Let us put the matter in another point of view. Vegetables of all kinds have been necessarily scarce and dear this winter. If the use of meat were entirely abandoned, even supposing enough vegetables could be produced or imported, the price would be so high that we doubt whether the poor man would be at all the better in purse did he confine his meat to vegetables. Our country friends, and those with large garden establishments to draw on, will, we expect, be surprised to see the prices paid to a suburban grocer at the end of March and beginning of April; and they will agree with us, we think, that with such prices it would not be practicable to feed a family of hungry children on vegetables alone at economical rates, even if the fresh vegetables were supplemented, as they would have to be, by farinaceous foods of various descriptions.

Rhubarb, 1s. the small bundle; dish or Turnip-tops, 6d.; small Broccoli, each, 4d.; small bunch of Turnips, 5d.; Celery, per head, 6d.; Beetroot, each, 1½d., 2d., or 3d., according to size; small bottle of dried herbs, 6d.; Oranges, each, 1d.; small bunch of Parsley (withered), 1d.; dessert Apples (very small),

1*d.*; stick of Horseradish, 3*d.* and 2*d.*; Potatoes, 5*s.* the bushel; pudding Apples, 1*d.* each; Lemons, each, 2*d.*; Carrots, about three for 2*d.*; Onions, rather cheaper, but very variable; dish of Broccoli Sprouts, 6*d.*; a pickling Cabbage, 9*d.*; Savoys, each, 3*d.*

In this, as in so many other matters, use with discretion and thankfulness is better than abuse, which is always indiscreet and ungrateful.

— On April 16 a meeting of botanists, from various parts of Scotland, was held in Perth to hear the report of the committee appointed at the Fungus Show at Aberdeen, in September last, to organise a CRYPTOGAMIC SOCIETY OF SCOTLAND. The

EXHIBITION OF 1876 are numerous, and of a satisfactory character. In consequence, however, of arrangements recently communicated by the American authorities, whereby the time for Foreign Commissions to make definite application for amount of space required is extended, it will be possible for the British Executive to receive applications from intending exhibitors, addressed to 5, Craig's Court, Charing Cross, London, up to May 15 inclusive.

— In the fine collection of ORCHIDS at Whitechurch Rectory, the property of the Rev. J. B. NORMAN, are at present in bloom some fine varieties of *Odontoglossum Andersoni*, a *Masdevallia ignea*, with over forty flowers; one of the finest varieties of *Vanda suavis Veitchii* we remember to have seen, with two spikes of fifteen flowers each; *Vanda gigantea*, with

The standard shape seems to be best suited to the purpose.

— The fourth summer exhibition of the GRANTHAM AND SOUTH LINCOLNSHIRE HORTICULTURAL SOCIETY will be held on July 7 and 8, at the Cricket Ground, Grantham.

— Those interested in the fertilisation of the flowers of the female *AUCUBA* would do well to pay a visit to the Royal Horticultural Gardens at South Kensington, and there examine the results obtained where plants of the male variety have been placed in juxtaposition. Immediately at the top of the broad walk on the Exhibition Road side of the gardens is a block of shrubs bordered with fine female *Aucubas*. Exactly at the angle of this block is placed a small

FIG. 119.—THE QUEEN'S CORRIDOR, CRYSTAL PALACE, DECORATED WITH CLEMATIS, ETC.

Society was then duly founded, and the following office-bearers appointed for the present year:—President, Sir T. Moncrieff, of Moncrieff, Bart; Vice-President, Professor Dickie, Aberdeen; Secretary, Dr. Buchanan White, F.L.S., Perth; Treasurer, Rev. J. Stevenson, Glamis; members of Council, Rev. J. Ferguson, Fern, near Brechin; Rev. M. Anderson, Menmuir; Rev. J. Keith, Forres; Mr. J. Roy, Aberdeen; Colonel Drummond-Hay, of Seggieden, Perth; Professor Ogilvie, Aberdeen; and Mr. C. Howie, Largo. It is proposed to have a show of Fungi, &c., every year, in different districts of Scotland, in rotation; and arrangements were made for the show this year, to be held in Perth on October 1. Persons desirous of further information regarding the show or the Society should communicate with the Secretary.

— The applications for space in the British section of the PHILADELPHIA INTERNATIONAL

two spikes 18 inches long and with sixteen flowers each; two plants of *Aeridas Fieldingii*, with each two spikes 2½ feet long; and a very beautiful variety of *Dendrobium Wardianum*. Orchid growers will find this collection well worthy of a visit.

— Among forced flowering plants the *LABURNUM* takes a prominent position, though it is not so generally seen grown in this fashion. Mr. GEORGE BUCK, the gardener at Castle Ashby, finds it invaluable in early spring, and his forced plants yield him splendid wreaths of yellow flowers, which are much prized for house decoration. Late in autumn the plants are lifted from the open ground, and the roots thrust into suitable sized pots *sans chrémonie*; but the plants flower well when introduced into heat, notwithstanding the summary character of the potting process. After they have done flowering they are planted out in the open ground for the summer, and in the autumn again potted and placed in warmth as stated above.

plant of the male variety, just now in full bloom. The effect of the previous season's fertilisation is seen in the beautiful crop of berries borne by the female plants, and these, in spite of the proverbial London smoke, are robust, and look exceedingly ornamental. It is noticeable that the plants nearest to the male variety have the greatest quantity of berries. The crop is thinner in proportion to distance. All who have female *Aucubas* should plant male *Aucubas* near to them, if they wish to possess the additional ornament of a nice crop of berries.

— The ROSSEDALE FLORAL AND HORTICULTURAL SOCIETY will hold an exhibition on the 7th of next August.

— Messrs. COLE BROTHERS, Holly Nursery, Hundley, Spilsby, Lincolnshire, inform us that a specimen in their nursery of *MAGNOLIA CONSPICUA*, 16 feet high and 33 yards in circumference, has now

some thousands of blooms upon it. This plant is flowering most freely this year, and amongst other good specimens we have seen is a fine tree in Sir Henry PEAR'S garden at Wimbledon House. We also saw a splendid specimen, as large as the above, in full bloom, a few days since, at the Goldsworth Nursery, Woking.

— A schedule of prizes offered for competition by the CROYDON HORTICULTURAL SOCIETY at the exhibition of flowers, fruit, and vegetables, to be held on Wednesday, July 14, has just been issued.

— The recent mention of the fine specimen CHUSAN PALM, at Gunnersbury, naturally leads to a renewed notice of the very fine pair of the same Palm growing in the pleasure grounds at Heckfield; but these receive no protection of any kind, and have come through the trying ordeal of the past winter quite unscathed. These plants are about 9 feet in height, and the same in diameter, and promise to develop into the fine pair of outdoor Palms in the kingdom. Peculiar interest attaches to this pair, although not the slightest knowledge as to their sex existed when planted, yet, singularly enough, they now prove to be a veritable pair—male and female. Both of them flower annually, and the female produces seed that is found to ripen, and to germinate freely. A knowledge of these facts may lead to a wider planting of these Palms in sheltered parts of our large gardens.

— THE NOTTINGHAM AND MIDLAND COUNTIES GRAND ROSE AND HORTICULTURAL EXHIBITION will be held on July 8, 9, and 10, instead of on July 9 and 10, as previously announced.

— THE DISEASE OF THE LEMON AND CITRUS TREES IN SICILY spreading very fast, as we are informed by M. HÉRITTE, in the *Journal de la Société d'Acclimatation*, and threatens to destroy the whole of the plantations. The writer thinks that the growers are to blame in the matter, because they have induced an unnatural degree of fertility, and disregarded the conditions under which these trees flourish in a natural state. He states that the trees are planted very thickly, are very highly manured, and are permitted to bear enormous crops of fruit year after year; hence the decay of constitution. Be this as it may, the destruction of the plantations is a very serious affair for the inhabitants, as they have long been the principal source of their wealth and prosperity. M. HÉRITTE says that it has been an exceedingly profitable industry, and the fortunes it has made are incalculable. There is far less risk of loss from decay than there is in the Orange trade, as the Lemon is a firmer fruit, and thus bears pressure, and keeps longer than the Orange. The only remedy known is to graft healthy scions of the Lemon on the bitter Orange, which has been done to a considerable extent during the last few years, and so far appears likely to succeed. But as the trees do not begin to bear until they are eight or ten years old, a long time must elapse before the old trees can be replaced.

— The first annual exhibition of the newly-formed RICHMOND HORTICULTURAL SOCIETY will be held on July 8, and about £200 will be offered in prizes. The subscription list is rapidly increasing, and there is good prospect that a first-class suburban society will be established.

— The golden-blossomed BERBERIS AQUIFOLIUM is just now in the height of its beauty. The inflorescence of the present year is remarkably strong and abundant, and the shrub, whether seen in fine specimens or in masses, can hardly be exceeded in beauty and effectiveness. At all times a handsome foliage plant, it has now glorious heads of yellow flowers that will presently be succeeded by bunches of rich purple berries that are exceedingly ornamental. This shrub is so hardy that it makes capital cover, and its fruit presents the choicest of food to wild birds in the autumn; it is not over particular as to soil, and thrives alike in clay, loam, gravel, or peat. Few shrubs present in a mass seedling such singular varieties of foliage, for not only are hues of colour numerous, but the character of the leafage is most varied.

— We learn, from an abstract in the *Bulletin of the Botanical Society of France*, xxi., p. 101, Rev. Bibl., that M. FRANZ KRASAN has published some observations on the GEOGRAPHICAL DISTRIBUTION of certain plants, with a view to ascertain the reasons why they are capable of living in various very different climates. Allium oleraceum, in fact, grows on the high Alps with Saxifrage, and equally well in the vicinity of the Olives and Figs of the Mediterranean district. Our gardens supply very numerous illustrations of a similar pliancy in plants. M. KRASAN, in his endeavours to elucidate the matter, remarks that while in the Alps the plant above-named flowers in August, it is not till September that it is found in bloom near GÜZ. M. KRASAN remarks that water at

a temperature of 4° C., absorbs as much as five volumes of carbonic acid, while at 15° C. it only absorbs one volume. Carbonate of lime is much more easily soluble in the cold water of the mountains than in the more temperate water of the Mediterranean. The humus, so abundant in mountain districts, has moreover a much greater capacity for absorbing and retaining heat than the purely mineral soils—a circumstance which obviates the ill-effects of oscillations of temperature. M. KRASAN has further cultivated Colchicum autumnale on the mountains and in the hotter regions. The plant, as is well known, thrives equally well in both situations, and flowers about the same time in both. It becomes then a matter of interest to know how this plant can escape the influence of the heat of the plains, which one would suppose would hasten its growth. The peculiar mode of vegetation accounts for this: at first the plant is purely foliaceous, and remains so during the formation of the young corm, which period is prolonged till the end of July. During this time the heat of spring and of summer has not much effect on the development of the flower. With regard to the expansion of buds in spring, M. KRASAN remarks that the intensity of the winter's cold—short, of course, of actual destruction—has no influence in delaying the expansion of buds when a favourable season does occur; a conclusion supported by common experience.

— Mr. NEWMAN, Devonshire Square, Bishopsgate, sends us specimens of his PAPER FOR DRYING PLANTS. From many years' use we can thoroughly recommend this as the best drying paper with which we are acquainted.

— THE SOUTH ESSEX FLOICULTURAL SOCIETY'S next exhibition will take place on June 10, at Leyton.

— M. GILLEKENS, in the *Moniteur Horticole*, ridicules the idea of planting FRUIT TREES along the roadsides, as there is little or no shelter in such situations. As to the scheme for planting the railway banks with fruit trees, the same writer points to the insignificant results along the line from Brussels to Louvain, or Marchiennes to Laume, where hedges of this kind have been planted without due preparation of the soil beforehand.

— A new COOLING APPARATUS FOR LIQUIDS, such as water, wine, milk, beer, &c., and which is claimed to be most efficient and convenient, and at the same time among the cheapest, has been recently patented in Vienna. It consists simply of a tube, most conveniently made of tin, with a tight-fitting cover, which is rapidly packed, by aid of a wooden stamper, with pounded ice and salt, either mixed or in alternate layers. This tube thus charged is to be plunged into the liquid that is to be kept cool.

— We do not remember to have seen the fine PYRAMIDAL PEAR TREES in the Royal Horticultural Society's garden at CHISWICK clothed so lavishly with flowers as they are at the present time, every branch carrying such a profusion of pearl-white blossoms as they have never borne before, and which is the more surprising when we consider the great strength and robustness of the branches. Many of these trees have newly carried a full crop of fruit, and that such a good promise of abundance may not be blighted by frost is a consummation devoutly to be wished. When the orchard was given up some four or five years ago, many of these pyramids were cut back and grafted with such varieties as it was thought desirable to perpetuate in this way, and it is most pleasing to note how satisfactorily they have grown since. The Apple trees are not yet in full bloom, but the show is equally fine. The trained pyramid Plum trees have also flowered magnificently, but the sharp frost of Sunday morning last killed great numbers of the blossoms both on them and the Cherries. The small bush Pear trees, the upright cordon Cherries, and the lateral cordon Apples in Mr. RIVERS' suburban garden, show a like abundance of bloom; and, indeed, it is most gratifying to look upon the fruit trees in all parts of the garden decked with such a profuse inflorescence. Of the lateral cordon Apples, three years worked on the true French Paradise stock, none are more beautiful than Braddick's Nonpareil, which seems to adapt itself to this style of training better than any other English variety—its pretty rosy blossoms being evenly and freely produced through the entire length of the cordons.

— We have comparatively few ORNAMENTAL TREES WITH PINNATE LEAVES, and therefore the acquisition of another species of that class will be hailed with delight by amateurs. In 1865, M. CARRIÈRE, the editor of the *Revue Horticole*, published in that journal what he then called a new species of Ailantus, to which he gave the name of flavescens. He described it as closely resembling the common species, which doubtless was the cause of little notice being paid to it at the time, especially as it is well known that M. CARRIÈRE's wretchedly gives names to

slight varieties, and calls them species. After a period of ten years, however, he has discovered, he says, that the tree in question is the *Cedrela sinensis*, of JUSSIEU, a perfectly hardy subject, from North China. In a recent number of the *Revue Horticole* he gives a figure representing a specimen of it growing in the Jardin des Plantes de Paris, upwards of 25 feet in height. It may also be seen in some of the French nurseries around Paris. We are told that it has not suffered the slightest injury, even from the most extreme colds, and we may therefore expect it to prove quite hardy in the climate of London. It has large, unequally pinnate leaves, resembling those of *Ailantus glandulosus*, small flowers, and a five-celled woody seed-vessel, differing in this particular very materially from *Ailantus*. Indeed, it belongs to a different family.

— THE SOUTHGATE HORTICULTURAL AND COTTAGE GARDEN SOCIETY'S SHOW will be held in the grounds of Southgate House on July 3, by the kind permission of W. J. ARMITAGE, Esq.

— The cultivation of the Red Cedar, JUNIPERUS VIRGINIANA, is being tried on a considerable scale in Bavaria, North Germany, and other parts of the Continent. No other wood, except the still rarer *J. bermudiana*, has been found equal to it in the manufacture of lead pencils, and as the consumption for that purpose is very large some of the makers have recommended their Governments to attempt its cultivation. FABER, one of the largest manufacturers on the Continent, has already planted upwards of 5000 on his own estate in North Germany; it has been planted in the forests, and on the waste ground by the side of the railways. We have not heard of its being planted in this country for commercial purposes, but there is no doubt it would succeed very well, especially in the South. It will bear the wind well, and flourish on the sea coast, and certainly deserves to be more generally planted than it is.

— According to the *English Naturalist*, if you wish to get rid of ANTS, FLIES, AND OTHER TROUBLE-SOME INSECTS, you have only to cultivate some plants of *Azalea viscosa*, whose clammy flowers hold prisoner all that once alight upon them. The more they struggle to free themselves the more hopelessly they become fixed in the fatal glue. The experiment may easily be tried, but as the flowers do not last long, and not all insects would be so imprudent as to visit them, this fly-trap is more interesting than useful.

— For a long time it was generally believed in America that the FLOWERS OF WISTARIA SINENSIS WERE FATAL TO BEES; but Mr. MEHAN, who has been investigating the matter, thinks the death of numbers of bees frequently found lying around this plant must be attributed to some other cause. He says that he has himself often seen hundreds of dead bees under this shrub, and that the cause is the popular idea that the flowers contain a secretion that poisoned them; last year, however, he observed that bees eagerly visited the flowers without the least apparent injury.

— THE TOBACCO HARVEST IN ALGERIA last year was very productive; the quantity delivered to the State being 4,856,000 kilogrammes, or about 10,704,170 lbs. worth through the growers 5,536,607 francs, or about £1414,222, or nearly double that of the previous year. From 1847 up to last year the French Administration had received about 68 millions of kilogrammes of tobacco from the European and native planters, for which 54 millions of francs were paid. The profits realised by the State on manufactured articles during the same period amounted altogether to a sum of 493,360,000 francs, or £19,734,444.

— A paragraph in the *Times* a few weeks ago, appealing for presents of flowers for the Home of Industry, Spitalfields, and Mildmay Park, seems to have given some benevolent people the excellent idea of collecting spring and other flowers, and sending them to the hospitals for the patients. "The *British Medical Journal*" believe a FLOWER MISSION has been started in this view, which has from Commercial Street, Spitalfields. Children are employed in their playtime to gather the flowers in the woods, fields, or gardens, as the case may be, and then the vicar of the parish sends them in hampers to the hospital. Guy's has been the fortunate recipient of several hampers of flowers during the week, and the Home of Industry has sent 120 bouquets, in flower-holders, tastefully surrounded by appropriate texts, for the patients. If the clergy will take the matter up warmly, "The Flower Mission" will be the means of cheering many a poor sufferer, and we hope all who have flowers to spare will send them to some one or more of the London hospitals. We assure our readers that a ward at Guy's Hospital, after the arrival of one of these hampers of flowers, was indeed a pleasant and cheering sight. The poor patients seemed to take a new lease of life from the freshness of the flowers, and bright, happy, contented faces

were to be seen on all sides after its advent. Will anybody refuse to aid the "Flower Mission," or deny these poor sufferers so cheaply purchased and yet so inestimably valuable as a pleasure as a bunch of fresh, sweet, radiant flowers? We hope, some will be sent for the sailors of the old *Dreadnought*, Greenwich."

— The *Journal de Rouen* takes the *Bulletin Français*, the cheap official journal, to task, for the nonsense it talks about WATERCRESES. While confirming the fact that four millions of francs worth (£160,000) of Watercresses are annually sold in Paris, the *Bulletin* repeats the ridiculous statement that the Watercresses in France are only fifty years old. If we are to believe this *one*, their cultivation was imported from Erfurt to Paris by a surgeon of the French army during the First Empire. Both the *Journal de Rouen*, the *Magasin Pittoresque*, and other publications, have already corrected that error. In the first, it was proved that the existence of *cressonnières*—Cress-beds, or cresseries—was authentically demonstrated, 220 years ago, at St. Martin-du-Vivier. Cresseries, and the culture of Watercresses, had been practised at a still earlier date. VALMONT DE ROMARE, an inhabitant of Rouen, in a *Dictionnaire d'Histoire Naturelle*, printed more than a hundred years ago, speaks of the excellent Watercress grown at Cally. RICHELIEU, under LOUIS XIV., also mentions Watercress as an excellent salad. In "Rabelais," under FRANCIS I., Watercresses are eaten. And is not the family name of the LACRESSONNIÈRES a proof of the antiquity of cresseries in France? In truth, Russia herself, to whom the invention is attributed, is less ancient than some of the French Cress-beds. The *Bulletin Français* is, therefore, advised to give no further currency to so absurd a fable. Nevertheless, people might eat Watercresses, and even gather them from Cress-beds, which were not artificially or intentionally planted.

— The whole of the FLORAL DECORATIONS AT THE ALBERT HALL, on the occasion of the installation of R. H. FREEMAN, the WALES, at Grand Master of the English Freemasons, on Wednesday last, were supplied by Brother J. WILLS, of the Royal Exotic Nursery, Onslow Crescent, W. The Prince's room was very tastefully decorated with a choice collection of handsome foliaged and flowering plants, which were very judiciously arranged in groups about the room, the great feature of the decoration being the table usually in the centre, the surface of which was entirely covered with undulating banks of Lycopodium, on the raised portions of which were hillocks surrounded by graceful Palms, and appropriately interspersed with the beautiful *Odontoglossum Alexandræ*. The ground-work below was embellished with Lilies of the Valley, arranged naturally as if growing on mossy banks. These were relieved by masses of *Marchal Niel roses*, *Garcinias*, *Staphanotis*, and various other plants and flowers. On the four corners of the table were placed Masonic emblems; in one the square and compass, arranged with Lilies of the Valley and light blue *Cinerarias*, the opposite corner being occupied by the square, the centre of which was composed of blue *Cinerarias*, with a margin of Lilies of Valley; in the other two corners the plummet and compass were similarly depicted. On a raised terrace in the centre of this lofty plateau the following initials were placed—"T. K. H. A. E., M. W. G. M.," wrought in dark blue *Cinerarias*. Right and left of the stairs leading to the dais were handsome groups of plants, consisting of Palms, *Dracænas*, *Azaleas*, and many other flowering and foliage plants, the whole being surrounded by an undulating bank of *Isolepis* and Lycopodium, the surface of the dais being covered with crimson cloth. Brother WILLS had arranged a margin of yellow *Genistas* beneath a canopy of graceful Palms, which imparted to the eye the appearance of a covering prism, the whole being in complete harmony with the other decorations of this noble hall. Brother WILLS was ably assisted in the above arrangements by Brother A. F. BARRON, Superintendent of the Royal Horticultural Society's Gardens at South Kensington and Chiswick.

The large show-house at the PINE-APPLE NURSERY, Maida Vale, is just now particularly attractive, an excellent display being made of a fine lot of *Azaleas*, *Acacias*, *Cinerarias*, a few late *Camellias*, *Lily of the Valley*, *Cytisus*, show *Pelargoniums*, *Spiræas*, *Heaths*, *Deutzias*, &c. Some pots of *Narcissus Bulbocodium* and *Muscari racemosum* are very beautiful, and so also is *Amaryllis Harrisoni*. *Erica Victoria*, a very showy variety, is well represented, and a standard bushy plant of *Acacia grandis* forms a striking object backed up with the dark foliage of *Erica Camellia*, and handsome Tree Ferns. The furnishing of floral decorations and bouquets forms a branch of the operations of this establishment of no mean importance, and Mr. BESTER, the courteous manager, has gathered around him a considerable quantity of suitable materials for this work; and we are bound to add that the ordinary nursery stock has been greatly improved under his superintendence.

OATS AND WHEAT.

I AM surprised to see that Mr. Read has taken up the exploded idea that Oats may by constant cutting be changed into Wheat. Of course I never believed it to be a fact, although positively stated to be one by credible persons. A few years since the idea was prevalent in this neighbourhood to such an extent that a supposed new variety of Wheat was sold as thus obtained. A former curator of our Botanic Garden (Mr. Stratton) and I determined to try the experiment, and although I mention the result almost every year in my lectures, I believe that it has never been published.

We were obtained from a first-rate seedman clean samples of the best kinds of Oat. We took one or more of these samples, and divided them into two parts. One of these parts was sown as it came from the shop, the other was spread out on a table, and the grains passed individually under our eyes. By this examination we discovered that even in what seemed a very clean sample there was a considerable number of seeds of weeds. After cleaning it thoroughly, this part of the sample was also sown. According to the directions given to us by the gentleman who supposed that he had obtained Wheat from Oats, we cut the young plants five or six times in the course of the year, so as effectually to prevent them from flowering, and allowed them to remain through the succeeding winter. In the second year as many survived were allowed to grow unchecked. Of the part which we had thoroughly cleaned only one or two plants survived, and they produced Oats. Of the other part most of the plants had borne the treatment, but most of these were *Brome-grass* (*Bromus mollis*, or *commutatus*), and not a single instance of Wheat appeared, nor anything of which we had not seen abundance of the seeds in the part of the sample thoroughly cleaned by us. Of course many other weeds came up as well as the *Brome-grass*, but they were not grasses, and did not affect the question.

We came to the conclusion that Oats would not bear this treatment, but that the *Brome-grass*, a native weed, would do so, and flourish under it; also that it was dirty seed that had been used by those who obtained the Wheat, for we took many grains of Wheat out of the sample of Oats before sowing it. It proves to be next to impossible to clean a large quantity of seed quite perfectly; and I must add, to the credit of the seedsmen, that this seemed to be an absolutely clean sample until we examined it grain by grain.

Of course we communicated the result to our correspondent, and I am afraid that I need hardly add that he was not convinced of his error. He had no idea of the great care requisite to obtain results of any value from experiments of this kind.

I am reminded whilst writing this, that Mummy Wheat is still sold and believed in, although a careful examination of the evidence of its origin was made by my respected predecessor, Prof. Henslow, and traced to Sir Gardner Wilkinson, who himself said, in answer to a question, that he obtained it in Egypt, but not in such a way as to render its origin certain. All the real mummy grain which has been examined is found to be totally deprived of vitality by the process to which it had been submitted by the embalmers.

I venture to think that in these cases we have an evidence of credulity which was hardly to have been expected in the present day, when experimental research is so common, and, when properly conducted, so trustworthy. C. C. Babington, Cambridge.

After your severe criticism upon my statement at the Society's Annual Meeting it might be thought that you were right in not furnishing us with some authority for what I said. I don't think it at all likely that those half-dozen sharp and most respectable men of business would be deceived, and I am positive they would scorn to deceive others. There is a new variety of Barley extensively grown in Norfolk which is called *Oat-Barley*, and if it would interest your readers I am assured that the same positive proof of this Barley having been produced in like manner to Mr. Colman's Wheat will be forthcoming. I was a long time before I could believe what appeared to be an utter impossibility; nor should I now credit the evidence if it was not corroborated by the indisputable testimony of so many unimpeachable writers. *Clare Sewell Read, The Farmers' Club, E. C., April 28.*

"East Haring, April 27, 1857."
"C. S. Read, Esq., M.P.—Dear Sir—The assertion I made in conversation with you respecting Wheat being produced from Oats I am positive is correct. The Oats were planted in the presence of half-a-dozen persons—my neighbour, Mr. John Everett, for one. I am surprised the writer in the *Gardener's Chronicle* is not content with the fact, and I think I can refer him to those who have produced Wheat in the same way.—I am, dear Sir, faithfully yours, TIMOTHY COLMAN.
"I enclose Mr. Everett's note."

"Haring, April 26, 1857."
"Dear Mr. Colman.—I beg to return the *Gardener's Chronicle* of the 24th. The article at page 533 has an especial interest for both of us, as the strange fact has been 'observed properly' and the 'weighed evidence' so positive as to convince us and others that the Oats, planted in our presence, cropped and covered during the winter under our direction, and reaped during the following season, produced a sample of red and white Wheat, and from which very simple James Barnes secured his prize Wheat, now so extensively grown and approved. I think it due to our worthy member, *Clare Sewell Read*, that you should by evidence help to confirm his remarks, which the Editor calls 'nonsense.' His remarks as to the 'utility and proper method of conducting agricultural experiments' are so appropriate that I feel surprised, when so carried out, that it should think the ass and the horse a happy illustration.—I am, my dear Sir, yours very faithfully, "J. EVERETT."

"[How many grains of Wheat were there in the 'covering of straw,' which, it appears, was applied 'from the first?'] Why was the covering made use of?" EDS.]

MAIZE.

I HAVE waited until the time for planting the Maize has nearly come in the hope that some one better versed in this affair than the writer would have come forward and given us his experience on the subject. I see, from the agricultural papers, that Maize acclimated is for sale in bulk for farmers to try in the best parts—that is, the southern parts of the country—but, strange to say, the vendor objects to supply seed for mere gardening experiments; and this is just what is wanted, viz., a supply of seed to start half the cottagers in the kingdom growing Green Maize, not to mention starting also all the great and good gardeners in the same race. Surely America can pouch for the free-growing qualities of this corn, and it is also cultivated in the Old World as well as in the New, and is even at our doors in France. And when we see the word "acclimated" used in the advertisement in reference to this grain, there ought to be no hitch in having Green Maize along with Green Peas this very summer, and ripe in autumn.

About the year 1850 I grew a *Seaman's Day* Maize in Devon, and not only had the green corn, but also the ripened ears, yielding mature seed for future sowing.

Most people are alarmed at Maize when they see some tall kind 12 feet high that could not be supported, and could not be ripened for want of more heat and longer summers. Kean's Maize was all that it professed to be, an early dwarf-growing variety, and mine did not rise higher than 3 to 4 feet. The ground was laid double in depth and richly manured, and the seed was not dibbled or planted until the middle of May, when the May bug was to be seen. This natural barometer and thermometer was to be the cultivator's guide as to the time of sowing or planting. These instructions, and some others, were sent along with the small bag of seed corn bought for experiment.

Another item was to the effect that it was not to be grown in pots and turned out as bedding plants as Maize is said not to bear transplanting well. I followed the instructions given, and, favoured by a southern climate and being near the sea level, the experiment was satisfactory; and if seeds could only be distributed now to the growers everywhere, we should have data to guide us in this highly important affair for future years. Of course premiums should be offered to cottagers, to get them to compete for the prize, and the honour of being able to grow Green Maize and to eat of the fruit thereof. A. F.

THE PLANTAIN AND BANANA.

The Plantain and Banana, which are known in this country only in tropical plant-houses, producing fruits which are considered a delicacy rarely to be obtained, are so common throughout the tropics that in many countries they form quite the chief food of the natives. The two plants are very similar to outward appearance; the fruits, however, of the Banana (*Musa sapientum*) are usually more round and plump than those of the Plantain (*M. Paradisiaca*). Numerous varieties of both plants are known, the difference in the fruits being one of the chief characteristics.

The Banana fruits, as ripened in our stoves, are of a yellow colour, somewhat Cucumber-shaped, but slightly angled longitudinally. They are of a rich milky flavour almost melting in the mouth. The whole of the fruit, excepting the thick rind, which easily peels off, is edible, the pulp being of a similar consistency throughout, and the fruits being without seeds. The flavour varies somewhat in the different varieties. In some countries Plantain fruits are dried and reduced to a meal, and stored away for future use. In the Calcutta bazaar some four or five distinct

varieties of edible Plantain fruits are known, which are again divided in sub-varieties, as follows:—

Variety Kanchakalla:—

1. Kanchakalla proper.
2. Blossom, green fruit with white bloom.
3. Loomber, yellow fruit.

Var. Kantallee:—

1. Kantallee proper.
2. Chinese Kantallee. This often has seeds.
3. Bichee Kantallee. A variety with seeds.

Var. Martaban:—

1. Martaban proper; large fruit.
2. Sabree; medium.
3. Chatan; small.

Var. Champa:—

1. Champa proper.
2. Chinese Champa; smallest.
3. Kanai Bansee; Khrishma's Flute. Fruit often 15 inches long.

Besides these there is the Dacca Plantain or Girtto Kanchau, and the Kamkela, a red-fruited kind.

Few of the above, it will be seen, bear seeds, but seeded Plantains, Dr. King informs us, are common in Pongalee village, and are often to be bought at the bazaar in Calcutta; the only reason why they are not always to be seen there, is that they sell for so little.

Two varieties of these seeded Plantains are distinguished. The first, known as Bichee Kalla, is described as having a scanty pulp and numerous seeds, a thin stem, the central part of which is eaten. The inflorescence is boiled whole, and the flowers eaten with salt as a vegetable. The entire fruit is cooked as curry by poor people, and the pulp is also eaten by such raw. It is moreover taken as a cooling remedy by dyspeptics, and the seeds are medicinal.

The second is the Dayra or Daura kalla. In this the seeds are less numerous than in the last, and the pulp correspondingly larger. It is best distinguished from the last by its very much thicker stems and larger inflorescence, the pulp is sweet and is eaten, and is of a cooling nature, the entire fruit is also cooked, and is eaten as curry. The central part of the stem is also edible, as are the flowers similar to the last, and the seeds are medicinal. Both are common on the east coast—neither is cultivated. The central part of the stem is brought into the Calcutta bazaar to the amount of half a ton to a ton daily, and is largely eaten by the fishing population after being boiled. The fruit is occasionally to be had in the bazaar, but is hardly worth bringing to market. J. R. J.

BUDS.

THE accompanying illustration, which we owe to the skillful pencil of Mr. Fitch, may suffice to call the attention of amateur landscape gardeners, and especially of young gardeners, to the great importance of making themselves acquainted, ere the season be too far advanced, with the different forms and appearances of buds.

To the lover of Nature, at this season of the year in particular, no such recommendation is needed—there is a charm and a freshness of enjoyment in watching the unfolding bud that is quite unique. We need scarcely add that, as throughout Creation, the more closely observed the more fully studied, the greater the beauty and interest revealed. The skillful pruner of Peach trees knows full well the varying form, position and arrangement of the buds, and directs his course accordingly. The Rose-grower is not less keenly alive to the way in which the buds grow on the shrub which claims so much of his attention. We are inclined to think that the woodmen, and those who have to deal with growing timber, are, of all classes of the gardening community, those who most neglect the teaching of the buds. Of course we do not intend to make broadcast imputations, but common observation will, we think, bear out our opinion of the matter. This neglect is the more unfortunate as the buds are the very foundation of the tree, and upon their due development and proper position depends not only the symmetry and beauty of the tree, but also its value for timber purposes. All the text-books go into greater or less detail as to these organs. They tell of leaf-buds and flower-buds, of mixed leaf and flower buds, of scaly buds and naked buds, of side buds and terminal buds, buds definite in position and station, and buds that are adventitious in this respect. Gardening books prurish how these buds are developed into shoots, or spurs, or laterals, or what-not. In the case of fruit trees there is a wealth of terms expressive of the different appearance and mode of development of buds. The French gardening language is especially rich in such terms, as might be expected from the variety and neatness they show in their methods of pruning and training fruit-trees. Though it is quite possible our neighbours are over-nice, and sometimes show an unnecessary refinement in their manipulations, yet it cannot be denied that their practice is a logical sequence of their more thorough knowledge of the buds, and of their mode of growth.

Mr. Fitch, in his study of buds, fig. 120, has had

an artistic purpose in view rather than a practical one. But this artistic purpose is precisely what the landscape gardener also aims at. What rounded, billowy masses the Horse Chestnut buds make at this season with their downfolded leaves, no yet strong enough to float horizontally in mid-air; how the Elms seem studded over with little green balls, while the Poplar shoots are tipped with sharp lances, and still more so the slender, graceful shoots of the Beech. The forked Sycamore boughs end in broad-ended clubs; the Oaks are thick-set with clusters of stout, sturdy, egg-shaped buds; the Hawthorns bear inverted pyramids of clearest green foliage; the Ash, only a day or two since a mass of thick black knobs, has burst into a blurred, confused mass of black, which in another day will spread out into an open, feathery mass of bloom. Each tree, in fact, has its own mode of budding, and when the times are propitious, each day makes a notable difference in their appearance. The accompanying sketch shows us how these general outlines, such as we have just seen speaking of, are made up. Multiply by thousands the Horse Chestnut buds, and you figure them on a tree trunk, and the mind will have no difficulty in realising what the entire tree was like when that spray was drawn. The rounded form of the spray is easily accounted for when we remember that the centre of that bud is a mass of flowers, an inflorescence whose power of lengthening in a direct line is limited. Compare it with the narrow lances of like buds of the Poplar or the Beech, and there will be no difficulty in understanding the different form of the framework, if we may so call it, of the respective trees.

Now, too, is a good time to see on the Hazel, the Elm, and specially the Lime, the curious downward bend which the young shoots present just as they merge from the buds, and the explanation of which is not easy.

Lastly, not to clutter with detail an article which, like the sketch itself, is intended to be merely suggestive, we may call attention to the beautiful series of transitions which we meet with between the rudimentary leaf in the shape of a bud and the perfect organ. The Horse Chestnut, the common Maple, the Currant and the Rose, not to mention others, afford admirable illustrations of this, and are a source of genuine satisfaction to those who like to know how things are made and why.

Florists' Flowers.

THE CINERARIA.—I have recently been favoured with an opportunity for a critical inspection of the fine strain of the Cineraria grown by Mr. James at Eccles, Isleworth. A small group of a dozen plants staged at some spring show fairs but an indifferent chance to note the merits that exist in a large collection of several hundreds. Moreover there is room for suspicion that the pick of the strain only are sent, whilst the poorest samples are kept at home. Now the great merit of Mr. James' strain is this obvious fact, there is not an indifferent flower to be found in the whole collection. One is struck with the general evenness of height that prevails all the plants, and the breadth and evenness of the bloom and the size of individual flower-heads, combined with breadth and substance of the florets, their excellent form, and varied hues of colour. There were many "blooms" so large that when a half-crown piece was laid on them there was a margin nearly a quarter of an inch in width still visible all round outside the coin, and these not starchy blooms but of good form. Nothing oppressed me so much as the difficulty experienced in describing the hues of colour found in many of the flowers. Florists are producing such combinations that this is a growing difficulty, and although any one flower is not a chameleon in possessing the power to change its colour, yet it is probable that there are many flowers of which a dozen observers would pronounce diverse opinions as to its colour markings. Here are a few of the colours that struck me as effective. One has a white disk and the florets rich violet-rose. Another has a white disk, and the florets are of a bright rosy crimson. Then comes a new colour, a flower having a grey disk and rosy magenta florets. Another is in colour rich reddish-crimson, then rich rosy-maroon, violet-cerise, and deep indigo-blue. Most of the self-flowers have white disks, except the blue, and these are invariably dark. Although deep-coloured flowers predominate, there is yet a considerable admixture of those that have a light markings, and I especially noted two extremely fine flowers having black disks encircled with broad rings of pure white, and margined with wide bands of in one case deep reddish-crimson, and in the other rosy-violet. Mr. James has received several certificates for seedling flowers, to which names have been given, but these are used by him solely for exhibition purposes, and he grows no other named kinds; indeed, so productive of the best form through seed is the Cineraria, that seed of a good strain is certain to give a fine lot of flowers equal to ordinary named kinds, and in great variety of markings. The Cineraria

still retains a high position as a decorative plant, and so much has it been improved of late years that its growth is not likely to show any signs of decadence during the present generation. A. D.

Natural History.

MR. RUSTS, TOADS, AND SNAKES.—Having read Mr. Rust's remarks (p. 463) under the above heading, and being a subscriber to and constant reader of your paper, I venture to give my experience on similar subjects. In my younger days, now some fifty summers since, I remember seeing many snakes' eggs, which I believe were struck together by the owner with a mallet in a manner very similar to that in which we see sausages; these were deposited in and about some old manure-heaps, and left there to be hatched by the heat of the sun. On one occasion only did I see the young adders run down the parent's throat, and she escaped with them; this occurred on my jumping over a hedge and coming suddenly upon them, but, so quick were their movements, that in my fright, having nothing in my hands in readiness to strike the parent, some years after this, being at Mitcham Grove, the then seat of the late Sir John Lubbock, on a very boisterous day, when many small branches were strewn on the carriage drive, at some distance from me I saw what appeared to be a naked stick twisting about, and curiosity led me to go and see what it was, when, to my surprise, I found it was an adder struggling to cross the gravel drive, and I noticed, some distance down the body, a slight projection, similar to the knuckle on the finger. Much as I dreaded such things, being in the open I had the courage to take it up by the tail, when it twisted all manner of ways to get at my hand, but could not; when, to my utter dismay and astonishment, its mouth opened, as though the head was turning inside out, a pair of claws appeared, and down dropped a frog, extended to an extraordinary length, the front legs being in advance of the head and the hind legs in the opposite direction, and he immediately drew himself up and hopped, the only perceptible injury being the skin a little torn on one hind leg. The adder in the meantime turning his head up to my hand, I dropped it and killed it with my boot, leaving poor froggy to escape into the shrubbery. This, I think, proved, without doubt, that with the frog extended in the inside the adder could not bend his body, and therefore he disgorged him to attack me. With reference to toads, my gardener always encouraged them in his Cucumber-house and other places. I remember well a very large one that he christened, and which would come from his hiding place when called by him, A. E.

Notices of Books.

THE NARCISSUS: its History and Culture, &c.

By F. W. Burbridge; to which is added a Scientific Review of the entire Genus, by J. G. Baker. Reeve & Co. 8vo, pp. 95, tab. col. 48.

Very opportunely, considering the revived taste for these beautiful border flowers, Mr. Burbridge has issued the work whose title is above given. The contents of the book comprise the history of the cultivated Daffodils, the poetry of the Narcissus, notes on the propagation and culture of the plants, observations on the diseases and insects to whose attacks they are subjected, a full descriptive list of all the species and varieties, together with miscellaneous information concerning them; and, last not least, forty-eight coloured plates, in which a large number of the species and varieties are figured, including several which are not in cultivation, and which, in consequence, Mr. Burbridge has drawn either from dried specimens or from other illustrations not readily accessible to the ordinary reader. In the literary portion of his volume Mr. Burbridge has culled from various sources a large amount of valuable or interesting information; he appears sometimes not to have given himself sufficient time to digest or revise his material, hence we find occasionally that the paragraphs do not fit well together, but show signs of hasty workmanship, while the misprints give here and there evidence of inadequate revision. Perhaps the desire to have the book issued before the Narcissus season was over for the year, has had something to do with this.

It appears, however, not to have given blemishes in what is likely to prove a very useful book. So far as the arrangement and description of the species is concerned, Mr. Burbridge has reproduced the monograph which first appeared in these pages from the pen of Mr. Baker, who has revised it for the purpose. This circumstance, together with the abundant correspondence which has appeared in the gardening journals on the subject of this genus of late, a good deal of which is incorporated into the volume before us, relieves us of the necessity of saying much in the way of either criticism or elucidation of the text. We may only note in passing the careful manner in

which Mr. Durbidge has cited his authorities when he has had occasion to make use of their materials, setting in this wise an excellent example to other authors and compilers. After all it is the plates which give the special value to this treatise; they are numerous, and, generally speaking, faithful to Nature. There is no attempt at exaggeration or distortion for the sake of effect, but an honest attempt in every case to represent the flower as it is. Here and there are to our eyes errors of perspective or colouring, which are not to be wondered at when the difficulties in the way of the artist are considered. Colour indeed is very much a matter of individual appreciation.

In any case it is no slight boon to have in so accessible a form so large a series of illustrations. In many cases it is almost impossible by words to convey an accurate idea of a particular variety or of its distinguishing characteristics, but a faithful figure makes apparent to the eye niceties of character which words alone are insufficient to define. Again, for strictly botanical purposes it is a great advantage to have

place as the standard reference book for advanced pupils in anatomical and physiological botany. In any case a good translation will prove of great service.

Reports of Societies.

Royal Botanic: April 28.—Favoured with one of the brightest days we have had since last year, a fair complement of good flowering plants and cut flowers, and a good attendance of visitors, the Royal Botanic Society may be said to have altogether had a very successful exhibition on Wednesday last. Stove and greenhouse plants were shown in fair numbers. Mr. J. Ward gr. to F. G. Wilkins, Esq., Leyton, had his superb variety of *Anthurium Scherzerianum*, *Odontoglossum hystrix*, with four fine spikes; *Tremandra ericifolia*, 2 feet through, well flowered; *Cypripedium villosum*, well flowered; *Odontoglossum Pescatorei*, with two fine branched spikes; *Eriostemon intermedium*, well flowered, &c. A nicely flowered group also came from Mr. G. Wheeler.

very nicely flowered group came from Mr. G. Ward; and in the class for nine *Cinerarias* the best came from Mr. James, Messrs. Dobson & Son being 2d. Mr. Parker, Tooting, contributed a fine group of flowering herbaceous plants, including, as well as many shown at Kensington last week, *Anemone nemorosa rubra* flore-pleno, very pretty; and the beautiful little *Viola Delabardei*, a close tufted dwarf species, with pink and lilac flowers.

The miscellaneous class was rather a large one, and comprised fine groups of new plants from Mr. B. S. Williams, Messrs. James Veitch & Sons, and Mr. Bull; admirable collections of *Auriculas* from Mr. Turner and Mr. Douglas; four boxes of very fine cut *Roses*, two of them being of *Maréchal Niel*, from Mr. J. Walker, of Thame, Oxon; a basketful of splendidly bloomed plants of *Col. Champneys Auricula*, from Mr. Turner; a fine basketful of flowering plants of *Primula amœna* [Sieboldii], from Mr. J. Douglas; a collection of *Cinerarias* from Messrs. Standish & Co.; a choice collection of stove and greenhouse plants from Messrs. Cutbush & Son; four boxes of excellent cut *Rose*

FIG. 120.—A STUDY OF BUDS.

such a series of varieties as Mr. Durbidge has given us in the case of *N. Tazetta*, brought together so as to be seen at a glance, and compared one with the other.

We have not scrupled to allude to what we think are the deficiencies of the work, but at the same time we should be very sorry to convey any other general impression to the reader than that this is a very serviceable piece of work, useful and trustworthy, and one for which all Narcissus growers owe their hearty acknowledgments to the artist. We may add, in conclusion, that this is one of a series of works on cultivated plants which it is proposed to issue; and, judging from the specimen before us, the utility of such a series will be so great, that we hope the publisher will receive every encouragement to proceed, and authors and artists be stimulated to do their best to secure fulness and accuracy.

—The publication of the translation of Professor Sach's *Lehrbuch* of Botany by Messrs. Macmillan is announced. The translation has been made by Mr. Alfred Bennett, who has been assisted by Professor Dyer. It is expected that this book will take its

place as the standard reference book for advanced pupils in anatomical and physiological botany. In any case a good translation will prove of great service.

Azaleas were well shown by Mr. Turner, who staged six very finely bloomed standards, with bushy heads, from 3 to 4 feet through. The varieties shown were *Etendard de Flandre*, *Comtesse de Flandre*, *Reine des Fleurs*, *Duc de Nassau*, *Madame de Cannart d'Hamale*, and *Cedo Nulli*. Nicely flowered groups of six also came from Messrs. H. Lane & Son, Mr. G. Wheeler, and Messrs. Dobson & Son.

Mr. Turner was the only exhibitor in the class for nine *Roses* in pots, and he showed beautifully flowered specimens, from 3 to 4 feet through, of *La France*, *Madame Clémence Joliveau*, *Le Mont Blanc*, *Edward Morren*, *Duke of Edinburgh*, *Cécile Forestier*, *Madame Thérèse Levet*, *Paul Verdier*, and *Juno*. A capital group of plants was also shown by the same exhibitor in the miscellaneous class. Forced *Rhododendrons* were excellently represented by a dozen specimens from Messrs. H. Lane & Co., the varieties being much the same as those shown at Kensington last week. Six finely grown cone-shaped specimens of *Mignonette* came from Mr. T. Barnes, gr. to A. Chancellor, Esq., The Retreat, Richmond; and a group of *Anaryllis* from Mr. Harborough, gr. to C. Keiser, Esq., Broxbourne, Of *Heaths* a small but

from Mr. William Paul; flowering plants of *Primula mollis*, a very distinct species from Bhotan, with flowers resembling a *Lychnis*, and produced in tiers like *P. japonica*, shown by Mr. Chambers, Westlake Nursery, Spring Grove, Isleworth; a stand of *Pansies*, from Mr. Hooper, of Bath; a basketful of the *Duchess of Edinburgh Coleus*, from Messrs. Jas. Carter & Co.; seedling double *Cinerarias*, standard specimens of *Lithospermum fruticosum*, and several varieties of *Pelargoniums*, from Messrs. E. G. Henderson & Son; and a nice group of flowering and fine-foliated plants, *Orechids*, &c., from Messrs. Rolison & Son.

New plants were exhibited in fair numbers, and the following awards were made:—Botanical Certificates to Mr. William Bull for *Crinum brachynema*, *Typhonium Brownii*, an Aroid with three-lobed leaves, and a broad, dark, bronzy brown spathe, a plant of dwarf stature; *Odontoglossum Roezlii* album, *Draacæna insignis*, candida, and elegantissima; *Tillandsia muscica*, in flower; *Metroxylon filare*, the handsome Palm figured at p. 497; *Pychosperma robusta*, a strong clean-growing Palm, in the style of a *Sea-fortnia*; and *Thrinax nobilis*, a very distinct *Fan Palm*. To Messrs. James Veitch & Sons, for *Crotans*

Disraeli, tortile, and appendiculatum, and *Draenas* hybrida and elegantissima, the latter being a narrow, dark-leaved form from the South Sea Islands. To Mr. B. S. Williams for *Gloneria jasminiflora*, a Brazilian plant of a *Daphne*-like habit, with short terminal racemes of white flowers; and the *Metroxylon filare*, and *Odontoglossum Roezlii* album before-mentioned. To the New Plant and Bulb Company, Colchester, for *Freesia Leichliniana*, a pretty bulbous plant, with flowers of a primrose-yellow colour tinted with orange. To Messrs. E. G. Henderson & Son, for *Sonchus elegantissimus*, an exceedingly fine-leaved graceful foliaged plant. To M. Louis Van Houtte, Ghent, for *Bertonia Van Houtte*, a most superb plant, in which the venation of the leaves is distinctly delineated in bright sparkling rose; and for *Bertonia Miranda*, a cordate leaved form, the leaves being evenly but thickly spotted with minute rose dots. And to Mr. R. Parker, Tooting, for *Saxifraga rotundifolia*, a small dense growing species with primrose-yellow flowers—quite a little gem in the alpine class. Floral Certificates were awarded to Mr. Turner for *Rhododendron Countess of Dudley*, a very fine hybrid, with pure white flowers, of good substance, and measuring 4 inches across,—the flowers, which are delicately scented, being produced in trusses of three or four, and of a grand appearance; for *Auricula Gertrude Knight* (Turner), green-edged with show variety of dark purple ground; for *Auricula Auricula* (Turner), glowing velvety purple, with pale lemon centre, the lips measuring $1\frac{1}{2}$ inch across; and for *Alpine Auricula Iron Duke*, a smaller-flowered variety, almost black in colour, and tipped with purple. To Mr. Carmichael, gr. to W. Tugwell, Esq., Crowe Court, Bath, for *Azalea William Carmichael*, a hybrid between *A. amena* and *A. Flag of Truce*, with bright rose flowers; and for *Azalea Gertrude Knight*, a hybrid between *A. amena* and *A. Stella*, with rose purple flowers. *Azalea amena* was the male parent in both cases, and the general habit of the plants partakes more of the character of this parent; they are stronger growers, however, and flower most profusely. To Mr. William Paul for his new Hybrid *Perpetual Rose Peach Blossom*, a globular-shaped flower, very well named as to colour.

THE METROPOLITAN FLORAL SOCIETY offered prizes in several classes for Auriculas, and though the exhibition was only a small one, it was much better than any the Society has had before. Mr. Turner was 1st for twelve show varieties with the following:—Grey-edged, Competitor (Turner), Robert Traill (Lightbody), John Waterson (Cunningham), George Lightbody (Headley), and Colonel Champeys (Turner); green-edged, Lovely Ann (Oliver); white-edged, Alderman Wisbey (Headley); Charles Perry (Turner); dark-purple self, Blackbird (Spalding), black self; and three varieties not named—very fine, even and refined lot. Mr. James Douglas, gr. to F. Whitbourn, Esq., Loxford Hall, Florist, was 2d, with stronger plants of Colonel Champeys (Turner), Robert Traill (Lightbody), Lancashire Hero (Cheetham), Unique (Dickson), and Competitor (Turner), grey-edged; Lovely Ann (Oliver), Duke of Wellington (Jackson), Apollo (Beeston), and Admiral Napier (Cambridge), green-edged; Mrs. Sturrock (Martin), purplish black self; and Meteor Flag (Lightbody), a bluish purple self. Mr. J. James, gr. to W. F. Watson, Esq., Isleworth, came in 3d, and the Rev. H. H. Dombrai, 4th. In the amateurs' class for six show varieties Mr. Douglas came 1st with Prince of Wales (Ashton), green-edged; General Neill (Traill), green-edged; Master Hole (Turner), black self; Mary Ann (Fletcher), grey-edged; Lord Clyde (Lightbody), crimson-maroon self; and Colonel Champeys (Turner), grey-edged. Mr. James and the Rev. H. H. Dombrai were 2d and 3d respectively.

The best selfs were Charles Perry (Turner), deep violet-purple, shown by Mr. Turner, 1st; Master Hole (Turner), black or bluish black, shown by Mr. Douglas, 2d; and Blackbird (Spalding), almost black, shown by Mr. James, 3d. In the class for white-edged flowers, Mr. James was 1st with Countess of Wiltton, Mr. Douglas 2d, and Meteor Flag (Turner), and Mr. Douglas 3d with an unnamed plant. The Rev. H. H. Dombrai's Richard Headley (Lightbody) was the best in the grey-edged class, followed by Mr. James' Colonel Champeys (Turner), and Mr. Douglas' Alderman Charles Brown (Headley); while amongst green-edged varieties, Alderman Wisbey (Headley), shown by Mr. Turner, and Lady Richardson (Gairn), shown by Mr. Douglas, were respectively 1st and 2d.

The best twelve alpinas also came from Mr. Turner, and consisted for the most part of seedlings unnamed, the only named ones being John Gair, Iron Duke, and National, the two latter also gaining Floral Certificates. Mr. James came 2d with Diamond, Mr. Reeves, Spangle, Miss Colvin, Miss Andrews, F. Camille, Dazzle, Beauty of Redless, Mercury, Queen Victoria, Doll, Vandyke, &c.; and Mr. Douglas was 3d with Mercury, Favourite, Brilliant, Elcho, Mimmie,

John Leech, Sydney, King of Crimsoms, Edgar, Miss Reed, and two seedlings.

Manchester Botanical and Horticultural: April 27.—In the present unhappy circumstances of the Royal Horticultural Society, Manchester has certainly shown a considerable march on South Kensington. One of the small meetings of the Manchester Botanical and Horticultural Society was held on this occasion, and, both in the extent and value of the subjects staged, it certainly equalled, even if it did not transcend the early Rhododendron show at South Kensington on April 21. Then there was the added attraction of the National Auricula Society's exhibition, and the two combined filled every available part of the spacious Town Hall; while the company was so numerous, owing to the fine afternoon, which followed a somewhat unpromising morning, that locomotion was almost impossible; and there was no band to stimulate visitors to put in an appearance. These meetings—so happily conceived and so successfully carried out—appear to have become a necessity. Meetings, such will have to be continued as a part of the programme of the Botanical and Horticultural Society.

One of the most conspicuous features was a fine bank of pot Roses, staged by Mr. Charles Turner, Royal Nursery, Slough, and to which the Gold Medal of the Society was awarded. This included capital ground and flowered plants of *Céline Forbes* 'ier, *Mdlle. Thérèse Levet*, *Madame Victor Verdier*, *La France*, *Madame C. Joigneaux*, *Edward Moran*, *Dupuy* *James*, *Socin*, *dun Amant*, and *Marie Lutzmann*. A First-class Certificate was awarded to Mr. C. Turner for *Azalea Apollo*, one of Verschaefel's newer seedlings, the flowers white, slightly striped with carmine, very large and of excellent form. In addition, Mr. Turner had *Mdlle. Léonie Van Houtte*, *Comtesse de Beaufort*, and the fine old *Charmer* in grand condition. A First-class Certificate was awarded to E. G. Wigley, Esq., for a capital example of *Dendrobium macropteron*, bearing a fine spike of flowers, one having as many as fourteen fine blossoms. The exhibitor had D. Pierardi major, D. thysiflorum, D. crystallinum, *Odontoglossum citrosum* and its variety *roseum*, O. Pescatorei, with a finely bloomed spike of forty flowers; *Cattleya Mendell*, *Vanda cereulescens*, *Masdevalla Lindeni*, and M. Veitchii. From Mr. Geo. Toll came *Odontoglossum hystrix*, bearing a fine spike of flowers; O. *nevium majus*, O. *Blanchi*, *Cyclopium Grossi*, *Erwin*, &c. Advers, Esq., came *Dendrobium Dalhousianum*, *Cypripedium Dominiannum*, and a small plant of *Odontoglossum vexillarium*, with one large flower of fine substance. A First-class Certificate was awarded for *Rhododendron Countess of Derby*, partaking of the character of R. Edgworthi, with very large pure white flowers of great beauty and substance, flowering very freely in very small plants; this came from Mr. Isaac Davies, of Ormskirk. Messrs. Adams, Esq., Yates, of Manchester, contributed a large group of plants, consisting of Palms, *Azaleas*, *Rhododendrons*, greenhouse-flowering plants, &c. Some charming bouquets were furnished by Mr. Thos. Studd; H. Martindale, Esq., sent a box of fine blooms of *Gloire de Dijon* Rose; and Messrs. E. Cole & Sons got up a box of cut flowers, comprising *Acacia longifolia magnifica*, *Richardia zehnpfana*, *Vanua sandvis*, *Musa comata* (very fine), *Magnolia composita*, *Philas Wallichii*, the showy *Scutellaria Mocciniana*, *Franseria calycina major*, and *Brugmansia grandiflora*. A First-class Commendation was awarded to Mr. Richard Dean, Ealing, W., for a stand of twelve bunches of cut fancy *Polyanthuses*, which appeared to find much favour amongst the Auricula cultivators.

In the way of fruit there was a capital basket of President Strawberries, from J. Rylands, Esq.; white *Elm*, every one of the same, from the garden of Lady Downe's Grapes, cut from the Vines about two months ago, and kept in water. The berries were fine and plump, and covered with a beautiful bloom.

The exhibition of the National Auricula Society fell somewhat short of the expectations of the promoters, both in point of numbers and general average quality of the flowers; on the other hand it must be admitted that some of the flowers were as perfect in the matter of substance and finish as could be desired. The Town Hall is not adapted to show off Auriculas to the best advantage; it is too dark to bring out the exquisite marking of the finely-finished examples of this "beautiful and fascinating flower"; and the judges, owing to the gloom which prevailed in the early part of the day, had to carry the flowers to the light in order to give them that searching examination required in the circumstances of such a spirited competition. The regulation which requires that all the trusses must be shown free from all artificial packing and support, is not calculated to show off the flowers to the best advantage; they get a handgrip appearance—large trusses are apt to overweight the stems, and they bend over, even to the danger of snapping asunder; it is also tends to encourage small rather than bold trusses. Exhibitors at a distance are allowed to turn their plants out of pots, shake out a portion of

the soil from the roots, bind them up in damp moss, and in this way a good number of plants can be closely packed in a small space; but as the plants are provided at the place of the exhibition, the plants are reported previous to staging, and the soil is covered with damp moss, which is not as a general rule laid on in a neat and tidy manner. The space at the service of the Auricula growers in the Town Hall was circumscribed in space, and the plants were huddled together, giving them a confused appearance. These matters are set forth, not in a captious spirit, but merely as indicating defects that might be remedied; and it is to be borne in mind that such an exhibition as that of the National Auricula Society is intended mainly for the fanciers of the Auricula, and they prefer to see the plants in all their naked loveliness of pip and truss, apart from all attempts at enhanced attractiveness.

The blue riband of the exhibition was undoubtedly the 1st prize in Class A, for six dissimilar varieties of show Auriculas, one at least in each of the classes being required. This was won by the Rev. F. D. Horner, Kirby Malzeard, Ripon, the premier amateur cultivator of a small class, and a former opponent to practised growers like Mr. Charles Turner. He staged excellent examples of *Regulator* and *Smiling Beauty*, white-edged, the last very fine; *Prince of Greens*, green-edged, a very fine flower; *Complete*, and *George Lightbody*, grey-edged, both very fine, the latter especially so; and *Pizarro*, a very fine maroon silk with a pure white paste. Mr. C. Turner was 2d with *Cygnét*, white-edged; *Alderman Wisbey*, green-edged; *Robert Traill*, *Colonel Champeys*, and *George Lightbody*, grey-edged, all very fine; and *Charles J. Perry*, a very fine deep violet-red, with a clear white paste. Mr. H. Wilson was placed 3d with *George Lightbody*, grey-edged; *Favourite*, white-edged; *Colonel Taylor* and *Imperator*, green-edged; *Pizarro* and *Othello*, selfs. Mr. S. Cooper, who was 4th, staged *John Waterson*, A. Smith, and *Lovely Ann*, white-edged; *Imperator*, green-edged; and Mrs. Sturrock and *Metropolitan*, selfs. Four collections only were staged in this class. In that for four dissimilar varieties, one in each class, Mr. C. Roys was 1st with *Imperator*, green-edged, bearing six fine pips; *Smiling Beauty*, white-edged, *Conqueror of Europe*, grey-edged, a very fine example, with seven splendid pips; and a fine dark self, named Mrs. E. Lancaster, raised by Mr. Pohlman, paste and body colour being almost perfect. The Rev. F. D. Horner was 2d with *General Bolivar*, grey-edged; *Smiling Beauty*, white-edged; *Charles E. Brown*, grey-edged; and Mrs. Sturrock, self. Mr. S. Cooper, who was 3d, had *Imperator*, green-edged; *Conqueror of Europe*, grey-edged; *Taylor's Glory*, white-edged; and *Pizarro*, dark self. Mr. C. Turner came 4th with *Alderman Wisbey*, green-edged; *Privateer*, grey-edged; *Arabella*, white-edged; and *Blackbird*, white-edged. In Class A, Mr. C. Roys was 1st, in condition being that the plants be dissimilar both in variety and class. Mr. C. Roys was again 1st, having self Mrs. Lancaster in splendid condition; and *Imperator*, green-edged, with five fine pips. The Rev. F. D. Horner was 2d with *Walker's George Levick*, a very fine but scarce grey-edged of splendid quality; and *Prince of Wales*, a fine green-edged. Mr. E. Elliott, who was 3d, had *General Bolivar*, grey-edged, and *Imperator*, white-edged. The Rev. F. D. Horner was 4th, with *General Taylor*, grey-edged, and *Stapleford Hero*, white-edged. There were seven pairs competing in this class.

Next came the classes for the premier flowers in the four sections, viz., green, grey, and white edges, and the selfs. Here, as might be expected, the competition was numerous and exciting. In the green-edged class, out of some thirty flowers, the judges selected for the premier prize a finely finished example of *Colonel Taylor*, furnished by Mr. R. Lord. Next in order came *Imperator*, shown by the Rev. F. D. Horner; *Lady Ann Wilbraham*, *Beeston's Apollo*, *Lovely Ann*, *Traill's Anna*, *Lancashire Hero*, and *Prince of Wales*. The premier grey-edged were *Alexander Meiklejohn* (Kay), shown by the Rev. F. D. Horner, a fine flower of great beauty; next came *George Lightbody*, *Complete*, *Chas. E. Brown*, *Robert Traill*, *Alexander Meiklejohn*, *Alma*, *Conqueror of Europe*, and *Ne Plus Ultra*. The Rev. F. D. Horner also exhibited *Robert Traill* in fine character. The premier white-edged was *Catherina*, and the same variety took second honours also; then came *Omega*, bearing a fine truss, *Smiling Beauty*, *Richard Headley*, the next two unnamed, *Robert Traill*, and the next unnamed. There were forty-two grey-edged, and about twenty white-edged flowers competing in these two classes; but selfs were much more numerous, representing not less than seventy being staged. The best was a fine dark self *Othello*, staged by the Rev. F. D. Horner; next came *Pizarro*, *Charles Perry*, the body colour very fine; *Topsy*, *Lord of Lorne*, a bright deep red self, very attractive; *Garibaldi*, *True Blue*, *Lord Clyde*, and *Meteor Flag*.

Alpinas were divided into two groups, those with yellow and those with white centres, and they were shown singly for premier honours. The best was

Bessie Ray, a splendid new form, from Mr. C. Turner, the body colour dark maroon, edged with very bright pale orange red. Then in order came Nimrod, Ovid, Alice, Diadem, Dolly Varden, Bronze Queen, John Leech, and Evening Star. The premier Alpine with a white centre was Mauve Queen, pale mauve body colour, very pretty indeed; this was shown by Mr. K. Gorton; then came George Lightbody, fine velvet ground colour; Beatrice, Constance, and others.

Polyanthes were poorly shown—it was said that the severe winter tested their endurance severely. Such fine old varieties as Exile, Lord Lincoln, George the Fourth, President, and Cheshire Favourite, put in appearance, being shown as pairs, as usual in the class for premier honours.

All the plants exhibited in the "pans"—*i.e.*, a class requiring two and more examples—must have not less than five expanded pipes. Those in the premier classes must carry not less than three.

After the judges had done their work, a large number of exhibitors and fanciers met them at dinner, under the presidency of Mr. Samuel Barlow; and when dinner was over a liberal subscription list was started to hold the exhibition in 1876. It is due to the Council of the Manchester Botanical and Horticultural Society to state that they give liberal encouragement to the Auricula, Tulip, Carnation, and Picotee cultivators, and that this support is doing much to increase the interest attaching to these exhibitions. The Tulip show will take place at the Botanical Gardens, Old Trafford, during the third or fourth week in May, and the Carnation and Picotee show at the same place during the second or third week in August.

The Villa Garden.

BEDDING PLANTS.—In another week or two we shall have reached onwards to that time when plans for filling the flower-beds must be laid down, and the plants intended to fill them must be got together. In large gardens, where from five to fifty and sixty thousand subjects are wanted to fill the flower-beds, it is necessary that the work of preparation commence quite early in the year, and already thousands of plants are established singly in 60-pots ready for—balling in columns, groups, and divisions at the opening of the summer floral campaign. Such a task needs much forethought and nice calculation; the gardener must be constantly looking ahead, and something very nearly allied to genius—even if it be not that sublime quality—is required to plan the embellishment of a large flower-garden, and arrange all its details in a complete and symmetrical manner.

The Villa gardener has no such weighty cares on his mind. Still the task of filling his beds, even if they be small, is one requiring thoughtful care. Our floral competitions are by no means confined to flower shows; the development of modern gardening has given birth to pleasant local rivalries; neighbours vie with each other in the perfection of their floral displays; neighbours who are not personally acquainted imitative competition gives—a zest to gardening, and creates a larger interest in it.

Now many bedding plants have been wintered in boxes and large pots—placed there as cuttings in August and September last, and wintered on the shelf of a greenhouse, in cold frames, and in lofts and store-rooms. In this way Pelargoniums, and Calceolarias especially, Echeverias, the variegated Mesembryanthemum, dwarf Nasturtiums, *Festucas*, and *Verbenas*, &c., are annually wintered in quantities, and with more or less success. It has been an unfortunate winter for amateur gardeners, however—many and complete are the losses sustained; but then the winter was unusually severe and prolonged, and continuously wet. Any plants wintered in this way should be potted off singly into small pots, if it has not already been done, to admit of their becoming established somewhat before being planted out in the open borders for the summer display.

What to do with these when they are potted off is a matter of considerable importance with many who have a greenhouse or conservatory can store them away on upper shelves, where they will do well provided they are kept watered. Some who have no house can place the plants in a cold frame, which can be kept close for a time, till the plants make growth and should have air. But what of those who have neither house nor cold pit, who yet winter a few plants in some such way as that mentioned, and who, now they are potted off, want more space in which to stow them away? To such we tender advice of this character. Select the warmest and cosiest spot in the garden, and there dig out a pit a foot or so in depth, the diameter according to the number of the plants to be provided for; put a layer of cinder ashes or slates at the bottom, then add about 4 inches of cocoa-nut fibre, which can be obtained anywhere almost, and at a small cost, and plunge the pots in it thickly together.

