobium striatum, or Death Watch, 86
 Antiaribus signatus, 691
 Ant, flies, and other insects, 565
 Anthurium espadatum, 438; Patteni, 524;
 Wallisi, 429
 APIARY:—American swam signal, the,
 787; how I winter my, 467; on the
 swarming of bees, 275; glass Wood-
 bury hive, the, 371; "hive of hives,"
 the, 307; Italian bees, 666; nading
 system, the, 787; swarming season,
 the, 787; swarming, what is, 787;
 work for March, 307; April, 530;
 May, 626; Yates' round-topped hives,
 431
 Apple of literature, the, 459, 491
 Apple, Redleaf Russet, 118
 Apple stocks, notes on, 600
 Apple tree mussel scale, 531
 April, lines on, 467
 Apricots, blossom and prospects, 472
 Aralia fastigiata, 179; Sieboldi, flowering
 of, 85, 115
 Araucaria excelsa wintered in open air,
 629
 Araucaria imbricata, 535, 563, 759
 Arbours or bowers, 305
 Ardross Castle, 272

Aroids at Kew, the, 141, 335
 Artichokes, Jerusalem, on heavy land, 19
 Arrum italicum, germination of, 470
 Arums, notes on, 523
 Ascot, the Royal Nurseries at, 43, 75
 Ash and Oak, leafing of the, 823
 Asparagus beds, making with Seaweed,
 504
 Asparagus, early forcing, 18
 Aspidiotus conchiformis, 531
 Aubrietia Campbellii, 663
 Aucuba berries, 436
 Aucuba japonica at Regent's Park, 400
 Aucubas, 504
 Aucubas, fertilisation of, 555; large, 472
 Auricula Society, the National, 470
 Auricula, the old yellow, 620
 Australia, Mulberry trees for, 562
 Avenues, richly coloured, 716
 Ayres, Mr. W. P., death of, 119
 Azaleas and Camellias, 367
 Azaleas, Indian, hardness of, 750
 Azalea linearifolia, 662

B

BAINES, Mr. T., memoir and portrait of,
 180
 Bamboo, the, 506
 Bamboos, hardy, 245; poison in, 573
 Bangalore, notes from, 402
 Barked Elm trees, 281, 313
 Barrow, a spring, 536; Chinese, 632
 Basket case, a disputed, 281
 Bast masts, 74
 Batemania armillata, 780
 Bath and West of England Society, 316
 Barding, carpet, with hardy plants, 528
 Beerschoten, Holland, gardening notes
 from, 623
 Bees and Wistaria sinensis, 566
 Bees, how I winter my, 467; Italian, 666
 Beetle, the Colorado Potato, 144, 209,
 210, 438, 502, 593, 598
 Begonia Emperor, 796
 Begonias, hardy hybrid, 440
 Belfast, the Royal Botanic Garden at,
 817
 Belvoir, the spring garden at, 564
 Berberis Aquifolium, 566
 Beurré Clairgeau Pear tree, grown in
 Jersey, 140
 Bethnal Green, the new garden at, 661,
 761
 Biological instruction at Oxford, 502
 Birch rod, the, 401
 Birchs and Crouses, 665
 Birmingham and Liverpool, notes by the
 way, 44
 Birthplace of the Duke of Wellington,
 502
 Black Monukka Grape, on crossing the,
 84, 116
 Bladder-nut, forced flowers of the, 207
 Blight, American, the, 789
 Blue flowered Hortensias, the, 375
 Boilers at Manchester, 718
 Boletus, living on, 436
 Bolca Fatini, 8
 Bombyx neustria, 413
 BOOKS, notices of:—Aird's Civil Laws of
 France to the present time, 143; Al-
 phand's Description, Culture, et Usage
 des Arbres, 307; Belgique Horticole,
 15, 409, 595; Bernardi's Classified
 List of Vegetable Oils and Fats, 47;
 Botanical Locality Record Club's Re-
 port, 15; Botanical Magazine, 111,
 206, 467, 659; Bulletin de la Fédération
 des Sociétés d'Horticulture de
 Belgique, 15; Burbridge's, the Narcis-
 sus, 568; Cassell's Child's Bible, 467;

Cogniaux et Marchal's Les Plantes Or-
 nementales, à feuillage pansché et
 coloré, 307; Concordia, 659; Cooke's
 Fungi Britannici exsiccata, 531; Cox's
 Address to the Psychical Society of
 Great Britain, 722; Dupont's Les
 Bois Indigènes et Etrangers, 499;

 Fish's Pruning, Grafting and Budding
 Fruit Trees, 722; Floral Magazine,
 275; Flore des Serres, 627; Florist
 and Pomologist, the, 307, 595; Gar-
 dener, the, 627; Gartenflora, 15, 206,
 467, 595; Geographical Magazine, 275;
 Goese's Beitrag zur Kenntniss der
 Orangengewächse, 14, 47; Gordon's
 Pinetum, 403; Göschke's Das Buch der
 Erdbeeren, 371; Göschke's Die Ration-
 nelle Spargelzucht, 435; Hartwig's
 Aerial World, 79; Heath's Fern Para-
 dises, 47; Hertz's L'Explorateur, 175;
 Hibbert's Amateur's Rose Book, 15;
 Hogg's Fruit Manual, 595, 627;
 Hooker and Baker's Synopsis Filicum,
 339; Hooker's Flora of British India,
 339; I. Giardini, 15; Illustration
 Horticole, 15, 467; Jennings' Orchids,
 and How to Grow Them in India and
 other Tropical Climates, 275; Journal
 of the Asiatic Society of Bengal, 46;
 Journal of Botany, 206, 467; Journal
 of the Linnean Society, 595; Lawson's
 Ten Years of Gentleman Farming, 14;
 Lockyer's Primer of Astronomy, 175;
 Lubbock's British Wild Flowers con-
 sidered in Relation to Insects, 143;
 Markham's Progress and Condition of
 India, 402; Meunier's La Terre Végé-
 tale, 499; Micrograph Dictionary, 15;
 Miller, the, 499; Mullen's Twelve
 Months in Madagascar, 786; New
 Quarterly Magazine, the, 47; Nichol's
 Forty Years of American Life, 499;
 Page's Economic Geology, 174; Paxton's
 Cottager's Calendar of Garden
 Operations, 339; Paxton's Calendar of
 Garden Operations, 499; Pfeiffer's
 Nomenclator Botanicus, 722; Regel's
 Descriptions Plantarum novarum et
 minus cognitarum in regionibus Turke-
 stanicis, 110; Reichenbach's Xenia Or-
 chidacea, 307; Revue de l'Horticultu-
 re Belge, 467; Sachs' Lehrbuch
 of Botany, 559; Sachs' Text-Book of
 Botany: Morphological and Physio-
 logical, 658; Saskatchewan and the
 Rocky Mountains, 79; Smiles' Lives of
 the Engineers, 15; Sowerby and John-
 son's British Wild Flowers, 111, 627;
 Spooner's History, Structure, Economy,
 and Diseases of the Sheep, 79; Spryde's
 Le Jardin Potager Complet, 275;
 Spryde's Le Jardin Potager, 371;

 on Laying Down Land to Permanent
 Pasture, 175; Tschibatchef's transla-
 tion of Grisebach's Vegetation der
 Erde, 659; Transactions of the Arbo-
 ricultural Society of Scotland, 659;
 Van Eeden's Album Van Eeden, 47;
 Villa Gardener, 627; Warner's Select
 Orchidaceous Plants, 79; Weddell's
 Quelques Mots sur la Théorie Algo-
 liche, 275; Weinhold's Introduction
 to Experimental Physics, 435;
 Wood's Insects Abroad, 46; Wood's
 Out-of-Doors, 371; Yarrell's History
 of British Birds, 79

Boston Squash, the, 20
 Botanical collectors, 29, 631
 Botanical geography, elementary lessons
 in, 8, 76, 138, 202, 366, 431, 495, 594,
 621

Botanical instruction at Harvard, 110
 Botanical problems, Dr. Cohn on, 210
 Botanical work, prizes for, 470
 Botanic gardens, the Adelaide, 656, 759;
 Belfast, the Royal, 817; Calcutta, the,
 244; Edinburgh, the, 16
 Botanists, Lancashire operative, 525
 Botany of the Islands of Finistère, 333,
 365
 Botany, Sachs' text-book of, 690
 Botany, systematic, report on the recent
 progress and present state of, 112
 Bougainvilles at Bangalore, the, 181
 Bouquet girl of the Paris Jockey Club,
 the, 404
 Bouquet of spring flowers, a, 470
 Bowers or arbours, 305
 Bragg, Mr. W. R., death of, 213
 Brandis, Dr., portrait and memoir of, 13
 Brassica brachypus, 136
 Brazilian drugs, 72
 Brazil, notes on, 468
 Brisbane Botanic Garden, 759
 British climate, some remarks on the
 fickleness of the, 408
 British plants in bouquets, 725
 Broccoli, early winter, 18; hardy varieties
 of, 505, 562
 Brome, transmutation of Wheat into, 599,
 722
 Broomebarrow Yew, the, 535
 Broomfield, the Orchids at, 338
 Brown, Mr. Robert, 827
 Brussels v. Amsterdam Horticultural
 Exhibitions, 436
 Brugmansia lutea, 502
 Buckley, Mr. William, death of, 119
 Budding Gooseberries, 114
 Buds, a study of, 598
 Buds on roots of Peach trees, 146
 Bulb season of 1874, the, 75
 Burnett, Mr. T., death of, 149
 Burnet moth, the, 755, 819
 Burns on Elms, 720
 Button-hole, an early spring, 245

C

CABBAGES, grafted, 244
 Cabbage root-gall weevil, 819
 Cacti and Agaves, Frank Buckland on,
 534
 Calcutta Botanic Gardens, 244
 Calantha Veitchii, 50
 Calanthe, New, the Yam feast of, 492
 California Redwoods, 507
 Calliandra Saman, 724
 Canna indica, 402
 Canon Hall Muscat, the, 791
 Canterbury Bells, 824
 Cautchouc, fresh sources of, 437
 Capercaille, notes on the contents of the
 crop of the, 108
 Carboniferous fruits, 506
 Cardamine trifolia, 503
 Cardamom, the, 406
 Cardiff Castle, the hardy vineyard at,
 462
 Carving Sunday, 349
 Carloville, effects of the frost on the trees
 and shrubs at, 367
 Carnations, Pinks, &c., 796

Carnivorous and sensitive plants, 303, 340, 405, 527, 790
 Carolina Rice in India, 406
 Carpet bedding with sandy plants, 538
 Cashmere, the *Daily Telegraph* on, 437
 Catalogue of garden plants, a systematic, 594
 Cattle ropes, Cingalese, 279
 Cats, *Nemophila insignis* and, 535, 599
 Cattails, *Hydrocotyle*, 144; *gigas*, 171
 Ceanothus, grafted plants of, 470
 Ceanothus, synopsis of the species, 687
 Cecil Oak, the, 249
 Cedar of Lebanon, the, 824
 Cedrus, notes on, 115
 Celcebs, intended explorations in, 822
 Celery, roots from the leaf-stalk of, 207
 Celery, Colonel Trevor Clarke's, 114; the
 Sulham Prize Pink, 408, 439, 440
 Celosia pyramidalis, 82; on the culture
 of, 555
 Cereals, fertilisation of, the, 37; origin of, 12; transformation of, 533, 567, 623, 686, 694
 Ceterachythus assimilis, 849
 Chamaerops, the, 785
 Chamaerops, Mr. Little's, 507
 Chamaerops Fortunei, 526; humilis, 438
 Charcoal, kilns for, 313
 Charlotte Rothschild Pine-apple, the, 20
 Chauliophora, Special Supplement issued with No. 78
 Cheiranthus Marshallii, seedlings from, 310
 Chemical works and trees, 651
 Cherry, the double white-flowered, 600
 Chess (Promiss) and snails, 115
 Chess, transmutation of Wheat into, 182
 Chicory, essence of, 439
 Chicory imported into New Zealand, 724
 Chicago Botanic Gardens, 178
 China, the tea produce of, 432
 Chiswick, Pelargonium trial at, 469; and the Chiswick Fancies at, 780
 Chlorophanes, 383
 Christmas trees, 19
 Chrysanthemum catananche, 603
 Chrysanthemum viridula, 210
 Churchyard plants, 725
 Chusqueba, the, 666
 Cigars, manufacture of, 406
 Cinerarias, double, 408, 535, 632; Mr. James', 568
 Cinchona succubina in Madeira, 439
 Clarence Park, Gooseberry and Currant training at, 207
 Clematis alba magna, 685; Grand Duchess, 796; Lord Nevill, 728; montana for spring decoration, 665
 Clematis, the new, 790; Messrs. Jackson's exhibition, 662, 684; as exhibition plants, 560
 Clematis stocks, 146
 Climate, change of, in Scotland, 278
 Climatic changes, 219
 Climate, some remarks on the fickleness of the British, 408
 Closets, dry earth, 468
 Cocoa-nut, the home of the, 625
 Colonial International Horticultural Exhibition, 278, 438, 534, 639, 759, 799, 820, 821
 Colax jugosus flowering at Glenside, 210
 Colorado, Conifers from, 402
 Colorado potato beetle, 209, 210, 438, 502, 509, 598
 Coleman's Flora Hertfordiensis, 436
 Coleus, 402
 Collinore, Pyreneeas orientales, notes from, 434
 Colton, Pyreneeas originating, 593, 600
 Columbia sericea, 758
 Combinations of flowers, chance, 820
 COMMITTEE, SCIENTIFIC of the Royal Horticultural Society, subjects brought before the:—*Achillea Millefolium*, galls on the leaf, of 633; ammonia, absorption of, by the leaves of plants, 118; ant-galls on the leaf-stalk of *Melastomum*, 247; ants, formed by the leaves of *Caustilia*, 314; *Bambusa gracilis*, flowering of, 376; buds on the roots of the Peach, 117; Cabbage, early St. John's, 536; Chestnuts of 210; coppered ferns, 118; Cinerarias, double, 118, 247; Coccos on *Trichopilia*, 727; Colorado beetle, the, 118, 473, 536; *Conophallus bulbifer*, 795; Copper-web fungus, 247; Cucumbers, plants the roots of, 118, 314; *Cyrtanthus Thozetii*, 117; *Cycads*, insect on seeds of, 633; *Cyclamen monstrosus*, 118, 376; *Datura arborea*, 247; Elm buds, 536; *Encelarthus*, seed of, 247; ferns, by an insect, 536; filter, cotton wool as a, 633; *Fuchsia procumbens*, 247; fungi, fertilisation of, 377; fungus growing on the body of a caterpillar, 314; fungi in ant hills, 376; graft hybridisation, 118;

grub in Pears, 727; *Hedychium Gardnerianum*, fruiting of, 377; *Helleborus*, seedlings, 537; *Hibiscus venosus*, fruiting of, 118, 727; honeydew, 117; *Hypoxylon ostraceum*, 726; insect destructive to Orchids, 247; knots in Vines, 117; Larch disease, 727, 795; lichens on trees, the effects of, 314; *Lychinis*, spiracles, 727; *Mitella*, parasite on itself, 118; *Myxomycetes*, circulation in, 473; *Narcissus*, fruiting of the, 376; *Oidium* on Apple blossom, 727; *Opium blight*, 376; packing plants for transportation, 727; *Palm roots*, diseased, 473; *Paraguay Tea*, 795; Peach bister, 795; Peach shoots, diseased, 536; Pears, cracked, 118; *Peiza lanuginosa*, 536; phenological phenomena, 277; *Phylloxera*, 118, 633; *Polyporus betulinus*, spawn of, 314; *Poplars*, diseased, 473; *Portugal Laurel*, diseased, 473; *Potatoes*, grafted, 536; *Potatoes*, diseased, 795; *Potato disease*, new, in Algeria, 118, 247; *Primroses*, *Oxalis*, &c., 526; *Primroses*, sport in, 314; root pruner, an undesirable, 795; rust on Pear leaves, 795; *Scotch Fir*, disease of the, 376; *Seville Longpod Beans*, 247, 537; *Strawberry*, the *Plymouth*; *Sycamores*, Pears, &c., leaf-galls of, 795; Tea, leaves affected with a lichen, 247; *Telfaira pedata*, 473; *Telfaira pedata albino*, leaves of, 726; terrestrial radiation, 247; transmission of seeds, 633; trap-door spider, 795; tubers in the interior of a Potato, 247; Turnip, inverted leaves of, 473; *Wallflowers*, malformed, 633; yeast, reproduction of, 376; *Yew*, female flowers of, destroyed by an Acarus, 536; *Yew*, galls on, 795; *Yews*, galls on, caused by *Tetranychus Taxi*, 726
 Como, Lake, notes from, 14
 Conite of Kerchote, the garden of the, 535
 Compton's Surprise Potato, 821
 Conifers, 792; rare, 105, 148, 464, 752
 Conifers for chalk land, 19, 52
 Conifers from Colorado, 402
 Conifers as gravel, 725
 Conservatories, curved roof, 824
 Conservatory of Court Kerchote, the, 376
 Conservatory, heating a, 52
 Co-operatives gardening, 600
 Corceps sinensis, 342
 Corners and holes, 749
 Cornwall, May-day in, 600
 Cornwall, notes from a garden in, 334, 234
 Correa cardinalis, 19
 Costus after flowering at Kew, 503
 Cotton, cultivation of, at Kourou, 178
 Couve Tronchuda, 462
 Cowslip, the, 695
 Cramb, Mr. A., memoir and portrait of, 719
 Cranberry, the, 142, 662
 Craspedia Richea, flowering at Kew, 661
 Crataegus, a monograph of, 759
 Crinum brachyneura, 473
 Crinum aureus, 243; *Imperati*, 117; *nivalis*, 179
 Crocuses and sparrows, 634, 665
 Croton Dixieii, 473
 Cryptogamic Society for Scotland, 565
 Cryptorhynchus laphatia, 662
 Cuba, the forests of, 820
 Cuckoo, habits of the, 786
 Cucumber, the Alston, 493
 Cucumber, Daniell's Duke of Edinburgh, 601
 Cullum, Lady, death of, 248
 Curmeria picturata and Gunnera bre-phogea, 216
 Currier, the, in North Wales, 51
 Curiosities of grafting, 789
 Currant bud mite, 659
 Currant galls on Oak, 765
 Curved roofed conservatories, 824
 Cutwax and Stone pruning show, 414
 Cycads in cultivation, the, 470
 Cyclamen persicum, 400; *persicum giganteum*, 179
 Cyclamens for sitting-rooms, 406
 Cyclonema, 799
 Cymbidium elegans, 428
 Cyperus papyrus, notes on, 79
 Cypress and column in the grounds of the Seraglio, Constantinople, 438
 Cypripedium caudatum at Melchet Court, 210; japonicum, 624, 665; spectabile and pubescens, poisonous qualities of, 210
 Cytisus Adami, 758
 DACRYDIUM cupressinum, 630
 Daffodil, the wild, 338, 375, 408, 439; the true double, 500, 535, 562, 532

Daffodil of our gardens, the great double, 471
 Daffodil and its varieties, the, 500; its double varieties, 471
 Dahlia cultivation, 595
 Dahlias, early blooming, 472
 Dahlias, German, 399, 437
 Daisies, double, notes on, 619
 Daisies, the, 537
 Dallah Towers, Westmoreland, the gardens at, 108
 Dallwitz, the old Oaks at, 755
 Dandelion: is it a cultivated root? 827
 Dangan Castle, 526
 Darwin, Mr. Charles, as a horticulturist, 308
 Deep planting of trees, 436, 662
 Deidamia Thompsoniana, 790
 Dendrobium amocum, 395; crassinode
 Barbierianum, 683; *marmoratum*, 492; *rhodopterygium*, 684; *tetragonum*, 82
 Dendrochilum glumaceum, 410, 438
 Derbyshire, fruit prospects in, 632
 Deutschlands Flora, the, 406
 Dictionary, by Mr. Charles, 421
 Digging and dunging about fruit trees, or *Dionaea muscipula*, 790; Dr. Balfour's observations on, 790
 Disa grandiflora grown by Mr. Denning, 440
 Discovery of the germination of Ferns, 116
 Diseased Palm roots, 409, 472
 Divining rod, the, 116
 Doronicum caucasicum, 303; for ribbon borders, 562
 Doryphora, the climate for, 591
 Double white Cherry, the, 600
 Double flowers, 532
 Doum Palm, the, 84
 Do varieties wear out? 16
 Down House, Blandford, the Orchids at, 304
 Downing, Mr. Charles, portrait and memoir of, 139
 Dracena, a new species of, 146
 Dracaena hybrid, 537
 Dress, a tropical travelling, 792
 Drimia Haworthioides, 366
 Drimys Winteri, 470
 Drosera capensis, 410
 Droseras, do the leaves of, eat flesh? 405
 Drugs, English, 410
 Dry earth closets, 504, 632
 E
 EASTER flowers, 397
 Eaton Hall, the glass corridor at, 16
 Eccentricity of growth, the, 279, 338, 409, 477
 Echinopsis lobata, 147
 Echites peltata, notes on, 136
 Edinburgh Botanic Garden, the, 16; open-air vegetation at, 238
 Edwards, Mr. George, death of, 825
 Effects of close pruning, the, 625
 Electro-culture, 82
 Eilon, the large tree at, 312
 Elm trees, barked, 281, 312

In Liquidation. TO NURSERYMEN and OTHERS TO BE LET. With immediate possession, an old-established BUSINESS of a NURSERYMAN, SEEDSMAN, and FLORIST, situate at Thirsk, Yorkshire. The Stock-in-Trade, which is of a general character, will be taken at a valuation. There are several thousand feet of glass (belonging to the greenhouse), adapted for the growth of Grapes and Stove and Greenhouse Plants, with Propagating Houses and Cold Pits. The principal Houses are heated with hot water. The Vines are now in a fruit-bearing state, and the Pits are well constructed for growing Cucumbers and Melons. An energetic man will find this an excellent opportunity to establish himself in business. This is on the main line of the North-Eastern Railway, and distant from the Station 1 mile. For particulars, and order to view, apply to Mr. THOMAS SUTTON, Fife, or to Messrs. SWARBRECK and RHODES, Thirsk, Yorkshire, Dec. 21, 1874.

FOR DISPOSAL, cheap, a West End SEED and FLORIST BUSINESS. Splendid position. Low rent. Convenient Shop and House. L. D., Gardener's Chronicle Office, W.C.

Victoria Colony, Kansas, U.S.—To Farmers and others.

TO BE SOLD, FINE STOCK FARMS of 640 Acres and upwards. Freshhold, from 10s. to 25s. per acre. Grass in its natural condition unsurpassed for feeding Sheep and Cattle. For PAMPHLET containing full particulars respecting this Property, apply to ROBERT W. EDIS, Esq., E.S.A. 14, Fitzroy Square, London, W., Architect to the E.S.A.

THE HANDSOMEST SEED CATALOGUE EVER PUBLISHED.

THE ILLUSTRATED GUIDE FOR AMATEUR GARDENERS—Spring, 1875.

Now ready, price 1s. post free. Gratis to Customers.

A thoroughly practical and comprehensive Guide for the Amateur or professional Gardener, containing a select List of choice Kitchen Garden and Flower Seeds; many-six pages of beautiful illustrations, with complete directions for the successful management of the Kitchen and Flower Garden throughout the year; and also two superbly finished coloured plates. The whole in an illuminated cover of the most exquisite design and workmanship. The London Review says—"This is the most beautiful garden catalogue we have ever seen, the coloured illustrations are infinitely more numerous, than the printed ones, may justly feel proud in issuing such a complete and truly valuable catalogue as this, which will enhance the high reputation they have already so deservedly gained."

DANIELS BROTHERS, Seed Growers, THE ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

ROYAL HORTICULTURAL SOCIETY, 1875.

CHARLES SHARPE and CO., SEED GROWERS and MERCHANTS, SLEAFORD. The Most Practical Work on Gardening yet PUBLISHED IS

From the COTER CIRCULAR. "We have received 'Sutton's Spring Catalogue and Amateur's Guide,' an admirable and complete catalogue of root, fruit, and flower seeds, grown by the great firm at Reading. This handsome book is illustrated with some beautifully executed plates. The instructions given in the case of each are clear and concise, and of great use to amateur and professional gardeners. They raise the work above the level of a trade catalogue that of a work on gardening." Price 1s., post free.

"Sutton's Amateur's Guide" is beautifully illustrated with several coloured plates and hundreds of engravings. It is, without exception, the most practical work on Gardening extant.

SUTTON'S MINIATURE AMATEUR'S GUIDE, price 3d., post free. SUTTON and SONS, THE QUEEN'S SEEDSMEN, READING.

KNIGHT'S NEW PEA, DUKE OF CONNAUGHT.

This is a really useful new Pea, of a branching habit, about 3 feet high, and very prolific—well adapted for second and general crops; also for late sowing, as it is never affected by mildew. It is a fine exhibition and market Pea.

Quarts, 5s.; Pints, 2s. 6d.

THE OXONIAN PRIZE ONION.

A very superior white Onion, growing to an immense size, quite surpassing the white Spanish, both in mildness of flavour and quality of bulb. Ripens early. Has obtained 1st prize wherever exhibited.

Per Packet, 1s.

NUTTING & SONS,

Seed Warehouse, 60, Barbican, London, E.C.

MAURICE YOUNG'S NEW DESCRIPTIVE CATALOGUE

Is now ready, and may be had on application.

IT COMPRISES:—

- HARDY JAPANESE and other CONIFERÆ.
- HARDY ORNAMENTAL TREES, SHRUBS, and EVERGREENS.
- RHODODENDRONS in fine named varieties; PONTICUMS, and other common kinds for covers.
- ROSES, Standard, Half-standard, and Dwarf, in all the best kinds.
- FRUIT TREES.
- CLEMATIS, and other climbing Plants.
- Cheap EVERGREENS and DECIDUOUS TREES and SHRUBS for Planting Belts and Shrubberies.
- TRANSPLANTED FOREST TREES.
- QUICKS, and other Hedge Plants.
- DWARF EVERGREEN and VARIEGATED PLANTS for Winter Bedding, &c.

DESIGNS, PLANS and ESTIMATES prepared for Laying-out and Planting New Grounds, and for Improving Park Scenery and Existing Shrubberies and Plantations.

MILFORD NURSERIES, near GODALMING.

NEW and SELECT VEGETABLE SEEDS.

BROCCOLI, Christie's Self-Protecting Late White.—This valuable Broccoli has been raised by Mr. Christie of Aswarby, and is pronounced by all who have seen it as the finest self-protecting late Broccoli in cultivation. See Testimonials. Sold only in sealed packets, 1s. 6d. each.

BORCOLE, Variegated Triple-curl'd, extra selected.—This stock includes all the best varieties for decorative purposes, for garnishing, the embellishment of the flower garden and the dinner-table. Price 6d. and 1s. per packet.

BRUSSELS SPROUTS, Roseberry, extra selected.—Price 1s. 6d. per ounce.

CELERY, Dixon's X L Red.—A very strong grower, early, hardy, remarkably solid and crisp. Has obtained a First Prize wherever exhibited during last season, and is acknowledged to be a very decided acquisition. Price 1s. 6d. per packet.

CELERY, Dixon's Mammoth White.—The best White extant. Price 6d. and 1s. per packet.

CUCUMBER, Burnett's Perfection.—Growing from 24 to 30 inches long, fine flavour and very productive. Price 1s. 6d. per packet.

CUCUMBER, Rollinson's Telegraph.—True, handsome, and very prolific. Price 1s. per packet.

LETTUCE—Dixon's Champion Green Cos still maintains its well-known reputation as being the largest and most delicious Lettuce in cultivation. Price 6d. and 1s. per packet.

PEA, Dixon's Yorkshire Hero.—My stock of this magnificent variety of the wrinkled Marrow is grown from the original stock introduced by me a few years ago. It is exceedingly prolific, having as many as sixty or seventy pods on a single stem. The Pea, of a most delicious Marrow flavour, is fourteen days earlier than Veitch's Perfection, and withstands the effects of mildew better than any other variety. Price 1s. 6d. per quart.

TURMIP, Silver Ball.—A superb white, solid root, fine shape, flesh tender and delicious; very select stock. Price 1s. 6d. per ounce packet.

EDMUND PHILIP DIXON, The Yorkshire Seed Establishment, 57, Queen Street, and 75, 76, and 77, High Street, Hull.

NEW ROSES.

SEEDLING HYBRID PERPETUAL ROSE,

SIR GARNET WOLSELEY (Cranston's).

First-class Certificate awarded by the Royal Horticultural Society at the Grand National Rose Show, July 1, 1874.
 First-class Certificate awarded at the Oxford Rose Show, June 25, 1874.

This fine New Rose, which has been the attraction of all full, and perfectly formed, standing out bold and erect; habit during the past season, was raised from Prince Camille de Rohan. Its colour is the richest vermilion shaded with bright carmine, and well retained throughout. Flowers very large, strong and vigorous, producing flowers on every shoot. An exhibition flower it will undoubtedly take a very prominent position.

N.B.—Orders are now being looked for Plants to be sent out in the Spring of 1875, price 7s. 6d. each.

NEW HYBRID PERPETUAL ROSE,

CRIMSON BEDDER (Cranston's).

As a Crimson Bedding Rose this variety surpasses every other of brilliancy of colour and continuous blooming; its habit and crimson, very effective and lasting, clean glossy foliage, and of growth is moderate and shoots short-jointed, producing a mass free from mildew; introduced as a Bedding Rose only.

Strong Plants 3s. 6d. each; 30s. per dozen.

CLIMBING PERPETUAL ROSE,

CLIMBING JULES MARGOTTIN (Cranston's).

A sport from Jules Margottin; flowers exactly similar to it, but branching as freely as an evergreen climbing Rose. A great parent; a free and vigorous climbing habit; not in a robust form, acquisition as a free growing perpetual climbing Rose.

Strong Plants 3s. 6d. each.

Address: **CRANSTON & MAYOS,**

NURSERIES, KING'S ACRE, near HEREFORD.

"GENUINE SEEDS ONLY."

JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

MR. LAXTON'S NEW PEAS FOR 1875.

HURST & SON

Have pleasure in offering the following four varieties of MR. LAXTON'S NEW PEAS, all of which have been selected for their high quality, flavour and distinctness, three of them having received First-class Certificates from the Royal Horticultural Society after the great Chiswick trial in 1872:—

UNIQUE.

This is a very handsome and prolific Dwarf Early Pea, with long, deep-green coloured pods, of the same habit and coming into use at the same time as Little Gem, and may be briefly described as a Dwarf William the First. Received a First-class Certificate.

Price 7s. 6d. per sealed quarter-pint packet.

DR. HOGG.

"A very handsome Pea. The earliest green wrinkled Marrow, very sweet and of excellent quality, pods being well filled and of a beautiful deep green colour, like the Ne Plus Ultra."—*Vide Proceedings of the Royal Horticultural Society for 1872.*

"No higher recommendation could be given to it than to introduce it as a competitor of Ne Plus Ultra."
"To sum up the whole it is a fine Ne Plus Ultra, coming in one week after Dillstone's."—*Hogg's Gardener's Year Book for 1873.*

Height 3 feet, habit and type of Sangster's No. 1. Awarded a First-class Certificate and received its name at the instance of the Fruit Committee of the Royal Horticultural Society.

Price 7s. 6d. per sealed quarter-pint packet.

SUPLANTER.

"A cross between Veitch's Perfection and Little Gem—the earliest of the Veitch's Perfection type; plant very robust and vigorous, producing very large broad pods in pairs. A large, handsome, and very prolific Pea, which received a First-Class Certificate."—*Proceedings of the Royal Horticultural Society for 1872.*

"Appropriately named, for it is a large, handsome, and very prolific Pea, and will take the place of many others."—*Hogg's Year Book, 1873.*

This Pea is of fine quality, and is also first-rate for exhibition, having been shown by Mr. R. Gilbert during the past season, in three of his Prize Collections of Peas. Height 3 feet.

Price 5s. per sealed quarter-pint packet.

CONNOISSEUR.

A remarkably distinct and very late wrinkled, bright green seeded Pea, raised from Ne Plus Ultra, pronounced by the Royal Horticultural Society to be of very excellent quality. Height 6 feet.

Price 5s. per sealed quarter-pint packet.

HURST AND SON can also supply:

BILLBASKET.—Unquestionably the most prolific and best Market Pea yet introduced. First-class Certificate Royal Horticultural Society.

Price 2s. 6d. per sealed half-pint packet.

LAXTON'S No. 1.—The earliest blue wrinkled Marrow.

Price 2s. 6d. per sealed half-pint packet.

£50 will be offered in Four Prizes at the Royal Horticultural Society's Show on July 7 next, for Six Varieties of Mr. Laxton's New Peas sent out by us in 1872, 1873, and 1874, 50 pods each. These Prizes will also be repeated at the Society's Provincial Exhibition in 1875.

UNIQUE (Dwarf).—First-class Certificate.

DR. HOGG.—First-class Certificate.

SUPLANTER.—First-class Certificate.

PLANTING SEASON.

LARCH, SCOTCH FIR, ENGLISH OAK, and all other Forest Trees.
 QUICK, and all other Hedge Plants.
 COVERED PLANTS in great variety.
 FRUIT TREES, including all the best and most esteemed varieties—quarter of a million trees.
 ROSES, Standards, Dwarfs, the newest and best varieties—100,000 to select from.
 VINES, all the leading varieties in 2000 well ripened cans for fruiting in pots and for planting out.
 EVERGREENS in great variety, including large quantities of all the choicest Hollies, &c.
 CONIFERS, including *Picea Nordmanniana*, &c.
 ORNAMENTAL TREES and Plants of all sorts.
 * * * The whole in very great quantity and stout vigorous condition, with fine roots for sale removal.
 Priced List sent on all particulars on application.
JAMES DICKSON & SONS, Newmarket Nurseries, Chester, near The "Newton" Nurseries are within eight minutes' walk, by the new road, from the Chester Railway Station.

ORNAMENTAL HEDGES.

THUJA LOBBII, 4 to 5 feet, 50s. per 100; 5 to 6 feet, 100s. per 100. This tree forms a most beautiful evergreen fence.
 THUJOPSIS BOREALIS, 2½ to 3 feet, 75s. per 100; 3 to 4 feet, 100s. per 100.
 ENGLISH YEW, 2½ to 3 feet, 75s. per 100; do., very bushy, 1 to 1½ feet, 100s. per 100.
 AMERICAN ARBOR-VITÆ, 5 to 6 feet, 50s. per 100; 6 to 12 feet, 60s. per 100.
 LAUREL, Common, 2½ to 3 feet, 20s. per 100, 60s. per 1000.
 "Portugal, 2 to 2½ feet, 50s. per 100.
 PRIVET OVALIFOLIUM, 2 to 3 feet, 5s. per 100.
 "Common Evergreen, 2 to 2½ feet, 10s. per 100.
 LAURUSTINUS, transplanted last spring, bushy, 50s. per 100.
 RHODODENDRON PONTICUM, 1½ to 2 feet, 60s. per 100; 2 to 2½ feet, 75s. per 100.
 BOX, Broad-leaved, 1½ to 2 feet, 21s. per 100; 2 to 2½ feet, 25s. per 100.
 Cranston's Nurseries, King's Acre, near Hereford.
 Address: CRANSTON AND MAYOS.

4000 Double-flowered Chinese Primrose.

E. G. HENDERSON AND SON can now offer of the above, strong healthy New Plants, of 1874 growth, including *Arvensis*, *Bushy*, *Leamy*, *Equisetis*, *Empress*, *Emperor*, *Lilac Queen*, *King of Purples*, *Magenta Queen*, *Magnifica*, *Mrs. Eyre Crabbe*, *Pearl Blossom*, *Princess of Wales*, *rubra grandiflora*, &c. Twelve varieties, from 35s. to 42s. 6d. each.

PRIMULA JAPONICA, mixed varieties, 6d. each, 6s. per dozen; in six colours, selected from selected varieties, 1s. 6d. each.
 AERIALIA HENDERSONI, the finest variety in growth and colour, strong plants, 2s. each, 18s. per dozen.

DAISY, Flower of Spring, beautiful and effective, pure white, with elegant gold-blotched leaves, 1s. each, 9s. per dozen.
 VIOLETS, White Earl and Victoria Regina, 1s. 6d. each.

 DAVISON AND WHITTEM, White Cross, Hereford.

Hollies.
ANTHONY WATERER respectfully invites the attention of Holly buyers to the very fine Stock to be seen growing at Knapp Hill. It comprises upwards of Thirty Thousand Plants, from 3 to 10 and 12 feet high, of the finer Gold, Silver, and Green-leaved kinds, affording a choice in size and variety such as can be met with in no other Nursery in Europe. Every Plant has been recently removed, and will be guaranteed.

The Stock of Common Green Hollies alone occupies 5 acres of land, and Purchasers will find them in large numbers of all heights up to 15 feet.

Knapp Hill Nursery, Woking, Surrey.

THE GAINSBOROUGH SEED ESTABLISHMENT.

Dixon's X L Celery—1s. 6d. per packet.

JOHN ETHERINGTON DIXON, Seed Grower and Merchant, Lead Street, Gainsborough, having grown a quantity of this, one of the finest Red Celeries extant, begs to offer it to those who are particularly fond of this vegetable. It is very crisp and delicious, and a sort that when once tried will be well appreciated, as it is very early and will stand forcing better than any other variety.

The usual discount allowed to the Trade.
On account of the short crop of this Celery early orders are requested.

J. E. DIXON, Seed Merchant, &c., Lord Street, Gainsborough.

Standard Oaks, &c.

A. M. C. JONGKIND CONINCK, Tottenham Nurseries, Deddensway, near Zwole, Holland, offers 1000 thousand well-grown transplanted Standard Oaks, from 12 to 14 feet, at 1s. 3d. each, franco Rotterdam and Harlingen.

ROSA MULTIFLORA DE LA GRIFFERAIE, stocks, 20s. per 1000.

ROSA MANETTI, stocks, 20s. per 1000.

Samples can be seen at Mr. T. S. WARE'S, Hale Farm Nurseries, Tottenham, near London.

Planting Season—Avenue Trees.

LIMES, 12 to 16 feet high, straight stems, girthing 4 to 8 inches at 4 feet from the ground, with well-balanced heads, and splendidly rooted. A stock of more than 5000 of these fine Trees to select from.

PLANTING OCCIDENTAL, 12 to 15 feet.

HORSE CHESTNUTS, 10 to 12 feet.

SCARLET HORSE CHESTNUTS, 10 to 12 feet.

NEW W. MAPLES, 10 to 15 feet.

All being stout, straight stemmed, and finely rooted. Every Tree has been removed within two years.

POPULAR CANEBOIS NOVA, 4 1/2 to 20 feet—This new variety of Poplar, far exceeding in rapidity of growth any tree I am acquainted with, is strongly recommended as a Town Tree, especially in smoky districts. There are hundreds in this Nursery 3 years old, measuring 18 to 22 feet high, and stout in proportion.

ANTHONY WATERER, Knapp Hill Nursery, Woking, Surrey, S.W.

WELLINGTONIA AUREA

Planted by H.R.H. the Prince of Wales at Sandringham.

Planted by H.R.H. the Princess of Wales at Blenheim.

Planted by H.R.H. the Duke of Edinburgh at the Vice-Royal Lodge.

Planted by H.E. the Earl Spencer at Althorpe.

And by the leading Noblemen in the United Kingdom.

Splendid plants, finely rooted, 5 feet high, and covered with Golden Variegation, at 45s. smaller, £3 2s., £2 2s., and £1 1s.

CIRCULARS, with List of Prizes taken, and Testimonials received on the leading Conifer Growers of Europe, can be had on application to

R. HARTLAND, The Lough Nurseries, Cork.

November 26.

THE MOST IMPORTANT PRIZE
OFFERED TO
GARDENERS, GENTLEMEN,
AMATEURS, and OTHERS,
 During the year 1875, is
THE CARTER CUP,

Which is to become the absolute Property of the Winner,

Which is to become the absolute Property of the Winner.

VALUE FIFTY GUINEAS,
 And will be awarded at the

Summer Show of the Royal Horticultural Society,

UNDER THE FOLLOWING CONDITIONS:—

FIRST PRIZE—The "CARTER CUP," Value **FIFTY GUINEAS**, to become the absolute property of the Employer to whom the Prize may be awarded, also Ten Guineas for the Gardener.

SECOND PRIZE—Seven Guineas.

THIRD PRIZE—Five Guineas.

FOURTH PRIZE—Three Guineas.

FOR THE

Best Collection of Vegetables, 24 Dishes,
 TO INCLUDE

- 1/2 peck Carter's Early Premium Gem Pea.
- 11 James' Prolific Pea.
- 11 G. F. Wilson Pea.
- 11 Hardy's Pedigree Windsor Bean.
- 11 Carter's White Advancer French Bean.
- 11 Carter's Champion Runner Beans.
- 11 Blue Peter Pea.
- 11 Carter's Commander-in-Chief Pea.
- 11 Carter's New Mammoth Long Pod Bean.
- 11 Carter's New Fern-leaved Parsley, and Little Heath Melon.

* Owing to the difficulty that would be experienced in getting this Parsley to perfection in time for the show any other good cured variety will be eligible.

Conditions, &c.—All vegetables to be grown by *both* *side* Gentlemen's Gardeners or Gentlemen Amateurs, and in the open ground, excepting Cucumbers and Melons.

Many valuable Prizes are also offered at the other Meetings of the Royal Horticultural Society during the year by JAMES CARTER and CO. See Schedule.

SATURDAY, JANUARY 2, 1875.

A HOLIDAY IN NORWAY.

THE incidents attending a voyage across the North Sea to the coast of Norway are not generally of a character to excite any particular interest. Leaving the track of coasting vessels, even the small excitement contributed by a passing ship is seldom afforded, the cold, clear, metallic waves present but few evidences of marine life; occasionally the spout of a whale may be seen, and sometimes a school of porpoise, but the passage is often made without the appearance of one or the other, and until approaching the coast very few sea birds are met with. Steamers going from Hull to Bergen call at Stavenger, a fishing-town, built on the side of a promontory, in the Stavenger Fjord, and, like many other Norwegian coast towns, built down to the water's edge, the houses and warehouses are of wood, and painted yellow, white, or a reddish brown, and, seen from the steamer, the town has a freshness and neatness that is very pleasing; but a very short inspection of the place suffices to remove the idea of exceptional propriety, the streets are narrow and ill-paved, and on the land side the houses have by no means a clean or inviting aspect. Small and unimportant as the town appears, its trade is by no means inconsiderable. The catch of herrings off the coast averages 300,000 to 400,000 barrels, and a tonnage of 27,000 tons entered, and 31,408 tons departed from the port according to the last returns. In pursuing the voyage along the coast, one of its great natural features and advantages is presented in the fringe of rocks and islands, which extend for 1000 miles, and form a great natural breakwater, within which vessels ride with comparative ease, however stormy the sea may be, without. After a short stay at Stavenger, the voyage was continued until we reached the city of Bergen, which is situated at the head of a fjord, and about 25 miles from the North Sea. Mountains of great altitude tower up majestically, and except on the side of the fjord almost encompass the place. To this fact, and the proximity of the city to the sea, and the western breezes that come from the sea charged with moisture, may be attributed the very heavy rainfall of 73 inches.* The position of this western capital of the country gives it special advantages, the branches of the fjord, on the banks of which it is built, penetrate far into the interior, and it is easy of access from the sea, the waters of which are at all times open. Its trade in cod-liver oil and stockfish is considerable, and it has the aspect of a particularly well-to-do and even opulent city: it contains about 25,000 inhabitants. It is remarkable that the first Treaty of Commerce which England entered into with any foreign nation was contracted with King Hakon Hakonson in 1217, Bergen being then the principal trading city. The Museum is an imposing building, of modern erection. Some of the departments devoted to natural history are exceedingly well filled, and, as might be expected from the extent of the coast, and the opportunities that exist for forming a collection in the well-known enterprise and industry of Norwegian fishermen, the divisions that illustrate the products of the northern sea are rich in specimens, and the fish and corals are well

preserved. Some of the sections devoted to ornithology are remarkable for the beauty of the objects they contain. The collections of gulls, ducks, eagles, hawks, owls, grouse, and game birds, may be distinguished as being of exceptional interest, and in the instance of the rapacious birds the numerous examples tend to show that a domain still exists in Europe not altogether overrun with civilised exterminators. It was no slight disappointment to find that the collection of minerals was boxed up, and in the cellars of the Museum, and unattainable.

An enclosed space of ground, with trees and shrubs planted in large beds, cut out in the coarse and ill-kept turf which covers a large portion of the ground, is the public garden and promenade of the city. Seats are placed by the side of the walks that are carried through the enclosure, and, rough and unadorned as the place is, the trees and flowers that are placed in it give some interest, as serving to show that the climate does not offer insuperable impediments to the cultivation of many trees and plants, and to a much greater indulgence in horticultural pursuits than the city at present sanctions. The garden affords examples of Lime, Sycamore, Cherry, Lilac, *Asculus*, *Viburnum*, *Crataegus*, Maple, Elder, Laburnum, and, of Conifers, *Picea Nordmanniana*, *Abies alba*, *Abies cephalonica*; and in the few scattered flower-beds were Roses, *Pæonias*, *Spiræas*, *Veronicas*, *Campanulas*, *Phloxes*, and *Iberis*.

A few well-kept private gardens of modest proportion may be seen, but many spaces of what should be garden ground are given up to weeds which in so rainy a place doubtless assert themselves with great determination. In one well-managed little garden I saw *Zinnias*, *Asters* (German), *Stocks*, *Auriculas*, *Nemophila insignis*, *Potentillas*, and *Roses*; and in the garden attached to the summer residence of Carl Konon, Esq., were Hybrid Perpetual *Roses* growing vigorously, and in the fruit garden were rows of *Red Currants* just ripe—*August 10*—*Gooseberries*, *Raspberries*, and *Strawberries*, all healthy and in bearing condition. In the kitchen garden the *Potatos* were in bloom and exhibited no sign of disease. The masses of primitive rock which crop out here in all directions on the hill-side, show that no slight difficulties attend the cultivation of the soil on the declivities about Bergen.

Facilities exist for travelling to all parts of Norway from Bergen, and to travellers proceeding southward the small steamers which make voyages up the many branches of the fjord are particularly convenient. Starting early, the steamer *Voss* carried me up through the ever-changing and lovely mountain scenery that enclose the fjord to Bolstroden. I was so fortunate as to meet on board Mr. Neilson, the Director of Telegraphs, and Lieutenant Lund, who was proceeding with a party of engineers to survey a new line of country for a railway, projected to cross the country between Bergen and Christiania; these gentlemen readily afforded all the information in their power concerning the geology and natural history of the country. Crossing from the station of Bolstroden to the Lake Evenger, a distance of 2 or 3 miles, I was somewhat disappointed, finding only the ordinary plants that would be encountered in a walk in England. A characteristic Norwegian boat, pointed at each end, built of fir, and propelled by two men pulling a pair of sculls, took me to the head of the lake, and my first experience of the carriele was gained in travelling from Evenger to Vossevoengen, a station situated near a fine lake and amidst grand mountain scenery. In a country which is so much dependent on the products of its own soil, and where climatic obstacles are added to the physical difficulties presented by the conformation of the country, seen in its mountains, lakes, rock-strewn valleys, agricultural operations are

necessarily pursued during the short summer season with great assiduity, and but few natural advantages are neglected, and many contrivances are brought into action to facilitate the gathering of the crops of hay, barley, and oats. Thus in every small meadow a framework of stakes and cross-rails is seen, on which grass is hung as soon as cut, and so dried. In the cornfields poles are placed at intervals about the fields, on which the small sheafs of corn are strung one above the other, the ears outwards.

Vossevegen is a convenient station for an excursion to Ulvig, a village at the head of one of the branches of the Hardinger Fjord, and to the Voring Foss, a celebrated waterfall. After resting one night at the fairly good house of Mr. Fleischer, I started for Ulvig, proceeding along a very good road lined by woods of Scotch Pine, with occasional masses of Spruce. Some of the woods had very much the appearance of well arranged English plantations. Down in deep gorges a river rushed dashing into foam against the black slaty rock which bounded it; mountains, their crests covered with snow, rose up against the sky, and every turn of the road brought to view some new and picturesque feature in the landscape. The mountain sides and valleys are covered indiscriminately with natural forests of Fir and Pine; intermixed with these, or growing where they fail to thrive, are seen Birch, Populus nigra, Alder and Juniper, sometimes Mountain Ash. In situations adapted for a farmstead, open green spots are seen parcelled out in small fields, and placed in the midst is the house of the peasant farmer and owner. The rails for the hay and poles for corn are seen on every farm. Potatoes are universally cultivated, and were in bloom the middle of August. Saw-mills of very simple construction, the motive-power of which is a stream of water diverted from the main current and turned upon the wheel, are of frequent occurrence.

The Scotch Pine appears to thrive in damp valleys, and to grow equally well on the mountain sides. In a country where the preservation of fine timber is not considered, and the needs of each small proprietor govern the course of action he pursues with reference to timber, as may be expected, but few examples of either Pine or Fir of any size or matured development are met with. Finer examples of these Norwegian trees may be found on almost any English estate than their native woods afford. Immature and decrepid specimens, left on account of their inferiority, are prone to produce cones more abundantly. These trees become the parent stocks of future forests, and thus degeneracy goes on. It is commonly remarked that Norwegian timber is less in size than in more ancient times. It would be a prudent and proper course for the Government to insist on the preservation of a few acres of the best trees in each district, as seed parents for future forests; but perhaps the process of exhaustion, which has been going on from time immemorial, is approaching that period when the tribe of Firs can no longer be produced by the sparse, over-taxed soil: and according to the lessons that modern farming gives us, and of which even remote geological periods furnish examples, such a time must arrive. *William Ingram, Belvoir.*

(To be continued.)

New Garden Plants.

BOLLEA PATINII.

This very remarkable plant, which is now figured for the first time, is the first described species of an entirely new genus, founded by Professor Reichenbach; it is named in honour of its discoverer, Mr. C. Patin, who found it in 1873 in the forests of New Grenada.

The plant from which our illustration (fig. 1) is taken lately flowered in the choice collection of G. Herriot, Esq., Cholmeley Park, Highgate, to whose courtesy

we are indebted for the opportunity of figuring it. The plant was described in the *Gardeners' Chronicle*, 1874, vol. ii., p. 34.

MASDEVALLIA SIMULA, n. sp.*

Quite a little wonder of beauty in colours. The flower has a purplish upper sepal, with many pelucid honey-coloured bars. The base of the inferior sepals is purplish, the anterior part is honey coloured. It is near M. Molossus, Rehb. f., and, like that, it has a ghost flower. Those species are among the Masdevallias what the mastiffs are among the dogs. It was discovered by Mr. Chesterton in New Grenada, and has already flowered twice in the Royal Exotic Nursery of Messrs. Veitch. It is the Troglodyte among Masdevallias. If amateurs would like to admire its charms they would have to arm themselves with very powerful eye-glasses, the flower just equalling in size a poorly-flyed fly of our windows. *H. G. Rehb. f.*

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

I.—ON THE HEAT OF A PLACE AS PRODUCED BY LATITUDE.

The distribution of plants over the world at the present time depends principally upon three causes, which are—

I. Climate, or the way in which heat and moisture are at present spread over the globe.

II. The influence of man in spreading some kinds, and voluntarily or involuntarily restricting the distribution of others.

III. Their past history, or the times and places when and where they have been created or differentiated, and the way in which sea and land, heat and moisture, have been distributed in former times.

First, then, we have climate to consider under the two heads of heat and moisture. The distribution of the world depends upon three causes, viz. :—

1. The position which a place occupies with regard to the sun whilst the earth makes its annual revolution.

2. The distribution of the masses of sea and land in its neighbourhood.

3. Its height above sea level.

This first paper will be devoted to the consideration of the first of these three points.

A circle is always spoken of as divided into 360 degrees. For the earth, in the direction from the equator to the pole, we call these degrees of latitude. Taking the round of the circle in the direction in which the earth moves upon its axis in its daily rotation from east to west, we call them degrees of longitude, and begin to count from Greenwich. Between the equator and the pole at each end we have a quarter of the circle, or 90°. At the spring and autumn solstices—that is to say, near the end of March and of September—the sun is directly opposite the equator as it makes its daily circuit, and day and night are equal all over the world. But the axis of the earth—a line drawn from pole to pole—changes its position with regard to the sun, and to the path of the earth's orbit from day to day. These positions only a small difference in the relative positions of the sun and the equatorial regions, but a great difference in the relative positions of the sun and the country round the poles. This movement of the earth's axis is what produces the great difference which in this country we see and feel between winter and summer. At midsummer the earth moves round the sun opposite a line 23½° north of the equator, which we call the tropic of Cancer. At Christmas it moves round the sun opposite a line 23½° south of the equator, which we call the tropic of Capricorn. Within these tropics the sun at mid-day is always nearly overhead. It rises and sinks without any interval of twilight, and there is very little difference in heat and light between one season and another. At midsummer the sun is directly opposite a line 23½° north of the equator, and consequently so much nearer all points north of the tropic of Cancer, and so much further away from all points south of the tropic of Capricorn. At midsummer we get in the southern part of the north temperate zone nearly as much heat as they are getting at the equator, and in England the day is twice as long as the night. At this time, as viewed from the north pole, the sun does not sink below the horizon for several months together, whilst the heat and light which the northern

* Dense caespitosa. Foliis a lineari basi linearibus-lanceolatis apice cuneato-contractis microscopicis crenatis; pedunculo unifloro; bractea spatulata angustata apice pedicello subduplo breviori; demum cyatho quadrifloro; calice tubo supero triangulo cucullato apice lineari, dorso coronato; sepalis lateralibus ima basi connatis gutturosis, denis orbis apice caudatis; caulis brevibus limbum non equantibus, latus triloculo callosis; tepalis brevibus subquadatis, margine anteriori angulatis; labello bene unguiculato, lamina transversa oblonga, antheris dense tribus, angulis minoribus utriusque basin; columna gineae longiori apice cucullata, cucullo dentato.

hemisphere is getting in excess the southern hemisphere has lost, and for just as many months at the south pole the sun is never seen. At Christmas, on the contrary, the sun moves round the tropic of Capricorn, and the condition of things is reversed. Their summer is our winter, and their spring is our autumn. At Cape Town it has been shown, by a series of observations continued through several years, that on the average the hottest day in the year is the 4th of January, and the coldest the 6th of August. So that the heat which any place in the world gets, and the course of its seasons, depends largely and primarily upon latitude. The difference between being exposed to a sun shining overhead for twelve hours, and for eight hours to a sun whose rays strike the earth with a moderate degree of obliquity, makes a greater difference than there is between a midsummer day in England and a Christmas day in England.

By geographers the earth is commonly treated as divided into three zones of heat and latitude—a torrid, temperate, and frigid zone. The torrid zone is the district that extends upon both sides of the equator to the two tropics. Over every place within this central belt of 47° of latitude in breadth, the sun is directly vertical at some period of the year, and never far from overhead at mid-day at any season. The temperature of this torrid zone does not vary in the shade from a daily average of from 75° to 90° of Fahrenheit's thermometer from one end of the year to the other. The principal difference in heat is not between summer and winter but between day and night, between shade and exposure. At 38° north latitude of the sun the daily temperature in the shade rises to an average of 85° at 1 o'clock in the afternoon and sinks to 75° at 6 o'clock in the morning. In exposed places of course the heat registered in the shade is enormously increased. In the full blaze of sunlight it often rises on the ground to 120° or 130°. It was measured by Sir John Herschel at the Cape up to 159°. In the arid regions of Central Australia Captain Sturt says that it is sometimes so hot that a man may drop a coal and see it smoulder in the fire.

For purposes of botanical geography it is very important that the great difference between shade temperatures—which are those that are always given in tables—and the heat that is reached in exposed places, should be carefully kept in mind.

Humboldt invented a plan of connecting together upon a map those places which have the same average annual temperature in the shade, by what he called isothermal lines or isotherms. These isothermal lines run round the world nearly, but by no means exactly, parallel with the lines of latitude. The isotherm of the equator is about 82° Fahr., and they do not sink more than 5° to the tropic in each direction. The temperate zone reaches from 23½° from the equator to 23½° from each pole, so that it is 43° of latitude broad in each hemisphere.

For purposes of botanical geography and climate it is useful to divide the temperate zone of geographers into two—a warm temperate or subtropical and a cool temperate zone, because the climate within its bounds varies greatly. In the north hemisphere Europe, Asia, and America all extend beyond the cool temperate zone into the frigid or arctic zone; in the southern hemisphere Africa, Australia and New Zealand do not stretch beyond the warm temperate zone, and the South American continent does not nearly reach the arctic circle. As we cross these temperate belts in the direction of the poles these isothermal lines fall rapidly, the fall growing faster and faster, and the lines consequently closer and closer, as we get into more polar latitudes.

The average annual temperature of Naples is 63°, of Paris 51°, of London 49°, of Stockholm 42°, of St. Petersburg 38°. In central Europe one degree of latitude beyond north is equal to the lowering of average annual temperature one degree of Fahrenheit's thermometer. In England the difference in the temperature of the air in the shade between day and night amounts to 15° or 14°, and in the night the minimum is 5° or 8° below that of the air, and in exposed places the daily maxima are on an average 20° above what they reach in the shade. In the north temperate zone, through the influence of the Gulf stream, the temperatures of the western shores of Europe are raised all through the year materially above their proper average—a circumstance which in England makes a great difference in our daily comfort. Virginia, where the annual temperature is 56°, is opposite Lisbon, where it is 62°. Quebec, where the annual average is 42°, is 5° of latitude south of London, where it is 49°, and is opposite the south of France. We may safely say that in Britain we get, month by month through the year, 10° of heat brought from the tropics by the Gulf stream, and added to what we get direct from the sun.

But this lowering of the yearly averages is only one point of difference between the temperate and torrid zones. As we cross the temperate belt in the direction of the arctic circle, the difference in heat and light between summer and winter grows greater. It is not until we get at least 10° across it that we ever get snow or ice

or hoar-frost at sea level. In the warmer half of the temperate zone the thermometer never sinks below 32°, and there is no such thing as winter in the sense of a check to vegetation. As we proceed northward, through the cooler half of the temperate zone snow and ice become more and more abundant, and continue for a longer time, till at the arctic circle we reach a belt where the period of vegetation does not last for more than three months out of the twelve. The arctic zone is reached in the northern hemisphere by land in all the three great continents, but in the southern hemisphere only by the perpetually snow-bound, plantless, antarctic continent. Throughout all its southern, and the greater part of its northern,

NEW PLANTS OF 1874.

THE New Plants of the year which has just passed away present, as we took occasion to mention last week, nothing which stands out pre-eminent as marking an era in plant introduction. Many good things of average merit have, however, been acquired, so that those to whom novelty presents especial charms will have little cause to complain. We propose, as usual, to pass the more important acquisitions under review.

Stove plants of the flowering class have been reinforced by such subjects as *Aphelandra fascinator*,

of a family which seems to be again making way in popularity—the Bromeliads—and its orange and yellow flowers are particularly attractive. Two of the *Anthuriums* referred to are New Grenadan—*A. floribundum*, with erect lance-shaped oblique leaves, and *A. Patinii*, with the leaves of nearly the same shape but deflexed, both having the spathes pure white, and forming neat and interesting, if not specially showy novelties. The new white-spated form of *A. Scherzerianum* (*G. C. 1874, i. 501, fig. 103*), which has been called both *A. S. Williamsii* and *A. S. album*, is likely moreover to become a fine decorative plant when it becomes thoroughly established. A very curious *Asclepiad*, called *Decabelon elegans*, has

FIG. 1.—BOLLEA PATINII.

area, there is perpetual snow and ice; man cannot live there, plants cannot grow there, and at the very pole it is supposed that the average annual temperature sinks to Fahrenheit's zero. It is only in a limited part of the arctic zone, principally in a tract in Lapland that comes under the favouring influence of the Gulf stream, that any cultivation can be carried on, and that any considerable population can permanently reside.

At Spitzbergen, in latitude 76°—80°, the sun never rises above the horizon from October 22 to February 22; the average temperature of the three warmest months of the year, taken together, is 34°, and the whole period of vegetation does not last for more than six weeks—beginning in an average year late in July, and continuing through August and ending when September begins. *J. G. E.*

Medinilla amabilis (*G. C. 1874, i. 372, fig. 81*), *Lasiandra lepidota*, *Pitcairnia Andréana*, and two or three white-spated plants referred to *Anthurium*. The *Aphelandra* hails from New Grenada, and is a very showy plant, apparently of free growth; its foliage is effectively barred with silvery veins, and its cone-shaped spikes of flowers are of the most brilliant scarlet. The *Medinilla*, which comes from the Indian Archipelago, is bold in habit and remarkable for its angular winged stems; it has good and ample foliage, and immense panicles of numerous purplish rose-coloured flowers, which are erect, and in this respect abundantly different from *M. magnifica*, which it otherwise resembles. *Lasiandra lepidota* is another acquisition from New Grenada—that interminable mine of plant wealth, and has large carmine-red, pale-centred blossoms. *Pitcairnia Andréana* is a showy member

been introduced from Angola; it is an ally of *Stapelia*, and has succulent, leafless, spiny-angled stems, and narrow bell-shaped flowers 3 inches long, of a lurid yellow, with brownish purple streaks and spots.

Of handsome-leaved Stove plants the gems are certainly Mr. Bull's *Bertolonia superbissima* and Mr. Van Houtte's *B. Houtteana*, which appear to be better constituted than others of the same family, and have a certain degree of resemblance to each other, but the first has the rosy spottings confined to the spaces between the ribs, and intermixed with innumerable dots of the same colour, while the latter has fewer and more uniform spots, and lines of rosy hue along the course of the ribs. Under this head (because grown principally for their curious foliage) we must record the two most interesting plants of the year, *Sarracenia Moorei*, and *S. Stevensii*, the former a

hybrid between *S. Drummondii* and *flava*, the latter between *S. purpurea* and *flava*, and both decided and well-marked intermediates between their respective parents. *Saxo-Fridericia* subcordata, or *Rapanea pandanoides* (*G. C.*, 1874, i. 275, fig. 65), an introduction from the Amazon country, is quite a novelty to cultivators, and belongs to the order Rapateaceæ, hitherto not represented in our gardens; its distichous leaves, with a broad equitant base, narrowed spiny petiole, and ribbon-like blade (coloured red while young), give it a very distinct and curious appearance. Of the new class is the South Sea Island *Picus Farellii*, which has large herbaceous-textured hairy leaves, and is very effectively variegated with creamy-white and green, disposed in angular blotches, after the style of marking seen in *Abutilon Thompsonii*. Other distinct variegated stove plants are *Craton* (or *Codicium*) *variegatum ovalifolium* and *volutum*, the former remarkable for its flat, oblong-oval, blunt-ended leaves, the latter for having its leaves rolled under in a volute, both being handsomely marked with a yellow cross and veins; *Pathyphium pictum* is a pretty mottled-leaved *Diefenbachia*-like Aroid; while amongst *Draecenas*, *Kealii*, *princeps*, and *Hendersonii*, the latter having its leaves streaked with white and pink, are amongst the most desirable.

Palms, which continue in high favour as decorative plants, have received an accession almost as elegant as *Cocos Weddelliana* itself, in *Geonoma gracilis*, a Brazilian species with slender pinnate leaves; while in *Martinezia granatensis* (a garden name), from New Grenada, we have almost the opposite extreme, in a dwarf-growing dwarf broad-leaved species, the rose blunt apices of which are more or less undulated. The plant exhibited as *Asplodia australis Williamsii* (*G. C.*, 1874, i. 725, fig. 154), whatever may be its origin, and that is as yet obscure, is a stately addition to our greenhouse Tree Ferns, its long tripinnate evergreen fronds having naturally a decidedly drooping character. *Pleomecia Lenzeana* (*G. C.*, 1874, ii. 354, fig. 74), if, as possible, a still more elegant fern of the present class. *Polystichum quadrifidum* is a beautiful triangular fronds, with tripinnate division, and with the pinnules so set on below the upper edge of the rachis that a distinct ridge-and-furrow aspect is given to the surface of the fronds. This is from the Philippine Islands, and is probably the form which has been called *Cumingiana*.

Orchids have kept up their numbers, but have not reached up to the standard of excellence of last year, when we had to chronicle *Odontoglossum vesicularium*. Some of the more interesting of this year's acquisitions are hybrids, for which we have to thank the Messrs. Veitch and their staff of assistants. Thus, \times *Cattleya Veitchiana* is a fine cross of theirs between *C. lobata* and *crispata*, with the large rosy pink flowers and yellow disc of the first, combined with the rich purple-crimson lip colouring of the last; \times *Cypripedium Arthurianum* is *C. insignis* improved by being crossed with *C. Fairieanum*; \times *Laelia flammia* is a very handsome cinnabar-orange form, bred between *L. cinnabarina* and *Pilodorum*. *Ainsworthii* here also given us a very pretty hybrid *Dendrobium*, in *Dendrobium Ainsworthii* (*G. C.*, 1874, i. 443, figs. 93-4), obtained by the inter crossing of *D. heterocarpon* and noble, and whose white flowers are prettily blotched with amaranth. One or two other pretty *Dendrobies* have been imported, *a. g.*, *D. Boxallii*, from Moulmein, allied to *crystalinum*, with white flowers having the sepals and petals tipped with purple; and *D. amicum* from the Himalayas, with small white flowers tipped with magenta, and having a delightful fragrance of Violets. Another imported gem is *Masdevallia amabilis*, a New Grenadan species, in the way of *M. Harryana*, and in which the flowers are of a rich ruby-crimson, and have straight short tails an inch or two in length. Many other additions have been made to this rapidly extending genus, but none of the rest rank above second-class as ornamental plants, though they highly commend themselves to the fanciers of the ornamental flower-garden. One of the most important novelties of the year, and experience so far goes to show that they will be valuable for flower-garden purposes, as well as for pot-culture. The fine *Lilacaceæ* genus *Blandfordia* has also yielded to the

hybridiser a new form in \times *Blandfordia flammia elegans*, which has been raised between *B. flammia* and *Cunninghamii*. In *Echeveria Peacockii* we gain a welcome addition to that very ornamental group of succulents, the plant consisting of a densely rosulate tuft of about fifty very glaucous leaves, and a scorioid spike of from thirty to fifty orange-red flowers—it is from New Mexico. Among *Cycads*, *Cycas media*, which has been introduced from Queensland, grows seventy feet high, with a crown of long pinnate leaves; and *Macrozamia plumosa*—from the same country—has small, ovate, woody stems, surmounted by very elegant, spirally-twisted, erect pinnate leaves, the pinnæ being very narrow linear, and from 6—8 inches long.

Several welcome additions have been made to the Hardy or Half-hardy Perennial list. In the variety of *Irish Kæmpferii* named *E. George Henderson* (*G. C.*, 1874, ii. 45, fig. 11) we gain a remarkable \times double Japanese Iris, with six broad flat spreading segments of a deep violet-purple, with golden rays. *Pentstemon humilis* is a charming little Rocky Mountain plant, with deep blue flowers.

The most welcome of the additions to the hardy bulbs are *Brodiaea volubilis*; *Criatum Moorei*, a grand thing, suggestive of the *Belladonna Lily*, and hardy in Ireland; *Fritillaria pudica* (*G. C.*, 1874, i. 831, fig. 174), *Lilium avencanum* (*G. C.*, 1874, ii. 231, fig. 49), remarkable for its strongly reflexed perianth; and *L. Washingtonium purpureum* (*G. C.*, 1874, ii. 32, fig. 67), the latter a particularly interesting plant, quite unlike any of the more familiar *Liliums*.

Lastly, among Hardy Trees and Shrubs we note the following as being specially desirable—*Aralia Maximowiczii*, a Japanese species, with erect spiny stems, and large palmately five to seven lobed serrated leaves; *Clematis Flammula roseo-purpurea*, a chance seedling, probably a hybrid, with rosy-purple flowers; *Pyrus Maulai* (*G. C.*, 1874, i. 756, fig. 159; ii. 744, fig. 144), a charming new Japanese Quince, whose profusely developed bright orange-red flowers are succeeded by roundish bluish golden fruit; *Retinospora obtusa area gracilis*, a fine hardy evergreen, with elegant pendulous branches, freely variegated with golden-yellow; *Robinia Pseud-Acacia pyramidalis*, with the habit of the Lombardy Poplar; and *R. P. pendula*, with that of the drooping *Sophora japonica*, two fine ornamental trees. Finally, *Wistaria multijecta*, which is said to be intermediate in some respects between *W. sinensis* and *pubescens*, but to be a large ornamental woolly creeper on account of its long racemes of lilac and purple flowers, which are described as being upwards of 2 feet in length. *T. M.*

GREENHOUSE PLANTS.—XIX.

THEIR CULTURE AND MANAGEMENT.

Pleroma elegans.—When this plant was first flowered in this country, now more than thirty years ago, it made quite a sensation, its unrivalled rich purple blossoms were the admiration of all who saw it—and no wonder, for, when seen either by itself, or in company with other flowering subjects, it has few rivals. It is, however, when the plant, well-flowered, stands beside something complementary in colour to it, say a good example of *Allamanda*, or a nicely-bloomed *Cassia corymbosa*, that it is seen to advantage. Yet so distinct is it in colour and habit, that there is not a plant with which I am acquainted, of any colour, either in the conservatory or on the exhibition stage, that it does not harmonise with, and that is not improved by its presence. The individual blossoms do not last very long on the plant—some three or four days from the time they open—yet this is compensated for by their being produced in succession and developed in clusters of three to half-a-dozen on the points of the shoots. When cut, their duration is somewhat similar, but if taken from the plant when half open, there is no flower in existence that is more telling in a bouquet to be seen by daylight. Under the influence of artificial light the flowers lose much of their lustre, consequently they are not to be recommended for use under such conditions. It is found indigenous in the Organ Mountains, so will bear a little more warmth than some greenhouse plants; in fact, cultivation has been attempted in the open, but so treated it does nothing but grow, never getting enough rest to ripen its wood preparatory to flowering.

The plant is easy of propagation, growing freely from half-ripened cuttings, taken off at any time of the year that can be obtained in such condition: all they require is to be inserted in the usual way in silver sand in a moderate heat, and kept a little, but not too close, or the leaves will receive injury, and be liable to fall off. It will grow well in either peat or loam, yet prefers the latter, and it can be had of good quality containing plenty of fibre; in such it grows stronger and shorter-jointed, with a greater disposition to flower freely than in peat. There is one thing the plant is subject to suffer from—too much exposure

to strong sunlight; in fact, we often see it grown well in an old-fashioned house glazed with small glass, and with the accumulation of dirt under the laps usually found in such structures. When it is grown in a very light house it must be slightly shaded in bright weather, otherwise its leaves become so much disfigured as to seriously interfere with its appearance, even when well-flowered—I have seen this occur in bright March weather. Neither should the plant be in the winter time submitted to so low a temperature as the generality of greenhouse stock will bear; 40° in the night is low enough for it. If nice, stout, healthy plants in 6-inch pots are obtained in the autumn and wintered in a temperature as above indicated, with just sufficient water given to keep the soil in a healthy condition, towards the beginning of March the roots will be sufficiently active to admit of their being moved into pots 3 inches larger; add to the loam one-sixth clear, sharp sand, drain well, and pot firmly, placing the plants where they will be a little cooler, without exposure to the sun's full rays.

This *Pleroma* possesses what plant-growers call a good habit, not being too much inclined to run up with a few straggling branches; but, to insure the requisite equality of strength amongst the shoots from the commencement, the centre one should be cut back sufficiently to cause an equal disposition of the sap in all the branches near the base; the omission of this, in the first stages of the plant's existence, destroys its after symmetry, as, if the shoots near the base are weak they soon perish, to an extent not usual in most plants. Train all the strongest shoots to the outside of the pot, which will cause the weaker ones to gain strength, any that appear to take the lead must have their points pinched out all through the summer. As the weather gets warmer use the syringe in the afternoons, damping the under as well as the upper surface of the leaves, as the plant is sometimes, although not often, affected with spider. By the middle of June, if they have made their wanted progress, they will again require potting, giving about 3 inches of root-room, using soil similar to that first used, grow them on as earlier in the season, giving them the necessary attention in respect to water, which they require in greater quantities than most hard-wooded greenhouse plants, consequent upon their freer growth, and much greater evaporating leaf surface; continue also to shade sufficiently to preserve a healthy condition of the leaves. The shading will have to be accommodated to the character of the house, that is, whether it is very light or otherwise. Adrain sufficient air every day to induce short stout growth, and by the end of August discontinue the use of the syringe, giving more air and less shade. Keep through the winter, as before advised, in a night temperature as near 40° as may be. The plants must be tied into shape, which will be easily done, from their natural symmetry. In the spring, at the same time as advising last year, report, if they have plenty of roots, giving them a 3-in. shift, and treating as in the preceding season in respect to watering, shading, and watering, closing the house with a little sun upon it, and at the same time maintaining a sufficiently humid condition of the atmosphere in the evenings by using enough water on the stages and paths. The plants will not require a second shift this season, and by the middle of July should receive a full complement of air day and night.

By the middle of August remove them to the open air: but here they must not be submitted to the direct action of the sun. They should be placed on the north side of a tall hedge or trees, where they will not receive more than the morning and evening sun. Syringe them whilst here on the evenings in bright weather. Before they are thus turned out they must have sufficient sticks put to them so as to properly secure the branches, otherwise they will be liable to break with the wind. Do not let the plants remain out later than the middle of September, or they might be seriously injured by frost, and in such cases to risk them, for the month's exposure will have sufficiently ripened their growth to induce their flowering freely in the spring. Winter as before, keeping them well up to the light. Tie them into the required shape, and as early in the season as there is danger of their suffering through the effects of the sun, either shade slightly, or remove them to where they will not be exposed to its mid-day influence.

In respect to flowering, there is no particular time through the spring and summer that can be exactly calculated for the flowering of such plants—much will depend upon the situation where they have wintered. It is not a plant that can be hurried on; if any excitement were attempted by heat it would run into growth, and not flower at all. I have had it in by the beginning of June, and on other occasions not until the end of August. When in flower the plants can be removed to the conservatory, where they will be very effective. Place them where they will not be too much crowded. They should be here for a month, after which they should be removed to the growing house, and have any shoots that are unduly taking the lead shortened back. If they have flowered early in the season they will have sufficient time before winter to make growth for the

next year's bloom, in which case they ought to be moved into pots 3 inches larger, and in the autumn turned out for a few weeks, and then tied and wintered as before, but so treated they never bloom so profusely as if allowed a season's rest. More commonly they are only flowered every other year, in which case the plants should be shortened back somewhat freely after flowering, then placed in a house where they can be enabled to make some growth without any attempt at pushing, as they will have time sufficient the ensuing summer to grow into a large size. When so treated they had better not be potted until the spring, giving them as heretofore a 3-inch shift, and subjecting them through the summer to the same treatment as advised in their early stages, as to shade and water, as also in exposing them out-of-doors; but this season they may be placed out by the end of July, at which time, if all has gone well with them, they will be large enough for any purpose they may be required, even to exhibit in the company of the best and most select collection of plants, in which there are few more telling subjects.

After this flowering they should be cut to within a foot or 15 inches, and placed in a growing temperature, and syringed overhead every afternoon until the end of August, when they should have plenty of air, and the syringe should be withheld: it will not be necessary to place them in this state out-of-doors, for under any circumstances they cannot be expected to flower much, if any, the ensuing season. In the spring give them a pot 3 inches larger, encourage growth through the summer, and turn them out in the open air as before advised to ripen; train so as to keep enough young shoots to furnish the base of the plant with green healthy growth. This will be facilitated no doubt by the production of a number of shoots from the crowns of the plants, which the cutting back will have caused them to produce. After flowering this time it is as well to discard them for younger stock, which it is more satisfactory to bring on, particularly as it is such a free grower, making as much progress in a single season as many plants do in two; besides younger plants always have a fresher appearance. All that is necessary is, each year, to provide a few young ones to replace those that are made away with, for it is naturally such a good grower that unless very badly treated it rarely goes off or gets out of health. On this account it is a fitting subject for new beginners in the cultivation of hard-wooded plants, while as a subject for general decorative purposes it cannot fail to give satisfaction.

It is seldom attacked by insects, sometimes red spider will make its appearance, but this will not hurt the syringe, which is employed as advised, either brown or white, will live upon it, if communicated from other plants, but in case the plants become infested with either of these insects, it is better to destroy them, as the leaves are too soft to bear dressing with any solution strong enough to kill the insects. *T. Baines.*

TRANSPLANTING EVER-GREENS.

THERE does not appear much diversity of opinion among planters as to the proper time for planting deciduous trees and shrubs, as most are agreed that early autumn is the best time for that purpose. Deciduous trees may be planted from the beginning of November to the end of February with varying success, but the earlier they are planted after the fall of the leaf the less check will they receive, and the success will be in proportion to the earliness of the period at which the operation is carried out. It is erroneously supposed by many that deciduous plants are dormant during winter, and that the roots are in a state of rest and inactivity. That they are so in a degree I readily admit, but Nature is never wholly at rest, either in the animal or vegetable world, for no sooner do the leaves of one season burst forth than she is busy bud-forming and preparing for the next; and these buds go on slowly but continuously increasing all through the winter, till they burst forth in the spring. If the roots of deciduous trees were entirely at rest during winter, the drying winds and frosts would rob the trunk and stems of all the stored-up sap, and the trees would cease to exist.

Evaporation goes on from the stems and branches of trees in the same ratio as it does from any other surface equally exposed to the weather, and the roots are ever at work to supply the demand. Any one who has had experience in transplanting large deciduous trees will have observed the beneficial effect that results from binding bands of hay or moss round the trunks and branches. This is because it keeps the bark plump by preventing the action of frost and drying winds from robbing the tree of its stored-up sap, till the roots get to work to send up a fresh supply. If the bark is allowed to shrivel and become contracted, the channels for the flow of sap are impeded, and the growth of the trees is checked for years.

As to transplanting evergreens, I note that Mr. Saal recommends autumn for that purpose, and speaks of spring as unfavourable on account of drought which then prevails, accompanied by frost and drying winds, but this state of weather applies more to February and March, which are of all others the most unfavourable months planters have to contend with, as the winds usually then prevailing are much more searching and drying than at any other time in the year, and generally prove more fatal to autumn-planted stuff, than any of the summer months are to that planted in spring. The case of Laurel cuttings put in September is no proof that autumn is the proper time to plant evergreens, as it takes a long time for the callus to form before an emission of roots can take place, and the long months of winter give time for that process to go on before spring calls all vegetable life into activity. Laurel and all cuttings of evergreens are always inserted deep in the ground to keep them moist and plump, and to favour this but few leaves and a small portion of wood are left above-ground for the weather to act on, and they are always put in the most sheltered position to be found for them. I think the species of Berberis are about the best evergreens to transplant; they rarely succeed if moved in the autumn, but if caught in the spring just as they are beginning to move, success is certain. If spring planting holds good in this case with one of the worst subjects we have for removal, it must be equally so with others, and points to that season as the proper time for the operation. My experience has led me to choose April as the month of all others for transplanting evergreens, as just at that time the atmosphere is generally in that genial state of sunshine and shower so favourable to vegetation. At that season evergreens naturally shed a portion of their old leaves, and rapidly form young ones to replace them, and it is a well-known fact that these greatly aid the formation of roots. In winter, after a long continuance of wind frost, we frequently see old established evergreens killed or greatly injured, and in such winters it is impossible for those recently transplanted to struggle through. The only excuse or plea in favour of autumn planting is that labour is more abundant, but if we take into consideration the losses often entailed through planting late in the autumn, and having the labour over again in the spring, I think the saving will be found greatly in favour of the latter. If the winter should turn out moist and mild, evergreens may be transplanted as successfully in the autumn as deciduous trees and shrubs, and the last few winters have been exceptional, allowing of a succeeding mild and favourable success; but it would be unfair on this account to condemn spring planting, as the summers have been exceptional, too, for dryness—so much so, that old established trees have suffered severely, and I admit that it has been a work of labour to save those recently transplanted. Nevertheless, it is much easier to protect them from severe drought, by giving an occasional syringing overhead, than it is to save them from the scathing blasts of winter. If there is not sufficient snow at that time to pump up a supply of sap to replace that taken out of them by the winter winds and frosts, they stand but little chance, and appear in the same unfavourable condition for withstanding cold as a half-starved animal would be.

If I were obliged to plant evergreens in the autumn I should advocate September and October as the limit of time for the operation, as later than that they stand but little chance of making sufficient root to carry them successfully through even an ordinary winter. The dryness of an ordinary summer is much more easily counteracted than the cold of winter, for if the fresh growing buds receive a mild frost, and the roots are entirely covered in, and is then finished off with the dry earth without further watering, and afterwards covered over with a good heavy mulching of half rotten litter, they will require but little after attention. I attach the greatest importance to a good mulching either for spring or autumn planting, and look on it as almost indispensable to success, as it secures a uniform state of moisture, and with such protection root-action sets in rapidly, assisted by the daily increasing warmth. I had to superintend the planting of a large number of evergreens in the autumn some years ago, and although every care was taken, very few survived the winter, and they were dried through and through by the wind frosts. These shrubberies were replanted the following April, and so far as my recollection serves me, we did not lose a single plant, although many were of large size. Evergreens present, on account of their leaves, a large surface for the atmosphere to act on, and if cold frosts prevail, evaporation goes on more rapidly from their surfaces than can be kept up by the limited root-action of an autumn transplanted plant, as roots are formed much more slowly at that season than during the early summer months. I therefore advocate April as the proper time for transplanting evergreens. What say yours of your correspondents? *J. Sheppard, Woolerstone Park.*

FLOWER FESTIVALS IN YEDO.

ONE of the most agreeable characteristics of the people of Japan is the lively sensibility they exhibit to the beauties of Nature, and the pleasure they experience in witnessing the rich display of vegetation which the well-known fertility of their soil each year affords to them. At each of the many pretty spots in the neighbourhood of Yedo from which a beautiful *couple d'œil* may be obtained, numerous tea-houses and light temporarily-built sheds of Bamboo are erected, to which old and young resort in the fine weather, in order to enjoy the beauties of the landscape. The greater number of the suburban houses are surrounded by well-tended gardens, and even in the narrow and confined streets of the town, little garden plots, or perhaps pots only, of flowering plants and shrubs in endless variety of form may be seen, which are changed according to the season of the year, and in the order of succession of the flowers. The adornment of the temples with shrubs and flowers forms no unimportant part of the religious festivals. The principal temples are usually surrounded with pleasure gardens, and the skilful adaptation of the conditions of the ground, and the choice and grouping of the trees, and the happy effect of the architecture of the buildings in its relations to the surrounding plantations, frequently exhibit a refined artistic sense.

The influence of the changing seasons of vegetation is largely felt by the people of Yedo, and flower festivals occupy a prominent place among the recreations of all strata of the population. The introduction of the spring season is indicated in February by the coming into blossom of the cherished Japanese Plum tree. At this season the houses and altars are decorated with its beautiful blossoms, which closely resemble those of our Apricot, though exhibiting, from the greater care expended upon the culture, a larger variety of shape, colour, and size. The people of Yedo visit in crowds the localities most distinguished for the beauty and number of these trees. Among these Kamedo and Omusai on the left bank of the Ogawa, the large river upon which Yedo is built, and Tabata, on the road to the villages of Odsi and Sungita, on the south side of the town, are at this season the most popular. At the end of April the country wears its most charming aspect. The evergreen trees assume their new foliage, a vast number of shrubs and trees burst into blossom, and chief of all these the Cherry tree. This tree is very largely planted, and thrives especially at Askayama, a mountain plateau, from which a lovely view is obtained. The grounds here—among the largest and most beautiful in Yedo—exhibit themselves at this season in their greatest splendour. The snow-white blossoms of the Cherry offer a glowing contrast to the dark green colour of the surrounding foliage, and afford for many weeks a scene of gay and animated movement. In many parts of the grounds, and more especially close to the chief entrance gate, a large number of simple tea-houses constructed of Bamboo are raised. Everything is at its best in this season. The houses are decked with flags and gay-coloured lanterns, and sellers of food, confectionery, and children's toys throng the spot in great numbers, and from morning until night the grounds are filled with crowds of visitors of every age, appearance, and condition. In many of the tea-houses music is played and dances are performed by girls and children; young and old refresh themselves with tea, Cherry-blossom water, *saké*, and the fragrant weed; and on all sides pleased countenances are seen, and singing and laughter may be heard. The effect of the entire scene is to produce the pleasantest impression, for though occasionally an intoxicated person may be met with, the pleasure of the festival is rarely disturbed by misconduct or intemperance.

In the month of June the Fudsi (*Wistaria sinensis*) comes into bloom. This is a shrub of a climbing nature, and is much cultivated in gardens and in the vicinity of temples, where a stem about 2 inches in diameter may be seen supporting a thick umbrageous roof of a superficial area of from 2 to 3 square metres. When a *Wistaria* bower is decorated with all the wealth of its massive branches of butterfly-hued flowers, it forms a truly charming retreat, and spots in which the tree has been most largely planted—Kamedo, for example, where the trees surround and shade a piece of water—form the favourite resort of

the Yedo people at the flowering season. Picnics are held under the branches of the trees, and the beauties of the flower are frequently commemorated in verses which are written upon slips of clean paper and hung upon the boughs. Lovers, too, resort to the Fudsi as to an oracle, and fastening their *billets-doux* to the buds, read a presage of the realisation of their hopes according to the period of their fall.

Shortly after the Fudsi, the Ajame, and Hama Scorbu of the Iris family come into flower. At this period Horikiri in the vicinity of Mukoshima exhibits a spectacle rarely to be met with of its kind. Irises of the loveliest hues and in endless variety of form crowd the ponds and flower-beds. House-boats filled with pleasure-seekers dot the ample stream, and on the river-side road people may be seen, all alike bound to the Iris gardens, where, seated in the tea-houses or bowers which crown each little hill, they enjoy the charming scene, its *agréments* being in no small degree heightened by music and conviviality.

The late autumn is not without its festivals, towards the end of October the Kiku (*Chrysanthemum indicum*), chief favourite of all their cherished flowers, attaining its full bloom. This lovely Composite is cultivated in all its numerous classes with particular care and attention, and the variety of its flowers in colour, shape and size, is very great. Presumably from its similarity to the sun, the Kiku has been adopted in the Imperial escutcheon as emblematical of the Mikado's house. The *shifu* may be observed upon weapons, porcelain and lacquer-ware, and even the parti-coloured cakes which it is usual to present to the guests at the Imperial Court bear it. One of the five popular festivals (*Gosoku*) which originated in the earliest days, and are universal throughout the country, bears the name Kiku-no-setzu, or "Period of Chrysanthemum bloom," or Festival of the Gold Flower. This festival is observed on the ninth of the ninth month, according to the old Japanese calendar, and occurs usually in the latter half of the month of October.

For more than thirty years past, flower exhibitions of a very original description have existed at Yedo, and there, though playing an important part in the recreations of the people, possess no religious significance. Among these exhibitions, those which took place this year at the great temple of Asakusa, and in the garden suburbs of Sugamo and Somei, are especially deserving of attention.

The temple *enclave* of Asakusa, situated upon the Golden Dragon Hill, near to the chief river, is a rallying point to the tradespeople of Yedo. The various attractions to sight-seers are here combined. A French circus, a stereoscopic panorama, a building fitted up with a variety of electrical apparatus, a remarkable waxworks, and rare animals may be seen; while jugglers perform their wonderful tricks, and story-tellers, jesters, and soothsayers exercise their attractions upon a pleasure-loving public. Objects for sale are displayed in numerous booths, such, for instance, as cheap ornaments, children's toys, &c. In fine weather the grounds are crowded with visitors from town and country, while walking or flying among them are numbers of fowls and pigeons which are fed by the pious worshippers at the temples. Within a garden is situated, where one of the before-mentioned sights is exhibited for a trifling fee. Here may be seen bushes or shrubs cut so as to represent the figures of individuals or groups, mostly of the size of Nature, the faces being made from paper and painted, while clothes, fans, and weapons are formed by suitably trained leaves and flowers—in fact, in just such a manner as a mosaic is created by the combination of a number of bright coloured stones. Skilful though the work of these figures may be they are far excelled in originality of invention and careful execution by the products of the gardeners of the suburbs of Sugamo and Somei, who, relying upon the attraction of a special *chef d'œuvre* to bring them customers, expose to view some curiously-trained plant in such a position as to challenge the attention of the passer-by. Among these may be seen the often described Japanese dwarf trees in flower or fruit bearing descriptions, many of them with leaves marked with spots or stripes, and a numerous selection of deformed dry stumps of the Plum tree, the Mune so dear to the Japanese horticulturist. These flower-figures are most numerously represented in Dango Sanka in the tea-house grounds, their proprietors seeking by this means to add to the other attractions of their hostelry.

For nearly a month these tea-houses, favoured by fine weather, are filled with crowds of joyous guests, and a long holiday reigns of which the sellers of toys, cakes, and fruits do not fail to avail themselves. The exhibitions in the gardens are also numerously attended, and the behaviour of the visitors, while testifying to the pleasure excited by the flower-tableaux, evidences also the deep-rooted sympathies of all classes of the people with the clever productions of their national art-gardeners. *The Japan Mail.*

THE ORIGIN OF CEREALS.

THE late Dr. Lindley hazarded the opinion that the cereals, notwithstanding the dissimilarity of what botanists call their fruits, may have had a common origin, and may have sprung from one kind of grain. The heads of Barley so much resemble the heads or ears of bearded Wheat that an ordinary observer would say they were very near akin, and it is a fact bordering on the miraculous that the cereals are only of annual duration, and our daily bread is dependent upon seed-time and harvest; so that we should look in vain to the roots or stubble of last year for a single grain of Wheat; thus, then, as years roll on there is left no evidence that waving corn, being an annual plant, had flourished in this place or in that. The line between Maize and Wheat seems well defined, but if the illustrious botanist above named is to be heeded it is not a hard-and-fast line; and such has been the cavilling about the origin of species that even the citadel of Mansoul itself, as John Bunyan would call it, has been so battered with scientific blows that the godlike face of the Caucasian variety of the *genus homo* is in danger of being allied to the beast whose soul or spirit is said to go downward to the earth.

Wheat is found in the wrappings of Egyptian mummies, and Mummy Wheat, said to be raised from such, has been advertised frequently. This, if it could be depended upon, would be good evidence of the character of the corn of those days, and the mode of threshing out the corn by oxen treading on it tells us that it was Wheat and not Maize that could be so trodden out. [Prof. Heer indicates two varieties of Barley and six sorts of Wheat, in addition to other cereals, as having been found in the lake-dwellings of Switzerland B.C. 1000—2000?] In the case of the Cedar of Lebanon, spoken of so often in Holy Writ, we get evidence on the spot of their descendants, and so of the Olive, the Vine, &c.; but in the case of an annual grass there is no such evidence to be got, for the precious bread corn lives not from year to year like some of the tufted grasses, every year getting better established, but has a short life of one summer only. We read indeed that the Egyptians harrow the seed into the mud of the Nile in September, and in March following have their harvest—only seven months from their seed-time. When Macaulay's artist from Australia comes to be mounted, as no doubt he will be, on one of the arches of London Bridge, sketching the ruins of St. Paul's, he will doubtless find evidence of a city having stood there, but of the hundreds of beautiful annuals that now adorn the gardens round London one half at least would be irrefragably lost, realising the poet's vision of the Deserted Village—

"Near yonder church, where once a garden smiled,
And still where many a garden flower grows wild."

No one seems able to fix the native habitat of the Wheat plant; its history is lost in dry antiquity, so that we look in vain about the confines of the Old World for any starting point or reliable information respecting the origin of our grain plants, although they have all along played an important part in keeping the world alive. We know when the tubers of the Potato were first turned to account as food for man and beast, and we have chronicled the arrival on our shores of the leaves of the poisonous drug, Tobacco; but although the polite heathens had a special divinity to watch over their corn crops, the corn field, like Moore's "garden of beauty," was but "carelessly watched after all." Ceres, the daughter of Saturn, was accredited to corn and tillage, and that lady (goddess, I beg her pardon) has not left a rack behind to tell the tale of her cereals in their infancy. Loudon says the Zea Mays was introduced into this country a little over 300 years ago from America. Its importance in that country is well known, from the hundreds of cargos imported into this country from the New World. The uripe seeds were used in America just as we use green Peas here. I am much obliged by the Editors' comments in setting me right on the score of Maize being unknown in Holy Writ. I wrote asking for information on points of great importance, viz., what is known of the botany of the sacred books of the Old and New Testaments, and I am sorry to find so little light thrown upon the subject up to this date, and feel much obliged by the writers that have taken the matter up for what they have done. *A. Forsyth.*

DR. BRANDIS.

The botanical career of Dietrich Brandis began early in life. He was but thirteen years of age when in 1837 his father took the family to Greece, where he commenced his pursuits under Dr. Fraas at Athens. During his sojourn there he frequently accompanied his venerable relative Link on excursions; these were not confined to the mainland but extended to the islands, and gave Dr. Brandis great opportunities for cultivating his natural passion for botanical researches, every moment of leisure being assiduously devoted thereto. He never left the house without his botanical apparatus, and never came back without bringing some additions to his herbarium.

On the return of the family to Bonn in 1839 this

Bonn, where he had the advantage of being under the guidance of Treviranus. Here he took his degree of Doctor in Philosophy, and was soon after attached to the University as botanical lecturer, and continued to occupy that position to the period of his departure for India.

His researches in vegetable physiology gained him a great reputation among the botanists of Germany, and many of those who pursued their studies under his instruction, and enjoyed the benefit of accompanying him in his scientific excursions, cherish a grateful recollection of the pleasure and advantage they derived from his lectures and demonstrations.

In 1855 the post of Conservator of Forests in British Burmah became vacant on the resignation of Dr. McClelland, and Lord Dalhousie, the Govern-

vinces, to organise a more efficient and methodical conservancy.

In 1864 he was appointed Inspector-General of Forests to the Government of India, which post he has held ever since. From 1864 to 1871, with the exception of 1865, when he was on leave in Europe, Dr. Brandis annually made long tours of inspection in the different forests; in fact his official duties during these years were so arduous as to compel him almost entirely to abandon scientific pursuits.

In the latter part of 1871, Dr. Brandis' health gave way, and he returned to Europe on sick certificate. In March, 1872, he was directed by Her Majesty's Secretary of State for India to complete for publication the *Forest Flora of North-west and Central India* (commenced by the late Dr. J. Lindsay-Stewart, M.D.).

DR. BRANDIS, INSPECTOR-GENERAL OF INDIAN FORESTS.

herbarium formed no small portion of their luggage, the facilities of transport at that time being very defective. During the next four years he pursued his studies with great ardour at the Gymnasium at Bonn, and was always distinguished as the foremost of his class; and, notwithstanding his delicate health, he never ceased to enrich his herbarium. In 1843 he proceeded to Copenhagen and resided with his grandfather Brandis, the well-known physician, then attached to the Court of Denmark. He entered the Natural History Classes of the University, and became a pupil of the celebrated Professors Schouw and Oersted, the latter of whom took especial interest in the pursuits of the young and ardent botanist, nor did he cease to the day of his death to be his friend and counsellor. From the University of Copenhagen he proceeded to that of Göttingen, where he studied under Grisebach and Lantzius-Beninga, and subsequently to that of

General of India, ever on the search for merit, having heard of the distinction Dr. Brandis had acquired in Germany, caused it to be intimated to him that if he was disposed to accept the office it was at his service. The prospect of extending his favourite researches to this magnificent field was too tempting to be resisted, and the offer was at once accepted. Dr. Brandis continued to occupy this position for eight years, with great benefit to the interests of the State, by the success of his efforts to preserve the valuable Teak forests from extinction through reckless improvidence and mercantile cupidity. During this period the improved system of administration was apparent, both in the nett money returns and in the timber available to the public.

In 1863 he was promoted to a post of more enlarged usefulness and greater importance, and was directed to proceed to Oudh, the North-west and Central Pro-

This work (lately reviewed in this journal, see pp. 395, 426, vol. ii., 1874) will do Dr. Brandis infinite credit, the identification and description of species, and the botanical part generally, being entirely the result of his independent researches. During the last two years he enjoyed the privilege of working at Kew, and of conferring with Dr. Hooker, Mr. Bentham, Professor Oliver, Mr. J. G. Baker, and other botanists. He also had the assistance of his friend and coadjutor, Dr. Cleghorn, who had been for many years associated with him in the Forest Department of India, and to whose efforts mainly Indian forest conservancy owes its very existence.

In April last Dr. Brandis resumed his duties, and is now inspecting the forests of the North-west Himalayas. In these lines we have but imperfectly noticed the important services which Dr. Brandis has rendered to the Government of India by organizing a department such as the Woods and Forests.

Foreign Correspondence.

ST. PETERSBURG.—In your list of portraits of garden plants given in the number for December 5, mention is made of a *Panax sessiliflorum*, Pancher, a native of New Caledonia, and described in the *Revue Hortícola*. There seems to be some confusion here, as the true *Panax sessiliflorum* is a native of Amooria, and was described in 1857 by Ruprecht and Maximowicz (*Mélang. Biologiques du P. Acad. des Sc. de St. Pétersb.* 1857, 426). This latter plant is quite hardy here, and forms one of the best acquisitions we have had for a long while. *P. T.* (*Panax sessiliflorum* of Ruprecht) has been referred by Seeman to *Acanthopanax sessiliflorum* (*Revis. Hédw.* p. 102). We have no personal knowledge of the New Caledonian plant. Eds.]

COMO.—In a recent number of the *Gardeners' Chronicle* reference is made to the blooming of *Analis Sieboldi* in the temperate-house at Kew. A plant in my garden here has also bloomed. It is in the centre of a bed (*testis*) formed of *Alternanthera*, *Lobelia*, *Mesembryanthemum*, &c., and in August last threw up a fine panicle of white flowers. *L. T.*

CAMBRIDGE, MASS., U.S.A.—I enclose photographs of *Agave schidigeri*, which I lately photographed at Brookline. The plant differs in some particulars from the one figured in the *Botanical Magazine*, tab. 5641. Horticulture has during the last ten years taken a seat here, and is making solid progress. C. S. S.

Florists' Flowers.

The fine old varieties of DOUBLE TULIPS still hold their own against the new improvements, so called, of the past ten years. If any one desired to use a double variety that would make him a gorgeous densely-flowered bed, he would employ that finest of all the double varieties, the grand old *Touneisel*. If he wanted the most effective double variety for pots, he would select the same. Of dwarf growth, and bearing cerise-red flowers deeply edged with gold, of prodigious size, and showy in the extreme, it is difficult to imagine how this particular flower can be surpassed. The raiser of it deserves a monument to his memory, if it was necessary to add anything to the flower itself. Old *Rubrum* holds its own, notwithstanding that green tips occasionally show themselves on the bright red petals. Then there is *La Candeur*, with its stiff dumpty habit of growth and lateness of flowering, and yet standing alone as a double white Tulip, without a rival to dispute its claims. I well remember when Mr. Stuart, formerly of Nuneham Park Gardens, used to employ these three Tulips on the terrace garden to form masses of colour in spring in beds carpeted with *Delicatis*; his practice was to plant *Touneisel* and *Rex Rubrum* 2 inches deeper in the soil than *La Candeur*, and by this means get them in bloom together. An excellent quartette is formed by the addition of *Couronne Pourpre*, a rich deep crimson self-flower, of great beauty and large size. Duke of York, dark rose, bordered with white; *Extrême d'Or*, very bronzed feathered with orange; *Gloria Solis*, in the way of *Touneisel*, but of a richer red; *Mérida*, pale rose, and white; *Overwinter*, striped with aprish blue, and *Yellow Rose*, are second-rate as compared with those just named. There are two fine self-coloured varieties, as yet somewhat expensive, that are remarkably good, viz., *Imperator Rubrum* and *Yellow Touneisel*. The former is of a scarlet-crimson hue, very bright and fine; it is decidedly earlier to flower than the red *Rex Rubrum*, and is without the defect of the green tips among the petals. The *Yellow Touneisel* is a fine variety for pots, and is also a good variety and makes a grand display either in beds or pots. *Marigé de ma Fille* is an early Tulip, and it appears to be a double form of one of the late flowering florists' varieties. If grown in the border, the stems should be secured to stakes. The flowers are charmingly flaked with rose on a white ground.

Of newer double varieties there are *Couronne des Roses*, pale rose, and pink on the edges, very pretty; *Rose Agnès*, a bright crimson self; *Soleil d'Or*, very like *Yellow Touneisel*, and with a tendency to become stained on the base with age; and *Turban Violet*, pale pinkish violet with dark base.

But little novelty has shown itself among the single varieties this season, which is perhaps not to be wondered at, seeing what splendid varieties we already possess.—The most promising appear to be the following:—*Admiral Regnier*, bright carmine-rose, feathered and flamed with white, very pretty; *Assolyn*, an intense carmine self, and a fine hue of colour; *De Kaiser*, a very nice dwarf Tulip, deeper in colour, and fully two days later than *La Belle Alliance*, which is one of the earliest to flower; and *scarlet Pottebakker*, which, being at least ten days later than the rest of the varieties in the *Pottebakker* section, can scarcely belong to them. It cannot, at least as seen this season, be termed an acquisition. *R. D.*

Notices of Books.

Ten Years of Gentleman Farming at Blennerhassett, by William Lawson, C. D. Hunter, and others. Longmans.

This is one of the most amusing and instructive books we have read for a long time. Amusing because in spite of the mishaps recorded by the authors they are invariably good-humoured and disposed to laugh with those who laugh at them—instructive because full of warnings and cautions to rash experimenters whether in political economy or practical agriculture. With perfect candour the authors relate the results of a costly experiment at farming on co-operative principles, of estate management under the direction of a committee of co-operators chosen by universal suffrage without any particular regard to their special knowledge of farming. Were it not for the evident good faith and excellent intentions of the promoter of this scheme the whole thing would read like a farce. The excellent spirit, however, which animated him and the frankness with which this record of failure is written engender a feeling of great respect for the good hearted experimenter.

The Blennerhassett establishment existed for ten years. "It included a farm, extensive farm buildings, a market garden, artificial manure works, steam-ploughing machinery, a laboratory, a free library, a school, and several other works." Twelve acres all established by Mr. Lawson, not only for his own benefit, but also especially for that of his labourers. "I want you," said Mr. Lawson, "to feel no longer that you are working for me, but that you are really working with me, as cultivators of the soil, with a view to participation in the profits, if we can make them." It was hardly likely that any profits would be made when the labourers assembled in "parliament" to discuss what they should do, and were paid for the time spent in their deliberations. "I have nothing to say at all." "The parliament of industrial council was thrown open to anybody in the village to come in with their conflicting and confusing advice." An amusing instance of this is given in a case where the increase of wages was the matter under discussion. The men-voters hesitated, and took into consideration whether the concern could honestly afford the increase; and when a limit was proposed to be put to their wages, they voted for it,—not so the women; and one got out of their net, and retained the slightest doubt on the question, and the rest of the vote at once voted in favour of increasing their own stipend.

How the farm was carried on, what extravaganzas were committed, what blunders made, what accidents befel the steam-ploughs, may be read in the candid pages of the book, which we commend to the notice of our agricultural and amateur readers. In spite of the financial want of success, the good effected indirectly by Mr. Lawson must have been very great. Cooperative societies, dispensaries, schools, reading rooms, established by him, or through his agency, or that of the "public good department," testify to this. It is impossible also that the standard of intelligence among the labourers must have been raised, and even the progress of agriculture largely, if indirectly, benefited by the Quixotic experiment. So far then, we are far from looking at the Blennerhassett Farm as an entire failure. There was a strong principle of benevolence, a strong desire to benefit his fellows, in all that Mr. Lawson did, and these have not failed. As to the financial loss, that, we imagine, is of secondary consequence in this case.

We regret we cannot find space to insert some details concerning the farming operations and the reports on various manures, which give a permanent value to the book. We may, however, find a place for the following extract from the section relating to the garden:—

"In February, 1864, the garden was first laid out, and soon afterwards a small plantation and hedge were planted around it. By November, 1000 Gooseberry bushes, and 1000 of the best fruit trees had been planted. Mr. Lawson engaging his father's head gardener to plant every one with his own hands. Things evidently looked well at this time, for in December, when his father's steward valued the estate, the 1000 acres of garden land were estimated at £100 per acre.

"Meantime marketing was begun, but proved rather an expensive mode of sale; the cost of man, and horse, and tolls often amounting to nearly one-fourth of the sales. But sometimes it was worse; for in June, 1865, a man was sent to Sibth, a watering place 10 miles to the north, where good prices were obtained for vegetables and fruit; but night came and he did not appear. Next day a second man was sent to find him, and though he was successful, the cause of the delay and the cheapness of the sales were never clearly explained.

"Sibth was proved the most paying crops; for the farm generally grew better Potatoes and Cabbages than the garden did. Why, it is difficult to say—the chemist claiming that his chemical manure, which the farm used largely and the garden but little, was the cause of superiority, and others attributing it to soil and rotation.

"Subjoined is a list, rejecting fractions for brevity, of the annual sales of the more important products:—

Annual Sales of Garden Produce.

	1867.	1868.	1869.	1870.	1871.
Strawberries ..	466	£34	£49	£40	£32
Other berries ..	3	3	8	12	11
Rhubarb ..	1	1	17	33	37
Cabbages ..	47	95	22	26	3
Potatoes ..	40	51	22	37	34
Peas ..	14	6	10	3	4
Onions ..	1	3	15	24	32

"The variety and tendency of our garden cropping will be best shown by the following table, which gives the extent of land under the different crops. But it must be borne in mind that some of the land was under two crops; 53 acres, included in the table, also containing Gooseberry bushes or other fruit trees, Cabbages or other crops being grown on two different crops.

Garden Cropping in 1868.

	Acres.	Roots.	Acres.	Roots.	
Potatoes ..	5	14	Strawberries ..	0	14
Cabbages ..	2	14	Fruit trees ..	0	14
Peas ..	1	1	Currants, &c. ..	0	12
Tares ..	1	1	Onions ..	0	1
Onions ..	1	0	Grass ..	0	3
Carrots ..	0	3	Roads ..	0	34
Plantations ..	0	0			
Cuttings and seeds ..	0	0	Total ..	20	14
Young Thorns ..	0	24			

"Many of the above quantities represent three or four different plots, and a few minor crops have been omitted. The fruit trees, it will be seen, occupied nearly 6 acres, but they did not do very well, though perhaps six years is too short a period in which to judge of the success of a new fruit plantation.

"In 1867, 8 acres of nice loamy soil were added to the garden land, and further extension was contemplated.

"At this time the cropping sheet system (explained in another chapter) was just begun, and the gardener showed (on paper) such enormous profits per acre, that gardening threatened to out-farm agriculture. Leeks were to clear £76 per acre, Onions £66, and other crops in proportion.

"Below a few figures are given which will indicate the progress of the garden. Like that of the rest it is in progress in the right direction, the sales per acre reaching £20 in 1871, the expenditure at the same time decreasing. The manure was almost entirely farmyard:

Garden Accounts.

	1864.	1865.	1866.	1867.	1868.	1869.	1870.	1871.
Wages ..	46	£5	£6	£6	£6	£6	£6	£6
Plants and trees ..	42	95	339	150	16	49	139	176
Manure ..	12	12	27	52	34	59	47	37
Sales of produce ..	10	20	240	229	245	412	412	412
Stock in December	128	265	466	554	467	467
Profit	59	47	34	34	18
Loss	59	91	313

"It is easily seen that in the earlier years, when planting &c. were active, the wages greatly exceeded the sales; but after 1866 there was a manifest improvement; so that in 1871 the sales were nearly three times as large as the wages. Indeed, the concern was then clearing itself, and perhaps might have been made really profitable in time. Our critic, however, thinks not; as he says 'each succeeding year brought more weeds, more work, and consequently more wages to pay; and while such was the case, the fruit, which ought year after year to have increased in quantity, seemed to be all but an entire failure.' Since Mr. Lawson sold the estate, I have had an opportunity of seeing the soil, and find it to be a clean glare, thus giving at once a clue to the cause of the failure of the fruit." Certainly the land was, as our critic remarks, very foul by 1871; but that was an unusual year for weeds; and it is doubtful if, taking season for season, the land was much worse than in 1862.

"The balance-sheet for the whole period shows a net loss of £339 11s. 3d., the land being valued as neither better nor worse; the £2438 10s. 3d. transferred to land and buildings account, including £364 10s. 3d. worth of fruit plants, &c. On the other side, the loss, it will be noticed, occurred before 1867, the later years doing much better; but never making enough to pay rent, which, at £2 an acre, would have amounted to £60.

"Lastly a considerable extent of the garden land was devoted to farm crops, such as hay and Oats, £229 of the sales in 1871 being for such crops; and this presents a fair estimate of the gardening expenditure. Roughly divided, the wages averaged over the eight years £10 per acre, the manure £1 14s., the sales £11, and the loss (no rent or interest being charged) £2 6s. per acre. Much of the garden land could be reached by the irrigation hose, and to this we largely owe our success in growing Rhubarb and Strawberries, the latter crop in 1869 growing £49 worth of Strawberries on about 1 statute acre."

Ein Beitrag zur Kenntniss der Orangengewächse.—A Contribution to our Knowledge of the Orange Tribe. By Dr. Goetz. Svo. pp. 32. Hamburg, 1874.

This little pamphlet is dedicated to the King of Portugal, and owes its chief interest to the historical portion respecting the introduction of the Orange, &c., into Portugal; the author being at present engaged in superintending the formation of a botanical establish-

"Besides the 53 acres planted also with other crops, and included in the list.

ment at Lisbon. In the first place the genera of the plantaince are briefly discussed, and the geographical distribution of the group given. Unfortunately this part is disfigured by many typographical errors. Then the genus Citrus itself comes under consideration, and the author gives a good summary analysis of the principal writings on this subject, together with his personal knowledge of the numerous forms in cultivation. The views of different writers respecting the number of species represented by the cultivated varieties, and other questions, are carefully examined, showing great industry and research, but containing little that is new to the English reader.

With regard to the history of the introduction and dispersion in Europe of different varieties and species, we find many interesting paragraphs, a selection from which may serve to supplement the article by "D. M.," at page 74.0 of the last volume. On the question of the exclusively Asiatic origin of the Seville or bitter Orange, he quotes several Portuguese authors. André Alvares de Almada says in his *Tratado dos Rios de Guiné*, cap. xv., "The river Togo waters numerous Orange trees which grow on its banks, the fruit being of the same kind as the rivers Tonco, Batium and das Allianças exhibit luxuriant fruitful shores, clothed with many Palms and Orange trees." Also, "Opposite Cape Ledo, which forms the extremity of the Serra Leas, there are two small well-watered islands, called Bravas, which produce quantities of Oranges, Lemons, Citrons, Bananas, and other fruits." Almada wrote this in 1580. He resided at Cape Verde, and was practically acquainted with the coast of Guiné. The monk Ferns Guerreiro, in his *Itinerário* quoted in the dated February 20, 1606, respecting Serra Leas, addressed by Bartholomew André to the King, in which he says "Respecting Orange trees of all sorts I will say nothing here, for the forests are full of them." Another monk, Balthasar Tebbes, says that Congo was celebrated for its Oranges. Several other quotations to the same effect are adduced, so that whether or not the Orange tree is indigenous in West Africa, it is exceedingly unlikely that the Portuguese introduced it. Respecting the celebrated Golden Apple, or the Hesperides, the investigations of the recent writers seem to show that they were Quinces, and not Oranges, as commonly assumed. At all events, the celebrated bas-relief in the medical garden at Rome, in which Hercules is sitting on a stone and leaning against a tree, represents a Quince tree, and not an Orange tree.

On the introduction of Orange trees into Portugal, the author quotes the *Elucidario* of P. Santa Rosa de Viterbo, whose records are dated 1262 and 1374, and who affirms the general opinion that Oranges were first grown in Portugal until after the doubling of the Cape of Good Hope, to be erroneous, as at the time the so-called Chinese Orange was introduced, plantations of Orange trees had been in existence in the kingdom for several centuries. The celebrated geographer, Edrisi, who finished his great work in 1154, speaks of the abundance of Oranges in Morocco. Other evidence of the early cultivation of the Orange is adduced, but there is no doubt that in all instances the bitter, or Seville Orange is intended, and there is nothing to substantiate the belief that the sweet Orange was known in Denmark at that time. Jacques de Vitri (1200), speaking of the fruits of Syria, after mentioning Citrons and Lemons, describes the Oranges as of a bitter taste, from which we may infer that the sweet Orange was unknown to him, both in Europe and also in the country through which, in all probability, it passed on its way to Europe. Here is the quotation:—"In parvis atomis arboribus quedam crescant alia poma citrina, minoris quantitatibus frigida, et acidis sine pontici saporis, que pome oranges ab indis et arabibus vocantur."

The exact nature of the introduction of the sweet Orange cannot be given with certainty, but there is no doubt that it was known in the beginning of the reign of Don Manoel (1500). When the celebrated traveller and missionary, Father Jordan (Jordán), passed through Asia in 1330 the sweet Orange had probably not reached Europe, or at all events was not very widely spread; for, from his "in India nemo, in quibusdam partibus, rimones acerbi sicut nostri, sicut zachara, et alii limones acerbi sicut nostri," it appears that he there first became acquainted with the sweet Orange. From the context and other circumstances Dr. Goetz thinks that Oranges and not Lemons are intended, though the word Limones is employed. The Editor of *Roteiro de Vasco de Gama* relates that when the Portuguese ships arrived at Bombay in 1498, two Malayan boats brought them baskets of the most delicious Oranges, which were much better than those then known in Portugal. His words lead us to the conclusion that sweet oranges were meant. But the mention of the sweet Orange in the east coast of Africa at that period does not rest entirely upon the meaning of a more or less ambiguous phrase, for Duarte Barbosa, who wrote twenty years later, reports that both sweet and bitter Oranges were plentiful in Bombay. If the former had been entirely unknown to him in Portugal he would doubtless have expressed his surprise at meeting with a new fruit; hence it is

quite evident that the sweet Orange was spread over Portugal at the beginning of the sixteenth century.

The true Chinese and the sweet Orange are often spoken of as one and the same thing, but the superior Chinese variety of the sweet Orange was not introduced into Portugal till about 1630. Through the Jesuit missionaries very glowing accounts of the superiority of the Chinese Oranges reached Europe. Naturally the Orange-producing countries were anxious to secure the Chinese variety; and Portugal was so fortunate as to obtain it first. From Duarte Ribeiro de Macedo we learn that Don Francisco Mascarenhas brought an Orange tree to Lisbon, which had come by way of Goa from China. The superiority of this new variety was soon apparent, and the Portuguese trade in Oranges increased accordingly. To retain the foremost position in the trade, a law was passed in 1671 strictly prohibiting the exportation of Orange trees of any sort. The introduction of this variety by the Portuguese probably gave rise to the general opinion that they were the first to import the sweet Orange. On this point the Monk Antonio do Sacramento gives us some interesting information. When on his journey to Jerusalem through Alexandria he visited the garden of a rich Mohammedan, who pointed out as a great rarity a Chinese Orange tree under the name of Portugal Orange. Chinese Orange afterwards became the general term for all sweet Oranges, and the Chinese varieties received the name of Portugal Oranges. The Chinese Orange must have been propagated by grafting in the earliest time, for the exportation of the fruit was permitted; and, therefore, we may assume that the authorities entertained no objection to its being propagated in other countries from seed.

As mentioned above, both sweet and bitter Oranges existed on the east coast of Africa at the time when the Portuguese sailed round the Cape of Good Hope; and they were soon established in the various Portuguese possessions, Madeira, the Azores, Cape Verde Islands and Brazil.

Pereira describes the true St. Michael Orange as a small, seedless fruit, but Dr. Goetz during his stay in the Azores in 1866 could not discover that it was known to the growers.

Speaking of the Mandarin Orange he says the Tangierine is often mistaken for it, the former being rarely met with in cultivation, whereas the latter is widely grown. Recently some of the growers have recommended grafting the Tangierine on the Mandarin, in order to obtain stronger growth and larger fruit.

For upwards of twenty years the Orange plantations have been devastated by an epidemic disease, respecting which Goetz gives us some interesting details, but we have left no room for further extracts. There is, however, one fact worth mentioning. The only means of at all successfully combating the disease is by grafting, and using seedlings of the common bitter Orange as a stock, which is another proof of the gradual weaning out of varieties continuously propagated by cuttings, &c., where there is no infusion of fresh vigour, but a sort of artificial prolongation of the life of one and the same individual. H.

The last number of the *Belgic Horticultor* contains coloured figures of *Vriesia Malinica* and *Canistum viride* (two striking *Bananas*), of which we have left no room to say another accession, and of *Dendrobium Falconeri* var., which has flowered in the collection of M. Oscar Lamarche, of Liège. Notices of *Maranta leucina* (sp. n.), of *Opuntia Rafinesquii* and *Vriesia regia* follow. Of this latter plant we hope shortly to publish an engraving from a photograph kindly forwarded to us by M. Antoine, of Vienna. The remainder of the number is occupied with scientific and practical information of a description which gives this journal so high a place in garden literature.

In the last issued number of the *Illustration Horticole* we find coloured plates of *Masdevallia Trochilus*, *Dracena Casanova* (a very handsome form, of compact growth, with purplish leaves edged with red), and *Cypripedium Schlimii*, var. *albiflorum*. Mr. André details the following plan, devised by M. Mas, for protecting Vines from frost, and which we mention here as the plan may be applicable to other things. It consists simply in making a hole at the base of each Vine, and then coiling the whole cane within it. The warmth of the soil is said to be sufficient to preserve them from frost.

The October number of the *Gartenflora* contains coloured figures and descriptions of *Freesia Leiblinii*, a yellow-flowered Iridaceous plant, grown in some gardens under the name of *Sparaxis Thoubertii*, and of *Amaryllis* (*Hippeastrum*) *Roezlii*, a Bolivian species, closely allied to *A. equestris*. An uncoloured lithograph is devoted to *Polygonum tomentosum* (Willd.), a tropical species.

The November number of *I Giardini* (Milan) has a coloured figure of *Echeveria panicea floribunda*, a form with a rather dense reticula of scarlet flowers. The number in question also contains the

first part of an Italian translation of Professor Sorauer's treatise on the diseases of plants.

The last volume of the *Bulletin de la Fédération des Sociétés d'Horticulture de Belgique* is before us. A large portion is as usual taken up with official reports of the several societies constituting the Fédération, together with a list of the gardeners elected to receive at the hands of the Government "decorations," of the first or second class respectively. Then follow biographical notices and portraits of Lambert Jacob-Makoy, and Gilles François Godin. A large space is occupied with a description of the "Floralia" at Ghent in 1873, and translations of articles that appeared in our own columns and in those of our contemporaries are given. Then follows a report on the London Parks, addressed to the Minister of the Interior by M. Oscar Cas, graduate of the School of Horticulture at Gandbrugge, illustrated by lithographs showing the arrangement of the flower-beds, &c. The author's criticism on our fruit culture is not flattering. "Nowhere about London," says he, "have I seen fruit trees which by their form and good pruning rival those of Belgium. In most nurseries, not to say all, the young trees are massacred by routine gardeners destitute generally of the rudiments of knowledge of horticulture, and that is not astonishing when it is remembered that there are neither schools of horticulture nor public lessons on the pruning and training of fruit-trees." This is sweeping criticism, and to some extent it is just, but before accepting it as wholly so we should like to know more as to the average produce and value of the fruit produced from equal areas in the two countries. We should not be at all surprised to find, after all, that we compare favourably in these points. With the writer's remarks on the absence of training schools we entirely concur, and have over and over again lamented the deficiency. M. Cas devotes special sections of his report to our methods of cultivating Holly-hocks, Tree Mignonette, Roses (the Manetti, it appears, is not much used in Belgium, owing to its slow growth and short duration), Cyclamens, &c. The volume terminates with a reprint of Professor Morsen's useful *Correspondance Botanique*, to which we have previously referred.

The concluding portion of the new edition of the *Micrographic Dictionary* (Van Voors) has just been issued. This work has long been indispensable as a work of reference, and in its new guise will be specially valuable.

Mr. Murray has published a new edition of Mr. Smiles' *Lives of the Engineers*, one of the most interesting and instructive series of biographies that has ever been written. No more acceptable present could be made to an intelligent lad with a taste for mechanics than these elegant little volumes.

It seems quite a matter of course for new Rose books, and new editions of old Rose books, to appear, and we cannot wonder at it, for while the popular homage to the Rose seems to grow by what it feeds on, the books which aid in this matter are each in their way good. *The Amateur's Rose Book* (by Shirley Hibberd), of which a new edition has just been published by Messrs. Groombridge, is an "all round" book of great merit, and one which may be consulted by the amateur as a reference book on any subject on which he may require information with the assurance that he will, as a rule, find all he wants. Another book, an old friend, comes before us for the fourth time. We allude to Mr. W. Paul's *Observations on the Cultivation of Roses in Pots, including the Autobiography of a Pol Rose*. All we need say of it is that we are glad to see it whenever it comes, and trust to see it again and again. One of our greatest horticultural triumphs is manifested in our exhibitions of pot Roses, to which nothing of the kind on the Continent can be compared. We ought not to forget that the initiative was set by the Horticultural Society of London, and among the very first to practise and preach (and thoroughly in both cases) was Mr. W. Paul. May his exhibitions and his editions increase!

The *Botanical Locality Record Club*, an association with an unfortunate title, but one capable of doing good work, as is evident from the document before us, has just issued its *Report* for 1873. It contains a record of localities for wild plants not heretofore met, and in this way will contribute to the more perfect knowledge of the distribution of our British plants. The attention of members is particularly desired to be given to variations and sub-species, so that ultimately the local conditions favouring these forms may be elucidated, as well as the range in altitude and distribution of our commoner plants. The statements of the collectors are authenticated by specimens forwarded for the Club herbarium, and precautions are taken to prevent the extermination of rarities. Such an association has obviously the means of bringing to light many interesting facts connected with the botanical geography of Britain in its wide sense and apart from mere plant-collecting, and at present its operations have been but commenced. Another season will, we trust, find the association in good working order.

SATURDAY, JANUARY 2, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Jan. 4 Sale of 10,000 Bulbs of *Lilium auratum* just arrived from Japan, at Stevens' Rooms.
TUESDAY, Jan. 5 Sale of 300 Pairs of Choice Poultry and Pigeons, at Stevens' Rooms.

IN a recent number of the *New York Tribune*—for advance sheets of which we have to tender our thanks to the Editor—Dr. ASA GRAY has raised once again the question so warmly debated in our own columns some thirty years ago—"DO VARIETIES WEAR OUT?" or tend to wear out?" Of course, the question was not definitely decided, or it would scarcely be raised again now. Nor do we think it at all likely that our knowledge is sufficient to enable us to give a definite answer to it at the present time. Still, the general diffusion of Darwinian ideas at present tends to put the matter in a new light, and affords a justification for re-opening the question. The main advocate of the theory that varieties do degenerate and die out was no less a person than THOMAS ANDREW KNIGHT. He, as LINDLEY records in his *Theory of Horticulture*, "finding that the orchards of Herefordshire no longer contained healthy trees of certain varieties of Apples, which were said to have flourished fifty years before, and failing in his attempt to restore health to such varieties by grafting, assumed that old age had overtaken them, and that they were incurable." KNIGHT'S theory was accepted by many cultivators, among others by the late WILLIAM MASTERS, of Canterbury, who, in an article in our columns (1853, p. 373), adduced evidence in favour of KNIGHT'S views, which was considered by LINDLEY to be the best evidence up to that time brought forward in favour of KNIGHT'S hypothesis. Mr. MASTERS showed that several varieties of Apples, such as the Golden Pippin, Lemon Pippin, Winter Nonpareil, and others, used to be grown in large quantities in the neighbourhood of Canterbury, and cites cases where, in spite of all precautions of grafting on new stocks, planting in fresh soil, the acquisition of trees grown on a different soil and the like, failure ensued, though other sorts were grown with good results.

"The whole experience of my life," writes Mr. MASTERS, "shows that in no instance, although I have, under my father and myself, sent out thousands of these trees, in no instance to my knowledge is there a tree living that has acquired a size agreeable to its age, or in a condition likely ever to form a large tree; and, let it be remembered, that some of these older varieties were the largest trees in the old orchard." In the nursery, grafts taken from the old Golden Pippin, placed on no matter what stock, soon showed their weakness, and in the third year, or even sooner, canker set in. From these facts Mr. MASTERS arrived at the conclusion that, as the trees formerly did well, while latterly grafts taken from them did not do so,

and as neither climate, soil, nor situation occasioned the change, it must be due to degeneracy of the variety. With such opinions it is no wonder that Mr. MASTERS became (and remained to the end) an adherent of KNIGHT. On the other hand, he quotes SPEECHLEY'S dictum that "Apples properly planted will retain their good qualities so long as sun and earth endure." LINDLEY was of SPEECHLEY'S opinion, and controverted KNIGHT'S views, so did DOWNING and DE CANDOLLE. Admitting the facts brought forward, they rejected the reasoning and inferences drawn from them.

It was actual disease, not mere degeneracy, that was propagated by grafting in such cases as those related by Mr. MASTERS. "But change the circumstances, place the plants under more favourable circumstances, keep off the cause of the evil and the evil will gradually disappear, as has actually occurred when carried to better climates than our own." We are inclined to think LINDLEY here has the best of the argument, and for this among other reasons—If varieties die out and degenerate so rapidly, how is it that so many remain? Ribston Pippins, to all appearance, are as good as ever they were; and numberless instances will occur to the practical horticulturist of varieties of great age which are as healthy and productive as ever they were. But, as Dr. GRAY well puts it, the tendency of scientific thought nowadays would be much more favourable to the notion that varieties may die out than it was in pre-Darwinian days. Two questions, or rather the answers to them, will, as Dr. GRAY says, cover the whole case. First, will races propagated by seed, purely bred and not crossed, continue indefinitely, or will they run out in time and at last lose their distinguishing characteristics? Without presuming to pronounce definitely Dr. GRAY yet leans to the opinion that they do not do so, since the older a race is the more reason it has to continue true, the presumption of the unlimited permanence of old races is very strong.

The second question is, will varieties propagated from buds, cuttings, grafts, tubers, &c., necessarily deteriorate and die out? As we have seen, KNIGHT answered this question in the affirmative, and was not without supporters among practical men. And now Dr. GRAY himself brings forward considerations in support of this position, and his conclusions are so important that we will not run the risk of distorting them, but will give them in his own words, the more particularly as we believe the view he takes is a novel one, and one which bears not only on the question under review but also on that of Bud Variation or Sports:—

"Finally, there is a philosophical argument which tells strongly for some limitation of the duration of non-sexually propagated forms, one that probably KNIGHT never thought of, but which we should not have expected recent writers to overlook. When Mr. DARWIN announced the principle that cross-fertilisation between the individuals of a species is the plan of Nature, and is practiced to the extent that it fully sustains his inference, that no hermaphrodite species continually self-fertilised would continue to exist, he made it clear to all who apprehend and receive the principle that a series of plants propagated by buds only must have a weaker hold of life than a series reproduced by seeds; for the former is the closest possible kind of close breeding. Upon this ground such varieties may be expected ultimately to die out; but 'the mills of the gods grind so exceedingly slow,' that we cannot say that any particular grist has been actually ground out under human observation.

"If it be asked how the asserted principle is proved or made probable, we can here merely say that the 'proof' is wholly inferential. But the inference is drawn from such a vast array of facts that it is well nigh irresistible. It is the legitimate explanation of those arrangements in Nature to secure cross-fertilisation in the species, either constantly or occasionally, which are so general, so varied and diverse, and we may add so exquisite and wonderful, that, once propounded, we see that it must be true. What else, indeed, is the meaning and use of sexual reproduction? Not simply increase in numbers; for that is otherwise effectually provided for by budding propagation in plants and many of the lower animals. There are plants, indeed, of the lower sort, in which the whole multiplication takes place in this way, and with great rapidity. These also have sexual repro-

duction; but in it two old individuals are always destroyed to make a single new one! Here propagation diminishes the number of individuals 50 per cent. Who can suppose that such a process as this, and that all the exquisite arrangements for cross-fertilisation in hermaphrodite plants, do not subserve some most important purpose? How and why the union of two organisms, or generally of two very minute portions of them, should reinforce vitally, we do not know and can hardly conjecture. But this must be the meaning of sexual reproduction.

"The conclusion of the matter from the scientific point of view is, that sexually propagated varieties or races, although liable to disappear through change, need not be expected to wear out, and there is no proof that they do. It is not necessary to insist, however, though not liable to change, may theoretically be expected to wear out, but to be a very long time about it."

— On the opposite page we present our readers with an illustration (fig. 3) of the interior of a glass corridor in the gardens of the Duke of WESTMINSTER, at Eaton Hall, near Chester, and which was prepared from a photograph kindly supplied to us by his Grace's head gardener, Mr. SELWOOD. The corridor is 385 feet long, 10 feet wide, and 18 feet high (from floor to apex). The back wall is planted principally with Camellias, the roof being festooned with *Rhynchospermum*, *Lagerflora* (alba and rosea), *Clematis*, *IGNONIA*, *Mandevilla*, *Lonicera*, *Cocoba*, *Tropaeolum*, *Saxifraga*, &c. &c. The temperature, and at present contains an attractive display of such flowers as *Eranthemum pulchellum*, *Justicia* of sorts, *Poinsettias*, *Thysanacthus*, *Epiphyllum*, *Salvia* of sorts, *Lobelia*, *Tree Carnations*, *Primulas*, *Cytisus*, *Camellias*, &c. We shall shortly publish another striking view of a plant-house in this princely establishment.

We wish every success to the efforts now being made to extend that admirable institution, the EDINBURGH BOTANIC GARDEN, into a training school for botanists and horticulturists it has retained immense services, and nothing but increased space and augmented means are required to make it even more useful to botanists, gardeners, and specially foresters. From a document before us we learn that the Botanic Garden of Edinburgh was founded in 1570 by Sir ANDREW BALFOUR and Sir ROBERT SIBBALD, and was at first specially devoted to the cultivation of medicinal plants in connection with the School of Medicine. The first site was in the vicinity of Trinity College Hospital. The Garden was afterwards transferred to Leith Walk, and in 1820 to its present locality in Inverleith Row. The ground at present occupied by the garden embraces 27 acres, and contains a series of hothouses and conservatories, a large Palm-house, and an extensive collection of herbaceous plants, shrubs, and trees, all arranged for the purposes of study. The number of students who attend the garden is very great. The class for the last three years has consisted of upwards of 200 students (in 1874, 354). The lectures given in the class-room of the garden are illustrated by numerous specimens. The number of these specimens required last summer amounted to 86,000. On one day, when there was a competitive examination as well as a lecture and demonstrations, the cut specimens supplied numbered 7000. The School of Design at the Royal Institution is also provided with flowers from the garden. In order to supply these demands, and also to ensure practical work for students, much greater space is required than is at present available, both as regards garden and class-room accommodation. The shrubs and trees have encroached so much on the ground necessary for the herbaceous plants, that not only is the supply of the latter limited, but the plants themselves are injured by shade. The arboretum (even in its present young state) is now so crowded, that it is absolutely necessary, for the sake of the trees as well as for the benefit of students of botany and arboriculturists, that additional ground should be acquired. An opportunity of thus improving the garden is now afforded. At present Inverleith Grounds, which adjoin the Botanic Garden on the west side, are unoccupied by buildings, and the Fettes Trustees, to whom they belong, are willing to give them to Government at a fair valuation. The sum asked is a few £35 per acre. There are 20 acres which could easily be made available, and could therefore be secured for £700 per annum, or the fee might be redeemed by purchase.

An opportunity of enlarging the garden, and of supplying the want of an arboretum, is thus presented, of which advantage should certainly be taken. It will be a serious matter if the adjoining grounds are feued for building purposes, as thereby the amenity of the garden will be much impaired and the vegetation injured by the smoke from the houses. It should also be taken into consideration, that in the present park are cut down a number of trees, the effect will be produced on the garden by the removal of the excellent protection against the westerly gales which is afforded by them. If the present opportunity is lost, it is doubtful if the Government will ever have it in their power to purchase the ground, as it will in all proba-

FIG. 3.—GLASS CORRIDOR IN THE GARDENS OF HIS GRACE THE DUKE OF WESTMINSTER, EATON HALL.

bility be occupied ere long by buildings. This might ultimately involve the expenditure of a much larger sum, by necessitating the removal of the garden to another site. We earnestly hope that the Government will seize the opportunity now afforded them, and if they would, as they might, make provision for practical instruction in the physics and physiology of vegetation, as well as in the practical departments of horticulture and tree culture, the University of Edinburgh would become as famous for its school of horticulture and forestry as it now is for its departments of medicine and botany.

— We have received, through the kindness of Professor WESTWOOD, the following communication relating to THE PHYLLOXERA, from the pen of Professor FOREL, of the Academy of Lausanne:—

"I have been so fortunate lately as to make an observation of considerable importance relating to the Phylloxera. This insect, which was discovered by you in 1863 in some vineries near London, has lately made its appearance among some Vines in the County of Franche, in the Canton of Geneva. On inquiry, I found that the Vines were first attacked in 1870. On making inquiries in the neighbourhood, I ascertained that Baron ROTHSCHILD had planted in his vineries Vines received from England; and quite lately I have ascertained that the Phylloxera is present in the vines imported in 1869, at such a distance one from the other that the insect could not of itself pass from one to the other; I concluded that the Phylloxera was introduced in 1866 from the English vineries. Upon one point alone I am in doubt—the plants attacked by the Phylloxera in the houses of M. DE ROTHSCHILD are decidedly weaker than the others, but they are far from being in a dying condition; they have resisted the disease much better than other Vines cultivated in the open air, and which I suppose to have been attacked afterwards. Whence does this relative immunity arise? Is it to be attributed to the particular varieties, Black Hamburg, Muscat, and Alicante? Can it be due to the abundant manure placed at the foot of each Vine? Can it be owing to the system of cultivation in vineries? It is in order to arrive at a conclusion upon these points, that I have undertaken to restrict myself to you, and to ask if in the vineries of England the plants attacked by the Phylloxera can resist its evil effects as those of M. DE ROTHSCHILD have done.

— We have received further communications from Mr. GOODACRE and "W. S.," and from Messrs. COPELAND & DORAN, Streteford, with reference to the judging at the late show at the Pomona Palace, Manchester, but which, as the subject is of but little interest to our readers generally, we cannot insert in full. Mr. GOODACRE denies Mr. POTTS' statement that there was an exhibition from Ireland, or that there were West's St. Peter's Grapes in his collection, that variety not being grown at Watlington. He writes—"The Vines were not damaged in any way; and, if the judges had doubted their weight, they should have examined them, and also have tested the quality of the other fruits." "W. S." says—"After the judges' remarks in your last issue it is too late to say nothing was good enough to win. Black Hamburgs even as good as at midsummer, and no medal! And were not the other varieties as well represented? It is a fact that the plant judges had the power and did award two medals. My own notes—sent wide from those of Mr. POTTS respecting the Elvaston collection, except in one particular—namely, the crown of one of the Pines being deformed—but what of that? Surely some of the foreign Pines would also have been much improved by recropping had such an act been legal in the British Isles." Messrs. COPELAND & DORAN claim that they were the exhibitors of the six splendid Black Jamaica Pines, averaging 4 lb. each, to which our correspondent, "W. S.," alludes, and which were judged by Mr. SMITH and his colleague Mr. POTTS to be inferior to six foreign Cayennes, worth in the market about 10s. each, and they cannot understand how Mr. SMITH reconciles his practice in this instance with the theory of judging which he professes.

— The Secretary of the Royal Horticultural Society informs us that the dates selected for holding the five evening meetings of the Fellows and others interested in horticulture, at which papers will be read by speakers of acknowledged reputation in the scientific world, and discussion invited on details of the science, are as follows:—January 13 and 27; February 3 and 24; and March 10, at 8 p.m.

— We are informed that Mr. WM. PAUL'S great show of Roses in pots, potted trees, Pelargoniums, &c., will this year be held in the Royal Botanic Society's Gardens, Regent's Park, from May 3 to 10, inclusive.

— The present spell of sharp wintry weather serves to call attention to the necessity that exists for protecting the tender kinds of EARLY WINTER BROCCOLI from the effects of frost. Sometimes whole plantations become irremediably injured through exposure; and the probability that we may have a prolonged and unusually severe winter points to the necessity that exists for mitigating its effects as much as possible. Some gardeners pull up their Broccoli

by the roots as soon as they turn-in ready for use, and remove them to an airy shed, and suspend them from the roof till wanted. By doing this means they are preserved from injury from frost, or from rotting through exposure to heavy and continuous rains; and they remain in a good state of preservation for eight or ten weeks, and are then fit for table use. This appears to be preferable to, and at the same time safer than, the old plan of lifting these plants and laying them in, in a slanting direction, with their heads towards the north.

— A very good plan for obtaining EARLY FORCED ASPARAGUS is adopted by Mr. J. TEGG, the gardener at Bearwood, near Reading, which, though neither original nor strictly novel, yet serves to show how this much-esteemed vegetable can be had unusually early in the season. In the month of October Mr. TEGG forms in his early vineries a deep bed, fenced with ordinary Hazel or Ash hurdles, and within this is placed, to a considerable depth, a bed of fermenting material, such as leaves and dung, in about equal proportions on the bed, surfaced over with rotten dung, and in this are placed good roots, planted so thickly as that one overlaps the other, and rich old soil is worked in well among the fibres. A bottom-heat of from 50° to 55° is sufficient; but in order to insure high-flavoured and coloured Asparagus, it is necessary that the temperature of the air be lowered as much as can be afforded soon as the fibres break through the soil. Three inches of soil, or thereabouts, is sufficient to produce Asparagus of a nice green colour; but if white is preferred, that is, well bleached, the soil must be increased to 8 or 9 inches in depth, and light and air excluded from contact with it as much as possible.

— Among the many ill-fated passengers who, it is believed, perished by the burning of the ship *Cosack* recently, in the region of the Cape of Good Hope, was Mr. C. M. BENTON, for some years gardener to J. O. BACCHUS, Esq., of Leamington, and well known as an exhibitor of stove and greenhouse plants, Ferns, &c., at the various horticultural exhibitions held in that district. At the Midland Counties Exhibition, held at the Lower Grounds, Aston, in July last, Mr. MARSH exhibited in several classes, and materially assisted the display made on that occasion. In company with his wife, who is supposed to have perished with him, he was on his way to New Zealand, to fill a capacity as farm bailiff.

— Mr. GEORGE THOMSON, whose general management of the pleasure-grounds at the Crystal Palace has given such great satisfaction, and whose bedding-out last summer gained almost universal commendation, has, we are pleased to hear, succeeded to the management of both the indoor and out-door departments of that establishment.

— The December number of the *American Agriculturist* contains a view of the HORTICULTURAL HALL in process of erection at Philadelphia, in connection with the International Exhibition to be held in that city in 1876. The Horticultural Hall is one of five buildings respectively entitled the Industrial Hall, the Machinery Hall, the Agricultural Hall, and the Art Gallery. The Horticultural Hall is a handsome structure of glass and iron, 370 feet in length by 160 feet in width, giving an area of a quarter of an acre. The main central portion is to be arranged as a conservatory, while at the sides and ends will be placed hot and greenhouses, dining-rooms, &c. A Victoria-house, orchard-houses, vineries, &c., will also be in juxtaposition. The surrounding grounds will be planted as an ornamental pleasure-ground, wherein representative American forest and fruit trees will be planted. The arrangements are entrusted by the Centennial Commission to a National Horticultural Society organised for the express purpose.

— A new part of the *Journal of the Royal Horticultural Society* has just been issued. It contains a classified list of the Passifloraceae grown in European gardens, by Dr. MASTERS, with illustrations; an article on the Hollyhock mildew, by Mr. BERELEY; and on a pink sport of Gloire de Dijon Rose, by Dr. MASTERS. There is also a paper on pollen-eating flies, by Mr. BENNETT. Then follow reports of the Chiswick Board of Directors, including an account of the results of the trials of bedding Pansies, bedding Pelargoniums. Mr. A. F. BARRON contributes a valuable report on the varieties of broad Beans and Potatoes grown for trial in the garden, and an interesting paper on the crosses raised between the Black Monukka and the Black Hamburg Grape, the object being to obtain a Grape which should be as nearly seedless as the Monukka with the flavour of the Hamburg. Fifteen varieties have been thus raised and fruited, all having more the character of the male or pollen-parent (the Monukka), than of the Hamburg, as far as foliage goes. As to the fruits great differences exist: eight have white berries, six have long or ovate berries, and seven have round fruits, part of each being black and part white.

Three are very early, and two are very late, and, with one exception, they are all small. Two of them have small berries, resembling the female parent (Hamburg), with the leaves of the Monukka. One resembles the Monukka in the shape and appearance of the berries, but it is a coarse late Grape. Two of them have proved seedless, like the Black Monukka; but the berries are round, and the one white, the other black. Practically, we learn, the results are in their present stage useless. We hope, however, these experiments will be continued and extended. The great and sudden variability developed by a first cross is a familiar phenomenon to hybridists, and so far from being looked on as discouraging, should be considered as a sign of promise and a harbinger of ultimate success. We greatly regret that circumstances prevent the more frequent publication of the *Journal*, the contents of which are of a valuable character. The trial reports and records of experiments at Chiswick are especially valuable, inasmuch as they can hardly be published elsewhere.

— A new horticultural establishment has been founded at Pallanza, Lago Maggiore, by the Marquis FEDERICO DELLA VALLE DI CASANOVA, in conjunction with M. LINDEN. The title of the establishment in question is "Succursale dello Stabilimento d'Introduzione e d'Orticoltura di J. LINDEN." It will be seen that the nursery over which the Marquis CASANOVA presides is a branch of M. LINDEN'S establishment at Ghent, and is destined for the more ready introduction into Italy and Southern Europe of the novelties imported by M. LINDEN, and also for trials of hardihood and so-called acclimatisation.

— According to the *Illustration Horticole*, the first seedling Wellingtonias (*Sequoia gigantea*) raised from seed ripened in Europe have been grown by M. THIL, near Eprenon.

— A new species of Willow, called by Dr. SYME SALIX SADLERI, was discovered in August, 1874, by the gentleman whose name it bears, during an excursion of the Scottish Alpine Botanical Club to Glen Callater, Aberdeenshire. In habit the plant is like *S. reticulata*, but the leaves differ in shape and texture from those of that species, the under side not being hoary. In the same neighbourhood Mr. SADLER was so fortunate as to find *Carex frigida* of ALLIONI in abundance, plants of which are now growing in the Edinburgh Botanic Garden. Figures and descriptions of these interesting additions to our native flora will be found in a forthcoming number of the *Transactions of the Edinburgh Botanical Society*.

— We see that some of our Belgian friends are welcoming the idea of a horticultural club as a desirable meeting-place for foreign horticulturists on their visits to London.

— We learn from a Belgian correspondent that the King of the Belgians is about to erect a vast circular conservatory in his park at Laeken, from the designs of M. BALAT.

— We have received from Mr. CORDEROY, of Didcot, some specimens of MISLETO parasitic on itself. The young seedlings have, in fact, attached themselves to the parent branches just in the same way that they usually do to branches of the Lime or other tree. Mr. CORDEROY mentions also a variegated form, produced as a sport, and alludes to other variations in habit, similar to those which have been described in our pages at different times, and especially in 1873, at p. 1703, fig. 340.

— We find from the *Cultivador*, a publication devoted to horticulture and agriculture in the Azores, that the number of Pines exported during the month of October from the Azores was 664, of which 323 were despatched to Bristol, 219 to London, 99 to Hull, and only 23 to Lisbon, though the Azores are a Portuguese possession.

— According to the *Belgique Horticole*, the King of ITALY has conferred the honour of Commander of the Order of the Crown of Italy on MM. LINDEN and RONNBERG, and that of Chevalier on MM. BERNARD, DALLIERE, KEGELJAN, and MORREN. The immediate occasion of these honours was the International Horticultural Exhibition at Florence.

— M. DENIS, of Lyon, according to the *Revue Horticole*, has devised a plan of destroying the Phylloxera, and which he deems a good one. In the winter, when there are no herbaceous shoots, the base of the stem is laid bare to a depth of 10 to 12 inches, and boiling water, mixed with a small proportion of tobacco juice, poured into the hole round the stock. Farm-yard manure, or by preference sheep's dung, is then added, and the hole filled up with soil.

— The methods adopted to prevent injury from spring FROST to the young VINES in France are protected by means of laths supported on posts, forming a sort of roof. This plan is partially adopted in the Burgundy and Côte d'Or districts, but is costly and of

only partial efficacy. In other cases the whole Vine is covered up with netting, a more effectual but a costly process. Straw mats, in the form of extinguishers, are also used with advantage, as they are inexpensive and readily made, and serve as protectors against hail as well as frost. Dense fumes from the burning of gas tar are also made use of as a preservative, but as the direction of the wind may change, removal of the brasiers becomes necessary—to troublesome an operation to render this plan a desirable one to follow. Other preservative means are the burying of the rods, as mentioned previously.

— We have received from Mr. CARRUTHERS a communication in reply to Professor DYER'S observations in our last number, and in which Mr. CARRUTHERS maintains the validity of his position and the correctness of his views, and contravenes those of Professor DYER, especially on points connected with the history of the POTATO DISEASE. On the main point at issue both controversialists are substantially agreed, viz., that it is to Mr. BERKELEY that we in this country are virtually the most indebted for what we know of the Potato fungus. Because there were strong men before him, it does not follow that we should ignore AGAMENNON himself. The further continuance of the controversy in its present lines would, we believe, be productive of more harm than good, and would, we are sure, be distasteful to our readers. We must therefore decline to insert any further correspondence on the subject.

— MM. NARDY & Co. have established at Salvador, near Hyères, a nursery, which, from the reputation of its founder and its climatic advantages, will probably prove of importance in the introduction of new plants. MM. NARDY liberally offer to botanists, directors of botanic gardens, horticultural societies, and the like, the opportunity of using their grounds as trial grounds for testing the hardiness and applicability of new plants, and promise to report progress regularly to those interested.

Home Correspondence.

Jerusalem Artichokes on Heavy Land.—These are poor the first year after planting, but the second year they furnish good, large, fine-flavoured tubers. This excellent tuber seems to be increasing in demand in families, and in cold heavy-soil districts a difficulty arises in keeping up a supply, and hence it is a decided advantage to let the tubers remain in the ground the first winter after planting, well protecting the surface with stable dung, which may be taken off in spring partly, and the rest allowed to rot and feed the tubers if the ground is poor. Invariably this tuber is planted in any out-of-the-way place, sometimes acting as a screen to an unsightly object, which is all very well, provided the soil is good; but when grown on the same spot for some years it dwindles away, and scarcely produces any tubers at all. They should be planted on a trenched line of ground, and allowed plenty of room between them—2 to 3 feet. Where they are wanted to any extent, and especially when, with good cooking, they are considered *recherché*, they should have quite as much care and culture bestowed on them as Potatoes. Although they are far from being as mealy as some Potatoes, they are nevertheless as good, and quite as easily swallowed, and do not require any more water on the table for assistance than does the Turnip—which reminds me of a joke. A friend asking a merchant whether the Potatos she was buying were mealy, replied: "Be sure and have plenty of water on the table, or 'ye'll all be choked on eating 'em." Of course the Artichoke requires no such assistance, any more than the Turnip. *H. K. F.*

Gardeners' Portraits.—Since you commenced the series of portraits of British gardeners, it has occurred to me that in several instances the accompanying account of their lives and career has been far too short. The lives of many gardeners are full of anecdote. I think it would add greatly to the interest of your portrait gallery if you were a little more exacting in requiring a more detailed account of the career of each individual. The lot of a gardener is peculiar and entirely different from that of most other men; our lives are devoted entirely to producing luxuries, other people's lives are devoted to making money. Had I brought to bear the same amount of assiduity and perseverance which I have found necessary as a gardener on any other trade or profession,

the chances are that to-day, instead of only being a working or serving gardener, I might have been a *millionaire*, employing gardeners having far greater abilities and much more general information than myself. In the solitude of our lives we devote ourselves during the long evenings to study of all sorts, whereas in towns most men of business spend their time on the surface of gay society. No doubt by-and-by you will publish a book of our lives, which will be very interesting. *One of the Craft.*

Conifers for Chalk Land.—I am at this time trenching ground for planting Conifers, and as the soil is of a very chalky nature and much exposed to the west winds, I shall feel greatly obliged if some of your numerous correspondents would kindly give their experience as to what sorts are best adapted to give general satisfaction in such a situation. I am anxious to plant only such varieties as are likely to thrive and do well. I find *Pinus insignis*, *Pinus Cembra*, *Abies Douglasii*, and *Picea lasiocarpa*, positively refuse to grow on the chalk. *Pinus austriaca*, as a rule, thrives well in exposed situations: will it do equally well on chalk? *F. V. Holwell.*

A Few Good Vegetables.—Here are a few vegetables which ought to find a place in every garden. They are the kinds which I mainly depend on for a supply, having proved them more satisfactory than others. Of Kidney Beans for out-of-doors I prefer Negro Long-podded; it is early, prolific, and produces Beans throughout the season. In the past season, with the aid of one thorough watering and the old leaves trimmed off, the early lot kept on bearing till October, when they were destroyed to make room for another crop. An excellent vegetable, seldom seen, is the Cottage's Kale; in the sprouts which form on the stem after the heads are cut off are superior to anything else amongst Kales in February and March. Amongst Cabbages, Wheeler's Imperial is a grand sort for spring use; it requires sowing later than others: in an open season, like last, seed sown in June will produce heads from November on to Christmas. Little Pixie is a very "good thing"—it may be planted as thick as Coleworts. Enfield Market should be grown to succeed Imperial. Of Carrots for general crop we like James' Intermediate Scarlet. Amongst lettuces, Sandwich is the best. White and Major Clark's Solid Red will give satisfaction. Of Lettuces we confine ourselves to few sorts—All the Year Round and Neapolitan, both grand Cabbage Lettuces and thoroughly reliable, as are also the two following Cos—Hick's Hardy White and Paris White. I have grown Alexandra White Cos two seasons, but could see no distinction betwixt it and the last-named. Hick's Hardy is admirably adapted for autumn sowing; Hardy White Dutch Cabbage is a worthy competitor to L. James' Keeping and Brown Globe are the most servicable Onions. I tried the Queen last season, but got very little of it to germinate—it will be a good thing, sown early, to come in after the late kept Onions are past. French Breakfast Radish is a very mild-flavoured and excellent sort. Veitch's Red Globe Turnip is a very superior sort, large, tender fleshed, and stands well. Myatt's Prolific Ashleaf and Veitch's Improved Early Ashleaf Potatoes are both excellent sorts, and very suitable for small gardens; Myatt's is more so. I have had no experience as to the other, but the tubers grow close together, and small tubers are generally conspicuous by its absence. Coldstream Early is an old and fine round sort. Amongst Cucumbers I like the true Telegraph best. Pearson's Long Gun is a very handsome and prolific summer variety, which will most likely be supplanted by Tender and True, if it comes true from seed. This fine variety is merely Telegraph in a very enlarged form, and it is not possible to say more in its favour. Tomatoes of some kind have been long a position since ever it was sent out; it is about as ugly a fruit as can be conceived, and yet it has very often been placed before better sorts at provincial shows. Tomatoes have had a fine addition in Hathaway's Excelcior, which is incomparably the best variety I have had to do with, the skin being smooth, very thin, and without corrugations; it is also superior in flavour to other sorts. When well grown the fruit attains a larger size than Earley's Defiance and Orangefield Dwarf, and if there be any difference in point of earliness between it and these varieties it is very slight indeed. Trophy, though producing very large fruit, is not really worth growing, being very thick-skinned, and in flavour very inferior. What difference is there between this sort and Hepper's Goliath? A variety named Munn's Seedling, very like Excelcior, was exhibited in a collection of vegetables at the 1873 Chrysanthemum show at South Kensington. Is Munn's Seedling in the trade? Peas are like Potatos, in that there is much difference of opinion concerning them. I note the following as being suitable for small gardens—Little Gem, Ringleader, G. F. Wilson, Veitch's Perfection, and Maclean's Premier. These are all dwarf, prolific, and fine-flavoured sorts, with the pods filled as full as they will hold. As an instance of the mildness of the season up to the time the present cold weather set in, it may be interesting to state that Peas

were being picked in the south of Scotland in the second week of November. Pods were filled and fresh flowers developed up to the time the frost set in, but not in quantity sufficient to make up a dish. *K. P. E.*

Correa cardinalis.—This is a fine winter-flowering plant, worth a place in every collection where scarlet flowers are needed. It does best in a plant-out state, and although it is admitted a slow grower in a pot, in this way it grows freely, and makes long slender shoots a yard or more long, which at this season are laden with its long scarlet flowers, which come in very useful at times, and more especially now when flowers are scarcer than at any time of year. It is really a brilliant, commendable plant, worth attention. *H. K. F.*

Christmas Trees.—Can those whose trade it is to provide Christmas trees and other amusements for the young at our great annual festival, take an idea from Nature when she decks all vegetation in a mantle of silvery sheen? To all who saw the trees and hedges a few days since, when they were literally bedecked with the frosty crystals, the thought must have been present that it was surpassingly beautiful. Probably since that severe hoar-frost of Christmas Eve, 1860, there has not been seen such a wondrous Christmas tree, some lofty fellow lifted his head singly against the misty sky, thus rendering up its beauties to the utmost. Beautiful as were the evergreens under the frost, Deodars, Wellingtonias, and the varied forms of the *Pinus* tribe, none equalled in beauty the fine-sprayed deciduous trees; and in these latter refuse during the winter to lend the charm of leafiness, they at least amply compensate in special beauty on such an occasion as this hoar frost. What I would suggest is this: cannot our confectioners or toy merchants offer to our children at the Christmas festival, instead of a tree, one to be coated or silvered over with some substance that shall make them exact copies of the tree in a state of Nature, as seen so recently. This would be something at once novel and striking, and yet not unnatural, seeing that, according to our common notions of Christmas weather as it ought to be—notions that have received a rude support during the past fortnight—vegetation should be either covered with hoar-frost, or be laden with the weightier snow. Some lofty fellow lifted his head singly against the frosty light, sparkling and reflecting all the rays that gas and fire emitted!—how pleasing, too, would be then the contrast of coloured toys, *bonbons*, and the thousand and one little nick-nacks that make up the dressing of a Christmas tree. The whole would create a sensation for the young not easily forgotten. Such deciduous trees as would be needed for this purpose could be easily obtained at our nurseries; and, indeed, if it became a special branch of trade, without doubt special means would be taken to produce trees suited for the purpose. *A. D.*

Rivina humilis.—We have had various opinions as to the most suitable plants for decorative purposes, but few, if any, I think, can come up to the old but lovely *Rivina humilis* when well done. In a hurried visit to the gardens at Colwich Abbey some short time since, I saw a half span-rooted stove, 30 feet by 10 feet, in which plants principally for decorative purposes were grown, but excelling all others was the *Rivina humilis*, plants from 6 inches to 2 feet high, and all laden with the brilliant drooping racemes of scarlet berries—such a sight is rarely met with at this dull season of the year. Such plants cannot be too extensively grown for decorative purposes. If Mr. Bradshaw, the intelligent gardener, would kindly give us, through the pages of the *Gardeners' Chronicle*, his mode of treatment of such plants, it would interest many of your numerous readers. *E. Gilman, Woolton Gardens.*

Fruiting of *Stephanotis floribunda*.—I observe your correspondent's, Mr. Harry Hepburn, article in last Saturday's *Gardeners' Chronicle* requesting information regarding the fruiting of the above creeper, which he supposes to be uncommon. I beg to inform him that we have fruited it either five or six times, and have raised a quantity of young plants on two different occasions from seed of our own ripening. We had on one season three pods on one plant, two of them being on the same stem. We have a fruit at the present time on a plant, which has been growing there for upwards of twelve months, and is only just showing signs of changing to ripeness. The others, which we have fruited, were on plants, were on the plants about the same time. The pod we now have is about 4 inches long by 2 inches in width. I attri-

butted to the fact that the plants were on the same soil, and that the weather was equally favourable to all of them.

bute our success in seed-bearing to the plants being kept in a cool airy situation while in flower. *John Webster, Gosden Castle.*

—Would some of the correspondents of the *Gardeners' Chronicle*, who have lately mentioned that they have been fortunate enough to fruit specimens of the *Stephanotis floribunda*, be obliging enough to spare one specimen for modelling? Fac-simile models were taken of the outside, and also of the internal arrangement of the fruit, for the museum at Kew, from the specimen lately mentioned as exhibited by the Horticultural Society in the *Gardeners' Chronicle*, but this would not afford more perfect results; and another model is much desired for scientific purposes. If any of the correspondents who might be kindly disposed to spare a fruit, would mention it to "O," in the *Gardeners' Chronicle*, the direction and the carriage for the parcel would be gratefully forwarded at once. O.

