BOULTON & PAUL (LATE W. S. BOULTON & CO.), NORWICH, HORTICULTURAL BUILDERS and HOT-WATER APPARATUS MAKERS.

Improved Steam-power Machinery for working wood enables us to supply first-class Horticultural Buildings of every description at very low prices. Only the best materials used. Houses designed to suit any situation. Estimates given Free. Gentlemen are respectfully invited to have price from us before ordering elsewhere. Ladies or Gentlemen requiring advice as to the Situation, Style, Dimensions, &c., of proposed Horticultural Buildings, waited upon in any part of England, Ireland, or Scotland.
Our NEW ILLUSTRATED CATALOGUE OF HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

BOULTON & PAUL'S PATENT UNIVERSAL PLANT PRESERVERS—GREAT IMPROVEMENTS for 1875.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these to be by far the best and most useful articles of the kind they ever saw, and awarded them the ONLY PRIZE.

Now Ready, our NEW LIST OF PRICES, containing full description and a number of Woodcuts clearly showing the uses to which these handy articles may be applied. Free by Post.
PATENT UNIVERSAL PORTABLE PLANT PRESERVERS and GROUND VINERIES.—Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 feet by 3 feet wide; thus proving them to be really portable.
PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. Far superior to anything of the kind yet offered.

OPINIONS OF THE PRESS.

GARDENERS' CHRONICLE, February 6, 1875.
The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value.

FLORAL WORLD.
The Ground Vinery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co.

GARDENERS' MAGAZINE, May 25, 1872.
Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known.

THE GARDEN.
Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and putted—an essential point. They are complete and ready for use the moment they are received, &c.

MELON OR CUCUMBER FRAMES.
All sizes (glazed with 21-oz.) ready for immediate delivery.
Height at back, 24 inches; at front, 13 inches; sides, 1 1/2 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as putted in. Each light is provided with an iron strengthening rod and handle.
Glazed with 21-ounce.

Cash Prices, carriage paid to any station in England when orders amount to 60s. and upwards.

KINAHAN'S LL WHISKY. This celebrated and most delicious old mellow spirit is the very CREAM OF IRISH WHISKIES, in quality unrivalled, perfectly pure, and more wholesome than any other gradually built up, and strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fall, only by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the *Civil Service Gazette*.

Grateful—Comforting.

E P P S' S C O C O A.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided for breakfast a beverage which has delicately flavoured beverage, which may save us many a heavy doctor's bill. It is by the judicious use of such articles of diet that a constitution may be gradually built up, and strength restored to the debilitated. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fall, only by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the *Civil Service Gazette*.

Made simply with boiling water or milk. Sold in packets (10 in each) and in tins. JAMES EPPS and CO., HOMOEOPATHIC CHEMISTS, 485, Threadneedle Street, and 170, Piccadilly, W. Works.—Eaton Square, and Cannon Town, London, N.W. Makers of Epps's Glysterine Jujubes for Trochil Irritation.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for Acidity of the Stomach, Headache, Gout, and Indigestion; and the best mild Aperient for delicate Constitutions, especially adapted for Ladies, Children and Infants.

DINNEFORD AND CO., 172, New Bond Street, London, W., and of all Chemists throughout the World.

Freedom from Coughs in Ten Minutes is given by

DR. LOCOCK'S PULMONIC WAFERS.—

They act like magic, and are cheaply sold by all Druggists at 1s. 3d. and 2s. 6d. per box.

BETTERIDGE'S PRIZE ASTERS,

All saved by Mr. BETTERIDGE this season, and including every variety sent out by him, as see copy of letter by Mr. BETTERIDGE enclosed with each packet supplied through

READING,

Sutton Sons

BERKS.

BETTERIDGE'S NEW VARIETIES,

Duke of Edinburgh,
Grand Duchess Marie, Cantab,
and Improved Oxonian

The 3 superb varieties, which were sent out by us last year for the first time, have given great satisfaction, notwithstanding the unfavourable season. Each variety is perfectly symmetrical in form, with a delicately-qualified centre, surrounded respectively by crimson, pink, light blue, and dark blue guard-petals.

DUKE OF EDINBURGH	Per packet—s. d.
GRAND DUCHESS MARIE (Duchess of Edinburgh)	2 6
CANTAB	2 6
IMPROVED OXONIAN	1 6
THE COLLECTION OF FOUR VARIETIES	8 0

From Mr. BETTERIDGE to Messrs. SUTTON: Nov. 6, 1874. "The eighteen varieties which have improved by discarding one light blue and adding a fine pure crimson with very light guard-petals (a splendid Aster)."

This is included in every Collection of eighteen varieties, for 3s. 6d., sent out by Messrs. Sutton.

Silver and Bronze Medals, with valuable Money Prizes, will be offered by Messrs. Sutton at the Royal Horticultural Society's Meeting on September 1, 1875, for the best Collection of Asters. Full particulars on application.

BETTERIDGE'S INTERNATIONAL PRIZE COLLECTIONS OF ASTERS.

These well-known Collections of Asters have this season fully sustained their reputation of being the finest Quilled Asters in cultivation, and they cannot be too highly recommended.

Mr. Betteridge has again consigned to us a full supply of new seeds, which we offer to our customers with every confidence.

Eighteen beautiful varieties	s. d.
Twelve ditto	3 6
Six ditto	2 6
Mixed	1 6
per packet 1 0	

N.B.—Purchasers of the above will obtain every sort sent out by Mr. Betteridge this season. The Collection of eighteen varieties for 3s. 6d. is much improved, and includes the new and beautiful Crimson, with pale guard-petals, sent out this year for the first time. See Mr. Betteridge's letter.

Please observe our Trade Mark on every parcel, and copy of Mr. Betteridge's letter accompanying the same.

MR. LAXTON'S
NEW PEAS, 1875.

HURST & SON

Have pleasure in offering the following four varieties of MR. LAXTON'S NEW PEAS, all of which have been selected for their high quality, flavour and distinctness, three of them having received First-class Certificates from the Royal Horticultural Society after the great Chiswick trial in 1872. —

UNIQUE.

This is a very handsome and prolific Dwarf Early Pea, with long, deep-green coloured pods, of the same habit and coming into use at the same time as Little Gem, and may be briefly described as a Dwarf William the First. Received a First-class Certificate.

Price 7s. 6d. per sealed quarter-pint packet.

DR. HOGG.

"A very handsome Pea. The earliest green wrinkled Marrow, very sweet and of excellent quality, pods being very well filled and of a beautiful deep green colour, like the Ne Plus Ultra." — *Vide Proceedings of the Royal Horticultural Society for 1872.*

"No higher recommendation could be given to it than to introduce it as a competitor of Ne Plus Ultra." "To sum up the whole it is a fine Ne Plus Ultra, coming in one week after Dillestone's." — *Hogg's Gardener's Year Book for 1873.*

Height 3 feet, habit and type of Sangster's No. 1. Awarded a First-class Certificate and received its name at the instance of the Fruit Committee of the Royal Horticultural Society.

Price 7s. 6d. per sealed quarter-pint packet.

SUPPLANTER.

"A cross between Veitch's Perfection and Little Gem — the earliest of the Veitch's Perfection type; plant very robust and vigorous, producing very large broad pods in pairs. A large, handsome, and very prolific Pea, which received a First-Class Certificate." — *Proceedings of the Royal Horticultural Society for 1872.*

"Appropriately named, for it is a large, handsome, and very prolific Pea, and will take the place of many others." — *Hogg's Year Book, 1873.*

This Pea is of fine quality, and is also first-rate for exhibition, having been shown by Mr. R. Gilbert during the past season, in three of his Prize Collections of Peas. Height 3 feet.

Price 5s. per sealed quarter-pint packet.

CONNOISSEUR.

A remarkably distinct and very late wrinkled, bright green seeded Pea, raised from Ne Plus Ultra, pronounced by the Royal Horticultural Society to be of very excellent quality. Height 10 feet.

Price 5s. per sealed quarter-pint packet.

HURST AND SON can also supply:

FILLBASKET. — Unquestionably the most prolific and best Market Pea yet introduced. First-class Certificate Royal Horticultural Society.

Price 2s. 6d. per sealed half-pint packet.

LAXTON'S No. 1. — The earliest blue wrinkled Marrow.

Price 2s. 6d. per sealed half-pint packet.

£7 Lvo will be offered in Four Prizes at the Royal Horticultural Society's Show on July 1 next, for Six Varieties of Mr. Laxton's New Peas sent out by us in 1872, 1873, and 1874, so pods of each. Further Prizes will be announced next week.

HURST & SON,

NEW AMERICAN POTATOS

ALPHA,
EUREKA,
EXTRA EARLY VERMONT,

SNOWFLAKE,
BROWNELL'S BEAUTY,
COMPTON'S SURPRISE.

FIFTY GUINEAS IN PREMIUMS.

B. K. BLISS & SONS,

SEED MERCHANTS (SEED POTATOS A SPECIALITY),

34, BARCLAY STREET, NEW YORK, UNITED STATES, AMERICA.

THE great popularity of the new varieties of Potatos which have been sent out from our establishment within the last six years, among which are the Early Rose, Late Rose, King of the Earlies, Bresee's Prolific, Peerless, Climax, Extra Early Vermont, Compton's Surprise, Brownell's Beauty, and Snowflake, and their general adaptation to the various soils and climates of the civilised world, together with the liberal premiums offered by us for two years past to those who produce the largest crop from 1 lb. of seed, have induced many growers in various sections of the country to experiment in raising seedlings, a large number of which, considered by the originators as the very choicest in their collection (some of which embrace several hundred varieties), were sent us for trial the past season.

Several of the most promising of these were sent by us to the Royal Horticultural Society, one of which, the Dwarf White, since named Alpha, received a First-class Certificate, this being the fourth instance in which our Potatos have received this distinguished token of appreciation. A Silver Medal was awarded to the Alpha and Snowflake, also to the Eureka and Brownell's Beauty, by the Massachusetts Horticultural Society of Boston, besides having received numerous prizes from various State and County Fairs throughout the country. From the many flattering testimonials received from those who have tested these varieties, we are fully confident that they will compare favourably with others that have been sent out from our establishment. Many others are very promising, but it is yet too early to decide upon their respective merits.

ALPHA. (Pringle.)

EARLIEST VARIETY IN CULTIVATION.

Raised in 1870 by C. G. Pringle, originator of the Snowflake, and one of our most experienced hybridisers, from seed home on Early Rose and impregnated by pollen of Salce. A very early dwarf variety, adapted to garden culture and for forcing under glass; fit for the table ten or fifteen days before the Early Rose. Tubers of medium size and good shape, clear white, with the slightest tinge of red about the eyes; flesh very white, fine-grained, dry, and firm, and possessed of a decided and excellent flavour; haulm seldom exceeding a foot in height; quality, first-rate in every respect.

As the stock is limited, it will only be offered in small quantities.

Price 12s. per lb.

SNOWFLAKE.—Showing habit of growth in the hill.

THE SNOWFLAKE. (Pringle.)

This new variety, first sent out by us last Spring, has been thoroughly tested, both in this country and in Europe the past season, and we have yet to learn of the first instance where it has failed to give entire satisfaction. The superior quality claimed by the originator, when first offered, has been confirmed in every case, as far as heard from.

It is an early variety; tubers a good uniform size; and in shape the most handsome Potato yet known; skin white. Its flesh is of exceedingly fine grain, snow-white when boiled, and of a lightness and porosity almost approaching a snowflake. In quality, we do not hesitate to say nothing can surpass this new variety; its meanness, its pure, delicate flavour, and the evenness with which it cooks through, have never been equalled by any Potato. The tubers have attained the full development of their quality as soon as they are fit to dig, and do not lose it during winter; samples kept till June a did not show the least deterioration. The haulm is of medium height, and the tubers are compactly clustered around the base of the stalks,—an important consideration in digging the crop. This variety has been tested on widely varying soils—sand, gravel, loam, as well as heavy clay—and has in every case given the same favourable results, and produces a yield of from 300 to 400 bushels per acre.

Price 3s. 6d. per lb.; 7 lb. for 21s.

EXTRA EARLY VERMONT.

Respecting this variety the committee for awarding the premium offered by us in 1873 make the following statement:—

"The Early Vermont has, as proved by the numerous reports before us, more than sustained its previous reputation. Nearly all the competitors declare it from one to two weeks earlier than the Early Rose, and many more. Its uniform and large size is recognised by every one. Mr. McLeod says: 'There are more than one hundred in the amount I raised that would weigh from one to two pounds each;' and Mr. Salter raised one tuber that weighed three pounds twelve ounces. Its superior cooking and eating qualities are unanimously commended, as well as its compact growth in the hill and its freedom from disease; and with the thousands of cultivators who have grown it alongside the Early Rose there seems to be no doubt left, that in quality, hardiness, earliness and yield, it far surpasses that celebrated variety."

A First-class Certificate was awarded this variety by the Royal Horticultural Society of London, 1873.

Price 10s. per peck; 32s. per bushel.

EUREKA. (Brownell.)

Mr. E. S. Brownell, the originator of the Brownell's Beauty Potato, in his persistent experiments in hybridising, succeeded in producing, in 1871, this seedling, which is likely to fill a want of those who may be fastidious as to the colour of the skin, and outside, as well as general appearance of their table Potato.

It is of strong and vigorous growth; the tubers of a medium and uniform size; elongated oval, symmetrical and uniformly handsome; eyes few, exceedingly small, and very nearly level and flat; skin white and fair; season, second early. It is one of the most productive in cultivation, besides being an excellent keeper. Its flesh is exceedingly fine-grained, white, and when boiled or baked, meaty and of excellent flavour, cooking through uniformly, without any fault at the centre. Certainly an acquisition among the white varieties, well worthy of further trial in different sections.

Price 3s. 6d. per lb.; 7 lb. for 21s.

BROWNELL'S BEAUTY.—Showing habit of growth in the hill.

BROWNELL'S BEAUTY. (Brownell.)

The beauty and superior keeping qualities of this variety, together with its fine quality for the table, and productiveness, place it in the front rank of those recommended for general cultivation. We know of no variety whose good qualities can be retained for the entire year, as this has done. Samples were sent in 1873 to the gardens of the Royal Horticultural Society of London, where they received a First-class Certificate, and have also received many premiums at various agricultural fairs in this country. Eyes few and small, nearly even with the surface; shape oval, somewhat flattened; skin reddish, or a deep flesh colour; flesh white, fine-grained and very delicate; flavour unexceptionable. The tubers grow compactly in the hill, and are easily dug. All who tested it the past summer agree that its beautiful appearance, fine quality, extraordinary productiveness, and remarkable keeping qualities will render it a most valuable variety for the market.

Price 10s. per peck; 32s. per bushel.

COMPTON'S SURPRISE.

The Committee for awarding the premiums offered by us in 1873 make the following report:— "Compton's Surprise has received the unanimous verdict by the most prolific Potato cultivated at present. Yields of from 12 to 20 lb. to the hill are reported by the hundred, and in one instance 28½ lb. were dug from one hill. As a rule, the most prolific varieties are not of the best eating quality, but to this Compton's Surprise is an exception. Thousands have testified that they never ate a better Potato. Its uniform meanness of grain, combined with the purest flavour and its snowy whiteness of flesh, which is not in the least affected by its blue skin, cannot fail to make it highly valuable as a family Potato. This variety shows a peculiar tendency to produce a surface crop, not found in other kinds.

"Its rampant-growing vines lying on the ground will frequently take root, and establish a new centre of production. Subterranean branches will likewise often grow above the surface, and form self-propagating plants, which produce an additional crop of tubers."

Price 8s. per peck; 25s. per bushel.

The above varieties are for sale by the following Seed Houses:—London: HOOPER and CO., Covent Garden; J. CARTER, DUNNETT, and BEALE, 237, High Holborn; LAWSON SEED and NURSERY COMPANY, London and Edinburgh; CHRISTMAS QUINCEY, Peterborough; COCKS BROTHERS, Donington DANIELS BROTHERS, Norwich; HARRISON and SONS, Leicester; A. BUSCH, Gr., Massow, bei Zewitz, in Pommern, Germany, General Agent for the Continent,

NEW AMERICAN POTATOS — (CONTINUED).

The Committee for awarding the premiums offered by us in the Spring of 1874 to the six largest products from 1 lb. of the tubers of the Extra Early Vermont, Brownell's Beauty, and Compton's Surprise, after a careful examination of the reports of the various competitors, report as follows:—

BROWNELL'S BEAUTY, the newest of the three, has made a most splendid record. Not only has it given much the largest returns, from the single pounds as well as from the quarter acres, but it has also elicited the unanimous praise of all cultivators, and cannot fail to become soon a leading market Potato.

The **EARLY VERMONT** seems to have gained legions of new friends this year, while it has lost none of its old ones. All are satisfied as to its superiority as an early Potato, for market as well as for the table. In many localities where other early varieties have failed entirely, the Early Vermont has given most satisfactory returns, leaving its rank undisputed as the earliest and best early Potato in cultivation.

COMPTON'S SURPRISE has given not less satisfaction as a Potato of the highest quality. In many reports we find that "no praise can do justice to its excellent quality."

Address: B. K. BLISS & SONS, Seed Merchants, 34, Barclay Street, New York, U.S.A.

FIFTY GUINEAS IN PREMIUMS.

OFFERED BY HOOPER & CO., COVENT GARDEN, LONDON, W.C.

Wishing to have the above New Varieties of Potatos fairly tested in Europe, HOOPER & Co. offer Special Premiums, amounting to Fifty Guineas, to European Cultivators only, which will be awarded to Growers of the largest quantity from One Pound of "Snowflake" and "Eureka;" Twenty-five Guineas to each variety, to be awarded as follows:—

Twenty-five Guineas for SNOWFLAKE.

For the largest quantity of Snowflake Potatos grown from 1 lb. of seed	10 Guineas
For the second largest	5 "
For the third largest	4 "
For the fourth largest	3 "
For the fifth largest	2 "
For the sixth largest	1 "

Twenty-five Guineas for EUREKA.

For the largest quantity of Eureka Potatos grown from 1 lb. of seed	10 Guineas
For the second largest	5 "
For the third largest	4 "
For the fourth largest	3 "
For the fifth largest	2 "
For the sixth largest	1 "

Competitors for the Prizes will be required to give date of planting, date of digging, with a written statement of their mode of culture, characteristics of the soil—whether clay, alluvial, sandy, or loam—nature of the subsoil, whether underdrained or not; also, the kind and quantity of fertilisers used, how and when applied, with the weight of the crop when dug, and the number of square feet occupied by the crop, which must be witnessed and sworn to before a Justice of the Peace, Notary, or any other one competent to administer the oath, which statement must be sent to the Firm of whom they purchased their stock (if procured elsewhere than of us), who are requested to certify that the Seed was purchased of them, and that they have full confidence in the report of the Grower, and forward the report to our address previous to November 1, 1875. The reports will be examined and premiums awarded by a committee of gentlemen well known in the agricultural community (either in England or America), and will be printed, and a copy posted to each competitor. A list of the successful competitors will also be published in the leading agricultural papers of Great Britain. Competitors for premiums will be placed under no restrictions as to their mode of culture, excepting that they must not be grown from slips, or forced by artificial heat, our object being to ascertain their respective merits with such culture as is usually given to crops in a well managed vegetable garden or farm. Persons intending to compete should, in buying their seed of us, inform us of the fact, in order that their names may be registered.

HOOPER & CO., Seedsmen, Covent Garden, London, W.C.

NEW HYBRID BEGONIAS.

THE FOLLOWING NEW BEGONIAS belong to the handsome-flowered, bulbous-rooted section, and are most desirable acquisitions, as they succeed and bloom well in an ordinary Greenhouse. The Bulbs being similar to those of Gloxinias, and now dormant, can be sent by Post:—
ANACREON, deep crimson, a beautiful flower, very long petals, 7s. 6d.
BRILLIANT, very rich bright orange, a fine showy flower, 7s. 6d.
CARDINAL, magnificent variety, fine large flowers of a rich deep magenta-rose, 7s. 6d.
CAROLINE, deep rose pink, with broad petals, 5s.
CERMAX, deep rich rose carmine, broad outer petals, 5s.
CORSAIR, rose salmon, profuse bloomer, 5s.
ENSIGN, bright pink, a very elegant variety, 5s.
GEM, cream colour, the reverse of the petals pink, 5s.
GLITTER, vivid orange-scarlet, extremely showy, 7s. 6d.
HERMINE, bright orange cinnamon, very distinct, 5s.
LOTHAIR, deep rose, a fine flower, with short broad petals, 7s. 6d.
LUCINDA, fine flowers with long petals, of a deep rose colour, 7s. 6d.
MAGNET, light pink, the reverse of the petals deep pink, 5s.
MAZEPPA, light cream colour, tinted with orange pink, 5s.
PHYLLIS, delicate sulphur colour tinted with pink, 5s.
SERAPH, soft pink suffused with rose, 5s.
SURPRISE, bright pink, a very pretty colour, 5s.
TROJAN, light rose pink, very distinct, 5s.

The entire Collection of the above Eighteen Varieties for Four Guineas.
 Seed of the above New Begonias, separate kinds, 2s. 6d. per packet; mixed, 3s. 6d. per packet.

SEED POTATOS—Wholesale and Retail, in any quantity. Prices and Terms on application. **LITTLE and BALLANTYNE**, Seed Growers and Merchants, Carlisle.

The Lucombe Oak may be seen in perfection at **LUCOMBE, PINCE, and CO'S Exeter Nursery**. "It is," says the *Gardener's Chronicle*, p. 32, "a tree that deserves to be planted more extensively. At the present time, after the cold weather we have experienced, it holds its foliage and looks as cheerful as at the beginning of autumn. The leaves are a bright glossy green, and otherwise like the ordinary Quercus Cerris, though they may be a trifle thicker."

MOUNT HOPE NURSERIES, ROCHESTER, NEW YORK, U.S.A.

THESE NURSERIES, covering 600 Acres of Land, were founded by the present Proprietors thirty-five years ago, and contain the most extensive and complete COLLECTIONS of FRUIT and ORNAMENTAL TREES, &c., in the United States. Orders for American varieties of Fruits and Hardy Ornamental Trees and Shrubs solicited. CATALOGUES MAILED FREE ON APPLICATION. **ELLWANGER and BARRY.**

CAMELLIAS.

MESSRS. JAMES VEITCH & SONS

Invite Inspection of their fine Collection of the above, which is now in bloom.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

LOBELIA PUMILA MAGNIFICA.

THE PINE APPLE NURSERY COMPANY

Will commence sending out this fine Lobelia on March 15 next. Price 2s. 6d. each, or 24s. per dozen for not less than half a dozen.

It received the Floral Certificate at the Royal Botanic Society, and a First-Class Certificate at the Royal Horticultural Society. It has been favourably noticed by all the gardening papers, and the *Gardener's Magazine* of July 18 says of it:—"This dwarf bedding Lobelia, exhibited by the Pine-Apple Nursery Company, is unquestionably the most important of the many bedding Lobelias introduced of late years. The colour of the flowers is a deep indigo blue, and as there are no conspicuous eyes to mar the general effect, a solid mass of band will tell in a wonderful manner." **MAIDA VALE, LONDON, W.**

Rare Opportunity.
 NEW and VERY RARE BIRD'S EYE SPORES from AUSTRALIA and NEW ZEALAND.
J. H. LEY, having just received an importation from his Collector, can supply good packets, with directions for sowing and rearing, at 3s. 6d., 5s., and 7s. 6d. each.
 The fronds from which three sorts have been obtained are new species, the four first sorts are *Cyathea dealbata* (Silver), *C. medullaris*, *Alphitoph. McArthurii*, *Dicksonia filiformis*, and a small quantity of *Dicksonia squarrosa*. Should be sown now to obtain nice plants before autumn.
J. H. LEY, Royal Nursery, London Road, Croydon.
 N.B.—Twelve choice *FALM* SEEDS, in distinct sorts, 5s.

Snowflake.
THE FINEST POTATO ever introduced; will yield from 300 to 400 bushels per acre of handsome tubers of the most splendid quality and FREE FROM DISEASE. **Messrs. DANIELS BROS.** have just received a consignment of this magnificent variety direct from the original raiser in America, where it has obtained immense popularity, and which is now being distributed at the following rates, carriage free to any address—3s. 6d. per lb.; 7 lb., 21s.; 14 lb., 42s.; cheaper by the cwt.
DANIELS BROS., Seed Growers and Importers, Royal Norfolk Seed Establishment, Norwich.

FOREST SHRUBS, RHODODENDRONS, &c., transplanted—a large quantity for Sale.
 Birch, 10 to 12 feet, 18s. 6d. per 100

 Sycamore, 3 to 4 feet, 12s. per 1000; 6 to 8 feet, 60s. p. 1000

CATALOGUES free.
HENRY DERYSHIRE, Darley Hillside Nursery, near Mallock, Derbyshire.

Planting Season—Avenue Trees.
LIMES, 12 to 16 foot high, straight stems, girth 4 to 8 inches at 4 feet from the ground, with well-balanced heads, and splendidly rooted. A stock of more than 5000 of these fine Trees to select from.
PLANES, OCCIDENTAL, 12 to 16 feet.
HORSE CHESTNUTS, 10 to 12 feet.
SCARLET HORSE CHESTNUTS, 10 to 12 feet.
NORWAY MAPLES, 10 to 16 feet.
 All being stout, straight stemmed, and finely rooted. Every Tree has been removed within two years.
POPLAR, CANADENSIS NOVA, 18 to 20 feet—This new variety of Poplar, for exceeding in rapidity of growth any tree I am acquainted with, is strongly recommended as a Town Tree, especially in smoky districts. There are hundreds in this Nursery 3 years old, measuring 18 to 22 feet high, and stout in proportion.
ANTHONY WATERER, Knapp Hill Nursery, Woking, Surrey, S.W.

Carnations, Picoetes, and Pinks.
ISAAC BRUNNING AND CO. beg to announce that they have this Season a very fine and extensive Collection of seeds to offer, strong plants of which are now ready for sending out. LIST of Varieties and Prices, together with Illustrated SEED CATALOGUE, on application.
Our ONE GUINIA COLLECTION OF CARNACTIONS, &c., contains six pair of choice Show Carnations, six pair of choice Show Picoetes, twelve pair of Show Pinks, and twelve choice mixed Carnations and Picoetes for borders.
 Carriage and package free on receipt of Post Office Order. Half of the above quantities, 11s.
ISAAC BRUNNING AND CO., Great Yarmouth Nurseries.

JAMES TYNAN, Seed Warehouse, 68, Great George Street, Liverpool, offers—
GLOXINIA CRASSIFOLIA GRANDIFLORA—Magnificent and distinct variety, leaves broad and fleshy, requiring so as to almost cover the pot; flowers much larger than in the older sorts, very brilliant and varied in colour. Sown in January or February, they bloom the following autumn. Erecta and horizontal, separate or mixed, 2s. and 2s. 6d. per packet.
STEPHANOTIS FLORIBUNDA—Fine variety from the Mauritius, flowering profusely at every joint, and possessing in a high degree the delightful fragrance of this beautiful climber. 1s. 6d. per packet.
CYCLAMEN PERSICUM, Prize strain—Seed saved from one of the best collections in the kingdom. 2s. 6d. per packet.
DOUBLE PETUNIA, large flowering—Will produce a large percentage of splendid double flowers of great size, and charmingly varied shades of colour. 1s. 6d. per packet.
 Post-free on receipt of Stamps or Post Office Order.
 Send for CATALOGUE of CHOICE VEGETABLE and FLOWER SEEDS.

Six Beautiful Orchids, 21s.
FOR WINTER and SPRING FLOWERING no class of plants can compete with Orchids, their culture being extremely easy, and the flowers very lasting. Above are a distinct and complete list of the catalogue and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

Twelve Graceful Palms, 21s.
HEALTHY YOUNG PLANTS, to grow on for Table-decoration, and will be ready in about six months, or fit for immediate use, including many choice and very rare kinds, 6s., 8s., and 10s.
J. H. LEY, Royal Nursery, Croydon.

Twelve Flowering Stove Plants, 21s.
INCLUDING ANTHURUM SCHERZERIANUM, ALLAMANDA CHELSONI, and other equally fine sorts, in nice plants. Package and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

Twelve Ornamental Foliage Plants, 21s.
INCLUDING many of the finest and newest varieties of *ALOCASIAS*, *MARANTAS*, *CROTONS*, &c., well established, clean, and healthy plants, to grow on for specimens. Package and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

By Her Majesty's Letters Patent
RENDEL'S
 PATENT ORCHARD HOUSES
 AND
FRUIT TREE PROTECTORS.

The tender and delicate Blossoms of Peaches, Nectarines, Apricots, &c., can be protected by the four following methods:

No. 1.—Rendle's Patent Portable Glass Protector for Walls.
 Patent Glass Copings, 18 inches wide, 3s. 7 1/2 inches wide, 4s. 7 1/2 inches wide, 5s. per running foot, 2 1/2 to 3 feet, OR IN THIS WAY.

No. 2.—Patent Combined Glass and Network Wall Protector.
 This Combined Protector can be supplied at 10s., 12s., or 14s. per foot run. Highly recommended by Mr. Wm. Ingram, Belvoir Castle. OR IN THIS WAY.

No. 3.—Rendle's Patent Glass Wall Screen.
 These Screens can be supplied at 15s., 18s., or 20s. per running foot, according to the height of the wall and the width of the border. OR IN THIS WAY.

No. 4.—Rendle's Patent Fruit Wall Orchard House.
 These Houses, for converting existing Fruit Walls into Orchard Houses, can be supplied at 20s., 24s., 26s., 30s., to 34s. per running foot, according to the height of the wall or width of the border.

Illustrated CATALOGUES and BOOK of DESIGNS can be obtained from the Patentee and Inventor,
Mr. WILLIAM EDGEMOND RENDEL,
 3, WESTMINSTER CHAMBERS, VICTORIA STREET LONDON, S.W.

Twelve Choicest Stove or Greenhouse Ferns, 21s.
OR SMALLER SIZE, 12s., including many very rare varieties. This is the best time to buy Ferns, as the young and delicate fronds are not yet started, and they are consequently stronger, healthier plants. Package and delivery free to London on receipt of Post Office Order or Cheque.
J. H. LEY, Royal Nursery, Croydon.

W. POTTEEN'S SEED LIST is now ready, and will be sent post free to all applicants. W. P. has a large stock of *CALCEOLARIAS*, *CINERARIAS*, and *FRIMULAS*, strong healthy plants, in 48-pots, from the very best strains, 1s. per dozen; extra strong, 6s. per dozen.
CYCLAMEN PERSICUM, good plants, in 3-inch pots, 3s. per dozen, 20s. per 100.
Camden Nursery, Sissinghurst, Staplehurst, Kent.

Red-skin Flourball Potatoes.
H. AND F. SHARPE particularly recommend this variety for Field Cultivation, being, without doubt, the heaviest cropper grown. **FOURTEEN TONS PER ACRE** have been produced this season on ordinary marl land. They are largely grown for Cattle-feeding purposes in lieu of Mangels and Koli Rabi. It is perfectly free from disease, and the quality is very fine. It keeps well until May or June. For price, &c., apply to **H. AND F. SHARPE**, Seed Growers, Wisbech, Cambridgeshire.

Hollies.
ANTHONY WATERER respectfully invites the attention of Holly buyers to the very fine Stock to be seen growing at Knapp Hill. It comprises upwards of Thirty Thousand Plants, from 9 to 10 and 12 to 14 feet high, of the finer Gold, Silver, and Green-leaved kinds, affording a choice in size and variety such as can be met with in no other Nursery in Europe. Every Plant has been recently removed, and will be guaranteed.

The Stock of Common Green Hollies also occupies 5 acres of land, and Purchasers will find them in large numbers of all heights up to 14 feet.
Knapp Hill Nursery, Woking, Surrey.

R. B. MATTHEWS, SEED MERCHANT and NURSEMYN, Belfast.
NEW VEGETABLE and FLOWER SEEDS now to hand direct from the growers.
GRASSES and CLOVER SEEDS, suited for all purposes, soils, and situations.
GENERAL NURSERY STOCK, Stove, Greenhouse, Conservatory and Orchard-house Plants, Fruit Trees, and Hardy Ornamental Trees and Shrubs, Hedging Plants and Underwood.
 Seeds, Plants, &c., carefully packed for export to all parts of the world.
 SEE CATALOGUES Post-free on application.

CHRYSANTHEMUMS, FUCHSIAS, GERANIUMS, FLORIST'S FLOWERS, &c.—Chrysanthemums in all the new and good varieties, 2s. per dozen, 20s. per 100. Fuchsias, from the best sorts, 2s. per dozen, 20s. per 100. Geraniums, autumn-struck *Zonalis* and *Nosegays*, strong and well-rooted, twelve varieties, best for pots, 4s.; bedding varieties, 2s. per dozen, 15s. per 100.
 Twelve beautiful named Antirrhinums, 4s. Twelve fine Pentstemons, 4s. Twelve *Phloxes*, 4s. 6d. Twelve *Pinks*, 4s. Twelve *Pansies*, 4s. Twelve *Carnations and Picoetes*, 6s. Twelve *Coleus*, 3s. Twelve fine Show and Early-flowering *Pelargoniums*, 6s. and 9s. All the above and good varieties. Trade prices on application.
WM. CLIBRAN and SON, Oldfield Nursery, Altrincham.

SURPLUS STOCK for SALE.
 5,000 LAURUSTINUS, 2 to 2 1/2 feet.
 10,000 FIRS, Scotch, 2 to 2 1/2 feet.
 2,000 OAKS, English, 9 to 10 feet.
 1,000 Turkey, 10 to 12 feet.
 5,000 PINUS AUSTRIACA, 4 to 5 feet.
 1,000 CUPRESSUS LAWSONIANA, 6 to 8 feet.
 1,000 MACROCARPA, 7 to 8 feet.
 5,000 HOLLIES, Green, 2 to 3 feet.
 All the above are finely rooted, strong, and healthy plants, and will be sold cheap. For prices apply to
W. ROSSLIER, Nurseries, Farnington, Devon.

CONIFEREA SEED, New and Rare, collected by M. Roetz in November, 1874—
ABIES HOOKERIANA, A. Murray.—According to M. Roetz this fine Conifer attains the height of 100 feet; its branches are long and pendulous, resembling the Deodar Cedar, but of a much more graceful habit—a description fully confirmed by Mr. Lobb, who also compares it to the Deodar. M. Roetz says that he found it without exception, in northern aspects, never fully exposed to the sun, and he believes it prefers shady situations. Price 3s. 6d. per 1000, 15s. per 5000 seeds.
PINUS (Strobis) MONTICOLA, Douglas.—Sixty per cent. good, 2s. 6d. per 1000, 15s. per 5000 seeds.
PINUS (Pinaster) CONTORTA, Douglas.—This species grows in swampy places in the lowlands of California, and forms dwarf compact trees, with tortuous branches. On the mountains where M. Roetz encountered it, and where he collected the seeds, it forms stately trees of 100 feet in height; the wood is owing to its elasticity and durability much sought after. Seed of excellent quality, 90 per cent. good, price 3s. 6d. per 1000 seeds.

We also offer the following, collected by M. Roetz, in October, 1874; many of them familiar to, and ably described by, M. F. Urtgies, of Zurich; see *Gardener's Chronicle*, December 11, 1874; and Mr. A. Murray's article, January 23, 1875.
PICEA CONCOLOR, Engelmann: 2s. 6d. per 1000, 15s. per 5000 seeds.
 " var. *violacea*, Roetz: 2s. 6d. per 1000, 15s. per 1000, 15s. per 5000 seeds.
 " *BIFOLIA*, Murray: 1s. 6d. per 1000, 12s. per 1000, 8s. per 5000 seeds.
 " *DOUGLASHI*, var. *glauca*, Roetz: 1s. 6d. per 1000, 8s. per 1000, 15s. per 5000 seeds.
ABIES COMMUTATA, Parlatore: 4s. per 1000, 15s. per 5000 seeds.
PINUS ARISTATA, Engelmann: 6s. per 1000, 15s. per 5000 seeds.
 " *FLEXILIS*, James: 1s. 6d. per 1000, 12s. per 1000 seeds.
 " *DEFLXEA*, Torrey: 1s. 6d. per 1000, 8s. per 1000 seeds.

 " *MAGNIFICA*, Murray: 2s. 6d. per 1000, 15s. per 5000 seeds.
 " *MACROCARPA*: 2s. 6d. per 1000, 12s. per 1000, 15s. per 5000 seeds.
 " *LAMBERTIANA*: 1s. 6d. per 1000, 7s. 6d. per 1000 seeds.
F. SANDER AND CO., New and Rare Seed Importers and Growers, St. Albans.

BETTERIDGE'S PRIZE ASTERS,

SAVED BY MR. BETTERIDGE;

OBTAINED DIRECT FROM HIM THIS SEASON.

ORIGINALLY SENT OUT BY *Carter's* ORIGINALLY SENT OUT BY

Mr. BETTERIDGE'S NEW ASTERS, DUKE OF EDINBURGH, DUCHESS OF EDINBURGH, IMPROVED OXONIAN, &c.

In consequence of a statement in the Seed Catalogue of a Provincial House, that "the raiser has again consigned to us his ENTIRE Stock" of the above new Asters, and which statement being totally unfounded in fact, MESSRS. *Carter's* consider it necessary to publish the following letter, received from Mr. Betteridge, the raiser of these celebrated Asters:—

Mr. Betteridge's
NEW VARIETIES.

Duke of Connaught,
Duke of Edinburgh,
Duchess of Edinburgh,

AND
Improved Oxonian.

"THE COMMON HILL, CHIPPING NORTON,
"Messrs. JAMES CARTER & Co.,
"February, 1875.
"Gentlemen,—In accordance with your esteemed order I have sent you the bulk of Seed of my "Betteridge's Aster," including the new and beautiful crimson colour with pale guard-petals, and which, I presume, is the one sent out and named by you this year, 'Duke of Connaught.' This I consider a very superior variety.—I am, &c.,
(Signed) "JAMES BETTERIDGE."

DUKE OF CONNAUGHT (offered this season for the first time by us). The entire surface is of a pure vivid crimson colour, with pale guard-petals; one of the most brilliant flowers ever introduced 2 6
IMPROVED OXONIAN, rich purple, with pure white eye 1 0
DUCHESS OF EDINBURGH, rich crimson, with pure white eye 1 6
DUKE OF EDINBURGH, bright rose, with pure white eye 1 6
18 splendid varieties, Betteridge's Exhibition Aster the collection 3 6
12 splendid varieties, Betteridge's Exhibition Aster " 2 6

CAUTION.—Each packet of these Asters is impressed with our Trade Mark, without which none are genuine.

Carter's The Queen's Seedsmen, 237, HIGH HOLBORN, LONDON, W.C.

PRINCE'S ROSES

ON

CULTIVATED SEEDLING BRIAR.

GEORGE PRINCE offers the undermentioned Twenty-five finest Exhibition and Garden varieties of DWARF ROSES, in SPLENDID PLANTS, for 25s., package included:—

- | | | |
|---------------------|---------------------|-------------------|
| ANNIE WOOD, | ELIZA BOELLE, | MARIE BAUMANN, |
| BARON HAUSSMAN, | ETIENNE LEVET, | MARIE RADY. |
| COUNTESS OF OXFORD, | LA FRANCE, | MAR. CASTELLANE, |
| DEVIIENNE LAMY, | EXPOSITION DE BRIE, | MONS. NOMAN, |
| DR. ANDRÉ, | MAURICE BERNARDIN, | MONS. WOOLFELD, |
| CAMILLE BERNARDIN, | MAD. LAURENT, | MONS. PAUL NERON, |
| DUPUY JAMAIN, | MIDLE. E. VERDIER, | REINE BLANCHE, |
| EMILIE HAUSBERG, | MAD. C. CRAPELET, | VICTOR VERDIER, |
| | | MARÉCHAL NIEL. |

Also the following Twelve newer varieties for 25s., package included:—

- AUGUSTE RIGOTARD,
CLAUDE LEVET,
DUCHESS OF EDINBURGH (Bennet),
ETIENNE DUPUY (Levet),
ETIENNE LEVET,
LE HAVRE,
MADAME LACHARME,
MADAME GEO. SCHWARTZ,
ANTONIA DECARLI (Tea),
THOMAS MILLS,
ANNA OLIVIER (Tea),
MARÉCHAL NIEL.

14, MARKET STREET, OXFORD.

IMPORTANT ANNOUNCEMENT.

The date or locality not having been fixed for the Provincial Show this season,

JAMES CARTER & CO.

Have the pleasure to announce, in reply to repeated enquiries, that

BY SPECIAL PERMISSION OF THE

Council of the Royal Horticultural Society,

THE COMPETITION FOR

THE CARTER CUP,

VALUE FIFTY GUINEAS,

TOGETHER WITH

THIRTY POUNDS IN MONEY PRIZES,
FOR VEGETABLES,

WILL TAKE PLACE AT

SOUTH KENSINGTON, on WEDNESDAY,
July 7, 1875.

CARTER'S NASTURTIUM RUBY KING
(with Dark-coloured Foliage), 1s. 6d.

A seedling variety of that type of dwarf Nasturtium originated by us, viz., the dark-foliaged or King of Tom Thumb section, the popularity of which is now universal—from the fact of their bright colours contrasted with dark foliage, compact habit, and duration of bloom, rendering them quite equal in effect to bedding Geraniums. The colour of the new variety now offered is quite unique and distinct—pure pink shaded with carmine—and forms an effective contrast with the varieties already in cultivation.

SATURDAY, FEBRUARY 13, 1875.

A HOLIDAY IN NORWAY.

(Continued from p. 176.)

THE whole surface of the plateau seems to have been exposed to the crushing action of an enormous glacier, which in its passage ground the rock as a mill breaks grain in the first revolution of the stone, some portions being completely pulverised, the others being left in disjointed fragments. The rock masses exposed to view are all more or less rounded and worn. Sections of the mounds of debris through which the road has been carried exhibit boulders of gneiss, micaceous schist, granite, and various examples of metamorphic rock, imbedded in gravel and sand, offering in a limited space numerous specimens interesting to the mineralogist. After crossing this rather dreary but exceedingly interesting mountain, a gradual descent commences towards the south. The exposed sides of the hill still show the direction of the glacial river; the dislocated masses are larger and still varied, and afford examples of hornblende, red granite, striped gabbro, glimmer gneiss, and other forms of rock. Fir woods now line the road: the rude and wasteful way in which timber has been felled in this upland district shows how much its value is reduced by a sparse population and a difficult or non-existent water carriage; but waste is inexcusable—cut off 3 feet from the ground the stump is left to rot, while trees lie rotting on all sides. The forest in parts seemed sadly to require provident official supervision.

The small new station of Gravedalen, conveniently situated on the hill-side, gave me an opportunity of changing horses. Although taken from the grazing ground amongst the rocks, and utterly ignorant of the taste of corn, the willing animal dashed along at a great rate: his speed was almost tantalising, for he shot with uncontrollable rapidity past fine scenery—beautiful masses of rock, glittering with mica, plants, mosses, and lichens. The water that rested in placid pools on the plateau of the mountain escapes on its southern face, and, forcing its way at first down a narrow tortuous channel, gradually increases in volume, sometimes tumbling in cascades where the rock is precipitous, sometimes brawling and foaming down the rocky bed, swift and destructive. At one place the stream roars through a narrow pass cut through the hard granite rock, where it is spanned by a bridge. Nothing can be finer than the rocky banks of the river at this place. The road is excellent all the way, and leads by easy inclines far down into a valley, where houses and fields and signs of cultivation appear. The river, no longer tumultuous, flows peacefully and broadly through green meadows, which are an agreeable relief from the scenes so recently passed, displaying so strongly the stern examples of untrammelled Nature, and which are indeed instructive to look upon sometimes. The road again winds by wooded heights, on which huge blocks of rock lie tossed in confused masses. Emerging from the serried ranks of Spruce that form the staple of the forest, an open and cultivated valley lies before us, through which a stream passes. Turning from the high-road we approach a cluster of buildings, the most prominent of which is the station of Tomlevolden. A very evident improvement takes place in the character of the houses of entertainment as we advance towards the

southern capital—Tomlevolden is a present instance in its arrangements and accommodations; it is certainly a great improvement on establishments farther North. Having found the trout especially good, one of my first inquiries was invariably for fish—and here, close by waters famous for fish, I was told there was none in the larder; and, I suppose, observing my disappointment, the landlord went off with a sack, and was not long before he returned with two fine fish—one a lake trout of 12 to 14 lb.

Fir woods spread widely over the country between this station and Christiania, giving it the appearance of a vast forest, occasional clearings occurring with tolerable regularity. Towards the lower part of the slope of the hill the individual trees appear to increase in vigour and altitude. Some lovely groups of Birch stood in clusters in the more open land below the station.

In our highly cultivated country it is rare to find forests that have escaped the controlling hand of man, or that have not been brought into existence by his means. It is all the more interesting to visit these wild Norwegian woods of Fir and Pine, in which we may see the slow but inevitable operation of the law that ordains the destruction of the weak, the survival of the strong, and where similar results in the production of timber are attained as when the energies and intelligence of man have been brought to bear upon the subject. In the one case the waste of life and material according to our view is excessive, as in the struggle for supremacy that is perpetually going on the old, the weak, the unhealthy are thrust on one side to perish—the result of their decay, assisted by insect agency, being to fertilise the ground. In the other case we direct, appropriate, and apply to economic purposes, apart from the sustenance of the forest, all that we deem in excess of an estimated proportion. Nature destroys to save. In these natural forests we find in various groups trees of every age and size attainable by the Fir tribe; the tall and vigorous trees that have fought out the problem of might overtopping the less robust seem to revel in the advantage they have gained. Trees of less altitude within this group show signs of languishing—they are gradually losing the free exposure they love and the soil that sustains them; others, again, of lesser growth, have already perished, and seedlings of a year old have sprung up, finding breathing space amidst the wreck of the decaying trees above them; and thus the great struggle for existence goes on unceasingly. Beneath the trees, and completely covering the ground, there is a great pile-carpet of moss, hypnum, sphagnum, and here and there *Lycopodium clavatum*, taking little from the ground but largely from the atmosphere: the decay of these mosses gives to the ground the vegetable *pabulum* required for fertility; and yet another influence is at work—colonies of the great ant have reared their habitations thickly through the forest. These creatures assist in the destruction of decaying vegetable matter, and in their turn enrich the land that supports them. Streaming like hair from every dead and living bough, the Pine moss, *Usnea longissima*, waves its long green tresses, and gives the wood a strange and weird appearance.

It would be difficult to overrate the economic value of the Birch tree to the people of Norway, as it would be impossible to enumerate all the purposes to which it is applied. It affords the requisite material for all descriptions of furniture and fancy articles; its boughs feed the stock during the winter; its bark roofs the houses, forming a durable and weather-proof covering—in fact, it is said to last forty years; its thinner shoots are twisted and replace cordage; it is used in harness; hobbles are made that no horse can break; it fastens the oar to the thole-

pin in boats, it binds up fences, it hinges gates. It is a circumstance to be remarked that the bark is exceedingly thick, much thicker than Birch bark is in England, and in its substance can be detected a gummy secretion, developed by the tree to a much greater extent than in countries less inclement. It would seem that trees, like animals, do a thicker covering to preserve the parts where the vital energies are most active.

The Spruce, *Abies excelsa*, has a wide range in Norway. Altitude does not altogether govern its distribution. Its occurrence and absence in certain districts are not easily explicable; exhaustion of the ground may in some instances explain its extinction. About Bergen it was largely felled by the people established by the Hanseatic League, and the forests have not been restored, although much required. The best and most vigorous trees that came under my observation were growing on the rocky slopes of mountains, where the broken and scattered masses of rock had arrested the waste that vegetation and atmospheric action gradually produces.

The trade in timber is of considerable importance—40,000 tons of shipping are annually employed in its exportation from Drammen alone. Its employment in the smelting of iron is restricted, and wisely, as an abundant supply of wood is essential to the very existence of the nation.

Before I pass from this subject I may remark that a correspondent of the *Garden*, writing under the heading of "The Scotch Pine," puts himself to the trouble of correcting what he supposes to be a mistake in my remarks regarding the relative magnitude of *Pinus sylvestris* in England and Norway. He unwittingly furnishes me with an additional illustration of what I said—which must be clear enough to any ordinary reader—that finer examples of both *Pinus sylvestris* and the Spruce Fir could be found in England than on their native hills—England being understood to mean the United Kingdom, and their native hills Norway. And this writer from the North, who is so irate at the supposed slight put upon his country, is probably unaware that *Pinus sylvestris*, or what is called the Scotch Pine, is indigenous to Norway, and growing there, is strictly on its native hills. *William Ingram, Belvoir.*

(To be continued.)

New Garden Plants.

POLYSTICHUM LEPIDOCALYON (*Aspidium lepidocalyon*, Hooker, *Sp. Fil.* iv. 12, t. 217; Hooker and Baker, *Syn. Fil.* 250*.)

This remarkable Fern, which is a native of Japan and Tsus-Sima, has been recently introduced to our gardens by Mr. E. S. Williams, of Holloway, from whose plant our illustration (fig. 36) is taken. The plant has at first sight all the aspect of a *Cyrtomium*, and, in fact, it comes near to that genus in the occasional though rare and casual anastomosing of the veins, which are nevertheless so generally free that we prefer to place it in *Polystichum*. It is an evergreen Fern of moderate size, the fronds being a foot or more in length, narrow but broadest at the base, and either acuminate at the apex, or prolonged and proliferous as is the case with the form introduced by Mr. Williams. The pinnae are narrow, lanceolate-falcate, with a sharp auricle, in this respect resembling *P. falcinellum*, but with the pinnae more distant. The sori form a line on both sides of and near the rachis, supplemented sometimes by another exterior sord line near the base. The dimorphic and fringed brown scales of the stipes are remarkable, and have suggested the name; similar scales are continued thickly up the rachis, and are also scattered more sparingly over the under surface of the frond.

* *Polystichum lepidocalyon*.—Fronds elongate-ovate, lengthened, and often proliferous at the point; pinnae lanceolate, rather numerous, almost sessile, auriculate on the anterior side; the auricle triangular, tapered off below, 2-3 inches long, falcately lanceolate, acuminate, entire or obscurely crenate; upper pinnae dimorphous, and at length confluent into the pinnatifid apex; sori mostly in two rows near the midrib; stipes and rachis densely clothed with large, broad, ovate-acuminate, ciliated dark brown scales, intermixed with large subulate spreading ones.

This Fern will probably prove a hardy plant, or, if not, will certainly grow freely in a cold greenhouse. As a garden plant, it will surely be appreciated for its beauty, of which our figure gives a good representation, while its evergreen character will make it all the more desirable from a decorative point of view. *T. Moore.*

VANDA UNULATA, Lindl.*

The flowers of this *Vanda* are nearly stellate. The very much undulated lanceolate sepals and petals make one think of some small *Methonia*; and both those organs are rather fleshy, cream-white, the ends of the sepals green. The side laciniae of the nearly boat-shaped lip is greenish, with brown stripes internally; the middle part of it has a purplish middle line, and some fresh stripes are to be seen in the internal basilar hollow, where there are also some very short hairs. The flowers do not exceed those of a good variety of *Odontoglossum nevium*.

This plant is an extraordinary curiosity. For many years—since 1853—it was only known to the scientific world by Dr. Lindley's short description. He called it a fine addition; he had, however, never seen the plant—he only saw a drawing out of the Catherinian collection, obtained by the kindness of Dr. Hooker. This matter stood for a very long time, when last year the unexpected plant appeared in England, in the garden of the Earl of Lovelace, East Horsley Towers, Ripley, Surrey, grown by Mr. R. Miller, who has been so kind as to send me, just now, an inflorescence and a leaf. Mr. Miller knows nothing about its origin, save that it comes from India. After all the plant is a great botanic curiosity, but not what amateurs like, though the shining foliage would appear rather nice. I have placed the species under *Vanda*, which I accept as a separate genus; but I do not care to trouble amateurs with my private views, the more so as amateurs will ever be high Tories, keeping up a certain aristocratic conservatism. *H. G. Rehb. J.*

ROSE CULTURE AND OTTO OF ROSES.

It is much to be regretted that there exist no official records or trustworthy information on the culture of Roses for making "attar" or otto. Private enterprise, however, has to a certain extent largely supplied the want, and the following particulars, compiled from data furnished to Mr. Dupuis, Her Britannic Majesty's Vice-Consul at Adrianople, by Messrs. Pappazogion Brothers, horticulturists and Rose oil merchants of Constantinople and Kazanjik, the latter being the centre of the Rose-growing district, may not be uninteresting to our readers.

The Rose plant is cultivated largely in the northern parts of Roumelia (ancient Thrace), at the foot of the Balkan Mountains, where it thrives in a sandy soil on sloping land well exposed to the rays of the sun. The process of planting takes place during spring and autumn, as follows:—

Young Rose twigs are torn (not cut) from the parent plant, so that each twig may carry with it a portion of the adhering roots. Parallel trenches are then dug about 5 feet apart and 1 foot in depth and breadth, in which the twigs are laid almost horizontally, so as to form a continuous row; the whole is covered with earth from the sides of the trenches, and well trodden down, care being taken to mix with the covering earth a fair proportion of manure.

The process of planting being thus completed, young shoots will, under favourable circumstances, appear at the end of about six months, and if the earth be then carefully loosened about their base they soon develop themselves rapidly. In twelve months the plants attain to a height of some 12 or 15 inches, and at the end of the second year yield a few blossoms, and begin to assume a bushy appearance; in the third year the yield of blossom is turned to account, and at the end of the fifth the plants attain their greatest vigour, having reached an average height of about 6 feet.

The Rose plant is not pruned as is the Vine, but care is taken to free it from dead and withered branches, whenever they may chance to appear, and the earth about the roots is loosened and turned over about four times a year, the manure being renewed at least once in two years.

Harvesting commences in the month of May and lasts some twenty days, during which the process of distillation is carried on. The flowers are gathered

in the early morning by hand, detaching each blossom from its stem without touching the unopened bud, and this operation is repeated day by day until the plants are entirely denuded of their flowers. When the crop is abundant, and the flowers cannot be gathered during the morning, it unfortunately happens that a great part of the blossoms is necessarily much exposed to the sun, in which case the yield, besides being inferior in quality, is hastened in the process of distillation, and a consequent deterioration in the essence ensues. Whereas if the flowers develop slowly, and the work is not unduly hurried, the reverse is the case.

The process of extracting the attar or Rose-oil is somewhat primitive, the appliances consisting mainly of a convex copper boiler, narrowed at the top to a neck surmounted by a head-piece fitting into it, from which a straight condensing tube passes through a tank of cold water into a receiver. The boiler contains probably about 240 lb. of water, and the principle consists in the distillation of this water mixed with a proportionate quantity of Roses, generally about 25 lb., the boiler being then about three-fourths full. The steam engendered by this process carries with it volatilized particles of the flowers, the result being a troubled and somewhat murky fluid, familiarly known to us as Rose-water. The process is then repeated until a quantity of liquid attar is in weight to the mass of Roses originally put in the boiler obtained, when the residuum is emptied out, and the operation gone over again with a fresh gathering of flowers.

So far, however, Rose-water only is obtained, and in order to extract the essence this is subjected to further distillation, until the fluid is so far condensed that a yellowish liquid is perceived to be floating on its surface, which is the attar or essential oil of Roses, which is collected by means of a funnel-shaped spoon provided with a small aperture sufficient to allow the free passage of the water without permitting the oil to escape.

The yield of the Rose crop, and the quality of the Rose, of course vary greatly under favourable or unfavourable circumstances, but it may be stated that on an average it requires 7200 lb. of flowers to produce about 2½ lb. of attar.

No precise information seems to exist in Turkey as to the true botanical name of the plant yielding the attar; it suffices for the growers to know that they possess the plant. But Dr. Hochstetter of Vienna, in a report to the Geographical Society of that city in 1869, observes that the most important species of Roses planted in the Vilayet are the *R. damascena*, *R. sempervirens* and *R. moschata*, and that the last-named affords the chief ingredient of the attar. The natives are unable to determine for themselves the names of the three varieties, and doubt exist as to whether the *R. sempervirens* can be grown for the purposes of distillation. *C. J.* [Mr. Linker has recently determined that the Balkan specimens are mainly composed of *Rosa damascena*. See *Journ. Bot.*, n. s., iv. 8. Eds.]

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

(Continued from p. 139.)

IV.—ON THE BOTANICAL CHARACTERISTICS OF THE ZONES OF HEAT.

WHEN we have ascertained what is technically called the habitat of a species, whether it be a roadside plant, or a swamp plant, or a parasite, or an inhabitant of woods or meadows, the next thing to do is to study the flexibility of its constitution in regard to heat. Over about half the area of the land, that is to say, within the torrid zone, and for a space beyond its limits, heat plays only a secondary part in plant distribution, because there is always as much heat anywhere as any plant needs to grow with, and there is no danger of its being checked in its growth or killed by cold. Within this tract moisture is the main determining agent in plant distribution, but taking the earth as a whole, the distribution of heat is the most important element of influence.

Orders, genera, and species are very different in the flexibility of their constitution, and in the amount of change to which they can adapt themselves. Out of the 200 known natural orders, there is but a small proportion that are thoroughly at home in all the four zones of heat. We have examples of orders that sweep the whole range of the four zones in Compositae, Leguminosae, Cyperaceae, Gramineae, Ferns, Rosaceae, Onagraceae, Naidaceae, Scrophulariaceae, Plantaginaceae, Saxifragaceae, Equisetaceae, and Lycopodiaceae, some of which, though large orders, are some small, but all of them are thoroughly cosmopolitan, being represented in all latitudes and longitudes. Out of the 10,000 known genera the number that sweep the whole range is very small. We have examples of such in *Senecio*, *Lotus*, *Rubus*, *Polygala*, *Potamo-*

* *Vanda unidata*, Lindl.—Folius ligulatis valde coriaceis apice obtuse ac. Inaequaliter bilobis; racemus panicularis; floribus approximatis; bracteis triangularibus panicellatis mucrotes brevioribus; sepalis rotundatis cuneato lanceolatis acutis undulatis; lobis labii trilobis; lacinis lateralibus semi-oblongis imae basi cum columna brevis truncata connatis; fundo cymae foris; lacina antica valde carinata crassa triangula sub apice corollae corosae gutturosa; callo depresso quadrato valde obscuro. *Vanda unidata*, Lindl. Proc. Linn. Soc. iii. p. 42.

FIG. 36.—POLYSTICHUM LEPIDOCAULON.

geton, Gnaphalium, Plantago, Typha, Oxalis, and Nasturtium. Of species thoroughly at home in all four it is difficult to find a satisfactory example. Some aquatics, like *Ceratophyllum demersum*, *Potamogeton lucens*, *pectinatus*, and *pusillus*, are the most thoroughly independent of solar heat of all known plants, and extend their range into all the four zones. Amongst land plants a few annual weeds, Ferns, and small perennial herbs, such as *Cerastium glomeratum*, *Capsella bursa-pastoris*, *Sonchus arvensis*, *S. asper*, *S. oleraceus*, *Plantago major*, *Aspidium aculeatum*, *Nephrodium Filix-mas*, and *Athyrium Filix-femina*, pass within the bounds of all the four zones, but none of these can fairly be considered as more than stragglers into the warmest. *Pteris aquilina* is plentiful in the woods on the banks of the Amazon, and gets up into Lapland, but generally stops short on the hills at the upper limit of cultivation. Of species quite at home in the three warmer zones we have many instances amongst water plants, perennial herbs, and annual weeds, such as *Ruppia maritima*, *Typha angustifolia*, *Lemma minor*, *Drosera longifolia*, *Oxalis corniculata*, *Bidens bipinnata*, *Solanum nigrum*, *Gnaphalium luteo-album*, *Elephantopus scaber*,

Mikania scandens, *Panicum Crus-galli*, *Juncus tenuis*, *Cynodon Dactylon*, and *Eragrostis prostrata*. But none of the plants which are cultivated on a grand scale for the use of man, and no shrubby or woody plants, are sufficiently flexible in constitution to grow in more than two out of these four heat-zones.

Probably at least three-quarters of the known species are concentrated in the two warmer zones. It does not always follow that in any tract of country where there is a luxuriant vegetation there is a great number of species, or that the number of species is always small when the vegetation is poor. We have a good instance to the contrary of the last of these two propositions in Cape Colony, which consists to a large extent of grassy plains and barren sandy deserts, and which yet produces nearly as many species of plants as Europe within about a quarter of its geographical area. We have a case of a small flora constituting a luxuriant vegetation in Ireland, where the number of species is not more than 1000, and where a few heath and swamp species growing in enormous quantity cover large tracts of surface. For about 40° on each side of the equator—that is to say, till we reach the polar boundary of the warm-temperate zone—there is not

any lowering of the average number of flowering plants in a given area, and that number is larger than it is anywhere else in the world. But as soon as we pass from the two warmer of the four heat-zones into the region where winter comes in as a real check to vegetation, the number of species begins to lessen, and it goes on lessening in about the same proportion as the winter increases in length and intensity, till at last the flora within the whole round of the arctic circle falls short of 800 flowering plants.

Taking these four heat-zones one by one, the following are their principal characteristics:—

1. *The Torrid, or Intertropical Zone*, includes a belt round the world 3300 miles broad, with the equator for its centre, and, of the total 52,000,000 square miles of land, takes up not less than 21,000,000 square miles, or about two-fifths of the whole, about half of which is included in tropical Africa, and the other half almost equally divided between tropical America and tropical Asia, including along with the latter Polynesia and tropical Australia.

Of this 20,000,000 square miles a large part is not suitable for the production of plants under a continuous torrid heat. In the immense compact mass

of tropical Africa in particular, there is a vast tract of arid desert, and in the heart of South America there is also much bare sandy desert country; but in the Asiatic and Polynesian portion of the zone the relative distribution of sea and land is eminently conducive to plant growth; and in those regions where moisture and soil are suitable, such as the Gold Coast and Senegal in Africa—in Asia, the jungles of Ceylon, the Bombay ghauts, the Neilgherries, Birma, the Malay peninsula, Java, Borneo, and Sumatra—the numerous islands of Polynesia—in America, the dense primeval forests of the banks of the Amazon and its tributaries, Nicaragua, Panama, the West Indies, and the belt along the coast of Brazil from Pernambuco to Rio Janeiro, which constitutes the *regio dryadum* of Martius, we have an energy and richness and luxuriance of forest vegetation far beyond that of any other part of the world.

The leading features that give the characteristic general zone to the vegetable physiognomy of the intertropical zone are the following—1. The richness and luxuriance of forest-vegetation in the most favourable places; huge trees whose evergreen leaves form overhead a covering of perpetual shade which the sun's rays cannot penetrate, bound together by tangled masses of interlacing woody climbers, and the fallen trunks and rocks overgrown, not, as in temperate regions, by mosses and lichens, but by climbing Ferns, Aroids, Bromeliaceae, Orchids, and other monocotyledonous and dicotyledonous epiphytes. 2. The large proportion of the total number of plants that are either trees or shrubs, not herbaceous annuals that spring up during the rainy season, such as Corchorus, Grewia, Sebastiania, Sida, Triumfetta, and Crotalaria, assuming a half-shrubby character, like the bushes of temperate regions. 3. The variety of the forest vegetation, different kinds of trees, climber and epiphyte being so mixed up together that it is often difficult for a collector to see to what a fallen fruit belongs—the woods being made not of a large number of trees of the same kind, like our European Pine woods, Oak woods, and Birch woods, or the same bush covering large tracts of surface, like our Heather, Furze, and Brambles. 4. The absence of greensward and terrestrial mosses and lichens. 5. The presence of arborescent Ferns and monocotyledons, which are almost confined to this intertropical zone, and several of which, Palms, Bamboos, Tree Ferns and Pandani, are types that strongly affect the general aspect of the vegetation. 6. The presence in the forests of a crowd of climbing shrubs, principally dicotyledons, a type of form which is almost restricted to this zone. Of these we have examples in Passiflora, Serjania, Gouania, Lygodium, Ficus, Echites, and a crowd of Leguminosae, Malpighiaceae, and Bignoniaceae. 7. The presence of several peculiar types, composed of a large number of species, which possess in common a highly differentiated aspect, as Peppers, Begonias, Gingers, epiphytic Orchids, Bromeliaceae (confined to America), Figs and Diereniaceae. 8. The presence on muddy shores of groves of interlacing trees, with broad entire coriaceous leaves, as Rhizophora, Brugiera, Ceriops, Avicennia and Barringtonia.

We cannot count the whole flora of this zone at less than 40,000 species, already known, out of a total of 100,000 in the world. Only a small proportion of these extend their range beyond one of the three great continents, and a considerable part of its area still remains to be botanically explored, and there are in our herbaria crowds of species yet unnamed and undescribed. The following natural orders are either restricted to this zone, or run out rapidly when its bounds are crossed, viz., Annonaceae, Menispermaceae, Capparidaceae, Bixaceae, Guttiferæ, Bombacæ, Dipterocarpaceae, Vochysiaceae, Malpighiaceae, Simarubæ, Onacæ, Burseraceae, Meliaceae, Sapindaceae, Dalbergiaceae, Soporaceae, Cessalpiniæ, Chrysobalanaceae, Connaraceae, Melastomaceae, Lecythidaceae, Tumeraceae, Passifloraceae, Rhizophoraceae, Cinchonaceae, Vernoniaceae, Eupatoriaceae, Sapotaceae, Ebenaceae, Myrsinaceae, Apocynaceae, Rubiaceae, Cordiaceae, Gesneriaceae, Gramineae, shrubby Verbenaceae, Acanthaceae, Lauraceae, Myricaceae, Artocarpaceae, Moreae, Palmaceae, Pandanaceae, epiphytic Orchidaceae, Zingiberaceae, Marantaceae, Commelynaceae, Smilacaceae, Dioscoreaceae, Podostemaceae, Burmanniaceae, Chloridaceae, Paniceae, Andropogoneae, Cyatheaceae, Hymenophyllaceae, and Marattiaceae.

Amongst large genera concentrated here not included in the orders already mentioned are Grewia, Sida, Corchorus, Zizyphus, Crotalaria, Leprosia, Mucuna, Yucca, Yuccifera, Loricaria, Loricaria, Eluera, Hyptis, Ipomoea, Plecctranthis, Physalis, Phyllanthus, Croton, Coccoloba, Pilea, Elatostemium, Dorstenia, Fisonia, Boerhaavia, Cyperus, Fibribristylis, Eragrostis, Lindsaya, and Adiantum.

Of plants cultivated on a large scale for the use of man the following are more or less characteristic of the intertropical zone. Amongst roots yielding farina the Yam, Batatas, Tacca, Arrow-root, Manihot, Caladium, and Colocasia; the various Palms and Cycads from the pits of which sago is made (Sagrus Phoenix, Corypha, Cycas). Of farinaceous grains,

Rice, Maize, Anacardi, Vandeziæ, Sorghum, Penicillaria, Eleusine cornæna, Panicum miliatum and frumentorum, Poa abyssinica, Trapa, Cajanus, Phaseolus Mungo, and Dolichos Lablab. Amongst Nuts, the Cocoa-nut and Brazil-nut. Amongst fruits, the Mango, Custard-apple, Guava, Jambosa, Bread-fruit, Banana, Date, Tamarind, Papaw, Granadilla, Jujube, Averrhoa, and Betel-nut. Amongst dyes and scents, Vanilla, Gamboge, Indigo, Logwood, and Henna. Amongst oil-yielding plants, the Oil-Palm (Elaeis), Sesamum and Castor-oil. Of beverages, Coffee and Cocoa. Of spices, Sugar, Nutmegs, Cloves, Cinnamon, and Capsicum. Of fibre-yielding plants, Cotton, Corchorus, Broussonetia, and Sansaveira; and amongst valuable woods, Rosewood, Teak, and Ebony. J. G. B.

A PLEA FOR MOSSES.—I.

I do not remember to have ever seen the mosses in greater beauty than they were in January. Probably, owing to the long-continued frost and snow, to which we have been of late years unaccustomed, the eye got weary of colour and was ravenous for green (in botany white is reckoned a colour and green is none), and the cleansing and fertilising effects of a top-dressing of snow are very apparent on this class of cryptogamic plants. Whatever be the reason, they were unusually vivid and fine, and I was stirred up to refresh my very scanty knowledge of them, acquired long ago.

One would think that botany can only be prosecuted in summer, or at best spring, as it is always in these seasons that beginners commence. Now I do not think that a Tulip (the first flower given to the botanical student) will be found more difficult to handle and dissect if the eye has been trained to see and observe the various species of our common mosses for a couple of months previously. No preparation of shining vasculum, with stiff leather strap and deadly sharp spud, is needful; pockets, eyes, and hands, are all that is required. True, a microscope will alone exhibit certain portions and distinctions in these minute plants; but let us begin with surely knowing those we see with our naked eye everywhere, in the country, in the outskirts of towns, in the most exhausted town square gardens, back greens, paved yards, boundary walls of stone or brick, or roofs of tile or slates. No town hedge or paling is too scrubby for mosses, and, in short, there is no excuse for not finding mosses, if only there is the wish to do so.

The study of mosses or other cryptogamic vegetation is more likely to make a botanist than that of any other class of plants. All the year round they can be studied. If inconvenient to examine them when first collected, they will keep an unlimited time; even when dried for herbaria; and, as mosses lose less than any other tribe when transported, and as families rarely exist with the different species it is essential to have them actually under one's eye. This is most easily done, and they form, I was going to say, the most beautiful groups for the room. They cannot be killed, are no trouble, bear utter neglect, and cause no mess or litter. When sprinkled or watered with a fine rose (which is all the care they require, even when kept to fruit for identification of doubtful specimens) the mosses have their own delicate woodland open-air smell.

We have had several common Fern-classes filled with different sorts for weeks past, and they are a constant source of interest and admiration, particularly at night when the strong light from a green-shaded reading lamp is thrown down on them; then, indeed, it is like fairyland, and, of course, one can enjoy their beauty without knowing their names or peculiarities, but that is a very curtailed enjoyment. The first point is to collect them yourself, and then there is no chance of forgetting where and how they grow. One dish, 13 inches in diameter, contains about two square inches of patches, viz., the largest British moss, Polytrichum

commune (Hair-moss), with fine fruit, large enough to catch the eye when walking along a path, and the only moss whose seed-vessel one can actually handle without a lens. Pulling off the calyptra or hood, and exposing the oblong quadrangular capsule or seed-vessel, one finds how wonderfully tough and persistent is the seta, or footstalk of mosses; they continue standing up long after the capsule casts off its operculum or lid, and scatters its spores. The seeds have, however, another protection in the shape of a delicate fringe at the mouth of the capsule, called the peristome, which comes in the form of a row of scales as dropped off. Next to this handsome Hair-moss comes Hypnum sericum (Feather-moss), pressed against the side of the glass, so that the beautiful forked way in which the young portions grow may be seen; but a grey wall is the place to see this beauty in perfection, and the time now, when it is of a bright yellow colour: the patterns it makes on the stone would be well worthy of being used for borders of papers, "running patterns" on muslins, &c. It would be well if the unimpaired line of the mosses were used for the scales of embroidery patterns had "no sale," and mosses copied from life were used instead, they are so perfectly suitable and so delicately varied in their outlines. Hypnum proliferum or tamariscinum (Proliferous Feather-moss) comes next. It is a moss that always attracts, the distinct feathers of yellow-green rising well above the creeping stems. One has no right to expect anything real about an artificial flower, but it is this Hypnum which is used in imitating Moss Roses.

There are two grand divisions of mosses: 1, those that have their capsules at the summit of the branches (terminal); and 2, those that have their fruit-stalks from the side of the branches (lateral). Polytrichum belongs to the first division, and Hypnum to the second. A fine dark cushion of Tortula muralis (Wall Screw-moss) and a bright green one of Bartramia pomiformis (Common Apple-moss), divide the two Hypniums in our dish; both are terminal mosses and loaded with fruit—the Bartramia capsule is round like an Apple, that of Tortula is oblong. I am always sorry to have to cement or link our walls and ceilings, as I love to see them regularly pointed with these neat tidy mosses of softest texture, or a mass of bristles stiff to the touch, according to their age. After rain or a heavy fog one wonders at the strength of these bristles; there will be a drop hanging on the capsule six times its own size and weight, but the sturdy little seta hardly bends—and cobwebs, concave and opaque with moisture, and almost hiding the mosses below them (which webs, if dry, the naked eye would barely see), are another set of aids that make one pause and think of the mighty power of little things. Against the sky these cushion-mosses show well, and are most conveniently placed to be seen by sunshine, or in a foggy day, with different but pleasing effects from either state of weather. The little Grimmia pulvinata (Grey-cushioned Grimmia) is better seen on its wall-top than in the glass dish. It is loaded with fruit, whether ripe or unripe requires a lens to decide, and more knowledge than the mere fact of its being a Grimmia really requires. Grimmia is particularly rich in Grimmiæ. Mr. Sadler states, in a paper read before the British Association at the meeting in 1871, "that perhaps in no district of equal size in Britain would so large a number of species of this genus be found." "At one part of the hill (Arthur's Seat) there is an area of very limited extent, where the whole of the species which occur on the hill can be collected in a very few minutes; eleven species (besides varieties), including the rare G. anodon, first discovered there, a British moss, and which, as yet, Mr. Sadler told me, is elsewhere only found in Africa.

However, these minute mosses may not be so attractive to the beginner as some of larger growth. Bryum ligulatum (Long-leaved Thyme Thread-moss) is distinct, both in its "elegant tree-like branches and pale green waved foliage" (Stark's *Popular History of British Mosses*—the quotation is, I believe, a reprint from Smith's *Flora*), forms a good contrast to the cushions; and next the firm, is solid lump of Sphagnum rubellum (Bog-moss), a part of which I had not the heart to draw the little evergreen Cranberry, easier seen now when the bog-mosses are not at their full growth. In July this Sphagnum will be in ripe fruit, terminal, and of so bright red a colour that one has to look close to distinguish Drosera with its fringed edges of red hairs. S. cymbifolium, of long straggling growth, is also not at its best; one can split with the finger-nail its erect-growing capsule, causing a distinct little sound. The Sphagnums form a complete variety to Dicranum scoparium (Broom Fork-moss), which reminds one somewhat of Polytrichum in its growth and dark green colour; it also is one of the terminal division of mosses, is very common, and has a long back to the operculum (lid). Two Hypniums, H. Schreberi (Schreber's Feather-moss), so common among grass and much used for packing plants when Sphagnum is not to be had, and H. striatum (Common Striated Feather-moss), found everywhere, and a good variety for covering the sur-

face of pots or lining baskets containing plants as it can be got in large pieces, fill up the bottom of the dish, just leaving room for a little cluster of the pretty "red tipped lichen" (*Cladonia coccifera*) which one finds in dry portions of bogs and bare places among the heather, and a group or two of another well known and attractive lichen, *Scyphophorus pyxidatus* (Fairy Cups), frosted and powdered with silver, as it were.

Such are the most distinctive contents of moss-dish No. 1. In another paper I may note the contents of dish No. 2. *F. J. Hope, Wardie Lodge, Edinburgh.*

THE CONSERVATORY AT LUTON HOO PARK.

THE exterior of the north wing of the fine mansion at Luton Hoo Park, Beds, the residence of Gerard Leigh, Esq., was built by the late Marquis of Bute, while the interior remained quite unfinished, and looked like a vast barn without flooring or divisions of any sort, until the year 1873, when operations were commenced, and the whole work of converting the greater portion into a beautiful chapel, and the remaining space into a large number of bedrooms,

and, as partially shown in the engraving, they form a graceful outline, far preferable to the old formal stand, with tier above tier. They are provided with wire "boxes," the shape of the stand, for *Lycopodiums*, and, in order to keep up a succession, two sets are supplied; these "boxes," when well furnished, impart a pleasing and refreshing edging. It will be observed that the legs that support the stands are set well back, they are, therefore, quite out of the sweep of ladies' dresses, &c.

To lessen the formality of this structure it was thought that wire canopies, supported on wire columns, and creepers trained over them, would enhance its beauty and interest, which has been fully realised, for the effect is charming. Of course the creepers are grown elsewhere, and brought here and tied up. The whole of this wirework has been substantially executed by Mr. R. Holliday, of Portobello Terrace, Notting Hill Gate, and reflects great credit on his abilities as a wireworker and designer.

Most cultivators know full well that structures of this kind are most difficult to manage, and they must have a great deal of care and attention bestowed on them to be at all successful; this is in a great measure due to the dry arid atmosphere and deficiency of light. However, by a judicious selection of foliage plants with dry leathery or wiry leaves and Ferns, an interesting display may be kept up throughout the year. Flower-

in no very important particulars. The following method is followed out in Sendai Vaidzu. Boiling water is got ready in an iron cauldron, over which a lattice-work of sticks is placed, and on these some matting. The sifted rinds of the fruit are then laid out on the matting and steamed, after which they are placed in hempen bags and again steamed. The bag, with its contents, is then put in a wooden trough, wooden wedges or blocks are inserted in the trough and driven home on to the bag with heavyblows from a mallet. An aperture at the bottom of the trough provides for the egress of the wax. The trough and wedges are made of *Kiaki* wood, and the mallets and blocks of wild Mulberry, a very hard wood, and well suited to the purpose. A small quantity of oil, in the proportion of about one-tenth, is added to the wax to allow of its being expressed more easily. It then goes through another steaming process, and is again pounded in the trough.

Wax from the *Yama-urushi*, or wild Lacquer tree, is obtained thus:—The fruit is collected at the latter end of the summer, and is at once steamed without being pounded with a pestle, as is the case with the *Urushi* wax. The wax is purified by melting. A large tub of cold water is taken, and placed under a wooden tank, having a small aperture close to the bottom. The melted wax is then poured into this tank, and escapes through the aperture into the tub

FIG. 37.—CONSERVATORY AT LUTON HOO PARK.

offices, &c., was finished by the present owner in magnificent style. In order to obtain easy access from the other portion of the mansion to the chapel it was considered necessary to continue the already grand corridor the whole length of the house, and, in doing so, it was deemed advisable to convert the centre part into a conservatory, so as to obtain more light, which is the great drawback to this otherwise unique corridor. Unlike the other portion, the ceiling here is flat and divided into panels, with lanterns in each panel. On the left-hand side are glass windows, and on the right is the side wall which separates it from the dining-room, which is painted with different subjects in oil, such as *Musa Cavendishii* in fruit, Orchids in bloom, *Cissus discolor* climbing about, tropical birds, monkeys, butterflies, &c. Access to the dining-room is gained through this wall, and visitors can pass through the conservatory to the billiard-room, the door of which is seen at the end of the return path (fig. 37). The floor is paved with richly-arranged marbles, polished. To prevent their being stained with dirty water or marked with flower-pots it was suggested that wire stands should be used for the plants; these stands are provided with zinc trays with a draw-off tap in each, which allows all stagnant water to be removed, and also prevents it running through to the floor. There are eight stands,

ing plants, as a rule, do not succeed well, the summer season especially being the most unfavourable; but the able gardener, Mr. Budd, has little difficulty in keeping the house gay at this time of the year.

Foreign Correspondence.

JAPAN.—In his report upon the trade of Kanagawa, Consul Robertson mentions the subject of the Japanese vegetable wax. The trees from which this wax is made are the *Urushi* or Lacquer tree, the *Yama-urushi*, the *Hage-urushi* and the *Koga-no-ki*. The wax is made from the rind of the fruit. In places where wax is manufactured to any great extent the *Urushi* is not made use of for its lacquer. As the trees are not cut for several years, they may be seen in the wax-producing districts growing to a height of 35 to 40 feet. In districts where the trees are used for their lacquer or varnish, they are cut every seven or ten years. The mode of obtaining wax from the *Urushi* or Lacquer tree is as follows:—Late in the autumn the branches heavy with fruit are lopped off and taken into the house. The fruit is pounded up with a pestle and then shaken in a basket-sieve, so as to separate seed from rind. From this rind the wax is made. The mode of expressing it differs here and there, but

beneath. While doing so it is stirred rapidly with the hand, after which it is placed either in matting or in shallow boxes, and dried in the open air for about fifteen days.

The *Hage-urushi*, from which wax is largely obtained, grows in the south-western portion of the island. This tree was first brought from the Loochoo Islands to Sakurajima, an island near Sakuma. Its production has so increased that there are now no less than seven different species, known as *marunsi*, *yasutomi*, *inozume*, *ogawa*, *famka*, *fukiage*, and *matsu-yama*, the last-mentioned being regarded as the best. The *Hage-urushi* tree is raised from seed or from slips. *Koga* wax is made from the fruit of the *Koga* tree, which differs from the *Urushi* and *Hage-urushi* trees. It is an evergreen, and is largely grown in Otsugori, in the northern part of Nagato. It flowers in the middle of summer, the fruit ripening in autumn, when it is plucked and soaked in water for four or five days, after which it is trodden out with the feet, thus separating the outer rind. This is then dried and pressed, and the same course pursued as already described. The *Koga* wax contains a large proportion of natural oil, which in a measure restricts its use to cold and temperate districts. Candles made of it show a very bright light, and if some contrivance could be hit upon for extracting the oil the consumption of this wax would be increased, as it is cheap compared with the other kinds. Refuse wax is used for manuring purposes.

Notices of Books.

The *Botanical Magazine* has entered upon its first volume. It has, we believe, been issued with a degree of regularity and punctuality quite unparalleled from the date of its first establishment by Curtis in 1786 up to the present time. The services of the most eminent botanists and artists have always been secured, and under its present editorship, and with its present artist, its interest and value are well maintained. If we were a more excitable nation than we are, we should ere this have started a centennial celebration of some sort in honour of this publication entering upon its second century of volumes. The February number contains plates of *Epidendrum srynghothris*, a handsome species with dense spikes of purplish flowers. The plant is figured from a specimen which flowered at Messrs. Veitch's. *Lilium canadense*, var. *parvum*, is supposed to be a small variety of *L. canadense*, as its name implies. In any case it is a pretty species, not unlike an *Alströméria* in habit. The specimen figured was furnished by Messrs Barr & Sargent. *Veronica pingüifolia* is a pretty white flowering shrubby plant, hardy at Kew, and reminding one somewhat of a *Ledum* as to its flowers. *Fourcroya* stems from the grand set of plants which flowered in (or rather outside of) for their flower-stems protruded high above the roof) the succulent-house during the past autumn. Like other *Fourcroya*s the flowers were intermixed with bulbils. *Senecio macroglossus* is a remarkably handsome evergreen climber suitable for greenhouses—for dwelling-room culture, even, according to Dr. Hooker. It has glossy, lily-like leaves, and produces in midwinter large, clear yellow flowers, which remain for a considerable time in perfection. The plant has been in flower for some time in the succulent-house, where the combination of its lily-like leaves with large yellow flowers has created much interest among those who have seen it. This is a plant that should be inquired after by all plant lovers; it is a native of the Cape. The last plate of the present number is devoted to a curious Indian *Commelynad*, with over-lapping two-ranked leaves, of a bright red colour beneath. The flowers are small, of a pink colour, while the bracts on the stamens are bright pink; the flowers are in short clusters at the ends of the branches. Dr. Hooker considers this as the type of a new genus, which he calls *Erythrorhis Beddomei*. The plant is a native of the hills of Southern India, whence it was introduced to Kew by Col. Beddome. It is described as a stove plant well adapted for a warm conservatory in summer, when it may be trained over the pots and made very ornamental. The colour of the under-surface of the leaves fades in winter.

The *Journal of Botany* for the present month contains, in addition to articles, notices, &c., which are of purely botanical interest, or which have already been alluded to, a notice of two new species of *Ribes* from northern China, by Dr. Hance, one of which, *R. macrocalyx*, has edible fruit. Mr. Duthie continues his list of plants found in the Maltese Islands, and Mr. Nicholson his enumeration of the indigenous flora of Kew Gardens. It is remarkable how few garden plant species have become naturalised; even the *Gallinago*, which is so common in the adjoining market gardens, is very rare in the pleasure grounds. We have before remarked, with reference to this subject, the fact that in some seasons *Erigeron canadense* is very abundant on the railway cutting on the upside at Kew Bridge, while on the opposite side, as also on the North London Railway banks close by, few or no plants of this species are to be seen. A funny story is told with reference to *Cypripedium Calceolus* (which, by the way, we are happy to learn is not, as was feared, extinct in a wild state). It appears that a gardener confessed to the late Mr. Joseph Woods that he had uprooted a number of plants of this *Cypripedium*, whereupon Mr. Woods threatened the gardener with a special Act of Parliament, enacted for the express purpose of hanging him—a threat that did not cause so much alarm as might have been wished. For our own parts we could not cut down such an offender if we had the chance!

Among recently published books lying on our study table are *Heredit and Hybridism*, by E. W. Cox; *Les Moyens d'Attaque et de Défense chez les Insectes*, by Dr. Candèze of Liege; *Geological Notes on some Portions of Greenland*, by Dr. Robert Brown; *Introduction to Experimental Physics*, by Adolf Weinhöld, translated and edited by B. Loewy, with a preface by Prof. Foster.

The plates in the November number of the *Gartenflora*, which has lately reached us, are devoted to *Tillandsia juncea*, a narrow-leaved species with violet-coloured flowers; *Iris acutibolla*, with brown-pink streaked flowers; from the Caucasus; *Lithospermum Gastoni*, a native of the Pyrenees; and *Cercus pectinosa*, a Mexican species. Lily growers

should be on the outlook, as a correspondent describes in the number of the journal before us a specimen of the bulbs of the common white Lily, occasioned by the fungus. M. Salomon contributes a list of the species of *Ficus*, which will be continued in a future part.

The *Florist* for the present month opens with a coloured representation of two new show Pelargoniums of great merit, though to one who is not a specialist there seems to a great similarity to what we already have. The second coloured plate is devoted to the Souvenir du Congrès Pear, a seedling from the well-known "Williams." Mr. Cox commences what promises to be a valuable set of articles on the culture of fruit trees on walls; and Mr. Fish has a characteristic article on the desirability of increasing the consumption of fruit, as a means, amongst other benefits, of reducing the price of meat. Sympathising with much that Mr. Fish says, we yet do not think it would be an advantage to the labourer to adopt an exclusive fruit diet, even if he could; but if by increasing the supply of fruit—in itself a most desirable thing—we can insure a few more pounds of meat to the labourer in the course of a month, all the better; meantime let us have the fruit.

A fourth edition of Mr. W. Earley's practical little treatise, entitled *How to Grow Anthuriums* (Bradbury, Agnew & Co.), has been published—a fact sufficiently indicative of its merits.

A triple number of the *Illustration Horticoles*, for October, November, and December, 1874, is before us. The plates represent × *Sciadocalyx Luciani*, an interesting hybrid between the beautiful *Sciadocalyx digitalifolia* and *Tydena parvifolia*. If it could be at all sure that what is called a genera had a right to its appellation, especially among Generands, the interest attaching to this cross would be great. In any case, for garden purposes a very showy plant has been obtained. *Camellia Miss Minnie Merritt* is a salmon-pink coloured variety, apparently of good form and substance. *Fourcroya Lindenii* is a variegated form from New Granada, with leaves 3 feet in length. *Draœna Trubetzkoi* is a dwarf form, said to be intermediate between *D. regina* and *D. albicans*—the leaves are dark green margins with white. *Clawija Kodakovi* is a *Thesophia*-like plant, with fine foliage and racemes of orange flowers. *Spathephillum heliconiifolium* is a Peruvian species, originally described by Schott, but now more fully described by M. André; the leaves are 3 feet in length and 1 foot wide, of a rich lustrous green. *Draœna densicoma* is shown in flower, the white blossoms being profusely borne in dense pendulous panicles, but surely the artist has left out one segment in nearly every one of the pentamerous *Draœna* now included so loosely. In any case it is a magnificent plant as to its inflorescence, and is supposed to be a native of New Caledonia or adjacent islands. *Kentia Belmoreana* is a pinnate-leaved Palm from Lord Howe's Island, and was mentioned in our columns for 1873.

Of Professor Bailion's *Histoire des Plantes* (Hachette) we write before as the monographs of *Terebinthaceæ*, *Sapindaceæ*, *Malpighiaceæ*, and *Meliceæ*.

Among miscellaneous publications which have reached us we may also mention a list of seeds offered for exchange by the Botanic Garden of Claudiopolis, which, after some research, we find means Klausenburg, alias Kolozsvár, in Transylvania.

Home Correspondence.

Royal Horticultural Society.—As an old Fellow of this Society, and one who has for years aided in its practical work, I was much disconcerted on reading the recent report of the Council. The only satisfactory part of it is the opening paragraph, wherein it is stated that the shows have been "magnificent displays," and that the plants and flowers at the concluding exhibition "transcended almost all similar collections of former years." This shows at least that the enterprise of the horticultural body has in nowise diminished, and that they have not withheld their support from the present governing body. It is most unfortunate that, in the face of these facts, the Council for want of funds should judge themselves compelled to reduce the prizes during the coming year to the amount of something like £700. To the horticultural mind this looks something like ingratitude. As a rule in life promotion or reward is looked for in return for work well and liberally done, but here we see the case reversed. It does not seem to be sufficient ground for this line of action to say that "the ordinary revenue of the Society cannot support its expenditure." Every good man of business knows that if he wishes to keep clever and good men attached to him as co-workers in his pursuit he must not only treat them courteously, but pay them liberally. The bright spots in the discussion on Tuesday last were the speeches which, I presume, we may

take as expressing the views of Her Majesty's Commissioners. They were candid, calm, and unimpassioned; and there was a breadth about them which contrasted nobly with the waspish personalities and ungenerous innuendos which characterised some of the speeches delivered two years ago. I have always maintained, and still maintain, that the best and most natural alliance for horticulturists is an alliance with Her Majesty's Commissioners. They are pledged to the nation to do nothing antagonistic to the interests of art and science, but to do everything to support and promote them; and I am glad to find that some horticulturists who two years ago took an opposite view have since changed their opinion. I am not antagonistic to the present Council; I sincerely believe that they have done their utmost to serve the interests of the Society; but man cannot do impossibilities. I think from the tone of the meeting last Tuesday it was the opinion of the majority that the Council should work in harmony with Her Majesty's Commissioners. [Hear, hear.] There can be no permanent prosperity and comfort when landlords and tenants disagree. If it is possible for the present Council to work with the Commissioners, I should be sorry to see them resign; but in the interests of horticulture we must have a Council that can do this. One word more: I do hope that at the adjourned meeting no personalities or needless recrimination will be indulged in, or, if so, that the noble Chair-firm will suppress them, come from whatever quarter they may. There has been too much of that in the past, and no good has come of it, or can come of it. The speaker who is more bent on wounding an adversary than on pushing his own views by force of argument is not worthy to be accepted as a leader, or trusted as an exponent of high and truthful principles. *William Paul, F.R.H.S.*

At the present crisis of the Royal Horticultural Society's affairs, I conceive that the policy of the Horticultural Fellows is to request our Council to open a committee of inquiry to Her Majesty's Commissioners with a view of transferring to them (the Commissioners) the gardens, under satisfactory arrangements for our debenture-holders, the life and local Fellows, and with a *locus standi* there for our shows and meetings. We have but to be united, and act with vigour and determination, and the thing is done. *John Denny.*

Fuchsias.—As your correspondent, W. B. Hemley (p. 179), is anxious to know the origin of *Fuchsia Riccartoni*, allow me to say that when I was a gardener in Ayrshire a young man of the name of Buchanan came from either the Glasgow or Edinburgh Botanic Garden, to be gardener at Caprington Castle, near Riccarton, Kilmarnock. He brought a plant of a seedling *Fuchsia* with him under the name of a hardy *Fuchsia*, from Fort Sumner, on the Southern American coast of Terra del Fuogo. This *Fuchsia* he told me was raised from seed in the Botanic Garden, he came from, and I had a plant of it from him, and when propagated introduced it into the neighbouring island of Arran, where the climate was likely to suit it better in the open air than in Ayrshire. Whether he gave it the name of *Riccartoni* from the suburb of Riccarton, near the Castle, I know not, but the plant is the same, and in the western isles of Scotland, the south of Ireland, and the southern counties of England and Wales, it is hardy, and forms one of the grandest flowering hardy shrubs or trees that have ever been introduced. In a catalogue of indigenous and tropical plants I have cultivated and kept from 1832 until this date, under the heading of *Fuchsias* are the following old varieties:—*coccinea*, introduced from Chili in 1788; *lycoides*, from Chili in 1796; *tenella*, from Chili, in 1824; *virgata*, from Chili, in 1825; *exortica*, from New Zealand, in 1825; *microphylla*, from Mexico, in 1828; and *fulgens*, from Mexico, in 1837. None of the Chili varieties are so hardy as *Riccartoni*, for if planted out they require covering up in severe frosty weather even in the south of England. *Globoea*, *canalis*, and other old varieties, which I have likewise grown, are very likely to have been early garden hybrids, as Mr. Hemley supposes, and raised from *magellanica*. The Mexican varieties of *Fuchsia*, *fulgens*, *serratifolia*, and others, are tender, and only fit to make fine clusters in greenhouses and conservatories. *William Tillery.*

Stapelia olivacea.—I was rather surprised to find in the notice of this plant at p. 136, that Mr. Brown believes it to be the plant known as *S. eruceiformis*. If the figure is correct, the plants are very distinct, as also is the description. *S. eruceiformis* is little more than half the diameter of the fibres of *S. olivacea*. It is not so deeply sulcate, has black flowers 1 inch wide; and the marginal cells are black. My plant grew 9 inches high last season, and is always purplish. The one figured is like a plant we have, which came from the Botanic Garden, Oxford, called *S. Massoni* in error. The name, *S. eruceiformis*, came from Paris. The plant came from Graham's Town in 1868. M. Piersford has it, and got it christened. *J. Coucher, Sudbury House, Hammersmith, Feb. 1.* [See sent

your note to Mr. Brown, who replies as follows:—

In reply to Mr. Croucher, I can only say that I had a plant in cultivation and have seen two others bearing the name of *S. eruciformis*, which, so far as the plant was concerned, were identical with the *S. olivacea*, but the flowers of *S. eruciformis* I have never seen. It is possible they may be different, as Mr. Croucher describes, for in this group of plants there are several species that are almost indistinguishable from one another except by their flowers. But Mr. Croucher says that the plants in themselves are distinct; if this be so, it is only another proof how utterly worthless "garden names" are, and to which Mr. Croucher seems to attach the same importance as to a published name. I alluded to the name *S. eruciformis* for two reasons—first, that cultivators might have a better clue to the plant; secondly, that the name *eruciformis* (caterpillar-like) might be abolished, being an unpublished name, and having no possible application to a *Stapelia*. As to the nomenclature of the whole group, it is in a most disgraceful state among cultivators, and it was with a view to remedy this evil that I began collecting material for a monograph of them. I have now dozens of flowers sent to me, but among them all only two (!) were named correctly. Since Mr. Croucher has mentioned the name of *S. Massoni*, Haw, I may state that I have had five distinct species sent to me under that name; and Mr. Croucher himself, when on a visit to Kew last summer, put this name to two or three specimens (without flowers) of the *S. grandiflora* type, at which I was considerably astonished, for *S. Massoni* is a name that cannot be identified with any plant, as Haworth gave no description of it beyond this—that the stems were 4-angled and pubescent, a character common to all of the true genus, or section, *Stapelia* known to me. Therefore, unless Mr. Croucher can show that he has compared specimens of the plant in question with a *bona fide* type of Haworth's *S. Massoni*, I must refuse to have faith in his determinations, more especially when I find he also gave the name *S. luscata*, Jacq., to the common and well-known *Tromotriche* (*Orbea*) *mutabilis*, Jacq. *N. E. Brown*.

Hardiness of the Double Crimson Primrose.—I have just seen a statement by a large firm that they have lost by the recent frost upwards of 2000 of the above. If this is the case, cultivators should be on their guard in future, as this is a new danger. In my experience I never knew any variety of *Primula acutis* to suffer the least from frost, even when lying entirely upon the surface. *T. Smith, Neary*.

Ribes sanguineum: Origin of Varieties.—At p. 525, vol. ii., 1874, you express a wish for information upon the origin of varieties. The accompanying very rough sketches show the progress of a fastigiated shoot upon a plant of *Ribes sanguineum* growing in my garden. In 1870 I observed a straight vertical shoot from an elbow in one of the stems, which assumed a fastigiated character in its side shoots the next year. I encouraged it by tying to the main stem upon which it grew, and some of the others. Last winter I cut away all the other stems, and shortened what had become a branch to about 4 inches. Last year's growth has brought the fastigiated stem to the thickness of the branch, and the height of the tree is about 8 feet. Whether this is an everyday occurrence, or whether it is to be the parent of a race of *Ribes sanguineum* var. *regia*, emulating *Poplars* in height and manner of growth, I am profoundly ignorant, but the facts are simply as I have stated them. *H. J. Saxe*. [The character will doubtless be perpetuated by cuttings, but doubtfully by seed. Eds.]

Myosotis dissitiflora as a Winter Pot Plant.—I have been accused, I believe, of Forget-me-not on the brain. Well, supposing any plant to have a place there, or in my heart either, and a choice were given, I do not know that I could choose any more beautiful or useful; and of all the Forget-me-nots this is undoubtedly the best. It is the earliest, and, properly cultivated, by far the most beautiful. It may be had in flower all the year round. By frequent division, high culture, a proper choice of sites, and giving a fair, well-grown plant the shelter of glass from November to January, or the middle of February, the last batch of autumn and the first batch of spring may be linked together, and then this lovely Forget-me-not will link the year round with its matchless sprays of blue beauty. Through January and February few plants are more lovely under glass. The plants look best, perhaps, in 4-inch, or at the largest in 6-inch pots. Place well-grown patches in these; they will not only cover the surface, but flow over the sides. Give them a temperature of 45° to 50° till in flower; then range them against well-filled pots of Lily of the Valley, *Spiraea japonica*, or *Deutzia gracilis*, and see if the deep blue colors not add to the spotless purity of their bluish whiteness; or place the Forget-me-not near to pots of golden *Crocuses*, mixed *Cyclamens*, double and single white Chinese *Primroses*, and the effect is equally good. It is equally valued for conservatory and greenhouse decoration. And then it is invaluable for cutting. In

small vases, with Lily of the Valley, &c., its azure is intimitable, and its bouquets it adds the charm of sentiment as well as the grace of beauty. While this colour contrasts or harmonises, or both, with nearly all other material, I cannot conceive why some one does not go in for it by the thousand for market purposes. Somehow it does not seem at home in London smoke, but there can be no reason why those at some distance from the metropolis should not grow it in quantity—as it is certainly as beautiful as the best of spring flowers—for market purposes. The snow has been merciful to the plant this winter, as out of several thousands I do not think we have lost one. *D. T. Fish*.

Stone Breakers.—A stone-breaker which shall not cost quite as much as £240 is a great desideratum in the country, where the difficulty of getting hand work done is much increased; and no other machine than the one I have mentioned above is satisfactory, as the smaller ones on the same principle do not pay their expenses. The principle of the above is faulty in that it makes no use of the weight of the hammer, and also that it wastes great quantities of material in dust and gravel. Such a one as I propose would cost only—Cast steel mortar, two cast steel hammers, £10; framing, upright pistons to act against rollers—altogether within £50, which is within any private gentleman's or farmer's means. *East Somerset*.

Roots of the Leaf-stalk of Celery.—I have just found the piece of Celery which I forward, which is perfectly rooted from a wound in the outward

FIG. 38.—CELERY-STALK ROOTING.

portion of the stem. Has such a thing ever come under your notice? *F. Groombridge, Gr. to Sir Siles J. Gibbons, Bart., Fudge Place, Hurst Green*. [The production of roots under these circumstances has been occasionally observed. We reproduce a woodcut (fig. 38), which almost exactly represents your specimen. Eds.]

Forced Flowers of the Bladder-nut.—I have received from Mr. Dickson, of Covent Garden, some sprays of bloom of this shrub, the introduction of which for market purposes you noticed last week. From the ternate form of the leaf and the looseness of the inflorescence I should have suspected that it would have proved to be *Staphylea trifoliata*, instead of *S. pinnata*. [Possibly: when better specimens are before us we will decide. Eds.] I now learn that the grower received his plants under the name of *S. esculonioides*. Is there such a species? [We can find no trace of this name. Eds.] Of the staying properties of the flowers for use in bouquets there need be no doubt, as I have now in my coat a piece with fifteen open flowers on it, and as many more unopened buds, looking as fresh as when it was cut four days ago, although it has been out of water for the last twenty hours. Its pellucid whiteness by daylight may induce some to think less of it than it deserves; let them see it by lamplight, and they will then change their opinion of it. It is really an acquisition to the *bouquetière* *W. T. P.*

Pinus austriaca.—The account of the *P. austriaca* in your number for January 13 deserves to be noticed by all who, like myself, have planted this tree largely.

It grows with me admirably. I have planted it both on moorland and on the sandy shores of the Lough Ennell or Lake Belvedere, some 320 feet above the sea-level. There it has grown luxuriantly, defying the gales which sweep over the lake, brought by the storms of the Atlantic. The *P. maritima* and insignis, sometimes the Silver, and I hope *Pinus Nordmanniana*, alone share with the austriaca the power of withstanding the terrible south-west winds which rage over the high table-land on which Belvedere stands. The Douglas Fir does not do well there, and the *P. ponderosa* I cannot yet judge of, though it looks well. I open your columns so liberally to contributors, that I trust you may be induced to collect information on the effects which climate and situation have on the newer forest trees, and so obtain some data on which to lay down rules that may guide planters like myself, with large tracts laid bare by the carelessness or rapacity of their ancestors. *Brisley Marley, St. Katherine's Lodge, N.W., Jan. 20*. [Such information would be most welcome. Eds.]

The Lindley Medal.—The editorial remarks appended to my letter at p. 181 show that I have committed the grave error of making an incorrect statement in reference to Lord Londesborough being a member of the Council of the Royal Horticultural Society in 1873. I am sure your readers will believe me when I say that I am sorry I made that statement. But before they whip me all over me to give the authority upon which I based the statement: In my former letter I referred to the *Gardeners' Chronicle*, 1873 or 1874, but 1873 only was given; and to prevent any mistake this time allow me to give an extract from the *Gardeners' Chronicle* of 1874, p. 221—it is taken from the report of the annual general meeting of the Royal Horticultural Society:—"The Chairman here announced that the list recommended by the Council had been unanimously adopted: it was as follows:—Extraordinary vacancies—names of vacating members—H. R. Prince Arthur, H. S. H. Duke of Teck, Lord Londesborough, and Mr. Andrew Murray." Then follows—"Names of Fellows proposed by the Council to fill up the vacancies"—and these gentlemen were elected. Now, I understood this to mean that Lord Londesborough and the other honourable gentlemen were officially relieved of their duties as members of Council on the 10th of February, 1874, when their successors were elected; and I certainly thought that this was good evidence that his lordship was a member of the Council for 1873, and wrote the letter in the full belief that it was so; this will explain how I fell into the mistake, and I beg to congratulate Mr. Denning upon his lucky escape from the prohibition rule. *W. Wilson, Gr. to Mrs. Adams, Chase Park, Epsford*.

The Lucombe Oak (*Quercus Cerris* *Lucombiana* and *Quercus Cerris* *Lucombiana* var. *erecta*).—These two varieties may be seen at the Old Nurseries at Exeter, which are still carried on under the name of Lucombe, Pince & Co. Neither the ordinary Lucombe Oak, nor the variety called *crispa* are ever found without their leaves, as before they shed one year's leaves the new ones are all but fully expanded. There is a history attached to this most beautiful of all the evergreen Oaks. Mr. Lucombe found one or two young trees in a seed bed of the acorns of the Turkey Oak (*Quercus Cerris*) which had their leaves all through the winter whilst the rest were quite bare; and was no doubt the original tree of the ordinary variety. A suite of excellent and handsome furniture was made from a portion of the timber, the grain of which is very ornamental. *Exeter*.

Gooseberry and Currant Training at Clarendon Park.—The *modus operandi* practised in these gardens is to plant the trees about 15 inches from the edging on either side of the walk, and train against a set of wires which are run through posts driven into the ground at a certain distance from each other. Trees thus trained are found to be more easily protected from the ravages of birds. This I consider a very neat way of training the Gooseberry and Currant, and it also economises the ground, inasmuch as the trees only cover a strip 1 foot or 15 inches wide on either side of the walk, whereas the old system of bush-training covers from 4 to 5 feet of the border on both sides of the walk, which in a kitchen garden of small dimensions, with a large family to supply, renders the above method of training a great desideratum. As a preventive of bullfinches, Mr. Chard, the clever gardener at Clarendon, finds a solution of lime and soot applied with the garden engine answers admirably. *H. W. W. Salisbury*.

HORTICULTURAL EXHIBITIONS, 1875.

MARCH.

- 3.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 10 and 11.—Leeds Horticultural Gardens Company. Spring Flower Show. Sec. and Manager, James Birbeck, 293, Hyde Park Road, Leeds.
 16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.
 17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Hycouth Show.
 24.—Glasgow and West of Scotland Horticultural Society's Spring Exhibition. Sec., F. G. Dougall, 267, Cananah Street, Glasgow.
 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

APRIL.

- 4.—Special Exhibition of the Royal Horticultural Society of Antwerp.
 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Early Rhododendron Show.
 22.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Bille, 28, Westland Row, Dublin.
 27.—Manchester Botanical and Horticultural Society. Exhibition of Artichokes, &c., in the Town Hall. Manager, Bruce Findlay.
 28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 13, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

		Meeting of the Entomological Society, at 7 P.M.
MONDAY, Feb. 15	Sale of Rare Californian and Japanese Lilies and Hardy North American Ferns, at Stevens' Rooms.	
TUESDAY, Feb. 16	Sale of Poultry and Pigeons, at Stevens' Rooms. Royal Horticultural Society: Meeting of Fruit and Floral Committee, at 11 A.M.; Scientific Committee, at 2 P.M.; General Meeting, at 8 P.M.	
WEDNESDAY, Feb. 17	Sale by Auction of Bury Nursery, Edmonton, by Frothero & Morris. Sale of Camellias, Azaleas, and Palms, from Ghent, Roses, Shrubs, &c., at Stevens' Rooms. Meeting of the Linnean Society, at 8 P.M.	
THURSDAY, Feb. 18	Unreserved Sale at the Park Nursery, Richmond Road, Kingston, Surrey, by Frothero & Morris.	
SATURDAY, Feb. 20	Sale of Fruit Trees, Roses, Shrubs, Herbaceous Plants, Gladioli, &c., at Stevens' Rooms.	

RARELY has the sense of a public meeting been more unequivocally expressed than it was at the Annual General Meeting of the ROYAL HORTICULTURAL SOCIETY on the 9th inst. Seldom of late years has a brighter gleam of hope lightened the gloomy prospects of the Society as a horticultural establishment, than on that occasion. Referring our readers to the detailed account of the proceedings in another page, in confirmation of our statements, we now emphatically urge the Council to take the lesson to heart, act on it fully, frankly, loyally. With equal earnestness we implore the horticulturists to maintain an unbroken front, seize the present opportunity—the most favourable they have had for years—and once again make the Society powerful and respected as a Horticultural Society. In spite of differences of opinion on matters of detail the general issues are becoming more sharply defined. The local Fellows, as the South Kensington residents may be designated, know what they want. The horticulturists are, as the meeting showed, far more unanimous in opinion than they have been for a long time past. The Commissioners profess the utmost readiness to treat on fair and equitable terms for the benefit of the Society as a Horticultural Society. Let there be no further doubt or misapprehension on this score. There has been reason for it before, but after Sir HENRY THRING'S emphatic statement on Thursday last those doubts are removed. Sir HENRY, speaking on behalf of the Commissioners, and with their Secretary by his side, said:—

"I am authorised to say, on behalf of Her Majesty's Commissioners, that their intention has never been in the remotest degree hostile to Horticulture. The Commissioners consider themselves quasi partners in the

promotion of Horticulture, and it is their wish to promote it. Whatever might have been said of the Commissioners, I am authorised to say that they never had any wish to do anything but to promote the objects of the Society in every possible way. So far as regards Horticulture, and now as to the appropriation of the land. It has been whispered that the Commissioners wanted to build upon the land. Now I am authorised to say that proposition had never been submitted to them—I mean the proposition to build upon the Horticultural Gardens. I am authorised to say such a proposition was never brought before them; that they never for one moment thought of such a proposition, and that they never held any intention on the subject. It appears to me that the agreement or arrangement of the Society with the Commissioners is drawn in a worse and more loose manner than any Act of Parliament I have ever seen or drawn. I can say on behalf of the Commissioners that they have never thought of determining the lease, or of putting an end to the Society in order to benefit themselves."

Let the Council at once put these emphatic utterances to the test of actual proof. After the conciliatory tone adopted by the President, Lord BURY, there need be no difficulty in coming to an amicable understanding. Lord BURY did virtually, in his speech, retract the hard sayings made by the Council, and after his speech the cancelling or modification of the objectionable passages in the report ought to present no difficulty. Gentlemen who have had differences of opinion, and uttered fierce words in the heat of debate, know what is the proper course to pursue when a better tone prevails. The Council have only to act up to the spirit of Lord BURY'S speech, and peace will ensue.

Supposing the ground cleared in this way, what next is the right thing to do? We will not presume to dictate to the Council, and say Do this or do that. They are in power, and they must do what seems to them best. We, as outsiders, but at the same time as warmly interested in the Horticultural work of the Society, can only suggest and urge what we think right in the interests of Horticulture; and if the Council cannot or will not carry out the views of Horticulturists, we have the constitutional remedy in our hands to employ as best we can. We, however, trust that Horticulturists will offer no factious opposition to the Council in this crisis, but fully and freely make known to them what their views are, and support them so far as they consistently can, or be prepared to act on their own account if the Council cannot or will not carry out their wishes.

In the interests of Horticulture and of the Horticultural Society the duty of Horticulturists now is to insist upon an immediate opening of negotiations with Her Majesty's Commissioners, in a friendly spirit, with a view to serve the best interests of all parties.

The local Fellows want the garden for their own purposes; let them have it, on the most equitable terms that can be devised. The Horticulturists want a place for their meetings and exhibitions; they want free scope for carrying on the Horticultural work of the Society, for preventing it being strangled and stifled by other interests, and starved at the expense of other sections. Both parties—honourable men—wish that the financial difficulties shall be met in an honourable way. Both parties have rights which must be respected, all parties have duties which must be fulfilled, if they do not wish to be disgraced in the eyes of right-minded men. The bone of contention is the Kensington Garden. Over and over again have we advocated the severance—on fair terms always understood—of the Kensington Garden from the purely Horticultural part of the establishment. The two cannot be worked satisfactorily together. The experiment has been tried, and failed lamentably, as we see. If horticulture could be relieved of the burden of a useless and costly garden, matters would speedily improve. How can this be done without injuring the Society, without infringing on the rights and privileges of

the Fellows, life Fellows, and debenture holders? The solution of this question lies with the Council and the Commissioners. Let a committee be forthwith appointed from the Council and from the Commissioners, taking especial care that that committee be thoroughly representative. Let that committee discuss freely and fully the state of affairs, and come to an understanding. There can be no doubt that, if that undertaking were satisfactory, it would be gladly hailed by all sections of the Fellows. All would sacrifice something for the sake of the general good. As a mere suggestion we throw out a scheme, of which, if the principles be adopted, the details could readily be adjusted.

Let the Commissioners cancel the present lease, grant a new one to the Society, with power to let the Kensington Garden at a remunerative rental to the local Fellows. The local Fellows would make the best terms they could with their constituents, and the Society would have an income wherewith to meet their obligations and carry on the proper work of the Society. Under an arrangement of this character Horticulturists should retain full rights over the meeting rooms; they would have the use of the whole garden, or any portion of it, on exhibition days; while life Fellows and debenture holders should, in consideration of their rights, have access to all portions of the establishment at all times.

A scheme of this kind would preserve the rights and privileges of all parties. Both sections might act in concert when joint action was desirable, as at exhibition times, or either might act independently if concerted action was not necessary or desirable. By some such plan harmony might be restored, and the Society be left free to carry out, unrestricted, the objects for which it was founded. At the adjourned meeting on the 9th prox., let us hope the Council may have to announce to us something conceived in the spirit, if not in the letter, of what we have now advocated.

— OUR illustration (fig. 39) represents a portion of one of the many BANKS of SUCULENTS in the rich garden of M. THURET, at Antibes, near Nice, where this class of plants thrives with astonishing vigour and, it need hardly be said, with surpassing beauty. Nothing can excel the gorgeousness of some of these succulent beds when in full bloom, while by judicious intermixture the rigidity of form is by no means so objectionable as it seems to be in some of our succulent-houses at home, where the uniform level of such detract from the effect of the plants. Among the plants represented are *Cereus multiplex*, various species of *Echinocactus*, *Agave*, *Aloe*, *Crassula*, *Angiosanthus* (?). The photograph, taken by Dr. BORNET, shows also a dense undergrowth of smaller succulents, which it is impracticable to show satisfactorily in the woodcut. For this, and other exquisite photographs taken by Dr. BORNET, we have to thank M. THURET.

— The thirty-second anniversary festival of the GARDENERS' ROYAL BENEVOLENT INSTITUTION will be held on July 2 next, at the London Tavern, under the presidency of ROBERT BROADWATER, ESQ., the Master of the Worshipful Company of Fruiterers.

— We notice with great pleasure the prospectus of a new series of works on POPULAR GARDEN FLOWERS, to be brought out by Messrs. LOVELL REEVE & Co. "Cultivated flowers," says the prospectus, "have now become so numerous that it is impossible for any one grower to give adequate attention to all. It is, therefore, natural, as well as advantageous to floriculture, for him, while not neglecting others, to select one or two as his special favourites, to the study and cultivation of which he will devote more than ordinary attention. For this purpose he will require more information than is to be found in books treating of gardening generally; and it is to supply this desideratum that the present series is projected. Monographs of particular flowers have, in a few instances, been published, but these are on so large and costly a scale as to be within the means of only the most wealthy. The present series, while comprising all that can be desired both in matter and illustration, will be published at such a moderate price as will place them within reach of all. The volumes will be a large super-royal 8vo in size, and will contain chapters on history, culture, and classification, with descriptions and coloured plates, in the best style, of all the species and principal varieties. The first volume, now in the press, and shortly to be

FIG. 39.—BANK OF SUCCULENTS IN THE GARDEN OF M. THURET, AT ANFIBES.

published, will be *The Narcissus—its History and Culture*, by F. W. BURBIDGE; with a *Review of the Classification*, by J. G. BAKER, F.L.S. Illustrated by forty-eight coloured plates. It is proposed that similar volumes on the *Rose*, the *Lily*, the *Crocus*, the *Iris*, be subsequently published, and the publishers will be glad to receive and consider any suggestions or communications relative to the above series; it being their desire, as far as practicable, to meet the actual wants of the public, and to render the volumes as practically useful as possible.

— Mr. WILLS, of Onslow Crescent, Brompton, proposes to raise a subscription for the benefit of the widow and daughter of the late Mr. W. P. AYRES, who, it is stated, are left totally unprovided for.

— In the House of Commons on Monday last, Mr. HERBERT, M.P. for Kerry, asked the Chief Secretary for Ireland whether Her Majesty's

Government had taken any steps to prevent the introduction of the COLORADO BEETLE into Ireland by the importation of American seed Potatos or otherwise; and, should no precautions have already been instituted, what were the intentions of Her Majesty's Government on this subject. Sir M. H. BEACH stated in reply, that the subject of the hon. member's question had been brought under his notice some time back, and he thought it right first to ascertain what steps had been taken by foreign Governments in the matter. He found that the only Governments which have taken any real action were those of Austria and Belgium. The former had assured the Government of Switzerland, which had warned the European maritime countries of the possible danger, that the importation of American Potatos would be prohibited; and the Belgian Government had introduced a Bill for a similar purpose, which had been agreed to by a special committee. He had also made inquiries as to the nature and extent of the evil to be apprehended,

and thought there was reason to suppose that the harm recently done to the American Potato crop had been much exaggerated. He was also informed that the insect in question had been known in America for more than a century, and that it attacked the stalks and leaves of the Potato plant, not the root, though that naturally became diseased in consequence. No Potato stalks or leaves were imported from America, and as only healthy roots would be imported, it would seem hardly possible that the insect could be thus conveyed into this country. He was now in communication with the English Privy Council on the subject, because it was obvious that if any preventive measures were adopted they ought to apply to the whole of Great Britain as well as to Ireland. But he must add that the importation of Potatos into the United Kingdom, especially in the event of a failure of the home crop, was very large, and therefore any interference with this trade would require the most careful consideration on the part of Her Majesty's Government.

— We are glad to find that Mr. McLACHLAN as an entomologist protests against the false security likely to be engendered by the refusal of the Government to adopt precautionary measures against the introduction of the COLORADO BEETLE. The danger is real, but with proper precautions it might be averted.

— The *Hamburger Garten und Blumenzeitung* for January contains articles on the CULTURE OF CECYLOGYNES, of QUISOQUALIS INDICA, of NYMPHÆA RUBRA, of CHRYSANTHEMUS, &c.; a translation of the first part of Mr. MOORE'S review of the species and varieties of ILEX in cultivation, which appeared in these columns; the giant bladder seaweed, as a material for tying, to which we shall advert; "Notes on My Last Trip to New Grenada," by G. WALLIS, an abstract of which we may give as soon as the whole narrative has been published; the PALMS of HERRNHUSEN, one of the richest collections in Europe, under the superintendence of M. WENDLAND, the well-known writer on this class of plants; and an article by Dr. GEFFERT on the Japanese flora. Altogether this number is an excellent one.

— In the new German periodical called the *Deutsche Rundschau* is a contribution from the pen of Dr. COHN of Breslau, entitled "Botanical Problems." The perusal of this very interesting, though brief sketch of the history of botanical science has made us long for a more complete work on this subject, and we trust that the English publication expected will prove a concise and useful book. Dr. COHN'S object appears to have been to show the important position botany has attained in the circle of sciences since vegetable biology has been taken into partnership with animal biology. He commences with ARISTOTLE and THEOPHRASTUS, giving a summary of the questions they put to themselves; and although he claims for them the merit of having founded scientific botany, he is obliged to admit that they were less acute in their explanations of the various phenomena of plant life. PULTENEY, in his *Rise and Progress of Botany in England*, opens with words to the effect that scientific botany had no existence in the enlightened days of Greece, &c.; but this is a question of degree, and of little importance to us. With the exception of a bare mention of the Roman herb doctors, Dr. COHN makes a leap of 2000 years, and follows the development of the different branches of botany down to the present day, noting the solution of the principal problems of this science. He then goes on to speak of the still hidden mysteries of life—mind, matter, force, cause, &c., and adds that a philosophical study of plants has already taught us much, and may, if properly pursued, teach us yet more.

— We are requested to state that all plants and other objects for exhibition at the forthcoming special exhibition of the ROYAL SOCIETY OF HORTICULTURE AND AGRICULTURE AT ANTWERP, which opens on April 4, will be conveyed at half-fares by the Belgian railways, the Great Eastern Railway, the boats of the Société Anversoise, the General Steam Navigation Company, and the vessels of Messrs. Van MAENEUC & Co.

— Those who are interested in the question of CLIMATIC CHANGES, which occupied much of our space last year, should read an interesting article in the *Builder* of the 30th ult., and in which the writer gives a summary list of the occasions upon which the Thames at London has been frozen over so completely as to allow of fairs being held upon it. Numerous instances are given from 1564 to 1814, not to mention other cases of which less authentic accounts have reached us. The last frost-fair was held in 1814, since which time, though we have had severe and long-continued frosts, they have not been of sufficiently long duration to permit of the "frost fair,"—possibly a result of modern improvements, such as the restriction of the river channel by the extension of wharfs and embankments, and the consequent greater velocity of force of the current.

— M. CARRIÈRE figures and describes in the last number of the *Revue Horticole*, an instance where a bud of Chionanthus inserted on Fraxinus Ornus had lain dormant for fourteen years. It appears that the Ashes were cut down and the stumps left just above-ground, and from these stumps proceeded vigorous shoots of Chionanthus. Supposing that M. CARRIÈRE is right in his assumption that the buds were inserted on the stock so long ago, the case is remarkable as being probably the longest duration of dormant vitality in a bud similarly placed, yet chronicle.

— The *Chicago Pharmacist* for January contains a note by Mr. H. L. BABCOCK, in which he states his belief that CYPRIPEDIUM SPECTABILE and C. PUBESCENS POSSESS POWERFUL POISONOUS PROPERTIES. The unpleasant effects on some constitutions following the mere touch of Rhus Toxicodendron and R. venenata have often been described,

Some persons suffer severely, whilst others experience no inconvenience, from contact with these shrubs. Mr. BABCOCK says he was particularly careful during the seasons 1868 to 1872 not to touch Rhus Toxicodendron, pluck specimens of other plants growing in its immediate vicinity, nor to receive from the hands of another person a freshly-gathered plant, for fear it might have come in contact with Rhus. In spite of these precautions, he was so severely poisoned each season as to be confined to his room for several days. In June, 1872, he observed that his hands were stained with the purplish secretion of the glandular hairs of Cypridium spectabile after gathering a quantity of specimens, and soon he experienced a peculiar irritation about the eyes, and next day his face presented the appearance of a severe case of Rhus poisoning. On looking over his notes of previous years Mr. BABCOCK found that these symptoms had invariably set in after plucking the two species of Cypridium named above. In 1873 and 1874 he avoided touching the Cypridiums with the bare hand, but was not particularly careful as to the Rhus, and these seasons he escaped poisoning. He is now convinced that, upon himself at least, these plants are capable of producing effects similar to those caused by Rhus Toxicodendron, and thinks it possible that others may have wrongly attributed to Rhus the annoyance caused by the Cypridiums. It would be interesting to know whether we have any accidental coincidences or cases of real poisoning. Acridity in the raw tubers of Orchids is probably not uncommon, but poisonous venom we should not have suspected, and we cannot help thinking that Mr. BABCOCK is wrong in attributing his indisposition to the plants in question; but, to set the matter at rest, we suggest that he should make a trial in which there could be no mistake.

— M. BOISDUAL mentions in the *Bulletin of the Central Horticultural Society of France* the injury done to the cultivated Spinach by the larva of a beetle, CHRYSOMELA VIRIDULA, which, we believe, has also been noticed to attack Spinach in this country. Tobacco-water kills the larvæ, but would not improve the flavour of the Spinach unless the latter were carefully soaked in water before use.

— We find in the last number of the *Journal of the Central Society of Horticulture of France* an article by M. A. LAVALLÉE on the CONIFERS which were commented on by Mr. MURRAY in our own pages on a recent occasion. Mr. MURRAY'S article must have been written quite independently of M. LAVALLÉE, and it is interesting to compare the conclusions at which the two authors have arrived. We may probably say that on the subject when we figure, as we hope to do, some of the species in question, some specimens sent to us by Messrs. SANDER, of St. Albans.

— M. A. RIVIÈRE advocated recently, at a meeting of the Central Horticultural Society of France, a mode of PROPAGATING the FIG by burying branches in the ground to a depth of 19 or 20 metres before winter. The following spring the branches are cut into several pieces, each one of which becomes a cutting, which is so placed that its upper extremity is also covered by soil. In the course of a year these cuttings form plants of 80 centimetres in height. It will be remembered that M. RIVIÈRE has adopted a similar plan with Vines.

— The *Irish Farmer's Gazette* reports that the novel and extremely pretty Brazilian Orchid, COLAX JUGOSUS, is just now in flower (for the first time in Ireland, we apprehend) at Glasnevin. The sepals, it remarks, are of the same snowy whiteness and substance as the flower of the lovely little Cypridium niveum, and if the reader will imagine one of these with the side petals, instead of being pure white, regularly dotted with rich chocolate, and the lip flat, and dotted and barred with bluish purple, he will form a very good idea of what the flower of the Colax jugosus are like. It is, indeed, a little gem in its way. Colax jugosus was exhibited in flower at South Kensington, by Mr. W. BULL, in May, 1873; and a few days later at the Royal Botanic Society, Regent's Park, both by Mr. BULL and Mr. B. S. WILLIAMS.

— At the ordinary meeting of the METEOROLOGICAL SOCIETY, to be held at 25, Great George Street, Westminster, on Wednesday, the 17th inst., at 7 P.M., the following papers will be read:—"Report of the Conference on the Registration of Phenological Phenomena." "On the Weather of Thirteen Summers," by R. STRACHAN, F.R.S. "On a Universal System of Meteorography," by Professor F. VAN RYSELBERGHE. "Results of Meteorological Observations made at Patras, Greece, during 1873," by Rev. HERBERT A. BOYS.

— We learn from Melbourne, Australia, that early in the month of December last there was on view at the Collins Street Nursery of Messrs. T. LANG & Co., the largest and most varied collection

of RHODODENDRONS that has been seen in that city. "Rhododendrons," says the *Melbourne Weekly Times*, "are not so generally cultivated in this part of the world as they are in England, and the opportunity seldom occurs when a number of varieties can be seen in flower together. Messrs. LANG & Co., however, seem to have made them a speciality, and after importing a large number of the finest varieties, have succeeded in growing them at their Ballarat establishment to the greatest perfection. The sight of so many fine varieties, all in full bloom, called up memories of the grand displays of this noble flower that we have seen in England in bygone years. Visions of Bagshot rose before us, and the names of STANDISH, HOSKA and JOHN WATERER, with others, were brought to mind. The collection embraces a great variety, and though many of the plants are rather small, they are well-bloomed and remarkably healthy and vigorous."

— On the occasion of the marriage of Mr. MARTIN SUTTON, jun., of the firm of SUTTON & SONS, Reading, last week, the *employés* of the firm, with their wives, 250 in number, sat down in the evening to an excellent dinner, after which the health of the bride and bridegroom and other members of the family was drunk with the greatest enthusiasm. About 8 o'clock the large party adjourned to the Abbey Lecture Hall for the enjoyment of a musical entertainment. Among the many wedding presents were a silver epergne of elegant design and workmanship, presented by the heads of departments, and a beautiful dining-room clock, together with an illuminated address, signed and presented by the whole of the establishment.

— Respecting the HARDINESS of EUCALYPTUS GLOBULUS, which has lately been questioned, a correspondent of the *Gardener's Record* writes—"I think it has proved itself capable of standing any degree of cold that it may be liable to. Some fifteen years ago there was, at Lakeland (near Cork), the seat of WILLIAM H. CRAWFORD, Esq., a fine plant of Eucalyptus globulus, 30 feet in height at least, and which used to ripen seeds. I venture to say it is there still. If I do not mistake there is one at Fota, the seat of SMITH BARRY, Esq. I remember seeing more than 1000 of seedlings raised from seeds ripened on the Lakeland specimen, some of which may very probably be growing there still. I have known it to pass unharmed through a frost that killed some and severely injured other plants of a seemingly hardier nature, such as Cupressus macrocarpa, C. Goveiana, C. Lawsoniana, and Cryptomeria japonica. At the same time, I have seen the tops of shoots of seedlings killed by late spring frosts on one occasion. The seeds used to be sown as soon as gathered, started and grown on in heat for the first season, then hardened off and planted out in nursery quarters in the garden, where they grew, although in a very dry soil, most luxuriantly. I have seen them from 10 to 12 feet in height in two or three years, from the seed, but I believe they used to be pretty liberally supplied with water, both pure and manurial, with mulching." Mr. WHITE, of Hazlewood Gardens, Sligo, states that with the exception of a few of the leaves being browned the Eucalyptus has received no injury there; the trees have attained 10 or 9 feet to 9½ feet, having been planted nearly five years. Mr. THOMAS OF Curragh Chase, Limerick, states that with him it is quite hardy. This is tolerably conclusive evidence, so far, at least, as regards Ireland.

— The *Melbourne Leader* states that the VINE MILDEW or OIDIUM made its appearance some two or three months ago in the Murray and other warm districts of South Australia, and has also been seen south of the dividing range at Murgebolac and on the Colac Road.

— Mr. THOMAS INGRAM, the son of the fine old gardener who so long and worthily presided over the Royal gardens at Frogmore, called up to the Royal service, and receives by command of HER MAJESTY, an annuity in consideration of faithful services extending over a period of some five-and-thirty years. Before leaving Frogmore, last week, the members of the Royal Garden Book Society presented him with an inkind, as a small token of respect, together with their thanks for the numerous kindly services rendered during the many years he was president of the Society.

— To Mr. WILLIAM CROSS, gardener to the Dowager Lady ASHBURTON, Melchet Court, Romsey, we are indebted for the photograph from which the illustration (fig. 40) of CYPRIPEDIUM CAUDATUM was prepared. The plant was grown at Melchet Court. About four years ago it was growing in a pot 5 inches or 6 inches in diameter. It has since had the benefit of liberal shifts, and an abundance of light, air, and moisture; and when photographed last year it bore twenty-six flowers on seven stems, many of the tails measuring 27 inches in length.

Reports of Societies.

Royal Horticultural: Feb. 9.—The annual meeting of this Society took place on Tuesday, in the Council-room, South Kensington, at 3 p.m., under the presidency of the Right Hon. Viscount Bury, K.C.M.G.

The Secretary read the minutes of the last meeting of the Council, which were duly confirmed.

Mr. Pinches and Mr. Fortune having been appointed scrutineers,

The Report, as given in our columns last week, was taken as read.

The result of the ballot for new members of Council and officers was that, in place of Mr. J. A. Harcastle, Mr. Alfred Smee, F.R.S., and Mr. J. Herbert Tritton, the following Fellows were elected:—The Hon. and Rev. J. T. Boscawen, Mr. William Longman, and Mr. J. D. Chambers. To fill up the extraordinary vacancy created by the retirement of Lieut-General the Hon. Sir Alexander H. Gordon, K.C.B., Mr. Frederick Campion was elected. The balloting list for officers had the following result:—President, the Right Hon. Viscount Bury, K.C.M.G.; Treasurer, Mr. Bonamy Dobree; Secretary, Mr. W.

is no doubt in the heat of argument that both parties have said hard things, which we regret, and which we regard as better if left unsaid. We put forward this frank expression of opinion on our part, and I think I express the opinion of my colleagues; and I only hope it will be accepted as frankly as it is given, and that the circumstances will be taken into consideration under which the report referring to the Commissioners has been made. I must go back for a moment to the time when we first took office. The Royal Commissioners were placed in relation to the Royal Horticultural Society by a resolution, the terms of which were undefined, and which might be taken to mean that both bodies should work in common for a common end. But outside the Royal Commissioners there had sprung up two bodies who had great and substantial rights under the agreement with the Commissioners—the Fellows on the one side and the de-facto holders on the other. At the last time came when the Royal Commissioners—or rather when the Royal Horticultural Society, acting in what they then believed to be not altogether their own interests, proposed to accept terms from the Royal Commissioners which the outside Fellows of the Royal Horticultural Society considered detrimental to the interests of the Society. Under these circumstances what does an

know whether they think the result of the election under your auspices can remove the taint of illegality, but I am strongly inclined to believe—and you may take it as my own opinion, and not an official one—that Her Majesty's Commissioners will assume that after the election to-day we are in a legal and proper position. In our position to-day we have to be careful that there is no flaw as to the legality of our proceedings, but I am sure that at the end of our proceedings any objection to our existence as a legal body will be entirely removed. The position of the Society's finances may not be found to be very sound, but while it may give the members of the Society ample room for reflection, it is not one which would allow us in any way to despair. We are the only society—I will not say the only—but we are the society which has the means at its disposal to do the greatest amount of good, from our official position, for the horticultural world. We can easily keep that position, but in order to do that we must keep shoulder to shoulder, and assist each other. These gardens must be retained in the interest of horticulture. Then the question arises, there are besides the horticultural Fellows proper the Fellows who are owners or occupiers of house property about this neighbourhood. I need not tell you that they are deeply interested in keeping open the gardens—one of the lungs of London, and that they feel that if it went over into the hands of any other body than the Royal Horticultural Society, it would be a grievous detriment. As I have before said, Englishmen if they know they have rights are very careful to associate themselves in defence of those rights, and I think the local Fellows are not at all unlikely to die hard if they are put to it. But I do not, as I have said before, believe there will be any necessity for a fight, but that on the contrary—and I wish to repeat it, even at the risk of wearying you—the Royal Commissioners are quite willing to meet us evenly and fairly. I will not consider it either unkind or uncorrect if I give this frank and plain expression of our feeling and opinions. I say that we are perfectly well aware we hold some good trump cards in our hands, and know how to deal them on terms of perfect equality. This, I trust, will not be construed as being in any way hostile to the Commissioners; and I believe I am right in saying that there are some gentlemen present representing the Royal Commissioners who will comment upon any statement I make on your behalf, and say whether it be correct or not, and who will be able to make, on behalf of Her Majesty's Commissioners, a statement, whether it be satisfactory or not. I will frankly say I have heard—and perhaps from very good authority—that some terms made use of in the Council's report to the Society have been felt as wounding to the feelings of the Royal Commissioners. I hear that two paragraphs in the report have been construed into a sneer. I am sure, and I know I speak the sentiments of my colleagues, that anything like a sneer towards Her Majesty's Commissioners was foreign to our minds, and I need say, if such an impression was conveyed to them, I own I frankly regret any expression that may have caused it. I will, however, ask the Royal Commissioners to remember that at the time this report was framed the Society was labouring under the smart—I will not say unjust—but in any case the smart of dealing with Her Majesty's Commissioners. The principal diversity of opinion between the Commissioners and ourselves is upon the proposed skating rink in these gardens. Her Majesty's Commissioners have felt aggrieved that we did not communicate with them on the subject, because the agreement under which the rink was to be built was signed by us. The answer to the objection is a simple one. We were, and always have been, most desirous to be on the most friendly and open terms with Her Majesty's Commissioners, but I have taken the trouble to look into our letter-book, and I can tell you we have seven times addressed letters to the Commissioners, requesting them to allow the Expenses Committee to meet, and discuss the affairs of the Society; and on these seven occasions we were told that it was impossible for the Commissioners to allow it to be done. I do not now question whether it was right or wrong, I merely state the fact that, having seven times asked Her Majesty's Commissioners to meet us for the purpose of entering into the affairs of the Society, and having been seven times refused—certainly in a courteous and civil manner—we felt we were bound to act for ourselves in this matter, and that we could not again ask the Royal Commissioners to meet us on the affairs of the Society. Under the charter, and according to the bye-laws, there is only one way of dealing with the affairs of the Society, as between ourselves and the Royal Commissioners, and that way is through the Expenses Committee—and all the monetary affairs of the Royal Horticultural Society are committed to their decision. That being the case, now, when I say we seven times requested that the Expenses Committee should meet, and have seven times met with a refusal, I think—without entering into by-gones, and

FIG. 40.—CYPRIPEDIUM CAUDATUM, AS GROWN AT MELCHET COURT. (FROM A PHOTOGRAPH)

A. Lindsay, Expenses Committee-men: Sir Coutts Lindsay, Bart., Sir Alfred Slade, Bart., and Mr. Bonamy Dobree, Auditors: Mr. P. M. Leonard, Mr. Henry Liggins, and Mr. Conrad H. Pinches.

The CHAIRMAN rose and addressed the meeting as follows:—Ladies and gentlemen: The question I shall have to submit to you, I am happy to say, requires from me only a few remarks—I mean with respect to the report which the Council think it their duty to submit to you. There was a time when we had reason to believe that this meeting would be of a stormy character, and that we should have to battle for our lives, but I am happy to say that these sinister auguries have been entirely dispersed, and that, far from being here to encounter any direct hostility, or even covert hostility, from our landlords, the Royal Commissioners, we are likely to receive from them all the consideration which is consistent with their high position. It is only quite recently that I am permitted to state that affairs have taken this happy turn. I will confess—and here I agree with the Council—that the Royal Horticultural Society felt that we had been hardly dealt with, and that the Commissioners did not appreciate our real position. It is possible that, as we felt the interests of ourselves and of the Society trembling in the balance, we should not have been so courteous or so conciliatory as we might have been under happier circumstances. There

Englishman do? It is suggested that he has rights, and he thinks his rights are invaded, and accordingly he takes constitutional means of asserting his rights. He moves the rejection of the proposition submitted to him, and if he is successful, he places himself in the position of those who made the proposition, and pursues the course of business in the best way he can for himself; indeed, he has succeeded the late ministry, and become a minister in power. When we did that we were in something like revolutionary troubles, and we did the best we could to make ourselves legal, and, according to the best advice, we did succeed in making ourselves a legal tribunal—in making ourselves the Council of the Royal Horticultural Society—your representatives, gentlemen.

ARRANGEMENT WITH THE COMMISSIONERS.

I need not tell you that on all points the Royal Commissioners did not entertain that opinion of our legality which we ourselves were advised to entertain. They disputed our legality, and they would not deal with us as the Council of the Royal Horticultural Society; and from that time until now we have been met with this difficulty—that the Commissioners would not deal with us as frankly as they might have dealt, simply because we were not legally constituted a Council. That, then, frankly, was our position as regards Her Majesty's Commissioners. The Commissioners knew it. I do not

with a desire to avoid them—you will see it was quite impossible to approach Her Majesty's Commissioners on the subject of the skating rink again. And now that they feel aggrieved that we have not consulted them, I hope that the representatives of Her Majesty's Commissioners will accept this frank explanation of the circumstances. I have the honour to make to them as the real, true, and only reason why the communication was so long delayed. And, after all, the communication was not so long delayed, because it was only a few weeks after it was made that the Royal Commissioners met, and a letter was sent by Sir Coutts Lindsay giving them the fullest information. I do not know whether I should enter at greater length into the arrangements between this Society and the Royal Commissioners. I hope I have explained our aim and objects in acting as we have done. As I have before said, if there be anything in our report—written at a time when the Council were labouring under considerable irritation, and with the notion that their dignity was offended—which was considered as being hurtful to the Commissioners, I regret it, and, paraphrasing the words of Hotspur, say, "Let not this report come betwixt my love and your Majesty." Having thus explained, I hope, on the part of myself and my colleagues, that all the clouds which lie between the bright sunbeams of the full fellowship of the Commissioners and ourselves may soon be swept away.

FINANCE.

I now pass away to another subject—the Society's finances. We have now to discuss the position of our finances in detail. It will suffice to say that we are in a position which, although grave, is not irretrievable; nor irretrievable because, by the terms of our lease, we have enough yet to pay a certain rent to the Royal Commissioners, and if that rent be paid we shall be free for several years to come. At the same time, the finances of the Society—I of course mean the income of the Society—do not meet its necessary expenditure by a long way. We must "put our shoulders to the wheel," as others have often done, and devise some means of meeting the difficulty. The present Council has been in an unfortunate position since it first accepted office. They found themselves heirs to a very large amount of debt, which ought to have been previously discharged. That debt amounted to between £6300 and £6400, and out of our limited income we have paid about £2000, so that our debt now stands at about £4300. According to our charter and bye-laws we ought never to be in debt. The expenditure of the year should be the yearly income ought to balance, and nothing should be left outstanding. You will agree with the Council when I say that, when we find ourselves with a very limited income—which is often the case with scientific societies—the position of having to discharge large amounts in payment of debt places us in a very unfortunate position.

RETIREMENT.

This year, I regret to say, in the interests of horticulture, we have been obliged to diminish the number of prizes so as to curtail our necessary expenditure—even in those legitimate prizes in which the Royal Horticultural Society ought to be very liberal indeed. With respect to the skating rink, we no doubt diverted a small portion of the funds from the legitimate pursuit of horticulture. We felt, however, that the income derived thereby would give a corresponding amount, which could be devoted to the interests of scientific horticulture. Sir Coutts Lindsay reminds me that the sum to be paid was £1000. How happy should we be if we could get £1000 towards the cultivation of scientific horticulture! I must say that we come before you with all possible confidence, and ask you to ratify what we have done.

THE SKATING RINK.

I may say that a great point in connection with the skating rink question is that not one shilling of the Horticultural Society's money has been, or would have been, expended on the construction of the rink. The agreement we concluded with Messrs. Prince is to the effect that the whole thing is to be done at the expense—that large privilege—should be reserved for the Fellows of the Society, the arrangement being very favourable to the interests of the Society; and thus we feel no hesitation in recommending the scheme for your adoption. Now I do not think I need trouble you further in introducing the report.

EVENING MEETINGS.

What alone remains for me to address you upon, is our horticultural position. You will see, in the report before you, that the Council have established a series of evening meetings for the discussion of horticultural subjects. These meetings have already begun. I was going to refer to the black board behind me for illustrations, but I see they have been effaced. I am told, however, that the meetings have been highly successful.

EXPENDITURE.

I have just been reminded by Sir Alfred Slade of the fact that in the year 1875 our expenditure will be £2400 less than it was last year. The very compendious statement which is now before you will show that the Council have most closely looked into the finances of the Society, and have tried to keep the expenditure down to the lowest possible limit.

LINDLEY MEDAL.

The Lindley Medal was struck last year, and it reflects great credit upon the Society generally. I shall leave Sir Coutts Lindsay, who has taken so great an interest in this matter, to state the arrangement for the delivery of the medal, which is certainly the most important ever issued by the Society. Gentlemen, I have placed these matters before you—they are practical statements. It is quite unnecessary for me to indulge in oratorical flourishes, and I will sit down recommending to you the adoption of the report.

Mr. BATEMAN then asked whether the adoption of the report now before them would be formally moved before criticism upon it would be permitted? He wished to say that he had listened to the Chairman's remarks with a good deal of pleasure. Nevertheless, he could hardly go over the ground as delicately or as daintily as the noble lord had done—so smoothly, in fact, that one could imagine he was careering on the polished surface of the skating rink. He had no feelings of hostility towards the Council, and he did not wish to speak in a hostile spirit and when referring to the report he should confine himself to horticultural matters only. In the second paragraph of the report it is stated "The Council have established a series of evening meetings for the discussion of horticulture. They are convinced that the comparatively small attendance at the ordinary meetings arises from the inconvenience of the hour rather than any inefficiency on their part of the Fellows; and they, therefore, consider that evening meetings may be considered of value both by the Fellows and others engaged in the pursuit of horticultural science." Here now was a statement that there was a small attendance at the ordinary meetings, but it was the opinion of all horticulturists without exception that the meetings were for the cultivation of the science of horticulture. Now, if the Chief Pontiff in the chair, or any of his suffragans, thought that the meetings of the Society were of so little moment that it was not worth their while to attend, it was hardly to be expected that the outside world would pay them more respect. It was to be remarked that all the alterations were made in a non horticultural direction, and that the Council went in for large reductions. He went on to say that the local Fellows—the Kensingtonians—who lived in the neighbourhood, did not appear to have any special interest in horticultural matters. They had in their Society the town element and the country element. The town Fellows had the advantage of these gardens, and could attend all the show during the summer, whereas country Fellows possessed the advantages which sprang from the distribution of new plants. He did not know how much more than £100 (which had been saved by the dispersion of the Orchids) was the salary of an additional doorkeeper at Elvaston Place, but for his own part he should prefer the sight of a few pretty plants, when entering by the old Orchard-house, to the new entrance, even though it be amongst the chalk and plaster effigies of some monsters of the deep. Mr. Bateman went on to say that he could not see why the difficulties and antagonistic interests between the Commissioners and the local Fellows could not be arranged. The local Fellows wanted their arcades, and their hand, and their promenade, but these were no horticultural elements whatever; but still, why should not people have these things as long as they were willing to pay for them? Why should not some arrangement be come to between the Royal Commissioners and the local Fellows, in order that the latter might be provided with whatever accommodation they required? He felt quite certain that the Commissioners would not be slow to give the Fellows all the accommodation they required, and he again said he could see no reason why an amicable arrangement should not be come to between the two bodies.

Mr. WALFORD said he had long taken a deep interest in the affairs of the Society, and had watched the changes which had taken place in the Council, with the hope that they might go on from what was regarded as bad to something better. He was of opinion that they had not been successful in that. The Chairman, who had put everything so pleasantly before them—it really went against his heart to say anything in an opposite direction—said he saw nothing in our present position at which they need be much alarmed. But if his own expenditure nearly exceeded his income, and he found himself surrounded with debt, he should regard the position as a very serious one indeed. He knew very well that the people who lived in the neighbourhood did not feel the same interest in horticulture that others

did. He should not trespass on the attention of Sir Alfred Slade, as he saw now, what he had perceived before, that when Fellows were addressing the chair, the members of the Council were holding a conversation. He should stop if he saw the conversation renewed. (A pause.) The fact was that the local Fellows had made the gardens into a nursery—very different indeed from the sort of nursery originally designed. They had not been successful, and the time had arrived when they ought to take some steps to have a remedy applied. He asked whether it would not be prudent to go to the Commissioners and treat with them, if, as had been said, the very existence of the Society depended on the Commissioners. Why not put the whole case before them, and say that a number of gentlemen both in London and the country had joined the Society to promote horticulture, but that horticultural purposes were being wiped away to make room for other purposes? It was with great regret he saw the name of Mr. Smee withdrawn from the list of the Council; and he was reminded of the gloomy condition of the Society by the black board which stood behind the Chairman.

The CHAIRMAN said that the Council had approached the Commissioners on many occasions. Mr. Smee's name had been eliminated as one of those who had made the smallest number of attendances.

Mr. G. F. WILSON assured the meeting that, for a considerable time past, Fellows deeply interested in horticulture had said to him they would retire, as so little was being done for horticulture. He had told them not to be in a hurry, but to wait for the good time. He thought that everything which was possible to be done to introduce a better state of things should be done at once. The Chairman had spoken about the feelings of Englishmen, but he (Mr. Wilson) thought that the Chairman and Council were open to a charge very objectionable to Englishmen, and which was a want of pluck. He applied that to the subject of country shows. Why had not the subject been mentioned in the report? When the show was held at Bury St. Edmund's it was an untried experiment; but what had been an untried experiment then was now, with ordinary good management, an ascertained success. Therefore the Council showed want of pluck in not encouraging country shows.