Next put a fence of old boards or something similar round the pit in the form of an outside wall, but on the ground level (this fence should be a foot or so in height); then lay some cross pieces from one side to the other, and cover with mats, Frigi Domo, pieces of old sacking, and other materials. In this way considerable protection can be given to half-hardy plants; and if covered by night, and opened by day, the plants will become gradually hardened off by the last week in May. If it is inconvenient to dig out a pit, then stand the pots on the ground level; but the protecting fence should be at least a foot higher than in the case of the sunken bed. The weather is now warm and bright, leaves are rapidly unfolding themselves, the cuckoo is heard in the woods, and the fall flow of summer life is at hand, but it must not be assumed that the summer season is so near as it now seems. May is a precarious month; sometimes it is very cold and stormy. Nature may have exhausted its store of winter forces for the present—it may be that onwards, till the summer closes, the weather will be all that is desired—but a careful gardener will not venture to rely on the weather coming in, and the time of eggs may be very distant.

Succulents, such as hardy *Sempervivums* and tender *Echeverias*, are now much in request, together with a few close growing *Sedums*, for small flower gardens. They have the great advantage of being wintered with comparative ease; and they grow from small to large plants with considerable rapidity in early summer. Many offshoots of *Echeveria secunda*, and the glaucous variety also, have been wintered in shallow boxes, pricked in thickly in August and September, and now growing into charming rosette-like plants. These want room. They don't require potting, as they are well able to take care of themselves, and what we would suggest is that a bed of fine soil be made up under a warm wall, and the plants placed out there in rows, giving each a little space to grow in. Unless the weather should come in very badly—cold hail-storms, snow, rain, and frost—no protection will be needed, and a net thrown over them at night will keep them quite safe until the weather comes in, and cold with it, so raise the mat over the surface of the bed as that it will form a kind of sloping roof, and the rain will then fall away on either side. *Sedum glaucum*, silvery-grey, and *S. lividum*, deep bright green; *Sempervivum californicum* and *S. montanum*, and those two charming grasses, *Festuca viridis* and *F. glauca*, are perfectly hardy, and they can be planted out ready for use by-and-by, in neat beds, in lines a little way apart. If it has not already been done, sow a pinch of Golden Feather *Pyrethrum* on a warm spot; it will soon come away if kept watered in dry weather. It is not well to have this too early. Early raised plants throw up their flowers at midsummer, when they are not wanted.

The charming *Mesembryanthemum cordifolium variegatum*, one of the best variegated-leaved bedding plants of recent introduction, is a difficult plant to winter, requiring a dry heat. Hundreds of plants have died for want of requisite warmth during the past winter. Those who have succeeded in wintering a store plant or two, or who can obtain them now, should place it in a greenhouse or in a sunny window, and as the young growth is put forth make cuttings of it and place them thickly in shallow pans in a light sandy soil; they will soon strike on a warm shelf in a greenhouse, or on the inner sill of a window. Villa gardeners should include this plant among their indispensable summer bedders, and few things are better suited for suspending either in pots or baskets to enliven a sunny window.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

The subjoined directions are intended to supply general information, and must, of course, be adapted to the peculiar circumstances of each locality. Other departments of the garden will be treated on from week to week in succession, according to the requirements of the season. Special directions for the management of "the Villa Garden" will be found in the preceding columns.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—*Euphorbias* for winter flowering are much more useful in a comparatively small or moderate size, than when allowed to get large; by keeping them somewhat limited in their dimensions, they do not individually occupy so much room in the forcing pit when being brought on into flower in the autumn, which is an advantage, as it admits of more variety. The nature of the plants, in bearing without injury closely cutting in, favours their being kept for years in a comparatively small state, yet withal healthy. Plants that have been flowered in succession through the spring will in many cases have had their shoots reduced in length by removal for decorative purposes in the shape of

cut flowers, yet they are not cut so close in as to prevent their increasing in size more than may be wanted; where such is the case they should at once be shortened back before any shoots that may have already broken out have grown much. In this shortening the operator should be guided by the size he desires his plants ultimately to attain; they will bear very well to be thus reduced to within 4 inches of where they were cut back to last year. Although they will make their growth well with ordinary greenhouse treatment, yet where the object is to have them early in flower this will be much accelerated by now keeping them a little warmer, closing the pit or whiter structure they occupy early in the afternoon, springing over-cuts at the same time. *Acacia Goumoudii*, *A. arnata*, and other varieties of moderate growth; *Ceanothus*, *Halvathamnus elegans*, grown bush-fashion in pots, and similar plants that have flowered through the spring, should also now be cut back as far as required. These are better not cut in so closely as advised for the *Euphorbias*, but, like them, will be much benefited by a somewhat closer atmosphere and by being damped overhead in the afternoons. If this is carefully done, so as to get the water well to the under side of the leaves, it will not only accelerate growth, but keep them free from their summer pest—red-spider. Prevention in this way is much easier than the necessity for recourse to more decided means when the insect has established itself upon the plants.

The small Otahete Orange, so useful for winter flowering, should, when out of bloom, have its growth pushed on in a little warmth. This plant is subject to scale, and before any young growth is made they should be thoroughly cleansed with insecticide, using the sponge in preference to the brush, the latter being liable to scratch the leaves. Plants of varieties of large growth that have flowered should be similarly treated. Oranges of all kinds, whilst making their growth, must be well supplied with water, especially overhead, and be also slightly shaded from the sun. The Orange is a plant of comparatively easy growth, and naturally able to withstand a good deal of bad treatment without being killed outright; and to this, no doubt, may be attributed the indifferent condition in which they are often seen. When in a bad state the roots are generally few, and almost dormant at a time when they should be ramifying in all directions; when thus stunted and unhealthy the best course is to turn them out of their pots, reduce the balls considerably, put them in smaller pots, and place at once in moderate heat with a close moist atmosphere until the roots are unmistakably active and the growth is made; it is then in such condition that it will be much benefited by a moderate bottom-heat of about 70°.

Coprosma Baueriana variegata is a very useful conservatory plant, its shiny variegated foliage being effective amongst flowering subjects, but through the winter it is liable to get bare of leaves, when it becomes unsightly. When in this state, it should now be cut back and kept a little warm in a moist atmosphere until it pushes growth; the points of the shoots thus cut away will at the present time strike much more freely than further on in the season—they will do this singly in small pots, or several placed round larger ones.

Azaleas.—In time plants of these sometimes get somewhat large and straggling in their branches, having a thin open appearance, or they get too large. In either case they may at the present time be cut back, but this must not be carried too far, or to the extent that it would be safe to go with *Camellias* in a similar state; neither must the cutting back be attempted if the roots are not in good condition. If the plants are large they may with safety have their branches shortened a foot or so all round. They must then be placed in a close, warm atmosphere, syringed twice a day overhead, keeping the soil rather dry until they have made an inch of growth.

Dactylis gracilis that has been forced through the winter and has done flowering will now be pushing growth. The best way of treating this plant, and by which it may be kept in a healthy, useful condition for a number of years, is to cut near the old wood after it has flowered, depending on next year's bloom upon the young shoots that push up freely from the collar when the plant has plenty of roots. To ensure its blooming satisfactorily every year when forced it should, after flowering, be kept in a little heat, such as a vinery at work, until the growth is made and flower-buds formed. If in small pots give them a moderate shift if they do not require more room they will whilst growing be benefited by manure-water twice a week or so. Hardy shrubs, such as *Chenit Azaleas*, *Rhododendrons*, the *double Pinks*, as *Laurustinus*, &c., that have been used for conservatory decoration, should, when done flowering, be placed for a few weeks in a cool house, instead of, as too often seen, turned out-of-doors and neglected; if allowed to harden a little before being exposed they may be induced to flower again next winter.

T. Baines.

ORCHIDS.—At the present time, and for four months to come, most of the plants will be in a growing state. The temperature should now be increased

in the East Indian house from 70° to 90° by day, and to from 65° to 70° by night. The Cattleya-house should be from 65° to 75° by day, and from 60° to 65° by night. The Odontoglossum-house should be 60° to 70° by day, and 55° to 60° by night. Should there be any plants that are not growing satisfactorily, ascertain at once the cause of it, and apply a remedy; the roots must be examined, and if it is found that any part of them are decayed—*i.e.*, rotting—which is frequently the case if they are kept too wet, the parts should be cut away to prevent the disease being carried into the plant. If the plant can be turned out of the pot without damaging the healthy roots, so much the better; the roots can then be washed, and repotted into moderately dry material, of a kind suitable to the plant which is to be operated upon, and very little water should be given until new roots, are formed. It should be borne in mind that air-plants do not require a large mass of material to root into. Shading will become more and more necessary as the season advances; at the same time air will be required. It often happens that when the blinds are rolled down the air is excluded from the house, except that entering by way of the bottom ventilators. Where sliding top-lights are in use, and the canvas is allowed to lie close down on the glass, it effectually prevents the escape of heat. This does not so much matter in the case of many East Indian Orchids, but to the majority of pseudobulbous plants it is very injurious. When the sun is sufficiently powerful for the plants to require shading there should be a free circulation of air, and to allow of this the canvas must be kept off the glass. The most easy way to do this is to raise the lath on which the canvas is nailed on 3 inch blocks of wood screwed firmly on the top of the rafter; a piece of quartering 3 inches by 1½ inch should be screwed on each rafter; if where rafters are not used the ends may be made fast to the top and bottom rail of the house, at distances of about 5 feet apart. It is necessary to nail thin laths about 3 feet apart to prevent the canvas "sagging" on the glass when wet; thus the roller and blind will be kept 3 inches above the glass, which will allow a free circulation of the air. Plants hanging very near the glass will be especially benefited, for when the sun is shining brightly the glass becomes so hot that with the shading lying upon it than when there is no shading at all. Some of the Mexican Orchids will be found to succeed better in the greenhouse for the next four months. *Lelia majalis* should be grown in the full sun and air; if grown in a shaded house it is a shy bloomer. The *Stanhopes* should be examined frequently, and if found at all dry should be well soaked in tepid water; any that are starting into growth may be repotted. *Zygostylis* may now be repotted. A general routine will now and for some time to come be required in the matter of watering and syringing. *G. Baker, Clapham Common.*

FLOWER GARDEN, &c.

THE PARTERRE AND MIXED GARDEN.—*Erythrina*, which make very effective plants for the centres of large beds, should now be started with a view to forwarding them for planting or plunging out in May; and if desirable to increase the stock, a portion of the young shoots when formed may be taken off with a heel and be inserted in heat, where they will soon strike. Any *Canas* not yet started should at once be placed in gentle heat. Any old half-spent hot-bed, containing a few rotten leaves on the surface, will do admirably for the purpose of plunging them in and will save potting. *Caladium esculentum*, *Aralia papyrifera*, and many other fleshy-rooted plants used for bedding out, may be treated in the same way, and by so doing space, time, and labour in potting may be saved. Seed of the fast growing subtropical plants, such as *Zea*, *Ricinus*, *Beta Cida*, *Amaranthus*, &c., may now be sown, and these will be found far more satisfactory than others of the same varieties sown at an earlier date. The different *Solanums*, *Chamaecypariss*, *Uldens*, *Acacias*, *Ferdinanda*, and such like subjects, advised to be sown in February or March, should be potted on and nursed in gentle heat to get them large and strong. *Coleus*, *Alternanthera*, *Iraine*, and other tender quick-growing plants to be used for bedding purposes may still be propagated, as there is ample time to grow them to a good size by the first of the second week of June, which is quite as soon as it is safe to venture them out. As soon as struck, such things as the above, together with *Lobelia*, *Verbena*, dwarf *Ageratum*, and many other fast-growing bedding plants, should be pricked out in frames prepared for the purpose. If planted in leaf soil, or old spent Mushroom dung, they lift with large balls without a check, and succeed in this way; it saves a large amount of time and labour in potting, watering, &c., and is far preferable in every way. It will now be necessary to transfer from the houses to cold pits and frames all the hardier varieties of bedding plants that may be standing under the shade of Vines, Peaches, &c., so as to gradually harden them off and inure them to the sun and air.

Ivy-clad walls and buildings should now be gone over with the shears, and be closely clipped in, so as to shave off all the old leaves of last season. Their appearance will not be of the most desirable kind for a week or two, but they will amply repay any little loss of effect for the time by clothing themselves with lovely fresh green foliage, free from dirt or discoloration. *F. Sheppard.*

FRUIT HOUSES.

THE ORCHARD-HOUSE.—The present spring has been remarkably backward, and this circumstance of course operated upon fruit trees in unheated structures, such as orchard-houses, as well as upon those in the open air, but with no injurious results, as far as can be at present perceived, and the prospects of the fruit crops of all kinds are all that can be desired. *Apricots* are now fairly set, and where they are in very great abundance they should be at once slightly thinned out. At the same time that this is being done, strong or superfluous shoots should be rubbed off or pinched back, so as to secure symmetrical development of the trees, which are also about this time not unlikely to be attacked by a small caterpillar, which preys upon the young shoots and leaves; these are easily discovered by the leaves being drawn together, and when this is observed they should be carefully unfolded and the caterpillar removed, or it may be effectually destroyed by gently pinching the leaves enclosing it. The trees should also at this stage be abundantly supplied with water, whether they are growing in pots or planted out; well diluted manure-water should also be given about twice a-week. This is more particularly necessary as regards trees in pots, which may also about this time have the surface-dressing renewed. If they are carrying a heavy crop of fruit, the pots being full of roots—which may be supposed to be case—should the soil become very frequently dry, the bricks on which the pots are placed may be withdrawn, allowing the water to rest upon the surface of the prepared border of soil, into which the roots may be allowed to travel freely for a time; and should any undue luxuriance be the result of this treatment, it can readily be checked by raising the pot and severing a portion of the roots which may have entered the border.

The fruit of the *Peach* and *Nectarine*, although less forward than that of the *Apricot*, will now be set, and as such trees are common at this stage altogether free from aphid, the garden engine must be brought into active operation about 7 o'clock on the morning of every day which promises to be fine. Should these syringings fail recourse must at once be had to fumigation, and this should be done during calm evenings, when the trees are perfectly dry. In cases of this kind, where only a few trees are infested with green-fly, these need only be treated with quassia water, prepared by boiling quassia chips, after the rate of an ounce of chips to a quart of rain-water, for ten or more minutes; and adding to this while cooling an ounce of soft soap. This when cold should be applied to the infested trees with a soft painter's brush, or the trees may be well dusted with Pooley's tobacco powder, during any still evening; and this, together with the dead or paralysed insects, will be washed off by the engine on the following morning. About this time mildew sometimes attacks *Peach* and *Nectarine* trees, and whenever this occurs no time must be lost in applying sulphur (the only known remedy) in some of its forms—either dusting the trees well with flowers of sulphur well dried, or syringing with Ewing's Infalible Composition, which is the most convenient and effectual remedy which can be applied to fruit trees suffering from mildew. Abundance of air is necessary to induce *Cherry* trees under glass to set their fruit freely, and they are also exceedingly liable to be attacked by the black or Cherry fly, which it is somewhat difficult to destroy, but which will, nevertheless, generally succumb to the incessant use of the syringe or garden engine, or repeated fumigations. Should the fruit set in great abundance it may, in some cases, be necessary to thin it out, and this should be done carefully, using for the purpose Grape shears of *Fig* trees, in pots or otherwise, are now swelling their fruit rapidly, and should be abundantly supplied with water, as if they are even once allowed to become too dry the check they will sustain will be likely to cause the young fruit to drop off. Ventilation must now be very carefully attended to, and the ventilators should be opened every morning about 7 or 8 o'clock, and during the afternoon, and by this means an undue depression during the night or early morning may, to some extent, be prevented. *P. Grice, Cultord, Bury St. Edmunds.*

KITCHEN GARDEN.

Amongst other matters which will soon demand attention here will be the thinning out of the various kinds of spring-sown crops of roots, such as *Onions*, *Parsnips*, and *Carrots*. This operation is best done before the plants become large, and therefore it should not be unnecessarily delayed much beyond the time when they can be readily handled. A large supply of what are termed *Button Onions* are generally wanted. Instead of sowing seeds specially for this purpose, replant into drills thickly those which are drawn from the main crop when thinned out. These give the requisite supply of such, and of *Spring Onions* also, without necessitating any interference with the regularity in appearance of the chief beds. These matters are of importance where appearances are studied, which should always be the case in every garden of the amateur. *Parsnips* should now be planted at once finally to about 9 inches or a foot apart, as the nature of the soil or circumstances require. In thinning out *Carrots*, as many more as those which will ultimately be required should be left, in order to give a supply of them in a young state. These can be obtained in this way by judicious thinning, without detriment to those which are left for the main crop, which should always be left at from 9 inches to a foot apart for long varieties, and 6 inches for the shorter kinds. Set out *Chicory* to about 9 inches or a foot apart, and leave *Scorzonera* and *Salsify* at about 6 inches from each other. Plant the main crop of *Dwarf French Beans* and *Scarlet Runners*; the former should include that remarkable variety, Canadian Wonder, and among the latter Carter's Champion should be grown, as being fine for exhibition purposes, and equally as prolific as the common variety. In both cases plant the Beans in rows about 6 inches asunder; there is no advantage in having double rows, as but two side surfaces can be fully exposed to the operating influences of those elements which are the essence of success with this subject. The antiquated practice of planting double rows of *Scarlet Runner Beans* has not yet become obsolete at many places. Experience in practice will, however, soon convincingly demonstrate its futility, and cause its abandonment. The cultivation of this vegetable can be varied according to circumstances, whether sown and prepared soil. Where long sticks are employed the rows should be 6 feet apart; at a less distance with shorter sticks, by stopping the plants when they reach the top; and where sticks are not procurable, it will do exceedingly well without them planted in rows about 3 feet apart. Surface heat, with plenty of moisture at the roots, are the elements which are most suitable to *Runner Beans*, therefore places possessing these advantages should be selected for them. We plant in drills 3 inches deep; in heavy soils 2 inches will suffice. After the Beans are up in light soils, raise the soil about 3 inches on either side of the row about 18 inches wide, slightly inclining the fall towards the row; this will arrest the penetrating power of the sun's rays until the sticks are placed, when an addition of from 4 to 6 inches of mulching material should be applied. This when well saturated will preserve the equality of moisture which is so desirable. Encourage growth by frequently stirring the surface soil between the rows, and, if necessary, by watering the Spanish section of *Onions* which were sown last autumn. These will now be coming in, and supplying the lack of old *Onions*, which now are becoming soft. The *Early White Naples* and *Giant White Tripoli* are much esteemed by cooks generally, and by French ones particularly, because of their whiteness. Care should be exercised in removing those for use, so as to leave some of the most promising in appearance, if fine examples are likely to be required. Take advantage of suitable weather to surface hoe the quarters, and wherever weeds are likely to be found. Use such available places as those between *Pears* which are being sown now for the sowing of *Spinach*, *Lettuce*, or similar subjects. Look over *Carrot* plants, and remove those which have buttoned, and replace them with plants from the late sowing. Keep up plentiful supplies of salading, which, to be tender and good, will require liberal supplies of water in hot dry weather. As *Potatoes* protrude, draw the soil lightly round them. At the beginning of May make a sowing of *Broccoli* for late use; this will also be a good time to make another sowing of *Savoy*, and the newly-introduced dwarf varieties, such as King Koffee, Tom Thumb, and Early New, are decided improvements on the large section both in regard to quality and usefulness.

In the glass department continue to give constant attention to stopping, tying, and watering early-fruited Tomatoes; shift on into 5-inch pots those which are to be placed against the walls outside. Prepare *Gherkin* and ridge *Cucumbers* for planting out under hand-lights or otherwise, and likewise Vegetable Marrows. Liberate any *Canas* with water, and sprinkle the surface of them every morning. *G. T. Miles, Wycombe Abbey.*

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 28, 1875.

Table with columns: MONTH AND DAY, BAROMETR. (Mean Reading, Highest, Lowest), TEMPERATURE OF THE AIR (Range, Mean for Day, Mean for Month), WIND (Direction, Force, Average Velocity), RAINFALL (Average, Maximum).

- April 22—Overcast and dull day. Occasional rain: cold.
23—Fine, bright, mild, and partially cloudy.
24—A fine bright day. Little hoar-frost on ground in early morning.
25—Fine, bright, and partially cloudy throughout.
26—Fine, mild, partially cloudy, misty.
27—A fine mild day.
28—A fine warm day; light clouds were prevalent.

In the vicinity of London, the reading of the barometer at the level of the sea decreased from 30.16 inches at the beginning of the week to 30.10 inches by the early morning of the 18th; increased to 30.19 inches by the evening of the 19th, and remained almost without change at this reading till the morning of the 20th; it then decreased to 29.85 inches by the afternoon of the 21st; increased to 29.93 inches by the evening of the same day; decreased to 29.88 inches by the afternoon of the 22d; and again increased to 30.28 inches by the end of the week. The mean reading for the week was 30.06 inches, being 0.21 inch lower than the value of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged from 72° on the 20th, to 43 1/2° on the 22d, the mean value for the week was 59 1/2°. The lowest temperatures of the air varied between 40 1/2° on the 21st and 33 1/2° on the 24th, the mean weekly value being 37 1/2°. The mean daily range of temperature in the week was 21 1/2°, ranging from 32° on the 20th to 5 1/2° on the 22d. The mean daily temperatures of the air, and the departures from their respective averages, were as follows:—18th, 48°, -1°; 19th, 51° 9', +4°; 20th, 54° 2', +6° 8'; 21st, 53° 5', +5°; 22d, 39° 1/2', -20° 8'; 23d, 42° 2', -5° 8'; 24th, 41° 8', -6° 4'. The mean temperature of the week was 47° 2', being 0° 7 below the average, as deduced from observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 131° and 129° on the 19th and 20th, but on the 22d day the sky was overcast throughout, and the reading was no higher than 54 1/2°. The lowest readings of a thermometer placed on grass, with its bulb fully exposed to the sky, were 31° and 29 1/2° on the 23d and 24th, but on the 21st 29 1/2° was the lowest reading. The mean for the seven low readings was 34 1/2°.

The direction of the wind was E. and E.N.E., and its strength very gentle.

The weather during the week was fine and mild, with the exception of the 22d, which was cold, dull, and the sky overcast, and frequent rain fell.

Rain fell on two days; the amount measured was 0.31 inch.

In England, the extreme high temperatures observed by day varied from 80° at Sunderland to 66° at Norwich, with a general average all over the country of 71 1/2°. The extreme low temperatures observed by night ranged between 38° at Newcastle-on-Tyne and 29° at Hull, with a general average of 33 1/2°. The mean of the extreme ranges of temperature in the week was 38 1/2°, the greatest range being at Sunderland, 46°, and the least at Newcastle-on-Tyne, 29°. The mean high day temperatures ranged from 66 1/2° at Manchester to 57° at Newcastle-on-Tyne, the general average being 61 1/2°. The mean low night temperatures varied between 43 1/2° at Truro and 32 1/2° at Norwich, with an average value of 38 1/2°. The mean daily range of temperature in the week was 23°, ranging from 28° at Nottingham to 16 1/2° at Newcastle-on-Tyne. The mean temperature of the air for the week was 48°, being 7 1/2° lower than the value for the corresponding week in 1874; the highest occurred at Manchester, 51 1/2°, and the lowest at Norwich, 43 1/2°. Rain fell to the depth of

quarter of an inch at most stations in the South of England, but in the midland counties no rain fell. The average fall was one-tenth of an inch.

The weather during the week was fine, bright, and mild, with the exception of the 22d, which was cold and dull; the sky was overcast throughout, and occasional rain fell. Snow fell at Bristol on the 22d instant.

In Scotland, the highest temperatures ranged from 76 1/2° at Aberdeen to 68 1/2° at Glasgow. The lowest temperatures varied from 34 1/2° at Aberdeen to 26° at Perth, their respective averages being 71 1/2° and 30 1/2°. The mean range of temperature was 41°. The mean temperature of the air for the week was 48 1/2°, being 1° warmer than that of England, and 5° lower than the value for the corresponding week in 1874. The highest happened at Greenock, 49 1/2°, and the lowest at Glasgow, 47 1/2°. No rain fell at any station, with the exception of Aberdeen, where 0.01 inch only was measured.

At Dublin, the highest temperature was 72°, the lowest 27°, the mean 47°, and rainfall 0.31 inch. JAMES GLAISHER.

Variorum.

BAMBOOS.—Early last year the Straits Times had a note on the deadly quality said to belong to certain small black filaments found within the hollow stems of the Bamboo, and which the natives of Java employed to cause the death of obnoxious persons. These black filaments are clothed with exceedingly minute sharp hairs. Introduced into food and eaten, they cause irritation and violent inflammation, terminating in death. This may be true or not, but the Editor of the Bulletin de la Société d'Acclimatation de France, in making an allusion to it, described it as a deadly poison, and thereby created quite a commotion throughout the South of France, where the cultivation of the Bamboo is now becoming very general. This unfortunate slip provoked a great deal of correspondence, and also a very interesting article on the uses of the Bamboo, contributed to the above-named journal in December last by Dr. Vidal. Some of the facts, if not absolutely new, are worth reproducing, as the author writes from personal experience in China and Japan. The purposes to which different parts of the Bamboo are applied are innumerable, and many of them well known to our readers. We shall confine ourselves here to one or two less widely known. In a climate where it will succeed, the Bamboo is one of the best things for shelter, as it will resist the most violent winds, and it is at the same time a great ornament to the garden. In Europe it will flourish only in the most favoured localities in the South, that is to say, attain anything approaching its normal dimensions. We do not here include the hardier smaller growing species occasionally seen in the open air in British gardens; the species commonly planted in Japan for shelter and shade is called Medaké, or Onakaké; but there is another more slender species, called Hatchikou, used for the same purpose. For forming dense hedges a dwarf species, named Chinodaké, is commonly employed. It is a very hardy kind, growing in great profusion on the hills. For ornamental purposes in the flower garden a smaller species with slender stems, spotted with black, is frequently cultivated—it is the Soudzotaké. In addition to the use of the Bamboo in constructing buildings, in furniture, &c., it is also extensively used both in China and Japan as a vegetable. It is taken to all the markets in large quantities all through the spring, and is highly esteemed by the inhabitants of both countries. The part eaten is the young tender shoots, taken off soon after they appear above the ground. They vary in length, from 3 or 4 inches to a foot, or a foot and a half, according to the species. Although probably all of the species are edible, only a very few are used as an article of diet. Those most cultivated for this purpose are the Onakaké in Japan, the Medaké, Otechikou, Hatchikou, and Medaké. The Chinese eat it in a fresh state in the spring, and preserve it in a sort of brine for use during the rest of the year. Not only the natives, but also the resident Europeans, eat it served up with white sauce or gravy sauce. Only quite young shoots should be taken, and all the preparation they require is washing. They need, however, a great deal of cooking—an hour and a half, or two hours boiling, at least—a fact that will tell against them with the cooks.

Answers to Correspondents.

ACUCBAS (Q. 49, p. 540). In answer to "J. F. M.," I may say that Aucubas may be budded in the same manner and at the same time as Roses, and grow as readily. I have at this time a bud, inserted last June, now 4 inches long, all bloom. J. H. N. BEDDING-OUT: Young Gardener. Your proposed arrangement for planting in circular beds seems a very good one. We do not quite understand your other question.

BEDDING PANSIES: W. Oxford. The strain seems to be a good one. You should send plants to Mr. Johnson, at Chislehurst, for the standard kinds. The merit of bedding varieties depends mainly on their habit as regards continuous flowering, and this cannot be judged of from cut specimens. Nos. 5 and 6 appear likely to be the most useful, though Nos. 3 and 4 are good in colour and fine in form. The white edges which show near the eye of the other two are defects. Whole colours and fertility of blossom are the essential qualities in bedding Pansies.

CORYNOPHALLUS: X. Y. Z. We are not aware of Corynophallus Afzelii having any synonyms. There are many forms of it, however, such as C. elegans, C. spectabilis, and C. latifolia were described, together with the typical plant, at p. 1619, 1872.

CROCUSES: R. C. Walker. The defect you mention is probably attributable to disease such as attacks the Gladiolus, Tulip, &c. We can suggest no other cause.

DOUBLÉ AURICULA: H. Cannell. The flower sent is very handsome, large, bright yellow, with about three rows of petals. There is, however, a double yellow variety in cultivation, the colour of the tinct from this or not we have no means of determining.

INSECTS: Abergole. The leaves of Holly are infested with the larvae of a minute two-winged fly (Phytomyza filix), which eats the fleshy part of the leaves, leaving the two surfaces entire, and the hole from the centre, not squeezing the infested part between the fingers, or by picking off and burning the infested leaves. J. O. W.

MARANTAS: X. Y. Z. The following sorts are deciduous—namely, M. tubispatha, M. leopardina, and, we believe, M. concinna.

NAMES OF PLANTS: A. Bennett. Centaurea nigra, var. decipiens. — Kiti. Epidendrum sanguineum. — A. G. Calceolaria violacea. — Amaryllis. Spreckelia formosissima. — An Anxious Inquirer. Pyrus japonica, Japan. It is difficult to say what may be the cause of the paleness of some of the flowers; it may be due to a want of direct sunlight, or an insufficient supply of the colouring principle in those parts, or to other and unknown causes. — D. C. The true Citrus Aurantium, Japan. We have no means of determining the particular variety. — M. J. C. Citrus trifoliata, flore-pleno; 2, Lathraea squamaria; 3, Petasites vulgaris; 4, Chrysosplenium oppositifolium; 5, Luzula campestris. NECTARINES: R. H. Perhaps it arises from scalding during some of the very hot days we have had recently; or possibly from the quality of the soil, without knowing all the circumstances. The appearance of the fruit is suggestive of scalding.

PELARGONIUMS: C. Burley. The petals had all fallen off when the flowers reached us, and they were in too hopeless a condition for us to deal with.

ROSES: Young Amateur. The leaves appear to have been caught by a bright sun while wet from springing. There is no other cause of mischief apparent.

* * * Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Gardener's Chronicle," to the Editor's staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors. FOREIGN SUBSCRIBERS should be requested by the Publisher to desire Foreign Subscribers sending Post Office Orders, to be good enough to write to the Publisher at the same time.

COMMUNICATIONS RECEIVED.—T. Shortt.—W. B.—J. Scott.—J. W.—R. P.—E. A.—M.—G. G.—G. P.—Fry.—J. M.—J. C.—N. B.—H. W.—E. W.—G. G.—R. E.—G. T. M.—J. C.

Markets.

COVENT GARDEN, April 29.

A moderate rate of business is being done here. Importations are heavy, and a large quantity of inferior late Apples are in the market, causing a decline in price. The new Potatoes from Lisbon and Malta are easing the market, frame Potatoes having fallen to 9d. and 1s. Thos. Taylor, Wholesale Apple Market.

Table of market prices for Fruit: Apples, Grapes, Lemons, Nuts, Oranges, etc.

Table of market prices for Vegetables: Artichokes, Asparagus, Beans, Beet, Cabbages, Cauliflowers, Cucumbers, Endive, Herbs, Potatoes, etc.

THE COWAN PATENTS COMPANY, LIMITED, 21, WHITEHALL PLACE, LONDON, S.W.

BOULTON & PAUL (LATE W. S. BOULTON & CO.), NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

Now Ready, our NEW ILLUSTRATED CATALOGUE OF HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings with Prices of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

AS A LAWN CONSERVATORY.

FOR PLANTS OR VEGETABLES.

AS A VINEY.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these Patent Plant Preservers and Ground Vineyries to be by far the best and most useful articles of the kind they ever saw, and awarded them the ONLY PRIZE.

Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 ft. by 4 ft. wide; thus proving them to be really portable. They are made in the following sizes. One pair of ends is sufficient for any number of lengths, if set in a continuous row.

Cash Prices carriage paid to any Station in England on Orders amounting to 60s. and upwards.

	Price.	Ends per pair extra.		Price.	Ends per pair extra.
6 feet long by 2 feet wide	£1 5 0	.. 5s. od.	6 feet long by 4 feet wide	£2 6 0	.. 8s. 6d.

Lawn Conservatories, with Glass sides and ends, 12 feet long by 4 feet wide, £7 5s.; 12 feet long by 5 feet wide, £8 15s.; 12 feet long by 6 feet wide, £10. PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. Write for New Illustrated List post free.

OPINIONS OF THE PRESS.

"The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value."—*Gardener's Chronicle*.

"The Ground Viney which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co."—*Floral World*.

"Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known."—*Gardener's Magazine*.

"Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and putted—an essential point. They are complete and ready for use the moment they are received, &c."—*The Garden*.

Cash Prices, carriage paid to any station in England when orders amount to 60s. and upwards.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION—
 These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground
 in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the
 Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers
 is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either
 collected in the box—the nearest plan—or delivered at the back of the Machine and left on the lawn, to prevent the
 grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and
 hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction,
 and a month's trial allowed. Orders executed on receipt.

Important to Market Gardeners and Others.
THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one
 light but strong steel shovel, for marking out rows to plant, or for loosening up
 the ground after the plants are up. Also a small Steel Plough, to be used for
 filling up the rows when desired; and a Cutter for exterminating weeds, and
 Rake for pulverising the ground. These pieces are made separate, and attached
 or detached in a moment by means of a simple fastening. Its construction
 enables the user to push it readily and easily through the ground, stirring the
 earth, if required, to a depth of six inches. It is exceedingly light, strong, and
 tasty, and fully adapted to the purposes designed. A large number have been
 sold, and are giving unequalled satisfaction.
 Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

VIENNA PRIZE WIRE NETTING.

Awarded The Medal For Merit

At Vienna, 1873.

CAUTION TO BUYERS OF WIRE NETTING.

The great reputation and success of Messrs. J. B. BROWN AND CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & Co. are THE SOLE MANUFACTURERS.

Messrs. BROWN & Co. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced prices. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting.

90, Cannon Street, London, E.C.—March 12.

For Park, Farm, and General Enclosures.

Is in use over many thousand miles, And has been awarded the Silver Medals and Highest Commendations of the leading Agricultural Societies. It forms the most efficient strained iron fence known.

RALPH WALLER and CO., 45, Dale Street, Manchester, MANUFACTURERS of all kinds of GARDEN NETTING, &c.

The serious injury done every spring to Fruit Crops by frost has proved to every Gardener the absolute necessity of providing for Protection to the trees early in the season in its earliest development but slightly weakened by frost, the vitality of the fruit-germ is destroyed, and the fruit lost. In this climate, on the average of a century, there is not more than one year in nineteen when the protection is unnecessary. Many fabrics have been tried for this purpose of protection, but few have been successful, and every one who has had fear of contradiction, that we have succeeded in manufacturing the only fabric which is altogether objectionable for this purpose. Without unduly nursing, it effectually protects the young trees, and does not impede the action of light and due circulation of air. Some other fabrics do this, and thus weaken the vitality of the tree altogether. Almost every large grower in the three Kingdoms can testify to this fact.

HOTHUSE SHADING of various thicknesses, superior to any other yet discovered for lightness, strength and durability, standing, as it does, weathers.

"I have had the netting No. 6 on my Orchard-house for eighteen months, and I find it now in very good order, and likely to last many more months, and I intend to use it on all my houses in future, being well satisfied both as to its lasting qualities and also as to the shade it gives, which is sufficient to prevent burning, and yet not thick enough to keep out the light, as the ordinary strong shading stuffs do; indeed, it is suitable for shading any kind of plants."—*Broomfield, Feb. 13, 1871.* TIPPANY of various kinds always on hand. NETTING and SHADING in pieces 20 yards long, 2 1/2 yards wide, 11 pieces in pieces 20 yards long, 3/8 inches wide. For prices, &c., apply to the above address. 45, Dale Street, Manchester.

Grateful-Comforting E P P S'S COCOA. BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage, which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us, ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." See article in the *Civil Service Gazette*.

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Side Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness :—

DONKEY AND PONY MACHINES.

To cut 26 inches	£	15	0	0
" 28 "	17	0	0	0
" 30 "	18	10	0	0
Leather Boots for Donkey	1	0	0	0
" " Pony	1	4	0	0

HORSE MACHINES.

To cut 30 inches	£	22	0	0
" 35 "	25	0	0	0
" 42 "	30	0	0	0
" 48 "	34	0	0	0
Leather Boots for Horse	1	9	0	0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machinery.

GREEN'S PATENT "ROYAL" LAWN MOWER.

The special features of this Machine, which recommend it for universal adoption, are its novel construction and its extreme simplicity. It is composed of the smallest number of parts of any Lawn Mower extant.

The Framework is cast all in one piece, and, therefore, is not liable to be twisted, or by any means get out of order.

The Cutters are fit in the cylinder without wedging or wringing, and yet they are so firmly fixed that they cannot be shaken, or in any way become loose.

The Fixings or Caps of the Cylinder are fitted together by two bolts and two screws only; and the cylinder itself can be adjusted or removed by the most inexperienced person in two or three minutes.

WITH SINGLE GEARING.

To Cut 6 inches	£	1	5	0
" 8 "	1	15	0	0
" 10 "	2	10	0	0
" 12 "	3	5	0	0
" 14 "	4	0	0	0
" 16 "	5	0	0	0

The Motive Power is given by the travelling wheels, into which a pinion fixed on the end of the cylinder shaft is geared, giving revolving motion to the cutters; and it will cut either short, long, wet, or dry grass, bents, &c.

The Grass-box is placed in front of the cutters, and by removing it the Machine will cut grass close up to trees, seats, and underneath shrubs, &c. It is eminently adapted for Banks, Slopes, Flats, &c.

The Rollers fixed behind the cutters enable the Machine to cut over the edges of Flower Beds, Borders, Verges, &c., and close to any object.

The Handle of the Machine is self-adjusting, and will suit the height of the person using it at any angle.

The Mowers are of the strongest manufacture, simple in their construction, not liable to get out of order, and require the least repairing of any Machines of their kind extant.

WITH GEARING ON EACH SIDE.

To Cut 18 inches	£	6	10	0
" 20 "	7	0	0	0
" 22 "	7	10	0	0
" 24 "	8	0	0	0

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

Every Machine is Warranted to give entire satisfaction, or may be returned at once unconditionally, without any expense to the Purchaser. Green's Patent Lawn Mowers have proved to be the best, and have carried off every Prize that has been given in all cases of competition.

Our reason for bringing out the "Royal" Mower is to meet a want which has been repeatedly expressed by the purchasing public to have a good, useful, and efficient Machine CHEAP.

Green's Lawn Mowers are the only Machines used by the Royal Horticultural Society, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as AN EFFICIENT STAFF OF WORKMEN IS KEPT AT BOTH PLACES.

A Stock of 500 Mowers, including all sizes, is kept at our London Establishment, from which Purchasers can make their selection, and have prompt delivery.

SPECIAL NOTICE.

GREEN'S PATENT LAWN MOWERS possess (over those of all other makers) the advantage of self-sharpening: the cutters, being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again; and by bringing the bottom edge of the cutters against the bottom blade, the Machines will cut equal to new ones. Arrangements have been made so that the cylinder can be reversed by any inexperienced person in two or three minutes.

When Green's Lawn Mowers are used there is no ridgy or wave-like appearance left on the sward, but they leave the lawn with a smooth, even, and carpet-like surface, which is pleasing and delightful to the eye of the observer.

THEY CAN BE HAD FROM ALL RESPECTABLE IRONMONGERS AND SEEDSMEN IN THE UNITED KINGDOM; OR FROM
THOMAS GREEN & SON, Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London, S.E.
ILLUSTRATED PRICE LIST FREE ON APPLICATION.

JOHN LAING'S ANNUAL CATALOGUE is replete with all the Novelties of this Season in STOVE and GREENHOUSE PLANTS, FLORISTS' FLOWERS, FOLIAGE, VINES, &c., and will be forwarded, post free, to intending purchasers.

PART I. contains New Antirrhinums, Chrysanthemums, Coleus, Dahlias, Fuchsias, Gloxinias, Pansies, Pentstemons, Petunias, Pelargoniums (Golden Bronze, Golden Tricolor, Double and Zonal), Phloxes, Roses, and choice Stove and Greenhouse Plants (pp. 1 to 12).

PART II. comprises General Collections of Florists' Flowers, Pansies (Show and Fancy), Bedding Pansies, Bedding Gladioli, Hollyhocks, Gladioli (Show and Fancy), Pelargoniums (Show, French, Fancy, Golden Bronze, Golden Tricolor, Ivy-leaved, Zonal, &c.), Fuchsias, Phloxes (Early and Late), Chrysanthemums (Japanica, large-flowering, and Pompon), Cinerarias, Petunias, Verbenas, Pentstemons, Antirrhinums, Caratissos, Picotees, Pinks, Mimulus, Calceolarias, Delphiniums, Pyrethrums, Peonies (Tree and Herbaceous), and Miscellaneous Bedding and Herbaceous Plants (pp. 12 to 43).

PART III. consists of Select Lists of Stove Plants, Stove Climbers, Caladiums, Coleus (Golden), Gloxinias, Palms (Stove and Hardy), Ferns (Stove and Greenhouse, Hardy, Exotic, and British), Greenhouse Plants, Greenhouse Climbers, Azaleas, Camellias, Ericas, Epacris, Clematis, Hardy Climbers and Shrubs, Strawberries, Vines, Figs, and a useful assortment of Requisites for the Garden, Park, and Pleasure-ground (pp. 43 to 62).

Stanstead Park and Rainton Park Nurseries, Forest Hill, London, S.E.

TREE FERNS.

THE LARGEST AND BEST STOCK IN EUROPE.

WILLIAM BULL, F.L.S.,

Respectfully invites the Nobility and Gentry to an inspection of the above; also of his
MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS,
Adapted for the decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

NEW BEDDING AGERATUM

"COUNTRESS OF STAIR."

This variety is without doubt a decided advance upon any other Ageratum yet offered. There is not a shoot but throws up a head of dense blossoms, beginning a few inches from the ground, and only ending when its entire height of 6 or 8 inches is attained, when the whole top of the plant is one mass of fragrant lavender-blue blossoms. It was raised by Mr. Fowler, of Castle Kennedy, where it has been bedded out for five or six years with great success, withstanding, as it does, the heavy rains better than most bedding plants. Being of such compact habit and free-flowering qualities, it cannot fail to recommend itself for flower-garden purposes.

Price 3s. 6d. each, 30s. per dozen. Special price per 100.

B. S. WILLIAMS,
VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

NEW FUCHSIA PROCUMBENS.

T. JACKSON & SON

Have much pleasure in introducing this exceedingly interesting Novelty, which they have purchased from the Gardener of Dr. C. Blackett, Esq., of Thorpe Lea, seeds of which he received from New Zealand. It is of a shrubby trailing habit, producing freely at the axils short erect flowers with orange-yellow tube and violet-black sepals.

Strong Plants 5s. each, free by post 5s. 6d.; extra strong ditto, 10s. 6d. each.

A LARGE REDUCTION BY THE DOZEN OR HUNDRED.

N.B. A Plant of the above has been by us presented to the Royal Botanic Garden, Kew, where it may be seen in flower bearing the name of F. procumbens.

NEW DOUBLE PETUNIA "MRS. WILSON."

The above is a fine Double Crimson variety, striped and edged with white, very fine and distinct. It received three First-class Certificates last year.

Good Plants, now ready, 3s. 6d. each, post free 3s. 9d.

A LARGE REDUCTION BY THE DOZEN OR HUNDRED.

T. JACKSON AND SON, THE NURSERIES, KINGSTON, SURREY.

Carters

THE FINEST COLEUS EVER INTRODUCED.

NEW COLEUS,
"DUCHESS OF EDINBURGH."

AWARDED FIRST-CLASS CERTIFICATES—

Royal Horticultural Society, June 17, 1874; Royal Botanic Society, June 20, 1874.

The foliage of this distinct and beautiful variety has margins of purple and creamy yellow, with a centre of bright crimson-magenta, forming a superb contrast to the green-leaved section of Coleus, by reason of its dazzling brilliancy of colour. Professor Tutin, in the *American Agriculturist* says:—"It is the most beautiful foliage plant that has ever been exhibited."

Price 3s. 6d. each. Extra Strong Plants 5s. each. Post Free 6d. extra.

See *Carters' Illustrated Plant Catalogue with beautifully coloured Engraving of above. Price 6d., Post Free, Gratis to Customers.*

CARTER'S (The Queen's Seedsmen), 237 and 238, HIGH HOLBORN, LONDON, W.C.

At 9s. to 12s. per dozen; or, 70s. to 80s. per 100.

Roses by the dozen, 100, or 1000. Many thousands to select from.

Splendid Plants. Inspection invited.

WM. WOOD & SON,
WOODLANDS NURSERY, MARESFIELD,
NEAR UCKFIELD, SUSSEX.

ODONTOGLOSSUM ALEXANDRÆ.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 13, at half-past 12 o'clock precisely, 300 good plants of ODONTOGLOSSUM ALEXANDRÆ. These have been recently imported, many of them breaking freely, and are in the best possible condition.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

ESTABLISHED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 13, at half-past 12 o'clock precisely, a small Collection of ESTABLISHED ORCHIDS, including some fine specimens of PHALÆNOPSIS SCHILLERIANA, ODONTOGLOSSUM VEXILLARIUM, ODONTOGLOSSUM ROEZLI, CATTLEYA DOWIANA, EPIDENDRUM VITELLINUM MAJUS, and many other rare kinds. Also a large quantity of DENDROBIUM DEVONIANUM and PLEIONES, imported from India, in excellent condition.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

NEW MASDEVALLIA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 13, at half-past 12 o'clock precisely, a few plants, all breaking strongly, of the magnificent MASDEVALLIA "MACRURA." This is the largest flowered species yet introduced. Individually the flowers are 11 inches long. Colour orange, with red rays. The growth is very strong and robust, very much more so than that of any other species in cultivation. A Drawing of this handsome Masdevallia will be shown at the Sale.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

TRADE NOTICE.

PRIMULA PRINCE ARTHUR.

First-class Certificate Royal Horticultural Society.

First-class Certificate Manchester Botanic Society.

F. PERKINS,

REGENT STREET, LEAMINGTON,

In reply to numerous enquiries, begs to announce that he will SEND OUT SEED OF THIS SPLENDID NOVELTY in Sealed Retail Packets, at 2s. 6d. and 5s. each, on and after the 15th of July next, and orders will be executed in rotation.

F. P. has arranged with Messrs.

WAITE, BURNELL, HUGGINS & CO.,

Seed Merchants, Southwark Street, London,

For the Wholesale Distribution,

who will quote Trade Price on application.

PRINCE ARTHUR PRIMULA

Is described by the Press as "an exquisite carmine-crimson double variety," of pyramidal form and vigorous habit, a profuse bloomer, and admirably adapted for a dinner-table plant. It comes quite true from seed.

MAURICE YOUNG'S NEW DESCRIPTIVE CATALOGUE

Is now ready, and may be had on application.

IT COMPRISES:-

- HARDY JAPANESE and other CONIFERAE. HARDY ORNAMENTAL TREES, SHRUBS, and EVERGREENS. RHODODENDRONS in fine named varieties; PONTICUMS, and other common kinds for covers. ROSES, Standard, Half-standard, and Dwarf, in all the best kinds. FRUIT TREES. CLEMATIS, and other climbing Plants. Cheap EVERGREENS and DECIDUOUS TREES and SHRUBS for Planting Beds and Shrubberies. TRANSPLANTED FOREST TREES. QUICKS, and other Hedge Plants. DWARF EVERGREEN and VARIEGATED PLANTS for Winter Bedding, &c.

DESIGNS, PLANS and ESTIMATES prepared for Laying-out and Planting New Grounds, and for Improving Park Scenery and Existing Shrubberies and Plantations.

MILFORD NURSERIES, near GODALMING.

H. CANNELL begs to draw the attention of the Public to the COLEUS "CHAMELEON," which is unquestionably by far the most attractive and the greatest acquisition in Coleus ever sent out: even the most accurate description conveys but a very inadequate idea of its beauty. The entire Horticultural Press speaks of it in the most eulogistic terms. The following is the report of the Editors of the Gardeners' Chronicle (May 15, 1874):-

"We have received from Mr. Cannell specimens of a new type of Coleus, of great beauty, and very distinct in cultivation. Sometimes the leaf is mainly of an intense purple maroon, flushed with bright rose, giving a kind of shot-crimson hue, the edge being just banded with green. In other cases half the leaf is of this character, while the other half is mostly of a deep rose crimson with golden beaded edge, and sometimes the rose-tint and the maroon-crimson are variously streaked and blended. The flush of rosey crimson appears in the maroon gives a remarkably yellow richness, which must be seen to be appreciated. With this superb and varied colouring the plant may be exceedingly effective."

This variety has received First-class Certificates wherever shown. Post free, 2s. 6d. each. New Florist Flowers and Florist Flower Seed Merchant, Woolwich, S.E.

New and Genuine Seeds (Carriage Free).

10 INCH "CROQUET" 70/-

Important to Market Gardeners and Others. THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separate, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and easy, and fully adapted to the purposes designed. A large number have been sold, and are giving unqualified satisfaction. Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

FOLLOWS & BATE, Makers, Dutton Street Works, MANCHESTER.

ROYAL EXOTIC NURSERY AND WINTER GARDEN, ONSLOW CRESCENT, SOUTH KENSINGTON, S.W.,
NEAR THE ROYAL HORTICULTURAL GARDENS.

NEW PLANTS.

MR. WILLIAM BULL

Intimates that the following New Plants are now being sent out:—

ALOCASIA ROEZII.

A handsome-foliage stove perennial, with the habit of a Caladium, furnished with tuberous root-stocks, and having broad petiole leaves, upwards of a foot in length. The leaf-stalks are terete, greenish, mottled with purple; the blades are sagittate-ovate in outline, acute or shortly acuminate, the two basal lobes being slightly divergent. The colour is a dark bottle-green, variegated with grayish or silvery angular spots and blotches. The foliage is not only effectively marked, but quite dissimilar in appearance to any of the Alocasias at present in cultivation. It was discovered by Mr. Roetz, in the United States of Colombia. 1 guinea.

CATAKIDAZAMIA HOPEI.

A remarkably fine new Cycadacean plant, introduced from Queensland. It has a ovate, rounded, 5-ribbed thick broad-based stem. The leaves are of a dark green colour, somewhat crowded, with a stout petiole and rachis, and very thick leathery rounded leaflets, linear-lanceolate in form, bluish, with an apiculus, slightly recurvo-falcate, and having a broad flattened decurrent base, those situated near the base of the leaf being more or less convergent. It is a distinct and well-marked plant. 5 guineas.

COLOCASIA ARGYRONEURA.

A bold-headed ornamental-leaved stove perennial, with a tuberous root-stock. The leaves are attached to erect, solid, pale green glaucous petioles. The blade is large, bright green, with a marginal vein at the base of the costa and the principal veins pale yellowish or watery green, the lines either inosculating, or continued straight across, nearly to the margin, which is green throughout. A distinct and bold Arid, introduced from Colombia. 10s. 6d.

MARTINEZIA LEUCOPHOREA.

A handsome dwarf Palm, discovered in New Granada by Mr. Roetz, very ornamental and distinct. In young plants the leaves are cuneate at the base, bilobed at the apex, each lobe being obliquely truncate, with the truncate portions unequally crenate-errate, the basal portion entire, and with a few marginal hairs. The petioles and the basal part of the costa behind are furnished with needle-shaped deflexed dark brown spines. As it acquires size the leaves become prettily undulated at the margins. 15s.

PAULLINIA OCEANICA.

A stove plant of slender and much-branched habit, introduced from the South Sea Islands. It has dark-coloured pubescent stems, furnished with scattered lenticles. The leaves are alternate, slender, linear in outline, pinnate, with a brown downy rachis, and rather distant pinnas, which are sometimes simple, small, ovate, inciso-dentate, less than an inch long, sometimes terminate with a larger terminal and two smaller lateral leaflets, all of them inciso-dentate. The leaves are also sometimes equally, sometimes unequally pinnate; and there is a slight wing developed upon the rachis, near the insertion of the upper pinnas. From its light elegant foliage this plant is a charming object for decorative purposes. 1½ guinea.

SABAL CERULESCENS.

This is described by the collector as a remarkably bold and handsome Palm. It has been sent from the United States of Colombia, but is only known here in the young seedling state. These young plants have the leaves of an elongate linear-lanceolate form, with a plicate surface, and a bluish or glaucous tinge of green, which is very strongly marked on the under surface. 15s.

SCHEELEA IMPERIALIS.

A fine Colombian Palm, which in the young state has simple linear-lanceolate, unequal, acute leaves, of a bright green colour, with a plicate surface. In the mature state the leaves are pinnate. The Scheeleas are unnamed Palms of the group Coccolieve, closely related to the genus Attalea. 10s. 6d.

NEW PLANTS.

SATURDAY, MAY 8, 1875.

THE ROYAL ACADEMY.

IT is more than probable that the pleasures of our flower shows are relished with a much keener zest by practical horticulturists than by the ordinary public, because practical growers of flowers know the points to be observed, the difficulties of production, and the successes gained, better than any outsider. Any one who has been over a large nursery knows how the pleasure is enhanced if one is accompanied on his round of the houses by one of the firm. It is the same with pictures and painters: an artist takes a deep interest in the works of all other artists, he glories in well beating inferior men, and he should take it with good grace when he is well beaten by somebody better than himself. The opinion of a man who knows the difficulties of drawing and painting, and has striven and beaten others and been well beaten himself, should always be worth hearing. It is from this point of view that the following notes on some of the natural history and plant pictures in this year's Royal Academy are penned.

Passing by Nos. 7 and 16, "Chilworth Pond," C. Collins, and "A Quiet Spot," W. S. Lloyd—both small, but remarkably clever and natural pictures of a pond with boat and a lane with stick-gatherers—we come to 25, "The Right of Way," F. Walker, A., which is in every way one of the best pictures in the Academy: it is unlaboured and sketchy, but every touch of the brush shows that the artist had definite ideas in view. The picture represents a pasture in spring with a meandering brook and a sheep and lamb disputing with a child the path by the brookside: observe how the folds of the woman's drapery have been studied, the leaden, watery April sky, and the flowers in the meadow. The latter are mere touches of the brush in a small picture, but one sees at a glance that the pasture is dotted all over with Ranunculus Ficaria, and that the plants by the brookside are not the lesser Celandine but the Primrose. 40, "Apples," F. R. Stock, is a remarkably well-painted picture. 56, "Anne Page and Slender," C. W. Cope, R.A.: in this (of course a figure subject) are various flowers, as Tulips, Pink Primula, Camellia, Geranium, a Fern, a Tulip in the flower-bed, &c.; they are not well done, but in the next picture, 57, "Tell Him" C. E. Perugini, are an India-rubber plant and a Polyanthus Narcissus uncommonly well-painted. 63, "Old Neighbours," C. Green, is one of this artist's best pictures, irrespective of the figures: how remarkably well the Crocuses and the denuded branches of the trees as seen in early spring are done.

In 66, "Wild Roses," Miss F. Tiddeman, we have a poorly painted child's portrait with wild Roses in front as unlike wild Roses as possible. 73, "Gainsborough's Lane," E. Edwards, a notable and well executed painting of trees, all the tree stems slanting in a certain direction (so driven by the prevailing wind). 74, "The Fringe of the Moor," J. E. Millais, R.A., a bright picture of moorland, hills, distant heather, cattle, bushy foreground, with wild Roses in fruit, and fencing—a painfully true and staring picture, undoubtedly real, but with the naturalness of photography. 99, "Azaleas," M. A. Langdale, the flowers very poorly painted, but the vase perfect. 103, "Fruit and Still Life," E. Ladell, a picture of Walnuts, Grapes, Currants

Plums, Raspberries, a Peach, and a glass of hock, is in its way perfect—every object is worthy of study: observe the effect of the rich green curtain beside the white Grapes. 105, "Where the Ferns Grow," E. Parton, appears to us monotonous, unless, and dull. 118, "On a Voyage of Discovery," J. L. Pickering, is a well-painted picture of swans in a body of still, weedy, and overgrown water. 119, "Nemo me impune lacessit," J. MacWhirter, a roughly-painted picture of Thistles and Brambles, very bold, and well done, with a very rich general effect throughout, but the leaves of the Thistles are unsatisfactory and without perspective, and the flowers of Campanula rotundifolia are much too dark. It is no easy piece of work either to draw or paint a Thistle well. 123, "On the River Mole," Birket Foster; every one knows this artist's exquisite transcripts of Nature, but this picture, though thoroughly natural, is singularly quiet and flat. Compare it with Walker's rougher work, No. 25. M. Stone's powerfully painted "Sain et saur" (130) should be well noted. 140, "Hopwas Wood: Winter," A. W. May—a picture of snow melting away amongst Birches—impresses us as not being very natural. 147, "Blenheim," John Faed, a very unpleasant subject, with a human skull obtruded in a most ghastly manner in the centre of the picture. 153, "Too Good to be True," W. Q. Orchardson, A. The colour in this delightful picture, in which is an abundance of vegetables and fruits, is a perfect study; omitting all notice of the well-painted figures we would call attention to the rich effect of colour in the Oranges and Lemons, the Carrots, Onions, Apples, Vegetable Marrows, and Broccoli, and how these objects are so disposed in reference to each other as to produce the happiest effect of colour. 155, "Charles Darwin, Esq., F.R.S.," W. W. Ouless. We think the friends of Mr. Darwin will consider this a most successful portrait of their leader, it is eminently natural and well-painted: the light and shade is thoroughly worthy of study.

In 159, "Evening," Birket Foster, we have a lovely picture of the country, with figures and a purple evening sky, but, like 123, it is dull; in both pictures Mr. Foster introduces the white dead Nettle, Lamium album, in the foreground. 166, "The Jolly Post-Boys," H. S. Marks, A. This figure subject, from its perfect drawing and colour, is one of the most notable in the exhibition. Without describing the subject, we will refer to the colour and background of flowers. The three post-boys who are sitting at the table are dressed in bright blue; now to produce rich and harmonious colouring orange must be freely introduced: see how the artist has done this by painting a good background of Sunflowers in full bloom; observe also the effect of colour in the glass of ale upon the table, and the yellowish pan on the right of the picture, and the red handkerchief and the waxed ends of the pipes, all trifles light as air in themselves, but how reverse of "jolly" the post-boys would be without all or any of them. This picture also includes some well-painted double Poppies. 169, "The Little Epicure," H. H. Coudery—kitten and fish, green leaves and a lobster—deserves special mention on account of its exact reproduction of Nature; nothing could be better than the group of fish. 170, "Nature and Art," J. Medland. The small vase which represents "Art" is well done, but "Nature," in the shape of Roses, Pansies, &c., in this picture, is very poor; it is much easier to paint a pot (however elaborate) than a flower, because the former is always the same, whilst the latter is ever changing in aspect. 182, "A Path of Roses," G. H. Boughton. This is an excellent figure subject, but of the Rose bushes which are introduced the less said the better, a rosarian would look on such

Roses with strong aversion; the other plants in this picture (though large) represent nothing in particular. 185, "A Lady and her Daughters," S. Sidley: one daughter is furnished with a pair of gardening scissors; the effect of the flowers in this picture is good, bold, and life-like: the same, however, cannot be said for either 189, "Flower Girl," G. E. Hicks, or 195, "The Daughters of the Hon. James Bain," D. Macnee. In 191, "The Early Post," J. Sant, R.A. (a portrait group), are Azaleas and Crocuses, but they are not well done. 196, "School Revisited," G. D. Leslie, A. This is an excellent figure subject, thoroughly well-drawn and painted, but the Honeysuckle and white Roses on the walls are very poor; observe, however, the happy effect of colour in the bunch of Roses on the green seat. 199, "Convent Life," Mrs. S. Anderson, a picture of an interior of a conventual establishment, with a laughing country girl presenting a wreath of Orange blossoms for copying to an old abess who is naturally and preferably engaged on the embroidery of a pattern of terrible dragons. The wreath of flowers is particularly well painted, as is the languishing young girl in the rear. 203, a picture by F. R. Pickersgill, R.A., illustrative of some lines by Tennyson, includes a large life-sized plant of *Lilium longiflorum*, with an Orange behind, remarkably well done.

"The Crown of Love," 214, J. E. Millais, R.A., a picture notable for its perfect drawing and rich bold colour. The original idea for this painting was published by Messrs. Bradbury & Evans in *Once a Week*, December 31, 1859, p. 10. 227, "Miss Evelyn Tennant," J. E. Millais, R.A. There is no other picture in the exhibition possessing such bold and startling colour as this, indeed very few painters would venture on such tints. Notice the effect of the black hat and the deep crimson dress with a black belt, the blue necklace, and the black velvet zone round the lady's neck appearing to cut her head clean off; the Oak leaves and the Ivy and Ferns in the basket are all well painted. 232, "H.M. Ship *Devastation*," E. W. Cooke, R.A., is a picture well worthy of study for excellent sky and sea; the latter is perfect as a study of water, bold and dashing, yet all the details of waves and wavelets worked up with the most truthful delicacy. 233, "The Festival," E. J. Poynter, A. This is a decorative painting, purposely kept low in tone, and containing a number of Roses, but neither well-drawn nor painted. Observe the happy effect of the orange and lemon-coloured band at the right hand of figure. 234, "The Children of Robert Barclay, Esq.," C. Bauerlé. In this Buttercups, Daisies, and Blue Bells are introduced, but they are all very queer to the botanical eye. 246, "Reposing on God's Acre," T. S. Cooper, R.A., a churchyard subject, with a capially-painted Yew tree, but the spades and pickaxe in the foreground are disproportionately small. 250, "Les Coquettes, Arles," P. H. Calderon, R.A., a figure subject remarkable for its rich and harmonious colour. Observe the studied and fine effect of lemon, white, and black in the central figure, and the effect of the long, straight line of the scissors string. 256, "Wise Saws," J. C. Hook, R.A., is also notable for intensely rich colour. How true is the dark rich green of the river-side pastures, and how bold and striking the effect of the black raven on the white reflection in the water. 262, "No!" Millais. Remarkable for its rich colour. 265, A ruinous garden landscape, by Millais, illustrative of a few graceful lines by Campbell. 277, "Deserted," J. L. Pickering, is worthy of a notice in passing to 281, "Spring," S. Sidley, a group of pretty children with Primroses and Bluebells—Bluebells and young unfolding Ferns conspicuously figure in the distant early spring landscape.

(To be continued.)

New Garden Plants.

PHALANOPSIS CASTA, Rehb. f.*

Take leaves of a thinly spotted *P. Schilleriana*, the spots finally disappearing in the oldest leaf, a flower-spike of *P. amabilis*, with the lip having the characteristic callus, and have the bases of the upper sepals and petals tinged with purple. This would be our plant; quite distinct from any *P. Veitchiana*, *leucorrhoda*, or *intermedia*, by its callus. I believe it is a natural male; but if somebody should tell us it was a variety of *P. amabilis* with wrong roots, spotted

To my taste, this plant bearing the splendid white of *amabilis*, with a little tint of blushing purple, is quite unrivalled in its chaste beauty. And we know only of two existing specimens, about which I will give prudently chronological statements. I saw this plant March 26 at Mr. Low's, and March 28 at Mr. Bull's; and I said farewell to the first-named specimen on April 8. Both plants are decidedly the same, though the roots of Mr. Bull's plant are a little rounder. H. G. Rehb. f.

MASDEVALLIA HETEROPTERA, Rehb. f.*

This is a most remarkable new type, and a very pretty

FIG. 121.—*FREESIA LEICHTLINII*.

Section of flower and ovary twice real size; the two spatheaceous bracts of flower four times real size.

leaves, and purplish paint on the flower, we could, indeed, not gainsay him by proofs. There can be no doubt that the days will come when there will be much more horticulture in the Orchid trade than now-a-days—viz., when the few remaining showy Orchids in Europe will be used for getting seedlings of the species, not only for obtaining new hybrids, as is now done at a very few places; then we — or those who come after us — will get much better views about constancy of character than we can possibly have now-a-days.

* *Phalanopsis casta*, Rehb. f. — Radicibus rotundatis paulo acutiusculis, raro asperis; foliis *P. Schilleriana*, floribus *P. amabilis*, Lindl.; callo ejusdem; sepalis summo at tepalis basi purpureis; sepalis lateralibus basi punctatis. — *P. Aphrodite-Schilleriana*.

little thing, though by no means a grandiose plant. The chief feature is that the flower is totally open, and the upper sepal totally different from the lateral ones. The upper sepal is oblong, with a strong middle keel outside, yellow, with numerous blackish purple transverse narrow bars. It is extended in a yellow tail that is very different in length, shorter than the body in the

* *Masdevallia heteroptera*, Rehb. f. — Pedunculo unifloro; flore omnino aperto; sepalis superiori oblongo ciliato in caudam breviorum seu aequalium teretium attenuato; sepalis inferioribus basin usque fissis ligulatis apice in caudam teretem attenuatis; lamina retorsum tubuloso-convolutis, muriculato-asperis; tepalis cuneato-rhombicis apice obtuse bilobis, angulo superiori gibberoso; labello optime mobili, a basi oblongo subito angustato, ligulato, obtuse acuto; carinis geminis angulatis in parte anteriori, limbo antico minute crenulato; columna trigona apice acuta. — New Granada.

fresh flower I saw, equal to it in some dry specimens. The lateral sepals are much narrower, blackish purple, revolute, into a tube 1 with yellow tints of different lengths. The small petals are white, with purplish dots. The lip is blackish purple. The column is yellow, with dark spots. The upper sepal is minutely ciliate on its borders. The lateral ones are totally covered with small, distant hairs.

I have to thank for the inspection of this little gem the Rev. J. B. Norman, Whitechurch Rectory, Edgware, London, who kindly informed me that the plant grows in a dense tuft, has 14-flowered flower-stalks, and certain oblong leaves. When I saw the little neophyte I knew I had seen it before, though not published. And so it is. I find flowers of it, gathered in the environs of Medellin by Mr. Patin, the young Belgian traveller; and Mr. Normau's plant, too, may be of Patinian origin. I have with the flowers a dried plant with stalks bearing four flowers, all fallen off. Yet the bracts look different. It is much to be regretted that such assiduous travellers as Mr. Patin and Messrs. Klaboch, the modern Czechian discoverers, never take care to separate, by placing in a separate cover, what belongs to each species. I once put many such specimens, just forming one mass, in the *Rebh. f.* to avoid the most ridiculous confusion. H. G. *Rebh. f.*

AERIDES VANDARUM, *Rebh. f. (Gard. Chron. 1867, p. 997).*

I lately obtained a beautiful specimen of this rare plant from Mr. Edwin G. Wrigley, Broadwalks, Bury, Lancashire. It is the *Aerides cylindricum* of *Bot. Mag.* 1857, t. 4982, and it was well figured in the *Gardeners' Chronicle* (No. 69, p. 537). The true *A. cylindricum*, Lindl., may be seen in Wight's *Icones*, v. 1744. It has a totally different lip, with short side lacinia, a blunt ridged middle lacinia, a short spur, and shorter leaves. I felt much pleased when I saw that Mr. Deanning shared my feelings; he alluded to its being like *Rebh. f.*; I named it "*Vandarium*."

There is no doubt that the Editors of the *Gardeners' Chronicle* have made a grand progress in making the *Gardeners' Chronicle* a store of good representations of plants taken from fresh specimens. I may, however, be forgiven for wishing that only such things may be illustrated which have not been represented well before. This plant has already been so well figured in the *Botanical Magazine*, that its very good representation is totally superfluous. There are so many thousands of plants waiting with ambitious impatience for a good representation, that it is a misfortune to see these passed over in order to introduce once more an old acquaintance to our notice. H. G. *Rebh. f.*

ORANGE BLOSSOMS.