Lineikin Heating.—Mr. John Cowan is not quite correct in stating that the system of lineikin heating used by him has nothing in common with that originally invented by me, for, his, like mine, consists of a boiler heated by a lineikin. They differ strikingly indeed in detail, but Mr. Cowan's "improvements" may probably in time make them less unlike. He also errs with regard to the chimney. I never stated anywhere that I did not use one, and in point of fact I had one attached to my first kiln years before his "invention" was patented. *Alex. Colles, Mill Mount, Kilkenny.*

The Gardeners' Royal Benevolent Institution.—It gave me great pleasure to read the earnest appeal of Mr. Fish on behalf of the widow of Mr. John Scobie. While the gardener at Holland House I was employed there as journeyman, and experienced many acts of kindness from him. I now feel glad to be able to give a helping hand to his widow, and I beg most earnestly to second Mr. Fish's appeal, and trust that those who knew Mr. Scobie, and are subscribers to the *Gardeners' Benevolent Institution*, will give their votes in favour of the widow, and so assist in placing her above actual want. *H. Beasley, Ecton, Northampton.*

The Severity of the Weather.—Those who have deferred transplanting evergreens will have reason to congratulate themselves, as we are now getting very severe weather, the thermometer having registered 17° of frost on the morning of the 24th, 25° on the 28th, and 20° on the 29th. This part of England has not been visited by such severe frosts since the winter of 1860-61, when the glass went down to zero. The winter of that year will be remembered as a very fatal one for many kinds of evergreens. *Enonymus*, *Laurentinus*, *Sweet Bays*, and even common *Laurel*, were then killed to the ground. At that time the frosts were accompanied by that pernicious blast—a cutting north-easter—that dried everything to the core. Fortunately for vegetation just now, the air is very still; and plenty of snow having fallen previous to the frost, everything is well protected. This is now a most valuable season, as most things continued growing very late this season, owing to the soaking rains and splendid weather that prevailed in the autumn after such a dry summer. The barometer is still rising, with every appearance of a continuance of sharp weather. Every berry-bearing plant will soon be stripped, as thousands of fieldfairs have made their appearance, clearing all before them. I do not remember ever seeing them in such numbers before, and their appearance now points to very severe weather in Norway. *F. Sheppard, Woolverstone.*

New Roses.—I too, like your correspondent, "Old Subscriber," have grown *Cheshunt Hybrid*, and, strange to say, my experience is totally different from his, for almost every shoot had a bloom on it. I may mention when I was at the *Cheshunt Nurseries* last summer I saw it in all conditions—standards, half standards, dwarf, and on its own roots, and in every case it was covered with bloom. I consider it to be a very attractive and useful Rose. My opinion of *Madame Lacharme* is better than that of your correspondent, and indeed of most *Rose-growers*, and I should say wait for another season, and see what it is on cut-back plants. *Perle de Lyon* I have not grown, but, as I am told, it was at the *Cheshunt Nurseries*. *Geo. Paul* sent me the other day a nice bloom and bud of *Cheshunt Hybrid*, taken from two plants plunged out-of-doors up to a day or two before the frost. Eds.]

The Paraffin Lamp.—In your issue of November 7, last, "W. H. T.," states that he can carry coloured *Pelargoniums* through the winter by merely burning a small paraffin lamp. I should like to see what "W. H. T." has to state now that we have had a continued frost, with the thermometer registering 20° within the last few days: how are the *Tricolors* looking now? Perhaps some other correspondent who has tried, or is now trying the system, will be able to throw some light on this subject. *F. F.*

Flower Shows.—Mr. Shuttleworth's letter of December 26, which I suppose he intended as a reply to mine of the 19th, though it entirely fails in being so, requires a few remarks from me. The question at issue is not whether I or he is "immaculate." But he believes it to be wrong for persons to wait until others have staged their plants, so that they may see what best to do, and, if necessary, to put more than one plant in a pot; he believes also that the judges are inefficient, and is of opinion that because a man has not grown *Ferns* he knows nothing about them. Mr. Shuttleworth's opinions are—I am willing to admit, and he says so, he is not doing so yourself. To this I reply that he did so at Bath, 1873, and at Kensington, 1874. 2. It is objectionable to put more than one plant in a pot. This he did at Bath, 1873. 3. That the judges are inefficient, and a man who has not grown *Ferns* is incapable of telling a good lot from an inferior one. I am of opinion that the judges are selected with care, and from a large class of proved men. Why should not a man who has paid most of his time growing *Heaths*, *Azaleas*, and *Berberis*, and has also a well-grown *Fern* from a bad one? The question with a judge is, not which is the rarest or newest, but which is the handsomest, best grown, and best adapted for general cultivation. These are the objects which horticultural societies have in view when offering the prizes, and I doubt if there are any gardeners (properly so called) that have had *Ferns* to grow, who have not found them the easiest things they had to manage. I was not aware of Mr. Shuttleworth's great triumph over my competitor, Mr. Croucher, at Mr. Bull's, but always thought it was his purse that beat me, not his cultivation. Before my first purchase for the purpose I had three of the plants; in February, 1873, I bought sixteen plants for £36 10s. The price will tell their size. I grew these on, and selected from them for Kensington, and at Bath showed some of the others. Having nineteen at first I do not see why I needed fortying at Bath. Now I have grounds for suspecting that Mr. Shuttleworth gave more than that for one of his plants, and doubtless for the remainder. This I do not complain about, he was quite at liberty to do so only if it detracts from the triumph. When speaking to my employer about purchasing the plants, he left me at liberty to spend what I chose; but I said if I couldn't get the cup by buying small plants and growing on I would go without. I am not aware that I attacked the judges at Bath the moment the card was on, for I was not in the tent at the time, nor that I got a "severe reprimand" from Mr. Parker. I spoke to him about it when I went into the tent, and he, being annoyed, retorted, but said nothing that affected me. The other judges I did not know, nor do I to this day—though even if I had given note to words which on reflection I should not have done, through being "shocked and scandalised," Mr. Shuttleworth has felt the same, and might excuse it in a younger man. Mr. Shuttleworth then says, "this is the man who is tolerated as a judge," but he does not give a single reason why I should not rate as high as he in the matter, he says I am "immaculate"; surely these are the kind of men we want as judges, though I don't lay claim to the title. Mr. Shuttleworth in his first letter writes of "favouritism, tricks, dishonesty, and ignorant judging." Now these are serious charges, and if founded on fact will bear publishing, and if not they ought not to have been made. *F. Croucher, Sulbury House, Dec. 26, 1874.*

—If you will turn to your issue of June 14 last, you will find at p. 816 a short letter from me. I wrote it in consequence of your reporter having stated, in his account of the show held the previous week at Kensington, that some of my cup plants were staged in my name, the inference being, of course, that they were not really my own. Now, that report was written, after his defeat, by Mr. Croucher—[Mr. Croucher was not the writer of the remarks in question. Eds.]—so he informed my own servant when they met at Bath; and he added that I had no occasion to have written my letter to you above mentioned, though how you honorarily might allow publication of such gross dishonesty to rest upon me uncontradicted for a moment I confess I cannot see. I certainly could not, *T. M. Shuttleworth, F.R.H.S., Hovick House, Preston, Dec. 29, 1874.* [Will Mr. Shuttleworth say how long the identical plants shown by him for Mr. Bull's cup at the June exhibition last year, had been in his possession previous to the day of competition? Eds.]

The Boston Squash.—At a season of the year when the common dishes of vegetables on our tables, exclusive of the universal *Potato*, are a constant variation between varieties of the *Cabbage* tribe and *Turnips*, it is a relief to turn to anything that offers at once variety and a most pleasant dish. This is found in the *Boston Squash*—one of the large round American kinds that has been largely grown in this country, but still not nearly so extensively as it deserves. This *Squash* is distinguished by its tall, erect leaf-stalks, upright cup-shaped leaves, and long robust stems. The fruits are *Apple-shaped*; skin greenish-yellow, much

netted; flesh deep golden-yellow, and when cooked, of a sweet marrow texture, and devoid of that stringiness so common to the *White Marrow*. Apart from its colour, which is of little moment when a good dish is in question, I think it to be by far the best of all summer-eating *Marrows*. But its real merits are most forcibly displayed in midwinter, when it is quite as nice as at any other time. If grown in good ground the fruit will come to a large size, and if these be gathered when about two-thirds ripe, just before the skin is firmly set, they are easily cut up, peeled, and cooked, and constitute a most acceptable dish, especially when, as during the past severe weather, other vegetables are scarce. A. D.

Charlotte Rothschild Pine-apple.—This is a free fruiter, and an excellent *Pine* in every way; but what I wish to call attention to is this—that it seems to start earlier into fruit at this season than any other variety. Starters at this season come in at the winning-post at a time when they are most wanted as a rule, *viz.*, May, and this is why I think we have in this *Pine-apple* an advantage over most other kinds. We have a quantity, that were potted in 10-inch pots in May this year, now putting forth their embryo fruit freely. My opinion is, that it will in time entirely outrun the *Queen Pine* for general supply; for, although it is a little stronger or longer in the leaf than her majesty, it has fewer leaves, and can be grown, consequently, quite as closely together. Moreover, as far as I can judge, it matures its fruit quite as soon, or sooner, than the *Smooth Cayenne* or *Black Jamaica*. *Henry Knight, Floors.*

The Origin of the Green Rose.—There appears to be some uncertainty in regard to the origin of this *Rose*. It is a sport from *Rosa indica* (the *China Rose* of England and *Daily Rose* of America). It was caught in Charleston, S.C., about 1833, and came to Baltimore through Mr. R. Halliday, from whom I obtained it, and presented two plants to my old friend, Theobald Rivers, Esq., of the *London Hort. Soc.* It was also found in Charleston and sent to Noisette, of Paris, and there founded the *Noisette family* of *Roses*. *R. Buist, Rosedale Nurseries, Philadelphia.*

London Jobbing Gardeners.—In looking through a recent number of the *Gardeners' Chronicle* I find that a notice is made of the *London Jobbing Fraternity*, and from many years' practice I can quite confirm all your contributor says. Now how to remedy this evil is rather a difficult point, and if you or any of the numerous readers of the *Gardeners' Chronicle* could show the way to get over the difficulty I am sure every one would be pleased, as at the present time men who know how to do their work decently are scarce. I really believe that one half of the so-called "gardeners" are men who, having at one time or another done two or three weeks' work in a garden when men were scarce, and who found they could "make" more at gardening (?), at once set up for themselves, to the great detriment of the men who know their business; and as no good workman will work under price, these self-styled "gardeners" get the largest share of the work, many of them at the present time charging as low as 3s. 6d. per day. I do not wish to praise myself, neither do I want to hurt or "run down" others, but had I a garden, and then employ this class of men I would pay them to keep away. I have generally two men at work for me, and men I can trust, but if extra help is wanted in the fall or spring I generally cannot get decent workmen, although I give 4s. per day. The men that are really wanted are those that have a fair knowledge of their work, are sober, and can at a pinch do a little in laying out; by saying a little, I mean that they can do the work under competent supervision. But the whole of the men who are gardeners (?) in the *London District*, I do not suppose that half of them can do so simple a job as Box planting, and the style of putting in tiles is simply hideous—not a true line anywhere; and as to being level—well, there is nothing to be compared to it. Now, at the same time there are scores of men who do their work well, and, as a consequence, never lack work; but, in proportion to the "duffers," their numbers are few. In the nurseries, too, great difference exists in their work, but as in all cases they are under good supervision, no very ordinary man is required long. I am not alluding to others than "jobbers." At present inside men don't trouble the public. I think, however, that the men should have 4s. per day, as 6d. per day and the profit from the plants supplied is certainly enough—a shilling a day from each man being certainly too much. From this cause I think the men object to station, and a nursery longer than that can procure a situation, and, consequently, both the customer and nurseryman lose in the end. Now, I really do not see anything to prevent the inhabitants of towns being as well served as those in the country who keep regular gardeners, if the mode of application were regularly carried out. A rise of wages is not desired, neither a reduction of the hours of labour; is the only requirement that I can see, is to get competent men

to do the work. We do not want the best men, men who have a staff of under-gardeners and labourers, but what we want is some of the under-gardeners (not boys) who can do their work. The only way I can see out of the difficulty is to form a union of gardeners—masters and journeymen, and admit only those men who can do their work in a manner to bear inspection. Let there be a council in each large town of masters and men, and one in each county—the town council to be composed solely of masters and “jobbers,” and the county councils of head and under gardeners, in equal numbers. By this means bad workmen (and those I mentioned in the first part of my letter are bad) would be weeded out, and people employing men would be better served. Many ways of trying the men will readily be suggested, one, for instance, would be by certificate from the chief of the garden where the man had been employed, and by other means. The chief rule to be borne in mind should, however, be that on no account should strikes be allowed, and while a small sum should be paid for entrance and annually, to pay expenses and assist others in their distress, and when illness, not one farthing should be paid as strike money, or where a man was discharged for misbehaviour or abusiveness. The advantage to be gained by dividing the country into counties is that in each county the same rate of wages would be kept up, without reference to any other county, and the masters and men being equal would protect each other's interests. The preceding is the best method that I can see to adopt, but at the same time some of my fellow-readers may be able to propose a better plan; and although I am aware that the malpractices of the many incompetent men referred to have cast a shade on the few competent men who do work as “jobbers,” and which causes the whole of us to be looked on with an eye of contempt, I do not see why the subject should not be aired a little. As you are doubtless aware, we cannot all be head gardeners, nor would it be advisable for us to be so; neither is it right that gentlemen who employ men to do garden work should be imposed on by a parcel of fellows who work most in the public house, and when outside spoil everything they lay hands on. And after drawing my letter out so long, I suppose I must cut it short, and subscribe myself, *A Hater of Imposition.*

Prize Gardens.—I fully concur with your correspondent as to the advisability of offering a prize for the best managed fruit and vegetable garden. Grapes are the luxury of the few, but the production of the outdoor fruits should by all means be encouraged, as contributing more to the common weal. How would this be compatible if vineries and fruit gardens were included in one prize? Is it a general rule that where the vineries are in a high state of cultivation, the same proportion of care is exercised on other parts of the garden? From some examples I have seen I should say the reverse. Where the difficulties in growing fine fruit the outdoor productions are little thought of. Would it not also cause some difficulty in the judging? Whereas, if there were a separate prize for each, one would feel sure that each was the best in its way. *E. O. M.*

Primula Parryi.—This Rocky Mountain Primrose, is, by the collectors, said to be one of the rarest and most beautiful of the alpine plants of those regions. The leaves are lanceolate, entire, and somewhat leathery, 6 to 10 inches long. The flowers are borne on stalks 9 to 12 inches high, and generally look one way (toward the north); they are large and handsome, varying in colour, some being of a deep magenta, whilst others are lilac-purple, and some lilac. It was introduced into our English gardens about five or six years ago by Mr. Thompson, of Ipswich, but, I believe, was soon lost again, until about two years ago, when it was reintroduced by Messrs. Backhouse & Son, of York, at a price of 2000 feet, although I need hardly say that it has flowered the last two summers. It proves not to be so difficult to manage as was supposed when it was first introduced. The plant in its native habitat is found by the sides of mountain streams tightly wedged between stones, its roots frequently penetrating down to the water. Now, if we take into consideration for a moment the condition of a plant growing in such a situation, it is quite obvious that the first essential under culture for the full development of the plant is moisture. As it is found, also, at such a great elevation, some 5000 to 8000 feet above the level of the sea, it will not only be the roots of the plant that will be constantly supplied with water, but at that elevation the atmosphere is so heavily charged with moisture that the whole plant, during its growing season, will always be moist. As an illustration of this I may mention that I have found *Hymenophyllum Wilsoni* on exposed rocks, on one of our mountains in the North of England, at an elevation of from 1000 to 2000 feet, although I need hardly say that this miniature is essentially a moisture-loving Fern, being generally found clinging to rocks near small waterfalls. If the above described conditions are imitated as far as circumstances will permit

in the culture of this Primrose, it will be found to grow freely. The soil most suitable is stiff loam, with an admixture of peaty bog, or well-decayed leaf-mould, compressed quite firm when the plant is placed in it. *R. P.*

Singular Sport upon a Grape Vine.—Will you kindly allow me to relate the following somewhat remarkable circumstance in connection with the Trebbiano and the Golden Champion Grapes? The Trebbiano is a well-known white variety, producing large handsome bunches, not remarkable for high flavour but exceedingly valuable as a late keeping sort; while the Golden Champion, on account of its fine appearance, great size of berry, as well as of bunch, and its by no means inferior quality when well grown, will no doubt for long be admittance into most choice collections. The fruit, however, seldom keeps well for any considerable time after it is ripe, consequently it is unadvisable to associate it with late keeping varieties, its great draw-

FIG. 4.
A, Stem of West's St. Peter Vine; b, Showing where it was grafted with Black Alicante; c, Showing height of front wall; d, e, The Black Alicante stem grafted at the point F with c, Trebbiano, H, Golden Champion (removed), and I, Mr. Pince's Black Muscat. x indicates the position on the Trebbiano rod where the bunch of Golden Champion was produced.

back being its unfortunate propensity to become spotted as soon as, or even before, it becomes quite ripe. It is not, however, of the merit or demerit of this remarkable fruit that I am about to write, but merely to narrate what appears to be a very remarkable circumstance in connection with it, which is as follows. Some twenty or more years since a house here was planted with the variety of Grape known as West's St. Peter, and some seven years afterwards several of these Vines were grafted with the Black Alicante and the Lady Downe's varieties, and some time after this one Vine was re-grafted with three distinct varieties, viz., Trebbiano, Golden Champion, and Mrs. Pince—each variety forming distinct rods which were annually pruned according to the spurting system, and during several years each rod continued to produce its respective kind of fruit. Last January, however, when the Vines were pruned, on account of the fruit of the Golden Champion variety

not keeping so well as the other sorts which the house contained, this rod was cut out altogether at a point some inch or two below its union with the Alicante variety, on which it had been grafted, as is shown in the accompanying rough sketch, leaving only the rods of the Trebbiano and the Mrs. Pince varieties upon the Vine; both of which varieties have produced their respective kinds of fruit during the present season as usual, excepting that the Trebbiano rod produced upon one spur a bunch of the true Golden Champion variety, true as to size and form of berry, and of bunch, colour, flavour, and even to the characteristic spot. The bunch was produced about the middle of the rod, or about 8 feet from where it is united to the Alicante stock, so that several bunches of the true or ordinary Trebbiano variety are produced below, as well as above, this very unlooked for production, which appears difficult to account for; but it naturally suggests the question, viz., can it be ascribed to the circumstance of the Golden Champion variety having for several years grown upon the same stock as the rod of the Trebbiano, which has produced the bunch in question? And if, as I have admitted, it still seems very strange that this, or a similar result, should not have been developed during the years when the Golden Champion sort actually existed upon the plant. It would, doubtless, be very interesting to know if anything similar to this has ever come under the notice of others of your many readers and correspondents, whether in the case of the Grape Vine, or among any other kinds of fruit trees. It would also be interesting to many to know something of the origin of the Golden Champion Grape—as to whether it was originally the result of a sport, and if so from what variety? or, if it was a seedling, from what variety was it raised? Possibly Mr. Thomson may kindly furnish this information. *P. Grieve, Cufford, Bury St. Edmunds.* [A remarkably interesting case, but not unparalleled, if our memory serve us right. We shall revert to the subject shortly. Meantime here is another proof that the scion does affect the stock even as the stock affects the scion. Eds.]

Digging and Dunging about Fruit Trees.—Where I first began my gardening career, it so happened that a change of gardeners took place; the newcomer being a very energetic man. Finding the outdoor fruit trees in a similar condition to what “H. M.” had to contend with (see p. 528), he set us at once to work to remove all the old soil out of a Peach border to the depth of about 2 feet, the border being about 150 feet by 12—commencing at the front and working the soil out behind us to be taken away, with the exception of about a foot and a half of the surface soil, which was mixed with the new, for placing on the surface again. The border contained only poor light soil, with a yellow, stiff, and also poor rocky subsoil, through which the roots were trying to penetrate; hence the starved condition of the trees. Proceeding with our work, we carefully preserved all the roots both good and bad, until we had worked all the soil out with forks, keeping the desired depth, which allowed the soil to fall down among the roots with greater facility. After the old soil was removed, it was replaced by turf, cut some months previous from a meadow, mixed with a little dung (not leaf-mould) taken from a farmyard. When we came up to the level for the roots to be laid down, we spread them openly and evenly, leaving only the best, which were very few for such large trees. We then put the same compost above the roots, treading the whole firmly, and lastly the old fine soil on the top, which completed the task. The following spring the trees broke out with renewed vigour, looking all that could be desired, but I did not remain to see the first year's crop. However, on paying my late master a visit last year, he informed me that they were now all he desired, producing heavy crops of the finest and best-flavoured fruit. *A Young Gardener.*

Sericographis Ghiesbreghtii.—Few winter-blooming plants excel this either for usefulness, continuity of bloom, or general effect. Its pleasing, shining, bright green leaves set off the feathery scarlet flowers to great advantage. The habit of the plant, too, is all that can be desired, and as it will stand in a temperature of 50° to 55° during the winter, its value is much enhanced on that account. *Sericographis* mixed with *Libonia floribunda* and *L. penrhosensis* form a charming group for *parlours* or stands, as they associate well together, the latter forming a capital edging on account of its dwarfier habit. *L. penrhosensis* is a true cross, partaking equally of the characters of the *Sericographis* and *Libonia floribunda*. [It is the more interesting as being a cross between two distinct genera. Eds.] The leaves and habit are exactly those of the *Sericographis* in miniature, while the flowers resemble those of the other parent. These three plants are indispensable for winter decoration, and will add a charm to any house. The *Sericographis* should be propagated early, so as to get strong useful plants during the summer, and afford them time to mature their growth, as late struck plants seldom flower well. As soon as the plants go out of bloom they should be

placed in a brisk, moist heat for a week or so, to get them into free growth, when the tips may be taken off and inserted in cutting pots, and if placed in a close, moist heat they will strike freely, after which they should be potted in small pots and nursed carefully on in moist, gentle heat. When well rooted, the points of the shoots should be pinched out, so as to induce a nice bushy growth; and after breaking again they should be placed on light airy shelves till the middle or end of May. If well-rooted at that time, they should be potted on into 48-sized pots, and gradually hardened preparatory to being placed in cold frames to complete their summer's growth. Here the pots should be plunged in half-spent leaves, and the plants kept well syringed once or twice a day according to the state of the weather. If syringed and shut up early in the afternoon the growth will be rapid, so that by the end of July they may receive their final shift into 6 or 8 inch pots, according to size and strength of plant. During September the plants will be much benefited by having the lights drawn off for a few hours in the day, as this will harden and mature the growth and induce a good head of bloom. The Sericogifera is not at all subject to insects, except scale and mealy-bug, and these seldom occur unless they are grown in too much heat, or near other plants already infested.

If either of these insect pests occur, nothing but a careful sponging of the whole plant will rid them of their presence. The soil most suitable to grow the Sericogifera is an equal mixture of loam and peat, with a dash of sand. By the end of September the plants should be removed to a cool stove or warm greenhouse, where they will soon begin to show bloom, and if kept in a temperature of from 50° to 55°, they will continue flowering the greater part of the winter. If large plants are required, it will be necessary to save some of the old ones after blooming. After they are out back, they should be kept rather dry till they break again, when they must be carefully shaken out and repotted in small pots, to be shifted on, and treated as recommended for young plants as growth proceeds. *J. Sheppard, Wolverton.*

The Melting of Snow on Long and Short Grass.—Mr. Fish has started a very interesting subject for inquiry. In referring to reading his remarks on the above, I had observed that the melting snow was disappearing from certain parts of the garden here compared with others. In every case where it was melting most rapidly it was where it lay on the bare undisturbed soil, and this led me to the opinion that it is there acted on by heat escaping from the soil beneath, as well as from the atmosphere above.

I think that the fact of the snow melting faster on the long grass than on the short may be accounted for by the rust of the grass, which, from the ground where the surface has not probably become compact to the same extent as the other, owing to the slight protection afforded by the longer grass; and the snowy particles, lying somewhat loose and hollow, would allow the air either from above or below to act more readily on it. That on the short grass would lie more compact, and would consequently form a better non-conductor than the more scattered atoms, presenting considerably more surface. I have often noticed that snow melts sooner on bare ground than it does if there is anything to cut off contact and intercept the escape of heat, and there may be other than mechanical reasons for what your correspondent observed. Do plants absorb heat? If so, this will account for snow lying longer on grass than it does on bare ground. Before the snow fell I had mulched a good many newly planted fruit trees, and I found that the snow lying on the mulching thawed much more slowly than it did on the ground immediately adjoining. This shows that the warmth is thus kept below for the benefit of the roots, instead of being allowed to escape into the atmosphere. Trenching is generally supposed to add to the warmth of the soil, but on ground recently broken up, a yard deep, the snow is thawing very much slower than on that which is undisturbed. It may be that during the operation of breaking it up it had parted more rapidly with the stored-up heat than it would otherwise have done. *W. P.*

Reports of Societies.

Market Gardeners, Nurserymen, and Farmers' Association.—The usual quarterly meeting was held at the committee rooms, Bedford Head Hotel, Covent Garden, W. Haward, Esq., in the chair. An application was made by Mr. W. Brandon for the reward offered by the Society for the detection and conviction of any person stealing goods or provender from the waggon of members in their transit to or from the London markets, on behalf of his carman, and requesting the policeman to bring some Celery from his wagon. The policeman, it appeared, was on duty at the time, but would not let the carman take his number, and being obliged to return to his horses, he could not detain him. Upon inquiries being made at the station, it was stated that the policeman had

decamped, and has not been heard of since. The committee decided to award the sum of one guinea to the carman. Application was also made by Mr. G. W. Alderson, for the reward to be given to Detective Boatwright, of the V. division, for the detection and conviction of his carman in stealing goods from his wagon. The committee granted the reward of two guineas, and hoped it would have the double effect of putting carmen on their guard and policemen on the alert, although in the first case the policeman was the thief, and not the carman. Several new members having been proposed and elected, the question of the alteration in the Borough market was postponed for fuller particulars. *A. C.*

Obituary.

WE regret to have to record the death, on December 23, of Mr. CHARLES NORVAL THOMPSON, only son of the late Mr. Robert Thompson, of Chiswick. Inheriting a large share of his father's abilities, and a most industrious worker, Mr. Thompson possessed a wide and varied knowledge of all subjects appertaining to horticultural pursuits. He was for a few years in the Excise Department of the Civil Service, but his tastes lay not in gauging spirits, and he afterwards entered the office of Messrs. James Veitch & Sons, Chelsea; subsequently becoming sub-editor of the *Journal of Horticulture*, which post he held for the last fifteen years. Modest and unassuming in disposition, Mr. Thompson gained the respect and esteem of a large circle of friends, who now regret his early death. He died somewhat suddenly on the afternoon of the 23rd ult., aged about forty years, leaving a widow and four children, who are, we are sorry to say, but slenderly provided for, to mourn his loss.

The Villa Garden.

FORECOURT GARDENS.—In dealing with this subject in a previous paper, the remarks made had reference to gardening as it is, and may be, in many of the oblong strips of ground fronting the houses that line some of the main thoroughfares on either side. That much more in the way of real ornamental gardening can be done in these gardens than is now generally accomplished is placed beyond doubt. An occasional attempt at something higher than the usual aspect of decorative gardening proves this conclusively.

In many of the less modern parts of London, such as Old Brompton, can be seen lines of quiet streets that are simply connecting links between main thoroughfares, without being considerably used for the purposes of traffic. A kind of respectable gentility pervades such streets; the forecourt gardens which belong to the houses are in the main shut in by high walls instead of open railings; the gardens are as a rule kept clean and neat; there is almost certain to be a tree or two or some evergreen shrubs, the proverbial sooty and attenuated Privet, and a few other evergreens of sorry appearance. In these small enclosed spaces, the trees, where they are present, effectually prevent anything like free and healthy undergrowth of shrub and plant. If the trees are to be maintained, ought else must be to a great extent sacrificed, and one would be sorry to lose the trees, as their leafy garniture in summer does much to relieve the naked monotony of lines of brick or stuccoed dwellings, without much claim to architectural beauty. If there is sufficient space below the branches overhead, let a small circular bed about a foot in depth be made and edged with a sloping bank of turf, choosing, if possible, that of a thick texture from a light sandy pasture in preference to that taken from stiff land, in which case the grass grows thin and rank, and soon gets bare. In this bed could be planted a nice bushy plant of *Aucuba japonica*, which invariably does well in an enclosed shade place. The marbled and blotched leaves of the *Aucuba* will contrast well with the green hue of the turf, and if occasionally sprinkled overhead in warm weather, and well watered in dry weather, it will add much to its appearance and well-being. The remaining part of the ground-work of the garden might be planted with the Irish or Algerian Ivy, and against the walls could be placed the *Cotoneaster microphylla*, *Pyrus japonica*, *Escallonia macrantha*, *Ceanothus azureus*, and *Jasminum nudiflorum*, alternated with a few of the hardy summer-flowering Clematises. It would, perhaps, be somewhat presumptuous to suppose that all these would do well, but their well-being in a great measure depends on the attention they receive. If left to

grow untrained and wildly, if suffered to lack water in dry weather, and starved for want of some necessary stimulus when the soil becomes impoverished, the plants must of necessity decline and decay. A little careful attention works wonders, even when plants are growing under disadvantageous circumstances.

The foregoing remarks are intended to be suggestive rather than authoritative as to how such gardens can be planted. The subjects, as well as the arrangement, can be varied; supposing that position and fitness be considered. It is not well to have a rigid uniformity in the planting of gardens, a stereotyped sameness falls on the taste, and becomes monotonous and very irksome.

There is yet another type of town or forecourt garden that is eminently capable of being made a sweetly pleasant thing to look upon; that is, the gardens attached to many handsome villa residences in the pleasantest suburbs of London. The Clapham and Brixton Roads, the Kentish Town Road, parts of Highbury, Canonbury, Stoke Newington, Hackney, &c., furnish abundant illustrations in point. Already many of such gardens, being cultivated according to the custom of contract with some local nurseryman, are nicely done during the summer months, but are left bare and tenacious during the winter. This is much to be regretted, for a naked grass plot and bare beds are as much out of place at midwinter as in the middle of summer. What has always struck us as being a charming garden, cheerful alike in winter as in summer, can be seen in the Kentish Town Road, near to the foot of Hlggate Hill. A fair sized oblong strip of land reaches from the house to the pathway skirting the road; it is wholly laid down with grass, excepting, of course, the pathway leading to the front door, and it is planted entirely with evergreens, both plain-leaved and variegated. The fence in front is of brickwork, about 2 feet in height, with an iron palisading fixed on it, next this is a low Laurel hedge, and then the turf. The centre bed is in the form of a raised mound, with two tiers of border, one above the other, that can be planted; it is edged and lined with turf, and at the top there is a specimen evergreen. This bed, with its tiers, is filled with *Aucubas*, *Eunomyas*, *Laurustinus*, *Bay*, *Portugal Laurel*, *Hollies* green and variegated, common *Laurel*, *Box*, and *Rhododendrons*, all nice compact symmetrical specimens, and so arranged as that the *Aucubas* and variegated *Hollies* and *Eunomyas* freely alternate with the green-leaved types. Specimen evergreens, large and small, the size answering to the place they fill, are dotted about the grass plots; and as the grass is always kept closely trimmed and swept, the dead leaves picked off the plants, and their growth kept within bounds, and all well watered when required, this little garden has at all times an exceedingly cheerful appearance. *Ivies* and certain creepers line the walls, and cover the lower portion of the walls of the house also. There are spaces in these beds or shrubs to plant a few tender flowering plants in summer, and some bulbs, &c., in winter for blooming in early spring. On the whole, perhaps, there is no better arrangement for a London forecourt garden of this character than the one just described, if it be only intelligently worked out and properly maintained. There is always something refreshing to feast the eyes on, and at the hottest part of the year it has a surprisingly cool and pleasant appearance.

There is one feature that used to characterise town gardens in former years of anything but a highly satisfactory character—the employment of statuary and vases. They are now being pretty generally abolished, and we witness the substitution of green-leaved trees in their stead. A witty and clever, but anonymous writer has laid down the doctrine, paradoxical as it may appear, that no man or woman has a right, within the bounds of law, to do anything he or she chooses or pleases with his or her own; and he goes on to say—“Neither has a man any right to do what he pleases with his garden. Has a landlord any title to let a house with a garden to a tenant known to possess a cartload of the ugliest and most lumpy vases that have ever been turned out of clay? If not, what damages may the landlord of the house next-door be liable to, unless he will serve a *distringens*, or a *fieri facias*, or something else that is potent upon his new tenant to compel him to arrange his vases round his dining-room, or round his bed, or anywhere, so that he may have private enjoyment of them, and respect the eyesight

of his neighbours. Vitriol works are nothing to these vases, with which some people speckle their grass. They are of all sizes, and, of course, perfection of disorder is the sense of order that has governed the arrangement. The pipkins are laid near the house, and the further we go the bigger they grow—none being on pedestals—until we come to the big boilers at the bottom of the garden." The force of wit has perhaps laid a little undue colouring on this imaginative picture; but there are yet elements of truth in it that were very true a few years ago, but it is none the less certain that the display of gawgaws of this character is fast ceasing to be an aspect of London gardening.

THE FARM.

THE POULTRY YARD.—The early winter season is often one of much difficulty to amateur poultry keepers. Round the country, sometimes many of the summer grounds remain loaded with clinging leaves, the hedges abound with Briars and Ferns dripping with wet, the grass is long, matted together, and sodden, whilst the roads are muddy and full of puddles, and in the yards the ground is often in little better order. If the fowls are permitted to roam abroad they get chilled and soaked, and confinement at home is as bad for their health in other ways.

Some comfortable accommodation to which the fowls may have access at will on wet days is highly desirable, especially for the stock of the lady amateur, as the days, in which she will be most unwilling to face discomforts of weather are precisely those on which her dependents will most require an eye to their comforts, and, failing her superintendence, they are very likely to go short of necessary care.

The difficulty of management varies in some degree with the breed. Black Spaniards are comparatively easy to manage, for where they can be allowed the use of some warm shed or outbuilding abutting on a bake-house or boiler in regular use, they will probably retire early to their perch, and, on dry days, will warm themselves giving trouble. Cochins, on the contrary, from their feathered legs, are particularly difficult to keep dry and clean, and high-bred Dorkings are sufferers from cramp and various illnesses induced by chills, whilst any young broods necessarily require a constantly watchful eye.

Now is the time when the run of a farmyard, with its adjacent sheds, is particularly valuable. The fowls will then be safely let out on a wet morning, and can dispose of themselves comfortably throughout the day, and where there are young broods the hens may be cooped under shelter, and the chickens will probably thrive far better than in the dirt and confinement of a small pen; but where this protection, with its warmth and various food is not attainable, an open shed, where wood, or old barrels, or any dry lumber is stored, which the fowls may perch on so as to keep their feet from being wet and chilled, is a valuable help, especially if a sheaf or two of threshed straw can be thrown for them to nestle in.

Where nothing can be arranged, it is worth while to have two or three rough logs placed in the yard for them to perch on, so as to keep their feet from being constantly on the sodden ground, and also to give them a little wholesome exercise in flying up and down to their temporary perches. If, however, the arrangements are such that any young broods must necessarily be confined to their pens, it is of the greatest importance to remove the hens regularly about the same time in a morning, for a five minutes' run in the yard, whether the weather is wet or dry. If this system is not attended to, the health of the fowls will probably suffer, but the chickens certainly will, from the accumulations of foul matter, and the necessarily accompanying foul smells. Whether in the chickens' pens or the sheds for the full-grown poultry, all matters of cleanliness should be most scrupulously attended to at this season; all drips of wet from the roofs should be carefully stopped, as also leakage across the floors from outside gutters, and the accumulations of dirt being greater now than in the summer, when the longer confinement of the poultry, the eye of the overlooker should especially be directed to the due use of brooms and scrapers, to throwing down lime and dry rubbish where necessary, and also to making sure that the little heaps of hay (which add so much to the comfort of the fowls for nesting in) are dry. If these are neglected, and allowed to remain as wet masses, they are only a cause of mischief.

The amateur who loves his pets needs only an occasional hint to secure their comfort, but where the fowls are kept in the way too often seen in country farmyards, and which the poultry maids are too apt to return to unless well watched, some improvement is requisite. Here the shed and the contained small pens may be found coated with filth, apparently never disturbed from one year's end to another, and the damp, the smells, and the legions of fleas, which might defy even the wormwood of Ragusa, requires a

practical acquaintance with them to be appreciated. Here a middle course in poultry treatment would be a great improvement. On going into a farmhouse you may find the back kitchen with fowls in every place where they have no business to be, and occasionally coming to an untimely end in the boiler, a couple of hens as snug as possible in the kitchen fender, and another sitting a batch of eggs in a drawer. But still, when the feathered gentry are turned out, there is no better accommodation for their comfort than the almost pestiferous hole above described, dangerous in its neglected state alike to the fowls and their owners.

The various diseases to which fowls are liable from cold and wet and want of good housing, when sufficiently developed to appear under a distinctive name may be generally classed under the heads of consumption, bronchitis, catarrh, roup, cramp, and rheumatism, especially induced by the fowls being allowed to run in the wet grass early in the day. In all cases the preventive treatment is the same—warm and dry lodgings and nutritious food; but the cure, when once disease is developed, is a much more difficult matter.

Consumption and roup it is recommended by good authorities to sacrifice the affected fowl, the consumptive tendency being a taint in the breed, and the roup infectious in the yard. In the other diseases the cure and the preventive treatment correspond. The best that can be done is to provide dry lodging with sunny exposure, and freedom from draughts and drips, and plenty of warm nooks to nestle in, a possibility of dry outdoor exercise, and nutritious and varied food, with the addition, in the case of catarrh, of some stimulant to the diet. A little pepper dusted over the food is said to answer well at times.

Commonly, however, instead of a developed form of some recognised disease, the fowls only look through miserable and spiritless, their feathers raggedly, tails hanging down, and no heart in them to stir about for warmth or food. In this state of things a good meal of waste bits of meat, with some rough bits of snow and gristle amongst it, which they can fight and struggle over, is an excellent preservative to begot with. The amount of meat should be small, and the food, besides the mashing and struggling over the large pieces is almost more beneficial, restoring circulation, and (so to say) mental energy, enabling them to help themselves; a dry shelter where they can get their wet plumage into order is the next step, and in especially bad cases it is well to put the invalid fowl with some hay in a covered basket large enough to hold it comfortably in some warm room, a corner of the kitchen away from the fire, for instance, or if very wet to dry it with warm cloths.

A little bread soaked in beer is also a good thing for rousing a batch of fowls too moping with the damp to take care of themselves, and a dish of fresh milk just a little warmed is beneficial as a variety; but the whole secret of successful poultry keeping in bad weather lies in constant care and thought. There is always some delicate foul requiring attention, or some matter of diet, whether of food or clean water, equally requiring an eye, and the proper housing which will need daily supervision. To resist the adverse weather, the more chilling, wetting, and uninviting it may be to the amateur, and especially to the lady amateur, so much the more necessary is it in the same proportion that they should personally be on the spot to counteract its effects amongst their poultry. O.

WHEAT MIDGES.—The yearly amount of injury usually caused to our Wheat crops by these minute insects, and the enormous amount of harm of which they are capable when left unchecked, makes some attention to them at the present season highly desirable. As now is the time when their eggs are but too often thrown wide in myriads in heaps of chaff left undisturbed through the winter, thus affording a secure and suitable shelter for the grubs till the time of their change in the early summer. If any one will be at the pains to stoop down and examine the chaff and dust which are accumulated after threshing on an ordinary barn floor, he will see the mass sprinkled with small orange or scarlet larvæ of various shapes and shades of colour, according to the amount of injury they have undergone, and in the case of the same time, the germ of next summer's crop of Wheat midge, a minute dipterous fly, *Cecidomyia tritici* or *Lasioptryx obfusata*, as the case may be.

In my own observations in Gloucestershire, the fly proved to be the *L. obfusata*, but in the large mass of observations which have been made by various naturalists in England, Germany, and America, the fly referred to is apparently the *Cecidomyia tritici*. The Wheat midge larvæ are variable in colour (yellow, lemon colour, orange, red, or bright red), about a line in length, and pointed towards the head; the tail is blunt and tuberculated, so as to assist the progression of the grub, and in the more advanced stage of larval growth it is to be found cased in a transparent membrane. As far as I am aware, the larvæ of *C. tritici* and *L. obfusata* are indistinguishable.

The pupa of the *C. tritici* is stated by Kollar and Kirby to be reddish in colour and pointed at both ends. The developed female fly hardly exceeds an eighteenth of an inch in the spread of the wings, and is ochreous in colour, with yellowish white iridescent wings longer than the body.

The *Lasioptryx obfusata* is of similar size, but easily distinguishable by its black colour, and by the double fork of the median nerve of the wing.

For a detailed account of the time of appearance and oviposition of the female *C. tritici*, and the early habits of the larvæ, the observations of Kirby in the *Transactions of the Linnean Society*, vol. v., p. 97, can hardly be surpassed in precision and clearness of description. He mentions the appearance of the "Triple" (*Cecidomyia*) in myriads on June 3, and continuing till the end of the month, the insects usually not coming out till about seven o'clock in the evening, the process of egg-laying proceeding vigorously about eight, and the flies disappearing again about nine.

He observes that these countless hosts appeared to be entirely composed of females, and in one case noticed as many as twelve ovipositing at once in one ear of Wheat, and by careful watching he succeeded in making out the time of oviposition, even to the passing of the eggs down the style of the ovipositor, following one another like minute air bubbles, whilst the extremity (the "aculeus," as he terms it) was steadily inserted in the floret. This insertion of the aculeus appears only too firmly effected occasionally for the security of the Wheat midge, as Mr. Kirby notices its withdrawal as now and then impossible, and its propretiness consequently firmly fixed at the mercy of the first passing enemy. On June 7 the eggs were observable in a floret (oblong, transparent, and pale buff in colour), and after June 17 many larvæ were noticeable on the plumose stigmata, and with their heads buried in the summit of the germin. The whole passage, of which the above is but a slight sketch, is given at p. 263 and the following pages in *Curtis' Farm Insects*, and is well worth careful study.

The injury caused by the Wheat midge larvæ lies in the abortion of the grain, and its precise cause has given rise to much speculation. The food of the larvæ appears to be the pollen of the anthers; but how, when so many losses of grain exist, the farmer should effect their appointed task of the fertilisation of the grain, is a curious subject of investigation. The consumption of the moisture on the stigma—a possible secretion on the larvæ themselves acting on the stigma or the anther dust in some way destructive to the fertilising principle; or again, the destruction of the essential organs of production by the nibbling of the larvæ, have all been suggested as the cause of abortion, but whatever the details of the method of injury may be, the result is often very serious.

Looking over the notes of various observers, the result of loss is given as, in one case, two to six grains in an ear; in another, a third of the crop; and Professor Henslow mentions Wheat midge larvæ being present in almost every ear of the fields under his observation, and his calculations give the presence of 834,956 larvæ and pupæ of the Wheat midge in seven bushels of chaff and barn-floor sweepings.

The vitality of the larvæ is extraordinary, dried and shrivelled specimens threshed out of the Wheat appearing little the worse, and in appearance or power of movement, on the application of moisture; but, nevertheless, there is great difficulty in rearing them to development in artificial circumstances; and my own experiments, continued through a winter and spring with every possible care, failed in producing any appreciable result as long as the larvæ were placed with artificial surroundings. Under other circumstances, however (and unfortunately in the very arrangement too often made in small country farms), the proper preservation of them has been thus developed in myriads. If any one wishing to ascertain the point will go about three o'clock in the afternoon, early in June, to some wheat-chaff heap, which has been left lying untouched during winter in some shady spot, he will probably see almost a cloud of minute flies hovering close over it, settling and making short flights, and only waiting a light wind to waft them in all directions; and here also, as far as my own impressions go, are to be found the preliminary stages, which Mr. Kirby regrets as missing in his own observations. He mentions the entire absence of the male fly in the swarms appearing in the evening, and suggests its previous disclosure from the pupa as a necessity of the social economy of the insect; and from my own observations I should conjecture the pairing to occur almost immediately on hatching from the pupa, and that the short subsequent duration of the life of the male accounts for its absence in the swarms on the evening.

My own observations on the insects proved to be the *Lasioptryx obfusata* (*Agricultra Getzli*, for August 20, 1870), and their numbers were enormous, such as would have made it well worth while to be at the cost of a man's labour for a couple of hours to put a stop to the rapidly developing mischief.

It is some little trouble certainly to get rid of masses of chaff; but whilst the custom remains unchecked of allowing these heaps to accumulate through the winter, there, in the favourable shelter, will the nurseries of Wheat midges still exist, fostering and rearing this destructive insect to the detriment of the neighbourhood, whilst, by a little attention being paid to burning, rotting, or in some way thoroughly destroying the chaff with its contents, we should get a sure diminution of the number of Wheat midges, instead of an arrangement especially adapted for their propagation. O.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 30, 1874.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRI- CAL DEVIATIONS FROM GLAISHER'S TABLES, 2d Edition.	WIND.	RAINFALL.

- Dec. 24.—Overcast. Rain fell in the early morning hours and occasionally in the afternoon and evening.
- 25.—Overcast generally. Very gloomy and foggy in the morning.
- 26.—Overcast. Foggy and gloomy in the morning. A light granular snow fell in the evening.
- 27.—The amount of cloud was large, and the weather dull; slightly foggy at times.
- 28.—Cloudy generally; snow and sleet fell frequently during the day.
- 29.—Fine and partially cloudy till 2 P.M.; generally cloudless afterwards. Lowest reading of thermometer on these days, 15°.
- 30.—Generally cloudy. Fog was prevalent in the low grounds. Lowest temperature of vegetation, 14½°.

The following was unavoidably omitted in our last issue:

In Scotland the highest temperatures ranged from 47° at Paisley to 38° at Greenock, the general average over the country being 42½°. The lowest temperatures varied between 22½° at Aberdeen and Greenock, and 16° at Paisley, the general average being 20½°. The mean range of temperature in the week was 22°. The mean temperature for the week was 32½°, being 11½° lower than the corresponding week in 1873; the highest being at Paisley, 33½°, and the lowest at Dundee, 30½°. Rain was measured at each of these stations, varying in amount from nine-tenths of an inch at Aberdeen to one-hundredth of an inch at Greenock and Paisley, the average fall over the country being three-tenths of an inch.

At Dublin the highest temperature was 42°, the lowest 23½°, the mean 34½°, and the rainfall 0.48 inch.

In the neighbourhood of London the reading of the barometer at the level of the sea decreased from 29.78 inches at the beginning of the week to 29.46 inches by the evening of the 20th, increased to 30.01 inches by noon on the 23d, decreased to 29.48 inches by the afternoon of the 24th, and then increased to 30.04 inches by the end of the week. The mean reading for the week was 29.74 inches, being 0.12 inches lower than that of the preceding week. The mean daily readings were all below their averages, the greatest departure in defect being 0.48 inches on the 20th and 21st and 0.50 inches on the 24th.

The highest temperatures of the air at 4 feet above the ground ranged from 36½° on the 24th to 30° on the 22d, the mean for the week being 34°. The mean of the seven low night temperatures was 26½°, the extreme readings being 33° on the 24th and 19° on the 23d. So low a minimum as this last named value has not been recorded since December 8, 1871, when the temperature was 18½°. The mean daily range of temperature was 7½°, the greatest being 14½° on the 23d, and the least 3½° on the 24th.

The mean daily temperatures of the air were all much below their averages, the values being as follows:—20th, 32½°; 21st, 30°; 22d, 26½°; 23d, 23°; 24th, 34°; 25th, 33°; 26th, 29°; 27th, 26°; and the departures in defect of their respective averages were 7°, 8°, 11°, 9°, 14°, 6°, 5°, 4°, 5°, 8°. The mean temperature for the week was 29.9°, being 8° below the average of the corresponding week, as deduced from fifty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in the sun's rays, were 40½° and 40½° on the 20th and 21st respectively, the other maximum values were all below 40°, and that on the 26th was as low as 33½°. The lowest readings at night of a thermometer placed on grass, with its bulb fully exposed to the sky, were 18½° on the 22d, 13½° on the 23d, and 20½° on the 26th, and the mean of the several low night values was only 22½°.

The sky was generally cloudy, the sky on the 22d, 24th, and 26th, being entirely overcast.

The direction of the wind was very variable, and its strength was gentle throughout.

A little sleet and snow fell on the 24th; its amount measured was only three-hundredths of an inch.

In England, the extreme high day temperatures ranged between 42° at Sheffield and Sunderland and 36° at Norwich, with a general average of 38½°. The extreme low night temperatures ranged from 24° at Sunderland to 17° at Hull, with an average value of 19½°. The mean range of temperature in the week was 19°, varying from 26° at Hull to 15° at Leeds. The mean high day temperatures varied from 38½° at Sheffield to 31½° at Norwich, the general average all over the country being 35½°. The mean low night temperatures ranged from 28° at Bristol to 20½° at Hull, the general average being 25½°. The mean daily range of temperature in the week was 10½°, the greatest range being at Eccles, 13½°, and the least at Norwich, 6½°. The mean temperature for the week was 30°, being 12½° lower than the value for the corresponding week in 1873, 17° lower than in 1872, and 13° lower than in 1871. The highest in the week occurred at Liverpool and Sunderland, 32½°, and the lowest at Hull, 27°. Rain or melted snow was measured at each of these stations, varying in amount from six-tenths of an inch at Sunderland to three-hundredths of an inch at Blackheath. At Sheffield no rain was measured. The average amount over the country was three-tenths of an inch.

The weather during the week was very cloudy, dull, and the frost severe. Snow fell at several stations on December 21, 22, and 23.

In Scotland the highest temperatures varied from 51° at Paisley to 35° at Dundee, the general average over the country being 40½°. The lowest temperatures ranged between 22° at Greenock and Leith, and 12° at Aberdeen, with an average value of 18½°. The mean range of temperature in the week was 21½°. The mean temperature for the week was 29½°, being 11½° below the value for the corresponding week in 1873.

Rain was measured to the amount of eight-tenths of an inch at Aberdeen; at Greenock and Paisley no rain was measured, the average fall over the country being two-tenths of an inch.

At Dublin the highest temperature was 43°, the lowest 23½°, the mean 32½°, and the fall of rain 0.25 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

[The subjoined directions are intended to supply general information, and must, of course, be adapted to the peculiar circumstances of each locality. Other departments of the garden will be treated on from week to week in succession, according to the requirements of the season. Special directions for the management of the "Villa Garden" will be found in the preceding columns.]

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—If the new year brings us a continuance of such weather as we have experienced through December, the principal thing required in connection with hard-wooded plants is to keep them safe from the effects of frost without using more fire-heat than is necessary to ensure their safety, for if on these plants are induced by overheating to grow so unseasonably early, there is no means of stopping the movement afterwards, and growth so made of the most possible description. With such plants as flower before commencing their growth it is by no means desirable to hasten on their bloom before the proper season, and in the case of those that are required for exhibition during the spring very little fire-heat so early will destroy all hopes of bringing them out in good condition, for it necessitates their being kept back in the last stages of opening their flowers, which is fatal to a free and healthy development of the bloom. Therefore, so far as possible, keep them at a temperature of 60° during the night, and this should as near as possible be evenly maintained through the hours of darkness, not to just simply have the thermometer down to the point indicated at daybreak, if it has been ranging through the early part of the night some 5° or 10° higher. For checking this there is nothing more necessary than registering thermometers in the different houses in which all valuable plants are grown. If any plants are very near the glass, especially the roots of it, during very severe frost to lower them a little; and the

points of the shoots that are within a few inches of the glass are much more liable to suffer than those that are an equal number of feet removed from it. See that no plant is allowed to stand upon open trellised stages in such close proximity to the hot-water pipes as to be affected thereby, for, if in good health, quantities of the best roots are generally lying thickly at the bottom of the pots, in which position they are most likely to be affected by the manner shown. To prevent injury in the above way thin boards may be placed immediately under the plants, or upon the pipes, sufficiently wide to disperse the heat. Keep the atmosphere as dry as possible in the houses devoted to this description of plants. With this view, whatever watering is done should be completed as early in the day as possible, after which open the roof ventilators a little, according to the state of the outside temperature. Give no side air whilst severe weather continues, even if the internal temperature would seem high enough to warrant such, for the cold air rushing amongst the plants is always injurious.

Acacias will bear a lower temperature than other hard-wooded plants, not being injured by the thermometer falling down to the freezing point, or even a few degrees of frost at this early period. I have seen them frozen so that the soil was slightly crisped on the surface of the pots without injury, opening their flowers to all appearance as well as if they had never been subject to frost; but it was when the plants were quite at rest, in the middle of the winter. And under no circumstance is there anything gained by subjecting them to so low a temperature, except where the plants are required to flower very late in the spring—say, in June; this can only be assured by keeping them during the winter months as cool as possible. Although kept very cool, they must not be allowed to get so dry at the roots as Cape or New Holland plants require to be at this season; being indigenous to the cool mountain hills regions of India they cannot bear them when quite at rest, to have the soil about their roots too dry. **Heaths** like a low temperature all through the winter; less fire-heat will excite growth in them than most other plants, and if the atmosphere is dry they will bear anything except actual frost. Do not admit air at the side lights during frosty weather, but a little may be given at the roof in the day when not very cold, and admit it on all favourable occasions both at the roof and side lights. Look over all the stock, large and small, every other day, to ascertain what water is required, for although their requirements in this respect are now at the lowest, still the roots are never quite at rest, and must be supplied when they need it.

SOFT-WOODED GREENHOUSE PLANTS.—*Pelargoniums*.—The night temperature for these should not be allowed to fall lower than 45°, nor should it rise above this in the night. The use of fire-heat in frosty weather will excite them to require more water than they otherwise would, but for some time yet, until they are making more progress, they must be kept much drier in the soil than most plants will bear, or they run to leaf, forming coarse, rank shoots, with a small amount of roots. A portion of the stock may be stopped by pinching out the points of the shoots. These will succeed the first unstopped plants in flowering. *Pelargoniums* of the *Zonal* and *Noveboracensis* section require similar treatment, as to warmth, light, and moisture. The rose, from its more profuse flowering disposition, are, for decorative purposes, even more useful than the show varieties, but should by no means be allowed to supplant them. Those that are intended for summer-flowering should, where they require it, be potted on, being careful not to give them too much root-room, potting firm and not using too much sand in the soil. Stop the shoots as they require it, not allowing such as are intended for summer blooming to flower at the present season, and tie them well out. *T. Baines, Southgate.*

FLOWER GARDEN, &c.

PARTERRE AND MIXED GARDEN.—There is but little of an attractive nature in the outdoor department of a garden just now, therefore it is of the greatest importance that this deficiency should in some measure be made up by keeping the walks and grass frequently rolled, and the beds and borders as neat and clean as possible. If lawns or grass verges are the least unlevel they should be taken in hand at once, as nothing disfigures a place so much, or so offends to the eye, as a rough, uneven, or uneven piece of lawn. The first ought to be as straight as a line can make it, and the latter as level as a billiard table. Any alterations involving the relaying of turf should be proceeded with as soon as the weather is favourable, so as to afford time for the grass to get established before dry weather sets in. Before laying the turf, and during the process of levelling, the ground should be thoroughly rained, so as to pack it down after setting, and to give it a firm, level surface. It should be taken, by means of plenty of guide sticks, to get the surface perfectly level. Lawns that are at all coarse or mossy should be swept and rolled frequently, as nothing improves the texture and quality of the grass so much as this

In sowing, use good soft half-wood birch brooms, and if it weeps as at all troublesome, give a good dressing of fresh shaked lime or wood ashes, or both combined. Strawberry and herbaceous borders should be dug over as deeply as the nature of the soil will allow, and where it is intended to grow any of the strong grass-feeding plants, such as *Ricinus*, *Solanum*, *Cannas*, *Wigandias*, &c., a good dressing of manure should be dug in. Most of the herbaceous plants will be greatly benefited by the same treatment, or by stirring the soil deep, so as to allow their roots to ramble in search of moisture—they will last in bloom much longer. *Phloxes* especially—delight in a deep rich soil. Such plants as *Thermopsis*, *Vitis*, *Platysa* and other strong-growing herbaceous plants, soon outgrow the space allotted them, and while digging the borders, advantage should be taken of the opportunity to re-arrange or reduce them to proper limits. *J. Sheppard, Woolerstone.*

Seeds of sub-tropical plants, such as *Uthala*, *Canna*, *Ferdinanda*, *Wigandia*, and *Solanum*, should be sown, and placed in a good brick, moist heat, as soon as possible, so as to afford time to grow them a good way before planting. All sorts of plants of the above that have been kept for propagating should now be pruned, and plunged in bottom-heat, to induce them to throw out side-shoots for cuttings. *Adiantum papilliferum* increases best from the root. The large fleshy portions of these should be cut into lengths of 2 inches or so, and placed in pans or pots of sandy loam, and plunged in heat, where they will soon break and form nice plants. *Arabis Sebaldii* should be obtained from seed, as it is slow in growing cuttings. Where the stock of succulents is likely to be short, the fleshy leaves of such things as *Echeveria mgalica*, *Lachypylon bracteosum*, *Kleinia repens*, *Cotyledon Umbilicus*, &c., should be put in at once in dry heat, where they will soon root. If sufficient leaves cannot be procured for this purpose, seeds of any sown now will make nice plants by bedding-time if grown on in gentle heat. Carpet-bedding is coming much into favour, and most of the low-growing succulents are indispensable to work out the decorative patterns, and their rigid outlines associate well with the architecture of a garden. *J. Sheppard, Woolerstone Park.*

FRUIT HOUSES.

PINES.—The character of the structures which are extensively employed in the cultivation of this kind of fruit at most places is such as to render during the winter months the performance of certain indispensable operations, such as re-planting or transferring the plants, or the renewing of beds with fresh materials which contain them, solely dependent upon favourable climatal influences for its accomplishment. As such opportunities happen with great uncertainty, and are not of frequent occurrence, generally at the season referred to, the forthcoming requirements in that respect should be considered, so that whatever may be wanting to enable the work to be proceeded with should be in readiness, that at the proper time it may be executed with despatch, as much more injurious effects result from Pine plants being out of their proper quarters than is generally supposed. With a little forethought such matters can be accomplished beforehand at times, and external operations are impeded by natural causes (as is the case at the present time). In pot culture the soil, if properly prepared (which is by hand), occupies considerable time in preparation. If this material is in proper order for potting, it should be got ready for that purpose in quantity sufficient to meet all demands for the next three or four months, provided it be kept together where it will not become parchingly dry. Pots and crocks should also be prepared, and tan or other fermenting materials should be at command. In good hot dry sheds, which will give the needful supply of that material in a warm state, an expedient which is very desirable during the cold winter months. Let the temperatures, as before indicated, continue in force, excepting under the pressure of severe cold outside (which is now the case); the minimum degrees as noted will then suffice. Continue to examine all plants which are in pots weekly, or fortnightly at the most, and water as usual with weak manure water at about the temperature of the bed whenever necessary. This important matter in connection with cultivation should never lack attention at any season, as the rapidity with which Pine-plant plants are developed and the fruit brought to perfection at the present day demands an active condition at the roots to be maintained throughout the whole process. There are a few sorts which are an exception to this rule, amongst which may be named the Queen and Black Jamaica as being prominent in that respect. *G. T. Miles, Wycombe Abbey.*

CUCUMBERS.—The weather is now what has been for the past few weeks, "very slow" for Cucumbers, rendering the greatest care and attention necessary to maintain a healthy and fruitful condition. It is in such weather as this that we discover the form of house that best adapts itself to the winter requirements of the Cucumber, and we should provide accordingly. My own experience is that "roomy"

houses are quite unsuitable for winter work, and that small lean-to's, about 10 feet wide and 9 feet high, built at an angle of from 35° to 43°, having four rows of such hot-water pipes run through, are the structures that produce the best supplies. Be careful not to over-excite the plants, either by extra sharp firing, or by repeated doses of strong liquid manure; on the contrary, let everything go on quietly and evenly, and especially the temperatures, for it is abundantly proved that great disparities in the temperatures, or sudden fluctuations in the same, will result in a plentiful supply of yellow and stunted fruits, and other evils. The night temperatures should not fall below 68°; employ night coverings to secure that end. Be sparing in the supply of moisture; at the same time avoid a too dry atmospheric condition, and take care the roots do not suffer, consequent on the sharp firing. Continue to pick off all male blossoms, and do not suffer the foliage and wood to overcrowd. It would be an advantage, too, to fertilise the female blossoms every day or two, during a continuance of this weather. Directions for Melons will be given in the next Calendar. *Thos. Simpson, Broomfield.*

Answers to Correspondents.

ANSWER TO DOUBLE ACROSTIC (p. 86, 1874): Gothic; Ash; Robur; DourO; Eden; Naomi; Exotic; RimmeL; ScythE—Gardens' Chronicle. *Edwitis.*

BOOKS: *T. W.* We are not aware that any of the many treatises on Cucumber growing are now in print. The last has been *Edwitis*.

"GOD TEMPER THE WIND TO THE SHORN LAMB": *W. V. B.* This quotation is from Sterne's *Tristram Shandy*.

HARDY HEATHS: *T. J. Marshall.* You cannot get seeds of these; but you may furnish your proposed beds with plants from the Surrey nurseries, such as that at Knapp Hill, where peat-earl plants are extensively grown.

INSECTS: *J. R.* The caterpillars sent are the destructive larve of the moth *Agrotis segetum*. The ground round the roots attacked must be carefully stirred and looked over. The grubs are easily seen, as they do not go deep into the ground, and small is a rare species. Testaceous; salt will destroy it. *A. O. W.*

NAMES OF FRUITS: *George Crawford, Ochtertrye.* We believe the Apples sent to be the true *Bienheim Orange*; but how very different are they grown in your northern latitude! They are quite acid, or entirely wanting in flavour, and mostly out of the usual normal form. *Charles Elliot*, 1, may probably be Bessop, a finely-flavoured fruit; 2, Winter Strawberry. *A. F.* We do not recognise the Apples sent. *A. O. Walker*, 4, London Pippin; 3, Fearn's Pippin, probably, but with an unusually long stalk; 1, 2, not known.

NAMES OF PLANTS: *H. Hughes.* Six specimens is our limit at one time, as we constantly give notice, yet you send twelve, 1, *Pteris argyrea*; 2, *Asplenium marianum*; 3, *Asplenium Fabianum*; 4, *Gymnogramma tartarea*; 5, *Pteris serrulata*; 6, *Hypolepis distans*. *M. J.* 1, *Hymen tamariscinum*; 2, *H. triquetrum*; 3, *H. purum*; 4, *Dicranum copiarium*. *W. H. M.* *Stephanophyllum Herbstii*—*G. T.* *H. flex Aquilium scoticum*, certainly.—*H.* and *S.* *Streptocarpus Rexii*.

VINE-STEMS DYING: *M. W.* We cannot assist you in determining the cause of your Vines dying. It must be due to local causes. The stems have perhaps been injured in some manner.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers who send Post Office Orders, to be good enough to write to the Publisher at the same time, stating that they have done so.

Correspondents are specially requested to address to all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements should be addressed to the Publisher.

CATALOGUES RECEIVED.—Benjamin S. Williams (Victoria and Paradise Nurseries, Upper Holloway, London, N.), Descriptive Catalogue of Flower, Vegetable, Agricultural, Seeds, &c.—James Carter & Co. (237 and 238, High Holborn, London, W.C.), List of Novelties for 1875—Vick (Rochester, New York), Floral Guide for 1875—Richard Dean (Ealing, London, W.), Catalogue of New and Choice Potatoes, also his Catalogue of New and Choice Primroses, Polyantuses, Daisies, Hepaticas, &c.

COMMUNICATIONS RECEIVED.—Surgical.—D. D. F. G. H.—J. B. G. G.—J. G. H. P. (Yes).—J. T. W. A.

Markets.

COVENT GARDEN, December 31.
A very quiet week, both in the wholesale and retail markets, business being much influenced by the weather, which has caused a little advance in the price of rough outdoor produce. Apples in bulk still making very low prices. St. Michael Pines good and plentiful. *Thos. Taylor, Wholesale Apple Market.*

SEEDS.

LONDON: Dec. 30. In consequence of the holidays, the business passing on our seed market has during the past week been exceedingly limited. All descriptions of winter flower seed are in moderate sale. With regard to Alsike and white Clover seed choice samples are still very scarce. Trefoils continue in fair supply at late rates. We have a moderate inquiry for foreign Italian. Bird seeds show no change since our last issue in feeding. Lined and fair trade has improved. Very high prices are asked for new spring Tares. The cold weather has increased the demand for boiling Peas and Haricot Beans. Mustard and Rape seed move off slowly at recent currencies. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.

At Mark Lane on Monday little activity prevailed in the trade. Fine descriptions of Wheat were held for the extreme rates of Monday last, but inferior produce remained neglected. Barley was firm, and good malting qualities experienced a steady sale. Malt was rather dull, but not cheaper. Oats were abundant and difficult to move, though rates were maintained in all instances. Malt, being in a very few hands, commanded very full prices. Beans and Peas were purchased sparingly on former terms. The flour trade was very slow, and prices were unaltered.—The market on Wednesday was firm, and extreme rates were paid for all classes of Wheat. Barley was a little more sought after, and rather disposed to improve; but Malt was dull, and a very moderate demand prevailed for Oats or Maize. Beans and Peas were steady, and recent prices were well supported for flour.—The average prices for the week ending December 26, 1874, were: Wheat, 44s. 8d.; Barley, 44s. 5d.; Oats, 29s. 4d.; and for the corresponding week in 1873: Wheat, 61s. 8d.; Barley, 44s. 6d.; Oats, 26s.

CATTLE.

There was a large supply of beasts at market on Monday, but a dull trade, consequently prices generally were lower. Sheep were also plentiful and buyers scarce. A few choice qualities made nearly as much as of late, but on the average prices were decidedly lower. Trade was very dull for calves, at lower prices.—On Thursday the supply of beasts far exceeded the demand; only a few choice animals were wanted, and they were lower in price. Scarcely anything was done in sheep. Choice calves were dearer, and more activity was observable in mch cows.

HAY.

Good supplies were on offer at Whitechapel, but there was also a brisk demand, and a fair clearance was effected at fully late rates.—Clover, best, 120s. to 123s.; inferior, 80s. to 100s.; hay, best, 114s. to 120s.; inferior, 70s. to 90s.; and for the corresponding week in 1873: Clover, 120s. to 123s.; inferior, do., 90s. to 112s.; superior Clover, 120s. to 130s.; inferior, do., 100s. to 112s.; and straw, 40s. to 45s. per load.

COALS.

At Wednesday's market there was a large supply on offer, and the price fell 11. 6d. per ton.

THE LONDON MANURE COMPANY

(ESTABLISHED 1840)

Have now ready for delivery, in fine dry condition—
WHEAT MANURE, for autumn sowing.
FINE DISSOLVED BONES.
PURSER'S BONE MANURE.
PURSER'S BONE TURNIP MANURE.
SUPERPHOSPHATE.
NITROPHOSPHATE.
NITRATE OF SODA, SULPHATE OF AMMONIA,
Genuine PERUVIAN GUANO, &c.
FURSER, Secretary.
116, Fenchurch Street.

ODAMS' MANURES, FOR ALL CROPS.

Manufactured by the NITRO-PHOSPHATE and ODAMS' CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant-Farmers occupying upwards of 150,000 Acres of Land.
Chairman—ROBERT LEEDS, Castle Acre, Norfolk.
Managing Director—JAMES ODAMS.
Sub-Manager and Secretary—C. T. MACADAM.
CHIEF OFFICE—109, Fenchurch Street, London, E.C.
WESTERN COUNTIES BRANCH—Queen Street, Exeter.
Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, is solution of from 1 to 2 ounces to the gallon of soft water, and of from 1 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in boxes, 1s., 2s., and 10s. 6d. Wholesale by FRICES' PATENT CANDLE COMPANY (LIMITED).

Russia, Mats. The only Importers of Mats in London, have, in consequence of the SCARCITY of ARCHANGEL MATS, instructed their Russian friends to send 100,000 best selected PETERSBURG, which they are now offering, to the Trade only, at low prices. Samples and prices on application, at 4 and 5, Wornwood Street, London, E.C.

Russia Mat Merchants. MARENDAZAND FISHER, of James Street, Covent Garden, W.C., have a large Stock of Archange, Heavy and Close-woven ST. PETERSBURG MATS, and all kinds of DUNNAGE MATS, RAFIA FIBRE, &c. N.B.—The best Heavy St. Petersburg Mats are most suitable for covering purposes.

FIFTEEN THOUSAND ARCHANGEL BEST MATS, and 2,000 ST. PETERSBURG MATS, just arrived; also a Parcel of SECOND-HAND good MATS, for covering or Packing, cheap. Prices, &c., on application to WM. PETERS, 44, Tenet Street South, Goodman's Fields, near Minories, E.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post free on application. JAS. T. ANDERSON, 7, Commercial Street, Shoreditch, London, E.C.

RUSSIA MATS.—A large stock of ARCHANGEL and PETERSBURG, for Covering and Packing.—Second sized ARCHANGEL, 1000; PETERSBURG, 600 and 800; superior class Mat, 45s., 50s., and 55s.; PACKING MATS, 20s., 30s., and 35s. per 100; and every other description of MATS at equally low prices, at J. BLACKBURN and SONS, Russia Mat and Sack Warehouse, 4 and 5, Wornwood Street, E.C.

The most Perfect Hot-water Pipe in the World. MESENGER'S PATENT FLEXIBLE-JOINTED HOT-WATER PIPES are as cheap when fixed as the common pipes, and are much superior, may be rapidly put together, and, by a handy Labourer, can be easily unjointed and refixed at any time.

4-inch Pipe, per yard 3s. 4 1/2d.
3-inch Pipe, per yard 2s. 8 1/2d.
2-inch Pipe, per yard 1s. 10d.
Connections at proportionate prices.

Illustrated Price List free on application to T. G. MESENGER, Hot-water Engineer, Loughborough.

E. T. ARCHER'S "FRIGI DOMO."

Patronised by Her Majesty the Queen for Windsor Castle and Frogmore Gardens, the late Sir J. Faxon, and the late Professor Lindley, &c., &c.

MADE OF PREPARED HAIR AND WOOL. A perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied. A good covering for Pits and Forcing Frames.

PROTECTION FROM COLD WINDS AND MORNING FROSTS.

"FRIGI DOMO" NETTING, 2 yards wide, 1s. 4d. per yard.
"FRIGI DOMO" CANVAS—
2 yards wide 1s. 10d. per yard run.
3 yards wide 2s. per yard.
4 yards wide 2s. 10d. per yard.

ELISHA T. ARCHER, only Maker of "Frigi Domo," Southend and Breckley Roads, Forest Hill, London, S.E.; and of all Florists and Seedsman. All goods carriage paid to London. NOTICE.—REMOVED FROM 3, CANNON STREET, CITY.

Reduced Prices. THE CELEBRATED GRANITIC PAINT.

Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company. See Price Lists, Testimonials, and Patterns of Colours, apply to THOMAS CHILD, Manager, 39A, King William Street, London, E.C.

THE SILICATE ZOPISSA COMPOSITION TO CURE DAMP IN WALLS, AND PRESERVE STONE, &c., from DECAY, at a very trifling cost. Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company, Colourless, and in all Colours.

Particulars, and Testimonials, apply to THOMAS CHILD, Manager, 39A, King William Street, London, E.C.

DANIELS' DUKE OF EDINBURGH.

"THE FINEST CUCUMBER IN CULTIVATION."

This magnificent variety, sent out by us last season, is undoubtedly the grandest ever offered to the Horticultural Public. It is a fine pearl-white-spined variety, of a beautiful rich green colour, which it retains to the last. It is a remarkably shy seeder, immensely prolific, and of a quality for table that is not to be excelled. It grows rapidly to the length of 30 to 36 inches, being at the same time tender and crisp, and of the most beautiful proportions. For exhibition this variety will be found to have no equal, and for general use cannot be surpassed.

In Sealed Packets, 2s. 6d. and 5s. each. Priced to the Trade on application.

£10 IN PRIZES

Will be given by us as follows, at the Grand Provincial Meeting of the Royal Horticultural Society in 1875:—
£5 for the best Brace; £3 for the second best Brace; and £2 for the third best Brace.

The following Firms have already ordered:—

- BENARY, MR. ERNST Erfurt, Prussia.
BROWN, MR. STEPHEN Nurseryman and Seedsman, Weston-super-Mare.
BULL, MR. WM. King's Road, Chelsea, London, S.W.
BURGESS, KENT & CO. Penkhull, Stoke-upon-Trent.
CANNELL, MR. H. Nursery, Woolwich, S.E.
CARTER, MESSRS. JAMES & CO. High Holborn, London, W.C.
COOPER, MR. J. Hadleigh, Suffolk.
COOPER, MR. ROBT. Fleet Street, London, E.C.
CROSLAND, MR. B. Richmond Nursery, Sheffield.
DAWSON, MR. S. St. John Street, Peterborough.
DEAN, MR. RICHD. Nursery, Ealing, Middlesex.
DEERON, MR. ROBT. West End, Ely, Cambridgeshire.
DENVER, MESSRS. & SON 82, Gracechurch Street, London, E.C.
DICKSON, MESSRS. F. & A., & SONS 106, Eastgate Street, Chester.
DICKSON, MESSRS. JAMES, & SONS 108, Eastgate Street, Chester.
DICKSON & CO. 43 and 45, Corporation Street, Manchester.
DOWNIE, LAIRD & LAING Frederick Street, Edinburgh.
HALSTEAD, MR. J. Holme Nursery, Todmorden.
HEINEMANN, MR. F. C. Nurserymen and Seedsmen, Epsom, Surrey.
HURST, MESSRS. & SON 6, Leadenhall Street, London, E.C.
KENNEDY & CO. Nurserymen and Seedsmen, Dumfries.
KENT & BRYDON Priestgate, Darlington.
LAWSON SEED & NURSERY Co. Edinburgh.
LAWSON SEED & NURSERY Co. London.
LITTLE & BALLANTYNE Nurserymen and Seedsmen, Carlisle.
LOW & CO., MESSRS Clapton Nurseries, London, E.
MAY, MR. S. 29, Upper Head Row, Leeds.

* * * Circulars with prices and further particulars of Wire Netting, also of Iron Fencing, Expansil and other materials for Wiring Garden Walls for Fruit Trees on the French System, on application.

Messrs. J. B. Brown & Co.,
Offices—80, CANNON STREET, LONDON.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER,
2A, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability.

For Neatness.—Because all the Wires are kept perfectly tight, without the use of the Raddisseur.

For Strength.—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.

For Durability.—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system.

The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 723 yards long, wired on both sides; making a total length of 1506 yards,—our system being chosen in preference to any other.

Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

GALVANISED WROUGHT IRON FITTINGS for WIRING WALLS,
For the Purpose of Training Fruit Trees

ON THE FRENCH SYSTEM,
and as recommended by Mr. W. ROBINSON, F.L.S., in his new work, "The Parks, Promenades, and Gardens of Paris."

By this system nails and shreds are entirely dispensed with, the walls are not injured, and no labour is afforded to small insects. The Tying of the Fruit Trees is effected in one-fifth of the time required by the old system. The arrangement is so simple, that it can easily be applied to any Walls by inexperienced hands.

PRICES OF MATERIALS.—

GALVANISED RADDISSEURS for Tightening the Wires. One of these required for each Line of Wire.

No. 900. 4s. per doz.

GALVANISED WALL EYES, 6d. per dozen.
GALVANISED TERMINATING HOLDFASTS, 2s. per doz.
GALVANISED WIRE, 2s. 6d. and 3s. per 100 yards.

ILLUSTRATED LISTS, with full particulars of the above, and of FITTINGS for ESPALIER TRAINERS, on very economical principles, free on application to

BARNARD, BISHOP & BARNARDS,
NORFOLK IRONWORKS, NORWICH.

The "Victoria" Hot-water Circulator.

THE ONLY APPARATUS thoroughly adapted for its purpose. No other possesses half the merits and advantages. Warranted for ten years. Also guaranteed to far surpass and give much more satisfaction than the common Boilers. A break-down never yet known. See Illustrated Prospectus and Testimonials from most eminent men, sent post free.

Patronised by H.R.H. the Prince of Wales.
Hill Side, Clapham Park, S. E.

MESSES. CANNELL & CO. November 11, 1874.
GENTLEMEN,—After a year's trial, I have much pleasure to inform you that your large-size Hot Water Circulator has given me the fullest satisfaction; and, although I have not yet completed the three-quarters of a mile of piping, I feel sure that it will accomplish all that you have said respecting it. I may also add that I find the consumption of fuel much less than you prepared me for. You are quite at liberty to make use of this letter as a recommendation, should you think fit.
I remain, Gentlemen, your obedient Servant,
THOMAS FOSTER.

HOT-WATER CIRCULATOR COMPANY,
48 and 49, King Street, Woolwich, S. E.

STEVEN'S
TRENTHAM GREENHOUSE BOILER,
After long experience, has proved the most Simple, Economical, Effective, and Lasting Boiler extant; recently much improved.
For Illustrations, with full particulars, apply to the Sole Makers, F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

ESTABLISHED 1856.
KEEP OUT THE FROST.

WILLIAM H. HONEY'S
PORTABLE
VAPORISING STOVES,
To Burn Kerosene or any mineral oil.
They will burn for twenty-four hours at a cost of one penny for three hours. They require no attention beyond replenishing the oil.
Suitable for greenhouses, conservatories, halls, bed-rooms, &c. They will not injure the most tender exotics, nor are they in any way injurious to the health.
Prices, in block tin, gas; in copper, 50s. Copper, with glass, to give light and heat, 55s. Either will be sent on receipt of Post-office Order.

To be seen in operation at
WILLIAM H. HONEY,
263, REGENT STREET, W.
Catalogue free. No agents appointed.

HOT-WATER APPARATUS ERECTED COMPLETE.
PRICE LIST on application; or, Six Stamps for DESCRIPTIVE CATALOGUE, 4th Edition.

TRIAL OF HOT-WATER BOILERS.
Winter is the Season to Test the Efficiency of a Hot-Water Apparatus.

At the Pine-Apple Nursery the Hot-Water Apparatus, on the "One Boiler System," is allowed to be the most perfect of any in the World. The Hothouses are equal to 3000 feet in length, and the Winter Garden Conservatory is 100 feet by 100 feet. The Hot Water circulates through 12,700 feet of Cast Iron Pipe.

Gardeners are most respectfully invited to Visit and Inspect the whole.

THE
PINE-APPLE NURSERY COMPANY,
32, MAIDA VALE, EDGWARE ROAD,
ST. JOHN'S WOOD, W.

Silver Medal, 1874.
THE TERMINAL SADDLE BOILER.—
First-class Certificate, 1867; Highly Commended, 1873.

The following Letter from Mr. WM. THOMPSON needs no comment:—

"Tweed Vineyard, March 21, 1873.
"Dear Sir,—I have now had your Terminal Saddle Boiler heating two large Span-houses, 21 feet wide and 15 feet high, containing 1284 feet of 4-inch pipe, and it does its work to my entire satisfaction. In fact I know of no Boiler of the same size and cost that will do the same amount of work with the same quantity of fuel. It is an excellent Boiler. You should advertise more than you do, for it deserves to be better known than it is.—Yours truly, WM. THOMPSON."

Illustrated Circulars, post free.
THOMAS JONES, Temple Street, Manchester.

GEORGE'S PATENT CALORIGEN,
FOR WARMING AND VENTILATING.

COAL CALORIGEN,
26 6s.
Height, 36 inches; diameter, 21 inches.
GAS CALORIGEN,
23 3s.
Height, 28 inches; diameter, 24 inches.
The only Gas Stove which retains the whole of the heat given off by the gas without vitiating the atmosphere. The "Coal Stove" consumes the smallest amount of Fuel—2s. per diem being the average cost. It will be found very valuable in the Nursery or Sick Room, Lamp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).
Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 35, Queen Street, Chesham, E. C.
This Stove introduces a strong current of warmed (not burnt) fresh air.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED.

This Company, having purchased from the Dromore Patent Heating Company Mr. Cowan's valuable Patents for the United Kingdom, is now prepared to undertake the Erection of Apparatus on that System in all parts of the Country.

THE ADVANTAGES OF THE SYSTEM ARE AS FOLLOWS:—

- | | |
|--|--|
| <p>1. In most Cases it SAVES the ENTIRE COST of FUEL.</p> <p>2. The Heat is maintained more steadily than by any other System.</p> | <p>3. No Night Attendance is required.</p> <p>4. There is no Smoke or Unpleasant Smell produced.</p> |
|--|--|

THE SUCCESS OF EVERY APPARATUS ERECTED BY THE COMPANY IS GUARANTEED.

Full Particulars of this System, Testimonials, and Opinions of the Press, can be seen in the Company's Illustrated Pamphlet, which can be obtained, post free, on application.

The Company has an Efficient Staff of Engineers, and sends at any time to inspect places where the idea is entertained of Erecting the Apparatus.

The System has lately been adopted at Hazelwood, Herts, the seat of Lord Rokeby; Stackpole Court, the seat of the Earl of Cawdor; Ripley Castle, Yorkshire, the seat of Sir H. D. Inglyby, Bart; Langleybury House, Herts, the seat of Jones Lloyds, Esq.; and at many other places. Also Mr. E. Bennett, of Hatfield, says:—

"I now most cordially beg to congratulate you on the glorious success of your Heating Apparatus (now in use at Hatfield), which is working most satisfactorily, and which has exceeded my expectations. It is a decided success, and more cannot be said in its favour. Should it continue to work in the manner it now does, it will prove a great boon here, and start a new era in the heating of horticultural buildings generally. By your Compensating System we have for every barrow of coals thrown into the kiln some substantial return; by the old system the returns were ashes, and the trouble of clearing them away. I find our chalk is of an inferior quality to some I have seen in the neighbourhood, but we have plenty of heat."

The Company also undertakes the Erection of all other kinds of Heating Apparatus, and of Horticultural Buildings.

PLANS AND ESTIMATES FURNISHED ON APPLICATION.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

Office: 4, **LOTHBURY, BANK, LONDON, E.C.**

Conservatory erected at Mr. Ley's Nursery, Croydon.

LASCELLES' PATENT CURVED STRUCTURES

Are constructed entirely of Wood, bent on his Patent Principle, whereby each Bar forms a complete truss. They are strong, light, cheap and durable.

THE AGRICULTURAL GAZETTE,

A Weekly Illustrated Journal for
LANDOWNERS AND TENANT FARMERS.

Published by
W. RICHARDS, 7, Catherine Street, Strand, W.C.
Price 4d., post free 4½d.

THE AGRICULTURAL GAZETTE

gives Weekly Reports of the Metropolitan and chief
Country Cereals and Markets; Manure and Seed Markets;
Wool, Coal, Hop, Hay, and Vegetable Markets, and the Cheese
Markets of Derbyshire, Somersetshire, Cheshire, and Glasgow.

THE AGRICULTURAL GAZETTE

is the Tenant Farmer's Journal, and has published, during
the past year, Contributions and Communications from Land-
lords and Tenant Farmers in fifty-six Counties in England,
Scotland, and Ireland.

THE AGRICULTURAL GAZETTE

is the Weekly Reporter of the proceedings of all Agri-
cultural Societies, and has during the past year reported the
Meetings and Discussions of the Royal Agricultural Society of
England, the Highland and Agricultural Society of Scotland,
the Bath and West of England and Southern Counties Agri-
cultural Association, the Yorkshire and all other County Agri-
cultural Societies, Chambers of Agriculture, and Farmers' Clubs.

THE AGRICULTURAL GAZETTE

is a Weekly Illustrated Agricultural Journal, and has
published, during the past year nearly 300 Engravings, in-
cluding Woodcuts of Agricultural Machines, Portraits of
Noteworthy Agriculturists, Plans of Cottages and Farm
Buildings, Portraits of Breeds of Particular Cattle, Sheep,
and Pigs, Illustrations of Colonial Agricultural Life Illustra-
tions of Plans, Drawings of Veterinary and other subjects.

THE AGRICULTURAL GAZETTE

is a record of the Progress and Improvement of the Agri-
cultural Machine Manufacture, and has published, during 1874,
of Standings, Reports of the following Agricultural Machines for
1874:—Messrs. Howard, of Bedford; Messrs. Clayton & Shute-
leworth, of Lincoln; Messrs. Ashby, Jeffery & Inke, of
Stafford; Messrs. Ashby & Percival, of Leicester; Messrs.
Harford & Perkins, of Peterborough; Mr. Boby, of Bury St.
Edmunds; Messrs. Burgess & Key, of Brentwood; Messrs.
Casson & Toun, of Warrimour; Messrs. Cotter, of London;
Messrs. Denings, of Chard; Messrs. Garrett & Sons, of Sax-
mundenham; Messrs. Horsnail & Son, of Grantham; Mr. Le
Hunt, of Bury St. Edmunds; Messrs. Marshall & Co., of
Birmingham; Messrs. Nicholson, of Newark; Messrs. Page
& Co., of Bedford; Messrs. Samuelson & Co., of Banbury;
Messrs. Reeves & Co., of Westbury; Messrs. Ruston, Proctor
& Co., of Lincoln; Messrs. Tuxford & Co., of Boston; Messrs.
Woods, Cockedge & Co., of Stowmarket; Messrs. Barnard &
Bishop, of Norwich; & the Bristol Waggon Co., and the Reading
Agricultural Implement Co.

THE AGRICULTURAL GAZETTE

is a Weekly Record of the Progress of Agricultural Sci-
ences, and has during the past year published communi-
cations from Professor Baldwin, of Dublin; Professor
G. P. Brown, of the Veterinary Department of the Privy
Council; James Caird, C.B.; J. H. Caird, F.W.C.;
Messrs. F.K.S. Consulting Botanist to the Royal Agricul-
tural Society of England; J. Bailey-Denton; H. Evershed;
Dr. A. Gilbert, F.R.S.; James Howard, of Bedford;
H. Kains-Jackson; H. M. Jenkins, F.G.S., Secretary to the
Royal Agricultural Society of England; W. Bruce Jones, the
Royal and Kesteven; B. Lawes, F.R.S., of the late Lon-
don Ganness, M.P.; J. J. Mechi; Rev. W. J. Pope;
J. P. Sheldon, of Derbyshire; W. Smith, of Woolston;
Augustus Voelcker, Ph.D., F.R.S., Consulting Chemist to
the Royal Agricultural Society of England, and to the Bath
and West of England Society; R. Warrington, F.C.S.; Rev.
G. Wilkins, of Wix; Willoughby Wood; & Professor Wrightson,
and many others.

THE AGRICULTURAL GAZETTE

is a Record of Foreign Agricultural Progress, and
has published Periodical Communications from its Correspond-
ents in Foreign Countries, in Australia, the United States,
Canada, France, Germany, Hungary, Austria, South America,
and India.

THE AGRICULTURAL GAZETTE

contains Weekly Articles and Reports, Illustrated when
necessary, relating to the Poultry Yard, the Forester, the Bee-
keeper, the Gardener, the Householder, and the Weather.

THE AGRICULTURAL GAZETTE

is a full Record of all Matters relating to the Shorthorn
Breeders and Live Stock generally. It will contain Reports
published Reports of the Herds and Flocks at Holker, Underley,
Audley End, Havering, Lighthour, Witham-on-the-Hill,
Wyntney, West Farm, Kington, Wateringbury,
Wetting Hall, Carlton Court, Dunmore, Warley, Steyning,
Taverham Hall, Hove, near Brighton, County Cork, &c.

THE AGRICULTURAL GAZETTE

is a Journal of Veterinary Practice and Experience, and
has contained during 1874 weekly articles by its Veterinary
Editor, besides frequent reports from Veterinary Inspectors at
the leading Live Stock Markets.

THE AGRICULTURAL GAZETTE

is the strenuous advocate of Security for the Capital
employed in Cultivation, the Removal of Restrictions upon the
Cultivator, the promotion of Professional Agricultural Educa-
tion, and the increased acknowledgment of the commercial
principle along with good neighbour-hood, as properly regulat-
ing the Relationships of Landlord and Tenant and of Master
and Servant.

THE AGRICULTURAL GAZETTE

of 1875 will continue to Report, with promptness and
care, all Agricultural Markets, Society Meetings, and Agri-
cultural Machine Improvements. It will contain weekly
Articles from Correspondents in England, Scotland, Ireland,
and Foreign Countries. It will contain Illustrated Reports of
all matters connected with our Live Stock, our Plants, our
Poultry, Bees, Gardens, &c. It will contain articles descriptive
of the various Farms, and will contain weekly Reports of
articles on the Social Relations, the Sciences, the Business
Transactions, the Practical Details of Agriculture. It professes
to be a Political Journal, but it will not hesitate to discuss any subject
affecting the position or relations of those whose Professional
Order it desires to be. It will be found absolutely independent,
excepting only of such rules as govern honorable men; and
nothing which affects the interests, whether of the Landowner,
the Tenant Farmer, or the Labourer, will be excluded from its
columns.

THE AGRICULTURAL GAZETTE

VOLUME for 1874
Can be had at 7, Catherine Street, Strand, W.C.,
Price £1 2s.

It contains an unequalled Agricultural History of an eventful
agricultural year, and a large quantity of information of perma-
nent agricultural interest.

THE FLORIST AND POMOLOGIST:

A PICTORIAL MAGAZINE OF GARDENING.

Monthly 1s.; Annual Subscription 12s., or Free by Post, 13s.

Two finely Coloured Plates issued with each Number.

Established as the "Florist" in 1848.

The FLORIST and POMOLOGIST is a Popular Monthly Magazine of Gardening in all its Departments.
It supplies a class of information required by GARDEN AMATEURS, as well as by PROFESSIONAL and COM-
MERCIAL GARDENERS. It keeps its readers informed as to the NOVELTIES which may interest them, and instructs
them as to the best forms of GARDEN PRACTICE.—The subjects for the COLOURED PLATES are selected with the
greatest care, and the drawings are made by the leading Floral and Botanical Artists; while as the LETTERPRESS
is contributed by some of the most distinguished Practical and Scientific Horticulturists of the day, the sound
practical character of the information contained in its pages is assured.

The FLORIST and POMOLOGIST may be obtained through any Bookseller or Newsgate, or direct from the
Publisher,

WANT PLACES.

To Gardeners in Want of Situations, WHOSE CHARACTERS WILL BE A STRICT INVESTIGATION. THE PINE-APPLE NURSERY COMPANY devote special attention to this important matter—proper Men to suitable Situations. For a GARDENER, apply to the Managers, or to the proprietors, Mr. JOHN BESTER, the Pine-Apple Nursery Company, Maid Vale, London, W.

GARDENER (HEAD).—Age 36, married; all his branches, including the Forcing of Fruits, Vegetables, and Flowers, and Stove and Greenhouse Plants. Good character, &c.—Apply to Mr. Eaton, Shepperton, near Abingdon; or Read Hall, near Whalley, Lancashire.

GARDENER (HEAD).—The Advertiser, middle-aged, married, one child, who has devoted over twenty years to Gardening in its various branches, will pay five guineas to any one who will procure him a suitable situation as Head Gardener, or second class Gardener. Wages not under £70 per annum. References good.—V. K. T., 28, Bed Street, Luton, Beds.

GARDENER (HEAD).—Age 30, married, no family.—HENRY GODFREY, Nurseryman, Stourbridge, can with confidence recommend the above to any Lady or Gentleman being well up in his profession, having had great experience in Early and Late Forcing of Fruit, Flowers, and Vegetables, Kitchen and Flower Gardening, &c.; also being an expert in sowing, and well-contrived Man. Testimonials can be had from several former employers.—H. H., as above.

GARDENER (HEAD, WORKING).—Has a thorough knowledge of the profession in all its branches, including all kinds of Fruit, Flower, and House, Flower, and Kitchen Gardening, Early and Late Forcing, and a First-class Grower of Orchids. Seventeen years' first-class character, and highest testimonials.—N. V. Z., J. Ivery & Son, The Nurseries, Reigate, Surrey.

GARDENER (SINGLE).—Age 28; thoroughly understands Greenhouses, Fruit Trees, and Flower and Kitchen Gardening. Nineteen years' experience. Four years' good character.—G. A., Post Office, West Wickham, Kent.

GARDENER (SECOND).—A good Establishment.—Age 26. Good character and first-class references.—S. G., 13, Elizabeth Place, Kochampton, S.W.

GARDENER (UNDER).—Age 24; several years' experience. Good character.—T. KNIGHT, The Nursery, Warwick Road, Stratford-on-Avon.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 24; well up in Pines, Vines, and Early and Late Forcing; also the Cultivation of Stove and Greenhouse Plants. Eight years' experience. Good references.—J. W. B., Eastgate Nurseries, Peterborough.

FOREMAN, in a Seed Shop or Nursery in or near London.—Age 26, married. Good experience and reference.—W. H. D., Spiring Nursery, St. Alban's.

FOREMAN, or SECOND, in a Nobleman's or Gentleman's Garden.—Age 23. Good references.—C. M., Hardwick Gardens, Elmester, Salop.

PROPAGATOR.—A young Man, several years' experience in all departments. Good reference as to character and ability. Has had a charge.—A. B., Belmont, Strand, W.C.

PROPAGATOR, of Soft-wooded Plants.—Age 25. Good character as to ability, &c. Seven years' experience.—T. H. C., Eastgate Nurseries, Peterborough.

To the Seed Trade. SHOPMAN, or MANAGER.—Fifteen years' experience in all branches of the Trade.—H. S., Gardeners' Chronicle Office, W.C.

SHOPMAN, or ASSISTANT SHOPMAN. S.—A young Man, of character and ability in the Seed Trade. First-class testimonials.—T. B., Gardeners' Chronicle Office, W.C.

FARM BAILIFF, or STEWARD.—The Advertiser (age 40, married) desires re-employment; has had nineteen years' experience in all sorts of Light and Heavy Soils, Breeding, Rearing, Buying, and Selling of Stock. Will conduct Dairy and Poultry. Highest references given.—N. Y. X., St. Yves, Exeter, Devon.

KINAHAN'S S. L. L. WHISKY. This celebrated and delicious and mellow spirit is the very CREAM OF IRISH WHISKIES, in the quality unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and Cork Branding. Kinahan's Whisky. Wholesale Depot, 20, Great Titchfield Street, Oxford Street, W.

Grateful—Comforting. E P P S S C O C O A BREAKFAST.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which may be safely used by all weak and nervous persons. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame. See article in the *Brit. Revue*.

Made simply with boiling water or milk. Sold in packets (in tins for abroad) labelled:—JAMES EPPS AND CO. HOMOEOPATHIC CHEMISTS, 48, Threadneedle Street, and 170, Piccadilly, W. Works:—Euston Road, and Camden Town, London, N.W. Makers of Epps's Glycerine Jujubes for Throat Irritation.

Lea & Perrin's Sauce. THE "WORCESTERSHIRE," Improved the appetite, and aids digestion. Unrivalled for piquancy and flavour.

ASK FOR LEA AND PERRINS' SAUCE, and see the names of LEA AND PERRINS on all Bottles and Labels.

Agents—CROSSE AND BLACKWELL, London; and sold by all Dealers in Sauces throughout the World.

FREEDOM FROM COUGHS in ten minutes is given by DR. LOCOCK'S PULMONIC WAFERS. 12,000 Cures have been published in the last year of Asthma, Consumption, Bronchitis, Croup, and all the Coughs of Infants and Lungers. In Hysterical, Nervous, and Heart Complaints they are unfailing, while in Rheumatism and Nervous Pains they act like a charm. Sold by all Druggists at 1s. 2½d. per box.

A NEW AND PERFECTLY DISTINCT WRINKLED PEA, SUTTONS' GIANT EMERALD MARROW.

Far superior to any of the present tall wrinkled varieties.

NOTICE.—This splendid New Pea, together with the other valuable Novelties introduced and offered by Messrs. SUTTON this season for the first time, can only be obtained direct from them.

Parcels value 20s. and upwards Carriage Free.

SUTTONS' GIANT EMERALD MARROW PEA. Price, 5s. per Quart.

This New Wrinkled Pea is of a distinct type, and far superior to any of the present tall wrinkled varieties. We have had it under trial for the past 6 years, while getting up a sufficient stock to offer to the public, and every season its decided superiority has become more manifest when growing alongside all the best sorts. The leaves, stems, pods, and peas possess the peculiar glass-green colour of our Emerald Gem, but it is a wrinkled variety, growing to the height of 6 feet, and coming in for use at the end of June and beginning of July. It is more robust in habit than any of the 84 sorts grown in our experimental grounds last year. From its earliest stages of growth its distinctive character is at once apparent, and it resists drought

and mildew in a remarkable manner. In productiveness it is unequalled, and superior to any of the high-priced varieties recently sent out. The pods are from 4 to 4½ inches in length, and hang very thickly, in pairs; they contain from eight to ten fine peas. The flavour is delicious; and the Peas come to table with the same beautiful green colour that characterises the entire plant.

This fine Pea is recommended by the principal Horticultural Authorities in the country. A Coloured Plate of the above, also Coloured and other Illustrations, with full particulars of other valuable Novelties for 1875, appears in SUTTONS' AMATEUR'S GUIDE. Price 1s., Post Free. Gratis to Customers.

At the Royal Horticultural Society's Meeting, South Kensington, July 7, 1875, we offer Silver and Bronze Medals, with valuable Money Prizes, for Six Dishes of Wrinkled Peas, to include Suttons' Giant Emerald Marrow, Duchess of Edinburgh, and Duke of Edinburgh.

SUTTON & SONS, THE QUEEN'S SEEDSMEN, READING.

Editorial Communications should be addressed to "The Editor;" Advertisements and Business Letters to "The Publisher," at the Office, 41, Wellington Street, Covent Garden, London, W.C. ROZEEN and SON, Overseas, near Haarlem, Holland.

THE GAINSBOROUGH SEED ESTABLISHMENT. Dixon's X L Celery—1s. 6d. per packet. JOHN ETHERINGTON DIXON, Seed Grower and Merchant, Lord Street, Gainsborough, having grown a quantity of this, one of the finest Red Celeries extant, offers it to those who desire a particularly fine lot of this vegetable. It is very crisp and delicious, and a sort that when once tried will be well appreciated, as it is very early and will stand forcing better than any other variety. The usual discount allowed to the Trade. On account of the short crop of this Celery early orders are requested. J. E. DIXON, Seed Merchant, &c., Lord Street, Gainsborough.

Hollies.

ANTHONY WATERER respectfully invites the attention of Holly buyers to the very fine Stock to be seen growing at Knapp Hill. It comprises upwards of Thirty thousand Plants, from 3 to 10 and 12 feet high, of the finer Gold and Silver kinds, affording a choice in size and variety such as can be met with in no other Nursery in Europe. Every Plant has been recently removed, and will be guaranteed to stand forcing. The Stock of Common Green Hollies also occupies 5 acres of land, and Purchasers will find them in large numbers of all heights up to 15 feet. Knapp Hill Nursery, Woking, Surrey.

WRIGHT'S GIANT WHITE CELERY.

—This is quite a distinct pure white variety; it is very crisp, and of excellent flavour, combining a robust, compact habit, forming very solid hearts, which blanch very easily. Heads of this variety have been grown weighing from 8 to 10 lb. each, and can be highly recommended for exhibition, private or market purposes. 1s. per 1/2 oz. packet. WRIGHT'S RED GROVE and WHITE GROVE CELERIES.—These possess all the good properties of the Giant White, but do not grow quite so large. 1s. per 1/2 oz. packet. The usual price of Trade.

The following fourteen firms have secured supplies of the above for this season, for which I beg to thank them, soliciting extended patronage:—

- Hunt & Son, London. Lawson Seed Co., Edinburgh. Cooper, Robt., London. Downie, Laird & Laing, Edinburgh. Daniel Bros., Norwich. Drummond & Son, Sterling. Dickson, Brown & Tait, Manchester. Howden & Co., Inverness. Dixon, E. W., Hull. Laird & Sinclair, Dundee. Holmes, Ed., Lichfield. Finney, S., & Co., Newcastle. Brotherton, Wm., Leeds. Unkley, Geo., Leeds. CUCUMBERS.—Wright's Wonder, fine white-spine, and Wright's Improved, black-spine; these will grow to 20 inches long, are very prolific, and of a good flavour. Parson's Long Gun, Rollinson's Telegraph, Berkshire Champion, Improved Lion House, Masters' Early Prolific. 1s. per packet. Lowest price quoted per 100 seeds on application. W. WRIGHT, Seed Merchant and Nurseryman, Market Square, Reford, Notts.

CATALOGUES may be had free on application to WITTY AND SON, The Nurseries, Cottingham, Hull.

NEW and SELECT VEGETABLE SEEDS.

PROCCOLI, Christie's Self-Protecting Late White.—This valuable Broccoli has been raised by Mr. Christie of Aswarby, and is pronounced by all who have seen it as the finest self-protecting Late Broccoli in cultivation. See Testimonials. Sold only in sealed packets, 1s. 6d. each. BORECOLE, Variegated Triple-curved, extra selected.—This stock includes all the best varieties for decorative purposes, for garnishing, the embellishment of the flower garden and the dinner-table. Price 6d. and 1s. per packet. BRUSSELS SPROUTS, Roseberry, extra selected.—Price 1s. per ounce. CELERY, Dixon's X L Red.—A very strong grower, early, hardy, ripens in cultivation. Price 1s. per packet. Prize wherever exhibited during last season, and is acknowledged to be a very decided acquisition. Price 1s. 6d. per packet. CELERY, Dixon's Mammoth White.—The best White extant. Price 6d. and 1s. per packet. CUCUMBER, Burnett's Perfection.—Growing from 24 to 30 inches long, fine flavour and very productive. Price 1s. 6d. per packet. CUCUMBER, Rollinson's Telegraph.—True, handsome, and very prolific. Price 1s. per packet. LETTUCE.—Dixon's Champion Green Cos still maintains its well-known reputation as being the largest and most delicate lettuce in cultivation. Price 6d. and 1s. per packet. PEA, Dixon's Yorkshire Hero.—My stock of this magnificent variety of the wrinkled Marrow is grown from the original stock introduced by me a few years ago. It is exceedingly prolific, having as many as sixty or seventy pods on a single stem. The pea, of a most delicious Marrow flavour, is fourteen days earlier than Veitch's Perfection, and withstands the effects of mildew better than any other variety. Price 1s. 6d. per quart. TURNIP, Silver Ball.—A superb white, solid root, fine shape, flesh tender and delicious; very select stock. Price 1s. per ounce packet. EDMUND PHILIP DIXON, The Yorkshire Seed Establishment, 57, Queen Street, and 75, 76, and 77, High Street, Hull.

IMPORTANT to Clergymen, Employers, Landowners, Army Officers, and SECRETARIES OF SOCIETIES.

Extremely fine and well ripened this season.
 DWARFS, new varieties of 1874, 36s. per dozen.

SPECIAL ROSES, raised here at Cheshunt.

TEA, or HYBRID TEA, CHESHUNT HYBRID.—Of this deservedly favourite Rose we had, at the commencement of the season, 2000 plants, showing our estimate of its value. It is still finely in bloom here, and is valuable in all ways, more especially as a free autumnal climber. Standards, 2s. 6d.; Dwarfs, 2s.

H.P. REYNOLDS HOLE.—The finest dark maroon Rose yet raised, which has a good vigorous habit and free flowering character. Standards, 2s. 6d.; Dwarfs, 2s.

H.P. WILSON SAUNDERS.—A grand novelty. A peculiarly free perpetual crimson Rose. Standards or Dwarfs, 5s. each.

H.P. THE SHAH.—The brightest-coloured garden Rose yet obtained. Standards or Dwarfs, 3s. 6d. each.

ROSES CULTIVATED IN POTS, speciality of the Old Nurseries.

ROSES—Teas and Hybrid Perpetuals, established for forcing or pot culture:—

EXTRA FINE PLANTS, in 8-inch pots, 42s. per dozen.

QUARTER SPECIMENS, in 9 to 10-inch pots, 60s. to 84s. per dozen.

SPECIMEN ROSES, 42s. to 105s. each.

ROSES ON OWN ROOTS.

SORTS, as Special Lists, in 48's, 12s. to 18s. per dozen, 100s. per 100.

FRUIT TREES.

Of Espalier Palmetti-Trained Fruit Trees for Walls PAUL & SON hold a very large Stock, with from two to six tiers of branches. 3s. 6d. to 7s. 6d. each.

HARDY TREES AND SHRUBS, NEW AND OLD.

We will be glad to send, Post Free,

DESCRIPTIVE CATALOGUE of FRUIT TREES and HARDY GROWTHS,

WITH
 SPECIAL SUPPLEMENT of NEW HARDY TREES and SHRUBS.

THE
ILLUSTRATED GUIDE for AMATEUR
GARDENERS—Spring, 1875.

Now ready, price 1s. post free. Gratis to Customers.

A thoroughly practical and comprehensive Guide for the Amateur or professional Gardener, containing a select List of choice Kitchen Garden and Flower Seeds; ninety-six pages of beautifully illustrated letterpress, with complete directions for the successful management of the Kitchen and Flower Garden throughout the year; also two superbly finished coloured plates. The whole in an illuminated cover of the most exquisite design and workmanship.

The *London Review* says—"This is the most beautiful garden catalogue we have ever seen, the coloured illustrations are inimitable. Messrs. Daniels, the eminent seed growers, may justly feel proud in issuing such a complete and truly valuable catalogue as this, which will enhance the high reputation they have already so deservedly gained."

DANIELS BROTHERS, Seed Growers,
THE ROYAL NORFOLK SEED ESTABLISHMENT,
NORWICH.

KNIGHT'S NEW PEA,
DUKE OF CONNAUGHT.

This is a really useful new Pea, of a branching habit, about 3 feet high, and very prolific—well adapted for second and general crops; also for late sowing, as it is never affected by mildew. It is a fine exhibition and market Pea.

Quarts, 5s.; Pints, 2s. 6d.

THE OXONIAN PRIZE ONION.

A very superior white Onion, growing to an immense size, quite surpassing the white Spanish, both in mildness of flavour and quality of bulb. Ripens early. Has obtained 1st prize wherever exhibited.

Per Packet, 1s.

NOVELTIES OF STERLING MERIT.

JAMES VEITCH & SONS

HAVE MUCH PLEASURE IN DIRECTING ATTENTION TO THE FOLLOWING

NEW AND CHOICE VEGETABLE AND FLOWER SEEDS.

TENDER AND TRUE CUCUMBER.

This splendid new Cucumber was raised by Mr. Douglas, Gr. to F. Whitbourne, Esq., Loxford Hall, Hford.

It is a seedling from Telegraph and Blue Gown, combining the good qualities of both these fine kinds.

It is very symmetrical in shape, with scarcely any neck, and grows to a length of about 24 to 30 inches. The colour is of a beautiful deep green shade, and the flavour is excellent. It is a free bearing variety, of very strong constitution, and is equally suitable both for winter and summer use. It received a First-class Certificate from the Royal Horticultural Society on May 3, 1874, and was awarded 1st prize at each of the spring shows for the past three seasons. It also gained first honours at Birmingham on July 7, 1874, in competition with twenty-one other kinds.

Price, 3s. 6d. per packet.

CULVERWELL'S PROLIFIC MARROW PEA.

This remarkably fine late Pea has been placed in our hands for distribution by Mr. Culverwell, Gardener to Mark Millbank, Esq., Thorpe Perrow, Bedale, Yorkshire.

Mr. Culverwell describes it as one of the finest late Peas grown for productiveness, as it bears pods from within a short distance of the ground to the top of the haulm, and thus the crop lasts a long while. The pods are straight, pale green, and contain from five to six exceedingly large peas of excellent quality. It is of strong and robust growth, from 5 to 6 feet in height.

We have letters from Mr. Westcott, Raby Castle, Darlington, and Mr. Saul, Stourton Park, Knebrough (to whom it was sent for trial), speaking of its wonderful quality. The former says, "There is not the slightest doubt in my mind of its being the greatest acquisition among Peas that we have had for many years past, and truly deserving the term 'new and distinct,' the flavour quite equalling, and if possible surpassing, the world-wide-famed variety Veitch's Perfection." Mr. Saul speaks of it as follows:—"It is a most deliciously-flavoured Pea, and its great merits when known must soon cause it to become a standard variety of the year first-class."

The ripe seed is very large, bright green, wrinkled, and very distinct in appearance.

Price, 5s. per quart.

CAULIFLOWER, VEITCH'S AUTUMN GIANT.

This extremely valuable variety is perfectly distinct from any other sort. The heads are magnificent, beautifully white, large, firm, and compact, and, being thoroughly protected by the foliage, remain longer fit for use than any other kind.

Price, 1s. 6d. per packet.

PREMIER RUNNER BEAN.

A very distinct Runner Bean, growing from 4½ to 5 feet high, and producing continuously a large number of pods, in appearance like those of a Dwarf French Bean, very tender, and invaluable for table purposes.

The Editors of the *Gardeners' Chronicle*, in reviewing the Novelties of 1868, speak of it in the following words—"Amongst Runners, Premier is a decided acquisition, a true Kidney Bean, with a running haulm, and consequently a continuous bearer."

We extract the following description of this variety from *The Garden* of March 24, 1874, p. 225—"Premier is really a runner form of the Dwarf French Bean, and when grown with a large number of other kinds at Chiswick it was considered sufficiently meritorious to receive a First-class Certificate, and since then, in its peculiar form, it has not been excelled. The plant grows to a height of about 5 feet, and does best on ordinary pea-sticks. It commences to crop close to the ground, and continues to bear heavily until the winter. The green pods are very tender and delicious when cooked, and it is altogether a really useful garden vegetable."

Price, 5s. per quart.

EASTNOR CASTLE GREEN-FLESH MELON.

This splendid Melon, a hybrid between Beechwood and Victory of Bath, was raised by Mr. Coleman, Eastnor Castle, Leicestershire. It has been exhibited at several of the principal shows during the past season, and has been universally admired. It was also in Mr. Coleman's First Prize Collection of Fruit, exhibited at the great Birmingham Meeting, July, 1874.

It takes its setting, colour, and depth of flesh from Beechwood, and ripens off pale yellow. It is a free grower, 1er sizer, and bears a profusion of fruit, generally averaging about 3 or 4 lb. in weight.

When exhibited at the Royal Botanic Society, where it gained the First Prize on June 24, 1874, it was acknowledged to be the deepest green-fleshed and best flavoured Melon ever shown.

Price, 2s. 6d. per Packet.

FLOWER SEEDS.

BLUMENBACHIA (CAJAPHORA) CORONATA.

This very pretty plant was introduced by us from Peru, through our late collector, Mr. Pearce. It is a dwarf, shrubby-growing annual, forming handsome tufts about 1½ feet high by about 1 foot through. The flowers, which are borne in great profusion, are of a striking orange-red colour, coronal-shaped, and are about ¾ inch deep by 1½ inch in diameter.

Mr. Worthington Smith, in describing the stinging hairs of this plant in the *Gardeners' Chronicle*, of September 6, 1873, p. 1221, commences his article thus—"The presence of danger always renders beautiful objects still more fascinating. 'The Rose, with all its thorns, is best of all.' This is the reason why the beautiful plant of *Blumenbachia coronata*, exhibited by Messrs. Veitch at the Royal Horticultural Society, proved so attractive to many a visitor in the Council-room. The beautiful habit and fine large orange-coloured flowers of this plant were fascinating enough in their way, but the label, requesting no one to touch it on account of its stings, completed the charm."

A Coloured Plate of this plant was given in the *Floral Magazine* for November last.

Price, 1s. 6d. per packet.

RICINUS GIBSONII.

A very fine dark-leaved variety of this useful group of sub-tropical plants. It grows from 4 to 5 feet high, has a fine branching habit, and particularly distinguishes itself from every other variety by the intense deep red colour of its foliage, reminding one of some of the dark-leaved varieties of *Amaranthus*, which are so much grown for the purpose of giving colouring and effect to groups and masses. It will undoubtedly take a high position in the sub-tropical garden on account of its bright hue, which is retained during the whole of the season. It is in every way so distinct and fine a kind that we have considered it worthy of being named after Mr. Gibson, late of Hyde Park, who has done so much for the advancement of sub-tropical gardening in this country. It was imported by us from the Philippine Islands.

Price, 1s. 6d. per packet.

CELOSIA HUTTONII.

This very beautiful plant was introduced by us through our collector, the late Mr. Hutton, after whom we have named it. It is of compact pyramidal form and bushy habit, profusely branched, each leading branch being tipped with a small spike of bright crimson flowers. In colour the plant resembles the well-known *Treasure Linden*, the upper surface of treated leaf being of a deep chestnut colour, while the under side is of a bright crimson shade. It grows to a height of 1½ to 2 feet, leaf being of a deep chestnut colour, the leaves measuring 3 to 4 inches long by ¾ to 1½ inch wide at the broadest part. As a bedding or sub-tropical plant it will take a high rank, from its fine habit and rich and effective colouring.

Price, 1s. 6d. per packet.

Blumenbachia (Cajaphora) coronata.

ILLUSTRATED PRICED CATALOGUE OF SEEDS, now published, Post Free on application.

Special Offer to the Trade of this Season's Novelties and other Choice Seeds forwarded on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

The Finest White Spine Cucumber
SUTTONS' DUKE of CONNAUGHT.

Notice.—This splendid New Cucumber, together with the other valuable Novelties introduced and offered by Messrs. SUTTON for the first time this season, can only be obtained direct from them, and bear their Trade Mark.

ALL GOODS CARRIAGE FREE.

FIRST PRIZE
 GRAND INTERNATIONAL
 SHOW,
 MANCHESTER, 1873.

Sixteen Gold, Silver, and Bronze Medals and valuable Money Prizes are offered by Messrs. SUTTON at the Royal Horticultural Society's

Seedling during 1875 for the best specimens of White New Varieties of Cucurbits, Fruits and Flowers. Particulars may be had on application.

SUTTONS'
DUKE of CONNAUGHT CUCUMBER.

This remarkably handsome Cucumber was raised by one of the most eminent Manchester growers, from whom we have purchased the entire Stock of Seed.

We have no hesitation in recommending it as the very best and handsomest white-spined variety in cultivation. It is perfectly level, from 22 to 26 inches in length, very uniform, with a bright green skin, well covered with bloom, spine scarcely discernible, and the fruit is very slightly ribbed. Its great recommendation, however, is its wonderfully small handle, not more than $\frac{1}{4}$ to 1 inch in length; this gives it a beauty of form not possessed by any other Cucumber, and shows its decided superiority for exhibition and table purposes. It is remarkably productive and of delicious flavour.

In addition to the First and Second Prizes at the Manchester Grand International Exhibition, 1873, First Prizes have been awarded for it during the past three years wherever exhibited, which includes the following Shows:—

A HOLIDAY IN NORWAY.

(Continued from p. 8.)

APPROACHING Vasenden, the road descends by bold, sweeping zig-zags down a fearfully grand gap in the mountains, the cleft sides of the gorge rising black and threatening, and becoming more awful and oppressive in their shadowy vastness as we descend more deeply into the valley. A waterfall at the head of the gap falls in a great white sheet over the rocks, and roars in a succession of cataracts down the abrupt declivity. Enormous masses of rock choke the space on each side of the road. Wild Raspberries grow abundantly amongst these fragments of rock. From Vasenden it was necessary to relinquish the carriage, and to take a horse (pony in our comprehension of the fact), as the roads across the mountains to Ulvig are too precipitous for carriages. A Norsk horse can climb a mountain and go over stony ground better than it can travel on a level road, at least, in my experience of riding, the only time a horse fell with me (or that others made false steps) was on smooth roads. Going over a somewhat bare and desolate region towards Ulvig, the crests of the hills above being covered with snow, the vegetation on the sour black peaty soil was not striking or varied—dwarf Willow, Vaccinium, Calluna vulgaris, occurring more abundantly than other forms. I was tempted to dismount, and clamber over some rough ground, on seeing a whitish plume of flower hanging from the face of a black mica slate precipice; on reaching it I found it to be Saxifraga Cotyledon. I subsequently discovered the same plant in great profusion, and gathered specimens of it with delight. Tufts of the Parsley Fern grew by the rocks that skirted a small mountain lake further on the road.

Reaching Ulvig, I found a very good resting-place at Madame Wilhelmson's, which was not unwelcome after a tedious ride and walk encumbered with a knapsack and travelling bag. Very early on the following morning I took a boat to go to Eide Fjord, a sail that occupies from three and half to four hours. On landing and inquiring for a horse to take me to the Voring Foss, I learned that the hotel was full, that every animal was taken up; visitors from the yacht moored off the place had also swelled the number of excursionists to this noted foss, and there was nothing for it but to walk, or give up the visit to the waterfall. I chose the latter course, and re-engaged the boatmen to pull me back to Ulvig. The wonderful beauty of the scenery that encompasses this branch of the Hardanger Fjord, the loveliness of the day, the sparkling purity of the rippling waters, made the voyage up the inland sea one of unmixt enjoyment. No words can convey an adequate idea of the grandeur of Norwegian scenery, and even the pencil but imperfectly represents its glories. On each side of this fjord the rocks, in endless diversity of form, rise grandly from the water, sometimes precipitously, often in bold sweeping slopes; Pines cluster on the hill-sides in every possible spot, and where a little ledge or less abrupt slope occurs, there the farmer has fixed his dwelling; there we see the closely-shaven grass, every blade of which is treasured; the plot of Barley, the field of Oats, and outbuildings enough to secure all the produce of the

farm, for stacks are never made as with us, and everything is housed in Norway. Boats and nets tell us that the waters afford a harvest as well as the land.

At the head of the fjord, the bay round which Ulvig is situated is encircled by mountains, the most prominent rising to a height of 5200 feet. This and others about it are capped with snow, which, slowly melting, send down ceaseless torrents, that run like lines of silver down the steep sides of these frowning masses of rock. At Ulvig during the summer the roar of falling water is continuous; there is a very fine waterfall and a succession of cascades at the head of the fjord, one of which is spanned by a wooden bridge, and along the sides of the broken stream saw-mills are placed, each mill having its own conduit. The water-power available for machinery in Norway is enormous; much of it is readily accessible, and it may probably be more utilised as coal becomes more precious.

Returning over the hills that intervene between Vasenden and Ulvig I saw, while traversing this solitary and sterile region, some mountain sheep, free, active, handsome creatures, with little of the stolid stupid fatness about them that characterises our advanced breeds; they had a half-wild and watchful, wary look, as if scenting the mountain air had given them dim visions of ancient freedom.

The boy who accompanied me to take back the pony I rode, left me for a short time, and, returning, brought me a handful of Multebar, Rubus arcticus—a fruit that would surely pay for cultivation in Norway, as it will grow and thrive in these upland situations, and on soil so adverse to ordinary hardy fruits. The northern slope of the range has a straggling growth of Pine, Birch, and Alder upon it, amongst which, with tinkling bells, I saw a herd of cows feeding on the scant herbage that was afforded by the poor and often swampy ground.

Waiting for a fresh horse at the station, I went into the family-room to sign the day-book and take shelter from the rain, which had begun to fall. A line of wooden bedsteads occupied one side of the room. The cradle, within reach of the chief bed, was a wooden box, suspended by cords to the thin end of a long pole, which was fastened to the rafters above. A very slight pull caused the hensky to spring rapidly up and down, imitating the movement of a mother's arms more naturally than our rocking cradles.

After a night's rest at Vossevingen I started for Gudvingen. The intervening stations are not inviting, but the country presents many scenes of savage grandeur. Just after leaving Twinde, the rocky bed of the river is contracted, and is spanned by a simple bridge of wood, beneath which pours a volume of foaming water, pitching down a fall with a great roar and rush. It is most tantalising not to be able to carry off pictorial recollections of such charming bits of river scenery. In Norway, if a man sketches, he must travel slowly, and be prepared to linger at unexpected spots. He should have a tent and ample provisions. An angler must remain by his river, a sportsman must go to the mountains, an ordinary traveller, with limited time, and a desire to see as much as possible, must push on. The last arrival at stations sometimes a distance of 10 miles from similar houses, often has but a poor chance of lodging or entertainment. I have the picture before me of two wet and weary pedestrians, who came to the Vossevingen Hotel late one evening, and were, owing to the crowded state of the little place, sent away without rest or refreshment.

Travelling in Norway is rendered less fatiguing and more enjoyable by the excellence of the public roads. The labours of the engineers employed in the task must have been enormous, in carrying out some of the great works that have rendered stations before inaccessible to

vehicles of easy attainment. Thus to reach Gudvingen, which is situated at the lower end of a profound valley close to a branch of the Sogne Fjord, a road has been carried from the heights above by a series of gradually sloping curves, by which the traveller can descend with his carriole, without the least danger, to the comparatively level road that is formed along the lower part of the valley. No tourist in Norway should fail to visit Gudvingen. Before the descent is accomplished the view of the mountain region, which this great rift in the hills opens up, is magnificent. To the right and left of the sloping road waterfalls pour over the black cliffs, and, uniting, form the river that runs down the valley. Enormous blocks of granite, gneiss, quartz, and porphyritic rock lay tossed about, seeming the theatre of the sudden disruption of the subterranean world. The dark walls of rock rise up to a giddy height, and appear to gather in vastness above the wondering gazer, and dwarf him into pigmy proportions the more he descends to the lower depths of the gorge. It is awful and awe-inspiring to stand at the foot of a great black cloud-crested rock, that rises before you like a veritable presence. The element of danger adds to the sublimity of the scene. The masses scattered about, which have been hurled from its greatest heights, tell you that danger lurks in its craggy frown. The ceaseless splash of waters from the melting snows show that agencies are at work that even these masses of rock cannot resist; and the tiny cascade that falls like rain-dust from its crest, its scoring time-marks that surely forbode decay and destruction. The great masses of rock that are scattered about the valley are covered with what may be likened to miniature forests, composed of the most beautiful mosses and lichens; these afford a protective covering to the stone, preserving it from the decay to which exposed surfaces are liable.

Leaving Gudvingen with the utmost regret the following day, the obligation being enforced by the arrangements of the steamer, which only calls once a week, I passed down the Sogne Fjord, and landed at Lierdalsören in the afternoon. A crowd of carts and carriages met the vessel, but delays and difficulties occurred in securing a suitable conveyance, and late in the day, with several English tourists, I started on my journey to the Fille Fjeld. A glorious salmon river bounded the road for some distance. Changing my horse at Blaafoten, I pushed on with all possible speed towards Husum, but the abruptness of the ascent made the way long; though every hill gained, and every turn of the road brought the finest imaginable mountain scenery into view. At one point I saw some distinct river or lake terrace, formed evidently when this region was at a lower level than it is at present. There are other and similar evidences of a gradual upheaval of large areas in different parts of the country; but the night closed in, and as it was quite dark when we reached the station, it was no slight disappointment to find that the house was full, and that not even the accommodation of a floor could be afforded, and we had no choice but to change horses and proceed towards the next station. There are some impressions which are never effaced, and this journey through scenery of such savage grandeur, magnified by the sombre shadows of the night, and often rendered terrible by the roar and rush of waterfalls and foaming rivers, dashing in white foam hundreds of feet below, or sometimes from the top-most cliffs above the narrow road, that seemed itself oftentimes suspended in mid air, is one that can never be forgotten.

Murray describes the scenery which the obscurity of night only allowed me imperfectly to realise. "The road continues to ascend, the torrent thundering close alongside all the way. The falls and cascades which this stream makes

are most numerous, and afford fine subjects for the sketcher. Some of the peasants' cottages are particularly picturesque. They are built of solid trees on foundations of rock, generally one storey high; when more, a gallery is made outside. The roofs are constructed with planks, overlaid with Birch bark, and then covered all over with turf. The church of Borgund, a singular and interesting edifice, built in the eleventh or twelfth century, is passed on this road. The road keeps the bank of the river almost all the way, and runs through a magnificent pass, at times so narrow that the road is blocked out of the face of the perpendicular rock. In one place it passes through a cleft in the rock, just wide enough to allow a carriage to pass. In a narrow part of the pass the road is carried across the stream a great distance above it. The views both up and down are very fine."

At 2 A.M. we reached Husum, and found, fortunately, that we were in advance of the rush of travellers. After resting here for a few hours, I again mounted my carriole and continued on my way, influenced by the thought that, as many tourists were behind, any delay would deprive me of the accommodation I required near the fjeld, and my companions were urged by the desire to secure horses to carry them well on towards Christiania. Keeping by the banks of the Lierdals Elf the road goes through a magnificent pass; huge masses of rock lie scattered beneath the mountain, like relics of the earlier world. Approaching more nearly the plateau of the fjeld the scenery becomes more savage in its grandeur—the wastes of snow come nearer, vegetation becomes more alpine in character, trees have a stunted and weather-worn look, and horses and travellers are not sorry to rest for a short time at Maristuen. This station is 3900 feet above the sea. Looking round at the great snow-covered wastes there seemed little to tempt one to linger, and I decided to proceed to the next station. *William Ingram, Belvoir.*

(To be continued.)

New Garden Plants.

MASDEVALLIA POLYSTICTA, *Rehb. f.*

This novelty has just flowered in two places—at the Royal Exotic Nursery of Messrs. Veitch, and at the garden of Donaueschingen belonging to the Prince Carl Egon zu Fürstenberg, under the able management of Herr Hofgärtner Kirchhoff. It produces numbers of flowers at once, and if there are very many spikes at once in a mass it may well deserve the name of a gem. I must, however, state that all the three inflorescences I have obtained are of the variety with very numerous small dark brown spots on a white ground colour, while that variety which has few great dark spots may better explain M. Roez's allusion to *Ondotoglossum n-ivium*. I have it in my herbarium, and hope it may appear among the, no doubt, rather numerous imported specimens. *H. G. Rehb. f.*

NEW FRUITS OF 1874.

In the fruit department the acquisitions during the past year have not been quite so abundant as usual. The season, although extremely trying during the early part to the fruit cultivators, was not on the whole an unkindly one for fruits in general. But for the frosts in May the crop of fruit everywhere would have been excessive, and, as a consequence, helped by the succeeding dry summer, very inferior. The crop of Plums was perhaps more affected by the cold spring than any other fruit, and that of Strawberries by the excessive drought. There were, indeed, excepting in such favoured spots as the county of Kent, scarcely any good Strawberries last year. We have, therefore, no new varieties of this most popular fruit to call attention to, but we would just remark, *en passant*, as a most noteworthy fact, that the winning Strawberry of the past season was Sir Joseph Paxton. Its great size and beauty made it conquer at almost every exhibition.

In Apples, the number of new seedling varieties submitted for public opinion has been unusually great. There has not, however, been any of very startling merit. The variety amongst Apples is now so great, and the quality so good, that it is extremely

difficult to secure any advance. We must here note, if not as a novelty as a very important addition to our pomological knowledge, the fruiting, or the observation of the fruiting, for the first time in the gardens of the Royal Horticultural Society at Chiswick of the true Pomme du Paradis (the French Paradise Apple). This is the stock so much used in France as a dwarfing stock for Apples, and about which there has been so much controversy in our columns during the past few years. The fruit is of medium size, pale yellow, with a flush of light rose on the exposed side, and would pass muster very well in a basket of Keswick or Manks Codlin. It ripens early in August, and is then of very good quality; so that not alone is it valuable as a stock, but it is also worthy of cultivation as a useful fruit on its own account. It may be described as precocious in every sense of the word. It flowers and fruits at a very early stage, and induces the same habit or character in any variety grafted upon it. It blossoms early in the season, which is rather a demerit, and is one of the earliest sorts to ripen.

Of Pears we have not many to notice, yet here is one of sterling merit—Lucy Grieve, an English seedling, raised by Mr. Grieve of Calver Hall. It is not unlike a small Glon Morecan, and is of equally good quality. The following, although not exactly new, yet have stood so prominently forward this season as worthy of extensive cultivation that we think well to mention them, viz., Pitamont Duchesse d'Angoulême, Bauré de l'Assomption, and Souvenir du Congrès. We must not forget to mention, either, the Pyrus Maulei, the fruit of which we were introduced to for the first time last season. It is a sort of Quince, the ripened fruits of which make an excellent marmalade. It is doubtful, however, whether it will be most appreciated as a useful fruit or as an ornamental plant.

Amongst Melons we had many claimants, and size actually carried the day. The biggest Melon we have ever seen was the most remarkable, and was certainly not the worst in quality. To Mr. Groom, of Stradbroke Hall, Suffolk, we are indebted for this great mountain, being no less than nine inches in length. It is stated to be of African origin, and is worthy of preservation for hybridisation purposes, for the introduction of some new blood into our present very abundant class of "turnips." For another novelty in the fruit line we have to thank Mr. Woodbridge, of Sycamore House, for the Musa Champa, a variety of paradisiaca, from Trinidad. This is a very free fruiting sort, and considered of superior flavour to Cavendishii, and so is extremely welcome.

Lastly we come to by far the most important introduction of the past year, and again it is amongst Grapes—and again we have to thank our indefatigable friend, Mr. Pearson, for his splendid new Grape, Mrs. Pearson. This delicious Grape is of the same origin as Golden Queen, which was noticed last year. It is a seedling from the Alicante crossed with Ferdinand de Lesseps, and so partakes of a good deal of the peculiar Strawberry-like flavour of that variety. The bunches are large; berries of medium size, roundish oval, of a fusc amber colour; the flesh firm, juicy, and exceedingly rich. It may be noted as one of the finest white Grapes yet introduced. It has not only been awarded a First-class Certificate, but received Mr. Alfred Smees's prize as the best new fruit of the year. There is another newish Grape of considerable excellence, which, although it has been already noticed, we may again advert to as coming this season more especially before the public—we allude to Venn's Seedling Black Muscat. This is of the character of the well-known Muscat Hamburgh, and is stated to inherit all its good qualities without any of its defects. If so we need nothing better.

MASDEVALLIA CHIMÆRA.

In the *Gardeners' Chronicle* for May 16, 1874, p. 639, will be found a figure and description of the "night-bird"—*Masdevallia nycteria*, a plant illustrated and sold by M. Linden under the name of the "true Chimera," but, as my friend Prof. Reichenbach has conclusively shown, the coloured plate and plant alike are altogether chimerical. I certainly cannot agree with the Professor that *M. nycteria* is a "miserable thing" (*G. C.*, 1873, p. 1238), but that it should ever be figured and sold as the true Chimera is certainly most improper. The present picture of the actual *Masdevallia Chimera* (fig. 5), will serve to set some dubious points at rest regarding the two species here mentioned, for, however much they may seem alike in the descriptions, they are very different things in the life. *Chimæras* and "night-birds" are notoriously ugly, discordant, fascinating, and not to be trusted; they bewitch mortals, and have an occult influence over terrestrial affairs, and in this respect the two Orchids under consideration and the mythological monsters resemble each other.

FIG. 5.—MASDEVALLIA CHIMERA.

No one who sees *M. Chimera* for the first time can say it possesses any intrinsic beauty of its own, for its aspect is grotesque and whimsical in the extreme. The prolonged extremities of the sepals are the snakes' tails of the dreadful *Chimera* itself, and the abundant hairs are the bristles of its horrible flaming mouth. *M. Chimera* is like certain sounds, odours, colours, and persons familiar to all thinking people, disagreeable in themselves, yet possessing irresistible hidden attractions to which one is ever bound to return. Who is not familiar with certain themes in the music of Beethoven or Schubert, disagreeable, discordant, and stirring in themselves, yet the very notes one is always wishing to hear again. The same holds good with odours: certain scents (as the aroma of the Truffle) are to many persons actually hateful, yet the odour has such a peculiar fascination when once smelled that it must always be returned to. It is the same amongst tastes, colours, forms, persons, and all other things—things not in themselves positively ugly and offensive, but deficient in pure beauty and consonance, the deficiency being made up by some irresistible attraction, to which most people are bound to submit. *M. Chimera* will always be esteemed for its peculiarities: the flowers are yellowish with deep reddish brown markings, and densely clad on the interior surface with long hairs; they remind one of acrobats walking on stilts with a balancing pole, and the front view of a flower is not unlike a twisted clown's face distorted with a grimace. The accompanying figure was taken last month from a living specimen in Mr. Bull's collection at Chelsea, obtained from that "stronghold of Masdevallias, the United States of Columbia." *W. G. Smith.*

NOTES BY THE WAY.

BIRMINGHAM AND LIVERPOOL.

So recently have the general complexions and contents of the Botanic Gardens at the above-named places been described in the columns of the *Gardeners' Chronicle*, that a new notice of them would, at present, be quite superfluous. Wherever horticulture is extensively and skilfully practised there is always plenty, nevertheless, that remains to be talked of another time, for the simple reason that to see everything at once is quite impossible, and more particularly because every day something different is developed. I never visit a fine and well-managed collection of plants without feeling that in Nature a good garden is just what one of those grand old achievements in Greek marble is in Art—a thing inexhaustible in its lines of beauty; and this feeling having just been experienced anew, both in Birmingham and Liverpool, I cannot refrain from jotting down some half dozen of my observations. Going again and again to such gardens, it becomes almost amusing to discover how much we have missed when we have thought we were securing the whole. To get it all at once, we very soon become aware, is no more possible than to comprehend the classic sculpture at a glance. Every one, of course, has found this out. To let the mind rest sometimes upon the fact is, nevertheless, a salutary course. I specially commend it to the consideration of every young gardener, who, because he was born with eyes, considers himself entitled to say that he can "see," and who imagines that the world of plants is to be viewed as easily as a cow eats grass. Another and yet larger class might profit perhaps by the application of the principle. The prospectuses of our great and fashionable schools are accustomed to give at the end of the proffered banquet a list of "accomplishments," charging extra for them. They appear to me always to forget one of the most important of human accomplishments, viz., the art of learning to see. Happy the day when it shall reckon with the music and the dancing, and be followed with the intimation, "These lessons given in the garden and the fields;" for there is no place where this delightful and most practical art is acquired so well—where seeing, that is to say, is discovered to consist not in simple casting of the eyes to the right and left, but in minute and thoughtful observation of delicate outlines, and the adjustment of parts, plus their symmetry, varying tints, and illustrations of adaptation of means to ends. Many people fancy that the power of seeing comes "by Nature." The principles do, the rudiments, and the suggestions; but exactness and completeness are every bit as much a result of careful and patient culture as accuracy is in performance on the piano or the harp. Highly regarded, it demands as much culture even as the power of working out arithmetical calculations, problems in mathematics, or right conclusions in applied logic. Turning over the elaborate pages that tell of Oxford and Cambridge examinations for our sons and daughters, I find, I acknowledge gladly, some little recognition of the need above referred

to, in the shape of questions in book-botany and book-geology. But the genuine art of seeing has yet to be made a practical one, and to receive its fitting place. Like the line upon the precept upon precept, counselled of old, it needs thoughtful look upon look, and years of culture. By-and-by, it is to be hoped it will rank with all sensible teachers, as a *bona fide* branch of the true "higher education;" meanwhile the practical gardener should remember that he enjoys an immense advantage in being provided with the opportunity of daily practice; and he is inexhaustible from thoughtful experience he does not count it as one of his privileges, to tutor or lesson-book it so efficient in regard to seeing as trees and flowers, while we think we are observing only leaves and petals, we are in truth learning to see quicker and further as regards the world in general. The enjoyment of a second visit to a good garden, year, of a third visit, and a fourth, carries with it accordingly a twofold value and interest; it is not only a new harvesting of special facts and ideas, but the eyes go out with livelier aptitude for all that is worthy of other kinds. And I have brought round to my place a special object—the noting of one or two things recently observed in the above-named storhouses.

At Birmingham it was very interesting to find in full flower that very curious North American shrub or small tree, the *Hamelis virginica*. Introduced from Florida or Canada as far back as 1736, and, perhaps, formerly more common than at present, it is, nevertheless, in our own age quite a rarity, though found in the lists of some of the leading nurserymen—Messrs. Osborn, of Fulham, for example, as its native country. *Hamelis* attains the stature of 20 to 40 feet. The leaves are large, simple, and ovate. The innumerable gay yellow flowers come out, singular to say, just when the foliage is about to fall, and, if the season be tolerably mild, remain as a pretty and conspicuous decoration of the bare branches for a considerable period. Hence, in the advanced flowering stage, the tree reminds one of the *Cornus mascula*, of which it is an almost exact late autumn repetition, or, rather, of the dimorphic and sessile character of the flower-clusters. The parts of the flowers are all in fours, as in the *Cornus*, but here the petals are at least an inch in length, and somewhat twisted, reminding one of the corolla of the *Strophanthus*. The name is one of those old classical ones which have led, with impetuous authors, to many dull misstatements. Literally it signifies "blooming in company with the Apple tree," and, probably, was correctly enough in its original application. But what that was is entirely unknown, and when Linnaeus bestowed the name upon the American genus it was probably with no other design than to utilise an idler. The writer responsible for it appears to be Athenæus, that delightful old author of the third century, who, in his "Deipnosophists," or "Dinner-table Philosophers," introduces us to boundless wit and wisdom, art, poetry, and everything else that constitutes the life of refinement and the flow of our present-day, much of the antique that would otherwise have become totally obliterated, and in the middle of it this pretty name, *Hamelis*.

In one of the Fern-houses, where so many curious little gems nestled together, Mr. Latham pointed out a plant of *Branea insignis* that had been raised from the spore. The circumstance is interesting from the fact of Mr. Smith, late of Kew, having failed to get anything more than barren prothalli, and leads one to inquire whether the prothalli of Ferns may not perhaps be like the *Actæa* ones—some of them bisexual, others exclusively male. Most of the grand Tree Ferns at Birmingham were also raised from the spore, say about eleven years ago, the spores coming from English-ripened sporangia. Looking at these magnificent plants, the question arises in one's mind whether it would be any more than a simply right and fair matter of business, when a curator or a gardener is induced into his office or situation, for the money-value of the collection of plants entrusted to him to be taken by some competent person, like Mr. Latham, to be done again when he resigns or quits, or even periodically during his tenure of responsibility. Commercial men and merchants "take stock" at definite times, with a view to determining what they have gained or lost, and were a similar course pursued in gardens it might be useful. How enormously the money-value of the Birmingham plants has been raised, for instance, by Mr. Latham, would have become apparent to the proprietors. Nothing can be more beautiful than the Tree Ferns at Edgbaston—*Asplenium excelsa*, *Cyathea medullaris*, *Cibotium regale*, *C. spectabile*, *Dicksonia antarctica*, *D. arborescens*, &c.—their fronds displayed so perfectly against the light, while their great unrolling croziers declare them, as everywhere else, the veritable archbishops of the Cryptogamia. Lay, by, again, is the spectacle a sample of the mingled scales of the *Lapageria*, and the rich violet-purple of the *Pleroma*. By means of an ingenious network of strings Mr. Latham fills the space overhead with their beautiful flowers, the effect being that of the descending firs of a good skyrocket. One of the *Lapageria* plants is this year

quite loaded with green seed-pods—a circumstance the more remarkable, since the neighborhood is totally without a single flower of it! Plenty of flowers are substantial, but the *Lapageria* would do to put in scales. Not far from it is a very interesting object in the shape of a young *Coccoloba* Palm—say, rather, the nut in a state of advanced germination. How pleasant it would be if gentlemen's gardeners would look as sharply after such things. They would be sure to invite attention, and bring credit. The nut in question was a common one, bought in the market-place.

Carminiferous plants have of late been so greatly in favour that the slightest observation in regard to them has its value. Mr. Latham's plants of *Nepenthes*, though not large, are in excellent health; and very interesting must it be to the Birmingham people to observe that all the young and unopened pitchers are half full of limpid fluid, showing plainly enough that the contents are neither dew nor rain, nor yet derived from a watering-pot, but a genuine secretion from the plant itself. On tasting the fluid, it appears to be uniformly acidulous, as if a few drops of lemon-juice had been let fall in it. This, perhaps, is exactly what we ought to expect, the juices of plants being far more commonly acidulous than of any other flavour. I have often wondered why Linnaeus gave to this genus the name of *Nepenthes*. Every reader of classic story remembers that when Telemachus reached the court of Menelaus, tired and famished, the beautiful Helen gave him "nepenthe" to drink. No one has ever been able to say what this nepenthe was, though no doubt it is the same as the "drinking water." For my own part, I should have valued under such circumstances a cup of good Souchong—

"Tired Nature's sweet restorer, balmy Tea."

Johnson defines *Nepenthe* as "a herb that drives away sadness." Linnaeus, perhaps, intended to refer to the tankard-like structure, so like, also, in the original species to a hot-water jug with its lid. Sometimes I am disposed to think that old Linnaeus may have had in his mind the mythical beverage, not even tea, but the sweet graces of Helen's queenly and consummate hospitality and welcome, touching, as they did, her guest's inmost feelings of love and reverence. If so, *Nepenthes* is well applied to its present owner, for assuredly no plant of botany appeals more strongly to our sense of the admirable and the unique. A plant of *Dionaea* was also very interesting, from the fact of one of the leaf-traps, though half-dead, retaining within its clasp the flattened corpse of a large fly—apparently, of the kind commonly called "meat-flies." The insect had palpably been put to death in identically the same manner as the wretched victims of the mediæval punishment called the "iron shroud," opposing plates of iron being worked by mechanism in such a way as to squeeze the poor wretch to death. Over this matter of carnivorous plants another thing was suggested anew at Birmingham. Every one who cultivates *Ericas* has noticed how flies are captured by the species with glutinous and sticky corollas. If they do not eat or digest, these *Ericas*, at all events, kill and destroy. I should like to see this department of the carnivorous-plant question handled as carefully as the more obvious one has been, not omitting the consideration of the behaviour of the sticky-surfaced species of *Silene*, which from time immemorial have borne the English name of "Catchfly." *Drosera dichotoma*, at the time of my visit, was beautifully decorated with its fleeting diamonds. In this particular species the vernalia appears to be truly circinate. Is the vernalia correctly described as being so in the *Droseras* generally? So far as I have had opportunities of observing, the blade of the leaf seems to be simply bent or doubled down, a very different thing from being incurved. Hooker and Benthams, in the *Genera Plantarum*, p. 661, say "circinate, except in one species;" and Dr. Hooker elsewhere approves of the name of Decandolle's "coiled" and concludes, therefore, that the term circinate includes with these high authorities the condition I refer to, but it is certainly very different from the incurving of Fern-fronds, and of the inflorescence of the *Boraginaceæ* and the *Phacelias*. Accepting the term as correctly applied to the leaves of the *Drosereas*, is it not a little curious that one example, and scarcely more, of the circinate form among the exogens here, in the Sandwies, among the endogens in the Palm trees, and among the cryptogams in the Ferns? A very curious plant in full bloom in the Birmingham garden the other day was *Calceolaria Pavonii*.

I have left myself scarcely room to speak fairly and justly of the present state of the Liverpool garden. Details of the new and singular I must reserve till another time. Suffice it here to say that the splendid promise for the future which was so soon developed after the completion of the new conservatory, has in every way been perfectly fulfilled. The new growth has been everywhere rapid and brilliant, and, as to be seen at the present moment, it is difficult to conceive anything more luxuriant, graceful, or vivid. What has been said above of the increased money-value of

plants under good management, has illustration every bit as marked and conspicuous in those which at Liverpool are looked after by Mr. Richardson. *Malpighia glabra* has just been blooming here very profusely. *Aloysia citrodora*, grown as a little standard, is quite a picture. *G. Nov.*, 1874.

THE IVY IN THE DICTIONARY.

We shall never reach the beginning of things, but we shall never cease to try. The primary passion of all intellectual life is the endeavour to "find it out," and the passion is sustained by the oft-recurring fact of new truths being brought to light. In any case, however, the knowledge only carries us back a step or two

"Upon the great world's altars—
That slope through darkness up to God."

If the chemist, the statistic, the astronomer, lose themselves—as they delight to do—in the inquiry about the co-ordination of form and force, and the naturalists are in no certain way guided by the light of Nature alone towards the genesis of organic forms, shall we not sympathise with the poor philologists who have equally hard tasks, though all their problems come within the "human period," and are for the most part pro-historical? If we were to question the ethnologists and all of that ilk about the names of the plants in the Christmas wreath, and the association of those names with the qualities and ideas of the plants, and the intentions of the minds by whom the names were invented, how we should puzzle them, and compel them to lurk near the Mistletoe to find relief. Anything about Scalds and Runes and Druids is appropriate just now, and so long as the Ivy is green in the hall, we may ask it to serve us as a Bean-stalk whereby to clamber into giant-land or fairy-land, or any other land that is a little less real than the one that darily distinguishes December 25 as quarter-day! My amusements have lain that way many years. The Christmas garlands have transported me to all times and all climes, and I hail their hanging up as a signal for a reverie that shall leave in my memory some pleasant dream long after they are taken down. I begin now, when I see everybody busy in adorning the place with leaves and berries and everlasting flowers, to propound conundrums that nobody can answer. Why anything what it is? That is the essence of all conundrums. Why, for example, is Ivy called Ivy? There must be a reason for it. The name in some way is as truly a natural fact as the plant—of that I feel certain.

I hold that originally the names of things were the mind's pictures of the things themselves. In due time I shall hope to prove this in a work extending to several quarto volumes. For the present I want the reader to catch hold of the idea and ponder it. We will suppose we have got a philosophical foundation, and it therefore follows that the proper name of anything is suggestive or descriptive of its character. This, you will say, takes us back to Adam naming the creatures. All the better. Indeed, I don't mind if it takes us back to chaos, or beyond. We were taught at school that our great progenitor named the creatures by a descriptive system. Genuine philology is founded on Genesis ii. 19, 20, for therein the descriptive or characterising nomenclature is presented as the foundation of human knowledge.

The question, then, arises, "How shall we get at these names?" They must be more or less buried in living languages, as probably they are living in dead ones. I take the word "Ivy" wherever it appears to amuse myself in this rigid speculation, and I am at once pushed into a corner by the chorus of Caliope and Clitio, "How do you spell it?" Thus am I drifted back again to speculate on the origin of the letters. But a happy thought occurs: letters represent things in the same way as words do, and letters are words more or less, as well as the raw material for word-manufacture. The capital "I" is a man standing erect—the simple pronouncing letter contains within itself, for the imagination at least, all the poetry, and all the history, and all the philosophy and experience of the world. We must be content with the relative when the absolute is beyond reach; and so I propose to look at the latest dictionaries and the oldest alphabets in hope of discovering if the word Ivy will illustrate my theory of the origin of names.

Of the Greek name we know nothing. I am well aware the student of Greek, fresh from the classic coach, can tell me all about it, and, in fact, I have *Schœdion* on my desk and fifty more such books within reach. The question is, "Can we, in the Greek references, identify the plant?" You will refer me to *Throphiastus*, who discourses of two kinds of Ivy: one that creeps (*εἰς*, 3, 18, 6), which may be the veritable plant; and another, that grows

as an independent shrub, producing flowers abundantly, the *κάρως* (6, 1, 4), which cannot be an Ivy, and is probably a corrupted name. Permit me to play conjurer; suggest the copyist to have thus written when he should have written *κάρως*, and you have, instead of the Ivy, the *Cistus*, with which the description strikingly agrees.

In the Latin we appear to be quite out of the fog. It is called *Hedera*, and that seems to me a thoroughly descriptive yet essentially poetic name. Those who are familiar with the fundamentals of philology will allow me to annihilate the H as a nuisance, and put F in its place. Presto! The Ivy, a federal plant, a vegetable brotherhood; it consists not of one stem, but many, and it is really distinguishable for this quality of throwing up stems from below to an extent that few trees are capable of. Here we seem to have obtained a glorious confirmation of the proposition that the name of a thing is the mind's picture of it; the tongue being the painter, and sounds taking the place of colours.

I wonder why Linnaeus named the Ivy, *Hedera Helix*? I once thought he must have regarded it as "creeping like small unwillingly to school." But the snail is not the helix in the ultimate analysis of words; it is simply helix-like in growth; it increases spirally, every new growth being a new coil, or *εἶλε*. Any creeping plant is *ὀκρίπιος* (*Helicritus*, ii., 78), and whatever twirls or rolls about is *εἰκίσιον*. The Ivy is a twining, winding, spirally-growing plant, very properly *Hedera Helix*, the snail-like federation, the india-rubber horticultural brotherhood!

But you will ask about the homely word Ivy, How old is it, and what does it mean? I really think the dust of ages can be swept off the word without difficulty, and it will then appear as a true mind's picture of our bonny plant. The Ivy grows like an I. It grows like a V. It grows like a V. Does any one doubt it? Go and search for Ivies that the hand of man has never touched, and you will find them all i's and v's and y's. Other letters may be represented by the plant, but we have to do only with such as come consistently within our cognisance. The Italians and Spaniards follow classic models; the first call the Ivy *Edera*, the second call it *Hedera*. By those nations it is regarded as the federal plant, and it might become for them a suitable symbol in their struggles after nationality. The French call it *Lierre*, the friendly plant, the emblem of family ties, the binder, embracer, *pluribus unum*. The Germans call it *Ephen*, which is undoubtedly Runic, as there can be no doubt our own word Ivy is. Thus, change the e to i, the ph to v, and the eu to y, and *Ivy* stands confessed. The Dutch have stuck to the descriptive nomenclature best of all, for they call it *Klimop*, and this is more graphic, though less fanciful than the classic name, for although the federal character is manifest, the tendency to climb up is much more manifest; and what the word loses in warmth it gains in factual characterisation.

The tendency of the Ivy to assume the V form may be illustrated by an appeal to Nature anywhere. In all my travels "from Ind to the northernmost pole" in search of Ivies, I have seen none so strikingly V-shaped and Y-shaped as the hundreds of wild Ivies that adorn the boundary walls of Ovington, near Worthing, in Sussex (fig. 6). These, indeed, are, in their way, as interesting as the Ivy-clothed Thorns that make a wondrous Ivy garden of a scarp of the Undercliffe, near St. Lawrence, in the Isle of Wight.

If any theory of words and letters is worth a rap, it will bear confronting with archaic types; and I propose, for the sake of the argument solely, that we assume (without regard to fact) that in four good types the word Ivy consists of four letters. As a hypothetical arrangement must suffice for a hypothetical spelling, the following arrangement will serve the purpose:—

RUNIC ..	I	V	A	F
MÆSO-GOTHIC ..	ἰ	ṽ	ṽ	ṽ
OLD RUSSIAN ..	Ѣ	Ѧ	Ѧ	Ѧ
OLD ROMAN ..	I	F	G	V

Here every letter is like an Ivy, more or less. Thus, you see, we may not only propound a proposition that takes us back to the beginning of things; but by selecting and inventing material the proposition

may be established in a way to satisfy all, except the stubbornly sceptical and the extravagantly cantankerous. *Shirley Hall*, in " *Pictorial World*."

THE ROYAL NURSERIES, ASCOT.

THESE extensive nurseries are situated about a mile from the Ascot Station, on the London and South-Western Railway, the road winding its way by the side of the far-famed Ascot race-course. The grounds are also in near proximity to the Royal residence of Windsor. There is considerable difference in the nature of the soil, yet most of it is of a strong peaty character, well calculated for the growth of most trees and shrubs, but particularly such as are evergreen, as also the different species of Coniferæ. The nature of the soil is such that any plants, even up to those of large size, can be moved with their roots almost intact, offering facilities for replanting with little check that do not exist in the case of soils of a heavy retentive nature. The surface being almost flat, and fully exposed, a hardy vigorous constitution is naturally imparted to the stock generally. Near the centre of the nursery is a large number of forcing and other houses, devoted to the growth of plants for sale, and to the production of quantities of the choicest descriptions of cut

under the year to some 2½ feet in height, and nearly as much through—dense bushes, clean, healthy, and covered with bloom buds, fast swelling. *Gardenia* flowers are not gathered in the winter season until fully expanded; in the summer they are cut in the bud state, on account of their liability then to lose colour. On the stage round the house were stood hundreds of plants of *Adiantum scutum* [*Giesbreghtii*], which is held in great estimation for the bottom fringe or base of bouquets. Over these outside stages and the path running betwixt them and the central pit the roof is wired, and on this is grown *Stephanotis* planted in each corner of the house; on the outside of the path fronting the surrounding stage, thus economising space, was planted a continuous row of *Pteris serrulata*, intermixed with the variegated *Panicleum*, both so useful for cutting.

The next house, similar in size—55 feet by 15—has also the centre pit filled with hundreds of *Gardenias* similar to the last; the surrounding stage occupied by *Adiantum Farleyense*, *Bouvardia jasminiflora*, *B. Vreelandii*, *B. Humboldtii*, *Poinsettias*, and *Azalea amona*. These flowering plants, except the *Gardenias*, were as near the glass as they could be placed without touching it—an absolute necessity where, as here, a night temperature was being kept up of 70°. Those who act upon the principle of false economy in having an insufficiency of heating power should see this house with its twelve rows of 4-inch piping, which some would consider more than necessary, yet those who garden for profit are not likely to make mistakes

FIG. 6.—V-SHAPED IVIES ON WALLS AT OIVINGTON.

flowers, which are required for the London establishment.

The indoor departments of this nursery differ widely from those of others generally met with; for, in addition to the ordinary stock generally grown, particular attention is paid to the cultivation of enormous quantities of a limited number of specialities, in the shape of plants found to be the best adapted for producing such flowers for cutting as are held in the highest estimation for bouquets, table decorations, &c., in which Messrs. Standish & Co. do a large trade. It is more particularly to the system of culture practised in the production of these that this notice will be confined. The houses and pits, collectively, are plainly, but substantially built, with nothing to intercept or absorb the light, every ray of which, from the sun's rising to its setting, is available. This is of great importance in flower-forcing, for, with few exceptions, the duration of a forced flower when cut will depend very considerably upon the amount of light it has received in the different stages of its development.