Sir HENRY TIRING wished to say what he considered he was bound to say on behalf of the Royal Commissioners. He wished to allude to himself respecting some advice he had given to the Commissioners lately, and he wished to say a few words upon the legal aspect of the question, having for twenty-four years taken a very great interest in the Society. He might say he was no longer a Commissioner. As to the legality of the Council, when the revolution occurred, either for good or bad, the Commissioners sought the advice of the law officers of the Crown, and the latter said, in their opinion the Council was illegal. Consequently, the Commissioners did not appoint the Expenses Committee, as they were brought to a deadlock. The Commissioners did not think it their duty to interfere, but simply to let matters alone. The Commissioners were perfectly willing when the present, or the next Council, obtained an opinion from the law officers of the Crown in their favour, to at once acknowledge them. The Commissioners never had the slightest hostility or ill-feeling towards the noblemen and gentlemen on the Council. The Commissioners never had the slightest feeling as to the revolution, but they were advised by the law officers of the Crown that the actions of the Council were illegal. The next question referred to the unfortunate rink. He believed he was in this matter the most guilty person, for, when he was asked whether in his opinion it was legal to devote any portion of the gardens to the purposes of a rink, he pronounced it with the greatest confidence to be illegal. He told the Commissioners this—"It is illegal, and we cannot allow it." That was the whole history of that affair. He was perfectly certain there was no more hostile feeling on the part of the Commissioners in refusing to sanction the skating rink than in any other matter. The refusal to sanction the rink was not the result of hostile spirit, but was a mere question of law. If ever there was a clear case of ordinary common sense and of legal common sense, it was this. It was perfectly impossible for a Commission established for the promotion of science and art to allow a Society which was established for scientific horticulture to put up a skating rink. Whatever might have been the intention of the Council, or whatever had been the speech of the Chairman, there appeared to have been something more in their minds when the report was penned. He did not blame them for it, but he was authorised to say on behalf of Her Majesty's Commissioners that their intentions had never been in the remotest degree hostile to horticulture. The Commissioners considered themselves equal partners in the promotion of horticulture, and it was their wish to promote it. Whatever might have been said of the Commissioners he was authorised to say that they never had any wish to do anything but to promote the objects of the Society in every pos-

sible way. So far as regarded horticulture, and now as to the appropriation of the land. It had been whispered that the Commissioners wanted to build upon the land. Now he was authorised to say that proposition had never been submitted to them—he meant the proposition to build upon the Horticultural Gardens. He was authorised to say such a proposition was never brought before them; that they never for one moment thought of such a proposition, and that they never held any intention on the subject. It appeared to him that the agreement or arrangement of the Society with the Commissioners was drawn in a worse and a more loose manner than any Act of Parliament he had ever seen or drawn. He could say on behalf of the Commissioners that they never thought of determining the lease, or of putting an end to the Society in order to benefit themselves. Now, he wished to address a few words to his brother Fellows, the "Kensingtonians." With great deference to the noble Chairman, he could not but think, after reading the report, that it did not bear a pleasant aspect as regards the Commissioners. He had now nothing to do with the Commissioners. He might say in the language of Shakspeare, "My withers are unprung." Since they were, however, in a great measure dependent upon the Commissioners, he did not think it was wise to use terms which appeared to him to be—he would not say offensive, but assuredly not calculated to conciliate the Commissioners. He did not want to find fault with the Council. He thought that meeting ought to authorise the Council to consider some of the sentences in the report, and either to confirm these sentences or re-cast them. If they did that it would not be the slightest reflection upon the Council or the Society. He should also suggest that, after reconsidering their report, the Council should take steps to establish their own legality.

Mr. SHIRLEY HIBBERD felt there were so many unsatisfactory passages in the report, the Society appeared to be in so unfortunate a condition, and the Council had seemed to be without a definite policy—and therefore he should move that the report be referred back to the Council for reconsideration. He would point out one clause in this report which he could not allow to pass, after the Chairman said as it was intended to appear up between the two authorities. It was impossible for them to be on friendly terms, or even on proper business terms, with Her Majesty's Commissioners, when they had in the report a paragraph which told them that Her Majesty's Commissioners attempted to get the lease voided, so that the Society should be cast upon their mercy to receive some dole. That sentence jarred upon the whole of the proceedings that had then appeared to be no other course open than to ask the Council to take back the report and reconsider it. He begged to move, as an amendment, that the report be referred back to the Council for further consideration.

Dr. DENNY said, that, considering the way in which the Chairman spoke, and the conciliatory way in which he mentioned the Royal Commissioners, he (Dr. Denny) looked upon the report as one drawn up in the worst possible taste, besides being untrue. They had no right to say that Her Majesty's Commissioners intended to take their lease from them. They seemed to forget that, if the lease was voided, it was voided by themselves, and not by the Commissioners, and simply because they did not pay their rent to the Commissioners. The report alleged what was not true, and as it was quite impossible for them to pass the report as it now stood, he had much pleasure in seconding the amendment moved by Mr. Shirley Hibberd. They were told they were to save £2500 next year; but what was it to be saved out of, if not out of horticulture and shows? The first thing the Council did was to do away with the salaries of the staff upon which the Society leaned. What were they to do if their staff were to be done at Chiswick? Were they to have no science there, no records kept or published? Was the Society to be concerned a nonentity as far as horticulture was concerned? They must recollect that gentlemen on the Council were elected for a certain purpose. He did not find fault with the South Kensington interests, which certainly had a right to be represented but not to sweep off everything. The President of the Society was a South Kensingtonian, so was the Vice-President, so was the Treasurer, so was the Secretary; and so were the members of the Finance Committee, and so were the members of the Horticultural Society, who were not South Kensingtonians had not a voice in the matter at all. How, he should like to know, were they going to pay their rent next year? If they were about to do so, they ought to do it at once, and not leave it until Her Majesty's Commissioners chose to take proceedings, and when the Society would not be in a position to make any terms whatever. If they could not pay their just debts, they ought to have some means of doing so. It would have been much better if the Council had proposed to their wealthy inhabitants of South Kensington to put their hands in their pockets and pay off the debenture debt. There were thousands of rich people in South Kensington who could pay it, and it would only cost

the Fellows about £17 each to pay the amount off. That would be better than to go begging to people who had nothing at all to do with the matter. With regard to horticulture, they ought to show what was to be taken off and what put on. Anything should be done before they touched their stamps and money; a right to ask gentlemen whose time was valuable to give it to the Society, and in addition pay a considerable sum for railway fare?

THE CHAIRMAN asked Dr. Denny what gentlemen he was alluding to?

Dr. DENNY: I am referring to your scientific staff. THE CHAIRMAN: Well, then, what about the Council?

Dr. DENNY: I am simply referring to our scientific staff.

THE CHAIRMAN: But all the members of the Council are unpaid.

Dr. DENNY: I am quite aware the members of the Council were unpaid, but still he asked the question, Would any man work without pay? Would their lawyer work without pay? Next year, when they had to pay their rent, they would find that horticulture would be cut down to nothing.

Mr. HAUGHTON congratulated the Chairman upon his speech—a speech which was an announcement of a total reversal of policy. It announced that, at the last moment, the Council had ceased to wage war against the Royal Commissioners, and that, practically, a treaty of peace had been entered into. He had hoped to have heard something about the details of the treaty, and something as to the real state of the Society and the loss which was the result of ill-adviced warfare. On both points the meeting had nothing but promises. They were told they were to have a great reduction of expenditure next year, but how that reduction was to be effected they did not know, for no estimate had been laid before them. They had nothing but a bare statement placed before them; but it was wrong to do every one in the room that a reduction must be effected if they were not to forfeit their lease and be turned out of their gardens. Having criticised the accounts submitted by the Council, Mr. Haughton said there was one thing they should keep in mind, and that was, not to quarrel with one another. They must be unanimous in insisting upon the Council carrying out their policy, and to come to satisfactory arrangement with Her Majesty's Commissioners at the earliest possible time. It would be most desirable, when that was done, that the result should be announced to a meeting of the Fellows. The Chairman had told them that Her Majesty's Commissioners considered they had some cause of offence before the skating rink was commenced; but really the Fellows had some cause of complaint, that they had not been consulted. He hoped something would be done to ensure peace, lasting and durable. He thought that the concluding words of the report ought to be struck out, and if they were not, he should support the amendment.

Mr. QUILTER said he was anxious, as a country Fellow, to see some amicable means adopted by which this controversial strife should be ended. He did not think the Council could refuse to send back the report, so that the words which reflected on Her Majesty's Commissioners should be expunged. If that was not done, let an independent committee be appointed to seek an interview with Her Majesty's Commissioners in order to come to some arrangement with them. What, he asked, had the Kensington Gardens done to benefit horticulture? The whole object seemed to be to raise money for the benefit of these gardens. He should be anxious that either a committee or the Council should undertake to seek an interview with the Royal Commissioners, and see what were the best terms into which they could enter with them. He should be exceedingly sorry to see the gardens done away with; but there were many ways in which they could be helped, as the Prince Consort had wished to do. What they wanted was to give the people something to see and hear, and not give exclusive rights to the people of the locality. As a country Fellow, he did not see what advantage it was to him to continue his subscription to the Society. He begged to support the amendment, and hoped the Fellows present would vote for it; and he trusted that before it was again presented the Council would seek an interview with Her Majesty's Commissioners.

Sir ALFRED SLADE gave some explanations of the figures quoted by Mr. Haughton, and then

Mr. EDGAR DOWRING addressed the meeting, stating that he spoke as a member of the Royal Horticultural Society, and not as a Royal Commissioner. He had listened with much pleasure to the speech of the Chairman when opening the meeting, and he hoped the time was not coming when amicable arrangements would be entered into between the Council and Her Majesty's Commissioners. He entirely endorsed the remarks made by Sir Henry Thring. He was unwilling to take a hostile step towards the Council, but now that a motion had been brought before the meeting to refer back the report he could not think he

should show any hostility to the Council, but, on the contrary, show his good will, when he said he would support this motion—that the report be sent back for reconsideration. He should only say that he hoped the result of the meeting would be to place the Council in a legal position. The Chairman said that seven times the Expenses Committee were asked to meet, and that the Royal Commissioners seven times gave a refusal; but really that was not because the Royal Commissioners did not want to sit, but because there was an expressed opinion by the law officers of the Crown that they could not meet. The suggestion about the skating rink was altogether outside the province of the Expenses Committee. The CHAIRMAN observed that he had only asked the question to be discussed—not to be sanctioned.

Mr. BOWRING said that, under the Act, the Society could not appropriate any of their land to the purposes of a skating rink, nor could the Commissioners approve any such appropriation. It seemed to him better to refer the report back to the Council, and he hoped the result of the meeting would be, that the present Council would be declared legally elected. The CHAIRMAN said it was now time to declare the course the Council felt it they ought to pursue. He asked the Fellows to do a little trust in the Council which had carried on the affairs of the Society during the past two years. The Council had heard with the greatest possible satisfaction it was not the intention of the Commissioners to build on the gardens. They accepted that as a most gratifying fact, and he should not state the evidence upon which the Council thought it was otherwise. Again, they heard that the Royal Commissioners did not intend in any hostile sense to determine the lease of the gardens, and the Council accepted that statement as frankly as it was given, and certainly with sincere delight. But if the meeting were to come to a resolution that the report should be sent back, then, before the meeting did that, he should ask them out to turn out their Council. Surely the Council had some self-respect left. If the meeting told the Council to take back the report, of course the Council would at once resign; but it would be childish to say the Council would not again look at the report and endeavour to arrive at some amicable solution of the difficulty. If the amendment was put to the vote the Council would be bound in honour to stand by their report, and the Fellows knew it; and he asked them not to place the meeting in an awkward position.

Mr. GODSON: I move that the discussion be adjourned to this day month.

Mr. HAUGHTON: And I second the motion.

Mr. SHIRLEY HIBBERD: On the understanding that we adjourn, so that the report be reconsidered. I shall, with great pleasure, withdraw my amendment, and further discussion of the report adjourned to the second Tuesday in March.

A vote of thanks was given to the noble Chairman, and the meeting separated.

Obituary.

MR. W. R. BRAGG, OF SLOUGH.—This well-known florist, once a keen exhibitor, but who of late years has seldom been heard of outside his own immediate circle, died very suddenly, at his residence, on the morning of Thursday, the 4th inst., in the 70th year of his age. William Roland Bragg was born in the Royal Mews, at Windsor, and was the son of a coachman in the service of his late Majesty King George IV. Evincing a liking for flowers and their culture in his early days, he was, when quite young, apprenticed to the head gardener at Lord Sefton's, Stoke Farm, near Slough, but afterwards left the garden, and became book-keeper to Messrs. Lillywhite, Moody & Thumwood, the coach proprietors at Windsor. Subsequently he became a licensed victualler at Slough, having been landlord of the North Star Tavern for something like twenty-seven years. Though he gave up the profession of a gardener so early in life, he did not cease to be a cultivator of flowers, and as an amateur exhibitor he gained considerable renown. He was a grower of Pinks, Carnations, Picotees, Dahlias, Hollyhocks, Pansies, Sweetwilliams, &c., and one of his greatest triumphs as an amateur was the winning of a cup, value £20, with Dahlias, at Birmingham, in 1849.

Eventually he entered into business as a florist, cultivating some ground at the back of the hostelry so long associated with his name, which was known as the North Star Nursery. This was the exhibition place of the once well-known Slough Dahlia Show. He was a much-respected contemporary of such well-known florists as John Edwards, C. F. Locher, George Weedon, Richard Staines, and others; that he now associate with the old school of floral enthusiasts.

Of late years he obtained some notoriety as a cult-
vator of a fine break of Sweetwilliams, known as Hunt's
strain; and to the last he continued his business, and
raised Hollyhocks, Pansies, &c. That somewhat
over-rated leading Pansy, Cliveden Blue Improved,
originated as a sport at the North Star Nursery.

He was a most genial, good-natured man, a pleas-
ant social companion; and though the later years of
his life were somewhat clouded by adversity, he
passed away amid many regrets; and numerous cul-
tivators of florists' flowers, both past and present, will
cherish his name with kindly remembrance.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,
FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 10, 1875.

MONTH AND DAY.	BAROMETRICAL.		TEMPERATURE OF THE AIR.		HYGROMETRIC DEGREES FROM GLASSER'S TABLES 3rd Edition.	WIND.	RAINFALL.		
	Height Reduced to Sea Level.	Direction.	Highest.	Lowest.

10	30.00	W.	40.22	33.8	4.6	3.7	8.4	E.S.E.	0.00

— In England, the extreme high temperatures
observed by day ranged between 65° at Sunderland
and 41½° at Nottingham, the general average all over
the country being 49½°. The extreme low tempera-
tures observed by night varied from 29° at Bir-
mingham to 21½° at Nottingham, the general average being
26°. The extreme range of temperature in the week
was 23½°, being as large as 37° at Sunderland, and as
small as 19½° at Birmingham. The mean high day
temperatures ranged from 48½° at Sunderland to 36°
at Nottingham, with an average value of 43½°. The
mean low night temperatures varied from 35½° at
Leeds to 30½° at Bristol, with a general average of
33°. The mean daily range of temperature in the
week was 10½°, varying from 13½° at Sunderland to
4° at Nottingham.

The mean temperature of the air for the week was
38°, being 1½° higher than the value for the corre-
sponding week in 1874; the highest reading in the
week was at Sunderland, 41½°, and the lowest at
Nottingham, 33°.

The amounts of rain which were recorded at the
different stations were generally small; at Liverpool,
Manchester, and Eccles nearly four-tenths of an inch
was measured, being considerably larger than the
amount recorded at other stations; at Bristol one-
hundredth of an inch only was recorded, and at Leeds
no rain fell. The average fall over the country was
rather more than one-tenth of an inch.

The weather during the week was fine; cold and
frosty, with dense fog, on the morning of the 6th.

In the suburbs of London the reading of the bar-
ometer at the level of the sea decreased from 30.67
inches at the beginning of the week to 29.99 inches
by the afternoon of February 7; a steady increase
then occurred, and by the evening of the 5th, 30.38
inches was reached; it then turned to decrease, and
by the end of the week 30.20 inches was recorded.
The readings were all in excess of their averages
except that of the 3d, which was 0.02 inches in defect.
The mean reading for the week was 30.25 inches,
being 0.22 inch higher than that of the preceding
week.

The highest temperatures of the air at 4 feet above
the ground ranged from 49° on February 1 to 38° on
the 5th; the mean for the week being 43°. The
lowest temperatures of the air ranged between 35° on
the 3d, and 27° on the 6th, with a mean for the
week of 31½°. The mean daily range of temperature
in the week was 11½°, the greatest range being 16° on

the 1st, and the least, 7°, on the 3d. The mean daily
temperatures and the departures from their respective
averages were as follows:—January 31, 38.4°, + 0.1°;
February 1, 40.4°, + 1.5°; 2d, 38.5°, + 0.7°; 3d,
38.5°, + 0.3°; 4th, 41.6°, + 3.2°; 5th, 34.4°, -
4.2°; 6th, 32.3°, - 0.8°. The mean temperature
for the week was 36°.9, being 1°.9 below the average
of sixty years' observations.

The highest readings of a thermometer with black-
ened bulb in vacuo, placed on grass in the full rays of
the sun, were 96½° and 80½° on February 1 and 4,
but on the 3d it did not rise higher than 49°. The
lowest readings of a thermometer on grass, with its
bulb fully exposed to the sky, were 29° and 24° on
the 4th and 6th; the mean for the seven low readings
being 28½°.

The weather during the week was fine, but cold.
The sky was entirely covered with cloud on the 2d,
on which day slight fog prevailed.

Rain fell on one day, the amount being 0.04 inch.
In Scotland, the highest temperatures ranged from
55° at Paisley to 48° at Greenock, the lowest tempera-
tures varied from 25° at Greenock to 18½° at Aber-
deen, their averages being 51½° and 22½° respectively.
The mean range of temperature was 29°.

The mean temperature of the air for the week was
37.8°, being 3½° below the value for the corresponding
week in 1874; the highest happened at Glasgow, 39½°
and the lowest at Greenock, 36½° nearly. Rain fell
at Aberdeen to the amount of four-tenths of an inch,
but at Paisley and Perth five-hundredths of an inch
only was measured, the average fall over the country
being two-tenths of an inch nearly.

At Dublin, the highest temperature was 54½°,
the lowest 23½°, the mean 42°, and the rainfall 0.30 inch.
JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—In the
autumn, when plants are got into their winter quar-
ters, it frequently happens that insufficiency of room nec-
essitates the stock being placed closer together than
consistent with their well-being, yet, whilst compara-
tively dormant, they do not receive so much injury as
when growth commences. Where such has been the
case means should at once be taken to give the plants
in the hard-wooded house more room, as growth of
the shoots and swelling of the bloom-buds will with
many things shortly commence. Room for these will
now generally be found in the place of a portion of
the *Aralias* and similar plants that are being brought
on into flower, or a late vinery may often with ad-
vantage be used for this purpose, so essential to the well-
being of the stock, especially during the earliest stages
of the season's growth. If any old plants exist of that
most useful decorative subject, *Aralia Sieboldii*, that
are furnished with cuttings, these should at once be
taken off and struck in heat; when rooted, potted on,
and growth encouraged by the time that frosts are
over, they will, if they are plunged out-of-doors in a
sheltered sunny situation, make nice small conservatory
or room decorative subjects for the ensuing winter;
but by far the best method of increasing the plant is
from seed, which is sown during the spring, and grown
on under glass through the summer, and wintered
out of the reach of frost, they will make splendid
plants the second season. Where any exist that were
raised from seed last season, and are now transferred
to 10 or 12-inch pots, according to their strength,
they will get well established before the time for
plunging them out arrives; so treated, almost every
plant will bloom, throwing up in the autumn their
large panicles of white flowers, that will last for
weeks. Independent of its bloom, it is one of the very
best subjects in existence for standing in situations
where plant-life can scarcely exist. There are few
things, except some succulents, and some of the
Palms that will thrive in a low temperature, that
equal this *Aralia* as a room plant; even far away
from a window, such as in an entrance hall, it will
retain its leaves, healthy and fresh, for as many months
as the generality of plants would for days: when its
properties in this respect are better known it will be
more than extensively grown. Where there is a
considerable demand for decorative things of this
description each spring a few small plants of *Draena
australis* should be procured, both for using in a small
state and for growing on to succeed others that get
too large, and which find a suitable place in the con-
servatory, corridors, or similar situations, where their
elegant habit of growth is seen to the best advantage.
The stronger-growing *D. Draco* is another most useful
plant for this purpose, and if procured in a small
state, by liberal pot-room and an occasional
application of manure water, it will soon grow into a
handsome size. A few small plants should also be
periodically added to the stock of the most useful
varieties of *Yucca*, such as *Y. aloides variegata*, *Y. albo-
sphaica*, *Y. filamentosa*, *Y. quadricolor*, and its finer form,

Y. Stoketii. They have everything to recommend
them in the way of their adaptability for associating
well with each other, or with flowering plants, and may
be placed for a time without injury where many things
would die or suffer seriously. Where plants of *Yucca
aloides variegata* exist that have got old and naked
at the bottom, or too large for the place they have
to fill, if about 2 feet of the head is cut off, the bottom
leaves removed for 6 inches, and the top, so prepared,
inserted in peat and sand in equal parts in a little
heap, they will root directly; sections of the hard
stem taken off an inch and a half in length, and in-
serted half their length in sand in a peat-pan, will
root and push growth during the summer in heat.
The propagation and attention in growing on of all
such things as these is much better done at once than
deferred to later in the spring, when there are things
innumerable requiring attending to.

ORCHIDS.—Potting and top-dressing must be pro-
ceeded with as the plants indicate signs of growth.
Miltonia Moreliana, and the varieties of *M. spectabilis*,
succeed best when grown in shallow perforated pans
or baskets, suspended from the roof, in a conservatory,
will root and push growth during the summer in heat,
and part of the Mexican-house, where they can be con-
veniently shaded. *Miltonias* require more shade than
the occupants of the Mexican-house generally. For
potting use good fibrous peat with a little sphagnum.
Good drainage is indispensable, and the plants should
be cleaned previous to being potted. They frequently
get infested with white scale; these can easily be got
rid of by washing the plants over with soft soap and
tobacco water; to do it effectually the mixture should
be allowed to remain on the plants for some time; they
should afterwards be washed with tepid rain-water.
The small-growing *Cattleya Aclandiae*, *C. marginata*,
and *C. Regnellii*, that require repotting or blocking,
should be done as soon as they show signs of starting
into growth. These small *Cattleyas* are rather more dif-
ficult to keep in health than the stronger growing kinds;
they, nevertheless, succeed very well when grown in
small pans or pots suitable to the size of the plant.
They should be suspended from the roof, where they
can obtain a good circulation of air, and have plenty
of light. For potting, use fibrous peat and a few
lumps of charcoal, with good drainage; the plant
must be a little elevated above the top of the pot.
Care must be taken not to over-water them—once or
twice a week will be sufficient. Under the above
treatment I have found them to continue in health a
much longer time than when grown on blocks. The
constant changes from drought to saturation, when
grown on blocks, weakens the constitution of the
plant so much, that after two or three years they
begin to decay, and in nine cases out of ten *C.
Aclandiae* dies. *C. superba* should be grown in the
way recommended for the above, but it requires
the heat and moisture of the East India house when
making its growth. A few of the *Dendrobiums*
are now starting into growth; these require an
increase of water at their roots; those plants requiring
larger pots or baskets should be shifted as soon as
the growth is fairly started. An increase of moisture
will be necessary after the spring, and in December.
A dewing over with the syringe will be found very
beneficial to such plants as *Aerides* and *Vandas* which
have been repotted. *G. Baker, Clapham Common.*

SOFT-WOODED GREENHOUSE PLANTS.—*Mignol-
lette*, if the plants have been well managed, will now
come in very useful; if they are kept a few degrees
warmer than ordinary greenhouse temperature the flowers
will come stronger, but the plants should be placed near
the light. *Pelargoniums*, both show and fancy sorts,
should have enough sticks placed to them to keep
them in shape; this is necessary, and must be done at
once, so as to keep them open and allow the light and
air to get to the centre of the plants. *Zonalas*, if kept
in a temperature of 45° in the night with a dry at-
mosphere, will flower freely and be useful for cutting or
conservatory decoration. *T. Baines, Southgate, N.*

FLOWER GARDEN, &c.

PARTERRE AND MIXED GARDEN.—Any alterations
necessitating the removal and relaying of turf, or the
transplanting of deciduous trees and shrubs, should
now be brought to a close as soon as possible. If this
work is deferred and the spring sets in dry, it will
entail much labour to get the things properly
established. Continue to eradicate weeds, and
look closely to the margins of walks and beds,
and if they are found to be at all unlevel, ram down
and roll. After getting the whole level and firm,
the verges should be neatly cut with a sharp edging-
knife. By doing this every spring the clipping during
the summer, is greatly facilitated as a man can then
go quickly over them with the edging shears, and
keep them sharp and well defined. If the grass
is all mowed as frequently as occurs on poor,
sandy soil, or if it is at all thin and poor,
or shows signs of exhaustion from frequent cut-
ting or any other cause, it should now receive a
good top-dressing. Rich vegetable mould is best for
this purpose, and to this should be added a good
quantity of soot, wood-ashes, and lime, and the mass
will soon disappear and give place to fine grass.

Soot is a powerful fertilizer, and imparts that rich healthy green to grass so desirable as a setting to gay flowers. The texture and appearance of grass is much improved by frequent sweeping and rolling; therefore the broom and roller should not be idle when opportunity offers for their use. Walks, too, will now require free use of the roller to get them thoroughly consolidated after the loosening they have had from the frost, and before dry weather sets in any that are dirty or discoloured should have a sprinkling of bright gravel, and be well rolled down. Walks kept bright and clean in this way impart an air of comfort, and give a cheerful tone to the whole place.

Borders containing herbaceous plants, bulbs, &c., if not already done, should be neatly forked over, as may be first pushing through. Advantages should be taken while working among them to reduce such as have become too large, or to divide and increase such as are choice and desirable. Bulbs of any of the *Liliums* may now be planted. These are very effective in shrubby borders backed up by evergreens, or among thinly planted Rhododendrons, in the peat beds of which they revel. The bulbs should be planted 6 inches deep, and have a handful of sharp sand scattered over them to prevent them rotting. *Gladioli* for early coming may now be planted, and should be treated in the same way. Plant *Kaunuchias* and *Anemones* in deep rich soil, with a pinch of sand round them, and sow seed of the latter for blooming in autumn. *Roses* and other climbers on walls and trellises should now be pruned, regulated, and tied in, and any standard or dwarf perpetual varieties required to bloom early should be pruned at once, but the main lot should be left till later. No time should be lost in sowing seed of such of the subtopical and other hardy plants as require time to get them into planting size. Some of these may be enumerated as follows:—*Wigandias*, *Solanums*, *Melanthus*, *Ferandinandis*, *Cineraria*, *Acacia lophantha*, *Centauria*, &c. Such things as *Beta Cicla*, *Ricinus*, *Zaas*, *Amaranthus*, and others of quick growth, should not be sown till April, as they only get checked and stunted. A few *Sweet Peas* and *Mignonette* may be sown for early blooming. Divide and place in heat such things as *Cannas*, and start all stock plants required for propagating purposes. Roots of *Aralia pycnantha* put in a pot, and will make fine plants in June. *Aralia variegata* is a fine thing, being much superior to *Thomsoni*. If placed in heat now it will soon afford a good supply of cuttings. Tricolor and other choice variegated *Pelargoniums* should be enjoying a little gentle heat, so as to afford a batch of cuttings. These may be partly severed, and left on the plants a week or so to callus, after which they may be entirely severed and inserted in small pots with a certainty of them rooting if placed on shelves near the glass. Push on the propagation of all kinds of bedding plants from stock plants previously placed in heat for that purpose. Most bedding plants are better from spring-struck cuttings, and a sufficiency of these should be grown on, so as to be able to discard the old stock plants. Such things as *Mesembryanthemum cordifolium variegatum* will be found to root more readily on shelves near the light than in close, moist propagating boxes, as such places are only suited to cuttings containing but little moisture in their stems. The old neglected *Verona variegata* is one of the best and most pleasing bedding plants now in vogue, and forms a pleasing contrast if mixed with one of the variegated *Pelargoniums*. Seed sown in heat now will afford nice plants by May, and old roots may be cut up and divided. Place in heat roots of any choice *Dahlia*s. These should be plunged in a bed of old leaves, tan, cocoa-nut fibre, in either of which the young shoots root freely, and they can then be taken off with safety, and potted in loam vegetable soil. *J. Sheppard, Woolverstone Park.*

FRUIT HOUSES.

At about the commencement of March it is customary to start a batch of suckers, which are intended to provide plants to give a supply of ripe fruit from about December and onwards through the spring and early summer months. The present expeditious method of cultivation dispenses with considerable labour which at this time was formerly necessary in overhauling the principal part of the whole stock of plants, stripping off the lower leaves and soiling up the stems to induce new roots therefrom, and in some cases even shortening it back a bit. Preliminary arrangements are nevertheless to a certain extent still required with regard to materials which will be wanted for use in potting, and the necessary preparation of the fermenting bed in some close structure, which will generate and maintain a temperature near the surface of it of from 80° to 90°; where an abundance of fire-heat will not be necessary to keep up a degree of warmth of from 55° to 65° regularly; these matters should have immediate attention if not already done. If a number of the best developed plants were selected at about the beginning of last December, and were stimulated by an advanced temperature and other suitable requirements, as have

been from time to time indicated in this Calendar, these will now be showing fruit. It is in most cases both desirable and profitable to advance the ripening of the fruit of these as much as possible; therefore the temperature about them should be well sustained at a mean of 70°, with 5° or 10° more under favourable conditions. Ventilate as before advised, and economise fuel as much as possible whenever sunshine assists. If such plants can be afforded a suitable structure together it is much to be preferred; otherwise they should occupy the hottest end in the house. With the fruit advancing the plants will want more water at the roots. It will also be necessary to go over the stock once every week, as other plants will with increased light and heat, require it also. Recently started plants, which are intended to furnish a succession of ripe fruit to those already named, should not be hastened on too rapidly; 65° at night, and 70° in the day-time, artificially, will suffice throughout the present month. *G. T. Miles, Weycombe Abbey.*

CUCUMBERS.—A fair amount of sunshine during the past fortnight has wrought wonders in the progress of Cucumbers, and very healthy growths, with good supplies of fruit, have resulted. The early salmon season is now fully in, too, which always increases the demand. Lent is also in, when Cucumbers, to be served with fish, are sure to find sale in many quarters; hence the importance of securing a good supply just now. The general treatment for the ensuing fortnight remains much the same. A little more moisture, both at the roots and in the atmosphere, however, may be safely employed, and the evaporating troughs may be regularly charged in bright weather. A slight increase in the day temperatures may also be permitted. Still be very careful in the admission of air, and don't overlook that injunction which I have ever striven to enforce in regard to regulating the temperature of the fire, and also the water valves; your practitioners often get a hint in this direction. Encourage a free rotation by a repeated introduction of fresh compost, and never omit to cut the plants over regularly at about once a week. Pits and frames must now be thought about, and as fast as they become cleared of winter salads and the like let them be turned to account forthwith, by way of a thorough cleansing and the getting in of the fermenting materials, which must previously have received a thorough course of preparation, preparatory to planting on such Cucumbers and Melons. Pits and frames need never be unoccupied. A good and a lasting heat should be secured; do not, therefore, get in the materials of fermentation before they are well prepared, or it will only end in failure to a greater or less extent. The plants to be turned out, it is presumed, are also in hand. The 1st of March is a good time to turn them out. Those who have no convenience for raising their own plants by that date should court the good offices of a neighbour. *Thos. Simpson.*

KITCHEN GARDEN.

THE MUSHROOM-HOUSE.—All Mushroom beds prepared in early autumn should have borne their crops, and in the order of things now show marked signs of exhaustion; hence, it will be necessary to renew them with as little delay as possible. This may quickly be done when fresh materials have been prepared in readiness. Where these do not exist, however, resort should be had to the necessary collection and drying of such. If practicable, collect the crude horse-droppings direct from the stables, and under no circumstances allow rain or water in any form to reach them. Along with the latter procure all the dry sweepings of a short description, and let them be mixed freely together. Spread them out where practicable on the floor of an open airy shed, and in such a position that they may dry freely. If old beds do not bear at all, then it will be necessary to hasten the matter, and resort must be had to fermentation, in view to dispel all excess of moisture contained in the new material. Turn them over about twice each week, and immediately following each distinct ferment, and when steam is seen to issue freely from the apex of the mass. This is to be followed until such time as it is judged that all excessive and impure moisture is expelled, and only sufficient latent moisture remains in the whole mass to cause a slight fermentation to produce a maximum heat of not above 95°, when they will be in a proper state to form the bed or beds as may be needed. *William Early.*

Answers to Correspondents.

BLACK FLY ON PEACH TREES: *F. T. B.* Your trees are infested with the common black fly, which is a sad scourge to Peach trees, and is very difficult to get rid of. You must persevere in dusting the trees with Pooley's Tobacco Powder. INSECTS: *T. J. Chapman.* The grub which has gnawed your *Pinus* and *Teach* trees are the omnivorous larvae of the weevil, *Otiorhynchus sulcatus*. Their size and white colour render them easy to be discovered on carefully removing the soil round the roots. As they are near the surface, it will be well

to remove the earth and bake it, in order to kill the grubs. *I. O. W.* NAMES OF PLANTS: *Nil Desperandum.* We do not recognise your plant from a single root.—*J. C.* *Myrphyllum asparagoides.*—*J. G. C.* *Abies nigra.*—*W. S.* *Kenodia monophylla*, a very old-fashioned pretty greenhouse plant.—*G. P. S.* *Sibonia argyrostigma*; *Fittonia Pareoni*; *Pileophyllum arcolatum*; *Gymnogramma*; *Aspidogramma*; *Aspidogramma*. The specimen seems to be only a var. of *Berberis aristata*; but it would be better to send again when in flower.—*F. B.* *Berisidea*. *Cyripedium venustum*. The *Oncidium* is apparently *O. cobeletta*; but without leaves or description it is impossible to be certain.—*F. H. G.* *Dendrobium atrypae*, var. *millardii*.—*D.* rhomboid of Lindl. Please send another specimen of the Ceylonese *Dendrobie*.

PEACH BORDERS: *Nil Desperandum.* You must water when it is required. Keep the soil always moist, but never in a soddened state. We should say the borders would require watering in about a fortnight's time.

WHITE PAINT: *F. G.* Nothing better than good white-lead—pure; not, as sometimes happens, adulterated with whitening.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers who send Post Office Orders, to be good enough to write to the Publisher at the same time, stating that they have done so.

* * * Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

SEEDS.
LONDON: Feb. 10.—A brisk business is now passing in agricultural seeds. Red Clovers continue in active request at full rates, the stocks on the market being by no means excessive. Strong home-grown samples come to hand very sparingly, and such qualities realise extreme prices. From the United States our importations thus far have been very limited, both France and Germany having competed with us for their supplies in the American market. White Clovers are hardening in value. In Trefoil the recent advance is more than maintained. Alsike keeps dull. Imported Italian and perennial Ryegrasses meet with an improved inquiry. On account of its great scarcity, Sainfoin seed is dear. A large business at enhanced prices is doing in spring Tares; the rise on the week for all descriptions is fully 2s. per qr. Large Scotch Gores are freely placed at long figures, and Brunswicks are also in great favour. The country generally is this year most unusually bare of both spring and winter Vetches. Canary seed is in diminished request, without being quotably cheaper. An increased demand is shown for white Millet, at an advance of 2s. to 3s. per qr. For blue boiling Peas the trade more animates than for any other articles without change. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.
The market on Monday opened quietly, and closed in a like manner. The condition of English Wheat, somewhat improved, tended to assist the sale a little, at the quotations of Monday last. Foreign Wheat was taken off sparingly, at an altered rate, and a tendency was set downwards. Flour remained dull, with drooping prices. Barley hung on hand, and to press sales easier rates had to be taken. Beans on the spot were firm, with more doing; Peas unchanged in value, and a quiet sale. Oats were taken off rather more freely, at 6d. per quarter less than on Monday. The market for Maize was very difficult of sale except at reduced rates.—Trade on Wednesday was dull, but, influenced by the cold weather, factors were not disposed to accept money for either English or foreign Wheat, the condition of which was comparatively good. Barley and Oats realised Monday's quotations generally, but Maize was again slightly cheaper to sell. Beans and Peas also were drooping, and recent quotations with difficulty supported for flour.—Average price of corn for week ending Feb. 6.—Wheat, 42s. 7½; Barley, 45s.; Oats, 29s. 11d. For the corresponding week last year:—Wheat, 43s. 9½; Barley, 48s. 9½; Oats, 28s. 3d.

CATTLE.
As usually is the case in Lent week, the trade on Monday morning at Copenhagen Fields was dull. Few beasts lower priced than to be taken to close sales; and for a general top quotation, 5s. 10d. to 6s. only could be quoted. The sheep trade was also somewhat disappointing. For very prime and small Down wethers, which were exceptionally scarce, stiff rates were paid, but, as a current topping market rate, 6s. 8d. was quite the extreme. Frying and fat calves were in request, at an advance on top quotations to 7s. per pair. Pigs were not in request. Quotations.—Beasts, 3s. 4d. to 4s., and 5s. 8d. to 6s.; sheep, 4s. 8d. to 5s. 8d., and 6s. 4d. to 6s. 8d.; calves, 4s. 10d. to 5s. 4d., and 6s. 8d. to 7s.; pigs, 3s. 8d. to 4s. 4d., and 4s. 6d. to 5s.—On Thursday there was scarcely any business done in beasts; and, notwithstanding lower prices, trade in sheep was exceedingly dull. Calves being in plenty, the average price was lower. No alteration reported in the rates for milch cows.

HAY.
The trade in fodder at Whitechapel market has been steady and fairly animated, supplying late extreme rates. Quotations.—Clover, best, 11s. 10s. to 12s.; inferior, 7os. to 8os.; hay, best, 10s. 10s. to 11s.; inferior, 6s. to 7os.; straw, 3s. 4s. to 4s. 6d. Cured and Marketed into London last week consisted of 13,749 bags, 109 baskets, and 10 casks from Antwerp; 435 sacks Boulogne, 343 tons Duclere, 36 barrels New York, 160 St. Malo, and 217 bags from Rotterdam.

POTATOS.
With large supplies on sale at the Borough and Spital-fields markets trade has been slow, at easier rates. Regents, 75s. to 85s.; flukes, 110s. to 125s.; Yorkington into London last week consisted of 13,749 bags, 109 baskets, and 10 casks from Antwerp; 435 sacks Boulogne, 343 tons Duclere, 36 barrels New York, 160 St. Malo, and 217 bags from Rotterdam.

COALS.
A steady business was done at market on Monday, at prices ranging between 18s. 3d. and 24s. per ton. On Wednesday the demand for house coals was active on account of the cold weather, and the price advanced 1s. per ton. Hartley's also rose 6d. per ton.

GARDEN SEEDS.
The 6s2. Collection contains 25 varieties of Peas (see Catalogue), carriage paid. **FLOWER SEEDS.** Thirty varieties for 3s. free by post, including German Stock and Aster. **POTATOS.** Myatt's prolific, 1s. 6d. per stone (see our Catalogue); all other kinds equally cheap.

Nursery and Seed Grounds, Seed Warehouses, &c., Cottesham. Established 87 years. Hall Establishment, 61, Market Place.

NEW BEDDING VIOLA WAVERLEY.

We have much pleasure in offering this fine Viola for the first time. Orders are now being booked, and will be executed in rotation after March 1. The flowers are large, of good substance, and produced in great profusion from early spring, until late in autumn. Colour very bright violet, shaded with purple towards the centre; yellow eye, with pure white brow. The most effective bedding Viola of its colour yet raised, and very hardy. Last season it was shown before the Royal Caledonian Horticultural Society at Edinburgh, and the Glasgow and West of Scotland Horticultural Society at Glasgow, and by both Societies it was awarded a FIRST-CLASS CERTIFICATE. Regarding it—
Mr. ROBERT FLEMING, *Gardener to J. C. Wakefield, Esq., Eastwood Park, Glasgow, writes*—
"I have no doubt that when Waverley becomes better known no other Viola of its colour will be used. As regards colour, habit, and density of flowering, it leaves nothing more to be desired. In my opinion, at present it has no equal."
Mr. JAMES GRAHAM, *Gardener to Lady Campbell, Garscube, Glasgow, writes*—
"That for colour, substance, habit, and flowering qualities, Waverley surpasses all the Violas that I know, as much as the best of them exceeds the old Viola cornuta."
Mr. HENRY W. LEWIN, *Gardener to Colonel Buchanan, of Drumneller, Glasgow, writes*—
"We use a great quantity of Violas here, and I have had an opportunity of comparing Waverley with most of the varieties yet sent out. It is the best bedding Viola I have yet seen—having an excellent habit, yielding a profusion of flowers, which are of good colour and very constant, and these I consider to be the principal points necessary in a good bedding Viola."
Mr. DUNCAN McLELLAN, *Superintendent of Parks, Glasgow, writes*—
"I have much pleasure in stating that your new Viola Waverley was thoroughly tested in the Queen's Park during the summer of 1874—having been grown in several situations. The colour is a deep violet with light eye, and its habit similar to Cornuta Perfecta. We grow Violas very extensively, but I consider Waverley the best I have yet seen of its class, both in regard to habit and colour."

Frics: One plant, 2s. 6d.; six plants, 10s.; or 12s. per dozen, post free. Trade price on application. A List of Firms Ordering before March will be published in the *Gardener's Chronicle* the following week.
ROBERTSON and GALLOWAY, Seed Merchants and Nurserymen, 157, Ingram Street, Glasgow, and The Heritage Nurseries, Hulerburgh.

WHEELERS' CHOICE SEEDS.

WHEELERS' TOM THUMB is the smallest and the best CABBAGE LETTUCE. Large packet, 1s.; small packet, 6d., post free.
WHEELERS' KINGSHOLM is the largest and the best COS LETTUCE. Large packets, 1s.; small packet, 6d., post free.
WHEELERS' COCOA-NUT CABBAGE.—Very early and excellent. Large packet, 1s.; small packet 6d., post free.
WHEELERS' GLOUCESTERSHIRE KIDNEY is the best early Potato grown. 3s. 6d. per peck; 15s. per bushel.
WHEELERS' FIRST EARLY PEAS.—The earliest in cultivation. 1s. 6d. per quart.
WHEELERS' GUINEA COLLECTION OF GARDEN SEEDS is a Marvel of Cheapness, as it contains a liberal supply of some of the very choicest Seeds in cultivation, and is delivered, carriage free by rail, to any part of the Kingdom. Special attention is called to the fact, that Wheelers' First Early Peas, Wheelers' Tom Thumb, and Kingsholm Cos Lettuce, Wheelers' Cocoa-Nut and Imperial Cabbages, are included in the Guinea Collection, and that this is the cheapest and most economical method of purchasing really choice Garden Seeds.
WHEELERS' GARDEN ORDER SHEET contains the Lowest Prices of the choicest Garden Seeds, Flower Seeds, and Seed Potatoes in cultivation; with columns ready for the quantities required to be filled in; thus rendering the usual troublesome matter of making out a "Seed Order" excessively easy; it will be forwarded gratis and post free. It contains a complete List of all the Best Varieties.

WHEELERS' CHOICE GARDEN SEEDS AND POTATOS, to the value of 20s. and upwards, are delivered, Carriage Free by Rail, to any part of the Kingdom.
J. C. WHEELER & SON, SEED GROWERS, GLOUCESTER, AND 59, MARK LANE, LONDON, E.C.

MAURICE YOUNG'S NEW DESCRIPTIVE CATALOGUE

It is now ready, and may be had on application.
IT COMPRISES:—
HARDY JAPANESE and other CONIFERÆ.
HARDY ORNAMENTAL TREES, SHRUBS, and EVERGREENS.
RHODODENDRONS in fine named varieties; PONTICUMS, and other common kinds for covers.
ROSES, Standard, Half-standard, and Dwarf, in all the best kinds.
FRUIT TREES.
CLEMATIS, and other climbing Plants.
Cheap EVERGREENS and DECIDUOUS TREES and SHRUBS for Planting Belts and Shrubberies.
TRANSPLETED FOREST TREES.
QUICKS, and other Hedge Plants.
DWARF EVERGREEN and VARIEGATED PLANTS for Winter Bedding, &c.

DESIGNS, PLANS and ESTIMATES prepared for Laying-out and Planting New Grounds, and for Improving Park Scenery and Existing Shrubberies and Plantations.
MILFORD NURSERIES, near GODALMING.

PLANTING SEASON. RHODODENDRONS.

WILL BE SUPPLIED, In Fifty of the most Popular and finest known Hardy Kinds, Sturdy, Bushy Plants, 1½ to 2 feet high, at £10 per 100, Carriage Free to any Railway Station in England. Many of these are Raised from Layers, and better Plants of their height cannot be desired or obtained.
A Descriptive Catalogue free on application to ANTHONY WATERER, KNAP HILL NURSERY, WOKING, SURREY.

AZALEA INDICA—VAN HOUTTE'S SEEDLINGS, in fine bushy heads, full of buds, from 8 inches to 1 foot in diameter.

PAUL'S ROSES.

"Mr. Wm. Paul has been deservedly placed at the head of English Rose growers.—Standard."
"The Roses of Mr. Paul are things to see once and dream of for ever."—Atheneum.
"Mr. Wm. Paul is famous for his Roses all over the world."—Graphic.
"Mr. Paul is the most successful Rose Grower in England."—Journal of Agriculture.

WILLIAM PAUL,
PAUL'S NURSERIES, WALTHAM CROSS, HERTS,

Begs to announce that his **ROSE CATALOGUE** will be forwarded post free, on application.

The Public is respectfully requested to observe—

1. That the stock is in the finest possible condition. The growth is healthy, moderate, and well matured, rather than gross and ill-ripened.
2. Every Plant in this Establishment is for Sale, no reserve being made for prize winning or other purposes.

"Despite the much talked of disadvantages of the season in regard to Roses, Mr. Wm. Paul manages to bring together a marvellous assortment of cut blooms."—Daily Telegraph, July 9, 1874.

PRICES OF ROSES FOR SPRING, 1875.

STANDARDS, large, full, and finely shaped Roses, selected from the exhibitor's point of view
Per dozen, 15s. and upwards; per 100, £6 and upwards.

SPECIMEN ROSES, 5s. to £5 5s. each.

DWARF ROSES, for Bedding or Massing, a fine selection. Per 1000, £25 and upwards.

My Rose Shows at the Royal Horticultural Gardens, South Kensington, and the Crystal Palace, Sydenham, where thousands of Roses in pots, the sole produce of my Nurseries, have been shown year by year, and the show of Cut Roses at the Royal Botanic Gardens, in the Regent's Park, where 8000 trusses of flowers were staged last July, have been visited at various times by—

HER MAJESTY THE QUEEN,
THEIR ROYAL HIGHNESSES THE PRINCE AND PRINCESS OF WALES,
THEIR ROYAL HIGHNESSES THE DUKE AND DUCHESS OF EDINBURGH,
and several other members of the Royal Family:

HIS IMPERIAL MAJESTY THE EMPEROR OF RUSSIA,
THEIR MAJESTIES THE KING AND QUEEN OF THE BELGIANS;
and Thousands of Visitors, many of them Amateur and Professional Horticulturists.

These Shows, as artistic displays, and the plants and flowers of which they were composed, have also received the highest encomiums of the Horticultural and General Press. The idea which prompted them was not conceived or worked out in opposition to existing Rose shows, but to occupy ground which they failed to touch—to show Roses in a free and natural rather than in a crowded, formal, and artificial state—in a state in which any one might produce them with ordinary advantages and ordinary cultivation without the technical knowledge of the florist's art.

WORKS ON ROSE GROWING BY WILLIAM PAUL, F.R.H.S.

THE ROSE GARDEN. Fourth Edition in the Press.

"Infinitely the best work ever written on the Culture of the Rose."—Botanic Garden.

ROSES IN POTS. Fourth Edition. Post free, 2s. 2d.

"The sound teaching of the book will necessitate the publication of a fifth edition shortly."—Gardeners' Magazine.

ROSES AND ROSE CULTURE. A Shilling Book on Roses. Second Edition.

"In this little shilling book Mr. Wm. Paul tells Amateur Rose growers all that is really necessary for them to know."—The Garden.

PAUL'S ROSE MANURE. In boxes, with directions for use, 2s. and 4s. each.

Dr. SCOTT, Sandwich, says:—"It is by far the best Manure I have ever tried."

THOMAS LAXTON, Esq., Stamford, says:—"I shall certainly use it again."

A. H. KENT, Esq., Blethingly, says:—"An invaluable boon to Amateur Rose growers."

Mr. DOUGLAS, Loxford Hall Gardens, Hford (writing in the Journal of Horticulture), says:—"The best Manure for this purpose is Mr. W. Paul's Rose Manure."

☞ The **SPRING CATALOGUE**, containing descriptions of the **NEW ROSES** of the **COMING SEASON**, will be ready by March 1, and will be sent, post free, on application.

IMPORTANT.

The Public is respectfully informed that the old firm of A. Paul & Son no longer exists. Of that firm I am the sole surviving partner; all letters, therefore, intended for me, should be addressed,

WILLIAM PAUL (the Christian Name in full), Paul's Nurseries, Waltham Cross, Herts.

COWAN'S COMPENSATING SYSTEM OF HEATING.

WAUCHOPE & COWAN'S NEW AND ECONOMICAL SYSTEM OF MAKING GAS.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, having recently been offered a valuable Patent for the Manufacture of Gas, to be worked in combination with their Patents for Heating Horticultural and other Buildings, have found it necessary, so as to acquire and work such Patent, to form a new Company with larger powers; the old Company having been incorporated for the purpose of dealing with the Heating Patents only.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, will, therefore, be wound up and dissolved, and a new Company, called "THE COWAN PATENTS COMPANY, LIMITED," has been formed, and has taken over the entire business of the old Company. From this date the new Company will carry on the business of the old Company, with the addition of the New System of Making Gas—full particulars of which, with Illustrations, can be had on application.

Contracts entered into by the old Company will be carried out by the new one and all its responsibilities fulfilled.

The Directors of the new Company have thought it advisable to change the Offices from Lothbury to 21, WHITEHALL PLACE, WESTMINSTER, S.W., where all communications should in future be addressed, and where full information concerning their Patent Systems of Heating and Gas Making can be obtained.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

ILLUSTRATED PAMPHLETS SENT FREE ON APPLICATION.

All Communications in future to be addressed—

21, WHITEHALL PLACE, WESTMINSTER, S.W.

From Mr. F. SAUNDERS, Gardener to Sir Wm. Miles, Bart., Leigh Court, Bristol, October 23, 1874. "Sir—I have much pleasure in saying the Wall Coping you erected here in April, 1872, has given the greatest satisfaction. Many of the Peach trees, at that time apparently worthless, are now in full vigour, and have borne extraordinary crops this season, the fruit being unusually fine, and of excellent flavour. I have recommended it to several gentlemen, who, I believe, will give it a trial."

PATENT PORTABLE PLANT PRESERVER.

Glazed with 21-oz. glass (under W. Parham's Patent) without putty, on channelled wood rafters.

Messrs. J. B. BROWN & CO., Offices—90, CANNON STREET, LONDON.

TIME PROVES ALL THINGS.

By those best informed on the nature and subject of Heating by Hot Water, it has long been predicted that an Apparatus would be forthcoming possessing such merits as to wholly supersede all existing appliances, and to approach as near as possible to the ideal of PERFECTION.

H. CANNELL and CO. now append the following invaluable correspondence, extracted from The Field, which clearly proves their

"VICTORIA HOT-WATER CIRCULATOR" TO BE THIS "DESIDERATUM."

January 16, 1875. THE CIRCULATOR BOILER.—Seeing a question asked regarding the merits of Cannell's boiler, now called the Victoria Hot-water Circulator, does all it PROPOSES, and is one of the most powerful and efficient in the trade. We have had one very heavily weighted with work, heating six houses and a pit for more than a year, and it does its work well.

In answer to "Rus," in last week's Field, I beg to state that Cannell's boiler, now called the Victoria Hot-water Circulator, does all it PROPOSES, and is one of the most powerful and efficient in the trade. We have had one very heavily weighted with work, heating six houses and a pit for more than a year, and it does its work well. It is economical, being so constructed as to absorb nearly all the caloric from the fuel before the products of combustion are discharged upon the chimney. It must prove durable, for no joints or vulnerable points are exposed to the fire, which expends its force on a series of iron flues or water jackets formed by the boiler. As to the final question—Will it burn up anything—that will depend very much on the furnace, and the amount of draught provided. Mr. Cannell, the inventor of the boiler, burn up anything and everything in his furnace at Woodbury, which I visited to master its details and test its efficiency before adopting it. We find here that this boiler and furnace burn up common coal or coke well. The best form of the boiler or circulator is the one that forms its own furnace by a series of water cases; the whole heating power of the fuel is thus utilised and brought to bear upon the water. I have no hesitation in adding that the boiler is simple and strong in construction, efficient in action, and economical in use. Each part of it is also independent and complete in itself, so that if the plate forming the crown of the furnace should burn out, it can be replaced without injury to the other parts. Should a fuller answer be required by "Rus," or other readers, I should be pleased to give a detailed description of this "Circulator," with illustrations. To those who do not know me, it may be needed to add that I have no interest in the Victoria further than I take in any useful invention likely to save fuel, and thus cheapen production, and tend to advance the science and practice of horticulture.

The Circulator Boiler.—"In answer to your correspondent, 'Rus,' I beg to state that I have a 'No. 6 Circulator Boiler,' attached to 2500 feet of 4-inch piping, and, as I could allow me to remark that, between Monday, the 28th, and Tuesday, the 29th, of December last, my black-bull thermometer registered 0° (or zero), while the temperature of the stove at 8 A.M. on the 29th was 42° difference 74°." It is only fair to mention that there were five houses besides kept at a temperature of 35° by the same boiler. I use good Scotch coal, but am convinced there is no boiler so economical as the Circulator; it will burn anything, but everybody knows that the better the fuel the more heat and the less work. Regarding durability it would be premature on my part to give an opinion further than this, that should one of the sections of the Circulator give way, it can easily be replaced in a few hours without interfering with the piping—a most important matter."—FRANK LOVER, Overcote, Northampton, Decr. 2, N.B.

NEW PROSPECTUS SENT POST FREE. Works: 48 and 49, King Street, Woolwich, S.E.; and at Berwick-on-Tweed.

CONSERVATORIES, HOTHOUSES, GREENHOUSES, &c.,

STEVEN'S

TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most simple, Economical, Effectual, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole-Makers, F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

GEORGE'S PATENT CALORIGEN,

FOR Warming and Ventilating Small Conservatories.

COAL CALORIGEN, £6 6s.
 Height, 36 inches; diameter, 21 inches.
GAS CALORIGEN, £3 3s.
 Height, 28 inches; diameter, 14 inches.
 The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory, while a constant stream of warmed, not burnt, fresh air is introduced. The "Coal Stove" consumes the smallest amount of Fuel—2d. per diem being the average cost. It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).
 Illustrated Prospectuses and Testimonials on application.
J. F. FARWIG AND CO., 36, Queen Street, Cheapside, E.C.
 This Stove introduces a strong current of warmed (not burnt) fresh air.

ESTABLISHED 1856.

KEEP OUT THE FROST, WILLIAM H. HONEY'S PORTABLE VAPORISING STOVES,

L." Whisky. Wholesale Depot, 20, Great Titchfield Street, Oxford Street, W.

Grateful-Comforting.

E P P S S C O C O A. BREAKFAST. "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shiver by keeping ourselves well fortified with pure blood and a generous nourishment frame." See article in the Civil Service Gazette.

Made simply with boiling water or milk. Sold in packets (in tins for always) labelled JAMES EPPS AND CO., HOMOEPATHIC CHEMISTS, 48, Threadneedle Street, and 170, Piccadilly, W. Works:—Euston Road, and Camden Town, London, N.W. Makers of Epps's Glysterine Jujubes for Throat Irritation.

In consequence of Spurious Imitations of LEA AND PERRINS' SAUCE, which are calculated to deceive the Public, LEA AND PERRINS have adopted a New Label, bearing their Signature, thus—

Which will be placed on every bottle of WORCESTERSHIRE SAUCE, after this date, and without which none is genuine.—November, 1874. DINNERFORD'S FLUID MAGNESIA. The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best Aid for delicate Constitutions, especially adapted for Ladies, Children and Infants. DINNERFORD AND CO., 172, New Bond Street, London, W.; and of all Chemists throughout the World.

BETTERIDGE'S PRIZE ASTERS,

All saved by Mr. BETTERIDGE this season, and including every variety sent out by him, as see copy of letter by Mr. BETTERIDGE enclosed with each packet supplied through

READING,

Sutton Sons

BERKS.

BETTERIDGE'S NEW VARIETIES,

Duke of Edinburgh,
Grand Duchess Marie, Cantab,
and Improved Oxonian.

These superb varieties, which were sent out by us last year for the first time, have given great satisfaction, notwithstanding the unfavourable season. Each variety is perfectly symmetrical in form, with a delicately-qualified centre, surrounded respectively by crimson, pink, light blue, and dark blue guard-petals.

DUKE OF EDINBURGH	Per packet—	2 6
GRAND DUCHESS MARIE (Duchess of Edinburgh)	2 6
CANTAB	2 6
IMPROVED OXONIAN	1 6
THE COLLECTION OF FOUR VARIETIES	8 0

From Mr. BETTERIDGE to Messrs. SUTTON Nov. 6, 1874. "The eighteen varieties we have improved by discarding one light blue and adding a fine pure crimson with very light guard-petals (a splendid Aster)."

This is included in every Collection of eighteen varieties, for 3s. 6d. sent out by Messrs. Sutton.

Silver and Bronze Medals, with valuable Money Prizes, will be offered by Messrs. Sutton at the Royal Horticultural Society's Meeting on September 1, 1875, for the best Collection of Asters. Full particulars on application.

BETTERIDGE'S INTERNATIONAL

PRIZE COLLECTIONS OF ASTERS,

These well-known Collections of Asters have this season fully sustained their reputation of being the finest Quilled Asters in cultivation, and they cannot be too highly recommended.

Mr. Betteridge has again consigned to us a full supply of new seeds, which we offer to our customers with every confidence.

Eighteen beautiful varieties	s. d.
Twelve ditto	3 6
Six ditto	2 6
Mixed	1 6
	per packet	1 0

N.B.—Purchasers of the above will obtain every sort sent out by Mr. Betteridge this season. The Collection of eighteen varieties for 3s. 6d. is much improved, and includes the new and beautiful Crimson, with pale guard-petals, sent out this year for the first time. See Mr. Betteridge's letter.

Please observe our Trade Mark on every parcel, and copy of Mr. Betteridge's letter accompanying the same.

ROYAL EXOTIC NURSERY, CHELSEA.—February 16, 1875.

NECESSARY CAUTION.

MESSRS. PAUL & SON,
 THE "OLD NURSERIES," CHESHUNT, N.

Respectfully beg their Customers to address business letters simply as above,

WITHOUT CHRISTIAN NAME OR INITIAL.

Through the use of young Initials several letters intended for them have recently failed to reach them direct. Will their friends therefore carefully address—

PAUL & SON, THE "OLD NURSERIES," CHESHUNT, N.

LOBELIA PUMILA MAGNIFICA.

THE
PINE APPLE NURSERY COMPANY

Will commence sending out this fine Lobelia on March 15 next.
 Price 2s. 6d each, or 24s. per dozen for not less than half a dozen.

It received the Floral Certificate at the Royal Botanic Society, and a First-Class Certificate at the Royal Horticultural Society. It has been favourably noticed by all the gardening papers, and the *Gardeners' Magazine* of July 18 says of it—"This dwarf bedding Lobelia, exhibited by the Pine-Apple Nursery Company, is unquestionably the most important of the many bedding Lobelias introduced of late years. The colour of the flowers is a deep indigo blue, and as there are no conspicuous eyes to mar the general effect, a solid mass or band will tell in a wonderful manner.

MAIDA VALE, LONDON, W.

SEED POTATOS.

WRIGHT'S GIANT WHITE CELERY.
—This is quite a distinct pure white variety; it is very
crisp, and of excellent flavour, combining a robust, compact
habit, forming very solid hearts, which bleach very easily.
Heads of this variety have been grown weighing from 8 to 10 lb.
each, and can be highly recommended for exhibition, private or
market purposes. 1s. per 1/2 oz. packet.
WRIGHT'S RED GROVE and WHITE GROVE
CELERIES.—These possess all the good properties of the
Giant White, but do not grow quite so large. 1s. per 1/2 oz.
packets. Usual discount to the Trade.

The following fourteen firms have secured supplies of the
above for this season, for which I beg to thank them, soliciting
extended patronage:—
Hurst & Son, London.
Cooper, Robt., London.
Daniels Bros., Norwich.
Dickson, Brown & Tibb, Man-
dixton, E. P., Hull. (chester).
Holmes, Ed., Lichfield.
Brereton, Wm., Leeds. (K. & Co., Newcastle).
Nutting & Son, London.
Umpley, Geo., Leeds.

CUCUMBERS.—Wright's Wonder, fine white-spine, and
Wright's Improved, black-spine; these will grow 24 to 30 inches
long, are very prolific and do good favour. Pearson's
Long Gun, Rollinson's Telegraph, Berkshire Champion,
Improved Sign House, Masters' Early Prolific. 1s. per packet.
Lowest prices quoted per 100 seeds on application.

W. WRIGHT, Seed Merchant and Nurseryman, Market
Square, Retford, Notts.

B. S. W.'s Illustrated CATALOGUE is now ready, post-free on application.

VICTORIA AND PARADISE NURSERIES, Upper Holloway, London, N.

NEW BEDDING VIOLA—WAVERLEY.

We have much pleasure in offering this fine Viola for the first time. Orders are now being booked, and will be executed in rotation after March 1st. It is a large of good substance, and produced in great profusion from early spring until late in autumn. Colour very bright violet, shaded with purple towards the centre; yellow eye, with pure white brow. The most effective bedding Viola of its colour yet raised, and very hardy. Last season it was shown before the Royal Caledonian Horticultural Society at Edinburgh, and the Glasgow and West of Scotland Horticultural Society at Glasgow, and by both Societies it was awarded a FIRST-CLASS CERTIFICATE. Regarding it

MR. ROBERT FLEMING, Gardener to J. C. Wakefield, Esq., of Drumhead, Glasgow, writes:

"I have no doubt that when Waverley becomes better known no other Viola of its colour will be used. As regards colour, habit, and density of flowering, it leaves nothing more to be desired. In my opinion, at present it has no equal."

MR. JAMES GRAHAM, Gardener to Lady Campbell, Glasgow, writes:

"That for colour, substance, habit, and flowering qualities, Waverley surpasses all the Violas that I know, as much as the best of them excels the old Viola cornuta."

MR. HENRY W. LEWIS, Gardener to Colonel Buchanan, of Drumhead, Glasgow, writes:

"We use a great quantity of Violas here, and I have had ample opportunity of comparing Waverley with most of the varieties yet seen in our garden. It is the best Viola I have yet seen—having an excellent habit, yielding a profusion of flowers, which are of good colour and very constant, and these I consider to be the principal points necessary in a good bedding Viola."

MR. DUNCAN M'LELLAN, Superintendent of Parks, Glasgow, writes:

"I have much pleasure in stating that your new Viola Waverley was thoroughly tested in the Queen's Park in the summer of 1874—having been grown in several situations. The colour is a deep violet with light eye, and its habit similar to Cornuta Perfection. We grow Violas very extensively, but I consider Waverley the best I have yet seen of its class, both in regard to habit and colour."

Prices: One plant, 2s. 6d.; six plants, 10s.; or 18s. per dozen, post free. Trade price on application. A List of Firms Ordering before March 1 will be published in the Gardeners' Chronicle the following week.

ROBERTSON AND GALLOWAY, Seed Merchants and Nurserymen, 195, Ingram Street, Glasgow, and The Hermitage Nurseries, Haleshurg.

ANTHONY WATERER respectfully invites the attention of Holly buyers to the very fine Stock to be seen growing at Knapp Hill. It comprises upwards of Thirty Thousand Plants, from 10 and 12 feet high, of the finest Gold, Silver, and Green-leaved kinds, affording a choice in size and variety such as can be met with in no other Nursery in Europe. Every Plant has been recently removed, and will be guaranteed.

The Stock of Common Green Hollies alone occupies 5 acres of land, and Purchasers will find them in large numbers of all heights up to 15 feet.

Knapp Hill Nursery, Woking, Surrey.

Six Beautiful Orchids, 21s. FOR WINTER and SPRING FLOWERING no class of plants can compete with Orchids, their culture being extremely easy, and the flowers very lasting.

The above are of distinct varieties, and are sent packed and delivered free to London on receipt of Post Office Order or Cheque.

J. H. LEV, Royal Nursery, Croydon.

Twelve Graceful Palms, 21s.

HEALTHY YOUNG PLANTS, to grow on for Table decoration, and will be ready in about six months; or fit for immediate use, including many choice and very rare kinds, 6s., 8s., and 10s.

J. H. LEV, Royal Nursery, Croydon.

Twelve Flowering Stove Plants, 21s., INCLUDING ANTHURUM SCHERZERIANUM, ALLAMANDA CHELSONI, and other equally fine sorts, in nice plants. Package and delivery free to London on receipt of Post Office Order or Cheque.

J. H. LEV, Royal Nursery, Croydon.

Twelve Ornamental Foliage Plants, 21s., INCLUDING many of the finest and newest varieties of ALOCASIAS, MARANTAS, CROTONS, &c., well established, clean, and healthy plants, to grow on for specimens. Package and delivery free to London on receipt of Post Office Order or Cheque.

J. H. LEV, Royal Nursery, Croydon.

JAMES TYNAN, Seed Warehouse, 68, Great George Street, Liverpool, offers: GLOXINIA CRASSIFOLIA GRANDIFLORA.—Magnificent and distinct strain; leaves broad and fleshy, recurring so as to almost cover the pot; flowers much larger than in the older sorts, very brilliant and varied in color. Sown in January or February, they bloom the following autumn.

ERECTA and horizontalis, separate or mixed, 1s. and 2s. 6d. per packet.

STEPHANOTIS FLORIBUNDA.—Fine variety from the Mauritius, flowering profusely at every joint, and possessing a fragrance in a high degree the delightful fragrance of this beautiful climber. 1s. 6d. per packet.

CYCLAMEN PERSICUM, Prize strain.—Seed saved from one of the best collections in the Kingdom. 1s. 6d. per packet.

DOUBLE PETUNIA, large flowering.—Will produce a large percentage of splendid double flowers of great size, and comprising varied shades of color. 1s. 6d. per packet. Post-free on receipt of Stamps or Post Office Order. Send for CATALOGUE of CHOICE VEGETABLE and FLOWER SEEDS.

Carnations, Pinks, and Finks, ISAAC BRUNNING & CO. beg to announce that having this Season a very fine and extensive Collection of the above to offer, strong plants of which are now ready for sending out. LIST of Varieties and Prices, containing full details, on application.

OUR ONE GUINEA COLLECTION OF CARNATIONS, &c., contains six pair of choice Show Carnations, six pair of choice Show Pinks, twelve pair of Show Finks, and twelve choice mixed Carnations, Pinks, and Finks for borders.

Carriage and package free on receipt of Post Office Order. Half of the above quantities, 12s. ISAAC BRUNNING AND CO., Great Yarmouth Nurseries.

Planting Season.—Avenue Trees. LIMES, 12 to 16 feet high, straight stems, girthing 4 to 8 inches at 4 feet from the ground, and FREE well-balanced heads, and splendidly rooted. A stock of more than 2000 of these fine Trees to select from.

PLANES, OCCIDENTAL, 12 to 16 feet.

HORSE CHESTNUTS, 12 to 12 feet.

SCARLET HORSE CHESTNUTS, 10 to 12 feet.

NORWAY MAPLES, 10 to 16 feet.

All being stout, straight stems, and finely rooted. Every Tree has been removed within two years.

POPLAR, CANADENSIS NOVA, 18 to 20 feet.—This new variety of Poplar, far exceeding in height 20 growth any tree I am acquainted with, is strongly recommended as a Town Tree, especially in smoky districts. There are hundreds in this Nursery 3 years old, measuring 18 to 22 feet high, and stout in proportion.

ANTHONY WATERER, Knapp Hill Nursery, Woking, Surrey, S.W.

Snowflake. THE FINEST POTATO ever introduced: will yield from 300 to 400 bushels per acre of handsome tubers of the most splendid quality and FREE from disease. Messrs DANIEL FROSE, just received a consignment of this magnificent variety direct from the original raiser in America, where it has obtained immense popularity, and which is now being distributed at the following rate: carriage free to any address—3s. 6d. per lb.; 7 lb., 21s.; 1 lb., 2s. 6d.; cheaper by the cwt.

DANIEL FROSE, Seed Growers and Importers, Royal Norfolk Seed Establishment, Norwich.

Rare Opportunity. NEW and VERY SCARCE TREE FERNS SPORES from AUSTRALIA and NEW ZEALAND.

J. H. LEV, having just received an importation from his Collector, can supply good packets, with directions for sowing and rearing, at 3s. 6d., 5s., and 7s. 6d. each.

The fronds from which these spores have been obtained are new species, the other four sorts are (1) Asplenium (felvay) medullaris, Alsophila McArthurii, Dicksonia fibrosa, and a small quantity of Dicksonia squarrosa. Should be sown now to obtain nice plants before autumn.

J. H. LEV, Royal Nursery, London Road, Croydon.

N.B.—Twelve choice PALM SEEDS, in distinct sorts, 5s.

The Lucombe Oak may be seen in perfection at LUCOMBE, PINCE, and CO.'S Exeter Nursery. 'T' 11 1/2," says the Gardeners' Chronicle, p. 82, "a tree that does not seem to have attracted more extensively. At the present time, after the cold weather we have experienced, it holds its foliage and looks as cheerful as at the beginning of autumn. The leaves are of a bright green, and otherwise like the ordinary Quercus Cerris, though they may be a trifle thicker."

New Potatos for 1875. JOHN CATTELL with the greatest confidence recommends the following, which have received a First-class Certificate:—ECLIPSE KIDNEY (Cattell), price 6s. per 7 lb. BELLIANCE KIDNEY (Cattell), price 4s. per 7 lb. ADVANCER KIDNEY (Cattell), price 4s. per 7 lb. The Set 12s. for cash with order. Trade price on application. See large Advertisement in last page of the Gardeners' Chronicle for January, p. 1875. Full description, and testimonials, post-free on application. Sole Wholesale Agents in London, Messrs. HURST AND SON, 6, Leadenhall Street, E.C. Nursery and Seed Establishment, Westerham, Kent.

RHODODENDRONS.—The six most distinct and beautiful hardy Rhododendrons—BRVANUM .. vivid scarlet, MR. JOHN CLUTTON .. beautiful clear white, JOSEPH WHITEWORTH .. rich dark blue, MICHAEL WATERER .. very fine crimson, MINNIE .. white, beautifully spotted, EVERESTIANUM .. delicate rosy blue, are offered in any quantity, nice bushy plants, in 6 1/2 inch pots, by W. H. ROGERS, Red Lodge Nursery, Southampton. A CATALOGUE, containing the names of upwards of one hundred other choice varieties, may be had on application.

Notice. SEED POTATOS. A CHANGE OF SEED ALWAYS PAYS. Myatts' Prolific Ashleaf, 10s. 6d. per cwt. are a splendid seed sample, and warranted good. Early Red Rose, 10s. 6d. per cwt. all should plant this kind that have not, as it is a heavy cropper, and produces a good stock of Jersey Blue, 7s. 6d. per cwt. American Seedlings, 7s. per cwt.; this kind is a white Potato, and the heaviest cropper in cultivation. These prices include bags. All orders must be accompanied by a remittance. W. FANE, Seed Grower, Bedford.

R. B. MATTHEWS, SEED MERCHANT and NURSEMAN, Belfast. NEW VEGETABLE and FLOWER SEEDS now to hand direct from the growers. GRASSES and WHEAT SEEDS, suited for all purposes, soils, and situations. GENERAL NURSERY STOCK, Stove, Greenhouse, Conservatory and Orchard-house Plants, Roses, Fruit Trees, and Hardy Ornamental Trees and Shrubs, Hedging Plants and the Underwood. Seed Plants, &c., carefully packed for export to all parts of the world. 1875 CATALOGUES Post-free on application.

Red-skin Flourish Potatos. H. AND F. SHARPE particularly recommend this variety for Field Cultivation, being, without doubt, the heaviest cropper grown. FOURTEEN TONS PER ACRE have been produced by this variety. It is a very fine and will be largely grown for Cattle-feeding purposes in lieu of Mangels and Kohl Rabi. It is perfectly free from disease, and the quality is very fine. It keeps well until May or June. For price, &c., apply to H. AND F. SHARPE, Seed Growers, Wisbech, Cambridgeshire.

W. POTEN'S SEED LIST is now ready, and will be sent post free to all applicants. W. P. has a large stock of CALCEOLARIAS, CINCERARIAS, and PRIMULAS, strong and healthy plants, from the very best strains, 4s. per dozen; extra strong, 6s. per dozen. CYCLAMEN PERSICUM, good plants, in 3-inch pots, 3s. per dozen, 20s. per 100.

Garden Nurseries, Sissinghurst, Staplehurst, Kent. Twelve choicest Stove or Greenhouse Ferns, 21s., OR SMALLER SIZE, 12s., including many of the most desirable varieties. This is the best time to buy Ferns, as the young and delicate fronds are not yet started, and they will consequently travel better. Package and delivery free to London on receipt of Post Office Order or Cheque. J. H. LEV, Royal Nursery, Croydon.

SEED POTATOS.—Wholesale and Retail, in any quantity. Prices and Terms of Sale on application. LITTLE AND BALLANTYNE, Seed Growers and Merchants, Carlisle.

NEW CATALOGUE for 1875, post free for two Stamps.—Our LIST of the newest and best varieties grown of the undernamed classes of plants is now ready, and may be had on application. Prices very moderate, and true to name. Geraniums in all the various classes, Fuchsias, Chrysanthemums, Lobelias, Coleus, Dahlias, Show Carnations, Pinks, Panetes, Phloxes, Penstemonas, Antirrhinums, Double Potentillas, Prethmans, Delphiniums, and all leading Florists' Flowers and Bedding Plants, Greenhouse and Stove Plants, Spring-flowering and other choice Hardy Plants, Winter-flowering and the best Conservatory Decorative Plants, Show and Fancy Pelargoniums, &c. WM. CLIBURN AND SON, Oldfield Nursery, Altrincham.

NEW CHRYSANTHEMUMS of 1874, twelve varieties for 3s.; twelve older sorts, 2s. 6d. Six new Fuchsias of 1874, including Mrs. H. Cannell, for 4s. 6d.; twelve varieties of 1873, for 4s.; Calceolaria Golden Gem, 1s. 6d.; Iresine Lindley, 1s. 6d.; Mesembryanthemum cordiformium variegatum, 1s. 6d.; Lobelia paniculata grandiflora, 1s.; Echeveria secunda glauca, 2s. per dozen; Calceolaria Golden Gem, 1s. 6d. per dozen, 5s. per 100, 40s. per 1000. Geraniums, twelve new varieties of 1874 for 9s.; Dr. Denny's second set of 1873 for 5s.; new Double Geranium of 1873, for 4s.; twelve older sorts, 2s. 6d. per dozen; 13s. Tricolors: Mrs. Pollock, S. Dumareque, 3s. per dozen; Lady Clifton, Louisa Smith, S. Cusack, 3s. 6d. per dozen.

L. LEIGH, Sandy Lane Nursery, Luton, near Newton-le-Willows.

PLANTING SEASON.

THOMAS THORNTON,

Heatherside Nurseries, Bagshot.

Forest Trees, when taken in quantity, charged at a proportionately reduced price.

NEW STRAWBERRIES
AND

DOUBLE PELARGONIUMS.

Messrs. W. & J. BROWN are now sending out Mr. Laxton's fine firm-fleshed new STRAWBERRIES—TRAVELLER and EXQUISITE; the flavour of both these is distinct and unequalled. Traveller has received a First-class Certificate from the Royal Horticultural Society, and is undoubtedly the most suitable Strawberry for transmission yet raised. Strong plants of last season—Traveller, 25 for £1, £3 per 100; Exquisite, 25 for 12s. 6d., £2 per 100. Early struck runners of each in 6-sized pots, 7s. 2s 25 extra.

Prices for Fruits of these will be offered in 1876.

W. & J. BROWN will also send out in May next the following new Double Laxton PELARGONIUMS for 1875, raised by Mr. Laxton:—

EMILY LAXTON.

First-class Certificate, Royal Horticultural Society. The largest-flowered and most remarkable scarlet Pelargonium, either double or single, hitherto sent out. Individual flowers upwards of 2 inches in diameter; true also enormous, semi-double, but full and very striking. A coloured plate post free for 1s. 6d.

Strong plants, 15s. each.

GUIDING STAR.

The most shrubby and dwarf double Pelargonium yet raised. Foliage pale green, and partaking somewhat of the character and habit of the Show Pelargoniums. Flower very pretty, purplish pink and full; quite unique and distinct.

Strong plants, 30s. 6d. each.

ILLUMINATOR.

A striking and distinct purplish carmine-coloured variety, semi-double but full; petals large and stout.

Strong plants, 7s. 6d. each.—The set for £1 1s.

Prices will be offered for the above in 1876.

Trade orders on application to

W. & J. BROWN,

NURSEYMEN and FLORISTS, STAMFORD.

MESSRS. J. B. BROWN & CO., 90, CANNON STREET, LONDON, E.C.

IRON AND WIRE TRELLIS FOR TRAINING FRUIT TREES.

Prices of Iron Standards, Stays, &c., for Fruit Trellises.

Extreme standards of T or angle iron for ends or angles of trellis, for straining the wires from, with self-fixing anchor feet bases, bored for wires from 7 to 10 inches apart, at prices as under. The T or angle iron stays for these standards are the same price as the standards:—

Painted.		Galvanised.		Painted.		Galvanised.	
5 feet high ..	6s. 0d. ..	8s. 6d.	8 feet high ..	9s. 0d. ..	12s. 0d.		
6 feet high ..	6s. 9d. ..	9s. 6d.	9 feet high ..	10s. 0d. ..	13s. 0d.		
7 feet high ..	8s. 0d. ..	11s. 0d.	10 feet high ..	12s. 0d. ..	15s. 0d.		

The intermediate T or angle standards, say about every 10 feet apart, are one-half the above prices.

No. 13 Galvanised Wire, the larger size  for trellises, 2s. 6d. per 100 yards, or 32s. 6d. per cwt., containing 1789 yards.

IMPROVED GALVANISED POULTRY FENCES.

No. 1. Drawn to 1/4 inch scale.

No. 2. Made of 1 inch Mesh Wire Netting.

These Poultry Fences are made in pieces 3 feet wide and 6 feet high, with iron standards fastened between each piece by means of small bolts and nuts. A run or pen can thus be formed of any length or shape without incurring any extra cost.

The prices are the same for either pattern, 6 feet high and 3 feet wide, 6s. 6d. per yard, including one japanned iron standard, with bolts and nuts. Doorways, 5 feet high and 2 feet wide, 4s. each, extra.

Angle Iron Standards, for angles or corners, which are recommended for neatness and strength, instead of intermediate flat standards, 3s. 6d. each, extra.

ROYAL BERKS SEED ESTABLISHMENT, READING.

SATURDAY, FEBRUARY 20, 1875.

A HOLIDAY IN NORWAY.

(Continued from p. 202.)

ALL travellers in Norway speak of the delicious milk of the country; its richness is quite remarkable, and differs from the milk of Alderney cows in being less suggestive of absolute butter. I drank it in many places, and found no exception to its excellence. Norwegian cows are small and hardy, and not unlike our unimproved Ayrshires. During the summer months they graze over a large extent of ground, on mountain sides, amongst woods, on heaths, or wherever pasturage, whether it be leaves of trees or herbage, can be found. This varied food, combining so many plants possessing both nourishing and tonic properties, gives that character to the milk that renders it so refreshing and agreeable. The more common plants of our own pastures are found in Norwegian fields. I noticed amongst grasses that the Poas were represented, with *Cynosurus cristatus*, *Festuca*, *Anthoxanthum odoratum*; and intermixed with them, in about the same proportion, the Clovers, Sorrel, Leontodon, and Ranunculus. However desirable it may be to increase the produce of our pastures—developing, by applications of manure, the more nutritious and fattening grasses, at the expense of the natural herbage—it is pretty certain that the quality of the milk and cheese from cows fed on such improved pasture is deteriorated. Stilton cheese is particularly affected by the land on which cows feed that produce it being dressed by stimulating manures.

The main roads for general traffic are well made, a variety of hard rock suitable for road material being everywhere at hand. The roads are kept in repair by the owners of land contiguous to them, whose names are inscribed on posts or tablets of stone at the commencement of the work they are responsible for. Many of the ancient and more difficult carriage tracts which led over the hills and down dangerous declivities have been abandoned, and others constructed by engineers, who, by blasting the rocks, have opened out passages along the mountain sides, continuing them along valleys that offer suitable levels, across rivers where necessary, and where ascents are unavoidable they have made the gradients as easy as possible, so that travelling on the high-roads is by no means so hazardous as it was less than a quarter of a century ago.

In pursuing the valley roads the rush and roar of waters sweeping down the rocky channels accompanies the traveller for days together, and it is an absolute relief to climb the hills above the road, and to penetrate the depths of a Pine forest—the sudden stillness after the tumult of rushing water falls with almost oppressive solemnity upon feelings alive to new impressions. The absence of animal life, not only from such solitudes, but throughout the country, is very observable. The joyous birds of our English woods are nowhere to be heard in the forests of Fir and Pine. Squirrels are sometimes seen in the Fir woods. In open spaces on the hill-sides, where the Cranberry grows and bears profusely, fieldfares are met with; the grey crows may be observed about cultivated land, feeding like our rook on grubs and insects; magpies find homes near every farmstead, and their interest in the eggs laid by the goodwife's hens is unflagging. The sparrow haunts the cornfields and yards, but he is not

the noisy obtrusive robber of my acquaintance, but a quiet, sodate, subdued bird, seeming as if the weight of the long dark winters was upon his spirits. The wagtail and cuckoo are summer visitants. I saw the great northern diver in the Sogne Fjord, and once caught sight of an eagle. The ducks, occasionally observed on lakes, were too wary to permit approach and identification. Grouse, ptarmigan, blackcock, abound in certain districts, but a mere passing tourist seldom has an opportunity of seeing birds whose habits carry them away from roads and fields and cultivation.

Starting early from Tomtevalden I drove to Odnes, a station at the head of the Ronds Fjord, one of the great lakes and water routes for travellers proceeding to the south. The voyage was a very pleasant one down the lake, in a well-equipped and well-managed steamer. The mountain ranges that bound this inland sea are covered with Fir forests, in which open, verdant spaces occur with great regularity, betraying the presence of farmsteads, which are conveniently situated for access to the water, which is their highway, and a subsidiary field, yielding perennial crops of fish. Signal flags from the farmhouses warned the steamer of intending passengers, who pulled off in the light pointed Fir-built boats which one sees on fjord, lake, and river, and which appear to be as common a possession as a horse. Evidence of the extent of the timber trade is manifested by numerous rafts and floats of that commodity, either collected in depôts, on the shores of the lake, or floating down as if aware of their destination.

Approaching the lower end of the lake the accumulation of floating timber was so great, that, except a narrow channel left for the passage of boats, the whole of the lower end of the lake was covered, presenting a most singular appearance.

The railway station, Honesfos, which is within a short walk of the landing place, warns us that the excitement of mountain travelling is at an end—the wild rush of the horses down the hills, the toilsome climbing of the heights, the anxiety lest accommodation should be forestalled and the journey arrested at an impoverished station, the voyages down the fjords, the boat excursions up lakes—all hopes and fears, pleasures and discomforts are over, and we may resign ourself with becoming placidity to the prospect of an easy, uneventful journey, the end of which will be a city possessing all the luxuries of an advanced civilisation.

Happily the rate of speed is not so great as to deny the traveller the pleasure of observing the romantic river scenery, which is frequently brought to view by the passage of the line along the valleys through which the waters, fed by the Ronds Fjord, pour with fretful haste.

The channel down which the water rushes has too many rocky impediments to allow of its navigation by boats; but it is nevertheless made available for the transport of timber, which, in the shape of roughly trimmed poles, is carried in immense quantities down the stream. An amusing aspect in the scene was the odd and seemingly prescient manner in which the poles held on their way, twisting and turning with the windings of the river, gathering in clusters, going singly, proceeding in file, tumbling over cascades, and, as if resting after a journey, masses would occasionally be seen collected in eddies or bays of the river. As the waters spread out over more level spaces we find the waifs and strays are collected, and appear in ordered rows, and, gaining the great timber depôt of the country, Drammen, the extent of the timber trade becomes more evident in the enormous accumulations that are found arranged by the river.

The railway crosses the Drammen River by means of a long wooden bridge, and presently passes up a very steep incline, along the slope

of a formidable hill, and winding amongst woods, past lakes, by scarped mountain sides, and along sheltered valleys, it reaches, but not before darkness has overtaken us, the city of Christiania.

Traversing for the first time a country so remarkable in its physical features and interesting, and in some respects exceptional, in various departments of natural history, it is not to be wondered at that the tourist should desire to seek within the walls of the National Museum for the information such institutions are established to furnish. Unluckily the Professor we desired to see was away exploring the mountain regions of the country; his assistant was also absent, and after losing precious hours I could only get a hasty and unsatisfactory view of one small division of a very important and wealthy museum.

Entrance to the Botanic Garden is not surrounded with the restrictions that defy the most pertinacious applicant for admission to the museum. Judging by the limited attractions of the garden, and the general indifference of the people to the pursuits of natural science, an influx of visitors is the last event anticipated. The surprised look of the good woman who answered the door of the curator's house, and directed me to the garden, led me to think that a visitor was a *rara avis* indeed.

The situation of the garden is favourable, being on a slope with a good southern exposure. The soil grows native plants (weeds) to perfection, and there was no spot on it in which they were not abundantly represented. Indeed, it required in many cases special powers of vision to discriminate between the cultivated and intrusive plant; yet it was evident, on looking over the sadly-neglected garden, that good practical and experimental work had been executed and more projected, but parsimony and neglect had replaced such enlightened directions and endeavours.

The hothouses illustrated what a few years of carelessness or disregard will do for such structures; they are in a ruinous condition and empty. Trees, both deciduous and evergreen, occupy good positions; collections of alpine and herbaceous plants have been formed, but in many cases labels alone remain to indicate the spots once worthily occupied. Hedges for shelter, formed of many hardy and suitable trees and shrubs, intersect the garden, and appeared to me as being of especial interest in a country at present without the advantage of living hedges. It was evident by what existed here that farmers need not be without such useful boundaries to their fields. There are hedges of Privet, Rhamnus cathartica, Spiræa, Caragana arborea [? Colutea arborescens], and Whitethorn; and, as illustrating the suitability of the country for many more trees than are generally or ever planted, I saw good examples of Larch, Lime, Elm, Ash, Beech, Horse Chestnut, Lombardy Poplar, Salix alba and other species, Black Poplar, and Sycamore, which had changed its smooth for a thick and corrugated bark, like that of the Elm; a collection of hardy Conifers, amongst which I could not find the most suitable for the country, Abies Douglasii; a fair collection of Crataegus and of Cerasus. Some small attempts at bedding out had been made, and a considerable space of ground was devoted to annuals. Wading through a wilderness of weeds very many interesting herbaceous plants were to be found set out on mounds in open quarters—the number of species of certain genera being unusually great. In one neglected corner I found blooming in great perfection and perfect beauty that gem of gems, *Geniata septemfida*.

That a country so much dependent on the products of the fields for sustenance, and on its forests for fuel and for so many conveniences of life, should be so utterly regardless of its one national and experimental garden is a great re-

proach to it. Whether the responsibility rests with the Government, or with those who have the immediate control of such institutions, I am unable to say. Without adequate or intelligent labour, a curator can do little or nothing in an extensive garden; and I felt sincerely sorry for that polite and attentive official when I surveyed the field of his labours. *W. Ingram, Belvoir.*

New Garden Plants.

MILLA (EMILIA) LEICHTLINII, *sp. n.*, Baker.*

A native of the Southern Andes, imported to Europe by Herr Leichtlin, who presented seeds and a living plant a year ago to the Kew collection, which flowered again this year at the end of January and beginning of February. It is a well-marked species, nearest biflora (*Bot. Reg.*, t. 1555), and porifolia (*Bot. Mag.*, t. 5977; *Rejog.*, t. 258), in its very long flower-tube and very short peduncles and pedicels, but distinguishable at a glance.

Corolla large, white, ovoid, 18–21 lines long, with filaments in the base. Leaves 6–8 to a corolla, not more than 1½ inches high at the flowering time, narrow, lorate, bright green, blunt, glabrous, under ½ inch broad, membranously dilated at the base, afterwards growing out to half a foot or more. Umbels 2–3 to a root, their peduncles so short as scarcely to rise above the soil, 1–3 flowered. Spathe-valves 1–2, lanceolate, erect, 1½ inch long, reaching to the top of the flowers and, if two, connate above the base. Pedicels very short. Perianth 18–20 lines long, the tube green, twice as long as the segments, which are lanceolate, ½–¾ inch long, pure white on the face, with a conspicuous green keel down the back. Flowers slightly fragrant. Stamens all from near the throat of the tube; filaments flattened, greenish, 3–4 lines long. Anthers small, yellow, oblong, versatile. Ovary oblong, with very numerous horizontal ovules in each cell. Style reaching to the throat of the tube. Stigma obscurely three-lobed. Capsules oblong, ¼ inch long. Seeds turgid, black, roundish. *7. G. B.*

STEPHANOLIRION, *Baker's genus novum* (Nat. order Liliaceæ, tribe Milliceæ).—*S. NARCISSIDES*, *Baker, species sola*.

This interesting novelty was imported by Messrs. Veitch from Chili, and flowered in their London garden last September. Its general appearance at a first glance is most like that of the slender varieties of *Narcissus* 'Tazetta', with a white limb and orange crown, such as *patulus* of Loiseleur or *Hermione* *garnymedides* of Jordan. But on a second look one sees that the plant is not *Amaryllidaceæ* at all, but the ovary is free inside the perianth, and that the texture and shape of the flower is like that of one of the umbellate *Milla*s, say *porifolia*. It is, therefore, a *Milla* with a *Narcissus*-like crown. Though crown are abundant in *Amaryllidaceæ*, there are only two small and little-known genera of coronate Liliaceæ, *Androstaphium* and *Bessera*, and in both these the crown is simply the united base of the filaments, not a distinct whorl, as we have here. So that we have to thank Messrs. Veitch for bringing to light an entirely new Liliaceæ type.

Bulb globose, under 1 inch thick, clothed with several brown membranous tunics. Leaves about four to a bulb, developed at the same time as the flowers, erect, half a foot high, narrow linear glabrous acuminate, 2 lines broad. Spathe slender terete purple, above 1 foot long. Umbel of 5–6 flowers. Valves of the spathe two, linear acuminate membranous, 12–15 lines long. Pedicels slender, ascending, ¼–¾ inch long. Perianth hypocrateriform; tube scarcely half an inch long, cylindrical, dirty white, with six green bands decurrent from the middle of the segments; segments six, spreading horizontally when fully expanded, obtuse-lanceolate, subacute, 8–9 lines long, ¼ inch broad, pure white on the face, with a slender, ¼-inch-nerved greenish keel. Corona erect from the throat of the tube, bright orange, a line deep, irregularly slit down to the base, the lobes mostly quadrate. Stamens 6, the small sessile oblong yellow anthers packed tightly in two sets of three each in the upper half of the tube. Pistil (in the specimen seen) not reaching more than half way up the tube; ovary cylindrical, with numerous horizontal ovules in each of the three cells; style erect, much shorter than the ovary; stigma capitate. Fruit not yet known. *7. G. B.*

**Milla Leichtlinii*, Baker.—Corno magno ovoido, foliis 6–8 erectis ovatis loratis obtusis tempore florandi brevibus; capsulis brevissimis; umbellis 1–2-floris; spathe valvis 1–2 lanceolatis; pedicellis brevissimis; perianthi tubo pollicari anguste ovuliferi; segmentis albis viridivittatis lanceolatis; tubo duplo brevioribus; staminibus prope faucem tubi obscure bicernatis, filamentis brevibus.

Stephanolirion, Baker.—Perianthium corolliforme hypocrateriforme tubo cylindrico; segmentis 6 oblancoatis patulis tubo longioribus ad basin 2-nerviatis; corona capsitiformi erecta angusta angulata dorso irregulariter fissata alba; filamentis tubi præditum ovuliferis; ovum cylindricum tubi insertis sessibus brevibus; parvis oblongis. Ovarium cylindricum triloculare; ovulis in loco albaribus; stylo brevi cylindrico, stigmate capitato. Capsulum non vidi.

VRIESIA REGINA.

FOR a photograph of this magnificent Bromeliaceæ plant (fig. 41) we are indebted to the courtesy of M. F. Antoine, the Director of the Emperor of Austria's private garden at Vienna, and under whose care the specimen in question flowered for the first time in Europe last summer. According to M. Ed. Morren, this plant is the same as was called by Lemaire *Vriesia Glazouana*. It has also been known as *Tillandsia regia*, and *Vriesia gigantea*. For a full description of the plant, as well as for its synonymy, we refer the reader to an article in the *Belgique Horticole* (1874, 335), from the pen of Professor Morren, the learned investigator of the Bromeliaceæ, and whose collection of living species is, we believe, the most numerous in point of diversity of any that now exists.

The leaves of the plant in question are about a feet in length and 7 inches broad. The flower-stalk, which developed with great rapidity, attained a height of 7 feet. The flowers are arranged in two-ranked conical spikes, disposed in a branched panicle, and spring from the axils of rose-colored bracts. The flowers are white, and have a strong perfume of Jasmine. The plant is a native of Rio Janeiro, where, according to M. Glazou, it grows in the clefts of the rocks, flowering from October to December.

NOTES FROM A GARDEN IN CORNWALL.

A FEW notes from my garden in Cornwall will enable your readers to make comparisons with their own in other parts of the country. I will endeavour to give some of the local peculiarities, which have such an important influence on vegetation, and will explain many anomalies that would appear to a casual visitor.

A person travelling by rail from Exeter to Penzance might come to the conclusion that gardening in this county must be conducted under very adverse conditions, so bleak and sterile is the view on both sides until the town so famous for Broccoli and early Potatos is reached; and should he leave the rail and diverge to the right anywhere between those two places, he would not find much to interest him unless he searched diligently in the many sheltered fertile valleys, where there are to be found numerous interesting and pretty places. On the left, or south side of the line, is what may be truly termed the garden of Cornwall; between Plymouth and Truro almost every acre of land is in a high state of cultivation, and the unsightly mine engine-houses and refuse heaps are few and far between. On this more favoured spot is my little garden with its limited surroundings. The house, and what for convenience sake I call the flower garden, are situated on the extreme margin of a flat piece of table-land, and the other portion of the garden, which is far more floral than vegetable, is situated on a rather steep descent dipping to the south-west. The length of this garden is about 120 yards; the difference in level is 56 feet, and this difference gives a remarkable diversity of soils and climate, quite peculiar to this county.

At the bottom of the garden is an excellent spring of water, clear as crystal, and constant in its supply, rising to the surface within a few feet of the garden fence, which is of the true Cornish type—half wall, half hedge. This stream first does duty in a bed of Water-cresses, which I find a valuable addition to our culinary department. If they are constantly pinched over from this time on to a inch with the water, they remain tender and crisp all through the summer, and yield a constant supply. From this the water passes through the hedge to a small pond in the garden, which is wholly occupied with *Aponogon distachyon*—a plant truly at home in this county, and greatly to be admired. With me it flowers through the entire summer and half the winter. This season I have been able to gather its delightfully fragrant blossoms every month. In the opposite corner of the garden is another small pond, made last year to accommodate a miscellaneous collection of hardy aquatics; in this the seeds of the *Aponogon* have been conveyed by the stream, and threaten soon to take sole possession of this, as it did in the other case.

I am now adopting an expedient, in the vain hope of raising my molehill into a mountain, or to endeavour to make two or more possible occupy the space of which it were better, if it subjects, that one alone held possession; and in a new pine garden I have in hand I am sinking large pots (they are better known by the name of pan mugs) to the level of the ground, and conveying a stream of water through one to the other. In this situation I have never

known the water to freeze, and this gives me hopes that many aquatics, hitherto considered tender, will do with me here, and as a first experiment I have procured a root of *Nymphaea crotella*, a very common Cape aquatic. As Cape plants, particularly bulbs, do well with me, I have thought it a suitable place for trial after the *Aponogeton* from the same place.

The geology of my garden is what the Cornish miners call killas, that is, an argillaceous, slaty rock, with occasional veins of quartz; this is first overlaid with a friable shaly marl, and then with very porous yellow loam, containing iron in considerable quantities, but very little lime. The soil varies in thickness from 12 to 18 inches, on the summit of the ridge to 8, 10, or more feet in the valley. With such loose open soil and the shaly rock beneath, we are not troubled with stagnant water; and, though it may rain in torrents for days together, as it frequently does here, so soon as the rain ceases we are able to work in the ground. For the same reason we suffer from drought in the summer. The same conditions exist in most parts of this county, which will account for several plants having become naturalised and rather common here, as several species and varieties of the *Tazetta* group of *Narcissus*, and many interesting forms of *Primulaceae*, &c.

This peculiar subsoil, the mildness of the climate during my six to seven years' experience, and the knowledge that undoubted records exist of very ancient mining and cultural operations, would lead one to expect to find many more examples than we do of large and rare trees and shrubs from temperate climes. But the reason is that of a certainty sooner or later—

stroying all hopes of any fruit this season, and I find they have not entirely neglected the Peaches. Not in my garden alone, but everywhere in the county, more or less, it is doing damage, the extent of which it is difficult to realise; and unless joint action is taken to get rid of them it will be useless to attempt to grow Plums and Cherries. The trees are not covered with nets most part of the year.

The weather during the present season has so far been remarkable. Since Christmas rain has fallen almost daily, and I understand from the Registrar in Truro that during that time about 16 inches have fallen. The ground has not been covered with snow, there have been only occasional showers of hail, and the thermometers in my garden have never registered more than 9° of frost, and that but on one occasion, when it continued for only an hour or two: the general average of extreme cold has been about 5° below freezing point. Some plants, in addition to *Aponogeton* already mentioned, have been growing and producing a succession of flowers all winter, and I have always been able to gather a respectable bouquet of Tea Roses, Violets, *Triteleia allacea*, *Vittadenia* (*Erigeron*) *inlaba*, evergreen *Candytuft* (*Iberis*), shrubby *Veronica*, *Convolvulus Cneorum*, *Laurus tinus*, *Anemones*, *Coronilla glauca*, *Tritoma intermedia*, *Mignonette*, &c. December and January have added *Cyclamen ibericum*, *Atkinsii*, *Coum*, and *dever persicum*; also Winter *Aconite*, *Helleborus*, several species, *Grevillea rosmarinifolia*, white *Primroses*, coloured *Polyanthus*, &c.; and now at the beginning of February they are too many to enumerate, but the most conspicuous are *Habrothamnus elegans*, *Fyrus japonica*, *Iris reticulata*, *Hepaticas*, *Primula*

FIG. 41.—VRIESIA REGINA (MUCH REDUCED).

as in the winter of 1861 and 1862, when the severe weather endured for many weeks—Cornwall, with its extremely moist atmosphere and semi-tropical vegetation, suffers greatly; and it is sad to reflect that the noble examples frequently met with of such things as *Embrotium coccineum*, *Eriobotrya japonica*, *Benthamia fragifera*, *Pinus longifolia*, &c., and even *Pinus insignis*, at times suffer greatly. I think the evil might be greatly avoided by planting such things on the more elevated land instead of, as is now nearly always the case, in the sheltered damp valleys, which in winter are mostly dripping as from a recent shower, and in summer form a warm vapour bath. The rapid growth in such situations produces a very succulent vegetation, ill suited to withstand severe frost. In the more exposed parts the growth if not so rapid would

be much more enduring, and would well repay the little extra care required in sheltering and nursing the plants while young.

Undoubtedly one of the greatest drawbacks to the successful cultivation of many things, particularly fruits, is the extreme mildness of the winter, which excites a too early development, so that the spring frosts in a moist atmosphere destroy the early buds and blossoms; consequently, Peaches, Nectarines, and Apricots, are a very uncertain crop. But a new enemy has taken the field, or rather garden, of late, in that beautiful pest, the bullfinch (better known here by the name of "hoop"). Knowing the enemy I had to contend with, I have diligently shot all I possibly could, but with all my care they have stripped all Cherry, Plum, and Gooseberry fruit-buds, de-

Palinuri, *Cytisus candicans*—this shrub is nearly always in flower—*Lithospermum prostratum*, several *Muscaris* and *Bellevalias*, &c. About the middle of last month I gathered seventy species of flowers from the open garden. In addition to the weather reports in the *Gardeners' Chronicle*, we have had with us true harbingers of the severity of the weather in the North: vast numbers of starlings, fieldfares, and redwings, which always flock here and remain through the winter, have this season mustered ten times stronger than I have seen them before, and now as I write the field in front of my window is literally covered over with them—they are there in thousands. While the cold continued in the North they might be seen arriving in large flocks all the day long and apparently very

feebly, but a few days' rest here and the exertion of clearing the Thorns and Hollies of their berries soon restored them. *Y. S. Z.*

THE ROYAL HORTICULTURAL SOCIETY.

WILL you allow me space to direct the attention of the Fellows of the Royal Horticultural Society to a subject which, I believe, must soon occupy them, and which it will be that they should be timely turning over in their minds—the steps that must be taken either for the rehabilitation or reconstitution of the Society.

It is long since I have addressed you on the subject. I have not opened my lips, nor inked my pen, by way of advice or comment on the management of the present Council since I resigned my place as one of the old Council in 1873. I have felt that both the old and the new Council have been on their trial, and that it did not become one on his trial to obtrude advice. You will easily believe that it has cost me some self-restraint to keep silence; for after the long series of years during which I have been connected with the Society in one way or another, more than twenty years, I feel as if I had no sympathy with its difficulties, or no feeling for its distresses. But my mouth is now unsealed. The attempt to establish a skating rink, the late report of the Council, the speech of the chairman at the annual meeting in 1874, and more than the concession in which the Society is now landed, are all proofs or acknowledgments in favour of the policy of the old Council. I consider, therefore, that I am now free to speak my mind like any other man, and I trust to your allowing me the exercise of my recovered speech by hearing my views, even though they may not, in all respects, correspond with yours.

The Society is now in such a critical state that it depends upon the action of the Council in the next fortnight whether it shall continue as a Society or be broken up. There seems to be four events upon the cards at the present moment. The Council may succeed in their negotiations with the Commissioners, and obtain favourable terms from them. If they get what the Commissioners were understood to be willing to grant to the old Council in 1872, and what they were turned out for proposing to take, they may still be well off. If I recollect aright, the Commissioners were willing to take the whole of the debenture debt (£50,000) off the shoulders of the Society, to give it gratuitously all the accommodation it can require for its working operations, for its meetings, and for its show and other purposes, and to pay for the building at its own cost, or to pay a liberal price for the plants and property of the Society in the gardens, which it was supposed would be sufficient to pay off all the Society's debts, and leave it something to start comfortably with, the only return being the surrender of the lease; and I cannot help thinking that any fair man will acknowledge that such terms would be not only generous on the part of the Commissioners, but noble, and worthy of the Prince whose plans they administer. Indeed, according to my purblind (and I am well aware of it) imagination, I occasionally reminded that the same antipathy as my old colleague, Mr. Bateman), if we look only at the acts of the Commissioners, their conduct to the Society has been characterised by the same antipathy and hostility. It is not my business to defend them, nor do they need my defence, but I might challenge any man, if you leave out of view gossip and reports as to their intentions, and look only at their acts, to point to an act which is not of this character. In taking up the management of a park, and in agreeing to the re-constitution of property of great value, the Commissioners naturally and properly reserved a controlling power; and all the misunderstandings and cross purposes which have subsequently arisen, have flowed from the mode in which it was arranged by the advisers of the Commissioners and those of the Council that that control should be exercised; but that they did not hit upon a wise means of exercising it is a detail for which the Commissioners should not be blamed. Whenever the Society has come face to face with their policy they have been obliged to make a general and friendly submission; therefore, as I have already said, an quite prepared for such terms as the above being granted by the Commissioners. The Society, as a horticultural society, could want nothing more; and, were the horticultural element alone consulted, it would have been ready to offer. But what is the present Council accept such terms? It is not with them a mere question of *amour propre*, but one of principle. Two antagonistic motives stand opposed to each other—exclusiveness against freeness. 'I' voted out the old Council because it was not prepared to give up the advantage which it had in the countervailing advantages, and insisted that not an item of their exclusive privileges should be given up; but if they surrender the lease, then, or at all events all control of these, must go. These exclusive privileges are wholly opposed to the principle on which the Society has always acted. Their object is to effect a great public benefit, to improve the masses, to educate and refine them, and the way in which they have hitherto tried to work out their principle is by throwing open works of art and beauty to the view of the masses, and encouraging them to come and find inside their essence. That object will not be served, so far as the Horticultural Society is concerned, by any arrangement such as you have suggested for granting a new lease either to the Society or the local Fellows; and, unless I am greatly deceived, no arrangement such as the Commissioners' will be possible which does not put in their hands the power of using the gardens as they please as an adjunct to the other means

of education carried on in the neighbourhood. For the local Fellows to accept any terms abandoning their exclusive garden privileges would be to surrender at discretion. It is undoubtedly according to your views, and to the views of the majority of the duty of the Council as guardians of the interests of the Society to accept such terms if offered; but whether the majority that is in it of local non-horticultural Fellows may think so too, is another question. Let us however, like Mr. Fyfe, and his celebrated "not an inch of our territory, &c.," they may find themselves forced by the necessity of circumstances to sacrifice their most cherished determination. If they do so they will certainly be entitled to the gratitude of the Society, although they may lay themselves open to the remark that they would not have anticipated anything but a success in 1875. The result of such a settlement would be twofold. First, we should require a new charter. The present one is so involved with the agreement with the Commissioners that it would be unworkable when that agreement should be broken, and we should lose a considerable number of our non-horticultural local Fellows. But we could then afford the loss; and I have the bad taste to think the loss would be a gain to horticulture. This is one of the events that are on the cards. Another is that the Council may decline to accept terms from the Commissioners which are satisfactory to the horticultural mind of the Society; in that case it seems to me that the horticulturists should insist on its being done in spite of the resistance of the Council and of the local Fellows; and if defeated by them again, as they would be in 1873, the local Fellows should either a third or fourth contingency would alternatively ensue. There would be an effort to carry on the Society in the way suggested by the Council in their report, viz., by increasing the subscriptions of the local Fellows, and this would succeed so far as to pay a year's rent and so on over the crisis with the Commissioners for another five years, or it would fail. It is unnecessary to consider anything more than the amount of success implied in the getting the rent paid. Anything like progress is out of the question; with a falling exchequer and diminished means of action, no one can anticipate anything but a still more rapid decline than has already taken place during the last two years. If, as Mr. Haughton stated (I take his figures, for he was not contradicted, and I have not time to pick them out for myself), the receipts from the subscriptions of Fellows have since the year 1872, and during the year 1874, have been in office, which, however, practically only represents the result of the first year's operations (the subscriptions falling due in January), we may reasonably fear that the falling off next year will be still greater—a fear not diminished by the obvious slight increase of report as to the number of new Fellows and of resignations during the year just closed, a feature which would naturally have been put well forward had it been satisfactory. Horticulture must, therefore, inevitably suffer; and if horticultural inducements to join or continue as Fellows were withdrawn, the horticultural Fellow themselves will withdraw also. Independently of that, it would be unbusiness-like, and show little knowledge of human nature, not to recognise the fact that the mere publication of such a dolorous report must in itself already have done a great amount of damage to the Society, and I do not blame the Council for publishing the report, for that they could not help, but they cannot escape the responsibility for the results of their policy, which would appear to have had such an unfortunate result.

It will take much time and much labour before its effect can be effaced. The inevitable result of such a report is that the means which it is proved by the present budget, be a reduction of expenses, and that can only be effected at the expense of horticulture. Even although, therefore, the Council should succeed by the means proposed or otherwise in raising funds sufficient to enable them to preserve the lease and their exclusive privileges, such a success on the part of the Council as the most disastrous thing that could happen to the horticultural element of the Society. Still loaded with debenture interest and the expense of keeping up the garden at South Kensington, we should have the miserable prospect of the present year rendered the permanent condition of affairs so long as the rent could be met. It would retain the horticulturists in a sort of death in life state, attached to the corpse of the Society, unable to do anything, but to wait and grope about in the darkness by the side of the defunct in the vain hope of its resurrection.

Far better for horticulture would be the fourth contingency which is before us, viz., that the Council fail in their efforts to raise the subscriptions sufficiently to meet next year. This would no doubt leave the Society at the absolute mercy of the Commissioners, but practically it would be no worse than the present state of affairs, and it is almost a foregone conclusion that the dreaded contingency must occur. The voidance of the lease would make it more difficult for them to be liberal, but I still believe they would deal nobly with us. The moment that we have any means of getting on our feet, and from an equitable point of view we have a claim for unexhausted improvements. The Society, moreover, is not a private or personal one, with exclusive aims. Rightly regarded, it is maintained for objects which tend not to the advantage of the present generation, but whose considerations would influence the Commissioners is very possible, and that not much more stringent terms might be got by the plea *ad misericordiam* than might be obtained now is not improbable; but a heavy responsibility would rest upon the present Council, and almost certainty of obtaining terms by which our creditors may be paid for the problematical chance of an almsman's "dole." *Andrew Murray.*

PILEWORT.

"The first gilt thing
Which wears the trembling pearls of spring."

To the poet Wordsworth, who penned the above lines, this plant was welcome. Troubled for many years with weak lungs, he longed as the winter slowly rolled on for spring to come again, and about the first sign which greeted him was the homely Pilewort (*Ranunculus Ficaria*). We cannot, therefore, wonder why he so joyously sang its many charms, nor why it should find a place at last on the monument in Grassmere church. After all, we have no plant in our flora which so truly tells us of the approach of spring as the Pilewort. Both the Whitlow-grass (*Draba verna*) and Snowdrop, sometimes looked upon as the harbingers of warm days, more often bloom in January than in March. Gerarde, with his usual quaintness, says—"It cometh forth about the calends of March, and flourish a little after; it becometh to fade away in April, it is quite gone in May, afterwards it is hard to be found, yea, scarcely the root."

Why is it locally named Small Celandine, or Lesser Celandine? Even in the north of France it is still called by the peasantry "Petite Chelidoine;" it is so named by Wordsworth, as also by several other poets:—

"Peeping from 'neath thy leaves of green,
In early spring thy flower is seen,
And bright thy yellow petals shine,
Thou pretty, little Celandine."

Some of our early Floras describe it as Lesser Celandine; this is, however, a deceptive and confusing name; it is really a corruption of Chelidonium, and the name Celandine should with propriety only be applied to Chelidonium majus. The true English name is Pilewort, which is doubtless given to it from the shape and appearance of its tubercled roots. Our old herbalists, who followed the doctrine of signatures, must have supposed a striking resemblance betwixt the tubercles and hæmorrhoids (piles); it was for many years applied to this distressing disease; hence its trivial name, Pilewort. Culpeper remarks as follows:—"Here is another secret for my countrymen and women,—a couple of them together. Pilewort made into an oil, ointment, or plaster, readily cures both the piles or hæmorrhoids, and the king's-evil. The very herb borne about one's body next the skin helps in such diseases, though it never touched the place grieved. Let poor people make much for their uses. With this I cured my own daughter of the king's-evil. Again, in Green's *Original Herbal* we note:—"The particular form of the roots probably recommended this plant as a cure for the piles, and this fancied quality was the origin of the English name. The roots are sometimes washed bare by the rains, and this induced the ignorant and superstitious to imagine that it rained Wheat, to which the uncovered tubercles bear a little resemblance."

Green's description is more sensible than many other herbalists' in later years. We cannot find the virtues which are so highly extolled by Culpeper. The village doctresses seem to be averse to its use, and to discard it from their practice as worthless or injurious. Perhaps our enemy has been as jealous of the Pilewort as he was of the Devil's-bit Scabious. *W. de Gerarde.*

By some botanical authors it is made into a distinct genus—*Ficaria ranunculoides* var. *F. verna*, from its possessing three deciduous, instead of five persistent sepals, and nine petals instead of five, as in *Ranunculus*. We confess it is unlike the *Buttercup*, both in habit and general appearance, although the characters on which the genus is founded are very slight.

Two varieties are now recognised by British botanists, distinguished by the variation in the leaf. Our readers should keep a look-out in their several districts, as the distribution is but imperfectly understood at present. The one named *R. divergens* (F. Schultz) appears to be the most frequent, whereas, so far as we are informed, *R. incanens* is rare in our northern counties.

Every one at all observant must have noticed the peculiar whitening of the burnished golden petals, after they have been fully expanded about a fortnight. Sometimes they are found with white patches scattered about, at others it commences at the tip, and runs half, or two-thirds down the petals. Underneath the white patch appears as if the cellular matter was in a state of decay. The corolla is not marcescent, as in the bell-flower (*Campanula*). The term marcescent cannot be applied to a deciduous corolla, and without doubt the petals of this plant are deciduous. I am not aware that any satisfactory reason has been assigned for this peculiar phenomenon, which does not exist only in this species, but may be witnessed in several *Buttercups*. The changes going on in the petals of the Alkanet, Evening Primrose, &c., are different to those in the Pilewort. In the Evening

Primrose (*Eriogonum*) the corolla does not suffer any loss of colour; it is only more intense, as from light yellow often to bright pink or purple; on the contrary the *Alkanet* changes from blue to pink.

May not the following be assigned as one reason for this change?—at all events, it is in harmony with first principles. At the season when the *Pilewort* begins to bloom very few flowers are to be met with. The brilliant petals may, then, be designed to attract insects, so as to bring about more effectually the fertilisation of the ovules. This being accomplished, the corolla begins at once to exhibit the white blotches. After the whitened and withered-looking petals appear the bee never visits the flower. I speak from my own limited observation, which may not be in strict accordance with the observation of other botanists. Observe, the carpels are but loosely attached to the

partially procumbent, with stiff cylindrical or somewhat angular branches ramifying at acute angles, and covered with an ash-coloured, wrinkled rind, thinly beset with whitish strigose hairs. The leaves are alternate or tufted, spreading, very variable in the native specimens, but in the living specimen before us uniform, about $\frac{1}{2}$ inch long, scarcely $\frac{1}{4}$ inch broad, leathery, with a few minute whitish scales on both surfaces, paler beneath, linear-spathulate, entire, rounded or slightly emarginate at the apex, tapering at the base into a very short stalk. Stipules ultimately deciduous, minute membranous deltoid. Flower-stalks solitary, axillary, scarcely exceeding the leaf-stalk, ultimately bent downwards. Bracts three, minute roundish membranous erose, one at the

by Messrs. Veitch, is a welcome addition to our lists of hardy shrubs, among which its habit, neat foliage, and white berries give it a distinctive character. Botanically it is interesting as a shrubby violaceous plant, having, on superficial glance, nothing of the *Violet* about it. The structure of the flowers and seed is, however, quite that of the *Violet* order, as indicated to us by Professor Oliver. In the *New Zealand Flora* Dr. Hooker describes the berries as blue-purple, but this probably arose from an inspection of dried specimens only, wherein the white skin has become transparent, and allowed the remains of the purplish pulp above referred to to shine through. In our specimen the berries were chiefly one-seeded—rarely two-seeded, as in native plants. *M. T. M.*

FERTILISATION OF THE CEREALS.

By ALEXANDER STEPHEN WILSON.*

To the position taken in my last paper on the fertilisation of the so-called European cereals (*Gardeners' Chronicle*, pp. 349, 375, vol. i., 1874), that these grasses were self-fertilised; that the act of fertilisation in those cases in which the flower opens is probably performed in the opening, and is necessarily confined to the twenty or thirty minutes during which the flower remains open, certain objections were taken. It was objected that I appeared to make the mistake that fertilisation took place when the pollen was shed, which, as was illustrated by the case of many plants, it was said, was not necessary.

The meaning of the word fertilisation is partly a matter of convention. It may mean that act of the anthers by which they project or discharge the pollen, which, falling directly on the pistil, shall produce the embryo; or it may mean the falling of the pollen on the ovule after being carried a distance by the wind; or it may apply to the instant in which the elements of the pollen set up that action in the ovule which produces a new plant.

It is with the first meaning that these papers are concerned. I find that many of the cereal florets never open at all, and that in the case of those which do open, part of the pollen is discharged inside the cup. The discharge and the contact may be very nearly simultaneous, so that the pollen may adhere to the inner sides of the palea, and may not touch the stigmas until the palea are again squeezed close to the stigmas. It is the discharge which is here called fertilisation, so that in florets which open and close again in twenty or thirty minutes, this fertilisation must, by its definition, take place in these few minutes. In florets which do not open, but simply become more or less inflated, the process is the same; discharge and contact closely follow each other, and this process is here called fertilisation. How long the pollen may lie dormant on the stigma, or how long it may take, in any form, to reach the ovule, I am not aware that any one has determined. If it be said that fertilisation does not take place till some of the matter of the pollen has reached the ovule, the two meanings are not contradictory, but refer to different stages of the same process.

Last season (1874) I had opportunities of observing the flowering of a *Wheat* not referred to in previous notes. This was the Polish *Wheat* (*Triticum polanicum*). The descriptions of it which I have seen are somewhat defective. The glumes or outer chaff-scales are more than an inch in length and somewhat shorter than the outer pale of the lowest floret, which is frequently an inch and a half in length. The inner pale of the lowest floret is less than half the length of the outer; the second floret on the spikelet is shorter than the first, the third than the second, the fourth is shorter than the third, while the fifth and sixth are rudimentary. Only the two lower florets are awned. But the peculiarity which distinguishes this from all other *Wheats* is, that while in other *Wheats* the inner florets of the spike reach further up the rachis than the outer and form a convex outline, the outer florets of the Polish *Wheat* reach highest, so that the spikelet has a concave outline.

In this *Wheat* two of the anthers are usually enclosed within the reflexed edges of the inner pale. They are pushed upwards in flowering. But the outer pales of the two lower florets are so large that the filaments of the anthers never acquire length to carry the anthers outside. They are not prevented from getting outside, as in some other *Wheats*, by the edges of the outer pale enfolding the edges of the inner. The two pales are quite unconnected, and the anthers, though free to come out, are overlapped by the great size of the outer pale. The anthers of the third and fourth florets sometimes appear outside, when hanging favourably for falling out between the pales. But, from the structure of these pales, almost all the pollen must be discharged inside; so that cross-fertilisation seems to be very rarely possible.

* Read at the February meeting of the Edinburgh Botanical Society.

FIG. 42.—HYMENANTHERA CRASSIFOLIA.

A, B, Front and back of calyx, &c., from which berry has dropped, showing remains of anthers (a) and sepals (b), enlarged two diameters; C, Transverse section of berry.

receptacle, and are easily displaced. If they fall before they are fully matured, of course germination cannot take place; thus the speckled petals may be produced solely at this stage to repel bees and other insects. The petals vary much both in number and size: this may depend to a great extent on the richness or fertility of the soil in which they are growing. *R.*

HYMENANTHERA CRASSIFOLIA.*

This is a striking shrub, hardy near London, and having much the appearance of *Arctostaphylos Uva-ursi*; the structure of its flowers is, however, unmistakably that of *Violaceae*. The shrub is erect or

base, two at the apex of the flower-stalk. Sepals five, persistent, orbicular, imbricate, membranous, and erose at the margins. Petals five, persistent, rather longer than the sepals, reflected at the tips. Stamens five, inseparate at the base; filaments very short, broad. Anthers two-celled, connective, prolonged into a broad lance-shaped appendage, entire (or sometimes erose?) at the margins. Ovary not seen in our specimens. Berry surrounded by the remains of the style, and also by the remains of the style, about $\frac{1}{2}$ inch long, oblong-obtuse, white externally, with a purplish pulp within. Seed, one or two. Testa hard, bony. Embryo straight in the axis of fleshy albumen.

The shrub, whose main characteristics we have above detailed from fresh specimens kindly furnished

germinis sinuato-dentatisse, crassis coriaceis; petalis sepaliq; eroso-dentatis. North Island, &c.; see also Hook. fil., *Handbook of the New Zealand Flora* (1864), pp. 18, 755.

* *Hymenanthera crassifolia*, Hook. fil., Fl. Nov. Zealand (1854), l. 17, t. 7.—*Ranunculus crassipuberulus*; foliis 3 lin.—unc. longis linearis spatulatis v. rhombico-ovatis obscuris inter-

And, from some peculiarity unknown to the writer, self-fertilisation was less successfully accomplished in this Wheat than in others growing beside it.

In order to test more fully whether self-fertilisation was adequate, or whether foreign pollen was necessary, two clear bottles were attached to two poles inserted in the ground, and into each bottle an ear of Barley, near the time of flowering, was introduced, and the bottles corked, leaving only a notch for the culm. They fertilised and ripened in the bottles as if no bottles had been present; one presenting two barren florets, which may often be seen in ordinary culture, the other being fully fertilised. Into each of two other stone bottles, and therefore dark, two ears of Wheat were introduced, as in the previous case. These ears were as fully fertilised in the dark bottles as the same Wheat in the open air. But I discovered that such experiments were being performed in all directions through the cornfields, and that I had only to read off the results.

In a field of Barley I found here and there solitary ears of Oats; they were as fully fertilised as the ears in Oat fields.

In a field of Oats I found two spikes of spring Wheat and no others, and there was not a field of Wheat for miles from the spot in any direction; they were both, in succession, fully fertilised.

In various Oat fields solitary ears of various Barleys were found, and all were as fully fertilised as if they had been fertilised by spring Barley.

In a field of hay, which had carried Oats the previous year, a good many dried panicles of Oats were found, struggling up through the seeds which had lain through the winter. Some of them carried but a single floret, some two or three, some five or six. They were all fully fertilised.

On roads and railways here and there dwerfish specimens of the cereals were also found, and fertilisation in these was as completely effected as if they had been taken from the midst of thousands of others.

At a later period of the season, after the crops were ripe, Turnip fields threw up a green panicle here and there, and in these also fertilisation was in no degree deficient.

Of course it is well known that some of the pollen may be carried to great distances. The pollen of the cereals, in the condition in which it is discharged, falls in air with considerable rapidity. The flowers of Wheat, Barley, Rye and Oats, which do open, remain open but for a very brief period. Only two or three flowers on a spike are open at one time. Unless, therefore, a constant stream of pollen were passing over a spike of Wheat for a week, it could not be wholly cross-fertilised. This would require the concurrence of a properly directed wind, and that the fertilising source should be at the same stage of maturity as the subject to be fertilised. In the case of Oats, the locusta of which is pendulous, and the ovary of which is covered from above, cross-fertilisation could only be effected by pollen moving first in a horizontal direction, and then rising up into the flower against the force of gravity. That single ears of Wheat growing miles away from all other Wheat, or panicles of Oats six inches above the ground amongst the roots of grass, or ears of Barley enclosed in bottles, should be cross-fertilised, seems impossible.

A former paper may have given the impression that all the florets of Wheat, Rye, Barley, and Oats close again in twenty or thirty minutes. There are some exceptions to this in the case of Rye. Some of the florets of Rye never close after opening. Now, if it were the case that the spikes of Rye were more fully fertilised than the spikes of Barley, this fact, coupled with the possibility of cross-fertilisation, might be held to explain this fuller fertilisation of Rye. But further observation confirms the fact previously stated, that Rye is the most imperfectly fertilised of the four grasses under review.

Certain botanists have assumed the responsibility of maintaining that Nature abhors self-fertilisation. This she does, her practice being short of her principles. But who is self-fertilisation and what is cross-fertilisation? Consider a Wheat plant. The seed falls into a poor soil, and only a single stem and a single spike is produced. The pollen and the ovule enclosed in each floret have a certain relationship to each other; what that relationship is, in terms of the production of a new plant, we do not know. But is this relationship between the pollen in one floret and the ovule in another floret of the same spike a different relationship from that between the pollen and ovule in the same floret?

Suppose, again, that the seed falls into a rich soil, and produces fifty stems and fifty spikes; is the relationship between the pollen on one spike and the ovules on another different from the relationship between the pollen and ovule in any single floret?

Suppose, further, that a Wheat plant of fifty tillers is torn asunder when young, divided into ten plants, and grown in ten different fields. Is the relationship between the pollen of one plant and the ovules of another different from the relationship between the pollen and ovule of a single floret in the supposed single stem?

If what is usually called cross-fertilisation—the conjunction of pollen from one floret with the ovule of another—bring different elements together from those brought together by self-fertilisation, this is a physiological difference of real value. But, if in “cross” fertilisation the pollen transferred contains nothing but what is contained in the home pollen, then cross-fertilisation and self-fertilisation, dealing with the same elements, are physiologically identical. To call the process self-fertilisation when the pollen comes half an inch to the stigma, and cross-fertilisation when it comes half a dozen yards, seems to be the making of a distinction in advance of any real knowledge. If a botanist, by using the word cross-fertilisation, wishes his hearer to understand that a different vegetable element is involved from that which is involved when he uses the term self-fertilisation, it is incumbent on him to fix in his own mind what is his own meaning.

OPEN-AIR VEGETATION

AT THE ROYAL BOTANICAL GARDEN, EDINBURGH.*

This winter, so far as it has gone, has been remarkable for its severity, particularly during the month of December last, when the thermometer was observed on twenty-seven mornings at or below the freezing point. The lowest markings were on the mornings of the 15th, 23d, 25th, 28th, 29th, and 30th, indicating respectively 17°, 18°, 17°, 13°, 5°, and 15°, while the highest night temperatures were on the 1st, 4th, 5th, and 6th, indicating 33°, 33°, 40°, and 38°. The united morning frosts during that one month amounted to 277°, being 31° more than was registered throughout the whole of the winter months last year, which was 246°, and of this number 36° only were recorded during the month of December.

The last very severe frost experienced at Edinburgh was during December, 1860, when the united degrees of frosts of that month amounted to 267°, although the amount is 10° less than in December last year, the mischief done to vegetation was very much greater (see *Transactions of the Edinburgh Botanical Society for 1860-61*). The lowest point indicated during the winter of 1860 was 5°, or 10° less than was indicated during last December.

After the disappearance of the frost on January 1st, the weather for some time was dull, and comparatively little injury to vegetation has as yet been observed; had the weather been clear and sunny, vegetation, in all probability, would have suffered greater damage. Some plants, however, have shown considerably. A few points of some of the Cupressaceae are observed to be a little browned, particularly in low situations. The leaves of the Golden Queen Holly are also much discoloured. The green Hollies, particularly the tree forms, have parted with a large quantity of their leaves. The *Phormium tenax*, or New Zealand Flax, as well as the *Cordyline angustifolia*, have suffered severely. Many of the latter plants have stood unprotected on the rock garden during the last five years, some having attained the height of 6 feet. During December, 1870, we had 165° of frost, and several of the *Cordylines* at that time were killed to the ground, but again pushed up from the lower portion of the stem, and afterwards became fine plants; hopes are therefore entertained that the injured specimens will all break out again, the plants being considerably stronger than they were when last damaged. In consequence of a coating of snow being on the ground during the severest frost, it will be some time before the mischief done to herbaceous vegetation can be known.

During last month (January, 1875) the thermometer was fourteen times at or below the freezing point, indicating together 73°, while the previous January (1874) only indicated 32°. During the last month the lowest markings were on the mornings of the 1st, 8th, 16th, 25th, 26th, and 30th, indicating 15°, 26°, 28°, 29°, 27°, and 26°, while the highest morning markings were on the 10th, 11th, 14th, 16th, 19th, and 28th, indicating 38°, 39°, 39°, 42°, 42°, and 44°. Owing to the severe frost experienced during December, 1874, vegetation has been very much retarded. The following plants have bloomed in the open air during the month:—

Jan. 15. <i>Corylus Avellana</i>	Jan. 21. <i>Leucopium vertum</i>
„ 15. <i>Callunus nivalis</i>	„ „ <i>Veronica alpestris</i>
„ 15. <i>Fuchsia venusta</i>	„ 23. <i>Crocus susianus</i>
„ 20. <i>Primula denticulata</i>	„ „ <i>Scilla precox</i>
„ „ <i>hata</i>	„ 24. <i>Crocus imperati</i>
„ „ <i>Eriogonum alba</i>	„ 26. <i>Hyacinthus angustifolia</i>
„ 21. <i>Heptatica triloba</i>	„ 30. <i>Eranthis hyemalis</i>

On the first day of January this year the only open-air flowers that could be procured were *Jasminum nudiflorum*, four species of *Helleborus*, and certain annuals, the earliest being *Viola* that, in 1874, no less than 83 specimens and varieties were collected in bloom. (See *Transactions of the Botanical Society for 1874*, p. 62.)

* Read at the February meeting of the Edinburgh Botanical Society. By James McVail, Curator.

PLANT GOSSIP.

THAT interesting novelty, *FUCHSIA PROCUMBENS*, which was exhibited by Mr. F. R. Kinghorn, of Richmond, in August last, has verified the prediction made as to its probable hardihood. Mr. Kinghorn planted out two examples of it at the end of last summer on a piece of rockwork in his Sheen Road Nurseries, and he informs us that it has stood unharmed by the frost of January last. This fact adds considerably to its value as a decorative plant for rockwork and sloping banks in the summer, in which position its curious, erect, brilliant head of flowers will be shown off to the best advantage.

It is surprising how well the beautiful early spring flowering *MYOSOTIS DISSEIFLORA* has stood the excessive rainfall and severe frost of the present winter, even in situations where the soil about the roots is of a cold clayey nature. It suffered much more during the comparatively mild winter of 1873-74, than amid the almost arctic severity of the opening days of January in the present year. Even where growing under apparently trying circumstances the plants are rapidly making nice tufts, and are fast developing their flower-buds. Old plants left over from last year have stood almost as well as seedlings. Attempts made to put up this vernal gem so as to have it in flower early under glass have not been crowned with marked success; it does not do kindly in pots, and the best plan is to lift the tufts at this season of the year, when the buds begin to show themselves, placing them in 48-pots, and then keeping them in a cold frame till the plants begin to send up the flower-spikes. They should be lifted from the ground with nice balls of earth adhering to the roots. It is a matter for wonder that this lovely Forget-me-not does not find its way into Covent Garden Market in the spring.

THE RHODODENDRONS are naturally regarded as ornamental rather than useful, but Dr. Brandis states that the beautiful *R. arboreum*, a Himalayan species, which is one of the most striking features of the “hollow walk” in Kew Gardens in early spring, is of some economical importance. On the ranges of the Himalayas it attains a height of from 30 to 40 feet, with a girth of 7 or 8 feet, and the hard close-grained wood is employed for building, making iron dishes, and used for fuel and charcoal. Although the flower-buds and young leaves are believed to be poisonous to cattle, the flowers are eaten, and made into a pleasant subacid jelly. They are also applied for headache, and offered in temples, as those of *R. ponticum* are used in decorating the altars of churches. Two or three other Himalayan species are of some slight importance; the leaves of *R. campanulatum* are brought to the plains and used as snuff, while those of *lepidodendron* and the *R. acuminatum*, antipogon are employed as stimulants in native medicine.

In the *Hamburger Gartenzeitung* for January a M. Rothe professes to have made the discovery that the tying material commonly used in gardens under the name of *M. RAFFIA*, or *RAFFIA*, is not (and in this country, probably what is known as *Raffia grass*), is a kind of seaweed, *Nereocystis Lütkeana*. The writer says that the whole structure of this product proves that it is neither the bast fibre of a tree nor the vascular bundles of a Palm, and points to a lower organisation. It seems to us extremely doubtful whether M. Rothe ever saw the seaweed he has attempted to describe. He supports this unlucky guess of his on the facts that the tough hollow stems of this tree-like seaweed are employed by the natives of North-west America as siphons to turn the water out of their canoes, and the laminae or branches are twisted and used as fishing lines. But it is only in the fresh state, we imagine, that it can be used for these purposes. Mr. Jackson, the curator of the Economic Museum at Kew, kindly gave us all the information he could. Certainly the specimens of *Nereocystis* in the museum, whether natural or in the form of fishing lines, &c., were the very reverse of tough, and about as much use for tying the famous sawdust rope! Mr. Jackson gave it as his opinion that the *Raffia grass* was the same as the undoubted material received direct from Madagascar as the young undeveloped foliage of *Kaphia Kuffia*, or, if not actually the same, at any rate the product of a Palm. In South America a similar product is obtained from *Mauritia flexuosa*, one of the most valuable Palms of the Rio Negro region. In both cases it is only the outer skin of the leaves that is used, and this is peeled off in strips while the leaves are still young and tender. Mr. Jackson gave us a piece for microscopic examination and comparison, and there is little doubt that it is the product of a Palm, and not a seaweed.

What is the *EUCALYPTUS COLOSSEA* we read about in so many French Journals at the present time, and even in *Bentham's* *Flora*? This question has been repeatedly put to us, which is not surprising, as it is not mentioned in *Bentham* and

Mueller's *Flora Australiensis*. It is a peculiarity of Barrow's to have rarely sent his specimens or seeds of plants without provisional names, and it frequently happens that these provisional names cannot be retained, on account of the plant having been previously described, or from some other cause. This practice has the great disadvantage of making a plant known in gardens by a name not taken up in botanical works; and a plant once thoroughly known under a certain name by gardeners, retains it to the end. Of this we might adduce numerous instances. In Mueller's *Fraxinoides Phycobolus Australis* there is a bare mention of a *Eucalyptus collosa*, but no description, and we have been unable to find any description of a species bearing this name. It appears to be quite evident that Mueller has applied the name to two distinct plants himself, for he now speaks of a *Eucalyptus collosa* in the Victorian territory, which cannot be the same as that mentioned above, or it would have appeared in the *Flora Australiensis*. A comparison of the two works named will show that some of the evidently bad names are not to be retained. Mr. Kamele, writing in the *Illustration Horticolæ*, says that the *E. diversicolor* of the *Flora Australiensis* was sent to him by Mueller as *E. collosa*, and that he intends retaining the latter name for it, as more appropriate, &c. In the *Journal of Botany* Baron Mueller expressly mentions *E. collosa* as one of the tallest trees of West Australia. It seems, therefore, that this name should have appeared in the *Flora Australiensis*, otherwise how are we to know what is intended by a name?

— The question of the true OXIP, and how it may be distinguished, is one which frequently crops up in horticultural journals. Botanists are more or less agreed in regarding as a distinct species or form the *Primula eliator* of Jacquin, which was at one time known as the "Bardfield Oxlip"; but it does not seem to be so well-known to horticulturists that this plant is very valuable as a spring border flower. A correspondent who has grown it for many years from Essex specimens is not only quite satisfied of its distinctness, which he was previously inclined to doubt, but regards it as one of the most ornamental of its race. Without enumerating the botanical characters by which the Bardfield Oxlip may be recognised, it may be observed that it differs from the false Oxlips—whether hybrids or developed Primroses—in its more compact umbel, in its paler and more drooping flowers, in the comparatively direct growth of the leaves, and in the peculiar and somewhat unpleasant odour of the blossoms, which recalls that of the *Grape Hyacinth*. The scapes rise much more boldly above the leaves—we have seen them nearly 2 feet high, and the plant remains in blossom for a longer period, and comes into flower later than other Oxlips. Those of our readers who have friends in Suffolk, Cambridgeshire, or Essex—the three counties in which *P. eliator* occurs—would do well to secure from their roots of this handsome plant.

BRITISH GARDENERS.—XII.

GEORGE JOHNSTON.

AMONGST the younger Scottish gardeners who have achieved success in their profession, we must assign no mean position to the subject of our present memoir, Mr. George Johnston, whose name has often been found well up amongst the prize winners at great horticultural gatherings, and whose productions have taken the first position at some of the International shows. Our former volumes bear record of these facts. Mr. Johnston has been an exhibitor of fruit since 1868; and we find that he has won over £300 in prizes, chiefly for large general collections of fruit, and for Grapes, at the various International shows, including those of Edinburgh, Glasgow, Manchester, and Belfast—upwards of a third of that sum being won by exhibits comprised under seven entries; while as an exhibitor of Peaches, Figs, and Melons, he has been equally successful. Some of his examples of Pine-growing have won for him the certificate of the Royal Horticultural Society.

George Johnston was born at Fingask, in the parish of Kirkcubbin, Inverness-shire, on October 31, 1837. When seventeen years of age he was apprenticed for three years to Mr. Findlay, at Rulig, the seat of James Baillie Fraser, Esq., in the above parish. Mr. Findlay was a model gardener, and Rulig at that time was quite a model place, and an excellent school for young men, everything relating to gardening being carried out in the most thorough manner. He was very particular in the training of his pupils, and would see that they handled their tools properly, and got through their work in an active and systematic manner. He was also a keen competitor at the Inverness shows, and was always very successful. "Indeed," writes Mr. Johnston, "I never knew any one to surpass him in growing all kinds of soft-wooded

specimen plants, and the many valuable lessons I received from him are still fresh in my memory. The fine Cedar grove at Rulig is worth going miles to see.

"After my time expired at Rulig, my first journeyman's place was at Red Castle, in Ross-shire, the seat of the Hon. Henry Baillie, under Mr. Fraser, who still holds the situation of gardener there, and is justly looked upon as one of the best judges and cultivators of fruits, especially Grapes and pot Figs, in that part of the country. All kinds of hardy fruits receive much attention from Mr. Fraser, and the climate being a favourable one, the finest kinds of Plums and Pears are extensively cultivated, and as a rule very successfully. Grapes and other fruits under glass are grown extensively and well at Red Castle, and of these I had the charge for one season. In 1866 I went to Balbirnie, in Fife, the residence of John Balfour, Esq., where I took charge of the flower gardens, under Mr. Edwards, who was then gardener. I held that situation for one year, when I got advanced to the charge of the forcing-houses. Mr. Edwards, who was a clever gardener, carried out many important improvements at this fine place; he was also a highly educated man, and offered his aid frankly and freely to any of his men who wished to improve themselves.

"My next engagement was in 1862, with Mr. Fowler, at Castle Kennedy, as foreman in the forcing department. The far-famed Castle Kennedy Grapes were at that time beginning to be spoken about, and I shall never forget the first sight I got of these extra-

afford rendered my task comparatively easy. My employer entered fully into the spirit of the work, including every matter of detail in connection therewith, sparing no expense to secure thorough efficiency in all the arrangements, and taking particular interest in those which affected the accommodation and comfort of the garden employes. The arrangements in this respect are most complete, and are not surpassed by those existing in any garden in the kingdom, thanks to Mr. Fowler's good judgment, and Lord Strathmore's liberality.

"The construction, heating, ventilation, and general plan of the glass-houses are of the most complete and efficient character, as is everything else in connection with the forcing department, reflecting the greatest credit on Mr. Fowler, who was architect for the whole.

"Few men, I believe, at my age have had a better opportunity of achieving success, seeing that I have had the oversight from beginning to end of the formation of a first-class garden establishment, and that I have had for the last nine years every encouragement from my employers, who, in their love of gardening and their knowledge of the art, and in their kind consideration for those in their employment, are certainly unsurpassed."

ALSTRÖMERIAS.

HOW rarely one meets with these, and yet how beautiful and so easily managed they are. For supplying cut flowers during the summer months there is nothing to equal them, either for beauty or lasting qualities. Many of the best varieties rival some of the Orchids, which they closely resemble, both in the singular form of the individual flowers, as well as in their delicately marbled or spotted petals. The flowers, too, are of great substance, and as the stems are very open and soft, this accounts for their great lasting properties when cut. In the herbaceous border they are equally valuable, as they stand up very bravely. *Alströmérias* deficient in one of the choicest and most attractive of the many choice things belonging to that class of plants.

"Perhaps it is on account of the difficulty of transplanting them that one so seldom sees them, for it requires very deep digging indeed to find their fleshy tuberous roots, and when found they do not bear removal at all well, and the chances are that one not only loses those removed, but the parent plant as well if unduly interfered with. The best way to get them established is to sow the seed where they are to remain, unless the roots can be purchased in pots from the nurseries, in which case they are sure to succeed; but to grow them in perfection the ground must be properly prepared for them. This must be done by trenching at least 2 feet, or as deep as the nature of the soil will allow, and if the subsoil is naturally dry and sandy it will not require any artificial drainage. The bottom should, however, be broken up, mixing in at the same time a good dressing of thoroughly rotten leaf-mould or mill-rot dung. If the subsoil is at all wet or retentive, the bottom must be well drained by putting in 6 inches or so of broken bricks or some other absorbent material.

"The soil should be dug out at least a yard deep before putting in the broken bricks, and over this some dry straw litter should be shaken, so as to prevent the soil from blocking up the drainage. If the natural soil is tolerably light and sandy, a little rotten manure or leaf-soil added will make just the bed for them. If cold and adhesive, it will be necessary to add a portion of fresh light soil, leaf-mould and sand, or the latter may be likely to rot during the winter.

"The plants may be planted from a foot to 18 inches apart, at a depth of 6 or 8 inches. If plants cannot be obtained in pots, sow the seed 3 or 4 inches deep and the above distance apart. While growing and blanching they should receive a thorough good soaking of water, as they will continue much longer in bloom if assisted in this way, especially if the ground is previously mulched over with spent Mushroom dung or leaf-soil, and a mulching of some kind should always precede the water-pot, where its appearance is not objectionable.

"Before winter sets in they should receive an additional quantity of either of the above materials, to protect the roots from severe frost. Once planted the roots should never be disturbed. If they require cleaning it should be done by hand, and the use of the hoe or fork interdicted.

"After blooming, if the seed is not required, it should be picked off, as its removal will add to the strength and vigour of the plant, and cause them to produce a finer head of bloom than they would do if allowed to mature seed. In removing the seed-vessels, care should be taken not to rub or remove any portion of the stems or leaves, as these are necessary to mature the tuberous roots, but as soon as these are ripe and discoloured they may be removed. In choosing a site for their cultivation, it should be as open and sunny as possible, as they delight in plenty of light and air. J. Sheppard, Woolerstone Park.

The Villa Garden.

WINTER PRUNING OF WALL TREES.—We have already treated of the winter management of the Apricot and Peach on walls, and now that the weather is dry and frosty, and the borders can be trodden on without doing them much injury, the work should be pushed on as fast as possible. This leads us to treat of the Pear, Plum, and Cherry, as a continuation of the remarks given on p. 150. Pears and Plums are planted as frequently against the walls of Villa Gardens as the Apricot and Peach, and they invariably have the east or south-east aspect.

THE PEAR.—There is one advantage of growing Pears on walls—that the fruit comes much finer, and often much better ripened, than when grown on standard or espalier trees. The modes of training are as various as those mentioned in the case of the Peach, but, as a general rule, however high or low the walls, the branches are trained horizontally. What, then, should be done to such trees at this season of the year? In the case of Pears grown on walls, what is termed spur pruning is the mode followed; that is, all the small branches thrown out from the main branches trained horizontally are cut back to short spurs.

In the case of a Pear tree that is in a good fruitful condition, a one-year-old shoot, after the fall of the leaf, is usually furnished with small-pointed buds from base to point. In the following season some of these buds will produce growth that develops into shoots like which bears them. Others, instead of throwing out a shoot, simply put forth two or three leaves, and extend a little from the main branch; and by-and-by, at the fall of the year, they will be seen to have a round plump bud at the extremity of each. This is a blossom-bud, and in the course of the winter pruning they should be preserved, for it is from such that fruit must be looked for the following summer, the same being produced on the extremity of the growing points. When the fruit is gathered the point of the shoots is invariably bare, and in a season, or two, this forms what is termed a spur, and gives forth, perhaps, three or four—more or less—blossom buds, which in their turn become spurs. It will be at once apparent that an accumulation of these spurs forms a large cluster, year after year, as they make growth, and by growing out from the walls have an awkward look and become inconvenient. If the branches are vigorous and healthy, the spurs may be thinned out by cutting them back to near the main branch, when the small incipient buds just visible at the base of each spur will be developed in course of time, and will go through the same regular course as the primary buds. If a few of the largest of these spurs are annually removed from the branch, it may always be kept with a sufficient number to bear a good crop of fruit, while the annual removal of a few of the most advanced will keep the branch in order, as long as it may continue in health.

In strong clay soils, the Pear on walls makes a very strong growth, and in some gardens, where villas are built in lines, and the walls are of necessity low, it is difficult to get fruit, for the trees, when they make a luxuriant growth, go very much to wood. It is difficult to know what treatment to recommend under such circumstances; the soil was never meant for fruit culture. Perhaps the best course to adopt would be to dig out a good portion of the stiff rank soil about the roots, and replace it with lighter material, taking out about one-third or so at a time, and so gradually effecting a renewal of the soil in which the tree is growing. Pears really want plenty of room for development; they are very rapid growers, and attain a great height, therefore the sides and fronts of dwelling-houses, if the aspect be suitable, are more favourable than walls, if the ground suits the roots, and the tree is healthy.

THE PLUM.—This fine fruit, when planted against walls, should be in a soil that is freely drained. A bed of alluvial gravel forms an excellent subsoil, and the roots do not penetrate into it, but are kept near the surface. It is essential to the well-being and fruitfulness of the Plum that the roots do not go deeply into the soil.

The principal training and pruning can be made at the end of the summer or early in autumn, or during mild weather in winter or spring, if it cannot be conveniently done at the fall of the leaf.

The well-being of the Plum tree depends very much on the summer pruning, which will be treated of at the proper time. At this season of the year the cultivator should cut back the young shoots to four or six buds, leaving the central or leading shoot somewhat longer. The fruit-buds are produced on the lateral shoots, and it is necessary in the summer to pinch off the ends of these when they are likely to grow strong. The aim of the cultivator should be to get these distributed over the tree; and at this season of the year they must be thinned out where they are too thick, or

laid in proper position if necessary. A great deal of the pruning is actually done during the summer.

THE CHERRY.—The Cherry, when planted against walls, requires a good soil to do it justice. Not that it is necessary to be profuse of manure, but in a light good loam it will do well.

The Cherry, like the Pear, is, trained both in the horizontal and fan fashion; and what the cultivator should aim to produce is strong and healthy branches from 6 to 9 inches apart. The great object should be to cover the wall with good fruit-bearing wood, leaving sufficient room for the fruit to hang free of the branches. The fruit is produced chiefly on short spurs, which grow on the branches at two years old. The Morello Cherry, which is usually planted on north walls, bears fruit on the one-year-old branches, and generally on short shoots. The Cherry is easily regulated as to training and pruning; the great thing is to keep the branches moderately thin and regular in their arrangement.

It is very difficult to give precise details as to pruning to suit all cases. Our advice to villa gardeners is to call in the friendly counsel of some practical gardener who is a good fruit cultivator; and an occasional illustration or two as to the best mode of pruning, at the proper seasons of the year, will be of great advantage; any one wishing to be more exact in respect of this important detail of practical gardening.

THE FARM.

AGRICULTURAL STATISTICS.—From the recently issued *Agricultural Returns of Great Britain for the year 1874* we take the following extracts:—

The total number of acres of cultivated land returned in 1874 as under crops, bare fallow, and grass, for the whole of the United Kingdom, was 47,143,000 acres, divided thus: in Great Britain 31,267,000 acres, in Ireland 15,752,000 acres, the Isle of Man 94,000 acres, and the Channel Islands 30,000 acres.

Besides the acreage returned as under cultivation, about 2,187,000 acres were occupied by woods and plantations in Great Britain, and 325,000 acres in Ireland.

The total acreage returned as under cultivation in Great Britain shows a gradual increase year by year. This increase has amounted in the six years from 1868 to 1874 to 970,000 acres, or 4.2 per cent. in England; to 175,000 acres, or 7 per cent. in Wales; to 166,000 acres, or 3.8 per cent. in Scotland; and to 1,111,000 acres, or 4.3 per cent. for the whole of Great Britain. When a portion of this increase is due to the greater care and accuracy of occupiers of land in making the returns it is not possible to determine, but although a large allowance must probably be made on this account, there cannot be a doubt but that several thousands of acres of fresh land are annually brought under the plough or improved for pasturage. The reclamation of waste land is mentioned by the collecting officers as having taken place, and having caused an addition to the cultivated acreage in many parts of the country. In fact it is specially alluded to by the officers in ten English, eight Welsh, and in as many as fourteen Scotch counties.