ALTHOUGH Orange blossom has, for an indefinite time in this country, been highly prized for its fragrance, still by many the Citrus family have hitherto been grown more as decorative plants for their fruit than their flowers; but of late years, with these as with flowers in general for cutting, the demand has been greatly on the increase. Time was when Orange blossom was simply associated with a bridal wreath or bouquet, but now, even in some private establishments, it is in general request. In bygone years the Orange, as a decorative plant, held the highest place, as is evident by the first efforts in the erection of plant structures in this country, with any pretensions to a decorative character, being principally confined to the orangery; these places, as is well known, being more of a protective nature for winter, than for the growth of the plants.

The Orange, under artificial cultivation in glass structures, when making its growth enjoys a moderate amount of shade from the direct rays of the sun, nevertheless, as may be supposed from the countries where it succeeds altogether in the open air, it is a light-loving plant. Neither, by any means, are the Citrus family difficult subjects to grow, rather, it may be said, they are, as compared with many things we cultivate, difficult to kill—to this may be attributed the indifferent condition in which they are often met with. For it is a common occurrence to see plants that have had a good deal of bad treatment subjected to so much of it as to prevent the possibility of their succeeding well. As to soil, good fibrous loam, such as Camellias will grow in, does well for the Orange, or it will succeed in peat, or a mixture of peat and loam; the foliage is more ample and of a darker hue in peat, but the disposition to flower not quite so great.

In preparing the soil for Oranges—as for all other plants of an evergreen character which, from the amount of leaf-surface they possess, evaporate a good deal, and require a correspondingly large quantity of water—it is necessary to mix a liberal amount of manure with the soil, which it sufficiently opens and porous, after the fibrous matter contained in it has become quite decomposed; want of attention in this respect frequently causes the trees to get into

a bad condition. Healthy roots in quantity are the first essentials, the next thing of importance is, after the plants have flowered, to treat them so as to induce a good free growth; without this it is useless to expect anything approaching a satisfactory crop of flowers. When Orange trees get in bad condition at the roots it is almost impossible to bring them round without a good bottom-heat, and plants that are in a healthy condition usually enjoy it, although these will do without it if kept in a genial temperature, with a moderately moist atmosphere. The plants should have, whilst making their growth, enough air to keep them stout and strong; any deficiency in this matter will not be made up for by giving an unlimited quantity, with a drier atmosphere, after they have formed the wood, although they require this in plenty to ripen it and induce a disposition to flower freely.

After the season's growth is complete, the plants may be placed in a cool house, so as to keep them back until the time they are required to flower. One essential in their cultivation is to keep them clear of insects. They are much subject to scale, especially the brown species. If this insect is allowed to increase upon them to a considerable extent they cannot do well, for not only does it live upon the vital juices of the plants, but the coating of dirt it deposits upon the leaves and bark clogs up the pores, preventing them from performing their wonted functions. The continued use of the sponge and syringing with Fowler's insecticide, at 4 oz. to the gallon, will, if persevered in, free them. The leaves of the Citrus tribe cannot bear so strong an application of any insecticide as some plants, and the above strength will not kill the large insects, but such as are young it will, and thus, if the dressing is repeated often enough, the pest can be got rid of. Large trees with this, as with other things, produce the greatest quantity of flowers; but for keeping up a supply smaller plants are preferable, as they can be brought on in succession, and do not occupy so much room. Messrs. J. Standish & Co., the Royal Nurseries, Acton, who grow large quantities for their London trade, use comparatively small plants, placing some in heat every fortnight through the winter and spring, to keep up a supply. The variety they use is one extensively grown about Paris; its name I have not been able to ascertain, but it is a much more profuse flowerer than the common sort usually met with in gardens. T. Baines.

FREESIA LEICHTLINII.*

THIS is a beautiful and sweetly-scented bulbous plant (fig. 121), native of the Cape of Good Hope, with a fibrous-coated bulb, crowded linear lanceolate glabrous leaves, sheathing at the base, and a central, somewhat angular spathe, bearing a one-sided curved spike. The flowers are funnel-shaped, white when they first open, buff-coloured subsequently. The full description is given by Klatt, the monographer of the Iridaceæ, in the *Gartenflora*. The plant was exhibited at the last meeting of the Royal Botanic Society, by the New Plant and Bulb Company, of Colchester, who have forwarded us the following particulars concerning it:—

"It is of very easy culture, potted in a mixture of two-thirds peat and one-third loam, with plenty of coarse sand. Our plants in pots were potted in October, and stood out-of-doors, with the protection of a hand-light, till the end of November. They were then removed to a cool house, where they have been flowering most profusely for the past month. The flowers, which are of great substance, are on their first opening quite white, with the two lower petals marked with orange streaks. After a few days they assume a primrose tint, and the orange markings become deeper in colour. They emit a very grateful perfume, which pervades the whole house—the opinion of some like that of the Primrose and Auricula, but to our minds most like that of the Tea Rose. Our plant, which was exhibited at the Royal Botanic Society's show on Wednesday last, and obtained a Botanical Certificate of Merit, was composed of three bulbs. These bulbs have spikes of buds in the open air during the winter, which are now just appearing above ground, from which we expect to gather bloom in June or July. We are of opinion that it will prove to be perfectly hardy."

THE CLIMATE FOR DORYPHORA.

I AM personally acquainted with the Colorado Potato beetle, and I think he has been a little misrepresented. The *Tribune* expresses the idea that the insect would rather enjoy the temperate climate of England, and also that excessive heat is prejudicial to it. Now, on the latter point you are certainly mistaken, for when the weather is rather cool their eggs mature very slowly; they do not hatch in so many days, like hens' eggs, but remain without any perceptible change for weeks, and the old bug is as

* *Freesia Leichtlinii*, Klatt, in *Gartenflora*, 1874, tab. 803 = *Sparaxis Thouberti*, Hort.

dumppish as a hedgehog. But when the weather is very hot—and the hotter the better for them—the eggs will hatch in a few days, and the old ones are as busy as bees from morning till night, and when the thermometer tells 95° to 100° in the shade we frequently see them flying, which they seldom, if ever, do in cold weather. Among Potatoes planted adjoining a timber lot, where it is shaded a part of the day, they will not lay their eggs. This I have seen rapidly hatch them. D. L. Garver, *Oceana Co., Mich.*

COMMENTS BY PROFESSOR C. V. RILEY.—All insects breed and develop most rapidly during the hotter seasons of the year. But rapidity of development is not necessarily a sign of health and well-doing; and a pretty extensive experience with *Doryphora* has convinced me that it will enjoy the comparatively temperate climate of Southern England, and that, indeed, it will thrive in any part of the world where the Potato thrives. The native home of the insect is sub-alpine rather than tropical, and it has proved more injurious in the more Northern than in the more Southern States, and while it thrives best during a warm, dry summer, extreme dryness, or dryness, or moisture, or excessive heat, or excessive drouth, when combined with drouth, causes the death of the pupa in the ground; excessive dryness causes the eggs to dry up—an occurrence so constant 8000 feet above the sea level that Potatoes are not affected by the insect above that level in the Rocky Mountains; excessive moisture drowns and rots the insect in all stages. It is argued by others that on the continent of Europe our *Doryphora* would not thrive if introduced, and, in a recent letter, received from Mr. Oswald de Kerchove, of Ghent, Belgium, author of an interesting pamphlet on the insect, that gentleman says, "I do not think that the *Doryphora*, awakened by our early warm weather, could resist the effects of the late cold which we are apt to have in these European countries."

"The idea that the climate of North America is less extreme than that of Europe is rather novel to us of the Cisatlantic, and from a sufficiently long residence in England, France, and Germany, I am decidedly of opinion that they delude themselves who suppose that *Doryphora* could not thrive in the greater part of Europe, and that to abandon all precautionary measures against its introduction on such grounds would be the height of folly. An insect which has spread from the high tableland of the Rocky Mountains across the Mississippi Valley to the Atlantic, and that flourishes alike in the States of Minnesota, Wisconsin, and Connecticut, and in Maryland, Virginia, and Texas—in fact, wherever the Potato succeeds—will not likely be discomfited in the Potato growing districts of Europe. Some few, again, have ridiculed the very idea of the insect's passage to Europe in any state, arguing that it is an impossibility for any coleopterous insect to be thus transferred from one country to another. Considering that half the weeds of American agriculture, and a large proportion of her worst insect pests, in gaining two beetles, viz., the Asparagus beetle (*Crioceris asparagi*), and the Elm-leaf beetle (*Galeruca californiensis*), in the very same family as our *Doryphora*, have been imported among us from Europe, there would seem poor foundation for such argument. Moreover, a number of other insects, among them some beetles, of less importance, may be included in the number of importations, and the Rape butterfly (*Pieris rapæ*), whose progress westward has been simultaneous with the *Doryphora's* eastward, and whose importation dates back but a few years, bears witness to the fact that insects more delicate, and with fewer chances of safe transport, than *Doryphora*, may succeed in getting alive from one country to the other, and in gaining a foothold in the new home. *New York Tribune*.

ROCKWORK FOR ALL SEASONS.

DURING the last half year I have been trying much such a plan for a small rockery for succession of plants as Mr. Wilson (at p. 563) requests experiences of; and though my own is intended more for common garden favourites than for choice and delicate plants, it is possible he may like a note. The position is a border in front of a wall facing south, and I have endeavoured to give in the arrangement the suggestion of a low rocky bank with the plants appearing in it as they would group naturally.

The only materials at hand for the solid part were the masses of injured brick known near London as "burs," which seem singularly well suited for this kind of work, the porous texture taking down air and water in turn into the substance of the bank in a way which suits the plants admirably, and, picturesquely considered, the dark purple, or yellow ochreous masses, and the varied shapes, can be grouped artistically so as to contrast with the vegetable forms and colours, and to suggest (even in the small scale of a

thing of this sort) the lines of geological formation, rather than a row of lumps set down side by side to keep the plants together. The plan of forming "pockets," as Mr. Wilson so aptly terms them, seems exactly to suit the plants, the little cliffs rising just a few inches above them, sheltering the growing leaves and keeping a damp atmosphere round; and beneath, for their roots, I have placed a thoroughly good supply of garden mould and partially decayed leaf-mould, and here and there (in places where the roots might presently find it, or at present benefit by the water washed through it) a supply of ordinary farmyard manure.

In forming the rockwork, I began at one end, placing some earth and burrs, and then (taking whatever seemed suitable) planted it with the greatest care where it might show picturesquely, as if in its natural habitat; and when this was satisfactorily arranged went on with burrs, earth, and plants alternately, building up the rockwork and its inhabitants together, and so insuring (by the section being exposed) that all beneath each plant was as wished. For picturesque effect I endeavoured to arrange the brick masses so that, besides the cavities, there should be little lines like

health. Meanwhile, though the few yards of rockwork have nothing to boast in the way of rare flowers, it answers the purpose fairly of a pleasantly grouped mass, with some point of constantly renewed interest and varied colour to catch the eye on its passage to the more general grouping of the garden. *O.*

THE BIRTHPLACE OF THE DUKE OF WELLINGTON.

THE remains of DANGAN CASTLE (fig. 122) stand in the centre of what was some three-quarters of a century ago a richly-wooded park, the undulating surface of which gives evidence of its former beauty. It consists of the ruins of a modern mansion, incorporating the old tower of Dangan, which has lost much of its original character in consequence. All are now totally ruined, and this, combined with the denuded surrounding demesne, are sad mementos of the decadence of Ireland. Yet here was born, on May 1, 1769—when the Castle of Dangan was in its palmy

characteristic of the little lonely oceanic spot previous to man's first visit there.

"This most wonderfully curious little flora, which has been aptly termed "a fragment from the wreck of an ancient world," was made a prominent subject in a very able and highly interesting lecture upon Insular Floras, delivered before the British Association for the Advancement of Science at Nottingham in 1866. In that lecture Dr. Hooker, in reference to St. Helena, with its indigenous flora, says, "When discovered about 350 years ago it was entirely covered with forests, the trees drooping over the tremendous precipices that overhang the sea. Now all is changed, fully five-sixths of the island are utterly barren, and by far the greater part of the vegetation that exists, whether herbs, shrubs, or trees, consists of introduced European, American, African, and Australian plants. The indigenous flora is almost confined to a few patches towards the summit of Diana's Peak, the central ridge, 2700 feet above the sea."

The destruction of the Madeira forests, you will remember, was by fire. A much more insidious agency has operated with tenfold greater effect in St. Helena, viz., goats. These were introduced in 1513,

FIG. 122.—DANGAN CASTLE, CO. MEATH, BIRTHPLACE OF THE LATE DUKE OF WELLINGTON.

miniature terraces, down which the plants should run as on rock ledges to the grass beneath, and in this way the common white *Arabis* makes a beautiful show, running, as it were, in little white streams, till it spreads itself in a little snowy lake below. The purple *Aubrietia* just now looks very pretty as a cap on the burr, with lines of *Forget-me-not*; and *Foxgloves*, which I moved as large plants in the autumn, have thriven perfectly (their delight in water making them of easy management), and are now throwing up strong flowering stems in the background. The single blue *Hepatica* also thrives better in a "pocket," with plenty of vegetable mould, than I have ever seen it elsewhere, even in the cottage gardens of the West of England, where it grows in great luxuriance; and such other matters as the little *Cheddar Pink*, the *Erica carnea*, some of the *Saxifragas*, and other favourites, all prosper.

The *Clematis montana* also promises well to mask the wall at the back, and for present succession where room was left I have put a few annuals. As summer advances, if the various rooted inhabitants do not give sufficient brilliancy, a few greenhouse plants, in or out of their pots, in the upper pockets would bring as much colour as is wanted; and plentiful watering, which the bricks absorb and gradually impart during the heat of the day, keeps the plants in excellent

days, "bosomed high in tufted trees," with its terraced gardens and broad lakes and wide encircling park—the great Duke of Wellington, whose grandfather, Richard Colley, succeeding to the possession of the Castle and estate in the year 1728, by bequest from his cousin Ganet Wellesley, took the name of Wellesley, and was created, in 1746, Baron Mornington.

Dangan Castle was sold by the Marquis Wellesley to Colonel Burrowes, by whom it was sublet to a Mr. Roger O'Connor, during whose tenancy it was destroyed by a fire supposed to have been not altogether accidental. It stands about two miles from Summerhill, Co. Meath.

ST. HELENA.

A MOST interesting subject for investigation is afforded by the botany of the island of St. Helena. The plants growing there at the present time number about 1048; for the presence of the larger portion of these it is not difficult to account, they having followed through a period of 372 years in the track of man and civilisation; but a most interesting question as to their origin is dictated by the remaining seventy-seven species which form a remnant of that flora

and multiplied so rapidly that in 1583 Captain Cavendish states that they existed in thousands, single flocks being almost a mile long.

In 1709 trees still abounded, and one, the native *Ebony*, in such quantities that it was used to burn lime with. At this time, however, the Governor of the island reported to the Court of Directors of the East India Company that the timber was rapidly disappearing, and that the goats should be destroyed for the preservation of the *Ebony* wood, and because the island was suffering from droughts. He received the laconic reply, "The goats are not to be destroyed, being more valuable than *Ebony*."

Another century elapsed, and in 1810 another Governor reports the total destruction of the great forests by the goats, which greedily devoured the young plants and killed the old by browsing on their leaves and bark, and that fuel was scarce. Still even then so great was the amount of seed annually shed, so rich the soil and so rapid the growth of native plants, that the Governor goes on to say that if the goats were killed and the island left to itself, it would in twenty years be again covered with indigenous vegetation.

About this time the goats were killed, but another enemy to the indigenous vegetation was at the same time introduced, and which has now rendered it in all probability impossible that the native plants will ever

again resume their sway. Major-General Beaton, then Governor, an active and sagacious officer, proposed and carried out the introduction of exotic plants on a large scale, and from all parts of the world. These have propagated themselves with such rapidity, and grown with such vigour, that the native plants cannot compete with them.

The struggle for existence had no sooner begun than the issue was pronounced; English Broom, Brambles, Willow, and Poplars, Scotch Pines and Gorse bushes, Cape of Good Hope bushes, Australian trees, and American weeds, speedily overran the place, and wherever established they have actually extinguished the indigenous flora, which, as we have said before, is now almost confined to the crest of the central ridge.

Napoleon I. died on the evening of May 5, 1821, at Longwood Old House, and he was interred in a pretty green verdure-clad valley below Hut's Gate, somewhat more than a mile from his residence. It is said that when alive he frequently resorted to this secluded spot, and from a clear little spring of water

admirable monograph lately published by Reeve & Co., of Covent Garden. This work, entitled *St. Helena*, gives a full and complete physical, historical, and topographical description of the island, and is, moreover, well illustrated by Mrs. Melliss, the wife of the accomplished engineer, John Charles Melliss, the author of the volume.

The accompanying sketch was made on the spot by Captain S. P. Oliver, Royal Artillery.

PLANT GOSSIP.

In describing a superb portrait of the TEA ROSE, CATHERINE MERMET, given in a recent number of the *Florist and Pomologist*, Mr. Postans remarks that—

"In a recent election of Roses, Catherine Mermet was placed by a large majority of electors amongst the best twelve Roses known; and that it is one of the very finest varieties we have there can be no sort of doubt. Probably, if all the good qualities it possesses are taken

Tea section. Madame Bérard may be shortly described as an improved Glorie de Dijon, which is not saying a little in her favour. Madame Camille is sometimes extremely fine, but it is a somewhat uncertain variety; if it could be always depended on, it would run Catherine Mermet very close. Perhaps one of the most distinct new Tea Roses we have had for some time is Madame F. Janin, a small Rose indeed, but most beautiful; in colour it is deep orange-yellow, inclined to coppery; in habit it is robust and healthy, and it is most floriferous; as a button-hole Rose it is *facile princeps*."

— The inspection of a fine series of varieties of EARLY-FLOWERING RHODOENDRONS, from the garden of the Hon. and Rev. J. T. Boscaam, is extremely suggestive of the desirability of growing these fine sorts for our spring exhibitions, since they may be had in splendid bloom by merely placing them under glass, instead of needing the forcing which is necessary in the case of later kinds. They furnish, too, the most gorgeous tints of colour to be found in the whole family, and as such are magnificent objects for the decoration of cool conservatories, requiring

FIG. 123.—VALE OF THE TOMB, ST. HELENA.

which bubbled up through the moss-covered bank had the water for his own use carried up to Longwood, and that in accordance with his own expressed wish it was selected for his grave. On October 15, 1840, the late Emperor's body was exhumed, taken from the peaceful little "Vale of the Tomb," of which a view is given (fig. 123), and, amidst military funeral honours, placed on board *La Belle Poule* frigate, and carried to France.

The tomb where his body rested is, together with the little spring of clear water, carefully railed round and guarded, so that no ruthless hand now, as formerly, hacks and chops away the remains of two old Willow trees, which still hang over the tomb itself. These trees, although descended from, are not the original Willows; and it is commonly rumoured that more than one or two generations have been carried away piecemeal by visitors as relics. For more information about St. Helena, with its shady lanes lined on each side with bright yellow blossoms of Gorse, brilliant scarlet Pelargoniums, and the deeper tints of the Fuchsia mixing with the bluer foliage and orange blossoms of the Buddleia, its rich meadows, sunny hayfields, and bounded with bare, precipitous volcanic cliffs, we must refer our readers to the

into consideration, it will be acknowledged to be the best of all the Teas. It is large, of the finest form, constant, and floriferous. As a pot plant it is a good healthy grower, and makes sufficiently strong though not large wood. Probably it would be a more robust grower in the open, budded on the Briar, which suits most Teas better than any other stock. Though the blooms vary more or less in depth of colour, the prevailing tint is flesh-coloured rose, with a dash of yellowish buff. On the whole, Catherine Mermet is, as the catalogues say, a "superb" Rose, and ought to be in the most choice collection. There have been several fine additions to the Tea-scented section within the last two or three years. The cream of these are probably comprised in the following:—Amazon, Anna Olivier, Catherine Mermet, Chestnut Hybrid, Duchess of Edinburgh, Madame Bérard, Madame Camille, and Madame F. Janin. Amazon does not seem to be much known, but it is a good and distinct flower, with a long pointed bud, which opens well, and is fine, bright, clear yellow in colour; it is a good healthy grower as a pot Rose, and flowers freely. Anna Olivier is a first-rate flower, of good size; the petals are creamy white, their base deep rose; it is most distinct and pleasing, and is a healthy grower. Chestnut Hybrid and Duchess of Edinburgh are dark red Teas; the first has the better form, the Duchess is rather brighter in colour, but both are good and valuable additions to the

simply the protection of a glass roof in order to secure the most perfect development of their flowers, and which, produced under such circumstances, are much more durable than when exposed to the vicissitudes of our climate.

— The names of the common Milkwort, POLYGALA VULGARIS, as given in the old herbalists, are good examples of the class which sprung from some connection of a plant with a religious ceremony. These names—Crosswort, Gangflower, Procession-flower, and Rogation-flower, as well as the old Latin title, *Ambarnalis flos*—were bestowed upon it, as Gerard tells us, "because it doth specially flourish in the Grosse or Gangweeke, or Rogation weeke; of which flowers, the maidens which use in the countries to walk the procession, do make themselves garlands and nosegays." The Rogation days still hold their place in the prayer-book as the three days preceding "Holy Thursday," or Ascension day, which we have just passed; but the religious processions with which they used to be accompanied do not now exist, except, perhaps, in the form of "heating the bounds," a ceremony which in many places takes place on the last-named day. It would appear that in

old times the streets through which the procession passed were ornamented for the occasion. Gerarde speaks of the branches of Birch being employed in "beautifying the streets in the Crosse or Gange-wecke." Cole is inclined to believe that the Wood-sorrel received its name of Alleluia because it was met with by the people whilst taking part in the Easter processions; although Gerarde's explanation, that it blossoms at the time "when Alleluia is wont to be sung in churches," is probably the correct one.

— A recent number of the *Revue Horticole* contains a figure and description of an AGAVE AMERICANA which flowered at the age of fourteen years, but, what is more remarkable, each of the lateral offsets with the plant proper, which were also produced small panicles of flowers. What could have induced this extraordinary tendency to produce flowers? The plant was grown in the open air, the only heat being derived from dung.

— M. Baillon, in a paper read before the French Association of Sciences at Lyons, in 1873, a copy of which we have before us, contains some very interesting remarks on the BULB-LIKE SEEDS OF SOME AMARYLLIDS. It is now generally admitted that these bulb-like bodies, as in *Critium*, for instance, are true seeds with their seed coats excessively swollen, but in *Calostemma Cunninghamii*, according to M. Baillon, the ovules are actually transformed into bulbils. In this plant the ovules are at first ordinary pendulous anatropal ovules; presently, however, the base of the ovule itself lengthens into a rod, and, on cutting through the ovule vertically a small conical bud is seen projecting in the interior from the base of the ovule—this lengthens into a shoot, which passes out of the micropyle and then develops leaves. Here, then, we have the substance of the ovule itself developed into a bud, which produces a root and a shoot. Usually what happens is that within, and comparatively independent of, the ovule an embryo plant is formed, which forces its roots through the seed when it germinates, but here the substance of the ovule itself is developed into a bud. This is a curious confirmation of the theory of the essential identity of buds and seeds. M. Baillon, however, does not tell us whether the change from an ovule into a bud is the result of fertilisation or not. We rather expect not, and that if the ovule had been fertilised by the pollen in the ordinary way an embryo would have been produced as usual. Any reader having ripe seeds of *Calostemma Cunninghamii* would oblige us if he would kindly forward some for examination.

— THE TULIP DISEASE, of which mention was lately made, seems to be prevalent to a degree which renders the case extremely serious. The bulbils are found when plants are dug, but sooner or later rot. At present we know nothing of the history and progress of the disease, we merely see its miserable result. Perhaps some of our Dutch friends may have watched its progress, and may be able to give us some information.

— M. André de Vos, in recent numbers of the *Belgique Horticole*, has given a systematic enumeration of all the new or interesting plants described or exhibited in 1874, and mentioned in the various Continental and British horticultural periodicals. The usefulness of this enumeration, which is of no botanical but purely of horticultural value, would have been greatly enhanced by affixing numbers to the plants described, and especially by appending an alphabetical index to the genera, at least. Surely *Campidium chilense* does not belong to Aurantiaceæ.

— It is proposed at the congress of botanists and horticulturists, which is to meet next year at Brussels, to discuss a plan for compiling a *Hortus Europæus*, or systematic CATALOGUE OF GARDEN PLANTS, THE PARTS OF WHICH ARE TO BE DIVIDED INTO THE FEDERATION OF THE BELGIAN HORTICULTURAL SOCIETIES IS TO allot particular orders to those botanists most conversant with them, and to leave the collation and editing of the lists so furnished to the Federation under whose auspices the catalogue would be published. We should gladly welcome any well-devised scheme of the kind, but we think a preferable course would be for the authorities at Kew to give us a new *Hortus Kewensis*. The facilities at that establishment are greater than any private individual could hope to command, and the reference to authentic wild specimens, so extremely important in a matter of this kind, could be better made at Kew than in any other establishment of the kind at home or abroad.

— ROMANZOFFIA SITCHENSIS and R. UNALASCHENSIS are now in flower on the rockwork at Kew. The former is a native of North-West America, and was figured in the *Botanical Magazine* of July last year. It has a lax spreading habit, reaching a height of about 6 inches, is very succulent, and light green; the leaves are orbicular-reniform, and the flowers white, and very Saxifraga-like. R. unalascensis is closely related; it is, however, smaller, with reddish stems and petioles, and dark

green leaf-blades, with the lobes pointed. It is a native of Unalaska, in Russian America. The genus belongs to the order Hydrocladaceæ, and "is closely allied to the majestic Wigandia," a relationship that could not be detected from a cursory glance. Both are well adapted for rockwork cultivation, and may be recommended to those who grow a select few. They are yet rare.

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

(Continued from p. 456.)

VIII.—ON THE DISTRIBUTION OF ATMOSPHERIC MOISTURE.

ALL over the earth, the more largely where its beams reach the surface with the least diminution of heat, the sun is continually engaged in evaporating moisture from all exposed surfaces of water; this remains suspended in the atmosphere, and is carried about by the winds in the form of impalpable vapour or of clouds, till the point of saturation is reached, and the moisture falls again to the earth's surface in the form of rain, or snow, or hail. Air becomes lighter, and consequently expands and ascends when it grows hotter, and becomes heavier and falls with cold. The hotter it is the more moisture it is able to hold in solution. Between the equator and the poles there is a difference of 80° of average annual temperature. In the torrid zone the light warm vapour-laden air is ascending continually to the upper regions of the atmosphere, and there flowing onwards north and south towards the poles, and the cold heavy air from the polar regions comes rushing along the surface to fill its place. As the seasons change, the line of the greatest heat in the world gradually moves its position. At the equinoxes of spring and autumn it runs along the actual equator, or near it. In winter it lies south of the earth's equator, about midway between the equator and tropic of Capricorn. Not more than half as much of the tropic of Capricorn as of the tropic of Cancer runs over land, and this makes a material difference, because the more sea the more the intense heat is deadened and absorbed. In summer the great continental area traversed by the tropic of Cancer, a long line of which is removed from the ameliorating influence of the sea, becomes excessively heated, and from the great African Sahara, through Nubia and Arabia to the north of India, runs a tract of intense heat, in which the July average in the shade rises to 90°.

Zone of Periodic Winds and Rains.—It is to this changing line of the greatest heat that the main currents of the wind are due. Within a zone extending for about 30° on each side of the equator the wind blows with great regularity. When they leave the polar regions the tendency of the surface currents is due north and south, but in their course they become deflected longitudinally in consequence of the earth's motion, and reach the line of greatest heat as north-east and south-east currents. The tropic of Capricorn has its air rarified by heat in our winter, and this produces the wind in the torrid zone which is called the north-east trade wind or monsoon. The tropic of Cancer has its air still more rarified by heat in our summer, and this produces the south monsoon. Through these causes this central belt of the world has its winds and rains perfectly steady and regular, and within it there falls the greatest quantity of rain which there is in any part of the world. The rainy season begins some time before the sun reaches the zenith of a place, and continues for some time afterwards. In a belt near the equator there are two rainy seasons, the main one, which lasts three or four months, beginning when the sun, in its progress to a vertical position, has crossed the equator, and a shorter one, which lasts four or six weeks, when the sun is coming again from the tropic to the equator. Nearer the two tropics the countries have only one rainy season, which begins when the sun approaches the tropic, and one dry season, the year being divided between the two. The rain pours down in torrents between 8° N. and 9° S. W., measured 103 inches. In the Himalayas of Khasia as much as 600 inches are said to fall in a single year. The rain, however, does not commonly pour down without intermission night and day, and day after day, as is sometimes the case in the English lake country. The ordinary succession of atmospheric phenomena is as follows:—The sun rises in a cloudless sky. Towards noon some faint clouds appear on the horizon, which increase rapidly in density and extent, and are soon followed by thunder and violent gusts of wind, accompanied by

heavy rain. Towards evening the rain abates, the clouds disappear, the sun sets in a serene sky, and during the night no rain falls. The annual quantity of rain which falls upon any particular place depends greatly upon local circumstances, just as it does in the temperate zones, and is greatest where hill ridges are placed so as to catch the clouds, and smallest in tracts liable to landward of such ridges. To take our illustrations from India, where the south monsoon blows laden with the copious vapours raised by the equatorial sun from the broad expanse of the Indian Ocean, we find that in the Eastern Himalayas the rainfall varies from 200 to 600 inches a-year, and that at Mahabaleswar, where the clouds drift against the high ridge that lines the west side of the peninsula, it is 248 inches, but that at Courtallam it is only 40 inches, at Bangalore 35 inches, at Cape Comorin 30 inches, and at Bellary 22 inches, Mysore 22 inches, which is only as in any part of England.

Zone of Periodic Winds without Rain.—Outside the zone of periodic winds and rains comes a double belt, one girdling the world in the northern, and the other in the southern hemisphere, the breadth and area of which is greatly modified by local circumstances, within which no rain ever falls. These belts are estimated to include altogether an area of 5,000,000 square miles, but it is impossible to make any calculation that is at all precise, because round these tracts that are uniformly rainless are regions in which rain falls but very sparingly, and which pass gradually into the two rainy zones, through countries like Southern Palestine and the Gangesic plain, which, though usually rainy, are liable at intervals to years of drought. These belts of rainless land near the tropics contain some of the most hopelessly dreary country which the world can show. Beginning with the west of the old continent we have the tract of the tropic of Cancer in Africa, the Sahara or great desert, on the southern border of which the rains cease at 16° north latitude, and begin again on the north at 28°. Passing further east the southern rains cease in the countries on the banks of the Nile between 18° and 19°, and the northern begin between 27° and 28°. Passing into Asia, there is a great rainless tract in Arabia of which we do not know the exact bounds, and it reaches through Beloochistan over into the delta of the Indus, where it does not cover more than 4° of latitude. From this point the rainless zone turns to the north-east and extends to 30° north latitude. Crossing the great Himalayan chain it includes the high tableland of Tibet, but does not appear to reach into the Chinese empire. In South Africa there is a sandy desert rainless tract on the north of the Orange River, between 24° and 28° south latitude, and a great part of the interior of Australia seems to be nearly or quite rainless. In North America the zone of no rain extends to the northern peninsula, and extends round the northern end of the Sierra Madre chain past Chihuahua and Monterey to the shores of the Gulf of Mexico between latitudes 24° and 26°. In South America it includes between latitudes 23° and 27° the northern province of Chili, and, through an extensive low tract in the interior of the continent belonging to the territory of the Argentine Confederation, rain is very unfrequent and small in quantity.

Zone of Variable Winds and Rains.—From about latitude 30° on each side of the equator to the poles extends a zone of ever-changing and variable winds, and of rain that is irregularly distributed throughout the whole year. Sometimes in these middle latitudes, in Britain, for instance, we fall within the sway of the south-rushing polar current deflected to the east by the earth's rotation, and sometimes within that of the north-rushing current from the equator, deflected to west by the rotation which it shared with the earth at the zone from which it started. In Britain this south-west wind comes to us laden with vapour from the great mass of the Atlantic, and makes Ireland and our western shores unusually damp and rainy. The relative temperatures of sea and land in the temperate zones are continually changing with the seasons. In summer and autumn the Atlantic is colder than the European continent, and this has a tendency to produce a west current at the surface. In winter and spring the Atlantic is warmer than the continent, and this has a tendency to produce an east wind. Sometimes one of these varying tendencies gains the predominance and sometimes another, and the result is constant and often rapid change and variety. The heat and moisture which the wind brings with it depends entirely upon where it comes from, and what it has passed in its way. A west wind blows to us from the Atlantic, and usually brings rain; an east wind brings up the fog of the German Ocean; and in winter and spring the prevalent north-easter brings the cold and often the snow of Russia and Norway. At the seaside, unless it be overpowered by a general current, there is a breeze from off the sea during the day, and a breeze from off the land during the night. The quantity of rain that falls in this zone at different points is extremely variable, and depends upon the position of the wind, and upon the mountain masses and the seas from which the vapours come.

In England the rainfall is greatest in the west side of the island and smallest in the east. The difference within a short distance is sometimes very striking. There are 140 inches a year at Borrowdale, in the lake district, and not more than 20 inches at Shields and Sunderland, which are directly opposite on the east coast. But the habitual humidity of the atmosphere often varies but little between places the rainfall of which is very different. The number of days upon which more or less rain falls, varies in England from 100 to 300, but in the Mediterranean region the number of days is fewer, the quantity is smaller, and there is an almost regular period of entirely dry weather in summer. Taking the north temperate zone as a whole, there is, as a rule, least rain in places away from hills in the interior of continents, and most in insular and mountainous situations. The following list gives the annual rainfall in inches at the places mentioned:—

Zone of Periodic Rains.—Singapore, 97; Kandy, 52; Sierra Leone, 86; Madras, 44; St Helena, 45; Rangoon, 84; Bombay, 75; Calcutta, 76; Kio Fook, 59; Havannah, 51; Poonah, 25; St Domingo, 77; Mahabaleshwar, near Bombay, 254; Cherra Pongee, Khasia, 592.

Zone of Variable Rains: Insular Climates.—Charleston, 54; Madeira, 27; Coimbra, 118; Seathwaite, Borrowdale, 141; Cahircivry, Kerry, 59; Westport, Galway, 46; Isle of Man, 37; Dublin, 29; Oxford, 26; Washington, 41; London, 24; Bergen, 88; Edinburgh, 24; Rotterdam, 22; Palermo, 22; Toulon, 18; Marseilles, 23; Padua, 36; St. Petersburg, 36; Montpelier, 37.

Zone of Variable Rains: Mountainous Countries.—St. Bernard, 58; Geneva, 31; Berne, 46; Milan, 38; Lausanne, 40.

Zone of Variable Rains: Continental Climates.—Hobart Town, 18; Peking, 26; Tiflis, 19; Paris, 22; St. Petersburg, 17; Upsala, 18; Prague, 14; Cracow, 13; Coblenz, 22; Nertschinsk, 16; Göttingen, 26; Stockholm, 20.

THE GOVERNMENT GARDENS, HONG KONG.

THE colony of Hong Kong, which is an island of about 15 miles circuit, situate off the mouth of the Canton River, was ceded to Great Britain by the treaty of Nankin in 1842. It possesses one of the finest harbours in the world, and, looked upon as a naval and military station, it dominates the whole coast line. "Public administration and private enterprise," it is said, "have done much to convert what a few years since was little better than a barren and unhealthy rock into a beautiful and salubrious city. As neither the one nor the other, however, avail much without something more material to depend upon, that support is found in the commercial importance of the colony as the depot of foreign trade with China, and the head-quarters of the mail services of Great Britain and France, the United States and India." Hong Kong is, in short, the market of Canton, frequent and regular steamers pling between Canton and the island, which carry from 800 to 1200 passengers daily. Besides this traffic manufactures to some extent are carried on, a sugar refinery on a large scale, with all the modern appliances, having been established, which draws its supplies of sugar from the mainland of China.

Hong Kong has its civil, military, and naval establishments, with a governor and commander-in-chief at the head, and it has likewise its Government or botanic gardens, in which are some fine plants and trees, many of which, however, were destroyed, and others severely injured in the typhoon of September last. Amongst them were one or two large Banyans (*Ficus indica*), some Casuarinas, some good trees of *Poinciana regia*, a *Sophora japonica*, and some fine trees of *Ficus religiosa*.

Our engraving (fig. 124, on p. 597), which is copied from a photograph taken in these gardens, shows in the foreground on the right-hand side a fine plant of *Rhodoleia Championii*, a splendid shrub or small tree belonging to the natural order Hamamelidaceæ. It is remarkable, however, in having its flowers, which measure about 2½ inches in diameter, surrounded by several rows of imbricating sepals or bracts of a reddish yellow or brownish yellow colour, while the petals, which are rose-coloured, are arranged around the circumference in a double row, the sepals and petals thus forming a kind of outer and inner involucre. The stamens number from thirty to fifty in each flower, and have large brownish-yellow anthers. The leaves are bright green, similar to those of *Camellia*. Each flowering branch bears from six to eight or more flowers. The plant is a native of Hong Kong, and seeds of it were first received from Captain Champion, who discovered it in 1849, and he describes it as the handsomest of Hong Kong flowering trees. It is described in vol. lxxvi. of the *Botanical Magazine* for 1850, and is figured at t. 4509 of that volume. This

figure, however, as will be seen from the engraving, as well as by comparison of original specimens, does not convey an idea of the size of the foliage and consequent habit of the plant. The tree shown in the engraving was about eight years old at the time the photograph was taken.

Thinking that anything relating to gardening in such a distant part of the world as China might interest some of your readers, I beg to send you photographs representing the third annual flower show of Hong Kong, which was held on one of the terraces in the Government gardens on the 19th and 20th of February last. The first horticultural show in Hong Kong took place in February, 1873, and was organised chiefly for the purpose of encouraging the growth of foreign kinds of vegetables for the supply of the market. Previously to 1873, foreign kinds of vegetables were scarcely procurable in the market at any price, but now, I believe owing to the influence of the horticultural shows, most of the kinds of vegetables which are desired by the foreign residents can be procured during the cold season at moderate prices. The cultivation of pot plants has also been encouraged by the flower show committee, and consequently the plants which have been exhibited have shown some improvement in cultivation, but the Chinese gardeners are very far indeed behind British plant growers as regards high cultivation, although they certainly excel in growing the dwarfed plants which they value so highly. I also send you a photograph of the rare and beautiful *Rhodoleia Championii*, taken from a tree in flower growing in these gardens; the tree is about 10 feet high. *Charles Ford, Superintendent of Government Gardens, Hong Kong, March 17.*

Notices of Books.

THE contents of the last part of the *Journal of the Linnean Society* (botanical section) include notes on Indian Garcinias, by Dr. Hooker; on Aristolochias and Durionaceæ, by Dr. Masters; and on Asparagaceæ, by Mr. J. G. Baker. In the latter paper, of which only the commencement is given, we observe that most of the brightly-coloured garden *Drazenas* now so common as decorative plants are considered to be varieties of *Cordylina terminalis*; *D. erythrostachys* of gardens is *C. Bankii*, Hk. fil. in *Gardener's Chronicle*, 1866, 792; *C. Haagenii* is retained; *Drazena lineata*, *Cordylina lentiginosa*, and *Drazena Veitchii* of gardens are all referred to *Cordylina australis*; *Charlwoodia congesta* is referred to *C. stricta*, and *C. violascens* to *C. rubra*.

The March number of the *Gartenflora* contains a coloured figure of *Musa velutina*, a species with beautiful pink bracts; of *Primula algida* var. *cuspidata*, and of *Parassia caroliniana*, and some diagrams illustrative of the distribution and cultivation in the open air of *Agave americana* and *Amygdalus communis*.

The April number of the *Belgique Horticole* contains a coloured figure and description of a new Malvaceous plant, *Pawonia Wrotii* (Ed. M.), with an epicalyx of numerous linear pink bracts, which give a very striking appearance to the flower, and link the plants producing them together. It is a native of Brazil, whence it was introduced to the nurseries of MM. Makoy & Co., of Liège, and received the 1st prize for a new plant at the recent exhibition at Antwerp.

The *Florist and Pomologist* for the present month contains a coloured plate of the flowers and fruit of the French Paradise Apple (*Pommier de Paradis*) which fruited last year at Chiswick, and a beautifully coloured illustration of the tuberous-rooted *Begonia Model*, which has large bright rose-coloured blossoms, remarkable for their perfection of form, and which was raised by Messrs. Veitch & Son, who gained a First-class Certificate for it in September last.

We have to announce with pleasure the long-looked-for publication of the fourth edition of Dr. Hogg's *Fruit Manual*. We shall take an early opportunity of commenting upon the contents of the work, which is much larger and more comprehensive than the last edition, published in 1866.

Florists' Flowers.

THE large cultivators of the DAHLIA—those who require great quantities of plants—will, by this time of the year, be in the very full swing of their Dahlia propagation; and already hundreds of nicely struck cuttings will be undergoing the hardening process in close cool frames. The rule of the trade is to send out new Dahlias on the first day of May—March and April are, therefore, busy months, when large quantities of Dahlias are required. There is nothing like having the use of a low lean-to house against an east or north-east wall, and if the floor of the house is beneath the outside level of the ground, so much the better. A gangway along the back leaves space for a bed between it and the front of the house, with a tank beneath it, through which hot-water pipes pass; or without a tank, for the matter of that. In such a house the bed will be up pretty near to the glass. The bed should allow of four or five roots being placed across it in lines; but the width of the beds depends in great measure on the size of the house. The tubers must be just or nearly buried in the soil, but leaving the collar clear. There should be at least 6 inches of a good, free, rich soil for the tubers to root into, and the soil must be kept well moistened, so as to give every encouragement to the growth of the tubers. Here, then, the young wood, out of which cuttings are made, is forced into growth.

Meanwhile, the dung pits are also necessary to strike the cuttings after they are placed in the cutting pits. These, in order to utilise and economise the heat of the dung as much as possible, should be sunken brick pits, so that the lining round them can be renewed as required, with holes in the brickwork through which the heat can pass to the cavity beneath the bed. Sunken pits of this character should be permanent erections; and as the manure is, to a great extent, below the ground level, there is not that evaporation going on that there is in the case of beds built up on the ground level. They are exposed all round to the drying action of the sun and the cooling influence of the wind. The interior bed is formed, in the first instance, of fermenting material, and over this is placed a layer of leaves, tan, or soil, in which to plunge the cutting-pots.

The cuttings are taken off when they are 3 or 4 inches in length, and are cut through nearly, but not quite, close to the tuber, and just beneath a joint. They are then put somewhat thickly into well-drained pots, firmly pressed, but not too deeply planted, in a rich, free soil. Each variety, if more than one be contained in a pot, is separately labelled; and the pots are then plunged nearly to their rims in the dung frame, and kept close. They soon strike roots and are as quickly as possible after potted firmly and singly into thumb-pots, and are then placed in another warm frame to become established, when they are removed to a cool close frame, and then gradually hardened off. This does, in general, include the propagating plants applied by those who have to furnish Dahlias in large quantities. It may, however, be stated that the roots employed to produce cuttings are what is known as ground roots that flowered the previous year, and were lifted in October and November, and kept in a cool, dry place during the winter. The roots are lifted with some soil adhering to them, and stored away without shaking it off. Some break freely into growth and yield a large number of cuttings, others break only sparingly; a few will sometimes scarcely yield a cutting.

The amateur who every year raises a few cuttings does not need such elaborate arrangements to do what is requisite on his part. He has recourse to an ordinary dung frame, and in constructing this the dung should be well mixed, and turned and shaken out two or three times before it is finally put together, or there is danger of a foul atmosphere resulting, which is at all times detrimental to the well-being of the cuttings. When the dung bed is in general ready for the plants to go in, a bed of soil 8 or 9 inches in depth must be laid over the manure; and when the tubers are placed in it care should be taken that there is sufficient soil between them and the soil forming the bed to keep the roots from coming into contact with the dung of the bed, as it is apt to rot them.

If there is a brisk bottom-heat to such a bed, in a short time there will be plenty of cuttings to take off. The heat can be maintained by placing some fresh dung round the compost, and the composting them to fall off, and a brisk moist heat is indispensable to the well-being of Dahlia cuttings. If there be another frame at command, a second hotbed should be made up, so as to receive the cuttings taken from the first bed; and these should be put in pots, as before mentioned. Four inches of soil should be placed over the second bed, and on this the cutting-pots should be stood, having previously made the surface level. By standing the pots on the soil—not plunging them in it—the cuttings are brought near the glass. A 4-inch pot is the most convenient size to use; the cuttings should be firmly inserted round the edge of the pot, about an inch from each other. *K. D.*

HORTICULTURAL EXHIBITIONS, 1875.

MAY.

- 17 and 18.—Halifax Floral and Horticultural Society's Annual Exhibition. Sec., Leonard Kershaw, 20, Gladstone Road, West Hill Park.
- 20.—Royal Horticultural Society of Ireland. Early Summer Exhibition. Sec., A. Ellis, 23, Westland Row, Dublin.
- 21.—Crystal Palace Great Flower Show. Sec., F. W. Wilson.
- 26.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
- 26.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 31.—Coventry and Warwickshire Floral and Horticultural Society's First Show of the Season. Sec., Thomas Wigston, 3, Portland Terrace, Lower Ford St., Coventry.
- 31 to June 4.—Bath and West of England Society's Exhibition at Crofton.

JUNE.

- 1 and 2.—Royal Western Horticultural Society's Exhibition at Plymouth. Hon. Sec., F. B. Bond, 16, Penrose Street, Plymouth.
- 2.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Great Summer Show.
- 9, 10, and 11.—Leeds Horticultural Society's Twelfth Annual Summer Show. Sec., James Birbeck, Delph Lane, Woodhouse, Leeds.
- 10.—South Essex Horticultural Society's Exhibition at Leyton. Sec., G. E. Cox, Leyton.
- 16.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., F. G. Douglass, 167, Canning Street, Glasgow.
- 16.—Glasgow and West of Scotland Horticultural Society, Midsummer Exhibition. Sec., F. G. Douglass, 167, Canning Street, Glasgow.
- 16.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 17 and 18.—Lee and Hackney Horticultural Society's Exhibition. Sec., J. Helmer, 5, Boones Road, Lee.
- 18.—Scottish Fanny Society's Exhibition at Edinburgh. Sec., W. M. Welch, 1, Waterloo Place, Edinburgh.
- 19.—Crystal Palace Rose Show. Sec., F. W. Wilson.

THE

Gardeners' Chronicle.

SATURDAY, MAY 8, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- TUESDAY, May 11.—Clearance Sale of Florists' Stocks at Gailford Nurseries, Whitefields, near Dover, by Mr. H. Hayward.
- 11.—Royal Horticultural Society, South Kensington: Pot Rose Show, and Meetings of the Fruit, Floral, and Scientific Committees.
- WEDNESDAY, May 12.—Sale of Hardy Plants and Bulbs, Wire Garden Handles, Lawn Mowers, &c., at Stevens' Rooms.
- 12.—Flower Show at Bath.
- THURSDAY, May 13.—Sale of Established and Imported Orchids, at Stevens' Rooms.
- 13.—Manchester Botanical and Horticultural Society's Annual National Exhibition at Old Trafford (until Sat.).
- FRIDAY, May 14.—Sale of Bedding Plants at "The Vineries," Nightingale Road, Wood Green, by Froehner & Morris.
- SATURDAY, May 15.—

THE fortunes of the ROYAL HORTICULTURAL SOCIETY must surely have arrived at their lowest ebb. It is scarcely possible to imagine that they can sink lower. The new Council, which came into office with such vehement promises, especially as to financial matters, has been obliged to humiliate itself by deferring payment, even of the prize money fairly won in the last season. Some have even gone so far as to attribute to the governing body the intention to repudiate their obligations. This, however, we believe to be a mistake. A little charity toward a great Society fallen into misfortune should have prevented such an insinuation. We feel assured that the Fellows of the Society, to say nothing of the Council, will not allow so dishonourable and damaging an insinuation to remain long without practical refutation; whether or no, it will be more profitable to look forward to the resuscitation of the Society on a more secure basis than to indulge in vain and irritating recriminations. Better to admit at once that all parties are more or less to blame—the local Fellows for a narrow selfish policy, which would degrade the Society into a sort of better tea-garden; the horticulturists for a want of unity of purpose and an equally selfish desire to use the Society for their own ends rather than the advancement of practical and scientific horticulture.

The Society was founded purely and simply for the latter purpose. The wider it has diverged from it the more signal has been its loss of influence, the deeper its humiliation. Is it possible to rescue the old Society from the slough? Some throw up their hands in despair at the thought. Such is not our view. We

believe that the reorganisation of the Society, heavily burdened as it is, is still possible.

In the first place, we have a Society which, whatever its present low estate, has grand traditions. No Society of a similar kind has done so much—nay, even now, not one does so much pure horticultural work of the best character. Where will you find a Society whose officers and committees include so picked a body of practical and scientific members? Nowhere. Is it, then, likely that such a Society can entirely fall to pieces? It is incredible.

Other Societies, we doubt not, nay, we know, can and do get up as good and better flower shows. The provinces take the lead in this particular. But is this all? Are flower shows the be-all and end-all of horticulture? Unquestionably not. It is comparatively easy to get up a good flower show, but it is not an easy matter to create an organisation which shall promote the higher interests of horticulture. Such an organisation exists still in the Royal Horticultural Society. It has survived the disputes and misfortunes of the last few years, and this makes us confident that it will survive yet longer, and be the means of lifting the Society to its proper position. But how? To this we answer, by going back to first principles. The Society dates its present low fortunes from the time when it left its own proper sphere to pander to the fashion of the day. The Commissioners for the Exhibition of 1851, or rather their predecessors, the partners of the Society, as we are often told, were—not intentionally of course—the primary source of the troubles of the Society. They contented themselves with being the most indulgent of landlords; they did not, as might perhaps have been expected from a body expressly constituted, if we appreciate the matter rightly, to be the promoters and encouragers of art and science—they did not actively foster the higher interests of the art and science of horticulture. They stood by and allowed the Society to drift into a mere airing place for Kensingtonian nursemaids and a lounge for West End Dundrearies. At the best they looked upon the Kensington Garden as a pleasant *displacement* from the galleries of the annual exhibitions. The higher work of the Society at its several committees, and at Chiswick, received little or no countenance or support from the sleeping partners. It may be that, if they had done so, they would have exposed themselves to some accusation of interference, which might have been resented. It may be so, but even if it be so, that would have been better than the underhand influence which people suspected was somehow or another exercised in the name, or under the shelter of the Commissioners' authority. Be this as it may, circumstances have made it apparent that, if the Society is to remain the Royal Horticultural Society, its persistence—shall we say its rehabilitation?—depend now upon the goodwill and active assistance of Her Majesty's Commissioners. They have the power—and, from all we hear, they have the will—to free the Society from its present desperate condition. As trustees for the public they cannot favour any sectarian party, be it local or be it commercial; but they would, we believe, actively help a Society which was true to itself—which was, before all things, horticultural.

To maintain a garden which is horticultural only in name, to divert the funds and energies of the Society to stock a conservatory which could probably be as well and more cheaply furnished by a contractor, to continue bands, to establish a skating rink—these are things not absolutely blameworthy, but they should be entirely subsidiary, if they must be tolerated at all, to the real work of the Society. The real work of the Society, as we understand it, should be to maintain and improve the work now done

by the committees; to develop Chiswick into an experimental horticultural garden worthy of the age; to institute a school of practical and scientific horticulture which shall rescue us as a nation from the disgrace of being beaten by Belgium, by Germany, by America; to hold exhibitions which shall be something more than trade advertisements—something which shall not tempt the less scrupulous amongst growers to indulge in something very like gambling; to raise the status and secure the proper position of gardeners; in a word, to promote the highest, most catholic interests of horticulture, and of horticulture only—such as we have the fullest reason to know was the intention of the enlightened Prince who formerly held the Presidential chair.

To do all this some arrangement must be made whereby the burden of the Kensington garden and its conservatory, and of the debenture debt, may be lightened, and the funds now expended on them spent in a manner more beneficial to the nation at large. The Royal Horticultural Society is, or should be, the national representative and embodiment of horticulture. It is impossible it can be so all the time it is kept simply as an appanage to the houses of the residents in South Kensington. We believe the Commissioners now recognise this truth, and we have sufficient confidence in them to believe that, taught by the lessons of the past and the dismal facts of the present, they would now willingly help the Society out of the mire. If they do not do so it will, we believe, be the fault of the present Council, or of the "local Fellow" element in it, and they must be prepared to bear the whole responsibility attaching to the fall and degradation of a great Society if they persist in their present exclusive and non-horticultural policy.

QUITE recently (pp. 176, 276) we have reviewed the subject of landscape gardening, with more especial reference to the peculiar characters of different TREES and THEIR EMPLOYMENT IN FORMING PICTURESQUE and HARMONIOUS SCENERY. Too little attention is given to the study of the varied beauties of trunk, mode of branching, foliage and flowers presented by the numerous species of hardy trees where-with a bounteous and inexhaustible Nature has supplied us. Books devoted to the consideration of hardy trees and shrubs are not wanting, but they are, almost without exception, limited to mere technical botanical descriptions. A tree may be designated as noble, majestic or graceful, its foliage as handsome or elegant, and its flowers as brilliant or fragrant, but beyond this those who write for practical purposes rarely go. Poets, it is true, never tire of singing the praises of the forest and the field; but something between the dry descriptions of botanists and the fancies of the poet, is needed to awaken an artistic enjoyment and appreciation of the peculiar beauties and the proper use of different trees in landscape gardening.

No one, probably, possesses a more extensive knowledge of hardy trees and shrubs than Professor KOCH of the University of Berlin, and few persons have had better opportunities for studying landscape gardening as carried out in different countries. During the past autumn and winter the author of the *Dendrologie* has been supplementing that descriptive work by a course of lectures on the history of landscape gardening as a plastic art, and the history and spread of the various styles in vogue at different periods. In these lectures the tree element is the main feature developed, and, judging from the condensed reports which alone have as yet reached us, the veteran Professor has handled his subject in a masterly style. We are glad to learn that they are to be printed in full, and we have the author's consent to make what use of

them we please for the benefit of our readers. We anticipate a profitable and pleasurable addition to our literature on this subject, and, in the interest of diffusing as widely as possible a more correct taste in planting, we shall give them as much space as they deserve. In Berlin, these lectures at the University soon became so popular and so numerously attended that Professor KOCH was induced to accede to a request to repeat them in a hall open to ladies and the general public; and the public class proved equally successful. We have little doubt that a similar course of lectures would be equally well supported in this country, and we heartily wish our horticultural societies would take up the subject in a popular spirit. Prizes

pressed his gratification with the details of the Muskau Park—regarded as one of the finest specimens of modern landscape gardening in Germany, but as a whole considered it to be wanting in the higher flights of imagination. But Prof. KOCH observes that he thinks the Latin races will never fully comprehend the merits of the German style. This is doubtless true; moreover it is very desirable that each nation should develop its own artistic genius. As specimens of the first order in Germany the parks of Branitz, Muskau, Sans-Souci, Glienicke, and Babelsberg are cited. Those of our readers who have visited some of these places will better understand the force of the observation. Among collateral topics touched upon by Prof. KOCH

for its peculiar root-hairs, which are short, thick, bristly, of equal length, and of a lustrous metallic brown colour. The spores of the Gleicheniaceæ observed are of an almost sulphur-yellow colour, and may thereby readily be distinguished, even without a lens. Among the Marattiaceæ, also, only one representative was raised from spores, namely, *Marattia latifolia*. From the day of sowing until the appearance of the prothallium a month elapsed, and another month passed before the plantlets were sufficiently large that it was possible to prick them out. The first frond did not show itself for a period of six to eight months, and in some cases even a longer period was consumed. In this *Marattia* the prothallium is very large, and an experiment was tried to propagate some of them by cutting up. On each portion one of the deep sinuses was left, as the first fronds are usually produced in or near one of them. The experiment was perfectly successful, nearly all of the pieces producing fronds in

FIG. 124.—RHODOLEA CHAMPIONI, IN THE HONG-KONG BOTANIC GARDEN.

are sometimes offered for designs for flower-gardens, but they are so inadequate to the labour involved, that the result is usually worse than useless. Without entering into any details here, we may remark that we are not credited by Professor KOCH with progress in the art of landscape gardening in the natural or picturesque style, though it may be said to have originated and generally flourished in Britain. There may be a difference of opinion on this point, but he claims, as we have previously mentioned in this journal, an advance and an improvement of the "English" style in Germany. He confesses, however, that of the numerous foreigners conducted by him in 1869 through some of the most attractive of German gardens, few appeared to fully appreciate the peculiarly German features. BARILLET DESCHAMPS ex-

pressed his gratification with the details of the Muskau Park—regarded as one of the finest specimens of modern landscape gardening in Germany, but as a whole considered it to be wanting in the higher flights of imagination. But Prof. KOCH observes that he thinks the Latin races will never fully comprehend the merits of the German style. This is doubtless true; moreover it is very desirable that each nation should develop its own artistic genius. As specimens of the first order in Germany the parks of Branitz, Muskau, Sans-Souci, Glienicke, and Babelsberg are cited. Those of our readers who have visited some of these places will better understand the force of the observation. Among collateral topics touched upon by Prof. KOCH

— IN THE February number of the *Gartenflora* M. E. MAYER, Inspector of the Karlsruhe Botanic Garden, gives the results of a series of experiments, extending over several years, in RAISING FERNS FROM SPORES, more particularly the Gleicheniaceæ, Marattiaceæ, and Hymenophyllaceæ. He has succeeded in raising one species of *Gleichenia*, *G. dicarpa*, in large numbers; but, in the absence of spores of any other species, he could not extend his experiments. From the first beginning of the development of the prothallium until the appearance of the first frond, exactly five months were consumed. The dark green prothallium of *Gleichenia dicarpa* is nearly circular, and about half an inch in diameter. It is remarkable

a much shorter time than those imported. Every attempt to raise any of the Hymenophyllaceæ from spores proved fruitless, even although the spores were sown directly. The first stage of germination or vegetation of the spores of this group of Ferns takes place in the spore-cases before they are detached from the plant, and the shortest interruption in the vegetative process seems to be fatal to the vitality of the spore. Cultivators of Ferns, even those of some experience, are frequently perplexed with the results of their attempts to raise Ferns from spores. M. MAYER, in the article from which we have taken the preceding notes, treating of Ferns generally, points out some of the chief difficulties and the best means of surmounting them. The principal aim should be to exclude the spores and germs of other Ferns, Liverworts, &c., but this is no easy task; in fact M. MAYER, in the course of his experiments, found it impossible to do so altogether. The only thing is to abate the evil as much as possible, destroying the animal as well as the vegetable life contained in the compost used. This is most effectually done by boil-

ing or baking it for a short time, and using it immediately afterwards. But the greater danger is in the Fern-house itself, where there are more breeding plants, and the sowing of the exceedingly fertile spores of *Meris*, *Gymnogramme*, &c., the spores of which penetrate every nook and corner, and, being of much more rapid vegetation than many others, they take possession of the pots or pans, and effectually choke the species sown. The operation of sowing, then, should be conducted in a place where there is the least probability of the spores of other species being present floating about in the air. There is also a risk in sowing, in several different sorts, at the same time, and in spite of every precaution intruders will make their appearance. The frame, or whatever they are put in, should be thoroughly purged with scalding water, and tobacco-smoke is as effective as anything in driving away insects and other noxious animals. Twenty years is about the limit, so far as M. MAYER'S experience goes, up to which the spores of some of the freer-growing Ferns will germinate.

— With reference to the project, at present visionary, of holding an INTERNATIONAL HORTICULTURAL EXHIBITION, in 1878, in London, like that of 1866, we are reminded that in that year the quinquennial exhibition at Ghent will take place. We merely notify the fact, for, in the present disturbed state of the Royal Horticultural Society, it is premature to speculate on what may be.

— The following information for intending English exhibitors at the forthcoming INTERNATIONAL HORTICULTURAL EXHIBITION AT COLOGNE, to be opened on August 25 next, has been sent to us for publication. The Netherlands Steam Navigation Company and the Belgian Company, whose steamers ply respectively between London, Rotterdam, Dover, and Ostend, as well as the Rhinish, always carry a cargo of fresh fruits and vegetables to the Exhibition by 50 per cent., and no duty will be charged on such objects unless they should be sold in the country.

— *TACCA ARTOCARPIFOLIA* is flowering in the new Victoria-house at Kew. It combines the interest of a curious and rare species of its ally, the *Taccaria cristata*, with foliage of a different type, and of very ornamental character. This specimen is growing in a 9-inch pot, and has four leaves, with petioles 5 feet in height, measuring about 4 feet across. The blades are trisected, and the stalked segments pinnatifid to nearly the base, with the pinnules opposite or alternate, five or six on each side. They are 1½ inch in width, and taper to long points. The scape, two in number, are over 6 feet in height, and bear many flowers, which in themselves are of more interest than ornament; some are passing into fruit, and from their similar form remind one forcibly of *Luffa acutangula*. The inner leaves of the involucre arch upwards, and form, as it were, a canopy over the young buds; the sterile pedicels are numerous, about 12 inches long, and pendulous. It was contributed to the Royal Gardens by W. W. SAUNDERS, Esq., and flowered for the first time last year, when it was figured in the *Botanical Magazine*. We there learn that it is a native of Madagascar and Johanna Island, whence there are excellent specimens in the Hookerian Herbarium from Mr. Justice BLACKBURN, Dr. LYALL, and W. T. GERRARD. It is further said no doubt to be as full of starch and as wholesome as its nearest ally, *T. pinnatifida*, which yields the South Sea arrow-root, used as food in the form of puddings and cakes, and said to be the best in all cases of dysentery. So far it has proved of evergreen habit, is easily cultivated, doing well with ordinary stool treatment; and by division is readily increased.

— As an instance of the fluctuation of trade, we give the substance of two notes which lie before us on the cultivation and traffic in CANARY SEED (*Pharbitis esculenta*). Both notes were written by one of the principals of a firm dealing largely in the seed. The first, dated May, 1860, says:—"Canary seed is cultivated in some parts of England, chiefly in the Isle of Thanet and the county of Essex. It was formerly shipped from Spain, but has recently been neglected in that quarter. Holland exports large quantities of this seed, and very lately large shipments have been received from the Mediterranean, the Sea of Marmara and the Black Sea, and are supplied to the Greeks. We have purchased it in small lots from the surrounding districts, and from the activity of their collection they have succeeded in shipping to this country alone within a few months something like 12,000 bushels. As much as 10,000 quarters of this seed are annually consumed, principally by caged birds and chiefly in the manufacturing districts of Yorkshire and Lancashire; of this bulk England produces by far the greatest portion." In the second note, which bears date April 23 of the present year, we are told that there are no official statistics with regard to the traffic in Canary seed, but it may be safely assumed at 200,000 bushels annually. Of this quantity probably more than nine-tenths are derived from Barbary and Turkey;

Holland and a few only of the English counties furnishing the remaining quantity. During the last eighteen months an unusual demand has sprung up from the United States, and this, coupled with an utmost total failure of the 1874 crops of both Barbary and Turkey, has created a scarcity almost unparalleled in the history of the trade. Prices in consequence have advanced to about 240s. to 250s. per quarter, the average price during the previous twenty years having been about 52s. per quarter. Its chief use is still for feeding birds, the great consumption in Yorkshire and Lancashire being attributable to the custom amongst the factory hands of keeping pet birds. Prior, however, to the advance in price Canary seed was used to a limited extent in the food of highly trained race-horses, its effect being to form muscle and not fat, the seeds being free from oil.

— Some additional special prizes are announced by the promoters of the INTERNATIONAL POTATO EXHIBITION, to take place at the Alexandra Palace on September 29 and 30. Messrs. B. K. BLISS & SONS, of New York, offer special prizes for three varieties of new American Potatoes, distinct, that have been offered in commerce for the first time in the years 1874-75, nine tubers of each; and Mr. JOHN COUTTS, Potato salesman, Covent Garden, offers special prizes, also, for three varieties of English seedling Potatoes, distinct, not yet in commerce, nine tubers of each. The sum of five guineas is given in each case. This recognises the claim of English seedling Potatoes to consideration, while it also gives an opportunity of exhibiting the newer forms of American production. A supplementary schedule containing these prizes is now in course of distribution.

— The following SPECIAL PRIZES FOR ESSAYS are offered by the Massachusetts Horticultural Society:—

For the best essay upon the Culture and Varieties of Roses; to be read during the Rose Exhibition, Thursday, June 17—25 do.

For the best essay upon Grape Culture in gardens and on buildings, with a list of varieties best adapted to such purposes; the essay to be read on Saturday, October 10—18 do.

For the best essay upon the Culture of the Cauliflower and other vegetables of the Cabbage family (*Brassica oleracea*); the essay to be read on Saturday, November 6—15 do.

For the best essay upon the principles of Landscape Gardening as applied to small suburban estates; the essay to be read on Saturday, November 27—25 do.

The essay upon Rose Culture must be submitted by the first Saturday in June; all others at least one month before the day for the reading of the essays. All essays must be in sealed envelopes directed to the Committee on Publication and Discussion, Horticultural Hall, Boston, and must be unsigned, but may be accompanied by the name of the writer in a sealed envelope. These prizes are open to general competition.

— At a recent meeting of the Central Horticultural Society of France, Dr. BOISDUVAL, unintentionally, no doubt, does us the injustice of stating that we reported his observations on the new POTATO DISEASE IN ALGERIA, alleged to be produced by a moth, without giving him credit for them. If Dr. BOISDUVAL will turn to our columns for the present year he will find at p. 82 that we give chapter, verse, and author's name. We may add that some doubts are expressed by our entomologists as to the correctness of M. BOISDUVAL'S views.

— In the current issue of the *Journal of Botany* Dr. H. F. HANCE has a paper on some MOUNTAIN PLANTS FROM NORTHERN CHINA, from which we gather that at the commencement of last summer Dr. ÉMIL BRETSCHNEIDER paid a visit to a celebrated mountain named Po-hua-shan, or "Mountain of a Hundred Flowers," situated three days' journey west of Peking, in the midst of that country, where it is believed to extend westward as far as the Yellow River. Some idea of this "Mountain of a Hundred Flowers" may be gathered from the following extract:—

"The mountain itself is separated from the neighbouring elevations by a deep and rugged valley, formed by a small tributary of the Hun-ho, which bounds it on the north, the west, and the south, whilst to the east, where also the descent is exceedingly steep, another tributary of the Hun-ho rises. Po-hua-shan is thus almost entirely isolated from the surrounding mountains, which it exceeds in height. Its actual elevation has not yet been determined, though Dr. BRETSCHNEIDER took barometrical observations; but he estimates it as between 7000 and 8000 feet above the sea level. The mountain appears fully to deserve the poetical name it has received—

"Nanque hic per frondes redolentia liliæ pendet,
Hic rosa cum violis, hic omnis gratia florum."

Republ. Musc. Sinens. Venc., 41.