The first house is span-roofed, 55 feet by 15 feet, with a central pit running the entire length, filled with dung and leaves. Here, as in all cases through the establishment where fermenting material is used, leaves are added in sufficient quantities to prevent excessive heating. In these pits a little of this mixture of dung and leaves is regularly added to keep up the heat. The beneficial effect of the presence of this ammonia-charged bed was fully apparent in the size (for their age) and general appearance of the plants occupying the central pit, which was filled with *Gardenias*, struck last Christmas and grown

on this head. *Stephanotis* is here again grown over the paths. The next house is also span-roofed, 65 feet by 18. This is used as a cool stove, in which are brought into flower quantities of *Azaleas*, amongst which were a number of the double white variety, *A. Borsig*, which Mr. Standish finds to be the best for early forcing, large in size, and very early. The flowers when cut stand much longer than the single sorts. The estimation it is held in here may be judged from the fact of 2000 plants of it being grown. In the centre of the house was a row of fine *Drazena australis*, in the front of which were quantities of *Azalea narcisiflora*, another double white variety that forces well: 2000 of this sort are also grown. The roof is almost covered with the New Zealand white-flowered *Clematis indivisa* and *Jasminum grandiflorum*, also bearing white flowers about the size of *J. Sambac*: the blooms are cut in the bud state for bouquets. Planted out right and left of the doorway, in the corners of the house, were very large plants of *Bougainvillea glabra*, laden with dense wreaths of flower. Fine as is this *Bougainvillea*, even grown as a pot specimen, still it is never seen, so confined, in anything approaching the condition it assumes when planted out; one peculiarity about it is that when its roots have full liberty to roam about, it will bloom freely with a much lower temperature than when confined to a pot. Where cut flowers are required in quantity and continuously, a plant of this *Bougainvillea* should have a place; so treated, in a house where an intermediate temperature can be kept up, it will not fail to afford a supply of its lovely mauve-coloured bracts for eight months in the year. Its colour is such that it is suitable for associating with almost any

other flower. In this house were most of the newest sorts of Azalea, and on shelves quantities of Cyclamens, all white varieties. Here also were numbers of Asparagus decumbens, a bulbous-rooted climbing plant, with finely subdivided leaves, very useful for decorative purposes. Entering the next house, which is 25 feet by 15, we find more Azaleas and quantities of Roman Hyacinths, Narcissus, Rhynchospermum jasminoides, Stags-horn Pelargoniums, and on shelves almost touching the glass the double Pelargoniums Victor Lemoine and Marie Lemoine; also numbers of plants in small pots of the narrow-leaved Myrtle, put in here to push young pale green growth, which, when strong enough to stand in a cut state, is used for bouquets. Small Oranges in pots are put in heat every fortnight through the winter to keep up the supply of this flower. In this house were a number of the best coloured varieties of Coleus, the leaves of which are used for laying flat on the cloth in dinner-table decorations.

The adjoining house, 65 feet by 18, is used as a general store for plants, and contains a number of large plants of Stephanotis and quantities of Eucharis amazonica undergoing the drying process by withholding water until the leaves flag a little, but not so as to injure them; they are thus treated for a month, after which water is given, when they throw up flowers in abundance. The plants are subjected to this alternate resting and flowering three times a year, and are kept well mulched with cow-dung. In this house was another favourite plant for the production of sweet-scented white flowers, Jasminum Maid of Orleans, the blooms very double, as large as a Pompon Chrysanthemum, and highly perfumed; here also were a number of the new Crotons and Ixoras, the elegant Aralia Veitchii, and the old white-flowered Pavetta Caffra, with flowers something like small bunches of Ixora. On the side shelves were quantities of Dracena Cooperi and others; Peperomia resedeiflora, the white Mignonette-shaped flowers of which are most useful for bouquets when Lily of the Valley and Hoteia japonica are over; the red-spotted Anthurium Scherzerianum, Echeua splendens, a first-rate dwarf table plant in or out of bloom; Hoya bella, the flowers of which are well adapted for bouquet-making; the fine winter-blooming Calanthe Veitchii, and the equally useful Euphorbia jacquincifera, a small bunch of which is often drawn through the centre of a flower of Eucharis amazonica in floral arrangements. *T. Baines.*

(To be continued.)

SWEET-SCENTED FLOWERS.

THREE years ago I published a small volume on the sweet-scented flowers and shrubs cultivated in the gardens of Great Britain (*Flora Odorata*; G. & Co., 1843). The volume has long been out of print, but as recent investigations into the functions of scent and colour have given a new interest to the subject, it seemed worth while to make a classified list of the species mentioned in that forgotten work, and which were there partly arranged in an alphabetical manner.

It will be observed that the catalogue is limited in several ways. It does not include stove or greenhouse plants, nor wild plants which are never cultivated, nor agricultural plants, nor pot-herbs. A few species are included whose scent resides in the leaves and not in the flowers, because it was intended for the help of amateur gardeners. Opinions may differ as to the sweetness of some of the odours, but I give the list entire, with the nomenclature of that period. It was no doubt imperfect even at the time, and probably many more species might now be added by any one familiar with the gardens of the present day. There can scarcely be less than 5000 species, hardy and half-hardy, cultivated in English gardens, and 217, which is the number in this list, seems to be but a small proportion of fragrant ones.

The following observations suggest themselves in looking through the list:—

That scent is associated with flowers of all colours. That, nevertheless, the order Campanulaceæ and the genus Centaurea are unrepresented, and that the flowers of these groups are chiefly blue.

That scarcely any order can claim fragrance as a universal character.

That in many genera one species only will be fragrant, while all the rest are scentless. That by cultivation and hybridisation fragrant varieties may be developed from scentless stocks.

EMIGRATION.

THE loss of the *Cospatrick*, with her hundreds of men, women, and children, by fire in the open sea is a terrible lesson when calmly contemplated from cause to effect. It becomes fearfully so when we look at the loss of life as in some measure the outcome of the recent struggle between the farm labourers and their employers, so that when we ask the question, Where are the belligerents? we are answered that the farmers are still to be found alive and happy in their homes, grumbling, as is their wont, to keep the landlords from raising their rent, and to keep the labourers content with a little wages as can be agreed upon. But what of the turn-out labourers who were sacrificed to the Moloch of the Union? Whatever good they may have achieved, or in what they may have benefited others, they themselves, after beating the bushes, have certainly not bagged the game. Without blaming any one, we can honestly say that had there been no turn-out of labourers, the living freight of the *Cospatrick* would have now been filling up "the short and simple annals of the poor," instead of swelling the roll of names of those that the sea shall have to give up of the dead that are in her.

But it is not to the subject of the agricultural labourers that I now wish to call attention, but to the horticultural side of the question. I read in the *Banffshire Journal* that some young gardeners, who had been well instructed by their master, the gardener at Fyvie Castle, Aberdeenshire, and who had gone to America, and "done well" there, wished to show their gratitude to their late master, and accordingly had sent him, by the hands of a farm labourer who was homeward bound, a valuable silver stand some 3 or 4 feet high, and other gear of the same metal—a gift equally honourable to the givers as to the receiver. Being single men of good moral character, trained to outdoor labour, and well able to see what land was capable of yielding, and with habits of economy, order, and cleanliness, they could hardly fail to do well wherever the raw materials of their craft could be subjected to cultivation; and their history illustrates the North countryman's sagacity, for the thrifty Scot will thrive, like the limpet on the rock, by sticking to business.

Emigration has often been made a scapegoat to hide the indolence and irregularities of individuals, by carrying them to the wilderness where no one cares to chronic events. Some twenty years ago a gardener applied to me to beg for him, that he might take himself and his wife and family to Australia. He had lost his situation, and his begging from friends and acquaintances had become a nuisance. I reasoned with the man that he was too old, and too much encumbered with young children to go such a voyage, but the secret of this affair of sending nine souls to Melbourne, Australia, lay in few words. I was in earnest, but my emigrant was not so, but wanted to get a good haul of goods and money, and had no intention whatever of leaving England. As, however, a large sum, to pay the passage and provide necessaries for the voyage, and something to begin life with at the Antipodes, had been put into my hands, I was in duty bound to see him off; and it was his task to let the vessel go, but not the goods; but I had the satisfaction to see honesty prevail, for he paid the heavy penalty of transportation for his deceit. Little did I know at the time that he had done a mock emigration in London at least once before. Some years after I learnt from a successful navvy, who had realised several large nuggets of the "root of all evil," that my emigrant had buckled on to hard work, and become gardener to the navvy, at the fair recompens of £1 per day. More than one fresh impetus unknown here is given to industry in Australia, for in the first place there is a high premium (20s. a day) for skilled labour by way of reward for well doing; and there is moreover a certain punishment, by Lynch law, for evil doers who might wish to live upon the community without contributing aught to the common wealth. When such parties are found sheep stealing, it has been the habit to shoot them without any formality, beyond the fact of their being taken red-handed; and as the modern institution of the workhouse had not been introduced, the idler could only either fall back upon his mother earth, and work, or die.

Another gardener of my acquaintance after railing loudly against British institutions, rates, taxes, and want of liberty, set about bettering his condition, and

sold his "fixings," and in an evil hour left England for New York, accompanied by a young, industrious wife and one child. On arriving there he found some 30,000 (be the same more or less) in the same predicament as himself—wanting work; and when he had worn the shoes off his feet on tramp, trying to get work and bread for the bare life, he wrote home to his friends to send him, for the love of God, as much money as would pay his passage home again, for he had been nothing so good as an English workhouse since he left. He returned a wiser man, and, taught by adversity, took service thankfully in the "Old Country," and reckoned the relieving officer, the guardians, and all who work the machinery of the poor-law, to be employed, if not on "Heaven born charity," at least on a near relation thereto, where property is taxed, and where it is made compulsory on the well-to-do to keep those who are unable to support themselves.

Such an example may well point a moral, if it does not adorn the tale, for the pighedness of some persons is so strong that nothing but adversity, suffering, and ruin will convince them of their errors, and those who take to Atlantic travel may well say "broad is the way." Good resolutions and solid lessons of instruction have, however, been made and lumbered into dull heads, when the landsman has made "his home upon the deep."

Magistrates have often remarked that if culprits had only done half as much for virtue as they have been compelled to suffer for vice, they might have been ornaments to society. Most people suffer a good deal for want of money, and well he may who cannot pass a gin-palace or a tobacconist's shop without contributing to each, as well as to his own misery. One of the greatest ornaments to a certain northern city consists of a splendid hospital, built and endowed by a man whose perseverance in the practice of saving money enabled him after a long life to leave a monument to his memory, for which thousands have blessed him; and although he had his eccentricities (which are more to be admired than imitated), it is well to let a single young man know what unwearied perseverance, when well directed, can do to make money. The gentleman in question, in order to save fire, carried a hamper on his back up and down "his room in the uppermost story," and thus warmed himself when the weather was not severe enough to necessitate a fire being made; and as a weaver occupied the room under his "garret," he left an opening in the floor by way of ventilator, but really to get the benefit of the weaver's light, and thereby save the cost of candles or lamp. It is easy enough to save money when a man makes the best use of his time, and does not bury his talent in the earth. The way my American emigrant missed it, was in not trying the experiment of going to America when he was single, as in that case only half the expenses would have been incurred, and—mark it well—it is hard to make headway against an early or an improvident marriage, for, says the old adage, "Not only choose a proper mate, but proper time to marry, not to mention Moore's remonstrance anent trifling youthful time away—

"The time that's lost in wooing,
In watching and pursuing,
The light that lies in woman's eyes
Has been my heart's undoing."

The success of some of my gardening friends has been in their specialities: one has got a name for fruit culture, another for his knowledge of succulents, while Orchids, Roses, Camellias, &c., have their professors and their students. One important post was held for many years by a gardener whose speciality was a knowledge of mosses and lichens. Cobbett mastered grammar in French and English under the most unfavourable circumstances, but afterwards floundered in the mazes of botany and in attempting to master horticulture and arboriculture. Cobbett's Locust tree still bears his name, and his famous ice-house, designed in Yankee style, and built of sticks and straw all round, and, as it is still unruined, and which he said that, if it failed, as an ice-house, it would be a pattern for a pig bed at all future time. Cobbett's example adds another proof that there is no royal road to horticulture, and seven years of hard study under good masters may be counted a near cut to make a well-educated youth into a good gardener. The biography of some of my acquaintances, who, like Cobbett, wanted to get credit for horticulture without taking the trouble to school themselves in its discipline for a few years, might have surprised and their employers from grievous disappointments. He is the best friend of the young gardener who does not flatter him by saying that his task will be an easy one and free from care, or that by a voyage to America or to Australia he will find gold growing upon trees in those distant lands. If I can only convince one man in time of the folly of such hopes, and of the snares and traps that he may be likely to fall into, I shall not have regretted the tale in vain. My two emigrants have indeed paid nearly for their experience, and their cases should be a wholesome warning to others. *Alex. Forsyth, Idington Square, Salford.*

BRITISH GARDENERS.—IX.

GEORGE SMITH.

THE accompanying portrait is that of Mr. George Smith, the talented head gardener at the Vice-Regal Lodge, Phoenix Park, Dublin. Mr. Smith was born in Perth in 1825, and while a boy was employed in the nursery there for about four years. At the age of seventeen he was apprenticed to Mr. Dodds, the gardener at Scone Palace. This was an excellent school for a young man, Mr. Dodds being a thorough-going horticulturist, doing well whatever he took in hand. "The following incident," writes Mr. Smith, "is characteristic of him:—The Potato disease was at the time making such havoc as to threaten the entire extinction of that esculent. In order to secure a fresh start, upon untainted ground, a considerable belt of plantation was cut down, the roots grubbed out and the ground well trenched over. Seed Potatoes were procured from a high-lying neighbourhood and started into growth, the shoots being broken off and potted separately into 4-inch pots, grown on into sturdy plants, and then transferred to the prepared ground. But alas for 'the best laid schemes'! The disease appeared on these quite as soon as upon any other in the neighbourhood. After an interval of thirty years we are stranded high and dry on the same

mysterious difficulty. The only hope of success appears to be in the direction of new varieties with strong constitution. At Scone, gardening as a mechanical art was carried out with great precision. To be able to nail a large Morello Cherry tree quickly, with the branches radiating with the regularity of rays of light, and to be a thorough proficient with the scythe, were with Mr. Dodds indispensable qualifications for the diploma of a regularly qualified "blue apron."

"In 1846 I removed to Whittingame, in East Lothian, then under the management of Mr. Rintoul, an anxious hard-working man, with a large extent of ground to keep with a very limited number of hands. This he did, however, with very great credit to himself. I do not know if ribbon borders have made as great innovations at that quarter as elsewhere, but at that time a good old-fashioned herbaceous border ran the whole length of the kitchen garden, with standard Roses at intervals, and there were yearly sowings of the best hardy annuals. When well filled and trimly tied up as it was, it formed a very pretty and interesting feature. The endless profusion of bedding stuff has led us somewhat into the position of a young spendthrift parting recklessly with good old substantial friends, and taking up with new and often indifferent acquaintances. Our modern style of bedding will no doubt hold its ground for some time to come, but it must be toned down, and instead of flaunting red and yellow everywhere, accommodation must again be found for many of our old friends, together with new forms in the shape of succulents, subtropical

plants, &c. In 1848 I removed to Gosford House, East Lothian, the seat of the Earl of Wemyss, and acted as foreman under Mr. Addison, who was then in charge of the garden.

In 1850 I went to Eglinton Castle, and served as foreman under Mr. Sharpe until 1852. In the spring of that year the late Earl of Eglinton became Viceroy of Ireland, and the position of gardener at the Vice-Regal Lodge falling vacant the same year, I was called on to fill it. In a large establishment like this a plentiful supply of fruit being of primary importance, I set to work at once to endeavour to make two blades of grass grow instead of one. There are nine vineries, extending 500 feet in length by 18 feet in width. The whole width was 12 feet, the additions being made to portions of the range from year to year until the vine was completely about seven years ago. I have recently seen strong heavy loam recommended for giving sustained fruitfulness to the Vine. This must be taken with a 'grain of salt.' My acquaintance with this material has been, perforce, rather too extensive. The surface of the Phoenix Park is composed of a hazel loam—answering admirably to the words 'strong and heavy,' and inasmuch as it was the only available material, it formed the chief ingredient in the making up of our borders. I had a good supply of old building materials in the way of hard lime rubbish, it was incorporated with the loam to the extent of nearly one-third, in order to make up for the absence of sand, and to get rid of some of the loam's superabundant strength. On taking up a lump of this compost, after a few years' use, instead of disintegrating readily it clung together, and on pressing the foot upon the border there was no perceptible yielding or elasticity. For the last few years I have thrown our heavy friend overboard, and adopted a relative of his from the Wexlow mountains.

"In the making up of the borders, instead of excavating the entire area in the old orthodox fashion, and filling in the whole border at once, we begin by planting upon a flat ridge just as much as will keep the roots going for one year, and then make annual additions to this, just as much as the roots can take possession of—say about 2 feet. The advantage of this is twofold. In the first place the roots can be examined annually, and the strong growers that are inclined downwards can be raised towards the surface, and laid on fresh fibrous material, in which they ramify with great rapidity; and in the next place where material of the right sort is expensive or difficult to be got, as it is here, it is like paying into a friendly society: a small yearly instalment is all that is necessary to secure the best results. In order to save time, I have sometimes been induced to plant Vines two or three years old, but this is a practice we had always reason to regret. Our best results have been obtained from eyes started in January, grown on slowly, and planted out in May, guarding carefully against any check until they have fairly taken with the border.

"I have had an opportunity here of testing the utility of bottom-heat for Vines. No. 1 house is constructed on the principle recommended by Mr. Fleming, of Trentham, about eighteen years ago, namely, that of supporting the border upon a series of brick arches, and thus forming chambers underneath for fermenting materials. The only difference in our case lies in the size and length of the arch, which is 7 feet 6 inches in breadth by 4 feet 6 inches in height, and extends into the house to within 2 inches of the back wall. The Trentham arches were 3 feet 6 inches wide by 2 feet 9 inches in height, and if I mistake not were carried only to the front wall. The large size of the arch makes the changing of the fermenting material an easy process, while the heating power is much more effective. Our outside border is covered with slatters of corrugated iron, galvanised. The Vines (Black Hamburgh) are planted inside, the roots running through the slatters, and out at the house on April 1 a good crop of medium-sized bunches—black as a Sloe. It is interesting to notice the colouring process going on. Under circumstances of favourable root-action, as in this case, it goes on quickly and regularly all over the house, no green berries being left behind, and the colour is laid on thickly, after the style of the Kempsey Alicante. No. 2 house is also furnished with bottom-heat, but in this case it is supplied by hot water. This is less in height than the other; but there is always a certain amount of apprehension regarding a fracture in the pipes or other break-down after the border is filled with roots. As utility is the object aimed at, bunches averaging from 2 lb. to 3 lb. are found the most convenient for combining quantity and quality, and we take as many of these as is consistent with the production of good-sized berries and a decent colour. Our bunches seldom exceed the weight mentioned, but from what has recently transpired in this direction, I confess to certain misgivings as to a standard of ambition; and sundry resolutions have been formed to run up fresh canes, and go before the gale.

"My connection with the Royal Horticultural Society of Ireland commenced about 1854, the Earl of

St. Germain being then Vicerey. Lady St. Germain, wishing to support the Society, requested me to become an exhibitor, but, unfortunately, there were absolutely no plants to show. However, a beginning was made with *Gloxinias*, *Cinerarias*, and herbaceous *Calceolarias*, and then *Pelargoniums* and stove and greenhouse plants were added. In growing *Pelargoniums* I started with the principle of abolishing stakes, which had become very unsightly, and tied the plants down instead of tying them up, taking as the model of the plant a well-developed *Dahlia* flower, or three-fourths of a ball. Some of my plants measured 5½ feet in diameter, resembling a tolerable-sized haycock. The rapid improvement in *Pelargonium* growing induced the Society, in 1850, to offer a cup for them (a rarity in those days), which has been continued ever since. Of late years the exhibition of stove and greenhouse plants, and of fruits, has been our principal bond of connection with the Society.

"It is somewhat interesting to compare notes on the progress of horticulture during a campaign of twenty years. The prize list and the tent accommodation of twenty years ago, as compared with the present resources of the Society, may be taken as a tolerably fair criterion of the change. Not that exhibitors were scarce in 1854, but their various groups had as yet assumed but a feeble proportion, and staking was obtruded everywhere. By-and-by, however, one class of plants after another came to the front, remodelled as to form, and so altered in dimensions that tent accommodation was not to be found for them. There are one or two classes, however, that have not improved of late years, which is much to be regretted. Orchids, for instance, were better grown a few years ago when really fine groups were staged, but the breaking up of various good collections in the vicinity of Dublin has led to a kind of Orchid famine on show days. Heath, again, seem to have died out in a gradual way, being too slow growers for the fast times in which we live. Fruit growing has undergone a vast change for the better, not only as regards quality, but also in reference to the number of its patrons. Though we cannot boast of such Brooding-nagian bunches of Grapes as are produced on the other side of the water, yet we can point to good samples for both size and quality. We can also rejoice in the widespread love for the cultivation of fruit and flowers, with its ameliorating and humanising influences, and which is mainly due to the stimulus and encouragement given by the Society. There obtrude, however, feelings of regret, as memory brings back the recollection of clever enthusiastic men, who have contributed largely by their zeal and abilities to the general advancement, but who have passed away."

Forestry.

JANUARY 3.—When the ground becomes covered with any considerable depth of snow, and the stems, branches, and leaves are loaded, the ordinary operations of forestry are suspended, and it becomes a matter of no small concern to the forester how to employ the workmen to the best advantage, not only in their own, but also in their employer's interest.

Extent, locality, the order in which the estate is kept, and the means at command, have each their specific influence in determining how the workmen are to be employed during a protracted snowstorm. Those who have a great number of men to keep employed all the year round, require always to exercise very considerable forethought, so that any sudden change of weather may not at any time seriously interfere with the regular routine of work. A memorandum of the various sorts of work most suitable to be done in wet, windy, frosty, hot, cold, or snowy weather should always be kept, and ready at hand for reference.

Deer, rabbits, and hares are now very hurtful to trees and shrubs, and should therefore be vigilantly looked after by a sufficient staff of careful men. Messrs. Davidson & Co's (Leith) "composition for tree protection" is what we use, and it is the best and cheapest known to us. Holly, Laurel, Laburnum, and Common Ash, require more attention than most other plants, while Box, Rhododendron, Privet, and Spurge Laurel, are seldom if ever injured in severe snowstorms. As regards employment, this, however, only constitutes a small item; hence, others must be sought.

The roots of wind-fallen trees can with due advantage be grubbed, blasted, and removed during severe snowstorms—beginning with those in the policies, and most under view, and extending the operation as means and circumstances subsequently suggest. Not only are the upheaved roots of wind-fallen trees unsightly in appearance, but they almost invariably constitute a permanent harbour for rabbits, rats, and other vermin; hence the manifold reasons for removing them.

The work is frequently let by contract, either at so

much per stool, grubbing, blasting, and loading, or by measurement at 8s. to 10s. per cord. The cord of roots is usually set up 14 feet long, by 3 feet 3 inches high, and 3 feet 3 inches wide, solidly packed. For fuel, the roots are worth at least the grubbing price, and are used in heating greenhouses, churches, burning lime, tiles, &c., as also for common domestic purposes of heating and cooking.

The roots of old Pine trees, grown on hard gravelly soils, are unsurpassed for combustibility and efficiency in fire lighting, being full of resin; nor are the hardwood roots less valuable as common household fuel, as they burn strong, clear, and bright, especially if stacked up to dry twelve months or so before being used.

The largest and best timber upon an estate is generally thrown by means of the felling saw, both because it is cheapest done, and because it saves a portion of the timber that would otherwise be wasted if the trees were cut with the axe instead of the saw. Timber merchants have also a decided objection to axe-felled timber, even when cut by first-class axemen, and refuse giving such high prices for the timber so cut.

It is, therefore, the rule, axe-felling the exception. The stools of saw-felled trees remain fresh and sound many years longer than axe-felled ones. At three years the latter is often farther decayed than the former at ten years. When the site of an old plantation has to be replanted, the unadecayed roots form a great barrier to its success, as those too well know who have them to deal with. The only practicable way of meeting the requirements of the case is to go over the old stools from whence the trees had been previously cut with the saw, and with the common long felling axe hollow or scoop out the tops of the stools. To those who have never seen timber felled with the long axe, and the stool left in a basin-like shape, the scooping of stools may be altogether misunderstood and its advantages unappreciated. The process is very simple, and the expense comparatively small: a good axeman will scoop from twenty to thirty stools in a day, leaving each capable of holding from a quart to a gallon of water. The first shower of rain, or melted snow fills the basin of the stool, which usually remains till summer drought evaporates it, but it is difficult to say whether the process of decay is not rather promoted than retarded by the basin being alternately filled and emptied of water. Our more immediate object in introducing the stool scooping practice here is in order that idle hands may be, not only filled, but employed to great advantage—for there is no labour or process known to us whereby the roots and stools of an old Fir or Pine plantation can be so quickly, cheaply, and efficiently got clear of as by scooping or hollowing out the stools, so as to induce the water to stagnate in them in the way recommended; and the work is such as can be equally well done in a snowstorm as in fine weather. C. Y. Nichol, Cullen.

Notices of Books.

Insects Abroad: being a Popular Account of Foreign Insects, &c. By the Rev. J. G. Wood, M.A., F.L.S. Longmans, 8vo, pp. 780.

We do not know any book in which the amateur entomologist can obtain so thorough a general knowledge of all sorts and conditions of insects as in this thick and richly-illustrated volume. Tribe after tribe in systematic order is enumerated, and illustrative specimens of each described. In this manner no less than 860 insects have been described, and 600 figured. The descriptions and figures leave nothing to be desired on the score of accuracy and artistic finish.

By merely turning over the pages and inspecting the woodcuts, the reader may obtain an insight into the morphology of insects, the variations in shape and size of the same organ in different insects, and its adaptation to various purposes which he could hardly glean so readily, and certainly not so rapidly, from more pretentious treatises.

By an extract or two we can indicate, better than by any other means, the general style of the work.

"Among the Homoptera variety of form seems to run riot, and we have in the present instance (fig. 9) one of the most singular forms that could be imagined. Any one unacquainted with entomology could hardly believe that it was not the creation of some ingenious and fantastic manufacturer of sham insects." It is a native of Mexico. The general colour of the insect (*Phenax auricoma*) is pale green, but it has upon its head a crest of long, soft, silken, gold-coloured hair. The whole upper surface of the body is covered with a white downy secretion which looks as if the insect had been brushed, made from cotton-wool. The long fibres that trail behind the insect are of similar material, and look very much as if they had been made of cotton-wool loosely twisted between the hands" (p. 737).

Another Homopterous insect, rejoicing in the name of *Boycidium tinianabuliferum* (fig. 8), is remarkable for the thorax,

"in which part eccentricity of form seems to have reached its utmost limits. *Boycidium tinianabuliferum*

is a native of Brazil. Although the largest of the extensive group to which it belongs, it is but a little creature, growing about as long as a common housefly, but not so stoutly made. By the way, it is worth noting that the scale of magnitude does not accompany the illustrations." The colour of the body is pale brown, while that of the thorax with its extending appendages is black. The form of these appendages can be better seen by reference to the illustration than by description, and the four round little knobs look very much like hawk-bells, and have given rise to the long specific name, which signifies 'bell-bearer,' they are covered with long black hairs."

Our last illustration (fig. 10) refers to a butterfly which, when at rest, so completely resembles a leaf as frequently to escape observation. There are many species of *Kallima*, most of which are remarkable for the manner in which the colouring, as well as the shape of the closed wings, resembles that of a leaf. The upper surface of the *Kallima Inachus* is mostly brown, the tips of the upper wings being black, and orange-tan bands running across them. The following extract is taken from Mr. Wallace's work—

"This species was not uncommon in dry woods and thickets, and I often endeavoured to capture it without success, for, after flying a short distance, it would enter a bush among dry or dead leaves, and however carefully I crept up to the spot, I could never discover it till it flew suddenly into my net. It is not very common in a similar place. At length I was fortunate enough to see the exact spot where the butterfly settled, and though I lost sight of it for some time, I at length discovered that it was close before my eyes, but that in its position of repose it so closely resembled a dead leaf attached to a twig, as almost certain to diagonally across them. I captured several specimens on the wing, and was able fully to understand the way in which this wonderful resemblance is produced.

The ends of the upper wings terminate in a fine point just as if made of many irregular shrubs, and trees are pointed, while the lower wings are somewhat more obtuse, and are lengthened out into a short thick tail. Between these two points there runs a dark curved line, exactly representing the midrib of a leaf, and from the radiate on each side a few oblique marks, which well imitate the lateral veins of a leaf. On the outer portion of the base of the wings, and on the inner side towards the middle and apex, and they are produced by striae and markings which are very common in allied species, but which are here modified and strengthened, so as to imitate more exactly the venation of a leaf.

"The tint of the under surface varies much, but it is always some brown or ashy colour, which matches with those of dead leaves. The habit of the species is always to rest on a dead twig, and among dead or dried leaves, and in this position, with the wings closely pressed together, their outline is exactly that of a moderate sized leaf, slightly curved or shrivelled. The tail of the hind wing forms a perfect stalk, and touches the stick upon which the insect is supported by the middle pair of legs, which are not noticed among the ashy fibres that surround it. The head and antennae are drawn back between the wings, so as to be quite concealed, and there is a little notch hollowed out at the very base of the wings, which allows the head to be retracted sufficiently. All the various details of this insect are so disguised that it is so complete and marvellous as to astonish every one who observes it; and the habits of the insects are such as to utilise all these peculiarities, and render them available in such a manner as to remove all doubt of the purpose of this singular case of mimicry, which is undoubtedly a protection to the insect. Its strong swift flight is sufficient to save it from its enemies when on the wing, but if it were equally conspicuous when at rest it could not long escape extinction, owing to the attacks of the insectivorous birds and reptiles that abound in the tropical forests. A very closely allied species, *Kallima Inachus*, inhabits India, where it is very common, and specimens are sent in every collection from the Himalayas. On examining a number of these, it will be seen that no two are alike, but are the variations corresponding to those of dead leaves, such as yellow, ash, brown, and red is found here, and in many specimens there occur patches and spots formed of small black dots, so closely resembling the way in which minute fungi grow on leaves that it is almost impossible at first not to believe that fungi have grown on the butterflies themselves."

"If such an extraordinary adaptation as this stood alone it would be very difficult to offer any explanation of it; but, although it is perhaps the most perfect case of protective imitation known, there are hundreds of singular resemblances of this kind. It is so clear that it is possible to deduce a general theory of the manner in which they have been slowly brought about."

—Mr. S. Kurz has recently published in the *Journal of the Asiatic Society of Bengal* some "Contributions towards a Knowledge of the Burmese Flora," in the shape of a classified list of Burmese plants, with occasional comments. The present instalment extends from *Ranunculaceae* to *Geraniaceae*, and is principally descriptive in character. The following extracts, relating to tropical forests, and to those of Burma in particular, are of general interest:—

"The distinction between evergreen and deciduous forests must always be the leading one in tropical countries, and such forests differ always most conspicuously in their vegetative components.

"The former are divided into the littoral forests (tidal

and Mangrove), the result of saline influence; farther into swamp forests, the product of superabundance of fresh water and heavy inundations during rains. Then come the tropical forests, which are more regulated by moisture and amount of shade than by substratum, although great differences (not so much habitually as specially) are observable in those that grow on permeable or on half-permeable strata, on silicious sandstones or on metamorphic or permeable laterites, the latter rich in purely Malayan types, the former poorest of all (with those growing on limestone in Tenasserim I am not acquainted). The last sort of evergreen forests are the hill-forests, rather confusedly huddled together by me, but sufficiently distinguished for present requirements. The lower damper ones of these are a modification of the tropical forests below them, while the drier ones consist chiefly of Pines, Oaks, Ericaceae, &c., and pass soon into the temperate forests, which contain a great number of winter-deciduous trees, but are not represented in Burma, except on a few peaks above 6500-7000 feet elevation. Here the slope and resultant amount of light and moisture, and not so much the quality of rock, are the principal regulators, at least so it is on the metamorphic and older formation, while limestone, &c., will form exceptions. Higher up the influence of elevation modifies and changes vegetation according to well-known laws. The leaf-shedding or deciduous forests form the other large class of Indian forests, and cover in these regions a greater area than the former. These grow either on impermeable strata, such as compact calcareous sandstones, and form then the "dry forests," where *Catechu* trees and several Hindustani trees and arborescent Euphorbias find their home, while higher up, on the crests of the Yomah they become formed almost exclusively of an arborescent *Hiptage*, often accompanied by several rather temperate forms, like *Heracleum*, *Vaccinium*, *Hymenopogon*, &c. On laterite and gravelly strata, and also on very stiff plastic clay, grows another variety of forest, called by me the open forests. Those growing on the first named strata are especially interesting, and are generally known to the Burmans as the 'eng' or 'ein' forests, so named after the prevailing tree, *Dipterocarpus tuberculatus*; here the botanical rarities of Burma are scattered, and catch the eye the more readily that the surrounding forest is open, and the soil-clothing rather scanty. Higher up in the hill eng forests (which grow on laterite formed by decomposition of older rocks, or on *abris* of them), the eng-tree is often replaced by other kinds of wood-oil trees (chiefly *Dipterocarpus costatus* and obtusifolius); while those open forests that occupy the stiff clay at the base of the hills are characterised by the absence of eng.

"The last variety of deciduous forests are the mixed forests (as they are called by the forester) in which *Teak*

— The *Fern Paradisi* is to be the title of a forthcoming work from the pen of Mr. Francis George Heath, author of *The English Pansy*. Mr. Heath's new book, which will be published by Messrs. Hodder & Stoughton, purports to be "a plea for the culture of Ferns." It will include descriptions of ferny rambles through the green lanes, the woods, and the glens of Devonshire—"the home of our native Ferns."

— The *Album Van Eden*, published by Van Eden, florists, of Haarlem, is a half-yearly publica-

FIG. 8.—BOCVADIUM TINTINNABULIFERUM.

tion, forming an annual album of a dozen handsome chromolith plates, intended apparently for displaying in the seed shops, for the purpose of augmenting the sale of bulbs. They consist entirely of Dutch bulbs and bulbous plants, and form exceedingly effective pictures. The plants figured in the Album for 1874 are *Crocsmia aurea* and *Anemone japonica* (Homonore Jobert, a group of bizarre Tulips, *Lilium tigrinum* flore-pleno, double Tulip Yellow Rose, a fine-looking flower; *Lilium candidum*, *Iris reticulata*, *Hyacinths La Tour d'Auvergne* and *Grand Lilas*; *Cyclamen Atkinsii*, in

— The current number of the *New Quarterly Magazine* (Ward, Lock & Tyler) contains amongst other good reading an interesting account of the farming and social experiences of an emigrant in Canada; a capital paper on the agriculture of Portugal, by Mr. John Latouche; and a vigorously written protest against the modern system of bedding-out by Mr. Archibald Banks. In the latter, however, we find plenty of evidence that the author is not quite master of his subject, and while thoroughly sympathetic with his intentions, we think it is a pity he did not make himself better acquainted with gardens and gardening, and with gardeners too, before he put pen to paper. Who that knows anything of English gardens and their owners—as distinguished from the Jack-Towel garden of the suburban amateur, with its solitary greenhouse, would write such nonsense as the following:—"Where is your pride gone, gentlemen, who are owners of gardens, that you permit this clean sweep of every green thing from your flower beds at the end of autumn? Have you no proper spirit left, that you submit to be dictated to by a servant, who 'makes a desert and calls it a garden'—who, when you want the sight or the smell of a flower at Christmas, shows you into a damp and stuffy greenhouse, reeking with stale tobacco smoke, the abode of greenfly and red spider, and crowded with five thousand miserable little flowerless cuttings!" Were Mr. Banks a gardener in a good establishment he would learn soon enough that, as regards fashions, he would have to take the cue from his employer, who has a position to maintain, and usually is not in the habit of being dictated to. Again, Mr. Banks tells us that "the English gardener has a high repute all over Europe; the Scotch gardener is confessedly the best in the world"—a statement which contains as much truth as the following, from the same page:—"A modern English gardener requires an education which is nothing less than scientific, and, as every one knows, his salary in large establishments is higher than that of many professional men." The latter statement would be highly gratifying to us, if only it were true. Unfortunately, however, in many large establishments the salary and emoluments of the gardener are not so good (in proportion to the intelligence of the two men) as those of the family butler; and in very many cases are not equal to the wage of a town artisan's labourer. But reading further on that the Winter Aconite and Christmas Rose are "tuberous plants,"

FIG. 9.—PHEXAN AURICOMAE.

s chiefly found, almost always accompanied by *pyenkadu* (*Xylia*). The upper ones grow either on permeable siliceous argillaceous sandstone, as in the case on the Pegu Yomah, and the trees are then usually very lofty, or on metamorphic and other older strata in Martaban, and in this case they are richer in species, but lower in growth, often accompanied by trees which are very rare in the Yomah, such as *Pterocarpus*, *Ternstroemia*, &c. The lower mixed forests occupy the alluvial lands of the greater rivers, and gradually pass into the savannah forests and the true savannahs. Along the larger chougins in the hills, where alluvial deposits spread out to a larger extent, similar savannah forests recur on a small scale, but much better grown, and, especially by favourable exposure, much mixed up with trees that are missed in the plains, such as *Erythrina lithosperma*, *Bischofia javanica*, &c.

three colours; early Tulips, White Pottbakker and Proserpine; *Fritillaria imperialis maximus*, group of *Anemone coronaria*, very handsome; and *Narcissus maximus*, *moschatus*, and *nanus minimus*. The plates are large and exceedingly well executed examples of chromolithography, but they ought to be so, being charged at the rate of one shilling each plate. This art of chromolithography has now reached a very high degree of perfection, and the Belgian artists are particularly successful in their delineation of flowers, &c.

— In the notice of Goetz's *Beitrag zur Kenntnis der Orangenevöckise*, in the last number, for the word "Bombay" read "Nombaz," otherwise the sense is destroyed. H.

FIG. 10.—KALLIMA PARALEKTA.

and that "the Pomegranate" seldom flowers with us except it be treated "as a creeper," we are constrained to say that, by his imperfect knowledge of the subject on which he treats, Mr. Banks has, we fear, done more to injure the cause he advocates, than to promote a much needed reform.

— M. Bernardin, the Curator of the Commercial Museum at Mlle, near Ghent, has just published a second edition of his *Classified List of Vegetable Oils and Fats*, which serves to give an idea of the immensity of the resources (to a large extent imperfectly developed) which Providence has placed at the disposal of mankind.

THE

Gardener's Chronicle.

SATURDAY, JANUARY 9, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Jan. 11. Sale of Imported Orchids and Liliun auratum, at Stevens' Rooms.
 TUESDAY, Jan. 12. Sale of 250 Pairs of Choice Poultry and Pigeons, at Stevens' Rooms.
 WEDNESDAY, Jan. 13. Sale of Hardy Trees and Shrubs and Dutch Bulls, at Stevens' Rooms.
 SATURDAY, Jan. 16. Sale of Roses, Fruit Trees, Conifers, Shrubs, Bulbs, &c., at Stevens' Rooms.

IN a recent article we alluded to Professor CASPARY'S paper on the ORIGIN of SOME of the VARIETIES of the common SPRUCE FIR, and the fastigate variety of the OAK. The chief point of interest in these inquiries is, whether certain known seminal varieties of different plants are capable of reproducing themselves from seed, giving rise to new races having the value of species, and in their turn giving birth to other new races, and so on *ad infinitum*. It is argued by some that, although plants may vary to a great extent, there is a certain fixed limit beyond which they will not go, and that the progeny of seminal varieties is not constant, frequently showing a reversion to the original parent. There is no doubt that this actually does take place, and that there is a limit, though perhaps not fixed, to variation within the period over which the observations of man extend. But everything remains to be done in this branch of inquiry, that is to say, so far as absolute and irrefragable proof is concerned.

Almost all botanists who have much experience of living plants, and more particularly of the same species in a wild state and under cultivation, admit that it is impossible to draw up descriptions of species or forms that will exactly define, or rather include, all that must eventually come under each of them, unless we go so far as to distinguish individuals. The best description written can only be looked upon as a guide to the characteristics of a certain form or aggregation of forms. In the case of plants from unexplored countries, descriptions are frequently based upon specimens taken from a single individual, and some, or all, of these descriptions may have to be modified to include the next batch of specimens. On the other hand, the descriptions of the plants composing the flora of a country so thoroughly explored as our own, apply to forms that in many instances are rarely exactly matched, or they are more comprehensive, and include a certain range of variation of types more or less unequal in value. All who have formed a collection of dried British

plants have a certain number of specimens which cannot be referred to any described critical species, they do not satisfactorily agree with the descriptions or the authentic specimens upon which the descriptions were based; and they can only be said to belong to such or such a set of things. Nevertheless, the study of minute differences is profitable, indeed, properly directed, of the utmost value from a scientific point of view.

A gradual evolution of species is not an attractive theory to those who look for mathematical precision in descriptive botany, but it is a fact beyond question that no two plants can be found exactly alike in every detail. How far variation may go is still, probably, an open point, and can only be guessed at, hence the importance of directing our investigations into this channel, and carefully and impartially recording all facts, whatever their bearing. Preconceived notions should not in any way influence the inquirer after truth, otherwise he may fail to discover it. The history of many of the forms of plants in cultivation is only imperfectly known, and consequently of no importance in support of this or that view. Let us, then, pay more attention to this interesting subject.

One of the trees most fertile in giving birth to new forms is the false Acacia, *Robinia Pseud-Acacia*. It was introduced into France upwards of 200 years ago by ROBIN, after whom it was named. The original plant stands, or did stand a few years ago, in the Jardin des Plantes at Paris. For many years there was no further importation, and this one tree, if we may rely upon our authority, gave birth to the multitudinous forms now in cultivation, many of which, it is averred, come true from seed to a greater extent than seed from the parent tree; but grafting is so universally practised to propagate forms obtained in this way, that our information is too meagre to be considered of absolute value.

Professor CASPARY'S article on the origin of the upright Oak has given rise to the foregoing remarks, for he, as we have already stated, does not believe in the origin of forms equal in value to what we term species, though he recognises the importance of tracing out the parentage of varieties, and determining their stability from seed, &c. To this end he has collected all the evidence he could respecting the origin and propagation of *Quercus fastigiata*. Like the varieties of the Spruce Fir alluded to in a former article, the upright Oak appears to have sprung up independently in several different and distant localities.

The earliest information CASPARY has found respecting this tree is in the fourth volume of the *Hanau'schen Magazin* for the year 1781, where there are two figures of it, one in and one out of leaf. A description is given of a specimen 100 feet high growing in the forest not far from Aschaffenburg. Nothing is known of course of its actual origin, but it is stated that it showed a tendency to develop an irregular form of branching on the north side, and a large branch was shot off. At that period (1781) it was believed to be upwards of 200 years old, and it was regarded as a freak of Nature, because many fruitless attempts had been made to raise it from seed. All the plants raised from its acorns resembled the common Oak. To the writer of the article in question this was the only specimen of the upright form known.

The next account of this tree is in the *Flora der Wetterau* of GÄRTNER, MEYER, and SHERBIUS, in which work "the beautiful Oak of Harreshausen" is mentioned, and described as a remarkable variety of *Q. pedunculata*, all attempts to propagate which, whether from seed or by grafting or budding, had been futile. Further information respecting the same tree

was given by BECHSTEIN in the fourth edition of his *Forstbotanik*, 1821, and in the *Gardener's Chronicle* in 1842.

The result of Professor CASPARY'S investigations is that the upright Oak can only be propagated with certainty by grafting, though it may sometimes come true from seed. The specimen above mentioned still exists, and is regarded as the mother of all of the same variety cultivated in Germany.

LAMARCK, in his *Encyclopædie* (1789), gives the first account of the upright Oak in the Pyrenees and Navarre, and names it *Q. fastigiata*. LOISELEUR-DESLONGCHAMPS (*Nouveau Duhamel* (1819), vii. 178, t. 57) figures it, and says that it occurs in the Eastern Pyrenees and the Landes; but DE CANDOLLE did not consider it indigenous. Professor CASPARY thinks it probable that these also descended from the tree above mentioned, as it is stated in the first named article referring to it, that during the Seven Years' War a French General placed a guard over the original tree to protect it from injury, and sent acorns of it to France. According to TENORE the upright Oak is also found in Calabria.

Evidence from various sources confirm what has been said before, that some, at least, of the seed comes true; but further information respecting the age of the tree in different localities, its constancy from seed and other particulars, especially whether the females of the fruit-bearing specimens are fertilised by pollen from the same tree, are points deserving the attention of those in a position to contribute to our knowledge.

One fact more we may set down. The Denmark Oak of carpenters, *Q. sessiliflora*, is considered by many botanists as a variety of *Q. Robur-Q. pedunculata* being another variety of the same species—but the timber of the two is so different that it can always (?) be distinguished, and their distribution favours the idea of their being races rather than varieties.

— THE SERAGLIO, or the *Serai Boornoo*, at Constantinople is the ancient palace of the Osmanli Sultans, and was their state residence until Sultan MAHMOOD ceased to live there. The enclosures of this far-famed palace occupy the area of the ancient city of Byzantium, on the extreme point of the eastern promontory between the Bosphorus and the Golden Horn. The situation is entirely unique, and the walls which remain are the remains of the city which the great fire of August 12, 1863. The ancient palace was originally built by MOHAMMED II., and continually added to by his successors. THE GARDENS AND PARKS are now in a rather wild but picturesque state. Close outside one of the entrances, that to the northeast of the winter harem, is a magnificent column, surmounted by a Corinthian capital, forming an admirable contrast to a fine Cypress tree adjacent to it. What column this is seems doubtful, and it is not mentioned in the guide books (*Murray, &c.*). It is possible that it may be the one known as Marcian's Column: if so, this would give the date of its erection in 454 A.D., over 1400 years ago. *Murray* says that the column of Theodosius is of the Corinthian order. Within the Seraglio is the magnificent treasury of the Sultans, the accumulated stores of jewellery of past ages, also the armoury, once the ancient church of St. Irene. In the grounds of the Seraglio are deer and other animals from foreign countries. The mosque in the distance, whose domes and minarets appear, is that of VALIDEH TERKHAN, Sultan, and is close by the great bridge of boats on the Golden Horn. For the sketch from which the illustration (fig. 11) on the opposite page was prepared we are indebted to Captain S. P. OLIVER, R.A., who made it on the spot, whilst awaiting the examination of his firm to enter the treasury and armoury on October 23, 1872.

— The current number of the *Florist and Pomologist* contains a beautifully coloured plate of the WELBECK SEEDLING NECTARINE, which was raised by Mr. TILLERY a few years ago, and is the result of a cross between the Balgowan and Elruge varieties. The fruit is described as being as large as those of Balgowan, and the skin almost wholly covered with dark red, the shaded parts showing a little watery or pale green ground colour, while the most exposed parts are of a very deep purple-red, sometimes slightly speckled. The flesh is greenish-white, red and free at the stone, full-flavoured, very juicy, rich and sugary.

FIG. II.—COLUMN AND CYPRESS IN GROUNDS OF THE SERAGLIO, CONSTANTINOPLE.

The flavour is brisk yet luscious, and altogether it is regarded as one of the very best of Nectarines.

— The *Gardeners' Magazine*, which has like ourselves (see p. 749, vol. ii. 1874) recently called attention to the mischievous results likely to follow the absurd method of fastening the PLANE TREES on the THAMES EMBANKMENT, learns that they were not strapped up by the beadle, as our contemporary had imagined, but by the engineers in the employ of the Metropolitan Board. "This is satisfactory, because, as a matter of engineering, the work is perfectly satisfactory, the trees being absolutely immovable, no matter how strongly the stormy winds may blow. But from another point of view the case is worse than we thought it; for, if the aid of science is to be invoked in the cause of tree murder, the Board of Works may acquire dreadful notoriety in the ignoble art of dendricide."

— One of the prettiest features of the great conservatory at Chatsworth during the autumn and winter months is the grand display of EPIPHYLLOIDS of the truncatum type. Upon its exhibition there are numerous monstrous hanging baskets filled with them, and that one side bench, for the entire length of the building, is almost wholly occupied by them, some faint idea of the pictorial effect of these plants may be realised. The baskets are large, probably a yard in diameter, and are covered at top and bottom with the Epiphylloids, so that in the blooming season they are a mass of bloom. On the stage they are grown in pots, some as dwarfs, some as standards, and some worked on stocks trained up the rafters. Amongst the most striking varieties were violaceum grandiflorum, Ruckerianum, spectabile superbum, and Bridgesianum. There were also when we saw them some promising seedlings, and Mr. SPEED has taken up the crossing of these plants, in the hope of gaining improvements on existing kinds.

— Nowhere, we suppose, is RENANTHERA COCINEA to be seen in such perfection as at Chatsworth. In our journeyman days it was considered a wondrous feat to get the Renanthera to blossom at all, so obstinate was it supposed to be under artificial cultivation. At Chatsworth the plants had not, we were told, been out of blossom for four years, and that they had blossomed abundantly the panicles (past and present) attached to the stems bore evidence. The Chatsworth plant has several stems, which grow up to a considerable height in the great conservatory. This Renanthera appears to have a decided preference for growing on Birch poles, and in the case referred to the roots have acquired great vigour, and cling with remarkable tenacity to the surface of the Birch wood.

— Amongst the specimens of WELLINGTONIA GIGANTEA growing near the great conservatory at Chatsworth, is one which might well bear the name of var. PENDULA. We have noticed it on different occasions as being very distinct. It is paler in colour than the other Wellingtonias of the ordinary form which grow near to it, and has all the smaller spray most gracefully drooping. The variety appears to us to be well worth perpetuating if, as would probably be the case, plants from cuttings would assume the same habit. T. M.

— Mr. WILLIAM PAUL'S new hybrid perpetual ROSE ST. GEORGE is the subject of the first coloured plate in the *Florist and Pomologist* this month. It is a rich dark globular Rose, of robust habit and hardy constitution, has splendid foliage, and flowers freely. It is stated to be the offspring of Black Prince, a Rose not yet so widely known as it deserves to be.

— During the past autumn we saw at Elyfield, the seat of Lord BAGOT, a very remarkable illustration of the EFFECT OF CLOSE PRUNING on the constitution of a plant, as compared with a free extension of its growth. In one part of the pleasure grounds was a Hornbeam hedge of considerable age, about 8 feet high, presenting the usual appearance of a hedge of this kind, that is to say, the individual trees bore a thicket of slender twigs, and their stems were perhaps barely as stout as one's wrist. From some cause or other the end tree of this line of Hornbeams had been allowed to grow unmolested, and while the constantly pruned plants were no larger than above indicated, the unpruned growth was a fine unbranched specimen with a thick trunk, and a head at least 40 feet high. It formed a capital illustration of the truth, that constant repression is exhausting. There is, of course, nothing very remarkable in the fact recorded, nor does it teach any new lesson, but the accidental juxtaposition of the hedge and the tree brought out in strong contrast the different effects of the two systems of pruning.

— M. BUVIGNIER, writing to the *Courrier de Verdun*, in reply to a certain correspondent, who states that the Small Birds' Protection Act would have no influence on the INCREASE OF INJURIOUS INSECTS, says that he believes he can adduce positive facts to

prove that the prohibition to kill small birds will result in serious and even dangerous consequences, and have just the opposite effect to that expected by the promoters of the measure. There are useful insects as well as useful birds, and we ought to protect the one as well as the other, up to a certain point. An important thing to ascertain, as M. BUVIGNIER observes, is, what insects the insectivorous birds devour. He maintains that, with the exception of the cuckoo, none of our birds eat the hairy caterpillars, and nearly all those which devastate our gardens belong to the hairy class, and therefore have nothing to fear from the birds. The birds, instead of clearing off the caterpillars, attack the natural enemy of the latter, the ichneumon fly, and thus the caterpillars increase in the same ratio that the ichnemons decrease. A case in point is cited. In 1853 there was quite an invasion of caterpillars, and trees were as bare of foliage in June as in winter. M. BUVIGNIER succeeded in partially saving his orchards by keeping up a constant warfare against them. When they went into the chrysalis state he carefully collected all he could find. These were kept with the intention of destroying the butterflies as they issued from them, and setting the ichnemons at liberty. The result was that, out of upwards of 600 chrysalides, only three had escaped being punctured by the fly, and 1829 there were very few caterpillars. Since the interdiction to kill small birds has been in force, caterpillars have increased enormously from year to year and the ichneumon has become rarer, and the consequence is that scarcely a leaf is left on the trees at the end of May. This state of things, he predicts, will continue until such time as the equilibrium between the two insects is restored, and this cannot happen so long as the birds are protected. This reveals a subject that we have often advocated before in these columns, and that is the study of the mutual relations of plants and animals, particularly insects, birds, moles, &c. Ill-paid gardeners will exclaim, "What? another subject!" Well, it is quite time; a good gardener must have a very varied stock of knowledge.

— We glean the following facts respecting the manufacture of WOODEN SPOONS OR LADLES, from Mr. WESCHINIAKOFF'S *Notice sur l'état actuel de l'industrie manufacturière de la Russie*. It is estimated that 30,000,000 of wooden spoons are annually turned out of hand. The three governments, Nijni-Novgorod, Kostroma, and Viatka, alone produce half of this number, amounting in value to a sum of about 125,000 roubles. The district of Semenov, in Nijni-Novgorod, is the centre of this industry, sixty villages producing 3,000,000 pieces per year, valued at 20,000 roubles. Poplar, Aspen, Maple and Box, are the woods used for this purpose. The wooden spoons fetch from 6 roubles to 25 roubles per 1000. The first operation consists in cutting the wood into the proper lengths, and making up into bundles. These bundles are sold in the markets, and are often procured from long distances. The second stage is forming the bowl of the spoon, the third, shaping the handle, and the fourth and last, dyeing them of a yellow colour.

In the pleasure-grounds at Ingestrie Hall, near Stafford, are growing some splendid specimens of Little Gem, which are at least 20 feet high, and as much through. They are quite a feature amongst the other fine specimens of arboreal vegetation with which this antique residence is embellished. At the same place is a well-grown Araucaria imbricata of from 25 to 30 feet in height.

— The EPIPHYLLOID TRUNCATUM may be employed in a variety of ways as a decorative plant. At Knowsley we saw tufts of it ornamenting the roof of a plant stove. It was worked in the Persia which was first trained as a creeper and then grafted at intervals with the Epiphylloids. The masses of flower were very effective, and all the more so, perhaps, from their appearing to grow out of nothing, the Persia stem not being at all prominent.

— Among EARLY PEAS that can be recommended for the earliest sowing, one of the most useful is Multum in Parvo. This belongs to the late Dr. MACLEAN'S valuable strain, though it was distributed by Messrs. NUTTING & SONS, and not by Mr. C. TURNER, who sent out most of MACLEAN'S seedlings. It is a very early dwarf wrinkled marrow, growing from 12 to 15 inches in height, of hardy constitution, bearing freely a good supply of well-filled pods. It is almost superfluous to state that the Peas are deliciously flavoured when cooked. It is sufficiently distinct from Little Gem to be classed as a variety; it is a taller and more robust grower, has larger pods, and produces more of them; when supported by a few small sticks the crop is increasingly valuable. The London market gardeners, naturally enough a conservative class, but cautious also in what they select to grow, are beginning to appreciate the value of this early variety for market purposes; and those who have

tried it assert that the crop taken from a given piece is as large as that gathered from the Early Emperor, Sangster's No. 1, or any other early variety of that type, while it fetches a larger price. By some of them Carter's First Crop Blue Pea is also favourably mentioned for market purposes, being fairly early, a good cropper, and of commendable flavour. It also is a dwarf-growing variety.

— EUPHORBIA JACQUINIÆFLORA almost stands alone for the incomparable beauty of its cerise-scarlet flowers, arranged in such elegant wreaths, at this season of the year. At an evening party not long since, where the beauty of flowers, among other pleasant agencies, ministered to the delight of the company, this beautiful stove Euphorbia was singled out for special praise. Such a glow of colour as the flowers present appears to be especially acceptable when snow and ice and frost of unvarying hold Nature in a state of repose. The flowers, though small, are individually very exquisite in form and colour, and being produced with much profusion on the elongated branches the plant throws up at this time of the year, and the leaves being also of elegant form and of a transparent green, it has come to be much used by ladies as wreaths for the hair. The flowers are set on at the base of the leaves in short spikes of three or four to a dozen buds, and as all regularly face in an upward direction, they form a wreath of great natural beauty. It is a grand plant for stove decoration at mid-winter, and it can be met with as specimens 6 to 7 feet in height, with from twelve to twenty leading branches, each starting from the base, and at the blooming season crowded with flowers. For winter decoration the Euphorbia, when appropriately managed, is scarcely second to any other plant known to gardeners.

— We are informed that Mr. QUILTER intends holding a large horticultural exhibition at the Lower Grounds, Aston, Birmingham, on Thursday, July 1, and the Friday, Saturday, and Monday following, for the benefit of the Midland Institute Building Fund.

— We are informed that the presentation of a Testimonial to the Secretary of the Gardeners' Royal Benevolent Institution, Mr. E. K. CUTLER, consisting of a silver tea and coffee service, &c., subscribed for by the members of the Institution, will take place at a supper, to be held at Simpson's Tavern, Strand, on Thursday next, January 14, after the annual general meeting. The chair will be taken at half-past 8 o'clock by Dr. HOOG.

— Sir THOMAS D. ACLAND, Bart., M.P., was summoned before the magistrates at Exeter, on January 1, for neglecting to have the hedges trimmed and the trees lopped in various parts of his estate at Killerton. In defence, the honorable Baronet said his father was fond of preserving the picturesque features of the Devonshire lanes, and, out of respect to the memory of the trees and shrubs which were left in their natural growth. An order was made by the magistrates for the removal of the cause of complaint.

— At the meeting of the Council of the ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, held at the Society's offices, 25, Charles Street, St. James's, on the 5th inst., Messrs. J. G. Cantrell (chair), Batcock, Johnson, Marten, Shaw, Scott, and Wagstaff—after the transaction of the ordinary business of the monthly meeting, cheques to the amount of £1917 for the payment in advance of the quarterly pensions were drawn, and the Secretary stated that since the last election fifty-four fresh applications had been received at the office, bringing up the total number to about 200.

— We have received from Mr. S. A. WOODS, gr. to E. W. WALKER, Esq., Berry Hill, Mansfield, some particularly fine spikes of CALANTHE VEITCHII, C. VESITIA RUBRO OCLATA, and C. VESITIA LUTEO OCLATA, together with the following note, which speaks for itself:—

"I have to-day cut off between fifty and sixty spikes of Calanthes, which have been in bloom from about the third week in October. Although considerably past their best, I send you two spikes of each variety (named above), most of them having had from twenty to thirty expanded flowers on a spike at a time. They have been growing, from the time they were potted last February, at the back of one of our fine-stoves, where the temperature during the summer months was from 70° to 80°, and at times, with sun-heat, up to 85° and 90°. They were well supplied with water, and about twice a week with guano-water, until they began to show their flower-spikes, when it was gradually withheld. The temperature during the winter months has been from 65° to 75°, and occasionally below 65° during the very cold weather. In the autumn of 1873 we removed a lot of Calanthes which had been grown in the same house to a span-roofed house, where the temperature was kept at 60° by day and 55° at night; but though the bulbs were as strong as the present ones a great many of the flowers came deformed, and did not last so long as these have done."

The LEEDS HORTICULTURAL GARDENS COMPANY have just issued a Schedule of Prizes for the first spring exhibition, to be held on Wednesday and Thursday, March 10 and 11. The Secretary and Manager is Mr. JAMES BIRBECK.

The showy and interesting plant, GREVIA SUTHERLANDI, which Dr. HARVEY at first placed in Saxifragaceae, but which has since found a resting place in Sapindaceae, is a native of the rocky mountainous country about Port Natal. It would seem, from a letter recently received by Dr. HOOKER from Mr. H. BODDIE, F. L. S., late of Graft Reinet, that the tree is deciduous, and that the flowers appear before the leaves. Mr. J. I. MCLEA, saw it at Macamac, on the east slopes of the Drakensbergen, in June of last year, when its bright red or crimson flowers were crowded at the ends of the branches, and only one leaf of the previous year remained hanging under the racemes. Some of the specimens seen were from 10 to 18 feet high.

The appearance of EROGOT on the RYE-GRASS in New Zealand has been causing great consternation among the stock owners, the fungus having spread very rapidly, and over a great extent of the colony, during the past season. It has seriously affected the cattle and horses pastured on Rye-grass, and the increase of lambs has been impaired to a considerable extent. The effect on the animals is to produce giddiness, convulsions, and paralysis of the hind quarters, sometimes terminating fatally. After being attacked, the sheep, if removed to pasture on natural grasses, mostly recover. Steps are being taken in the colony to consider the best means of arresting the progress of the pest.

A new periodical is announced to appear on the 15th of every month, entitled the *Familie Almanac*, containing a monthly review of the cotton, woollen, silk, and linen trades. It will deal separately with the raw materials, machinery apparatus, tools and processes employed in their conversion, and with the manufactured products. Mr. EMMOTT, of 135, Fleet Street, is the publisher.

Home Correspondence.

Prize Grapes versus Prize Vinerias.—I agree with Mr. Melville's remarks in your issue of December 26, that it would be much better in the interest of horticulture generally that the whole of a garden establishment should be taken into consideration in judging, and not the vinerias alone. Grape growing, of course, is one of the most important duties a gardener has to perform; but to judge of a gardener's abilities, or to represent the merit of a place by the quality of one of its vinerias, I consider altogether too narrow a basis to start upon. It is well known that in successful Grape growing as much or more depends on soil and situation as on skill and superior knowledge. Therefore, it would be very difficult indeed to arrive at a correct conclusion as to the relative merits of different cultivators. I take it that the principal aim and object of the promoters of the scheme is to advance the science of gardening by rewarding superior merit wherever it may be found. There are many difficulties in the way, which I hope may be found not to be insuperable. The chief one that presents itself to me is this: the best place which may not reflect the most credit on the gardener, inasmuch that one gardener may be obliged to manage a place with half the expense and strength that another does, so that the same standard of perfection cannot be expected. If this comparative difficulty can be got over, I see no others more difficult for the Royal Horticultural Society to surmount, than those which meet the Royal Agricultural Society in adjudging the prize to tenant-farmers' farms. If such a scheme can be established, I shall be glad to become a subscriber. Owen Thomas, Drayton Manor Gardens.

What is an Oxlip?—In the early spring of 1864 I brought from the meadows a tuft of Primroses, just showing the bloom-buds, which I divided into four and planted in my garden. At the same time a Cowslip, similarly divided, was planted. I may add that my garden runs east and west, and on the south side there is a Whitethorn hedge, having a 2 feet border; on this border the Primroses were planted. The garden quarter opposite was planted with Currant and Goose-

berry bushes in alternate rows, and here the Cowslips were planted, the garden pathway running between them and the Primroses. As the spring advanced the latter opened into bloom, but showed poor, pale, pin-eyed flowers. The Cowslip was rose-eyed, but not remarkable for size or depth of colour. The whole grew vigorously and bloomed profusely, and ripened much seed, which I permitted the plants to shed, as in a natural state, the ground being kept clear of weeds.

The following spring there were many seedlings, showing both Primroses and Cowslips. I noticed many of the seedlings growing in the meadow hedges. At the succeeding spring (1867) there were hundreds of seedlings blooming, both Primroses and Cowslips; amongst the former there were two or three Oxlips, but these were very unlike the Oxlips on the Cowslip side, the flowers being very round and flat, more so than in the Primrose; the colours were also paler, having but little vigour, the stems being short and but few pimples on the crown. With the Cowslip seedlings this season there were numbers of Oxlips, vigorous, and in colour from the brightest gold to the palest lemon. The Cowslips, too, I observed, were travelling fast northward across the garden, and did not cross the path towards the Primroses; and at no time have I seen a Cowslip blooming with the Primroses, but I have seen the latter with the former blooming profusely; but I am pretty nearly certain that these are the progeny of the Oxlips, as it is in close proximity to them that the Primroses are found.

The Cowslips have now about died out. I saw but one sickly specimen growing in the year 1874; the year past I did not observe one. With the Primroses it is otherwise, these having extended themselves on their border east and west, blooming every spring with the utmost profusion, being then like a bank of Primroses in a wood. The Oxlips, too, appear to be an enduring race of plants, as there are still remaining several fine clumps of them. I believe the two first (those that appeared in 1866) are still in existence, never having been disturbed. One of these last spring threw up more than twenty blossoms of bloom, and was quite as vigorous among the Currant trees for a considerable time. The Oxlip, I find, is not like the Cowslip, soon getting out of bloom. In the autumn of 1869 I planted a high-coloured Polyanthus with the Cowslips, also a similar plant with the Primroses. From this time a race of seedlings (coloured) sprang up, the Cowslips showing the deepest colouring, many of the seedlings being of a dark, ruddy crimson, others inclining to scarlet—the Primroses, showing a shade that where coloured, never retreating beyond a deep violet, with every intermediate shade below, many of them having in the centre of the outer edge of the petals a light spot. I fancy, too, that planting the Polyanthus among the Cowslips has had something to do in respect to their dying out, as there are still several healthy clumps of coloured Cowslips, which bloomed profusely last season. W. H. T.

Do Varieties Wear Out?—I have often thought about this subject, and from my observations have been inclined to doubt it. The Golden Pippin Apple is generally brought into such discussions. I knew it was three years ago; the tree was old, and bore freely, and is alive now. In the garden here there is a tree about ten years old, which grows vigorously, in fact is the healthiest in the place, and crops abundantly with elegant fruit; it has grown so fast that within three years I have had to cut half the growth away. The subsoil is brick earth, with a substratum of sharp sand, which keeps the ground well-drained. I should like to know if propagators of Camellias have found them to be more difficult to grow than fifty years ago. Many Heaths have been kept by cuttings for some years, have they become more liable to disease? We find the old varieties of Pelargoniums grow as freely as ever, viz., P. scutellatum, elatum, dentatum, citrodorum, &c. As to cross fertilisation I may mention that in 1867 some pollen was obtained from Chatsworth to impregnate the Victoria regia at Kew; some were impregnated with their own pollen, and some with the foreign. The result was that those in which their own pollen was made use of were more prolific of seed, and the plants from them grew the strongest the next spring. Though they were raised in the same tank, sown the same day, and potted off at the same time, the plant for 1868 was selected from those raised by means of their own pollen. J. Croucher, Sudbury House, Jan. 4.

The Charlotte Rothschild Pine-apple.—This is certainly a most desirable variety to cultivate, by reason of its robust constitution and its free-fruiting

character. We are now cutting fine fruits of this variety from plants which were rootless suckers at the end of last February. In these respects I quite concur in the opinion of your correspondent in last week's issue, but, with regard to the time stated for the fruit to attain perfection—namely, starters at the present season to be ripe in May—I differ very much, because the fruit requires at least a month longer to ripen perfectly than the Queen of the Providence, and these sorts usually occupy about eighteen weeks after the fruit is visible. A considerable number of plants of this kind have fruited here, at different periods in the year, which varied in weight from 4 lb. to 9½ lb. each. So far my experience does not warrant such sanguine expectations about it as being a suitable sort to ripen in May and June; as some of the fruits of it, which ripened at that period, indicated plainly cracks in the fruit, which very much disfigured them: neither do I for one moment entertain the opinion that, with all its excellencies, it will supersede that old and sterling variety, the Queen, even for general supply. As an autumn and winter fruiting variety it should be in every collection. Geo. Thos. Miles, Wycombe Abbey, Jan. 4.

The Currajong in North Wales.—I have sent you a twig of the Currajong now in bloom at Colwyn, North Wales. It was cut, with the other flowers sent, on Saturday last, though the weather had been for six days after 15° of frost. I could have cut many more flowers, such as Virginian Stock, Mignonette, Roses, and lots of common things, but had barely time to cut even what I did. The Currajong is about 10 feet high, and as straight in the stem as a Larch, which in form (though of course not in foliage) it somewhat resembles. It is scarcely conceivable that it should ever become a shrub. The plant in question is only four years old, and was raised from seed sent from Tasmanian shores, should be obliged by your opinion as to whether it is the Currajong (Platanthus) [Ves. Eds.]. You will observe that Ozolum rosmarinifolius has produced seed here. Alfred O. Walker, Chester. [The flowers received from our correspondent were Aralia Sieboldi, Chrysanthemums, Stocks, Aster grandiflorus, Lepotospermum scoparium, Ozothamnus rosmarinifolius, &c. Eds.]

Size of Old Holly Trees.—A correspondent, writing in the *Gardener's Chronicle* some few weeks ago, wished for information regarding the size of Holly trees in other parts of the kingdom in comparison with one of which he gave the dimensions. Being busy at the time, I could not then give attention to it. For his satisfaction I would now give to inform him that this place (Gordon Castle) has been noted for its fine old Hollies, and that many of them are several hundred years old. Numbers of them are divided into stems nearly close to the ground of three, four, or five each, and could not be properly measured as one tree unless quite close to the surface, which I do not consider fair measurement for the trunk of a tree. There are, however, numerous examples of clean straight stems, one of which I measured a short time ago and found its girth at 3 feet above ground was 7 feet 9 inches, and again at 4 feet it was 7 feet 6 inches; another, a few feet above ground girthed 3 feet, and being the smallest part, and immediately above it began to divide into different stems, and could have been measured to show a much higher figure. I measured at the same time an old Alder, at 3 feet above ground, which girthed 15 feet 2 inches. This is perhaps nearly as rare in regard to size as the Holly. J. Webster, Gordon Castle.

Abutilon Thompsoni.—This plant was, for a time, much sought after, but from personal observation it is now generally seen standing neglected among a lot of plants which are shortly to be thrown on the rubbish heap to make room for something newer. When thus seen it is certainly a wretched-looking object, not worth its room. In my opinion, however, it ought not to be discarded yet, as with very little trouble it can be made to brighten conservatories, greenhouses, drawing-room screens, &c. through the dull winter months. It is easily propagated in a gentle bottom-heat in the spring, and may be treated shortly after other bedding-plants, and used with them for "dotting" among *Iresine*, *Coleus*, &c. If the best of these are carefully lifted as soon as convenient, they will be found very useful, however leggy they may appear. Good plants may be had with special treatment; the following I would recommend, being a sure method to obtain better plants than is generally obtained by pot-culture. At the end of May or early in June a bed with a south aspect should be prepared for them by merely mixing a quantity of leaf soil or decomposed dung with the common garden soil. The plants required should have been previously pinched back hard often enough to obtain five or six shoots. Plant about 18 inches apart each way. They should be watered occasionally, and a trowel frequently run at about 3 inches distance around them; this will check a top-luxuriant growth, and also enable the operator to lift the plants with a good bill, which should be done before the frosts set in

(this is not really necessary, but is advisable, the Abutilon being semi-hardy). When potting use pots as small as convenient; the soil in which they were growing will be good enough. They should then be watered, kept close, syringed, and shaded a few days, and the operation won't affect them. Old plants should be cut down in the spring and treated much the same as above. They will all prove very useful either for their beautiful foliage or their curious flowers, which are produced freely through the winter, providing the plants are in a moderately warm and airy position. *W. T.*

A New Potato.—What! another variety added to the thousand and one already in commerce? Yes; and that a very desirable one, if we are to believe the following witty story, which I heard related when travelling in a railway carriage the other day, and where Potatos formed the subject of a long conversation.—“Have you not heard of the new ‘Kocca mirabilis’ Potato from California?” said Mr. D. “No,” was the reply; “what is it like?” “Oh! it is an immense cropper, and grows as large as a long Vegetable Marrow, but it won't boil!” “I won't boil?” interrogated a fellow passenger, “then, I fear, it will never come into general use.” “But it will bake beautifully,” said Mr. D.; “and the most remarkable thing connected with it is that, when it is cut open, there is found in the middle a nice piece of butter, pepper, and salt.” I need hardly say this announcement was received with a general burst of laughter. *T. S.*

Conifers on Chalk Land.—Your correspondent “J. V. Holwell,” p. 19, may take heart that the list is not so restricted as may at first appear. I take it that the whole is not pure chalk, but more or less strongly mixed with it after trenching. From some experience in the matter, I can recommend the following as certain. In the first batch, *Larix*, when the chalk is in greatest quantity, plant *Pinus austriaca* and its cognates *P. pyrenaica*, *Laricio*, and *romana*. Add *Cupressus Lawsoniana* and *nutkatensis*, *Juniperus virginiana* and *chinensis*, *Thuja Lobbi*, and common Yew. All these will thrive and grow with fine dark colour on fresh trenched and pulverised chalk. Next in order (with reference to the chalk apparent in earth) plant Cedar of Lebanon and *C. atlantica*, *Wellingtonia gigantea*, *Picea cephalonica* and *P. Pinaster*, and if there is one comparatively sheltered corner plant a *Pinus excelsa*: it will enjoy the chalk though it cannot stand the west wind—*Pinus Pinaster* can do so: act accordingly. Any of the above, singular to say, I have found to thrive better than the common Scotch Fir under the circumstances. The list may be very much extended, and not—mark—with plants “dragging out” an existence, but “happy” and comfortable. Let planters of Conifers on chalk trench early, and allow the whole to mellow, and in every case if possible give a little assistance in the barrowload of good earth, till the plant has taken to its new quarters, and, as a rule, do not plant large plants from a different soil. *A. Mel.*

Heating a Conservatory.—I should be obliged to “H. K., Sussex,” who wrote in the number of Dec. 26, 1874, about heating a conservatory, if he would state the cause of the vapour entering the room—i.e. from the pipes bursting or what, and the kind of stove that he alludes to. I am about to have one put in a room to heat a conservatory, so wish to know more particulars before I do so. I do not see how a cylinder boiler could emit a “foul vapour” unless it burst. *C. Oakley, Monmouth.*

Rhododendron Flowering Early.—Yesterday, in making my way through several inches of snow to a Rhododendron in my garden, I was surprised that the intense frost had not delayed the coming out of one of the buds, which is rather more sheltered than the rest. It is a rose-coloured variety, and, I believe, Chinese. It always flowers early, but this year before Christmas it had one bloom out, which kept many weeks in the house and fully expanded. *E. O. M., Jan. 5.*

Planting Young Fruit Trees.—The season for planting young fruit trees having arrived, it has occurred to me that a word or two as to their management may be useful to some of your numerous readers. The usual practice with many on receiving their trees from the nurseries is to cut them hard back, leaving only a bud or two on each shoot, thus sacrificing at once a year's growth, as the tree at the end of the following season will be much in the same state as when received from the grower. This practice of heading young trees cannot be too strongly condemned, as it serves no useful purpose whatever. The object in planting a tree is to fill the allotted space on the wall or trellis, and to get it thoroughly established in a fruit-bearing state as quickly as possible. Instead of cutting back, every inch of wood, if ripe and firm, and properly situated, should be laid in, so as to form the main branches of the future tree. If it is intended to train in the fan-shape, an equal portion of

the branches should be trained to the right and left, so as to keep the middle of the tree quite open, as that part is sure to fill. In spring, all buds except those properly situated should be removed, and those left to form the tree should always be on the upper side of the branches, as it is impossible to have a handsome-shaped tree if this is not observed. Many are of opinion that it is necessary to cut a young fresh-planted tree hard back to get it to break properly; but planted in suitable soil, and duly cared for, the lower buds will be found to start almost as freely as those at the extremity of the shoot. On receiving the trees from the nursery the roots should be carefully examined, and any broken or mutilated part cut away with a sharp knife. In planting, it is not necessary or desirable to renew the whole of the border, as it is much better to do this piecemeal as the trees require it. A semicircle of 5 feet or so, and 2 feet 6 inches deep, will be found quite sufficient for the first year. This hole should be partly filled with good sound, yellow loam, without a particle of manure or other admixture, and a few mould, or any other decomposing vegetable matter, should never be allowed near the roots, as it is sure to lead to the formation of fungus, and ultimately the entire destruction of the tree. This has more to do with failure in fruit growing than many imagine, and want of success is too frequently attributed to other causes when it should be sought for at the roots, for if these are not active and healthy, no treatment the top can receive will be of any value. The roots should be carefully spread out and covered with fine soil, afterwards filling up with the rougher portions, gently treading the same as the operation proceeds. The surface should then be mulched over to protect the roots from the action of frost in winter, and in a uniform state as to moisture during the summer. If the roots are shaded in this way, one or two good waterings will carry them through the driest of seasons, and it is surprising how soon plants thus treated become established, it is the greatest mistake possible to allow a fresh-planted tree a flag or water in any way for want of moisture, either at the root or in the atmosphere, and the former is almost certain to be the case if not well mulched over. If allowed to flow, the bark is sure to become contracted, and the growth of the tree much impeded in consequence. To counteract the exhausting effect a dry state of the atmosphere has on all fresh-planted trees, they should be well syringed at least once a day till they become fully established. In regards to above, I have been troubled with one small and one large tree, 2 or 3 feet of trellis in three years with good fruit-bearing wood. *J. Sheppard, Woolverston.*

The Noble Tuber or Pomme de Terre.—As I have practised autumn planting most successfully for three years it is right that I should give necessary cautions. Do not plant cut sets but whole tubers, or worms and centipedes may cause great havoc. Do not plant till the earth is thoroughly cold, or the sets may sprout and come up, if the pre-Christmas weather is mild. I began planting in the 21st of August, and on November 1st in warm gardens Potatos should not be planted till all fear of premature growth is over. I do not recommend autumn planting in strong ground, that seals like asphalt. If the Potatos have sprouted the scions must be taken off. Plant the tubers 4 inches deep and cover them in the trench with grassy turf (I use this) or clean straw. I plant the Potatos 22 inches from rank to rank, and 9 inches or a foot from tuber to tuber according to their size. My lands this season were quite covered with tubers. The tubers used are too good for a pig, but not good enough for a table. Those of the size of a bantam's egg I plant 9 inches apart, and those of the size of a hen's egg a foot apart. The sorts I use are, for earliness, Royal Ashleaf, Veitch's Ashleaf, and Gryffe Castle, an admirable white, round Regent. It is a short haulmed, early ripening Yew Regent; and I believe it and Turner's Union to be two of the best in the white line that are not kidneys. My late dependence are Lapstone and two congenial sorts, the large and small Yorkshire Hero and Taylor's Yorkshire Hybrid. The two former have white flowers and the last blue flowers. It will be a “hard nut to crack” to beat the above. As soon as the skin adheres firmly to the tuber dig. Never mind whether the haulm is decayed or not; the tubers ripen a little in store. The late Potatos last till new ones come in; and they were so good that my servants preferred them to the new Potatos. There appears to be a great favour for large Potatos; but even if the sort is good, a mid-sized tuber is always better in quality than a large one. For poor people, who depend on quantity, I specially recommend Suttons' Red-skinned Flourball. The crops hereabouts of this sort have been wonderful, and, as far as disease is concerned, this sort this year has signally escaped disease. It might not be so another year, for disease depends much upon circumstances. It is a great mistake to suppose that Potatos freshly raised from seed have any advantage over Potatos, whether freshly raised from seed or otherwise, may escape one year, and the next year

be the most diseased of all. My object in autumn planting is, not to escape disease, but to utilise tubers, which, if grown out in store, would be useless. I believe that the growing out in store before planting has done more than anything to weaken the constitution of the noble tuber. I have much pleasure in highly recommending Mr. Fenn's Bountiful. It is as rich as, but an earlier ripener than the Salmon Kidney. It is the best quality new Potato that I have eaten for many years. His hybrid from Hero and Onwards is also a Potato of great excellence; I advise a trial of it. I believe it is called Alice Fenn. It is distinct in flavour, being midway between that of a round and kidney. His Rector of Woodstock is a beautiful round level white Potato. Next year I shall be able to speak of it more definitively; it is perfect in shape, and well worth a trial. One object of my autumn planting is this: the Potatos do not appear above ground till frosts are nearly over. When mine are just peeping the March-planted Potatos are a foot high, and the May hoar frosts commit sad havoc. When mine peep I snub them by just covering them with earth, and so escape. I thus get more results from my kidneys than poor people do from their round deep-eyed “whoppers.” *W. F. Radclyffe, Okeford Fitzpaine.*

Flower Shows.—Allow me to deny the truth of Mr. Croucher's assertion, that I put more than one plant in a pot at Bath. He is “not aware” of my great triumph over him, he is “not aware” that he attacked the judges “‘‘ does not see” that he needed fortifying at Bath. I pass over this, and ask him to deny point-blank that he did fortify himself. I happen to know rather more about it than he imagines. He may possibly not have written the offensive remarks I referred to, but if he prompted them to your reporter [which we deny, Eds.], directly or indirectly in any way, he is equally the author. Why did he claim the “merit” of having written them? [Mr. Croucher denies having done so, &c.] To satisfy your editor's request—which ought never to have been made—and to prevent my silence being misconstrued, the following is, I believe, an exact list of the twelve cup plants I showed in June last at South Kensington:—*Carculigo recurvata*, *striata*, *Macrozamia corallipes*, *ditto spiralis eburnea*, *Pandanus Veitchii*, *Vriesia reticulata*, *Dracaena Sherpherdii* and *metallica*, *Gulielmia utilis*, *Cyathia Burkei*, *Encephalartos villosus amplius*, *Maranta Makoyana*, and *Desmonorops palmaticus*. I showed the first eight (the same plants I mean—let us have no misunderstanding in this, I believe, a year previously. I bought the *Cyathia* in August of the same year, received it at Golden Hill, Leyland, on September 12, and exhibited it in June, 1874—nine months afterwards. The *Encephalartos* and *Maranta* I bought early in 1874 (together, if I remember right), and I showed them both at Manchester in May. The *Desmonorops* I bought shortly before the June show in London (had it been the day before no matter); I picked it up in a nursery, and showed it because it was a little larger than mine of the year previous. Let me add that I have never written a word against the practice of buying plants for exhibition. Constituted as schedules are at present, it is perfectly fair; everybody who requires to do so does it, and it is thoroughly understood. I wrote against incompetent judging, dishonesty, and tricks, having seen plenty of all, and possessing the moral courage to speak out like a man at any cost to myself. *T. M. Shuttleworth, F.R.H.S., Hewick House, Preston, Jan. 5.* [We have sent Mr. Shuttleworth's challenge to Mr. Croucher, as it has no general interest for our readers. Our request, which we claim the right to have made, was, by some misadventure, not quite so definite as we intended. It was meant to refer to the exhibition of June, 1873, when it is alleged that Mr. Shuttleworth bought certain plants on the eve of the show day, and showed them in competition. According to Mr. Shuttleworth's views, as I have expressed, this is “no matter,” but at any rate it is not plant-growing, and gives a manifest advantage to the longest purse; and this is what Mr. Croucher and other correspondents, whose letters we have not published, complain of as being unfair. Eds.]

The Villa Garden.

THE GREENHOUSE.—As an invariable rule at this season of the year, when the shortest days prevail, the weather is cloudy and foggy, and there is a marked absence of solar light. In ordinary greenhouses but little fire-heat is employed, and only when the weather is very frosty, to keep out the effects of this wintry visitant. It is not well to employ any more artificial heat than is absolutely necessary for this purpose, as it has the effect of exciting plants that should be kept at rest. The ordinary occupants of a greenhouse at this season of the year are in the main bedding plants, and all that is required is that they exist, and to do

this they will require but little water, and artificial water only when absolutely necessary.

Even at a season of the year when there is but little in the greenhouse that may be termed attractive, cleanliness is of as much importance as if the house was filled with costly flowering plants. The glass at the sides and on the roof should be kept clean, so as to admit all the light possible, and shelves and pits should be similarly cleansed; the damp always hangs about deposits of dirt, and it should be remembered that a dirty house is not merely an evidence of an untidy gardener, but most commonly a sign of a bad one. A frequent turning round and moving of the plants not only benefits them, but betrays and gives opportunity for the destruction of any hidden insects—a desirable end, which cleanliness and attention in every shape have much to do in effecting.

It is difficult to give definite directions as to the temperature to be maintained in a mixed greenhouse, the mixture of plants being frequently of a very incongruous character. There will be plants that are nearly hardy, such as the Zonal Pelargoniums, and which, if well-established in pots, and pretty dry at the roots, will withstand a moderate degree of frost without harm. As safe advice on the subject of temperature in houses that can have the assistance of fire-heat, we say let it range from 40° to 50°, but at the same time avoid fire-heat as much as possible. In the event of a continuance of damp, foggy weather, a little fire, however, is often highly beneficial, doing much good in keeping the house free from damp. When applied for this purpose, air should be given on that side of the house farthest from the quarter where the quantity of such appliances is stated against the recent paper. Wherever it is practicable, as is often the case in small structures, apply outer coverings as a protection against frost, rather than light fires on every doubtful occasion; but the substitution of the one for the other requires a steady and watchful attention, which will be amply repaid in the way in which some descriptions of plants will thrive in the one case, as compared with their progress when subjected to the drying influences of the fires or pipes. As a matter of course in such a case, if the plants have not had to be kept, no cold house without the means of artificial heating by fire or hot-water pipes could have stood any chance against the invader. Many persons have, during the past three or four years, when the winters have been comparatively mild, managed to winter their plants without much loss or harm, by the use of a portable stove of some kind, a lamp burning mineral oil, &c. Alas! say a house, with its occupants blasted and ruined to a great extent, testifies to the incompetency of such appliances to stand against the attacks of old Winter when he comes in force, accompanied with unusually severe frost like that which we have recently experienced, and which penetrated into warm and cold corners alike, positions supposed to be impervious being surrendered from sheer inability to hold them. Owners of cold houses saw the enemy invading every nook and cranny; temporary protections were exterminated without avail, for the march of destruction could not be arrested. Fortunately, those who, having kept their plants dry, to a great extent mitigated the effects of the visitant frost. If not already done, the plants should be gone through at once; all decaying leaves, and they are unfortunately many, removed; and the house thrown open altogether as soon as a few bright hours present themselves, watering every plant that is dry, and then trusting to time. We have seen a house—one of the unfortunately unheated structures built now-a-days—not to grow plants in, but to ornament (?) a modest villa—where the recent frost was so intense that the Veronica Andersonii and Acacia longifolia, and a few other plants were killed outright, but the Zonal Pelargoniums, Primulas, and a few other such plants, though touched about the leaves, are yet living and apparently secure. But no one must allow till he is clear of the wood; plants that have had to stand such a frost as that of the closing days of 1874 may appear sound for weeks to come, and then, by-and-by, when the awakening forces of Nature begin to rouse themselves to action, may give up the struggle and their existence together.

KITCHEN GARDEN.—All villa gardeners esteem an early crop of Radishes. If there is any part of the garden that affords a warm bed in sunny slope in aspect, let a few Radishes be sown there at once if the ground be unoccupied. Fork it over, crumble the soil to pieces, and, as soon as workable, make a thin sowing of Wood's Early France Radish, and cover the seed with fine soil to the depth of about a third of an inch. Then cover with a thin layer of short straw, to protect the surface and prevent the seed being taken by the birds. Turn it over occasionally, to keep it from getting next the soil; and as soon as the seed leaves appear, remove the covering by day when fine and sunny, and replacing it at night. At this stage the birds must be kept from the seed plants, as the grain-loving propensities of some will induce them to work havoc among the growing crop, unless prevented by some timely interposition.

THE FARM.

THE DRAINAGE OF LAND is properly done in winter time, when the surface is not occupied by growing crops, when the land is softer and more easily cut, and when labourers are more likely to be obtained. At from 3 feet 6 inches or 4 feet deep in homogeneous soils, to any greater depth which may be required to tap any gravel bed or other subterranean reservoirs of water causing the springs or surface wetness which it is desired to remove—2-inch pipes are laid, with a sufficient slope to ensure their efficacy, in rows not nearer than is necessary to ensure the drainage of the interval. Where springs exist, owing to which a large surface is kept wet, a large pipe or other conduit may be required. When the wetness is just an occasional water-logged condition owing to the rainfall, then 2-inch pipes are laid both in old furrows and in parallel lines down the slope, about 4 feet deep, and from 6 to 10 or more yards apart, according as the ground is more or less stiff, and the climate more or less wet. These parallel minor drains taken down the slope deliver their water into a main drain connecting them all at foot, which, by a 3 or 4 or 5 inch pipe, carries the whole water drainage of the field to a bricked-outfall. Drains cost from 8d. to 10d. per perch (5½ yards) for digging 4 feet deep and filling in again over the tiles, which should in every case be placed by hand. Tiles cost from 18s. to 25s. per 1000 for 2-inch pipes, and with carriage they may amount to any sum from 28s. to 30s. per 1000 in the field. Add cost of direction, cost of outfalls, &c., and even when the interval is as much as 40 feet, involving only about 60 perches per acre, it will now cost at least, if not more than, ½ an acre to effect through drainage. The return, however, will amply repay the cost. If money is borrowed for the purpose from any land company, to be paid off in twenty-five years by an annuity of 7 per cent., the annual charge will be 7s. an acre for an outlay of 25, and the improvement effected is often materially greater, few soils being worth less than 10s. per acre increased rental after draining, and some soils are worth 20s. per acre more rental. But the labour question has destroyed all the old landmarks of charges, and it is now very difficult to define cost per acre in consequence.

The tillage operations possible in January sometimes include the breaking-up of old turf land, and the ploughing-up of clover and corn stubbles, if that has been delayed till now. In the North the ploughing-up of late intended for Oats proceeds, and when dry, the ploughing up of land cleared of Turnips, whether intended for spring Wheat or for Barley. There, too, when free from frost, every exertion will be made now to secure the remainder of the Swedish Turnips, storing them in ridge-shaped pits, or, which answers equally well, and saves labour and straw for covering, in broad flat pits, any width and length, but not exceeding 18 or 20 inches deep, putting a little clay on the sides of the pits to keep the straw from blowing. In case land to be fallowed has not been ploughed, the sooner it is done the better. Our best farmers dislike to plough in the spring, as the land always works best when sown on the fine and weather-beaten surface. Putting farmyard manure on the young Clovers is proper for this month. This need not be spread till after the frost. The subsoil plough will be of great service, and ought to be kept going in every instance where it is needed. Upon heavy soils it is well to plough down manure at this season.

SEED OPERATIONS.—When land is in good condition, and the season dry and open, the latest sowings of winter Wheats may be still conducted. Peas are sown in market gardens for early summer crops of Green Peas in January—the land being dry and rich. It is a good plan to sow in drills 12 or 15 inches apart, and cover with the hoe, letting the raised drill stand as a shelter for the young row. Beans, too, may be planted this month in dry and early situations. The threshing of grain, pulse, clover, and grass seeds, should be done during this and the succeeding month. This is a labour question, both in preparing and delivery, and is best done when labour is plentiful, as it prevents the displacement of labour in other busy periods of spring and summer. Tresh and prepare Clover seeds for market. *The Agricultural Gazette.*

Obituary.
On the 31st ult., at St. Peter's Street, Canterbury, CATHERINE ANN, widow of WILLIAM MASTERS, Esq., in her 82d year.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 6, 1875.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRICAL DEVIATIONS FROM 100th PART OF 5th Edition.	WIND.	RAINFALL.
	Mean Reading to 10th Part of an Inch.	State of Sky.	Thermometer in Shade.	Thermometer in Sun.			
Dec. 31	30.00	+0.26	24.5	18.5	6	S.S.E.	0.00
Jan. 1	30.00	+0.11	35.0	18.5	47	S.S.E.	0.24
2	30.80	+0.03	44.2	13.0	13	W.S.W.	0.28
3	30.82	+0.05	50.0	12.0	4	S.W.	0.17
4	30.65	-0.07	51.2	10.0	7	S.W.	0.66
5	30.81	+0.09	48.5	14.7	6	S.W.	0.02
6	30.88	+0.13	49.0	15.0	4	S.S.W.	0.01

Dec. 31.—Overcast, dense fog in morning; Hoar-frost; fine and dull afternoon.
Jan. 1.—1.—Fine; much hoar-frost; dull; and overcast in afternoon and evening. Lower temperature of vegetation, 17° 0.
2.—3.—Nearly cloudless in morning; heavy rain before midnight.
3.—Rain in early morning. Fine during the afternoon.
4.—Overcast at night.
5.—Overcast; a little rain fell in the morning; the sky became cloudless by the evening. Overcast at night.
6.—5.—Fine; mild; nearly cloudless all day, but overcast at night.
6.—Overcast in early morning. Fine; light clouds in afternoon; overcast again at night.

— In the neighbourhood of London the reading of the barometer at the level of the sea increased from 30.04 inches at the beginning of the week to 30.30 inches by the evening of the 28th, decreased to 29.22 inches by the afternoon of the 29th, then turned to increase again to 30.32 inches by the morning of the 30th, decreased to 30.25 inches by the evening of the same day, then increased to 30.29 inches by the night of the last day of December; a sudden and rapid fall was then observed, and by the early morning hours of January 2, 29.60 inches was recorded; it then increased to 30.03 inches by the afternoon of the same day, and was 30 inches at the end of the week. The mean daily readings were all above their averages, but not to a very great amount.

The highest temperatures of the air at 4 feet above the ground ranged from 44° on January 2 to 24½° on December 31, the mean for the week being 32½°. The mean of the seven low night temperatures was 24°, the extreme readings being 35° on January 2, and 18½° on January 1. The mean daily range of temperature was 8½°. The mean daily temperatures of the air were all below their averages, except on January 2, the values being as follows:—27th, 31°; 28th, 30°; 29th, 28°; 30th, 24°; 31st, 21°; 1st, 16°; Jan. 1, 27°; 2nd, 24°; 3rd, 40°; 4th, 37°.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in the sun's rays, were 43½° and 40½° on December 27 and 29, but on January 2 it rose to 78°. The lowest reading of a thermometer at night placed on grass, with its bulb fully exposed to the sky, were 13° and 14½° on December 30 and 31, and the mean for the seven low readings was about 21°. The weather was generally cloudy and dull.

A little snow fell on the morning of Monday, December 28. Rain fell to the amount of half an inch during the week.

In England the extreme high day temperatures ranged from 49° at Sunderland to 36½ at Nottingham, with a general average over the country of 42½°. Till Friday, January 1, the weather was very cold; on the last day of the week it changed to warm. The low night temperatures were remarkable, especially on December 30 and 31; the following table shows the lowest temperatures observed on both those nights at the several places named:—

December 30.			
Hull	5.0	Bradford	15.3
North Shields	6.8	Eccles	17.0
Bywell	9.0	Liverpool	17.5
Somerleyton and Norwich	10.0	Stratford Vicarage	18.3
Wich	10.0	Manleywood College	19.5
Sunderland	11.0	Birmingham	19.7
Cardiff	11.2	Blackheath	19.8
Silloth	11.4	Wolverhampton	20.5
Leeds	12.0	Portsmouth	22.8
Nottingham	12.0	Bristol	23.4
Weybridge Heath	12.8	Osborne	27.4
Calceorpe	13.1	Barnstable	30.0
Leicester	14.5	Halton	30.0
Sheffield	14.7	Truro	37.0

December 31.

Eccles	7.1	Sheffield	15.5
Calceothorpe ..	8.1	Wolverhampton ..	15.7
Marlborough College ..	8.2	Liverpool and Leeds ..	15.6
Helston	9.0	Birmingham	20.0
Silloth	11.0	Blackheath	20.7
Carlisle	13.0	Portsmouth	20.7
Nottingham	13.3	Sunderland and Bywell ..	11.0
Leicester	13.5	North Shields	22.8
Bristol	13.8	Osborne and Barnstable ..	26.6
Weybridge Heath	14.0	Truro	32.0
Southeryton	14.0	Salston	39.0
Strealey, Norwich ..	14.0		
Bradford	15.0		

Thus the temperatures varied on December 30 from 15° at Hull to 37° at Truro, and on the 31st from 7½° at Eccles to 39° at Helston. The average for the week from the usual stations was 13½°. The mean range of temperature in the week was 29½°, the greatest range being at Sunderland, 38°, and the least at Liverpool, 20½°. The mean high day temperatures ranged between 38½° at Sheffield and 29° at Nottingham, with a general average of 32½°. The mean low night temperatures varied from 26½° at Bristol to 14° at Hull, with an average value of 20½°. The mean daily range of temperature in the week was 12½°, varying from 17½° at Sheffield to 7½° at Bristol. The mean temperature of the air for the week from all stations was 26½°, being 14° below the value for the corresponding week in 1872, 17½° below that of 1873, and 12½° below that of 1874; the highest in the week occurred at Bristol, 30½°, and the lowest at Norwich and Hull, 22° respectively. The cold weather was felt severely everywhere, excepting in Cornwall and Devonshire.

Rain fell on two days, and snow on one or two days in the week at most stations, varying in amount from 1½ inch at Portsmouth—three-quarters of which fell on January 2—to five-hundredths of an inch at Norwich; the average fall over the country being three-quarters of an inch.

The weather during the week was dull and the frost severe, but on Friday night a thaw set in, and since it has been fine and mild.

In Scotland, the highest temperatures ranged between 45½° at Glasgow and 39° at Dundee; the lowest temperatures varied from 18½° at Greenock to 5° at Perth; therefore, the severe cold weather has been felt in Scotland, but not with greater severity than in the midland, northern, and eastern counties of England—their averages being 42½° and 13½° respectively. The mean range of temperature in the week was 29½°. The mean temperature for the week was 26½°, being 22½° below the value for the corresponding week in 1874; the highest in the week happened at Aberdeen, 36½°; and the lowest at Perth, 21°. Rain or melted snow was measured to the amount of 1 inch at Dundee and Aberdeen, but only to the amount of a quarter of an inch at Perth; the general average over the country was three-quarters of an inch.

At Dublin, the highest temperature was 52½°, the lowest, 24½°, the mean, 36°, and the rainfall, 0.37 inch.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVE.—A plant or two of *Allamanda*, the freest flowering of which is that called *A. Cheloni*, as also of *Bougainvillea glabra*, from among those put to rest earliest in the autumn, should now be started; this does not refer alone to such plants as are required for the exhibition stage, but also for home use. The system of deferring the growth of these continuous-blooming subjects until later on is a mistake, inasmuch as it tends to shorten their season of flowering. If the plants have been treated as advised through the autumn, their wood will now be hard and ripened shoots; and all excess cutting out all weak *Bougainvillea*, as the object should be rather to get a fair number of vigorous young shoots than a quantity of small ones, which will be the case if this weak wood is not in great measure removed. The soil will probably be very dry, and previous to the removal of all the wood should be soaked for some hours in tepid water, so that all the sand that has to be removed can be got away without mutilating the roots. Upon this in a great measure will depend their early flowering, as if the roots are very much broken, it naturally requires more time to get the plants up in strength. About one-half the whole ball should be removed.

For *Allamandas*, strong yellow thal, from one-sixth of rotten stable manure, such as that from an old horse, carefully sifted so as to detect all worms—If dried, so as to destroy these, all the better; add sand, more or less, according to the nature of the loam, so as to less, according to the nature of the loam, so as to admit the large quantities of water which these plants in the summer season require passing freely through it. In potting ram the soil quite hard; for *Allamandas*,

it can scarcely be made too solid. The *Bougainvillea* will grow in either peat or loam; if the latter is good it is preferable, and add one-fifth of manure and a little more sand than is required for the *Allamandas*, neither do they need potting so hard. In the case of *Allamandas* and *Bougainvilleas* it is better to cut back and report at the same time than to wait for them to break growth after cutting in before potting, as is usual with most plants. This *Bougainvillea*, started thus early, will flower three times during the season, if well managed.

If the earliest lot of *Roses*, prepared as previously advised, were now placed in a little moist heat without pruning, they will shortly furnish a quantity of useful flowers. These should be followed by a second lot pruned in the ordinary manner before they are taken in; for this purpose nothing is so well adapted as the *Tea* varieties. The following are a few of the most esteemed amongst the best growers for the London flower market, in following which, any one growing for a private establishment will not be far wrong. At the head of the list stands the white variety, *Niphetos*; *Madame Falco*, pale yellow; *Monsieur Furtado*, sulphur-yellow; *Souvenir d'Elise*, white; and the old but beautiful *Deconinois*. These, with a few of the freest-blooming hybrid perpetuals, will be found most useful in furnishing a succession of flowers, and, combined with the regular indoor winter-blooming subjects, will go far to meet the increased demand for winter flowers that exists in most places, large or small. Regularly introduce to the forcing-pit, if such exist, if not, to the stove, or any other structure wherein there is heat, more *Hyacinths*, *Narcissus*, *Early Tulips*, and *Crocuses*. These should not be allowed to remain in the bed of ashes or other material in which they are plunged, too long, so as to become drawn. When the pots have got well filled with roots, and the tops have pushed an inch or a little more, they should be removed to a cool place, and the light partially excluded from them for a few days, when they may gradually be inured to it, and placed near the glass, so as to prevent the leaves getting drawn, for if this takes place it much impairs their use for any purpose. The unsightly, drawn condition of the leaves and weak flower-stems often met with completely spoils the appearance of this class of plants. When put in heat, if possible, bulbs should occupy a shelf near the roof, within a short distance of the glass. It is not alone the maximum of available light they receive in such a position, but here there is always a motion in the air to an extent that does not exist elsewhere in the house, and which exercises the best influence in producing stout, sturdy growth. A few pots of *Lily of the Valley*, according to the demand, should be regularly brought into heat. This most prized of winter-forced flowers can scarcely be had in too large quantities, either conservatory or room forcing. In the plant or for most, but English-grown roots bear no comparison, especially for early forcing, with such as are imported from Germany and Holland. The crowns being all selected scarcely any fail to flower, which is anything but the case with ordinary home-grown roots, as many a gardener has experienced to his great disappointment, especially in early forcing, even when carried out with care. In flower forcing it should always be borne in mind that, with very few exceptions, the less heat a plant is subjected to, the longer and the less heat a plant it receives the greater substance they will have, which also has a very considerable influence upon their endurance, consequently there should not be any undue hurry with the plants now, especially the earliest forced, when their energies are most dormant, accompanied by a minimum of light. *T. Baines, Southgate, W.*

FRUIT HOUSES.

VINES.—So much has been written on the culture of the Vine, that it really seems difficult to say anything, or give any instructions, Calendarial or otherwise, that have not previously been given. I shall, however, in these notes, confine myself strictly to my own practice in its culture, and as that practice has been fairly successful, I will indulge the hope that some Vine growers, and amateur cultivators especially, may perhaps get a wrinkle from my treatment. I recommend the adoption of the following rules:—First, to plant none but proved good kinds; next, to avoid over-cropping; next, avoid extremes in temperature; and lastly, avoid starvation. Vines are, if I may so express it, ravenous plants, and will take any amount of food, if of the right kind; for instance, they never tire of good loam, containing a judicious admixture of half-inch bones, only they must have plenty of water also; of this latter element, if the drainage is good, it is almost impossible to give them too much. I am convinced that most of our failures in Grape growing arise from a too scanty supply of water; but should the drainage be defective, then the mischief done by over-watering is incalculable—so look to the drains. If ripe Grapes are desired by the beginning of June, the Vines should be started forthwith, premising that the house has been thoroughly cleaned, whitewashed,

&c., and if the Vines had any insects on them last season, they, too, should be washed, or rather painted with Gishurst Compound, 8 oz. to the gallon of water, and reduced to the consistency of paint by the addition of soft sulphur, and clay. A bed of fermenting material (leaves and litter) inside the house will help the Vines to break more kindly than would otherwise be the case. If the roots are outside recourse must be had to the old hotted style of heating, *i.e.*, unless there are heated or chambered borders, of which I have a very low estimate. The maximum temperature at this stage, even with sun-heat, should not exceed 64°, with a minimum of 45°. Syringing will be requisite on sunny days only. Houses from which the Grapes have been cut should be immediately pruned, and the mode of pruning I recommend is a modification of the "cut to the best bud system." That is, I elect to cut to a pump bud, but at the same time to keep as near as possible to the main stem. In course of time the Vines get very long spurs by this plan, and to some may appear unsightly, but it is a very easy matter to run up a new rod and begin again. All loose bark should be picked off (not scraped), and the Vines painted with the before-named composition; the border also should receive a top-dressing of good loam, having previously taken off 2 or 3 inches of the old soil. The Grapes are still hanging look frequently over them, and remove any bad or decaying berries, as a preventive against decay. The Grapes should be thoroughly ripened, and an equable temperature maintained, say as nearly as possible to 45°. If the houses are wanted for plants, the Grapes may be cut with a piece of the wood attached, and placed in bottles of water in any dry room. Lady Dove's cut in January kept quite plump till June, served in this manner, last year. *W. Williams, Southgate.*

FIGS.—Where Figs are required very early they are best grown in pots, and if they can get the advantage of a slight bottom-heat in a bed of fermenting leaves or tan, with the temperature never exceeding 65° or 70°, they will ripen fruit early in May. I find the Early Violet, Early Prolific, Negro Largo, and Col de Signora Bianca Figs the best for early forcing in pots. In starting Figs in pots at this early period the temperature by fire-heat should not exceed 50°, and in the day time by sun-heat never to be raised above 70°. Figs are best started in favourable weather, to keep down red-spider—a great pest to the foliage of Figs. I generally plant my Fig trees with the same mixture as the Peaches and Nectarines in the autumn after the leaves have all dropped, and this helps to keep the red-spider in check, if preserved with year after year. Figs grown in pots require plenty of light and all the sunshine they can get, so should not be placed in houses too much shaded with other fruit trees. In the early Fig-house, where the trees are permanently planted out, forcing may be commenced in the middle of the month. See that the house is now, therefore, shut up and properly ventilated, as in the late severe frost fire-heat must have been applied to keep the trees safe from its effects. *William Tiller.*

HARDY FRUIT GARDEN.

The favourable change after the late severe weather will now admit of pruning being followed up, and, where not already completed, *Apples* and *Pears*, where grown as pyramids, laid bare, and, especially in the interior of the tree, so as to admit the borders being cleaned up. In pruning it should be especially borne in mind that many of our best *Apples* and *Pears* produce their finest blooms on the terminal points of the last year's growth, and therefore pruning in too closely should be avoided, except in the case of over-gross shoots. But if root pruning and summer-stopping of the stronger shoots has been attended to, there should be little use for the knife at this season, except to thin out wood or spurs where thick, and, especially in the interior of the tree, so as to admit a due amount of light and air. When the flower-buds are very thickly set it is well to thin them considerably, so as to give additional strength to those left. An overcrop of bloom is not desirable, as the energies of the tree are frequently too severely taxed in its production to admit of the fruit setting or swelling properly afterwards. Should American buds or scale in any form have attacked the trees they should be dressed over the affected portions with Gishurst Compound, or common linsed oil, is equally effective. The severity of the weather has been productive of much damage by birds to the buds of *Plum*s, *Gooseberries*, &c. The pruning of these should, therefore, be deferred for a time, until the buds can be more plainly seen. Pruning and nailing, or tying-in when the walls are wiced, should also be proceeded with. *Apples*, especially, are better pruned early, as the wounds have more time to heal, and are consequently less liable to gum than when pruned after the sap gets into action. The same remarks also apply to the *Peach* and *Nectarine*, save that these should have been pruned some time since, the nails and sheds removed, and the shoots tied from the walls, so as to retard the trees from coming so early into bloom. There needs

sary to make fresh plantations of bush fruits, *Raspberries*, &c., the ground should be prepared by well manuring and trenching, so as to be in good condition for planting next month. *W. Cox.*

KITCHEN GARDEN.

The refuse which accumulates from various sources in different departments in a large garden is considerable. This, when concentrated and well incorporated with decayed vegetable matter and a slight admixture of quicklime, forms one of the best fertilising agents that can be employed for many purposes in this important department. The incorporation of the materials in question does not everywhere command sufficient attention, considering its value as a fertiliser, which contributes so much towards maintaining the Kitchen Garden (especially in the highest condition of cultivation at so little cost or additional labour. At such times therefore as when, from the effects of frost or other causes, the progress of ordinary operations is interrupted, attention may with profit be directed to those materials which constitute the refuse-heap—by turning them, and taking out such as is fit for use (a heap of which should always be kept in readiness), and by adding a little quicklime to what remains, well mixing it together, in order to accelerate decomposition and to furnish further supplies of valuable stuff as speedily as possible. While outside operations are restricted by the force of existing circumstances, all indoor matters should be pushed on vigorously, and where there are pits and frames with fermenting beds, which are extensively used at most places for producing early vegetables, these should be seen to now. In order to cope with the demand for certain kinds of vegetables, such as *Peas*, *Asparagus*, &c., when they first come in for use, it is advisable to sow plentifully in order to meet the requirements. As soon as practicable sow a good breadth of early *Peas*; for hardness and earliness combined *Laxton's William the First* is to be recommended for borders and the open quarters, and *Little Gem* for sowing or planting out at the base of south walls. *Longpod Beans* may also be planted as far as practicable. Forward operations now as much as possible, as with the advancement of the season pressing matters in all directions will increase that could not admit of being postponed. Give regular attention to *Cauliflowers* and *Lettuces* which are in frame or handlights; strive to keep them sturdy by removing the sashes or top entirely at 35°, excepting during wet weather when they should be tilted.

Forcing Department.—It is a matter of primary importance here to have at all times during the season a supply of warm fermenting materials at hand to meet the requirements as they become necessary. Introduce fresh supplies of roots of *Asparagus*, *Seakale*, and *Rhubarb*, also *Chicory* for salading where it is appreciated as such; and continue to maintain the supply of *Mustard* and common and Australian *Cress* by making sowings of these occasionally, and also *French Beans*. On prepared beds, where the soil has become warmed, sow in drills *Early Horn Carrots* and *Radishes* in alternate rows each 3 inches apart. One of the earliest and best *Radishes* for this purpose is *Sutton's White Egg*. *Festuca* which are growing freely should be earthed up when requisite; here the earliest crop of these are obtained from large unused Pits pots, the result being highly satisfactory. Three sets are inserted in each, and they are advanced in the Peach-houses. This is also a suitable place to start sets for succeeding crops; place them, not too thickly together, on a layer of leaf-mould, and slightly cover them with it also. Where good salads are constantly required the *Lettuce* and *Endive* for this purpose should be sown a pit with the means at command to fully exclude frost, and where they can be abundantly supplied when favourable for so doing. *G. T. Miles, Wycombe Abbey.*

Enquiries.

He that questeth much shall learn much.—BACON.

34. JUNIPERUS DRUPACEA.—Can any of your readers favour me with a few ripe fruits of *Juniperus drupacea*? Though cultivated here and there, I cannot learn that any one has a fruiting specimen. *D. Hauxbury, Clipham Common, S.W.*

Answers to Correspondents.

FUNGUS: *E. Sankey, Guilford*. Your fungus was a *Boletus* in a state of decay, and thoroughly permeated by another fungus as a parasite, viz., *Sepedonium chrysospermum*. You will see it described in your *British Flora*, vol. v. part 1, p. 350.
MOULDED VINES: *George Harcourt*. We see nothing particularly the matter with your Vines, beyond the ordinary black mould produced from aphides, &c., and encouraged by damp. Your Vines are, in short, "Salty." Wash them well with soft soap, sulphur, &c., after being pruned, and keep a drier atmosphere about them whilst ripening.
NAMES OF PLANTS: *H. Hughes*. 7. The leaf of some pinnate flowering plant, quite indeterminate; 8, *Platycodon alcinone*; 9, *Ficus cretica* or *almeida*; 10, *Asplenium fontanum* (Haller); 11, *Peris trineata*;

12, *Spartmannia africana*.—*G. G. A.* *Dendrobium moniliforme*.—*H. Dredalcanthus nervosus*.—*J.* *Dalchampia Rozeliana*, var.—*M.* *Polygonum*, specimen too bad to name.—*Surgical*. 1, *Eunomium radicans*, var.; 2, *Aristolochia Macqui*; 3, *Eunomium japonicum* variegatum; 4, *indeterminata*; 5, *Grielinia radicans*; one without a number. *Escallonia* (London). *J. G.* 1, *Atherosperma moschatia*—send flowers; 2, *Leucopogon lanceolatus*, both greenhouse plants.—*H. T.* 1, *Gymnogramma Lanchana*; 2, *Asplenium bulbiferum*; 3, *Chelidonium hirta*; 4, *Adiantum cucullatum* (send better specimen); 5, *Adiantum Capillus-Veneris*.

POMONA PALACE SHOW: *J. Potts*. The mistake has already been corrected by another correspondent.—*J. S.* We cannot afford space for any further discussion of the matter.

VEGETABLES: *T. P.* If young gardeners will undertake the responsible duties of a chief while "they know little or nothing of kitchen gardening," surely no one is to blame but themselves if they have to leave in disgrace through the bad management of their department.

VENTILATING HOTHOUSES: *L. J.* No; there is no better or other way of opening the sashes than by sliding them down. But this can be done very easily by a connecting rod and machinery; the sashes should also be fitted with six small castors, or rollers, three on each side, to make them slip more readily. Simple machinery for this purpose could be supplied by any respectable hothouse builder.

VINES: INSIDE BORDERS VERSUS OUTSIDE: *A. H. Clough*. In cold, damp localities, Vines should all be planted in inside borders; and also for very early forcing, and for late keeping Grapes. The advantages of inside borders are these:—The roots are more at command; they can be kept warmer in the one case, and also drier, for the better keeping of the ripe fruit. In our climate, in fact, it is more difficult to keep vines in outside borders, and those that do succeed require a far greater amount of attention, and more skill in management, especially in respect to watering. For general purposes, and for all ordinary Vine growing, the Vines succeed best, last longest, and require the least amount of skill and attention, when grown in inside borders. We therefore prefer the inside.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers who send Post Office Orders, to be good enough to write to the Publisher at the same time, stating that they have done so.

* * * Correspondents are specially requested to address post-paid, all communications intended for publication to the "Editors," and not to an member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements should be addressed to the Publisher.

Markets.

WEATHER GARDEN, January 7. We have but slight alterations in the prices to notice this week. Trade is very steady. *Thos. Taylor, Wholesale Apple Market.*

VEGETABLES.

Table with 2 columns: s. d. s. d. and s. d. s. d. listing prices for Arichokes, Asparagus, Beans, Broccoli, Carrots, Cauliflowers, Celeriac, Cucumbers, Endive, Herbs, Horse Radish, Lettuces, Mushrooms, Onions, Parsley, Parsnips, Radishes, Spinach, Turnips, &c.

Table with 2 columns: s. d. s. d. and s. d. s. d. listing prices for Apples, Chestnuts, Cucumbers, Melons, Nuts, Peas, Potatoes, &c.

CUT FLOWERS.

Table with 2 columns: s. d. s. d. and s. d. s. d. listing prices for Azaleas, Camellias, Chrysanthemums, Cyclamen, Hyacinths, Pinks, &c.

PLANTS IN POTS.

Table with 2 columns: s. d. s. d. and s. d. s. d. listing prices for Begonias, Bouvardias, Calceolarias, Cyclamen, Fuchsias, &c.

SEEDS.

LONDON: Jan. 6.—Our agricultural seed trade continues quiet but firm. Fine purple samples of new English red Clover seed are scarce, and command high prices. In foreign descriptions the tendency of values is upwards. For Trefoil seed there is an improved inquiry, and quotations are quite 1/1 per ton higher. In Alsike and white Clover seeds the business doing has been too limited to cause any alteration in price. Imported Italian keeps steady. Owing to continued scarcity, Canary seed is again scarce, and 1/1 per quarter dearer. 10-day's quotations for ordinary foreign seed is 180s. per quarter. For Hemp seed 1s. per qr. more money is now asked. Good black Rape seed is in short supply. For both white and brown Mustard seed the demand at present is very small. Of home-grown Linseed the supply offered is scanty. The high rates demanded for new spring Tares hinder business. Blue bonning Peas are firm at the recent advance. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.

At Mark Lane on Monday, in consequence of the mild temperature, some degree of weakness prevailed. In Wheat, dry descriptions realised recent currencies, but damp and inferior produce was neglected. Barley was about as dear as on Monday last, with little inquiry. Malt was without change in price. Oats were somewhat dearer on the week, but firm. Purchased Malting Maize supported late prices, and to change occurred in either Beans or Peas. For flour there was a slow demand, and prices were, if anything, inclined in buyers' favour.—On Wednesday the market was dull, and quotations rather easier on the whole. The supply of Wheat was short, and its condition being somewhat damp, there were very few sales effected. Barley was also difficult to move, and scarcely any inquiry prevailed for malt. Sound Oats were steady, as also was Maize; but in the value of Beans, Peas, and flour, a slight downward movement was apparent.—Average prices of corn for week ending Jan. 5.—Wheat, 48s. 6d.; Barley, 44s. 6d.; Oats, 29s. 7d. For corresponding week in 1874:—Wheat, 61s. 8d.; Barley, 44s. 4d.; Oats, 25s. 5d.

CATTLE.

At the metropolitan market on Monday there was a shorter supply of beasts than expected, but the demand was very limited. Prices were lower, and it was difficult to effect a clearance. The number of sheep was not excessive for the day, yet it was difficult to clear out at the usual quotations. A few calves were on offer, consequently prices were not lower. Quotations:—Beasts, 3s. 8d. to 5s., and 5s. 8d. to 6s. 4d.; calves, 4s. 4d. to 6s. 8d.; pigs, 4s. 4d. to 5s. 4d.; sheep, 4s. 8d. to 5s., and 5s. 8d. to 6s. 4d. (On Thursday trade for beasts was excessive, but owing to the few calves and quotations on offer. Of sheep there were very few, and scarcely any trade. Choice calves were scarce and dear, and trade for milch cows was dull.

HAY.

The supplies of fodder offered at Whitechapel were large, and trade was rather flat, at the following prices:—Prime Clover, 100s. to 124s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 104s.; inferior, 55s. to 75s.; and straw, 33s. to 40s. per load. Cumberland Market quotations:—Superior meadow hay, 114s. to 120s.; inferior, 90s. to 98s.; superior Clover, 120s. to 130s.; inferior, 100s. to 108s.; and straw, 42s. to 46s. per load.

POTATOS.

Borough and Spitalfields reports are to the effect that only moderate supplies of Potatoes are on sale, and the trade is slow, at the following prices:—Regents, 100s. to 125s.; Victorias, 110s. to 120s.; Flukes, 130s. to 140s.; and Rocks, 70s. per ton.—Last week's imports consisted of 405 tons from Dumkin, and 150 tons from Antwerp.

SUTTON'S
HOME GROWN

CARRIAGE FREE
SUTTON'S
COMPLETE COLLECTION
OF
CHOICE VEGETABLE SEEDS.
*To produce a supply of
the best vegetables,
all the year round.*

CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND. **2/-** PRICE 5 PER CENT DISCOUNT ALLOWED FOR PROMPT PAYMENT.

This Collection is especially suited to the "Amateur's" Garden, and contains the following excellent varieties:

Peas, Sutton's Ring-leader and other best sorts ..	6 pts.	1 pkt.
Beans, the best sorts ..	12 pts.	1 pkt.
" French ..	12 pts.	1 pkt.
Beet, Sutton's Improved Dark Red ..	1 pkt.	1 pkt.
Borecole or Kale, best sorts ..	2 sorts	1 pkt.
Brussels Sprouts, Sutton's Matchless ..	1 pkt.	1 pkt.
Broccoli, Sutton's Superb, Early White, and other best sorts ..	3 sorts	1 pkt.
Cabbage, Sutton's Imperial ..	3 sorts	1 pkt.
Savoy, best sort ..	1 pkt.	1 pkt.
Carrot, do. ..	3 oz.	1 pkt.
Calliflower, do. ..	1 pkt.	1 pkt.
Celery, Sutton's Sultan Prize ..	2 sorts	1 pkt.
Couve Tronchuda ..	1 pkt.	1 pkt.
Endive ..	1 pkt.	1 pkt.
Cress ..	3 oz. and	1 pkt.
Cucumber, best sorts ..	2 sorts	1 pkt.
Leek, Musselburgh ..	1 pkt.	1 pkt.
Lettuce, Sutton's Superb White Cos ..	2 sorts	1 pkt.
Mustard ..	4 oz.	1 pkt.
Melon ..	1 pkt.	1 pkt.
Onion, Sutton's Improved Reading ..	2 pkts.	1 pkt.
Parsley, Sutton's Improved Curled ..	1 pkt.	1 pkt.
Parsnip, Sutton's Improved ..	1 oz.	1 pkt.
Radish, finest sorts ..	3 oz.	1 pkt.
Spinach ..	4 oz.	1 pkt.
Turnip, Sutton's Snowball ..	3 oz.	1 pkt.
Vegetable Marrow ..	1 pkt.	1 pkt.
Sweet and Pot Herbs ..	1 pkt.	1 pkt.
Tomato ..	1 pkt.	1 pkt.

GUIDE,

From the COURT CIRCULAR.

"We have received 'Sutton's Spring Catalogue and Amateur's Guide,' an admirable and exhaustive catalogue of root, fruit, and flower seeds, grown by the great firm at Reading. This handsome book is illustrated with some beautifully executed plates. The directions for the cultivation of the various seeds given in the case of each are clear and concise, and of great use to amateur and professional gardeners. They raise the work above the level of a trade catalogue to that of a work on gardening."

Price 1s., post free.

"Sutton's Amateur's Guide" is beautifully illustrated with several coloured plates and hundreds of engravings. It is, without exception, the most practical work on Gardening extant.

SEE SUTTON'S MINIATURE AMATEUR'S GUIDE, post free for three stamps.

NEW AND CHOICE SEEDS, 1875.

CELERY—Brettle Red, a sort grown nearly by all, and raised by the old Golden Perfection. It has a pale green flesh of great thickness and exquisite flavour, with a beautiful golden skin the thickness of paper, and thickly netted, and is also a remarkably fine setter. It has always obtained the highest honour wherever exhibited, and pronounced by the best judges to be the handsomest and best Melon ever coming under their eye. Our stock is very small, every Gardener that we have yet seen having ordered it. 2s. 6d. per packet.

BRUSSELS SPROUTS.—Our improved Roseberry. 1s. per packet.

MELON—Wood's A. 1. This splendid variety of Melon is the result of crossing Meredith's Hybrid Casimere with the old Golden Perfection. It has a pale green flesh of great thickness and exquisite flavour, with a beautiful golden skin the thickness of paper, and thickly netted, and is also a remarkably fine setter. It has always obtained the highest honour wherever exhibited, and pronounced by the best judges to be the handsomest and best Melon ever coming under their eye. Our stock is very small, every Gardener that we have yet seen having ordered it. 2s. 6d. per packet.

THE MAGNUM BONUM (212.) SELECTION OF GARDEN SEEDS which we supply has always given the greatest satisfaction. Other Collections, 30s., 40s., 55s. and 64s. carriage free.

FOREST TREES, SHRUBS, &c.

100 Mixed ORNAMENTAL TREES and SHRUBS, &c., 3 to 6 feet high, 25s. per 100.
500 do., 3 to 6 feet high, 12s. per 100.
1000 do., 3 to 6 feet high, 6s. per 100.
LAURELS, common, bushy, 1 to 1 1/2 feet, 6s. per 100; 1 1/2 to 2 feet, 8s. per 100; 2 to 3 feet, 12s. per 100; by the 1000 cheeper.
FIR, Austrian, 1 1/2 to 2 feet, 40s. per 1000; 3 to 4 feet, 50s. per 1000.
SYCAMORE, 6 to 8 feet, 20s. per 100, &c. Apply to

Mathon & Son

for their General Nursery and Seed CATALOGUES, which may be had on application, and also Trade Lists of Seeds and Trees; Nursery and Seed Grounds and Warehouses, Cottingham, and 61, Market Place, Hull.

SELECTED VEGETABLE SEEDS.

BROCCOLI—Witty's Conqueror, the best late Broccoli in cultivation; has always stood the severest winters without injury. Price 1s. 6d. per packet.
BRUSSELS SPROUTS—Scrymger's, extra selected. Price 1s. 2d. per ounce.
CELERY—Laing's Mammoth Red (rue), the finest and best Red Celery in cultivation. Price 6d. and 1s. per packet.
CELERY—Wright's Grove Red, an excellent variety. Price 1s. 2d. per packet.
CAULIFLOWER—Veitch's Autumn Giant; this valuable variety is perfectly distinct from any other. Price 1s. 6d. per packet.
PEA—Burnell's Market Gardener; a most desirable Pea, earlier than Lion's Supper, and not so tall, more prolific; pods well filled, eight to ten Peas in each. Price 2s. 6d. per quart.
BEANS—At Joseph Paxton, dwarf French; one of the earliest and best in cultivation. Price 1s. 6d. per quart.

A Certain Crop of Fruit, in spite of Frost, is secured by PARHAM'S

PATENT GLASS COPING For Sheltering Fruit Trees.

The Patentee has sent out many trees of it during the past three seasons, and additional orders have each year been received from those who have tried it.

PRICE—Per foot run, with 21-oz. glass. With the iron framework painted, 2 feet, 2s. 6d.; 3 feet wide, 3s. 9d. With the iron framework galvanised, 2 feet, 2s. 3d.; 3 feet wide, 4s. 9d.

From Mr. F. SAUNDERS, Gardener to Sir Wm. Miles, Bart., Leigh Court, Bristol, October 23, 1874.

"Sir—I have much pleasure in saying the Wall Coping you erected here in April, 1872, has given the greatest satisfaction. Many of the Beach trees, at that time apparently worthless, are now in full vigour, and have borne extraordinary crops this season, the fruit being unusually fine, and of excellent flavour. I have recommended it to several gentlemen, who, I believe, will give it a trial."

PATENT PORTABLE PLANT PRESERVER.

Glazed with 21-oz. glass (under W. Parham's Patent) without putty, on channelled wood rafters.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED.

This Company, having purchased from the Dromore Patent Heating Company Mr. Cowan's valuable Patents for the United Kingdom, is now prepared to undertake the Erection of Apparatus on that System in all parts of the Country.

THE ADVANTAGES OF THE SYSTEM ARE AS FOLLOWS:—

1. In most Cases it SAVES the ENTIRE COST OF FUEL.
2. The Heat is maintained more steadily than by any other System.
3. No Night Attendance is required.
4. There is no Smoke or Unpleasant Smell produced.

THE SUCCESS OF EVERY APPARATUS ERECTED BY THE COMPANY IS GUARANTEED.

Full Particulars of this System, Testimonials, and Opinions of the Press, can be seen in the Company's Illustrated Pamphlet, which can be obtained, post free, on application.

The Company has an Efficient Staff of Engineers, and sends at any time to inspect places where the idea is entertained of Erecting the Apparatus.

The System has lately been adopted at Hazelwood, Herts, the seat of Lord Rokeby; Stackpole Court, the seat of the Earl of Cawdor; Ripley Castle, Yorkshire, the seat of Sir H. D. Inglyb, Bart.; Langleybury House, Herts, the seat of Jones Lloyds, Esq.; and at many other places. Also Mr. E. Bennett, of Hatfield, says:—

"I now most cordially beg to congratulate you on the glorious success of your Heating Apparatus (now in use at Hatfield), which is working most satisfactorily, and which has exceeded my expectations. It is a decided success, and more cannot be said in its favour. Should it continue to work in the manner it now does, it will prove a great boon here, and start a new era in the heating of horticultural buildings generally. By your Compensating System we have for every barrow of coals thrown into the kiln some substantial return; by the old system the returns were ashes, and the trouble of clearing them away. I find our chalk is of an inferior quality to some I have seen in the neighbourhood, but we have plenty of heat."

The Company also undertakes the Erection of all other kinds of Heating Apparatus, and of Horticultural Buildings.

PLANS AND ESTIMATES FURNISHED ON APPLICATION.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

Office: 4, LOTHBURY, BANK, LONDON, E.C.

**ESTABLISHED 1856.

TRIAL OF HOT-WATER BOILERS.

Winter is the Season to Test the Efficiency of a Hot-Water Apparatus.

At the Pine-Apple Nursery the Hot-Water Apparatus, on the "One Boiler System," is allowed to be the most perfect of any in the World. The Hothouses are equal to 3000 feet in length, and the Winter Garden Conservatory is 100 feet by 100 feet. The Hot Water circulates through 12,700 feet of Cast Iron Pipe.

Gardeners are most respectfully invited to Visit and Inspect the whole.

STEVENS' TRENTHAM GREENHOUSE BOILER,
After long experience, has proved the most Simple, Economical, Effectual, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole Makers, **F. AND J. SILVESTER,** Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

GALVANISED WROUGHT IRON FITTINGS for WIRING WALLS,
For the Purpose of Training Fruit Trees on THE FRENCH SYSTEM,

and as recommended by **MR. W. ROBINSON, F.L.S.**, in his new work, "The Parks, Promenades, and Gardens of Paris." By this system nails and shreds are entirely dispensed with, the walls are not injured, and no labour is afforded to small insects. The tying of the Fruit Trees is effected in one-fifth of the time required by the old system. The arrangement is so simple, that it can easily be applied to any Wall by inexperienced hands.

PRICES OF MATERIALS:—
GALVANISED RAIDSSEURS for Tightening the Wires. One of these required for each Lye of Wire.

No. 900. 4s. per doz.

GALVANISED WALL EYES, 6d. per dozen.
GALVANISED TERMINATING HOLDFASTS, 2s. per doz.
GALVANISED WIRE, 2s. 6d. and 3s. per 100 yards.

LONDON OFFICE—

1, DELAHAY ST., WESTMINSTER, S.W.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER,

2A, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired, to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability.

For Neatness.—Because all the Wires are kept perfectly tight, without the use of the Kaldissaur.

For Strength.—Because every single stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.

For Durability.—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system.

The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 753 yards long, wired on both sides making a total length of 1506 yards,—our system being chosen in preference to any other.

Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

JONES'S

PATENT

"DOUBLE L" SADDLE BOILER.

This boiler, which has now had a good trial, presents advantages that other boilers do not possess. Instead of a large portion of the heat being absorbed by the brickwork setting, or passing direct up the chimney, before the heated particles emitted from the fuel in process of combustion have properly done their work, as is the case with many other boilers at present in use, this boiler, by its peculiar, yet simple, construction, as well as by a judicious arrangement of flues, obtains the full amount of heat from the fuel before the products of combustion pass into the chimney. Compared with the old Saddle and other boilers, it is computed that it will do nearly twice the amount of work with the same amount of fuel. The cost of setting is less, as is also the space occupied, and the boiler being made in wrought instead of cast iron, thereby avoiding its liability to crack, renders it one of the best boilers yet brought out.

For the rapidity with which heat can be got up in one or any number of houses it is unsurpassed, and the following extracts from Testimonials received from persons accustomed to the use of hot-water apparatus will prove that the expectations raised for this boiler have been fully realised.

J. JONES & SONS beg to state, in conclusion, that they are prepared to send to any part of the country, at a moderate charge, to take particulars and prepare plans and estimates for hot-water work of every description; or they will, on receipt of full particulars by post, send estimates, &c., free of charge.

The Patent "DOUBLE L" SADDLE BOILER is made in sizes to heat from 300 to 10,000 feet of piping, and can only be obtained from the Patentees.

All communications respecting prices of boilers, &c., should be addressed—

**J. JONES AND SONS, HOT-WATER ENGINEERS,
6, BANKSIDE, SOUTHWARK, LONDON, S.E.**

EXTRACTS FROM A FEW TESTIMONIALS

IN FAVOUR OF

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

From Mr. J. ATKIN, Gardener to W. Stuart, Esq.

"ALDENHAM ABBEY, WATFORD, June 5, 1873.
"Concerning the working of your Patent 'Double L' Saddle Boiler, I have only to say that it gives entire satisfaction, and, although a small one, it heated the 700 feet of 4-inch piping nearly all the winter. I had seldom to use the other Boiler that is attached to the pipes; it also requires a considerable deal less fuel than the old Saddle, which is of some importance at the present price of coal; it also heats much quicker than any Boiler I ever had to superintend."

From Mr. J. W. ABRAHAM, Gardener to N. M. Forbes, Esq.

"TILBURNSTOWN LODGE, GODSTONE, December 30, 1871.
"I have proved your 'Double L' Saddle Boiler, and find it everything that could be needed. I am of opinion that the Boiler is able to drive as much more piping as it is now required to do. It is the kind of Boiler I should recommend to all Gardeners for Forcing Houses, as you can get both a quick heat and a regular heat; in fact, I believe it to be the best Boiler I ever had to deal with."

Extract from Second Testimonial from the above.

"The 'Double L' Saddle Boilers, as well as the apparatus in the Stove House, answer exceedingly well, and give whatever heat I require—from 80° to 90° day or night—with very little trouble or attention."

From Mr. R. WILMOTT, Gardener to C. Dorland, Esq.

"BUS GARONS, ADELPHI PARK, May 26, 1873.
"The 'Double L' Saddle Boiler and Apparatus erected by you has given me great satisfaction, as it does its work quickly and economically, and requires very little attention. I consider it a great improvement on the old Saddle Boiler; in fact, I prefer it to any other boiler we have."

From Mr. J. SMS, Gardener.

"BOVINGDON HOUSE, HEMEL HEMPSTEAD, December 18, 1871.
"I have given your 'Double L' Saddle Boiler a fair trial during the severe weather we have had, and am well satisfied as to its being a great deal more economical than the old Saddle, and will do the same amount of work with about half the quantity of fuel."

From Mr. D. ROBERTSON, Gardener to Rev. Dr. Ainger.

"WHITTON TOWER, ROTHBURY, June 3, 1873.
"Your 'Double L' Saddle Boiler is giving great satisfaction. We have had a severe winter, the houses are old, and consequently very open, and yet it has kept them at the proper temperature from 10 P.M. to 8 A.M., which would be very hard on any other boiler that I am acquainted with, considering the size."

From Mr. CHARLES VOUNG.

"NURSERIES, BALKHAM HILL, S.W., May 29, 1873.
"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

From Mr. R. THOMPSON, Gardener to H. Crawshaw, Esq.

"LANGLAND BAY, near SWANSEA, June 5, 1873.
"Your 'Double L' Saddle Boiler I like very much. I have worked it regularly since it was fixed, and I find it to be a very powerful, and, at the same time, an economical Boiler. I am also pleased with the manner in which the pipes are fixed, and their working throughout. The stops could not possibly be better. This I consider a good point, as it enables the person in charge to regulate the heat as he pleases."

From Mr. L'ANSON, Gardener to the Rev. G. H. Devonport.

"FOXLEY, near HEREFORD, June 4, 1873.
"I have given your 'Double L' Saddle Boiler a fair trial, and it gives every satisfaction. It is the quickest heating boiler I have had under my charge, and burns the least fuel."

From Mr. H. BROOKS, Gardener to J. T. Belk, Esq.

"THE PARK, MIDDLESBORO, May 28, 1873.
"I have given your 'Double L' Saddle Boiler a fair trial, and have found it give every satisfaction. It sets admirably with a small amount of fuel, which is a great point at the present price of fuel. I consider it the best I have used, and the most economical."

From Mr. J. McCULLUM, Gardener to J. W. Hallowell, Esq.

"STATFORD COURT, STAFFORD, May 30, 1873.
"I have thoroughly tested the efficiency of your Patent 'Double L' Boiler, and I am so satisfied with its heating powers that I can recommend it with confidence. When properly managed I find it one of the most economical Boilers I ever used."

From Mr. W. BECH, Gardener to Sir J. W. Hartopp.

"KINGSWOOD WARREN, EPSOM, May 30, 1873.
"The two 'Double L' Saddle Boilers you put in here for the hot-water apparatus are working very satisfactorily."

From Mr. S. PETTIT, Gardener to F. Sartoris, Esq.

"RUSHON HALL, HIGHAM FERRERS, May 29, 1873.
"Your 'Double L' Saddle Boiler has had a good trial this last winter, and does its work first-class, with comparatively little fuel, considering the work it has to do."

Horticultural Builder and Hotwater Apparatus Engineer,
 STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

T. G. MESSENGER,
 CONTRACTOR, MIDLAND HORTICULTURAL BUILDING
 AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Begs to inform his numerous Patrons and the Public generally, that since his recent disastrous fire he has erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, of any required dimensions. T. G. MESSENGER is now, therefore, in a position, from his great facilities and experience, to carry out with dispatch and in the best manner, at moderate cost, the orders with which he may be entrusted. Glasshouses erected on Messenger's Patent principles are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed; are economical in cost and maintenance. Hot-water engineering in all its branches. Messenger's Patent Hot-water Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application.
Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out.

A richly Illustrated CATALOGUE forwarded Post Free on receipt of 33 Stamps.

greatly Enlarged Edition of

GORDON'S PINETUM:

BEING A

Synopsis of all the Coniferous Plants
at present known,

WITH
DESCRIPTIONS, HISTORY,
and SYNONYMS,

AND

Comprising a considerable number of New and
Undescribed Kinds;
With elaborate Indexes of both Scientific and
Popular Names.

In One Volume, 8vo, Cloth, Price 18s.

* * * The former Edition, now extremely
scarce, was published at 16s., the Supplement at
6s., both of which are included in the present
with considerable additions.

LONDON:

HENRY G. BOHN,
18, HENRIETTA STREET, COVENT GARDEN, W.C.

A NEW VOLUME COMMENCES IN JANUARY.

THE FLORIST AND POMOLOGIST:
A PICTORIAL MAGAZINE OF GARDENING.

Monthly 1s.; Annual Subscription 12s., or Free by Post, 13s.

Two finely Coloured Plates issued with each Number.

Established as the "Florist" in 1848.

The FLORIST and POMOLOGIST is a Popular Monthly Magazine of Gardening in all its Departments. It supplies the class of information required by GARDEN AMATEURS, as well as by PROFESSIONAL AND COMMERCIAL GARDENERS. It keeps its readers informed as to the latest and most interesting items, and interests them as to the best forms of GARDEN PRACTICE.—The subjects for the COLOURED PLATES are selected with the greatest care, and the drawings are made by the leading Floral and Botanical Artists; while as the LETTERPRESS is contributed by some of the most distinguished Practical and Scientific Horticulturists of the day, the sound practical character of the information contained in its pages is assured.

The FLORIST and POMOLOGIST may be obtained through any Bookseller or Newsagent, or direct from the Publisher,

MR. EDWARD H. MAY, 171, FLEET STREET, LONDON, E.C.

THE AGRICULTURAL GAZETTE,

A WEEKLY ILLUSTRATED JOURNAL FOR
LANDOWNERS AND TENANT FARMERS,

PUBLISHED BY

W. RICHARDS, 7, Catherine Street, Strand, London, W.C.

Price Fourpence; Post Free, Fourpence-Halfpenny.

THE AGRICULTURAL GAZETTE
gives Weekly Reports of the Metropolitan and chief
County Corn and Agricultural Markets; and of the
Wool, Cosh, Hop, Hay, and Vegetable Markets, and the Cheese
Markets of Derbyshire, Somersetshire, Cheshire, and Glasgow.

THE AGRICULTURAL GAZETTE
is the Tenant Farmer's Journal, and has published, during
the past year, Contributions and Communications from Land-
lords and Tenant Farmers in fifty-six Counties in England,
Scotland, and Ireland.

THE AGRICULTURAL GAZETTE
is the Weekly Reporter of the proceedings of all Agri-
cultural Societies, and has during the past year reported the
Meetings and Discussions of the Royal Agricultural Society of
England, the Highland and Agricultural Society of Scotland,
the Bath and West of England and Southern Counties Agri-
cultural Association, the Yorkshire and all other County Agri-
cultural Societies, Chambers of Agriculture, and Farmers' Clubs.

THE AGRICULTURAL GAZETTE
is a Weekly Illustrated Agricultural Journal, and has
published during the past year nearly 50 Engravings, in-
cluding Woodcuts of Agricultural Machines, Portraits of
Noteworthy Agriculturists, Plans of Cottages and Farm
Buildings, Portraits and Diagrams of Particular Cattle, Sheep,
and Pigs, Illustrations of Colonial Agricultural Life, Illustra-
tions of Plants, Drawings of Veterinary and other subjects.

THE AGRICULTURAL GAZETTE
is a Record also of Foreign Agricultural Progress, and
has published Periodical Communications from its Correspond-
ents in Foreign Countries, in Australia, the United States,
Canada, France, Germany, Hungary, Austria, South America,
and India.

THE AGRICULTURAL GAZETTE
contains Weekly Articles and Reports, illustrated when
necessary, relating to the Poultry Yard, the Forester, the Bee-
keeper, the Garden, the Household, and the Weather.

THE AGRICULTURAL GAZETTE
is a full Record of all Matters relating to the Shorthorn
Breeder and Live Stock generally; and, during 1874, it has
published Reports of the Herds and Flocks at Holker, Under-
Audley End, Havering, Lightburne, Witham-on-the-Hill,
Kilberry, West Dereham, Westford, Kingsford, Wateringbury,
Weeting Hall, Carlton Court, Dunmore, Worsley, Skyeing,
Taverham Hall, Hove, near Brighton, County Cork, &c.

THE AGRICULTURAL GAZETTE
is a Journal of Veterinary Practice and Experience, and
has contained during 1874 weekly articles by its Veterinary
Editor, besides frequent reports from Veterinary Inspectors at
the leading Live Stock Markets.

THE AGRICULTURAL GAZETTE
is the strenuous advocate of Security for the Capital
employed in Cultivation, the Removal of Restrictions upon the
Cultivator, the promotion of Professional Agricultural Educa-
tion, and the increased acknowledgment of the commercial
principle along with good neighbour-hood, as properly regu-
lating the Relationships of Landlord and Tenant and of Master
and Servant.

THE AGRICULTURAL GAZETTE
is a record of the Progress and Improvement of the Agri-
cultural Machine Manufacture, and has published, during 1874,
Illustrated Reports of the following Agricultural Machine fac-
tories:—Messrs. Howard, of Bedford; Messrs. Clayton & Shute-
loworth, of Lincoln; Messrs. Ashby, Jeffrey & Luke, of
Stanford; Messrs. Aveling & Porter, of Rochester; Messrs.
Barford & Perkins, of Peterborough; Mr. Eoley, of Bury
St. Edmunds; Messrs. Burgess & Kory, of Brentwood; Messrs.
Carson & Toole, of Warminster; Messrs. Cottam, of London;
Messrs. Denings, of Chard; Messrs. Garrett & Sons, of Sax-
mundham; Messrs. Gornby & Son, of Grantham; Mr. Le
Butt, of Bury St. Edmunds; Messrs. Marshall & Co., of
Gainsborough; Messrs. Nicholson, of Newark; Messrs. Page
& Co., of Bedford; Messrs. Samson & Co., of Banbury;
Messrs. Reeves & Co., of Westbury; Messrs. Ruston, Proctor
& Co., of Lincoln; Messrs. Tuxford & Co., of Boston; Messrs.
Woods, Cockbridge & Co., of Stamford; Messrs. Bernard &
Bishop, of Newark; the Bristol Waggon Co., and the Reading
Agricultural Implement Co.

THE AGRICULTURAL GAZETTE
is a Weekly Record of the Progress of Agricultural
Science, and has during the past year published commu-
nications from Professor Baldwin, of Dublin; Professor
G. T. Brown, of the Veterinary Department of the Privy
Council; James Caird, C.B., J. A. H. Caird, W. Car-
rington, F.R.S., Consulting Botanist to the Royal Agricultural
Society of England; J. Bailey-Denton; H. Eyreshead;
Dr. J. H. Gilbert, F.R.S.; James Howard, of Bedford;
H. Kinn-Jackson; H. M. Jenkin, F.G.S., Secretary to the
Royal Agricultural Society of England; W. Reace Jones; the
late Lord Kesteven; J. B. Lawes, F.R.S.; the late Lord
George Manser, M.P.; J. J. Mechi; Rev. W. J. Pope;
J. P. Sheldon, of Derbyshire; W. Smith, of Wokington;
Augustus Voelcker, Ph.D., F.R.S., Consulting Chemist to
the Royal Agricultural Society of England, and to the Bath
and West of England Society; R. Warrington, F.G.S.; Rev.
G. Wilkins, of Wix; Willoughby Wood; Professor Wrightson,
and many others.

THE AGRICULTURAL GAZETTE
of 1875 will continue to Report, with promptitude and
care, all Agricultural Markets, Society Meetings, and Agri-
cultural Machine Improvements. It will contain weekly
Articles from Correspondents in England, Scotland, Ireland,
and Foreign Countries. It will contain illustrated Reports of
all matters connected with our Live Stock, our Plants, our
Poultry, Bees, Gardens, &c. It will contain articles descriptive
of Estates, Farms, Herds, and Flocks. It will contain weekly
articles on the Social Relations, the Sciences, the Business
Transactions, the Practical Details of Agriculture. It professes
no Party Politics, but it will not hesitate to discuss any subject
affecting the position or interests of the British Farmer. The
Organ it desires to be, it will be found absolutely Independent,
excepting only of such rules as govern honourable men; and
nothing which affects the interests, whether of the Landowner,
the Tenant Farmer, or the Labourer, will be excluded from its
columns.

THE AGRICULTURAL GAZETTE
VOLUME For 1874
Can be had at 7, Catherine Street, Strand, W.C.

It contains an unequalled Agricultural History of an eventful
agricultural year, and a large quantity of information of perma-
nent agricultural interest.

Wholesale Depot, 20, Great Titchfield Street, Oxford Street, W.

Grateful-Comforting.

EPPS BREAKFAST. "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually brought up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the Civil Service Gazette. Made strictly with boiling water or milk. Sold in packets (in tins for abroad) labelled:—JAMES EPPS AND CO., HOMOEPATHIC CHEMISTS, 148, The Strand, London, W.C., and 170, Piccadilly, W. Works:—Euston Road, and Sandon, Town, London, N.W. Makers of Epps's Glycerine Jubilee for Throat Irritation.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion, and the best mild purgative for delicate Constitutions, especially adapted for Ladies, Children and Infants. DINNEFORD AND CO., 172, New Bond Street, London, W.; and all Chemists throughout the World.

NEW POTATOS FOR 1875.

JOHN CATTELL,

With the greatest confidence, recommends the following as something superior, they having been selected by himself from over 300 Seedlings, raised seven years since—special attention having been paid to select those only with moderately strong growing haulm, abundant croppers, very white, floury, and superior flavour. The constitution of all is good, resisting the attacks of disease better than many other varieties, and as store kinds they cannot be surpassed, yet equally good at digging time.

ECLIPSE KIDNEY (Cattell).

A medium early variety, with moderately strong growing haulm; tubers of a medium useful size; very handsome in shape; eyes nearly level with the surface;

very white, floury, and excellent flavour.

Received First-class Certificate from Royal Horticultural Society, September 10, 1874.

Price, per 7 lb., 6s.

RELIANCE KIDNEY (Cattell).

A second early kind, moderately strong growing haulm, very productive, and large

handsome tubers; white, floury, and fine flavour.

Price, per 7 lb., 4s.

ADVANCER KIDNEY (Cattell).

This is also a second early variety, with moderately strong growing haulm; good cropper, very white, floury, and fine flavour. Price, per 7 lb., 4s.

A few of each having been placed in the hands of Gardeners for trial, the following is the opinion expressed by them:—

Mr. F. BRIDGER, *Gardener to the Right Hon. Lord De L'Isle, Penshurst Place, states:—*"I find Eclipse Potato floury, white, and flavour exquisite; cannot be better. Reliance, very floury and white; a first-rate Potato; good in all its points."

Mr. H. WOOD, *Gardener to W. Tipping, Esq., Brasel Park, states that:—*"Eclipse is very white and floury; a most splendid Potato. Advancer, white and floury, with a very fine flavour. Reliance, very white and floury; a most splendid Potato; I can recommend it as first-class."

Mr. BOLTON, *Gardener to W. Spottiswoode, Esq., Combe Bank, Sundridge, states that:—*"Eclipse Potato is mealy, white, and good flavour. I consider it fit for any gentleman's table. Reliance, very mealy and good flavour."

Mr. J. E. ROSE, *Gardener to J. Kitchin, Esq., Dunsdale:—*"The three samples of Potatoes you sent me for trial are by far the finest quality I have ever eaten, especially Eclipse; they are like balls of flour, very white, and a splendid flavour. I think they cannot fail to give satisfaction on every gentleman's table."

New Potatoes for 1875.

JOHN CATTELL with the greatest confidence recommends the following, which have received a First-class Certificate from the Royal Horticultural Society, August 29, 1874. W. P. can highly recommend this Geranium as being one of the most distinct and useful varieties of its class yet introduced.

NEW DWARF SILVER-VARIEGATED GERANIUM, LITTLE TRUMPET.

GERANIUM LITTLE TRUMPET. This very distinct Geranium was raised by Mr. Davis, the Cemetery, and is placed in W. Potten's hands for distribution. The dwarf, compact-branched habit of this variety, and its broad, clear white margins, will make it available for edging or small work. Its average height is about 6 inches. The flowers are a deep scarlet. It has been admired by all who have seen it, and received First-class Certificate from the Royal Horticultural Society, August 29, 1874. W. P. can highly recommend this Geranium as being one of the most distinct and useful varieties of its class yet introduced.

Planting Season.—Avenue Trees.

LIMES, 12 to 16 feet high, straight stems, girthing 4 to 8 inches at 4 feet from the ground, with well-balanced heads, and splendidly rooted. A stock of 1000 fine Avenue Trees for sale from Mr. W. Potten. PLANES OCCIDENTAL, 12 to 16 feet. HORSE CHESTNUTS, 10 to 12 feet. SCARLET HORSE CHESTNUTS, 10 to 12 feet. NORWAY MAPLES, 10 to 16 feet.

F. GEE begs to offer as follows for cash with orders.

The Most Practical Work on Gardening yet Published is

SUTTON'S AMATEURS' GUIDE.

From the COURT CIRCULAR.

"We have received 'Sutton's Spring Catalogue and Amateur's Guide,' an admirable and exhaustive catalogue of root, fruit, and flower seeds, grown by the great firm at Reading. This handsome book is illustrated with some beautifully executed plates. The directions for the cultivation of the various seeds given in the case of each are clear and concise, and of great use to amateur and professional gardeners. They raise the work above the level of a trade catalogue to that of a work on gardening." Price 1s., post free.

"Sutton's Amateur's Guide" is beautifully illustrated with several coloured plates and hundreds of engravings. It is, without exception, the most practical work on Gardening extant.

SUTTON'S MINIATURE AMATEURS' GUIDE, post free for three stamps.

Sutton Sons THE QUEEN'S SEEDSMEN, READING.

**KNIGHT'S NEW PEA,
DUKE OF CONNAUGHT.**

This is a really useful new Pea, of a branching habit, about
3 feet high, and very prolific—well adapted for second and
general crops; also for late sowing, as it is never affected by
mildew. It is a fine exhibition and market Pea.

Quarts, 5s.; Pints, 2s. 6d.

THE OXONIAN PRIZE ONION.

A very superior white Onion, growing to an immense size,
quite surpassing the white Spanish, both in mildness of flavour
and quality of bulb. Ripens early. Has obtained 1st prize
wherever exhibited.

Per Packet, 1s.

MR. LAXTON'S NEW PEAS FOR 1875.

HURST & SON

Have pleasure in offering the following four varieties of MR. LAXTON'S NEW PEAS, all of which have been selected for their high quality, flavour and distinctness, three of them having received First-class Certificates from the Royal Horticultural Society after the great Chiswick trial in 1872:—

UNIQUE.

This is a very handsome and prolific Dwarf Early Pea, with long, deep-green coloured pods, of the same habit and coming into use at the same time as Little Gem, and may be briefly described as a Dwarf Willam the First. Received a First-class Certificate.

Price 7s. 6d. per sealed quarter-pint packet.

DR. HOGG.

"A very handsome Pea. The earliest green wrinkled Marrow, very sweet and of excellent quality, pods being very well filled and of a beautiful deep green colour, like the Ne Plus Ultra."—*Vide Proceedings of the Royal Horticultural Society for 1872.*

"No higher recommendation could be given to it than to introduce it as a competitor of Ne Plus Ultra." "To sum up the whole it is a fine Ne Plus Ultra, coming in one week after Dillestone's."—*Hogg's Gardener's Year Book for 1873.*

Height 3 feet, habit and type of Sangster's No. 1. Awarded a First-class Certificate and received its name at the instance of the Fruit Committee of the Royal Horticultural Society.

Price 7s. 6d. per sealed quarter-pint packet.

SUPLANTER.

"A cross between Veitch's Perfection and Little Gem—the earliest of the Veitch's Perfection type; plant very robust and vigorous, producing very large broad pods in pairs. A large, handsome, and very prolific Pea, which received a First-Class Certificate."—*Proceedings of the Royal Horticultural Society for 1872.*

"Appropriately named, for it is a large, handsome, and very prolific Pea, and will take the place of many others."—*Hogg's Year Book, 1873.*

This Pea is of fine quality, and is also first-rate for exhibition, having been shown by Mr. R. Gilbert during the past season, in three of his Prize Collections of Peas. Height 3 feet.

Price 5s. per sealed quarter-pint packet.

CONNOISSEUR.

A remarkably distinct and very late wrinkled, bright green seeded Pea, raised from Ne Plus Ultra, pronounced by the Royal Horticultural Society to be of very excellent quality. Height 6 feet.

Price 5s. per sealed quarter-pint packet.

HURST AND SON can also supply:

FILLBASKET.—Unquestionably the most prolific and best Market Pea yet introduced. First-class Certificate Royal Horticultural Society.

Price 2s. 6d. per sealed half-pint packet.

LAXTON'S No. 1.—The earliest blue wrinkled Marrow.

Price 2s. 6d. per sealed half-pint packet.

£30 £50 will be offered in Four Prizes at the Royal Horticultural Society's Show on July 7 next, for Six Varieties of Mr. Laxton's New Peas sent out by us in 1872, 1873, and 1874, 50 pods of each. These Prizes will also be repeated at the Society's Provincial Exhibition in 1875.

HURST & SON, 6, LEADENHALL STREET, LONDON, E.C.

UNIQUE (Dwarf).—First-class Certificate.

DR. HOGG.—First-class Certificate.

SUPLANTER.—First-class Certificate.

NUTTING'S "MULNUM IN PARVO" PEA.

A first-class Early Dwarf Wrinkled Marrow Pea, an improvement on Little Gem, exceedingly prolific, the haulm being covered with broad, well-filled pods, an excellent flavour, ready for use only a few days later than SANGSTER'S No. 1, highly recommended as one of the best and most useful early Dwarf Peas in cultivation. Height, 12 to 16 inches.

NUTTING & SONS, SEED WAREHOUSES, 60, BARBICAN, LONDON, E.C.

NEW AND CHOICE SEEDS, 1875.

CELERY—Brettle Red, a sort grown nearly by all, and raised by one of the market gardeners here, and considered the very best Celery grown, 1s. 6d. per packet. LETTUCE—Martin's Mammoth Cos, a very crisp and superb kind, very large, and better in flavour than Malta, 1s. per packet.

BROCCOLI—White Perfection, a truly valuable middle season hardy kind. 1s. per packet. Gardeners' Friend, a very late and very large variety, and a great acquisition. 2s. per packet.

BRUSSELS SPROUTS.—Our improved Roseberry. 1s. per packet.

MELON—Wood's A. 1. This splendid variety of Melon is the result of crossing Meredith's Hybrid Cashmere with the old Golden Paragon. It has a pale green flesh of great thickness and exquisite flavour, with a beautiful golden skin the thickness of paper, and thickly netted, and is also a remarkably fine setter. It has always obtained the highest honour wherever exhibited, and pronounced by the best judges to be the handsomest and best Melon ever coming under their eye. Our stock is very small, every Gardener that we have yet seen having ordered it. 2s. 6d. per packet.

The MAGNUM BOMUM (212) SELECTION OF GARDEN SEEDS which we supply has always given the greatest of satisfaction. Other Collections, 30s., 40s., 63s. and 84s. carriage free.

FOREST TREES, SHRUBS, &C.

100 Mixed ORNAMENTAL TREES and SHRUBS, &c. 3 to 6 feet high, 25s. per 100. 500 do. 3 to 6 feet high, 110s., or 22s. per 100. 1000 do. 3 to 6 feet high, 200s., or 20s. per 100 taking the 1000. LAURELS, common, bushy, 1 to 1 1/2 feet, 6s. per 100; 1 1/2 to 2 feet, 8s. per 100; 2 to 3 feet, 12s. per 100; by the 1000 cheaper. FIR, Austrian, 1 1/2 to 2 feet, 40s. per 1000; 3 to 4 feet, 50s. per 1000. SYCAMORE, 6 to 8 feet, 20s. per 100, &c. Apply to

RENDLE'S PATENT SYSTEM
OF
CIRCULAR GLAZING.