The increased acreage returned was chiefly for arable land between the years 1868 and 1874, more especially in England; but in 1873 and 1874 there was a falling off of arable acreage, and a more decided increase in the acreage of permanent pasture.

Although agricultural labourers may still be more than equal to the demand for them in some parts of the country, their aggregate number in Great Britain continues to diminish. By the census returns, farm labourers fell off in England and Wales from 958,000 in 1861, to 798,000 in 1871, or by nearly 17 per cent.; and in Scotland from 105,000 in 1861, to 93,000 in 1871, or by nearly 12 per cent.

Indoor farm servants, of whom about five-sixths are males, and many of whom probably are out-of-door labourers living in farmhouses, numbered in England and Wales 1,095,000 in 1861, and 1,150,000 in 1871, showing a decrease at the rate of 22 per cent.; and in Scotland the number of the same class was 63,000 in 1861 and 61,000 in 1871, showing a smaller falling off, at the rate of about 4 per cent.

According to the census returns of 1871, the total number of persons engaged in the management and working of the soil (including farmers and graziers, farm bailiffs, labourers, farm servants (indoor), and shepherds), was 1,246,000 in England and Wales; 220,000 in Scotland; and 931,706 in Ireland. In England alone the number was 1,153,000. These numbers, compared with the total acreage returned as under cultivation in 1874, show for England, with 56 per cent. of acreage under the plough, that, upon an average, 100 acres are managed and worked by 4.8 persons, and for Ireland, with only 33 per cent. of arable acreage, that six persons are engaged in the cultivation of every 100 acres. But if allowance be made for the different proportions of arable land in

the two countries, a much greater difference in the average number of persons employed to cultivate the soil would be shown.

The total acreage of land returned as under cultivation in 1874 in the United Kingdom (including the islands), and amounting to 47,143,000 acres, was, as nearly as possible, equally divided into the two great classes of arable land and permanent pasture. But whilst for the whole kingdom the percentage proportions of arable land and permanent pasture were 49.8 and 50.2, there was no such near approximation in any one of the separate divisions of the country.

The arable land returned for the United Kingdom in 1874, and amounting to 23,463,000 acres, was apportioned to the principal classes of crops in the proportion of 48 per cent. for corn crops, 21 per cent. for green crops (including Potatoes), 3 per cent. for bare fallow, and 27 per cent. for artificial grasses, leaving a small proportion over for Hops and Flax.

In England rather more than one-half, or 55 per cent. of the arable acreage, was occupied by corn crops, 20 per cent. by green crops, and 15 per cent. by artificial grasses. In Wales the proportion of the arable land devoted to corn crops was large, being about one-half, or 49 per cent.; the proportion for green crops was only about 12 per cent., and artificial grasses had as much as 35 per cent. In Scotland, the corn crops did not take more than 40 per cent. of the arable acreage, the green crops reached 20 per cent., and the artificial grasses had as much as 39 per cent. In Ireland the corn crops were only upon about one-third, or 36 per cent. of the arable acreage, the green crops (including Potatoes) upon 23 per cent., and the artificial grasses upon 36 per cent.

The total extent of land returned in 1874 for the United Kingdom (including the islands) as under corn crops of all kinds, including Peas and Beans, was 11,364,000 acres, of which 7,830,000 acres, or nearly 34 per cent., were under Wheat, 2,507,000 acres, or 22 per cent., were under Barley, 4,088,000 acres, or 36 per cent., were under Oats, and 936,000 acres, or 8 per cent., were under Bye Beans, and Beans. A very large proportion of the Wheat acreage belonged to England—as much as 88 per cent., or nearly nine-tenths of the whole Wheat crop of the kingdom. Of the acreage under Barley a large portion was also in England, to the extent of 75 per cent., or three-fourths of the whole crop. The acreage under Oats was more equally divided between the chief portions of the Kingdom: 33 per cent. was in England, 24 per cent. in Scotland, and 36 per cent. in Ireland.

Green crops, including Potatoes, were grown upon 4,957,000 acres in the United Kingdom in 1874, of this acreage, 50 per cent. was under Turnips, 28 per cent. was used for Turnips and Swedes, and 28 per cent. for Potatoes. As much as 63 per cent. of the total acreage under Turnips and Swedes was returned for England, against 20 per cent. for Scotland, and 13 per cent. for Ireland. Of the total acreage returned for Potatoes, England had only 22 per cent., Scotland 11 per cent., and Ireland as much as 63 per cent.

Looking at the returns for the separate divisions of the kingdom, it will be seen that in England a considerable part of the arable land under cultivation is appropriated to other crops than Potatoes and Turnips. These two descriptions of crops did not occupy more than 67 per cent. of the green crop acreage in England, against 88 per cent. in Wales, 96 per cent. in Scotland, and 90 per cent. in Ireland.

The land returned in 1874 for Clover and other artificial grasses under rotation, amounted for the United Kingdom to 6,284,000, or 26 per cent. of all the land under tillage. There was more land by 1,328,000 acres under the artificial grasses than under the other green crops. In England there was no great difference in the acreage under green crops and under artificial grasses. In Wales, artificial grasses had nearly three times as much acreage as the green crops; in Scotland about twice as much, and in Ireland about one-half as much again. Differences in the rotation of crops and systems of cattle-feeding, as adopted in the separate divisions of the kingdom, will partly account for these variations.

The amount of arable and grass land returned as used also for fruit trees of every kind, is for the most part included in the returns for crops and grass, and should not, therefore, be added to the general acreage. In 1874 the land returned as used also for orchards was 145,622 acres in England, 2994 in Wales, and 1910 in Scotland.

The separate returns for land used by market gardeners for the growth of vegetables and other garden produce, show in 1874 an acreage of 4,989 for England, 477 for Wales, and 2741 for Scotland. An increased demand for fruit and vegetables is stated by some of the collecting officers to have led to the extension of orchards and market gardens in the neighbourhood of towns. For land used by nurserymen for the growth of trees, shrubs, &c., the returns for 1874 show an acreage of 9245 for England, 630 for Wales, and 1868 for Scotland.

As the extent of woods and plantations does not vary greatly from year to year, annual returns are not obtained for land so occupied, and the acreage is

given for 1874 at 2,187,000 acres for Great Britain, as ascertained in 1872, and 325,000 acres were returned for Ireland.

Forestry.

PLANTING is now the forester's chief occupation. Where the operations are conducted upon an extensive scale, the work on some estates is steadily prosecuted at all seasons, weather permitting, between the months of October and April, both inclusive. It used to be a maxim with the ancients to plant during all the months of the year in which the letter "R" occurs, and this gives a long calendar, extending to eight months. Such has been both spoken and written upon the subject of "the best season of the year for planting forest trees," and having planted (partly by way of experiment) during every month of the year, I am in a favourable position to give an opinion, both as to the most and least favourable seasons or periods of the year for planting operations. Confining my remarks for the present to Scotch Pine, my conviction is that better results proceed from planting in October and November than at any other period, and worse results from planting in June and July than any other time. The state of the weather and condition of the soil, however, both at the time of planting and subsequently, influence and alter in a very marked degree the growth of the plants, one year compared with another.

It is no uncommon practice with foresters to go over the newly-planted ground about the month of August, and ascertain the actual percentage of deaths that have occurred, and upon this data base their calculations of success or failure. Now, it must be borne in mind that there are other and even greater evils and worse results connected with planting than a comparatively high death-rate. I would rather see 15, or even 20 per cent. of deaths in a new plantation, and the remainder healthy and vigorous, than only 5 per cent. of deaths with a general sickness pervading the whole crop.

One very unfavourable result arises from planting in June or July, namely, the loss of that year's longitudinal growth: the top and side shoots being at that period only in a half-formed condition, invariably shrivel and decay. The loss of one year's growth, though very considerable, in a 1000-acre plantation, does not in any true way represent the actual amount of the loss sustained; for the loss of the leading shoot of a Scotch Pine tree may in a certain sense be regarded as an irremediable evil, extending its baleful effects throughout the existence of the plantation. Too much importance cannot therefore well be attached to the preservation of the top growth of the plants, and every precaution should be taken to secure it. If the top bud, which may be regarded as the future top shoot encased in its scaly cell, is unfavourably influenced in any way, so that its product is either sickly or distorted, the future development of the tree will be thereby greatly marred. In order, therefore, that the newly-planted tree be enabled to perform all its functions properly and perfectly, the following amongst other matters should be attended to:—

First: The plants in the nursery ground should be well furnished with lateral branches close to the surface of the ground, and the growth of the plants should be rather under than over vigorous—in other words, grown upon soil not too rich.

Second: That the nursery ground from whence the plants are taken be dry, free, and open, with a mixture of sand in it, so that the plants may be well furnished with abundance of healthy fibrous roots.

Third: That the plants in the nursery have been either removed the year previous to planting out, dug round, or otherwise treated so as to retard the top growth and increase the root growth.

Fourth: Every precaution should be taken so that the plants may be grown in and lifted from a loose sandy loam or sandy moss, and not from clay or even certain kinds of peat soil. Probably more failures, at least of large plants, result from lifting trees out of stiff or tenacious clays and planting them in dry sandy loam than by any other cause. In all such cases the roots, on being submitted to the change of soil, rot and decay, and the plant thenceforth is left to struggle and produce for itself a new class of roots suited to its changed condition.

Fifth: Do not plant deep. If the herbage is so rank as to necessitate burying the plants deeply in order to reach the active soil, better to pare off the turf, and thus avoid the very injurious results of deep planting. Large transplanted trees are apt to suffer greatly by the loose soil in which they are planted suddenly and carrying down the whole structure of the tree along with it. C. Y. Michie, Cullen.

Notices of Books.

A *Flora of Canada*, edited by Dr. A. M. Ross, has just been published at Toronto. It contains the following families:—"Caperidaceae, Lentillaceae, Orobanchaceae, Plantaginaceae," and many others, which might be taken as new, only they betray the same origin as some well-known families. It is really too bad that a "Doctor" should be allowed to publish such a specimen of bad spelling as his catalogue (it is nothing more) is from beginning to end. We frequently have occasion to remind gardeners that this subject deserves more attention than some of them bestow upon it; but some men who are very clever cultivators have not the advantage of anything beyond the most elementary education, and in their case there is something to be said in extenuation.

—A number of the *Journal of the Linnean Society* (botanical section) has just been issued. Its principal contents comprise a note on the habits of *Crocifera*, by Dr. Masters; Observations on the Vegetable Productions of Baghdad, by Surgeon-Major Colville; On the Restiacea of Thunberg's Herbarium, by Dr. Masters; On Indian Gentians, by C. B. Clarke, Esq.; On a Fruit from Comassi, by Professor Oliver, said to be the only specimen of botanical interest received at Kew from the Ashanti Expedition. It proved to be a fruit of a new species of *Duboseia*, a remarkable *Tiliaceae* genus. On the Lichen Flora of New Zealand, by Dr. Stirton; and Notes on *Physica arborea*, together with some Notes on the Vegetation of Amsterdam Island, by Dr. Hooker. From this latter paper we glean the following interesting particulars:—"Amsterdam Island, lat. 37° 52' S., long. 77° 35' E., has been stated to be covered with trees, while St. Paul's Island, 50 miles to the south of it, is destitute even of a shrub. The great difficulty of effecting a landing on Amsterdam Island has prevented its flora from being investigated, but in October, 1873, Commodore Goodenough, of H.M.S. *Porpoise*, landed on Amsterdam Island, brought off a specimen of what he considered to be the only tree growing on the islet, a frond of a Fern, and an armful of Cabbages, "pulled" from the deserted garden of departed whalers. The tree proves to be *Physica arborea*, a native of Tristan d'Acunha, lat. 37° 6' S., long. 12° 2' W., "a most singular fact, considering that about 5000 miles of ocean intervene between these oceanic specks of land." The present species of *Physica* "connects botanically the three remote islets of St. Helena, Tristan d'Acunha, and Amsterdam, with one another and with the African continent. Speculations as to the causes that have led to the establishment of *P. arborea* on Tristan d'Acunha and Amsterdam are "hopelessly vague." In the enumeration of the plants of the southern of the two islands (St. Paul's) mention is made of the curious fact that *Lycopodium ceruam* grows in the immediate neighbourhood of hot springs of a temperature of 114°. In this way a tropical species is enabled to extend beyond its proper latitudinal range. This fact is also remarked in the case of the same plant in the Azore islands." Dr. Hooker mentions additional instances of a like phenomenon in the case of *Gleichenia dichotoma*, *Nephrodium molle*, *N. unitum*, and *N. suberosum*, in the northern island of New Zealand. *Nymphaea Lotus* (var. *thermalis*) also grows in the hot springs of Hungary; and the writer of these lines collected in a warm spring near Vöslan, in Austria, quantities of a species of mollusc, *Neritina*, whose proper habitat is much further south.

Florists' Flowers.

THAT section of PINKS adapted for forcing—for out of the great group of florists' or exhibition varieties found in a catalogue like that of Mr. C. Turner but few are suited for forcing—has gradually been augmented, though the growth of numbers is necessarily slow, and the appearance of new varieties infrequent. The old Anna's Boleyn Pink will be familiar to all who love their gardens and cultivate some old-fashioned flowers. Then there is the Paddington Pink, with its deep purple and white flowers; and Kubens, having crimson-purple flowers, and of a dwarf and free habit. These have been grown for many years past, because

of their great usefulness and their free-blooming properties.

A few years ago these old types were considerably improved on by some varieties raised by Mr. James Clark, of Bury St. Edmunds, a well-known florist in the eastern counties. The latest of his flowers, or at least one of the latest, is Lord Lyons, a very fine and showy variety, having deep rose and purple flowers, full, smooth, roundly fringed, and very early.

I have heard it stated that this fine Pink is not of a robust habit; and I must confess I was surprised to hear the statement. Since Mr. Clark sent it to me in 1867 I have constantly grown it in the open border, and have found it all that could be desired as a garden Pink. It makes a dwarf but very dense growth, and flowers as freely as one could desire to have blossoms produced in a border Pink. I have frequently potted up plants to bring on early in a cold house, but have never succeeded with them. I think it is a little impatient of pot culture.

Mrs. Pettifer is a pretty, free-blooming, early Pink, that forces well, and has white flowers with the colour that generally appears in the florists' varieties as a lacing grouped in the centre. The broad white edge surrounding this gives it a charming appearance. The fine purity of the white self Pink, Lady Blanche, and its great adaptability for forcing, makes it a great favourite among those whose business it is to grow cut flowers early in the season. The blossoms are well become and of a "good useful size," that is, they are small, and can be worked into bouquets and button-holes; the flowers are smooth and moderately full, the pod does not burst, it is of free habit, and blooms most profusely, and it is thoroughly first-class in every respect. Messrs. Standish & Co. grow this largely.

A really scarlet Pink has recently been added to the forcing section. It is a fine bright scarlet self, the flowers large, full, and very compact, of very dwarf habit, and blooming very freely. This is named *Compass*, and also forces remarkably well. It was raised a few years ago by Mr. W. Lee, and sent out by Mr. C. Turner. It can be seen in fine perfection at the Slough Nurseries in the spring, as Mr. Turner grows a large quantity of it for cutting from.

The culture of forcing Pinks differs in detail from that employed in respect of the laced varieties. At Slough they are propagated as soon as pippings can be obtained, and they strike freely in a gentle bottom-heat, and when they are strong enough, and have become duly hardened to exposure, they are planted out in a prepared bed, and kept growing freely all the summer, and potted up early in the autumn. An ordinary soil for Pinks suits them well; and during the winter the plants should have the protection of a cold frame. The size of the pots must be regulated according to the plants; but forcing Pinks should not be over-potted.

In order to have Pinks well in flower it is very essential that they be well-established in pots. It is also very necessary that they be brought on into flower gradually, and not forced to too great heat. The plants should be placed as near the glass as possible, and as they throw up their flower-stems and expand their blossoms a little weak manure-water should be given about twice a week. R. D.

Law Notes.

A SALESMAN'S ACTION DISPUTED.—*Thomas v. Hill*.—This was an adjourned action, heard in the Westminster County Court, before F. Bayley, Esq., in which the plaintiff, a salesman, carrying on business in Covent Garden, sued the defendant, another salesman, of the Borough Market, to recover the sum of £9 16s. 6d. in damages for the loss of a case of Horse Radish, solicitor, called Mr. Pratt, the plaintiff, who stated that the defendant ordered one case of Horse Radish containing eighty-four bundles, at 1s. 2d. per bundle, for which the witness gave a delivery note to the wharf clerk, and that on the following day he received an order from the defendant's son for a second case at the same price for delivery on the following day, and for which the witness also signed a delivery note. Subsequently, on the Saturday following the transaction, when he applied to the defendant for the amount, he refused, stating he had only received one case. After several applications had been made for payment, without avail, the present action was brought.

The defendant being called, said in the first place there were only seventy-four and not eighty-four bundles, as stated, and that he had paid the amount due on the first case into court. George Stone, clerk at the Southwark Wharf, was called to prove the delivery of one case to the defendant, but said he had no authority to deliver the second, and it still remained at the wharf, at the plaintiff's risk.

The learned Judge now said there was no proof of the delivery of the second case, and he should therefore nonsuit the plaintiff. Mr. Willis applied for an adjournment, but the learned Judge, remarking that this was the second time the defendant had been in court, refused the application.—Nonsuit entered.

HORTICULTURAL EXHIBITIONS, 1875.

MARCH.

- 3.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 10 and 11.—Leeds Horticultural Gardens Company. Spring Flower Show. Sec. and Manager, James Birbeck, 103, Hyde Park Road, Leeds.
- 16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.
- 17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 24.—Glasgow and West of Scotland Horticultural Society. Spring Exhibition. Sec., F. G. Douglal, 467, Canning Street, Glasgow.
- 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

APRIL.

- 4.—Special Exhibition of the Royal Horticultural Society of Antwerp.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 22.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.
- 27.—Manchester Botanical and Horticultural Society. Exhibition of Anticulis, &c., in the Town Hall. Manager, Bruce Findlay.
- 28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 20, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- TUESDAY, Feb. 23. Sale of Poultry and Pigeons, at Stevens' Rooms.
Sale of Nursery Stock at the Exotic Nurseries, 8, W. V., by Froehroer & Morris.
- WEDNESDAY, Feb. 24. Sale of Hardy Trees and Shrubs, Roses, Gladioli, &c., at Stevens' Rooms.
Lecture at the Royal Horticultural Society, at 9 P.M.
Clearance Sale at the Frimley Park Nursery, by Froehroer & Morris.
- THURSDAY, Feb. 25. Sale of Catalogues, Books, &c., at Stevens' Rooms.
- FRIDAY, Feb. 26. Sale of Roses, Fruit Trees, Shrubs, Bulbs, &c., at Stevens' Rooms.
- SATURDAY, Feb. 27. Sale of Roses, Fruit Trees, Shrubs, Bulbs, &c., at Stevens' Rooms.

EACH year it is becoming more and more difficult to answer the questions that pour in upon us from all quarters—WHEN, HOW, AND TO WHAT EXTENT SHALL WE PRUNE OUR ROSES? In the good old times, when Roses were few and almost all of one character, such as the Damask, Provence, or Moss Rose, almost every grower pruned his Roses with as little ceremony as he did his Gooseberry or Currant bushes. As soon as convenient after the fall of the leaf the Roses were pruned or sheared overhead to keep them in form or within reasonable limits, and also to add to the size and beauty of the flower by concentrating the vital force provided by bountiful Nature for the manufacture of many Rosebuds, into a few of unusual size and abnormal intensity of colour, or fullness of fragrance. And for these objects the old modes and time of pruning were sound in theory and successful in practice. Crippling as little as any system of pruning could the powers of the roots, it concentrated vital force into fewer channels or outlets, with the legitimate and deserved result of enlarging the individual flowers. It was also successful in limiting the area of the plant, and improving its form. Both are essential in most gardens.

Perhaps no garden was ever overdone with Roses; but it is one of the highest objects of successful cultivation to get as many flowers as possible from a given space. Skilful pruning insures this object. It also places the flower in the best position for pleasing effect, and the perpetual well-being and well-doing of plants. The law of natural growth seems to lie as far and as fast as possible from old centres; in other words, the strength and the beauty of plants left to Nature is in their heads. Each has a leader, and all the power of the plant is bent on following it. The result is—strength ahead and weakness behind; and to such a degree is this carried that growth is in many cases almost wholly confined to the upper

portions of plants, and the lower buds are too weak to break at all, or, if strength enough is left to enable them to break, they break to starve, as all the food of the plant is drawn to its head. Cut off its head by pruning it back, and its strength is thus distributed among the buds left, and the plant breaks back and clothes its base with growth and beauty. Hence pruning is an expedient for ensuring a diffusion of force and its distribution to any and every part of the plant. It thus helps us to mould plants into form, and secure an aggregate amount of produce or of bloom within the most limited area.

The practice of our forefathers illustrated all this, though few of them stayed to formulate the theory on which that success rested. But pruning for these objects only, they were pruned at the best time as soon after the fall of the leaf as may be. Thus the entire root-action of the plant throughout the winter and spring months was turned to account in filling up the strength and vital force of the buds left at the base of the beheaded shoots. That the roots fulfil some such mission is not a matter of theory but of observation. Observe the buds in November, when the leaves fall, and the same buds at the end of February, and note the difference. Whence comes it? In great degree, no doubt, from the altered condition of the buds themselves. They have been moving onwards as to a large extent independent centres of growth, but they have likewise been filled fuller by the ministry of the roots—a ministry that rests not wholly at any time during the life of plants, unless when forcibly frozen into inaction by the severity of the cold. By early pruning we utilise this filling-up process of the roots, and turn the supplies into the buds left—a point of vital importance to the strength and beauty of the coming Roses.

So far the true theory and practice of pruning Roses is almost as simple and exact as a mathematical proposition, or a problem in the rule of three. As this is to that, so is that to the answer required, and so also is the pruning of Roses to the moulding into shape and the distribution of their blossoms all over them, instead of having them chiefly or only on their crowns. But operations on living plants, as on animals, are subject to disturbances and modifications from a variety of causes. For instance, we have no longer to deal with a class of Roses of uniform character that yield a harvest of beauty and sweetness in June, mature their wood, and rest quietly in comparative idleness till the next June. On the contrary, the restlessness that pervades life—horticulture as well as all other phases of existence—seems to have entered into the very blood of our Roses, and to have excited them and their cultivators to such an extent that nothing less than Perpetual Roses will now satisfy cultivators.

It would be beside our present purpose to attempt to show how this new blood has been infused. Suffice it to say that nearly all our best Roses are more or less imbued with the new tendency towards perpetual growth, and that the force of this tendency is developed to the utmost by special culture, in order, as far as possible, to adorn our gardens with the beauty and sweeten them with the odour of Roses from May to December.

This change of character, condition, and object, has necessarily brought about changes of culture, and especially of pruning. To prune for one perfect harvest of Roses is one thing, to prune for two or more within the compass of a season is another, and a widely different thing. And the latter has now become by far the more important, and expert cultivators have now determined the best time and the most perfect mode of pruning to yield the most perfect

flowers when wanted, and to insure successive displays from May to November, and in open weather till the end of the year.

As to the time to prune, that must largely depend upon the previous question of the time of flowering. We can determine the latter, to a great extent, by adjusting the former. In general terms, and barring accidents from late spring frosts, the earlier we prune the earlier we gather Roses. Hence, if we want late Roses we prune late, and in our attempts to adjust the time of the Rose harvest the pruning of Roses may be performed in any month from November to April. Of course there are great risks in pruning so early or so late. In the former case, the more highly excitable our modern races of Roses the greater the danger of the blossom being cut off by late frosts. And by pruning so late as April we weaken the Rose plants tremendously, by depleting them of the strength cut away in the already broken buds, and leaving the crippled remainder of the vital force to plump out and up the weak buds left into strong growth or fine blossoms—a task well nigh impossible, for it is proved by experience that the strongest plants may be reduced to a state of weakness, ending in death, by late pruning persisted in for several seasons. Unless, then, for special and exceptional reasons, the question when to prune Hybrid Perpetual Roses may be answered thus—February; that is, take the happy mean between the two extremes of too early and too late, and the result will prove satisfactory. But continuous blooming can only be ensured by continuous and successive pruning. Therefore, while the general stock of Roses should be pruned in February, part of them should be pruned earlier and part later; and of course the pruning continues throughout the summer. As soon as China, Tea, Noisette, and Perpetual Roses have finished flowering, the flowering shoots should be cut back to within a bud or two of their base. This forces them to break strong, and consequently to flower again, and thus the supply of bloom is kept up. Again, by pruning Tea and China Roses as late as May they will make a grand show in July, just when the summer and perpetual Roses are in the sere and yellow leaf. On the same principle, too, we can anticipate the season of Roses. Prune Banksian Roses in July, and they will flower early in May; prune Maréchal Niel Rose in October, slightly protect it, if need be, during winter and spring, and it also will flower in May, to be followed by Gloire de Dijon or other Teas, treated in the same manner. So that in fact it comes to this, that those who would gather sweets from Roses throughout the season, must be also pruning Roses, perhaps nine months out of the twelve, if not each month in the year.

As to the how and to what extent Roses should be pruned, the only general rule that can be laid down is—the weakest most, the strongest least. This is just the opposite to what has so generally been done. The attempt to enforce weakness at the point of the knife, has by no means passed away with our remote horticultural progenitors. In a certain condition of the plant, as we have already seen, this may be the result of pruning or further depleting an already exhausted reservoir of vitality; but, as a rule, excessive pruning has quite the opposite effect. It concentrates force, and thus adds to the strength of weakly plants. Therefore, the weaker the variety, the more severely it should be pruned, and *vice versa*. The fact is, almost each Rose needs a special time and mode of pruning to do it the fullest measure of justice. Prune all alike, and to the same extent, and reap mediocre flowers. Prune each in accordance with its idiosyncrasy of habit, constitution, season, and each Rose will be perfect. Scarcely any horticultural practice has been performed on more haphazard rule-of-

FIG. 44.—ALOE FEROX, AND OTHER SUCCULENTS, IN THE GARDEN OF M. THURET, AT ANTIBES.

thumb methods than that of the pruning of Roses. The immense advances that have been made in the number, quality, cultivation, and showing of Roses is fast forcing this vital matter of the true mode and extent of pruning them to best purpose, on the attention of cultivators; and it may be added, that never will Roses be pruned as they ought to be, until profound skill and special knowledge regulate and control each cut of the knife.

— THE illustration which we give this week (fig. 44) represents another view in the rich garden of M. THURET, of Antibes. We have on several occasions mentioned the splendid collections of SUCCULENT PLANTS in this garden, and an inspection of the cut suffices to show that we have not indulged in exaggeration. Our

view shows a perfect forest of Aloes, with a noble plant of *A. ferox* in the foreground. This is a species long known in British gardens, and is remarkable for its thick leaves beset with short conical spines. The flowers are yellow, and their magnificent aspect may be inferred from the cut. The collection of Aloes at Kew is very rich, and many have bloomed during the present season. At Mr. PEACOCK'S, at Hammer-smith, and also in the Botanic Garden, Oxford, are also fine collections of this too much neglected genus. Some of the Aloes assume the form and dimensions of trees, as mentioned in an article on the subject (*Gardeners' Chronicle*, 1874, i. 567, with illustrations) from the pen of Professor DYER. The drug aloes is obtained from the dried juice of various species.

— To the kindness of Colonel TREVOR CLARKE we are indebted for a curious flower of *CROCUS AUREUS*, in which the segments of the flower are all more or less three-lobed, and banded with stripes of

paler yellow. It appears as if Nature had been un-certain whether to make a petal or a stamen, and so has effected a compromise between the two—the central lobe representing the connective, the two side ones the anther lobes. Although a similar malformation is, according to our experience, not uncommon, yet we do not remember to have seen so perfect an instance.

— We understand that Mr. WILLIAM LEWIN, of Upletham, succeeds the late Mr. MICHAEL GRAY, as gardener to the Earl of ZETLAND, at Aske Hall, Richmond, Yorkshire.—Mr. BOOTHROYD, well known in Kent as a good plant grower, is leaving Woodville Hall, near Dover, in consequence of the death of his employer.—Mr. JAMES SMITH, late of Exton Park, is appointed to succeed Mr. SLOW, at Mentmore, Bucks.

— *STEPHANOPHYSUM BAIKIEI* is one of the most beautiful of the rarer and least known members

of the rather neglected order Acanthaceæ. During the past winter it has been flowering in the Begonia-house and Palm-stove at Kew. It is one of the many interesting plants received there some years ago from the Niger Expedition, under the command of Dr. BAIKIE, after whom the name was given. A good figure is published in the *Botanical Magazine* of 1859. The leaves are ovate-lanceolate, about 6 inches in length, and of good appearance. The flowers are scarlet, tubular, about 2 inches long, and curved, produced in terminal panicles, with racemose or spicate branches. Its habit requires a little management, in the way of cutting back, in order to ensure a well-furnished specimen.

— The next evening meeting of the ROYAL HORTICULTURAL SOCIETY will take place on Wednesday next, February 21, at 8 o'clock, when Dr. MAXWELL T. MASTERS, F.R.S., will lecture on "Charles Darwin as a Horticulturist."

— With reference to the ROYAL HORTICULTURAL SOCIETY'S SCHEMATIC arrangements for 1875, notice has been given that the following shows will not be held, viz., March 17, April 21, September 1, and November 10.

— The PELARGONIUM SOCIETY is progressing, though its ranks are not filling up so rapidly as we should have expected and desired—perhaps from an erroneous impression, strengthened by its present year's schedule, that it is to devote itself solely to the Zonals. The following new members have been added since the last meeting, namely:—Mrs. Carter, Faversham; Dr. Sankey, Cheltenham; Thos. Kibble, Tunbridge; H. G. Quilter, Aston, Birmingham; Miss Skipworth, Derby; Messrs. Veitch & Sons, Chelsea; F. Campion, Red Hill; J. F. West, Keigate; and several other subscriptions have been promised. We trust that sufficient subscribers may be induced to join the Society to enable the committee another season to offer encouragement to all classes of Pelargoniums.

— We are glad to learn that Mr. ORMSON, the well-known horticultural builder, of Stanley Bridge, Chelsea, has recovered from his late serious illness.

— Mr. A. MCKENZIE, of Alexandra Palace and Park, having nearly completed the outdoor works and glass structures there, is prepared to take commissions in landscape gardening, and the improvement of landed estates. Although enabled to enlarge his sphere of operations, Mr. MCKENZIE will continue on the official staff of the Alexandra Palace Company.

— Notwithstanding that gardeners, as a general rule, consider the WRINKLED MARROW PEAS to be the best flavoured, experience has yet shown that, in the case of a dry season, the round early varieties are often better than the wrinkled kinds, as the latter are apt to become hard and flinty, whereas the round varieties do not partake of this character so much, especially when picked young. Experience gained in several quarters determined this opinion last season when the trying drought set in, and in the case of one large market gardener, who grew for market large breadths of First Crop Blue and Veitch's Perfection—the latter, owing to the drought, being ready to gather almost as soon as the former—his testimony was most emphatically given in favour of the superiority of First Crop Blue.

— The report for the year 1873-74 of Dr. KING as Superintendent of the CALCUTTA BOTANICAL GARDEN, shows how serious have been the effects of the cyclones of 1864 and 1867 in uprooting so many of the noble trees for which the garden was once famous, and which were so important for purposes of shade. Among matters of merely local interest, we find other statements of more general importance, such as the fact that in Sikkin, owing to the success of the method of propagating by root and leaf-cuttings, the number of Ipecacuanha plants has been raised to over 63,000. Attention has also been given to the propagation and distribution of the Mahogany, which succeeds well in Bengal. The question of the difficulty of importing Sweet Chestnut seeds alive into India has already been noted in our columns, with special reference to the mode of keeping in sand practised with so much success by Mr. A. SMILE (see p. 185). The total number of Cinchona plants of various species grown in the Government plantations at Sikkin is no less than 3,251,275. About two thousand acres are devoted to the cultivation. It is found that the Cinchona cannot be induced to grow in places that do not exactly suit it, hence selection of site has to be made with more than ordinary care. How desirable it is to extend the culture is shown by the fact, that quinine is still almost unobtainable by the mass of the population, who have to use a very inefficient substitute.

— READ'S NEW HYBRID SCARLET-FLESHED MELON is considered by growers to be much superior to many of the Scarlet-fleshed Melons in cultivation. It has a very thin rind, like some of the best of the green-fleshed types. The flesh is of a bright pale scarlet

hue, of exquisite flavour, rich and melting. An old Melon-grower, of considerable repute, regards it as the best introduction to the class of scarlet-fleshed Melons that has taken place for some time past.

— His Royal Highness the Prince of WALES has consented to preside at the annual dinner of the ROYAL AGRICULTURAL BENEVOLENT INSTITUTION. The date has not yet been fixed.

— The following circular with reference to the PROPOSED POTATO SHOW has been widely distributed:—

"Woodlode House, Beckenham, Kent,
February 1, 1875.

"Dear Sir,—I beg to call your attention to a proposal to hold in or near London, during the ensuing autumn, an exhibition of Potatoes on a large and extensive scale. The Potato being a subject of great national importance, seeing how largely it is used as an article of food, it is very desirable that the utmost encouragement should be given to its cultivation and improvement, and that every improved variety should be brought more prominently before the public. For this end the intended exhibition is proposed, and my present object is to ascertain how far those more immediately interested in the improvement and cultivation of the Potato will promise their co-operation and pecuniary support. Should the answers received by me in reply to this note be favourable, an influential committee will be immediately formed, to whom would be entrusted all the necessary arrangements. Soliciting an early reply and the promise of your personal support, I am, dear sir, yours respectfully, PETER MCKINLAY.

— A name familiar enough to botanists, but as puzzling to the uninitiated as was either *Opopanax* or *Zokerit*, is now making its appearance on the "knifboards" of omnibuses and in other vehicles for advertising. This is *PSIDIUM*, and its present prominence is due to the same firm who a few years back pleaded nearly every available Spanish with the first of the names above mentioned. We believe we are correct in stating that the name has been adopted by Messrs. PIESSE & LUBIN for a new perfume which they will shortly bring before the public. The scent, however, has nothing to do with the Guava, as might be imagined, but is so called because its odour is intended to resemble that of a freshly-cut Pomegranate, of which fruit *Psidium* was the ancient Greek name.

— Some curious statistics relative to the CONSUMPTION OF WOOD IN FRANCE have recently appeared in the *Independence Bêge*, of which the following is only a small item. Every person in France consumes on the average daily five lucifer matches, so that 4,600,000,000 matches are consumed monthly by the entire population. A large quantity of soft wood is used for making toys, and, to give an idea of the magnitude of this trade, it will be sufficient to take one article alone—children's drums—of which in Paris every year, 200,000 are secured for their Potato crop immunity from disease by planting the late varieties first and the early ripeners last, thus inverting the ordinary method, seems to be one worthy of imitation by cultivators of this popular esculent. Mr. MCKINLAY claims two advantages as resulting from the adoption of this plan:—First, that the late varieties are thereby assisted to ripen early, before the disease puts in an appearance; and, secondly, the crop is pretty well matured before drought sets in. The early varieties, as an invertible rule, throw a short haulm, and, even if planted a month or so later than usual, they yet turn in nearly as quickly as when planted early. The later varieties are got into growth earlier than usual, and as a matter of course ripen earlier. In cases where autumn planting cannot be carried out as it is by the Rev. W. F. RADCLIFFE and others, the next best course is to follow the example of Mr. MCKINLAY.

— Mr. COUNCILLOR ROGERS, of the Red Lodge Nursery, Southampton, has just made to the corporation of that town the valuable and acceptable present of several hundreds of TREES of various kinds to complete the planting of the PUBLIC PARKS in the centre of the town. Southampton is well supplied with public lands, and the conversion of a large portion of them some years since into admirably laid out parks has been attended with the happiest results, as they are at once an ornament to the town and a source of delight to the inhabitants. The grand natural park on the northern border of the town, generally known as the common, but which is a superbly wooded expanse of some 300 acres, is an appanage of which any town might well be proud, and it is of no small advantage to the borough that it has in its councils a gentleman possessed of such eminently practical knowledge and abilities as Mr. W. ROGERS.

— In a short article on TOUGHENED GLASS, here reproduced, the *Times* remarks:—

"It has long been known that when glass is heated to redness, and kept at that temperature for a considerable time, its physical properties are changed in a remarkable manner. Thus it becomes opaque or feebly translucent, much harder and tougher, and somewhat like porcelain in appearance. This change is termed 'devitrification,' and is caused by the conversion of the glass into a confusedly-crystalline mass, of which sections are beautiful objects when seen with a microscope in polarised light. The subject was investigated by the renowned French philosopher, REAUMUR, early in the last century; and to objects of devitrified glass the name of REAUMUR'S porcelain is usually applied. It has been reserved for another Frenchman, a gentleman farmer, to discover the singular fact that when glass is heated to redness and then cooled or annealed in its toughness is greatly increased, or, what is equivalent, its fragility is greatly diminished, while its transparency remains the same. Thus, suppose a rectangular pane of glass placed flatwise, and supported on two of its opposite edges, to break when a given weight is allowed to fall upon it—say, from the height of a foot—it would, after having been toughened in the manner above stated, resist the same weight falling upon it from the height of 6 feet or 8 feet. It is strange that, although glass has been made in this manner since the year 1800 years, yet such a simple and probably of great importance discovery could only recently have been found out, and equally strange that the discoverer should be a gentleman farmer. The foregoing information on the new process of toughening glass is given on the authority of Mr. C. W. STEWENS, F.R.S., who is well known in connection with photography and the furnace which bears his name. His brother, an eminent glass-maker at Dresden, has tried the process, and pronounces it to be certain and unquestionable."

— We copy the subjoined from the *Irish Gardener's Record*. The statements made are so remarkable that it would be well if our contemporary could induce his correspondent to give fuller details of his method of procedure, and specially what, if any, means he took to prevent "cross fertilisation" of his GRAFTED CABBAGES:—

"Some three years ago there was a prominence given to this subject" [the influence of stock on scion] "in the pages of the *Record*, and, although not altogether ignorant of the results, I was tempted to try my hand with a different class of subject to those that I had previously been in the habit of operating with, hoping thereby to obtain more apparent demonstration of the influence exercised by the stock on the scion and *vice versa*. The results have been very satisfactory so far. For the purpose I made choice of two varieties of the Cabbage—Enfield Market as the stock, and the Red Dutch as the graft, choosing the darkest plant that my then seed-bed afforded. The grafting was performed at the end of April, 1873; they united very freely, and the scion grew very luxuriantly. It is well known that, under ordinary circumstances, each of those Cabbages produces very close, firm heads, but in this case the graft showed no inclination to do so; it remained open, with a slightly appressed edge of stock tissue. At the end of spring, 1873, it threw up a very strong, straggling, flowering stem, from 7 feet to 8 feet in height, the individual flowers being particularly large, but by no means abundant; consequently the quantity of seed ripened was not large. During the first week of February, 1874, I sowed the portion of the stock, the result of which is that I have obtained a somewhat interesting lot of Cabbages, Kale plants (very dark and curled, nearly if not altogether, as dark as Dell's and Belvoir Castle Beets), Savoy, and Red Cabbage, a considerable number partaking of the character of the stock family. Although imbued with the blood of the graft, that of the stock predominates in the majority of cases, and, strange to say, all the progeny appear to be more or less deficient of the tendency to Cabbage. *C. P., Co. Cork.*"

— The HALIFAX FLORAL and HORTICULTURAL SOCIETY will hold its annual exhibition in the grounds at Craven Lodge on Whit Monday and Tuesday, May 17 and 18.

— We gather from the *Kent Herald* that the ASHFORD GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION is progressing. Nearly thirty gentlemen and working gardeners have become members, and the gardeners to His Royal Highness the Duke of EDINBURGH, Sir H. J. TUFTON, Bart., Sir W. KNATCHBULL, Bart., M.P., the Right Hon. E. H. K. BLESSING, M. C. S., Esq., and other county gentlemen of the neighbourhood are favourable to the movement, and are likely to take an active part in forwarding it.

— The *Banffshire Journal* says that the trunk of a massive tree in front of a house occupied by Mr. LOW, blacksmith, Ellon, referred to by Dr. JOHNSON in his *Tour through Scotland* as one of the only two trees in Scotland capable of sustaining a man in being hanged (the other being in Perthshire), has just been destroyed. It is well known, adds the *Journal*, that the Doctor got the blinds of his carriage pulled up so that he might not to see the avenue of fine trees while going up to Cullen House.

Home Correspondence.

Fuchsias.—Three or four of the older hardy varieties have stood in the shrubberies here for the past thirty years, and for how much longer I cannot tell. In mild winters, and with protection, a few feet of the old wood could be saved, but as they stand entirely unprotected, they are every season cut down to the ground. All these hardy varieties I had previously met with in situations I was living in for eight or ten years before; so that Riccarton, to my knowledge, dates six years farther back than 1841, as the time that I refer to was forty years ago. Two very handsome plants of it were trained as creepers up the conservatory at Woodhill, near Aberdeen, then the property of Geo. Hogarth, Esq. F. Riccarton I always understood was a seedling raised at Riccarton Castle, in the south of Scotland. No mention is made of it in London's *Lortus Britannicus*, although he has fidegens in 1837, which is of more recent introduction. F. excorticata is also met with at the same place, and have seldom seen since. The sorts I allude to as being so hardy are Riccarton, gracilis, and cocinea; the latter I find very free in flowering, and of dwarfier habit than the others. I strike it freely in autumn, and use it for flower gardening purposes. Two other old sorts I still retain, are globosa and microphylla. These are not so hardy, although they will stand out-of-doors in winter. The latter, I expect, may be the *thymifolia* of your correspondent, Mr. Hemsley. While writing this I have received intimation of the death of Benjamin Reid, Esq., the oldest nurseryman in Aberdeen, who, from his connection with Woodhill, could have given the particulars as to the introduction of the two Fuchsias above referred to. *R. Farquhar, Eyrie Castle, [F. thymifolia and F. microphylla are distinct small-growing species. Eds.]*

—Mr. Hemsley may like to learn the origin of the first white Fuchsia—*Venus Victrix*. It was a chance seedling raised thirty-five or forty years ago at Horsmondon Park, in Kent. The gardener, Mr. Gulliver, seeing a ripe berry on one of his pots, smeared it with his thumb on the surface of the mould. In the following spring several seedling plants appeared, which were potted off, and one of these proved to be this very elegant and novel variety. It was sold to Mr. Cripps for £15. I had these particulars from Mr. Gulliver himself, S. S.

—Your correspondent, Mr. Hemsley, p. 179, is anxious to know the origin of Fuchsia Riccarton, and he has been replied to by Mr. W. Tilley, but I think the version he gives is hardly the correct one, as I know Fuchsia Riccarton was raised by the late Mr. John Young, gardener at Riccarton, near Edinburgh, afterwards gardener at Abercromby for many years. It was sent from a pot of seed from the old globosa, and this variety took such a stride beyond the other seedlings in growth that it received a little extra attention from Mr. Young—on account of its strong growing habit, and being much dissimilar from the other seedlings. Mr. Young grew it in a rather close house, and it was fully two years old before it flowered, and that very sparingly. It was considered at the time to be a shrubby variety, and I believe I was the first to get a cutting of it, which I struck and planted out. I lifted it again in autumn, and had it planted out the following season, when it made extraordinary growth, and flowered most abundantly. Mr. Young then distributed it very freely, and planting it out became general all over the country. The remark I have heard him make several times was, "I have made no money by it, but I have the satisfaction to know that I have raised something to beautify my country." *John Downie, West Coates, Edinburgh.*

This fine old Fuchsia had its origin at Riccarton, the seat of Sir James G. Gibber Craig, Bart., near Edinburgh. Its name has no connection with Riccarton, near Kilmarnock, as Mr. Tilley supposes, although it is very probable the young man he speaks of took it with him into Ayrshire from the Edinburgh Botanic Garden. It was raised from seed by the late Mr. Young, when gardener at Riccarton. I regret I cannot give the exact date, but it must have been betwixt the years 1830 and 1835. I have heard Mr. Young say it was a seedling from globosa. It is quite hardy in the east, and of the west coast of Scotland. *W. W. Kinnmont, Exotic Nursery, Canterbury.*

—Miss Gibson Craig answers my inquiry, as to the origin of Fuchsia Riccarton, as follows:—"It was raised at Riccarton (near Edinburgh), I should think certainly about forty years ago at least, by our then admirable gardener, John Young. One parent was globosa, but which the other was I do not know." On the east coast here we never require to protect it. It grows to the top of our sea-wall, 10 feet, where spray occasionally comes over in easterly gales, and was also grown in this autumn border as bushes 2½ feet high. The wall plants were cut down like the Myrtles in 1860-61, but this

year it has not suffered above 7 feet from the ground, as we can see as yet judge. *F. J. Hope, Wardie Lodge, Feb. 16.*

Zéphirine Grégoire Pear.—I send you a sample of Zéphirine Grégoire Pear, which sort I think ought to be better known to gardeners and more cultivated. As a late Pear, I think it is superior to most. I find it has this peculiarity, to grow it in perfection it should hang on the tree till the beginning of November, and indeed until it begins to drop pretty freely (if grown on a pyramid, the fruit is not damaged by falling). I find, if picked with other late Pears towards the end of October, when apparently ready for gathering, it frequently shrivels and never ripens properly. The specimens I send you I think you will find excellent. [Yes, very good. Eds.] You named this Pear for me some years ago, and I have recommended it to many of my friends. *John Barnett, Coleraine House, Stanford Hill.*

Plants from the Straits of Magellan.—Mr. Tilley's interesting letter, proving that Fuchsia Riccarton is from the Straits of Magellan, confirms the opinion which I formed after reading Cunningham's *Natural History* of that region, namely, that we are not, as gardeners, sufficiently acquainted with its flora. Desfontaines spinosa is stated in the botanical dictionaries to be from Peru, and yet it is found growing abundantly in the Straits. Is it not possible that we may have got a more tender species? *Pernettya mucronata* is described by Dr. Cunningham as 8 feet high, and we not a more stunted variety from the Falkland Islands? *Drymis Winteri* does not appear to be hardy here, and yet the cold of Punta Arenas must be rather severe. I should imagine the climate of the Straits of Magellan to resemble that of the Forth and Clyde if united—cold and dry to the eastward, milder and more humid at the western extremity. My plant of *Embothrium coccineum* appears to have had its younger shoots pinched by the severe frost, but I hope that it is not seriously injured. What is known of *E. Despardii*? I received some seeds from Ushuaia, but have not yet heard of their germinating. They were sent by Mr. Bridges, the devoted missionary near Cape Horn. I use the adjective in its most literal sense, and am sure that no one can read a description of the settlement, in the *South American Missionary Magazine*, without feeling impelled to contribute something to its support. He describes the climate as so severe that they are unable to fell timber during four months in winter; a shrub from such a locality would certainly prove hardy, and be a most valuable addition to our gardens. *H. K., Sussex.*

An Early Spring "Button-hole."—Some of your correspondents are fond of describing their experiences in the making up of effective button-holes. Mine consists entirely of hardy flowers, but of course allied to a spray of the Maidenhair Fern, but which in my case, for consistency's sake, is of the hardy [?] *Adiantum Capillus-Veneris*. A spray of Fern behind, then a spike of the small dark blue *Scilla biflora*, beneath to remain on either side is a flower of the lovely single white Hepatica, a bloom of the single red Hepatica in the centre, and a small spray of the charming pale-blue *Myosotis dissitiflora* beneath. This is a very pleasing combination, none the less so that the flowers did not shudder when taken into the cold external air. Those who grow only exotics and hot-house flowers have not all the beauties of Flora at their command, whilst all the wealth in the kingdom could not invest them with those charms that our lowly but hardy spring flowers ever will possess in the esteem of the public. *D.*

Paper Protectors.—Our crop of early Potatoes under glass has been easily and completely saved, while that of neighbors has been lost, by the use of newspapers spread over the haulm during the late severe weather. People hardly realise the extent of defence afforded by paper; its utility is almost unknown as yet. The newspapers were suffered, in our case, to remain on during the succeeding sunshine, so as to avert sudden changes of temperature. Should additional protection be needed, it would be easy to paste together any convenient number of newspapers, and fold the edges over twine (as a boy does for his kite), and these, suspended some inches above the others spread over the haulm, would enclose between the layers enough fixed air to protect anything. In 1873 we had the dubious honour of affording the earliest recorded instance of diseased Potatoes; since then we have been quite free, and have transferred our care to our neighbours, besides saving every leaf while theirs perished. *T. Bréant, Richmond House, Guernsey.*

Substitute for Grass in Shady Lawns.—Should your correspondent "Lux" (p. 184) be tempted to experiment with Yarrow as a substitute for grass, it may possibly assist him to mention that it grows in great quantities in the neighborhood of Chestport, especially on the Gloucestershire side of the Wye; and if he has friends through whom he could set the

children to collect the heads in the season, he might easily get as much as he wished. The plant is more common (where growing in grass) especially to prefer the edge, where the roots can make into the gravel path or the broken limestone road, to the better soil of the plot itself; from which, and from the size of its leaves when in healthy growth, I should doubt its answering for a lawn, which would require the plants to be closely set to secure a continuous green surface, but I have never seen it grown, so only guess. If your correspondent wishes, I could give him a gardener's address, who possibly might next season procure it for him. For a small plot the common wild Thyme is surely a most lovely substitute for grass; it requires absolutely no care, nothing but leaving alone, keeping itself in the perfection of neatness summer and winter, and always presenting a soft dark green carpet, excepting at its blossoming season, when the sprinkling all over of its tiny purple flowers has a charming temporary effect. Where I knew it the plant had spread from a neighbouring bed, and was gradually spreading onwards, taking the place thoroughly of the grass. The little plot was then about 4 feet long, and 1½ feet wide, its general trimness made a good well-raked-up shade over the gravel walk. The locality was only slightly during part of the day, but I think the Thyme would have succeeded well with less light. *O.*

Notes on Streptocarpus.—There is now coming into bloom in my cool stove-house a beautiful species of the above-named genus—which is not by any means as frequently cultivated as I desire to see here and there in the gardens of the Glasgow Botanical Gardens, where they had it without any specific or distinguishing name, but believed it to be *Streptocarpus Saundersii*. It now turns out not to be that plant, as figured in the eighty-seventh volume of the *Botanical Magazine*, tab. 521, but *S. polyanthus*, figured in the eighty-first volume of the same work, tab. 485. These two plants are what are termed monophyllous, each plant producing only a single leaf, which is of great length, and sometimes reaching a foot in length and 8 or 9 inches in breadth, closely adhering to the earth and hanging down over the side of the pot; from the base or axil of this large leaf rise the flower-scapes, which are produced in great abundance, and usually begin to appear about this time of the year, continuing to produce their beautiful flowers for two or three months in constant succession. The individual flowers of *Streptocarpus polyanthus* resemble a large Violet in shape, and are of a clear pure lavender colour; it was introduced from Natal in the year 1853, by Captain Gouvier, by the merest chance, some seeds of the plant having fallen among the roots of some living Ferns. The blossoms of *S. Saundersii*, which is perhaps the most beautiful of the four, are of a delicate greyish blue colour, with two distinctly-marked purple spots or blotches at the opening of the throat. When the plate for the *Botanical Magazine* was drawn from a fine potful of the plant in the collection of W. Wilson Saunders, Esq., of Reigate (to whom seeds had been sent from Natal by Mr. Plant, and after whom it is named), no more than the twenty-one flower-scapes had been produced from the bases of the three large leaves contained in the pot, and over 120 flowers were then in perfection. The two other species as yet introduced are not monophyllous, and are of much less robust growth, and also much less free-flowering than the two first described; the first of them, *Streptocarpus Gardenii*, named after the introducer of the fine *S. polyanthus*, only producing two pale lilac flowers on each stem; while the second, *S. Rexii*, seldom, if ever, produces more than a single flower on each stem, its blossoms, however, are of a deeper shade of lavender colour, prettily streaked with purple, and continue to be produced for from six weeks to two months, thriving well also in an ordinary greenhouse. The first-named of these is figured in volume eighty-one of the *Botanical Magazine*, tab. 4862, and the second-named in *Edwards's Botanical Register*, volume fourteen, tab. 1173. *S. Rexii* is the only one of the four commonly met with, and I should be glad if any of your readers could put me in the way of obtaining either plants or seed of *S. Saundersii* or *S. Gardenii*, as both are well worth growing. I may add that I have only once met with the former in the collection of a London nurseryman, and the plant I then obtained having died without flowering, when I inquired for it again it could no longer be supplied. *W. E. Gumbelton, Belgrave, Queenstown.*

The Royal Ashleaf Potato.—Mr. Rivers, in a letter of to-day (February 13), wishes me to correct an error as regards this valuable Potato. It was brought out by him, but was raised by his friend, Mr. James Ashven of Evesham, in 1858. He adds, "the Royal Horticultural Society make it a synonym, as Myatt's." I wish you would make this right, as I am too old to live my own life. I long may be glad if any of your readers have a greater debt of gratitude. The Royal Ashleaf is not Myatt's, nor is it Veitch's Ashleaf, though there is some likeness in all. The same may be said of the Lapstone and its race, Hero, Taylor's Hybrid, and

Pebble White. Taylor's Hybrid has blue flowers, the other three have white flowers. Years ago Mr. Rivers wished me to correct this error, and I ought to have complied. [The error has often been corrected, but a garden-name sticks, *nomen convensum*!] The following, as well as I can remember, were what he told me. I was staying with my friend, Mr. Ashburn, at Evesham, and he gave me and Mr. John Spencer, head gardener at Wood, now stewards, three seedling Potatoes—A., B., and C.—to try. We both fixed on the one now called the Royal Ashleaf. As I brought it out, the salesmen, for their purposes, attributed its origin to me. This I corrected at the time, but it has ever since gone by the name of Rivers' Royal Ashleaf." W. F. Kaddyffe, *Oxford Fitzpaine*.

Rating of Greenhouses.—The letter of my impression for February (p. 181), from Mr. Tuttle, of East Wickham, respecting the rating of nurserymen's greenhouses, encourages us to hope that the time is near at hand when the trade generally will combine to resist what we consider an unjustifiable and illegal rate. That it is illegal there can be very little doubt, from the fact of the great inequality which exists in rating greenhouses; and from the parish authorities in so many instances compromising with nurserymen who have resisted the rate. Others, who have calmly submitted, have been crushed under the heavy assessment. There are not many florists so excessively rated as Mr. Tuttle, whose rafter-roof greenhouses we have valued, and know them to be of temporary and hazardous construction, and built to last only for the short term of his lease. His home nursery, which assessed £150, he has instructed us to let out on a repairing lease at £50 per annum, but we have not yet been able to procure him a tenant. We are aware of other small plots occupied by men making strenuous efforts to become florists, but we fear that the parish authorities have so taxed their industry, in consequence of their having ventured to complete a small span-roof pit, or some such structure, that they will not be able to attain to that honourable distinction. Those of the trade with whom we have discussed the question of rating greenhouses are particularly anxious to have a committee at the Queen's Bench, and have promised to send in their subscriptions as soon as a committee is formed for that object. *Protheroe & Morris*, 98, Gracechurch Street, E.C. [This is a matter upon which we are constantly receiving complaints, and which the trade should, for their own protection, take steps to rectify. Eds.]

Curmeria picturata and Gunnera brephoga.—I beg to say a few words about two plants, in addition to *Cattleya gigas* and *Tillandsia muscica*, viz., *Curmeria picturata* and *Gunnera brephoga*, to show that M. Linden has made a mistake about their introduction. *Curmeria picturata* was not discovered by M. Roetz, as M. Linden states in his *Illustration Horticole*. I first found it, in the month of August, 1868, on the Magdalena River, when going down from Sonson to the river in order to visit some plantations. It grows in the fertile soil of the forests (in humid places) between San Carlos and Canoas. It was in this rich place for new and rare plants that I was so fortunate as to meet with the gorgeous *Maranta hierophylla*, *Aphelandra fascinator*, and *Anturium crystallinum*. There were also intermingled with the original green ones some rare plants of *Curmeria picturata* of a dark violet or salmon colour. In 1868 I passed three times over this same route before returning to Europe. It was in the year 1871 that M. Linden told M. Roetz, who was then collecting plants for him at Buenaventura (on the western side of New Grenada) to make his way through the Cauca Valley up to the State of Antioquia, in order to take advantage of some discoveries of mine made at Sonson, Medellin, and Frontino. When he reached Antioquia he directed his steps down towards Nare, thus it was that M. Roetz came in contact with *Curmeria picturata*. Afterwards M. Roetz went to Cauca, and he sent home with others some plants of *Tillandsia muscica*, which was discovered by me in the year 1867, *Gunnera brephoga*.—It seems that M. Linden, when publishing the account of this new *Gunnera* in his *Illustration Horticole*, forgot that it was found and introduced to him twice by me—first by seeds in the year 1868, and then in 1872 by seeds, and also by some small living plants. I collected on my memorable Journey in the State of Antioquia four distinct *Gunneras*, two of them (including the above) being the No. 298 in my plant-list of that country) coming from Sonson; they are of small size, and grow imbedded in the sandy but heavy humid soil of the river banks. The third comes from a highly elevated part of the Paramo de Ruiz, a very considerable snow-capped mountain, where it acquires extraordinarily strong large dimensions. It grows there in its own way, quite distinct, and constituting compact and extensive masses in a forest in the forest! The fourth *Gunnera*, introduced by me, stands on the highway between Rio Negro and Medellin, and grows, as do the two first ones, in wet places. I procured large quantities of the seeds of nearly all, especially of that in question. I scattered

the seed about where it would do good throughout my stores, sprinkling them in the sphagnum and in the bulbs of the Orchids as well as into the earth destined to be packed with certain bulbs, stems, roots, &c., and even amongst the trunks of the *Gunneras*. *Gunnera brephoga*, therefore, is not at all an *exotic*; it is a legitimate inmate of M. Linden's stores, as well as many others brought by his collectors. This manner of proceeding with seeds will be the only practicable one for many plants of an unusually doubtful character; it was regularly employed by me. There is a fifth *Gunnera*, occurring in the same State of Antioquia, which is worthy of mention: it occurs in the vicinity of Frontino, far beyond the above named ones, where it grows in a higher temperature, at about 6000–7000 feet; it is of medium size, and prefers open swampy slightly shaded places, and is subject to great changes in its habit. *G. Wallii*. [We have received from M. Linden a letter in reply to M. Wallis, and which we hope to insert in our next issue. Eds.]

Grafting on the Quince Stock.—Can any of your readers inform me of the success attending grafting on the Quince stock? Having had nearly forty years' practice at budding and grafting, I never heard of the practice being successful, and have only known one nurseryman who practised it. He used to say that he saddle-grafted them, and they did well. I have tried the practice many times, but have never succeeded. Seeing the statement made respecting the beautiful specimen of *Benrè Clairgeau* illustrated on p. 141, I am curious to know if it is much practised? I have always attributed my failures to the redundancy of sap in the stock, which invariably gladdened the scion before it became fairly attached to it. My usual and most successful practice is to bud them in the autumn, but not until the sap is on the decline, as the buds are liable to become surcharged and pushed out, or, should they adhere to the scion, to commence growing the same autumn, which invariably spoils the shoots which would be produced the ensuing season. Growing Pears upon Quince stocks is an easy and simple process, when the essential elements of success are attended to. Some varieties, such as *Marie Louise*, the celebrated *Uvedale's St. Germain*, or *Belle de Jersey*, *Benrè Rance*, *Knight's Monarch*, and others, do not thrive so well in some soils on this stock as could be wished; hence the *free* or *Pear* stock is generally used for them. The superb specimens produced in the Channel Islands and on the neighbouring coast of France, which have of late been exhibited at the Kensington fruit shows, must strike all admirers of fine fruit with astonishment. The beauty and size are the results of the well applied skill of the growers, but when one dozen of these remarkable fruits are grown it must not be forgotten there are often thousands of inferior size and quality. They are the *crème de la crème* of the most successful growers' productions, who are often surprised at the result of their own handiwork, favoured by soil and situation. It is a peculiar feature in the cultivation of Pears, that some growers are successful with one variety, and others with another, as evidenced at our local exhibitions, where growers are expected to exhibit their own productions. *Charles E. Saunders, Jersey*.

Transplanting Evergreens.—In the *Gardeners' Chronicle* of the 2d ult. (p. 11), your correspondent, Mr. Sheppard, who is inclined to spring planting, asks the question: "What say others?" &c. If I had had any opinion, I should likely have opposed his opinion. No doubt it is well that the lessons we learn in youth should abide by us, nevertheless it is sometimes necessary that some of these be unlearned, and that we strike out in the very opposite direction. Having been trained from childhood to believe that late autumn and winter was the right time to plant, it was not easy to lay aside the belief, but, forced by circumstances, bit by bit I came to the conclusion that spring and early summer was by far the best season, and the one on which I have found it to succeed the best on the Briar. In 1871, when remodelling a mansion and grounds belonging to the estate, it was necessary to hide some unsightly objects. For one of these, in the end of April, I lifted a pair of Spruce Firs—how old they were I know not; they, with many others, had been originally planted for cover, and had been frequently headed down, but for some years past they had been left alone, and had reached a little over 30 feet high. They were watered from the roots about an inch low. Our means of transportation was very bad—a two-wheeled timber truck, over the "bed" of which they had to be pulled and made fast to the pole. We had to take them about a mile, and before they reached their destination scarcely a particle of soil remained upon their roots; they were planted in a terribly exposed place, but never seemed to cease growth. Strong pillars were necessary to keep them in an upright position, but, notwithstanding this, during a heavy gale in the following winter one of them was blown down, the roots very much broken off, and it died the following summer. During the operations it was necessary to move many

very large shrubs—common and Portugal Laurels, Boxes, Yews, Hollies, &c. Many of them might have been considered hopeless, and chopped up; but we had ground to cover, and, having strong faith in the season, they were all transplanted, and I may say the deaths were *nil*. We continued moving up to June 12, when everything in this neighbourhood, but the ordinary garden operations, must cease for the making. Want of men makes this absolutely necessary. My employer here had frequently wished an Oak to be planted in an open space on the side of the carriage drive; accordingly, in the autumn of 1872, a tree was selected, 31 feet high. It was dug round, and left till the following April, when the timber truck was again brought into requisition. A lifting machine to have carried it in an upright position could not have been employed, the arch over the front entrance not being high enough, and fine trees, with branches too low, surrounded all the other gates. Like the Spruce Firs, it was necessarily brought over the truck. It had a good ball, which remained intact during the journey of half a mile. It was just bringing into leaf, the development of which went on without any apparent check, until a terrible night's frost destroyed its leaves and those of all its neighbours. For weeks afterwards they looked as if they had been scorched by fire. The ground was very dry, and a newly-lifted tree, after a considerable time to take again, and by the autumn had made shoots 6 inches long. Last spring it again suffered from the same ganche, on April 29; but now its buds are plump and round, and it looks as if it meant to catch the giants round about it. I could mention many cases of successful transplanting at the same season, but will trouble your readers with only another. In the beginning of the same year, 1873, it was considered necessary to hide a newly-erected building; and as there are acres of common Laurel, we are never at a loss for material. They are very old, and growing in dense thickets under trees—plants varying from 5 to 15 feet high and by no means in good condition for lifting. I purposely put off beginning as late as I could, so as just to have time to get the job finished before hay-time. We began on May 26 and finished on June 9. Many of the young shoots were 6 inches long, these flagged while we were moving, but when once in the pits and well watered they soon recovered; we supplied them liberally with strong manure and water, and, at the end of three weeks, when I examined them, I found their white roots like crowquills pushing in all directions, and by the end of July the foliage was of a beautiful dark green colour, and remains so now. There is no doubt it is sometimes necessary to do such work in the winter time when the weather is open. I had to do the winter before last, in making a large Rhododendron bed. Laurels had to be dug up; they were all transplanted, and although not many of them died, it was a very bad make, such progress through the following summer, and also lost a great many of their leaves. April and the beginning of May for deciduous trees, and June for evergreens.—Some may be ready to doubt, and say the sun would scorch them up. Well I had a case in point in the summer before last—it was about the middle of July, on a showery day, when, as we could not get into the hay-field, we moved a few Laurels. The sun when it came out was very hot, and showers excessively hot. The following day the weather cleared up and remained hot with bright sunshine for several days afterwards, and these poor Laurels had the full benefit of the sun's rays from 9 a.m. till late in the afternoon. The remark made some weeks afterwards by one who saw them moved, and no doubt thought I was rather "queer," was, "Why, they have not lost a leaf!" Perhaps this was not strictly correct, but it was not far wrong. Any one doubtfully may easily convince himself during the coming summer. Plant a few evergreens of any kind; let them be fully exposed to the sun's rays; only keep them moist at the roots, and by the autumn all scruples will be gone. *D. Buchanan, Dyrham Park*.

Hardiness of the Eucalyptus.—I raised plants of the following varieties of Eucalyptus from seed in the year 1871:—*E. globulus*, *E. elata*, *E. Lehmanni*, *E. splendens*, *E. stricta*, and *E. oppositifolia*. Until last summer I grew them in pots and wintered them indoors, but last summer I had them planted out in the pleasure ground, and by the autumn some of them had grown so large as to be accommodated under glass again, so I planted them in a sheltered situation in the American garden. The result is that they are all killed down to the ground by the late frost (the lowest registered here was 20°). The situation they were planted in is rather damp, but against that I may say that they were grown under conditions calculated to enable them to resist frost, that is, in pots standing on ashes, and not over well supplied with water, so that their growth there made was very firm and well. They were planted out last summer it was in open situations and on gravelly soil, so that they did not grow very luxuriantly. The plants may stand our now and then severe winters on the south coast, but I fear they cannot be depended on for permanent plant-

ing anywhere in the midland counties. It would be interesting to know from your correspondent, "T. W. M.," how many degrees of frost his plants withstood. *Owen Thomas, Drayton Manor Gardens.*

Leptotes bicolor.—This is a charming Orchid, of very easy culture, which might be found in every greenhouse or in greenhouses from a moderate artificial heat. It thrives well on a block of Thorn or Oak wood, with a little sphagnum moss. The little quill-like leaves contrast well with the white flowers, for the plant forms a dwarf mass of flowers and leaves. The plant here, on a block of wood, is only about 8 inches by 5, and it has about a hundred flowers on it, which form on the top of the leaves in twos and threes. Its beauty lasts fully a month. Fancy a little gem like this lasting so long at this dull, flowerless season. As a lady said to me the other day, "What a lovely bouquet it would make, but what a shame it would be to cut it." The blotch of purple on the lip enhances its beauty, and when our olfactory nerves are pure and not tainted with any artificial odour, one discerns a slight perfume when the sun is on the plant, but it is slight. In *Leptotes bicolor* we have one of the most valuable of Orchids for this season of the year, not only on account of its colour, but from its free-and-easy growing propensity under very ordinary care, and its longevity and adaptability for the chase, and for decoration, and hence it is worth recommending to the notice of every one on the outlook for really useful plants. *H. K. F.*

Reports of Societies.

Royal Horticultural: Feb. 17.—W. Burnley Hume, Esq., in the chair. The Rev. M. J. Berkeley made some observations on several subjects which came before the Fruit and Floral Committees, including some specimens of the so-called *Primula altaica*, which he believed did not belong to the species, properly so called, of which he hoped to be able to say something at the next meeting; and a plant, shown by Mr. Bennett, of *Thunbergia Harrisii splendens*, which very closely resembled *T. laurifolia*, and he thought it was a question if both were not varieties of the same species.* Mr. Berkeley stated that, since the lecture delivered by him on February 3, he had placed some old specimens of *Micrococcus prodigosus* (Blood Rain) on rice paste, and that they had spread as far as could be expected from the state of the weather. He hoped to repeat the experiment in July. The matter is the more interesting as Mr. Stephen has asserted that the plant retains its power of vegetation after it has been in an oven forty-eight hours.

SCIENTIFIC COMMITTEE.—Andrew Murray, Esq., in the chair.

Double Cinerarias.—The Rev. M. J. Berkeley showed, on the part of Mr. Bennett, The Gardens, Hatfield, a so-called double *Cineraria*, in which the flowers were in an abortive condition, and had remained so since Christmas. The appearance was very similar to that of a number of young *Cauliflowers*.

Seville Long-Pod Bean.—Mr. Barr sent specimens of this variety perforated by the larva of a kind of weevil, *Bruchus rufimanus*, which attacks the ripe seeds in the warehouse. Mr. Barr remarked that this Bean, in his experience, rarely produced an abundant crop in this country, on which account he supposed that the plant was not thoroughly acclimated, and stated, in confirmation, that MM. Vilmorin, of Paris, were similarly unable to grow their seed in France, but procured their stock annually from Seville. Dr. Hogg, on the other hand, stated that the Bean in question produced an abundant crop at Chiswick. Dr. Hogg further remarked that Peas introduced to this country from a warm climate were for a year or two very early in ripening, but lost this quality very soon. Brussels Sprouts also degenerated in a similar manner.

Fuchsia procumbens.—Dr. Masters showed, on behalf of Mr. Kinghorn, a fruit of *Fuchsia procumbens*, figured in our columns some time since (fig. 60, p. 291, vol. ii., 1874). The fruit is about 1/2 inch long, obovoid, pink, and covered with a glaucous bloom. The pretty fruit are an additional attraction to this interesting species, which we are glad to find is likely to be hardy.

Copper-vein Fungus.—Dr. Masters also showed a Potato from Mr. Fryer, covered with the Copper-vein Fungus (*Rhizoctonia*).

Datura arborea.—The Chairman showed specimens of this in a wild or probably naturalised state, and which he had procured from California, where its beautiful flowers are used to decorate dinner-tables, &c.

Tea Leaves affected with a Lichen.—Professor Thistleton Dyer showed leaves of *Thea Bohea*, from Natal Botanic Garden, attacked with what Mr. Berkeley believes to be *Strigula Peeli*, Mont. Mr.

Keit, the curator of the Natal Botanic Garden, says that it "makes its appearance as a minute speck, of brown colour, enlarged in circumference gradually until the end of the season, when the margin assumes a pale green colour, and ceases to grow." According to Mr. Berkeley "the brown substance is a species of *Cephalopezus*, according to Fries. . . . I have not seen this before. It consists of decumbent articulated threads, each of which has at its tip a globose sporangium. It is very near to *Chroolepus*, and if some lichens are parasitic on *Chroolepus*, this may be so on *Cephalopezus*."

Terrestrial Radiation.—Professor Dyer then made the following communication to the committee, basing his remarks upon the observations of Mr. Buchan:—"The effects of terrestrial radiation are at the maximum when the air is calm and very dry, and its temperature rather low. If, however, the cold air produced

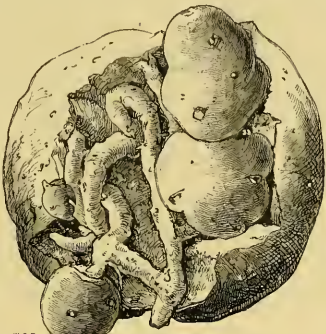

FIG. 45.—TUBERS PRODUCED IN THE INTERIOR OF THE POTATO.

through the influence of terrestrial radiation be allowed to accumulate close to the ground, no small amount of damage may be done by a comparatively slight frost. On sloping ground such accumulation of cold air cannot go on, because, cold air being heavier than air which is warmer, as soon as the air in immediate contact with sloping ground is cooled it flows down to a lower level, just as water would do, and its place is taken by the warmer current of air immediately over the downward-flowing cold current of air. In this way a higher night temperature is maintained in situations where the ground slopes down to lower levels, and accordingly such situations should be

FIG. 46.—BUDS PRODUCED FROM THE PITH OF SEAKALE.

chosen for those plants which, at any stage of their growth, are peculiarly liable to be injured by frost.

"If the air be not calm, but a wind—even a slight wind—be blowing, the different layers of air are thereby mixed; and thus the air cooled by contact with the cold ground is not suffered to rest on the ground, but is mixed with the air above it, and the temperature is thus prevented from falling so low as it otherwise would."

These remarks were made in describing the destruction by frost of some beds of seedling Ash trees which had been covered by an old fishing net. Mr. Buchan proceeds:—

"The steady blowing light wind was sufficient to disturb the air cooled by contact with the ground, and mix it with the stratum of air lying immediately over it, in all places where the wind was felt. Over the beds unprotected by the net the wind passed freely and unchecked, and there, consequently, the temperature did not fall lower than was necessary to brown without destroying the young seedlings. But to the bed protected by the net the wind had no access owing to the intervention of the net; and there, consequently, the air

strata not mixing, the temperature fell so much lower than over the beds adjacent to, as to destroy the seedlings." *Trans. Bot. Soc. Edin., vol. xii., pp. 51, 52.*

Insect Destructive to Orchids.—Professor Dyer then read the following letter from R. James, Esq., on *Baridius atermis*, an insect most destructive to *Phalenopsis* and other Orchids at Singapore and Burmah:—

Extract from letter from J. Jamie, Esq., Singapore, dated May 16, 1874.

"These pests are still here, but not in such numbers as formerly. The damage they have done to the Orchids is beyond belief; nothing but actual sight would convince any one of their powers of destruction. I still have all my Orchids examined daily (and you can imagine the trouble when I tell you that I have thousands to go over), and yet the Orchids are destroyed. I am put to my wits' ends to circumvent these insects. If they only attacked one kind I should not think so much of it; but every kind is alike to them—terrestrial as well as epiphytial suffer. . . . A good many years ago, when I had no Orchids, I remember that those who had suffered from this same weevil, it is only within the last eighteen months or two years that this same weevil has again become so prevalent, and what has made them so, and why at such a long interval, is what I want to fathom, if possible."

New Potato Disease.—It was stated that the insect affecting the Potato, lately described by M. Boisduval (see p. 82), would probably turn out to be a common South European insect.

Tubers in the Interior of a Potato.—Prof. Dyer read a communication from Mr. Shirley Hibberd on this subject, in which he adverted to the possibility of obtaining buds from the very centre of a thin slice of the tuber, and this not once or twice but many times. Mr. Hibberd considers it a death-blow to the proposal to produce new varieties by grafting. Prof. Dyer considered that in the case in question the tubers had been produced by an inversion of the rind of the Potato and the gradual absorption of the cells of the central portion from the pressure exerted by the ingrowing tuber.

Dr. Masters had similar specimens under examination, and confirmed to some extent Mr. Hibberd's assertion, that adventitious tubers might be formed in or near the centre of the tuber. In such cases Dr. Masters had always observed a formation of spiral vessels in the tuber at or about the point where the adventitious tubers sprang. [A similar formation in the Potato is shown in fig. 45, and also in the pith of the Seakale, fig. 46—both reproduced from former volumes.] In other cases the adventitious tubers sprang from the ring of vessels just within the rind of the Potato. Another mode of obtaining these productions was, that a shoot had perforated the one tuber, and produced in it another. The explanation given by Professor Dyer was a novel one, but one borne out by similar cases of inversion in the Turnip.

Anti-Galls on the Leaf-stalks of Melastomaceae.—Professor Dyer then read the following letter, addressed by Mr. Trail to Dr. Hooker:—

Letter from J. W. H. Trail to Dr. Hooker.
"Santarem, Jan. 3, 1874."

"As regards the species of *Melastomaceae* bearing bulbe on the leaves, I have found two species, one of which I take to be *Myrmedone formicaria*. This one is common both at Montalegre and at Prainha. In regard to both species I must say that after careful observation I am quite at a loss to determine the exact connection between the bulbe and the ants, of which at least three species inhabit them. Neither plant seems specially liable to the attacks of other insects, in fact, if possible, they are more free from such attacks than most other plants here."

"The leaves of the *Myrmedone* frequently bear hardly any trace of bulbe even on the same twig on which occur largely developed bulbe; and the same holds in regard to the other plants. . . . Ants are usually to be found in those on *M. formicaria*, but not by any means constantly, while sometimes they are taken possession of by solitary bees and wasps. The other plant is still more puzzling. Of it I have yet seen only two bushes. In one of them every bulbe was tenanted by ants; on the other not one was so occupied, though the bulbiferous leaves bore numerous small ant-nests on their under-surface, commonly just over the origin of the petiole. I have also found hollow swellings inhabited by ants on the stem of a shrub near Pará, and at Erecó, and at Prainha; and also ants inhabiting swellings in the twigs of a species of *Cassia*."

Diseased Palm Roots.—Mr. Worthington Smith showed drawings of a curious hypertrophy of the cellular tissue in the root of a Palm. The rind had burst, and a cellular mass had protruded from the interior. [Of this we shall probably give an illustration shortly.]

FLORAL COMMITTEE.—Dr. Denny in the chair. The meeting held to-day was of an unimportant character. A very fine group of *Cyclamens* from Messrs. Veitch & Sons, and a beautifully grown lot of *Primulas* from Mr. Smith, of the Ealing Dean Nursery, formed the bulk of the contributions. The vote of thanks passed to Messrs. Veitch & Sons for the *Cyclamens* was well deserved, the plants being all that could be

* Mr. Bennett informs us that *T. Harrisii splendens* and *T. laurifolia* are identical in foliage and flower but that where the latter produces one flower the former produces fifty—a distinctive character worth considering from a horticultural point of view.

desired from a cultural point of view. Messrs. Veitch also gained a First-class Certificate for *Abutilon Darwinii*, a dull orange scarlet-flowered species, said to be an improvement on *A. pictum*; and a Second-class Certificate for *Odontoglossum Warszewiczii*, of which we hope to publish Professor Reichenbach's description next week. The *Primulas*, nicely done—especially the double red ones—and a small collection of *Cyclamens* from Mr. H. B. Smith were also accorded a vote of thanks; while a similar award was passed to Messrs. F. Cooper & Co., Coventry Garden, for a dozen very strong growing but rather coarse *Cyclamens*. To Messrs. W. G. Caldwell & Son, Knutsford, for a specimen of *Azalea amena* Caldwellii, a seedling from *A. amena*, crossed with magnifica, and having flowers about twice its size, and of a brighter colour. To Mr. J. Woodfield, The Gardens, Osberton, for two very fine cut trusses of a grand variety of the magnificent wax-white *Rhododendron argenteum*. To Mr. W. Perry, gr. to J. W. Miles, Esq., Shirehampton, for a basket of the purple-flowered, and hardy *Impatiens*, commonly but erroneously called *Primula alata*. Mr. Taylor, gr., Longleat, sent several plants of the old favourite, *Browallia elata*, a pretty tender annual, whose bluish violet flowers have for some years been strangers to the exhibition boards; and from Mr. Bennett, Hatfield, came a small plant of *Thunbergia Harrisii*, one of the most valuable of winter decorative plants, producing in abundance, and that continuously, its large handsome blue flowers.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. Mr. Speed, gr. to the Duke of Devonshire, Chatsworth, sent two dishes of fine fruit of the Cape Gooseberry, *Physalis edulis*; and Mr. James McDonald, nurseryman, Chichester, showed two fruits of a Pear named Gloria Mundi, too much like Jersey-grown specimens of *Catillac* to be considered distinct from that variety. Under the name of Wheeler's Favourite, a small Apple, which the committee considered to be the same as *Aromatic Russet*, together with the *Warringer*; and Mr. Bennett, Hatfield, showed handsome fruits of *Lowndes' Pippin Apple*—a variety of good size, pale straw-yellow in colour on the shady side, and bright crimson facing the sun, admirable for the dessert or culinary purposes, a good keeper, and, as Mr. Bennett stated, a certain cropper. The Rev. G. Kemp exhibited specimens of *Délices Evard* de Tournai and *Beurré de Jonghe* Pears, the latter being of excellent quality, somewhat resembling *Beurré de Capiaumont*, and valuable on account of its excellent keeping qualities. Mr. Berkeley stated a fact which most growers experience, that some varieties keep well and unimpaired in quality some years, but quite the opposite in others; but that *Beurré de Jonghe* had been proved to be continuously good. Mr. W. Taylor, gr., Longleat, showed some new Orangefield Tomatos and two brace of *Dickson's Favourite* Cucumbers; and Messrs. James Carter & Co. contributed numerous samples of their improved Red-skinned French, *Bowen's Beauty*, Snowflake, *Emery's Early* Vermont, and *American Breadfruit* Potatoes. At the last meeting Mr. James Batties showed a dish of new Potatoes, which the committee afterwards learned had been grown in pots, and now awarded him a Cultural Commendation.

Linnaea: January 21.—Dr. G. J. Allman, F.R.S., President, in the chair. Dr. Hollis read a paper on Oak-galls. He divided Oak-galls into two classes, the one and the many celled. To the former class belong the woody marbled Oak-galls, the lignous galls of Réaumur, and the Currant-galls; to the latter the spongy "Oak-apple" and the "Oak-spangles" of the leaves. The author described the structure and mode of growth of the different kinds, all of which he believed, with the exception of the "spangles," are formed during the growth of the leaf, the egg being laid in the bud. The origin of the different layers of tissue in the gall itself the author believed could be traced to the different layers of the leaf which produce it. The paper was illustrated by a splendid series of specimens from the Bethnal Green Museum, lent by Mr. A. Murray.

February 4.—Dr. G. J. Allman, F.R.S., President, in the chair. A letter from Mr. J. Gamble, on the peculiar appendage to the spadix of *Arisema speciosum* was read. It had been supposed that the terminal appendage, which, as in many *Aroids*, is destitute of flowers, was in some way a contrivance for the cross-fertilisation of the flowers at the bottom of the spadix, but the author had not been able to detect that it was ever visited by insects. A paper was read by Mr. H. N. Mosely, on the Plants and Insects of Kerguelen's Land. It has been stated that the insects of these islands were entirely apterous; but, in addition to several wingless insects, Mr. Mosely had found a winged gnat. One of the insects was found in great quantities on the Kerguelen's Land Cabbage, Pringlea, but not on the inflorescence. A paper was read by Mr. Hiern, in the absence of the Rev. G. Henslow, on the Origin and prevailing Systems of Phylloxera. The author traced the origin of all

other modes of phylloxera to modifications of the decussate as the simplest. A discussion ensued, in which Mr. Hiern, Professor Dyer, Dr. Masters, and Mr. A. W. Bennett took part.

Obituary.

DIED on the 7th inst., at Turkey Street, Enfield, after a short illness, BENJAMIN FIELDERS, aged eighty-two years. Outside the parish of Enfield Mr. Fielders was probably unknown to the present generation of gardeners, but thirty or forty years ago he was a man of mark at the London shows, winning several of the then Horticultural Society of London's medals with his Orchids, Grapes, and Pines, &c. He was at that time gardener to the late Mr. William Linwood, of Enfield, in whose service he continued for twenty-five years, subsequently entering the service of the late Mrs. Child, and the late Mr. Alderman Challis. About fifteen years ago Mr. Fielders partially retired from active service, and only at the request of the proprietor of Roselands, Waltham Cross—Mr. James Patehall Jones—did he undertake the partial supervision of those gardens and pleasure grounds, which he continued to do until quite recently. Mr. Fielders was well known to Sir Joseph Paxton, and to the Pauleys of three generations; and besides being a talented and most devoted horticulturist, he was esteemed by all who knew him for his industry, high character, and conscientiousness.

—We have also to record the death of a highly accomplished patron of horticulture, in the person of LADY CULLUM, of Hardwicke House, Bury St. Edmunds, which sad event took place early in the morning of Wednesday last. Lady Cullum spent an hour or two in her garden nearly every day, and, singularly enough, her last act was the choice of a site for some upright Cypresses.

The Weather.

STATE OF THE WEATHER AT ELGACHEE, 17, 1875.

- Feb. 11.—Overcast and dull throughout. Heavy rain and sleet at night.
- 12.—Overcast, dull, and mild throughout; this rain all morning. Slight frost in evening.
- 13.—Overcast and dull all day. Rain commenced to fall at 0.45 p.m., and continued all the afternoon.
- 14.—Overcast, dull, and rain at intervals throughout the day.
- 15.—A moderately fine day, though light clouds and slight fog prevailed in the morning.
- 16.—Fine, cool, and dense fog in morning, clear about noon.
- 17.—Overcast, and brisk wind afterwards.
- 17.—Overcast, and dull throughout, with rain in morning and evening.

—In the neighbourhood of London the reading of the barometer at the level of the sea decreased from 30.20 inches at the beginning of the week to 30.13 inches by the morning of the 7th, increased to 30.26 inches by about mid-day on the 8th, decreased to 30.08 inches by the afternoon of the 9th, again increased to 30.22 inches by the night of the 10th, then decreased again to 29.85 inches by the afternoon of the 12th, then steadily increased to 30.10 inches by the morning of the 13th, and was 30.07 inches at the end of the week. The mean reading for the week was 31.11 inches, being 0.14 inch less than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged between 45° on the 12th and 33½° on the 9th, the mean for the week being 38°. The lowest temperatures of the air varied from 37½° on the 13th to 28½° on the 9th, with a mean for the week of 31½°. The mean daily range of temperature in the week was 6½°, varying from 14½° on the 12th to 1½° on the 9th. The mean daily temperatures of the air were as follows:—Feb. 7, 34°; 8th, 31°; 9th, 30°; 10th, 32°; 11th, 33°; 12th, 40°;

13th, 39°; 8th, and the departures from their respective averages were, -4°.4, -7°.7, -8°.4, -6°.4, -5°.6, +1°.1, and +0°.9. The mean temperature for the week was 34°.7, being 4°.4 below the average, as deduced from observations extending over a period of sixty years. The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in the sun's rays, were 58½° and 53½° on the 8th and 13th, but on the 9th and 10th 39° and 36½° were the highest readings. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 26½° on the 8th and 9th respectively, but on the 13th, 36° was the lowest reading. The mean for the week of these low readings was 29½°.

The weather during the week was dull, cold, and showery, and the sky overcast throughout, with the exception of one day, viz., Monday, the 8th inst. The direction of the wind was variable, and its strength gentle. Rain fell on five days, the amount being 0.38 inch.

In England, the extreme high day temperatures observed at different parts of the country varied from 55° at Liverpool to 43° at Norwich and Leeds, the general average all over the country being 47½°. The extreme low night temperatures ranged from 28½° at Blackheath, and 23½° at Foston, with a general average of 27°. The extreme range of temperature from all stations was 20½°; the greatest range was at Liverpool, 27½°, and the least at Leeds, 15°. The mean high temperature observed by day ranged from 41½° at Bristol to 35½° at Nottingham, with an average value of 38½°. The mean low temperatures observed by night varied from 34½° at Bristol to 28½° at Portsmouth, the general average being 31½°. The mean daily range of temperature in the week was 7½°, varying from 10½° at Birmingham to 5° at Leeds. The mean temperature of the air for the week was 34½°, being 1½° less than the value for the corresponding week in 1874. The highest in the week occurred at Bristol, 37½°, and the lowest at Nottingham, 31½°. Rain fell on three or four days in the week at most stations, and the amounts collected varied from 1 inch at Portsmouth and Bristol to two-tenths of an inch at Sunderland, the average fall all over the country being four-tenths of an inch.

The weather during the week was cold, dull, with frequent showers of rain; the sky was nearly overcast throughout.

A little snow fell generally over the country on the 8th and 11th inst.

In Scotland, the highest temperatures by day ranged between 54° at Glasgow and 39° at Perth. The lowest temperatures by night varied from 28½° at Glasgow to 24° at Dundee, their averages being 50° and 26½° respectively. The extreme range of temperature was 23½°, ranging from 26° at Glasgow to 2½° at Perth. The mean temperature of the air for the week was 35½°, being 1° higher than that of England, and 1° lower than the value for the corresponding week in last year. The highest was at Glasgow, 37½°, and the lowest at Perth, 32½°. The fall of rain varied from 21 inches at Greenock to ¼ inch, nearly, at Leith. The average fall over the country was 1 inch.

At Dublin, the highest temperature was 55½°, the lowest 31½°, the mean 43½°, and the rainfall a quarter of an inch.

JAMES GLAISHER.

Variorum.

THE STINGING TREE.—One of the torments to which the traveller is subjected in the North Australian scrubs is the Stinging tree (*Urtica gigas*), which is very abundant, and ranges in size from a large shrub of 30 feet in height to a small plant measuring only a few inches. Its leaf is large and peculiar, from being covered with a short, silvery hair, which, when shaken, emits a fine pungent dust, most irritating to the skin and nostrils. If touched it causes a dull, gnawing pain, accompanied by a burning sensation, particularly in the shoulder and under the arm, where small lumps often arise. Even when the sting has quite died away, the unwary bushman is forcibly reminded of his indiscretion each time that the affected part is brought into contact with water. The fruit is of a pink, fleshy colour, hanging in clusters, and looks so inviting that a stranger is irresistibly tempted to pluck it; but seldom more than once, for, though the Raspberry-like berries are harmless in themselves, some contact with the leaves is almost unavoidable. The blacks are said to eat the fruit, but for this I cannot vouch, though I have tasted one or two at odd times, and found them very pleasant. The worst of this *Nettle* is the tendency it exhibits to shoot up wherever a clearing has been effected. In passing through the dry tracks cut through the scrub, great caution was necessary to avoid the young plants that cropped up even a few weeks after I have never known a case of its being fatal to human beings, but I have seen people subjected by it to great suffering, notably a scientific gentleman,

who plucked off a branch and carried it some distance as a curiosity, wondering that while what was causing the pain and numbness in his arm. Horses I have seen die in agony from the sting, the wounded parts becoming paralysed; but, strange to say, it does not seem to injure cattle, who dash through scrubs full of it without receiving any damage. This curious anomaly is well known to all bushmen. From "Cassell's Illustrated Travels" for December.

TAPIOCA.—This elegant and delicate starch is the product of a plant that is cultivated very extensively in the Malay Peninsula, where its culture is almost entirely in the hands of the Chinese. The tubers of the plant (*Manihot utilisima*), which weigh on an average from 10 lb. to 25 lb., are first scraped and then carefully washed; after which they are reduced to a pulp by being passed between rollers. This pulp is carefully washed and shaken up with abundance of water, until the fecula separates and passes through a very fine sieve into a tub placed beneath. The flour so obtained is repeatedly washed, and then placed on mats, and bleached by exposure to sun and air. It is finally mixed into the pearl tapioca of commerce by being placed in a cradle-shaped frame covered with canvas; it is slightly moistened, and subjected to a rotary motion, by which means it is granulated. It is next dried in the sun, and finally over the fire in an iron pan greased with vegetable tallow, and is then ready for the market. *Boston Journal of Chemistry.*

THE SUNDews.—Baron F. von Mueller, Melbourne, calls attention to the fact that some species of Australian Drosera are not merely acrid, as the European ones are katechu, but that they are the deadly poisonous. He states that in over-stocked commons in Victoria many cattle have perished from feeding on the Sundew (*Drosera*), and that within the last few weeks a child died near Albury from eating some of the tubers of *D. peltata* as "native Onions." This plant has for some time past been considered injurious to sheep, but until very lately no one supposed that the Australian species were poisonous. Baron Mueller expresses his conviction that all the indigenous Sundews are poisonous; but, as far as observation goes, sheep and cattle do not eat them unless the season is unfavourable to vegetation, or the commons are overstocked. The species *D. peltata* is very common in the spring in fields near Sydney and Parramatta, and, indeed, everywhere on this side of the Blue Mountains; but no one ever suspected until very lately that it was capable of doing the mischief which is now attributed to it. One of the European Sundews (*D. rotundifolia*) is described in the *Pharmacopœia* as being "acrid, anti-arthritic, detesive, and externally, rubefacient, to which the Brazilian *D. rotundifolia* is reported to be poisonous." The former species, however, although said to occasion the rot in sheep, and to curdle milk, has some remedial qualities, for it will remove warts and corns, take away freckles and sunburn, and, when distilled with wine, will produce a very stimulating spirit. Respecting the properties of our indigenous species, little is yet known, excepting the fact of their absorbing insects, and the fact that they are poor eaters. Some people have thought that a valuable dye might be procured from the West Australian *D. gigantea*, as it stains paper with a brilliant purple colour, which, on being treated with ammonia, yields a clear yellow. Now that public attention has been called to these plants, it would be well to institute a series of experiments on them with a view of testing their supposed poisonous and industrial properties. *Sydney Mail.*

PEAT.—Of the fuels obtained from the earth's crust the most obvious and accessible is peat, whether fibrous, woody, or earthy. Peat is a product of temperate and cold temperate countries, and occurs in the case of our own islands, in Holland, Denmark, Germany, Russia, and Siberia, in the Old World; and in Canada, Hudson Bay territories, and Alaska, in the new. The colder latitudes of the southern hemisphere being chiefly occupied by the ocean, it has no great area for development, and appears in sporadic patches only in Patagonia and the Falkland Islands. It is strictly a vegetable accumulation—Mosses, Conferees, Epiphytums, Rushes, Grasses, Heath, and other marsh plants, contributing to its growth—and occurs in all stages of consolidation, from the light fibrous turf of the surface, in which the several plants are apparent, to the dark compact peat below, in which the component species are with difficulty discernible. In some instances it has accumulated in boggy marshes, in others it occupies the sites of silted-up lakes; occasionally it has gathered over waterlogged and fallen forests, the decayed trees of which (Oak, Scotch Fir, Birch, Hazel, Alder, &c.) it still encloses; and in unfavourable cases it appears on high hills and high open moorlands. Many of the British peat-mosses are in a dead state, and undergoing waste and disintegration, with only a small proportion in a living or growing condition. This result has been brought about by drainage, felling of forests, and other causes affecting the rainfall and climate; but in other countries, where human interference has been less felt, peat-mosses are

still on the increase, and at different ratios, according as they are situated on hill sides, in swamps, or on exposed moorlands. It is very difficult to approximate the rate of growth; but in Britain many peat-bogs show an accumulation of from 3 feet to 5 feet since the time of the Roman invasion, now nearly eighteen hundred years ago. Besides the ordinary terrestrial or surface peats, there occur along many parts of our own shores submarine peats or forest-growths, dipping away beneath the waters to an unknown extent, and varying from 2 feet to 5 feet in thickness. These submerged forests, as they are termed, appear in the Firths of Tay, Eden, and Forth, along the coasts of Northumberland, at the mouth of the Tees, along the Humber, at Bournemouth, the Solway, and also along the Devonshire, Lancashire, and other coasts. They are composed of a very compact and pure peat, enclosing enormous trunks of Oak and Fir, together with Alder, Hazel, Birch, and other indigenous trees; and, from their great age and compression under 20 feet or 30 feet of marine clays, may be looked upon as intermediate between peats and lignite. *Pagel's Geology in its Relations to the Arts and Manufactures.*

THE CECEL OAK.—In what is called "the flat" of Petworth Park stands a fine and still flourishing tree, on which is a plate which tells of its planting in the beginning of the seventeenth century, to commemorate the marriage of Algernon, tenth Earl of Northumberland, and his first wife, Lady Anne Cecil. Can any reader kindly inform me of any existing Oak elsewhere, thus planted so long ago in commemoration of a marriage? *H. Arnold, L.L.B., in "Harvard's Science-Gossip."*

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

[The subjoined directions are intended to supply general information, and must, of course, be adapted to the peculiar circumstances of each locality. The departments of the garden will be treated on from week to week in succession, according to the requirements of the season. Special directions for the management of "The Villa Garden" will be found in the preceding columns.]

PLANT HOUSES.

PLANT STOVE.—The species of *Fraxinea*, *Isora*, *Ronidetia*, *Aphelandra*, *Eranthemum*, *Hoya*, *Talernacoula*, *Aibiscus*, *Cyrtoceras*, *Ascymanthus*, *Gardenia*, with *Muscadina frondosa*, *Plumbago rosea*, and the rest of the stove plants not yet potted, may now have a shift if they need it, but they must not be disturbed if their roots have not begun to work, as repotting when the roots are not in an active condition is very often done, and the plants are thus put into a bad unhealthy state. Though the above plants are not tender roots, still it is not advisable to shake them out or remove the soil, as in the case of deciduous subjects, but any soil, particularly towards the top of the ball, that is not occupied by roots may be got away. The size of pot given to each plant must be ruled by the state of the roots, where they exist in plenty a larger shift will be necessary than where they are poor or few. In the case of plants that it is desirable to pot on as quickly as may be, the shift should be larger comparatively than for those that are got nearly to the required size. The soil for potting stove plants should be quite as warm as the roots, consequently some days before commencing the work this must be provided for by putting the peat, sand, &c., where it will get into a proper condition as to warmth. All peat is preferable to a mixture of peat and loam for evergreen stove plants. Use a liberal quantity of manure in the soil, and the plants of seedlings as these plants need a good deal of water, and so of necessity the soil must be such as will allow it to pass freely away. The quantity of sand added will be regulated by the amount contained in the peat. Use the potting stick so as to make the soil firm. Where good fibrous peat is not easily procurable, not a bad substitute in part is a sixth or a seventh of flaky rotten leaves, not too far decomposed. Leaves of hard texture, such as Oak or Beech, are the best.

Stove Climbers that are planted out are, mostly of a free-growing habit, and the space devoted to their roots being generally very limited, they are apt to get so poor as neither to be able to grow or bloom in a satisfactory manner. To guard against this, each year 2 or 3 inches of the surface soil, or even more, if it can be done without disturbing the roots much, should be removed, and replaced with such as is new and good.

As soon as the flowering plants are potted, the fine-leaved subjects should receive the same attention. Even in the most select collections the following are worthy of a place:—*Maranta*: *Semami*, *Veitchii*, *Livieri*, *Makoyana*, *ornata*, *fasciata*, *rosso-linoata* and *albo-linoata*. *Alocasia*: *Lovoi*, *Veitchii*, *metallica* and *Jenningsii*. *Anthurium crystallinum*, *Ficus dalbata*, *Curellogia recurvata variegata*, *Pandanus Vander-marshii*, and *P. Veitchii*: *Spherozygia latifolia*, with

a few of the best *Crotons* and *Dracaenas*, amongst which are *C. mojeaticum*, *C. angustifolium*, *C. undulatum*, and *C. Weissmanni*; and *Dracaenas* *Shepherdii*, *Fraseri*, *amabilis*, and *Cooperii*. All the above do well in ordinary peat and sand except the *Alocasias*, whose roots require a more open material. The following will be found to answer for them well:—Two parts chopped sphagnum, two parts fibrous peat, and one part rotten dung in a dry state, such as any that has been used for mulching a Vine border exposed to the open air, which will answer for crocks and a sprinkling of sand. *Alocasia macrophylla* *Veitchii* is still one of the very finest fine-leaved plants, grown large, either for exhibition or the decoration of a large house. Many variegated plants, if grown in a very rich soil, lose their colour, the reverse is the case with this—it can scarcely be grown too rich; two-thirds loam and one-third rotten dung, such as that from a Mushroom bed, with a fair sprinkling of sand, will induce it to produce its leaves beautifully variegated. Amongst plants suitable for standing on outside tables in the stove, and in positions for which many of the above would be too large, the following may be named:—*Aralia Veitchii*, *Vriesea splendens*, *Nidularium fulgens*, *Tillandsia tessellata*, *Bertolonia marmorata* and *margaritacea splendens*, *Sonerila margaritacea*, and *Gymnostachyum Verschaffelii*; they are of easy growth, and succeed in sandy peat well drained. *Achimenes* started as advised some time back will now be in a fit state for putting in the pots, and in which they are in bloom, except where restrictions for exhibition purposes; they are much more useful for general decoration grown in comparatively small pots, say 8-inch. They will do in either sandy loam or peat. For the baskets ordinary galvanised wire is the best, worked sufficiently close to hold the sphagnum lining required to prevent the soil coming through; here, again, unless for very large houses, small or moderate-sized baskets look the best. Baskets of this description do not admit of being drained in the way that pots are, still, as they are placed in them, they require a good deal of water, a sprinkling of small crocks in the soil, in addition to the sand, will be an advantage.

Azaleas that have been forced for cut flowers should, when their blooming is over, be placed in a warm humid atmosphere, where they will at once commence to make growth, for the heat they have been subject to will have naturally excited them; and if placed in a cold chilly atmosphere for a time after flowering, as is sometimes done, the growth is checked, whereby the health of the plants is injured, the strength very much impaired, and the disposition to bloom early, which they acquire through early forcing and suitable after-treatment, is lost. One of the first things to observe is to see that they are free from their greatest enemy, thrips, for if even ever so few of their eggs have escaped the washings that have been advised they will now no doubt have come to life with the heat that has been used to bring the plants into flower.

If any trace of the insects exist wash at once with tobacco water, as the young soft leaves are in no condition to bear tobacco water, and wash the sides of the pests, which, if killed before they have commenced to breed, the plants will stand a good chance of being free from them through the season. If any are suffering for want of root-room they should be removed to larger pots at once, or their season's growth will lack the requisite strength. The old single white varieties of this flower, which have done long and good service in supplying winter borders, will now have to give way to kinds such as *A. Borzig*, *Raine de Portugal*, and *Narcissiflora*, which the leading flower forcers for the London trade have found better than the old sorts. One great advantage in the double varieties is that the flowers, especially when cut, stand so much longer. *T. Baines, Southgate, N.*

FRUIT HOUSES.

VINES.—The best soil for new borders and replenishing old ones, and which should now be got ready, is the top spit of a rich pasture, cut to a depth of 4 or 5 inches. If inclined to alkali, mix with it a good percentage of crushed bones, charcoal, burnt ashes, and mortar rubbish; but if high, crushed bones and chalk only. Vegetable mould or farmyard manure should not be mixed with the soil, but applied as a mulching to the borders afterwards. In preparing borders keep in view the fact that Vines require an immense amount of water, but at the same time are impatient of stagnant moisture at the roots; hence drains and drainage should have first attention. Planting may be done at any time if the Vines are ready to put in, but the best season is from April to June. Vines intended for planting at that season ought now to be cut back to three eyes or joints, and placed in a cool Peach-house or pit to start, and when the new shoots are 2 or 3 inches long shaken entirely out and planted in permanent borders. Plants from eyes of this year are now by many preferred to "cut backs" for permanent planting, and now is the time to propagate for that purpose. If late houses of Grapes are not yet cleared of fruit they should be forthwith—if the future well-being of the Vines is studied. Franc and

dress as directed for the early crops, and let the Vines have a short season of rest by keeping the houses as cool as possible. Disbud in the succession houses, and so soon as the bunches can be seen raise the temperature 5° , as, if the wood has not been thoroughly ripened, the probability is that many of the bunches may turn out to be little else than tendrils, and a high dry temperature at this stage will greatly prevent the prospects of a crop. Should any Vines break irregularly, or manifest a disposition to break at the top only, sling them in a horizontal position till all the shoots are a couple of inches long. Where the Grapes are thinned, approaching the stoning period, examine the inside borders, and if at all dry they should be well soaked with water, at a temperature of 80° . Air should be given regularly, less or more, according to the weather, but avoid cold draughts, or rust is certain to put in an appearance. Handling, rubbing with the hair, and sulphuring hot pipes are frequently accused of doing what nothing but a cold current of air coming in direct contact with the young Grapes has caused. Thus far we are having a heavy rainfall, and early vineries that have outside borders would be better if covered with shutters, slates, tiles, or tarpaulin—anything to throw off the rain, and prevent the plants from getting chilly. Look frequently over Grapes still hanging, as well as those in rooms, as one mouldy berry soon destroys a whole bunch. The more equable the temperature the better they will keep, and, provided frost is just excluded and the room kept dry, fire-heat should not be given. *W. Wildsmith.*

FIGS.—The earliest forced Figs in pots, if in bottom heat, will now require regular attention as to syringing them and waterings at the root. With increased sun-heat the ventilation both top and bottom may be given when the day is temperate reaches 70° . The night temperature may still range from 55° to 65° . If a second batch in pots is required the plants may be now started, and they will make a succession to the earliest forced. They should have the same course of treatment as regards temperature. The house where the Figs are permanently planted out, if their forcing commenced in the middle of January, will now be making growths in the shoots, which will require pinching at the fifth or sixth joints of the terminal buds, and a thorough syringing to be given in a favourable weather, and the air of the house kept as moist and congenial as possible. Attend to the tying in of the young shoots to the trellis as they advance, and thin out where too crowded. *W. Tillery, Welbeck.*

THE ORCHARD-HOUSE.—The season has now arrived when it is necessary to prune all such trees as were not pruned in autumn or early winter. On account of the *Peach*, the *Nectarines*, the *Cherry*, and the *Plum* being so liable to the attacks of aphides and red spider, &c., it is advisable to syringe the young trees after the leaves fall, and to dress them immediately with some approved insecticide; while it may be as well to defer the pruning of the *Apricot* and the *Pear* until about the present time. But as soon as this has been done, such trees, if in pots, should be at once placed in their proper position, or where they are intended to remain during the season, or until they have ripened their fruit. This position should, if possible, be in the lightest part of the structure, and where a thorough ventilation can be given for them at all times, but more particularly during the period when the trees are in bloom, as without this necessary condition a crop of Apricots under glass is exceedingly uncertain. The *Apricot*, when in bloom, should be kept dry and free from drip; and if this condition can be secured, then little apprehension need be felt of the blossoms suffering from the effects of cold winds. The trees are also fortunate in being, to some extent, exempted from the attacks of aphides and red spider, or other insects injurious to most other kinds of fruit trees; so that winter dressing and continuous syringing are not in their case necessary. *Cherry* trees, in pots, should likewise be placed in as light and airy a position as possible, as, like the *Apricot*, there is sometimes a difficulty in getting them to set their fruit freely under glass; and, unlike the *Apricot*, they have the great disadvantage of being exceedingly liable to the attacks of insects, particularly to that of the black or cherry fly; so that winter dressing is always advisable in their case. The *Cherry* under glass should in most respects receive treatment similar to the *Apricot*, with the exception of its being benefited by a somewhat heavier soil, which can be secured by allowing a portion of well-pulverised clay, or what is known as the runnings of a-slave pit, to form a considerable ingredient in the compost used to form the border in which they are planted, or of the soil in which they are potted. All kinds of *Cherry* trees are to succeed well in orchard-houses, and for the sake of variety it is advisable to grow a good many sorts, as nearly all the varieties are well worthy of cultivation; the *May Duke* and the different varieties of the *Bigarreau* should, in any case, be well represented in every collection. In placing potted trees in their summer position, it is

of importance that the pots should stand perfectly level; and if it be desired to confine the roots of the trees to the pots—which, unless the pots are very full of roots, it is advisable to do for some time at least—let each pot be raised on three bricks. This will prevent the roots entering the border, and allow the superfluous water to pass freely away from them. Let the mulching also be removed from borders where trees are planted out. The soil of such borders will generally be found to be somewhat firm and dry, and therefore in order to allow the water to penetrate freely into the soil, let the surface be slightly pricked, and loosened with a fork, to a depth not exceeding one or two inches; then let a thorough watering at once be given to the planted-out trees, as well as to those in pots. In cases where the latter may be found to be very dry, this watering should be repeated until the soil becomes thoroughly saturated. Regulate the ventilation in accordance with the state of the weather, and when frost is not apprehended the ventilator may be kept open by night as well as by day. *P. Grievé, Cullford, Bury St. Edmunds.*

HARDY FRUIT GARDEN.

Where *Peaches* and *Nectarines* have been loosened from the walls, as before recommended, it will shortly be necessary to dress the trees with a composition to prevent blight; this, applied as late as possible without injury to the swelling buds, is a great preventive during the summer growth. The composition used here, and which is generally sufficient to prevent all attacks, is 1 lb. soft soap, 8 oz. sulphur, and 1 pint of strong tobacco-water, added to 1 gallon of water, and kept gently boiling for twenty minutes, so as thoroughly to dissolve and mix the ingredients. When boiled, add as much finely-sifted quicklime and soot as will bring the mixture to the consistency of thick paint, in which state, when cool, it should be applied over young and old wood. The trees should be nailed in or tied, where wires are used, as fast as possible after the washing is done, so that all may be in readiness for covering to protect the bloom as it begins to open. *Cherry* plants, also, are much benefited if treated in a similar manner. Morellos in particular are so subject to attacks of aphids during the season of growth that the extra time and attention now given are more than compensated for in preserving the trees in good health during the summer. The planting of wall trees to replace any that is intended to remove should now be brought to a close as soon as possible. The same also applies to dwarf trees or bushes. Where grafting is contemplated, a selection of the required kinds may now be taken off and the ends placed in the ground in a shaded situation, so as to retard the action of the sap in these until the stocks to be grafted have made a start. If for young stocks the grafts may be the base of the last season's shoots, but for older trees headed down scions of two or three years old wood are preferable. *W. Cox.*

KITCHEN GARDEN.

The soil in gardens which have been in existence for a number of years becomes, under proper cultivation and management, friable and workable within a very short period after the prevalence of even most adverse conditions; but even in these and all other cases it is by no means prudent for the sake of advancing such matters as sowing seeds or planting crops, to proceed with them unless the soil is in a suitable state for the purpose. The uncertain and variable nature of our climate at this season often impedes or delays such operations considerably, and thereby renders prompt action essential under existing favourable circumstances; no delay should, therefore, be permitted in having the plots of ground ready for sowing, or in having the seeds to be put in, the sowing of which should not necessarily be delayed beyond suitable occasions for the purpose, which happen generally in every establishment. These roots are required in quantity nearly the whole year, and therefore good breadths will be required to give a supply. In sowing drills are much to be preferred for these and all other kitchen garden crops to which they can be applied, as being more economical in labour than otherwise, and in tending to give effect to uniformity and regularity in crops, which should in every well-managed garden be of the utmost consideration. In gardens such as those referred to above, seeds of most kinds require to be firmly embedded in the soil. In the case of Onions it cannot well be put in too solid. The ground should be well trodden down before the drills are made, and it should be repeated again after the seed is sown. *Carrots* and *Parsnips* also will do better when the soil about them is moderately firm. Onions in drills should be 12 inches asunder, and the Early Horn section of *Carrots* about the same distance, long varieties 3 inches more, and *Parsnips* 15 inches apart. There is no advantage in having plants too thickly placed. As usual, *Brussels Sprouts* and *Cottagers' Kale* have this season withstood the severity of the weather better than other kinds of winter Greens.

This practical fact should serve as a guide as to what may be depended on in this way for another similar season, and as plants of these varieties cannot be got too large, the best attention to them is worthily bestowed. Make a sowing of these for general requirements at any time, if the soil is suitable, in a place with every advantage of sunshine, air, &c. Sow also with these other sorts of winter stuff, and *Broccoli* for autumn use, and for spring also, where the soil is poor and exposed, the main sowings for highly cultivated places being reserved until April and May. *Leks* should also be sown for the general crop, and a good row or more of *Parsley*. To render these seeds secure from the attacks of birds, they should be covered with netting, as otherwise a few goldfinches would do the means of bringing reproach on the seedsman's character most unjustly. When the plants are up, dust them occasionally with damp with wood-ashes, with a slight admixture of soot, to prevent the attacks of fly. Plantings of *Jerusalem Artichokes*, *Shallots*, *Garlic*, *Onions*, for scallions and for seed should be made. Allow the former from 2 to 3 feet between the rows, and 15 inches between the sets, which should be planted the same depth as *Potatoes*. The growth of these deserves better attention than is frequently accorded to them, considering their value as esculents. Autumn-sown *Onions* and *Lettuce*, which have been wintered in seed-beds or otherwise, should be transplanted into rich soil; and so successive crops of *Peas* and *Broad Beans* on open quarters. Annual plantings of *Mint* should be made at about this time into well-enriched soil in a rather sheltered situation; by so doing a good supply can be obtained much earlier than otherwise.

FORCING DEPARTMENT.—Keep the lights entirely off *Cauliflower* plants in frames whenever the temperature is above the freezing point, and apply the same treatment to *Peas* and *Beans* which are sown in boxes for transplanting. When fine, freely ventilate early-sown *Radishes*, *Carrots*, and *Potatoes*. Sow *Mustard* and *Celery* as often as necessary to maintain a supply. Pot off singly into 60 pots as soon as they are ready plants of recently-sown *Tomatoes*, *Capsicums*, and *Celery*; or *Celery* can be pricked out in frames if preferred. Keep them near the glass in a house with a temperature of 60° or 65° . Continue to maintain the supply of *Rhubarb*, *Savahle*, and *Asparagus*. Reserve the roots of *Rhubarb* for transplanting. When the crop is gathered, they should be laid in for that purpose until they again show indications of growth. *G. T. Miles, Wycombe Abbey.*

Answers to Correspondents.

SUBSTITUTE FOR GRASS IN SHADY LAWNS (*Qy. 37, p. 184*): If "Lux" will try *Spergularia pilifera* he will find a substitute for grass. I have found it grow freely where the former would not live. I would not advise planting it in any place where there are gravel walks near, for if it then becomes a pest on account of its free seeding properties. *W. S.*

BEE-HIVES: *Subscriber.* Write to Messrs. Neighbour, of Regent Street, or Mr. Pettib, of Dover.

BOUGAINVILLEA GLABRA: *G. B., Acton.* There is in existence a bad variety of *Bougainvillea*, unfortunately such like in appearance to the free-flowering plants that a comparison of the leaves and young shoots fails to show any difference. We have known it grow for years without showing a single flower. It is possible you may have got this variety; if such is not the case, we cannot assign any cause for your plant not blooming; for, of all stove plants grown, it is amongst the very freest. A plant started in heat, from a dry, dormant state, will, if managed as directed by Mr. Baines in the *Garden Operations*, be a complete sheet of bloom in ten or twelve weeks, according to the temperature kept up; and, if in consequence it remains in the stove, it will be again sheeted over with bloom in a similar length of time. One principal thing to be observed is, it must never be allowed to want for water. If allowed to flag whilst in active growth, and when the bloom is in appearance, it is in consequence of forming, it will make them stop at the points, either preventing its blooming, or causing the blooms to come in very small numbers.

INSECTS: *W. A. C.* The Beech ligh, *Lachnus fagi*, closely allied to the American ligh, *Lachnus lanigerum*, or *Eriosoma aphid*. Dress the affected parts with paraffin oil as far as No. 20, but we believe it

NAMES OF FRUITS: *F. F. Apple*, Wheeler's Russet. **NAMES OF PLANTS:** *F. S., Warwick*, 1, *Hex Aquifolium Lawsoniana*; 4, *L. A. argentea angustifolia*; 6, *L. A. argentea marginata*—*R. H. G.* 1, *Laetrea dilatata tanacetifolia*; 2, *Laetrea spinulosa*—very characteristic; 3, *L. dilatata micromera*. *Index Filicum* as published on the 1st of Nov. 20, but we believe it will be resumed shortly.—*W. H.* 1, *Salicinea viticulosa*; 2, *S. Galeotti*; 3, *S. egyptiaca*; 4, *S. Martensii*.

ORCHARD HOUSE TREES: *F. S.* 1, Want of a proper supply of water last autumn is probably the cause of the blossoms dropping, and the fruit which such trees grow will certainly be kept more or less moist, according to their requirements. 2, The English edition of *Du Breuil's Modern Peach Pruner*.

PEACHES ON BACK WALL OF VINERY: *A. T. D.*

Your Peach trees are too far from the glass and the sun's influence ever to succeed, and the Vines, being grown overhead, so shades them that the wood cannot ripen properly, &c. &c. To succeed, well, must be grown fully exposed to the direct influence of the sun.

PINE-APPLE BLACK AT THE CORE: West End. Your statement that you are unable to keep the heat up as you would like in winter, accounts for the fruit going black at the core, and rotting.

POTATO: Yellow Fever. The Potato was covered by the Copper-Web fungus (Rhizoctonia).

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers who send Post Office Orders, to be good enough to write to the Publisher at the same time, stating that they have done so.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements, and notices of the value of the same, to be addressed to the Publisher, and not to the Editors.

DIED, on Sunday, the 7th inst., at Enfield, Middlesex, BENJAMIN FIELDS, aged 82 years.

Markets.

COVENT GARDEN, February 18.

The markets generally are very inactive, the supply of ordinary produce being ample both for home and provincial demands. A few inquiries have been made for first quality Oranges, owing to the non-arrival of any cargoes from St. Michael's during the last ten days. Some very fair samples of Easter Beurre from California are offered at prices varying from 4s. to 8s. per dozen. Thos. Taylor, Wholesale Apple Market.

FRUIT.

Table with 2 columns: s. d. s. d. Apples, per 1/2 sieve or 1 Melons, each lb. ... 1 6-2 0 Chestnuts, per bush 10 0-20 Nuts, Cob, per lb. ... 8 0-12 0

VEGETABLES.

Table with 2 columns: s. d. s. d. Artichokes, Fr., each 8 0 Horse Radish, per bush 3 0-5 0 Asparagus, English, per bunch 1 0-2 4 Lettuce, per doz. ... 1 6- ... 1 6- ...

PLANTS IN POTS.

Table with 2 columns: s. d. s. d. Azaleas, per dozen 30 0-50 0 Heaths, in var. doz. 10 0-30 0 Begonias, do. 6 0-12 0 Hyacinths, per doz. 4 0-12 0

CUT FLOWERS.

Table with 2 columns: s. d. s. d. Azaleas, 12 blooms 5 0-6 0 City-of-the-Valley, 12 s. d. s. d. Carnations, 12 sprays 2 0-6 0 sprays ... 2 0-6 0

SEEDS.

LONDON: Feb. 16.—We have a good reasonable demand for most kinds of farm seeds. Red Clovers, both home-grown and foreign, move off freely at full prices. Choice qualities, on account of scarcity, are hardening in value. Some considerable quantity of Trifolium seed is now changing hands at a further improvement of £1 per ton. White Clovers keep steady. But little attention is now given to Alsike. Advices from France describe the stocks of Italian Ryegrass to be getting low. Perennial grasses are in fair request at the moderate rates now current. For Mustard and Rape seed prices keep very firm. Spring Tares are in brisk request at extreme values, supplies continuing limited. In Canary seed there has been less doing. White Millet is readily placed at enhanced currencies. John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.

CORN.

At Mark Lane on Monday the market was flat, and a fresh fall of 1s. per qr. took place in Wheat, both English and foreign. The quality was certainly bad. Barley was almost neglected, and decidedly cheaper, when reserved for sale. Malt was dull, with a downward tendency. Oats were plentiful, and not easily disposable, even at a reduction of 9d. on the week. Maize was nominally unchanged in value. Beans were fully 2s. per qr. lower, but Peas were only a little weaker in some instances. Flours were depressed.—On Wednesday dullness again characterised trade, and quotations remained weak. Sales were difficult to close in either Wheat or Barley, even at a further reduction in price. Malt was almost unsealable, while the demand for Oats was small, and principally confined to soured corn. Maize was offered on rather easier terms, and Beans, Peas, and flour were cheaper to sell.—Average prices of Corn for the week ending February 13:—Wheat, 41s. 11d.; barley, 44s. 5d.; Oats, 25s. 6d. For the corresponding week last year—Wheat, 63s. 2d.; barley, 48s. 9d.; Oats, 28s. 12d.

CATTLE.

At the Metropolitan market on Monday the number or beasts was considerably smaller than last week; trade was, however, very dull, and prices were not higher. There was scarcely any difference in the sheep trade; our top quotations were with difficulty realised. Calves were more plentiful, and quotations were higher. Quotations for Beasts, do. and 3d. to 6s. 4d.; sheep, 5s. 4d. to 5s. 8d.; and 6s. 2d. to 6s. 10d.; calves, 4s. 8d. to 6s. 4d.; pigs, 4s. to 5s. 4d.—On Thursday trade in beasts dull, and Monday's prices were not exceeded. In sheep there was little doing, and it was difficult to realize Monday's rates. Though choice calves were scarce, yet the demand being limited, there was no advance in the quotations. Business very dull in milk cows.

HAY.

The report from Whitechapel market states that trade there was dull, and prices somewhat easier. The arrivals of fodder were fair. Prime Clover sold at from 100s. to 120s.; inferior ditto, 85s. to 95s.; prime meadow hay, 120s. to 125s.; inferior ditto, 5s. to 7s.; and straw, 35s. to 40s. per load. Cumberland Market prices:—Superior meadow hay, 112s. to 118s.; inferior, 84s. to 105s.; superior Clover, 115s. to 126s.; inferior, 95s. to 107s.; and straw, 40s. to 44s. per load.

POTATOS.

From the Borough and Spitalfields markets reports we learn that the arrival of Potatoes to these markets are good, and the trade dull at the following prices:—Flukes, 110s. to 130s. per ton; Victorias, 110s. to 130s.; Regents, 70s. to 100s.; Rocks, 60s. to 70s.—Last week's imports into London amounted to 7995 bags and 123 tons from Antwerp; 423 sacks, and 734 tons from Dunkirk; 141 bags from Harlingen; 273 tons from Dahouet; 26 bags from Ostend; 112 tons from Rouen; 6 bags from Rotterdam; 100 sacks from Boulogne; and 534 bags from Ghent.

COALS.

In the market on Monday house coals fell 1s. per ton. The following were the quotations:—Hartley's West, 21s. 9d.; Beside West, 22s. 3d.; Carr's, 21s. 9d.; Hastings, 22s. 3d.; and West, 21s. 9d.; Weardale Secreted, 17s. 6d.; Walls End-Hetton, 23s. 6d.; Lamb-Hetton Lyons, 21s. 3d.; Hawthorn, 21s. 3d.; Lamb-Hetton, 22s.; South Hetton, 23s. 6d.; Tunstall, 21s. 3d.; East Hartley, 23s. 3d.; and Tees, 23s. 3d.—On Wednesday there was a further reduction of 1s. per ton.

BETTERIDGE'S PRIZE ASTERS,

Saved by Mr. BETTERIDGE this Season, and obtained direct from him this Season.

ORIGINALY SENT OUT BY

Mr. Betteridge's New Asters, DUKE OF EDINBURGH, DUCHESS OF EDINBURGH, IMPROVED OXONIAN, &c.

In consequence of a statement in the Seed Catalogue of a Provincial House, that "the raiser has again consigned to us his entire Stock" of the above new Asters, and which statement being totally unfounded in fact, Messrs. CARTER consider it necessary to publish the following letter received from Mr. Betteridge, the raiser of these celebrated Asters:—

"THE COMMON HILL, CHIPPING NORTON, "Messe, JAMES CARTER & CO., "February, 1875. "Gentlemen,—In accordance with your esteemed order I have sent you the bulk of Seed my "Betteridge's Aster," including the new and beautiful crimson colour with pale guard-petals, and which, I presume, is the one sent and named by you this year "Duke of Connaught." This I consider a very superior variety.—I am, &c., "JAMES BETTERIDGE."

DUKE OF CONNAUGHT, offered this season for the first time by us.—The entire surface is of a pure vivid crimson colour, with pale guard-petals. One of the most brilliant flowers ever introduced. Per packet, 2s. 6d.

IMPROVED OXONIAN, rich purple with pure white eye. Per packet, 1s. 6d.

DUCHESS OF EDINBURGH, rich crimson with pure white eye. Per packet, 1s. 6d.

DUKE OF EDINBURGH, bright rose with pure white eye. Per packet, 1s. 6d.

Eighteen splendid varieties, Betteridge's Exhibition Aster. The collection, 35s. 6d. Twelve splendid varieties, Betteridge's Exhibition Aster. The collection, 25s. 6d.

CAUTION.

Each packet of these Asters is impressed with our Trade Mark, without which none are genuine.

NASTURIUM RUBY KING

(with Dark-coloured Foliage), per packet, 1s. 6d. A seedling variety of that type of dwarf Nasturium originated by us, viz., the dark-foliated or King-of-Tom Thumb section, bedding Geraniums. The colour of the new variety now offered is quite unique and distinct—pure pink shaded with carmine—and forms an effective contrast with the varieties already in cultivation.

CARTERS,

THE QUEEN'S SEEDSMEN, 237 and 238, HIGH HOLBORN, LONDON, W.C.

AZALEA INDICA—VAN HOUTTE'S
SEEDLINGS, in fine bushy heads, full of buds, from 8 inches to 1 foot in diameter:—
JOHN GOULD VEITCH, 8 to 10 inches, 40s.
SIGSMUND RIEKER, 10 inches, 20s.
PRINCESS LOUISE, 10 inches, 20s.
DAPHNE, from 11 to 13 inches, 12s.
BARONNE DE VRIESE, from 11 to 13 inches, 12s.
COMTESSE DE BEAUFORT, from 11 to 13 inches, 12s.
MARQUIS DE LORNE, from 11 to 13 inches, 12s.
MRS. WRIGHT, 10 inches, 12s.
BARON GEORGE DE ST. GENOIS, 10 inches, 12s.
LOUISE DE KERCHOVE, 10 inches, 12s.
GEORGE LODDIGES, 10 inches, 12s.
45, Abchurch Lane, E.C.

HARDY GHENT AZALEAS—
In bud, per dozen, 15s.
In bud, per 25 varieties, 32s.

HARDY RHODODENDRONS—
In fine varieties, from three to eight buds, 2s. 6d. to 30s. per dozen; in twenty-five varieties, 6s.
LOUIS VAN HOUTTE, Nurseryman, Ghent, Belgium.

THE LONDON MANURE COMPANY
(Established 1840)
Have now ready for delivery, in fine dry condition—
CORN MANURE, for spring sowing.
PURE DISSOLVED BONES.
PURSER'S BONE MANURE.
PURSER'S BONE TURF MANURE.
SUPERPHOSPHATE.
NITROPHOSPHATE.
NITRATE OF SODA, SULPHATE OF AMMONIA,
Genuine PERUVIAN GUANO, &c.
116, Finchurch Street, E.C. E. PURSER, Secretary.

ODAM'S MANURES,
FOR ALL CROPS.
Manufactured by the NITROPHOSPHATE and ODAM'S CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant-Farmers occupying upwards of 150,000 Acres of Land.
Chairman—ROBERT LEEDS, Castle Acre, Norfolk.
Managing Director—JAMES ODAM.
Sub-Manager and Secretary—C. T. MACADAM.
CHIEF OFFICE—129, Finchurch Street, London, E.C.
WESTERN COUNTIES BRANCH—Queen Street, Exeter.
Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

MILLER AND JOHNSON
(Established 1856)
Manufacture the highest quality of
ARTIFICIAL MANURES
For ROOT, CORN, and GRASS CROPS.
35, Mark Lane, London, E.C.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Phitis, and other Blights, in solution of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it.
Sold Retail by Seedsmen, in boxes, 12s. 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

MARENDAZ AND FISHER, the largest Importers of Russia Mats in London, have now prepared to sell at prices for new ARCHANGEL MATS, to arrive in July or August next, to the Wholesale Houses only. Agents in Archangel, St. Petersburg, and Odessa.

RUSSIA MATS—A large stock of ARCHANGEL and PETERSBURG, for Covering and Packing—Second sized ARCHANGEL, 100s.; PETERSBURG, 60s. and 80s.; superior close Mat, 45s., 50s., and 55s.; PACKING MATS, 20s., 30s., and 35s. per 1000; and every other description of MATS at equally low prices, at J. BLACKBURN AND SONS, Russia Mat and Sack Warehouse, 4 and 5, Wormwood Street, E.C.

Russia Mats.
BLACKBURN AND SONS, the only Importers of Mats in London, have, in consequence of the SCARCITY of ARCHANGEL MATS, instructed their Russian friends to send 100,000 best selected PETERSBURG, which they are now offering, to the Trade only, at low prices. Samples and prices on application, at 4 and 5, Wormwood Street, London, E.C.

RUSSIA MATS, for Covering Garden Frames,—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post free on application.
JAS. T. ANDERSON, 7, Commercial Street, Shoreditch, London, E.C.

Russia Mat Merchants.
MARENDAZ AND FISHER, 9, James Street, Covent Garden, W.C., Importers of ARCHANGEL and all kinds of ST. PETERSBURG MATS, RAFFIA FIBRE, &c. Tanned GARDEN NETTING, Tanned TWINES, TIFANY, &c., always on hand.
N.B.—Special terms for large buyers.

14, MARKET STREET, OXFORD.

BOULTON & PAUL (LATE W. S. BOULTON & CO.), NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

Improved Steam-power Machinery for working wood enables us to supply first-class Horticultural Buildings of every description at very low prices. Only the best materials used. Houses designed to suit any situation. Estimates given Free. Gentlemen are respectfully invited to have price from us before ordering elsewhere. Ladies or Gentlemen requiring advice as to the Situation, Style, Dimensions, &c., of proposed Horticultural Buildings, waited upon in any part of England, Ireland, or Scotland. Our NEW ILLUSTRATED CATALOGUE of HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

BOULTON & PAUL'S PATENT UNIVERSAL PLANT PRESERVERS—GREAT IMPROVEMENTS for 1875.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these to be by far the best and most useful articles of the kind they ever saw, and awarded them the ONLY PRIZE.

Now Ready, our NEW LIST of PRICES, containing full description and a number of Woodcuts clearly showing the uses to which these handy articles may be applied. Free by Post. **PATENT UNIVERSAL PORTABLE PLANT PRESERVERS and GROUND VINERIES**—Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-in.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 feet by 3 feet wide; thus proving them to be really portable.

PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. *Far superior to anything of the kind yet offered.*

GARDENERS' CHRONICLE, February 6, 1873.

The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value.

FLORAL WORLD.

The Ground Vinery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co.

MELON OR CUCUMBER FRAMES.

All sizes (glazed with 21-in.) ready for immediate delivery. Height at back, 24 inches; at front, 13 inches; sides, 14 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as putted in. Each light is provided with an iron strengthening rod and handle.

Glazed with 21-ounce.

OPINIONS OF THE PRESS.

GARDENERS' MAGAZINE, May 25, 1872.

Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known.

THE GARDEN.

Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and putted—an essential point. They are complete and ready for use the moment they are received, &c.

Cash Prices, carriage paid to any station in England when orders amount to 60s. and upwards.

Two-thirds allowed for Packing Materials when returned free to our Works. Cash or reference respectfully requested with transmission of all first orders.

COWAN'S COMPENSATING SYSTEM OF HEATING.

WAUCHOPE & COWAN'S NEW AND ECONOMICAL SYSTEM OF MAKING GAS.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, having recently been offered a valuable Patent for the Manufacture of Gas, to be worked in combination with their Patents for Heating Horticultural and other Buildings, have found it necessary, so as to acquire and work such Patent, to form a new Company with larger powers; the old Company having been incorporated for the purpose of dealing with the Heating Patents only.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, will, therefore, be wound up and dissolved, and a new Company, called "THE COWAN PATENTS COMPANY, LIMITED," has been formed, and has taken over the entire business of the old Company. From this date the new Company will carry on the business of the old Company, with the addition of the New System of Making Gas—full particulars of which, with Illustrations, can be had on application.

Contracts entered into by the old Company will be carried out by the new one, and all its responsibilities fulfilled.

The Directors of the new Company have thought it advisable to change the Offices from Lothbury to 21, WHITEHALL PLACE, WESTMINSTER, S.W., where all communications should in future be addressed, and where full information concerning their Patent Systems of Heating and Gas Making can be obtained.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

ILLUSTRATED PAMPHLETS SENT FREE ON APPLICATION.

All Communications in future to be addressed—

21, WHITEHALL PLACE, WESTMINSTER, S.W.

CONSERVATORY FLOWER STANDS.

For Conservatories fitted up with this Flower Stand, see Catalogue.

R. HOLLIDAY, HORTICULTURAL IRON and WIRE WORKS, 2A, PORTOBELLO TERRACE, NOTTING HILL GATE, LONDON, W.

MESSENGER & COMPANY, CONTRACTORS, MIDLAND HORTICULTURAL BUILDING AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Be glad to inform their numerous Patrons and the Public generally, that since the recent disastrous fire they have erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, of any required dimensions. T. G. MESSENGER & Co. are now, therefore, in a position, from their great facilities and experience, to carry out with dispatch and in the best manner, at moderate cost, the orders with which they may be entrusted. Glasshouses erected on Messenger's Patent principles are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed, are economical in cost and maintenance. Hot-water engineering in all its branches. Messenger's Patent Hot-water Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application. Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out.

A richly Illustrated CATALOGUE forwarded Post Free on receipt of 33 Stamps.

PRICE LIST on application; or, Six Stamps for DESCRIPTIVE CATALOGUE, 4th Edition.

JONES'S

PATENT

"DOUBLE L" SADDLE BOILER.

This boiler, which has now had a good trial, presents advantages that other boilers do not possess. Instead of a large portion of the heat being absorbed by the brickwork setting, or passing direct up the chimney, before the heated particles emitted from the fuel in process of combustion have properly done their work, as is the case with many other boilers at present in use, this boiler, by its peculiar, yet simple, construction, as well as by a judicious arrangement of flues, obtains the full amount of heat from the fuel before the products of combustion pass into the chimney. Compared with the old Saddle and other boilers, it is computed that it will do nearly twice the amount of work with the same amount of fuel. The cost of setting is less, as is also the space occupied, and the boiler being made in wrought instead of cast iron, thereby avoiding its liability to crack, renders it one of the best boilers yet brought out.

For the rapidity with which heat can be got up in one number of houses it is unsurpassed, and the following extracts from Testimonials received from persons accustomed to the use of hot-water apparatus will prove that the expectations raised for this boiler have been fully realised.

J. JONES & SONS beg to state, in conclusion, that they are prepared to send to any part of the country, at a moderate charge, to take particulars and prepare plans and estimates for hot-water work of every description; or they will, on receipt of full particulars by post, send estimates, &c., free of charge.

The Patent "DOUBLE L" SADDLE BOILER is made in sizes to heat from 300 to 10,000 feet of piping, and can only be obtained from the Patentees.

All communications respecting prices of boilers, &c., should be addressed—

J. JONES AND SONS, HOT-WATER ENGINEERS, 6, BANKSIDE, SOUTHWARK, LONDON, S.E.

EXTRACTS FROM A FEW TESTIMONIALS

IN FAVOUR OF

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

From Mr. J. ATKIN, Gardener to W. Stuart, Esq.

"ALDENHAM ABBEY, WATFORD, June 5, 1873. "Concerning the working of your Patent 'Double L' Saddle Boiler, I have only to say that it gives entire satisfaction, and although a small one, it heated the 700 feet of 4-inch piping nearly all the winter. I had seldom to use the other Boiler that is attached to the pipes; it also requires a considerable deal less fuel than the old Saddle, which is of some importance at the present price of coal; it also heats much quicker than any Boiler I ever had to superheat."

From Mr. J. W. ABRAHAMS, Gardener to N. M. Forbes, Esq.

"TILBURYTON LODGE, GODSTON, December 29, 1874. "I have proved your 'Double L' Saddle Boiler, and find it everything that could be needed. I am of opinion that the Boiler is able to drive as much more piping as it is now required to do. It is the kind of Boiler I should recommend to all Gardeners for Forcing Houses; as you can get both a quick heat and a regular heat; in fact, I believe it to be the best Boiler I ever had to deal with."

Extract from Second Testimonial from the above.

"The 'Double L' Saddle Boilers, as well as the apparatus in the Stove House, answer exceedingly well, and give whatever heat I require—from 50° to 90° day or night—with very little trouble or attention."

From Mr. R. WILLMOTT, Gardener to C. Doridante, Esq.

"THE GARDENS, ALDERSHOT PARK, May 26, 1873. "The 'Double L' Saddle Boiler and Apparatus erected by you has given me great satisfaction, as it does its work quickly and economically, and requires very little attention. I consider it a great improvement on the old Saddle Boiler; in fact, I prefer it to any other boiler we have."

From Mr. J. SIMS, Gardener.

"BOVINGDON HOUSE, HEMEL HEMPSTEAD, December 18, 1871. "I have given your 'Double L' Saddle Boiler a fair trial during the severe weather we have had, and am well satisfied as to its being a great deal more economical than the old boiler, and will do the same amount of work with about half the quantity of fuel."

From Mr. D. ROBERTSON, Gardener to Rev. Dr. Ainger.

"WHITTON TOWER, ROTHAM, June 3, 1873. "Your 'Double L' Saddle Boiler is giving great satisfaction. We have had a severe winter, the houses are old, and consequently very open, and yet it has kept them at the proper temperature from 10 P.M. to 9 A.M., which would be very hard on any other boiler that I am acquainted with, considering the size."

From Mr. CHARLES YOUNG.

"LANGLAND BAY, near SWANSEA, June 5, 1873. "Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

From Mr. R. THOMPSON, Gardener to H. Crawshaw, Esq.

"Your 'Double L' Saddle Boiler I like very much. I worked it regularly since it was fixed, and I find it to be a very powerful, and, at the same time, an economical Boiler. I am also pleased with the manner in which the pipes are fixed, and their working throughout. The stops could not possibly be better. This I consider a good point, as it enables the person in charge to regulate the heat as he pleases."

From Mr. J. ANSON, Gardener to the Rev. G. H. Devonport.

"I have given your 'Double L' Saddle Boiler a fair trial, and it gives every satisfaction. It is the quietest heating boiler I have had under my charge, and burns the least fuel."

From Mr. H. BROOKS, Gardener to J. T. Belk, Esq.

"I have given your 'Double L' Saddle Boiler a fair trial, and have found it give every satisfaction. It acts admirably with a small amount of fuel, which is a great point at the present price of fuel. I consider it the best I have used, and the most economical."

From Mr. J. McCULLUM, Gardener to J. W. Hallowell, Esq.

"I have thoroughly tested the efficiency of your Patent 'Double L' Boiler, and I am so satisfied with its heating powers that I can recommend it with confidence. When properly managed I find it one of the most economical Boilers I ever used."

From Mr. W. BECHT, Gardener to Sir J. W. Hartopp.

"The two 'Double L' Saddle Boilers you put in here for the Hot-water Apparatus are working very satisfactorily."

From Mr. S. PETTIT, Gardener to F. Sartori, Esq.

"RUSHDEN HALL, HIGHAM FERRERS, May 20, 1873. "Your 'Double L' Saddle Boiler has had a good trial this last winter, and does its work first-class, with comparatively little fuel, considering the work it has to do."

W. H. LASCELLES, HORTICULTURAL BUILDER, Fishbury Street, Joinery Works, 121, Bunhill Row, London, E.C.

Estimates given on application for GREENHOUSES and CONSERVATORIES of all kinds, and to any design.

ESTABLISHED 1856.

THE GARDENERS' CHRONICLE.

Second Edition, Price 3d., Post Free 4d.

THE

Agricultural Gazette Almanac, 1875.

The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compilations, many good serviceable hints on farming, cattle, growing of root crops, &c. The illustrations are admirably executed, many being engraved from photographs." - Weekly Dispatch, Jan. 23, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition." - Lloyd's, Jan. 17, 1875.

"It is a very cheap threepennyworth of information of interest and utility to farmers, and contains numerous illustrations." - The Field, Jan. 16, 1875.

"In addition to the usual matter to be found in an almanac, we have here useful information to the farmer, as to stock and crops, with illustrations of prize animals." - Gloucestershire Chronicle.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for the dairy cult." - Farmer's Herald.

"In addition to the usual matter to be found in a cattle shows, races, &c., space for diary and memoranda by the side, and various useful information of an agricultural character." - Oxford Times.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics and a series of portraits of the Prince of Wales, Dr. Voelcker, and Viscount Bridport, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'" - South Express.

"To farmers, cattle dealers, and others interested in agriculture, work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is profusely illustrated with engravings chiefly taken from photographs." - Devonshire Chronicle.

"This almanac, which appears to be carefully compiled, and the contents judiciously selected, may be commended to the notice of agriculturists generally. It is issued at a low figure, and contains a large variety of information. There are numerous illustrations, and the likeness of the Prince of Wales, which forms the frontispiece, is especially deserving of mention." - Grantham Journal.

"To all persons interested in agriculture in this neighbourhood 'The Agricultural Gazette Almanac' for 1875, price 3d., will be worth obtaining. It contains a fund of information, as well as a variety of advertisements on topics especially connected with the portion of the community which it is intended to serve." - Halifax Guardian.

"Although this almanac comes rather late it is none the less welcome; as containing a mass of information, both interesting and valuable to any person connected with agriculture, it is to be commended. In addition to the usual calendar it contains a diary, supplies us with authentic portraits and verbal descriptions of prize cattle, sheep, and pigs, &c. of the members of the 'Crickets in the Counties in 1874,' and alphabetical lists of the members of the Houses of Parliament. It is besides admirably illustrated with notable prize-winning stock. The diary is well adapted to the requirements of agriculturists." - East Anglian Daily Times.

"It contains a lot of information useful to farmers and breeders." - Cornish Times.

"It contains a mass of information which will be found exceedingly useful to all who are engaged in agricultural pursuits. In addition to the usual matter there is a capital portrait of H.R.H. the Prince of Wales, and several other engravings." - Gloucester Mercury.

"It is a wonderfully good threepennyworth, containing, as it does, in addition to the calendar specially arranged for agriculturists, some of the beautiful portraits of stock which have appeared in the columns of our contemporary within the last year and a half. Among others, there are portraits, from photographs, of the splendid black and white buck of Genoa, the Red Bull, and the Prince of Wales' Champion Shorthorn Heifer, among the Shorthorns, and a lithographed portrait of a Jersey cow. There are also illustrations descriptive of noteworthy American 'winkles' for farmers." - Norwich Mercury.

"It contains much interesting matter for the farmer, who may be able to put a question to the questions listed in a section. As may be imagined, the notes relate to matters of purely farming interest, such as rotation of crops, manures, and implements, &c. containing, besides, advice which they contain being sound and practical." - Land and Water.

THE VEGETABLE KINGDOM; or, THE STRUCTURE, CLASSIFICATION, AND USES OF PLANTS, Illustrated upon the Natural System. In One Volume, 8vo, cloth, price 25s. with upwards of 500 Illustrations.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in the arts, and in the culture of the soil, and of domestic economy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the Vegetable Kingdom of the author, with the sequence of matter departed from in a few instances, to believe that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in a way not at all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was independently made, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

London: BRADBURY, AGNEW AND CO., Bouverie Street, E.C.

PARTNERSHIP—Owing to the decease of the Proprietor of an Old Established Nursery &c., &c., Executors are desirous of meeting with a person possessing moderate capital, who would be disposed to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Protheroe & Morris, 35, Gracechurch Street, E.C.

WANTED, a HEAD GARDENER, who must be thoroughly trustworthy, and experienced in every branch of his profession, especially in the production of good Grapes, and in the culture of the Strawberry. Good references required.—Apply, stating age, experience, and wages expected, to ALEXANDER BLAKE, 9, Norfolk Terrace, Fulham, S.W.

WANTED, a thoroughly practical WORKING HEAD GARDENER, where an Under Gardener and a Boy are also kept; must be well up in all kinds of Kitchen, Flower, and Greenhouse Work, and some knowledge of Stock desirable. Unimpeachable character indispensable. A total abstainer preferred. Also wife to take charge of the Laundry. Apply for the two, or either, to Mr. W. G. WOOD, 10, St. Andrew's Address by letter, in the first instance, CHARLES DICKENS, Gadsdill Place, Rochester, Kent.

WANTED, a WORKING HEAD GARDENER, without children, thoroughly experienced, competent in the Management of Conservatory and Vines, and ordinary work of the kind. Good references required. Wife should be able to Manage Poultry. Unexceptionable references from the last and previous places must accompany application. Good cottage, and one minute from MALCOLM SMITH, Esq., Grosvenor's Chronicle Office, W.C.

WANTED, a good WORKING GARDENER, for a Six-acre Place (assistance given in the rough work). He must understand thoroughly the Growing of Cucumbers, Melons, &c., and forcing generally. Address, with full particulars, ALFRED ELTON, Shenstone Lodge, Bedford.

WANTED, an experienced GARDENER, to Grow Grapes, Flowers, and Vegetables. Highest references required, and liberal wages given to a thoroughly competent Man.—R. H. FREMLIN, Waterbury, near Maidstone.

WANTED, a MAN and WIFE—the former as Gardener, the latter as Laundress. Cottage, with every convenience for laundry-work found, but nothing else. Apply, by letter, stating wages required, to Dr. ARNISTON-GUY, Bracknell, Berks.

WANTED, a WORKING GENERAL NURSERY FOREMAN, in a small Nursery. Must be a good Budger and Grafter, steady and industrious—State age, qualifications, and references, to C. MACLAIN, Norfolk Nursery, East Dereham, Norfolk.

Table with 4 columns: Line number, Rate per line, Total lines, Total cost. Includes rates for 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 lines.

And two shillings for every additional five lines. If set across columns, the lowest charge will be 30s.

Advertisements for the current week MUST reach the Office on Thursday noon. P.O.O. to be made payable at the King Street Post Office, W.C. to W. RICHARDS. OFFICE—41, WELLINGTON STREET, COVENT GARDEN, LONDON, W.C.

KINAHAN'S . . . WHISKY. This celebrated and most delicious old mellow spirit is the very CREAM OF IRISH WHISKIES, and is of quality unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and Cork Bunch of Kinahan's L.L. Whisky. Whittlesea Depot, 20, Great Titchfield Street, Oxford Street, W.

Grateful—Comforting. E P P S BREAKFAST COCOA

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which may save us many heavy doctors' bills. It is justly ranked as one of the articles of diet that a constitution may be gradually built up from, and which is the best tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the *Civil Service Gazette*.

Made simply with boiling water or milk. Sold in packets (in tins for abroad) labelled:—JAMES EPPS AND CO., HOMOEPATHIC CHEMISTS, 45, Threadneedle Street, and 179, Piccadilly, W. Works:—Euston Road, and Canmies, London, N.W. Makers of Epps's Glycine Jujubes for Throat Irritation.

DINNFERD'S FLUID MAGNESIA.

The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best mild Aperient for delicate Constitutions, especially adapted for Ladies, Children and Infants.

DINNFERD AND CO., 172, New Bond Street, London, W., and of all Chemists throughout the World. COUGHS, COLDS, PAINS IN THE CHEST, SHORTNESS OF BREATH, PHTHISIS.—Two of DR. LOGGON'S PULMONIC WAFERS give immediate relief, and nothing else gives such a sound, refreshing night's rest, while in Rheumatic and Nervous Pains they act like a charm. They have a pleasant taste, and are given in 156d., 2s. 6d., 4s. 6d., and 11s. per box. Sold by all Medicine Vendors.

WINTER GARDENS for Home or Export.
CONSERVATORIES in Iron or Wood.

GREENHOUSES from 10 ft. in length upwards.
FORCING PITS for all purposes.

GLASS PORCHES. Ornamental or Plain.

NEW AMERICAN POTATOS

ALPHA,
EUREKA,
EXTRA EARLY VERMONT,

SNOWFLAKE,
BROWNELL'S BEAUTY,
COMPTON'S SURPRISE.

FIFTY GUINEAS IN PREMIUMS.

B. K. BLISS & SONS,

SEED MERCHANTS (SEED POTATOS A SPECIALITY),

34, BARCLAY STREET, NEW YORK, UNITED STATES, AMERICA.