The Chinese report that in July and August it is in its full glory, teeming with blossom; and it is then visited by the Peking herbalists, for the purpose of gathering the medicinal plants for which it is famous. It is wooded throughout to the very summit, the forest consisting of

Betula (sp. 3), Populus (sp. pl.), Castanea, Juglandacera, Quercus, Acer, and many other trees, mingled with a thick underwood, and towards the foot—that is, still at an elevation of between 3000 and 4000 feet above the sea—masses of Syringa, exhaling a most delicious fragrance, and with, whilst the rocks are covered with the brilliant rose blooms of *Rhododendron*.

— The Rev. M. J. BERKELEY, M.A., and Dr. MAXWELL T. MASTERS, F.R.S., have been elected EXAMINERS IN BOTANY at the University of London for the ensuing year.

— We are informed that the HORTICULTURAL CLUB will be opened for the use of members on Wednesday next, May 12. Dining, drawing, smoking, reading, and billiard-rooms will be at the disposal of the members. The situation is central, and occupies one of the best sites in London, viz., Adelphi Terrace, overlooking the garden on the Thames Embankment, close to Charing Cross Station. Nothing now is wanting to complete success but an accession of new members. The entrance fee is fixed for the present at two guineas, with an annual subscription of two guineas. All communications should be addressed to the Hon. Secretary, 3, Adelphi Terrace, Strand, London, W.C.

— The *Moniteur Horticole* recommends the following twelve PEARS as pyramids on the Quince, on the ground of hardness of bloom, vigorous constitution, and ascending branches:—Ananas de Courtrair, from very good trees August and September; Beurré Dumont, excellent, October; Louise Bonne d'Avranches; Concellier à not 'de,' as so often written in this country) la Cour; Duchesse d'Angoulême, Beurré Durondeau, Soldat Laboureur, Doyenné du Comice, Thompson's, Sœur Grégoire, Passe Crassane, and Bergamotte Espéren. We do not doubt the propriety of the selection made by our contemporary; we would, however, remind the amateur of the enormous differences that local circumstances make in the quality of Pears, so that a selection applicable to one site or one soil is far from being appropriate to another even close by.

— According to M. DUCHARTRE, France has not much to fear from the introduction of the COLO-RADO BEETLE, inasmuch as the exports of Potatoes largely and imported very few. Last year, we are told, France exported 110,000,000 quintals, and imported only 9,000,000 quintals.

— In many parts of Japan where the TEA PLANT is cultivated, a very great deal of care and attention is given to the proper manuring and irrigation of the ground. For the finer kinds of Tea the leaves are gathered from the shrub when it is in what is known as the three-leaf stage, namely, when the three leaves at the ends of the branches are young and tender. When four or more leaves appear they get harder and drier, and, consequently, make Tea of an inferior quality. The finest, however, and most esteemed amongst the Chinese is what is known as *Pan-tea*; and this is the great variety. Though the produce of the same plant as ordinary Tea, it is described as being cultivated in a different manner, "thus developing a leaf different in consistency and flavour." Two kinds of this Tea are known, one under the name of "koicha," and the other as "resucha," both are made from the leaves of very old shrubs selected from the best grounds or plantations. These shrubs are described as being very freely manured some ten times in the year for "koicha," and some six times for "resucha." "About the end of March or beginning of April," it is stated, "they are surrounded on all sides, in addition to being covered with a Bamboo screenwork, so as to protect them from frost. This screenwork is removed as soon as summer has well set in. After the leaves have been picked they are steamed for about half a minute, spread out on matting, and cooled. Then follows the same process as with ordinary Tea, namely, firing—first over a quick fire, the other a slow fire. The preference being that the leaves are turned about with a stick, and not with the hand. When about half dried the leaves are placed on trays, and dried gradually over a light fire, after which they are passed through Bamboo sieves; finally they are spread out on sheets of paper, each leaf being picked out singly. Great care is shown in the mode of storage of this particular kind of Tea. The leaves are placed in one or two metal jars, which again are enclosed in wooden boxes and packed with a certain quantity of common leaf. This preserves the scent and flavour for a long time. When about to be used for drinking, a sufficient quantity is taken out of the metal jar, placed in a small hand tea-mill, and slowly ground into a very fine powder. This powder is then removed with a feather and placed in an airtight jar. Boiling water is then got ready, and when just at boiling point about one quarter of an ounce of Tea powder is put into a tea-cup and boiling water poured on to suit taste. The whole is then rapidly stirred with a Bamboo stick especially made for the purpose, until a good froth is produced, when the Tea is fit to be drunk, much ceremony being observed in its drinking."

Home Correspondence.

Transmutation of Wheat into Brome (pp. 112, 115, &c.).—I have been anxiously hoping that Mr. Meehan would kindly communicate to your paper some account of the "trick" by which so many scientific Americans were "taken in," and for so long a period. It would be a useful contribution to our knowledge, and would be the means of protecting young gardeners and others from being deceived in a similar manner. I intended to wait a little longer, hoping that the information would have found its way into your journal without any suggestion from me; but your notice of Mr. Clare Sewell Read's remarks recalls my mind to the subject, and induces me to beg of Mr. Meehan to tell us what he knows about it. I remember, when the subject was last discussed in your columns, it was stated, with respect to the other popular belief as to snakes swallowing their young (Jan. 23, 1875, p. 115), that Professor Goode's authority consisted of "replies from over eighty persons residing in twenty-four different States and Territories, all being written by farmers and persons in rural life, of sufficient intelligence to subscribe to an agricultural journal." Mr. Sewell Read occupies a far higher position than this. He is a "farmer," it is true, and he is "a person in rural life of sufficient intelligence to subscribe to an agricultural journal;" but he is far more than this—he is a most intelligent man, and one who would be found not only subscribing to an agricultural journal, but contributing to its columns valuable papers on agricultural subjects with which he was practically acquainted. Mr. C. S. Read has been such a character for intelligence that he has come to be known by his brother tenant-farmers to represent their interests in the Commons' House of Parliament. He is, moreover, a prominent member of the Central Chamber of Agriculture and the London Farmers' Club, and whenever he makes a speech on any subject within the limits of his own personal experience he brings to it an amount of strength, shrewd common sense, which makes it a delight to read and study his most valuable observations. Mr. Read is reported to have said, "If Oats were not sown and left constantly cut as they grew, it would be found next year that they produced, not Oats, but something else. He knew an instance where this had been tried in a garden, the Oats being kept cropped with a pair of shears, and covered from the first with a little straw in the winter, and the next spring they produced a crop of Wheat. In other cases, Barley and Rye had been the result. It was only Oats, however, which thus varied—other grain always reproducing itself." But although Mr. Read is reported to have said all this, and that "he knew an instance" of Oats treated in the above manner having produced Wheat, I will venture to say that if he uttered the phrase at all it was used in a very loose sense, and that Mr. C. S. Read will not tell the scientific world that he made the experiment himself, nor that the experiment, if made by anybody else, was conducted with that amount of care which is requisite for a critical investigation of such importance as revolving itself in the well-settled belief of scientific men in the stability of our common cereals. I may add that the recent experiments by Mr. A. S. Wilson on Wheat and Rye hybrids (referred to in your number for the 17th inst., p. 496), afford no support to the transmutation hypothesis, but, so far as they go, make directly the other way. *W. Marshall, Ely, April 26.*

The Royal Horticultural Society.—It would be interesting to know on what grounds Mr. Burnley Hume based his belief when, acting as chairman of the meeting at South Kensington on the 21st ult., he stated that at the next show, on May 12, "they hoped to put before the Fellows a fine display of pot Roses." Certainly, if Mr. Hume really hopes so much, he must have greater faith than is possessed by most mortals. If the March show was a comparative failure, that of April 21 was a lamentable failure, and judging by what is seen as well as by what he heard, it seems probable that the May show will be, "to use a stronger adjective," a miserable failure. And such will be all the remaining shows of the year—as far as the Society's schedule is concerned—unless some change in the present mode of doing business is speedily made. Are the Council aware that many of the principal exhibitors have resolved not to exhibit for high prizes, and that many others are equally resolved never again to exhibit until the Society's financial engagements towards them are discharged; whilst the few that do exhibit do so only at considerable loss, and are moved to show only from motives of pity, lest the exhibitions should utterly collapse? It is disheartening to be told, in excuse for the non-payment of the previous year's prizes, "that the Fellows are so behindhand with their present year's subscriptions," as this is a tacit avowal that the prizes of the past year are to be met out of the present year's income. The acknowledgment is alike "discreditable to the Council and to the Fellows." In your report of the recent

show, you allow a margin of £5 for extra prizes. It is most probable that 20s. or less will pay these, several of our leading nurseries having very fine collections of plants, to which extra prizes (silver medals, according to the prize cards) were awarded, for 15s. each—a display of meanness so extreme as to be almost beyond belief, but which received complete verification on the 21st, as neither of the firms in question sent collections of plants on that occasion. I believe now that things have advanced so far at South Kensington as to be absolutely beyond the Society's means of dealing rapidly and destructively, and not a hand will be stretched out to help it. The horticulturists are either indifferent or antagonistic, and a strong power, in the shape of the outside public, is beginning to inquire as to the right of the Commissioners of the Exhibition of 1875 to dispose of the site of the Horticultural Gardens for its present exclusive and comparatively useless purposes. It is rumored that the Council and the Commissioners are gradually getting on their feet, but that shells no ray of hope. Doubtless 'twere better that the Society should expire, if a new and rejuvenescent one could arise like the Phoenix from its ashes. *Hortus.*

Notes on Stapelææ.—Having just completed the examination of a small collection of Stapelææ preserved in spirits of wine that were sent to Kew by Mr. J. N. Rose, and partly in Mauritius, by Sir Henry Barclay, the Governor of the Cape of Good Hope, I now make these few notes upon them in hopes they may prove interesting to some readers of this paper. Among them are several new species, and some of those rare and almost unknown forms discovered by Francis Masson about eighty years ago. A few of the specimens were collected in Namaqua-land by Sir Henry Barclay, the rest are from various parts of South Africa. The most noteworthy species among them were *Stapelia pulvinata*, Masson, remarkable for its very great central cushion of soft hairs; two curious *Piaranthi*, one of which is very like *Piaranthus pullus*, Mass., but the angles are bolder, the spines more robust, and the flowers differently colored; the other species appears to be a variety of *P. incarnatus*, Mass. A new species of *Huernia*; an *Obesia*, which is probably *O. decora*, Mass.; *Tridentea moschata*, Haw.; and a curious new and small species of the same section, with greenish yellow flowers, the edges of the corolla lobes being turned back, as in *Olebia* and *Stapelia Asterias*; also the interesting and strange-looking *Carucularia peniculata*, Masson (not of other authors). But the most remarkable of all is a new species of *Stapelia*, that seems to be a natural hybrid between a true *Stapelia* and *Haworthia* genus *Orbea*, to which *S. normalis*, *bufonia*, &c., belong. The stems are like those of an *Orbea*, but having the pubescence and stoutness of a *Stapelia*; the flowers are about 6 inches in diameter, and colored something like *S. hirsuta*, L. In the centre is a raised orbicular, as in *Orbea*, but thicker and more fleshy; the outer corolla resembles that of *Stapelia*, the inner corolla being intermediate between *Stapelia* and *Orbea*; the orbicular at its base, both outside and inside, is fringed with long reddish hairs, as are also the corolla lobes, a character which specially belongs to *Stapelia*. From the above it will be seen that the characters belonging to the two sections are pretty equally combined in the present plant. This interesting species was discovered by the Rev. Mr. Morris in Little Namaqua-land, and a living plant of it is, I believe, in cultivation at Kew. Besides the above mentioned there is a very curious abnormal specimen of what I believe to be *Stapelia (Orbea) marginata*, Willd., in which the peduncle has become fasciated, and bears two flowers that are much contorted. Premising that the normal number of parts in each whorl in any *Stapelia* is five, I will call the flowers A. and B., and contrast the number of parts in each whorl of the two flowers—

- | | |
|--|--|
| <p>A.
Calyx—6-parted.
Corolla—6-lobed.
Orbicular—6-angled.
Ligule (outer corolla)—5.
Inner corolla, consisting of the 2-nerved processes called rostræ, and the 3-nerved rostræ has a tendency to be pentagonal.
Stigma—dentated.
Pollen masses—6 pairs.</p> | <p>B.
Calyx—6-parted.
Corolla—7-lobed.
Orbicular—7-angled.
Ligule (outer corolla)—6.
Inner corolla, &c.—6, 5 normal, and the sixth with two rostræ and two ale.
Stigma—hexagonal.
Pollen masses—6 pairs.</p> |
|--|--|

Covering Primula Seed.—How often do we hear complaints about the inferiority of Primula and other seeds, and the blame thrown on the nurserymen, who are often subjected to the annoyance of letters complaining that such a packet of choice seed they had supplied had never made its appearance, when I fear that the fault often rests with the sower in the mode of covering the seeds. Take *Primula sinensis* for instance, and what a number of failures we see, and how often the sowing has to be repeated, causing loss of time and cost of extra seed, as in the case of the *Præcox*, for a packet that will lie in the hollow of your hand, I have tried a great number of materials

for covering, but have found nothing better than to raise the surface of the soil in the seed-pan smooth, sowing the seed and covering with freshly-gathered moss. The merit I claim for moss over peat or sand is that it does not bake hard and hot, and so destroys the vitality of the seeds before they can germinate, but keeps the seeds cool and moist until germination takes place, as will be seen by gently moving the moss a few days after sowing; the seed, too, will be up in half the time that would be taken if covered by soil. I sowed two packets of seed in the end of March. Placed in a Gleaner from they began to germinate in a week, and in another I moved the moss and gave them a top-dressing of fine soil, and they look now, to use the words of some gardeners that saw them, like peas of Mustard and Cress. I do not believe one seed was lost. *Joseph Murdoch, The Gardens, Green Hayes, Warwick.*

Nemophila insignis and Cats.—I find an effectual mode of protecting *Nemophila* beds from being rolled by cats is to surround them with rabbit netting when sown in the autumn. Being rather disfiguring, I have it removed when the plants are coming into bloom, as at the present time, and find the cats do not attack it so violently as when more tender. The netting is also useful when protection from frost is needed during the winter. *A. Grubb, Glenam.*

Sweet Nancy.—At p. 471, in the paragraph about "Sweet Nancy," "B. M." speaks of an ancient provincial name of *Narcissus* as "Lanstibi," and questions its meaning. I think it has been a misprint for "Lauz ibi," judging from the analogous name, "Gratia Dei," given to some medicinal plants, particularly (as mentioned in the *New English Botany*) from its being possessed of properties making it useful for medicinal purposes. *A. Rawson, Bromley.*

Strawberry Culture in Pots, &c.—Most people in possession of a garden devote part of their time to the cultivation of the Strawberry, and the few remarks which I am about to offer are intended for the information of amateurs, and are based on my own experience. For several years past, the Prince and Keens' Seedling are the best. Sir Charles Napier, Sir Joseph Paxton and President, make a very good succession, and are put to work in the order named. The first runners that show should be layered in pots (60's) filled with good loam (for the Strawberry delights in a stiff soil), and plunged to the rim to prevent them drying up too quickly, and a stone placed upon each runner to prevent them being blown down when dry they receive a watering, which should be repeated when necessary; and when the pots have become partly filled with roots, they should be detached from the parent plants, and the Black Prince shifted into small 32's, and the others into large 32's and 24's. The pots should be well crocked—say 2 inches of crocks. We use our best loam with a little road-sweepings added. Previous to potting, the plants should get a thorough soaking, for be it understood that if potted when dry the runners are that is, until the whole soil has become one mass of roots. In potting the soil should be well pressed by a rammer; they should then be placed in a situation fully exposed to the sun (we find the Vine border walls to answer admirably), but not too closely together, for if otherwise placed they would become drawn. This done they receive a watering, after which a little judgment will be required in the application of water until they have caught hold of the soil. When the pots get pretty well filled with roots liquid manure may be applied in a diluted state three or four times a week. But at no time while growing should they be allowed to suffer for want of water, and all runners should be kept pinched off during their growing season. When the plants have completed their growth by making nice solid and well ripened crowns, they should be put to rest, and the earlier in the season this can be accomplished, the more satisfactory the results, which, with proper treatment, may be anticipated in the following year. regard to the time to commence forcing the Strawberry much depends on circumstances, but there is not much use in putting them into heat before the turn of the day, but we always try, and therefore put a batch into our first early vinery, which we start on November 1. Sometimes we are successful, and manage to gather a dish about the middle of February. But much depends on the weather, for in the absence of bright weather, when the Strawberry is in flower, it is difficult to get them to set. Night temperature from 50° to 60°; day temperature, with sun, from 85° to 90°. From the time the berries are set we use saucers, which every Strawberry forcer knows the value of, as they retain part of the water that passes through the pots, which the plants ultimately absorb. So soon as the fruits are set, they should be thinned out, and not allowed to remain for a week or more before doing so, as is too often the case; ten or twelve berries (more depend upon the size and condition of the plants), and those as near the same size as possible, will be sufficient to leave on each plant, and which will weigh as much as if thrice the number were left on the plants.

The reason for leaving so many berries of equal size on the plants is that each batch of plants in their respective stages ripen their fruits at one time, when they can be gathered, and the plants turned out-of-doors or into some pit to be hardened off before they infect the other plants with red-spider, which would be the case were each batch of plants allowed to ripen a successional crop. These plants should be placed as near the glass as possible where they can have plenty of air and sun—the former to set, and the latter to ripen and give flavour to the fruit. Liquid manure in a diluted state should be applied three or four times a week, from the time the berries have set until they begin to colour, when it should be withheld, and clear water used. We force 1400 pots of Straw-berries every year, and of these, when forcing is over, we make a fresh plantation every year, destroying an equal quantity of the old plants. These plants bear a good crop the first year after planting, and after the third year they are destroyed. The ground should be trenched and well manured previous to planting, when they should be planted in rows 2 feet apart, and at the same distance in the rows. They should get a thorough soaking the evening previous to planting. *H. W. Ward, Longford Castle, Salisbury.*

Apple Stocks.—I send you by this post specimens of early flowering Apples, for the purpose of showing their resemblance to one another, as well as to prove that the sort marked Scott's Pommeir de Paradis is earlier in coming into flower than the sort marked as having been received from Mr. Barron, of Chiswick Gardens, as their earliest flowering Paradise stock. I wish to call your attention to the difference between the two as to earliness, as at p. 541 of the *Gardener's Chronicle*, 1874, it was stated that the variety was the earliest and best stock. [It was so there, Eds.] I may have been the earliest at Chiswick, but it is very different here. I possess all the sorts of Paradise stocks that are obtainable, and have plenty of Apples growing upon them all, but I fail to find amongst them any one sort that is equal in all respects to what I call Scott's Pommeir de Paradis. [This at Chiswick is much given to develop knots or burrs, which the French Pommeir de Paradis does not. Eds.] I send a piece of a branch cut from the earliest flowering of France, to show you how well and how strongly Apples succeed upon my stock. There is no Apple in my collection, numbering 1400 sorts, that flowers earlier than my Paradise excepting the Irish Peach, but the Oslin comes out nearly as soon. You will be able to note the similarity of the sorts sent. I looked over my collection this morning to see how many sorts were in flower, and expecting the kinds sent to you there are none else expanded, although several kinds are fast advancing. Our Apple orchards, as a rule, will hardly be in full flower before the middle of May. Our Pears, Cherries, and Plums, are a sight worth seeing. I never have seen such a sight, and I suppose shall never see such another. Should May prove propitious fruit will not pay for gathering, such is the present appearance of the trees in this part. We had a mild winter and warm summer, and now a cold dry spring with little frost in April, from 2 to 3 nights during the month, and this did little damage; altogether the season has been a favourable one as far as it has gone, but now a good rain would much accelerate things. *J. Scott, Merriott, April 28.*

Fruit Prospects.—So far as the season has advanced we have every reason to expect a heavy return. For many years past we have not experienced such congenial weather during March and April. Occasionally for a few days we had cold biting winds from the north and north-east, but fortunately the atmosphere was dry, and consequently no damage occurred. Compared with the spring of 1874 the state of vegetation in 1875 is at least two weeks later—an advantage, as the increase of solar heat will, to a great extent, counteract the effects of the May frosts. It does not follow that an escape in one place or locality is a guarantee that the fruit crops are everywhere safe. There are intervening circumstances which bring about very different results—such as altitude, a cold subsoil, or an excess of water. Water, as most of us know, stands at the head of all radiating substances, and consequently solar heat penetrates through it very slowly; while on the contrary, where water passes off freely the damage is equally severe during the warmth of summer, which reduces the size of the fruit and deteriorates the flavour. The quantity of Apple blossom is great, giving promise of an abundant crop, and the same may be said of Pears. Peaches and Nectarines have set well, so much so that at least three parts must be removed. Apricots are a moderate crop. For this we cannot blame the weather; owing to some cause which I do not quite understand the flowers were feeble and small, producing a slight amount of pollen. As a rule Apricots have never succeeded well with us, so much so that a large part of the wall has been covered with glass. Under protection the Moorpark, Hemskirk, Large Red and Kaisha fruit freely, while the Royal is a shy setter and guilty of dropping its fruit, still it is an ex-

cellent kind, and very desirable where Apricots succeed on the open wall. The crop of Plums will be, unless by some mishap, excessive. Cherries are, no means out of danger; they are sometimes difficult to manage, even on the open wall, as the crop is as often lost by a blazing sunshine as by too much cold and wet. The prospect of small fruit is very encouraging—beyond what we usually experience. *Alexander Crabb, Tortworth.*

The Past Winter.—Mr. Ellacombe's interesting list of plants which have withstood or succumbed to the severity of the past winter, tempts me to send you a note of what I have experienced in a small way. It must be remembered that my garden is at least 700 feet above the sea, the soil wet and sticky, and many of the plants not well established. All things considered I have lost wonderfully little, though perhaps the damage done is not yet fully discovered. I hope Mr. Maw and others will give us a similar list of gains and losses, as they are of great value to all gardeners in this country. Plants alive, mostly uninjured, though some are killed to the ground level:—

Bomarea acutiloba	Libertia pulchella
Boraria aurantiaca	" grandiflora
Bourardina Rauwolfia=Leontice	Xiphon caucasia
Cyrtogram	Iris Kämpferi (many varieties
Bambusa Metaké	quite unhurt, only one or
Aspidistra lurida (protected	two killed)
with a little straw)	" Iberica
Cistus laurifolius	" acutiloba
" albidus	" cretica
" corbariensis (foliage and	Cactinus Veitchii (against a
young wood mostly killed,	wall)
but plants breaking well)	Fremontia californica (against
" Instansium (foliage and	a wall, somewhat injured,
young wood mostly killed)	but breaking well)
but plants breaking well)	Bigonia radicans
Primula crocea	" grandiflora (somewhat in-
of the same crowns above the	jured, but breaking well)
soil quite uninjured by 20° of	A bella rupestris
frost)	Akebia quinata
Tricyrtis macropoda	Smilax aspera
Ophiopogon spicatus	Capparis orientalis (seedlings
Ornithogalum arabicum	brought in a bottle from
Salix cernua	Smyrna last year)

Plants apparently killed:—

Eryngium bromatifolium	Leontice leontopetalon (per-
Celastrus involucreta	haps fully dormant, as it must
Iris sinensis=finistata	be certainly able to stand
Solanum jasminoides (on a wall,	severe cold)
not established)	Iris tetorum.

Ophrys and Orchis, many species from Southern Europe, though in a frame and covered with cocoa fibre and mats during frost, have lost all their foliage, and are probably dead. This, I believe, solely the result of frost, as all those I brought into the house in November are well and flowering splendidly. *N. J. Elwes, Miserdale House, Cirencester.*

Wireworm and Vine Roots.—I should be glad to believe, if I could, with Mr. Parsons, that the wireworm will not attack the Vine. Hitherto I have had a conviction that it did, at certain stages at least. One year I lost a few young Vines, just as they came away from eyes. I did not find the wireworm actually at work, but something had bored into the soft neck of the young plants, just at the eye, and otherwise so eaten into them that they died; and in breaking up the pieces of turf in which the eyes were inserted I got the wireworm in the view of the roots, and thought the evidence sufficient to convict. That season the turf we used was very much infested with the worm. I have little fear, however, of it attacking Vine roots after they get woody; but when Vine eyes are just beginning to grow, and those soft callosities which are the forerunners of roots are forming round the edges of the bark where the knife has passed through, I think it will be found destructive enough. *J. S. W.*

Erythronium giganteum.—This distinct and charming Dog's-tooth Violet forms quite a gay feature in the herbaceous grounds at the York Nurseries. It has been in full flower for some weeks past, and, to all appearance, will continue so for ten or fourteen days longer. As many as five flowers are frequently produced on one stem. In one instance, it is said to produce as many as nine flowers on a stem, and resemble the flowers of *Lilium colchicum* in colour. The form of the flowers, and the way in which they hang upon the stem, suggest a miniature form of the beautiful *Lilium excelsum*. The plants are growing in deep spongy peat mixed with sand. This *Erythronium* when cultivated in pots is very handsome, as the plants can then be elevated so as to cause the flowers to be seen to greater advantage; for when the flowers are merely looked down upon a great portion of their beauty is lost, the centre of the flower being particularly beautiful. *R. P.*

Paper Protectors.—I think it a pity that what I did say respecting the trial of paper protectors over the plants, and a few trees, should have been misunderstood by Mr. Lee of Hounslow, and I object to the use of the words "simply ridiculous" as being beyond the subject, which I thought was the discovery of the reason why the Plum trees in question should suffer such losses in shoots and leaves. We may differ in opinion without being un courteous. What

I attempted to advocate was the greater use, or rather the introduction, of paper as a protecting material of immense power, as is well known in Japan for instance. The difficulty of application is obvious; but here was a case where a few trees could have had stout paper applied only to their tops. This would have tested both the value of the protector, and done something to ascertain whether spring frosts—I am no believer in October frosts as capable of injuring a tree at its best time for defence—were the real cause of injury. After all, if the Plum in question is tender, there are others which are not so. I have at this moment, on the lawn, three valuable specimens, too long coming here, are looking very miserable. These I have covered with stout newspapers sewed together, and I hope to save the trees yet. Neither the wind nor the rain has, as yet, damaged the paper. We had no trouble whatever in winding this long roll of paper round the trees, nor did it tear in so doing. What I desire to call attention to is the use of this material, as yet untried for horticultural subjects. A little experience will modify all our ideas on this, as it has on many similar things. It is also certain that the original communication in the *Gardener's Chronicle*, recommending its use for early Potatoes, has been copied into many other journals, so that Mr. Lee will find himself in a minority as to his idea of its value. *T. C. Brihaui.*

Co-operative Gardening.—I read many years ago in a horticultural magazine an account of a co-operative garden for gentlemen. The plan seems well adapted for this place, and I should be much obliged if any of your readers could afford particulars of any similar system in actual practice. About ten or fifteen gentlemen purchased an acre or more of ground, towards which each contributed his quota, say £100 apiece. The ground was then walled, leaving a slip all round, a ledge for a gardener built at the top, a main (south) entrance, and at the top of the top walks were laid out and the inner portion lotted into as many plots as there were proprietors. The gardener protected and swept the garden, for which he had the use of the lodge and slip, and also earned money by managing the plots of those disposed to engage his services. *W. H., Brighton.*

The Double White-flowered Cherry.—Here with I beg to send you a spray of double flowers from a Cherry tree 25 feet high, which may now be seen in this square, covered to its very top with these lovely white flowers. Horticulturists will appreciate the sight when they are informed that this tree has not been worked or grafted. Gardeners have greatly admired this large specimen, nor do they lose sight of the same display by Mrs. Laura Sit, Joseph Faxton in mapping out the garden, which by its undulating grass and serpentine walks remains unsurpassed in London squares. *F. J. B., Amphill Square, N.W.*

May-Day in Cornwall.—Will you allow an old Cornish woman to say a few words on the subject of May-Day and its former observance in that county? In "the part which fetches furthest west" it was kept in times long past, and is still a holiday for many a thrifty person who on that day attempted to purchase his usual calling was subjected by his neighbors to various ludicrous penalties. "About the springing of the day" the younger members of every family and of all degrees set forth in large parties to "bring home the May," thereby meaning the Hawthorn, if it was to be found. But as Nature did not always choose to send forth that lovely blossom so early, they were obliged (as I suppose) to give the name that case to some other plant, and used instead to gather the clear red shoots of the Sycamore, not the flowers. Our name for the Lilac is Prince's Feather; in Devon only have I found it usurping the place of the true May. Perhaps it may be worth while to add, in reference to a late discussion, that I brought a few plants of the exquisite *Narcissus poeticus* in its single form a few years ago from a Cornish garden into a light and most productive soil, and that being planted in a clayey loam they are quickly becoming double, fat, and heavy. *Commelina.*

The Primrose Changing Colour.—I have for many years carefully observed the behaviour of the common Primrose in the cultivated and half-cultivated state, and have the strongest doubts, though I concede the possibility, of an artificially produced change of colour in this plant where the individual was born a real pure primrose-coloured or white Primrose. This, however, I know, that coloured blood, so to speak, can exist, and remain latent in a normally coloured cultivated subject, only showing its presence occasionally in a purple streak, or more strongly in a petal, or even an entire blossom. Old women, old gardeners, intelligent, too, in their way, declare that the wild Primrose, treated with cow dung in its strongest and freshest state will produce the change, but none of those with whom I have conversed ever came well out of a properly conducted cross-examination. I may add, that the last winter I examined

was a believer, and, according to his own account, an eye-witness of the adder phenomenon. Would your Eton correspondent kindly say how long he had known his Primroses in the uncoloured state? Or whether he cultivated coloured ones in his garden or in the vicinity? Also, again, whether the coloured individuals are old plants (judging from habit and appearance), or seedlings flowering for the first time this spring? The Primrose intercrosses naturally as freely as the Brassicas; it will also breed as freely with the florists' Polyanthus, which seems from this to be a strain, though a distinct and remarkable one, of the species in question. I have resumed the cultivation of my old nice strain of this plant, and have made, I hope, a little advance this spring. Among other things, I have at last succeeded in reproducing the curious "blue Primrose," a little less distinct in colour but of good form, and in all probability fertile. I have also raised a fine double lilac one, stalked. As I distributed both plants and seeds to various friends a year or two since, I hope they, by the aid of their own breeds and that of mine, will soon raise this very charming plant to the rank of a practicable florists' flower. R. T. Clarke, Northampton, May 2.

Duke of Edinburgh (Daniels) Cucumber.—This is truly a magnificent Cucumber, so far as size goes. To-day I have cut several from plants growing in 12-inch pots, the largest of which measured 27 inches long, 7½ in circumference, and weighing 5 lb. I do not know whether this is an unusual size for this variety at this time (with several growing on the same plants) when grown in pots. I may state that they were watered with liquid manure, as well as having the pots top-dressed with short dung. Last year I cut one of the Marquis of Lorne Cucumber, which was grown in the same-sized pots, and which received the same treatment as above stated, which measured 27 inches long, and weighed 4½ lb. The skin of the "Marquis" is more spiny and finer than that of the "Duke;" the appearance of the latter is rather coarse, but, nevertheless, it is a fine Cucumber. H. W. Ward, Longford Castle, Salisbury, May 3.

International Potato Exhibition: a Suggestion.—Many Potato-growers are very much pleased to see that the "noble tuber" is now likely to be raised to the position it deserves, thanks to Mr. McKinlay and the other gentlemen who have framed the liberal and complete schedule of the exhibition to be held at the Alexandra Palace in September. There can be no doubt but the show will meet with the encouragement it deserves, and that it will be continued yearly with such alterations as may be found necessary. Could it not be managed to have a medal struck in commemoration of this the first show devoted entirely to Potatoes, and let one be awarded to the exhibitor of the best dish of round, and another to the exhibitor of the best dish of kidney Potatoes in the whole show, to be picked out of the exhibits in all the classes, the medal to have the Alexandra Palace on one side, and on the other a wreath of Potato haulm, with the name of the exhibitor, and also the name and native country of the Potato—thus: Awarded to A. B. for American kidney Potato Snowflake, or to C. D. for English round Potato Model; and to give the show more of an international character, in the event of the best dish in either class being an American variety, let us pay the cost of the medal, but if an English variety, let our American cousins pay for it, and as they are now enthusiastic Potato growers they would readily do so. If this was done every year it would show at once the best round and the best kidney Potato in cultivation [Not necessarily, if they are judged by form, which is no guide to flavour; and besides, the tubers which may make up the handsomest dish on an exhibition table might perhaps be selected from a second-rate cropper. Eds.] and stimulate the rivalry in the production of improved varieties (the Breese, &c., on this side and the Breese, &c., on the other side of the water), which has been a chief reason for getting up this international Potato exhibition. C. R.

Primula denticulata.—In the garden attached to the residence of Mr. Samuel Barlow, Stoke Hill House, Chadderton, Manchester, and where there is a constant battle going on between the smoke deposits on the one hand and bright flowers on the other, one of the most surprising of several pleasant features was a line of Primula denticulata, growing in the open border, and fully exposed as the other hardy flowers about it. Nice established tufts of it, planted out two and three years, bore from seven and eight, to thirteen, and even sixteen trusses of bloom, and was even striking in front of a line of smoke-begrimed evergreens. Mr. Barlow states that though he lives some eight miles from the centre of Manchester, he has considerable difficulty in getting the common Primrose to exist in his garden, while this Nepaulese species, amid surroundings one would imagine of a very different character to those of its native mountains, flourishes unprotected, notwithstanding that noxious deposits of sulphuric and

maritic acids are constantly being made from the great chemical works that surround Manchester. R. D.

BRITISH GARDENERS.—XVII.

ANTHONY PARSONS.

IN Mr. Anthony Parsons, whose portrait we now publish, we have one of the comparatively few professional horticulturists who, to a thorough knowledge of practical gardening in all its departments, adds a well-trained acquaintance with the culture and merits of florists' flowers. In consequence of this extended range of information, no less than for his uncompromising and unswerving integrity, his services are much sought for and appreciated as a censor at the metropolitan exhibitions. He was born in 1810, at Merton, in Surrey, his father, whom it was his great misfortune to lose while he was yet young, being a small farmer, and carrying on also the business of a hay and corn dealer.

"To a passion for flowers, which possessed me from my very earliest days," writes Mr. Parsons, "I trace the impulse which caused me to follow horticultural pursuits to gain a living. I used to save up my pence to purchase Primroses, Daisies, and such plants. As I grew my ambition increased, and, among other things, I purchased a Pelargonium called Commander-in-Chief. This purchase I shall never forget, my delight in its possession was so great that it deter-

mined me in my future career. Shortly after this period a friend of the family, Mr. Lee, entered the service of the Earl of Chichester, at Stanner Park, near Brighton, as gardener, and, knowing my desire, he offered to take me into the gardens. I readily accepted his offer, and was duly installed in the office of kitchen boy, filling up my spare time in the houses under the late James Cuthill, who was foreman. After two years' service I left, and shortly after entered the employ of Mr. Charles Robinson, of Thames Ditton, where I worked hard, and learned much. I remained here one season, a considerable part of which time I was employed in the houses. I left Thames Ditton to accept a situation offered by Mr. Hugh Fenton, gardener to J. Berens, Esq., Kewton, St. Mary's Cray. At this place there was a very fine collection of herbaceous plants, made by the former gardener, Mr. R. Sim, now of Foot's Cray, and I used to spend hours of my spare time in studying these plants, and learning their names. While here I first took an interest in British Ferns, in search of which I made frequent excursions about the neighbourhood, where in those days many fine species as well of Ferns as of British Orchids were to be found. Here, also, I made myself acquainted with the Kentish system of Filbert and bush pruning, there being many hundreds of acres of these under cultivation in the locality.

"I left Kewton in 1831 to take the foreman's place at the Retreat, Battersea, where I stayed but six months, when I left to take charge of the gardens of J. Ricardo, Esq., in whose service I remained until his death.

"My friend, Mr. William Andrews, Fine and

Grape grower, of Vauxhall, then recommended me to A. R. George, Esq., of Ponder's End, into whose service I entered in February, 1833. The experience I had been gathering up now began to bear fruit, and I exhibited for many years with great success at Chiswick and the metropolitan shows, Pines, Grapes, Roses, and many other things. I also turned my attention to the improvement of various florists' flowers, one of my first achievements being to raise the Dahlia known as Metropolitan Wonder. Great numbers of Panics raised by me were introduced to the floricultural world by May and others. The Verberna Enfield Scarlet was another of my productions; and I also had considerable success in raising new varieties of Petunias. Later on I made Hollyhocks my chief study, with very satisfactory results—letting out, through Mr. Chater, twelve fine varieties in one season, 1851. My employer died in August of this year, and my unbloomed seedlings passed into the hands of Messrs. Paul, who, I believe, found them to be a very fine lot.

"From Ponder's End I came to Danesbury, where I now am. Since I came here I have had to carry out improvements in the pleasure-grounds, involving the making of new roads and of a new kitchen garden, and I have also had to make a hardy fernery, which now contains a magnificent collection of British Ferns, and is well known to many admirers of these lovely plants. The Grapes, Peaches, and fruits grown here have always been of first-rate quality, or have florists' flowers been altogether neglected by me since I came here, although I have had much besides to occupy my attention. My later experiments have been with Achimenes, in which I have been eminently successful, having obtained among others Mauve Queen, Aurora, Williamsii, and Fire-fly, which are not yet approached by the production of any other raiser. Besides thus devoting my attention to the improvement of flowers, I have found opportunities from time to time to attempt the amelioration of vegetables, several of which I have had the satisfaction of improving."

Reports of Societies.

Horticultural of New South Wales: Feb. 24.—We abstract from the Sydney Morning Herald the following particulars of the autumn exhibition of this Society, which took place on Feb. 24 in the Botanic Garden. The weather was delightful, a fresh breeze from the sea moderating the warmth of the sun, and affording a delicious coolness. The exhibition was thrown open at 1 o'clock, and during the afternoon it was inspected by a very large number of visitors, most of whom were ladies. A great improvement was noticeable in the appearance of the gardens, the late rain having imparted a freshness to everything around. The exhibition of plants was good, but little support was given by the growers of fruit and vegetables. One of the principal objects of the Society should be to encourage the introduction of new and valuable products in this department, and to promote a high degree of culture; but the prizes awarded do not appear to tempt growers. The plants shown were not so numerous as on some former occasions, but, as a whole, they were better grown; and the collection from the Botanic Garden was about the best and most attractive which has been shown for some years. On the stage opposite the entrance were placed twenty plants grown by Mr. Brown, whose plant of *Alcaecia metallica* was the best yet shown by an amateur, and whose specimens of *Hibiscus Guilfoylei* were well grown and richly coloured; an *Isora* covered with a magnificent head of reddish flowers, and the pretty purple spikes of the variegated plant called *Opibionop Jahuran variegatus* were much admired, as were the *Croton Morisii* and *Dracena Bartlettii*, both well known to frequenters of flower shows. The plant of *Cyrtoceras reflexum* was well worthy of remark. In another collection, shown by the same exhibitor, *Croton undulatum* appeared to be the best; while the double-flowered white *Azalea* secured attention, for it is an unusual thing to get these beautiful spring blossoms in autumn. Among the other plants exhibited by Mr. Brown were three good *Crottons*, some of them new; three *Marantas*, and a specimen of *Angelonia grandiflora*, whose numerous spikes of light purple flowers make it a valuable addition to any outdoor collection at this season of the year. Mr. Joseph Graham's collection of *Dracenas*, *Crottons*, and miscellaneous plants challenged admiration by the diversity of their colours and the beauty of their form. Some of the *Dracenas* were new to the colony; but, irrespective of that, Queen Victoria will be generally esteemed the best. Of the half-a-dozen *Crottons*, *C. volutum* was the only one named; two were long narrow-leaved varieties, in one of which light green and yellow predominated, the foliage of the other being dark green blotched with red. The dark variety of *Phyllanthus* has its variegation richly developed, and the habit of the plant was good.

The exhibition of plants from the Botanic Garden, if not the most numerous was certainly the best collection shown from that establishment for some years past.

The specimens, taken as a whole, were splendidly grown, and we should have hardly thought that such magnificent growths could have been housed with the very inferior accommodation at command. The collection consisted of about eighty plants, the uppermost row comprising some very handsome Palms. The clear bright yellow flowers of the different varieties of *Allamanda* were very conspicuous; but not more so than the massive richness of a new twisted leaved *Croton*, from Fiji, the upper portion of which is pure yellow, the foliage at the base being dark green, mottled with red. The halberd-shaped *Croton*, named *Disraeli*, which was first shown by Mr. Saxeby, improves on acquaintance, and with age has developed a richness and variety of colour which could scarcely have been anticipated. The Pijian *Croton Harwardianum* was also another admirable variety, and nothing could well exceed the vivid tints of gold and crimson which illuminated the midrib and veins of the leaves. Among other *Crotons* of great merit, *C. undulatum* was much admired on account of the richness of its bronze and crimson markings. The *Marantas* in this collection included several old favourites; we may name *M. Fortiana*, *M. zehrina*, and *M. regalis* as being the largest and best grown specimens which have been exhibited for some time. *M. pulchella*, similar in habit to *M. zehrina*, though of smaller growth and lighter foliage, was much admired. The collection of *Dracænas* included two new sorts from Samoa; and of the *Palms*, two of the most interesting were an unnamed one from the Royal Gardens at Kew, and *Pritchardia Martiana*. *Caladiums* are always a principal feature in the autumnal exhibitions of the Society, and those exhibited this year possessed great beauty if they lacked the charm of novelty. There were some new introductions, but none which surpass the old favourites. In this collection was a nice little plant of *Erythrina Parcellii*, or *E. picta*, whose golden midrib and veins make the foliage of this South Sea Island Coral-tree so rich; and the bronze-coloured *Passiflora-shade foliage* of the new Fig, *Cucumis*, introduced by Mr. Walter Hill, of Brisbane, which attracted curiosity from that vast field of vegetable wonders—the South Sea Islands. There were some very beautiful Ferns in this collection, among the rest *Adiantum farleyense* (which is quite new here) and *A. concinnum*, which is but little known, and whose graceful habit and perfect development make them coveted.

Mr. Graham showed three of the new *Allamandas*, two of which were well flowered; a specimen of *Begonia carminata*, which, although not new, is still far from common, and as seen on this occasion a show plant of rare excellence and beauty. Mr. Graham was also great in *Caladiums*. The collection of plants from Mr. Piper included some interesting exhibits. The light-colored *Phyllanthus* was a very pretty shrub. Mr. Kippax showed great skill as an amateur; and an exceedingly interesting collection of *Palms* and Ferns were sent by Captain Broomfield, who at former exhibitions has earned a reputation for the rarity and excellence of his plants, and other spring flowers; they were all grown in a bush-house, and many a professional might well envy the wonderful success which has rewarded Captain Broomfield's horticultural efforts.

Mr. Piper was almost the only exhibitor of fine-foliated *Begonias*, but he well filled up this section, and among his miscellaneous plants we would call particular attention to the specimen of *Coprosma Baueriana variegata*, which will form a very handsome shrub for the border.

Near the centre was placed a large and very interesting collection of novelties, many of which were the fruit of Mr. Charles Moore's visit to Europe, and although the plants had as yet attained only a small growth they were all shown in fine condition, and will be much sought after for greenhouse decoration. Among many others we may enumerate *Eugenia Ulmi variegata* and *Daphne elegansissima*, which will be very valuable for outdoor cultivation; *Curmeria picturata*, *Phlox*, *Campanula*, *Kempferia*, *Roscochina*, *Higginsia macrophylla*, *Maranta orbifolia*, *Aphelandra nitens*, *Campylobotrys discolor*, *Martinezia granatensis*, and several handsome *Alternantheras* and Ferns.

Lady Robinson exhibited a number of very beautiful Ferns, as well as choice specimens of *Sanchezia*, *Diplazium esculentum*, *Rhapis flabelliformis*, and *Musa vittata*, a plant quite new to the exhibition. In the collection of Mr. Wood, gardener to Henry Prince, Esq., there were some excellent exhibits, *Croton*, *Caladium*, *Dracæna*, *Maranta*, *Alchemilla fulgens*, *Lilium speciosum*, *Marattia*, *Cissus discolor* (Java), and a number of very handsome *Lycopods*. The exhibits of the Hon. T. W. Smart included a choice lot of Ferns; *Areca sapida*, a fine Palm; the very pretty *Maranta tabispata*, *Dicksonia squarrosa*, a fine Tree Fern; *Hypolepis tenuifolia*, *Cyathea* and *Alocasia macrorrhiza*, the last mentioned being especially good, and of large and perfect growth. Mr. R. Piper, gardener to the Hon. Henry Moore, exhibited a fine collection of Ferns and cut flowers; the latter consisting principally of *Verbenas*

and *Gloxinias* of fine form and careful nurture. Mr. Saxeby's cut flowers included some pretty *Zinnias*, *Verbenas*, *Antirrhinums*, *Asters*, and *Phloxes*; those of Mr. Brown, some finely formed *Dahlias* and *Verbenas*. Mr. Brown also exhibited some large and remarkably well grown Figs.

Royal Botanic.—MESSRS. JACKMAN'S CLEMATIS EXHIBITION.—In this exhibition, which was opened on Saturday last in the glass corridor leading to the large conservatory in the Royal Botanic Society's Garden, Regent's Park, we have one of the most novel displays that has been seen for a very long time, and which is truly of surpassing excellence. All who have attended the spring shows of this Society will know that the larger exhibits are placed on a somewhat elevated stage running the length of the back wall, some 200 feet long, and the dwarfier growths, such as cut *Violas* and a lower stage of the same length in front of the glazed side. To give an idea how the Messrs. Jackman have arranged their show, we may mention that all the staging before alluded to has been removed, and a temporary structure along the back wall has been substituted, this being arranged in three tiers, the highest of which does not carry the plants above the line of sight. The tallest plants are placed at the back, and the smaller ones in front, according to their size, the outside row of plants, about 18 inches high, completely hiding the staging. Some 350 plants are thus dealt with, and, with few exceptions, these, consisting of the varieties named below, and a host of unnamed seedlings, are in nice flower, but not yet quite at their best. The bright coloured are relieved here and there by suitable-sized specimens of *Retinosporas* and other choice *Conifers*, *pyramidal Hollies*, &c., the whole furnishing a floral *tableau* of sparkling brilliancy and rare interest.

The varieties in flower of the patens type during the past week are:—*Fair Rosamond*, bluish-white, with a somewhat indistinct wine-red bar, and very prominent rosette of stamens—a very fine flower, with the additional attraction of being delicately scented; *Lady Londesborough*, deep mauve or bluish lilac, with a purplish red bar; *Albert Victor*, deep lavender, with pale bar; *Miss Bateman*, white, with chocolate-red stamens; *Patens Florida*, French-white; *Sophia* plants, lilac-purple, double under ordinary conditions, but, being forced for the purpose of this display, the flowers have very singularly all come single; *Standishii*, light mauve-purple; *Mrs. S. C. Baker*, French-white, with claret bar, very fine; the *Queen*, pale lavender, or mauve-lilac, and primrose-scented, very fine; and *Stella*, deep mauve, with well-defined reddish plum-coloured bar. All the above are more or less well known.

The following new varieties, not yet in commerce, and belonging to the same type, are also represented: *Miss Crawshaw*, eight-sepalled, 6 inches across, delicate rosy pink, a novelty as regards colour, and a free grower; *Edith Jackman*, bluish-white, with a purplish rose or wine-red bar, which is not shown in plants that have been forced; *Lord Derby*, eight-sepalled, 5 inches across, pale lavender or bluish mauve, very fine; *Lord May*, 5 inches across, deep rosy lilac, finer darker towards the base, and especially so; bar, sweet scented, and very fine; *Conness* of *Lovelace*, double, with bluish lilac guard sepals, and a rosette-like deep lilac centre, in the style of *John Gould Veitch*, but a much superior flower, and a more vigorous grower; *Maiden's Blush*, eight-sepalled, delicate bluish-white; bright rosy lilac at the base of the bar, and marked by a creamy stain; *Vesta*, dead-white, with a creamy tint over the central bar, form very fine, the best white yet raised; *Ada*, lavender-blue, with mauve edges, flowers 4 or 5 inches across, and very freely produced; *Aureliana*, a Continental variety, scarcely distinguishable from *Standishii*; and *Sir Garnet Wolseley*, rich plum colour, with a shaded red bar, distinct, and a very free bloomer. The Florida type is represented by the well-known *C. Fortunei*, *Lucy Lemoine*, a very good improvement on the first-named; and *John Gould Veitch*.

Of the *lanuginosa* type we noticed only the following new varieties:—*Princess of Wales*, deep bluish mauve, seven-sepalled, and about 5 inches over; it has good foliage, is a very free grower and flowerer, and remarkable for the great depth of its colour; *Robert Hanbury*, six-sepalled, mauve-lilac, shaded red up the bars, a very fine flower of good substance and grand foliage; *Morikata Oke*, bluish lilac, with a well marked deeper coloured margin, pretty, and a very free and Angled eight-sepalled, 4 or 5 inches over, bluish lilac, with edges of a deeper colour, very fine, and free blooming.

Three only of the Jackmann type are represented, viz., *Lady Stratford* of *Redcliffe*, eight-sepalled, 6 inches over, of a delicate and peculiar tint of mauve colour, *Rubella*, rich claret-purple; and a new one, not yet sent out, named *W. E. Essington*, six-sepalled, of a reddish violet hue, deeper towards the base. This is a great acquisition to the plant, flowering twice during the year, and though it belongs to the summer and autumn blooming sec-

tions, it comes into flower naturally with the patens type.

Thomas Moore, pacy violet, with white stamens, is the only member of the viticella type yet in flower.

MR. WILLIAM PAUL'S ROSE SHOW.—Mr. Paul's annual display of cut Roses, &c., which was last year held at the Crystal Palace, and the year previous at the large exhibition tent at South Kensington, has this year been transferred to the well-known Rhododendron tent in the Royal Botanic Society's garden at Regent's Park. As at South Kensington, Mr. Paul has had to fight against the difficulties incumbent upon the want of accessories in the way of bold clumps of dark-foliated trees and shrubs to relieve or set off the bright colours of the grand blossoms on his giant Rose trees. At South Kensington the plants, though very fine, were dwarfed to an appreciable extent by the height of the structure, and their thinness on the ground. This defect Mr. Paul has attempted to remedy at Regent's Park by planting, in the more conspicuous points of view, suitable clumps of pictorial trees, such as the variegated *Acer Negundo*, the golden and silver-leaved *Elder*, the *Purple Nut*, the *Sea Buckthorn*, &c.; but the fates have been against him, and, the season being late, the planted trees have refused to clothe themselves in their parti-coloured foliage, and, instead of a striking and effective display, which, the ground favoured, there is nothing to catch the eye but blossoms upon blossoms of Roses, and the result from a pictorial point of view is disappointing. Horticulturally speaking—that is, from a grower's point of view—Mr. Paul's Roses, as usual, leave nothing to be desired; they are there in hundreds, old sorts and new ones, and in all sizes, from those in an 8-inch pot to trees 6 feet high and 4 feet through, and all superbly flowered. It is needless to repeat the names of the varieties which Mr. Paul shows, for he shows all that are worth growing, and, excepting the newer ones, the names are familiar enough. The new *Star* of *Waltham* is shown very fine, as also are *Princess Christian*, *Princess Beatrice*, *Marie Van Houtte*, *Madame Hippolyte Jamin*, *Captain Christy*, *Marquis de Castellane*, *Catherine Mermet*, *Madame Lacharme*, and *Peach Blossom*.

Forestry.

Now is the time to prosecute with all diligence the peeling or tan-flaying of Oak, Larch, Alder, Willows, and all other descriptions of wood and timber, whether for the sake of the bark itself or in order to improve the wood by making it more suitable for a variety of rustic and other purposes. At one time it was believed that if Larch trees were peeled in the growing position, and allowed to stand six or eight months before cutting down, the timber of such trees would not, on being manufactured and seasoned, warp or twist, as it is liable to do when cut in the usual way. Experience has, however, proved that such is a false belief, and now the dangerous and expensive mode is departed from both as regards Larch and other timber.

According as the price of labour increases and day wages rise, the tendency on the part of employers is to resolve as much work as possible into contract or piece-work, and the peeling or tan-flaying, which at one time was invariably done by day-work, is now almost universally done by contract, at least upon all properties of large extent where such work is extensively carried on.

It is imperative that all curious, fancy, and fantastic growths, whether roots, stems, boughs, or branches, which are intended for careful preservation in their natural nude state, should be peeled on the first rise or flow of the sap, or at least before the cambium has begun to form into alburnum; otherwise, when the latter operation takes place, the transparency of the wood is destroyed, the fine, delicate convolutions and intricate network of the cambium, and the smooth, glossy surface abraded in such a way that no subsequent manipulations of art can restore it to its original beauty and elegance. For the sake of those, however, who are more engaged in plain practical work than fancy, ornamental and artistic kinds, I would give the following direction as the result of my own experience in different parts of the kingdom.

In the North of Scotland the following transaction took place in 1866:—The plantation of birch trees, eighteen to thirty years old, composed principally of Larch, with a small mixture of Scotch Fir and Norway Spruce, together with a few hard woods, chiefly Oak, Elm, Sycamore, and Birch. The trees were all marked by the forester previously, and shown to the contractors in the usual way, and the conditions were—1. To cut and peel all the Larch trees (except such as were bark-bound). 2. To carry all the bark out of the plantation, erect stages, and dry it thereupon. 3. To chop, bag and put upon trucks at railway station.

The whole quantity of bark peeled was 27 tons,

which realised £87 2s. - £3 4s. 6d. per ton delivered. The various items of expense stand thus—

Table with 2 columns: Item, Amount. Items include Cutting trees, peeling and carrying bark, Chopping and putting into bags, Carting to railway station, Railway carriage to market, Incidental expenses, Discounts.

Total expenditure ... £66 4 11

The clear profit is thus £20 17s. 1d., which would be rather considerably greater but for the distance and expense of conveyance to market—an item essentially variable.

Amongst other experiments I have found 50 cubic feet of medium-size Larch trees yield 16 stone imperial of green bark, equal to 9 stone 7 lb. dry. One superficial foot of Larch bark, taken off one foot above-ground, gives 1 lb. 14 oz. green, or 1 lb. 4 oz. dry; one superficial foot of Larch bark from middle of tree gives 1 lb. 3 oz. green, or 12 oz. dry; one superficial foot of bark from top of tree, 1 lb. 2 oz. green, or 15 oz. dry.

The operation of Oak-barking begins in the South of England about the middle of April, and in Scotland about the middle of May. Some localities, and also some trees, are much earlier than others, and it requires the practised eye of the forester to discern when the trees are in the most proper state for operating upon, the size and form of the bud being the principal index to such a state.

In Sussex the operation of tan-baying, as it is there termed, is much in advance of any I have seen in any other part, nor can I find better evidence be sought or given of the superior management, and specially the harvesting of the bark in England as compared with Scotland, than the fact of its commanding 10s. or 20s. per ton more in the market.

In contracting for peeling Oak it usually lets at about 30s. per ton, including felling the trees, drying or harvesting, 2s. per ton extra, and 9s. per ton for chopping and putting into bags. Wood merchants make a calculation of 47 worth of bark to one cubic foot of Oak timber, including the bark upon the branches, up to 2 inches diameter.

The following extracts from my note-book are afterwards which they occurred at random in Scotland—A man in one day peeled 6 cwt. of green bark, equal to 3 cwt. 6 stone dry. Fifty cubic feet of Oak timber produces 8 cwt. green bark, equal to 5 cwt. 4 stone dry. One superficial foot of bark taken from the trunk of the tree near the ground weighed, when green, 33 lbs., and when dry, 2 lb. 4 oz. One superficial foot from near the middle of the tree weighed 2 lb. green, and 1 lb. 4 oz. dry. One superficial foot of bark taken from a large branch weighed 1 1/2 lb. green, and 12 oz. dry. Young fleshy bark is the best and most valuable, but loses most in weight during the harvesting. Care should be exercised in stripping the bark to take it off in lengths of 3 feet, and as broad as possible; and no mallets should be used if possible, as thereby the tanning properties of the bark are much deteriorated. In harvesting, the bark should be set on end in long double ranges, and not laid or built upon stages as is generally practised, to its very serious detriment and depreciation of value. C. Y. Nichol, Culler, May 4.

The Villa Garden.

WATERING.—Dry weather is a visitation that perplexes the soul of an elementary Villa gardener, and after two or three days of bright sunshine he commences watering, at all hours and at all times, as if the act were as essential to his own existence as that of his plants. He rarely waters wisely or effectually, and he had a great deal better not do it at all. But you cannot force him to take your advice, and it is very difficult to persuade him he is wrong. Still it is well to reason with him, and in doing so let us observe that though the soil may be dry on the surface it is yet nice and cool and moist about the roots of the plant; and though the action of the noon-day sun may cause a plant to flag, the refreshing dew of the evening will soon bring it right again. If our Villa gardener will note a few of his plants, he will find, notwithstanding the apparent drought, which gives him so much uneasiness, that they gradually attain size and make a vigorous growth. Let him set himself to stir the surface soil about the plants, not descending deep enough to disturb the roots, for in dry weather there is nothing like a loose soil frequently stirred on the surface to mitigate the effects of drought. He will be certain to demur to this, and deem it paradoxical, but it is a fact notwithstanding.

Only a few days ago we observed a neighbour, who, without being a very intelligent, is at any rate a most assiduous gardener, taking advantage, as he thought, of the cool of the evening to water his garden, and he

was casting about him in every direction a fine spray from a rose watering pot, as if he, at least, enjoyed it. He watered nothing thoroughly, but he moistened everything in his way. As the evening advanced the air grew chilly and cold, the wind had the eastward position, and the early morning saw a white frost, and the sun rising bright and clear over the blossoms on which it was deposited, last night's sprinkling having assisted the mischief. One or two very simple principles will serve to explain how watering in such a way at such a time may do mischief. The temperature about the blossoms was fast falling as the shades of evening came on, and the application of the water at that time only served to augment the cold. The moisture deposited on the flowers was seized on by the frost, and converted into ice, and a greater body of cold was thereby created, and there was a heavier deposit of frost. The lighter the deposit of frost on the flowers, the less danger is there when the rising sun strikes it ere it is thawed. Thus it is that gardeners, when they are calculating the chances of frost overnight, say, "Well, the air is nice and dry, and so it may not do much harm after all." Then the sprinkling given to the soil about the trees only served to cool the surface, without descending to the roots and moistening them. Heat was thus drawn from the soil that it were better should have been retained.

And there is another point worth bringing out a little more clearly, for we have already slightly touched upon it. It will often happen that, when the soil about the roots is damp enough to keep the plants doing well, that they will flag under the effects of a bright sun following close, cloudy weather. Roots and leaves alike have been acting in perfect harmony in promoting the well-being of the plants, when a bright hot sun breaks out suddenly, and, to the physiological effect in plain words, "the quickened activity of the leaves in evaporating cannot at once be met by the action of the roots, though moist enough, and flagging and signs of distress follow." Those who are not well informed on the matter at once proceed to pour water over the soil that was moist enough the night before, and which leaves it afterwards much too wet. As that fine gardener, the late Mr. Robert Fish, put it, "the result is that the soil is cooled indelicately by evaporation, and thus frequently painful after a painful of water is used without redressing the evil, when a few quarts thrown as a sort of mist over the foliage would prevent all the mischief and most of the labour, and leave the soil in a more healthy condition. In a bright sun the leaves would soon dry, and therefore no danger would ensue from the foliage being left in a damp state at night. Such a slight syringing will merely serve to quicken during the forenoon, and night shading would be equally sufficient." This last sentence contains a wholesome truth. When we see a plant with drooping leaves our practice is to invert a flower-pot over it for the sake of shade; or if it should be too large for the pot, then it is shaded by sticking a few sprigs of an evergreen shrub about it.

Now let us apply this matter of watering to the greenhouse also, for it opens with as much point there as to plants in the open ground. During sunny bright weather, especially if it be accompanied by a breeze, plants in pots should be rapidly under glass. Our Villa greenhouse is open to the south, and the sun shines on it for several hours during the day. We have a tank in a sunny corner, and thus the water is to some extent chilled. Now, as a rule the water should be as nearly as possible as warm as the atmosphere about the plants. If there is no water in the house, use rain-water; but if rain-water is not at hand, then let that used, whether from pump or cistern, have the benefit of the sun shining on it during the day. The Villa gardener should have a tub placed in the open air in a sunny place during the summer months, so that the water may become warmed before it is applied to the plants. To take cold hard water from a pump and apply it at once to plants is injurious, and it is a practice that should be avoided.

In cloudy, dull weather plants do not dry nearly so rapidly as in sunny, drying weather, therefore less water at the roots is required. Our practice is to look over our plants every morning before breakfast, and not to water unless the soil on the surface is beginning to dry or has become dry. If the plants are strong and growing vigorously apply water two or three times, if weakly only once. If the day is hot and sunny, some will want water again in the evening. We also syringe occasionally during the day, or distribute a fine spray through the fine rose of a watering-pot over the foliage of the plants, and even the flowers, unless it is something whose flowers might be injured. When the sun is shining, there is always free current of air passing through the house; and we never realise among our plants, though we cultivate a rather miscellaneous collection, those evils of burning, spotting, and blotching of the leaves, which are so much enlarged upon as the consequence of the sun shining on damp foliage.

The Weather. STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 5, 1875.

Table with 5 main columns: Month and Day, Barometer, Temperature of the Air, Hygrometric reductions (W.S.W., G.W., S.W., S.S.E., S.), Wind, Rainfall. Includes daily readings for April 29, May 1-5, and monthly means.

April 29—Fine, bright, warm, and nearly cloudless throughout. 30—A fine, bright, mild day. May 1—Overcast, dull, cold, and rain fell throughout. 2—Overcast, dull, and gloomy in morning; fine and bright afterwards. 3—Fine, bright, but cloudless, and mild. 4—A fine, bright, partially cloudy day. 5—A fine cloudy day. Fog in early morning.

—In the neighbourhood of London the reading of the barometer at the level of the sea increased from 30.28 inches at the beginning of the week to 30.31 inches by the morning of the 25th, decreased to 30.02 inches by the afternoon of the 27th, again increased to 30.18 inches by the morning of April 29, then decreased to 29.90 inches by the afternoon of May 1, and was 29.91 inches at the end of the week. The mean reading for the week was 30.11 inches, being 0.05 inch above that of the preceding week. The highest temperatures of the air at 4 feet above the ground varied from 70° at April 30 to 54° on May 1, the mean for the week being 64 1/2°. The lowest temperatures of the air ranged between 30° on April 25 and 47° on April 28 and May 1; the mean value for the week was 42 1/2°. The mean daily range of temperature in the week was 21 1/2°, the greatest range being on April 25, 20 1/2°, and the least on May 1, 6 1/2°. The mean daily temperatures of the air, and their departures from their respective averages were as follows:—April 25th, 44.1°; 26th, 48.3°; 27th, 56°; 28th, 57.4°; 29th, 54.2°; 30th, 57.2°; 31st, 49.5°.—0°, 3°. The mean temperature for the week was 52.4°, being 3.5° higher than the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 125 1/2° and 131° on 27th and 30th of April, but on the 1st of May 61 1/2° was the highest reading. The lowest readings of a thermometer placed on grass, with its bulb fully exposed to the sky, were 27° and 32 1/2° on the 25th and 26th of April, but the lowest reading on May 1 was 45 1/2°. The mean for the several low readings was 38°.

The direction of the wind was W.S.W., and its strength very gentle. The weather during the week was fine, bright, and mild, with the exception of Saturday, which was dull, cold, and the sky overcast throughout. Rain fell on one day; the amount collected was 0.33 inch.

In England, the extreme high temperatures observed by day ranged between 74° at Sunderland and 50 1/2° at Liverpool, the general average over the country being 67°. The extreme low temperatures varied from 43 1/2° at Liverpool to 28 1/2° at Norwich, with a general average of 35 1/2°. The mean of the extreme ranges of temperature in the week was 31 1/2°, the greatest range being at Blackheath, 49 1/2°, and the least at Liverpool, 16 1/2°. The mean high day temperatures ranged from 64 1/2° at Blackheath to 57 1/2° at Liverpool, with an average value of 61 1/2°. The mean low night temperatures varied between 46 1/2° at Liverpool and 40 1/2° at Bristol, the general average being 43°. The mean daily range of temperature in the week was 18 1/2°, varying from 21 1/2° at Blackheath and Manchester to 11 1/2° at Liverpool. The mean temperature for the week was 50 1/2°, being 1/2° lower than the value for the corresponding week in 1874. The highest in the week occurred at Blackheath, Wolverhampton, Leicester, and Sunderland, 52° respectively, and the lowest at Bristol, 49 1/2°.

Rain fell on one day in the week at most stations. The amounts varied from four-tenths of an inch at Sheffield, Liverpool, and Truro to three-hundredths

of an inch at Bradford and Hull. The average fall over the country was two-tenths of an inch. At Bristol, Birmingham, Norwich, & Nottingham no rain fell.

The weather during the week was fine, bright, but not so cloudy at times. Showers of rain fell generally on Saturday, May 1.

In Scotland the extreme high day temperatures ranged from 67¹/₂ at Aberdeen to 50³/₄ at Glasgow, the general average being 63°. The extreme low night temperatures varied between 41¹/₄ at Dundee and Aberdeen, and 34¹/₄ at Paisley; with a general average of 38°. The mean of the extreme ranges of temperature in the week was 25°. The mean temperature of the air at Glasgow was 45¹/₂, being half a degree lower than that of England and a quarter of a degree higher than the value for the corresponding week in 1874; the highest in the week was at Dundee, 50³/₄, and the lowest at Paisley, 49¹/₄. Rain fell at Glasgow to the amount of seven-tenths of an inch, at Paisley one-tenth only was measured; the average fall over the country was four-tenths of an inch.

At Dublin the highest temperature was 65¹/₄, the lowest was 36¹/₄, the mean 52¹/₄, and the rainfall 0.67 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVE.—*Gloxinias* are amongst the most useful summer decorative plants we possess, standing for weeks in a conservatory that is kept a little closer than an ordinary greenhouse, but a 50¹/₂ being kept up in this way they must not be grown in their early stages too hot, or where they receive an insufficiency of air and light by being crowded amongst plants of larger growth. To prepare them for removal to cooler quarters as the season gets further advanced they should now be kept where the night temperature is not much over 60°, with plenty of air, and on a self either up to the front lights, or, still better, over the paths, with their tops a few inches from the roof glass. The flowers of these plants are very useful for decorating the base of Maripal's stands; similar appearances when grown as above indicated, but, as often seen, they are so soft and flabby as to become bruised with the slightest touch, and so are comparatively useless, for nothing in its way can be more objectionable than bruised or flagging flowers, a very few of which completely destroy the appearance of what otherwise would be a pleasing arrangement. *Achimenes* and *Tydasia*, in either pots or baskets, should be similarly grown where required for decorating cooler houses during the summer; by being so treated their duration in flower will be double that of weakly soft-grown plants, to still further prolong which, as soon as they show bloom give them manure-water, not too strong, once or twice a week : applied at this time it will be found much more effectual than if withheld until the plants are partially exhausted by flagging. *Verbenas* (Oleander) now be they must be plentifully supplied with water, to enable them to open their flowers. They are profuse rooting, water-loving plants, that cannot endure to become dry. They are not so much grown as from their easy culture and general usefulness they should be. Where prepared in 6 or 8-inch pots in sufficient numbers they will furnish a succession for many weeks, and are equally useful for general decoration, in the shape of blooming plants, or for cutting. For the latter purpose they are little inferior to Carnations, especially the white varieties.