Circular Roofs can be Glazed with ordinary Straight Sheet or Rolled Plate Glass, without any expensive bent Glass.

No more bent Glass will be required for any Circular or Curvilinear Work, when this system is thoroughly known.

The Great Circular Roofs of the Royal Aquarium and Winter Garden at Westminster are to be Glazed on this System.

Illustrated Catalogues and Books of Designs can be had from the Inventor and Patentee,

MR. WM. EDGCUMBE RENDLE,
3, WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON, S.W.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED.

This Company, having purchased from the Dromore Patent Heating Company Mr. Cowan's valuable Patents for the United Kingdom, is now prepared to undertake the Erection of Apparatus on that System in all parts of the Country.

THE ADVANTAGES OF THE SYSTEM ARE AS FOLLOWS:—

- | | |
|---|--|
| <p>1. In most Cases it SAVES the ENTIRE COST of FUEL.</p> <p>2. The Heat is maintained more steadily than by any other System.</p> | <p>3. No Night Attendance is required.</p> <p>4. There is no Smoke or Unpleasant Smell produced.</p> |
|---|--|

THE SUCCESS OF EVERY APPARATUS ERRECTED BY THE COMPANY IS GUARANTEED.

Full Particulars of this System, Testimonials, and Opinions of the Press, can be seen in the Company's Illustrated Pamphlet, which can be obtained, post free, on application.

The Company has an Efficient Staff of Engineers, and sends at any time to inspect places where the idea is entertained of Erecting the Apparatus.

The System has lately been adopted at Hazelwood, Herts, the seat of Lord Rokeby; Stackpole Court, the seat of the Earl of Cawdor; Ripley Castle, Yorkshire, the seat of Sir H. D. Ingilby, Bart; Langleybury House, Herts, the seat of Jones Lloyds, Esq.; and at many other places. Also Mr. E. Bennett, of Hatfield, says:—

"I now most cordially beg to congratulate you on the glorious success of your Heating Apparatus (now in use at Hatfield), which is working most satisfactorily, and which has exceeded my expectations. It is a decided success, and more cannot be said in its favour. Should it continue to work in the manner it now does, it will prove a great boon here, and start a new era in the heating of horticultural buildings generally. By your Compensating System we have for every barrow of coals thrown into the kiln some substantial return; by the old system the returns were ashes, and the trouble of clearing them away. I find our chalk is of an inferior quality to some I have seen in the neighbourhood, but we have plenty of heat."

The Company also undertakes the Erection of all other kinds of Heating Apparatus, and of Horticultural Buildings.

PLANS AND ESTIMATES FURNISHED ON APPLICATION.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

Office: 4, LOTHBURY, BANK, LONDON, E.C.

NOVELTIES OF STERLING MERIT.

JAMES VEITCH & SONS

HAVE MUCH PLEASURE IN DIRECTING ATTENTION TO THE FOLLOWING

NEW AND CHOICE VEGETABLE SEEDS.

**CULVERWELL'S
PROLIFIC
MARROW PEA.**

This remarkably fine late Pea has been placed in our hands for distribution by Mr. Culverwell, Gardener to Mark Millbank, Esq., Thorpe Perrow, Bedale, Yorkshire.

Mr. Culverwell describes it as one of the finest late Peas grown for productiveness, as it bears pods from within a short distance of the ground to the top of the haulm, and thus the crop lasts a long while. The pods are straight, pale green, and contain from five to six exceedingly large peas of excellent quality. It is of strong and robust growth, from 5 to 6 feet in height.

We have letters from Mr. Westcott, Raby Castle, Darlington, and Mr. Saul, Sturton Park, Knaresborough to whom it was sent for trial, speaking of its wonderful quality. The former says, "There is not the slightest doubt in my mind of its being the greatest acquisition among Peas that we have had for many years past, and truly deserving the term 'new and distinct,' the flavour quite equaling, and if possible surpassing, the world-wide-famed variety, Veitch's Perfection." Mr. Saul speaks of it as follows: "It is a most deliciously-flavoured Pea, and its great merits when known must soon cause it to become a standard variety of the very first class."

The ripe seed is very large, bright green, wrinkled, and very distinct in appearance.

Price, 5s. per quart.

CULVERWELL'S PROLIFIC MARROW PEA.

PREMIER RUNNER BEAN.

A very distinct Runner Bean, growing from 4½ to 5 feet high, and producing continuously a large number of pods, in appearance like those of a Dwarf French Bean; very tender, and invaluable for table purposes.

The Editors of the *Gardener's Chronicle*, in reviewing the Novelties of 1865, speak of it in the following words:—"Amongst Runners, Premier is a decided acquisition, a true Kidney Bean, with a running haulm, and consequently a continuous bearer."

We extract the following description of this variety from *The Garden* of March 14, 1874, p. 230:—"Premier is really a runner form of the Dwarf French Bean, and when grown with a large number of other kinds at Chiswick it was considered sufficiently meritorious to receive a First-class Certificate, and since then, in its peculiar form, it has not been excelled. The plant grows to a height of about 5 feet, and does best on ordinary pea-sticks. It commences to crop close to the ground, and continues to bear heavily until the winter. The green pods are very tender and delicious when cooked, and it is altogether a really useful garden vegetable."

Price, 5s. per quart.

EASTNOR CASTLE GREEN-FLESH MELON.

This splendid Melon, a hybrid between Beechwood and Victory of Bath, was raised by Mr. Coleman, Eastnor Castle, Ledbury. It has been exhibited at several of the principal shows during the past season, and has been universally admired. It was also in Mr. Coleman's First Prize Collection of Fruit, exhibited at the great Birmingham Meeting, July, 1874.

It takes its netting, colour, and depth of flesh from Beechwood, and ripens off pale yellow. It is a free grower, free setter, and bears a profusion of fruit, generally averaging about 3 or 4 lb. in weight.

When exhibited at the Royal Botanic Society, where it gained the First Prize on June 24, 1874, it was acknowledged to be the deepest green-fleshed and best flavoured Melon ever shown.

Price, 2s. 6d. per Packet.

**TENDER AND
TRUE
CUCUMBER.**

This splendid new Cucumber was raised by Mr. Douglas, Gr. to F. Whitbourne, Esq., Loxford Hall, Ilford.

It is a seedling from Telegraph and Blue Gown, combining the good qualities of both these fine kinds.

It is very symmetrical in shape, with scarcely any neck, and grows to a length of about 24 to 30 inches. The colour is of a beautiful deep green shade, and the flavour is excellent. It is a free bearing variety, of very strong constitution, and is equally suitable both for winter and summer use. It received a First-class Certificate from the Royal Horticultural Society on May 3, 1871, and was awarded 1st prize at each of the spring shows for the past three seasons. It also gained first honours at Birmingham on July 7, 1874, in competition with twenty-one other kinds.

Price, 3s. 6d. per packet.

**GAULFLOWER,
VEITCH'S
AUTUMN GIANT.**

This extremely valuable variety is perfectly distinct from any other sort. The heads are magnificent, beautifully white, large, firm, and compact, and being thoroughly protected by the foliage, remain longer fit for use than any other kind.

Price, 1s. 6d. per packet.

For other Varieties of Choice Vegetable and Flower Seeds, see ILLUSTRATED PRICED CATALOGUE. Post Free on application.
Special Offer to the Trade of this Season's Novelties and other Choice Seeds now published and forwarded on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

IMPORTANT ANNOUNCEMENT.

The date or locality not having been fixed for the Provincial Show this season,

JAMES CARTER & CO.

Carter's

THE ROYAL SEEDSMEN,

237 and 238, HIGH HOLBORN, LONDON, W.C.

SATURDAY, JANUARY 16, 1875.

A HOLIDAY IN NORWAY.

(Continued from p. 40.)

THE great sources of supply of the river system of the country are the lakes that are found in the mountain plateaus. Constantly fed during the summer by the melting of the masses of snow that wintry storms accumulate, their overflow, increased by the many subsidiary torrents that fall down the mountain slopes, form the streams that pour their waters simultaneously into the valleys. The waters that are gathered in many and wide-spreading pools on this field, are the sources of two rivers that flow east and west. The eastern river, the Beina Elf, finds its way to Christiania Fjord; the Lierdals Elf flows in the opposite direction until it joins the south-east arm of the Sogne Fjord. A mountain farmstead, or seater, is passed shortly after leaving Maristuen. As all kinds of farm produce must be housed in Norway this necessitates many buildings—in this instance they are rough, rude, and dirty. The cows, horses, goats, and sheep, are driven in at night. Watch fires are lighted, and the men sit up to keep off the bears and wolves that are prone to make attacks on unprotected animals. The skulls fastened to the outside of the seater, and the skins constantly seen within the houses, are assurances that the dwellers in these mountain farms effectually resist the onslaught of these predatory animals.

From its contiguity to the field, and as a point for excursions to various places of interest, Nystnen possesses advantages which may justly commend it to the notice of travellers. The accommodation at the station, though homely, is generally sufficient, and when the lake trout can be secured it is luxurious. Kanute Janson, the owner of the farm land, is a fine specimen of his class; his son, who manages the posting, speaks English, and is a careful driver and good guide and adviser. At the commencement of the ascent of the mountain that towers above the station—which I lost no time in attempting—many familiar English plants are met with, but here, at the foot of the slope, there is little chance for plants, for no space, however small, that affords herbage, escapes the notice of the provident farmer, and marks of the scythe, which is a small tool adapted for cutting short swathes, frequently occur on the mountain side, often to the discomfiture of the botanical explorer.

Interpersed amongst the alpine herbage the Harebell on its delicate stalk waves its bright blue flower bravely in the wind; the large size of its blossoms and the vigour of the plant show how much it is at home on the mountain side. Euphrasia (Eyebright) asserts its privilege to be seen on its native hills; it is not the humble and obscure, grass-overgrown plant we find in our pastures, but lifts its bright little blossoms fairly above the herbage amongst which it grows, in profusely blooming clusters. Ling (*Calluna vulgaris*) appears again and again, wherever vegetable decay has mixed with the rocky *aldris* and given it the soil it loves; examples of *Geranium*, *Potentilla*, *Rhinanthus*, *Alchemilla vulgaris* and *alpina*, are frequently met with. *Silene inflata* and *Linaria vulgaris* present themselves as familiar friends; in most hollows masses of *Aconitum* occur, and whole beds of *Epilobium montanum* give quite a flush of crimson to the hillside. *Gentiana purpurea*

grows in tolerable abundance, and the little bright blue *Gentiana campestris* peeps out from tufts of protecting grass. *Stellarias* show their little starry white blossoms from the foot to the summit of the mountains; on the swampy ledges, where silty soil has been washed down, and through which trickles little rills, I found charming tufts of a crimson-blossomed *Sedum*, and more in the water way; and amongst the shady stones another of larger growth, bearing reddish-brown and orange coloured flowers; near it a *Viola* like *pedata*. One little lingering blossom of *Saxifraga oppositifolia* caught my eye: it abounds in many places in Norway. *Lychnis Flos-Cuculi* was high up the hill-side and along ledges of shaly rock, and in the wet places beneath them dwarf mountain Willows grew thickly. Above these fringes of shrub, and where a less abrupt declivity had allowed a peaty soil to collect, I disturbed a number of fieldfares whilst feasting on the abundant berries of *Vaccinium Myrtillus*, which grew in masses in this and similar congenial spots adjacent. Higher up towards the summit of the mountain I discovered a charming little *Lychnis*, a dwarf *L. Flos-Cuculi*, but brighter and more compact in habit of growth. Ascending still higher I found the rocks carpeted with a dense growth of mosses and lichens, which had spread over every block, giving their own rich colouring, and triumphing in very numbers and beauty over the magnitude of the inert masses they covered and protected. Sterile and desolate as these mountain summits appear from a distance, as they are more nearly approached and examined they show multitudes of forms of life, which, though exposed to the intensity of storm and vicissitudes of climate, yet rejoice in health and vigour. I observed that the few grasses that grew on these alpine heights have stalks that are flexible, tough, and smooth, as if varnished, so that no moisture could rest upon them, and no wind break them.

Standing on one of the huge blocks of metamorphic rock that, dislocated from its bed by some great convulsion, gave me the commanding point I desired, I gazed with delight on the glorious prospect that opened before me. As far as the eye could reach mountain rose above mountain, many of them capped with snow, and bearing far down their sides glistening fields of gleaming white; great fleecy cumulus clouds sailed slowly over the field, and sometimes dipped down and bathed the mountain tops with rainbow-tinted vapour. The air is raw and cold on such heights, and, heated by the exertion of the ascent, I soon felt its penetrating character, and turned reluctantly away from a scene in which the solemn grandeur of Nature was so apparent. The descent was a little perplexing, but was accomplished, and when my specimens were duly cared for I borrowed Kanute Janson's boat, and pulled across the Utzavand, a lake celebrated for its trout. The range of hills on the side opposite to the station seemed to dip down on easily accessible slopes, and much more snow rested upon them than on the range north of the station-house.

To no unaccustomed to mountain climbing nothing is more deceptive than the appearance of the surface of a mountainous district looked at from the distance of even half a mile. Green unbroken slopes appear to stretch away from ledge to ledge, smooth and free from any impediment to an easy ascent; a nearer acquaintance soon reveals a very opposite state of things; the close smooth vegetation of the distance becomes a tangled scrub of dwarf Alder, Willow, Juniper, and Birch. You turn to a spot free from the tangled vegetation that has barred your passage, and find that one of the many mountain streamlets has spread over it, and it is simply a bog. Clambering along through brake and across bog, you presently find your path arrested by a deep gully, down which

roars a torrent. It requires all the tact and judgment at your command to make your way over this obstacle, and often your upward course is stayed by a precipitous wall of rock which must be tediously skirted. I encountered all these, which I dare say are only ordinary difficulties, and often met with by alpine travellers, and at length reached the elevation where snow in masses still rested on the mountain slopes and in deep hollows, and all about it I saw, by the pressed and flattened shrubs and the decayed herbage, how much farther the snow had reached. Lichens, mosses and Ferns were just reviving, so recently had the snow left them. Making my way down I met with *Betula nana*, *Azalea procumbens*, *Salix glauca*, and *S. herbacea*; *Vaccinium Myrtillus* and *uliginosum* occurred plentifully, but otherwise the vegetation was less rich on this than on the hills to the north of the lake. Regaining the point at which my boat beached, with more difficulty than I had anticipated—no path to lead or person to guide being discoverable on this lonely hillside—I returned to Nysten to find it invaded by a hungry band of tourists, who speedily cleared the larder of what little provision it contained. I am afraid Janson thought my pursuit of wild plants a sad waste of time. The cultivation of land for profit—farming, in fact—has a tendency to narrow the feelings of interest in the broader field of natural history; restricted to a few objects that under cultivation give profitable results, all other plants are classed in the category of weeds, and treated accordingly by the majority of farmers both at home and abroad.

That any one should care for and take the trouble to collect the plants that grow wild and neglected on the hillsides was a constant source of surprise and amusement to the boys, as well as men, who sometimes rode behind my carriage. But when I chipped fragments of rock, and carefully deposited them in my collecting bag, I am afraid that I was credited with an amount of eccentricity that approached lunacy. My proceedings were duly related to the station-keeper, and the heavy bag handed out with unmistakable grins, in which the feelings of contempt and pity were mingled. Although proud of their country, and fond of it as men can be, they (the agriculturally inclined) would willingly agree to a general levelling of hills, and, from familiarity with their mountain scenery, their fjords, waterfalls, and foaming torrents, they are often unconscious of the features of grandeur and picturesque beauty they possess. Fine hills, and hard to get up, is the qualified praise some of them are willing to agree to. *William Ingram, Belvoir.*

(To be continued.)

New Garden Plants.

ORTHOGALUM (HELIODIAPHORUM) SOROKUM,

*Schott & Kotschy, Ester. Bot. Wochen., 4 Jahr, 3, 105.**

A native of the Cilician Taurus, discovered by Kotschy, sent by Leichlin to the Kew collection, where it flowered early in January, 1875. A species of the umbellatum group, like *exscapum* in its sessile corymb of flowers, but quite different in leaf and in its shorter permanently erect pedicels. All the twenty-three species of this section are so near to one another that only botanists will appreciate the difference, so that it is not a novelty of much horticultural interest.

Leaves 5-6, contemporary with the flowers, forming arosette surrounding and much overtopping the corymb, 3-4 inches long at the flowering time, $\frac{1}{2}$ - $\frac{3}{4}$ inch broad at the base, from which they are gradually narrowed to the point, destitute of hairs both on surfaces and edges. Corymb quite sessile, crowded, 6-8 flowered, flowering pedicels $\frac{1}{2}$ - $\frac{3}{4}$ inch long, the pedicels remaining short and erect, reaching finally an inch

* Folia 5-6, erecto-patentibus lineari-lanceolatis glabris caudiculis 7-8, pili longis, corymbis duplo eminentibus; corymbis sessile, 6-8-floro pediculis distinte erectis 6-12 lin. longis; bracteis lanceolatis perianthio et limbo longi segmentis exterioribus oblongis intus brevioribus; filamentis deltoideis perianthio triplo brevioribus; stylo brevi apice stigmatoso breviter truncato.—*Baker, Linn. Journ.* 13, 261.

long. Bracts small, lanceolate. Perianth $\frac{1}{2}$ inch deep, the divisions pure white with a broad streak of green down the back, the three outer oblong, $\frac{1}{2}$ inch broad, the three inner narrower. Filaments erect, deltoid, $\frac{1}{2}$ inch long; anthers minute. Ovary oblong, nearly half as long as the perianth, deeply 6-angled; style $\frac{1}{2}$ inch long, obscurely tricuspidate at the stigmatose lip. *T. G. B.*

BAST MATS.

THESE useful articles rise in price for an inferior quality from year to year, and gardeners are obliged to contrive all kinds of substitutes, none of which answer the purposes so well through all changes of weather. Judging from Mr. Werekha's report of the forest products of Russia, and Mr. Weschniakoff's account of the domestic industries of the same country, bast mats are likely to become dearer, and their production is not considered conducive to the prosperity of the provinces where they are made. The working of the bark of the Lime tree is chiefly carried on in the Governments of Viatka, Nijni-Novgorod, and Kostroma, and in some parts of those of Simbirsk, Tambow, and Penza. About 400,000 mats are annually exported from the port of Arkhangel alone. Besides the Governments above mentioned, large quantities of mats are manufactured in those of Minsk, Mohilew, and Vitebsk, from whence they are exported by way of the Baltic and Black Sea boats. The exportation from the latter Governments reaches about a million and a-half mats per year. The home consumption cannot be given in exact figures, but there is no doubt that it greatly exceeds the quantity exported. The manufacture of mats is mainly a domestic industry. The peasants employ their spare time from agricultural labour in the maceration and separation of the liber into slips, and in plating the latter into mats, which are purchased wholesale by commissionaires. In the Governments of Nijni-Novgorod, Viatka, Kostroma, and Minsk this industry assumes the proportions of small factories in some places.

Lime trees from twenty-five years of age are fit for decortication for the manufacture of mats; when younger, not more than from five to ten years old, their liber is used by a large number of the inhabitants of Russia to make their foot-gear (*topki*). In localities where the Lime is not sufficiently plentiful to supply the wants of the inhabitants in this respect, it is replaced by the bark of the Willow and Birch. It is estimated that the number of pairs of shoes (*topki*) annually made from the liber-bark of these trees is not less than one hundred millions. About one quarter are manufactured from the bark of the Birch, which is taken from about half-grown trees. For each pair of *topki* the bark of four stems about 7 feet long is required; thus for this purpose alone 400,000,000 trees are annually cut down in Russia. This enormous destruction of young trees must act very prejudicially against the future of silviculture in Russia. Indeed, in the Government of Kostroma, one of the principal centres of this industry (including, of course, the manufacture of mats), the Lime forests are already all destroyed, so that the materials to carry it on have to be procured from other districts, for the inhabitants are left to give up an occupation which has been continued for centuries.

The bark is removed in the spring or early summer, about three weeks being devoted to this part of the work. The entire bark is also employed for roofing, making boxes, cordage, baskets, &c.

The value of the mats exported to Europe in 1871 amounted to 296,951 roubles.

PLATYCERIUM WALLICHII.

THIS fine species of Elk's-horn Fern was first published by Sir W. J. Hooker in our volume for 1858 (p. 764). The plant had about that time been imported from Moulmein, and was producing its fertile fronds both in the collection of Lady Dorothy Nevill and of Messrs. Veitch. It appears to have continued till now a rare species in gardens. Mr. Williams, of Holloway, in whose collection the accompanying sketch (fig. 12) has been made, has, however, again imported it, and as it is an extremely elegant plant, and perfectly distinct, we may hope that it will become more widely spread than has hitherto been the case.

It is, of course, a stove Fern, with very much the general habit and character of *P. grande*; that is to say, having the sterile fronds erect, with copious dichotomous segments, while the fertile ones, which are also dichotomously divided into much more elongated segments, are drooping. The contour of the

entire plant, as will be seen from the woodcut of it, is most elegant. The Moulmein *P. Wallichii* differs from its ally above-named in the character of the sorus or broad patch of spore-cases, which in *P. grande* is solitary on the frond, and occupies a broad, ovoid-reniform space in the upper edge of the disc, in the axis between the two dichotomously parted branches of which it is composed; while in *P. Wallichii* there are two sorus to each frond, the frond being first biparted, and then each division bearing a roundish sorus on a projecting lobe in the sinus between its two branches. Thus, in *P. grande* the fructification occupies the solitary primary sinus near the base of the frond, while in *P. Wallichii* the primary sinus is barren, and the sorus occupies the two secondary sinuses instead. The Rev. C. Parish, by whom specimens were sent to England, describes the fertile fronds as varying from 1 foot to 2 feet 4 inches in length, the plant producing two fronds each hot season, one falling towards the right, the other towards the left. In *P. bifrons*, another species of the same group, the siformous patch occupies a distinct, stalked, scutiform disc, occupying the sinus of the basal fork of the fertile fronds. *T. M.*

NEW VEGETABLES OF 1874.

OF new vegetables brought under our notice during the past year, the list is not a very extended one. This is partly owing, no doubt, to the extremely unpropitious character of the season, which, especially during the early spring and summer months, was very trying to the vegetable classes. The great cold of May, with the succeeding great drought, almost totally ruined the Pea crop, and greatly injured many others. Of new Peas, therefore, of which in some previous years we have had such an *embarras de richesses*—the difficulty being to select the most deserving—we have this season but few aspirants. True, our great and indefatigable seedsmen present us with about the usual quantity of new names, which as a rule may be taken to represent carefully selected stocks of the most approved forms, and in this way they may be quite as valuable to the grower as though quite new and distinct. As examples of these we may note Sutton's Bijou, of the Little Gem type; Duchess of Edinburgh, and Young's Nonsuch, of the Ne Plus Ultra character; also Duke of Connaught. Of a new form, some what in the character of Laxton's seedlings (Dr. Hogg type), we have Carter's Commander-in-Chief, and a very good sort. The greatest novelty is that called Sutton's Giant Emerald Marrow. This is said to be a marrow Pea, having the peculiar non-glaucous or glabrous green foliage of the old Dancetto Rival (Emerald Gem).

Broad Beans were introduced to our notice somewhat prominently by the trials of the Fruit Committee at Chiswick. In this class a very remarkable variety comes forward, although not exactly new, having been for some time known to our seedsmen, but, from the difficulty of obtaining seed, never introduced to the public. We allude to the Seville Long Pod of Messrs. Vilmorin. This is earlier by some two or three days in coming fit to gather, and produces very long pods, but it is not a heavy cropper. It will prove a most desirable variety to cultivate for very early work and for exhibition purposes. Of other good Broad Beans, Carter's Mammoth Long Pod, and Hardy's Pedigree Windsor (a sort of intermediate form between the Windsor and Long Pod), merit our attention. As a desirable variety to cultivate we may mention Beck's Dwarf Green Gem, and, as a highly effective decorative plant, the old Red-Blossomed.

Kidney Beans were, on account of the dry, cold season, a very unsatisfactory crop. Of Runners, Dean's Exhibition Runner is a very fine selected stock of the old white Dutch or white-seeded Scarlet Runner. Of Parsleys, we have a singularly pretty variety in Carter's Fern-leaved, the leaves being finely cut, and not curled, as in the more ordinary forms.

Celeries next invite our attention. We last season remarked upon the general excellence of Leicester Red, and this season have to confirm it. It may be said to be identical with Major Clarke's. Of the same type we have Wright's Improved Grove Red, but producing somewhat shorter and stouter heads. Carter's Incomparable Crimson may be described as a fine dwarf red sort. Of white varieties Wright's Grove White is an excellent sort, of the same type as the Grove Red or Leicester Red. Another excellent white Celery will be found in Veitch's Solid White, the leaves of which are very distinctly cut.

Amongst the Brassica tribe there is not much to notice. Messrs. Hurst offer us a new Broccoli, named King of the Broccolis, but of which we have no information. Messrs. Harrison offer us Savoy King Koffee, a selection of the Gem type, a very excellent one in Savoys, the plants occupying little space but producing a large quantity of eatable matter. In Onions there is not much to notify. Messrs. Cuthush brought forward a very promising sort, named Oscar, apparently selected from the White Globe, but having the reputation of being a better keeper. Cantello's Prize is another sort, recommended as larger and superior to the Reading or White Spanish. In Cucumbers, Daniels' Duke of Edinburgh has many believers. It is of the character of Marquis of Lorne, and to those who like big Cucumbers it may be welcome; and Messrs. Sutton offer us another, named Duke of Connaught—the Royal Dukes, &c., being seemingly in favour just now for Cucumber nomenclature. In Tomatos we have one decided gain in Carter's Green Gage, a pretty, round, golden-yellow fruited sort. Why, in the name of all Tomatos we would ask, should this be called Green? A more misleading name as to the true character of

the Americans. Of this year's introductions we would first especially note Snowflake. The tubers of this are of a long ovate form, the eyes very full, skin rough pale straw, the most handsomely formed of all, and of excellent quality. Another acquisition will be found in Bliss' Dwarf White, now named Alpha, which is a round form, and one of the very earliest. Mr. Farquhar, of Fyvie Castle, Aberdeen, gives us another, evidently of American origin, named Early Dimnick. This is a second early, and a great cropper; the tubers are large and of fine quality. Our English raisers are not behindhand either, Messrs. Cattell bringing forward no less than three new kidney varieties, Eclipse, Reliance, and Advancer—the first named being a particularly fine sort, of very fine quality. The great English Potato King, Mr. Fenn, has been working more quietly at home this past season. Doubtful, the prettiest red kidney in cultivation, is the only one that comes out from his store. We have inspected many seedlings of exceeding promise, but which, being yet unnamed, we have no means of identifying; and thus we close our record of the gains of the past year with much cause for thankfulness, showing, as they do, that the gardening of

is the fact that scarcely any double flowers are staged at the spring exhibitions, besides which no new varieties of any note have been brought out during the past two years. [Much more to the fact that few or none of the doubles produce close symmetrical spikes. EDS.] Hyacinths for bedding, although largely in demand, have not exceeded last season's sales; the continuance of the frost is in a great measure the cause of this. As in all cases the quality of the bulbs was above the average, the prospects of blooming are very hopeful.

Tulips present scarcely any variation compared with last year's sales; the large demand for the popular bedding varieties still continues, despite the high prices, which a temporary scarcity renders necessary.

Narcissi.—A considerable increase in the demand for these showy flowers has taken the place of the steady decline visible during the past four years; the Polyanthus varieties have been especially in request.

Crocus.—Sales have not been above the average; the heavy rains in October and the early frost are doubtless the cause of this.

Snowdrops, owing to the prevalence of a disease amongst them, were very scarce; the demand has far exceeded the supply.

Miscellaneous articles generally have met with a fair share of public favour; they are too numerous to be particularised.

One of the most striking features connected with the season has been the very unusual demand for bulbs producing white flowers. Lily of the Valley, Hoteia japonica, white Roman Hyacinths, and everything else that will force easily, have been quite at a premium.

The spring exhibitions have already been fully commented upon in your columns, and some good hints were thrown out by several of your correspondents at the time, which I trust have not been lost upon those who have had the compilation of the schedules for the forthcoming displays. I should like to see some good prizes offered for new varieties of Tulips, with a view to the introduction of something new in colour, combined with adaptability for forcing.

Taken as a whole the season must be considered very satisfactory. It affords ample evidence of the growing taste for the beautiful, and at the same time the audacious desire to bridge over the gulf that has, until very lately, separated the last floral beauties of autumn and the first bright flowers of early summer. Doubtless ere long we shall have our gardens bright and beautiful "all the year round;" raisers and growers will combine and do their best to direct the forces of Nature into the requisite channels, and winter, instead of being a state and time of absolute lethargy and barrenness, will be the time for Nature to put on a new and varied robe, none the less cheering and beautiful because it differs from the gorgeous mantle which is her summer garb. S. B. D.

THE ROYAL NURSERIES, ASCOT.

(Continued from p. 44.)

THE Rose-house, 60 feet by 15, at the time of my visit—the middle of November—was filled with plants for winter flowering. Instead of using a number of varieties, but very few find a place here, and these such as are found to best answer the purpose by producing the greatest number of blooms of the most desirable colours and shape. Full-blown Roses are here useless, the long-shaped, close, half-opened buds are what is required. Teas are principally used, and amongst them Niphetos stands at the top, white or straw-coloured, free-flowering, and a vigorous grower; Madame Falcot, yellow, fine, and a good grower; Monsieur Furtado, sulphur, fine, and fine; Souvenir d'Elize Vardon, white, with pale yellow centre, one of the best forcers; Devonensis, Boule de Neige, H. P., pure white, stout petals and good habit, and not subject to mildew [this is not our experience out-of-doors]; Madame Lacharme, H. P., white, shading to rose, a fine forcing sort. The above are the kinds principally used, most of them on their own roots. Fairy Roses are also largely employed in the bud.

Adjoining is a 55 feet by 15 lean-to house, with a north aspect, filled with Camellias—many of which were planted out—mostly white sorts, a dozen of which are wanted for one coloured flower. The inside of the glass was slightly smeared with white paint, which in a house of this description and so placed is all the shade required. The next is a narrow house, 50 feet by 12, in which, amongst other things of a mixed description, were a number of moderate-sized plants in pots of *Avatia's* eboldii, in full bloom, bearing very large panicles of white flowers a foot or more in length; they will last for a month, in which state it is one of the best autumn conservatory sub-

FIG. 12.—PLATYCODON WALLICHI.

the fruit could not well be found. As to quality it is said to be amongst Tomatos what the Green Gage is amongst Plums, and no better recommendation is required. It is a most prolific bearer. To Messrs. Vilmorin we are indebted for another new Tomato, the striped fruited; this is interesting as a curiosity, the fruits otherwise being of the ordinary type.

In Potatos the commonest, yet withal the most important of the vegetable classes that come directly under the control of the gardener, we have again to notice some very important additions. It is not many years ago since our American cousins introduced us to the first of their wonderful Taters, and just see what a revolution they have caused! On the exhibition tables frequently no other than American varieties are to be found. They are unmistakably great croppers, and of fine taking appearance. We cannot say that in point of quality they are always so superior, yet we can say from personal experience that some of the best Potatos we tasted during the past season were of the American sorts. In rich heavy lands they are, as a rule, of inferior quality, but on light lands, and in dry seasons like the past, these free-growing great cropping Potatos are of the utmost value, a good crop being secured where such as the Ashleaf, Lapstone, and Regents would be very poor. We dislike a crop of small Potatos nearly as much as a crop of coarse tubers—a good word, therefore, for

the present day is not at a standstill, but, as in the past, ever on the march forward.

THE BULB SEASON OF 1874.

In taking a brief glance at the bulb season just closed we are better able to arrive at correct ideas respecting the extent of its transactions than has been the case for some years past. If the weather keeps open bulbs will be wanted as late as February, but when the frost sets in the bulb trade closes, and this year has been no exception to the general rule. As we have before remarked, the financial condition of the country influences the demand for bulbs in a much larger degree than it does the other requisites of floricultural display; and, as there have not been any startling additions to commercial prosperity during the year just closed, neither has there been any largely increased demand for these spring-flowering luxuries.

Taking the principal bulbs *seriatim*, and beginning, as the catalogues generally do, with *Hyacinths*, we have to record a very good demand for the named varieties, especially those with white flowers. The sale of single sorts has largely increased, while that of the doubles shows a considerable decrease. This latter circumstance owes its existence in some measure

jects. As a room plant it has few equals; even in a town it will bear the confinement of a hall for months with comparatively little light; altogether it is one of the most useful plants grown.

From this we enter a house, 55 feet by 20, the centre stage filled with *Heaths*, *Droacophyllums*, *Hedaras*, *Eparises*, *Kennedy* *ovata* alba, and hundreds of *Calla* (*Richardia*) *ethiopia*, for flowering at Christmas; double *Pelargoniums*, a small-flowered crimson coloured variety named Major Trevor Clarke, and the white-bloomed *National*.

The next house, 55 feet by 20, was filled with *Tea Roses* that had not been pruned, but brought in to open their already formed buds. Many of these were large plants, and all elevated up to the glass. Interspersed amongst the *Roses* on the side stages were quantities of the white-flowered miniature plant *Oldenlandia Deppena*, which can be had in bloom all the year round by keeping it in a little heat through the winter.

After these are a number of low, long, narrow houses. The first of which is 75 feet by 10. In it were 20 Carnation Miss Jolliffe, a very dwarf, free-flowering variety; colour pale pink. The plants are struck in May, moved on during the summer into 7-inch pots, and in this size kept. Through the winter they receive a little warmth and air, and are kept close to the glass. They produce on an average during the winter fifty flowers each. Some of the spikes had on them a dozen blooms in different stages. The following April they are put into pots 3 inches larger in size, and are grown through the summer, and bloom the following winter, after which they are destroyed, getting too hard to flower freely. The blooms of this variety are in great demand. It is a very dwarf, stout grower. *La Belle* is considered here the best white, *Prince of Orange* and *Ascot Yellow* the best yellows. *Garibaldi* and *Dragon*, fine red sorts, are also grown in quantity.

From this we come to another house, 75 feet by 10, filled with winter-flowering *Pelargoniums*. The sorts principally grown are the red variety, *Brilliant*, *Major C. Keeler*, *mitis* White, and *Alba* plain. Adjoining is another long narrow house, 75 feet by 10, in which were *Azaleas* and a quantity of the elegant drooping white-flowered *Cytisus filipes* grafted on the common *Laburnum*, 3 feet high. So grown it makes a most charming decorative plant. Amongst the *Azaleas* were a number of the white variety, *Reine de Portugal*; it is a later sort, that succeeds A. Borsig. The roof of this house is covered with *Marcbala* *Rose*. The next house, 75 feet by 12, was filled with *Adiantum cuneatum*, in 6-inch pots.

Near to this, in course of erection, is a lean-to house, 120 feet by 12, for *Camellias*. This has a northern aspect, not, as might be supposed, erected against an existing wall, but altogether built facing this direction, simply on account of such being found the best for *Camellias*; this is a circumstance that should not be lost sight of by growers of these plants—all the houses here devoted to their culture being of a like disposition with this aspect.

In front of and adjoining these houses are some long narrow pits, one of which was filled with the miniature *Myrtle*, *Jenny Reitenbach*; it is a small but apparently very free grower; the plants struck last May were completely covered with flower-buds from top to bottom.

In others were *Neapolitan Violets* and *Cyclamens*. Here also is the pit used for *Tuberoses*; this is a plant that many private growers do not succeed well with. The pit they are here grown in is sunk some 3 feet below the ground level. The wall is pigeon-holed from the bottom up to the level, and then carried up solid some 2 feet higher. In this the bulbs are plunged; round the outside is a 3 feet cavity, formed by an outer wall, this is kept filled with fermenting material: by this means the bulbs can be supplied with a gentle bottom-heat, and the surface kept comparatively cool by giving it liberally, the object being to induce rotaction before top-growth commences. Water is withheld until they have formed roots freely and begun to grow, after which they will bear more heat and moisture.

We now come to some houses in which are grown *Bouvardias*, the flowers of which are so much in demand for bouquet-making. The first of these is 80 feet by 15. In this house was the free-flowering *B. Vreelandii*, *B. jasminiflora*, and *Humboldtii* *combylandii*, *B. jasminiflora*, and *Humboldtii* *combylandii*, the best variety in cultivation. It is an excellent grower, deliciously scented, and a continuous bloomer; the flowers are as large as the old *B. Humboldtii*, and produced in bunches of a dozen. The individual blooms are 3 inches long in the tube; they are used singly, to stand above and relieve the even surface of bouquets, and for this purpose a pair which is pushed down the inside of a wire, and the stalk of the flower fastened to it; this is to keep them in their wanted position, and to prevent their falling over. In this house were over 2000 plants in fine health; they are kept near the glass, and moderate stove-heat is used all through the winter, without which they do not bloom

freely. The adjoining house is 80 feet by 10, also filled with *Bouvardias*, many of which were the American pink variety, *Bride*. The above four sorts are the best in cultivation, and, where fragrant flowers are continuously in demand, are indispensable. The path of this, as most of the other houses (which are all span-roofed, unless where stated to the contrary), runs down the centre; here it is composed of trellis-work, beneath the immense quantities of *Lily* of the Valley forced, than which in London there is no dower in greater demand. This pit is filled with dung and leaves. Fifteen selected roots of the *Lily* are placed in a 48-pot and plunged 6 inches over-head in the fermenting material, which is kept up to 85°. Here they stop eight days, in which time the tops make 2 inches of growth; they are then removed to the next house, which is 75 feet by 10, and is one of four used in spring for propagating. The path runs down the centre. On one side is a stage running the whole length, on the other is a pit filled up in the usual way with lights; in this the *Lilies* are plunged in dung and leaves. Here they are kept for seven or eight days, and air given, the first two or three days they are slightly shaded if the weather is bright; they are then moved to the stage at the opposite side of the path, where they are very soon ready for cutting—the house all the same being kept up to 85° at night. The first are ready by the end of November, and for this earliest work the roots are procured from Germany; their earlier matured growth permits of their being forced before the Dutch-grown roots. In this house were 800 newly-grafted plants of the fine new *Azalea Sigismund Rucker*, and a quantity of *Cyperus luteus*, a good decorative plant for use in vases and similar purposes.

Another of these propagating-houses, 80 feet by 10, was filled with *Poinsettias*. The old stools, when they have started about the end of May, are planted on a pit up to 3 feet of dung and leaves. By the end of August they have made very strong growth, these are half cut through with a sharp knife 3 inches below the top of the shoots; in eight days the remaining portion is cut through; each is then placed singly in a 60-sized pot, and moved into the propagating-house, and as soon as rooted it is transferred to the stove, and kept there until it flowers, some being placed in a cooler temperature for succession. If any of the plants have an appearance of getting too high they are slightly cut through, allowed to remain for a time, then cut again, and struck, after which they make beautiful dwarf plants, flowering when not more than 8 inches or a foot high.

Another propagating house is 75 feet by 12—one side of it was filled with double white *Primulas*. This is far more useful for cutting than the single varieties, the flowers standing so much better, yet it is a plant that gardeners frequently find a difficulty in managing, through its disposition to damp off at the collar, this generally occurring through a mistake in its cultivation of leaving a portion of the stem bare above the soil, in which state it is almost certain to rot off. The way it is here treated is, in the spring, when moving into larger pots, to sink each plant down so that the soil comes up amongst the bottom leaves: so treated it roots freely, and will quickly break up small crowns, which are divided and potted singly, keeping them well down. Here also were a quantity of *Camellia* stocks for working and grafted *Rhododendrons*. This brings us to another 75 feet by 12 house, in which was a quantity of *Pelargonium album plenum*, and the new white variety, *Ascotensis*—a sort that is expected to do good service for cutting on account of the length of time the flowers stand. Here also were numbers of the Japanese *Acers*, and the large and continuous flowering *Abutilon Boule de Neige*. In the next house, similar in size to the last, was a quantity of grafted plants of the variegated Japanese *Daphne*, quite hardy, and as fragrant as *D. indica*, and many hundreds of newly struck *Hydrangeas*.

This leads to another house, 40 feet by 12, in which were winter flowering *Orchids*, such as *Odontoglossum pulchellum*, *Ceoloyne cristata*, *Dendrobium nobile*, and *Cypripedium insigne*, *Tuberose*, *Adiantum pubescens* and *Selaginellas*; the roof covered with *Stephanotis*.

The next is a retarding house, and was filled with climbers in pots in quantity, such as *Tacsonia Van Volxemi*, *Clematis indivisa*, *Rhynchospermum jasminoides*, &c. The adjoining house, 70 feet by 12, was occupied with *Adiantum cuneatum*, *Isolepis gracilis*, *Lomaria gibba*, *Ficus elastica*, and dwarf *Palms*.

We now enter another (70 feet by 12) retarding house, occupied for the time being with *Hymenophyllum flexuosum*, *demissum*, &c.; *Tichomanes radicans*, *Lomatia elegansissim*, a Fern-like hard-wooded *Protea*, with most elegant leaves, and a single pink-flowered *Azalea linearis*, as unlike an *Azalea* as anything could be imagined—the petals of its numerous flowers (produced in bunches of a dozen together) being much more like a Japanese *Chrysanthemum*; it is used for lightening up the surface of bouquets. Here also was the beautiful new evergreen shrub, *Azara microphylla*, which, should it

turn out quite hardy, will be one of the finest plants in cultivation for covering walls; the new *Stauntonia hexaphylla*, said to be a good conservatory plant, producing very ornamental fruit; the fine blooming *Nerine Fothergillii*, a plant not nearly so well known or so often met with as it should be—a much finer thing than the *Guernsey Lily*, the flowers deep crimson, which are produced freely.

Near this are eight pits, each 50 feet in length, which are filled with *Cinerarias*, the white *Pink Lady* *Blanche*, *Aralla Siedolii*, *Tea* *Roses*, *Veronica salicifolia*, *Azalea amoena*, the harder varieties of *Palms*, *Japanese Maples*, and *Desfontainia spinosa*. Two other pits, each 45 feet long, complete the glass erections; these are warmed from the boiler that heats the *Gardenia* houses, and are used for forcing things that do not require so much heat as these.

From this notice, which has endeavoured to make as clear as possible, it will be seen that Mr. Standish keeps no secrets as to the manipulation and general cultivation of the large quantities of plants here grown for general decoration, and especially for the production of cut flowers. Although for the latter the number of different things employed may appear small, yet they comprise nearly all that are in general request in the London flower trade, and convey some idea of the present fashion in these matters. As will be seen, the prevailing colour in demand is white, nine-tenths of the whole being of that colour, with a little blue, pink, and red, although it frequently happens that some particular flower is required—even such things as half-pipe *Blackberries* have been specially stipulated for as forming part of a bridal bouquet.

In the outside nursery *Rhododendrons* are largely grown, as also deciduous and evergreen trees, and shrubs, *Conifers*, fruit trees, *Roses*, and general nursery stock. *T. Baines*.

EUCHARIS AMAZONICA.

THE illustration (fig. 13) gives a view of the interior of the *Eucharis*-house in the gardens of the Duke of Westminster, at Eaton Hall, Chester, taken from a photograph kindly sent us by Mr. Selwood. As regards the contents of the house, the illustration speaks for itself; but we may mention that at Eaton Hall there are three houses devoted entirely to the culture of *Eucharis* and *Pancratium*. One has just done flowering, the second is now coming into perfection, and will be followed in turn by the third. The first house will be full of flowers again in April and September, and so on in rotation.

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

(Continued from p. 9.)

II.—ON THE WAY IN WHICH THE DISTRIBUTION OF SEA AND LAND INFLUENCES THE DISTRIBUTION OF HEAT.

It is estimated that at least a third of the heat of a vertical sunbeam is absorbed in traversing a cloudless atmosphere before it reaches sea level. The more obliquely the beam is received at any point of the earth's surface the greater is the proportion of the heat that is lost. The remainder is absorbed in the air, and although it helps to keep up the general temperature, its effect is to a great extent lost in the upper regions. If there be any haziness or cloud in the air, the effect of the sunbeam on the earth's surface is lessened. In a cloudy sky nearly the whole effect of the sun's heat is spent in warming the air and evaporating the clouds. From this it results that the heat which any tract of country gets depends largely upon the habitual cloudiness or clearness of its atmosphere. Out of 197,000,000 square miles of the earth's surface, 145,000,000 are at the present time taken up by sea, leaving only 52,000,000, or rather more than a third, for the land. Heat acts upon land and water in very different ways. Upon the land the surface in a hot sun becomes intensely heated, but the heat does not penetrate far below the surface, and is not stored up for future use. In Britain the extremes of temperature during the year, which in the air in the shade show a difference of 70°, 80°, or even 90°, are, at 3 feet below the surface, not more than 15° or 20° apart, at 25 feet only 3° or 4°, and at a depth of 50 feet are reduced to nothing. But the heat which falls upon the sea is differently treated. It penetrates the surface to a moderate depth, and is absorbed internally. Water is eminently a non-conductor of heat, so that what is received into its substance is diffused again mainly by agitation, and as this, however violent at the surface, diminishes fast as we sink downwards, the heating-up of a great body of water is a slow process. At a cer-

tain depth, varying with latitude, the sea is at a uniform temperature of 39° all through the world. At the equator this temperature is reached at a depth of 7200 feet. Rising in level gradually it reaches the surface in latitude 56°, the parallel of the Shetland Islands, and there, superficial currents apart, the sea is of a uniform temperature at all depths. Going towards the poles this isotherm of 39° sinks again below the surface, and at the arctic circle has already reached again a depth of 7000 feet. So that taking the 56th parallel of latitude in both hemispheres as a boundary line, the sea is divided into three basins—one equatorial, in which the temperature falls from above to below, and two polar basins, in which the temperature rises as we descend. The average general temperature of the superficial sea at any parallel of latitude does not differ appreciably from

tions, in moderating alike the cold of winter and the heat of summer. In this way we get the climates of the temperate zone separated into two classes—insular climates, marked by a comparatively small difference between winter and summer (or, as it is called in technical meteorology, a small hiberno-estival variation), and continental climates, in which terrestrial radiation has full sway in both directions, and the difference between summer and winter is large. The influence of nearness to a large mass of ocean is modified by the habitual cloudiness or clearness of the atmosphere of the country, and by the prevalent direction of the wind; but, as the same nearness to the sea which cuts off the extremes of temperature tends also to produce cloudiness, this does not much affect the actual result. Britain furnishes a typical illustration of an insular climate, and there is even an

ance between January and July 54°. At Montreal the annual average is 44°, and the difference between January and July 52°. On the north-west shores of Hudson's Bay the annual average is 11°, and the difference between January and July 70°. At Yakutsk, where in the heat of the great Asiatic continent occurs the most extreme case of a continental climate that is known, the difference between January and July is said to rise to 100°. We have examples of climates neither characteristically insular nor continental in Spain, France, and Palestine. South of the tropic of Capricorn there are only 4,000,000 of square miles of land, against 28,000,000 north of the tropic of Cancer, and, as in the southern hemisphere the land is cut up into three pieces, the difference between insular and continental climates has little scope to operate in the south temperate zone; but in the north temperate zone it amounts to this—that whilst in the insular climates the coldest month of the

FIG. 13.—EUCHARIS HOUSE AT EATON HALL, THE SEAT OF THE DUKE OF WESTMINSTER.

that of the annual average of the air in the shade at the same place. At the equator it is scarcely ever known to rise above 85° in the day and to sink below 83° in the night. As we advance into the temperate zone, where there is a great difference between the heat of the air at different seasons, the sea exercises an important influence. It absorbs heat during the day and gives it off during the night. It absorbs heat during the summer, and gives it out during the winter, and thus lowers the temperature of the summer and raises that of the winter in its neighbourhood. It was found from a series of observations made by Dr. Cooke at Scarborough during 1853-4 that the average temperature of the sea was 5½° above that of the air in the shade in December, that it was 7° below it in July and August, and that the two were upon an equality at the end of October and the end of February. We find that, in actual practice on a broad scale, the sea exercises a very important influence in cutting off the extremes of temperature in both direc-

appreciable difference in the annual range of temperature between the west side of the island, which is nearest the great mass of the Atlantic, and the eastern counties, which are nearest the European continent and comparatively small German Ocean. In Cornwall, Devonshire, and the west of Ireland, the annual temperature is 51°-52°, the difference between January and July, 20°-21°, and between the average of the three months of summer and the three months of winter, 14°-15°. At Greenwich the annual average is 49°, the difference between January and July 25°, and between summer and winter, 20°. In the northern island of New Zealand the annual average is 52°, and the difference between January and July 14°. At Cape Town the annual average is 59°, and the difference between January and July 16°. But take a tract in the interior of one of the great continents, and mark the difference: at St. Petersburg the annual average is 38½°, and the difference between the three months of summer and the three months of winter 46°. At Moscow the annual average is 39°, and the differ-

year falls only 8° or 10° below the annual average, and the warmest month rises only 8° or 10° above it, in the continental type of climate the difference amounts to 25°, 30°, or even 40° or 50° in each direction.

These are all average temperatures in the shade; but there is another point which it is important for us to consider in this connection, and that is the influence which the sea exerts in cutting off those extreme falls of temperature in winter which are so harmful to plant life. To take an illustration from England, it was found that during the exceptionally cold night of the Christmas of 1860 the thermometer sunk at Helston to 32°, at Ventnor to 24°, at Scarborough and Liverpool to 16°, at Whitby to 10°, at Shields to 6½°; but inland, at Wakefield, to 2° below zero, at Manchester to 3° below zero, at York to 4° below zero, and at Nottingham to 8° below zero. Here the mitigating influence of nearness to the sea is found to be considerable, but it does not seem to extend more than a few miles inland.

The following list, the figures in which represent monthly average temperatures at sea level, will give

an idea of the heat of the world, as influenced by latitude and nearness to the great ocean masses :-

	Latitude.	January.	July.	Difference between the two.
<i>Torrid or Tropical Zone.</i>				
Nubia	17-23	68	90	22
Gold Coast .. .	5	77	77	0

THE PAPYRUS.

(CYPERUS PAPYRUS, LINN.)

PROBABLY few persons in this country are prepared to regard the Papyrus as a European plant, yet it has long been known to occur in many parts of Sicily, and it is more than likely that it is from this source rather than from the East that the specimens in various botanic gardens have been ultimately derived.

The illustration (fig. 14, on p. 81) is copied from a photograph, taken on the Anapo River, near Syracuse, for the use of which the *Gardeners' Chronicle* is indebted to the kindness of my friend, Mr. E. R. Lankester, Fellow of Exeter College, Oxford.

The following description, written by E. O. Fenzl a few years ago (*Gardeners' Chronicle*, 1870, p. 314), gives a vivid impression of the beauty of the river with its banks clothed with Papyrus thickets :-

"Starting from Syracuse in a small boat, I crossed the magnificent harbour which bears its name, from the mouth of the Anapo. . . . Winding up the course, which slowly carried to the sea a large volume of excellent water, I soon reached the confluence of the Cyane stream. . . . Gliding more than rowing on the deep blue water I arrived where the stream, widening into deep marshes, is covered as far as the eye can reach with dense bushes of Papyrus. Nothing can equal the elegance of these plants, their roots drowned in the tepid water which slightly agitates the feathery foliage which crowns their slender stems.

"The Papyrus grows here to the height of from 12 to 15 feet, and under such a favoured climate new suckers are continually growing up to take the place of the older stems, which may be either broken by the wind or exhausted after their seeding."

In Sicily, according to Parlatores (*Mem. presentis par divers Savants*, tom. xii.), the Papyrus is now only found on the eastern side of the island, namely, at Syracuse and Milili, a place at no great distance, along the Cantara River, on the northern side of Etna, and at Spaccaforno, the extreme southern angle. Formerly it grew at Palermo, in the small lakes formed by a little stream, which derived from it the name of Papiroto. Numerous writers mention Calabria also as a locality on the mainland, but Parlatores finds no corroborative evidence to confirm this state-

ment, which seems to have originated with Micheli. According to Strabo it grew on Lake Trasemene, near Perugia, but some other Cyperaceous plant is supposed to have been confused with it.

Parlatores has endeavoured to show that, while the Sicilian plant was identical with that which occurs in Syria, it was distinct from the true Papyrus of the Nile. This view has not gained general acceptance among botanists, and it is difficult to resist the conclusion arrived at by Professor Oliver, that "the alleged differences are trivial and inconstant" (*Kew Gardeners' Guide*, 25th ed., p. 21). They mainly, indeed, consist in claiming for what may be called the Mediterranean plant (*Cyperus syriacus*, Parl.), a spreading inflorescence like a mop, with very short linear leaflets (bracteoles) subtending the spikelets; and, in contradistinction, for the Nile plant (*Cyperus Papyrus*, Parl.), a close besom-like inflorescence, with very long bracteoles, which are also more numerous.

As, however, in very many other cases, these characters began to break down when applied to a large series of specimens. Parlatores supposed that the Syrian plant was distinct from the Egyptian. He had only seen the plant from near the coast (Jaffa). Bruce had found it on the upper waters of the Jordan, and had identified it there with the plant he had found in Abyssinia (*Travels*, vol. 1, p. 113). This was also the conclusion adopted by Professor Babington in a communication to the Cambridge Philosophical Society (February 26, 1866). He stated that the Papyrus of the plain of Genesaret and of the marshes of Huleh, by the Lake Merom in the north of Palestine, is not the plant found at Syracuse and on the coast of Palestine, but is identical with that which grows in an extensive swamp or shallow lake connected with the White Nile, at about the seventh degree of north latitude. These identifications are also accepted by Tristram in his *Natural History of the Bible*, pp. 433, 434.

No doubt some differences of habit will, as in every other plant, be produced by differences in the local conditions of growth. The way in which the Papyrus grows at Huleh is very remarkable. An account of it, from which the following particulars are extracted, was given by Macgregor in the *Illustrated London News* (April 24, 1869).

Three rivers, each born full grown—the Hasbany, the Leddan, and the Banias—converge in the plain of Huleh and unite in a small lake, called in the Bible 'the waters of Merom.' The Leddan spreads almost at its birth into a hundred streams and gets lost. The Banias and Hasbany unite to form a stream which runs south about 3 miles and then spreads into a morass. "On this is a vast floating forest of Papyrus and cane, perfectly dark inside. I could never penetrate more than 3 feet. . . . Many of the stalks of the Papyrus are as thick as my arm. The water is very fetid below and over the spongy mass, and there is a most pestilential odour, which is increased by evaporation. This impassable barrier is about a mile wide."

Of course the significance of the geographical distribution of the two forms of Papyrus is altogether destroyed when we find ourselves forced to admit that both occur in Syria, and to abandon Parlatores' view that the Nile Papyrus was essentially a tropical plant; and the *à priori* probability of their being really distinct is still further diminished, when we agree with Parlatores that it was introduced from Syria into Sicily not earlier than the tenth century. His reason for this belief is that, while the Syrian Papyrus is mentioned by Theophrastus and other classical writers, the Sicilian Papyrus is never noticed in literature till the travels of Abn-Haualc, an Arab, who made a voyage to Palermo in the tenth century. Ovid, in his *Melamorphoses*, speaks of Cyane, where the Papyrus is now so abundant, but he is silent about the Papyrus itself. However, this may be a mere coincidence of the series of specimens from Sicily in the Kew Herbarium show conclusively that the length of the bracteoles is extremely variable, and that, trusting to that character, both species might be identified from Sicily as well as from Syria. African specimens, on the other hand, show that the mop-headed inflorescence is by no means wanting in them, so that, trusting to that character, both species might be identified in Africa. It may be doubtful what degree of certainty should be attached to the drawings illustrating Sir Samuel Baker's recent book, *Zambia*, but it is noteworthy that wherever the Papyrus is introduced it is always with a mop-headed inflorescence like that attributed by Parlatores exclusively to *Cyperus syriacus* (see, for example, the view of the White Nile, facing p. 189 in vol. i.). It is extremely probable that the difference in the spread of the heads seen in the series of specimens from Sicily is due largely due to the age and maturity of the particular specimens. As, therefore, the two forms everywhere seem to co-exist, the presumption is that they are not really distinct, and that the Papyrus of the Nile, of Syria, and of Sicily, are all one and the same species. I may also say that I have found more than three bracteoles to the rays in a Sicilian specimen.

The Papyrus was first cultivated in a botanic garden

by Casalpino, who introduced it to Pisa from Sicily. Lobel saw it here and identified it with the plant described by Theophrastus and Pliny (*Adversaria nova*, 1576, p. 38). He gives a figure with besom-like heads, which, however, it is tolerably certain must have been taken from the Sicilian plant, notwithstanding that he describes it as Papyrus nilotica. This figure was copied by Mathioli, Bauhin, and other botanists of the sixteenth century. Parlatores thinks that the Sicilian plant has done duty in all the botanical gardens of Europe for the Egyptian. If his views were well founded all the cultivated plants should have short bracteoles. Lamarck, however, expressly states (in the *Encyclopédie méthodique*) that the form in cultivation in his time at the Jardin des Plantes had the bracteoles longer than the rays of the umbel.

In Africa the Papyrus probably forms a characteristic member of the Tropical African flora. It was found on the White Nile, as already stated, by Bruce, and there are in the Kew Herbarium specimens collected in 9° 50' N. lat. by Petherick. In Hooker's *Niger Flora*, p. 551, it is stated to be "very abundant on the banks of the Lagos, a river near Accra (Dahome), also near the Niger, by Barter." These are also specimens taken at Kew from the Congo, and, what is remarkable, an extension of its range, from Delagoa Bay, collected by Forbes.

Pliny describes the Papyrus as a plant of the Euphrates Valley, and Guilandini corroborates him, but whether the true plant grows there or not still appears to remain in doubt. From the remarkable but well-known fact that the Lotus (Nelumbium) has disappeared from the whole Nilotic region within historic times, and that the Papyrus is not found beyond 9° N. lat. Schweinfurth arrives at the conclusion (*Bull. de l'Inst. Egypt.*, Dec. 19, 1872) that the climate of Egypt has lost the characteristic features which formerly united it with that of tropical Africa, and that the natural productions of the country have gradually become more northern.

This is not strictly accurate, even as to the range, for Bruce found the Papyrus at Lake Zana in Abyssinia, in 12° N. lat. It is hardly credible that Egypt should have ceased to be able to support a plant which flourishes in Sicily and Syria. It seems much more probable that both it and the Nelumbium never were indigenous to Egypt proper, but that the Papyrus was introduced from Nubia and cultivated. The reason of its disappearance is probably to be sought, not in any change of climate, but in the physical conditions of the river—perhaps the periodical rise and fall of its waters—not enabling it to hold its ground without human intervention.

The earliest figures of the Egyptian Papyrus is that given by Prosper Alpinus, 1606 (*De Plantis Egypti*, p. 111). He simply alludes to it as a plant of the River Nile (*et plantis Juminis Nilii*), and that the Egyptians call it *berda*. Bruce found it in the last century in Lower Egypt. According to Delle it occurred at Damietta, and Savary speaks of it as growing near Lake Menzaleh as well. Bromfield, however, searched there in vain for it (*Letters from Egypt and Syria*, p. 235), and elsewhere (p. 180) "it speaks the rumour of the Papyrus still lingering in the vicinity of Lake Menzaleh, proving it, however, a mistake; another species having been confounded with the true Papyrus of antiquity." M. Figari (quoted by Parlatores) believes this to have been *Cyperus dives*.

Bruce was of opinion that the Papyrus was only an introduced plant in Egypt. It did not appear to him to have been a plant that could have existed in the Nile, or, as authors have said, been proper to it "Its head," he says, "is too heavy, and in a plain country the wind must blow too violent a hold of it. The stalk is small and feeble, and likewise too tall; the root too short and slender to stay it against the violent pressure of the wind and current; therefore, I believe it never could be a plant growing in the Nile itself, or in any very deep and rapid river."

Savary (*Lettres sur l'Egypte*, p. 323) quotes a passage from Strabo, according to which those who had the manufacture of a writing material from Papyrus were careful to restrict its growth to a very few places in Lower Egypt. It is owing to the fact that it was—if this account be true—never allowed to become very plentiful that the way was prepared for its final extinction. It seems probable, therefore, that the Papyrus lingered down to the last century in the marshes of the Nile delta, and is now finally extinct in Lower Egypt. But this fact seems to afford no secure basis for Schweinfurth's generalisation as to a deterioration of the climate.

Du Petit Thouars discovered a *Cyperus* in Madagascar which has been described as a distinct species—*Cyperus madagascariensis*—by Willdenow. It is closely allied to the Papyrus, if indeed it be more than a slight variety of it. The same form also occurs in Mauritius, but is probably naturalised there. This extension of the species is more especially interesting, seeing that the African distribution extends so far south as Delagoa Bay. *W. T. Thistleton Dyer.*

Botanical Notes.

IN the *Faunain of the Linnean Society of Paris*, M. de Lanesan continues his observations on the FORMATION and DISTRIBUTION of the VASCULAR BUNDLES in PLANTS, and succeeds in showing by numerous illustrations that M. Van Tieghem's dictum, that an organ is not to be considered as an independent foliar organ unless it receives directly from the axis a vascular bundle, is subject to too many exceptions to be accepted as axiomatic. On the other hand, it appears to us that M. de Lanesan lays himself open to a similar charge, when he says "that the study of the arrangement of the vascular bundles of the adult plant cannot lead to any result in the determination of the morphological nature of any particular organ."

At a recent meeting of the Linnean Society of Paris, M. Raney called attention to the EXHALATION of WATER from the LEAVES of Amorphophallus Rivieri (figured in *Gardener's Chronicle*, 1873, p. 609). The plant was grown in a pot in a dry room and allowed to suffer for want of water. Water was then supplied abundantly, and after an interval of from two to four hours, all the lobes of the leaves showed near their points a drop of water, which disappeared subsequently as it reabsorbed by the plant. This is analogous with what has been previously observed in another Aroid (Colocasia).

— Professor Eichler, of Kiel, has lately published the first part of a volume on the SYMMETRY of FLOWERS, under the title of *Blüthenadiagramme* (Williams & Norgate). The work is intended to give in a concise form the plan of construction of the flower in the principal natural orders of plants. For each order a diagram is given, showing the disposition and relative position of the several organs. The text contains an explanation of the diagrams, together with other information. We propose on a future occasion to refer at greater length to this volume, which is one of first-rate importance as regards vegetable morphology.

— M. Chabaud, in the *Bulletin of the Central Horticultural Society of France*, records the FRUITING for the second time at Toulon of ENCEPHALARTOS ALTERNIFOLIUS. The flowers were fertilised with the pollen of a species of Macrozamia. Fruits were formed, but no embryo, though the seeds were otherwise perfect. The same absence of embryo characterised the seeds or fruits of Stangeria paradoxa, which fruited some time since in the collection of Mr. Wilson Saunders.

Forestry.

The Russian forest reports, from which we have already given some extracts, contain many interesting paragraphs, from which we select the following:—

The construction of boats and various kinds of river-craft forms an important branch of industry. Every year upwards of 100,000 vessels of different descriptions descend the water-ways of Russia. Very few of them make the return voyage, but are demolished for fuel or building purposes after reaching their destination. More than two million roubles are annually spent on wood for renewing or completing vessels for river navigation. Scotch Pine and Norway Spruce are usually employed for this purpose, but recently, the value of these timbers having increased, the Aspen is used for lining barges, particularly in the Governments of Mohilew and Minsk. Sawing is now done to a great extent by steam. In the Government of Arkangel there are six steam saw-mills solely occupied on Pine timber for exportation to England. About eighty saw-mills are constantly employed cutting out timber for exportation, at least two million trees annually falling for this purpose.

Resinous products are a source of considerable wealth, and in many parts, especially in the Archangel, Volgoda, and Kostroma governments, their collection and preparation is the chief employment of the inhabitants. In the North, where forests are abundant, the trees are drained to death in from ten to fifteen years, in the same wasteful manner practised in the Pine forests of the Landes of Gascony during the last century. The tar, both for home consumption and exportation, is obtained for the greater part by a very primitive process, a hole being made in the earth at a safe distance constructed. But, within the last few years, several factories have been established, not only for the extraction of tar, but also for the preparation of various refined articles belonging to this class. It would be difficult to ascertain the quantity of tar consumed within the empire, but something like 7000 tons are annually exported. Under the name of *gombki* the following Boleiti are exported, viz., obtusis, undulatus, and laricis. In 1874 about 9530 lb. of this article were exported.

Recently the Aspen, which was considered as a tree of a very little use, has become of great importance in the manufacture of paper. In 1871 there were ten manufactories in Russia, and two in Finland, occupied in grinding the wood by means of hydraulic mills. The low price of this wood, the facility with which its pulp is blanched for making paper, and the increasing high price of rags, promise a grand future for this industry, especially as the forests are rich in reserves of the Aspen, and it renews itself without the aid of man. The annual value of the wood consumed within the empire is estimated to amount to at least 265,450,000 roubles. The railways use wood for fuel to the amount of 7,200,000 roubles yearly.

Poices of Books.

The Aerial World: a Popular Account of the Phenomena and Life of the Atmosphere. By G. Hartwig, M. and P. D. Longmans.

We have frequently had occasion to allude to the publications of Dr. Hartwig, and to speak in favourable terms of his efforts to interest the general reader in some of the more important natural phenomena, their causes and effects. Good, however, as have been the author's works on the polar world, the sea, the tropical world, &c., we are of opinion that he has been even more successful in the present case. A treatise on meteorology is to most folk but dry reading, but Dr. Hartwig has contrived to construct a book which may fairly be styled "meteorology made easy." It was no part of his plan to write a scientific treatise, but to make public, in an agreeable, yet accurate form, the results gained by modern investigation into the nature and phenomena of the atmosphere. Accordingly we have in Dr. Hartwig's pages chapters devoted to the composition and qualities of the air, the force and direction of winds, the nature of clouds, water-spots, fogs, dew, rain, snow, storms, cyclones, electrical phenomena, &c. The concluding chapters are devoted to the balloon as a scientific instrument, and as an observatory in time of war. The illustrations are numerous and for the most part good and appropriate, but we fail to recognise an Orchid in the cut on p. 499, entitled "Orchids growing on dead trunk," and which, if we mistake not, has done duty elsewhere. The work as a whole is one which, judged from its own standpoint, deserves our warm recommendation.

The History, Structure, Economy, and Diseases of the Sheep. By W. C. Spooner. Lockwood, 1874.

It would hardly have been necessary for us in this place to do more than announce the publication of a third edition of Mr. Spooner's admirable little book on the sheep, were it not that sundry questions relating to hybridism and cross-breeding, have lately been attracting the attention of some of our cultivators. We believe that the rules and principles which have been deduced from experience in the animal kingdom will apply equally well, all due allowances being made, among plants. It may not be without value, therefore, to condense in a few words what Mr. Spooner says about cross-breeding among sheep. A Pelargonium is not a sheep, decidedly, but it shares with the animal a number of qualities and functions, and it cannot be without interest to compare the two. In trying to improve a breed of sheep, says Mr. Spooner, the qualities of both parents must be considered, with a view of correcting as well as perpetuating good qualities. It must be acknowledged, however, that in the majority of cases the influence of the male parent preponderates, so that the offspring shows more of the characteristics of the sire than of the mother, though this rule is not without exception. This is perfectly in accordance with Dr. Denny's views on the Pelargonium. To render crossing successful, says Mr. Spooner, we should endeavour to find "some affinity of constitution between the improvers and those we wish to improve."

No raiser of hybrid Vines or florists' flowers will contest that dictum. We fancy, however, that greater objection would be raised to the statement that "a first cross between a superior and an inferior race is, as a general rule, very successful, producing animals approximating in most respects to their more improved

parents, but after the first cross the breed often deteriorates."

Among plants the first cross is often productive of a very large and often mishapen progeny, some of which may possess desirable properties, and may in time be improved; but as to the majority, but little favourable can be said. In any case the raiser of plants will agree with our author that "crossing is an experiment sometimes succeeding and sometimes failing in producing a proper combination of the qualities of both parents. Judgment is shown in selecting the successful and rejecting the others." It was by judicious crossing and careful selection that Bakewell ultimately produced from a great variety of flocks of different characters the celebrated breed of New Leicester sheep. Having gained what he wished, he altered his plan, and, instead of continuing to cross, took every means to secure the purity of his flocks by in-and-in breeding. With regard to the latter process, it must be remembered that the circumstances and conditions are so different in the human race and in animals—in which latter case every care is taken to secure the health and *physique* of both parents—that no fair analogies can be drawn. Certain it is that close intermarriage in the animal kingdom is far from being prejudicial to the issue, as a rule; and were circumstances different it need not necessarily be so among the human family.

Among plants we do not think we have sufficiently numerous or authentic data to decide the question; but in the case of Wheat, for instance, in-and-in breeding can hardly be injurious.

We conclude this notice by citing a sentence from Mr. Spooner, the principle of which should be acted on as far as possible by every hybridiser. Though crossing may be practised with impunity, or even advantage, "yet no one should do so for the purpose of establishing a new breed unless he has clear and well-defined views of the objects he seeks to accomplish, and has duly studied the principles on which it can be carried out, and is determined to bestow for the space of half a lifetime his constant and unremitting attention to the discovery and removal of defects."

— Mr. Murray promises for the ensuing season a new book by Mr. Darwin, called *Institutes on and Climbing Plants*. According to the *Athenaeum*, it will consist of two parts, the first of which is devoted to a discussion of the sensitiveness of the leaves of Drosera, Dionaea, Pinguicula, &c., to certain stimulants, and of their power of digesting and absorbing animal matter; the second to the habits and movements of climbing plants. Three books of travel are also on Mr. Murray's list—*The Caucasus, Persia and Turkey in Asia, being a journey through the Caucasus to Tabreez, Kurdistan, down the Tigris and Euphrates to Nineveh and Babylon, and across the Desert to Bagdad*, by Baron Malmgren; *Thunberg's Travels translated from the German by Mr. C. Heneage*; *The Land of the North Wind, or Travels among the Laplanders and Samoyedes, and along the Shores of the White Sea*, by Mr. Edward Rae; and *The Hawaiian Archipelago, Six Months among the Palm-Groves, Coral-Reefs, and Volcanos of the Sandwich Islands*, by Isabella Bird.

Of *Warner's Select Orchidaceous Plants* (Reeve), Parts 11 and 12 have recently been issued. It is to be regretted that this fine work, the most attractive now publishing of all the books devoted to this most attractive race of plants, should make its appearance at such uncertain and distant intervals that one never knows when to be on the look-out for it. From the size of the page, Mr. Fitch's sketches are most effective, and the execution of the illustrations is, in most cases, quite satisfactory. The numbers before us contain a splendid plate of *Oncidium varicosum* (Lacour's drawing), from Messrs. Veitch's specimen plant (the plate lettered O. varicosum); *Laelia purula*, the *Cattleya marginata* of many collections; *Masdevallia Veitchiana*, a plant which no artificial colouring can reproduce; *Laelia* *aceps* Dawsoni, remarkable for its chaste and elegant colouring, and which is still very rare; the singular *Batemannia Burtii*, well represented from Mr. Hame's plant; and finally a grand figure of the lovely *x* *Cattleya* *coniensis*, one of the earliest and finest of the Messrs. Veitch's hybrid Orchids, and one in which the colouring of the lip is most superb. It was obtained by crossing *Cattleya Mossie* with *Laelia purpurata*, and combines the best features of each.

The first volume of the reissue of *Verrill's History of British Birds* (Van Nostrand), under the patronage of Dr. Newton, is now completed. It is needless to say anything in commendation of so well appreciated a book.

— Messrs. Edmonston & Douglas, Edinburgh, will shortly publish, in one volume, *seven 8vo*, with illustrations on wood by Whymper, *Sooty-tailed and the Rocky Mountains*; a diary and narrative of travel, sports, and adventure during a journey through the Hudson's Bay Company's territories in 1859 and 1860. By the Earl of Southesk, Kt., F.R.G.S.

HORTICULTURAL EXHIBITIONS, 1875.

- FEBRUARY.
- 17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- MARCH.
- 9.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 10 and 11.—Leeds Horticultural Gardens Company. Spring Flower Show. Sec. and Manager, James Birbeck, 705, Hyde Park Road, Leeds.
- 16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.
- 17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Hyacinth Show.
- 24.—Glasgow and West of Scotland Horticultural Society. Spring Exhibition. Sec., F. G. Douglall, 167, Canning Street, Glasgow.
- 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.
- APRIL.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Early Rhododendron Show.
- 22.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.
- 27.—Manchester Botanical and Horticultural Society. Exhibition of Arviculas, &c., in the Town Hall. Manager, Bruce Findlay.

THE Gardeners' Chronicle.

SATURDAY, JANUARY 16, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- TUESDAY, Jan. 19. Sale of Pigeons and Poultry, at Stevens' Rooms.
- WEDNESDAY, Jan. 20. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 4 P.M. Sale of Unvarnished Fruit Trees, Roses, Shrubs, &c., at Stevens' Rooms. Meeting of the London Society, at 8 P.M. Sale of Lilyum auratum Bulbs, at Stevens' Rooms.
- THURSDAY, Jan. 21. Sale of Lardy and Ornamental Trees and Shrubs, Fruit Trees, &c., at Stevens' Rooms.
- FRIDAY, Jan. 22. Sale of Lardy and Ornamental Trees and Shrubs, Fruit Trees, &c., at Stevens' Rooms.

IN the midst of disseminating rumours concerning the future of the ROYAL HORTICULTURAL SOCIETY, which, whether partially true or wholly false, shake public confidence and prevent useful development, it is satisfactory to have to announce the inauguration, on Wednesday last, of a series of EVENING LECTURES ON HORTICULTURAL SUBJECTS at South Kensington. These lectures were suggested by the present Secretary, Mr. W. A. LINDSAY, to the Council, and were by that body at once sanctioned, as likely to tend to the fulfilment of what should be the main object of the Society—the advancement of horticulture. The remarks with which the Secretary prefaced the inaugural lecture were much to the point, and evinced a just appreciation of the claims of science in general, and of horticulture in particular. At no time, he remarked, was horticulture, whether as a science or as a practical art, of more importance than at present. Very appropriately and very dexterously did he remind his audience that life, whether manifested in the plant, in the insect, in the animal, was one and the same throughout all Creation, and reached its climax in man. A knowledge of the simpler life in plants is, therefore, an essential preliminary to an acquaintance with the life history of animals and of man. Continuing in this vein Mr. LINDSAY had no difficulty in finding an excuse—not that any such was needed—for the establishment of a series of evening lectures at South Kensington. The noise and confusion incident to the general meeting, the mass of routine business to be got through, the distractions caused by those who come rather to see and be seen, than to listen to learned dissertations, the time of the meetings, which prevent young gardeners and others with business avocations from attending—all these were urged as reasons for the course adopted by the Council. It was pointed out, in addition, that though among practical horticulturists the most cherished traditions are those connected with Chiswick, yet South Kensington

was not destitute of a horticultural history prior to the establishment of the Society in that locality. One of the most celebrated nursery gardens—that of LONDON & WISE—occupied, in fact, the site of the Kensington garden, a nursery established in the reign of CHARLES II., and which maintained a well-merited reputation for a long series of years. Allusion was also made to the services which the Society had rendered in past times to horticulture by the despatch of collectors to various districts, and by the introduction, through their agency, of a very large number of useful and ornamental plants. With such prefatory matter did the Chairman introduce Professor DYER, the lecturer of the evening.

The Professor, taking up in a measure the strain of the preceding speaker, soon made it apparent that plants had a life of their own as marvellous as that of animals. It is the general recognition of this fact that is doing so much at present to restore botany to a position whence it ought never to have fallen. For some years botany was taught and studied as if it consisted merely in the determination of variations of the external form of particular parts, in the application of uncouth names to those variations, and of equally unfamiliar names to individual plants distinguished one from another by the diversities just mentioned. All the time this, and little else but this, passed current for botany, it is no wonder people of intelligence sneered at it as an agreeable pastime, and held it in no esteem as an intellectual exercise, and but slightly for its practical utility. Nowdays, thanks in no small measure to Mr. DARWIN, this has been changed. An intelligent purpose and a definite end is seen to underlie even the most apparently trifling and minute variations.

The special subject chosen by the lecturer to illustrate his remarks was the development of Ferns from spores. With great clearness Professor DYER sketched the growth of the spore into a small green plate or prothallus, the formation of reproductive organs of two sexes on the prothallus, and the subsequent growth of a perfect plant thereon as a direct consequence of the contact of the spirally-coiled ciliated filaments of the antheridium or organ analogous to the anther, with the cells of the pistillidium, or organ analogous to the pistil of flowering plants. The possibility of effecting artificial hybridisation was thus made manifest, and allusion was made to the cases in which this is supposed to have taken place naturally, as in many Gymnogammas, &c.

To those who had already a general familiarity with the details described, the most novel and interesting portion of Professor DYER'S remarks were those relating to the history of the subject prior to the remarkable discoveries of NÆGELI and SUMINSKI. The share which MORISON, the Oxford botanist, and later, Dr. LINDSAY, took in sowing the spores of Ferns and studying their development is, we are confident, very little known even among professed botanists; and while referring the reader to our report of Professor DYER'S lecture in another column, we may thank him for unearthing historical details which have been well-nigh forgotten. It is curious to learn that while Sir THOMAS MILLINGTON was among the first to discover the proper function of the pollen, and in all probability in the Oxford Botanic Garden, MORISON was the first to sow the spores of Ferns and watch their germination in the same academic garden. The Oxford garden derives additional claims to the respectful attachment of English botanists from this circumstance.

Pending the realisation of what has been the dream of so many interested in horticulture, both in and out of the several Councils of the Society, viz., the establishment of a thorough school of horticulture, scientific and practical,

in connection with the Society, great good might be done by carrying out a more modest programme. Of this the series of lectures which has furnished us with a text may well form part. How valuable, for instance, would be a series of practical demonstrations of the proper way of pruning fruit trees, such as are given annually in almost every rural district in France—practical demonstrations, accompanied by sound explanations of the "reason why." We have mentioned pruning as a good subject for rational demonstration, but it is only one among many which might be so treated at little cost to the Society, and to the great benefit of young horticulturists and amateurs.

— We have received from Mr. ELWES a prospectus of a MONOGRAPH OF THE GENUS LILIUM which he proposes to publish, with the assistance of Mr. W. HOOD FITCH as the artist. Messrs. WELSON, MAJ. LEICHTLIN and BAKER have one and all most liberally placed at Mr. ELWES'S disposal their specimens, notes, and drawings. A splendid series of oil paintings in the possession of M. LEICHTLIN will serve to illustrate those few species which it is impossible to obtain in a living state. It is proposed to publish a series of folio plates uniform with those of Mr. BATEMAN'S "Monograph of Odontoglossum," which will be drawn on stone from life by Mr. FITCH, coloured by hand in the best style, and accompanied by a complete account of the native countries, culture, varieties, and history of all known Lilies. These will be issued in parts containing eight plates each, at the price of one guinea per part; but this cannot be done in a manner worthy of the subject without the support of a large number of subscribers. The work will be commenced at once, and completed in six parts, which (unless new Lilies are discovered in the meantime) will, it is thought, be sufficient to include all the species, as well as many of the most interesting. Each part will also contain a large engraving, reproduced from a photograph, of the scenery of the countries where Lilies are most abundantly found—as Japan, the Himalaya, and California. Woodcuts and coloured drawings of the bulbs, seed pods, &c., will be added. Subscribers' names should be sent to H. J. ELWES, Esq., 6, Tenterden Street, Hanover Square, London. We earnestly hope that this spirited proposal will meet with the encouragement which it merits.

— HYACINTHS and TULIPS in flower in considerable numbers have for a few weeks past appeared in our flower markets, and in the windows of the shops of the flower dealers. Certain varieties are scarce, and some, which are somewhat precocious, and the bulbs—keeping those of each variety separate—are planted as thickly as possible in shallow wooden or zinc trays in about 3 inches of fine soil, and the boxes placed in a brisk bottom-heat. In a month or so the coloured flowers begin to show themselves, and two or three bulbs of equal height and of a similar stage of development are placed in a 48-pot, and they perfect their flower-spikes without appearing to receive any check. They can also be planted in drawing-room boxes, jardinetts, vases, &c., or mingled with other plants in more elaborate displays. Tulips and other early-flowering bulbs are similarly treated, but in the case of the Tulips certain varieties are specially selected, such as the Van Thols, Yellow Prince, Tournesol, White Pottebakker, &c. They are simply pulled up from the boxes, and the dense tufts of roots potted in soil as in the case of the Hyacinths, two, three, or four occupying a pot, according to its size. In some cases two white and two scarlet, or two yellow and two scarlet, are placed in a pot, affording bright contrasts. Many thousand bulbs are yearly grown in this way. The easy and rapid manner in which they can be got into flower enhances the value of their brilliant hues at the dead season of the year.

— In the description of the HATFIELD GARDENS, given in the Special Supplement of the *Gardeners' Chronicle* some time ago, the writer commented especially on the immense quantity of salading planted out there, and described it as growing by the acre; and indeed he was right, for the consumption daily is something enormous. Some idea of the quantities used may be formed when we state that 5000 heads of Celery are grown, together with a quarter of an acre of Chicory, and Endive and Lettuce by the tens of thousands. In five days, in mid-winter, the consumption of Endive has been 800 heads, independent of Lettuce, Chicory, Corn Salad, Cucumbers, the different varieties of Cress, &c. The call for Parsley, we understand, is also very great, and Chervil is almost daily required in quantity.

— Apparently the high-coloured PRIMROSES of the vulgaris type which have been raised of late years show a precocity not exhibited by cultivated plants of the common Primrose of the fields. There can now be seen in the seed grounds of Mr. R. DEAN, at Bedford, a bed of strong seedlings raised from

some of the most approved types, that are rapidly coming into flower, while established plants that flowered last spring for the first time have continued to throw up their flowers since October last. It seems matter for regret that such charming bright blossoms should be furnished at a season of the year so ill calculated to show them off to the best advantage; at the same time it demonstrates the value of the Primrose in the mixed border. Tufts of Primroses in February and March, even if cradled in the storms that sometimes prevail at that season, are yet welcome objects, and they gild the lengthening days with the bright promise that the tardy springtime cannot be much longer delayed.

At a recent meeting of the Central Horticultural Society of France, M. LEMOINE of Nancy contributed a note on the appearance of VARIATION IN THE LEAVES OF THE STOCK, after and in consequence

of *sidora vitifolia* (Tacsotia Buchananii of some gardens) was engrafted on a stock of the variegated *P. quadrangularis*. The scion or graft now begins to show variegated leaves. In this case it is the variegated stock which has induced variegation in the scion, while in the preceding instances it was the graft which communicated to the stock the tendency to produce variegated leaves. These are excellent illustrations of the reciprocal influence one on the other of scion and stock, of which we have had occasion to record several instances, and which seem to us to afford conclusive evidence of the incorrectness of the old notion, still held by some gardeners, that the stock has no influence over the scion, and *vice versa*.

MM. BALLET, of Troyes, took the *Prix d'Honneur* for a collection of 350 varieties of fruit at the October exhibition in Paris. MM. BALLET'S

was passed to Mr. BLIGH for his contribution. Mr. TALMAGE gave notice that at the next meeting he would read a paper on the Cyclamen, and Mr. BEACH said that he would read a paper in March on the culture of the Hyacinth.

We earnestly hope that the provisions of the ADULTERATION OF SEED BILL, which was passed some year or two since, may be put in force whenever necessity arises. Still more do we hope that the good feeling and moral influence of the trade may suffice to knock this hydra on the head without resort to legal penalties. Respectable seed-louses should endeavour to maintain, not only their own good character, but, so far as in them lies, the respectability of the trade.

In the *Monthly Report of the American Department of Agriculture* for October, 1874, Mr. TAYLOR gives his notes on the cause of a disease known as the

FIG. 14.—THE PAPYRUS AS GROWING ON THE ANAPO RIVER, NEAR SYRACUSE: FROM A PHOTOGRAPH. (FOR DESCRIPTION, SEE P. 78.)

of the engrafting upon it of a scion with variegated leaves. Two cases are cited, the stocks being different, the scion the same, in both cases. The stocks were furnished by a variety of *Passiflora Raddiana* (kermesina of gardens), and by *Passiflora Impératrice Eugénie* (supposed to be a hybrid between *P. cœrulea* and *P. Decaisneana* or *P. alata*). On both of these stocks was grafted a variegated scion of the variety known as *P. quadrangularis aucubifolia*. The graft was effected *en place*, and consequently the branch of the stock above the graft was not cut away but allowed to remain. From this branch, above the graft, branchlets were produced which bore variegated leaves. Cuttings were taken from them, and the result is that two variegated varieties have been produced, which will be distributed by M. LEMOINE in the ordinary way. M. LEMOINE remarked that the variegation was most intense on those shoots issuing from a green stock, the graft on which, though alive, had never grown, and had even lost its leaves after two or three months. M. LEMOINE further cited a converse illustration, where a scion of *Passiflora*

Peas, Peaches, and other fruits were arranged in alphabetical order. The collections of M. CROUX and of M. JAMIN contained respectively 550 and 400 varieties, for which gold and silver-gilt medals were awarded.

A handsome SILVER MEDAL has been forwarded, through the Italian Ambassador, by the Royal Tuscan Horticultural Society, to some of those gentlemen who took part in the BOTANICAL CONGRESS AT FLORENCE.

At a meeting of the SEVENOAKS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT SOCIETY, held on the evening of Jan. 6, Mr. BLIGH, gr. to A. SWANZY, Esq., read a paper on the CULTURE OF FLOWERING BEGONIAS, in which he traced their introduction, and fully explained his mode of culture, and the best varieties for cultivating for general and exhibition purposes. Some discussion ensued as to the treatment for exhibition plants, in which several members took part, and ultimately a vote of thanks

CRANBERRY ROT OR SCALD. We have already alluded to the very large scale on which Cranberries are cultivated in the New England States, and have pointed out how easy it would be to establish a similar culture in many parts of Scotland, Ireland, Wales, or even in some parts of England, at present left wholly uncultivated. Due precautions must, however, be taken to ensure that there be no stagnant water in the bogs where they are cultivated, else the soil becomes sour and charged with sulphuretted hydrogen, the roots become diseased, and the fruits rot. The circulation of water and thorough drainage appear to be essential to success. To give some idea of the extent to which Cranberry culture is practised in New Jersey alone we may add from the report in question the following particulars:—

"The recent statistical report of N. R. FRENCH to the New Jersey Cranberry Growers' Association shows the entire acreage in New Jersey, under regular cultivation, to be 4950 acres. Average cost at three years from setting (the fruit-bearing age), 324.50 dols. per acre, making total investment 1,662,750 dols. Crops in

this State have been, in 1871, 58,830 bush.; in 1872, 93,322 bush.; 1873, 116,409 bush. The average market prices have been in the years named, 3.42 dollars, 3.21 dols., 2.93 dols., respectively. Abating 1 dol. per bush. from market price for cost of picking and marketing, would make the net average worth, on the vines, 2.42, 2.16 dols., or 133 per cent. on the entire investment.

"The New Jersey fruitage in 1873 was most bountiful, but 40 to 50 per cent. was destroyed by the rot. This season the average fruitage upon old plantations is believed to be 30 to 40 per cent. below last year, but rot on these has not been so severe. New bogs have suffered most, as usual, the entire crop in many cases being lost. Allowing for increase of acreage, we think the entire crop of the State must be 25 per cent. below that of a year ago.

"The crop on the eastern portion of Cape Cod is very light, and in many districts almost an entire failure. The western portion and the adjoining islands have good crops. The other Cranberry districts of Massachusetts and Rhode Island, nearly all of them, have good crops. The few plantations on Long Island and other portions of New York have good crops.

"The fruit not affected by New Jersey rot seems sound and solid, promising to keep well."

M. ROGER, in the *Bulletin* of the Central Horticultural Society of France, declares that from *apriori* reasons it must be impossible to GRAFT a scion on the TUBER of a POTATO, but, as we doubt the correctness of his admission to refer to the present on the experiments of MR. FENN, which we have seen, and which appear to us in some particular to contradict M. ROGER'S preconceived ideas.

— We have been favoured with the following copy of a letter addressed to PROFESSOR ASA GRAY by MR. JEAN STISLEY, of Lyons, on the subject of the WEARING OUT OF VARIETIES:—

"In reply to an article which you published in the *New York Tribune*, and in which you have done me the honour to quote me, I take the liberty of pointing out to you that there are in my opinion two incontestable facts, the first of which is, that, under all circumstances, and that every individual is a variety.

"From this it follows, that throughout the universe, and through all created beings, life is transmitted in the same way: that every being that is born must die, and re-appear into universal life to give place to others of the same kind, or in a more perfect condition than itself; that variability is everywhere manifest: that there are not two leaves of the same tree that resemble one another identically: that there are not two beings exactly alike, even in the case of twins; that the seeds of the same plant, of the same capsule, never reproduce identically the parent plant: and that no one of them is ever identically the same as others, even amongst annual plants.

"If this be true, man cannot by artificial means perpetuate what Nature has made variable; man has not the power of changing natural laws.

"Can those who say that man can by artificial means indefinitely prolong the existence of a variety (individual) furnish any proof of it? Is the life of man long enough to enable him to know the duration of his own life? Is the life of a plant? We know that annual plants die as soon as they have accomplished the act of their reproduction, and that is all. Has the duration of the life of perennial plants been studied? I think not.

"An objection may be raised to the extinction of varieties, that Nature has provided a large number of plants with the power of continuing their existence by suckers, tubers, or rhizomes. But as Nature has, side by side with this means of reproduction, placed that of the continuation of the race of the species by seed, I conclude that the first method can only be temporary, and that the second permits us to conclude that Nature does not desire the perpetuation of the variety, because it would be in contradiction with the law of variability. Why does man study the laws of Nature? Why does he endeavour to penetrate their mysteries, if he does not wish to apply them to his wants? Of what use would that knowledge otherwise be to him? It is a useful thing, therefore, for man to know that varieties cannot be perpetuated. Knowing this, man avails himself of the means that Nature offers to him to produce the varieties and improve races, and it is this which is being done instinctively and unconsciously for the Potato and for various fruit trees, and which is done every day in the different branches of horticulture."

According to some recent researches of M. MAYER, of Heidelberg, PLANTS have the POWER of ABSORBING, by their leaves, carbonate of ammonia, in vapour or in solution in water. The nutrition of a plant by means of ammonia absorbed in the manner above mentioned, may induce a more vigorous growth and increases the proportion of organic matter. The amount of absorption varies greatly in different parts of the same plant. Although plants can be made to absorb ammoniacal gas artificially, it does not appear that in a natural state they absorb ammoniacal gas from the air in quantities large enough to be appreciable. The roots constitute the only medium through which plants receive the nitrogen which is indispensable for them, the quantity absorbed by the leaves being too minute to be of any practical importance.

— A tree that deserves to be planted more extensively is the LUCOMBE OAK, *Quercus Cerris*, which is a subperennial. At the present time, after the cold

weather we have experienced, it holds its foliage and looks as cheerful as at the beginning of autumn. The leaves are a bright glossy green, and otherwise like the ordinary *Q. Cerris*, though they may be a trifle thicker. There is a fine specimen of it at Kew, in the "Sion Vista," just within the Botanic garden, on the right-hand side entering from the pleasure grounds. If this be merely a seasonal variation, as LONDON states—"raise by LUCOMBE, a nurseryman, at Esher, from seeds of the species, about 1762"—it is rather perplexing. But it seems far more probable that it is of hybrid origin.

—According to M. BOISDUVAL, the POTATOS in ALGERIA have been very injured by the larva of a Tineinid moth belonging to the genus *Brytrophya*, and called *B. solanella*. The insect deposits its eggs on the young shoots of the Potato, the caterpillars, scarcely thicker than a hair, penetrate into the tuber, which they tunnel in all directions. No remedy is at present known for the ravages of this new pest, which is fully described in a recent number of the *Bulletin of the Central Horticultural Society of France*.

—In view of the forthcoming FLORA of the MAURITIUS and SEYCHELLES, which Mr. J. G. BAKER, of the Kew Herbarium, is now at work upon, the following notes from a letter of Mr. JOHN HORNE, of the Botanic Garden, Mauritius, addressed to Dr. HOOKER, may be of interest. Mr. HORNE has but recently returned to Mauritius from a three months tour in the Seychelles group. The islands visited by him were Mahé, Praslin, Silhouette, Felicité, La Digue, Aux Frigates, St. Anne's, and Aux Cerfs—all of which were thoroughly explored botanically, the result being the collection of about 300 species, the bulk of which, Mr. HORNE says, he had not seen in his previous tour in 1871. These collections are to be sent to Kew, indeed a portion of them is on its way at the present time; and though many of the species will doubtless not be new to that established museum, they may prove interesting in a geographical point of view. Another point of interest is that of the similarity of the flora of one part of the world with that of another, and perhaps a widely distant one. Thus Mr. HORNE thinks at a glance, without, of course, considering the subject minutely—opportunities for which will be presented when the specimens are worked up at Kew—that the flora of the Seychelles will be found to have closer affinities to the floras of Madagascar, East Africa, Southern India, the Malay Islands, and Polynesia or Oceania, than to those of either Mauritius or Bourbon. The collections before referred to do not contain a single plant which is confined to the islands of Bourbon, Mauritius, and the Seychelles. Numbers of the same genera and species are of course common in all these islands, but are equally common in other countries. On the other hand, the largest portion of the genera and species of the Seychelles are also common to many instances in one or other of the first four places mentioned above—namely, Madagascar, East Africa, South of India, and the Malay Islands. Illustrations of this are to be found in *Campnosperma zeylanicum*, an Amarcidaceous tree of Ceylon, which is amongst the commonest plants in Seychelles. *Dittelaema Karak*, a Sapindaceous tree of 50 or 60 feet high, common in the Malay peninsula and Southern China, is also abundant in the Seychelles, with the Madagascar and East African species, exceedingly common, and of the Oceanic or Polynesian flora; which likewise has many representatives, may be mentioned *Barringtonia speciosa* and *B. racemosa*, both trees belonging to the Myrtaceæ; *Calophyllum Inophyllum*, a very useful Guttiferous tree, growing to a height of some 80 or 100 feet; *Heritiera littoralis*, a Sterculiaceous tree; *Cordia subcordata*, and others. Two or three species of *Calophyllum* are indigenous to Mauritius, but *Inophyllum* is not amongst them. It is one of several Oceanic genera and species, though common in Seychelles, does not occur in Mauritius. The geological formations of the several countries as well as the oceanic currents may probably affect the distribution of plants. Seychelles, Madagascar, East Africa, Southern India, and many of the Malay and Polynesian Islands are granitic, and during the whole or greater part of the year a strong sea current passes Seychelles from the east. Interesting as this group of islands is, Mr. HORNE points out the great desirability of a complete exploration of the large and more popularly known island of Madagascar. He thinks that when the plants of this island are better known many will be found there that are now considered peculiar to Seychelles. So satisfied is he as to the great interest and value of the Madagascar flora, that he strongly recommends any young man who wishes to make a name for himself to devote a year, or two to exploring and collecting the plants of Madagascar.

— We learn from the *Sydney Mail* that a meeting was held in that city in October last, to consider the advisability of forming a society for the cultivation of the science of natural history in all its branches. It was resolved after some discussion that such a society should be formed, under the name of THE LINNEAN SOCIETY OF NEW SOUTH WALES, and that the officers should consist of a President, Vice-President, Secretary, Treasurer, and a Council of six. The following gentlemen have been requested to accept the respective offices—President, MR. MACLEAY; Vice-President, Sir W. MACARTHUR; Secretary, Captain STACKHOUSE; and Treasurer, MR. BURTON BRADLEY.

— DENDROBIUM TETRAGONUM, a very distinct and interesting species, is now in flower in the Orchard-house at Kew. It is chiefly remarkable on account of the tetragonal pendulous stems, which are produced in a dense fascicle. They have a globose tuberos base, from which they are slender for one-third or two-fourths of their length, then gradually thicken to rather more than the size of a pencil, and bear at the extremities two or four elliptical lanceolate leaves. The flowers are borne in short racemes of from one to six, usually terminal, but sometimes axillary on the thicker portion of the stem. The two lateral sepals are curiously twisted. From the tip of these to that of the dorsal sepal the blooms are 4 inches across, and though of a dull yellow appearance, yet from their profusion in this instance they make a most striking display. It is a native of Moreton Bay, whence it has been received by the Royal Gardens, and also by the Messrs. Rolleston, from one of whose plants it was figured in the *Botanical Magazine* of 1872. On a block in a cool house it is easily made to flourish.

— A JUBILEE *file* will be held, from April 4 to 7 inclusive, at Antwerp, by the Royal Horticultural and Agricultural Society of that city. The exhibition is open to British exhibitors. One hundred and twenty-four classes are mentioned in the schedule. The exhibition promises to be one of importance. Baron CONSTANTIN DE CALERS is the President, and M. ALPHONSE DE COCK Secretary.

— THE ROYAL HORTICULTURAL SOCIETY OF LIEGE will hold its twenty-third exhibition on March 25 and 29. Ninety classes are comprised by the schedule. The President is M. O. LAMARCHE DE ROUSIUS, and the Secretary Professor EDOUARD MORREN.

— At a meeting of gardeners and nurserymen, held at the George Inn, Ashford, Kent, on the 7th inst., it was decided to form a Gardeners' and Amateurs' Mutual Improvement Society for that district.

Home Correspondence.

The Weather in the West of Scotland.—The change of weather in the West of Scotland came rather rapidly, beginning with the last quarter of the moon and going on steadily. The ice in the Clyde was of much greater thickness than the snow estimated some of the blocks nearest the water's edge measuring 12 inches thick. There has been no such sample in this quarter for fourteen years. So far as I can estimate, most of the choice shrubs and trees have escaped nearly uninjured, showing clearly that the frost of December 24 and 25, 1860, amounting to 45° below the freezing point, was mainly instrumental in doing the vast damage among Conifers, Laurels, &c. In Scotland generally the frost during last December has been continuous and severe, accompanied in many districts by a heavy fall of snow and dense fog. *J. James Anderson, Meadowbank Nursery, Jan. 6.*

Electro-culture.—Just two years ago, in the pages of this Journal, I gave an account of an experiment, in reference to "galvanism in plant cases," upon *Cress*-seed, showing that while a healthy and luxuriant growth took place around the positive pole, at the positive pole the seeds sprouted "heels up wards," made very little growth, but were impeded with fungus mycelium. Soon after the appearance of this announcement I received a communication from Paris, where the subject appeared to have excited some degree of attention, and has evidently not been lost sight of, for in the current number of the *Monthly Journal of Microscopic Science* I find the following paragraph, proving that the principle of action is not confined to the vegetable kingdom alone, but that it is equally applicable to animal life, and hence there is little doubt but that it is one of the general laws of Nature, the cultivation of which may be turned to very great practical advantage:—"Action of electricity on frog's spawn.—M. Onimus, in a recent communication to the Société de Biologie, of Paris, states that by electrifying the eggs of the frog, the development of those which are in connection with the negative pole will be accelerated, whilst the hatching of those in connection with the positive pole will be either retarded or stopped." *W. A. Bridgman, Norwich.*

Flower Shows.—Mr. Shuttleworth, in his letter of the 9th inst., appears to have adopted the legal motto, "Win, or never," and, in consequence of a serious charge, and though boasting of "courage," has not yet returned positively to plainly expose what

he has "seen plenty of." A general charge is indefinite, and does not give managers or secretaries of horticultural societies any opportunity to explain or refute the assertions made. If Mr. Shuttleworth wishes the evils he complains of remedied, he ought to say where and when they happened, "like a man." As to the challenge, allow me to say that I cannot accept it, having no desire to drag plant growing or showing down to the level of horse-racing, though even racing men buy yearlings and grow them on. *J. Croucher, gr. to J. T. Peacock, Esq., Sully House.* [Mr. Croucher having exercised his right to reply, this discussion must now cease, so far as our columns are concerned. EDS.]

Yucca gloriosa var. *angustifolia*.—We have a *Yucca gloriosa* var. *angustifolia* pushing forward its bloom. The spike is about 15 inches in length, on a stem of nearly 3 feet, elevated nicely above the centre leaves. We gave it a "cap" of straw, during the late severe weather. Is not this a rare occurrence? [No. EDS.] *Harrison & Sons, Leicester.*

Calluna vulgaris.—Some time since Mr. S. J. Salter forwarded to us some singular specimens of *Calluna vulgaris*, which were subsequently exhibited at the Scientific Committee of the Royal Horticultural Society, and which we have now the opportunity of figuring. The peculiarity consists in the densely tufted branchlets, which form ball-like masses (fig. 15, A, C). In one instance (fig. 15, B) the branchlets have lengthened, but have assumed a downward direction. This variation was found

characteristics of a well-appointed dinner-table. To have them in perfection at this season of the year they should be sown in heat in April or early in May, and as soon as the young plants are large enough to handle, they should be pricked out in light rich soil, and replaced in gentle moist heat for a fortnight or so,

sufficient space between them to keep the bottom of the plants well furnished, or their beauty will be spoiled, as they will not produce their inflorescence down to the pot, or assume that perfect pyramidal form that adds so much to their beauty. If grown in a house, care must be taken that they do not become dry at the root, or receive a check in any way, or red spider will be the result. To prevent the attacks of this pest they should be heavily syringed and closed early on the afternoons of bright days. As soon as the nights become cold they should be moved to a nice light position in a cool stove or temperate house, where they will continue in beauty all through the winter. If wanted for summer decoration the seed should be sown now, and the plants grown on in cool stove heat, with plenty of light and air to keep them stocky. Even for summer decoration they have few equals, and add variety to the ever-recurring *Fuchsia*, *Balsam*, *Zonal Pelargonium*, &c. *J. Sheppard, Worcester-stone.*

Successful Lifting of Fruit Trees of a Large Size.—*Samuel Bateson, Esq., of Cambusmore, Sutherlandshire*, had occasion to lift some of the fruit trees in his garden some three years ago. Several of the trees were of rather large size, and the following method was adopted. About the first week in August a trench was cut round the trees, and the strong roots, as far as practicable, were cut back, and the ends seared with a red-hot iron. Some finely sifted soil mixed with leaf-mould was placed round the roots, and the trenches filled in again. The trees were allowed to stand till the following March, when they were

FIG. 15.—A, B, C, PECULIAR MOP-LIKE GROWTHS OF *CALLUNA VULGARIS*.

in great abundance near Poole Harbour, in Dorsetshire. We do not remember to have seen it before, nor is it, so far as we know, in any of the nurseries. We have not been able to discover the cause of this singular growth, to do which would probably necessitate an examination, on the spot, of specimens in various stages of growth, and especially when very young. It is conceivable, however, it may have been caused by insect puncture in the first instance, as in the case of the not dissimilar growths so common in the Birch; or it may be the result of some check to growth arising from browsing of cattle, frost, or exposure to wind, though, if the latter were the cause, we should not expect to see so uniform a shape.

Celosia pyramidalis.—I send you with this some cut blooms of *Celosia pyramidalis*, that you may see how valuable they are as decorative plants at this season of the year, provided the strain obtained is a good one [as yours appears to be, from the specimens received. EDS.]. For supplying cut flowers they are unrivalled, as few things equal them in lasting qualities, and their light, elegant, drooping habit and fantastic forms add a charm to a vase of flowers quite unapproachable by anything else at this season. For dinner-table decoration they are unsurpassed, as they are of the most symmetrical form, and the rich plumes droop over in the most graceful manner, and form a pleasing contrast to the white cloth, silver, and all the

after which they will be fit to pot off singly in small pots. They should then be replaced in gentle moist heat, and sufficiently near the glass to prevent them from becoming drawn. As soon as the roots fairly touch the sides of the pots they should be shifted on into larger, continuing to use a moderately light, rich compost, as before. If convenience exists for plunging them in a bed of gently fermenting material, the growth will be more rapid; but they must have suf-

ficient space between them to keep the bottom of the plants well furnished, or their beauty will be spoiled, as they will not produce their inflorescence down to the pot, or assume that perfect pyramidal form that adds so much to their beauty. If grown in a house, care must be taken that they do not become dry at the root, or receive a check in any way, or red spider will be the result. To prevent the attacks of this pest they should be heavily syringed and closed early on the afternoons of bright days. As soon as the nights become cold they should be moved to a nice light position in a cool stove or temperate house, where they will continue in beauty all through the winter. If wanted for summer decoration the seed should be sown now, and the plants grown on in cool stove heat, with plenty of light and air to keep them stocky. Even for summer decoration they have few equals, and add variety to the ever-recurring *Fuchsia*, *Balsam*, *Zonal Pelargonium*, &c. *J. Sheppard, Worcester-stone.*

lifted, and it was then found that all those strong roots that had been treated as above had emitted a large number of small rootlets. The trees were then carefully replanted and properly staked, and the success has been most complete. I trust to have something more to say by-and-bye about this beautiful place. *John Davnie, West Coates, Edinburgh.*

Hybrid Pelargoniums, &c.—My attention has been directed to some letters in the *Gardeners' Chronicle* on the crossing of *Geranium pratense* (the blue field *Geranium*) with the *Zonal Pelargonium Madame Vaucher*. Will you, therefore, allow me a small space in your journal to say a few words on the subject of various crosses from my own experience? There can be no doubt with regard to my seedling *Pelargonium*, *Mrs. Illingworth*, being a true cross between *G. pratense* and *Madame Vaucher*; the habit is different and more bushy than *Madame Vaucher*, the leaves are unlike any *Zonal*, the cluster of bloom is large, the colour pale pink, the petals closely copy silver paper in texture, hanging down and giving the blooms a distinct and elegant appearance. Another variety, *Hebe*, differs in having the colour a brick red, and this variety proved very hardy out-of-doors last summer. Several varieties have a bluish-pink tinge. A large number of the seedlings are white, many had evidently not taken the pollen of *G. pratense*, and scarcely differed from *Madame Vaucher*, yet *Pisy*, *Puck*, *Lea*, and *Liberatrix*,

though all white-flowered, are most certainly crosses. The two first-named have the individual blooms very small; Leda will stand a month's incessant rain without its colour changing from a pure white, whilst Madame Vaucher, with a week's rain, will be quite pink. Libatrix is a grand white flower, but has not yet been planted out-of-doors. I cannot understand why so many persons believe that seedlings take more after the male than the female parent; my experience only of three plants out of 200 had the leaves and habit of G. pratense, and out of nearly 200 seedling Fuchsias, using fulgens as the male, only one had the leaves of that variety. Three months ago I gathered a number of seeds from Fuchsia fulgens, which had been crossed with Delight and other varieties with white corollas, also a number from various varieties that had been crossed with fulgens, so that this summer I hope to strengthen my views. From a number of years' experience, I have found to the opinion that the habit of a plant and the form of its flowers takes after the female plant, whilst colour is given by the male. For many years, where practicable, I have always used a white-flowered plant of good habit for the female, impregnating it with coloured male pollen in order to produce new tints. By carrying out this plan I raised the Imperial Blue Pansy, and, by persevering in the same manner, do not despair of raising a blue Pelargonium. Last summer I was exceedingly successful in raising new varieties of Fuchsias and Pansies. By crossing Fuchsia Sedan with F. fulgens, using the former as the female parent, a cross was obtained which has been named Polythymia, having orange-scarlet flowers of large size, a small leaf, and an excellent habit; it is so remarkably distinct and pretty that it must become a general favourite. Another cross, named Concordia, with a strong habit, has the tube and sepals scarlet and the corolla purple and very large, the sepals curving in a very graceful manner; a third, Fortuna, has deep scarlet, with a large purple corolla; and a fourth, Titania, using the small-leaved variety pyramidalis as the male, has the flowers scarlet with a mauve coloured corolla; this variety is quite unlike anything else yet raised. Turning to Pansies, out of over thirty very fine varieties (carefully crossed) having strong vigorous habits and large well-formed flowers, the following may be mentioned:—Johanna, a rich dark blue-purple; Harmonia, deep blue (a splendid flower); Nysa, intense blue; Thyra, lavender-purple self (a splendid flower); Polythymia, a lavender self; Diana, pale blue; Brunhilda, black self; Sylvia, dark blue self; Daphne, lavender self; Gerda, clear blue; Olympia, a many coloured fancy; Galatea, blue and white fancy; Camilla, purple and white fancy; Melponene, pink and white fancy; Pomona, white self with bright blue eye (a splendid flower); Clytie, lavender and straw-coloured fancy (a splendid flower); Iphigenia, white with blue centre (a splendid flower); Flora, a much-improved Imperial Blue; Conservative, another improved Imperial Blue; Princess Teck, a rich crimson-scarlet, purple and white fancy (a splendid flower). The above seedling Pansies have resisted seven weeks' intense frost unprotected, their constitution being as good as Imperial Blue. Mr. Pearson of the Chilwell Nurseries has my Pelargonium Mrs. Illingworth, and Fuchsia Polythymia, so that the public will soon be able to judge for themselves as to their claims. Allow me to point out that when a flower has been impregnated it needs no protection from insects, as no second impregnation will take place; care is, however, requisite before this operation, and all stems should be cut from the female before they have ripe pollen, or the colour of crossing will be lost, indeed some flowers require dissection, as the pollen is mature before they become expanded. *E. J. Love, Highfield House, Jan. 11.*

Morello Cherry Training at Scone Palace.—Mr. George Smith (p. 45), in alluding to Scone Park gardens in the year 1842, says, at Scone gardening as a mechanical art was carried out with great precision; and adds that "to be able to nail a large Morello Cherry tree quickly, with the branches radiating with the regularity of rays of light, and to be a thorough proficient with the scythe, were, with Mr. Dodds, indispensable qualifications for the diploma of a regularly qualified 'blue apron.' Perhaps it may be readily to Mr. Smith to know that the same old points in the proficiency of a well-trained young gardener are, and have been for many years, strictly observed by Mr. Dodds' almost immediate successor, Mr. Halliday. Having had the pleasure of serving under the latter gentleman for some time, I may be permitted to say that nowhere in Great Britain or Ireland have I seen such large, well-trained, and particularly well-furnished Morello Cherry trees as those growing in Scone gardens. I am speaking of several years ago, and, if I remember rightly, they were growing and trained against a wall (north), 18 feet high, in what was there and then known as the South Garden; and I may here add that the wall was furnished almost to the ground with regular and well-trained shoots. The trees seemed to

be more long-lived there than in many other places which I am acquainted with. The bothy at Scone is one of the most comfortable and picturesque in the kingdom, and was erected in 1866, the old one having been previously destroyed by fire; but fortunately the young men escaped with their lives and property. Scone has produced many eminent men, including Messrs. Fish, Douglas, Smith, &c., and I am sure that the old reputation of the place will lose nothing while in the care of Mr. Halliday. *H. W. Ward, Longford Castle, Sarum.*

Gravel Walks.—The severe weather we have had has heaved walks in their foundations, and an advantage should be taken of this to remake such as are not satisfactory, or to break up and turn such as are mossy or discoloured. If they are properly made, there will only be a small portion of fine gravel on the surface, and care should be taken not to disturb them too deep, so as to break up the coarse gravel beneath. In forming new walks, or remaking old ones, it is of the utmost importance to start with a good foundation, as successful in forming a good firm, dry walk that will be serviceable in all weathers depends principally on this. The soil should be dug out to the depth of 8 inches to a foot, and a drain laid along each side, so as to be connected with gratings to take off the surface-water, as this should never be allowed to soak into the walk. Any kind of gravel-walk is tolerably firm in fine weather, but one of the principal attractions of a garden at this season is to have walks that can be used when others are dirty and uncomfortable. After the drains are complete, half the depth dug out should be filled up with some good rough material, such as clinkers from iron-works, broken bricks, or rough stones. The former are preferable, as they present a good deal of rough, angular surface, that helps to bind and solidify the bottom, and prevents the annoyance of worms breaking through to discolour or disturb the surface. If chalk or lime cobbles can be obtained, sufficient to fill up all the interstices, it should be shaken in among the rough material; and where chalk cannot be used as a substitute, it is the greatest mistake possible as a firm walk can never be made on such a foundation. Many put in a rough, loose bottom, thinking to drain the walk, whereas water should never pass through, but he carried off the surface by properly formed drains. If the bottom of a walk lies hollow, it is impossible to have a hard, firm surface, as it will shift under the foot or roller, and never bind properly. After forming a thoroughly sound bottom as above, proceed with the next layer of stony gravel, not sifted too fine, and if this is sandy, or lacks binding material, a little fine dry marl or chalk should be added. The top 2 or 3 inches should be finished off with very fine stones, having just sufficient binding material left in to keep them together. Make thoroughly level, and roll down while dry, and after this advantage should be taken of settling and solidifying the soil as they are thoroughly settled and solid. One of the principal attractions of a garden in the winter season are walks that may be used with comfort, and if made as above they will always be dry and firm, and not subject to weeds, moss, or worm-casts. *J. Shepherd, Woolverstone Park.*

Jatropha australis. The "Australian Physic-nut."—Under these names I have several times met with an evergreen conservatory shrub, concerning which the owners could give me no further information. Among other places where I have observed it are the Liverpool Botanic Gardens, and the greenhouse at Allon Towers. It exists also in private collections at Arundel, Dufkinfield, &c. In De Candolle's *Prodromus* the name is mentioned as belonging to something which had not been identified. The state of affairs being uncomfortable to me, I forwarded a specimen of the plant to the question to Professor Oliver, confident that the resources of the Kew herbarium would enable him to determine it. With his accustomed courtesy and promptitude, Professor Oliver replied immediately, and for the sake of possessors of the plant who care for accuracy in their labels, I now make public the facts. This so-called *Jatropha* is not even a member of the Euphorbiaceae. The proper name is *Scaevola diversifolia* Don, or perhaps *Scaevola orientalis*, referred to in Ben-tham's *Australian Flora*. Don gives as a synonym *herbarium*, Cunn. Sm. The specific name is well deserved, some of the leaves being lanceolate, with a very wide base; others in various degrees trifid, the lobes of the largest being 3 inches in length. They are leathery and glabrous, provided with long petioles, and alternate. Don seems never to have seen the inflorescence, and the plant does not appear to have blossomed in any of the collections where I have seen it. *L. O. Grindon, Manchester.*

Crossing the Black Monukka Grape.—In 1870, at the instigation of Arthur Trollope, Esq., of Lincoln, I tried to effect a cross between the Black Monukka and Esperiere Grapes. Mr. Trollope is an

extensive grower of hardy Grapes, and was desirous of obtaining a seedless hardy early Grape for his collection. I took the greatest pains in effecting the cross, making the Black Monukka the male and the Esperiere the female, and was rewarded with seven plants from the seeds sown. Three of these plants fruited last year, but none of them produced seedless Grapes, the bunches and berries being smaller than the Esperiere, and their colour black. The berries were all round, like the Esperiere, except on one plant that produced many seedless berries, but those perfect with seeds on the same bunch were oval, and like the shape of the Monukka. Like the cross which Mr. Barron effected between the Monukka and Black Hamburg (p. 18), some of my plants showed a considerable likeness in their foliage to the Monukka, being deeply lobed like it. None of the varieties I have yet fruited are worthy of cultivation from this cross, and will be discarded. The late Lord Kesteven (Mr. Trollope's brother) sent me last autumn a white variety of Grape from Persia, said to be seedless, which if found to be so when fruited may prove worthy of cultivation. The Black Monukka I have fruited for several years, having had it from the Horticultural Society when first sent out. I have found it to be all that Mr. Barron writes in its favour, as to flavour and distinctness from any other variety grown. Here it is much esteemed for using in jellies, its long bunches furnishing no end of little ones, which can be cut off for that purpose. Along with the Monukka and Esperiere seedling Grapes I was more successful last year in fruiting a seedling plant from a cross between Lady Downe's Seedling and West's St. Peter's. This late winery promises to keep as long as that variety, with the delicious flavour of West's St. Peter's. Last year it kept till the end of April plump and good although in a pot. It is very distinct in its appearance, the young wood being of a light purple colour, as well as the midribs of the foliage, and the bunches present the same peculiarity of Lady Downe's in coming with a shoulder nearly as large as the bunch itself. *William Tillyer.*

The Down Palm.—With reference to the use of the fruits of the Down Palm (*Hyphene thebaica*, see *Gardener's Chronicle*, vol. 743, 314, vol. ii., 1874), I may perhaps be allowed to say that a quantity has recently arrived in this country, shipped from Bombay, with a view to their being applied to similar purposes as the vegetable ivory. The hard, bony substance of the *Hyphene*, which is used in the East for rosaries, beads, &c., is, however, so small in proportion to the size of the fruit, that it is doubtful whether they will ever be of any use in a commercial point of view, though I am told that it is intended to import a quantity, with the "gingerbread" or rind removed, for the purpose of testing the market. *John R. Jackson, Kew.*

Mushroom Culture in Tan.—It may be of interest to some of your readers to know that Mushrooms can be grown in tan. I have grown them with great success for the last year, following in tan the same plan as is used for hunting horses to trample on through the summer, and of course there is some of their manure incorporated with the tan. The genial heat that the tan gives renders it one of the best materials that can be used for the growth of Mushrooms. When well beaten together with the horse-dung, "and in sufficient quantity," I find the beds are more productive and last longer than with all horse-dung. The beds are, in fact, masses of clumps with as man as from twenty to fifty in each, which could be and were often taken up whole. Some may say, Does not tan produce unwholesome fungi? With me, and used in the same way, there is no fear, for I have not found one spurious one. As to flavour, they were pronounced by those who partook of them to be very savoury and delicate. It must not be inferred that I recommend tan alone, but let a quantity be put in a loose box, or any other suitable place where a horse is shut up for a time, so that its manure is incorporated with the tan, the use is when in a nice friable state, neither too nor dry; if too wet the spaw will not run so well, and if too dry the beds will not keep in bearing so long. My experience leads me to think that tan will be much sought after when its goodness is more known to Mushroom growers, for I believe it to be superior to all droppings. *Charles Penfold, Meynell Langley, Derby.*

New Tulips.—At p. 14, under the heading *Florists' Flowers*, there is an article about Tulips, wherein "R. D." states that nothing remarkable in Tulips has appeared of late. Permit me to inform him that last year two new species flowered with me, of which the one, *Tulipa Eichleri* of Regel, is a very pretty species, and the other, *Tulipa Greigi* of Regel, will outvie anything existing in this genus, as well in compact growth, size of leaf and flower, and colouration as also. Indeed, the plant will be the mother of a new generation in April next, and it will be worth while walking a few miles to see it. *Max Leichtlin, Baden.*

Baden. [Our correspondent referred to new garden varieties, such as were imported with other Dutch bulbs. EDS.]

The Late Severe Weather.—Although we have had such severe weather, few things appear to have suffered any ill-effects. This may, I think, be accounted for by the still state of the atmosphere, as the air was scarcely moved, and the snow remained where it fell, nestling at the axils of the leaves, and snugly covering the crowns of plants. There was an absence of sun, too, and the temperature did not rise sufficiently high during the day to melt the rich covering of snow, so that plants were not subjected to alternate thaw and severe frost, generally so fatal to sap-vessels. The fact of the thaw taking place during the absence of sun and light was much in favour of vegetation, and to those combined causes plants have

Kew, says that it flowered with him at Como in the open air. Permit me to state that it flowered here in the open air last autumn, and was quite unprotected. It develops numerous heads of bloom every year, but this is the first instance in which it has fully expanded them. The plant stands in the open ground, along with miscellaneous shrubs. I send you some wild Primroses, gathered on the side of the road on the 10th inst. *Frederick Tynons, Laskin Hill, Drumcondra, Co. Dublin.*

Gardeners' Royal Benevolent Institution.—Will you kindly permit me to thank, through this channel, the many friends who have sent their proxies or promises to insure the election of Mrs. John Scobie as a pensioner of the Gardeners' Benevolent Institution? I trust her election is safe; but either way I am equally grateful to the many friends—known

worthy of note that this same plant, although having young shoots made in the autumn several inches in length, has come out of the severe weather through which we have just passed quite uninjured, although the thermometer on two mornings recorded 20° of frost. I think the Loquat may be planted out in shrubbery borders with comparative safety. *A. Deau, Bedford.*

Obituary.

We chronicle, with sorrow, the death of Mr. JOHN GIBSON, which took place at his residence, Argyll Lodge, South Kensington, on the morning of Monday last, the 11th inst. In him horticulture loses one of her most worthy sons, and the younger race of gardeners one of their brightest exemplars. Mr.

THE LATE JOHN GIBSON.

escaped much better than could have been expected, taking into consideration the late growth everything made, and the severity of the late frost we have had. It is early yet to judge fully of the effects, but it is satisfactory to find that Broccoli have entirely escaped, and these rarely stand over 20° of frost. *Dracena australis* left out, and the stem protected by a hayband, is dead; *Eucalyptus globulus* are all killed, and fevers may rage with their accustomed virulence, so far as this tree is concerned, as it will never become established in this climate. Although *Laurus nobilis* has escaped, the common Laurel shows many brown leaves, and appear to have suffered a good deal in places. *Laurustinus* are a little cut, and *Berberis Darwinii* are much disfigured and shedding their leaves, but a month or two more elapse before the full effect of the frost shows itself. *T. Sheppard, Wood-averstone.*

Flowering of Aralia Sieboldi.—In your number for the 2d inst. a correspondent from Como, commenting on the mention in a previous number of the flowering of *Aralia Sieboldi* in the temperate-house at

and unknown to me personally—who responded to my appeal. *D. T. Fish.*

The Paraffin Lamp.—For "J. J.'s" information I beg to state that I have kept coloured Pelargoniums through the last five winters by merely burning a small paraffin lamp. We have had continued frost, and the thermometer as low as he mentions, and the tricolors are looking as well as ever they did in any of the preceding milder winters. *G. W., Aberdennshire.*

Heating a Greenhouse.—In reply to Mrs. Oakeley, I beg to say that the vapour referred to in "Heating a Conservatory" was simply carbonic acid gas with the smoke, the fatal effects of which have more than once been felt in gardeners' apartments. The peculiarity in this instance was its descending a chimney after gaining the open air. *H. R., Sussex.*

Hardiness of the Loquat.—During last year I mentioned a young plant of the Loquat that was growing in the open ground in a garden near here as having proved itself so far perfectly hardy. It is

Gibson had for some time past been afflicted with paralysis, which unfitted him for any public duty, and the appointment of Superintendent of Hyde Park, which he had held since his removal from Battersea, was a few months since given to his son, Mr. J. Gibson, jun., who had since the commencement of his father's illness been entrusted with his duties.

Mr. Gibson was born in 1815, and was consequently in his 60th year. He commenced his career as a gardener under his father, at Eaton Hall, near Congleton, and was in 1832 apprenticed to Mr. (afterwards Sir Joseph) Paxton, at Chatsworth. Subsequently in 1835 he was sent by the late Duke of Devonshire to India, for the purpose of obtaining plants of the *Antheria nobilis*, and *Orchids*. Of this journey some account will be found in our volume for 1872, accompanied by Mr. Gibson's portrait, here reproduced. In 1837 he returned to England, and was appointed foreman of the exotic plant department at Chatsworth, remaining there until 1849, when he was appointed to the superintendence of Victoria Park, then in course of formation, the additional charge of Greenwich Park being made over to him

two or three years after. This park he remodelled, making all the new drives, roads, and footpaths, and draining the whole place. It was also very actively engaged with the late Sir K. Mayne in suppressing that great evil—Greenwich Fair. In 1855 he was called upon to undertake, as well, the laying-out and planting of Battersea; this he did, until he was removed there altogether, which took place in 1857. Shortly after this, Kennington Park, &c., as they were afterwards called, and the Chelsea Asylum grounds, and those attached to Chelsea Hospital, which latter he entirely laid out as they are at present. Battersea Park, however, which he always spoke of as his favourite work, occupied his attention till 1871, when he was appointed to the charge of Hyde Park, with the Green Park, St. James's, and Kensington Gardens attached. This prominent office he filled, with the entire approbation of those in authority, until his health broke up, and the affliction which has now terminated his days fell upon him.

In addition to the above-named offices, Mr. Gibson was called upon to take temporary charge of other parks, &c., when vacancies have occurred; and we are informed that at one time, with one exception, the whole of the Metropolitan parks were under his charge.

To Mr. Gibson we are in great degree indebted for the change in public taste, which has enabled us to break away in some degree from the monotonous formality of modern flower-gardening, and which he effected by bringing the beauties of plant-form into equal prominence with those to be derived from the contrast or harmony of the colours of their flowers. His works will form a lasting memorial.

Foreign Correspondence.

ANALEFI, SOUTH ITALY: Disease in *Petunias*.—We were given some seed of very fine double *Petunias*, and were most successful in raising several varieties. We had bushes 3 feet in height in flower all summer and autumn planted in the beds. I took cuttings from them, and gave them shelter in winter, growing them in good garden mould. They threw well for two years. Last winter all the plants died from disease, which begins with the leaves getting yellow, and having a smell like the Grape disease. The points of the hairs on the underside, when seen with a microscope, are black, instead of being bright white. These leaves fall off, and those that come on are small and hard, of a peculiar green, the roots begin to shrivel up, and the plant dies. Is this disease known in Britain, and if so, what is the cause and the remedy? I have tried sulphur on the leaves, and mixed with the carb—in vain; also sifted earth and various mixtures of leaf-mould and silver sand. The plants get the disease more in the pots than in the ground, but this year I lost many in the beds. This summer I set to work with fresh seed, and raised more than twenty varieties, and by the end of September had over 100 fine plants from cuttings. I have not twelve left now. [We should be glad to know if our home or foreign friends have observed a similar disease. It is not known to us. Eds.]

THE FARM.

NEW FORAGE PLANT.—For some years past I have been making experiments upon a plant which has been proposed as a substitute for Clover on Clover-sick land, and generally as a green fodder plant similar to, but more robust and producing larger growth upon poor soil than Lucerne. It is a leguminous plant, known as *Galga officinalis*, and, though European, it is in the greater part of Europe. It is hardly here, as it is not a native of this country. Though it is very enduring, and yields immense cuts of green fodder, it is not, so far as I can learn, very acceptable to sheep or farm stock, while its analysis is rather disappointing on account of the abundance of woody fibre present. The plants analysed were cut on June 10 last, the seed examined having been gathered in September, 1872.

Analysis of *Galga officinalis*.

VALUE OF ROOTS.—One of the questions of agricultural interest which I have endeavoured lately to answer has been the relative feeding value of Turnips,

Swedes, and Mangels. In analysing these roots it is the custom of chemists to calculate all the nitrogen found into its equivalent of flesh-formers or albuminoids. If this be done, the order of merit of the three roots becomes, in ascending series, Turnips, Swedes, Mangels—in other words, if we have regard to the presence of flesh-formers alone, Mangels would hold the highest place of the three. Now whatever be the fattening power of Mangels, I am given to understand that their flesh-producing character hardly equals, in actual farming experience, the theoretical value assigned to them by the ordinary chemical analyses. An explanation of this discrepancy is not difficult, for much of the nitrogen of Mangels exists in the form of alkaline nitrates, a little in the form of ammonia salts, and more than mere traces in the form of an organic base or alkaloid. I am engaged in solving this problem, which is a rather difficult one, of how much of the nitrogen of this root really does exist in a form which is available for the production of flesh and for the other functions performed by albuminoid matters. All I can say on this point at present amounts to this—That chemists have always hitherto exaggerated considerably the amount of the flesh-formers in Mangels, while they have also rather over-estimated the same substance as present both in Turnips and Swedes. The investigation to which I have just referred has led me to make determinations of water and other constituents in certain roots grown this year side by side under the same condition of manuring, &c. The results are given below, but they must be accepted with the proviso concerning the over-estimation of the flesh-formers to which I have just alluded.

Trimmed roots, about 2½ lb. in weight of

	Turnips.	Swedes.	Mangels.
Water	92.8	90.8	89.1
Cellulose	1.8	3.1	2.6
Flesh-formers	0.1	1.4	2.8
Sugar, pectose	3.66	7.8	4.7
Ash	1.64	0.60	1.03

(From a paper recently read by Professor Church at a meeting of the Cirencester Chamber of Agriculture.)

Reports of Societies.

Royal Horticultural: Jan. 13.—Evening Meeting.—W. A. Lindsay, Esq., in the chair. This, the first of a series of evening lectures intended specially for those who from their business engagements are unable to attend the ordinary meetings, was opened by a few prefatory remarks from the Chairman, the substance of which is adverted to in our leading article. Professor Dyer, in commencing his discourse on the growth of Ferns from spores, said that the older botanists were extremely perplexed as to the production of Ferns from seeds. It was at first supposed that they were of an invisible sort, and by a transference of properties common at that time it came to be believed that the possessor of Fern seed would be invisible too. Shakespeare makes one of his characters say—"We have the receipt of Fern seed, we walk invisible." Ray, our great English naturalist, laughs at Tragus for spreading linen cloths upon the ground to catch the seed of Ferns on the eve of Midsummer night, when, as Ray properly observed, it would be indeed astonishing if any fell, seeing that it is not mature till the autumn.

In 1648 Columa argued the question with much ingenuity. He gave three *a priori* reasons why Ferns must be held to have seeds—First, nothing is said in the book of Genesis about any plants being destitute of them; secondly, it is improbable that such large and stately plants should depart from the rule and analogy of all other plants; lastly, to be found growing beneath other plants. He concluded by comparing the Fern frond to Butcher's Broom, and identified the fructification in the one case, with the flowers in the other. Cæsius came to his help, and, having examined the *sori* of a Polyopod, "telescopio adjumento," distinctly made out what he supposed to be the seeds.

What Cæsius saw were, no doubt, the spore cases. W. Cole appears to have first microscopically observed the spores themselves (1666) and Ray (1685) himself described the curious hygroscopic movements of the spore cases, which assist the dispersion of the spores.

Morison (1715) seems to have been the first to put the matter to the test of actual experience. If, he argued, the spores of Ferns are analogous to seeds, plants ought to spring from them when sown. He accordingly sowed the spores of *Homid's-tongue*, and raised plants from them.

This important observation seems to have been quite forgotten, for we find Dr. Lindsay, a physician trained at Edinburgh, writing to Sir Joseph Banks in 1789, in response to a request for Ferns from Jamaica (where Dr. Lindsay had settled), and suggesting that spores would be much more convenient to send than plants. Sir Joseph Banks seems to have been quite unprepared for this suggestion, which he wrote of as a great discovery. Dr. Lindsay accord-

ingly wrote a paper on the subject, in which he figures the germinating stages of *Polyopodium lycopodioides*, and this was published in the *Linnean Transactions* a few years afterwards.

The spores of Ferns were still regarded as equivalent to seeds, i.e., as the result of a process of fertilisation similar to what takes place in flowering plants. A variety of attempts were made to see in hairs or glands upon the young fronds, or even in the indusia, something that would do duty for an anther. As late as 1832 De Candolle argued that the prothallus, the membranous structure produced by the seedling Fern, was analogous to a cotyledon.

In 1844 Negeli discovered the antherozoids, which correspond in Ferns to pollen grains. They are not produced by the mature plant at all, but in small bodies on the prothallus. In 1846 the whole matter was finally cleared up by Sumikini, who detected the "archegonia," also produced on the prothallus. They are minute, bottle-shaped bodies, containing a cell which is fertilised by the antherozoids, and then by repeated divisions and multiplications grows up into the embryo plant, which we see growing out of the prothallus when the germination is well advanced. The prothallus and the Fern plantlet, although apparently united in their growth, belong to different generations. Ferns, therefore, afford an instance of what is termed "alternation of generations."

A prothallus producing both antheridia (containing antherozoids) and archegonia is a monoecious structure. In some cases there is a tendency to be dioecious. In *Osmunda regalis* the prothallus in some cases only produces antheridia; in others (apparently it is so in *Adiantum*) the archegonia are produced much later. These circumstances would seem to favour the possibility of the production of hybrid Ferns. In the genus *Gymnogramma* there are several forms, which it is easy to believe were produced in this way.

A very curious circumstance has been lately added to our knowledge by Dr. Farlow, an American botanist. He found that in some cases where archegonia were not produced, the prothallus, by a kind of budding, gives rise to a plantlet, which grows up into a native Fern, and is therefore produced asexually. [In proposing a vote of thanks to the Council and to Professor Dyer, Dr. Masters took occasion to urge the importance of establishing, for the benefit of young gardeners and amateurs, a series of lectures such as they had just heard, and specially a series of practical demonstrations of some of the more important garden operations, accompanied by explanatory comments.]

Natural History.

ANOBIIUM STRIATUM, OR DEATH WATCH.—The *Anobium striatum*, or Death Watch, as it is commonly called, from the peculiar sound, like the ticking of a watch, which it has the faculty of making, is well known for its injurious effects upon timber. Whether in the most carefully preserved specimens in botanical museums, or the unprotected rafters of farm sheds, the insect is equally to be found at work, and the wood in all stages of attack, from the sprinkling of minute larval borings as if a large pin had been inserted at intervals, to the last stage where it has been pierced till it is little more than a mass of powder crumbling away at a touch. The perfect beetle is easily attracted by newly pasted paper, and the greatest number of it which I have seen together was during a few weeks in the course of last summer in a newly-papered room at Torquay, where it appeared in such quantities as to give an opportunity of studying its habits, partly at large and partly in captivity.

The *Anobium striatum* is about a line and a-half long, but very variable in this respect, pitchy brown in colour, and somewhat cylindrical in shape, with the elytra reflexed round the edge of the abdomen, and especially distinguishable to general observation by its retreating head and gnathopods compressed behind as if they were raised above. The beetles behind are usually alarmed, and are usually sluggish in their habits, though occasionally (possibly from some atmospheric influence) temporarily brisk and moderately active, and they are so brittle to the touch as to be easily broken to pieces by careless handling.

The place of deposit of the egg seems to be selected with great care, and in captivity the female may be observed moving about with the ovipositor extended, pausing from time to time for a few seconds to insert the extremely tiny small hole suitable for oviposition. Sometimes apparently simply for exploration, sometimes for deposit of an egg. Where the circumstances provided were tolerably natural the eggs were always deposited singly, and I never noticed more than twelve inside the abdomen of the female *Anobium*.

The eggs are white, in some degree transparent, and deposited with such a strongly glaucous secretion, as to make it almost impossible to remove them from their position—this secretion probably playing a very important part in the insect economy by glueing, as it were, the egg both in the place, and also in the exact

position, suitable, and apparently requisite for the safe transition of the larva from the egg to its future shelter. The form of the egg varies from a perfect lemon shape to a more or less irregular oval, corrugated for the most part, but not invariably all over, the small raised round spots being placed with great regularity, so as to give the smooth surface of the egg work of bands, each spot having a depression in the centre, and the number being approximately thirty-two in the circumference of the egg about a third from the extremity. Complete development of the contained larva appeared to take place in twenty-one days from the date of laying, and under favourable circumstances exclusion from the egg took place about the twenty-fifth day, but where the egg was unsuitably placed for the passage of the larva into its future food it remained, through breaking the egg-shell, helpless within, or, if removed, equally helpless without, as far as its own unassisted efforts were concerned, towards forming its larval burrow.

Where the egg had been placed naturally by the female beetle, the greater part remained firmly fixed as a protecting cap over the boring of the larva—the sides of the egg-shell, and of the hole in which it was glued, apparently giving points of resistance necessary for the support of the grab in beginning its main operations, for in the only case of a fully-developed larva placed on the surface of some similar material was totally unable to make any progress towards forming a tunnel for itself till a little hole was bored for it to start in; then, having been placed with its head in the cavity, it at once went downwards, working itself forwards rapidly and steadily.

The larva is white, with brown eyes and tips to the mandibles, six short legs, the head somewhat sunk in the preceding segment, the body sparingly sprinkled with white spots, and the antennae, which in the only instance in which I was able to watch a specimen in the act of burrowing, it did not then preserve the incurved form, but stretched itself straight out while working.

The ticking noise resembling the movement of a watch, popularly supposed to mark the hours of some member of the household drawing to a close, is most wearisome, and so plainly audible in the deep stillness accompanying the long, sleepless nights of severe sickness, that it is no wonder a supposition should have arisen with those who have a little knowledge to account for the measured sound. It is, however, very far from being a fact that

* A kettle of scalding hot water ejected, infallibly cures the timber affected ;

for the cause of the noise is the beetle, not the maggot, and at the first disturbance it is much more likely to have been the insect than to have resorted to scalding. As far as my own experience goes of death-watches, they will only cease the noise (save a temporary breaking-off) at their own pleasure. The cause of the noise appears to be the search for a mate, the *notus operandi* in the case of the Anobium striatum, as described by Latreille, being merely a stroke of the mandibles on wood, the signal of the beetle under observation being answered from within the piece of timber. [In an old house in the country we have found the insect in making the insects appear by tapping on the wood in imitation of the noise made by the beetle. Eds.]

A good practical remedy for the real evil, caused by the borings of the larva, is most difficult to find, but some good might be done by taking the matter in hand in its very earliest stages. The attacked wood when in farm out-buildings is often left entirely alone, the evil of course multiplying itself year by year, and where attended to in other cases is often left alone till the dust falling from chairs, rafters, or whatever it may be, has become so thick, and an ample application, turpentine, whitewash, or whatever may be preferred, is rubbed or washed over—the fluid by no means necessarily penetrating down the minute holes, or saturating the wood sufficiently to effect the desired purpose. If instead of this the preservative applications were thoroughly well applied to any wood likely to be attacked, directly the beetles made their first summer appearance they would probably answer much better than the case of a handsome Bamboo carving soaking in a solution of corrosive sublimate (poison !), such as is used for dried plants, has proved quite successful. Eds.]

The female beetle when in captivity exercises so much care in her choice of a spot for oviposition that when at liberty it is very unlikely she would choose one so prepared as to be unsuitable for her purpose, and as in this case (unlike that of many other insects) it appears necessary to the continuance of the existence of the larva that the egg should be so secured to the wood, which is to be both the shelter and food of its tenant, as to facilitate its first passage into the hard substance, the result would be the destruction of the beetle in embryo. As far as I could gather from careful observation, it appeared that where the female beetle laid in unsuitable circumstances the larva was unable or unwilling to leave the egg, and it remained

within, breaking the shell, and moving restlessly about day after day. If removed and laid on material similar to that bored by a larva under natural circumstances of exclusion, it was still perfectly unable to form a home for itself till a little hole was pierced for it, and it was inserted conveniently for its future operations in the cavity, and all seemed to point to the ease with which the wood liable to attack might be made distasteful for her purposes to the beetle bent on oviposition, and that eggs laid elsewhere would perish. O.

The Villa Garden.

OUTDOOR GARDEN.—The weather succeeding the spell of sharp frost which waited on the advent of the opening year, has not proved favourable to gardening operations out-of-doors, notwithstanding there are many things requiring the attention of the gardener at this season of the year. It is warm, moist, and miserable, the soil sticking like clay; gravel paths soft and yielding; trees of all kinds as slimy as eels; while the cultivator turns his wistful eyes to the clouds for signs of a break in their dense surface, and the springing up of a breeze that shall scatter them, give birth to a drying air, and make the face of Nature not only a little pleasanter, but a little less moist also than we have seen it of late. But it is such weather as this that always follows a frost; the mud and slush that succeed a thorough thaw is infinitely worse than that which we associate with the dulllest days of November.

THE LAWS.—The time for action cannot be far distant, and there is ample work waiting to be done. The grass plat wants a new face put on it. Now that the snow has passed away the brown grass looks as if a deluge had passed over it, and there are various deposits left there which give it an untidy appearance. Bring the broom first of all into requisition, and sweep the surface hard; and then pass the roller over it; and while the turf is thoroughly saturated with moisture, it will yield to the superincumbent pressure, and the sward will become hard, firm, and level as soon as drying weather sets in. If there are any protrusions of humps, or mounds rising above the ordinary level of the lawn, allow the roller to rest on them for a time, or beat them down with the back of a spade, or with a turf-beater. If they will not go down open the turf carefully, take out a little of the soil, relay the grass, and conquer the obstacle in that way. In like manner, where there are evidences of subsidence, open the turf and put in some nice fresh soil till the surface is brought up to the ordinary ground level.

It is necessary at least once a year to pare down the edges of the turf round borders, beds, and by the side of paths, to keep them neat and tidy. There is a constant tendency on the part of the grass to grow out, and trench on the boundary of the beds. Worm-casts are thrown up, soil is washed down to the turf, and the roots lay bold of it and make a vigorous growth. In most cases when the grass of a lawn is neglected it will be observed that it grows rankest at points where it comes into close contact with the soil of the beds. A turfing-iron, as it is termed, reminds one of an old chace-cutter with a long handle. Any one with the knack of using this tool can pass it rapidly along the edge of the turf, cutting away about an inch and a-half or so, and maintaining an even line. In cutting, the knife should be very slightly (only very slightly) slanted towards the bed. A crooked or fitful line made by the cutter gives the edges a rough and uneven appearance. Every bit of this trouble may be gathered up and treasured, for it is of great value for potting purposes. Wheel it away to the compost yard, and lay it by in a heap to rot, and by-and-by it will give excellent soil for *Hyacinths*, *Pelargoniums*, *Fuchsias*, and many other things grown in pots through the summer. In cutting the grass edges to paths, an ordinary garden line should be used when the path is straight. The line should rest on the turf, but be pulled quite tight at each end; but the operator must be careful not to cut it with the edging iron. Our practice is to trim our grass (twice a year in this manner—in January or February, when the weather serves, and again in August. The early cutting allows room for the permanent line of *Crocuses*, which margins our beds, to flower and make their growth.

CROCUSES.—If any one would see *Crocuses* in perfection let them adopt this method. In the first instance, let a trench from 6 to 8 inches in depth be dug about 4 inches from the turf, and at the bottom of this trench put a good layer of leaf soil; and then plant the *Crocuses* in purple, lilac, striped, white and yellow together, and allow them to remain undisturbed for five or six years, or even for a longer period of time. Permanent lines of *Crocus* flower earlier than those planted in the autumn, and with a wondrous profusion of bloom. What if the rich crop of grassy foliage that follows the harvest of blossoms of the

“happy and beautiful *Crocus*” does grow a little rank, it is not obtrusive, and the foliage soon ripens and dies away; or the same plan can be adopted that one sometimes sees in country gardens, where the leaves of the *Crocuses* are tied into knots in a neat and tidy manner.

DAISIES, &c.—There is another simple matter connected with the outdoor garden that requires immediate attention. A spell of frost has a loosening effect on many ordinary border plants, such as *Daisies*, *Pansies*, and others too numerous to mention; the consequence is, the plants are raised up slightly above the soil, and when a thaw comes followed by rain the soil subsides, but the plants are left bare at the roots; and when the worms begin to work about them they are either thrust out of the soil altogether, or so exposed that when warm drying weather sets in they suffer and die. All these should be gone over in the beds and borders, and the soil pressed down firmly about the roots, so as to make them secure. Then, when this is done, let advantage be taken of a drying day or two, and the soil about the plants be stirred on the surface, and some top-dressing added if necessary. Beds and clumps of *Daisies* are fast coming into flower, for it is one of the earliest to bloom of our pleasant spring flowers, and occasional top-dressings of a rich soil about the plants by the root. When the *Daisy* throws out fresh roots, they are produced from what is termed the collar of the plant, i.e., where the stem joins the roots, and they are therefore near the surface, hence the value of top-dressing to keep them growing.

RHUBARB.—By means of a simple contrivance, blanched *Rhubarb* can be had early in the season, if there be convenience for pushing it on into growth. We have seen excellent forced *Rhubarb* grown in a shed, by simply fitting up a bed of soil at one end of it, to the depth of 18 or 20 inches, and by lifting some roots of the earliest *Rhubarb* in the open ground, planting them in the prepared bed, covering them up with some litter, and then they will soon start into growth and throw up their stalks. When leaves are used they are apt to get infested with woodlice, but a little oversight will soon keep them under. *Rhubarb* grown in this way seems doubly welcome—first, because it is obtained before the ordinary supply furnished by the garden is ready and secondly, because the fact that it is grown by the cultivator adds a double zest to its enjoyment of it. It is not absolutely necessary to keep *Rhubarb* entirely dark, but it is best to keep it as dark as possible. In like manner some *Seakale*, which is considered a great delicacy early in the season, might be dark, but, unlike the *Rhubarb*, it should be kept quite dark and free from air. Perhaps it would be best to leave the *Seakale* in the open ground, and force it there, by placing some *Seakale* pots over it, and then covering them up with dung and leaves. The *Seakale* 1865—at least the old-fashioned ones in use a quarter of a century ago—were roomy, and allowed a free growth of the crisp blancher stalks; and that greater delicacy, *Asparagus*, can, by a little scheming, be had quite early. Let an old crate or box 2 or 3 feet in depth be procured, and filled with leaves and dung sufficient to give forth a mild bottom-heat, and over this place a thick layer of good soil, to the depth of 3 or 4 inches. Then pack in as tightly as possible in a single layer some good roots of *Asparagus* and fill in the soil well about the same till they are covered to the depth of at least 2 inches. Unlike the *Rhubarb* and *Seakale*, *Asparagus* needs plenty of light and air; and if the box or crate could be placed in an earlyinery, in which the *Vines* are being pushed on into growth, the development of this popular vegetable will be much accelerated. Nice green stalks are to be preferred for table to long blancher white stems, though the latter are generally assumed to be the most tender eating.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Tying and training should, as time is available, be got on with before the season is so far advanced as to interfere with other work. Other matters will be of a routine character, simply attending to watering when required, the admission of air to the soil well about such that it can be given without injury, and a diligent look-out as to the weather when the wind is in the direction to bring frost.

Heaths.—Soft-wooded autumn-flowering varieties of the *lyemalis* type do not usually receive treatment in their different stages of growth, subsequent to blooming, such as to give them the best chance of surviving longer than the season when they are intended to flower, for the greater number dying as soon, or not long after, they have bloomed; but, nevertheless, an effort may be made to keep them going, and if they can be got to start fairly into growth in the spring they sometimes will live for years. After they have flowered do not let them remain standing closely

together, but give them a good light situation, and do not over-water, yet at the start it must be borne in mind that the soft-wooded *Heaths* cannot bear to be allowed to get so dry at the roots as the hardest-wooded sorts. The latter will now begin to swell their flowers, and must not be suffered to get over-dry, otherwise it will sometimes have the effect of crippling the buds. Finish tying in this department as early after the present time as possible; the plants will look much better when they flower, in consequence of a considerable time intervening betwixt their being tied and their blooming, from the leaves and points of the shoots having time to assume a natural position.

SOFT-WOODED GREENHOUSE PLANTS.—Autumn-stocked cuttings of *Pelargoniums* of the show section should, as soon as they have filled their small pots with roots, be potted on into larger; from 4 to 6 inches in diameter will be large enough for them the first season, according to the size of the plants, or the vigorous nature of the variety: use good loam well enriched with rotten dung, and a little sand, such as has been advised for the larger plants. Any that have not had their points already pinched out, should now be stopped, so as to induce them to break; such as have the several roots should be trained so as to lay the groundwork for the future plant. Keep the whole stock, large and small, free from greenfly by fumigation. *Herbaceous Calceolarias* should be moved into larger pots as they require it, not allowing them to get pot-bound before giving them more root-room. The soil can scarcely be too rich, and if a good quantity—one-fourth—of well-rotted leaf-mould is added, they will do all the better in it. Few plants are more subject to greenfly, and they are impatient of severe sprinkling; consequently, must never be allowed to get much infested with the aphides before they are fumigated. Slight and frequent applications are the safest with these and *Cinerarias*, the large under-leaves of which are injured if submitted to a strong dose of tobacco-smoke. There is no better plan than to always keep in readiness some tobacco-water in a vessel sufficiently large to admit the heads of such plants as the above being dipped as soon as they are found to be affected, which is much better than allowing the insects to spread over the whole before means are taken to destroy it. The useful decorative *Campulula pyramidalis*, both the blue and the white varieties, are worthy of more general cultivation; sown early in the spring they make, if well attended to, fine flowering plants in about sixteen months. Plants sown late spring, or grown from suckers, should now have a light situation, and not on any account be allowed to become stunted for want of pot-room. Keep *Kalosanthes* close to the glass. For ordinary purposes, they are the most useful grown in 6 or 8-inch pots. Do not at this season over-water them, yet they must not be allowed to get so dry as to injure their bottom leaves, which will occur if the soil becomes too dry.

Primula japonica.—To do this plant well it requires very liberal treatment, using rich soil, and giving it plenty of pot room. The soil should be good loam, with one-fifth rotten dung and leaf-mould in equal proportions added, and good sprinkling of water, so that the plants be filled with roots which roots should now have a liberal shift into soil of the above description. They will then flower strongly and well late in the spring. Such as are intended to bloom earlier should be well supplied with liquid manure; they will bear it tolerably strong.

Chrysanthemum should stand at once be put in and drawn. Select such as are moderately stout, and not drawn, placing a couple in a 60-sized pot. They will root freely in a house where the temperature is from 45° to 50°. They are better not covered with bell or hand-glasses, as under such they become drawn, and the leaves subject to damp. They should not be placed on dry shelves, but ought, if possible, to stand on a moisture-holding surface, such as ashes or sand. *T. Baines, Southgate, N.*

ORCHIDS.—The temperature to be maintained during January is the same as that recommended for December. Water must be poured over the floors and benches, to create moisture. *Phalanopsis* on blocks will require frequent syringing; those growing in baskets or in pots should be examined every morning, and have the surface kept damp. *Saccolabium retusum* and many of the *Vandas* will now be showing flower. Cockroaches and woodlice are extremely fond of the young spikes, therefore place poison about the house and use Potatos cut in half and hollowed out to trap the woodlice. Plants of *Calanthe vesiliata* that have gone out of flower should be kept dry until they again start into growth. Many of the plants that have been in pots for some time will possibly show signs of growth towards the end of the month; it is a good practice to place them in the warmest part of the house for a week or two previous to their being potted. *Dendrobium* that are showing flower should receive a moderate supply of water at their roots; they will require an increase of heat and light to encourage the flowers to grow. *Odontoglossum* and *Oncidium* will be coming into flower about this time; they must be well supplied with water at their roots, otherwise the bulbs

will shrivel. Any new or rare plant which it is desirable to grow into a specimen as quickly as possible, rather than to induce it to bloom for a season, should be encouraged to grow by placing it in more heat and moisture. If any of the pseudo-bulbous Orchids have more than three or four old bulbs, and only one leading growth, the plant should be cut in two between the bulbs; but be quite sure the eyes are sound before you cut them, otherwise you will lose the back bulbs altogether. The best time to operate on them is just after they are showing signs of growth. *Miltassia* generally break freely enough, except *M. candida grandiflora*; this sometimes requires cutting to produce back breaks. Let all the potting material be ready, as recommended last month, as repotting and top-dressing must be proceeded with next month; also have some hard wood in readiness for blocks. *G. Baker, Clapham Common.*

FLOWER GARDEN, &c.

PARTERRE AND MIXED GARDEN.—Should we get continuance of weather unfavourable to outdoor work, labour may be profitably employed in preparing a good stock of neat stakes of different sizes, suitable for such things as Ricinus, Dahlias, Hollyhocks, and other large growing plants, and smaller sizes for Gladioli, Phloxes, &c. If not already done, the plan of proposed arrangement for the summer bedding should be got out and decided on. By doing this early it will afford a good opportunity of preparing the soil properly for the intended occupants, such as such things as *Calceolarias*, *Violas*, *Verbanas*, and other moisture-loving plants, the beds should be specially prepared by trenching at least 2 feet deep, and if the soil is at all light, with porous subsoil, add a good dressing of stiff loam or clay and some rotten manure, and mix these in with the bottom foot or so of soil. Unless the beds contain very poor soil, trenching will be sufficient for such things as *Pelargoniums*, as they produce their flowers more freely when not encouraged to make too much growth, but nevertheless the trenching will be found of great benefit, as it enables them to root deeply, and withstand the effects of drought. Beds intended for the bronze, tricolor, or gold-leaved section, should be more liberally treated, as these are grown for the beauty of their leaves, and require rich feeding in order to develop them to perfection, and to bring out their colour. This class will now require a little more warmth to start them into growth to afford a supply of cuttings, as these form the best plants to grow on for the following year. Golden Chain will be the most effective of all the yellow-leaved section, but the plants should be at least a year old before they are turned out, and be planted in deep rich soil. A rough estimate of the quantities of the respective kinds of bedding plants should be got out, and if there is likely to be any deficiency, stock plants should be set to work at once to give a supply of cuttings. The beautiful soft lavender-coloured *Ageratum*, *Impatiens Dwarf*, propagates very freely in spring, and a few stock plants in moist heat now will afford any quantity of cuttings. Our stock last winter was only six plants, and from these we propagated nearly 2000. Seedlings are never satisfactory, as they are very irregular in height, and spoil the uniformity of the bed. Spring struck *Verbanas*, too, are much to be preferred, as they grow on without a check, and soon cover the bed. A few pots put to work now in gentle heat will soon give a supply of cuttings. *F. Sheppard, Woolverstone Park.*

FRUIT HOUSES.

PINES.—In the progress of plants which are swelling off fruit, and those which are required to make growth and start into fruit speedily, very much depends upon proper attention and good treatment at this season, because so little assistance is obtained from natural causes. Unvarying attention should be given to artificial help in this way; syringe what available surfaces are considered fit for it twice every day, and moisten the pathways, &c., as they need it; and plants should also be syringed overhead occasionally during the afternoon, when the axils of the leaves become dry. At some places it is usual to syringe the surface of the bed between the plants, but this practice is attended with so much danger from the water which is used in that way being conveyed to the collars of the plants by the leaves, and over-saturating them with moisture there, that it is best left alone. Evaporating troughs are likewise used, which are cast or fixed on the heating apparatus; these, being filled with manural or other water, are almost incessantly kept steaming away; this vapour, which is oftentimes produced by highly heated pipes, or that which rises from the troughs when the quantity is very much reduced by evaporation, is of such a nature as not to be likely to prove beneficial to vegetation; therefore the practice has for a long time been discontinued here in those houses where high temperatures are maintained, without in the slightest degree affecting ordinary results. Fritting plants and starters should now have a mean tem-

perature of about 70°, varying it 5° according to external aspects; with sunshine open the house at 80° or 85°, and close it at about that degree—at the same time utilise sunshine for heating purposes as much as possible whenever practicable. About the commencement of next month another lot of Queens or other kinds should be started, to supplement the supply of fruit from those plants which are already introduced for that purpose. Beds having hot-water pipes under them can soon be made fit to receive such plants, but it is not the case where fermenting materials alone are used; this matter should be seen to at once, and 85° to 90° should be obtained for this purpose. When plants which have been kept somewhat drier are to be started, if the heat in the bed is well up, see that the balls of the plants are made thoroughly moist, so that with additional heat root-action may directly take place. A night temperature of from 58° to 65° will suffice for other stock, and from 58° to 10° more in the daytime, according to circumstances. *G. T. Miles, Wycombe Abbey.*

MELONS.—If not already done, sow at once for the first crop. The seeds may either be sown singly in small 60's, or a dozen seeds may be placed round the edge of a 32-pot, to be afterwards potted off into 60's. In either case the pots should only be about two-thirds filled, covering the seed about half an inch, and be placed in a brisk bottom-heat of from 75° to 80°, top-heat 70°. A mixture of leaf-mould and light loam in equal proportions, with a moderate dash of sharp river or road sand, pressed gently down, will form a nice porous compost for the young rootlets. The pots should be well drained for this early sowing. I have studiously avoided recommending any particular sort, and, with your permission, will adopt the same course during the ensuing year, for long experience has taught me that it is not the variety, so much as the treatment, that results in a well-finished and richly-flavoured fruit. *T. Simpson, Broomfield Lodge.*

CUCUMBERS.—Never, perhaps, was the wisdom of getting the plants out so well established before the very short days set in more manifest than this year, when the weather has been such as to render their progress at the best but very slow. The autumn fruiter, however, which were sown early in September, are yielding very good supplies. It is now that Cucumbers realise a high price. The temperatures advised, and the directions as to watering and atmospheric moisture, in the last Calendar, should still be maintained. Continue to cut over the foliage once or twice a week, removing weakly and exhausted growths, and lay in from time to time as much of the young bearing wood only as will ensure every leaf receiving a due proportion of light. Still keep a sharp eye for canker, and do not omit to apply a moderate dusting of flowers of sulphur weekly. The autumn fruiter, under favourable conditions, and such as I have advised, yield a good supply for the house, for good or more; those, however, who have followed my advice, and who possess the necessary structures, will have no necessity for making further sowings at present. Those, however, who do not indulge in winter Cucumbers, but require a supply early in spring, had better sow a few seeds forthwith, observing the same conditions as are laid down for Melons. It will now take six or seven weeks between sowing and planting out. *T. Simpson, Broomfield Lodge.*

KITCHEN GARDEN.