THE great popularity of the new varieties of Potatos which have been sent out from our establishment within the last six years, among which are the Early Rose, Late Rose, King of the Earlies, Bresee's Prolific, Peerless, Climax, Extra Early Vermont, Compton's Surprise, Brownell's Beauty, and Snowflake, and their general adaptation to the various soils and climates of the civilised world, together with the liberal premiums offered by us for two years past to those who produce the largest crop from 1 lb. of seed, have induced many growers in various sections of the country to experiment in raising seedlings, a large number of which, considered by the originators as the very choicest in their collection (some of which embrace several hundred varieties), were sent us for trial the past season.

Several of the most promising of these were sent by us to the Royal Horticultural Society, one of which, the Dwarf White, since named Alpha, received a First-class Certificate, this being the fourth instance in which our Potatos have received this distinguished token of appreciation. A Silver Medal was awarded to the Alpha and Snowflake, also to the Eureka and Brownell's Beauty, by the Massachusetts Horticultural Society of Boston, besides having received numerous prizes from various State and County Fairs throughout the country. From the many flattering testimonials received from those who have tested these varieties, we are fully confident that they will compare favourably with others that have been sent out from our establishment. Many others are very promising, but it is yet too early to decide upon their respective merits.

ALPHA. (Pringle.)

EARLIEST VARIETY IN CULTIVATION.

Raised in 1870 by C. G. Pringle, originator of the Snowflake, and one of our most experienced hybridisers, from seed borne by Early Rose and impregnated by pollen of Selce. A very early dwarf variety, adapted for garden culture and to forcing under glass; fit for the table ten or fifteen days before the Early Rose. Tubers of medium size and good shape, clear white, with the slightest tinge of red about the eyes; flesh very white, fine-grained, dry, and firm, and possessed of a decided and excellent flavour; haulm seldom exceeding a foot in height; quality, first-rate in every respect. As the stock is limited, it will be offered in small quantities.

Price 12s. per lb.

SNOWFLAKE.—Showing habit of growth in the hill.

THE SNOWFLAKE. (Pringle.)

This new variety, first sent out by us last Spring, has been thoroughly tested, both in this country and in Europe the past season, and we have yet to learn of the first instance where it has failed to give entire satisfaction. The superior quality claimed by the originator, when first offered, has been confirmed in every case, as far as heard from.

It is an early variety; tubers a good uniform size; and in shape the most handsome Potato yet known; skin white. Its flesh is of exceedingly fine grain, snow-white when boiled, and of a lightness and porosity almost approaching a snowflake. In quality, we do not hesitate to say nothing can surpass this new variety; its mealiness, its pure, delicate flavour, and the evenness with which it cooks through, its have never been eclipsed by any Potato. The tubers have attained the full development of their quality as soon as they are fit to dig, and do not lose it during Winter; samples kept till June 1 did not show the least deterioration. The haulm is of medium height, and the tubers are compactly clustered around the base of the stalks,—an important consideration in digging the crop. This variety has been tested on widely varying soils—sand, gravel, loam, as well as heavy clay—and has in every case given the same favourable results, and produces a yield of from 300 to 400 bushels per acre.

Price 3s. 6d. per lb.; 7 lb. for 21s.

EXTRA EARLY VERMONT.

Respecting this variety the committee for awarding the premium offered by us in 1873 make the following statement:—

"The Early Vermont has, as proved by the numerous reports before us, more than sustained its previous reputation. Nearly all the competitors declare it from one to two weeks earlier than the Early Rose, and many even more. Its uniform and large size is recognized by every one. Mr. McLeod says: 'There are more than one hundred in the amount I raised that would weigh from one to two pounds each; and Mr. Sulter raised one tuber that weighed three pounds twelve ounces. Its superior cooking and eating qualities are unanimously commended, as well as its compact growth in the hill and its freedom from disease; and with the thousands of cultivators who have grown it alongside the Early Rose there seems to be no doubt left, that in quality, hardness, earliness and yield, it far surpasses that celebrated variety.'

A First-class Certificate was awarded this variety by the Royal Horticultural Society of London, 1873.

Price 10s. per peck; 32s. per bushel.

The above varieties are for sale by the following Seed Houses:—London: HOOPER AND CO., Covent Garden; J. CARTER, DUNNETT, AND BEALE, 237, High Holborn; LAWSON SEED AND NURSERY COMPANY, London and Edinburgh; CHRISTMAS, QUINCY, Peterborough; COCKS BROTHERS, Donington; DANIELS BROTHERS, Norwich; HARRISON AND SONS, Leicester; A. BUSCH, Gr., Massow, bei Zwickau, in Pommern, Germany, General Agent for the Continent.

Growers are cautioned to get the true Sorts, as it is feared that substitutions have been made in some cases, and other inferior varieties sent out in place of the above.

EUREKA. (Brownell.)

Mr. E. S. Brownell, the originator of the Brownell's Beauty Potato, in his persistent experiments in hybridising, succeeded in producing, in 1871, this seedling, which is likely to fill a want of those who may be fastidious as to the colour of the skin, and outside, as well as general appearance of their table Potatos.

It is of strong and vigorous growth; the tubers of a medium and uniform size; elongated oval, symmetrical and uniformly handsome; eyes few, exceedingly small, and very nearly level and flat; skin white and fair; season, second early. It is one of the most productive in cultivation, besides being an excellent keeper. Its flesh is exceedingly fine-grained, white, and when boiled or baked, mealy and of excellent flavour, cooking through uniformly, without any fault at the centre. Certainly an acquisition among the white varieties, well worthy of further trial in different sections.

Price 3s. 6d. per lb.; 7 lb. for 21s.

BROWNELL'S BEAUTY.—Showing habit of growth in the hill.

BROWNELL'S BEAUTY. (Brownell.)

The beauty and superior keeping qualities of this variety, together with its fine quality for the table, and productiveness, place it in the front rank of those recommended for general cultivation. We know of no variety whose good qualities can be retained for the entire year, as this has done. Samples were sent in 1873 to the gardens of the Royal Horticultural Society of London, where they received a First-class Certificate, and have also received many premiums at various agricultural fairs in this country. Eyes few and small, nearly even with the surface; shape oval, somewhat flattened; skin reddish, or a deep flesh colour; flesh white, fine-grained and very delicate; flavour unexceptionable. The tubers grow compactly in the hill, and are easily dug. All who tested it the past summer agree that its beautiful appearance, fine quality, extraordinary productiveness, and remarkable keeping qualities will render it a most valuable variety for the market.

Price 10s. per peck; 32s. per bushel.

COMPTON'S SURPRISE.

The Committee for awarding the premiums offered by us in 1873 make the following report:—
"Compton's Surprise has received the unanimous verdict for the most prolific Potato cultivated at present. Yields of from 12 to 20 lb. to the hill are reported by the hundred, and in one instance 25½ lb. were dug from one hill. As a rule, the most prolific varieties are not of the best eating quality, but to this Compton's Surprise is an exception. Thousands have testified that they never ate a better Potato. Its uniform mealiness of grain, combined with the purest flavour and its snowy whiteness of flesh, which is not in the least affected by its blue skin, cannot fail to make it highly valuable as a family Potato. This variety shows a peculiar tendency to produce a surface crop, not found in other kinds.

"Its rampant-growing vines lying on the ground will frequently take root, and establish a new centre of production. Subterranean branches will likewise often grow above the surface, and form self-supporting plants, which produce an additional crop of tubers."

Price 8s. per peck; 25s. per bushel.

NEW AMERICAN POTATOS — (CONTINUED).

The Committee for awarding the premiums offered by us in the Spring of 1874 to the six largest products from 1 lb. of the tubers of the Extra Early Vermont, Brownell's Beauty, and Compton's Surprise, after a careful examination of the reports of the various competitors, report as follows:—

BROWNELL'S BEAUTY, the newest of the three, has made a most splendid record. Not only has it given much the largest returns, from the single pounds as well as from the quarter acres, but it has also elicited the unanimous praise of all cultivators, and cannot fail to become soon a leading market Potato. First Prize awarded to H. C. Pearson, Pitcairn, N.Y., for 1018 lb. raised from 1 lb.

The **EARLY VERMONT** seems to have gained legions of new friends this year, while it has lost none of its old ones. All are satisfied as to its superiority as an early Potato, for market as well as for the table. In many localities where other early varieties have failed entirely, the Early Vermont has given most satisfactory returns, leaving its rank undisputed as the earliest and best early Potato in cultivation. First Prize awarded to A. K. Titus, Wilmington, Vt., for 708 lb. raised from 1 lb.

COMPTON'S SURPRISE has given not less satisfaction as a Potato of the highest quality. In many reports we find that "no praise can do justice to its excellent quality." First Prize awarded to P. C. Wood, Esther, Ill., for 900 lb. raised from 1 lb.

Our Illustrated Descriptive POTATO CATALOGUE, 24 pages, containing a List of 200 varieties, with Report of Committee and Culture of successful Competitors in 1874, will be mailed free and post paid to all applicants.

Address: **B. K. BLISS & SONS, Seed Merchants, 34, Barclay Street, New York, U.S.A.**

FIFTY GUINEAS IN PRIZES,

OFFERED BY HOOPER & CO., COVENT GARDEN, LONDON, W.C.,

Will be Awarded at the MEETING of the ROYAL HORTICULTURAL SOCIETY, on November 10th of the present year.

Wishing to have the above New Varieties of Potatos fairly tested in Europe, HOOPER & Co. offer Special Premiums, amounting to Fifty Guineas, to British Cultivators, which will be awarded to Growers of the largest quantity from One Pound of "Snowflake" and "Eureka;" Twenty-five Guineas to each variety, to be awarded as follows:—

Twenty-five Guineas for SNOWFLAKE.

For the largest quantity of Snowflake Potatos grown from 1 lb. of seed 10 Guineas
For the second largest 5 "
For the third largest 4 "
For the fourth largest 3 "
For the fifth largest 2 "
For the sixth largest 1 "

Twenty-five Guineas for EUREKA.

For the largest quantity of Eureka Potatos grown from 1 lb. of seed 10 Guineas
For the second largest 5 "
For the third largest 4 "
For the fourth largest 3 "
For the fifth largest 2 "
For the sixth largest 1 "

Competitors for the Prizes will be required to give date of planting, date of digging, with a written statement of their mode of culture, characteristics of the soil—whether clay, alluvial, sandy, or loam—nature of the subsoil, whether underdrained or not; also, the kind and quantity of fertilisers used, how and when applied, and the nature of the crop which occupied the ground immediately before. Competitors must send us their names for registration before the 10th of April next, and only those who are entered will be eligible to compete for the prizes. Local agents will be appointed by us to supervise the planting and lifting of the Potatos, and will make a return to us of the space occupied, and certify that the conditions published have been carried out. The crops when dug must be carefully packed and forwarded to the Secretary of the Fruit Committee of the Royal Horticultural Society, South Kensington, London, W., with the words "Hooper's Potato Competition" on the corner or back of the address. The packages must reach South Kensington by the 9th of November, and the written statement about soil, &c., alluded to above, be enclosed on the top. A duplicate of this statement should be forwarded to us by post. The packages containing the crops should be sealed.

The Seals will be broken, the Crops weighed, and the Prizes awarded by Members of the Fruit Committee of the Royal Hort. Society, and all the competitive lots will be exhibited at the show of Nov. 10, with the names of the raisers attached. The names of the winners will be published in the leading agricultural papers of Great Britain. Competitors for premiums will be placed under no restrictions as to their mode of culture, excepting that they must not be grown from slips, or forced by artificial heat, our object being to ascertain their respective merits with such culture as is usually given to crops in a well managed vegetable garden or farm. The Potatos may be cut into "sets."

In reference to the above IMPORTANT ALTERATIONS in the METHOD of AWARDING the PRIZES, the reader is requested to observe that the affidavit required by the last announcement is abolished.

HOOPER & CO., SEEDSMEN, COVENT GARDEN, LONDON, W.C.

E. G. HENDERSON & SON'S

SEED CATALOGUE FOR 1875,

Containing over Two Hundred Illustrations of Flowers,

WILL BE POSTED FREE ON APPLICATION.

THE VARIETIES OF FLOWER SEEDS are so arranged that the Amateur may readily recognise the most beautiful and desirable.

THE VEGETABLE DEPARTMENT is complete with the best kinds in each Section.

The following is a selection from the numerous Novelties described in the Catalogue:—

SOLANUM HYBRIDUM HENDERSONI.

Amongst the most attractive novelties of the present year must be included this highly picturesque fruiting variety of Solanum, which may be considered the most elegant and effective fruit-bearing plant yet introduced for the cool conservatory, greenhouse, or drawing-room decoration; producing a profusion of brilliant, glossy, orange-coloured, cone-shaped, erect fruits, matured into perfect beauty during the mid-winter and early spring months. These are produced so abundantly that not less than six successive tiers are counted upon one branch, and it also forms clusters upon the matured firm undergrowth. Upon one plant alone, scarcely 18 inches in height, were counted 200 fruits. Their enamel-like polished surface, rich profusion, and picturesque effect, produce a very fine feature. Price, 1s. 6d. and 2s. 6d. per packet.

NEW STRAWBERRIES

AND
DOUBLE PELARGONIUMS.

Messrs. W. & J. BROWN are now sending out Mr. Laxton's fine firm-fleshed new STRAWBERRIES—TRAVELLER and EXQUISITE; the flavour of both these is distinct and unequalled. Traveller has received a First-class Certificate from the Royal Horticultural Society, and is undoubtedly the most suitable Strawberry for transmission yet raised. Strong plants of last season—Traveller, 25 for £1, £3 per 100; Exquisite, 25 for 12s. 6d., £2 per 100. Early struck runners of each in 60-sized pots, 7s. per 25 extra.

Prizes for Fruits of these will be offered in 1876.

W. & J. BROWN will also send out in May next the following new Double Zonal PELARGONIUMS for 1875, raised by Mr. Laxton:—

EMILY LAXTON.

First-class Certificate, Royal Horticultural Society. The largest-flowered and most remarkable scarlet Pelargonium, either double or single, hitherto sent out. Individual flowers upwards of 2 inches in diameter; truss also enormous, semi-double, but full and very striking. A coloured plate post free for 1s. 6d.

Strong plants, 15s. each.

GUIDING STAR.

The most shrubby and dwarf double Pelargonium yet raised. Foliage pale green, and paraking somewhat of the character and habit of the Show Pelargonium. Flower very pretty, purplish pink and full; quite unique and distinct.

Strong plants, 10s. 6d. each.

ILLUMINATOR.

A striking and distinct purplish-coloured variety, semi-double but full; petals large and stout.

Strong plants, 7s. 6d. each.—The set for £1 1s.

Prizes will be offered for the above in 1876.

For Prices (which are very moderate), and further particulars apply to

H. and F. SHARPE, SEED GROWERS, WISBECH, CAMBRIDGESHIRE.

LOBELIA PUMILA MAGNIFICA.

THE

PINE APPLE NURSERY COMPANY

Will commence sending out this fine Lobelia on March 15 next.

Price 2s. 6d each, or 24s. per dozen for not less than half a dozen.

It received the Floral Certificate at the Royal Botanic Society, and a First-Class Certificate at the Royal Horticultural Society. It has been favourably noticed by all the gardening papers, and the *Gardener's Magazine* of July 13 says of it:—"This dwarf bedding Lobelia, exhibited by the Pine-Apple Nursery Company, is unquestionably the most important of the many bedding Lobelias introduced of late years. The colour of the flowers is a deep indigo blue, and as there are no conspicuous eyes to mar the general effect, a solid mass or band will tell in a wonderful manner.

MAIDA VALE, LONDON, W.

THE CORINNIUM GUINEA COLLECTION
OF VEGETABLE SEEDS,

Carriage Paid to any Railway Station in England.

JOHN JEFFERIES AND SONS have every confidence in recommending the undenamed, as the VERY BEST and CHEAPEST SELECTION OF VEGETABLE SEEDS for all seasons of the year which can be obtained. C. LAWRENCE, Esq., says:—"Mr. Lawrence was satisfied with Messrs. Jefferies' supply of Garden Seeds for the past season, and will continue them for the season of 1875. The Celery, Jefferies' Cirencestor Red, was the best Mr. L. has had for a long time."

ILLUSTRATED CATALOGUE 6d. each, Presented to Customers.

JOHN JEFFERIES AND SONS, SEED MERCHANTS, CIRENCESTER.

IMPORTANT.

WILLIAM PAUL

(SON AND SUCCESSOR TO THE LATE A. PAUL),

Respectfully informs the Public that the old firm of A. PAUL AND SON, founded by his FATHER, the late Mr. A. PAUL, no longer exists.

Of that firm he is the sole surviving Partner. All Letters intended for him should therefore be addressed—

WILLIAM PAUL,

PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

CAMELLIAS.

WILLIAM PAUL (Son and Successor to the late A. PAUL) begs to announce that his Collection of Camellias, unsurpassed in England for extent and beauty, is now in bloom, and will continue so throughout the month of March. Trains from Bishopsgate and St. Pancras Stations twelve times daily (in about half an hour).

Entrance from the Platform "WALTHAM" Station, Great Eastern Railway.

PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

WALTHAM CROSS GRAPE.

WILLIAM PAUL (Son and Successor to the late A. PAUL), has still a few Canes to offer of this splendid New Amber-coloured Grape, which has received a "First-class Certificate" from the Royal Horticultural Society, and has been highly commended by many of the leading English Grape Growers.

Price 21s. to 31s. 6d. each.

A good Stock of Planting Canes of all the best sorts of Grape Vines.

PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

BETTERIDGE'S PRIZE ASTERS,

Saved by Mr. BETTERIDGE this Season, and obtained direct from him this Season.

ORIGINALLY SENT OUT BY

Carters

Mr. Betteridge's New Asters, DUKE OF EDINBURGH, DUCHESS OF EDINBURGH, IMPROVED OXONIAN, &c.

In consequence of a statement in the Seed Catalogue of a Provincial House, that "the raiser has again consigned to us his entire Stock" of the above new Asters, and which statement being totally unfounded in fact, Messrs. CARTER consider it necessary to publish the following letter received from Mr. Betteridge, the raiser of these celebrated Asters:—

"THE COMMON HILL, CHIPPING NORTON, Messrs. JAMES CARTER & Co., February, 1875. Gentlemen,—In accordance with your esteemed order I have sent you the bulk of Seed of my 'Betteridge's Aster,' including the new and beautiful crimson colour with pale guard-petals, and which, I presume, is the one sent out and named by you this year 'Duke of Connaught.' This I consider a very superior variety.—I am, &c., (Signed) 'JAMES BETTERIDGE.'"

SATURDAY, FEBRUARY 27, 1875.

ROSEMARY.

"For you there's Rosemary and Rue; these keep Seeming and favour all the winter long, Grace and remembrance to you both.

Winter's Tale, act iv., sc. 3.

IN these lines Shakspeare has immortalised the properties which tradition has assigned to two of the oldest inhabitants of our gardens. Rosemary has long been regarded as possessing important medicinal qualities, although it does not occupy a very prominent position in our Pharmacopœia. Of the antiquity of this belief, evidence is given in a fragment of a 14th-century poem on the virtues of herbs, published in *Reliquie Antique*, which is exclusively devoted to the praise of Rosemary, or, as it is there spelt, "Rosemarie." The author says that neither he nor any "ethely man" can tell "all the vertues;" but he certainly enumerates a good number of them, and some which are sufficiently remarkable. Such, for instance, is its property of restraining thieves: of which we are told that if the root be seethed in "vynacre of wyne," and a thief afterwards should wash his feet therein, he will have neither "myghte no strenthe" to steal, and that no man need "drede with him to dele." Whether a thief could be prevailed upon to consent to deprive himself thus of his means of existence seems, however, somewhat doubtful. The smoke of Rosemary inhaled will heal "colde in thi hede"—a seasonable prescription for the present winter: and a bath in which it has been seethed will make the bather "lyght and joly." A story is given, on the authority of Galen, of a queen who was "goutus and croket," and sixty years of age, who took "of Rosemary six pounds" and ground it well, and bathed herself three times a day for nine months in water in which this Rosemary was placed. Such perseverance deserved its reward: and accordingly at the end of the time her old flesh fell away, and she appeared "tender and neishe." She then thought of entering the marriage state: but here the fragment abruptly ends, and her subsequent fate is left to conjecture. Some idea of the extent of the "vertues" attributed to Rosemary may be gathered from the fact that in Langham's *Garden of Health* (1633) it is prescribed in no less than 131 cases of the most various description! We learn from *Pharmacographia* that Rosemary was mentioned by Pliny, and "was also familiar to the Arab physicians of Spain, one of whom, Iba Baytar (13th century) states it to be an object of trade among the vendors of aromatics. In the middle ages Rosemary was doubtless much esteemed, as may be inferred from the fact that it was one of the plants which Charlemagne ordered to be grown on the imperial farms. John Philip de Ligraine, a writer of the 15th century, describes it as the usual condiment of salted meats. It was probably in cultivation in Britain prior to the Norman Conquest, as it is recommended for use in an Anglo-Saxon *Herbal* of the 11th century. The essential oil was distilled by Raymundus Lullius about A.D. 1330." The modern applications of Rosemary are but limited. Oil of Rosemary is used as an external stimulant in liniments and hairwashes, being supposed to promote the growth of the hair, and to cure baldness; the green colour of certain pomatums is due to the presence of Rosemary. It was also an important ingre-

redient in the famous "Hungary water" of former days, a preparation to which various invigorating properties were attributed, and which is said to have taken its name from its use by a queen of Hungary, to whom it was communicated by a hermit. In this the Continental Rosemary was used, the otto yielded by this variety having quite a different odour from that obtained in England. The quantity of oil procured from a hundredweight of the tops is variously stated as from eight to twenty-four ounces. Rosemary also enters into the composition of Eau de Cologne, and into the famous French Vinaigre à quatre volours. The peculiar and admired flavour of the white Narbonne honey is said to be caused by the bees which produce it feeding largely on the flowers of the Rosemary, which abounds in that district; and it is stated that, when from any cause the blossoming of the Rosemary is interfered with, the honey harvest of Narbonne is a failure. Its value as a bee-plant is noticed by many old writers, as by Lawson in the *Country Housewife's Garden* (1637), who says that its use is "much in meates, more in Physicke, most for Bees." A preparation of the dried leaves was formerly sometimes used as a substitute for Chinese tea, and was recommended in cases of headache.

We gather from Surlet's *Countrie Farms* (1600) that charcoal obtained from Rosemary wood was charcol for artistic purposes. He says: "some do make of the wooddie parts thereof . . . coales to draw the first lineaments and ground-work of pictures and such other things to be painted."

The folklore of the Rosemary is extensive, and some of the superstitions attaching to it are very odd, and quite inexplicable—such, for instance, is the general belief in England, that it will only flourish in the gardens of houses where, to use an ancient proverb, "the grey mare is the better horse!" The use of this plant at funerals was referred to in our last volume (p. 353); but it appears to have been equally, if not more popular at weddings; and the older poets are full of allusions to it in this connection. This twofold employment of Rosemary is referred to in Herrick's distich:—

"Grow for two ends; it matters not at all,
Be 't for my bridal or my burial."

And Dekkar, speaking of a bride who died of the plague on her wedding-night, says:—"The Rosemary that was washed in sweet-water to set out the bridal is now yet in tears to furnish her burial."

It appears to have been the custom at weddings to dip the Rosemary in perfumed water before distributing it. It was often gilded upon such occasions. "So late as the year 1698," says Brand, "the old country use appears to have been kept up of decking the bridal bed with Rosemary," and the bridesmaids were accustomed to present the bridegroom with a bunch of it on the morning of the wedding. Roger Hacket, in a wedding sermon preached in 1607, says, "Rosmarius, the Rosemary, is for married men, the which by name, nature, and continued use, man challengeth as properly belonging to himself. It over-toppeth all the flowers in the garden boasting man's rule. It helpeth the braine, strengtheneth the memorie, and is very medicinable for the head. Another property of the Rosemary is, it affects the heart. Let this Rosmarius, this flower of men, ensigne of your wisdom, love, and loyalty, be carried not only in your hands, but in your heads and hearts."

"Rosemary and Bays," were combined on these nuptial occasions, as well as at other times; from which it would seem that there was some connection between the two which cannot now be traced. Herrick speaks of gilding "the Bays and Rosemary." That there was some meaning in the wearing of the two plants

DUKE OF CONNAUGHT, (offered this season for the first time by us)—The entire surface is of a pure vivid crimson colour, with pale guard-petals. One of the most brilliant flowers ever introduced. Per packet, 2s. 6d.

IMPROVED OXONIAN, rich purple with pure white eye. Per packet, 1s.

DUCHESS OF EDINBURGH, rich crimson with pure white eye. Per packet, 1s. 6d.

DUKE OF EDINBURGH, bright rose with pure white eye. Per packet, 1s. 6d.

Eighteen splendid varieties, Betteridge's Exhibition Aster. The collection, 2s. 6d.

Twelve splendid varieties, Betteridge's Exhibition Aster. The collection, 2s. 6d.

CAUTION.

Each packet of these Asters is impressed with our Trade Mark, without which none are genuine.

NASTURTIUM RUBY KING

(with dark-coloured foliage), per packet, 1s. 6d. A seedling variety of that type of dwarf Nasturtium originated by us, viz., the dark-foliaged or King of Tom Thumb section, the popularity of which is now universal—from the fact of their bright colours contrasted with dark foliage, compact habit, and duration of bloom, rendering them quite equal in effect to bedding Geraniums. The colour of the new variety now offered is quite unique and distinct—pure pink shaded with carmine—and forms an effective contrast with the varieties already in cultivation.

CARTERS.

THE QUEEN'S SEEDSMEN, 237 and 238, HIGH HOLBORN, LONDON, W.C.

appears from an account of the "memorable Parliament begun at Westminster, Nov. 3, 1640," in which we are told that Prynne and Burton, on their entry into London, "rode with Rosemary and Bayes in their hands and hats; which is generally esteemed the greatest affront that ever was given to the courts of justice in England." According to Deering, it was formerly the custom at Nottingham on the election of a new mayor, to place the mace on a table covered with black cloth, "covered with Rosemary and sprigs of Bay, which they term burying the mace."

Rosemary formerly played a prominent part in Christmas festivities. The old "Boar's Head Carol" which dates from 1521, and which is still sung on Christmas Day at Queen's College, Oxford, when a boar's head decked with Rosemary is carried into the hall, begins—

"The bore's head in hande bring I,
With garlande gay and Rosmary;"

and Herrick's often quoted poem on the ceremonies of Candlemas Eve commences with—

"Down with the Rosemary, and so
Down with the Baies and Mistletoe."

These frequent allusions to Rosemary point to the fact that it was far more commonly cultivated in former days than it is at the present time. The garden of Ironmongers' Hall, in London, was celebrated "for its Vines and Roses, and knots of Rosemary," and (again in conjunction with the Bay) it was sold in the streets for Christmas decoration. Gay says—

"When Rosemary and Baies, the poet's crown,
Are bawled in frequent cries through all the town,
Then judge the festival of Christmas near."

And in the churchwardens' accounts for St. Margaret's, Westminster, in 1647, is the item— "Paid for Rosemarie and Baies that was stuck about the church at Christmas, 1s. 6d."

Rosemary was employed in one of the many charms used on St. Agnes' Eve to obtain a sight of the future husband of the girl who exercised it. Two sprigs, one of Rosemary and one of Thyme, were to be sprinkled with water on St. Agnes' Day, and, on going to bed, one was to be placed in each shoe, the shoes being put on either side of the bed. A brief invocation to the saint was then repeated, and the future husband appeared during the night.

We do not find much reference to folklore connected with Rosemary in other countries. In Germany the *Todenkranz*, or death wreath of a girl who died shortly before her intended marriage, was formed of this plant—a custom which corresponds with Herrick's already quoted lines. In Thuringia it is worn at confirmation, and woven into bridal wreaths. Its name in Denmark, *Elle-grin*, or Elves' green, would appear to point to some legend connected with it in that country. The plant is, however, known in most countries by an equivalent of its Latin name, Rosmarinus, which means literally sea-dew, and originated, according to Prim, "from its usually growing on the sea coast, and its odour." Its habitat, however, is by no means exclusively maritime. *B. M.*

New Garden Plants.

ODONTOGLOSSUM WARSCWICZII, Rehb. f.*

Very much in the way of *Odontoglossum vexillarium*, whose growth and bulbs and leaves it imitates so much that the two would easily be confounded when out of flower. The rather small bulbs are nearly oblong-

* *Odontoglossum Warszewiczii*, Rehb. f.—Pseudobulbo oblongo seu oblongo-ligulato ancipiti monophyllo; foliis fulventibus ad septem; foliis linear-ligulatis acutis; pedunculo gracili ad quinqueflores; bracteis triangularibus minutis; sepalis linear-ligulatis ovatis acutis; sepalis laterioribus magis obtusis; labello a basi latissime hastata pandurato dilatato quadrioblo; antice bene emarginato bifido; nunc scalse ad instar urinque trilobis; lobis medianis medio-lobis anticis latissimis; callo acutiformi in basi ante medium tumido nunc in lineam elevatum velutina bicurven exserte; columna humillima.—*Odontoglossum Warszewiczii*, Rehb. f. in v. Mühl and v. Schlechtendal's *Botanische Zeitung*, 1859, t. 69; Rehb. f., *Genia Orchidacea*, t. 208, tab. 81; Lindl. *Folia I. Odontoglossum*, No. 21 (additional species), floribus sphaulmate illi *Odontoglossi grandis* aequalibus dictis.

FIG. 47.—GROTESQUE DENUDED OAK ON THE SIDE OF THE SUGAR LOAF MOUNTAIN, ABERGAVENNY.

ligulate, ancipitous, with a usually single elongate linear-oblong acute leaf, that appears to be generally broader than those organs in *O. Roezlii*, and a little narrower than those of *O. vexillarium*. There appears to be six or seven under the bulb, the lowest being also the smallest. The species appears to flower very freely, for I have several dry specimens with two spikes developed at once. Perhaps it may even make the *tour de force* of Mr. Rucker's *O. vexillarium*, that brought an anomalous third inflorescence at the top of

the largest pseudobulbs conjointly with the smallest leaves. The flowers of this plant may be called intermediate between those of *Odontoglossum Phalenopsis* and *O. vexillarium*. They have the same tendency as in the last species to show the anterior lobes of the lip a little asymmetrical, sometimes much so. The general colour is a mild creamy-white. Each petal has a great blotch at its base, no doubt always corresponding to the colour of the area of the lip; these are also single, but smaller, blotches at the base of the

FIG. 48.—GROTESQUE SWOLLEN OAK IN THE POUND NEAR PERSHORE, WORCESTERSHIRE.

the bulb—no doubt a splendid sight, though not agreeable to the morphological botanist, who does not like plants to jump over their usual bounds, and decidedly not to the benefit of future shoots, though the too great benefit may be balanced by the early cutting of the inflorescence, in order that it may not too much exhaust the poor bulb. The native peduncles bear three to five flowers, and we are entitled to expect them to improve by being well grown. We would call those specimens well grown which show at once

the base of the lip, whose callosities nearly resemble those of the most exquisite Mexican *Odontoglossum* (thus explaining the position of its relatives in this genus), shows a hippocrepic broad dark area, with a few projecting angles outside. This chief ornament would appear to show several varieties of colour, just as in the *Odontoglossum vexillarium*. In all instances the centre of that area is of a shining yellow, while the area itself appears to be now purplish-scarlet, now brownish-purple. It may

FIG. 49.—OLD OAK NEAR CASTLE MARTON, MALVERN CHACE (40 FT. ROUND BASE).

depend a good deal upon the amount of light given to the plant, as I have good reason to believe is the case with *Odontoglossum Phalaenopsis*. M. Linden gave a representation of that plant with such pallid colours that all praise of the flower had the impression of a joke—not a benevolent one, and yet we have several, even many instances, in which the flowers, when exposed to good light, are really charming in colour. The column is exceedingly short. There is scarcely a foot left under the stigmatic hollow, which usually has a single little tooth in its basilar middle part. No wings have been observed to the column, and yet we should not wonder if, finally, specimens were found with such ornaments.

We candidly profess that the species is not equal to *Odontoglossum vexillarium*, yet we are fully persuaded it will be liked much by amateurs, the more so if it shows a profusion of varieties. Another reason for loving it will be, that as far as human judgment goes it can never be expected to appear in quantity in the European market, as will be explained immediately. I placed in Mr. Harry Veitch's hands a wild inflorescence, giving evidence that the representation in *Xenia* is not exaggerated.

The discoverer of this plant is the gallant Orchidist hero, the late Joseph von Warszewicz, the Polish nobleman. He boasted of it as being one of his best discoveries; and what splendid things had he discovered at that lucky period, when there were so very many choice hunting-grounds unvisited by any one! We cannot expect nowadays to see reappear such lucky men as Joseph von Warszewicz and Thomas Lobb, though they may be far surpassed by more assiduous collectors for botanical purposes. Warszewicz declared, however, we had no hope ever to see this plant in Europe. It was, he said, exceedingly scarce, growing but at two places, and in very few specimens. The bulbs, he said, were so soft, that they always became rotten as soon as they descended to the level of the sea; and for a long, long time—twenty-two years are nowadays, in our time of excited, over-excited activity, an immense span of time—his prophecy proved to be well founded. Mr. Wallis himself, then M. Linden's keen champion, failed in its introduction. Now came Señor Endres, who observed the plant once more, though he was not too anxious to give the exact localities. His plants, though cultivated with his usual care (as if his babies), for a long while at a low altitude, arrived all dead in Europe except a single specimen, a little tiny fellow, which Messrs. Veitch used to grow in a 1-inch pot. All our hopes were concentrated in the little dwarf, who gave occasion to the expectation to see it in flowers in ten years, provided the development was a lucky one. This was our hope. Mr. Bateman, however, the father of the *Odontoglossums*, appears to have abnegated to the dwarfs all rights of individuality. Last April, in the preface to his splendid work on *Odontoglossums*, he said: "In this way whole importations have been lost, including, I am sorry to say, one or two cargoes of the exquisite

FIG. 50.—BUR OAK, RIFLE, WORCESTERSHIRE.

Odontoglossum Warszewiczii (figured in Reichenbach's *Xenia*), which still remains a desideratum."

And now, at length, the desideratum is within our reach, in full-grown individuals. Señor Endres, who loves the Orchids one might say more than himself—and he, as soon will be proved, made the richest collection of Orchids ever made by any one in the world—succeeded finally in bringing over a small lot alive, having taken the greatest possible trouble to tend them carefully on board: a most difficult task, and most so on board an English boat, where, it is well known, passengers are under stricter regulations than on board German or French boats. Having the satisfaction of seeing Señor Endres awhile, I asked him whether he could bring over a larger lot. He simply answered he would regard an order for a fifty or hundred a ridiculous, impossible thing, not to be fulfilled at the greatest expense. Since this gentleman knows the land so well, we may fully trust what he said. A plant has brought two inflorescences in the nursery of Messrs. Veitch, where the totality of the European colony of the plant may be seen.

The flowers, just as first flowers used to be, were nearly half as large as those of good wild specimens. There is no doubt they will improve; and Mr. Harry Veitch tells me that, when once alive in Europe, the plant appears not to be more difficult to manage than *O. vexillatum*.

I think it must be a great satisfaction for Messrs. Veitch that they have introduced to Europe both these celebrities—*Odontoglossum vexillarium*, that once so mysterious plant, whose habitat Mr. Wallis discovered when in the last state of exhaustion (may we never forget him in the history of that wonderful plant), and the old *Odontoglossum Warszewiczii*, so much desired since 1852. *H. G. Rehb. f.*

NOTES UPON OLD OAKS.

THE Oak (*Quercus Robur*) has been ever remarkable for its duration above all other British forest trees, and one of our poets has designated it as

"Lord of the woods, the long-surviving Oak!"

—an appellation that it well deserves. To what extent its longevity extends can only be judged of by those trees of enormous bulk that now remain extant, with any traditions that may exist concerning them. Walter Scott, in one of his novels, has alluded to gigantic Oaks "beneath which Roman legions may have marched;" and Gilpin says, with somewhat more precision, in his *Forest Scenery*, that "a few venerable Oaks in the New Forest chronicle upon their aged trunk ages before the Conquest." But such observations are rather too vague, being only probable guesses, and do not refer to particular trees that might be examined and measured. Considering the havoc made by the axe in past times, and the disafforestation of most of the ancient forests of the country, very few, if any, truly undecimated woods can now remain having trees that could certainly be considered coeval with the Saxon rule in England. There may be some in long-established parks where the timber has been scrupulously preserved, and the following extract from *Lysons' Bedfordshire* is curious with regard to the number of trees mentioned, which must be truly "patrician trees," as worded by Evelyn in his quaint *Sylva*, as the history of Lysons was published in 1806:—"A survey of Amphill Park, taken by order of Parliament in 1653, describes 287 trees as being hollow, and too much decayed for the use of the navy. These Oaks, thus saved from the axe, remain to the present day, and by their picturesque appearance contribute much to the ornament of the place." According to this statement there would appear to be a greater number of old Oaks at Amphill than anywhere else in Britain, if the number mentioned by Lysons are all still existing. He does not give the dimensions of any of them, but Loudon in his *Arboretum et Fruti-*

FIG. 51.—NEWLAND OAK, FOREST OF DEAN.

cedum Britannicum, mentions "the Leadon Oak in Amphil Park, so called from a large piece of lead having been fixed on it many years ago, is remarkable for having been one of the Oaks marked in a survey made of the park in the time of Cromwell, as being then too old for naval timber. It is 67 feet high, its trunk is 30 feet 6 inches in circumference, and the diameter of its head 85 feet." The species (or rather variety) is *Q. sessiliflora*. It is rather difficult to ascertain with certainty the age of trees of similar or greater dimensions to that of the Amphil Oaks, unless a tree has been associated with some historical event which gives it a standing place at that time; and if its dimensions were then known, a clue might be obtained as to its probable age. Various Oaks are mentioned by Loudon, presumed to have existed before the Norman Conquest; and Marshall, the author who has written on the planting and growth of forests, has gone so far as to "venture to infer that the existence of these truly venerable trees [Oaks] commenced some centuries prior to the era of Christianity." How long an Oak when reduced to a mere shell might possibly exist, in a spot secure from the rage of tempests, is dubious and open to conjecture, but probability would not carry its duration much beyond 1500 years. The oldest known Oak in England now existing would seem to be the Welfarthing Oak, in Norfolk, an inscription of which states it to be 70 feet in circumference at the extremities of the roots, and in the middle 40 feet, as taken in 1820. This Oak is now an arboreal ruin, with only a single branch of vitality, but "is said to have been an old Oak at the time of the Conquest." But though this may be probable, there is unfortunately no authority to support the supposition. The trunk of an Oak, in the branches of which Wallace and a number of his followers once sheltered themselves, as reported, yet exists near Stirling, and Dr. Lindley, presumed to be "the tree 700 years old." Dr. Lindley, in an article on "the age of trees in the *Penny Cyclopaedia*," says that "many other cases of Oaks of extreme old age are recorded, some of which have been estimated at 1500 or 1600 years." An estimate however, ought to be founded on correct data, and here observation is at fault as to the rate of growth in very old Oaks, it being only certainly known that every kind of exogenous tree diminishes its rate of growth after a certain age, the Oak in particular between the fortieth and sixtieth year. In the first century of its growth an Oak may attain a diameter of 3 feet, gradually diminishing its rate of increase after its fiftieth year, as shown by Dr. Lindley from an actual section of a tree sent to him from Stirling in 1855; and Professor De Candolle found that in an Oak of *Quercus sessiliflora* its increase in diameter, which was at the rate of 33 lines from ten to twenty years old, and 38 lines between thirty and forty years old, had at 350 years old diminished to 8 lines, while at 500 years old its annual increase would be almost imperceptible, or noted with extreme difficulty. It has been, therefore, suggested, that in very old Oaks an average increase of a line and a half in diameter might approximate very nearly to their actual age, and if this measurement be applied to the Cowthorpe Oak in Yorkshire, celebrated as one of the largest and oldest British Oaks, it would make it above 1600 years old, and the Winfarthing Oak in Norfolk would be nearly as old. The Amphil Oaks mentioned previously, the oldest may be put at 900 years old, while as they were aged hollow trees in 1653, appears to be a fair computation. As stating what may be considered as generally true with respect to the growth of the Oak, the old and well-known rhyme may be quoted—

"Three centuries it grows, three centuries stays,
And slowly three long centuries decays."

The Rev. A. G. H. Hollingsworth, in his *History of Stowmarket*, mentions a "Gospel Oak," in the park of Polstead Hall, Essex, which may take a place with the largest recorded British trees, though it has escaped the notice of Loudon in his *Biography of the Oak*. The describer states that "this earth-born giant is 43 feet in circumference, 4 feet from the ground, and the base slopes gradually outwards as the sides; the trunk is in the fifth year, 60 years old, which as they were aged hollow trees in 1653, appears to be a fair computation. As stating what may be considered as generally true with respect to the growth of the Oak, the old and well-known rhyme may be quoted—

"Three centuries it grows, three centuries stays,
And slowly three long centuries decays."

Most of these have been recorded in local or general histories, and I shall, therefore, only notice a few that have fallen under my own notice, and hitherto escaped description.

The largest Oak that I have seen and measured stands at Newland in Gloucestershire, within the bounds of the Forest of Dean (see fig. 57, p. 271), and is still vigorous, notwithstanding its great bulk. It rises almost direct from the ground, without throwing out any buttress roots that so many aged Oaks do, and

the measurement of its bole is, therefore, more exact and faithful than when taken from the extension of the roots, as is done in many recorded cases in the works of Gilpin, Strutt, and Loudon. I found the girth of this tree at the base to be 52 feet, and this is scarcely lessened up to the height of 12 feet, which is five grand primary branches spread out from the vast hollow bole, divaricating into more than fifteen secondary arms. Its horizontal spread is very considerable, so that it is not a lofty tree, not much exceeding 50 feet in height. Its great age, which can only be a matter for conjecture, is well indicated in its massive tessellated bark, which is more rugged than in any other antique Oak that has ever met my view.

One of the largest and oldest Oaks that Worcestershire, once covered with forests, can boast is a tree standing at Holt, in a meadow, not far from the river Severn, which bears the name of the Bonstags Oak, a corruption from Hoarstag, in allusion to the bleached, hoary, bare branches rising from its top, as seen in many old Oaks. It is a perfect specimen of the class that Shakespeare has described as existing in his time in the forest of Arden—

"Under an Oak, whose antique root peeps out
Upon the brook that brawls along this wood;

Whose gnar'd and spreading boughs were moss'd
With age,
And high top bald with dry antiquity."

This Oak spreads out at the base (see fig. 53, p. 275), but at 3 feet from the ground its girth is 34 feet. I have represented it in its winter aspect.

As the representative of the old class commonly called "Bur Oaks," that have been hacked and pollarded time out of mind, but, hollow and swollen at the base, present a picturesque aspect, yet with very scant appearance of vitality, I have sketched a hollow veteran unusually protruding from the base, a relic of the trees of the disforested Malvern Chase, within the parish of Castle Marton; see fig. 49, p. 270. It measures 40 feet in circumference round the extended base, and, though there is no memento to fix its age, I may be sure that it has withstood the worst of torays of the Red Earl of Gloucester, to whom Malvern Chase was granted by Edward I., when with hound and horn and his train of yeoman prickers, he pursued the deer and other quarry that then peopled the Chase and delighted the gaze of the eager hunters.

Though forest ground in England is scarcely more than a name at present, and the most remarkable Oaks are generally to be found in parks, where they have been allowed to enjoy a green old age and decay at the hands of the family residing at the Court or Hall has kept up the old name, as at Moccas Park, Herefordshire, famous for its Oaks, and Okeaver, in Derbyshire, where are many trees lifting to heaven their aged, hoary heads; yet the wanderer in out-of-the-way places may often find in the hedges of myriads of hollow ways, a few battered veteran Oaks that have been left here and there, and which, of course, unmercifully lopt, and unable to extend themselves above, have swollen into misshapen or grotesque forms, below abandoned relics of the forest that Celtic tribes once foraged in. Such a monstrous, seared, and ragged bole appears by the side of an old pathway at Ripple, Worcestershire, which is here depicted (see fig. 50, p. 271). It measures 36 feet round the base, but would measure more higher up, on account of the huge wens upon its bark. It is difficult to say how long it has stood in this ruinous state, but it must have been very long ago when it appeared in full leafage as a stately tree—and that many have seen it in person living in its glory has been marked, in his *Forest-Society*, that "it is through age that the Oak acquires its greatest beauty, which often continues increasing even into decay, if any proportion exists between the stem and the branches. When the branches rot away, and the forlorn trunk is left alone, the tree is in his decrepitude, the last stage of life, and all beauty is gone." But it may be truly said that if beauty is not apparent there is interest attachable to an old gnarled and even deformed Oak, which carries back the imagination to long past days, historical events, and perhaps heart-felt joys or sorrows endured under its boughs, even should it be as Cowper has said of the Yardley Oak,

"A quarry of stout spurs and knotted fangs,
Which, crook'd into a thousand windings, clasp
The stubborn soil, and hold the trunk erect."

Such a knotted and distorted Oak is enclosed, curiously enough, within the parish pond near Pershore, Worcestershire (see fig. 48, p. 270), and no doubt stood long in forest solitude before thus imprisoned.

The most curious denuded Oak that I have met with, and sketched a short time since, forming a singular extended mass of swollen wood, hard as a rock, is located on the bank of a deep old lane leading up the Sugar-Loaf Mountain, near Aberpenny, Monmouthshire (see fig. 47, p. 270). Swollen into a monstrous and a shape which carries back the imagination to defy any ordinary storm, it is certainly a dendrological curiosity. Of such a mass of timber that it may

yet take centuries to moulder away, it can well be said—

"Still stands the lone old forest tree,
Though past his leafy prime,
A type of England's past is he—
A tale of olden time.
He has seen her soldier for a thousand years
Around him rise and fall;
But well he serves his old age heirs,
And still survives them all."

Many more curious aged Oaks might have been depicted, but the few given have not been engraved before, and are, therefore, some additional contribution to what Loudon has denominated the "Biography of the Oak." Mere description, without representation, is imperfect and insufficient, for, as Strutt has remarked, in his *Sylvia Britannica*, with the true feeling of art, "Who can hear of Alfred's Oak or Chaucer's Oak, without regretting that not even an outline of them is in existence for fancy to fill up with the enthusiasms their names inspire." But, independently of all other considerations, trees afford such delightful individuality, joined with such exquisite variety of character, and bring with them so many charming and hallowed associations of liberty and peace, of rural enjoyment or contemplative solitude, of the sports of childhood or the meditations of old age—in short, of all that refresh or exalt the soul—that it is wonderful that they have not hitherto been more decided objects of interest to the painter and the amateur." Since Strutt wrote, however, his own spirited delineations of forest trees, as well as the laboured works of Loudon, Selby, and others, have given a spur to the study of old, as well as the planting of young, trees, and much information has been given on the subject at various times in the pages of the *Gardener's Chronicle*.

In connection with the Oak and the ancient Druidic times, when it was particularly honoured, the parasitical Mistletoe appeals to the imagination, from authors ever since the time of Pliny having associated it with the Oak, as venerated by the Druids when found growing upon that tree, and gathered with mystic ceremonies. Yet, in reality, the Mistletoe prefers to grow upon any other forest tree rather than the Oak, being now the pest of Apple orchards; and the utmost industry and research of Dr. Bull, of Hereford, who was anxious to collect notices of all the Mistletoe-Oaks in Britain, could only find or hear of eleven, to which have been subsequently added one mentioned by Mr. Dovaston, as seen by him in Anglesea, and two more recently detected in Worcestershire. Strange, however, to say, all these are young, flourishing trees, less than 200 years old, and I have never seen Mistletoe growing on any aged Oak; either, therefore, the venerated Oaks having Mistletoe upon them have been all felled, or the Mistletoe once upon them has been cut away. This, however, does not militate against the ancient Oaks now remaining as not having existed in the Druidic period, because the parasite was then considered as a rare inhabitant of the Oak, and a careful search has to be made after it. Though the use of the Mistletoe as an adornment for the hall or kitchen at Christmas is still kept up in the country to an extent scarcely credible—of course only as an excuse and license for frolic and fun—Mistletoe from any tree being acceptable, and the Worcestershire and Herefordshire orchards furnishing loads to be sent northward, where the Mistletoe is very rare or unknown in a growing state—yet a superstition, no doubt derivable from ancient times, still exists in rural districts among the old people, that Mistletoe growing upon the Oak is efficacious for particular disorders both in man and cattle, and when met with is gathered accordingly. Indeed, an old friend of mine, familiar with rural pursuits, customs, and traditions, has assured me that he once knew an Oak having Mistletoe upon it, which had been entirely stripped of the parasitical plant for its supposed medicinal efficacy. If this has occurred in other places, it may, in some degree, account for Mistletoe being so rarely met with upon the Oak. *Edwin Lees, F.L.S., Green Hill Summit, Worcester.*

ARDROSS CASTLE,

THE residence of Alexander Matheson, Esq., M.P., is situated in Ross-shire, about 30 miles north from Inverness by rail, and 7 miles north-west from the pretty village of Alness on the Highland Railway. It is approached from the high road leading from Dingwall to Bonar Bridge. In days long gone by it was the residence and fastness of the great clan Ross. This property was purchased by its present proprietor from the Duke of Sutherland in 1846, and since then most extensive and sweeping improvements have been carried on most successfully, as will be seen by what follows. Since the property came into the possession of Mr. Matheson, 5000 acres of plantations have been laid down, over 4000 acres of land reclaimed, and

upwards of 60 miles of private roads made. The new plantations consist principally of Scotch Fir, with a good portion of the hardier sorts of forest trees intermixed.

I may here mention that all the alterations and improvements effected on those vast estates were carried out by Mr. William Mackenzie, Mr. Matheson's factor, with a perseverance and originality of conception that is most creditable to him, everything seems to have been so thoroughly done. The half-and-half style of doing things seems to have had no favour with Mr. Mackenzie. His system was to have trenching, dyke building, road-making, draining, and the erecting of farm steadings all going on simultaneously. To execute such works cheaply and effectively they must be carried on together, for, as he puts it, to trench the land one season, drain it the next, clear it the following, laying down the stones somewhere or anywhere, from which they must be re-carried when dyke-building begins, is a most expensive and unprofitable way of doing things. In the course of nine years 2600 acres of land have been reclaimed by means of trenching, draining, liming, &c., 67 miles of dykes, and 11 miles of wire-fencing erected, 23 miles of roads made, and 3000 acres of ground enclosed and planted. It is with pleasure I observe that during all those

the old baronial style, with a slight mixture of modern architecture, and is most elaborately furnished. It is pleasantly situated on an eminence overhanging the Alness River. The Castle, as seen from the main road, has a very imposing appearance, standing out in strong contrast with the lofty dark mountains of Ross-shire, which form the background, and is much heightened by its position at the apex of the glen. The green undulating fields which stretch between the Castle and the road give at a glance some idea of the magnitude of the improvements effected here. The pleasure-grounds extend to upwards of 700 acres, with the Alness River winding its way through the middle of them. The walks through the pleasure-grounds are upwards of 14 miles in length, their width varying from 5 to 6 feet. They have been all properly bottomed with stones, and finely covered over with gravel. The walks are chiefly along the Alness River and Tolly Barn. In the latter there is a pretty waterfall of about 50 feet in height, and well worthy of a visit at any time. The grounds are open to the public, and it is very gratifying to notice that there has never been anything like wanton mischief perpetrated. In some of the young plantations, where the herbage is too luxuriant, the poor people on the estate who keep a cow, horse, or pig are allowed to cut the grass for their own use; and the young trees are as carefully preserved, and everything done as neatly as if under the eye of a forester. In this instance Mr. Matheson has found, by his kind-

75 feet long by 9 feet broad. In this I found a very nice healthy collection of Ferns, necessarily in a small state, as they are mostly used for table decoration; also a large number of spring-flowering plants. Orchard-house, 30 feet by 15 feet, with Peaches on the back wall; Pears, Peaches, &c., in pots, very heavy crops. Greenhouse, ridge-and-furrow roofed, a handsome erection, principally filled with soft-wooded plants, amongst which there were some grand Cockscombs and a few well managed plants of *Ericas* and *Azaleas*. Vinery, 30 feet by 15 feet: very heavy crop in this house, principally Black Hamburgs and Alicantes. Vinery, 30 by 15 feet: the sorts in this house are Muscats, Mrs. Pince's, and Lady Downes; very heavy crop all over the house.

The flower-garden proper lies between the Castle and the kitchen garden. On the outside of the latter, on nearly an angle of 45°, there is a bank about 300 feet long. This is ribboned its entire length, and faces the flower garden, consisting of the following:—First row, at bottom, *Viola Princess Teck*; second, *Viola Perfection*; third, *Cerastium*, in two rows, with small circles of scarlet and dots of *Dell's Black Beet* at intervals; fourth, *Perilla*; fifth, scarlet *Pelargonium*; sixth, *Calceolaria Golden Gem*; seventh, *Hollyhocks* and *Dahlias* alternately. The flower garden is of rather large extent, although, from its high altitude, bedding-out is on rather a limited scale. Several of the figures are filled with *Rhododendrons* of the finer sorts. In one or two beds I saw plants of the rarer

FIG. 52.—ADROSS CASTLE, ROSS-SHIRE, THE SEAT OF MR. ALEXANDER MATHESON, M.P.

alterations it was the express wish of Mr. Matheson that not one of the old tenants should leave the property. He was anxious that all should be provided with good farms and better houses than they possessed before. On the whole of Mr. Matheson's extensive estates there has been no clearing-out of old inhabitants to make room for improvements, &c. It has been found perfectly compatible to carry out those alterations without having to remove a single tenant, or to expatriate a peasantry which any country might be proud of. I may here remark that when Mr. Matheson purchased Adross, in 1846, the population on the estate amounted only to 109, while the number now is nearly 500. In 1846 there were eleven bachelors out of nineteen tenants, now there are only three out of thirty-seven. These facts speak cheerfully of the happy connection between agricultural improvements and the increase of a comfortable and contented peasantry. It is gratifying to hear of hundreds of quarters of grain and scores of well-fattened bullocks and sheep (both of which compare favourably with any in the district) being exported from a glen that only a few years ago was not able to supply its inhabitants, and to see the busy scene of human activity that everywhere prevails. Improvements still go on, and are to be continued till all that can be reclaimed is completed. Mr. Matheson has about 1200 acres of arable land in his own hands, 200 of which form a depastured lawn, and 200 are annually let as grass parks. The remaining 800 acres form two farms of equal size, upon which the five-course shift system is carried out.

Adross Castle is a noble pile of modern erection, in

ness and generosity to these poor people, the old saying verified—"Use the public well, and there is no fear of the public." Adross may be said to be enclosed with mountains. To the south is the finely-wooded hill of Fyris, with its singular cairn of stones on the top, and to the east the view is intercepted by a detached knoll or hill of that enormous deposit of red sandstone which crops out in bold precipices towards the Dornoch Firth. To the south-west are seen the beautifully wooded hills of Novar, and to the west Ben Wyvis (3720 feet in height) rears its snow-capped brow far above the intervening mountains.

Mrs. Matheson takes special interest in the well-being and education of the children on this vast estate. The number attending the day school averages about 140; and many of those children who received the first rudiments of their education in these schools have carried first honours in our universities. The kitchen garden lies to the west of the Castle, and is about 2½ acres in extent, surrounded by a most substantial brick wall flue-heated. It is approached from the Castle by a walk 8 feet broad, which passes through the southern end of the flower garden, curving gently to the right till the kitchen garden is reached, which it enters by a rather high flight of steps and handsome gateway. Here I found the wall covered with well managed trees of all the most approved sorts of Apples, Pears, and Plums, but the crops on these are rather precarious, as frost very often in spring comes here just when it is not wanted; however, all sorts of small fruits are had in abundance.

The glass erections are of considerable extent. Entering from the west the first is an excellent pit,

sorts of succulents had been used with good effect. There was one plant used rather extensively for bedding purposes, and of which I would advise those in high and wet districts to make use, and that is the double dark variety of *Senecio elegans*. I saw two beds of this at Adross in the beginning of October one sheet of flower. At a little distance I think they were the most telling beds I ever saw. Mr. Massey, Mr. Matheson's head gardener here, and who most creditably fills his present position, informs me that heavy rains have no effect in diminishing their beauty. To the east of the Castle the grounds assume more of the appearance of a shrubbery, with large spaces of kept ground intervening. In this quarter there is a very fine sheet of water, surrounded by a neat iron railing and stone base, with a handsome fountain in the centre. One little drawback to Adross Castle when seen from a distance is, the want of a few grand old trees in its immediate neighbourhood. Such companions the Castle does not enjoy; however, the young woods in the surroundings are making rapid progress. It requires but little help from the imagination to understand what the scenic effect must be by-and-by, as both clumps and individual trees of the finest hardy sorts of *Coniferae* have been most judiciously planted in all directions, among which I noticed the following as very superior, and making extraordinary growth for their age:—*Picea Pinnapo*, *Cedrus atlantica*, *Cupressus Lawsoniana*, and *Picea nobilis*, 30 feet—beautiful specimen with cones. The average height of the arable land above the sea is 550 feet. *John Downie, West Coates, Edinburgh.*

THE WEEPING WILLOW.

WHEN was the Weeping Willow introduced into England? The well-known and popularly-believed story, which attributes its introduction to the poet Pope, seems to have originated in a paragraph in the *St. James's Chronicle* of 1801, which runs as follows:—"The famous and admired Weeping Willow, planted by Pope which has lately been felled to the ground, came from Spain, as a present to the late Lady Suffolk. Mr. Pope was in company when the covering was taken off; he observed that the pieces of stick appeared as if they had some vegetation, and added, 'perhaps they may produce something we have not in England.' Under this idea he planted it in his garden, and it produced the Willow tree that has given birth to so many others." According to Plukenet, however, as quoted in the *Hortus Kewensis*, it was cultivated in 1692 in the Royal Garden at Hampton Court; but on this Mr. Dillwyn, in the *Hortus Collinsonianus*, has the following note:—"In the first edition of the *Hortus Kewensis*, on the authority of L'Heritier's *Sertium Anglicanum*, this species is said to have been first introduced in 1730, but the date in the second edition has been altered to 1692, from a reliance on Plukenet's l. 173. f. 5, which, on examination of the original specimen in the British Museum, I found to be an entirely different plant. By the *Catalogus Plantarum*, published by a society of gardeners in 1739, it appears then to have been cultivated in our nurseries." If such were the case, not only would the tradition which connects Pope with its introduction disappear, but Collinson's account of its first appearance in England would also be incorrect. The last-named writer says: "Mr. Vernon, Turkey merchant at Aleppo, transplanted the Weeping Willow from the River Euphrates, as brought in with him to England, and planted it at his seat at Twickenham Park, where I saw it growing, anno 1745. This is the original of all the Willows in our gardens. In July, 1765, I measured a Weeping Willow at Mr. Snelling's, at Godalming, Surrey, of fifteen years' standing; it measured 6 feet in girth, or 2 feet in diameter, and the height in proportion." B. M.

THE STORING OF POTATOS.

THE recent spell of severe frost found out the weak points of the Potato store, and many are the complaints of those who, not being forwarder, were not forearmed. Of all our winter store vegetables none are so liable to damage from frost as the Potato, as when once bitten it is not merely useless but absolutely obnoxious; moreover where the stocks of Potatos are small, the want of a little forethought may occasion considerable deprivation for the present and a heavy loss in the future. Probably the greatest sufferers by the frost have been those who, having a few bushels in store, have placed them somewhat carelessly, either in an exposed outhouse, or in some cold attic, little thinking that the frost would penetrate therein, but so^d of frost means mischief, as many have found to their cost. Thus wisdom has been gained at considerable expense.

Now in all houses where it is the practice to keep a few bushels of Potatos in store for consumption, there should be provided either a large, stout, close-jointed case or else nice dry flour-barrels, as in such depots as these Potatos are kept dry, clean, and well together; the tubers also do not come into contact with the external wall, and if the room be dry, cooled, and have only one window, it will require an extraordinary frost to penetrate to the Potatos through the tubs or boxes, especially if any old pieces of carpet or other covering be thrown over them when the weather is usually severe. Where there are quantities of several varieties to be stored and the space at command be limited, I know of no better mode of storing than by placing the respective sorts in long shallow boxes, say 4 feet by 1½ foot and 9 inches in depth. These will each hold about 2 bushels, and there are these particular advantages attached to this mode of storing—that the tubers are easily looked over, and any precocious shoots rubbed off. They can be so exposed to the light and air during fair weather as to harden the growth, if wanted for seed; and when very severe weather ensues they can be built up in a block, one box on another, so that each box partially protects its fellow, and an old carpet or a mat or two will fully protect the whole. If, also, the name of each sort be written on a card, and fixed on the box containing it by means of a stout tack, no possible blunder or mishap as to names can occur. Potatos so stored are also less liable to damage by moving than when placed together in bulk. With many sorts we find, as the winter advances, that they have about them many black spots, that mar their table usefulness. This comes mainly from the bruising they get by frequent movings, an evil that it is well to avoid. Those who have good dry cellars are not in danger of

having their Potatos frozen, but there is the possible evil surrounding them, that the milder and more even temperature usually existing in a cellar will induce an early growth of the tubers, which necessitates a constant looking over of the stock, and sometimes great waste. Of course, if the stock be a limited one, and the consumption regular and large, there will not be time sufficient for mischief to be produced. It is when the winter's stock is so stored that harm is done. Potatos when lifted should always be thoroughly dried before storing, and be as free from soil as possible. It is also well to make two sizes of the stock, and housekeepers will do well to see that when a dish of mashed Potatos are required the smaller selection be used, the larger ones being saved for cooking whole. If some are needed for seed the next spring, a portion of these second size tubers should be saved for that purpose. Of course I assume that all tubers not larger than a Walnut have been previously set aside for the pigs or poultry. By putting these assorted tubers into the boxes I have described, it will be found that when the first of the middings have been consumed the remainder will make a good seed sample, and being this in bulk will get plenty of light and air to mature them. The storing of Potatos in pits—at all times a bad practice—is doubly so when we are visited by a month's continuous frost. To tap a pit under such conditions is difficult, if not impossible, and if there be not a good store in the house it would be exceedingly awkward. If the Potato cannot have a frost-tight house specially devoted to it, at least it is best to have plenty of tubs and boxes at hand in which they may be stored, and selected and collected until the winter is past. It must not be forgotten that if the store has a dry floor and the atmosphere be dry also, much less mischief will result than if the air be damp. It is wise also when a thaw follows severe frost to allow a few days to elapse before the external air is admitted, as the sweating so common after a thaw will not be so evident. In any case, whether the Potato stock be large or small, it is well to exercise discretion in time, and not allow Jack Frost to clutch them in his cold embrace. A. D.

INVERLOCHY CASTLE.

THE seat of the Right Hon. Lord Arbuthnot, Inverloch Castle, lies about 3 miles north-east of Fort William, and about the same distance off Ben Nevis, which is 4406 feet high, and is allowed to be the highest mountain in Scotland. As seen from a distance, Inverloch Castle has a very imposing and commanding appearance. Its internal arrangements and decorations are in good keeping with its imposing exterior. Its site has been well chosen. Its towers and turrets meet the eye of the tourist long before it is reached. A fine view of it is also had from the Caledonian Canal, west from Benevie. The Castle stands on three grass terraces, and to the south-west a fine site has been selected for a flower-garden of rather large dimensions. About a mile to the south-east of the present Castle stands the old Castle of Inverloch, a place of undoubted antiquity. This Castle stands alone in its solitary magnificence, having outlived all record of its own builder and age.

"Who raised this wondrous pile?" we asked and sighed, And, in answer for a reply, but none replied. Time passed us by, and answered with a frown, "Whoever raised it, I will put it down!"

Its towers and ramparts are built of solid masonry, 9 feet thick, and the whole building covers about 1600 yards. From the name of one of the towers it probably was occupied by Edward I. of England and the Comyn, who were then in the zenith of their power, and with equal probability by the Thanes of Lochabar, particularly by Banquo, the predecessor of the Royal family of Stuart. Near this place, on February 2, 1685, a great battle was fought between a Jacobite army, under the celebrated Marquis of Montrose, and a mixed Highland and Lowland army, under the Marquis of Argyll, ending in the complete overthrow of the latter. The glass erections here are rather extensive, in all extending to 134 feet, but in a short time they are to be extended to 215 feet. There is a Peach house, 38 by 15 feet, with curved trelliswork in front; and in which the trees are young and very promising. In this house there was a splendid crop of Tomatos in pots, Trophy being the variety. Early vinery, 58 by 15 feet, fine crop; late vinery, 34 by 15 feet, splendid crop, both in bunch and berry, Foster's Seedling especially being very superior. In the stove, which measures 24 by 15 feet, I found well managed plants of the following:—*Cissus discolor*, *Allamanda Schottii*, *Fittionias*, *Draacenas*, *Crotons* of sorts, and a few remarkably fine plants of *Caladiums*, among which were very conspicuous Princess Alexandra, Imperatrice Eugénie, Reine Victoria, Napoléon III., Madame Dombrain, Marquise de Caux, Triomphe de l'Exposition, a few of the finest Salicagnellas and Ferns of the newer

varieties, and a small but very select collection of miscellaneous plants, principally used for table decoration purposes. In this house also there are a number of plants of Melons grown in pots in two varieties, viz., Cox's Golden Gem, and a netted green-flesh of Mr. Dow's own raising, with a fine crop on it, each averaging 4 to 5 lb. in weight. The seedling Gloxinias here are very fine.

The kitchen garden proper is about 3 acres in extent, and is surrounded by an excellent stone wall. As there is no flower garden outside as yet, the principal walks in the kitchen garden are, as a compensation, ribboned on each side, which in summer gives the place a very gay appearance. The ordinary kitchen garden crops here are good (soil peaty loam), considering the climate. Early Peas and Potatos are generally had about the middle of June, although on the north side of Ben Nevis, 2 miles off, snow lies all the year round. Small fruits are generally very abundant. Mr. Dow, his lordship's head gardener here, is a thorough enthusiast in his profession, and everything that is under his management reflects great credit on him. The woods on the estate are very considerable, mostly in a young state, very healthy and thriving, and will add greatly to the beauty of the place in a few years. The principal buildings here are of large extent, in two squares, and built on the most approved principles. The crops are generally the finest in the neighbourhood. His lordship takes great interest in farming operations, rearing of cattle, improvement of stock, &c., and Lady Arbuthnot is equally interested in the well-being of both old and young on the estate. *John Downie, West Coates, Edinburgh.*

Foreign Correspondence.

HORTICULTURAL AND BOTANIC GARDENS IN INDIA.—Reports frequently reach us from the several horticultural societies of India, from which we are enabled to indicate to our readers from time to time the progress of horticulture in our great Eastern Empire. The good effected by these societies, from experiments on the introduction and acclimatisation of new plants of commercial value, is well known, besides the more general cultivation by the natives of such well known vegetables as Potatos, Peas, Cauliflowers, &c. In a recent report on the general progress of India some account of the various agricultural and horticultural societies is given, from which we gather the following facts. The oldest society, the Agricultural and Horticultural Society of India, was established by Dr. Carey in 1820. It imported fruit trees, offered prizes for essays on the cultivation of Indigo and Sugar, and on the acclimatisation of foreign plants. At one time it had a farm of 160 acres near Calcutta, which was, however, given up. It now has an income of £3000 a year, including a Government donation of £500.

The Agri-Horticultural Society of Bombay was founded in 1830, and in the following year an annual grant of £300 was granted by the Government. In 1835 the Society bought a piece of land at Surl and laid it out as a garden, and in 1853 they established an experimental garden at Kirki, where, down to 1861, experiments were carried on at a loss of expenditure over receipts of £1126; but the only experiments of which a record exists are those conducted by Dr. Birdwood with Cotton and the Sorghum or Great Millet (Impeche). In his report, dated May, 1861, Dr. Birdwood makes the following remarks with reference to the Impeche experiments:—

"I deeply regret the poor results of these experiments with Impeche at Kirki, for I anticipated their success with pleasure. The rapid decay of the manufactures of India invests with the highest importance every attempt to increase the number of its exchangeable raw products. The most trifling articles of native workmanship are being replaced in the bazaars by similar wares from Europe; are being driven from the home markets by the sheer force of Saxon production. Our manufactures, therefore, must be directed to counterbalance the decline in manufactures by a proportionate development of the agricultural wealth of the country; new raw exchangeable products must supply the place of each manufacture as it in succession falls, if the prosperity of India is to be sustained under the direction of the present and anticipated intercourse with Western civilisation."

The Bombay Society was reconstituted through the exertions of Dr. Birdwood, in 1859. When he became its honorary secretary it had only twenty-nine members, and an income from all sources of £500 a year. When he left, in 1868, the members numbered 153, with a fixed income of £1235, besides special subscriptions. Dr. Birdwood's great work was the establishment of the Victoria Gardens and Museum at Bombay, including a complete botanical garden. The botanical garden was composed of exotic plants first introduced by Dr. Birdwood; of naturalised exotics, such as the Cocoa-nut, Tobacco, and many other plants, and of indigenous plants. A sum amounting to £36,000 was raised by public subscription entirely through Dr. Birdwood's exertions, for the laying out and decoration of the

Victoria Gardens. It is much to be regretted that, after Dr. Birdwood left India, the botanical garden should have been destroyed, and that the Society should not have published a single report.

The Agri-Horticultural Society of Lahore was founded in 1851, for the collection of information respecting agricultural operations, to institute experiments, and to supply members with seeds and plants. It has initiated experimental cultivation of the better kinds of Flax and of silk; has introduced the Olive, the Chinese Tallow-tree, and the Australian Gum-tree, has established a school of gardeners, and has distributed seeds and plants.

The Government gardens at Calcutta, Saharunpore, Madras, Bangalore, Lucknow, and Utkalamund, have also done most valuable service in the introduction and distribution of new plants and seeds. During 1872-73 the Calcutta garden sent out 8620 packets of seeds, 2302 plants in cases, and 2891 in pots. In the same year there were 3706 packets of seeds, 4088 fruit and other trees, and 6142 flowering plants, distributed from the Utkalamund garden in the Madras Presidency. At the Saharunpore gardens, in the North-west Provinces, 37,593 fruit, 156,766 timber trees and flowering shrubs, and 530 parcels of seeds were distributed during 1872-73, showing a considerable increase over the previous year. As many as

than I have in the birds which make their nest thereon, and therefore, if another lives them, he shall be the proprietor; but a swarm which flies from and out of my hive are mine so long as I can keep them in sight and have power to pursue them, and in these circumstances no one else is entitled to take them."

"Hence the origin among villagers of pursuing a swarm with the clamour of pans and fire-irons, not for the benefit of the bee, *quid* bee, but in order to inform others that the followers are the possessors of the swarm.

"It is easy to imagine that now some villagers may (confounding cause and effect) assert that the sound assists the operations of the bees or those of their hive. *Alfred George Renshaw, Doctor's Commons, London.*"

Notices of Books.

THE February number of the *Geographical Magazine* contains several articles of considerable interest to horticulturists. Among them we may cite an important and very readable article on "Disco Bay, Greenland," from the pen of Dr. K. Brown, and which is of special interest in connection with the

In an amusing article, entitled "Some Unscientific Notes on the History of Plants," Colonel Yule alludes to the curious mistakes made sometimes by people who ought to know better than make such hasty assumptions. One instance of this is given in the alleged representation of the Custard Apple, Anona, on the walls of caves of the 7th or 8th century in India, the truth being that the Anona is a native of the West Indies, which were not discovered at the time alluded to. In a similar way authors have stated that certain representations on the Assyrian marbles were those of the Pine-apple (Ananas), also of American origin. Colonel Yule throws out the suggestion that the European Poplar (*populus*, *pappel*) is etymologically connected with the *pippala* or *pippul* of India, the *Ficus religiosa*, the leaves of which have a strong superficial resemblance to those of the Black Italian or Lombardy Poplar. Colonel Yule also cites a curious passage relating to the Jack fruit, *Artocarpus*, "which looks like a sheep's stomach stuffed and made into a haggis. . . . The fruit is very adhesive; on account of this adhesive quality, many rub the mouth with oil before eating them. . . . They grow not only from the branches and trunk of the tree, but even from its root. You would say that the tree was all hung round with haggises!"

— We have before us the parts of the *Floral Magazine* for January and February respectively. Tydea Madame Heine is a very handsome Gesnerad. Two handsome Japanese *Chrysanthemums*—Gold Thread and Cossack—occupy another plate. The best of these Japanese *Chrysanthemums* make splendid subjects for conservatory decoration, and we have little doubt that the ragged, untidy look which some of them have may be improved by our patient florists. *Bollea Patini* is one of the most remarkable of recently introduced Orchids, and was described in our columns July 11, 1874. *Hemathus Rooperi* is very striking but devoid of elegance. *Masdevallia Chimera* (true) is decidedly one of the most singular even among the eccentric race to which it belongs. *M. nycteria* is almost equally so. In reference to this plate we may ask the artist whether he considers the flower-pot adds to the beauty of his plate? *Bertolonia superbissima* is a splendid Melastomad, with ovate leaves, sprinkled above with crimson spots, and of a fine rich claret colour on the under surface. It appears that the ladies have christened the plant as the Jewel plant, and not inaptly. *Antheicum variegatum* is a handsome variegated plant, very similar in general appearance to *Pandanus Veitchii*, but destitute of marginal spines.

— The twelfth and last part of Mr. Jennings' work, entitled *Orchids and How to Grow Them in India and other Tropical Climates* (Reeve), has been lately issued. The plates, which are from the pencil of Mr. Burbidge, are a great improvement upon the earlier ones. In the present number are figured *Cattleya labiata*, the true *Vanda insignis*, *Pleione lagenaria* and *præcox*, and *Calanthe Veitchii*. The work as now completed is dedicated to Dr. Hooker, and if it does not quite fulfil the expectations that were raised concerning it, the fault is not to be attributed wholly to the work itself, which is well calculated as a whole to excite an interest in the Orchid culture in India. It is always a matter of regret when books of this character, got up at considerable expenditure, pains and artistic talent, are allowed to lose half their value by the absence of scientific information. As it is, for scientific purposes this handsome volume is of little worth.

— *Quelques mots sur la Théorie Algolichénique*, par H. A. Weddell. In this communication to the Institute of France, M. Weddell fully adopts the notion of Schwendener and of Bornet as to the gonidia of lichens being really algae, which the lichen annexes in order to make them contribute to its nutrition, and he quotes in support of this opinion the observations of Professor Gibelli communicated to the Botanical Congress at Florence last spring. According to M. Gibelli, zoospores have been seen by himself and other witnesses on many occasions to be developed in the gonidia of *Lecanora subfusca* while still contained within the thallus. M. Gibelli has also himself cultivated the gonidia of *Opegrapha varia*, and, after some time, he had the satisfaction of seeing the gonidia develop into magnificent *Chrooclepus*, which developed zoosporangia and zoospores. Thus, then, the evidence in support of the somewhat *hæretic* notion as to the nature of the green masses in the interior of the tissues of lichens is receiving important accessions, and it is quite evident that the matter cannot be dismissed without full examination.

— We have received a copy of the second edition of M. Spruyt's *Le Jardin Potager Complet*, an excellent work on kitchen gardening as practised in Belgium, to which we shall probably refer at greater length on another occasion; also a list of seeds offered for exchange by the St. Petersburg Botanic Garden, and entitled *Delictus seminum que Hortus Botanicus Imperialis Petropolitans pro mutua commutatione offert*.

FIG. 53.—BOARSTAG OAK, NEAR HOLT, WORCESTERSHIRE (34 FT. GIRTH).

4½ tons of seeds were supplied to the Canal Department. Potatoes have become one of the great food staples of the country. They are extensively grown in Kumaon, Garwhal, Kangra, Dehra, as well as on the plains in Saharunpore, Mirat, Campwore, Bulandshahr, and Fathigarh. It is recommended that a small quantity of fresh seed Potatoes should be annually imported from Europe, to prevent degeneration by frequent renewal. E.

Apiary.

We take the following interesting extract, relating to the swarming of bees, from a letter in *Nature*:—

"With regard to swarming bees by heating the warning-pans, Sir John Lubbock thought there was nothing in it, but that it was an idea which had got possession of some people in the same way as many savage tribes believed that, by making hideous noises during the eclipse of the moon, they could frighten away the evil spirit which held her. Sir John Lubbock would appear to have overlooked the fact that this is a practice arising from the peculiar ownership of which, under English law, bees are the subject.

"Bees are *ferre natura*, but when hived and reclaimed, a man may have a qualified property in them, by the law of Nature as well as by the civil law." (*Puff. c. iv. c. b. s. 5; Inst. ii. l. 14*) "Though a swarm," says Blackstone, "lights upon my tree, I have no more property in them till I have hived them

proposed Arctic Expedition. The climate of this deleterious region may be inferred from the circumstance that the mean temperature of the winter is 3° F., that of spring 19.9° F., of summer 43.1°, of autumn 24.1°. Nevertheless, the flora is, all things considered, rather a luxuriant one. At some future time we may possibly find room to insert Dr. Brown's notes on this subject; meanwhile we may add that Sequoias, like the Redwood and the Wellingtonias of California, once existed in Greenland, as also *Tujas* and *Salisburias*. Magnolias, Sassafras, Diospyros, and other American types once existed there, when the climate must have been wonderfully different from what it is now. The account of the Nicobar Islands, in the Bay of Bengal, by M. de Rœpstorff, furnishes an interesting summary of our knowledge of our last new colony. The islands are of course tropical, and at present very unhealthy, but by clearing the jungle in the vicinity of the settlements, and draining the Mangrove swamps, it is confidently expected that the sanitary condition will be materially improved. The natives live in huts raised above the swamps on piles, as was the case with the lake dwellers of Switzerland. Fish and Pandanus bread constitute their chief food. The account of their manners and customs, as told by the writer, is very interesting. Arrack and other abominations derived from the white men are producing the usual results, so that the Nicobarians are destined to speedy obliteration. On the other hand, M. de Rœpstorff speaks very hopefully of the prospects of the British colony just established.

HORTICULTURAL EXHIBITIONS, 1875.

MARCH.

- 10 and 11.—Leeds Horticultural Gardens Company. Spring Flower Show. Sec. and Manager, James Birbeck, 103, Hyde Park Road, Leeds.
- 16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.
- 17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 24.—Glasgow and West of Scotland Horticultural Society. Spring Exhibition. Sec., F. G. Dougall, 167, Canning Street, Glasgow.
- 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

APRIL.

- 4.—Special Exhibition of the Royal Horticultural Society of Antwerp.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 22.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Baile, 28, Westland Row, Dublin.
- 27.—Manchester Botanical and Horticultural Society. Exhibition of Auriculas, &c., in the Town Hall. Manager, Bruce Findlay.
- 28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

MAY.

- 1 to 24.—Royal Botanic Society, Regent's Park. Special Exhibition of Clematis, by Mr. G. Jackson.
- 12.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Pot Rose Show.
- 14 to 21.—Manchester Botanical and Horticultural Society's Annual National Exhibition, at the Garden, Old Trafford. Manager, Bruce Findlay.
- 17 and 18.—Halifax Floral and Horticultural Society's Annual Exhibition. Sec., Mr. Leonard Kershaw, 20, Gladstone Road, West Hill Park.
- 20.—Royal Horticultural Society of Ireland. Early Summer Exhibition. Sec., A. Baile, 28, Westland Row, Dublin.
- 23.—Crystal Palace Great Flower Show. Sec., F. W. Wilson.
- 26.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
- 26.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 27, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- MONDAY, Mar. 1. Meeting of the Entomological Society of London.
- TUESDAY, Mar. 2. Sale of a Consignment of Tree Ferns, Liliiums, &c., by Protheroe & Morris. Meeting of the Hort. and Ficoons, at Stevens' Rooms.
- WEDNESDAY, Mar. 3. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 2 P.M.; General Meeting, at 8 P.M.
- THURSDAY, Mar. 4. Sale of Hardy Trees and Shrubs, Roses, Herbaceous Plants, Gladioli, &c., at Stevens' Rooms.
- Meeting of the Linnean Society, at 8 P.M.
- FRIDAY, Mar. 5. Sale of 500 Bulbs of Liliun auratum, at Stevens' Rooms.
- SATURDAY, Mar. 6. Sale of 500 Lots of Shrubs, Roses, Fruit Trees, &c., by Protheroe & Morris, at Stevens' Rooms.

CONTINUING our remarks on landscape gardening, we now have to consider that most important element of the subject—the form of trees. It must have been remarked that there is a PECULIAR CHARACTER ABOUT EVERY TREE, that may be occasionally useful for a particular purpose. We all know the effect of the lithe and pendulous branches of the Weeping Willow. As a single tree the Birch is generally too light for an agreeable effect, but place it in composition with heavier foliage, let it hang from the edge of a group, and it will fringe it delightfully. Again, if two or three trees of rigid character are placed on the fore or mid ground, where a mass is not required, add a Birch, and what appeared stiff and formal is instantly rendered firm and beautiful by the contrast; nor is this produced by form alone—the effect of colour, of light and shade, is equally enhanced. How often must this have been remarked in the case of the Copper Beech tree; when in shade it appears almost black, yet the detached boughs, with a light behind them, have a scarlet tinge. As to the Ash, it is a mistake to make a group of these trees only; one or two in a mass of Sycamore, Plane, or Lime trees produce a very beautiful and brilliant effect, but, when viewed singly, their foliage is thin and poor; and this, again, proves that massing is generally a far more advantageous disposition than the line, avenue, or dotted manner of planting, for in the latter

mode the light falls equally upon each tree, and then if it be one, like the Ash, of thin foliage, it becomes of no character, and if of a dense foliage, each tree, if of the same species, must look like its neighbour. Where, however, many are grouped together, the shade of the broad Sycamore admirably sets off the cut and divided leaves of the Ash, which, towering above and admitting the light through, causes the dark masses of the Sycamore below to become of a deeper tinge. Besides it is well known that the same kind of tree assumes generally the same figure as to its top; thus the Lombardy Poplar is always spiral, the Oak branching, the Cedar of Lebanon horizontal, &c. Now, where they are not allowed to group there must be a monotony of aspect, and where the trees are of a round-headed character, this produces an effect which is commonly and happily designated moped-headed.

Speaking of the Lombardy Poplar it must be said that no tree has so sadly treated since its introduction. Naturally a stiff-growing tree, and affording in itself but little diversity of character, its native rigidity has been increased by planting it in single files or rows, where it can harmonise with nothing. The same remark applies to the evergreen Cypress in Italy. Of all things the straight line of a tree that is naturally thin in itself is the least likely to produce an harmonious effect out of its own material. Had a few of them been judiciously planted amongst other trees, as is done, for instance, in a belt facing the Hounslow Road at Spring Grove, their tapering heads would have been seen towering above their spreading neighbours, and each would have derived consequence; but, so convinced are the public that a straight line of any perpendicular-growing tree is not elegant, that they will rarely allow one to be planted where it would really be an ornament to the situation. In such cases no tree that we have in this country would compensate for the absence of the Lombardy Poplar. Thus abuse prevents use in this as in many other matters.

But there are many other Poplars too seldom used in the formation of our landscapes. Our own White Poplar once formed a feature of Epping Forest, where its shining silvery bark and drooping character were allowed to assert their beauty; and the large Canadian Poplar, of which magnificent specimens are to be seen here and there, and whose leaves change to a bright orange in autumn—that, too, must be discarded, because, forsooth, it is a Poplar.

It is time we rose superior to these prejudices, and learned to view objects in Nature with reference to their own capabilities in combination, and then we should learn to despise nothing and to prize those objects most that have a distinct character of their own, for with such material in skilful hands a better result may be hoped for.

Firs, when well placed, give a magnificence and solitary grandeur that few other plants can produce. They will not succeed as single trees; they must be grown in quantity, and to be seen in their greatest beauty, they must be situated on an ascending plane of considerable extent. Firs have been extensively planted in various places, but in almost every instance they are in too thin belts; the lower limbs die after a time, leaving the upper part of the tree only with foliage. Where the belt is thin the light, of course, is visible; this, if confined to a few places, is a beauty, but when it is regularly visible for the whole length of the plantation it convinces us the trees have not answered the purpose for which they were planted, and moreover their aspect is little better than that of a line of hop-poles. Had the belts originally been planned of three or four times the depth, this thinness would have been avoided. In such

cases a young plantation in front would materially improve the aspect in a few years.

It is surprising to find that, in plantations of this kind near houses, so little attention has been paid to produce a variety in the undergrowth. Let us go into a natural wood, one that has never been planted, and we shall be as much struck with the humble undergrowth as with the timber trees themselves. After straggling through a half-mile of thick well-wooded land, where the sun's rays struggle in vain for entrance, we suddenly emerge upon an open glade abounding in Heath, Furze, and Broom; how variously does the light affect it—how different the strips lit up with the sun's rays to those embrowned with the deep shadow of the wood! And then, again, how we admire the bright and varnished Holly and Box that grow secluded from the sun and wind! The very Periwinkle that twines at our feet, and the Briars and Honeysuckles that fling their fragrance above and around us, have each a beauty to lend and to borrow from their situation.

This principle may be carried much further, and with equal truth. Who does not admire the beautiful Fern that grows at the foot of the Oak? or ask a painter if he would give up the intricacy of the twining Clematis or Bramble in the foreground? Why, the very Ivy stem which, destitute of leaves below, yet clings like a coarse lacing about the trunks of trees, cannot be omitted.

But vegetables much more humble than these claim the painter's attention. The trunk of a Beech, an Elm, or an Oak, is often the habitation of whole colonies of lichens and mosses; these diversify the surface, render the bark more intricate, and add a beautiful glow of orange, or a brilliant dash of green, agreeable to the species. If, therefore, the imitator of the beauties of Nature cannot dispense with all these appendages in the foreground of his landscape, why is a plantation to be contrived where trees of the larger growth are only permitted, where Ash, Oak, and Elm, with perhaps Beech and Fir, are to mingle, with no Privet nor Thorn, nor Heath, nor Bramble, to fill up and contribute their share of beauty?

Were we to reason on the case, we should say that where profit only is sought, such spots should not be permitted; but, they ought to be freely introduced in all plantations where ornament is to be combined with profit.

When the Beech is kept low by being placed under larger trees, it then mixes with Holly, and forms, during winter, the most beautiful contrast in the underwood. This principle extends itself to the effect of colour in trees of large growth, as well as in shrubs. Whoever has remarked a quantity of Willows in one situation, or of the Silver Poplar, cannot fail to have observed how cold an aspect they communicate—the grey or whiteness of their leaves so predominate that the very air seems cooled by them; but let a few of these trees occasionally skirt a wood or plantation, and a bold relief is the instant consequence—they start forward and, receiving part of the shade of their more umbrageous neighbours, become objects of beauty instead of aversion. Some deciduous trees retain their leaves fully three months after others even of the same family. A remarkable instance of this occurs in the Elm, the Scotch variety of which sometimes sheds every leaf at the end of August, and in exposed situations at a much earlier period, while the Kidbrooke Elm does not shed its foliage till much later. By a careful use of this instead of the Scotch Elm, in particular situations, a summer-like effect may be kept up for a much longer period.

The principle under which most of the latter remarks would be ranged is that of composition in general, the right ordering of which is equally essential in music, painting, and landscape-gardening. The composition of the masses

ought to be regulated in great measure by the character of the surrounding scenery and the extent of the domain, always with reference to the regularity or irregularity of its surface.

It must be laid down as an obvious principle in massing, never to shut out anything that can contribute to the beauty of the distance; but, by judiciously arranging the middle ground, to contrive to heighten its effect by giving the

former instance, when the landscape artist is allowed to join effect with either natural woods or plantations, another great good results; he is enabled to give breadth of light and shadow—an effect equally pleasing in a landscape and in a picture, for it may safely be laid down as a rule, that whenever the objects are scattered, disconnected, or in patches, the light and shadows will be so too, and *vice versa*. If, for instance,

been planted in that style, the variety of light and shadow will be greatly increased, and still the general breadth will be preserved. But if the wood were so thinned as to have a poor, scattered, or unconnected appearance, or the hills were planted in clumps, patches, and detached trees, the lights and shadows would have the same broken and disjointed effect as the trees themselves. If to this were added any harsh con-

FIG. 54.—*ANGRÆCUM ELLISI*, IN MR. DAY'S COLLECTION AT TOTTENHAM.

appearance of greater distance through massing in the middle ground, leaving fields of view open between them. In this way, too, very frequently one property may apparently be joined to another, in such a manner as to make the whole appear like one estate. This appearance is given readily by observing the flow of lines in neighbouring plantations, and making them continuous with those on one's own. In open situations the introduction of the ha-ha has in a great degree tended to this effect. In the

we suppose a continued chain of hills, either entirely wooded or entirely bare, under the influence of a low cloudless sun, whatever parts are exposed to that sun will have one broad light upon them, whatever are hidden from it one broad mass of shadow. If, again, we suppose this wood to have been thinned in such a manner as to have left masses, groups, and single trees, so disposed as to present a pleasing and connected whole, though with detached parts; or if we suppose the bare hills to have

trast, such as Scotch Pines and white buildings, the irritation would be increased, and the eye, instead of reposing on one broad connected whole, would be arrested and harassed by little disunited discordant parts.

With one other remark on the manner of arranging plants with a view to effect, we bring these hints to a conclusion. It is, that in many plantations it has been the practice carefully to mix the same kind of tree in equal proportions and distances over the whole ground.

Now, upon the slightest consideration, it will be recognised that the effect of this must be to produce a uniformity that invariably becomes insipid, and as during the infancy of the plantation at a little distance an individual plant is lost, so such mode must occasion a similitude in light over the whole mass, whether it be viewed at morning, mid-day, or evening. But suppose that an irregular number (thirty or forty of the same species) be placed in a group, and then next to them half the quantity of another, and on the right and left masses of others still varying, how widely different will be the result. The external form of such plantation would afford, in early growth even, a diversity and character that would be striking, and the effect of light and shadow on masses of light foliage at twilight, and on dark ones in the mid-day sun, would be highly increased and appear almost magical. Besides, if all the varieties of plants in a shrubbery are to be carefully placed at equal and recurring distances, what inducement is there to proceed to view the whole when the first few yards contains all the variety that probably a walk of a mile will afford?

— RESPECTING ANGRÆCUM ELISII, of which we give at fig. 54, p. 277, a representation, from the plant which flowered in the rich collection of Mr. DAY, of Tottenham, in April last, we may quote the following particulars, from Mr. WILLIAMS' *Orchid Growers' Manual*:—"This beautiful species was introduced to this country, from Madagascar, by the Sieur, W. ELLIS, whose name it bears, and is undoubtedly one of the finest species of the genus in cultivation. The leaves are arranged in a distichous manner, and about 10 inches in length by upwards of 2 inches in breadth; dark green on the upper side, paler below, and unequally bilobed at the apex. Flower-spikes some 2 feet long, arching, bearing from eighteen to twenty-four flowers, pure white, and very fragrant; sepals and petals reflexed; spur of the lip 6 inches long, and light cinnamon in colour. The profile of the flower is an exact resemblance of a cockatoo. It requires the temperature of the East India House." Mr. DAY'S specimen is one of ELLIS'S original plants, and differs in some particulars from others in the hands of the trade. The flowers have a perfume of sherry, and the nectar has, on the authority of Mr. W. G. SMITH, a taste like that of the berries of *Solanum Dulcamara*. The flowers change to a brown colour if bruised. The name *Angræcum* is a Latinised form of a Malayan word signifying epiphyte.

— The first show of the year at the Lal Bagh, Bangalore, was held in January, in the Darwina, and the display of cut flowers and fruits was remarkably good, the Apples and Strawberries being especially noticeable for their size and fine appearance. The vegetables too, were not to be despised, and did credit to their exhibitors. Special prizes were given by Colonel PUCKLE for the best arranged round dinner-table for six persons, laid out with garden flowers, one vase or centrepiece and four specimen glasses being only allowable in the decoration. For a similar arrangement in camp, where wild flowers, Ferns and grasses only are available. No vase or centrepiece or specimen glasses of any sort were allowed in the competition for this prize. Also for the best model of a small carpet-garden laid out suitably for the compound of an Indian bungalow.

— We find from the schedule of the GRAND NATIONAL HORTICULTURAL EXHIBITION AT MANCHESTER, which is now before us, that there are sundry prizes offered which are well worth competing for. There is a prize of £30 for twenty plants, of which half are to be in flower; and a prize of £20 for ten plants, distinct, and in flower. Other prominent prizes are £16 for sixteen exotic Orchids, and £10 for eight stove and greenhouse plants, in the amateur's classes; and £16 for sixteen exotic Orchids, £10 for ten exotic Orchids, £10 for eight greenhouse Heaths, £10 for eight *Azaleas*, £10 for twenty greenhouse *Azaleas* in 8-inch pots, £15 for twenty-five hardy Rhododendrons, £25 for twelve Roses in pots, £15 for forty Roses in 9-inch pots, £10 for ten hardy evergreens, £10 for ten hardy Conifers, £12 for a collection of Clematis, and £12 for twelve new and rare plants, among the classes set apart for nurserymen. The schedule extends to seventy-one classes. The show is to be open from May 14 to May 21 (inclusive), and entries close on May 6.

— We mentioned some time since the death of Mr. W. BUCKLEY, of Tooting, after a prolonged

affliction, and we are sorry to have to add that his widow and young children are left almost destitute of means. We are very glad, however, to find that Mr. BUCKLEY'S employers, the Messrs. ROLLISSON, whom he served so long and so well, have taken up the cause of his bereaved family, and have organised a committee to obtain subscriptions on their behalf. We trust that the public sympathy manifested towards them may be as wide and as free as was his own love for plants, and his amenity towards and predilection for all those who took an interest in them for their own sakes. Any contributions in their behalf may, in the meantime, be sent to Messrs. ROLLISSON & SONS, nurserymen, Upper Tooting, Surrey.

— We believe that the prospects of a more harmonious action between the "local Fellows" of the ROYAL HORTICULTURAL SOCIETY and the horticulturists on the one hand, and between the Council and their landlords, the Commissioners, on the other, are likely to be much improved by the resignation of Sir ALFRED SLADE and Mr. CHETWYND. Though excellent and energetic men of business, their procedures raised opposition to a more conciliatory tone might have been beneficial. We earnestly trust that the horticultural Fellows will not fail to attend the adjourned meeting on the 9th of March, and take advantage of the favourable turn of affairs. It ought to be quite practicable to secure the rights of local Fellows, and still carry out the main objects for which the Society was founded.

— Dr. MASTERS' lecture at the Royal Horticultural Society on February 24, on CHARLES DARWIN as a horticulturist, was, owing to the inclement weather, but thinly attended. The lecturer alluded to several of the more important discoveries and deductions made by DARWIN in vegetable physiology, and showed their bearing on practical horticulture. The further report of the lecture is deferred in order that we may at the same time give a portrait of the great naturalist.

— The summer show of the LEE and BLACKHEATH HORTICULTURAL SOCIETY will be held on Thursday and Friday, June 17 and 18. The Society will also hold an exhibition expressly for cottagers, on Saturday, September 11.

— We understand that the specimen plants prepared for Messrs. JACKMAN & SONS' CLEMATIS SHOW at the Royal Botanic Gardens, Regent's Park, are in a most promising condition, so that a good display may be confidently anticipated. The buds are now swelling out fast, foreshadowing an abundant crop of blossoms, to the development of which, if we may judge from the past, the air of Woking seems particularly favourable, aided no doubt by some practice of "wintering" which we have seen learned by experience. A Clematis show will be something of a novelty, the plant having so rapidly taken up a prominent position amongst decorative subjects; but from what we have already seen of its capabilities we shall be disappointed if a really good exhibition of the best sorts, well grown, will not be a sight to be many times indulged in, and still retained with pleasure in the memory. The exhibition is to be open during May.

— Mr. J. F. JOHNSON informs us that for the last six years a considerable number of plants of *EUCALYPTUS GLOBULUS* have been planted out in the Royal Botanic Garden, Belfast, all of which have died, with the exception of one example planted in 1872 in a very sheltered corner protected from wind and cold. This produced a growth of a few feet, but the exact measure was not noted. In the winter of 1872-3 it was killed to the ground, but the following summer made a growth of 8 feet 6 inches high. In the winter of 1873 it was killed to within 15 inches of the ground, but last summer it made a clear 15 feet of growth, and branches in proportion. The plant has not yet suffered any serious injury this winter. The *Dracena australis* does well here in the open ground.

— THE ISLE OF THANET FLORAL AND HORTICULTURAL ASSOCIATION and Cottagers' Gardening Society, will both hold their annual shows at Bromstone Park, St. Peter's, Ramsgate, on Wednesday, August 25.

— THE BEST MODE OF SECURING NEWLY PLANTED TREES having long slender stems and full heads from danger of being loosened by winds is one of some moment to planters. The common method of fixing three stout stakes in a triangle, the apex of which is secured to the stem of the tree by handbands, is decidedly objectionable, as presenting an unsightly appearance. In the course of some planting which has been extensively done at Gunnersbury, the residence of Baron L. DE ROTHSCHILD, during the winter, and especially in the case of planting exposed mounds, a simple plan was adopted, which appears likely to answer every purpose, and is carried out with rapidly important consideration, when the weather is unsettled, and operations are liable to frequent suspension. Three stout stakes, the width

of the hole in which the tree was planted, were so laid below the surface of the soil as to form a triangle, which gripped the stem of the tree just above the collar, and were then trodden firmly into the soil. The stem might sway about with the wind, but there is no loosening of the roots, and by the time the tree is firmly established in the soil the grip on the stem loosens through the effects of rot.

— The showy double carmine variety of *PRIMULA SINENSIS FIMBRIATA*, shown at the last meeting of the Royal Horticultural Society by Messrs. H. B. SMITH & Co., of the Falling-ban Nurseries, is especially worthy of notice, because so useful for decorative purposes by night, as the colour is unaffected by gaslight, except that it is considerably heightened, and so rendered more effective. It is also to be preferred to the single variety of the same colour in that the flowers do not drop till they fade, and this also makes it very useful to cut from. The habit of growth is all that can be desired, as the flowers are produced in evenly displayed clusters, not too crowded, on erect stiff foot-stalks well above the foliage. Messrs. SMITH are growing it largely, as they find it invaluable for cutting from, as well as for market purposes.

— The African traveller, Dr. SCHWEINFURTH, has been appointed director of the KHEDIVE'S natural history museum and botanical gardens at Cairo.

— The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, March 1, when a paper will be read by Mr. E. RYDE, entitled "The Rating of Country Mansions." The chair to be taken at 8 o'clock. After the reading of the paper (the discussion on which will be postponed until the next meeting) Mr. J. R. BONNY will call attention to the provisions of the Home Secretary's Bill for facilitating the Improvement of the Dwellings of the Working Classes in Large Towns.

— The inquiry of a correspondent reminds us of the following memorandum on an IRISH HABITAT for the MAIDENHAIR FERN, kindly furnished by Mr. A. F. BARRON, of Chiswick, on the occasion of a visit to Ireland in the course of last autumn. Mr. BARRON states that on the very ridge of one of the peaves in the Giant's Causeway his eyes for the first time rested on the Maidenhair fern in its natural habitat. It is there growing freely, seemingly with but little soil. The fronds are very short. Although exposed to view, it is quite inaccessible, being some 30 feet above one's head when in a boat on the open sea. Let us hope that this inaccessible station may prove, also, indestructible.

— A new candidate for public favour is announced to appear shortly, in Belgium, under the name of the *Revue de l'Horticulture Belge*. Its editorial staff includes many of the most competent Belgian, and indeed of European horticulturists, and one main object of the promoters is to interest amateurs in common plants of merit, or in plants whose merits have been overlooked or neglected. M. PYNÆRT is the *redacteur en chef*. We await the newcomer with much interest.

— At a meeting of the Meteorological Society of Edinburgh on the 10th inst, Mr. BUCHAN read a paper on the bearing of meteorological records on the supposed CHANGE OF CLIMATE IN SCOTLAND, a subject discussed by Mr. M'NAB at the Botanical Society of Edinburgh, whose remarks were criticised from a cultural point of view by our correspondent, "Fruiter" in our last volume. Mr. BUCHAN concludes that there has been no general tendency towards a permanent change, either as regards summer heat or winter cold.

— An influential committee has been formed for the purpose of organising a great INTERNATIONAL HORTICULTURAL EXHIBITION to be opened at COLOGNE on August 25, and to remain open till September 26, 1875, in the grounds of the "Flora," which will be considerably enlarged by the annexation of the adjoining premises. Her Majesty the Empress and Queen of PRUSSIA, as Patroness of the Flora, together with His Imperial and Royal Highness the CROWN PRINCE, are the patrons of the exhibition. Negotiations for the nomination of commissioners from foreign Governments have been already begun by the Minister of Agricultural Affairs; and the committee invite all who take an interest in the progress of horticulture and gardening to contribute to the exhibition. The exhibition is to comprise all horticultural plants and productions (with the exception of Vines and Grapes, which are excluded, owing to the possibility of the appearance of the *Phylloxera vastatrix*), also working utensils, machinery, implements for building, as well as collections of any kind connected with rural life and the development of garden culture, under the following classifications:—

I. Horticulture.—(a) Glasshouse plants; (b) plants grown in the open air; (c) fruit trees and shrubs; (d) cut and dried flowers.
II. Horticultural Productions.—(a) Fruits: fresh, dried, an

preserved; (f) produce of vegetable juice and vegetable fibre, viz., wines, beers, liquors, oils, resin, gum, colouring matter, honey, wax, cotton, paper, card, silk, and various manufactures therefrom; (g) rearing of bees, and produce thereof; (h) vegetables, fresh, dried, and preserved; (i) seeds of all kinds.

III. Garden Architecture, including—(a) Plans and models of gardens, pleasure-grounds, and parks of all kinds; (b) glass-houses of all kinds, their heating, ventilation, shade, and cover glass; (c) bridges, fountains, waterfalls, terraces, arbours, tents, marisques, as also ground-fairs in squares, tiles, mosaic, cement, asphalt, or other materials; (d) garden furniture; (e) hedges, hedges, fences, aviaries, swim and duck-houses, &c.; (f) construction of roads and walks; (g) rock, tunnel, and grotto work; (h) fences, garden gates, espaliers of various kinds; (i) models and plans of conservatories specified in list B to B₄, together with an estimate of prices.

IV. Garden Decoration, including—(a) Artificial fountains, jet d'eau spouts; (b) statues, vases, urns, pedicels, and all kinds of articles of all varieties of materials; (c) hortening and trimming of walls and flower beds; (d) flower baskets and stands, flower ladders, hanging lamps, and panorama globes, &c.; (e) collections of garden illuminations of all kinds.

V. Garden Tools and Machinery, viz.—(a) Pump works, steam, gas, petroleum, air, and other machinery; (b) Abyssinian and other fountains, water-pipes for garden grounds, &c., watering apparatuses, water conduits, &c., watering carts, &c., water engines, garden syringes, &c.; (c) working implements, such as spades, hoes, rakes, &c.; (d) water-carts, and all kinds of mowing-machines, &c.; (e) barrow-carts for transport and transplanting of plants, &c.; (f) flower-pots, plant labels, staves, bouquet boxes, bouquet holders, &c.; (g) surveying, leveling, and drawing instruments.

VI. Garden Collections, including—(a) Wood and seed collections; (b) collections of beetles, insects, and butterflies, with the various larva which may be injurious or beneficial to garden tillage.

VII. Artificial Fruits, Flowers, and Plants—(a) Artificial fruits, single and in collections; (b) bouquets and wreaths, (c) all kinds of plants, &c.

VIII. Garden Literature—(a) Works concerning the auxiliary science of horticulture; (b) works on rural tillage; (c) works on the culture of plants, &c.

The committee will endeavour to facilitate as much as possible the means of communication, and to remove all difficulties connected with the transport of goods. Negotiations have been already begun with the railway and steam companies to procure a reduction of the usual freight charges, and with the Custom-house authorities to procure every possible facility for all articles sent to the exhibition. Information as to the result of the negotiations will be given as soon as possible. Eminent and impartial members of the different nations represented in the exhibition will be chosen as judges. Care will be taken that the machinery sent in shall be put in action during the exhibition. Articles exposed will be purchased and disposed of by lottery, for which the sum of 135,000 marks Pruss. money (£6750) shall be laid out; exhibitors are therefore requested to state, on announcing objects, whether they can be bought, and at what price, as also to keep in view the following regulations:—(1). The exhibition opens on August 25, and closes on September 26, 1875. (2). On sending articles exhibitors engage to leave them until the close of the exhibition, and to withdraw them within a week after the same. (3). Covered space will be set apart for all objects requiring it. (4). Objects to be exposed must be announced at latest by July 20. (5). Flowers and fruit will be exhibited in two series; the first series from August 25 till September 10, and the second series from September 11 till 26. (6). Prizes, awarded by the decision of a jury, will consist of sums of money, prize medals of gold, silver, and bronze, as also honourable mentions. (7). After the close of the exhibition the public sale of the objects exhibited, and the disposal of the same, themselves will take place. (8). Stall money will not be raised. It is requested that all communications be addressed, post paid, to the Horticultural Society, "Flora," Cologne, from whence all necessary information can be obtained.

—Amongst a collection of CEYLON native products recently received at the Kew Museum are a series of ropes made of the stems of *CATTLE ROPES*, made from the twisted or plaited stems of various Cingalese plants. Many of these ropes are rough in their manufacture, but are nevertheless very strong. The interest in this collection lies in the singularly careful selection of the plants themselves, showing that the natives are fully alive to the characteristics of toughness and strength which prevail in some orders, and are quite absent in others. Thus we find that in *Mentha* maceae an excellent rope may be formed from the plant stems, that many of the Brazilian species are used for tying up Cotton bales, instead of ordinary ropes—three plants are so used, viz., *Coscinium fenestratum*, *Ananiam Cocculus*, and *Limacia cuspidata*. The first-named (*C. fenestratum*) really makes an excellent rope, compact, pliant, and strong. The other plants used, and of which specimens are at Kew, are *Delima sarmentosa*, a Dilleniaceae plant with rough leaves, which are used sometimes as sand-paper; *Gyrinops Walla*, an Aquilariaceae plant; *Ichneumium frutescens*, an Araceae plant; *Chlorocarpus*, a Convolvaceae plant; *Rourea santaloides* (Connaceae); *Strychnos cinnamomifolia*, and *Anticostrotodes Vahlilii*. Besides these, however, the stems of the Calami make strong but stiff ropes. These can be obtained in almost any length, as they grow to such enormous heights, and twine themselves to such immense distances among the trees. The ingenuity with which the ropes are made is striking, the stems being split up nearly to the end into the number of strands

required, and then plaited. Stems of *C. gracilis*, *C. longisetus*, *C. tenuis*, and *C. rudentum*, so treated, are in the above collection.

—*CYCLONEMA MYRICOIDES*, a very pretty deciduous shrub, is now flowering in the Palm-house at Kew. The genus is very nearly allied to *Clerodendron*, if, indeed, it is not quite the same. The leaves are lanceolate, or oblong-lanceolate, deeply serrated, shortly petioled, and, at this season, of a pale green. When bruised they have a disagreeable smell. The flowers are produced in loose cymes, situated in the leaf-axils of the young growth. The corolla is irregular, its lower and longer lobe pale blue, the four upper pure white. It measures in breadth about 1 inch, by 1½ in the other way. For the sake of variety, this *Cyclonema* is well worth cultivating, and a common or well-known plant it does not seem to be. Increase is easily effected from cuttings. A native from Abyssinia to Natal.

—THE WEST OF ENGLAND ROSE SHOW is fixed to take place in the Shire Hall, Hereford, on Tuesday, June 29.

Home Correspondence.

Fuchsia Riccartoni.—I am surprised at Mr. Tilley's account of the origin of this grand old Fuchsia (p. 206), as he is generally so well informed on such matters as this. In 1833, when living near Edinburgh I visited the best gardens in that neighbourhood, and perhaps more especially Riccarton, the seat of Sir James Gibson Craig, Bart., about 6 miles west from Edinburgh, where things were done well, particularly from both indoors and out. The management of the wall trees and produce from them I have not seen surpassed since, and all other plants grown there showed the same good cultivation under the able direction of the late Mr. John Young, afterwards gardener at Archerfield. On one of my visits there I was shown what I believe was the seedling plant of Fuchsia Riccartoni, raised by Mr. Young from seed of Fuchsia globosa; the others then in cultivation were coccinea, virgata, conica, gracilis, microphylla, and one or two others. I believe the stock was never strictly pure, as it is now, but it was originally sold by the firm of Messrs. James Dickson & Sons, of Edinburgh, who were then the most active in florists' flowers. It was about that time when the herbaceous Calceolarias began to attract attention, and I well remember the pretty C. Kellyana, named in honour of Mr. Kelly, their intelligent foreman. These seedlings so took my fancy that I determined to try my hand at seedling raising as soon as I had an opportunity, with what success I well know, and I have been among the seedlings of various sorts ever since. *Francis R. Kinghorn, Sheen Nursery, Richmond, Surrey, Feb. 18.*

—When I lived in the Glasgow Botanic Garden, from 1832 to 1835, upwards of forty years ago, I remember very distinctly a variety of Fuchsia then grown there under the designation of Fuchsia sp., from Port Famine, which was, I think, named about the same time, or soon after, by Dr. (afterwards Sir) William Hooker, Fuchsia discolor. I remember about the same period, or a little later, the Fuchsia Riccartoni being then generally grown under glass, and considered a decided improvement on the Fuchsia discolor. Miss Gibson Craig, at p. 205, in describing the origin of Fuchsia Riccartoni, says, that "one of the parents was globosa;" Mr. Downie corroborates the statement. In all probability the other parent was Fuchsia discolor, as it resembles the latter much more than the former in appearance, hardness, and vigour of growth, the globosa strain being, however, quite apparent. I have tried most of the hardier varieties of Fuchsias for outdoor culture, but find none of them succeed so well as the Fuchsia discolor. It is harder than the Fuchsia Riccartoni, consequently is less liable to be cut down by severe frost. This is the Fuchsia generally grown within a moderate distance of the sea coast in the south and south-west of Scotland and many parts of Ireland, forming large spreading bushes from 8 to 12 or more feet in height, very frequently confluent with the Fuchsia Riccartoni, but quite distinct from it. *A. Fowler, Castle Kennedy.*

Primum altaica (so-called).—If the origin of this pretty single mauve-coloured Primrose could be traced, it would no doubt be found to have started from the common Primrose as a coloured seedling, purchased the result of impregnation with the pollen from a coloured Oxlip may have again given coloured seedlings until this pretty mauve form was finally evolved. The wild Primrose in this sportive form is very abundant at Dropmore, from whence a few years since I obtained a plant of a pure white variety. This, although flowered in a house remote from other kinds, has produced seedlings of which, when sown, all have pure white flowers, yet some are coloured, one being of a pale mauve, and almost a duplicate of

the variety hitherto known as *Primum altaica*. Persistence in the same way must we look for the origin of *Primum auriculatum*, although here the flowers are of much more perfect form and richly coloured, and probably in these two respects it will never be excelled by any other Primrose. Still there is room for size and variety in colour, and these are now rapidly forthcoming. *Alex. Dean.*

The Eccentricity of Growth.—Some of our readers may be interested in the enclosed drawing from an insignis trunk, taken soon after a large branch had been cut off—April 17, 1874. It will be noticed that the growth of wood and bark is 1½ inch above the pith, and 11 inches below it; it also has 8 inches of wood and bark on the north-east side, and only 2 inches on the south-west side of the pith. I have noticed the growth of trees as to eccentricity of sections of trunk since 1865, when the theory I had seen stated, that the growth is greatest on the sunny side of a tree, was quite contradicted by facts I observed in the case of the plantation that had been lately cut down. The eccentricity of trunk section at the base depends much more on the position of other trees relatively to the one observed. Thus, if a tree grows on the south side of the one whose section is observed near enough to interfere with its roots and kill the branches on that side, while the tree has room to throw out its roots and expand its branches on the north side, its roots on the south side fork on each side of the tree near it, and there will be no root of any size growing directly towards its neighbour. On the contrary, if a tree grows on the north side, its roots will be much less on the side where there is less interference with the growth of the tree. The only exceptions to this rule that I have noticed are when one tree overtops another, or where the soil is so much better on one side of a tree than the other, that is, has enough food on the crowded side. This I once noticed in a Pinaster which was robbed of all the good soil on the outside of a plantation by its having been taken to make a turf edge, causing most wood on the plantation side of the pith. As the tree had been quite sheltered by another plantation across the road, I was at first puzzled at its eccentricity being on the side where other trees grew, and not on that where it had room to expand its branches. Now to account for the eccentricity in growth of branches. In the section enclosed there are two causes. Gravitation in a horizontal branch causes most of the sap to flow on its lower side, and consequently there is most albumen deposited on the lower side of the branch, and the bark cracks, and shows marks of growth that it does on the upper side. The greater growth on the north-east side I account for by there being more branches that intercept the current of sap passing down the trunk on the south-west side than on the north-east—as you will see from the diagram on a small scale in the corner of the tracing where the wound observed is marked with a cross. *H. R.* [The diagram already given at p. 147 sufficiently illustrates our correspondent's remarks. Eds.]

Botanical Collectors.—Mr. Gustav Wallis has published some statements, and alleges certain grievances, in your columns, and also in the *Illustration Gardeners' Chronicle*, and in the *Gardener's Magazine*. I cannot allow to pass uncontradicted. The writer styles himself a botanical traveller, although I have never obtained from him a single dried specimen in the interest of science. He explains that I no longer mention his name in the *Illustration Horticolæ*, and takes the opportunity of advancing the most extravagant claims. As Wallis has himself thought fit to lift the veil which I had permitted to conceal his conduct, I think it my duty now to set before you his behaviour in its true light. What I have to say may be a lesson to others who, like myself, may have the unfortunate weakness to put too high a value on the services of their employes, and to raise them on a pedestal and fill them, as in this case, with the most ridiculous self-conceit. Wallis went to Brazil as an assistant gardener. After dragging on a miserable existence there for several years, he besought my assistance. I listened to his entreaty, and shortly afterwards took him into my service as collector. This was probably the happiest moment of his life, for far from having sacrificed his name to my interests, as he now affirms, his admission into my service was, on the contrary, a piece of good fortune, which saved him from poverty and assured him a career. I found him poor, unknown, and forsaken; and he left me with a name, a small fortune, a museum of curiosities of all sorts (formed in his native town in Germany by numerous consignments during his voyages) and honours, obtained through my influence, such as a colony to set him up in the months of the Amazon to the other side of the Isthmus of Panama. This journey cost me upwards of £5000. The expenses of crossing Peru and

Ecuador were enormous, and the returns were insignificant, in consequence of the bad state in which the plants arrived. Apart from several introductions which made more noise than profit, the journey remained unproductive until New Grenada—the classic ground of the genera *Odontoglossum* and *Masdevallia*, many of which were discovered by myself—was reached. Following my directions a collector might have refound them—in a manner of speaking—blindfolded. Moreover, this voyage had not the slightest scientific pretensions. It was simply a commercial enterprise, undertaken for the purpose of supplying the wants of my establishment. The idea, its accomplishment, and the results belonged to me alone. Regardless of the name or quality of the agent, I had the right, if I chose, to omit all mention of his name and of the habits of the plants—a course which the most elementary knowledge of commercial prudence would have dictated, in order to avoid competition. English importers of plants act in a similar manner, and let those who would blame them remember what has happened in Wallis's case. In fact, if instead of Wallis, I had known by all the means in my power, associating his name with the plants received and obtaining medals for him at the exhibitions, I had left him in the obscurity from which assisted he would never have emerged, he would not have had the chance of profiting by the experience which he gained through my teaching and at my cost. I deny most positively the right of Mr. Wallis to speak of the plants which he has been commissioned to collect for me, or of the localities in which they were found. In carrying out a commercial mission for me and at my expense, he would only have done his duty, as any one else would have done; but how stands the case? Inflated with self-importance, Wallis deserted me once; but after an absence of two years, I was so imprudent as to take him into my service again, imagining that a remorseful conscience brought him back again to me, and for this act I experienced the most sorry recompense. Continuing to mention his name after such proceedings would be simply to reward ingratitude and encourage defection. I disdainfully decline to criticise the false pretensions of Mr. Wallis concerning the introduction of *Cattleya gigas* and *Carmeria picturata*; but, desirous to refer to Cesar the things that are Cesar's, I declare that it is not true that these plants were introduced by Wallis, but that their first introduction to my stoves is due to Mr. Roelz. Had Mr. Wallis succeeded in introducing these plants, would it have been necessary for me to go to the expense of a second expedition for the purpose? With regard to the part that Wallis claims to have played in my service, it is scarcely necessary for me to mention that, after more than ten years' scientific travels, carried out at the order of the Belgian Government, I have since employed myself during thirty years in the organisation of expeditions in different parts of the world, and during that long period I have had from eight to ten collectors as well, and some better known, thanks to me, than Wallis. My chief introductions were made long before I knew him. *Odontoglossum* and *Masdevallia* flourished in my houses ten years before they became fashionable with amateurs, yet none of my collectors made the ridiculous pretensions raised by Wallis. If such absurd claims were admitted, there is no reason why each and all of my gardeners should not urge similar claims. Collectors, both before and after Wallis, have never failed me. Other expeditions are at the present moment in course of execution, and there is no cause to suppose that the services of my actual travellers will be less than those rendered by a man who, in return for numerous kindnesses, has shown towards me the greatest ingratitude and bad feeling, *J. Linden*.

The Eucalyptus, &c.—As an instance of the comparative hardiness of this plant, I may mention one growing here, which has been out two or three years and which was quite uninjured by the late severe frost, when on one or two occasions a thermometer hanging within a dozen yards of it registered 16° of frost, a very unusual degree of cold in this locality. The plant referred to is certainly growing under the shelter of a wall, and hence may not quite fairly indicate what cold it would stand in a more exposed place, but it overtops the wall 2 or 3 feet and the top is quite as uninjured as the lower part, in fact the accompanying shoots, cut from the top and therefore freely exposed part, will show that to be the case. [Yes.] If it prove equally hardy when planted free from artificial shelter it will be a welcome addition to plants suitable for seaside planting, though in such localities it should be planted in such a position that it will not feel the effect of the sea winds, its large leaves being evidently ill-adapted to withstand their force. We intend to give it such a trial at this place, where Myrtles, Camellias, and Indian Azaleas, planted in the open ground, have passed through the late severe weather without the least injury. The same may be said of *Clianthus puniceus* and *Cornicola glauca* against walls, but

otherwise unprotected; the former of which will in a short time be a sheet of bloom, while the latter has been in full flower for several weeks. The *Clianthus* as a pot plant is seldom satisfactory, but grown against a wall in the open air it is a most distinct and striking object, and speedily covers a large surface of wall. It would undoubtedly require protection in severe weather in a less favoured climate than we have here. *J. Ellam, Bodorgan, Anglesey*.

Romneya Coulteri.—This fine annual represents a type of Papaveraceae and is closely allied to the well-known species of Argemone. It is an annual of 4 to 5 feet in height, with a branching habit, and pinnatifid-lobed leaves. The flowers are large and beautiful, of a compactly circular salver-shaped outline, 5 to 6 inches in width, pure white, and deliciously fragrant. Some idea may be gained of its effective character when it is stated that a single plant will produce from 60 to 80 flowers. *E. G. Henderson & Son*. [To this account we may add that the plant above-mentioned was first described

than those really charged by these eminently successful cultivators of the plant. I have the Messrs. Kelway's list of new varieties issued this year before me; and the total charge for all the bulbs—eighteen in number—is £10 2s. 6d.! In this list I need hardly say that we have some of the finest Gladioli ever raised, eight of the number having borne the scrutiny of the best judges, and gained First-class Certificates. On the important point of exhibition at the leading shows, we are not enlightened by "Argus." Surely, if I pay £3 for a bulb, or £33 for twenty-four bulbs, quality is an important consideration; and quality in this case means exhibition at an important show, and certificates and prizes as evidence of success. I have not the list of M. Souchet or his agent at hand, but I am quite sure that no such exorbitant prices are asked for the best of their bulbs. *Lynce-eyed*.

The Orchids at Fallowfield.—I had the pleasure a few days ago of making a visit to the gardens of Professor Williamson, of Fallowfield, Manchester, where, amongst a nice collection of Orchids, there were several fine plants that seem to me deserving a

FIG. 55.—ROMNEYA COULTERI.

by Harvey in the *London Journal of Botany* for 1845 (vol. iv., p. 73, t. 3). Messrs. Henderson have forwarded us a dried flower, but we have seen no living specimen. The plant is described as glaucous, and with a few scattered hairs. The stigmas are distinct, except at the base. There is some discrepancy in the description of the placenta in Harvey's original description and that given in Bentham and Hooker's *Genera*. The ornamental character of the plant, however, is quite beyond suspicion. [EDS.]

The Prices of New Gladioli.—As one taking an interest in the cultivation of the Gladioli, and having been a purchaser of the bulb to a great extent, I was much surprised at the statement made by "Argus" in your issue of January 30, with regard to the prices charged for this beautiful flower. It would be wrong of me to impugn the statement of "Argus," who, with his "hundred eyes" and sound senses, has, no doubt, the catalogue of some firm before him; but he must not overlook the fact that his assertions have a tendency to affect the reputation for liberality of the most eminent growers of the flower. Take Souchet's novelties, or take our best English growers', the Messrs. Kelway's, newest varieties—in either case the prices named by "Argus" are preposterously higher

in your paper. The Orchids are grown in three houses devoted chiefly to the culture of the three divisions of the family—East Indian, *Cattleya*, and *Odontoglossum*—though in each there were flowering and foliage plants and Ferns interspersed among them, which, while breaking up the precise character of the houses, gave an enlivening appearance, especially when, as at the time of my visit, the *Cattleya*-house was very gay with a nice lot of Gesneras of the zebra and cinnabarina section in flower. In the East India house, among some well-managed plants of *Aerides*, *Vanda*, and *Saccolabium*, was a nice plant of *Angreicum eburneum* in flower, and also a fine plant of *Saccolabium violaceum*. This plant was in robust health, and had thrown up two spikes of bloom over a foot long, bearing flowers of a much darker colour than usual, and the spotting of the sepals and petals was much finer than in any variety I ever remember to have seen. In this house were a nice lot of *Calanthe Veitchii*, and the lutea and rosea varieties of *vesitita*, which were flowering very profusely. In pans suspended from the roof were some fine plants of *Dendrobium*s, among which *Cambridgeanum* was remarkably strong. This plant was just coming away with ten leading growths, whilst the old bulbs gave one an idea of

what it had been for a number of years past. In March, 1873, this plant was exhibited at the floral meeting of the Manchester Botanical Society held at the Town Hall, when it was awarded a Cultural Certificate. It certainly is one of the finest specimens of this *Dendrobium* that has ever come under my notice. Grown under similar conditions were several fine plants of *D. cucullatum giganteum*, several bulbs measuring 3 to 4 feet long, showing bloom for a good part of their length. A splendid plant also of *D. Farmeri* was also to be met with in this house, its short, stout bulbs giving one the idea that it was receiving treatment which it does not require. Among several plants of *D. noble* in pots was a nice plant of the pale variety, intermediate; here also a plant of *D. heterocarpum* with growths 2 feet long, flowering superbly and scenting the whole house. A fine plant of the useful winter flowering *Cyclopogon cristata*, was just expanding a quantity of blooms. On the back stage of this house, grown in small pots and standing in little frames with movable glass tops—so placed that as they lie on the boxes there is always a space for the free circulation of air, these are sufficiently open to expose the plants to a draught, was a nice collection of *Anacochitli*. It was quite refreshing to see these gems thus grown well, for lately they have seldom been seen in the free-growing condition in which they used to be met with some ten years ago. In robust health were such species as *A. setaceus*, *Xanthophyllum*, *intermedium*, *striatum*, whilst *Macodes Petola* in a little frame by itself was in excellent condition. By-the-bye, are those two fine sorts *Veitchii* and *Lobbii* to be met with anywhere? It is some years since I saw either of them in any collection. In the Cattleya-house are some well managed plants of *Laelia purpurata*, *Cattleya Mossiae*, *lobata*, &c., and also a very nice plant of *Lindleyana* coming into flower. Here also was, to my mind, one of the gems of the collection, namely, *Laelia prestans*, a foot across, that had just matured eleven growths, and had brooded nine flowers. This plant the gardener, Mr. Goodyear, informs me has been in the collection for many years, and it certainly is one of which the learned Professor would well feel that *Laelia prestans* was here flowering very profusely. In the *Odontoglossum* house were some nice plants of the usual types to be met with—*Alexandre*, *Uroskinneri*, *Phalaenopsis*, and also a quantity of *Dionea muscipula*, which does exceedingly well here: a quantity of seedlings have been raised, which were just making a fresh start. In the conservatory adjoining the house were some well flowered *Camellias*, and on the side stages were a quantity of well grown Chinese *Primulas*. *W. Swan, Feb. 5.*

Myosotis dissitiflora.—Mr. Fish might be afflicted with a worse evil than Forget-me-not on the brain—boilers, for instance. I am quite as great an enthusiast over the beauties of this lovely spring flower as is Mr. Fish himself, and wish I could induce others to look upon it in a similar way. Doubtless it is the most beautiful of its tribe, because it is also the earliest, and is favourable to the present state of our corn and blue by the middle of March. If any of your readers are still sceptical as to its merits, I think I could satisfy them perfectly in a very few weeks, as I have many hundreds of strong plants of it that are fast throwing up their buds, and will soon, if favoured with sunshine (a stranger for the past two months) be in full bloom. The bulk of my stock is growing on cold wet clayey loam, but in spite of the severe winter and recent heavy rains, it never looked better or more healthy. *A. Dean, Balfont.*

Rating Nurserymen's Greenhouses.—Seeing in your impressions of the 6th and 20th inst. (pp. 181 and 246) letters complaining, and I may add very justly, of the extraordinary manner in which nurserymen's floral greenhouses and pits are rated in some parish rates, per acre, for a few remarks. In the first place, I agree with your correspondents respecting the illegality of the rating of the slightly-constructed glass erections, they being to all intents and purposes part of a nurseryman and florist's stock and implements-in-trade. Allow me to quote the heading and the decisions of two cases, similar in point to ours, which have been tried in the Court of Queen's Bench. 1st. Is machinery rateable? 2d. Is a greenhouse a chattel or a fixture? The first case, the Court held that nothing could be rateable unless it was annexed to the premises, so as to be part of the free hold; therefore it would be no more rateable than a carpet nailed down to a floor. In the second case the learned judge ruled that greenhouses were not buildings or fixtures within the meaning of the Act. Now what is machinery? Are not our hot-water boilers and pipes our machinery? Can it be said that these, with our glass erections, are annexed to the freehold, when we can take them down and remove them at our own will and pleasure? The assessment of your correspondent, Mr. Turle, is certainly most extraordinary and oppressive, but my own case is still more so. Four years since I rented a cottage, sheds, and garden in Wickham Lane, including in all about half an acre, which was rated at

£10 10s. Some time after I erected three span-roof rafter pits, the plates being a few inches from the ground, and by digging out 3 feet in the centre there is room enough to walk down, if you do not carry your head too high. They average in length about 100 feet by 11 feet wide. For these three pits I was rated separately at £22 10s. Against this rate I gave notice of appeal, but was informed by the Assessment Committee, through the medium of the collector, that there was some little mistake, which should be seen to, and they reduced it to £11 5s., upon which I paid without taking further trouble. However, they have made up since for the former reduction by increasing the assessment on the same three pits to the extent of £60, and rated them at £40. *Richard Lock, Florist, East Wickham, Kent.*

Royal Horticultural Society.—Catching the infection propagated by my old friend Mr. Murray, I pray your insertion of my letter. Our time for the discussion of any important subject at public official meetings is rarely or ever sufficient for the purpose. Half of it is not unfrequently wasted over irrelevant matters, and the really important work is usually compressed into a "circle of greatest confusion" during the lingering moments of the sitting. Therefore let those who are so anxious to see our Society important to us all say so, and that quickly, and in print. A man may be hot and impracticable, or, on the other hand, nervous and inefficient in the debating room; but let him take pen and ink in the quiet of his own fireside, and straight flies forth into all lands that *littera scripta*—those *τρετα ππερα*—words, winged now, to be seen and heard of all. About twelve months since a storm, long looked for by those behind the veil, at last burst over us. Our Society found itself rent in twain, and there arose two parties, with two incompatible interests, each strongly, and even somewhat bitterly, opposed to the other. That section of our body now conveniently called the local Fellows, whether holding annual or life tickets, have certainly a strong, if not altogether invulnerable claim to consideration. They became members on the expectation, but by no means on the condition, that nothing should be done to curtail or modify their use and enjoyment of the South Kensington Gardens. Certain measures proposed by the Council of the time raised their apprehensions and led to their open hostilities. Let me explain why I hinted that our local co-Fellows' case was short of perfection. Had measures unfavourable to them been actually carried into effect, they would not have suffered more than those who went before them. We of the older generation have suffered also. Years ago I and my contemporaries entered the Society, which then held forth to us the use of a very valuable botanical library, and the enjoyment of one of the loveliest grounds in town, and for these things we were these were alienated and are gone—both sacrificed to the common enemy, heavy, hopeless, irrepressible, monetary encumbrance. Was there no bitterness in bearing this? Yet we hoped on and bore it. Secondly, these members must bear in mind that in becoming such they bound themselves morally, if not legally, and independently of collateral benefit to carry out the objects of their charter. It remains to speak of the other party—I hate the word party—the other 400 or whatever their numbers may be, a large portion of whom the thing in question have been brought up in a different school of thought. These have had their bitter day, and its memories now perhaps sit lighter upon them. Kindly words have been spoken on both sides, and a disposition to concede, with honour, seems apparent on all sides. Upon this position I found my hopes of making a successful dash for the attainment of a better state of things. That a break-up of the old state, a *coup d'etat*, so to speak, is inevitable I need not stop now to argue. The question is now a strong and solid one on the subject. But before any weighty matter of this kind can be approached, indeed under any circumstances whatever, the personnel of the governing body must be modified to meet the requirements of the charter and satisfy the demands of the large majority of members for a truly horticultural Council. Without going into the question of method and means, I confess I see no "impediment why these two" opposed and perplexed parties, indeed above, should not each neutralise the double-edged position of the other, and all work together as one great influence for good. One thing remains to be considered, and that not an unimportant factor in the business. I and not a few others, I believe, still have the firmest conviction of the illegality of the present Council. [Surely not now. Eds.] I have no desire now to press this in a spirit of offence or antagonism, but a difficulty it is, and it is one which will have to be got over. But if a large and influential body of Fellows should be gathered together as doubtless they will be at the adjourned meeting—if these men could see the prospect of the immediate improvement of their government by the appointment of an ample proportion of horticultural expert independent members, then I think that the Society might be justified in stamp-

ing with legality the uncertain position of their government. If the meaning shadowed forth in my letter still appear indistinct, it is to the effect that if, as I hope, the hone of contention is removed, then whatever the constitution of the Council may be there is no reason why all parties should not act together with one accord and for one object, *Pro bono republica*. *R. Trevor Clarke.*

Use of Turpentine by the Reduvius.—You ask where are the "wonderful statements recorded?" They are to be found, first, the facts in detail, in the *Proceedings of the Academy of Natural Sciences of Philadelphia*, vol. xxiii, p. 110; second, the explanation of the use of the turpentine, in vol. xxiii, p. 51. Leaving out the misapprehension, that in my report of anything I have said there is ought to warrant the idea that I endorsed the Chest trick as genuine, I cordially unite in the meriment which my English friends make over my "zoological" or other statements, feeling quite safe that, when the bill comes in for final settlement, I shall not be called on to wholly pay for the entertainment. *Thomas Methuen.*

Barked Elm Trees.—In a field near here there are standing a number of fine Elm trees. During the past severe weather some hungry colts were turned into the field, and these, for stress of food, barked some of the trees completely to a height of 6 feet. The stems are from 5 feet to 6 feet in diameter, and the trees hitherto healthy and vigorous. Will any of your readers who have had experience of a similar case please to say whether trees so injured will recover if allowed to stand, or whether they will soon die. *A. Dean, Balfont.* [It depends on the depth to which the trees are barked, and other circumstances not explained. Eds.]

Law Notes.

A DISPUTED BASKET CASE AGAIN.—*Pankhurst v. Godwin.*—At the Westminster County Court on Wednesday last this case came on for hearing. The plaintiff, a salesman of Covent Garden, sued the defendant, a salesman at Manchester, to recover the sum of £4 6s. for baskets in which Currants and other goods had been sent from London to Manchester. Mr. Robert Willis, solicitor, appeared for the defendant, and proceeded with witnesses from Manchester to prove the return of the baskets. The defendant had paid £2 into court, and denied further liability, and now applied for the costs of himself and his witnesses from Manchester. After some discussion between the plaintiff and defendant, the plaintiff agreed to receive the amount paid into court on condition that the costs on either side were abandoned. This arrangement was ultimately effected.

Obituary.

The death of Sir CHARLES LYELL at a ripe age may fairly be said to close an epoch in geological history. Students of geology know the state in which the science was prior to the days of Sedgwick, of Murchison, and Lyell. They know how vast has been the influence of the teachings of the last-named; how he may fairly be said to have revolutionised the science, and claimed the still, restless forces of Nature, ever acting throughout unconceivably long periods of time, as the real factors in the changes which have taken place on the surface of the globe since creation's dawn. Nowadays it seems strange that any other doctrine should have been held, and the intervention of numerous series of violent cataclysms to explain almost every phenomenon would be scouted as ridiculous. It was not so when Lyell began. His *Principles of Geology* is a work fascinating in its style, full in its details, accurate in its statements, and convincing in its arguments. It was the text-book of those dicta students pinned their faith; and even those who were not geologists studied the third book with avidity. In that third book were treated the questions relating to the changes in the organic world now in progress, the nature and limitations of species, the different races of man, and various other matters of interest not only to the naturalist, but to any intelligent reader. Of course it was in pre-Darwinian days. Then came Darwin, and Lyell was looked upon as a champion of a mighty champion of the idea of permanence in species to demolish Darwinian speculations. But among the first converts was Lyell himself, and no one has exercised greater authority in diffusing Darwinian notions as to the probable gradual modification of living organisms than Lyell himself. In this matter Lyell showed a noble spirit of self abnegation which philosophers of his calibre have not always practised. To usay and reason the teachings of a honoured career, and adopt from honest conviction the views of another, is not so common a thing under such circumstances that it may be passed over without notice. It redounded to the credit of Lyell, and was a vast source of strength to the rising doctrines of

Darwin. The "third book" wears naturally a very different aspect in the later editions to that which it did in the earlier ones. Another book of Lyell's must also be mentioned—his *Student's Manual of Geology*—one of the very best works of its class ever written. Not to every author it is given to write the best textbook for advanced students and the best manual for beginners. But most will agree that Lyell did this. In private life Lyell was beloved, and his loss will be severely felt among many to whom geology is but as the uniform inscriptions and Darwinism as heresy.

It is of interest to add, in conclusion, that Lyell's father was known as a botanist, and was an early patron of Lindley, who dedicated his monograph of *Roses* to his benefactor.

The Villa Garden.

SEED SOWING.—The time and mode of sowing seeds are matters of considerable importance to villa gardeners who are in the ranks of elementary learners in things relating to the garden. Various questions are put in relation to the sowing of seed from time to time through the medium of the gardening journals, and in other ways. One person is anxious to know whether seeds should be sown thickly, and then wishes to know the proper depth, and if some sorts should be sown thicker than others; and some plead ignorance as to the proper place where they should be sown, the distances apart, &c. These are apparently small matters, but they are of prime importance to those who are learners of the first principles of gardening; for, simple as these questions may appear to the practical horticulturist, they are the very first that arise in the minds of those who have no gardening experience.

PREPARATION OF THE SOIL.—A most important thing in relation to seed sowing is the preparation of the soil. There must be a soil fitted to assist in the germination of any seeds that may be placed in it. The New Testament parable of the Sower who went out to sow, contains much instruction for gardeners, as well as being fitted to serve moral ends. The soil intended for seeds must not be low and wet; it should, instead, be open, friable, and fairly rich, so as to supply nutriment to the growing plants, and it should also be freshly stirred or turned up when seeds are put into it. The soil is apt to become caked on the surface after being exposed to heavy rains, and is thus closed to some extent to atmospheric influences, which have much to do with the rearing of the plant. It is a very injudicious proceeding to draw drills and sow seed in soil that has recently been visited with heavy rains without previously breaking it up, and allowing it to become somewhat dry before doing so; the result is, that the seeds are deposited in a cold, clammy soil; and as the mechanical operation of sowing always entails more or less treading with the feet, this aggravates the evil considerably.

Soils vary so much in different localities—in one part heavy, stiff, and retentive of moisture, in another light, sandy, and dry, through being shallow, and in the gravel, with varying conditions between these two extremes—that it is necessary for an experienced character can be devised to meet the necessities of every case. It may, however, be observed that a clay soil is always a cold one when the weather is moist; while when the weather is hot and dry it is frequently baked as hard as a mud floor that has become dry and firm with age, or nearly so. In such a soil it cannot be expected that seeds would germinate so freely as in a black or brown friable loam. Then it must be borne in mind that some of the finer flower seeds, sown too nearly will not germinate at all for lack of the natural warmth that is essential to their development. Every garden, then, having a soil of a cold and tenacious nature, is always a late and untoward one, and will remain so till the nature of the soil is to some extent changed. In localities where there is much rainfall, and not a great deal of genial warmth at any season, the growth of vegetables is very slow; and, as a matter of course, germination of the seeds will be both irregular and imperfect. How often the gardener and the seedsman come in for a share of blame that ought not to be laid to their charge. Occasionally seeds are to be met with the growth of which is by no means so good as might be expected, but more frequently the failure, when it occurs, is attributable to radical defects in the soil—to an unsuitable situation, and, it must be stated, to incompetent sowing. But on the other hand—and it is only just that the alternative be clearly put—before the gardener can be charged with incompetence it must be proved that the soil was proper, the situation good, and the seeds of an excellent growth, and that they were sown hap-hazard, without the sower knowing what he was about.

SOWING.—A few general rules may be appropriately laid down under this heading, and they will be applied as circumstances dictate their adaptability.

One rule very necessary of observation is this—that small seeds should not be sown very early in retentive and heavy soils. As the conditions of such soils are against a perfect germination of the seed, they should be sown rather thicker than when the soil is fine, friable, and early. Now-a-days, gardeners of all grades desire to sow early—much earlier than our immediate ancestors did. If we get a few mild sunny days early in February, then there arises a passionate desire to sow, and it is done, notwithstanding the warnings of old and experienced gardeners, who say early sowing is not advisable under the most favourable circumstances, for, fitting as the opportunity seems, there will be many changes in the weather, and much cold and wet ere spring sets in earnest. The inevitable consequence is, that unpropitious weather and the devastation wrought by slugs and other pests tell much against the success of the crop, being cut off or covered so soon as they make their appearance above-ground. The more the necessity, therefore, for thick sowing, as the plants greatly assist in nursing each other in their younger stages of growth.

Here is another point of importance—it is much easier, as well as much better for the growing crop, to thin seedlings than to have to transplant them, and thereby run the risk of losing the crop altogether. When the seedlings remain where they were sown, they are able to stand drought and drying winds; but if they are small, and with delicate roots, they bear transplanting badly if the weather be against them. Such plants as winter stuff, Broccoli, Cabbage, Brussels Sprouts, &c., must of necessity be transplanted, to do which opportunities should be waited for, so that, to use a term of the old gardeners, it may be done during a dripping time, *i.e.*, when refreshing showers are prevalent.

A novice at gardening is pretty well certain to fall into the prevailing bad habit of sowing small seeds too deeply. This particularly relates to flower seeds. In the matter of vegetable seeds there is not so much danger of smothering them under an almost impenetrable coating of soil. An old gardener once said that the size of the seeds is a very good guide to take when in the act of sowing. All very small seeds only require the slightest covering, and were it possible to keep the ground in a certain state of moisture on the surface, it would be best to do without drilling, and press the seeds slightly, so that each seed might then form its own cavity in the soil.

Our advice to villa gardeners who are contemplating sowing, is to fork over all ground intended for the reception of seeds, so that it may become friable and pulverised under the action of frost and drying winds. The present windy weather will no doubt be succeeded by genial, sunny days, and then seed sowing will have to be pushed on with alacrity, for the spring-time is at hand.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 24, 1875.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		Hygrometric Declensions from Glasgow's Table, 3rd Edition.	WIND.	RAINFALL.
	Mean Reading.	Departure from Mean of 18 Years.	Highest.	Lowest.			
Feb. 18.	30.0	0.0	32.0	2.0	89	N.N.E.	0.04
19.	29.95	+0.13	34.7	+2.7	89	N.N.E.	0.02
20.	29.85	+0.04	34.9	+2.9	91	N.N.E.	0.15
21.	29.94	+0.13	30.3	-2.7	88	E.	0.01
22.	29.96	+0.14	30.3	-2.7	80	E.N.E.	0.00
23.	29.62	-0.19	32.6	0.6	78	E.S.E.	0.00
24.	29.71	-0.07	36.0	4.0	80	E.N.E.	0.18

Feb. 18.—Overcast, dull, and strong wind throughout. Snow in afternoon and evening.
 19.—Overcast, dull, and cold, with occasional snow throughout.
 20.—Overcast, dull, and cold, snow all day. Lowest temperature of vegetation, 27°.
 21.—Fine, bright, with light clouds, and brisk wind.
 22.—Very fine bright and cloudless day.
 23.—Fine and bright, but cold; light clouds prevailed throughout. Lowest temperature of vegetation, 23°.
 24.—Overcast, dull, and foggy. Drizzle, and sleet; sleet and dull snow ceased about 2 P.M. Depth, 3 inches. Lowest temperature of vegetation, 24°.

— In the vicinity of London the reading of the barometer at the level of the sea decreased from 30.00 inches at the beginning of the week to 30.04 inches by about mid-day on the 14th, increased rapidly to 30.50 inches by the morning of the 16th, decreased again to 30.00 inches by the morning of the 20th, and was 30.07 inches at the end of the week. The

readings were all above their averages, that for the 16th being 0.47 inch in excess. The mean reading for the week was 30.20 inches, being 0.09 inch above that of the preceding week.

The highest temperature of the air at 4 feet above the ground varied from 50° on the 14th to 33° on the 20th, the mean value for the week being 42°. The lowest temperature of the air ranged from 42° on the 14th to 20° on the 20th, with a mean for the week of 33°. The mean daily range of temperature in the week was 8°, ranging from 14° on the 15th and 16th to 4° on the 19th and 20th. The mean daily temperatures of the air were as follows:—14th, 46° 6'; 15th, 41° 3'; 16th, 36° 6'; 17th, 39° 9'; 18th, 35° 4'; 19th, 32°; and 20th, 30° 6'; and the departures from the respective averages were, +7° 8', +2° 6', -2° 1', +1° 2', -3° 4', -6° 8', -8° 3'. The mean temperature for the week was 37° 5', being 1° 3' below the average of sixty years' observations. The highest readings of a thermometer with blackened bulb in vacuo placed on grass in the rays of the sun were 93° and 76° on the 15th and 18th, but the highest reading on the 20th was 44°. The lowest readings of a thermometer placed on grass with its bulb fully exposed to the sky were 28° both on the 19th and 20th, but on the 14th 40° was the lowest reading; the mean for the week of the seven low readings was 31° 9'.

The direction of the wind was N. and N.E., and its strength feeble. The weather during the week was dull and cold, and the sky generally overcast, dense fog prevailed on the morning of the 16th, and snow fell on the 19th and 20th.

Rain or snow fell on six days during the week to the amount of 0.28 inch.

In England, the extreme high day temperatures ranged from 58° at Sunderland to 50° at Newcastle-on-Tyne, the general average all over the country being about 52°. The extreme low night temperatures varied from 33° at Leeds to 25° at Portsmouth, the general average being 29°. The mean of the extreme ranges of temperature in the week was 22°, the greatest range being at Hill and Sunderland, 27°, and the least at Leeds, 19°. The mean high day temperatures ranged between 49° at Sunderland and 41° at Norwich, with an average value of 44°. The mean low night temperatures varied from 35° at Sheffield and Leeds to 30° at Nottingham, with a general average of 33°. The mean daily range of temperature in the week was 19°, varying as large as 17° at Nottingham, and as small as 7° at Liverpool. The mean temperature of the air for the week for all stations was 38°, being 2° lower than the value for the corresponding week in 1874. The highest occurred at Sunderland, 42°, and the lowest at Norwich, 36°. Rain or snow fell on every day in the week at Nottingham, the amount collected being three-tenths of an inch nearly, at Wolverhampton seven-tenths of an inch nearly was measured on four days only, but at Bradford three-hundredths of an inch only was recorded on two days; the average fall over the country was a quarter of an inch.

The weather during the week was cold, dull, and the sky generally cloudy. Snow fell all over the country on the 19th and 20th of February.

In Scotland, the highest temperatures by day ranged between 53° at Paisley and Perth and 50° at Greenock, the general average being 52°. The lowest temperatures by night varied from 34° at Leith to 26° at Perth, with a general average value of 30°. The mean range of temperature in the week was 21°, varying from 27° at Perth to 17° at Leith. The mean temperature of the week was 40°, being 1° lower than the value for the corresponding week in 1874. The highest was at Paisley, 41°, and the lowest at Edinburgh, 38°. The amount of rain or melted snow measured at the several stations varied from nine-tenths of an inch at Paisley to five-hundredths of an inch at Greenock, the average fall over the country being three-tenths of an inch.

In Dublin, the highest temperature was 53°, and the lowest 25°, the mean 38°, and the rainfall 1.44 inch.

JAMES GLAISHER, J.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—It is now quite time to see about potting the young stock of these plants, those whose roots are most active, of course, being first attended to. The earliest in this matter will usually be such things as *Boronia pinnata* and *serotina*, *Euphrasia*, *Pimelia spectabilis*, *mirabilis*, and *Hedersoni*, and the continuous-blooming *P. hispida*; *Rodla ciliata*, *Leschenaultia formosa* and *biloba*, *Hederaea tulipifera* and *fuchsoides*, *Gompholobium barbigerrum* and *polymorphum*, and *Correa*. Good to have the peat in the best manner for potting them in, without any admixture except, say, about a seventh of silver sand—that is, supposing the peat naturally to

contain little or no sand. The best peat is almost free from any; it is always of a much richer description, and plants last longer in it than in such as is of a sandy nature, which is more fit for *Heaths*. To obviate the necessity of giving water as long as possible after the potting, see that before the operation the ball of each plant is properly moistened (not saturated); this gives more time for the healing of such roots as may get injured. In potting, never disturb the roots of this class of plants more than is just necessary to remove the drainage; there must not be any attempt to disentangle them. Should any get dislodged, give them only a small shift now, with another more later, when they have got their roots into the new soil of the present potting. Be very careful to ram the new soil with the potting-stick till it is quite as hard as the ball. Plants that are healthy at the roots should have a 3 or 4-inch shift, and, in their case also pot hard, never elevating the balls so much in the pots as not to leave room for efficient watering. In an 8 or 9-inch pot, when the operation is finished, the surface of the ball should be an inch and a half below the rim. Pinch out the flowers of any that are to be grown up as quickly as possible. This especially holds good with small plants, the bloom of which does not make a commensurate return for the loss of growth entailed in the time occupied with blooming. As frequently before advised for young plants of this section, bring the strongest shoots down in a horizontal position to the rim of the pot, and there secure them, as there is no other means of laying the foundation of a well-formed specimen that will keep its balance in growth by a well-furnished base of roots. If any large plants are pot-bound it is safer to move them now than to wait till they have flowered, when the weather may be so hot as to make it impossible to keep the atmosphere close and moist for the requisite length of time for the roots to get to work; if the operation is carefully performed without disturbing the roots, and the plants are kindly treated after, it will not, as a rule, interfere with their blooming. As the plants are potted, place them on some material that can be kept moist, in hours by themselves if available; if not, let the flowers of any that are to be kept rather close. During very sunny weather use thin shading, and have plenty of moisture in the atmosphere, and for some weeks admit no side air.