Nepenthes will now be commencing to grow freely; they should be kept quite close to the glass, slightly, but not too much, shaded, with abundance of water at the roots, giving it to them once a day, and syringing overhead in the afternoons. This is necessary, as if any thrips, especially the small yellow species, exists, it will establish itself upon them, injuring both leaves and pitchers, so as to cause their decay long before their allotted time. Any that require more root-room should be potted without delay, but on no account overpot, or the soil will be liable to become sour—a condition from which they rarely recover. They do well in an equal mixture of chopped sphagnum and good fibrous peat, with all the earthy matter sifted out; add to this a fifth part of crocks or charcoal broken small, and a sprinkling of sand. When in active growth weak manure-water twice a week will benefit them.

Ardisia crenulata and *A. crenulata alba* should now be in a nice growing temperature, with sufficient light to keep them short-jointed and stout. When in flower they must not be kept too hot and moist, or their berries will not set freely, which so much reduces their value as decorative subjects. These *Ardisias* are much the most useful in a small state, with single stems, in 6 or 8-inch pots. If not already done seeds should now be sown in well-

drained pans, filled with fine sandy peat, covering the seed with a fourth of an inch of soil, and placing in heat. When large enough to handle pot them singly in thumb-pots, in similar soil to that advised for sowing the seed in. The highly-perfumed *Cleodendron fragrans* will now be pushing up its flowers, as also *C. fallax* and *C. Kampferi*. These should be liberally supplied with manure-water. With quick-growing plants of this description, that will bear, at the time of potting, much of the old soil removing, it is not necessary to use nearly such large pots as they are often grown in, providing they are regularly fed with manure-water after their flowers are formed. This treatment has the effect of producing a larger harvest of bloom in proportion with the size of the plant, than if all the manual sustenance they receive were put in the soil at the time of potting; it also has the desirable effect of restricting the size of the leaves in such plants; which if potted in rich soil with a deal of root-room are apt to get too large. *Amaryllis* that have done flowering and require more root-room may now be potted; this should be attended to as soon as the flowering is over, for if the young growth has made much progress it will not derive the full benefit of the new soil. Do not over-pot, as they are not plants that need a deal of room; they cannot endure over-light soil or light potting. Good yellow loam, to which add a little sand, more or less according to the quantity it contains naturally, is the best soil to grow them in; soil of this description will require that the pots be well drained, for if it gets at all sour the bulbs will decrease in size instead of getting larger. These beautiful decorative plants do not like their roots disturbed, and should never be potted or repotted, if any interfered with unless they absolutely need it. As the solar heat increases and recently potted plants get better furnished with roots, they will be benefited by a corresponding rise in the temperature of the house.

T. Baines.

FLOWER GARDEN, &c.

PARTERRE AND MIXED GARDEN.—Laws will now require constant attention in sweeping, rolling, and mowing. Grass grows rapidly at this season, and it will be necessary to use the machine over it at least once a week, as a close-bottomed velvet turf can only be cut by being cut. The lawn is more likely to show themselves in a manner too conspicuous to require much looking after, and nothing tends to disfigure a lawn so much as these. Daisies especially are most troublesome, as they are in bloom again a few hours after the machine has passed over them, and are a great disfigurement; but by a little perseverance they may soon be got rid of. There is no better or more expeditious way of effecting this than by grubbing them entirely out, and this is easily accomplished by using a sharp spud-like tool for the purpose. Should their removal cause any disfigurement to the turf, a slight top-dressing of soil containing a few seeds of Dutch Clover and fine grasses, rubbed into the holes with the back of a rake, will soon set matters right. Any verges or grass edges that have not yet been trimmed with the edging knife should now receive that attention. After rain the turf will be found in a soft state when the operation can be performed in a neat and satisfactory manner. Verges generally squeeze out under the roller, and extend sufficiently during the year to allow of a small portion being taken off every spring; and by so doing the edges can be gone over much more expeditiously with the edging shears during the summer, and always look sharp and well defined. Gravel walks soon become sadly infested with weeds at this season if not frequently looked over, and time spent in their removal now will be very profitably employed, as if left they will soon get into a seedy state, and lead to endless labour hereafter. Choose showery weather for extracting them, as then the gravel is in a comparatively soft state, when they can be easily uprooted and much time saved. Any walks that are showing a discoloured surface, or that contain too many small weeds to be removed by hand, may with advantage be broken up with a hoe to the depth of an inch or so, and have the surface kept stirred occasionally with a rake during dry weather. This will effectually destroy any moss or seed weeds, and has a very cleansing and brightening effect on the gravel, in some cases equalling in appearance a fresh top-dressing. After being well exposed to the sun and dry air for a time, carefully rake over, and take advantage of all weathers to roll down again. Recently transplanted shrubs will be greatly benefited by a slight syringing overhead, should the weather set in dry, so as to counteract the exhausting effects of rapid evaporation. See that all have a good mulching, and are securely staked, as this is of the greatest importance.

The great business of the past month or two has been to increase and multiply all kinds of plants to be used for the summer's display, and all glass structures in most places will now be overflowing. It will be necessary to transfer most of these from the warm atmosphere of houses to cold pits and frames, and other temporary places, in order

to gradually harden them off. Many of the hardier varieties may now with safety be placed under walls or other sheltered places where they can receive temporary shelter, so as to set glass rooms at liberty to receive such plants as *Alternanthera*, and other tender things that will require that kind of protection for some time longer. These should all be turned out of their cutting pots, and planted thickly in old rotten leaves or spent Mushroom dung, in which they grow rapidly, and lift with large balls. *Lobelia*, *Verbenas*, *Heliotropes*, and indeed most of the fast-growing bedding plants, conform to this treatment readily, and make far better plants than they would do in pots, without the use of some amount of root, or involving a third of the labour. The beautiful little *Membranthemum cordifolium variegatum* is a very indifferent thing to transplant, and should not be attempted in this way, as it makes but little fibre. *Roses* will now require watching, to prevent that insidious little enemy, the Rose maggot, from destroying the bloom-buds. They should be looked carefully over, and any leaf that looks at all likely, from its curled appearance, to contain one of the destructive pest in its folds, should be very slightly squeezed between the thumb and finger. This will be found quite as effectual in ridding the plants of their presence as opening the leaves and picking them out, and is not so likely to injure the young growth. The Rose maggot in its young state is a very soft insect, and a slight pressure suffices to rupture its skin and destroy it. The cold weather has greatly retarded the growth, and insect pests are sure to be rife and more troublesome on that account. Greenfly is the most troublesome of these that the Rose-grower has to contend with, and all sorts of insecticides are brought into requisition. These require much care in their use, as such tender foliage as that of the *Rose* is easily injured. Tobacco-water is, perhaps, the safest and best, and as soon as the shoots are of sufficient length they should be dipped in this to save waste. Pooley's tobacco-dust is quite a boon to gardeners and all who are engaged in horticultural pursuits, as it is easily and quickly applied, and being very destructive, and it is very destructive in its effects if used while the leaves are damp, as occurs on a dewy morning. *Sheppard*, *Woolerston's Park*.

FRUIT HOUSES.

MELONS.—It is presumed that both the amateur and the student as well as the young beginner are diligent readers of what is advised from time to time, not only in this, but in every department of the *Calendar*, which will save the trouble and cost of much needless repetition. That being so, I may refer to the last *Melon Calendar* as expressing nearly all by way of cultural detail that is requisite to be done just now. To secure a full crop of fruits remember what has been advised in regard to securing a number of fruits on individual plants of a simultaneous stage of growth. After the fruits begin to swell off give them a good earthing-up with a rather strong rich compost, ramming it down fairly tight, at the same time place a little freshly slaked lime round the collars to guard against canker. The first batch of fruits are becoming ripe; break the trellis, and are being supported by means of tables, 6 inches square, made of half-inch deal, with a goodly-sized hole bored through each corner, through which is passed two pieces of string from the top, and coming underneath are then passed again through to the top, and finally are looped up to the trelliswork in such positions as will carry the fruits and relieve the vines of their weight. The weather is now nearly all that can be desired for plants setting their fruits. Do not shade for the present. Sow for succession and pot off as occasion requires. Train out the growths in pits and frames, one leader towards the back, one towards the front, and the laterals at right and left angles from them. Use but few pegs until after the final earthing-up, which should be directly the fruits begin to swell off, and avoid overcrowding the growths. Still maintain a good bottom-heat by means of good linings. *T. Simpson*.

When the plants in applying new materials to fermenting beds at this season, as the heat in such is quickly stimulated. Unless absolutely required, any interference with them should be avoided beyond adding new materials, when it is necessary, to the surface, or between the pots, as the case may be. As the roots of all Pine plants should now be very active, and consequently in a very tender state, it is necessary to beware lest too much heat should be added to these winter plants, and they materially check the progress of the plants. If the space cannot be spared to afford accommodation to the stools after the fruit is cut, they should be removed to a light or two else where, keeping the suckers on them until about the end of the present month, when, with the small ones already in reserve from last March, potting should be started. To hold over suckers on the stools in this way, and then starting them in moderate succession, is a suitable time facilitates and simplifies matters in this respect considerably, and is far preferable to inserting them in pots in twos or threes, as the case may be,

when the fruit is cut, entailing as it does attention to almost individual bunches, and necessitating also in a corresponding manner a constant series of potting. Fixed dates for starting sets may be disregarded, but defined periods are reasonable. Those which we have proved to be most suitable for the purpose of obtaining a constant supply of ripe fruit throughout the year are about March, June, and September—the plants of course being subject to the condition of treatment as from time to time indicated for them in the Pine Calendar, to which reference will again be made. Under such favourable conditions as those which are now afforded by natural means, the progress of Pine plants will be rapid, providing the roots be in a proper state. See that no check results from inattention in the way of watering; go over the plants at least once a week, and plentifully supply weak guano-water in a tepid state when it is required. Syringe the plants overhead two or three times every week at the time of closing the house, and take every advantage of solar heat attending to the ventilator &c. in the manner before advised. *Geo. Thos. Miles, Wycombe Abbey.*

VINES.—The weather during the past three weeks has been all that Vine-growers could possibly desire; and truly they have benefited by it, for foliage which, previous to the advent of sun, was looking a sickly yellow, and akin to tissue-paper in texture, is now a healthy green, with much more substance in it. Now that we have sunshine, the most should be made of it, first by increasing the ventilation which it allows, and secondly, by using, early and not only to economise fuel, but to prolong the health of the Vines. Excessive firing is most injurious in several ways, and not unfrequently ends in a full crop of red-spider and a thin crop of Grapes. The remarks and directions as to thinning, disbudbing, stopping, and tying, in last fortnight's Calendar, are still applicable. Especially let all superfluous bunches be cut off as soon as the number to be left on the Vine is decided, for every hour they remain is just so much loss of benefit to the bunches that are to ripen. Where the Grapes are ripe, the dung, leaves, and litter that were put on outside borders for warmth may be removed, leaving sufficient to serve as a mulching in dry weather, for though the Grapes are ripe, attention to the welfare of the Vines ought to go on as usual, remembering that next year's crop depends in no slight degree on the treatment given from now until the fall of the leaf. Stop laterals just the same as on Vines in earlier stages of growth, unless they have become infested with spider or thrips, and then it is desirable to let them remain, in lieu of which, the worst infested old leaves may be picked off, and as soon as the fruit is cut thoroughly wash the Vines with the garden engine. Examine the borders of succession houses at least once weekly, and water copiously when dry. Inside borders if well drained will take almost any amount of water at this season, and the Vine being a gross feeder, manure-water should be given every alternate watering. Having had a good rainfall since the beginning of the year, outside borders, if well mulched, will not yet require artificial watering. Newly planted Vines should be closely watched, that they do not suffer from over-dryness. Usually these are planted in close contact with hot-water pipes, consequently are dried up quickly. In training them let all the wood and spray remain that can be exposed to light, but supermarceries intended for fruiting next season should be closely pinched and confined to one rod. *W. Wildsmith, Heckfield.*

FIGS.—The earliest forced in pots will now be ripe, and when so, watering at the roots and syringing overhead must now be gradually diminished to secure flavour. For the colouring process a free circulation of warm air is required, and the top ventilators may be left a little open at night as the weather gets warmer, the highest coloured fruit being the first favoured at this early period. As soon as the first crop is gathered, attention should be given every two or three days, watering also at the roots with weak guano-water, which will enable the trees to produce a more vigorous second crop. If the second crop of fruit shows very abundantly, they must be thinned out so as not to over-tax the trees for early forcing next season. The trees in the houses where they are permanently planted out in the borders, will still want constant attention in pinching out the tops of the young shoots, and thinning out the most rampant unfruitful ones to prevent the fruit from being shaded much from the sun and air. Attend daily to syringing the trees, and water their roots twice or three a-week with manure-water, especially when the borders are circumscribed, and the trees of a good size; and more air must be given as soon as the fruit shows signs of maturation. *William Tillyer.*

CUCUMBERS.—The importance of maintaining a clean growth cannot be over-estimated, and if greenflies or black flies commence fannate at once. Red-spider, however, is the greatest enemy we have to contend with, and it is just at this season that it may be expected to put in an appearance. Directly it is

perceived, take it as a bull by the horns, and remove it forthwith. There is no faith in syringing, for besides being a very tedious task, the construction of the Cucumber leaf is of such a nature as to render it almost or quite impossible to penetrate all the interstices without much injuring the leaf. It is better, therefore, to remove it entirely. I have ever striven to enforce the necessity of a close and regular attention for the Cucumber is of so jealous a nature, that if it be neglected it will speedily exhibit a bad temper in the shape of stunted fruits and many other evils. Remember what was said in the last Calendar about maintaining a good root-action. An old adage says that if you take care of the roots the head will take care of itself, and the adage is true so far as it goes. The blinds will now require to be rolled down for an hour or two at mid-day on houses having a southerly aspect, houses facing east or west, however, will not require shading. Little or no fire-heat is now requisite by day; the valves should be shut off about 8 A.M. and opened again about 5 P.M. Keep plenty of moisture in houses all day long. Maintain previously advised temperatures, and sow for succession. As fast as pits and frames become cleared of bedding stub and the like, let them be turned to account for thwih; a fair bottom-heat should first be secured. Keep a good degree of warmth in pits and frames wherein the plants are already established, and beware of canker at the collar, and of slugs. Prepare to turn out ridge varieties under handlights as soon as they are well hardened and the ridges ready. *T. S.*

HARDY FRUIT GARDEN.

Where *Apricots* have been duly attended to, sufficient foliage has been made to efficiently protect the fruit, which is generally abundant and coverings may now be removed, except in low or damp situations, where it may be necessary to continue it on a few days longer, but in such cases it is well to uncover in fine days so as to harden the trees previous to final exposure, otherwise it is possible the foliage may be injured by sudden exposure to bright sunshine. Thinning the fruit where necessary should also be attended to in good time; we have already commenced on a warm wall, and hope to gather a considerable quantity during the next week. Where the trees are young and healthy the fruit may be thinned to 9 inches apart, but if old or unhealthy a larger number should be left until the stoning process has fairly commenced; otherwise during this period a portion may fall off, and so render the crop lighter than intended. The great evil in the cultivation of the Apricot is allowing the trees to carry too much, and too late, in fruitful seasons; the consequence being that they are so much exhausted as to be unable to perfect the bud for the following season, and the result is a state of barrenness every alternate season. If thinned early the young fruit is available for many culinary purposes, and that remaining on the trees is both fine and well-matured, and, what is still more important, the trees are enabled to perform annually their functions in due season without loss of crop or impairing the vigour of the tree. *Peaches* and *Nectarines* are now fairly set. The trees being generally cleared at present here, the coverings may be left on a little longer, but advantage must be taken to uncover on fine days, and at the same time to partially disbud the more forward growths, so as not to check the action of the sap by disbudbing the whole of the tree at once. This is an operation requiring some little care and judgment as to properly supplying the tree with young shoots for next season, it being borne in mind that the Peach and Nectarine bear principally upon the growth of the previous season only, and that consequently it is necessary to replace the bearing wood of this season by the young growth for the next, the most important point being to retain a well-placed bud in the base of the bearing shoot, and another at its extremity, in order to secure to the fruit the full benefit of the sap action. The latter growth above the fruit may be stopped when a few inches long, unless required to extend for filling up the wall, as in the case of young trees, &c., so as to allow more space for the growth of the shoot from the base which will replace it next season. Very little aphid has yet made its appearance, but it must be watched for, and the usual remedies applied as soon as possible. *W. Cox.*

Obituary.

We greatly regret to hear of the death of the excellent botanical collector, M. ENDRÉS. We are promised an account of his career from Prof. Reichenbach.

Answers to Correspondents.

BRIDGE: T. E. Cover the arch with a layer of asphaltum in the line, gravel, and coat tar, and then put a layer of gravel over all.

DECOMPOSING LEAVES: J. O. Turn them over frequently, and well water, so as to get them to heat; and to assist in this mix with them the grass mowings, stable litter, or even soil.

FIG TREES: J. O. We are of opinion that you would succeed better with young plants. Take up the old stools, and secure some of the suckers with roots, which plant. They ought to fruit in about three years if properly attended to. Confine the young plants to one stem—i.e., allow no suckers to be produced. The trees will fruit earlier and better when grown so.

FUNGUS: W. M., Ely. The substance sent is merely a mycelium, common on old boughs cut up for firing. It may belong to some Polyporus, as *P. igniarius*, but we have never been able to trace it to any perfect plant.

GOLDEN HAMBURG VINE: R. T. T. The flowers are not properly fertilised, otherwise set; you must do this artificially with a small camel-hair brush, or draw the hand gently down the bunch on a bright day when the Grapes are in flower.

INSECTS: J. P. M., J. G. Your small beetle is *Malthinus biguttatus*. *I. O. W.*—*J. G.* The soil in which you planted your pot Roses must have been swarming with the eggs or white maggots of the beetles, found upon the trees after dark, of which you have killed many as 300 in one night. Lay down a white cloth under the trees, and search for the insects as before, with a light, which frightens them, and causes them to fall to the ground. *I. O. W.*

MELONS: A Subscriber. The leaves are affected by scald.

NAMES OF PLANTS: R. P. A garden variety of *Anemone hortensis*.—*W. Leolin, Ashe.* *Lathraea squamaria.* Not particularly rare.—*Cor.* The numbers were unfortunately shifted before we received your plan. The *Narcissus* is *N. tazetta*, not a yellow cup is *N. tazetta*, var. *lactior*; the pure white, sweetly-scented *Narcissus*, is *N. papayaceus*; the onion-scented violet-coloured flower is *Triteleia uniflora*.—*P. W. J.* *Claytonia perfoliata.* It is an introduced plant, which I have seen at *Edwards' Stepney*. *Sparmannia africana*.—*A. D.* *Rhododendron Thomsoni*, a Himalayan species.—*A. B.* *Odonoglossum triumphans*.—*Ignoramus.* *Rubus spectabilis*.—*Clarke.* *Alonsoa incelsifolia*.—*J. Falconer.* *Firmilia verticillata*, and *Sedum lydium*.

PELARGONIUM LEAVES: J. K. The leaves are affected by spot, the result of disturbed root-action, probably arising from excess of moisture in the soil.

PHORMIUM TENAX: W. F. G. The flower stem will rise to a moderate height above the leaves, and will be an interesting subject for your local show. Probable duration, two or three weeks.

* * * Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

COMMUNICATIONS RECEIVED.—Westbury.—E. Gilman.—W. M., Ely.—R. D.—W. H. F.—F. L. & Co.—Clemant.—G. Smith.—A. W.—W. H. F.—F. L. & Co.—Clemant.—R. D.—J. B.—W. B. H.—W. C. T.—A. B. M.—C. P.—J. A. H.—W. Sowerby.

Markets.

COVENT GARDEN, May 6.

Early produce is now being consigned, and also brought to market in very small quantities. Asparagus from the open ground becoming very general. Broccolis and rougher goods in fair demand. The bright sunny weather has also had a marked influence on such produce as is raised under glass; Gooseberries and Rhubarb have now almost closed the demand for kitchen Apples; good dessert varieties, however, still command a fair price. *Thos. Taylor, Wholesale Apple Market.*

—The choicest descriptions of fruit and vegetables in the retail markets may be quoted as follows:—Tomatoes, 6s. per doz.; Peaches, 42s. and 62s. per doz.; Grapes, 10s., 15s., and 20s. per lb.; Figs, 18s. per doz.; Raspberries, 10s. to 16s. per lb.; Gooseberries, 6s. per quart; Apples (green), per punnet, 1s. Peas, 2s. 6d. to 4s. per quart; Potatos (new), 6d. to 2s. per lb.

SEEDS.
 LONDON: May 5.—The consumptive demand for Clover seeds appears to be drawing to a close. Occasional orders for small quantities drop, in which are executed at full prices. It is a long time since, at the close of the season, the stocks remaining on hand have been so light as they are now. Spring Tares continue in some request at the extraordinary high rates now reached. Agricultural Mustard and Rape seed meet an active inquiry at enhanced currencies. The impression prevails that a large demand will be experienced for these descriptions. Good samples of either sort are scarce. In Canary seed a further movement upwards must be noted of fully 10s. per quarter. Hemp seed is also dearer. White Millet and English Linseed keep steady. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.
 At Mark Lane on Monday trade was influenced by the fine weather and the satisfactory condition of the crops. For Wheat previous prices were obtained. Barley was very slow of sale, and in some instances rather cheaper. Malt was difficult to move, and easy in value. For Oats the demand was quiet, and prices were hardly so firm. Maize was slightly lower. Beans were dull, as were also Peas. Flour barely maintained the rates of last Monday. Canary seed was scarce and considerably dearer, the quotation being 220s. to 250s. per quarter.—On Wednesday the market was quiet. The show of English Wheat was small, but that of foreign rather large, and factors had again to submit to some reduction in many of the sales effected. Barley also was slightly easier in some instances, and little inquiry prevailed for malt. Oats were steady, and late rates were about supported for Malze, Beans, and Peas. Flour was rather weak.—Average prices of corn for the week ending May 1:—Wheat, 42s. 10d.; Barley, 38s. 10d.; Oats, 30s. For the corresponding week last year:—Wheat, 62s. 1d.; Barley, 46s. 6d.; Oats, 27s. 1d.

CATTLE.
 At the Metropolitan Market on Monday there was a fair demand for beasts at last Monday's quotations. Trade in sheep was not very brisk, but prices advanced for all kinds. There were a few more calves, and a demand for them at fully late rates. Choicest lambs were freely sold, but second-rate met with a dull sale. Quotations:—Beasts, 3s. 6d. to 4s. 6d., and 5s. 6d. to 6s.; calves, 4s. 6d. to 5s. 8d.; sheep, 5s. to 5s. 8d., and 6s. to 6s. 8d.; lambs, 7s. 4d. to 8s. 4d.; pigs, 4s. 4d. to 5s. 4d.—At Thursday's market trade in beasts was active, and Monday's quotations were well maintained throughout. For sheep the demand was good, and prices were not lower. Choice lambs were scarce, and rather dearer. Quotations for calves remained unaltered. For milch cows business was more active, at somewhat higher rates.

HAY.
 Whitechapel Market reports a moderate supply of fodder, which changed hands steadily on former terms. Prime Clover, 100s. to 130s.; inferior ditto, 85s. to 95s.; prime meadow hay, 90s. to 120s.; inferior ditto, 55s. to 75s.; and straw, 35s. to 40s. per load.—Cumberland Market quotations:—Superior meadow hay, 120s. to 130s.; inferior, 90s. to 110s.; superior Clover, 126s. to 135s.; inferior, 105s. to 114s.; and straw, 40s. to 44s. per load.

POTATOS.
 The Borough and Spitalfields markets report fair supplies on sale, and the trade as slow at the subjoined currents:—Regent, 75s. to 125s.; Victoria, 105s. to 145s.; Flukes, 110s. to 155s.; rocks, 65s. to 75s. per ton.—The imports of foreign Potatoes into London last week amounted to 17,896 bags from Antwerp, 5328 sacks and 1218 tons from Dunkirk, 1052 barrels and casks from Malta, 149 tons from St. Valery, 731 bags from Boulogne, 33 barrels and 4 boxes from Gibraltar, 55 cases from Valencia, and 22 packages from Lisbon.

COALS.
 In the market on Monday house coals gave way 1s. per ton. On Wednesday the top price for best coals was unchanged, but a clearance was effected at 6d. per ton over.

Reduced Prices.

And 21, BACHELOR'S WALK, DUBLIN.
NO AGENTS.

Oil Paint no Longer Necessary.

HILL AND SMITHS' BLACK

VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and it sets cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which **HILL & SMITH** will forward on application.

Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Clangwilly, Llanpumpant, Carmarthen, Nov. 27, 1873."
"Mr. Lloyd Lloyd encloses cheque for £3 5s. amount due to Messrs. **HILL & SMITH**, and he considers the Black Varnish one of the most useful things he ever possessed."
Apply to **HILL AND SMITH**, Brerley Hill Ironworks, near Dudley, and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of **HILL & SMITH** that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

BELGIAN GLASS for GREENHOUSES, &c.,
Can be obtained in all sizes and qualities, of
BETHAM & SON,
9, LOWER THAMES STREET, LONDON, E.C.

Prices of Horse, Pony, and Donkey Machines on application.
Carriage Paid to all the principal Railway Stations in the United Kingdom.

The "SILENS MESSOR" Machines have a world-wide reputation for their superiority and excellence, and the improvements which have been made in them from time to time still keep this Machine the best and most approved one in the Market. They will cut either SHORT or LONG GRASS, BENTS, &c., and wet as well as dry, advantages which no other Lawn Mowers possess. They are the only Lawn Mowers in constant and daily use in the Royal Gardens, and in most of the principal Gardens and Parks throughout the Kingdom.
A stock of 500 Mowers is kept at our London Establishment, including all sizes, from which purchasers can make their selection and have prompt delivery.

GREEN'S PATENT "ROYAL" LAWN MOWER is a far superior Machine of its kind to any Lawn Mower extant, and it will cut either short or long grass, bents, &c., and wet as well as dry.

Prices of the "Royal" Machines. To cut—
6 inches | 8 inches | 10 inches | 12 inches | 14 inches | 16 inches
25s. | 35s. | 50s. | 65s. | 80s. | 100s.
Delivered carriage free at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland. Every Machine is warranted to give entire satisfaction, and if not approved of, may be returned at once unconditionally, without any expense to the purchaser.

Our reason for bringing out the "Royal" Mower is to meet a want which has been repeatedly expressed by the purchasing public, to have a good, useful, and efficient Machine, CHEAP.
N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

GREEN'S PATENT ROLLERS for LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, and GRAVEL PATHS.
Suitable for Hand or Horse Power.

The above can be had from all respectable Ironmongers and Seedsmen in the United Kingdom; or from the Manufacturers, **THOMAS GREEN & SON,** SMITHFIELD IRONWORKS, LEEDS; And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.
Carriage paid to all the principal Railway Stations in the United Kingdom.

SCATTERING GRASSWITH BOX ON
FOR
COLLECTING GRASSWITH SIDE ROLLERS
FOR
CUTTING LONG GRASS**TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—**

These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction, and a month's trial allowed. Orders executed on receipt.

2-inch Pipe, per yard 2s. 8 1/2d.
4-inch Pipe, per yard 1s. 8d.

Connections at proportionate prices.

Illustrated Price List free on application to MESSENGER AND COMPANY, Hot-water Engineers, Loughborough.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz.: the water space at back and top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron, are not liable to crack. They are made of the following sizes—

Table with 4 columns: Sizes, To heat of 4-in. Pipe, Price. Rows include High, Wide, Long, Feet, and L s. d. values for various dimensions.

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Ballham Hill, S.W., May 29, 1875.

"Having given your Patent 'Double L' Boilers a fair trial at my nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southward, London, S.E. When ordering Boilers please refer to the above advertisement.

VIENNA PRIZE WIRE NETTING.

CAUTION TO BUYERS OF WIRE NETTING.

The great reputation and success of Messrs. J. B. BROWN and CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & Co. are THE SOLE MANUFACTURERS.

Messrs. BROWN & Co. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced prices. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting. 90, Cannon Street, London, E.C.—March 12.

THOMAS'S GALVANISED WIRE NETTING

BY IMPROVED MACHINERY. Superior Quality. Reduced Prices.

Prices per lineal yard, 2 1/2 inches wide.

THE AGRICULTURAL GAZETTE ALMANAC, 1875. The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compendiums are many good serviceable hints on fattening cattle, growing of root crops, &c. The illustrations are admirably executed, many being engraved from photographs." - Weekly Dispatch, Jan. 31, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition." - Lloyd's, Jan. 17, 1875.

"It is a very cheap threepennyworth of information of interest and utility to farmers, and contains numerous illustrations." - The Field, Jan. 16, 1875.

"In addition to the usual matter to be found in an almanac, we have here useful information to the farmer, as to stock and crops, with illustrations of prize animals." - Gloucestershire Chronicle.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for family use." - Farmer's Herald.

"The Calendar contains all the fixtures for cattle shows, races, &c., space for diary and memoranda by the side, and various useful information of an agricultural character." - Oxford Times.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics and contains a large variety of information. There are numerous illustrations, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'" - Bath Express.

"To farmers, cattle dealers, and others interested in agriculture, this work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is profusely illustrated with engravings chiefly taken from photographs." - Dewsbury Chronicle.

"This almanac, which appears to be carefully compiled, and the contents judiciously selected, may be commended to the notice of agriculturists generally. It is issued at a low figure, and contains a large variety of information. There are numerous illustrations, and the likeness of the Prince of Wales, which forms the frontispiece, is especially deserving of mention." - Gresham Journal.

"To all persons interested in agriculture in this neighbourhood, the 'Agricultural Gazette Almanac' for 1875, priced 3d., will be worth obtaining. It contains a fund of information, as well as a variety of advertisements on topics especially connected with the portion of the community which it is intended to serve." - Halifax Guardian.

"Although this almanac comes rather late it is none the less welcome; as containing a mass of information, both interesting and valuable to any person connected with agriculture, it is to be commended. In addition to the usual calendar, it contains a diary, supplies us with authentic portraits and verbal descriptions of prize cattle, sheep, and pigs, a list of the members of both Houses of Parliament, and the Chambers of Agriculture, another of County Agricultural Societies, besides hints as to practical farming. Such a combination of information most recommend itself to every agriculturist." - Western Daily Mercury.

"Though it is rather late to be noticing an almanac for 1875, we make an exception in favour of the one before us, which, owing to its great merits and low price, ought to be purchased by every agriculturist in the kingdom. The illustrations of prize cattle, implements, &c., are a valuable feature in the Almanac." - Prescott Reporter.

"Considering the valuable information for the farmer and stock breeder to be found in this publication, no wonder the first edition has had to be followed by a second. In addition to treating of farming matters, it contains a good paper on 'Crickets in the Counties in 1874,' and alphabetical lists of the members of the Houses of Parliament. It is besides admirably illustrated with notable prize-winning stock. The diary is well adapted to the requirements of agriculturists." - East Anglian Daily Times.

"It contains a lot of information useful to farmers and breeders." - Cornish Times.

"It contains a mass of information which will be found exceedingly useful to all who are engaged in agricultural pursuits. In addition to this there is a capital portrait of H.R.H. the Prince of Wales, and several other engravings." - Gloucester Mercury.

"It is a wonderfully good threepennyworth, containing, as it does, in addition to the calendar specially arranged for agriculturists, some of the beautiful portraits of stock which have appeared in the columns of our contemporary within the last year and a-half. Among others, there are portraits, from photographs, of Telemachus, 10th Duchess of Geneva, 'Victorine' being the Prince of Wales's Champion Shorthorn Heifer among the Shorthorns, and a lithographed portrait of a Jersey cow. There are also illustrations descriptive of noteworthy American 'winkles' for farmers." - Norwich Mercury.

"It contains much interesting matter for the farmer, who may get many a wrinkle from its unpretentious little publication. As may be imagined, the notes relate to matters of purely farming interest, such as rotation of crops, manures, and implements are worth the consulting the advice they contain being sound and practical." - Land and Water.

Works on Botany, by Dr. Lindley.

THE VEGETABLE KINGDOM; OR, THE STRUCTURE, CLASSIFICATION, AND USES OF PLANTS, Illustrated upon the Natural System. In One Volume, 8vo, cloth, price 28s., with upwards of 200 Illustrations.

EXTRACT FROM THE AUTHOR'S PREFACE. "The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, in the arts, in the various branches of domestic economy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the Vegetable Kingdom of the author, with the sequence, matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that the present arrangement will have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, museums, and herbaria, will be enabled to give the same. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

By the same Author. INTRODUCTORY BOTANY. Fourth Edition, greatly enlarged, with six Plates, and numerous Wood Engravings. Two Volumes, 8vo, 24s. "It has been the Author's wish to bring every subject that he has introduced down to the most popular level, in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: BRADBURY, AGNEW AND CO., Bouverie Street, E.C.

PARTNERSHIP.—Owing to the decease of the Proprietor of an Old Established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who would be desirous to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. SPRING

AT THIS SEASON PARR'S LIFE PILLS are USED by THOUSANDS. They clear from the body all hurtful impurities, and promote a regular and healthy action of the Liver and Bowels.

PERSONS SUFFERING from HEADACHE, INDIGESTION, Pains in the Shoulders and the Back, Gout, Rheumatism, and General Debility, are particularly recommended to try PARR'S LIFE PILLS. They have never been known to fail in affording immediate relief.

SOLD BY ALL CHEMISTS.

THE "ARCHIMEDEAN" AMERICAN LAWN MOWER

HAS BEEN AWARDED

GRAND DIPLOMA of HONOURABLE MENTION, Vienna, 1873.
SILVER MEDAL, Vienna, 1870. SILVER MEDAL, Hamburg, 1869.

NOTE.—The "Archimedean" was specially selected from the Mowers exhibited at Vienna for constant use in the Exhibition Grounds, and gave great satisfaction; and we have pleasure in calling attention to the following Testimonial, received from the Inspector of the Royal Gardens, Schönbrunn, Vienna:—

"Your 'Archimedean' Lawn Mowers have been used for some time past at the Imperial Gardens, and I have great pleasure in stating that they have given perfect satisfaction. Their quick and good work prove them to be the best and most efficient machines of the kind."

PATRONIZED BY

HER GRACIOUS MAJESTY THE QUEEN,
HER IMPERIAL MAJESTY THE EMPRESS OF GERMANY,
THE LATE EMPEROR OF THE FRENCH,

HIS ROYAL HIGHNESS THE PRINCE OF WALES,
HIS IMPERIAL MAJESTY THE EMPEROR OF AUSTRIA,
THE VICEROY OF EGYPT,

And many of the Nobility and Gentry of Great Britain.

CHIEF ADVANTAGES.

They are extremely LIGHT IN DRAUGHT,
SIMPLE IN CONSTRUCTION, WELL
MADE, and NOT LIKELY TO GET
OUT OF ORDER.

They cut LONG or SHORT, WET or DRY
Grass, and do not clog.

They have no ROLLERS in FRONT of the
Cutters, and therefore cut the Grass as it
GROWS, and do not miss the BENTS.

They work well on SLOPES, STEEP EM-
BANKMENTS, UNDER SHRUBS, and
close up to Trees, &c.

They can be USED either WITH OR WITH-
OUT GRASS BOX, as may be desired.

TESTIMONIALS.

From A. F. BAREON, Esq., *Royal Horticultural Society, Chiswick Gardens, W.*

"GENTLEMEN,—We have now had your 'Archimedean' Lawn Mower in use for several months, and without hesitation I can truly say it is the best and most efficient implement of the kind we have ever used."

From the late Mr. GEORGE WYNES, *Royal Gardens, Buckingham Palace.*

"GENTLEMEN,—I beg to say that we have had your Patent 'Archimedean' Lawn Mower at work in Her Majesty's gardens at Buckingham Palace for some time past, and I have much pleasure in testifying that it has given every satisfaction, as it does its work well and quickly."

From the Rev. J. H. WHITE, *Hemingford Grey, St. Ives, Hants.*

"I am much pleased with the working of your 'Archimedean' Mowing Machine. I think it superior to others which I have used in previous years."

OPINIONS OF THE PRESS.

"The quickest, most simple, and most efficient Mower ever used."—*Gardener's Chronicle.*

"Far superior to any of ours."—*The Field.*
"Remarkably easy to work."—*Gardener's Mag.*

"We feel bound to recommend it to our readers as one of the best Mowers we have as yet made acquaintance with."—*Floral World.*

AUCTION ROOMS and OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

THE FINEST COLEUS EVER INTRODUCED.

Carter's

NEW COLEUS,
"DUCHESS OF EDINBURGH."

AWARDED FIRST-CLASS CERTIFICATES:—

Royal Horticultural Society, June 17, 1874; Royal Botanic Society, June 20, 1874.

The foliage of this distinct and beautiful variety has margins of purple and creamy yellow, with a centre of bright crimson-magenta, forming a superb contrast to the green-leaved section of Coleus, by reason of its dazzling brilliancy of colour.

Professor THURNER, in the *American Agriculturist*, says:—"It is the most beautiful foliage plant that has ever been exhibited."

Price 3s. 6d. each. Extra Strong Plants 5s. each.

POST FREE, 6d. extra.

See Carter's *Illustrated Plant Catalogue* with beautifully coloured Engraving of above.

Price 6d., Post Free, Gratis to Customers.

PRICE ONE SHILLING.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KINGS' ROAD, CHELSEA,
LONDON, S.W.

NEW FUCHSIA PROCUMBENS.

T. JACKSON & SON

Have much pleasure in introducing this exceedingly interesting Novelty, which they have purchased from the Gardener of T. C. Blackett, Esq., of Thorpe Lea, seeds of which he received from New Zealand. It is of a shrubby trailing habit, producing freely at the axils short erect flowers with orange-yellow tube and violet-black sepals.

Strong Plants 5s. each, free by post 5s. 6d.; extra strong ditto, 10s. 6d. each.

A LARGE REDUCTION BY THE DOZEN OR HUNDRED.

N.B. A Plant of the above has been by us presented to the Royal Botanic Garden, Kew, where it may be seen in flower bearing the name of *F. procumbens*.

NEW DOUBLE PETUNIA "MRS. WILSON."

The above is a fine Double Crimson variety, striped and edged with white, very fine and distinct. It received three First-class Certificates last year.

Good Plants, now ready, 3s. 6d. each, post free 3s. 9d.

A LARGE REDUCTION BY THE DOZEN OR HUNDRED.

T. JACKSON AND SON, THE NURSERIES, KINGSTON, SURREY.

NEW BEDDING AGERATUM
"COUNTESS OF STAIR."

This variety is without doubt a decided advance upon any other Ageratum yet offered. There is not a shoot but throws up a head of dense blossoms, beginning a few inches from the ground, and only ending when its entire height of 6 or 8 inches is attained, when the whole top of the plant is one mass of fragrant lavender-blue blossoms. It was raised by Mr. Fowler, of Castle Kennedy, where it has been bedded out for five or six years with great success, withstanding, as it does, the heavy rains better than most bedding plants. Being of such compact habit and free-flowering qualities, it cannot fail to recommend itself for flower-garden purposes.

Price 3s. 6d. each, 30s. per dozen. Special price per 100.

B. S. WILLIAMS,

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

SPECIAL PRIZES FOR NEW PLANTS.

WILLIAM BULL, F.L.S.,

HAVING OFFERED THROUGH THE ROYAL HORTICULTURAL SOCIETY

ONE THOUSAND POUNDS

FOR NEW PLANTS OF HIS OWN INTRODUCTIONS, ANNOUNCES THAT THE THIRD ANNUAL SERIES OF PRIZES AMOUNTING TO £260, WILL BE DISTRIBUTED IN SILVER CUPS THIS YEAR, AS FOLLOWS.—

FOR PRIVATE GROWERS.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

FOR NURSERYMEN.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

The above Six Silver Cups will be given at the principal Show, to be held at Kensington, in 1875.

At the Provincial Show of the Royal Horticultural Society in 1875, the following Silver Cups will also be given:—

FOR PRIVATE GROWERS.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

FOR NURSERYMEN.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

In each and all cases the above Prizes to be offered for Twelve New Plants of Mr. W. Bull's introductions, and sent out for the first time since the commencement of 1872. The Plants available for the Prizes to comprise only those announced in Mr. W. Bull's Catalogues as sent out by him for the first time. The Catalogues can easily be referred to, or a List of the Plants had on application.

In each and every entry the names of the Twelve Plants to be exhibited must be sent with the entry. Exhibitors can only compete for one Prize at a time in each class.

The Twelve Plants must be twelve distinct species or varieties, but each may be composed of one or more individual plants, if grouped in one pot, pan, or vase.

In addition to the above, Mr. William Bull will give the following PRIZES this year, for 12 NEW PLANTS of his introduction sent out since the commencement of 1872:—

FOR PRIVATE GROWERS.

- Manchester, Silver Cup, value £10 10 0

- Belfast ... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Ireland.

- Leeds Silver Cup, value £ 6 6 0
- York Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Yorkshire.

- Taunton.... Silver Cup, value £ 6 6 0
- Devon, Somerset, Dorset and Gloucestershire.
- Glasgow... Silver Cup, value £10 10 0
- Glasgow... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Scotland.

- Manchester, Silver Cup, value £10 10 0
- Manchester, Silver Cup, value £ 6 6 0
- Glasgow... Silver Cup, value £10 10 0
- Glasgow... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Lancashire.

- Leeds Silver Cup, value £ 6 6 0
- York Silver Cup, value £ 6 6 0
- Taunton .. Silver Cup, value £ 6 6 0
- Devon, Somerset, Dorset and Gloucestershire.

The above Prize is confined to growers in Yorkshire.

FOR NURSERYMEN.

- Glasgow... Silver Cup, value £10 10 0
- Glasgow... Silver Cup, value £ 6 6 0
- Dublin ... Silver Cup, value £10 10 0
- Dublin ... Silver Cup, value £ 6 6 0
- Belfast ... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Scotland.

- Dublin ... Silver Cup, value £10 10 0
- Dublin ... Silver Cup, value £ 6 6 0
- Belfast ... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Ireland.

- Dublin ... Silver Cup, value £10 10 0
- Dublin ... Silver Cup, value £ 6 6 0
- Belfast ... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Lancashire.

- Leeds Silver Cup, value £ 6 6 0
- York Silver Cup, value £ 6 6 0
- Taunton .. Silver Cup, value £ 6 6 0
- Devon, Somerset, Dorset and Gloucestershire.

The above Prize is confined to growers in Yorkshire.

- Manchester, Silver Cup, value £10 10 0
- Manchester, Silver Cup, value £ 6 6 0
- Glasgow... Silver Cup, value £10 10 0
- Glasgow... Silver Cup, value £ 6 6 0

The above Prizes are confined to growers in Lancashire.

- Leeds Silver Cup, value £ 6 6 0
- York Silver Cup, value £ 6 6 0
- Taunton .. Silver Cup, value £ 6 6 0
- Devon, Somerset, Dorset and Gloucestershire.

The above Prize is confined to growers in Yorkshire.

PRIZE CUP.
Specially Designed by Messrs. Elkington & Co., to be awarded for Mr. William Bull's New Introductions.

A SERIES OF SILVER CUPS, as follows, will be given to those not having previously won any of

MR. WM. BULL'S SILVER CUPS:

FOR PRIVATE GROWERS.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

FOR NURSERYMEN.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

The above Six Silver Cups will be given at the principal Show to be held at Kensington, in 1875.

At the Provincial Show of the Royal Horticultural Society in 1875, the following Silver Cups will also be given:—

FOR PRIVATE GROWERS.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

FOR NURSERYMEN.

- 1st Prize, a Silver Cup, value .. £15 15 0
- 2d Prize, a Silver Cup, value .. £10 10 0
- 3d Prize, a Silver Cup, value .. £ 6 6 0

In each and all cases the above Prizes to be offered for Twelve New Plants of Mr. W. Bull's introductions, and sent out for the first time since the commencement of 1872. The Plants available for the Prizes to comprise only those announced in Mr. W. Bull's Catalogues, as sent out by him for the first time. The Catalogues can easily be referred to, or a List of the Plants had on application.

In each and every entry the names of the Twelve Plants to be exhibited must be sent with the entry. Exhibitors can only compete for one Prize at a time in each class.

The Twelve Plants must be twelve distinct species or varieties, but each may be composed of one or more individual plants, if grouped in one pot, pan, or vase.

NEW PLANTS.

MR. WILLIAM BELL

Intimates that the following New Plants are now being sent out:—

AUCUBA JAPONICA LUTEOPICTA.

A very freely-marked and handsome variety of the Japan laurel, the leaves of which are large, springy, leathery, of a deep green colour, marked in the centre with a broad and tolerably constant blot of pale creamy yellow, irregular as to size and shape, but usually most developed towards the base of the leaf, and extending in a narrow line nearly to the apex. This blotching is sometimes confined to one side of the costa. 10s. 6d.

ERANTHEMUM ATROPURPUREUM.

An erect-growing stove plant, with the stems and leaves wholly of a dark lurid purple colour, which in the young leaves takes a deep sanguineous hue. They are ovate, entire, stalked and opposite, and acquire rather a large size, so that the plant is adapted to take a very prominent position amongst the ordinary decorative stove plants, the deep wine-purple colour of the leaves contrasting finely with the ordinary green of most other plants. 10s. 6d.

ERANTHEMUM MOOREI

A stove plant of distinct and interesting character. The stem is slender, the leaves opposite decurved oblong-ovate acuminate, rather large, with mottled-green centre and a broad yellowish margin, which gives the plant a very lively appearance. The edges of the leaves are somewhat undulated. 10s. 6d.

ERANTHEMUM RETICULATUM.

A very pretty-leaved branching-stemmed stove plant of erect habit. The leaves are opposite, ovate-lanceolate, acuminate; they are of a light cream colour, with a yellowish green throughout with golden yellow, the marking very much resembling the variegation of "Lonicera aureo-reticulata." 5s.

ERANTHEMUM VERSICOLOR.

A very free-growing stove plant, of somewhat peculiar character to the *E. marginatum*, sent out by me last year, but quite different, being much stouter in habit, and having much larger leaves. *E. versicolor* has erect nodose stems, furnished with opposite leaves, which, in rather large, long-stalked, ovate, or oblong-ovate, narrowed to the base, and irregularly sinuate at the edge. The ground colour, of which very little is apparent, is a deep green, splashed or mottled with grayish green, and becoming pure creamy white at the edge, where an irregular sinus is formed from the imperfect development of the tissue. 7s. 6d.

The four above-named *Eranthemums* were imported by the director of the Royal Botanic Gardens, Kew, by whom they are named, and they have not yet become known in this country. The names are provisional.

HEIBISCUS (ROSA SINENSIS) VIVICANS.

A fine free-flowering and exceedingly showy stove plant of vigorous habit, with ovate, coarsely but shallowly toothed leaves, and remarkably large flowers, $\frac{3}{4}$ to 5 inches in diameter, full double, the centre being completely filled up with broad, more or less convolute petals, having tufts of stamens interspersed. The colour is a brilliant crimson scarlet. The outer petals reflex, so that the blossoms become globular in outline, the surface being "pockety," as in some *Hollyhocks*, and a yellowish sometimes projecting. It is a very showy variety, and was imported from the South Sea Islands. 10s. 6d.

TODEA INTERMEDIA.

A charming New Zealand Fern, intermediate in character between the equally charming *Todea* and *T. hymenophylla*. The former of these the frond is lance-shaped, tapering to the base, and the segments bristle up like a dense fill on the upper surface, while in the latter the fronds are entire throughout, and the surface is plain. Amongst the numerous slight variations which occur in the wild plants is one tolerably well marked, which is called *Todea intermedia*, in which the fronds are less about below than in the *hymenophyllodes*, are not feathered to the base with the gradually shortening pinnae which occur in *superba*, and the surface, though not quite plain, like *hymenophyllodes*, is much less bristly with erect pinnae than in *superba*. It is a most beautiful Fern, having the same pellucid texture and deep green colour which are characteristic of its allies. 2 and 3 guineas.

NEW PLANTS.

FOR NAMES, DESCRIPTIONS, AND PRICES OF—

Alcacia rosea, *Catactozamia Hopei*,

Colocasia argyrea, *Martinezia leucopneusa*,

Passiflora, *Passiflora*, *Sabal corallae*, *Scheelea imperialis*,

Vide page 589 of last week's Gardeners' Chronicle.

Cinnamomum sericeum,

Dalechampia Roelziana alba,

Dracaena gemma, *Dracaena rubella*,

Laportea Schomburgkii var. *colorata*,

Gontopodium and *Stenocarpium*, *Panax obtusum*,

Vide page 557 of the Gardeners' Chronicle for May 1, 1875.

Acalypha marginata, *Curmeria Roelzii*,

Maranta leopordiana, *Demotum chrysophyllum*,

Cycas Normanbyana, *Gerononopsis ornatus*,

Vide page 583 of the Gardeners' Chronicle for April 24, 1875.

Rheum nobile, *Rheum officinale*,

Rheum palmatum tanguticum,

Astrocaryum argenteum, *Astrocaryum flare*,

Anthurium candidum,

Vide page 491 of the Gardeners' Chronicle for April 17, 1875.

New Double-flowered Ivy-leaved Pelargonium,

"Pelargonium Lateripes König Albert,"

New Mossy Pelargonium,

New Bronze and Gold Pelargonium,

New Ivy-leaved Pelargonium,

Vide page 459 of the Gardeners' Chronicle for April 10, 1875.

New Fuchsiae and Chrysanthemums,

New Zonal Pelargonium,

New Zonal Pelargonium with Variegated Flowers,

Vide page 427 of the Gardeners' Chronicle for April 3, 1875.

SATURDAY, MAY 15, 1875.

DOUBLE DAISIES.

ABOUT Daisies there has been a diversity of sentiment. From the "wee, modest, crimson-tipped flow'r," of Burns, to the blating ditty "I'd like to be a Daisy, if I could be a flow'r," making the most of the matter at every passing show'r, poets and poetasters have taken kindly enough to the Daisy. Too sensitive Keats, at the approach of death, felt the Daisies growing over him. On the other hand, high-finishers gardeners use every effort to exterminate every Daisy from their lawns, treating them as plants in the wrong place, i.e., weeds; whilst to the lovers of country strolls is there anything more charming than a meadow in May brightly spangled with Daisies? The Germans call the Daisy *das Marlieb* or *die Massliebe*, the Measure-love, doubtless from the popular practice of girls' repeating, as they pluck off the florets one by one, "He loves me," "He loves me not"—the last floret indicating the state of the lover's feelings. Perhaps it is an appreciation of the wisdom of those girls that the Daisy is also called *die Gänseblume*, the Goosefower, unless its simultaneous appearance with goslings be the reason. The German catalogues, however, make compensation, by announcing it as *Tausend schön* (thousand times beautiful), fine double sorts in great variety, twelve named sorts being to be had for so much, besides the double white and double red *aucubefolias*—a slight misnomer, because the leaves of the *Aucuba* are spotted, whereas those of the Daisy are veined with yellow. A Pearl, in Latin, is *Margarita*, in Italian also; in which latter language, *Margherita* and *Margheretta* are Daisies. The French call them *Paquettes* (Easter flowers), and *Petites Marguerites* or *Marguerites*, China Asters being *Reine Marguerites*, or Queen Margarets; and as both those nations claim to be of the Latin race, we may assume, if there be anything in etymology, that they regard the Daisy as the pearl of the meads. The English Daisy is the day's-eye—a term more pleasing than that bestowed on the Ox-eye, although amongst Homer's epithets "ox-eyed" is especially indicative of beauty. Loudon's *Encyclopaedia of Gardening* simply admits the Daisy into the list of perennial flowers, white and red, which bloom in February and March; Glenny does not even allow it a place amongst the flowers which have a right to "properties." I must confess to thinking that it merits floral rank as much as the Pansy and the Polyanthus. And now, after having been long abandoned to cottage and farmhouse patronage exclusively, it is being promoted to the spring gardens of the nobility, perhaps even of royalty itself.

Bellis perennis is a hardy perennial; nevertheless some of its double varieties are delicate, disappearing without giving warning. From the time of their ceasing to bloom to the date of their flowering again they are mostly forgotten, and left to take care of themselves, during which interval they are apt to go off, through drought, or frost, or wet, or unsuitable soil, or slugs. When they are looked for in early spring they fail to answer to the roll-call; their place is vacant, or simply marked by the presence of a few weakly, lingering survivors; and people are surprised that they have perished. Who would have thought that any care was needful for the cultivation of a Daisy? But the occasional scarcity of some of the sorts

—of the quilled crimson, for instance—proves that something more than mere neglect is required to have them in ornamental and thrifty condition, and that these little beauties resemble Eve, "who would be woo'd, and not unsought be won." The quilled white cannot be called a common border flower; the same of several other choice old varieties. The commonest, in consequence of its superior robustness, is the double pink.

If we could be content with this last, it is always to be had in quantity, but a diversity of hues is most desirable, and the others, less certain to propagate themselves unaided, may sometimes not be ready to hand. I would, therefore, suggest a mode of obtaining double Daisies, in various shades of colour, which is not often practised, I think, in private gardens, namely, by seed. Last spring, more with the hope of obtaining some one pretty variety than with any expectation of getting quantity, I sowed seed in earthen pans, had the seedlings pricked out in a bed in summer, and bestowed on them no further care than weeding and watering when necessary. In autumn they began to flower; the first blooms were encouraging. They continued to show themselves all winter long, stopping when the frost compelled a halt, and starting again as soon as a thaw allowed them. This spring the show was brilliant. On nearer inspection, the number of singles was small, and we turned them out as soon as they showed themselves; semi-doubles were more numerous, some of them so pretty that it cost us much to suppress them. Would it be worth while to save seed of such? Of doubles, or of flowers remaining so until their last moments disclosed a latent eye, we had a sufficient number to plant a long border. As the whites greatly predominated, I had them planted a white root alternately with some shade of pink, with a result which we think very cheerful and sparkling. Amongst the seedlings we have no dark crimsons and no quilled varieties, which probably depends on the plants whence the seed was obtained; but we have some of the Hem-and-Chickens type, some narrow-petalled having a sort of fluffly appearance, and others with the underside of the petal of a dark pink and the upper surface light pink or white, giving a kind of marbled or shot-silk effect as the flower is seen in different positions. Your impartiality would prevent my naming the house from whom I procured the seed, and it is the less necessary to do so as double Daisy seed is offered in the catalogues of most of the British seedsmen. The soil best suited for Daisies would seem to be their natural wild one—a good alluvial loam, well drained. Heath mould or leaf-mould alone are too light and too easily penetrated by drought; clayey soils are too retentive of wet. Separating and replanting the tufts every second year, or even every year, may be judicious treatment, but should my readers discover amongst their seedlings any real gem, a true *Margarita*, I venture to advise them not to be too much in a hurry to propagate it by division. The new variegated-leaved sorts, as well as several others, make exceedingly neat and pleasing pot plants for window sills and balcony gardens, while their early and long-continued blooming insures their hold on popular favour. *E. S. D.*

THE ROYAL ACADEMY.

(Continued from p. 590.)

WHAT could be more wearisome for a garden with one flower, or a concert with one tune, or a book or man with one idea, or a dinner with one dish? These notes on the Royal Academy pictures would be a little flat if entirely confined to a review of flowers, fruits, and vegetables; if, therefore, clouds, sea, rocks, and figures with their varied forms and colours are at times here adverted to, it is because all beautiful forms and hues are so intimately allied with each other that it is almost impossible to appreciate and review the beauties of one natural object without equally appreciating and noting the beauties of one and all.

Returning to Gallery No. 1V, No. 284, "St. Cecilia," is by Miss A. M. Lea. "St. Cecilia" has

a ring on her finger, and touches a sharp or a flat of a piano; the white Lilies in the saint's hand are very poorly given. 289, "Eveline, daughter of Evan Lees, Esq.," one of Millais' series of portraits: this is a brown-eyed child with naked feet and a white dress, with a background of Ferns; *Vinca minor* is introduced in this picture, which is well worthy of study in its entirety. 286, "Cat the yowes to the knowes," R. W. Macbeth, another landscape by one who is professedly a figure artist, good in itself but not to be compared with the landscapes by Millais or Walker. 293, "Gracia, daughter of Evan Lees, Esq.," another of Millais' series of portraits: the child (judging from the presence of *Iris Pseudacorus* and *Lychnis flos Cuculi*, both roughly indicated) must be kneeling in a very damp place. 296, "An Enemy in the Path," F. E. Cox, is a lovely picture of a child with Daffodils—the Daffodils, be it observed, set off to their utmost advantage by the child's blue dress. 298, "Returning with the Spoils," F. P. Shuckard, is a picture of a pretty little girl with a basket of flowers—all of a dubious nature. 300 and 305, "Near Troutbeck" and "The Homestead," both by A. Hague, and both curious and dull, not to say unnatural. 309, "Autumn," T. E. Cox, a picture of a well-painted Apple orchard; girls heavily laden with Apples, and scampering ducks. 310, "Peonies," W. J. Mackley, is apparently a well-painted picture of Peonies, Roses, Delphiniums, Rhododendrons, &c. It appears to be well painted, rich in colour, and correct, but unfortunately it is placed at the top of the room. 314, "Woods and Forests," J. Linnell, sen., is one of this well-known painter's masterpieces. It represents old Oaks, distant country, woodmen and vagrants, and is full of rich colour. 317, "Miss Margaret Stuart Wortley," A. Stuart Wortley. In this capital portrait there is a life-size group of *Calla aethiopica*, well and correctly painted, with the flowers spathes kept yellowish-grey in colour (pure white would be far too obtrusive in the middle of a picture). 319, "Toujours Fiable," P. H. Calderon, R.A., an excellent figure subject, and a study of colour. Observe the black dress, white sleeves, and yellow "immortelles." 324, "How Sweet!" B. Amiconi—a girl with her head thrown back smelling a monthly Rose in a flower-pot. 338, "A Doubtful Greeting," Miss R. Brett—a semihumorous little picture of a bird and snail, but not very well done. 343, "Neglected," W. C. Symons—Pompon Chrysanthemums, unfortunately at the top of the room. 346, "Chrysanthemums," A. Parsons: the vase is well painted, as is the background; the prevailing colours are slate, white, and yellow, low in tone but good: the flowers, however, will prove unsatisfactory to those who know what Chrysanthemums are. 352, "Gardening," C. E. Perugini: this is a charming picture, and is in its way perfect; it is full of floral detail, and represents an old-fashioned garden abounding in old-fashioned plants. Passing by No. 344, noticeable for its wretchedly conceived rendering of "Ophelia," by A. Elmore, R.A., we come to 345, "Little Fatima," by F. Leighton, R.A., a rich study of colour—a girl with a magenta and mauve cloak on a black background: the broad flat gold margin of the frame considerably adds to the beauty of this picture with its purples and jet black. 353 and 37, "A Palm Fan," "A Flower Walk," and "Panisies," all by A. Moore, are decorative figure subjects, low in colour. 369, "Sandy Cove: Tide Flowing," E. W. Cooke, R.A., a magnificent picture of sea, pines, hedges, rocks, and Scotch Firs, full of good drawing and colour, bold, yet every detail of rock, sea and trees well made out. 381, "Queen Lily and Rose in One," E. H. Fahey, a picture of an old-fashioned garden, full of flowers, especially white and yellow Lilies and Poppies; the painting is full of careful detail, and the plants are correctly painted. 391, "Cottage Window," Miss D. M. Mutrie. This is a masterpiece of drawing and colour as applied to flower painting, and represents a group of Primulas, Cyclamens, Tulips, &c., in a cottage window; the colours are extremely brilliant and the drawing is good, for without perfect drawing colour is worse than useless. Observe the shining deep blue vase in which the Tulips are placed, with the light upon it, as contrasted with the opaque flower-pot in which

the Primulas grow—the single fallen white flower on the table, which could not be dispensed with, the lemon-coloured Apple, the blue saucer just touching it, and the old Bible marked with a thread of red worsted; the position and colour of every trifling object shows the constant thought and design of the painter.

(To be continued.)

New Garden Plants.

ADIANTUM MACROPHYLLUM GLAUCUM.*

Though undoubtedly a form of *Adiantum macrophyllum*, this Fern has at first sight quite a distinct appearance. It is, as our figures (126, 127) show, a very ornamental plant, the specimen represented being upwards of 2 feet broad in the spread of the fronds. The fronds are from 18–20 inches high, simply pinnate, with a dark-coloured shining stipe and rachis, and furnished with five or six pairs of opposite sessile pinnae, which in the perfect fertile fronds assume a remarkable form, the anterior base being straight and parallel with the rachis, while the posterior is cut away obliquely, but in a straight line, and the two sides, again forming nearly straight lines, converge in the somewhat acuminate apex. The terminal pinnae is equally cut away on both sides in an oblique manner, and in about the same degree as the posterior base of the lateral pinnae. The sori are continuous, nearly or quite as long as the pinnae. As compared with the cultivated forms of A.

found in the *Gartenflora* of last year, as quoted. It is a native of Georgia, and was discovered in the district of Blak, near the Persian border, by the collector whose name it bears. The specimen from which my notes were taken was grown by Max. Leichtlin, Esq., at Carlsruhe, and flowered at the end of April of the present year. I have not heard of it in England yet,* but no doubt we shall have it soon, and, like *Tulipa Greigii*, which will appear shortly in the *Botanical Magazine*, it will prove a general favourite. Its general character will be best conveyed by saying that it is intermediate between *T. suaveolens* (the Duc Van Thol) and *T. Oculis-solis* or *precox*. It has the downy stem and very glaucous leaves of the former, combined with the tall stature and very distinct black basal blotch, with a yellow border, which is the most striking characteristic of the flowers of the two latter. It is still nearer the Greek *T. boetica*, but that is not yet in cultivation with us, and probably would not be hardy.

Bulb ovoid, with brown membranous tunics, which are slightly hairy inside upwards. Scape, including the peduncle, a foot and a half high, glaucous, terete, clothed throughout with distinct short spreading pubescence. Leaves two or three to a stem, the uppermost placed about its middle, lanceolate, narrowed gradually to a long point, glaucous, obscurely pubescent on both sides, very fleshy in texture, ascending, the lowest 8–9 inches long, 1½ inch broad at the middle. Peduncle erect, 8–9 inches long, conspicuously pubescent. Perianth 3 inches deep, campanulate, the erect segments bright crimson, with a black deltoid blotch on the face at the base, which

FIG. 126.—ADIANTUM MACROPHYLLUM GLAUCUM (FERTILE PINNA AND FRUIT).

macrophyllum, this plant appears at once and absolutely distinct by its glaucous green colour, which is very pronounced, and by the narrower pinnae, which have always a strong tendency to be straight-tipped. The opposite pinnae look almost like some tropical butterfly with expanded wings, from the parallelism of the anterior sides, and from the evenly-balanced obliquity of their posterior base. Altogether it is a very desirable plant for decorative purposes, and quite an acquisition to our collections of Ferns.

This Fern has been imported by the Messrs. Veitch & Sons both from Peru and New Granada, the two forms being undistinguishable. Our illustrations have recently been drawn from plants cultivated in the Royal Exotic Nursery, at Chelsea. The young fronds, as in *A. macrophyllum* itself, are of a fine red colour; but the bright green of the normal *A. macrophyllum* is thoroughly distinctive and contrasting, and a first-sight character of which cultivators may avail themselves when making use of either or both for decorative uses. *T. Moore*.

TULIPA EICHLERI, *Regel, Gartenflora*, 23, p. 193, tab. 799.†

This is a well-marked new species of Tulip, of which a full description by Dr. Regel and a figure will be

* *Adiantum macrophyllum*, Swartz; var. *glaucum*, Moore. — Pinnae narrower than in the type, distinctly glaucous, nearly straight-sided, the terminal one pyramidal, with a broadly cuneate equal-sided base.
† *Tulipa Eichleri*, Regel. — Bulbo ovoido tunicis intus superne piosis; caule sesquipedali glauco conspicuo puberulo; foliis 2–3 infra medium caulis impositis lanceolatis acuminatis utrinque glaucis obscure pubescentibus; pedunculo elongato recto unilobato; perianthii tripliciter segmentis splendide coccineis basi macula nigra magna deltoides flavo-gincta praeditis; interioribus obovatis obtusis cuspidatis; exterioribus oblongis acutis; staminibus nigris perianthio triplo brevioribus;

is 3 inch deep, with a distinct yellow border, the inner segments obovate-cuspidate, 1½ inch broad above the middle, the outer oblong-acute, an inch broad at the middle. Ovary 1½ inch long, glaucous green, cylindrical, the ear-shaped deeply channelled downy stigmas little broader than the ovary itself. Anthers 1½ inch long, both anterior and filament black, polished and glabrous. *F. G. Baker*.

VANDA BICOLOR, Griff.†

The reappearance of an old plant lost some thirty years is as a grand l'été for us. The lamented Griffith discovered this *Vanda* on trees on the banks of the Monas River, in Bhoatan, at the elevation of 2300 feet. And lately, April 8, at Mr. Low's grand sale, when a *Dendrobium Wardianum* fetched 700 guineas, a few plants of this *Vanda* came under the hammer. My reason for my statement is simply this, that Mr. Boxall died (!) a single flower of this *Vanda*, which Mr. Low kindly sent me; and this flower is that of *Vanda bicolor*, Griff. itself. It is very near, as Mr. Low well suggested, both to *Vanda Bensoni* and *V. Denisiana*, yet the anterior part of the lip distinguishes it at once. The flowers are rather larger than those of *V. Bensoni*, at least equaling those of a good *Denisiana*, they

antheris filamentis glabro aequalibus; ovario cylindrico; stigmate parvo profunde lobato.

† Since this was written I have had a fine specimen from Mr. Elwes, grown and flowered at Cirencester.

† *Vanda bicolor*, Griff.—Folius ligulatis apice bidentatis; pedunculo parviter exsertis planiteris; ovario pedicellatis elongatis; sepalis oblongis obtusis basi cuneatis, sepalis summo superne aequaliter dilatato, sepalis interioribus inequalibus, latere interno revolutis, submajoribus; tepalis bene ligulatis medio obtusangulo hastatis; labelli auricularis ovatis, lamina hastato-triangula, apice obtuse dilatata, bifida sine lobis, angustis; callo bicarinato in una basi, calcaris brevi coloris *oculoidis bicolor*, Griff. Not. 254. E. Plant. As. ccccxxx, (excerabans icon), Lindl. Folia 1, *Vanda*, No. 11.

have been yellowish inside, with numerous dark tessellations, white outside. The lip is stated to be like by Dr. Griffith, whose indications as to sepals and petals are coincident with what we see. Are there any ridges on the lip? It seems so, but we cannot well judge on the question before we have seen living flowers, for which I recommend myself to those who may happen to flower the plant. The basilar auricle of the lips afford an excellent mark of distinction from *V. Bensonii*. I am sorry to add that Dr. Lindley himself appears to have been misled by the execrable representation, when stating "labello linguiformi emarginato"—which is decidedly wrong; and according to this I should have had to give the plant a new name, if I had not known the type. *H. G. Rehb. f.*

FRITILLARIA (MONOCODON) ACOMPETALA, Boiss.
Diagn. vii. 104; *Baker, in Linn. Journ.* xiv. 262.