THE MUSHROOM HOUSE.—The earlier Mushroom-beds, which have produced abundant crops, will now be showing signs of exhaustion. Where there is good drainage and the materials were not too greatly decomposed at the time the beds were made up, it is possible to resuscitate the waning vigour of the beds by giving to each a good soaking of water heated to about 100° Fahr., and into which about one pint of common salt to every six gallons of water has been well stirred. At the same time the temperature of the house should be raised to about 80° or 85°, if possible. Beds in full bearing should be surface sprinkled frequently with tepid water, but care should be taken not to allow the bed to become too wet, or soddened with moisture; because if such a condition is brought about, it will too forcibly induce decomposition, and even if the delicate mycelium be not destroyed, which is not at all improbable, the crop will cease to be as abundant as it should be. Later beds, which are just beginning to produce their crops, must be treated very carefully at this particular season of the year in regard to watering. If the beds are known to be formed of light, somewhat dry materials, and especially if they are placed immediately over pipes or flues, and hence are in no danger of becoming, and remaining too wet, they will require watering frequently and freely; otherwise at such a stage a very moderate amount only must be given, so that the main object to be accomplished is followed by a slight increase in the temperature. When beds are in bearing give air daily for an hour or so, along with abundant light, as this enhances both their flavour and the quantity or permanency of their texture, which is quickly exemplified

under the cooking process, by all who test these against those drawn up in dark, airless structures or situations. It is admissible to use good thick coverings of dry warm hay upon all beds placed in positions where a sufficient supply of artificial heat cannot be insured. William Earley.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 13, 1875.

Table with columns: MONTH AND DAY, BAROMETR. (Mean Reading, Reduced to Sea Level, Difference from Average of 63 Years, Highest, Lowest), TEMPERATURE OF THE AIR (Range, Daily, Mean of Month, of Year), Hygro-metric Deductions from Glaisher's Barometer (Dew Point, Degree of Humidity, Sat. - 100), WIND (Average Direction), RAINFALL (Inch).

In the suburbs of London the reading of the barometer at the level of the sea decreased from 30 inches at the beginning of the week to 29.95 inches by the morning of the 3d, increased to 30.08 inches by the evening of the same day, it then decreased to 29.80 inches by the evening of the 4th, again increased to 30.17 inches by the morning of the 8th, and then decreased to 29.88 inches by the end of the week. The mean reading for the week was 29.95 inches, being 0.18 inch lower, than that of the preceding week. The mean daily readings were all in excess of their averages except that of the 4th, which was 0.07 inch in defect.

The highest temperatures of the air at 4 feet above the ground ranged from 51° on the 4th and 41° on the 7th, the mean for the week being 47°. The mean of the seven low night temperatures was 40½°, the extreme values being 44° on the 4th and 38° on the 8th and 9th. The mean daily range of temperature was 6½°, ranging from 0° on the 6th to 23° on the 7th. The mean daily temperatures of the air were all above their averages, the values being -3d, 46.4°, 4th, 47.6°, 5th, 45.6°, 6th, 44.7°, 7th, 40.5°, 8th, 39.7°, 9th, 41.6°, and their departures in excess of their respective averages were 9.7°, 11.2°, 9.4°, 8.7°, 4.2°, 3.4°, and 5.3°. The mean temperature for the week was 43.7°, being 7.3° above the average for the corresponding week, as deduced from sixty years' observations.

The highest readings of a thermometer with blackened bulb in a place on grass in sun's rays, were 74° and 90° on the 5th and 6th on the 7th and 8th it did not rise higher than 45°. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 34½° on the 6th, and 35° on the 5th, 8th, and 9th, and the mean for the several low readings was 36½°.

The weather during the week was generally cloudy, dull, and mild. The direction of the wind was generally S.S.W., and its strength gentle. Rain fell on five days, the amount being 0.27 inch.

In England the extreme high temperatures observed during a day ranged from 51° at Bristol to 45° at Hull, the general average all over the country being 40½°. The extreme low temperatures observed by night varied from 30½° at Bristol to 32° at Manchester, with a general average of 36°. The mean range of temperature in the week from all stations was 13½°, varying from 17½° at Manchester to 11° at Hull. The mean of the seven high day temperatures ranged between 48½° at Bristol and 41¼° at Nottingham and Hull, the general average being 45½°. The mean of the seven low night temperatures ranged from 41¼° at Bristol to 35½° at Hull, with an average value of 38°. The mean daily range of temperature in the week was 7½°, the greatest range being at Eccles, 9½°, and the least at Nottingham, 5½°. The mean temperature of the air for the week was 41½°, being 3° above the average of the corresponding week in 1874, 5½° below

that of 1873, and 13° above that of 1872; it was 15½° above the mean temperature of the preceding week, the highest in the week occurred at Bristol, 44½°, and the lowest at Hull, 38½°.

Rain fell on the first three days of the week at most stations, varying in amount from eight-tenths of an inch at Bristol to one-tenth at Leicester, the average fall over the country was four-tenths of an inch.

The weather during the week was dull and very mild; the sky was generally covered with cloud.

In Scotland the highest temperatures ranged between 52½° at Leith and 45° at Dundee and Aberdeen, the lowest temperatures varied from 32½° at Glasgow to 29° at Perth, their respective averages being 49½° and 31°. The mean range of temperature in the week was 8½°. The mean temperature for the week was 40½°, the highest being at Glasgow, 44½°, and the lowest at Dundee, 38°. Rain fell at Greenock to the amount of 2 inches, but at Aberdeen four-tenths of an inch only was measured. The average fall over the country was 1½ inch nearly.

At Dublin the highest temperature was 58°, the lowest 26½°, the mean 46½°, and the rainfall 0.11 inch.

Enquiries.

35. FINOCHIA. - R. T. S., Co. Cork, wishes to know where he can get seeds of this plant. He does not see it mentioned in any catalogue at his command.

Answers to Correspondents.

ANNUALS: Amateur. The following twelve sorts of annuals are, on the whole, early to flower, of dwarf growth, and bright and distinct in colour: - Candy-tuft (White Rocket and dark crimson), Collinsia bicolor, C. violacea, Eucharidium grandiflorum, Godetia Wilneyi, Leposiphon roseum, Nemophilis insignis, N. maculata, Saponaria calabrica, Silene pendula, and Virginian Stock. They should be sown in the new ground, where they are to flower, as early in March as possible. The Stocks and Asters to succeed the annuals should be sown in prepared beds, in a cold frame, or in shallow boxes, if placed in a greenhouse. If they could be once transplanted previous to being placed into the border, to succeed the annuals, the plants would be all the better for it.

BOOKS: H. H. Cuthill on market gardening, and W. Paul on pot Roses. Briars are obtained from itinerant collectors who traverse the country to obtain them.

BOTANICALS: W. Wood. We cannot name garden varieties. No. 1 appears to be Hogarth's.

COCA-NUT REFUSE: G. W. Most plants root very freely into this substance, and it forms a very good substitute for leaf-mould in all light composts such as may be used for newly struck cuttings of soft-wooded plants, seedlings, &c. For the root of a plant, after potting such plants as these and others of a more permanent character, it requires a proportion of the usual potting soil to give it body, and plenty of grit should be used. It is not to be recommended for Orchids, nor for plants like Heaths, which require a special compost.

DABIJAS: A Young Amateur. Divide each old root into two or more parts, each having a portion of the bud-producing "collar" and a good sound tuber firmly attached. Pot each into a rich open compost, and place them in a light airy temperature of 45°. Do not hurry their growth, but when this begins keep only the strongest shoot on each, and induce it to grow as robust as possible up to planting-out time.

DOUBLE ACROSTIC: H. H. B. Anticipated. See p. 25, January 2.

GARDENIA BUDS FAILING: D. Cameron & Son. The cause of your Gardenia buds turning brown is probably due to a too languid root action, resulting from an insincerity of water at this season, when the plants require an additional incentive to activity. We fear the loss is irremediable, otherwise we would recommend you to raise the temperature to 60° by night, and 65° by day, with frequent sprinklings overhead, when the moisture-water already given may be assimilated by and aid them, not otherwise.

GLAZING: J. H. Howard. If a working model is forwarded we shall then be in a position to express an opinion on the matter, but obviously cannot do so unless we see the system. You might also send a model to one of the meetings of the Royal Horticultural Society for exhibition.

HEATING GREENHOUSES: Amateur. You should fix sufficient pipe to warm the house by means of a stove placed in an enclosed case just outside the house, or, if a gas stove can be employed and the products of combustion certainly carried out of the house, the stove itself might stand inside in some convenient spot not too contiguous to the plants. We have no faith in heating by means of stoves only placed inside the house.

HOGES: Amateur. The best and quickest growing covercrop for affording shade to your young plants is the Holly, which would do well in your heavy soil, if well drained and well worked and enriched, so as to make it friable ready to planting.

HOLLYHOCKS, FLEARGONIUMS, &c.: A Young Amateur. Place 6 inches of ashes in the frame, upon

which again place slates, and stand the pots on these. Place also an external covering over the glass at night, leaving a little air at the back all night, whilst the plants are burning. Water sparingly, and let every plant which requires it be brought out of the frame and receive a good soaking before it is returned.

HOLLY LEAVES: J. S., Warwick. They may be gathered any time when in good condition. We will name them if you are moderate in your demands. We do not know of any book on drying flowers.

INSECTS: S. B. No. 2 is terribly infested by the thrips: give it three or four good fumigations with tobacco smoke at intervals of three or four days, and watch afterwards to see they do not reappear. Or you may dip the head of the plant, if removable, in some of the insect-destroying washes, as Abyssinian Mixture or Fowler's Insecticide. It has been in too dry a day to root, but, atmosphere. We do not see that No. 3 has sustained any injury. The dying off and curling of the fronds are quite likely to have arisen from drought at the root, especially if the position "near hot-water pipes" is a new one for it.

MAGNOLIA GRANDIFLORA: C. S. Yes.

MARY WHEAT: E. O. H. There is so much deception and misapprehension about this, that we are extremely sceptical about the matter. Is your straw Wheat-stalk at all? We suppose not, from your description. NAMES OF PLANTS: H. Huntley, 1, Cypripedium venustum; 2, C. barbatum. - Antony, Helleborus niger, - New Zealand, Lotus tetragonolobus, an introduced plant. - 7, E. G. D. - 8, C. Robus australis, var. cisissoides. - H. T. No. 4 proves to be a small-pinnled form, or starved condition, of Adiantum Capillus-Veneris.

ORANGE TREES: J. S. We can only attribute the simultaneous fall of the leaves, along with the blooms, to the probable fact that during the past summer the soil had become too dry, and possibly it has never been thoroughly soaked through since. If you have any doubt on this point, place end puddle clay around the outsides of the tubs, and give many waterings in such manner that the water may be forced to percolate down through the very centre of the soil of the tub.

PROPAGATING THUJAS, &c.: S. G. S. Arbor-vitae and similar evergreen trees can be propagated by cuttings, put in in summer in a cool frame, and when callused removed into heat; but the process is slow and altogether too tedious for an amateur.

RAINFALL: J. H. H. Synmond's British Rainfall is probably what you want.

ROSES: A Lover of Roses. In your case, we think it would be worth the expense to build a Rose-house such as you describe; but as to what it would cost to build such a house in your locality, we cannot say. A local builder would be the best authority.

FOREIGN SUBSCRIBERS. - We are requested by the Publisher to desire Foreign Subscribers who send Post Office Orders, to be good enough to write to the Publisher at the same time, stating that they have done so.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

COMMUNICATIONS RECEIVED. - E. P. G. (second of receipt). - S. J. E. L. H. R. - B. G. W. - W. H. - W. P. - W. S. - W. W. - J. R. - J. - P. L. - R. - C. W. Y. - S. E. - D. T. F. - J. H. - G. S. (shall be glad to hear from you). - J. T. G.

Markets.

COVENT GARDEN, January 14. The market remains much the same as last week. Imports are less from France, comprising saladings, Artichokes, Apples, and some first-rate Easter Beurré Pears. The latest cargo of St. Michael Pines came in capital condition, realising fair prices. Thos. Taylor, Wholesale Apple Market.

Table of market prices for various goods including Asparagus, Beans, Beet, Broccoli, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Horse Radish, Lettices, Onions, Parsley, Parsnips, Radishes, Shallots, Salsify, Tomatoes, Turnips.

Table of market prices for various fruits including Apples, Chestnuts, Currants, Muscats, Lemons, Oranges, Pears, Peaches, Walnuts, Potatoes, Early Shaw's, Early Regents, Early Dons.

CUT FLOWERS.

Table listing various cut flowers such as Azaleas, Camellias, Carnations, and Cyclamens with their respective prices and quantities.

PLANTS IN POTS.

Table listing various plants in pots including Begonias, Bouvardias, Chrysanthemums, and Cyclamens.

SEEDS.

LONDON: 77s. 13. We have to report an improved demand for agricultural seeds. Advice from New York describes the Clover market somewhat excited, and values hardening.

CORN.

Owing to the subsidence of frosty weather, the trade at Mark Lane on Monday was depressed. Dry Wheat receded from 1s. to 2s. per quarter.

CATTLE.

At the Metropolitan Market on Monday there was an over-supply of choice quality beasts. Trade was dull, but at scarcely any reduction in price.

HAY.

There was a full supply of fodder at Whitechapel, but trade was steady, and no material inquiry prevailed for the better descriptions.

POTATOS.

The Borough and Spitalfields markets report moderate supplies of Potatoes on sale, and trade slow at the subjoined quotations.—Regents, 9s. to 11s. per ton.

COALS.

In the market on Monday "best" house coals fell 6d. per ton, whilst "seconds" were unchanged.

SPECIAL OFFER

- To the Trade Only. RASPBERRIES, Red Antwerp... per 1000 30 0. LAURUSTINUS, in pots, very bushy... 25 0.

WILLIAM RUSHFORTH, Seed Merchant and Nurseryman—Nursery, Woodhouse Hill, Hunslet; Seed Establishment, 40, Year Lane, Leeds.

SELECT VEGETABLE SEEDS.

- BROCCOLI—Witty's Conqueror, the best late Broccoli in cultivation; has always stood the severest winters without injury. Price 1s. 6d. per packet.

SPECIAL TRADE OFFER.

- ASPARAGUS, strong, 2-yrs. and 3-yrs., 15s. to 20s. per 1000. COUSEBERRIES, strong, 16s. per 1000.

To Planters and the Trade.

MESSRS. MASTERS AND KINMONT

- call to get the attention of Planters and the Trade to their stock of the following trees, which can be furnished at low prices. LIMES, 7 to 9 feet, clean grown.

Special Offer to Noblemen, Gentlemen, the Trade, and OTHERS engaged in PLANTING.

- WITTY AND SON have the following WITTY FOREST FRUIT TREES, ORNAMENTAL TREES, and SHRUBS to offer, which are all fine transplanted stock.

ASPARAGUS PLANTS from imported Seed in quantities of 1000s, 500s, 250s, 100s, 50s, 25s, 10s, 5s, 2s, 1s, 6d. per 1000.

Monro's Duke of Edinburgh Cucumber. MONRO begs to inform the Trade that he has supplied the Steam Printing Works of H. M. Pollett, 12, Bridgewater Gardens, Barbican, London, E.C.

WELLINGTONIA AUREA

VARIEGATA. Planted by H.R.H. the Prince of Wales at Sandringham. Planted by H.R.H. the Princess of Wales at Blenheim.

JAMES TYNAN, Seed Warehouse, 68, Great George Street, Liverpool, offers:—GLOXINIA CRASSIFOLIA GRANDIFLORA—Magnificent and distinct strain; leaves broad and fleshy, recurring 20s to 40s.

STEPHANOTIS FLORINDUA—Fine variety from Mauritius flowering profusely at every joint, and possessing a high degree of delicate fragrance of this beautiful climber. 1s. 6d. per packet.

DOUBLE PENTINA, large flowering.—Will produce a large percentage of splendid double flowers, and charmingly varied shades of colour. 1s. 6d. per packet.

JOSEPH SMITH, JUN, Moor Edge Nurseries, Tandem near Middlesbrough, offers:—BROOM, 2yrs. 3s.; White, 2yrs. 5s.; PRIVET, 2yrs. 4s.;

NEW and SELECT VEGETABLE SEEDS. BROCCOLI, Christie's Self-Protecting Late White.—This valuable Broccoli has been raised by Mr. Christie of Aswarby, and is pronounced by all who have seen it to be the finest self-protecting late variety.

BORECOLE, Variegated Triple-curled, extra selected.—This stock includes all the best varieties of Borecole, for garnishing, the embellishment of the flower garden, the dimmer-table. Price 6d. and 1s. per packet.

BRUSSEL SPROUTS, Rosobery, extra selected.—Price 6s. per ounce.

CELERY, Dixon's X.L. Red.—A very strong grower, early, hardy, remarkably solid and crisp. Has obtained a First Prize wherever exhibited during last season, and is acknowledged to be a very decided acquisition. Price 1s. 6d. per packet.

CUCUMBER, Burnett's Perfection.—Growing from 24 to 30 inches long, fine flavour and very productive. Price 1s. 6d. per packet.

CUCUMBER, Rollinson's Telegraph.—True, handsome, and very prolific.

LETTUCE.—Dixons's Champion Green Cos still maintains its well-known reputation as being the largest and most prolific Lettuce in cultivation. Price 6d. and 1s. per packet.

PEA, Dixon's Yorkshire Hero.—My stock of this magnificent variety of the wrinkled Marrow is grown from the original stock introduced by me a few years ago. It is exceedingly prolific, hardy, and gives a very early and good crop of stem. The Pea, of a most delicious Marrow flavour, is fourteen days earlier than Veitch's Perfection, and withstands the effects of mildew better than any other variety. Price 1s. 6d. per quart.

TURNIP, Silver Ball.—A superb white, solid root, fine shape, and very tender and delicious; very select stock. Price 1s. 6d. per ounce packet.

EDMUND PHILIP DIXON, The Yorkshire Seed Establishment, 57, Queen Street, and 75, 76, and 77, High Street, Hull.

THE FINEST BROCCOLI IN CULTIVATION, COOLING'S MATCHLESS.

G E O R G E C O O L I N G

Begs again to offer Seed of the above now well known Broccoli. It has taken its rank as one of the finest self-protecting varieties grown, coming into use immediately after Snow's Winter White, with immense pure white heads of a pyramid shape, very close, and of a delicious flavour. It was awarded a First-class Certificate by the Royal Horticultural Society when first exhibited, and has upon several occasions since been shown and Specially Commended, and again obtained the First Prize in a strong competition at South Kensington last spring.

Price 1s. 6d. per packet.

Price to the Trade per Hundred Packets or per Pound on application.

JOHN MATTHEWS (late C. PHILLIPS),
Manufacturer of TERRA COTTA VASES, FOUNTAINS, ITALIAN BASKETS, FLORAL ARBORETTES, STATUARY, GARDEN POTS (from 2 to 30 inches in diameter), of superior quality, withstand frost, and do not become green; EDGING TILES, &c. See specimens in the Royal Horticultural Gardens. Price List free. Books of Drawings, 7d. each.

JOHN MATTHEWS, Royal Pottery, Weston-super-Mare.

Rosher's Garden Edging Tiles.

THE above and many other PATTERNS
are made in materials of great durability. The planer sorts are especially adapted for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. **GARDEN VASES, FOUNTAINS, &c.,** in Artificial Stone, very durable and of superior finish, and in great variety of design. **ROSHER and CO.,** Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BIKES.

Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES,
for Conservatories, Halls, Corridors, Balconies, &c., from 24. per square yard upwards. Pattern Sheets, of plain or more elaborate designs, with prices, sent for selection.

WHITE GLAZED TILES for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds, Roofing Tiles in great variety, Slates, Concrete, &c.

F. ROSHER and CO., Brick and Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truck Load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. **FLINTS and BRICK BURKS** for Rockeries or Fereries. **KENT PEATS or LOAM** supplied at lowest rates in any quantities.

F. ROSHER and CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount to the Trade.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER,
24, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability.

For Neatness,—Because all the Wires are kept perfectly tight, without the use of the Raddisour.

For Strength,—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.

For Durability,—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system.

The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 73½ yards long, wired on both sides, making a total length of 206½ yards,—our system being chosen in preference to any other.

Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

CONSERVATORIES, HOTHOUSES, GREENHOUSES, &c.,

MANUFACTURED BY STEAM-POWER MACHINERY.

THE BEST MATERIALS, THE BEST WORKMANSHIP, THE LOWEST PRICES, PRACTICAL ADAPTATION.

Notice.

MIDLAND HORTICULTURAL WORKS,
LOUGHBOROUGH, January 1, 1875.

T. G. MESSINGER has pleasure in informing his Patrons that in consequence of the continued increase of his business as a General Horticultural Builder and Hot Water Engineer, arrangements have been made by which, in order to provide adequately increased supervision and to extend the facilities for supplying the very liberal demand of his Patrons, the business will in future be carried on under the style of "**MESSINGER and COMPANY,**"

by whom the existing contracts will be carried out. All amounts due to or from him will also be received and paid by the Company. **T. G. MESSINGER** takes this opportunity of thanking his Friends for their very extensive favours kindly bestowed upon him during the past 20 years, and to solicit on behalf of the new Firm a continuance of their patronage, having confidence that, with the arrangements now made, the fullest satisfaction will be given.

MIDLAND HORTICULTURAL WORKS,
LOUGHBOROUGH, January 1, 1875.

In taking to the above Business, **MESSINGER and CO.** beg to assure the Nobility, Gentry, Nursermen, and Public generally that it will be their endeavour, by faithfully carrying out all contracts entrusted to them, and at the most moderate rates consistent with the use of the best materials and workmanship, to merit an increased patronage; and they trust by the present extension of the Firm—the interest and services of **T. G. MESSINGER** being retained in the business—to increase the attention given to all departments, and consequently to insure even greater efficiency, and more rapid execution of works undertaken.

P.S.—Please Address all Letters, "**MESSINGER and COMPANY.**"

**AGRICULTURAL LOCOMOTIVES,
STEAM PLOUGHING MACHINERY,
ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
STEAM ROAD ROLLERS.**

For Prices, Description, and Reports of Working, apply to the Manufacturers,

**AVELING & PORTER,
ROCHESTER, KENT; 72, CANNON STREET,
LONDON, E.C.; and 9, AVENUE MONTAIGNE, PARIS.**

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The Two Medals for Progress and Merit were awarded them at Vienna for their **STEAM ROLLERS and ROAD LOCOMOTIVES;** and at the last trials of the Royal Agricultural Society of England their **AGRICULTURAL LOCOMOTIVES** gained the First Prize after exhaustive trials, when one of their 20-horse power Engines, fitted with single slide and ordinary locomotion, indicated 1 1/2 horse power with a consumption of 3 1/2 and one-fifth pounds of coal per horse-power per hour.

THE THAMES BANK IRON COMPANY

(Successors to LYNCH WHITE),

OLD BARGE WHARF, UPPER GROUND STREET, LONDON, S.E.,

THE THAMES BANK IRON COMPANY

(Successors to LYNCH WHITE). Old Barge Wharf, Upper Ground Street, London, S.E., ERECT HOT-WATER APPARATUS complete, or supply BOILERS of all kinds. PIPES and CONNECTIONS at Wholesale Prices. Price List on application, or six stamps for Catalogue.

TRIAL OF HOT-WATER BOILERS.

Winter is the Season to Test the Efficiency of a Hot-Water Apparatus.

At the Pine-Apple Nursery the Hot-Water Apparatus, on the “One Boiler System,” is allowed to be the most perfect of any in the World. The Hothouses are equal to 3000 feet in length, and the Winter Garden Conservatory is 100 feet by 100 feet. The Hot Water circulates through 12,700 feet of Cast Iron Pipe.

Gardeners are most respectfully invited to Visit and Inspect the whole.

THE **PINE-APPLE NURSERY COMPANY,** 32, MAIDA VALE, EDGWARE ROAD, ST. JOHN'S WOOD, W.

The “Victoria” Hot-water Circulator.

THE ONLY APPARATUS thoroughly adapted for its purpose. No other possesses half the merits and advantages. Warranted for ten years. Also guaranteed to far surpass and give much more satisfaction than the common Boilers. A break-down never yet known. See Illustrated Prospectus and Testimonials from most eminent men, sent post free.

Patronised by H.R.H. the Prince of Wales. The Gardens, Sandringham, October 29, 1874. DEAR SIR,—I am in receipt of your Warranty, and am now able to tell you, after my having tried all kinds and all sizes of Boilers for the last twenty-five years, that your Hot-water Circulator beats them all—not by a head, but it is a simple walk over for economy and power. I think I may say, we shall never need any further resources for a thorough good Boiler. I am, dear Sir, yours truly, CHAS. PENNY, Messrs. Cannell & Co. P.S.—You are at liberty to make what use you like of this.

HOT-WATER CIRCULATOR COMPANY, 43 and 49, King Street, Woolwich, S.E.

MR. MECHE'S AGRICULTURAL ADDRESS.

In reply to many inquiries, I beg to state that the record of my thirty years' endeavours to stimulate horticultural Progress are contained in two Volumes, entitled—**HOW TO FARM PROFITABLY, and PROFITABLE FARMING.**

These contain my Lectures, Speeches, Letters, and Accounts and Balance Sheets, up to 1874. An additional Volume will probably be added in 1876. My sole office in publishing them is to benefit British Agriculture.

Messrs. ROUTLEDGE & SONS, Broadway, Ludgate Hill, London, E.C. are the publishers, and they supply the Booksellers and Railway Stations. J. J. MECHE. Trentee Hall, Kelvedon, Essex, January, 1875.

Just published, in post 8vo, price 57. 6d., **TWENTY YEARS OF GENTLEMEN FARMING** at Blennerhassett, with Co-operative Objects. By W. LAWSON, C. D. HUNTER, F.C.S., and others. London: LONGMANS AND CO.

In the Press. In One Volume, crown 8vo, **HANDY BOOK OF CONIFERS, RHODODENDRONS, AMERICAN PLANTS, and other FLOWERING SHRUBS**, suitable for the Climate and Soils of Britain. With descriptions of the best kinds, and containing Useful Hints for their successful Cultivation. By HUGH FOSTER, Fellow of the Botanical Society of Edinburgh, and Wm. BLACKWOOD and SONS, Edinburgh and London.

THE NEW METHOD OF GROWING FRUIT and FLOWERS. By the Rev. J. FOUNTAINE, Southacre, Brandon, being a practical combination of Vinery, Orchard House, and Conservatory, as now worked in a new house erected for the purpose at Chiswick. Fourth Edition, illustrated.

Free by post for seven stamps to the *Journal of Horticulture* Office, 171, Fleet Street, E.C.; or to the Author.

BELGIAN. BULLETIN D'ARBOICULTURE, de HORTICULTURE, et de CULTURE MARAICHERE. A monthly horticultural society with superb coloured Plates and Illustrations. Published since 1855 by A. BURVENICH, E. PYNABET, E. ROUGAS, and H. J. VAN HULLE, Professors at the Horticultural School of the Belgian Government at Ghent. Post paid 10s. per annum. H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

In Imperial 8vo, printed on fine toned paper, with Eleven Illustrative Plates, **THE NATURAL PRINCIPLES OF THE LANDSCAPE GARDENING.** Post-free 7s. 6d., from JOSEPH FORSYTH JOHNSON, Landscape Gardener, and Curator of the Royal Botanic Gardens, Chiswick, Middlesex.

SIMPkin and MARSHALL, London; Mr. JOHN HEWWOOD, Manchester.

Notice. ENLARGEMENT OF “THE GARDENER.”—Owing to the rapidly increasing demands upon the space of *“The Gardener,”* a Journal of Rural Pursuits, the Proprietors have determined to permanently enlarge the paper to thirty-two pages weekly, without extra charge.

The Journal contains Articles, News, and Reports upon Fishing, Shooting, the Kennel, the Stable, Natural Science, Travel, Emigration, Farming, Gardening, Cage Birds, Bees, Poultry, Fingones, Rabbits, Cricket, Racing, Athletics, Aquatics, Golf, Tennis, Billiards, and other sports, and illustrations are frequently given.

The enlargement will take place with the commencement of the fourth Volume on January commencing Quarterly, on 22, 28, 8d.; Half-yearly, 5s. 4d.; Yearly, 10s. 8d., post-free. The present is the bestly possible time to begin a subscription.

Office: 32, Wellington Street, Strand, London, W.C.

THE CULTIVATOR.—A Portuguese Monthly Agricultural Journal, which circulates in Portugal and her Possessions, and in the Principal Towns of the Brazils.

This Paper offers an excellent medium for Advertisements of every description of industry and of every article of consumption in the countries and places above mentioned.

Advertising charges, 8d. per square inch, Translation included.

Ten per cent. Discount for six months; 20 per cent. Discount for twelve months, if paid in advance. Address, The Editor of the *Cultivator*, St. Michael's, Azores.

Works on Botany, by Dr. Lindley.

THE VEGETABLE KINGDOM; or, THE STRUCTURE, CLASSIFICATION, AND USES OF PLANTS. Illustrated upon the Natural System. In One Volume, 8vo, cloth, price 25s., with upwards of 500 Illustrations.

EXTRACT FROM THE AUTHOR'S PREFACE. “The Vegetable Kingdom contains an almost large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic economy. The principal part of the plants which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the *Vegetable Kingdom* of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater whole would have been necessary to bring under the notice of purchasers; and secondly, because experience shows us that who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects.”

By the same Author. **INTRODUCTION TO BOTANY.** Fourth Edition, greatly enlarged; with six Plates, and numerous Wood Engravings. Two Volumes, 8vo, 24s.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

LONDON:

HENRY G. BOHN,
18, HENRIETTA STREET, COVENT GARDEN, W.C.

THE AGRICULTURAL GAZETTE,

A WEEKLY ILLUSTRATED JOURNAL FOR

LANDOWNERS AND TENANT FARMERS,

Published by W. RICHARDS, 7, Catherine Street, Strand, London, W.C.

Price Fourpence; Post Free, Fourpence-Halfpenny.

THE AGRICULTURAL GAZETTE
gives Weekly Reports of the Metropolitan and chief
Country Corn and Meat Markets; Manure and Seed Markets;
Wool, Coal, Hop, Hay, and Vegetable Markets, and the Cheese
Markets of Derbyshire, Somersetshire, Cheshire, and Glasgow.

THE AGRICULTURAL GAZETTE
is the Tenant Farmer's Journal, and has published, during
the past year, Contributions and Communications from Land-
lords and Tenant Farmers in fifty-six Counties in England,
Scotland, and Ireland.

THE AGRICULTURAL GAZETTE
is the Weekly Reporter of the proceedings of all Agricul-
tural Societies, and has during the past year reported the
Meetings and Discussions of the Royal Agricultural Society of
England, the Highland and Agricultural Society of Scotland,
the Bath and West of England and Southern Counties Agricul-
tural Association, the Yorkshire and all other County Agricul-
tural Societies, Chambers of Agriculture, and Farmers' Clubs.

THE AGRICULTURAL GAZETTE
is a Weekly Illustrated Agricultural Journal, and has
published during the past year nearly 500 Engravings, in-
cluding Woodcuts of Agricultural Machines, Portraits of
Noteworthy Agriculturists, Plans of Cottages and Farm
Buildings, Portraits and Diagrams of Particular Cattle, Sheep,
and Pigs, Illustrations of Colonial Agricultural Life, Illustrations
of Plants, Drawings of Veterinary and other subjects.

THE AGRICULTURAL GAZETTE
is a Record also of Foreign Agricultural Progress, and has
published Periodical Communications from its Correspondents
in Foreign Countries, in Australia, the United States,
Canada, France, Germany, Hungary, Austria, South America,
and India.

THE AGRICULTURAL GAZETTE
contains Weekly Articles and Reports, illustrated when
necessary, relating to the Poultry Yard, the Forester, the Bee-
keeper, the Gardener, the Householder, and the Weather.

THE AGRICULTURAL GAZETTE
is a full Record of all Matters relating to the Shorthorn
Breed, and Live Stock generally, and during 1874, it has
published Reports of the Herds and Flocks at Holker, Underley,
Audley End, Havering, Lighthou, Witham-on-the-Hill,
Killerby, West Dereham, Westford, Kingsford, Waterbury,
Westing Hall, Carlton Court, Danmore, Wadbury, Steyning,
Taverham Hall, Howe, near Brighton, County Cork, &c.

THE AGRICULTURAL GAZETTE
is a Journal of Veterinary Practice and Experience, and
has contained during 1874 weekly articles by its Veterinary
Editor, besides frequent reports from Veterinary Inspectors at
the leading Live Stock Markets.

THE AGRICULTURAL GAZETTE
is the strenuous advocate of Security for the Capital
employed in Cultivation, the Removal of Restrictions upon the
Cultivator, the promotion of Agricultural Education, and the
increased acknowledgment of the commercial
principle along with good neighbour-hood, as properly regulat-
ing the Relationships of Landlord and Tenant and of Master
and Servant.

New Volume Commences in January.
THE FLORIST and POMOLOGIST: a
Pictorial Magazine of Gardening. Monthly, 1s.; yearly,
12s.; or free by post, 12s. Two magnificent Plates issued
with each Number. Established as the "FLORIST" in 1848.
THE FLORIST and POMOLOGIST is a Popular Monthly
Magazine of Gardening in all its Departments. It supplies the
class of information formerly furnished by the AMATEUR GAZETTE
as by PROFESSIONAL and COMMERCIAL GARDENERS. It keeps
its readers posted up to the NOVELTIES which may interest
them, and instructs them in the best mode of GAZETTE
PRACTICE; and as the LETTERPRESS is contributed by some of
the most distinguished Practical and Scientific Horticulturists
of the day, the sound practical character of the information con-
tained in its pages can be vouched for.

THE FLORIST and POMOLOGIST is issued on the 1st of
every Month, and may be ordered through any Bookseller or
Newspaper, or direct from the Publishers,
MR. EDWARD H. MAY, 171, Fleet Street, London, E.C.

HORTICULTURE.—The following Works
(by THOMAS RIVERS) may be had by post at the prices
quoted:—

containing Directions for Root Pruning, &c. Seventeenth
Edition. 2s.

THE ROSE AMATEUR'S GUIDE; con-
taining the History and Culture of Roses. Tenth Edition. 4s.

THOMAS RIVERS and SON, Sawbridgeworth, Herts.

THE AGRICULTURAL GAZETTE,

A WEEKLY ILLUSTRATED JOURNAL FOR

LANDOWNERS AND TENANT FARMERS,

Published by W. RICHARDS, 7, Catherine Street, Strand, London, W.C.

Price Fourpence; Post Free, Fourpence-Halfpenny.

THE AGRICULTURAL GAZETTE
is a record of the Progress and Improvement of the Agricul-
tural Machine Manufacture, and has published, during 1874,
Illustrated Reports of the following Agricultural Societies and
Factories:—Messrs. Howard, of Bedford; Messrs. Clayton & Shut-
tleworth, of Lincoln; Messrs. Ashby, Jeffery & Luke, of
Stamford; Messrs. Aveling & Porter, of Rochester; Messrs.
Barford & Perkins, of Epsom; Messrs. A. B. Enley, of
St. Edmunds; Messrs. Burgess & Key, of Brentwood; Messrs.
Cannon & Toone, of Warrminster; Messrs. Colman, of London;
Messrs. Deangis, of Chard; Messrs. Garrett & Sons, of
Maidenhead; Messrs. Horsley & Son, of Grantham; Mr. Le
Butt, of Bury St. Edmund's; Messrs. Marshall & Co., of
Gainsborough; Messrs. Nicholens, of Newark; Messrs. Page
& Co., of Bedford; Messrs. Samuelson & Co., of Eanbury;
Messrs. Reeves & Co., of Westbury; Messrs. Ruston, Proctor
& Co., of Lincoln; Messrs. Tuford & Co., of Boston; Messrs.
Woods, Coodegate & Co., of Stowmarket; Messrs. Barnard &
Bishop, of Norwich; the Bristol Waggon Co., and the Reading
Agricultural Implement Co.

THE AGRICULTURAL GAZETTE
is a Weekly Record of the Progress of Agricultural
Science, and has during the past year published communi-
cations from Professor Baldwin, of Dublin; Professor
G. T. Brown, of the Veterinary Department of the Privy
Council; James Caird, C.B.; J. A. H. Caird, W. Car-
ruthers, F.R.S., Consulting Botanist to the Royal Agricul-
tural Society of England; J. Bailey-Denton; H. Evershed;

Royal Agricultural Society of England; W. Benze Jones, the
late Lord Kesteven; J. B. Lawes, F.R.S.; the late Lord
George Manners, M.P.; J. J. Moore, Esq.; Rev. W. J. Pope;
J. P. Sheldon, of Derbyshire; W. Smith, of Wotton;
Augustus Voelcker, Ph.D.; F.R.S., Consulting Chemist to
the Royal Agricultural Society of England, and to the Bath
and West of England Society; R. Warrington, F.C.S.; Rev.
G. Wilkins, of Wix; Willoughby Wood; Professor Wrightson,
and many others.

THE AGRICULTURAL GAZETTE
of 1875 will continue to Report, with promptitude and
care, all Agricultural Meetings, and Agricultural
Machine Improvements. It will contain Weekly
Articles from Correspondents in England, Scotland, Ireland,
and Foreign Countries, and will contain Illustrated Reports of
all matters connected with our Live Stock, our Plants, our
Poultry, Bees, Gardens, &c. It will contain articles descriptive
of Estates, Farms, Herds, and Flocks. It will contain weekly
articles on the Social Relations, and the Science, the Business
Transactions, the Practical Details of Agriculture. It professes
no Party Politics, but it will not hesitate to discuss any subject
affecting the position or relations of those whose Profession
Organ it desires to be. It will be found absolutely Independent,
excepting only of such rules as govern honourable men; and
nothing which affects the interests of either of the Landowner,
the Tenant Farmer, or the Labourer, will be excluded from its
columns.

THE AGRICULTURAL GAZETTE

VOLUME FOR 1874

Grateful—Comforting. E P P S ' S C O C O A. BREAKFAST. By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our invalids with a delicate and nourishing beverage, which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the Civil Service Gazette.

Made simply with boiling water or milk. Sold in packets (in tins for abroad) labelled—JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS, 48, Threeold Street, and 170, Piccadilly, W. Works:—Euston Road, and Camden Town, London, N.W. Makers of Epps's Glaxo and Dulcino for Infant Nutrition.

Lea & Perrins' Sauce. THE "Worcestershire," pronounced by connoisseurs "the only good Sauce," Improves the appetite, and aids digestion. Unrivalled for piquancy and flavour.

ASK FOR LEA AND PERRINS' SAUCE. BEWARE OF IMITATIONS, and see the names of LEA AND PERRINS on all Bottles and Labels. Agents—CROSSE and BLACKWELL, London; and sold by all Dealers in Sauces throughout the World.

DINNEFORD'S FLUID MAGNESIA. The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best and safest for delicate Constitutions, especially adapted for Ladies, Children, and Infants.

DINNEFORD & CO., 172, New Bond Street, London, W.; and of all Chemists throughout the World.

NO MEDICINE FOR THE CURE OF ASTHMA, CONSUMPTION, and COUGHS was ever attended with such speedy and unflinching success as Dr. LOCKOCK'S PULMONIC WAFERS. In every periodical may be seen testimonials of their wonderful efficacy. In Hysterical, Nervous, and Heart Complaints they are unfailing, and in Rheumatic and Nervous Pains they act like a charm.

Sold at 1s. 1/6d. per box by all Druggists.

THE BEST AND MOST DISTINCT PEA OF THE SEASON.

SUTTONS' GIANT EMERALD MARROW PEA.

The above engraving is from Specimens grown in Messrs. SUTTONS' Experimental Grounds in 1874.

☞ *This splendid New Pea, and the other valuable Novelties offered by Messrs. SUTTON this Season, can only be obtained direct from them, and each Packet will bear their Registered Trade Mark.*

This New Wrinkled Pea is of a distinct type, and far superior to any of the present tall wrinkled varieties. We have had this Pea under trial for the past six years, while getting up a sufficient stock to offer to the public, and every season its decided superiority has become more manifest when growing alongside all the best sorts. The leaves, stems, pods, and peas possess the peculiar glaucous green colour of our Emerald Gem, but it is a wrinkled variety, growing to the height of 5 feet, coming in for use at the end of June and beginning of July. It is more robust in habit than any of the 84 sorts grown in our experimental grounds last year. From its earliest stages of growth its distinctive character is at once apparent, and it resists drought and mildew in a remarkable manner. In productiveness it is unequalled, and superior to any of the high-priced varieties recently sent out. The pods are from 4 to 4½ inches in length, and hang very thickly, in pairs; they contain from eight to ten fine Peas. The flavour is delicious; and the Peas come to table with the same beautiful green colour that characterises the entire plant.

Price, 5s. per Quart.

The following are the opinions of some of the most eminent Gardeners in the kingdom, who have tried Suttons' Giant Emerald Marrow by the side of other sorts:

From Mr. WILLIAM PATERSON, Gardener to Her Majesty the Queen, Balmoral Castle.

"I find your 'Giant Emerald Marrow Pea' is an excellent cropper and of very fine flavour."

From Mr. WILLIAM WHALLEY, Gardener to His Grace the Archbishop of Canterbury, Addington Park.

"Your 'Giant Emerald Marrow Pea' is one of the best, if not the best, we have grown, and it is going to be a first-class Pea. It is free from mildew, where nearly all the others are more or less affected."

☞ *At the Royal Horticultural Society's Meeting, South Kensington, July 7, 1875, we offer Silver and Bronze Medals, and valuable Money Prizes, for Six Dishes of Wrinkled Peas, to include Suttons' Giant Emerald Marrow, Duchess of Edinburgh, and Duke of Edinburgh. Further particulars on application.*

From Mr. JOHN TOWILL, Gardener to the Right Hon. the Earl of Glasgow, The Garrison, Millers.

"I consider your 'Giant Emerald Marrow' to be altogether a splendid Pea; quite distinct; decidedly an acquisition."

From Mr. JOHN MALCOLM, Gardener to the Most Noble the Marquis of Chalmersley, Chalmersley Castle.

"Your 'Giant Emerald Marrow' is a Pea with a beautiful light green foliage, very prolific, large podded, and will make a capital Exhibition Pea."

SUTTON & SONS, THE QUEEN'S SEEDSMEN, READING, BERKS.

Editorial Communications should be addressed to "The Editor;" Advertisements and Business Letters to "The Publisher," at the Office, 41, Wellington Street, Covent Garden, London, W.C. Gladioli from Paris, per Names and Seedlings.
LEVEQUE AND SON, NURSERYMEN,
 117, rue de la Chapelle, near Paris, beg to offer splendid, healthy, and good flowering bulbs of GLADIOLI, to the prices:—Gladioli, seedling, first-rate, 8s. per 100, 4s. per 500; mixed white, 12s. per 100; 2s. per 100; 4s. yellow, 24s. per 100; rose, 22s. per 100; per names, 100, 10 sorts, 8s. per 100; 25 sorts, 14s. per 100; 50 do., 4s. to 4s. 10s.; 100 do., 4s. and upwards, according to the quality of the sorts, all in good flowering bulbs. English Cheeser or Post Office France, Paris accepted for payment.

Rare Opportunity.
NEW AND VERY SCARCE TREE FERNS from the Mountains of the ALPS, and NEW ZEALAND.
J. H. LEY, having just received an importation from his Collector, can supply good packets, with directions for sowing and rearing, at 3s. 6d., 5s., and 7s. 6d. each.
 The ferns from which three sorts have been obtained are new species, the other four sorts are Cyathia dealbata (silver), C. medullaris, Alsophila MacArthuri, Dicksonia fibrosa, and a small quantity of Diacoma squarrosa. Should be sown now to obtain nice plants before autumn.
J. H. LEY, Royal Nursery, London Road, Croydon.
 N.B.—Twelve choice PALM SEEDS, in distinct sorts, 5s.

TREE FERNS, for Conservatory, with magnificent large heads, will be sold at the following low prices:—to make room, Dicksionia antarctica, trunk 1 foot 2 inches, 31s. 6d.; ditto, trunk 3 feet 3 inches, very stout, 62s. D. squarrosa, trunk 3 feet 3 inches, 42s.; ditto, trunk 1 foot 2 inches, 22s. D. fibrosa, trunk 2 feet, 25s. Lomaria cycadifolia, trunk 1 foot 2 inches, 42s.; L. gibba, major, huge plant, trunk 1 foot 2 inches, 31s. 6d.; L. gibba, minor, trunk 22s. 6d.; Glottium princeps, trunk 7 inches, 21s. Also a splendid specimen Platycerium grande, 42s.; Asplenium nidus avery, 35s.
J. MORSE, Nurseryman, Dursley.

NEW JAPANESE FRUIT, ORCHIDS.
LILIES, AMARYLLIS, &c.—Our first consignment of Japanese Orchids is in excellent condition, including Ardenia japonicum, Calathea Sieboldii, Angraecum falcatum, Goodyeria japonica, &c.; also the new fruit, the Persimmon, in the four best varieties of Japan; also Lilies—1. aurantiacum, very fine, in many rare sorts; Peruvian Bulbs and Amaryllis in excellent condition. A few bulbs left of the scarce and beautiful Lilium neilgherense.
 CATALOGUES can now be had.
THE NEW PLANT AND BULB COMPANY, Lion Walk, Colchester.

Nursery and Seed Establishment, Westerham, Kent.

NEW DWARF SILVER-VARIEGATED GERANIUM "LITTLE TROT."—This very distinct Geranium was raised by Mr. Davis, The Cemetery, Maidstone, and is placed in W. Potten's hands for distribution. The dwarf, compact-branched plant, with its variety and its broad, clear white margin, will make it invaluable for edging or panel work. Its average height is about 6 inches. The flowers are a deep scarlet. It has been admired by all who have seen it, and received a First-class Certificate from the Royal Horticultural Society, August 20, 1874. W. P. can highly recommend this Geranium as being one of the most distinct and useful varieties of its class yet offered. It will be sent out the first week in May, 1875. Price 2s. 6d. each, 24s. per dozen; the usual discount to the Trade. Orders are now being booked, and will be sent out in rotation at the above date.
WILLIAM POTTEN, Camden Nursery, Sissinghurst, Staplehurst, Kent.

Planting Season—Avenue Trees.
LIMES, 12 to 16 feet high, straight stems, girth 4 to 8 inches at 4 feet from the ground, with well-balanced heads, and splendidly rooted. A stock of more than 5000 of these fine Trees to select from.
PLANES; OCCIDENTAL, 12 to 16 feet.
HORSE CHESTNUTS, 10 to 12 feet.
SCARLET HORSE CHESTNUTS, 10 to 12 feet.
NORWAY MAPLES, 10 to 16 feet.
 All being stout, straight stemmed, and finely rooted. Every Tree has been removed within two years.
POPLAR, CANADENSIS NOVA, 18 to 20 feet.—This new variety of Poplar, far exceeding in rapidity of growth any I am acquainted with, is strongly recommended as a Town Tree, especially in smoky districts. There are hundreds in this Nursery 3 years old, measuring 18 to 25 feet high, and stout in proportion.
ANTHONY WATERER, Knapp Hill Nursery, Woking, Surrey, S.W.

PLANTING SEASON.
LARCH, SCOTCH FIR, ENGLISH OAK, and all other Forest Trees.
QUICK, and all other Hedge Plants.
COVERT PLANTS in great variety.
FRUIT TREES, including all the best and most esteemed varieties—quarter of a million trees.
ROSES, Standards, Dwarfs, the newest and best varieties—100,000 to select from.
VINES, all the leading varieties in 2000 well ripened canes for fruiting in pots and for planting out.
EVERGREENS in great variety, including large quantities of all the choicest Hollies, &c.
CONIFERS, including Pines, Nordmanniana, &c.
ORNAMENTAL TREES and Plants of all sorts.
 *The whole in very great quantity and stout vigorous condition, with fine roots for safe removal.
 Priced LIST and all particulars on application.
JAMES DICKSON & SON, Newton Nurseries, Chester, 27 The "Newton" Nurseries are within eight minutes' walk, by the new road, from the Chester Railway Station.

THE HANDSOMEST SEED CATALOGUE EVER PUBLISHED.

THE
ILLUSTRATED GUIDE FOR AMATEUR GARDENERS—Spring, 1875.

Now ready, price 1s. post free. Gratis to Customers.

A thoroughly practical and comprehensive Guide for the Amateur or professional Gardener, containing a select List of the choice Kitchen Garden and Flower Seeds; ninety-six pages of beautifully illustrated letterpress, with complete directions for the successful management of the Kitchen and Flower Garden throughout the year; also two superbly finished coloured plates. The whole is an illuminated cover of the most exquisite design and workmanship.

The *London Review* says—"This is the most beautiful garden catalogue we have ever seen, the coloured illustrations are inimitable. Messrs. Daniels, the eminent seed growers, may justly feel proud in issuing such a complete and truly valuable catalogue as this, which will enhance the high reputation they have already so deservedly gained."

One of the Traditional Homes of the Rose.

MESSRS. PAUL & SON

RESPECTFULLY SOLICIT EARLY ORDERS FOR

ROSES IN ALL FORMS.

The Stock for Sale is by far the finest ever produced at these long-celebrated Nurseries, and the plants are thoroughly grown, healthy, vigorous, and well ripened. The undernamed prices will be found really reasonable, and comparatively cheap for really good plants.

PAUL & SON'S DESCRIPTIVE ROSE CATALOGUE

Contains a septennial review of the New Roses as sent out in the past seven years, special notes on New Roses of the year, and Cultural Directions for the Rose year. LIST sent post free on application.

PRICES OF ROSES FOR 1874-1875.

STANDARDS, fine stems and heads, of best kinds only, as grown here, 18s. per doz., £7 per 100.
STANDARD ROSES, newer kinds, 24s. to 30s. per dozen, £10 per 100.
DWARF STANDARDS, Hybrid Perpetuals, 12s. per dozen, 90s. per 100.
DWARFS, Hybrid Perpetuals, older kinds, on Manetti or on Seedling Briar, 10s. to 15s. per doz., 75s. to £6 per 100.
DWARFS, on Manetti, Hybrid Perpetuals, newer sorts, 18s. to 30s. per dozen, £7 10s. per 100.
DWARF TEAS, 18s. to 21s. per dozen, £7 10s. per 100.
Extremely fine and well ripened this season.
DWARFS, new varieties of 1874, 36s. per dozen.

SPECIAL ROSES, raised here at Cheshunt.

TEA, or HYBRID TEA, CHESHUNT HYBRID.—Of this deservedly favourite Rose we had, at the commencement of the season, 2000 plants, showing our estimate of its value. It is still finely in bloom here, and is valuable in all ways, more especially as a free autumnal climber. Standards, 2s. 6d.; Dwarfs, 2s.
H.P. REYNOLDS HOLE.—The finest dark maroon Rose yet raised, which has a good vigorous habit and free flowering character. Standards, 2s. 6d.; Dwarfs, 2s.
H.P. WILSON SAUNDERS.—A grand novelty. A peculiarly free perpetual crimson Rose. Standards or Dwarfs, 5s. each.
H.P. THE SHAIL.—The brightest-coloured garden Rose yet obtained. Standards or Dwarfs, 3s. 6d. each.

ROSES CULTIVATED IN POTS, speciality of the Old Nurseries.

ROSES—Teas and Hybrid Perpetuals, established for forcing or pot culture:—
EXTRA FINE PLANTS, in 8-inch pots, 42s. per dozen.
QUARTER SPECIMENS, in 9 to 10-inch pots, 65s. to 84s. per dozen.
SPECIMEN ROSES, 42s. to 105s. each.

ROSES ON OWN ROOTS.

SORTS, as Special Lists, in 4 1/2's, 12s. to 18s. per dozen, 100s. per 100.

FRUIT TREES.

Of Espalier Palmetti-Trained Fruit Trees for Walls PAUL & SON hold a very large Stock, with from two to six tiers of branches. 3s. 6d. to 7s. 6d. each.

HARDY TREES AND SHRUBS, NEW AND OLD.

We will be glad to send, Post Free,

DESCRIPTIVE CATALOGUE OF FRUIT TREES and HARDY GROWTHS,

WITH

SPECIAL SUPPLEMENT OF NEW HARDY TREES and SHRUBS.

An Inspection of the Stock, which is large and fine, and unimpaired, not having been weakened by frequent Auction Sales, is invited.

Upper Holloway, London, N.

NEW and CHOICE SEEDS, 1875.

CELERY—Brettle Red, a sort chosen nearly by all, and raised by one of the market gardeners here, and considered the very best Celery for growth. 1s. 6d. per packet.
LETTUCE—Martin's Mammoth Cos, a very crisp and superb kind, very large, and better in flavour than Malta. 1s. per packet.
BROCCOLI—White Perfection, a truly valuable middle season hardy kind. 1s. per packet.
" Gardeners' Friend, a very late and very large variety, and a great acquisition. 2s. per packet.
BRUSSELS SPROUTS.—Our improved Roseberry. 1s. per packet.
MELON—Wood's A. 1. This splendid variety of Melon is the result of crossing Meredith's Hybrid Cashmere with the old Golden Perfection. It has a pale green flesh of great thickness and exquisite flavour, with a beautiful golden skin the thickness of paper, and thickly netted, and is also a remarkably fine setter. It has always obtained the highest honour wherever exhibited, and pronounced by the best judges to be the handsomest and best Melon ever coming under their eye. Our stock is very small, every Gardener that we have yet seen having ordered it. 2s. 6d. per packet.
The MAGNUM BONUM (21s.) SELECTION OF GARDEN SEEDS which we supply has always given the greatest of satisfaction. Other Collections, 30s., 40s., 63s. and 84s., carriage free.

Marie,
Cantab,

AND
Improved Oxonian.

BETTERIDGE'S
INTERNATIONAL
PRIZE
COLLECTIONS
OF
ASTERS.

These superb varieties, which were sent out by us last year for the first time, have given great satisfaction, notwithstanding the unfavourable season. Each variety is perfectly symmetrical in form, with a delicately quilled centre, surrounded respectively by crimson, pink, light blue, and dark blue guard petals.

	per packet	s.	d.

LONDON ADDRESS: 106, SOUTHWARK STREET, S.E.

AMARANTHUS HENDERI.

Patronised by Her Majesty the Queen, and H.R.H. the Prince of Wales.

This Amaranthus, from its hybrid origin, may be considered as a strain of entirely new varieties, and has a range of colours never before seen in any class of plants. Height, from 2 to 5 feet. Growth elegantly pyramidal, being thickly furnished with side shoots; the stems and branches are ruby red or claret colour. Leaves 7 to 12 inches long, which when seen against the light admirably sets off the varied tints. Each plant has its own distinct colours:

- BICOLOR.**—Orange splashed with Carmine, Madder and Sage Green, Carmine and Orange, Carmine and Russet, Lemon splashed with Carmine, Chrome Yellow striped with Carmine.
- TRICOLORS.**—Orange, Carmine, and Green; Rose Madder and Aureoline, running into Olive Green; Carmine, Madder, and Sage Green.
- MONOCOLORS.**—Deep Carmine, Lake, Purple Madder, Light Carmine, Yellowish Carmine, Vermilion, Rose Madder.

These are the finest ornamental foliage ever brought before the notice of the Public.
Four pages of description, &c., may be seen in the Florist for February. Testimonials and Print of Plant free on application.

Packets 2s. 6d. each, Sealed with the Raisers' Name—"Hender & Son."

Abele, 8 to 10 feet, 50s. per 100.
ROSES, Standard, 4s. per 100.

WRIGHT'S GIANT WHITE CELERY.
This is quite a distinct pure white variety; it is very crisp, and of excellent flavour, combining a robust, compact habit, forming very solid hearts, which blanch very easily. Heads of this variety have been grown weighing from 8 to 10 lb. each, and can be highly recommended for exhibition, private or market purposes. 1s. per 1/2 oz. packet.
WRIGHT'S RED GROVE and WHITE GROVE CELERIES.—These possess all the good properties of the Giant White, but do not grow quite so large. 1s. per 1/2 oz. packets. The usual discount to the Trade.

The following fourteen firms have secured supplies of the above for this season, for which I beg to thank them, soliciting extended patronage:—
Hurt & Son, London.
Cooper, Robt., London.
Daniel Ross, Norwich.
Dickson, Brown & Tail, Manchester.
Dixon, E. P., Hull.
Holmes, Ed., Lichfield.
Brotherton, Wm., Leeds.
Nutting & Sons, London.
CUCUMBERS.—Wright's Wonder, fine white-skin, and Wright's Improved, black-skin; these will grow 24 to 30 inches long, are very prolific and of mild, good flavour. Pearson's Long Gun, Kollinson's Telegraph, Berkshire Champion, Improved Lion House, Master's Early Prolific, 1s. per packet.
Lowest price quoted per 100 seeds on application.
W. WRIGHT, Seed Merchant and Nurseryman, Market Square, Reftord, Notts.

GLOXINIANS.—Twelve finest named Glorians, 21s., very large roots, fit for exhibition this spring, including many sorts not yet in commerce; smaller size, 12s. 6d. per dozen. Packed and delivered free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, London Road, Croydon.

CALADIUMS.—Twelve finest sorts, 21s., including many of the best introductions of late years; large roots, fit for exhibition this year, or smaller size, 12s. 6d. per dozen. Packed and delivered free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, London Road, Croydon.

ACHIMENES.—Thirty-six corns, in 12 finest sorts, 10s. 6d.; or 100 corns, in 24 finest sorts, 2s. Free by post on receipt of Post Office Order.
J. H. LEY, Royal Nursery, London Road, Croydon.
N.B.—CATALOGUES free on application.

SURPLUS STOCK of the following to be sold cheap:—
CLEMATIS JACKMANNI and LANUGINOSA.
VINES, Vase-gated, in pots.
Sweet, well rooted, 2 1/2 feet.
SKIMMIA JAPONICA, bushy, 6 to 12 inches.
CUPRESSUS LAWSONIANA, 4 to 8 feet.
GEOXIS ATLANTICA, 5 to 7 feet.
THUOPSIS BOREALIS, 1 to 4 feet.
ROSES, Climbing, extra strong.
ANDROMEDA FLORIBUNDA.
HEATHS, hardy, best varieties.
AZOLENDRON MULTIFLORUM and PRÆCOX, a mass of bloom-buds.
RHODEN, Indian, in great variety.
DAPHNE INDICA RUBRA, CNEORUM, and other flowers.

For particulars of these, with Connoisseur, see previous advertisement.
HURST & SON, 6, LEADENHALL STREET, LONDON, E.C.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—At a General Meeting of the Subscribers to this Institution, held on January 12th for the purpose of ELECTING TWO PENSIONERS on the Funds, the following was the result of the Ballot:—
 CANDIDATES.

Name.	Age.	Votes.
THOMAS EVLES	67	802
THOMAS HOPKINS .. .	64	426
HENRY BUTCHER .. .	70	124
GEORGE DYER .. .	67	594
JANE SCOBIE .. .	67	213
JOHN BLACKSHAW .. .	61	121
JOSHUA LANCASTER .. .	40	481

The Meeting then declared **JANE SCOBIE** and **THOMAS EVLES**, as having the greatest number of Votes, duly ELECTED PENSIONERS.—By Order,
 EDW. R. CUTLER, Secretary,
 14, Tavistock Row, W.C.—January 19, 1875.

THE ASPATRIA AGRICULTURAL CO-OPERATIVE SOCIETY (Limited).
 The Committee are prepared to RECEIVE TENDERS for the supply of Agricultural Seeds for the coming season. Quantities sold last year were 300 quarters Perennials, 50 quarters Italian, 120 cwt. Clover Seeds, 30 cwt. Turnip Seeds.
 For further particulars apply to the Secretary, Aspatria, Carlisle, January 20, 1875.
HENRY THOMPSON.

HOLLIES.
ANTHONY WATERER respectfully invites the attention of HOLLY buyers to the very fine Stock to be seen growing at Knapp Hill. It comprises upwards of Thirty Thousand Plants from 3 to 20 feet high of the finest Gold, Silver, and Green-leaved kinds, affording a choice in size and variety such as can be met with in no other Nursery in Europe. Every Plant has been recently removed, and will be guaranteed.
 The Stock of Common Green Hollies alone occupies 5 acres of land, and Purchasers will find them in large numbers of all heights up to 15 feet.
 Knapp Hill Nursery, Woking, Surrey.

NEW and SELECT VEGETABLE SEEDS.
BROCCOLI, Christie's Self-Protecting Late White.—This valuable Broccoli has been raised by Mr. Christie of Aswarby, and is pronounced by all who have seen it as the finest self-protecting late Broccoli in cultivation. See Testimonials. Sold only in sealed packets, 1s. 6d. each.
BORRER, Varied Triple-curtain Turnip. One of the finest stock includes all the best varieties for decorative purposes, for garnishing, the embellishment of the flower garden and dinner-table. Price 6d. and 1s. per packet.
BRUSSELS SPROUTS, Rosbery, extra selected.—Price 1s. per ounce.
CELEBY, Dixon's X.I. Red.—A very strong grower, early, hardy, remarkably solid and crisp. Has obtained a First Prize wherever exhibited during last season, and is acknowledged to be a very decided acquisition. Price 1s. 6d. per packet.
CELEBY, Dixon's Mammoth White.—The best White extant. Price 6d. and 1s. per packet.
CUCUMBER, Burnett's Perfection.—Growing from 2 to 30 inches long, fine flavour and very productive. Price 1s. 6d. per packet.
CUCUMBER, Rollinson's Telegraph.—True, handsome, and very prolific. Price 1s. 6d. per packet.
LETTUCE—Dixon's Champion Green Cos still maintains its well-known reputation as being the largest and most delicious Lettuce in cultivation. Price 6d. and 1s. per packet.
PEA, Dixon's Yorkshire Hero.—My stock of this magnificent variety of the original Marrow is grown from the original stock introduced by me a few years ago. It is exceedingly prolific, having as many as sixty or seventy pods on a single stem. The Pea, of a most delicious Marrowfat flavour, is fourteen days earlier than Veitch's Perfection, and it stands the effects of mildew better than any other variety. Price 1s. 6d. per quart.
TURNIP, Silver Bull.—A superb white, solid root, fine shape, flesh tender and delicious; very select stock. Price 1s. per ounce packet.
EDMUND PHILIP DIXON, The Yorkshire Seed Establishment, 57, Queen Street, and 75, 76, and 77, High Street, Hull.

JOSEPH SMITH, JUN., Moor Edge Nurseries, Tansley, near Matlock, begs to offer at p. 100:—
BROOM, 1 sylv. 2s.; White, 2 sylv. 5s. **PRIVET**, 1 sylv. 4s.; 2 sylv. 6s.; 1 to 1½ foot, 12s.; 2 to 3 feet, 20s.; 3 to 4 feet, 25s.; 4 to 5 feet, 30s.; 6 to 8 feet, 40s.; 8 to 10 feet, 50s. **BIRCH**, 1 to 6 feet, 10s.; 6 to 8 feet, 12s.; 8 to 10 feet, 15s. **CHRISTMAS HORN**, 3 to 4 feet, 20s.; 4 to 5 feet, 25s. **ELM**, 1½ to 2 feet, 12s.; 2 to 3 feet, 18s.; Scotch, 1½ to 2 feet, 20s.; 2 to 2½ feet, 25s.; 2 to 4 feet, 30s. **LIME**, 1 to 1½ foot, 20s.; 1 to 2 feet, 25s.; 2 to 3 feet, 30s.; 3 to 4 feet, 35s.; 4 to 5 feet, 40s. **MAPLE**, Norway, 2 to 3 feet, 32s.; 4 to 5 feet, 40s.; 5 to 10 feet, 70s. **ACER**, 2 to 3 feet, 25s.; 3 to 4 feet, 30s.; 4 to 5 feet, 35s.; 5 to 6 feet, 40s. **PIN**, 2 to 3 feet, 15s.; 3 to 4 feet, 20s.; 4 to 5 feet, 25s. **AUSTRIACA**, 1 to 1½ foot, 15s.; 1½ to 2 feet, 20s.; 2 to 3 feet, 25s.; 3 to 4 feet, 30s. **POPULAR**, Italian, 5 to 6 feet, 50s.; Ontario, 2 to 3 feet, 25s.; 3 to 4 feet, 30s.; 4 to 5 feet, 35s.; 5 to 6 feet, 40s.; 6 to 8 feet, 70s. **WILLOW**, Bedford, 1½ to 2 feet, 15s.; 2 to 3 feet, 20s.; 3 to 4 feet, 25s.; 4 to 5 feet, 30s.; 6 to 8 feet, 50s.; 8 to 10 feet, 80s. **SYCAMORE**, 4 to 5 feet, 35s.; 5 to 6 feet, 40s.; 6 to 8 feet, 50s. **SPRUCE**, 1 to 1½ foot, 22s.; 2 to 2½ feet, 25s.; 2½ to 3½ feet, 40s.; 3 to 4 feet, 7s. per 1000.
QUICK, 2 sylv., 12s. transplanted, 8s. **BERBERIS**, 2 to 1½ feet, 12s.; 1½ to 2 feet, 15s.; 2 to 3 feet, 18s.; 3 to 4 feet, 20s.; 4 to 5 feet, 25s.; 5 to 6 feet, 30s. **LAEUREL**, 2 to 1½ inches, 20s.; 1 to 1½ foot, 30s.; 1½ to 2 feet, 40s.; 2 to 3 feet, 50s.; 3 to 4 feet, 60s. **RHO**, DENDRONS, &c. LIST of General Stock free.

Fibrous Peat.
BROWN FIBROUS PEAT, best quality, for Orchids, Stove Plants, and Potting. 6s. 6d. per Six-ton Truck-load.
BLACK FIBROUS PEAT, for Rhododendrons, Azaleas, Heaths, New Holland Plants, &c. 4s. 5s. per Six-ton Truck-load.
 Delivered on rail at Blackwater, South-Eastern Railway, or Farnborough, South-Western Railway.
WALKER AND CO., Farnborough Station, Hants.
Sphagnum, or Peat Moss, for Orchids.
FRESH SPHAGNUM MOSS, 10s. 10s. per Six-ton Truck-load.
 WALKER AND CO., Farnborough Station, Hants.

IMPORTANT ANNOUNCEMENT.

The date or locality not having been fixed for the Provincial Show this season,

JAMES CARTER & CO.

Have the pleasure to announce, in reply to repeated enquiries, that

BY SPECIAL PERMISSION OF THE Council of the Royal Horticultural Society, THE COMMISSIONERS FOR

THE CARTER CUP,

VALUE FIFTY GUINEAS,

TOGETHER WITH

THIRTY POUNDS IN MONEY PRIZES, FOR VEGETABLES,

WILL TAKE PLACE AT

SOUTH KENSINGTON, on WEDNESDAY, July 7, 1875.

SCHEDULE OF PRIZES AND CONDITIONS.

FIRST PRIZE—The "CARTER CUP," Value FIFTY GUINEAS, to become the absolute property of the Employer to whom the Prize may be awarded, also Ten Guineas for the Gardener.

SECOND PRIZE—Seven Guineas.

THIRD PRIZE—Five Guineas.

FOURTH PRIZE—Three Guineas.

FOR THE

Best Collection of Vegetables, 24 Dishes,

TO INCLUDE

- 1/2 peck Carter's Early Premium Gem Pea.
- 1/2 " James' Prolific Pea.
- 1/2 " G. F. Wilson Pea.
- 1/2 " Hardy's Pedigree Windsor Bean.
- 1/2 " Carter's White Advancer French Bean.
- 1/2 " Carter's Champion Runner Bean.
- 1/2 " Blue Peter Pea.
- 1/2 " Carter's Commander-in-Chief Pea.
- 1/2 " Carter's New Mammoth Long Pod Bean.
- 1/2 " Carter's New Fern-leaved Parsley, and Little Heath Melon.

ALSO

First Prize—Two Guineas, Second Prize—One Guinea, For 6 Dishes of Peas

(1/2 peck of each variety) to include—

- Carter's G. F. Wilson, James' Prolific Marrow, Carter's Hundred-fold or Cook's Favourite, Carter's Commander-in-Chief.

For particulars see "Schedule of the Royal Horticultural Society," or apply to

Carter's

THE ROYAL SEEDSMEN,

237 and 238, HIGH HOLBORN, LONDON, W.C.

SATURDAY, JANUARY 23, 1875.

RARE CONIFERS.

WE lately received from Messrs. F. Sander and Co., of St. Albans, a few specimens of cones and branches of Conifers discovered by M. Roehl, and forwarded to them by him. The locality where they were found is not mentioned by these gentlemen, but from the species we are safe to give it as New Mexico. The specimens so received, they have kindly sent for our inspection and opinion, and as they prove to be both rare and curious, our readers will probably be glad to have some note of them.

Those who remember the deluge of pseudo-new species sent by M. Roehl from Mexico some sixteen or seventeen years ago, when upwards of one hundred species were manufactured out of half a dozen, will naturally look with doubt and hesitation upon anything new coming from the same quarter; and we do not deny that when we read who they came from we clothed ourselves with a double armour of distrust. We soon found, however, that the present *cuvioi* had nothing in common with the old ones; the number of species was small, which in itself was a good sign, and although nothing was absolutely undescribed among them, all were interesting and rare.

The first species is that named *ABIES* (*Picea*) *CONCOLOR*. Its history is brief. It was found on the mountains of New Mexico by Engelmann, and was described by Gordon in the first edition of his *Pinetum* as having leaves much resembling those of *Picea grandis*, but with both faces of the leaf of the same colour. It was said to be a tall tree with cylindrical deciduous cones, but "nothing further was known" of it. Parlatore, who had received specimens (at least of the cones) from Engelmann, preserves it as a good species, and had we been writing two years ago, before seeing the character of *grandis* (a variety of which we now take it to be), when growing wild in its native country, we should have done the same thing. The distinguishing characters by which Parlatore separates it from *grandis* are that the leaves are concolorous both above and below—white, turning greenish with age, and often marked on each side by a middle rib—"the bracts of the scales, larger than in *P. grandis*, and not emarginate or mucronate." To these we may add that he notes (in which he is supported by the specimens now under examination) that the leaves, though long and flat, are slightly curved in the falcate fashion of *nobilis*. In no other respect is any difference indicated. Now, so far as we examined the single cone that we have before us—which we only did partially, for we did not like to tear the whole cone to pieces, and therefore confined our examination to a few of its topmost scales—the bracts of the scales are identical with those of *P. grandis*, and the cone in size and appearance is also exactly the same. We incline to think, therefore, that there must either be some amount of variation in the form of the bracts, or that in some way Parlatore has been deceived in his estimate of their size and appearance. Be that as it may, we can see no difference. Next as to the leaves: the most striking feature in them—namely, their mealy white appearance—is one that is common to *grandis* all over the mountains alongside of the alkaline wastes between the Rocky Mountains

proper and the Sierra Nevada. There this mealy aspect is the prevailing feature over the whole of the vegetation. Almost everything partakes of it, and in certain parts *grandis* has it too. The olive, semi-transparent hue of the young shoots, which is characteristic of *P. grandis* in this country, is, although often present, by no means their commonest phase. They become white, and, in the more barren places, the leaves take the same hue. We brought home specimens (now in the British Museum) from plants the whole of which were every whit as white as the leaves of *P. concolor* now sent home by Roehl. There only remains the slight curving of the leaves to distinguish *concolor* from *grandis*, but even this is not unknown in *grandis*. We have seen great variation in this respect, generally the leaves lying out quite flat, herring-bone fashion, but sometimes standing up and curving more or less.

Of course it may be said that such specimens belong perhaps to *concolor*, and that both species may occur in the places to which we refer, but the fact that no American botanist has recognised it there, and that *grandis* stands without any allied species in the floras of Utah and Colorado, where these white varieties of *grandis* are common, is sufficient to negative any such idea. As a marked variety, however, it is deserving of cultivation, and it will be of much interest to see whether the young plants retain the character of their parents, or come up as *grandis* pure and simple.

PICEA MAGNIFICA.—This is one of the most provoking species, so far as we are concerned, that we have ever met with. We described it as a new species in the Royal Horticultural Society's *Proceedings* of 1862, from a cone in the possession of Messrs. Low, of Clapton, from a young plant reared by them. The cone, scales and bracts, were those of a gigantic *amabilis*, so much so that, from the figures which we gave, Parlatore has quoted it as a synonym of that species; and other botanists of eminence, judging only from these figures, have come to the same conclusion. We had scattered fallen leaves, but no displayed foliage, to go by—only the immature foliage of seedlings, both different from *amabilis*; but the mature foliage afterwards turned out to be so exactly like that of *nobilis* that we acknowledge ourselves unable to tell from the trees without the cone which are *nobilis* and which *magnifica*. If we could see them in the seed-leaf we could tell, for *magnifica* has a young state quite peculiar to itself—liker a Spruce than a Picea; but that very soon wears off, and the livery of *nobilis* comes on. It is a clear case of the voice being the voice of Jacob, but the hands being the hands of Esau. Being so much puzzled with this curious transformation, we latterly, when we have been pounced upon and carried off to say whether a plant is *magnifica* or *nobilis*—"for you, having described *magnifica*, are of course sure to know"—have taken to indulging sceptical notions in regard to our own offspring. May not Messrs. Low of Clapton have made some error in their sowing? While they thought and told us that they had sown the seed of this cone like a gigantic *amabilis*, may it not have been the seed of true *nobilis*? But then the curious young stage—so different alike from *nobilis* and *amabilis*—how was that to be accounted for? It was therefore with great satisfaction that we found in this *cuvioi* of Roehl specimens of *magnifica*—both scales and mature foliage, the foliage as distinctly that of *nobilis* as is that of the young plants growing in this country, and the cone corresponding with that which we described. We have here therefore the curious anomaly of a species with the foliage of *nobilis* and the cone of *amabilis*, and the reader will remember that there is no resemblance between the two cones—that of *nobilis* being compact and bristling with pro-

jecting bracts, while the bracts are differently shaped and not visible in the cone of amabilis. It may be an example of the creation of a species by hybridisation, in which, instead of a general *mélange*, the chief features of each parent have been preserved unaltered.

PICEA BIFOLIA.—We described this species at the same time and place as *magnifica*, from specimens in the Kew Herbarium. The cone is something like that of *amabilis*, or rather a medium between it and *Pattoniana*; and *Parlatore*, we imagine from this similarity, has reckoned it, too, as a synonym of *amabilis*. The leaves, however, are wholly different (there are two kinds of leaves, whence the name), and the mature ones are short, thick, curved, and stumpy—more in the line of nobilis than *amabilis*. Whatever it be, it is certainly not *amabilis*, and it would appear at all events that it is sufficiently well discriminated to have allowed M. Roehl to recognise it and send it home.

ABIES COMMUTATA.—This is one of the *Menziesii* race, and we see that the specimens also bear the title of *A. Menziesii argentea*. It has a handsome silvery gleam on the foliage, and we should think this must prove a valuable addition to the species of this race grown in Britain, if it stands our climate. *Parlatore* has doubtless rightly united Lindley's *A. microsperma* from Japan to *A. Menziesii*. We should have no great disinclination to go a little farther, and regard the other Japanese species, *Alcoquilana*, as well as the present species also, as varieties of it; but whether species or variety its beauty will remain the same.

ABIES DOUGLASSII.—Of course we do not quote this species as a novelty or rarity. We only note it for the locality. We have no information as to the size or vigour of the trees from which the specimens are taken. No doubt they will be of the smaller sized kind, the great giants, reaching to 200 or even 300 feet in height, being confined to British Columbia, while those in the Rocky Mountains and southwards into Mexico are said not to exceed 90 feet in height; still we can vouch for it that many in the Rocky Mountains and Sierra Nevada, high up and on the sides of hills where little nourishment or moisture was to be had, still reached an enormous height and size. The bark of these trees when they are old is of a peculiar character, like dark brown cocoa fibres felted together. Every different species has a different character of bark, and we would suggest to Dr. Hooker that a collection of 6 foot slabs of bark of different trees in the museum at Kew would be not less instructive than, and render more complete the information given by, the array of woods which are there displayed.

PINUS DEFLEXA.—This was first described by Dr. Torrey in the *United States Mexican Boundary Report*, vol. ii., p. 209, where he speaks of it as being closely allied to *P. rigida* of the Atlantic States, but is sufficiently distinct; and being unable to refer it to any Californian or Mexican Pine hitherto described, he described it under this name. *Parlatore* puts it among his doubtful species. For ourselves we have no doubt that it is one of the climatal varieties of *Pinus ponderosa*. Its leaves are indistinguishable from those of *ponderosa*; and although the cone is slightly different, the base being narrowed towards the stalk, still the difference is not greater than occurs in several of the other admitted varieties of *ponderosa*, e.g., *Beardsleya*, *Craigana*, *Jeffreyi*, *Benthamiana*, or *Sinclairiana*. There is one great character which we have never seen to fail for *ponderosa* in its native country, and that is, its colossal columnar trunk, rising like an Ionian pillar, and seeming almost as thick upwards of 100 feet up as it is at the bottom. This is specially quoted by Torrey as a character of *deflexa*, from the notes of the collector:—"A handsome tree, with an

even columnar trunk." The trunk is also in all cases scamed with great large scales or plates 2 or 3 feet in length, but *Torrey* is silent as to the bark.

PINUS FLEXILIS.—One of the erroneous impressions of which we were disabused by a visit to the Rocky Mountains and Sierra Nevada is, that *Pinus flexilis* was a low-growing, scrubby Pine, not entitled to much favour. It no doubt is, in some places very high up in the mountains, when exposed to cold and severe blasts, reduced to little more than a trailing shrub a foot or two high, wandering over the ground, and with its foliage so densely packed that a man could almost walk over it; but in less trying situations it is a fine object, generally gnarled and twisted, tossing its limbs freely abroad, and with a rich dark foliage. It reminded us of the Scotch Fir, but had not its peculiar shape, nor had its limbs its ruddy hue. It is not, however, distinguished in any way for size, usually not exceeding the dimensions of a Scotch Fir.

PINUS ARISTATA.—This is another species which braves the whirlwind and defies the blast.

right. I need not add that my botanic feeling does the greatest justice to any small things, yet I cannot praise trifles as being showy. It is often difficult enough to judge of the value of plants from mere flowers, dried scraps, or horrible caricatures, which pretend to be genial masterpieces. *H. G. Rehb. f.*

NEW JAPAN PEAR.

SOME time since, on the occasion of describing *Pyrus* (*Cydonia*) *Maulei*, we gave a list of the species of this genus, chronicled up to that time as natives of Japan. That list certainly does not include the subject of our illustrations (figs. 17, 18), and which was originally figured in the *American Agriculturist* for December, 1871. For our knowledge of it we are indebted to the publication just mentioned, to Mr. Quinn, of New Jersey, and to Dr. Thurber, to whose courtesy we are indebted for the specimens from which our drawing was taken. It is a question whether it should be called an Apple or a Pear, for while the tree has the wood, leaves, and habit of growth of a Pear, the fruit has the shape of an Apple and the odour of a Quince." The leaves are very large, and are stated to remain on the tree late in autumn, and to assume as brilliant a colour as the Maple. The tree is therefore valuable as an ornamental tree, and bears [abun-

FIG. 17.—NEW JAPAN PEAR.

It was described by Engelmann a few years ago from specimens obtained from Pike's Peak. It has five leaves in the sheath, not more than an inch in length. Seeds and specimens were introduced into England some ten years ago. The branches had every appearance of being very slow-growing; and, so far as we have seen of the young plants raised from the seed, that character has been quite sustained. *Andrew Murray.*

New Garden Plants.

MASDEVALLIA NYCTERINIA, *Rehb. f.*

Mr. Smith does not understand how it is that I have little admiration for his pet, *M. Nycteria*. I have already stated that I have never had a chance of seeing such a beautiful flower as that represented by our highly valued artist, though I happened to see several flowers on the very same plant in Mr. Day's excellent collection. After all I must add, that when I write for collectors and amateurs I must look at the things as they do. When I was a young beginner I thought it was very easy to make these gentlemen admirers of *Stelids* and *Pleurothallids*, of green *Epidendras*, brown *Acampes*, and dirty *Maxillarias*. I was utterly mistaken. I remember well how Dr. Lindley was amused at it. "Vons ne les changez jamais," was his answer; for when he was very gay he used sometimes to speak French. He was quite

dance of fruit, which "makes the most delicious preserve, with a positive Quince flavour." The fruits with which we were favoured had a very peculiar musky flavour, without the acidity of the Quince. There are stated to be two varieties of it, differing in the fruit, which in the one case is bright green with a few russet splashes, and in the other of a "fine golden russet with conspicuous white dots." It is supposed to have been derived from Japan, where, according to Mr. Thomas Hogg, both forms of the fruit are common. This pomologist considers it specifically the same as the Sand Pear (*Pyrus sinensis*), an opinion, however, from which we, though under reserve, venture to express our dissent.

NOTES ON PINUS AUSTRIACA, &c., IN SCOTLAND.*

I most gladly give you what information I possess, as well as my experience of the *P. austriaca*. I believe I induced the late Mr. Lawson to bring to Scotland seeds of this tree. I corresponded for him with Professor Hess, at Vienna, having passed some time at Vienna (1825), and visited the district where the "Schwarzkiefer" grows. I then thought over the possibility of introducing this beautiful Pine to Scotland. Being a zealous planter, I arranged with Mr. Lawson to have the first crop of plants, and accord-

* Read by Sir John Murray Naismyth at the January meeting of the Edinburgh Botanical Society.

ingly, in the spring of 1836-7, I planted forty Scots acres, mixing the Tyrol Larch with austriaca. In the spring of 1852 nearly the whole of this young wood was burnt, in consequence of workmen smoking whilst making a road in this part of the wood. Mr. Lawson, however, made a great mistake in planting the *P. austriaca* on a very high and exposed part of my hills. What remains of this wood has never succeeded well; they are mere sturdy stumpy trees, and are year by year dying out. Subsequently I planted very extensively over my woods (which average 800

of the district between Samaden and Silva-plana. He had formerly had the charge of a great district of forest in the Rhine country—the Eifel. He told me, in answer to my inquiries as to his knowledge and experience of *P. austriaca*, that the tree had been largely introduced into the German forests of Thuringia, Taunus, Eifel, Schwarzwald, and the Pomeranian forests, and that it had been found to give way after thirty to forty years; the timber also was considered quite inferior to *P. sylvestris*, owing to the superabundance of *harz* (resin), in fact, it could hardly be

aware, I think, that the first Larches planted in Scotland were here (Dawick, Stobo, N.B.), brought by my grandfather from Tyrol as seed, and put out in 1725!—(this is an authenticated fact)—six years before those at Dunkeld.

These great trees are now sadly torn, one lately (October 21-22), but the great one was torn in 1820, and one magnificent tree is quietly dying out. All my young Larch plantations I raised from seed sent me by Appellus & Eichel, from Erfurt. I am convinced that one cause of the so-called Larch disease arises from want of timely thinning, as well

FIG. 18.—NEW JAPAN PEAR.

to 1000 feet above the sea), as well as through the lower grounds. The result of my experience is that *P. austriaca* will never make a lofty tree in this hilly country. Even in its limited habitat (in Lower Austria, between Vienna and the Sommering Mountain Pass) it is always a low-growing, and never a large tree.

This tree, as you probably know, is so rich in resin (called by the Germans *harz*) that its chief use in the country where it grows is for lighting the houses. The wood is split into very thin "laths," and about 2 feet long, kept in bundles, and used as candles. I passed a whole summer in the Upper Engadine, and while there made the acquaintance of the head forester

sawn or worked. I find this information sadly true. Those I have planted in my hill woods, mixed with *P. sylvestris*, have attained no size for their years, and are almost without exception dying off; the foliage seems to wither and brown, the tree exudes low in the trunk a quantity of resin, and those I have cut down have with difficulty been sawn, owing to the amount of resin.

When passing an autumn (1863) at Ischl, in Upper Austria, I had the same information given me by the Emperor of Austria's head gardener, who, I remember, was busy transplanting some large specimens of *P. austriaca* (October): he told me they were merely ornamental, and did not succeed on the mountains. In Mr. McNab's pamphlet on the change of our climate, he alludes to the Larch. Mr. McNab is

as from home-grown seed. I have thinned my Larches early and gradually, always insisting upon having room for sun and air to the roots, and I have never had any disease.

As to the Arve, or *P. Cembra*, I have pruned some, and find they do not bear it so well as the *austriaca*. They are growing very luxuriantly, but for some years past have been sadly injured by the boring beetle. The *P. ponderosa*, of which I have one large tree, is a miserable-topped unsightly tree, and is especially preferred by the borer.

The *P. pyrenaica* has almost entirely failed with me. Being a Spaniard, it lacks sun in Tweeddale. The true *P. uncinata* grows a pretty diminutive tree. The tree named by nurserymen in their lists as *P. uncinata* is nothing but the *P. Mugho*. *John Murray Nicolson*.

ON THE CONTENTS OF THE CROP OF THE CAPERCAILZIE.*

HAVING occasion recently to examine the crops of several Capercaillie, with reference to their destructiveness to forest trees, it has been suggested that the results of my examination of one or two of the crops might be of interest to the members of this Society, and in accordance therewith I have drawn up the following short notes.

In the crop of a male bird, which I examined on November 15, 1873, I found the contents to be as follows—203 points of shoots of Scotch Fir with the leading bud entire, some of the shoots being fully 3 inches long, and 2 inches wide, measured across the leaves as taken out of the crop; eleven pieces of young wood, 14 to 2½ inches long, and about an inch in circumference at the thick end, each having some leaves attached but no terminal bud; and fifty-two buds: making in all the enormous number of 266 shoots and buds of Scotch Fir, besides a large handful of detached single leaves of the same, devoured by one average-sized bird at a single meal. The bird weighed 11½ lb., the crop weighing 9 oz., and measuring 6 inches in length, 5 inches in breadth, and 3 inches in depth; its circumference being 15 inches the longest way and 12½ inches the shortest. The leaves, buds, and shoots, were all quite fresh and green, apparently selected with good taste from healthy growing trees.

I examined the crop of another rather small male bird on April 16, 1874, and found the contents to consist entirely of the young shoots, buds and leaves of Larch, excepting three small bits of lichen, probably picked off the same tree. I counted five pieces of young shoots, each over an inch long, and the extraordinary number of 918 buds with or without leaves attached, and an ordinary sized teaspoonful of tender young leaves. The contents in this case were very moist and sticking together in small bundles, but separated easily. All were plump, juicy, and fresh, evidently the produce of a free healthy growth. The bird weighed 9½ lb., its crop when full weighing 7½ oz., the weight of the contents being 6½ ounces. Its length was 4½ inches, breadth 2½ inches, depth 2½ inches, and circumference, the longest way 12 inches, the shortest way 7½ inches.

By the above analyses of their crops, which are similar to many I have examined in the winter and spring, it will be seen that where Capercaillie are very numerous they must do considerable injury to Larch and Scots Fir plantations, although their food is by no means confined to the produce of those trees, as at other seasons I have examined crops which contained (besides Larch and Scots Fir) various sorts of berries, such as Junipers, Mountain Ash, or "rowans," haws, hips, Brambles, Cranberries, Blackberries, &c., generally mixed with a few leaves of the same plants; and sometimes the leaves and buds of Birch, Hazel, and Oak, but the latter is rare. In July and August I have found some crops filled with nothing but the young tops and bloom of heather, *Erica cinerea* and *E. tetralix*, both species generally intermixed, neither seeming to be preferred. In birds of the first year there is generally found a large quantity of Fern fronds and less of the Scots Fir, which at all times afterwards seems to form their staple food. The Fern fronds are almost wholly the common Polypody (*Polypodium vulgare*), but occasionally I have found small quantities of the male Fern (*Lastrea Filix-mas*) the Lady Fern (*Adiantum Filix-femina*) and *Lastrea dilatata*. Barley and Oats are also found in the crops of birds when got in the neighbourhood of cultivated land, but I have never found them in any quantity; and in all the specimens I have examined, young or old birds, I have never found a single morsel of Spruce Fir, although the bird is said to feed freely upon it in Norway.

From my own observation, and in reply to inquiries I have made of people who are in the habit of observing the Capercaillie feeding in the northern forests, I believe it prefers to feed upon the healthy young "sappy" growth of vigorous trees, and they have been known to return to the same tree day after day until they had completely denuded it of its healthy young buds and points of shoots; however, I believe cases of such severe injury are rare, and, generally speaking, if the birds are not too numerous, the injury they do is trifling compared with the great pleasure and gratification of seeing such a magnificent

bird again becoming common in the forests of our native country. *M. Dunn, Dalkeith Palace Gardens.*

Mr. Dunn opened before the meeting of the crop of a female Capercaillie which had been shot in Perthshire the previous day. The crop was filled with the leaves and buds of the Scotch Fir.

GLASS.

It is now, I should think, twenty years ago that I witnessed a new process for making glass, which was invented and patented by Mr. Bessemer (*the Bessemer*), and by which the manufacture was rendered less costly by at least 50 per cent. I went over the experimental factory in Agar Town, saw the whole machinery, simple, ingenious, and complete, from the first preparation of the "metal," the melting, annealing, and perfect completion of the article, some of which I saw and handled.

The process differed from the usual and present mode of making glass in this respect: instead of putting the crucible containing the raw material on the fire, the fire was made to go into the crucible, by which simple reversal of the manipulation time and fuel were economised in the proportion that five hours bear to sixty hours. The crucibles employed in fusing the "metal" are made of very non-conducting material—Stourbridge clay, and are of enormous thickness, so that when placed over the fire days and nights elapse before the heat gets through the pot, and fuel is consuming all the time. By the improved process, a large rotating fan, charged with heated air, conveyed like an immense blow-pipe a flame of intense heat direct upon the "metal," and the pot was heated only, as it were, incidentally. This superheated blast, of some 20 feet or more in length, afterwards expended its heat in other duties, as in keeping up the temperature of the annealing ovens. A very ingenious plan was employed for lifting and tilting the crucible. Beneath the crucible was supported upon the pistons of an hydraulic press: by letting in a small stream of water, and which could be regulated by a tap, the massive vessel with its contents was gradually raised into the spot where the immense tongue of flame was playing; this was slowly and surely accomplished by the pressure of water, and it could be arrested at a moment. When the metal was sufficiently melted, the crucibles were lifted at the back edge, and thus tilted on to a metallic slab in front. The molten "metal" was then rolled out into sheets by passing under rollers; thence it gradually travelled down an inclined plane, and was received at the other end on to wagons which were used to transfer it to the annealing ovens. These rollers and metallic slabs were kept cool by currents of cold water passing through them. The glass thus made was rolled glass—rough plate; but the principle of melting could of course be applied to blown glass such as is used for ordinary glazing.

Such, briefly, was what I saw, and now I want to ask, what has become of this process? I was given to understand at the time that the patent was bought up at a goodly price by a well-known glass manufacturer for the purpose of burying it. A commercial *coup de commerce*—I suppose, it must be called. Such a process of making glass was calculated to revolutionise the whole trade; of what use henceforth would be all those cumbersome furnaces, and those immense buildings, if glass could be made like this? Every appliance in the already existing manufactories, all the details, all the machinery, mechanical and human, would be at once rendered obsolete. So the spirited proprietor of one of the largest works bought the invention out of the way, satisfied with the profit he could make in the old mode; and doubtless the talented inventor accepted the cash with another sigh over his lost offspring, strangled before it could cry, and kept the money to nurture the next bantling that was to come from that fertile brain.

But what has all this to do with the *Gardeners' Chronicle*? Surely this is obvious. Most of our readers, I feel certain, would hold up their hands for a reduction in the price of glass; and if this patent had not been suppressed there is no reason why glass should not now be had at 5s. the 100 feet, or from that to 15s., according to quality; but beyond the smaller or personal importance of the question there is a much wider and higher one, and even a national interest, in the production of a cheap glass, so essential to health, by introducing light and cleanliness into our homes; and while the whole science of horticulture and the whole botany—and therefore many economic sources of national wealth—would be enhanced by the increased facilities which a cheap glass would give to both scientific investigators and mercantile producers.

The patent has long ago expired. It would be a good speculation for a company to take up the plan, and start a factory. *W. H. O.*

DALLAM TOWER, WESTMORELAND.

THIS place, the seat of G. E. Wilson, Esq., is beautifully situated on the banks of the River Bela, eastward from and near the head of Morecambe Bay, into which the river empties itself a little lower down. A more lovely situation could not well be selected. The mansion, a large, substantial stone building (fig. 19), fronts northwards, overlooking the river, which, when the tide is in, forms a broad expanse of water. Coming up into the park, eastward lies an extensive and finely wooded park of magnificent land, with broad open glades; the ground rises in this direction gradually far away until it reached the wood-clad summit, which stretches right and left, forming an elaborate framework to the enclosed landscape. Here and there, on a judiciously selected elevated spot, are clustered a few trees, groups of the Scotch Fir (*Pinus sylvestris*), the dense black-green foliage of which contrasts well with the paler tints of the neighbouring groups of deciduous Limes and Beeches, still further brought out by noble round-headed Chestnuts. The land here, mostly resting on the limestone rock, is extremely fertile, necessarily dry and free from stagnant water, yet everything looks fresh and green even in dry summer weather. The high ridge in this eastward extremity of the park, besides the fine effect it produces, affords a most welcome break to the eastern blasts that come sweeping down from the higher hills in the winter season. Westward, at some three-fourths of a mile distant, lies the bay, with its magnificent sheet of water, in calm weather placid as a mirror, yet when lashed by the western gales its rolling waves come surging in as if intent on engulfing everything that opposed their way; but the effects upon vegetable life of these breezes off the bay are a totally different nature to what is experienced off the open sea, where the salt-laden gale stunts and dwarfs almost the whole vegetable family. The nature of the land, here undulating on the surface, breaks the force of the wind; almost everything in the shape of timber trees, evergreen and deciduous shrubs, thrive most luxuriantly; things of a half-hardy character, such as Fuchsias, Hydrangeas, Myrtles, and numbers of others of similar nature seldom feel the effects of the mild winters. On the opposite shores of the bay, in the direction of Coniston, the view is most extensive, stretching away to the more western and distant hills: the eye here takes in one of the finest agricultural districts in the kingdom, including Furness, so famed for the corn-growing capabilities of its red ore-impregnated soil.

At the westward end, and connected with the mansion by a glass-covered colonnade, stands the conservatory; it is an irregular shaped structure built of iron with a curvilinear roof, which is nicely clothed with Passifloras, the Jasmine-leaved *Bignonia*, Tacsonias, and other similar things. The centre is occupied by Tree Ferns, *Cordylina australis*, and others of commanding appearance, filled in with the usual blooming plants, such as Lilies, specimen Fuchsias, *Pelargoniums*, &c. The plants are arranged naturally, most of them being in pots, or on very low irregular shaped stands, and have a pleasing effect. On the southern front of the mansion is a terrace running the whole length of the building, over 80 yards, bounded on the side opposite the house by a stone balustrade sloping into a deep narrow valley laid out as a lawn. Here is one of the most beautiful bits of combined Nature and Art that could well be imagined; it slopes gradually from east to west, with an irregular outline at the opposite side, and which rises almost perpendicularly for several hundred feet, the whole surface of this slope being covered with fine trees intermixed with evergreens and intersected by lengthy walks completely shaded and forming an agreeable retreat in hot weather and for evening promenade, under the thick dense foliage. At the bottom of this lawn, on the south side of the mansion, are some of the most perfect specimen trees of Weeping Beech and Ash; sheltered as they are here, growing in the best soil, they assume a character only to be attained where such favourable conditions for their growth exist: they not only come down to the turf, but the branches lie thickly upon it for a considerable distance, care being taken that in mowing they are not injured in the least. At the foot of the terrace is a small flower garden, filled with bedding plants and dwarf Roses: this has a very beautiful effect, not being too large. The space it occupies is not more than a twentieth of the green surface out of which it is cut: the plants assume such subdued colours as not to be offensive, even to the most fastidious eye in these matters, contrasting most favourably with the overdone flower garden too often met with, which fill the whole possible space, leaving no room for the all-essential broad grass margin, the absence of which always puts one in mind of a big gaudy picture, with all the canvas filled with

* Read at the January meeting (14th inst.) of the Edinburgh Botanical Society.

glaring colours and minus a frame. This garden was planned and made by Mr. Sarpie, Mr. Wilson's gardener, and does much credit to his taste.

Eastward in this valley are planted coniferous trees, forming a small pinetum; they comprise many of the most popular kinds, one especially exemplifying the mild nature of the climate—*Cryptomeria japonica*, which here grows most luxuriantly dense, and as green as the grass from the surface of which it springs; it escapes unscathed from the effects of winter. The soil here as to quality is similar to the generality in the neighbourhood, but where this *Cryptomeria* and its congeners are grown it is rather shallow, consequently they do not make such rapid growth, but are less likely to suffer from frost. The greater portion of both deciduous and evergreen trees and shrubs that will withstand our winters even in the south of the kingdom thrive here.

Proceeding from this point southwards, by a continuation of broad View and Holly shaded walks, at some distance, is situated the walled kitchen garden, wherein are the different plant and fruit-houses. It occupies a similarly sheltered position to the last, and is divided from it by the high-lying ridge already

into stone sockets, which prevents their rotting better than if simply inserted in the ground; from these light rafter-shaped bars extend under the wall-plates, these are secured in their places with tie-pieces of timber, and the whole is covered with inch mesh wire netting. Strawberries thus enclosed, as well as the fruit on the walls, are securely out of the reach of the marauding songsters; the only objection to the plan is its first cost. Early vegetables do well in this garden, and in summers like the last such things as French Beans and Lettuce, that through the season have been very difficult to manage in some parts of the country, have succeeded well here; but in the early autumn, from its confined position, Peas milled seriously. At the western extremity of the garden is an orchard of considerable extent, filled with bush and standard trees in good bearing condition; adjoining this, and separating it from the kitchen garden, are the houses, the first of which is a moderate sized plant stove filled principally with fine-leaved subjects, mixed with Ferns, Palms, *Dracænas*, *Alocasias*, and *Marantas*, amongst which was a very fine example of *M. Veitchii*, and *Agave filifera*.

Next to this is a stove in which was a grand plant

umbrella fashion, with heads about a foot in diameter, loose and airy, with its flowers hanging beautifully at the under-side of the head. They were in 6-inch pots, with straight thin stems, and were altogether the best and most effective plants for the purpose I have met with. With these were a selection of the best of the new flowering Begonias.

At a short distance are the vineries, lean-to, with a south-eastern aspect. The first is 40 feet by 20. It has been planted two years. In it were Madresfield Court Muscat, bearing a few good bunches showing no symptoms of cracking; Mrs. Pince's Muscat, Black Hamburgh, Lady Downe's, and Golden Champion—the latter good in both bunch and berry, but here inclined to crack. After all that has been said about this Grape, it is evident that it deserves a better character than it received after its first being tried. I have seen it in at least a dozen places through the autumn, in all of which it was bearing very fine fruit in both bunch and berry, and while the roots were principally inside, or under such control as to keep them dry, as the atmosphere of the house, there were no signs of cracking, but where the reverse of these condition existed it suffered materially. The Vines in the hou

FIG. 19.—DALLAM TOWER, WESTMORELAND, THE SEAT OF G. E. WILSON, ESQ.

noticed, and is also bounded on the south-west by similar high ground rising abruptly. To form this garden on the south side has been no small affair; the rock in some places has had to be quarried to the depth of 12 or 14 feet, and removed to a considerable distance; it is indeed rather too much sheltered almost on every side by the high-lying ground by which it is enclosed; this, and its proximity to the sea, as will be supposed, gives it an almost immunity from spring frosts, but there is a difficulty in getting summer-growths matured in such things as Peaches, which consequently do not bear satisfactorily; Apricots, on the other hand, from the humid nature of the country where indigenous succeed better, as also Figs; Pears likewise do fairly on the walls; Plums succeed moderately. A quantity of Apples on Paradise stocks, and Pears on the Quince, were planted three years ago, but the results are yet to be learnt. Few varieties of Strawberries will succeed well in this part of the country, most of them making too much leaf; those which do best are Veitch's Eclipse and President. Birds exist here in such numbers that it was found impossible to deal with them in the ordinary way. A portion of the borders have been enclosed with a durable wooden framework against the walls, as high as, and similar in shape to, a range of lean-to houses: the upright posts are let

of the lovely *Hoya bella*, 4 feet by 4, and *Bougainvillea glabra*, finely in flower; some good *Orchids*, amongst others two very fine plants of *Leelia purpurata*; the beautiful winter flowering *Celogyne cristata*, very strong, some of the bulbs measuring 4 inches in length. There are also in this house a number of winter flowering *Dendrobiums*, *Cypripedium caudatum*, several plants of *Anthurium Scherzerianum*, *Stephanotis floribunda*, a fine specimen of *Nepenthes Rafflesiana*, and an extraordinarily well-grown and finely coloured example of *Croton interruptum*—a plant not often seen in good condition.

The next is a large span-roofed general plant house, filled with mixed hard and soft-wooded greenhouse subjects, consisting of *Daphnes*, *Heaths*, *Acacias*, *Kalosanthes*, and a very fine lot of half-specimen *Azaleas*, comprising good sorts, such as *Brilliant*, *Prince of Orange*, *Madame Ambrose Verschaffel*, and *Roi Leopold*. Here also was a good plant of *Sarracenia flava*, doing beautifully in this cool situation. Associated with it was one of the finest coloured plants of *S. purpurea* I have ever seen, and in the same corner *Dionæa muscipula* and *Cephalotus follicularis* doing equally well. Here, likewise, was a number of the best table decoration plants imaginable. They consisted of *Abutilon megapotamicum*, grafted at about 18 inches upon *A. Thompsonii*, and trained

were in fine condition, carrying a few bunches each, yet not too many, so as to injure them. The wood was strong and thoroughly ripe, with the foliage large, green, and free from spider. They are planted inside, and the roots occupy the whole of the inside of the house. The front wall is on arches, with a 12 feet border outside.

Adjoining is another house, similar in size to the last, and also two years planted with Muscats. These have done equally well, carrying about four bunches each, which they were finishing beautifully; they had made plenty of good strong wood that was ripening as early as the fruit, promising well for another year.

The next is also a vinery, similar in size to the two preceding, filled with very old Vines; these are planted outside, and are very nearly worn out. Mr. Sarpie has in this house made a new inside border and planted young vines, to make way for which the old ones are being gradually cut away as the new ones require room, and will ultimately be removed altogether, and the outside border renewed. All the borders are covered in the autumn before the heavy rains come on, which is here necessary. In the pits used for bedding plants in winter were remarkably fine crops of Melons; *Victory of Bath* is the sort most held in esteem here. The place altogether is well kept, reflecting very great credit on Mr. Sarpie

whose care and attention are alike to be seen in each department.

Southwards from Dillam Tower, at the distance of about a mile, on a hill of considerable height, rising immediately from the bay, is to be seen a most remarkable natural curiosity. On the side of the hill, and extending for a considerable distance towards its summit, the surface is composed of rock, channelled and worn as if (and no doubt) by the action of water, all at one time evidently having been in one gigantic piece, like a huge flag covering the surface, but by some violent upheaving of the earth the whole has been lifted up, which has had the effect of breaking it into pieces some 4 or 5 feet square, to the depth of 6 or 8 feet. These fissures are most regular in size, from 3 to 6 inches wide; the entire surface is free from any covering of earth, sand, or loose material of any kind, and consequently denuded of vegetable life, except in the fissures, where in some places there are a few Ferns, native Heaths, grasses, and similar vegetation. It is altogether one of the most singular examples of Nature's gigantic handiwork probably to be seen in the country, and is visited by many who are interested in geological pursuits. T. Baines.

Forestry.

Now that the snow is nearly gone the ordinary operations can be proceeded with, but, as is often experienced, there are many duties which the forester has to discharge by no means very intimately connected with practical forestry, and, for the sake of those who may feel disposed to murmur at having to do things not belonging to their so-called profession, I will briefly indicate from time to time a few which we not infrequently have to discharge, and which after due reflection will be seen to come more properly under the forester's duties than under that of any other employé.

Cover beating for game is an employment for which the woodmen are almost invariably called out, and, generally speaking, the young men like the job very well. It seldom extends over a few days, the shortest and most wintry in the season; with it, there is an amount of excitement which many people greatly enjoy. Much, however, depends upon the nature of the cover itself, and the treatment the men receive, whether they will like or dislike the employment, and, as they are usually under the direct command of the gamekeeper while on duty, their pleasure or discomfort mainly depends on him. On some estates *Whin* or *Furze* greatly abounds, on others the covert is composed chiefly of *Bramble* and *Briars*. When the latter abound outer clothes of sheepskin leather are essentially necessary for the beaters. Hat, coat, breeches, leggings, and gloves must all be of leather, as ordinary moleskin or corduroy, not to speak of tweed or cloth, would be literally torn to fragments in a few hours. Each man is also provided with a strong clasp pruning knife in his pocket, a long staff in his hand, and a game bag over his back. Thus equipped he enters the covert lithe and strong, but after a mile's travel he is very much exhausted. To those who have never roughed a real tangle of *Bramble* and *Briar* covert, or know what it really is, the use of a large knife can scarcely be imagined, but to those of us who have had to cut our way inch by inch, and roll out when walking was impossible, the use of the knife is a well realised fact.

Every beater is instructed to lift and carry all the dead game he finds, and, to encourage them in this, a premium is usually given for each head in addition to the usual pay. Dinner or luncheon is always provided for the beaters at a certain hour and known place, and, being more savoury than their ordinary fare, adds another, and by no means unimportant, attraction to the covert beating.

When the general covert beating is over, the woodmen's services are still further required by way of ferreting, digging out, and killing rabbits and rats, both of which classes of animals are highly injurious to forest produce; hence the forester's interest in having them killed down, especially as they are increasing all over the country to an alarming extent.

Levelling Dykes.—Before planting and other pressing work begins all old turf dykes should now be levelled, and holes filled up, so as to get rid of every rabbit, for unless they are completely eradicated all successful forestry is impossible.

We commonly pay the levelling of old turf dykes by contract, and pay from 10s. to 16s. per 100 yards lineal. The former price is sufficient when there are no roots or *Whins* to contend with, and the earth is thrown equally to both sides, but when tree roots ramify in the earth and *Whins* have to be cleared off before the spade and mattock can be applied, the latter is sometimes barely sufficient.

Roads.—Shooting roads should now also be proceeded with as weather and other circumstances will permit, for there is no season of the year when the gamekeeper is more willing to let the forester have

freedom in the woods than when hatching commences. He should, therefore, prosecute with all diligence the clearing of *Whins*, and forming of rides and roadways in the woods.

Various modes have to be adopted in forming shooting roads, according to the state of the ground and kinds of herbage and trees upon it. Where *Heath* abounds as under-cover and trees as top growth, we cut the latter first and clear them off, and with a strong *Whin* scythe mow the *Heather* and rake it off. In cutting roads through masses of *Whins*, we prefer cutting them close to the ground with a hand-bill, letting them lie upon the stools one year, in order to promote decay or weaken the roots, and afterwards clear them off, when they soon decay. Fifteen feet is a common width for shooting roads, but they are made of various widths, from 10 feet to 20 feet, according to circumstances or wish of the proprietor. Some prefer sacrificing trees to game, while others would rather lose a shot than cut down a tree. C. Y. Michie.

A valuable report on the *Durability of New Zealand Timbers*, drawn up by Mr. Kirk, has been forwarded to us, and from which we shall probably extract some portions at a future time. The trees especially mentioned are the *Kauri* (*Dammara australis*), which produces the most valuable timber; various species of *Podocarpus*, of which *P. Totara* is the best; *Dacrydium cupressinum*, *Phyllocladus trichomanoides*, *Libocedrus Bidwillii*, *Leptospermum ericoides*, *Vitex littoralis*, various species of *Fagus* and *Metrosideros*, *Elaeocarpus dentatus*, *Sophora tetrapeta*, and several others, including *Fuchsia excorticata*, which furnishes timber large enough for house-building purposes.

Foreign Correspondence.

ROYAL HERBARIUM, BERLIN, W. FRIEDRICH-STRASSE, 227: January 18. — I was pleased to find in your numbers 47 and 50 of the last year so full an abstract from my preliminary notes on the botany of the Libyan desert and its oases. I shall feel much obliged to you if you would kindly allow me to make a few corrections. Most of them concern the spelling of Arabic names, which I accommodated in my paper, of course, to German pronunciation. They would, in consequence, I am afraid, be pronounced very incorrectly by English readers—thus it will be preferable to spell

<i>Berbes</i> instead of <i>Berik</i>	<i>Mookhdyt</i> instead of <i>Muechet</i>
<i>Boljak</i> „ <i>Bulak</i>	<i>Serfer</i> „ <i>Serir</i>
<i>Dikhel</i> „ <i>Dehakel</i>	<i>Simeh</i> „ <i>Simeh</i>
<i>Dakkin</i> „ <i>Dawakh</i>	<i>Siakh</i> „ <i>Siakh</i>
<i>Enah</i> „ <i>Eshnah</i>	<i>Tenedeh</i> „ <i>Tenedeh</i>

Then allow me to correct two slight mistakes. I would not say that all *Date* trees at *Seewah* have brown leaf-rib, as I only noticed the occurrence of a brown-ribbed variety in a certain number of individuals. The fruit of the sweet *Lime* is more juicy than aromatic.

I recognized the two undetermined species of the list, p. 10, as *Matthiola livida* and *Helianthemum Lippii*, both gathered in flower and fruitless specimens. *Nitaria tridentata* also is to be enclosed in this list. P. Ascherson, Dr.

BOTANICAL INSTRUCTION AT HARVARD.—The change in the public appreciation of botany is due to the fact that the first botanists have written most popular works, and by their aid intelligent people now look upon botany not as a mere study of stamens and pistils, and giving of hard names to plants, but as a science which regards every phenomenon of plant-life and every relation of plants to the earth, the air, and to animals, including man. Taking this view of botany, it is not to be wondered at that it has risen in public estimation, and that instead of being dismissed with, "it is a beautiful study for ladies"—a doubtful compliment to both ladies and the science—it has come to be thought worthy of the serious attention of our educators, and Harvard has provided ample facilities for all who would study botany as an essential part of a liberal education, or take up some department of it as a special pursuit. The botanical instruction at Harvard is, of course, at the Botanic Garden; and the writer can contrast the single combined dwelling-house and study, the swampy, rubbishy garden and dilapidated greenhouse of twenty years ago, with the handsome range of botanical buildings, conservatories, and well-arranged garden of the present. With the advantages here offered, there is no need that the botanical student go abroad, for at the head of the whole is Professor Asa Gray, not only the very first of American botanists, but if we enumerate the five leading botanists of the world, his name must be included. Here, as Director, and the magnificent herbarium which he founded, and his unequalled library, are accessible to students. While

Professor Gray has transferred a portion of his duties to others, he still remains as supervisor and "court of last appeal." Botanists everywhere will be glad to know that he is devoting himself to the *Flora of North America*, and will join in our wish that he may be spared to complete this much needed work, which no one else is so well able to undertake. His labours on this are much interrupted by correspondents in all parts of the country, who send him plants to name, and his time is much frittered away in doing that which any one fit to edit an agricultural or horticultural paper should be able to do—and we know that he would be very glad to be relieved of much of this. Plants from the higher Rocky Mountains, Arizona, Alaska, and such out-of-the-way places, he would be glad to see, but do not trouble him with near-at-home specimens. We may add that a postal card enclosed for an answer is no small saving of time. Every man of science is annoyed by descriptions of wonderful things in his department. A poor specimen is better than the best description; such things only take up time, and are only, after all, conundrums to be given up. We volunteer this on behalf of Professor Gray, knowing how much his time is taken up by inconsiderate people, who might as well get their information elsewhere.

Professor Sereno Watson, formerly botanist to Clarence King's Expedition, is now the curator of the herbarium, and attends to its accessions, and looks after the wants of those who consult it. Besides this he is doing much valuable work, not the least of which is an index to the scattered materials of North American botany.

Professor Goodale takes the work of general instruction in botany. The classes, which now number fifty or sixty, meet in the new lecture room and laboratory; this building communicates on the one side with the herbarium and library, and on the other, with the conservatories and hothouses. The laboratory is very conveniently arranged and well equipped; each student is provided with a simple dissecting microscope, and each advanced student with a compound microscope for his special use in minute investigation.

Professor W. G. Farlow, a former pupil of Professor Gray, and later abroad with De Bary and Thuret, has charge of the botany at the Bussey Institution (also a department of Harvard), where he is establishing a laboratory, with all the modern appliances, for cryptogamic botany. He will give special attention to the lower fungi, so injurious to plants and animals, and about which there is a great want of positive knowledge. Professor Farlow also gives instruction in the regular course, in cryptogamic botany, especially to intending medical students. He is full of enthusiasm in his specialities, and we look for valuable results from his work.

Professor C. S. Sargent is in charge of the Botanic Garden, which contains many of the specimens of rare plants, and which has recently been greatly improved by bringing the species into botanical order. He has charge of the horticulture at the Bussey Institution, and will establish the Arnold Arboretum, for which there is abundant provision, and which, with his thoroughness and enthusiasm, will be the finest arboretum in America.

Besides the regular collegiate course, there is at Harvard a summer course especially for teachers; this was started by Professor Gray, and is now continued. Last summer there were about twenty teachers from various parts of the country, a majority of whom were ladies, who, as Professor Gray says, "worked like good fellows." Some have been there two and others three years in succession, and all are learning to be good investigators and better teachers. In addition to these, Professor Farlow contemplates a summer course on the lower cryptogamic plants, at some place upon the seashore not yet selected. It will be seen from this account, that there is at Cambridge ample provision in the way of instructors and apparatus for all who would study botany in general or in special departments. The herbarium is not only the largest in the country, but one of the most valuable in the world, and is well supplemented by the great abundance of living plants in the garden and houses. *American Agriculturist*.

Notices of Books.

Descriptioes plantarum novarum et minus cognitarum in regionibus Turkestanicis a cl. P. et O. Fedchenko, Korolow, Kaschakowicz et Krause collectis, cum annotationibus ad plantas vivas in horto Imperiali botanico Petropolitano cultas. Fasciculus II. Auctore E. Regel.

We have taken this up more particularly for the purpose of reproducing Dr. Regel's defence of his ideas of specific limitations in the genera *Tulipa* and *Vitis*. It will be remembered by some readers of the *Gardener's Chronicle* that we were more than once alluded to the theory advanced by this acute botanist respecting the origin of the varieties of *Grape* collectively known as *Vitis vinifera*, from *V. vulpina* and *V. Labrusca*.

* *Erys* as in valley.

† Not Sinah, the well-known Oasis of Jupiter Ammon.

Before proceeding to Dr. Regel's defence we may briefly notice the other contents of this part. The descriptions of new plants from Turkestan are mixed up with those of various garden plants obtained from all parts of the world, a conspectus of the species Eupheharatos, and an enumeration of the species of *Prunella* found in Russia and Mandchuria. A large proportion of the new plants from Turkestan belong to the genera *Astragalus* and *Oxytropis*. The following new species of *Prunella* are described.—*P. Kamfmaniana*, Thian-shan and Turkestan; *P. Fedtschenkoii*, Turkestan; *P. Maximowiczii*, North China; and *P. Olga*, Turkestan. Then follow some amended and amplified descriptions of plants recently figured in the *Gartenflora*.

We now come to the "supplementary remarks to my enumeration of the species of the genera *Tulipa* and *Vitis*."

Dr. Regel says, "Various botanists, whose opinions carry considerable weight with them, have accused me of having too freely combined the species of *Tulipa* and *Vitis*; but a fresh investigation of the American plants has necessarily led me to that instead of having distinguished too few species, I have admitted too many, especially in the genus *Tulipa*."

He goes on to argue that our ideas of species and forms in an unprejudiced examination are essentially biased or formed from the nature and extent of the material under investigation; and, what is quite true, specimens from one or few localities are quite insufficient to illustrate the extent to which a species may vary in the same or in different countries. In such forms, species are frequently founded upon extreme forms of one and the same species. But numerous specimens from various localities, extending over the entire geographical area of a species, present us with the manifold deviations we are accustomed to see in cultivated plants. Systematists of the old school either excluded cultivated specimens in drawing up their diagnoses of species, or, like Schrader with the genus *Berberis*, made a species of each individual. And it was a pretty generally received notion that North American plants could not necessarily be specifically different from those of Europe or Asia, and this opinion long prevailed, in spite of the facts to the contrary cited by Asa Gray, Maximowicz, and by Regel himself.

Respecting the *Tulips*, Dr. Regel states he had extraordinarily rich materials at his disposition, which, he maintains, fully justified him in reducing many so-called species, based upon such inconstant characters as colour and size, to *T. sylvestris*. Moreover, he thinks *T. turkestanica*, Sieb., should have the same fate, and his *T. sylvestris*, *L.*, *7 turkestanica*, would be more correctly placed as a form of *T. biflora*. *T. Schrenkiana*, Regel, is, doubtless, the wild form of *T. Gesneriana*, whose bulb-coats were described chiefly from cultivated specimens, and supposed to be different.

"Respecting *T. suaveolens*, it may be observed that I subsequently had an opportunity of examining specimens from the Caucasus, and I see no objection to combining *T. altaica*, Pall., and *T. stranguilata*, Rebohl, with it. Further, I have never seen any very complete ones, of *T. Didieri*, Jord.; *T. Lehmanniana*, Merklin; *T. soogiana*, Ege.; *T. armena*, Boiss.; and *T. Sittorhiopiana*, Sm.; so that I could not form any opinion respecting these species. Finally, *T. Haageri*, Regel, is one of the handsomest forms of *T. sylvestris*, which must be placed near *T. sylvestris* Orphanidea.

"Coming to *Vitis*, it has been urged upon me that the Asiatic and American species of this genus are certainly specifically distinct from each other. But Asa Gray, the best qualified judge of North American plants, who has also thoroughly studied the flora of Japan, writes *V. Thunbergii* of *V. Labrusca*; and I can only reiterate, that not only is there no specific difference between these first species, but also between the Asiatic and American forms of *vulpina*. I am only in doubt whether *V. amurensis* and *V. rotundifolia* should not be regarded as transition forms of *V. vulpina* to *V. Labrusca*."

Other critics have objected to the union of certain forms (*V. heterophylla*, *β Maximowiczii*, and *V. Labrusca*, *c ficulifolia*, and *c sinata*), because they are constant under cultivation. But who would affirm that the cut-leaved varieties of *Alnus incana*, *A. glutinosa*, *Betula alba*, *Tilia parvifolia*, *Sambucus nigra*, &c., are not forms, but good species? Although non-sexually propagated they retain their respective characteristics, and the forms of *Vitis* mentioned are non-sexually propagated. Dr. Regel adds that Maximowicz forms his, that these forms, with deeply-divided leaves of both species, are usually confined to shady places in Japan, where he had the opportunity of observing them; and seen in their native habitats, nobody could doubt their being merely varieties. Further, Dr. Regel contends that there is a gradual transition in the varieties of *V. Labrusca* and *V. vulpina* with acute sinuses to those with rounded sinuses, and the non-sexually propagated cut-leaved varieties of *V. vinifera* are admitted without question. Finally, the geographical position of North America and North-east Asia is instituted, and palæontology is also cited in support of the argument.

In a great measure we can accept the views held by Dr. Regel; but we should probably not agree as to the origin of the forms. But the great points, so far as descriptive botany is concerned, is to draw a medium between excessive division and aggregations of forms. Carried too far either way, no useful result is gained.

—The January number of the *Botanical Magazine* opens with a double plate of a very striking *Eucalyptus*, *E. cornuta*, which flowered in the course of the summer in the temperate house at Kew. The name *cornuta* was evidently given from the long horn-like calyx, like that of an *Eschscholtzia*, and which assumes a brilliant red colour, and the upper portion of which ultimately falls off. The plant is a native of South-Western Australia. *Crocus Byzantinus*, a figure of which follows next, is a fine autumnal species with pointed perianth segments of a purple colour. *Jamecia americana* is a hardy deciduous shrub, with terminal panicle of white flowers, which has lately flowered with Mr. Ellacombe, at Bilton. *Blumenbachia chiquensis* is a handsome Peruvian hardy herbaceous plant, closely allied to *B. coronata*. It was introduced by Mr. Pease to the establishment of Messrs. Veitch. The last plate in the present number represents *Odontoglossum maxillare*, a plant of which was recently exhibited at the Royal Horticultural Society.

—By the aid of photography and the Dallastype process, Messrs. Sutton & Sons have reproduced their *Amateur's Guide* in a very neat form, in the smallest possible size, and at a considerable reduction in price. The type, though clear, is painfully small.

—The ninth part of Sowerby and Johnson's *British Wild Flowers* (Van Voorst) brings the work up to the genus *Senecio*. Though of little scientific value, the small coloured figures are useful as reminders.

Natural History.

SUMMER PESTS IN THEIR WINTER QUARTERS.

—There are a number of destructive insects which may be reckoned on with tolerable certainty each year as summer guests, always raising a disturbance when their unwelcome presence is perceived, but yet which, during the winter season, when they are quietly maturing in nooks and corners for the summer campaign, though in many cases visible, and in others so presumably present that the appropriate remedy might be applied, are generally left in peace, and not being then aggressive are not then attacked.

When summer comes, with its masses of flowers, swelling fruit, and luxuriant leafage, a large portion of the plant is hidden from minute observation, and difficult to reach without causing injury to the coming crop. Sometimes it is almost impossible to do battle effectually with the insect destroyer, and the very conditions of existence point to the probability of the ordinary means of continuance of the insect being such as cannot without some degree of difficulty be counteracted.

When the Cabbage butterflies appear, a pinch is generally at the service of any unlicky specimen which comes in reach, but during the winter the chrysalis may hang unscathed, wherever it may have found convenient to attach itself; and here, to begin with, some good might be done by a thorough brushing down of rough shed walls, clearing out corners, and especially looking well into all the nooks in rough woodwork, behind badly-fitting doors, under bars, and all other favourite lurking places.

The pupa may be generally described as somewhat club-shaped, obtusely pointed at the larger end, more gradually narrowed to the caudal extremity, by which it is hung to the little lump of web that it wove in its larval stage; the length about an inch, and the colour a dull greenish, striped with yellow and spotted with black. Hung motionless on a wall, the chrysalides make little show, but gathered in a mass, a minute's inspection, with a little disturbance, will show them full of vitality, even in their endeavours to regain a point of attachment, fixing themselves firmly on each other by the caudal processes, sometimes as many as three at a time, and so securely as to allow of being raised and held in the air by one of the group

independently of any web or threads. These pupae change from the larval state in the autumn, and remain undeveloped till the following April or May, and meanwhile a thorough search indoors and out, and the destruction of all that are found, would diminish the summer attacks much more than the desultory attempts at capture of such as may chance then to fit by on the wing as recognised destroyers.

Another unwelcome visitor is the Gooseberry and Currant moth, *Abraxis grossulariata*, often known as the magpie moth, which in the larval state is the cause of great mischief. The moth is usually distinguishable by its white wings with yellow band, and

FIG. 20.—ABRAXIS GROSSULARIATA.

blotch at the base of the upper and both black blotches on both pairs, but it is variable in the extreme in its markings. It appears about midsummer; the egg is deposited on Gooseberry and Currant bushes (as far as its garden selection is concerned), and the caterpillar, after feeding some weeks on the leaves, spins the edges of one of them together, and having also taken the precaution of spinning the leaf to its twig (thus securing it against the autumn fall) wais sheltered within its folds for the return of spring, when emerging it attacks the new leaves and changes to a chrysalis, in a slightly spun cocoon, in May.

When occurring in numbers the attack of the larva is almost sure to be fatal to the Gooseberry crop of the year if left unchecked, and the application of lime, hellebore powder, and all the other remedies, not certain cures for the evil, are apt to do at least no good to the growing fruit, whilst a survey of the bushes during the winter months may do all that is requisite. A careful search beneath the Gooseberry branches will most likely show some dried leaves hanging solitary from them, and if these are opened they will most likely be found to contain the caterpillar. Even where the moth was of rare occurrence I have found the dried leaves hanging exactly as so well described by Newman, in his account of this insect in his *History of British Moths*. The bushes should be gone over during the winter, and these dead leaves carefully removed and destroyed, and after the picking and winter pruning is concluded the top earth should be removed from beneath the bushes to the depth of about 3 inches, so that all the larvae and worms certainly be also removed. The operations would not take long, and would assist much towards saving the summer crop.

The under sides of Apple boughs form another starting-point for unbounded summer mischief from American blight; the parts exposed to sight are cleaned and dressed most carefully with whatever may be thought desirable, but it is no easy matter to get a good view of the under-side of an espalier bough a little way from the ground, and without care some masses are left untouched, and with warm weather out comes the white, woolly testimony to the renewed presence of the insect in quantities of places utterly impossible to reach without great injury to the tree when again in leaf. Where from their position the branches cannot be examined all over, it is highly desirable to wash Gishurst Compound (or whatever remedy may be preferred) well in with a brush into every spot where the disease may possibly lurk, an old tooth-brush being a most effective instrument for the purpose, as from its small size and the bristles being at right angles to the handle it can do its work thoroughly where the eye cannot penetrate. Trunks of trees affected with *Coccus* (especially the Wellington Apple, which may sometimes be found with the bark nearly covered with mussel scale for several feet above the ground), walls in front of which apphs have been prevented—and in which consequently the eggs abound, which during the winter entry on the tree instead of the viviparous production of the summer—and any spots in which a little reflection would point out insect pests as in all likelihood finding a shelter, should now be well scrubbed, dressed, or cleaned in whatever may be the most effective method. Whilst the winter still lays them open to operation, and by a little careful consideration carried out in general attention to future attacks whilst still in leaf, they might be greatly diminished with infinitely less labour than is spent on many a useless attempt to lessen them when in full progress in the summer months. O.

HORTICULTURAL EXHIBITIONS, 1875.

FEBRUARY.

17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

MARCH.

3.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

10 and 11.—Leeds Horticultural Gardens Company. Spring Flower Show. Sec. and Manager, James Birbeck, 103, Hyde Park Road, Leeds.

16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.

17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Hyacinth Show.

24.—Glasgow and West of Scotland Horticultural Society. Spring Exhibition. Sec. F. G. Douglall, 167, Caning Street, Glasgow.

31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

APRIL.

7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Early Rhododendron Show.

27.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec. & Exec. Comtee, Westland Row, Dublin.

27.—Manchester Botanical and Horticultural Society. Exhibition of Auriculas, &c., in the Town Hall. Manager, Bruce Findlay.

28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

MAY.

1 to 24.—Royal Botanic Society, Regent's Park. Special Exhibition of Clematis, by Mr. G. Jackson.

10.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Pot Rose Show.

20.—Royal Horticultural Society of Ireland. Early Summer Exhibition. Sec. A. Balfe, 25, Wexford Row, Dublin.

14 to 20.—Manchester Botanical and Horticultural Society's Annual National Exhibition, at the Garden, Old Trafford. Manager, Bruce Findlay.

25.—Crystal Palace Great Flower Show. Sec. F. W. Wilson.

25.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.

26.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

THE

Gardeners' Chronicle.

SATURDAY, JANUARY 23, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan. 25.	Anniversary Meeting of the Entomological Society, at 7 P.M.
TUESDAY,	Jan. 26.	Sale of 300 Pairs of Choice Poultry and Fowls, at Stevens' Rooms. Royal Horticultural Society: Lecture at 8 P.M.
WEDNESDAY,	Jan. 27.	Sale of Hardy Trees and Shrubs, French Roses and Dutch Bulbs, at Stevens' Rooms.
FRIDAY,	Jan. 29.	Sale of Scientific Books, at Stevens' Rooms.
SATURDAY,	Jan. 30.	Sale of Hardy and Ornamental Trees and Shrubs, Bulbs, &c., at Stevens' Rooms.

IT is very curious to see what vitality POPULAR ERRORS have, and how large an amount of proof is required to disestablish a prevalent belief. This arises sometimes, amongst other things, from the difficulty of furnishing sufficient proof, and more often from the inability of some people to understand the nature of proof when it is set before them. Such people very naturally set the evidence of their own senses before any proof that other people can lay before them. With the most perfect good faith, people of unquestionable veracity will sometimes cling to the evidence of their senses, when that evidence is known by all other persons competent to judge to be worthless. Thus it is that many popular errors are perpetuated, and so long as human nature remains what it is will continue to be so. While good observers and well-trained reasoners may thus be excused for entertaining a great deal of scepticism, yet, on the other hand, it must not be forgotten that there is such a thing as being too sceptical.

It is not long since that the alleged injurious relation of Berberis bushes to Wheat was looked on by scientific men as a myth. Yet further knowledge has proved the essential correctness of that which was once esteemed a gross popular error. Caution, then, is as incumbent on the man of science as on the untrained observer, and, indeed, much more so.

Two subjects which have lately been revived in our columns may be taken in illustration of our remarks. One of these is the oft-revived story of the TRANSMUTATION OF SOME OTHER GRASSES INTO WHEAT, or, *vice versa*, in reference

to which, in spite of the numerous cases which have been alleged, not one has stood the test of inquiry and investigation. All have proved myths, misapprehensions, or hoaxes. And yet the same story crops up again and again with slight variation, and we dare say a large number of worthy, respectable witnesses could at any time be brought forward to speak to the fact, as they would term it, and to laugh at the scepticism of the botanists.

The other subject which the rotating wheel has again brought to the surface is the old question, whether VIPERS can or do SWALLOW THEIR YOUNG? Mr. MEEHAN has lately revived this question, and he cites his own youthful experience in support of the occurrence, and also of the statements in the twenty-second volume of the *Proceedings of the American Academy*. An amateur zoologist (ominous appellation under the circumstance) refers us to a large array of testimony collected in America. Far be it from us to dispute the veracity of the testators. We in England have had, not long since, too notorious a series of instances of the fallibility of testimony—even the accumulated testimony of great numbers of honest witnesses—to venture to speak disrespectfully of any honest witness, however sceptical we may be as to the worth of his testimony. It happens, however, that in this snake question a large amount of evidence was afforded in our own columns in the year 1848, when much space was devoted to it. Numbers of writers, some anonymous, others well known, testified to what they had actually seen or thought they had seen. Nevertheless, as will be found on referring back, a small minority, but one including such names as LINDLEY, HENSLOW, BREE, WESTWOOD, and an eminent zoologist (see 1848, p. 603), expressed their decided scepticism, and proposed various tests to prove the correctness of the assertions, not one of which, so far as we can find, was ever put into practice. In spite of overwhelming numbers of ordinary and honest observers, we prefer to adhere to the opinions expressed by a minority of professed naturalists and anatomists. Unless some correspondent, American or otherwise, can bring forward something more than mere assertion—something beyond the evidence of his own eyesight—we must beg to remain among the sceptics. Anatomists can very well understand how, when a viper's body has been laid open by the rude dissection of a spade or a hedge-stake, that the oviduct might well be confounded with the stomach, and the young vipers be supposed to be in the latter when they were really in the former. But that does not explain the reiterated testimony of observers who declare positively they have seen the young vipers, often of some inches in length, enter the mouth of the parent. We confess our scepticism on this point, though we own we do not fully understand what are the appearances which have induced so many people in America, as in Europe, to come to such a conclusion.

Some old readers of the *Gardeners' Chronicle* may perchance remember the "tail-piece" which Dr. LINDLEY appended at the conclusion of the long series of articles on this subject to which we have referred, in our volume for 1848, but, as it may cause some amusement to a new generation of readers, we reproduce it at p. 115.

—The River Panaloya is the stream which connects the Lake of Managua with the great Lake of Nicaragua, and close to its outlet from the former lake, which is 156 feet above the level of the Pacific, falls over a ledge of volcanic rock some 13 feet high, forming what are called the Falls of Tiptiapa, and naturally obstructing the navigation of the stream. It is usual, therefore, when ascending the Panaloya River to take the canoe out of the water at a place called PASQUEL, below the falls, and transport it on a caretta drawn by oxen to the lake above the falls. Whilst waiting for his canoe, "The Sue," to be transported

thus, Captain S. P. OLIVER, R.A., made the accompanying sketch (fig. 21) of a picturesque "rancho" on the wooded banks of the river. Plenty of Brazil-wood, which is used for dye purposes, was collected here ready for transport to the coast. There are numerous "haciendas" in this neighbourhood, with numerous herds of cattle, horses, &c., whilst the waters swarm with fish and alligators. The trees abound in macaws, with brilliant plumage, and innumerable humming-birds, whilst monkeys and iguanas are seldom out of sight. The hammocks in the rancho are generally occupied through the heat of the day, as the climate within 12° of the equator is enervating at most times. North of the river is what is called a "jicaral," or tract of country overgrown by Jicara (Crescentia Cupe), or Calabash tree, with long thin worm-shaped branches covered with few leaves, but bearing an additional vegetation of bright-leaved Bromeliaceae, whose tufts often appear like the blossoms of the tree.

—We have received another letter from Mr. T. M. SHUTTLEWORTH on the subject of FLOWER SHOWS; but while we decline to reopen the question, we may, in justice to Mr. SHUTTLEWORTH, say that he positively denies having bought plants on the eve of the show for the purpose of exhibiting at South Kensington in 1873.

—We have before us a copy of Mr. BENTHAM'S "Report on the RECENT PROGRESS and PRESENT STATE of SYSTEMATIC BOTANY," read before the Biological Society of the British Association at Belfast. As might have been expected, this is a highly interesting and important document, from a botanical point of view. Its object is sufficiently expressed by its title. After giving a slight, but valuable historical sketch of the subject, Mr. BENTHAM treats of the principal methods by which the progress of systematic botany may most appropriately be advanced—viz., by the preparation of "Ordines Plantarum," or general expositions of the natural orders as in such books as LINDLEY'S *Vegetable Kingdom*, LE MAOUT'S and DECAISNE'S *Traité de Botanique*; 2, "Genera Plantarum," or descriptions of the genera, of which the best illustration is the work of this name published by Mr. BENTHAM himself in conjunction with Dr. HOOKER; 3, "Species Plantarum," or descriptions of the species of plants of which DE CANDOLLE'S *Prodrromus* is the best example; 4, Monographs of separate orders and genera, such as LINDLEY'S *Genera and Species of Orchids*, &c.; 5, Floras or histories of the plants of particular countries; 6, Detached miscellaneous descriptions of species. Under each of these heads Mr. BENTHAM explains what should be the general method of treatment, so as to secure completeness, consistency and uniformity of method, with consequent facility of comparison. Mr. BENTHAM'S opinions and counsel will be valued by all who know the extent of his services to science and the profundity of his knowledge of systematic botany—so much so, that anything like criticism would seem an impertinence. We shall on a future occasion probably revert to this subject, and make some comments on the last section of Mr. BENTHAM'S essay.

—The following persons are recommended by the Council of the ROYAL HORTICULTURAL SOCIETY to be appointed to the offices of President, Treasurer, Secretary, committee-men of the Expenses Committee, and auditors of the Society, at the annual meeting on February 6, 1875: President: Right Hon. Viscount BURY. C.M.G. Treasurer: Mr. Bonamy Dobree. Secretary: Mr. W. A. Lindsay. Expenses Committee-men: Sir Coutts Lindsay Bart.; Sir Alfred Slade, Bart.; Mr. Bonamy Dobree, Auditors: Mr. P. M. Leonard, Mr. Henry Liggins, Mr. Conrad H. Pinches. The ordinary voting members of the Council are J. A. Hardcastle, Alfred Smece, F.R.S., J. Herbert Tritton; and the Fellows recommended by the Council for the vacancies are Hon. and Rev. J. T. Boscawen, William Longman, and J. D. Chambers. Lieut.-General Hon. Sir Alexander H. Gordon, K.C.B., has given notice of his wish to resign, and the Council propose Frederick Campion to fill the vacancy.

—Having a desire to see other amateur growers of SUCULENTS come forward at the ensuing exhibitions, Mr. PRACOCK has determined not to compete during the year, in the hope of bringing out the reserve.

The *Renee Horticole* speaks of a peculiar seedling variety of a Mulberry, raised by M. BRUN, and which is remarkable for its extremely dwarf tufted habit. During three years the stem has not attained more than about 18 inches, while other seedlings of the same batch have in a like period attained a height of 9 or 10 feet. Now, in the ninth year of its existence, the dwarf variety has a stem of less than 6 feet. The leaves are large, and retain their tufted character. Apart from its curiosity, the dwarf variety is important in relation to the rearing of silkworms in the open air, a plan alluded to by us in 1873, p. 773, and recommended as a remedial

preventive measure in some forms of silkworm disease.

— We are informed that the competition for the CARTER CUP and other prizes offered in the schedules of the Royal Horticultural Society by Messrs. JAMES CARTER & Co., for competition at the Society's great provincial show, has now been arranged to take place on July 7 at the Society's gardens, South Kensington.

— The Federation of the Horticultural Societies of Belgium offers PRIZES FOR ESSAYS on some one or other of the following subjects:—

1. Past history and sketch of the present condition of horticulture in Belgium.
2. Composition and analysis of arable soils, especially of soils used in gardens, such as peat, leaf-mould, humus compost, &c.
3. Essay on construction, warming, and ventilation of glass houses.
4. Essay on market gardening, and especially on the forcing of Mushrooms.

16. Essay on the diseases of the Pear in Belgium.
17. An essay on the nutrition of plants, particularly of dicotyledonous plants.
18. The action of light on vegetation; influence of latitude, altitude, of glass, and of different colours.
19. Structure, growth, and functions of the roots.
20. Transpiration of plants, relation of the quantity of water evaporated to the different circumstances of vegetation.
21. Relation of soil and vegetation in Belgium.

— One of the French horticultural journals assures its readers that we in this country are in the habit of cooking the pods of LAXTON'S Supreme Pea. We are not aware of this, but have often lamented the waste of serviceable food incurred by throwing away in all cases the pods of peas.

— The *New York Tribune* publishes the results of a competition among Potato growers, originated in the spring of last year by Messrs. B. K. BLISS & SONS, of New York, who offered premiums to a con-

Compton's has given not less satisfaction as a Potato of the highest quality, and that Brownell's Beauty, the newest of the three, has made 'a most splendid record,' not only giving 'much the largest returns,' both from the single point and the quarter acre, but eliciting 'unanimous praise of all cultivators.'

— *JONESTIA ASOCA* is flowering beautifully in the Kew Palm-house. It is a handsome tree, allied to Brownea, having foliage of the same character, but with flowers that differ from being without petals. They are produced in clusters on the old as well as the young wood. No one at first sight would think of referring it to Leguminosae, the order to which it belongs. The calyx is tubular, with a four divided spreading limb, and, but for the long stamens, would resemble an *Ixora corolla*, which it quite equals in showiness, and resembles in colour, being of the same orange-yellow as some of the varieties. It is called *Ushoka* by the Bengalese, and is planted widely throughout India; in the Mauritius also it is culti-

FIG. 21.—PASQUEL: PORTAGE BELOW THE FALLS OF TIPTAPA, NICARAGUA.

5. Theory of manuring, with indications of the best method of renovating an exhausted soil, and of the best rotation to follow so as not to exhaust the soil, and at the same time to derive all the advantage possible from it.
6. The botanical and horticultural history of a genus or family of plants cultivated in Belgium.
7. Catalogue of grafts and *resumé* of facts concerning the reciprocal influence of stock and scion.
8. Essay on insects injurious to plants grown under glass, remedial measures, &c.
9. Diseases to which the Spruce Fir is subject in Belgium—noxious insects, fungi, &c.
10. An essay on flower-forcing, together with an account of the present state of our knowledge on points of vegetable physiology bearing on premature flowering.
11. A horticultural and botanical monograph of the Ferns grown in Belgium.
12. A horticultural and botanical monograph of the Conifers best suited for Belgian woods.
13. An essay on the use of manures in the culture of ornamental plants.
14. The best methods of heating and ventilating glass houses.
15. A criticism of the work of VAN MONS, with a *resumé* of his works and opinions, with the necessary bibliographical references.

siderable amount, hoping "as much to stimulate interest in improved methods of cultivation as to induce an extended trial of varieties, in the dissemination of which they were interested." The varieties specially selected were Extra Early Vermont, Compton's Surprise, and Brownell's Beauty, the prizes being awarded to those who raised the largest quantity from 1 lb. of seed, and on a quarter of an acre of ground respectively. The largest quantity obtained from 1 lb. of Extra Early Vermont was 708 lb.; from Compton's Surprise, 900 lb.; and from Brownell's Beauty, 1018 lb. The largest produce of a quarter of an acre of Extra Early Vermont was 6247 lb.; of Compton's Surprise, 7350 lb.; and of Brownell's Beauty, 8890 lb. "The committee—Messrs. Geo. Thurber, F. M. Hexamer, and P. T. Quinn—assure us that, while abstaining from comment on the 'astounding yields from single points,' a 'most careful and scrupulous investigation' has fully satisfied them of the 'correctness of the statements.' Of the merits of the Potatos, as developed under this later and more extended test, it is said that there is general acknowledgment of the superiority of the Vermont as an early variety, both for market and table, in fact, 'the earliest and best in cultivation;' that

rated for the flowers and foliage. Some Japan species are said to have flower clusters, 6 to 8 inches across. Surely some of these would be worth introduction.

— THE FERTILISATION OF FLOWERS BY INSECTS is the subject of the lecture to be given by Mr. A. W. BENNETT, F.L.S. at the evening meeting of the Royal Horticultural Society, on Wednesday next.

— Some of the American journals have recently been commenting upon the disastrous CLIMATIC EFFECTS FOLLOWING DISAFFORESTATION. Mr. F. HUBBARD, *Bulletin of the Torrey Botanic Club*, referring to some previous observations on this subject affecting the island of Santa Cruz, by Mr. L. MERRIMAN, says that the final depopulation of this beautiful island seems now to be written indelibly among the decrees of fate. Already some twenty-seven years ago Mr. HUBBARD observed that this island was slowly but surely becoming a desert waste. He mentions the efforts of a planter to reclaim some of the lost land, which were all to no purpose, as they were made too late. Curaçoa is quoted as another instance. Formerly it was a "garden of fertility," now it is an

almost perfect desert; fresh-water is a luxury, though "almost within sight is the coast of the Spanish Main covered with the rank vegetation, and watered with copious rains." These calamitous results ought to be a warning to the authorities in our possessions in the same region, or we may be confronted with the same serious consequences.

— *SALVIA TUIFFERA* VAR., a plant but little grown, is very attractive in the conservatory at Kew; there it has been in flower for many weeks, and has taken the attention of several to whom it was new. As a winter-flowering plant it is of great value, from the long continuance of bloom. The flowers are small but of bright colour, much like *Azalea amurensis*, and show off well by the dark foliage. In addition to this it has a good branching habit, far better than that of *Salvia* in general. The leaves are ovate acuminate, with a serrated margin, quite glabrous, and about 4 inches long. It is sometimes grown as *S. lantanaefolia*. Though a tolerably good name, it should not be used, as it belongs to a distinct species, having the leaves and young stems covered with soft hair. Our plant, on comparison with herbarium specimens, agrees well with one from Texas, contributed by Dr. A. GRAY, and named as above by Mr. BENTHAM. It was figured in the *Revue* under S. Goudotii, to which it was perhaps best referred at the time. The flowers are rather smaller than those of that species, and the leaves broader. No genus can more easily be cultivated than *Salvia*, yet several fine species appear to have been in gardens that are now lost, or at least rare. *S. formosa*, *S. fulgens*, *S. mexicana*, and *S. sagittata* may be mentioned as plants which perhaps many would be glad to hear of.

— A general meeting of the subscribers to the GARDENERS' ROYAL BENEVOLENT INSTITUTION was held on January 14, for the purpose of electing two pensioners on the funds, and the following was the result of the ballot:—

Name.	Age.	Votes.
THOMAS EYLES	64	802
THOMAS HOPKINS	67	486
HENRY LUTCHER	70	114
GEORGE DYER	67	594
JANE SCOBIE	64	931
JOHN BLACKHAM	64	191
JOSHUA LANCASTER	40	51

The meeting declared JANE SCOBIE and THOMAS EYLES, as having the greatest number of votes, duly elected.

— On the evening of the 14th inst., at the termination of the annual meeting of the Gardeners' Royal Benevolent Institution, some sixty or seventy of the members adjourned for supper to Simpson's Tavern, Strand, and subsequently presented a handsome TESTIMONIAL to Mr. E. K. CUTLER, the secretary to the Institution. The sum subscribed was £250, and the testimonial took the form of a beautiful silver tea and coffee service, with silver, table forks and spoons, a massive gold watch-chain; and a diamond half-hoop ring and gold watch-chain for Mrs. CUTLER.

— A male *STANGERIA PARADOXA* in the stove at Kew has now a fine cone, the smell from which is very delicious, though not easily compared with any leafy clasp. Its height is about 15 inches, and one leaf measures 5 feet. This plant shows how deceptive are some members of the vegetable kingdom. Though a Cycad, it was named *Lomaria eriposa* before the cones were seen, perhaps from the parallel forked veins, which resemble those of that genus. It was long the only species known to botanists, but Dr. REEGLER has recently published as distinct his *S. Kratzen*, and a reportedly distinct kind, *S. schindleri*, said to differ by having the veins more deeply and regularly toothed, has been imported to this country. In that particular the original species appears to vary, one of the leaves on the above plant being variously cut, and with some of the pinnæ forked. It is to be hoped that any one having the female plant in flower will communicate with the Kew authorities, and procure pollen.

— Among the minor horticultural industries of Paris may be mentioned, says M. MAYER DE JOUE in the *Revue Horticole*, the sale in large quantities of leaves for GARNISHING purposes. They consist of Ferns, Chestnuts, Lilacs, Maples, Nuts, Elms, Poplars, and especially of the Vine, and are used for decoratively purposes, garnishing dishes, and the like. Large quantities of Bramble leaves are also used, in spite of their prickles, during the winter season, when they are still to be found in the woods near Paris. The leaves are collected into little packets, slightly pressed, and sold by hundreds of thousands in the Paris markets.

— A NEW MEDICINAL PLANT, *Amnempis californica*, is mentioned in the *Monthly Reports of the Department of Agriculture* (America) for 1873. The plant in question is, or has been, in cultivation in this country, and was figured in the *Botanical Magazine*,

1862, t. 5292, "from plants raised from seed by Mr. WHEELER." It has a wide range on the western side of North America, from San Diego to Zacatecas in Mexico. Mr. J. J. WARNER, of Los Angeles, California, has recently written to Professor HENRY, Secretary to the Smithsonian Institution, a letter respecting the medicinal qualities of this plant. The letter, and a package of roots accompanying it, was sent to the Agricultural Department. Mr. WARNER states that he has been acquainted with its medicinal properties for some fifteen years, and in his own person, and the persons of others, has known it to have remedial powers of unusual efficacy in the treatment of diarrhoea and bowel complaints, and externally for bruises, for inflammations, and for old ulcers. The use of the plant has heretofore been restricted principally to the Indian population, and to domestic practitioners among the residents of California. Mr. WARNER believes that its use would prevent or mitigate cholera. Dr. EDWARD PALMER, who has travelled in California, Sonora, and Arizona, as botanical collector for several of the Government surveys in that region, reports that the plant is highly esteemed as a medicinal plant among the Indians in the above-mentioned countries where it grows. It is a scapose herbaceous plant, with oblong leaves on long petioles in the lower part of the stem, and a strictly upright, branched stem, destitute of both calyx and corolla, and crowded in short dense spikes, subtended by a whorl of bracts, giving the inflorescence the appearance of an Anemone flower.

— An invading weed, in the form of *POTENTILLA FRUTICOSA*, is somewhat unexpected. "Weeds," as a rule, are of the herbaceous class, of plants that strike a sub-shrubby plant taking possession of hundreds of acres of land, and inducing the loss of thousands of dollars—at least, such is the information we gather from the *Monthly Reports of the Agricultural Department of America*. Connecticut and Massachusetts are the States in which it has spread so greatly to the detriment of the husbandman. It bears the name of Hardback—a name also applied to a widely different plant, *Spiraea tomentosa*. The plant in question has a wide range of distribution in both temperate and arctic regions in Europe, Asia, and America, and it is a native of the North of England. We do not remember a similar case among the weeds of temperate climates.

— In the *Revue Horticole*, M. CARRIÈRE calls attention to a method of BUDGING GOOSEBERRIES practised by MM. CROUX & SONS, nurserymen of Seaux. Among other experiments of this nature, MM. CROUX have trained a number of plants of *Ribes palmarum* to a single stem, and budded the stock with Gooseberries and Currants of various colours and forms. The result, as may be imagined, has been both curious and ornamental.

— We have received from Prof. SARGENT the report of the present condition of the ARNOLD ARBORETUM, presented to the President and Fellows of Harvard University, and which shows that, in spite of limited means, satisfactory progress has been made. A catalogue of the trees growing in the arboretum is subjoined to the report.

— The death of Mr. CHARLES NORVAL THOMPSON, at the early age of forty, and who left a wife and four children unprovided for, makes it desirable for those who knew and valued him to make an appeal to horticulturalists on behalf of the survivors. For many years he was the Sub-Editor of the *Journal of Horticulture*, and all who came into contact with him were ready to acknowledge his genuine modesty and worth; and, as a tribute to his memory, it is intended to raise a small fund, which may be applied in the way he would have himself have liked best—the benefit of his little ones. It is hoped that one or two of them may gain admission to some of our orphan asylums, and votes will be thankfully received when the necessary steps are taken, while, in order to carry out this and other plans for the benefit of their orphans, an earnestly requested, and will be received by the Editors of the *Journal of Horticulture*, 171, Fleet Street, E.C.

The President of the Royal Society, in his annual report, gave some interesting particulars with reference to the FAIRCHILD LECTURE, from which we learn that in February, 1728, THOMAS FAIRCHILD, of Hoxton, gardener, bequeathed £25, to be placed at interest, for the payment of 20s. annually for ever for preaching a sermon in the parish church of St. Leonard's, on Tuesday in Whitsun week, on "The wonderful work of God in the creation, or on the certainty of the resurrection of the dead, proved by certain changes of the animal and vegetable parts of the creation." From 1733 to 1758 most of the lectures were read by Archdeacon DENNE, who in 1746 contributed all his lecture fees to the fund, which, with a subscription raised by the trustees, enabled them, in 1746, to purchase £100 South Sea stock. Subsequently this stock was offered to and accepted by the Society; and the transfer was made

in 1767. The lectures have been regularly delivered, but at late years to empty pews; and the Council unanimously resolved that it was desirable to relieve the Society from the Fairfield Trust, and that to this end application should be made to the Charity Commissioners. The regular forms having been gone through, the trust was transferred to the Commissioners in November last, and thus disappears from the Society's balance-sheet.

Home Correspondence.

Rhododendron Growing on the Trunk of an Old Tree.—About fourteen years ago I had occasion to lop off the head of an old Alder tree which grew in a shrubbery forming a boundary to a flower garden; all the upper part, being decayed, was cut off as low as 20 feet from the ground. The gnashing cut, being made with a sharp angle, was carefully covered over with lead, so as effectually to prevent water getting in. It is on the edge of this lead that a *Rhododendron* has established itself, and is now of some seven or eight years growth, being fully a foot in height, with healthy spreading branches. Not very far off is a large clump of *R. ponticum*, and it is possible the wind carried the seed there. The evergreen foliage was quite a conspicuous appearance amongst the deciduous branches growing 20 feet from the ground. While walking through an old plantation a few months back, I discovered growing between the limbs of an aged Scotch Fir a fine healthy Holly plant upwards of 2 feet in height. The tree shows no sign of decay, and the root of the Holly appears to be supported entirely upon decayed foliage and branches that have there accumulated from time to time. I have repeatedly met with Mountain Ash, Sycamore, Gosh, Elm, &c., within the forks of large branches of other trees, but I have never seen the evergreens above described. *J. Webster, Gordon Castle.*

The Hardiness of *Euonymus japonicus aureo-variatus*.—This plant I always thought only half-hardy, but I find it has stood our last three winters quite as well as the *Euonymus japonicus* and *E. japonicus variegatus*. I find some plants a little cut where they had made a late growth, but those matured in growth are not in the least injured. Some plants here are from 4 to 5 feet in height, others smaller; some are much exposed to the cold cutting east winds so prevalent here in the spring. The last frost I think a real test of its hardiness, the thermometer registering for ten days from 10° to 22°. *Henry Hepburn, Scarisbrick Hall, near Ormskirk, Lancashire.*

Pretended Gardeners.—A few correspondents have lately drawn attention to the sufferings occasionally inflicted by jobbing gardeners on their employers, but a much worse trouble lies in men, making a pretence of being gardeners, seeking employment, to gain admittance where they can do a business to be. A few days ago a message was brought me that a man wanting employ in my garden was at the back door, and, on going to speak to him, I found a most doubtful looking character, with a stick, who could give no further account of himself than that he was "practical," his arrival being followed by that of another man (avowedly a beggar) with another stick. My second visitor I had ordered off at once; and the first, having nothing further to say, excepting that he had not had a mouthful of bread for two days, although he looked as comfortably fed as one would wish to be, I declined his services, and, as he was difficult to get rid of, cut the matter short by having the door shut in his face. On making inquiries of the nursery gardener, by whom he stated that he was about to be employed (disregarding that he was asking me for work at the time), he knew nothing at all of the man, excepting that he had heard of the same application being made by the same person at several houses. The proposed gardener was a short man, remarkable for looking in any direction except at the person he was speaking to, but not powerful; his companion was quite the reverse—a tall, strong-built man, very likely to intimidate ladies or women servants, if taken unawares; and visitors of such a sort being a likely cause of great annoyance, perhaps you will not think a note of their appearance ill placed in your columns. *A Suburban Resident.*

Colonel Trevor Clarke's Celery.—A year or two since a very capital kind of Celery, bearing my name, was sent out by Messrs. Veitch. I observe this year that it is quoted as synonymous with a sort called Leicester Red. As this is in effect an assertion that the plant in question is another sort under a new name, it may be interesting to gardeners, and especially to Messrs. Veitch, as well as to the raiser, that its true history should be known. It is not a production of mine at all, but was selected more than twenty years ago, a distinct sport from some red Celery, by my gardener, who brought the seed of it to Welton with him when he took the situation. It is really a red Celery as far as the coloration of the outer leaf-stem goes, but when

prepared for the table appears white, with exception of a clear red spot at the base of the leaf-stalks, the said spot disappearing in the innermost ones. Ever since we have had it we have, for curiosity, tried some other sort against it yearly, and have met with it appreciably better than any we have yet met with. I have allowed Mr. Collins to grow a batch of it for Messrs. Veitch yearly, and, if any doubt exists on the subject, I recommend the trial of Messrs. Veitch's seed, which will be found undoubtedly pure. It is a small, neat, solid sort, not fit for exhibition purposes, but of undeniable excellence where the "proof of the pudding" is in question. R. T. Clarke, Torquay, January 18.