Camellias.—Where *Camellias* are required late, a few plants of the late white variety, *caudissima*, and the red *Baldi*, should be grown. These, if properly prepared by late growth, and now moved into a north (or retarding) house, will furnish flowers for weeks after the general season ordinarily treated have gone by. For the like purpose of retarding the flowers, plants of other varieties that have not yet bloomed should be kept shaded from the very bright sun we often get during the ensuing month. *T. Baines.*

FLOWER GARDEN, &c.

PARTERRE AND MIXED GARDEN.—Anticipate the busy season in these departments as far as possible by keeping the work well up, and push on all alterations to completion as fast as circumstances will permit. A week saved now in such operations as relaying of turf and Box edgings, planting deciduous trees, &c., will lead to a large saving of labour later on in rolling and watering to get such things established. A few sunny days, if they have had, have started grass into growth, and as most of the ends are brown and shabby looking from the effects of winter, the appearance of lawns may be greatly improved by running the machine over them at once, as the succeeding growth will then be fresh and verdant. The ground amongst shrubs should now be lightly forked over, but only sufficiently deep to impart a fresh clean look and to bury any small weeds that may have found their way through during the winter. It is a great mistake to dig deeply among choice shrubs, as it so often does the practice of mutilating and destroying the surface roots as most inevitably occur if deep digging is resorted to. Before pointing the ground over it may be necessary to prune and thin out any common varieties that are unduly encroaching on choice kinds. Many plants may, by a judicious use of the knife for a year or two, be made to assume almost any form desirable; and once the growth is equalised in this way they will generally retain the same form with but little further attention. The best plan of pruning and natural of all forms is the pyramidal or tapering and round, or bush-shape for evergreens, to which they readily conform with but little assistance. In pruning *Conifers*, shrubs, &c., the great thing to be avoided is unnatural shapes, stiffness, and formality.

The bare ground among shrubs may be much enlivened by introducing quantities of spring-flowering plants that are natural to such situations, as *Violas*, *Snowdrops*, *Primroses*, *Daphnids*, &c. These should be planted in masses, instead of dropping isolated plants here and there, to be passed unobserved. Plants of a half-hardy nature that have been covered to protect them from the severity of the weather should now be partially uncovered to give light and air, to prevent them rotting at the collar, or

the young growth from becoming attenuated and drawn. *Aralia Sieboldii*, *A. papyrifera*, *Phormium tenax*, *Chamaerops Fortunei*, and *Cineraria cymata* [What is this? Eds.] have stood with us by being slightly protected round the collar with a few brakes; but *Bambusa gracilis* appears to have suffered a good deal, having lost all its leaves. *Herbaceous Phloxes* will now require attention. To have the heads of bloom really fine the shoots should be freely thinned out, leaving only such as are strong. If the plants are old, and have pushed themselves above the ground, they should be taken up, and divided, and be replanted in fresh, stirring, well-manured, with rotten manure. Cuttings of choice sorts will now be put in, and if grown freely on, these will afford much finer heads of bloom than can be obtained from old plants.

The different *Violas* are in much esteem for bedding, and they are certainly a very useful class of plants for this purpose, provided the beds are suitably prepared for them, and the situation is not too hot and dry. Where this is the case they either become infested with red spider, or get stunted and cease flowering. Old plants of these should now be divided, and be planted singly in light, rich vegetable soil for the purpose of lifting and transferring to their summer quarters when the bedding season arrives. The *Violas* associate well with the variegated *Pelargoniums*, especially the silver-leaved kinds, as *Flower of Spring*, *Bijou*, and others of that class, with which they harmonise, and form very chaste and pleasing combinations. Beds intended for these, *Calceolarias*, and such like plants that are fond of moisture, should be especially prepared by trenching them at least 2 feet deep, stirring in at the same time dressing of rotten manure. Edgings of *Cerastium*, *Golden Thyme*, and other hardy plants should now be taken up and related to the site required.

Such things as *Wistarias*, *Clematis*, *Wall Roses*, and all climbing or trellis plants should now be pruned and regulated, leaving the strongest and best ripened wood to be tied or nailed in. *Marchal Niel*, *Climbing Deonionisii*, *Cloth of Gold*, and such like *Roses* should have the best and ripest shoots laid in full length, except just the tips, as the flowers of these trellis plants are not so much to be depended on; these in would only produce a crop of gross shoots instead of flowers. *Pelargoniums* and other bedding plants should now be taken in hand, and potted in suitable soil, to be grown on in gentle heat for a month or so longer, so as to get good plants, as one well grown is worth half a dozen small weakly ones. To save pots and space, where large numbers are required the hardier kinds may have their roots tied up in moss, with a little of rich light soil, and be taken in hand in leaf-mould. Plants treated in this way require but little attention as to water, and they can be transferred to their summer quarters much quicker than if they were in pots. Many prefer this way of treating the green-leaved kinds, as the ball of moss forms just a sufficient check to stop that exuberance of growth which the plants are apt to assume when their roots can ramble in the beds unrestrained. Some beds last season at Ashgrove, treated in this way, were everything that could be desired. *Cerastium*, *Phloxes*, and *Pinks* should now be gone over for the purpose of cleaning and filling any gaps that may have occurred during winter. Wireworm is their great enemy, and is often very destructive; soot and lime are the best remedies; give a good dressing of these, and lightly stir the surface to work it in. *J. Sheppard, Woolverstone Park.*

FRUIT HOUSES.

PINES.—Concerning the best mode of potting these plants no doubt practically exists. The results in a great measure depend on the state of the materials used and the manner of potting the plants. Whatever time may be occupied in these matters is certainly not misapplied, for it should be borne in mind that the nature of the soil to which these plants are ordinarily subjected is such as to render them more susceptible to the pernicious effects of those invertebrate enemies, worms, than any other class of plants in ordinary cultivation. This source of mischief may be to a great extent diminished by having the plants potted firmly, even apart from its being highly essential, not only in promoting root-action, but in consequently sustaining the vital energies of the plants better than under reverse conditions; it is, moreover, rendered necessary by the substitution of the material of the time it is used. Suitable instructions were recorded in last fortnight's *Pine Calendar*, concerning starting rootless suckers and plants: the requisite number of these should now be commenced. Firmly implant them by ramming the soil into the pots—we use for this purpose part of an old broom handle, about 15 inches long; it should consist of the fibrous part of loam, broken into suitable-sized lumps, according to the size of the pots being used, which for suckers should be from 5 to 8 inches in diameter. These should be clean, and drained with about an inch of crocks. When the plants are potted, plunge them at once into the prepared bed; give them no water until the roots are to be seen at the sides of the pots, which

generally occupies about a fortnight. A genial state of atmosphere is most desirable, which should be maintained by sprinkling all available surfaces without wetting the plants, excepting if bright weather abounds, when very light syringing overhead may be indulged in not more than twice a week. If a sufficient number of strong suckers are at hand, it will be advisable to have smaller ones on the stools until about the end of May, which is a good time for another start; stools when the leaves are cut off should be inserted closely together in any of the pits having a moderate degree of both bottom and top heat where light air can be obtained. *Geo. Thos. Miles, Wycombe Abbey.*

MELONS.—The first batch is now growing apace, and will be ready for planting out about the second week in March; meantime attend well to the preparation of the dung and soils. For the cultivation of early Melons it is of the utmost importance to secure a good and a lasting bottom-heat, and hot-water pipes, without doubt, are the best; a very successful result, however, may be achieved by the aid of fermenting materials only. The best form of house for all purposes for early Melon growing is a low span, 10 feet wide in the interior, and built at a level angle about 35°. Such a structure allows of a 3 feet path down the centre and a bed on each side, and should be provided with eight rows of hot-water pipes, two running through each bed for bottom-heat, the remaining four being distributed one on each side the path, on the curb, and the other running round by the front walls. This arrangement will be found to work a much better than cramming together a lot of pipes—very common error amongst horticultural builders. The pipes in the bed should be covered with rough bricks to within a few inches of the top, and over these should be placed a layer of turf, grass side downwards, and then the soil—nice mellow, and rather heavy loam and cow dung, or nicely dried horse-droppings—raised in hillocks and well rammed down. For pits and frames, see the directions in this week's *Cucumber Calendar*. Keep the young plants near to the glass to secure a sturdy growth, and those that are intended to travel up a trelliswork need not be stopped at present; others that are to be turned out into the open should be stopped about the first rough leaf, at discretion of the cultivator. Maintain a mean of 72°. *Thos. Simpson.*

Enquiries.

He that questioneth much shall learn much.—BACON.
[Many enquiries which reach us would be more suitably answered by those of our correspondents who have experience or requirements are, or have been, similar to those of the questioner. These we propose, in future, to gather together for facility of reference; and as fellow feeling makes us wondrous kind, so we would fain hope that this enquiry column may serve as a bond of sympathy and good-will between our correspondents and readers, and be the means of eliciting much valuable information. Eds.]

39. POLYANTHUSES.—*J. M.* wishes to know any of the old-fashioned name varieties of *Polyanthus* with laced margins are now obtainable?

Answers to Correspondents.

ALYSSUM. *E. R.* The variegated bedding variety is usually propagated by cuttings at this season. It strikes most freely in heat now. We cannot tell you where you can get seeds of it.
BOOKS. *H. G. Mrs. Loudon's Amateur Gardener's Calendar* (Warne & Co.).—*C. Hibberd's Amateur's Greenhouse* (Groombridge).
BUG ON VINES. *Agropyrum.* Your Vines should have been dressed with sulphur to grow, with a mixture of Gishurst Compound and clay, or soft soap, sulphur, and clay, mixed to the consistency of thick paint. We can only recommend you now to brush all off that is easily accessible, and so keep it under until the foliage is off.
CAPE VINES. *A. M.* You may either cut them back and start again, or propagate afresh from eyes. Unless the wood is tolerably well ripened, the former would be the safest plan; but you can try both.
CORVILUS. *A Perplexed Student.* Delete the words "in hand," which are evidently there by accident, and the meaning will be clear.
DRYING PLANTS TO RETAIN THEIR COLOURS. *H. C. J.* We know of no certain and easily applied method of drying leaves and flowers that will keep them in their natural colours. Drying in silver sand perfectly free from moisture in an oven is sometimes practised, but is not always successful.
EXCHANGE. *Aberia.* Write to Dr. Aug. Kanitz, Jardin Botanique, Klausenburg, Hongrie.
INSECTS. *G. C.* The "insect enveloped in a white, stringy, Cotton-like substance" is, no doubt, the mealy-bug—a pest which is now known to gardeners. A strong application of Gishurst Compound is the remedy, but you must apply it again and again, until the pest is got rid of.
NAMES OF PLANTS. *Hopkins.* Your plants were damaged beyond recognition in coming to garden. The post. Send better specimens in a small box.—*J. Marshall.* 1, *Pilea serpyllifolia*; 2, *Adiantum cucu-*

tum; 3. Selaginella Gaiolotti; 4. Goniopteridium nerifolium; 5. Selvia (next week); 6. Woodwardia radicans; 7. C. Pittosporum tenuifolium. —Irene should send a better specimen. It is the so-called Alexandrian Larra (Ruscus racemosus).

OCHEA, OCKRA, or OKRA: Cucumis. This is Abelmoschus esculentus, a Malvaecous plant, which produces the Ochro or Gobbo pods used in thickening soups. It is a native of the West Indies, and requires the treatment of a stove annual.

POTATO PRIZES: A. D. Send your suggestions to the Messrs. Hooper.

SEED SOWING: Young Amaranth. Seeds that require heat to start them are much more delicate to manage, sown in pots, the latter being set in the heated frame, than they are if sown in the soil which covers the beds. The coal-ashes for the floor of the cold frame are intended as a dry foundation on which to set the pots, and also to prevent worms getting into the pots through the drainage hole. We do not understand how the "mill-dust" is to be used as a source of heat. If you want heat, you should either make up a hotbed of fermenting stable manure (mixed with dead leaves of trees, if you can get them); or, if the structure is a permanent pit, carry hot-water pipes, or a tank, through it, which would necessitate the fixing a boiler. The site proposed for the greenhouse will probably answer. The latter, and the pit, might be heated from one boiler, if conveniently placed.

WATER MELONS: Cucumis. Treat these like other Melons. For details consult the calendar of Garden Operations in another column.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers sending Post Office Orders, to be good enough to write to the Publisher at the same time.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements, or to the supply of Lists, should be addressed to the Publisher, and not to the Editors.

Markets.

COVENT GARDEN, February 25.

A moderate demand, and prices nearly stationary, except for quite first-class goods, which are a little higher. There has also been some improvement in the trade demand from the provincial markets. Good English Pines are fairly inquired for, the St. Michael's having moved pretty freely; another cargo, however, is daily expected. *Ther. Taylor, Wholesale Apple Market.*

FRUIT.

Table with 3 columns: Fruit name, s.d.s.d., and price. Includes Apples, Chestnuts, Raspberries, Lemons, Medlars, etc.

VEGETABLES.

Table with 3 columns: Vegetable name, s.d.s.d., and price. Includes Artichokes, Asparagus, Beans, Broccoli, Carrots, Celery, Cucumbers, etc.

PLANTS IN POTS.

Table with 3 columns: Plant name, s.d.s.d., and price. Includes Azaleas, Begonias, Bouvardias, Cinerarias, etc.

CUT FLOWERS.

Table with 3 columns: Flower name, s.d.s.d., and price. Includes Azaleas, Camellias, Carnations, Cineraria, etc.

SEEDS.

LONDON: Feb. 24.—In consequence of the wintry weather farm seeds are for the moment in diminished request. All kinds of Clover seeds are, nevertheless, held with great firmness. The arrivals of red seed from America continue on a limited scale; this fact, coupled with the acknowledged lightness of the stocks held here, imparts considerable steadiness to the trade. Trefoils are in good request at last week's advance. Imported Italian is noted, 1s. per bale dearer. Alsikes and white Clovers are quiet. A good business has been doing in spring Tares, at a reduction on recent ton currencies of from 15s. to 25s. per quarter. For Hemp and Canary seed the demand is slow. White Millet is in good request at full rates. Sanfon being scarce, and is 1s. per quarter higher. In Blue Peas the tendency of values is upwards. Linseed is unchanged. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.

At Mark Lane on Monday the market was quiet and rates for Wheat were a degree steadier. For Barley and Oats were lower in some cases. Malt remained without alteration. In Oats, sound corn supported the rates of Monday last. Maize was difficult to move, except at much lower prices. Beans and Peas were purchased at about like rates. For four country marks were fully 6d. per bush cheaper on the spot, and town made has been reduced 3s., or to 40s. per 280 lb.—On Wednesday the market was dull. There was a moderate supply of Wheat, with but little disposition to purchase, and prices were not wholly supported. Barley was rather heavy, as also were Oats and Maize, but the value of these latter was pretty steady. Beans and Peas were neglected, and flour experienced a slow demand at Monday's reduction.—Average prices of corn for the week ending Feb. 20.—Wheat, 41s. 6d.; Barley, 43s. 3d.; Oats, 29s. 9d. For the corresponding week last year:—Wheat, 62s. 10d.; Barley, 49s. 1d.; Oats, 28s. 10d.

CATTLE.

At the Metropolitan Market on Monday there was a much larger supply of beasts than on that day of the night. Choice descriptions were not any lower. Sheep were also more plentiful, and last week's prices were pretty generally realised. There was a short supply of calves; trade was, however, dull, and prices not high. Quotations:—Beasts, 3s. 8d. to 4s. 8d., and 5s. 6d. to 6s. 4d.; calves, 4s. 8d. to 6s. 4d., pigs, 4s. to 5s. 4d.; sheep, 5s. 4d. to 5s. 8d., and 6s. 2d. to 6s. 10d.—On Thursday trade in beasts was very slow, and prices were lower for all descriptions. For sheep there was less demand, and a considerable proportion remained unsold. Choice calves were scarce and dear. Trade in milch cows was excessively dull.

HAY.

Whitechapel reports that the market being rather sparingly supplied, was rather firmer, and a steady demand prevailed for the better kinds of fodder. Prime Clover ricks from 100s. to 125s.; inferior, 110s. to 95s.; prime meadow hay, 95s. to 110s.; inferior, 55s. to 75s.; and straw, 33s. to 40s. per load. Cumberland Market quotations:—Superior meadow hay, 112s. to 118s.; inferior, 90s. to 100s.; superior Clover, 118s. to 126s.; inferior, 90s. to 105s.; and straw, 40s. to 44s. per load.

POTATOS.

The Borough and Spitalfields markets report large supplies on sale. Sound qualities move off freely at full prices, and for medium parcels a steady demand prevails. Quotations: Regents, 75s. to 110s.; Victorias, 100s. to 125s.; Flukes, 120s. to 140s.; Rocks, 60s. to 70s. per ton. The King's Cross report is to the effect that the best descriptions are in demand at full prices. The supplies offered are large. Quotations: York and Lincoln Victorias, 100s. to 120s.; ditto Flukes, 110s. to 140s.; York Regents, 100s. to 135s.; Lincoln Regents, 90s. to 110s.; East Lothian Regents, 80s. to 115s.; Perth and File Regents, 70s. to 80s.; ditto Rocks, 65s. to 70s.; Kent, Essex, and Cambridge, 60s. to 80s.; ditto Regents, 90s. to 120s.; French, 50s. to 55s.; ditto seedlings, 70s. per 72s.; Belgian Kidney, 70s. to 75s. per ton. Last week's imports into London amounted to 6912 bags, 1847 tons, 38r sacks, and 100 packages.

COALS.

There was an active demand for house coals on Monday, at an advance of 1s. per ton. The weather continuing severe there was a further rise of 1s. 6d. at market on Wednesday.

New and Genuine Seeds (Carriage Free).

B. S. WILLIAMS, Nurseryman and Seed Merchant, VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

Complete Collections of Kitchen Garden Seeds,

to suit Gardens of various sizes, 2x1, 4x2, 6x2, and 8x4, each.

Table listing various seeds and their prices, including Broad Bean, Broccoli, Brussels Sprouts, Cauliflower, etc.

NEW AND CHOICE FLOWER SEEDS.

Table listing various flower seeds and their prices, including Alonzoa, Almarantha, Auricula, Balsam, etc.

VICTORIA AND PARADISE NURSERIES, Upper Holloway, London, N.

Planting Season.—Avenue Trees.

LIMES, 12 to 16 feet high, straight stems, glirging 4 to 8 inches at 4 feet from the ground, with well-balanced heads, and splendidly rooted. A stock of more than 6000 of these trees to select from. PLANES, OCCIDENTAL, 12 to 16 feet. HORSE CHESTNUTS, 10 to 12 feet. SCARLET HORSE CHESTNUTS, 10 to 12 feet. NORWAY SPRUCE, 10 to 16 feet.

All being stout, straight stemmed, and finely rooted. Every Tree has been removed within two years. POPLAR, CANADIAN, NEW, 15 to 20 feet.—This new variety of Poplar, far exceeding in rapidity of growth any tree I am acquainted with, is strongly recommended as a Town Tree, especially in smoky districts. There are hundreds in this Nursery 3 years old, measuring 18 to 22 feet high, and stout in proportion.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey, S.W.

Advertisement for Suttons Grass Seeds for All Soils, Carriage Free. Includes logo and text: 'Suttons Grass Seeds for All Soils. Carriage Free.'

SPECIAL FEBRUARY LIST OF GRASSES, CLOVERS, &c., Is now ready, and may be had, gratis and post free, on application. ROYAL BERKS SEED ESTABLISHMENT, READING.

 DUPLEX UPRIGHT TUBULAR BOILER and FUEL ECONOMISER,

KING'S ROAD, CHELSEA, LONDON, S.W.

COWAN'S COMPENSATING SYSTEM OF HEATING.

WAUCHOPE & COWAN'S NEW AND ECONOMICAL SYSTEM OF MAKING GAS.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, having recently been offered a valuable Patent for the Manufacture of Gas, to be worked in combination with their Patents for Heating Horticultural and other Buildings, have found it necessary, so as to acquire and work such Patent, to form a new Company with larger powers; the old Company having been incorporated for the purpose of dealing with the Heating Patents only.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, will, therefore, be wound up and dissolved, and a new Company, called "THE COWAN PATENTS COMPANY, LIMITED," has been formed, and has taken over the entire business of the old Company. From this date the new Company will carry on the business of the old Company, with the addition of the New System of Making Gas—full particulars of which, with Illustrations, can be had on application.

Contracts entered into by the old Company will be carried out by the new one, and all its responsibilities fulfilled.

The Directors of the new Company have thought it advisable to change the Offices from Lothbury to 21, WHITEHALL PLACE, WESTMINSTER, S.W., where all communications should in future be addressed, and where full information concerning their Patent Systems of Heating and Gas Making can be obtained.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

ILLUSTRATED PAMPHLETS SENT FREE ON APPLICATION.

All Communications in future to be addressed—

21, WHITEHALL PLACE, WESTMINSTER, S.W.

Illustrated and Priced Catalogues of every description of Horticultural Wirework on application.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER,
24, Portobello Terrace, Notting Hill Gate, London, W.
We beg to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability.
For Neatness.—Because all the Wires are kept perfectly tight, without the use of the Raddisseur.
For Strength.—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.
For Durability.—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as a thin Wire, as used in the French system.
The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 753 yards long, wired on both sides; making a total length of 1506 yards,—our system being chosen in preference to any other.
Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

Messrs. J. B. Brown & Co's
VIENNA PRIZE WIRE NETTING.

THE

Agricultural Gazette Almanac, 1875.

The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compilations are many good servicable hints on fattening, catelgories of root crops, &c. The illustrations are admirable executed, many being engraved from photographs."—Weekly Dispatch, Jan. 31, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition."—Lloyd's, Jan. 17, 1875.

"It is a very cheap three-pennyworth of information of interest and utility to farmers, and contains numerous illustrations."—The Field, Jan. 16, 1875.

"To add to the usual matter to be found in an almanac, we here have useful information to the farmer, as to stock and crops, with illustrations of prize animals."—Gloucestershire Chronicle.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for daily use."—Farmer's Herald.

"The Calendar contains all the fixtures for cattle shows, races, &c.; is a diary and memoranda by the side, and various useful information of an agricultural character."—Oxford Times.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics and series of points of the Prince of Wales, Dr. Voelcker, and Viscount Droghda, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'"—Bath Express.

"To farmers, cattle dealers, and others interested in agriculture, this work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is profusely illustrated with engravings chiefly taken from photographs."—Dewsbury Chronicle.

"This almanac, which appears to be carefully compiled, and the contents judiciously selected, may be commended to the notice of agriculturists generally. It is issued at a low figure, and contains a large variety of information. There are numerous illustrations, and the likeness of the Prince of Wales, which forms the frontispiece, is especially deserving of mention."—Gloucester Journal.

"To all persons interested in agriculture in this neighbourhood the 'Agricultural Gazette Almanac' for 1875, price 3d., will be worth obtaining. It contains a fund of information, as well as a variety of advertisements on topics especially connected with the portion of the community which it is intended to serve."—Taifos Guardian.

"Although this almanac comes rather late it is none the less valuable, as containing a fund of information, both interesting and valuable to any person connected with agriculture, is to be commended. In addition to the usual calendar it contains a diary, supplies us with authentic portraits and descriptions of prize cattle, sheep, and pigs, a list of the members of both Houses of Parliament, another of the Chambers of Agriculture, another of County Agricultural Societies, besides hints as to practical farming. Such a combination of information must recommend itself to every agriculturist."—Western Daily Mercury.

"Though it is rather late to be noticing an almanac for 1875, we make an exception in favour of the one before us, which, owing to its great merits, and its price, ought to be purchased by every agriculturist in the kingdom. The illustrations of prize cattle, implements, &c., are a valuable feature in the Almanac."—Preston Reporter.

"Considering the valuable information for the farmer and stock breeder to be found in this publication, no wonder the first edition has had to be followed by a second. In addition to treating of farming matters, it contains a good paper on 'Crickets in the Counties in 1874,' and alphabetical lists of the members of the Parliament of Great Britain. It is besides a thoroughly illustrated with notable prize-winning stock. The diary is well adapted to the requirements of agriculturists."—East Anglian Daily Times.

"It contains a lot of information useful to farmers and breeders."—Cornish Times.

"It contains a mass of information which will be found exceedingly useful to all who are engaged in agricultural pursuits. In addition to this there is a capital portrait of H.R.H. the Prince of Wales, and several other engravings."—Gloster Mercury.

"It is a wonderfully good three-pennyworth, containing, as it were, in addition to the calendar, a series of portraits of agriculturists, some of the beautiful portraits of stock which have appeared in the columns of our contemporary within the last year and a-half. Among others, there are portraits, from photographs, of Tomachus, the Duke of Devon, Neatrice Bud, and the Prince of Wales' Champion Shorthorn Heifer—among the Shorthorns, and a lithographed portrait of a Jersey cow. There are also illustrations descriptive of noteworthy American 'winkles' for farmers."—Newrich Mercury.

"It contains much interesting matter for the farmer, who may get many a wrinkle from this unpretentious little publication. As may be imagined, the notes relate to matters of purely farming interest, such as rotation of crops, manures, and implements. These are worth consulting, the advice they contain being sound and practical."—Land and Water.

W. RICHARDS, 7, Catherine Street, Strand, W.C.

Belgian. BULLETIN D'ARBORICULTURE, de FLORICULTURE, et de CULTURE MARAICHERE. A monthly horticultural work, with superb Coloured Plates and Illustrations. Published since 1855 by F. BOURVENNE, B. PONSARD, R. ROMAS, and H. J. VAN HULLE, Professors at the Horticultural School of the Belgian Government at Ghent. Post paid 10s. per annum. H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

PARTNERSHIP. Owing to the decease of the Proprietor of an old Established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who would be disposed to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Frothero & Morris, 68, Gracechurch Street, E.C.

WANTED, as NURSERY MANAGER and SALESMAN, an experienced Man. Must be a successful Grower of Rhododendrons, Roses, Conifers, &c., and have a general knowledge of the profession.—Apply, stating terms, &c., to WILLIAM IRELAND, Piton Nurseries, Barnstable, Devon.

WANTED, an experienced GARDENER, without family. Wife as Laundress. House found.—Apply, stating age, length of service in last situation, wages, &c., to HENRY STEPHENSON, Endcliffe Vale, Sheffield.

To Gardeners.

WANTED, a GARDENER, in North Yorkshire, to assist in Laying-out a New Place, of about 3 acres, in Pleasure Grounds, Flower Gardens, Kitchen Garden, with Conservatory, Vinery, &c., and having the prospect of being Gardener, with a house on the premises, when the work is completed. Liberal wages will be given to a suitable person of good character and abilities.—Apply first to MR. PRINGLE, Landscape Gardener, Wragby, Lincolnshire.

WANTED, a single young Man, as SECOND GARDENER, to assist in the Houses; also a YOUTH—Letters, with full particulars, W. J., Post Office, Waltham Abbey, Essex.

WANTED, as SECOND GARDENER, a thoroughly practical married Man (without family preferred), to live in entrance Lodge. He must be well up in Kitchen and Flower Garden-work. Wages £1 per week, with coal and gas. Those who cannot produce a good character for honesty, ability, and sobriety need not apply.—T. TAYLOR, Gardener, Whittingham Lodge, New Barnet, Herts.

WANTED, a young Man as COOLING GARDENER. Wages 12s. per week.—E. COLLIER, Mile Ash Nurseries, Derby.

WANTED, as FOREMAN and PROPAGATOR, a young Man (not under 27), to take Charge of the Houses in a small Nursery.—Apply, by letter, to D. CAMERON and SON, Swiss Nursery, Loughborough Road, Epsom, S.

Propagator.

JOHN STEWART and SONS, Dundee, REQUIRE the services of a Man as PROPAGATOR of Roses, Rhododendrons, Fruit Trees, Conifers, &c.

WANTED, a PROPAGATOR and GROWER, principally of Soft-wooded Greenhouse Plants, Ferns, &c. Liberal and progressive wages, and make himself generally useful.—State experience and references from former employers, and wages required, WILLIAM CUNNINGHAM, Nurseryman, The Forge, Burton-on-Trent.

Notics.

WANTED, a first-rate PLANT GROWER; who is well up in the Cultivation of choice Palms, Stove Plants, and Ferns. Liberal and progressive wages, and be given to a really good Man.—Apply in first instance by letter to J. WILLS, Royal Exotic Nursery, Onslow Crescent, South Kensington.—N. B. He is wanted for the Onslow Crescent Establishment.

WANTED, a steady and industrious young MAN, under the Propagator, in the Houses: one who has had some experience with Greenhouse and Bedding Plants.—State age, when first employed, and salary expected, JNO. JEFFERIES and SONS, Royal Nurseries, Cirencester.

WANTED, a young Man under the Foreman in the Plant Houses; must have knowledge of the Work, Potting, Lying, &c. Wages 16s., with lodging.—T. DEDMAN, Sundridge Park, Bromley, Kent.

WANTED, an active young MAN, with some knowledge of Stove and Greenhouse Plants, to assist in the House.—C. FAIRNINGTON, 4, Elm Tree Road, St. John's Wood, N.W.

WANTED IMMEDIATELY, for the Houses, THREE active young Men as JOURNEYMEN: must have been used to forcing. Also a young MAN, to assist at a large forcing establishment. Wages 10s. per week and bothy.—Apply, with full particulars, to JOHN MONRO, Potter's Bar, N.

WANTED, a married MAN, accustomed to Kitchen Garden-work, to live in the lodge (one of two children, if not too young, not objected to). Also one to take the lead on the pleasure ground. A cottage on the premises.—Apply, with full particulars, wages, experience, and other particulars, to HEAD GARDENER, Dumfries, Tumbidge Way.

WANTED, TWO or THREE young MEN well up in Planting, Forest Trees, and General Nursery Stock.—WOOD AND CO. Barbours, Nurseries, Worcester.

WANT PLACES.

To Gardeners in Want of Situations, WHOSE CHARACTER SHALL BE STRICT INVESTIGATED, THE PINE-APPLE NURSERY COMPANY devote special attention to this important matter—proper Men to suitable Situations. For a GARDENER, or for a SITUATION, please send full particulars to MR. JOHN BAKER, the Pine-Apple Nursery Company, Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS in my Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head Gardeners.

JOHN LAING can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BALIFFS, or GARDENERS for First-rate Establishments or Single-hand Houses, can be met, and have full particulars applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S. E.

GARDENER (HEAD), where three or four are kept.—Thoroughly understands the Cultivation of Vines, Pines, and Stove and Greenhouse Plants, Orchard-work, and Kitchen Gardening. Good character from present place.—J. B., The Gardens, Hill Top, Erping, Essex.

GARDENER (HEAD), where two or more are kept.—Age 28, single; understanding Forcing Vines, Stove and Greenhouse Plants, and the general routine of the Garden.—Good character from present place.—J. B., The Gardens, Hill Top, Erping, Essex.

GARDENER (HEAD).—A GENTLEMAN is very desirous of recommending a thorough practical Man as above, who has been an employer for the last twelve years. Married.—P. D., Stoke Post Office, Slough.

GARDENER (HEAD).—Age 34, married; has a thorough practical knowledge of the growing of all kinds of Fruits, Flowers, and Vegetables. Good testimonials.—A. B., Pine-apple Nursery, Maida Vale, London, W.

GARDENER (HEAD).—Age 31; thoroughly understands the profession in all branches. Nearly four years' good character.—A. B., 4, Elton Villas, South Road, Forest Hill, S. E.

GARDENER (HEAD).—Age 27, married, no family; has had good experience in Forcing Fruits and Flowers, and perfect knowledge of Kitchen Gardening. Good character from present and previous employers.—R. G., Post Office, East Grinstead, Sussex.

GARDENER (HEAD).—Age 31; thoroughly understands Forcing Vines, Stove and Greenhouse Plants and the general routine of Flower and Kitchen Gardening. Good references.—H. A. D., Mr. Door, Ivery's Nurseries, Reigate, Surrey.

K I N A H A N ' S L L W H I S K Y. This celebrated and most delicious old mellow spirit is the very CREAM OF IRISH WHISKIES, in quality unrivalled, perfectly pure, and more wholesome than the finest Cognac or Brandy. Red Seal, Pink Label, and Cork Brands.—"Kinahan, LL" Whisky. Wholesale Depot, 20, Great Titchfield Street, Oxford Street, W.

Grateful-Comforting E P P S ' S C O C O A BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which may save us many heavy doctors' bills. It is by the judicious use of such articles that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating about us, ready to attack and bring down our strength. It is by escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the City and Westminster Gazette.

Sold in packets (in tins for abroad) labelled—JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS, 48, Threadneedle Street, and 179, Piccadilly, W. Works:—Euston Road, and Camden Town, London, N. W. Makers of Epps's Glycerine Jujubes for Throat Irritation.

In consequence of Superior Imitations of L E A and PERRINS' SAUCE, which are calculated to deceive the Public, LEA and PERRINS have adopted a New Label, bearing their own Signature, thus which will be placed on every bottle of WOR- CESTERSHIRE SAUCE, after this date, and without which none is genuine.—Sold Wholesale by the Proprietors, Worcester; and Wholesale and Retail, by the Proprietors, London; and Export Oilmen generally. Retail, by Dealers in Sauces throughout the World.—W. No. 4874.

Lea & Perrins

D I N N F O R D ' S F L U I D M A G N E S I A. The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best mild Aperient for delicate Constitutions, especially adapted for Ladies, Children, and Infants.—Sold Wholesale and Retail, by Messrs. D I N N F O R D A N D C O., 172, New Bond Street, London, W.; and of all Chemists throughout the World.

NECESSARY CAUTION.

MESSRS. PAUL & SON,
THE "OLD NURSERIES," CHESHUNT, N.,

Respectfully beg their Customers to address business letters simply as above,

WITHOUT CHRISTIAN NAME OR INITIAL.

Through the use of wrong Initials several letters intended for them have recently failed to reach them direct. Will their friends therefore *carefully* address—

PAUL & SON, THE "OLD NURSERIES," CHESHUNT, N.

MESSRS. PAUL & SON,
THE "OLD NURSERIES," CHESHUNT, N.

In case the recent Advertisement, stating that

"The Old Firm of 'ADAM PAUL & SON' no longer exists,"

Might lead the Public to think it related to their Firm, PAUL AND SON beg to say that

It refers to an event which occurred 15 years ago.

MESSRS. PAUL AND SON are unable to understand the motive for the resuscitation of this family matter.

They inherit the interest in the late Firm which belonged to their late Mr. Paul (one of its founders), and PAUL AND SON hold as PART OF THEIR NURSERIES, the whole of the few acres which constituted the Nursery of "ADAM" PAUL & SON, except a few perches of Osier Beds.

As in 1866 it was arranged with Mr. William Paul that their late Mr. Paul was (to quote the document) to have the benefit of the outstanding partnership accounts, and the partnership books belonging to "Adam" Paul & Son, the latter are now in the possession of PAUL & SON.

MESSRS. PAUL AND SON, concluding that all Customers of the late Firm have long since elected which House they would support, and that the only outstanding business would be the payment of some long-forgotten account, need hardly say they would be glad to exercise their right of receiving the same.

MESSRS. PAUL AND SON much regret, and must apologise for intruding these matters on the Public, but on this occasion, as on many others, they find themselves forced to act on the defensive.

Friends will kindly, therefore, in future carefully address, without Christian Name or Initial,

PAUL & SON,

THE "OLD NURSERIES," CHESHUNT, N.

IMPORTED POTATO SEED, 2s. 6d. per ounce, post free.

Most of the best English and American varieties in stock. Wholesale and retail prices on application.
CHRISTMAS QUINCEY, Potato Seed Grower and Merchant, Peterborough.

HOLLIES.

ANTHONY WATERER respectfully invites the attention of Holly buyers. Stock to be seen growing at Knap Hill. It comprises upwards of Thirty Thousand Plants, from 3 to 20 and 22 feet high, of the finer Gold, Silver, and Green-leaved kinds, offering a choice in size and variety such as can be met with in no other Nursery in Europe. Every Plant has been recently removed, and will be guaranteed.
The Stock of Common Green Hollies also occupies 5 acres of land, and Purchasers will find them in large numbers of all heights up to 15 feet.
Knap Hill Nursery, Woking, Surrey.

To Seed Potato Buyers.

HAVING had numerous enquiries from different persons in all parts of the country when ordering **SEED POTATOS** of me, such as "Can you guarantee your stocks to be true; and if so, how can you offer them at a much lower price than other Houses?" and "How is it you charge so little for Sacks and Bags?" In reply, I beg to say, that to the best of my knowledge the Seed is as good as can be procured, and the reason I can charge such low prices is, because I reside in the midst of extensive growers, and that I buy for Cash only. The American varieties I have direct from an Agent in New York, in large quantities, so am placed on the best terms, added to which I superintend my own business as far as possible, and am satisfied with small profits. Sacks and Bags I procure from the Manufacturers at their lowest quotations. This I trust will satisfy my friends and the public generally, and induce them to send for lots of Seed at once from
CHRISTMAS QUINCEY,
Seed Grower & Merchant, Wholesale and Retail, Peterborough.

New Potatos for 1875.

JOHN CATTELL with the greatest confidence recommends the following, which have received a First-class Certificate—

THE LAWSON SEED AND NURSERY COMPANY, LIMITED,
106, SOUTHWARK STREET, LONDON, S.E.; and at EDINBURGH.

SOLE WHOLESALE VENDORS OF PHOSPHO-GUANO.

LOBELIA PUMILA MAGNIFICA.

THE PINE APPLE NURSERY COMPANY

Will commence sending out this fine Lobelia on March 15 next.
Price 2s. 6d each, or 24s. per dozen for not less than half a dozen.

It received the Floral Certificate at the Royal Botanic Society, and a First-Class Certificate at the Royal Horticultural Society. It has been favourably noticed by all the gardening papers, and the *Gardener's Magazine* of July 18 says of it:—"This dwarf bedding Lobelia, exhibited by the Pine-Apple Nursery Company, is unquestionably the most important of the many bedding Lobelias introduced of late years. The colour of the flowers is a deep indigo blue, and as there are no conspicuous eyes to mar the general effect, a solid mass or band will tell in a wonderful manner.

MAIDA VALE, LONDON, W.

E. G. HENDERSON & SONS'S SEED CATALOGUE FOR 1875,

CONTAINING OVER TWO HUNDRED ILLUSTRATIONS OF FLOWERS, will be Posted Free on application.

THE VARIETIES OF FLOWER SEEDS are so arranged that the Amateur may readily recognise the most beautiful and desirable.

THE VEGETABLE DEPARTMENT is complete with the best proved kinds in each Section.

ERYTHRAEA MUHLENBERGII.

ERYTHRAEA MUHLENBERGII.

This beautiful new hardy annual is one of a group of elegant alpine herbaceous plants, remotely allied to the tribe of Gentians, the majority of kinds in the present group producing rose-coloured flowers. The one now offered is a remarkable plant, from 12 to 18 inches in height, having opposite, oblong-spathulate-shaped leaves, erect flower-stems, with terminal cymes clusters of bright rose-coloured flowers, with yellow centre, from 1 to 1 1/2 inch in diameter, and producing a succession of bloom, which retains its beauty in a cut state for several weeks. Its profuse flowering, neat growth, and richly-coloured bloom, distinguish it as the most effective species in its family yet known. 1s. or 2s. 6d. per packet.

SOLANUM HYBRIDUM HENDERSONI.

For an illustration and full Description of this highly attractive and picturesque Winter Fruiting Plant for Conservatory and Drawing-room Decoration, see page 265 of the Gardeners' Chronicle for February 27.

ROMNEYA COULTERI.

See Description and illustration of this new and beautiful Annual, with remarkably large and fragrant snow-white flowers, at page 280 of the Gardeners' Chronicle for February 27.

Also for a GENERAL LIST of the most desirable Novelties for the season as fully described and illustrated in the Catalogue.

Imported GERMAN ASTERS, BALSAMS, LARK SPURS, STOCKS, ZINNIAS, &c., in collections as imported.

B. S. W.'s Illustrated CATALOGUE is now ready, post-free on application.

VICTORIA AND PARADISE NURSERIES, Upper Holloway, London, N.

CHOICE GLADIOLI, FOR SPRING PLANTING.

Gladiolus Gandavensis hybridus.

ISAAC BRUNNING & CO.

Beg to intimate that they are in a position to supply strong flowering Bulbs of the choicest kinds of Gladiolus, as under:—

- No. 1. Collection contains 100 Bulbs, in 50 choicest kinds £5 0
 - No. 2. " " 100 Bulbs, in 25 " " " 3 10
 - No. 3. " " 50 Bulbs, in 25 " " " 2 10
- Fine selections can also be supplied at 6s., 9s., 12s., 18s., to 30s., per dozen.

GLADIOLUS BRENCHLEYENSIS.

For growing in large quantities either as back lines to ribbon borders, beds, or in clumps, this variety cannot be surpassed; its intense bright scarlet flowers claiming for it the position of one of the most showy occupants of our gardens. Being very large growers of this variety we beg to offer it at the following low prices:—

- Per 500, 40s.; per 100, 9s.; per dozen, 1s. 6d.

FINEST MIXED 20s. per 100; 2s. 6d. per dozen.

FINE MIXED 15s. per 100; 1s. 6d. per dozen.

NEW AND CHOICE FLOWER SEEDS,

POST FREE.

- ALONSO LINFOLIA** (New), per packet, 1s. 6d.
- ASTER**, Victoria, in 12 finest varieties, 2s. 6d.; do, mixed, 6d.; Dwarf Chrysanthemum-flowered, in 12 varieties, 2s. 6d.; do, mixed, 6d.; Truffaut's Peony-flowered French, 12 varieties, 2s. 6d.; do, mixed, 6d.
- LOBELIA splendens** and Rose-flowered, in 12 varieties, each 3s.; do, mixed, 6d.
- CALCEOLARIA**, choicest strain, 1s. and 2s. 6d.
- CAMPANULA MEDIUM CALYCANTHEMA** (New), 1s. 6d.
- CINERARIA**, finest strain, 1s. and 2s. 6d.
- COCKSCOCK**, extra fine, mixed, 6d. [2s. 6d.]
- CYCLAMEN PERSICUM**, Edmonds' prize strain, 1s. and HEARTSEASE, fine, mixed, 6d.
- HOLLYHOCK**, extra fine, mixed, 6d. and 1s.; do, 12 vars., 3s. 6d.
- PERILLA NANKINENSIS**, 6d.
- PETUNIA**, fine mixed, 6d.
- PHLOX DRUMMONDII** 12 vars., 2s. 6d.; do, mixed, 6d.
- POLYANTHUS**, choice, mixed, 6d.
- PRIMULA JAPONICA** (hardy), 1s.
- PRIMULA SINENSIS FIMBRIATA RUBRA**, extra choice, 1s. and 2s. 6d.; do, alba, 1s. and 2s. 6d.; do, mixed, 1s. and 2s. 6d.; do, Fern-leaved, 1s. and 2s. 6d.
- PKYETHRUM AUREUM**, 6d.
- STOCK**, Dwarf German Ten-week, 12 varieties, 2s. 6d.; do, mixed, 6d.; newest Giant or Tree Ten-week, 1s. 6d.; do, 2s. 6d., mixed, 6d.
- WALKER'S ROMER**, Double German, 12 varieties, 3s. 6d.; mixed, 6d.
- ZINNA ELEGANS**, choicest double, 6 varieties, 1s. 6d.; do, mixed, 6d.
- EYEBLASTING FLOWERS**, 12 splendid varieties, 3s.; do, smaller packets, 1s. 6d.
- ORNAMENTAL GRASSES**, 6 varieties, 1s. 6d.

All orders value 20s. and upwards carriage free.

For other varieties of choice Flower Seeds, also select Lists of Kitchen Garden and Agricultural Seeds, detailed Price Lists of Gladioli, &c., see our NEW ILLUSTRATED SEED CATALOGUE for the present season, gratis and post free on application.

ISAAC BRUNNING & CO., SEED MERCHANTS and NURSERYMEN, GREAT YARMOUTH.

Eucalyptus globulus (Australian Blue Gum). **JOHN WILSON, SEEDSMAN**, Whitehaven, has just received, in fulfillment of a Government of Seed (hitherto very scarce) of this well-known EUCALYPTUS from Messrs. Thos. Lang & Co., Nurserymen and Seedsmen, Melbourne. Prices on application.

Australian Seeds and Plants.

SEEDS OF TIMBER TREES, PALMS, SHRUBS, &c. Plants indigenous to Australia, New Zealand, and Fiji, including ARCAUCARIAS, TREE FERNS, variegated FLAX, &c. Orders may be left with our London Agents, Messrs. C. G. BLACKIE and CO., Cox's Quay, Lower Thames Street, London, E.C., for transmission.

SHEPHERD and CO., Nurserymen and Seedsmen, Darling Nursery, Sydney, New South Wales. (Established 1827.)

CRANSTON'S NURSERIES, Established 1785.—The following CATALOGUES are just published, and will be forwarded on application to the Publishers.

- DESCRIPTIVE CATALOGUE OF ROSES (1874 and 1875).
- DESCRIPTIVE CATALOGUE OF FRUIT TREES.
- DESCRIPTIVE CATALOGUE OF CONIFERS, SHRUBS, and FOREST TREES.
- DESCRIPTIVE CATALOGUE OF BULBS. Address, CRANSTON and MAVOS, King's Gate Nurseries, near Hereford.

S. BIDE can still supply good strong PLANTING WINES, in Pots, of the undermentioned varieties, at 30s. per dozen (a special price for a large quantity will be given on application)—Tynningham Muscat, Madresfield Court, Black Hamburg, Mrs. Pines's Black Muscat, Lady Down's Seeding, Burdard's Prince, Seaciffle, Black, Frankenthal Hamburg, Ferdinand de Lesseps, Black Morocco, Primrat's Frontignan, Black Barbera, Sweetwater, Crozer Muscat, Bowood Muscat, Muscat of Alexandria, White Ice, Duches de Boucheval, Rasin de Calabre.

S. BIDE, Alma Nursery, Farnham, Surrey.

POTATO SEED FOR SALE (see of the Liberty)—Two Ounces seedling One Acre, and giving Eight to Nine Tons of Tubers per Statute Acre in First Year. Price 5s. per ounce, with Instructions how to Grow it free of the Disease. **JAMES TORRETT**, Belfast.

Also, in the Press, and to be obtained of the Advertiser or of all Booksellers, price 1s.

CAUSE OF THE POTATO DISEASE, Being a Paper read at the late Meeting of the British Association.

Snowflake.

THE FINEST POTATO ever introduced; will yield from 300 to 400 bushels per acre of handsome tubers of the most splendid quality and FREE FROM DISEASE. Messrs. DANIEL BROS. have just received a consignment of this magnificent variety direct from the original raiser in America, where it has obtained immense popularity, and which is now being distributed at the following rates, carriage free to any address:—3s. 6d. per lb.; 7 lb., 21s.; 14 lb., 42s.; cheaper by the cwt.

DANIEL BROS., Seed Growers and Importers, Royal Norfolk Seed Establishment, Norwich.

ROBERT NEAL begs to offer to the notice of all Gardeners and the Trade his extensive Stock of HARDY SHRUBS, FRUIT TREES, and ORNAMENTAL TREES, ROSES, RHODODENDRONS, CLIMBING PLANTS, &c., which are now in first-class condition for removal. CATALOGUES may be had on application. The Nurseries are within a few minutes' walk of the Clapham Junction and Woodstock Common Railway Stations.

ASPARAGUS.—Special offer of 2-yr., 3-yr., and 4-yr. old. Price per 100 or 1000 on application.

ROBERT NEAL, The Nurseries, Wandsworth Common, S.W.

Special Offer for Cash.

LAUREL, Common, good, transplanted and bushy, 2 to 3 feet, £5 per 1000; 3 to 4 feet, 6s. 7s. 10s. per 1000. PINE, Austrian, fine specimens, 3 to 4 feet, 12s. per 1000. OAKS, English, extra stout, transplanted, 25s. per 1000. BLACK POLIARS of all sizes, and TREE BOX, very cheap, samples free.

R. AND J. TUCKER, The Nurseries, Faringdon, Berks.

Great Reduction in Price.

COCOANUT FIBRE REFUSE (newly made), 3d. per bushel, 25s. per 100 bushels, 45s. per 500 bushels. Larger quantities contracted for.

J. STEVENS, Fire Works, High Street, Battersea, S.E.

To Propagate and Plant Growers.

The most useful material for the attainment of successful and profitable culture is—

COCOANUT FIBRE REFUSE.—Price 1s. per bushel, or 6d. per bushel for quantities of 20 bushels and over.

MICHAEL TILBURY, Steam Cocoa-nut Fibre Works, Farm Lane, Waltham Green, S.W.

Fibrous Peat.

BROWN FIBROUS PEAT, best quality, for Orchids, Stove Plants, and Potting, 6d. 6d. per Six-ton Truck-load. **BLACK FIBROUS PEAT**, for Rhododendrons, Azaleas, &c., New Holland Plants, &c., 4s. 6d. per Six-ton Truck-load. Delivered on rail at Blackwater, South-Eastern Railway, or Farnborough, South-Western Railway.

WALKER and CO., Farnborough Station, Hants.

Sphagnum, or Peat Moss, for Orchids.

FRESH SPHAGNUM MOSS, 10s. 6d. per sack.

WALKER and CO., Farnborough Station, Hants.

PEAT—For Sale, a few hundred tons of excellent PEAT. Apply to **W. TARRY**, the "Golden Farmer", Bagshot, Surrey.

COCOANUT FIBRE REFUSE.—This valuable material now within reach of all. Truck, holding 500 bushels, for sale at 10s. per 1000 bushels. For more Works—**H. WRIGHT**, Fire Works, Heneage Street, Brick Lane, London, E.

COCOANUT FIBRE REFUSE.—"It should everywhere take high rank among the requirements for root-development." *The Gardener*, January 30. Reprinted by permission of the Liberator, and published by **H. WRIGHT**, Fire Works, Heneage Street, Brick Lane, London, E.

SATURDAY, MARCH 6, 1875.

LENT LILIES.

THIS pretty name for the "Daffodils That come before the swallow darts, and take The winds of March with beauty,"

is in very general use in England, and refers to the time of flowering—Lent being originally only another name for spring, although now restricted to an ecclesiastical season; and to the Lily-like appearance of the plant. Not that our ancestors were at all particular in their use of the term Lily: the Liliun inter spinas of the Book of Canticles was understood by them as referring to the Honeysuckle, although, as Coles says in his *Art of Simpling*, "that the Lilies amongst the Thornes were Woodbines is not known to every one." It is not necessary to multiply instances to show that the term "Lily," like "Rose," has been, and is still employed in popular parlance as a general name for almost any flower; thus the large Bindweed (*Convolvulus Sepium*) is in many places called Hedge Lily, and, to go farther a-field, the beautiful *Ranunculus Lyallii* is known as the Water Lily by the New Zealand shepherds, although it has as little affinity as the Water Lilies themselves with the order Liliaceæ.

Of late years Daffodils and their allies have received their full share of public attention, and seem likely to recover that position in popular favour which was theirs two centuries back, when Parkinson, in his *Paradisus Terrestris*, devoted pages to the description of Daffodils. Among them, however, he includes many plants which are now-a-days excluded from even the widest application of the term, such as *Hemerocallis*, *Sterbergia lutea*, the *Atamasca Lily*, and others. Mr. Baker has fully elaborated the botanical history of the various species in his papers upon the genus, originally published in these columns in 1869. A few brief notes on the popular history of Daffodils may now be added as a supplement to his more important contributions.

Some botanists have doubted whether the Daffodil is a native of this country. It has certainly a suspicious partiality for the neighbourhood of farmhouses and similar localities; but if not really a British plant, its naturalisation is of very distant date. Parkinson says it "is so common in all England, both in copses, woods, and orchards, that I might well forbear the description thereof, and especially in that, growing wild, it is of little respect in our garden;" and other herbalists mention it as undoubtedly an English plant. Various double varieties were in cultivation at the date of Parkinson's work (1629), among which he mentions Tradescant's great Rose Daffodil, which "may well be entitled the Glory of Daffodils," and has a "faire large great flower, as great and double as any Province Rose;" Parkinson's Daffodil, which he raised in his own garden in 1618, and Gerrard's double Daffodil, which "Mr. Gerrard first discovered to the world, finding it in a poor woman's garden in the west parts of England [in Wiltshire, according to Lobel], where it grew before the woman came to dwell there, and, as I have heard since, is natural of the Isle of Wight." These and many others are well figured by Parkinson; the one known as "Master Wilmer's green double Daffodil" appears to be that which is now-a-days most frequent in gardens.

The Daffodil is a favourite with children, who have a rhyme—

"Daffidowndilly is coming to town
In a green petticoat and yellow gown;"
or, as the Sussex version runs—

"Daffidowndilly grew by the well;
Who was her mother, no one could tell."

It was also a favourite with the poets, and nothing but its somewhat hackneyed use would prevent us from quoting at length Herrick's exquisite poem, "To Daffodils." Wordsworth, too, speaks of a "host of golden Daffodils;" and Spenser, Milton, and Drayton have references to it. A field of Daffodils is a very striking and beautiful object, the somewhat stiff bend of the scape just below the blossom gives the plant an appearance which, for want of a better term, may be called "pre-Raphaelite," and which is very effective.

The name Daffodil is said by some writers to be "simply the old English word affodyle, which signifies that which cometh early;" but Dr. Prior looks on it as a corruption of the Latin *asphodelus*, and thus identical with *asphodol*. He says the name was "subsequently confused with that of another flower, the so-called Sapharoun or Saffron-Lily. With the taste for alteration that is shown in popular names, the Sapharoun-Lily, upon blending with Affodilly, became, by a sort of mutual compromise, Daffadown-dilly, whence we get our Daffodilly and Daffodil." Daffodil and *Asphodel* have, however, long been distinct enough in popular parlance, although it appears that there was a danger of confounding them, as Markham, in his *English Housewife* (1637) says, "You must be careful that you take not Daffodil for Affodill." Other country names for it are Bellflower, Lent Rose, Lents, and Butter-and-Eggs, although this last is more usually applied to the double garden forms. Culpepper calls it Lide-Lily, "because it flowereth in March, which month in some countries is called Lide." Like Lent, Lide was an old equivalent for the spring season; we meet with it in the old distich, which recommends us to "eat ransons in Lide."

Like many other ornamental plants, the Daffodil has but few useful qualities to recommend it. The flowers have been employed in France as an antispasmodic, and a good yellow colour has been extracted from them. Gerarde, however, speaks of the employment of the plant in cases of palsy; he says, "The distilled water of Daffodills doth cure the palsy, if the patient be bathed and rubbed with the said liquor by the fire. It hath been proved by an especial and trustie friend of mine, a man learned and a diligent searcher of Nature, Master Nicholas Belsor, sometimes of King's Colledge in Cambridge." As an embrocation this distillation of the Daffodil has been employed in palsy, and also in dropsy in more recent times. A spirit has been distilled from the root which at one time seemed likely to be of considerable commercial importance; and a decree was published in France in 1855 by which alcohol obtained in Algeria from the Daffodil or an allied species was ordered to be admitted into France without payment of duty. B. M.

New Garden Plants.

PHALANOPSIS LEUCORRHODA, sp. n.*

This is a highly curious plant. *Phalanopsis intermedia*, Lindl. (see Paxton's *Flower Garden*, iii, fig. 310), has nearly the leaves of *P. amabilis*, and flowers more nearly approaching to those of *P. Schilleriana*, with a peculiar callus; this may be a hybrid

* *Phalanopsis leucorrhoda*, Rchb. f.—Aphrodite-Schilleriana & foliis *P. Schillerianæ*; flore prope *P. Aphrodite*; lobelli laciniæ antica, utrinque acutangula, cinctis anticis basi multo latioribus; callo selliformi, basi pendulato, extusum gibbosum. —Flores albi, sepala purpureo lavata; sepalis cæcis flexis; lobelli laciniæ laterales basi purpureo-striatula; callus aureus atro-purpureo guttatus; sepalia lateralia intus basi purpureo-maculata.

between *P. Schilleriana* as the male and *P. amabilis* as the female. The present novelty appears to be a hybrid between the pollen parent, *P. amabilis*, and the seed parent, *P. Schilleriana*. The leaves are said to be quite those of a dark mottled *P. Schilleriana*. The flower is rather larger than the flowers of an average *Schilleriana* as in many-flowered inflorescences. The colours might be richer, yet they are rather lovely; the chief colour is white; the unusually long petals being washed in the middle with rose; the white lip has the small short lines (nearly linear spots) on the base of the lateral lacinia, as in *Schilleriana*; even the peculiar dots on the base of the lower part, which are conspicuous in the last-named species, are at least indicated. In lieu of the middle lacinia, with rounded angles of *P. intermedia* (Lobbi), which are those of *P. Schilleriana*, we hear of it with sharp angles, as in *P. amabilis*. The callus is much nearer that of *P. amabilis* than that of *P. Schilleriana*, it having three prominences. The lateral sepals bear inside similar small dark spots to those which ornament *P. Schilleriana*. The sepals are tinged with pale yellow in their centres towards the apex, and are wholly white towards the base. The column is rather, and very short, as in *P. amabilis*, not elongate as in *P. Schilleriana*.

I have used in the Latin description the name of *P. Aphrodite* for science, and in the English remarks I speak of *P. amabilis*. The plant alluded to is, however, the same. It is well known that Dr. Lindley's *P. amabilis*, the Manila plant, with blunt, dark leaves, is not Dr. Blume's original *P. amabilis*, which was Dr. Lindley called the *P. grandifolia*. Those names are so much in use in the trade, in the meaning of Dr. Lindley, that it is prudent to keep them as they are for horticultural purposes, not to make a terrible confusion, between a *francuimonia*, or even a revolution of amateurs.

I have to thank Mr. Low for this great curiosity and perhaps unique novelty. He writes: "The plant which produced it (*viz.*, the flower) has leaves like those of *P. Schilleriana*, perhaps not quite so much white in the mottling as the former, but still before it flowered any one would have looked for it to be *Schilleriana*. Both species are flat in that species." The plant must, therefore, be of Philippine origin, and if Mr. Low should have lately disposed of plants of *P. Schilleriana*, the possessors of those may do well to watch the flowers of their plants. And if I had the satisfaction of being Mr. Low, I would now make a "strike" in selling any plants of supposed *P. Schilleriana* which have not flowered, the new thing having decidedly a much higher value by its being new, and exceedingly rare. *H. G. Rivb. f.*

PLATYTERIUM WILLINKII, sp. n.*

This fine and very distinct species of Stag's-horn Fern is a native of Java, whence it was introduced by M. Willink, of Amsterdam, who exhibited it with much *clat* at Ghent in 1873. It has since passed into the hands of the Messrs. Veitch & Sons, of Chelsea. The accompanying sketch (fig. 56) was made a few weeks since from the original plant, now growing in one of Messrs. Veitch's propagating-houses, and gives a very correct idea of its general aspect.

Like its congeners, the *Platytarium* is epiphytal, and protects its rootstock by the broad, roundish, imbricating bases of its sterile fronds, which, in the specimen in question, are six inches broad. The sterile fronds are erect, and slightly spreading, 12 to 18 inches high, and about a foot broad, cut down into deepish blunt-ended lobes on a dichotomous plan, the ultimate lobes being about an inch broad. The fertile fronds, which are produced in threes, not in pairs, as in some nearly allied kinds, issue from the growing point situated in a notch in the base of the orbicular clove-fitting base of the sterile ones, and at once fall straight down to a length of 2½ feet; they are quite narrow in all their parts, the basal portion being upwards of a foot long and from two to two-and-a-half inches broad at the point where the fronds become forked. The branches are quite entire on one of their margins, and dichotomously cut into numerous lobes on the other side; but in some of the fronds these lobesless or entire margins are those forming the two inner or adjacent sides of the primary branches, the lobate sides being on the exterior, while in other fronds this arrangement is reversed, and the two inner sides are lobed while the outer ones are entire. There are about three series of lobes in each branch; the ultimate divisions varying from two or three to several inches in length, and being about half an inch broad as they approach the apex, which is tapered at last to

a bluntnish point. It is on these ultimate lobes that the patches of spore-cases forming the sori are developed; they are consequently, very unequal in length, since they extend from near the base of the lobes almost to the apex, and occupy the whole surface except a narrow line on each margin. The fronds appear to be less coriaceous than those of the other species known in gardens. The venation between the principal veins consists of a series of unequal, elongated, hexagonal areoles, with occasional free veinlets.

As a species, this plant is thoroughly distinct from any of those at present known. With regard to its general habits it groups with *P. grande*, *P. Wallichii*, and *P. biflorum*—having long pendent fertile fronds cut into many narrow furcate divisions, and very broad erect sessile barren fronds with a lobate margin; but it differs entirely in its fructification, which, instead of forming a patch on the disk in the sinus of the branches, as in *P. grande*: or on a projecting lobe occupying the same position, as in *P. Wallichii*: or on a separate, stalked, rounded lobe, as in *P. biflorum*, covers nearly the whole surface of the apical lobes, as is well shown in our figure. This novelty will prove a welcome addition to the few well-marked and very ornamental species of Stag's-horn Ferns already familiar in our hot-houses, and, if report be true, there are others in store in the islands of the East, which may some day reward the search of some keen-sighted explorer. *T. Moore.*

LINDLEY AND THE ORCHIDS.

IN the preface to the second volume of his *Novis Orchidaceæ*, just completed, Dr. Reichenbach, the pupil and successor of the late Dr. Lindley in the study of the numerous and perplexing family of Orchids, gives a short sketch of the lamented Lindley's Orchid-life—if we may be allowed the term—with some incidents of their always friendly intercourse, from which we make the following extracts.

He says:—"Instead of introducing this volume with an account of my own labours and hopes, I prefer giving some reminiscences of a man, whose death, at half-past 6 o'clock in the morning of November 1, 1865, falls within its period of issue—I mean of Lindley."

John Lindley found no useful work treating of the overwhelming majority of Orchids—namely, those with waxy pollen masses. Louis Claude Richard's excellent little memoir is essentially the starting-point of our knowledge of European Orchids. True, R. Brown's earlier celebrated elaboration of the Australian Orchids includes thirteen species with waxy pollen, referred to four "genera"; but there is a total absence of a proper appreciation of the important characters. In London our investigator had the not always willingly accorded access to a small collection of specimens stacked down on paper, and the gradually increasing numbers of cultivated forms, mainly grown at his and Cattley's instigation, unfolded alluring malformations to the yet unprepared mind such as those which even now cause us to look forward with much suspense to the first flowering of many newly introduced forms.

During the period of Lindley's earliest labours many leading men were striving to reach the same goal, and discover the key to a systematic arrangement of Orchids. Kunth, who was so fortunate as to participate in the teachings of the great master, L. C. Richard, unhappily united the *Ophrys* and the *Neottia*, against the opinion of the latter. On the other hand his researches into and separation of the *Epidendrum* genera were far more successful than the contributions of Blume in his *Tabellen* and *Bijdragen*. Neither the latter, nor Aubert du Petit-Thouars—for whom, however, we must conceive a liking if we take him according to his times—developed that accuracy of observation in the investigation of the contents of the anther which Lindley made his great object, and in which lies the greatest merit of his labours among Orchids. R. Brown soon retired from the competition.

Probably we should be right in saying that the young self-dependent Lindley owed nothing to fortune. We might regard his residence in London as a gift of fortune, but he went thither from Norwich on his own responsibility, provided with a single letter of recommendation from his amiable friend, William Hooker. To remain in London especially during the critical period of the arrangement of Sir Joseph Banks' library, was a sad task; and for a long time the young interloper found no favour, on account of his having introduced, in conjunction with the reserved Scot, Brown, the bold zoologist, Gray, and the still youthful Hooker, the natural system of the hated Frenchman, where the more numerous disciples of Linnaeus had thought to pass their lives in the glory of pondering and admiring the great Swede.

Lindley possessed, moreover, extraordinarily fine

powers of observation, very uncommon energy, a brilliant talent in drawing, an acute and truthful discrimination, and a happy, appropriate, even poetical style of description, which, however, from want of time, he never fully developed. This circumstance, too, was the cause of some shortcomings in his monographs. The more thoroughly he carried out his first examination, the more he considered himself justified in making it the basis of future work. Hence, he freely took up his old descriptions, and even diagnoses, without alteration; and if the materials were insufficient, the results made him still more doubtful; but he was ever ready to defend himself with a repetition of his first views, if his statements were questioned. Much too honest not to acknowledge with pleasure his errors, if discovered by himself, he was not always inclined to be just respecting the representations of others. I remember well the case of *Calanthe vestita*, Wall, whose *Epidendrum* affinities he laughingly refused to study with me from fresh specimens, adding with that humour so characteristic of him, "I will never look at that stupid plant again." It is remarkable for that, in the eyes of the world, to be led by the gardening world, although he was honoured as the leader. It was my wish that the union of several genera, rendered necessary by the connecting links of new discoveries, should be done by himself, especially as I was perfectly satisfied that he recognised the necessity for it as fully as I did. "I should have all the amateurs up in arms against me," he replied. "They have had better enough to get the existing names into their heads." He did not do so the easy course of allowing those gentlemen to retain their own nomenclature.

I am inclined to believe that Lindley did not possess to a very high degree the gift of at once recognising what he had seen before—a gift that greatly facilitates the labours of the systematist. "Let us examine it first," he used to say, when we were looking at anything—and who investigated with more pleasure? The mere sight of his favourite, always brightly shining, simple "Ross," was sufficient to lift his spirits. "I am happy as a child, and oblivious of all cares," he would exclaim, and draw the most delicate flowers with the greatest joy—and he was always endeavouring to invest his representations with a certain grace. When finished, he would exclaim with pride, "There!" And it was with real satisfaction doubtless that he heard to say, "Ah! I am a dandy in my herbarium."

Overwhelmed with duties, he very seldom was able to linger leisurely over his investigations. His scientific labours were carried on at intervals, when he found the reliever from the pressure of the most uncongenial official duties.

Thus, Lindley spent forty of the best years of his life in uninterrupted devotion to our favourites, probably unsurpassed in perseverance by any monographer, and certainly equalled by few. During this time he, like so many other botanists, might have written scores of volumes, which is certainly a great recommendation in the eyes of those who estimate a scientific man's efficiency by the number and size of the books he may write; but this was an honour his country well renowned. [Surely no country was a voluminous writer. Eds.] Before all, it should not be forgotten that Lindley never occupied such a position in life as would justify any one in demanding scientific work from him. He never belonged to the favoured few, and nobody in wealthy England did ought for him in this respect, although the proud Briton willingly lulls himself into the belief that his country is also an Eldorado for scientific men. [We very much doubt whether scientific men are to be found in some of his last works.] It was exceedingly painful to me when I went to him, the excellent man whom I had known ever since 1849, and found that he did not remember one of his favourites—he who shortly before was one of the most active workers; and he felt the full weight of the affliction, upon which he expressed himself with such touching eloquence to Bateman and myself. I still see him in the verandah at Tamham Green, as he appeared one October evening, when he called after me, bidding me not to forget him on his next visit as often as I came to England. Except his household and physician, I was the last who saw him. I was also present at his interment, when Bentham, J. D. Hooker, T. Thomson, and many others, paid him the last tribute of respect on November 5.

We cannot tell how long science, how long botany will be pursued; but we may affirm that, so long as a knowledge of plants is considered necessary, so long will Lindley's name be remembered with gratitude.

* *Platytarium Willinkii*, Moore.—Frons large, dimorphous, subcoriaceous, thinly furnished with minute stellate hairs; at length glabrous and of a pale green colour; sterile fronds bifarious, sub-orbicular and lobed at the base, and there imbricated around the growing point, erect, the upper part deeply cut into numerous spreading, blunt, furcate lobes; fertile fronds in threes, elongate, pendent, narrowly caespitose, with scarcely any ribs, about two-thirds of their length, one of the margins of each primary branchette, the other bearing numerous lobes in about three series on a dichotomous plan, the ultimate lobes entire, narrowing towards the bluntnish point; sori forming long narrow unequal patches at the apex of the ultimate lobes of the fronds.

PLANTS THAT EAT ANIMALS.

THE Bladderwort (*Utricularia*) is a common plant, growing in shallow ponds and swamps; Dr. Gray, in his *Manual of the Northern United States*, describes twelve species found within this range, and almost every muddy pond contains one or more of them. Some grow wholly or nearly out of water; but the species which I am about to describe are immersed, with finely dissected leaves on long stems floating in the water. Scattered among the leaves, or along the stems which are destitute of leaves, are numerous little bladders, the use of which

But as the bladders always seemed to be open, the significance of the fact of the imprisoned animal was not very apparent. We thought it could hardly be for the purpose of feeding the plant, but a kind of wanton cruelty. Still, my curiosity was aroused. I soon found larger animals in the bladders—dead larvae of some aquatic insect—large enough to be seen distinctly with the naked eye. But I was not aroused to earnest work until I watched the movements of an imprisoned living larva, and saw its struggles and final death. This was in October, 1874. I now visited the ponds and procured abundant material.

The plant that I experimented mostly with was the one known to botanists as *Utricularia clandestina*. I

more slender and of lighter colour. Under the microscope it appears quite formidable, with fierce-looking jaws, and a pair of telescopic horns which it thrusts in and out at pleasure. Near the head are two beautiful brush-like telescopic feet, and at the other extremity are two more feet, which the animal thrusts out as a sort of propeller while swimming. I worked with this larva for several days, determined, if possible, to see him walk into the trap. I repeatedly took individuals from the water and placed them in the live-box with a spray of plant containing bladders; but it was of no use, the obstinate things would not accommodate me. The light or unnatural position, or both combined, made them fairly frantic, and they dashed about, paying no attention to the bladders. But I entrapped them another way. I put growing stems of the plant in a small dish of water with several larvae, and set it aside. In a few hours thereafter I would find the living larvae imprisoned. This served for another purpose, but not for the object I was aiming at. Forced to give up this plan of seeing the larvae enter the bladder, I now directed my attention to the smaller ones—animalcules proper. I placed the bladders in water inhabited by numerous tiny creatures, and soon had the satisfaction of seeing the *modus operandi* by which the victim was caught.

The entrance into the bladder has the appearance of a tunnel-net, always open at the large end, but closed at the other extremity. The little animals seemed to be attracted into this inviting retreat. They would sometimes dally about the open entrance for a short time, but would sooner or later venture in, and easily open or push apart the closed entrance at the other extremity. As soon as the animal was fairly in, the forced entrance closed, making it a secure prisoner.

I was very much amused in watching a water-bear (*Tardigrada*) entrapped. It went slowly walking around the bladder, as if reconnoitering—very much like its larger namesake; finally it ventured in at the entrance, and easily opened the inner door and walked in. The bladder was transparent and quite empty, so that I could see the movements of the little animal very distinctly, and it seemed to look around as if surprised to find itself in so elegant a chamber; but it was soon quiet, and on the morning following it was entirely motionless, with its little feet and claws standing out as if stiff and rigid. The wicked plant had killed it very much quicker than it kills the snake-like larva.

Entomostraca, too, were often captured—*Daphnia*, *Cyclops*, and *Cypris*. These little animals are just visible to the naked eye, but under the microscope are beautiful and interesting objects. The lively little *Cypris* is encased in a bivalve shell, which it opens at pleasure, and thrusts out its feet and two pairs of antennae, with tufts of feather-like filaments. This little animal was quite wary, but, nevertheless, was often caught. Coming to the entrance of a bladder it would sometimes pause a moment, and then dash away; at other times it would come close up, and even venture part of the way into the entrance and back out as if afraid. Another, more heedless, would open the door and walk in; but it was no sooner in than it manifested alarm, drew in its feet and antennae and closed its shell. But after its death the shell unclosed again, displaying its feet and antennae. I never saw even the smallest animalcule escape after it was once fairly inside the bladder.

So these points were settled to my satisfaction—that the animals were entrapped, and killed, and slowly macerated. But how was I to know that these animals were made subservient to the plant? If I could only prove that the contents of the bladders were carried directly into the circulation, my point was gained. This now was my sole work for several days, to examine closely the contents of the bladders. I found the fluid contents to vary considerably, from a dark muddy to a very light transparent colour. Hundreds of these bladders, one after another, were put to the test under the microscope, and I found that to a greater or less extent I could trace the same colour that I found in the bladder into the stem on which the bladder grew, though the observation was not so clear and satisfactory as I could wish. After more critical examination I arrived at the conclusion that the cells themselves, and not their contents, change to a red colour; the stems also take on this colour, so as to make it appear as if a red fluid was carried from the bladders into the main stem, which is not specifically the fact so far as the observations yet made determine, though the main point, that the contents of the bladders are carried into the circulation, does not seem open to question.

The next step was to see how many of the bladders contained animals, and I found almost every one that was well developed contained one or more or their remains, in various stages of digestion. The snake-like larva above mentioned was the largest and most constant animal found. On some of the stems that I examined fully nine out of every ten of the bladders contained this larva or its remains. When first caught it was fierce, thrusting out its horns and feet

FIG. 56.—*PLATYCYPERUM WILLINCKII*.

A, Sporangia. B, Stellate hairs and spores from back of leaf; C, Stellate hair from surface of leaf.

we had supposed was to float the plant at the time of flowering. The flowering stems of most of the species are smooth and free from leaves or bladders, and shoot up straight from the water to a height of from 3 to 12 inches, bearing at the top from one to ten curiously-fashioned flowers of a yellow or purple colour. It has always been taken for granted that these little bladders were made to float the plant, although I had noticed that the stems most heavily laden with bladders sank the lowest in the water.

About a year ago (in December, 1873) a young man now at Cornell University and myself, on placing some of the bladders under the microscope, noticed animalcules—dead Entomostraca, &c., apparently imprisoned therein. But our attention was not sufficiently aroused to follow up the subject very closely; we laughingly called it "our new carnivorous plant."

soon became so deeply interested that I scarcely took note of time, and the small hours of the morning frequently found me absorbed in the work.

My observations were now more specially directed to the structure of the little bladder, which is quite complicated and very beautiful. It seems to be composed of irregular cells, and evenly distributed over the inner surface are clusters of star-like points, always four in number, arranged very regularly. The office of these stellate points I am as yet unable to determine. I have thought they might be to prevent the living animal from making too much exertion.

My next work was to see what prevented the escape of the animal from the bladder, and to this end I directed all my attention for several days. The animal that I found most commonly entrapped was a snake-like larva, about the length of the mosquito larva, but

and drawing them back, but otherwise it seemed partly paralysed, moving its body but very little; even small larvae of this species, that had plenty of room to swim about, were soon very quiet, although they showed signs of life from twenty-four to thirty-six hours after they were imprisoned. In about twelve hours, as nearly as I could make out, they lost the power of drawing their feet back, and could only move the brush-like appendages. There was some variation with different bladders as to the time when maceration or digestion began to take place, but usually, on a growing spray, in less than two days after a large larva was captured the fluid contents of the bladders began to assume a cloudy or muddy appearance, and often became so dense that the outline of the animal was lost to view.

Nothing yet in the history of carnivorous plants comes so near to the animal as this. I was forced to the conclusion that these little bladders are in truth like so many stomachs, digesting and assimilating animal food.

What it is that attracts this particular larva into the bladders is left for further investigation. But here is the fact, that animals are found there, and in large numbers, and who can deny that the plant feels directly upon them? The why and wherefore is no more inexplicable than many another fact in Nature. And it only goes to show that the two great kingdoms of Nature are more intimately blended than we had heretofore supposed, and, with Dr. Hooker, we may be compelled to say, "our brother organisms—plants."

About December 1, after I had made most of my observations, I wrote to Dr. Asa Gray and to Mr. Darwin, both on the same day, telling them of my discovery. Dr. Gray then informed me that Mr. Darwin had been engaged in the same work on *Utricularia*, and also sent me a note from him, bearing date August 5. From this note it would appear that at that date he had not worked the matter up as far as I had—at least had not found so many imprisoned animals—but, with his superior facilities, he may have far outstripped me. Since writing the foregoing I have frequently trapped the snake-like larvae and seen them enter the bladders. They seem to be wholly vegetable feeders, and specially to have a liking for the long hairs at the entrance of the bladders. When a larva is feeding near the entrance it is pretty certain to run its head into the net, whence there is no retreat. A large larva is sometimes three or four hours in being swallowed, the process bringing to mind

what I have witnessed when a small snake makes a large frog its victim. *Mary Treat, Vineland, N. J., in "New York Tribune."*

YOUNG GARDENERS' NOTE-BOOKS.

THE remarks of various writers in the *Gardeners' Chronicle* of late, upon the desirableness of young gardeners making lists of the names of plants, have induced me to forward you the following observations on the subject.

At this period of the year, young gardeners commence to write out lists of plants adapted for certain objects. As the next step they add notes of the probable "treatment" necessary for the successful growth of these plants. Both these are solid steps by which to mount the ladder of their profession.

In after years comes the wish to display the beauties of vegetation, and to make clear their ideas thereupon. To be able to exhibit these beauties to the general public, as well as to the learned lover, who can by labour find them for himself, and to develop effects, so that both special and ordinary observers may see their beauty, is the result to be aimed at. For young gardeners to gain the knowledge which it is necessary they should obtain to be able to arrive at this point, the labour and study of many years are involved. They must drink in deeply the general impressions produced upon the mind by the aspects of vegetation and their accompaniments, and by their diversities, or rather, in relation to the present subject, the impression produced at various times of growth. The study of these general and special impressions will give advantages in respect to arrangement that nothing else will.

In my list-making of early days I have felt the want of system in studying this third step, and have sustained much loss from its not being added to the two former. This want emboldens me to forward the enclosed sample of a table of observations, the utility of which, in assisting young gardeners in taking their notes upon vegetation, and as affording them assistance in working out their ideas into results in further years, will at once be apparent.

Should this table be fortunate enough to gain the approval of students they might readily form a cheap book for taking observations in accordance therewith. In filling in the columns every note should be made in presence of the subject annotated. It might

be an inducement to young men to make such observations if you would promise to publish any collection of notes possessing sufficient merit. (We should most willingly help in this matter so far as the demands on our space will allow. EDS.)

In conclusion, I venture to assert that the gain of real pleasure in the case of all students who have thus impressed upon their feelings a clear conception of the beauties of vegetation will be far greater than those who are non-students can possibly be aware of. *Joseph Forsyth Johnson, Royal Botanic Gardens, Belfast.* [We agree in principle with our correspondent, who seems to have landscape-effects solely in view, but botanical accuracy should also be studied. EDS.]

DOWN HOUSE, BLANDFORD, DORSET.

ON visiting Down House, the seat of Sir W. H. J. Marriott, Bart., a few days ago, I was most agreeably surprised to find the following Orchids, which I think are worthy of mention. In one of the Cattleya-houses, and facing the door upon entering, stood two splendid specimen *Cymbidiums*, one eburneum and the other eburneum Dayi—the former with eight fine flowers expanded, the latter with eleven flower-spikes, and differing from the former by being spotted on the labellum. Suspended from the roof, and growing in a basket, was a magnificent specimen of *Dendrobium thyrsiflorum*, with fourteen flower-spikes (very fine), each measuring a foot long; from three of the single growths come two spikes each. This *Dendrobium*, when seen as here, is one of the most beautiful of any of this type, and should be grown in the most limited collection. Grouped with the *Cymbidium* were two *Odontoglossum* Inseleyi, one a very fine variety with six flowers on one spike. *Odontoglossum hystrix* had thirty-one flowers on one spike, very fine. There were some good *Odontoglossum* *Alexandree*, with from eight to twelve flowers; two *O. pulchellum majus*, with a dozen spikes each. (The rarely seen (I believe) *Odontoglossum platyodon* from New Grenada had only four flowers, nearly as large as those of *O. Alexandree*, but of a bright yellow. *Dendrobium litiflorum*, a good variety, *D. eburneum*, *D. infundibulum*, *D. luteolum*, *D. fimbriatum oculatum*, were all good and well flowered; likewise *Cypripedium niveum*, *liliosum*, *venustum*, and *Roezlii*; *Oncidium*

NOTE.—P, is Permanent, and the numbers in the column for time represent the months of the year. The detailing of vegetation as above would greatly assist persons to select characteristic plants for their scenery.

Krameri and Papilio, the latter with several spikes; *Oncidium luculosum*, *Calanthe Tuermeri*, some having had forty flowers on a spike; *Comparctia falcata*, and *Miltonia cuneata*; these altogether forming a charming sight at this cold season. In the same house, showing flowers, were *Vandacecurelenses*, two spikes, *Epidendrum Imperator* and *ibagueense*, *Oncidium flexuosum*, and several good *Cattleyas* and *Laelias*, too numerous to detail; while noticeable, and growing most luxuriantly, were *Dendrobium Falconeri* (this plant had fifty flowers last year), *Wardianum* and *Bensonae*, making grand growth; also some of the finest pans of *Anatocichlus Ieversaw*, viz., *Petola*, *Lowii*, *Dayii*, *xanthophyllus*, *Ordiannus* and *intermedium*. These are beautiful objects when seen as here, but alas! how seldom do we meet with them; they are in pans 1½ to 2 feet diameter, and are grand examples of good culture. Mr. Hill had taken the tops off some of them and stuck them in the moss on the surface of his *Saccolabium* and *Vanda* pots, and in these positions they were growing marvellously.

Passing into the cool Orchid-house, there was standing just inside the door a grand lot of *Disa grandiflora* in pans 2 feet through, with from fifty to sixty strong shoots each; next stood some nice plants of *Masdevallia*, in variety; several good *Odontoglossums*—*Alexandre*, showing good spikes, also fine plants of *triumphans*, *maculatum*, *Warneri*, *Rossii*, *Andersonianum*, *nelulosum* and *hystrix*; *Oncidium macranthum*, the spike over 7 feet long; *O. cucullatum*, fine; with several good *Lycastes*, and *Epidendrums*. *Orchis foliosa* and *Ophrys tenthredinifera* were in flower, the latter a most peculiar plant. In the plant-oven, mixed with a nice clean collection of foliage plants, including the best of the new *Diacaenas*, *Crotons*, and *Palms*, &c., were some good *Generas*, as *exoniensis* and *refulgens*, mixed with *Begonias odorata*, *nitida*, *subpeltata*, *semperflorens*, *fuchsoides*, *Ingramii*, which had a charming and most lively effect at this dull season of the year; the whole reflecting great credit on the liberality of the owner and the skill and ability of the clever gardener, Mr. Hill. *A. Outram, Victoria Nurseries, Holloway.*

TRADE MEMORANDUM.

It may not be without interest to some of our readers to bring under their notice a special list of new and rare seeds which has been forwarded to us, particularly as the stock is said to be so small "that only a limited quantity can be supplied." What a misfortune for horticulture this is may be inferred from a few extracts. The first is "a new and matchless Yellow King Potato," of which we say no more than that it has, according to the circular, been exhibited at so large a number of exhibitions as to have obtained upwards of one hundred prizes in six months. We regret very much not to have seen this interesting novelty at any exhibition and to have received no report from our lynx-eyed reporters, who must, in this instance, have grossly failed in their duties to us and our readers. Again we find our contemporaries, the *Times* and the *Gardeners' Magazine*, as well as many others, have given testimonials in its favour, a selection from which, made on account of their "conscience and independence," is printed in the circular. We regret, however, that we have not been able to find in the *Times* or the *Gardeners' Magazine* of the dates quoted any such comment. This may be from an oversight on our parts or from a printer's error of dates. This Yellow King ought to be known by the name of Golden King, for we find the price is 5s. per set, or 10s. 6d. for three, the proprietors not guaranteeing to send out whole tubers. Sealed packets of seed carefully saved from the same variety are advertised at 5s. the packet. We have not space to do more than allude to the "Hetypmpka" Parsley, or the "Encruma," or "Ashantee Asparagus, introduced to Spain from Ashantee by the celebrated traveller and collector, Simon Don Santiago de Roxas, in 1571," and of whom we are ashamed to confess, we never before heard. Nor were we previously aware that Wheat grew near Coomassie; but as "Ashantee Wheat" is announced at 5s. a packet in the circular, of course we must be mistaken. "A single head" will, we are told, produce "three or four pints of grain." We should have supposed this to have been Millet, not Wheat; but perhaps we are in error, for Millet seeds are to be had for feeding little birds at considerably less than 5s. a packet.

As it would be an act of injustice to omit to mention the name of the firm which advertises (by circular) these novelties, we may state that the name on the circular is that of Messrs. Dunbar & Co., of 91, London Wall, Moorgate Street, E.C. We regret that our own endeavours to secure—by a personal interview with Messrs. Dunbar or their agents—seeds of some of these rarities have failed, owing to the unfortunate absence of the principals or their agents from their place of business on the second floor, and which, moreover, bears but feeble traces of the enormous business which of course the introducers of such rarities must be doing.

FIG. 57.—DENDROBIUM AMENUM.

FIG. 58.—DENDROBIUM AMENUM (FLOWER NAT. SIZE).

DENDROBIUM AMENUM.

THIS very pleasing Dendrobium (fig. 57) was awarded a First-class Certificate by the Royal Horticultural Society's Floral Committee on the 4th of June last, and also a Botanical Certificate of Merit by the Royal Botanic Society on the 10th of June. The plant was exhibited on both occasions by Mr. W. Bull, of Chelsea, to whom it had been sent by Major E. S. Berkeley;

and we learn from Mr. Bull that it was collected at an elevation of 5000 feet, at a point where frost frequently occurs. It is, no doubt, a very desirable introduction, not only on account of its distinct character, but also from the delightful fragrance of its flowers.

The plant as exhibited, and which we presume was blooming from the imported stems, was of slender growth, the stems being about two feet high. The flowers (fig. 58) prove to be rather small, but as a compensation they are numerous; they have a white ground colour, and the sepals and petals are distinctly tipped with rosy purple, while the lip is coloured like the other parts of the flower. These blossoms are most deliciously sweet-scented, the fragrance resembling that of *Violets*—a quality which alone would be sufficient to recommend it to cultivators. *T. M.*

ON ARBOURS OR BOWERS.

ARBOURS are a necessity abroad, but even in this country many love such open-air retreats. At Interlaken, last autumn, I saw a very nice natural one, formed by a *Plane* (*P. occidentalis*); the trunk formed the centre and sole support, and on three sides the branches were trained down to the ground and formed a complete shelter from the sun; four or five persons could sit under it. On the same self-supporting plan, at Spa, I was startled by a huge crimson umbrella of *Virginian Creeper*. It occurred to me if there had been, in the case of the *Vine*, two or three plants set originally for the centre support, twined so so as to form one stem, a greater height of bower might have been attained and strength to bear the weight of the summer growth. As it was, two people could sit in comfort. One cannot expect deciduous alleys, arches, or arbours, to be strictly symmetrical, or on the perpendicular, at the end of autumn. The young wood requires arranging and curtailing, but, I thought me, how superior such shelters were to the sentry-boxes of trellised woodwork one meets with, over which the creepers never do grow as expected, and which are so often either fresh painted and nailed out of the carpenter's hands, or in a state of dishevelled disrepair. With a real tree each season only strengthens and beautifies the arbour. A *Laburnum* would form in our country a beautiful golden umbrella, or arbour, as likewise would a *Mountain Ash*. Both are free flowerers and certain fruiters, easy to train and wattle, and around each bower there would be sure to spring a perfect sod of seedlings, pleasant to watch, and useful for waiting when the wall gets thin as the tree grows older. Those who love hovers sit under them, I presume, and had better do so early and late, when the rowans begin to colour, and so keep in check the voracious thrushes. Possibly a tame winged hawk might keep them off, or a well-fed tangle with kittens trained merely to blink at and watch the birds. For my own part I like to see the blackbirds gorging themselves, and struggling with wings out-stretched to keep their balance on a weakly shoot, which they do not intend to leave until every berry is devoured.

Weeping trees of course are all ready and natural for sun shelters, and have always been used. Planted and grown for bowery purposes their position as to sun and wind should be particularly considered. *Ash* and *Elm* are the best I have ever seen; *Thorns*, *Birch*, *Willow*—good weepers all—would be, I fancy, too small-leaved, and *Beech* too close in growth. The dark impervious evergreen bower, of *Yew* for instance, I cannot like. There is always a stuffy, dusty, unventilated air in it, and one pants for the open. Possible windproofness outside prevents freedom of conversation; and inside are certainly spiders—old, grey, dusty ones, that have woven their first and now they they are in their last web, in that very bower—desperate spiders, made up of eyes and nipping jaws. In the fresh deciduous arbour, on the contrary, however closely grow the branches, you can see as well as be seen—can hear all the gentle summer sounds and feel "the air nimbly and sweetly" passing through the leaves (*Macbeth*, act i, s. 6). There the spiders are young and active "spinners in the sun." Heavy-bodied "white cross" *Arachne* (a beautiful insect) makes her web as you sit; and another garden spider, of small body and preternaturally long legs, will harmlessly stalk over you. True, caterpillars dropping down by their swinging threads, on cocoon "thoughts intend," may light on your neck, an unwelcome *Evie* (*Paradise Lost*, book v.), but sitters in bowers must lay their account for such trivial annoyances as insects. Always busy when in the garden, I have never had time to "take mine ease in mine" arbour (*Henry II.*, part i, act iii, s. 3); but nothing would tempt me into fog-houses or rustic *Heather erections*,* with benches of decaying

* Such structures are very suitable for glens and woods, or points of view where shelter from a storm or rain may be frequently required.

Pine logs, out of which protrude rusty old nails; or, if of sound Fir, then resinous ooziings greet you. Wooden houses, like enlarged bathing-machines, are likewise odious, scathed and whittled over in all directions. When such are the garden sun-shelters, I think one is better off indoors at once, with wide-open windows, in a comfortable chair. To sum up these desultory remarks, the best bowers surely are—

1. A noble tree, not far from the house, in the style of the grand Beech at Newbattle Abbey. 2. A Weeping Ash or Elm. 3. The umbrella, or trained and wattled arbour of a growing tree. 4. The clipped evergreen bower. (For invalids who must have such close shelter, and no circulation of air, a conservatory or glass plant-house would surely be more pleasant.) 5. The purely artificial house of moss, wood, or plaster.

6. "A Temple to Friendship,"
Cries Laura, enchanted,
'Till build in this garden—
'The thought is such
The temple was built;
And it now only wanted
An image of Friendship
To place on the shrine."

(Author unknown.)

F. J. Hope, *Wardie Lodge, Edinburgh, Dec., 1874.*

P.S.—I have had the large "white cross" spider settled in the baskets of mixed plants which I have done in the way destroyed when we left the room at night, by the morning he had a new one completed in another plant all ready.

"In eager watch he sits,
O'erlooking all his waving snares around.
The prey at last ensnared, he dreadful darts
With rapid glide along the leaping line."

Thomson's "Seasons"—Summer.

For an invalid this spider is a most interesting object, and I have never found it to leave the plants, so there need be no fear of its intruding where not desired. Scotch people are careful not to kill spiders, from belief in the Bruce's traditional insect, it is said.

PLANT GOSSIP.

SCILLA PERUVIANA is flowering in the Cape-house at Kew. It is a rare plant in this country, and perhaps few know that what is usually grown under the specific title is the variety Ughi. *S. peruviana* may be obtained from the Continent as *S. cilicaria*. It has long, narrow, dull green leaves, with a densely ciliated margin, thus differing conspicuously from the well-known variety. Little, if any, difference can be found in the inflorescence. Both are very ornamental, and distinct in appearance for conservatory decoration, varying in colour from deep blue to paler shades with a yellowish cast. The raceme is conical, about 7 or 8 inches in diameter, and the flowers dense. It is a native of Spain, and should not be called the Peruvian Hyacinth.

— In the *American Naturalist* for February Mr. Edward Palmer mentions a mode in which *MARTYNNIA PROBOSCIDEA* is employed in Arizona, where it is very common. Its large seed-pods, after being deprived of their outer covering, are used by all the Indian tribes of Arizona in ornamenting their willow baskets. The method resorted to is first to soften the pods by macerating them in water, and then splitting into the requisite strips, and worked into the baskets, forming the black ornamentation seen in those made by all the tribes of Arizona. The same writer, in referring to the RESURRECTION FERN of Florida (*Polypodium incanum*), says that he collected some apparently dead examples, and sent them to the Cambridge Botanic Garden in April last. On his return there in September the plants, which had most moss placed round their roots, were secured to blocks of wood and hung up in the green-house. The leaves unfolded and assumed a bright green colour, and the plants now appear to be in a healthy condition.

The discovery of the VENUS' FLY-TRAP appears, from a note in the *Hortus Collinsianus*, to have been made about 1759 by Arthur Dobbs, Governor of North Carolina. His description of it is as follows:—"The great wonder of the vegetable kingdom is a very curious unknown species of Sensitive. It is a dwarf plant. The leaves are like a narrow segment of a sphere, consisting of two parts, like the cap of a spring purse, the concave part outwards, each of which falls back with indented edges (like an iron spring fox-trap); upon anything touching the leaves, or falling between them, they instantly close like a spring trap, and confine any insect or anything that falls between them. It bears a white flower. To this surprising plant I have given the name of Fly-trap Sensitive." This seems to be the earliest notice of the plant, and antedates the letters of Ellis upon the subject.

— The chaste, snowy *PRIMULA NIVEA*, generally known as *nivalis*, is a most attractive form to cultivate in pots at this season of the year. It flowers

too early in the season, and the blossoms are of too delicate and fragile a character, to have full justice done to in the open air, except in a very favourable and sheltered position. It is well adapted for growing in pots in a cold house, for it does not require warmth but simply protection from the windy elements. It deserves generous treatment, and where grown in good soil, such as a good yellow loam, with which plenty of leaf soil is mingled, it throws up its large trusses of pure white blossoms on stems as high again as the leaves, and so shows them off to the best advantage. Its simple beauty is one of its greatest recommendations.

— According to an American correspondent of the *Floral Magazine*, the IRIS IBERICA, as grown and flowered in the States, differs considerably from the coloured plates that he has access to, and he affirms that no coloured representation has yet done it justice. "The flowers," Mr. Chitty writes, "come much larger, and the colour richer and more distinct. It appears to be perfectly hardy in our climate. In the spring of 1873 we planted a large bed in the open ground, putting in very small pieces. During the season they grew very rapidly, many of them making towards fall plants a foot in diameter, some of which produced in the following May as many as from fifteen to twenty flowers each. Some of the flowers, after the drooping petals were raised to the horizontal, measured $\frac{3}{4}$ inches in diameter. We have now a large bed of this plant in the open air, and as the mercury this winter has been more times below zero than we have ever known before, its hardiness will be thoroughly tested."

— The display of CYCLAMENS, usually so attractive a spectacle at this time of the year at Mr. H. Little's, Cambridge Park, Twickenham, is again well worthy a visit, as the houses present as much of beauty and interest as on any previous occasion. Certainly no private grower can excel Mr. Little in the extent of his collection, excellence of cultivation, or variety of colouring, the latter point being most marked. A long span-roof house, with broad stage on either side, contains nothing but Cyclamens of various ages and sizes, but all in full and beautiful bloom, probably just now at their best. There are besides a large number of seedlings blooming, although, so far, nothing has been produced so striking as were the deep-coloured seedlings of last year—Royal Purple and King of Purples—both of which, now in flower, stand out in striking contrast to the many lighter hued flowers by which they are surrounded. In all the newer flowers there is a marked tendency towards size of bloom, breadth and substance of petal, and intensity of colouring. There is a large bulb of eleven years' growth with a large healthy head, but the blooms, no doubt good in their day, point out forcibly the immense progress that has been made in the improvement of the Cyclamen since that plant was a seedling. Mr. Little is an enthusiastic as well as an intelligent hybridist, and is producing the most satisfactory results.

Foreign Correspondence.

THE ISLAND OF KAWAU, AUCKLAND, NEW ZEALAND (the property of Sir Geo. Grey, K.C.B., F.R.S., late Governor of New Zealand).—The island contains about 7000 acres, two-thirds of which is under bush, and the rest is cleared and under grass, and carries a large number of sheep. Sir George has the whole of it in his own hands, and employs about twenty men, who live in different parts of the island; their wives and families make up a population of about seventy souls.

The garden in which this house stands would delight the heart of a botanist; it is full of trees and plants from all parts of the world. Plants from all climates seem to thrive in this delightful place. Oranges and Lemons are now hanging on the trees as thickly as at Mentone. Loquats are fully ripe, and are in perfection. We had a large dish of Strawberries yesterday; and green Peas, Asparagus, and young Potatoes are in abundance. Peaches, Nectarines, Apricots, Figs, Plums, Pears, and Cherries, will all be ripe in a couple of months. The trees, all of which grow like standard Apple trees in England, are now covered with little red fruit. Bananas do thrive in the open air, and though the leaves are somewhat split by the winter winds, yet the fruit is beginning to show.

Palms of many kinds are planted about, and a large hill covered with Pines rises out of the garden. Bulbs from the South of Europe, Primroses, Foxgloves, and Violets from England, all grow under the shadow of Pines from California, of Olives from Spain, and of Bamboos from India. The hedge in front of my window is composed of Honeysuckles, Passion-flowers, and a burserium and Heliotrope 6 feet high, all now in full blossom.

Sir George must have spent a fortune in bringing plants and animals, birds and insects, from all parts of the world. He tells me that he had a quantity of earthworms and English snails sent, and they are now flourishing. The latter I can vouch for—the Strawberries.

The English pheasant is very plentiful all over the island, and peacocks in some places. The Californian quail is literally in myriads; they are calling throughout the place, this being the breeding season. There can be no difficulty in killing fifty or sixty brace in a day to one gun, in the proper season.

Fallow deer are numerous, but keep to the bush. There are some red deer and sambar, but not so many as the fallow. There are quantities of wild cattle in the bush, and they are shot whenever they are seen; but they increase rapidly, and have become a great nuisance, eating so much grass.

Pigs infest the bush, and are a greater nuisance than the cattle. This year alone they have destroyed £200 worth of lambs. Sir George turned out some American peccaries, but they have not been seen since.

There are hundreds of kangaroos of different kinds, and these have to be killed in numbers on account of the quantity of grass they eat. The most common is the tree kangaroo of New Guinea, dozens of which can be seen in the woods close by the garden.

Opossums are becoming a great nuisance; they only come out in the night, and make sad havoc in the garden, eating the young shoots of the fruit trees. A man sits up on moonlight nights to shoot them.

In the ponds about are carp and perch, but the extent of fresh water is but small, and all artificial, for the island is everywhere very undulating, and if you are not walking down a hill, you are very certain to be walking up one. From a Correspondent.

Forestry.

PLANTING of forest trees, like the sowing of grain crops, is too important a work either to be vaguely described, or to admit of anything hazy or obscure hanging over it that can possibly be removed. If the agriculturist commits an error one year in sowing, he can next year, or at least in a rotation, find opportunity for correcting it; but if certain kinds of errors or mistakes are made in planting, they are put at once and for ever beyond the planter's power of correcting. Certain kinds of errors may be mitigated and others considerably modified, but all such are exceptionally slight if they do not carry with them injurious results to the end of the history of the plantation. Having myself committed many mistakes in planting, I can at least caution others against falling into similar errors. The distance apart at which forest trees should be planted, is a subject which very legitimately admits of various opinions being formed and expressed. In reference to Scots Fir, Larch, and Spruce, alone or mixed, I have planted them at all distances from 2 to 6 feet, both in the open air and the results at all distances have been equally satisfactory or equally disappointing—not on account of the distances at which the trees were planted but chiefly on account of the size or extent of the plantation and the manner of treatment the plants subsequently received by way of thinning. I have superintended the planting of 800 acres in one season on sandy and gravelly moorland, the plants put in 4 feet 9 inches apart, and on examination four months subsequent to planting less than 3 per cent. destruction occurred. This plantation or forest when finished will comprise probably 5000 acres, which if planted $3\frac{1}{2}$ feet apart must have required, in addition to the extra plants and labour, to be thinned long before any benefit could be derived from the thinnings, thereby entailing such an unwarrantable expense that the benefits arising from the closer planting would not have covered it. I have also on many occasions planted heavy clay soils and strong loams, when 10 to 30 per cent. of deaths occurred, and in addition to the natural deaths as many more plants were destroyed by game and being overgrown with rank herbage. In these cases the plants were put from 2 to 3 feet apart, according to the size of plantation. In planting small groups—say 1 acre or less—where the chief object is shelter and early effect in the landscape, my practice is to plant very thick, say 2 feet apart, and thin early, sometimes the third year, if the growth is rapid. Similar advantages arise from having a thick crop of trees to select the growing crop from, or from having a good braid of Turnips to thin out. If only as many Turnips grew from the seed as was necessary for the permanent crop, without requiring to thin them, according to a well-established fact in connection with agriculture, the crop would not be nearly so good as under the usual treatment of thick sowing and timely thinning.

However well a plantation may thrive from the time of planting, one part of it will be taller and thicker grown in every respect than the others. If there is, therefore, as many straight and

well-proportioned trees as to constitute a crop of, say, 800 per acre, after all the crooked, dwarfed, and other inferior grove ones are cut down, the additional number of plants, and labour both of planting and cutting down before they are of any money value, will amply compensate for the additional expense, seeing the object of planting is thereby very perfectly fulfilled.

Next, if not equal in importance to that of properly putting the plant into the ground, is to give it due and proper facilities for growth and development; and as no inconsiderable portion of the moorland put under plantations in Great Britain (especially in Scotland) is either too cold and wet, or too close and hard for forest trees to grow well in, it is necessary to render dry that which is wet, and to break up and render free, loose, and open that which is too retentive. Trenching is, of all known means, probably the most effective for accomplishing the latter object, while draining in one of the many well-known ways is effective enough in accomplishing the former.

Trenching, however efficient in breaking up and pulverising the soil, is too expensive for general planting operations; hence it is seldom done except upon a limited scale. Pitting the ground is a common and cheaper means of preparing it for the growth of trees than trenching, but the one common objection to it is with many planters entirely abandoned. Pits formed in either hard or clayey soils become only receptacles for water to stagnate in, to the destruction of the plants. As a rule, plants do not succeed so well in pits as they do in unprepared soils. Without, however, explaining the causes which lead to the failures in pitting, I shall state the preferable system which I practise, and have adopted for many years with very great success above all others.

One or more men go over the ground to be planted, and with a sharp spade pare off the turf from the exact spot in the centre of which the tree is to be planted. The parers are succeeded by others with the planter's foot-picks, who at each place where the turf has been removed insert their instrument once, twice, or thrice, thereby stirring and loosening the soil all around where the plant is to be put in. The foot-pick used differs from the drainer's and trencher's tool of the same name in being broader on the back or part that forms the fulcrum, and also in being sharper and lighter, the handle being wood. This operation in effect trenches the ground in a most effective manner at a cost of about 5s. per 1000 plants, while pitting would cost about 25s. for doing similar work much less efficiently. If the plants are small they are notched in the usual way, and the ground receives a good firm tramp with the foot, it having been rendered very loose and open by the process of boring. One great advantage of the use of the borer, as it is locally termed, is that the process may be carried on at any season and at any stage of the plant's growth. I have greatly improved certain unhealthy plantations several years planted by boring the trees round at some distance from the base of the stem. *C. Y. Michie, Cullin.*

Apiary.

WORK TO BE ATTENDED TO IN MARCH.—Every skillful beekeeper, who has an eye to a profitable investment, will learn the grand secret, "keep your stocks strong." Early in this month examine each hive carefully, for we can only expect those hives which contain a strong and healthy stock to be profitable.

Look well to the entrance of the hive; if the bees are observed to void a yellowish excrement you have cause to suspect dysentery. This disease is brought on either from dampness or improper and sour food. I have always found the best remedy is cleanliness, and feeding with good new honey.

Also it is well this month, if the apiary is composed of straw skeps only, to give to each stock a clean floor-board; if this is impossible, the sooner the old boards are cleansed the better. In bar-frame hives gently lift up the upper part, on a fire, warm day, and brush all the dead bees and other dirt from the bottom-board. Bees attend closely to all sanitary matters in the working season, their dead are speedily carried forth; but in the winter this cannot be done, because of their close confinement, therefore it is well to aid them in the matter; they will afterwards appreciate and repay the kind forethought.

If they have not commenced soon after the month of March has set in, to carry pollen to the hives, when the weather is favourable, something is wrong, and the sooner the stock is examined the better. Perhaps they are a queenless colony, if so unite them to some other stock; if the hive, with its valuable comb, will be reserved for a swarm. Sometimes, as it was ten years ago, the greater part of the month is cold and frosty, with occasional slight snow storms, and with scarcely a *Crocus* visible until the third week; if this should be so during the present month, we cannot, of course,

expect to see any pollen carried in. It has been found useful under such circumstances to place barley-meal within reach; the bees have used it instead of pollen. I shall refer again to this subject.

If any stock is deficient in food, which may be ascertained by feeling the weight of the hive, give them a small quantity of newly-made syrup each warm afternoon; this will stimulate and do the colony good; breeding will also go on at a greater rate, but care should be exercised not to smear any syrup or honey on the hive or floor-board, it will entice robbers, and most likely produce fighting. I have used most successfully the best barley sugar; in using this, which is not stored in the cells, it can easily be ascertained when food is scarce.

The winter *Aconite* (*Eranthis*) and various species of spring *Crocus* yield the chief supply of pollen during this month. It is scarcely needful to remind bee-keepers to close the entrance if snow lies on the ground. Hundreds of bees perish from being enticed out by the glare of the sun and snow combined. *A.*

THE HIVE OF LIVES.—As our bee-keeping friends are now eagerly scanning the various illustrated lists and making inquiries about hives for the coming season, I propose to bring a few useful novelties from time to time before them. I make no comments upon their merits, and do not recommend one maker before another. The "Hive of Lives" is the name given to the hive which is figured below (fig. 59). Why Mr. Pettitt has adopted this name I am unable to state. Perhaps he had the idea that it was the best hive ever invented, or the most practical ever brought before the apian world. Each inventor thinks his own child the best, and I do not envy any man his thoughts.

This hive contains thirteen bar-frames, besides a mook or dividing frame, by which the size of the hive can be enlarged or contracted at pleasure. There are

FIG. 59.—PETTITT'S HIVE OF LIVES.

very few hives which can be used by the experimental bee-keeper either as a collateral (a system which many readers will recollect gained numerous adherents and followers, under the guidance of old Father Nutt, but which is now seldom used), or employed and worked with super on the top, but the hive I now bring before the notice of your readers can be worked under either system, at the option of the bee-master. The frames, which are on the natural scale of 1 1/2 inch from centre to centre of combs, I think preferable to the Langstroth scale, or 1 3/4 inch. It is fitted with the patent metal rack, which at once secures uniformity in placing the bars in the hive. The top bar of the frames extends quite through the back and front of the hive, projecting about half an inch; this gives greater power and facility in the removal of combs for examination.

Mr. Pettitt, the manufacturer, is well known in the South of England as a successful apian; his place of business is 151, Sargate Street, Dover. Amongst his stock, without doubt the largest and most comprehensive in bee-keeping requisites to be met with in Great Britain, are all kinds of hives, from the plainest and simple cottagers' skep to the grand mahogany temple hive; he also supplies stocks of either the black or Italian breeds. Mr. Pettitt's catalogue is well worth perusal, and his little volume on the *Home Treatment of the Honey-bee* contains much valuable and original information, as well as advice, on the management of the apiary. *R.*

Notices of Books.

Description, Culture, et Usage des Arbres, Abrévatures, et des Plantes herbacées et Fruiteuses de plain air et de serre, employées dans l'ornementation des parcs et jardins, &c. Par A. Alphand. Paris, Rothschild. Folio.

This is a reprint from that truly magnificent publication entitled *Les Promenades de Paris*, of which we have had occasion to speak on more than one opportunity. A work of that character, and of that size and

sumptuousness, is after all so ill adapted for general use that to the great majority of horticulturists and landscape gardeners it is a sealed book. M. Rothschild has, therefore, exercised a wise discretion in issuing in a separate form the tabular lists of trees, shrubs, and herbaceous plants used for the decoration of the Paris squares, and for the ornamentation of public buildings on occasions of state or festivity. The tables contain in alphabetical order the botanical names and native localities of the several plants, the soil and aspect suitable for them, the purpose they are best adapted to fill in landscape gardening, the general character of the leaves, flowers, and fruit, together with such brief general observations as may be required. In this way more than 2000 species and varieties are catalogued under their appropriate headings. It is greatly to be regretted that this list was not submitted for the revision of some competent botanist previous to its re-issue. Its value would thereby have been enhanced, and sundry errors in nomenclature avoided. It is a useful though still rather cumbersome list of the plants which are most in use for decorative purposes.

Les Plantes Ornamentales, a feuillage panaché et coloré. Rédigé par MM. Cogniaux et Elie Marchal. Edité par Alexis Dallière, Ghent. (Ornamental Foliage Plants, &c.)

M. Dallière is well known to horticulturists as one of the most enterprising nurserymen in that city of nurserymen—Ghent. His establishment does great credit to his business capacities, and is by no means the least interesting of the two hundred or more nursery establishments in or about the city. It is with no surprise, therefore, that we find him following the example of the Van Houttes, the Verschaffels, and the Lindens, in publishing a series of coloured plates representing some of the most noteworthy of the ornamental plants cultivated by him.

The plates are chromo-lithographed by M. Stroobant, and the botanical descriptions are drawn up with care by MM. Cogniaux and Marchal. M. Dallière himself contributing the cultural notes. The plates are in general very characteristic, though some, e.g., that of *Tillandsia musacea*, are rather over-coloured. Devoted as they are principally to the representation of foliage plants, they contain few botanical details. Indeed, as many of the plants have not yet flowered, still less fruited their precise botanical position is in some cases still doubtful. MM. Cogniaux and Marchal have not overlooked this difficulty, and their descriptive notices are so worded that no one need be misled on these points. Considered as a series of horticultural plates, this publication is creditable to all those concerned in it. Two volumes have been published, containing together sixty plates.

Xenia Orchidacea: Beiträge zur Kenntnis der Orchiden. Von Dr. Heinrich Gustav Reichenbach. Zweiter Band, zehntes heft.

This part of Dr. Reichenbach's contributions to orchidology completes the second volume of his publication bearing the above title. The first volume of this work was completed in 1858, and in the preface to that volume the author gives an account of the materials at his disposal, and mentions the few described species he had then had no opportunity of examining. Among other things, he alludes to the kindness and assistance he had experienced at the hands of the late Dr. Lindley. The preface to the second volume is devoted to the memory of that great man, the founder of this Journal, who probably did more to popularise botany in this country, and to infuse scientific principles into practical gardening, than any other single man. The ideas of a foreigner, and a rival in the study of Orchids, respecting our lamented master, may interest our readers, and therefore we give a nearly complete translation of Dr. Reichenbach's preface in another place.

The *Xenia*, as is doubtless known to many of our readers, is a collection of descriptions and figures of new species, most of which have been published elsewhere, many in this journal. The plates, numbering too in each volume, illustrate one or more species, and are beautifully drawn by Reichenbach himself. Some are partially coloured, or patches of colour are put on to indicate in a general way the colouring of the flowers, and as the colours in our opinion are often too bright, the first impression on seeing them is not a favourable one.

The March number of the *Florist* contains a good coloured figure of the flower and fruit of *Pyrus Maulei*, already described in our columns; and also of Lady Henniker Apple, a large Codlin-shaped Apple, highly recommended as a kitchen Apple by Mr. Barron. The tree was raised as a seedling by Mr. Perkins, gardener to Lord Henniker, and the stock is in the hands of Messrs. Ewing & Co., of Norwich.

HORTICULTURAL EXHIBITIONS, 1875.

MARCH.

- 16.—Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall. Manager, Bruce Findlay.
 17.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 24.—Glasgow and West of Scotland Horticultural Society. Spring Exhibition. Sec., F. G. Dougall, 167, Caning Street, Glasgow.
 27 to April 3, inclusive.—Royal Horticultural Society, South Kensington. Mr. William Paul's Special Show of Hyacinths, Tulips, Roses, and other spring flowers.
 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

APRIL.

- 4.—Special Exhibition of the Royal Horticultural Society of Antwerp.
 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 22.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Byles, 27, Westland Row, Dublin.
 27.—Manchester Botanical and Horticultural Society. Exhibition of Auriculas, &c., in the Town Hall. Manager, Bruce Findlay.
 28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.

MAY.

- 1 to 10, inclusive.—Royal Botanic Society, Regent's Park. Mr. William Paul's Special Show of Roses, Pelargoniums, &c.
 1 to 24.—Royal Botanic Society, Regent's Park. Special Exhibition of Clematis, by Mr. G. Jackman.
 12.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Pot Rose Show.
 14 to 27.—Manchester Botanical and Horticultural Society's Annual National Exhibition, at the Garden, Old Trafford. Manager, Bruce Findlay.
 17 and 18.—Halfpenny Floral and Horticultural Society's Annual Exhibition. Sec., Leonard Kershaw, 20, Gladstone Road, West Hill Park.

THE

Gardeners' Chronicle.

SATURDAY, MARCH 6, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	Mar. 9.	{ Royal Horticultural Society; Adjourned Annual General Meeting, at 3 P.M. Sale of Poultry and Pigeons, at Stevens' Rooms. Royal Horticultural Society's Lecture on the History of the Society, at 8 P.M. Leeds Horticultural Gardens Company's Spring Show. Sale of Rhododendrons, Laurels, Yew, Fruit Trees, Climbing Plants, &c., at Stevens' Rooms. Leeds Horticultural Gardens Company's Spring Show continued.
WEDNESDAY,	Mar. 10.	{ Sale of Auriculas, Picoetes, Standard Roses, Fruit Trees, American Plants, &c., at the City Auction Rooms of Peabody & Morris. Sale of Specimen Camellias, Orchids, Lilies, Gladioli, &c., at Stevens' Rooms.
THURSDAY,	Mar. 11.	{ Sale of Auriculas, Picoetes, Standard Roses, Fruit Trees, American Plants, &c., at the City Auction Rooms of Peabody & Morris. Sale of Specimen Camellias, Orchids, Lilies, Gladioli, &c., at Stevens' Rooms.
FRIDAY,	Mar. 12.	{ Sale of Auriculas, Picoetes, Standard Roses, Fruit Trees, American Plants, &c., at the City Auction Rooms of Peabody & Morris. Sale of Specimen Camellias, Orchids, Lilies, Gladioli, &c., at Stevens' Rooms.
SATURDAY,	Mar. 13.	{ Sale of Auriculas, Picoetes, Standard Roses, Fruit Trees, American Plants, &c., at the City Auction Rooms of Peabody & Morris. Sale of Specimen Camellias, Orchids, Lilies, Gladioli, &c., at Stevens' Rooms.

COMPARATIVELY few among practical horticulturists, we venture to say, have duly considered the extent of DARWIN'S services to horticulture. Succeeding generations will, it may be, apply his principles to their daily work quite unconsciously, but even now physiologists will admit that, since the days of THOMAS ANDREW KNIGHT, no physiologist has done so much to extend the basis on which successful culture, whether of animals or of plants, depends.

To say, as some may do, that DARWIN has never concerned himself directly with horticultural pursuits, does not invalidate our statement. When GALVANI was dissecting frogs, or GALLIHO was watching the swaying of a candelabrum, neither the one nor the other thought of the practical consequences which would result from their speculations. Most of the great discoveries which have subsequently been so prolific in practical results have been made by men of science working from the love of science, without thought of aught else but the investigation of the truth. But it is quite impossible for a conscientious accurate worker in any one department to be wholly without influence on other departments. On such grounds alone we might claim for DARWIN the merit of having advanced horticulture.

We have, however, much more direct reasons for claiming him as the physiologist who has done the most in our time to advance

the science of horticulture. The intelligent reader needs but to read the headings of the chapters in the *Origin of Species* or the *Variations of Animals and Plants* to find ample justification of our remarks. The illustrations there given are so numerous and so varied that it would be quite impracticable within the limits of an article of this character to do more than allude to a very small proportion of them.

Let any one who knows what was the state of botany, in this country at least, even so recently as fifteen or twenty years ago, compare the feeling between botanists and horticulturists at that time with what it is now. What sympathy had the one for the pursuits of the other? The botanist looked down on the varieties, the races, and strains raised with so much pride by the patient skill of the florist as on things wholly unworthy of his notice and study. The horticulturist, on his side, knowing how very imperfectly plants could be studied from the mummified specimens in herbaria, which then constituted in most cases all the material that the botanists of this country considered necessary for the study of plants, naturally looked on the botanist somewhat in the light of a laborious trifler. Both classes carried on their investigations in a narrow spirit of isolation, unconscious or unheeding of the assistance that either might give to the other.

The investigations of GAERTNER, of KÖLREUTER, of SPRENGEL, of VAUCHER, had been allowed to remain by British naturalists as so many dead letters. It was a chance if a page or two were devoted to them in text-books; rarely, if ever, were they mentioned in lectures, still more rarely was their bearing on horticulture alluded to. DARWIN, by his renewal and extension of these experiments, and specially by his deductions from them, altered all this. He made the dry bones live; he invested plants and animals with a history, a biography, a genealogy, which at once conferred an interest and a dignity on them. Before, they were as the stuffed skin of a beast in the glass case of a museum; now they are living beings, each in their degree affected by the same circumstances that affect ourselves, and swayed, *mutatis mutandis*, by like feelings and like passions. If he had done nothing more than this we might still have claimed DARWIN as a horticulturist; but, as we shall see, he has more direct claims on our gratitude.

The apparently trifling variations, the variations which it was once the fashion for botanists to overlook, have become, as it were, the keystone of a great theory. The variation which the florist saw, seized on, perpetuated, "improved," furnished the suggestion for the theory of "natural selection." It is quite unnecessary to go into explanations now-a-days on this point: suffice it to say that an apparently trifling variation may be (it has not been proved absolutely that it is), may be—probably is—the first stage in what will, under favourable circumstances, eventually develop into what we call a species. From this point of view a new variety raised by man, as DARWIN himself says, is a more interesting subject for study than one more species added to the crowded lists. DARWIN borrowed the idea of "natural selection," or, as it is more accurately termed, "the survival of the fittest," from the gardener. The gardener or the florist selects, causes to survive, and propagates varieties showing one particular quality or tendency which he may happen to desire; but in Nature the selection or the survival is not so simple an affair. If it were a mere question of strength, "the weakest would always go the wall;" if of speed only, the hare must outrun the tortoise; but we all know how diverse and complicated are the conditions under which living beings, plants as well as animals, exist, and we admit with SOLOMON that "the race is not always to

the swift, nor the battle to the strong, but time and chance happeneth to them all." We may safely interpret the word "chance" here as the equivalent to our "circumstances."

Passing from this question of selection, in which, if DARWIN has taken much from the practical man, he has repaid him with abundant interest, we may allude to one of the great elements in the consideration of the aforesaid circumstances, viz., the "interdependence of living organisms." We all know and admit this principle to some extent, but it is probable that few of us realise how greatly and of necessity one organism is dependent upon another. Almost every gardening book we take up has a chapter or a paragraph on the insects injurious to this or that crop, but we do not find, at present, in our theories of horticulture and books of the garden, any but the slightest reference to the insects that are beneficial to the plants we cultivate. We ought to have learnt something about this from SPRENGEL, from GAERTNER, and others. HERBERT did learn and did teach somewhat of this, but his lessons never took much effect. Surely the laborious researches of, and the important practical results obtained by, DARWIN will open our eyes to this matter, and fix our attention a little more closely and fixedly on what is of such vital consequence to us. We must remember this is no visionary theory; if anybody wants facts let them study the record of DARWIN'S labour and DARWIN'S patience in the *Journal of the Linnean Society*. These labours and these facts establish beyond controversy the manifold and intricate way in which living beings are tied together, and the extreme complexity of the conditions under which living beings have to maintain their struggle for existence.

Space would fail us if we attempted to give further illustrations of this, it must suffice to mention the great subjects of fertilisation by insects, of cross-fertilisation, of hybridisation, of dimorphism, on all of which DARWIN has experimented patiently and written lucidly. While the florists have for years been selecting their pin-eyed and thrum-eyed varieties of Auricula, selecting the one and rejecting the other, it seems never to have occurred to them to inquire, or even to care about inquiring, what was the meaning of the difference. Here was a difference brought prominently under their notice, they regulated their course accordingly, they acted from motives of mere caprice or fashion, without troubling themselves any further about the matter. "Why should we?" they might have asked, in pre-Darwinian days. "Of what good would it be to us? We know what we want and how to secure it. Why concern ourselves further?" And the pre-Darwinian botanist, if he considered the matter of any interest at all, would have been unable to answer these questions. How altered is the state of things now. Thanks to the laborious experiments of DARWIN—thanks to the example he has set, the purpose of this, as of many other curious points of structure, passed over before as merely curious, has been made apparent. No more persuasive apostle of natural theology, no more powerful advocate of the argument furnished by design and adaptation, ever lived than CHARLES DARWIN.

We cannot now go into further details of physiology, important as they are. We are addressing, we presume, practical men, and we say it to them, if they now ask the botanist the meaning of the pin-eyed and thrum-eyed flowers and other similar variations, they will learn something very much to their advantage. They require improved varieties, fixity of form, abundance of seed, and robust constitution in the seedlings. Let them study the chapters on cross-fertilisation and dimorphism which DARWIN has written, and they will—unless they are blind—see how they may attain their ends. So

with such cases as "bad setters" among Vines or Cucumbers, or such things as blind Strawberries, the great physiologist of our day has supplied the thoughtful cultivator with innumerable facts, careful observations, and suggestive inferences.

It is impossible for us to do more than indicate these matters, nor can we do more than allude to the many other subjects elucidated by the genius of DARWIN, and which have, or may have, a direct practical bearing on the pursuits of the gardener and agriculturist. Among them are the subjects of variation, inheritance, reversion, bud variation, acclimatisation, genealogical

Tuesday next. Provincial Fellows, however, we regret to say, need such a reminder. We need not stop to inquire now into the causes of this apathy. We only ask them to shake it off forthwith. Here is an institution which is, or should be, national in its aims and sympathies—an institution capable of doing good service if it had free play in every parish in the United Kingdom; an institution which has rendered great services in the past, is still capable of doing so, and, under happier auspices, is potential for more good and greater influence than ever it had. The question is, Shall this society go to pieces because horticulturists do

and observations on the science of horticulture might be carried out—experiments and observations on which the future of horticulture, we believe, very largely depends. Now the whole country is benefited by work of this character, limited and restricted though it unfortunately is. Are the horticulturists of this country prepared to let this organisation fall to pieces from internal dissensions, from its load of debt, and from the fact that its income is so largely diverted from its legitimate purpose—the advancement of horticulture? We do not, cannot believe it; on the contrary, we believe the horticultural spirit of the country is

CHARLES DARWIN.

descent as the basis of rational classification, carnivorous plants, climbing plants, and many similar subjects. Space forbids us to do more than mention these.

Enough for us now if we have shown that to CHARLES DARWIN, setting aside, as beside the question we are at present concerned with, all direct reference to his theories as to the origin and progress of species, are due grateful homage and reverence from every thoughtful horticulturist of the present, from every careful practitioner of the future.

THE metropolitan Fellows of the ROYAL HORTICULTURAL SOCIETY are not likely to forget that the adjourned ANNUAL MEETING of the Society is to be held on

not subscribe in sufficient numbers, and because those that do take so little interest in its work?

It is comparatively easy to get up a flower show society—we see how successful the provincial towns are in this respect, often more so than in London; but the Royal Horticultural Society has other aims, of at least equal, and we think much greater importance than the mere holding of exhibitions. The verdicts of its committees command respect, the trials at Chiswick are valuable so far as they go; so is the possession of a collection of authoritatively named fruit trees. Its experimental garden, though small, is large enough for most purposes. Very little really is required to enhance its value as a practical garden, and at any rate there is the place where experiments

so widely diffused that, were it once stirred, the Royal Horticultural Society, with its branches and local secretaries throughout the empire, would speedily be more powerful for good than it ever has been. Not only a greater interest in the Society's work is required, but a large accession of new Fellows and new blood. Whether this can be effected by Mr. WILSON'S guinea scheme, or by some modification of it, we cannot stop to discuss now, though we believe under altered circumstances—and circumstances are changing every day—such a project would be most beneficial.

We can only earnestly beg those who wish to see the Society out of its difficulties, and to see it encouraging and directly promoting all branches of horticulture, practical or scientific,

to be in their places on Tuesday next. Those who love and care for horticulture have a better chance before them than they have had for many a long day. Let them sink for one day at least all petty jealousies, and miserable, baseless insinuations, all narrow spirit of cliques—let every one keep his own pet hobby in his stable for that day, and by united action show that the Royal Horticultural Society is something more than a sham.

The first thing to do is to insist upon the opening of negotiations with the Commissioners. By their own mouthpiece they expressed a friendly desire to come to terms. Let us put that assertion to the test immediately, and ascertain how and in what way they are disposed to help us. All other matters, it appears to us, are matters of detail, of secondary importance. Some say there is no scheme—no policy—no programme. That surely is not the want. There have been plenty such, and long and carefully discussed, but of not one can even the first sod be turned till this primary matter is in some way satisfactorily settled. The horticulturists must come forward and do their best to this end. Not one should be absent on Tuesday, not a vote given except for horticulture, not a policy, a scheme, a hobby listened to, which is not in strictest accordance with the principle—Horticulture for Horticulturists.

—**TOMORROW** is the Sunday known to church-going people as *Mid-Lent Sunday*, and in some places as the puzzling title of *Fig Sunday*. How and why it acquired this name is not obvious, but it is certain that Figs on this day form a prominent part of the repast in various parts of the country. Such is the case in Lancashire, where the day is known as "*Fig-pie Sunday*," and fig-pie is eaten at dinner. (By the way, it may not be generally known that fig-pudding is a sufficiently palatable variation upon plum-pudding. It is made in the same way, but figs chopped in small pieces are substituted for the plums.) Probably the eating of figs on Mid-Lent Sunday is a remnant of the old custom of regarding that day as a festival. In Northamptonshire, however, it is Palm Sunday that is called Fig Sunday. A dish of figs is on the table at dinner in every orthodox family; and Miss BAKER, in her *Northamptonshire Glossary*, tells us that on the preceding Saturday the Northampton market is abundantly supplied with Figs, and there are more purchased at this time than throughout the rest of the year, even the charity children in some places being regaled with them. In Hertfordshire and Oxfordshire a similar custom prevails. Another custom connected with this Sunday, which is, however, more exclusively ecclesiastical than the preceding, is the blessing at Rome of the "*Golden Rose*," a ceremony which was formerly performed by the POPE in one of the Roman basilicas, but now takes place in the palace where he happens to be residing at the time. The origin of this custom is of some antiquity, and is assigned by various writers to the eleventh or twelfth century. CALMET states that it was instituted by LEO IX. in 1043. The Rose is described as a cluster of Roses and rosebuds growing on one thorny stem, of the purest gold, chiselled with exquisite workmanship. It is blessed by the POPE with various ceremonies, and a few grains of musk and amber are inserted by him among the petals. It was formerly bestowed upon the Prince whose privilege it was to assist the Pontiff to dismount at the basilica; but in later times it was sent to any one of exalted station for whom the POPE had an especial regard. One was sent by LEO X. to the ELECTOR of SAXONY at the commencement of the religious movement instituted by LUTHER, while the present POPE has thus honoured the ex-EMPEROR of FRANCE, and, in 1863, the ex-QUEEN of SPAIN. Last year a less exalted personage was selected, the Rose having been bestowed upon the Baronne VIGIER, who, as SOPHIE CRUVEYER, was a candidate, catanatrice, and conspicuous by her charity and good works.

—A correspondent asks to be furnished with a list of FLOWERS WHICH EXPAND AT CERTAIN HOURS, and in acceding to his request we cite the following list from DE CANDOLLE's *Physiologie Végétale*. The observations were made at Paris—in our latitudes the hour would be slightly different. Since DE CANDOLLE wrote, a new light has been thrown on the subject, through the impulse given to so many similar matters by DARWIN, and it now seems most probable that in many cases the period of expansion corresponds to the time of appearance of particular insects which visit the flowers and transport the pollen from one flower to another.

It may be in the case of a cultivated flower that the right insect is not a native of the country, and then, if no substitute be at hand, the flower literally wastes its sweetness on the desert air. It is obvious, however, that too literal an interpretation must not be exacted, but only a general co-relation. Again, full allowance must be made for climate, season, weather, aspect, and other circumstances. In this matter our observations, so far as they have gone, agree with those of Sir JOHN LUBBOCK, who says that in his experience "the opening and closing was more gradual and more dependent on the weather than I should have expected from the statements of DE CANDOLLE and others." Our correspondent is also referred to an elaborate paper by FRITSCH, abstracted in the eighth volume of the *Journal of the Royal Horticultural Society*, p. 1.

<i>Ipomoea purpurea</i>	2 A.M.	<i>Calceolaria arvensis</i> , Wild Marigold	9 A.M.
<i>Calystegia sepium</i>	3-4 A.M.	<i>Arenaria rubra</i>	9-10 A.M.

<i>Anagallis arvensis</i> - <i>is</i> , <i>Pimpernel</i>	8 A.M.	<i>Cercis grandiflora</i>	7-8 P.M.
<i>Nolina prostrata</i>	8-9 A.M.	<i>Rus. Oenothera tetrapectera</i> , &c.	

In this country the Daisy (*Day's Eye*) opens at sunrise and closes at sunset. The *Dandelion* opens about 7 A.M. and closes at 5 P.M. The *Geranium* remains open from 9 till 3; the white *Water Lily* from 7 till 4; the *Mouse Ear*, *Hawweed*, *Hieracium pilosella*, from 8 till 3; the *Scarlet Pimpernel*, *Anagallis arvensis*, from 7 till 2; *Tragopogon pratensis*, from 4 A.M. till 12 noon, whence the English name of "John Go-to-bed at noon." The matter is of some interest to "hadders out," as the following case proves. The writer visited the superb terrace gardens at Monte Carlo, near Monaco, in the morning, and found edgings and "ribbons" of *Gaillardia* in startling contrast with the rest so that they could be seen from the hill-tops at a distance. Leaving the garden, on his return to it after some hours the effect was well nigh obliterated. In the afternoon the flowers in question were asleep. A similar, but less marked change, was noticed in the case of the beds of *Mesembryanthemum*. We recommend those who are curious in such matters to watch their flower-beds, if these plants occur in them, and note the insects which visit them. In relation to this subject, Mr. YULE has observed that *Epidendrum caput-meduse* exhaled an agreeable odour from midnight to 5 A.M., and remains free from odour the rest of the day. This also seems to be a provision to attract night-flying insects. *E. cochlearatum* var. *fragrans*, on the other hand, is sweet-scented between 6 A.M. and 6 P.M.; *Cattleya bulbosa*, between 6 A.M. and 11 A.M.; *Angrecum distichum* becomes sweet-scented from 11 A.M. till 6 P.M.; *Rodriguezia crispata*, from 6 A.M. till 11 P.M. Some *Aroids*, as *Conoplasium*, exhalt the detestable odour just at the moment when the anthers burst. All these cases would seem to be connected with the appearance of particular insects at particular times, these insects conveying the pollen from flower to flower and thereby setting the seeds. Many night-flowering plants, such as the night-smelling *Stock*, have dull neutral-tinted flowers, the perfume alone being sufficient to attract insects. Again, wind-fertilised flowers, which do not require the visits of insects, do not, as Sir JOHN LUBBOCK has pointed out, go to sleep.

—THE SOUTHAMPTON HORTICULTURAL SOCIETY will hold a spring show on April 13, and a grand horticultural exhibition and gala on Saturday and Monday, July 31 and August 2.

—**TOXICOHPLEA THUNBERGII** is blooming in the Palm-house at Kew. The white flowers are deliciously scented, they are produced in dense cymes, in the axils of nearly all the leaves of the growth of last year, forming beautiful wreath-like branches. This specimen is planted out, and from the slender habit, with closely disposed leaves and flowers, may evidently be trained effectively in any desirable way. Cuttings are rooted without difficulty, and afterwards require but the simplest cultivation. A decoction of the bark was once used by the aborigines of the Cape of Good Hope for poisoning their arrows. It is the Gift Boom, or Poison-tree of the colonists. A plant closely allied, sent out by Mr. B. S. WILLIAMS, was figured in this journal as *T. spectabilis* about three years ago (p. 363, 1872). Another, apparently quite distinct, is cultivated in the Royal gardens under that name. There are now no flowers, but otherwise, on comparison with herbarium specimens, it appears correctly named. The most evident difference is that the leaves are much larger, and separated by long internodes.

—Colonel YULE has some interesting notes on the HISTORY OF PLANTS in the February number of the *Geographical Magazine*, in which he points out that Pine-apples and Tobacco are mentioned as in use in the Old World in translations of two works which appeared before the discovery of America, of course in both cases owing to an erroneous rendering of the original. He shows that the name Pine-apple was known long before the discovery of America, and was then applied to the cones of Fir trees, which are still called Fir-apples in some parts of the country. This is the only sense given to the word Pine-apple as comparatively recent was as MUSEN'S *Conium in Belgica*. The name Pine was given to *Ananassa sativa* by the Spanish discoverers. This appears from PARKINSON'S description of the plant in his *Theatrum Botanicum*. He says, "They of Brasil call it Nana, others Anana, the Spaniards and Portugalls Pinas, from the likeness, and so does most countries, following that name." He says that he calls it "like to a cone of the Pine tree, which we fruit a Pine-apple, for the forme."

—THE LOUGHBOROUGH HORTICULTURAL SOCIETY'S exhibition will be held on Wednesday, July 14, in the Elms Park, Leicester Road, Loughborough.

—The current number of *The Gardener* contains the following remarks with respect to AN EFFECTUAL REMEDY FOR BLEEDING VINES, from Mr. WILLIAM M. BAILLIE, The Gardens, Beaufort Castle, Hexham:—

"After pruning our early house this winter there was a Muscat of Alexandria Vine commenced bleeding copiously from more than one wound: this I attributed to the heat from a drain which conveys the main pipes through below the border to a range of plant-houses, which had set the sap in motion. We tried various remedies, but without effect, until we tried POOLEY'S tobacco-dust; to this we rubbed well into the wounds, dusting them well over with the dry dust. The effect was almost instantaneous, the wounds being sufficiently dry in a few hours to admit of the receiving a dressing of PARKINSON'S Symplic. I do not lay claim to any new discovery, but as bleeding Vines are of frequent occurrence, and are, moreover, a source of loss and annoyance, and I never remember of having seen tobacco-powder recommended for prevention, I deemed it of sufficient importance to lay before your readers."

—THE WISBECH "All England Prize" ROSE SHOW and HORTICULTURAL EXHIBITION for the present year has been definitely fixed for Wednesday, June 30.

—In a communication received from Mr. JAMES ALLEN, Shepton Mallet, he mentions that he, last season, obtained some seed of CHEIRANTHUS MARSHALLII, which is a very infrequent occurrence. This came about as a result of what might be termed a happy accident. After the profuse spring bloom of this valuable hardy decorative plant, Mr. ALLEN'S gardener cut off the flower stems. This induced a scanty growth, which produced a second bloom, and it was the flowers so obtained that produced the seed. It is Mr. ALLEN'S hope that new varieties of the Cheiranthus will result. The first crop of flowers will produce an abundance of seed-pods, but on examining the seeds they will be found to be immature, and, therefore, incapable of germination. Some two or three years ago Mr. A. DEAN, Bedford, tried his luck at crossing Cheiranthus Marshallii on the Belvoir Castle Wallflower, a well-known dwarf pure yellow strain. A few seedlings raised had the growth and elongated spikes of the Wallflower, but with the rounded smaller flowers of C. Marshallii. The practical result was that both parents were spoiled, and it was thought not advisable to pursue the attempt farther. Perhaps more can be done in the way of seedling from C. Marshallii, than from attempting to cross what has hitherto been regarded as a seedless plant with dwarf types of the common Wallflower.

—Mr. LETTS, late foreman at Sandringham, succeeds Mr. E. LEWIN (at Upleatham), who, as already announced, has gone to Aske Hall, another seat of Lord ZETLAND'S. Mr. LETTS was at one time a pupil of Mr. BAINES, and is a young man passionately fond of the pursuit, and likely to make his mark.

—Quite a new phase has been given to the important question of RATING NURSERYMEN'S GREEN-HOUSES, by what transpired at the Hammersmith Police Court a few days ago. It was the case of *Hiscocks v. Lobjot*, and is one of considerable importance to nurserymen, market gardeners, and others. The defendant, a market gardener, residing at not giving notice of the district surveyor for the purpose of the defendant was that the greenhouse was exempted according to clause No. 6 of 18 and 19 Vic., cap. 122. In reply the plaintiff referred the magistrate, Mr. INGHAM, to a recent notice of his, that the greenhouse must be 30 feet from the nearest buildings, "whether belonging to the occupier or the adjoining

owner." The defendant contended that the clause meant from the nearest buildings of an adjoining owner, and from the ground of an adjoining owner, and pointed out what a serious case it would be for all nurserymen and florists if Mr. INGHAM's construction of the clause was correct, and greenhouses had to be put 30 feet apart. According to the magistrate's reading of the clause, if any occupier put up a pigsty or even a dog-kennel in his field, he could not erect another building whatsoever nearer than 30 feet. The greenhouse in question was the fourth built in a row, from 4 feet to 6 feet apart, and defendant contended that the first greenhouse, not being a building according to one clause of the Act, it could not be considered as a building referred to in the exemption clauses. Mr. INGHAM said, from the way the defendant put it, he quite saw the importance of the case, and the serious consequences to nurserymen and florists, and he should wish the defendant to consult with other growers, and, if they wished, he would have a case drawn up and submitted to a superior Court. The case was then adjourned to March 13. What is wanted is some combination of horticulturists and others interested in such matters to ventilate and take action in regard to questions of this character. It is reported that the Horticultural Club, of which little has been heard of late, is being re-organised, and that one of its objects will be to take cognisance of matters of this character, in the interest of horticulture. Messrs. PROTHEROE & MORRIS are, we believe, likely to take action in this matter.

—The annual show of the FAREHAM and SOUTH HANTS HORTICULTURAL SOCIETY will be held on June 23.

—Mr. JOHN NEVILLE KEYNES, of Pembroke College, Cambridge, son of Mr. JOHN KEYNES, nurseryman, Salisbury, has just been elected President of the Cambridge University Chess Club, and in this capacity will captain the Cambridge team at the coming inter-University chess match, to take place in London on the Friday evening preceding the boat race.

—THE LOUGHBOROUGH CHRYSANTHEMUM AND FRUIT SHOW will be held at the Town Hall, on Monday and Tuesday, November 15 and 16.

Our contemporary, the *Globe*, a few days since had a leading paragraph advocating, on the authority of a French peasant, the use of salt in growing POTATOS as a substitute for forcing. The tubers are to be planted in August on a "thin stratum of soil, each root (*racine*) having placed over it a pinch of compost, and the earth heaped over that. The crop is ripe in the middle of January." Our contemporary has doubtless discovered one of those mysterious facts for which the ordinary cultivators of the potato are famous. The discovery of the French peasant—assuming the whole story to be true—is but a well-known form of superterbutation, common enough with certain kinds of Potatoes under peculiar conditions. Early Kidneys, for instance, if the first shoots have been rubbed off before planting, or are injured by frost after planting, will commonly produce a few small tubers without developing any foliage. In the same way, a heap of partially diseased Potatoes covered with earth have often in the spring produced young tubers without any accompanying leafy growth. Not long since complaints of this tendency in the early planted crops were abundant in these pages, and there are few gardeners to which the phenomenon is not well known. The peasant's "invention" is therefore one of no modern character; the most that can be said for it is that it is an endeavour to convert a species of natural abortion into a marketable commodity of an exceedingly doubtful value. The application of a "thin stratum of salt" in the mode of cultivation searched for, which our knowledge of its evil influence upon all forms of vegetable life. A dressing of a few hundredweights of it to the acre may be productive of benefit to ordinary crops negatively, by the partial destruction of insect life, but that could not, in the most exaggerated language, be termed "a thin stratum"—a phrase that we can better understand by the words a "thin layer,"—but it is notorious that such a dressing as this would render the soil incapable of producing vegetable life for years afterwards. Again, such a dressing of salt, if applied as described in the extract, and then covered up thickly with soil, would be liable to induce a temperature almost akin to freezing; and if the tubers passed safely through the action of the salt, their vegetating powers would probably be rendered nugatory by the reason of an intensely cold soil. Some of the particulars of cultivation require explanation: for instance, if the "breaking up" be done in August, why should it require to be again done in September, and "weeded" in October?—as in the latter case the growth of weeds is soon after winter digging must be somewhat marvellous. The whole story wears an air of improbability, and the conclusion is simply ridiculous, as it is impossible to conceive that any beneficial result can follow upon the "dis-

covery" of such a mode of growing Potatoes. To write of the produce as a "ripe" would be, under such conditions of culture, simply absurd. Potatoes are only ripe when healthily matured, and this follows only after the ordinary conditions of growth, such as we are all familiar with. No better description of our Frenchman's Potatoes could be found than these quotations from the article afford.

The annual summer exhibition of the BITTERNE AND WEST-END HORTICULTURAL SOCIETY will take place on Wednesday, June 9.

—On the 26th ult. the friends of Mr. JAMES ANDERSON, Uddington, entertained him at dinner, and presented him with a purse of sovereigns, in the Clyde Hotel, Bothwell. The occasion of the presentation was Mr. ANDERSON's entering on possession of the Meadowbank Nurseries, which he managed for many years while they belonged, as a private garden, to the late Mr. THOMAS DAWSON. About fifty gentlemen sat down to dinner in the large hall connected with the hotel. Mr. JAMES NICOL, accountant, Glasgow, presided, and Mr. F. G. DOUGALL acted as croupier. The Chairman, in proposing the health of the guest of the evening, glanced rapidly at the career of Mr. ANDERSON as a writer and a practical man, and stated that it was their object at present to tell Mr. ANDERSON of their wish that Meadowbank might become more famous in the future than it had ever been before. The Chairman proposed "The Health of Mr. ANDERSON," and afterwards presented him with a purse containing 150 sovereigns, and a piece of silver plate bearing the following inscription:—"Presented, along with a purse of sovereigns, to Mr. JAMES ANDERSON, Meadowbank, Uddington, at a complimentary dinner in the Clyde Hotel, Bothwell, as a mark of recognition of his fame as a gardener while in charge of the renowned Dawsonian collection of plants, and esteem for his general activity and usefulness, on the occasion of his entering into business as a nurseryman."

—THE HISTORY OF THE ROYAL HORTICULTURAL SOCIETY is the subject of the lecture to be given at South Kensington on Wednesday evening next. The lecturer is W. A. LINDSAY, Esq.

—The spring exhibition of the READING HORTICULTURAL SOCIETY will be held in the Abbey Rains on Thursday, May 27.

—The first number of the *Revue de l'Horticulture Belge*, of which we spoke in our last number, is before us. It opens with a description of a fine hybrid perpetual crimson Rose, *Gloire du Ducher*, by M. OSVAY DE KERCHOVE, which follows an article on noble flower-beds, the "beds" consisting of trays of pottery or zinc of definite sizes and patterns, so constructed as to be put together puzzle-wise, when they form a regular pattern. The trays may of course be filled with any suitable flowers. This is analogous to the plan of exhibiting Roses followed by Mr. W. PAUL at the Regents' Park last summer. In an article on the Colorado Potato Beetle, *Doryphora decem-lineata*, M. DE KERCHOVE remarks that the European Governments ought in strict logic to prohibit, not only the importation of American Potatoes, but all tubers coming from thence, all bales of cotton, and rolls of tobacco. In the news column we are told that the Belgian residents at Nice forwarded to the Princess LOUISE a bouquet of more than 3 feet in diameter, composed exclusively of Orange blossoms edged with a border of Parma Violets. We hope a bevy of Cupids were in attendance with a wheelbarrow on the occasion. We cordially wish our new contemporary a successful career.

—THE ROYAL WESTERN HORTICULTURAL SOCIETY will hold an exhibition in the new Guildhall, Plymouth, on June 1 and 2.

Home Correspondence.

Royal Horticultural Society.—I should be greatly obliged if you would help me in a matter I have much at heart by inserting the following letter, a copy of which I have sent to several friends, with encouraging prospects of success.—"The Royal Horticultural Society is now divided into two sections, with different interests—the local Fellows, who use the South Kensington Gardens as a recreation ground; and the horticultural Fellows, who only care for them as a convenient place for holding shows and meetings. It appears likely that the two sections will more or less amicably separate, that the local people will bear the cost of the South Kensington Gardens, and that the horticulturists will have what funds they can collect to spend on horticulture proper. A long experience on the Council has satisfied me that our Society would be much stronger and more influential with a very large

number of Fellows all over the country, at a guinea subscription, than with the limited number of Fellows at a high subscription. Some very influential people would cordially back this plan, but I doubt whether enough guinea Fellows would come in. I am most anxious to have a practical fact for them. While talking over the question recently, one of the great nurserymen said, 'I know something of Manchester, where I am doing some large work, and I think many would join there;' it then struck me that Manchester would be an excellent test place. By its work at the old Chiswick gardens, where new vegetables and fruits are grown side by side, justly, and names reduced by some of the best men in the country, and at the committee meetings at South Kensington, to which all new flowers and fruits are sent from all parts, and most carefully judged and reported on, real horticultural work is done which benefits the whole country. I do not think it is too much to ask a guinea from those who care for a garden, and who would like to keep the old Society in an efficient state. I have enclosed a paper, and should be very much obliged if you would send your friends and see how many names could be collected. They are forming a committee, and have a pamphlet to show that it is no new idea!—"Should the Royal Horticultural Society admit to fellowship at a guinea annual subscription, giving for this transferable ticket of admission to all the Society's shows at South Kensington and elsewhere, and every day to Chiswick garden, we the undersigned would be willing to address Fellows on this footing."—(name) (address)," George F. Wilson, Heatherbank, Weybridge, Feb. 15.