Besides a new Snowdrop and a new Crocus we owe to the excursion of Mr. Elwes to Asia Minor last spring a couple of *Fritillarias*, which are new to cultivation. As I have lately given a full diagnosis of this in the *Journal of the Linnean Society*, I need not repeat it here. The bulbs were procured by Mr. Elwes in Lycia, in the Dembra gorge, whence we have dried specimens at Kew, gathered long ago by

ELEMENTARY LESSONS IN BOTANICAL GEOGRAPHY.

(Continued from p. 595.)

IX.—ON THE BOTANICAL CHARACTERISTICS OF THE ZONES OF MOISTURE.

As, in speaking of heat, we have had to speak of four groups of plants which have a special constitution in respect to the amount of heat they require, so now, in speaking of moisture, we have to separate plants into three groups, according to their needs as regards aerial humidity. These groups are, 1st, Xerophilous plants, which can live in climates in which the air contains habitually very little moisture; 2d, Hygrophilous plants, which can only live in climates in which there is habitually a great deal of atmospheric moisture; and, 3d, Notoerophilous plants, intermediate in constitution between those of the other two groups.

Broadly stated, the grand influence which the distribution of moisture over the earth's surface exercises upon the distribution of plants is, that the earth is girdled round, in and near the borders of the two rainless zones, which run like a belt round the earth near the two tropics, and separate the region of the periodic rains from the region of irregular rains, by

Gum Acacias, and Acanthosicyos; 6th, shrubs with small hard rigid leaves, as Fabiana, Proteaceæ, Larrea, Epacris, Bruniaceæ; 7th, leaves, and often also branches, gland-dotted, as Myrtaceæ, Rutaceæ, and Rosaceæ, or yielding gummy exudations, like myrrh and frankincense; 8th, flowers protected by an excessive development of scariose bracts, as in *Heli-chrysum*, Gomphrena, and *Barleria*; 9th, dense hairiness or scurfiness on the leaf, bract, and other foliar organs, as shown in *Kochia*, *Erioccephalus*, *Aerva*, and *Dalea*; 10th, in the development of a tuberos root, large out of all ordinary proportion in comparison with the stems and leaves that come from it, as shown in *Hoareæ*, *Seymouria*, *Diposis*, *Oxalis*, and *Brachystelma*.

In Monocotyledons we have the Xerophilous type represented in two very characteristic forms, the large thick fleshy-leaved type, as illustrated by *Aloe*, *Gasteria*, *Haworthia*, *Fourcroya*, *Agave*, and *Bulbine*; and the familiar bulb type, to which so many of our most beautiful open-air garden flowers belong—*Lilies*, *Tulips*, *Hyacinths*, *Daffodils*, *Crocuses*, *Colchicums*, *Ixias*, plants which mostly inhabit, not the heart of the rainless tract, but its borders, where rain comes but seldom and sparingly, and which push up into leaf and the flower in the brief season of fertility, and

FIG. 127.—ADIANTUM MACROPHYLLUM GLAUCUM.

Professor Edward Forbes. The species, which is exclusively oriental, may be roughly described as a compromise between *F. Meleagris* and *F. pyrenaica*, with the tall habit and narrow leaves of the former, and the dull coloured untesellated flower with a great deal of green in its composition of the latter. So that it is by no means a beauty, not half so handsome as our common English *Meleagris*, nor, for that matter, either is our other novelty. Boissier has separated a *Fritillaria Lycia* from *F. acompetala*, and if the two be distinct our plant is doubtless the former; but after examining a pretty good set of dried specimens, I cannot make out any satisfactory character between the two.

Bulb like that of *F. Meleagris*. Stem about a foot long, slender, glabrous, mottled with glaucous and purple. Leaves 5—6, all linear, scattered, rather glaucous, acuminate, the lowest 4—5 inches long, 1/4 inch broad. Flower solitary, cernuous. Perianth 13—14 lines long, the segments untesellated, green, only bordered with purple; the nectary obscure, purple, oblong, placed a little above the base, the outer oblanolate-oblong, 1/4 inch broad, the inner obovate-oblong, 2/3 inch broad above the middle, deltoid at the tip. Genuitalia about half as long as the perianth. Ovary clavate, 4 lines long; style as long as the ovary, with three forks, reaching half-way down. Oblong yellow anther, 2 lines long, half as long as the very downy filament. *J. G. Baker.*

two broad belts of country in which the Xerophilous plants predominate more decidedly than they do in any other part of the world, and that they run out from these belts into the interior of the continents, both towards the equator and the poles, avoiding the insular climates.

The concomitants in plant form of the Xerophilous type of constitution are as follows:—In Dicotyledons—1st, leaves becoming thick and fleshy, with pulpy inner and leathery outer layers, in which the air-passages and stomata are few, and the cells either small or their walls thickened by secondary deposits of cellulose, as shown in *Mesembryanthemum*, *Sedum*, *Cotyledon*, and *Sempervivum*; 2d, the stem condensed into a single central unbranched barrel-shaped or top-shaped mass, which is either leafless, and armed only with spines, as in *Mammillaria*, *Echinocactus*, and various *Euphorbias*, or without spines, and bearing fleshy or rigid leaves, as in *Cycads*, *Wel-witschia*, and *Vitis Bainesii* and *V. macropus*; 3d, branching fleshy or hard stem-types without proper leaves, but in which the main stems or petioles put on a leafy appearance, as in *Opuntia*, *Phyllocactus*, *Colletia*, and the phyllocladous *Acacias*; 4th, much-branched shrubs with copious whip-like branches without either leaves or prickles, as *Ketama*, *Ephedra*, *Rhipsalis*, *Cassytha*, and *Euphorbia Tirucalli*; 5th, much branched wiry herbs or shrubs with an excessive development of prickles, as *Fagonia*, *Alhagi*,

spend the rest of the year in the form of an underground mass of dry or fleshy leaf-scales, in the axils of some of which new plants are formed by a process of vegetative reproduction which enables them to hold their ground even if no seed be ripened.

One of the most remarkable points about these Xerophilous plants is the extraordinary way in which many familiar groups of plants which are distributed through different climates are modified in form in the Xerophilous belts. We have an excellent instance of this in *Euphorbia*, which is a genus of 700 species, spread over all parts of the world, all the members of which coincide in the extremely peculiar structure of the flower. About 600 of the species are annual or perennial herbs, several of them widely-spread garden and cornfield weeds, with slender unarm'd stems and a copious development of scattered entire sessile simple leaves. About a hundred species inhabit the specially Xerophilous region, and these, whilst retaining absolutely their floral structure, become so extremely modified in habit that they are usually taken for Cactuses by inexperienced visitors to our living collections. I can only indicate roughly the general appearance of two or three, taken at random. *Euphorbia canariensis* is a shrub 20 feet high, with a general shape like a chandelier, thrown out from the main stem copious firm, fleshy, ascending branches a couple of inches thick, without any leaves, each branch furrowed so as to have five angles, and each angle

armed with a row of pairs of hard, pungent prickles, which spread from the ridge at an angle of 45°.

The large flora of decidedly Xerophilous type are five in number—two in the Northern and three in the Southern hemisphere, and are as follows:—

1st. The Desert flora, extending from the Canaries, through the Sahara, and through Egypt and Arabia to the Indus delta. This is not so rich in large groups and large genera of decidedly Xerophilous type as some of the others, but it is the largest arid tract in the world, and has a great many endemic genera and species.

2d. The flora of Southern California, New Mexico, Texas, and North Mexico, running out northward to Utah and Kansas, but stopped in a southern direction by the Mexican Andes. This is the exclusive home of Agave and its allies Fouroyra and Beschorneria, and of the rigid-leaved tree Liliaceæ, Yucca, Hesperaloe, Daylily and Beauveria, and it is the great centre of the Cactaceæ.

Turning now to the Southern hemisphere, we have—

3d. The flora of Southern Angola, stretching down the coast to the mouth of the Orange River, and across the Kalihari Desert and Cape Karroo to Kapfland. This is the great home of Aloe (of which one huge arborescent species is said to reach 150 feet in the spread of its branches), Gasteria, Haworthia, Stapelia, Mesembryanthemum (of which latter genus alone there are said to be not less than 400 species of extremely varied habit), and the tree-like Euphorbia.

4th. The flora of Central Australia, including the Swan River territory, and reaching on the north to the tropic, and on the south to the Victorian alps. Here there are the same genera, Stapeles, Agaves, nor Aloes, and Crassulacæ is only represented by Bryophyllum. The fleshy-leaved dicyotyledons are represented by Zygothymallum, Calandrinia, two or three species of Mesembryanthemum, and several Chenopodiaceæ; and the fleshy endogens by Bulbine. Of the phylloidaceous Leguminosæ there are Brachysema, Jacksonia, and not less than 270 species of Acacia.

and gland-dotted leaves, very abundantly represented here in Bononieæ, Leguminosæ, Myrtaceæ, Euphorbia, Ericaceæ, and Proteaceæ.

5th. The flora of the Chillian province of Atacama, which extends on the west side of the Andes from the borders of Bolivia to 28° or 30° south latitude, and in the heart of the continent of Catamarca, Tucuman, Cordova, Mendoza, and other provinces of the Argentine Confederation. Here there are no Agaves, Aloes, nor Stapelias, and scarcely any Crassulacæ, but a good many Cactaceæ and the Cactus-like Euphorbias are represented by one, and Mesembryanthemum by two or three species.

The concomitants in plant form of the Hygrophilous type of constitution are luxuriant growth, erectness, and great size of the timber trees, the presence in the tropical zone of abundant climbers and epiphytes, the absence of prickles, whether adhesive or stipitate, or formed by indurated branchlets, leaf-borders, or calyx-teeth; the absence of hair or matting from the leaves, bracts, and other foliar surfaces, the abundance of flowers with large delicate corollas, and the organisation of the leaves, which are planned by air-channels, stomata, and the arrangement and structure of the cell-layers, so as to favour copious evaporation.

The distribution of Ferns in general illustrates extremely well how the presence and absence of plants of these two types affects the general character of the tropical floras. Taking Ferns as they stand, as regards species limitation, in the first edition of our Synopsis Filicum, out of 2228 known species, 1901, or 85 per cent., occur in the tropical zone, and 1437 species, or 65 per cent. of the order, are confined to it; but of these there are but any three—Cheilanthes, Pellaea, and Notochloa—included together in the 215 species—which can be considered Hygrophilous.

By neglecting these as not materially affecting the result, because many of them are also not tropical, we find practically that the number of Ferns in any tropical or sub-tropical flora furnishes an excellent test of the moisture or dryness of the climate of the country. To take first the continents:—There are 944 species in tropical America, 863 in tropical Asia, and 116 in tropical Africa. To take next countries with an insular climate, there are 320 in the Himalayas, 118 in Japan, 153 at the Cape, 113 in New Zealand, 160 in Australia, 213 in the Mascaren Isles, about 200 in Ceylon, 100 in Formosa, 400 in the Polynesian, and 650 in the Malayan islands. Contrast these with the number of species in continental climates—Asia Minor, 25; Algeria, 24; Spain, 39; and 7, 10, and 12, respectively, apart from the hills, 113; Italy, 7; Arabia Felix, 12; and in England, 14. In Arabia there are five, the same Adiantum, Notochloa vellea, Onychium melanopus, Actinopteris radiata, and Ophioglossum vulgatum. In the neighbourhood of Pekin there are five—Adiantum Edgeworthii, A. Capillus-Junonis, Cheilanthes argentea, Asplenium japonicum, and A. keikense.

In Brazil we have the two kinds of flora displayed side by side under the same latitude—the Hygrophilous type in the Regio Dryadum of Martius, which belts the coast from the province of Santa Catharina through Rio Janiro and Bahia, to Pernambuco; and the Xerophilous type in his Regio Oreadum, which occupies a large tract in the interior of the empire in the provinces of Goyaz, Minas Geræas, and St. Paulo. A great many species and genera are restricted to one of the two districts, but there are also a great many other groups and genera, which are represented by a large number of species in both, and, for instance, in orders Malpighiaceæ, Convolvulaceæ, and Bigoniaceæ, and in genera Eupatorium, Vernonia, Mikania, Vitis, and Echites and its allies. The species of these are mostly distinct in the two tracts, and put on so different a type in their vegetative organs, that though, of course, where there is generic identity there is no sensible difference in flower-

structure, yet, in nineteen cases out of twenty, it is easy to see from which tract the plant comes, by a mere glance at its texture and its general aspect, the rigidity of the leaves or their hairy coating, the shortened petioles, the diminished flowers, the congested inflorescence of all, the erect stems of the Malpighiaceæ and Bigoniaceæ, the vanished tendrils of the Vines, the greater quantity and rigidity of the pappus-bristles of the Compositæ, marking the Oreads from the Dryads.

Even within the compass of Britain we have the two types contrasted to a certain extent. Out of the 606 species which in Britain are gradually lost in passing from the south to the north of the island, Mr. Watson has separated seventy which belong by preference to the west side of the island, and constitute what he calls the "Atlantic type of distribution;" and 127 species which belong by preference to the east side of the island, and constitute what he names the "Germanic type of distribution." In Britain, as we have already explained, the west side is more insular, and the east side is more continental in its climate; and difference in atmospheric climate is in this case intensified in its relation to plant-stations by the nature of the subjacent rocks, the chalk and other dry rocks of calcareous nature being mainly concentrated in the eastern half of England, between Hampshire, Sussex, and the Tynne. There can be little doubt that a principal cause of one set of these plants affecting the east, and the other the west, side of the island, is the more Xerophilous constitution of the Germanic, and the more Hygrophilous constitution of the Atlantic group—the two types being as elsewhere in extra-tropical latitudes, corresponding in the main to the groups which, in their relation to temperature, I have called the warm-lovers and cold-lovers.

In the North of England, and especially in my native Yorkshire, we have masses of these dry rocks of calcareous constitution, with great belts interspersed between them of strata of the kind. There are a certain number of plants which follow the rock from area to area, and avoid the intermediate belts. In the North Riding of Yorkshire I found that sixty-seven species, or one in thirteen of the indigenous plants, did this more or less decidedly. As instances of such plants, I may mention the common Columbine, the Lily of the Valley, the Fly Orchis, Bee Orchis, Helianthemum vulgare, Geranium sanguineum, Sesleria coerules, Actæa spicata, and Brachypodium pinnatum.

In the heart of the Continent there are two great hill-masses of different lithological constitution, the granitic Vosges and calcareous Jura. The late M. Thurmann, who investigated the subject very carefully, has given an account of the species which are peculiar to each range; and we find that many species (such as Betaula alba, Sarothamnus scoparius, Galium saxatile, Hypericum pulchrum, and Stellaria Holosteæ), which in Britain are the common product of strata of all kinds, and grow freely upon these same limestone hills to which the insect Orchises and wild Columbine are restricted, upon the Continent are absent from the calcareous Jura, and restricted to the granitic Vosges. It would seem that under the more insular climate that these plants could grow freely on soils which they avoid under the Continental climate, that in this way the moisture of the air in relation to plants is modified by the character of the soils which they grow, and the nature of the great masses of rock beneath the immediate surface.

SCARLET RHODODENDRONS

AT KEELE HALL.

The notice of Mr. Boscawell's Cornish specimens of early-flowering Rhododendrons has served to recall to our recollection the magnificent masses of these plants growing at Keele Hall, and of which, thanks to the attention of Mr. Hill, we have been furnished with numerous trusses of flowers. They consist mostly of shades of rose scarlet, some lighter, approaching to a carmine hue, others tending in various degrees towards crimson or purplish-rose, but all brilliant in the extreme, and such as must render that part of the extensive and varied pleasure grounds, in which they are situated, resplendent with their floral trusses.

Keele Hall has been for many years a place of horticultural celebrity, thanks in great measure to the munificent encouragement given to the gentle craft by the former proprietor, Ralph Sneyd, Esq., and which is continued by the present worthy possessor, the Rev. Walter Sneyd. The fine old place stands on a well-sheltered hill of the new red sandstone formation, a soil which is particularly favourable to the growth of the Rhododendron. The late Mr. Sneyd was fortunately led, some forty-five years ago, to plant freely some of the earlier crosses of Rhododendron arboreum, and he lived to see and enjoy the rich effect they produced.

In low damp situations, it is true, this breed of early-blooming varieties, having a large intermixture

of the arborum blood, are comparatively useless, since they are generally frost-smitten, and the beauties they are known to possess are but seldom fully developed; but this is not the case in elevated and sheltered localities, where, if the soil is suitable, they are well worthy of being planted, even in the present day, though the materials available for this purpose are so ample and so various. A month's gain in the earliness of the blooming season is worth risking something for, if there is any hope of occasionally realising it.

The Rhododendron grounds at Keele Hall are, so far as our memory serves, exceedingly well sheltered, and at this season are usually to be seen sparkling and ablaze with their rich flower tints—all the richer for having at that season no floral rivals with which to compete. Some of them are often really grand. One group, of about 20 yards by 10 yards, is now covered with bloom. They are all on their own bottoms, and were supplied by Mr. Skirving, of Liverpool. They vary in height, the higher coloured ones not being so vigorous as those with more purple in their flowers. Mr. Hill informs us that, during the twenty-five years he has known them, they have never been so fine as this year. They have the scenic advantage which is imparted by the grand tree-like masses which these original crosses from R. arborum take on in a very marked degree. A correspondent, writing in one of our past volumes respecting the grand appearance these trees present, observes truly that although it is not an uncommon sight to see fine masses of ponticum and catawbiense varieties from 12 to 15 feet high, yet it is not by any means common to see in the open garden masses of scarlet and crimson Rhododendrons, 18 to 24 feet high—"little mountains, spangled and sparkling from top to bottom, with their rich inflorescence laughing the lingering east winds to shame, and proclaiming the reign of the goddess once more." Long may they flourish. M.

BEERSHOTTEN, DRIEBERGEN, UTRECHT, HOLLAND.

This place, the seat of J. A. Willinck, Esq., is within easy reach of Amsterdam. It is beautifully situated on the side of the high road a few miles from Utrecht, and is reached by a pleasant drive through avenues of fine trees, along which there are many noble mansions on each side almost hidden by the fine specimen trees that surround them. After a journey over flat open country, such as one meets with generally in Holland, it is a relief to find a place of this description to remind one of the well wooded districts of England, where our wealthy merchants generally build their residences. The Dutch are a persevering race, and, amongst other pursuits, gardening seems to be well kept up. Most of their residences are a short distance from the road, and have well kept lawns in front of them, and gardens that present a very neat appearance. There is generally a lake in these grounds, with sloping banks, on which are planted deciduous trees, interspersed with good Pines and other ornamental trees and shrubs.

We now arrive at Mr. Willinck's domain, situated near the main line of railway leading to Amsterdam, and near the station which is next to Utrecht. Alighting from the train the visitor walks a short distance until the fine avenue of trees that leads to the entrance is reached. The main road divides the estate, the park being on one side of it and the mansion and pleasure grounds on the other. In the carriage-drive are some fine trees; on the right are deciduous trees, such as Chestnuts, Oaks, Elms, &c. The mansion, which is a well built one, with a fine veranda in front of it, overlooks a well-kept lawn, sloping down to a lake in front, which winds round the pleasure-grounds; it has a mound rising in the distance, well planted with trees, and grassy banks slope down to the water below. There is a fine view of the park from the front of the house, where you can see the fine spotted deer basking in the sun. In bad weather they are well cared for also, for there is an ornamental building for them to take shelter in; there is also a fine view of the surrounding country. The grounds are not of great extent, but are laid out with good taste and to much advantage; indeed, it might be imitated by many who have such places to lay out and make the most of. It was originally a flat surface, but the rising ground at the end of the lake has been formed years ago, and the trees being of a large size they have by their appearance evidently been well looked after. The lawn is laid out with beds for ornamental foliage plants, which are much used on the Continent. Bedding Pelargoniums are in great variety, and many other plants which, when in full beauty, must produce a charming effect. It is really one of the prettiest places I have seen in Holland.

After leaving the ornamental department we come to the useful, namely, the kitchen garden, which we

enter soon after leaving the pleasure-grounds through a short avenue of trees. It is a well cultivated fruit trees and excellent vegetables. The trees on the walls, such as Peaches, Nectarines, Plums, &c., promise well for fruit. The next thing that attracted my attention was a good range of fruit-houses, the Grapes being well grown, and the crops very promising. There are several houses of this fruit, all in different stages of development. Next came Peach and Nectarine-houses, all giving promise of good crops. Strawberries are also well cultivated, and forced early. The pits were well filled with Lettuce and other salads. Mr. Willinck has a good and attentive gardener, who has been with him for a number of years. After leaving the fruit-houses we crossed the kitchen-garden to a well-built range of plant-houses, all of which have been erected within the past few years, and their structure has been well considered according to the requisitions of the plants. The centre house contains fine specimens of Ferns, such as the rare Cyathia contaminans, 12 feet high, with its graceful fronds. Next this was the silver Tree Fern, Cyathia dealbata; the noble C. princeps, with its light green drooping foliage. Then there is a fine collection of Marattias, perhaps the finest in Europe. I noticed a very fine one named after Mr. Willinck—a good and noble kind; also a good specimen of M. elegans and M. cicutaefolia. Cibotium regale was a fine plant; associated with this was the rare Alsophila subaculeata, with a stem 5 feet in height; also the rare Hemitelia interfolia. There are, as well as those mentioned, many other fine Ferns grown in this house. In the adjoining house was a fine plant of Rhopalora corcovadense, Orange trees, Geraniums, and many other greenhouse plants. The Orchid-house is of a large size, and in it there are many grand specimens, especially such as Vanda snavis, 5 feet high, with many branches, and well-bloomed; V. tricolor, also a good plant, and many others about the same size. Cypripedium, or fitchii, was also well grown; C. villosum, a grand plant, and well-bloomed; C. Lowii, in great beauty. Aerides crispum was a good plant; Odontoglossum citrosium has grown well, and showed well for bloom; the slow Dendrobium aggregatum was finely flowered; Saccolabium giganteum and many others were worthy of notice. Mr. Willinck is a great lover of Orchids and Ferns, of which there are a number grown for cutting to supply the town house in Amsterdam, where Mr. Willinck resides in winter.

The next house was filled with Marantas and other decorative plants. I noticed a fine specimen of Pterocarpium grande, also the new P. Willinckii, which was figured in the *Gardener's Chronicle* of this year, from the Messrs. Veitch & Sons. I noticed in one of the houses a rare Lycopodium, a plant of very curious habit. Pines are also grown here, and a good collection of Begonias, Tillandsias, Selaginellas, such as Widenovii, casium arborum, and the beautiful T. Galottianum, &c. After leaving these houses we enter another fruit garden, which leads back to the mansion. We then started on our way back to Amsterdam. I must say that I never spent a more pleasant afternoon than I did at this place, and gave me a most kind reception. Any one visiting the Netherlands, and fond of horticulture, should devote some of his time to visiting this well-kept place, where, I have no doubt, he would be equally well received. B. S. Williams.

OATS AND WHEAT.

In reply to my inquiry, "Why was the covering made use of?" I answer, to protect the plants from the severity of the frost, which I should have imagined any one who conducted such an experiment would have considered necessary after the Oats had undergone such exceptional treatment. Your Cambridge correspondent did not take this explanation, and, consequently, only one or two of his plants survived the winter, and therefore I cannot think his experiment was properly conducted. But one experiment, or, indeed, one hundred that failed, would not disprove the fact that Wheat had been produced from Oats when treated in a peculiar manner. Difference of variety, of climate, of soil, of culture, and sandy other matters, might alter the results; and, as the experiment is so easily tried, and next month is the best time for sowing the Oats, let me advise some of your numerous readers to make a few trials, rather than allow the dogmatic opinion of even a clever man, who made one slovenly experiment, "to settle the exploded idea." You will see that the covering of straw was not "applied from the first," but I had better give you Mr. Colman's own words:—

"East Hamling, May 4, 1875. "I planted clean Freedland Oats about the middle of June, cut them down, I think, four times during the summer and autumn. When the frost came in the winter I covered them up with the straw I had, which

was clean Wheat straw, to protect them from the frost, and cleared it off again in the spring. Some few of the Oats in the rows died off, and till the remainder came into ear there was a great speculation what they would be—whether Oats, Barley, or Wheat. They came early, very long, long ears of coarse Wheat, and there were a few ears of coarse inferior Oats with it. Mr. D. K. Emson, of Wimbury, Essex, saw some of the ears, took them home, rubbed them out carefully with his hands, and planted the seed, one kernel in a hole, in his garden. The following year I was visiting him, just before the harvest, and, to his great surprise, we found one ear of very coarse Oats, and the rest were very large ears of red and white Wheat."

I also enclose a letter, addressed to Mr. Mechi a few years ago; and some observations which were made by that experienced agriculturist and most careful observer of all farm plants, the late Mr. Hudson, of Castlescare:—

[Copy.] "Theilnetiam, [Haring, Norfolk, Nov. 23, 1868. "Mr. Alderman Mechi, &c. "Dear Sir,—As regards the transmutation of Oats into Wheat, enclosed is a specimen of Wheat and ear. The stock was given to me two years ago by Mr. No. man, who planted in a garden of Mr. T. Robinson's, of Harpton, Suffolk, a sample of best white Oats in May, and, as usual before the harvest, cut some of the ears first, then the second, and so on, down to October, taking care to leave the leaves and straw entire. In October he took all the plants up and separated the young offsets carefully from the old roots, which he re-planting in fresh ground, taking care to place over the plants a slight shelter (such as a few leaves or straw placed over a few bushes during very sharp weather). Next spring they had a miserable appearance, scarcely discernible from the ground. After cleaning it in April, and giving the little plants a good soaking, they quickly recovered their growth, and were allowed to ear, which proved to be Wheat, with a few Oat ears to it. Then he selected two of the best ears of Wheat for another crop, which he planted in a well manured garden, with liquid manure, soot, and ashes, taking care to put only one kernel in a hole. The plants tillered very much, and the straw was like reeds. The produce he gave me, of which, after two years' cultivation by me, the enclosed is a fair sample, grown on light land. To set the matter at rest I should recommend you to select a small plot of ground, taking care to follow the instructions, and you can satisfy yourself by the result.—Yours faithfully, "HENRY BUTTON."

From the *Norfolk Chronicle*, May 23, 1863. "Mr. Hudson, of Castlescare, states the following freaks of Nature:—Last year I grew a few acres of what is called Oat-Barley, viz., Barley produced by a gentleman in Huntingdonshire from Oats being sown together with the Barley, and allowed to produce seed the first year, but stood till the following year, and then the produce was Barley with a very stiff straw. I liked it so much that I have sown 30 acres of it this year. Last year my brother-in-law, Mr. Thomas Sewell Moore, of Wareham, near Holkham, ploughed up a piece of land that had been plantation for a great many years, and drilled it with Oats. It produced a very fine crop of Oats; two or three bushels were shed down when ripe, and ploughed in immediately after the last harvest, and the land drilled with Barley. The whole came up well, &c. a large crop on the ground, the Oats being tall, being tall and Tares, as expected, it is now Rye and Tares in full ear, and not an Oat to be seen."

It would appear that Wheat may be produced in another way, which is recorded by my friend, Mr. J. Chalmers Morton, with whom you are, no doubt, better acquainted than I am:—

From the *Cyclopaedia of Agriculture*, edited by John C. Morton, 1855. "Triticum vulgare (common Wheat).—Within the last few years, however, the experiments and observations of M. Esprit Fabre, of Agde, in the South of France, seems to prove a fact which had been more than once suggested, but almost always scouted, that our agricultural Wheats are cultivated varieties of a set of grasses common in the South of Europe, which botanists have usually regarded as belonging to a different genus named *Elytus*, the principal characters by which the latter genus had been distinguished, consisted in the greater fragility of the ear, and in the glumes being generally terminated by three or four, and the pales by two or three, perianth or stamens. The M. Fabre has shown how readily these characters become modified by cultivation; and wide as is the apparent difference between *Elytus ovata* and common Wheat, he has practically proved their botanic identity, for, from seeds of the *Elytus*, first sown in 1838, carefully raised in a garden, he has produced a crop of wheat produce, he had, through successive transformations, by the eighth year (1846) obtained crops of real Wheat as good as the generality of those cultivated in his neighbourhood.

Clare Seccell Road, Farmers' Club, E.C., May 6. [Mr. Read does not now tell us what precautions were taken against the presence of Wheat grains in the Oat-straw used, and to which our former note was mainly referred. We are afraid, moreover, that he has not sufficiently weighed the evidence he puts before us. Even supposing that Wheat had originated as a hybrid from some *Elytus* (which we cannot admit as an established fact), it would not prove that Oats would, by the treatment he mentions, or by any other treatment, be changed into Wheat. Eds.]

THE PRIMROSE.

WHILE every one knows the common Primrose and the Cowslip, it is not every one who knows the Oxlip. The truth is, that while several separate plants have been termed Oxlips, there has been no such confusion in the case of either Primrose or Cowslip. Every one admits that the two plants we have named are distinct species, that is, as species go in the present age of scepticism as to the existence of any such thing. In any case they are well-defined types, at opposite ends of a long train of intermediate forms. Of these intermediates some are nearest to the Primrose, others to the Cowslip, while those in the middle of the series are so cunningly blended that it is difficult to say whether they are most like to the one or the other.

No words of ours are needed to describe the common Primrose or to point out its differences from the Cowslip—still less are words needed in eulogy of this real "heart's delight" among flowers. The illus-

tration (fig. 128) is the result of a visit to Mr. Fitch's studio, where we met with a water-colour sketch of a "Primrose by a river's brim," so charming in its truthfulness that we begged the artist to reproduce a portion of his sketch on wood, not only for the sake of its artistic merits, but because it illustrates one marked difference between the Primrose and the Cowslip as to locality—the Primrose, as a rule, frequenting woods and hedge-banks, the Cowslip, as a rule, luxuriating in open meadows. Nevertheless, in Derbyshire, a week or two since, we met with a meadow full of Primroses without a single Cowslip; and we know of copses in Middlesex full of Cowslips, with scarce a Primrose visible. We may have more to say on this matter in a subsequent number, when we propose to illustrate the Oxlip (or one of the forms so-called) and the Cowslip.

The common single Primrose has proved itself so susceptible of improvement, and that so far in the direction of the qualities of form, substance, and colour, that it is now practically admitted among the florists' flowers. It is now included with the *Auricula*, *Polyanthus*, and others of the great *Primula* group. We should like to get at the history of that fine variety known as *Auriculiflora*. It was a happy

thought that led Mr. A. Dean to cross the crimson *Auriculiflora* on to the pale lilac Primrose grown as *Primula aitalica*, for the progeny, after two or three generations had been flowered, has yielded some charming varieties, and seedlings from *Auriculiflora* alone have proved equally good. Then by crossing the best of the seedlings we have gradually been supplied with the fine varieties which have recently been exhibited. It was a work of time to obtain flowers rich in colour, stout in substance, circular in form, and with bold and striking and well-defined golden centres; but it has been done, and floriculture is the richer for the gain. *Gem of Roses*, *Lilacina*, *Crimson Banner*, the *Fairy*, *Queen of Violets*, *Rosy Morn*, *Splendour*, *Sunrise*, *Violeacea*, and *Violet Gem*, all attest the beauty and value of the new single Primroses.

Primroses can be usefully employed in various ways as decorative agents; it will suffice to mention two. One is to cultivate them in pots for flowering under glass in mid-winter. If nice established tufts are lifted in October, and potted in some good soil in 48-pots, they come into bloom in December, in the figure in Blume's work, below cited; and by a coloured figure in the *Flore des Serres*, copied from a Japanese drawing. It is no wonder that on looking at the latter drawing some may have considered it a somewhat imaginative production on the part of the Japanese artist. Recently, however, the New Plant Company of Colchester have succeeded in flowering the plant from which Mr. Worthington Smith's drawing is made (fig. 129), and which, though in a faded state, was exhibited on Wednesday last at South Kensington. We are obliged to admit that some injustice has been done to the Japanese artist.

The rhizome is creeping, flexuose, the thickness of a quill, beset here and there with scales, and emitting numerous roots. The stems are erect, terete, shaggy, about a foot high, bearing two nearly opposite plicated truncate leaves about the centre, just as in *Listera ovata*. The shape of these leaves is very peculiar, and is sufficiently shown in the illustration. The flower is terminal, protected by a lanceolate bract; the flower segments are lanceolate, greenish, sprinkled with reddish dots, the lip is whitish, suffused with pink. As the plant is so singular, and as this is the first time that it has

FIG. 128.—"A PRIMROSE BY A RIVER'S BRIM."

first instance from the ripened crowns of the previous summer's growth; and they give another lot of flowers in March and April from the spring growths. A cold frame or cool greenhouse suits them well, and when grown in this way the individual flowers are very fine. They should be planted out in a shady moist place during summer and potted in the autumn.

The next use to which they can be put is to plant them out in woodland walks, and in shady nooks and places on the fringes of shrubby borders where the wild Primrose abounds. The result would be the admixture of flowers of darker hues, thus affording a striking and pleasing contrast. One fact deserves recording—the richest and most striking varieties are the earliest to flower.

CYPRIPEDIUM JAPONICUM.*

This very singular species has up till lately only been known to us by the imperfect figure in Thunberg's *Icones Plant. Jap.*, dec. 1., tab. 1; by the

* *C. japonicum*, Thunberg, *Flora Japon.* (1784), p. 39; Blume, *Atlas Bot.*, Arch. Inst. Japon. (1828), i., p. 165, tab. 59 (ubi synonymiam hujusce speciei insignis inventas);

flowered in British gardens, we hope even Professor Reichenbach will forgive us for placing this representation before a much larger circle of readers than would have ready means of seeing the other illustrations. We add some remarks with which we have been favoured by the introducers.

"We have very little to say respecting *Cypripedium japonicum*, except that it is of very easy culture. We have tried it in various soils, but that which we find most suitable is a light sandy loam, giving the plant plenty of water when it commences growth, and keeping it rather dry during the winter. This of course has reference to pot culture. Our collector in one of his letters writes that he found a "Bamboo wood full of it," and that they "grow best in moist Bamboo groves." This led us to try the cultivation of it in pots, but not wishing to place all our eggs in one basket we selected a suitable spot in our grounds nearly cool, and prepared a border for this and other

Flore des Serres, xx. (1871), t. 2064.—"C. foliis suboppositis, rhombo-ovatis, acutis repando-undulatis plicatis; bractea lanceolata acuminata ovario longiore; perigonii phyllis acuminatis; labello brevioribus, inferioribus subsuffocatis intus villulis; stamine sterili cucullato-cordato subbaccinato."—Blume, loc. supra cit.

FIG. 129.—*CYPRIPEDIUM JAPONICUM* (NAT. SIZE; FRONT AND SIDE VIEW OF COLUMN TWICE NAT. SIZE).

Cypridipeds from America. Here we placed several hives; those in pots went out into New Zealand and Tree Fernery, a lofty structure, with plenty of shade, and in a temperature where the thermometer rarely exceeded during the winter 40°, and at the present time 60°; the result has been that the plants have done well, and flowered nicely. But although these have done well, we believe the plants in the border will beat them in point of strength and colouring of flower, for not only have these—the Japanese Cypridipeds—thrived up well, but so also have the American forms, some having already attained a height of 3 to 4 inches, and bid fair to bloom freely. We may however, mention that this border was never allowed to get dry during the months of March and April, when we supposed their growing season about to commence. We do not pretend to say that ours is the correct mode of treatment, but we do think that any one having found any difficulty in growing these beautiful plants might try this. *The New Plant and Bulb Company.*"

THE HOME OF THE COCOA-NUT.

In its peculiar style of beauty, says Sir Emmons Tennent, nothing in the world can exceed in loveliness the road from Point de Galle to Colombo; it is literally an avenue of Palms, nearly 70 miles long, with a rich undergrowth of tropical trees, many of them crimson with flowers and over-run with Orchids and climbing plants—such as the *Gloriosa superba*, with its splendid red and amber blossoms—whose tendrils descend in luxuriant festoons. Birds of gaudy plumage dart amidst the branches, gay butterflies hover over the shady foliage, and insects of metallic lustre glitter on the leaves.

There is no quarter of the world in which the Cocoa-nut flourishes in such rich luxuriance as in this corner of Ceylon. Here it enjoys a rare combination of every advantage essential to its growth—a loose, friable soil, a free and genial air, unobstructed solar heat, and an atmosphere damp with the spray and moisture from the sea, toward which the crown of the tree is always more or less inclined; this tendency, causing its fruit to drop in the water, appears to account for its marvellous extension to the innumerable islands and atolls to which the nuts are floated by wind and tide. Of late years its cultivation has been vastly increased. Some idea may be formed of its importance from the fact that at the time when the English took possession of Colombo, it was estimated that the single district lying between Doodera Head and Calpenty contained ten millions of Cocoa-nut trees, and such has been the increase since that the total number in the district cannot be less than twenty millions.

All that has ever been told of the Breadfruit, or any plant contributing to the welfare of man, is as nothing compared with the blessings conferred on Ceylon by this inimitable Palm. The Singalese, in the warmth of their affection for their favorite tree, avow their belief that it pines when beyond the reach of the human voice, and certainly the Cocoa-nut grows more luxuriantly in the vicinity of human dwellings; but then it finds there a soil artificially enriched, and it is never found wild in the jungle. Every particle of the substance of the Cocoa-nut the Singalese turn to account—for instance: The leaves for roofing, for mats, for baskets, torches or chimes, fuel, brooms, fodder for cattle, manure. The stem of the leaf for fences, for pingoes, or vokes, for carrying burdens on the shoulders, for fishing rods, and innumerable domestic utensils. The cabbage, or cluster of unexpanded leaves, for pickles and preserves. The sap for toddy, for distilling arrack, and for making vinegar and sugar. The unfurled nut for medicine and sweetmeats. The young nut and its pulp for drinking, for dessert; the green husk for preserves. The nut for catnip, for curry, for milk, for cooking. The oil for rheumatism, for anointing the hair, for soap, for candles, for light; and the refuse of the nut, after expressing the oil, for cattle and poultry. The shell of the nut for drinking cups, charcoal, tooth-powder, spoons, medicine, bookbaks, beads, bottles, and knife-handles. The coir, or fibre which envelops the shell within the outer husk for mattresses, cushions, ropes, cable, cordage, canvas, fishing-net, fuel, brooms, and floor mats. The trunk for rafters, laths, railing, boats, trunks, furniture, firewood; and, when very young, the first shoots, or cabbage, as a vegetable for the table. Dr. Thwaites, the well-known curator of Peradenia, has enumerated fifteen species of the Palm tree as indigenous to Ceylon, viz.:—*Areca*, 4; *Caryota*, 1; *Calamus*, 5; *Borassus*, 1; *Corypha*, 1; *Palmyra*, 2; *Coccoloba*, 1. The road from Galle to Colombo crosses three estuaries of rivers, which are bridged. The scene of one of them, the Gindira River, is here represented (fig. 130), and shows the curious canoes, hollowed out of single trees, with a peculiar wash-board sewed to the gunwale by coir-yarn, so that no iron or any other metal enters into the con-

struction. Their characteristic peculiarity is the balance-log of very buoyant wood carried at the extremity by two elastic outriggers. These canoes are manned by the *Oroo*, or certain classes of the fisher caste, or *Karivee*, who form the most numerous section of the coast population. Thus there are the *Maddell Karivee* and the *Baroodell*, who cast nets; the *Dandu*, who carry the rod; the *Kivabi*, who catch turtle; and the *Gode Kavoolo*, who fish from the rocks. The small houses, on little islands and piles in the water, remind one of the ancient Swiss lake dwellings, and the pre-historic *crannoges* of the Tuaita de Daxan, in Ireland. The estuaries on this coast also supply small but delicious oysters, which many a wearied traveller has enjoyed at the charming half-way rest-house of Bentotte, of which the present writer recalls pleasing associations. [Our illustration of the home of the Cocoa-nut, on p. 629, was prepared from a sketch made by Captain S. P. Oliver, of the Royal Artillery. Ets.]

Apiary.

WORK FOR THE MONTH OF MAY.—This, the merry month of May, generally opens with joy to all. The bee-keeper looks forward to this flowery and happy season with joy, because he expects his bees now to become profitable. Weak stocks may and ought still to be encouraged with a little feeding, but this is the exception, not the rule. The spring sometimes witnesses the prevalence of east or north-east winds, evidenced by the late appearance or backwardness of vegetation; the bees, if this should occur, are unable to glean much honey, and we have known what are called hungry swarms leave the old stands to seek a better home elsewhere.

Hungry Swarms.—What an ominous name! nay, we cannot recall it to memory without shuddering at the thought that our favourites are actually starving when there should be plenty of food within reach, but forgotten by the careless apiarian, so that they are compelled to seek shelter in some more hospitable locality, where their wants will receive attention.

How to begin Bee-keeping.—We turn now to a more delightful theme. Those of our readers who purpose making their fortunes from the happy occupation of bee-keeping, should begin to keep a sharp look-out. Making their fortunes! say some of our readers with an incredulous smile. Yes, you may smile, but we just mean what we say. An old schoolmaster told his pupils to shoot at the moon, if they did not succeed in hitting the mark they would be none the worse for the attempt. So say we, by all means begin bee-keeping; you know it is a honey-making concern, and honey in its turn makes money. Never mind the distasteful you live in, your bees will make their way, never fear; and if you do not make £1000 per annum, you may probably in time clear £200 each year. We are running away from our subject, of course, thinking of the number of persons who have become rich by bee-farming, only we cannot tell you where they are now living. But begin (whatever you do, take our advice upon this one point) first with a single swarm, the earlier the better; if you intend making a market round the cottage apiaries in the district in which you reside, and engage with one of them to sell you a Mayswarm. The better to secure your object leave with them the hive in which you wish them to be carried home; you will seldom be disappointed. You have by this time learned the old rhyme, by whom composed we cannot state—*Punch* thinks it was first given to the world by Solomon, because it contains much wisdom—

"A swarm of bees in May,
Is worth a cartload of hay.
A swarm of bees in June,
Is worth a silver spoon.
But a swarm of bees in July,
Is worth no butterfly."

It would be well if our village bee-keepers would follow it more faithfully, instead of hiving, as separate colonies, the often worthless third swarms, or, more correctly speaking, "casts." If we purchase a Mayswarm we have this confidence about it, that it is genuine. At this early period we could not well be deceived—casts are far more than you can just now get. Above all secure a swarm as early in the month of May as possible, and remove them on the evening of the day on which they are hived to the stand you intend them to occupy permanently. On warm, quiet afternoons watch the mouth of your hives for the appearance of the fat and lazy gentlemen bees, commonly called

Drones.—"Early drones early swarms," say our farmers' wives; this saying, every other thing being favourable, is correct. We have known drones to be hatched in April, but this was caused probably from the hive being filled with drone-comb—the bee a poor bee-master who will allow too much of this to exist in any hive. It is a necessary evil, but take care they are not allowed to manufacture too much. If you

meet with it in those hives you are necessary for the purpose of supping, cut it out without delay.

A sign beheld with delight and pleasure by most bee-keepers is to observe the busy, active workers carry in great quantities of pollen the early part of this month. Nearly all our bee-keepers in the northern counties believed, about twenty years ago, that it was wax, or what was intended to be employed in comb-building; but it is astonishing what a change has taken place since that time in the knowledge and opinions of people: very few can be found now to adhere to the old doctrine—three-fourths at least know it is pollen, from the anthers of flowers, and is used to feed the young brood in the cells.

In this month of all others in the year have an eye to the farmer's

Enemy, who is also far from being a friend to the bee and its industrious occupants—we refer to the bird found everywhere in this island, the common sparrow. You may laugh and make merry at the thought that he should prove to be an enemy, but laugh or cry, such is the fact. When first we were informed upon this subject, we were inclined to make light of it, though after experience has taught us wisdom. Very early in the dewy morning, when the bees are flying about rather slowly (from the impediment of watery particles adhering to their hairy bodies probably), the bird is on the watch not very far away, often on the ground beneath the hive, watching its opportunity; suddenly, and in much less time than we can write the account, it darts upon the prey, and bears it triumphantly to the neighbouring slates, from thence to its nest. It has been supposed that this game is not sought except in the breeding season; whether this is so or not we cannot positively assert, all we know is that throughout May and June, though seldom in the after-part of the day, the war is carried on. The bee, having to be done is to protect the entrance—a rabbit net thrown carelessly over the entire hive is a capital plan; the bird seems to think it is a snare to be avoided, and accordingly so long as it contines it is cautiously shunned. This enemy may be unknown in village apiaries—we are speaking more of the outskirts of our towns, where insect food may not be so plentiful, therefore they may be compelled to some extent to seek it in the apiary. R.

The Villa Garden.

IMPORTANCE OF HOING.—The recent rains, while they had the effect of nicely moistening the soil, also served to beat it down and cake it on the surface, and as hot sun and drying winds followed, quite a hard crust has formed itself on all garden ground. This requires loosening at once. Observe the London market gardener, how persistently he applies the hoe among his crops, chopping up weeds and loosening the soil at the same time; and the various plants he cultivates, how rapidly they grow for the treatment. His two main principles are—plentiful manuring, and constant deep hoeing. Both are equally important to the Villa gardener; the first need not be discussed now, the second must be insisted on as an important part of the weekly round of gardening duties.

All young plants that are making growth are much benefited by having the soil about them stirred after rains; it breaks up that incrustation of the surface which prevents the atmosphere from reaching the roots. A loose stirred surface is not so much burned by sun-heat as a caked soil at the top. Thus it is that nurserymen and others encourage deep hoeing at times of drought.

Potatoes are rapidly pushing their way through the soil, and they will be much benefited by hoeing, stirring the soil round and about them, and between the rows. The same holds good of Peas, Broad Beans, Sugar Runners, Dwarf French Beans, and other kitchen garden crops. Hoeing, guard against drawing the hoe too near the plants, so as to cut them off. A careful gardener with the hoe does not chop with it in an awkward downward fashion, but by a rather gentle, careful stroke he brings down his hoe into the soil in a slanting direction, and then draws it towards him. It is a study to watch a market garden labourer hoeing; he does it in quite an artistic manner, thoroughly, rapidly, and with a minimum amount of exertion.

The soil should be drawn up to Peas and Beans on both sides as soon as they are sufficiently advanced in growth. This is of great assistance to them; but the bank of soil on either side should not be allowed to bake hard, as when rain comes it is thrown off; therefore they should be occasionally stirred with the hoe. Potatoes and Dwarf and Scarlet Runner Beans are very tender, and a little frost soon disfigures them, and gives them a serious check, even if it does not destroy their growth. If the nights turn cold, as they frequently do in the month of May, it is a good precaution to draw some soil up to or slightly to cover the plants. It is a capital protection.

SURFACE STIRRING OF FLOWER BEDS.—In like manner the surface soil of flower beds should be stirred, as recommended for the vegetable garden. Even if the process were not a beneficial one, it is to be commended on the ground of imparting to the beds a tidy appearance. Beds of double Daisies are just now at the height of their beauty, and it is a good plan to go over them occasionally, and pluck the decaying flowers. Beds of Pansies require going over in the same way, so that no seed-pods be allowed to form. If the plants have to turn their strength to the production of seed, less energy will go to the production of flowers. We have seen some very charming beds of mixed Pansies on several occasions this spring, and have been much pleased with them. We have now in our own garden a bed of mixed Violas, mainly seedlings from a pale lavender-coloured variety named Princess Teck, but there are white flowers and rich purple ones among them, with many intermediate tints, and the effect is charming. We have just top-dressed the bed, to the manifest advantage of the plants. Immediately after the rain the surface-soil was stirred, and then there was added about an inch of refuse potting soil, laid evenly over the surface. The young growth eats into it, and derives strength from it. What charming posies these Violas make! A bunch of them will pleasantly perfume a sitting-room.

HYACINTHS, &c., OUT-OF-DOORS.—Some persons with limited garden accommodation are at a loss to know what to do with the Hyacinths and Narcissi that have gone out of flower. They don't like the idea of throwing them away, and they are disfiguring in the greenhouse. Two or three courses can be recommended: one is to open a trench in any spare corner of the garden, and plant them in it, turning the balls of earth out of the pots without disturbing the roots, and simply remove the crocks; or if the roots have bound themselves about them, they can remain. Some fine mould should be placed about the balls, and the soil put back and firmly pressed about them. Treated in this way the Hyacinths, Tulips, Narcissi, &c., will ripen their bulbs and their growth, and come in very useful next autumn for planting out in beds or borders. They will, however, need to be watered in dry, hot water. Another good mode is to open holes along the fringe of a shrubby border, almost beneath the lowmost branches, and plant out for permanent effect. In such a spot they come into flower early in the spring, and they are sufficiently out of the way not to interfere with the summer planting, if the margin of any shrubby border admits of its being done.

We are now making use of our cool ash-bed for any choice spring-flowering plants that, having gone out of flower, it is desirable to preserve in pots. It is under a north wall in a cool shady position. Species of Crocus, Primroses, Violets, Triteilia, Narcissi, and such like, are plunged here, to ripen their growth, previous to the period of rest. It is a most useful spot, very little water is required, and the plants thrive well. So many Villa gardeners are now turning their attention to the culture of a few choice hardy plants in pots, especially those which bloom early in the spring, that any suggestion for keeping their plants through the summer will be gladly welcomed by them.

Notices of Books.

The Fruit Manual, &c., by Robert Hogg, LL.D., F.L.S., &c. Fourth edition. *Journal of Horticulture* Office. 8vo, pp. 600, and cuts.

It is rarely that we find it necessary to do more than announce the publication of a new edition of a book, especially if it be a fourth edition, but in the present case the additions are so extensive as almost to constitute a new book. It is a pleasure, therefore, to be able to go to the publisher to recommend the book warmly to all interested in fruits, and to tell them that this edition is a great improvement on its predecessors, and an indispensable tenant of their book-shelves, so we shall feel no compunction in first of all alluding to sundry shortcomings. In the first place, so far as we have seen, there is no further attempt at classification than there was before. The novice who is ignorant of the name of any given fruit would be wholly at a loss in his attempts to discover what it was from the book before us. It is possible that the present state of pomology does not admit of this being done, but at least it would have been practicable to have established definite if arbitrary rules for distinguishing leading classes, such as, among Apples, for instance, Pearmaines, Pippins, Russets, Codlins, &c., or some attempt might have been made to group Apples according to their form: thus, there is the depressed spherical form, as in the Quarrenden, the globose, the ovoid, the obovoid types, &c. Doubtless it would be wholly impracticable to make a classification without including very numerous exceptional or transitional forms, but that difficulty occurs

throughout all Nature; while, for the sake of beginners, any classification is better than none. Again, it would have been better if some definite standard of size had been given instead of such terms as "large," "very large," "pretty good size," "medium," and so forth.

Among Apples, too, we find no mention in the work before us of the "Stock" Apples, of which a collection was got together at Chiswick, which formed the subjects of a notice in our columns last year, and one of which—the French Paradise—is figured in the *Florist* for the present month.

Of course, it is not to be expected that even now all the varieties of fruit should find a place in this volume. Many volumes would be needed for this, while many of the varieties would be better entirely ignored; still we are surprised to find so fine a Nectarine as the Welbeck Seedling omitted, and to find no mention whatever of the numerous new varieties of Filberts, for which pomologists are indebted to Messrs. Rivers and Webb, and many of which were well illustrated in our columns in 1872, by the skillful pencil of Mr. Worthington Smith. Our last complaint is ament the cuts, which are mere sectional outlines, not always characteristic, and which might more profitably have been replaced by a smaller number of well-drawn types, specimens selected as types of form, or as illustrations of superior varieties.

Now, having alluded to what we consider the deficiencies of the book before us, it is time we said something as to its good qualities. These much outweigh any defects there may be. The present edition is a great advance in all ways upon its predecessors; it is fuller in detail, more scientific in method and description, and in all ways most satisfactory.

As an illustration of the additions that have been made, we may give the following table, showing in round numbers the number of varieties mentioned in the last and in the preceding editions. Thus, while the list of Almonds remains the same, no less than 313 more varieties of Apples are included, and so on.

	Third Edition.	Fourth Edition.	Additions to Fourth Edition.
Almonds	42	42	..
Apples	410	723	313
Walnuts and Filberts	29	19	..
Apricots	83	103	20
Berberries	2	472	470
Cherries	260	2	..
Chestnuts	2	2	..
Crabs	4	0	..
Curries	5	5	..
Currants	30	32	2
Eggs	133	145	12
Figs	234	275	41
Gooseberries	34	37	3
Grapes	405	430	24
Medlars	11	11	..
Mulberry	1	1	..
Nectarines	75	85	10
Peaches	241	226	15
Pears	1006	1487	481
Pistachios	37	43	6
Quinces	3	3	..
Raspberries	53	55	2
Strawberries	122	120	less
Walnuts	20	20	..

Apart from this evidence of the increased value of the book, and of the diligence of the author, it is interesting to see the immense additions in certain fruits and the small increase in others. Of course, it must not be imagined that the excess is wholly due to the increase of new varieties—the great augmentation, as we take it, is due to the insertion of a large number of old or locally known varieties. It is a pity that so many indifferent varieties should be perpetuated in the presence of improved subjects, but all the time they do exist it is well that their names at least should be registered.

One great feature of the present volume, to which we must refer in terms of the highest approbation, is constituted by the historical notes. These have been got together with diligence and care, and they are not only valuable, but to any one interested in fruits they are very pleasant reading. While we thank the author for giving us so good a descriptive catalogue of fruits, we thank him yet more for appending to his descriptions these historical details, which raise the *Fruit Manual* from the level of a catalogue to that of an encyclopædia. We append two of these notes (omitting the descriptive matter), which will illustrate our remarks, and demonstrate the value of the volume which has given rise to them:—

"The *Cathead Apple*.—In the Horticultural Society's *Catalogue of Fruits*, and also in Lindley's *Guide to the Orchard*, this is made synonymous with the *Costard* of *Recherches*, which is undoubtedly an error, the *Costard* being a distinct variety.

"The *Cathead* is one of our oldest varieties, and was always highly esteemed for its great size. Phillips, in his poem on *Cyder*, says,—

"Why should we sing the throat
Coddling or Pomroy, or of pimpled coat
The Russet, or the *Cat-head's* weighty orb,
Enormous in its growth, for various use?
Tho' these are not the best, after full ripen they
Are oft required, and crown the rich dessert."

"In Ellis's *Modern Husbandman* he says the *Cathead*

is 'a very useful Apple to the farmer, because one of them pared and wrapp'd up in dough serves with little trouble for making an Apple-cake, so many in request with the Scotch farmer, for being part of a ready meal that in the cheapest manner satiates the keen appetite of the hungry ploughman, both at home and in the field, and, therefore, has now got into such reputation in Hertfordshire, and some other counties, that it is become the most common food, with a piece of bacon or pickle-pork, for families.'"

"*Gros Mignonne Peach*.—The numerous synonyms which this variety possesses are an evidence of the favour in which it has been held. Its origin is unknown, but it has been in cultivation for upwards of two centuries, being mentioned by Merlet and all subsequent authors. From the fact of its reproducing itself from seed, nursery-men, with good faith, have introduced it from time to time as a new variety. Grimwood, of the Kensington Nursery, sent it out in George the Third's reign as Grimwood's Royal George. The late Mr. Lee of Hammersmith did so under the two names of *Early Vineyard* and *Smooth-leaved Royal George*. Neal (or Neil), a nurseryman, sold two plants of it to Mr. Padley, the King's gardener at Hampton Court, for five guineas, under the name of *Neal's Early Purple*, and hence the name also appears among the synonyms. Shute of Chelsea, who raised the white *Moss Rose*, also sent it out under the name of *Superb Royal*; and Ronalds, of Brentford, sold it as *Ronalds' Galand*. It was called *Royal Kensington* by Forsyth, the Royal Gardener, who, when he went to Kensington in 1784, sent some of the *Peach* sent with some others from France to the Queen."

—The *Flore des Serres*, of which the three first parts of the twenty-first volume have just reached us, contains several representations of old friends or reproductions from other periodicals. Among less familiar illustrations we may cite the beautiful little *Mammillaria senilis*; and *Tydaea Belebuzh*, a handsome *Cesneria* with maroon-coloured flowers, with darker spots and pale tube. "Un *Conservatory*" is a reproduction from our own pages, though the fact is not stated. *Pilococcus Dautwizii* is capitally represented; it was described in our columns, 1873, p. 7, but it remains doubtful whether it is sufficiently distinct from *P. Williamsii*. *Gloxinia Ami Thibaut* is described by M. Thibaut, who ought to be a good judge, as the most beautiful variety he had ever seen; the flowers are partially erect, with a limb prettily spotted with pink. The representation is said not to be equal to the original, which we can well believe, else M. Thibaut's eulogy would seem exaggerated. The curious little *Petunia intermedia* of Lindley, we are told, is only managed by being grafted on to *Nicotiana glauca*. Paul Neron *Rose* is a good representation of a glorious *Rose*, of good form and pure rose colour. By way of contrast, perhaps, a figure of the *Ocotopus* is given.

—The *Villa Gardener* for May opens with "freshness and purity." These are the opening words of the first article, and they may not inaptly be applied to the contents of the number, which are fresh and varied. The versatility of the Editor is something amazing.

—The re-issue of Sowerby's *British Wild Flowers* (Van Voort) has now reached as far as the commencement of the *Incomplete*. The figures, though small, are useful as reminders.

—The May number of the *Revue de l'Horticulture Belge* opens with a coloured plate of certain Pansies, and in the accompanying article M. Rodigas takes occasion to recommend the cultivation of the *Pansy* to the amateur. We entirely share the opinion of our *confreres* as to bedding Pansies, than which nothing more effective or tree-flowering can be selected. Their low price and easy culture render them available for gardeners of the most slender means.

—The current number of the *Gardener* opens with an article on VINE BLEEDING, the ill effects of which with respect to the persons, we think, may be exaggerated. We altogether demur to the writer's dictum as to the "generally accepted theory" of the storing up of sap, and the bleeding that occurs in consequence. The writer seems to be a quarter of a century behind the day in his physiology, and to have only vague notions as to what the sap is, and what it is not, although he is "heretical enough to doubt the greater part of Dr. Lindley's theory." We should consider it equally heretical now-a-days, first, to state that Dr. Lindley ever had or had published any theory of his own on the subject; and, next, we should consider it heretical not to doubt the validity of any theory as to sap-flow which was five-and-twenty years old. Vegetable physiology in this country is so backward that it is cruel to make it appear worse than it really is. The other articles in the number are of the excellent practical nature so characteristic of this magazine. Mr. Pearson's article on grafting Vines is particularly suggestive.

HORTICULTURAL EXHIBITIONS, 1875.

MAY.

- 26.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
 26.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 29.—Crystal Palace Great Flower Show. Sec., F. W. Wilson.
 29 to June 6.—Annual Exhibition of the Central Horticultural Society of France, Paris. Sec., A. Lavallée, 84, Rue de Grenelle.
 31.—Coventry and Warwickshire Floral and Horticultural Society's First Show of the Season. Sec., Thomas Wigston, 3, Portland Terrace, Lower Ford St., Coventry.
 31 to June 4.—Bath and West of England Society's Exhibition at Croydin.

JUNE.

- 1 and 2.—Royal Western Horticultural Society's Exhibition at Plymouth. Hon. Sec., F. B. Bond, 16, Penrose Street, Plymouth.
 2.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Great Summer Show.
 9, 10, and 11.—Leeds Horticultural Society's Twelfth Annual Summer Show. Sec., James Birbeck, Delph Lane, Woodhouse, Leeds.
 10.—South Essex Horticultural Society's Exhibition at Leyton. Sec., G. E. Cox, Leyton.
 16.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
 16.—Glasgow and West of Scotland Horticultural Society. Midsummer Exhibition. Sec., F. G. Dougall, 167, Canning Street, Glasgow.
 16.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
 17 and 18.—Lee and Blackheath Horticultural Society's Exhibition. Sec., G. Helmer, 5, Bores Road, Lee.
 18.—Scottish Fanny Society's Exhibition at Edinburgh. Sec., W. M. Welch, 1, Waterloo Place, Edinburgh.
 22 and 23.—The Kingston and Sutton Royal Horticultural Society's Eleventh Exhibition, at Norbiton. Sec., J. Kirk, 2, East Villas, East Road, Richmond Road, Kingston-on-Thames.
 23.—Fareham and South Hants Horticultural Society's Show. Sec., Harry Smith, Fareham.
 24.—Royal Horticultural Society of Ireland. Great Summer Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.
 26.—Crystal Palace Rose Show. Sec., F. W. Wilson.

THE

Gardeners' Chronicle.

SATURDAY, MAY 15, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 17	Halifax Floral and Horticultural Society's Annual Exhibition (two days). Continuation (to 21st) of the National Horticultural Exhibition at Manchester. Clearance Sale of Bedding and Greenhouse Plants, &c., at the Kirkdale Nursery, Upper Sockburn, S.E., by Frother & Morris.
WEDNESDAY,	May 19	Royal Horticultural Society of Ireland's Early Summer Exhibition. Sale of Stove, Greenhouse and Bedding Plants, at the Nursery, Park Road, West Dulwich, S.E., by Frother & Morris (two days).
THURSDAY,	May 20	Sale of Imported Orchids, collected by M. Koeel, at Stevens' Rooms, 5, St. James's Place, London, W.
FRIDAY,	May 21	Royal Horticultural Society of Ireland's Sale of Specimen Stove and Greenhouse Plants at South Park, Surliton, by Mr. Stevens.

MR. HUTCHINSON, of Carlowie, in an excellent paper lately read before the Botanical Society of Edinburgh, has pointed out various features of resemblance between two winters of unusual severity—those of 1860-61 and 1874-75. THE FROST-MARKS ON VEGETATION have in a good many cases been almost identical. Shrubs and trees of different sorts that have seemed to hover on the border land of perfect hardiness, have suffered very much in the same way and almost to the same extent during this winter as in that. Even the bark and bodies of hardy trees have been rent and split in the same way. This is one of the most serious injuries inflicted by severe frosts. It is often not noticed at the time. On falling some Beech trees this spring the timber split, and flew into pieces as the bole touched ground, almost as a tube or rod of glass might be expected to do. On examining into the cause of this extreme brittleness it was found that old rents, obviously made by the severe frosts of 1860-61, penetrated the timber in various directions, and caused it to fly into fragments by the concussion of falling. In the eastern counties the bark-splitting of Planes and old Banksian Roses has been carried further than in the year 1870-71. The latter, too, are more severely injured, whilst the old *Buddlea globosa* and *Triomphe de Rennes* Rose on its own roots seemed killed to the ground, and the *Maréchal Niel* Rose is likewise very severely hit. But the shrubs and trees seem far less hurt now than then. In fact the *Laurustinus*,

Arbutus, and evergreen Oaks, killed by wholesale throughout the frosts in 1860-61, are hardly touched now; and Laurels, Hollies, &c., in favourable localities, are scarcely hit by the frost. Roses, too, and *Araucarias*, killed by wholesale then, have escaped now. But the greatest contrast is to be found in the fruit trees. Peaches, Nectarines, and Apricots were killed by a wholesale slaughter in the memorable winter of fourteen years since—they have passed through this long and severe season with almost perfect impunity.

Whence the striking difference? The chief cause can hardly be one of temperature. Several times during the past winter the thermometer has hugged zero very closely, and even sunk within a few degrees as far beyond it as during 1860-61. Mr. HUTCHINSON registered only a difference of 2° to 8° below zero this winter, and 10° below zero during that. This difference between the two has been more marked in the South. But that difference is not sufficient to account for the marked disparity in the effects of cold in the two cases.

The fact is—and it cannot be too often repeated—the effects of frost on plants is as much and more a matter of condition as of temperature. Vegetation was, upon the whole, in fair condition this winter to bear frost with impunity. During the winter of 1860-61 the frost hit vegetation in a crude and unfinished state or condition of growth; the previous summer had been wet and dull, and the winter caught growth before it was consolidated, and easily wrecked it by wholesale. The crude state of plants let the frost in, and the result was seen in the destruction of thousands upon thousands of plants. Frost-bitten branches, and even trunks of trees on walls, proved alike their weakness of resistance, and the severity of the attacks of the frost. This year the well-ripened wood bore the attacks of the frost almost without injury, and the walls were pinked over with Peach, or whitened with Apricot blossoms in unusual numbers, and of almost abnormal strength and vigour.

The lesson to be drawn from the contrast of the two winters is obvious. We cannot make nor sensibly influence the climate, but we may, we can, we do mould conditions to a large extent. By the skilful choice of sites, by drainage, and skilful cultivation, we may so determine the rapidity and character of growth, and the measure of its maturity, as to either give it up into the power of severe cold, or enable it to resist it. Site alone largely determines conditions. To place a garden in the bottom of a valley, is to invite the destruction of all the plants with which it is furnished or enriched. To place it there for the sake of so-called shelter, or to be near the water, is like placing an army within range of the enemy's guns, that they might be out of the wind, and near to their drinking-fountains. The frost must hit such gardens hard, for the site chosen is not only the coldest during frost, but that most favourable for the development of gross and, consequently, frost-susceptible growth. Place the garden higher up, and a more solid, hardy growth will reward the wisdom of a better choice of a site, and the cold air will also roll past without affecting it, bent on concentrating its destructive force on what it can find in the bottom of the valley. Drainage, again, by keeping the base of the root-larder dry, likewise favours growth adapted for endurance with impunity. The wood is no longer gorged with stagnant water, the roots only taking up what the plant can assimilate or convert into firm, durable, hardy tissue. Drainage also moderates the energy of cold by checking surface evaporation and covering the surface with a layer of mellow earth. This conserves heat, for a mellow surface performs the same functions for

the earth's tilth that a warm great-coat does for ourselves. All the water that is passed through the soil by drainage, that would otherwise have been lifted off the surface by evaporation, becomes a source of warmth or a conservator of heat; and either way it creates a local atmosphere superior in temperature to the general mass of the air.

Finally, skilful cultivation promotes a sound and healthy condition in plants. The greatest bulk in the least time may end in giving up plants a sacrifice to the first severe frost. Skilful culture conserves vigour of constitution, and promotes that measure of robustness that enables plants to meet and resist frosts and other evils most successfully. For instance, growths of medium strength are mostly the most thoroughly ripened, and the strength of growth can be regulated well-nigh at pleasure. It is largely a matter of soil, food, pruning, training, cropping, &c. Again, transplantation, by checking the supply of sap, strengthens the power of plants to resist cold. This is the sound theory that underlies the old-fashioned practice of heeling our Broccoli in the autumn. The greater part of the roots were disturbed, and the plants slightly wilted in consequence; hence the frost could gain little or no hold upon them. Doubtless, too, part of their immunity arose from their prostrate position. With their heads to the north and closely hugging the ground, the slightest snow covered them, and the sun could not hit their crowns. But the conservative power against frost is also seen in the safety of transplanted Cabbages, Lettuces, Cauliflowers, Stocks, Wallflowers, and hardy annuals; while the same plants that have not been disturbed, on the self-same ground, side by side, are often cut down.

Root pruning becomes a means of resisting the frost from a similar cause. Less fluid is forwarded to the plant or tree when fully stored with juice or sap, and hence it passes without injury through weather that would half kill trees in a more spongy or watery state or condition.

The chief aim of all autumnal cultivation should be to perfect maturity and keep the fluids at rest or at a minimum amount for the winter. Growth will be all the better in quality for the rest through the danger period in a dry condition.