Hybrid Pelargonium, &c.—Allow me to correct a misprint in my remarks on this subject in last week's *Gardener's Chronicle*, viz.: "or the colour of crossing will be lost," should be "or the colour of the leaves will be lost." In speaking of the habit of the plant and form of the flowers taking after the female whilst colour is given by the male, it should have been added, "if we use a white flower for the female, and a coloured one for the male." For if the female will produce a more or less similar plant to itself and we merely wish to obtain a new colour, by using a white-flowered female, any change in colour which we obtain by using a coloured male will be given by the male. If *Fuchsia "conspicua"* be crossed by *Fuchsia fulgens*, the progeny will have small leaves, whilst if *Fuchsia "fulgens"* be crossed by *"conspicua"*, the progeny will have the large leaves of *F. fulgens*. This example will make what I mean perfectly clear. E. F. Lowe.

Aralia Sieboldii.—The *Aralia Sieboldii* appears to be meeting attention from several correspondents, not only in England, but Ireland as well. Allow me to state that we grow it here in quantity, in vases, beds, and also under a north wall; and in whichever position planted it flowers without the slightest protection, and I am so satisfied with its perfect hardiness that I intend to plant several at an elevation of 930 feet above sea level, where we have a plantation of *Rhododendrons* doing remarkably well, and set with thousands of bloom buds. I would also remark that some of our *Aralias* are 3 feet 6 in. in height, and 5 feet in diameter. G. Doidl, Woodstock Park, Ireland.

Snakes Swallowing their Young.—"R." inquires for the overwhelming evidence as regards the snake. My own observation was made when a youth. Not to burden this note by long quotations, I feel safe in saying "R." will agree with me that the evidence as regards true snakes is overwhelming if he will examine it in vol. xxi. of the *Proceedings of the American Association*, a copy of which he may see at the library of the Royal Society, or in those of the Royal Institution, the Royal Geographical Society, Museum of Practical Geology, Royal Astronomical Society, or India Office, or in the libraries of some of the Manchester scientific institutions. As to the occasional viviparous condition of the common toad (*Bufo vulgaris*), I have to fall back on my memory of the popular literature of thirty years ago, which I think does not deceive me in my statements. I believe it was then regarded as settled beyond dispute, not only that the toad, but lizards, and probably some ophiidians, had this power of adapting themselves to circumstances. Very closely allied species were found oviparous or viviparous, and all the physiological differences found in either case were, that while in the oviparous condition the eggs were ejected from the ovarium at once into the water, in the viviparous condition they were simply thrown into the oviduct, where the heat and moisture of the body took the place of solar power. These varying modes of hatching the eggs seem characteristic of species of *Bufo*. B. obstetricus assists the sun by carrying the eggs on her back, thus adding her own slight warmth to that of the water or atmosphere. *Zootoca vivipara* always brings forth its young alive, while I think it was proved that *Iacerta agilis* was sometimes oviparous and sometimes viviparous. I believe our American lizards are usually oviparous, but I have seen *Phrynosoma cornuta* caught in the dry desert of Colorado, and boxed by one of my companions, be the mother of a nice little family twenty-four hours afterwards. I did not see them being born, but unless, like the snakes, she had the young down her throat when caught, I feel safe in saying they were born alive. There seems no difficulty in regard to impregnation, as suggested by your correspondent, as the fluid can be readily absorbed by the oviduct. It is, as "R." says, my "special domain," but yet I think the investigators in that field are hardly aware how great this power is. It fell to my lot to discover that in one of our common insects, *Reduvius novemarius*, turpentine is placed by the insect on the mouth of the duct, thence drawn into the ovarium, and each egg coated therewith during deposition, both as a means of fastening the block of eggs together, and of protecting them from enemies. [Where is this extraordinary statement recorded? Eds.] It is not the place to quote it, but "R." may find in the best modern works on the subject that even in much

higher organisms than toads contact is not absolutely essential to impregnation. In the toads the fluid is more often than not ejected on to the back of the spawn-bearer, and can as readily find its way into the oviduct as anywhere else. But more than this, it was stated in discussions at the time referred to, that there was no impossibility in actual contact when such action was desirable. I think, in a species of *Urodelia*, it was found that impregnation was sometimes by actual contact, and sometimes not. In my own life it has been my endeavour not to rest satisfied with other people's experiments, but to endeavour to repeat them. At the time of the discussion referred to, I watched the toad very carefully, but could never find any in the actual bringing forth of their young alive. I found, however, that the young toads, when brought forth in the ordinary tadpole state, were never smaller than the mature tadpole. Among my toads, which I kept in caves and cellars entirely secure from contact with water, I often found little toads no larger than early frame Peas, and I am sure, from their small size, these never were tadpoles, even had it been possible for them to have emerged from a watery nidus. Still, "might not the eggs have been deposited in the damp crevices of the mortared walls?" I don't know. I feel at least that I might have as good a right, from the analogies and possibilities I have submitted, to ask "might they not have been hatched in the oviduct?" These are the leading grounds for the statements I made. If proved to be untenable, I trust "R." will at least acquit me of having lightly made them. Thomas Meehan, Germantown, Philadelphia, U.S., Dec. 20, 1874.

FIG. 22.—A TAMP-PIRE. (SEE P. 112.)

Snakes and Chess.—Your correspondent, Mr. Marshall, Ely, in the *Gardener's Chronicle* for Dec. 12, 1874, in his strictures upon Mr. Meehan's remarkable statement in regard to the transmutation of Wheat into Chess, seems to assume that the belief that snakes swallow their young is as unfounded as that of the changing of Triticum into Bromus. The botanical question I will not discuss, but if that is as well supported by evidence as the snake story, it has more foundation than I supposed. In February, 1873, Professor G. Brown Goode, of the Wesleyan University, Middletown, Connecticut, in a communication to the *American Articularist*, asks for "any observations that would aid in settling the question—'Do snakes swallow their young?'" In November of the same year Professor Goode, in a communication to that journal, gave in a condensed form the results of his inquiry, which he had presented in detail in a paper read before the American Association in the previous August. He received over eighty letters from persons residing in twenty-four different States and territories, all these being written by farmers and persons in rural life of sufficient intelligence to subscribe to an agricultural journal. Professor Goode says: "The total number of testimonies in my possession is 104; fifty-eight saw the young enter their mother's mouth; nineteen heard the mother warn them by a sharp whistle [...], hiss or click; thirty-two who saw the young enter killed the mother, and found them living within her;" and various other details are given. While I am as thorough a disbeliever in the Chess transmutation as your correspondent, I shall be forced to admit its

truth whenever Mr. Meehan or any one else brings such an array of evidence to support it as that presented by Professor Goode in respect to the snake question. *Amateur Zoologist, Lond. Dec.* [In the case of testimony of this kind, weight is of greater moment than number. Eds.]

Tillandsia musacea.—This handsome plant (figured for the first time in the *Gardener's Chronicle*, at 127, vol. ii., 1874) is as yet very scarce in Europe. Mr. Wallis and Mr. Roezl both sent over some boxes, but few of them arrived alive. In 1873 I brought a few boxes over with me; some plants came over well, but many died after unpacking. It is, no doubt, one of the prettiest of stove epiphytes, particularly as regards the variegation on the leaves, which is of all known colours. I promised to send Mr. Bull some dried flowers, for none had been seen in Europe, and he was doubtful whether it was a true *Tillandsia*. After my return I collected some flowers, and forwarded them, with a sketch, and it has now been ascertained to be a variety. This plant flowers in January or February, when it throws up the spike, and flowers but once, after which the plant does not produce any more leaves, but keeps its colour as before. When the flower is gone, it produces below the stem a stolon 10 or 12 inches long, on which the leaves and roots form, the roots taking hold of the first tree or Palm to which they reach. The flowers are 12 to 15 inches high, of a flesh colour, changing to a brilliant scarlet as it reaches maturity. The flowers are close together, and thick, like wax, from an inch to an inch and a half long, about twenty to twenty-five flowers forming a bullet-shaped inflorescence, which stands upright on the spike. In the place where this plant grows moisture is abundant during the whole year, but I observed that they grew more vigorously where well ventilated than in the thick forests. It is only 5000 feet, and, as it is a scrambling plant, the trees and Palms are covered with them from bottom to top. Some of the plants, when not within reach of a tree to climb up, have five or six branches, forming quite a shrubbery; and I noticed that they do quite as well this way, growing in a kind of leaf-mould to an enormous size, the leaves being 4 inches broad. Where I cut some plants off, I found in about a year that the trunks had produced a lot of young ones, forming large tufts of beautiful plants. Very large specimens can be formed in this way for decorative purposes, covering walls, rockwork, or Tree Ferns, and, where moisture can be conserved, would make a beautiful display. I have some plants in my garden growing amongst rocks, fully exposed to the sun; they do very well, and keep a beautiful colour. Seed is very difficult to obtain, and the season when it is well ripe must be carefully noticed, as it sometimes damps off by the excessive wet. It is very likely I shall have the chance of seeing some of it if I pay great attention to it after the flowering season is over. All the plants that have been sent as yet have damped off, very few having arrived in good condition; but I think a stock of it might be obtained by means of seed. There are several varieties amongst them, some being light green and darkly variegated, others of a brownish colour; some have long and some short leaves. There is no doubt it is one of the most elegant decorative plants ever introduced. The charming and remarkable variegation of the leaves, like illegible writing, will soon cause it to gain great attention for decorative purposes. *Albert Bruchmüller, Ocaña.*

Transmutation of Wheat.—Your correspondent, Mr. W. Marshall, misapprehends me in regard to the Bromus-Triticum matter. What was the use of my asking to have the specimen referred to the Microscopical Committee, if I were satisfied that it was as it appeared? I confess I was puzzled. It was sure, as I expressed myself, that the usual explanation—such, for instance, as the Barley one offered by Mr. Marshall—could not account for it. To show how ingenious was the trick, I may say that a leading scientist of Laporte, Indiana, was first imposed on, then the members of the Indiana Geological Survey, and many of their scientific acquaintances. It was by them sent to the Academy of Natural Sciences, to which it was simply my duty as a member of its Botanical Committee to present it. Some thirty members handled and examined it, and even the chairman of the microscopical section, who is one of the best vegetable biologists in the United States, had the specimen in hand two weeks, and had made microscopical sections and drawings of the various parts before he discovered the trick. All these gentlemen were puzzled, as I was, but it does not follow that on that account we are to be charged with being transmutationalists. I still think that the course I took in the matter was the wisest one. It was the means of exposing a trick, which, by a note from Professor Asa Gray, I believe has been yanked by the party practising it for some years past. It would have been better, of course, if my remarks and the exposure of the fraud could have gone together, but it is the practice of

Gerarde (1597). Quoting Johnson's edition (1636), p. 1129, I find that he says under *Filix* has *remota pinnulis dentatis* (*Lastrea dilatata*)—"Necere the old plants I have observed very many small young plants growing, which came by the falling of the seeds from those dusty scales: for I believe all herbes have seeds in themselves to produce their kindes. Gen. 1, 11 and 12." What Colonna said on the matter is contained in a curious book, of which there is a copy in the Lindley Library—Recechi's *Nova Plantarum Arminorum et Mineralium Regni Mexicani Historia* (1648). This was based upon the collections and drawings of Mexican plants belonging to Franciscus Hernandez, of whom nothing seems to be known, except that he was in Mexico at the close of the sixteenth century, and spent a considerable sum of money in having plants drawn. He carried with him to Madrid seventeen volumes, all of which, except five, perished in a conflagration in the Escorial. To Recechi's work Colonna added a kind of appendix that I hunted down in the middle of a kind of panegyric of his friend Cæsius, his remarks about Ferns. I will quote what he has to say:—"Et si Rusco Hypoglossæ et Lauro Alexandrinæ flores: et fuscus in summo foliorum constituit conspicuus; quid merum in Filiceis et capillariibus si in eorum dorso non tam conspicuos sed parvos adeo (natura) nasci voluit." Colonna argues, from the presence of comparatively large flowers on the upper side of what he supposed to be the leaves of Rusco; that those on the under side of the leaves of Ferns might be very small. He then proceeds to describe Cæsius's observations on what he took for the seeds of Ferns (doubtless the spore cases). As I stated, W. Cole (1669) first actually examined the spores of Ferns. His observations were communicated to Hooker, and I have not had an opportunity of examining them in the original. Ray quotes them in his *Historia* (l.c.), and I believe that I was mistaken in attributing the first notice of the hygroscopic movements of the spore cases (producing their disruption and the consequent shedding of the spores) to Ray rather than to Cole, from whom apparently Ray quotes it. Lastly, Dr. Lindsay appears to have been anticipated in the discovery of the prothallus. According to Hofmeister (*Highest Cryptogams*, p. 257) this was observed in 1788—the year preceding Lindsay's communication to Sir Joseph Banks—by Ehrhart. *W. T. Thistleton Dyer*.

Crocus Imperati.—This lovely little flower is just now in full bloom with me, taking precedence even of the Aconites, and keeping pace with *Helleborus niger*. I know of nothing more exquisitely delicate than the blending of its colours, and I know of no spring flower which approaches it. I have for some years past been nursing up my small stock of bulbs, and have saved enough at last to plant a small round bed, which, if spared till next spring, I hope to see a perfect mass of fawn-colour, purple, and mauve. There is a white variety of this beautiful species, said to be not uncommon on the hills round Naples, which ought to be in all our gardens, and which I shall be deeply grateful if any botanical dweller or sojourner in Naples will send me. I get fonder of this beautiful gem every year I live, in fact I may say I have a violent attack of Crocus on the brain. If I were a richer man I would follow the excellent example of my friend Mr. Eves, and publish a monograph of all known Crocus; perhaps some day, when my ship comes in, I may; meanwhile, there are a good many species whose acquaintance I have yet to make. If home duties did not prevent me I would go off at once and dig them up and bring them home to this chalybeate corner of Bucks, which will grow Crocus, and grow them well, though it is terribly trying to floral life in general. Will all good Samaritans in foreign parts, who know a Crocus when they see it, kindly remember that a spring, I hope to see a perfect mass of fawn-colour, purple, and mauve. From February till the end of April these species are all more or less in bloom. *L. Harpur-Crewe, Drayton Beauchamp Rectory, Tring, January 16.* (Mr. Berkeley, in his remarks at the meeting of the Royal Horticultural Society, alluded to the precocity of Crocus Imperati in his own garden, where it also preceded the Aconitis; and we learn that Mr. Parker and Mr. Barr both have had it for some time in flower. Eus.)

BRITISH GARDENERS.—X.

PHILIP FROST.

The British gardener whom we introduce to our readers this week—Mr. Philip Frost, of Dropmore—was born at Moreton Hamstead, in Devonshire, on July 10, 1804. His father, who was a farmer's son, became in 1807-8 gamekeeper and park-keeper to Lord Grenville, at Bocconoc, in Cornwall, and about the year 1817 the son became employed, under the forester, Mr. William Pond, in the shrubberies, plantations, and nursery grounds, in the winter months planting on waste lands, in summer chiefly in the nursery, and in early autumn in the young plantations, clearing Brambles and removing superfluous leaders from young trees.

"On November 29, 1822," writes Mr. Frost, "I started from house for Dropmore, where I was first put in the flower-garden, which was not then of so much note as it is now. I soon moved into the frame-ground, where I thought there was more to be learnt. In 1826 I left Dropmore and went to Colonel Howard's, Ashted Park, near Epsom, under Mr. Hilsop. Lady Grenville objected very much to my leaving, and desired me to write and state how I liked it. I found I was rated and treated as a common labourer, but I thought I deserved something better,

and soon obeyed her ladyship's request, the result being an intimation to return to Dropmore immediately and resume my old place. In 1827 I was made foreman of the frame-ground, and at that time we had a vineery to force, which is still producing excellent crops. We had also Melon and Cucumber frames, in very great extent, and it was a fight who should excel. The neighbourhood of Windsor stood prominent in Cucumber-growing, and Gould, Weedon, Patrick, and many others strongly competed for the lead. In the year 1828 I wished to go, for improvement, into a kitchen-garden, and accordingly left on March 20 for Caen Wood, making a sacrifice of 6s. per week by so doing. In a short time the foreman, John Milne (a nephew of Mr. Milne, of the Fulham Nurseries), left, and I was promoted to the position of foreman of Caen Wood garden. In June, 1829, I had the offer of a situation in Derbyshire, but went, in preference, to the Botanic Garden, Chelsea, as foreman under Mr. Anderson. I soon gained his confidence, and the improvement I made in the plants was noticed by Sweet, Haworth, and others, who were in the habit of visiting the garden. I raised a new stock from cuttings, which had not been done for years. In the autumn of 1832, Lord Grenville had reasons for dismissing Mr. Baillie, my old master, and told me that he would take me in preference to any one he knew. I must here add that Lord Grenville offered me a botanical work before I left in 1828, and accordingly gave me Sprengel's *System of Vegetables*, and Schultes's *Mantissa in Volument Tertium, Systematis Vegetabilium Caroli a Linnæ*. I was much interested in English botany, and at that time knew most of the wild plants of this neighbourhood. Lord Grenville had

each volume put in two parts, and bound, interleaved, with my name printed on the cover. I took charge of the garden here in January, 1833. In October, 1834, I planted the first trees here—five Deodar Cedars. The largest is now 60 feet high, and measures in diameter of branches 52 feet, the girth of the trunk at 3 feet from the ground being 9 feet 7 inches. From a note of Lord Grenville's, I learn that the seed of the finest Abies Douglasii was sent here in December, 1827, which settles a point I was not clear about. A gentleman from Whiteknights measured it a short time since, and made it 106 feet high. The finest Araucaria is 60 feet high (see *Gardeners' Chronicle*, 1872). There were three A. Douglasii plants raised from seed sent here from the Horticultural Society's garden. One has been cut down, and there are now two growing; but the tree that has had the most attention is a long way the finest—a proof of the method of top-dressing I have adopted being beneficial. There has not been much glass erected since I have had charge—in fact, only a range of Peach-houses 150 feet long, which has produced magnificent fruit. There are two vineeries; one here when I came, still going on, the other, planted in 1825, producing excellent fruit and splendid crops. The trees I have planted since 1833 will bear inspection, especially when the nature of the soil—a sterile gravel—is taken into account.

Our readers will remember that in December, 1872, the friends and admirers of Mr. Frost presented him with a handsome silver cup, of the value of £25, on which were engraved the portraits of two of his more remarkable nursings—*Araucaria imbricata* and *Abies Douglasii*, together with an annuity purchased with the sum of about £200. Long may he live to enjoy it, and to care for the wants of the magnificent trees at Dropmore.

Reports of Societies.

Royal Horticultural: Jan. 20.—W. A. Lindsay, Esq., in the chair. The Rev. M. J. Berkeley, after the usual preliminary business had been completed, called attention to the subject of the awards made by the Fruit and Floral Committees, and observed that though there were many interesting plants from Mr. Willis, Messrs. Veitch, and others, and a fine collection of Cycadaceous plants from Mr. Bull, there was not much that required remark. The Rhododendron shown by Mr. Baker, gr. to Ambrose Bassett, Esq., which was supposed to be *R. niveum*, was really *R. argenteum*, a species described in Dr. Hooker's *Himalayan Journals*, and figured in the *Botanical Magazine*, tab. 5054. With regard to the late severe weather, Mr. Berkeley hoped that the experience of others had proved as favourable as in the case of his own garden in Northamptonshire, which is about 300 feet above the sea level, and in which, owing to a good covering of snow, all the plants seemed to have escaped unurt, and are now doing well. He was pleased to find lately two patches of Crocus Imperati in full bloom, this proving to be rather earlier than the common Aconite, and of easy culture: it ought to be in every garden. It is perhaps the most beautiful of the genus, and increases rapidly. A Snowdrop had that day been received from Tweedside, which was very early; in his own garden there would be a further stock. Flowers of *Aponocyrtis* distachyon were also shown by Mr. Parker, which had been developed in the open air; and specimens of *Corbularia cantabrica* in full blossom had been received from Algiers by post. Mr. Bull sent an *Arisema*, doubtless a variety of A. Wightii, as it differed slightly from it in colour only, the spadix in Mr. Bull's plant being deep purple and in the typical plant yellow. Mr. Berkeley then mentioned other objects of interest that had been before the Scientific Committee, and the meeting adjourned.

SCIENTIFIC COMMITTEE.—Dr. J. D. Hooker, C.B. Pres. R.S., in the chair. This meeting was well attended, and numerous subjects were brought forward for discussion.

Honey Dew.—Mr. Alfred Smece stated that his "manufactory of honey dew" by means of aphides was in full operation. This will probably be brought forward on a subsequent occasion.

Buds on Knots of Peach Tree.—The Rev. Mr. J. Berkeley read a letter from Mr. Andrew Murray, enclosing a specimen of the root of a Peach tree with adventitious buds proceeding from it. The tree from which it was taken was understood to be retarded and stunted in its growth.

Knots on Vines.—Mr. Berkeley also exhibited specimens of *Vitis*, rods with large burr-like excrescences growing from them, and suggested that it would be desirable to ascertain whether the production was due to the attacks of a fungus like the *Exobasidium*, known to produce swellings on the leaves of *Rhododendron*.

Cyathus Theorii.—A beautiful little fungus from Australia, whence it was sent by Baron Müller, was then exhibited under this name.

Double Cineraria.—A specimen was shown, from Mr. Bennett, gr. to the Marquis of Salisbury at Hatfield, and where the flowers were nearly or entirely absent, and replaced by small green scales—a most undesirable variation for horticultural purposes.

Vibrios in the Roots of Cucumbers.—A conversation took place on this subject, with reference to the figure of these creatures in a recent number of the *Journal of Horticulture*. It was stated that the animal was a species of *Celenchus*, but little known to naturalists. Mr. Berkeley had seen a similar occurrence in the roots of *Gardenia*. [See *Gardeners' Chronicle*, 1872, vol. ii., p. 302. Eds.]

Chestnuts of 1873 preserved fresh.—Mr. Alfred Smee exhibited Chestnuts of the growth of 1873 which had been preserved simply in dry sand in a flower-pot placed in a dry garden shed. On cutting one open it was found to be quite fresh, and the embryo in a good condition. This supplies a valuable hint to those concerned in sending Chestnuts to India and elsewhere. Dr. Hooker stated that the English Chestnuts he had sent to India in sacks had not germinated, but those that he sent from Italy had done so.

Phylloxera.—Professor Dyer called attention to the letter of Professor Forel, of Lausanne, to Professor Westwood, which has already been published in our columns (p. 18, 1875).

The Colorado Beetle.—Professor Dyer also alluded to the recent prohibition enacted by the German Government against the introduction of Potatoes from America, so as to exclude the importation of a beetle. [Our Government refused to prohibit the entry of American Potatoes, on the ground that "it does not appear that the eggs or larvae of the beetle have been or are deposited or conveyed in the tuber of the Potato." Eds.] Mr. Andrew Murray said that he had seen prodigious quantities of the beetle in Canada, where it made great havoc with the leaves and haulm, on the latter of which the eggs were deposited. The Tomato was similarly affected. A species of *Solanum* originally attacked was a tickly, red species. Mr. McLachlan stated that the ravages of the beetle were first observed in Mexico, from whence it had extended and was still extending. Dr. Hooker commented on the singular circumstance that a semi-tropical beetle should be enabled to resist the severe winters of Canada. Mr. McLachlan, in reference to this point, noted the appearance of quantities of the winter moth, *Cheimatobia brumata*, a night or two after the recent frosts.

Cracked Pears.—From Mr. Webb came some specimens of Pears (*Beurré d'Areberg*), which had cracked and grown together again. Mr. Webb stated that with him Pears often cracked to the core and grew up again, so that the split was only perceptible by two lines in the skin. The cracks generally appear after rain, following our drought.

New Potato Disease in Algeria.—Mr. Alfred Smee alluded to the destruction wrought by a Tineine larva already reported on in the *Gardeners' Chronicle*. *Luminous Fungus*.—The Hon. Sir H. Gordon forwarded a luminous fungus, a species of *Marasmius*, from the Seychelles.

Fruiting of Hibiscus rosa-sinensis.—Professor Thielson Dyer stated, with reference to the fruiting of *Hibiscus rosa-sinensis*—which had been stated, on the authority of Dr. Cleghorn, not to take place even in India—that he had received a note from Mr. H. Gorrie, of Maudslayi Castle, Carlisle, N.B., to the effect that in 1871 and 1872 the plant had fruited with him after being artificially fertilised, and that he had raised plants from the seeds. The flowers of the seedlings were larger than those of the parent plant.

Absorption of Ammonia by the Leaves of Plants.—Professor Dyer called attention to some experiments of M. Schloesing, who has shown that plants absorb and assimilate the ammonia of the atmosphere in the way that has been supposed, but not before demonstrated. He grew two plants of Tobacco in the same soil under bell-glasses, supplying both with fresh air. In one case he used a weak solution of ammonium in very dilute solution, placed at the bottom of the apparatus each day. Between July 31 and September 14, 1.93 grm. of ammonia was volatilised in the atmosphere of one glass, while the other glass received none. Analysis then showed that the plant which grew in the ammoniated atmosphere contained 2.22 per cent. of nitrogen, and the other one only 1.77 per cent., the former being the normal quantity. Although the ammonia must have been absorbed by the leaves, its nitrogen did not remain in them, but was diffused throughout the plant, including the roots. (*Academy*, Nov. 14, 1874, p. 540.)

Mistletoe Parasitic on Itself.—Dr. Masters showed specimens from Mr. Corderoy, of Didcot, in which young seedling Mistletoes had grown upon the branches of the parent plant.

Graft Hybridization.—Some conversation then ensued as to the possibility of dividing two buds so evenly as to allow of the adhesion of the two halves of different buds. While it was theoretically not impossible, the committee thought the practical difficulties in the way would be too great to be surmounted.

Monstrous Cyclamens.—Some specimens of Cyclamens, in which the flowers were borne in stalked umbels mixed with leaves, and also in the axils of alternate leaves, were shown. They were obtained from plants growing at Chiswick.

FLORAL COMMITTEE.—Mr. B. S. Williams in the chair. There was a full attendance of members to-day, but a paucity of subjects for adjudication. The largest contributors were Mr. W. Eull, Mr. John Mills, of Onslow Crescent, and Messrs. Veitch & Sons. Mr. Bull's contributions consisted of a very fine group of Cyclams, including beautiful specimens of *Encephalartos Lehmanni*, *E. horridus*, *E. Altensteini*, and several forms of *E. villosus*; *Dion edule*, *Macrozamia spiralis*, *M. corallipes gyata*, *M. plumosa*, and *Zamia furfuracea*. A vote of thanks was awarded. From Mr. Mills came a most attractive group of plants, composed of Orchids, *Dracenas*, *Filices*, *Ferns*, and *Lycopods*, *Amilias*, *Marantas*, &c.; and Messrs. Veitch had a particularly fine collection of Cyclamens, and a smaller group of *Primula sinensis kermesina flore-pleno*. In both cases the thanks of the committee were voted. The only certificate awarded was one of the first class to Messrs. Veitch & Sons, for *x* *Nepenthes intermedia*, a hybrid between *N. Raflesiana* and an unnamed species with spotted pitchers. *N. intermedia* has oblong pitchers spotted and banded with red. Mr. Baker, gr. to Ambrose Bassett, Esq., showed a cut flower of a Bhotan *Rhododendron*, which proved to be *R. argenteum*. Its very pretty flowers are white, campanulate in shape, forming a close stiff truss. Cut flowers of *Aponogon distachyon*, scented like the Hawthorn, or *Odontoglossum gloriosum*, and produced in the open air, were shown by Mr. Parker, of Tooting. Messrs. E. G. Henderson & Son sent a few seedling *Hippocratus*, and from the Society's garden, Chiswick, came a small group of *Primulas*.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. But little of general interest was shown at this meeting, which was well attended. Mr. G. T. Miles, gr. to Lord Carrington, Wycombe Abbey, showed five remarkably fine Charlotte Rothschild Fine Apples, weighing together 35½ lb., and received a Cultural Commendation. Votes of thanks were accorded to Messrs. Stuart & Mein, of Kelso, for a small but interesting collection of Apples, grown in the State of Michigan, U.S.A.; and to Mr. James Batters, gr., Chilworth Manor, Romsey, for a good fruit of the variegated Pine-apple. A Cultural Commendation was also awarded to the Rev. W. Broomfield, who sent a meritorious collection of Apples, grown in the neighbourhood of Kelso. Mr. Batters also sent a nice dish of new Potatoes, and one of Mushrooms, and a good dish of the latter was also contributed by Mr. John Stirling, Park House, Swansea. Mr. Bennett, Hatfield, showed fruits of the Telegraph, Improved Syon House, Masters' Prolific, and Monro's Duke of Edinburgh Cucumbers, principally to illustrate the very free-bearing character of the latter. A First-class Certificate was awarded to Mr. Cox, gr. to F. Clarke Hills, Esq., Redleaf, Penhurst, Kent, for a seedling Apple named Redleaf Russet. It was raised from the well-known Golden Knob, which it somewhat resembles, but is flatter and of a more even golden russetty colour. The flavour was said to be particularly good.

The Villa Garden.

CUCUMBER BED.—If a Villa, or perhaps it would be best to be comprehensive and say Amateur Gardener, is proud of any achievement in connection with his garden it is that of growing his own Cucumbers. If he can manage to have some nice bunches of Grapes in his small vineyard, and is able to cut a few nice Cucumbers in his frame or pit, he becomes locally quite an authority in gardening matters, and he is very well sure to be proposed on the committee of the horticultural society of the place.

Cucumbers require constant attention; they cannot be planted out as one would a Currant bush, and then be left to take care of themselves; they will not take care of themselves, they must be taken care of. They require close attention, they require to be kept growing, healthy, and vigorous, in a moist regular heat; a check from the cold, an injury through neglect, will undo all the precious work of the previous weeks.

Next to growing Cucumbers of the short, prickly, or ridge type out-of-doors during the summer, the most elementary form is that of the old-fashioned dung-bed, and this is the one that must be resorted to in the case of ordinary Villa Gardens. The earlier in the season that the culture of Cucumbers is commenced the more difficult does the process become to those that are in the alphabet of this part of their garden work: there are greater alternations of temperature to contend with; a frequent absence of solar light and heat; and there is also a copious rainfall,

which lowers the temperature of the bed at a time when the bottom-heat is most wanted. Still, Cucumbers can be and are grown in this way very creditably indeed, and notwithstanding the difficulties that beset the cultivator.

When Cucumbers are grown on the old-fashioned hotbed the labour of the preparation of the material which forms the bed, by frequent mixing and turning before it is in a fit condition to be made into a hotbed, must be undergone. Then when it is made there comes a pause, when the cultivator anxiously waits for the time when the burning heat has subsided and the noxious gases have escaped, and the bed is reduced to a sufficiently low temperature to admit of the plants being planted out.

The best materials out of which to construct a Cucumber bed are fresh stable dung and leaves, about two-thirds of the former and one of the latter. Some gardeners prefer to dispense with leaves altogether, others advocate their use to the extent of one-half. Fresh stable manure, that which has lain together for some time, and has become so dry as to require a good manure. Let it be thrown up together, so as to reduce any rankness of the manure before the bed is made; but rank manure need not be rejected, as it can be used to go at the bottom of the bed, and what the gardeners term "sweetened manure" may be placed on the top of it, by way of completing the bed. The mixing together of the materials out of which the bed is to be formed is a matter of some moment, simple as it may appear. As the materials are collected and brought to the place where they are to be used, and then let them be well shaken out as loosely as possible, and if the stable manure be dry, as it sometimes does when lying in a confused heap, let plenty of water be thrown over it as the mixing proceeds. It should then be left in a tidy heap, and in the course of a week or so it will have generated a considerable quantity of active warmth through the moist dung. It should then be thoroughly turned all over, and the same process will require to be followed after the interval of a week or two, until the bed can be made. In building it up, let the space it is to occupy be first decided on, and then lay the manure so as to cover it. The sides should be built up evenly and regularly, and all the material be well shaken out; it should also be piled up high, as it will subside considerably in a week or two. The invariable rule is to have the bed slightly slanting away to the front, say about a foot lower at this part. As the dung is piled up in even layers, it should be thoroughly beaten down as the work proceeds, the sides of the bed being as regularly built up as a wall. A newly formed bed should be 4 to 4½ feet high at the back, and not so deep to a foot in front. It is customary with some cultivators to mix in with the dung the pieces of turf obtained by using the edging iron on grass plots, and anything of a like character, for the purpose of preventing the fermentation of the material, and that always takes place when dung is thrown up together and over the manure a layer of turf is placed, with the grassy side downwards, before the soil in which the plants are to grow is placed on it. "The first consideration," states Mr. J. Simpson, of Wortley Hall Gardens, "is the selection of a site for the bed, which should always be in a dry and sheltered situation; nothing extracts the heat so rapidly as cold winds; indeed where a hotbed is made up annually, it is better to have a sunk tub in the ground. It would be preferable, in fact, to have it wholly in the ground; but, as the bed will settle down at least one-third of its height during the summer, the frame would get below the ground line, which would be inconvenient. For a frame 9 feet by 5, the pit needs to be 14 feet long and 10 feet wide, and if the bed be intended to last eight or nine months it requires to be 2 feet deep, allowing one-third of the bed to be in the ground, giving a total depth of 6 feet of fermenting material. If the pit be double-boarded with strong rough deal, so as to form a 2-inch cavity all round between the earth and the sides of the bed, the heat will last a considerable time longer, as the cavity prevents the bed being robbed of its heat by the cold earth." These remarks contain some excellent suggestions, and the idea of a sunken permanent pit is a good one, as it can be made serviceable at all times of the year. In the case of small gardens, where space is principally considered, the bed must be put in the most convenient position; but wherever it is possible to do so it is a good plan to fence it in, in some convenient corner of the garden. A compost and frame yard shut in by a Privet, Laurel, Hornbeam, or any other hedge that will screen it from cold winds, and by shutting it off from other parts of the garden prevent it from interfering in any way with the love of order that is always felt by a tidy gardener, is most desirable.

The building up of the bed completed, the frame should be placed in position at the top of it. An ordinary two or three light Cucumber frame is some 2 feet in depth at the back, and rather more than half the depth in front; and it is often recommended that after it is placed in position, in addition to keeping the lights shut down close, some covering, such as loose

litter, should be piled up round the frame, so as to economise the heat, as well as to assist it in spreading itself equally through the body of the bed.

No one must dream of putting the plants into the frame directly the bed is prepared in the way indicated, as the rank heat given forth in the first instance would soon burn them up.

Obituary.

MR. WILLIAM PORT AYRES, whose name is well-known amongst horticulturists, died, after a lengthened and severe illness, at Carisbrook Villa, Forest Hill, on the 14th inst.

— We have also to record the death of Mr. WILIRAHAM BUCKLEY, of Tooting, which took place, after a long and painful affliction, on the 18th inst.

— From a Perth newspaper we learn of the death, at the good old age of eighty-five, of Mr. ARCHIBALD TURNBULL, of the firm of Dickson & Turnbull, nurserymen, Perth.

City and County Infirmary, and for many years was Chairman of the Parochial Board of Kinnoull. In 1829 he filled the office of City Treasurer, and retained his seat at the Council Board until the passing of the Municipal Reform Act of 1832.

— The Paris horticultural journals announce the death, on December 31, of M. COCHET-GERARD, whose treatise on market gardening is a model of its kind, and whose attainments and character entitled him to a high place among horticulturists.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 20, 1875.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, WIND, and RAINFALL. It contains data for January 14th to 20th, including mean readings, range, and wind directions.

- Jan. 14—Overcast; dull; and rain throughout the day.
15—Fine and bright in morning. Overcast, dull, and rain in afternoon.
16—Overcast, and rain fell in morning. Fine; and bright in afternoon and evening.
17—Overcast, and dull throughout. A little rain fell in the afternoon.
18—Overcast; dull; and rain in morning. Dull; overcast; and strong wind at night.
19—Fine; bright; and nearly cloudless all the morning. Overcast; dull; and rain at night.
20—Fine, and bright till 11 A.M. Overcast; and dull afterwards. Fine at night.

— In the vicinity of London the reading of the barometrical level of the sea decreased from 29.88 inches at the beginning of the week to 29.80 inches by the evening of the 10th, increased to 30.11 inches by the morning of the 13th, then turned to decrease, and was 30.05 inches by the morning of the 14th, again increased to 30.13 inches by the evening of the same day, decreased to 29.62 inches by the morning of the 16th, and was 29.71 inches at the end of the week.

— The highest temperatures of the air by day at 4 feet above the ground varied from 52° on the 15th to 45.1° on the 10th, the mean for the week being 49.3°. The mean of the seven low night temperatures was 42.3°, the extreme values being 45.4° on the 15th and 38.3° on the 10th and 11th.

— The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 81° and 70° on the 13th and 16th, but on the 14th, 49° was the highest reading.

— The weather during the week was dull, and the sky generally overcast. The direction of the wind was S.W. Rain fell on five days, the amount being 0.33 inch.

— In England, the extreme high temperatures observed by day ranged from 59° at Sunderland to 51.4° at Norwich, the general average over the country being 55°. The extreme low temperatures observed by night varied from 41.1° at Bristol to 36° at Norwich and Hull, with a general average of 38.4°.

and Bristol. The mean high day temperatures ranged between 51° at Bristol and Sunderland to 46.3° at Hull, the general average being 49.4°.

The weather during the week was dull and showery, and the sky generally overcast.

An aurora borealis was seen at Bristol on January 15.

— In Scotland the highest temperatures ranged between 55° at Paisley, and 47° at Dundee. The lowest temperatures varied from 38.3° at Greenock to 34° at Perth, their averages being 51.4° and 46.3° respectively.

Variorum.

ROYAL HORTICULTURAL SOCIETY.—The following is a list of the gentlemen appointed by the Council to serve on the various committees for the year 1875:—

Scientific Committee.—Chairman: Joseph Hooker, M.D., C.B., P.R.S., V.P.L.S., Royal Gardens, Kew. Vice-Presidents: Maxwell T. Masters, M.D., F.R.S., Mount Avenue, Ealing, W.; Andrew Murray, F.L.S., 67, Bedford Gardens, Kensington, W.; Alfred Smees, F.R.S., 7, Ebury Circus, E.C.; J. G. Beyer, F.L.S., Royal Herbarium, Kew; Henry Charlton Bastian, M.D., F.R.S., F.L.S., 20, Queen Anne Street, W.; James Bateman, M.A., F.R.S., 9, Hyde Park Gate South, W.; Alfred W. Bennet, M.A., B.Sc., F.L.S., 6, Park Village East, N.W.; Professor Robert Bentley, F.L.S., 91, Alexandra Road, South Hampstead, N.W.; George E. Blinks, 5, Sandford Place, Cheltenham; Major R. Trevor Clarke, Walton Place, Devontry; Charles Darwin, M.A., F.R.S., Down, Beckenham, Kent; John D. Hooker, M.D., High Street, Stoke Newington, N.; W. T. Thistleton Dyer, M.A., B.Sc., F.L.S., 10, Gloucester Road, Kew; M. P. Edgeworth, F.L.S., Mastrim House, Anderley, S.E.; Rev. T. A. C. Firringer, M.A., Warren Lodge, Edmonton, N.; W. Gilbert, D.Sc., 46, Great Russell Street, W.C.; J. H. Flight, Ph.D., F.R.S., Harpenden, St. Albans; Arthur Grote, F.L.S., Athenæum Club, S.W.; W. P. Hiern, M.A., F.L.S., 1, Foxton Villas, Richmond, S.W.; Robert Hogg, L.D., F.L.S., 99, St. George's Road, Finsbury, S.W.; Professor Lawson, M.A., F.L.S., Botanic Gardens, Oxford; R. McLachlan, F.L.S., Lime Grove, Lewisham; John Miles, V.P.L.S., F.R.S., 84, Addison Road, Kensington, W.; Thomas Moore, F.L.S., Botanic Gardens, Chelsea, S.W.; Giles Munby, Alice Hill, Farnham; J. Renny, 62, The Hermitage, Roehampton; W. Wilson Saunders, V.P.L.S., F.R.S., 2, Selden Terrace, Worthing; W. J. Scofield, M.R.C.S., 13, South Hill Park Gardens, Hampstead, N.W.; Edgar J. Scott, F.L.S., 4, Scott, C.B., F.L.S., 3, Sunningdale, Ealing, W.; R. H. Scott, M.A., F.R.S., 36, Onslow Square, S.W.; Worthington G. Smith, F.L.S., 13, North Grove West, Mildmay Park, N.; Thos. Thomson, M.D., F.R.S., The Cottage, Earleigh, Maidstone; A. Volckel, Ph.D., F.R.S., 11, Salisbury Square, E.C.; Professor Westwood, M.A., F.L.S., Walton Manor, Oxford; George F. Wilson, F.R.S., Heatherbank, Weybridge Heath. Secretary.—The Rev. M. J. Berkeley, M.A., F.R.S., Sluiterhof, Market Harborough.

Local Committee.—Chairman: W. B. Kellock, Esq., Stamford Hill, N. Vice-Chairmen: John Denny, M.D., High Street, Stoke Newington, N.; R. B. Postans, Brentwood, Essex; Benjamin S. Williams, Victoria Nursery, Upper Holloway, N. Floral Director, Thomas Moore, F.L.S., Botanic Garden, Chelsea, S.W.—Thomas Baines, Avenue Road, Southgate, N.; George Baker, Sister House, Clapman Common, S.W.; Samuel Barlow, Chadwell, N. Horticultural Secretary, Hatfield House, Hatfield, Herts.; J. Croucher, Sudbury House, Hammer-smith, W.; William Denning, Lodesborough Lodge, Norbiton, Surrey; John Fleming, Cliveden, Bucks; Robert Fortune, 1, Gilston Road, West Brompton, S.W.; John Fraser, Lea Bridge Nursery, Clapton,

E.; Charles Green, Holmesdale Road, Reigate; Peter Griever, Culford Hall, Bury St. Edmunds; W. B. Gurnbton, Belgrave, Queenstown, Ireland; Andrew Henderson, Wellington Road Nursery, St. John's Wood, N.W.; George Jackman, Woking, Surrey; Daniel Judd, Hawkstone Park, Shrewsbury; W. B. Kellock, Stamford Hill, N.; John Keynes, Salisbury, Wilts; Francis R. Kinghorn, Sheen Nursery, Richmond, Surrey; John Laing, Stanstead Park Nursery, Forest Hill, S.E.; Frederick O. Lane, Great Berkhamstead, Herts; Charles Lidgard, Albion Road, Hammersmith, W.; Maxwell T. Masters, M.G.D., F.R.S., Mount Avenue, Ealing, W.; A. McIntyre, Victoria Park, Hackney, E.; Charles Noble, Bagshot, Surrey; Nathaniel Norman, Crescent Road, Plumstead, S.E.; Robert Parker, Exotic Nursery, Tooting, S.W.; Anthony Parsons, Danesbury Park, Welwyn; George Paul, Cheshunt, Herts; J. D. Pawle, Wray Park Road, Reigate; Charles Pilcher, West Hill, Wandsworth, S.W.; Alexander Roger, Erza House, Surrey Lane, Battersea, S.W.; Alfred Salter, 11, Pembroke Road, Kensington, W.; George Smith, Tollymore Nursery, Highgate Road, N.; John Goodrich, Royal Nursery, Ascot, Staines; Zadok Stevens, Trentham Hall, Stoke-upon-Trent; Charles Turner, Royal Nursery, Slough; George Westland, Witley Court, Stourport.

Fruit Committee.—Chairman: Henry Webb, Redstone Manor House, Redhill, Surrey. Vice-Chairmen: George F. Wilson, F.R.S., Heatherbank, Weybridge Heath; Rev. George Kemp, 41, Weymouth Street, Portland Place, W.; John Lee, Royal Vineyard Nursery, Hammersmith, W.; P. Monaghan, Director, Robert Hoag, L.L.D., W.L.S., 99, St. George's Road, Piccadilly, W.—Peter Barr, 12, King Street, Covent Garden, W.C.; E. J. Beale, F.L.S., Stoneypool House, Teddington Grove, S.W.; George E. Blenkins, 5, Sandford Place, Cheltenham; George Bogue, The Gardens, Gorhambury, St. Albans; John Cox, Redleaf Gardens, Tunbridge, W. Coleman, Eastnor Castle, Ledbury; Robert Cooper, 152, Fleet Street, E.C.; A. Crabb, Tortworth, Wootton-under-Edge; Francis Dancer, Little Sutton, Gurnham Green, J. Douglas, The Gardens, Royal Hall, Ilford, E.; John K. Lane, Great Berkhamstead; G. T. Miles, Wycombe Abbey, High Wycombe; W. J. Nutting, jun., 60, Barbican, E.C.; William Paul, Waltham Cross, N.; John R. Pearson, Chilwell, Nottingham; John Peel, Cambridge House, Twickenham, S.W.; Thomas Perkins, Warren House Gardens, Stanmore, N.W.; Thomas Record, Vinters Park Gardens, Maidstone; T. F. Rivers, Sawbridge-worth; George Sage, The Gardens, Ashridge Park, Berkhamstead; Alfred Smea, F.R.S., 7, Insbury Circus, E.C.; T. Speed, Chatsworth, Chesterfield; David Thomson, Drumlannig, Thornhill, N.E.; J. L. Vetch, F.L.S., Royal Exotic Nursery, Chelsea, S.W.; James Frederick West, Lynnmouth Lodge, Reigate; John Woodbridge, Syon House Gardens, Brentford, W. Secretary: Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVES.—The length of time through the season that most stove plants that naturally flower over a considerable part of the year can be had in bloom, is consequent upon not giving them too long a rest; if they are subjected to a little more heat, so as to get them moving as soon as the days begin to lengthen, their flowering season is so far lengthened. This is also better in every way than a long rest, as it enables them to take an excessive high temperature. If the stove at the close of the present month is kept some 5° warmer in the night, with a corresponding rise by day, or more when there is a little sun, it will induce many plants to move gently that will thereby have a much longer flowering season; but before any growth is excited everything possible should be done to exterminate or reduce as low as can be the worst species of insects, such as mealy-bug and scale. Where either of these, and especially the former, are allowed to get to a head, it is impossible to grow stove plants as they ought to be. The continual brushing and sponging to remove these pests disfigures the leaves, and destroys quantities of the newly-formed, undeveloped flowers. The facilities for destroying insects when the plants are comparatively at rest is also such that as much can then be effected in a short space of time as could take immeasurably longer when there is a considerable amount of young growth. There is also at this season usually more time at disposal to carry out this kind of work. Keep *stove Begonias* at the driest end of the house, and do not allow them to get wet overhead with the syringe, as moisture in this way makes them soft and tender, and the flowers of short duration when cut. The useful winter-flowering *Aphelandra cristata*, and the dwarf brilliant-coloured *A.*

Rooletii, will now be coming into flower; give them also a light situation, and as little humidity in the atmosphere as can be obtained, keeping it too dry for the general state. If in cutting the flowering shoots of *Euphorbia jacquiniiflora* there is not too great a length of the current season's growth removed, they will push out a fresh lot of flowers, but keep the plants, as hitherto advised, as near the glass as possible without their absolutely touching it, as on this depends their flowers having their fine deep colour, and lasting when cut. To secure this the best method of treating this plant through the winter is to tack thin strings across the roots, six or eight inches asunder, then stand the plants that are to be blooming-shoots will lie up against these strings, then tack more similar strings under the shoots; this keeps them so that their leaves and flowers do not touch the glass, yet not more than the depth of the sash-bar away from it; so treated the flowers are of the finest possible colour, and will stand when cut in wet sand or water for a week, instead of being, as often grown, worthless through flagging in a few hours. Keep *Gardenias* at the warmest end of the stove, and supply them with soft water during the winter, not too much, for if the roots were to get injured thereby the buds would fall. *Anaryllis*.—Recent additions to this fine family of plants have been such as to make them of still further importance. Their easy growth and moderate size are such as to commend them to general cultivation, for with fair treatment there is little danger of losing them; although in reality many of them are greenhouse plants, still the ease with which they can be brought to bear in heat during the winter, and the variety of their being of more use as decorative subjects during this season than later, when greater plenty of blooming plants are in, makes it desirable to now place some in heat. If they have been kept cool and quite dry, soak the balls by plunging the pots in a vessel of tepid water for some hours, until the soil is moistened; if they are then placed in a temperature of 60° in the night—a few degrees more or less will not matter—they will soon throw up flowers. Any *Geraniums* of the *holboellii* and *exoniense* type that are not flowering, or whose flowers should not be kept warmer than just sufficient to enable them to open, otherwise they are of little use for conservatory decoration. Even where such is kept at an intermediate temperature, the large bulbous species, such as *G. Cooperii* and *G. Donkelaeri*, if they have been dried off in the autumn, may now be started, potting them similarly to *Gloxinias*, and placing them in the warmest end of the stove. If it is desirable to increase these plants, it can be done by dividing the roots similarly to *Gloxinias*. In flower forcing it is necessary to calculate a considerable time beforehand as to the probable requirements and supply, otherwise the result is likely to be either a profusion or scarcity, the best way to avoid which is to introduce into heat a few plants at a time and often; with this view some *Genistas* and *Acaecias* should at once be placed in the forcing pit or cooler end of the stove. *Acaecia armata* and *A. Drummondii* are well suited for this early work, being comparatively hardy plants, and naturally inclined to open their flowers without being subjected to strong heat. A few *Gloxinias* may now be potted and placed in heat; if there happens to be a scarcity of any variety, and a few large bulbs exist, they will bear dividing, similarly to cutting a Potato for planting, but each piece must have a portion of the central buds attached to it. After potting at once place them in heat. I have known these bulbs seriously injured by being left in the new damp soil in a cold potting shed for two or three days. Some *Adiantums* may also now be put in; these are best started in broad shallow pans, and, after they have made an inch or two of growth, pricked out into the pots or baskets they are ultimately to occupy. Mix one-fourth sifted leaf-mould with the soil the bulbs are started in; this will enable their removal to the flowering pots without injuring their roots materially. Keep *Borwardias* in a warm temperature, which will not only cause them to flower freely, but will induce lateral growth, which will be of great service in forcing in a room. The glass, especially the roof portion in stoves, soon becomes obscured, more particularly in the winter season, when little air is given, not only from accumulations of soot and dust on the outside, but also on the inside from the slimy coniferæ that form upon it. Another good washing outside and in, similar to such as advised in the autumn, will be of very great use in admitting all the light possible. T. Baines.

HARDY FRUIT GARDEN.

Where, from unavoidable circumstances, the planting of young fruit trees has been deferred, no time should be lost in making the necessary preparations for their reception. In the formation of a new garden, or for orchard planting, if the ground has not been previously trenched it will be better at the present to take out holes of 6 to 8 feet diameter, turning out the top spit round the side of the hole and afterwards trenching up the bottom to a depth of 18 inches, but should this be heavy clay or gravel a portion should be removed and a good layer of stone or brick refuse,

or other suitable material placed in the bottom, so as to form an efficient drainage, without which it is hopeless to expect young trees to continue in a healthy vigorous state of growth. Means also must be taken for the thorough drainage of the ground generally, otherwise taking out holes as above recommended is liable in retentive soils to form receptacles for the retention of water about the roots. Most, or indeed all, hardy fruit trees may be successfully planted during the next month, or even later, providing care is taken to expose the roots to the air as short a time as possible. Indeed, in cold or late soils, where not too drained or otherwise ungenial, it is questionable whether, in the case of young trees removed from the shelter of a nursery quarter, spring planting is not preferable to autumn, unless the latter can be done sufficiently early to admit of the formation of fresh roots before absorption of heat ceases. In either case much will depend upon the necessary attention as to mulching and watering during the first summer after planting. Pruning and nailing wall trees should be followed up as fast as possible, as every day now brings an additional day of growth, and the more the well keeping of a garden of any pretensions is fully cared for. Dessert and other *Cherries* should be washed with a composition of some kind previous to nailing in. Gisburt Compound is among the best, but these mixtures are so numerous that the selection is best left to the decision of the operator or his assistants. Prune and stake *Raspberries* where not already done, and prepare by well trenching and manuring ground for fresh plantations where required. The planting of growing useful fruit are now in practice, when a little expense at the commencement is not an object place strong training posts, 5 feet high, of iron or wood, at either end of the rows, which should be 5 feet apart; and to these fix three wires, at 18 inches apart, the lowest 2 feet from the ground. The plants should then be put in 2 feet apart, and two rods trained upwards from each stool, which will leave them 1 foot apart for bearing. After pruning, staking, and syring in, establishing and nailing the ground should be cleaned if necessary, and well mulched with half decomposed manure, but on no occasion fork or dig between the rows except in the case of newly made plantations, when a light summer crop, as Lettuce, Spinach, &c., may be taken for one season only. William Cox.

FRUIT HOUSES.

VINES.—Now that the weather is milder forcing will be comparatively easy work, and should be pushed on during all such spells of mildness, as it is always advisable to proportionately reduce the forcing temperature the moment there is a reduction of such outdoor. A "cut-and-dried line" temperature at which to maintain forcing-houses is wrong in principle, and, if practised, must end in disappointment. Our aim ought rather to be how best to maintain the most equable temperature compatible with the state of the weather outside. In very early houses the Grapes will be ready to thin, in doing which the variety of Grapes being cultivated, the ground should be in mind, and those kinds producing the largest berries be most thinned. Experience alone can teach how thin they ought to be, or how many bunches each Vine ought to carry. It is always good policy to err on the side of having what is termed a thin crop, which invariably finishes off well, whilst a heavy crop frequently comes to grief through shanking and other ills. Disbud the Vines in succession-houses as soon as the best "shows" can be distinguished, of course taking off the weakest shoots, and leaving one shoot on to each spur. Pinch out the joint of the shoots two or more joints beyond the fruit; but should there be plenty of space for foliage without overcrowding, several joints beyond the fruit may be left with advantage. Discontinue syringing, but keep the floors and walls damp, and otherwise maintain a healthy growing atmosphere. In starting later houses the preliminaries should be—through clearing, depressing of borders, and other operations, the same with tepid water. Late Grapes still at the Vines will require almost daily attention. So long as the weather is damp it will be advisable to keep up a little fire night and day, giving air whenever practicable. Grape rooms deserve to become more general, as, if properly managed, Grapes keep better and need less attention when cut and bottled than if banging on the Vines. Moreover, the Vines are at rest, and can be pruned and cleaned, and the same may be in order for another season's crop. H. Wiltshire, H. Hildred.

FIGS.—The Figs in pots, if started in the beginning of the month, will now be showing their young shoots, and the sturdier they can be kept by plenty of light and air, combined with a slight bottom-heat, the greater will be the chances of gathering a satisfactory early crop. The best and richest favoured crop of early Figs I ever grew in pots was of the White Marselle variety, grown on the fluc of a Fine pit, where the little trees had plenty of light and heat. The pots were placed each on four bricks on the top of the hole, and the trees watered frequently with weak liquid

manure, and syringed twice a day to keep red-spider down. The night temperature was never below 60° when their forcing commenced in February, and the day temperature from 80° to 85°. Where Figs are permanently planted out in a house and required for early forcing, they must now be pruned and dressed, and when forcing commences duly kept syringed twice a day, should the weather be favourable. The night temperature may range from 50° to 55° when the forcing begins, and in the day-time from 70° to 75° when the forcing is in full way. *William Tillyer, Welbath.*

THE ORCHARD HOUSE.—It may be necessary to say here that the cultural directions which will be attempted to be given under this head are intended to apply only to the orchard-house *par et simple*; that is, to structures which may vary to any extent as to form and dimensions, but all so far alike in being destitute of any means of increasing their internal temperature, otherwise than by the prevention, to some extent, by their roofs, &c., and by like means the retention of solar heat transmitted to them by the sun's rays during the day. The possession of heating apparatus of any kind would necessarily constitute such structures, to some extent at least, forcing houses. The advantages which the orchard-house offers for the cultivation of fruit trees over open-air cultivation are very considerable and now generally known. The fruit trees grown in these houses may be either grown in pots or planted in prepared borders or beds of soil. In most cases it is advisable to follow, to some extent, both systems of culture, that is, to have a portion of each kind of fruit tree planted out, as well as a portion in pots. If all such trees, whether planted out or in pots, have been attended to as has been recommended in former Calendars—viz., surface dressed, mulched, &c., and in some instances pruned and dressed, while those in pots will have been placed somewhat close together, and the pots surrounded with litter well covered with hay or dry litter of some kind, to prevent injury by severe frost—if all this has been done, the trees may be allowed to remain in their present position for some time longer; but as the weather is now very mild, the soil in the pots should be examined, and if found to be very dry water should be given. In most instances, however, the litter with which the pots are covered will have had the effect of preventing the soil from becoming very dry, and in these cases water will not be required until the blossom-buds begin to swell. To prevent, as far as possible, such buds from doing so prematurely, the ventilators of the house should be kept open by night as well as by day, closing only when the thermometer falls under the freezing point, and again opening the same during the day, unless the frost is intense and the sky obscured. It is of importance, as far as possible, to keep the temperature of the house being raised to any great extent by the bright sunshine which usually accompanies sharp frost, and which would, if the house should be kept close, be sufficient to disturb that state of quietude which it is desirable to preserve in the trees during the entire month of January at least. Although it is quite true that our summers are barely of sufficient length to ripen some of our best late Peaches, &c., even with the assistance of glass, yet it would nevertheless be inadvisable to allow such trees to be excited into growth at an earlier period than can be avoided, on account of the danger which is to be apprehended from late spring frosts; for although the blossoms of fruit trees in orchard-houses, on account of being kept dry, can generally bear with impunity a very considerable amount of cold, yet such depressions of temperature as sometimes occur very late in the season (such as that of the night of the 10th inst. of last March, when the thermometer fell to 13°, or 19° below frost), are calculated to endanger the fruit, even when under the protecting influence of a glass roof. *P. Grieve, Calford, Bury St. Edmund's.*

KITCHEN GARDEN.

The injurious effects resulting from a severe frost like that which we have recently experienced is often too speedily estimated. It will doubtless prove so in many cases this season, particularly where gardens are located in valleys, which at this time of year abound with moisture. Such is the case here, and doubtless we shall still have to suffer considerably in respect to already sown Broccoli plants in quantity are only fit to be removed to the refuse heap. After the departure of such severe weather certain crops will require immediate attention; foremost amongst these will be the winter plantings of Lettuce. These are very liable to be disturbed at the roots by the operation of severe frost, and as being a crop which is everywhere indispensable and most generally esteemed it should have immediate attention, and all those plants which are likely to suffer by being so disturbed should have the soil pressed firmly round them again. Globe Artichokes will likewise want looking over, and the decayed parts removed from them at once, and all the other kinds of winter stuff. It is a common practice in some places to have the Globe Artichoke roots lifted and stored away from the effects of severe frost. This is quite unnecessary if they are properly protected

with ashes round the surface of the roots. For this purpose a mixture of wood ashes is preferable. These are likewise most valuable for other purposes in this department, and therefore should be obtained by burning such materials as accumulate and are only fit for that purpose, and when reduced to this condition they should be stored away in a dry place in readiness for ordinary use, such as the dusting of *Peas, Radishes, Turnips*, &c. As spaces of ground become vacant, which *Rosette Coleworts, Savoy, Early Brussels Sprouts, and Celery* have occupied, these plots, if deemed necessary, should be well manured, and at this season be properly prepared. None should be turned over less than two spits deep, if the depth of soil will admit of its being done, not necessarily bringing to the surface soil which is not desirable there. Deep cultivation in combination with good surface mulchings of manure are the best means to be employed for producing vegetable of the finest quality and in quantity under any conditions. If a sufficient breadth of autumn sown Cabbage plants are not already planted out, it should be attended to in suitable weather; these plants will provide young tender heads when earlier planted ones are gone or otherwise have become hard and only fit for soups.

Forcing Department.—Turn over and refresh with new materials fermenting beds where *Asparagus* roots have become exhausted, and introduce fresh roots; this, the best of all forced vegetables when properly managed, is oftentimes much deteriorated in quality through not being well aired. Pits having movable lights are best adapted to its requirements; these should always be kept off when the external temperature is 50°. To obtain it from December until March, fermenting beds at from 70° to 80° are most suitable, with the means to introduce a little artificial heat when needed for ventilation purposes. As soon as *Kalishes* are up, and the best of all forced vegetables, these must be well ventilated. *Early Carrots* will require constant attention. Slugs will be very destructive to these if they are not carefully sought. Various kinds of small seeds must shortly be sown, and soil in a proper state for this purpose should be at hand.—*G. T. Miles, Wycombe Abbey.*

Enquiries.

He that questioneth much shall learn much.—BACON.
[Many enquiries which reach us would be more suitably answered by those of our correspondents whose experience or requirements are, or have been, similar to those of the questioner. These we propose, in future, to gather together for facility of reference; and as fellow feeling makes us wondrous kind, so we would find hope that this enquiry column may serve as a bond of sympathy and good-will between our correspondents and editors, by the means of eliciting much valuable information. Eds.]

36. EGYPTIAN WHEAT.—*A Correspondent* asks where he can obtain a few good seeds of the Egyptian Wheat, Triticum compositum?

Answers to Correspondents.

AZALEAS: *Constant Reader.* Our answers to your questions are, 1, no; 2, when the blooming season is over, and the plants ready to be started into growth; 3, good sound hly peat, with sand according to its texture.
ECHARIS AMAZONICA: *F. Denman.* You will find all the information you require in our volume for 1872, pp. 289, 509.
FERNERY: *F. W.* Glaze with rough plate glass.
HEATING CONSERVATORY: *Old Subscriber.* If you wish to retain the flue you might have a saddle boiler under the press, furnace, and the pipes carried alongside the flue; but you had better ask some one accustomed to such work to inspect the house, and advise you thereupon. Any of the hot-house-builders or boiler-makers who advertise in our columns would do this for you, and give an estimate of the cost.

NAMES OF FRUITS: *S. E. Craper.* The berries were much bruised when received; the white one had become nearly brown. It is most probably Muscat of Alexandria, or perhaps White Tokay. The black one is the Alicante. *F. C. H.* 9, Yorkshire Greening; 11, Northern Greening; 6, dumelow's Seedling; *J. B. Nelson.* 2, Northern Greening; 3, Calville Blanche; 5, Searlet Nonpareil; 16, Coe's Golden Drop; 14, Sturmer Pippin; 10, 11, Glou Moreau; 12, St. Germain.

NAMES OF PLANTS: *E. D.* Momordica balsamina, we believe.—*T. Smith.* Cotoneaster frigida.—*S. Y.* If you will send fair specimens, we will name them for you; but we cannot attempt it with such miserable scraps.—*D. H.* Rhododendron arboreum album, or a white sort, with the arbican type; Gravelia juniper.—*G. F. S.* Linum trigynum; the other is some Pteronia, but indeterminate in the state sent.—*M. J. R.* 1, Selaginella Schottii; 2, Blechnum occidentale; 3, Polystichum coriaceum; 4, Selaginella longisigra; 5, Cyanothis vittata; 6, Phlebodium aureum.

PLANT GROWING: *Zotin Bates.* All in good time.
CLEAN UP FERNS: *M. J. Y.* There is no better plan than persistently to brush off the insects, and wash the plants with any one of the many insecticides from time to time recommended in the Garden Operations

and other departments of the paper. If the scales are old, and full of egg, do this with the plant on its side and the fronds over a vessel of water.

VINE DISEASE: *W. S. P.* The nodules on Vine branches are not uncommon. The cause is unknown. Like the analogous knots on Pelargoniums, they probably arise from some anomalous development of the leaf-laud. It does not appear that they are always injurious, as healthy branches are sometimes developed beyond them. *M. J. B.*

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers who send Post Office Orders, to be good enough to write to the Publisher at the same time, stating that they have done so.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early as possible, so that they may be inserted in the week as possible. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED.—William Rollinson & Sons (Tooting), General Seed Catalogue, comprising also a List of Seeds of Subtropical Plants.—William Drummond & Sons (Surrey), Catalogue of Vegetable and Flower Seeds.—Alfred Legerton (5, Aldgate, London, E.), Special Trade Catalogue of Garden, Agricultural, and Flower Seeds.—J. Berger, Spence & Co. (75, Mark Lane, E.C.), Weekly Chemical, Mineral, and Metal Report.—Dickson & Co. (1, Waterloo Place, Edinburgh), Descriptive Catalogue of Select Fruit Trees, &c.—The Pine Apple Nursery Company (Maida Vale, Edgware Road, London, W.), Catalogue of Kitchen Garden, Farm, and Flower Seeds, Tools, &c.—The Lawson Seed and Nursery Company (1, George IV. Bridge, Edinburgh, and 106, Southwark Street, London, S.E.), Descriptive Catalogue and Order Sheet for 1875.—Downie & Laird (17, South Frederick Street, Edinburgh), Descriptive Catalogue of Garden, Flower, and Agricultural Seeds.—Jenkinson & Co.—James Dickson (108, Eastgate Street, Chester), Catalogue of Vegetable and Flower Seeds, Tools, Implements, &c.—Wenzel Brothers (Quedlinburg, Prussia), Extract from their Trade Catalogue of Choice Flower Seeds, &c.—Masters & Minant (Exeter), Seed and Nursery Company (1, George IV. Bridge, Edinburgh, and 106, Southwark Street, London, S.E.), Descriptive Catalogue of Kitchen Garden and Flower Seeds.—John Cattell (Westerham, Kent), Spring Catalogue of Kitchen Garden, Floricultural, and Agricultural Seeds.—V. Lemoine (Rue de l'Etang, a Nancy, Meurthe-et-Moselle, France), Catalogue of New Florists' Flowers.

COMMUNICATIONS RECEIVED.—Mrs. Homan.—E. S. D.—A. B.—J. H.—H. H.—W. S.—E. S. (we are unable to judge without a knowledge of the locality).—J. M. (vide our record).—J. F. G. S.—F. D. M.—K. R.—B. G.—W.—W. H.—A. C. (thanks).—J. W. M.—A. F.—G.—E.

DEATH.—ARCHIBALD TURNBULL, Esq., of the firm of Messrs. Dickson & Turnbull, Nurserymen and Seedsmen, Perth, died here this morning at 2.20. *Belshoo, Perth, January 19.*

Markets.

COVENT GARDEN, January 21.

There is scarcely any change worth notice, the open weather enabling the growers to load up the outdoor produce sufficiently for the demands of the trade. Retail orders and business generally is dull; none but the best samples of English-grown Pines now command any price, in consequence of those from St. Michael's coming very good. Inferior Apples are scarcely saleable. *Thos. Taylor, Wholesale Apple Market.*

The choicest descriptions of fruit and vegetables in the retail markets may be quoted as follows:—Seakale, 2s. 6d. per punnet; Asparagus, 10s. per bundle; Mushrooms, 1s. to 1s. 6d. per basket; Pomatoes and Shaddocks, 6s. to 12s. per dozen; Bananas, 3s. to 4s. per dozen; Easter Peas, 8s. to 12s. per dozen; and Pines, 6s. to 8s. per punnet.

FRUIT.

s. d. d.	s. d. d.	s. d. d.	
Apples, per bush	1 0-10	Melons, each	1 0-3 0
Chestnuts, per bush	10 0-20 0	Nuts, Cob, lb.	1 6-2 0
Grapes, English, lb.	4 0-6 0	Oranges, per 100	8 0-12 0
Muscats, doz.	4 0-6 0	Pears, per bush	3 0-6 0
Lenons, per doz.	8 0-12 0	Pine-apples, lb.	3 0-6 0
Medlars, per doz.	1 0-2 0	Walnuts, lb. bush	11 0-10 0

VEGETABLES.

Potatoes.—Early Show, 110s.; and Early Myatt's, 120s.; per ton of Regents, 120s.; and Early Dons, 120s. per ton.

CUT FLOWERS.

Table listing various cut flowers such as Azaleas, Carnations, Cyclamen, and others with their respective prices and quantities.

PLANTS IN POTS.

Table listing various plants in pots such as Begonias, Doreas, and others with their respective prices and quantities.

SEEDS.

LONDON: Jan. 21.—The seed trade now exhibits a marked increase of activity. In all descriptions of red clover seed a good business is now doing at improving rates.

CORN.

At Mark Lane on Monday the supply of English Wheat was not large, and the condition bad. The best samples met a dull sale at 15s. to 25s. per quarter decline from the rates of this day week.

CATTLE.

The general aspect of trade on Monday at the Metropolitan Market was very quiet. Of English-fed cattle the proportion of really prime was short.

HAY.

Supplies of fodder continue large at Whitechapel, at the following quotations:—Clover, best, 115s. to 120s.; inferior, 80s. to 90s.; hay, best, 105s. to 112s.;

POTATOS.

The Borough and Spitalfields markets report moderate arrivals of Potatoes, and that trade is slow at about late rates. Regents, 90s. to 100s. per ton; Victorias, 105s. to 115s.;

COALS.

There was no alteration in prices at market on Monday. Business was steady. On Wednesday trade continued steady, at previous rates.

Reduced Prices.

THE CELEBRATED GRANITIC PAINT. Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company.

THE SILICATE ZOPISSA COMPOSITION TO CURE DAMP IN WALLS, and PRESERVE STONE, &c., from DECAJ, at a very trifling cost.

FOWLER'S PATENT STEAM PLOUGH and CULTIVATOR may be SEEN at WORK in every Agricultural County in England.

THE THAMES BANK IRON COMPANY (Successors to JAMES WHITE).

Old Barge Wharf, Upper Ground Street, London, S.E., ERECT HOT-WATER APPARATUS complete, or supply BOILERS of all kinds. PIPES and CONNECTIONS at Wholesale Prices.

SIR J. PAXTON'S HOT-HOUSES FOR THE MILLION are SIMPLE, CHEAP, and PORTABLE. Illustrated Price Lists free.

J. G. SMEATON & CO., Horticultural Architects and Builders, HOT-WATER and STEAM-HEATING ENGINEERS, &c., HARWOOD ROAD, FULHAM, LONDON, S.W.

Plans and Estimates for every Description of Horticultural Structure. Consultations in all parts of the Kingdom. HEATING and VENTILATING ENGINEERS TO THE SCHOOL BOARD.

CANTHARIKOPHO. COCKROACH and BEETLE POISON. Destroys Rats and Mice. Sold everywhere in Tin Boxes. By post, 15s. 3d. and 15s. 10d. each.

Indestructible Terra-Cotta Plant Markers. MAW AND CO'S PATENT.—Prices, Printed Patterns, and Specimens, sent post free on application; also Patterns of Ornamental Tile Pavements for Conservatories, Entrance Halls, &c.

Labels—Labels. PARCHMENT or CLOTH LABELS, TREE or PLANT LABELS. Punched Parchment, 4 inches long, 3s. 6d. per 1000, or 30s. per 10,000; if eyeleted, 4s. per 1000.

By Appointment to, and Under the Distinguished PATRONAGE of, HER MAJESTY.

J. SMITH'S IMPROVED METALLIC LABELS.

The above Labels—which have just been adopted for the Royal Gardens at Windsor—are made of a White Metal, with RAISED BLACK-FACED LETTERS, and are of various shapes and sizes.

THE FRENCH SYSTEM OF WIRING GARDEN WALLS, &c., FOR TRAINING FRUIT TREES.

Plans on application to J. B. BROWN and CO., 99, Cannon Street, E.C.

Garden Wall Wiring.

HOLLIDAY, PRACTICAL WIREWORKER, 2A, Parthello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as superior to all others for neatness, strength, and durability.

For Neatness,—Because all the Wires are kept perfectly tight, without the use of the Raddisour. For Strength,—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.

For Durability,—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system. The above Engraving is an Example of one system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 753 yards long, wired on both sides; making a total length of 1506 yards,—our system being chosen in preference to any other.

Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

For Park, Farm, and General Enclosures.

Is in use over many thousand miles, and has been awarded the Silver Medals and Highest Commendations of the leading Agricultural Societies, it forms the most efficient strained iron fence known.

ORNAMENTAL IRON ENTRANCE GATES, &c., IN WROUGHT AND CAST IRON, Designed for the Mansion, Villa, or Farm.

Field, Wicket, and Garden Gates In Great Variety of Patterns. ORNAMENTAL and FIELD HURDLES, With Round or Flat Bars.

Continuous Bar Iron Fencing, Fitted with F. M. & Co.'s Patent Selflocking Joints, which form a continuous rigid brace from end to end of the Fence, and the most perfect system for securing its efficiency.

F. M. & Co.'s New Illustrated CATALOGUE is now ready, and will be forwarded on application.

LONDON OFFICE—1, DELAHEY ST., WESTMINSTER, S.W.

W. H. LASCELLES, HORTICULTURAL BUILDER, Finsbury Steam Joinery Works, 121, Bunhill Row, London, E.C.

Estimates given on application for GREENHOUSES and CONSERVATORIES of all kinds, and to any design.

CONSERVATORIES, HOTHOUSES, GREENHOUSES, &c.,

MANUFACTURED BY STEAM-POWER MACHINERY.

THE BEST MATERIALS,
THE BEST WORKMANSHIP,

THE LOWEST PRICES,
PRACTICAL ADAPTATION.

UNSURPASSED BOILERS AND HEATING APPARATUS.

GENTLEMEN WAITED ON AT THEIR RESIDENCES IN TOWN OR COUNTRY.

(Successors to LYNCH WHITE),

OLD BARGE WHARF, UPPER GROUND STREET, LONDON, S.E.,
SURREY SIDE, BLACKFRIARS BRIDGE,

Have the largest and most complete Stock in the Trade; upwards of Twenty Thousand Pounds' worth to choose from.

**HOT-WATER
BOILERS,**

("CLIMAX.")

**PIPES,
CONNECTIONS,**

AND ALL CASTINGS FOR HORTICULTURAL PURPOSES.

NEW PATENT "CLIMAX" BOILER (1874).

See p. 666, 1874, *Gardeners' Chronicle*.

"GOLD MEDAL" BOILER (Birmingham, 1872).

PATENT "EXCELSIOR" BOILER (1871).

"WITLEY COURT" BOILER (Silver Medal, 1872).

"TRENTHAM IMPROVED" BOILER, with Water-

way End and Smoke Consumer.

"TUBULAR," and every other Boiler of known merit

or excellence.

HOT-WATER APPARATUS ERECTED COMPLETE.

PRICE LIST on application; or, Six Stamps for DESCRIPTIVE CATALOGUE, 4th Edition.

By Her Majesty's  Royal Letters Patent

**RENDEL'S
PATENT
ORCHARD HOUSES
AND FRUIT TREE PROTECTORS.**

The tender and delicate Blossoms of Peaches, Nectarines, Apricots, &c. can be protected by the four following methods:

No. 1.—Rendle's Patent Portable Glass Protector for Walls.

Patent Glass Copings, 18 inches wide, 35; 24 inches wide, 45; 30 inches wide, 55, per running foot.
OR IN THIS WAY,

No. 2. Patent Combined Glass and Network Wall Protector.

This Combined Protector can be supplied at 102, 127, or 145 per foot run.
OR IN THIS WAY,

No. 3.—Rendle's Patent Glass Wall Screen.

These Screens can be supplied at 155, 185, or 205, per running foot, according to the height of the wall or width of the border.
OR IN THIS WAY,

No. 4.—Rendle's Patent Fruit Wall Orchard House.

These Houses, for converting existing Fruit Walls into Orchard Houses, can be supplied at 205, 245, 265, or 305, per running foot, according to the height of the wall or width of the border.

Illustrated CATALOGUES and BOOK of DESIGNS can be obtained from the Patentee and Inventor,

Mr. WILLIAM EDGUMBE RENDEL,

Price 12s. 6d.
R. AND J. BECK, 51, Cornhill, London, E.C.

Rosher's Garden Edging Tiles.

THE above and many other PATTERNS are made in materials of great durability. The plainest sorts are especially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down incur no further labour or expense, as do

"grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheets, of plain or elaborate designs, with prices, sent for selection. **WHITE GLAZED TILES,** for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Staircase Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds, Roofing Tiles in great variety, Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truck Load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post.

FLINTS and BRICK BURRS for Rockeries or Ferpetries. **KEST PEATS or LOAM** supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly attended to by Wharves. A liberal Discount to the Trade.

TRIAL OF HOT-WATER BOILERS.

Winter is the Season to Test the Efficiency of a Hot-Water Apparatus.

At the Pine-Apple Nursery the Hot-Water Apparatus, on the "One Boiler System," is allowed to be the most perfect of any in the World. The Hothouses are equal to 3000 feet in length, and the Winter Garden Conservatory is 100 feet by 100 feet. The Hot Water circulates through 12,700 feet of Cast Iron Pipe.

Gardeners are most respectfully invited to Visit and Inspect the whole.

THE PINE-APPLE NURSERY COMPANY, 33, MAIDA VALE, EDGWARE ROAD, ST. JOHN'S WOOD, W.

KEEP OUT THE FROST.

WILLIAM H. HONEY'S PORTABLE VAPORISING STOVES,

To Burn Kerosene or any mineral oil. They will burn for twenty-four hours at a cost of one penny for three hours. They require no attention beyond replenishing the oil. Suitable for greenhouses, conservatories, halls, beds, rooms, &c. They will not injure the most tender exotics, nor are they in any way injurious to the health. Prices, in stock, 2s.; in copper, 2s. 6d.; Copper, with glass, to give light and heat, 5s. 6d. Either will be sent on receipt of Post-office Order.

To be seen in operation at WILLIAM H. HONEY, 265, REGENT STREET, W. Catalogue free. No agents appointed.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most Simple, Economical, Efficient, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole Makers, F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

This boiler, which has now had a good trial, presents advantages that other boilers do not possess. Instead of a large portion of the heat being absorbed by the brickwork setting, or passing direct up the chimney, before the heated particles emitted from the fuel in process of combustion have properly done their work, as is the case with many other boilers at present in use, this boiler, by its peculiar, yet simple, construction, as well as by a judicious arrangement of flues, obtains the full amount of heat from the fuel before the products of combustion pass into the chimney. Compared with the old Saddle and other boilers, it is computed that it will do nearly twice the amount of work with the same amount of fuel. The cost of setting is less, as is also the space occupied, and the boiler being made in wrought instead of cast iron, thereby avoiding its liability to crack, renders it one of the best boilers yet brought out.

For the rapidly with which heat can be got up in one or any number of houses it is unsurpassed, and the following extracts from Testimonials received from persons accustomed to the use of hot-water apparatus will prove that the expectations raised for this boiler have been fully realised.

J. JONES & SONS beg to state, in conclusion, that they are prepared to send to any part of the country, at a moderate charge, to take particulars and prepare plans and estimates for hot-water work of every description; or they will, on receipt of full particulars by post, send estimates, &c., free of charge.

The Patent "DOUBLE L" SADDLE BOILER is made in sizes to heat from 300 to 10,000 feet of piping, and can only be obtained from the Patentees.

All communications respecting prices of boilers, &c., should be addressed—

J. JONES AND SONS, HOT-WATER ENGINEERS, 6, BANKSIDE, SOUTHWARK, LONDON, S.E.

EXTRACTS FROM A FEW TESTIMONIALS

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

- From Mr. J. ATKIN, *Gardener to W. Stuart, Esq.*, 1873. "Concerning the working of your Patent 'Double L' Saddle Boiler, I have only to say that it gives entire satisfaction, and, although a small one, it heated the 700 feet of 4-inch piping nearly all the winter. I had seldom to use the other Boiler that is attached to the pipes; it also requires a considerable deal less fuel than the old Saddle, which is of some importance at the present price of coal; it also heats much quicker than any Boiler I ever had to superintend."
- From Mr. J. W. ABRARAH, *Gardener to N. M. Forbes, Esq.*, 1871. "TILBURSTOW LODGE, GOOSTONE, December 30, 1871. 'I have proved your 'Double L' Saddle Boiler, and find it everything that could be needed. I am of opinion that the Boiler is able to drive as much more Piping as it is now required to do. It is the kind of Boiler I should recommend to all Gardeners for Forcing Houses, as you can get both a quick heat and a regular heat; in fact, I believe it to be the best Boiler I ever had to superintend.'
- Extract from Second Testimonial from the above. May 29, 1873. "The 'Double L' Saddle Boilers, as well as the apparatus in the Stove House, answer exceedingly well, and give whatever heat I require—from 80° to 90° day or night—with very little trouble or attention."
- From Mr. R. WILLMOTT, *Gardener to C. Dorland, Esq.*, 1873. "THE GARDENS, ALPHEASTON PARK, May 26, 1873. "The 'Double L' Saddle Boiler and Apparatus erected by you has given me great satisfaction, as it does its work quickly and economically, and requires very little attention. I consider it a great improvement on the old Saddle Boiler; in fact, I prefer it to any other boiler we have."
- From Mr. D. ROBERTSON, *Gardener to Rev. Dr. Ainger.* 1871. "BOYNGOOD HOUSE, HEMEL HEMPSTEAD, December 18, 1871. "I have given your 'Double L' Saddle Boiler a fair trial during the severe weather we have had, and am well satisfied as to its being a great deal more economical than the old Saddle, and will do the same amount of work with about half the quantity of fuel."
- From Mr. D. ROBERTSON, *Gardener to Rev. Dr. Ainger.* 1873. "WHITTON TOWER, ROTHBURY, June 3, 1873. "Your 'Double L' Saddle Boiler is giving great satisfaction. We have had a severe winter, the houses are old, and consequently very open, and yet it has kept them at the proper temperature from P.M. to 8 A.M., which would be very hard on any other boiler that I am acquainted with, considering the size."
- From Mr. CHARLES WONG. "NORSEBURY, BALHAM HILL, S.W., May 29, 1873. "Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."
- From Mr. R. THOMPSON, *Gardener to H. Crawshaw, Esq.* 1873. "LANGLAND BAU, near SWANSEA, June 5, 1873. "Your 'Double L' Saddle Boiler I like very much. I have worked it regularly since it was fixed, and I find it to be a very powerful, and, at the same time, an economical Boiler. I am also pleased with the manner in which the pipes are fixed, and their working throughout. The stops could not possibly be better. This I consider a good point, as it enables the person in charge to regulate the heat as he pleases."
- From Mr. T'ANSON, *Gardener to the Rev. G. H. Devonport.* 1873. "FOXLEY, near HEREFORD, June 4, 1873. "I have given your 'Double L' Saddle Boiler a fair trial, and it gives every satisfaction. It is the quickest heating boiler I have had under my charge, and burns the least fuel."
- From Mr. H. BROOKS, *Gardener to J. T. Bell, Esq.* 1873. "THE PARK, MIDDLEBORO', May 28, 1873. "I have given your 'Double L' Saddle Boiler a fair trial, and have found it give every satisfaction. It acts admirably with a small amount of fuel, which is a great point at the present price of fuel. I consider it the best I have used, and the most economical."
- From Mr. J. McCULLUM, *Gardener to J. W. Hallowell, Esq.* 1873. "STRATFORD COURT, SPODD, May 30, 1873. "I have thoroughly tested the efficiency of your Patent 'Double L' Boiler, and I am so satisfied with its heating powers that I can recommend it with confidence. When properly managed I find it one of the most economical Boilers I ever used."
- From Mr. W. BEECH, *Gardener to Sir J. W. Hattopp.* 1873. "KINGWOOD WARREN, ELSOM, May 30, 1873. "The two 'Double L' Saddle Boilers you put in here for the Hot-water Apparatus are working very satisfactorily."
- From Mr. S. PETTIT, *Gardener to F. Satoris, Esq.* 1873. "RUSSHEN HALL, HIGHAM FERRERS, May 29, 1873. "Your 'Double L' Saddle Boiler has had a good trial this last winter, and does its work first-class, with comparatively little fuel, considering the work it has to do."

J. JONES & SONS, HOT WATER ENGINEERS, 6, BANKSIDE, SOUTHWARK, LONDON, S.E.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED.

This Company, having purchased from the Dromore Patent Heating Company Mr. Cowan's valuable Patents for the United Kingdom, is now prepared to undertake the Erection of Apparatus on that System in all parts of the Country.

THE ADVANTAGES OF THE SYSTEM ARE AS FOLLOWS:—

1. In most Cases it SAVES the ENTIRE COST OF FUEL.
2. The Heat is maintained more steadily than by any other System.
3. No Night Attendance is required.
4. There is no Smoke or Unpleasant Smell produced.

THE SUCCESS OF EVERY APPARATUS ERECTED BY THE COMPANY IS GUARANTEED.

Full Particulars of this System, Testimonials, and Opinions of the Press, can be seen in the Company's Illustrated Pamphlet, which can be obtained, post free, on application.

The Company has an Efficient Staff of Engineers, and sends at any time to inspect places where the idea is entertained of Erecting the Apparatus.

The System has lately been adopted at Hazelwood, Herts, the seat of Lord Rokeby; Stackpole Court, the seat of the Earl of Cawdor; Ripley Castle, Yorkshire, the seat of Sir H. D. Ingby, Bart.; Langleybury House, Herts, the seat of Jones Lloyds, Esq.; and at many other places. Also Mr. E. Bennett, of Hatfield, says:—

"I now most cordially beg to congratulate you on the glorious success of your Heating Apparatus (now in use at Hatfield), which is working most satisfactorily, and which has exceeded my expectations. It is a decided success, and more cannot be said in its favour. Should it continue to work in the manner it now does, it will prove a great boon here, and start a new era in the heating of horticultural buildings generally. By your Compensating System we have for every barrow of coals thrown into the kiln some substantial return; by the old system the returns were ashes, and the trouble of clearing them away. I find our chalk is of an inferior quality to some I have seen in the neighbourhood, but we have plenty of heat."

The Company also undertakes the Erection of all other kinds of Heating Apparatus, and of Horticultural Buildings.

PLANS AND ESTIMATES FURNISHED ON APPLICATION.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

Office: 4, LOTHBURY, BANK, LONDON, E.C.

BOULTON & PAUL (LATE W. S. BOULTON & CO.), NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

Improved Steam-power Machinery for working wood enables us to supply first-class Horticultural Buildings of every description at very low prices. Only the best materials used. Houses designed to suit any situation. Estimates given Free. Gentlemen are respectfully invited to have price from us before ordering elsewhere. Ladies or Gentlemen requiring advice as to the Situation, Style, Dimensions, &c., of proposed Horticultural Buildings, waited upon in any part of England, Ireland, or Scotland.

Our NEW ILLUSTRATED CATALOGUE OF HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

BOULTON & PAUL'S PATENT UNIVERSAL PLANT PRESERVERS—GREAT IMPROVEMENTS for 1875.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these to be by far the best and most useful articles of the kind they ever saw, and awarded them the only vote.

Now Ready, our NEW LIST OF PRICES, containing full description and a number of Woodcuts clearly showing the uses to which these handy articles may be applied. Free by Post. PATENT UNIVERSAL PORTABLE PLANT PRESERVERS and GROUND VINERIES.—Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 22 feet by 3 feet wide; thus proving them to be really portable.

PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. Far superior to anything of the kind yet offered.

OPINIONS OF THE PRESS.

GARDENERS' CHRONICLE, February 6, 1873. The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value.

FLORAL WORLD.

The Ground Vinery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co.

MELON OR CUCUMBER FRAMES.

All sizes (glazed with 21-oz.) ready for immediate delivery. Cash Prices, carriage paid to any station in England when orders amount to 60s. and upwards. Height at back, 24 inches; at front, 13 inches; sides, 1 1/2 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as puttied in. Each light is provided with an iron strengthening rod and handle.

Glazed with 21-ounce.

GARDENERS' MAGAZINE, May 25, 1872. Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known.

THE GARDEN.

Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and puttied—an essential point. They are complete and ready for use the moment they are received, &c.

4 feet long by 6 feet wide, 1 light	..	£1 17 6
8 feet long by 6 feet wide, 2 lights	..	3 5 0
12 feet long by 6 feet wide, 3 lights	..	4 17 6

Prospectus.

A MONOGRAPH OF THE GENUS LILIUM.
By HENRY J. ELWES, F.Z.S., F.L.S. Illustrated by
W. HOOD FITCH, Esq., F.L.S.

Lilies, which are among the most beautiful and graceful
plants that adorn our gardens, have for the last few years re-
ceived an unusual though not unmerited share of attention and
admiration from all lovers of flowers in England and on the
Continent. Owing to the exertions of Mr. G. F. Wilson,
F.R.S., Herr Max Leichtlin, of Baden, Baden, and others, many
beautiful species a few years ago quite unknown in
Europe have not only been introduced in a living state, but
have become general favourites. The confusion which so long
prevailed in their nomenclature has now been entirely cleared
up by Mr. Baker, of the Royal Herbarium, Kew, whose clas-
sificatory papers in the *Gardener's Chronicle* and the *Proceedings*
of the *Linnæan Society* have described all the known species,
and shown us what may be scientifically considered as species
and what as varieties. It appears now that the time has
come when a work devoted to the illustration of these general
favourites may be presented to the public without fear of its
being superseded, as many similar Monographs have been, by
fresh investigations.

I should not have ventured to undertake such an important
work had it not been for the unusually favourable circumstances
in which I am placed by the never-to-be-forgotten kindness of
my friends Messrs. Wilson, Leichtlin, and Baker, who have
one and all most liberally placed at my disposal their specimens,
wax, and drawings. A splendid series of oil-paintings in the
possession of Mr. Leichtlin will serve to illustrate those few
species which it is impossible to obtain in a living state.

I have also been fortunate enough to obtain the services of Mr.
Fitch, the well-known and justly celebrated artist of the
"Botanical Magazine," whose talents as an artistic and accurate
delineator of plants are generally acknowledged in England.

I therefore propose to publish a series of folio Plates uniform
with those of Mr. Bateman's "Monograph of Odontoglossum,"
which will be drawn on stone, and engraved by Mr. Fitch, by
hand in the best style, and accompanied by a complete
account of the native countries, culture, varieties, and history
of all known Lilies. These will be issued in Parts containing
eight Plates each, at the rate of One Guinea per Part; but this
cannot be done in a manner worthy of the subject without
the support of a large number of Subscribers.

The work will be completed in six, and completed in six
Parts, which (unless new Lilies are discovered in the meantime)
will, it is thought, be sufficient to include all the species as well
as many of the finest varieties. Each Part will also contain
a large engraving, reproduced from a photograph, of the scenery
of the countries where Lilies are most abundantly found—as
Japan, the Himalayas, and California. Woodcuts and coloured
drawings of the bulbs, seed-pods, &c., will be added; and it
will be my endeavour to omit nothing which can add to the
beauty and value of the work both to botanists, horticulturists,
and the general public.

Specimens of the illustrations and letterpress will be issued
shortly and may be seen at the principal libraries in London
and elsewhere, as well as at the offices of the *Gardener's*
Chronicle, *The Gardener*, the Zoological Society, the Linnæan
Society, and several of the principal nurseries in England and
abroad. They will be sent free of post, or on request, on an
application to H. J. ELWES, 6, Tottenham Street, Hanover
Square, London, W., where they will be published, and
where interesting Subscribers are requested to apply by letter,
giving their full names and addresses.

New Volume Commences in January.

THE FLORIST and POMOLOGIST; a
Historical Magazine of Gardening. Monthly, 1s.; yearly,
12s.; or free by post, 13s. Two finely-coloured Plates are issued
with each Number. Established as the "Florist" in 1848.

The FLORIST and POMOLOGIST is a Popular Monthly
Magazine of Gardening, in all its Departments. It supplies the
class of information required by GARDEN AMATEURS, as well
as by PROFESSIONAL AND COMMERCIAL GARDENERS. It keeps
its readers posted up to the NOVELTIES which may interest
them, and INSTRUCTS them as to the best forms of GARDEN
PRACTICE; and as the LETTERPRESS is contributed by some of
the most distinguished Practical and Scientific Horticulturists
of the day, the sound practical character of the information con-
tained in its pages can be vouchsafed.

The FLORIST and POMOLOGIST is issued on the 1st of
every Month and may be ordered through any Bookseller or
Newsgate, or direct from the Publisher,
MR. EDWARD H. MAV, 177, Fleet Street, London, E.C.

THE NEW METHOD OF GROWING
FRUIT and FLOWERS. By the Rev. J. FOUNTAIN,
Southacre, Brandon, being a practical combination of Viney
Orchard House, and Conservatory, as now worked in a new
house erected for the purpose at Outiswick. Fourth Edition,
illustrated.

Free by post for seven stamps to the *Journal of Horticulture*
Office, 177, Fleet Street, E.C.; or to the Author.

This Month will be Published a New and
greatly Enlarged Edition of

GORDON'S PINETUM:

BEING A

Synopsis of all the Coniferous Plants
at present known,

DESCRIPTIONS, HISTORY,
and SYNONYMS,

AND

Comprising a considerable number of New and
Undescribed Kinds; With elaborate
Indexes of both Scientific and
Popular Names.

In One Volume, 8vo, Cloth, Price 18s.

* * The former Edition, now extremely
scarce, was published at 16s., the Supplement
at 6s., both of which are included in the present
with considerable additions.

Notices.

ENLARGEMENT OF "THE COUNTRY"
—Owing to the rapidly-increasing demands upon the space of
THE COUNTRY, a Journal of Rural Pursuits, the Pro-
prietors have determined to permanently enlarge the paper to
thirty-two pages weekly, without extra charge.

The Journal contains Articles, News, Reports upon
Fishing, Shooting, the Kennel, the Stable, Natural Science,
Travel, Emigration, Farming, Gardening, Cage Birds, Bees,
Poultry, Horses, Rabbits, Cricket, Athletics, Aquatics,
Golf, Tennis, Billiards, and other sports, and illustrations are
frequently given.

The enlargement will take place with the commencement of
the Fourth Volume, on January 7. Subscriptions: Quarterly,

WANTED, a PARTNER, or a FLORIST

NURSERV to be DISPOSED of, containing five new
Houses, heated with Hot-water Pipes and stocked with the
choicest of Florist Plants for Cut Blooms, &c.; Dwelling-house
attached. Nineteen years Lease unexpired. Distance seven
miles from London. For further particulars direct to
W. H. *Gardener's Chronicle* Office, W.C.

Wanted, a Nursery Foreman.

H. CANNELL is open to engage a thorough
practical Man, to Superintend the Formation of an
entirely new Nursery. It is very necessary that he should be of
good address, well acquainted with the Management of Labour,
and able to work up large quantities of Soft-wooded Plants, &c.
To any aspiring young Man determined to persevere, with a
fair amount of education, and possessing a good character, this
is a rare chance, and valuable opportunity to improve his posi-
tion. Liberal salary, with cottage, and every encouragement
given to one really worthy.—Application, in the first instance,
to be made in own handwriting, stating age, reference, and
well experience, &c.—The Nursery, Woolwich, S.E.

Leeds Horticultural Gardens Company, Limited.

WANTED, a practical GARDENER to
take entire Charge of the Grounds, to act as Secretary
and Manager, and generally to carry out the objects of the
Company, as defined in their Articles of Association. Salary to
commence at £100, with house (rent and tax free)—Applica-
tions, with references, to be sent to the Secretary, Leeds Horti-
cultural Gardens Company, Limited, Hyde Park Road,
Leeds, on or before February 5.

WANTED, a well experienced and practical

MAN to take the Charge and Management of an exten-
sive Range of Forcing Houses where Fruit—Grapes principally
—will be grown for Market. Must have a sound, practical
knowledge of his person, of respectability, energy and judgment. Habits of sobriety strictly indispensable.
Salary will progress according to ability. State age, if married,
with particulars and salary required, and testimonials, as to
competency and character. House on the place.—W. H. W.,
Gardener's Chronicle Office, W.C.

WANTED, by a Clergyman, a GARDENER who thoroughly understands his work... small Conservatory andinery. Wages 4s per week. Highest character required.—Apply to Rev. M. A. King's Langley Vicarage, Watford, Herts.

WANTED, a GARDENER, at a Gentleman's Residence (6 miles from London), principally to attend to the Vines, Greenhouse, and Flower Garden... Wages according to qualifications and results; use of a cottage.—Apply, personally, between 10 and 12 o'clock; or send full particulars to CHEMIST, 37, Old Broad Street, E.C.

WANTED, a good WORKING GARDENER to Manage Flower and Kitchen Garden single-handed, or, if desired, with a boy. Apply by letter, with full particulars, to H. F. P., Post Office, Chertsey, Surrey.

WANTED, a SECOND GARDENER, principally to attend to the Houses. He must thoroughly understand Flowers and Conservatory-work, and have filled a similar situation before. Wages 24s.—Apply, personally, before 10 o'clock, or, by letter, to R. B., 42, Lez Terrace, Blackheath, Kent, S.E.

WANTED, as UNDER GARDENER, a good, useful young Man (about 24 years of age), with a wide knowledge of gardening. Wages 14s. to rise to 15s. per week.—Mr. SMITH, The Gardens, Fairfield Court, Heston-on-Thames, Oxon.

WANTED, as UNDER GARDENER, an active, industrious young Man, chiefly for Kitchen and Flower Grounds. Wages 18s. per week.—Apply, with particulars as to references, &c., to J. ANDERSON, The Gardens, Streatham Grove, Norwood, S.E.

WANTED, as GARDENER, and to take Charge of a small Farm (pasture), an industrious, sober, and trustworthy Man. Must be able to milk, and understand cattle. Wages 20s. per week, with house and coals.—G. E. S. Messrs. Francis & Arthur Dickson & Sons, Chester.

WANTED, as FOREMAN, in a Gentleman's Garden, an active, industrious, single Man. He must be a good Plant Grower, and understand Forcing-houses. A JOURNEYMAN is also WANTED.—For terms apply to Mr. AYSON, Oton House, Wotton.

WANTED IMMEDIATELY, a WORKING FOREMAN and PROPAGATOR, married. Must be a good Plantsman and used to Growing Soft-wooded Plants, Mushrooms, and Cucumbers for Market. Liberal wages to a competent Man.—G. STRUTTON, Baker's Farm, Harefield Green, Wiltshire, Wotton.

Foreman of Glass Department. WANTED, a Person well qualified for the above situation; must be a man of first-class character, well up in Plant-growing and Propagation, energetic, and a first-class Salesman. Salary, 30s. per annum.—Apply to Mr. JOHN STAW, 29, Oxford Street, Manchester.

OSBORN and SONS are in WANT of a first-class GENERAL PROPAGATOR and for the services of a thoroughly energetic, capable Man they are prepared to give a liberal salary.—Communications to the first instance must be made by letter addressed to The Nursery, Fulham, S.W.

WANTED, a young Man to take Charge of a Plant Stove and Conservatory, to Superintend Dinner-table and other Plant Decorations, to Make Bouquets, &c. A steady person of good taste indispensable. Also an ASSISTANT.—EDWARD BENNETT, Hatfield House, Herts.

WANTED, a MAN, to Grow Stove and Greenhouse Plants, and Vines in pots.—E. COOLING, Mile Ash Nurseries, Derby.

WANTED, a MAN who can Propagate and Grow Clematis for Exhibition—he would have the charge of a unique collection. The position would be permanent. He would have the honour of bringing out a valuable lot of new ones, and he would be required in about three weeks.—State, at once, wages, age, and references, to CHARLES NOBLE, Bagshot, Surrey.

WANTED, a young MAN, for Garden and Pleasure-ground Work. Wages 16s. per week; to live in both with other young Men.—Apply, stating age and references, to JAMES HATLEY, The Gardens, Wentworth Castle, Ransley, Yorkshire.

WANTED, a steady, trustworthy MAN, experienced in grafting, Budding, Planting, and General Nursery-work. Wages 24s. R. THORNHILL, Bowdon Nurseries, Bowdon, Cheshire.

WANTED, as IMPROVER, in an Establishment where the usual work of a large Garden is carried on, a respectable young Man. A Premium expected.—GARDENER, Mr. Turner, Royal Nurseries, Slough, Bucks.

To Florist's Assistants. WANTED, an active young Man, about eighteen or twenty, who has some knowledge of the business.—Apply by letter, stating age, references, and salary expected, to W. HOOPER, Florist and Seedsman, 83, Oxford Street, W.

WANTED, a CLERK, and to assist in the Seedshop when required.—Address, stating experience and wages expected, to THOS. DAVIES and CO., Waverley Nursery, near Liverpool.

WANTED, as ASSISTANT SHOPMAN, a young Man of strict integrity and perseverance.—Apply, stating age, wages required, and references, to THOMAS PERKINS, 42, Drapery, Northampton.

WANTED, an ASSISTANT SHOPMAN. Good references required.—Address, stating age, abilities, and salary asked, to EDMUND PHILIP DIXON, 37, Queen Street, Hull.

KINAHAN'S L.L. WHISKY. This celebrated most delicious old mellow spirit is the very CRACK of the Whisky Trade, and is of superior quality unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and the Guaranteed Kinahan's L.L. Whisky. Wholesale Depot, 40, Great Titchfield Street, Oxford Street, W.

Grateful-Comforting. E P P S' S C O C O A BREAKFAST. By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which not only saves us from the usual ailments, but by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the *Chief* Review.

Made simply with boiling water or milk. Sold in packets (in tins for abroad) labelled—JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS, 48, Threadneedle Street, and 170, Piccadilly, W.

Works.—Euston Road, and Camden Town, London, N.W. Makers of Epps's Glycerine Jubjubes for Throat Irritation.

GENUINE HOME-GROWN SEEDS,

CARRIAGE FREE.

The best and most distinct Wrinkled Pea is

SUTTONS' GIANT EMERALD MARROW,
Price, 5s. per Quart.

This Pea is far superior to any of the present tall wrinkled varieties, and while under trial its decided superiority has become more manifest. The leaves, stems, pods, and peas, possess the peculiar glaucous green colour of our Emerald Gem, but it is a wrinkled variety, growing to the height of 5 feet, and coming in for use at the end of June and beginning of July. It is more robust in habit than any of the 24 sorts grown in our experimental ground last year. In productiveness it is unequalled. The pods are from 4 to 4½ inches in length, and hang very thickly in pairs; they contain from 8 to 20 fine peas. The flavour is delicious, and the peas come to table with the same beautiful green colour that characterises the entire plant.

From the "GARDENERS' CHRONICLE,"
January 16, 1875.

"NEW VEGETABLES of 1874.—THE GREATEST NOVELTY IN PEAS IS THAT CALLED SUTTONS' GIANT EMERALD MARROW."

The best White Spined Cucumber is

FIRST PRIZE
GRAND INTERNATIONAL
SHOW.
MANCHESTER 1873.

SUTTONS' DUKE of CONNAUGHT.

Awarded First and Second Prizes among 50 entries at the Grand International Exhibition, Manchester, 1873.

Price, 3s. 6d. per Packet.

This is the very best and handsomest white-spined variety in cultivation. It is perfectly level, from 22 to 25 inches in length, very uniform, with a bright green skin well covered with bloom; spine scarcely discernible, and the fruit is very slightly ribbed. It is remarkably productive and of delicious flavour.

From SHIRLEY HUBBER, Esq., *Stoke Newington.*

"Suttons' Duke of Connaught Cucumber is quite tender and deliciously flavoured. For beauty and quality I am quite sure it cannot be surpassed."

CARRIAGE FREE PRICE 5 PER CENT TO ANY DISCOUNT RAILWAY STATION ALLOWED FOR IN ENGLAND. PROMPT PAYMENT.

42/-

This Collection is specially suited to a Gentleman's Garden.

Other Collections, price 105s.,* 63s.,* 31s. 6d.,* 21s.,* 15s., and 12s. 6d. each.

* Carriage Free.

Royal Horticultural Society, 1875.

SIXTEEN GOLD, SILVER, AND BRONZE MEDALS,

AND VALUABLE MONEY PRIZES.

Will be offered by SUTTON AND SONS at the various Meetings of the Royal Horticultural Society during 1875, for the best specimens of new varieties of Vegetables, Flowers, Fruits, and Potatoes, introduced by them in 1875.

Full particulars may be had on application.

The most Practical Work on Gardening yet published is

SUTTONS' AMATEUR'S GUIDE,

Price 1s., Post Free. Gratis to Customers.

Suttons' Amateur's Guide is beautifully illustrated with several Coloured Plates and nearly 300 Engravings.

From the "GARDENERS' CHRONICLE."

"We have received 'Suttons' Spring Catalogue and Amateur's Guide.' This handsome book is illustrated with some beautifully executed plates. The directions for the cultivation of the various seeds are clear and concise, and of great use, both to amateur and professional gardeners. They raise the work above the level of a trade catalogue to that of a work on gardening."

SUTTONS' MINIATURE AMATEUR'S GUIDE,

Price 3d., Post Free.

Suttons' Miniature Amateur's Guide is beautifully Illustrated throughout.

From the "WESTERN MORNING NEWS," January 15, 1875.

"Two or three weeks since I noticed the 'Spring Catalogue and Amateur's Guide'—the King of the Seed Catalogues—issued by Messrs. Sutton & Sons, the Queens Seedsmen, of Reading. There is now lying before me a miniature copy of this work reduced in perfect facsimile by photo-lithography, every line distinctly legible, and a perfect little gem. Messrs. Sutton have thus once more struck out a new line in their extraordinary enterprise."

SUTTON & SONS, The Queen's Seedsmen, READING, BERKS.

As see Copy of Letter by Mr. Betteridge, enclosed with each Packet supplied through

Sutton & Sons

READING,

BERKS.

BETTERIDGE'S NEW VARIETIES.

Duke of Edinburgh, Grand Duchess Marie, Cantab, AND Improved Oxonian.

BETTERIDGE'S INTERNATIONAL PRIZE COLLECTIONS OF ASTERS.

These superb varieties, which were sent out by us last year for the first time, have given great satisfaction, notwithstanding the unfavourable season. Each variety is perfectly symmetrical in form, with a delicately quilled centre, surrounded respectively by crimson, pink, light blue, and dark blue guard petals.

Table listing varieties and prices: Duke of Edinburgh (2/6), Grand Duchess Marie (2/6), Cantab (2/6), Improved Oxonian (1/6).

The Collection of Four Varieties, 8s.

N.B.—Purchasers of the above will obtain every sort sent out by Mr. Betteridge this season. The Collection of 18 varieties is much improved, and includes the new and beautiful crimson with pale guard petals sent out this year for the first time—see Mr. Betteridge's letter.

Please observe our Trade Mark on every Parcel, and Copy of Mr. Betteridge's Letter accompanying the same.

These collections have been specially selected with the greatest care, so as to include as many colours as possible.

FINE VARIETIES, Suitable for Garden Decoration.

Table with 2 columns: Variety Name and Price. Includes 50 beautiful varieties for £5 0 0, 25 for £2 10 0, 12 for £1 5 0, and 6 for £0 6 0.

CHEAPER, but SHOWY VARIETIES.

Table with 2 columns: Variety Name and Price. Includes 25 varieties for £0 17 0 and 12 for £0 9 0.

In addition to these assortments for ordinary uses, we have prepared the following Collections, which include the finest show varieties only:—

SUTTONS' CHOICE EXHIBITION VARIETIES.

Table with 2 columns: Variety Name and Price. Includes 25 splendid varieties for £2 0 0, 12 for £1 0 0, and 6 for £0 10 0.

FINE MIXED SEEDLINGS.

Table with 2 columns: Variety Name and Price. Includes Finest Mixed, per doz. 15s. 6d.; Fine Mixed French Seedlings, per doz. 10s. 6d.; and Good Mixed, per dozen, 2s. 6d. per 100 12 6.

SUTTON & SONS, THE QUEEN'S SEEDSMEN, READING.

SUTTONS' CHOICE SEED POTATOS

For Planting.

SUTTONS' DESCRIPTIVE LIST

Is now ready, and may be had Gratis and Post Free.

N.B.—Potatos as well as Seeds Carriage Free. SUTTON & SONS, THE QUEEN'S SEEDSMEN, READING.

New and Genuine Seeds (Carriage Free).

B. S. WILLIAMS, Nurseryman and Seed Merchant, VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

Complete Collections of Kitchen Garden Seeds, to suit Gardens of various sizes, 21s., 42s., 63s., and 84s. each.

Table listing various seeds and their prices, including Broad Bean, Broccoli, Cauliflower, Celery, Cucumbers, and Peas.

NEW AND CHOICE VEGETABLE SEEDS.

Table listing new vegetable seeds and their prices, including Alonsoa Linifolia, Amaranthus, Auricula, Balsam, Blumenthal Coronata, Cyclamen, Cineraria, Cockscorn, Gloxinia, Myosotis Alpestris, Petunia, Pentstemon, Polyanthus, Phlox Drummondii, Primula, Ricinus Gibsonii, Stock, Verbena, and Viola Cornuta.

VICTORIA AND PARADISE NURSERIES, Upper Holloway, London, N.

HOLLIES.

ANTHONY WATERER respectfully invites the attention of Holly buyers to the very fine Stock to be seen growing at Knapp Hill Nursery, near Windsor. The plants are from 3 to 10 and 12 feet high, of the finer Gold, Silver, and Green-leaved kinds, affording a choice in size and variety such as can be procured nowhere else in Europe. Every Plant has been recently measured, and is guaranteed.

The Stock of Common Green Hollies above occupies 5 acres of land, and Purchasers will find there in large numbers all its heights up to 15 feet. Knapp Hill Nursery, Woking, Surrey.

CHARLES NOBLE begs to remind all engaged in Planting that in clearing a large portion of his Nursery Grounds he is offering, at very reduced prices, an immense stock; amongst other things the following may be worth notice:—

Table listing various plants and their prices, including Spirea palmata, Rhododendrons hybrid named with buds, Californian with buds, hybrid seedling with buds, Anemone Berlandia flowering, Kalmia latifolia bushy, Skimnia japonica bushy, Picea Nordmanniana, Arbor-vite, Cupressus Lawsoniana, Fir, Spruce, Berberis Darwini, Mahonia Aquifolia, Roses, dwarf hybrid perpetual, best known varieties, climbing, best known varieties, Elm, English and American, 6 to 20 feet, Oak, English and Turkey, 6 to 8 feet. Special quotations for small or large quantities on application.

CLEMATIS, all the best known kinds. A few thousand QUINCE STOCKS at 6s. per 1000. CHARLES NOBLE, Bagshot, Surrey.

IMPORTANT ANNOUNCEMENT.

The date or locality not having been fixed for the Provincial Show this season,

JAMES CARTER & CO.

Have the pleasure to announce, in reply to repeated enquiries, that

BY SPECIAL PERMISSION OF THE

Council of the Royal Horticultural Society,

THE COMPETITION FOR

THE CARTER CUP,

VALUE FIFTY GUINEAS,

TOGETHER WITH

THIRTY POUNDS IN MONEY PRIZES, FOR VEGETABLES,

WILL TAKE PLACE AT

SOUTH KENSINGTON, on WEDNESDAY,

July 7, 1875.

SCHEDULE OF PRIZES AND CONDITIONS.

FIRST PRIZE—The "CARTER CUP" Value FIFTY GUINEAS, to become the absolute property of the Employer, to whom the Prize may be awarded, also Ten Guineas for the Gardener.

SECOND PRIZE—Seven Guineas.

THIRD PRIZE—Five Guineas.

FOURTH PRIZE—Three Guineas.

FOR THE

Best Collection of Vegetables, 24 Dishes,

TO INCLUDE

- 1/2 peck Carter's Early Premium Gem Pea.
- 1/2 " James' Prolific Pea.
- 1/2 " G. F. Wilson Pea.
- 1/2 " Hardy's Pedigree Windsor Bean.
- 1/2 " Carter's White Advance French Bean.
- 1/2 " Carter's Champion Runner Bean.
- 1/2 " Blue Peter Pea.
- 1/2 " Carter's Commander-in-Chief Pea.
- 1/2 " Carter's New Mammoth Long Pod Bean.
- 1/2 " Carter's New Fern-leaved Parsley, and Little Heath Melon.

ALSO

FIRST PRIZE—Two Guineas. Second Prize—One Guinea, For 6 Dishes of Peas

(1/2 peck of each variety), to include—

Carter's G. F. Wilson, James' Prolific Marrow, Carter's Hundred-fold or Cook's Favourite, Carter's Commander-in-Chief.

For particulars see "Schedule of the Royal Horticultural Society," or apply to

Carters

THE ROYAL SEEDSMEN,

237 and 238, HIGH HOLBORN, LONDON, W.C.

SATURDAY, JANUARY 30, 1875.

A HOLIDAY IN NORWAY.

(Continued from p. 74.)

IN the descent from the fjelds, the roads generally pass a succession of lakes, and run by the side of rivers that sweep grandly along, becoming torrents when the valleys narrow, and dashing down over broken rocks, when such impediments intervene, forming cascades of great beauty. The rush and roar of these tumultuous waters scarcely leave the ears of the traveller for days together. Going from Nysten to the next station, Skogstad, on the southern descent from the Fille Fjeld, the scenery is superbly grand; majestic rocks rise on each side of the road, many of them torn and rent, and showing in their dislocated and precipitous heights that the forces Time brings to bear on the hardest rock are mightier than even the strength of hills of gneiss or granite. One very striking and picturesque waterfall occurs between the two stations; it is not remarkable for its height or the volume of water it precipitates, but it presents a series of broken and tumultuous falls that are more pleasing to the eye than others of more Niagara proportions. Seen from one part of the road a black mass of rock forms a background, that throws out the broken masses of stone amidst its sparkling waters most effectively.

Advancing southward the country becomes more thickly wooded, the hill-sides being covered with Firs. There is an extensive natural forest of Spruce approaching Vongs from the north; the finest specimens are on the lower sweeps of the mountains, and where there are accumulations of detrital matter. The trees here are a naked and drawn-up appearance, the branches are shorter and more rigid, and the branchlets have not that graceful pendulous sweep that characterises the growth of the same tree in English woods. Many trees were thickly hung with cones, but the starved and stunted specimens were generally the most prolific cone bearers.

Approaching Vongs the road is carried along the shores of a large lake. The enormous masses of rock that cover a considerable space of ground between the mountain heights to the right, and the lake through which the road has been made, seem to indicate, by their dislocation and extensive distribution, a more sudden and violent disturbing cause than atmospheric action. They form a feature of great interest and beauty associated with the lake; delicate Ferns grow amongst them, choosing the moist and shady spots. Saxifraga oppositifolia occurs in great abundance, growing in the shale and on the rocky ledges. The spot altogether seemed a most promising one for the botanical explorer.

Several valleys converge in the large, open, cultivated space in which the scattered hamlets of Vongs and Tune are situated, the lake occupying the lower portion of the valley. The very small stockingless lad who was my skydsgut from the last station, left me at the parsonage to return to his home. The wind was cuttingly cold, and I could not but think that it was hard for both boy and horses—the former to face the long, dark, difficult road alone, ill clad and probably hungry; the poor little fellow clutched my hand gratefully when I gave him, in addition to his fee of six skillings, a little cake of chocolate.

Installed in the guest chamber of Vongs Prestigard, and privileged to enjoy the society

and hospitality of the excellent rector of the place, the Rev. Otto Konow—whose perfect English made one forget his nationality, when not recalled to it by his truly Norwegian observance of the laws in force amongst a noble people, that make a stranger guest the honoured person of the house—I enjoyed many opportunities of obtaining glimpses of the domestic life of the people, which as a mere passing tourist I could not otherwise have possessed.

The wind, passing over the great fields of snow to the north of this place and rushing down the valley over its very cold waters, is of a peculiarly penetrating character, and a plaid, my constant companion, was an insufficient covering. A fall of snow took place one night during my stay, a warning of the gradual and near approach of the long, dreary winter. Much chilled in the day by the keen mountain air, I was glad, to go for warmth into the priest's kitchen, and while there I saw preparations going on for the farm-servants' supper. A large saucapan, partly filled with water, simmered on the fire, into this a buxom maiden ladled barley meal, vigorously stirring the mess after each addition; when sufficiently thickened it was carried to the table, and each person, with a wooden bowl of sour milk before him, helps himself, dipping each spoonful into the bowl of milk before carrying it to his mouth. This is the favourite food of the people—they prefer barley meal, for its staying and satisfying qualities.

Asking for the localities most likely to afford rare plants, I was directed to the Syndes Fjeld, and on the morning following my arrival at Vongs, mounted on a fine old mare, I started on an excursion to a mountain within this district, called Helestrandberg. The first part of the way led up the hill south of the place. The track was rugged and abrupt, and through an extended thicket of Alder, Birch, and dwarf Willow; portions of this belong to different farms. The boughs, of Birch principally, are cut and thrown into the yards in the winter, and with the sweepings of the stable, form the sole food of the store cattle. Several streams had to be crossed, but the mare picked her way warily, feeling for secure stones on which she might place her feet, and landing me always in safety. Her foal, which accompanied us the whole way, trotted along, sometimes before, sometimes behind, occasionally scrambling into the wood, always having to pick its way amongst stones. Such a training, begun so young, tends to make the Norwegian horses what they are—unrivalled for rough mountain roads. The frequent passage of horses along this track had worn away the soil, and the great stones which everywhere encumbered the ground made constant watchfulness necessary on the part of the faithful beast I rode. Most of the masses of rock stood from 1 to 2 feet above the ground, and the passage through them was often narrow, and the way wound round about to avoid blocks of unusual size. A few flat boggy spots occurred, and through these the mare floundered uneasily. Crossing the summit of the mountain the descent was still amongst stones, and most perilous. Presently we came to an open space of grass and amongst haymakers. The road then led along the steep side of a hill that rose from a calm, clear, mountain lake. Sometimes the path narrowed to a sheep track, and touched the verge of declivities where a single false step would have been certain destruction. Open spaces of grass occur all along this mountain side, near which are sheds or *seitirs*, in which hay is stored and the dairy people lodge.

Our destination gained—the mare hobbled with twisted Birch, which is used everywhere instead of rope—the foal fraternising with another of the same age—I started with a boy to guide me in my quest for plants. The mountain side, up which we commenced the ascent, was

steep, some portions loose shale, others covered with a compact growth of Juniper, which here is flat and smooth, as if pressure by a weight of snow had given it the form it grows in. Little streamlets in several places trickled down the channels the water had worn in the hard shaly rock, and then in drier places large areas appeared covered with Bilberries, Vaccinium Myrtillus, so evenly that we could glide down over the thickly grown masses: the refreshing berries could be gathered by handfuls, and very pleasant it was to sit surrounded by grand mountain scenery in this rarely trodden spot, and feast on fruits that ever-provident Nature has given in such profusion even to such wilds. We were able also to add the fruit of *Rubus Chamemorus* and that of the wild Strawberries to our dessert. When the rock crapped out, forming little cliffs, I found *Saxifraga Coteydon*; in moist spots *Sedum purpureum*; amongst broken rocks *Saxifraga oppositifolia* occurred abundantly. On various parts of the mountain slope I collected specimens of *Astragalus alpinus*, *Papaver nudicaule*, *Gentiana purpurea* and *campestris*, *Trifolium procumbens*, *Viola biflora*, *Arabis petraea*, and several *Drabas* and *Arenarias*. *Alchemilla alpina* and *vulgaris* fringed the little streamlet, and the graceful *Equisetum* clustered in damp spots; masses of *Euphrasia* appeared again and again, and the graceful *Harebell*, so large and striking as to invite frequent notice. In peaty spots *Empetrum nigrum* and *Calluna vulgaris* gave variety to this beautiful garden of Nature, and various handsome dwarf *Salices* afforded a little cover, from which the fieldfare flew noisily as we invaded its haunt.

The fieldfare seems pretty generally distributed over Norway, certainly no bird is more commonly met with; and its cry recalls English scenes and early winter, of which these migrating birds are the harbingers to us: the first heavy fall of snow depriving them of the berries they subsist upon on their native hills they take their flight across the North Sea, and on their arrival clear our Hollies, Hawthorns, and hedges of berries. Securing the mark I started on my homeward journey, not caring to be benighted on the mountain tract, the difficulties of which seemed sufficiently perplexing in daylight. I was glad again to reach the Rectory, and to please the rector by assuring him that my excursion had been eminently satisfactory. Corn mills enclosed in small square wooden sheds are frequently seen, one succeeding another, by the side of mountain streams; these little mills, so primitive in construction, and pertaining to each household, really seem to be the next step from the quern hand mill of our forefathers. A scattered population without the advantage of roads may find it convenient, with water-power so closely at hand, to possess separate mills for each farm or household, and it is in accordance with the principles of independence and self-helpfulness that this system is pursued, but in a village or scattered hamlet, one good mill, under the supervision of a professed miller, would do the work better, and would be a great saving of time and material.

The independence of action and position enjoyed by the peasant proprietors is still further confirmed in them by the possession of home resources, which, developed by their own industry and skill, render them as little dependent on the outer world for the necessaries and even luxuries of life as any men living in a civilised or uncivilised country can be. The food they require is produced on their farms, in the shape of beef, mutton, bacon, with milk, cheese, and butter. Barley, Rye, and Oats afford them meal. The wool of their sheep is spun and woven by themselves into a coarse but serviceable cloth, the dyer alone being called in to give the tint of colour required. The skins of their slaughtered animals are variously em-

ployed: those of the sheep form the covering for their beds, and of the calves and oxen are converted into leather for boots, in the making of which many are expert. Flax is grown on some farms, and affords the material for linen. Hops are cultivated, and used in making their beer. Fish they can often catch, or buy at a cheap rate; game they can shoot. The Potato, which is very generally grown, affords them, by distillation, a raw, coarse spirit. They shoe their own horses, and in this they have much to learn. Wood is at hand, and adapted for furniture, which they make during the long months of winter, so that the world may fight, commerce be prostrated in luxurious capitals, navies abolished—the Norwegian bondar can still afford to be indifferent. The seasons each in turn give him work and give him food, and he is blessed with health, strength, and content, and a love of Gamle Norge.

There is one drawback to this picture. The possession of all these advantages, while it encourages independence, tends, I fear, to narrow the sympathies, and isolate men from that community of interest and feeling which is beginning to draw together in amicable relations the widely-scattered nations of the world. Those farmers who have a majority in the Legislative Assembly represent the non-progressive or obstructive element in the national councils, and they are impatient of any measures that tend to alter a state of things they find sufficiently satisfactory. Great and enlightened measures, that embrace the whole community in prospective benefits, often fail to meet with the support that men more highly educated would more readily appreciate and sanction.

William Ingram, Belvoir.

(To be continued.)

New Garden Plants.

STAPELIA (TRIDENTEA?) OLIVACEA, n. sp.* Fig. 24.

The plant here described and figured, like nearly all its congeners, is a native of the Cape of Good Hope, whence it was sent to Kew and to myself in April, 1874, by Dr. J. Shaw. It flowered at Kew in September last, and seems to be identical with a plant known to Stapelia cultivators by the garden name of *S. eruciformis*, but which has not hitherto been described. It differs from all the other described Stapelias in its slender, almost entire-ribbed (*i.e.*, neither toothed nor tubercled) smooth looking stems and olive-brown flowers. The following is a description of the plant.

Stems erect, branching at the base, minutely puberulous, 3–5 inches high, $\frac{3}{8}$ –1 inch thick, tetragonal, angles obtusely rounded, with an impressed transverse line at the base of the minute erect adpressed puberulous teeth, greyish green, the impressed lines and the spaces between the angles darker; when fully exposed to the sun and allowed plenty of air the plant becomes blotched with rich purple. Flowers in pairs, from the base of the younger branches. Peduncles short, 2–3 lines long, puberulous, green; calyx 5-partite, puberulous, lobes 2–2½ lines long, subulate. Corolla rotate, very fertile, about 1½ inch in diameter, deeply 5-lobed, without the lobes of the great width, rigid, rugose, deeply and closely rugose, dark olive-green, the rugosities brown; lobes ovate acute recurved, 5-nerved, fringed with white hairs. Ligule somewhat spreading, narrow, deltoid, subulate, 1½ lines long, dark purple-brown, with a smooth polished central stripe extending from the base to the middle. Alae and rostra dark purple-brown, the former falcate-subulate erect, 1½ lines long, the latter acute erect, 2½ lines long. *N. E. Brown, Herbarium, Kew.*

MASDEVALLIA MELANOPUS, *Rchb. f.*

This little gem has just flowered at Donau-scheing in the garden of the Prince Carl Ego von Fürstenberg, under the excellent management of

* *Stapelia olivacea*, *N. E. Br.* Ramis erectis gracilibus, minute puberulis, 3–5 poll. longis, cinereo-virentibus purpureo-maculatis, tetragonis, angulis obtusis sub-integer, ad denturam insertionis lineolis transversis impressis notatis, dentibus minutis erectis appressis; pedunculis ex parte inferiore ramorum juniorum, binatis 2–3 lin. longis, puberulis, viridibus; calycis puberuli segmentis subulatis 2–2½ lin. longis; corolla fatis diametra 1½ poll., profunde quinqueida, aetis sordide viridi puberula; intus glabra, rugosissima, tenebrosa olivaceo-brunnea; lobis ovatis acutis recurvis, 5-nerviis, albo-clavatis ligulis subulatis acutis purpureo-brunneis cum zona verticali centrali pallida; alis falcato-subulatis acutis erectis 1½ lin. longis; rostris acutis; aetis subulatis 2½ lin. longis, omnibus purpureo-brunneis.

Herr Hofgärtner Kirchhoff. The tails of sepals are yellow, the sepals white with purplish dots, in the way of those of *M. polysticta*. The lip has three longitudinal keels, and is far more blunt than it appeared to be in the dry specimens. *H. G. Rchb. f.*

BRASSIA BRACHYPUS.*

A very interesting novelty, introduced by Messrs. Backhouse from Ecuador. It is in the way of *Brassia glauca*, but is very distinct both in the lip and the very short ovary. The flowers are yellowish, with brown spots. The lip is whitish, with brownish cinnamon bars and blotches, and the callus is yellow. *H. G. Rchb. f.*

ECHITES PELTATA.

In the last part published of the *Adansonia* Mr. Saldanha furnishes some notes on the useful plants of Brazil, among others *Echites peltata*. This plant, according to his account, possesses medicinal properties of a very powerful and extraordinary nature, and is in great repute with the inhabitants of the province of St. Paul. It belongs to the Apocynae, and abounds in tannic acid, which renders it exceedingly astringent. An infusion of the leaves, or even the whole plant, is employed to reduce swellings in different parts of the human body, but more particularly in cases of excessive enlargement of the testicular glands. Its action is said to be so powerful that it occasionally causes these organs to disappear altogether. This singular property being so rare, Mr. Saldanha thinks it his duty to call the attention of botanists to it; and this interesting fact, he says, explains the origin of the common name by which it is known in St. Paul, where it is called *Cipo capador*—literally, emulsating climber. Though the writer of the notes in question does not appear to have been aware of it, this plant is not unknown in our gardens; but we have not succeeded in finding any allusion to its medicinal properties, either in books or on the labels accompanying the dried specimens in the herbarium at Kew. Mr. Bentham refers it to *Mandevilla*, and in habit and the form of the flowers it resembles the more familiar *M. suaveolens*, but the nearly orbicular, unilaterally peltate leaves are from 4 to 6 inches in diameter, and the flowers are yellow. It was figured in 1843, in the *Flore des Serres*, vol. iv., plate 390; and there is a specimen at Kew from Gay's herbarium, labelled "*Jardin des Plantes, serres chaudes, Paris, 1854*."

A very slender climbing plant, bearing a name still in vogue in our gardens, grows in the Pijama Mountains, near Rio de Janeiro, and possesses similar properties, as Mr. Saldanha has himself been able to verify. This is a species of *Eupatorium*, closely allied to, if not actually the same as, *E. ayapana*, says Mr. Saldanha; but in this he is doubtless mistaken, for Mr. Baker, who is elaborating the Composite for the *Flora Brasiliensis*, has seen no specimen of this species from the region in question, and there are no new specimens of it in the herbarium at Kew. The only habit known is on the Rio Negro, one of the tributaries of the Amazon. The history of the true *E. ayapana* is rather interesting, and we will briefly relate it here. It was introduced by the French into the Island of Mauritius as long ago as 1797, on account of the high repute of its medicinal properties. The only specimen in the herbarium at Kew is from Bojer's Mauritius collection, but there is an original letter from Puerari of Copenhagen to Gouan of Montpellier respecting this plant, a few of the leaves of which were sent with the letter, but do not appear to have been preserved. In this letter Puerari says he has identified *E. ayapana* with *E. triplinerve*, and he was quite correct. Puerari's letter is without date, but it was in cultivation in Europe at the beginning of the present century. Ventenat, in his illustrated work entitled *Jardin de la Malmaison*, 1803, gives a good figure of it, and a full account of its virtues. The leaves of the right bank of the Amazon, he says, have long regarded it as an excellent sudorific and a powerful alexipharmic, and Mr. Albert made some experiments with it and found it highly antiscorbutic. Respecting its powers as an antidote in cases of bites of venomous reptiles, we are told by Descourtilz, in his *Flore Pittoresque et Medicale des Antilles*, vol. iii., plate 203, that, although its powers had been greatly exaggerated, it was really an efficacious remedy. He says that the fresh juice, applied in cases of bites of venomous animals shortly

* *Brassia brachypus*, *Rchb. f.* Pseudobulbis oblongis angustibus parvis; foliis oblongo-lanceolatis basi acutis; pedunculo cuneo-dentato; floribus bracteis ligulatis acutis spatulatis ovatis pedicellatis ovario superantibus; ovario loculo; sepalis ligulato-caudatis; tepalibus falcato-caudatis brevioribus; labello ovali lobulato apice aristato; callis concoloris clavatis geminis basi versus discum pilosum, callo parvo conico exserto utriusque aetis juxta apicem calli.

after the accident, effects a rapid cure, putting an end to all alarming symptoms at once. But, unfortunately, none of these vaunted remedies have hitherto borne the test of thorough investigation. As a sudorific and antiscorbutic it was formerly in great request in Mauritius, but whether still used there medicinally we have not been able to ascertain. *W. B. H.*

AT GHENT.

(Concluded from p. 175, ii., 1874.)

On the outskirts of the town a long, straight, deep-cut canal is bordered with straight roads and rows of trees. The length and breadth of the whole are considerable, and it is called by courtesy the Allée Verte—the Green Alley—although, of all the tints of the rainbow, green is often the least prevalent. Each road, on the side furthest from the canal, is bounded by lines of houses, by public buildings and private dwellings, some of pretensions, some of modest proportions, but all, or nearly so, encased in the prevalent coat of white paint. Along the line most distant from the town more than one horticultural establish-

after and so highly prized by great people for their great places throughout the eastern half of Europe. Whether round-headed or pyramidal (*en couronne* or *en pyramides*), they are not formed without long time and untiring care. "How old may that Laurier tree be?" we inquired. "Really I cannot tell you," was the reply. "Perhaps it is as old as you are." "Certainly older; my father began to train it before I was born." We cannot, therefore, wonder if prices, even at first hand, range high. At the end of a long railway journey, with packing and other incidental expenses, and land carriage, perhaps, at the end of that, such standards necessarily become expensive ornaments, only to be indulged in by the rich, especially as they require roomy house accommodation to protect them from the frost of those regions during winter.

De Coninck's establishment professes to have always in hand—and is sure to be able to hunt up and supply any forms and sizes it may not have in hand—a rich collection of Bays (*Laurus nobilis*), grown with heads and as pyramids. Details are communicated to inquiring customers. Handsome specimens may be had from 40 to 300 francs the couple. A nice pair of

with great interest. If by any possibility the old historical Orange and Pomegranate trees which decorated in summer the Tuilleries Garden were put up for sale by public auction, who can guess what prices they would fetch? Certainly something more than an inconsiderable trifle.

It is useless to criticise taste, when it is supported by long-established fashion. Demand will create supply, which people who have their living to gain by trade furnish, as a matter of course. The love of standard evergreens in boxes is extending, amongst the same class of customers, to other things besides Bays and Laurustinus, and now calls for standard Rhododendrons. To meet this, and gratify his Russian and German friends, M. de Coninck makes Rhododendrons *sur tige* by grafting choice varieties on clean straight stems of *R. ponticum*, 3 or 4 feet high, which form exceedingly florid heads, that are kept in symmetry and shape by being stretched on frames, or merely attached to rings of wire. These plants are found to flower better than dwarfs; they are less liable to injury by frost, and cleaner, being out of the reach of bespatterings of dirt from heavy rains. Again, the Ghent nurseryman furnishes the young subject; time, and the gardener's care must do the rest. But we can imagine the beauty of a terrace, of a long line of old, thick-stemmed, large-headed, many-lined Rhododendrons in full bloom, alternating with or faced by well-grown respectable-sized Myrtles, Laurustinus, or Bays.

Of course at De Coninck's there are houses, full to overflowing. Room is made for a few illustrative plants in the most advanced stage of growth, kept at home in the order of the general commercial turn-out, the exodus of emigrants into foreign lands and gardens, to show what the youngsters will be like when they come of age. Besides, it would be hard indeed if a nurseryman could not keep a few favourites for his own pleasure and satisfaction. There are a Tree Fern or two, a variegated *Phormium tenax* or two from 50 to 100 francs apiece (more than they are worth, as far as beauty is concerned), *Magnolia purpurea*, var. *Lemoé*; but the majority are small things, vegetable babes just beginning to feed themselves and go alone. Here is a lot of weaned *Draecena congesta* stuck upright on shelves (to save space) so immediately one above the other that they are more like a book-case than a stage for plants to stand on. Then we slip into a warmer nook, where *Draecena terminalis vesiculosa* is bred by dozens and scores. The Egyptians hatched chickens in ovens—the Ghentese propagate plants in stoves. Thus whole shelves are edged with very presentable seedlings or sportlings of *Blechnum brasiliense* in little pots plunged in the fibrous material with which those shelves are covered. "What is the price of those?" we ask. "Twenty-five centimes each." "Twenty-five centimes!" Who could resist the opportunity of treating oneself to a couple of these Ferns at 2s. a piece? I could not. But other pretty small things are not wanting, such as *Anthurium Schzerianum*, an Aroid with a bright red spathe, and many others whose beauties are still only possible and potential. Out-of-doors the nursery grounds contain useful stock—*Erythrina* two years old, *Roses*, and a multitude of hardy plants, which M. de Coninck enumerates in a catalogue—French, with a few explanations in English.

The name of M. Emile de Coninck, the son, is honourably connected with a literary enterprise—the *Journal d'Horticulture Pratique, publié par la jeunesse horticole*, which, as long as it existed, may be pronounced a success, even if not commercially remunerative. It was a creditable endeavour, on the part of the young Ghent gardeners, to ventilate questions and communicate information connected with their profession, something after the manner of the Home Correspondence of this Journal. I find in it a pretty popular synonymy, though a little too long for our forget-me-nots, namely, "going South," to see you the more I love you. Towards the close of its career it changed from a quarto to an octavo or pamphlet form, and offered to subscribers for a year the privilege of two advertisements gratis of ten lines each. But the world is wide, Ghent is limited, if not small, and the horticultural youth had to leave their homes to seek their fortune or complete their education. One after the other the contributors were dispersed—some in one hemisphere and some in another, but almost all, like Scotchmen, "going South," to brighter regions, whither unknown flowers and ferns, future ornaments of our plant-houses, invited them. Contributors, however willing, cannot conveniently post "copy" from Amazonian forests or Himalayan hillsides, and so M. de Coninck, left alone to bear both the editorship and the authorship, was obliged to let the journal drop, his time being fully occupied by horticulture in its various branches.

A sight to see, of quite different interest to the establishments where plants are on sale, is the garden of the Baroness, the Comtesse de K... and especially his winter garden—a vast glass structure, mainly filled with admirable specimens of Palms and Tree Ferns. Here is *Phoenix recinata aurea*, which the gardener boasts to be worth 500 francs, or

FIG. 24.—STAPELIA OLIVACEA.

ment is to be found. We enter that of M. Frédéric de Coninck, Allée Verte, No. 222, and find the same practical mode of doing business, although on a larger scale than the compressed and narrow nurseries of the really small growers, and the same willing and unceremonious reception. At the season for lifting and transplanting stock, housing pot plants, and sending off orders, a commercial garden cannot be very trim; but we suspect that in this, as in the other Ghent establishments, the grand object is utility rather than show—multiplication and growth instead of display. The propagator's business is necessarily confined to the raising, rearing, and disposing of as many promising young subjects as he can. The horticulturist proper, who receives them, has then to take up and continue the task, and, if he fulfils his office efficiently, it is he who reaps the fruit, in the shape of exhibition prizes, friends' admiration, and private personal enjoyment. Ghent gardeners are like the rearers of animal live stock; they bring their produce up to a certain point, and then, in most instances, hand over what they have raised to others to fatten, finish off, and bring to its full completeness.

In most instances, not in all; in some cases they are obliged to do it themselves through long years of untiring patience—witness the standard Bay and Laurustinus trees already mentioned, so much sought

Laurustinus, with good heads, ranges from 40 to 75 francs. But these works of art and objects of connoisseurship (exactly like pictures, statuary, and gems), bear completely fancy prices, dependent on the peculiar merits of each individual specimen. Some few are perfect; many are deteriorated by flaws and faulty weak places. In accordance with the trite expression, they must be seen to be appreciated in respect to their money value. Not a few old specimen evergreens in boxes have a history of their own, which would stand them in good stead at a sale, not to mention the circumstance of unusual age. The Ghent Botanical Garden some years ago possessed (certain of them may be still surviving) a number of very old trained small-leaved Myrtles, which were really old lumber and an incumbrance there. They would readily have fetched money if offered for sale, and have been snapped up by the lovers (or the furnishers and providers of the lovers) of standard Bays and such like. But the statutes or constitution of the garden absolutely forbade their being sold. So they were stuck about, poor aged things, anywhere and anyhow, to pine away neglected in their helpless decrepitude—the Director preferring their room to their company, their place being wanted for things more serviceable in botanical instruction. And yet the age and singularity of those Myrtles invested them

£200; *Alsophila elegantissima*, truly most elegant; *A. excelsa*, looking quite at home, on account of the little seedling Ferns growing on its stem. *Abutilon marmoratum* gives variety. Amongst smaller things a tuft of *Adiantum cucumatum*, the pride of the garden, growing in a pot or tub, measures not less than 5 or 6 feet in diameter. But this gardener has set his heart on his work and on his employer's horticultural reputation. His French vocabulary is somewhat limited, but he is well up in the botanical names of all his charges. It is delightful to note how he lays stress on and shows off all the fine points of a plant, raising it in his arms, when not too heavy to be lifted, turning it in all directions in every favourable light, and evidently loving and admiring it himself, at least as much as any of his visitors possibly can.

A *Todea superba*, bearing eighty-five fronds (fronds green were mourning, what is a fine bunch of hearse-plumes this would make!), is taken out of the atmospheric vapour-bath contained in its case, set on the ground to be approvingly inspected, raised aloft, made to revolve slowly on its axis, and then carefully restored to its case again, to join its companion, *Todea Wilkesiana*. It is a pleasure to be shown things so sincere and unfeigned. But to the Count himself the thanks of strangers are due for the liberal permission to visit his garden on no harder condition than signing an album.

The winter garden is a costly structure (164 feet long, 65 broad, and 46 high, in round numbers), and expense is not spared in procuring valuable novelties. Its entrance (when you are once inside the glass) is original, simulating the mouth of a natural grotto, on each side of which are stairs of rough stone conducting to a picturesque look-out above, the whole now draped with Ferns and drooping plants, and improved by time and the loss of its newly-constructed raiment. This is only the portal or introduction to a tropical grove containing winding walks and pools of water. A spiral staircase leads to a gallery encircling the whole, from which you look down upon a striking mass of exotic vegetation.

Besides this, there are smaller structures for small things, pleasant to behold, such as *Amaryllis crispis*, with its pretty pink flowers, and *Adiantum radiata*, a singular Fern, which seedlings have been obtained. There is what is called an infirmary for sick Palm trees, in which the patients seem to us in quite a consoling state of health. Glass walls show that fruit is not disregarded, and a bed of Lily of the Valley in the kitchen garden indicates that sweets are mixed up with usefuls. *E. S. D.* [We hope shortly to publish some illustrations with a full description of this noble winter garden, which has been more than once incidentally mentioned in our columns, but which amply merits the more detailed description we shall shortly give. EDS.]

TRANSMITTING FERNS.

At a recent meeting of the Agri-Horticultural Society of Madras, Captain Henderson communicated the following account of his method of transmitting Ferns from India to England:—

The most natural, reliable and successful of all modes is probably the Wardian case, with which we are all familiar; but the expense is so great as to deter all but the very wealthy from resorting to it, to say nothing of the risk and trouble entailed upon sending a large case of plants through the Suez Canal. Another mode which has been recommended, and in some cases tried with success, is that of selecting tolerably young hardy roots, then partially drying them, and sending them home packed in dry moss or cocoa-nut fibre. On reaching England they are (speaking generally) subjected for a short time to a high degree of temperature, with subdued light and copious moisture, with the result of resuscitating a large number of them. This plan I have more than once adopted, but the measure of success has not been such as to satisfy me, for though a certain number of the harder kinds, with vigorous succulent root-stocks, usually survived the journey and made handsome plants, the greater number were too delicate or capricious for the experiment, and these were not unfrequently the most rare and desirable. It therefore occurred to me that the pattern post could be made available for the transmission of all but the most balky specimens, and I was the more induced to give it a trial in consequence of the following fact. In the autumn of 1870, when residing at Ootacmund, I undertook to supply to the Agents of the Agri-Horticultural Society at Madras some hundred varieties of Ferns, and with that object in view proceeded to the Wynaud and down the Carcor Ghaut, whence I sent three large tin boxes full. The Ferns were carefully uprooted, with a little earth adhering to the roots, and made up separately in moss, and immediately before despatch copiously watered; the boxes were sparingly perforated with air holes. The first two boxes reached

Dr. Bidie without mishap on the fifth or sixth day, and succeeded as well as could be expected in that climate. Through some unfortunate mistake, however, the third and most valuable box was detained at the Pothenore Railway Station for upwards of a fortnight, and finally reached Dr. Bidie on the twentieth day after despatch. The contents were, however, found to be in fairly good order, and Mr. Henry succeeded in growing a good number of them. Now, be it observed, that these plants were packed for only a journey of a week at the most, and also that another week would have sufficed to take them to England. Acting on the experience thus obtained, I transmitted from Darjeeling, in the Himalayas, both to England and to Ootacmund, a considerable number of valuable Ferns through the pattern post, and with almost uniform success, the failures being in nearly every case due to some fault of my own and not attributable to the system. My *modus operandi* is as follows:—I select young but healthy roots, and removing them with great care from the soil, I leave only a very small portion indeed adhering to them. I then envelop each in fresh long-stapled moss, tightly bound round, and then cutting off all the fronds, pack them "heads and tails" in a box, such as oatmeal, mustard, &c., come out from home in, and perforate a number of holes for the admission of air. For transmission to Bombay an outer covering is required, which is there removed, and the parcel is conveyed to England by the P. and O. steamers within a month. Dr. Moore, the Curator of the Royal Botanic Garden at Dublin, reports that the experiment was a great success.

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

(Continued from p. 78.)

III.—ON HEAT AS INFLUENCED BY HEIGHT ABOVE SEA LEVEL.

The ocean of air in which we live covers sea and land alike, and reaches over the top of the highest mountains. In our latitude at sea level it balances a column of mercury 30 inches in height. The weight of the column of atmosphere that presses on each square inch of the earth's surface is calculated at between 14 lb. and 15 lb. avoirdupois. A cubic foot of dry air weighs 1½ oz., so that were the atmosphere of equal density throughout, its top would be reached in about 5 miles, a height which is exceeded by the Andes and Himalayas. Such, however, is not its real constitution. Each stratum of air, as we ascend from the earth's surface at sea level, bears only the weight of the column above it, and being less and less pressed, occupies therefore more and more room in proportion to its weight. This gives us a ready means of measuring heights by the barometer. It is found in round numbers that the column of mercury falls an inch when we climb a hill of the height of 900 feet, and we may easily see by means of the clock-like faces of our ordinary barometers that there is a change in the level of the column of mercury equal to the twentieth part of an inch when we carry the instrument from the ground-floor to the top storey of a house 50 feet in height. With the decrease in the density of the air there is also a regular fall in its temperature. Upon first consideration it would seem likely that the nearer we got to the sun the hotter we should be, and that the tops of the equatorial mountains ought to be the hottest places in the world. But in quitting the earth's surface we are quitting the neighbourhood of a heated body which is fast diffusing its heat by conduction, and are interposing more and more of a medium obstructive of heat between ourselves and the heated surface. It is probable that the temperature of the inter-planetary spaces reaches a degree of cold far beyond what our utmost conceptions can enable us to realise. We have already seen that in the equatorial zone in clear weather twice as much of the heat of the sun's rays is received by the earth as by the atmosphere. A large proportion of this is diffused near the great mass of the earth and there absorbed. By a great number of observations which have been made to settle the question, we learn that the rate of decrease in temperature as we ascend mountains may be fairly stated at one degree of Fahrenheit's thermometer for every 300 feet of elevation. So that in the middle of the north temperate zone an elevation above sea level of 300 feet makes a place as much colder as if it were 70 miles farther north. A hill in Surrey 1000 feet high has the same temperature as a place at sea level in Northumberland. A bill in the Mediterranean basin 10,000 feet high, like Etna, has the same average temperature as a place near sea level on the arctic circle. This circumstance is well illustrated by the fact that even within the tropics when we climb a mountain that is high enough we reach a zone of perpetual snow and ice. This circumstance modifies extremely the heat which different parts of the world

possess in virtue of latitude, and makes the distribution of heat, in its relation to the spread of plants, not a matter that is complicated in its principles, and therefore hard to understand, but one in the application of which it is useful to learn and bear in mind a crowd of details.

In regions, therefore, which are equatorial by latitude, we pass through zones of climate corresponding to the warm-temperate, cool-temperate, and arctic in latitude before the snow-line is reached, and in this way sometimes get in a limited tract of country all the variations in average annual temperature which there are in the whole world, each zone inhabited by the plants that are fitted for that particular climate.

The zones of heat, therefore, as they really apply to the earth's surface, may be sketched out and characterised as follows, beginning with the warmest and proceeding outwards and upwards towards the poles and the mountain-tops:—

1. A *Torrid or Intertropical Zone*, including all the land within the two tropics up to about 5000 feet in height, with an average annual temperature of 75° to 82°, and summer rising but little above, and winter falling but little below the annual average.

2. A *Warm-Temperate, or Subtropical Zone*, including all the country at sea level where snow and ice come to the end of making winter which is really repellent to the sense of a check to all vegetation. In the southern hemisphere this includes Natal and all Cape Colony except the hills, all extra-tropical Australia and Van Diemen's Land except the hills, the whole of New Zealand except the hills, and in America, La Plata, Buenos Ayres, the southern provinces of Brazil, and the whole of Chili, except the Andes. In the northern hemisphere it extends in Europe to about the 45th parallel of latitude, but in Asia and America scarcely beyond 35°, reaching up to about 5000 feet in the eastern, and 3000 feet in the western Himalayas, but not beyond them to the Tibetan plateau. So that north of the tropic of Cancer it includes the southern half of California, North Mexico, Texas, the Southern United States, Barbary, Egypt, and the rest of the Mediterranean basin, Asia Minor, Persia, the northern half of Arabia, the southern half of China, and India except the Peninsula. In tropical Africa the hills of the head of the Nile, Guinea, and Abyssinia contain it as well as the mountains of the interior of all the western Himalayas and Guiana reach into it, and the Andes far overtop it; in Asia the Neilgherries and hills of Ceylon reach into it, and those of Java and Sumatra overtop it; and in Polynesia those of the Sandwich Islands far overtop it. The average annual temperature may be said to vary in round numbers from 75° to 60°, or even 55°, with the warmest month rising in the continental climates of the northern hemisphere (highly as in Persia, Gangetic plain) to nearly or quite as high as in the torrid zone, and the coldest month (January or July, as the case may be) not sinking below an average of 45° or 40°.

3. A *Cool-temperate Zone*, with an average annual temperature of from 60° to 40°, a winter low enough at sea-level to give a decided check to all vegetation, and a summer rising at least high enough to ripen the common cereal grains, Wheat, Oats, Rye, and Barley. In the northern hemisphere it stretches at sea-level for about the 45th parallel of latitude in Europe, and the 35th parallel in Asia and America, up to the arctic circle. So that it includes Iceland, the British islands, the Scandinavian peninsula, Denmark, the northern half of France, all Central Europe north of the Alps and Carpathians, the whole of the great Russian empire, except a narrow arctic belt, the great central plateau of Asia, the northern half of China, Japan, in America a large part of California, the Northern United States, Canada, and the British possessions in the arctic circle. In the southern hemisphere it includes at sea-level only Patagonia, Terra del Fuego, and a few small islands, such as the Falklands, Marion Island, and Kerguelen's Land. In the zone warm temperate by latitude a great many mountain ranges rise into it; in Europe the Pyrenees, Sierra Nevada, Apennines and the hills of Corsica and Greece; in Africa, the Atlas and peaks of the Canaries; in Asia, the Himalayas up to 10,000 feet; in America, the Andes of Mexico and their northern continuation in the Rocky Mountains; in the southern hemisphere, the Andes of Chili and mountains of Cape Colony, New South Wales, Victoria and Van Diemen's Land; and in the inter-tropical zone, the Andes, Camarons, mountains of Abyssinia, and the head of the Nile, and some of the Malayan and Polynesian peaks.

4. An *Arctic-alpine or Frigid Zone*, extending at sea-level from the arctic circle to the region of perpetual snow, with an average annual temperature of from 20° down to 2° or with its upper limit upon the mountains the line of perpetual snow, and its lower the line where cereal cultivation commences. In arctic latitudes this zone has a very short period of vegetation, but this character does not apply so fully where it forms a belt upon mountain ranges rising out of the warmer zones. In Lapland there is a little corn cultivation within the arctic circle; but here the

heat is raised by the same exceptional circumstances that make the climate of Britain 10° warmer than corresponding latitudes in America. In the Himalayas and tropical mountains the snow line is 15,000—17,000 feet above sea level; on the Alps, Caucasus, Apennines and Pyrenees, 9,000—10,000 feet; in the south of Norway 5,000 feet, and in Iceland and Lapland, 2,000—3,000 feet. In the Andes cereal cultivation ceases at 12,000—13,000 feet, in the Himalayas at 10,000—12,000 feet, in the Alps and Pyrenees at 5,000—6,000 feet, and in Britain at 1,500—1,800 feet.

5. *A Zone of Perpetual Snow and Ice*, into which no vegetation reaches, extending at sea-level round the two poles, and into which stretch a long sweep of the Andes, Himalayas, Alps, Rocky Mountains, Dovrefeld, and the peaks of Mount Kilimanjaro, the Sierra Nevada, Pyrenees, Balkan, Caucasus, Altai, Lebanon, Ararat, and many more northern ranges.

The following list of heights and diagrams are intended to help the mind to realise the details of the area and distribution through the world of these zones of ice:—

Approximate Heights of Mountain Ranges, &c., in English Feet.

Europe and North Africa.—Alps, 15,739; Pyrenees, 11,688; Auvergne, 6388; Sierra Nevada, 11,843; Apennines, 9524; Corsica, 8767; Etna, 10,874; Greece, 8358; Carpathians, 9912; Schneehatten, Norway, 8120; Ben Nevis, 4380; Snowdon, 3557; Iceland, 5125; Pass of St. Bernard, 8100; Atlas, 11,400; Peak of Teneriffe, 12,712; Pico, Azores, 7613.

Temperate Asia.—Kinchinunga, Sikkim, 28,728; Mount Everest, Nepal, 29,000; at sea-level round the 20,232; plateau of Tibet, 11,500; great plateau of Central Asia, 4000; Caucasus, 18,493; Ararat, 17,112; Altai, 11,062; Horeb, 9517; Sinai, 7498; Ural, 5397; Ladak town, Tibet, 9915; Darjeeling, 7165; highest villages in Kumaon, 8100; Aleutian Isles, 8593.

Temperate North America.—Mount St. Elias, Russian America, 17,850; Fremont's Peak, Rocky Mountains, 13,570; Mount Jefferson, Rocky Mountains, 15,000; Mount Whitney, California, 15,000; great plateau of California, 6000; Alleghanies, 6476; White Mountains, New Hampshire, 6248.

Temperate South America.—Aconcagua, Chilean Andes, 23,910; Mount Stokes, Patagonia, 6400; Mount Sarmiento, Terra del Fuego, 6000; Mount Erebus, antarctic continent, 12,400.

Australia and New Zealand.—Mount Edgecombe, New Zealand, 9930; Mount Egmont, New Zealand, 8840; Victorian Alps, 6500; Mount Kosciusko, New South Wales, 7176; Mount Lindsay, Queensland, 5700.

South Africa.—Table Mountain, 3846; Winterberg, 7000; Sneeuwbergen, Graaf Reinet, 7900—8000.

Tropical Africa.—Mount Kilimanjaro, 20,608; Abyssinia, 15,008; Madagascar, 11,506; Bourbon, 8400; Camarouos, 13,760; Fogo, Cape Verde, 9154; Fernando Po, 9450.

Tropical Asia and Polynesia.—Adam's Peak, Ceylon, 6152; Mount Slamet, Java, 11,930; Mount Ophir, Sumatra, 13,840; Mouna Roa, Sandwich Isles, 13,953; Nelgherries, 9000; Pulnieis, 8000.

Tropical America.—Popocatepeli, 17,717; Orizaba, 17,574; Volcan de Fuego, Guatemala, 13,460; Roraima, Guiana, 7450; Chimborazo, 21,424; Illimani, Bolivia, 21,140; Sahama, Peruvian Andes, 23,350; Titicaca plateau and lake, 12,847; Quito plateau and city, 9543; Mexico plateau and city, 7570; Santa Fé de Bogota city, 8730; Central Brazil, 7800; Blue Mountains, Jamaica, 7277; post station of Rumiuhasi, Peruvian Andes.

Height of Snow Line in feet, Upper Boundary of Arctic-Alpine Zone.

Height to which Cereal Cultivation reaches, Upper Boundary of Cool Temperate Zone.

Height up to which vegetation is not checked by Winter, Upper Boundary of Warm temperate, or Subtropical Zone.

—J. G. E.

GREENHOUSE PLANTS.—XX.
THEIR CULTURE AND MANAGEMENT.

Roella ciliata.—This is a native of the Cape; it has been long grown in a few collections of hard-wooded plants, but from its very distinct general habit, and the uncommon colour of its flowers, it seems strange that it has not been more frequently met with, especially as used for general decoration—its flowers, from their very unusual colour, associating well with almost any other plants. It is a free grower, but requires to be carefully looked after in respect to mildew, to which it is very subject, especially in the winter season, if kept in too low a temperature; in fact, to attempt to winter it in a chilly damp atmosphere is to court almost certain destruction. There is one peculiarity natural to this plant that some persons object to, its very small leaves are produced in tufts upon the weak thread-like shoots, and to each little bunch is one, a sort of guard-leaf, much longer than the rest, which whilst still young, and a full year or more before the others decay, turns brown, but is still retained upon the plant—giving it a rusty appearance; and if the plant is ill-grown, or kept too cold through the winter, this rusty appearance is increased. When, however, a well-flowered example is met with, its remarkable white purple-tipped blossoms, covering the surface almost so as to touch each other, effectually hide any brown appearance the foliage may have.

The plant never attains a size such as to render it unfit for growing, even where the room at command is limited. It requires good fibrous peat to grow it well, with one-sixth of sand added. It is a free-rooting subject, much more so than its general appearance would lead to suppose. Those commencing its culture should select healthy plants in 6-inch pots; at the end of February or beginning of March, move them into pots 2 inches larger, give 2 inches of drainage, and pot firmly, placing to them at the same time sufficient sticks for their support, running the sticks as far as possible into the new soil so as not to injure the roots.