—What between the conflicting interests of horticulturists and non-horticulturists, none can foresee the issue of the trial through which the Society is passing. It behoves the former to prepare, even at some personal inconvenience, to do all they can for the common cause. If we are to succeed, however, all idle regrets must be set aside. We must not cavil about existing circumstances, but set to work forthwith to initiate a policy, and if possible carry the same against all opposition, real or imaginary. No prescient art is needed to affirm the fact that misunderstandings will damage horticulture more than anything else, as they have done in the past. Indeed it is the "common cause," that has been the real object of the Society, and it is to be maintained by all means, free from aught having a suggestion of retaliation for imagined evils—let not a semblance be given that can in anywise be construed into the suggestion of venality against any person or party. Thus alone can either party hope to succeed on Tuesday next. Nor let any forget that, if horticulturists have permitted themselves to be beaten, they have permitted it even within the walls of what should have been their own citadel. Horticulture proper, as represented in the Kensington Garden, is to be maintained, and signally. To succeed it must be purely national. Is it so, or has it ever been so? are queries I will not pain myself in attempting to answer. Yet the reality has to be faced, and the facts met. If it does not justly claim an extended national support, then we have the explanation why country Fellows are so lukewarm, and seem so utterly unconcerned regarding it, even including meetings of the most vital import, where their votes are of great value. On Tuesday next is to be held the adjourned meeting. What is wanted is unity and organisation. Surely, if from amongst our many able horticulturists such cannot be wanting, and if forthcoming, as I believe it will be, then let every horticulturist conform to that discipline by which alone success is possible. With unity and determination all things are possible. Let us meet all non-horticulturists firmly, unflinchingly, but still as friends, asserting our proper position; and then to terms with the Commissioners, who surely are not so greatly to blame. Let country horticulturists lend their aid, and let fellows arise by the flows, and all in unison look forward hopefully to the future. *William Earley, The Gardens, Valentines, March 3.*

The Royal Horticultural Society: a Vision of the Past and Future.—A big and goodly steamship, sound at bottom and at heart—a vessel that might be registered at Lloyd's as a 1—well-equipped but somewhat heterogeneously manned, deep in the water, apparently from some heavy cargo, yet it would seem chartered by a noble and wealthy company, judging by the gay and gorgeous attire of those that peeped the deck—was seen at sea helplessly drifting, by the agency of a steady wind and tide, direct for rocks and shoals. Her sails were all furled, and her fires were out. A landsman stood listless beside her helm; her passengers and crew appeared quite indifferent to their fate: some stood like storks with their arms folded, some with their hands in their pockets, with laziness depicted on their countenances, while others lay sound asleep on the benches. To account for this strange spectacle of stolid and listless indifference impending danger and inevitable destruction, the vessel must be raised for a moment to show a glimpse of the past. The ship, it seems, from stress of circumstances

had had to shift its course, and while tacking was overtaken by a storm—a storm both sharp and boisterous, which compelled it to supplement its crew by a recruit of landsmen, who not only floundered over its deck and work, but larded it over her sailor crew, and took the old ship further still into troubled waters, trying even to steer her into some friendly port for help and succour, without success; for ports that welcomed and hailed her in times gone by refused to take her in. At last this crew, having failed to steer her through her native element, must needs try to make her go on ice; but, to their cost, they found she could not be made to skate. At this point (like the last feather on the camel's back) the crew and passengers alike gave way, paralysed from conviction of their utter incapability to avert destruction—hence the picture represented. But while we gazed with wonder and astonishment upon this strange scene, shouts arose as if some spirits had arisen from the dead. Voices were heard to exclaim, "Is there no hand left to take the helm? Is there not a crew with pluck to work the ship—no power in earth or heaven to stay her from her onward progress to destruction?" On a sudden a change came over the surface of the deep, the wind veered round and freshened, at which the landsmen were seen to sicken and the old crew seemed to pluck up courage; for shortly there were symptoms of the fires being lighted and of brisk movement among the sailors; and crew and passengers alike were heard demanding that a practical and steady hand should take the helm. When, lo! and behold, all on a sudden (it is believed on one Tuesday afternoon) the old ship was seen to have changed her course: her steam was up, her sails were set, and she was steering out to sea; the landsmen it is supposed had gone below to poke the fires, as they were nowhere to be seen. Now who's to say that this good old ship may not yet weather the storm? She may by skilful pilots be steered into calmer waters, perhaps into some genial haven, and when the sun breaks forth some fine summer's morning her crew and passengers may be found fraternising with the princely, the noble, and the gay inhabitants of some favoured clime, who from a sunny bank had been waiting for their approach with open arms, and only chiding them for their long delay. The smile of the former part of the vision will easily be perceived; let's hope the remainder may as easily be accomplished. If it's true the change of wind and took place on a Tuesday, as sailors are said to be superstitious they should bear in mind there is another Tuesday near at hand, and let them see to it that the old ship's steam is well up on that day, that her deck be cleared of all incumbrances, and manned by practised hands; and, above all things, let it be borne in mind that then, at 3 P.M., "every man will be expected to do his duty." *Nelson.*

Rating Nurserymen's Greenhouses.—In the *Gardener's Chronicle* for Feb. 6, I see that Mr. J. Turtle, of the nurseries, Walling, is in a position similar to many others, myself among the number, who feel the unfairness of the parochial assessment upon their glasshouses. About two years since I appealed against the rating of my houses, but before doing so took the precaution to write to several of the largest owners of glasshouses in this country, to ascertain, if possible, upon what basis they were assessed. All were most kind in replying to my inquiries, and many took great pains to supply me with important particulars that I had not asked for; from which I gathered that a considerable amount of strong feeling existed upon the subject of rating. On my appearance before the Assessment Committee, the chairman refused, point blank, to allow me to refer to the evidence I had collected, and stated that nothing could be entertained by that committee, as a precedent, unless it could be found within the limits of their own Union. I often see this question cropping up in the horticultural papers, and am not a little surprised that it has not been settled before this. I have a suggestion to offer, and shall be pleased to see it taken up with that amount of earnestness which so important a matter deserves: That subscription lists be opened by the conductors of the horticultural press, and all interested in the market garden trade invited to subscribe, to defray the expense of a trial in one of the superior courts in London. Let some case be fairly tried, that its ruling may be final for others. Should it be found that, in the present state of the law, horticultural buildings for *bona fide* market purposes are assessable to the poor, then let the question be brought before Parliament, that it may be settled upon a broad and intelligent, *ad valorem* basis, applicable alike to all growers, and thus removed from the incapacity of parochial officers and the caprice of assessment committees. *Geo. Beer, Chesswood Gardens, Worthing, Sussex.*

I am very pleased to notice, by the letters in the *Gardener's Chronicle*, that Messrs. Protheroe & Morris are prepared to take a lead in testing the legality of rating nurserymen's glasshouses as they are done at present; and I hope the subject may receive immediate support. I bind myself to pay £5 towards a fund for the purpose of

bringing the matter into court for a decision, if such decision is applicable to Scotland as well as England; if not, of course we in Scotland must raise the question for ourselves—and in that case I would reserve my subscription for action here. I will undertake to get many subscriptions for the purpose in Scotland, if I am advised that an English decision will settle the case in Scotland. I took a field here that a tenant-farmer was paying £6 a year for, and before I got a shilling off the place I was rated at £217 a year, and am now raised to £307—all this on trade glasshouses, except £40 for my dwelling-house and stable. *W. Thomson.* [We trust the trade will take this matter up. It is a perennial grievance, which should be settled once for all. Eds.]

New Vines.—I shall feel obliged if some of your correspondents will give me their experience respecting the following Grapes:—Madresfield Court, Duke of Buccleuch, and Waltham Cross Seedling; also Venn's Black Muscat. I have some Vines that I am not altogether pleased with, and intend replacing them with one or other of the sorts I have given. Madresfield Court is a splendid Grape, but I am told by some that it is very liable to crack. My house is an early one, for which I require them. Those I intend discarding are Golden and Black Frontignans, both of which occupy space which I think can be better filled. *T. Martin, St. Austell.*

Monstrous Mushroom.—I have sent you a Mushroom (fig. 61), which I took from the bed this morning. Being somewhat curious in shape, I am desirous, if possible, to know the cause of this malformation. I

FIG. 61.—MONSTROUS MUSHROOM.

have grown the Mushroom for a number of years, but never saw one like this before. I send you the part of stool which I broke off in taking it up, it having three parts to the stool. *G. T. B.* [Such variations are not uncommon. We suppose the spawn, in over-running the cap of one Mushroom, have somehow become reversed; but we never had an opportunity of seeing such a one in a stage early enough to ascertain the real cause. Eds.]

Fuchsia Riccartoni.—It is satisfactory that the history of this fine variety of hardy Fuchsia is now fully known. I distinctly mentioned, in the short article I wrote in the *Gardener's Chronicle*, that all I knew concerning it was told me by the gardener who brought it into Ayrshire. From the place at which he was gardener being situated near to Riccarton, near Kilmarlock, it was reasonable to suppose he might have named it after that place, as he said it was a seedling. I find this variety, when growing in the open border, always grows stronger and flowers best in wet summers. In the autumn of 1872 I had plants of it 8 and 9 feet high, and as much in diameter, and these immense weeping bushes were covered with flowers. Here it always requires protection at the roots in severe winters. We cover them up with old tan or some litter, which is never taken off till all danger from the spring frosts in May is over. *William Tilly.*

The Large Tree at Ellon.—In your issue of February 20 I observe a paragraph, on p. 244, copied from the *Banffshire Journal*, in which it is stated that "the trunk of a massive tree in front of a house occupied by Mr. George Low, blacksmith, Ellon, referred to by Dr. Johnson, in his *Tour through Scotland*, as one of the only two trees in Scotland capable of suspending a man in being hanged, has just been destroyed." This statement is incorrect, and consequently misleading. The facts of the case

are as follows. On October 3, 1860, during a violent storm of wind, the whole of the top of the tree in question was blown down. Since that time it has been allowed to stand in its dead but dilapidated condition until lately, when it was removed for the following reasons:—1st, because of its dangerous proximity to occupied houses; 2d, its decayed and insecure state; and 3d, with the object in view of preserving a small part, yet fresh, of the base of the trunk for the purpose of retaining a memento of the famed lexicographer's remark. This, instead of being destroyed, as the *Banffshire Journal* states it, has been carefully preserved, so as to prevent exposure to the weather and decay from doing that which the present authorities are accused of having done. *Adam Howitt, Gr., Ellon Castle.*

Grafting Pears on the Quince Stock.—In the short article on the above subject at p. 246 of your impression of the 20th ult. I appear to ask, "What success attends grafting from the Quince stock?" whereas the question I proposed was as to grafting Pears on the Quince stock. The two questions are so widely different that the rule applying to the one would not apply to the other. Kindly correct this, so that I may get at the information desired. *Charles B. Saunders, Jersey.*

The Garston Vineyard.—I notice with much regret in your advertising columns an announcement of the sale of the above justly celebrated establishment. The magnificent examples of Grape culture that have so frequently been exhibited not only before Her Majesty Queen Victoria, and nearly all the crowned

heads of Europe (by special command), but before the general British and Continental public at various international and horticultural exhibitions during the last twenty years, have undoubtedly done much to increase the growing taste, not only for Vine culture, but for horticulture generally in all parts of the civilised world; as well as to help in raising the science of Grape growing to its present extraordinary perfection. I therefore look upon the probable dismantling of the Garston Vineyard as a great national loss to horticulture. I feel this particularly myself, having gained in years gone by so much practical, and, to me, most useful knowledge from what I had from time to time seen there, and from the honest truths so freely imparted to me by its skilful and accomplished owner. I trust I may be pardoned for believing that the diffusion by means of the descriptions I then and subsequently gave of my own successful practice as a Grape grower in the pages of a contemporary, has been the means of greatly improving the system of Grape culture in the present day. In the year 1867 I gave a very minute description of the Garston Vineyard, and explained fully how the marvellous successes obtained were realised. Previous to the period mentioned above it was generally thought that to grow the Vine successfully, so as to insure a continuous crop of well-finished Grapes, it was absolutely necessary that every vineyard should have a southern aspect. I explained how a vineyard having a very flat roof and facing the north, and overshadowed by large Elm trees, had been constructed by Mr. Meredith and planted with late varieties of Grapes; that the Vines so situated seldom or never felt the benefit of a ray of sunshine. I also described the wonderful crops of well-finished and beautifully-coloured Grapes the Vines produced year after year, and how easily the fruit was kept in good condition to a very late period in the year, or, I may say, until well-finished new Grapes were ready for cutting in

an early house close by in the beginning of the following year. I also described the beautiful condition of the Vines in the various houses that were then producing the unequalled bunches which, for size and finish, met the admiring gaze of visitors to the horticultural exhibitions of that period, and which, up to the present time, have not been surpassed for quality and finish. Larger bunches have, within the last few years, been produced, but have not possessed that finished appearance always so recent occasion (December 1, 1874) I carefully looked through the vineries, and was pleased to find the same Vines that had borne such splendid Grapes fifteen years previously more vigorous than ever, and capable of much greater results under the same or similar care and treatment. In the north house were to be seen bunches in larger quantities equal in size and finish to those produced by the same Vines in 1867. In the other vineries the Vines were equally good, and the Grapes as good as in previous years, the young wood in every instance being well ripened and stronger than I ever saw it before. I wished that the care of them for this year was in my own hands, feeling certain that by judicious management, if I wanted to gain a name as a Grape grower, I could take every first prize offered this year in this or any other country. I therefore hope Messrs. Protheroe & Morris will succeed in disposing of the Garston Vineyard entire to some enterprising firm, who might, by combining the business of horticultural builders with that of cultivators of the Vines, reap a good return for their outlay, and save from destruction the finest collection of Vines in the world. *John Will, Royal Exotic Nursery, Ousley Crescent, London.*

Barked Elm Trees.—I can give Mr. A. Dean a crumb of comfort. Much depends, as you say, "on the depth to which the trees are barked, and other circumstances." This, however, I have learnt by observation—that trees will bear barking to a much greater extent than the faith generally prevailing on the subject will allow. Some ten years ago a number of young Maple and other trees were planted in Queen Elizabeth's Walk, Stoke Newington, and some mischievous boys barked them all round to a height of 5 or 6 feet, and so deep that the alburnum was laid bare, and in some places the heartwood was bared; yet none of the trees died, they made new bark somehow or other. [Our own experience with some young Limes is precisely similar. Eds.] I could point out some of them now, and show the disfigurement scars that remain. The new bark spread from the edges of the old bark over the exposed alburnum like thick varnish, being brown and glossy, as if nourished by extravasation of viscid sap. About the same time I planted a lot of Planes and other trees in Stoke Newington Churchyard, and these were cruelly barked by boys, but they were not much injured in the end, and are now thirty trees, well protected with an iron palisade. You will remember some years ago M. Robert scarified the Elm trees on the public walks of Paris to get rid of scolytus, cossus, and other of their insect enemies. Not many of the trees died in consequence, though, in some cases, they ought to have died to satisfy the expectations of orthodoxy. Truth is truth, but this sort of truth must not be over much paraded, for we do not want to see trees flayed alive because the process is not sure to kill them. *Shirley Hibbert.*

In answer to Mr. Dean (see p. 281), allow me to say that we have a case very similar here. It is that of two very large Walnut trees, which had the bark taken off by some ignorant fisherman to dye their nets. About six years ago the bark was cut round the trunk at 1 foot from the ground, and again at 5 feet. The bark was then taken off the same as peeling Oak. Those two trees are still living, and have since carried a crop of fruit. I would also add that the buds are this year as plump and forward as the other trees near them; and as these two trees have certainly outlived their mutilation, it would only be fair to suppose that the Elms may also continue to put forth their leaves in due season. *G. Dodd, Woodstock Park, Ireland.*

Germination of Holly Berries.—Many of your readers will doubtless be aware that Holly Berries when sown often lie long in the ground, and do not germinate in a year, when the majority of them germinate. I shall be glad to hear whether any of your correspondents have ever tried removing the pulp that surrounds the seeds with a little tepid water, and then sowing the little hard seeds (of which each berry contains three or four) in a pot in the house, and if so with what result. I should also like to know the proper treatment for Californian seeds with very hard shells in order to insure as far as possible their germination. Should they be soaked in warm water, and for how long? or should the hard shells be broken and only the kernel sown? *W. E. G.*

Odontoglossum Warscewiczii and Phalaenopsis.—In my note about *Odontoglossum Warscewiczii*, in your last number, p. 270, three words were

omitted, thus giving a wrong impression. At p. 271, before the words "M. Linden gave," insert "a rival of." It is very natural that M. Linden, who was so fortunate as to introduce *Odontoglossum Phalaenopsis* through Messrs. Schlim and Wagener, would not have said ought to discredit his own plant, but those who do not know the history of the species might understand it so. To be plain, I alluded to the representation in the *Illustration Horticole*, iii. 109, which shows the flowers, if not a little too pallid, yet much too sordid in colour. This impaired the reputation of the plant, as I have experienced myself in conversation with several amateurs. *H. G. Kitch, f.*

Kilns for Charcoal.—The common method of making charcoal in pits—that is, in conical pits covered with a layer of leaves and earth—is here abandoned, and kilns are substituted for the pits. These kilns are made of brick, one course being suffi-

FIG. 62.—CONICAL CHARCOAL KILN.

cient, bands of iron or timber framework being added to strengthen the brickwork, with great economy. The most prevalent style of kiln is the conical shaped one, shown here (fig. 62). A usual size is 24 feet in diameter, with an equal height, holding about 40 cords of wood. This size has been found to be the

FIG. 63.—ARCHED CHARCOAL KILN.

most economical. I have had coal made in kilns of this character, and of the kind next described, for 4½ cents (2½d.) a bushel, delivered, the contractor being furnished with the timber standing and the use of the kilns free. In pits the coal cost at the same time is 6½ cents (3½d.) a bushel. The cost of one of these kilns with a lining of fire-brick for 10 or 12 feet up from the bottom was 1200 dollars. (£250). The wood turns out more coal than when burned in pits, and 43 to 45 bushels of coal to the cord have often been made with first quality hard wood. The extra yield and less cost give a very good profit upon the cost of the kilns. The wall of the kiln (fig. 62) is carried up nearly straight for 6 feet, when it is drawn in and made to form a blunt cone. Upon the top a plate of iron is fastened in the manner of a keystone to an arch. Bands of 3-inch hoop-iron an eighth of an inch thick are placed around the kiln, and drawn together (A) with screw bolts and nuts to strengthen it. There are double sheet-iron doors at the bottom and near the top of the kiln, by which it is filled with wood

or emptied of coal, and a few air-holes (B), which may be stopped up with loose bricks, are left in the bottom. When the kiln is filled it is necessary to plaster over the cracks of the doors or any that may exist in the brickwork with well-tempered clay, to exclude air. The second figure (fig. 63) shows a kiln of another shape, made to burn over 3000 bushels of coal and holding 80 cords of wood. It is a parallelogram in shape, with an arched roof, and strengthened by a framework of timber 10 inches square. The walls of this kiln should be a brick and a-half thick, to stand the pressure of the gas which sometimes accumulates within and occasionally bursts one of them with great force. A usual size is 40 by 16 feet and 16 feet high, outside measure. These larger pits need four weeks for a round—that is, to be filled, burned, and emptied; the smaller ones require three weeks, which is about the time needed to "cook" a pit. *A Charcoal Burner, in the "New York Tribune."*

The Lindley Medal.—My attention has been drawn to a correspondence in your journal, in which the fact of my late gardener, Mr. W. Wilson, having gained the "Lindley Medal," has been called in question. Mr. Wilson is, I am sure, quite aware that he cannot claim the Medal, from the circumstance that at the time it was awarded to him I was a member of Council of the Royal Horticultural Society, but I am perfectly certain that he did have it awarded to him. I was present at the Council meeting upstairs when the recommendation of the Floral Committee that the Medal be awarded was read by the Rev. J. Dix, and remember distinctly Mr. Saunders (who, I think, was the chairman) pointing out that although the Medal had been won, it could not be given, for the reason above mentioned. This was likewise stated downstairs at the general meeting. I think Mr. Wilson ought certainly to have the "credit" of it at least, as a finer collection of *Cattleya Triana* has never been shown in the Society's rooms, *W. Marshall.*

The Fruiting of *Hibiscus rosa sinensis*.—Had I have been asked last summer the question whether this plant seeds I should have replied "Yes," freely enough, but now I should hesitate before giving that opinion. I have two plants that have seeded every summer since they were three years old, for these are seedlings from some old ones I had previously. Last summer I picked off a good many pods in the green state merely to prevent them robbing the plants. The seed-pods are about an inch long, rather flat at the top, where they open and show the black seeds inside, which do not readily fall out, as the pods retain their nearly upright position. The shape of the seed-pod is very like the growing flower-bud, indeed, in one state of the bloom-bud there is a very great similarity between the bud and the unripe fruit, so much so that I think where they are growing naturally they might be easily overlooked. *William Burns, The Gardener, Thingwall Hall, Woodchurch, Birkenhead.*

Reports of Societies.

Royal Horticultural, March 3.—Bonamy Dobree, Esq., took the chair, but being called away soon after to an important meeting of the Council, the remainder of the sitting was under the presidency of Mr. Thomas Moore. The Rev. M. J. Berkeley said that the Mandarin Oranges shown by Mr. Webb were closely allied to the well-known variety called the Tangierine, but had a rather finer rind, which, however, does not separate so freely from the flesh as the last named. There was also rather more perfume in the rind of the Tangierine than in that of the Mandarin. With reference to the Kumquat (*Citrus japonica*), Mr. Berkeley stated that there were two varieties, one being thorny and the other thornless, to which latter section the specimen before the meeting belonged. It had been said that Mr. Bateman's plant was the only one in the country, but he thought he had seen others, though they were exceedingly scarce, owing to the fact that it could not be worked on any other stock than *Limonium trifoliatum*, and not always successfully on that. Its propagation was indeed difficult, but on account of its exceedingly handsome appearance he hoped gardeners would try to find out some easy way of growing it. With regard to the Sweet Potato, he might remark that when Shakespeare mentioned Potatoes this was the plant he alluded to, as at that time the Potato had not been introduced by Sir Walter Raleigh. The Sweet Potato was also cultivated by Gerard. Personally he disliked the flavour, which resembled that of a hard-baked rice pudding seasoned with treacle. It was, however, much liked by some. The genus *Batatas* had a 4-celled ovary with one seed in each cell, instead of being 2-celled, with two seeds, as in most *Convolvulaceae*. A closely allied plant, *Ipomoea macrorhiza*, formerly called *Batatas jalapa*, had roots which weighed from 40 lb. to 50 lb., and was perhaps sometimes used for true Jalap; while another *Convolvulaceae*, named *Rhodorhiza*, gave the Oil of Rhodium, used by ratcatchers for attracting their prey. With regard to *Masdevallia*

melanopa, Mr. Berkeley stated that he had some doubt whether the plant shown under that name was not *M. polysticta*, as Reichenbach, in describing the plant in the *Gardener's Chronicle*, 1874, p. 322, had done so from dried specimens, which misled him as to the colour of the tails; but in the *Gardener's Chronicle*, 1875, p. 136, the Professor had put the matter right by stating that the tails of the sepals were yellow, the sepals white with purple dots, and the lip having three longitudinal keels, and far more blunt than appeared in the dried specimens. It was, he thought, a pity that the name had not been altered, for it was very misleading. Messrs. Veitch & Sons had shown him a plant unknown to them, but which he had determined to be *Anthoecis viscosa*, and he alluded to the matter only to state that it was one of the plants belonging to Solanaceæ, which was affected by the Potato disease, as also was the Tomato, the fruit of which was attacked and rendered quite disgusting. Alluding to the beautiful *Narcissus Bulbocodium monophylla*, which had only flowered once before in this country (at Kew), Mr. Berkeley stated that he had been favoured by a lady with some bulbs direct from Algeria, and that they had flowered beautifully with him lately in a cold frame. Mr. Berkeley also mentioned, as a point of some interest, that he had lately met in Halliwell's Dictionary with the word "ambyr," signifying a swelling or pimple, and which was, no doubt, the source whence the word "ambyr" was derived.

SCIENTIFIC COMMITTEE.—Dr. Hooker, C.B., Pres. R.S., in the chair.

Fungus Growing from the Body of a Caterpillar.—The Rev. M. J. Berkeley read a letter from Mr. Moseley, the naturalist on board the *Challenger*, relating to a fungus, *Spheria sinensis*, growing out of a caterpillar, and which is used as food by the Chinese. The caterpillars so affected are tied together in bundles, as shown in our illustration (fig. 64), and sold in the markets. Mr. Berkeley remarked that in these cases the body of the caterpillar was permeated by the mycelium. Allusion was made to a similar fungus affecting caterpillars in New Zealand, and to *Spheria*,

FIG. 64.—SPHERIA SINENSIS.

or *Torrubia militaris*, which affects the pupæ of insects in this country.

Spawn of Xylotromus behulimus.—Mr. Berkeley showed a portion of the spawn of this fungus, of unusually tough consistence. It was sometimes called *Xylotroma giganteum*.

Balls formed by the Leaves of Caninia.—A specimen of a mass of leaves of *Caninia* agglomerated into a ball from the movement of the waters of the Mediterranean was shown. It was analogous to the similar "moss balls" found in some of our lakes, and formed of *Conifera aggregopila*.

Effect of Lichens on Trees.—A conversation arose with reference to the lichen on the leaves of Tea, mentioned at the last meeting, in the course of which Mr. Berkeley observed that lichens were really injurious to trees, as he had proved by the good effects consequent on their removal. He considered the injury was mechanical, and that nothing analogous to the spawn entered the tree.

Professor Dyer read the following passage from a report dealing with the introduction and culture of the *Cinchona* into the *Netherlands* (p. 167, 1866):—

"Further experience in removing strips of bark indicate that to be the most profitable system. The causes of failure in our first experiments having arisen, first, from the stem not being instantly covered with moss; and, secondly, from allowing lichens to be mixed with the moss used for this purpose. This season the treatment of the plants in this system has been most successful, in consequence of the stems being covered with moss the instant the strips of bark were removed, care being taken to select such moss as was entirely free from admixture from lichens, it being found that the presence of these among the moss generated a fungus which penetrated into and injured the wood of the plants, preventing the formation of new bark. It is, therefore, of the utmost importance to select the best green moss, a uniform bright green in its texture indicating that lichens are not present." *Papers Relating to the Introduction of*

the Cinchona Plant into India, p. 167 (1866); *Report of the Netherlands Plantations for 1864-5*.

Mr. Smees asked whether lichens did not absorb by simple dialysis their mineral ingredients from the tree on which they grew.

Prof. Dyer suggested in reply that they obtained them from the decaying bark.

Mr. Berkeley alluded to the presence of lichens in the shallow crevices of the surface of old painted glass, and occasionally in small cavities in the chalk.

Dr. Hooker adverted to a species of *Alga*, which is stated to erode the pebbles to which it is attached in some of the Swiss lakes.

Vibrios in Cucumber Roots (see p. 118).—Dr. Bastian stated that he had examined the specimens, but had been unable, from the immature condition of the creatures, to say to what genus they belonged.

Sport in Primrose.—Dr. Masters alluded to a *Cinchona* Primrose exhibited before the Society, and bearing one white flower among several lilac ones. The stem and leaves were also pretty regularly coloured, one portion being green the other purple. Dr. Masters thought in this case the most reasonable interpretation was that offered by Naudin, viz., the dissociation of hybrid characters. There were other cases where a similar bilateral want of symmetry was manifested, in which hybridisation in the ordinary sense of the term did not apply; these might be cases of reversion to some ancestral state, or due to some principle of variation in different cells, not yet explained.

FLORAL COMMITTEE.—R. B. Postans, Esq., in the chair. The severity of the weather, and the troubled state of the Society's affairs, combined to keep Flora and Pomona away from South Kensington on this occasion, and succeeded admirably. The only things exhibited were a very nice batch of *Spiræa japonica* from Mr. H. B. Smith, of Ealing; *Desa*, a nicely-flowered plant of *Coleogyne conferta*, with small white flowers, yellow at the base of the labellum, from Mr. C. May, gr. to J. S. Bockett, Esq., Stamford Hill; a very finely flowered growth of *Dendrobium nobile*, on which were 32 blossoms, produced in nearly every case three in a spray, from Mr. Stevens, gr. to G. Simpson, Esq., Wray Park, Reigate; and a beautiful little specimen of *Masdevallia melanopus*, itself a miniature *Orchid*, with white tails spotted with purple, and yellow tails. This specimen, which had three spikes, the strongest having five flowers, came from Mr. C. Green, Holmesdale Road, Reigate, and gained a Botanical Commendation. We understand that the plant is of easy culture, and flowers early in spring under cool treatment. The thanks of the committee were voted to the first-named exhibitor, and for the *Coleogyne*.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. Dr. Hooker, Pres. R.S., the Royal Gardens, Kew, sent a gigantic specimen (weighing over 15 lb.) of the Sweet Potato, *Convolvulus Batatas*, or *Batatas edulis*, received from Madeira. Mr. Pottle, gr. to Sir Richard Wallace, Bart., Ladborne Hall, Suffolk, showed specimens of a very peculiar Cabbage—in fact, a combination between a Cabbage and a Broccoli. They are planted in November with Collards, and come into use now as Cabbage, while further on in the spring they sprout out, and assume the character of a sprouting Broccoli. The crop at the present time was said to be worth three times the value of the Collards, and their delicious flavour had been well attested. The committee requested to see it again after sprouting before granting it a certificate. John Webb, Esq., Cannes, France, sent specimens of the Mandarin Orange; and from Mr. J. Sherratt, Knypersley Nurseries, Congleton, came a branch of the Kumquat (*Citrus japonica*), with fifty-six fruits on it, proving most conclusively its great decorative value. Mr. H. Scammell, gr. to C. Reily, Esq., The Priory, Newell Park, Tunbridge Wells, showed two Smooth Cayennes and one Ripley Queen Pine, not so large as many which have been shown here, but commended on account of the peculiar circumstances under which they had been grown.

The Villa Garden.

To a great extent gardening operations in the open air have been suspended during the past and present trying weather. Snow, frost, and slash succeed each other with so much rapidity that the gardener is practically excluded from his garden. He cannot dig or sow, nor attend to his wall trees or prune pyramids and standards, if this important work has not already been done. It will be best not to attempt to prune his Roses for the present, and he cannot do better meanwhile than turn back to his *Gardener's Chronicle* of three or four weeks ago, and study carefully the principles laid down in respect to this matter. The necessary work of putting in order creepers and climbers (among them Roses), growing on pillars,

trellises, and against walls, necessitates that the thinning out of these Roses should be performed speedily, in order to get this work out of hand by the time that the full flood-force of a vigorous plant life bursts upon us, as soon as—

"Coy spring,
With sudden passion languishing,
Maketh all things softly smile,
Painteth pictures mile on mile."

CLIMBING ROSES.—As climbing Roses are so generally and usefully employed as decorative agents on trellises, pillars, &c., a few simple rules may be laid down for thinning them at this season of the year. The *Crimson Bourcaillet* is bright in colour, vigorous in growth, and profuse in bloom—is one of the most common of pillar or wall Roses, and perhaps no young can be more attractive than its immense clusters of deep purplish-crimson semi-double flowers. In the matter of winter pruning, the Boursault Rose requires that the shoots be well thinned out, leaving the most vigorous, and shortening them back but sparingly. Thus the strong shoots thrown up from the base of the plants should be carefully laid in from time to time, to take the place of the wood that it may be advisable to cut out when it has grown too coarse and old to fill a circumscribed space. The Ayrshire Roses, and especially Dundee Rambler, and Ruga, are excellent trellis and wall Roses; the last flowers early, and with wonderful profusion. This race of Roses has been appropriately named "Running Roses" their growth being slender and very rapid. They are particularly recommended for planting against old trees or pillars rather than against walls, unless there is a trellis for them to attach themselves to; else so much labour is requisite in nailing. The two names are well adapted for planting in north aspects—a fact well worth bearing in mind; for in many odd corners in Villa Gardens Roses of this character would be well employed. Ruga is especially hardy, if any one of the section may be said to be harder than another. We have it growing as a pillar Rose in another aspect, where a gleam of sunshine never falls, and where the cold winds fly wistfully when they come, as they do now, with cutting force from the north and north-east. Shoots are already bursting forth, the inclement weather notwithstanding. They, too, should be thinned out judiciously, not cut back. The Evergreen Roses, as they are termed, because they maintain their dark green shining foliage through a great part of the winter, and especially the charming *Félicité Perpétuelle*, with its small but beautiful and full creamy-white blossoms, are also much used as summer decorative climbing and rambling plants.

The variety named is very hardy, flourishing in almost any soil, and flowering with great profusion. This, as well as other climbing Roses, when they come to be well established, make strong heads, and they, if the position is at all favourable, should be allowed to develop their growth into a liberal negligence, as, for instance, by covering archways, moulds, or pillars with weeping heads. They ought not, in justice to their free-growing and flowering qualities, to be so planted as that it will be necessary to constantly apply the knife to keep them within bounds. This is downright cruelty. Any one with a knowledge of these Roses will have remarked that they always show a tendency to form dense drooping heads; hence they have come to be known as Weeping Roses. In the case of the delicious *abandon* which frequently characterises an old-fashioned country garden, these summer-blooming climbing Roses can be met with having huge pendent heads, and such a wealth of bloom that here it may be said—

"Nature sheds all her beauty lavishly,
From her redundant horn."

The tendency of a good deal of modern gardening is to keep everything spick and span, and within duly regulated bounds, by cutting, pruning, and clipping, and the bloom of *Étienne Levêq*, *Victor Verdier*, or *La France*, taken from a standard Rose, is thought to outweigh a cartload of clustering blossoms taken from a climbing Rose of the *Félicité Perpétuelle* type. In pruning the evergreen Roses the heads should be well thinned out, a few of the most pendent shoots being left their whole length (in all cases where they can be allowed to ramble), and these shoots will flower to their very points when the great awakening comes a very few weeks hence, giving the tree the appearance of a half globular mass of ravishing blossoms.

PLANTING.—If not already done, let it be proceeded with at once. It is now as good a time of year as any for planting out climbing Roses; as a rule they come from the nurseries in pots, which is all to the advantage of the planter, as the roots do not thereby become dry from exposure. Let a hole be dug out, removing a good quantity of the soil if it be of a cold, clayey, and tenacious character, and replacing it with some good loam of a turfy character, and with this mix some leaf soil and well decomposed manure; there is nothing so well suited for this

purpose as that from an old Cucumber bed. The soil should be rather dry in preference to being moist and sticky. They turn the plants out of the pot, carefully unroot the roots, spread them out regularly, and cover them with some of the finest soil; lift the plant gently up and down, not sufficiently to drag the roots from the soil, but just enough to allow of its shaking down about them. Then place on them more soil till the hole is filled up, treading it in firmly at the top. If Roses have good fibrous roots they will root into the soil, and establish themselves quickly.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 3, 1875.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRICAL DEDUCTIONS FROM GLASHIER'S REGISTER, 25th Edition.	WIND.	RAINFALL.
	Mean Reading Reduced to 32° Fahr. from 30 in. Bar. Average of 48 Years.	In. at 3 P.M.	Highest.	Lowest.	Range for Day.	Range for Month.

Feb. 25.—Overcast, dull, and snow in morning. Wind in afternoon. Clear at night.
 26.—Overcast, dull, mild, and brisk wind in morning and afternoon, but clearer at night.
 27.—Overcast, dull, and cold throughout.
 28.—Overcast, dull, cold, and slight snow throughout.
 Mar. 1.—Overcast, dull, very cold, and slight snow throughout.
 2.—Overcast, dull, very cold, and slight snow in morning and afternoon. Cloudy at night.
 3.—Overcast, dull, cold, and strong wind in morning and afternoon. Clear at night.

— In the vicinity of the metropolis the reading of the barometer at the level of the sea increased from 30.07 inches at the beginning of the week to 30.16 inches by the evening of the 21st. A rapid decrease then set in, and by the afternoon of the 24th 29.31 inches was recorded; a increase followed, and by the morning of the 26th 29.56 inches was reached; then decreased to 29.51 inches by the evening of the same day, and increased to 29.71 inches by the end of the week. The mean reading for the week was 29.72 inches, being 0.48 inch less than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged from 45.2° on the 26th to 36° on the 24th, with a mean for the week of 40°. The lowest temperatures of the air varied between 34.1° on the 26th and 26.1° on the 24th, the mean for the week being 30.1°. The mean daily range of temperature in the week was 9.1°, the greatest range being on the 26th, 11.3°, and the least on the 27th, 6.5°. The mean daily temperatures of the air, and the departures in defect of their respective averages were as follows:— 21st, 33.6°, 5.4°; 22d, 34.2°, 4.9°; 23d, 32.2°, 7.1°; 24th, 30.8°, 8.5°; 25th, 35.2°, 2.4°; 26th, 38.3°, 1.4°; and 27th, 33.6°, 6.3°. The mean temperature for the week was 34°, being 5.4° below the average value, as deduced from sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in the sun's rays, were 104.1° and 101.0° on the 21st and 23d, but on the 24th the highest recorded by this instrument was 40°. The lowest readings of a thermometer placed on grass with its bulb fully exposed to the sky were 25.5° and 24.1° on the 23d and 24th, but on the 27th, 31.4° was the lowest reading. The mean for the seven low readings was 28.4°.

The direction of the wind was generally E.N.E., and its strength brisk.

The weather during the first three days of the week was fine, bright, but cold, and on the last four days, cold, and the sky overcast throughout, with snow on the 24th and 25th.

Rain or snow fell on four days in the week; the amount of melted snow and rain was a quarter of an inch.

In England the extreme high temperatures observed by day ranged between 53° at Sunderland and 39° at Newcastle-on-Tyne, the general average all over the country being 42.4°. The extreme low temperatures observed by night varied from 39° at the last, to 21.3° at Portsmouth, the general average being 28° nearly. The mean of the extreme ranges of temperature in the week was 14.1°, ranging from 24° at Sunderland, to

10° at Newcastle-on-Tyne. The mean high day temperatures ranged from 41.4° at Sunderland to 36° at Wolverhampton and Norwich, with an average value of 38°. The mean low night temperatures varied from 33° at Sunderland to 23.1° at Portsmouth, with a general average of 30.3°. The mean daily range of temperature in the week was 7.1°, varying from 10.1° at Nottingham to 4.1° at Leeds. The mean temperature for the week was 33.1°, being 7.8° lower than the value for the corresponding week in 1874; the highest was 36.3° at Sunderland, and the lowest 32°, at Norwich and Wolverhampton. Rain or melted snow was measured at each of the above stations, the amounts varying from 1.3 inch at Portsmouth to one-hundredth of an inch at Manchester, the average amount over the country being half an inch.

The weather during the week was dull, cold, and the sky generally cloudy.

Snow fell generally over the country on the 21st, 24th, 25th, and 27th.

In Scotland the extreme high day temperatures varied from 44° at Edinburgh to 40° at Greenock, the extreme low night temperatures ranged from 31° at Leith to 24° at Perth, their averages being 41.8° and 28.8° respectively. The extreme range of temperature in the week was 13.1°. The mean temperature for the week was 35°, being 6° lower than the value for the corresponding week in 1874, and 1.1° higher than that of England, the highest occurred at Edinburgh and Leith, 35.1°, and the lowest at Perth, 34.1°. Rain or melted snow was measured to the amount of six-sixths of an inch at Dundee and Leith, but at Glasgow one-tenth only was recorded; at Greenock and Paisley no rain fell; the average amount over the country was three-tenths of an inch.

At Dublin also the highest temperature was 45.1°, the lowest 27.1°, the mean 36°, and the amount of rain or melted snow 1.50 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

[The subjoined directions are intended to supply general information, and must, of course, be adapted to the peculiar circumstances of each locality. Other departments of the garden will be treated on from week to week in succession, according to the requirements of the season. Special directions for the management of the Villa Gardens will be found in the preceding columns.]

PLANT HOUSES.

PLANT STOVE.—If there are not separate houses for growing the stove plants that will bear the full sun, apart from those that need shade, these latter should be placed at one end of the house. The shading material should now be got ready, as it sometimes happens that the early March sun does harm when the plants needing shade are left without it.

Where the stove is a good light house, and the plants are in a strong healthy state, close to the glass and with plenty of roots, the night temperature may be increased to 70° or 75°, with 80° or 85° by day on bright days—5° more will do no harm. Now, whilst the external air is so cold and ungenial, I would rather let the temperature get up to the highest point named than admit air on days when there are cold cutting winds. The fires should be stopped in time in the mornings so as to keep the houses at the requisite temperature without any necessity for much airing.

Allamandas, *Bougainvilleas*, *Clerodendrons*, and all similar quick-growing plants that were started some weeks ago will now be pushing fast, and where it is thought advisable to increase the stock the present is a good time to set about it. Take shoots about 6 or 8 inches long off with a heel, put them in small pots well drained and two-thirds filled with good peat, which has been sifted with a sixth of sand, filling up with sand alone. If the cuttings are not left singly in the pots they must not remain long after they are rooted before they are potted off, or the roots will get rotted. Cuttings for early blooming of the useful *Euphorbia jacquiniiflora* should now be put in; when the plants that flowered first have pushed shoots, say 6 inches long, they must be taken off with a heel, or not many will strike. The old plants that have done blooming may be cut down to within 3 or 4 inches of the ground, which will be kept close, and when they have broken they can be shaken out and repotted. *Epiphyllums* that have done blooming, and are beginning to grow, should, if they need it, at once be potted, but it is well to remember that they do not like over-much pot-room—more particularly grafted plants. It is good practice to keep up a stock of young plants of such things as *Loasas*, *Gardenias*, *Rondeletias*, *Aphelandras*, and others of similar nature; they will strike now better than at any other time, and will make nice plants by autumn if kept growing on. When their propagation is led till late in the spring they do not root so easily, and the season is also half over before they get to growing freely.

The cuttings should be taken off with a heel with a sharp knife that will make a clean cut, being very careful not to bruise the bark, as it makes them much more liable to decay.

*Sarracenia*s.—These popular plants will bear a wide range of temperature. *S. purpurea* will live out in the open air, but so treated never exemplifies its character. The different varieties of *S. flava* and *S. Drummondii* frequently live for years struggling for existence on the shelves of very hot stoves, but this opposite extreme is equally as unsatisfactory for these as the outdoor treatment is for the other species. All the varieties will grow in a way that leaves nothing to be desired in a winter temperature of 48° to 50°, with a rise of 15° or 20°, according to the weather, in summer, placed as nearly up to the glass as possible, to impart strength to them. They may now be potted, first getting all the soil away, as far as can be, without injuring the roots; use chopped barnum and fibrous peat in equal parts, with a little silver sand and a good sprinkling of broken crocks; give them a fair amount of water at the roots.

As a decorative subject, where there is room for it, *Medinilla magnifica* is a fine plant; a nice intermediate-house temperature of, say 50° at night, will suit it now; if subjected to too much heat it is liable to grow many of its flowers off. It does not like over-much pot-room, never overtops, as many stove plants. *Aristolochias* should be grown by lovers of curious flowers. They will not need much care, and are rapid in growth. They will be in a nice flowering state in twelve months from the time the cuttings are struck. Cuttings put in now will root in a few weeks, when they should be potted on, using good loam, and sand enough to keep the soil porous, as they need a good supply of water. Plants in small pots should have a shift; give them 6 or 8 inches more room. Sprinkle every day, as they are liable to root-spider if kept too dry overhead. They show themselves well run on the roof, particularly over a path, or they can be put at once on a trellis, training the shoots round; but if so treated, the points must be kept higher than the rest of the plant, to keep them from stopping and breaking out afresh.

Ferns.—Attend at once to the potting of all that need it; if left till the young ferns are pushing they are liable to receive a check that may make them come deformed or crippled. The size of pot given such ferns is of some moment, by the size the plants are desired to attain. Where they are wanted as large as can be of their respective kinds, then it will be necessary to give them as much root-room as they require; if it is desirable to keep them restricted in size, this can be managed by growing them in comparatively small pots. A very humid atmosphere will grow the plants with very little root-room, but it has the disadvantage of rendering them so soft that they are almost useless for cutting, and an easy prey to insects. The best soil for Ferns in general is good peat with little sand and about one-seventh of crocks, coal cinders, or charcoal, broken small.

Heaths.—Be very careful not to give any air during the time of the cutting winds we generally get during March. Serious harm is often done even in a few hours, the leaves turning a bronzy red shade, and never afterwards recovering their proper colour; thereby very much injuring the plants in appearance, and also weakening them, such foliage seeming to lose the power of performing its natural functions. During such weather a nurse air must be kept at the such roof ventilators. Any plants that are likely to suffer for want of root-room had better receive a shift now than after blooming, although the autumn is in many cases preferable to any other season for potting these plants. All the species, but especially the spring bloomers, the flowers of which will be now fast developing, will begin to require more water, consequent upon this, as also by reason of their roots commencing to work.

SOFT-WOODEN GREENHOUSE PLANTS.—The latest batch of spring-flowering bulbs should at once be placed where they will receive sufficient light to prevent their leaves becoming drawn and weakly. *Cinerarias*.—The plants that are the latest in throwing up bloom should now be removed into the retarding house; this has the double advantage of preserving their leaves from the sun, which they much dislike, and retarding their flowers, so useful on account of their colour, much later than is possible by any other means. As the plants develop in a still moist atmosphere, it will be well to have them at some distance away from the front lights, and if on a moisture-holding surface it will be much better than dry shelves. *Polargoniums* will now begin to need a little more water, through the soil becoming filled with roots and the increased leaf-growth, the latter of which will suffer if they are allowed to get too dry. *Fuchsias*, both last year's struck plants and older ones, should be kept in a nice growing temperature of about 50° in the night. *T. Baines, Southgate, N.*

FRUIT HOUSES.

VINES.—Late *Grapes* of all kinds require a long growing season to ripen them thoroughly. If they

are not fully ripe by the end of September they will not keep well, no matter how favourable the weather or how assiduously the attention given to airing and firing; so that it is of the utmost importance that all late varieties be put into working order as soon as possible by washing the woodwork, dressing the Vines, and removing the loose surface-soil from the border, and adding new thereto. As a general rule, all houses should be started by the end of this month. Planting time is at hand, and to those intending to plant late kinds I would recommend *Gros Colman*, as next to *Lady Downes*, is considered the best late Grape out, only, like that variety, it must have a long season and strong heat, or it will be good in appearance only. *Lady Downes* is about the best maligned Grape we have, but for all purposes still the best. Its liability to scald, which has gained it such a bad character, is preventable by simply airing freely the moment the first berry is seen to change colour, so that those who have discarded it on this account (as I am told some have) cannot have exercised a large amount of skill in its culture.

The weather is most unfavourable for early forcing—no sun, cold north-east wind, and rain daily. Outside borders should therefore be covered up, and the fermenting material renewed as required, for if allowed to decline the worst results may be expected. Keep up a good supply of moisture in the early houses, and occasionally sprinkle a little guano in the evaporating pans, the ammonia arising from this generates an atmosphere at once genial to the Vines and ungenial to insect life. I am somewhat sceptical as to the merits of sulphur, so generally used, both as a remedy and a preventive for red-spider, having proved quite to my own satisfaction that its use will not prevent an attack of spider, nor yet kill it, unless applied to a surface so hot that the fumes arising therefrom greatly injure the Vines and fruit at the same time, so that I prefer the disease to the remedy. When spider is first discovered there is no better remedy, tedious though it is, than to have the affected leaves carefully sponged with clean water; also examine the border, and if at all dry give a good watering, and keep the atmosphere charged with moisture by any means at your command.

Vines in flower will set best when the air-moisture is not in excess; at this stage an over-moist or arid atmosphere should be equally avoided, and the ventilators opened on all occasions when the outside air permits, closing up early with sun-heat, not merely to economise fuel, but because it is better for the Vines. Rub the hand gently down the bunches of shy-setting kinds, or shake the rods two or three times a day when in flower; this distributes the pollen, and so aids fertilisation. If the Vines are in good health, this process will insure a "good set," either in a high or low temperature, by which I mean any temperature between 55° and 85°.

Fruiting Vines in pots must sustain no check through dryness or want of food. They will take almost any amount of nourishment in the way of liquid manure, particularly if the roots are confined to the pot. When convenient, it is a capital plan to stand the pots on a bed of rotted dung, and allow the roots that find their way through the bottom of the pot to ramify in it. Vine eyes, put in as directed in a former Calendar, will now be rooted; as soon as the roots reach the sides of the pots shift them into 6-inch pots, and stand them on shelves or slabs, immediately over hot-water pipes, in preference to plunging in bottom-heat. Ply the syringe well amongst them, and pinch out all lateral growths as produced, unless they are intended for planting out this season; then of course all growth should be left intact. *W. Williams, Heckfield.*

CUCUMBERS.—The condition of the weather must necessarily form a constant subject for the Calendar writer to build his advice on, hence the necessity for continually reverting to it, and bringing it under the notice of the cultivator, as the pivot on which many of his operations turn. The weather is now (February 22) quite wintery, frost and snow, with bitterly cold winds prevailing, rendering a little extra firing necessary to maintain the night temperatures, which must not now fall below 65°. The top-heat water valves are turned off, too, in bright weather for an hour or two at mid-day, to neutralise the sun's power, and thus avoid the evils attendant on great sudden disparities in the temperature. It is the reverse of good practice to stop the young growths over-much through the winter, but now that the plants are growing apace the finger and thumb may be a little more active in that particular at one or two joints above the fruit. Always keep lime and flowers of sulphur in hand; the former, freshly slaked and pressed well into the affected parts, is a certain remedy for canker at the collar, and the latter is the best known remedy for red-spider. Freed sowings must be made to meet the requirements of individual establishments. Now is the time to make up hotbeds for pits and frames, after the materials of fermentation have been thoroughly incorporated and well prepared by repeated turnings. For frames choose a good sheltered situation, and employ a good

thick layer of wood faggots for the foundation. Take care to provide a bed large enough—it should be quite 20 inches wider than the frame on all sides, and built up nearly, or quite, 4 feet above the faggots, treading it fairly down in the operation, when the frame may be placed on and filled up with the same compost to within 9 inches of the top; the exterior should be quite covered. Thrust a couple of test-sticks in the frame, and when the heat is rising lay a covering of turf, grass side downwards, over the entire surface of the dung, and put about a bushel of soil in each light, raised in a hillock, to start the plants. Do not be too much in a hurry about planting out; when it is found the bottom-heat will not exceed 85° to 88° will be the time. *Thos. Simpson.*

FIGS.—The earliest Figs forced in pots will now swell their fruit best by having occasionally some liquid manure given them. The night temperature may still range from 60° to 65°, and as the solar heat increases the day temperature may range from 75° to 80° at shutting up time. Syringing the trees twice a day must not be neglected, to keep red-spider down, as well as to keep the soil moist, and to keep the atmosphere of the house in sunny weather. The Fig trees which are permanently planted out will now be making rapid growth, if forcing was commenced as advised last month. Remove all the over-crowded shoots, and stop those intended to make well developed spurs for the second crop. This thinning and stopping the shoots, is highly necessary in growing Figs well, for it makes the trees more fertile, and gives more light and air to the swelling or ripening fruit. When the borders are watered, if some good guano is mixed in the water now and then it will soon show its effects by making the foliage look healthy and vigorous—but the quantity must only be a couple of handfuls in a large pan of water. *William Tillery, Welbeck.*

HARDY FRUIT GARDEN.

The continued prevalence of cold winds from the north-east, accompanied by occasional snowstorms and frost, has so far proved beneficial by retarding the expansion of flower-buds on the early blooming fruits, thus during the last ten days little progress has been made. This has afforded time for completing the pruning of fruit trees generally, which, from a pressure of other work, is too often neglected until the rapid advance of the season renders it imperative that it should be finished offhand. With a change to milder weather *Apricots* may be expected to be in full flower in a few days. These must be attended to as to covering in due time, or one night may destroy all hopes of a crop of fruit for this season. *Peaches* and *Nectarines* are also prominent in bud, and washing and nailing-in should be followed up as soon as a general change in the weather will admit of some progress being made with the work; but with the weather so extremely cold as at present, nailing or tying-in trees on the open walls is a waste of time which may be more usefully employed in work requiring more active exercise or bodily exertion.

Figs which have during the winter been covered up should be uncovered in the middle of the month. Pruning is better deferred until the germing of the buds is visible, so that the least fruitful shoots may be removed. To insure good crops of this delicious fruit, excessive pruning should be avoided, only the stronger or unripened shoots being taken out; and this should be done as far as practicable during the summer, so as to insure a regular and even supply of short-jointed, well-ripened shoots. These, except when required for filling in a vacant space on the wall, may be allowed to grow from the planting until they are 9 inches to 1 foot. The winter pruning will only be moderately thin these, so as to admit a sufficiency of light, and by judicious stopping the points of those bearing fruit, short-jointed fruitful wood will result, while the fruit, having the advantage of more light and air, are more completely matured than when buried under a mass of leaves. Where it is absolutely necessary to make new plantations of *Strawberries* at this season, ground should be prepared by well trenching and manuring if necessary. If good and well-rooted runners of last season are at command, it is better to defer planting until growth commences, and then left with a ball of earth to each, so that no check may occur. Older plantations, treated as before recommended, may now be cleaned over, and the ground raked down. *W. Cox, Madresfield Court.*

KITCHEN GARDEN.

A prolonged continuance of frost and snow will necessarily considerably delay many operations in this department this season, and will materially swell the number of other matters which usually require attention under favourable conditions at this somewhat busy period. These considerations should enforce the execution of all preparatory work which can be done, such as having a plentiful supply of Pea-sticks, stakes, &c., in readiness for forthcoming wants. Store roots should be looked over also, and, if not already done, *Potatoes* sets should be laid out singly in a place

where frost is merely excluded, which is cool and moist; here it will freely will keep firm, make but little growth, which will be of a sturdy nature. The aim at most places is to obtain a supply of new *Potatoes* from the open ground at the earliest period possible; for this object a breadth of early kinds, as *Asheaf Kidney*, *Monna's Pride*, or similar sorts, should be planted when the soil is in a fit state for it. Choose a south border or some other sheltered situation for this purpose. A single row planted at the base of a south wall where protection is afforded the trees, will advance the time of lifting by ten days, or fortnight, in gardens which are situated in low damp positions, where frost operates speedily, it will be found an advantage to make all preliminary preparations beforehand, and to defer planting the main crop until about April 20, when the matter should be despatched offhand quickly; by so doing the injurious effects of frost are avoided and the best results obtained. In ordinary kitchen gardens space is not generally available for late crops of *Potatoes*, neither is it desirable to grow these in such places, because the soil is so much saturated for that purpose, that it is more suitable for early sorts and choice kinds, amongst which may be enumerated *Rivers' Asheaf Kidney*, *Monna's Pride*, *Myatt's Prolific*, and *Premier*. It will require perfection in new varieties to surpass such sterling sorts as these. *Climax*, *Early Handsworth*, and *Coldstream* are good round sorts. In planting we use whole sets, which are placed 1 foot apart in the rows, which are 3 feet asunder. Between these are planted, when space permits, the earliest plants of the best kinds of winter stuff. Where the soil is not heavy and no water remains, *Asparagus beds* should be lightly forked over, and the alleys prepared for *Cauliflower* plants. These plants will have become tolerably hardy this season, still it will be advisable to defer planting them out for another fortnight. When the requisite quantity of *Asparagus* roots are taken up for forcing, the extent of that destroyed should be ascertained, and a corresponding quantity of roots should be planted annually. We plant these as soon as the tops of the seedlings are visible. The space which is to be applied for different crops should be settled at once, so that all matters can, under suitable conditions, be proceeded with systematically.

FORCING DEPARTMENT.—Where permanent planted beds of *Asparagus* are not forced, another lot of roots will be necessary to maintain the supply. *Saukale* will now advance rapidly with but little heat; when the *Kale* is cut remove the pots to fresh crowns, and cover as before. This excellent vegetable is not so much esteemed when *Asparagus* is to be had, but to obtain late supplies of it in good condition it should be covered now. When portions of the root are used to form plants, these should be cut into lengths from 4 to 6 inches long, and laid in moderately dry soil for planting. *G. T. Allies, Wycombe Abbey.*

Variorum.

BATH AND WEST OF ENGLAND SOCIETY.—At the Croydon meeting of this Society for the Encouragement of Agriculture, Arts, Manufactures, and Commerce, to be held from Monday, May 31, to Friday, June 4, it is proposed to hold a flower show, of which Orchids are to constitute the principal feature. The Hon. and Rev. J. T. Boscawen is the steward of the department, and has issued the following circular:—

"In requesting your assistance for the horticultural exhibition at the forthcoming meeting at Croydon by the loan of plants, &c., the steward of that department begs to state that, in order to obviate the objections so often made against the system of exhibiting plants in competition for money prizes, it has been determined to give sums of money, in proportion to the importance and value of the plants exhibited, as gratuities to exhibitors' gardeners, and also to enable them to pay the expenses of framing, &c."

"Exhibitors are requested to forward to the steward, before May 10, a description of the plants proposed to be shown, and the name of the gardener who will be in charge."

"All plants must be staged in their allotted places on Saturday, May 29, or not later than 10 A.M. on Monday, May 31."

"Plants may be changed during the exhibition, but must not be removed between the hours of 10 A.M. and 6 P.M. on any day except the last, when they may be removed at 6 P.M."

"Gardeners are expected to water and attend to their own plants. If they are unable to do so, the steward will direct his foreman to attend to them."

"N.B.—The tent in which the plants will be exhibited is closed with glass ends, and well ventilated, so as to afford perfect security to the most delicate flowers."

"Any further information may be obtained on application to the steward, the Hon. and Rev. J. T. Boscawen, Lamorran, Probosc, Cornwall."

SOILS AND SUBSOILS.—The soils upon which the agriculturist has to operate are usually classified as sandy, sandy or light loams, loams, clayey loams, heavy or retentive clays, marls, calcareous loams, peaty soils, or bog earths. This classification is a reference chiefly to composition and texture, a special

chemical composition (siliceous, calcareous, &c.) being necessary for the profitable growth of particular crops, and a certain mechanical texture (friable, porous, &c.) suiting best for the permeation of rain and air, and the descent or spreading of special roots and rootlets. Loams, consisting of fertile admixtures of sand, clay, and humus or decayed vegetable matter, may be regarded as typical soils, which become, on the one hand, light, by a preponderance of sand; and, on the other, heavy, by a preponderance of clay. But, whatever their composition and texture, these soils, geologically speaking, are mainly of two sorts—soils of disintegration, arising from the waste and decay of the immediately underlying rocks, together with a certain admixture of vegetable and animal debris; and soils of transport, whose ingredients have been brought from a distance, and have no geological connection with the rocks on which they rest. Under the former are comprehended such as arise from the disintegration of limestones, chalks, traps, granites, and the like, and which are directly influenced in their composition, texture, and drainage, by the nature of the subjacent rocks from which they are derived. Under the latter are embraced all drift and alluvial materials, such as sand, shingly debris, miscellaneous silt and clay, which have been worn from other rocks by meteoric agencies, and transported to their existing positions by wind, water, or ancient alluvial agencies. Besides these there are also soils, of organic origin, such as peat earths, and vegetable mould or humus, which is to a great extent also of animal origin or elaboration. Indeed, in all superficial soils there is a certain amount of vegetable and animal matter—the decay of plants, the droppings of animals, the exuviae of insects, the casts of the earthworm, and the like, conferring upon them that dark, friable, and loamy character so indicative of richness and fertility. From *Fair's "Geology in its Relations to the Arts and Manufactures."*

SHELTON OAK.—The dimensions of this famous old tree are thus stated in *Leigh's Guide, Descriptive and Historical, through the Town of Shrewsbury*, a useful little book, which has been out of print for some years.—Girth at bottom, close to the ground, 44 feet 3 inches; do., 5 feet from the ground, 25 feet 1 inch; do., 8 feet from the ground, 27 feet 4 inches. Height to the top of the main trunk, or principal bough, 41 feet 6 inches. *Proud Salopian in "Edwards's Shrewsbury Journeys."*

THE TAP-ROOTS OF TURNIPS.—It may be interesting to some of your readers to know how far the tap-roots of Turnips will enter the ground in search of food. On one of Lord Henikier's farms in this parish, and in the occupation of Mr. Cracknell—one of the best farms in the county—several Turnips were pulled up this season with tap-roots from 4 ft. to 15 ft. in length. This is good testimony of what deep draining and deep cultivation will do for this and other root crops. If Mr. C. could induce his Turnips to grow as far out of the ground as they grow into it, his stock might "stand" and "eat at ease," and probably the tops would be worth as much as the bottoms. But farmers generally, I believe, like small tops to their Turnips. The fashion often changes in bonnets, and why should we not have a change in Turnip tops? *Jno. Perkins, Thornham, Suffolk, in the "Field."*

Enquiries.

He that questioneth much shall learn much.—BACON.

[Many enquiries which reach us would be more suitably answered by those of our correspondents whose experience or requirements are or have been similar to those of the questioner. These we propose, in future, to gather together for facility of reference; and as fellow feeling makes us wondrous kind, so we would fain hope that this enquiry column may serve as a bond of sympathy and goodwill between our correspondents and readers, and be the means of eliciting much valuable information. Eds.]

40. DRIMYS WINTERI.—Some years ago this tree was to be found at Abbotsbury, Dorsetshire, the gardener there having kindly sent me specimens. Perhaps, if this tree should communicate with you, he or his successor would kindly communicate with you to say if it be still there or not. *G., Bath.*

41. CHURCHYARD PLANT.—In the *Family Topographer*, vol. 1, p. 175, is the following curious statement—"In Woking churchyard grows a kind of plant about the thickness of a Bulrush, with a top like Asparagus shooting up nearly to the surface of the earth, if this kind of sympathy and goodwill between our correspondents and readers, and be the means of eliciting much valuable information. Eds.]

Answers to Correspondents.

BASKET PLANTS: *H. W. C.* Convolvulus maritimus; some of the Tropaeolums of the Lobbianum strain; Sedum carneum variegatum; Saxifraga sarmatosa; and the Ivy-leaved Pelargoniums, of which there are several very elegant varieties, are all good basket plants for a greenhouse temperature.

BOOKS: *C. Mr. William Thomson's Practical Treatise on the Grape Vine*, 7th edition (Blackwood & Sons). **COVENT GARDEN MEASURES:** *S. W. P.* A half-sieve is one-third of a bushel. The whole does not frequently call the half-bushel a half-sieve, but the growers do not. The bundles are made up as follows:—Turnips, 12; young spring do., 36; Broccoli, 6 to 18, according to size; Carrots, 12; young spring do., 36; Lettuce, 12; Celery, 8 to 12, according to size. **MONSIEUR: H. W. C.** In your climate this method probably succeed as a greenhouse plant. It likes to be near to and root into water. We do not suppose seeds are obtainable.

MOSS ON LAWNS: *J. Newton.* We will not succeed in getting rid of the moss until your lawn has been drained. **NAMES OF FRUIT:** *W. Oxon.* We cannot identify it. **NAMES OF PLANTS:** *R. H. G.* 1, *Lactaria dilatata obtusa*; 2, *L. dilatata alta*; 3, *L. dilatata micromera*.—*W. Oxon.* *Cereus flagelliformis* apparently, the old *Azalea indica* and *Solignella cuspidata*.—*G. D.* A dwarf form of *Nephrodium molle corymbiferum*; there are several similar forms, but without comparison we cannot say if they are identical.—*Filix-mar.*

Have you not seen that six is our limit? 1, *Polystichum capense*; 2, *Scopolopodium vulgare medium*, a form of *S. Cytroidium Fortunei*; 4, *Adiantum Capillus-Veneris*; 5, *Asplenium lucidum* (young), apparently; 6, *Cheilanthes hirta*; 7, *Lomaria nuda*; 8, *Scopolopodium vulgare laciniatum*; 9, *Didymochloena lunulata*.—*R. Fuller.* *Helibellor orientalis*.—*B. D.* *Dalchampia Rossiana*, 2, please send leaves.—*J. Marshall.* *Salvia Heeri*. **PEACHES:** *W. Stevens.* The cause of the leaf-buds falling is due to some improper action of the roots—probably dryness, and assisted by too hard forcing.

RECREATION GROUND AT BIRMINGHAM: *T. Booth.* We cannot tell you what has been the result of the competition for laying out the "Recreation Ground" at Birmingham. You should apply to those to whom you sent the plans.

VINES; AERIAL ROOTS: *T. W. H.* Aerial roots are very likely to be caused by the maintenance of a too moist atmosphere; but by the roots of the Vines being in a border too cold to allow of their growth being made at the same time and rate as the foliage; and probably sometimes by both causes combined.

WELLINGTONIAS: *Ag. 8.* We cannot say whether the Wellingtonias is poisonous to cattle. We would recommend you to keep the fencing up, rather than cut the lower branches off.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to desire Foreign Subscribers sending Post Office Orders, to be good enough to write to the Publisher at the same time.

CATALOGUES RECEIVED.—Hender & Sons (Bedford Way, Finsbury) (Catalogue of Bedding Plant, Fruit Trees, Vegetable and Flower Seeds, &c.); Vilmorin, Andreux & Co. (4, Quai de la Magesicrie, Paris), Catalogue of Trees, Shrubs, Conifers, &c.; Harrison & Son (Royal Midland Seed Warehouse, Leicester), List of Choice Seeds for the Garden and Farm; E. C. Henderson, 35, Wellington Road, St. John's Wood, London), Illustrated Catalogue of Flower, Vegetable, and Agricultural Seeds.—J. Coombs (The Ferus, Enfield, Middlesex), Catalogue of Cuttings of Geraniums, &c.

COMMUNICATIONS RECEIVED.—O. T. J. W.—R. T. C.—B. V. H.—D. T. A. E. R. Ward & Co. (please say in what part of the world the island is situated)—E. P.—J. S. T.—J. Morse.—R. T. C. (only a portion of your note received).

Markets.

COVENT GARDEN, March 4.

The markets generally are very quiet, and without sufficient alteration to merit any notice. Some new Potatoes are to hand from Malta, and we expect some from Lisbon shortly. There is a very good supply of French Asparagus of good quality from the Channel islands, varying from 6d. to 1s. 6d. per pound; many samples of the old are diseased. *Thos. Taylor, Wholesale Apple Market.*

SEEDS.

LONDON: March 5.—In consequence of the late winter weather, *Barley* is doing no better than agricultural seeds. All grades of red Clover are nevertheless held with considerable firmness, stocks being by no means excessive. Alsikes continue neglected. For white Clover there has been an improved inquiry. In Trefoil seed the tendency of prices is upwards, a good quantity of this description having recently changed hands at occasionally enhanced currencies. A fair business has been doing in imported Italian and Scotch Ryegrasses. Spring Tares are in steady request at the decline noted last week. Of winter Vetches there are none offering. For Hemp and Canary seeds the orders received are quite of a retail character. White Millet, as a substitute for the latter, meets with increased favour. Fine black Rape seed, being very scarce, readily obtains an advance of 1s. to 2s. per qr. Other articles, in the present comparatively quiet state of our market, offer no subject for remark. *John Sharpe & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.

At Mark Lane on Monday business was slow in all departments, and the quotations for Wheat were not without difficulty maintained. Barley was less wanted, a few efforts to obtain more money for grinding produce were wholly unsuccessful, and the orders were not changed. Oats were firm, and prices advanced about 6d. per qr. on the week. Maize was cheaper rather than otherwise. Beans and Peas realised late rates. The flour market was quiet, though firm for American barrels. Wednesday's market was quiet, and no material change occurred in the value of Wheat. Barley was dull and weak, but oats maintained their advance of Monday, while Maize, Beans, and Peas were equally as dear as on that day. Flour was rather inclined to recede.—Average prices for the week ending Feb. 27: Wheat, 40s. 11d.; Barley, 42s. 11d.; Oats, 35s. 7d. For the corresponding week in 1874.—Wheat, 62s. 11d.; Barley, 49s. 3d.; Oats, 29s. 4d.

CATTLE.

At the Metropolitan Market on Monday trade was brisk for choicest quality beasts at about last Monday's quotations. In sheep only briskness was shown in the demand for choicest kinds: prices about the same as last Monday. There was very little done on offer, and the market were consequently dead. Quotations—Beasts, 3s. 8d. to 4s. 8d.; and 5s. 6d. to 6s. 4d.; calves, 5s. to 6s. 10d.; pigs, 4s. 4d. to 5s. 4d.; sheep, 5s. 6d. to 6s. 10d.; and 6s. 4d. to 7s. —At Thursday's market trade in beasts was brisk for choicest qualities, at about Monday's quotations. In sheep trade was slow, except for hickass descriptions, at but little alteration in prices. Calves were perhaps dearer than on Monday.

HAY.

The report from Whitechapel is to the effect that the supply of fodder was short, and the better descriptions sold steadily on somewhat higher terms. Prime Clover made from 100s. to 120s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 125s.; inferior, 25s. to 75s.; and straw, 35s. to 40s. per load. Cumberland Market quotations—Superior meadow hay, 11s. to 120s.; inferior, 90s. to 95s.; superior Clover, 11s. to 125s.; inferior, 95s. to 105s.; and straw, 40s. to 45s. per load.

POTATOS.

The Borough and Spitalfields markets report a moderate supply of Potatoes, good quality, and the trade as steady. The subjoined quotations—Regents, 75s. to 110s.; Victoria, 105s. to 135s.; Lakes, 115s. to 145s.; rocks, 65s. to 70s. per ton. Last week's imports into London amounted to 1650 tons from Dunkirk; 376 tons from Rouen; 2479 bags from Antwerp; 260 from Boulogne; 5 bags from Hamburg.

COALS.

Business at market on Monday was active, but no change occurred in prices. On Wednesday there was an advance of 1s. per ton, the vessels to arrive having been detained by stormy weather. Quotations—Bebside West Hartley, 21s. 6d.; Walls End Lambton, 25s. 6d.; Walls End Newcastle, 25s. 6d.; Walls End East Hartlepool, 25s. 6d.; Walls End Tees, 25s. 6d.

THE LONDON MANURE COMPANY

(ESTABLISHED 1840)
 Have now ready for delivery, in the dry condition—
CORN MANURE, for spring sowing.
PURE DISSOLVED BONES.
FURSEY'S BONE MANURE.
PURSEY'S BONE TURNIP MANURE.
SUPERPHOSPHATE.
NITROPHOSPHATE.
SALT OF SODA SULPHATE OF AMMONIA.
Genuine PERUVIAN GUANO, &c.
 J. M. PURSER, Secretary.
 116, Fenchurch Street.

O'DAMS' MANURES

FOR ALL CROPS.
 Manufactured by the **NITRO-PHOSPHATE** and
O'DAMS' CHEMICAL MANURE COMPANY (Limited),
 consisting of Tenant Farmers occupying upwards of 35,000
 Acres of Land.
 Chairman—**ROBERT LEEDS**, Castle Acre, Norfolk.
 Managing Director—**JAMES O'DAM**.
 Sub-Manager and Secretary—**C. T. MACADAM**.
CHIEF OFFICE—109, Fenchurch Street, London, E.C.
WESTERN COUNTIES BRANCH—Queen Street, Exeter.
 Particulars will be forwarded on application to the Secretary,
 or may be had of the Local Agents.

MILLER AND JOHNSON

(ESTABLISHED 1855)
 Manufacture the highest quality of
ARTIFICIAL MANURES
 FOR ROOT, COLI, and GRASS CROPS.
 36, Mark Lane, London, E.C.

GISHURST COMPOUND.

Used by more than 140 leading Gentlemen in 1874, against Red
 Spider, Mildew, Thrrips, &c., and other Blights in solutions of
 from 1 to 2 ounces to the gallon of soft water, and of from 4
 to 16 ounces as a winter dressing for Vines and Fruit Trees.
 Has outdone many preparations intended to supersede it.
 Sold Retail by Seedsmen, in boxes, 12, 31, and 70s. 6d.
 Wholesale by **PRICE'S PATENT CANDLE COMPANY**
 (Limited).

SIMPSON'S RED SPIDER, THRIP, and GREENFLY ANTIDOTE

is now extensively used, and has been found to be
 safe and effective against all Garden and Chemists. Pro-
 nounced a "valuable discovery," sufficient for the worst case
 of Red Spider diluted at the rate of one quart to 65 gallons of
 water. Price per gallon, 10s. 6d.
 Prepared by **JOHN KILNER**, Wortley, near Sheffield.
 Important Testimonials on application.

GRAVEL FOR SALE.

—Wandsworth Common
 Gravel, suitable for Road and Path-making, in large or
 small quantities. Prices on application to
ROBERT NEAL, Nurseryman and Contractor, Wandsworth
 Common S.W.

MARENDAZ AND FISHER, the largest Importers of Russia Mats in London.

are now prepared to quote prices for new **ARCHANGEL MATS**, to arrive in
 July or August next, to the Wholesale Houses only.
 Agents in Archangel, St. Petersburg, and Odessa.

RUSSIA MATS.

A large stock of **ARCHANGEL and PETERSBURG**, for Covering and Packing—Second sized **ARCHANGEL**, 100s.; **PETERSBURG**, 60s. and 80s.; superior class **Mat**, 45s., 50s., and 55s.; **PACKING MATS**, 20s., 30s., and 35s. per 100; and every other description of **MATS** at equally low prices, at **J. BLACKBURN'S**, Russ. Mat and Sack Warehouse, 4 and 5, Wormwood Street, E.C.

Russia Mats.

BLACKBURN AND SONS, the only Importers of Mats in London, have, in consequence of the scarcity of **ARCHANGEL MATS**, instructed their Russian friends to send 100,000 best selected **PETERSBURG**, which they are now offering at low prices.
 Samples and prices on application, at 4 and 5, Wormwood Street, London, E.C.

RUSSIA MATS, for Covering Garden Frames.

—**ANDERSON'S TAGANROG MATS** are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post free on application.
JAS. T. ANDERSON, 7, Commercial Street, Shoreditch, London, E.C.

Russia Mat Merchants.

MARENDAZ AND FISHER, 9, James Street, Covent Garden, W.C., Importers of **ARCHANGEL** and all kinds of **ST. PETERSBURG MATS**, **TARFFIA FIBRE**, &c. Tanned Garden NETTING, **RATED TWINES**, **TIFFANY**, &c., always in stock.
 N.B.—Price Lists sent free only, at low prices.

E. T. ARCHER'S "FRIGI DOMO"

Fatigued by Her Majesty the Queen for Windsor Castle and Frogmore Gardens, the late Sir J. Faxon, and the late Professor Lindley, &c. &c.
MADE OF PREPARED HAIR AND WOOL.
 A perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied. A good covering for Pits and forcing Frames.

PROTECTION FROM COLD WINDS AND MORNING FROSTS.

"**FRIGI DOMO**" NETTING, 2 yards wide, 15s. 6d. per yard.
 "FRIGI DOMO" CANVAS,
 2 yards wide 15s. 10d. per yard.
 3 yards wide 35s. per yard.
 4 yards wide 35s. 10d. per yard.
ELIZABETH ARCHER, only Maker of "Frigi Domo,"
 Stanstead and Brockley Roads, Forest Hill, London, S.E.; and of all Florists and Seedsmen. All goods carriage paid to London.
NOTICE.—REMOVED from 3, CANNON STREET, CITY.

MILDEW.

—Ewing's Infallible Cure. ("The finest of all antidotes," Wm. Earley.) Retail of most Seedsmen, 1s. 6d. per bottle, if packed for travelling, of the Manufacturers,
EWING AND CO., Norwich.

SHAW'S TIFFANY AND ELASTIC NETTING

for Shading and Protecting. Sold by all respectable Seedsmen. For Circulars and Prices apply to
JOHN SHAW AND CO., Tiffany Manufacturers, 29, Oxford Street, Manchester.

Rosher's Garden Edging Tiles.

The above and many other PATTERNS are made in materials of great durability. The plainest are especially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and once put down incur no further labour or expense, as do
GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design.
F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.
 Agents for **LOOKER'S PATENT "ACME FRAMES,"** PLANT FRAMES and PROPAGATING BOXES; also for **FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.**
 Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES.

For Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheets, of plain or more elaborate designs, with prices, sent for selection.
WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Bath, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds, Roofing Tiles in great variety, Slates, Cements, &c.
F. ROSHER AND CO., Brick and Tile Merchants.
 See addresses above.

SILVER SAND, fine or coarse grain as desired.

Prices by Post per Ton or Truck Load, as desired. In London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post on application.
WHIRLS and BRICK BURRS for Rockeries or Ferneries, **KENT PEATS** or **LOAM** supplied at lowest rates in any quantities.

ROSHER AND CO.—Addresses see above.
 N.B.—Orders promptly executed by Rail or to Wharves.
 A Liberal Discount to the Trade.

Reduced Prices.

THE CELEBRATED GRANITIC PAINT.

Manufactured Solely and Only by the Silicate Zopissa Compositum and Granite Paint Company, Limited.
 For Price Lists, Testimonials, and Patterns of Colours, apply to **THOMAS CHILD**, Manager, 39A, King William Street, London, E.C.

THE SILICATE ZOPISSA COMPOSITION.

TO CURE DAMP IN WALLS, and PRESERVE STONE, &c., from DECAY, at a very trifling cost. Manufactured Solely and Only by the Silicate Zopissa Compositum and Granite Paint Company, Limited, and in all Colours.
 For particulars and Testimonials, apply to **THOMAS CHILD**, Manager, 39A, King William Street, London, E.C.

RALPH WALLER AND CO.

45, Dale Street, Manchester, MANUFACTURERS of all kinds of **GARDEN NETTING**, &c.
 The serious injury done every spring to Fruit Crops by frost has proved to every Gardener the absolute necessity of providing some Protection to the Trees early in the year. If the blossom in its earliest development be but slightly weakened by frost, the vitality of the fruit-germ is destroyed, and the fruit lost. In this climate, on the average of a century, there is not more than one year in which the protection is unnecessary. Many fabrics have been tried for this purpose of protection, with more or less success; and we may now say, without fear of contradiction, that we have succeeded in manufacturing the only fabric which is altogether unobjectionable for this purpose. Without unduly nursing, it effectually protects the young germ, and does not impede the action of light and the circulation of air. Some other fabrics, but not so thick, weaken the vitality of the tree altogether. Almost every large grower in the three Kingdoms can testify to these facts.
HOUSE SHADING of various thicknesses, superior to any other yet discovered for lightness, strength and durability, standing, as it does, all weathers.

Testimonial from ROBERT WARREN, Esq.

"I have had the netting No. 6 on my Orchard-house for eighteen months, and I find it now in very good order, and likely to last as many more months, and I intend to use it on all my houses in future, being well satisfied both as to its lasting qualities and also as to the shade it gives, which is sufficient to prevent burning, and yet not thick enough to keep out the light, as the ordinary street shading does; indeed, it is especially suited for shading any kind of plants." *Groomfield, Feb. 13, 1871.*
TIFFANY of various kinds always on hand. **NETTING and SHADING**, in pieces 20 yards long, 1/2 yard wide. **TIFFANY**, in pieces 20 yards long, 3 inches wide. For prices, &c., apply to the above address.

THE TERMINAL SADDLE BOILER.

First-class Certificate, 1871; Highly Commended, 1873.

The following Letter from Mr. Wm. Thomson needs no comment:—"Tweed Valley, March 21, 1873."
 "Dear Sir,—I have now had your Terminal Saddle Boiler heating two large Span-houses, 21 feet wide and 15 feet high, containing 1,874 feet of 4-inch pipes. It does its work to my entire satisfaction. In fact I know of no Boiler of the same size and cost that will do the same amount of work with the same quantity of fuel. It is an excellent Boiler. You should advertise more than you do, for it deserves to be better known than it is.—Yours truly, Wm. THOMPSON."
 To be seen in operation at
THOMAS JONES, Temple Street, Manchester.

Conservatory erected at Mr. Ley's Nursery, Croydon.

LASCELLES' PATENT CURVED STRUCTURES

Are constructed entirely of Wood, bent on his Patent Principle, whereby each Bar forms a complete truss. They are strong, light, cheap and durable.

DRAWINGS AND ESTIMATES, WITHOUT CHARGE, ON APPLICATION TO THE PATENTEE,

W. H. LASCELLES, 121, BUNHILL ROW, FINSBURY, LONDON, E.C.

**BOULTON & PAUL (LATE W. S. BOULTON & CO.), NORWICH,
HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS,**

Improved Steam-power Machinery for working wood enables us to supply first-class Horticultural Buildings of every description at very low prices. Only the best materials used. Houses designed to suit any situation. Estimates given Free. Gentlemen are respectfully invited to have price from us before ordering elsewhere. Ladies or Gentlemen requiring advice as to the Situation, Style, Dimensions, &c., of proposed Horticultural Buildings, waited upon in any part of England, Ireland, or Scotland.

Our NEW ILLUSTRATED CATALOGUE of HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

BOULTON & PAUL'S PATENT UNIVERSAL PLANT PRESERVERS—GREAT IMPROVEMENTS for 1875.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these to be by far the best and most useful articles of the kind they ever saw, and awarded them the ONLY PRIZE.

Now Ready, our NEW LIST of PRICES, containing full description and a number of Woodcuts clearly showing the uses to which these handy articles may be applied. Free by Post.

PATENT UNIVERSAL PORTABLE PLANT PRESERVERS and GROUND VINERIES.—Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 feet by 3 feet wide; thus proving them to be really portable.

PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. *Far superior to anything of the kind yet offered.*

GARDENERS' CHRONICLE, February 6, 1873.

The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value.

FLORAL WORLD.

The Ground Vinery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co.

MELON OR CUCUMBER FRAMES.

All sizes (glazed with 21-oz.) ready for immediate delivery.

Height at back, 24 inches; at front, 13 inches; sides, 1 1/2 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as puttied in. Each light is provided with an iron strengthening rod and handle.

Glazed with 21-ounce.

OPINIONS OF THE PRESS.

GARDENERS' MAGAZINE, May 25, 1872.

Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known.

THE GARDEN.

Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and puttied—an essential point. They are complete and ready for use the moment they are received, &c.

Prices on application to
J. B. BROWN AND CO., 99, Cannon Street, E.C.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER, 2A, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls Wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability.

For Neatness,—Because all the Wires are kept perfectly tight, without the use of the Raddisseur.
 For Strength,—Because very much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.

For Durability,—Because, being able to use the strong Wire, it is not so likely to be eaten through with the galvanism as the thin Wire, as used in the French system.

The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 753 yards long, wired on both sides; making a total length of 1506 yards,—our system being chosen in preference to any other.

Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

For Park, Farm, and General Enclosures.

Is in use over many thousand miles, and has been awarded the Silver Medals and Highest Commendations of the leading Agricultural Societies, it forms the most efficient strained iron fence known.

 Illustrated and Priced Catalogues of every description of Horticultural Wirework on application.

COWAN'S COMPENSATING SYSTEM OF HEATING.

WAUCHOPE & COWAN'S NEW AND ECONOMICAL SYSTEM OF MAKING GAS.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, having recently been offered a valuable Patent for the Manufacture of Gas, to be worked in combination with their Patents for Heating Horticultural and other Buildings, have found it necessary, so as to acquire and work such Patent, to form a new Company with larger powers; the old Company having been incorporated for the purpose of dealing with the Heating Patents only.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, will, therefore, be wound up and dissolved, and a new Company, called "THE COWAN PATENTS COMPANY, LIMITED," has been formed, and has taken over the entire business of the old Company. From this date the new Company will carry on the business of the old Company, with the addition of the New System of Making Gas—full particulars of which, with Illustrations, can be had on application.

Contracts entered into by the old Company will be carried out by the new one, and all its responsibilities fulfilled.

The Directors of the new Company have thought it advisable to change the Offices from Lothbury to 21, WHITEHALL PLACE, WESTMINSTER, S.W., where all communications should in future be addressed, and where full information concerning their Patent Systems of Heating and Gas Making can be obtained.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

ILLUSTRATED PAMPHLETS SENT FREE ON APPLICATION.

All Communications in future to be addressed—

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

TESTIMONIALS.

Stonington Park Gardens, near Bedale.
 Mr. W. Parkinson.—Sir: Having thoroughly tested your
 Patent Studley Royal Lawn Mower against the two I have,
 one of Messrs. Green & Son's with chain action, and Messrs.
 Ransome's Automaton, I will give you the result.

I tried first on a good and well kept lawn, where we were
 using Green's and Ransome's machines, and I was surprised at
 the difference in draught, your machine being easy work on the
 slopes for a boy; the other machines being hard work for two
 men; upon inspecting the work done I found your machine
 had made by far the best work, taking all the Bents, Danc-
 lions, Daisies, and seed grass without leaving any ribs on the
 lawn, the other two not taking either the Bents, or Dandelions,
 or seed grass, and also ribbing the lawn, especially where
 there was a little heavy cutting. Your machine was very
 superior to the other two on the borders, cutting close up to the
 plants without injuring them, by the gearing being all inside
 the frames.

I then tried your machine on a lawn laid down the year
 before, neither Green's or Ransome's would touch it, and I let
 it grow to meadow, and cut it with the scythe. I put your
 machine into the fog (three weeks old), never expecting any
 lawn mower made would cut it, but found it make equal good
 work as when on the well kept lawn, though the grass was
 3 to 4 inches and in some places longer, and very wiry and
 thick. Your machine appears remarkably well made, and from
 the great strength of the cylinder there is no fear of any blades
 being bent or broken, even at stone gates in between the cutters.
 The driving from the centre between the drums is a capital
 idea, the machine being easily kept in line. I find also it is
 only about half the weight of the other machines, though cer-
 tainly in every detail very much stronger.

I can only add that it merely requires to be seen in operation
 to convince the most sceptical that it is far ahead of all other
 machines yet made.—I remain, yours respectfully,
 J. FEATHERSTONE.

Moorgate Grove, Rotherham.
 Mr. W. Parkinson.—The Studley Royal Lawn Mower appears to me to be a
 considerable improvement on all I have seen before; it works with
 great force and evenness, cuts longer grass than others, and
 whether wet or dry; and from the working part being all lashed
 up, cuts within an inch of terrace walls. It is in advance, in my
 opinion, of other inventions of the same kind, and only needs to
 be known to secure preference.
 JOHN GUEST.

Baldersley Park Gardens.
 Dear Sir,—Your Lawn Mower gives every satisfaction; it
 cuts long and wet grass better than any other machine with
 which I am acquainted, requires less draught, and cuts closer to
 a pedestal or border. In the cylinder, which is, I consider, the
 weakest and most expensive part of other machines, yours is
 especially strong.—Yours truly,
 W. MASTERPH,
 Gr. to the Viscountess Downe, Baldersley Park.

Swinnton Park, Bedale.
 Mr. W. Parkinson.—I am glad to say your Lawn Mower does its work
 very well. It certainly is the lightest to draw, and the
 handiest and best machine for cutting long grass I have yet
 seen.—Yours truly,
 J. MASTER.

The Gardens, Oakwood Hall, Rotherham.
 Sir,—I have used your Studley Royal Lawn Mower, and
 can with every confidence recommend it to the public. Its
 simple construction and efficiency surpasses all I have ever used.
 It cuts the grass well, either wet or dry, so that it may be used
 at times when other machines are of no use. Your machines
 only want to be known, when I am sure they will become general
 favourites.—Yours truly,
 JAMES TYSON.

WANTED, a WORKING FOREMAN, in a Small Nursery. One with knowledge of the Market Gardening preferred. He must be steady and industrious. State age, references, wages, &c., to GEO. WINFIELD, Sandhurst Road, Gloucester.

THE Agricultural Gazette Almanac, 1875.

The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compilations are many good serviceable hints on fattening cattle, growing of potatoes, &c. The illustrations are admirably executed, many being engraved from photographs."—Weekly Dispatch, Jan. 31, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition."—Lloyd's, Jan. 17, 1875.

"It is a very cheap threepennyworth of information of interest and utility to farmers, and contains numerous illustrations."—The Field, Jan. 16, 1875.

"In addition to the usual matter to be found in an almanac, we have here useful information to the farmer, as to stock and crops, with illustrations of prize animals."—Gloucestershire Chronicle.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for daily use."—Farmer's Herald.

"The Calendar contains all the fixtures for cattle shows, races, &c., and is very carefully and accurately compiled, and various useful information of an agricultural character."—Oxford Times.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics and a series of portraits of the Prince of Wales, Dr. Voeder, Viscount Eridport, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'"—Bath Express.

"To farmers, cattle dealers, and others interested in agriculture, this work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is prettily illustrated with engravings chiefly taken from photographs."—Devonshire Chronicle.

"This almanac, which appears to be carefully compiled, and the contents judiciously selected, may be commended to the notice of agriculturists generally. It is issued at a low figure, and contains a large variety of information. There are numerous illustrations, and the likeness of the Prince of Wales, which forms the frontispiece, is especially deserving of mention."—Grantsville Journal.

"To all persons interested in agriculture in this neighbourhood, 'The Agricultural Gazette Almanac,' for 1875, price 3d., will be worth obtaining. It contains a fund of information, as well as a variety of advertisements on topics, especially connected with the portion of the community which it is intended to serve."—Taifos Guardian.

"Although this almanac comes rather late it is none the less welcome, and contains a mass of information, both interesting and valuable to any person connected with agriculture, it is to be commended. In addition to the usual calendar it contains a diary, supplies us with authentic portraits and verbal descriptions of prize cattle, sheep, and pigs, a list of the members of both Houses of Parliament, another of the Chambers of Agriculture, another of County Agricultural Societies, besides hints as to practical farming. Such a combination of information must recommend itself to every agriculturist."—Western Daily Mercury.

"Though it is rather late to be noticing an almanac for 1875, we make an exception in favour of the one before us, which, owing to its great merits and low price, ought to be purchased by every agriculturist in the kingdom. The illustrations of prize cattle, implements, &c., are a valuable feature in the Almanac."—Prescot Reporter.

"Considering the valuable information for the farmer and stock breeder to be found in this publication, no wonder the first edition has had to be followed by a second. In addition to treating of farming matters, it contains a good paper on 'Cricket in the Counties in 1874,' and alphabetical lists of the members of prize cattle, sheep, and pigs. It is besides, very well illustrated with notable prize-winning stock. The diary is well adapted to the requirements of agriculturists."—East Anglian Daily Times.

"It contains a lot of information useful to farmers and breeders."—Cornish Times.

"It contains a mass of information which will be found exceedingly useful to those who are engaged in agriculture. In addition to this there is a capital portrait of H.K.H. the Prince of Wales, and several other engravings."—Gloucester Mercury.

"It is a wonderfully good threepennyworth, containing, as it did, a mass of information which is engaged in agriculture. In addition to this there are some of the beautiful portraits of stock which have appeared in the columns of our contemporary within the last year and a-half. Among other things, there are portraits, from photographs, of the Duchess of Geneva, the Duchess of Devon, and the Prince of Wales' Champion Shorthorn Heifer—among the Short horns, and a lithographed portrait of a Jersey cow. There are also illustrations descriptive of noteworthy American 'wrinkles' for farmers."—Norwich Mercury.

"It contains much interesting matter for the farmer, who may get many a wrinkle from this unpretentious little publication. As may be imagined, the notes relate to matters of purely farming interest, such as rotation of crops, manures, and implements. It is very concise, and the advice they contain being sound and practical."—Land and Water.

W. RICHARDS, 77, Catherine Street, Strand, W.C.

Scale of Charges for Advertising.

To Seedsmen or Florists.

CLERK.—The Advertiser, who understands the Seed Trade (disengaged after 4 o'clock in the afternoon), is open to an engagement as above during spare time.—J. ADAMSON, 7, Rathbone Place, Oxford Street, W.

CLERK.—The Son of a Nobleman's Gardener wishes for a situation as above in a good Nursery. Is expert in Writing and Accounts.—X. Y., Post Office, Bedford.

FORESTER, WOOD RANGER, or PARK KEEPER.—Age 33, married. Well educated. Satisfactory references.—JAMES BELL, 11, Michael, Penkiville, Cornwall.

To Florists.

BOUQUETIST.—Young Lady.—B. C., *Gardeners' Chronicle* Office, W.C.

KINAHAN'S LL WHISKY. This celebrated and most delicious old mellow spirit is the very CREAM of IRISH WHISKIES, in quality unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and Cork branded "Kinahan's L.L." Whisky. Wholesale Depot, 20, Great Fitzfield Street, Oxford Street, W.

Grateful-Comforting.

EPPS'S COCOA BREAKFAST. By a thorough knowledge of the natural laws which govern the operations of digestion and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which saves us many hours of doctors' bills by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame. See article in the *Civil Service Gazette*.

Made simply with boiling water or milk. Sold in packets (in tins for export) labelled—W. JAMES EPPS AND CO., CHEMISTS, 48, Thraenedale Street, and 70, Piccadilly, W. Works.—Eunston Road, and Camden Town, London, N.W. Makers of Epps's Glycerine Jujubes for Throat Irritation.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best mild Aperient for delicate Constitutions, especially adapted for Ladies, Children and Invalids.

DINNEFORD AND CO., 172, New Bond Street, London, W.; and of all Chemists throughout the World.

Cures of Old Standing Asthma, Colds, &c., by DR. LOCOCK'S PULMONIC WAFERS.

From Mr. ROBINSON, Chemist, Trinity Street, Hull: "In all affections of the Chest, old standing Asthma, and neglected Colds, they seem to act like a charm."—In Coughs, Colds, and Rheumatism, they give instant relief. Sold at 1s. 1½d. per box by all Druggists.

GREEN'S PATENT "SILENS MESSOR," "PHŒNIX," & "ROYAL,"

Or NOISELESS LAWN MOWING, ROLLING, AND COLLECTING MACHINES for 1875.

The Winners of Every Prize in all Cases of Competition.

PATRONIZED BY
HER MOST GRACIOUS MAJESTY THE QUEEN
On numerous occasions,

H.R.H THE PRINCE OF WALES. The KING of the BELGIANS,
The Late EMPEROR of the FRENCH,
The EMPEROR of RUSSIA.

And most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 75,000 of the above Machines have been Sold since the year 1856.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others :—

- 1st. Simplicity of Construction—every part being free of access.
- 2d. They are worked with far greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, and wet as well as dry.

SINGLE AND DOUBLE-HANDED "SILENS MESSOR" LAWN MOWER.

To cut 8 inches	£ 2 10 0
Can be worked by a Lady.	
" 10 " Ditto.	3 10 0
" 12 " Ditto.	4 15 0
Can be worked by one Person.	
" 14 " Ditto.	5 16 0
" 16 " Ditto.	6 17 0
Can be worked by one Person on an even Lawn.	

To cut 18 inches	£ 8 0 0
Can be worked by a Man and Boy.	
" 20 " Ditto.	8 10 0
" 22 " Ditto.	9 0 0
" 24 " Ditto.	9 10 0

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Side Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness :—

DONKEY AND PONY MACHINES.

To cut 26 inches	£ 15 0 0
" 28 "	17 0 0
" 30 "	18 10 0
Leather Boots for Donkey	1 0 0
" " " " " Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£ 22 0 0
" 35 "	25 0 0
" 42 "	30 0 0
" 48 "	34 0 0
Leather Boots for Horse	1 0 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

The improvements which have recently been made in the "Silens Messor," still keeps this Machine the best and most approved one in the Market.

GREEN'S PATENT "PHŒNIX" LAWN MOWER,

WITH MULTIPLIED GEAR ACTION, and SWIFT REVOLVING CUTTERS.

This Mower is specially designed to meet the wishes of those who would rather have a machine with Wheel Gearing in preference to one with the Chain Motion.

It combines all those excellent qualities for which GREEN'S LAWN MOWERS have been so long celebrated, as well as advantages that other mowers do not possess.

It will cut nearer to an object than any other Lawn Mower extant, and long, tough, wiry bents, which so mar the appearance of cultivated lawns, are cut with it as easily as ordinary grass.

The Rope and Pulling Handle are not supplied with Machines under 16 inches size unless specially ordered, and are then charged extra.

The Sizes and Prices of the "Phœnix" Mower are in both respects the same as those of the "Silens Messor."

GREEN'S PATENT "ROYAL" LAWN MOWER.

The special features of this Machine, which recommend it for universal adoption, are its novel construction and its extreme simplicity. It is composed of the smallest number of parts of any Lawn Mower extant.

The Grass-box is placed in front of the cutters, and by removing it the Machine will cut grass close up to trees, seats, and underneath shrubs, &c. It is eminently adapted for Banks, Slopes, Flats, &c.

The Rollers fixed behind the cutters enable the Machine to cut over the edges of Flower Beds, Borders, Verges, &c., and close to any object.

The Handle of the Machine is self-adjusting, and will suit the height of the person using it at any angle.

The Mowers are of the strongest manufacture, simple in their construction, not liable to get out of order, and require the least repairing of any Machines of their kind extant.

WITH SINGLE GEARING.

To Cut 6 inches	£ 1 5 0
" 8 "	1 15 0
" 10 "	2 10 0
" 12 "	3 5 0
" 14 "	4 0 0
" 16 "	5 0 0

WITH GEARING ON EACH SIDE.

To Cut 18 inches	£ 6 10 0
" 20 "	7 0 0
" 22 "	7 10 0
" 24 "	8 0 0

FOR DONKEY OR PONY.

To Cut 30 inches	£ 10 0 0
-------------------------	----------

Our reason for bringing out the "Royal Guinea" Mower is to meet a want which has been repeatedly expressed by the purchasing Public, to have a good, useful, and efficient Machine CHEAP.

Every Machine is Warranted to give entire satisfaction, and if not approved of may be returned at once unconditionally, without any expense to the Purchaser.

Delivered, carriage free, to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as AN EFFICIENT STAFF OF WORKMEN IS KEPT AT BOTH PLACES.

THEY CAN BE HAD FROM ALL RESPECTABLE IRONMONGERS AND SEEDSMEN IN THE UNITED KINGDOM; OR FROM

THOMAS GREEN & SON, Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London, S.E.

Further particulars will shortly appear.

Bruce's Nursery, Kingston, Surrey.

MESSRS. PROTHEROE and MORRIS respectfully announce that the SALE of this important FREE-HOLD ESTATE, advertised to take place on April 15, is POSTPONED TILL LATER DATE.

SURREY (2005).—In a first-class neighbour-hood, close to a station, and twenty-five minutes' ride from Waterloo, a flourishing NURSEYMAN'S and MARKET GROWER'S BUSINESS to be Disposed of in consequence of the death of the Proprietor.

NORTH ESSEX (1064).—To be Sold, a genuine NURSEYMAN'S BUSINESS, the Owner having retired from a farm. Part of purchase money could remain on security.

WEST OF ENGLAND (2006).—An old-established NURSEY and SEED BUSINESS to be Disposed of, on particularly easy Terms. £2000 to £3000 required, part can remain on good security.

Particulars of these three Nurseries, and of several others, will be found in Messrs. PROTHEROE and MORRIS' CATALOGUE, which may also be obtained at their Offices, 68, Gracechurch Street, London, E.C.

County of Limerick, Ireland.

ISLANMORE, within 9 miles of Limerick, and five minutes' walk of Croon Station, on the Great Southern and Western Railway.

MR. M. HARTIGAN is favoured with instructions from the Executors of the late Robert Wanless Kelley, Esq., to offer for SALE by AUCTION, at Islanmore, on THURSDAY, March 18, at 1 o'clock, this truly MAGNIFICENT ESTATE, containing 541 1/2 acres, of which 200 acres are in the highest state of cultivation. The Mansion House, which stands in the centre of a beautifully timbered Park, is approached by two avenues with gates and handsome entrance lodges. It is prettily surrounded by extensive lawns, and a fine avenue of the County Foxhounds is within a mile. The Farm Lands are of superior arable and pasture quality, well drained, thoroughly trenched, and in the highest state of cultivation. The Farm Buildings are extensively, newly, and substantially built, and there are also on the Farm a lincklin, a cowshed, and gravel pits. Immediate possession can be given to the purchaser.

For all further particulars and Conditions of Sale applications to be made to Messrs. REEVES and SONS, Solicitors, 75, Abchurch Lane, Dublin, or to M. H. HARTIGAN, Auctioneer, 46, George Street, Limerick, Ireland, who will give Cards to view the Estate.

Stapleford, Cambridgeshire.

MESSRS. MANN and RAVEN have received instructions to OFFER for SALE by Public AUCTION, upon the Premises, by direction of Richard Heath, Esq., of Stapleford, March 15, at 12 o'clock, all his valuable STOVE and GREENHOUSE PLANTS, most excellently grown, and clean and healthy. Among the Hard-wooded plants will be found the best specimens of the following: Camellias, Epacris, Heaths, Rhododendrons, &c. The Soft-wooded plants comprise Cinerarias, Calceolarias, Fancy and English Spotted Pelargoniums, Zonal Geraniums, and other Antennariums, Carnations, Picotees, Pinks, and Auriculas, &c.

The Auctioneers particularly call attention to the above Sale, as all the plants are well selected, and a most valuable floral exhibitor, and the plants have all been selected with the greatest care and judgment by that gentleman.

Applications may be made to Messrs. MANN and RAVEN, Hobson Street, Cambridge.

Isleworth. In Liquidation.—By order of Trustee.

PAUL'S ROSES.

"Mr. Wm. Paul has been deservedly placed at the head of English Rose growers.—*Standard*.
 "The Roses of Mr. Paul are things to see once and dream of for ever."—*Athenaeum*.
 "Mr. Wm. Paul is famous for his Roses all over the world."—*Graphic*.
 "Mr. Paul is the most successful Rose Grower in England."—*Journal of Agriculture*.

WILLIAM PAUL

(SON AND SUCCESSOR TO THE LATE A. PAUL),

PAUL'S NURSERIES, WALTHAM CROSS, HERTS,

Begs to announce that his New ROSE CATALOGUE is now ready, and will be forwarded, post free, on application.

The Public is respectfully requested to observe—

1. That the stock is in the finest possible condition. The growth is healthy, moderate, and well matured, rather than gross and ill-ripened.
2. Every Plant in this Establishment is for Sale, no reserves being made for prize winning or other purposes.

NEW ROSES.

QUEEN OF WALTHAM, H.P. (WM. PAUL)—Flowers rosy cherry, a new, distinct, and lovely colour, large and full.

STAR OF WALTHAM, H.P. (WM. PAUL)—Flowers deep crimson colour, very rich and effective; a magnificent flower, large, very double, and for form, substance, and smoothness of petal unequalled, splendid foliage. First-class Certificate from Royal Botanic Society.

Plants of the above will be ready the end of May, price 10s. 6d. each. Plates (coloured) shortly ready, post free, 1s. each.

A large and healthy Stock of the NEW FRENCH ROSES is now ready for delivery, at 2s. 6d. each; 24s. per dozen.

PRICES OF OLDER ROSES.

- STANDARDS. Per dozen, 15s. and upwards; per 100, £6 and upwards.
 STANDARDS, Newer Sorts. Per dozen, 24s. and upwards; per 100, £8 8s. and upwards.
 DWARFS ON THEIR OWN ROOTS, from the open ground, Hybrid Perpetuals. Per 100, £3 3s.
 DWARFS ON THEIR OWN ROOTS, in pots, Hybrid Perpetuals—a very fine stock of strong plants. Per dozen, 15s.; per 100, £5 6d.
 DWARFS ON MANETTI. Per dozen, 10s. 6d. and upwards; per 100, £3 3s. and upwards.

 DWARFS, extra sized, for Forcing or Greenhouse Culture. Per dozen, 24s. and upwards.
 SPECIMEN ROSES, 5s. to £5 5s. each.

My Rose Shows at the Royal Horticultural Gardens, South Kensington, and the Crystal Palace, Sydenham, where thousands of Roses in pots, the sole produce of my Nurseries, have been shown year by year, and the show of Cut Roses at the Royal Botanic Gardens, in the Regent's Park, where 8000 trusses of flowers were staged last July, have been visited at various times by—

HER MAJESTY THE QUEEN,
 THEIR ROYAL HIGHNESSES THE PRINCE AND PRINCESS OF WALES,
 THEIR ROYAL HIGHNESSES THE DUKE and DUCHESS OF EDINBURGH
 and several other members of the Royal Family;

HIS IMPERIAL MAJESTY THE EMPEROR OF RUSSIA,
 THEIR MAJESTIES THE KING and QUEEN OF THE BELGIANS;
 and Thousands of Visitors, many of them Amateur and Professional Horticulturists.

These Shows, as artistic displays, and the plants and flowers of which they were composed, have also received the highest encomiums of the Horticultural and General Press. The idea which prompted them was not conceived or worked out in opposition to existing Rose shows, but to occupy ground which they failed to touch—to show Roses in a free and natural rather than in a crowded, formal, and artificial state—in a state in which any one might produce them with ordinary advantages and ordinary cultivation without the technical knowledge of the florist's art.

WORKS ON ROSE GROWING by WILLIAM PAUL, F.R.H.S.

THE ROSE GARDEN. Fourth Edition in the Press.

"Infinitely the best work ever written on the Culture of the Rose."—*Botanic Garden*.

ROSES IN POTS. Fourth Edition. Post free, 2s. 2d.

"In this little work of ninety-one pages will be found every direction that can possibly be required."—*Journal of Horticulture*.

ROSES AND ROSE CULTURE. A Shilling Book on Roses. Second Edition.

"In this little shilling book Mr. Wm. Paul tells Amateur Rose growers all that is really necessary for them to know."—*The Garden*.

PAUL'S ROSE MANURE. In boxes, with directions for use, 2s. and 4s. each.

Dr. SCOTT, *Sandwich*, says:—"It is by far the best Manure I have ever tried."

THOMAS LAXTON, Esq., *Stamford*, says:—"I shall certainly use it again."

A. H. KENT, Esq., *Blechnigle*, says:—"An invaluable boon to Amateur Rose growers."

Mr. DOUGLAS, *Loxford Hall Gardens, Iford* (writing in the *Journal of Horticulture*), says:—"The best Manure for this purpose is Mr. W. Paul's Rose Manure."

IMPORTANT.

The Public is respectfully informed that the old firm of A. Paul & Son (founded by my Father, the late Mr. A. Paul) no longer exists. Of that firm I am the sole surviving Partner; all Letters, therefore, intended for me, should be addressed—

WILLIAM PAUL (the Christian Name in full), Paul's Nurseries, Waltham Cross, Herts.

RICHARD SMITH, Nurseryman & Seed Merchant, WORCESTER.

NECESSARY CAUTION.

MESSRS. PAUL & SON,
THE "OLD NURSERIES," CHESHUNT, N.,

Respectfully beg their Customers to address business letters simply as above,

WITHOUT CHRISTIAN NAME OR INITIAL.

Through the use of wrong Initials several letters intended for them have recently failed to reach them direct. Will their friends therefore *carefully* address—

PAUL & SON, THE "OLD NURSERIES," CHESHUNT, N.

MESSRS. PAUL & SON,
THE "OLD NURSERIES," CHESHUNT, N.

In case the recent Advertisement, stating that

"The Old Firm of ADAM PAUL & SON no longer exists,"

Might lead the Public to think it related to their Firm, PAUL AND SON beg to say that

It refers to an event which occurred 15 years ago.

MESSRS. PAUL AND SON are unable to understand the motive for the resuscitation of this family matter.

They inherit the interest in the late Firm which belonged to their late Mr. Paul (one of its founders), and PAUL AND SON hold as PART OF THEIR NURSERIES, the whole of the few acres which constituted the Nursery of "ADAM" PAUL & SON, except a few perches of Osier Beds.

In 1866 it was arranged with Mr. William Paul that their late Mr. Paul was (to quote the document) "to have the benefit of the outstanding partnership accounts, and the partnership books belonging to 'Adam' Paul & Son." The latter are now in the possession of PAUL & SON.

MESSRS. PAUL AND SON, concluding that all Customers of the late Firm have long since elected which House they would support, and that the only outstanding business would be the payment of some long-forgotten account, need hardly say they would be glad to exercise their right of receiving the same.

MESSRS. PAUL AND SON much regret, and must apologise for intruding these matters on the Public, but on this occasion, as on many others, they find themselves forced to act on the defensive.

Friends will kindly, therefore, in future carefully address, without Christian Name or Initial,

PAUL & SON,
THE "OLD NURSERIES," CHESHUNT, N.

MESSRS. JAMES VEITCH & SONS

INVITE EXHIBITION OF THEIR COLLECTION OF THE ABOVE, WHICH ARE NOW IN FINE BLOOM.

The **CAMELLIAS** are also still very fine.

ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

LOBELIA PUMILA MAGNIFICA.

THE
PINE APPLE NURSERY COMPANY

Will commence sending out this fine Lobelia on March 15 next.

Price 2s. 6d each, or 24s. per dozen for not less than half a dozen.

It received the Floral Certificate at the Royal Botanic Society, and a First-Class Certificate at the Royal Horticultural Society. It has been favourably noticed by all the gardening papers, and the *Gardeners' Magazine* of July 18 says of it:—"This dwarf bedding Lobelia, exhibited by the Pine-Apple Nursery Company, is unquestionably the most important of the many bedding Lobelias introduced of late years. The colour of the flowers is a deep indigo blue, and as there are no conspicuous eyes to mar the general effect, a solid mass or band will tell in a wonderful manner.

MAIDA VALE, LONDON, W.

ROBERT NEAL, The Nurseries, Wandsworth Common, S.W.

Snowflake.
THE FINEST POTATO ever introduced; will yield from 300 to 400 bushels per acre of handsome tubers of the most splendid quality and free from disease. Messrs. DANIELS BROS. have just received a consignment of this magnificent variety direct from the original raiser in America, where it has obtained immense popularity, and which is now being distributed at the following rates, carriage free to any address—3s. 6d. per lb.; 7 lb. 2s. 14 lb. 4s.; 2s. 7d. cheaper by the cwt.
DANIELS BROS., Seed Growers and Importers, Royal Norfolk Seed Establishment, Norwich.

Vines.—To the Trade.
S. BIDE can still supply good strong **PLANTING VINES**, in Pots, of the undermentioned varieties, at 30s. per dozen (a special price for a large quantity will be given on application)—Yinningham Muscat, Madresfield Black, Black Hamburgh, Mrs. Pines, Black Muscat, Lady Downe's Seedling, Burchar's Prince, Sealife Black, Frankenthal Hamburg, Ferdinand de Lessops, Black Morocco, Francis's Frontignan, White Pines, Blanche de Toulon, Muscat, Bowood Muscat, Muscat of Alexandria, White Nice, Duchesse de Buccleuch, Kasin de Calabre.
S. BIDE, Alma Nursery, Farnham, Surrey.

CRANSTON'S NURSERIES, Established 1785.—The following CATALOGUES are just published, and will be forwarded on application.
DESCRIPTIVE CATALOGUE OF ROSES (1874 and 1875).
DESCRIPTIVE CATALOGUE OF FRUIT TREES.
DESCRIPTIVE CATALOGUE OF CONIFERS, SHRUBS, and FOREST TREES.
DESCRIPTIVE CATALOGUE OF BULBS. Address, **CRANSTON AND MAVOS, King's Acre Nurseries, near Hereford.**

R. B. MATTHEWS, SEED MERCHANT AND NURSERYMAN, Belle Vue Nurseries, BELLS LANE, LONDON, E.C. has a large stock of **NEW VEGETABLE and FLOWER SEEDS** now to hand direct from the growers.
GRASSES and CLOVER SEEDS, suited for all purposes, and in situations.
GENERAL NURSERY STOCK, Stone, Greenhouse, Conservatory and Orchard-house Plants, Roses, Fruit Trees, and Hardy Ornamental Trees and Shrubs, Hedging Plants and Underwood.
 Seeds, Plants, &c., carefully packed for export to all parts of the world.

CATALOGUES Post free on application.

120,000 Vesuvius Geraniums for Sale.
F. C. WOOLVEN, Langhedge Nurseries, Church Road, Upper Edmonstone, London, N., has strong **AUTUMN-STRUCK PLANTS** of the above to dispose of at 8s. per 100. Packed and forwarded to London railway station, gratis, on receipt of Post Office Order for number required, payable at the Upper Edmonstone Post Office, London, N. Also several thousand **CHRISTINE** and **DOUBLE GERANIUMS**, at the same price.

New Dwarf Silver Variegated Geranium, "LITTLE TROT."

W. M. POTTEN is BOOKING ORDERS for the above. For particulars see advertisement in *Gardener's Chronicle* of 22nd Nov. A very favourable report of it may be seen in the *Journal of Horticulture*, November 10, 1874, by Mr. Robson, and February 4, 1875, by Mr. Lückhurst, Camden Nursery, Sissinghurst, Staplehurst, Kent.

TO AMATEURS OF ORCHIDS.—Gentlemen having a surplus stock of Orchids (not too common kinds), and willing to **EXCHANGE** them for **OTHER PLANTS**, such as Camellias, Azaleas, Conifers, or any other Stone or Greenhouse Plants, may apply to
A. VAN GEELT, Plantation, Ghent, Belgium.
 CATALOGUES free on application, either from himself or his Agents, Messrs. R. SILBERRAD and SON, 5, Park Lane, Great Tower Street, London, E.C.

THE NEW PLANT and BULB FIRM COMPANY have received the following SEEDS from Japan direct.

SYRAX JAPONICA, Swt. **SERRULATUM**.—A bush or small tree, much cultivated in Japan on account of its highly ornamental appearance. See *Entomologist Magazine*, July 1859. Flowers white; a valuable addition to our hardy shrubs. Per packet, twelve seeds, 1s.; forty seeds, 2s. 6d.; seeds large.

RETINOSPORA, species.—No description or specific name with the seed, but judging from the small quantity sent we should imagine it to be a rare kind. Per packet, 1s. and 2s. 6d.; seeds small.

CRYPTOMERIA JAPONICA.—A well-known, valuable, ornamental tree. Per packet, 1s. and 2s. 6d.; seeds small.

JAPAN COCKSOMB, Scarlet.—An entirely new variety of Cocksomb. No description will convey any idea of the brilliant colouring of this variety—rich glowing scarlet. The combs are almost as delicately cut as ruffled lace, and often in pyramidal masses. This is by far the handsomest of Cocksombs, and will no doubt, after this season, become a great favourite, and entirely set aside the dull crimson of our English variety. Per packet, 1s., 1s. 6d., and 2s. 6d.

JAPAN COCKSOMB, Golden.—This affords a striking contrast to the preceding, its counterpart in everything but colour. Per packet, 1s., 1s. 6d., and 2s. 6d.

LILIUM CORDIFOLIUM.—An extremely scarce and valuable Lily, seldom, if ever, arriving in good condition (as bulbs) in this country. Seed, 1s., 1s. 6d., and 2s. 6d. per packet. The usual Discount to the Trade.

Lion Walk, Colchester.

F. G. HENDERSON and SON'S SEED CATALOGUE for 1875, containing over 200 Illustrations of Flowers, will be posted free on application.
 The **VARIETIES of FLOWER SEEDS** are so arranged that the Amateur may readily recognise the most beautiful and desirable.
 THE **VEGETABLE DEPARTMENT** is complete, with the best proved kinds in each Section.
 For **SEEDS of NEW FLOWERS** for 1875, see List at page 365, and for Descriptions and Illustrations of **LEUTHYEA MITCHELNERI**, see page 227. **SOLANUM HEDRIGII** HENDERSONI, see p. 265. **ROMNEVA COLLETTII**, see page 285. *Gardener's Chronicle*.
 The Wellington Nursery, Wellington Road, N.W.

New ready, gratis and post free.

DICK RADCLYFFE & CO.'S ILLUSTRATED CATALOGUE.

PRIZE MEDAL SEEDS.
CARRIAGE TREE AND WIDE CATALOGUE.
Carriage Trees
GARDEN REQUISITES.

129, HIGH HOLBORN, LONDON, W.C.

To Gardeners.
 Gardeners are most respectfully invited to Visit

THE BEST TWO POTATOS.

VERY HEAVY CROPPERS.—LEAST AFFECTED BY DISEASE.

SUTTONS'
Red-skin Flourball.

Originally introduced by
SUTTON & SONS, in 1869,
and considerably improved
by them since that time.

A very Heavy Cropper.

Excellent Cooker.

Unequaled for Late Use.

Three Hundred Pounds
of Seed planted produced
Two Tons Fourteen Cwt.
One Quarter.

*From Mr. JOHN PULLIN, Gardener
to E. St. Paul Chaplin, Esq., Las-
borough Park Gardens, Sept. 26,
1874.*

"I have just had the Red-skin
Flourball Potatoes lifted, and again
found it free from disease. Having
grown it now three seasons, I can
speak confidently to its being disease-
proof, a heavy cropper, and of the
best quality for table use."

SUTTONS' RED-SKIN FLOURBALL POTATO.

From Seven Pounds
planted in 1874, One
Hundred and Eighty-five
Pounds weight were
raised.

*From Mr. WM. PATERSON, Gardener
to Her Majesty the Queen, Bal-
moral, Oct. 25, 1873.*

"Your New Hundredfold Fuke
Potato is of good size and flavour, and
quite free from disease."

Remarkably Free from
Disease.

Excellent Cooking
Qualities.

A very Heavy Cropper.

*From Mr. A. TUCKER, Gardener to
the Rev. H. Brice, Gouthurst,
Sept. 17, 1874.*

"The Hundredfold Fuke is the best
kidney Potato I have ever grown. A
splendid crop, and not one diseased."

SUTTONS' NEW HUNDREDFOLD FLUKE KIDNEY POTATO.

Lowest Price per Bushel, Sack, or Ton on application.

Suttons' Priced Descriptive List of Choice Seed Potatoes Gratis and Post Free on application.

THE ISLANDS OF FINISTÈRE.

MY botanical trips have often taken me to Le Conquet, a small village at the extremity of the Department of Finistère. It was always with pleasure that, after a hearty meal, whose chief attraction lay in a sharp-set appetite, I went and sat on the top of the cliffs at the close of my day's work, to enjoy repose and the splendours of sunset. On my left the ruins of the Abbey of St. Mathieu, remains of the fifth century, contrast by their sombre mass with the white tower of the lighthouse which indicates to navigators the way to the Rade or Roads of Brest; before me stretch to an apparently boundless extent the thousands of rocks and islets which separate Ouessant from the continent; the sun gilds them with his departing rays, and then disappears in the ocean. Soon the stars begin to glitter in the firmament, while the lighthouses gleam over the surface of the waters; the diverse sounds of the day die away into silence, and nothing is heard but the plashing of the waves agitated by the currents rushing through the Chenal du Four, or the voice of some fisherman making his homeward way into port.

On such lovely evenings as these the sea is an unusually seductive tempter. Consequently I was seized with an immoderate desire to visit these islands, which my imagination peopled with an unknown quantity of interesting plants. All who have ever herborised can appreciate the attraction of new localities to investigate; no rest is to be had until one has trodden the fresh soil, which sometimes turns out poor enough, but which has all the charm of mystery enveloping it. Ouessant and the other islands have been very rarely visited by botanists. It was therefore a veritable voyage of discovery which presented itself to my greedy longing.

But I am terribly afraid of sea-sickness, and the fear of shipwreck on that dangerous coast oppresses me with irresistible anxiety. To reach the islands I should have been obliged to go on board one of the numerous small craft which I had so often seen the sport of the winds and the waves; and my passion for botany did not go so far as that. But one lucky day, one of my friends, in command of a ship of war, invited me to accompany him in an official cruise, in which he would have to touch successively at Ouessant, Molène, and the Ile de Seins. Although the season was advanced (Sept. 6), braving the dread of sea-sickness, I boldly answered "Yes," and next morning, with undiminished courage, steamed away from Brest, happy in the thought of the vegetable treasures that were about to become my prey.

Aided by the ebb-tide, we glided rapidly along the north bank of the Golet de Brest, and I saluted in passing the scene of numerous herborisations. Here grow *Trichonema Columnæ*, *Scilla verna*, *Daucus gummiifer* and *parviflora*; in that turf is hidden the humble *Ophioglossum lusitanicum*. Soon we reach the only hillside which possesses *Erythraea maritima*; higher up are to be found a few rare plants of *Phelipæa cœrulea*, a true treasure-trove in that neighbourhood. Then come the rocks of Toulbroch and of the Bay of Bertheaume, garnished with *Stactis occidentalis* and *Dodartii*, and with *Ulex Galii*. In the caverns, *Asplenium marinum* grows abundantly; on the rocks bathed by the sea *Crithmum maritimum* and *Inula crithmoides* are intermingled with

Festuca duriuscula and *Agropyrum acutum*. Elsewhere, *Lepigonum rupestre* covers the rocks with its pretty pink flowers. At the mouth of rivulets, where they fall into the sea, in some spots are *Glaux maritima*, *Carex extensa*, and a few sparse plants of *Sonchus maritimus*; at others *Glyceria conferta* and *distans* and *Carex lavigata*. But all these treasures glide out of sight in less time than it takes me to enumerate them, and we have entered the Chenal du Four. Once more I behold the Abbey of St. Mathieu, the steeple of Le Conquet, and the cliffs where I used to dream my solitary day-dreams, now at last a reality.

While these pleasant fancies are flitting through my brain, the sky becomes overclouded, a thick fog surrounds the vessel, and we are obliged to slacken speed as much as possible; the men on the look-out announce every minute fresh rocks, close to which we pass. I dare not ask if we are in danger, but observing the serious look of my friend, the captain, I feel my courage oozing out. There seems no escape from shipwreck on one of those terrible rocks, which assume, to my eyes, the aspect of fantastic monsters, while the sea-thongs which hang about them look like multiple arms ready to seize and drown their victims. How I curse my foolish curiosity and my absurd weakness for botany. But the engine stops; I, anxiously ask what is the matter. We take up a pilot, who steers us into the little bay which forms the port of Molène.

All my terrors fly away as if by enchantment. Armed with my box, I jump on shore, forgetting to breakfast; as soon as landed, *Urtica pilulifera* catches my eye, then black Henbane and Belladonna, and here is that rarest of rarities, *Heliotropium europæum*, which the botanist finds nowhere else in Finistère. I successively gather *Lepidium latifolium*, a very rare plant with us; *Cynoglossum officinale*, *Asplenium lanceolatum*, *Sedum acre*, *Artemisia Abrotanum*, *Linaria vulgaris*, *Anchusa arvensis*, *Mercurialis annua*, *Panicum sanguinale*, &c. Close by the sea, I find *Armeria maritima*, *Sagina maritima*, *Galium arerianum*, *Erodium maritimum*, *Plantago Coronopus*, *Chenopodium vulvaria*, and many other vulgarities—seventy-six Phanerogams in all.

Molène is about half a mile* in diameter, and rises some 50 feet above the level of the sea. The soil is partly clayey and partly sandy. Five or six hundred inhabitants subsist on the produce of fishing, and principally by the sale of lobsters and crawfish which they take to Brest. They grow a little Wheat, Barley, and Potatos, and gather a large quantity of seaweed to manure their land and to burn for the soda contained in it, which is an important item in their revenue. A singular trade carried on in the island is the fabrication of *terre de Molène*—Molène mould or soil, a compost formed of clay, seaweed in decomposition, and the refuse of fish. This manure is highly esteemed and eagerly purchased by certain occupiers of land fringing the shores of the Rade de Brest.

At noon we left Molène and threaded our way through an interminable series of rocks, out of which nobody but a pilot would be able to get safe back again. The sea was calm, the sun shone brightly, and my fears were dissipated with the mist. I could therefore unreservedly admire, by favour of an exceedingly low tide, the splendid marine vegetation with which the rocks were covered. The grand Laminarias, gently heaved by the light undulations of every billow, were mixed with a crowd of Fucuses and Cystoseiras, whose lower portions were covered with finely divided strips of *Plocamium coccineum*, whilst their upper fronds bent beneath the burden of large tufts

* The "mile" mentioned in this narrative is the French *mille marin* or nautical mile = 1852 metres = 2024 yards = 1 English land mile 264 yards.

of *Rhodymenia palmata*. Then there was *Alaria esculenta*, all torn to shreds and tatters; *Nitophyllum Hilliae*, *Delesseria alata* and *sinuosa*, which contrasted by their bright red hues with the sombre tints of *Gelidium corneum*, var. *sesquipedale*. Out of the rocks at last, we are in the Passage du Fromeur—an exceedingly dangerous strait, on account of the currents, which stir up a nasty chopping sea. We skirt the perils which lie at the extremity of the south-east point of Ouessant, and cast anchor in the Bay of Porspaul.

I had two days to myself to explore an island 4 miles long and 3 miles broad, giving me ample time to do it. Ouessant is formed of two plateaus of unequal size, separated by a marshy valley which traverses nearly the whole of the island. A girdle of rocks and perpendicular cliffs encircle it almost without a break. The soil, mostly shallow, is composed of clay and sand. Manured with seaweed it produces excellent crops—more Wheat than the inhabitants require for their subsistence, Rye, Barley, and Potatoes, which, although small, are very good, and in high favour on the continent. There are a few meadows in the valley—not a single tree. People keep themselves warm with fires of turf, cow-dung, and the dried stems of *Laminarias*. The fields are separated by walls of un cemented stone, which afford a little shelter to the crops and the cattle against the terrible squalls and gusts of wind which sweep over the island: but of this more at another time. C. Z.

(To be continued.)

NOTES FROM A GARDEN IN CORNWALL.

February 1.—Rain continues almost daily, and being accompanied with warm west and south-west winds, stimulates into active growth a vegetation that has had but little winter's rest, which at this early season it is but natural to expect will suffer a serious check.

In no quarter of England do slugs and snails find a more genial home than in Cornwall. The large garden snails, *Helix aspersa* and *Helix hortensis*, do take a few weeks' slumber in the shortest days, but the slugs are always active in doing mischief. I do not suppose there is a garden in Great Britain that can outumber mine in point of species, multitude, and voracity. The best trap I find is a handful of brewers' grains (here called draft), laid down at intervals, and after dusk to go round and pick them off, or with a dredger filled with fresh-slaked lime to sprinkle a little over them. In this case it is necessary to renew the grains each time. The stone-faced fences of the country offer a convenient harbour for such vermin.

My first crop of Potatoes is now planted, and I hope to get in the remainder of the early kinds about the end of this month; they are principally Royal Ashleaf and Early Rose, both of which usually come to maturity before the disease is prevalent. The former is the best early kind I have met with, being a fair cropper and of excellent quality. Early Rose bears abundantly with me, and is of medium quality.

Peaches are already opening their blossoms—"better they were not;" although carefully protected with mats, I have but faint hopes of a crop of fruit, and mats are the only things in any way protected, as I am of opinion that plants requiring protection in our climate are better under glass. I have a small bed of *Hyacinthus orientalis*, a single pale porcelain-blue kind that usually flowers about this time; very hardy and early than the varieties usually imported, it does well in the ordinary soil of my garden and increases freely from offsets. In the hands of a caterer for Covent Garden it would be valuable, so delicately pretty is it, besides being delightfully fragrant.

Last spring the moles were very busy in one of the gardens turning up the soil in all directions, sometimes thrusting out of the ground some favourite plants, at other times burying them; but being so reluctant to destroy them, knowing that they have some redeeming points, I did not have them molested; and later on in the season I could observe that, although they did not turn up the soil as before, they were still present, evidently hunting in their old runs. This spring I find they are again active, but do not turn up the soil more than to clear away some obstruction; they do no further harm, but I find a real enemy has taken advantage of the mole's labours; it is the common vole or water-rat, which makes use of the

subterranean runs to the roots of trees and shrubs, which they eat through, as in Mr. Ellacombe's garden last year, giving no indications of their presence until the plants decay or fall over.

Amongst several plants left on trial but two have been destroyed by frost; they are the Pepper-tree, *Schinus Mulli*, and *Asteriscus maritima*. Near to the Pepper-tree is a fine healthy plant of *Mimosa sensitiva*, which is usually cultivated as a stove plant, but which is evidently quite hardy. It has stood out here two winters, and with Mr. Fox, in his very interesting garden at Pengerrick, for two or three years previously, although occupying a very moist situation.

Broccoli of the early Penzance kind is abundant, and of good quality—a very fortunate circumstance for the enterprising cultivators in the county, who work hard, pay high rents, and have to venture their capital on a chance crop, as it occasionally happens that a severe winter elsewhere, is also sufficiently equative here to ruin the Broccoli crop, and when equally mild throughout the country the demand is so small as to scarcely pay the cost of labour.

Narcissus orientalis, in many varieties, makes the cottage gardens gay around here, and the varied coloured Primroses that are found growing wild are frequently conveyed home. Sometimes amongst them may be seen the singular forms, here called "Jack-in-the-bush;" and as I never miss an opportunity to secure a strange form of either the hollyhock, holly, hingu, or exchange, I have got together quite an interesting collection, some of them very pretty, others more singular than beautiful, and amongst them are forms that would puzzle one to say if they are Primroses, Polyanthus, or what.

I have never before seen *Violets* flower so freely as they are doing this season, both in the garden and by the wayside. *Ficaria grandiflora* is a recent addition to our collection, and is worthy of note as being a giant beside its lesser brethren; it is more than twice the size of the common *Celandine*. The double yellow is in fine flower at this time, but a single white variety, which I found growing wild three or four years ago, is not yet in flower; it is usually ten days or a fortnight later. Cornish lilies are rich in Flora's treasures. I recollect a little girl from the North of England giving expression to her feelings by exclaiming to her companion, "Oh! I amitie, there are flower gardens everywhere in Cornwall."

It is true, from this time, beginning with the Primroses, till late in the autumn, when the hedges are decked with fruits, there is always a succession of beauties to admire. I never go out for a drive without taking my spud, and if I go beyond the ordinary highways rarely return without some chance treasure, consequently have now a very interesting collection of what a non-botanical friend calls *Roadsideum galathea*.

Feb. 16.—Our nocturnal visitants are here this evening to announce coming dry or fine weather. For several years past a pair or more of barn owls have been in the habit of visiting a small plantation which adjoins our house, disturbing our peace by their non-musical hootings; but, as we have long noticed, they are sure harbingers of a favourable change in the weather. This, and the consolation of deterring mice, makes some men wish they were not so goodly. The male *Anchusa* are flowering freely, but I see no signs of opening flowers on the females. The same thing happened last year, when the males were two or three weeks in advance of the females; nevertheless, the large and small plants are quite scarlet with berries, although artificial fertilising was not resorted to.

Sempervivum polytachion and ciliate have stood out the winter so far, with but slight injury. Mrs. Pollock, Lady Cullum, and several other tricolor and bicolor *Polygoniums* are quite healthy. *Abutilon megapotamicum* is flowering, also *Habrothamnus elegans*, *Fuchsia microphylla*, *Ribes speciosum*, *Leucogon pulchellum*, *Saxifraga cordifolia* (what a grand subject this is for the shrubbery or wild garden), *Spirea prunifolia* and *prunifolia flore-pleno*, also *Rubus biflorus*, are flowering unusually early.

Feb. 19.—After a couple of hot summer-like days the thermometer has suddenly fallen to freezing point, accompanied with a slight sprinkling of snow.

Feb. 20.—The snow that fell yesterday disappeared during the night. The wind is from the north-east, and bitterly cold, with 6° of frost. I judge it is much more severe in the North, as the redwings and fieldfares are flocking here in great numbers, looking feeble and starved as if from long flight and short fare. To see the starlings at twilight taking their way to the sheltered woods where they roost is something wonderful, and such as I have nowhere else seen. They quite darken the atmosphere while passing over, and with a noise resembling a hurricane.

Feb. 21.—The cold north-east winds still prevail, and the nights are slightly frosty. A decided check has been given to early vegetation, *Habrothamnus*, *Sparmannia*, and *Fuchsia* have had their leaves and young shoots blackened, but only a trace of injury is apparent on dwarf perennials and bulbous plants, which I attribute to their being sheltered from the

cold winds, and to the two previous sunny days having warmed the ground. *Sisyrinchium grandiflorum* alburn, *Bulbodium vernalis*, *Triteleia allicia*, all of the early blooming forms of *Narcissus* and *Cyclamen* of the Coom, Ibericum and Atkinsian section, look fresh and healthy as before the frost; but I notice the foliage of *Ixias* and *Trichonemas* is browned, and plants of *Cyclamen persicum*, which ten days ago were the picture of health and hardiness, now droop their flowers, and look dejected. J. S. T.

JOHN EDWARD GRAY.

THE announcement of the death of JOHN EDWARD GRAY will be received with universal regret among naturalists. Of late years Dr. Gray has been much better known as a zoologist than as a botanist. Nevertheless he began his career as a botanist, and never entirely abandoned the *ambulus scientia*. He also rendered considerable services to horticulture, on which account some brief references to his career will not be out of place, though naturally we shall make but little allusion to his zoological work, extensive as that has been.

The father of J. E. Gray, and of his scarcely less celebrated brother, G. R. Gray, was known everywhere to the last generation of druggists as the author of a most useful supplement to the *Pharmacopoeia*. John Edward was destined for the medical profession, but speedily devoted himself to botanical pursuits; the first over indication of this was a book published in the father's name, but of which the substance was furnished by the son. This book was worthy of a better fate. It met with a most unworthy reception at the hands of some of the leading botanists of the day, and their opposition was strong enough to mar the success of a book which, had it had fair play, would have constituted rest a epoch in the history of botany in this country. As it was, its merits were recognised only after the lapse of time, when much that it contained had been published elsewhere, and when many of the crudities of a young and inexperienced author had necessarily become more apparent by the progress of science in the interval.

At that time (in 1821) the influence of Linnaeus was paramount. Sir James Smith, the then leader in the botanical world, was an ardent Linnaean, the founder of the Linnean Society, the purchaser of the Linnean library and the Linnean collections, and the compiler of a standard work on British botany arranged according to Linnean principles. When, therefore, a young, and till then unheard-of, naturalist actually dared to bring out a systematic work on English botany, arranged according to the Jussicean or so-called natural system, it was an ardent Linnaean, too—we can imagine that the *Volscians* were flattered. Had this been the only result, no great harm would have been done; but unluckily, whether their self-love was wounded, or whatever the cause, the botanists of the day subjected Gray to something very like persecution. The facts have never been denied, and so we presume they are substantially true. One result of this persecution was, that when Gray was proposed in 1822 as a Fellow of the Linnean Society, by a number of his Fellows, including Haworth and Salisbury, he was unceremoniously rejected.

"If," says Dr. Gray, "the slightest hint had been given to any of my proposers I should have immediately withdrawn, as I could ill afford the subscription. Only a few of the proposers were present, they made so sure of my election, the rejection of a candidate being a very rare event. I only recollect one besides myself. The list of proposers—all persons doing their utmost to improve zoology and botany—may have frightened the regular 'Linnaeans,' of whom Dr. Shaw may be considered the type, and who proposed putting his *bees* on all shells not in the twelfth edition of the *Systema Naturae*. The result was, that the Linnaean Society. It was, however, too bad to inflict their wrath on the grandson of the Mr. Gray who translated the *Philosophia Botanica* of Linnaeus for his friend Mr. Lee (of Hammersmith), whose book first introduced the Swedish botanist's scientific writings to English readers. Mr. Haworth, who was present, was so displeased at what he called an unjust and underhand combination to crush a young naturalist, that he made a codicil to his will desiring that his collection of British Lepidoptera, arranged after and being the type of his *Lepidoptera Britannica*, which he had previously left to the Society, should be sold with his other collections. It stirred up my spirit of resistance, and I determined to leave the medical profession, and devote myself to the study of natural science, and I have no cause to regret the determination or its cause. The cause assigned was that in the *Natural Arrangement of the British Plants*, published under the name of my father (as I was very young, and only occupied on the synoptic part of it), we had quoted well-known English writers. Dr. Sowerby afterwards Sir J. E. Smith, contributed the text, as Sowerby's *English Botany*, and in so doing had insulted the President, which I may declare was perfectly unconscious and unintentional on my part. The text of the book was written by my father, and I have been gratified gratuitously by my predecessor—Dr. George Shaw. As Mr. Sowerby foresaw that the work was likely to be

successful, he arranged with Dr. Smith to give him a guinea for the description of each plate. Dr. Smith made a condition that he was to receive the money with the proofs of the descriptions. At the same time Dr. Smith published the botanical articles to *Keble's Periodic*, a kind of *States Plantarum*, written according to the name of the genus as it occurred in the alphabet. I suppose, considering the price that was paid for the articles in *Rees's Encyclopædia*, and that paid for the text of the *English Botany*, they must be considered as the best paid botanical writings known. Indeed, what with the money Dr. Smith got for these works, the *English Flora* and other scientific works, and the eventual purchase of the Linnæan collection by the Linnæan Society at his death, the acquiring of that collection must have been an excellent investment. Dr. Smith seems never to have forgiven me, for when engaged on the *Monograph of the Cycadæa* I wrote to him asking if I might be allowed to see two or three specimens in the Linnæan collection. He did not reply to me, but on asking Mr. Sowerby to make the same request for me, he replied that the Linnæan shells were not arranged, but any of Mr. Sowerby's friends might see them except Mr. Gray.

These details we quote from an article of Dr. Gray's in the *Journal of Botany*, written many years after the event to which it relates. From another volume of the same Journal we cite the following interesting details relating to the book which caused so much commotion:—

"I always look back," says Dr. Gray, "with pleasure to the time that I spent in collecting plants and in studying and teaching botany, and especially to the period when I was occupied in preparing the systematic part of the *Natural Arrangement of British Plants*, the work that first introduced the natural system of plants to the student of English botany; for I need make no secret of the fact that I alone am responsible for that part of the work, since, though it was published under my father's name, he wrote the introduction only. Having in his youth studied British plants according to the system of Ray, he never would adopt the Linnæan system; and the only interest that he took in the systematic part of the work was to consider the *Genera Plantarum* of Jussieu as a revision and modification, according to the increase of knowledge, of the Rayian method, while he regarded the Linnæan system as only a dictionary by means of which the names of plants could be most easily obtained. I had the advantage of his advice and assistance which I received during its preparation from M. De Candolle, the father, and M. Dunal, of Geneva (then in England), from Mr. R. A. Salisbury, and from my dear friends, Edward Bennett, the late secretary of the Zoological Society, and J. Bennett, Museum, and the use that the course of study it necessitated has been to me in after life, fully made up for all the obstructions and difficulties that were thrown in my way by other botanists, which delayed the appearance of towards me for many years after. But their opposition was of no avail: the natural system has been established for years; and though the work was not a success—and, indeed, how could one be so intended to in a country at once into English botany almost all that had been done on the Continent up to the period of its publication, and thus was so far in advance of the then state of botanical knowledge in England, where the study had been under the incubus of a bitter attachment to the Linnæan system, and to the system which was its ground; and the very opposition was useful to me by causing me to pay more attention to analytical studies, and to carry into zoology the knowledge, accurate terminology, and systematic method of study employed in the sister science, which has led me to believe that the study of botany is the best introduction, even now, for the successful prosecution of the other branches of natural science."

Dr. Gray was a most laborious and active worker in various fields of natural history, over-given to controversy—the result, perhaps, of his early experiences—but a warm friend, and zealous in giving help to younger men. His papers and memoirs must surely considerably outnumber those of any of his colleagues. In the societies and journals with which he was connected there is scarcely a meeting or a number in which Dr. Gray's name does not occur. In other fields than that of natural history his diligence and energy were equally remarkable. Many of the existing scientific societies owe their origin in greater or less part to him. Penny postage, decimal coinage, sanitary questions, education, prison discipline, the opening and utilisation of new farms, postage stamps, and we know not what beside, occupied his busy brain.

As a botanist he worked, even in later life, at the seaweeds, and published various memoirs on them.

The International Horticultural Exhibition and Botanical Congress of 1866, which was at first looked rather coldly upon by some of our great naturalists, found a warm advocate and a very liberal supporter in Dr. Gray, who gave up his time, his money, his house to the cause, and who, by bringing persons together beneath his hospitable roof, contributed not slightly to the success of the undertaking as a social gathering of botanists and horticulturists.

Dr. Gray had throughout the active aid and the intelligent sympathy of a wife—herself not unknown to fame—and who knew how to mingle with the

energy and sometimes fiery zeal of the man the soft grace and clever tact of the woman.

Dr. Gray some time since resigned his post at the British Museum—a post he filled with so much honour to himself and advantage to the institution since 1824, and was making arrangements to migrate to a new residence, within view of the building he loved so well, when he was bid to cease from his labours and be at rest. Though worn by years and tried by infirmity, he may thus be said to have died in harness, and we feel sure that this is what he himself would have preferred.

HALF-HOURS AT KEW.—II.

OUR first visit to Kew was spent in the Tropical Conservatory, where we may profitably pass another half-hour. Palms and Tree Ferns occupied our attention then; now we may admire the luxuriant vegetation represented by members of the Arum family. The general resemblance of the inflorescence in plants of this group has already been pointed out, and a brief explanation of the nature of what is popularly termed the flower may be acceptable. Briefly, then, we have here, not a single flower, but a collection of small flowers crowded together on a "spadix," usually more or less enclosed within, or subtended by, a leaf, termed a "spathe." In some species the spathe is large, encircling the spadix, as in the white Trumpet Lily of our windows; in other species it is small in proportion to the size of the spadix, examples of which may be seen in various species of Anthurium around us. The most familiar plants of this family to the majority of our readers probably are the beautiful variegated Caladiums, some of which figure at almost every flower show; and the brilliant scarlet spathes of Anthurium Scherzerianum will be remembered by all who have once seen them. Here, however, these smaller forms are replaced by gigantic climbing and epiphytial species, exhibiting a variety and exuberant growth of foliage that will enable us to form some idea of the rich vegetation of the virgin forests of tropical America especially, of which they constitute one of the most striking features. The slender columns supporting the roof, and the walls of this conservatory, are clothed with various species of this family, many of which display their native health and vigour. One of the most numerously represented genera is the genus Philodendron. This is a well chosen and appropriate name, being derived from φίλος (philo), to love or have an affection for, and δένδρον (dendron), a tree, in reference to the habit of most of the species climbing over trees. *P. erubescens* is a very conspicuous and luxuriant species, several plants of which may be seen in different parts of the conservatory. Its heart-shaped or arrow-head shaped leaves are tinged with a copper-red beneath, hence the specific name, which signifies blushing. *P. lacernum*, which has mounted to the top of two or three of the columns, has larger deeply lobed leaves, and is remarkable for its long, slender, cord-like aerial roots, descending in search of nourishment. These roots appear to increase in length only, not in size, at least not before they have reached the soil, and even then to no appreciable extent. They are exceedingly flexible, and are thus able to glide over any intervening branches that otherwise might obstruct their downward progress. They are given off some of them from the topmost branches, and are from 15 to 20 feet in length; but in this case it seems almost a waste of energy, for they have a stone floor to encounter instead of a fertile soil. Close by, on one of the side benches, is a plant of *Monstera dimidiata*, which also develops this faculty to a great degree, and being more favourably situated the aerial roots have pierced the soil, and may serve to convey food by a more direct channel to the upper branches than if it had to traverse all the windings of the main stem. Another species of Philodendron has large pinnate leaves, resembling those of a Cycad; and *P. Schottii*, in the left-hand corner, on entering at the east end, has enormous heart-shaped leaves, resembling those of *Colocasia esculenta*.

Various other species of this genus offer as many different forms of foliage, and several of them are flowering at the present time; but these are not so brilliant and conspicuous as they are strange in appearance. But perhaps the most striking of this group is *Torneia fragrans*, a plant with gigantic leaves, 2 or 3 feet or more in length, and curiously irregularly perforated and lobed. It often bears the names of *Monstera deliciosa* and Philodendron per-

tusum, and it is a native of Mexico. With the important exception of the *Taro*, *Colocasia esculenta*, whose farinaceous tubers form an important article of diet in the South Sea Islands and other tropical countries, this family yields few economic products; but the succulent spadix of *Torneia fragrans* is edible when perfectly mature, and has a rich luscious flavour. *Torneia* is a commemorative name; the others mentioned will suggest their own meanings. We may mention one or two more Aroids, and then note a few other rare or singular plants before leaving this house. *Anthurium digitatum* has large pinnately divided leaves, after the manner of the Horse Chestnut, but much more closely resembling the foliage of some of the *Aralia* tribe. *Pothos scandens* is singular in its jointed leaves; and Philodendron crassinervium has an enormously thickened midrib to the leaves. Here be it observed that the name *Anthurus* refers to the peculiar inflorescence of Aroids; it is from *ἄνθος* (anthos), a flower, and *ἄνθος* (oura), a tail, the form of the spadix.

The Cycadæe or Cycad family, represented in the fossils of the oolite formation in this country, resemble Palms and Tree Ferns somewhat in habit, in usually having a simple stem and pinnate leaves; but they differ essentially from both in their organs of fructification. We shall not enter into details here, as we shall have occasion to speak of them in a future paper; suffice it to say that they have very hard, rigid, coriaceous, often prickly leaves. But how few have seen the strange plant that produces it! A large specimen of it has been placed near the east door, but it does not seem to be quite at home and comfortable in its new quarters. *Vanilla* is the Spanish name of the plant in tropical America. It belongs to the Orchid family, and is singular in its climbing habit and articulated leaves. The flowers of this genus are not so brilliantly coloured as many of the tribe cultivated in this country.

Many other remarkable plants demand a word, but we can only select a few for notice. The *Papaw*, *Carica Papaya*, bears an excellent fruit, and it is extensively cultivated in tropical countries. The fruit varies in shape, resembling a Melon or Vegetable Marrow, and of about the same size. It is cooked unripe as a vegetable, or made into a preserve and variously prepared when ripe. The leaves of this small tree are said to possess the extraordinary property of rendering any kind of tender stuff spoiled with it or simply wrapped around the meat. By some writers this genus is considered the type of a distinct family, but most modern botanists refer it to the *Passifloræ*, several other members of which afford valuable fruits. The *Allspice*, *Pimenta vulgaris*, or *Eugenia Pimenta*, is an inconspicuous, Myrtle-like shrub, which by no means announces its importance. Several other economic plants are scattered about here, but as there is a house specially devoted to them we prefer leaving them out of consideration at present. Such are the *Cinnamon*, *Cocoa*, *Bread Fruit*, *Pepper*, and others. A small specimen of the singular aquatic plant from Madagascar, called the *Lattice-leaf*, *Ouvirandra fenestrata*, deserves notice. An illustration of the "home" of this plant was given at p. 11, vol. ii., 1874. The popular name scarcely conveys an idea of the plant. Skeleton-leaf would be more appropriate, as the leaves are reduced to a framework. The generic name is from *Ouvirandron*, the native name, signifying *Water-Van*, its roots, according to Mr. Ellis, being a valuable article of food. *Napoleona imperialis*, a plant of very curious floral structure from tropical Africa, named in honour of Napoleon I., is in this house, where it flowers frequently, though it is not in bloom at the present time. A very handsome tree, flowering now, is the *Brownæa coccinea*, a native of tropical America. This genus was named in honour of Patrick Brown, who wrote a history of Jamaica, and not, as is sometimes supposed, after Robert Brown, the most celebrated of English botanists. The flowers of the few species known are truly gorgeous, and the foliage of some exceedingly effective. *B. coccinea* has clusters of rich scarlet flowers, but its foliage and crooked branching habit render it less imposing than *B. princeps*, whose single stem, and pinnate leaves a yard in length, give it a majestic appearance.

In conclusion, we may mention that *Carludovica plicata*, a plant noticed in our former paper, is now in flower. Our next visit will be to the Winter Garden, or temperate conservatory in the pleasure grounds, as the flowering season of many of its occupants has already set in. H.

BRITISH GARDENERS.—XIII.

WILLIAM INGRAM.