—It is necessary that those desirous of building up a really National Society devoted to Horticulture—and horticulture only—should be vigilantly watchful at present, and ready to act at the right moment. Matters at the ROYAL HORTICULTURAL SOCIETY are at present so extremely critical, that a false move or a failure to act at the right time would imperil the existence of the Society. Every one admits that a thorough reconstruction is absolutely essential; but thorough reconstruction and utter annihilation are two different things. The latter would, in our opinion, be a great misfortune, and would most seriously injure the prospects of horticulture as a science and as an art. We presume the Fellows will shortly hear what the Council intend to do, and in the event of their explanations being unsatisfactory, it may be well to consider the propriety of addressing HER MAJESTY, and respectfully requesting her to nominate a commission of inquiry. Meanwhile, no time ought to be lost in paying the arrears of prize-money to the exhibitors, and in carrying out the original terms of the schedule for the year. The present state of things is not only a disgrace to the Council, but it is a humiliation to the Fellows at large; and if no other means be forthcoming, the required sum should at once be raised by private subscription. What the exhibitors think was shown by Wednesday's proceedings. Into what low estate the Society has fallen was shown by the fact that six pot-Roses, and six only, were shown, and these of quite indifferent quality. That the judges should have awarded a first prize, and so cast another stone at the Society and lowered it still more, is to our thinking a most lamentable and untoward proceeding. The horticultural Fellows, at least, are probably not aware how low the Society has fallen in public esteem—so low that we observed lately in one of the numbers of the *Chronicle* that the Kensington garden was so little in favour with the fashion of the town, that it was quite unnecessary to describe the

toilettes of the ladies !! This is a cruel stab for poor Horticulture.

— We are informed that it has been arranged to hold an INTERNATIONAL FRUIT AND FLOWER SHOW at the ALEXANDRA PALACE on September 2, 3, and 4 next. A liberal schedule of prizes will be issued in a few days.

— The "WARS OF THE ROSES" in pots is near at hand, and, judging from what we saw at the Royal Nursery, Slough, a few days ago, something very fine will be seen this season. One magnificent plant of Noisette Céline Forester contained no less than 250 flower-stems, many of them bearing twin blossoms; and a huge example of H. P. Paul Perras stood 8 feet in height, measuring from the base of the pot, and was 7½ feet in diameter. It, too, was literally loaded with fine blossoms. The Chestnut

effect is sadly injurious to the landscape, once so lovely. The same authority mentions, in reference to the removal of old trees on historic sites, that a considerable number of the once noble Elms in Gray's Inn gardens have been, of necessity it is presumed, cut down. Limes, or similar trees, have been planted in their place. We may add that the "apparent necessity" may be very real; large Elms, even when their branches without warning, and all of the Elms in question had long past their maturity.

— Some fine old plants of ALOYSIA CITRODORA are to be seen in one of the plant-houses at Gunnersbury. Mr. RICHARDS estimates them to be at least thirty years old, and they look like Gooseberry bushes, with stout, strong main stems. In their pruned state—and they are cut back to the old wood hard every year—they measured 2½ feet in diameter;

difficultly, and so lays the foundation of great good. We hope the example may be generally imitated, for few greater boons to the rural districts, may, to the nation at large, could be conferred. We would further suggest that the local societies should depute some competent gardener to show the cottagers how to manage and prune their trees.

— The *Times* states that a re-arrangement of the Judicial Bench has been rendered necessary by the lamented death of Baron PIGOTT. The new Judge is Mr. LINDLEY, Q.C., heretofore one of the leaders in the Court of Vice-Chancellor HALL, and author of a treatise on the *Law of Partnership*. He will go to the Common Pleas, where the presence of a judge with a knowledge of equity is desired by the Court, especially in view of the new judicial arrangements, the Exchequer having already that advantage in the presence of Baron AMPHLETT. In order to enable

FIG. 130.—RIVER SCENERY: WEST COAST OF CEYLON (THE HOME OF THE COCOA-NUT).

plants are said to be grand this season, and so the first meeting this season (probably at Manchester) of the two champion cultivators, Messrs. PAUL & Son and Mr. CHARLES TURNER, will be looked forward to with more than ordinary interest.

— Among the most beautiful of the spring flowers in use at Belvoir is a seedling IRIS with the habit of *I. pumila*. The "falls" are transparent white, with a violet disc and a yellow fringe, the petals and styles white. It is one of the most delicate and charming Irises we know, and it has the merit of being among the very earliest.

— The *Athenæum* states that a large portion, probably thirty or forty stalwart trees, of the NOBLE LINE OF ELMs which extended from near the bridge at Kew to the commencement of the open view and low wall of the gardens, have been destroyed. This apparently unnecessary operation has laid bare the brick wall in front of the old lodge in the gardens, lately occupied, we believe, by Sir A. HELPS. The

and when their full summer growth is on them they are considerably larger. They are found of great value both for conservatory decoration and for cutting from.

— PELARGONIUM TRIOMFÈ DE ST. MAUDE, a fine variety, of Continental origin, promises to make a splendid forcing variety. The flowers are of a deep crimson hue, very large, and trusses of an enormous size, very bright in colour and extremely effective; habit good, and a profuse bloomer. It has recently been distributed by Mr. CHARLES TURNER, and it can now be seen in fine condition at the Royal Nursery, Slough.

— An admirable scheme is carried out, or on the point of being so, at Grantham, in connection with the district Horticultural Society, viz., the distribution among the cottagers of varieties of FRUIT TREES suitable for the district. The ordinary cottager has practically no means of knowing what to plant, or procuring it if he did know. The Society meets this

arrangement to be made, Mr. Justice HUDDLESTON has consented to transfer his services to the Court of Exchequer. Mr. LINDLEY, as may be known to many of our readers, is the only son of Dr. LINDLEY, one of the founders of this journal, and is not only known as a sound and successful lawyer, but in his early days lent his aid in the instruction of the garden pupils at Chiswick.

— A huge example of ARAUCARIA EXCELSA has been successfully wintered in the open air at Gunnersbury by placing it near some trees, by which it was somewhat sheltered, and by covering the top with a canopy formed of mats. The plant was thus kept dry, and it appears to have passed through the ordeal of the severe winter without being in any way injured.

— It is remarkable to note how some once popular plants fall away, as it were, from cultivation and become quite rare, though once very plentiful. This is very true of the old double yellow Auricula, which was once grown in large quantities in that note-

worthy Auricula district, Middleton, near Manchester; for here died very recently ROBERT LANCASHIRE, who, as his memorial card states, "was a thorough florist, and raised from seed that fine Auricula, 'Lancaster Hero.' SAMUEL BAKER states that this yellow double Auricula was much grown in the Middleton gardens for the Manchester market, but it has now died out. It is well worth reviving, being deserving alike of pot and border culture, as the trusses are large and bold, and the individual flowers of a lasting character.

— From the *Journal of Botany* we learn that Dr. JOHN ANDERSON, the naturalist to the recent expedition to South-Eastern China, which met with so much opposition from the natives, and resulted in the death of Mr. MARGARY, has returned to Calcutta, and is now on his way to England. He succeeded in escaping with his life, but lost all his property, including his collections and apparatus.

— The same journal also intimates that Mr. CHARLES B. FLOWRIGHT, of King's Lynn, has prepared for publication a second *fasciculus* of his SPHERACEAE BRITANNICÆ. One hundred species are comprised in the *fasciculus*, the price of which is £1.

— One would scarcely expect to find CAMELLIAS FLOWERING OUT-OF-DOORS IN LEICESTERSHIRE; nevertheless in the beautiful woods of Belvoir a scarlet Camellia was in full bloom towards the end of April.

— The varieties of TROLLIUS now in bloom at Kew indicate its value either as a hardy border plant, or for cultivation and exhibition in pots. Trollius alpinus has large semi-double flowers that are quite globular, as are those of the other kinds; they are borne on stems about 12 inches in height, and in colour are pale yellow. T. europæus is less robust, but the colour of its flowers is deeper, whilst Trollius latus is still dwarfier, and has flowers in colour pale sulphur.

— Chance combinations and arrangements are often more effective than planned devices. The other day at the Sheffield Botanic Garden we saw a very graceful arch formed of DACRYDIUM CUPRESSINUM, which had grown over the path of the house, and been adapted by Mr. EWING in the way mentioned. In the conservatory at Wortley, Mr. SIMPSON has trained *Henryea scandens* over wire arches, and when we saw them the plants were short-jointed and full of flower. This is a plant not often seen now, but amply deserving of more attention.

— In consequence of the lateness of the season, the CRYSTAL PALACE ROSE SHOW has been postponed from June 19 to June 26.

— At the Sheffield Botanic Garden lately we were shown by Mr. EWING a CROSS between PRIMULA VERTICILLATA and P. JAPONICA. The leaves were in shape like those of the latter plant, but covered with the grey mealy powder of the former.

— In the herbaceous ground at Kew is now in flower VIOLA PUBESCENS, a native of North America. The flowers are purplish mauve in colour, and larger and rounder than those of Lee's *Viola Regina*; the foliage is thin and small; the plant blooms very freely and is a beautiful species. It would look well as a pot plant, and charming in the herbaceous border. Close by are several varieties of *Viola cucullata*; all have a compact habit of growth and plenty of foliage; the blooms in size and colour much resemble those of the Russian Superb; but in several of the kinds the flowers are beautifully splashed and flaked with white. These latter especially are exceedingly pretty, and deserve wide cultivation. *Viola obliqua* is another variety that has mottled flowers, but is not so showy as are the preceding kinds.

— Standing up boldly in the new spring garden at Belvoir is a notable STANDARD PORTUGAL LAUREL, one of the largest in the kingdom. The trunk is 5 feet 11 inches in girth at 3 feet above the ground; the trunk is 10 feet clear from the surface to the first branch, and the spread of the branches 42 feet.

— The following communication, dated April 26, 1875, has been received by the Council of the Royal Horticultural Society with reference to the COLOGNE INTERNATIONAL EXHIBITION:—

"Gentlemen,—A letter from Lord ODO RUSSELL, the British Ambassador at Berlin, under date of 16th inst., informs us of your having courteously intimated that the Council of your esteemed Society would be ready to act as a committee on behalf of British exhibitors at our forthcoming International Exhibition, and that it would also send a representative to the same.

"We now take the liberty to address you direct on this subject, and before all we beg to state that we shall be very happy to accept your kind offer, by which you will be putting us under great obligations, and that we shall thank you to inform us of the names of those

gentlemen who will kindly take the matter in hand, so that we may insert them in the catalogue to be issued, as forming the English committee, in the same manner as we shall publish the committees formed in other foreign countries.

"We are sending you by book-post general programmes, as well as the special regulations of our exhibition. If you should require any more of these, we will with pleasure be at your service.

"We do not at the same time send you application forms for entries, because we should first like to hear from you whether you will undertake to attend to this matter, or direct to us any exhibitors applying for the same, which we suppose would be more convenient to you.

"In our opinion it is especially desirable to see the English manufacturers of objects relating to garden architecture, machinery, &c. (divisions iii., iv., and v. of our programme) entering competition; and we beg you will kindly draw also their attention to our undertaking. Further there are fossil plants and their fruit sands (see special programme, vi. c.) of which we should be highly pleased to get a collection sent from your country. These latter are no doubt abundantly found in the coal and turpentine of Wales, &c., and perhaps there are collections of this kind in the Royal museums which Government might be induced to send to our Exhibition.

"Our undertaking, which already thus far promises to take very large dimensions, has found ready subvention on the part of the different Governments, as well as from the public in general. Most of the railway and steam navigation companies have reduced the freight on goods to be sent to the exhibition by 50 per cent., and there is no duty to be charged on such objects unless they should be sent by air from the country.

"For English exhibitors it will be of special interest that the Netherlands Steam Navigation Company, and the Belgian Company, whose steamers ply respectively between London and Rotterdam, and Dover and Ostend, as well as the Royal Mail Company, are, of those who have granted the before-mentioned reduction. B. EDWARD OFFENHEIM, Secretary."

Responding to this application, the Royal Horticultural Society have appointed a committee, consisting of W. BURNLEY HUME, Esq., W. B. KELLOCK, Esq., ROBERT WARNER, Esq., and Dr. HOGG.

VERONICA PECTINATA is one of the prettiest spring-flowering plants at Belvoir. Its close habit, regularly disposed, deep blue flowers are very engaging. The habit alters as the plant grows older.

— At Belvoir granite-dust is found an admirable soil in which to grow Vines, while the bunter sandstone, deficient in lime, is valued for Camellias.

HEATING.

THE arrangement of the boiler and water-pipes in a hothouse is one on which gardeners, as well as the mechanics who fit them up, have strong notions about the necessity of having the boiler at the lowest point of the flow, so that the water shall on no occasion have to rise to get into it. I was building a fernery last year, and, being my own architect and clerk of works, I found it convenient, in order that the pipes should pass a doorway without obstructing it, to require the boiler to be a foot above the floor, while the return pipes passed under it, and had to ascend about 2 feet to be connected to the boiler.

The off-let pipe from the boiler had to rise some 5 feet, and then cross above that same door and descend on the other side of it, to the system of pipes that were laid round the house.

My bricklayer, who was a candid, experienced old fellow, told me that it would never work. My gardener thought the same, but was a younger man, and expressed himself less confidently.

I said, "Well, I don't see what law of fluids we are contradicting, and we shall try it." When the ironmonger came to fit up, he backed up the opinion of the others, and, in fact, I know that I was quietly being laughed at by all, and the same opinion took possession of indoors in my household. I must be wrong; for the people whose business it was to do those things said so, and they must be right. To this I replied, "Well, it may be so, but I will try it; we can sink the boiler when beaten, meantime we will have some instructive experiments that will be worth all the money."

Well the work was carried out. The house was about 30 feet by 14 feet by 12 feet high. For this I had a double coil of 3-inch pipes connected to the boiler at each end by a few feet of 1-inch wrought iron tube. We made a trial and it was a lamentable failure—the water would not circulate. An air-pipe had been put in at the highest point, viz., where the delivery pipe crossed over the top of the door; another had been put in at another high point, viz., where the pipes began to dip where they commenced to return to the boiler; even two snuff-cocks had been put in at another place, just by way of extra security that there should be no stoppage.

These air-pipes were of 3/4-inch iron tube, and they were carried up 10 feet above the roof of the house. A

temporary water supply was rigged up on top of the house, or say 8 feet above the boiler, or say 4 feet above the highest point the warm water from the boiler had to pass over. All those details were done in strict conformity with all our opinions. The only one point on which we differed was the position of the boiler. I stayed at home from business a day to watch the matter and interrogate Nature.

Once we got the water to circulate; it took a long time—several hours—but we got the water warm throughout the whole length of the pipes, and sceptics began to think that we should succeed after all. However I said, "At this rate of heating we should be all adrift in a frost; urge the fire, and let us see what we can do." In a very short time the return-pipe began to get colder. Shortly a volume of steam poured forth from the air-pipes, the water was rising and sinking in the supply cistern. It was clear the fluids had all gone astray; they were not circulating. We had to draw the fire to save the boiler, and begin and think anew.

There was a variety of opinion; one thought the boiler must be lowered, another thought the feed cistern should be put higher to give it more force; and the fitter thought that we should have an enlargement of the return-pipe close to the boiler, to act as a receptacle for air, which he would let off by another air-pipe.

I replied, "Let all be done, save lowering the boiler, for that will cause me to disturb my tessellated paving." We heightened the tank that supplied the water 3 feet. The fitter erected a 6-inch pipe, like an ornamental column, to look nice, and to comply with the physical wants he saw apparent, and in a few days we were ready for another trial. We made it, and we failed again. While we worked the boilers with a slow fire all was well, but when we urged the fire to do what would be necessary in a cold winter night, the circulation ceased—forces arose that balanced each other, and stagnation was the result.

During these trials I had noticed that if we worked slowly all went well; here I found Nature endorsed the principle of construction; why, then, couldn't we work quickly? Why, because sufficient outlet had not been provided for an off-let for air which is expanded and developed in volume when water gets to a high temperature. Instead, therefore, of a small 3/4-inch pipe at the highest point, I said, "Cut away the pipe, and put an iron water-cistern there to form part of the line of pipe, and let the air or steam that accumulates fly off from its surface." This was done, and from that time all has gone merrily as a "marriage bell." During these *contraints* I never lost faith, but it often occurred to me how necessary it is not only to have a theoretical but also a practical knowledge of the operation of the laws of Nature, for, as it turned out, it was not only I that was at fault in the latter, but the practical men knew no better, and the nostrums which they proposed were not a cure.

The season for building plant-houses that require fire, or the alteration and improvement of those that exist, is now at hand, and I have a few suggestions to some of your gentlemanly readers to know that it is an accomplished fact that you may raise or lower your pipes in relation to the boiler as suits your taste or convenience, and you need not sink your boiler where it will be drowned in winter, nor need you close off a doorway, or dispense with pipes along a side of your house where you know the heat is necessary; but that you may sink under or go over doorways as suits your need, while you keep three things in view—water supply at sufficient height, heat sufficient to propel the water, and ample space wherein to let off air or steam. And that others may profit by my troubles is the sole reason why I ask you to give place for these remarks in your journal. *George Anderson, Riversdale Lodge, Hamworth, Middlesex, May 4.*

Home Correspondence.

Botanical Collectors.—For a long time I felt so disgusted with Mr. Linden's remarks (see *Gardener's Chronicle*, No. 61, n. s., p. 279, and his *Illustration Horticolæ*, January, 1875) that I desisted to make any reply; I am, however, urged by many friends to do so. The best I can do in my defence is to let Mr. Linden speak for himself, and reproduce some extracts from his letters. Those who take a special interest in me or Mr. Linden may consider themselves entitled to ask for judicial proceedings, if they prefer to see them in my hands at the next International Exhibition at Cologne. What was the reason that aroused Mr. Linden's unbounded ire? Nothing but my plain and harmless protest not to bear his conduct any longer, for he not only concealed my name when speaking of my discoveries, but he even substituted that of other travellers in place of mine. Mr. Linden himself wrote, under date of May 27, 1865:—"revint après un fiasco complet dût exclusivement à son indolence et à son incapacité. Toutes mes espérances se concentrèrent donc sur vous et avec d'autant plus de raison, que vous m'avez donné les preuves les plus manifestes, que vous

êtes un véritable voyageur botaniste et qui je suis me reposen en toute confiance sur vous. Mr. Linden me, when engaging me to travel on the Amazon River, had the advantage of finding me there, without loss of time or money, and surely not so "unknown and forsaken" as he now asserts. I had then travelled about two years on my own account, and under the most flattering auspices of persons some of whom I may be allowed to name here. The late celebrated Brazilian traveller, Von Martius, who had recommended me to the Embassy at Paris; the late Director Schott, from Schönbrunn, who offered for collecting; the celebrated traveller, Frézier (Tschudi); the General Consul Sturtz, at Berlin; the Brazilian statesman, De Capaneua; the Brazilian minister, Cansanzou de Sibimiri, and even His Majesty the Emperor of Brazil himself. Exactly in the same way as Mr. Linden did, I founded a horticultural establishment in Rio de Janeiro, on behalf of which I undertook to explore equatorial Brazil under the special protection of the Brazilian Government. The non-continuance of this arduous task was unavoidable by me, and was chiefly by the unexpected bankruptcy of my partner. Under such splendid auspices it was, of course, most probably a mistake on my part to accept the offer of Mr. Linden, quite captivated as I was by the style of his letters, and because I was so desirous of continuing my travels in the immense and interesting Amazon valley. I had his words been equalled by his deeds then I should never have left my patron. Had I not been his collector I should have travelled for some one else. I should also have accepted lucrative appointments, offered afterwards to me—as, for example, from the learned Archbishop Antonio Macedo da Costa, who repeatedly tried to get me to establish a botanical garden in Pará, the capital of Lower Amazon; then a good offer was made me as a botanical attaché by a Peruvian captain on an exploring man-of-war; then to go to Lima, to accept the direction of the Botanical Garden there. But once engaged with Mr. Linden I refused all, as I was too conscientious to accept any offer which would, in my view, be going back so much self-denial as I undoubtedly my work. I beg permission to call attention to several testimonials spread throughout the press for six or more years now. As for example—Mr. Fossinene (whom I have not the honour to know personally) said on one occasion in the *Belgique Horticole* (1869, p. 228):—"Pendant toutes ces excursions il n'a cessé d'expédier en grand nombre de plantes en Europe. Lors de l'Exposition Universelle de Paris, M. Linden rapporta, grâce aux belles découvertes de M. Wallis, les grands prix pour les plantes les plus nouvelles et les plus remarquables. Depuis lors, on a encore en l'occasion au Congrès de St. Petersburg, d'admirer ses heureuses importations." I need not add here that the same triumph occurred at the grand International Exhibitions held in Hamburg, Vienna, and Florence, as well as formerly in Amsterdam and London. Professor Morren expressed himself, among other things (see his *Plants des Serres*, rapport du Jury Internal, 1867, p. 67):—"A côté de ce mémorable voyage les autres explorations sont un peu effacées, bien que leurs succès ne puissent être amoindris." Many letters of Mr. Linden are full of the highest acknowledgments of my *faat*. Even Mr. Linden, in the remembrance of the former state of his establishment, declares in a letter dated September 28, 1867:—"Vous importez découvertes ont consolidé la réputation de mon établissement comme elles ont fait votre réputation." Thus the reader will admit that what Mr. Linden means by "ingratitude et mauvais procédés," &c., is incomprehensible. As to Mr. Linden's assertion of guiding me step by step through the immense Amazon territory, which he never saw with his own eyes, this has been the cause of the most continual disagreement, since he expects one to do in four weeks what cannot be carried out in four months. Nothing equals my disdain of Mr. Linden's pretensions of giving directions and assisting me by his experience, whilst it is he who has learned and profited by me. His letters during the time of my travels are surely more admissible than his assertions of to-day. Since he seems to have forgotten all, he will allow me to call them back to his memory. September 23, 1861:—"I leave your itinerary to your entire liberty, but I should like you to spend some months on the Rio Negro river. To besides, it is true he indicated to me several directions, I found formerly in his *Plants des Serres*, and he will be corrected by me, after having travelled already four years for him. But my best plants, Mr. Linden will admit, were found when following my own itinerary, even respecting to New Granada, visited by Mr. Linden. Another letter, dated October 12, 1865, says:—"Je vous laisse complètement libre de retourner par l'Amazono en par Panamá. The same as in regard to the itinerary. I was, in my own way also in regard to Waring, and as may be stated:—June 14, 1865:—"Grâce à votre emballage intelligent tout s'est bien conservé et m'a occasionné la plus grande joie." Mr. Linden will not have forgotten that here are meant plants that were seven months on their way to Europe, in consequence of a shipwreck.

October 6, 1865:—"Your method of packing is an excellent one—what a pity it is that you did not go instead of—" May 3, 1868:—"Le plus ingénieux de tout ce que vous avez fait, ce sont les caisses à 53.—De l'odontoglossum, Phalænopsis il n'y a pas une seule plante morte."... "Si ces plantes arrivent bien, je vous proclamerai roi des voyageurs." May 1, 1868:—"J'ounerai donc à votre grande activité, et à l'énergie que vous avez déployée malgré les contrariétés de toute nature." In regard to Mr. Linden's most singular assertions, that many distinctions of gold and other medals (perhaps the nominations of several societies as extraordinary member, too?) are for his and not my merits. I must frankly tell him that seventeen years before I knew him, in the year 1852, I obtained three silver medals at an exhibition at Munich for several horticultural objects, though foreigners, properly speaking, were not admitted to competition. In comparison with my successful voyages, I admit only that difference with Mr. Linden's "scientific expeditions," on which he was chiefly helped by his step-brother Schlim and by Funk, that I had to stand on my own feet and to do my chief work myself, and that I had a lucky eye for making the most interesting discoveries. I even fully admit that those plants discovered by him in New Granada may be found again blindfolded, as he said. However, I am proud to state that such an easy method of finding would not be the case with classical ground. Having done with his pre-arranged classical ground, I was rejoiced to find out also Odontoglossum nevadense, O. Wallisii, the splendid Tillandsia muscica, and resuming my own ways, as so many times before, I had the pleasure to discover a long series of the finest plants, as for example, Masdevallia Lindenii, M. ephippium (Trochilus), Odontoglossum vexillarium, Cattleya gigas, Aphelandra fascinator, Curmeria picturata, Anthurium crystallinum, Maranta hirsuta, ptelea, and many others. My Linden cannot deny that he knows as much of plants much better since I made my travels here, and since I followed my own itinerary; and how much he liked this country thereafter will be proved by the fact that he sent another traveller three times, notwithstanding his having said (Dec. 11, 1867):—"Keep in mind this is the last exploration in New Granada; I shall not send any other traveller there." It has always been regarded a point of honour for each nurseryman to give due honour to the collector of any plant, and I may quote Messrs. Veitch, who have always done full justice, among others to Messrs. Pearce and William Lobb, even a long time after they had left them. Localities, indeed, have usually not been given too clearly; neither would I have indicated any, if Mr. Linden had not offended my sense of justice by omitting my name when it was his duty to have given me the credit, or even by putting the names of others in my place. The trip Mr. Roze made for him, which I intended to profit by my Discoveries, which I could not do, on account of the fact, since when at Medellín and Tronito I was totally broken by fever. Mr. Linden's assertion that a traveller is no more than one of his garden people, is one of his choicest revelations! If Mr. Linden had not had me, where would his Begonia Rex. And if Mr. De Craan, then his excellent gardener, had not understood how to treat my plants so well, they would never have appeared in the trade, and would not have won honours upon honours. Now, as to the assertion of my having left him clandestinely, and of collecting the same plants for the profit of others, all this shall now be explained. I was neither satisfied with Mr. Linden's payment for my many years' services and sacrifices, nor had I found experience in the slightest degree of what he had so often called his generosity. Nevertheless, I decided to go once more for him, as I felt too much for him to desire to go to my dispute, and together united in the same lands and place. Mr. Linden supposed here the effect of a "remorseful conscience." When going over to Messrs. Veitch I told them conditionally:—"Send me wherever you like, except where I travelled for Mr. Linden, unless you should wish me to do so after three or four years." I left Mr. Linden a first and a second time for valid reasons, but surely in neither case "clandestinely," as may be seen by First desertion, Nov. 10, 1867:—"Dan, and de mes mères lettres, vous avais demandé de me donner dans tous les cas la préférence à conditions égales." (Mr. Linden referred to a letter written about two months before my starting, December 10, 1865.) Second desertion.—When Mr. Linden saw all his endeavours to make me go a third time for him were in vain (he now calls it a *faiblesse* to have me engaged a second time) he wrote, Dec. 6, 1872;—"Bref à quoi bon de prétendre dans le désert l'égalité, et autre, et ainsi, me faire le plaisir de me donner, sans vous les cas la préférence à conditions égales." (Mr. Linden referred to a letter written about two months before my starting, December 10, 1865.) Second desertion.—When Mr. Linden saw all his endeavours to make me go a third time for him were in vain (he now calls it a *faiblesse* to have me engaged a second time) he wrote, Dec. 6, 1872;—"Bref à quoi bon de prétendre dans le désert l'égalité, et autre, et ainsi, me faire le plaisir de me donner, sans vous les cas la préférence à conditions égales." After my second leaving him I did really recollect some plants formerly discovered for others, but then matters and circumstances had entirely changed, principally by my own conscience-stimulated period of four years having passed, and then I felt too much disinclined for any further

regard. I have tried to be as short as possible, but if Mr. Linden should not be convinced I shall have great pleasure in producing further proofs. C. Wallis. [These further proofs must be sent to M. Linden. We cannot occupy more space with what seems merely a matter of business arrangement with M. Linden and M. Wallis. Eds.]

Fruit Crops in North Staffordshire.—With regard to our fruit crops, there is a fine show of everything, and the trees appear to be unusually healthy. From what I hear the Damson crop is likely to be good. Apples with us are now in full bloom. Peaches are set. Apricots with us (all under glass) are thick as hail; all small fruits the same. Cherries in full bloom—standards quite a sight. Morellos on the Mahaleh stock (River-) very fine—the best way of growing Morellos; no Scotch Palace training required, easily netted, and always ripen a crop even in North Staffordshire—not altogether a favourable climate for outdoor fruits. W. Hill.

Defective Sense of Smell.—Some time ago I read a very interesting paper or papers on "Colour Blindness," showing how many there were per cent. unable to identify or distinguish between certain colours, the number of those so incapable being perfectly astounding. With your kind permission I would now draw attention to a deficiency I myself labour under in a kind of certain odours. Seeing in the *Botanical Magazine* (tab. 6046) a figure and description by Dr. Hooker of the beautiful new Boronia megastigma, which he described as having a fragrance resembling nothing known to him, as being "most delicious, and, though not overpowering, as soon filling a large room," and having at that time myself young plants coming away from seeds I had from King George's Sound of this odorous novelty, you may judge of my surprise when these came lately into flower with me, and flowered profusely, I failed to detect the faintest trace of any odour whatsoever; but to every one else to whom I submitted them Dr. Hooker's description was fully realised, and, though all were charmed with it, no two gave the same account of its perfume, some thinking it resembled the scent of Lemons, some the scent of Peaches, and some the scent of Sweet Violets. Judging from my own defect, I would regard those who likened it to the odour of Sweet Violets, as being nearest to the truth, for I am fully impressed with the scent of Lemons and Peaches, but of Sweet Violets, as of this new Boronia I utterly fail to detect odour of any kind, good, bad, or indifferent. I am still more unfortunate with that universal favourite, Mignonette, for instead of the sweet perfume everybody lauds it for, it exhales to me a small truly heavy and disagreeable; for which I infer that it may possess a double or combined odour, the heavy smelling portion of which is alone perceptible by me. [The odour of Mignonette is unpleasant to many.] Though there are other flowers which withhold from me their sweets, it may suffice, for the present, to instance the above as types of those in various tribes which I might put down in the same category. Now, on the other hand, I am very far from being insensible to the perfume of flowers generally. I may only instance a few; Roses of all kinds and characters, where perfume as all present, are to me delicious excepting an Ayrshire clematis named "Splendens," to me most fetid. And no less delicious to me are the common Hawthorn, many Actæas, many Rhoiodesdrons; all the Cheiranthus, Dianthus and Thymus tribes; in short, everything having the Heliotropo, Mentha or aromatic odours. My case may be singular, for I don't remember having found any, save one gentleman, devoid as I am of any pleasurable odour from the things I have named above, viz. Mignonette, Boronia megastigma, and Sweet Violets. Yet though the Pansy fragrance however faint, I hope that the publication of this letter may bring forward others similarly affected, or unaffected, and stating how and by what plants they are so affected. H.

Paper Protectors.—I can assure Mr. Bréhat that I had no intention of being unaccountable to him in my remark upon paper protectors for Plum trees; I merely intended to convey that if his scheme were successful it could not be carried into practice on acres of trees. C. Lee, *Hornslow*, May 12.

Primula cortusoides aemona.—In Mr. Smith's nursery, Wilton Road, Salisbury, I have to-day (May 8) seen a grand bed of this charming spring-flowering plant, which is of a bright magenta colour. The bed in question is 4 feet wide and 15 feet long, and on an average each square foot contains from twenty-five to thirty trusses, each truss having from nine to ten blooms, which on an average measure 2½ inch each in diameter. The effect which this bed produces is "simply magnificent," and, as I have seen it, it "only needs to be seen to be admired." It is of very easy culture, and is perfectly hardy. The plants were bedded-out two years ago, and the only protection which they received was a surface-dressing of leaf-mould. I consider no spring garden is com-

plete without this variety. I have also noticed in the same nursery a very fine seedling tree Carnation; in habit the colour it resembles that of the Souvenir de la Malmaison, but the blooms are much larger and sweeter than that variety; one which I measured was 4 inches in diameter, and it is to be hoped that ere long Mr. Smith will introduce it to the public. There is, too, in front of Mr. Smith's house, in a ribbon-bed, a very nice arrangement of spring-flowering plants in double rows of the following sorts, viz., *Stilene pendula compacta*, *Arabis saxatile compacta*, *Mycosotis dissitiflora*, and dwarf double Wallflowers—the whole making a very pleasing display. *H. W. W., Salisbury.*

Railway Rates for Nursery Stock.—In reference to the following extract from a circular of ours, sent out in February last, we have the pleasure to inform you, and, through you, all interested, that the several railway companies have agreed on and after June 1 next to reduce their rates to what they were last year, which will be a benefit.—

"Dear Sir,—You must be aware of the very largely increased rates for transit of our nursery goods, that has taken place since January 1 last on the railway systems. Here we have personally waited upon the goods manager, who promises to represent the same at head-quarters, so that the old rates—which were high enough—may be adopted. We think if all interested will take the trouble of promptly urging their several goods managers on the subject, the result may be worth while to the nursery trade. Last autumn's rate to London from this was, for trees, at old rates, *srs. 2d.*, now it is *70s.*, other places in proportion. Of late we have sent several lots of goods to England in the carriage of which comes to more than our invoice cost."

John Stewart & Sons, Dundee, May 7.

The Dry Earth System.—Independently of the approval of the dry earth system expressed in the letter and extract which I enclose, there is something peculiarly interesting to me, and doubtless it will be so to your readers, the fact of a Bengali studying British farming in East Lothian. In a more recent letter he informs me that he has been there six months; that he intended to remain another six months; then, before his return to Bengal, spend three months more in seeing things interesting to an agriculturist. Before that return I hope he will visit me, and that I shall be able to give him much information that may be of service to the people of India, and which, made known by a native of such manifest intelligence as his two letters in the *Times* prove him to be, will spread far more rapidly than if set forth by Europeans.

"Trarpan, East Lothian, March 26.
"Sir,—I enclose twenty-four stamps for your *National Health and Wealth*, Part I., and thank you very much for your excellent letter. You will observe that I am a Bengalee, staying just now in East Lothian, to acquaint myself with British farming. Whether the dry earth closet system is applicable in this country or not, you are the better judge; but so far as I can understand I think it would be a great blessing to India if this system were adopted, and (in towns) enforced by the municipal authorities. The dry earth closet system has been introduced in some large towns in India, but it has been at such an enormous cost that I think it has not any chance of success. In a letter which was published in the *Times* of January 13 you will find me highly approving of your system. I am glad that the Duke of Argyll, who was lately Secretary of State for India, is among your subscribers. Would you think it advisable to send a few copies of your book to the high officials in India? I may here mention a few Indian papers that you may send your book to. They are all published in Calcutta:—*r.*, the *Englishman*; *s.*, the *Hindoo Patriot*; *3.*, the *Indian Mirror*; *4.*, the *Friend of India*; and *5.*, the *Indian Daily News*. When I go back to India I shall try my best to spread among my fellow countrymen the knowledge of every simple contrivance for utilising house and town refuse.—I am, Sir, yours truly, SKINATH DATTA."

I append an extract from the letter referred to in the preceding letter.—

"— Besides these there is another source to which I am particularly anxious to draw your attention. It is nightsoil. In very few places in India has the system of draining nightsoil by water been yet adopted. Before this expensive system is further extended in a poor country like India I should think it would be wise to give a trial to the use of earth closets, or ash closets, as advocated in his *National Health and Wealth*,* by the Rev. Henry Moule, Fordington Vicarage, who tried them and found them successful. This system has the recommendation not only of its requiring no expense and making the use of the *methans* (nightsoil) less disagreeable, but also of doing what liquid-drainage has not done, and perhaps cannot do, namely, preventing the production of highly infectious gases, and at the same time supplying the nation with a source of excellent manure, which will increase with the increase of population.—

Henry Moule, Fordington Vicarage.

The Double Cineraria.—Having read nearly all the reports respecting the double Cineraria, and find it a general failure, allow me to state that I bought a

3s. 6d. packet of seed in the spring of 1874, which produced some sixteen plants, but only one which produced double flowers. That one, however, I must say, was greatly admired by all who saw it. For four weeks the plant occupied a prominent place in my employer's drawing-room; at length it was sent out, and after a little rest it commenced flowering again, from which I enclose a specimen that has been fully expanded as it is at present for the last three weeks. I may here state that all the other plants from the same packet were much inferior to Weatherill's ordinary strain, which proved a great success with us this season. *R. Russell, Gr. to Joseph F. Murphy, Esq., Old Forge, Belfast.*

A Chinese Wheelbarrow.—I have read with interest the account in your issue of the 24th ult. of a new spring barrow, which is doubtless an improvement on the common barrow, but which is still open to the great objection that a large portion of the weight is thrown on the workman. I enclose a photograph of a Chinese wheelbarrow, showing how these practical people place the entire weight on a large central wheel (fig. 131). In Shanghai thousands of these vehicles ply for hire in the streets, much as cabs do in this country, the usual load being two persons, who sit on the wooden platform on either side of the wheel, resting one arm on the framework above the top of the wheel and placing one foot in a stirrup made of rope. It is by no means uncommon, however, to see as many as four persons conveyed without any particular effort (the ground being level) by a stalwart coolie. The fare is from *2d.* to *4d.* per mile, according to the load. Garden and farm produce is transported in the same way, and even live stock: the Chinese farmer being much too sensible to attempt to drive his pigs to market, the barrow is often seen laden with a live

FIG. 131.—SHANGHAI WHEELBARROW.

fat hog on either side of the wheel. I cannot conceive why the Chinese barrow has not long since been adopted in England; with the barrows now used we task the strength of those who use them more in proportion than we do our horses, for who would tolerate a cart that threw half the burden on to the back of the horse? *Thomas Hambury, Ashburton House, Croydon, May 6.*

Prince of Wales Plum.—The state of the accompanying young shoots, taken from Prince of Wales Plums in the neighbourhood of Isleworth, may possibly be of interest just at the present with regard to the effects of weather on this variety. The trees are of considerable age—one trained on a wall with a north exposure, the other in the open bed, trained as an espalier, rather more than the width of a common garden walk, to the north of the same wall. The tree trained on the wall has healthy foliage (of which I send a specimen) till just the top of the wall, but there, where the leaves are more exposed, they are yellowish, wrinkled in large patches, and with a generally unhealthy appearance. In the espalier, which is necessarily much more exposed, this difference in the state of the foliage is still more striking, a large proportion of the upper parts of the tree showing the unhealthy development, and the lower and consequently more protected shoots being for the most part healthy. Whatever other causes there may be for the disease to which this fine variety of Plum is liable (which must be far better judged of by those whose experience is based on the superintendence of much greater numbers than can be observed in a private garden), still the present state of my own trees seems to point so surely to spring frosts as one cause of evil to the trees, that I venture to note the circumstance as of interest in the present circumstances. *O.*

Fruit Prospects in Derbyshire.—Summer-like weather has come at last, and fruit trees of all kinds are fast pushing into bloom. Standard Pears and on walls are now a blaze of beauty, and many already

have set; and we look forward, should the weather prove favourable for an abundant crop. Cherries are one mass of flowers; Plums are also quite as promising. Apples; many of the later varieties are now in bloom, while the early kinds will not be in flower for a few days hence. Apricots a moderate crop; as a rule, they do not thrive very well in this cold climate. Peaches and Nectarines have set an enormous crop, and are free from blight. Small fruits of all kinds promise well for a good supply. Strawberries will soon be in bloom, and are strong and healthy. The Damsons in orchards in this district are now one mass of bloom. From the time I have seen the gardens and orchards in this district look and promise better for an abundant supply of fruit in the coming summer. *E. Gilman, Wootton Gardens, May 5.*

Strawberry Culture in Pots: Sods v. Saucers.

—Having read Mr. H. W. Ward's interesting remarks on the above subject, I beg to say I cannot agree with him when he says—"From the time the berries are set we use saucers, which every Strawberry forcer knows the value of, as they retain part of the water that passes through the pots, which the plants ultimately absorb." This is contrary to all my practice and experience in Strawberry forcing, and I think the opinion of Strawberry forcers generally is well worth asking on this important question of saucers or sods. I have always found that the pots are kept in saucers until the fruit is ripe, that, compared with those grown on sods, the former are soft, watery, and insipid, while the latter are firm, and with colour and flavour usually as good as if they were grown out-of-doors—a thing of great importance to those who have to send them long journeys by rail. The plan we adopt here—and we force 5000 annually—is: On our shelves, made of wire, we place thin sods, grassy side downwards, then put the plants on, and in a few days they are rooted through the bottom of the pots into the soil. When watering we sprinkle some over the sod to keep it damp, and, as the grass grows through the shelf downwards, it has both an ornamental and beneficial effect. *J. McIndoe, Hutton Hall, Guisborough, Yorks.*

International Potato Exhibition.—Permit me to assure "C. B." that to stimulate a rivalry between the Potato raisers on both sides of the Atlantic has not been a "chief reason" for getting up the International Potato Exhibition. The real merit of the conception is due to the great show of Potatos held at Manchester in September, 1873; and the impression then made on myself, Mr. McKinlay, and other growers, was that a great Potato exhibition was both possible and desirable in the metropolis. Added to this, we believed that the Potato had now become both commercially and socially an article of such national importance that it was at least as deserving of a special exhibition as cats, dogs, Felargoniums, and even fungi. That the production of improved kinds is very desirable, is without doubt universally accepted; but the committee did not feel justified in making special classes for seedlings, because their appearance on the show table offers no verification as to table quality or productiveness. Moreover, the work of testing new kinds is so admirably performed at Chiswick, that it would be folly to attempt to supersede it. As to medals, I am heartily sick of them; their constant intrusion upon our notice is in execrable taste, and if I became possessed of the finest medal ever offered I would not retain it a moment longer than necessary to convert it into hard cash. With reference to the new class inserted in the schedule by the liberality of Messrs. Bliss & Co., of New York, for three varieties of American Potatos sent out in England in 1874-75, would it not be well, as the sorts included are so few, if the committee would state exactly which they are, so that no mistake might be made? I take them to be Snowflake, Alpha, Eureka, Thorburn's Paragon and Carter's American Breadfruit—that is all the new American kinds that I know of. Perhaps Mr. Hooper will kindly make an authoritative statement in the matter. With regard to Mr. J. Coult's valuable prizes for English seedling Potatos, I should assume that "English" means raised in the United Kingdom. I would also recommend that with each variety the names of the immediate parents and the year when raised should be given. *Alex. Dean.*

Notes on a South Shropshire Garden.—Since my notes made on January 20 we have had a long period of cold weather. The month of February was a very trying time both for gardeners and for those troubled with sensitive lungs, and frequent sharp frosts prevailed all through March; but fortunately they were dry, and did not injure the blossom of the Apricots, which began to open on the 16th. There was very little general weather till quite the end of April, but now

"Solvitur acris hiems, gratâ vice veris et Favoni;" and all rejoice in the grateful change that blesses the

* Published fourteen years ago.

country. Swallows made their appearance on the 5th of last month, but they must have had a bad time of it for the first three weeks. The cuckoos were heard on the 20th. The thrushes now pour out their varied songs in every tree, blackbirds (sad thieves) charm us with their rich contralto notes, and garden warblers on every side pour out their mellifluous happy voices—all Nature seems radiant with happiness and promise. The woods around are hurrying on their summer garb, still fresh and bright with the tenderest greens of early spring; the Hawthorns, Larches, Elms, and Oaks suffused with their respective tints, and the Spruce pouring forth a cascade of green at every branch. The Horse Chestnuts are now glorious with their flowers, and in the gardens and orchards Lilacs, double Gorse, Rhododendrons, Pears, Apples, and Cherries, charm the senses at every turn. The promise of wall fruit, now well set, is wonderfully great, and the blossom of the Pears, Cherries, and Apples, equally so. Every spring in turn seems more beautiful than the last, and the older we grow the more we enjoy the loveliness which the earth has to offer. The Chestnut who governs all for good in our garden we are busily making preparations for the summer campaign. Our Mrs. Follocks have disappointed us this time, and we hear the same complaint in other quarters. We have had to buy at a high price, in order to make up our required show; our Crown Imperials have been, as our double yellow Tulips are, gorgeous; Wallflowers, Narcissus, Globe Ranunculus, Auriculas, Polyanthus, Gentians, white and yellow Alyssum, and the blue saxatiles, have kept us busy during the past and present month. Pronics, Azaleas, and Rhododendrons, will carry us on to June, when the summer beds will be coming on with their blaze of colours. In the conservatory our Cinerarias are over, and the Azaleas which followed are waning away. Roses now reign sweetest and loveliest; our old friend, Général Jacqueminot, one of the freest as well as one of the handsomest, still holds sway. Saffron, before her buds have expanded, delights us with her consistency; we have a plant from the West Indies which has gathered at least one Rose during every week throughout the year. Then we have our Paeon flowers—Van Volkemi, very beautiful, with its crimson star-like flowers dangling from their long thread-like peduncles. The Manicata, a flower from which our friend Dr. Hooker figured last year in the *Botanical Magazine*, we cut back, but it has made vigorous growth, and will no doubt be as brilliant as before. Pelargoniums are at hand; then will come Fuchsias till the autumn. Rhododendron Dalhousii and Gibsoni ought to be in every well-regulated house; the one with its sulphur, and the other with its pure white flowers, are very pleasing. We are busy building a new stove, which is to help us over many difficulties, but as we are to make one boiler do the work of all the houses, the alterations necessary have interrupted the work of forcing the Vines, consequently these are not yet even in flower, but they promise well, and in another week or ten days we shall be green, and in time, we hope, for the Muscats; if so, we shall have no reason to regret the delay. No salmon have yet made themselves apparent in the pool, but we do not expect them before June; the river has been lower than last year, owing to the long-continued absence of rain. In the kitchen garden our Peas are nearly in flower; the Potatos planted before Christmas are breaking through the earth satisfactorily; the ground for Celery is made ready; Strawberries are in full bloom and profiting by the welcome showers, and notwithstanding the cold season we are quite as forward as we could wish. S., May 10.

On the Transmutation of Grain.—It is curious to observe how theories in plant growth are revived from time to time, and statements made with regard to them as though they were proved and admitted truths. Some few years since a statement went the round of the scientific papers to the effect that the transmutation of Oats into barley had taken place, the process consisting in sowing Oats in June or July, cutting them down from time to time, so that they should not flower in that season, when, lo! at harvest of the following year all the Oat plants that had survived the rigors of winter and other accidents, instead of producing a panicle of Oat seeds, were said to have been transmuted into even and regular spikes of two-rowed Barley. There was no mistake about it. No intermediate stages could be shown, nor were they even mentioned, as the matter was not out to be complete; and the experiments were so often repeated with the same results that we are assured that no experimental results with regard to grain have more thoroughly taken hold of the bucolic mind, or are more implicitly believed. Well, the subject is again revived from week to week; we have had to chronicle notes upon this very subject, and, strange to say, only a fortnight since we were interrogated at market by an intelligent farmer in the following strain:—"Mr. —, did you ever sow Oats in June, cut them down from time to time, and next year they came up perfect Wheat?" Ourselves:—"No, nor you." Reply:

"Yes, but I have, and I done it more than once too; and by you will do it I will answer for its success." Observe that in this case the transmutation is into Wheat, but the general notion is that the change is into Barley. Now it so happens that we have experimented upon this very subject, but in no case have we seen even an approach to the changes so confidently predicted. We have also repeated M. Fabre's experiments with the genus *Triticum*, and feel convinced from absolute results that this genus is the parent of the different forms of Wheat; and, again, our experiments with the wild Oat show us most conclusively that the *Avena fatua* is not the parent of our common cultivated forms, but in itself a degenerate form from the cultivated type. We are then prepared for extraordinary results in experimenting upon grasses as these founded on experiment, but we cannot subscribe to the belief so confidently affirmed of the transmutation of Oats into Barley, or Wheat either, as the results of experimental trial or as a matter of scientific probability. It is, however, interesting to observe how the farmer is impressed with the truth of these assertions; and perhaps this is due to the fact that, although he of all men claims to be the most practical, he is yet most impractical, from his usual want of scientific knowledge. How often have we heard it asserted that "it is dangerous to sow Italian Rye-grass, as it is sure to turn into Couch"—and this by men who have tried it and proved it over and over, as they most confidently affirm. Now we do not express our opinions upon this subject with a view to discourage experiments in the matter—on the contrary, we would rather encourage them—but still we cannot help thinking that if the change from Oats to either Wheat or Barley can take place, there should be some intermediate stages, which it will become the experimenter to accurately note. E.

Reports of Societies.

Royal Horticultural; May 12.—W. Barley Hume, Esq., in the chair. The usual preliminary business of the meeting, including the election of several Fellows, was transacted, and Professor Dyer called attention to several objects exhibited before the various committees, which are more fully alluded to below.

SCIENTIFIC COMMITTEE.—A. Murray, Esq., in the chair.

Insect Attacking Seeds of Cydad.—The Chairman said that the insect attacking the seeds, as referred to at the last meeting, was *Anthrenus signatus*, concerning which the Chairman handed in a note, which will appear, with illustrative woodcuts, in a subsequent number.

Transmission of Seeds.—A discussion ensued as to the best method of transmitting seeds to India, in the course of which it was stated that American seeds shut up in a tin can in which paraffin oil had formerly been contained, failed to germinate. The general opinion was that cold soldering was bad, but on the other hand it was mentioned that Mr. Bull had succeeded in procuring the germination of seeds of *Shorea* which were coated with wax.

Galls on the Yew.—The Chairman made a communication on this subject, the publication of which is unavoidably deferred.

Malformed Wallflower.—Mr. McLachlan exhibited a malformed Wallflower, on which Dr. Masters promised to report at the next meeting.

Plymouth Strawberry.—Dr. Masters mentioned that he had recently seen this plant, styled by Dr. Hogg a vegetable Dodo, in the garden of Mr. Ellacombe, near Bittou. The interest attaching to the plant was purely historical and morphological.

Phylloxera.—Dr. Masters showed specimens of the galls on the leaf produced by this insect.

Galls on Leaf of *Acidalia Miflosum*.—Prof. Dyer called attention to a paper of Dr. Franz Löw's on this subject, translated in the *Annals of Natural History* for the present month. The nematoid worm producing it is analogous to that producing the excrescences on Cucumber roots, and is called *Tyleuchus Millofilii*.

Effect of Cotton Wool as a Filter.—Prof. Dyer showed three flasks which contained Pasteur's solution, all three of which had been subjected to boiling and shaking. The one of No. 1 flask, treated on March 3, 1875, was plugged, while the contents were still boiling, with cotton wool, and the fluid remains clear and unaffected. In flask No. 2, otherwise similarly treated, but without any plug, so that access of air was allowed, and of spores in the air, there was a dense growth of mould (*Penicillium*). In No. 3, boiled on Sept. 30, 1873, but in which the plug was removed for five seconds only on Oct. 15, 1874, a dense mould had also occurred, and the precipitation had taken place. The meeting then adjourned.

THE POT ROSE SHOW!—Again we adopt the Society's nomenclature for the exhibition (save the name!) of Wednesday last; and again we have to note

a deplorable failure—a more complete one indeed than any we have seen before, and one so depressing in its effects upon those who were interested in the spectacle as to create a decided impression among regular *habituals* that the end cannot be far off, and the sooner it comes the better, rather than that horticulture should be made to cut such a pitiable figure as the blundering policy of the Council has brought about. The schedule included three classes for Roses in pots, and two for cut blooms; but the total number of plants staged was six, and the total number of cut blooms twelve—and such blooms, such specimens of *Keos* in pots, that they could not possibly get a prize anywhere else, though the 1st in each case was awarded to them on Wednesday—a proceeding which we protest against on the ground that if such plants and cut blooms are to be shown to the public as worthy of first prizes, the said public will soon not know what really are good plants, and when we go to shows at South Kensington we shall have to forget what we see elsewhere, and carry our ideas of plant growing twenty or thirty years back. So much for the Rose Show. The greenhouse Azaleas, of which several groups were shown, were not quite so bad as the Roses, but altogether so poor as to call for no further notice from us. Of herbaceous Calceolarias there were three exhibitors, but Messrs. Dobson & Sons had no difficulty in coming in 1st with nine fair-sized specimens, in which the special qualities of size of blooms, brightness of colour, and perfect form, were remarkably conspicuous, and made the prevailing dusky brown flower from their rivals. It was too late for show and alpine Auriculas, and consequently none of the former were represented, and only two groups of six of the latter—1st and 2d prizes being awarded to very poor things.

The class for eighteen hardy perennials in flower was an exceedingly good one—in fact, the only redeeming feature of the show. There were three competitors, and most people were surprised to see Messrs. Rollison & Sons, of Tooting, come forward and beat their neighbour, Mr. Parker, for the 1st place—the latter being the only exhibitor who has never, having been beaten before since the revival for these charming plants set in. Frequenters of metropolitan exhibitions must be well acquainted with the admirable manner in which Mr. Parker turns out his plants, so that when we say Messrs. Rollison had the best plants all round, the style of their productions can be easily imagined. Their group included a pot with twelve flowers of *Iberis iberica*, a telling plant in such a collection; the pretty blue-flowered and mottled-leaved *Pulmonaria sibirica*, *Gentiana acalycis*, very fine; and the exceedingly pretty *Gentiana verna*; *Primula cortusoides amena*, in grand profusion and superbly coloured; *P. cortusoides lilacina*, also fine; *Trillium grandiflorum*, better flowered and finer in condition than is generally seen; *Iberis Garraichia*, fine white; *Phlox setacea* and *Nelsoni*, *Dielytra spectabilis*, &c. In addition to the 1st prize, we believe Messrs. Rollison & Sons were awarded a Silver Medal for the excellence of their plants, and Mr. Parker's best blossom was of *Phlox divaricata*, very distinct; *Iris nudicaulis*, *Scilla nutans* and its variety *rosea*, *Orob. vernus*, &c. Mr. R. Dean, Ealing, was 3d, his best specimens being of *Lithospermum prostratum*, *Pansy Sulphur Queen*, a fine yellow; *Aubrieta Eyrei*, warm rose purple, a fine form in the way of A. Campbelli; and a large potful of plants with a dozen flowers of the scarce Irish *Butterwort*—*Pinguicula grandiflora*. This was, we think, the most interesting plant shown, being remarkably "well done," as Mr. Dean observed, "by simply letting it alone," and on account of the interest which Dr. Hooker and Mr. Darwin have created concerning its carnivorous propensities.

FLORAL COMMITTEE.—Dr. Denny in the chair. But very few things came under the notice of the committee to-day. From Mr. Charles Green, Botanical Nursery, Holmesdale Road, Reigate, came a large number of flowers of the *Amorpha canescens*, an evergreen greenhouse climber from South Africa, which, while having composite yellow ray-flowers, is in foliage and habit in all respects almost identical with some of the commoner forms of *Ivy*. It is figured in the *Botanical Magazine*, t. 6149, and has been growing up one of the rafters in the succulent-house at Kew for several years past, flowering in mid-winter. It is well recommended for "domestic culture, and for covering glass-houses. A Botanical Certificate was awarded. M. Louis Van Houtte sent a specimen of the splendid new *Bertolonia Van Houttei*, which we have before alluded to, and which to-day gained a First-class Certificate. A similar award was also voted to Mr. William Paul, Waltham Cross, for his very fine new hybrid perpetual Rose, *Star of Waltham*, which has been shown before.

Masdevallia amabilis—no great beauty—was shown by Mr. Gray, gr. to H. Smithies, Esq., Laurie Park, Sydenham; and a box of fine cut blooms of *Phlox* from the nursery of Miss M. Dean, Ealing. Pelargonium Duches of Edinburgh, a white-flowered show variety, of great decorative value, which was

certificated here last year, was again staged in fine condition by Mr. Braid, of Winchmore Hill, and was awarded a Cultural Commendation. Mr. J. Laing, Stansted Park, Forest Hill, showed *Caladium Madame* de la Derausage, a broad-leaved form, of a creamy white colour, with dark green venation and a narrow green margin. *Pinguicula grandiflora*, in flower, was shown by Messrs. Veitch & Sons, together with *Iris florentina*, a well-known strong-growing large white-flowered species, whose roots yield the Orris-root of the perfumers. Mr. B. S. Williams gained a Second-class Certificate for *Azalea Flambeau*, intense crimson-scarlet in colour, a very free flowerer, and remarkably firm in substance, likely to be very useful for decorative work. Mr. W. Miles, West Brighton Nursery, Brighton, showed a nice group of well-flowered plants of a dwarf strain of *Mignonette*, to which the committee voted a Cultural Commendation. A Pelargonium marked "ecullatum flore-pleno," shown by Mr. J. Woodward, and in the style of the old semi-double Copenhagen, but with deeper-coloured flowers of a bright rose purple, was well worth growing to cut from.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. Mr. J. Batters, gr. to Mrs. Willis Fleming, Chilworth Manor, Romney, sent six varieties of forcing vegetables; and Mr. Sydney Ford, gr. to W. E. Hubbard, Esq., Leonardise, Horsham, contributed eight dishes of well-kept Apples—both gentlemen receiving the thanks of the committee for their productions. A fine bundle of Conover's Colossal Asparagus came from Francis N. Dancer, Esq., Little Sutton, Turham Green; and another good bundle of the ordinary variety was sent by Mr. Allen, gr. to Lord Suffolk, Gunton Park, Norwich. A ripe fruit of *Stephanotis floribanda* came from Mr. Welsh, gr. to R. T. Coombe, Esq., Taunton; and very large examples of the Morel, *Morchella esculenta*, were sent by Mr. J. Barclay, The Verduns, Epsom. This delicious fungus seems to be very plentiful this season.

temperature for the week was 54° 3, being 3° 4 above the average as deduced from sixty years' observations. The highest readings of thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 128° and 135° on the 3d and 5th, but the highest reading on the 7th was 80°. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 41° and 42° on the 3d and 4th, but on the 8th 49° was the lowest reading. The mean for the week of the low readings was 44°. The general direction of the wind was S.W., and its strength very gentle.

The weather from the 2d to the 6th was fine and bright, but on the 7th and 8th it was dull, cold, the sky overcast throughout, and frequent rain fell. Rain fell on five days; the amount collected was 0.58 inch.

In England the extreme high day temperatures ranged between 72° at Leicester, and 63° at Bradford, with an average value over the country of 67°. The extreme low night temperatures varied from 46° at Liverpool, to 34° at Nottingham, the general average over the whole country was 40°. The mean of the extreme ranges of temperature in the week was 27°, the greatest range being 37° at Nottingham, and the least 20°, at Liverpool. The mean high day temperatures varied between 67° at Leicester and 60° at Liverpool, the general average being 63°. The mean low night temperatures ranged from 43° at Blackheath and Truro, to 40° at Hull, with a general average of 45°. The mean daily range of temperature in the week was 17°; the greatest daily range being at Hull, 24°, and the least at Truro, 12°. The mean temperature of the air for the week was 52°, being 9° higher than the value for the corresponding week in 1874; the highest happened at Leicester, 54°, and the lowest at Hull, 51°. Rain fell on five days in the week at most stations and the amounts varying from one inch and four-tenths at Truro, to one-tenth of an inch only at Newcastle-on-Tyne and Sunderland. The general average fall over the country was five-tenths of an inch.

The weather during the first five days of the week was fine and the sky nearly cloudless; but on the last two it was dull, the sky was overcast throughout, and rain fell on both days.

In Scotland, the highest temperatures ranged from 66° at Aberdeen and 62° at Greenock, the general average being 64°. The lowest temperatures varied between 42° at Leith and 40° at Aberdeen, with a general average of 41°. The mean range of temperature in the week was 23°. The mean temperature for the week was 51°, being 7° above the value of the corresponding week in 1874; the highest in the week was at Paisley, 52°, and the lowest at Aberdeen, 50°. Rain was measured at each of the above-mentioned stations, the amounts ranging from five-tenths of an inch at Aberdeen and Greenock to four-tenths of an inch at Aberdeen. The average fall over the country was two-tenths of an inch.

At Dublin, the highest temperature was 69°, the lowest 36°, the mean 55°, and the rainfall 0.1 inch.

JAMES GLAISHER.

Variorum.

CEDAR.—The stocks of Cedar on December 31 were quite excessive (4100 logs against about 2600 logs in 1873, Cuba and Honduras), and the landings much above the demands of the year, except as concerns pencil Cedar, which has been consumed more than up to the imports. While upon the subject we may mention that there were twenty-six lots of Mexican Cedar, comprising 1040 logs, put up to public sale recently, but all were bought in or withdrawn, bidding being about 37. 3/4 cents per 1000 ft. squared, but no one seemed to want the stuff, although the selling agent gave them plenty of time. But there is a suggestion about pencil Cedar which we think is worthy of attention, although we are not prepared to vouch for the success of such an experiment. The large firm of pencil makers, A. W. Faber, has been in the habit of paying high prices for pencil Cedar imported from the United States. Upon the subject of growing the wood for their own use, Mr. Deane, of Lohr, von Faber writes as follows—"Having previously drawn the attention of the Bavarian Government to the usefulness of the Florida Cedar (*Juniperus virginiana*), on account of the importance of the tree for the pencil manufacture, which is carried on more extensively in Bavaria than in any other State, and having referred to the fact that the wood of this tree is also used for many other purposes, and that higher prices are paid for it than for that of any other tree growing in our forests, we determined to import for ourselves from Florida (which, as is well known, has furnished as yet all the Cedar-wood for the pencil manufacture) the seeds to raise plants, and to hold them afterwards at the disposal of the Government for cultivation in the public forests. On my own farm I have already raised more than 5000 plants, with the best success. In consequence, and by my suggestion, planting of the Virginian Juniper has

already taken place in several parts of North Germany, along railroad dykes as well as in forests." The late quotation of prices in England for pencil Cedar was 2s. to 3s. per foot cube, but it may be quite possible that it would pay better in Bavaria to grow Cedar than here, but the Florida tree, so far, seems to thrive in Europe. *Timber Trades Journal.*

SPARROWS AND CROCUSES.—When calling in at Mr. B. S. Williams' nurseries, Holloway, a short time back, the Crocuses there were in full bloom, and were tremendously and deplorably torn to pieces by sparrows. The long line of flowers bordering the main walk had been mercilessly attacked, so that the ground was strewn with petals, and the untidiness was positively unsightly. Many times I have seen Crocuses treated in this way, and many times have complaints against the sparrows as flower destroyers reached me; sometimes in a tone of reproach as if I were responsible. On the morning of my visit to Holloway I saw in my own garden a good display of Crocuses, also a good display of sparrows, but not one of my Crocuses has been touched by the winged marauders, and I am bound to say, in illustration of the subject, that, during the many years that I have had about me plenty of Crocuses and plenty of sparrows, I never have seen the single Crocus of mine injured. Now, why should the sparrows destroy Crocuses in one garden and leave them wholly untouched in another? The answer is not to be found in a sentiment or a fancy; it must be somewhere and somehow wrapped up in a fact. Now, the fact, in my opinion, is one that all can understand—it is hunger! It is no reproach to people whose Crocuses are injured by the sparrows, that they do not feed them, but I am satisfied that if food were at hand, and the sparrows were not hard pushed, they would absolutely despise the Crocuses, as they appear to despise mice. I am not particularly partial to sparrows, for they plander me beyond reason. They are always crowding about the poultry yard, and there they obtain more food at my expense than I am willing to allow them. But that is the reason they take no notice of the Crocuses, and that, I think, suggests how the Crocuses might be protected. The flowers, we will say, are just beginning to expand; there should be in readiness for the occasion a peck or two of the cheapest grain obtainable—say, half barley and half Indian corn; this should be very sparingly scattered on a piece of ground some distance from the Crocuses, and on a spot somewhat secluded if possible. About three scatterings daily would suffice to keep all the sparrows of the district on a hungry look-out. Then when the expected bounty came they would have to spend a little time in fighting and searching for the grain, and leaving eaten all the barley they would try to swallow the maize, and this ridiculous performance would occur there until the time arrived for another feed. By managing this business adroitly, a very small expenditure of time and money would suffice to save any number of Crocuses. It may be that when they hack the flowers to pieces they get nothing for their pains; but it certainly is a fact that where they have a kind of open kitchen, the organisation which, as to hours and dishes, they perfectly understand, they do not trouble themselves to prey upon Crocuses. *S. H., in "Gardener's Magazine."*

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

[The subjoined directions are intended to supply general information, and must, of course, be adapted to the peculiar circumstances of each locality. Other departments of the garden will be treated on from week to week in succession, according to the requirements of the season. Special directions for the management of "The Villa Garden" will be found in the preceding columns.]

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—If the houses or pits that contain hard-wooded plants in a growing state are very light, it will encourage freer growth to have a little shade, the light weaker, but if, on the other hand, they are deficient in light, it would be a mistake to shade at all, and under no consideration should it be used except when the sun is powerful; even then it ought to be removed early in the afternoon. There are a few plants that require shade more than the rest; all the *Fimelias* are benefited by it, as also by being kept more moist at the roots as well as overhead by syringing. *Acrolythium westonii* will not bear continuous full exposure to the sun in a light house. This is a somewhat difficult plant to cultivate, as evidenced by its being so seldom met with in a large healthy condition—the best examples generally being found in rather dark, or what for most plants would be considered indifferent houses; it will also do further from the glass than many plants, and likes plenty of moisture in the atmosphere. *Eriostemon*, *Choresman*, *Dillwynias*, *Boronia* and most other hard-wooded plants, when in flower, even in a small

May 6.—Fine, bright, cloudy throughout. A very little rain fell in early morning, and heavy rain fell all day.
 — 7.—Overcast, dull; thin rain occasionally throughout the day.
 — 8.—Fine, partially cloudy, but bright. A little rain fell in early morning.
 — 9.—A fine day, though cloudy and dull at times.
 — 10.—A fine bright day.
 — 11.—A very fine warm day.
 — 12.—A very fine warm day.

— In the vicinity of the metropolis the reading of the barometer at the level of the sea increased from 29.91 inches at the beginning of the week to 30.03 inches by the morning of the 4th, decreased to 29.59 inches by about noon on the 7th, again increased to 29.88 inches by noon on the 8th, and was 29.83 inches at the end of the week. The mean reading for the week was 29.89 inches, being 0.22 inch lower than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground varied from 69° on the 5th to 55° 1/2 on the 7th, with a weekly mean value of 63°. The lowest temperatures of the air ranged between 45° on the 3d and 52° on the 6th, the mean value being 48°. The mean daily range of temperature in the week was 15 1/2°, varying from 23° on the 5th to 8° on the 7th. The mean daily temperatures of the air, and the departures from their respective averages, were as follows:—2d, 51° 6, + 1° 5; 3d, 55° 4, + 5° 4; 4th, 54° 7 + 4° 5; 5th, 56° 9, + 5° 9; 6th, 57° 2, + 6° 5; 7th, 49° 1, - 2° 2; 8th, 55°, + 3° 6. The mean

state, are very attractive for conservatory decoration, and if allowed a moderately light situation, and removed to their growing quarters as soon as the blooming is over, they will not receive injury by being used in this way. It is a mistaken idea that this family of plants will not bear removal, even for the time of their flowering, from the houses in which they are grown, and no doubt deters many from cultivating them. Their presence in a conservatory gives variety, and if fairly treated whilst there they will not suffer by being so used.

Ascleas.—As these go out of flower let the seed-pods be at once picked off; if allowed to remain upon the plants, even for a couple of weeks, they take good hold to support them, and will be better directed to the season's growth. Attend to such as are coming into bloom, either for home decoration or exhibition. If in cool north houses, as they show colour they should be removed to where they can be kept a little warm, and the atmosphere closer and containing more moisture, syringing overhead in the afternoon until the flowers are fully expanded; this will also increase the size of the blooms, and it is to be regretted that it is always necessary when they open in a dry, unwholesome atmosphere: this treatment is also conducive to their well-being for the coming year, by assisting the young growth. When *Ascleas* are placed in the conservatory during the time of their flowering they should not be put under, or in contact with, Camellias, or other plants that are infested with scale, especially the white species; they are not subject to these insects, nevertheless the different species of scale will live upon them, and are very difficult to eradicate.