The plant will flower in even the smallest state, but whilst young the flowers should be removed as soon as formed. This is generally all that is required in the shape of stopping, as it is a very even grower, not often making any over-strong shoots, but if such should appear they must be shortened back. Admit no side air for two or three weeks, and keep the stage on which they stand damped during sunny weather, shading a little when very bright, but do not spray overhead. The plants, if all goes well, will quickly take to the new soil. Attend to them properly with water, but do not account give it before it is required, as this, in common with most plants indigenous to the Cape, is impatient of too much moisture at the roots. Keep in a good airy house or pit near the glass, for it is especially a light-loving subject, that will not do well if crowded or shaded by other plants. Close the house early in the afternoon whilst the sun is on the glass through the spring months; through the summer admit plenty of air during the daytime, continuing to damp the stages and sides of the pots when the house is closed, but do not wet the plants overhead, for they are in no way benefited thereby, and the effects of water on the young growth renders it more liable to mildew.

By the end of July some of the strongest plants may probably have so far filled the pots with roots as to warrant a second potting; but in the case of any but the strongest it will not be required, and had better not be attempted, for if the roots do not exist in sufficient numbers, so as to enter this new soil in quantity before winter, it is apt to get sour, thereby inducing an unhealthy condition from which few plants will after recover. Give the most vigorous a 2-inch shift, using, as before, good peat, with a similar proportion of sand, as advised for the early potting. By August, most likely, they will set flowers upon the points of all the shoots; these, as soon as formed, should be picked off. By the middle of August discontinue early closing, and leave air on in the night during the succeeding month to ripen up the growth. Keep them quite cool through October, after which the house must be closed during the night, or the plants may get chilled. Most likely they will again show bloom, which must be picked off, or it would come in at a time when of little use, and seriously interfere with the next season's growth. They must be wintered at the warmest end of the hard-wooded house, if there is not other accommodation for them; but they will do much better if they can be placed where they can receive from 40° to 45° in the night, until the temperature is brought up to that by solar heat, as this subject cannot bear without injury so low a temperature as many plants indigenous to the same country. Tie them nicely, so as to keep their branches in the required position, for it is naturally procumbent in growth, and if not tied up it will lie over the pot in

a way calculated to both receive injury and have an unhealthy appearance. Again, about the beginning of March, repot; the strongest will bear moving into pots 3 inches larger; to such as are weaker do not give more than a couple of inches more room. Now, as the plants get stronger, use the soil a little more lumpy—it will do broken about the size of Walnuts. As before, tie the branches out to the rim of the pot; after potting treat as in the preceding season as to moisture, and keeping the house for a few weeks a little closer, until the roots have begun to take to the soil, as also in closing with sun-heat and moisture.

As soon time to winter what is to be done with the plants in regard to allowing all or a portion to flower. If the whole are grown simply for decorative purposes, then it is best to allow them to bloom, which they will do freely from the points of every shoot. If some are required to be grown on larger, these should without delay again have their flowers removed as soon as they are formed. Those that are allowed to flower may, when in bloom, be removed to the conservatory, placing them where they will receive plenty of light and not be overcrowded; as soon as they have done flowering remove them back to the hard-wooded house, and pick all the old flowers off. This is a matter of the greatest importance with this plant at all times, but more especially if they are allowed to open any during the autumn or winter; for if not immediately removed after they have decayed, they begin to mould, and will kill almost every shoot right back as far as the season's growth, and will afterwards destroy all that is a singular peculiarity to which this *Roella* is subject under cultivation; no doubt owing to the natural condition of the wood not being calculated to resist the effects produced by the confined atmosphere of a plant-house, which causes the flowers after they have closed to become mouldy.

After blooming, grow them on with the others that have not been allowed to flower, treating them as in the preceding season in every way, except that none will in this second season require another pot. As autumn approaches, move them again more air day and night, so as to mature the wood; but not even when they get large must they be fully exposed to the open air, as the plant does not well bear such treatment, the exposure only aggravating the rusty appearance of the leaves, without in any way benefiting it.

A full crop of flowers will no doubt be again formed this autumn, which should be removed, wintering the plants in a temperature similar to such as recommended the previous season, near the glass in a light house. In the spring, about the same time as hellebores, repot again, giving them a pot, as before, 3 inches larger, which is as large a shift as this plant ever requires. After they are moved, give them the same treatment as advised for the preceding seasons; and they will this year make nice young flowering specimens, and may be allowed to bloom either for conservatory decoration or for exhibition if required, where the plants, from their uncommon colour, are always effectually attracted. In the latter part of the season, say about August, by taking all the flowers off in the spring they will set a second crop later on, which will come in about the time indicated. Through the autumn and winter keep as in the past years, tying them nicely into shape; pot as before, and at similar time in the spring. This season, if all has gone well with them, they will be large enough to exhibit in any collection of plants, if they are required for such purpose; and for the time to come let the general routine of their culture be similar to what has been advised through the early stages of their existence.

In the cultivation of this plant one of the principal things to be guarded against is mildew. Whenever this makes its appearance sulphur should at once be applied. The plant is little subject to the attacks of insects. If it stands so as to touch others that are affected with brown scale, or under a plant upon which this insect exists, it will get upon it, but does not increase fast, and it can be easily kept down by going over the plant with a small brush at intervals. This is the only case in which I have ever seen it troubled with. *T. Baines, Southgate.*

CHARLES DOWNING.

AMERICA is not supposed to be so far advanced in horticultural taste as England is. This, if true, is not owing to any lack of love for it, but to the continually changing circumstances of Americans, which indicate the imprudence of large investments in gardening establishments that would fail to protect one in a rainy day. This may be remedied in time, and in the meanwhile the pomological branch of horticulture has progressed amazingly, and it is doubtful whether a knowledge of fruits, or of fruit culture, is so widely and so intelligently extended in any part of the world as in America to-day.

Much of this state of things has been brought about by the public-spirited efforts of men who have laboured continually, with no thought of adequate

remuneration, but from a desire to be useful in this particular field, and to do what they can to make others work as they do. They have local pomological and fruit growers' societies in almost every State, and often several in a State, to the meetings of which in the depth of winter large numbers of people go often hundreds of miles, at a cost of from perhaps twenty-five to over a hundred dollars, simply to communicate to one another what they have learned in fruit culture. Besides this there is a national society, which meets every two years, and to which numerous members go, often coming from over 2000 miles to the meetings at their own expense, and with nothing to give or gain but a knowledge of fruits and their culture. Foremost among these men, and especially foremost in the generous disinterestedness

and hardy wild flowers. In 1834 he took his younger brother, A. G. Downing, into partnership with him, which was continued till 1839, when the latter retired in order to devote his whole energy to landscape gardening, which, under his enthusiasm and enlightened teachings, took a tremendous start in the United States. His tragic death in 1852 will long be remembered in America as a great blow to this delightful art, while to all lovers of beautiful flowers Torrey's tribute of the pretty Lobellicaceous genus, *Downingia*, will be always a grateful recollection. A few years before this sad event, however, he sold out his nursery interest to Mr. Saul, and devoted himself wholly—say, about 1850—to collecting trees and grafts of all the fruits of America, for the purpose of testing their qualities and correcting their nomenclature—a monstrous work for one man to undertake. In 1869 the "march of improvement," very rapid

tural meetings or gatherings, his entrance being often marked by enthusiastic applause.

A BEURRÉ CLAIRGEAU PEAR TREE.

I SEND you a photograph (see fig. 26) of a Beurré Clairgeau Pear tree growing at my place here, which is considered by every one who has seen it to be a most remarkable tree, even for Jersey, where most of the varieties of Pears come to a greater perfection than in England. It was planted eight years ago against my fruit room, and the second season produced one fruit weighing 1½ lb. Since then it has continued bearing magnificent Pears each season, and I have never picked one from it weighing less than 1 lb. in weight.

CHARLES DOWNING.

with which he pursues the subject is Charles Downing, whose portrait we give to-day. From some of his American friends we gather that he was born at Newburgh, Orange Co., New York, on July 9, 1802, where he was educated primarily in the common school, and finally at the Academy. His brother, the elegant writer, A. J. Downing, tells us in one of his charming works that he was born in a garden amidst fruits and flowers on the banks of the Hudson, and it is presumable the same may be said of the subject of this sketch. His father had a nursery at Newburgh, and at the early age of thirteen he was taken from school to work in the nursery; although he continued to attend the school a certain portion of each year till he was eighteen years of age—a method of combining useful practical knowledge of life with literary attainments common with Americans. In 1822 he started the nursery business in Newburgh on his own account, paying especial attention to fruits

in America, put a street through this grand specimen orchard, but not before he had been able to test 1800 varieties of Apples, over 1000 Pears, and an army of Plums, Cherries, Peaches, and other fruits. He still resides with his good wife, but no family, on a small property near the scene of his former labours.

His literary labours have been confined to fruits. In 1857 he revised his late brother's work, the *Fruits and Fruit Trees of America*; and in 1850 was issued another edition, with so much new that it may be considered an original work. The book embraces over 1000 pages. In 1872 another extensive supplement was issued. This is all that he has published in book form, but American horticultural and agricultural literature abounds with articles on pomological subjects with the familiar initials "C. D.," most of which—indeed, probably all—is freely contributed. Personally Mr. Downing is retiring in disposition; and though his friends—all the world—can easily get all the information he has from him, he can never be prevailed on to make any public remarks. Yet there is not a man in America more welcome at horticultural

Last year I had the surface earth carefully removed and replaced with good turfy loam from a meadow, and this season [1874] the tree was allowed to bear 35 Pears, which, when gathered, turned the scale at 36½ lb. I may add that the tree is grafted on the Quince, and that the soil is a good sandy loam. At our show in October last all the leading varieties of Pears were exhibited in a manner worthy of notice. Indeed, some of the Pears quite ran out of character as regards size, and astonished our best judges. Fifty Chaumontelles were shown weighing more than 60 lb. (English weight), and the 100 containing this fifty were sold for £7 10s. I picked myself from five small pyramidal trees of General Todtleben eighty fruits, weighing 85 lb.; and the other varieties, such as Duchesse d'Angoulême, Beurré Bachelier, Doyenné du Comice, and Triomphe de Jodoigne, were equally large. James Pond, *The Vericra, St. Lawrence, Jersey, November, 1874.*

HALF-HOURS AT KEW.—I.

WITHOUT preface or apology, we will at once make our way to the grand Tropical Conservatory, immediately on the right as we enter the gardens from Kew Green. This house differs so entirely from the structures usually devoted to

shrubs, that ever existed in Europe; hence the term greenhouse, which, as understood by gardeners, signifies a temperate conservatory. Now it is filled with plants from tropical climes, and, in the somewhat inelegant language of the garden, would be termed a stove,—a name we intend to eschew. This being our favourite among the numerous conservatories at Kew,

young gardeners obtain their technical knowledge; and as the stay of the majority of them is limited to one, or at the outside two years, changes in the staff are continually taking place, consequently the difficulties in the way of attaining perfection in the cultivation of plants. Under more favourable circumstances—more permanent skilled men—we believe

FIG. 26.—A BEURRÉ CLAIRGEAU PEAR TREE AT THE VINERIES, ST. LAWRENCE, JERSEY.

the shelter of exotic plants, that we may be pardoned for pausing a moment to admire it. In the earlier editions of the *Guide* it was called "the architectural greenhouse,"—a name appropriate enough, for, though plain in style, it has an imposing effect. It is one of three that formerly stood in the gardens of Buckingham Palace, and was removed to Kew in 1836. Formerly it was the home of perhaps the finest collection of Proteaceæ, and other Australian

we ought to be able to say something to justify this preference, especially as many gardeners condemn it, and say that it is not suitable for plant growing. True it is not adapted for plants of dwarf habit, or such as need all the light we can possibly give them; but look at the health and luxuriance of many of its present occupants, and say whether it is not admirably suited for a certain class of plants. It should be remembered that Kew is a kind of school, in which

that this and other collections in the establishment could be greatly improved. In support of our statement respecting the suitability of this building for plants, we may recall the world-wide fame of the Australian collection it formerly sheltered.

But to come to the consideration of the principal types of the vegetable world it now contains. The greater part of the plants before us represent three families, namely, the Aroidæ, Palmæ, and Filices. The first of these families is represented in England

and Ireland by the familiar Lords and Ladies, or Cuckoo-fruit; and a common window plant of the same family is the Trumpet Lily, or Lily of the Nile, as it is sometimes incorrectly termed. We mention these examples to familiarise our readers with what may be termed the Aroid type of plants, the similarity in its primary will, once perceived, the striking resemblance the inflorescence (not flowers, as popularly termed) of many of the plants bears to that of the two species above named. This kind of inflorescence we shall shortly explain. There is also a general character about the foliage of these plants not easily mistaken, though not so evident as the form of inflorescence.

The Palms, or Palms, are here represented chiefly by one genus of miniature species and young plants of others, which have scarcely assumed their characteristic features. Of Palms in general we shall speak more fully on some future occasion, when we invite our readers to accompany us through the magnificent groves of these majestic plants in the conservatory devoted more especially to their culture.

Filices, or Ferns, are present only in the arborescent form. Tree Ferns exhibit the same characters of fructification as our native species of lumber growth, the enormous fronds being distinguished by their size and elegant modifications of an almost homogeneous structure.

In addition to the families named, various others are represented by one or more forms, but we have directed attention at starting more particularly to those three groups, because they constitute the prominent features and the bulk of the vegetation of this tropical garden.

We may now examine some of the details of the scene before us. To do this profitably we must set about it systematically, but this does not preclude us from enjoying the general effect. On entering, and casting our eyes above and around to take in a general view, we are struck with the elegant foliage pendent on either side from the girder supporting the somewhat lofty roof. Tracing the cable-like slender stem of one of them downwards to a very small pot we find it labelled *Chamaedorea elatior*. *Chamaedorea* constitutes an exclusively tropical American genus of Palms. About fifty species are known, many of them, however, only imperfectly, as they are usually dioecious—that is, the male and female flowers borne on distinct plants. Taking this genus in its widest sense, the size and habits of its species are sufficiently characteristic to enable us to distinguish them. They have exceedingly slender, reed-like, annular stems, rarely attaining the length of *C. elatior*, and frequently not more than 5 to 10 feet, bearing a plumed head of pinnate or entire leaves. The name *Chamaedorea* is from *χάμα* (chama), on the ground or dwarf, and *δωρεα* (dorea) a gift, said to be given to these Palms because their nuts are easily roached; but we have not the book at hand in which it was first published to confirm this. M. Wendland, who has probably a more extensive knowledge of Palms than any botanist of our day, refers the species usually considered as belonging to this genus to several different genera. Dr. Hooker, *Botanical Magazine*, plate 6088, under *C. geonomiformis*, revises the name *Nunnezharia*, which was given to this genus a few years early, and, according to the rule of priority, must take the place of the familiar and more euphonious *Chamaedorea*. Dr. Hooker mentions, in the same place, that the plant figured is said to have borne alternately male and female flowers. This statement is worth noting, as it is by no means improbable, for within the last few years several instances of the same phenomenon have been reported from the South of Europe, where many Palms flourish in the open air. About a dozen species of these Palms, known to the Palms, will be found in various parts of the house we are in. One of the handsomest, and one that has long been known in gardens, is *C. Ernesti-Augusti*. It rarely exceeds 6 feet in height, and its slender, flexible stem is surmounted by a crown of broad wedge-shaped leaves, about 2 feet long, and more or less deeply divided into two lobes. The branches of the inflorescence remain on the plant long after the small red flowers have fallen, and ultimately change to a beautiful bright red, giving the plant a highly ornamental appearance. *C. elegans* has pinnate leaves, and is of a lighter and more graceful habit. It is needless, and it would tire our readers, to mention all the species by name, but many of them are equal in beauty and grace to those described.

There is, however, one more to which we cannot forbear directing attention, though, possibly, it may not be a true *Chamaedorea*. It is named *C. glaucifolia*, and is remarkable for its long, slender, finely-divided, pinnate leaves, of a glaucous green color. Now, a word by way of recommendation of this attractive genus of miniature Palms. It will be seen that they love shade, and a moderate degree of heat is sufficient for most of them. Another advantage they possess for an ordinary conservatory is their small size; so many of the Palms have very large spreading leaves, and grow to a considerable height, and soon

become too large even for the largest conservatories usually found in private establishments. It is only within the last decade or two that Palms have received the attention in this country they deserve, and unfortunately, many of those sent out by our nurseries are fast-growing species of large stature. We would recommend amateurs to consider this point when purchasing.

As we shall have to speak more in detail of Palms when we visit the large Palm-house, we will content ourselves now with naming a few other genera, present here as young plants. *Phytelephas macrocarpa*, the vegetable ivory Palm, from New Grenada, whose dense white hard seeds are used in making toys, &c.; *Pritchardia pacifica*, a handsome fan-leaved Palm, from the Pacific Islands; *Diplazium cuneatum*, from Brazil (observe the elegant manner in which the segments of the unfolding leaves are disposed); *Hypophorbe Verschaffeltii*, Seychelles; *Stevensonia* (*Phenacophorum*) *grandifolia*, Seychelles; and *Coccoloba flexuosa*, an exceedingly elegant species of the Coccoloba genus.

There is another family so closely resembling the Palms in the foliage of some of its members, that they might easily be mistaken for true Palms. We allude to the Cyclanthaceæ, a small group sometimes associated with that of the *Senecio* Finis. We have here two genera of this group—*Carludovicia* and *Cyclanthus*. The flowers of these plants are arranged in very dense cylindrical spikes, which, when young, are enveloped in large leafy bracts—not a single spathe, as in the Palmæe. *Carludovicia palmata* and *C. rotundifolia* will be found facing the door by which we entered. The young leaves of the former species are used to make the celebrated Panama hats, further details of which will be found in the *Globe*, and specimens in No. 2 museum. This is an almost stemless species, but some of them are lofty climbers. The genus was dedicated to Charles IV., King of Spain, and Louis his queen. *Cyclanthus*, from *κύκλος* (cyclos), a ring or circle, and *άνθος* (anthos), a flower, in allusion to the arrangement of the flowers, is remarkable as showing the transition from undivided to divided leaves. *C. cristatus*, at the opposite end to which we entered, on the bench to the right hand, has simple leaves, traversed longitudinally by two prominent parallel bands of a greenish white, or a greyish green. In some other species of this genus the leaves are divided down to the leaf-stalk or petiole into two segments.

We will conclude our visit with a view of the magnificent Tree Ferns which occupy the centre of this house. First of all let us go to the west end and admire an incomparably beautiful and healthy specimen of *Cyathea insignis*, a native of Jamaica, with fronds 10 or 12 feet in length, the stipes or stalks of which are clothed with long, silky, shining, silvery grey scales. This splendid Fern is almost worth a journey from London to Kew. But here are also fine examples of *C. arborea* and *C. serrata*, from the same region. *C. arborea* is a very handsome species, sometimes met with in gardens under the name of elegans. *C. serrata* differs widely from the other two, in its much more slender stem and smaller fronds, besides other less evident characters. One or two specimens of this species have grown so tall, that even in this house it has been necessary to level them below the level of the floor. An experiment is being tried with these specimens to induce them to produce roots from a certain part of the stem, in order that the part beneath might be removed, and the plant, as it were, renewed; but so far it does not appear to have succeeded. This genus is the most numerous in species of the genera of Tree Ferns, and the species are widely dispersed in the tropics, extending to the Pacific Islands and New Zealand. The name is from *κύκλος* (cyclos), a cup, from the form the involucre (which covers the spores on the under side of the frond) assumes in some species. *Angiopteris evecta* is an enormous stemless Fern, from tropical Asia. There are two varieties here, or, as they are considered by some botanists, species. Sir W. Hooker referred the numerous forms of this Fern to one species, whilst Dr. Vriese, a Dutch botanist, made sixty species of the same! *W. B. H.*

Foreign Correspondence.

OCAÑA: Nov. 20, 1874.—Many scientific men and illustrious horticulturists know well the place called Ocaña, in the United States of Columbia, formerly known as New Grenada, about 8 leagues from Barranquilla, a town of about 18,000 inhabitants, and where about a dozen steamers have been established to carry on the import and export trades: the boat runs up the large River Magdalena, reaching Ocaña in about four days. At about half-an-hour's walk from the steamer you reach a small village called Puerto Nacional, where provision must be made for the journey to Ocaña, a distance of 18 leagues, which takes about two days' easy riding. This town was founded in the year 1572 by Francisco Hernandez, a

Spaniard, who settled among the Carátés Indians, at a place called Santaneda Hacari, about half-an-hour's ride from here. The Indians conspired together to kill him; he escaped, however, and shortly afterwards founded the town of Ocaña, which he named New Madrid. The town now contains about 8000 inhabitants, and the State of Santander, in which it stands, has in agriculture and other industries made far greater progress than any of the other States in this country.

Approaching the town, the aspect is somewhat dreary—all around are naked mountains and hills with little or no vegetation. The houses are built in the Spanish style—low and whitewashed, with small windows and large doors, under wide corridors.

The two small rivers, Rio Grande on the right, and the Cuchbrada Saca on the left, come down from the mountains behind the town, supplying the town with water as clear as crystal. The town is situated at an elevation of about 5000 feet, and is surrounded by mountains, which reach to a height of 8000 feet. The mountains to the west are clothed with luxuriant vegetation and an almost impenetrable forest. To the east the forests are found less, beginning at about a day's journey from here.

Several of the earlier, and even more recent, botanists and naturalists, sent out either by some scientific society, botanic garden, well-known firms, or men who take great interest in the progress of scientific horticulture, know this place well; they have explored the deepest and thickest forests for many miles around here, and quantities of good plants, principally Orchids, have been sent from here for many years.

The people still remember many of those who have passed here, as Mr. J. Luiden, L. Schlim, Warscewicz, F. Engel, H. Blunt, Brown, G. Wallis, "A. B.," B. Roetz, A. Wheeler, &c. Louis Schlim was one of the first to explore the mountains around here, and there are few places that I have visited where the people have not told me he had been there too. He passed his time most industriously, but was never recompensed for his labour, and the chagrin caused by this ingratitude brought him to the tomb at an early age.

The climate of Ocaña is very mild, fresh, and healthy; the medium temperature is from 15° to 18° Reaumur nearly the whole year round, being neither too hot nor too cold. The summer begins in the month of December, when the sky is of a deep blue; at night the stars shine so brightly that you can see your own shadow, and it never becomes so dark but that you can see. During this month everywhere is festivity and enjoyment, crackers and other fireworks being let off every night. The bells of the churches are ringing from early morning till late at night, and great processions, accompanied with fireworks, pass slowly through the streets; the people have such an aversion to work this month that it is difficult to get a boy to bring water for household purposes.

The principal exports are Coffee, about 100,000 sacks; medicinal plants, Ocaions, Aniseed, hides, &c. Peruvian bark has lately become an important item. The importations are gradually increasing, amounting at the present time to about 2,000,000 dols. worth of various European merchandise.

I do not think that for healthiness any other part of the world can be compared to Ocaña, it is, in fact, one continual spring. At present there are only five foreigners here. In my next letter I will give a few remarks on the culture of Coffee and other vegetable productions. *Albert Bruchmüller.*

THE CRANBERRY.—I think that the Cranberry plant might, as you remark in a leading article, be grown with great advantage in the bogs of England, Scotland, and Ireland, judging from my late investigation into the cause of Cranberry rot. Vines can be purchased in this country at 3 dols. per barrel (12z.), and if the bog land were properly prepared, would yield a handsome profit to the cultivator, and give considerable employment to the poor of the respective named countries. It is a native of Perth, Scotland, and, therefore, understand pretty well the character of the climate. The very high temperature here, up in the nineties, is what induces the great fermentation in the bog land, and causes rot by destroying the healthy growth of the plant. I intend following up the subject in another paper and more at length. *Thomas Taylor, Washington, U.S., Nov. 1, 1874.*

ST. PETERSBURG: Jan. 21.—For the last fortnight we have had the thermometer never above —20° Fahr. (52° of frost!) The windows of our rooms are covered with ice, although by means of our stoves we contrive to maintain an equable temperature of 66°, or even 68° F., in spite of which we suffer from the outer cold. We are not in much apprehension for our plants, as they are covered sufficiently thickly with snow to escape injury. *W.*

Forestry.

THE remarkable feature in the timber trade of the last year is the increase in the quantity of lower quality goods, and the small sizes that are now becoming so common, which some few years back would not have been worth the labour expended on them, if not absolutely valueless for building purposes. Waney and sappy as such dimensions must necessarily be, yet they are produced by some of the most extensive mills both in Norway and Sweden; indeed, they form a considerable proportion of the manufacture of the former, and manage to find buyers in this country, though for what such dimensions are really applicable it would be hard to determine. From the reports of our correspondents it appears that complaints are pretty rife as to the indifference displayed by some shippers in the way contracts made during the last season have been carried out; and the departure from the clauses as to quality, sizes, and quantities, causing great dissatisfaction. The merchant here has little or no check on the importers beyond the character of the house with which he deals, but we are sorry to say that many large firms abroad are not so particular in carrying out their engagements now as formerly, considering that it is mainly the repute of the high classification of their goods that gains them the preference.

From advices we learn that the prices of stocks for F. O. W. shipments will be at least 30 per cent. lower than they were offering this time last year, but this seems a great come-down. We hear of goods actually disposed of for spring delivery at this reduction from a reliable source, but before we can adopt this as the general decline we shall await further corroboration.

From the sources whence we draw our supplies of timber we observe no diminution in the imports during the past twelve months, and the returns, with the exception of Sweden, compare favourably with those of the previous year. In the face of such an inactive season as that of 1874, the quantity of timber brought into the country, of all kinds (hewn, split, or sawn), reached the enormous total of 6,252,641 loads, or, in round numbers, six millions and a half, amounting in value to £20,265,956; as against 1873, 5,487,113 loads, valued at £17,206,876, showing an excess in favour of 1874 of 765,528 loads, and in value more than three millions of pounds sterling; and this is most remarkable when we take into consideration the apathy displayed by the merchants here from the opening of the season till its termination. Contradictory as this appears, yet it is easily accounted for when we reflect on the vast quantity of timber that has not gone into circulation, now stored at the various large depots, or supply without parallel. The docks returns which we publish of the stocks now lying on the premises give a total quite amazing, and this at the present time, there is very little doubt, represents so much dead capital, which under ordinary circumstances would not be lying dormant. At this time of the year it usually happens that the docks and timber yards are pretty full, and rightly so, as during the winter, while the consumption goes on, the supply from abroad ceases during an interregnum of some months, and on the home stocks we generally rely to keep us going until such time as fresh cargoes can come forward; but the quantity now is far more than sufficient for any possible demand that can be created during the period named. And it is not only to London, but to the whole of the United Kingdom that this applies; and this fact must seriously affect the spring prices, as in many instances the holders of the goods in London and elsewhere, if not obliged to realise to meet their engagements, will rather sink the profits and interest than hold over while such uncertainty about future prices prevails both here and abroad.

The quantity of wood exported from Sweden and Norway into this country during the year just expired shows a decrease from that imported in 1873, of hewn timber, 80,000; manufactured, 14,000. The difference, it can be seen at a glance, is mainly on the square timber, and not so much on deals; thus it leads us to the inference that the stocks out there were so heavy as to hold over while, especially of hewn logs. The next year we may expect still less square wood from thence, as the law affecting the cutting of wood under 9 inches will be in full operation; hence it is pretty certain to react on the supply of the larger, as the quantity of undersized halks have been very considerable, and when out of the market the value of the bigger trees will be proportionately diminished.

The supply from Germany for 1874 shows an increase of 36,616 loads or thereabouts, while from Russia we get the largest difference in favour of the past year of all the other countries, viz., 156,000 loads hewn, and of manufactured 183,000, or in round numbers 339,000 loads, without taking into account

staves, which show even a greater difference. British North America, which in 1873 imported not much more than half the quantity of manufactured wood as that from Sweden and Norway, last year sent us 1,076,188 loads, as against 1,530,526 from the Scandinavian ports. The difference in favour of 1874 over 1873, may be briefly summed up thus:—

Russia	339,000 loads.
British North America	239,332 "
Germany	36,616 "
Total	607,948 "

607,948—very nearly the surplus 1873 showed over 1872, with the exception that Sweden in 1873 nearly doubled what she supplied the previous season, and was by far the largest contributor; while from the above summary she is entirely omitted, importing, as we before observed, less last season by about 90,000 loads. Although still holding the pride of place, Sweden is very nearly this time equalled by our American supplies, while in monetary value the approximation is not so marked—the total value of the wood imported from Sweden and Norway being £5,982,720, while that from British North America is £5,497,104, for a greater proportion of wood in comparison than the previous year. This, no doubt, is owing to the production on a large scale in Sweden and Norway of prepared flooring boards, the demand for which was pretty well maintained throughout last year.

The total value of all wood imported into Great Britain amounted to £20,265,956. *Timber Trades Journal.*

Notices of Books.

On British Wild Flowers considered in Relation to Insects. By Sir John Lubbock, Bart., M.P., F.R.S. (Nature Series.) Macmillan & Co., 1875.

Thanks to Mr. Darwin's writings, and to the lecture delivered by Sir John Lubbock at the Belfast meeting of the British Association, the fertilisation of flowers by the agency of insects can now be included within the domain of popular science; and we have here a very pleasant and readable survey of the present state of our knowledge as far as relates to British wild flowers. Without claiming any important original observations of his own, Sir John Lubbock sums up the results arrived at by other workers in the field, especially Sprengel, Axell, Darwin, Hildebrand, Delpono, and the two Müllers; a specially interesting portion of the volume, and one which the author's scientific knowledge well enables him to popularise, being the description, illustrated with numerous drawings, of the arrangement of the hairs on the thighs and bodies of various classes of insects, by which they are enabled to carry the pollen from flower to flower.

With reference to the historical part of the subject, we may remark that, while ample justice is now done to the acuteness and accuracy of Sprengel's observations in his *Befruchtung der Blumen durch Insekten, und die gegenseitigen anpassungen beider*, published in 1793, the greater number of writers have almost altogether lost sight of the still earlier researches in the same field of Kùreuter, who published his *Vorläufe Nachrich von einigen das Geschlecht der Pflanzen betrefenden Versuchen und Beobachtungen*, in 1761. In this little treatise Kùreuter records his observation that the pollination of the castor-oil plant is largely due to insects; and further that, especially in the case of lizards, in which he first detected the true stigmatic surface, the structure of the various parts of the flower clearly shows that the pollen can reach the stigma neither spontaneously nor by the action of the wind. Again, we find but little recognition of the light held up during the "dark ages" that intervened between Sprengel and Darwin, by Andrew Knight, who clearly propounded, in 1799, the doctrine that "no plant self-fertilises itself for a perpetuity of generations"—a theorem which, although Darwin fully credits it to Knight, is attributed, even by Hildebrand, to Darwin.

On the volume before us we have only one slight remark to make in the way of criticism, and that is a regret that Sir John has introduced the terms "proterandrous" and "protogynous" instead of "protandrous" and "protogynous." A philologist might possibly prefer the former, but we are not purists in the matter of scientific terms; and the latter have become so generally accepted in both English and German literature, besides being less cumbersome, that we think they may fairly be allowed to stand. A few slight errors would naturally disappear in a second edition, and a very critical reader might demur to the statement that *Plumbago europæa* is "allied" to *Plantago major*. The little volume is one for which the reputation of the author will doubtless secure for it as large a circulation as it deserves; and we trust it may be the means of awakening in many a family circle an intelligent interest in this interesting branch of natural history.

The Civil Laws of France to the Present Time; supplemented by Notes illustrative of the Analogy between the Rules of the Code Napoléon and the Leading Principles of the Roman Law. By David Mitchell Aird, Esq., Barrister-at-Law, of the Middle Temple. London: Longmans.

This handy volume, dedicated by permission to the Lord Chief Justice of England, is a translation of the famous Code Napoléon, so far as it relates to civil law. It is not within our province to criticise it from the legal point of view, but a code which is so clear and comprehensive as to have long been adopted by other nations, and which embodies in a form adapted to modern civilisation the principles of the Roman law, has an interest about it which all intelligent readers may turn to practical account. Mr. Aird's volume is divided into three books—1. Of Persons, containing eleven chapters; 2. Of Property, containing five chapters; 3. Of the Different Modes of Acquiring Property, containing twenty-nine chapters. The analogy existing between the Roman and French law is shown by explanatory notes at the foot of the page. We quote a portion of the section relating to "Party Walls and Ditches" as being a topic of interest to our readers, and also as furnishing an illustration of the style of the book, which we commend to the general reader as giving an insight into the principles upon which right and wrong are governed.

"All ditches that separate two estates are presumed to belong to both owners, if there is no deed or sign to the contrary. It is a proof that the ditch is not in common when the bank or earth is thrown up on one side only, and then the ditch is deemed to belong to him on whose side the earth is thrown up. A party-ditch is kept up at the expense of both parties. Every hedge that separates two estates is deemed in common unless only one of the estates is enclosed, or a deed or prescriptive right proves the contrary.

"Trees of large growth cannot be planted except at given distance from each estate prescribed by rules relating to them, or by usual and well-known customs; and in the absence of rules and customs, large trees must not be planted nearer than 6 feet from the line separating two estates, and half the distance for other trees and live hedges. When planted nearer, the adjoining owner may order them to be pulled up. An owner whose property is overhung by the branches of his neighbour's trees may compel him to cut off such branches; and if the roots encroach upon his property he has a right to remove them.

"Trees growing in a party-hedge are, like the hedge, deemed in common, and either of the owners may insist on their being cut down."

THE FADING FLOWER.

(FROM THE JAPANESE.)

I wandered where the sweetness of summer made completeness.

And all the woods were blushing with the fiery glow of flowers,

When softest winds were blowing, and songful streams were flowing,

And sped, alas! too swiftly the honey-laden hours.

I found amid the splendour a little bud so tender

I trembled with a thrill of joy I ne'er had known before;

Like one in a sad story who turns a page of glory,

Or shipwrecked sailor nearing a smooth Palm-plantéd shore.

With pride beyond all telling I bore it to my dwelling,

And placed it where it shone like star in night's engulfing gloom,

And there through years of gladness, or weariness and sadness,

It filled with Heaven's own lustre the lonely little room.

Now, though its leaves grow crisper, and cruel voices whisper

The flower has lost its beauty and growth dim and old,

To me it beams as brightly as when first it quivered lightly

In morning's dewy freshness, when the distant hills were gold,

Kujin, in "Japan Mail."

THE

Gardeners' Chronicle.

SATURDAY, JANUARY 30, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- MONDAY, Feb. 1. { Meeting of the Entomological Society, at 7 P.M.
Side of Lilies, Seeds, Ferns, Cycads, &c., at Stevens' Rooms.
- TUESDAY, Feb. 2. { Sale of 300 Fens of Poultry and Pigeons, at Stevens' Rooms.
- WEDNESDAY, Feb. 3. { 8 P.M.
Sale of Horticultural Society's Lecture at Stevens' Rooms.
- THURSDAY, Feb. 4. { Meeting of the Linnean Society, at 8 P.M.
Sale of Seeds, Conifers, Shrubs, Bulbs, &c., at Stevens' Rooms.
- FRIDAY, Feb. 5. { Sale of Seeds, Conifers, Shrubs, Bulbs, &c., at Stevens' Rooms.

FOLLOWING the example of the German Government, that of Belgium has enacted a decree forbidding the IMPORTATION OF AMERICAN POTATOS. This is so serious and important a matter that we trust our entomologists will be enabled to tell us definitely whether or no such precautions are necessary. The presumed necessity arises from the scourge occasioned in many of the States of the American Union by the ravages of the so-called "Colorado bug." This insect, which was described in our columns, p. 55, vol. i., 1874, was apparently first introduced from the southern districts of the Rocky Mountains, where it feeds on a prickly-leaved species of Solanum. From this starting point it has gradually spread over the American continent from west to east and from south to north. In such profusion does it occur that at the last Scientific Committee meeting Mr. ANDREW MURRAY stated that from one haul in Canada he could have collected two handfuls of the beetle. Neither the dry heat of the south-western States, nor the intense cold of a Canadian winter checks its progress. Brood after brood is produced during one and the same season. The eggs of the insect are deposited on the under-surface of the leaves, where, in the course of five or six days, the larvae are hatched, and commence their work of destruction. After some seventeen days the grub disappears below the soil, there to become a chrysalis or pupa, which, in its turn, develops into the perfect insect.

When once a field of Potatos has been attacked, all hope of a harvest must be given up; in a few days it is changed into an arid waste—a mere mass of dried up stalks. Against the ravages of this destructive pest, Paris-green—an arsenite of copper and highly poisonous—is employed. It is dusted over the haulm and destroys the insect, but is too dangerous a remedy to be safely used. Handpicking is the sole resource yet known, and this must not only be inadequate, but is stated to produce serious inflammation on the hands.

Now comes the question, Are we in this country likely to make the acquaintance of this most undesirable visitor? We cannot but fear that we are, nevertheless we do not think the case is one for panic—even if that be ever admissible.

When our Board of Trade was memorialised on the subject, they returned for answer that as the larvæ or eggs of the Colorado beetle are not deposited on the tubers, there was no reason to forbid the importation of American seed Potatos. The pupæ might, however, be introduced with soil adhering to the tubers, and in other ways, so that an immersion of all American tubers in a solution of sulphate of copper, and thorough washing, might at least be used as a matter of precaution. There is but little fear of the insect being introduced with the haulm, as that so speedily rots and decays that it is rarely, if ever, sent over even as package.

For most of what we know definitely about the beetle and its habits, we are indebted to Mr. C. V. RILEY, the State Entomologist of Missouri, and we cannot do better than repeat what this eminent entomologist has published on the subject. It will be seen from Mr. RILEY'S remarks that there is little fear of importing the insect with the tubers, though other sources of infection are, unhappily, abundant.

"That there will be danger," says Mr. RILEY, "of the insect finding its way to Europe when once it reaches the Atlantic seaboard, no one can doubt, for the impregnated female will live for weeks, and even months, without food, especially in the spring and autumn, when they also take most readily to wing. Such females, alighting on outward bound vessels, may easily be given free passage to European ports, and, as they will be apt to land without passports, it would be well for the authorities to look out for and prevent such unwelcome incursions. I do not think that there is danger of the insect being carried across the ocean in any other way, for Potato plants on which the eggs or larvae might be carried are not articles of commercial exchange, and seed Potatos do not, as a rule, harbour the beetles. Let our European friends profit by our sad experience with this insect, and, taking time by the forelock, endeavour to prevent its introduction into their Potato fields. The end will best be accomplished through the agricultural and horticultural societies, which should make provision for the dissemination of correct information concerning the pest. A small card, giving a coloured figure of the beetle, or of all stages of the insect, setting forth the disasters which would follow its introduction, and appealing to the reader to assist in preventing such a calamity, would do good service, if posted in the cabins of vessels plying between the two countries, in the warehouses and seed-stores of seaport towns, and in the meeting-rooms of agricultural societies." Some such simple means of familiarising the public with a possible enemy should be adopted in a country like Ireland, which will perhaps be the first to receive the pest, and would suffer most from it.

—We learn that in addition to the Silver Medal forwarded through the Italian Embassy by the Royal Tuscan Horticultural Society, Dr. MOORE, of Glasnevin, has also received two very handsome gold medals, one of which is, we believe, intended to be in recognition of raising his famous hybrid Saraceni—the first successful attempt of the kind, and the other to mark their sense of Dr. MOORE'S kindness as

well as ingenuity in transporting safely from Dublin to Florence the fine specimen of the Lattice plant of Madagascar—*Oviandra fenestralis*, which was quite a novelty in Italy, and an object of much interest at the Congress.

—The illustration we give this week (fig. 27) represents a view, taken in early spring, in the grounds of the veteran botanist, M. THURET, of Antibes, on the shores of the Mediterranean, near Nice. Neither photography nor the art of wood engraving can adequately represent the gorgeous glow of this mass of ANEMONES. If green turf, in our English sense of the term, be wanting, or nearly so, in the delicious Mediterranean regions, the residents have at least no slight compensation in the Anemones, the Scyllas, the Gladioli, the Irises, the Ornithogalums, the Tulips, and the many splendid plants which in succession occupy what would with us be the lawns. Let our artist may be credited, by those who have never seen Anemones growing wild in this profusion, with exaggeration, we may add that the engraving is an accurate transcript from an exquisite photograph taken by M. BORNET, who is as skillful with the camera as with the microscope, and for which we are indebted to the kindness of M. THURET.

—The twentieth annual session of the Western New York Horticultural Society was opened on the 6th inst., under the presidency of Mr. P. BARRY. The practical nature of the discussions may be gathered from the following list, which we extract from a Rochester paper:—

1. How can the fertility of large orchards be most economically maintained?
2. What variety of Apples, according to the latest experience, can be recommended for extensive markets in Western New York, for shipping?
3. Will the experience in Pear culture thus far in Western New York justify the Society in recommending the planting of large orchards for profit? Can dwarf Pear trees, or Pear trees on Quince stock be recommended for profitable culture? What varieties can be recommended to be grown as standards, for profit, and what as dwarf?
4. Would it be advisable for societies or individuals interested in Pear culture to combine in offering a large reward for the discovery of the cause of the disease known as "fire blight," and a practical remedy for the same?
5. What is the best kind of package for shipment of Pears to distant markets?
6. Can this Society do any influence coopers as to have all fruit barrels made of legal size?
7. Can any action be taken by this Society to induce railroad companies to transport fruit on the same terms as any other farm product?
8. Can unity of action be secured among fruit growers for the destruction of the Codlin moth? What remedies for that and other insects injurious to Apples have been tried, and with what results?
9. Can the Blackberry be recommended for extensive cultivation as a market fruit, and if so, what variety?
10. Has the introduction of new varieties of fruit within the past twenty years been productive of any real advantage to the public?
11. What new varieties of fruit have given promise of superior merit in 1874—Apple, Pear, Peach, Plum, Cherry, Grapes, and small fruits?
12. Planting country roads, streets, boulevards, &c., with the most suitable trees? What the proper distance apart? Should the trees be planted in single or double rows, and be all of one sort, or mixed up, to produce the best effect? What the best time for planting?
13. Plantations for shelter—What trees most suitable, and what the most judicious arrangements as regards shelter and picturesque effect?
14. What are the best Magnolias for general planting in Western New York, and what the most favourable time for transplanting them? Does it increase the hardiness of the Chinese Magnolia to work them on the native species—*acuminata*.
15. What varieties of the Clematis have proved hardy and otherwise desirable for planting in Western New York?
16. As an average in years, which is most profitable—raising fruit for market, or raising farm crops and domestic animals?
17. What general selection of fruits, and proportions of each, would be best to keep up a yearly family supply?
18. What method should be adopted to secure improved varieties of fruits and vegetables?

—The rare and chaste *CATTLEYA BOGOTENSIS* is now in flower in Mr. MICHAEL'S collection at Cholmeley Park, Highgate. The flower measures fully 6 inches in diameter, with petals and sepals crisped, and of the palest translucent white, the latter being 3 inches long by 2 broad. The lip is also white, and beautifully stained in the interior with lemon-yellow.

—The committee of the METROPOLITAN FLORAL SOCIETY have made arrangements for holding an autumn exhibition of flowers at the Alexandra Palace, on Tuesday and Wednesday, August 24 and 25, 1875, and "although, owing to the disastrous fire which destroyed the building, they have

been unable to hold an autumn exhibition for the past two years, as they had arranged to do, they hope that the very liberal schedule now presented will bring together as fine, if not a finer, collection of cut flowers than they have ever had. In order to induce exhibitors to come forward they have determined to abolish all entrance fees, trusting to the liberality of all growers of florists' flowers to help them by subscribing to their general funds. The committee have

sions;—No. 1, girth at the base, 28 feet 10 inches; at 4 feet from the ground, 19 feet 4 inches. No. 2, at 4 feet from the ground, 17 feet 7 inches. No. 3, at the same height, 20 feet. These trees are planted in the park at about 100 yards apart, and so that their positions form a triangle. Their heads are very symmetrical, each with a spread of about 100 feet in diameter. In one of the deer paddocks adjoining the park is a twin Oak, one of the stems of which girths

11 feet 9 inches in girth, and was quite 100 feet long; the middle portion was quite decayed, leaving only about 13 inch sound wood on the outside—this made a clean sweep of everything in its way in falling. There is an avenue of Spanish Chestnuts just inside the park, containing many specimens of remarkable size, and some with very curiously twisted stems; also another avenue of Planes and Limes, specimens of the former exhibiting the most grotesque

FIG. 27.—SCARLET ANEMONES ON THE MEDITERRANEAN COAST. (SEE P. 144.)

also determined to increase the value of their prizes for Auriculas and Carnations, which will be competed for at the Royal Botanic Society on April 28, and the Royal Horticultural Society on July 21.

— We have to thank Mr. EYLES for the following particulars relating to REMARKABLE TREES observed in the course of his professional visits to country seats as a landscape gardener. At Cowdray Park, Midhurst, the seat of the Earl EGDMONT, there are three very remarkable OAK TREES, having straight stems about 20 feet high, and of the following dimen-

18 feet, the other 17 feet 8 inches; the two together measuring at the base 32 feet 10 inches. They appear to be from one root, the heads forming a symmetrical whole, with a spread of branches quite 100 feet in diameter. There are also two remarkable Cedars of Lebanon, growing on the lawn in front of the mansion, measuring 16 feet 3 inches in diameter at 3 feet from the ground; and a Silver Fir in close proximity, measuring 12 feet 4 inches at 3 feet from the ground. This tree cannot be less than from 100 to 120 feet high, and perfectly straight. A similar tree, which was blown down in the deer paddock, measured

forms of growth, and many of the latter being of large size, and covered with tufts of Mistletoe. A lover of arboriculture would find these trees well worth inspection.

— During the severe frost we (*Irish Farmer's Gazette*) saw the fine mass of SARRACENIA PURPUREA which has now been growing out-of-doors for some years in the bit of artificial bog in the Glasnevin Botanic Gardens, with its toes (roots) literally in an ice-pail, the water surrounding it being completely frozen, and skaters disporting themselves alongside it.

We have seen it since nearly submerged, apparently emerging its cold bath, and looking quite hale and happy. A fusing alike to be either frozen or drowned. In fact, it is evidently one of the hardiest of hardy plants.

The hardness of *LAPAGERIA ROSEA ALBA* has been put to a severe test at CAMBERSHAY during the severe wintry weather that characterised the opening year. A vigorous shoot from a plant growing along the roof of a small span-roofed house thrust itself through an opening in the woodwork, and was nailed on the outside of the house on an open north aspect. Not a trace of injury appears to have been received: the shoot appears to be as fresh and healthy as any inside the house, notwithstanding the exposure during such inclement weather.

We learn from Mr. GREEN, of Holmesdale Road, Reigate, late gardener to W. W. SAUNDERS, Esq., that some of the species of *XEROTES* has been uninjured in the open air, though exposed to 20° of frost. At Kew, *N. longifolia* has also remained uninjured, though, curiously enough, it has succumbed at Reigate.

We are requested to state that the Rev. H. H. DOMBRAIN, Westwell Vicarage, Ashford, Kent, is the secretary to the fund for providing assistance for the family of the late Mr. C. N. THOMPSON—late sub-editor of the *Journal of Horticulture*. We trust that for the sake of the memory of the THOMPSONS (father and son), and for the sake of the sore-stricken family of the latter, Mr. DOMBRAIN'S labours will not be light.

Mr. J. GIRARD-COL, of Clermont Ferrand, France, sends us a specimen of a very neat and inexpensive *ZINC LABEL* for plants, and which is highly spoken of for durability. They are in use in many of the principal establishments of France.

We understand that Mr. SMYTHE, who for the last nineteen years has had the management of the gardens at Elmham Hall, Norfolk, will shortly retire from that post, in consequence of the death of his late employer, Lord SONDES. Mr. SMYTHE has given great satisfaction while at Elmham, and we trust he will soon meet with an engagement worthy of his abilities.

A handsome silver epergne or centrepiece has recently been presented to Mr. ALEXANDER JONES, for five years hon. secretary to the EALING, ACTON, and HANWELL HORTICULTURAL SOCIETY, by the subscribers to the same, in recognition of his great services to the Society during that period. The presentation was made by the President of the Society, the Right Hon. S. H. WALTON, M.P., on the occasion of a complimentary dinner to Mr. JONES at the Criterion Restaurant, Piccadilly. The table decorations, which were of an extremely elegant and appropriate character, were kindly supplied by Mr. JOHN WILLS, who also furnished some fine exotic flowers with which to embellish the epergne.

According to M. CLOS, the cultivation of the Potato was begun in France at Arras in 1589, by C. DE L'ÉCLUSE (Clusius). In some districts of France it was not till after 1832 that their cultivation became general, a landlord of Sorze having had to compel his tenants to grow Potatoes on pain of eviction.

A fine new and undescribed SPECIES OF *DRACENA* is flowering in the Palm-house at Kew, and will doubtless shortly be published. This specimen is about 12 feet high, a single stem springing a fine crown of leaves, from among which surmount several axillary panicles. The leaves are more than a yard long, linear-lanceolate, and spread with a gentle curve, showing on the under-side an ornamental pale yellow quill-like midrib. The panicles are erect, with spicate branches, either single or in twos or threes, from the same point, bearing small flowers in dense fascicles. They are pale yellow, and like an African species: a plant sent by Mr. G. MANN, in 1862, is apparently the same. The nearest relative is *D. fragrans*, native of Guinea and Sierra Leone, of which a fine specimen near at hand is coming into flower. Of this the panicles are all terminal, with few branches, and reddish dense flower-buds. The leaves are about 2 feet in length, and are without a coloured midrib. It may be worth remark that *D. latifolia* is frequently cultivated for *D. fragrans*.

The subject of the next evening lecture at the Royal Horticultural Society, to be given on February 3, is announced to be FUNGI AS CAUSES OF DISEASE, REAL OR SUPPOSED, by the Rev. M. J. BERKELEY.

At a general meeting of the Highland and Agricultural Society, held on January 20, it was announced, in connection with the forestry depart-

ment, that the premiums awarded in 1874 were a medium gold medal to each of the following—1, L. Bayne, forester, Kimmel Park, Abergele, North Wales, for a Report on Planting Exposed Land; 2, R. Hutchinson, of Carlwisle, Kirkliston, for a Report on the Cedrus Deodara; 3, A. Gilchrist, forester, Urie, Stonehaven, for a Report on Natural Coppice Wood of other species than Oak; 4, J. Nisbet, Probationer for H. M. Indian Forest Service, Hanover, for a Report on the Soils and Subsoils suited for the various Species of Forest Trees; 5, W. Gilchrist, forester, Cluny Castle, Aberdeen, for a report on the same subject. The premiums to be offered during the present year are:—On Extensive Planting by Proprietors, £10; on the General Management of Plantations by Practical Foresters, £10; on Planting on Peat Bog, £5; on Forest Trees of Recent Introduction, £5; on the Value for Economical Purposes of Corsican Fir, £5; on the Pines Finaster, or Cluster Pine, £5; on the Effects Produced on the Various Species of Forest Trees by Smoke from Public Works, £5; on Charcoal-producing Plants, £5; on Perthshire Woods, Forests, and Forestry, £10; on Ross-shire Woods, Forests, and Forestry, £10; on the Utilisation of Waste Produce of Forests and Woodlands as Matter for Making, either Separately or in Combination with other Substances, an Artificial Fuel, £10.

An amusing but very natural mistake is made in a recent number of a French scientific journal, when speaking of Owen's College, Manchester, which is gallicised into the "Collège de Saint-Ouen." What will our go-ahead Manchester friends say to this speedy canonisation of the founder of their new university?

From Messrs. VEITCH we have received (January 23) flowers of the pretty and singular *HAMAMELIS ARBorea*, figured in our vol. i., 1874, p. 187. That it should flower so early is an additional recommendation.

Home Correspondence.

The Royal Horticultural Society.—The present Council of the Royal Horticultural Society came into office with the belief that their predecessors had exaggerated the difficulties of the Society, and that they were sacrificing the Society's interest in arranging with Her Majesty's Commissioners, in consideration of relief from rent and debenture interest, and something for horticulture, estimated to amount in all to about £5400 a year, to admit exhibition visitors free. They then adopted the opposite theory, that the difficulties of the Society had not been fully shown to them. My object now is not to "cry over spilt milk," but—as the Council and all connected with the Society must feel, after the late sweeping retrenchments both at South Kensington and at Chiswick, that, especially as far as horticulture is concerned, the prospects of the Society are melancholy—to urge a change which I believe would conciliate country horticulturists, and make them join and support the Society, and which would not injure the recreation of the resident Fellows. This is to let the resident Fellows and those wanting the use of the gardens pay their present subscription, but to admit country and other horticultural Fellows to Chiswick at all times, but at South Kensington to shows and meetings only, charging them a guinea subscription. I believe that if this plan was properly worked by country committees, thousands of new Fellows would join, and then the Society would be a national one, which some means are taken to bring about this result, immensely valuable land, bought with the people's money, cannot long be allowed by those who are responsible for its use for public objects to continue of the very small public use the South Kensington gardens now are. *George F. Wilson, Heatherbank, Weybridge Heath.* [We believe that some such proposal as this will be made by the Council at the ensuing general meeting, but till we have more definite information, we forbear from comment. EDS.]

Guernsey Pears.—It will, no doubt, interest growers of English fruit to hear that the six Pears exhibited by me at Kensington, which weighed together nearly 20 lb., and one single Pear of which reached, when fresh, up to 5 lb. with a girth of 20 inches, the whole grown on one small cordon tree, have been pro-

nounced by the best Continental judges to be "very remarkable specimens." In the words of the Editor of the *Revue Horticole*, "It is a fact unparalleled," with other flattering commendations as to culture which I need not repeat. In addition to this many letters from English growers express their convictions that a single Pear of the size mentioned has never yet been seen, and, as a judge at the three largest shows ever held, and acquainted with most novelties in fruit culture for many years, such is my own opinion. What, however, I value most is the fact of these Pears having been grown on a diagonal cordon, a system I have advocated for many years—having, in fact, given it the name "diagonal," which is more determinate than the French "oblique," which is too vague—and being convinced that the diagonal is far more suited for our climate than the horizontal, which last some style "toy cultivation." Be that as it may, no doubt, as Professor Decaisne said to me when reporter at the Paris Exhibition of 1867, "What, have you, too, gone into the 'corkscrew' culture? Good as it is in its place, it will never do for national use." No doubt this great authority was right, and possibly, in time, we shall get to abolish praning altogether. At any rate we all agree that some considerable change is at hand. Neither the huge cordon alone, nor the future expensive walls, that is to say, if these then exist, and be not superseded by cheap glass. Nor will our cultivation of standard trees be the same; for my part I have generally given it up, except for Apples. But more of this at another time. What I feel bound to add here I do with some regret, but, as it concerns exhibitors of fruit it should be said, names being suppressed. Against the recommendations of the dealer at Covent Garden, and at a sacrifice by lots of sale, I was induced to forward the Pears to a provincial show. There was no class for them, as I knew (a strange omission), but I trusted to their merit being recognised by the judges—well known men too. It would excite wonder abroad, and will now to others here, to know that not the slightest notice was taken of my Pears! The largest Pear was slightly speckled near the stem, and is now ruined by the journey, the others are not much better. This is discouraging to exhibitors, and I mention it as a caution to them. Of what use is it to send long distances objects so precious, if, for this or that reason, all the risk is useless? There is this great advantage in a central society, like the Royal Horticultural, that its decisions are uniformly fairer and more liberal, and that they are accepted with greater confidence, not only here, but abroad. And, truly, as my departed friend Hoyle used to say, "Judges require cultivation quite as much as flowers or fruits." *Libera animam meam! Thomas Brabant.*

Variegated Bedding *Tropeolum Minnie Warren*.—I am quite at a loss to understand why the extremely beautiful, easily cultivated, and in every way most thoroughly satisfactory foliage bedding plant, whose name I have placed at the head of this paragraph, is hardly ever seen in our gardens, where, side its heavy and great merits but once known, I cannot but think it would soon become a general and universal favourite. This charming plant was raised as far back as 1869 by Mr. Cattell, of Westerham, and when shown the next year at South Kensington was most deservedly awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society. It is accurately figured in the ninth volume of the *Floral Magazine*, plate 506, and is there described in the following terms—"It is, as will be seen in our plate, exceedingly dwarf in character, in fact of a regular Tom Thumb habit of growth; the ground colour is green, blotched and broadly edged with pale cream, which bleaches out to pure white as the leaves reach maturity. It is perfectly constant in its variegation, and very seldom produces blossoms—another great merit in a foliage bedding plant." When, however, it does bloom and is allowed to seed, the seedlings come quite true to the beautifully variegated character of the parent plant. When budded out with a line of *Iresine Lindeni* on either side, the contrast produced between the two has a most pleasing effect. *W. E. G.*

Buds on Roots of Peach Tree.—In your notice of the Scientific Committee in last Saturday's *Gardener's Chronicle* it is stated that a letter was read "from Mr. Andrew Murray, enclosing a specimen of the roots of a Peach tree with adventitious buds proceeding from it." It was not stated if the tree in question was on its own roots, or had been budded on a Plum stock. If the latter, there is nothing extraordinary in the fact, Plum roots being ordinarily planted for the production of young stocks. *C. L., Hounslow.*

Clematis Stocks.—It may not be generally known that the root of the Clematis *Vitalba* (the Traveller's Joy), so common in many of our hedges, affords the best stock for grafting our garden species of Clematis on. As the season is fast approaching for the operation, a line or two may be useful. The

root, which is about as thick as a finger, and devoid of fibres, runs some yards into the bank. Unearthing it is not easy, but this done it only requires to be placed in bottom-heat for some ten days to quicken it. Lengths of 3 inches answer best; and it is somewhat singular that after the graft has taken the root changes its habit, and throws out a profusion of fibres, after which the graft makes a very rapid growth. April seems the most suitable month for the operation. I have a specimen of *C. montana*, grafted last year at that time, which has made 3 yards of hard wood. *B. Piffard, Hemel Hempstead.*

Covering of Walls.—The time is fast approaching when wall covering will be required. After an experience of seven years, I find that nothing is so well adapted (expense and efficiency considered) as Hessian. I have had to renew it twice in that time, and now it wants a third. During all these years I never missed a crop of wall fruit, excepting two seasons, owing to the covering being left off while I was absent only one night each season. Last year there was a fine "set" of standard fruit, but the destroying breath of April 29 made a clean sweep—not a left and not a sprigling of fruit. It began to fruit, whereas Nectarines, Peaches, Pears, and Plums were not only abundant, but of fine quality. I remember I sympathised with the writer of the "Notes from a Lancashire Garden." If he had only used as much Hessian as would cover his walls, he would not have had to lament a lost crop. I have often thought how improvident it is to take the trouble and spend money on walls about ten months of the twelve, and take a great deal of care to get the branches straight, &c., for against John Frost there is no protection helpless, they are left to his merciless power. *D. Buchanan, Dyrham Park.*

The Late Severe Frost.—I have been anxiously waiting to find some account of the doings of the last few boilers during the late severe frost. Some six years since I put up a large conservatory, a plant stove, and a Fern stove, and I thought, having new houses, I would have one of the newly-invented boilers, which I did—It began to work about October, and worked very well till the last week in November. We had a very sharp frost at the time, and I must tell you that this boiler had 2500 feet of 4-inch pipe to work—700 feet as mains before entering the houses. One night one of my men came, and called me in the middle of the night to say the boiler was leaking, which I found was the case, and all had to come out for new bars. Still, I had my fancy for the new boiler, and thought I would try it again. I had the new bars put in, and the boiler went all right for a time, when it leaked again. I still could not but think that this new system was better than the one, and I had another put in. The next winter came on, and it burst again just before the end of the year, with sharp frost at the time. Then I began to think I had ridden the hobby long enough, and decided to go back to the father of tubulars. I then had a duplex boiler put in, three inches diameter, and it has done its work first-rate through the late severe frost. It takes much less fuel, and gives me plenty of heat; so no more new inventions for me. *Henry Hepburn, Scarisbrick Hall, Ormskirk.*

Paraffin Lamps.—"J. J.," in your issue of the 2d inst., inquires how I am getting on with coloured Pelargoniums. Well, there is not much the matter in respect to frost, although on the night of the 30th ult. the thermometer had been down to 10°. I cannot say so much about damp, but as my plants—that is, the pots—stand on the common garden soil with, it was, only a glass roof over them, it is not very surprising that some few should succumb. Another season I shall make an attempt to lessen this. I enclose two or three leaves to show you that I have some colour still. *W. H. T. [In very good colour for the season. Eds.]*

Echinocystis lobata.—No family offers greater beauty and variety in its seed-vessel and seed than the Cucurbitaceæ. One of the most elegantly shaped water-bottles we possess was doubtless modelled from one of the numerous forms of fruit of *Lagenaria vulgaris*. And in the way of mimicry, what is there more perfect than the Orange Gourd? The seed-vessel of many Cucurbitaceæ does not open in any way to free the seeds, but in such cases it is usually very fleshy and decays rapidly after it is ripe. Others open in various ways. Thus the fibrous fruited *Luffa* opens at the top in as many pores as there are cells, and the Squirting Cucumber, *Ecballium agreste*, parts from the peduncle at the base when ripe, and ejects the pulp and seeds with considerable force. *Hanburia mexicana* has a large prickly fruit, which bursts in a similar manner to the last. The seeds are large, and we are told that the Mexican squirrels are very fond of them, and owing to the fruit being armed with prickly points they cannot open it, and therefore wait in the morning for the sun to burn the ripe ones. Zanoni has a very curious mode of dehiscence, the top of the fruit splitting into three triangular lobes,

which are finally turned inwards into the cavity of the fruit. The fruit of which I send a sketch (fig. 28) belongs to *Echinocystis lobata*, a native of North America, where it bears the name of Wild Balsam Apple. Like *Luffa* this has a fibrous endocarp of very beautiful structure, which opens at the top by two pores; but here the outer coating or epicarp parts at the top into five equal segments, which are gradually rolled back, allowing the seeds

FIG. 28.—FRUIT OF ECHINOCYSTIS LOBATA.

to fall out through the opening in the top of the cells, the fruit being pendent. The fruit is 2-celled, and each cell is 2-seeded, the seeds being attached at the base of the cells. On removing the epicarp and a layer of network-like fibrous tissue, the fibrous framework of the two cells parts of itself to the base. The fruit is described as bursting open with elasticity and irregularly, that is, in different species; and it is possible that the mode of opening shown in the above sketch is not normal. Mr. Jackson of the Kew Museum has kindly examined fruits of the same species preserved in glycerine, from which it appears probable that normally an operculum or lid is thrown off, but the seeds are not expelled. My fruit was taken from the wall at Kew before quite ripe, and placed in a cardboard box, where a few days afterwards I was surprised to find that it had opened in the manner I have tried to show. *II.*

Growth of Timber.—Having recently topped some branches from a group of Elms here, I was much struck with the fact that in each case almost all the expansion of growth in the stem of the branch was on the lower side. I send with this samples of this growth cut from two branches, each about 6 inches in diameter next the stem, the portions sent having been cut off about a yard from the base of the branch. The branches grew out from the main stem nearly at right angles, and on the south side of the group. The trees are vigorous and healthy, and fully exposed to both sun and wind. The nature of this growth may not be peculiar, but although I have done much topping in my time I do not remember to have noticed it before. The heart-wood of the branch is about one-fourth of the diameter from the upper side of the branch, and round it is each year's successive growth of new wood clearly defined; but whilst at the upper side the layers are crowded into an inch in thickness, on the lower side they expand, and are in some cases a quarter of an inch in breadth.

FIG. 29.—GROWTH OF WOOD.

Then again the bark, whilst fairly even all round, is smooth at top and very rough and uneven on the underside. Is this the usual growth of the Elm, or not? And, if the latter, what has produced it? *Alexander Dean, Bedford.* [This phenomenon was explained in an article in our volume for 1853, from which we take the following extract, which will explain all that Mr. Dean wishes

to know—"A tree grows near the north wall of a high house. On the side next the house—namely, the south side of the tree—there is least timber, while on the opposite or north side there is most. The figure (29) represents a circular wood, with four trees standing up its circumference at the cardinal points, the interior of the wood being crowded. At N. the principal formation of timber will be on the north side of the tree, at W. on its west side, and at E. on its east side. If a tree grows singly, without any hindrance to its regular development, it will have the same quantity of foliage on each side, and the production of timber will be as uniformly concentric as could be represented by successive circles drawn by a pair of compasses. In all these cases the excess of timber on the south side does not take place. No doubt at the point S, on the circle, which represents the south, most timber will be formed on the south side, but without any greater difference than will be found at E., N., and W." Eds.]

New Gladioli for 1875.—Having lately become possessed of a well known florist's catalogue, I find in it a list of new Gladioli for 1875, and from the high prices of some of the varieties I am struck at, that gorgeous flower must now be very much improved. On reckoning up the cost of twenty-four of the highest priced sorts in the list, I find it comes to the astounding amount of £33 1s.; and with the disease still rampant which attacks this bulb, I should like to see these new varieties exhibited before adding any of them to my collection. On analysing the names of the highest priced sorts, bulbs of the Duke and Duchess of Edinburgh are charged £3 and £1 each respectively; but it would have been more loyal and graceful to have made the Duchess the highest priced one of the two, unless a set-off is intended by there being a Grand Duchess in the list at £1 10s. There are two saints, male and female, namely St. Jerome and St. Marguerite, priced at £1 5s. and £1 10s. each respectively. Don Carlos figures at 2s. 6d. each year; but no doubt Don Alphonso will be at the list next year. The Duke of Brittany, Duc and Duchesse de Magenta, Madame Danget, Dr. Proudhon and De Tristray, Lescaz, Gosson, L'Ambo, all range from £2 10s. to £4 5s. each bulb. After reading the prices of the above varieties it is refreshing to turn to our old raiser of novelties, Sonchet, who when he ventured to charge 15s. for a bulb of Michel Angel, was regarded as taking the advantage of British growers of the plant. *Argus.*

The New Japan Pear.—Believing your drawings of this *Pyrus* at pp. 106 and 107 of your last number to be correct, as you have made it from Dr. Thurber's specimens, I have little doubt that you are correct in dissenting from Mr. Thomas Hogg's opinion, that the new Japan Pear and *Pyrus sinensis* are identical. But does he mean that they are simply varieties of one species? In comparing a specimen of *P. sinensis* I now enclose to you with your drawing of the new Japan Pear, it will be seen that the two are dissimilar in almost every respect. [Yes,] *P. sinensis* is not so robust in the wood; the buds are more slender and pointed; the leaf-stalk is shorter; the leaves are more obtuse or cordate, smaller, and the edges not so deeply serrated. The leaves do not turn red in autumn, but retain their bright glossy green till the end of January, and in mild winters till spring. The young leaves and shoots are, however, of a delicate rose brown tint when first developed in spring. It is a very bad bearer, no trees having fruited in our nursery during the last ten years, although some have attained a height of 15 feet. In the Bristol nurseries it never fruited while our foreman was employed there; it cannot, therefore, deserve the character of an abundant bearer. Loudon describes it as having "almost evergreen leaves," "bearing insipid, apple-shaped, warted, very gritty fruit." Let us hope that the "new Japan Pear" will be a welcome addition to our collections. *C. Lee, Hounslow.*

The Eucalyptus and the Late Frost.—I observe your correspondent, Mr. Sheppard, of Woolverstone, states that *Eucalyptus globulus* were all killed by the late frost. This is not the case here. I raised three in heat last spring, and planted them out in a shrubby sloping to the south. They have grown fast, making from 3 to 5 feet, and though the young shoots or tips are injured, yet the main and side stems do not appear to be hurt, and the trees appear to me as if they would quite revive later on. Mine were wholly unprotected. With reference to the hardness of the *Loquat*, which your correspondent, A. Dean, of Bedford, mentions, I have had a *Mespilus japonica* (which I believe to be the *Loquat*?) planted here against a south wall for several years, and it has never suffered. True, it has not as yet flowered, though I wish it would, for the flowers in the South of France have a marvellous fragrance. Can any of your correspondents tell me whether the Pepper tree will live in our climate? It is a wonderfully pretty tree, with its graceful foliage and coral berries hanging like *Curtains* in bunches. It is to be seen in every garden in

the South of France, and is well worthy of cultivation. I have some seeds just pushing through, in heat of course. *John W. Malton, The Hermitage, Tringham, near Rochester.*

Do Varieties Wear Out?—It would, I believe, interest many of your readers if some one well acquainted with tropical botany would inform them through your columns what they know of the Banana in reference to this subject. The late Canon Kingsley, in his *Lectures from the Tropics*, says:—“The Banana is wild nowhere now on earth. It has distant cousins, but no brother kinds. It has been cultivated so long that, though it flowers and fruits, it seldom or never seeds, and is propagated entirely from cuttings. It has been cultivated so widely, that it girdles the whole earth, and has girdled it as long as records go back.” Do the Musas show any signs of deterioration? If not, it would seem that, in this case, the ordinary mode of propagation can be dispensed with without ill effects. *Richard Binns, Uxerston.*

Rare Conifers.—I am so sorry, after reading in your issue of the 23d inst. Mr. Murray's notes on “Rare Conifers,” and particularly his missing “offspring,” *Picea magnifica*, that I am compassionately moved, with your permission, to write to you, to that he may, without much difficulty, be enabled to take it from among the nobilis, to which he, on his own confession, long ago assigned it. Of course, I do not mean to gainsay what Mr. Murray has written in connection with the up-grown plants which he long ago described, when they were yet in their infancy so to speak, namely, that “we acknowledge ourselves unable to tell from the trees without the cone which are nobilis and which *magnifica* ;” but this much I can state, without fear of being contradicted, that within the last few years thousands of seedlings have been raised in Britain and Continental Europe from seeds grown in cones identical in size and other botanical peculiarities with the one described by Mr. Murray in the Royal Horticultural Society's *Proceedings* of 1862 as *P. magnifica*. Mr. Barron, of this nursery, is in possession of just such a cone, which he received, along with 100 seeds of *P. amabilis*, falsely so-called, from the hands of the late Mr. High Low, of Clapton, in January, 1857. From those seeds he managed to raise a goodly number of seedlings, also about thirty young plants from seeds which he extracted from the cone which was presented to him. The seedlings of both lots were specifically the same, but entirely different from seedling nobilis. The seeds were identical with those which we sow from year to year as *P. amabilis*, but which invariably turn out to be *P. magnifica*. They are somewhat longer than the seeds of *P. nobilis*, but about the same proportion, perhaps, that the cone is longer than that of *P. nobilis*. We have in this nursery plants of *P. magnifica*, varying in heights from 1½ inch to 9 feet; but the one species' relationship is easily recognised in all the stages of development, from the smallest to the largest, and I find that the same species of plant was known to me fifteen years ago, in the Messrs. Dickson & Tunbull's nursery, Perth, Scotland, as *P. nobilis*, var. *robusta*, and a year or two subsequently as *P. magnifica*; and why it was called *robusta* I never could see, for it has not proved itself so robust as *P. nobilis*. The following comparison of the two species, in both their young and mature or aged states, may possibly help Mr. Murray to recognise his missing “offspring,” and at the same time assist others, who may have a greater practical and even moneyed interest in them, in determining the difference existing between the two much-confounded species:—

P. magnifica, one year old.—Seed leaves from seven to nine in number, and from 2 inch to 2½ inch long, thin, with sharp pointed, bluntly ridged, and entirely covered with a glaucous bloom on the upper face; flat and of a dull green colour on the under face. Mature leaves from ½ inch to 1 inch long, narrow, and tapering from about the middle to a rather sharp point, flat, or more properly slightly convex, never channelled, and covered with faint stomata along the middle of the upper face; convex and entirely covered with very faint stomata on the under face.

Picea magnifica, mature.—Leaves slightly falcate, incurved, blunt pointed, never emarginate, and somewhat four-sided, from ½ inch to 1 inch long, and ¼ inch broad, slightly adpressed to the stem, and turned upwards; ridged and covered with faint glaucous stomata on the upper face; ridged with two pale but rather broad bands on the under-face.

P. nobilis, one year old.—Seed leaves from five to six in number and from 1 inch to 1½ inch long, rather broad and flat, convex and covered with a faint whitish bloom on the upper face; flat and of a glossy-green colour on the under face. Mature leaves from ½ inch to 1 inch long, rather blunt pointed, flat, and channelled from base to point, with faint tracings of stomata on the upper face; slightly convex and over-spread with clear white stomata on the under face.

Picea nobilis, mature or aged.—Leaves linear, falcate, incurved, blunt pointed, often slightly notched, from ½ inch to 1½ inch long, by nearly ¼ inch broad, compressed, so much so as almost to hide the bark from

view except on the underside of the branches; channelled for about three-quarters of their length, and of a rich bluish-green above; slightly keeled and with two and sometimes four distinct silvery bands below.

Further comparison of the two species here is unnecessary, as the differences in the buds, colour of the bark, and the habits of the two trees are very slight. And after all that has been said about them, it will be seen that the distinguishing character of the leaves is their relative shape, those of *P. magnifica* being four-sided, while those of *P. nobilis* are rather flat, and invariably grooved for three-fourths their length on the upper face—a character, by the way, which Mr. Gordon in his *Pintum* and its supplement entirely overlooks. I herewith send a photograph of *P. magnifica* and *P. nobilis*, which, if you see fit, you can make use of. Mr. Barron sent a cone similar to the one named *magnifica* on the *carte* to Dr. Hooker, who, I understand, named it *P. magnifica*. *George Syme, Edwinton Nursery, Borrowash.* [The photograph corresponds with that of *P. magnifica* sent by Messrs. Sander. Eds.]

Proliferous Pear.—I have sent you a curiosity that was cut from a pyramid Pear tree here to-day during the process of pruning. I should like to know what you think of it. Do you think that the one bud was part fruit and part wood bud, and formed that monstrosity of a fruit and the shoot at the same time? Or do you think that it is an excrescence of the wood? It is evidently fruit, as

FIG. 30.—PROLIFEROUS PEAR.

the tomites have commenced eating it. *C. Orchard, The Gardens, Coombe House, Croydon.* [The specimen sent is very like the one figured at fig. 30. The edible portion of the Pear is now well-known not to be the true fruit, but a swelling of the branch enclosing the true fruit (the core). Eds.]

Rivina humilis.—This plant is held in great esteem here, both by my employers and myself, for furnishing the mansion and the embellishment of the stove and conservatory, the bright berries harmonising with any other colour they may be put against. If for a single specimen what is more lovely than a plant in a 5 or 6-inch pot, furnished to the bottom with berries and leaves, or for a group to make the *Rivinas* predominant, mixing a few white *Primulas*, *Poinsettias*, *Calanthe Veitchii* and *vesita* kinds, a *Draena* in the centre, a Fern, *Isolepis gracilis*, and a few *Adiantums*? In a group like this it tells gloriously. For the dinner-table I think it unsurpassed, the light above bringing the pendulous racemes out so well—if a little *Panicum veridulum* or *Selaginella* be placed under the plant, so much the better. The treatment I give them to obtain plants to answer this purpose is to pot seedlings, which may be taken in abundance from the pot of the old plant in early spring. I prefer seedlings to cuttings, as you can make a more compact plant of them. Pot them in light soil, in 3-inch pots, grow them on quick in a moist heat, and when 4 or 5 inches long take the top off them, repot in a stronger compost, and grow on

quick, pinching all the flowers off, shading a little, syringing freely, and generally affording the generous treatment, which all decorative plants are subjected to, especially in the dull and cold part of the year. *A. Bradshaw, Calwich Abbey Gardens.*

Vegetation in Merionethshire, North Wales: Jan. 21.—Snowdrops, Aconites, and yellow spring Crocus, in flower. *Olea europaea* has stood uninjured; *Dicksonia antarctica*, planted by a high rock, had the tips of the fronds browned; *Primula suaveolens* and *P. Farryi* coming away strong. The above at Tyn-y-coed, near Barmouth. *Laurus Camphora*, the tips of young shoots browned; *Benthamia fragifera*, a large plant, 8 feet high, quite green and un-injured; *Grevillea juniperina*, a large plant, in full flower; at Aberia, near Penrhynendreath. *Thomas Short.*

Notes from South Shropshire.—The severe frost with the thick covering of snow that locked up the earth during the last days of December disappeared soon after the new year commenced, and no mischief seems so far to have been done to the shrubs which are the glory of this garden. Get situated on the slope and than many others the *Desodars*, *Taxodia*, *Araucaria*, *Cupressus Lawsoniana* of several varieties, including the lovely *viridis erecta*, as well as the *Arbutus*, spread out their branches with a grace and luxuriance of growth that prove how well the soil and shelter suit them. The garden extends along the edge of the river for about 300 yards in length and receives the full benefit of the mid-day and afternoon sun, while the cruel north and easterly winds are shut out by high ground that ends in a bluff 300 feet or more above us crowned by thick woods and narrowing our space very picturesquely, especially where the red sandstone rock pushes forward towards the river, as if to show the cascade that leaps 70 feet down its face, almost covered with moss and Ivy, and forming a picture in its natural beauty, when the setting sun illuminates with its richest glow the rocks and foliage, that is hardly to be surpassed. The source of the cascade is but a few yards from the edge of the cliff over which it falls; the water, clear as crystal, contains so much fine sand and earthy matter that the moss which grows so freely in its spray is soon encrusted, and in course of time consolidated into stone, that becomes hard and durable and is sought after by builders of rockwork, who admire its peculiar structure. The supply is constant, and seems to vary very little, whether in summer or winter, in wet seasons or dry. Halfway down the cliff another spring fills a tank that lies embowered in Bamboos and other grasses, and might be a bath for a Naiad, and then both cascades meeting in a pool formed at the foot of the cliff, join in a stream that tumbles in a series of cascades to the river. Once upon a time a more prosaic occupier of the ground utilised this picturesque prodigality of water privileges, and erected a water-wheel, which the oldest inhabitants remember, and speak of with reverence and awe as “the biggest wheel that ever was made,” and built a mill, which no doubt did work in its way, but the wheel has long been rust and mill, like many more picturesque ruins, served as a quarry for the materials of a house; and now grassy terraces, planted with Roses and *Rhododendrons*, occupy the site, presenting a more agreeable though perhaps less profitable object to the eyes of those who stroll through the grounds. The front windows of the house look into a retired part of the garden, in which a fountain, supplied from one of the springs above, flashes lazily, and where the water-lilies that breed here in safety search industriously for food, jerking their short tails with quaint coquetish airs. My people know that these birds here are as sacred as the Isis was to the Egyptians, and they seem to be aware of the respect in which we hold them. In front of this part of the garden the river expands into a pool, about equal to 8 acres in area, and about 30 to 40 feet in depth, varying with the state of the weather. Here in the summer evenings we are wont to watch for the salmon, which we do, and then stir the waters in a way that excites the ardour of every fisherman who sees them, but I have never known any one who could persuade one of these giants of the river to take a fly in this pool. We are now looking forward with hope in our garden, mingled with fear that the present mild temperature will be followed by many pitiless frosts that will frustrate our work. Already the blackbirds and thrushes are making the whole neighbourhood full of song, the yellow Aconites are gay, and the Snowdrops beginning to whiten the borders. Primroses, which are self-sown in all the out-of-the-way spots, are opening here and there—the yellow leafless Jasmine in its full beauty, and the *Pyrus japonica* is opening its crimson flowers. In the greenhouse our *Primulas* and *Cinerarias* are in great beauty, the latter are rather more forward than we intended, and our Roses are already opening. Among these *Safra* are a great favourite, because of the uniform success of their gold and nettle buds (I hope your lady readers will accept the new colour) which she furnishes through the year; and though last, not least, *Souvenir de la Malmaison*;

these I consider our true perennials. Our Vines are now dormant; to them we do not give any heat until quite the end of February. In the kitchen garden we planted some Potatoes before Christmas, finding that so planted the year before produced better than what were set at the usual period. We shall see if the severe season lately experienced makes any difference. S., Jan. 20.

Reports of Societies.

Royal Horticultural: Jan. 27.—*Evening Lecture*.—Sir Alfred Slade, Bart., in the chair. "The subject of the lecture on this occasion was, 'The Fertilisation of Flowers by means of Insects,' and the lecturer, Mr. Alfred W. Bennett, M.A., B.Sc., F.L.S., commenced by giving a historical sketch of our knowledge of the existence of sexes in plants. After a brief reference to the very slight indication of any recognition of the phenomenon in the writings of the ancients, he spoke of the first distinct acknowledgment of the part played by the pollen in fertilisation found in Nehemiah Grew's writings in 1682, closely followed by Camerarius in 1694, and Vaillant in 1717, the new doctrine being, however, scarcely taken up on publicly known grounds by Tournefort in 1790, and Pondeira in 1801. It may be said to have been firmly established beyond all question by the writings of Linnæus, commencing in 1720, especially by his *De Nuptiis et Sexu Plantarum*, and *Sponsalia Plantarum*. The first discovery of the fact that a certain number of hermaphrodite flowers are not self-fertilised must be attributed to Kôlreuter in 1761, who distinctly asserts this to be the case with all Cucurbitaceæ, all Tridæe, and not a few species of Malvaceæ; and he correctly refers the agency in fertilisation, partly to the wind, partly to insects. This was followed in 1793 by the better-known and oft-quoted work of Sprengel, who brought more accurate powers of observation to bear on the subject, and arrived at the general law that "Nature does not intend any hermaphrodite flower to be fertilised by its own pollen." From this time the subject appears to have slept for nearly half a century. Treviranus, Schulz-Schultzenstein, the elder De Candolle, and Caspary, all doubted the correctness of the conclusions drawn by Sprengel had arrived at; while a few confirmatory observations were made by other observers, as Andrew Knight in 1799, who propounded the theorem that "no plant self-fertilises itself for a perpetuity of generations"; and Robert Brown in 1833, in the case of Orchidæe and Asclepiadæe. Attention was again first prominently called to the subject by Darwin's writings, especially in his work on the *Fertilisation of Orchids*, published in 1862, since which an immense mass of facts has been collected, and fully brought out in the main the correctness of Kôlreuter's and Sprengel's observations, and which is to be found in the writings of Darwin, Hildebrand, S. Axell, Delpino, Müller, and Lubbock.

The lecturer then proceeded to describe the various modes in which cross-fertilisation is secured in the vegetable kingdom, viz., diadichomy, or the separation of the sexual organs into different flowers (monoecious or dioecious), giving as illustrations the Hazel, *Aucuba japonica*, and *Vallisneria spiralis*. Dichogamy, or maturing of the sexual organs in the same flower at different times, whether protogynous (*Plantago Scrophulariæ*) or androgynous (Geranium, Caryophyllaceæ, Labiate, Campanulaceæ). Dimorphism and trimorphism (Linum, Primula, Oxalis, Lythrum). Special contrivances for preventing self-fertilisation (e.g., *Salvia, Marcarviva*). He then concluded by a reference to the purpose of colour and scent in flowers, and especially to that of variegation as a guide to insects in searching for the nectary; a point to which attention was called so long ago by Sprengel, and well illustrated in the case of the Pansy.

Leeds Professional Gardeners' Friendly Benefit Society: Jan. 13.—The eighth annual meeting of this flourishing Society took place on the above date, about eighty members of the Society being present. Mr. George Hemming, the president of the Society, occupied the chair, and Mr. Henry Kilvington, the vice-president, the vice-chair. Letters of apology were read from the Mayor of Leeds (H. R. Marsden, Esq.), H. Oxley, Esq., J.P., and other gentlemen of influence. Amongst those present were the Vicar of Leeds (the Rev. Dr. Gott), Councillors Jackson and Stead, Mr. J. W. Jones, Mr. Curtis, and others. After the usual loyal toasts had been duly honoured, Mr. Councillor Jackson proposed, "The Bishop and Clergy of the Diocese," Dr. Gott, in responding, said it afforded him very great pleasure to meet so many of the gardeners of Leeds that evening at their annual gathering. All such objects as the Society aimed at always had his warmest approval. He was glad to know that, in addition to the advantages of a benefit society, much other good was being done by there being read at the Society's monthly meetings papers or essays on subjects relating to gardening, which he thought would

tend to infuse a higher standard of education among gardeners than is generally to be found in any other body of tradesmen; indeed, gardening seemed to him to stand apart and above other trades, and to rank as a profession. The great responsibility which upon gardeners of the great variety of work they had to perform, the discoveries that were continually being made, must all tell immensely on the character of the gardener, and help to elevate him above the ordinary trades.

Mr. Councillor Stead, in proposing "The Town and Trade of Leeds," said the toast he had to propose, if not the toast of the evening, was at all events nearly allied to it, because on the prosperity of the town and trade of Leeds hung in some measure the condition of its gardening. As our business men prospered, so would they always long to devote a portion of their gains to the pleasing pursuit of gardening, and thereby contribute to improve the condition of its gardeners. He always had a strong love for gardening, and as he now held the position of Chairman of the Leeds Horticultural Gardeners Company, he felt more than ever interested in the welfare of gardeners and gardening. Leeds, being fortunate in the position in which it is situated, is able to compete successfully in many important branches of industry, particularly in iron, woollens, and leather. In gardening matters there is also evidence of progress. That Society, the Corporation had also done something towards encouraging gardening by purchasing the magnificent park at Roundhay. The Society of which he had the honour to be chairman was using its best endeavours towards carrying out a high class of gardening, and he begged to take that opportunity to thank the gardeners of Leeds for the valuable assistance they had already given the company. If they all co-operated they had good reasons for being hopeful that gardening, along with other branches of industry, would continue to advance to the point of prosperity.

Mr. William Rushforth, nurseryman and seedsman, Leeds, responded. The Secretary (Mr. William Sunley) read the report, from which we learn that the income of the Society for the past year is £144 18s. 2½d., the expenditure during the same period is £116 9s. 6½d., leaving a balance in favour of the Society for 1874 of £28 8s. 8d., which, added to the savings of the seven previous years of £495 3s. 4½d., makes a total placed to the credit of the Society of £433 12s. 0½d. During the past year seven honorary and eight ordinary members have been enrolled, making a total of thirty-one honorary and 136 ordinary members. During the same period the Society has lost by death two members and one member's wife; also three members, in consequence of very grievous affliction, are now receiving the stipulated allowances for continued illness. The committee gratefully acknowledge the very liberal support accorded to the Society by its honorary members, which in a great measure enables them to defray the pleasing fact that notwithstanding the Society having had to meet heavy claims of sickness, infirmity, and death, its prosperity continues. The committee has been much gratified in noting the good attendance of members at the Society's monthly meetings, the interest excited by the papers read thereat, and the discussion resulting therefrom, which must be the means of diffusing much useful information amongst all. To the younger members of the Society the committee gives its most earnest and pressing invitation to attend these meetings regularly, so that they may be able to contribute and receive their due share of the advantages to be derived by the readings of those papers, and of the discussion to which they give rise.

Mr. R. Featherstone, responding to the toast of "The Professional Gardeners' Friendly Benefit Society," stated that the report for the past year demonstrated some of the good accomplished by the Society. He was confident that all members who had the privilege of attending the monthly meetings would support him in testifying to the great pleasure and benefit they all derived from the reading of the papers alluded to. The Society's head gardeners and gardening in that district, owned many members of distinguished abilities in their profession who were pledged to do their utmost to uphold the honour and welfare of the Society. There was, therefore, good reason to anticipate that the future course of this Society would continue to be as prosperous as the past had been.

Obituary.

DIED on January 15, aged 46 years, Mr. THOMAS BURNETT, gardener to Sir Sydney H. Waterlow, Fairisle House, Highbury. Mr. Burnett commenced his gardening career at a very early age, leaving school at thirteen, and spending the early part of his time in different places in Devonshire, and a very important part of it with the late Mr. Veitch, of Exeter, grandfather of the present Messrs. Veitch of Chelsea. Possessing great aptitude for learning his business, he became head gardener at an earlier age

than usual, commencing at Ashby Court, Tiverton. During the two years he was there he entirely remodelled the place, showing his ability as a landscape gardener and an artist. From thence he went to Lord Boston and Lady Molyneux, near Slough. The next six or seven years were spent at Bynard's Park, Surrey. Thence he removed to Dowdshire House, Roehampton, for three and a half years. These were places of great extent, and where gardeners of ordinary temperament would have rested; but Mr. Burnett had not yet realised his ambition, for although a great lover of gardening generally, his ambition was to be more amongst exhibiting. This he soon commenced after going to Peterborough House, Fulham (W. Terry, Esq.). Here he grew as fast a collection of Orchids as has been seen round London for many years, especially in a short time, as the Horticultural, Botanic, and Crystal Palace Shows testified, and those that had the pleasure of visiting Peterborough House at that time will not soon forget the collection of *Anæctochilus* included perfect marvels of cultivation. But no doubt this proved to be to him a fatal mistake: confining his attention so much to the hothouse soon broke down his constitution, and after struggling for six years he was compelled to resign for some less exacting position. This he readily obtained at Fairisle House, Highbury, where, although no more suitable position could have been selected for an enfeebled constitution, combined as it was with the utmost indulgence shown by his employer, he finally gave way, after struggling for two years. B.

—Died suddenly, on Thursday afternoon [last, Jan. 21, in his 72d year (shortly after leaving his home in St. Swithin Street, in good health and spirits), and in the garden he had tended with undeviating care and ability for upwards of forty years, Mr. THOMAS WEAVER, gr. to the Rev. The Warden, Winchester College. Mr. Weaver was thoroughly practical and most persevering in the attainment of general as well as professional knowledge. His services were highly valued by the late and present Wardens, both of whom he had the honour of serving, and by those residents who sought from him information upon the botany and entomology of the neighbourhood, he being at all times willing to impart his very accurate and extensive knowledge on these subjects to all enquirers. Nearly half a century ago he was with the late Mr. Baxter at the Oxford Botanic Garden, and it is probable that while there he acquired a taste for British botany, which to the end of his days was a source of great pleasure to him. It must not, however, be understood that his love for plants was confined to those of our own island, for in the Warden's garden at Winchester are many of his pets in the way of good exotic hardy herbaceous plants, of which he was an ardent admirer. A few years back Mr. Weaver was a not unimportant contributor to the horticultural papers, and a successful exhibitor at the Southampton and other horticultural shows. W. H. B.

By the death of Canon KINGSLEY science loses an ardent admirer and a faithful expositor. Though not profoundly versed in geology or botany, he succeeded by his vigorous, accurate, graphic word-painting in instructing and interesting a large class of readers who could not otherwise be reached. His descriptions were simply magnificent; witness his accounts of Tropical Vegetation in his *At Last*. His *Town Geology* also is a masterpiece in its way. Vigour and truthfulness were as characteristic of the man as of his style. Several years since, at the instigation of the late Professor Henslow, Mr. Kingsley was an occasional contributor to the *British and Foreign Review* to regret that his ill health and premature death have prevented him from fulfilling a promise to renew and extend his connection with this journal.

—We first learn the death of General JACOBI, which occurred early in November last, through a brief biographical notice (in Dutch) of the deceased from the pen of M. de Jonge van Ellemet (*Albano van Jacobs, Levensbericht door de Jonge van Ellemet*). General JACOBI was a grandson of the celebrated philosopher and theological writer, F. H. JACOBI, a contemporary of Goethe during the early and middle periods of his life, and a warm supporter of the Kantian philosophy. Van Ellemet draws his materials partly from personal knowledge, and partly from a memoir by Lieut.-General Baron von Troschke, in the *Militair Wochenblatt*, Nov. 18, 1874. He is described as a highly-gifted man, a brave soldier and a true friend. His military talents were recognised and acknowledged in the highest manner, and it was as an amateur botanist and horticulturist that we in England knew him—an amiable unassuming man, who devoted his leisure time to botanical pursuits out of pure love for the beauties of Nature. Agaves and other succulent plants were his favourites. In 1864 he commenced publishing, in Otto's *Hamburger Garten und Blumenzeitung*, a monograph of the genus *Agave*, under the title of *Versuch einer Systematischen Ordnung der Agaven*, which was continued and

completed in the *Abhandlungen der Schlesischen Gesellschaft für Vaterländische Cultur*. For this work he very modestly claimed no scientific value, describing it as an attempt to devise a classification suitable for horticultural purposes. There is little doubt, however, that he possessed a far more extensive practical knowledge of the genus than any living botanist, and it was simply a want of scientific training that prevented him from producing a monograph of more lasting value.

The Villa Garden.

WINTER PRUNING OF WALL TREES.—We have now reached, in the order of the seasons, that time of year when wall trees, such as Apricots, Peaches, Nectarines, Plums and Cherries require to have their winter pruning done. For some time past a great rainfall has taken place, which has much retarded gardening operations in the open air, but as some settled weather may now be looked for, advantage must be taken of every favourable opportunity to get the pruning of wall trees performed. As a rule, Villa Gardens are bounded by walls, which may be turned to account for fruit culture. There are now so lofty as those which are found in fruit gardens, for the simple reason that tall walls would exclude from small gardens too much light and air. There is a certain disadvantage in having low walls, for the simple reason that they do not admit of a free development of the trees; a certain restriction must be applied to them, which calls for the exercise of some skill in so treating the trees as that they shall produce fair crops of fruit. Walls not more than 5 to 6 feet in height are frequently met with, and there is the additional disadvantage of having the trees planted in such soil as may compose the border; too frequently of a character not well suited to them. In planting Villa Gardens at the outset it suffices to plant—the appropriateness of the soil is not considered; the garden must be furnished in some way, and the commission goes forth to plant, and too frequently this is done in a careless and imperfect manner. Many difficulties thus beset the fruit cultivator, and the wisest thing to do is to endeavour to make the best of these discouraging circumstances.

APRICOTS.—In the case of this popular fruit, it is always best that the branches should be properly regulated in the autumn after the fall of the leaf. All weak branches are practically useless, and they should be removed; and when Apricots are in a soil that induces a strong growth, much superabundant wood is produced, and this should be removed also. Strong shoots require to be shortened back, especially if they are likely to prove unfruitful, one consequence of cutting back will be to cause them to send forth young growth in the spring, that will supply fruiting wood the following year if attended to during the summer. Old wood that is either naked or barren should be cut quite back, leaving, however, enough of the stem to send forth shoots to lay in during the summer to take the place of the wood removed, as just recommended. "In general, strong and vigorous branches or shoots should not be shortened so much as those that are weak and slender, except for the purpose of filling up a vacancy. In pruning, you should detach the branches from the wall, and when properly cut or shortened to the required length they may be again secured regularly and neatly." This passage enshrines one of George Glenny's golden rules for fruit cultivation.

THE PEACH.—The Peach produces its fruit-buds from the wood of the previous year's growth; it is therefore obvious that it is the duty of the cultivator to maintain such an even supply of fruitful shoots as will secure a good crop each year; at the same time the tree must not be over-cropped, or its productive powers will be weakened in consequence. The main branches of a Peach tree on a wall should be from 12 to 15 inches apart, and from the upper side of these branches the fruiting wood should be encouraged to grow, and those shoots that in the following season will be looked to produce fruit must not be too much crowded; as a rule gardeners like to have them several inches apart, but much depends on the variety, position of the tree, its age, and the soil in which it is growing. After all, a great deal of the success which attends on fruit tree culture depends on the observance of many little things that are taught by experience: the school of experience gives an excellent training, and the young cultivator, enthusiastic and hopeful, but yet inexperienced, will do well to get advice from some practised gardener from time to time. It is impossible to lay down general rules that will cover all the experiences of the cultivator or the requirements of the cultural process.

In many Villa Gardens round London, where clay abounds, the Peach makes a strong, gross, and what

some of the old gardeners appropriately termed a "watery" growth; alluding to its soft and immature character—such wood is practically useless for producing fruit. Where trees in such a condition of growth are also against low walls it is necessary to almost entirely renovate the trees at intervals of five or six years, by cutting away the main branches, and by laying in young wood out of which to construct a bearing tree.

In regulating the length of the fruiting shoots at the time of the winter pruning, regard must be had to their strength; and when a tree is trained on the nearly horizontal fan-shape (on low walls, the branches must of necessity be trained in this direction), the fruiting shoots should not be more than a foot long, and they should be cut back to a wood-bud, *i.e.*, a bud that will produce wood only, and not blossom. The blooming buds are generally produced towards the base of the shoots, the merely wood-buds towards the extremities of them. In order to keep up a succession of such shoots, the cultivator should train a young shoot from the base of the fruiting shoot each year during the summer, which shoot should not be stopped but allowed to grow, and may extend a few inches beyond the space it is required to fill; it should then be shortened by pinching out the point of the shoot.

The hints here given as to the cultivation of the Peach on walls applies also to the Nectarine, though the latter is not so commonly planted in Villa Gardens as the latter.

It is well once in two or three years to loosen all the shoots of the trees from the fastenings in the walls, and give the lines of mortar between the bricks a dressing of whitewash, and at longer intervals point the walls with fresh mortar. Large holes are frequently made in the walls by nailing, or by drawing out old fastenings, and in these holes slugs, small snails, and other insects are apt to secrete themselves; and there they are, ready at hand to work great injury to the ripening fruit, especially during a fall of rain, when the ripening process is being perfected.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 27, 1875.

MONTH AND DAY.	BAROMETRICAL DEPRESSIONS OF 30° FAHRENHEIT.	TEMPERATURE OF THE AIR.		HYGROMETRICAL DEVIATIONS FROM CLIMATICAL TABLES 6th Edition.	WIND.	RAINFALL.				
		Highest.	Lowest.

Jan. 21	— Fine; bright; and cloudless throughout the morning. Overcast; dull; and heavy rain fell in afternoon and evening.									
22	— Fine; bright; and nearly cloudless throughout the day. Lowest temperature of vegetation, 27°.									
23	— Overcast; dull; and rain in morning. Cloudless at noon. Overcast again at night. Strong gale.									
24	— Overcast; dull; and rainy throughout. Vivid lightning from 6 P.M. to 8 P.M. Gale.									
25	— Overcast; dull; and heavy rain in morning. Fine and bright from noon. Cloudy at night. Strong gale.									
26	— Fine; and nearly cloudless all day. Cold; fog at night.									
27	— Overcast; and dull in evening. Fine; mild; with light clouds in afternoon. Cloudless at night.									

— In the neighbourhood of London the reading of the barometer at the level of the sea increased from 29.71 inches at the beginning of the week, to 29.79 inches by the morning of the 18th, and decreased to 29.68 inches by the afternoon of the same day, increased to 29.92 inches by the morning of the 19th, again decreased to 29.32 inches by the early morning hours of the 21st, increased to 29.49 inches by about noon, and then decreased to 29.22 inches by the evening of the same day; a rapid rise followed, and 30.02 inches was reached by the morning of the 22d, and it then decreased again to 29.52 inches by the end of the week. The mean reading for the week was 29.53 inches, being 0.20 inch lower than that of the preceding week, and 0.21 inch below the average value for the same week. The readings were all below their respective averages, that for the 21st being as much as 0.51 inch in defect.

The highest temperatures of the air by day at 4 feet above the ground varied from 54¹/₂° on the 20th to 41¹/₂° on the 22d, the mean for the week being 49³/₂°. The lowest temperatures of the air at night ranged from 46³/₂° on the 19th to 51¹/₂° on the 22d, the mean value being 49³/₂°. The mean daily range of temperature was 9°, varying between 19° on the 23d and 41° on the 17th. The mean daily temperatures of the air and their departures from their respective averages were as follows:—17th, 46³/₂; 18th, 49³/₂; 19th, 45¹/₂; 20th, 48³/₂; 21st, 42¹/₂; 22d, 46³/₂; 23d, 43¹/₂; 24th, 44¹/₂. The mean temperature of the week was 45¹/₂°, being 8¹/₂ above the average of six years' observations.

The highest reading in the week of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, was 72° on the 22d, but on the 17th, 54° was the highest reading. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 30° and 31° on the 22d and 23d, but on the 18th and 19th they were 43° and 44° respectively. The mean for the week was 53¹/₂°.

The weather was overcast and dull on the 17th, 18th, and 23d, but somewhat fine and bright on the 19th, 20th, 21st, and 22d. The direction of the wind was generally W.S.W.

Rain fell on six days, the amount being 0.81 inch. Vivid lightning was seen on the evening of Sunday, the 24th inst.

In England the extreme high day temperatures ranged between 62° at Sunderland and 51¹/₂° at Nottingham, the general average all over the country being 54¹/₂°. The extreme low night temperatures varied from 33¹/₂° at Leicester to 26¹/₂° at Manchester, the general average being 29³/₂°. The extreme range of temperature in the week was 25°, varying from 33° at Sunderland to 20° at Leicester. The mean high day temperatures ranged from 51¹/₂° at Sunderland to 46° at Nottingham and Hull, with an average value of 51¹/₂°. The low night temperatures varied from 20¹/₂° at Blackheath to 34¹/₂° at Newcastle-on-Tyne, with a general average of 38¹/₂°. The mean daily range of temperature in the week was 10°, the greatest range being at Sunderland, 14¹/₂°, and the least at Leicester, 8°.

The mean temperature for the week was 43¹/₂°, being half a degree higher than the value for the corresponding week in 1874; the highest in the week occurred at Blackheath, Bristol, and Birmingham, 45° respectively, and the lowest at Hull and Newcastle-on-Tyne, both 40¹/₂°. Rain fell on every day in the week at Portsmouth, Bristol, Liverpool, and Leeds, and on six days at all other stations; the amounts recorded at the different places varied from 1¹/₂ inch nine-tenths at Bristol, to six-tenths of an inch at Liverpool, the average fall over the country being 1 inch.

The weather during the week has been somewhat fine, although the sky has been generally overcast, but showers of rain have been frequent. Snow fell at Liverpool, Manchester, and Bradford, on the early morning of January 23.

In Scotland the highest temperatures ranged from 57¹/₂° at Glasgow to 47° at Dundee. The lowest temperatures varied from 29¹/₂° at Greenock and Leith to 26¹/₂° at Aberdeen, their respective averages being 53¹/₂° and 28¹/₂°. The range of temperature in the week was 24¹/₂°. The mean temperature for the week was 40¹/₂°, being 1° lower than the value for the corresponding week in 1874; the highest was 41¹/₂° at Glasgow, and the lowest was 35¹/₂° at Dundee. Rain fell to the amount of 3 inches and three-tenths at Greenock and 2¹/₂ inches at Glasgow, but at Aberdeen seven-tenths of an inch only was measured. The average fall all over the country was 1 inch six-tenths.

At Dublin the highest temperature was 55°, the lowest 27¹/₂°, the mean 44, and the rainfall 1.10 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—*Adiantum*.—The plants will now have almost shed the leaves which annually through the winter they throw off, and their appearance will be much improved by being gone over and hand-picked, removing all that have turned yellow. Plants that are in good health and were thoroughly ripened in the autumn, will now begin to push young growth round the bases of the flower-buds, as an indication of good health and proper treatment, and will in no way interfere with their flowering, as by some supposed—that is, if the growth, flower, and buds were well ripened in the autumn. As they commence to push this young growth they will naturally need a little more water at the roots. Plants that are required to be retarded for exhibition late in the season, or for successional flowering for conservatory decoration, must be at once placed in the retarding-house, where they will not receive any sun.

Young plants of new varieties that it is desirable to grow on quickly should be put in heat, so as to give them as long a season's growth as possible, by which means they will make double the progress that would result from simply allowing them to start later on with solar heat.

Camellias, where planted out, are very often allowed to get so crowded as to become an absolute thicket, growing into each other. Where such is the case, if they have got at thin and straggling, head a portion of them out, and make a new season's growth, taking them up and putting them in pots or boxes: the plants so treated will not only make fine specimens, but their removal will allow room for those remaining to develop themselves much better. Let the whole be gone over with a hard brush and sponge, giving them a careful cleaning before the insects begin to breed and the plants commence to grow. If there is any appearance of the bed being exhausted, remove a little from the surface, without injuring the roots of the plants, and renew with good fresh soil. Camellias in pots should also at this time be well cleaned from insects, and their leaves sponged as recommended for such as are planted out; and if any are suffering from want of additional root-room, they should very shortly be potted so as to get their roots in the new soil before the shoots begin to grow, for if not potted until growth has commenced, it will, as would happen with most kinds of plants, injure their season's growth considerably. In potting Camellias it is necessary to be very careful to make the new soil quite as hard as the old ball (which in the case of these plants generally gets much harder than with most things), for if this is not attended to, the water will run through the new soil, leaving the ball a hard dry mass, which would quickly reduce the plants to a bad state. It is no bad plan in potting Camellias, to leave the new portion of the soil round the rim of the pot half an inch higher for a few months, so as to compel the water to pass through the ball: it can afterwards be removed.

SOFT-WOODED GREENHOUSE PLANTS.—Plants of *Fuchsias* used last year, and that were dried off in the autumn, if not previously pruned, should at once be attended to, cutting them well back, and placing them in a little heat. When they have made some growth, re-pot; these will flower earlier than the summer-struck plants, and will be very useful to precede them. If *Lilias* have been placed in the usual situations, under stages, or other places where there is not much light, see that they do not remain in such after they have pushed their new growth above the soil even ever so little, or they will in a very short time be so drawn as to be seriously injured: remove them at once to the full light, keeping the soil just moist.

Conservatory.—The whole of the different subjects that are here permanently planted out should be gone over and cleaned from the accumulations of dust that more or less gets upon the leaves, especially in the winter season, when there is little use of the syringe or garden engine to remove it; this is especially the case if the plants happen to be affected with scale. The glutinous excrement deposited by these insects upon the leaves catches the dust, which, if allowed to remain, hastens their decay, as well as impairs the general health of the plants. There is no better season for giving them a general and thorough cleaning than the present, before they begin to grow. If they are affected with either white or brown scale let the whole of the wood and leaves be gone over with sponge and brush. The conservatory climbers at the same time should be regulated, cutting in such as require much closer at this than at any other time during the year, and, where nearly bag and scale exist, giving as thorough a cleansing as possible. This is necessary at the present season, for if advantage is not taken of the reduced bulk of the plants to be gone over, through their being cut in, and with no young tender growth upon them, such an opportunity will not occur again for some time. Where this can be done, take them off the wires, and steep them in solution of insecticide as strong as the leaves will bear it, going over the whole with the hard brush. Where *Acacias* are grown, and are at all affected with white scale, the pest increases so fast upon them as to require incessant labour to keep it down, while at the same time it will get upon every plant that is stood under them. The best thing to do with plants of this kind so affected is to head well back, and dress them several times with strong insecticide before they have time to break into fresh growth. It takes a considerable time to go over the permanent plants in a house this way, but it is a saving of labour before the end of the season. The house at this season, before the principal spring-flowering subjects come in, is usually thinner than at any other season of the year, giving a good opportunity for cleaning it well. If the glass is washed, the shelves well scrubbed, and also the floor and internal fittings, the appearance will be much improved. Where the plants temporarily used here are arranged in groups in as natural a way as may be, the arrange-

ment should from time to time be varied, which imparts more interest to the place.

Conservatory borders are generally very limited in space for the roots of the different subjects that have to exist in them, and if not assisted with new soil they become so exhausted that the plants in time get poor and become an easy prey to red spider and other pests. The best way to remedy this is to remove a couple of inches of the surface soil each season, replacing it with such as is rich and new. *T. Baines, Southgate, N.*

ORCHIDS.—A rise of 5° in the temperature may now be given. The East Indian house may be kept at 70° by day, allowing 5° more with the aid of the sun; at the night temperature should be from 5° to 7° lower than by day. The moisture of the air must be proportioned to the heat, an increase of temperature must be accompanied by an increase of moisture; air should be given in fine weather, and where practicable it should be made to pass over the hot-water pipes; it then becomes warmed before it reaches the plants. There is no need of top air being given at present, as every lap in the glass is a ventilator. Above all, currents of air coming in contact with the plants, and especially the ones that are most delicate, as *Aerides*, *Scaccolabium*, *Vandas*, and *Camerotis* are amongst the first to be seen to. Previous to potting the plants should not receive any water for a few days; the old materials are much more easily removed from the roots than when in a wet state. Plants that do not require shifting should have as much of the old material taken from the roots as possible, as by doing so it frees the plants from many insects—the wood-lice especially is generally very close to the surface; on the other hand, the season is now so advanced amongst the crocks. Where ba-kets are used these must be examined; if they show any signs of decay, it is better to transfer the plant to a new basket than to trust to it until it becomes rotten: it is not wise to trust to a basket more than two years; when plants get into vigorous growth it is not an easy matter to transfer them into other baskets without injuring their roots. The most material point to be considered in potting is, that the pots should be well drained; portions of a suitable size should be used, filling two-thirds of the pot, and placing them edgewise, as when placed in that way it enables the point of the stake to be forced between them; by that means it is kept firm; it also allows the water to pass off freely. All species delight in a great amount of moisture at certain periods of the year, but they will not thrive without good drainage. The plants must be made firm by staking, the sphagnum must be made firm and clipped over neatly with the shears; give the plants sufficient water to keep the sphagnum in a fresh state. It adds to the appearance of the plants to cover over the moss with the common *Selaginella* or any small creeping plant with small leaves. Stagnation should be examined, and if they have become dry they should be dipped into a tub of tepid water, so that the whole mass may get a good soaking. Flowering plants which are placed in a dry atmosphere should not be neglected in the matter of watering, sufficient only to prevent shrivelling being given. *G. Baker, Clapham Common.*

FLOWER GARDEN, &c.

PATERRE AND MIXED GARDEN.—Neatness and order are requisite in every department of a garden, but in the flower garden this requires the most vigilant attention. Instead of having set times for performing certain work, as is too often the case, the eye should be ever on the alert to detect any defect, and as soon as observed the order should follow instantaneously for its removal. A good deal of the pleasure of a garden is derived from the manner in which it is kept, and any one having an eye for neatness and order is not slow in detecting a fault in this respect. A small affair, such as a few scattered leaves, a weed or two in the walk, an uneven piece of turf, or a trodden-down edging, will mar the beauty of the best garden eye can see. Worms and other great disfigurement on grass, and these should be kept down by constant sweeping and rolling, or by destroying the worms that cause it. This may be done, or their numbers greatly thinned, by using clear lime-water when they are near the surface, as occurs after heavy rain. A bushel or so of lime is sufficient for 150 gallons of water. If poured on quickly through the rose of a water-pot it will soon bring them to the surface, when they can be picked up and destroyed. Lawns containing extraneous plants, as *Daisies*, *Crowfoot*, *Plantain*, &c., should now be gone over, and such weeds carefully removed, as they are a great disfigurement, and spoil that rich velvety appearance so highly prized in a well-kept lawn. The best way of destroying the above weeds is to dig them entirely out. A simple tool for this purpose may be made out of a piece of iron about an inch or so wide and an eighth thick. This should be sharpened and have a swan-neck bend, so that it may be used as a lever to prize the weeds out by the roots. The late dry summer has been very trying for *Box*

and other like edgings. Look over these, and make good any defects. If the soil is found to be unsuitable to the growth of *Box*, by being deficient in calcareous matter, some fine chalk should be added before planting.

Continue to place in heat all stock plants required for propagating purposes, and keep such things as *Azaleas*, *Altheas*, *Wartburgs*, &c., near the stoves, so as to have plenty of light. If the stock is likely to be short, shift on the plants in light rich soil to get them into free growth. Plants in cold pits are liable to damp at this season. It is poor economy to winter things in these structures, as the expense of mats or any other covering involving breakages, &c., far outweighs the cost of pipes and fuel. If plants have to be wintered in such structures they should be frequently and carefully looked over, and every decayed leaf removed. Advantage should likewise be taken of every dry sunny day to change the air; on the other hand, they should be kept closed if the external air is at all damp. The practice is too common of putting air on these structures thoughtlessly, and without reference to the state of the atmosphere. This is often the case, too, with plants wintered in houses, when in reality little or no air is required during the winter season, unless accompanied with gentle fires for the purpose of drying the atmosphere. There is generally sufficient air in the ordinary wintering laps, and most plants will be found to do much better than when having large volumes of cold air rushing in. *Hollyhocks* should now be planted, so as to give time to get them strong and well-established, to insure a good spike of bloom. Seedlings of these can be obtained at a cheap rate, and are generally but little inferior to named varieties. Before planting out, the soil should be prepared by digging a foot or so in diameter, and as much deep, thoroughly enriching the same. If the manure is at all rank, it should be kept near the bottom of the hole, so as not to come near the collar of the plant, as it is apt to cause canker. Before forking or digging mixed borders, the clumps of bulbs or herbaceous plants hidden beneath the soil should be sought out, and marked by driving neat and lasting pegs of oak or strong galvanised iron wire to prevent them being destroyed. If the latter are made with a circular loop at top they are very neat, and when not in use can be threaded and taken care of. Advantage should be taken of the present season to get a stock of such things made. *F. Sheppard, Woolverstone Park.*

FRUIT HOUSES.

PINES.—The fate of fine Pines being obtainable at all seasons in the year, renders its accomplishment necessary where they are required, which necessitates successions of plants being started at various times during the year. To supplement the batch of autumn-potted suckers which was put into fruiting-pots about last October, it will about this time be necessary to select another lot from those plants which remained at that time, and which have been so far wintered in 7 or 8 inch Sine pots, choosing out the most vigorous and the best-rooted plants for the same purpose; and the plants which remain after this selection is made should be reserved until the spring potting time, when they should be shaken out and disrooted, and be subjected to the same treatment as those suckers which will then be started, thus completing the mode of treatment to which suckers which are potted in the autumn are subjected here. Presuming that the best fibrous loam which is procurable is already prepared for potting in the manner as advised in former Pine calendars, the soil may now be got for use, proceed with shifting these plants, keeping them well down in the pots, to admit of a copious supply of water being given them when necessary, and firmly ram the soil round the balls of the plants, which will, with the force of a brisk bottom-heat, speedily induce root-action, and soon establish the plants in the new materials. For the present, a mean temperature of 63° will be suitable for these plants, and also for those which were potted last autumn, with about 85° at the roots. See that the heat in those beds where plants are starting into fruit does not exceed 90° or 95° at the base of the pots, or the consequences arising from it will be most injurious to them. Teacup pots are most suitable for Queen plants and varieties of similar habit, and 11 and 12-inch ones for those of more robust growth. After the pots are crocked a free dusting of wood-ashes or soot should be applied on the crocks, to prevent the ingress of worms to the soil. *G. T. Miles, Wycombe Abbey.*

CUCUMBERS.—The other day it still very much necessitates all the more care of a close and vigilant attention. An absence of sun for the past few weeks has had the effect of producing foliage somewhat weak and flimsy, despite the greatest care and attention, and it needs no philosopher to discover that when the foliage is in this condition the energies and capabilities of the plants are very much weakened, and the fruits correspondingly stunted. This is, of course, an undesirable state of things, and the means which are calculated to successfully grapple with such

PLANTING SEASON

BURBRIDGE, at the Nurseries; or to Messrs. WORSFOLD and HAWWARD, Auctioneers and Surveyors, at their Offices, New Bridge, Dover.

THE HANDSOMEST SEED CATALOGUE EVER PUBLISHED.

THE ILLUSTRATED GUIDE for AMATEUR GARDENERS - Spring, 1875.

New ready, price 1s. post free. Gratis to Customers.

A thoroughly practical and comprehensive Guide for the Amateur or professional gardener, containing a select list of choice Kitchen Garden and Flower Seeds; ninety-six pages of beautifully illustrated letterpress, with complete directions for the successful management of the Kitchen and Flower Garden throughout the year. Also two superbly finished coloured plates. The whole in an illuminated cover of the most exquisite design and workmanship. This is the most beautiful garden catalogue we have ever seen, the coloured illustrations are inimitable. Messrs. Daniels, the eminent seed growers, may justly be proud to issue such a concise and reliable catalogue as this, which will enhance the high reputation they have already so deservedly gained.

DANIELS BROTHERS, Seed Growers, THE ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

WHEELERS' LITTLE BOOK FOR 1875.

"The Catalogue of Seeds sold by J. C. Wheeler & Son, of Gloucester, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible seed lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties: yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a Short Select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. Wheeler's "Little Book" will do something to satisfy their expectations."

The above was written by that eminent authority, Dr. Lindley, twenty years ago; we still adhere to our original plan of keeping the lists of the different varieties as short and select as possible, so that an order given almost at random from our Catalogue will secure something good and select.

It has grown, however, until it is almost a misnomer to call it a "Little Book," but this growth has been principally and gradually effected by the number of illustrations we introduce.

Our new edition for 1875, for instance, contains eight beautifully coloured drawings of the newest and choicest varieties of Calceolaria, Cineraria, Cyclamen, Mimulus, Pansy, Petunia, Primula, and double Zinnia, drawn from nature by Mr. Worthington C. Smith expressly for our book. In addition to the eight coloured drawings, it contains ninety-two other illustrations, and much descriptive matter; so that altogether it is a great improvement on all previous editions.

It abounds with cultural hints and instructions, and is got up expressly for our numerous customers throughout the Kingdom, to whom it is sent gratis. A few extra copies are printed, which may be obtained on application, post free, for 6d. each.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER, 2A, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability. For Neatness.—Because all the Wires are kept perfectly tight, without the use of the Radisseeur. For Strength.—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees. For Durability.—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system.
 The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 20 feet high and 753 yards long, wired on both sides; making a total length of 1506 yards,—our system being chosen in preference to any other.
 Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Fencing, &c., may be had on application as above.

S. OWENS & Co., HYDRAULIC ENGINEERS, WHITEFRIARS STREET, LONDON, E.C.

TRIAL OF HOT-WATER BOILERS.

Winter is the Season to Test the Efficiency of a Hot-Water Apparatus.

At the Pine-Apple Nursery the Hot-Water Apparatus, on the "One Boiler System," is allowed to be the most perfect of any in the World. The Hothouses are equal to 3000 feet in length, and the Winter Garden Conservatory is 100 feet by 100 feet. The Hot Water circulates through 12,700 feet of Cast Iron Pipe.

Gardeners are most respectfully invited to Visit and Inspect the whole.

Horticultural Builder and Hot-water Apparatus Engineer,
STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

MESSENGER & COMPANY,
CONTRACTORS, MIDLAND HORTICULTURAL BUILDING AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Beg to inform their numerous Patrons and the Public generally, that since the recent disastrous fire they have erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, of any required dimensions. T. G. MESSENGER & CO. are, now, therefore, in a position, from their great facilities and experience, to carry out with dispatch and in the best manner, at moderate cost, the orders with which they may be entrusted. Glasshouses erected on Messenger's Patent principles are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed; are economical in cost and maintenance. Hot-water engineering, in all its branches, Messenger's Patent Hot-water Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application.

Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out.

A richly Illustrated CATALOGUE forwarded Post Free on receipt of 33 Stamps.

STEVENS' TRENTHAM GREENHOUSE BOILER,
After long experience, has proved the most Simple, Economical, Effective, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole Makers, F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

FOWLER'S PATENT STEAM PLOW and **CULTIVATOR** may be SEEN AT WORK in every Agricultural County in England. For particulars apply to **JOHN FOWLER and CO., 71, Cornhill, London, E.C.;** and **Steam Plough Works, Leeds.**

GEORGE'S PATENT CALORIGEN,
FOR
Warming and Ventilating Small Conservatories.

COAL CALORIGEN,
Height, 36 inches; diameter, 21 inches.
GAS CALORIGEN,
Height, 28 inches; diameter, 14 inches.
The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory, while a constant stream of warmed, not burnt, fresh air is introduced. The "Coal Stove" consumes the smallest amount of Fuel—*sd.* per diem being the average cost. It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).
Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E.C.
This Stove introduces a strong current of warmed (not burnt) fresh air.

Prices, in block tin, 50s.; in copper, 50s. Copper, with glass, to give light and heat, 65s. Either will be sent on receipt of Post-office Order.

To be seen in operation at **WILLIAM H. HONEY,** 263, REGENT STREET, W. Catalogue free. No agents appointed.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED.

This Company, having purchased from the Dromore Patent Heating Company Mr. Cowan's valuable Patents for the United Kingdom, is now prepared to undertake the Erection of Apparatus on that System in all parts of the Country.

THE ADVANTAGES OF THE SYSTEM ARE AS FOLLOWS:—

1. In most Cases it SAVES the ENTIRE COST of FUEL.
2. The Heat is maintained more steadily than by any other System.
3. No Night Attendance is required.
4. There is no Smoke or Unpleasant Smell produced.

THE SUCCESS OF EVERY APPARATUS ERECTED BY THE COMPANY IS GUARANTEED.

Full Particulars of this System, Testimonials, and Opinions of the Press, can be seen in the Company's Illustrated Pamphlet, which can be obtained, post free, on application.

The Company has an Efficient Staff of Engineers, and sends at any time to inspect places where the idea is entertained of Erecting the Apparatus.

The System has lately been adopted at Hazelwood, Herts, the seat of Lord Rokeby; Stackpole Court, the seat of the Earl of Cawdor; Ripley Castle, Yorkshire, the seat of Sir H. D. Inglyb, Bart.; Langleybury House, Herts, the seat of Jones Lloyds, Esq.; and at many other places. Also Mr. E. Bennett, of Hatfield, says:—

"I now most cordially beg to congratulate you on the glorious success of your Heating Apparatus (now in use at Hatfield), which is working most satisfactorily, and which has exceeded my expectations. It is a decided success, and more cannot be said in its favour. Should it continue to work in the manner it now does, it will prove a great boon here, and start a new era in the heating of horticultural buildings generally. By your Compensating System we have for every barrow of coals thrown into the kiln some substantial return; by the old system the returns were ashes, and the trouble of clearing them away. I find our chalk is of an inferior quality to some I have seen in the neighbourhood, but we have plenty of heat."

The Company also undertakes the Erection of all other kinds of Heating Apparatus, and of Horticultural Buildings.

PLANS AND ESTIMATES FURNISHED ON APPLICATION.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

GARDENER (HEAD).—Middle-aged, married, no inebriance; has a thorough knowledge of Gardening in all its branches. Can be highly recommended from late and previous employments. Objecting to Land or Stock, or to take Charge of House in absence of Family.—S. P., 2, Felican Terrace, Newbury, Berks.

GARDENER (HEAD).—Age 29, married; thoroughly experienced in every branch of the profession. Has been a successful exhibitor of Orchids, Stove and Greenhouse Plants, and Exotic Rarities. Excellent testimonials and references from both present and previous employers.—NICHOLAS GERMAN, 70, Duke Street, Whitehaven.

GARDENER (HEAD).—Age 39, married, no inebriance; twenty-five years' experience in forcing all kinds of Fruits, Flowers and Vegetables; is also a good Kitchen and Flower Gardener.—D., 13, Church Road, Hammersmith, W.

GARDENER (HEAD).—Age 33, married, one child; through experience in Estery and Late Forcing, and Flower and Kitchen Gardening in all its branches. Fifteen years' experience (five years as Head Gardener). Good character.—The Chalet, Lindfield, Sussex.

GARDENER (HEAD, WORKING).—Age 32, married; thoroughly understands Forcing Vines, Stove and Greenhouse Plants, also Flower and Kitchen Gardening. Six years' good character, and highest reference.—A. M., Albion Cottages, West Hill, Epsom, Surrey.

GARDENER (HEAD).—Age 25, single; thoroughly understands Vinery, Greenhouse, and Flower and Kitchen Gardening. Good character.—T. C. BAINES, Town Hill, Lindfield, Sussex.

GARDENER (HEAD).—Age 30, single; thoroughly practical in all his garden professions. Five years' good character.—Bishops Hall Gardens, Lambourne, near Romford, Essex.

GARDENER (HEAD) and BALLIFF, or BALLIFF and COACHMAN.—Knows Town, and is thoroughly competent to take the entire charge, by contract, For all labour, &c. Wife is a good Dairywoman and Laundress. Four years' character and twenty-five years' experience in all three capacities.—A. B., 4, Royal Terrace, Richmond, S.W.

GARDENER (HEAD, WORKING).—Age 27; understands the Forcing of Vines, Melons, Cucumbers, Fruit, and Flower and Kitchen Gardening.—G. M., Quorndon, Loughborough.

GARDENER (HEAD, WORKING).—Age 30, married; well up in all the departments of In and Out-door Gardening, and thoroughly trustworthy. Fifteen years' experience. Excellent references.—C. M., Stansfield, Kersal Moor Nurseries, Manchester.

GARDENER (SECOND), in a Nobleman's or Gentleman's Establishment.—First-class references.—H. G., 12, Elizabeth Place, Rochester.

GARDENER (SECOND).—Age 21; six years' good experience.—C. B., Newton Hall, Dunmow, Essex.

GARDENER (SECOND) or ASSISTANT in the Houses.—Age 22, well up in Plant Growing. Four years' good character.—R. A., St. Margaret's Nursery, Ipswich.

GARDENER (UNDER).—Age 19. Good character.—W. W., 19, Comb Road, Sydenham, S.E.

GARDENER (UNDER), age 19.—The Advertiser wishes to recommend to any Head Gardener a well-educated Young Man, with three years' experience in present and former places.—K. G., The Gardens, Pepper Hall, Northallerton, Yorkshire.

GARDENER (UNDER).—Age 23. Good recommendation from last situation.—H. H., 6, Albert Road, Nunhead, Peckham Rye, S.E.

GARDENER.—Age 25; has a good practical knowledge of Flower and Kitchen Gardening, and Stove, Fruit, and Plant Houses.—A. L., 18, Redford Place, Old Dover Road, Hackney, S.E.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 27; twelve years' experience. Good testimonials.—C. G., Mr. White, Bagshot Park, Surrey.

IREMAN, in the Houses.—Age 23. Can be well recommended.—W. J. G., Mr. George Webb King Street, Twickenham.

FOREMAN, or SECOND, in a large Establishment where Forcing and Plant Growing are carried on with profit.—Age 23; has been Foreman for two years in present situation. Highest references.—State wages to F. HILL, Uffington, Stamford, Lincolnshire.

PARK BALLIFF.—Married, one child; thoroughly experienced; Wife capital Dairywoman or Poultrywoman if required. Good references. State wages.—E. CALLEY, Adwell, Tetsworth, Oxon.

TRAVELLER, or NURSERY MANAGER.—Mr. T. Fox, who has represented the Messrs. Rollisson & Sons throughout the United Kingdom for nearly six years, and who is thoroughly well acquainted with both the Wholesale and Retail Customers throughout such, begs to inform the Trade that he will be open to a similar engagement (or as above) after March 25 next. No objection to any part. First-class references from the Messrs. Rollisson.—The Nurseries, Tooting, London, S.W.

IMPROVER, where there are two in bothy.—Has had two years in Houses.—Mr. TODD, Stowe, Buckingham.

GARDEN LABOURER.—Middle-aged, married, without family. No objection to Cows. Good character.—Please state wages, &c., to J. WEBB, Post Office, Chislehurst, Kent.

WANTED, by an energetic, persevering Man, a permanent situation as SALESMAN and TRAVELLER, or any other position of trust, or to act as Assistant to the Principal. Has a sound knowledge of the Nursery Business, both in and out-of-doors, and well understands the general routine of the Nursery Office. Has a good connection, and can supply reasonable amount. References unexceptionable.—G. E. R., 1, Longley Road, Croydon.

SHOPMAN (SECOND), or SHOPMAN and SALESMAN.—Several years' experience in the Seed and Plant Trade in all branches. First-class references.—W. B., Post Office, King Street, Covent Garden, W.C.

To the Seed Trade.

SHOPMAN, Age 30; twelve years' experience. Good references.—SEEDSMAN, Gardeners' Chronicle Office, W.C.

To Nurserymen and Seedsmen.

PACKER.—Good Basket, Bundle, and Case Packer. Good references from late employers.—G. W., 10, New Park Road, Brixton Hill, S.E.

KINAHAN'S V.V.V. WHISKY. This celebrated and most delicious old mellow spirit is the very CREAM OF IRISH WHISKY, in quality unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and Gold Standard "Key Brand" on the wrapper. Wholesale Depot, 20, Great Tithefield Street, Oxford Street, W.

Grateful-Comforting.

E P P S ' S C O C O A BREAKFAST. By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which will keep you healthy and bright. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the *British Medical Gazette*.

Made simply with boiling water or milk. Sold in packets (in tins for abroad) labelled—JAMES EPPS and CO., THROATLE STREET, CHEMISTS, 48, Throatle Street, and 170, Finsbury, W. Works—1, Euston Road, and Camden Town, London, N.W. Makers of Epps's Glycerine Jujubes for Throat Irritation.

DINNFOR'S FLUID INFUSION.

The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best mild Aperient for delicate Constitutions, especially adapted for Ladies, Children and Infants. DINNFOR and CO., 172, New Bond Street, London, W.; and of all Chemists throughout the World.

Lea & Perrins' Sauce.

THE "WORCESTERSHIRE" is pronounced by connoisseurs "the only good Sauce." It improves the appetite, and aids digestion. Unrivalled for piquancy and flavour.

ASK FOR LEA AND PERRINS' SAUCE. BEWARE OF IMITATIONS, and see the names of LEA AND PERRINS on all Bottles and Labels. Sole Importers—CROSSE and BLACKWELL, London; and sold by all Dealers in Sauces throughout the World.

For Asthma and Disorders of the Chest and Lungs SPENCER'S PULMONIC ELIXIR is admirably adapted to Ease the Breathing, Loosen the Phlegm, Alleviate Fever, Allaying all Irritation in the Delicate and Susceptible Constitutions of the Throat, and the Importing of Tone and Vigour to the Respiratory Organs, whereby they are enabled to discharge their functions freely, and thus to overcome all Effluvia of the Throat, arising from a Cold, Foggy or Impure Atmosphere, and to throw off those insidious attacks which too often lay the groundwork of Consumption. Sold by all Chemists.

Suttons' Sons

IMPROVED

VARIETIES OF VEGETABLES, &c.

The Best and most distinct Early Pea.

SUTTONS' EMERALD GEM. Price, 2s. 6d. per Quart.

This invaluable and distinct first early Pea is now acknowledged to be the best variety for first gathering. It is perfectly distinct from every other early Pea; the haulm, foliage, and pods being of a bright glaucous green colour. It comes in at the same time as our Kingleader, which was previously the forwardest Pea in cultivation. It is more prolific and has larger pods than any other early variety, and the peas are of a delicious marrowlike flavour.

From Mr. GEO. MILFORD, *The Gardens, Egerton Lodge, Aug. 11*:—"The Emerald Gem I consider a good early Pea, productive and of good flavour."

From Mr. J. BONE, *The Gardens, Ashdown Park*:—"Your Emerald Gem is equal to Kingleader for earliness, better filled pods, good flavoured, and quite distinct from any other variety."

From Mr. A. INGRAM, *Head Gardener to His Grace the Duke of Northumberland, August 11*:—"I think more of your Emerald

Gem than ever. I find it to be a first-class early Pea in every respect. In every sowing Emerald Gem and Kingleader came into flower at the same time. If any difference in earliness, Emerald Gem had it. It is an excellent cropper. In cooking it keeps its colour, and is of excellent flavour."

From Mr. A. HAYTER, *St. Giles' Gardens, August 13*:—"Emerald Gem is the forwardest Pea that I know of, and I consider it more productive than your Kingleader."

Sixteen Gold, Silver, and Bronze Medals, and Valuable Money Prizes, will be offered by Messrs. SUTTON for the Best Specimens of the Novelties sent out by them in 1875, at the forthcoming meetings of the Royal Horticultural Society.

Full particulars may be had on application,
SUTTON & SONS, ROYAL BERKS SEED ESTABLISHMENT, READING.

THE BEST
 White Spine Cucumber.

The editor of the GARDENERS' MAGAZINE says (see issue of Jan. 23, 1875):—

"The best new Cucumber we do not doubt is Suttons' Duke of Connaught, a large white-spined variety, surpassing in form and productiveness Kinglee's Hall Defiance, which has been the best white-spined variety hitherto. The form is as near perfection as we ever expect to see; and we must regard the Duke of Connaught as one of the finest, perhaps the very finest, summer Cucumbers we have."

FIRST PRIZE
 GRAND INTERNATIONAL
 SHOW
 MANCHESTER, 1873.

SUTTONS' DUKE OF CONNAUGHT.

Awarded First and Second Prizes among 59 entries at the Grand International Exhibition, Manchester, 1873.

Price, 3s. 6d. per Packet.

This is the very best and handsomest white-spined variety in cultivation. It is perfectly level, from 22 to 26 inches in length, very uniform, with a bright green skin well covered with bloom; spine scarcely discernible, and the fruit is very slightly ribbed. It is remarkably productive and of delicious flavour.

Where it is anticipated they will be highly gratified.
JOHN BESTER, Manager.

NEW HYBRID BEGONIAS.

THE FOLLOWING NEW BEGONIAS belong to the handsome-flowered, bulbous-rooted section, and are most desirable acquisitions, as they succeed and bloom well in an ordinary Greenhouse. The Bulbs being similar to those of Gloxinias, and now dormant, can be sent by Post:—
ANACREON, deep crimson, a beautiful flower, very long petals, 7s. 6d.
BRILLIANT, very rich bright orange, a fine showy flower, 7s. 6d.
CARDINAL, magnificent variety, fine large flowers of a rich deep magenta-rose, 7s. 6d.
CAROLINE, deep rosy pink, with broad petals, 5s.
CLIMAX, deep rich rosy carmine, broad outer petals, 5s.
CORSAIR, rosy salmon, profuse bloomer, 7s. 6d.
ENSIGN, bright pink, a very elegant variety, 5s.
GEM, cream colour, the reverse of the petals pink, 5s.
GLUTTER, vivid orange-scarlet, extremely showy, 7s. 6d.
HERMINE, bright orange cinnamon, very distinct, 5s.
LOTHAIR, deep rose, a fine flower, with short broad petals, 7s. 6d.
LUCINDA, fine flowers with long petals, of a deep rose colour, 7s. 6d.
MAGNET, light pink, the reverse of the petals deep pink, 5s.
MAZEPPA, light cream colour, tinted with orange pink, 5s.
PHYLIS, delicate sulphur colour tinted with pink, 5s.
SERAPH, soft pink suffused with rose, 5s.
SURPRISE, bright pink, a very pretty colour, 5s.
TROJAN, light rosy pink, very distinct, 5s.

The entire Collection of the above Eighteen Varieties for Four Guineas.
Seed of the above New Begonias, separate kinds, 2s. 6d. per packet; mixed, 3s. 6d. per packet.

Martin & Son

Seed Merchants and Nurserymen,
COTTINGHAM, and 61, MARKET PLACE, HULL,
(ESTABLISHED 1788).
Have pleasure in inserting the following Testimonials:—
"December 28, 1874.
"Mr. MARTIN: Sir,—I am happy to say that, notwithstanding the past excessively dry season, the 25,000 Ornamental and Fruit Trees, Shrubs, &c., that I bought of you have done remarkably well. Had I not planted any Pinus austriaca (which do not like the soil here), I should scarcely have had any to make up this season.
"The Shrubs and Trees were from 3 to 30 feet high.
"December 28, 1874.
"Mr. MARTIN: Sir,—I am able to say that, after having bought Seeds, Plants, and Trees, of your firm for fifty-four years, I have no reason but to speak in the highest terms of the quality of the same which you have always supplied to me."
"F. B. A."

THE ILLUSTRATED GUIDE for AMATEUR GARDENERS—Spring, 1875.

Now ready, price 1s. post free. Gratis to Customers.

A thoroughly practical and comprehensive Guide for the Amateur or professional Gardener, containing a select List of choice Kitchen Garden and Flower Seeds; ninety-six pages of beautifully illustrated letterpress, with complete directions for the successful management of the Kitchen and Flower Garden throughout the year; also two superbly finished coloured plates.

The whole in an illuminated cover of the most exquisite design and workmanship. The London Review says—"This is the most beautiful garden catalogue we have ever seen, the coloured illustrations are inimitable. Messrs. Daniels, the eminent seed growers, may justly feel proud in issuing such a complete and truly valuable catalogue as this, which will enhance the high reputation they have already so deservedly gained."

SEED POTATOS.—Wholesale and Retail, in any quantity. Prices and Sorts on application. LITTLE and BALLANTYNE, Seed Growers and Merchants, Carlisle.

Red-skin Flourish Potatoes. H. and F. SHARPE particularly recommend this variety for Field Cultivation, being, without doubt, the heaviest cropper grown. FORTY-SEVEN TONS PER ACRE have been produced on this ordinary marsh land, and it will be largely grown for Cattle-feeding purposes, in lieu of Mangels and Kohl Rabi. It is perfectly free from disease, and the quality is very fine. It keeps well until May or June. For price, &c., apply to H. and F. SHARPE, Seed Growers, Wisbech, Cambridgeshire.

Notice.—For Cash. CARNATIONS, PICOTEES, PINKS, HERBACEOUS PLANTS, &c. BUY J. Conservatory erected at Mr. Ley's Nursery, Croydon.

LASCELLES' PATENT CURVED STRUCTURES

Are constructed entirely of Wood, Bent on his Patent Principle, whereby each Bar forms a complete truss. They are strong, light, cheap and durable.

DRAWINGS AND ESTIMATES, WITHOUT CHARGE, ON APPLICATION TO THE PATENTEE,

W. H. LASCELLES, 121, BUNHILL ROW, FINSBURY, LONDON, E.C.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED.

This Company, having purchased from the Dromore Patent Heating Company Mr. Cowan's valuable Patents for the United Kingdom, is now prepared to undertake the Erection of Apparatus on that System in all parts of the Country.

THE ADVANTAGES OF THE SYSTEM ARE AS FOLLOWS:—

- | | |
|--|--|
| <p>1. In most Cases it SAVES the ENTIRE COST of FUEL.</p> <p>2. The Heat is maintained more steadily than by any other System.</p> | <p>3. No Night Attendance is required.</p> <p>4. There is no Smoke or Unpleasant Smell produced.</p> |
|--|--|

THE SUCCESS OF EVERY APPARATUS ERECTED BY THE COMPANY IS GUARANTEED.

Full Particulars of this System, Testimonials, and Opinions of the Press, can be seen in the Company's Illustrated Pamphlet, which can be obtained, post free, on application.

The Company has an Efficient Staff of Engineers, and sends at any time to inspect places where the idea is entertained of Erecting the Apparatus.

The System has lately been adopted at Hazelwood, Herts, the seat of Lord Rokeby; Stackpole Court, the seat of the Earl of Cawdor; Ripley Castle, Yorkshire, the seat of Sir H. D. Inglyby, Bart.; Langleybury House, Herts, the seat of Jones Lloyds, Esq.; and at many other places. Also Mr. E. Bennett, of Hatfield, says:—

"I now most cordially beg to congratulate you on the glorious success of your Heating Apparatus (now in use at Hatfield), which is working most satisfactorily, and which has exceeded my expectations. It is a decided success, and more cannot be said in its favour. Should it continue to work in the manner it now does, it will prove a great boon here, and start a new era in the heating of horticultural buildings generally. By your Compensating System we have for every barrow of coals thrown into the kiln some substantial return; by the old system the returns were ashes, and the trouble of clearing them away. I find our chalk is of an inferior quality to some I have seen in the neighbourhood, but we have plenty of heat."

The Company also undertakes the Erection of all other kinds of Heating Apparatus, and of Horticultural Buildings.

PLANS AND ESTIMATES FURNISHED ON APPLICATION.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

Office: 4, LOTHBURY, BANK, LONDON, E.C.

Carnations, Picotees, and Pinks.
ISAAC BRUNNING AND CO. beg to announce that they have this Season a very fine and extensive Collection of the above, strong plants of which are ready for sending ready. Lists of Varieties and Prices, together with Illustrated SEED CATALOGUE, on application. Our ONE GUINEA COLLECTION OF CARNATIONS, consists six pair of choice Show Carnations, six pair of choice Show Picotees, twelve pair of Show Pinks, and twelve choice mixed Carnations and Picotees for borders. Carriage and postage free on receipt of Post Office Order. Half of the above quantities, 21s.
 ISAAC BRUNNING AND CO., Great Yarmouth Nurseries.

Planting Season—Avenue Trees.
LIMES, 12 to 16 feet high, straight stems, girthing 4 to 8 inches at 4 feet from the ground, with well-balanced heads, and splendidly rooted. A stock of more than 5000 of these fine Trees to select from.
PLANES OCCIDENTAL, 12 to 16 feet.
HORSE CHESTNUTS, 10 to 12 feet.
SARLET HORSE CHESTNUTS, 10 to 12 feet.
NORWAY MAPLES, 10 to 16 feet.
 All being stout, straight stemmed, and finely rooted. Every Tree has been removed within two years.
POPULAR CANADENSIS NOVA, 18 to 20 feet.—This new variety of Poplar, far exceeding in rapidity of growth any tree I am acquainted with, is strongly recommended as a Town Tree, especially in smoky districts. There are hundreds in this Nursery a year old, measuring 18 to 22 feet high, and stout in proportion.
ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey, S.W.

Six Beautiful Orchids, 21s.
FOR WINTER and SPRING FLOWERING no class of plants can compete with Orchids, their culture being extremely easy, and the flowers very lasting. The above are of distinct varieties, and are sent package and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

Twelve Gracful Palms, 21s.
HEALTHY YOUNG PLANTS, to grow on for Table decoration, and will be ready in about six months; or fit for immediate use, including many choice and very rare kinds, 65s., 84s., and 106s.
J. H. LEY, Royal Nursery, Croydon.

Twelve Flowering Stove Plants, 21s.
INCLUDING ANTHRUM, SCHEERZERIUM, ALMANDA, CHELOSIA, and other equally fine sorts, in nice plants. Package and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

Twelve Ornamental Foliage Plants, 21s.
INCLUDING many of the finest and newest varieties of ALOCAASIA, MARANTAS, CROTONS, &c., well established, clean, and healthy in growth, and specimens. Package and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

Snowflakes.
THE FINEST POTATO ever introduced; will yield from 300 to 400 bushels per acre of handsome tubers of the most superior quality and free from DISEASE. Messrs. DANIELS BROS. have just received a consignment of this magnificent variety direct from the original grower in America, where it has obtained immense popularity, and which is now being distributed at the following rates, carriage free to any address.—3s. 6d. per lb.; 7 lb., 21s.; 100; 12s. 6d. per cwt.
DANIELS BROS., Seed Growers and Importers, Royal Norfolk Seed Establishment, Norwich.

POTATOS for PLANTING.—Special offer for the Trade (for cash) of the undermentioned, in the following quantities:—Myatt's Prolific, by the sack, ton, or 10 tons; Red-skinned Flourish, ditto; Hesse's Peerless, ditto; Climax, ditto; ditto; Victoria, ditto; Goodrich, ditto; Hesse's Prolific, ditto; Mona's Pride Ashrops, by the sack or ton; Fortyfolios, ditto; Early Rose, ditto; Hundred-folios, ditto; ditto; Early Dun, ditto; Regents, ditto. Also established, clean, and healthy in growth, and specimens. Package and delivery free to London on receipt of Post Office Order or Cheque.
DANIELS BROS., Seed Growers and Importers, Royal Norfolk Seed Establishment, Norwich.

WRIGHT'S GIANT WHITE CELERY.
 This is quite a distinct pure white variety; it is very crisp, and excellent for cooking, combining a fine flavour, being firm, forming very solid hearts, which blanch very easily. Heads of this variety have been grown weighing from 8 to 10 lb. It is the highest recommended for exhibition, private or market purposes.
WRIGHT'S RED GROVE and WHITE GROVE CELERIES.—These possess all the good properties of the Giant White, but do not grow upon application.
 The following four firms have secured supplies of the above for this season, for which I beg to thank them, soliciting extended patronage:—
 Hurst & Son, London.
 Cooper, Robt., London.
 Brown Bros., Norwich.
 Dickson, Brown & Tait, Manchester.
 Dixon, E. P., Hull (chester).
 Holmes, Ed., Lichfield.
 Brotherton & Wm. Leeds.
 Nutting & Sons, London.
 Godwin, F. G., Sheffield.
 Lawson Seed Co., Edinburgh.
 Down, J. L., Leamington.
 Drummond & Son, Glasgow.
 Howden & Co., Inverness.
 Laird & Sinclair, Dundee.
 Finny, S. & Co., Newcastle.
 Umphey, Geo., Leeds.
CUCUMBERS.—Wright's Wonder, fine white-spine, and which is improved black-spine; these will grow 24 to 30 inches long, are very prolific and of mild, good flavour. Pearson Long Gun, Kollison's Telegraph, Berkshire Champion, Improved Sun House, Messers' Early Prolific, 12s. per packet. Lowest price quoted per 100 seeds on application.
W. WRIGHT, Seed Merchant and Nurseryman, Market Square, Retford, Notts.

WHEELERS' CHOICE SEEDS.

WHEELERS' TOM THUMB is the smallest and the best CABBAGE LETTUCE. Large packet, 1s.; small packet, 6d., post free.
WHEELERS' KINGSHOLM is the largest and the best COS LETTUCE. Large packets, 1s.; small packet, 6d., post free.
WHEELERS' COCOA-NUT CABBAGE.—Very early and excellent. Large packet, 1s.; small packet 6d., post free.
WHEELERS' GLOUCESTERSHIRE KIDNEY is the best early Potato grown. 3s. 6d. per peck; 12s. per bushel.
WHEELERS' FIRST EARLY PEAS.—The earliest in cultivation. 1s. 6d. per quart.

WHEELERS' GUINEA COLLECTION OF GARDEN SEEDS is a Marvel of Cheapness, as it contains a liberal supply of some of the very Choice Seeds in cultivation, and is delivered, carriage free by rail, to any part of the Kingdom.
 Special attention is called to the fact, that Wheelers' First Early Peas, Wheelers' Tom Thumb, and Kingsholm Lettuce, Wheelers' Cocoa-Nut and Imperial Cabbages, are included in the Guinea Collection, and that this is the cheapest and most economical method of purchasing really choice Garden Seeds.

WHEELERS' GARDEN ORDER SHEET contains the Lowest Prices of the choicest Garden Seeds, Flower Seeds, and Seed Potatoes in cultivation; with columns ruled ready for the quantities required to be filled in; thus rendering the usual troublesome matter of making out a "Seed Order" excessively easy; it will be forwarded gratis and post free. It contains a complete List of all the Best Varieties.

WHEELERS' CHOICE GARDEN SEEDS and POTATOS, to the value of 200 and upwards, are delivered, Carriage Free by Rail, to any part of the Kingdom.

J. C. WHEELER & SON,
SEED GROWERS, GLOUCESTER,
 AND
 50, MARK LANE, LONDON, E.C.

Rare Opportunity.
NEW and VERY SCARCE TREE FERN SPORES from AUSTRALIA and NEW ZEALAND.
J. H. LEY, having just received an important quantity from his Collector, can supply good packets, with directions for sowing and rearing, at 3s. 6d., 5s., and 7s. 6d. each.
 The fronds from which three sorts have been obtained are new species, the others being either *Cratichneum* (silver), *C. medullaris*, *Alphiphil* McArthurii, *Dicksonia fibrosa*, and a small quantity of *Dicksonia squarrosa*. Should be sown now to obtain nice plants before autumn.
J. H. LEY, Royal Nursery, London Road, Croydon.
 N.E.—Twelve choice PALM SEEDS, in distinct sorts, 5s.

LILIUM AURATUM.—This splendid flower, unsurpassed by any other in beauty, is especially recommended to Florists and Gentlemen Amateurs, and is suitable for Outdoor or Conservatory Decoration, and, although its price has hitherto placed it beyond the reach of many lovers of the beautiful, no longer being so scarce as the Advertiser has received consignments from Japan which enable him to offer them at very moderate prices. Splendid bulbs 2s. 6d., 4s., 6d., and 8d. each. Address, by letter only.
J. W. H. GRAY, Agent, Melford House, Lordship Park, Stoke Newington, N., who will punctually forward all orders.

CONFIFERA SEED, New and Rare, collected by M. Roez in November, 1874:—
ABIES HOOKERIANA, A. Murray.—According to M. Roez this fine Conifer attains the height of 100 feet; its branches are long and pendulous, resembling the *Deodar* in order, but a great deal more habit—a description fully confirmed by Mr. Lobb, who also compares it to the *Deodar*. M. Roez says that he found it, without exception, in northern aspects, never fully exposed to the sun, and that he believes it to be a new species. Price 3s. 6d. per 100, 15s. per 500 seeds.
PINUS (Strobis) MONTICOLOR, Douglas.—Sixty per cent. good, 2s. 6d. per 100, 12s. per 1000.
PINUS (Pinaster) CORTORTA, Douglas.—This species grows in swampy places in the lowlands of California, and forms dwarf compact trees, with tortuous branches. On the mountains where M. Roez collected it, and where he collected the seeds, it forms stately trees of 100 feet in height; the wood is, owing to its elasticity and durability, much sought after for the most excellent quality, 50 per cent. good, price 3s. 6d. per 100 seeds.

We also offer the following, collected by M. Roez, in October, 1874; of them familiar to, and ably described by, M. E. Oré, of the Jardin des Plantes, Paris, in the *Revue* number 11, 1874; and Mr. A. Murray's article, January 23, 1875:—
PICEA CONCOLOR, Engelmann: 2s. 6d. per 100, 12s. per 1000, 12s. per 1000 seeds.
 „ var. *violacea*, Roez: 2s. 6d. per 100, 12s. per 1000, 12s. per 1000 seeds.
 „ *BIFOLIA*, Murray: 1s. 6d. per 100, 12s. per 1000, 12s. per 1000 seeds.
 „ *DOUGLASSI*, var. *glauca*, Roez: 1s. 6d. per 100, 8s. per 1000, 12s. per 1000 seeds.
ABIES COMMUNIS, F. Parlatore: 4s. per 1000, 15s. per 5000 seeds.
PINUS ARISTATA, Engelmann: 6s. per 1000 seeds.
 „ *EXULS*, James: 1s. 6d. per 100, 12s. per 1000 seeds.
 „ *DEFLIXA*, Torrey: 1s. 6d. per 100, 8s. per 1000 seeds.
PICEA LASIOCARPA Virey: 2s. per 100, 16s. per 1000, 12s. per 1000 seeds.
 „ *MAGNIFICA*, Murray: 2s. per 100, 16s. per 1000, 12s. per 1000 seeds.
 „ *MACROCARPA*: 1s. 6d. per 100, 12s. per 1000, 12s. per 1000 seeds.
PINUS LAMBERTIANA: 1s. 6d. per 100, 7s. 6d. per 1000 seeds.

F. SANDER AND CO., New and Rare Seed Importers and Growers, St. Albans.

THE ROYAL SEEDSMEN,

237 and 238, HIGH HOLBORN, LONDON, W.C.

SATURDAY, FEBRUARY 6, 1875.

A HOLIDAY IN NORWAY.

(Continued from p. 156.)

ALTHOUGH dressed in a suit of plain homespun cloth, and very often seen with all "the defilements and defacements of labour," the pride that seems especially to belong to the possessors of hereditary estates is shown by the peasant farmer in considerable self-assertion in all political matters, in a manly and independent bearing, and in the jealous maintenance of his social position. Assisted in the work of their farms by men styled housemen, who occupy a portion of land as tenants, holding it under lease for two lives, and paying their rent in labour, the distinction that exists between the peasant landowner, and his associate is seldom forgotten so far as to permit of intermarriages between their respective families. A long and pure descent is claimed by many Norwegian bonders, and to illustrate how far this pride of lineage is cherished and its records preserved I may relate the following anecdote:—A young priest, fresh from college, who could have known little of the people amongst whom his lot was cast, said ironically on some festive occasion, when the principal men of the parish had assembled, that he supposed it not impossible that even amongst the present company some descendants of the ancient nobility might be found. He was seriously answered, that of the persons then present he alone was probably the only one who had no claims to such distinction.

The ordinary enclosed farms that came under my observation in meadow and under plough seemed to average from 40 to 60 acres. Attached to all farms is a certain extent of woodland and mountain pasture, the latter relieving the home farm for three months during the summer, and the former affording a supply of leaves and brushwood, on which the store stock are mainly fed during the winter season. Bere or Barley, Oats, and Rye are generally grown. Potatoes, which occupy the place of Turnips in their system of farming, appear on every farm; the ordinary brandy of the country is distilled from this crop, with an admixture of malt. The hay crop is one of great consideration, and the utmost care is exercised in making it; it is dried on rails erected expressly for the purpose, and is with other crops securely housed in special sheds, or more often in lofts above the cow-house and stabling. Such farms as I have mentioned will maintain a family, supplying all reasonable wants. Farming in Norway is not conducted on the manufacturing principle, as it is in England, very little, if any, of the produce being sold.

The dwelling-houses and outbuildings, which appear numerous in proportion to the extent of the land, are built of Fir poles, notched and laid end to end, the interstices being filled with moss; and sawn boards are, in the better class of houses, nailed on each side of the rough poles; the roof is formed of boards laid on the rafters, on which Birch bark is placed overlapping, on this are placed sods and sometimes slate—in either case the roof is tolerably impervious to wet and cold. The similarity of construction of all farmhouses and buildings over so great an extent of country seems to show that the people are satisfied that they have discovered the best and readiest system of construction that can be devised.

The mountain regions are the great grazing grounds of the country during the summer

months. Farmers mark their sheep, and drive them to the hills to roam at will over the immense ranges of pasture, forest, and moss-covered rock; the animals naturally congregate in large flocks, and graze with that degree of system practised by animals enjoying liberty. The young beast stock also range with but little supervision, and the horses have equal liberty, but the cows are accustomed to graze near, or rather within call of the *scater*, and to answer the summons to be milked; the milkmaids reward them by giving them a handful of salt. The girls who live in these mountain farms make cheese and butter: the whey or buttermilk is boiled, and sent down in tubs on the backs of horses, once or twice a week. This is the drink of the work-people; I found it detestable.

There is something congenial to the habits of even domesticated animals in the wild free life enjoyed on the mountain pastures. I was assured that horses, beasts, and sheep, acquire so great a fondness for their mountain life, that when the summer-time comes round it is with difficulty that they can be retained on the home farm, and if one happens for convenience to be left, he escapes and follows his companions on the first opportunity. The sweet fresh pasturage, and the invigorating mountain air, have doubtless much to do with the fondness the animals evince for the hills. The cultivated part of the country amounts to one forty-second part. Forests cover one-fourth; the rest is mountain, portions of which afford herbage and moss, the latter supporting considerable herds of reindeer, so that in the farming economy of the country the land reported to be barren and uninhabitable represents pasturage for the greater portion of live stock for three months in the year.

In its general aspect, Norway presents the most unpromising conformation of surface for farming operations that can well be conceived. Mountain ranges, with plateaus whose altitude precludes cultivation, and from which rise mountains that reach an elevation of 8300 feet above the sea, prevail generally throughout the country. Except in the South, the mountain tops are covered with snow for the greater part, if not all the year; their slopes, when not absolutely inaccessible, are far too rocky and abrupt for farming settlements. The deeper valleys that intersect these mountain ranges, and which ramify with the contortions of the hills, are channels up which the sea sends its tides; above the level of these fjords are other water-worn valleys, which convey the overflow of the mountain lakes, subsidised by countless streams that in varying volume leap from the hills as waterfalls, or rush foaming down the mountain side—the impervious primitive or metamorphic rocks that are characteristic of the country, not permitting the absorption of the melting snows or the summer's rains. There exists, therefore, a very extensive superficial area that presents physical as well as climatic difficulties of a character not to be surmounted by the most enterprising cultivator. With few exceptions, the homestead of the Norsk farmer is built on the lower slopes of the hills, where, in fact, the wash of the rocky surfaces, in broken stone and silty soil, has accumulated to a sufficient depth for the operation of the plough; or on the embanked levels of loamy soil, the deposit left by ancient rivers, or when rich lacustrine alluvium is met with, or where moorlands are spread out at the embouchure of glacier-grooved and expansive valleys, forming suitable sites of scattered hamlets and little farms.

The farms are generally parcelled out in fields, the necessary subdivisions being effected by loose stone walls, or fences made of poles placed in the ground without shortening, two cross-bars secured with twisted birch bands, holding sawn or split rails, which are laid so

close as to touch, and in a sloping position; such fences appeared to me prodigal of wood, and less secure than our ordinary post and rail fence. Quick hedges are rare; no rails are required in these simplicity, and they have the merit of great simplicity.

After making several excursions about Vang. I proceeded on my journey southwards, and I may here mention that I dispensed with the services of a guide, and never sent a *forbad* or messenger to order horses, and I do not think I lost time or horses by the avoidance of a custom strongly enforced by guide books; I found that "First come first served" was the rule.