The name of Ingram is well and honourably known amongst British gardeners, having been borne by that first old member of the profession who so long and so worthily presided over the Royal gardens at Frogmore. Of this stock comes the subject of our present notice, Mr William Ingram, gardener to the Duke of Rutland, at Belvoir Castle, and who has won for himself a foremost position amongst his fellow horticulturalists. He has earned a reputation also in other branches of science—geology in particular, and has achieved success, among other things, in the development of spring gardening, which has become so deservedly popular in many quarters. Mr. W. Ingram has obligingly sent us the following notes of his horticultural career, to accompany his portrait, which we now publish:—

"I was born at Frogmore in 1820, and spent my early days in that very charming garden attached to Frogmore House. I can only recall recollections that are pleasant to dwell upon of the Royal family of that day, and especially of the Princess Augusta, whose regard for my father, and kindness to his family, lasted while she lived. I believe I was rather distinguished by her notice, as I had to wait upon Her Royal Highness at least once every year, to tell her of the progress I was making in my studies.

"After some practice in the old Maestricht Garden, I was placed in the forcing establishment at Cumberland Lodge, and ultimately took the management of the garden there. The great Vine in that place was an object of my especial care, and certainly did not suffer in my hands. At that time the new Royal garden at Frogmore was commenced, and I very well remember going with my father to take it over. It was then a Turpin field. Associated with him in the consideration of the various details that attended the progress of this great work, I can recall one incident that occurred shortly after its completion with great satisfaction. It was the official visit made by the Prime Minister, Sir R. Peel, accompanied by Lord Liverpool, the Lord Steward, while I was left in charge, my father being at Balmoral, so that I was called upon to go round and answer all questions. The very careful examination made by Sir Robert, the acuteness of his remarks, and the acquaintance he exhibited with all the practical details, convinced me that the Minister's mastery of great questions did not preclude a just comprehension, or render him indifferent to even the small details of a garden.

"Desiring to extend my practice, and to improve myself in the language, I went to France in 1846, and while in Paris attended the lectures of M. de la Edwards and Brongnariat at the Jardin des Plantes, and occasionally joined the botanical class of Adrien de Jussieu in excursions to the neighbouring woods. From Paris I went to the Royal garden at Stèves, which was devoted to the cultivation of decorative plants. Enjoying the privilege of the acquaintance of M. Laffay, the celebrated Rose grower, and the raiser of Madame Laffay, La Reine, and other Roses, I frequently visited his charming gardens at Bellevue, just above Stèves, and speculated on the future of La Reine with my kind and hospitable friend; and if his assurance of doubling the size of La Reine was not realised in his time, the variety and perfection of the Roses raised since that date partly justified the hope he expressed in many other respects. The celebrity of the great nursery establishment at Orleans tempted me to visit that ancient and interesting town, and I found in the admirably managed nursery of M. Dauvasse much to learn. The facility with which the art of multiplication was carried on satisfied me that rich soils and fine climates give vigour and vitality to a large class of garden plants that in growth and habit seem rather to languish than grow in many places in England. I shall always remember with gratitude the kindness and consideration shown to me by that truly excellent man, M. Dauvasse, and subsequent visits exchanged cemented the friendship which I treasure as one of the happiest recollections connected with my sojourn in France.

"Returning to England just in time to escape the political explosion that drove Louis Philippe from the throne, I was offered the appointment at Hatfield on the introduction of Dr. Lindley. We grew good Grapes and Strawberries there, and I was glad to cooperate with the good old Marquis in the many projects and experiments which suggested themselves to his very active mind. I remember we fed some Oaks with strong stimulating manures, and I have often wondered if the record remains in a double deposit of woody fibre on those of the ancestral Oaks of that noble park thus operated upon. I planted Conifers wherever possible. The Royal Horticultural Society at that time often sent out travellers, and I learnt something of the grandeur of the City of Florence, of the marcenias and Sabinae, &c.—from Hartweg, who visited me after his return from

South America; my old companion in Paris, Rauch, joined him, and no one could be thus associated without acquiring a love and admiration for Conifers. I was not infrequently employed for the "Doctor," as we admirably called Dr. Lindley, and with my old friends Spencer and Frost I often acted as judge at Chiswick in the palmy days of flower shows, when Mrs. Lawrence and Lady Antrobus were rival exhibitors.

"The appointment at Belvoir Castle being offered me, I left Hatfield in 1853, and since that time have been hard at work in all departments of a very extensive establishment. A very large fruit and vegetable garden, situated near a wooded hill, and in the coldest of cold clays, has offered difficulties in the culture of fruits and vegetables, requiring years of patient labour to overcome, of which gardeners more happily situated know nothing; but difficulties and obstacles are only problems to be industriously worked out, and there is no greater pleasure in horticultural practice than to encounter and overcome such barriers to success. The complete drainage of the garden being effected I have gradually, on Pedro Lull's system, brought up the sub-soil clay to be operated upon by atmospheric agencies, but never more than can be completely reached and pulverised by the weather; next to this I have followed on with burnt earth and charred vegetable matter, preventing any future cohesion of the tenacious soil. The raking and wheeling away of much of the surface soil with weeds and rubbish, sometimes practised, I avoid as much as possible, taking care that every bit of soil is returned to the

William Ingram

garden in one shape or other; and so my clay garden has become a bed of loam in which all vegetables thrive; and pursuing my plan of surface planting Potatoes I succeed well with that capricious vegetable. Unfailing crops of Grapes have attended my system of culture; and I am amply rewarded in the fine and excellent fruits produced by the selection of Pears I have been gradually making. I have attempted to raise improved sorts of Pears and Apricots from seed, but nothing better than we already possess has rewarded me at present. We have a speciality for Strawberries, the crops of which are enormous, and I have great hopes of a seedling raised a few years since. Of Apples I have formed a very considerable collection.

"It has been a cherished object to give interest to the gardens by gathering together all kinds of plants of horticultural value, rather than to depend upon the attraction afforded by the more limited number that brighten our parterres for a short season. I have often lamented the banishment of the fine old herbaceous plants from our borders, and it has been with me a labour of love to reinstate many of them, as well as to multiply a class of plants unsuited for the blaze of a parterre, which yet shed a light of beauty on rocky ledges or shady nooks, where horticultural productions would be out of place.

"The distribution of soils, their varied character, derivation, and influence on vegetation, has been a favourite study of mine, and a paper read at the Congress at Oxford expressed some of my views on that interesting subject. Gardeners, who are so much dependent on weather for the success of many cultural operations, should endeavour to know as much about it as possible; and feeling this, I have conducted a series of observations for the last quarter of a century, which may some day be of use. Local rainfall is a matter that should

always be ascertained, especially as the rainfall varies in cultivated districts from 15 to 50 inches.

"Some years since it was a matter of common regret that our flower-beds were for more than half the year quite bare, and without interest or beauty. I have endeavoured to remove an acknowledged blemish in our gardening practice, by collecting as many hardy shrubs and plants as were suitable, and so filling every bed as soon as the summer flowers are over. Our flower gardens at Belvoir are now green and pleasant to look upon in winter and delightful in early spring, filled as they are with vernal blossoms; my great difficulty has been to secure the greatest display in March and early in April, and this has been in a great measure overcome and accomplished. For alpine plants I have made extensive rockwork, and, with such opportunities, I hope to gather together many alpine gems.

"I need hardly say that the wishes and interests of the owner of the princely estate of Belvoir has governed me in my arrangements, and to his artistic and refined taste is due the merit that belongs to the disposition of the pleasure grounds; and it is a source of pride and satisfaction to be allowed to feel that I have in many instances secured his Grace's approbation."

THE WINTER GARDEN OF THE COMTE DE KERCHOVE.

"If Ghent be the city of flowers," said, in 1873, one of the editors of the *Gardeners' Chronicle*, "it is so in the same sense that Manchester is the city of cotton. The casual visitor may be a long while in the Lancashire town without seeing so much as a flock of cotton. In like manner an ordinary traveller, not informed by his guide-book that Ghent was a great horticultural centre, would be a long while before he made the discovery for himself." These words were true and exact when written, and described perfectly the horticultural condition of Ghent in 1873, when, with the exception of the establishments mentioned in Murray's and Bodeker's *Guides*, nothing was seen in the streets or in the shops to suggest to the traveller the great interest which horticulture possesses in the old town of Artevelde, that proud citizen of Ghent who was godfather to a son of a king of England. Nowadays it is different. Horticultural industry has presented itself in a new aspect, and shops with gay fronts are opened in the town itself for the sale of seeds and flowers.

All the *Guides* point out now among the lions of the town the winter garden of the Burgo-master of Ghent, the Comte de Kerchove de Denterghem, entry to which, as to all the museums and other private collections in Belgium, is easily obtained.

Situated in one of the new quarters of the town in the centre of a garden of 3 hectares in extent, the conservatory constructed by M. le Comte de Kerchove is one of the largest on the Continent. Its total length is over 164 feet; its breadth about 68 feet; its height, not including the basement, is 42 feet. It has a glazed surface of 2100 square metres. The two smaller houses, built at the sides, have a glazed surface of 282 square metres. It was constructed by the Director of the Industrial School of Ghent, M. Bureau, one of the Professors of the University of Ghent, and has received, from the moment of its inauguration, the favourable verdict of all those familiar with horticultural buildings, and who know how difficult it is to unite and reconcile the exigencies of architecture and horticulture. It is constructed as is shown in the woodcut (fig. 66), of a nave and two aisles. The nave is bounded by twenty-eight columns, which support two galleries. These galleries not only allow the gardeners to regulate the ventilation and shade of the building, but also allow the access of visitors. Vast vaults are constructed beneath a large portion of the building, where are kept the stores of pots, &c., necessary for the daily work of the house; and, there, also, is the place where the bulbs are wintered—there, also, the numerous composts required by the various plants are made up.

In another part of the basement the boilers which heat the large house as well as the adjoining ones are placed, as may be seen in the plan (fig. 67, p. 339). A powerful hot-water apparatus heats the three houses, the pipes being concealed beneath gratings. Two boilers, each of 1.25 m. in height and 2.05 m. in width, serve to feed the 765 metres of cast-iron pipes, which are 145 mm. in external diameter, and the length of 255 metres of pipes of 175 mm. in diameter. These suffice to maintain, even during the severest cold, a minimum temperature of about 50° Fahr. in the winter garden. The houses at the sides are likewise heated by 90 metres of pipes of 125 mm. diameter, fed by the same boilers, but rendered completely independent of the winter garden by the use of valves supplied with a stopcock. In spite of the fears so expressed, in consequence of the late frosts, in regard to the success of the immense extent of glazing, in spite of

the height to which the nave rises in the middle, and the appearance of great lightness which the edifice presents, it has, up to the present time, well withstood the equinoctial tempests and storms of Flanders. Not a pane has moved, not a square of glass has been broken. Such a result, after three years' trial, does credit to the constructor, who is now one of the most famous architects of Belgium.

The winter garden of the Comte de Kerchove de Denterghem far surpasses the first glasshouse made in Belgium, in 1822. It was one of the fathers of Belgian horticulture, M. Van Geert, who was the first to venture, in spite of the adverse opinions that were then expressed, to build a conservatory, every portion of which was transparent, and thus to allow abundance of light to gain access to the plants. This house was 26 feet high, 24 feet wide, and 120 feet long. If the aristocrats of that time could return, how great would be their astonishment to see a crystal palace which has resisted the most violent storms, and wood and glass almost exclusively employed in the construction of an edifice as bold as it is elegant.

The plan (see figure 67, p. 330) shows the vertical

little streamlet stocked with gold fish. Escaping from the foot of the rockwork the streamlet is overhung by a noble plant of *Cibotium Schiedei*. Over the rocks falls a cascade, and in and among the rocks are planted fine specimens of *Alsophila excelsa*, *A. contumians*, *obtusata*, *radens*, *Loddigesii*, *denticulata*, *Cyathea elegans*, and *Cocos australis*. By the side of the steps leading to the gallery are *Balanium antarcticum*, between 6 and 7 feet in height; *Alsophila australis*, *A. ferax*, 7-9 feet high, and with its stems bristly with spines; a valuable specimen, 6-7 feet high, of *Cyathea Cunninghamii*, a worthy rival of the one at Kew. Half-way up the rockwork is a platform affording a charming view through the foliage of the Ferns, &c.; *Platyserium alconice*, and various *Selaginellas* cover this part of the rockery. From this point of view the plants which attract the attention most are a very large *Corypha australis*, 7 metres in diameter; a *Latania borbonica*, 5½ metres high; *Theophrasta australis*, *Chamedorea sinensis*, a Palm deserving to be more extensively grown. It grows rapidly, is very hardy in the conservatory, is elegant in habit, and its trunk is covered with silky yellow hairs. A specimen of *Cyathea dealbata* with large

the entrance-door without passing again by the rockwork. This staircase is concealed by fine Palms and Tree Ferns, while its base is surrounded by *Gymnogrammas* of many kinds, *Davallia tenuifolia*, *Alsophila denticulata*, and especially *Oleandra nodosa*. The aspect of this plant amid the other Ferns is singular; it excites remark, and visitors are apt to take it for a *Dicoyledon* rather than a Fern. Among other large specimens we may mention a *Cycas Rumphii*, 6-7 feet in height; a *Cycas circinalis*, with a trunk 4-5 feet in height, surmounted by a crown of seventy-five leaves perfectly symmetrical; and a noble plant of *Cyathea medullaris*, which was originally in the possession of the late M. Van den Hecke de Lembeke, and which gained great attention at the Quinquennial Exhibition of Ghent in 1867. It has much increased in size since then, and is now 13-14 feet high, while its crown has a diameter of at least 6 metres. So much for the assertions of those who maintain that Ferns have a slow rate of growth.

Among the most attractive of Ferns are *Todea superba* and its allies. These are grown in a glass case on a stage surrounded by young Palms. Different varieties of *Lomaria*, as well as specimens of *Dicksonia*

FIG. 66.—COUNT KERCHOVE'S WINTER GARDEN AT GHENT.

section of the building and the height of its different portions, as also various details, which may here be dispensed with. The ground plan shows the general arrangement of the structure. To obviate the ill effects of "drip" M. Bureau has principally confined himself to the use of wood and glass, only using iron where it could not be dispensed with. In this way the drip that does fall is not tinged with rust of iron, and the leaves are consequently not discoloured or corroded.

The interior of the building is planted in the picturesque "English" style. It would be unjust to overlook the influence of Addison and Pope on the reform instituted by Kent in 1710. Thanks to them stiff formal gardens were replaced by a more natural and picturesque style. Designed in excellent taste by M. Fuchs, the landscape gardener to the Royal gardens, winding paths conduct the visitor from the entrance to a colossal pile of rockwork at the other extremity, and the lines of which harmonise with the plants that surround and cover it. The rocks consist of calcareous stone from the banks of the Ourthe and of the Meuse, a stone pitted with many deep cavities which allow of the culture of many delicate plants in them.

Gentle undulations slope gradually to the edge of a

rounds, white on the under surface, is near the upper stairs, not far from one of C. Smithii; C. princeps, and *Rhaphis flabelliformis*, the latter having about forty stems, are to be seen at the top of the platform at the entrance to the gallery which surrounds the building, and which afford charming views of the plants, especially of the Ferns, which form nests of green foliage delightful to witness. By means of this gallery it is possible to obtain views of noble Ferns and Palms totally different from those which can be obtained on the ground, and which reveal new beauties and unexpected harmonies. Tufts of *Selaginella* encircle the base of the groups of plants surrounding the Tree Ferns and Palms above-mentioned. One specimen of *Musa Ensete* stands isolated on the borders of the rivulet, and has attained enormous proportions. Its leaves, more than 9 feet long, give a distinctly tropical appearance to the house. The columns are draped with climbing plants, such as the beautiful *Passiflora trifasciata*, *Tacsonia Van Volxemi*, *Passiflora Imperatrice Eugénie*, *Cobea scandens*, &c. *Caladium* and delicate *Adiantum* thrive in the depressions and recesses of the rocks, and *Asplenium Nidus*, with fronds 6 feet in length, surmounts one of the peaks, as if it were the nest of some gigantic condor. A spiral iron staircase allows the visitor to descend from the gallery to

squarrosa, *Balanium Sellowianum*, *Seaforthia robusta*, and *Chamærops Giesbreghtii*, are scattered here and there amid the groups.

Camellias, *Azaleas*, *Datura arborea*, *Sparmannia africana*, *Imantophyllum minutum*, serve to light up by their flowers the varied green of the foliage. The *Azaleas* are all trained into a globular form, the pyramidal style adopted in England not being practised in Belgium. The culture also differs. In Belgium they are not esteemed unless the heads, grafted on a stem of 0.40 m. in height, are well-formed and round. The leaves, therefore, are completely concealed at the time of flowering.

In summer time the stove Palms are brought into the conservatory, such as *Ceroxylon niveum*, *Areca Verschaffelii*, *Cocos Weddelliana*, *Oreodoxa Sanchezona*, &c. Large numbers of *Agaves*, *Bonapartias*, *Dracænas*, &c., are also introduced, and make a pleasing contrast amid the Ferns. Among the *Agaves* may be mentioned *A. Milleri*, *univittata*, *dealbata*, *applanata*, *filifera*, *Jacobiana*, *Verschaffelii*, &c., *Bonapartea gracilis*, *stricta*, *Yuccas*, &c.

On the side stages a large number of young Ferns and Palms are waiting their turn to be massed out. Most of these are home-grown seedlings. The seeds are sown in pans, and the young plants pricked out

into very small pots, plunged in tan in the case of Palms, in ashes in that of Ferns.

In another house are the Orchids, especially a complete collection of *Cypripedium*, *Crologyne cristata*, various *Vandas*, *Dendrobis*, *Sophranitis*, *Oncidium*, *Lycaste*, *Phalenopsis*, &c. This collection is of recent origin, and serves to form floral groups in the midst of a turf of *Selaginella* in the large house. In this case the pots are concealed by fragments of cork or of rock.

A fine specimen of *Astrocaryum mexicanum* is placed in the centre of a group of *Polypodium appendiculatum* and *sporodocarpium*; while, concealed beneath the huge leaves of *Corypha umbraculifera* and *cerifera* are specimens of *Marattia macrophylla*, *Verschaffeltiana* and *sorbifolia*, *Angiopteris evecta*, *pruinosa*, &c. The fronds of the *Marattia* and *Angiopteris* form a severe contrast with the more delicately cut foliage of other Ferns.

Further on an *Arenga saccharifera* forms, together with *Cocos spectabilis*, a raised arch, under which may be seen various kinds of Palms, such as *Thrinax barbadensis*, *Pritchardia Gaudichaudii*, and *pacificæ*, *Carlina rubriculcis*, *Phoenix dactylifera*, *Brahea dulcis*, *Blechnum brasiliense* and *corcovadense*, *Cibotium Cumingii*, *Alsophila gibbosa*, &c.

The effect produced by some old varieties of *Begonias* which stud the rocks is also worthy of comment, as is that yielded by the charming *Nertera depressa*. *Adiantums* abound, from *A. concinnum* to *A. fabellatum*, from the *A. peruvianum* and *chrysothalamum* to *A. farleyense*.

During the summer some of the plants are removed from the conservatory, such as certain Ferns, and especially *Chamerops stauracantha* and *C. humilis*. Many similar plants do not develop fully if they are not placed in the open air in summer.

It may be stated in conclusion that the great conservatory was inaugurated in 1873 by a visit from the Royal family of Belgium, including the Princess Louise, who made her first appearance on a state occasion at that time, and with such success that the Princess Louise shared in the popularity enjoyed by the beloved chiefs of the Belgian dynasty. *Oswald de Kerchove de Denterghem*.

THE ORCHIDS AT BROOM-FIELD, CHELMSFORD.

THE display of *Odontoglossa* at Mr. Warner's is at present magnificent. I have seen most of the best collections of these plants, but never one to equal this: it is worth going a long distance to see. As you enter the *Odontoglossum*-house, which is about 40 feet long, the effect is wonderful. There are two banks the whole length of the house, formed of double rows, which include fine plants of *Odontoglossum Alexandre* and *Bluntii*, some having branching spikes, on which are very large blossoms, some pure white, others beautifully tinged and spotted, and of thick substance; also some fine racemes of *O. Pescatorei* with forty-five pure white blossom-spotted on the upper part of the lip. There are many plants of this in bloom, and most of them different varieties, either in size or colour; some of the *Alexandre* species are 2 feet long. Intermixed with these are the showy *O. triumphans*, with its orange and scarlet flowers; also *O. luteo purpureum*, and the charming variety called *hystrix*, with its long spikes; and the showy *O. Inscay* *ardinum*, which produce a good effect among the light-coloured kinds. One of the most lovely I noticed is *O. Warneri*, with its white and spotted flowers; there is also a fine specimen of *Reichenbachii*, but it is going off flower—it is a charming and rare species, and produced 100 flowers of a purple-brown colour. The showy *Oncidium macranthum* was also in bloom, and, introduced in this bank of flower, produced a good effect. The bright-coloured *Anthurium Scherzerianum* also had a place in this house. There were many other Orchids in bloom, such as *Cattleya Triana*, &c.

In the East India-house there is another grand display. About forty *Phalenopsis* are in bloom, their charming and graceful spikes overhanging a good collection of *Aerides*, *Saccolabium*, &c.; these have good healthy foliage, and produce a fine effect. Amongst the mauve and white colours of the *Phalenopsis* there are some good varieties of *P. amabilis*, the flowers being of a large size and of perfect shape, well spotted, and the upper part of the lip of a good colour; the flowers of *P. grandiflora* were also well shaped and large, the orange centre of the lip contrasting well with the white. There are some very fine plants of *P. Schilleriana*, of a rich mauve colour; these envelop the white kinds wonderfully. The *Vanda*-house is at this time of the year very gay with bloom. There are some fine varieties of *V. tricolor* and *V. suavis*; I have never seen any bloomed better

than these are. Some think these plants do not flower until they attain a large size; but it is a mistake, because here they commence when quite small, and continue year after year until they are large-sized specimens.

Mr. Warner excels in flowering Orchids. Any class he takes in hand he succeeds well with. In the Cattleya house there are hundreds of sheaths which will make a grand display in their proper season. *B. S. W.*

Home Correspondence.

Eccentricity of Growth.—In an old Spruce Fir which was lately blown down here I have found a remarkable instance of the "eccentricity of growth" commented on by "H. R." in the *Gardeners' Chronicle* of February 27, p. 279. In a section of a branch, an oval 15 x 7 inches, the pith is 1 inch from the upper and 2 1/2 from the lower. The annual rings, which may be easily counted on that side, are about 100. Your correspondent is quite correct, as far as I have observed, as to the growth being greatest on that side of a tree where the branches and foliage are the most abundant. I have had several sections cut off, and shall be glad to give specimens to any public museum where they might be desirable, if the curators will apply to me, either directly or through your paper. *W. C. Trevelyan, Wallington, Northumberland.*

Myosotis disitiflora.—In several of your recent numbers the subject of *Myosotis disitiflora* has been under discussion. One of your writers says "it does not take kindly to pots." Now, as I have had a quantity of it in full bloom in pots for the last three weeks, and some now in seed, perhaps a line or two on my process of cultivation may be acceptable. I take seedlings, not old plants, out of the border in the months of April or May, before the great heat has injured them, and plant them behind a north wall. By October or November they have become spreading plants with every shoot well rooted, these I break off and put in in threes or fours in 6-inch pots, and place anywhere, well exposed to wind, rain, or frost. About Christmas I bring them into a greenhouse, and with little or no heat they bloom freely. Thus grown for market they would doubtless be very profitable. *B. Piffard, Hill House, Hemel Hempstead.*

The True Oxlip (*Primula elatior*, of Jacquin).—In a notice of this very distinct plant at p. 239 you mention a number of points, "without enumerating the botanical characters," in which it differs from the false Oxlip, whether hybrids or not. There is one point, there is, however, an off-hand feature which you have not referred to, with which, as having grown the plant in my garden for the last forty years, I have always been struck, especially at this season of the year. I allude to the "rosette" of young leaves, which it shows through the winter and in early spring. On examining any number of the true Oxlip growing among Primroses, Cowslips, or false Oxlips, it is readily distinguished by the rudimentary leaves, which are at first little more than scales or broad membranous bracts, the true figure of the leaf being scarcely perceptible. The inner rows of leaves show a little more of the true leaf, and as the spring advances the bract character of the leaf diminishes while the leaf proper expands. I have several plants at the present time, but it was more conspicuous a fortnight ago, when the young plants looked more like a *Pinguicula* than a *Primula*, so broad was the leaf-stalk, and so implacable the leaf. This distinctive character disappears altogether as the year advances, and therefore is one not likely to be noted by any but the cultivator. The other distinguishing botanical characters are admirably given by Babington, in his *Manual of British Botany*. I would, however, remark that the numerous seedlings which have come up from time to time in my garden, although they all present the specific characters mentioned by Babington, and also exhibit the leaf-development I have referred to, vary a good deal in the form of the corollas, the subdivisions of which in some are nearly square at the end and linear on the side, and many of the seedlings are, moreover very dwarf in size and feeble in growth. *W. Marshall, Ely, March 7.*

Grapes.—Your correspondent, T. Martin (p. 312), writes for information respecting certain Grapes which he is thinking of grafting on his Frontignans (a very delicate and bad stock). My first acquaintance with Duke of Buccleuch was as a judge at the international show held at Glasgow in the autumn of 1872, and although we had been tasting Grapes for two hours previously, yet this noble Grape pleased me very much, the flavour, to my mind, was perfection, and the appearance was everything to be desired. I did not take long for us to give it the first-class Certificate. Madresfield Court is a good mid-season Grape; with me it does not keep. Waltham Cross I hear good accounts of, but I have not tried it yet. *Venn's*

Black Muscat I know nothing about, but of Mrs. Pince's Black Muscat I do. This truly fine Grape I have stood up for ever since I saw it the first day it was staged in London, when there unfortunately was hardly a member of the Pomological Society present to judge it. A curious fact, Mrs. Pince's keeps better in this locality than Lady Downe's. The Black Muscat Hamburg is quite turned out of the field by Mrs. Pince's, and let those interested in late Grapes not forget Alicante—it is a fine kind. *J. Rust, Bridge Castle, Tunbridge Wells.*

The Wild Daffodil.—A propos of your article on Daffodils you will allow me to draw attention to an interesting circumstance in the history of the common wild Daffodil, namely that, if transplanted to the soil of a garden it becomes double in two or three years, and, conversely, that the common double garden variety if transplanted to a meadow, unless the soil is very rich and strong, soon returns to the wild type of *Narcissus Pseudo-Narcissus*. This may not be generally known, but will probably account for more elegant single flowers not being so more frequently in evidence. The same thing, however, should not be careful not to confuse a smaller species of single dwarf Daffodil, common to gardens, in which the calyx is of the same deep yellow as the corolla, whereas in *N. Pseudo-Narcissus* it is much lighter, in fact nearly white. *C. W. D.*

Rating Nurserymen's Greenhouses.—Seeing in the *Gardeners' Chronicle* several letters on the above subject, and being myself one of the unfortunate victims, I am glad to see that there is some probability of steps being taken to get a settlement of the question, for it is time something was done to resist these unjust assessments of nurserymen's greenhouses, which in certain local parishes they rate in a most excessive manner. In my own case, I really think they must have valued my profits as well as the glass. I have five small span-roofed glass-houses, the average length of 48 feet by 10 feet wide, which last year the parish authorities assessed at £60 and rated them at £40 (the land upon which they stand, with the dwelling-house and sheds, are rated separately). I appealed against the rate, and got it reduced to £27, which I consider most excessive even if they are rateable. There being little or no trade done at home, I have to take my goods to the London markets, a distance of 12 miles. I am glad to see that the case is being taken up by Messrs. Protheroe & Morris, and as soon as a committee is formed I will forward my subscription. *C. Greening, Florist, East Wickham, Kent.*

Eucalyptus amygdalinus.—I fear few of the species of *Eucalyptus* will be found sufficiently hardy to withstand the severity of our winters, except in the southern and more favoured localities. For many years past experiments have been made here with numerous species, not a few of which appeared to thrive for a few years, some of which grew rapidly; but all, with one exception, succumbed when a severe winter set in. I enclose a tube, the name of the species I do not know. [*Eucalyptus amygdalinus*, ERS.] This variety was planted out upwards of twenty years ago, in a shrubbery in a very exposed situation, and now stands 8 or 10 feet above the largest shrubs, uninjured by wind or frost, notwithstanding the late unusually severe winter. *Arch. Fowler, Castle Kennedy.*

Salad for Winter and Spring.—Most gardeners find it an easy matter to produce first-class salad during the summer and autumn months; but when the demand has been large and continuous for three or four months before Christmas, or when a very severe winter occurs, and glass accommodation is scanty, many, I believe, find a difficulty in keeping up a regular supply from this time until spring-sown Lettuce, Radish, &c., come in. Some of your readers may be glad to know that Lettuce sown thickly in pans or boxes (or, where a large quantity is required, in a frame or pit), like Mustard and Cress, and grown in a high temperature, will quickly produce some excellent stuff to cut from. For dressed salad this forced Lettuce is much to be preferred to a hardy Cabbage Lettuce from the open ground at this time of the year, being almost white, and very tender. In France this mode of Lettuce forcing is carried on extensively. I was told that they had a variety over there which forced so well that any possessor in England. My employer got me some seed from France, from which I grew on some plants, and had them planted out, intending to have saved the seed; but they turned out to be nothing but the old Drumhead Cabbage Lettuce, or a variety very similar to it. Seed of any summer variety of Lettuce will answer the purpose well. Where Chervil is in request for salad, this may be forced freely, if scarcity should arise out-of-doors. *Owen Thomas, Drayton Manor Gardens.*

Mistletoe.—It may interest some of your readers to know that in the pretty village of Bishopstoke, midway between Winchester and Southampton, are

three very large Black Italian Poplar trees, growing on a gentleman's lawn by the side of the River Ichen, covered with Mistletoe, and producing during the winter season a weird and singular appearance. On one of the trees I counted more than sixty large bunches, and on each of the other two nearly as many. In the same village a quantity of Mistletoe is growing on a large Medlar tree. In the next village of Swaithling, between Bishopstoke and Southampton, is a group of large Lime trees with quantities of Mistletoe, even to the topmost branches, proving that it is propagated by birds (the Missel Thrush in particular, hence the name—"Turdus viscosivorus") eating the viscid berries, and afterwards rubbing any stray seeds from their beaks, or, as some suppose, by voiding them, which, adhering to the branches, germinate the following summer. In fact, any means taken to fix the seeds of this parasite, either on or in the bark of its favourite trees, will generally prove successful. In my own kitchen garden I have several Apple trees and a standard Peach tree bearing several branches of Mistletoe, from seed I inserted in the bark a few years since. *W. H. Rogers, Southampton.*

are quite common, both amongst Pines and hard woods of all sorts. The heartwood of trees during its formation undergoes such important chemical changes as to constitute it an almost totally different substance from what it was in the condition of sapwood. The perfect or heartwood is scarcely if at all influenced by frost, at least in the Pines and Firs, neither does it sustain injury by being cut when the trees are full of sap, or become discoloured through humidity or high temperature, which latter are among the greatest evils that befall saplings and sapwood generally when cut during the summer season. Ash is more extensively used for tool handles than any other species of tree, possessing the fourfold merit, as the workmen say, of being soft and easy for the hands, elastic, and durable. That Ash-wood may be rendered all the more valuable for the various purposes for which it is applicable it should be cut during the winter season, or at least between the fall of the leaf and the opening of the bud. Ash for tool handle-wood (which implies comparatively young trees) after being cut should be allowed to lie with the bark on six or eight months before sawing up, and when manufactured it should

be doubtful, from old age, of producing a succeeding crop, is after the sap is flowing and the leaves are considerably expanded. On one occasion I had a Thorn hedge cut over in the second week of June, and, contrary to expectation, it made shoots the same season over 3 feet long and matured them equally as well as those on the other hedges which were not cut over.

It is a very general belief that the sapwood of Oak is impaired by cutting the timber when the sap is up, as it is termed. The sapwood, I am inclined to think, is more impaired by taking off the bark, and thereby exposing it to the elements, than by any effects the sap has upon it. If trees are cut in winter the bark adheres to the stem for many years, which, if in the form of a gate or paling-post, it protects and preserves better than paint or any other appliance; but if cut in summer, the cambium is in such an imperfect state as to cause the bark and the wood very soon to separate. *C. Y. Michx.*

Notices of Books.

Synopsis Filicum; or, Synopsis of all Known Ferns. By the late Sir W. J. Hooker and J. G. Baker. Second edition. Hardwicke. London.

The first edition of this work appeared in 1863, and was noticed in the columns of this journal. There is no alteration in the form or arrangement of the contents, and although of the utmost value to all students of pteridology, it is not exactly a gardener's book. In the first place, forms sufficiently distinct for horticultural purposes, and for which gardeners must have names, are not only referred in innumerable instances to the same species, but they are rarely noticed. Thus all the forms of Angiopteris are united under *A. evecta*. But it is not from a horticultural point of view that we may criticise it, as its object is to give an account of all the types of Ferns without going into too much subdivision. Many writers would carry division one step further, making (in many instances), genera of species, and so on; but there can be little doubt which is the better plan for a work of this nature, especially as the work is well done up to the point to which it is carried. Notwithstanding the broad view taken of species in this work, there are about 400 additional ones admitted, and the defective index of the first edition has been remedied. Unfortunately the first edition was stereotyped, and the additional species had to be given in an appendix, except in cases where more complete specimens has led to the reduction of others. This necessitates reference to both parts of the work. The new species belong chiefly to the genera *Asplenium*, *Nephrodium*, and *Polypodium*, as defined in the works of the late Sir W. J. Hooker. There is also a considerable number of new Tree Ferns described in this edition. Only one new genus, *Diplora*, is given. It is closely allied to *Asplenium*, and at present comprises a single species from the Solomon Isles.

We may mention that the complete index to the second edition has been reprinted, and is sold in a separate form. It will be very useful for purpose of exchange as a catalogue of all the species admitted, with some of their more important synonyms and varieties. The authorities for the names are unfortunately not given, so that in cases where the same name—as has often happened in Ferns—has been applied to different plants by different writers, it is not possible to tell without referring to the book which has been retained.

For many reasons beyond the new species it contains, botanists will be glad of the appearance of a second edition of the *Synopsis Filicum*. It is a pity that it does not contain more detailed information.

— The third part of *Dr. Hooker's Flora of British India*, completing the first volume, has just been issued (Reeve & Co.). The orders monographed are Balsaminaceae, Rutaceae, Chailletaceae, Illiciaceae, by Dr. Hooker; Simarubae, Ochnaceae, Burseraceae, by Mr. A. W. Bennett; Meliaceae and Sapindaceae, by Mr. W. P. Hiern; Olacineae, Icacinaceae, by Dr. Masters; Celastrineae, Rhizophoraceae, and Annonaceae, by Prof. Lawson. The magnitude and intricacy of the work may be gleaned from the enormous mass of synonyms to be hunted down and verified. In one case (*Allophylus Cobbe*) half a page of solid type is occupied with synonyms only. No wonder, then, that the index alone occupies forty pages of three columns each. Three years have been occupied with one volume; when, then, are we likely to see the end of this work, condensed and concise in type and matter though it be?

— A new and thoroughly revised edition of *The Cottage's Calendar of Garden Operations*, originally compiled by the late Sir JOSEPH PAXTON, M.P., will shortly be ready.

FIG. 67.—SECTION AND GROUND PLAN OF THE COMTE DE KERCHOVE'S WINTER GARDEN AT GHENT.

Forestry.

THE cutting down of most kinds of wood and timber should now be proceeded with and finished as expeditiously as possible, except Oak, Larch, and Alder, which may be required to stand till the sap rises, or rather liquifies, that they may be flayed or peeled for the sake of the bark for tanning purposes.

With certain descriptions of trees it is of no vital importance at what season of the year they are cut, while with others it is a matter of the first importance. Old and mature trees of whatever species may, without depreciating the value of the timber, be cut at any season, as the duramen or heartwood is in no way influenced either by the sap, which only flows in the vessels of the sapwood, or by the temperature of the atmosphere, which greatly influences the state and condition of the albumen. A tree may be deprived of all its heartwood, as is often seen in old and decayed ones, without suffering in its growth. I have seen trees in excellent health and vigorous growth externally which, on being cut down, showed that only the outer surface or shell was sound, and that not exceeding an inch or so in thickness. Examples of this

be stored in a dry place and excluded from the direct rays of the sun.

The smooth, glossy bark of the Ash indicates its suitability for purposes of strength and elasticity, while the rough, corticated, and fissured bark shows that toughness has given place to brittleness, and that the tree is either matured by age, or unfavourably affected by soil, climate, or other influence. Ash for handle-wood, if properly prepared, is at its best about two years from the time it is cut, after which it gradually loses elasticity, till it ultimately becomes quite brittle and worthless.

While many cogent reasons may be assigned for cutting both timber trees and underwood before the flow of the sap, I take exception to one of those commonly urged—namely, that the growth of the copse is better when the stools are cleared before the sap rises. Examples of this I have repeatedly seen in cutting over old hedges to renew them. When cut over in the winter season, or even in spring, before the buds expand, the shoots not only are few and weak, but the stools in many cases die outright. On the other hand, I have seen hedges and hard-wood trees of all sorts cut when in full leaf, without any injury accruing to the stools or without inducing feebleness of growth in the shoots. The best and safest time for cutting over all such trees, shrubs, hedges, &c., as

HORTICULTURAL EXHIBITIONS, 1875.

MARCH.

- 24.—Glasgow and West of Scotland Horticultural Society, Spring Exhibition, Sec. F. G. Dougall, 167, Canning Street, Glasgow.
- 27 to April 3, inclusive.—Royal Horticultural Society, South Kensington. Mr. William Paul's Special Show of Hyacinths, Tulips, Roses, and other spring flowers.
- 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec. W. Sowerby.

APRIL.

- 4.—Special Exhibition of the Royal Horticultural Society of Antwerp.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.

THE

Gardeners' Chronicle.

SATURDAY, MARCH 13, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 15	Meeting of the Entomological Society at 7 P.M. Royal Huxlett's Nursery, Clapham Rise, S.W., by Frotheroe & Morris. Sale of <i>Rosa Eilium auratum</i> from Japan, at Stevens' Rooms. Manchester Botanical and Horticultural Society's Floral Meeting in the Town Hall.
TUESDAY, Mar. 16	Sale of Poultry and Pigeons, a quantity of Wire Hurdles, Netting, &c., at Stevens' Rooms. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 2 P.M.; General Meeting, at 8 P.M. (Hyacinth Show).
WEDNESDAY, Mar. 17	Sale of Roses, Fruit Trees, Shrubs, Gladioli, &c., at Stevens' Rooms. Meeting of the Linnean Society, at 8 P.M. Sale of the Kirkdale Nursery, Sydenham, by Frotheroe & Morris, at Tottenhams.
THURSDAY, Mar. 18	Sale of Established and Imported Orchids, at Stevens' Rooms.
SATURDAY, Mar. 20	Sale of Rhododendrons, Conifers, Fruit Trees, Roses, Hardy Climbing Plants, &c., at Stevens' Rooms.

THE annual meeting of the ROYAL HORTICULTURAL SOCIETY has come and gone, but the situation remains unchanged, and therefore we can only reiterate our former arguments as to what is or what ought to be done. The legality of the present Council has been admitted by Her Majesty's Commissioners—that is one difficulty removed. The Council has carried its report in the face of a motion for adjournment; it is not so clear that this removes another difficulty from the Society's path, for in truth it either indicates a tendency on the part of the Council to trust to "concerted action" rather than to arrange workable terms with Her Majesty's Commissioners, or leads to the suspicion of another leap in the dark, as in the case of the skating rink.

Assuredly the proposal to let the report stand over until the Council could inform the Fellows what terms Her Majesty's Commissioners would agree to, was most reasonable; but its reluctance to do this, when it is patent to every onlooker that herein lies the salvation of the Society, if it is to be preserved at all, is, as we fear, an evil omen. The holding of the garden is, however, the crucial point. The horticulturists don't want it, except as a meeting ground, so that it is an utter fallacy to suppose they will continue to be taxed, even as they now are, for the mere benefit of the local Fellows. The local Fellows, it seems, won't pay the increased subscriptions which they certainly ought to pay for its maintenance, since it is they who derive the chief benefit from its being kept up. So the bankrupt condition of the Society is to be perpetuated, and the Council will retain its supremacy over—a pile of debts and a heap of ruins.

Thus, as we have said, the situation remains unchanged, and we must hold to our former recommendations. The Society is bankrupt, and apparently will not, perhaps cannot, help itself. Its only hope of surviving the present shock is to make NEW TERMS with the Commissioners. They, we are told, do not want the gardens in their own hands—a consummation of which the local residents profess to be afraid; and they will, so we have been told, make a new and workable bargain with the Society, as a society of horticulturists—not otherwise.

We have told the Council this already. The meeting, both that of February 9 and that of March 9, impressed these facts upon it, although in modifying its report for the latter it paid no heed to the sentiments so freely expressed on the negotiation question at the former of these meetings. We repeat the same advice and warning now, and we shall again and again reiterate it—"Go to the Commissioners, make the best terms that can be made with them in the interests of horticulture; we do not refuse to help maintain the gardens as a fashionable resort, but we do refuse to sacrifice horticulture to fashion. Go! and go at once, before the opportunity is lost." No other scheme can possibly remove the millstone from about the Society's neck. No amount of increased subscriptions which can be expected to be forthcoming can do more than stave off the final crash. No other course will prevent the rapid exodus of horticulturists from a horticultural society in which Horticulture itself is made a secondary consideration, and horticulturists the tools of a more united and powerful body.

Of the goodwill of Her Majesty's Commissioners we have never entertained any serious doubt, and none can possibly remain after the authorised assurances of their representatives. If, therefore, our own Council will not take the obvious steps to save the Royal Horticultural Society as a horticultural society, that is to say, primarily and before all things for the advancement of horticulture, LET IT GO. Her Majesty's Commissioners, with the son of the good Prince who planned the present scheme, and intended, had he been spared, to have made it work well, at their head, can scarcely, in the public interest, suffer the grand conception to fail; and they would doubtless cause to rise up on the ruins of the old a new Royal Horticultural Society, purified from the dross which clogs the progress of that which seems rushing onwards to its fate.

—We are requested to state that in consequence of the representations made by several of their regular exhibitors (particularly of florist's flowers), the Council of the ROYAL HORTICULTURAL SOCIETY have determined to bold all the exhibitions as originally advertised in the schedule for 1875; but that to carry out the reduction of expenditure suggested in their advertisement in the gardening papers of February 18 and 20 last—by striking off the list the exhibitions of March 17, April 21, September 1, and November 10—50 per cent. of all the several prizes offered in the schedule must be deducted, leaving the values of the "medals" as they were.

—To-morrow is the Sunday generally known in the North of England as CARLING SUNDAY. Carlings are small grey peas, which, having been steeped in water the night previous, are fried in butter upon Passion Sunday, and eaten usually at the evening meal. This custom has prevailed for a very long period, and is still in vogue at the present day. The day is also known as Care, Carle, or Carcing Sunday, and the custom prevails in Lancashire as well as in the more northern counties, and extends into Scotland. In Yorkshire it is the practice to spend on this day at the public-houses what is called the carling-groat, that sum being laid out in drink; the carlings are provided by the landlord, and the partaking of them is supposed to ensure luck for the ensuing year. At Newark a fair was formerly held on the Friday before this day, which was called Carcing Fair; and the couplet—

"Care Sunday, care away,
Palm Sunday, and Easter Day,"

is still in use in Nottinghamshire. It is difficult to ascertain the origin of this custom. Dried peas seem to have been commonly used as food during Lent in pre-Reformation times; thus the Lady CLARE, a grand-daughter of EDWARD I., bequeathed, in 1355, 61 qr. of Beans, Peas, and Vetches, for the season of Lent; and PALSGRAVE speaks of parching peas "as folks use in Lent." Possibly, as the more solemn ceremonies of the Lenten season commenced on Passion Sunday, the use of Peas on that day was intended to indicate the necessity of more severe mortification. A correspondent of the *Gentleman's Magazine* for 1786 quotes "an old author" as having said that the custom took its rise "from the disciples plucking the ears of corn and rubbing them in their hands"; but its origin may probably be traced to Pagan times. HONE

incidentally alludes to the custom when giving an account of a robbery by two footpads in 1785; he says that Carling Sunday is "so called because it is the custom of the lower orders in the North of England to eat immense quantities of small peas, called carlings, fried in butter, pepper, and salt, on the second Sunday before Easter."

—The first exhibition of the season of the COVENTRY AND WARWICKSHIRE FLORAL AND HORTICULTURAL SOCIETY will be held on May 31.

—The flowering of bulbs in glasses is now so common as to excite no remark, but it was not until 1720 that this method of WINDOW GARDENING was discovered. A Swede named TRIEWALD made the discovery, which he at once communicated to the Royal Society; and the following year experiments of this method were tried by PHILIP MILLER, at the Chelsea Botanic Garden, upon "a Hyacinth, commonly known by the name of Pulchra, Tulips, Narcissus, &c. The result of these experiments will be found in the *Philosophical Transactions* for 1731-2, where the glasses originally employed by TRIEWALD are figured. They differ very little from the Hyacinth glasses at present in use, but are somewhat broader at the base.

—An instance of the CLOSING OF FLOWERS, which is of importance in connection with "bedding-out" (see p. 310), may be found in the beautiful, if occasionally troublesome, *Oxalis corniculata rubra* (or *O. tetralobata*, as it is also called). Some three or four years since the beds on the slope below the Round Tower at Windsor were thickly bordered with this plant. The effect at mid-day, when the bronzed-coloured foliage was relieved by hundreds of little golden stars, was beautiful in the extreme; and the different appearance presented by the border later in the day, when the blossoms had closed, was very remarkable. In addition to the Orchids cited as possessing their fragrance only at certain times of the day, may be mentioned *Epilobium vulgare*, which M. ANDRÉ says has an odour of Carnations in the morning, but is scentless at night; *Cattleya chocoensis*, *C. quadricolor*, various *Lycaetes*, *Lelia anceps*, *Maxillaria nigrescens*, and several *Odontoglossa*, all of which are fragrant only in the morning; while *Cattleya Eldorado*, *Odontoglossum cristatum*, *Schomburgkia gloriosa*, and others, are fragrant only in the evening.

—The DUNDEE HORTICULTURAL SOCIETY's grand floral fête will be held in the High School Grounds, Eucly, Crescent, Dundee, on August 26, 27, and 28.

—In connection with the very interesting paper upon the CARNIVOROUS HABITS OF UTRICULARIA CLANDESTINA, which we printed in our last issue, it may be well to note that the insect-trapping peculiarity of the bladders of our common *U. vulgaris* has been already recorded. Mr. ROBERT HOLLAND, in the *Quarterly Magazine of the High Wycombe Natural History Society* for July, 1868, has the following observations upon this point:—"It is probable that the bladders also have another and a very different duty to perform, not less important, perhaps, than that of floating the plant in the water, namely, the capturing of insects which are destined for the plants to feed upon. Certain it is that very small insects are often found imprisoned in the bladders—the opening allowing them to enter, but, from its construction, preventing their escape. The Utricularia, it has been seen, cannot obtain mineral matter from the soil, having no roots; nor gaseous food from the air, having no stomata; and the animal food thus obtained may supply certain elements which it could not derive from the water; and the Utricularia may be added to the list of the highly interesting carnivorous plants."

—In the *Revue de l'Horticulture Edge M. BUCHETET* gives a TEST for ascertaining the QUALITY OF A PEAR. If, says he, you can write on it easily with pen and ink, it is a good Pear. Other Pears, whose rind does not take the ink so well, are inferior in flavour. We presume that as there are no rules without exceptions, so some may be found here. Some of our correspondents who are in the habit of writing the names of the Pears on them, will, perhaps, give us their experience.

—A correspondent brought under our notice the other day an exceedingly beautiful spike of MILTONIA WARSCEWICZII, which had been grown in the garden of G. COPELAND COPPER, Esq., Leyton. It was 6 inches long, and 5 inches broad at the base of the triangle; had three branches with four flowers on each, one branch with three flowers, and five single flowers, making in all twenty fully expanded blossoms. The lip measured about three-quarters of an inch square, one-third being pure white, and the remainder of a brownish plum colour, the sepals and petals being yellow, with the coloured lines. The plant is quite a modern introduction, and is known in gardens under the names of *Oncidium Weltoni*,

FIG. 68.—VIEW IN THE INTERIOR OF THE COMTE. DE KERCHOVE'S WINTER GARDEN AT GHENT,

Odontoglossum Weltoni, and *Oncidium fuscatum*. It was described in our volume for 1869, pp. 277, 1067, and figured in 1871, p. 1258; and there is a good figure in the *Botanical Magazine*, t. 5843.

— We have just received a communication, dated Hong Kong, December 31, 1874, from Mr. MOSELEY, the naturalist on board the *Challenger*, which, though containing nothing absolutely new, may be interesting to many of our readers. When at a Chinese dinner at Hong Kong he found on his plate three very questionable looking bodies, but which were evidently some *Spheria*, growing on a caterpillar. It is, in fact, *Cordiceps sinensis*, Berk., now referred by TULASNE to his genus *Torribia*, of which there is a figure in LINDLEY'S *Vegetable Kingdom*, p. 39. He does not say of what particular meat it was the commodity, but it is a well-known fact that it is often served as an invigorating drug in the form of a stuffing to a duck. It is also considered good for consumption. Little bundles of it are sold in the shops, at a high price, one of which accompanies this communication. It comes from the northern provinces, and bears the name of Jung-tung-tso, or the winter worm-grass, and is imported from Shanghai. It is probably called the winter grass because the caterpillar buries itself in the autumn. The Chinese know that it is a plant growing out of a worm like a silkworm, as one of Mr. MOSELEY'S notes explained the matter, who said that it was considered a very powerful medicine; and we, therefore, recommend the subject to the homeopaths. The Chinese also use a larger species, of which we have not seen specimens, but not impossibly it is the *Torribia Robertsii*, Berk., which is so common in New Zealand. *M. F. B.* [The fungus in question was shown at the last meeting of the Scientific Committee by Mr. Berkeley, and a woodcut illustration of it was given in our report (p. 314). EDS.]

— We understand that the Royal Botanic Gardens at the Cape of Good Hope are to be embellished with a new conservatory, of the present being constructed by Messrs. JAMES BOYD & SONS, at their works in Macdowall Street, Paisley. In shape the conservatory is cruciform, and consists of a centre house, 40 feet long 24 feet wide, and 26 feet high; with wings on either side of it, 33 feet in length, 20 feet wide, and 18 feet high. The conservatory is built entirely of Teak wood, which will stand the climate much better than any other wood, and the roof is a span, formed of curved astragals, which are made of malleable iron. Particular care has been paid to prevent ventilation, which has been secured by an ornamental lantern light along the roof of each house, while the sashes on each side are hung on pivots, and each set of sashes can be opened at one time by means of Messrs. BOYD'S improved gearing.

— The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, March 15, when the paper by Mr. E. RYDE, entitled "The Rating of Country Mansions," will be discussed, after which (should time permit) the adjourned Discussion on the Home Secretary's Bill for Facilitating the Improvement of the Dwellings of the Working Classes in Large Towns will be resumed.

— A cause which has much good in it, even though it is not all good, may be seriously injured by injudicious advocates. Most of us would advocate the increased CULTURE and use as food of VEGETABLES and FRUIT in this country. Most of us would agree that the quantity of animal food consumed by individuals in this country is greater than it need be, still few of us would be inclined to assert that the partaking of animal food was such a mistake as the ultra vegetarians do. "More light" is undoubtedly wanted in this matter, but it is clear we must not look to "Sister L." for it. This lady says, in the *Dietetic Reformer* for March, that a good time is coming, or will come, "when the Cow-tree, HUMBOLDT'S *Palo de vaca*, shall grow wild in England, and vegetable cream and butter be fresh gathered every morning." The Cow-tree is scientifically known as *Brosimum* (and sometimes as *Eleusine*), the Bread-tree generally (*Artocarpus*), inhabiting Venezuela. We fear we shall have to wait a very long while ere "Sister L.'s" hopes are realised; meanwhile will "Sister L." stir up the bakers and get them to give us good wholesome bread in variety, which shall not weary us by its unpalatableness, and choke up our *faucis* in the attempt to swallow it?

— The DUNDEE HORTICULTURAL SOCIETY has decided upon holding an International Exhibition of pot plants, cut flowers, fruits, roots, and vegetables, in August, 1876.

— Mr. Sergeant COX, in a recently published tract,* endeavours to show that many of the difficulties connected with the subject of INHERITANCE by the

offspring of the qualities of one or both of its parents, may be removed by supposing the original germ to be in itself of duplex nature. In a plant, for instance, the embryo would result, not from some unexplained action consequent on the contact of the pollen tube with the embryo sac or the germinal vesicle within it; not, as SCHLEIDEN supposed, from the pollen itself—the embryo sac merely providing, as it were, a cradle for it; not from either of these, but from the junction of two germs, one contributed by each parent. Among the *Algae* some such fusion is evident in the process of conjugation, where the contents of two originally separate cells become blended into one mass. The same thing happens in the case of the zygosporas of some fungi, though in others, as in *Pteronospora*, contact not fusion seems, as far as we know at present, to be the course followed in the development of the spore. The fertilisation of the ova of the *Amphibia*, as originally observed by Mr. NEWPORT, is another case in point. At any rate there are some grounds for supposing that what Mr. Sergeant COX puts forth as a "mere suggestion" may prove to be a fact of general occurrence. If so, then it is easy to see how certain phenomena, such as the bi-lateral symmetry of the organism (though this may perhaps be explained without any such assumption), the duality of the mind, and the inheritance by the child of the mental and bodily characteristics of both parents, may be explained. Hybridism and "sporting," or bud-variation, both receive much illustration from this notion. A "sport" is undoubtedly very often merely the result of the separation of the characters possessed by the parents of more remote ancestors, and heretofore blended in the seedling. NAUDIN showed how the same dissociation of characters might occur in crossed or hybridised seedlings. Seedling or bud must each contain dual elements. The blending may be more recent and more direct in the case of the seedling than in the bud, but it must exist in both nevertheless. Although the theory propounded by Mr. COX requires, of course, further evidence in its support, it is, however, very plausible, and would serve to account for many phenomena not readily explained at present save by DARWIN'S hypothesis of Pangenesis, which deals too largely in assumptions to maintain itself in the future without modification. Mr. COX'S theory, indeed, so plausible that we shall not be surprised to find that others have hit upon the same explanation previously—an impression which we have not at the moment the opportunity of verifying.

— An exhibition of plants and flowers will be held in the Kibble Conservatory and ROYAL BOTANIC GARDENS, GLASGOW, on May 7 and 8, when upwards of £150 will be offered in prizes, including four handsome silver cups, offered for competition by Mr. WILLIAM BULL.

— The approaching sale of the GARSTON VINERIES near Liverpool, by Messrs. PROTHROE & MORRIS is an event of sufficient magnitude to justify us in calling special attention to it. Horticulturists familiar with the triumphs won by Mr. MEREDITH will regret the disintegration of so extensive and complete an establishment, and it is to be hoped that some one may be found with spirit and means enough to carry on what was really creditable to the nation.

— Mr. R. S. DUNBAR, of the Thames Bank Iron Company, wishes us to state that he is in no way connected with Messrs. DUNBAR & Co., of 91, London Wall, E. C.

— Under the title *Sieboldia*, a weekly horticultural journal has been established at Leyden, under the editorship of M. WITTE. We learn also from the *Belgique Horticole* that a committee has been established in Vienna to erect a monument to PHILIP VAN SIEBOLD, who introduced so many fine plants from Japan. Professors FENZL and REICHBART, M. SCHRINHOFFER, Secretary of the Horticultural Society; and MM. ABEL and HOOIBREK, constitute the committee.

— The new edition of GORDON'S PINETUM has just been issued (BOHN). We shall take an early opportunity of examining its contents and reporting thereon.

PESCATOREA DAYANA CANDIDULA.

This interesting and distinct variety of *Pescatorea Dayana* (fig. 69), which was introduced both by Messrs. Veitch & Sons and Mr. Bull from New Grenada, was described by Professor Reichenbach at p. 756 of our first volume for 1874. The plant appears to afford considerable variety, four different kinds being mentioned by Reichenbach in the paragraph referred to. In the present instance the sepals and petals are of a pure white, while the lip is tinted with purplish crimson. The typical form has green tips to the sepals; the var. *rhodarea* has the sepals and petals

tipped with purplish rose, while the var. *splendens* has the tips of these organs of a deep violet. Hence it will appear that the variety now under notice is more especially distinguished by the absence of the coloration at the tips of the sepals and petals, which are uniformly white. T. M.

Reports of Societies.

Royal Horticultural: March 9.—The adjourned annual general meeting was held in the Council-room, South Kensington, the President (Viscount Bury) in the chair.

Mr. W. A. LINDSAY, the Secretary, read from the *Times* the advertisement convening the meeting.

Distributed through the Council-room were copies of the following amended

REPORT OF THE COUNCIL TO THE ADJOURNED ANNUAL GENERAL MEETING.

1. The Council are happy to inform the Fellows of the Royal Horticultural Society that, since issuing their report to the Society, the position of affairs has materially changed.

The speech made on behalf of Her Majesty's Commissioners at the meeting of February 9 was so friendly in character, and conveyed assurances so satisfactory to the Society, that the Council feel it incumbent upon them to omit from their report any passages which might present even the appearance of disunion between themselves and the Royal Commissioners.

2. The Council have great pleasure in again commenting upon the magnificent displays of fruits, flowers, foliage and other plants at the Society's exhibitions during the year 1874, and especially at the concluding exhibition of the season, when the collections of fruit and Chrysanthemums surpassed almost all similar collections of former years.

The amendments introduced into the schedule, together with the reduction in the number of the exhibitions, have all contributed to this gratifying result.

4. The more purely scientific work of the Society has been ably performed, and the meetings of the Fruit and Floral Committee have been attended.

To encourage still further the discussion of horticultural subjects, the Council have established, as an experiment, evening meetings, which those Fellows who are interested in horticulture are specially invited to attend. The programme of these evening meetings, as usual, the subject of a supplementary report.

5. In the course of last summer the Council received a very advantageous offer from Messrs. Prince, for the privilege of constructing a skating rink in the Society's gardens.

6. Messrs. Prince proposed to pay, by way of rent, a sum equal on an average to £1100 a year, to erect the rink and necessary approaches entirely at their own expense, and to conform to such conditions and regulations as might be approved by the Council. The Council considered it their duty to accept this offer, believing that it would be agreeable both to Her Majesty's Commissioners and to the Society. The monies accruing from this source would assist the Society to meet punctually their engagements towards their landlords, but with their debenture holders and other creditors, and by relieving the Society from the pressure of pecuniary embarrassment, would enable them to devote more time, attention, and funds to the improvement of horticulture in all its branches.

The rink might thus be said to come within the terms of our lease, by contributing materially, though indirectly, to the interests of horticulture.

7. Her Majesty's Commissioners, however, did not consider it expedient to become parties to this arrangement; and as, under the charter of the Society, Her Majesty's Commissioners have the power to prohibit any proceeding of the Society which is not directly of a horticultural nature, and the Society have, moreover, no power to assign, underlet, or part with the premises demised to them, without the consent in writing of Her Majesty's Commissioners first obtained, the Council felt it right to proceed no further with the arrangement with Messrs. Prince, although no direct prohibition had been sent to them by Her Majesty's Commissioners.

The Council have to express their thanks, based upon friendly communications recently made to them by Her Majesty's Commissioners, that all difficulties in the way of a satisfactory understanding between Her Majesty's Commissioners and the Society may soon be removed.

The Council have now to call the earnest attention of the Fellows to the financial position of the Society.

During the past year it has been impossible to make any great impression upon the amount of the debts due by the Society, referred to in the last report. The Council are, however, happy to inform the Fellows that they have succeeded in compromising for a cash payment of £600 a debt due to the executors of Sir Trayton Drake of £1000 (with interest since 1864), which was advanced by the Society prior to 1860, and which, until the accession to office of the present Council, had been ignored in the published accounts of the Society, and they have also settled a claim of Mr. Cooper's amounting to £105 for work done in the year 1862.

It has become evident to the Council, and indeed, must be apparent to the Fellows, that the ordinary revenue of the Society cannot support its present expenditure; and to prevent any increase of the Society's liabilities during the year 1875, the Council have been compelled to make several, in their opinion, most undesirable reductions in the ordinary expenses.

The attention of the Fellows is specially called to the

* *Heredity and Hybridism*. By E. W. Cox, S.L. Longmans.

fact that unless the rent of £2400 is paid to Her Majesty's Commissioners next year, the lease of the South Kensington Gardens may be forfeited, and to prevent this contingency an increased revenue must be obtained.

This increased revenue the Council suggest may be obtained by concerted action on the part of the Fellows, whether resident in the neighbourhood or not, and by increasing the number of Fellows. The Council are prepared to invite a general meeting of the Fellows to discuss this question in detail. A definite scheme will then be submitted for consideration.

In conclusion, the Council beg to express their unanimous opinion that it is the bounden duty of the Society to do its utmost to retain the gardens in its possession as "a suitable area in which they may exhibit and display the progress of horticulture," and also to enable them to fulfil the Society's obligations to their life Fellows and their debenture holders; and in such a course the Council feel sure they will have the hearty and cordial co-operation of every Fellow of the Society.

The noble CHAIRMAN rose, and, addressing the Fellows, said:—Gentlemen, it now devolves upon me to submit to you the report of the Council. No doubt you will recollect the circumstances under which the former report was withdrawn. The Council and the Society generally had been long desirous of coming into amicable and friendly relations with Her Majesty's

Horticultural Society. This fact I will place beyond any doubt before I proceed farther. We have received a despatch from Her Majesty's Commissioners, dated only yesterday, March 8, and which is in the following terms:—

"I am directed by Her Majesty's Commissioners of the meeting on February 9 had on the legal position of the present governing body of the Society, and that they have been advised there has been sufficient acceptance of the resignation of members of Council which took place in April, 1873, and a sufficient confirmation of the election of the existing members of Council to render the *status* of the Council free from objection. Under these circumstances I am to inform you that the Commissioners will have pleasure in resuming official relations with the Council of the Society."

Now, gentlemen, I doubt not that that despatch will be as satisfactory to you as it has been to the Council. We are now in the position we have so long desired to be in, *viz.*, in immediate relations with Her Majesty's Commissioners, and it has

form. I distinctly say I should oppose any action on the part of the local Fellows which I thought injurious to the well-being of the Society, and I should equally, if necessary, oppose any action by that section called horticultural, if I thought it would be injurious to the Society; and in acting in this way I should be loyal to both parties, because I should be loyal to the Society to which both belong. Under these circumstances I have been exceedingly sorry to hear it was the intention of the purely horticultural section of this Society to oppose the adoption of our report to-day. I trust that opposition is only the opposition of a very few members of the Society. You must remember that in your Council at the present moment there is an actual majority of what are called horticultural Fellows. I am sorry there should be that distinction between horticultural and local Fellows, for I believe it is injurious to the best interests of the Society; and unless you can get out of this distinction your Society will go altogether to the wall. I can assure you that at the Council board upstairs the division is not felt, and that in our discussions and deliberations the interests of the Society have been invariably brought to the front. We are not at that board regulated merely by a number of votes as divided between horticultural and local

FIG. 69.—PESCATOREA DAYANA VAR. CANDIDULA.

Commissioners. Well, gentlemen, a gleam of light dawned upon us not very long ago, and at the time I speak of the report of the Council had been communicated to the Fellows.

It was found that certain passages in the report stood between us and the consummation of our wishes, and that the Commissioners felt somewhat annoyed at the terms in which they were mentioned in the report. We felt that, as your representatives, nothing ought to stand between us and the fulfilment of our wishes, and, I may say, the fulfilment of our own wishes, to enter into relations of the most cordial amity with the Commissioners.

We had not, gentlemen, intended any disrespect to Her Majesty's Commissioners, and the Council merely intended to state in their report certain facts that they were in possession of. They felt, however, that it was perfectly essential that even the appearance of disunion should be avoided by them, and hence they consented most cheerfully to take back the report which they had placed before the Fellows. The result of that has been the drawing up of an amended report, which is now lying on the table for your consideration. We hope that the circumstances which have since occurred are such as will fully justify the course we have adopted. I may tell you, gentlemen, that we have several satisfactory announcements to make on the present occasion; one of these is the complete restoration of good offices and good understanding between Her Majesty's Commissioners and the Royal

smoothed the way for an amicable and equitable discussion of the basis on which the affairs of this Society are to be administered. And we think, with these amicable relations existing between us and the Commissioners, nothing need stand between us and financial success, and the success of the Society in a horticultural point of view.

Passing from that, I shall touch upon the position of the Society with regard to horticulture; and here, perhaps, you may allow me to say a preliminary word with respect to my own position in that regard. I know it has been thought and expressed in some of the horticultural journals that I am one of those outside Fellows—indeed I believe they are called local Fellows—who are not altogether acceptable to horticulturists, pure and simple. Well, gentlemen, I beg to say for myself that I am the President of the Horticultural Society; and as such I am neither a local Fellow nor a horticultural Fellow, and I may say that in all the meetings I have attended I have never tried to further the interests of the local Fellows over the horticultural Fellows, one above the other. I have considered it my duty, placed by your favour in the position of chief of this Society, to maintain an entirely neutral position, and I trust all those who sit around me will support me when I say that such a position I have always assumed. Therefore, gentlemen, I request you to take an honest expression of my opinion, as independent an opinion as it is possible for me to

Fellows, but by the independent opinion of members given for the best interests of the Society. When such is the case in the Council you have called upon to represent you, such should certainly be the case outside these walls; and I think if the Society will reflect upon the position in which we now stand they will find that all horticultural Fellows and local Fellows are equally willing to support the Council on this occasion.

It is true that we have been in, I may say, a state of great financial embarrassment—we are still in great financial embarrassment; but our ultimate escape from it is not to be obtained by throwing up the game in despair, but by putting our shoulders to the wheel and working together. We see now that we are in amity with Her Majesty's Commissioners, an opportunity of landing you in smooth water; and this is not the time, surely, to propose to surrender the gardens, held under an agreement, into the hands of Her Majesty's Commissioners. I think we may fairly say that such a suggestion is un-English and cowardly. I will further say that, through personal communication with Her Majesty's Commissioners, I am satisfied they are not desirous of possessing these gardens; and I go still further and say, they would feel a certain embarrassment in the possession of these gardens, of which we, as being partners with and well-wishers of the Society, should relieve them. Therefore it is that I think if any horticultural Fellow proposes to throw the report upon our

hands, which has been so carefully remodelled, he will commit a mistake in the interests of the Society.

It has been said that the present Council have not sufficiently devoted themselves to the interests of horticulture pure and simple, and one objection raised is, that the schedule proposed for 1875 has not been adhered to, as four shows have been withdrawn. Now, when the matter was brought before the Council the question was gone into on its merits, and we found that our funds did not admit of paying the large sum which was set down for prizes, and we were therefore bound to make a reduction in that respect. What we proposed to do was, to withdraw four of the shows advertised; and when we were told that it would not be acceptable to the horticultural interest generally we appointed a committee, and gave them instructions to investigate the whole matter, in order to see if they could retain all the shows advertised in the original schedule. The report of this committee has been presented to us, and I have the satisfaction to tell you that all the shows advertised to be held in 1875 will now be held. But of course, as we have not money to pay all the prizes to the full extent, we must diminish the amount of prizes. We have taken the opinion of many of the smaller exhibitors, who have not been shut out from the exhibitions by the non-holding of these four shows, and also the opinion of the larger exhibitors, who are very much concerned in the matter. The latter have very handsomely said they would exhibit, whatever the amount of prizes was, and as I hope the primary object of our horticultural exhibitions is not simply the money value of the prizes, but the distinction gained by those who win the prizes—I hope to say, that will be taken as evidence of the strong desire of the part of the Council to meet the views of the horticultural members of the Society as far as it is consistent with their funds to do.

There is one point, gentlemen, which at one time I thought must have produced some discussion at this meeting, and that is, that since the commencement of the meeting in February, of which this is an adjournment, two of the members of our Council have found it necessary to withdraw from our Council board. The gentlemen so resigning were members who had already taken a most active part in our Society, and who brought to bear upon their work the exceedingly valuable qualities of industry and ability. The Council regret their absence, and I am sure the Society will also regret their absence, because they were very strong props of the Horticultural Society. It was thought at one time that their vacancies would come before this meeting to be filled up. It was as well therefore, for the Council to be clearly aware of what their legal position was in the matter before they met the Fellows at this meeting. The Council have obtained the joint opinion of two learned Queen's Counsel—Mr. Cole and Mr. Lindley—the names of gentlemen which will command the assent of all, because we all know their high legal standing, and their solid and intimate acquaintance with the affairs of the Society. We are informed by these gentlemen that under the bye-law, all vacancies which is not impugned, the resignations of Sir Alfred Slade and Mr. Chetwynd must be filled up by the Council, and not by the Fellows generally. The resignations, therefore, will come in the ordinary course before the Council, and will not be submitted to the Fellows of the Society.

I think, gentlemen, I have now touched upon the principal items which it is my duty to notice. I am glad to say that our relations with Her Majesty's Commissioners are now of a perfectly amicable character, and that if any body of men can thoroughly carry out to their desired consummation the affairs of the society, the Council which have now the honour of addressing you have as good a chance as anybody else. There is one point which it is perhaps advisable for me for a moment to advert to, because I have heard that upon it some of the Fellows found an objection to our report. It is the last two clauses of the report, in which we give the bye-law, and the revenue obtained. Now, gentlemen, I have heard it said that there is a wish on the part of some Fellows to send back the report to us—in other words to again adjourn the meeting until we can tell them exactly what our proposal is. Now I say distinctly that that clause was worded in that way deliberately and advisedly. The first object before us at the meeting of Feb. 9, of which this is an adjournment, and the only object of which this is an adjournment before us, was to obtain such a recognition from Her Majesty's Commissioners as would enable us to enter into friendly and equal relations with them. We heard from them from time to time that when we made ourselves a legal Council they would—and I enter not now into the question whether we were a legal Council or not—but prepared to treat with us on an equal basis. We do not need you the despatch of the Commissioners that the action taken on the 9th of February has made us a legal Council, and that they are prepared to deal with us upon an equal basis. The one objection, therefore, which we had to discuss at the last meeting of the Society has been fulfilled, as far as the Council are con-

cerned. We felt, gentlemen, that we were bound not to divert the attention of the Fellows from the one main object which will be attained as soon as the report is adopted, by trailing a red herring across your path. Of course, in human affairs you cannot find a large body of men to be of one mind without discussion. If we had submitted any proposals to you in the report, the chances are, your attention would be diverted to the details of those proposals—that you would have had discussion on them, instead of pursuing the main object for which we have met. When you have passed this report, gentlemen, you will be in smooth water, as far as the Commissioners are concerned. Without doing that you cannot be in smooth water, and you will be going headlong to ruin. Pass this report, which commends you to nothing, and you are properly drawn, so that you could vote for the main object we have in view, viz., to land this Society, as regards the Royal Commissioners, in a position of legality, which it has not heretofore assumed. I hope, gentlemen, I have made this point clear to you, and I conclude by placing before you, for your consideration, the report upon the table.

Dr. MASTERS: Will you kindly say by whom the letter of the Commissioners is signed?

THE CHAIRMAN: By "Henry Scott, Major-General." Is there any objection in the body of the hall to the adoption of the report?

Mr. DOLMAN observing that Her Majesty's Commissioners were not disinclined to come to terms, or to a satisfactory understanding, said he should like to know in what particular way that was about to be arrived at.

THE CHAIRMAN: It would be premature for us to express any opinion on that point. There are members of the Royal Commission here present who can speak on that point if it is thought advisable to do so. As we shall not meet the Commissioners until the report is adopted, I am not in a position to answer the question.

Mr. ANDREW MURRAY: Why should you not meet the Commissioners before the report is adopted?

THE CHAIRMAN: This meeting is incomplete until the adoption of the report. We are not now in the position of absolute legality which we shall be in when the report is adopted.

Mr. MURRAY: I thought the report was received.

THE CHAIRMAN: The meeting is not yet over, and the report has not been yet adopted.

Mr. DOLMAN: What about the skating rink? Has it been assented to by the Commissioners?

THE CHAIRMAN: We have only had a private correspondence on the subject.

A FELLOW: We ought to have some definite assurance whether the proposition as to the skating rink is to be carried out or not.

THE CHAIRMAN: We have no definite assurance to give you on that point.

Mr. GUEDELLA had no wish to throw the apple of discord into the meeting, but wished to express his opinion that there had been an extraordinary change of opinion amongst all parties to the transactions. In the first place, the opinion of the Commissioners appeared to have changed very much after they got the opinion of counsel, which they could have obtained long ago. Then, what change was it that had come over the gentlemen sitting at the board? With the exception of two gentlemen, who had manfully stuck to principles, and sent in their resignations, the Board had adopted a peaceable line of action; and he should like to know some of the circumstances which induced these gentlemen to come down at the eleventh hour with a change of policy. Then came the question whether the members of the Council were the gentlemen who could conclude the best arrangement with Her Majesty's Commissioners—whether they were the proper people to carry out the arrangements for the benefit of the Society. He certainly thought the present Council should have exercised more care since they came into office. There was one of the finest conservatories in the world on their premises, and if they had a hall in it they could have made £2,500 by it. He thought the skating rink was one of the most advantageous speculations that could be made. His object was to rouse the Council from their state of inaction. He regretted the resignation of the two members of the Council, and should like to know what were the reasons for them—whether it was firm adherence to policy and principle that prevented them remaining in the Council?

The Rev. C. P. PEACH said he had been asked to propose the following resolution, or amendment:—"That the Chairman be requested further to adjourn the annual general meeting so that the Council may be able to present to the adjourned meeting, with their report, any scheme they may be able to enter into with Her Majesty's Commissioners." The Chairman went on to say it was quite necessary the meeting should be adjourned in order to see what agreement could be entered into between the Council and Her Majesty's Commissioners. The Chairman had said that the legality of the Council was admitted by the Commissioners, and immediately afterwards had tried to force the Fellows to accept the re-

port by saying that unless they did so the legality of the Council would not be obtained. He could not see how the legality of the Council could be recognised by Her Majesty's Commissioners when an attempt was thus made to force the Fellows to accept the report. There was another question which had not been brought before them, and that was the question of the provincial shows. Nothing in the report showed there was any attempt being made to get up provincial shows in the interest of horticulture. Their President said he was neither a local nor a horticultural Fellow. This was a horticultural Society, and surely horticulture ought to be considered first by the Society in all its hearings. He appealed to all horticulturists present whether it would not be of advantage to adjourn the meeting, in order to come to some definite arrangement, and see where they stood. At present they were, financially speaking, in a condition bordering on bankruptcy. He did not want to reject the report in any way, but he wished the meeting to be adjourned to see what arrangement could be come to.

Mr. LIGGINS remarked that the report had not been considered.

THE CHAIRMAN: No, and for this reason—our bye-laws say that after the report has been read, the consideration of other business may be proceeded with. A legal question arises whether it means the proposal of the report for adoption. Technically it does not. Practically, we hold to our report, and any amendment carried against it we should consider as a vote of want of confidence.

Mr. LIGGINS: Precisely so.

THE CHAIRMAN: We are bound by our bye-laws, so that I move that the report be considered.

Mr. QUILLER would second the amendment, which he considered a most reasonable one. When he saw the onslaught that had been made two years ago on the then existing Council, so much so as to cause them to resign. (Mr. LIGGINS: "They were turned out.") Well, he believed they would have helped the Society out of its difficulties. After having refused all reasonable propositions from Her Majesty's Commissioners, the Council had done nothing from that day forwards but to insist upon their views, and to horticulture instead of what would encourage it. The statements of the Council would prove it. First of all they gave up the provincial shows, which produced a good annual income; and next they curtailed the privileges of the members. The shows were also curtailed, and the result of all this was that the Society's funds were far worse now than they were then; indeed, the funds were something like £4500 worse now than they were two years ago. Under these circumstances, before they passed the report they ought to have something like a scheme before them to show them the way out of the difficulties in which they were placed. The Chairman told them that if they passed the report they would be landed in smooth water, but he could not speak with any certainty, and so they might be in worse water than they were in now. The exhibitors had not been paid last year's prizes, which ought to have been paid out of last year's revenue. He supposed the Council had been waiting to receive as much of the Fellows' money as they could before doing so. At the last meeting they heard in that room that the Commissioners were willing to meet the Fellows on fair terms, and certainly the Fellows had a right to know what those terms were to be. If the meeting did not insist upon the information, and passed the report, they would leave the matter in the hands of the same gentlemen who had landed the Society in its present position. The proposition he made was not an unreasonable one; it would not stultify the Council in any way, but, on the contrary, strengthen their hands. There was amongst the Fellows a vast difference of opinion as to whether it was advantageous to the Society to keep these gardens in their possession. The Chairman told them he did not think the Commissioners wished to have the gardens. Who did wish to have them under existing circumstances? He, for one, did not want to see the gardens done away with, and he felt sure there were means to be adopted by which the Society might be relieved from that necessity and the gardens kept on as well as ever. A Fellow had asked him the extent of keeping up the band. Well, they were told the band was to be discontinued for three months—September, October, and November, the time when no one wanted a band, but they really ought not to have a band at all unless they had got money to pay it. He begged and entreated the Fellows to vote—not for the rejection of the report—and even if it were rejected it would not amount to a vote of censure, but let them ask the Council to submit the scheme to them and let them see what was going to be done. That would not reflect upon the Council at all, or place them in such a position that they must resign their posts. He hoped the Fellows would adopt some means of making the Society in reality what it was in name. If they did not do so they should very soon have to get another name. Let them do everything they could to relieve themselves from the superabundant

ance of debt with which they were surrounded. The report should go back to the Council—let there be an interview obtained with the Commissioners as speedily as possible. If that were done the matter might be brought to a successful issue, and the Society placed on a sure and certain basis.

The CHAIRMAN: There is now a motion before the meeting, moved by Mr. PEARCE and seconded by Mr. QUILTER. It is right that the meeting should be accurately in possession of what they are voting about, and therefore it will possibly save time if I say, on the part of the Council, that the Fellows are now about to vote upon a question which the Council consider a vote of confidence. At any rate the Society will feel we adopt the most many course in stating at once the way in which we view any amendment to the report which we now have the honour to present for your consideration.

A FELLOW pressed upon the Council the necessity of adjourning the question, to see what arrangement could be come to with the Royal Commissioners.

Mr. LIGGINS said he was surprised at the last two speeches they had heard, because it was obvious to all men of business that if such an amendment was passed it would cast a stigma upon the Council which no men of honour could stand. The rule of all societies, from the House of Commons downwards, was that when such a resolution as the present was passed, it amounted to a vote of want of confidence. They had no right to express opinion as to amity existing between the Council and the Commissioners without supporting that expression by their votes. He asked them to oppose the obnoxious amendment, which had been brought forward in a manner which had astonished him. What, after all, was this report? It was coupled with the accounts of the Royal Horticultural Society for the past year. It was more a record of what had been done than a programme of what was to come. It was of no use to say "No," because the report was really an account of what the Council had done. If these accounts were insufficient the Fellows must have expected them to be so, because they knew the Council had to struggle against the deficit left them by the gross mismanagement of the gentlemen in office before them. Was there any wisdom in the expenditure of £500 for a statue?

Mr. BARR: What statue?—

Mr. LIGGINS: Well, the statue, but I never knew the name of it. The statue was the work of the late Mr. Foley. He contended that whilst they were in debt that was an expenditure of £500 unnecessary in the interests of horticulture. There was a legacy of debt equally unnecessary left upon the shoulders of these gentlemen. He begged to say the gentleman was wrong who said the late Council resigned. The fact was they were turned out. The Fellows, honestly and like Englishmen, turned them out, having lost confidence in their management. What had the present Council done? They had done everything to reduce expenditure, and make the gardens pay. It was painful for them to have to reduce the prizes and the shows, but it must be remembered that the last Council had been spending vast sums of money they had no right to spend. It was all very well to say "Reduce the number of bands," but if they did not make the gardens attractive their losses at Kensington would fall off, and their two guineas and four guineas would melt away, and they would have no money at all for prizes. They should remember the gardens were not of an altogether horticultural nature; but having got them, they ought to do the best they could to retain them, and not let their landlords get them back, for whether they did or did not desire to possess the gardens, there would be no difficulty in their disposing of them at a profitable rate. But it was the duty of the Society in the interests of the horticultural world, to retain these gardens, because they encouraged horticulture. Although he was a Kensingtonian, his connection with the Society arose from his love of horticulture. If they passed such a resolution as that now before the meeting, they would commit a great absurdity, because they ought to put the Council in the position the Commissioners believed they would be in. Did they suppose that if the meeting was adjourned for a month the International Commissioners would take any action during that month? Most certainly not. They would say, "Oh, you are in hot water with your Fellows—you have passed no accounts—they will have nothing to do with you, and until they are passed we can do nothing." Mr. Liggins concluded by earnestly asking the Fellows to support their Council.

Mr. PINCHES remarked that the report was simply a retrospective account of what had been done by the Society, and he could not see on what grounds the meeting could refuse to receive it. They had decided on expunging from the report the statements considered to be offensive to the Commissioners, and now they were to put the report before them, and not see any ground for postponing the reception of it. He thought they were treating the Council in a very shabby manner indeed. As a pretty close observer of the doings of the Society he must candidly say he

was utterly at a loss to know on what reasonable grounds they wanted to find fault with what the Council had done. If they displaced the Council they would incur, justly or rather unjustly, the enmity of the Commissioners; and by the fact of going so they put the Council out of a position in which they could communicate with the Commissioners. After a careful investigation of the accounts of the Society in the report, and those which went before it, he was bound to say these gentlemen had really done good work, and had succeeded in paying off a considerable accumulation of debt. One of their primary objects was to reduce their debt and Every one knew they could not reduce their debt and increase their expenditure at the same time. Surely the best thing the Council could have done was to maintain the chief feature of the Society. There had never been any shows so good as those of last year; and for his part he should sooner see three good shows than thirty indifferent ones. The Council had, he thought, exercised a sound discretion in determining to reduce the number of shows and increase their brilliancy. He asked the meeting to pass the report of the Council. Nothing could be more insulting to a body of men than to reject their report after, at the request of the Fellows, they had expunged from it certain phrases considered to be objectionable. It would be most ungentlemanly behaviour to do so, and he did not believe any body of gentlemen would lend themselves to such a proceeding. Now, as a gentleman panacea which had been suggested. One gentleman thought they had better get up a ball or a *fic* in order to clear off the debt of the Society. Well, when he was invited to come to an evening meeting there, and found just twelve ladies and gentlemen in the room, he asked them could anything be more disheartening than such a state of things? What they had to do now was to pass the report, which was simply a record of the past history of the Society for the last year. He quite understood the remarks of the Chairman as to the council being re-elected constituted if the report was passed, and he hoped the meeting would not hesitate to adopt the report.

Mr. EDGAR BOWRING, C.E., was understood to say he should support the Council's report. With respect to the 500 guineas expended on a statue, as the person most concerned in the matter was no longer alive, he would tell the exact circumstances. At the time this occurred the late lamented Prince Consort was President of the Society, and of the Royal Commissioners. His Royal Highness, the late Prince Consort, thought much might be done for the progress of science and of the fine arts, particularly of painting and sculpture, in connection with the Society; and it occurred to him that sculpture and horticulture might be combined in the gardens. He brought up a plan whereby, out of the profits of the Society, a sum of 500 guineas should be annually set apart for the purpose of inviting artists to design a sculpture gallery might be established in the gardens. This was brought before the Expenses Committee of the Royal Commission, of which he (Mr. Bowring) was then a member. As the Commissioners received half the profits of the gardens it was quite clear their consent to the suggestion should be obtained. It was under that arrangement that the beautiful piece of sculpture, "Boy at the Stream," was ordered from Mr. Foley. The Commissioners were willing to run the risk, and give half the sum towards the sculpture. The Society had the idea that if this could be carried out, it would be a great advantage, not only to horticulture, but would do much to promote the cultivation of the fine arts in this country.

Mr. CORNELIUS WALFORD regretted that he made the speech he had made at the last meeting, not exactly as what he had then said, because that had grown upon him day by day. He thought he had discovered a very great dissatisfaction existing amongst the members of the Society as to its future prospects. He had no personal object to serve. He did not want to serve on Council or Committees, or to take any part in the management, but he did want to see the opportunity for doing something, and doing it quickly, not lost. As far as the amended report went, the objectionable clauses had been withdrawn. That was all right, but there were certain paragraphs in the report which required very careful consideration. The third last paragraph said—

"The attention of the Fellows is specially called to the fact that unless the rent of £2400 is paid to Her Majesty's Commissioners next year the lease of the South Kensington Gardens may be forfeited, and to prevent this contingency an increased revenue must be obtained."

Then the report went on to state that it was proposed to call a special meeting to consider the question of raising the revenue of the Society. That seemed to be all very right and proper, but supposing it should happen that the scheme of the Commissioners was approved, the opportunity they had now, would be lost by adjourning the meeting. He had no wish to say a disrespectful word of the Council. He had a word to say about them at the last meeting and he was sorry for it, but the cause for his remarks

was no longer on the Council side of the table. But he should like to know how that change had taken place. It was known to them all that the time had now arrived when the Commissioners were prepared to discuss with the Council that which they were not prepared to discuss before. Was it wrong to say to the Council, "Don't shut us out from participation in any benefits which may arise—adjourn the meeting to any day suitable to yourselves—discuss the question with the Commissioners, and come to us and tell us what you propose to do." Were not these business propositions? The Society accepted the report, but deferred the adoption of it until they had a settlement on the scheme adverted to. It was all very well to say "No, no," but he only asked what was right and proper. There was no reason why these negotiations should not be made within the next month or six weeks, and it would be unwise of them to adopt the report until they had a statement before them of what was actually going to be done.

Mr. MACKENZIE said he rose to ask the proposer and seconder of the amendment to withdraw it, and not to drive the Fellows to a division. He was surprised that Mr. Walford should not consider it possible that the gentlemen who formed the Royal Commission would very well decline to negotiate with 3000 Fellows, while they would not decline to negotiate with the Council. He had not heard any specific denial of the word denying that they had the utmost confidence in the Council. He appealed to all the independent Fellows to receive this report, and to leave it entirely to the Council to enter into negotiations with the Commissioners, whether under the bye-laws or under the charter. It had been suggested that a certain number of Fellows had a right to call a meeting of the Society. With respect to that, he thought the paragraph at the end of the report was a highly honorable paragraph on the part of the Council, and would allow them time to meet with the Commissioners, and lay before the Fellows the result of their communication. He could not help putting it to the Fellows that it did not do for them to ride too high a horse with the Commissioners, because they were to a certain extent under the control of the Commissioners. But the latter were exercising their powers very much in the interests of the Fellows. He would, under all the circumstances, earnestly appeal to the proposer and seconder of the amendment to withdraw it. As to the question of horticulture, he was sorry to have read in Saturday's *Morning Post* a letter from a gentleman calling attention to a clique in connection with the Society. Now he had mixed up with many public societies, and he earnestly entreated all who wished the affairs of the Society to proceed in a right direction to do the best to have all cliques abolished. Let them all join together and keep the Society on the basis on which we are originally designed. Of one thing he was quite certain, that the Council had done the best they could for the Society.

The CHAIRMAN: Gentlemen, in a meeting like this it is well you should understand that the Council are willing to conciliate every one consistent with their dignity, and I will say at once that we are quite willing to give a day for the discussion of those questions. You will be then just as able to discuss the question—I mean the question as to the arrangements we are to make with the Royal Commissioners, and will be then just as able to put a veto on any of our proceedings as you are now; besides that, you will have the advantage that you will not have lost valuable time in dealing with the Royal Commissioners. I may say for myself and the Council we only wish in the interests of the Society that you will pass this report at the present moment.

Mr. HAUGHTON wished to know whether the Council would consent to the report being adopted, and that the meeting should be then adjourned for the purpose of discussing the question.

Mr. MACKENZIE earnestly entreated the Council, if he had brains, or sense, or judgment, which he believed they all had, to enter into negotiations with the Commissioners in a perfectly untrammelled way.

Mr. SMEE: There could be no doubt but that they would be treated fairly by the Commissioners. He believed the Commissioners wished well to the Society, and would do all in their power to promote its interests. He was quite satisfied that the Society would gain such a position as that it would be able to rival any other Society of the same sort in Europe if they only put their shoulders to the wheel. It had been said there was no difference between the Horticultural Society and the Commissioners. He denied that, for one cultivated the study of the laws which governed horticulture, the other body might be said to govern what might be called a fancy party.

Mr. HAUGHTON again rose, amid loud cries of "Divide," and considerable interruption. He said one objection was taken by Mr. Walford, that if a further meeting was called to consider any arrangement which the Council were prepared to lay before them, they might find themselves in the difficulty which they were in after the passing of the bye-law of 1873. If the Council would then resign in consequence of

an adverse decision, the new Council to be elected might be on the same footing of illegality which unfortunately the present Council has been in up to the present moment. It was beyond doubt Her Majesty's Commissioners had decided that the Council were illegally constituted. He was glad the decision had been come to, and he did not wish to embarrass the Council, but he believed the Society ought to retain the power it had at its annual meeting, that of being able to consider any statement to be submitted. He did not consider any reflection was cast upon the Council by asking them to adjourn the meeting. (Cries of "Spoke," and some uproar.) Let them pass the report, and adjourn the meeting. He begged to move that the report be adopted, and he begged to be adjourned to this day six weeks to consider the statement the Council may make. He had no wish to see the hands of the Council tied in any way, and he believed his proposition would put much strength in their hands.

Dr. MASTERS: I rise for the purpose of seconding the amendment proposed by Mr. Haughton.

The CHAIRMAN: There is no amendment before the meeting. I wish to say, as there appears to be some misapprehension as to the legality of the Council, that the bye-law of 1873 will give a general meeting dealing with resignations full power to deal with the question.

Dr. MASTERS again rose amid cries of "Divide."

The CHAIRMAN: Are you going to speak to the resolution or the amendment?

Dr. MASTERS: To the amendment.

Mr. PEACH: I can withdraw the first one if I like?

The CHAIRMAN: Do you wish to withdraw it?

Mr. PEACH: Certainly. I have no wish to say anything against the report but I think that the Fellows ought to have an opportunity of discussing any further arrangements made, and if you promise that there is to be a general meeting at which this will be matter for discussion, I am very willing to withdraw the amendment.

The CHAIRMAN: Is it then your pleasure, gentlemen, that the amendment be withdrawn?

It appeared to be the unanimous wish of the meeting that the amendment should be withdrawn.

The CHAIRMAN: There is no other amendment before the meeting, and now the subject falls to the ground.

Mr. PINCHES moved that the report of the Council be adopted.

Mr. LIGGINS begged to second the motion.

Mr. HAUGHTON said he was now in order in moving his amendment. This he accordingly did, in the terms stated above.

Dr. MASTERS seconded the amendment.

The CHAIRMAN put the amendment, and there appeared for it twenty-six, and a considerable majority against it.

The amendment was therefore lost, and the motion for the adoption of the report was carried unanimously.

On the motion of Mr. PINCHES, a vote of thanks was given to the noble Chairman, and the proceedings terminated.

March 10.—Evening Lecture.—W. Burnley Hume, Esq., in the chair. The subject of the lecture, which was the last of the series, was the "History of the Society" and the lecturer, W. A. Lindsay, Esq., commenced by stating that it was originally intended that Dr. Hogg should address the meeting on some branch of pomology, but at the last moment he found it had been introduced into this, rather than there should be no lecture at all, thought it would be of great advantage at the present time to consider the history of the Society. In doing so he would, he said, rather than attempt an oratorical display, give the history pure and simple, as he found it in the prefaces to the volumes of the Society's *Transactions*, and in subsequent reports of the Council. It had been well said by Mr. Andrew Murray, in his *History of the Horticultural Society*, that it would be impossible to give a popular history of the Society without at the same time showing the imperfect knowledge of horticulture which existed in this country at the time the Society was established. Previous to the year 1757 very few hardy plants had been introduced into this country, and the Royal Botanic Gardens at Kew were practically unknown in English gardens. In the middle of the last century the Royal Botanic Gardens at Kew were established and the importation of new plants began, to the great benefit of horticultural science, and of the country.

It was at such a moment that the idea of founding a society for the development of horticulture occurred to Mr. Thomas Andrew Knight, a gentleman of the highest attainments in the study of natural history, one of the country gentlemen, had ocular demonstration of the injury being done to orchards in the cider country by the ignorance of the cultivators, and who had, as a Fellow of the Royal Society, constituted himself one of the highest authorities on the subject then living.

The idea was communicated by Mr. Knight to Sir J. Banks, who warmly received it, and it was resolved, on the suggestion of Mr. John Wedgwood, to hold a meeting for the purpose of considering it. On March 7, 1804, this meeting took place, the other persons present being Mr. Richard Salisbury, afterwards secretary; Mr. Charles Greville, Mr. Acton, Mr. Fosyish, and Mr. Dickson. The meeting was held at Messrs. Hatchard's book shop in Piccadilly, and it resulted in the formation of the Horticultural Society.

It was interesting to recall for a moment the circumstances amid which occurred the birth of the Society. At this time the greatest anxiety existed respecting the King's health—His Majesty suffering at that time under the dreadful malady which from time to time affected him, and which has become matter of history. On the very day to which we allude, the House of Commons was investigating the causes of the disaffection in the East India Company, and a motion for the purpose which was thrown out by the Ministry of Addington. Mr. Pitt being in *quasi* opposition. General Welleley was just made a Knight of the Bath at the conclusion of the Indian campaign terminating with the storming of Gauth Ghur and the treaties with the Rajah of Berar, and Scindia, the representative of the Mahabata prince, and the Emperor Napoleon was first Consul of France, and was murdering the Duc d'Enghien. All Europe lay, so to speak, in the fist of France, just about to make its First Consul Emperor. We were in a state of enmity with France.

Amid such universal disquiet was our peaceful Society formed, destined to bear a part in a weightier development than that which even emperors and kings, states and wars had then to do—destined to be one of the bearers of the lamp of natural science, and so gradually influence the theology, the philosophy, and even the daily life of the world.

It is interesting to note the part the Society was to take in this movement was to be a practical one, as was shown by Mr. Knight's introductory remarks in vol. i. of the Society's *Transactions*, relative to the objects which the Horticultural Society had in view. It was interesting to note the great importance of the papers read before the Society during the first twenty years of its existence. In the first volume was a paper read by Sir J. Banks on the Introduction of the Potato; and here the lecturer remarked that the history of our knowledge of the vegetable, and the disease which affects it, is to be found within the history of the Horticultural Society. Among the very many interesting papers read in the first years of the Society is one on the Revival of an Obsolete Mode of Managing Street Trees, and by Sir Joseph Banks, in which he advocates the use of straw, and points to the derivation of the name. Mr. Knight's hints to the derivation of the name. Mr. Knight is particularly interesting.

On April 4, 1809, a paper was read by Sir Joseph Banks, the first paragraph of which alluded to the great usefulness of the Society's work. On April 17, 1809, is dated the Royal Charter incorporating the Society. By this instrument Lord Dartmouth was created President, Mr. Charles Greville Treasurer, Mr. Richard Selsey, and the following members of Salisbury Secretary, and the following members of Council—Lord Powis, the Lord Bishop of Winchester, Lord Selsey, Sir Joseph Banks, Messrs. Acton, Elliot, Knight, Miller, Trevelyan, Dickson, Hoy, Smith. The charter is very similar to that under which we now exist, but one of the differences is that it specially prohibits the removal of Councils in the manner which is lawful at present.

In 1810 was published the first volume of the *Transactions*, which extended to ten volumes, and the cost of which must have exceeded £30,000. At this time the Society appears to have occupied rooms in the house of the Linnean Society in Gerrard Street, Soho, at the rent of £26 5s. a year.

In the year 1811, Lord Dartmouth having died, Mr. Knight became President of the Society. He retained this post for twenty-seven years, and very much of the Society's work is bound up with his memory. But now the mighty war which followed the disturbed state of the world, already hinted at, was raging over all Europe. Elections of new members within the income, and there was at the end of each year a small balance to the Society's credit, and in 1815 the balance rose to £258, so that the return of peace after Waterloo found the Society in a position to take advantage of the English prosperity. In May, 1806, the Society had £1000 in the Treasury Chest, £1719, the funded property £1400, and the expenditure £1700, beyond all debts. In 1818 an experimental garden was established at Kensington, with a nursery at Ealing, and in 1820 a house in Regent Street was bought for £4200. The subscription was raised from two guineas to three guineas. The new members poured in to the extent of 200 or 300 a year; while on February 6, 1820, the entrance fee was raised to five guineas.

Among the papers brought forward during these years should be specified the extraordinary one

read on January 6, February 4, and March 3, 1812, on the Cultivation of Rare Plants, by Mr. Salisbury, an extract from which was read by the lecturer. The remarks quoted were followed by an account of a great number of plants, and the paper was probably as valuable a one for the purpose of illustrating the history of our science, as any we possessed. A quotation was then given from the preface to the second volume of the *Transactions*, in order to show what the historians of the Society thought of its work, but he (the lecturer) would not weary them with any mention of the valuable papers which followed.

After 1815 the practice of collecting seeds from foreign countries was commenced, and in 1825 a distribution took place. Mr. John Reeves sent over plants from China, and with the assistance of the East India Company the Society introduced into England many varieties of Camellias, Indian Azaleas, Chinese Peonies, Chrysanthemums, &c. The first living plant of the *Glycine sinensis*, sent by Mr. Reeves, arrived in 1818, and he believed was still growing at Chiswick. The Lords of the Treasury at that time treated the Society most liberally, and directed that all plants, &c., sent to the Society should be free of custom duty.

The progress between 1823 and 1830 was rapid. In 1823, 1200 kinds of Roses existed in the garden at Chiswick, which was acquired in the previous year from the Duke of Devonshire, with a perpetual power of renewal, upon a fine of £450. Most unfortunately at a later date the Society relinquished this power—a proceeding very short-sighted, considering the enormous value gradually accruing to property near London. The gardens at Kensington and Ealing were also given up.

In 1827 Sir Joseph Banks, the first great protector of the Society, died. About his time other collectors were sent out, the first being G. Don, who was followed by Forbes, who went to the west coast of Africa; and subsequently by Mr. John Fox, who went out only to die. Mr. Parker was the next, and he was followed by David Douglas, afterwards recommended by Dr. A. Forster, Sir William Hooker. He was to have gone to Chili, but went instead to North America, whence he sent home some valuable Conifers, &c.

In 1822 the subscription was raised from three to four guineas, and the entrance fee from five to six, while a sum of £7275 was voluntarily subscribed for the new garden works.

In 1825 the daily meteorological observations were commenced, long continued by Robert Thompson, which forms now the longest and most trustworthy journal of meteorology of the climate of London.

But the first period of adversity was setting in. The anniversary dinner was exchanged for the breakfasts, which were of little use for keeping the Fellows together, and introduced a policy of sacrificing horticulture to fashion, which developed afterwards an unsatisfactory extent. The last of these breakfasts took place in 1831, and at this date they were abandoned, to be succeeded by garden exhibitions, which have ever since been the special delight of the Society, and which owed their origin to the happy suggestion of Dr. Lindley. But now the financial position of the Society became more and more serious. A balance of £115, and at this date they were abandoned, to be succeeded by garden exhibitions, which have ever since been the special delight of the Society, and which owed their origin to the happy suggestion of Dr. Lindley. But now the financial position of the Society became more and more serious. A committee of inquiry was appointed, which reported that the Society's debts were £29,243, and its property £16,500. The gardens had cost £29,000 more than had been subscribed for them. Altogether the management was condemned, and in consequence Mr. Sabine, who had been secretary since 1815, or thereabouts, resigned.

The zeal in promoting horticulture was, however, applauded, and in point of fact very large sums of money had been spent on this object. Mr. Bentham now became secretary, and Dr. Lindley as his assistant, who had been assistant-secretary since 1822.

The exhibitions were now held in the gardens instead of Regent Street, and were in every way successful. A prosperous era now again set in, but the Council did not think it desirable to devote all their means to the payment of debt. Accordingly, between 1830 and 1855 £11,000 more was spent on the garden and £7000 on foreign importations.

In 1833 Mr. Knight died—the chief mover, says Mr. Murray, in all the scientific work of the Society during his life. He was succeeded by the Duke of Devonshire in the office of President. In 1842 the Society sent out Mr. Fortune, then the superintendent of the hothouse department at Chiswick, to China, for the purpose of collecting. Mr. Fortune's labours are well known to the Fellows. He introduced a very valuable collection of plants, and published some well-known books. But there is more to be said to the credit of the Society and Mr. Fortune. Having acquired a considerable knowledge of the cultivation and manufacture of Tea, Mr. Fortune was employed afterwards by the East India Company to establish that industry in India. By this course, therefore, the Society became the means of doing great service to the country. During all this period the Society was

hampered by the non-payment of subscriptions. This evil, which constitutes the chief difficulty with which all societies have to contend, began in its infancy and grew with its growth. Between 1824 and 1855, £12,879 was abandoned as irrecoverable from this source. Nevertheless, up to 1851 a steady reduction of debt continued to take place.

The Chiswick *fiets* did good by helping to bring the Society before the world, and also had much to recommend them from a horticultural point of view. The Duke of Devonshire materially helped them by throwing open his grounds to the visitors, but ultimately, owing to bad weather, they fell into disrepute. The Council now looked about for some show place nearer London, and in 1854 Her Majesty's Commissioners most obligingly placed Gore House and grounds at their disposal.

But not yet did the course of events improve. The debt was increased this year by £1200, and it seemed that this magnificent Society, with a history almost unequalled for splendour and work, would cease to exist. A circular was issued to the Fellows proposing to give up exhibition, and revert to the condition of 1827. Meetings were held at which the question of abandoning the Chiswick garden was discussed. In the end, however, a subscription to avoid this result took place, and £2367 was subscribed by 181 persons. The culture of *St. Paul's* was, however, abandoned. The last collector, who had been sent to Mexico, was recalled, and the herbaria were sold.

Two shows were held, one of flowers at Chiswick, and one of fruit in London, but both were unsuccessful, and by the close of 1858 the £3000 was all swallowed up. The total number of Fellows was but 985, and the debt £10,000. Many patriotic members lent money. The house in Regent Street was at last sold, and the glorious library—the collection of forty years—was dispersed by the auctioneer's hammer.

In January, 1858, the Duke of Devonshire died, and on March 2 his place was filled by one destined to transcend even his distinction as President of the Society—H. R. H. the Prince Consort. One of the first acts of the Council under their new President was to lay down the principle that if a garden more favourable to the Society could be found, the prosperity of the Chiswick would be higher than ever.

It happened that Her Majesty's Commissioners had determined to lay out the central part of their ground at South Kensington as a garden, and, as we all know, it was at last arranged that this ground should form the garden of the Horticultural Society. It was agreed that each party should lay out £50,000 on the ground, that a large conservatory should be built, and that the garden should be ornamented with statues. We all know that this arrangement was carried out. In two years 1500 new members joined the Society. The garden was opened by H. R. H. the Prince Consort on June 5, 1861, and an extract was read from his speech in reply to an address read by Dr. Lindley. The prospect of success seemed most brilliant, but the death on December 14 of the new President cast a gloom over all. It was on that occasion, so melancholy a one to the Horticultural Society, that the Queen caused a most gracious letter to be communicated to the Society.

So great was Her Majesty's interest in the Society, that, until advised to the contrary, she had an idea of becoming President of the Society, but ultimately nominated the Duke of Buccleuch. In 1862 the receipts, working with the International Exhibition, were £30,000, but of this a small balance only was saved, the principal sum being spent on improvements in the gardens.

It is at this point that Mr. Murray's history closes, and we must turn to the Reports for our authorities. But it is not necessary to do this. We all know that on the death of the Prince Consort the whole fabric sustained a gradual but sure decline. At last, in 1873, proposals were made which were held by the Fellows to amount to a surrender of the garden, and the results you all know.

In conclusion, Mr. Lindsay hoped that every one who had the welfare of horticulture at heart would seriously consider the fact—that, excepting the Royal Society, theirs had an unexampled history. It had introduced two-thirds of the plants which had been imported into this country; it had published *Transactions* which have not been out rivalled by any other society; and it had, at its own expense, sent out collectors to all parts of the world. The *Transactions* had come to a close, and the Society had no collectors, but he looked forward to these things being restored. They must look forward to a better and more useful future. They must hope to revive the magnificent foreign correspondence, which had ceased to flow to the Society; they must hope to resume the reading of papers of which these lectures he hoped were the commencement; and, whether he was to bear a part in the work or not, he trusted that he and all this will again be done—because horticultural science has now achieved an importance not felt in the past, and is, in fact, an essential part of the general study of the entire life of creation.

The Chairman proposed a vote of thanks to the lecturer, which he hoped would be most cordially given. Mr. Lindsay must have laboured hard to get together the facts for such an interesting lecture as they had heard; and to make the vote he asked them to pass more than a merely formal one, he had the pleasure of presenting to Lady Harriet Lindsay, on his own behalf and in their name, a basket of choice Orchids.

The Weather.

STATE OF THE WEATHER AT LACKHATCHEE, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 10, 1875.

MONTH AND DAY.	BAROMETRICAL.		TEMPERATURE OF THE AIR.		HYDROLOGICAL DEDUCTIONS FROM GLAISHER'S TABLE, 4th Edition.	WIND.	RAINFALL.
	Mean Reading on 5th Bar.	Departure from Normal of 40 Years.	Range.	Mean Daily (from average of 60 years).			
Mar 4	30.2	+0.2	31.1	49.3	4.1	89	S.S.E. 0.30
5	30.7	-0.12	47.8	48.4	36.4	90	S.S.E. 0.20

- Mar. 4.—Overcast, dull, and cold in morning. Fine, bright, and clear sky in afternoon and evening.
- 5.—Fine, bright, and partially cloudy throughout. Hoar-frost, and slight fog in morning.
- 6.—Overcast, dull, and mild in morning and afternoon, but clear at night. Rain fell in early morning.
- 7.—Overcast, dull, and very mild throughout, though bright at intervals in morning. Rain fell in afternoon and evening.
- 8.—Overcast, dull, and strong wind, though bright at intervals throughout the day.
- 9.—Fine, mild, and partially cloudy throughout. A gale of wind.
- 10.—A fine, bright, and cloudless day. Hoar-frost in early morning. Lowest temperature of vegetation, 29.6°.

In the suburbs of London the reading of the barometer at the level of the sea increased from 29.71 inches at the beginning of the week to 29.78 inches by the early morning hours of February 28, increased to 29.73 inches by the morning of March 1, again increased to 30.02 inches by about noon on the 4th, and decreased to 29.69 inches by the end of the week. The readings were all below their averages, that for the 6th being 0.37 inch in defect. The mean reading for the week was 29.84 inches, being 0.12 inch higher than that of the preceding week.

The highest temperature of the air at 4 feet above the ground ranged between 49° on the 6th and 33° on the 1st, the mean value for the week being 39.5°. The lowest temperatures of the air varied from 35.5° on the 6th to 28.1° on the 5th, the mean for the week being 31°. The mean daily range of temperature in the week was 8°, ranging from 18° on the 5th to 23° on the 1st. The mean daily temperatures of the air and the departures from their respective averages were as follows:—Feb. 28, 31.2°, -8.9°; Mar 1, 31.4°, -8.9°; 2d, 31.3°, -9.1°; 3d, 33.5°, -7.1°; 4th, 35.4°, -5.1°; 5th, 36.4°, -4.1°; and 6th, 40.7°, +0.2°. The mean temperature for the week was 34.3°, being 6.1° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in the sun's rays, were 62.3° and 95° on the 4th and 5th, but on the 2d, 38.1° was the highest reading recorded by this thermometer. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 28.1° and 17.1° on the 2d and 5th, but on the 6th, 31.4° was the lowest reading. The mean for the seven low readings was about 27.3°.

The weather during the week was dull and cold, with the exception of Friday, which was somewhat fine and mild. Slight snow fell on February 28, March 1 and 2.

The direction of the wind was N.E., and its strength brisk. Rain or snow fell on three days during the week; the amount of rain and melted snow together was 0.20 inch.

In England, the extreme high day temperatures ranged from 52° at Sunderland to 40° at Bradford, Hull, and Newcastle-on-Tyne, the general average over the whole country being 45.3°. The extreme low night temperatures varied from 31° at Leeds to 22.3° at Portsmouth, the general average being 28.8°. The extreme range of temperature in the week ranged between 22° at Sunderland and 9.8° at Bradford; the mean for the week was 17.2°. The mean

high temperatures observed by day ranged between 43.3° at Sunderland and 35.1° at Bradford, with an average value of 38°. The mean low temperatures observed by night varied from 32.1° at Liverpool and Sunderland to 28.1° at Portsmouth, with a general average over the country of 31°. The mean daily range of temperature in the week was 7°, varying from 11.4° at Sunderland to 4.1° at Bradford and Leeds. The mean temperature for the week was 33.3°, being 0.7° lower than the value of corresponding week in 1874; the highest happened at Sunderland, 37.4°, and the lowest at Wolverhampton, Norwich, and Sheffield, 32.1° respectively. Rain or melted snow was measured at each of the above stations, varying in amount from six-tenths of an inch at Portsmouth, Sheffield, and Hull, to five-hundredths of an inch at Norwich; the average fall over the country was three-tenths of an inch.

The weather during the week was dull, cold, and the sky generally overcast, with the exception of Friday, March 5, which was fine and mild. Slight snow fell generally over the country on February 28, March 1 and 2.

In Scotland the highest temperatures by day varied between 48° at Greenock and 40.3° at Leith; the lowest temperatures by night ranged from 33° at Aberdeen to 24° at Paisley, their respective averages being 43.3° and 28.3°. The mean range of temperature in the week was 14.1°. The mean temperature for the week was 35.1°, being 8.1° lower than the value of the corresponding week in 1874, the highest occurred at Aberdeen, 36.3°, and the lowest at Glasgow, 34.3°. Rain and melted snow was measured at Dundee to the amount of three-tenths of an inch, but at Leith two-hundredths of an inch only was recorded; the average fall over the country was one-tenth of an inch.

At Dublin the highest temperature was 54°, the lowest 32.3°, the mean 38.5°, and the amount of rain or melted snow three-quarters of an inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Proceed with the potting of *Chorizanthes*, *Aploxites*, *Dracophyllum gracile*, *Eriostemon*, *Acrophyllum venosum*, *Tremandras*, *Adiantums*, *Statics*, and all other plants of similar character. All spring potting in this department had better be completed as soon as possible, as the drier condition of the atmosphere, consequent upon the sun's increased power later on, renders it somewhat difficult to manage newly potted plants. The temperature under glass during the coldest days, if accompanied by bright sunshine, is such as to necessitate the admission of more air than is good for plants that have been recently potted; it is better when such weather occurs to let the temperature get up higher than it ought to be than to admit side air, which during this month is most injurious in its effects. Every day look carefully over the whole stock, to see that nothing wants for water; particular attention in this matter is especially necessary for plants that have been a few weeks in pots, as it is well time to see about the removal to the north, or retarding house, of any hard-wooded greenhouse plants that it may be desirable to keep back either for successional, conservatory decoration, or exhibition purposes; it is for the best plan to retard early, as by so doing the plants can, in the later stages of the flowers' expansion, be removed to a warmer more growing temperature. Independent of the beneficial effect this treatment has on the bloom, it is likewise much better for the plants than retarding them later on. See that whilst in the north house they are not overcrowded; they will require less water here. Any plants of *Epaeris*, *Cytisus*, and *Acacia* that have done blooming should, if they need it, have their shoots shortened back sufficiently to keep them in shape and of reasonable size; place them in a night temperature of about 48°; they will by this means make and mature an early growth, and so will be readily brought into bloom without much forcing next season. Syringe slightly every afternoon, and when they have got fairly into growth pot all that want it. The present is a good time to look over the stock of hard-wooded plants grown for winter blooming, and where necessary more should at once be procured of such things as *Epaeris* and *Acacias*, *Cytisus*, *Monochetams*, &c.; if got now they will soon be in nice condition for repotting. They might with advantage be kept for a fortnight or so in a little closer atmosphere than the rest of the stock; by so doing, root-action, which should always precede the operation of potting, would be encouraged. *Pimeleas* should be closely examined, to see if there is any red-spider on them, as they are especially liable to the attacks of this insect; should any of its eggs have existed on the plants through the winter, be kept for a fortnight or so in a little closer atmosphere than the rest of the stock, and they will quickly come to life, and often do much injury before they are even supposed to exist. The best

remedy is an application of the syringe once or twice a week, being careful to get well to the underside of the leaves; they are moisture-loving plants, and to grow them well want more at the root, as also in the atmosphere, through the growing season than most hard-wooded subjects. The different varieties of *Statice* and *Phoroma degans* do not, more especially at this season, well bear the direct action of the sun—the latter plant in particular is sometimes disfigured by it in a very short time. It means should therefore be taken to prevent this, either by shading the plants individually, or by placing them where they will not be exposed to its action. *T. Baines*.

Enquiries.

He that questioneth much shall learn much.—Bacon.
42. GARCINIA LIVINGSTONI.—Does *Garcinia Livingstoni* demand a constant or humid heat, or would it content itself with a greenhouse, or indoor culture, during the winter? *H. W. C.*

Answers to Correspondents.

ASTERS: *G. R. F.* Sow these as well as Stocks about the middle of April, on very gentle heat, and prick out the strong plants on prepared beds of rich soil. You need not start the Gladioli in pots, but plant them at once in the beds, placing a little clear sharp sand around each corm.

BOOKS: *H. J. B.* We should certainly give the preference to Thompson's *Gardeners' Assistant*, of which there is a new edition in hand. The termination "ii" is pronounced "i."

BOUGAINVILLEAS: *B. Martin*. Any of the Bougainvilleas will grow well in good fibrous loam, with sufficient sand to keep it open. *B. glabra*, far the best for pot culture and for general use, is a moisture-loving plant, and will do well with one-fifth of well rotted dung added to the loam. There is no better soil for *Camelias* than good turfy loam such as you describe. The fibre should not be too far decomposed, and to it add sand, more or less, according to the nature of the soil.

GARDEN SYRINGE: *E. K. S.* Read's syringes are very efficient and durable, and have long borne this reputation. Have you tried them?

HERBACEOUS PLANTS: *Clavus*. Many hardy perennials have a tendency to themselves out of the ground, and therefore require placing deeper in the earth when transplanted, but, in a general way, it is not advisable to bury the young shoots to the depth of 3 or 4 inches. It would not harm them to place them rather deeper than before.

LIFT OF THE VALLEY: *R. Y. Z.* We have seen a variety with flowers of a rose tint, but it is very scarce, and we cannot tell you where it could be obtained.

LOCAL TAXATION: *Camjee*. You will obtain the information you require by addressing Captain Craigie, 121, Abchurch Lane, Strand, London, W.C.

NAMES OF FRUITS: *G. N. N.* Large Pear is *Caillieu*; small, *Sussette de Bayay*.—*J. A. Hatfield*, 4, Beauty of Wilts; 5, Dutch Mignonette; others unknown.

NAMES OF PLANTS: *M. J.* 1 and 2, we decline to name without seeing them; 3, *Juniperus recurva*; 4, *Sisymbrium* sempervirens; 5, *Picea grandis*. *A. M. J.* *Morice*, *Hardenbergia Comptoniana*.—*L. I.* *Leucopogon Richelii*; 2, *Eparis exserta*; 3, *Draacena fragrans*.—*M. J.* *Leucothoe axillaris*, the flower-spikes immature.—*A. E. K.* *Eschscholus*. You *Nepenthes*, but we should be glad of an entire and fresh leaf before deciding, for the latter species is, we believe, new to cultivation, although the specimen sent is more like it than *N. ampullaria*. We should be glad to have a description of the Holly.

PILEWORT: *W. A.* We have no faith in the remedy, and would recommend you not to take any trouble in the matter. It would be very dangerous to take as a medicine in the way you suggest, being, in fact, poisonous.

POINCIANA REGIA: *An Old Subscriber*. There is a plant bearing this name, but it is a native of Madagascar, and not of Australia. It is a handsome tree, with orange or yellowish flowers, belonging to the order Cassipinina, of the genus *Leguminosae*.

ROCKWORT: *Forn*. *M.* Fulham, of Broxbourne, or Mr. Blake, of Fulham.

ROYAL HORTICULTURAL SOCIETY.—We have received letters from Mr. William Paul, Mr. William Bull, and others on the affairs of this Society, but, owing to the great length of our report, we must defer their publication until next week.

ZONAL PELARGONIUMS: *J. S. W.* Ten-inch pots are sufficiently large for all purposes, and it will be better to feed the plants with manure-water so far as they require it. The length of time that should elapse betwixt *Fuchsias* being stopped and being exhibited, is altogether dependent upon the after-treatment they receive at the hands of the grower. One principle thing to be observed is, the immediate removal as soon as they are formed of all flowers that are too early for the required time; if the extreme points are then nipped out eight weeks before the exhibition, at that advanced time in the summer you may calculate upon their being in, but this latter could only be decided off by seeing the condition the plants were in about that length of time previous to the exhibition.

COMMUNICATIONS RECEIVED.—*G. G. N.*—*W. R. Fryer*—*A. B. W.*—*R. W.*—*E. N.*—*E. E.*—*W. E.*—*W. T. P.*—*W. H. G.*—*J.*

Markets.

COVENT GARDEN, March 11.

The only alteration worth notice is the advance of price in Grapes of good quality, of which there are some good specimens of *Lady Downes* among the dealers. Rough goods are sufficient for the trade, and there are rather large consignments of late Apples placed on the market. *Thomas Taylor, Wholesale Apple Dealer.*

The choicest descriptions of fruit in the retail markets may be quoted as follows:—*Strawberries*, 2s. 6d. per oz.; *Grapes*, Englishblack, 15s. to 20s. per lb.; *Pines*, 6s. to 8s. per lb.; *Maitia Blood Oranges*, 3s. per doz.; *Shadlocks* and *Pomeloes*, 1s., 2s., and 3s. each.

FRUIT.

Apples, per 1/2-sieve	s. d.	Nuts, Cob, p. lb.	s. d.
Chestnuts, per bush	2 0-3 0	Oranges, p. 100	8 0-12 0

SEEDS.

LONDON: *March 10.* We have to report a good seasonable demand now prevailing for most kinds of farm seeds, the mild open weather at the beginning of the week having naturally caused increased activity in the trade. A good quantity of red Clover seed, chiefly of the finer qualities, has within the last few days been sold into the country. For old and yearling parcels there is at present less demand. Alsikes and white Clovers are without alteration. *Trifolium pratense* in brisk request at full rates. For foreign Italian holders in brisk request at 1s. per bale, more money. Ryegrasses are steady at last week's currencies. More inquiry is shown for white Mustard and sowing Rape seed. Spring Tares steadily maintain late rates; stocks in London are now reduced to narrow compass. Sanfoin and Lucerne seeds meet with more attention. Canary seed is drooping in value. White Millet and Hemp keep firm. There is a good inquiry for English Linsed. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

POTATOS.

From King's Cross we have a report that there has been a good demand for best samples at extreme rates; but the trade for inferior dull. *York and Lincoln Victorias*, 100s. to 120s.; ditto *Flukes*, 100s. to 120s.; *York Regents*, 100s. to 120s.; *Lincoln Regents*, 80s. to 120s.; *East Lothian Regents*, 80s. to 120s.; *Perth and Fife Regents*, 60s. to 80s.; ditto *Rocks*, 60s. to 65s.; *French*, 50s. to 55s.; ditto seedlings, 60s. to 65s.; *Belgian Kidneys*, 65s. to 70s.; *Kent and Essex Regents*, 100s. to 120s.; ditto *Rocks*, 60s. to 70s. per ton.—The Borough and Spitalfields markets are steady to the effect that moderate supplies are on sale, and the trade firm on rather higher terms. *Regents*, 70s. to 120s.; *Victorias*, 100s. to 120s.; *Flukes*, 100s. to 120s.; *Rocks*, 60s. to 70s. per ton.—Last week's imports into London amounted to 169 sacks from *Boulogne*; 597 tons and 741 sacks from *Dunkirk*; 170 tons from *St. Valery*; 2575 bags from *Antwerp*; 57 barrels from *New York*; and 15 barrels from *Malta*.

Roses! Roses! Roses!

Rosher's Garden Edging Tiles.
THE above and many other PATTERNS are made in materials of great durability. The patterns are especially suited for KITCHEN GARDENS, as they labour no Slugs or Insects, take up little room, and, once put down incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

LARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and a great variety of design. **F. ROSHER and CO.,** Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.
AGENTS for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.
Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheets, of plain or more elaborate designs, with prices, sent for selection.
WHITE GLAZED TILES; for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds, Roofing Tiles, in great variety, Slates, Cement, &c.
F. ROSHER and CO., Brick and Tile Merchants.
See address above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truck Load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post.
SLITS and BRICK BURNERS for Rookeries or Ferneries. **KENT PEATS or LOAM** supplied at lowest rates in any quantities.
F. ROSHER and CO.—Addresses see above.
N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Reduced Prices.

A Certain Crop of Fruit, in spite of Frost, is secured by

PARHAM'S

PATENT GLASS COPING For Sheltering Fruit Trees.

The Patentee has sent out many miles of it during the past three seasons, and additional orders have each year been received from those who have tried it.

Price—Per foot run, with 21-oz. glass. With the iron framework painted, 2 feet, 23. 6d.; 3 feet wide, 32. 6d.

With the iron framework galvanised, 2 feet, 31. 3d.; 3 feet wide, 41. 9d.

From Mr. F. SAUNDERS, Gardener to Sir Wm. Miles, Bart., Leigh Court, Bristol, October 23, 1874.

"Sir—I have much pleasure in saying the Wall Coping you erected here in April, 1872, has given the greatest satisfaction. Many of the Peach trees, at that time apparently worthless, are now in full vigour, and have borne extraordinary crops this season, the fruit being unusually fine, and of excellent flavour. I have recommended it to several gentlemen, who, I believe, will give it a trial."

PATENT PORTABLE PLANT PRESERVER.

Glazed with 21-oz. glass (under W. Parham's Patent) without putty, on channelled wood rafters.

Price—Including two wood ends to each length.

COWAN'S COMPENSATING SYSTEM OF HEATING.

WAUCHOPE & COWAN'S NEW AND ECONOMICAL SYSTEM OF MAKING GAS.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, having recently been offered a valuable Patent for the Manufacture of Gas, to be worked in combination with their Patents for Heating Horticultural and other Buildings, have found it necessary, so as to acquire and work such Patent, to form a new Company with larger powers; the old Company having been incorporated for the purpose of dealing with the Heating Patents only.

THE COWAN COMPENSATING HEATING COMPANY, LIMITED, will, therefore, be wound up and dissolved, and a new Company, called "THE COWAN PATENTS COMPANY, LIMITED," has been formed, and has taken over the entire business of the old Company. From this date the new Company will carry on the business of the old Company, with the addition of the New System of Making Gas—full particulars of which, with Illustrations, can be had on application.

Contracts entered into by the old Company will be carried out by the new one, and all its responsibilities fulfilled.

The Directors of the new Company have thought it advisable to change the Offices from Lothbury to 21, WHITEHALL PLACE, WESTMINSTER, S.W., where all communications should in future be addressed, and where full information concerning their Patent Systems of Heating and Gas Making can be obtained.

SPECIAL MEDALS WERE AWARDED AT MANCHESTER, 1873; BELFAST, 1874; BIRMINGHAM, 1874.

ILLUSTRATED PAMPHLETS SENT FREE ON APPLICATION.

All Communications in future to be addressed—

21, WHITEHALL PLACE, WESTMINSTER, S.W.

J. G. SMEATON & CO.,

Plans and Estimates for every Description of Horticultural Structure. Consultations in all parts of the Kingdom.

HEATING AND VENTILATING ENGINEERS
 TO THE SCHOOL BOARD.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz. the water space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron, are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	48 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, *Nurseries, Baltham Hill, S.W., May 20, 1875.*

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.

GEORGE'S PATENT CALORIGEN,
 FOR
Warming and Ventilating Small Conservatories.

COAL CALORIGEN,
 Height, 36 inches; diameter, 21 inches.
GAS CALORIGEN,
 Height, 28 inches; diameter, 14 inches.

The only Gas Stove in which the product of combustion is entirely excluded from the Conservatory, while a constant stream of warmed, not burnt, fresh air is introduced. The "Coal Stove" consumes the smallest amount of Fuel—*viz.* per diem being the average cost. It will be found very valuable in the Nursery or Sick Room, Damp Buildings, Conservatories, Offices, &c. Exhibited at the Exhibition of 1871 (Department of Scientific Inventions).

Illustrated Prospectuses and Testimonials on application.
 J. F. FARWIG AND CO., 35, Queen Street, Cheapside, E.C.
 This Stove introduces a strong current of warmed (not burnt) fresh air.

STEVENS' TRENCHAM GREENHOUSE BOILER,
 After long experience, has proved the most Simple, Economical, Effective, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole Makers, F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

CONSERVATORIES, HOTHOUSES, GREENHOUSES, &c.,

MANUFACTURED BY STEAM-POWER MACHINERY.

Horticultural Builder and Hot-water Apparatus Engineer,
 STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

MESSENGER & COMPANY,
 CONTRACTORS, MIDLAND HORTICULTURAL BUILDING
 AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Reg. to inform their numerous Patrons and the Public generally, that since the recent disastrous fire they erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, of any required dimensions. T. G. MESSENGER & Co. are now, therefore, in a position, from their great facilities and experience, to carry out with dispatch and in the best manner, at moderate cost, the orders with which they may be entrusted. Glasshouses erected on Messenger's Patent principles are, owing to mechanical arrangements, very strong, *most durable*, light, *elegant*; *perfect efficiency* for purpose intended is *guaranteed*; are economical in cost and maintenance. Hot-water engineering in all its branches, Messenger's Patent Hot-water Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application.
 Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out.

A richly Illustrated CATALOGUE forwarded Post Free on receipt of 33 Stamps.

"TUBULAR," and every other Boiler of known merit or excellence.

HOT-WATER APPARATUS ERECTED COMPLETE.
 PRICE LIST on application; or, Six Stamps for DESCRIPTIVE CATALOGUE, 4th Edition.

VIENNA PRIZE WIRE NETTING.

CAUTION TO BUYERS OF WIRE NETTING.

The great reputation and success of Messrs. J. B. BROWN and CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & CO. are THE SOLE MANUFACTURERS.

Messrs. BROWN & CO. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced prices. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting.

90, Cannon Street, London, E.C.—March 12.

TANNED GARDEN NETTING, 1d. per Square Yard, for Protecting Seed-beds, Peas, Fruit, Strawberries, &c., from Birds, Frost, Blight, &c., and as a Fence for Fowls, in 1, 2, 3, and 4-yards widths. Hexagonal, Triangular, and other Netting, Galvanised Wire Netting, Ice Hurdles, and Seed Protectors, by C. WRIGHT, 29, Lime Street, E.C., late 376, Strand, W.C.

NETTING FOR FRUIT TREES, SEED BEDS, RIPE STRAWBERRIES, &c.

TANNED NETTING for protecting the above from Frost, Blight, Birds, &c., 2 yards wide 3d. per yard, or 100 yards, 20s.; 4 yards wide, 6d. per yard, or 50 yards, 20s.

NEW TANNED NETTING, suited for any of the above purposes, or as a Fence for Fowls, 2 yards wide, 6d. per yard; 4 yards wide, 1s. per yard; 1/2 inch mesh, 4 yards wide, 1s. 6d. per yard. TIFFANY, 6s. 6d. and 7s. 6d. per piece of 20 yards. EATON and DELLER, 6 & 7, Crooked Lane, London Bridge.

Thomas' Pea and Seed Guards. SUPERIOR QUALITY. GALVANISED AFTER MADE. NEW PATTERN with Diagonal Stays.

3 feet long; 6 inches wide; 6 inches high. 9s. 6d. per Dozen. Two end-pieces included with each dozen.

THOMAS' Fittings for Wiring Walls ON THE FRENCH SYSTEM.

PRICES OF MATERIALS. Per dozen—s. d. Galvanised Raidisseurs for tightening the wires (one required for each line of wire) 4 0 Galvanised Terminating Holdfasts (two required for each line of wire) 2 0 Galvanised Wall Eyes 0 6 Galvanised Wire, 22, 24, 26, 28, and 31, per 100 yards.

Illustrated Lists, with full particulars of the above and Fittings for Espalier Trainers, on very economical principles, free on application.

Special quotations for larger quantities. J. T. THOMAS & CO., PADDINGTON WIREWORKS, LONDON, W. 285 and 362, EDGWARE ROAD, LONDON, W. Illustrated and Priced Catalogues of every description of Horticultural Wirework on application.

Garden Wall Wiring.

R. HOLLIDAY, PRACTICAL WIREWORKER, 24, Portobello Terrace, Notting Hill Gate, London, W., begs to call the attention of all Gardeners who are about to have their Garden Walls wired to his system of Wiring Walls, as being superior to all others for neatness, strength, and durability. For Neatness—Because all Wires are kept perfectly tight, without the use of the Raddisour.

For Strength—Because every much stronger Wire can be used, therefore not liable to be drawn out of the horizontal line by the branches of trees.

For Durability—Because, being able to use the strong Wire, it is not so likely to be eaten through by the galvanism as is the thin Wire, as used in the French system.

The above Engraving is an Example of our system of Wiring Garden Walls. We have recently completed the Wiring of the New Garden Walls for the Marquis of Salisbury, Hatfield House. The Walls are 12 feet high and 753 yards long, wired on both sides, making a total length of 1506 yards, our system being chosen in preference to any other.

Illustrated Catalogues of Garden and Conservatory Wirework, Rabbit Proof Hurdle Fencing, &c., may be had on application as above.

SHAW'S TIFFANY and ELASTIC NETTING for Shading and Protecting. Sold by all respectable Seedsmen. For Circulars and Prices apply to JOHN SHAW and CO., Tiffany Manufacturers, 29, Oxford Street, Manchester.

Second Edition, Price 3d., Post Free 4d.

THE AGRICULTURAL GAZETTE ALMANAC, 1875. The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compilations are many good serviceable hints on fattening cattle, growing of root crops, &c. The illustrations are admirably executed, and being engraved from photographs."—Weekly Dispatch, Jan. 31, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition."—Lloyd's, Jan. 17, 1875.

"It is a very cheap threepennyworth of information of interest and utility to farmers, and contains numerous illustrations."—The Field, Jan. 16, 1875.

"In addition to the usual matter to be found in an almanac, we have here useful information on the farm, as to stock and crops, with illustrations of prize animals."—Gloucestershire Chronicle.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for daily use."—Farmer's Herald.

"The Calendar contains all the fixtures for cattle shows, races, &c., spaces for diary entries, and, by the aid, and various useful information of an agricultural character."—Oxford Times.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics and a series of portraits of the Prince of Wales, Dr. Voelcker, and account of crops, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'"—Bath Express.

"To farmers, cattle dealers, and others interested in agriculture, this work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is profusely illustrated with engravings chiefly taken from photographs."—Dorsetshire Chronicle.

"This almanac, which appears to be carefully compiled, and the contents judiciously selected, may be commended to the notice of agriculturists generally. It is issued at a low figure, and contains a large variety of information. There are numerous illustrations, and the likeness of the Prince of Wales, which forms the frontispiece, is especially deserving of mention."—Grantham Journal.

"To all persons interested in agriculture in this neighbourhood 'The Agricultural Gazette Almanac' for 1875, price 4d., will be worth obtaining. It contains a fund of information, as well as a variety of advertisements on topics especially connected with the portion of the community which it is intended to serve."—Hull's Guardian.

"Although this almanac comes rather late it is none the less welcome, as containing a mass of information, both interesting and valuable to any person connected with agriculture, it is to be commended. In addition to the usual calendar it contains a series of portraits with authentic portraits and verbal descriptions of prize cattle, sheep, and pigs, a list of the members of both Houses of Parliament, another of the Chambers of Agriculture, and of County Agricultural Societies, besides hints as to practical farming. Such a combination of information must recommend itself to every agriculturist."—Western Daily Mercury.

"Though it is rather late to be noticing an almanac for 1875, we make an exception in favour of the one before us, which, owing to its great merits and low price, ought to be purchased by every agriculturist in the kingdom. The illustrations of prize cattle, sheep, and pigs, are a valuable feature in the Almanac."—Frescot Reporter.

"Considering the valuable information for the farmer and stock breeder to be found in this publication, no wonder the first edition has had to be followed by a second. In addition to treating of farming matters, it contains a good paper on 'Crisis in the Colonies in 1874,' and alphabetical lists of the members of the Houses of Parliament. It is besides admirably illustrated with notable prize-winning animals."—East Anglian Daily Times.

W. RICHARDS, 7, Catherine Street, Strand, W.C.

PARTNERSHIP.—Owing to the decease of the Proprietor of an Old Established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who will take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Protheroe & Morris, 65, Gracechurch Street, E.C.

WANTED, a HEAD WORKING GARDENER.—Middle-aged, good family. Wages, 25s., with house, fuel, and vegetables. Without personal character. Three or four assistants kept.—A. B. KEMNAL, Chislehurst, Kent. Nearest station is Sidcup.

WANTED, as GARDENER, an energetic business Man.—One accustomed to Nursery Work and who has a knowledge of Seed Growing preferred. Wages, 25s. per week and cottage.—Apply, stating references and experience, to ALPHA, Daniels' Brothers, Norwich.

WANTED, by a Gentleman in Berkshire, about 60 miles from London, an experienced GARDENER, under 45 years of age, and married, without incumbrances. He must thoroughly understand Vines, Hotbeds, Training, Fruit Trees, and Flower and Kitchen Gardening. A good character is indispensable.—M. N. 14, Charles Street, St. James', London, S.W.

WANTED a GARDENER, for good plain Gardening, Meadow Land, and a Little Stock. Second man kept.—Wife to take Charge of Poultry and small Livestock. Two or three men to do the most comfortable place for a thoroughly trustworthy couple.—Apply, stating ages, last engagement and wages received, to H. R., 20, James Street, Buckingham Gate, London, S.W.

WANTED, immediately, by a Clergyman, a WORKING GARDENER (a Churchman, married, and without child preferred), to have care of Cows and Pasture Land, &c. Wages, £1 and cottage rent free.—Rev. H. L. Cliffe Rectory, Rochester.

WANTED, as UNDER GARDENER, a strong, active Man, to reside on the Premises, who will be required to clean knives and boots, and make himself generally useful. A good person, and of an indisputable character. Apply, stating age, references, and wages to the GARDENER, Ferndale, Nightingale Lane, Clapham, S.E.

WANTED, as FOREMAN, a married Man; must be a good Correspondent, used to Laying-out Grounds and the Management of a Nursery, and thoroughly conversant with the trade. Would have to attend Markets.—JOHN CATELL, Nursery and Seed Establishment, Westerham, Kent.

WANTED, a WORKING NURSERY BY FOREMAN, also a PROPAGATOR and GENERAL GROWER.—Wages, 15s. per week.—W. HOPWOOD AND SON, Jersey Gardens, Cheltenham.

WANTED, a WORKING (Outdoor) NURSERY FOREMAN, in a Country Nursery of about 10 acres. Must be a good Grafter and Budder, steady, and industrious. To a suitable Man the situation would be a permanent one.—State age, wages required, and references, to J. WOODS, Nurseryman, Woodbridge, Suffolk.

WANTED, an UNDER FOREMAN and PROPAGATOR.—One who is a good Grafter and Budder.—Apply, stating age, wages expected, and where last employed.—WITVY AND SON, The Nurseries, Cottingham.

WANTED, a PROPAGATOR and GROWER of Soft-wooded Stuff, by G. BARTON, Florist, Fowler Street, Camberwell Grove, S.E.

WANTED, as PROPAGATOR, a young rising Man, having a fair general knowledge.—State reference and wages required to CHARLES NOBLE, Bagshot.

WANTED, an EXHIBITION PLANT-GROWER and PROPAGATOR (Indoor). Liberal salary.—Apply, stating all particulars, to G. ASO W. YATES, Seed Merchants and Nurseryman, Manchester.

WANTED, a married MAN, without family preferred, to take charge of Conservatory, Plant Houses, Pits, &c., Under the Gardener's direction. Must understand the work, and have a fair knowledge of Plants, and produce a good character for sobriety, honesty, and industry. Wages 15s. per week, house, fuel, and candles free.—I. DEDMAN, Sundridge Park Gardens, Bromley, Kent.

WANTED, a steady, industrious MAN, to take the full and sole charge of a Garden of about an Acre—Flower, Fruit, and Vegetable, near Bexley Heath. There are two small Greenhouses.—Address, stating wages required and references, to E. H. E., W. Dawson & Sons, 121, Cannon Street, London, E.C.

WANTED, a steady, trustworthy young MAN, from 25 to 30 years of age, who must have a fair knowledge of the Value of Nursery Stock, both in and out-door, and be a good Plant Grower. Will have to attend market three days weekly the year round. Wages 25s. per week.—C. J. NOYES, Ponditon Nurseries, near Manchester.

WANTED, a middle-aged, married MAN, without family, to take Charge of a Flower and Fruit Market Garden in a few miles from Liverpool. He must be able to keep the Books, and Dispose of all the Produce. Wife to take care of the House and do the Cooking when the Family are there, also have Charge of some 20 or 30 Fowls. Both to live in the House.—Apply, stating wages required, with references, to JAMES SMITH, Nurseryman and Seedsman, Palm Grove, Cloughton, E. Kentish.

WANTED, TWO or THREE young MEN, accustomed to Potting and Watering, of English Language Nursery, Church Road, Upper Edmonton, London, N.

WANTED, a young MAN of good address, thoroughly acquainted with Book-keeping, and competent to wait upon Ladies and assist as Salesman in a Floral Business. Salary would be increased where talent and energy are displayed. Undeniable references required. Address, by letter, to Mr. Dave, Stationer, 128, Crawford Street, Baker Street, W.

WANTED, two steady and industrious LADS, from 14 to 18 years of age. Must have some knowledge of Rose Budding and Tying. Comfortable lodgings found. Apply, by letter, stating wages required, to HENRY BENNETT, Manor Farm Nursery, Stapleford, Salisbury.

JOHN CARTER, Nursery, Keighley, is in WANT of ONE or TWO good JOBBING MEN. Constant work, at wages according to ability. I.C.C. can obtain Temporary Employment for TWO or THREE GARDENERS (with satisfactory characters) waiting for situations.

To Gardeners and Florists.

WANTED, active young MEN and LADS in the Furnishing, Jobbing, and Shop Departments; also, FEMALE ASSISTANTS and LEARNERS in Bouquet and Table Decoration Department, at ROBERT GREEN'S Floral Establishment, Crawford Street, Bryanston Square, W. Apply any day before 12 o'Clock.

WANTED, in a Gentleman's Family, a married COUPLE, without incumbrance—the man to look after an Alderney Herd and Farmyard, the Wife to Manage Poultry. Wages £1 per week and cottage. Apply, by letter only, stating age, to K. T., Post Office, Foot's Cray, Kent.

WANTED, a strong active LAD, to Milk Four Cows and to fill up his time in the Garden. Wages 12s. per week, to be increased according to merit. Also, a young MAN for the Garden, at 15s. per week.—Mr. SEWELL, Gardener's Cottage, Isetworth House, Isetworth, Middlesex.

WANT PLACES.

To Gardeners in Want of situations,

WHOSE CHARACTERS WILL BEAR STRICT INVESTIGATION. THE PINE-APPLE NURSERY COMPANY desire special attention to this important matter—proper Men to suitable situations. For a GARDENER, or for a SITUATION, please send full particulars to Mr. JOHN BESTER, the Pine-Apple Nursery Company, Maiden Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the quality of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head gardeners.

JOHN LAING can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS or GARDENERS for first-rate Establishments or Single-hand situations, can be suited, and have full particulars by applying at Strandstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

GARDENER (HEAD), where one or two others are kept.—Age 30, married, two children. Testimonials and references in view of good establishments—wards for three years in last situation.—H. H., Mrs. Laurie, Osborne Road, Wellington Road, Hounslow, W.

GARDENER (HEAD), where one or more are kept.—Age 28; thoroughly understands his profession in all branches. Four years' good character.—E. WATSON, The Gardens, Ealing Park, Ealing.

GARDENER (HEAD).—Age 30, single; thoroughly practical in all branches. No single-hand place accepted.—M. M., 81, Sunnyside Road, Hornsey Lane, N.

GARDENER (HEAD).—Married, two children (ages five and three years); has a practical knowledge of the profession. Nearly four years' character as Head Gardener.—T. WOOD, The Gardens, Normandy House, Alton, Hants.

GARDENER (HEAD).—Age 35, married, one child (age six years); thoroughly understands Vines, Peaches, Cucumbers, Flowers, Vegetables, and Early and Late Forcing. Seven years' good character.—R. T., Mr. Chard, Clarendon Park, Salisbury, Wilts.

GARDENER (HEAD).—Age 39, married; no incumbrance; 25 years' experience in every branch of the Profession. Forcing all kinds of Fruits, Flowers, and Plants; is an excellent Flower Grower and a good Kitchen and Flower Gardener.—D., 13, Church Road, Hammersmith, W.

GARDENER (HEAD).—Age 39, married; thoroughly understands his profession in all branches. Left last situation through death and change of hands. Good character; seven years in last place.—A. B., Post Office, Grays, Essex.

GARDENER (HEAD).—The Dowager Lady SANDLES will be very glad to highly recommend WILLIAM SAWYER as a thorough good practical Gardener in every department. He has lived with her nineteen years, and is leaving owing to the death of the late Lord Sandes.—WM. SMYTHE, Elmham Hall, East Dereham.

GARDENER (HEAD).—Age 43, married, no family; good knowledge of the profession. Proper help must be allowed, according to the wants of the family; also the necessary conveniences for carrying out the work. No wages preferred. Good character.—A. C., 2, Spring Grove Villas, Kingston-on-Thames.

GARDENER (HEAD), age 38, married.—J. SPAVEN, four years and a half at the Royal Kitchen Garden, Hampton Court, S.W., offers his services to any Nobleman or Gentleman requiring a trustworthy and efficient servant. Highest references from last and previous employers.—8, Queen's Road, Teddington, S.W.

GARDENER (HEAD), married.—GEORGE COOKE, upwards of four years Head Gardener to W. F. E. Wynne, Esq., Peniarth, Towy, seeks a re-engagement with any Lady or Gentleman in want of a good practical Man. First-class character.—The Gardens, Penarth, Towy, North Wales.

GARDENER (HEAD), age 29, married.—A GENTLEMAN can highly recommend the late Gardener, who has a thorough knowledge of the profession in every branch. Has had fourteen years' experience in extensive Establishments under first-class practical Men. Excellent references from previous employers.—N. GERMAN, 70, Duke Street, Whitehaven.

GARDENER (HEAD).—Age 33, married, without family. Eighteen years' sound practical experience in some of the best establishments in England. Thoroughly competent in every branch. Testimonials from late and previous employers as to abilities and moral character.—J. W., Mr. Henderson, Sion Nursery, Thornton Heath, Croydon.

GARDENER (HEAD), married, with family.—GEORGE BOOTHROD, twelve years Head Gardener at Woodville Hall, near Dover, who will shortly be disengaged, in consequence of the death of his employer, offers his services to any Lady and Gentleman in want of a thoroughly practical, trustworthy Man. Is capable of undertaking the Management of all large Green Establishments. Highest testimonials as to character and abilities.—The Gardens, Woodville Hall, Dover.

GARDENER (HEAD), to any Nobleman or trustworthiness and practical knowledge of the profession. Age 30, married. Seven years Head Gardener in a large place, and has had sixteen years' close practice in the Forcing of good Peaches, Apples, and several kinds of Fruit, and in the Kitchen and Greenhouse Plants, Flower and Kitchen Garden, and Pleasure-grounds.—A. Z., Mr. B. Watson, Church Terrace, Church Road, Tottenham, N.

GARDENER (HEAD, WORKING).—Age 41, married; understands the profession in all its branches. Good character.—A. H., Post Office, Havering, Romford, Essex.

GARDENER (HEAD, WORKING).—Age 29, married; good practical knowledge of the profession in all its branches.—J. G., Messrs. Hugh Low & Co., Nurseries, Upper Clapton, London, E.

GARDENER (HEAD, WORKING).—Age 32, married, no children; thirty years' experience in all branches of the profession. Good character from last and previous employers.—J. HANKINS, 1, Wilton Cottages, Grove Road, Acton, W.

GARDENER (HEAD, WORKING).—Age 24, no incumbrance; experienced in Growing all kinds of Flowers, Fruits, and several Vegetables. Good character from last situation.—W. H., The Seed Store, Station Road, Sutton, Surrey.

GARDENER, age 37, married.—A GENTLEMAN wishes to recommend his Gardener, who is a very industrious man, having a thorough knowledge of the profession in all its branches.—W. MASON, Warren Park, Hever, near Edenbridge, Kent.

GARDENER.—Experienced; has had the Management of Greenhouses, Conservatories, Fruit-pits, Frames, and Flower and Kitchen Gardens, and has served five years as Under Gardener where three Men were kept. Six years in last place.—E. R., Post Office, West Malling, Kent.

To Florists.

FOREMAN, or MANAGER.—Age 28; well brought up in Furnishing, &c., also thoroughly understands Floristry. Has had several years' experience in first-class West-end Firm.—J. B., 29, Queen Street, Bryanston Square, W.

FOREMAN, or good SECOND GARDENER, in a Gentleman's Garden.—Age 24; thoroughly understands the Houses and Kitchen Garden. Nine years' good practical experience.—A. HOARE, T. Rogers, Frimley Park, Surrey.

FOREMAN and PROPAGATOR.—Twenty years' experience in Growing Plants and Cut Blooms for Covent Garden Market; likewise Grape and Cucumber Grower, if required.—A. B., 43, Alpha Road, Surbiton, Surrey.

FOREMAN in the London FURNISHING TRADE, or similar situation in a Florist Establishment, where trust and experience are required. Unexceptionable character.—J. BROMWICH, Seedsman and Florist, 25, Buckingham Gate, S.W.

GARDENER (SECOND) in a Nobleman's or Gentleman's Garden.—Age 27. First-class references.—M. A. P., 23, Elizabeth Place, Rochester.

GARDENER (SECOND), in a Nobleman's or Gentleman's Garden.—Age 27, respectable. Two years' good character from present situation.—Address, stating wages, W. K., 6, Finsbury Cottages, Nightingale Road, Wood Green, London, N.

Wholesale Depot, 20, Great Titchfield Street, Oxford Street, London, W.

Grateful—Comforting.

EPPS'S COCOA.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavored beverage, which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shail by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the Civil Service Gazette.

Made simply with boiling water or milk. Sold in packets (in tins for abroad) labelled—JAMES EPPS and CO., HOMEOPATHIC CHEMISTS, 48, Thredneedle Street, and 170, Finsbury, W.

—RUSTON ROAD, and GARDEN TOWN, LONDON, N.W. Makers of Epps's Glyceric Jujubes for Throat Irritation.

In consequence of Spurious Imitations of LEA and PERKINS' SAUCE, which are calculated to deceive the Public, LEA and PERKINS have adopted a New Label, bearing their Signatures, thus—every bottle of WORCESTER'S PEPPER SAUCE, after this date, and without which none is genuine.—Sold Wholesale by the Proprietors, Worcester; CHOSSE & BLACKWELL, London; and EXPORT OILMEN generally. Retail, by Dealers in Saucers throughout the World.—Wm., 1874.

DINNEFORD'S FLUID MAGNESIA. The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best Aperient for delicate Constitutions, especially adapted for Ladies, Children and Infants.

DINNEFORD AND CO., 172, New Bond Street, London, W.; and of all Chemists throughout the World. AT THIS SEASON COUGHS, COLDS, ASTHMA, and INFLUENZA, are speedily cured by the use of SPENCE'S PULVIC ELIXIR. Sold by all Chemists.

Respectfully invites the Nobility and Gentry about to furnish their Conservatories, Greenhouses, Stoves, and Orchid Houses, to an Inspection of his Stock of Magnificent Specimens, that are unequalled in this country, consisting of

THE CHOICEST AND RAREST EXOTICS,
 TREE FERNS, DRACÆNAS, PALMS, CAMELLIAS, AZALEAS, AGAVES, YUCCAS, CYCADS,
 BEAUCARNEAS, ARALIAS, and all kinds of Flowering STOVE and GREENHOUSE PLANTS.

Besides the LARGE CONSERVATORY, which is at all times of the year worth a visit, there are numerous Houses, consisting of ORCHID HOUSES, PALM STOVES (to which many new and interesting Plants have of late been added), NEW HOLLAND HOUSES, FERN HOUSES, AZALEA HOUSES, &c., replete with Plants which, by the interest and instruction they will afford, will well repay a visit.

All New Plants that are worthy of notice are to be seen here. The houses have all been erected to suit the requirements of the Plants, which is one of the surest roads to success in their cultivation.

Should Purchasers require Selections or Collections of Plants they may depend upon having them put up with judgment. In such cases it is advisable to supply a List of the kinds already possessed.

Priced Catalogues Gratis and Post Free to all applicants.

LANDSCAPE AND SUB-TROPICAL GARDENING.

Estimates, Plans, and Advice given for the Laying-out Parks, Pleasure Grounds, &c.; also for Erecting Greenhouses, Conservatories, and the Construction of Rockwork and Ferneries.

Post 8vo, cloth, price 5s., or free by post 5s. 6d. each.

PUBLISHED AND SOLD AT VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, N.

THE HANDSOMEST AND BEST NEW POTATO IS
CARTER'S AMERICAN BREAD-FRUIT.

Indispensable as one of the best Potatos for Exhibition.

CARTER'S
 AMERICAN
BREAD-FRUIT.

FOR MAIN CROP.

This is a grand Potato in every respect. Handsome in shape, with very shallow eye. Flesh of fine texture and superb quality, whether baked or boiled. It is a first-rate keeper, and extremely prolific.

An invaluable acquisition to Hotel Keepers, for Public Institutions, &c.

CARTER'S AMERICAN BREAD-FRUIT POTATO.
 Per Peck, 6s.; per Bushel, 21s.; per Cwt. 35s.; per Ton, £30.

THE POTATO THAT BEST
 RESISTS DISEASE

CARTER'S
 IMPROVED RED-SKIN
 FLOURBALL.

Price per Peck, 2s. 6d.; per Bushel, 5s.;
 Per Cwt. 17s.;
 Per Ton, for not less than half a ton, £14.

We again offer a very fine selected stock of this invaluable Potato, which continues to resist the ravages of the disease in a most surprising manner. We have at all times avoided the statement published by some Houses, "that the Red-skin Flourball Potato is the only disease-proof variety." We, however, repeat that our Improved Red-skin Flourball resists the disease to a far greater extent than any other variety in cultivation.

CARTER'S Improved Red-skin Flourball was one of the varieties in the great Trial of Potatoes made by the Royal Agricultural Society of England last year, and we believe we are justified in stating that it fully maintained its disease-resisting reputation, whilst other varieties were nearly consumed by the disease.

Carter's

THE QUEEN'S SEEDSMEN, 237 & 238, HIGH HOLBORN,

To be sold cheap for cash, or would take the VALUE in SHRUBS, selected, Rhubarb, Seakale, and Asparagus Roots, Gooseberries, and Currants. E. WHITE, Nurseries, Holdenburth Road, Bournemouth.

AMERICAN CRANBERRY PLANTS.—There are doubtless many thousands of acres of Swamps, Bogs, and Marshes throughout the United Kingdom, which are now comparatively worthless and unproductive, that may be made to yield a handsome income by cultivating this delicious fruit. We are now prepared to furnish strong and well-rooted Plants, in any quantity, carefully packed for transportation, at the following prices, which includes cost of packing and delivery on board steamer, with full directions for planting and subsequent cultivation. 10,000 plants are required for an acre. Cash or satisfactory references to accompany the orders. No orders accepted for less than 1000 plants. Remittances can be made by Draft or Postal Order on New York. Address:—B. K. BILBINGSON AND SONS, Seed Merchants, 34, Barclay Street, New York.

WHITE'S CRANBERRY CULTURE, 100 pages, illustrated, sent post paid upon receipt of 6s. Cash or satisfactory references to accompany the orders. No orders accepted for less than 1000 plants. Remittances can be made by Draft or Postal Order on New York. Address:—B. K. BILBINGSON AND SONS, Seed Merchants, 34, Barclay Street, New York.

NEW SHOW PELARGONIUMS. CHARLES TURNER begs to call attention to the select LIST of PELARGONIUMS now offered. The New Varieties, both Show and Fancy, have been most favourably spoken of by the Horticultural Press, and the majority have received First-class Certificates at Metropolitan and other Shows. Plants are now ready, and if purchased at once and repotted will produce a fine head of bloom in May and June next. The following have been selected from many thousands of Seedlings, and are highly recommended:—ALICE (Foster).—Lower petals rose crimson, maroon spot on top petals, crimson-purple edge, large white eye, very fine. ARCHDUCHESS (Foster).—Lower petals richly painted crimson, with very purple edges, top petals black, with narrow crimson edge, large clear white centre, a fine dark and effective variety. ARISTOCRAT (Foster).—Rich deep crimson, black spot on top petals, crimson margin, white centre. CONSTANCE (Foster).—Fawn colour, with small spot on the top petals, shaded with orange, a large smooth flower of fine form, clear white eye. Figured in 'The Florist' for February, 1875. CROWN PRINCE (Foster).—Lower petals richly painted crimson, black on maroon top petals, bright narrow edge, clear white eye, very fine. Figured in 'The Florist' for February, 1875. DAUNTLESS (Foster).—A good specimen, style of Statesman, medium black spot, a good flower. DEFIANCE (Foster).—Crimson-purple maroon, black on top petals, edged off to edge with crimson, white centre, a rich dark flower. DUCHESS OF CAMBRIDGE (Foster).—Scarlet, medium black spot on top petals, smooth, fine form and a good habit. DUKE OF CONNAUGHT (Foster).—Lower petals crimson, dark rose top petals, white centre, a large fine-shaped flower, of good habit. FALCON (Foster).—Rosy purple, black spot on top petals, white centre. GRAND MONARCH (Foster).—Crimson lower petals, dark top, crimson edge, white centre. ISABELLA (Macveas).—Lower petals rosy pink, medium maroon spot on top petals, shaded brick orange-pink, lilac-rose edge, large white centre, very free. PRESIDENT (Foster).—Lower petals rich rose crimson, dark maroon spot on top petals, crimson edge, large clear white centre. QUEEN VICTORIA (Foster).—Lower petals crimson, medium black spot on top, bright orange-crimson edge, white centre, fine. SULTAN (Foster).—Light crimson-purple, suffused with lilac, light centre, good shape and substance, very free. SVBL (Foster).—Soft pale orange, small maroon spot, shaded with orange, white centre, a very fine novel flower. Price for above Set on application.

NEW FANCY VARIETIES. 7s. 6d. each, or 31s. 6d. the set. ATLANTIC (Turner).—Rich crimson suffused with purple, smooth and excellent habit. HENRY BAILEY (Turner).—Crimson, with white eye, very dwarf and a most abundant bloomer, a useful flower for exhibition, market, or the home stage. JEWESS (Turner).—Top petals rosy carmine suffused with carmine, lilac edge, light most lovely shade. LADY MAYORESSE (Turner).—Rosy lilac, large white eye, white edges, a fine flower. MRS. HART (Turner).—Rosy crimson purple, narrow white margin on top petals, shaded off with rosy purple to a large clear white eye, a fine-shaped and superior variety. THE SHAH (Turner).—Deep crimson purple, light centre, narrow lilac edge, a smooth and very pleasing variety, the best by far of its class. The Royal Nurseries, Slough.

LOBELIA PUMILA MAGNIFICA. THE PINE APPLE NURSERY COMPANY. Are now sending out this fine Lobelia. Price 2s. 6d each, or 24s. per dozen for not less than half a dozen. It received the Floral Certificate at the Royal Botanic Society, and a First-Class Certificate at the Royal Horticultural Society. It has been favourably noticed by all the gardening papers, and the 'Gardener's Magazine' of July 18 says of it:—This dwarf bedding Lobelia, exhibited by the Pine-Apple Nursery Company, is unquestionably the most important of the many bedding Lobelias introduced of late years. The colour of the flowers is a deep indigo blue, and as there are no conspicuous eyes to mar the general effect, a solid mass or band will tell in a wonderful manner. MAIDA VALE, LONDON, W.

FRESH SEEDS OF RARE CONIFERS. MR. J. C. STEVENS will SELL by AUCTION, on MONDAY, March 23, at his Great Rooms, 38, King Street, Covent Garden, W.C., fresh SEEDS of the following RARE CONIFERS, from the Californian Sierra Nevada, collected by M. Rocl in October and November, 1874, comprising:—

Extract from "The Times,"

Royal Counties Show at Reading, June 27, 1874.
 "To Horticulturalists the specimens of Rendel's Patent System of Glazing and the Portable Glass Protector for walls proved attractive."
 "Their distinctive features are that all the work is done without putty."
 "It is asserted that 1500 square feet of glass can be put in the building in one hour by one man, and any damaged glass can be replaced without calling in the aid of a Glazier."
 "All the wood and paint are covered by the glass, and the system goes well and satisfactorily tested by the heavy showers on Wednesday, there not being the slightest leakage of water to the interior."
 Illustrated CATALOGUES and BOOKS OF DESIGNS, with Eighty excellent Illustrations, can be had on application to the Patentee and Inventor,

Extract from the "Builder," Jan. 30, 1875.

"Rendel's Patent System of Glazing has been used for some time past in Horticultural Works with complete success. When adopted to think it may be, and will be, much extended. In this system the Glass is placed in horizontal metal grooves, and fixed on wooden rafters, without putty. The woodwork is completely covered by the metal and the glass, so that it is not exposed to the action of the atmosphere. The glass moves freely in the metal grooves, and can be easily removed, so that if a pane of glass is broken it can only be replaced without the aid of a glazier. Moreover, the system is said to be very economical."
 "The Water Garden and Aquarium about to be formed in Westminster are to be covered in this way; and so will be many other buildings before long."

New Potatoes for 1875. JOHN CATTELL with the greatest confidence recommends the following, which have received 1st-class Certificates... ECLIPSE KIDNEY (Cattell), price 6s. per 7 lb. RILLANCE KIDNEY (Cattell), price 4s. per 7 lb. ADVANCE KIDNEY (Cattell), price 4s. per 7 lb.

Will send out in May next Mr. Laxton's New Double Zonal Pelargoniums—EMILY LAXTON, strong plants, 15s.; GUIDING STAR, 10s. 6d.; and ILLUMINATOR, 7s. 6d. each; the set, £1 10s. A Coloured Plate of Emily Laxton post free for 1s. 6d.

W. & J. B. are also sending out Mr. Laxton's richly-flavoured and fine-fleshed New Strawberries, TRAVELLER and EXQUISITE. Strong plants of Traveller, £1 per 25, £3 per 100; Exquisite, 12s. 6d. per 25, £2 per 100. Early-struck runners of each, in 60-sized pots, 7s. per 25 each.

Trade Terms on application. W. & J. BROWN, NURSERYMEN AND FLORISTS, STAMFORD.

MAURICE YOUNG'S NEW DESCRIPTIVE CATALOGUE Is now ready, and may be had on application.

IT COMPREHENDS:— HARDY JAPANESE and other CONIFERÆ. HARDY ORNAMENTAL TREES, SHRUBS, and EVERGREENS. RHODODENDRONS in fine named varieties; PONTICUMS, and other common kinds for covers. ROSES, Standard, Half-standard, and Dwarf, in all the best kinds. FRUIT TREES. CLEMATIS, and other climbing Plants. Cheap EVERGREENS and DECIDUOUS TREES and SHRUBS for Planting Belts and Shrubberies. TRANSPLANTED FOREST TREES. QUACKS and other Hedge Plants. DWARF EVERGREEN and VARIEGATED PLANTS for Winter Bedding, &c.

DESIGNS, PLANS and ESTIMATES prepared for Laying-out and Planting New Grounds, and for Improving Park Scenery and Existing Shrubberies and Plantations. MILFORD NURSERIES, near GODALMING.

Hardy Dwarf-growing Scarlet and Crimson RHODODENDRONS. W. JACKSON AND CO., Nurseries, Bedale, Yorkshire, beg to offer their well-known, high-coloured, and freely-flowering dwarf Rhododendrons, all grown from layers, and perfectly hardy.

Cabbage Plants! Cabbage Plants! TRUE N. N. MESSRS. W. VIRGO AND SON can now supply any quantity of strong— ROBINSON'S DREAMHEAD .. 3s. 6d. per 100 EARLY WATERBURY .. 3s. 6d. ,, NONPAREIL .. 3s. 6d. ,, ENFIELD MARKET .. 3s. 6d. ,, RED PICKLING .. 5s. 0d. ,, Wonders Nurseries, near Guildford, Surrey.

Planting Season—Avenue Trees. LIMES, 12 to 16 feet high, straight stems, girthing 4 to 8 inches at a foot from the ground, with well-balanced heads, and splendidly rooted, to be more than 5000 of these fine Trees to select from. LIMES, OCCIDENTAL, 12 to 16 feet. HORSE CHESTNUTS, 10 to 12 feet. SCARLET HORSE CHESTNUTS, 10 to 15 feet. NORWAY MAPLES, 10 to 16 feet. All being stout, strictly stemmed, and finely rooted. Every Tree has been removed within two years. POPLAR, CANADENSES NOVA, 18 to 20 feet.—This new variety of Poplar, far exceeding in rapidity of growth any Tree I am acquainted with, is strongly recommended as a town Tree, especially in smoky districts. There are hundreds in this Nursery three years old, measuring 13 to 22 feet high, and stout in proportion. ANTHONY WATERER, Knapp Hill Nursery, Woking, Surrey, S.W.

New Roses—Strong Plants now Ready. JOHN FRASER, of the Lea Bridge Road Nurseries, Essex, has much pleasure in offering strong plants of the following carefully selected varieties of NEW ROSES for 1875, which may be relied on as being the best of this year:—

HYBRID PERPETUAL ROSES. Adanson Hippolyte Juinain Arthur Oger La Souveraine Antoine Mouton Madame Rougier Colored de Sansal Mademoiselle de Lons de Adorjan Casimir Perier May Turner Mons. E. Y. T. JOSEPH BAUMANN, Nurseryman, Ghent, Belgium, begs to offer:—

- AZALEAS, 11 New Hardy (A. Water's), named, with flower-buds, 2s. each. AZALEA MOLLEIS, 18 New Hardy (L. Van Houtte's), named, with flower-buds, 4s. each; without flower-buds, 3s. each. GHENT AZALEAS, 10,000 Hardy, named, with flower-buds, 12s. to 6s. 2s. per 100; per names, 10s., 10 sorts, 8s. 6d. RHODODENDRONS, 5000 Hardy, named, with flower-buds, 2s., 3s. and 4s. each.

Gladioli from Paris, per Names and Seedlings, IVEQUE AND SON, NURSERYMEN,

1799-Sur-Seine, near Paris, beg to offer splendid, healthy, and good flowering bulbs of GLADIOLI, to the price:— Gladioli, seedling, first-rate, 8s., 2s. 100, 2s. 1000; mixed white, 12s. 2s. 100; do. red, 12s. 2s. 100; do. yellow, 24s. 2s. 100; do. rose, 12s. 2s. 100; per names, 10s., 10 sorts, 8s. 6d. 100; 5s. 10s. 14s. 2s. 100; 5s. 10s. 14s. 2s. 100; 5s. 10s. 14s. 2s. 100; 5s. 10s. 14s. 2s. 100; 5s. 10s. 14s. 2s. 100; and upwards, according to the novelty of the sorts, all in good flowering bulbs. English Cheques or Post Office Orders on Paris accepted for payment.

Rhododendrons HENRY FARNSWORTH, Matlock Bank,

Derbyshire, has to offer a fine stock of the following, at a moderate rate:— 3-yr. Seedling, fine. 3-yr. Seedling and 2-yr. transplanted. 4 to 8 inches good stuff, 6 to 10 inches bushy. For prices and samples apply as above.

POTATOS for PLANTING of the following sorts, English-grown, in any quantity:—Mylatt's Prolifer, Breese's Peerless, Red-skinned Flourish, Paterson's Victoria, Climax, and Regent.

By the peck, cwt., sack, or ton:—Mona's Fringe Ashtep, Rivers Ashtep, Early Rose, Late Rose, Early Goodrich, and Hundredfold Fluke. By the peck, bushel, cwt., or sack:—Erian's Queen Ashtep, Belgium Kidney, Dalmaohy, Paterson's New Prince, and Early Don. The above, generally speaking, are grown on silt soil, and are, therefore, a good change for any part of the country. AMERICAN IMPORTED, as under, by the lb., stone, or cwt.:—Snowflake, Eureka, Acme, Nansuet, Early Gem, Comely's Surprise, King of the Fairies, Climax, and Late Rose. By the sack or ton:—Brownell's or Vermont Beauty, and Extra Early Vermont. Wholesale and Retail PRICE LISTS free on application. Also, 100,000 of 200,000 2-yr. CONNOVER'S COLOSSAL ASPARAGUS PLANTS. Also, 100,000 of 200,000 2-yr. CONNOVER'S COLOSSAL POTATO GROWER and MERCHANT, Market Place, Peterborough.

Cheap Plants. WILLIAM BADMAN offers the following plants for present potting:—

- YERBENA, Purple, White, Scarlet, Crimson, and Rose, from 20s. per doz. per dozen 2-yr. rooted cuttings, 1s. per dozen, 6s. per 100, 50s. per 1000. PELARGONIUMS, Scarlet, White, Crimson, and Rose, best sorts, good plants, from single pots, 1s. 6d. per dozen, 10s. per 100. LOBELIA, speciosa, true, from cuttings; also pumila grandiflora and little Gem, 3s. per doz., 20s. per 1000. HELIOTROPUM, finest dark varieties, 1s. per dozen, 6s. per 100, 50s. per 1000. CALEOLARIA, Golden Gem, finest bedder, 1s. per dozen, 6s. per 100, 50s. per 1000. AGERATUM, Imperial Dwarf, Blue, makes a fine bed, 1s. per dozen, 5s. per 100, 40s. per 1000. IRESINE, Linden, crimson leaf, good, 1s. per dozen, 6s. per 100, 50s. per 1000. COLEUS, Verschaffeltii, 1s. per dozen, 6s. per 100. STELLARIA, aurea, new golden edging plant, 1s. per dozen, 4s. per 100, 30s. per 1000. GERANIUMS, Show and Fairy sorts, strong plants, for spring bloom, 1s. per dozen, 6s. per 100. CENTAUREA, candidissima, silver leaf, strong plants, 3s. per dozen, 20s. per 100.

Forget Me Not. The Only Rare and Thoroughly Distinct LOBELIA of the SEASON, BLUE STONE—

hitherto a hidden gem. Strange that this, by far the best of all the Lobelias, should have been kept back from the public by a "crocket," and it is only within the last few days that the seed has been placed in my hands. The darkest blue, no eye, strong compact pumila habit, foliage strange to say, is most peculiar purplish green, and its whole character far exceeds any other Lobelia. Five hundred seeds, post free, 12s. 6d.

Price 1s. 9d. (Gross) per packet, February 20: "Challenging the whole of the Horticultural community to produce a better." New Florist Flowers and Florist Flower Seed Merchant, Woolwich, S.E.

H. CANNELL, FORGET ME NOT. H. CANNELL, begs to announce that his FLORAL GUIDE for 1875 is now ready, and will be sent, post free (cost price), for ten stamps. It is beautifully illustrated with 200 splendid and correct engravings. It also contains particulars and correct descriptions of all the new and the best new and old varieties of soft-wooded plants in cultivation, and it is highly important to amateurs and gardeners that they should procure it continually, for it contains invaluable and practical information on Florists' Flowers and Bedding Plants and their Seeds; and the cheap, ready, and correct manner in which they are supplied, forwarded to any part of the world cannot fail to be a great advantage and highly appreciated by all who are really fond of the choicest flowers.

NEW FUCHSIA, "MRS. H. CANNELL."

—This magnificent variety last year bore out even more than the high character previously given it, and is by far the best double white corolla variety; foliage and flower even an advance on the good old dark Avalanche. Fine half-specimen plants, 2 feet high, in 6-in. pots, 7s. 6d. each; 8-in. ditto, 5s.; nice plants in thumbs, 1s. 6d. each; small rooted little plants, or two cuttings, 1s. post free.

New Florist Flowers and Florist Flower Seed Merchant, Woolwich, S.E.

MR. WILLIAM BULL

HAS NOW IN BLOSSOM

PHALÆNOPSIS LEUCORRHODA AND P. LEUCORRHODA MAJOR,

With several other Hybrids and varieties, imported by him last year from the Eastern Archipelago. Those interested in these beautiful plants may view them at Mr. W. B.'s Establishment.

MR. WILLIAM BULL has lately received from his Collectors in the United States of Colombia many thousands of CATTLEYAS, extremely handsome and distinct varieties, dried flowers of which can be seen; ODONTOGLOSSUMS, including O. CRISPUM (ALEXANDRÆ), and O. HASTILABIUM; ONCIDIUM WELTONI, and O. KRAMERIANUM, and various other species.

- 1st, Mr. J. Douglas, 7s. 6d.

SATURDAY, MARCH 20, 1875.

THE ISLANDS of FINISTÈRE.

(Concluded from p. 334.)

WHAT strikes a stranger at first sight at Ouessant is to find nobody but women there. The men are away in the service of the navy, or are busily employed on board their fishing boats. Consequently it is the women who cultivate the ground. I saw some forking up Potatoes out of the earth. The children picked them up and piled them in heaps, whilst other women came and carted them away. Others, again, were digging their fields, for the plough is unknown in this corner of the world. All these people appeared healthy and strong. The women might be called very good-looking, with their long hair streaming over their shoulders, and their flat-topped head-dresses in the Italian style. They rear oxen and horses, a great many fowls, but especially a whole army of sheep—more than 6000 for 2000 inhabitants. And such sheep! One of these animals, skinned and dressed for cooking, weighed about 10 lb., and it was the fattest we could find. In justice I ought to add that it was excellent, as likewise was every one we ate. The hens are equally numerous with the sheep. There was a time when the horses were the same; but this small race, much sought after to go in harness, has disappeared through the fault of the inhabitants. According to what the old people told me, these horses were extremely vigorous, and must have borne a great resemblance to the good little island horses on which I have taken many a pleasant ride.

Everything, however, is small at Ouessant, even to the windmills. I stood stupefied before the first I met with. Fancy a cubic yard of unmortared masonry, on which a sentry-box is perched. Four sails, a yard and a half long each, complete this wonderful molarly system. But what a host of them there are! I pictured to myself that some dealer in playthings, having giants' children for customers, had left his stock in trade behind him, and I walked away laughing and humming the refrain—

"Pleurez, pleurez petits enfants,
Vous aurez des moutons à ven't."

"Cry away, children; cry till to-morrow;
You shall have windmills to comfort your sorrow.
Cry away, babies; cry, cry away;
There's plenty of windmills to help you to play."

Behind the houses, which are neatly constructed, are inclosures wherein grow a few meagre vegetables, consumptive Apples and Fig trees, which are pitilessly shorn by the wind the moment they venture to overtop their sheltering walls. A few inhabitants indulge in luxury to the extent of cultivating flowers, including Roses, Fuchsias, Lavatera arborea, Veronica decussata.

These people lead a happy life, undisturbed by the pressure of artificial wants, of which they remain in ignorance. They are honest, worthy people, who send their children to school, who listen to the voice of their mayor and their curé, and all whose cares and anxieties are centred in the father and the husband out at sea, when the storm is raging. Too often, alas! those fears are not groundless, and the poor widow and her orphan children have to follow, in tears, a cross, which is the representative of the beloved lost one, and over which—a touching custom of this primitive and religious people—the funeral ceremonies are

performed in the absence of his body beneath the cruel waves.

I return to my botany. What surprised me from the first moment was to see a large quantity of cultivated Arundo Donax, strong and vigorous. It is employed in the fabrication of fish-traps. Oziers also are grown for the same purpose. A plant found in the wild state almost everywhere is Veronica decussata, known here, as well as in Molène, by the name of Myrte de Ouessant or Ouessant Myrtle. In the two days which I spent on the island I collected 243 Phanerogams, for the most part extremely common. Nevertheless, I found Ophioglossum lusitanicum already in fructification, Raphanus maritimus, Viola lancifolia, Sambucus ebulus, very rare on the continent; Anagallis tenella, Plantago lanceolata var. lanuginosa, Sueda fruticosa, Scilla verna, Spiranthes autumnalis, Triglochin palustre, divers Kushes, several Carices, Rumex rupestris, one of the good plants of Finistère, Hydrocotyle vulgaris, several Mints, Inula crithmoides, Crithmum maritimum, Celery, Samolus valerandi, &c. I reckoned much on finding some of the rock-loving Statics, but there was not a trace of them. Another cause of astonishment was the absence of Ulex europæus. It exists on some cultivated lands as a forage plant, but is replaced in a wild state by U. nanus.

My herborisation finished, I returned to sleep on board, for we were to leave at daybreak. In fact, at five in the morning I was awakened by the preparations for getting under weigh, and I stepped on deck to bid farewell to Ouessant, which I am never likely to revisit. At a quarter past five we started for the Ile de Seins. I did not expect to make any grand discoveries in that island, which consists of nothing but rock covered with sand. Its length is a mile and a half, and its breadth does not exceed a quarter of a mile. Moreover, it lies so low that the sea sometimes submerges it. In 1864, during a gale of wind from the south-east, the water entered into the houses, and the complete destruction of the village was with difficulty prevented. In spite of the slight elevation above the level of the sea, there is a well in the middle of the island whose water is perfectly sweet. I could, therefore, only expect to find a few sand-loving plants. But an interest of a different kind attracted me to the Ile de Seins. I wished to have a near view of its inhabitants, to whom the Government, fifty years ago, was obliged to make an allowance of biscuit, bacon, and haricots, to keep them alive. It was no more than a just recompense for their devotion in saving the vessels so often in distress about their island. For a considerable time past, the increased means of communication have enabled them to sell their fish to advantage. The making of soda has also greatly helped their trade; so that amongst all the 750 inhabitants there is not a single pauper; comfort and ease are everywhere apparent. The land, tilled by the women, as at Ouessant, produces little besides Barley and a few vegetables. This Barley is given as forage, with a very sparing hand, to the few cattle kept in the place, and whose principal provender consists of seaweed; consequently, the milk from the cows is strong and charged with iodine. Might not this fact be turned to some good medicinal purpose? Flour, biscuit, bacon, and Potatoes are obtained from the continent, but the alimentary mainstay of the population are congers, whose flesh, prepared in the same way as cod, hangs drying in the sun on the walls of the houses all summer long. Dried seaweeds are exclusively employed as firing. I found there seventy-four plants, including Honkeneya peploides, Lavatera arborea, Eryngium maritimum, Matricaria maritima, Plantago intermedia, Armeria maritima, Salsola Kali, Carex arenaria, Euphorbia portlandica, Spargularia rubra,

- MISCELLANEOUS—EXTRA PRIZES.
- Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, for a Group of Hyacinths, Tulips, Narcissus, &c., Silver Medal.
- Mr. J. Wills, Sussex Place, Old Brompton, for a Group of Foliage and Flowering Plants, Silver Medal.
- Mr. W. Paul, Paul's Nurseries, Waltham Cross, for a Group of Camellias in pots in flower, Silver Medal.
- Mr. E. S. Williams, for a Group of Foliage and Flowering Plants, Silver Medal.
- Mr. J. Aldous, Florist, &c., Gloucester Road, South Kensington, for a Group of Foliage and Flowering Plants, Bronze Medal.
- Mr. G. Goddard, for a Group of Cyclamens, Bronze Medal.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, for the relief of decayed Farmers, their Widows and Orphans.

Patron—HER MAJESTY THE QUEEN.
President—HIS GRACE THE DUKE OF RICHMOND.
Allowances to Pensioners.
Married £40 per annum.
Male £20
Widow and unmarried Orphan Daughters £20
Every information to be had of the Secretary, by whom Subscriptions and Donations will be thankfully received.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—THE FIFTEENTH ANNUAL WINTER FESTIVAL.—The Funds of the Institution, will take place at Willis's Rooms on SATURDAY, June 5, at 6 o'clock.

H. R. H. THE PRINCE OF WALES, K.G., in the Chair.
Dinner tickets, 25s., application for which should be made to the Secretary not later than May 22.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—THE ANNUAL GENERAL MEETING will be held at Willis's Rooms, St. James's, on WEDNESDAY, June 16, at 12 o'clock precisely, and the ELECTION of PENSIONERS will take place on the same day, at half-past 11 o'clock.
All Subscriptions shall be deemed payable on January 1 in each year; and no Contributor shall vote in respect of an Annual Subscription while the same is in arrear.
Officers of the Institution—
No. 26, Charles Street, St. James's, London, S.W.

Malva sylvestris and rotundifolia, Oxalis corniculata, Mercurialis annua, Glyceria conferta, Sclerochloa loliacea, &c. But the plant which gave me the greatest pleasure was Euphorbia pepilis, which I had not hitherto been able to find on the Breton coast, where it is very rare.

About two o'clock we left the island for Douarnenez (on the mainland, and which gives its name to a capacious bay). We had to cross the Raz de Seins, notorious for the shipwrecks of which it is frequently the scene. We had then got away from the rocks which surround the Ile de Seins with a stockade of stone, and found ourselves in waters comparatively calm; but before us the stream of a veritable river more than a mile broad was rushing with a current of seven or eight knots an hour, covering the rocks with sheets of foam, and forming vast whirlpools here and there. The muffled roar which reached the ear increased the indescribable impression made on the eye by the sublime spectacle of the mighty and resistless sea, the inaccessible coast, the Baie des Trépassés, or Dead Men's Bay, rightly so called, with rocks, rocks, rocks, the terror of navigators, everywhere around; and I said to myself, with the Roman poet—

"Illi robur et æs triplex
Circa pectus erat, qui fragilium truci
Commisit pelago ratem
Primus."

We are now in the very midst of the current, which costs us considerable efforts to traverse. Running along the inhospitable coast which stretches from the Pointe du Raz eastwards, we reached Douarnenez at sunset. The bay was brilliantly lighted up, as was also the Ménéz-Hom, the last massive spur of the mountains of Arel, while the pointed church spires stood out in strong contrast to the bright blue sky. More than 600 sardine fishing-boats were returning laden in closely crowded groups, and filled the port of Douarnenez as it were in an instant.

The Ménéz-Hom, with its triple summit, is one of many examples of the way in which Christianity has been grafted on paganism. The tradition is that its name (the mountain of the trough) is derived from a trough employed in their ceremonies by the Druids, and by such of their followers as took to the art of healing. The first missionaries, finding it impossible to suppress the superstitious veneration of which this trough was the object, came to a compromise with the popular belief and built on the same spot a chapel, which they dedicated to St. Côme, mainly on account of the similarity of name, but also because the saint, like the Druids, practised medicine. On one of the Ménéz-Hom's, or Ménéz-Chem's, three tops stands a dolmen, on another are the remains of a cromlech. The summit, 1082 feet above the level of the sea, is often enveloped in mists, but when they clear away the tourist is repaid for the toil of the ascent by a splendid panorama, including the Rade de Brest and the Bay of Douarnenez, from which it is separated by the peninsula of Crozon.

At Douarnenez I bade adieu to my friend the captain, thanking him for his kind hospitality and for the pleasant voyage he had enabled me to make. Although I had not found those extraordinary plants which my imagination had led me to expect, I had been enabled to take a look at the insular vegetation of Brittany, and to make sure that it was the same as that of the neighbouring coasts, which is only a natural consequence of the same geological characters. But the voyage, if it had but slight botanical results, made me acquainted with populations whose life, passed in the midst of incessant dangers, endows them with an energy far from common, and whose removal from the contact of other men has preserved from many vices, by inspiring them with simple tastes and

peaceable and gentle habits. It is something also to have trodden spots on the sanctuaries of Druids and Gallic priestesses, every trace of whom has been unfortunately swept away by Christianity. I have thus also completed my peregrinations through that noble department, Finistère, so full of interest for the naturalist, the painter, the antiquary, and the historian. C. T.

New Garden Plants.

DRIMIA (?) HAWORTHIOIDES, Baker, n. sp.*

Sent by Mr. Bolus from the province of Graaf Reinet, Cape Colony, to the Kew Herbarium, where it produced flowers in December, 1874, and leaves in February, 1875.

This is a very curious and instructive plant. It has entirely the floral structure of the genus *Drimia*, but in the ten or a dozen species of that genus which are already known we have an ordinary underground tunicated bulb, with the outer coats dry, brown, and membranous, like those of a Hyacinth or Scilla. Here there is no underground bulb at all, but a dense above-ground rosette of thick fleshy scales, like a rosette of *Haworthia turgida* or *limpida*, from the centre of which, after the scape has died down, a few small fleshy proper leaves are produced. So that we have here a very curious link of connection in the series of provisions for a reservoir of nutriment for plants growing in rainless or arid tracts between the fleshy

FIG. 70.—BULB OF DRIMIA HAWORTHIOIDES.

leaves of an Aloe or Agave and the ordinary squamous bulb of a Lily, the latter passing by gradual stages of transition into the ordinary tunicated bulbs of Liliaceæ and Amaryllidaceæ.

Underground roots consisting of only a few fleshy fibres; above-ground rosette, like that of a *Haworthia*, a sessile rosette 3 inches broad and an inch high, consisting of about thirty oblong-spathulate purplish-green scale-leaves without chlorophyll, each 9–12 lines long, 3–4 lines broad, acute at the tip, $\frac{1}{4}$ inch thick, flat on the face, hemispherical on the back. From the centre of this comes in February a rosette of 3–4 blunt-spreading, ligulate, glabrous, carnosous-herbaceous proper leaves $\frac{1}{2}$ –2 inches long, 3–4 lines broad. Scape produced from the centre of the rosette in December, a foot long, slender, terete. Raceme 3 inches long, laxly 12–20 flowered. Pedicels ascending, $\frac{1}{4}$ – $\frac{1}{2}$ inch long. Bracts as long as the pedicels, caducous, with a short distinct basal spur. Perianth $\frac{1}{4}$ inch long, white banded with green, with, just as in the ordinary *Drimias*, a short campanulate basal cup, and six narrow strap-shaped divisions connivent at the lower part, and falling back at the top. Stamens and style nearly as long as the perianth. Ovary of an ordinary *Drimia*. *f. C. B.*

PHALANOPSIS LEUCORRHODA, Rehb. f. (see ante, p. 301).

I have lately received another specimen of this novelty. It is a broad variety with a green leaf. The new flower has the tendril of the middle partition of the lip very thin and long, and quite like those of *P. amabilis*; the callus, too, is like that of *P. amabilis*, but yellow. And yet the flower is easily recognised,

* *Drimia (?) haworthioides*, Baker, n. sp.—Radixibus fibris carnisibus pulvis hypogæo aulis; foliis creiter 30 densis rotatis exterioribus nove-aworthioides crassis oblongo-spathulatis haud chlorophyllis face subulnis dorso hemisphericis, foliis propriis 3–4 post scapum productis (in hortis nostris ver-

the petals having a rosy hue, the lines of the lateral partitions of the lip being brownish, not purplish, there being much yellow over the whole lip, and numerous brownish dots on the lateral sepals inside. All the sepals are yellowish green outside, while the whole shape of the flower is that of *P. Schilleriana*. This time the flower came from Mr. Bull, who did not send it earlier owing to the frost. *H. G. Rehb. f.*

I have just been favoured by Mr. Low with two flowers of another variety of the same plant. It is very much more like the old *P. amabilis*. The first difference that strikes me is the tendency of the tendril of the lip to be abortive; they are short and small in one flower, and exceedingly small, short bristles in the other. Then we must look to the callus on the lip's base. It is deep orange, with deep scarlet dots. The longest tooth is at its base. There is also much more dark purple on the anterior lacinia of the lip than in any genuine *amabilis*. I may state that the callus of *P. amabilis* is much narrower and higher, having three teeth, the intermediate being much higher, the whole body usually (always?) white, with brownish dots and some very little pallid sulphur colour. When I obtained the flowers they were pure cream-white, but when they had been two days in my room they were covered with a rosy hue on sepals and petals. I intend to give figures, at least of the flowers, in the third volume of *Xenia Orchidacea*, now in preparation.

Mr. Low writes—"I send two flowers from the same importation, from a plant which we sold to George Heriot, Esq., of Highgate, who tells us it is in habit like *amabilis*." This plant has a remarkable analogy to *Odontoglossum Warszewiczii*. It is as inferior to a good *P. Schilleriana* as any *Odontoglossum* previously seen is inferior to a good *O. vexillarium*, and yet both have their high value founded on their being exceedingly rare. *H. G. Rehb. f.*

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

(Continued from p. 204.)

V.—ON THE BOTANICAL CHARACTERISTICS OF THE ZONES OF HEAT (continued).

IN the last lesson we had only time to study the characteristics of the warmest of the four zones of heat, and have, therefore, still the three others to consider.

2. *The Subtropical or Warm-Temperate Zone.*—The tropic of Cancer runs through the middle of Mexico, to the north of the West Indies, strikes Africa midway between Morocco and Senegal, runs between Egypt and Nubia, stretches across the north of the great Indian peninsula from Kurrachee to Calcutta, and thence by way of Canton and Formosa, north of the Sandwich Islands. The tropic of Capricorn crosses from the north of Chili to Rio Janeiro, strikes Africa south of Benguela, and crosses to the opposite shore some distance north of Natal, crosses Australia north of all the settled colonies, and runs south of the Friendly and Society Islands. This subtropical or warm-temperate zone includes two belts round the world outside of these, varying in breadth from 900 to 1400 miles, which altogether take up about 13,000,000 square miles of land, or about a quarter of the earth's surface. As compared with either the intertropical or cool-temperate zones, this one is much broken up, and contains no less than seven considerable dissevered areas—in the northern hemisphere, North Mexico, the Southern United States and Southern half of California; in Asia, Persia, the northern half of Arabia, Afghanistan, Beloochistan, India south of the Himalayas, exclusive of the peninsula, the southern half of China, and perhaps we should also say the southern extremity of Japan; and in Europe and Africa the Mediterranean basin; in the southern hemisphere at sea-level the whole of Cape Colony; in Australia, Queensland, West Australia, South Australia, Victoria, New South Wales and Tasmania, the whole of New Zealand at sea-level; and in America, Chili, Buenos Ayres, La Plata, and the southern provinces of Brazil.

Its general climate is best defined by saying that, whilst in the south it slides into the torrid zone very gradually, and in the continental or excessive climates its summer heat falls scarcely short of that of the equatorial regions, yet this heat comes for one season only, and does not last during the whole four. The winter however sinks down to the point where vegeta-

nilibus) parvis ligulatis glabris viridibus herbaceis; bracteis (nyctemal) pedalis; racemo base 12–20 floro; bracteis basi calcitratis pediculis brevibus squamulosis; perianthio semianthali albo, viridi-vittato, tubo campanulato, segmentis elongatis ligulatis; genitalibus perianthio squamulosis.

tion experiences a sensible check from cold, but is such that in various warm portions of its area—as, for instance, the Gangetic plain and the oases of the Libyan Desert—the common cool-temperate cereals, especially wheat, which is a crop which is planted and reaped in the three coldest months, to be followed during the summer by something that needs a sub-tropical heat, like Cotton, Maize, or Indigo. As compared with the torrid and cool-temperate zones this is, upon the whole, a dry one. A good deal of the region where rain never falls comes within its limits, and the rain in other parts—as, for instance, round the Mediterranean basin, and in the mountains of the foot of a great range of mountains facing the South, has a tendency to periodicity in its downfall. Of these continental or dry flora we have examples in those of the Mediterranean basin, the Cape, Australia, Mexico, and the belt across South America from North Chili to Buenos Ayres; and of the other kind, the damp or insular type, in those of the Eastern United States, New Zealand, and the Southern Himalays, which last, lying as it does at the foot of a great range of mountains facing the South, has a flora that is most tropical in its character of all those of this zone.

We might, *à priori*, expect that, under these general conditions of diminished heat and moisture, the flora of this sub-tropical zone would show a marked diminution in number of species as compared with the torrid zone. But this is not really the case, for we have within its bounds some of the richest and most varied flora in the world. At the Cape, within about a quarter of the area of Europe, nearly 9000 plants have been gathered. We cannot estimate at less than 10,000 species the flora of the Mediterranean basin, taking into it the country up to the Caucasus and bounds of India, as included in Boissier's great *Flora Orientalis*, now in course of publication. In extra-tropical Australia, with New Zealand, there will probably be 7000 or 8000 plants.

The three areas of North India with China, Mexico, and Southern United States, and the sub-tropical belt in South America, may perhaps be counted as good for 5000 species each; so that as comparatively few of the species of this zone extend into more than one of the six or seven diversified geographical areas of which it is composed, we may fairly estimate the total flora of the zone as being not short of 40,000 species, or two-fifths of the known number of plants in the world. The diminution of heat and moisture works not in lessening the number of species, but in reducing the luxuriance of individuals.

The features which give the general tone to the physiognomy of its vegetation are as follows:—1. The most striking positive character of the zone is the abundance of its erect bushes, and low, stunted trees, which are spread through its limits in wonderful quantity and variety, the dry character of its climate telling upon their *juva* in producing compactness of growth, smallness and rigidity of leaf, and very often in the development of prickles on the stem and leaf-edges, and of glandular dots upon their foliar surfaces, such as the Cistaceæ and Labiate of the Mediterranean basin, the Myrtaceæ, Pataceæ, Proteaceæ, Thymelæaceæ, Epacridaceæ, and shrubby Composite of the southern hemisphere, and the Brooms and Heath of both its northern and southern belts. 2. Another positive feature is that it is that it is the great store of the terrestrial Orchids, which are usually represented in each geographical area by special generic types. 3. Entire absence of many of the tropical types of form, and great diminution and gradual running out of those of more flexible constitution, such as Tree Ferns, Palms, Dracænas, epiphytic Orchids, Peppers and Figs, all of which stop before the polar limit of this zone is reached. 4. Incidence of various striking types shared by this and the cool-temperate zone, such as Umbelliferæ, Crucifera, Cupuliferæ and Conifera. 5. A smaller proportion of woody plants than in the torrid zone, and especially a larger proportion of annuals and of terrestrial mosses and lichens. 6. Incoming of the greensward-producing grasses, such as Poa, Festuca, Bromus, Holcus, Agrostis, and Anthoxanthum, but the green covering they make is soon burnt to in the summer. 7. Incoming of the temperate cereal grasses, such as Wheat and Barley, which often yield great crops in a short time, and outgoing of such as Rice, Maize, Cotton, and Indigo.

The following are the principal natural orders and sub-orders which are either characteristic of the sub-tropical zone, or, at any rate, are much more abundant here than anywhere else:—Crucifera, Resedaceæ, Cistaceæ, Silenaceæ, Portulacaceæ, Berberidaceæ, Papaveraceæ, Rataceæ, Diosmeæ, Boraginæ, Rhamnaceæ, Fumariaceæ, Geraniaceæ, Oxalidaceæ, Pittodalyricæ, Genisteæ, Stackhouseaceæ, Brunoniaceæ, Ficoidæ, Cactaceæ, Umbelliferæ, Loasaceæ, Lobeliaceæ, Stellateæ, Campanulaceæ, Goodeniaceæ, Dip-sacæ, Valerianaceæ, Calyceraceæ, many tribes of Compositæ, Chamælaucæ, Leptospermeæ, Myoporaceæ, Selaginæ, Labiate, Orubonchaceæ, Bricaceæ, Epacridæ, Nymphæaceæ, Thymelæaceæ, Proteaceæ, Paronychiaceæ, Plumbaginaceæ, terrestrial Orchids,

Iridaceæ, Liliaceæ, Colchicaceæ, Restiaceæ, Hypoxidaceæ, Amariyllidaceæ, and Hæmorrhoidaceæ.

Amongst large or striking genera that have their head-quarters here, and are not included in the above groups, are Clematis, Althæa, Lavatera, Malvastrum, Rhus, Ilex, Linna, Ononis, Medicago, Trifolium, Trigonella, Coronnilla, Acæna, Clifortia, Fuchsia, Glinothera, Lythrum, Camellia, Aucuba, Escallonia, Gunnera, Crotyleadon, Jasminum, Phillyrea, Cyclamen, Scrophularia, Linaria, Verbascum, Petunia, Stapelia, Nicotiana, Verbena, Ephedra, Melastoma, Eriodaphne, Melica, Anilida, Cheilanthes, Pellaea, Notochloa, and Lomaria.

The principal plants cultivated on a large scale for human use in the sub-tropical zone are Rice, Maize, Wheat, Barley, Millet, Lentil, Cicer, various kinds of Bean, Fenugreek; amongst fruits the Vine, Fig, Pomegranate, Olive, Apricot, Peach, Orange, Lemon, and Spanish Chestnut, Saffron, the gum arabic tree, the Valonia Oak, Cichonina, Tobacco, Aloe, Maguey (Agave), Senna, Castor-oil plant, Tea, Opium, Clover (Trifolium alexandrinum), the scented Labiate, such as Marjoram, Thyme, Sage, Basil, Lavender and Rosemary, and the Cucumber and various kinds of Gourd and Melon.

3. *The Cool-Temperate Zone* includes in the northern hemisphere a belt from 1500 to 2000 miles broad, stretching across the three great continents, which embraces an area of about 16,000,000 square miles. In the southern hemisphere, at sea-level, it includes only the Patagonian peninsula and a few small islands, so that altogether it takes in about a third of the earth's surface.

The distribution of heat through its area varies far more than it does through the two warmer zones, the two broad general marks which characterise it being that there is always a winter of such a kind as to give a decided check to all vegetation, combined with a summer at least warm enough for the cultivation of the common cereal grasses and Potatoes, which, with the Cabbage and Turnip, are the hardest of the plants grown on a large scale for the use of man. As we cross this belt in the direction of the poles the winters lengthen and the summers grow shorter and shorter, subject to the modification caused by the difference between insular and continental climates. In England our deciduous trees are bare of their leaves for half the year; at a height of 4000—5000 feet in the Alps the length of the period of the vegetation is said to be 200 days; at 5000—6000 feet, where cereal cultivation ceases, 170 days; and at sea-level at St. Petersburg not more than 130 days out of the 365.

(To be continued.)

THE LATE FROST.*

THE WINTER of 1874-75 HAS PROVED MORE destructive to vegetation generally in this district than any of the intervening seasons since the memorable winter of 1860-61. Various circumstances combine to render the effects of a severe frost particularly noticeable in this situation, and they are always more marked after a very wet and foggy period, such as was experienced towards the close of last year. Situated in the centre of the long flat strath through which the river Almond flows, the wide area of level land in this district is peculiarly liable to mist and fog, which envelope the young plantation grounds, and, along with the retentive nature of the soil, frequently retard the ripening of the year's growth of wood during the autumn months. Another circumstance which contributes to render frost more severely felt upon evergreens in this locality than in many others, is the fact that its altitude is only 92 feet above sea-level, and that it possesses a southern aspect, which exposes vegetation to the severe alternations of frosty nights and sunny days. Although the frost of last winter was scarcely so intense as that of 1860-61, when the lowest indication of the thermometer was 10° below zero, there was a considerably greater amount of wind, which always proves very destructive to evergreens and Conifera; inasmuch as it blows off the covering mantle of snow which protects their young wood and buds. From this cause many of the shrubs in this district have, during the past winter, suffered severely; and indeed it is hardly possible as yet to estimate the full extent of the injury which has been done by last winter's frost: for some specimens, at present very much browned in appearance, may recover. So far, however, as we are able to discover, we may state that in this locality the Laurustinus (*Viburnum Tinus*) is killed outright—a few plants only, in more sheltered positions, being alive under the snow-line. The common Cherry Laurel (*Prunus Lauro-Cerasus*) is at the present date showing more signs of having suffered than it did immediately after

the continuance of the frost, and has lost all last year's growth of wood. In one situation, in rather wet soil, where some two-year-old cuttings were planted, about two-thirds were completely killed.

It is a noticeable fact that the Caucasian variety of the Cherry Laurel has proved much harder than the common, while the Colchic variety, with its handsome narrower-shaped leaves, of paler green, has suffered most of all. The common Portugal Laurel (*Prunus lusitana*) has been very much browned, and in many places is now shedding its leaves; and some of the young wood on the more exposed portions of the plant has been killed.

Hollies, both common and variegated, have been more or less affected, and the larger specimens, about 30 feet in height, have, as was the case in 1860-61, lost many of their leaves, and which they still continue to shed. It is a noticeable feature in regard to the variegated Hollies, that the golden varieties have suffered far more severely than the silver, and also that the parts of the leaves which are most injured are the variegated portions. At first it might be thought that this was merely apparent, and due to the tarnished brown colour being more visible on these than on the green parts of the leaf; but on examination it will be found that this is not so, but that the variegated parts have, in reality, proved more susceptible to the influence of the frost. The variety called popularly the variegated Friecky Hedgeway (*Ilex flex variegata*) has proved the most tender of the variegated varieties, and next to it the Golden Minkmaid (*Ilex aurea marginata*); while of the green varieties, the smooth-leaved sort, *Ilex aquifolium* Daubon, has been the most injured.

The common Ivy has been very much singed, and the points of its shoots are much frost-bitten. Variegated varieties have, as was noticed in regard to Hollies, generally fared the worst; one kind, the Algerian (*I. algeriensis*), has suffered more severely than any other, and, as was noticed in the case of the Colchic Laurel, it is of that delicate palish green colour; indeed, this peculiar tint of green appears to be more susceptible of injury from weather than any other, for we have instances of this in the *Pinus Pinsapo*, *P. lasiocarpa*, and other evergreens. In situations with a southern exposure the heart-leaved Ivy (*I. Kæmpferiana*) has been very much browned, and much of its young wood has been killed. Another wall-creeper, *Crataegus crenulata*, has been killed to the ground.

Wall Roses have been very severely injured, and on the open border there have been more casualties among standard and dwarf hybrid perpetual Roses than was experienced here even in the winter of 1860-61. Amongst the newer Coniferae, the *Wellingtonia gigantea* has stood uninjured—a peculiarity of this species which we have before noted; and it is far more likely that the *Wellingtonia* in this district will suffer from the effects of frosty spring winds than from the intensity of frost. The variegated *Wellingtonia* has suffered very severely in its golden patches of variegation, which are completely killed, although the plants are otherwise uninjured; and it is to be hoped that as they progress in growth they will again throw out fresh shoots here and there of their delicate straw-coloured markings. *Taxodium sempervirens* has probably suffered more than any other of the newer Coniferae. Plants of this species of from 3 to 6 feet in height, which had been transplanted to their present position last spring, although they had quite recovered from the effects of removal, and had made vigorous growths for the year, have perished outright. Other specimens, from 12 to 20 feet in height, have lost many of their outer last year's shoots.

Several specimens of *Cupressus Lawsoniana* have been much browned in the foliage, but although they may lose some of their outer fine branches, the plants are otherwise perfectly safe, and it is only when exposed to the sun and wind that they have been thus affected. One variety, *C. Lawsoniana amabilis*, has received so severe a check, and appears so sickly, that it is impossible at present to say whether it will survive or not. *Cedrus atlantica* has been a good deal scorched on the tips of its needles, and has suffered more in this respect than either *C. Deodara* or *C. Libani*. The *Araucaria imbricata* has been a good deal browned on its young shoots, and presents the peculiar and suspicious-looking feature which many plants did in 1860-61, that of curving the points of its lateral branches downwards; and although it is yet too soon to speak definitely as to the amount of injury which this species has received, we fear that, with a recurrence of frosty easterly winds during the present and next month, many specimens of this handsome plant will be found to have been permanently disfigured.

It is a notable fact that several *Araucarias* which were killed down to the snow-line here in 1860-61 have suffered materially less during the past winter than others which have been planted here since, though located under similar circumstances—a fact which, I think, goes to prove that as many of the more recently introduced conifers as have long survived in the climate of Great Britain, they will throw off any tendency to delicacy they at first

* Effects of the Late Frost on Trees and Shrubs at Carlisle, near Edinburgh: a paper read at the March meeting of the Botanical Society of Edinburgh by Robert Hutchison, Esq., of Carlisle.

vineed, and probably in future years the produce of cones grown and ripened in this country will present a vigour and robustness which their progenitors lacked. Among the other Conifers which have, more or less, been severely browned in their foliage, and which have partially lost some of their last year's growth, I may notice *Abies Douglasii*, which, where exposed to wind, has suffered severely; *Pinus monticola*, *P. grandis*, *P. Pinsky*, *P. cephalonica*, *P. Edgariana*, *P. Jeffreyi*, and *P. Lowii* (*Farsonii*). In some exposures *Cedrus Deodara* is slightly singed on the weather side, while the following have all escaped thoroughly unscathed—*P. Laricio*, *P. excelsa*, *P. balsamea*, *P. Nordmanniana*, *P. Sabiniensis*, *P. nobilis*, *P. cembroides*, *P. Cembra*, *Libocedrus decurrens*, *Thuja gigantea*, *Thuja borealis*, *Keinospora pisifera*, and *R. obtusa*. Amongst the *Cupressus* family, where again the pale green tint and foliage we have already referred to is predominant, it is noticeable that *C. Lambertiana* is in many places dead, and in others the young twigs are so severely browned that they are shed from the plant by simply passing the hand along the branch. *Cupressus microcarpa* has lost most of its young shoots, and contrasting with the fastigate habit of this Pine, the curved-over affection of its lateral branches is most striking and apparent. *C. Goveniana* has lost all its last year's wood, and looks sickly throughout the whole plant.

together and became loose, so that on the first blast of wind they were displaced and fell to the ground.

From the foregoing notes it will be observed, that it is hardly possible at this date to give an accurate list of all the shrubs and evergreens which have either proved hardy or unable to resist the severity of such a winter as that of last year; but it is to be hoped that the list already given of such specimens as the frost appears to have seriously affected will not require to be augmented by further experience, while, on the other hand, we trust that with a mild and genial spring, and an absence of easterly frosty winds, many of those species already reported as in a state of dubious vitality may yet recover.

P.S.—It should have been stated that the lowest temperature reached during last winter was on New Year's Day morning, January 1, 1875, when it registered here 4° below zero at 4 feet from the ground. On the ground, 8° below zero was the minimum point reached.

AZALEAS AND CAMELLIAS.

IN the Victoria and Paradise Nursery, at Upper Holloway, there are two admirably constructed spanned houses specially devoted to the culture and exhibition of Azaleas and Camellias respectively, and

shape; *La Maestosa*, cerise-crimson, occasionally mottled with white; and *Mathotiana alba*, one of the very best of the double whites.

To see the Azalea-house in full beauty we must wait until the month of May, when they form a most attractive spectacle, as may be imagined when we state that such well-known and highly esteemed varieties as the following are represented in all sizes:—*Criterion*, *Magnificent*, *Brilliant*, *Holdfordiana*, *Duchess of Edinburgh*, the new white sent out last year; *Chelston*, *Conciana*, *Prince Albert*, *Distinction*, *Duc de Nassau*, *Duchesse de Nassau*, *Rosea superba*, and many others which might be named.

ROYAL HORTICULTURAL SOCIETY.

I ATTENDED the adjourned meeting of the Royal Horticultural Society on the 9th inst., to see, hear, and judge how far the Council were prepared to act on the suggestions made by a large body of the Fellows at the annual general meeting. The first evidence offered was the new edition of the report, which I read, and found the objectionable passages expunged. This was eminently satisfactory.* The noble Chairman shortly afterwards announced that the Council was

FIG. 71.—CAMELLIA HOUSE IN THE VICTORIA AND PARADISE NURSERY.

Among other evergreens which have all suffered more or less severely, and sufficiently so to make the effects remarkable above those of any common winter, we may notice the following—*Pernettya mucronata*, *Aucuba japonica*, *Chamaecyparis spheroides*, *Cryptomeria japonica*, *Jasminum officinale*, and *Clematis Vitalba*. The *Nidpath Castle Yew* is considerably more browned in foliage, and appears to have suffered more, than the common English Yew, or even than the Irish. *Pinus maritima*, *P. Alberdiana*, *P. nobilis*, *P. ponderosa*, *P. excelsa*, *P. austriaca*, *P. Pallasiensis*, appear to be all perfectly safe and untouched.

One noticeable feature upon the hard-wood trees of larger growth, owing to the severity of last winter's frost, was their splitting down the stem—a fact which was also noticed in 1860-61. Individual Beech trees, of from 9 to 12 feet in circumference, which split in the winter of 1860-61 as if struck by lightning, were during last winter observed again to open up their old parts. This is a frequent occurrence in Canada, where old trees, especially if very vigorous and full of sap, are reported to contract and expand, to split and go together again, season by season, with the alternations of climate. Although this is a rare occurrence in a climate like that of Britain, and may be only noticeable after winters of severe frost, such as that of last year, it was not confined to Beeches alone, but Oaks, Limes, and Ashes were observed to suffer in a similar manner. *Sycamore* and *Plane* trees of old growth have, since the last winter's frost, shed in abundance the scales of their outer bark; and it was particularly noteworthy that after the severe and sudden depression in the thermometer these bark-scales shrivelled

we have thought it desirable to place interior views of each before our readers, in order the better to give some idea of their contents, and of the beauty of the display of bloom which every spring gladdens the eyes of visitors. They are situated on that side of the nursery which faces the Junction Road, and form two sides of a square, in which stands the foreman's cottage, the third and rear side consisting of a stove, which connects the subjects of these remarks. The houses are both of the same dimensions, viz., 55 feet long, 25 feet wide, and 15 feet high. They also partake in common of the same style of internal arrangement, of which the accompanying illustrations (figs. 71, 72), prepared from sketches made last spring, are good delineations even at the present time.

The Camellia-house is now, of course, as attractive as it will be this year, and includes many fine specimens of the choicer varieties in cultivation. Facing the door at the Junction Road end is a fine specimen of *Jubilee*, well sprinkled with its beautifully striped and imbricated flowers, while among the larger specimens we noted *Imbricata*, too well-known to need any comment; *Triumph de Lodi*, flesh-pink, mottled with crimson, very pretty; *Cygo*, fine white; *Limichezi*, dark red; *Comtesse Eostans*, mottled red; *Leeana superba*, deep blood-red, a single flower which shows its centre rather too much, but well deserving of culture on account of its fine colour; *Marchioness of Exeter*, red, a very fine plant; *Lavinia Maggi*, the original plant, and perhaps the largest in the country, just coming into bloom; *Henri Favre*, crimson, very fine; *Daviesii*, double, crimson-red, and much resembling the flower of a *Hollyhock* in

now on amicable and working terms with Her Majesty's Commissioners. Now these were the two points for the attainment of which I understand the original meeting to have been adjourned. Notwithstanding their attainment, I was surprised to hear the Chairman further announce that a report had reached him that what was called the horticultural party intended to move an amendment declining to accept that report, and which, if carried, must lead to the resignation of the Council. Surely this was a blunder on the part of that section of horticulturists which planned and adopted it. It was bad policy, as tending to increase the estrangement between the horticultural party and the local Fellows, and if it was not acting in bad faith towards the Council after they had yielded the points previously contended for, it was, at the least, treating them shabbily. But the meeting was not prepared to endorse this line of action; the majority of the Fellows present approved the conciliatory policy of the Council, and the report was adopted. And it appears to me that to this conclusion the meeting was guided by the Englishman's common sense and native generosity. A society must trust its governing body, or they are powerless for good; and societies where distrust becomes chronic fail to get men of position, character, and ability, to serve them. But let me pass to the subject for which I more especially took up the pen. If the Society is to be relieved from its present financial difficulties, it must

* It was not quite so satisfactory that it was not put into the hands of the Fellows until a few minutes before the meeting. EDS.

be by the union of all interests. A broad, conciliatory, and generous policy, must be adopted. Each interest, while pushing its own views and objects, must allow the others full space and opportunity to push theirs. Mr. Smee put the case of what should be the horticulturists' objects more clearly, truly, and strongly, than I have heard them put before, and I only regretted that, in his short and admirable speech he should have spoken of that part of the Society's programme which we may suppose specially arranged to meet the views of the local Fellows as "vanities." We cannot all be philosophers and men of science, and I cannot regard as vanities those light and harmless amusements which unquestionably give joy and health to so many of my fellow men. Besides, the Society ought to derive an immense revenue from the rank and wealth with which the Kensington gardens are surrounded, but to do this it must study the tastes and wishes of the population. All men are not horticulturists, although few cultivated minds are indifferent to the charms of the art, as, on the other hand, few horticulturists are indifferent to the delights of music and the fine arts generally. Now, if two parties starting from the same point, though seeking a different goal, find their road lie in the same direction for a part of the journey, and can travel safer, more expeditiously, more luxuriously, and more economically together

than separately, and wishal have but a limited purse, what folly to forego these advantages by insisting too rigorously on the details of arrangement. This, to my mind, is just the position at present of the contending parties at South Kensington. I repeat my conviction, that the Society can only be relieved of its present difficulties by opening some broad, clear, and solid road along which Her Majesty's Commissioners and the Council of the Royal Horticultural Society (the latter as representing the horticultural interests, the interests of the local Fellows, and sundry minor interests) can travel together amicably, expeditiously, and economically, dividing the expenses of travel, while each takes up the pleasures and advantages of the road. To do this it is first necessary to blot out on all sides the omissions and commissions of the past, and to be so earnest and full of the future as to leave no standing room for them should they rise and strive for readmission. Wm. Paul, F.R.H.S., Waltham Cross.

and these are generally guided to a successful issue. The many failures in the Society's affairs are owing in a great measure to one great fundamental cause, and that is that the Society has never, since I can remember, had a thoroughly practical horticultural Council—a Council in which the horticulturists throughout the United Kingdom, both professional and amateur, could have perfect confidence. If it had, I have little hesitation in saying that instead of 4000 it would have nearer 40,000 Fellows, not by reducing the subscription, as a member of the late Council has proposed, for there is already a two-guinea fellowship. This reminds me that the late Council did a really good horticultural work by establishing the provincial exhibitions; these, however, have fallen through, as I believe they also would have done if the late Council had remained in power; for the simple reason, that if the Horticultural Society of London is desired in the provinces, it is not because men of great social influence are on its Council, for in any district there are county families; but what is desired on these occasions is to hold communion with, to make the personal acquaintance of, and to fraternise with men whose names are known, not alone at Kensington, but throughout the horticultural world, for their technical knowledge and their practical experience in horticulture. There were only one or two such on the late Council. With fair management, and with such a

FIG. 72.—AZALEA HOUSE IN THE VICTORIA AND PARADISE NURSERY.

it is by scientificmen throughout the world if its managing members had not a profound knowledge of botany and zoology? Would the Institute of British Architects carry on its work for any good purpose if no architects were on its Board? In what an anomalous position, then, is the Council of the Royal Horticultural Society, without a single professional horticulturist belonging to it! I know the objections that may be urged against this. It has been said that the Council of the Society could not be composed of gardeners. Possibly not, but there are gardeners and gardeners; and I am afraid the professional horticulturists would be found lacking much of the technical knowledge that a gardener requires. However that may be, there have been eminent men who have not been ashamed to be called gardeners. The professional horticulturist, however, is only a gardener somewhat in the sense that an architect is a carpenter or mason. Again, it has been urged that if professional men were on the Council of the Royal Horticultural Society it would be swayed by trade influences; but has any one ever heard such an argument used against the Pharmaceutical Society because druggists direct its affairs? Or, indeed, can such be alleged against other societies, when professional and business men take an active part in their administration? It has also been stated that it is of the utmost importance, considering the state of the Society's affairs, that good financiers should be on the Council, rather than horticulturists; but I have yet to learn that the latter are wanting in this respect. The yearly expenditure or monetary transactions of the Royal Horticultural Society are as nothing compared to those of the best horticulturists,

Council as I have suggested, I have no doubt an annual profit of from £1000 to £2000 would be made from the provincial exhibition, and this besides doing legitimate horticultural work, enlisting the sympathies of country residents, and making a large number of Fellows in the districts visited. But I venture to say—and I do so with some regret, since I still be sorry to wound the feelings of any one, still it is necessary to be candid—that beyond a few the names of the present Council would not be known in connection with horticulture outside the Horticultural Society. What an anomalous position this for horticulture to be in at headquarters! If it were necessary for the Council to send a deputation on any horticultural matter abroad, beyond one or two of them their names even would not be known. Fortunately, however, horticulture does not depend on any society, for the love of it increases with the higher development of civilisation. Still, professional horticulturists cannot but deplore the present state of what should be the first horticultural society, not in England alone, but in the world; and this brings me to the consideration of the Horticultural Gardens, for about these I differ from some of my colleagues. They are leased on such easy terms that I am not one of those who advocate giving them up; for, whatever may be said against these gardens, I consider them a monument of horticultural skill as a town garden, and, from what I have seen, I much doubt if they are to be equalled in any capital in Europe. The rent need only be paid once in five years—something, therefore, under £500 a year for these magnificent ornamental grounds. I know it is

than separately, and wishal have but a limited purse, what folly to forego these advantages by insisting too rigorously on the details of arrangement. This, to my mind, is just the position at present of the contending parties at South Kensington. I repeat my conviction, that the Society can only be relieved of its present difficulties by opening some broad, clear, and solid road along which Her Majesty's Commissioners and the Council of the Royal Horticultural Society (the latter as representing the horticultural interests, the interests of the local Fellows, and sundry minor interests) can travel together amicably, expeditiously, and economically, dividing the expenses of travel, while each takes up the pleasures and advantages of the road. To do this it is first necessary to blot out on all sides the omissions and commissions of the past, and to be so earnest and full of the future as to leave no standing room for them should they rise and strive for readmission. Wm. Paul, F.R.H.S., Waltham Cross.

stated that £500 a year cannot be set aside to defray the rent, that £2400 must be paid in one year, and that every fifth year. Here again crops up the question of a truly practical horticultural Council for which a very various course would suggest themselves, and easily providing the rent. But one occurs to me at this moment—viz., to hold a grand International Horticultural Exhibition every five years. I doubt not that the horticultural Fellows would provide a guarantee fund, and if not, I believe the professional horticulturists would subscribe it themselves. But work such as this would involve could scarcely be expected from amateurs, or less from those who are not horticulturists. Amateurs may render good advice and service, but in practical work and technical knowledge they can seldom be expected to take the place of the professional man. If any one had a sick child he would scarcely send for his amateur friend, who has always a favourite pill to prescribe or some essence to recommend, but he would rather send for the man of professional skill, on whose practical knowledge the utmost reliance could be placed. The Horticultural Society is now the sick child, and the inference is obvious. If the primary object of the Horticultural Society is to be merely the keeping of the gardens at Kensington as a London square, then good horticultural work is not of paramount importance, and it matters but little how the Council is constructed, but if its legitimate objects for which it was founded are to be carried out, it belongs the Fellows to take action, and see that a good Council of the best known professional and amateur horticulturists are guiding it. As an instance of what practical horticulturists can do, I may mention that, previous to 1865, we at different times had been receiving invitations from our foreign friends to international entertainments; we had accepted them with hospitality, with an amounting and an astounding haul. The English horticulturists felt they must do something in return, and like Britons they were determined it should be well done, so they projected an International Horticultural Exhibition; they applied to the Royal Horticultural Society, but then, as now, their Council was too weak technically to do anything in the matter. The horticulturists, not to be beaten, then did it themselves, at an expense of something like £15,000. This was done with an amounting haul, the recollection of many of your readers. As the time neared for closing the exhibition, it was found there would be a deficit of some thousands of pounds; here, again, the practical element rose to the surface; the committee held a conference, and decided that they would not call on the guarantors who had given them their confidence, but that they would continue the exhibition a few days longer; this was easily managed, and the general of the committee were large exhibitors—the other exhibitors were their friends. In the end, instead of a financial failure, it was a success; so much so, that the committee actually had a surplus of £2000, which they scarcely knew what to do with; they gave £1000 to the Gardeners' Benevolent Institution, and bought the Lindley Library, which they placed in the hands of trustees and lodged in the rooms of the Royal Horticultural Society, otherwise to this day there would not have been a library for the use of the Society.

I cannot pass from this subject without paying a tribute to the excellent generalship of Lord Bury. I have sat at the anniversary meetings of many societies, but I have never seen a president who could meet great difficulties and smooth over extremely perplexing circumstances so calmly as his lordship. At the last meeting of the Horticultural Society one or two gentlemen incidentally mentioned that they belonged to certain learned societies. When the observation was made it occurred to me—for I also belong to eight or ten—how different they must consider the annual meetings of the Royal Horticultural Society to those of other societies, at which it is usual for the President or some member of the Council to give a short retrospect of the important events of the year, with glimpses of what is likely to occur in the future. Now, some of the Fellows of the Royal Horticultural Society would have been glad to have heard from the President what part the Society took in that great assemblage of botanists and horticulturists at Florence last year; what they intend to do this year at the International Exhibitions at Cologne and Antwerp, as also what they propose to do next year in Philadelphia and Amsterdam. Then what can be thought of the arrangements for the flower shows at Kensington this season? The Council issue a schedule announcing what shows will be held, detailing the objects for which prizes would be offered; they then advertise that four of those shows would not take place, but at the last meeting announced that they would all be held, and only the exhibitors would be asked to take 50 per cent. less than the prize money that had been offered. Can vacillation further go? *William Bull.*

The following are some reasons for Guinea Fellowships in the Royal Horticultural Society. There are few objects for a society, which have the sympathies of so many of all classes, as gardening and improvement of fruit, flowers, and vegetables. Therefore, the great

central horticultural society ought to be popular, successful, and prosperous. Is this the case with the Royal Horticultural Society as at present constituted? For the ten years I have known it, its action has been constantly crippled for want of funds. In earlier times the parting with the Regent Street rooms and sale of its splendid Library show great pressure of poverty, and tradition says that the Society was poor even in the days of the brilliant shows at Chiswick. It is no question of management. Successive members of Council have come into office in high hopes of showing themselves wiser and more successful than their predecessors, but soon has come the old tale of "further reductions on account of want of funds." I believe (and having served eight years on the Council, and having filled many other offices in the Society, I have had good opportunities of observation) that the way to place the Society in its right position is to increase its number of Fellows, bringing in more from all parts of the country, and that this can be done by Guinea Fellowships. It has been objected that different districts should support their local horticultural society; no doubt they should, but our claims do not clash, on the contrary we ought to help one another. The central society does work which local societies cannot do. Fruit, flowers, and vegetables come to Chiswick and South Kensington from all parts of the country, are judged, and the verdicts circulated all over the country the same week, being reported by the Horticultural Press, and so they serve town and country alike. It has been suggested that the guinea plan trusts too much to the support of gardeners. My first letter on the subject, written in the latter part of 1873, says:—"Consider what a vast number of well-to-do people, fond of all pursuits, there are now in the country. Very many of these would be willing to help horticulture, if it did not cost them much money or trouble. I would make the annual subscription a guinea." As I wrote then I think now. So much for trusting to the guineas from gardeners, though I hope we shall have the best of their class as Fellows. We have already received the names of many good would-be Fellows—I mean to go on till we can show a list which will be irresistible, and to follow the old saying:

"Guta cavat lapidem non vi sed sepe cadendo."
George F. Wilson, Heatherbank, Weybridge Heath.

I agree with you in doubting whether at the late meeting the Council showed a sufficient appreciation of the critical position in which the Society stands. You have arrived at that conclusion from your own observations. I have drawn it from one or two straws of trifling amount in themselves, but which have seemed to show how the wind blew. One of these is a passage in the amended report. This report is undoubtedly a great improvement on the previous one. It has been avowedly prepared with a feeling of abstaining from all charges or allusions which could irritate or give rise to feelings of disagreement, more especially as between the Commissioners and the Council, but also between any sections of the Fellows themselves. The appeal was, "Let us disagree with grace." It is the explanation of its not being decided for the common object in view; and yet they go out of their way to fling a stone at the old Council. It was out of their way, for all other criticism upon the accounts has been carefully eschewed; I cannot blame them for this, but as to the plea advanced, it does not retain the only passage relating to them from the old report, viz., that the Council had compromised for £600 an old debt of £1200 due to the late Sir Trayton Drake, which had been ignored by the old Council. If it was considered necessary or proper to take special notice of this alone out of all the items in the accounts, it would have been more in accordance with the conciliatory spirit advocated by the Council, not to say with the ordinary fairness, had they added two words of explanation why it was not debited to the Society by the old Council. It was a sum advanced by Sir Trayton in the old Chiswick days, and advanced with the promise or assurance that, although interest would be expected during his life, the principal would be bequeathed to the Society. This is the explanation of its not being debited with an ordinary debt of the old Council, and also, no doubt, of its being compromised for £600—Sir Trayton's men of business having been, as I am informed, quite cognisant of the footing on which the loan took place. Unfortunately, Sir Trayton's appeal should have written all about it, and died without making the promised bequest.

Another straw, whose direction I like still worse, was the observation of our President when disclaiming any partnership with any section of the Society, that as he had the consent on a fair basis of the majority of the Fellows to interfere with the horticultural objects of the Society, so he would oppose any attempt to surrender or deprive the Society of the garden at South Kensington. It was cleverly put, one might almost say—

"'Tis so like sense, 'twill serve the turn as well."

But it is neither sense nor logic. His lordship's propositions are not equal. The antecedent is a "fair trade," the consequent an attempt to deprive the Society of the duty of the President of the Royal Horticultural Society to do all he can to support the advancement of horticulture, but it is in no respect necessarily his duty to preserve the garden at South Kensington. The consequence of his duty, for duty being one of the essential elements of the Society, that our charter itself contemplates the alienation of the garden, and

provides for a termination of the lease by which we hold it. It is, therefore, a very mistaken notion of his duty on the part of our President to suppose that his obligations to horticulture and his obligation to preserve the garden are in *pari causa*, or of equal force. The one is vital and paramount, the other is merely incidental and indifferent, and matter of arrangement and detail.

Seeing that, from my stand-point at least, the views of the Council, as expounded by Lord Bury, are thus ill-balanced, it may do no harm if I state what I believe a large portion of the Fellows expect, and will be disappointed if they do not receive at the hands of the Council. They expect that in dealing with the Commissioners they will make an arrangement as to the debenture debt, their first, most pressing, and most anxious impulsion; and here permit me to say—in this motive, and in this point, it is necessary to give every point—that neither I nor any one connected with me have anything to do with the debentures. I am moved solely by a pure and honest desire for the good name of the Society. For it, an arrangement securing these debts ought to be the Council's first aim, and it will not satisfy the Fellows if their efforts in that direction be of a more perfunctory nature. If, to secure better terms with regard to the garden, they are cold and spiritless here, and merely put forward their claims as if to invite defeat, and to enable me to say that they are unsuccessful, I do not hesitate to say that, in my mind, it will be a betrayal of their trust. It is my firm conviction that they can secure an arrangement if they sufficiently press their point. They stand upon a vantage ground from which nothing should induce them to decline. The money borrowed has all been spent upon the buildings in the garden, devised and constructed by the Commissioners. If the Society has done the debenture holders wrong, it has been at the instigation and prompting of the Council's first aim, and it will not satisfy the Fellows if the wrong. It would, no doubt, be right legal for them to stand by the letter of their bond, but it would not be right royal. It would be but a poor example to set the masses, to disregard equity and to profit by what that is not the object of the Council. I have consented to give them in rearing these arcades, and it is not the spirit that animates the Commissioners. It may require urging and pertinacity to make them fully aware of the true position of the matter, but once that is done our cause will stand on a good and firm ground. I do not argue, and to make these explanations. It may not be convenient for the Commissioners now to pay either principal or interest; but that is not necessary. All that I plead for is that they will agree to interpose their security for the final payment of the debt. All the time to get it done when a new arrangement is under consideration, and before all recollection of the origin of the debt shall have faded from the memory of those administering the estate.

I have not the same anxiety about the interest on the debentures as I have about the debt; it also has its good side. If the Commissioners should accept the final responsibility for the whole of the debt (as they have already done for the half), it immediately acts as an additional stimulus to them to make the Society prosperous, and to make these explanations. It may not be convenient for the Commissioners now to pay either principal or interest; but that is not necessary. All that I plead for is that they will agree to interpose their security for the final payment of the debt. All the time to get it done when a new arrangement is under consideration, and before all recollection of the origin of the debt shall have faded from the memory of those administering the estate.

With security for repayment by the Commissioners will come new light upon the skating rink, which, to my mind, is an excellent scheme, deserving of every support, and quite within the indirect accessories of horticultural gardens. It is a scheme that has been worked out by the present Council, and they are fairly entitled to the credit of it, and as a sequel it seems only reasonable that the Society, if it is carried out, should benefit by it; how far, will no doubt form part of the present negotiations with the Commissioners. More pecuniary assistance than something of this kind need not, I fear, be looked for from the Government. The rent will, no doubt, be given up, but as we have so seldom paid it, and then only by the help (I had almost said connivance) of the Commissioners, that will not help us much. It is not the rent I do to more, but the power, that is wanting on the part of the Commissioners, that brings us face to face with the great difficulty that has to be met, viz., the financial deficiency.

On this point the Fellows will expect the fullest information as to the grounds on which any scheme that may be brought forward by the Council is based, and particularly as to the views of the local Fellows are prepared to do. You say that they have not responded, as was expected, to the appeal made to them by the Council. All will admit that the Council touched the thing with the point when they announced that they were to meet the local Fellows to meet by increased subscriptions the deficiency in the ways and means of the Society. It was in their interest and to meet their views, that the steps were taken which have produced this deficiency. It was not they who with opposition should have drawn the voices of those who could have warned them against the course they were entering on. It was they who stifled the protest of the Fellows at a distance by refusing them a vote by proxy; and surely it is not you, now that they are coming to meet in this show, should put their shoulder to the wheel to pull us out.

Will they be any better off if they decline to come forward, and so precipitate either the actual collapse of the Society, or its practical collapse from inability to perform

its functions? In such a case we are threatened with or promised a successor to the old Horticultural Society, to be recruited largely from its own ranks, which is expected to be more numerous and more homogeneous than the present Society, and, having no aims but the horticultural ones, and no do or die attitude, it is to be infinitely more powerful for horticultural good. What will be the position of the local Fellows then?—merely that of residents around a square. If they wish to have the benefit of the gardens they must pay for the privilege, and they must remember that they do not stand on such good ground as the Society. They have no claim for favour at the hands of the Commissioners, they have no scientific standing, and no national aims. Theirs are purely private and personal, and after paying for the privilege of using the gardens, they must bear the expense of maintaining them up. So regarded, it becomes a question of arithmetic, which they can easily solve. They best know what they would rather give than want the gardens, and if necessary by house visitation or personal canvass within a certain radius, the Council should be able to tell the Fellows with precision how much the local Fellows are prepared to subscribe annually for the purpose of enabling the Society to retain possession of the gardens. And when we know that, and what the Commissioners will do, we can then calculate for ourselves whether they can afford to keep the gardens or not; and if they cannot, Lord Bury, like every one else, will have to submit to the inevitable logic of facts, and throw his guns overboard to save his ship.

I was glad to see that Mr. Mackenzie's meeting—although by that time he must have seen that he could reckon on a majority—had the good sense to resist the appeal made to him by Mr. Mackenzie to give the Fellows no option or opportunity to discuss the terms the Council might resolve to enter into with the Commissioners, but simply to say that they thought best, and conclude without again consulting them. In an ordinary case, I quite admit that it is a most unfruitful and unwise thing for any Board to come and consult its constituents as to the course they (the Board) ought to follow. It is to invite the destruction of the best considered scheme by vain, unconsidered, and crude discussion. But there is no case without exceptions, and this is one of the exceptions. The success of any scheme that may be brought forward entirely depends upon the Fellows. They are leaving the Society in crowds, and if the Council wish to retain them, they must conciliate them. A more unhappy time for any display of the *sic volo sic jubeo* tactics could not be chosen. The Commissioners themselves know that any such will fail, and in the support of the local Fellows, and might reasonably object to enter into such. To what purpose then to affront the wishes of the Fellows? If they are satisfied, the scheme of the Council will be approved. If they are not, the conclusion of the scheme in opposition to them will only hasten the dissolution of the Society.

I have spoken out of the fulness of my anxiety, for I have no sympathy with those who are looking on with curious indifference (if not complacency) at what may be the death-throes of the old Society. No other new Society can be better than that the old Society has been with its glories and its traditions, and I will not believe that it is about to die. My trust, hope, and belief is that it will recover, and still run a long course of usefulness and honour before we or our successors shall have to say of it.

"There's the end of an auld sang."

Andrew Murray.

— When I had last the honour of addressing you on the subject of the Royal Horticultural Society there was an apparent disposition on all sides to adopt a policy of mutual concession, and so to put an end to the intolerable scandal of a great Society divided against itself, and this at a time when the depressed and beaten-down state of that body demanded the loyal and united support of every member of it. Such hope exists no longer. The advances made to the local Fellows, with the view to a beneficial compromise and fusion of interests, have been met by open war. The continuance of the lease is to be gained and held by force, while horticulture and horticulturists have no pleasanter prospect before them than five years of famine under conqueror's law.

We have much to reproach ourselves with for all this. Detection and no mercy have been the rule, and we have prepared the way for the deep humiliation now hanging over us.

Out of evil there comes good at times, and one result of these, our complicated wranglings, has been that the fog and mystery that so long enveloped us is all exists no longer. The position of the Society is now as clear and well defined as anything can be in this world. Our course, too, is now clear. The time for half measures is past. We cannot stay two masters.

I appeal to those who have and with whom I have worked, year after year, against wind and tide, for well nigh half a lifetime; to those who with me have seen themselves and their aspirations derided and insulted by the votaries of Vanity Fair, who have seen their Council "turned out" as one amiable gentleman expressed himself the other day, to make room for the alien; I appeal to those whom misunderstanding and small imaginary causes of irritation have kept asunder to come together in this our great strait, and acting with one will to say their piece or say no word, and to say it to me. You are weaving a rope of sand, you are fighting a windmill, you are trying to make the silk purse out of you know what, your very existence as a scientific body is an imaginary quantity, your bones are marrowless, you are effete, you are dead, your hosts are gone, and your independent leaders and supporters might be numbered on your ten fingers." I have never held this opinion, and do not

hold it now. The scene at the February meeting showed that we could exert ourselves if we would, and could, if necessary, do it again.

Should it be this gloomy view I have mentioned be, as I hope and believe, not founded on fact, and that the old fire, though long smothered, is still burning unquenched, there may be yet hope for the Society.

My general views and convictions as to what a horticultural society should be are perfectly well known, and any Fellow who shares them will oblige me by sending his name to my address, *R. Trevor Clark, Welton Place, near Daventry.*

Apiary.

NEIGHBOUR'S GLASS WOODBURY HIVE—Most bee-keepers are now conversant with the ordinary wood or straw Woodbury hives, either practically or by report. It is a bar-frame hive, and may be described simply as a wooden box 14½ inches square, inside measurement, and 9 inches deep; the usual ten frames fill up this space, resting upon a rabbit a little below the surface, leaving a space of three-eighths of an inch between the upper side of the bars and the crown (top) board. This allows a free passage for the bees on the top. Each frame, as recommended by the *Devonshire Bee-keeper*, is seven-eighths of an inch wide, the frames hang in the rabbit so as to leave three-eighths of an inch above the floor-board; in fact, if properly made, a free passage is allowed for the bees on all sides.

For many years British bee-farmers thought any hive containing more than ten frames was hurtful to the bees, rather they could not be worked successfully; I hope shortly to show your readers the fallacy of this opinion, which is, contrary to my experience of hives even double the size, or twenty frame hives.

The glass Woodbury hive, of which I give an illustration (fig. 73), is manufactured by Messrs.

FIG. 73.—GLASS WOODBURY HIVE.

Neighbour, of High Holborn, and which they describe as follows:—"Some bee-keepers like to be able to make a full and daily inspection of the hive; we have, therefore, constructed a hive of wooden frames, enclosed on all sides, and on the top with glass. The dimensions are precisely the same as the ordinary Woodbury. The crown has a round hole cut in the glass, to admit of feeding. The four sides are constructed of double glass, to preserve the bees from variations of temperature."

Many persons believe these hives, which are very elegant—the wood-work is stained oak, and varnished—will not answer as a winter residence for the bees; but if it has a wooden covering on all sides, the same as used to shield the other hives from the weather, they will winter in it, and come out early in the spring, hearty and strong. My experience has taught me that damp kills far more bees than cold; the top-board should be propped up about an eighth of an inch all the winter, to allow all the moisture to escape; this is all that is necessary.

These hives are well adapted for a gentleman's lawn, so that the more timid part of the fair sex may inspect them at any time with confidence. If asked to recommend a hive as an ornament to the garden, so as to give intellectual amusement for visitors, I should without any hesitation name this as being the best adapted for the purpose. R.

Foreign Correspondence.

OOSHOOIA, FIRELAND, PATAGONIA: June 12, 1874.—Here at Oshooia the Winter's Bark is not found; it abounds more in the open parts of the Archipelago. We are very busily engaged in a great variety of occupations which thoroughly engross thought and hand, so that we have little time for foreign matters. I think the greatest peculiarity in Fireland vegetation to be the growth of the various tree fungi—if they are fungi—abundantly by the natives as food, of which one or more sorts are to be had in abundance all the year round. There are twenty or more kinds all growing from living trees, the same tree bearing at different seasons different kinds. For the most part they are globular and very glutinous, and slightly sweet. Three of the kinds are true fungi, and sometimes attain an immense size. One kind is very decidedly

sweet, and must be very nutritious. They regularly grow out of a woody excrescence which is like a living tumour on the tree, around the stem and twigs of which it extends in all positions, and of all sizes. Of the four Fireland trees, the Winter's Bark is the only unproductive one; the other three are Birches (F. Beech), two deciduous, the white and red; the other is evergreen, and chiefly abundant in the outer parts.

At a future time, if you seek it, I shall be (D.V.) ready to give you further information. For the present I will say good-bye. [We should gladly have more information, and if possible specimens of these fungi. Can they be species of *Cytaria*? Eds.]

The enclosed seeds are *Margaria* *Embothrium Despardii*. This grows on exposed stony hills, and is a beautiful flowering shrub. The flowers are like honey-suckle and bright red, and have much honey. The plant is deciduous; wood very beautiful (red mottled), seldom larger than 6 inches diameter. B.

Notices of Books.

Das Buch der Erdbeeren, &c. By Franz Göchke. Berlin: Schotte & Voigt, 8vo. Pp. 274. (The Book of Strawberries.) London: Williams & Norgate.

This is a work of which we should gladly welcome an English translation. Still more pleased should we be to see an original pomological work in our tongue compiled with such scientific method and completeness as the one before us. The first section of the book is devoted to the planting, cultivation, and propagation of the Strawberry in the open air, or in forcing-houses. The second division comprises the botanical history and classification of the species, whether European, Asiatic, or American, together with a full list of the cultivated forms. The forms are also grouped according to their season of ripening, their use for forcing purposes, &c. The author has studied the works of Duchesne, Madame Vilmorin, Lédoué de Lambertye, and others, with profit.

Each variety is carefully described, sometimes figured; its synonyms are given, and references to the books wherein it is described by other authors, or wherein plates are given. All these details are given with the system and accuracy of a scientific monograph.

The garden forms are referred to six races, viz., 1, the Forest Strawberry, *Fragaria vesca*; 2, the Monthly Strawberry, *F. semperflorens*; 3, the Hunt-boy, *F. elatior*; 4, the Scarlet Strawberry, *F. virginiana*; 5, the Child Strawberry, *F. chiloensis*; and 6, the Pine-apple, or large-fringed Strawberry, *F. grandiflora*. These are further sub-divided, according to the form of the fruit, the insertion of the seed, the colour of the fruit and of the flesh. We use the words fruit and seed here in the gardening sense.

An alphabetical index fully terminates a volume which we may certainly say is one of the most complete and scientific treatises on Pomology that we have met with.

Out of Doors; a Selection of Original Articles on Practical Natural History. By the Rev. J. G. Wood, M.A. Longmans.

This volume comprises a number of agreeably written articles which have from time to time appeared in various magazines, some having been written so far back as 1862. Of course, this does not make them any the worse for those who may not have read them in the originals; but for those who have done so, the protracted interval between the first production and the re-appearance only seems to intensify the sense of partaking of *crumbs* *his actus*. The author, moreover, so far as we have seen, has done little in the way of revision or addition, though some of the subjects of which he treats—*e.g.*, fish hatching—would seem to require both, while his account of opening oysters and eating the same is positively cruel in a double sense, cruel in that oysters are not to be had by persons of modest incomes now-a-days, and cruel in the same sense that a sportsman's account of his day's work, or a huntsman's narrative of his runs, is cruel. For consistency sake we hope Mr. Wood is not an opponent of vivisection, though we are abundantly sure he is not one who would practise or see it practised needlessly or recklessly, in spite of the ferocious way in which he writes of the opening and cooking of oysters. Any one in search of a pleasant book to while away half an hour may be recommended to read this, from the perusal of which he is very likely to gain some new ideas.

Le Jardin Potager, &c. Par H. Spruydt, Second edition. Braine-le-Comte: Lonnia. (Williams & Norgate.)

A thoroughly practical and clearly-written treatise on kitchen gardening in all its branches, and which we commend to the notice of all those interested in the subject, and conversant with the French language.

HORTICULTURAL EXHIBITIONS, 1875.

- MARCH.
- 27 to April 3, inclusive.—Royal Horticultural Society, South Kensington. Mr. William Paul's Special Show of Hyacinths, Tulips, Roses, and other spring flowers.
- 31.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.
- APRIL.
- 4.—Special Exhibition of the Royal Horticultural Society of Antwerp.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 23.—Royal Horticultural Society of Ireland. Spring Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.
- 27.—Manchester Botanical and Horticultural Society. Exhibition of Auriculas, &c., in the Town Hall. Manager, Bruce Findlay.
- 28.—Royal Botanic Society, Regent's Park. Spring Show. Sec., W. Sowerby.
- MAY.
- 1 to 10, inclusive.—Royal Botanic Society, Regent's Park. Mr. William Paul's Special Show of Roses, Pelargoniums, &c.
- 1 to 24.—Royal Botanic Society, Regent's Park. Special Exhibition of Clematis. By Mr. G. Jackson.
- 7 and 8.—Exhibition of Plants and Flowers in the Kibble Conservatory and Royal Botanic Garden, Glasgow. Manager, Robert Bullen.
- 12.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Post Rose Show.
- 13 to 21.—Manchester Botanical and Horticultural Society's Annual National Exhibition, at the Garden, Old Trafford. Manager, Bruce Findlay.
- 17 and 18.—Halifax Floral and Horticultural Society's Annual Exhibition. Sec., Leonard Kershaw, 25, Gladstone Road, West Hill Park.
- 20.—Royal Horticultural Society of Ireland. Early Summer Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.
- 23.—Crystal Palace Great Flower Show. Sec., F. W. Wilson.
- 25.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
- 26.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 31.—Coventry and Warwickshire Floral and Horticultural Society's First Show of the Season. Sec., Thomas Wigston, 4, Portland Terrace, Lower Ford St., Coventry.
- 31 to June 4.—Bath and West of England Society's Exhibition at Crodon.

THE

Gardeners' Chronicle.

SATURDAY, MARCH 20, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 22	Unreserved Sale of Nursery Stock, at "The Nurseries," Leatherhead.
	Sale of Rare Tulips and Coniferous Seeds, Tree Ferns, &c., at Stevens' Rooms.
TUESDAY, Mar. 23	Sale of Rare Tulips, at Stevens' Rooms, near Liverpool, by Frothero & Morris.
	Sale of Fine Poultry and Pigeons, at Stevens' Rooms.
	Sale of Hardy Trees and Shrubs, Roses, Bulbs, &c., at Stevens' Rooms.
WEDNESDAY, Mar. 24	Sale of Lilium auratum and Chinese and Japanese Tulip structures, at the Guildhall Tavern, Gresham Street, by Frothero & Morris.
	Exhibition of the Glasgow and West of Scotland Horticultural Society.
THURSDAY, Mar. 25	Sale of Established and Imported Orchids, at Stevens' Rooms.

The season is late, and so far less protection for FRUIT BLOSSOMS (or protection, at least, for a shorter period) will be needed. Everything, however, ought to be held in readiness, for with a change of weather will come a rapid development of the blossoms and the danger period. Unopened blossom-buds are protected by the best of all coverings—those provided by Nature. The scaly coverings of buds have a resisting force out of all proportion to their relative thicknesses; they also present the substance of the bud in the best possible form for bearing the greatest amount of cold with impunity. By bringing the parts of the flower together as they do, the whole substance of the flower is interposed between the frost and the ovary or young fruit in the centre of the bud. The flower by these matchless arrangements protects itself, and especially its most vulnerable and vital parts, from excessive cold.

But no sooner do the flowers expand, than all those cold-resisting powers provided by Nature are either weakened, or altogether removed. The first efforts of growth consist in an unclenching process. Bud coverings are unwrapped and thrown off in obedience to the alluring stimulus of warmth; hence the tenderness of early growths. When more progress is made everything becomes harder, stronger, and endowed with greater powers of resist-

ance. Unfortunately, the fickleness of our climate reaches its extreme point at the season when our flower-buds present themselves all unclenched to its influence; hence the necessity that arises for artificial, as we call it, protection. The phrase is, however, unfortunate: it would be more true to call the protection we afford natural. Our clumsy modes of applying protection are artificial enough, but the protection arrived at is an attempt to place the trees under more natural conditions than our variable climate provides for them in the spring.

The fact is, we place the trees of a Persian climate, say, on our walls, and then talk of our moist atmosphere as their natural climate. This is quite a mistake. Those who by the most skillful protection of their trees can place them under circumstances most nearly like the conditions under which they grow in their native country are those that follow Nature most closely; and those who leave the trees to battle with and succumb to our climate are the most artificial, and, we may add, superficial cultivators.

Nor must it be forgotten that the original nature of plants is little changed by art. Much that has been written, and more of what is believed concerning acclimatisation is sheer fallacy. By little of actual fact can be sifted out of the masses of chaff to prove that any plant is one whit harder than it was when first imported, though we do not go to the extreme of denying the possibility of such a change, or even its occasional existence.

Take the Peach, Nectarine, and Apricot, for instance. They are as warm-blooded and excitable as when first grown in England. Though they have been cut by spring frosts, to the utter ruin of the crops and the crippling of their energies throughout centuries, they are just as ready to open their flowers on the first bright day and offer them up to the frosts of the first frosty nights, as when first introduced. And so with other plants: safety must be looked for, not in endowing plants with greater powers of endurance than Nature has given them, but in surrounding them, as far as we can, with the natural conditions that Nature provided for their safety in that particular climatal niche that she intended them to fill.

Looked at thus the question of protection is settled once for all in the affirmative. We have only to determine the time, mode, materials, and extent of it. In regard to time, that, too, is settled by condition. No good, but much harm, may come of protecting too soon. As already stated, while the bud-scalcs remain on their form the best protection; just as they are about to be cast off our help becomes necessary. In early seasons this may happen in February. In a season like this protection may not be needful till the middle of March; applied too soon it weakens the trees, and in so far as it weakens it injures—applied too late the injury of a frost-bite cannot be retrieved by any mode or means of protection. Neither must our artificial protections be continued too long; Nature, after a time, supersedes our clumsy expedients by growing better protectors for herself. Art may assist, but should never attempt to supersede Nature. Whenever it does so it fails. Thus Nature's winter protectors are sufficient till they are thrown off in obedience to its summons to grow in the spring. And again, as soon as the wood-buds develop into shoots our artificial protection may be withdrawn. If left on too long it induces weakness, and breeds hosts of insects that prey upon the tender growths of the trees. Measuring the importance of the protection afforded by the young branchlets, the skillful cultivator will not disbud much nor remove many of the young shoots until the danger from spring frosts has passed away. Neither does the tree suffer loss, but the reverse, from late disbudbing. The young shoots drain the trees but little during

their first stages of growth, while they wake up the sleeping energies of the roots and quicken them into new activity. As the weather becomes milder disbudbing may be proceeded with tentatively, reserving as far as possible not only the shoots that will best furnish the tree with wood, but likewise those that will most effectually protect the young fruits from injury. As to the mode of protection all methods have been tried almost—from absolutely covering the entire wall for a time with glass to the placing of an extra coping of wood to project beyond the wall coping. That method is the best that effectually moderates the energy of radiation. That energy is greatest towards the open sky, and consequently the most efficient modes of protection are those that deal chiefly with the top of walls. It has been found, for instance, that a wooden coping, a common or straw mat, laid on brackets along the upper part of a wall, has afforded more protection than a thin screen of bunting enclosing the entire surface. The reason is not far to seek: the vertical projecting protectors cut asunder the energy of celestial radiation, and left the wall and its surroundings in almost undisputed possession of what may be called the local supply of caloric. There is also another, though perhaps less obvious, reason for the efficiency of what may be termed horizontal protectors placed on the top of walls. They create more or less of motion, or currents. This, which at first sight may seem to result in a lower temperature, really acts as a moderator to and preventor of extreme cold. Air in motion frustrates the energy of radiation, and hence it is found that a body of air enclosed by the flimsy meshes of a net or canvas may be absolutely colder than if no such protection were given. The protection, while of little service in directly excluding cold, keeps the air still, and this helps radiation to exert its full and most natural cooling force upon it.

In regard to materials, doubtless opaque substances, such as wood, thick mats, straw, reeds, nets, common bunting, &c., are the most efficient. The thicker the greater their protective force; and if we wanted to cover dead substances, or even dormant plants, the question would be narrowed to the single point, to find the cheapest material to exclude the most cold. But in protecting tender plants in a state of growth, and the blossom of fruit trees, the problem to be solved is a much more complex one. Extreme cold must be kept out, and every ray of light let in. Hence, if opaque protectors are used, they must be so contrived as to be readily portable, and only employed when absolutely necessary. Canvas and other screens should be mounted on rollers, or suspended by rings or iron bars, to be pushed or rolled off and on when wanted. To save all this labour, and to find a substitute for opaque protectors that shall be better than either—all of this has long been a problem among fruit growers. That problem seems at last to have been almost solved by the very thick, rough, or rolled plate-glass protectors, placed under the wall copings. These afford shelter without shadow, and are frost-proof up to about 10°. During very severe weather it has been found that their efficiency is much strengthened by being smeared over with whitewash.

As to the extent of protection, care must be exercised not to overdo it. It should be applied as late and removed as early as possible. Neither must the amount of it be excessive. A glass coping, 18 inches wide for instance, is as near perfection as may be; but a wooden one of the same width is excessive, as we noticed last year, where wooden copings blanched the trees towards the top of the wall into great weakness, while under glass copings of the same width they were in perfect health. Further, all glass copings and protective expedients of all

kinds should be removed early in May, or sooner, if the growth of the trees and the state of the weather permit; and during the time glass copings are on the trees, should dry, mild weather set in, it must be borne in mind that the copings which keep out the cold and consume the heat, likewise exclude the refreshing showers and stimulating dews, and the loss of these should be supplemented, as far as possible, by frequent syringings and sprinklings of the trees overhead.

We have little to say to those who condemn

crop in the spring is neither worthy of the knowledge, ability, nor appliances of modern horticulture.

— ON various occasions we have referred to the flower shows connected with the annual exhibitions of the BATH AND WEST OF ENGLAND AGRICULTURAL SOCIETY. This week we have an opportunity of giving an illustration of a group of plants, including *Verschaffeltia*, *Lilium anatum*, *Adiantum Farleyense*, &c., which formed part of the last exhibition at Bristol. It will be remembered that these shows are entirely managed by a steward of the Society, the Hon. and Rev. J. T.

varying with the merit displayed in the cultivation of the plant, &c. Under this system every gardener deemed worthy of exhibiting at all is sure to receive something, for there are no blanks, but all prizes. We look forward with much interest to the show at Croydon in June next, when, as we have already remarked, Orchids are to constitute the main feature of the display.

— Referring to the DEATH of MR. HENRY HIND, near Naples, Messrs. GEDGE, KIRBY & MILLET, of 1, Old Palace Yard, Westminster, state in the *Times* that "there is much reason to believe that

FIG. 74.—GROUP OF PLANTS AT THE BATH AND WEST OF ENGLAND EXHIBITION, 1874.

all protective expedients. If recent springs and failures do not teach the necessity of protection, neither can any words of ours. It seems something akin to reckless improvidence to trust the most valuable crops of the year to the tender mercies of our English climate. Facts and experience alike point to protection during the blossoming and earlier stage of growth of our fruit crops as mightily increasing the probabilities, if not guaranteeing the certainty, of a crop. That being so, we are bound to protect wisely and well, at the best time, in a proper manner, with the right materials and to the right extent. Doing this a crop of fruit and healthy trees will generally be the rich and satisfying reward. To trust to chance for immunity to our fruit

BOSCAWEN, who sets to work on a plan widely different from that according to which most shows are organised. There is, in fact, no prize list and no competition. The collection is got together solely by the energy and persuasive importunity of the steward. Prior to the show he visits the principal gardens of the neighbourhood, selects those plants which give evidence of the best cultivation, and which are best suited for his purpose, and begs the loan of them from the proprietor. He is seldom or ever refused, and having the material thus at his command, he arranges and stages it as seems to him best. As Mr. BOSCAWEN is well up in plants, and is a man of taste and energy, this plan answers well in his hands, though it is doubtful how far it would succeed in the hands of a less competent dictator. A compliment in money is made to the gardener in each case, the amount

Mr. HIND was murdered by order of the Secret Society of Market Gardeners in Naples. His great skill in the cultivation of flowers had enabled him to undersell other florists, and a deputation from that Society had, shortly before his death, waited upon him, and demanded that he should raise his prices, which he had refused to do. His murder would get rid of a rival, and in such matters Naples is as much at the mercy of secret societies as Tipperary. Unfortunately, the fact that Mr. HIND's accession to fortune would remove him out of their way was unknown to the conspirators. Permit us to add that Mr. HIND's funeral was attended by nearly all the resident English and Americans at Naples, and that the chaplain of the English Church, the Rev. PELHAM MAITLAND, addressed the assembly at the grave, paying to the deceased gentleman the tribute of approbation which

was justly his due, and stating the reasons which had convinced the authorities that he had been murdered, and thereupon a subscription was commenced for a reward for the discovery of his murderers. Mr. CALVERT, Her Majesty's Consul, will receive donations, and he is co-operating with the Neapolitan authorities in their vigorous and systematic inquiries. Mr. HIND's gardener has been arrested."

— We find that the PINK LILY OF THE VALLEY, which is inquired for at p. 348, is included in Mr. T. S. WARE'S last *Illustrated Catalogue*, under the name of *Invallidula*, with roses, the flowers being "of a decided rose colour." This variety was cultivated as far back as the time of GERARDE, who says—"The kinde with the red floure is a stranger in England, howbeit I have the same growing in my garden." MARTYN speaks of it as having remained true in cultivation to its "reddish or red" colour for above forty years; and both double and single red Lilies of the Valley, as well as a form having large white flowers variegated with purple, are mentioned by PHILLIPS in the *Flora Horticola*. Mr. STRATTON records the occurrence of two large patches of *Convallaria majalis* in one of the combs of the Quantock Hills, the flowers of which were of "a full pink, inclining to rose, with no trace of any purple tint."

— The dinner of the ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, at which His Royal Highness the Prince of WALES will preside, will take place at Willis's Rooms on Saturday, June 5.

— We clip the following from the *Richmond and Twickenham Times* of last week:—

"From outside the gates of Osterley Park, the residence of the Duke of CLEVELAND, is being removed the fallen trunk of a tremendous hollow tree, known as the King's Retreat, and the following anecdote is related as to the manner in which it received its royal name. King GEORGE II. was on visiting terms with a Mr. RICHARDSON, the then owner of the House, now the residence of Dr. WILLETT, and His Majesty, whilst on his way to visit the Earl of JERSEY, at Osterley House, in company with Mr. RICHARDSON, was prevented from proceeding by a violent thunderstorm. On presenting himself at the lodge for shelter, and stating who he was, the lodge keeper disbelieved him, as he considered the King would never be so modest as to walk, and refused him admission. The lightning struck the tree and opened its trunk sufficiently to hold the King as well as Mr. RICHARDSON, and since then the tree has been named "the King's Retreat."

The thirty-first annual competition of the SCOTTISH FANSY SOCIETY will be held in the Music Hall, George Street, Edinburgh, on Friday, June 18.

— We perceive, from a recent number of the *Journal of the Central Horticultural Society of France*, that discussions have arisen as to the possibility of GRAFTING POTATOES. While M. ROYER is of opinion that it is impossible to effect this, M. VAVIN takes the opposite view, and exhibited specimens in support of his assertion, which the Society declined to pronounce any opinion upon, as none of the assembled members had been present when the Potatoes exhibited by M. VAVIN were dug. M. DUCHARTE insisted on the importance of ascertaining clearly whether they really were any union of stock and scion in these cases. He went to the opinion that new tubers might be formed in such cases either from the stock or from the scion, or from both together, but considered it very doubtful if grafting ever occurred. M. RIVIERE stated that he had tried the experiment in vain, never having succeeded in getting union. On the other hand, a case is cited from the *Botanische Zeitung*, January 15, 1875, where a portion of a white tuber was grafted on a red one, with the result that new tubers of intermediate character were produced. In this country, as is well known to our readers, numerous experiments have been made by Mr. FENN, and some who once were sceptics have converted. Certainly the results shown on more than one occasion by Mr. FENN were sufficiently remarkable, and were commented on very early in the time. For an experiment made by ourselves were negative, except in one case, where decided adhesion took place between the inserted portion and the old tuber. M. DUCHARTE talks of *soudure*, but no such fusion takes place in ordinary grafting. Again, the production of a thin layer of corky cells over the edges of the wound would, we imagine, not necessarily prevent adhesion, as a similar layer of dead tissue becomes of necessity interposed, in most cases, between the stock and the scion, as pointed out by Mr. MURRAY. It is a great pity an interesting question of this kind is not definitely set at rest at Chiswick, or in some other experimental garden, where all stages of the process might be carefully watched by competent observers. If no grafting takes place, how can we account for that abundant production of elongated tubers of all sorts, sizes, colours, and shapes, such as those exhibited by Mr. FENN? If by "sporting" only, why such an outburst of this not uncommon phenomenon under these peculiar circumstances? Of course we place perfect

confidence in the veracity of Mr. Taylor of Fenotce, who asserts positively that Yorkshire Hero was produced in this way, but the accuracy of the observation is at least open to question. We should ourselves think most very likely Mr. FENN'S oddities were the result of the grafting process than that so perfect a tuber as the one mentioned originated, *tout d'un coup*, in this manner.

— The following schedule of prizes has been decided on by the committee who are promoting the POTATO EXHIBITION, to be held in London during the autumn of 1875. Other special prizes are anticipated, and they will be published in a complete form when the arrangements for holding the show are completed. The time and place will be shortly announced by advertisement:—

List of Classes open to all Competors.

		1st.	2d.	3d.	4th.
A.	24 varieties, distinct, 9 tubers of each	8 0 0	6 0 0	4 0 0	2 0 0
B.	12 varieties, distinct, 9 tubers of each	5 0 0	3 0 0	2 0 0	1 0 0
C.	6 varieties, distinct, 9 tubers of each	3 0 0	2 0 0	1 0 0	..
D.	6 varieties, distinct, kidney-shaped, 3 white and 3 coloured	3 0 0	2 0 0	1 0 0	..
E.	6 varieties, distinct, round, 3 white, 3 coloured	3 0 0	2 0 0	1 0 0	..
F.	Best dish of 9 tubers of any white round	1 0 0	0 15 0	0 10 0	..
G.	Best dish of 9 tubers any coloured round	1 0 0	0 15 0	0 10 0	..
H.	Best dish of 9 tubers of any white kidney	1 0 0	0 15 0	0 10 0	..
I.	Best dish of 9 tubers of any coloured kidney	1 0 0	0 15 0	0 10 0	..

Special Prizes.

By Messrs. Sutton & Sons, Reading.

K. 18 varieties, distinct, 9 tubers of each; Silver Cup, value

By Messrs. Hooper & Co., Centre Row, Covent Garden, W.C.

L. 12 varieties, of American, distinct, 9 tubers of each; Silver Cup, value

— The ORCHIDS are now a prime feature in the LONDON NURSERIES. Looking through Mr. B. S. WILLIAMS' collection the other day, we noticed in the Cattleya-house a fine variety of *Dendrobium Wardianum*, with larger flowers than usual; *Vanda suavis* and *V. tricolor*, *Cyclopogon cristata*, *Lycaste Skinneri*, *Lodii-Turneri* (very rich in colour), *Cypripedium*, and *Odontoglossum triplumans*. In the East India house, *Phalenopsis Schilleriana*, *grandiflora*, and *amabilis* were all numerously represented. *Aerides Fieldingi* was making a beautiful show; *Cymbidium eburneum* and *Calanthe Turneri* were also among the *pieces de resistance*, together with the new *Cypripedium Roezlii* and C. Lowii. *Dendrobium litiflorum* will shortly be finely represented by an aggregate of twenty spikes on several small plants. Amongst the cool Orchids the gem at present is a plant of *Masdevallia Lindeni*, with twenty-five flowers and buds. *M. ignea* was represented by a single flower, while on one plant of *Odontoglossum Alexandre* there was a spike of sixteen flowers, very fine in size. *Oncidium cucullatum*, *Odontoglossum luteo-purpureum*, and *O. Uro-Simmeri* were also to be seen; and *Cyclopogon fœcidi*, though it had been flowering for a long time, was still in a fresh condition. We were also glad to see *Disa grandiflora* making very strong growth in the same department.

A cord of HORTICULTURAL SOCIETIES is being rapidly drawn around the metropolis. Fortunately this bodes nothing evil to the inhabitants of this wilderness of bricks and mortar; on the other hand, it may be taken as indicative of a considerable advance in a horticultural direction by the residents in suburban districts, who are the chief promoters of these societies. The Royal suburb of Richmond—that most famous of all Cockney residences—that most potent of advantages of a horticultural society, a movement recently set on foot has been so far favoured that already a good list of subscriptions has been promised, numbers of gentlemen, and professional as well as amateur horticulturists, have given in their adhesion, and a large aggregate meeting of all interested is to be held in the town on the last day of the month, when a managing committee will be appointed. Surely a better locality for a flower show could scarcely be found. We hear also that a movement in the same direction is proposed in the locality of Isleworth and Hounslow. In a neighbourhood so densely populated, and one in which reside many of our metropolitan exhibitors, it should be a matter of comparative ease to establish a strong and active society.

— We understand that Mr. EYLES, now that

his services are no longer retained by the Royal Horticultural Society, intends to devote the whole of his time and energies to landscape gardening, in so far as relates to the furnishing of designs for and superintending alterations and improvements, in the laying out of grounds as public and private gardens, the construction of horticultural buildings, &c. Mr. EYLES has already earned some reputation in this department of gardening, during the period in which he was connected with the Horticultural Society, having devoted a portion of his time to advising on these matters. His future address will be 44, Eardley Crescent, South Kensington, S.W.

— The following gentlemen have agreed to act as a committee for the purpose of raising a fund for the benefit of the widow and children of the late Mr. WILKINIAH BUCKLEY, of Tooting, so well known as a plantsman, who, in consequence of his long illness, have been left totally unprovided for:—James Brand, Esq., chairman; J. S. Bockett, Esq.; C. Gassiot, Esq.; S. Lucker, Esq.; Dr. Cooper Forster, Dr. Moore, Mr. Harry Veitch, Mr. Bruce Findlay, Messrs. Barr & Sugden, Mr. T. A. Dickson, Mr. G. Deal, Mr. Penfold, Mr. Howard, Mr. C. G. Baxter, Mr. Thomas Moore, Mr. W. Robinson, Mr. Thomas Ware, Mr. R. Parker, and Mr. James Wood; Mr. G. T. Rollison being honorary secretary. Subscriptions will be thankfully received by any member of the committee.

— Mr. ANDREW CAMPBELL, of the glass department, Stamford Nursery, Bowdon, has been appointed to the situation of head gardener at the Southport Winter Gardens.

— GARDENIA STANLEYANA, a species very rarely seen in flower, is now blooming in the stove at Kew. There are eight expanded flowers, with many others advancing. The habit of the plant is remarkably perfect horizontal manner, forming flat surfaces of foliage. Its leaves are oblong, acuminate, shortly petioled, entire, and glabrous. The buds are at first erect, inclined considerably with increasing weight. Compared with the more familiar members of the genus, the corolla in form is remarkable; it measures, when fully extended, about 9 inches in length, and about 4 inches across from tip to tip. The tube is 6 inches long, slender, and dark purple, expanding into a campanulate mouth, green without, and terribled, purple within. The limb is composed of five broadly ovate spreading segments, at length reflexed. They are white, with irregular oblong purple spots, not extending to the margin. The lobes are peculiar, in having a longitudinal band of colour on one side, lighter in shade than the spots. This is not represented in the figure published in the *Botanical Magazine* of 1845. It may not, however, be constant, though strongly marked in this instance, especially on the under-side, where there are no spots. There is also a decided obliquity, the white side being the most rounded. This species was sent to the Right Hon. the Earl of DERBY, by Mr. WHITFIELD, from Sierra Leone, "and assuredly one of the most remarkable and beautiful plants of the whole of our collections." At first there was evidence of its being a free flowering plant, but subsequent experience has proved it the reverse; and though perhaps with suitable treatment it may be made to flower annually. That accorded to the above plant may be of interest. About this time last year it was potted in soil consisting of fibrous loam, with a good part of peat, and a portion of dung. Of the latter a mulching was given afterwards. It was then plunged in a bed, with a bottom-heat temperature of 85°, where it remained during the summer, making good growth; and in the autumn was removed to its present position in the stove. Liberal treatment appears to be an important point in the cultivation of *Gardenias*, the heat and vapour of a dung-bed during the season of growth is found to be very congenial. G. Stanleyana is kept in stock to most of the nurseries.

— Some of the French papers are recommending the cultivation of LATHYRUS TUBEROSUS as a substitute for the Potato. The tubers are very palatable, but we are not aware of any attempts having been made to cultivate them on the large scale.

— We learn from BRUSSELS that the Royal Flora Society of that city intends to celebrate its hundredth exhibition by an INTERNATIONAL EXHIBITION of great magnitude, and by a Botanical-Horticultural Congress. The exhibition is to be held from April 26, 1876, till May 4. This intelligence will, we fear, be received with some consternation, and having announced her intentions so long previously. Should it not be practicable to adjourn the exhibition at Brussels, we trust that it may be judged convenient to carry it out on a less ambitious scale, so as not to interfere with the success of the exhibition proposed at Amsterdam.

Home Correspondence.

Foliage for Rose-buds.—The numbers of flowers suitable for "button-holes" which can be procured at all seasons of the year is very limited. Amongst these there is no more general favourite than a Rose-bud, and particularly the buds of Teascented Roses. It is usual to place a leaf or two of their own foliage at the back of the flower, and one or two leaves of the Fairy Rose in front, and sometimes a spray of Maidenhair Fern is also introduced. Though these leaves are usually supported by fine wires, they rarely survive exposure in a hot room for more than six hours without flagging, even if kept in a tube of water; while the Rose-bud, if so treated, will look well for a couple of days. In winter Roses are so costly that they are worth saving as long as they will last; and I am glad to report having found some foliage which goes capitally with Rose-buds, which wants no wiring and which outlives the Rose, in the leaves of starved plants of Balm of Gilead (*Dracocephalum canariense*), a small branch of which has been in my coat for five days, and looks fresh still. It is very sweetly scented. *W. T. P.*

The Opening of Flowers.—In addition to the plants noted at p. 310 as opening their flowers at stated hours, I have myself noticed that *Passiflora trifasciata* commences to open its small white flowers about 9 A.M.; they are fully expanded at 10 A.M., and closed for ever at 11 A.M. The flowers of this plant may no doubt be often overlooked on account of their small size and want of colour. *T. Smith, Newry.*

Streptocarpus Saundersii.—Mr. Gumbleton recently made some inquiries concerning *Streptocarpus Saundersii*, and where it could be obtained. As no one seems to have answered his inquiry, he and others may perhaps be glad to know that Mr. T. W. Bond, of the Holmehill Road, Ekeate, Surrey, has a stock of it a year or two back, and, I believe, has still. Some of them were, I think, raised from seeds collected by himself at the Cape of Good Hope. He had also, in 1873, a few plants that were raised from seeds of *S. Saundersii*, at Mr. Saunders'; these were a very distinct variety of the parent plant, having more numerous and smaller drooping flowers, of a delicate waxy white colour, faintly tinged and spotted with lilac, and proved to be really a very charming variety of the beautiful *S. Saundersii*. It may be well to mention that among the dried specimens collected by Mr. Cooper is a *Streptocarpus* that appears to be the same as the variety raised by Mr. Saunders; it is therefore probable that it is purely a natural variety, and not one brought about by the altered conditions of the plant under cultivation, or it may be that the plant is dimorphic, as the same batch of seed produced the true *S. Saundersii*, as well as the variety. *N. E. Brown.*

The Wild Daffodil.—I have read with some surprise the letter of your correspondent in last Saturday's *Gardeners' Chronicle*, who states that if *Narcissus Pseudo-Narcissus* be brought into a garden and diligently cultivated it almost always becomes double; whereas, *vice versa*, if the great double Daffodil be transplanted into a meadow it as surely shortly becomes single. I can only say that I never before heard of the occurrence of either one or the other of these things. My own experience leads me to form precisely the opposite opinion. Some twelve years ago I dug up an I brought into my garden a quantity of *N. Pseudo-Narcissus*; so far from showing any tendency to become double they have very decidedly deteriorated in every way. On the other hand there are two or three meadows in this parish where the great double Daffodil has grown long beyond the memory of the oldest inhabitants, and they are as double and full as any that could be grown by the most experienced Dutchman in Holland. The double variety of *N. Pseudo-Narcissus* is extremely rare. Mr. Barr was fortunate enough to get hold of a few bulbs last spring, and he has distributed them among his friends. Up to that time I know of no collector who grew them in his garden. *H. Harpur-Cress, Drayton-Beauchamp Rectory, Tring, March 15.* [Mr. Barr also writes to say that "C. W. D.'s" statements are in direct opposition to anything he has read of or seen in gardens or in fields. *Eds.*]

Miltonia Warszewiczii.—I do not wish in any way to detract from the beauty of the spike of *Miltonia Warszewiczii* mentioned at p. 340, still I think it but fair to mention that at the last Whit-week exhibition at the Manchester Botanic Gardens a plant was exhibited by Mr. Mitchell, gr. to Dr. Ainsworth, that had produced two spikes from the leading growth, on one of which there were forty-six blooms, and on the other there were forty, making altogether eighty-six blooms from one bulb. After being exhibited at Manchester, this plant was also taken to Leeds, and staged there among a collection of Orchids shown by Mr. Mitchell. Another plant in this collection had three spikes from

the leading growth, which produced seventy blooms. The beautiful triangular form you allude to produced by the number of laterals this plant brings when strong was very apparent in these spikes, and the rich colouring of the labellum, with the curious markings of the sepals and petals, forms an object as singular and interesting. *W. Swan, March 16.*

Relative Cropping Quality of Potatoes.—As considerable attention has been drawn to the cropping qualities of the American sorts of Potatoes, I should much like to see a thorough and reliable test of say six of the Americans against six of our most productive, but on condition that the Americans are supplied with these American kinds know that, in a given surface, they usually have double, and oftentimes treble, the number of eyes that good English kinds have. Thus, in cutting up 1 lb. of tubers of any of the former kinds, it is possible to secure from fifty to sixty separate eyes, and if these be planted carefully and nursed a large proportionate crop may follow; but as the latter kinds would, at the most, give but half the number of eyes, they would be placed at considerable disadvantage. To some persons this abundance of eyes may prove a recommendation; but generally, I think, it is not held in esteem, and good cropping kinds that have few eyes, and those shallower, are thought to be the best varieties. Now, if of twelve kinds, as already mentioned, twelve tubers of each sort were selected, all medium sized, and weighing in each case about 1 lb., and all planted and grown under similar conditions, and each crop lifted and weighed off as soon as ripe, I believe this would constitute a fair relative trial, as I think it would be found that what the Americans gave in size our kinds would equally give in both quality and quantity. *Alex. Dean.*

Midland Counties Exhibition.—The schedule of this Society has been distributed, and I have no doubt that the prizes offered will bring together a most brilliant collection of exhibits. The show is to be held from July 1 to July 5, &c., from the Thursday till the Monday following. Now, in the case of fruit, I think the time much too long, for after the exhibition is over the fruit is worthless—in fact, a loss. I would suggest, therefore, that the fruit exhibited on the first be removed on the close of the second day, and those intended to be competed for on the fifth be staged on the third instead. Intending exhibitors would do well to call attention to this matter at the proper quarters; a shorter fruit exhibition means fruit saved and exhibitors' expenses lessened. *T. W. Bond, The Beches, Weybridge, Surrey.*

Eucalyptus globulus.—Your numerous correspondents seem to solicit information respecting this tree, and the high encomiums passed upon it as to its utility in rendering unhealthy situations salubrious, by its powers of absorption and exhalation, have induced many landed proprietors to plant young trees of it on their estates and about their dwellings; but the operation has invariably failed in producing the desired effect, as the tree cannot resist severe frost, and consequently does not last many years. I have frequently seen young trees 10, 20, and even 30 feet high in the Channel Islands, growing vigorously during a period of three, four, or more years in sheltered situations, but on the appearance of severe frost being killed to the ground. I enclose you specimens of wood and leaves, which I cut from a young tree about 20 feet high, growing in the front of Mr. John De Gruchy's house, near St. Saviour's Church, Jersey. You will perceive that the leaves and young shoots are all burned or dried up by the wind and frost, and that, although the wood remains green, the destruction of the leaves or lungs will stagnate the sap and cause the death of the tree. It is evident that it requires a milder and more growing climate than this part of Europe offers, and that continuous growth is essential to keep it in health. The young trees are very beautiful, and often make shoots 6, 8, and 10 feet high in a season, with leaves 6 and 8 inches long, of a rich glaucous blue-green colour, commanding attention by their vigorous and healthy appearance. The seeds are easily obtained and raised; the young plants require but little nursing, and are usually kept in pots during the first season, to be planted out the following spring. The first season's growth is generally very promising, and should the following winter be mild, progression is very rapid, inducing the belief that all previous attempts to grow it have failed through the insufficiency of the experimentalists; but the third or fourth year's growth being a little more advanced than the previous ones, proves the correctness of the theory, that the *Eucalyptus* is not sufficiently hardy for our climate. We have very severe weather here just now. *C. E. S., Jersey, Feb. 23.* [It ought to be understood that this *Eucalyptus* is not generally hardy in England, though it may survive in favoured localities in the south-western districts, and also in some parts of Ireland. *Eds.*]

Pine Sucker Fruiting Young.—I feel curious to know what is the shortest time known for growing a Pine from a sucker (without a roof) till the fruit is

cut. We have a Queen Pine here, taken from the parent stem on the 5th of last August. "This one," said my foreman, "is large enough for a fruiting pot," to which it was consigned without loss of time, and plunged in a bottom-heat of about 100°—not too high, other things necessary to succeed being in proportion. It soon started into growth, and by the end of October was gradually rested, with a pot full of fine healthy roots. The treatment now was exactly the same as that given to others required to be started by January 1—all Queens—which showed fruit fourteen days after fresh excitement. The sucker (still called the sucker) did not "show" till February 1, and, judging from its appearance now, we hope to cut a fruit fully the average weight of Queens by the end of May—within a period of ten months. *T. W. Bond, The Beches, Weybridge, Surrey.*

Madresfield Court Vine.—I can highly recommend the Madresfield Court Grape to Mr. Martin (p. 312) for planting in an early viney. I grafted it on the Hamburgh in 1872 in my second early viney, so that I have my third crop just about commencing their second swelling. I commenced cutting them last year on April 21, and their size, colour, and flavour was every thing that could be desired. It has never shown the least signs of cracking with me. The Vines are planted inside close to the front wall, which is arched, so that the roots run outside as well as in; in fact, I look upon it as the finest Black Grape we have. I grow it at the cool end of a Black Hamburgh house, 50 feet long by 20 feet wide, and it is ripe in ten days after the first Black Hamburghs at the hot end, while it sets as freely as the Hamburghs. I intend planting one in the early house, which is now (March 5) colouring fast, and will be ready for cutting in about ten days. The Madresfield Court in my opinion is A 1 as a second early or summer Grape, but for a late keeper I would not recommend it, for if the least damp gets into the bunch it goes like ice before the sun. *James Smith, The Gardens, Waterdale, St. Helen's, Lancashire.*

Blue-flowered Hortensias.—The *Journal of the Horticultural Society of France* mentions that much has been said and still written on the causes which affect the red blossoms of the Hortensia, converting them into blue, consequent on their cultivation in certain soils. The action inherent in the soil occasioning the blue tint has been attributed to the special presence of certain qualities—a question at present little understood. A fact related in the *Hamburg Agricultural Journal* gives weight to the opinion that the blue shade of the Hortensia owes its colour to the iron nature of the soil. M. E. Siebert states that his attention having been drawn to this subject, he was able to profit by an experiment made by one of his acquaintances on a layer of feruginous earth. Having procured a quantity of earth he planted it with Hortensias, care being taken to divest the roots of all previous soil by thoroughly washing them. At the end of the following July the plants, instead of producing red, were covered with blue flowers. *B.*

Linum trigynum.—Few things are more useful for winter blooming than the above plant, and yet one seldom sees it in good condition. This arises from its being commonly treated as an ordinary greenhouse plant, whereas, to grow the plants in really good style, and free from red-spider, they require special treatment, while the temperature of an intermediate house or warm conservatory is necessary to induce them to unfold their blooms properly. Plants propagated at this season, and grown freely on, invariably form the best stuff for flowering the following winter; and if a small house or pit can be devoted to them, their requirements as to shade and atmospheric moisture can be much better attended to than if mixed up with other things. Old plants put to work now in moist heat will soon afford the necessary quantity of cuttings. These should be inserted in cutting pots, made up principally with leaf-soil or peat, with a dash of sand. Most soft-wooded things emit their roots much more freely in cutting pots filled with fine leaf-soil than they do in the hard, barren mixtures of sand and loam too commonly used for propagating purposes, and after rooting they can be more readily separated without injury than they can if inserted in the latter. As soon as the cuttings are rooted they should be potted in small pots of soil mixed with leaf-mould and loam, or peat and loam, in the proportion of two-thirds of the former to one of the latter, as they are fond of loose decomposed vegetable matter, in which they root and grow with great freedom. After potting they should be placed in gentle heat, where they can be well syringed and kept growing steadily on. Continue to shift into larger pots as they increase in size, and when they are well rooted in the roots will be found to run with great freedom. By the end of May they may be transferred to a cold pit, and if there should be sufficient depth to hold a few leaves or tan, to afford a slight bottom-heat, they will succeed all the better. In any case they should

be plunged in some material, so as to keep the roots in a uniform state as to moisture, or red-spider is sure to attack them if they are allowed to become dry. It will be necessary to afford them a thin shade for two or three hours during the hottest part of the day, and before shutting up they should have a heavy syringing, so as thoroughly to wet the leaves both on the upper and lower sides. If this is not attended to they are very liable to the attacks of red-spider, and once this pest makes its appearance on them the plants are soon disfigured and worthless. The mistake many make in growing the *Linum* is in treating it as an ordinary house plant, and under the such system it only partially succeeds. To get the flowers to open freely, it is necessary to give it the temperature of an intermediate house or warm conservatory; and in a temperature of this kind, if the plants have been previously grown properly, they will be a blaze of bloom and last in perfection the greater part of the winter. *J. Sheppard, Woolverstone.*

Count Kerchovo's Conservatory.—We give this week two small illustrations (figs. 75, 76) of the interior of Count Kerchovo's Winter Garden at Ghent, and which we were unable to publish last week with the descriptive letterpress. In the one is shown the stairs leading to the rock-work, in the other is shown a group of Tree Ferns, Palms, &c., which serve to show something of the magnificence of the building and its contents.

Reports of Societies.

Royal Horticultural. *March 27.*—W. A. Lindsay, Esq., in the chair. The Rev. M. J. Berkeley read a short communication from Mr. W. Gardiner, gr. to E. P. Shirley, Esq., Easington Park, Stratford-on-Avon, on a plan of preserving Apples which had been bird-pecked, and which simply consisted in dropping a spot of liquid sealing wax on the place while the fruit is hanging on the tree. In the specimens before the meeting, the plan seemed to be perfectly successful. It was then stated that the *Euphorbia panicula* shown by Mr. Suerel was imported from Jamaica in 1778, and had been figured in the *Botanical Register* so far back as 1817. Attention was called to a plant of *Cattleya amethystoglossa* remarkable for the number of flowers on the spike. These were not, however, individually so large as those figured in Warner's *Select Orchidaceous Plants*, nor were they so deeply spotted. A cut flower of *Cypripedium villosum* was sent by Major Berkeley, to show the persistency of the flowers, this one having been cut a fortnight, and mention was made of a fine specimen in a collection sent by Mr. B. S. Williams. This plant has not at present been figured in any of our more popular illustrated works, but there is a figure in the second volume of Mr. Warner's book. Cut specimens of a *Bambusa* in flower, said to be *B. gracilis*, was sent by Mr. Stevens, gr. to the Duke of Sutherland at Trenham, but it would probably prove to be an *Arundinaria*. Mr. Berkeley stated that in general these plants, when they produce seed, die. There are some which flourish for thirty years or more, and then bear seed, after which the plants invariably die. A letter from Mr. Durbridge was then read, in which the writer called attention to some cut flowers of *Narcissus Pseudo-Narcissus*, and *N. Tazetta*, received by him from Cornwall on Feb. 5 of the present year. The flowers were then only just expanded, and since their arrival had been kept in a vase of water and moss; with the result that they had nearly attained their full size, and the ovules were in many cases perfectly formed. Mr. Durbridge did not think that in this case they would come to maturity, but he wished to call attention to the fact that many plants which flower late in our climate might be induced to perfect their seeds if the fruit-bearing stems or branches were cut and placed in a light, airy position indoors, in vases of water, moist sand, or sphagnum moss. This was no new idea, others having previously called attention to it, but the fact was not sufficiently known among horticulturists and hybridisers. The cut seed-bearing spike of *Hedychium Gardenianum*, shown by Mr. Bennett, gr. to the Marquis of Salisbury, at Hatfield, was most interesting, on account of its beauty and the rarity with which the scarlet seeds are produced. The plant had been very attractive for the last four months, and Mr. Bennett recommends growers of *Hedychium* not to be too hasty in cutting down the plants after flowering, the spikes of seed vessels being as attractive and more durable than the flowers. The plant shown by Messrs. F. G. Henderson & Son under the name of *Salvia multiflora coccinea*, Mr. Berkeley believed to be the same as *Salvia bolivienis*, figured in the *Flore des Serres*, and which was raised from seed some years ago at Maidstone.

The Chairman stated that he had addressed an official letter to the newly-appointed Governor of Fiji, pointing out the necessity of collecting plants in that country, and asking that such might be sent to the Society. He had not yet received an official answer, but had heard privately that the reply would be a favourable one.

SCIENTIFIC COMMITTEE.—M. P. Edgeworth, Esq., in the chair.

Fruiting of the *Narcissus*.—The Rev. M. J. Berkeley exhibited specimens of *Narcissus Tazetta*, &c., from Cornwall, which had set their fruit after having been cut and placed in water. (*See ante*.)

Disease of Scotch Fir.—Dr. M. C. Cooke forwarded specimens of Scotch Fir from the Edinburgh Botanic Garden infested with spots of an imperfect form of *Hysterium abietinum*.

Monstrous *Cyclamen*.—Rev. — Rawson sent specimens of *Cyclamen* with stalked umbels of flowers intermixed with leaves, also partially double and syanthic flowers of the same plant.

Double *Cineraria*.—Mr. E. Bennett sent additional specimens of the so-called Double *Cineraria* before alluded to.

Flowering Specimens of *Bambusa gracilis*.—Mr. Stevens, of Trentham Gardens, showed flowering specimens of *Bambusa gracilis* (Hort.), a plant which he grew in considerable quantities for decorative purposes, but which had never before flowered with him till this year, when almost every plant produced panicles of bloom.

Mr. Edgeworth remarked on the rarity with which Bamboos flower in India, and on the long intervals which elapse between the flowering seasons.

FIG. 75.—VIEW IN THE WINTER GARDEN OF COUNT KERCHOVE.

Usually the plant dies after flowering. It has frequently happened that in the year previous to a great famine the Bamboos have seeded, and afforded a welcome supply of nutriment to the natives.

Opium Blight.—Mr. Berkeley commented on the fungi connected with the Opium blight, *à propos* of a report on the table, drawn up by Dr. Cunningham, and entitled "Microscopical Notes regarding the Fungi present in Opium Blight." The fungus seems to be a form of *Peronospora*.

Fungi in Ant-hills.—A conversation ensued as to the production of edible fungi in ant-hills, as alluded to at a former meeting, and the following extracts from the proceedings of the Agri-Horticultural Society of India were read:—

"In an extract from the *Gardeners' Chronicle* on 'Mushrooms in India,' in the *Society's Journal*, vol. ii., part 1, p. 36, the writer says:—'I cannot conceive whitest earth being of any use in gardening. The only growth I have ever observed on it, or in the nests, was that of a very small fungus, less in size than an ordinary pinhead, and often mistaken for the egg of the termites, in shape resembling a Button Mushroom of a white colour.'

"I now send you a bottle containing Mushrooms I extracted a few days ago from the centre of a white-ant hillcock. When I collected them they were in appearance like *Asparagus*, over 1½ inches in length, and the people about here consider them particularly good eating, partaking of them both raw and cooked, and call them 'Bheuphot.'

"When I read the above article in your *Society's Journal*, somewhat over a year ago, I was then aware that Mushrooms existed in the interior of ant-hills, for I had often seen them, but I did not know their season of sprouting, and whenever I searched was unsuccessful till the other day. I have now ascertained the season they sprout is the end of August, or the beginning of September, and I believe all ant-hills produce them then.

"These Mushrooms appear to me to proceed from a peculiar substance always found in ant-hills in this country (whether white or black), generally called ants' food, a bluish gritty substance, like coarse wheat-flour turned mouldy and adhesive—in dry weather brittle, and in damp weather like soft leather. It is this substance, under the combined influence of heat, damp, and darkness, from which the Mushrooms grow.

"As my experience is at variance with the writer in the *Gardeners' Chronicle*, you may care to record it perhaps.

"The liquor in the bottle with the Mushrooms is white wine vinegar, which I thought would best preserve them; and to ascertain their true shape and length I would advise your breaking the bottle, for I do not think you can possibly extract them entire otherwise.

"I would like these Mushrooms, if possible, referred to some mycologist, and their names ascertained; and I would like also to know, if the bluish substance, and ants' food, was collected and treated artificially, could similar Mushrooms be raised from it.

"I know of several other fungi which are eaten by the

people here, and considered good food, which on procuring I will forward to you, to be recognised. One in particular I am desirous of knowing more about, to all appearances like a small Potato, and considered the best of all. It is procured from under the ground, and its presence is indicated by the earth cracking, generally near the stumps of *Saul* trees."

The Secretary then read the following remarks, obligingly furnished by Dr. Cunningham:—

"I herewith return the letter sent to me more than a month ago, along with specimens of fungi said to have been procured from the interior of a white ant-hill.

"The specimens apparently belong to some species of *Leptota*, and are chiefly remarkable for the extreme length and coarse fibrous contents of the stem.

"The occurrence of fungi in connection with ant-hills is well-known, but in so far as I am aware those hitherto described as occurring on the hills of the white ant-hill to species of the *Gasteromyces* order, *Podaxini*, so that the occurrence of a species of one of the sub-genera of *Agaricus* in such localities is a new and interesting fact.

"With regard to the material from which they arise, and which must apparently be of the same nature as the so-called spawn of the cultivated Mushroom, consisting of vegetable *débris* permeated by the mycelium of the fungus, it may be noted that a similar substance is described by Belt as occurring in the nests of the leaf-cutting ants of Nicaragua, and is supposed by him to serve as food, the ants cutting and storing the leaves for the sake of the fungi which are subsequently developed in the *débris*."

* *The Naturalist in Nicaragua*, p. 50.

"Were this spawn artificially exposed to conditions similar to those which it naturally encounters in the interior of the hillocks—heat, darkness, and moisture—I believe that the pilei might very probably be raised at will; and if they really are good eating the experiment would be well worth trying.

Reproduction of Yeast.—Professor Thiseion Dyer exhibited under the microscope examples of the ascospores (or endospores) of yeast. These had been described by De Snydes in 1803 in the case of *Mycoderma vini*. Trécul stated that he had observed them in yeast, but Max Reess had given the first detailed account of them in 1870 (*Botanische untersuchungen über alkoholgährungspilze*). To obtain them it was only necessary to cultivate the yeast which had ceased active growth (*unterleufs*) on a moist slab of plaster-of-Paris in a damp atmosphere. After about ten days the cells of the yeast which had been starved by this treatment developed from two to four spores in their interior. These when placed under appropriate conditions were found to be capable of germinating and so of reproducing actively growing yeast.

Fertilisation of Fungi.—Mr. Renny alluded to some recent discoveries as to the fertilisation of Coprinus.

Phenological Phenomena.—A report on this subject, drawn up by a joint committee of the Royal Agricultural, Royal Botanic, Royal Dublin, Royal

hortugh, Miss Bateman and Albert Victor, with which were mixed specimens of bright coloured *Hippocrepis*; and a large basketful of *Rhododendron præcox* var., Early Gem, a new and most valuable variety, with pale rose purple flowers for spring decoration, the plants being now all out in full bloom in their Coombe Wood Nursery. Mr. John Wills, of Sussex Place, South Kensington, and the Melbourne Nursery, Amersley, S.E., contributed a very extensive group, including amongst flowering plants *Narcissus*, *Roses*, *Tulips*, *Hyacinths*, *Spiræas*, *Azaleas*, *Cinerarias*, *Heaths*, &c., and of subjects remarkable as fine-foliaged plants several of considerable beauty and interest. *Aralia Guillofeyi* was capitally represented, and so also was *Cupania undulata*, *Abutilon Sellowianum*, *Phyllanthus nivosus*, *Aralia Veitchii*, *Croton Weismannii*, *Cupania filicifolia*, *Dioscorea bausei*, *Ficus Parellii*, *Phyllanthus mimosifolius*, *Terminalia elegans*, *Phyllanthus comorensis*, and *Xylophylla latifolia*, &c., all neat and well-furnished examples. A silver medal was awarded. Mr. B. S. Williams also sent a good collection of flowering and ornamental-foliaged plants, which included *Lichmea Maria Regina*, with a fine spike; *Thalassopsis Schilleriana*, with fifteen flowers; *Dendrobium Wardianum*, *Lælia elegans*, *Odontoglossum triumphans*, *Amaryllis Mendelii*, vermilion-red, very fine; *Cyclamen persicum*

Mr. Douglas having very strong and finely-flowered plants of *Babiola*, *Keizerskroon*, *Chrysolon*, orange-yellow, very fine in colour; *Proserpine*, *Van der Ncer*, and *Vermilion Brilliant*. In the two classes for *Cyclamen*, the only exhibitor was Mr. Goddard, gr. to H. Little, Esq., Cambridge Villas, Twickenham, who had some truly magnificent specimens, and took both 1st prizes. Mr. Goddard also staged a very large and most striking collection in the miscellaneous class, and took a bronze medal. For six Orchids, Mr. B. S. Williams was 1st with a capital group, including *Odontoglossum Alexandricum*, with one spike on which were sixteen flowers, all being of fine size and great substance. This was considered to be one of the finest spikes ever seen. The others consisted of *Vanda suavis*, with two spikes; *Lycaste Skinneri*, with about a dozen and a half flowers; *Masdevallia Linnæi*, with seventeen flowers and buds; *Cymbidium eburneum*, and a fine *Cypripedium villosum*. Hardy spring flowers were represented by a nice group of eighteen from Mr. K. Dean, Ealing, who took a 1st prize, and also secured the premier awards in classes for *Frimroses* of the *Polyanthus* and *acaulis* type.

Of fruit and vegetables the display was very limited. The 1st prize for two bunches of late Black Grapes went to Mr. T. Kington, gr. to W. S. Brown, Esq., Woodthatch Lodge, Reigate, who had Alicante, good in bunch, berry, and bloom. Mr. W. Wildsmith, gr. to Viscount Eversley, Heckfield, was 2d with Lady Downe's—small compact bunches, fair sized berries, and carrying a splendid bloom. Alicante and Mrs. Pince's Black Muscat, cut from the Vine on December 1, were shown by Mr. Donaldson, gr. to Lord Chesham, Latimers. The 1st prizes for kitchen and dessert Apples went to Mr. T. Parsons, gr. to R. Attenborough, Esq., Fairlawne, Acton Green, who had amongst others very fine samples of Allfriston, Wellington, and Blenheim Orange, &c. Mr. J. Clarke, gr. to the Rev. A. D. Staurope, Writtle, was 2d for dessert kinds; and Mr. J. Woodbridge for culinary sorts. The Pears were very poor. Excellent Mushrooms came from Mr. T. Record, gr. Vinters Park, Maidstone; and Seakale from Mr. Clarke.

FLORAL COMMITTEE.—R. B. Postans, Esq., in the chair. A First-class Certificate was awarded to Mr. H. Bennett, nurseryman, Stapleford, Salisbury, for a new hybrid perpetual Rose named *Hippolyte Jamin*, bright rose, with a fine dark crimson centre; a full, well built flower, and particularly good as to foliage. A fruit-bearing spike of *Hedychium Gardnerianum*, the scarlet seeds on which were greatly admired, came from Mr. Bennett, of Hatfield; and Messrs. Paul & Son contributed two boxes of very fine forced *Roses*, and a white Lilac named *Alba grandiflora*. Messrs. James Veitch & Sons sent a dozen new *Hyacinths*, but no awards were made in this direction to-day. Four very fine specimens of *Cyclamen* came from Mr. W. Shorten, Rabbly Gardens, Herts, and gained a Cultural Commendation. From Mr. W. Bull came two plants of the new *Phalanopsis leuchoroda*, imported with several other new hybrids from the Eastern Archipelago, and described in our columns by Professor Reichenbach, at p. 301 (see also p. 365). Messrs. E. G. Henderson & Son exhibited, under the name of *Salvia multiflora coccinea*, a very bright scarlet flowering plant, which Mr. Berkeley believed to be the same as *S. boliviensis*, figured in the *Flore de Soree*. The same firm also showed *Cyclamen persicum multiplex*, a variety with two rows of petals instead of one, as in the ordinary form. A specimen of *Catleya amethystoglossa*, with one spike, on which were seventeen flowers, and the bright orange yellow-flowered *Lælia flava*, with three spikes, came from Mr. W. Wilson, gr. to W. Adams, Esq., Chace Park, Enfield. Mr. Marshall, gr. to J. R. King, Esq., Chace Park, Twickenham, sent a plant of the old *Asphorbia punicea*, whose crimson-scarlet bracts contrast well with its green foliage. *Tulipa Greigii*, a species from the mountains of the Caucasus, and remarkable for its spotted foliage, was shown by the New Plant and Bulb Company, Colchester.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. The only objects which came before this body were six brace of the Duke of Edinburgh Cucumber, shown by Messrs. Munro & Wilkinson, of Potter's Barr, N.; some fine specimens of *Uvedale's* St. Germain Pears and *Lowndes's* Pippin Apples from Mr. Bennett, Hatfield, and excellent examples of *Celery*, or *Turnip-rooted Celery*, from the Society's garden at Chiswick. This vegetable is but little grown in this country, but somewhat extensively in France, where the roots are sent to the table in thin slices to eat with cheese, and also stewed like our *Celery*.

Manchester Botanical and Horticultural.—The first show of the current season, held in the Town Hall, King Street, on Tuesday, March 16, presented several features of considerable interest. Upon no former occasion of a show in this room has

FIG. 76.—VIEW IN THE WINTER GARDEN OF COUNT KERCHOFF.

Horticultural, Marlborough College Natural History Society, and of the Meteorological Society, was placed on the table. The report consists in a list of the flowers, insects, birds, &c., whose first appearance in spring is to be noted in connection with meteorological phenomena.

Fruiting of *Hedychium Gardnerianum*.—Dr. Masters called attention to the beautiful specimen exhibited by Mr. Bennett, of the Gardens, Hatfield. Though so common in collections, the fruits had not been hitherto observed. No artificial fertilisation had been resorted to.

THE HYACINTH SHOW.—This was held in the Western Arcade, and, thanks to the liberality of several of the leading nurserymen, was a much better display than could reasonably have been anticipated under the circumstances now so familiar to all. As a *Hyacinth* show, however, it must be confessed that but for a large and attractive collection staged by Messrs. Veitch & Son it would have been like the play of "Hamlet" without *Hamlet*. The miscellaneous class was the mainstay of the exhibition, so that what is usually alluded to by us at the last must on this occasion be considered first. A silver medal was gained by Messrs. Veitch & Son for a large and important collection of plants, including over 100 *Hyacinths*, very good for the season, but not so fine as last year; some very good *Tulips*, *Cyclamens*, and *Crocuses*; a showy group of *Clematis*, including such varieties as *Lord Lonsborough*, *Lady Lons-*

giganteum, a very robust grower, with large flowers; *Adiantum gracillimum*, a fine specimen; with *Palms*, *Dracænas*, &c. A silver medal was awarded. From Mr. William Paul came a large and admirably effective collection of *Camellias* in pots, which were very much admired. By far the greater proportion of the flowers were white, which contrasted beautifully with the rich deep green of the abundant foliage; and these also won a silver medal. A bronze medal was awarded to Mr. J. Aldous, florist, Gloucester Road, South Kensington, for a neat group of capital decorative plants, which included one of the finest specimens in the country of *Kentia Forsteriana*.