Oilo, the first station after Vang, is charmingly placed, and has a good trout stream within sight. Continuing the journey, the stations of Skee and Riun were successively taxed for horses, and the day's journey was finished at Frydenlund. Evidences of glacial action are frequently met with in the course of a day's journey in this district; the greater part of the enclosed yard of the station is of rock smoothed down and rendered almost level by the great ice river that had at some remote period polished its surface. It is seldom such mighty operations of Nature, resulting in the degradation of mountains, are conjoined with so small an effect as that involved in the fashioning of an inn yard. There is a gradual ascent from Frydenlund, the road being carried along the side of a range of hills: far down, and at the bottom of the two ranges of mountainous heights which enclose this profound valley, a stream rushes, sometimes widening to the extent of a lake, in which islands covered with Fir trees every now and then are seen—sometimes pouring its waters over rocky channels, always lending a charm which bright moving water alone can give to the richly wooded landscape. Just before gaining the summit of the ascent, the view north looking up the valley comprehends an extensive range of snow-covered mountains, part of the Fille Fjeld, and under certain aspects of light and shade the prospect is exceedingly grand. The road in many places has been widened by blasting the exceedingly hard black crystalline rock, of which the mountain is composed at this elevation. The road is carried across the summit of this range: on one side Fir woods stretch away far and wide into the dim distance, and amongst the woods nearest the road immense rounded masses of rock, like the hulls of overturned ships, stand out in bold relief in the forest sea of dense green. Broad expanses of boggy land, opening sometimes in wider pools, and mosses and lichens, replace all other vegetation, and the country at this elevation has a dreary, cold, cheerless aspect. *William Ingram, Belvoir.*

(To be continued.)

New Garden Plants.

MASDEVALLIA SHUTTLEWORTHII, n. sp.*

This appears from dried materials to be a rather nice thing among the Masdevallias of the second order of beauty. The upper sepal is yellow, striped with nine longitudinal dark port-wine-coloured nerves. The lateral sepals are quite covered inside with innumerable small port-wine-colour dots over a yellowish ground. The long tails may be yellowish or green. The whole expanded flower is a little larger than that of *M. triangularis*. It was discovered in the United States of Columbia by Mr. Shuttleworth, one of the collectors of Mr. W. Bull, and has been dedicated to him. *H. G. Rehb. f.*

MASDEVALLIA CAUDATA, Lindl.

I am sometimes surprised by hearing my English acquaintances speaking in a sneering tone about

M. caudata. That species will, no doubt, one day prove to be one of the most elegant of those of second-class merit. I have never seen any specimen grown in Europe, and know just nothing about its being here. I am very suspicious that the *M. caudata* of my English acquaintances is the *M. coriacea*, Lindl., by no means a splendid plant, and, I am sorry to say, of a very unpleasant smell. *H. G. Rehb. f.*

MASDEVALLIA (SACCILABIATE) SEVERA, n. sp.*

This Masdevallia is rather near *M. Chimera* and *Roellii*. It comes nearer the last, but appears to be sufficiently distinct by its lateral sepals being straight, not divaricate; by all the sepals being narrower, and having all their apertures both on the surfaces or on the border from very short bristles, not from warts. The colour appears to be a vivid maroon, or rather port-wine-brown, with very numerous small transverse whitish (yellowish ?) bars, which gives it a rather gay appearance. I have at hand good flowers dried by Mr. Koelz, and others obtained from M. Patin, of young Belgian traveller. Lately obtained a sketch of dried flowers, sent from the United States of Columbia by Mr. Shuttleworth to Mr. W. Bull. We may therefore well watch Mr. Bull, to see whether he will not suddenly show this interesting plant. *H. G. Rehb. f.*

ROYAL HORTICULTURAL SOCIETY.

REPORT OF THE COUNCIL TO THE ANNUAL GENERAL MEETING ON FEBRUARY 9, 1875.

[In submitting this report the Council request the earnest attention of the Fellows to the concluding statements upon the financial position of the Society. It is conceived that there will be a good attendance at the annual meeting on February 9, when the Society's financial position will be discussed.]

THE Council, in presenting their report for 1874-5 to the Fellows, have great pleasure in again commenting upon the magnificent displays which the Society's shows have produced. The amendments introduced into the schedule, together with the reduction in the number of the shows, have both contributed to this result, and in no instance more remarkably than in the concluding exhibition of the season, when the collection of fruits and Chrysanthemums transcended almost all similar collections of former years. The more purely scientific work of the Society has again been attended with success. The experiments made at Chiswick form, as usual, the subject of a supplementary report. The meetings of the Scientific, Fruit, and Floral Committees have been well attended, and the work done considerable.

The Council have established a series of evening meetings for the discussion of horticulture. They are convinced that the comparatively small attendance at the ordinary meetings arises from the inconvenience of the hour rather than any indifference to them on the part of the Fellows, and they, therefore, consider that evening meetings may be considered of value both by the Fellows and others engaged in the pursuit of horticultural science.

In the course of the past summer the Council received an offer from Messrs. Shipp, the proprietors of Prince's Palace, of laying out by the way of rent for the privilege of constructing a skating rink in the Society's gardens under certain conditions. Whilst considering this offer, the Council gave weight to the following points:—1. That the present expenditure of the Society cannot be maintained upon its present income, and that some increase would have to be made in the Fellows' subscriptions, or additional sources of income be provided. 2. That the large majority of the Fellows would prefer to give up the rink for a time of a small portion of their ground rather than pay an increased subscription. 3. That a great number of Fellows would be likely to accept the opportunity of subscribing to a very popular amusement brought to their own doors, and that many persons would be induced to become Fellows in order to obtain the privilege of so subscribing. 4. That Messrs. Prince proposed to erect the rink at their own cost to receive three days of the rink for those Fellows who should subscribe to it, to conduct the rink in concert with the Society's officials, and to pay sums of money as rent amounting on the average to £1100 a year. The advantages thus offered appeared to the Council to be opposed by few countervailing objections, and they came to the conclusion that they ought not to let slip so admirable an opportunity of increasing the income of the Society. It is true the scheme had nothing to do with horticulture directly, but it would have been a

* *Masdevallia severa*, Rehb. f., n. sp.—Folio maximo a basi petiolarum spatulato oblongo acuto subacuminato; pedunculo valido apice trifloro (plurifloro ? homochronico ?); sepalis triangulis cordatis; sepalis lateribus alius callitis, demum liberis triangulari, porrecto subparallelis; caudis spissa demum oblongis; limbo acuto obovato brevissimis scaberris; tepalibus ovatis apice ligulatis; ligulis nulla; calice truncato-oblongo, basi bilamellato; lamina limbo implicito denticulato subcaecata; nervis omnibus carinatis; columna acuta.

great indirect benefit, tending to set more of the Society's funds at liberty for the direct advancement of horticultural science.

On this last respect the Council had before them the example of Her Majesty's Commissioners for the Exhibition of 1851, who have considered the sale on building leases of land which they had acquired for purposes connected with science and art a legitimate manner of advancing those interests. The mention of Her Majesty's Commissioners introduces the one difficulty which lay in the way of the skating rink. The Council had no power to sub-let any part of the ground held of the Commissioners, but Messrs. Prince were ready to accept of a "license to use" without a lease. But in addition to this the Commissioners have power to prohibit any proceeding of the Society with regard to the gardens which shall not be of a horticultural nature. The Council felt that to communicate with the Board of Management on this subject would be useless, seeing that the Board had declined to discuss with them the Society's affairs; but the earliest opportunity was taken of bringing the matter to the notice of the Commissioners at their meeting on December 15, which was finally resolved to acquaint Messrs. Prince fully with the exact terms on which the gardens are held, and if they were willing to proceed the Council would then undertake such arrangements as they were competent to make. Messrs. Prince, after examining the Society's documents, entered into an agreement, and commenced operations. It was confidently expected that in view of the many difficulties which the Society had encountered in consequence of the onerous engagements originally made with the Commissioners, and in consideration of the many concessions made to them from time to time in support of the International Exhibitions, no interference would take place. Such non-interference would have been at least consistent with the expressions of amity towards the Society with which the refusals to co-operate with the Council had been accompanied. Accordingly, for the first four or five weeks no objection was offered. The officials of the Commission were well aware of what was in course of effecting, and conversed about it to the Society's officials. Messrs. Prince spent a considerable sum in furthering the undertaking, when suddenly the Commissioners came to the conclusion that an interference was convenient, and intimated that they were about to file a bill in Chancery to test the legality of the Council, and to litigate all disputed points with the Society. The Council having repeatedly received this threat for two years, and having taken the highest legal opinion as to its *status*, and as to all other points in dispute, cannot feel any regret that the relations of the two bodies should be at length brought before the public. They are satisfied that not only will their own *bona fides* be vindicated, but that a public discussion will redound to the credit of the Society.

The Council have now to call the earnest attention of the Fellows to the state of the Society's finances. It has been impossible to make any serious reduction in the debt to which the Council called the attention of the Fellows in their last report. Indeed, since the session of the present meeting to office, the Council have been called upon to pay debts previously ignored in the published accounts of the Society. Sir Trayton Drake advanced prior to 1860 £1000 to the Society at interest; no interest had been paid since 1864, and although the matter had been before 1873 brought to the Council's notice by legal proceedings, no settlement had been effected. The Council have succeeded in compromising this claim by a payment of £600. There was also a claim by Mr. Cooper of £105, which the Council has settled.

It has become evident to the Council, as already stated, that the ordinary revenue of the Society cannot support its expenditure. Several reductions have been made which will prevent any increase of liability in 1875;* but this course is looked upon by the Council as wholly unsatisfactory. The question as to whether the Society is to remain at South Kensington is brought into prominence by the necessity of paying rent to the Commissioners in 1876, and that the local Fellows (and neighbourhood) must now make up their minds definitely either to risk the loss of the gardens at South Kensington or to subscribe more largely. The Council feel that any increased subscriptions ought fairly to fall upon those who use the gardens most frequently, and to whom their loss would be most serious. Those Fellows who live at a distance and support the Society on account of its being the national representative of horticulture ought not, in the Council's opinion, to be further taxed for the maintenance of the South Kensington Gardens. To this end the Council are prepared to suggest a scheme for increasing the annual income of the Society should the above policy be accepted, and will call a special meeting for the purpose of submitting their scheme to the Fellows.

In conclusion, the Council feel it their duty to

* In particular, reductions have been made in the staff; prizes will only be offered at the most important shows, those in May, June, July 7 and 21, and October. Other extensive reductions have been temporarily sanctioned.

remind the Fellows that whatever opinion they may have as to the desirability of retaining the South Kensington Gardens, the Society is bound to do its utmost to maintain its lease, if only for its obligations to the Life Fellows, and, above all, to the debenture-holders. If Her Majesty's Commissioners should succeed in an attempt to get the lease avoided, the property would be released of its debt to the debenture-holders, who would then lose the whole of their £50,000 originally advanced, or be obliged to accept such a dose as the charity of the Commissioners might induce them to offer.

REPORT OF THE CHISWICK BOARD OF DIRECTORS.
[FEBRUARY, 1875.]

The Chiswick Board of Directors have to report, that the operations in that establishment during the past year have been chiefly directed to the general maintenance of the garden, the experimental trials of vegetables and flowers, the supply of plants for the decoration of the gardens and conservatory at Kensington, and the provision of seeds and plants for distribution to the Fellows. As regards the latter, a new plan which has been adopted in lieu of the ballot, of allowing the Fellows to select a certain number of plants from a list provided for the purpose, has been found convenient to work, and, as they believe, has given greater satisfaction to the recipients. During the year the garden has been supplied with water from the waterworks, which has proved a great advantage, both as to convenience and economy of labour. The immediate cause of this supply being laid down was the failure, during the dry period with which we were visited last summer, of the wells upon which the water supply had formerly depended. In the Floral department the distributions to Fellows have consisted of 42,684 packets of flower seeds, 3643 plants selected from the distribution list by Fellows, and 428 packages of cuttings and bedding plants. The garden at Kensington has been supplied from Chiswick with 13,936 plants for the decoration of the conservatory; 56,627 plants have been used in the summer bedding arrangements, 3164 plants in the bedding provided for the spring season, and 8487 plants for autumn bedding.

The comparative trials of new flowers which took place last year were devoted to Pelargoniums and bedding Pansies, and reports of the results, drawn up by the floral director, will be found in the last number of the Society's Journal. The number of varieties of Pelargoniums planted out for these experimental purposes was 293, while eighty-three sorts, chiefly consisting of the rose-pink varieties, were grown in pots under glass, in order to ascertain which varieties were the best adapted for that mode of cultivation. Amongst the former, nine new certificates were granted, and in twenty-four cases the previous certificates were confirmed, on a comparison of the newer with some of the best older varieties. In the pot trial six new certificates were awarded, and the previously granted certificates were confirmed in the case of five others.

In the case of bedding Pansies, 139 varieties (some of them of the fancy class) were received and planted. The Floral Committee awarded eleven certificates, and suggested that the best varieties should be grown again and examined earlier in the season. In accordance with this suggestion, Mr. Barron is preparing to plant out an entire bed of each of the selected varieties.

So far as this year's limited means will allow, these interesting trials will be continued as heretofore.

The [Vegetable] trials which were made during the past season in the garden at Chiswick were a continuation of the examination of the Potatoes which was commenced last year, and a investigation of comparative selections of Broad Beans, Kidney Beans and Celeries. Of Potatoes, 158 varieties were dealt with which had not been included in the trial of the previous season, and of these five received First-class Certificates. In the trial of Broad Beans there were forty-seven varieties, of which a full report will be found in the Society's Journal; but on account of the dry, cold season the Kidney Beans, of which 113 varieties were sown, proved a failure, and it was determined not to proceed with any examination of them till another year, when a second attempt will be made. The trial of Celeries was a very successful one. Fifty reputed sorts were sown, and these were reduced after careful comparison to eighteen, of which six were distinct red varieties, and twelve distinct white.

The vegetable trials which are contemplated for 1875 are Kidney Beans and Onions.

The subjects most worthy of remark in relation to Fruits which have come before the board this season are a set of seedling Vines raised by crossing Black Monukka and Black Hamburg, with the view of obtaining a seedless variety with the quality of the Black Hamburg—the result of this experiment will be found in the Journal—and the other is the fruiting of the Pomme de Paradis for the first time in this country. The result of this is, to determine the distinct individuality of this variety, and to prove that it is not only valuable as a dwarfing stock, but that its fruit is one of great excellence as a dessert variety.

CATTELEYA GIGAS.

THIS plant was spoken of and illustrated in the *Gardener's Chronicle*, No. 46, 1874. Having not only been the discoverer of this most wonderful Orchid, but also sent it three times to M. Linden and to Messrs. Veitch of Chelsea, I am enabled to say something about it; and I think it only fair that my services as its discoverer should be known.

When travelling in the year 1868 from Medellin to Frontino (in Columbia, South America) I had the great pleasure to meet with Cattleya gigas, just when most desirous of discovering a novelty. I confess I had become tired of observing that a long series of different forms, hitherto met with, proved to be mere varieties of one type, as C. quadricolor, C. Trianae, and C. chocoensis.

When I discovered this brilliant Cattleya, just after having most fortunately met with *Odontoglossum vexillarium*, I found also a fine yellow-blooming Cattleya, probably a variety of C. Dowiana, not to mention hundreds of other valuable plants, gathered on that and other trips to the same place. Frontino since that time has become famous as a rich Orchid producing field. Mr. Chesterton went there subsequently, especially charged with the mission of acquiring a great lot of *Odontoglossum vexillarium*; and in the year 1871, M. Roelz, on account of M. Linden, arrived there in order to bring home large quantities of both Orchids and many other plants.

In the year 1872 another supply from my hands reached Brussels; and finally, in the year 1873, for a third time, I directed my steps to Frontino. It was then for a stay of about eight months, during which I undertook many rambles in all directions.

Another traveller, M. Patin, exploring at the same time the State of Antioquia (to which Frontino belongs), availed himself of my discoveries. Consequently, Frontino has become through me a true connoisseur to Orchid seekers. The inhabitants of Frontino—I may be allowed to state here as a mark of gratitude—in consideration of my activity and the services rendered to them, conferred a great honour on me by calling a street and a square after my humble name. There is now in Frontino a Wallis Street, and a Wallis Square!

But to return. I have to express some doubts whether the Cattleya brought in by M. Roelz is really C. gigas, as a great many plants imported by him came from Amalfi, a more easterly point, and about 80 miles distant from Frontino. The same may be said of all that were sent by Mr. Evans from Antioquia, which were sold. I saw the flowers of this Amalfi Cattleya, and I recognised a different but likewise fine species, introduced by me three years ago from Medellin and the Cauca Valley. It is not yet determined, but dried specimens and sketches are in the hands of our learned Orchidographer, Professor Reichenbach, and we shall have in a short time a full description of it. It has a delicate rose colour, the margin of the lip being nicely cut out; two large yellow spots, like a pair of shining eyes on each side of the lip, constitute the most characteristic feature.

The place of the true Cattleya gigas is in the immediate vicinity of the little town of Frontino, where it grows in thick forests, and also in the tops of high trees. The elevation above the sea is about 4000 feet, and the best-flowered plants were found in a shady situation, of course in a rather temperate climate. I believe your temperature statements are too high, and I should propose 65° to 70° in the night, and 70° to 80° in the daytime, as being more convenient. The rainy season, properly speaking, is not distinguished in that part of the Cordilleras.

Certainly you will be astonished to learn that I observed twice during my last stay at Frontino a hail-storm, the hailstones being nearly as large as a Hazel-nut. But I don't mean by this observation that it is a severe climate.

The extremely long blooming of C. gigas deserves to be mentioned here. I enjoyed the sight of the fine flowers during a period of three weeks. A sketch of a full-flowering spike of this plant was sent to Professor Reichenbach, and which gives an idea of its great beauty. To draw a conclusion from the differently situated localities, as well as the differences of elevation which C. gigas is growing in, I should be inclined to suppose that there are some three or four varieties in the large stocks existing in the stores of Brussels and Chelsea.

I was often told while in Frontino of a black-flowered Cattleya, as occurring on a certain place thereabout, and which was visited by me. If there can be any reliance placed on this statement, we might suppose it to be a dark violet-painted—an *Atropurpurea* form. *Gustavus Wallis, Botanical Traveller.*

ADIANTUM GRACILLIMUM.

In the *Gardener's Chronicle* for January 3, 1874, p. 14, will be found the original description of this most elegant Fern, from the pen of Mr. Thomas Moore, where the botanic state of the fronds, pinnae, sori, indusia, rachis, &c., are described in terms as correct and compact as the generic name itself.

For some months previous to the publication of this description the plant was known to horticulturists, and since that time Mr. Williams has gradually increased his stock, and more recently made the Fern public by an illustrated advertisement, so that now the plant is well known by name, if not by aspect, to all interested in new plants.

As *Adiantum gracillimum* has been already so well described botanically in these columns, I may well be excused for writing a few lines less botanical than popular, regarding perhaps the most elegantly graceful of all known Maidenhair Ferns. A too close description of anatomy and habit considerably detracts from the ideal character of a first-class and delicate beauty like *Adiantum gracillimum*. An anatomical description of the "bronchial tubes" of Dante's "Beatrice," or an account of what Goethe's "Margaret" was in the "habit" of eating for "supper," would considerably lessen the ethereal beauty of these heroines.

The size and habit of an individual frond of Mr. Williams' new Fern is shown in our illustration (fig. 31), but the pinnae themselves are often so small as to be no more than a thirty-second, or even a sixty-fourth part of an inch across; in fact, a full grown plant at times exactly looks as if it were covered with the finest green dust, or emeralds, or drops of glittering water finely balanced on the slenderest of slender hairs. As seen at its best in Mr. Williams' houses devoted to new plants, this Fern has been not inaptly compared with a small and elegantly refined fountain covered with pellucid drops. If such a "Maiden-hair" Fern could ever have its spray-like fronds associated with a maiden at all, it would be the "Maiden of the Mist" in Sir Walter Scott's *Annals of Geierstein*, or, better still, the exquisite *Undine* of De La Motte Fouquet. Compared with other *Adiantums*, it is in its parts the smallest of the small, with an elegance and refinement it is impossible to reproduce in wood engraving. If *Adiantum farleyense* is like the growl of the drums when the terrible one-eyed giant is announced in Handel's "Acis and Galatea," then *Adiantum* is like the innumerable, endless, tinkling midsummer-night's fairy-bells heard in Mendelssohn's "Wedding March." Its fineness is like the fineness of some grasses, as *Brizia minor*, but combined with a lightness, elegance, and emerald transparency never yet possessed by any grass, or indeed any Fern other than *Adiantum gracillimum* itself. *W. G. Smith.*

CAMBUSMORE.

SEEING Mr. Downie's note at p. 83 on the successful lifting of a large Apple tree at Cambusmore, I am induced to send you a few particulars of this estate, which is the residence of Samuel Bateson, Esq. It is a beautifully situated house, nestling in the midst of rocky surroundings and native Birch woods. Extensive views of the most varied and beautiful description are seen from the mansion, the most prominent of which are some of the mountainous rocks of Sutherlandshire, its fine woods and cultivated fields, in the midst of which is spread out the lovely estuary called Little Ferry. In looking over the garden there I observed several things truly worthy of notice. The standard Roses were most wonderful specimens of successful cultivation. On November 3 Gloire de Dijon had large numbers of very fine flowers in perfection, as well as many of the best sorts of hybrid perpetuals, the flowers of which were exquisite in colouring. The *Lilium auratum* is used here as a line or ribbon; it grows most luxuriantly, and at the above date many of them were throwing up flower-spikes, while others were in the full development of their beauty, and the colour perfect. Another plant largely used there, the common white *Heath*, *Erica vulgaris* alba, had been most effective. Grown in a front line, and with perfect uniformity as to size and shape, it had been one mass of pure white throughout the whole autumn. Bedding plants are grown extensively, and in all the fashions and styles of the day are they planted out. They grow and flower most abundantly under the judicious arrangements of the Hon. Mrs. Bateson, who takes much interest in all that concerns the garden, ably assisted by the care and skill of Mr. Gordon, the painstaking gardener there. T.

MOOR COURT, HEREFORD-SHIRE.

MOOR COURT, the residence of the Rev. James Davies, President of the Woolhope Club, is approached from the Leominster and Kington Road through a broad avenue of Elm trees, somewhat more than half a mile in length. The road through this noble avenue makes a considerable descent towards the house. The avenue is spacious in breadth, as it should be, that the tall forms of the Elms may be seen

cinnamon-coloured stems harmonise so well, or whether, when the winter has left bare the handsome rugged forms of these old trees and the Scotch Firs are fully seen, it is extremely interesting and picturesque.

There are other fine and lofty Elms in the approach from the lawn meadow, in girth 12 feet, 12 feet 1 inch, and 12 feet 9 inches, which must have formed originally one side of another avenue approaching the house from the south, since an old map of the estate, in the possession of Mr. Davies, shows four avenues from the four quarters: it is a quaintly painted map of a hundred years ago. No trees of the avenues from

kept so by clipping. The way in which this hedge has been varied and concealed, leaves nothing to be desired. The great bane of Herefordshire, the horrible west wind, is effectually turned aside by it.

A Deodar Cedar, of good and graceful character, is growing well toward this side of the lawn. It has been planted thirty years at least, is now some 30 feet high, and its trunk has the circumference of 3 feet 9 inches.

On the east side, and slightly to the south too, a grand belt of lofty Elms, closely planted together, forms beneath them that wilderness of pleasant shade which should be close at hand in every well-considered

FIG. 31.—ADIANTUM GRACILLIMUM. (SEE P. 171.)

to advantage, and that the small foliage of the tree may receive those grand masses of light for which it is so well adapted. This fine avenue is certainly the most striking feature of the estate. It has been planted at different times, but the trees have all attained the characteristic features. Below the second gate the Elms on each side are here and there alternated with Lime trees, and towards the end approaching the fish-ponds and the house, Scotch Firs, in support of the Elms, form, as it were, a double avenue. The Elms are the finest in the valley, but they are drawn up into very picturesque forms. This part of the avenue is very striking; and whether the dark foliage of the Firs is seen in marked contrast with the light green leaves of the Elm, with which their bright

the east and west farnian, unless, perchance, the one from the west is represented by an Elm in the garden field or paddock by the canal, 14 feet 1 inch in circumference. In this paddock is the finest Wych Elm to be found in Herefordshire. It is a remarkably well-grown, even-balanced tree; its trunk is columnar, with fine northern buttresses, and at 5 feet from the ground it has a measurement of 18 feet 10 inches in circumference; it keeps its central axis well up into the tree, and its branches droop well on every side, as is the wont of this graceful tree.

The garden in front of the house is shut in from the west, in the most effectual manner, by a row of Yew trees, meant to be clipped originally, doubtless, and by a hedge of the most substantial character, which is

pleasure-ground. An excellent finish is given to the cluster by a fine Silver Fir, which towers above them all, to reach the height of some 120 or 125 feet, and which can be seen from a considerable distance by those who travel the high road from Pembridge to Kington. Its fine bole—would that it could be more shown towards the lawn—gives the large circumference of 11 feet 9 inches at 5 feet from the ground. It is a grand tree, and gives its character to the grounds, as such a tree must ever do.

A critical eye—one that rejoices in broad sweeps of greensward—never tires in watching the varied effects of sunshine and cloud upon it, and ever admires afresh the charming lights and shadows from the oblique rays of a rising or setting sun upon its smooth green

surface. The home grounds of Moor Court are too much closed in by trees. It longs for vistas, not only to let in broad bands of skylight, but also to admit much more of the wide space of outer lawn, which is now shut out. A small opening has been cut through to the east with excellent effect—albeit the boughs are yearly dropping down and spreading out to contract it.

Through the opening to the east an Oak of picturesque form—and made more so by a dead bough or two—is let into the view. The bole has a circumference of 14 feet 1 inch. There is seen from this opening, also, a Sequoia Wellingtonia, which is growing well, of which it may be interesting hereafter if accurate notes be now given. It has been planted twelve years, is now 16 feet in height, at 1 foot from the ground the trunk measures 2 feet 7 inches, and it has a foliage diameter of 8 feet.

In the middle of a meadow, called in old maps Drummercraft, the Anglo-Saxon Donne Croft—*domini*

able"—trees that make a timber-dealer's eyes sparkle, "quartering 2 to 2½," and running their boles well up into their branches, "useful for everything." Occasionally, as in the Yelt meadows, one falls in with a pollard that gives off 15 feet in girth, but beyond those which have already been given there are no trees remarkable for great size.

In the course of his perambulations your commissioner came upon a young plantation of Larch to the north of the valley, hard by the farm of Cotmore. He was reminded by it of a fine plantation of Oak he once met with, where the trees, some thirty years old, all of them sent up straight boles from 20 to 30 feet high without a branch, and on enquiring how they had been educated in this very proper manner, he was told that they were self-sown acorns in a young plantation of Larch. This indeed has long been a recognised method of growing Oak timber. The crop of Larch is first gathered at intervals, and a still more valuable crop of Oak remains on the ground. It is

too, are certain double grooves in the turf cut in an angular form, and carefully renewed from time immemorial. A Mulberry tree occupies the centre, to which they all tend. This tree is of no great size, but rugged and gnarled enough to be of considerable age. What were the lawn games these turf grooves indicate, and who played them? It may be that they were not intended for any games, but simply indicated paths to be triuily short, leaving triangular plots within their lines which were suffered to grow more wildly. It is said that such was the case at an old mansion of Flemish character in Surrey, where, and where only, the same converging turf tracts as at Moor Court are to be seen. The house itself, altered and enlarged again and again, tells nothing more than may be surmised from its secluded position in the valley. As might be expected, however, some rays of light are thrown upon its history by the legal records and documents connected with it. [The sketches (fig. 32, p. 173, and fig. 33, p. 177)

FIG. 32.—MOOR COURT; HOUSE, AND PART OF AVENUE OF LARGE OLD WALNUTS.

predilectum, the Master's Meadow—and fronting the house, are a dozen Walnut trees. They form a short avenue, as if at one time they, too, were intended for an approach to the house. As they are thus seen in perspective they form a very handsome group, with lofty heads, strong gracefully-spreading branches, and the pale deeply furrowed bark peculiar to the Walnut.

The oldest and largest trees are nearest to the house, and gave these dimensions in girth:—10 feet 9 inches, 9 feet 9 inches, 12 feet 3 inches, 11 feet 8 inches, 10 feet 7 inches, and 8 feet 7 inches, and were judged to be from 60 to 70 feet in height. At the beginning of this century they were in great danger. Walnut wood for gun-stocks was in urgent demand, and a long price was offered for these trees, but the late Mr. Davies resisted the temptation. He valued them too highly as ornamental trees to lose them at any price, and so "Diana's Grove" was spared.

That the valley is admirably adapted for timber growing, the measurements of the trees already given prove, and still more clearly does a walk through it, for it abounds in Oaks that are already getting "size-

not now intended, however, to recommend with old Tasser—

"Sow acornes ye owners that timber do love,"

though this might be done, but it is suggested that young Spanish Chestnut trees should be planted in the many places where the Larch has failed. Let those Spanish Chestnuts be thus properly educated, too, and then, if tree for tree, and space for space, they are not one-third more valuable than the Larch in the year 1850, your commissioner will forfeit a silver threepence if the fact is proven to him on the spot. "If you are planting for profit, on good ground," said an old Herefordshire timber-dealer in a confidential way, "plant sweet Chestnuts." They are much quicker in growth, and up to thirty years old are more valuable than Oak itself.

There are, too, attaching to the place certain signs of a lost history that give it a peculiar interest. What means that small canal, *à propos* to nothing, that runs straight along the paddock and under the cart-road, being an artificial continuation of the Carl Brook, which runs from Elsdon and Lionshall through the Moor Court meadows? On the lawn,

which illustrate this article were taken expressly for us by "our artist," while the article itself is a condensation from a description in the volume of the *Transactions of the Woolhope Naturalists' Club* for 1870. Eds.]

Foreign Correspondence.

MADRAS.—*Gardeners in India.*—Situated as I am at present, many hundreds of miles away from my brethren in the craft, I cannot now meet and discuss with them, as I used to do weekly in my younger days, the various methods of culture pursued, and the different amount of success each had under very varying circumstances as regards appliances and situation. One privilege I still enjoy (thanks to a cheap post)—I can weekly read your journal; and allow me to thank you for publishing the portraits of British Gardeners. I think it is a step in the right direction; and it will lead to much good by directing and educating the minds of those young men who, in the course of Nature, must fill the more prominent situations ere

many more years roll over our heads. Nothing gives a greater incentive to activity in young aspirants than reading and learning what has been done, and that more to the point than they have had themselves. This naturally creates a desire to be up and doing—to try and achieve something of the same success themselves, and I daresay many a young man may even dream of surpassing those who have gone before him.

Perhaps I am a little before my tale, then let us turn back to No. 45 of 1874, p. 583, and see what we can glean there in the young men's favour. I would ask Mr. Fowler if he does not attribute to the very act of writing that string of names, useless as they have appeared at the time, his after-success in life? To a great extent it fostered a power of observation, and called into practice method, for want of which many a young man is wrecked on the sands of Time. I say, teach our young men to observe—teach them punctuality, in doing so you teach them their own ignorance; and if once a person feels he is ignorant, in ninety-nine cases out of the hundred you make him a better man, a better gardener, a better and more useful member of society, and a truer man than himself.

I have no desire to gild your remarks at p. 493 (1874), as it is but to go on and forward with fear. "Thank in God, and keep your powder dry," was the advice of a great General to his men. Then let each of us do what we can, and while doing so be more hopeful for the future. Young men of ability in any profession are generally backward, and do not, as a rule, show to advantage at first; how much more so in a profession like gardening, where there is so much deep thinking, and so much to learn? I admit horticultural societies and schools in general do little for the young men. They would go a step or two further, and say that head gardeners do not take the interest they ought in young men. Employers—I do not say all, but 75 per cent.—take no interest in the young men; and from my own experience I feel certain if you were to ask these employers to allow their head gardeners to contribute to the pages of your journal their experience and autobiography, you would get a negative reply. In the face of all this discouragement the young man who sticks to the profession and reaches the top of the ladder, deserves great praise. It is a well-known fact that many of our best men desert the profession either for a more lucrative calling, or in disgust at what is perceived ahead. I think the publishing these memoirs of British Gardeners will give the young and persevering man a beacon ahead—in fact, I think the more public everything can be made the better. The publishing of the awards at horticultural exhibitions is often of interest to others as well as to the winner of the prize or certificate. Although not now growing Grapes, I have observed with pleasure an establishment taking first prizes and cultural commendations for Grapes at many of the London shows, as well as at provincial ones, whose Vine borders I made, thereby convincing me of the correctness of the operations then performed. I read my diary notes each time I observe the occurrence with a new pleasure, and, like Mr. Fowler, I have to thank a strict master, not exactly for these notes, but for enforcing the rule of entering every day's work at night, and examining me strictly on the same monthly.

Young men are, therefore, not quite or wholly to blame for the position they hold, if they are not quite up to the mark of their forefathers; to a certain extent indeed it is these very forefathers who should feel ashamed of their want of interest in the young and rising generation of gardeners, or shall we put it down to the changes of the times? It has often been remarked that Scotchmen make better gardeners than Englishmen, whose such be the case or not I shall leave facts to bear witness—sufficient for my purpose to take the saying as it is. I account for it in this wise, and I feel I shall get many who will bear me out in the assertion, that children are more under the control of their parents in Scotland than in England, and like good soldiers accustomed to discipline they leave their father's house and enter as apprentices—under perhaps a very strict master, and one who often has not got a large establishment to look after, and is therefore all the more able to look after the new comer, and see that proper ideas are instilled into him, and that he is taught to keep his eyes open to all that is going on around him. The mind of the young gardener is similar to the young sapling, and while it is the duty of the gardener to train the latter, it is equally his duty to teach and lead the former. In bygone years gardeners were as one to ten now-a-days, and every young man who thought of making gardening his profession was regularly apprenticed, and taught what it was to his interest to know then, as well as in his after-career. There was none of that loose system that prevails now. I refer to the practice of taking in young men as day labourers, and after a year or two in a garden, passing them out as journeyman gardeners, without any scientific training of any kind—to the disparagement of journeyman gardeners, not only in a scientific point of view, but in a pecuniary point also. Make the properly apprenticed and trained young man of

the present time, and compare him with the young man of twenty-five years ago, and I, for one, have no doubt as to which side the balance will lean—most certainly in favour of the present and rising generation of gardeners. Look at our gardens both at home and abroad, and let the oldest among your readers, who knew what they were twenty-five years ago, come forward and tell us if there is not a vast difference, and that for the better—and among these gardens are under the direction of comparatively young men. Why should we as professional men be retrograding, while all other learned professions are pushing ahead, and none but the ablest intellects can find employment? Given a fair remuneration, I fear not but the skilled labour and the brains to direct it will be equal to the demand.

Chemistry and laboratory work are other branches in which young men are far behind the times; but, much as you are behind your Continental brethren, you are as the full-grown man, and we out here are mere babes and sucklings. In India, with our immense resources and our vast forests, untrudged except by wild animals, it is a national disgrace that we are where we are. We can do nothing here—a handful of Europeans, with no voice in our country's affairs; with the appellation of interloper hanging over us; and the Government, although pretending to do all in its power to forward and develop the resources of the country, actually putting obstacles in our way. If one requires a few acres of land here, he has to pay more for it than he would do for a better article in some colonies, and there are many other little hindrances too numerous for detail here.

I observe from the daily newspapers that some individual—well-meaning I have no doubt—is trying to get up an emigration agency to locate certain districts of India with labourers from Scotland. My advice to the labourers is to stay where they are, or to go where they can work and will get paid for it. Here we can give them from 6s. to 1s. per diem, and stigmatise them as interlopers. As to India is not the place for the day labourer. With drains and a little money India is the place for middle-class men, and those who do not know what to do with their sons, the learned professions being overstocked in the mother country, should teach them botany, agriculture, horticulture, and other sciences, and with a little ready capital and a firm determination to abide by their choice, these are the men India requires. There is plenty of labour, as, I doubt not, you are all aware, having but lately had to open your purses in aid of a famine, simply because India is undeveloped.

I am afraid I have wandered a long way from my subject; to return, we have only to look to the Coffee-producing districts of Southern India and Ceylon to see the great necessity for scientific and practical training. At one time we have the Coffee borer killing out whole estates, and men losing their all. Next we have what is called locally leaf disease, believed to be a fungus. We have another variety of disease, known as over-ripening, that has done us no harm, and only half cultivating the same. The want of training, both practical and scientific, is very evident in this reckless and ruinous proceeding. If he that so acts had been taught that one acre well kept and well cultivated would tell very much better on the balance-sheet than an acre treated otherwise, he would have stopped and considered before so acting.

The Coffee borer has died a natural death. I am sorry to have to record it, but we know now about as much concerning the borer as we did before it scourged the Coffee-producing districts. If we had had two or three practical and scientific men like Dr. McNab among us, we might have been able to meet the borer halfway when he took himself to our Coffee gardens, and, politely asking him to retire, have saved our Coffee trees, and, what is more, our fortunes. In the meantime the leaf disease runs its course. We believe we have found out it is a fungus, or, properly speaking, it has been found out for us; but so exactly has it been found out, that it is a sad state of affairs, calling loudly to our paternal father, the Secretary of State for India, for redress. *H. M. F., Madras.*

Forestry.

Now that covert-beating in most places is over, no time should be lost in doing what is to be done in permanently improving the coverts and benefiting the woods and plantations generally. Every forester knows from experience that the time placed at his disposal by the gamekeeper for carrying on the various departments of his work is by far too limited. So much is this the case, that on many large estates, with comparatively few hands to do the work within the time prescribed, it is utterly given up in despair.

In woods devoted to game it is essential that the drainage be strictly attended to, both for the sake of the game that inhabits them, the under-cover itself, and the health of the timber trees. Nothing will

cause hares, pheasants, and partridges so completely to desert the covert as a wet state of the ground, and no improvement will more effectually attract and draw them back, as that of draining and drying it. Any directions here given for draining must necessarily be brief and of a very general character, as almost every acre, if not every drain, requires to be made in a way and manner peculiar to itself. We put the drains at various distances apart, from 10 to 20 feet, sometimes even less and sometimes considerably more. The depth and width, too, must necessarily vary as greatly as the distances apart. In ordinary plantation drainage, we usually put the drains 20 feet apart, 20 inches deep, 30 inches wide at top, and the width of a common shole at bottom. Such drains, when free of roots or large stones, are cut, and the excavations spread, at 7s. 6d. per 100 yards. Ground very soft and smooth on the surface can be done for 6s., but as they are often cost 8s. per 100 yards on unfavourable ground. It is not, however, draining for new plantations, but keeping in order drains already existing, or deepening and extending them, that is now under immediate consideration and requiring attention.

Perhaps no department of work performed by the forester is so difficult to execute satisfactorily as that of drainage, in policies and plantations contiguous to the mansion. Open surface drains are unsightly, and close tile drains choke with the roots of trees, and speedily go wrong. To overcome these difficulties, by adopting means at once cheap and efficient, has taxed the minds of foresters more than any other with which they are acquainted. What appearance is only of secondary importance, and the situation such as to admit of common open drains and ditches being made and kept open, nothing is simpler than drainage where proper and sufficient fall for the water can be obtained. Where appearances, however, are the first considerations, and everything must accord with the rules of modern taste, close drains in some form or other become essential. Having tried various plans of constructing close drains amongst trees and shrubs where common open drains were inadmissible, we find the following answers best of any we have employed. The drain or ditch is cut of sufficient size to form a path 2 to 3 feet wide at bottom, and from three to six times wider at top, according to depth. The earth thus thrown out of the drains or ditches is so disposed of as to form mounds or convex ridges between them, and these ridges and slopes, when closely planted with evergreens, either trees or shrubs, produced not only a splendid effect in an year or two, but the plants in the newly-stirred and deep soil grow with great rapidity, far outstripping those on ordinary flat natural surfaces.

Particular attention should be paid to the line of the ditches in marking them off, so that they may assume agreeable and natural curves, especially where exposed to view. In policies, shrubberies, arboreta, &c., straight lines must be carefully avoided, as any such would impart an artificial appearance to the whole which is intended to appear as if it had been made by nature. The depth, but, if possible, so deep at least as to reach a hard and firm bottom. In the centre of the ditches a narrow rut is cut from 9 inches to a foot deep, sufficiently large to receive a round tile, or "mug and sole." For ordinary purposes a 3-inch pipe is sufficient, but if there is much water a 4-inch tile may be required, and in some cases even a large "mug and sole."

The loose soil having been removed, makes the bottom of the ditch a firm, dry foothold, free from rank grass or herbage of any kind, and less attractive to the roots of plants than it would otherwise be, as they always run where the soil is best. The tile receives all the water, and keeps it both out of sight and at a depth where it cannot injure the plants. When the trees or shrubs grow up on each side and close to the ditch, it presents the appearance of a well-designed serpentine walk winding through the plot or group. If at any time the roots do reach the pipe-drain, its depth from the surface soil is so shallow that it can be lifted, cleared, and replaced at a comparatively trifling expense. Drains in game coverts, whether of large or small dimensions, may with advantage be laid with tiles, so as to avoid the necessity of deep surface drainage. *C. Y. Michie, Cullin.*

Notices of Books.

Economic Geology; or, Geology in its Relations to the Arts and Manufactures. By David Page, LL.D., &c. Blackwood & Sons. Pp. 326.

A good text-book on this subject has long been a desideratum, for with the exception of some publications of Professor Ansted, of limited scope, and now somewhat out of date, we do not recall any general treatise on the subject, though portions of it have been dealt with from time to time by various authors. The general scope of the present work may be gleaned from a summary of its contents, which comprise, first, some general remarks, and then, in succession,

chapters on the nature of soils, mineral manures, the valuation of land for agricultural or mining purposes, on building stones and cements, on the making of roads, canals, docks, railways, and wells. Mining operations and the "getting" of fuel—peat, coal, petroleum, &c., are also dealt with. Lastly, a very extensive and miscellaneous group of subjects occupies several chapters, and is devoted to various raw materials—gums, ores, &c.—which are employed in commerce and the arts.

Under the head of soils and subsoils, the author points out the difference between the soils of disintegration, resulting from the wearing away of the rock on which they rest, and soils of transport—the waste and decay of distant rocks transported by water, ice, or other agencies. The subsoil is, of course, attended to with special reference to drainage, though but too little mention is made of the earth-temperature to which the roots of plants are subjected. The author proceeds to show how the defects of any given soil may be corrected by admixture with other soils of a more fertile character, or by drainage.

Dr. Page's illustrations are all taken from agriculture, and herein we think he has not done well, in ignoring or overlooking the teachings of horticulture. We believe in most matters relating to the management of the soil, according to varying circumstances, the gardener is, as a rule, far ahead of the farmer. Indeed, he can scarcely help being so, for the conditions and limited space under which the gardener works give him a great advantage. Be this as it may, Dr. Page would, we believe, have been enabled to succeed in his moral much more effectively had he treated the question of soil in its relation to garden-culture as well as to field culture. The principles are the same in the two cases, but practice is much more perfect in the garden than in the farm. While saying so much, we do not overlook the fact that great advances are requisite in our knowledge of geology as applied to gardening and fruit growing. The quantities, and specially the qualities, of fruits are particularly influenced by the nature of the soil and conditions. The ordinary geological maps are of very little service to practical men in these particulars. What is really wanted is a geological survey and map of the surface soil and subsoil of every farm and garden. We do not know any department of applied science which more stands in need of thorough investigation than this of the relation of the garden soils to garden plants and garden culture.

It may well be imagined that in dealing with so large a number of subjects, Dr. Page is unequal in his treatment of particular subjects, but he has succeeded in bringing together a great mass of very useful information, and much of it, too, which is not readily accessible or generally known.

How many of us, we wonder, know what Bath bricks are, whence they come (it is almost needless to say that they have nothing to do with Bath), what Tripoli, rotten-stone, crocus, and a score of other things in daily use, really are and whence obtained. The reader will find abundance of this kind of information in Dr. Page's volume, which we commend accordingly to his notice.

— Mr. Martin H. Sutton has reprinted from the *Journal of the Royal Agricultural Society* his essay *On Laying Down Land to Permanent Pastures*, and has added to it a geological map of Great Britain and a brief description of the principal agricultural grasses, with woodcut illustrations. We imagine the proportion of particular grasses recommended for particular soils is, to a considerable extent, arbitrary. Why, for instance, should a large quantity of one particular grass be used on the clay lands of one formation and a different quantity on the clay land overlying another formation, other things being equal, especially when the total quantities per acre recommended are identical for each formation? There is an appearance here of over-refinement which we do not think the present state of agricultural geology warrants.

— The first number of a new French journal, devoted to the subject of geography in its scientific and commercial aspects, has been forwarded to us. It is entitled *L'Explorateur*, and is edited by M. Hertz, well known far as the maps and charts are concerned, by M. Mamrot, Secretary of the Geographical Society of France. Among the articles we find one by Dr. Rouher, on the geographical range of Wheat culture, which is very interesting, and from which we hope to make room for some extracts on a future occasion. Among items of news we note a proposal for the construction of a railway, compared with which the difficulties of making the Channel tunnel would seem to be utterly insignificant. The scheme, proposed by Mr. John A. Lynch, is nothing less than a railway passing eastward from Western Europe through European and Asiatic Russia, Siberia, China, Kamtschatka, over Behring's Straits, Alaska, across British North America from west to east, and so to the United States!

— Mr. J. N. Lockyer's *Primer of Astronomy*, published as one of Macmillan's Science Primers, is an

admirable elementary book, which should find a place in all schools. Messrs. Macmillan are doing excellent service by the publication of this valuable series. All those that we have met with have been exceedingly well adapted for their purpose.

Natural History.

OUR SONG THRUSH.—No British song bird is hailed with more delight in early spring than the thrush, or song thrush. Its song is more flute-like and melodious, without being coarse, than any other of our early songsters; but I do not wish, in this brief sketch, to draw the attention of our readers so much to the song as to the other remarkable qualities of this bird. It has been remarked that the reason why many birds sing is because of the spirit of emulation; this is, perhaps, open to question, although many instances might be cited to prove this theory. An aged friend of mine, who kept several birds in his humble cottage, prided himself last summer on a song thrush which he had reared from the nest; this certainly was a noted songster. I several times walked past his house, solely to listen to his thrush. Early one morning another bird of the same species sat on the topmost bough of a tall Ash tree, opposite the cottage, and sang with great vigour for an hour or two. The caged thrush listened attentively, and, at first, tried to sing louder than the wild bird; however, the latter excelled the tame bird, and, to quote my friend's words, "he was silenced completely." Strange to relate he could never be prevailed upon to sing again, but from that day he pined and drooped, and in a few weeks died.

Although it may be, and is, I believe, often exceedingly jealous, yet I do not know a more affectionate bird. During a severe frost a few years since I found a young thrush crouching beneath the hedge-row in our garden, apparently dying from hunger; I, from motives of pity, took it into the house, warmed and fed it. Perhaps it was grateful for this little kindness, however it was very affectionate, not only towards myself, but to others. The following spring I placed a nest, containing four unfledged young of the same species, in its cage. It tended these most assiduously and carefully; if it could not find any food suitable for the tender things it was very uneasy, and each night until they left the nest it sat beside them to keep them warm. Had this bird been a female not much wonder would have been excited, but, being a male, it was thought, by all who knew of the circumstance, very remarkable. When the young were reared, and removed from its cage, it commenced feeding a flock of chickens. It watched my sister doing this, and calling them for food, when it afterwards imitated the well known call, "chuck, chuck," when the mother hen with her brood came beneath the cage, it manifested its joy by peculiar guttural sounds, whilst putting its own food through the bars and throwing it to the floor. Feeling compassion for it we afterwards placed beneath its fostering care a young blackbird, which it also reared. The following extract from the *Journal of a Naturalist*, p. 208, exhibits its affectionate nature:—"We observed this summer two common thrushes frequenting the shrubs on the green in our garden. From the slenderness of their forms, and the freshness of their plumage, we pronounced them to be birds of the preceding summer. There was an association and friendship between them that called our attention to their actions; one of them seemed ailing or feeble from some bodily accident, for, though it hopped about, yet it appeared unable to obtain a sufficiency of food. Its companion, an active sprightly bird, would frequently bring it worms or bruised snails, when they mutually partook of the banquet, and the ailing bird would wait patiently, understand the actions, expect the assistance of the other, and advance from its asylum upon its approach."

In some of our popular ornithological books it is stated to be very hardy; this is, without doubt, an error, for I know no bird which suffers more. In severe frosty weather I have often found them dead and dying. After several weeks' frost they become

so emaciated as frequently to be nothing more, if I may be allowed to use the common expression, "than skin and bones." In these hard seasons I have observed them busily engaged, along with fieldfares and blackbirds, feeding on the root of the *Arum maculatum* on the borders of Aston Woods, Cheshire. I should imagine they would not touch this food, except compelled from starvation, because of its strong pungent taste. I have never seen them feeding on these tubers except in frosty weather, for I have dug up and exposed them in hedgerows where these birds frequented, but they pass them by unnoticed in open, mild seasons. White, the Selborne historian, says the thrush and fieldfare are both tender birds, and suffer much in hard frosts. During the late severe weather the fieldfare was the first to show signs of suffering. In a short walk one day over our stubble lands I found several dead. Then the thrush began to die in flocks, so as to become very tame. I never saw them so near our house as during Christmas, 1874; in fact they were caught by boys in the street, but the blackbird appeared to be as hearty as usual. It is often supposed that thrushes congregate in small flocks in winter; this error has arisen by mistaking the redwing and fieldfare for the thrush, although we have seen thrushes mingle with a flock of redwings. I have observed a flock of thrushes just lately, but I have no doubt they had emigrated from Norway. The British thrush is a solitary bird, seldom mingling with its own or any other species.

Our bird is anything but a vegetarian from choice. Many mistakes have been made by their admirers feeding them too exclusively upon Hemp seed and bread crumbs. When wild, its chief food, when it can be procured, is the garden snail. In reference to diet they differ widely from their near ally, the homely blackbird, who would rather enjoy himself in either a Currant or Cherry tree, instead of toiling along the walls to find snails and worms. The thrush is thus often blamed unjustly—when seen in gardens it is at once pronounced a thief. It ceases to sing from about Midsummer; during August, which is its most silent month in the year, we occasionally hear young thrushes warbling; the old birds sing a little in September. I do not know if I can fully prove a theory which I have now held for some years, that the best and finest song thrushes (i.e., the best songsters) are to be found amid lovely or wild sylvan scenery. I do not apprehend that any one will, for a moment, question the fact that there is a vast difference in the song of these birds, although the notion is common that the song of any species of bird is the same everywhere. We do not doubt but that the strongest and healthiest females select as their mate the best singer which is to be found in the district (thus a fine and healthy progeny are reared), a bird who will morning and evening select the highest bough in the wood to pour forth his rich melody. The Manchester bird-catchers resort to the Derbyshire vales in early summer, where they secure many good songsters, and although they are plentiful near home, yet the Derbyshire bird will realize a far higher price, and pays them well for the journey, &c.

Another remarkable thing connected with this well-known bird is its habit of nesting year after year in the same locality—if it is successful in rearing its young it will, if alive, prepare it in the same tree the following spring. I knew a pair which built their nests three successive seasons on the branch of a Cherry tree nailed against a cottage. The hen bird, in this instance, became so tame that she would allow the cottager's wife to lift her from the nest, and would fearlessly feed her brood when she stood beside the nest; but this familiarity was not allowed if a stranger happened to be in the garden. When busy at the wash-tub one day, the cottar's wife was surprised to hear the birds screaming, as if terrified. The hen knew where her friendly protector was working, so rapidly flying through the open door she perched on her shoulder, then as rapidly flew back again. She imagined something was going wrong, so leaving her work and going outside the door, she discovered that her neighbour's cat was climbing toward the nest. After dislodging this unwelcome intruder from the garden, the thrushes showed their gratitude, at least the female perched again upon her shoulder, and, fondling against her cheek, seemed to say, "I feel so thankful for helping me in my trouble."

Another instance, somewhat similar, just now comes to my memory. A late sheriff of Chester, now living in a village not far from the old city, a man highly honoured and respected by his fellow-citizens, loves to encourage birds in his garden. In doing so, he sometimes, perhaps by sheltering them from the dreaded hawk, has persuaded many species to build their nests in his garden, so that every bush and tree, not to mention the hedgerow, which is literally filled with the hedge-sparrow's nests, has its tenants. Amongst the rest, a pair of thrushes regularly take possession of a fine *Arbutus* shrub, about 3 yards from the drawing-room window. These are also very tame: in this case even strange visitors are allowed to part the leaves and look at Polly, as she sits on the nest, without disturbing her in the slightest. R.

HORTICULTURAL EXHIBITIONS, 1875.

FEBRUARY.

17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

MARCH.

3.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

10 and 11.—Leeds Horticultural Gardens Company. Spring Flower Show. Sec. and Manager, James Birbeck, 103, Hyde Park Road, Leeds.

16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.

17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Hyacinth Show.

44.—Glasgow and West of Scotland Horticultural Society. Spring Exhibition. Sec., F. G. Dougall, 167, Canning Street, Glasgow.

31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

APRIL.

4.—Special Exhibition of the Royal Horticultural Society of Antwerp.

7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Early Rhododendron Show.

22.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Balfe, 48, Westland Row, Dublin.

27.—Manchester Botanical and Horticultural Society. Exhibition of Auriculas, &c., in the Town Hall. Manager, Bruce Findlay.

28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

MAY.

1 to 24.—Royal Botanic Society, Regent's Park. Special Exhibition of Clematis, &c., at the Junction Row, Dublin.

15.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Pot Rose Show.

14 to 21.—Manchester Botanical and Horticultural Society's Annual National Exhibition, at the Garden, Old Trafford. Manager, Bruce Findlay.

20.—Royal Horticultural Society of Ireland. Early Summer Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.

22.—Crystal Palace Great Flower Show. Sec., F. W. Wilson.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 6, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 8	Sale of Liliun auratum and other Japanese Lilies, at Stevens' Rooms.
TUESDAY, Feb. 9	Royal Horticultural Society's Annual General Meeting, at 3 P.M. Sale of 150 Pairs of Poultry, at Stevens' Rooms.
WEDNESDAY, Feb. 10	Sale of Hardy Trees and Shrubs, Roses, Hortensias Plants &c., at Stevens' Rooms.
THURSDAY, Feb. 11	Sale of Specimen Camellias and Azaleas, Established Orchids, &c., at Stevens' Rooms.
FRIDAY, Feb. 12	Sale of Imported Orchids and Lilies, at Stevens' Rooms.
SATURDAY, Feb. 13	Sale of Specimen Conifers, Fruit Trees, &c., Hortensias Plants, Gladioli, &c., at Stevens' Rooms.

HOWEVER much tastes may alter and fashions vary, there are certain broad principles which remain the same throughout all ages. This is a truism which no one will deny, and it is as applicable to LANDSCAPE GARDENING as to any other department of Art.

The nature of landscape gardening will be best understood by supposing ourselves on some extensive plain in which not a tree is visible. Our first sensation would be a surprise at the vastness and uniformity of the scene; let us journey a mile or two, and the scene not changing, would become dreary and monotonous—our ideas would be of a sombre cast, and we should soon become weary of our situation. In proof of this, hear the traveller's account of passing the deserts. But it might be thought, perhaps, the scene would be changed by supplying a broken and unequal surface—that the physical character of the surface would alone create delightful emotions. Let us take the evidence of travellers who have been weeks in ascending mountainous ranges where perhaps scarcely a blade of grass enlivens the vision. Are the rugged mountain path, the bold projection and the rocky chasm, with bold sky and clouds clinging to the mountain side in dizzy depth below, congenial to pleasurable emotion? As in the instance of a plain the traveller would for a time be delighted at the novelty of his situation—he would have in addition a variety and grandeur that would oppress, perhaps appal him, but it would not produce a quiet and delicious train of thought. He would journey

on much longer without disgust and satiety, but the scenery would impart sensations of solitude, the rugged and broken mountain-tops would afford no repose, a want of continuity would incessantly break the thread of his idea as the lines were abruptly and almost fantastically placed out of undulating surfaces and proportions—the grand outlines of Nature would be given, but nothing to fill up and harmonise with them. But let such traveller pass the summit, and commence his descent—what are his emotions on beholding in the distance the blue hills crowned with trees, and the slopes bright with grassy verdure? Do not the trees afford a brighter tint and more welcome shade; are not the green distances grateful to the eye, and do not a thousand pleasing sensations arise in his bosom? Every mile as he passes on ceases to produce *ennui*, for his hopes brighten, his mind is relieved by every passing change: not a forest in perspective, nor a tree or a shrub as he passes, but adds a grateful variety to his path, and beguiles his weary wandering.

Thus, then, we have by the two situations of our traveller shown that there are certain principles that regulate the feelings in surveying external scenery, and that an immediate effect is produced from the change of its character on the mind of him who beholds it. Now this principle is variety, and that variation is not alone produced by the harmonious forms of the trees themselves, but also by the innumerable changes that are produced by light and shadow, which are more Protean in their effects on trees than on any other surfaces in Nature.

We will now suppose our traveller pacing through immeasurable forests, abounding with every exuberance of the vegetable world. He would walk on surveying the leafy grandeur in admiration, until he was arrested even here by some beautiful, by some enchanting spot that it was impossible to pass by unscrutinised. Nor would this delay take place with one alone: suppose fifty travellers of cultivated taste to pass, forty out of the number would alike be arrested. There must, then, be a cause for the surprise or delight thus experienced. If a portion of these travellers were painters, they would remain long enough to catch the effect, and thus would be perpetuated the pleasure the painters first felt. In this way the thrill of delight that first was excited in a HOBBEEMA, a CLAUDE, or a WILSON, may still be vibrating in thousands of pulses, through their so potent art. If a poet, he would drink deep of the spirit of the place—would people it with imaginary beings, and ideas would crowd upon him thick and clustering as the foliage itself. In this way the Vallombrosa of MILTON has charmed thousands who never saw it, but so powerful has been the spell that painters have from his description again realised its leafy scenery. Now, suppose out of the number of travellers a landscape gardener was one; his feelings would also be awakened to the beauty of the place—he would carefully analyse the effect and study the cause—and in an after day he would endeavour to imitate in artificial plantation that which struck him as one of Nature's gems. If happily he succeeded, the same continuation of pleasing emotion would follow on the inspection of his labours that we have described in the picture or the poem. Thus, then, this art must, strictly speaking, belong to the same class, must make one of the imitative arts.

Those who have studied Nature from a poetic or a pictorial point of view know full well that every scene is not fitted for their pencils or their poems; so in like manner it is the selection only that ought to arrest the attention of the landscape gardener.

Every landscape is made up of many materials, which will require placing in certain order to produce a striking or a pleasing effect.

Trees are the individual objects of most importance in a landscape; in them there is an infinite diversity, but let us suppose that a number of sketches of the most beautiful were placed singly in the same picture, such would most certainly be an indifferent picture; it would be a thing of shreds and patches—there would be a want of unity and of breadth—it would appear specky, and would from that cause be unpleasing. But now suppose one of these magnificent or pictorial trees placed in the foreground, and under its spreading boughs let there be seen in the middle distance a dense mass, gradually becoming thinner towards the centre of the picture, at which point we may suppose the existence of water or a distant road with a few scattered trees in irregular forms, beyond which extend plains, and lastly an irregular outline of distant hills, while a copse-like brushwood may be imagined as filling up the opposite side of the picture, and forming a kind of ambush for concealing the various lines of the mid and extreme distance, and with a few cattle or sheep you would have the outline of a picture that, under proper and judicious management, would assuredly please.

Thus, then, while the sketch-book may be filled with the most beautiful of Nature's productions, it by no means follows that a perfect whole may be formed from such material: there is a harmony that results from the union of what may be termed the components of a landscape that can never be dispensed with, for without this, whether in a picture or in Nature, no composition can satisfy. Speaking of this, GIRARDIN very aptly says, "Were this principle not prevalent, the groups of trees, the lake and the buildings, would only please when considered separately; and the result would be as poor a production as a machine with wheels exquisitely wrought and neatly polished, which, however, would not act with each other so as to effect the intended movement."

Another of the principles of landscape is what perhaps may be called propriety. It consists in placing an appropriate kind of tree in a particular situation. In scenery that is naturally rocky, mountainous and abrupt, Firs may be planted with great effect; they harmonise with the savage character of the scene, and if a dashing cataract could be concealed by them at one point and be then made apparent by leaving bare the rocks on the near bank while on the opposite they are allowed to clothe the rugged rocks, a fitness as well as variety of character would be produced that would inevitably please for its very propriety. But the principle is equally in operation in the quieter scenes of Nature. Let us for a moment imagine ourselves on a lawn of great extent, with Lime trees whose leafy branches sweep the ground, and a feeling of quiet security steals over us; the mown lawn convinces us we were on a cultivated enclosure, and the Lime trees touching the grass assure us that no cattle are allowed to graze there: thus a propriety of a widely differing character is established.

Variety has been mentioned as a constituent of beauty: this is well illustrated in the analysis of HOGARTH, as is too well known to repeat here; but variety does not alone appertain to the ground line, as many imagine, it is equally recognised in the character of a single tree. The Oak is universally allowed to be the most beautiful of trees as well as the monarch of the woods. Look at an Oak when winter has stripped it of its leafy verdure: watch its knobbed and tortuous roots, which are disclosed for many feet from the trunk; let the eye ascend the trunk itself and dwell on the cracks and flaws of the bark, then, ascending, behold the massive and grotesque arms terminated with abrupt and tortuous branchlets; and then see if there can be found another tree in the whole European forest that in itself contains as much variety. Nor

does that character appear alone in winter, for the very manner in which the leaves are produced, in clusters at the extremity of the shoots, and the shape of the leaves themselves, all tend to keep up the character of diversity. Then let us see how magnificent a ruin it presents: unlike the Elm, that, when an untoward spring assails it, dies *en masse* before the succeeding winter, the Oak is still tenacious of life; and as it only acquired its character in the ripening of years, so also it is years before that character is obliterated. An Oak beginning to decay is far more pictorial than one in perfect vigour, for when dying the beauty of summer and winter are equally disclosed, and in addition a species of veneration is attached to its character of bald and hoar antiquity.

tinual state of disquiet. We may add a few comments on the document before us, and extract from it what comfort we may.

First, as to the shows. Undoubtedly these were quite up to average last season, and the reduction of the number has been productive of no serious loss or inconvenience, while to many it has been a great relief. The "scientific work," as it is called, has been also of an average character, while the practical work at Chiswick has, considering all things, been more satisfactorily carried out than heretofore. For certain reforms and improvements in that department, the present Council deserve the thanks of the Fellows. Mr. BARRON'S services are too well known to need a word of commendation, but it is clear that the more latitude, consistently

without their host in this matter. Turning now to the question of finance, it is indeed necessary to call the "earnest attention" of the Fellows to this matter. The misfortune is, that a perfectly plain and complete statement was not made long ago.

We are far from wishing to impute anything inconsistent with good faith to former Councils, but we may express our great regret that it should have been possible for their successors to make such statements as they have done in the present report. The want of explicitness on financial matters characterises also to some extent the present balance-sheet. How many of the Fellows, excepting a comparatively very small number, whose avocations have necessarily given them some insight into the matter—how

FIG. 33.—MOOR COURT: LARGE HORSE CHESTNUTS AND LAKE.

Out of the many feelings that arise from the contemplation of such a tree is the certainty that from the very early ages of the world such must have been their character, and instead of there being only now and then one to be met with, they must have occupied all the suitable soils in this quarter of the globe as they still do in some parts of Spain and the Apennines.

WERE it not that those interested in the prosperity of the ROYAL HORTICULTURAL SOCIETY have been on the tenter-hooks of suspense and anxiety for several years, the report which we publish in another column (p. 170), might well cause dismay. As it is, most of us would welcome any crisis which would really bring matters to a head, and permit of amputation, excision, or any other remedy which, even at a sacrifice, would put an end to this con-

with financial considerations, that is allowed the Superintendent of the garden, the better for the Society and for horticulture.

The paragraph relating to the skating rink brings the Commissioners—those *terribles enfants*—once more on the scene. As horticulturists, it was perfectly indifferent to us whether or no the Society established such a thing or not. It was not horticultural, but horticulturists would have assented willingly to anything that might have helped to improve the exchequer. It might have been supposed that the landlords, in the view of possibly getting the rent paid by this means, would at least not have objected. Objected they have, however, and it is not quite clear from the report whether, under the circumstances, they were not perfectly justified in doing so. It would rather seem as if the Council had somewhat recklessly counted

many of the Fellows, seeing a balance of nearly £800 on the credit side, without an equally explicit statement as to the present and prospective liabilities of the Society, would imagine that the Society is in such straits as it is? True, by turning to the report itself they may gather some information on this point, but not so much as, in our opinion, ought to have been afforded.

It is said to be a pleasant sight to watch strong men struggling against adverse fate. Such pleasure, if pleasure it be, can now be enjoyed to the full. The present Council came into office because they thought, and a majority of Fellows thought so too, that they could conduct the affairs of the Society better than their predecessors. How, then, has the sequel fulfilled the promise? On the whole, well, we venture to think. The general business of the Society has been carried on quite as well, and

in some particulars better than in former years. The administrative abilities of the present Council have in the main, we believe, been superior to those of other Councils. It is objected to this that the discontinuance of the Provincial Show, the arrangements with the Commissioners, the unkind treatment of Mr. FISKE, may be cited in disproof of our statement, we reply that our remarks are general, not specific, and that what naturalists call the "environment" must be duly considered.

After all, the supreme test will be afforded when the crisis really comes. Meantime, what do the Council propose to do in the present financial difficulty, with a view of paying the rent next year and so of retaining the lease of the garden at South Kensington, which otherwise will be forfeited? Their scheme, as we gather from the report, is that the residential Fellows, by whom the garden is most wanted, should pay [if they will!] a larger subscription than those who only want the garden in so far as it affords a convenient place for exhibitions and meetings. This proposal is at least fair to the horticulturists. We shall not now stop to discuss the project, which will probably be sufficiently ventilated by-and-by. What horticulturists want is some plan by which the Society may be relieved from the burden of a garden which is of no use to horticulture (with the exceptions just mentioned), and which swallows up a larger sum than any other department, and from a heavy debenture debt, incurred in great measure at the instigation of the Commissioners.

As things are at present, we see severe measures of retrenchment, with a prospect of others more severe; we see a garden kept up at great cost which is of little or no use to horticulture; and we see horticulture itself starved, the Society crippled with debenture debt, and threatened by the Commissioners with a Chancery suit: a pleasant prospect truly!

The present Council have shown themselves desirous, so far as possible, of meeting the views of the horticulturists; they have been conciliatory to them, and their general management, as we have above said, has been generally judicious and satisfactory. We may, therefore, suggest that the Horticultural Fellows, albeit, in some particulars, their interests are not the same as those of the party now in power, should not embarrass the Council in their present most difficult position, but, on the contrary, should lend them all the support they can consistently do in the present emergency.

AN EXHIBITION OF POTATOS in the forthcoming autumn is in progress of organisation, the initiator of the scheme being Mr. HENRY, Esq., of Beckenham, the champion amateur of the noble root. Mr. SHIRLEY HIBBERD is co-operating with the originator of the idea, and a committee will shortly be formed for the preparation of the schedule and other preliminaries.

The CHICAGO Pharmacist for January gives some interesting details concerning the BOTANIC GARDENS which are shortly to be established in that city. It is proposed that they should consist of—1. The botanic garden proper, in which all indigenous plants of the United States, and hardy species from other parts of the world, will be arranged, as far as possible, according to their natural affinities, while hothouses and greenhouses will be provided for the reception and display of tropical plants. 2. An arboretum or collection of hardy trees from all parts of the world, planted in such order as to serve the purpose of science and ornament. 3. A garden devoted to general floriculture, with special reference to furnishing material for beautifying the parks and boulevards. 4. A botanical museum, for the exhibition of vegetable economic products, which will serve to illustrate, in connection with the living plants cultivated in the gardens, the sources and various applications of substances derived from the vegetable kingdom. 5. An herbarium, or collection of specimens of dried plants, scientifically arranged. 6. A library of botanical works. The two last are rightly considered as forming indispensable adjuncts to the gardens, since they furnish the only means for correctly naming the plants under cultivation, and for maintaining the establishment upon a scientific and practical basis. This large undertaking will be set on foot with as little delay as possible. A committee has been appointed, the Botanical Director being Professor H. H. BACOCK, who possesses in an eminent degree the qualifications necessary for so important a post. It is hoped that the results of the first season's work

will succeed in attracting the attention and enlisting the co-operation of all interested in the subject. Our readers will not fail to notice that the plan proposed is precisely similar to that upon which Kew is regulated. We trust that its execution will not be less successful than that institution.

— We quote the following spirited "APOLOGY" FOR SCIENCE from the funeral oration preached by DEAN STANLEY on the occasion of the death of CANON KINGSLEY:—

"But even more than to the glories and wonders of man he (KINGSLEY) was, far beyond what falls to the lot of most, alive and awake in every pore to the beauty and marvels of Nature. That contrast in the old story of 'Eyes and No Eyes' was the contrast between him and common people. That eagle eye seemed to discern every shade and form of animal and vegetable life; that listening ear, like that of the hero in the fairy tale, seemed about to catch the growing of the grass, and the opening of the shell. Nature was to him a true companion, speaking with a thousand voices; and Nature was to him also the voice from the throne of the Invisible, as it can only be to those who study, and love, and know it. For his was no idle dreamer's pleasure: it was a wakefulness, not only to the force and beauty of the outward world, but to the causes of those comforts and pleasures, to the explanations given by its patient students and explorers. Never, or hardly ever, did he join in the presumptuous condemnation or the cowardly fear of science and scientific men. They were fellow workers with him and he with them. From his fearless confidence in the result of physical research he took every breath of the Divine spirit, to let every ear to the Divine truth. To you as to him 'let everything that hath breath praise' the eternal God. Children gathering shells on the seashore, fishermen by chalk stings, hunters in the bright sun, and anglers in the deep, and penetrating streams and shifting soil, fear not to learn and to teach those lessons of holy and innocent enjoyment which awakened in him constant praise of the eternal Cause."

— In the choice collection of ORCHIDS at WHITCOURCH RECTORY, EDGWARE, there are now some beautiful varieties in full flower. Especially we may mention an unrivalled plant of *Ceologne cristata*, which is over 12 feet in circumference, and displaying about 150 racemes of its chaste and snow-white flowers. We also very much admired some select varieties of *Cattleya* *Viviana*—one especially called C. T. magnifica, the bloom of which is 7 inches across, with sepals and petals of a delicate rose colour, and a bold labellum which displays an opening 2½ inches wide, and of a deep rich magenta colour, with throat of deep orange. This is one of the finest varieties we ever remember to have seen, and formerly belonged to the collection of the late Mr. DAWSON. There is also here a fine variety called C. T. atlantica, which formerly belonged to Mr. W. PALMER, of Florida. The petals of this variety are white, and the whole of the apex of the labellum is a rich dark purple. We were much struck, also, with a very large plant of *Masdevallia ignea*, which is now throwing up over thirty flowers of a fine variety.

— In an address on the produce and industry of Ceylon recently given in that colony, we are told that "Coffee is extensively cultivated in Ceylon. Coffee grows almost without artificial aid, and produces an article whose aroma is not to be surpassed by the most renowned of the West Indies. Cocoa, also indigenous, equals by its softness and perfume the Cocoa of Caracas. The Aromatic tree, revelling in the extreme humidity of the soil and climate, yields a vegetable which, ripened under the fierce rays of the Gulaian sun, takes its place in the foremost rank of its kind. The forests of Gulaia offer incalculable and precious provision for doctors, timber yards, railroads, and cabinet workshops, besides yielding gum, resin, balm, spices, and gutta-percha."

— From an official report on the TRADE of the little ISLAND of ST. THOMAS it appears that cultivation generally is at a very low ebb. The fact of the steep hill slopes being covered only with a thin layer of surface soil, which is often washed away rather than irrigated by the heavy rains which vary the atmospheric condition of almost habitual drought, indicates that St. Thomas even in its days of slave labour could never have been very favourable to cultural enterprise. At the present time the town and harbour offer so much employment to labourers, at a higher rate of remuneration than could be obtained in the plantations, that the larger estates are left wholly uncultivated and overgrown with bush, while of the smaller ones a few only are barely kept up, more as gardens than plantations. The greater part of the island, however, remains, in spite of nominal ownership, a mere wilderness, consequent upon the absurd prejudices of the old proprietors (for the most part Danish creoles) preventing their leasing or selling small plots of land to the negroes. Where, however, the negroes have been able to obtain land they have succeeded in making the soil profitable, either by the production of garden or farm produce, or by the

rearing of cattle. Exportation, however, is for the present out of the question—the amount of native growth, animal or vegetable, not being sufficient to sustain a twentieth part of the actual population. The produce resembles in kind that produced generally throughout the West Indies, though of poor quality, arising from the deficiency in soil and rainfall; so that the bulk of provisions required for use by the inhabitants themselves or for the steam and sailing ships that touch or lie in the port has to be taken from St. Croix, Vieques, Porto Rico, and the neighbouring islands.

— The case of MISTLETO PARASITIC UPON ITSELF exhibited by DR. MASTERS on behalf of Mr. CORDEROY at the last meeting of the Scientific Committee of the Horticultural Society, reminded us of an analogous case mentioned in Dr. HOOKER'S *Handbook of the New Zealand Flora*. In this instance it is one genus of parasites parasitic upon another genus of the same family, namely, *Tupia antarctica* on *Loranthus micranthus*. The former greatly resembles the Mistletoe of the northern hemisphere, and is one of the commonest of the family in New Zealand, where, in a phragmogenous flora of less than a thousand species, there are eight belonging to the Loranthaceae, all of them apparently endemic. We looked over the specimen in the herbarium at Kew to see if there were any showing this peculiarity, but we only found Mr. HECTOR'S note containing the information of its occurrence. Though he mentions the fact, he does not seem to have considered it of sufficient interest to illustrate by a specimen. While on this subject we may mention that the Germans are now actively engaged searching for Mistletoe on the common Oak, but so far their search has been unsuccessful, though they have found it on Turkey and two or three American Oaks. Both the *Oesterreichische Botanische Zeitschrift* and the *Botanische Zeitung* of last month (January) have notes on the subject, to which we may return again. We learn from the *Irish Farmer's Gazette* that a similar case had been observed in Ireland, previous to Mr. CORDEROY'S, and was recorded at the time in that journal.

— The wife of an Irish clergyman, who, with the view of benefiting the poor of her district, has heretofore been in the habit of giving SKELETON LEAVES in exchange for cast-off clothing and books for a Sunday-school library, wishes to dispose of a collection of leaves for another charitable purpose. Those who are disposed to assist in a work of charity should communicate with Mrs. M., The Rectory, Kinneag, West Meath, Ireland.

— A novelty has just appeared amongst the forced flowers in Covent Garden Market, in the otherwise well-known STAPHYLEA FINNATA, or Bladder-nut. Its pellucid white blossoms, with yellow anthers, have a very pretty effect for buttonhole bouquets when mixed with a dark rosebud or other flower appropriate for contrast. The plant appears to be most suitable for cutting purposes, as the leaves when forced are rather coarse and woody, but as a novelty amongst bouquet flowers, and one so easily obtained, its first appearance in the flower market is deserving of record.

— At a meeting of the Council of the ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, held at the offices, 26, Charles Street, Haymarket, on the 23rd inst., it was resolved that at the forthcoming election fifty pensioners should be added to the present list, viz., ten males, twenty females, and ten married couples; thus raising the total number of pensioners to 404, at an annual cost of £852s.

— CROCUS NIVALIS (Sieberi) and C. IMPERATI are now beautiful objects in Messrs. JAMES BACKHOUSE & SON'S nurseries at York. The flowers of the former are of a delicate but very bright blue-purple, those of the latter yellowish-buff externally, veined with very deep blue lines. Internally the colour is a bluish-lilac, the external veins showing through the outer petals. C. chrysanthus (Aucherii) is also in bud; it usually precedes all the other yellows. A new winter-flowering Grape Hyacinth has been in bloom for three or four weeks. It is *Botryanthus pallens*. Another, equally fine, or better, *B. paradoxus*, is also in bud.

— The recent severe weather, which was followed by heavy cold rainfalls, has proved very detrimental to the HARDY MARKET FLOWERS, the chief of which at this time of the year are Wallflowers and Violets. With a mild winter there is at all times a certain amount of bloom to be gathered, and this in the middle of winter invariably commands a good price. Even now that January is past but little bloom has been gathered, but the flowers are coming up rapidly, and with a few open days there will be some large gatherings in favoured localities. The Czar Violet is the earliest winter variety, and usually furnishes its head of flower before the blue Russian comes in, when the Czar is at once forsaken. The Russian blooms much more profusely, its flowers are deeper in colour, and more odorous

than are those of the Czar, and in the market colour and sweetness are of the first consequence. The breadth of the Violet grown to supply the London market increases yearly, and when well done probably pays as well as any other crop can do, whilst the labour involved in the cultivation is not great, and the bulk to be carried to market is as valuable as it is proportionally small.

— *RANUNCULUS FICARIA*, var. *CALTHIFOLIUS*, an uncommon plant, is flowering in the herbaceous grounds at Kew. It is much stronger than the species, such as we see it wild in this country, throwing erect large pale green leaves without marking, some on stout stems with the flowers, which are of proportionate size. Many botanists would consider it worth specific distinction, but perhaps every gradation between the two can be found. It is a native of the Mediterranean region. *Anemone pavonina*, in the same bed, is extremely showy. The scarlet flowers are as vivid as those of any *Pelargonium*. *Cyclamen Comm* and the var. *vernum*, are producing their beautiful rose-coloured flowers on the rockwork.

— THE EFFECT OF FROST upon the STOCK may just now be seen in a market garden at Feltham. Last spring a quarter of an acre of ground was sown with seed of the scarlet Queen Stock, with the intention that the plants, duly thinned, should remain on the same spot to flower. During the summer the thinnings were planted out upon an equal extent of ground close by, and these grew into strong plants, although not so large as those that remained in the seed-bed. Since the frost, it is now too plainly evident that three-fourths of the untransplanted stocks are entirely killed, whilst of those transplanted scarcely one is injured. The soil being rich, a strong succulent growth had been engendered in the one case, and this quickly succumbed to the severe frost, whilst the check administered by the transplanting had induced a firmer growth that the frost could not injure. Biennial Stocks are the better for transplanting, and they stand the winter best when growing in sheltered places, and especially on a dry, porous soil.

— The third annual exhibition of the WIMBLEDON and DISTRICT HORTICULTURAL and COTTAGE GARDEN SOCIETY will be held on July 15 and 16 in the grounds of Belvedere House, Wimbleton, the residence of A. SCHLUSSEK, Esq., President.

— In a recent number of the *Gartenflora* Dr. REBEL figures *RHEUM PALMATUM*, var. *TANGUTICA*, which is the most genuine of all the genuine *Rhubarbs*. It was brought from the west of China, in the country bordering on the highlands of Thibet, and is said to furnish the medicinal *Rhubarb* which enters Siberia by way of Kiachta. This re-opens the question of the origin of the true *Rhubarb* of commerce, and seems to favour the view that it is the product of more than one species. A review of the genus *Rheum* by MAXIMOWICZ is promised in the January number of the periodical named.

— We have received from Mr. B. S. WILLIAMS flowers of his *CYCLAMEN PERSICUM GIGANTEUM*, which he proposes to distribute shortly. It is said to be a very free-flowering variety, and of compact habit. The specimen sent to us well deserves the name of giganteum, the leaves are of a deep blotchy green, very slightly marbled, and about 4 inches wide. The flowers, which are white, or bluish-white, with rosy purple throat, have blunt oblong lobes 2 inches deep and three-quarters of an inch broad, and thus appear decidedly larger than the ordinary race of *Cyclamens*. It is a noble-looking flower, and though perhaps wanting in the refinement which characterises Mr. LITTLE'S strain, the acquisition of increased size is a manifest gain, to which quality may be superadded in the time.

— A second edition of HOOKER'S *Synopsis Filicum* has just been published. It contains 400 additional species, besides numerous rectifications, and, therefore, its importance is great to all lovers of Ferns. We shall refer to it again shortly more in detail.

— There seems to be quite a mania for planting the BLUE GUM just now, and it is doubtful whether it will not be overdone. Almost every periodical devoted in any way to arboriculture, whether English or foreign, has something to say about this wonderful tree, and the most extravagant virtues are ascribed to it. Now a report comes from India, informing us that the Indian Government has been importing large supplies of the seeds of this tree. We think some caution should be exercised, and only in places where nothing else will succeed so well should the Australian Gum tree be planted extensively. It is quite problematical whether the timber will prove equal in value in all localities where the tree will flourish; and, indeed, the probabilities are that it will not prove so good as to be had in Australia at the present time. A writer in the *Oesterreichische Botanische*

Zeitschrift makes some very sensible remarks on this subject; and we think, although the Blue Gum may be a very useful tree, that it scarcely deserves all that is said in its favour, and should not be planted to the exclusion of everything else.

— We have been favoured with the sight of a new seedling form of *PRIMULA CORTUSOIDES AMENA*, raised by Mr. JAMES ALLEN, of Shepton Mallet, and which promises to be quite distinct in character if the peculiarities of the seedling be continued through its later stages of growth. We are informed by Mr. ALLEN that in 1873 he saved a few seeds from several varieties of this fine hardy Primrose, having done his best to assist fertilisation by crossing the flowers. Elsewhere we have seen the produce of the seed sown in the spring of 1874, and the strongest has just flowered. The hue of colour, a bright pale lilac-violet, is very pretty; and it is in all probability a seedling from *P. cortusoides amena* lilacina, fertilised by *amena*; the flowers are as large and finely formed as those of the latter, and are destitute of the cut or fringed petals seen in the former. Mr. ALLEN thinks the character of the leaves and habit of growth will be different also; and the roots do not appear to creep so much as those of *amena*. A further development may however alter the aspect of these supposed diverse characteristics. When seedlings are rapidly coming into bloom Mr. ALLEN is of opinion that in order to obtain seed of the varieties of *P. cortusoides amena* the flowers must be artificially fertilised, as in no instance has he succeeded in obtaining seed if this were not done. In 1874 he succeeded in obtaining some quantity of seed from fertilising *amena*, *amena alba*, *lilacina*, and *grandiflora*, and other forms, and he hopes to obtain an interesting progeny. He finds it best to sow the seed the following spring, not in the autumn of the year, when it is gathered.

— One of the most striking in appearance of the many types of fine foliage plants to be seen in the large show conservatory attached to the residence of Mr. JOHN WILLS, Onslow Crescent, South Kensington, is *ARALIA FASCIATA*. It is a very elegant and handsome plant, with bold compound leaves, each of which had from six to eight petiole leaflets, somewhat oblong in shape, and bright green in colour. It is a bold-looking and handsome plant, one that would tell in a collection of ornamental foliage plants, because of its great distinctness of character and beautiful outline. Another handsome foliage plant is *Draecena fragrans*, a species that is largely grown by Mr. WILLS for decorative purposes. The bronzy-green leaves are broad, arched, and handsomely pendulous; the habit of growth is very regular and symmetrical. It is especially commended by Mr. WILLS as a house plant, to stand in halls and various suitable places in a dwelling. It will last in good condition for three months, if watered when required, treated to light, and the leaves kept clean from deposits of dust.

— *HETEROTROPA ASAROIDES* is showing several flowers in the Cape-house at Kew. It is a remarkable species of the Aristolochiaceae, with leaves closely resembling those of *Cyclamen*, and also of *Asarum*, to which genus this is "too nearly allied." They are united by MESSRS. MORREN and DECAISNE. The flowers have very short peduncles, throwing them out like the soil. The petals are globose, flattened at the top, and contracted to a pale yellow wrinkled mouth, with a spreading limb of three triangular segments. Outside it is of a blackish purple colour, and within is deeply celled. This species was figured in the *Bot. Mag.* of 1856, and another, *H. parviflora*, in 1865. Both are natives of Japan. The latter is quite distinct, though not nearly so curious as the former. They are very rare; *H. parviflora* is perhaps lost to cultivation.

— The old single mauve Primrose, which is now generally grown under the incorrect name of *PRIMULA ALTAICA*, is now in very fine bloom in the neighbourhood of Bristol. One lady states that she has had it in her garden for forty years past, and possibly, like *Primula vulgaris auriculata*, which is also now in bloom, its origin is involved in obscurity. Probably the lady in which the single mauve Primrose is growing at Bristol has something to do with its fine development; certain it is that the flowers are finer and better coloured than we are in the habit of seeing it round London.

— A magnificent form of *MASDEVALLIA VEITCHII*, now in flower in one of the Orchid-houses at Gunnersbury, the residence of Baron ROTHSCHILD. The colour of the singularly-shaped blossom is most brilliant, and the vivid orange-red is much flushed with purple on the upper part of the flower. Measured from the extremities of the sepals in a downward direction, its length is over 6 inches, and the plant is quite a small one. Mr. RICHARDS, the gardener at Gunnersbury, who is well-known as a cultivator of orchidaceous plants, pronounces it to be the finest form of *M. Veitchii* he has ever seen.

FUCHSIAS.

BEING engaged in the collection of materials for a horticultural history of this attractive genus, to be followed by a more purely scientific monograph, I should be glad to receive fresh specimens of some of the original species and very old varieties. I will name a few species that I have access to in the living state:—*F. fulgens*, *thymifolia*, *alpestris*, *radicans*, and several forms of *F. macrostema*. I should also be pleased to see specimens of the hardy *Fuchsias* of the south and west parts of the kingdom, as soon as they come into leaf, as I still hope to find the true *F. coccinea*. It will be in the memory of many readers of the *Gardeners' Chronicle* that Dr. Hooker discovered this plant in the Botanic Garden at Oxford a few years ago, and published a figure of it in the *Botanical Magazine*. Previously we had all been calling *magellanica coccinea*. Since Dr. Hooker read a paper on this subject to the Linnean Society additional evidence has come to light, and I hope to be able to clear up the confusion at present existing in the synonymy of the species. It may be useful to give a few preliminary notes here to indicate the kind of information sought. As recently as 1832 Gay collected a specimen of the true *F. coccinea* in a garden in Guernsey, of which he says, on the label accompanying the specimen in the herbarium at Kew, it was one of the chief ornaments. In 1837 he took specimens of it from a garden at Versailles; and Mandon's recent Madeira collections contain it, labelled quasi-spontaneous. Loddiges' figure (*Botanical Cabinet*, plate 933, 1825), is apparently the true plant, although badly drawn. Sweet (1838), *British Flower Garden*, 2d series, under plate 216, says that *coccinea* is distinct from the *F. magellanica* set; and somebody else says (I forget where for the moment) that he has not seen wild specimens of the true *coccinea*. Salisbury, however (*Leaves Stirpium variorum*, t. 7), respecting its native country says, "*Sponte nascentem*: ex Brasil habitu Vandellii circiter anno 1787." Dr. Hooker appears to have overlooked this, as well as Salisbury's reason for changing the name to *elegans*, which was "because the name *coccinea* was equally applicable to several other species." Duhamel figures the true *coccinea* as *F. magellanica*.

This is pretty well the extent of my knowledge of *F. coccinea* at present, but I expect it will prove to be the same as a species figured in St. Hilaire's *Flora Brasiliensis*, of which there are no specimens at Kew. Of course this evidence of its being a native of Brazil tells against its being hardy, but at all events it appears, from the way Gay speaks of it, to have been hardy in Guernsey. To guide those who may not have a figure for reference, I may add that it has very short-stalked, heart-shaped leaves, and the leaf-stalks are bearded, the hairiness extending more or less along the underside of the leaf on the midrib. *F. magellanica* and *F. macrostema* (not *macrostema*, as usually written) are undoubtedly synonymous, and it is doubtful whether any other species is hardy. Respecting *globose*, *conica*, *gracilis*, *discolor*, and several others, it is equally likely that they are simply varieties of *magellanica*, but an examination and comparison of wild and cultivated specimens may lead to the discovery that more than one species inhabits the extreme south of America. *F. lycioides*, Andrews (*Botanical Repository*, t. 120), introduced from Chili* in 1796, is the same as *F. rosea* of Ruiz and Pavon, and apparently a very distinct species. I am not sure whether it is quite hardy, nor do I know whether it is in cultivation now.

There must be much unwritten history respecting the early seedling *Fuchsias* that gardeners could furnish, as we have to go back only about fifty years. *F. globose* is said to have been raised by a Mr. Bunney. It would be interesting to know the origin of *F. Riccartoni*, the earliest mention of which has come under my notice at present is in the *Gardeners' Chronicle* for 1841, where it is spoken of as being quite hardy at Liverpool, Arran, &c. The preceding notes will give some idea of the information needed to complete the history of garden *Fuchsias*. Most books are here accessible, quite likely that they are the knowledge of the first seedlings raised that would be most serviceable. It should be borne in mind that both *coccinea* and *magellanica* were introduced towards the end of the last century, and not the first only, as was formerly supposed, therefore it is possible that there were garden hybrids earlier than the date 1825-1830. Loddiges' Catalogue of 1826 contains the names *arborescens*, *coccinea*, *excorticata*, *gracilis*, *lycioides*, *macrostema*, *seratifolia*, and *tenella*. Nothing approaching a complete and accurate history

* In *Botanical Repository* it is stated that this species was introduced by Menzies from North-Western America, and this error was copied into De Candolle's *Prodromus*.

of this genus is known to me in any language, and, therefore, I shall be obliged to any of your correspondents who may favour me with information or specimens. The names of species and original varieties will be communicated when desired. *W. B. Hensley, Herbarium, Kew.*

BRITISH GARDENERS.—XI.

THOMAS BAINES.

THE name of Thomas Baines has become a household word amongst gardeners, while a most honourable niche in the temple of horticultural fame has been won by its possessor, to whom may be fairly assigned the premier position as a plant grower at the present day. Of this the gardening records of the past few years are a sufficient attestation. The Thomas Baines to whom we refer, and whose portrait accompanies this notice, comes of a race of successful gardeners dating back some three or four generations. He was born in July, 1823, in the then entrance lodge to Cloughton Hall, the seat of the Brockholes, of Cloughton, in North Lancashire, one of the oldest families in the country, they having been in uninterrupted possession of the estate since the time of Edward II. Whitaker, in his *History of Lancashire*, traces the Baines family on the estate for 400 years. His great-grandfather, Thomas Baines, whom, he remarks, he well recollects, died at the age of ninety-six, at Cloughton Hall, after having been for many years steward of the estate for the grandfather and uncle of the present James Fitzherbert Brockholes, Esq. His grandfather served his time in the garden at Cloughton, and held the head-gardener's situation for fifty years; and his father was also there brought up to the profession.

"From early childhood," writes Mr. Baines, in the notes which accompanied his portrait, "I was passionately fond of gardening. My first essay, and the one most indelibly fixed upon my memory, occurred when I was about five years of age; I then assisted my mother in planting some Ivy near the door of the lodge, which Ivy now forms a complete porch over the door, and in the forty-five years which have elapsed has developed a trunk 33 inches in circumference. At thirteen years of age I commenced my gardening career under my grandfather, who was a really good gardener of the old school, and was well known in the north of the kingdom as a most successful grower of fruits, especially of Grapes. Indeed the fine old Vines planted by him some sixty years ago still bear ample testimony to the careful preparation first made for them, since they have never even had the soil renewed, and at the present day finish off such crops of sloe-black fruit, both early and late, as are rarely surpassed. In common with most garden-boys at that day I had to submit to what, even if against one's will, was of great advantage afterwards—that is to say, I had to commence at the foot of the horticultural ladder. There was in those days little chance of a youngster trying his hand at the walls until he was sufficiently initiated in the work of the kitchen garden, or in the houses, until he knew something considerable about both. In most of the old establishments fruit and vegetable culture were the chief considerations, with such plants as sufficed for decorative purposes, and to furnish the comparatively small demand for out flowers which was then made. Having fewer subjects to deal with, the young men learnt their culture, especially the things of a utilitarian description, more thoroughly. First impressions are lasting, more especially those affecting one's occupation, and if a man be from the first engaged in fruit culture, he will always feel a preference for it. Nevertheless, I was very fond of plants, and in the summer of 1842 walked 30 miles to see *Fuchsia corymbiflora*; rail-roads were not so plentiful then as now, neither was the money to spend in riding over-abundant, so that young men situated as I was, thought less of using their legs.

"I was excessively fond of reading. The books on gardening and kindred subjects to which I had access were not over-numerous, but they got pretty well thumbed. I also dropped upon an old copy of one of Linnaeus' works, over which for years I used to spend an hour or so of an evening out in the fields; but I was ultimately with reluctance obliged to give it up, seeing the impossibility of getting sufficient time for studying the science in a way likely to lead to proficiency. If young men in gardens in remote parts of the country had then comparatively few professional and really useful books for perusal, there was at least this advantage, that there was much less of the fascinating but useless light reading which is the bane of learning at the present time. Half the young men in gardens now indulge far too much in this sort of literature, never to become versed in the most essential knowledge of vegetable physiology. I also read every book I could procure upon landscape

gardening, and had a good opportunity of seeing such work practically carried out and judging of the effects produced, for, in addition to the natural beauties of the finely-wooded undulating grounds of the estate, alterations on a large scale were continually going on under the personal direction of the late Squire, who was known to be one of the very best landscape men of his time, and who succeeded in making the property unsurpassed in general effect by any in the country. Here were hundreds of miles of draining done before many people could see the necessity for draining at all; old fences were levelled and new roads made, large tracts of land were trenched and planted, irrigation on a large scale was carried out, and work of all sorts was done, such as afforded an excellent opportunity to any young man who was disposed to take a general interest in the cultivation and improvement of the land, as well as its effective embellishment upon correct principles of landscape art. Here were large open breadths to deal with, that gave scope to the planter in massing trees of distinct colours at different elevations, and which the undulating nature of the land admitted. As this work was going on for many years, it gave me an excellent opportunity to observe how it was done, and to note the effect produced in after years.

"High farming was also carried out at Cloughton, and in this I took much interest, especially in connection with stock, for which that part of the country was, and still is, celebrated. My grandfather, with whom I lived during the time of my learning the business,

continually impressed upon me the necessity for a gardener being well acquainted with general farming, in consequence of the frequency with which one individual is required to act in the double capacity of manager both of farm and garden. With this in view, I went, at twenty years of age, for some three years to the best general farmer in the neighbourhood, where by practical experience I was enabled to acquire a knowledge which in after years has been of the greatest service to me. Through those early years and up to this time I went regularly to a night school.

"I then engaged as gardener to S. L. Behrens, Esq., of Cateral House, near Garstang, in Lancashire, and afterwards removed with the family to the Polygon Avenue, Ardwick, near Manchester. Here Mr. Behrens became extremely fond of plants, and we soon got together a nice collection of Orchids, Heaths, stove, greenhouse, and fine-foliage plants, and Ferns, as well as most of the best florist flowers of the day, including Auriculas, Dahlias, Pansies, Pinks, Carnations, and Hollyhocks. These latter, although never exhibited, were just as carefully prepared by tying, thinning, and shading, even to the providing of stands similar to those used for exhibition, and in which the flowers were arranged for placing on the tables in the entrance hall. Few men had a more perfectly trained eye, or better taste as regards the appreciation of form and colour, either in a painting, a well-kept garden, or a florist's flower; and although at present we have such a *florist* against exhibiting these in the only way in which it is possible to decide their merits, unnatural as it may be, Mr. Behrens, even in his own house, could best enjoy and admire them when thus arranged

in the way calculated to display their individual excellence.

"I remained in Mr. Behrens' service for seven years, until he went to reside abroad. I then engaged with his cousin, H. L. Micholls, Esq., with whom I lived for twenty years—first at Bowdon, in Cheshire, where the collection of plants I had charge of was formed, and afterwards at Southgate. Mr. Micholls was exceedingly fond of his garden, and took the greatest delight in watching the growth of the plants, from their earliest stages up to the time of their full development. At the commencement, a few dozens in finch pots were purchased, and as they were kept up yearly, so as to provide a supply for filling up the places of such as got worn out or died—for plants, in common with other things possessing life, are liable to lose it by these natural causes; and those who profess to have few or no losses must be much more fortunate than I have been, or must possess some secret whereby vegetable life is indefinitely prolonged. Strictly speaking, the plants were not a collection, but a selection, representing most of the popular kinds at present in cultivation, requiring a wide range in the difference of their treatment.

"I feel the greatest repugnance to personal allusion relative to anything I have individually accomplished in this respect. The pursuit somehow begets feelings which are unobtrusive and reticent in their nature. In it, as in most other things, if a man is not able to do much, the less said the better, and if he does ever so little worth notice, the world is honest enough to give him all the credit he deserves. If, then, I make any allusion to my own doings, it is with a view of throwing a little light on the path of young men who may follow in the same track. Amongst the different plants I have grown, nineteen-twentieths were utterly strange to me, as I had no opportunity in early life of becoming acquainted with their usual treatment. This was in some measure an advantage, as I had nothing to unlearn. I always had a liking for growing plants that had the character of being difficult to cultivate; and whatever measure of success I may have been able to arrive at in the cultivation of such, I owe it to a close study of the nature and consequent requirements of vegetable life, and the natural conditions under which different plants exist in their native habits. This I learnt in my younger days through the diligent reading of such books as treated upon the climate and soil of foreign countries, and the general conditions under which the plants we receive from them exist. A want of this knowledge is the rock upon which many young men, who attempt to grow difficult plants, split. Such reading is, however, distasteful to those who have become habituated to light literature.

"Five years ago Mr. Micholls removed from Bowdon to Southgate House, near London, to which place I accompanied him and remained until his disposal of it and the dispersion of the plants. Few gentlemen take a greater delight in gardening than did he, or encourage it through a more genuine love of plants for their own sakes. From him, and the family in general, I experienced uniform kindness and liberality, such as is seldom accorded to a gardener."

Home Correspondence.

The Lindley Medal.—Permit me to make a few remarks anent the list of the winners of the Lindley Medal, published in the *Gardener's Chronicle* of December 12, 1874. It is endorsed by the Editors as "authentic," this showing that it was obtained from an accredited source; but with all deference to that source, I beg to say that list is not a correct one, for on March 3, 1868, the Floral Committee awarded a Lindley Medal to me for a fine group of Cattleya Trianae (Warszewiczii), from the collection of W. Marshall, Esq., of Clay Hill, Enfield, and this award is not in that list. The *Gardener's Chronicle* in its report of that meeting is quite correct, and mentions that the "medal" to be awarded to 240—the group (see *Gardener's Chronicle*, 1868, p. 140). Also in reporting the award of this medal to Messrs. Veitch, February 18, 1868, the word "medal" only is used, but it was the "Lindley" Medal that was awarded in both cases. I have had some correspondence with the Secretary of the Royal Horticultural Society upon these awards, and have learned from him that this award was never entered on the minutes of the Society, and there is no official record thereof. This explains the omission of my name in the list, but whether it is a satisfactory reason or not will appear presently, for this omission gives me the right to call attention to No. 12 in the list. But to explain the matter properly, I ought to say that I am not to have the medal under any circumstances, for according to the rules of the Society, neither a member of the Council nor his gardener may receive a money prize of any kind, and as Mr. Marshall was a member of the Council, at that time I got the benefit of those rules. Turn we now to 1873. Lord Lonsborough was a member of the Council for that year (see *Gardener's Chronicle*, 1873, p. 221), and on May 21,

1873, the committee awarded a Lindley Medal to his lordship's gardener, Mr. Denning, for a very fine plant of *Utricularia montana*. This award appears in the list, No. 12, upon equal terms with the others, and I—also many of my brother gardeners—would like to know how it happens that an official record is kept of this award, but there is no official evidence of the other, although they were both given under the same conditions and subject to the same rules. It is clearly impossible for a list to be "authentic" when the records from which it is compiled are kept in this unconnected manner. *W. Wilson, Gr. to Mrs. Adams, Chase Park, Enfield.* [Our statement was officially communicated to us, and it appears to be correct on Mr. Wilson's own showing. First, the committee could not "award," but only "recommend" the

a *Casuarina* tree at the Cubbon Hotel, Bangalore. The *Casuarina* tree is 40 feet high, and so completely has the *Bougainvillea* taken possession of it, that when in flower, during the present month, so gorgeous is the mass of colour that only a few leaves here and there are seen. "Imagine," writes Colonel Puckle, "all that a brilliant mass of young, bright mauve-coloured bracts, and you can judge what a habit it has amongst us. I have trained it over 100 yards of one entrance wall to the Lal Bagh, and next February it will be magnificent."

Rating Nurserymen's Greenhouses.—Will you allow me, through the medium of your columns, to call attention to the extraordinary manner in which in certain parishes nurserymen's and florists' stock

The dwelling-house and land I hold on lease at a rental of £42 per annum, and I have made no improvements since 1871; in fact, my glass erections are very much deteriorated in value through wear and tear, want of paint, &c. Up to 1872 I was rated at £17; the next rate I received showed that the authorities had increased it to £46 10s., upon which I paid, and did not appeal, although I considered I was paying an illegal rate. Last year the assessment committee—thinking (I presume) that these glass structures are such very valuable property, and as I submitted so tamely to the former increase—strained another nerve, and showed their good judgment and abilities by making the glass sheds and dwelling-house each a separate assessment, and have assessed the eleven greenhouses at my home

FIG. 35.—GROWTH OF BOUGAINVILLEA IN INDIA.

medal; and the award must be made by the Council. In the first case cited Mr. Wilson's employer was a member of Council, and according to a rule then in force no member of Council or his gardener could receive a money prize. In the second case cited Lord Lonsborough was not a member of Council at the time, since he resigned with the "old" Council in February, 1873, and did not accept his unauthorised re-election by the adjourned annual meeting, consequently Mr. Denning was fully eligible to receive the medal. *EDS.*]

The Bougainvillea.—The accompanying illustration (fig. 35), prepared from a photograph kindly sent to us by Lieutenant-Colonel Fuckle, Director of the Lal Bagh at Bangalore, admirably depicts a remarkable specimen of the Bougainvillea, climbing up

and implements in trade, such as those slight erections commonly called greenhouses, are rated. These slight glass structures, such as are put up by nurserymen and florists, are not buildings or fixtures, and are liable to be distrainted upon for rent or debt; therefore, I submit they are clearly part of a nurseryman and florist's stock and implements in trade, and as such are no more assessable to the poor-rate than the potting-soil, flower-pots, watering-pots, stakes, &c., which, with the aid of the glass, all assist in producing those plants which we grow for a living. I will just mention a case in which I am personally concerned. I have two nurseries in the isolated parish of East Wickham, in which I grow my produce for the London markets. In my home nursery I have about one acre of land, upon which stands a dwelling-house, three sheds, and eleven greenhouses.

nursery at the very modest sum of £150, and rated them at £100. At my Hill Grove Nursery I have three large greenhouses and one smaller unfinished, which they have also assessed at £150 and rated at £100. Against this most extraordinary assessment I appealed, but could get no redress—the worthy chairman of the three gentlemen present forming the assessment committee informing me that if he had come and valued them he should have put on double. *John Turle, The Nurseries, Welling.* [The whole subject is in a most confused and unsatisfactory state, and should be taken up by those concerned with a view to a remedy. *EDS.*]

Libonia pentrosiana.—Any one desirous of a variety of subjects for hanging baskets will find this plant a great acquisition for that purpose. It is

flowering with me in the most profuse manner, and continuing from September to the present time it is a good plant for amateurs, as a temperature of 32° does not appear to affect it. W. Jones, Gr., Abbey Manor, Evesham.

The Larch.—It would be interesting if your correspondent at p. 107, writing on the Larch, &c., could give the dimensions of those grand old trees at Dawick and Dunkeld, as from their great age they must be fine specimens. It is also more interesting to me, writing as I do from the demesne of the Right Hon. Colonel Tighe, where there are several fine specimens of Larch, supposed to be the first planted in Ireland. I measured one to-day over 60 feet in height; circumference of stem at 4 feet from the ground, 12 feet 6 inches; spread of branches, 78 feet in diameter. The trees appear to be in good health, and to all appearance will continue improving for years. I would also remark that the whole of those trees are planted a considerable distance apart; would that account for their having escaped the Larch disease, as at 500 feet higher elevation on the same range the plantations more thickly planted are all more or less diseased. G. Dood, Woodstock Park, Ireland.

New Japan Pear (see ante, p. 106).—I send you two pieces of a branch of what I have as Pyrus sinensis you will easily see that it very much differs from the figures at pp. 105 and 107 of the *Gardener's Chronicle*. Your figure exactly corresponds to that given by M. Decaisne, in his *Jardin Fruitier*, of Pyrus sinensis of Lindley. M. Decaisne quotes four varieties as having been sent to him by M. Van Houtte; these were raised in Holland, and M. Decaisne says that they are easily known by the small caducous calyx. The first is said to be like the Pear Sealing (*P. doyenenné* de Saumur), which is blunt turbinate; the second to be like the Pear Secutin, which is short turbinate; the third is said to be like Martin Lee, which is obtuse pyriform; the fourth is round, like Doyenné Grise. The seed from which these four forms were raised seems to have been imported into Holland by the Dutch Envoy to the Court at Yeddo, but the trees that produced the fruit from which the seed seems to have been obtained were originally imported into Japan from China.—so says M. Siebold, as quoted by M. Decaisne. In vol. vi., p. 396, *Hort. Soc. Trans.*, there is a notice of this fruit as having been sent to the Horticultural Society in 1820, and Mr. Knight had grafts of it, and fruited it at Downton, and Lindley figured and described it. I have not the *Botanical Register* to see whether Lindley's figure corresponds to my trees, but no doubt you can refer to it: the number is 1248. You will see by the old leaves I have sent, that they are spatulate at the base with a short stalk, acuminate at the point and perfectly smooth along the edges. [Your leaves are quite different from those of Dr. Thurbur's plant. Eds.] Your figures and Decaisne's are very much dentate, or "acutissime-serrata" and the leaves on Decaisne's figures are retundato-cordata, yours are oblongo-cordata. From the above I imagine that all are forms of one type, like yours a very distinct group, with beautifully almost evergreen, tinted foliage, and large beautiful flowers. The fruits, too, as produced in China and Japan, seem to be very beautiful and of long duration. They may yet become the parents of another race commingled with our common sorts. You will notice that the buds, both in yours and Decaisne's figures, have the scales open at the apex and obtuse, whilst those I send are closely imbricate and very pointed. Another character, which stands good with all sorts of Pears, is the venation. There is no character that I have been able to find, that is so constant in the foliage of Pears and Apples as this; and I dare say it holds good in many other families, Ferns particularly so. F. Scott, Merriott.

Fuchsia serotifolia.—This fine old evergreen Fuchsia is still seldome met with, and yet it is one of the best and freest winter-blooming things we have grown specially for that purpose. It is a shrubby and is very valuable, as it flowers in a long time in water; and the large glaucous green leaves form a charming setting to the rich pendulous tubes. To have good large plants in bloom early they should be propagated at once, and grown on in gentle moist heat till the end of May, to be then gradually hardened off preparatory to setting them outdoors. This variety is best grown in the shrubby or bush form, as it does not readily conform to the pyramidal shape, and by growing in the bush shape many stronger shoots can be obtained than if it were stopped and cramped to induce it to assume a form not natural to it. The corymbs of flowers are borne at the points of the shoots, and the stronger these can be grown, provided that the growth be firm and compact, the larger and finer will be the individual heads of bloom. To induce this kind of growth they should be potted in good turfy loam well enriched with old Mushroom

dung, and be grown without a check. By the middle of June, if properly established and carefully hardened off, they may be placed in an open air in a particularly shaded situation, when, with proper attention in watering and syringing, they will make fine firm flowering wood. They should be housed by the end of September, and if kept in a temperature of 45° to 50° during winter they will last in bloom several months. I have found Madame Corneliën almost a perpetual bloomer, having had plants of it both last winter and this almost equal to what they usually are in the summer months. It is only necessary to give them a slight rest in the autumn, and when started again this variety breaks freely into growth, and continues on through the winter, giving a profusion of bloom. F. Sheppard, Woolverstone.

The Eucalyptus and the Late Frosts.—If your correspondent, Mr. J. W. Malleson, will examine the bark and wood of his Eucalyptus, he will, I think, find both discoloured and dead. Plants often retain their leaves for a long time after severe weather, and unless examined closely, appear to have escaped. The Eucalyptus I have here stood out last winter, and were, therefore, large woody plants, and in a more favourable condition to withstand frost than those described by your correspondent, and yet both wood and bark are completely discoloured and killed, although the plants retain their leaves, and appear to have escaped. As the merits of the Eucalyptus have been so much lauded of late for various purposes, it would be interesting to know what amount of frost it will endure in our climate, and if it be regretted that such a rapid-growing ornamental tree is should not succeed with us, as it would add quite a fresh feature to our landscape, being so distinct in character to anything we have in that way. F. Sheppard, Woolverstone.

Transmutation of Wheat into Chess (or Cheat) a "Cheat" after all.—Referring to Mr. Meehan's explanation in your number for January 23 (p. 115), he says I have misapprehended him in being "Brome-Tritium matter," and objects to my using the word "being transmutationist." In reply, I certainly must plead guilty to believing that he was so, and I drew my conclusions from the report made to the *New York Tribune*, which it now appears that Mr. Meehan himself contributed, because, as he puts it, "ordinary reporters make sad work of scientific subjects." How, I would venture to ask, could any one believe otherwise, judging from Mr. Meehan's own words? In the first place, he begins by remarking on the popular belief that "Wheat will turn to Chess, and that, while the scientific world may well be pardoned for deriding such an idea," "for his own part he had seen many popular impressions derived by men of science prove true." Then, *à propos* of the viviparousness of toads, he tells us he had "proved the fact." Again, as to snakes swallowing their young, he says, "In like manner, in his youth, he saw five young snakes, one after the other, enter the mouth of the parent, who appeared to swallow them, and when these things came to his mind" he held himself open to get repeated facts with reference to this question of Chess. From all this I came to what appeared to me to be the very natural conclusion, that just as Mr. Meehan had found, from his own experience, how deluded the scientific man had been with regard to the toad and snake, so the scientific man who derided the transmutation of Wheat into Chess was in like manner to be confuted by the fact which Mr. Meehan then proceeds to relate. Let us see exactly how Mr. Meehan did and said. He exhibited to the Academy one of several specimens collected by Mr. Letvette, of the Indiana Geological Survey, and proceeded to point out first, "that there could be no mistake" about the branch from the Wheat ear being Bromus secalinus. Then he takes pains to meet the possible contention that in other cases an examination had shown only an accidental union of the two culms, and so he tells us "that the most careful examinations of the specimens, both by himself and friends, aided by powerful pocket-glasses, had failed to detect any such accidental union." "There was, indeed," says Mr. Meehan, "every presumption against the probability of any such accident in the present specimen." He then clinches his observation by declaring that the spike of Chess came out at one of the bands of the Wheat ear, and that the culm of Wheat was in the zig-zag rachis, whence the cluster of the "Wheat flowers should have sprung; and declares that this was "not an accidental union of two distinct parts, but a substitution of one part for the other." Mr. Meehan then notices the remarkable coincidence that it is always the Bromus secalinus with which the popular belief in transmutation is connected, and concluded by suggesting that it would be best to refer the specimen to the microscopical section of the Academy for an instrumental examination. Notwithstanding this suggestion (which seems by the context to have been made rather in bravado than in doubt), the leading Mr. Meehan's report, can come to any other conclusion than that at the time when the report was written

(and that is all with which I have to do), Mr. Meehan be believed in transmutation, or, in other words, was a transmutationist? Now, what has happened since? According to Mr. Meehan's statement just received (p. 115), he tells us of that which I am delighted to know (because it justifies my protest in your number for December 12, 1874, p. 74), that, after all, to the disgrace of somebody, the whole thing has turned out to be a trick. "So ingenious was the trick," says Mr. Meehan, "that a leading scientist of Laporte, Indiana, was first imposed upon by them; the members of the Indiana Geological Survey and many of their scientific acquaintances; then some thirty members handled and examined it; and even the chairman of the microscopical section, who is one of the best vegetable biologists in the United States had the specimen in hand two weeks, and had made microscopical sections and drawings of the various parts before he discovered the trick." It would be curious to know when the trick was discovered and exposed—that is, whether before or after Mr. Meehan's contribution to the *Tribune*; I presume it was after. I won't do Mr. Meehan the injustice to suppose him to be a transmutationist now that the trick has been exposed. All I maintain is that, judging from Mr. Meehan's contribution to the *Tribune*, he was a transmutationist then, i.e., before the illusion was so rudely dispelled. It really shocks me to find it stated by Mr. Meehan that the trick had been played by the party practising it for some years past. I agree cordially with Mr. Meehan's concluding observation, here could be no doubt but that fungi cases of disease there could be no doubt but that fungi cases of disease, while on the contrary, there were many cases in which the agency of fungi was extremely problematical, and it was desirable above all things that investigators of questions bearing on the influence of fungi in diseases should have an accurate knowledge of what fungi really were, for at present sadly too many books were written in utter ignorance of this point. Attention was then called to the generally recognised distinctions between the real, enteric, or fungoid fungi, and the Berkeley's, which were three forms of fungi which were most frequently associated with diseased conditions, namely, Aspergillus, Penicillium, and Mucor. These were described in detail, and mention made of the circumstance that many forms which had been named and described separately were mere conditions of one or the other. The most frequent fungus met with in connection with disease was, he believed, due to some form of Penicillium, case from the fact of our knowledge on this point being in a mass of confusion. Mr. Berkeley next called attention to some of the simplest forms of fungi, and alluding to the observations published some time ago by Professor Tyndall, on the enormous quantities of spores found floating in the air, and which were believed to be a fertile cause of disease, went on to describe the experiments carried out in India by Messrs. Cunningham and Lewis, and the instigation of the Government to the nature of the apparatus employed to catch the floating spores was explained, as also the results obtained by both investigators, who found that there was no relation between the presence and numbers of spores so caught and the prevalence of disease. Dr. Hallier's theory, that each form of fever was due to a specific fungus, then came under review, the lecturer remarking that he commenced his investigations with a great deal of prejudice, but his theory was ridiculed by De Bary and others; and, judging from Hallier's own mounted specimens, he, Mr. Berkeley, was not satisfied with his manipulation, and believed his theory and statements were equally untenable. With reference to the diseases caused by fungi on Rice, the lecturer stated that some years ago he had requested Dr. Thwaites, the able Director of the Botanic Garden at Peradeniya, Ceylon, to send him all the known forms of disease in Rice, but on examination it was found that only one minute fungus was peculiar to that plant. Rice soon decomposes, however, and persons eating it in that state might be seriously injured. "Sappy" meat was explained to consist of a number of little vesicles filled with very minute particles, which

Reports of Societies.

Royal Horticultural: Feb. 3.—Evening Lecture.—Sir Coutts Lindsay, Bart., in the chair. The subject selected for this occasion was "Fungi, the Causes of Disease, Real or Supposed," and the lecturer—the Rev. M. J. Berkeley—said he used the words "real or supposed" advisedly, because many cases of disease there could be no doubt but that fungi were the cause, while on the contrary, there were many cases in which the agency of fungi was extremely problematical, and it was desirable above all things that investigators of questions bearing on the influence of fungi in diseases should have an accurate knowledge of what fungi really were, for at present sadly too many books were written in utter ignorance of this point. Attention was then called to the generally recognised distinctions between the real, enteric, or fungoid fungi, and the Berkeley's, which were three forms of fungi which were most frequently associated with diseased conditions, namely, Aspergillus, Penicillium, and Mucor. These were described in detail, and mention made of the circumstance that many forms which had been named and described separately were mere conditions of one or the other. The most frequent fungus met with in connection with disease was, he believed, due to some form of Penicillium, case from the fact of our knowledge on this point being in a mass of confusion. Mr. Berkeley next called attention to some of the simplest forms of fungi, and alluding to the observations published some time ago by Professor Tyndall, on the enormous quantities of spores found floating in the air, and which were believed to be a fertile cause of disease, went on to describe the experiments carried out in India by Messrs. Cunningham and Lewis, and the instigation of the Government to the nature of the apparatus employed to catch the floating spores was explained, as also the results obtained by both investigators, who found that there was no relation between the presence and numbers of spores so caught and the prevalence of disease. Dr. Hallier's theory, that each form of fever was due to a specific fungus, then came under review, the lecturer remarking that he commenced his investigations with a great deal of prejudice, but his theory was ridiculed by De Bary and others; and, judging from Hallier's own mounted specimens, he, Mr. Berkeley, was not satisfied with his manipulation, and believed his theory and statements were equally untenable. With reference to the diseases caused by fungi on Rice, the lecturer stated that some years ago he had requested Dr. Thwaites, the able Director of the Botanic Garden at Peradeniya, Ceylon, to send him all the known forms of disease in Rice, but on examination it was found that only one minute fungus was peculiar to that plant. Rice soon decomposes, however, and persons eating it in that state might be seriously injured. "Sappy" meat was explained to consist of a number of little vesicles filled with very minute particles, which

presented the Brownian motion, and which Mr. Berkeley suggested, from their known effects on meat, might possibly be the cause of cholera, hospital gangrene, or other diseases. At least the suggestion was a fitting subject of inquiry, and he hoped that he should see the day when such schools of research were established at our universities and colleges. The nature of bacteria and vibrios was very imperfectly understood. They were exceedingly minute, and though he had witnessed some very delicate experiments he was not at all satisfied either with the manipulation or with the inferences attempted to be drawn that bacteria developed into moulds, or were the immediate cause of disease. The prevalence of ergot in New Zealand, and the imperfect knowledge possessed by agriculturists even in England of this pest, the silkworm disease, and the Potato murrain were then discussed, and it was stated that while in fever and diphtheria there is no evidence to show that fungi really caused the disease, it was certain that in many cutaneous diseases fungi are more or less directly connected with the maladies. Reference was made to the so-called fungus-foot of India, in which most serious disease of the bones of the foot is undoubtedly caused by a fungus which attacks the bare feet of the natives only, and for which there is no known cure but amputation. As to the precise effect of fungi on wounds there was at present no certainty, but surgeons have found from experience the policy of excluding the air as much as possible, and of using carbolic acid as a preventive of fungus infection. Reference was also made to the effects of the spores of *Ustilago* in producing headache, in the same manner that the pollen of grasses produces hay fever. A unanimous vote of thanks was accorded to the lecturer.

Market Gardeners, Nurserymen, and Farmer's Association.—An extraordinary meeting of the committee was held in their rooms, Bedford Head Hotel, Covent Garden—H. Hayward, Esq., in the chair. After the election of Mr. Wm. Hooper, jun., to the office of treasurer, the question of greenhouses and the Metropolitan Building Act came on for discussion. It appeared from a statement made by Mr. Lobjoit, one of the members, that he had been summoned by the District Surveyor for not giving notice of the erection of a greenhouse, for which he was liable to a penalty of £20. His defence before the magistrate was that greenhouses were always considered exempt—that the one in question was more than the required distance from the nearest street or alley, and upwards of 100 feet from the nearest buildings and ground of an adjoining owner. The magistrate considered that it must be 30 feet from any other building, whether his own or that of an adjoining owner. The defendant said that upon that construction of the clause, if he put up a pig-stye, or even a dog-kennel in the middle of his field, he could not put another building within 30 feet of it, and he pointed out what a serious thing it would be for nurserymen and market gardeners, who had frequently to erect temporary buildings and greenhouses on land held under a yearly tenancy. The committee considered it a very important question, and one that seriously affected the trade generally, and decided to take counsel's opinion upon it, and if necessary, to have a case submitted to the Court of Queen's Bench. It was decided also that the Society should assist by every means in their power in opposing the Bill for raising the tolls in the Borough Market.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 3, 1875.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRICAL DEVIATIONS FROM FAHRENHEIT'S TABLES 5th Edition.	WIND.	RAINFALL.
	Mean Reading Reduced to Sea-level.	Temperature from 6 a.m. to 9 a.m.	Lowest.	Highest.			
Jan. 30	30.08	+0.29	29.41	31.50	54.7	83	WSW 1.0
31	30.10	+0.23	30.74	31.46	53.8	83	WSW 0.29
Feb. 1	30.44	+0.64	41.253	7.9	39.2	83	N.E. 0.07
2	30.38	+0.62	40.31	5.74	38.4	83	N.E. 0.06
3	30.17	+0.41	40.33	10.05	44.4	88	S.W. 0.03
4	30.04	+0.27	40.37	12.3	38.8	99	S.W. 0.00
5	29.74	+0.94	41.8	6.9	38.5	91	WNW 0.00

Jan. 28.—Overcast; dull; and mild all day, but fine at intervals.
 29.—Overcast; dull; and rain throughout.
 30.—Overcast in early morning, but the sky became cloudless about 10 A.M. Fine afterwards.

- Jan. 31.—A very fine day.
- Feb. 1.—Hour-frost in morning. A fine day. Lowest temperature of vegetation, 27° F.
- 2.—Hour frost in morning. Fine, but light clouds prevailed all day. Slight fog at evening.
- 3.—Overcast; dull; slight fog in morning; somewhat brighter in afternoon and evening. Slight fog at night.

— In the vicinity of London the reading of the barometer at the level of the sea decreased from 29.53 inches at the beginning of the week to 29.16 inches by the early morning hours of the 24th, increased to 29.25 inches by about noon, then decreased again to 29 inches by the afternoon of the same day; it then turned to increase again, and by the evening of the 26th, 30.28 inches was reached; it again decreased to 30.20 inches by the evening of the 27th, increased to 30.32 inches by the morning of the 29th, decreased to 30.19 inches by the night of the same day, and increased rapidly to 30.67 inches by the end of the week. The mean reading for the week was 30.03 inches, being 0.32 inch higher than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged between 52° on the 28th and 42½° on the 26th, the mean value for the week being 47½°. The lowest temperatures of the air at night varied from 47° on the 29th to 35½° on the 30th, the mean for the week being 39½°. The mean daily range of temperature was 8°, ranging from 11½° on the 24th to 3½° on the 29th. The mean daily temperatures of the air were as follows—24th, 44.5°; 25th, 42°; 26th, 39.6°; 27th, 45.8°; 28th, 47.2°; 29th, 48.9°; and 30th, 39.2°; and the departures from their respective averages being, +6°.8, +4°.1, +1°.6, +7°.6, +9°, +10°.6, and +0°.8. The mean temperature for the week was 43°.9, being 5°.8 above the average, as deduced from sixty years' observations.

The highest readings in the week of a thermometer with blackened bulb in vacuo, placed on grass in the sun's rays, were 86½° and 89¾° on the 28th and 30th, but the highest readings on the 26th and 29th were 53° and 55°. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 34½° and 33° on the 26th and 30th; the mean for the week was 37°.

The weather during the week was fine and bright, but the sky generally cloudy.

The direction of the wind was for the most part W.S.W.

Rain fell on five days, the amount being 1.20 inch.

In England the extreme high temperatures observed by day ranged between 57½° at Bradford and 46° at Nottingham, the general average all over the country being 52°. The extreme low temperatures observed by night varied from 36½° at Liverpool to 30° at Hull and Newcastle-on-Tyne, the general average being 33°. The extreme range of temperature in the week was 18½°, the greatest range being 24° at Hull, and the least 11½° at Nottingham. The mean high day temperatures ranged from 50° at Bristol to 42° at Nottingham, the average value being 47½°. The mean low night temperatures varied from 41½° at Bristol to 33½° at Newcastle-on-Tyne, with a general average of 38°. The mean daily range of temperature in the week was 9½°, being as large as 13° at Sunderland, and as small as 4½° at Nottingham. The mean temperature of the air for the week was 42½°, being 4½° higher than the value for the corresponding week in 1874, the highest in the week being at Bristol, 45½°, and the lowest at Nottingham and Newcastle-on-Tyne, both 39½°.

Rain fell on every day in the week at Bristol, and on five or six days at most other stations, the amounts varying from 1 inch and four-tenths at Birmingham to 1 inch and two-tenths at Portsmouth, Blackheath, and Bristol, to three-tenths of an inch at Hull, but at Newcastle-on-Tyne no rain was measured; the average fall all over the country being eight-tenths of an inch.

The weather during the week was fine and mild, but the sky was generally overcast.

Lightning was seen at most stations on Sunday evening, January 24.

In Scotland the highest temperatures ranged from 54° at Glasgow to 49° at Greenock, the general average being 51½°. The lowest temperatures varied from 31½° at Glasgow to 26° at Perth, with a general average of 28½°. The mean range of temperature in the week was 23°. The mean temperature for the week was 39.5°, being 4½° lower than the value for the corresponding week in 1874, the highest was at Glasgow, 41½°, and the lowest at Aberdeen, 37°. Rain fell to the amount of 1 inch at Glasgow and Greenock, but at Dundee a quarter of an inch only was recorded, the average fall over the country being three-quarters of an inch nearly.

At Dublin the highest temperature was 58½°, the lowest 33°, the mean was 45½°, and the rainfall 0.64 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVE.—There is no time of the year when a good display of flowering plants is more acceptable or more required than throughout the early spring, more particularly if there happens to be a conservatory attached to the dwelling. To ensure this, it is necessary at the present time to prepare, by the introduction into heat, a good quantity of plants for this purpose—more *Deutzia gracilis*, the double-flowering *Fraus*, *Gent Ascalas*, *Rhododendrons*, *Kalmias*, and *Andromedas*. Where there exists a low pit that can be used for this purpose, it is better than the ordinary stove, on account of there being generally in such a place less difficulty in getting the plants well up to the glass, as also the chance of bringing them on into flower with less heat than in the stove, which, as the days lengthen, will need keeping warmer than these forced strains require or do well with; 60° in the night will be found quite enough, and so treated they will last longer in bloom than if placed where they will be hotter. Syringe overhead once in the day, and that sufficiently early to allow the plants to get quite dry before nightfall. Nothing tends to make the flowers of these forced plants so tender as having them dripping wet and hot during the night. A few more *Ascalas* should also now be put in heat to succeed those introduced some time ago; as also *Richardias*. Where a certain number of these plants exist they can be had in bloom over a lengthened period. As decorative subjects for conservatories, rooms, or in any place where a flowering plant is required, they are well adapted for the purpose.

Hyacinths, *Narcissus*, *Tulips*, and *Crocuses*, will now require less excitement in order to bring them into flower, and care must be taken that they are not either kept too hot or too far from the light. As a hardy plant for forcing there is nothing better adapted, or that makes a finer object, than *Zelkova spectabilis*; not only is it a good conservatory decorative plant, but its flowers, from their colour and form, associate well with almost anything else—as a pendulous bloom for hanging over the sides of a large vase it has few equals. But this plant must not be hurried with too much heat, otherwise half its beauty is destroyed; it must also be kept as near the glass as possible. *Solomon's Seal* is equally useful for cutting; its foliage, as well as the flowers, are fine for filling up large vases.

All the varieties of *Allamanda*, that have been kept quite dry at the roots and resting through the winter, and that have not previously been started into growth, should at once be cut back, their balls well soaked, half the old soil removed, and reotted into good sandy loam, ramming the soil quite close and firm, and at once placing them on the trellises that they are intended to be grown upon; if this is not done before the plants break into growth many of the shoots will be broken in putting them on afterwards. *Clerodendron Thomsons* and *Balfours*, that have been best and quite dry at the roots, should have the ball well soaked; these plants should be merely trained upon the trellises they are intended to flower upon, but not cut in at all, neither must there be any attempt at shaking them out, or it will, in all probability, stop their flowering. If the plants are small, and it is desirable to grow them larger, they may be at once reotted into larger pots, without in any way interfering with the roots, further than removing the fine crocks; this, with small plants, is preferable to deferring this until after they have flowered, as they will then have nothing to interfere with their going on growing. *Bougainvillea glabra*, which is far the best variety for pot culture, should at once be got to work, getting a portion of the old soil away from those that are already large enough, and returning them to the same pots in good sandy loam, well enriched with rotten dung. All these free-growing, gross-feeding plants must either have the soil made very rich at the time of potting, or be well fed with manure-water during their growth; if they are required for the decoration of a conservatory (that admits a dwelling-house, the use of manure-water is objectionable, consequently in potting such plants the soil used should be rich.

Caladiums should now be started; where they are required large they must be encouraged by plenty of pot room—they do best in peat; where they are wanted in a small state, such as in 6 or 8-inch pots, the bulbs may be divided, not using the pieces root too large, for if the root is too big in proportion to the soil it has to feed upon, the leaves will be poor and small. The small-leaved *Argyris* is an excellent plant for decorative purposes, grown in 6-inch pots near the glass, and not too hot, so as to prepare it somewhat for the lower temperature of the conservatory in the summer season. A small bit of the common *Sedgwickia*, with its roots just secured in

the soil on the surface of the pots, will soon spread over the top, and much improve the appearance of these small decorative plants without doing them any injury. If new tan was got in the stove, as advised some two months ago, it would be much assisted now by an addition of 8 or 10 inches of fresh tan, forking it in amongst the old; this will be especially useful if there is not a pit of considerable depth that will hold a good body of the tan. Where this is not to be had next to hand, a good bed of oak leaves and stable manure, mixed in equal proportions, is a good substitute, but will not maintain a regular heat so long, consequently will require some new material adding at intervals of five or six weeks. As it is now time to prepare for the general potting of stove plants, soil, both loam, peat, and rotten manure, should be prepared and placed where it will get sufficiently dry for use; if the ordinary soil shed will not effect this, it should be placed upon any flue from the boilers, or in a warm stove-hole, where, by turning it frequently, it can be brought to the best condition; but on no account use it too wet, for if such is the case the roots will not enter it freely. See that everything in the shape of clean pots and broken crocks are in readiness. *T. Baines, Southgate, N.*

FRUIT HOUSES.

VINES.—Cuttings or eyes of Vines may now be put in; they should be inserted singly in 60-sized pots in good loam. A bottom-heat of 75° will insure an early strike. Striking Vines eyes on turves is now no a common practice; and if the vines are intended for planting out this season, the turves are not to be adopted. In 1873 we planted a house with Vines thus propagated, and before the end of September some of them had made more than 30 feet of young wood. Vines in flower should have a mean temperature of 65°, and the air of the house should be kept rather dry, but not arid. Rub the hand gently over all shy-setting kinds to distribute the pollen. Thin out both branches and berries of advancing crops, leaving the most compact bunches, and studying appearances, by taking care to thin them evenly distributed all over the house. Pot-Vines should never be allowed to become dry, or all manner of ill befall them. It is a good plan to insert the pot containing the Vine in another containing a mixture of loam and dung, to which the roots of the Vine soon find their way; this obviates the necessity of too frequent watering. All inside borders should be frequently examined, and when water is requisite it should be a few degrees warmer than the temperature of the border. Look also to the fermenting material on outside borders, and where the heat is declining, renew the addition of fresh litter and leaves. It is both difficult and injurious to keep Grapes hanging on the Vines after this date, as the warmth necessary to keep the Grapes in good condition excites the Vines; the consequence is, the sap rises, and the Grapes either crack or damp off. If the Grapes have been thoroughly ripened they will keep well, and for a long period, if cut with a piece of wood attached, and inserted in bottles of water in any dry room or house. Exclusion of light, which is so much to be desired, is necessary to successful keeping. *W. Williams, Heckfeld, Hants.*

FIGS.—The earliest forced Figs in pots will now be in full growth, and the points of the shoots must be pinched out after a growth of 5 inches or 6 inches in length. If the pots are plunged into bottom-heat the temperature of the fermenting materials should not exceed 80°, for the roots and fibres of Figs are very gross and succulent, and so liable to be injured. The night temperature may still range from 50° to 60°, and from 65° to 75° in the daytime by sun-heat. Do not neglect to syringe the trees frequently, or to give waterings at the roots, and some well-rotted manure upon the surface of the pots. Well encourage the roots to ramify in it, which will strengthen their growth. In the house where the Figs are permanently planted out in the borders, forcing, if not already commenced, may now be done—presuming that the wood of the trees has been properly dressed, and the strong shoots thinned out so as to leave the terminal shoots for the first crop, which should be tied to the trellis, and given plenty of room for them to get all the sunshine and light possible. I find that when Figs are permanently planted out, the trees are more fruitful where the borders are circumscribed; and the roots can always be encouraged to run on the surface by adding fresh soil, and giving them liquid manure in the growing time. Where new borders are made for them they ought, therefore, not to be above 18 inches deep, with plenty of drainage, to let the water percolate through it rapidly. I find a good covering of lime scraps on the top of the draining materials to add to the health and fertility of Fig trees, as does the use of a calcareous soil where it can be got for the borders. *William Tillyer.*

MELONS.—But little can be done in this department at present. The preparation of soils, and the collecting of dung and leaves, however, must not be forgotten. The first batch is just peeping, and must shortly be raised near the glass, still keeping them in a brisk heat of 72° to 75°. Water sparingly for the

present, and earth-up with previously warmed compost as the plants advance in growth. There is nothing gained by potting off too early at this season. If it is contemplated to grow the first batch of Melons in boxes, let such boxes be prepared forthwith; water will be wanted for the next few weeks, but nothing is lost by having them well seasoned. A very good sized box for all ordinary purposes of Melon growing is 15 inches to 18 inches square, and 12 inches to 15 inches deep, made of three-quarter inch deal, with half-a-dozen good sized holes bored through the bottom. *Thos. Simpson, Broomfield Lodge.*

HARDY FRUIT GARDEN.

The heavy fall of snow which preceded the setting in of the severe frost of December last proved very beneficial in protecting the buds of bush and dwarf fruit trees, and consequently, but little mischief has been done. Where the pruning of these has been deferred on this account it may now be proceeded with, as the buds of the earlier kinds are swelling fast, and should the weather continue mild, active growth will soon commence. The general planting of fruit trees should now be completed as soon as possible. In making plantations of *Gooseberries* or *Currants* it is best to keep them together, so that, if necessary, they can be netted over, which it is both difficult and expensive to do when the trees are planted round the borders or detached from each other; they may be planted as bushes at 6 feet apart each way. Gooseberries succeed well planted to wires, as recommended previously for Raspberries, only that instead of three wires five or six would be necessary for the shorter shoots of the former. Currants, red and white, succeed well here trained as pyramids, and spurred in judiciously are very productive and ornamental when in fruit, and offer less opportunity for the attacks of birds, as when closely stopped in there is little space for them to rest upon while feeding. There is also another advantage of this system, that the fruit can be effectively protected by covering with strips of tiffany or any other light material, which excludes not only birds but wasps, which latter are generally very troublesome. By this means we have usually a good supply of fruit until November. The plants may be placed in rows 3 feet apart, and the same distance from plant to plant, or in groups of three, 2 feet apart each way, in triangles, at intervals of 10 to 12 feet round the borders of the walks. *Apricots* are now swelling their buds fast, and will soon be in bloom on warm walls. Timely attention is requisite to provide the necessary protection to prevent injury from frost. Where glass copings are in use little more will be needed for another fortnight, but where such aids are not at command other means must be provided. The copings here project 6 inches over the walls, and to these battens are fixed a nearly erect position, and a double row of mackerel net suspended over from the outer edge of the coping to within 2 feet of the ground. This is allowed to remain on until sufficient foliage is produced to protect the fruit. The netting, while being sufficient to prevent all but extreme frosts from doing injury, also allows sufficient light for the well-being of the trees, without the necessity of constantly removing the covering, which must be the case if a heavier material is used. A single batten may be taken of a fine dry day, and if necessary, to remove any crops of *Strawberries*, and, if necessary, to remove any open for raking down when sufficiently dry. *William Cox, Madrefield Court.*

KITCHEN GARDEN.

Early crops of Peas, when they are just emerging from the soil, are liable to the depredations of birds, sparrows in particular, and unless preventive measures are used at this stage of growth they will quickly become much impaired, if not altogether annihilated. The simplest means for effecting this purpose is to place a few lines of fine net to be stretched with twine lengths of wood ashes when the Peas are damp, generally secures them from these enemies and from slugs also. Where mice are troublesome a riddance will soon be effected by using the figure-of-four trap, and giving it to constant attention. As soon as the state of the soil is fit, make a successional sowing of early and second early kinds of Peas, sufficient in quantity to meet the demand. William the First can be dispensed with on this account, and amongst old kinds Rising Sun is still a desirable sort for an early second crop. Introduce between the Peas a single line of *Round Spinach*, so as to make available as soon as possible the ground which is occupied with the winter crop. The space between the rows of this excellent winter vegetable is oftentimes too much restricted, which renders it liable to decay when damp and sunless weather occurs. Go over the beds and remove all weeds and decayed weeds frequently. Intermediate plantings of *Cherry Leeks* frequently, in indications of running and become stunted; to check this it is advisable to lift it entirely, retaining a small ball of earth at the roots, and to lay it in at the back of a north wall, where it can be

securely protected from frost by mats or other suitable materials. We use spent tan from the Pine beds to cover it. When *Coriari* and *Radishes* are forced in frames the sowing of these outside may be deferred until the end of this month, but otherwise sowings should be made when the soil is suitable. It is a common practice with many to cover early-sown beds of Radishes with straw or similar materials, and where large quantities are needed, and the matter is properly attended to, it answers admirably; but for private requirements, where continuous and only limited quantities are wanted, we use borders and only limited frames the walls, which will hold about 18 inches wide and 6 inches deep. Here a ready means is afforded for protection by hanging canvas or netting on the walls. Eastern or southern aspects are best for early crops. We never sow *Turnips* in frames, but employ a border of this kind with an eastern aspect, and invariably get them as early and even better under such conditions. Towards the end of the month a sowing of the American strap-leaf variety should be got in. About the middle of the month make a sowing of *Qualificos*, *Veitch's Autumn Giant*, *Brook's Sprouts*, *Leeks*, and the old black-headed *Brown Cos Lettuce*. The angle of a southern and eastern wall is most suitable for such sowings, and is far preferable to bringing the seedlings up tenderly in heat. Look over the stock of seed *Potatoes*. Where space admits spread them out thinly. The shelves of fruit rooms (which are cool) as they become vacant can be usefully employed for Potato sets.

FORCING DEPARTMENT.—Maintain the supply of *French Beans* by making fresh sowings. At this season these are best planted out at suitable places for them to be at command. Both *Fulmer's Early Forcing* and *Long-podded Negro* are excellent sorts for forcing. Well air *Carrots* and *Radishes* when favourable for so doing; thin out early-sown crops to about 3 inches apart, and make another sowing of these. *James' Intermediate Carrot* is a good kind for sowing now. Do not suffer *Potatoes* which are growing vigorously to become drawn through lack of air; remove the lights when sunshine is powerful. Sets of these which have been recently planted in a break should be planted out when about a inches long. Large supplies of green *Mint* are required at most places; see to its being maintained by introducing fresh roots, also that of *Seakale*, *Rhubarb*, &c. Sow in pots or pans *Tomatoes*, *Capsicums*, *Basil*, and *Knotted Marjoram*; also *Celery*—Incomparable White and Leicester Red are the best sorts for sowing now. *G. T. Miles, Wycombe Abbey.*

Enquiries.

He that questioneth much shall learn much.—BACON.

37. SUBSTITUTE FOR GRASS IN SHADY LAWNS.—In shady situations in town gardens it is difficult to get grass to grow, and it requires to be frequently renewed by fresh turf from the fields. I think I have read that the common Yarrow is a good substitute for grass in such situations. Will some one kindly inform me if it will grow freely in the shade of buildings; if it can be kept in neat order by the use of the ordinary lawnmowers; if it is detrimental to the growth of other plants in its vicinity; where a supply of seed can be obtained to start the establishment in a lawn; and any peculiarity in treatment. The name of any better substitute for grass under similar circumstances, would much oblige *Lux*.

38. RUELLIA ELEGANS, ETC.—Where can I obtain a plant of *Ruellia elegans*, figured in *Bot. Mag.*, t. 3389? Where can I procure a second-hand copy of Seemann's *Flora Villarsii*? In both cases inquiries made in the ordinary way have failed. *O.*

Answers to Correspondents.

APPLE TREES: *T. D. M.* The shoots set are badly infested with American blight. Prune out as much of the swelled or infested wood as you can, and burn it; and then give the trees a good dressing with strong manure, or paint them over with Paris green. CRANBERRY CULTURE: *Inquirer*. There is a very good practical treatise on this subject, by J. J. White, published by the Orange Judd Company, 245, Broadway, New York, and which can be obtained through a bookseller or by post.

DRYING PLANTS: *R. O. D.* You must use more than two sheets, according to the succulence of your plant, and you must change the paper frequently. Otherwise your plan is a good one. As you do not state the conditions of the competition, we cannot answer the other questions.

GARDENIAS: *F. W. O.* These strike freely from cuttings made from the half-ripened shoots inserted in sand, covered with a bell-glass, and placed in a temperature of 70°.

INSECTS: *P.* The specimen of a beetle sent, which has gnawed into the pseudobulbs of your exotic *Orchids*, is a South American weevil of the extensive genus *Calandra*.—*H. P. P.* The minute black objects on the underside of your Strawberry leaves (which under a microscope show traces of segmentation and appendages, and which are therefore incapable of motion), are evidently the eggs of an aphid, of which there were various individuals of very small size, just hatched, on the leaves. *I. O. W.*

LONDON AND COUNTY BANKING COMPANY.

Established in 1835, and Incorporated in 1874 under "The Companies Act, 1862."

Subscribed Capital, £3,750,000, in 75,000 Shares of £50 each.

REPORT ADOPTED AT THE ANNUAL GENERAL MEETING, FEB. 4, 1875.

The Directors have much pleasure in laying before the Proprietors the Balance-sheet of the Bank for the Half-year ended on December 31st last, which shows that, after paying Interest to Customers and all charges, allowing for Rebate and making provision for Bad and Doubtful Debts, and for Interest accrued on New Shares, the Net Profits amount to £22,656 15s 1d.

The Directors recommend the payment of a Dividend of 10 per cent. for the half-year, free of Income-tax, which will absorb £120,000; and that the balance of £18,336 0s 6d. then remaining be carried forward to Profit and Loss New Account.

The present Dividend, added to that paid to June 30, will make 20 per cent. for the year 1874.

The Directors announce the retirement from the board of Frederick Voule, Esq., and the election of William Nicol, Esq., in his place.

The Directors retiring by rotation are:—Nathaniel Alexander, Esq., Thomas Tyringham Bernard, Esq., and William Nicol, Esq., who, being eligible, offer themselves for re-election.

The continued increase in the business of the Bank having made it imperatively necessary to enlarge the Head Office, the Directors have acquired the freehold of adjoining properties, which they have arranged to rebuild and incorporate with their existing premises. They have further acquired the leasehold interest for a long term of premises in Abchurch Lane, in direct communication with the Bank, and have already entered on their occupation.

The Proprietors were informed at the Meetings in February and August last that the Directors had under consideration a scheme for granting retiring and other allowances to Officers of the Bank. A resolution will be submitted to the meeting authorising the Directors to carry out this intention, under such rules and regulations as may be deemed by them desirable.

The Dividend, amounting to £2 per share, free of Income-tax, will be payable at the Head Office, or at any of the Branches, on or after Monday, the 15th instant.

BALANCE SHEET OF THE LONDON AND COUNTY BANKING COMPANY, DECEMBER 31, 1874.

Table with 5 columns: Description, £, s., d., £, s., d. Rows include: To Capital paid-up, 1,200,000 0 0; Instalment received in respect of New Shares, 148,210 0 0; Reserve Fund, 600,000 0 0; Instalment received in respect of New Shares, 74,105 0 0; Amount due by the Bank for Customers' Balances, &c., 19,892,586 10 11; Liabilities on acceptances, covered by Securities, 2,760,005 8 8; Profit and Loss Balance brought from last Account, 20,279 14 4; Reserve to meet Interest accrued on New Shares, 468 15 0; Gross Profit for the Half-year, after making provision for Bad and Doubtful Debts, 414,368 5 4; Less amount transferred to Premises Account, 15,000 0 0; Total, 429,116 14 8.

Table with 5 columns: Description, £, s., d., £, s., d. Rows include: By Cash on hand at Head Office and Branches, and with Bank of England, 2,461,448 7 6; Cash placed at Call, and at Notice, covered by Securities, 3,080,022 9 11; Investments, viz.: Government and Guaranteed Stocks, 1,930,054 16 9; Other Stocks and Securities, 93,545 6 11; Discounted Bills, and advances to Customers in Town and Country, 14,113,465 8 6; Liabilities of Customers for Drafts accepted by the Bank (as per contra), 2,780,005 8 8; Freehold Premises in Lombard Street and Nicholas Lane, Freehold and Leasehold Property at the Branches, with Fixtures and Fittings, 43,077 19 8; Less amount transferred from Profit and Loss, 15,000 0 0; Interest paid to Customers Salaries and all other Expenses at Head Office and Branches, including Interest on Profits and Salaries, 123,258 1 3; Total, £5,142,023 14 3.

Table with 5 columns: Description, £, s., d., £, s., d. Rows include: DR. PROFIT AND LOSS ACCOUNT. To Interest paid to Customers, as above, 103,375 15 1; Expenses, as above, 123,258 1 3; Relate on Bills not due, carried to New Account, 59,796 8 11; Dividend of 10 per Cent. for Half-year, 120,000 0 0; Reserve to meet Interest accrued on New Shares, 3,750 0 0; Transferred to the credit of Premises Account Balance carried forward, 18,936 9 5; Total, £444,116 14 8.

By Balance brought forward from last Account Reserve to meet Interest accrued on New Shares, 20,279 14 4; Gross Profit for the Half-year, after making provision for Bad and Doubtful Debts, 414,368 5 4; Total, £444,116 14 8.

We, the undersigned, have examined the foregoing Balance Sheet, and have found the same to be correct.

(Signed) WILLIAM NORMAN, RICHARD H. SWAINE, STEPHEN SYMONDS, Auditors. London and County Bank, January 28, 1875. By Order, GEO. GOUGH, Secretary.

London and County Banking Company. NOTICE IS HEREBY GIVEN THAT A DIVIDEND ON THE CAPITAL OF THE COMPANY, at the rate of 10 per cent. for the half-year ended December 31, 1874, will be paid to the Proprietors either at the Head Office, 21, Lombard Street, or at any of the Company's Branches, on or after MONDAY, the 15th instant. W. MCKEAN, WHITEHEAD TOMSON, Joint General Managers. 21, Lombard Street, February 5, 1875.

THE LONDON MANURE COMPANY

TRIAL OF HOT-WATER BOILERS.

Winter is the Season to Test the Efficiency of
a Hot-Water Apparatus.

At the Pine-Apple Nursery the Hot-Water
Apparatus, on the "One Boiler System," is
allowed to be the most perfect of any in the
World. The Hothouses are equal to 3000 feet
in length, and the Winter Garden Conservatory
is 100 feet by 100 feet. The Hot Water
circulates through 12,700 feet of Cast Iron Pipe.

Gardeners are most respectfully invited to
Visit and Inspect the whole.

Silver Medal, 1874.

THE TERMINAL SADDLE BOILER.—
First-class Certificate, 1877; Highly Commended, 1873.

The following Letter from Mr. WM. THOMPSON needs no
comment:—

"Dear Sir,—I have now had your Terminal Saddle Boiler
heating two large Span-houses, 21 feet wide and 15 feet high,
containing 243 feet of 4-inch pipe, and it does its work to my
entire satisfaction. In fact I know of no Boiler of the same size
and cost that will do the same amount of work with the same
quantity of fuel. It is an excellent Boiler. You should advertise
more than you do, for it deserves to be better known than
it is.—Yours truly, Wm. Thompson.

Illustrated Caricatures, post free.

THOMAS JONES, Temple Street, Manchester.

ESTABLISHED 1856.

KEEP OUT THE FROST.

WILLIAM H. HONEY'S

PORTABLE

VAPORISING STOVES,

To Burn Kerosene or any mineral Oil.

They will burn for twenty-four hours at
a cost of one penny for three hours.

They require no attention beyond
replenishing the oil.
Suitable for greenhouses, conservatories,
halls, bed-rooms, &c.
They will not injure the most tender
exotics, nor are they in any way
injurious to the health.

Prices, in block tin, 3s.; in copper,
5s. Copper, with glass, to give light
and heat, 55s. Either will be sent on
receipt of Post-office Order.

To be seen in operation at
WILLIAM H. HONEY,
263, REGENT STREET, W.
Catalogue free. No agents appointed.

STEVENS'

TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most Simple, Economical,
Efficient, and Lasting Boiler extant; recently much improved.
For Illustrations, with full particulars, apply to the Sole Makers,
F. AND J. SYLVESTER, Castle Hill Foundry, Engineering
and Boiler Works, Newcastle, Staffordshire.

JONES'S

PATENT

"DOUBLE L" SADDLE BOILER.

This boiler, which has now had a good trial, presents advantages that other boilers do not
possess. Instead of a large portion of the heat being absorbed by the brickwork setting, or passing
direct up the chimney, before the heated particles emitted from the fuel in process of combustion
have properly done their work, as is the case with many other boilers at present in use, this
boiler, by its peculiar, yet simple, construction, as well as by a judicious arrangement of flues,
obtains the full amount of heat from the fuel before the products of combustion pass into the
chimney. Compared with the old Saddle and other boilers, it is computed that it will do nearly
twice the amount of work with the same amount of fuel. The cost of setting is less, as is also the
space occupied, and the boiler being made in wrought instead of cast iron, thereby avoiding its
liability to crack, renders it one of the best boilers yet brought out.

For the rapidity with which heat can be got up in one or any number of houses it is unsur-
passed, and the following extracts from Testimonials received from persons accustomed to the use
of hot-water apparatus will prove that the expectations raised for this boiler have been fully
realised.

J. JONES & SONS beg to state, in conclusion, that they are prepared to send to any part of
the country, at a moderate charge, to take particulars and prepare plans and estimates for hot-
water work of every description; or they will, on receipt of full particulars by post, send
estimates, &c., free of charge.

The Patent "DOUBLE L" SADDLE BOILER is made in sizes to heat from 300 to 10,000 feet of
piping, and can only be obtained from the Patentees.

All communications respecting prices of boilers, &c., should be addressed—

J. JONES AND SONS, HOT-WATER ENGINEERS,
6, BANKSIDE, SOUTHWARK, LONDON, S.E.

EXTRACTS FROM A FEW TESTIMONIALS

IN FAVOUR OF

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

From Mr. J. AITKIN, Gardener to W. Stuart, Esq.

"ALDENHAM ABBEY, WATFORD, *June 1873.*
"Concerning the working of your Patent 'Double L' Saddle
Boiler, I have only to say that it gives entire satisfaction, and,
although a small one, it heated the 700 feet of 4-inch piping
nearly all the winter. I had seldom to use the other Boiler that
is attached to the pipes; it also requires a considerable deal less
fuel than the old Saddle, which is of some importance at the
present price of coal; it also heats much quicker than any Boiler
I ever had to superintend."

From Mr. J. W. ABRAMS, Gardener to N. M. Forbes, Esq.

"TILBURSTOW LODGE, GODSTONE, *December 30, 1871.*
"I have proved your 'Double L' Saddle Boiler, and find it
everything that could be needed. I am of opinion that the
Boiler is able to drive as much more Piping as is now required
to do. It is the kind of Boiler I should recommend to all
Gardeners for Forcing Houses, as you can get both a quick
heat and a regular heat; in fact, I believe it to be the best
Boiler I ever had to deal with."

Extract from Second Testimonial from the above.

"The 'Double L' Saddle Boilers, as well as the apparatus in the
Stove House, answer exceedingly well, and give whatever heat
I require—from 80° to 90° day or night—with very little trouble
or attention."

From Mr. R. WILLMOTT, Gardener to C. Deridante, Esq.

"THE GARDENS, ALEXANDRA PARK, *May 26, 1871.*
"The 'Double L' Saddle Boiler and Apparatus erected by
you has given me great satisfaction, as it does its work quickly
and economically, and requires very little attention. I consider
it a great improvement on the old Saddle Boiler; in fact, I
prefer it to any other boiler we have."

From Mr. J. SIMS, Gardener.

"BOVINGDON HOUSE, HEMEL HEMPSTEAD, *December 18, 1871.*
"I have given your 'Double L' Saddle Boiler a fair trial
during the severe weather we have had, and am well satisfied as
to its being a great deal more economical than the old Saddle,
and will do the same amount of work with about half the
quantity of fuel."

From Mr. D. ROBERTSON, Gardener to Rev. Dr. Ainger.

"WHITTON TOWER, ROTHELY, *June 3, 1873.*
"Your 'Double L' Saddle Boiler is giving great satisfaction.
We have had a severe winter, the Saddle Boiler old, and con-
sequently very open, and yet it has kept them at the proper tem-
perature from 10 P.M. to 8 A.M., which would be very hard on
any other boiler that I am acquainted with, considering the size."

From Mr. CHARLES YOUNG.

"NURSERY, BALMORAL HILLS, S.W., *May 29, 1873.*
"Having given your Patent 'Double L' Boilers a fair trial
at my Nurseries, I beg to say they are most satisfactory. I con-
sider them the best in use, and without doubt the most econo-
mical of all boilers; they will burn the refuse of other tubular
boilers I have in work."

From Mr. R. THOMPSON, Gardener to H. Crawshaw, Esq.

"LANGLAND BAY, near SWANSEA, *June 5, 1873.*
"Your 'Double L' Saddle Boiler I like very much. I have
worked it regularly since it was fixed, and I find it to be a very
powerful, and, at the same time, an economical Boiler. I am
also pleased with the manner in which the pipes are fixed, and
their working throughout. The stops could not be moved by
better. This I consider a good point, as it enables the person in
charge to regulate the heat as he pleases."

From Mr. FANSON, Gardener to the Rev. G. H. Devonport.

"FOXLEA, near HERFORD, *June 4, 1873.*
"I have given your 'Double L' Saddle Boiler a fair trial,
and it gives every satisfaction. It is the quickest heating boiler
I have had under my charge, and burns the least fuel."

From Mr. H. BROOKS, Gardener to J. T. Belk, Esq.

"THE PARK, MIDDLESBORO, *May 28, 1873.*
"I have given your 'Double L' Saddle Boiler a fair trial,
and have found it give every satisfaction. It acts admirably
with a small amount of fuel, which is a great point at the
present price of fuel. I consider it the best I have used, and the
most economical."

From Mr. J. McCOLLUM, Gardener to J. W. Hallowell, Esq.

"STRATFORD COURT, STRAFFORD, *May 30, 1873.*
"I have thoroughly tested the efficiency of your Patent
'Double L' Boiler, and I am so satisfied with its heating powers
that I can recommend it with confidence. When properly
managed I find it one of the most economical Boilers I ever
used."

From Mr. W. BEECH, Gardener to Sir J. W. Hartopp.

"KINGSWOOD WARREN, EPSOM, *May 30, 1873.*
Hot-water Apparatus are working very satisfactorily."

From Mr. S. PETTIT, Gardener to F. Sartoris, Esq.

"RUSHDEN HALL, HUCKNALL PARISH, *May 29, 1873.*
"Your 'Double L' Saddle Boiler has had a good trial this
last winter, and does its work first-class, with comparatively
little fuel, considering the work it has to do."

J. JONES & SONS,

HOT WATER ENGINEERS,

6, BANKSIDE, SOUTHWARK, LONDON, S.E.

THE FRENCH SYSTEM OF WIRING GARDEN WALLS, &C., FOR TRAINING FRUIT TREES.

Prices on application to
J. B. BROWN AND CO., 90, Cannon Street, E. C.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER,
2A, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability.
For Neatness.—Because all the Wires are kept perfectly tight, without the use of the Raddisseur.
For Strength.—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.
For Durability.—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system.