SOFT-WOODED GREENHOUSE PLANTS.—*Tuberose*, as required, should be brought on into flower. There are few subjects with which new beginners in their cultivation more often fail than with this most fragrant plant, the cause generally being traceable to the fact of their not having formed roots. At the time of potting the soil should be a little but not too moist, after which they should never be stood upon dry shelves, as in such a place the soil will evidently soon become dust-dry—a condition adverse to the formation of roots, necessitating the use of water before these are produced, which the plant so much dislikes. After potting they ought to be placed in a house or pit with an earth floor, or on some non-retaining surface, that will impart a little moisture to them. With this more than most plants it is essential to have the roots in advance of top-growth; this is best secured by plunging the pots in a little bottom-heat, at the same time keeping the top cool. A gentle hotbed, with air on night and day until the pots are well-filled with roots, is the best position to insure success; after this they may be removed to a house or pit where they will receive more warmth, giving plenty of water at the root, and keeping them near the glass, by which means they will not become so drawn as often happens. *Calla aethiops*.—Plants that have flowered through the winter and consist of several crowns to each, may now be divided and planted out-of-doors singly, in a moderately sheltered place; so treated they make much nicer plants, and are less trouble than when grown during summer in pots; lift and report any time about the end of September. *Pelargonium* of show and fancy varieties may be encouraged to make growth by potting if they require it, the use of manure-water at the removal of flowers as they are formed. *T. Baintn*.

KITCHEN GARDEN.

Mulching, by means of surface-dressing about 3 or 4 inches thick, of partly or wholly decomposed manure, at this season, is certainly a commendable practice, inasmuch as it, in a great degree, regulates the force of atmospheric influences, and preserves an equality of moisture at the roots of plants which in this department is generally so desirable. It is also undoubtedly the best mode of applying such manure during the hot months of the year, particularly under the condition of the soil which is to be found in our gardens, which have been established a series of years, and which through high-class cultivation becomes friable and more susceptible of the operating force of those elements which exist at the period referred to. We contrive to provide the necessary materials in quantity at this season, and apply them in this way annually with the most beneficial effects to such subjects as *Ranunc* and other kinds of *Bans*, *Peas*, *Globe Artichokes*, *Cauliflowers*, or any other crops that can be properly done. By this time *Coleworts* and *Cabbage* will be in abundance, and likewise spring-sown *Spinach*, therefore the stems of old plants of Brassicas and of the latter should be removed, as a present tendency greatly to

impoverish even the best soil. At this season let these vacant plots be turned up with despatch, so that they may be benefited by such rains as have lately been so acceptable. Make preparation for sowing late *Peas*, selecting a well enriched piece of ground, and sow them about the middle of this month; but few varieties excel for this purpose *Ne Plus Ultra* and *British Queen*. Seed-beds of winter stuff and *Broccoli* will require constant attention to prevent the ravages of the Turnip-fly, which is very troublesome this year. Dust the plants when moist with wood ashes. Continue to thin and prick out the required quantity of these plants as they become fit. As *Broccoli* and *Cauliflower* for autumn use usually occupy plots to themselves, the intervening spaces between the foremost plants may be filled up for transplanting elsewhere. If it be needful to make a supplementary sowing of *Parsnips* or *Carrots*, it should be done now. Sometimes those which are sown early in very rich soil do not keep so well as those of later and less exuberant growth. Make preparations for the most advanced portion of *Celery* plants, which should be planted out at once if they have been somewhat hardened beforehand. Early *Cabbage* ground will be a suitable place for this planting. As the later planted *Potatoes* advance in growth keep the soil drawn up to them, and if necessary, which it will be on heavy land, fork between the rows where these spaces are made available—for instance, between the rows of early kinds—for *Brussels Sprouts*, &c.: these should be planted there as soon as they are fit for the purpose. After the *Potatoes* are soiled up make successional sowings of *Turnips*; attend to dusting when required, water well whenever they become dry, to accelerate their season of usefulness; and apply the same treatment to all advanced crops which are situated in warm positions. Great efforts are always needed in this important period, and every thing in proper condition in order. About the end of the month make a sowing of *Endive*, and in the case of *Lettuce* it will be advisable after this time to sow in drills and avoid transplanting. Borders having northern aspects are now suitable places for such subjects as are improved by cool moist places. Cutting *Asparagus* will be an operation which will now require to be attended to almost daily. Where any portion of the beds will be required for forcing, and it becomes necessary to have recourse to cutting these early, it should not be continued for a long period, or the roots will be too much weakened thereby to render them fit for very early work next season. We cut every description of the "grass" until a certain period, and then let all up together. Continue to liberally water *Carrots* in frames, and draw out at the earliest period when ready every alternate one, so as to afford the rest every advantage. Harden *Tomato* and *Peppers* to subjects by degrees in cool frames, preparatory to planting them out-of-doors. As early crops of *Potatoes* are removed from frames or pits, these should be occupied with *Cucumbers*, &c., for summer use. *G. T. Miles, Wycombe Abbey.*

Answers to Correspondents.

ARM IN ESSEX: *A Constant Subscriber.* The plant you allude to is no doubt *Arm Dracunculoides*, procurable at most nurseries.
DOUBLE CINERARIAS: *J. McInde.* Much better than many that have been sent to us.
DUKE OF EDINBURGH (DANIELS): *CUCUMBER:* In my note at p. 601 the figures should have been as follows:—29 inches long and 9½ inches in circumference, instead of 27 inches long and 7½ inches in circumference.
H. W. Ward, Longford Castle, Salisbury.
FASCIATED ASH: *S. W. B.* Such a case as yours is commonly seen; generally speaking, it results from over vigour.
INSECTS: *N. S. S.* Please send specimens: we cannot answer your questions without.—*Camjee.* The beetle found at the root of your Vine is a common species of water beetle, *Aedius sulcatus*. It may have come out of your water-tank, or have fallen when on the wing, as these water beetles occasionally take flight and fall on glass, which they mistake for water when in the air. *L. O. W.*
MOREL: *W. M., Ely, Yes.*
NAMES OF PLANTS: *Eford.* *Scolopendrium vulgare marginatum lobatum.*—*G. Wallis.* *Aristolochia ringens*, not new to gardens.—*O. W. D.* *Senebiera coronopus.*—*Westphalen-Tryon.* *Oncidium sphigiferum.*—*H. S.* *St. John Falconeri.* *2.* *Glacium.*—*F. E. C.* *Rhododendron Falconeri.*—*Trichium erectum var. album.*—*J. S., Chester.* *Alechmilla alpina.*—*J. H. Sandeman.* The *Weymouth Pine*, and *Phytolmia serulata*.

PACKING STRAWBERRIES, &c.: *B. C.* Wrap the fruit in successive layers of paper layers with cotton wool above and below them, in trays fitting into an outer box, so that they may be held firmly without squeezing them. The smaller the trays the better, as it is the movement from loose packing, and from shaking in bulk, which does most injury. Flowers travel best in Chapman's boxes, but failing these, pack on the same principle as in the case of the fruits—only they will require deeper trays. If they are

quickly closed up they will not suffer much from flagging, but some subjects travel much better than others.

POLYANTHUSES: *P. Grieve.* They are bold, showy border flowers, but of no special merit, nor do we like them in the influence of *Triunfolia japonica*. No. 2 is the best.

SALT: *A. W.* We cannot recommend you anything safer than salt, and it will not act as a stimulant if you apply it scalding hot, in the form of brine. It must be done well to be efficacious.

VARIEGATED CELERY: *T. Simpson.* Interesting amongst other variegated subjects, but not very striking, judging from the samples sent.

VINE DISEASE: *J. K.* Your Vines are attacked by the Phylloxera in the strongest form, and you did wisely in burning the plants. We should be glad to have a few more leaves, if you still have any.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to inform our Subscribers sending Post Office Orders, to be good enough to write to the Publisher at the same time.

Markets.

COVENT GARDEN, May 13.

We have to report a free supply of open-air produce, especially Gooseberries and Asparagus; and of the latter there is still a considerable quantity imported, and we notice among the dealers Apricots and cherries in boxes from the south of Europe. Apples are now at a very slow sale, except for a few of the good late sorts. Some good *St. Michael Pines* are again in the market, from a recent arrival; English have been in moderate request. *Thomas Taylor, Wholesale Apple Market.*

CUT FLOWERS.

Table listing various cut flowers such as Anzleas, Camellias, Carnations, etc., with prices per bunch or dozen.

Suttons CHOICE FLOWER SEEDS, FREE BY POST OR RAIL.

Suttons' Collections of Choice Flower Seeds, to produce a beautiful and continuous display during Summer and Autumn.

Table listing different seed collections (No. 1 to No. 5) and their prices per bushel.

Small and Useful Collections can also be had, from 2s. 6d. to 7s. 6d. Free by Post.

Complete Instructions as to the Cultivation of Suttons Choice Flower Seeds will be found in

"SUTTONS' AMATEUR'S GUIDE," The most practical work on gardening yet published, beautifully illustrated with 300 engravings. Price 1s., Post Free. Gratis to Customers.

TO OBTAIN THE

Best Garden Lawns and Croquet Grounds

SUTTONS' LAWN GRASS MIXTURE,

Which forms a close velvety turf in a very short time. For making New Lawns or Croquet Grounds 3 bushels or 60 pounds is required per acre, or 1 gallon to every 6 rods (or perches) of ground.

For improving those already in turf, 20 pounds should be sown per acre.

March, April, and May are the best months for sowing.

Price 1s. per lb.; 20s. per bushel.

From Mr. J. MERRICK, Gardener to S. Foster, Esq., Le Cour.

"The Seed you sent me last year turned out uncommonly well. Several gentlemen who came to Le Cour could scarcely credit, from the appearance of the lawn, that it was only sown in May. In August it was as fine and thick as I have seen some lawns that had been laid down for three years."

Instructions on the Formation and Improvement of Garden Lawns and Croquet Grounds. Gratis and Post Free.

Suttons

THE QUEEN'S SEEDSMEN, READING.

To Planters and the Trade.

MESSRS. MASTERS AND KINMONT beg to call the attention of Planters and the Trade to their stock of the following trees, which can be furnished at low prices:-

- LIMES, 7 to 9 feet, clean grown. THORNES, of sorts, Standard and Pyramid, including Pauls new Double Scatlet. ASH, Weeping, 6 to 10 feet stems, good heads. [nock. WILLOWS, Weeping, American, Babylonian, and Kilnared. ELMS, of sorts, good size, including Huntingdon, fastigiated, and cork-barked. BIRCH, 8 to 10 feet. PHILADELPHUS, of sorts. VIBURNUM, of sorts. LILAC, of sorts. OAK, Scarlet, 6 to 8 feet. YUCCA RECURVA, very fine. ROSES, Standard and Half-Standard. DWART, on Manetti. CURRANTS, Black. GOOSEBERRIES, of sorts. ABIES CANADENSIS, 3 to 5 feet. AUCUBA JAPONICA, 1 to 2 feet. CUPRESSUS SEMPERVIRENS, 2 1/2 to 4 feet. Exotic and Vauxhall Nurseries, Canterbury.

Tollington Nursery, Horsney Road, London, N. NEW PLANTS.

GEORGE SMITH has much pleasure in offering the following new Hybrid and Zonal PELARGONIUMS, raised by Mr. George, of Pansey Heath, who has been one of the most successful raisers of this beautiful class of flowers; and those of last year are far in advance of any of the fine varieties previously offered. GEORGE SMITH especially recommends them to Friends and the Public.

SIR GARNET WOLSELEY (H.N.)—Crimson upper petals, shaded purple; large bold flower of great substance and very large truss. Received a First-class Certificate, South Kensington, July 15, 1874. 5s. each.

GEORGE FRIDERICK (Z.)—Orange scarlet; large flower; extra fine form; zone foliage. 2s. 6d. each.

BLACK PRINCE (H.N.)—Very deep glowing scarlet; very large truss; good habit and distinct.

HELENE (Z.)—Lustrous orange-scarlet flowers; pip stout and circular; large bold flower; zone foliage. 2s. 6d. each.

BELLE OF SURREY (H.N.)—White, with large distinct carmine centre; fine truss, and distinct.

ROSE UNIQUE (H.N.)—Lively salmon-rose hue, flushed with orange; fine pip, and truss. 2s. 6d. each.

ENCHANTRESS (H.N.)—Crimson, margined with deeper colour, flushed with purple; very fine bold truss, and distinct.

PAR EXCELLENT (Z.)—Extra bright scarlet; white eye; large pip; very fine form; fine large bold truss.

NEMESIS (George Smith)—Nesagey; very brilliant scarlet; large pips; immense truss, of compact form; and a grand flower for exhibition. 2s. 6d. each.

All zoned foliage except "Celebrity." Those not priced 3s. 6d. each. Now ready for distribution.

GEORGE SMITH has a few plants of the most choice Zonal GERANIUM SEED, grown and selected by himself, at 2s. 6d. and 5s. per packet. Also, INTERMEDIATE STOCK, Scarlet, White, and Purple, of the most superb kinds, 2s. 6d. per packet.

Post Office Orders, payable at Horsney Road, to accompany all orders from unknown correspondents.

New, Choice, and Rare Plants.

JOHN LAING'S ANNUAL CATALOGUE is replete with all the Novelties of this Season in STOVE and GREENHOUSE PLANTS, FLORIST'S FLOWERS, ROSES, VINES, &c., and will be forwarded, post-free to all applicants.

PART I. contains New Antirrhinums, Chrysanthemums, Coleus, Dahlias, Fuchsias, Gloxinias, Pansies, Pentstemons, Petunias, Pelargoniums (Golden Breeze, Golden Tricolor, Double and Zonal), Phloxes, Roses, and choice Stove and Greenhouse Plants of all kinds.

PART II. comprises General Collections of Florist's Flowers, Pansies (Show and Fancy), Bedding Pansies, Bedding Violets, Hollyhocks, Fuchsias (Show and Fancy), Pelargoniums (Show, French, Fancy, Golden Breeze, Golden Tricolor, Ivy-leaved, Zonal, &c.), Fuchsias, Phloxes (Early and Late), Chrysanthemums (Japanese, large-flowering, and Pompon), Cinerarias, Petunias, Verbenas, Pentstemons, Antirrhinums, Carnations, Picotees, Pinks, Mimulus, Calceolarias, Delphiniums, Pyrethrums, Fœnicies (Tree and Herbaceous), and Miscellaneous Bedding and Herbaceous Plants (pp. 12 to 13).

PART III. consists of Select Lists of Stove Plants, Stove Climbers, Glandium, Coleus (Golden), Gloxinias, Palms (Stove and Hardy), Ferns (Stove and Greenhouse, Hardy, Exotic, and British), Greenhouse Plants, Greenhouse Climbers, Azaleas, Camellias, Ardisias, Ericas, Clematis, Hardy Climbers and Shrubs, Strawberries, Vines, Figs, and a useful assortment of Requisites for the Garden, Park, and Pleasure-ground (pp. 4 to 64).

Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

H. CANNELL begs to draw the attention of the Public to the COLEUS "CHAMELION," which is unquestionably by far the most attractive and the greatest acquisition in Coleus ever sent out; even the most accurate description conveys but a very inadequate idea of its beauty. The entire Horticultural Press speak of it in the most eulogistic terms.

The following is the report of the Editors of the Gardener's Chronicle (May 15, 1875):

"We have received from Mr. Cannell specimens of a new type of Coleus, of great beauty, and very distinct from those already in cultivation. Sometimes the leaf is mainly of an intense velvety maroon, flushed with bright rose, and sometimes the rose-tint, the edge being just banded with green. In other cases half the leaf is of this character, while the other half is mostly of a deep rusty crimson with golden suffused edges, and sometimes the rose-tint and the maroon-crimson are variously streaked and blended. The flush of rose crimson appearing in the maroon gives a remarkably wavy richness, which may be seen to be appreciated. With this superior and varicolored plant must be exceedingly effective."

This variety has received First-class Certificates wherever shown. Post Free, 2s. 6d. each. New Florist Flowers and Florist Flower Seed Merchant, Woolwich, S.E.

SEEDS.

LONDON: May 12.—Our Clover seed season being now virtually at an end, the attendance on Mark Lane is, in consequence, very limited, and the business passing almost nil. There is still some quiet inquiry for spring Tares; stocks having got quite exhausted, the last prices made were the highest of the whole season. In agricultural Mustard and Rape seed a fair business has been doing at full rates: a brisk demand for these descriptions is expected later on. In Canary seed a still further remarkable advance must be noted. To-day's price is £14 to £15 per quarter—a quotation almost without precedent. Hemp seed also goes in favour of holders. Of English Linseed the supply offering is short. Blue Peas have likewise got into narrow compass. John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.

CORN.

At Mark Lane on Monday dulness was the characteristic. Wheat, English and foreign, declined, in some instances 1s. per qr. Barley was inanimate and cheaper when pressed for sale. Malt was disposed of with difficulty on rather lower terms. Oats were in limited request, and fully 6d. lower on the week, the supply being ample. Maize was weak, and from 6d. to 1s. per qr. cheaper. Beans and Peas were quiet at about late rates. The flour trade was inactive, and prices were in buyers' favour.—On Wednesday English Wheat was in short supply, but sales could only be effected at some reduction from Monday. Barley had a drooping tendency, so also had malt, while the sales for Oats were with difficulty maintained. In Mize, Beans, Peas, and flour there was little business transacted, and prices in one or two instances favoured buyers.—Average prices of corn for the week ending May 9:—Wheat, 42s. 8d.; Barley, 39s.; Oats, 30s. For the corresponding week last year:—Wheat, 62s. 2d.; Barley, 47s. 3d.; Oats, 30s. 10d.

CATTLE.

At the Metropolitan Market on Monday prices for beasts were on the average better. Choicest qualities of sheep were very scarce, and in a few instances the top quotation was exceeded. Choice lambs and calves were also scarce and rather dear. Quotations:—Beasts, 3s. 8d. to 4s. 8d., and 5s. 8d. to 6s. 2d.; calves, 4s. 6d. to 6s.; sheep, 5s. to 5s. 8d., and 6s. 2d. to 6s. 10d.; lambs, 7s. 4d. to 8s.; pigs, 4s. 4d. to 5s. 6d.—The hot weather prevailing made buyers cautious at Thursday's market, but choicest quality beasts held their own; sheep, however, were lower on the average. Choice lambs were in demand, but trade generally was dull. Calves were plentiful and lower. Trade was dull for milch cows.

HAY.

The Whitechapel market report notes the supply on sale as being rather in excess of the demand, but rates remain firm, prime Clover making 100s. to 120s.; inferior, 85s. to 95s.; prime meadow hay, 90s. to 126s.; inferior, 55s. to 75s.; and straw, 35s. to 40s. per load.—Cumberland Market quotations:—Superior meadow hay, 123s. to 124s.; inferior, 90s. to 112s.; superior Clover, 123s. to 124s.; inferior, 95s. to 112s.; and straw, 40s. to 44s. per load.

POTATOS.

The Borough and Spitalfields markets reports note that Potatos arrive in moderate quantities, but the demand seems chiefly confined to the better descriptions, the quotations for which remain firm.—Regents, 80s. to 130s.; Victorias, 110s. to 120s.; Flukes, 120s. to 140s.; Rocks, 105s. to 95s. per ton. Last week's imports comprised 12,075 bags from Antwerp, 5384 sacks and 234 tons from Lunik, 849 sacks from Boulogne, 2046 packages from Dublin, 1 basket from Oporto, 69 boxes 30 barrels from Gibraltar, and 11 boxes 235 casks from Malta.

COALS.

There was an advance of 6d. per ton in house coals at Monday's market, but a corresponding decline in Hartleys. On Wednesday house coals gave way 6d. per ton, and the following were the general quotations:—West Hartley, 20s. 3d.; Eden Hall, 19s.; Walls Ends—Hawthorn, 18s. 6d.; Lambton, 21s.; Pittington, 18s. 6d.; South Hutton, 21s. 6d.; Tunstall, 18s. 6d.; Hartlepool, 20s. 6d.; East Hartlepool, 21s. 3d.; South Kellow, 19s. 6d.; Tees, 21s. 3d.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

Important to Market Gardeners and Others.
THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Stead Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separate, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and tasty, and fully adapted to the purposes designed. A large number have been sold, and are giving unqualified satisfaction.

Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, 4/2 2s.

AS A LAWN CONSERVATORY.

FOR PLANTS OR VEGETABLES.

AS A VINERY.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these Patent Plant Preservers and Ground Vineeries to be by far the best and most useful articles of the kind they ever saw, and awarded them the ONLY PRIZE.

Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 ft. by 4 ft. wide; thus proving them to be really portable. They are made in the following sizes. One pair of ends is sufficient for any number of lengths, if set in a continuous row.

Cash Prices carriage paid to any Station in England on Orders amounting to 60s. and upwards.

	Price.	Ends per pair extra.		Price.	Ends per pair extra.

PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. Write for New Illustrated List post free.

"The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value."—*Gardeners' Chronicle*.

"The Ground Vineery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co."—*Floral World*.

MELON OR CUCUMBER FRAMES.

All sizes (glazed with 21-oz.) ready for immediate delivery.
Height at back, 24 inches; at front, 13 inches; sides, 1 1/2 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as puttied in. Each light is provided with an iron strengthening rod and handle.

Glazed with 21-ounce.

OPINIONS OF THE PRESS.

"Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known."—*Gardeners' Magazine*.

"Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and puttied—an essential point. They are complete and ready for use the moment they are received, &c."—*The Gardener*.

Cash Prices, carriage paid to any station in England when orders amount to 60s. and upwards.

Prices of Horse, Pony, and Donkey Machines on application.
Carriage Paid to all the principal Railway Stations in the United Kingdom.

The "SILENS MESSOR" Machines have a world-wide reputation for their superiority and excellence, and the improvements which have been made in them from time to time still keep this Machine the best and most approved one in the Market. They will cut either SHORT or LONG GRASS, BENTS, &c., and wet as well as dry, advantages which no other Lawn Mowers possess. They are the only Lawn Mowers in constant and daily use in the Royal Gardens, and in most of the principal Gardens and Parks throughout the Kingdom.

A stock of 500 Mowers is kept at our London Establishment, including all sizes, from which purchasers can make their selection and have prompt delivery.

GREEN'S PATENT "ROYAL" LAWN MOWER is a far superior Machine of its kind to any Lawn Mower extant, and it will cut either short or long grass, bents, &c., and wet as well as dry.

Prices of the "Royal" Machines. To cut—
6 inches 8 inches 10 inches 12 inches 14 inches 16 inches
25s. 35s. 50s. 65s. 80s. 100s.

Delivered carriage free at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland. Every Machine is warranted to give entire satisfaction, and if not approved of, may be returned at once unconditionally, without any expense to the purchaser.

Our reason for bringing out the "Royal" Mower is to meet a want which has been repeatedly expressed by the purchasing public, to have a good, useful, and efficient Machine, CHEAP.

N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

GREEN'S PATENT ROLLERS for LAWNS, DRIVES, POWLING GREENS, CRICKET FIELDS, and GOLF PATES. Suitable for Hand or Horse Power.

The above can be had from all respectable Ironmongers and Seedsmen in the United Kingdom, or from the Manufacturers,

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—
These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction, and a month's trial allowed. Orders executed on receipt.

MESSINGER & COMPANY,
CONTRACTORS, MIDLAND HORTICULTURAL BUILDING
AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Beg to inform their numerous Patrons and the Public generally, that since the recent disastrous fire they have erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, of any required dimensions. T. G. MESSINGER & CO. are now, therefore, in a position, from their great facilities and experience, to carry out with dispatch and in the best manner, at moderate cost, the orders with which they may be entrusted. Glasshouses erected on Messinger's Patent principles are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed; are economical in cost and maintenance. Hot-water engineering in all its branches, Messinger's Patent Hot-water Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application.
Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out.

A richly Illustrated CATALOGUE forwarded Post Free on receipt of 33 Stamps.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most Simple, Economical, Efficient, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole Makers, F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

Beehives.—Two Silver Medals awarded to GEO. NEIGHBOUR AND SONS at the Paris Exhibition of 1867. The only English Exhibitors who obtained a Silver Medal for Beehives.

NEIGHBOUR'S IMPROVED COTTAGE BEEHIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, working three bell-glasses, is neatly and strongly made of straw; it has three windows in the lower part of the Hive. This Hive will be found to possess many practical advantages, and is more easy of management than has any other Beehive that has been introduced.

Price, complete £1 10
Stand for ditto 0 10 6

The LIGURIAN or ITALIAN ALP BEE, being much in repute, G. N. & SONS supply a Swarm of Bees with genuine Italian Queen, in the Improved Cottage Hive, at £4, Hive included.

An Italian Alp Queen, with full directions for uniting to Black Stocks, 15s. each.

PRIZE WATER and LIQUID MANURE CARTS.
Prices and particulars on application at the London Road Ironworks, Chelmsford.

VIENNA PRIZE WIRE NETTING.

CAUTION TO BUYERS OF WIRE NETTING.

The great reputation and success of Messrs. J. B. BROWN and CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & Co. are the SOLE MANUFACTURERS.

Messrs. BROWN & Co. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced prices. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting.

90, Cannon Street, London, E.C.—March 12.

For Park, Farm, and General Enclosures.

Is in use over many thousand miles, And has been awarded the Silver Medals and Highest Commendations of the leading Agricultural Societies. It forms the most efficient strained iron fence known.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone.

This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, New Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Gladworthy, Llanpumpston, Carmarthens, Nov. 27, 1872. "My Lord Lloyd encloses cheque for £3 5s., amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful things he ever possessed."

Apply to HILL AND SMITH, Briefly Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

CARSON'S PAINT, PATRONISED BY THE QUEEN, H.R.H. THE PRINCE OF WALES,

The British, Indian and Colonial Governments, 8000 of the Nobility, Gentry, and Clergy, Railway and Canal Companies, Collieries, Iron-masters, &c., &c.

Is extensively used for all kinds of

OUTDOOR WORK.

It is especially applicable to WOOD, IRON, BRICK, STONE & COMPO. CAN BE LAID ON BY UNSKILLED LABOUR.

Sold in all Colours.

2 cwt. free to all Stations.

WANT PLACES.

Head Gardeners. JOHN LAING, can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and EAILIFFS, or GARDENERS for First-rate Establishments at good addresses, and in all situations, can be suited, and have full particulars of particulars at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

Gardeners and Under Gardeners. W. M. CUTBUSH and SON beg to state that they have at all times on their Books MEN of VARIOUS Grades for First-rate Establishments at good addresses, and in all situations, can be suited, and have full particulars of particulars at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

To Gardeners in Want of Situations, WHOSE CHARACTERS BEING STRICTLY INVESTIGATED. THE PINE-APPLE AND NURSERY COMPANY devote special attention to this important matter—proper Men to suitable Situations. For a GARDENER or for a SITUATION, please send full particulars to Mr. JOHN BESTER, the Pine-Apple Nursery Company, Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS who are great experience and trust are required. B. S. W. would be the same time to inform that where a Gardener is applied for, the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

GARDENER (HEAD), where three or four are kept.—Age 30, single; fourteen years' experience. Highly recommended by present employer.—G. J., Post Office, Halfway Street, near Eilthan, Kent.

GARDENER (HEAD), to any Lady or Gentleman requiring the services of a thoroughly practical Man.—Age 36. Can be well recommended.—Abstainer.—T, The Nursery, Upper Tooting, Surrey, S.W.

GARDENER (HEAD), to any Lady or Gentleman requiring the services of a good practical Man.—Age 38, married, no incumbrance; understands the general requirements of a good Establishment; can undertake the Cultivation of Great Lawn Stock (see Cows, &c.), if required. Good references.—X. V. Z., Northgate Nursery, Chichester.

GARDENER (HEAD).—J. W. LAURENCE, a Gentleman of the late Rev. Bishop Sumner, Farnham Castle, is at liberty to engage with any Gentleman requiring the services of an experienced Man.—Prospect Cottage, Upper Hale, Farnham, Surrey.

GARDENER (HEAD).—Has had good practice in the Cultivation of Pines, Grapes, Peaches, Melons and Cucumbers, Stove and Greenhouse Plants, and well acquainted with all Kitchen and Flower Gardening, and the general Management of a Gentleman's place.—H. NORRIS, 7, Russell Street, Battersea Park, S.W.

GARDENER (HEAD, WORKING).—Age 28, married; has a good knowledge of the profession. Three and a half years' good character.—T. W. J. Cooper, Purton, Swindon, Wilts.

GARDENER (HEAD, WORKING).—Age 35, married; thoroughly understands the profession in all its branches. Well experienced in Land, Stock, &c. Shall be discharged in a fortnight. Long and unblemished character.—H., 75, Hampden Road, Upper Holloway, N.

GARDENER (HEAD, WORKING).—Middle-aged, married, no family; Scotch; has had thirty years' experience both in England and Scotland in every branch of the profession. Can be well recommended.—A. B. C., Carter's Crystal Palace Nurseries, Forest Hill, S.E.

GARDENER (HEAD, WORKING).—Age 28, married; thoroughly understands the Forcing of all kinds of Fruits, Flowers, and Vegetables, also good Flower and Kitchen Gardener. Can have the highest testimonials as regards character from last and previous places.—A. B. C., Post Office, Eridge, near Tunbridge Wells.

GARDENER (HEAD, WORKING), age 38, married.—WILLIAM HENDERSON, for the last four and a half years Gardener to R. R. Robinson, Esq., Henley Park, Henley-on-Thames, is at liberty to treat with any Lady, Nobleman, or Gentleman requiring the services of a thorough practical Man, who well understands the Early and Late Forcing of all kinds of Fruits, Flowers, and Vegetables, and the Management of Fruit, Flower, and Kitchen Garden. Wife, having no family, is qualified to take Charge of Gentleman's Residence during the employer's absence. Characters will bear investigation.

GARDENER, in a good Single-handed Place, or otherwise.—Age 33, single; has had nine years' experience in Nursery and Garden, of good reference given.—E. W. M. Newcomb, Stationer, Boston.

GARDENER, in a Nobleman's or Gentleman's Garden, under the Foreman, where he is desirous of improving his knowledge of plants, &c. in the houses.—Age 23. Good knowledge of Outdoor-work. Three years in present situation.—A. H., The Gardens, Upper Gatton Park, Mersham, Surrey.

GARDENER (FOREMAN).—Age 23. Seven years' experience in Forcing Vines, Peaches, Strawberries, &c. Plant Forcing, and Kitchen Gardening. Good reference. Two years in last place.—J. C., 5, Henridge Villas, St. John's Wood, N.W.

FOREMAN in a Gentleman's Garden, or as GENERAL FOREMAN.—Age 28, single. First-class references can be given. Two years in last place.—C. C., Stanley Bridge Post Office, King's Road, Chelsea, S.W.

FOREMAN.—Thoroughly understands Growing Fruit and Plants for Market.—W. SHORTEEN Rabley Gardens, Barnet, Herts.

GARDENER (SECOND).—Age 23; has been accustomed to good places. Character will bear strict investigation.—Post Office, Stanley Bridge, King's Road, Chelsea, S.W.

GARDENER (SECOND), or under a Foreman in a good Establishment.—Age 20. Good references.—T. C., Post Office, Forest Hill, Oxford.

GARDENER (UNDER), as IMPROVER.—Age 20.—M. CHARLTON, Havlock Street, Barseley.

GARDENER (UNDER).—Age 23; has been accustomed to Fruit, Flowers, and Vegetables for the last eleven years. Four years' good character from last place.—W. B., Post Office, Alphongeton, Exeter.

PLANT GROWER (EXHIBITION), in a first-class Establishment in the Trade or otherwise, where Plant Growing is gone into with spirit.—B., Pine-apple Nursery, Maida Vale, W.

PROPAGATOR (HARD-WOODED), and GROVER in a large Nursery.—Age 34; married. First-class references.—C. T., Thornton Street, Heston Moor, Stockport.

TO NURSERYMEN.—A respectable young Man, with a knowledge of general Greenhouse Work. Excellent character from the Nurseryman he has just left. West of England preferred.—F. FARRY, Kingswear, Dartmouth.

SHOPMAN (HEAD), or TRAVELLER.—Has had upwards of twenty years' experience; knows the Midland Counties, Lancashire and Yorkshire, North of England, South of Scotland, and Ireland, and is well known amongst Gardeners, Stewards, &c.—M. D., Gardeners' Chronicle Office.

To the Wholesale Seed Trade. TRAVELLER, CORRESPONDENT, &c.—J. S. HAWKELL is open to an engagement as above.—44, Devonshire Road, Holloway, N.

KINAHAN'S "L.L." WHISKY. This celebrated and most delicious old mellow spirit is the very CREAM OF IRISH WHISKIES. It is of quality unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and Gold Brand "Kinahan's L.L." Whisky. Wholesale Depot, 20, Great Titchfield Street, Oxford Street, W.

PRELIMINARY ADVERTISEMENT.

MESSRS. CHESSHIRE AND GIBSON have received instructions to SELL by AUCTION, on JULY NEXT, in consequence of the death of the Proprietor, unless in the meantime an acceptable offer be made by Private Contract, a very excellent FREEHOLD ESTATE of 240 Acres, known as 'Bulling Grange,' situated at Poulton within 1 1/2 mile of the Pershore Station on the Great Western Railway.

A considerable portion of the above has been laid out as Fruit Gardens, the Trees being of the choicest kinds, now in their prime, the produce finding a ready sale at Liverpool, Manchester and Birmingham, where a very lucrative business was carried on by the late Proprietor.

In addition to a complete set of FARM BUILDINGS, with COTTAGES, there is a well-furnished and comfortable RESIDENCE, replete with every convenience, and the portion of the Estate not laid out as Fruit Gardens is occupied as a FARM, and contains the finest Pasture quality.

A Balance-Sheet, showing the profits for the last five years, has been prepared, and may be obtained of the undersigned *References.*

Further particulars and plans will be issued in due course, in the meantime further information may be obtained of H. G. GOLDINGHAM, Solicitor, or A. EUCK, Estate Agent, both of the Auctioneers and Messrs. CHESSHIRE AND GIBSON, 93, New Street, Birmingham.

TO BE SOLD, a small FORTRESS BUSINESS. Eighteen years' Lease. Price, including Stock, &c., £150. T. P., The Race Horse, Elm Grove, Brighton, Sussex.

Victoria Estate, Kansas, U.S.—To Farmers and OTHERS. FINE STOCK FARMS of 640 Acres and upwards, to be SOLD, from £22 to 300 per acre. Grass in its natural condition unsurpassed for feeding Sheep and Cattle. For PAMPHLET containing full particulars respecting this Property, apply to ROBERT W. EDIS, F.R.S.A., 14, Fitzroy Square, London, W., Architect to the Estate.

FOR SALE, an Orchard and Plant-house SPAN-ROOF RANGE, 60 feet, with 24 feet height 13 feet, with 207 feet heating pipes and 4 valves, iron Ratchet-worked Ventilators, Shelves and Stages, all in excellent condition. Inquire of Mr. WOODKEY, Heybridge Garden, near Malden, Essex.

THE FREEHOLD for SALE, or to be LET on LEASE a NURSERY doing a large Trade in Cut Flowers with the principal London Florists. Valuation about £500. Address by letter only. Mr. DICKSON, Centre Avenue, Covent Garden, W.C.

Window Glass, Sheet Lead, Paints, &c. THOMAS MILLINGTON AND CO., IMPORTERS and MANUFACTURERS. New LIST of PRICES, very much reduced, on application. 87, Bishopsgate Street Without, E.C.

NOTICE.

William Adam Mundell, Esq., Q.C. Alderman Naish Albert Pell, Esq., M.P. Clare Sewell Read, Esq., M.P. E. Hunter Redwell, Esq., Q.C., M.P. George Russell, Esq. John Russell Scott, Esq. Charles Shaw, Esq. Abel Smith, Esq., M.P. William Stanan, Esq. Thomas Wagstaff, Esq. Dinner Tickets 22s., application for which should be made to the SECRETARY, at the Offices of the Institution, 26, Charles Street, St. James's, W., not later than May 22.

Alteration of Date. THE EXETER ROSE SHOW will be held on JUNE 18, instead of JUNE 25, in consequence of the alteration of the Crystal Palace fixtures. Prices offered, £125. Schedules on application. T. W. GRAY, Hon. Sec., Exeter.

ROYAL BOTANIC SOCIETY, Regent's Park, S.W. EXHIBITION of CLEMATIS, in the Gardens, from May 5 to May 25, Sundays excepted. GEORGE JACKMAN and SON, of the Working Nursery, Surrey, beg to announce that their Exhibition of Clematis will be on view (as above) daily.

ALEXANDRA PALACE. THE GREAT ROSE SHOW will take place on THURSDAY and FRIDAY, June 24 and 25. Last day of Entry, Thursday, June 24. NOTE.—Rule No. 7 of Schedule will be altered, making the time for Specimens to be ready to 10 o'clock instead of 9 o'clock. SCHEDULES of PRIZES, &c., may be had on application to A. MCKENZIE, Alexandra Palace, Muswell Hill, N.

THE HORTICULTURAL CLUB is NOW OPEN for the use of Members. Dining, Drawing, Smoking, Reading, and Billiard Rooms will be at the disposal of the Members. The situation is central, and occupies one of the best sites in the City of London, overlooking the Thames Embankment, and close to the Charing Cross Station. The Entrance Fee is at present Two Guineas, and the Annual Subscription Two Guineas. Many of our leading horticulturists have already joined. All communications to be addressed to the HONORARY SECRETARY, 3, Adelphi Terrace, Strand, W.C.

Gaultheriflora Plants. H. J. HARDY begs to say he has a few thousands of the above offered at a very moderate price. The Plants are well-grown, strong, and healthy, and have been picked out from the seed-bed and well established. Carriage paid to any Railway Station in England for 20s. worth. Cash or reference. Post-office orders, made payable at Bures. Apply to H. J. HARDY, Stour Valley Seed Grounds, Bures, Essex.

Adiantum farleyense. MESSRS. JOHN STANDISH AND CO. have a number of magnificent specimens of the above splendid FEARN BEE fern in flower, exhibiting the 16 and 22-inch pots, and of perfect form. Also a few well-grown specimens of ADIANTUM GRACILIMUM, fine plants, 18 inches through, in 4-inch pots. Further particulars and price on application. Royal Nurseries, Ascot, Berks.

Lawn Grass Seeds. FRANCIS & ARTHUR DICKSON & SONS' Mixture of LAWN SEEDS is composed only of the purest and DWARFEST EVERGREEN GRASSES, and is the very superior to mixtures generally offered, quickly forming a close velvet turf. For New Lawns sow 6 lb. to 10 lb. per acre. To Renovate Old Lawns sow 10 lb. to 20 lb. per acre. Price 1s. per lb. Orders over 20c. Carriage Free. The Old-Established Seed Warehouse, 106, Eastgate Street, Chester.

Cheap New Roses from Paris. LEVÊQUE AND SON, NURSERYMEN, &c., Ivy-street-Seine, near Paris, beg to state that they have, in strong and healthy plants, the following sorts of 1874, 1875, and the following, at per 100.—Hypp. Jamain, Diana, Amelie Hohe, Ant. Mouton, Bernard Verlot, Marie Sisley, Jean Duber, Cécile Perrier, &c. 25s. per 100 (50 sorts). Also, at per 100 each, Captain Chirley, Madame Jéris Léveque, and Perle de Lyon, at low rates. Prices on application.

Bedding Roses. CRANSTON'S CRIMSON BEDDER: Strong plants, in 5-inch pots, 30s. per dozen. TEA-SCENTED CHINA, NOISETTE, and HYBRID-PERPETUAL ROSES, in 4 and 5-inch pots, 5s. to 15s. per dozen. Now is the best time for bedding-out the Tea-scented and China Roses, and Hybrid Perpetuals, from their own roots. Address, CRANSTON AND MAYOS, King's Road Nurseries, Hereford.

NEW CLEMATIS, to be sent out by JOHN STANDISH AND CO. on May 10.—ASCOTIENSIS.—The flowers are considerably larger than Jackman's, and are well shaped, containing six petals each; colour, a fine azure-blue; it throws a profusion of flowers the whole summer long, and is of a very vigorous habit, 20s. 6d. each. MRS. QUILER.—A magnificent white flower, containing eight petals; it is a large, smooth, and purest of all the whites, and a very fine bloomer, with strong habit, 20s. 6d. each. The above are decided acquisitions, and should be in every collection. Orders are now being booked for them. Royal Nurseries, Ascot, Berks.

Tree Ferns. THE NEW PLANT and BULB COMPANY have received a large quantity of Tree Ferns, and no longer is considered a luxury. They can be had in all sizes and in a fine growing condition, from 10s. 6d. each. Detailed Lists of sizes and Prices, just published, free on application.

FILMY FERNS, LOMARIAS, POLYSTICHUMS, and other FERNS from New Zealand, all suited for the Co. Fernery, for planting out, or pot culture, shortly to give effect, at the prices of ordinary pot plants. ORCHIDS are being constantly received in splendid condition in fine pieces. We respectfully invite Cultivators of these to send their Names and Addresses, that particulars of consignments, as to condition and quality, may be furnished from time to time, as all are sold at a moderate profit. For present consignments, see Lists, free on application.

AMARYLLIS.—Hundreds of these now throwing up fine flower-spikes. CYPRIENTAL JAPONICUM.—See Catalogue. FRENCH BELLIANS.—For particulars of this grand bulbous plant, see Gardeners' Chronicle, May 7, 1875. LILIES and other BULBOUS PLANTS.—An unrivalled collection. Lion Walk, Colchester.

VINES, extra strong leading roots, close-jointed and well ripened; SEAKALE, ASPARAGUS, and RHUBARB, extra strong, for forcing; ROSES, FRUIT, FOREST, and ORNAMENTAL TREES, STOVE and GREENHOUSE PLANTS, &c.
Priced Descriptive CATALOGUE, post-free.
DICKSON and ROBINSON, 23, Market Place, Manchester.

Baskets and packing, 6d. per dozen, or 3s. 6d. per 100 extra.
PRICED LISTS post free.
ALFRED FRYER, The Nurseries, Chatteris, Cambridgeshire.

H. CANNEL begs to draw the attention of the Public to the **COLEUS "CHAMELEON,"** which is unquestionably far the most attractive and the greatest acquisition in Coleus ever sent out; even the most accurate description conveys but a very inadequate idea of its beauty. The entire Horticultural Press speak of it in the most eulogistic terms.
The following is the report of the Editors of the *Gardener's Chronicle* (May 16, 1874):—
"We have received from Mr. Cannel specimens of a new type of Coleus, of great beauty, and very distinct from those already in cultivation. Sometimes the leaf is mainly of an intense velvety maroon, flushed with bright rose, giving a kind of six-crimson shade, the edge being just touched with green. In other cases half the leaf is of this character, while the other half is mostly of a deep rose crimson with golden beaded edge, and sometimes the rose-tint and the maroon-crimson are variously streaked and blended. The flush of rose crimson appearing in the maroon gives a remarkably velvety richness, which must be seen to be appreciated. With this superbly varied colouring the plant must be exceedingly effective."
This variety has received First-class Certificates wherever shown. Post free, 2s. 6d. each.
New Florist Flowers and Florist Flower Seed Merchant, Woolwich, S.E.

To Gardeners.
Gardeners are most respectfully invited to Visit

SALISBURY.

NEW ROSES.
WILLIAM PAUL
Respectfully solicits Orders for Plants of his two New Hybrid Perpetual Roses, now ready for delivery:—
STAR of WALTHAM.—First-class Certificate from the Royal Horticultural and Royal Botanic Societies. Colour, deep crimson, very rich and effective; a magnificent flower of immense size, very fragrant, very double, and for form, substance, and smoothness of petal unequalled; foliage very large, without being coarse, of a rich dark green colour, forming a beautiful contrast with the flowers. Nice plants in pots, 10s. 6d. each.
"Star of Waltham is the best new Rose we have seen this season." *Gardener's Chronicle*.
"A noble Rose, with great substance of petal, good colour, splendid foliage, and, what is more, delicious perfume." *Journal of Horticulture*.
"An exceedingly fine Hybrid Perpetual Rose." *The Gardener*.
"A grand Hybrid Perpetual." *Gardener's Magazine*.
"Large, full, lustrous in colour, and superbly beautiful." *Florist*.
QUEEN of WALTHAM.—Colour beautiful fiery cherry, very distinct and lovely, sunny weather the circumference of the flower becomes darker than the centre, proving a novel and strikingly beautiful feature. It is impossible to convey by a description any idea of the exquisitely charming tint of colour predominating in its variety. A large and full flower, in form and build perfect; growth vigorous, and foliage fine. Nice plants in pots, 10s. 6d. each.
"Star and Queen of Waltham are splendid examples in their colour." *The Queen*.
"Star of Waltham and Queen of Waltham, really gems, of which every rosarian ought to possess representatives." *The Country*.

W. P. has also a large stock of the following of his former introductions, which are now put well known to need description:—
DIANA (H.P.), 2s. 6d. each.
PEACH BLOSSOM (H.P.), First-class Certificate Royal Botanic Society, 2s. 6d. each.
PRINCESS BEATRICE (H.P.), 1s. 6d. each.
FIREBRAND (H.P.), 2s. 6d. each.
ST. GEORGE (H.P.), First-class Certificate Royal Botanic Society, 2s. 6d. each.
PRINCESS CHRISTIAN (H.P.), 1s. 6d. each.
THE NEW FRENCH ROSES of 1875.—Good plants, in pots, of all the best varieties, 2s. 6d. each, 24s. per dozen.
THE NEW FRENCH ROSES of 1874.—Good plants, in pots, 2s. each, 24s. per dozen.
OLDER ROSES, good plants, in pots, 10s. 6d. to 21s. per dozen, 43s. 12s. to 67s. per 100.
Just published, New and Enlarged Edition, post free, 10s. 6d., **THE ROSE GARDEN.**
By WILLIAM PAUL, F.R.H.S.
"An indispensable work for the shelves of earnest rosarians." *Gardener's Chronicle*.
"The most comprehensive book on all that relates to the Rose." *Journal of Horticulture*.

NEW GERANIUMS for 1875.
Five beautiful varieties of White-flowered Silver-leaved Bedding Geraniums, selected from the stock of R. B. Postans, Esq., viz.:—
LADY JANE GREY, QUEEN ELIZABETH, QUEEN ELEANOR, PRINCESS of THULE, RHODANTHE.
Price 5s. each; 30s. the Set of Five Varieties.
The following Six Varieties are especially recommended as worthy of a place in the most limited collections:—
LORD BURLEIGH.—Leaves green, broadly edged with pure white; flowers white, with carmine eye; fine shape and fine fruss. Price 7s. 6d. each.
SIR FRANCIS DRAKE.—Leaves green, broad white edge; flowers deep bright pink, with white eye; very beautiful. Price 7s. 6d. each.
EDWARD I.—Flowers crimson, slightly shaded with purple; good white eye, a fine fruss, and flower large, round, and smooth; leaves zoned. Price 3s. 6d. each.
MASTERPIECE.—Flowers rose scarlet, of great size and substance; form perfect; fruss and habit good; leaves zoned. Price 3s. 6d. each.
THE GENERAL.—Flowers fine bright scarlet, large white eye, good shape and substance; free bloomer; fine dark zone. Price 3s. 6d. each.
WALTHAM CROSS.—Flowers deep bright pink; fruss and habit fine; of great promise; the deepest pink bedding Geranium known. Price 7s. 6d. each.
The following comprise the FIRST PICK from the splendid Seedlings of Mr. George—several have received First-class Certificates:—
A. F. BARRON, VIRGIL,
TERENCE, MRS. J. GEORGE,
LUCRETIA, HORACE.
Price 12s. the Set of Six Varieties.
Also a large general COLLECTION of GERANIUMS, New and Old varieties. Priced Catalogue, with full description, post free on application.

THE FINEST COLEUS EVER INTRODUCED.

Carters

NEW COLEUS; "DUCHESS OF EDINBURGH."

AWARDED FIRST-CLASS CERTIFICATES—Royal Horticultural Society, June 17, 1874; Royal Botanic Society, June 20, 1874.

The foliage of this distinct and beautiful variety has margins of purple and creamy yellow, with a centre of bright crimson-magenta, forming a superb contrast to the green-leaved section of Coleus, by reason of its dazzling brilliancy of colour.

Professor THURBER, in the American Agriculturist, says:—"It is the most beautiful foliage plant that has ever been exhibited."

Price 3s. 6d. each. Extra Strong Plants 5s. each. POST FREE, 6d. extra.

See Carters' Illustrated Plant Catalogue with beautifully coloured Engraving of above. Price 6d., Post Free, Gratis to Customers.

TO OBTAIN THE

Best Garden Lawns and Croquet Grounds

SOW

SUTTONS' LAWN GRASS MIXTURE,

Which forms a close velvety turf in a very short time. For making New Lawns or Croquet Grounds 2 bushels or 60 pounds is required per acre, or a gallon to every 6 rods (or perches) of ground.

For improving those already in turf, 20 pounds should be sown per acre.

March, April, and May are the best months for sowing.

Price 1s. per lb.; 20s. per bushel.

From Mr. J. MERRICK, Gardener to S. Forster, Esq., Le Court.

"The Seed you sent me last year turned out uncommonly well. Several gentlemen who came to Le Court could scarcely credit, from the appearance of the lawn, in August it was as fine and thick as I have seen some lawns that had been laid down for three years."

that it was only sown in May. In August it was as fine and thick as I have seen some lawns that had been laid down for three years."

Instructions on the Formation and Improvement of Garden Lawns and Croquet Grounds Gratis and Post Free.

THE QUEEN'S SEEDSMEN, READING.

SATURDAY, MAY 22, 1875.

CHEMICAL WORKS AND TREES.

WHAT trees and shrubs will grow and flourish in seaside localities? is a question which has long occupied the attention of horticulturists; and a list of those which experience has shown to be suitable for such localities might easily be compiled from our own pages and those of other gardening periodicals. But there is another question which is of equal interest and importance, although perhaps to a smaller number of people, and that is—what trees will best resist the influence of the noxious gases which are, in too many instances, allowed to escape from the various manufactories which are the necessary accompaniment of our commercial progress? A recent visit to a locality which has suffered greatly from this cause has put us in possession of certain facts connected with this subject which may not be without interest to some among our readers.

The barren aspect of the immediate neighbourhood of the great Lancashire centres of commerce must have struck even the most casual visitor to those regions, and may be looked on as inevitable, or rather as beyond remedy. But the especial case which we have in view is one of a somewhat different kind. About 4 miles from Runcorn in Cheshire are the pretty and formerly well-wooded grounds of Norton Priory, the seat of Sir Richard Brooke. Runcorn itself is of the ordinary type of a manufacturing town, and emulates its neighbour, Widness, in the number of its chimneys and the quantity and density of the smoke which issues from them. Nevertheless, the surrounding country is pretty enough. The little village of Halton, perched picturesquely on a neighbouring hill, has its share of trees and flowers, and the grounds of the Priory are scarcely, if at all, injured by the Runcorn chimneys. Unfortunately, however, there are other works even nearer than Runcorn, and to them is clearly traceable the havoc which has been wrought among the trees and shrubs of the estate. The evidence which fixes the blame upon one of these in particular is nothing short of conclusive. Blasts of chlorine-vapour and hydrochloric acid are allowed to escape from these works; and the result is that the trees and shrubs in their course have been literally scorched up.

At Norton there is a small wood which until a certain night in April two years since—for the very date of the damage can be fixed—was as thick with trees as it yet is with Bluebells. In that one night hundreds of these trees were either crippled or killed; and hundreds of them are yet standing in evidence of the cruel treatment to which they were subjected. Some, notably Beeches, are altogether destroyed; others, especially Oaks, put out a few leaves upon some of their branches, while others have escaped with the death of their tops or more prominent shoots. In the Priory grounds the effects among the shrubs are equally disastrous, and present some striking contrasts. Rhododendrons growing almost side by side will exhibit perfect health and absolute destruction; and when the reason of the difference is sought, it is found in the fact that the dead or dying shrubs are exposed to the wind from the quarter in which the works referred to are situated, while the survivors are protected from it either by other trees, or by a situation slightly out of the current.

We state the damage done thus at length because we desire to put the case in the plainest and most straightforward manner. It would not be difficult to adduce other circumstances, which show yet more clearly how great is the extent of the evil. For example, not only will the rain-water of the district at certain times give a distinctly acid reaction, but it will even kill the grass, where it forms little pools, either at the foot of trees or in the open; and we were informed—though this we did not ourselves observe—that the young leaves of Beans are notched and burnt should rain fall upon them during one of these discharges of hydrochloric acid gas. The soil from beneath some of the trees, at the foot of which the rain-water has accumulated and formed pools, has been taken up, but nothing will grow in it.

As a practical outcome from what has been said, it remains to state what trees are found most proof against this serious nuisance; for, although legal proceedings may be talked of, and even carried out, the fine which might be levied on the offending works could not restore the splendid Oaks, whose stumps yet remain in evidence of their former grandeur, or reanimate the dead and dying Beech trees, which may be counted by scores. It is found that Sycamores, Austrian Pines, and Scotch Firs, are to a very great extent uninjured by the gases; Acer platanoides, too, is fairly successful. Oaks and Beeches suffer most of all; Elms are less injured; Larches will not grow. It would appear that the best policy of the proprietor of the estate would be to constantly cut down the dead and dying trees, and to plant Sycamores and other gas-proof trees in their places; but it must be remembered that these latter have not yet attained their full height, and when they have done so they, too, may succumb like their predecessors.

The experience of other proprietors of estates, should there chance to be some as unfortunately situated as Norton Priory, would be interesting for comparison. "It is an ill wind that blows nobody good;" and, although the wind which carries with it a devastating blast of hydrochloric acid gas is about as ill a wind as could be met with, it may, nevertheless, result in the discovery of trees which will resist its noxious influence.

THE ROYAL ACADEMY.

LAST week our notes concluded with some remarks on Miss D. M. Mutrie's excellent flower subject, the "Cottage Window" No. 391. This lady's pictures are always successes, not only because Miss Mutrie can draw and paint flowers to perfection, but because she never attempts anything she cannot thoroughly well execute. One may look in vain amongst Miss Mutrie's paintings for certain flaming Masdevallias, magenta herbaceous Phloxes, &c., because she never attempts such plants, their colours being simply unattainable by art. A good artist never attempts any subject that cannot be well executed, and it is said to be one of the greatest miseries endured by those unfortunate men who paint for nurserymen that the plant-merchants in nearly every instance select for portraiture such plants as, from the splendour of their colour, no art can reproduce.

392, "Home from Gleaning," Val. C. Princep, is notable for its perfection of drawing. 398, "Eastern Slinger Scaring Birds in the Harvest-time: Moonrise," F. Leighton, R.A.—a study of a copper-coloured figure against a slate-grey sky; the Poppies and Corn blue-bottles in the foreground corn, are mere dabs of colour. In 399, "Old Gentility," H. Goodwin: apart from the figures we have a truthful study of a quiet river side with yellow Water Lilies. 416, "Elmior and Ethel, daughters of the Hon. Henry Edward Butler," E. U. Eddis. Portraits of two young ladies disguised as ragged vagrants, one with sticks and the other awkwardly holding a basket of Marsh Marigolds which she is litter-

ing out. 415, "Hoppers on the Road," one of W. Linnell's gorgeous landscapes, with road and precipitous banks. 438, "The Path by the River," G. D. Leslie, A.—low in tone but nevertheless a perfect picture: observe the prostrate trunk and the reflections in the water. 439, "The Samphire Gatherer," J. C. Hook, R.A. This is an excellent painting of a rosy-checked girl with a basket of Samphire on the top of a cliff: the view of the distant sea and breaking waves below is beautiful, and the Samphire in the basket is the true plant. 443, "The Mountains and Plain of Denderah on the Libyan bank of the Nile, Drom and Date Palms, Sorrel trees, &c.," E. W. Cooke, R.A. This is, altogether, one of the most beautiful landscapes and studies of rich colour in the exhibition. The sky is suffused with various shades of purple, green, orange, gold, and scarlet reflected from the setting sun. Against these tints the dark trees stand out in bold relief, and are reflected in the rippling water. The trees are uncommonly well worked out, and correct. Notice the glariness of the water under the trees near the shore. 444, "Winter," H. R. Robertson. This is in strong contrast with the majority of the landscapes of this year's Academy. An old woman in a black dress and red hood is saving by the side of a ruinous hovel and equally ruinous dog-kennel. The distance is market-garden-like, and the sky is slate-coloured, with a white streak on the horizon. In the foreground are Cabbages. Mr. Robertson has painted several pictures from Mr. Smees garden at Hackbridge, but Mr. Smees, we are sure, would decidedly disapprove of these apocryphal Cabbages. What, however, can be expected from the gardening of an old woman who is a sawyer as well as a horticulturist? 456, "Sunset on the Moors," J. T. Linnell: a richly coloured stormy sunset. In 463, "At Ashfordly, near Melton Mowbray," J. M. Barber, we have another well painted river-side picture, with yellow Water Lilies, and the foliage of the Giant Coltsfoot. 478, "Among the Birches," A. J. Lewis, is a beautiful picture of woodland scenery, which only requires a group of the Birch-loving Agaricus muscarius to make it perfect. 481, "The Fallow Field," J. W. Oakes, is a spring landscape of the greatest beauty, with showery sky, and the sun lighting up a valley in the distance—Primroses and flowering Blackthorn in the foreground: observe the effect of the deep shadow over the distance on the left, and the sun just glancing over the field, as shown by the shadows cast by the distant trees. 489, "The Crofter's Moss," T. Graham, is a powerfully painted mountain subject. 503, by J. MacWhirter, and 513, "Loch Scaevaigh," Vicat Cole, A., are both magnificent studies of mountain and flood. 507, "Farewell Summer," Miss A. F. Mutrie, is a picture of Pompons, Roses, "modern antique," fan of peacock's feathers, &c., and is one of this artist's masterpieces; every part of the picture is worthy of close study: observe the effect of the sweet amber colour of the glass beside the deep purple and blue jar. 517, "The Gloom of Glen Ogle," J. Smart, is a most impressive painting of huge masses of slate-black rocks and heavy dark sky. 520, illustrative of some lines by Kirke White, H. H. Cauty, is a lovely picture of a pleasant sylvan walk and sandy path, beside a wooden park fence and overhanging trees: observe the position and importance of the black dog in this subject. 526, "Near Torquay," C. Simms, is a pretty little picture of a shady walk, but the attempt to paint the sunlight on the grass is hardly a success. 533, "Early Spring," E. Earle, is a charming woodland picture, with sloping banks covered with Primroses. 554, "Wild Water," B. W. Leader, is a picture of woodland and stormy flood; the water with the light upon it from the opening clouds is a masterpiece of painting. 566, "Twilight," P. Graham, a moorland scene, with black tempestuous clouds sailing over the picture. 585, "A Ferry on the Upper Thames," H. R. Robertson. This we esteem as one of this artist's best pictures; the effect of the evening sunlight on the piles, trees, and rippling water, is very pretty, and the plants of *Centaurea nigra* on the right are very good; the picture is less low in tone than other works by this painter. 613, "La Charge des Cuirassiers Français à Waterloo," Philippoteau, is notable as a suc-

cessful battle piece after the many dismal failures of former years. 615, "Isabel," a Portrait, Val. C. Prinsep, is a picture of a lovely girl (with a very pale face) carrying a bird's-nest in a large branch of Hawthorn, the latter rather carelessly executed.

According to the sequence of numbers the water-colour room is now reached. 635, "Magnum Bonum Plums," J. Sherrin, is a masterpiece of manipulation, after Hunt's style. 642, "Trentham Wood from the Garden," John O'Conner, is a beautiful garden sketch, with a great deal of sky. 663, "Primulas," Miss Isabella Green, is a neat little drawing, but not specially good. 674, "A Beech Forest," J. M. Fergusson, is an excellent picture of gigantic ruinous Beches, such as one sees at Burnham. 684, "Hyacinths," 701, "Hyacinths," both by S. J. Whiteford, the first a white and a purple Hyacinth, but without any special excellence; the latter a white and a pink Hyacinth and *Camellia* bud in an old earthen pot, well painted and brilliant. 712, "Snowstorm on the Glydders, North Wales," J. J. Cwmock; this is a magnificent water-colour of mountains and mountain streams, with an approaching storm of snow. 714, "In the Canterbury Meadows," C. Earle, is a good river-side picture, but to us a little unsatisfactory. 720, "The Chestnut Avenue, Cowdray Park, Sussex," T. J. Soper, fails to give us a true idea of Chestnuts. 728, "Chrysanthemums," Miss C. Philip. In this the work is imperfect and laboured, with the leaves unnatural and out of perspective. 780, "Green Gages and Apricots," P. Dolan, seems up to the average, but the picture is towards the top of the room. 793, "Primroses," Miss M. Natel, is very good, and in the style of Hunt, but really one has seen so many water-colours of Primroses in this room that the very name of "Primroses" seems to predispose one against them. 798, "Gum Cistus and Sweet William," J. J. Hardwick, is a pretty and brilliant bit of drawing and colour, and a relief from its freshness of subject. 808, "The Thames at Bolney, near Henley," W. Gosling, is a very fine piece of water-colour painting of trees and water; the horses and oxen, as seen lit up by the sun through the opening in the trees, is very pretty. 822, "Plums and Apples," W. Hough—Apples, Plums, Cob-nuts, and fruits of the wild Rose: our remarks on 635 exactly apply to this picture.

We now come to the remaining paintings in oil. 834, "The Baron's Dessert," W. Hughes: this is a picture painted in Lance's style, with a huge salver, bunches of Grapes, Nuts, and Pears (or Quinces), all well done, with a sombre background and the never-failing glass of hock. 846, "The Ornithologist," J. H. Hague, is an excellent picture, which includes, besides birds, fishes and other animals; it is a study of good drawing and colour: observe the tint of the sky as seen through the window, as contrasted with the coat on floor, and the colour of the ornithologist's nether garments, and the dish of rosy Apples on the ground. 853, "The 28th Regiment at Quatre Bras," by Miss Elizabeth Thompson, deserves a word of notice in passing to 860, "Gaffing a Salmon," J. Docharty, a Black Pine forest on the banks of a rocky stream. 1157, "Fruitful Boughs," W. Hughes, represents large branches of Plums and Apples, perfectly painted. 1158, "Great Sport," P. H. Calderon, R.A.—an altogether excellent and pleasant picture of two children in a flowery meadow, one with a net catching butterflies, the other with a basket to preserve them in when caught: the happy children are up to the waist in grasses, Mullein, Lychnis, Dog-Daisies, and Dandelions. 1191, "A Good Bargain," H. Woods. A country huckster driving a bargain in a country garden, in the beds in the foreground of which and in pots are flowers boldly and well painted and thoroughly true to life. 1193, "On the Banks of the Thames, A.D. 200," G. D. Leslie, A. An excellent picture of (judging from the scat, tessellated pavement, &c.) a Roman lady; growing in the deep bed of the Thames is the white Water Lily, and on the seat may be seen blooms of *Camellia japonica*. Such a lady as this must have had a very improving effect on the naked natives, who (if the *Commentaries* are truthful) were in the habit of painting themselves blue at the time when

Julius Caesar's soldiers crossed the Thames. We presume, after all, it must have been Scipimus Severus who introduced *Camellia* from China to our forefathers in blue, and helped them to put up their first fues and boilers. 1199, "Summer Days for Me," A. W. Hunt. There is an unpleasant chalkiness pervading this landscape, which is otherwise well painted. 1213, "Summer Noon," Vicat Cole, A. This is one of the most finished and perfect landscapes in the Academy. Observe the admirable dashing drawing and perfection of colouring in the group of Ferns in the foreground—one of the most difficult of all botanical subjects either to draw or paint well. 1215, "Lever's Water, Coniston," S. R. Percy: another highly-finished picture of mountain, rock, and water. Notice how uncommonly well-painted are the lowering clouds and the deep blue of the distance under the cloud on the right and just above the huge jutting rock. 1218, "The Disputed Toll," H. Hardy, is a picture abounding in quiet humour, and should be examined before leaving the room, if only to notice the placid, contented face of the elephant with its little twinkling, watery eyes. 1222, "Flowers, Fruit, and Vases," J. Robie, is the most highly finished and elaborate of all the fruit and flower pieces at Burlington House; the objects, both animate and inanimate, are the things themselves. 1235, "Dafodils," W. J. Muckle, is an unusually good picture, and includes Azaleas, Violets, &c.; the colour is thoroughly studied: observe the intense purple Azaleas at top, the sulphur Dafodils below, the blue jar to the right, and the pale rose-colour Azalea on the left. Any one of the pictures above adverted to would look much better removed from the walls, for a picture always requires some sort of isolation to bring out its qualities. The neighbouring pictures of a gallery always have an influence for good or bad on each other.

New Garden Plants.

MACROZAMIA PLUMOSA, HORT. BULL.*

Among Mr. Bull's rich collection of Cycads is one of great beauty, introduced from Queensland, and called by the garden name of *M. plumosa*. Although it is a very unsafe thing to attempt to identify certain species of Cycads from small specimens, especially when cones are absent, yet it seems probable that the plant of which we give a figure is the *Macrozamia Paulo-Guileimi* of Mueller's *Fragmenta*, i. 87 (1858), *Bentham's Flora of Australia*, and other works. *M. plumosa* is a peculiarly graceful plant, with a marked spiral twist in the leaves, the slender, rigid pinnae of which are alike, but in many cases spirally twisted. This is well shown in Mr. Worthington Smith's drawing, where also a plan of the spiral arrangement is given. The pinnae spring from the edges of a flattened rachis, and are quite glabrous, 6–8 inches long, $\frac{1}{2}$ inch wide, channelled along the upper surface, and with a more or less prominent midrib, the lower surface is marked

* *Macrozamia Paulo-Guileimi*, F. v. Mueller, *Fragmenta*, i. p. 86; ii. p. 179.—Trunk scarcely raised from the ground, covered with the woolly imbricate bases of the old petioles; leaves otherwise glabrous, 2–3 feet long, the rachis narrow, but often flat on top; pinnae numerous, very narrow and often almost contracted and sometimes callous at the base, the longer ones 6–8 inches long and 1– $\frac{1}{2}$ inch broad, thick and markedly retuse; cones on woody peduncles 2–3 inches, the scales oblong-cylindrical, scarcely above 3 inches, the scales about 4 lines broad, somewhat thickened at the apex, with a narrow point; fruiting cones about a inch long, 2 inches thick, the larger scales about a inch broad and rather thick, those of the lower part of the cone narrower and thicker, the apex almost rounded and flattened. Hort. Bull., appears to us not to belong to this species. *Eos.*, j. *M. plumosa, vide supra*. *M. spiralis*, Miq. *Mons. Cycad.* pl. t. 4. 5.—Trunk short; leaves glabrous, 2–4 feet long, the rachis usually more or less raised longitudinally on the upper surface between the two rows of the pinnae; pinnae numerous, flat, straight, or slightly falcate, the larger ones 8–10 inches long and 3–4 lines broad, marked beneath under the surface of the rachis with slender, slightly contracted and callous at the base, inserted longitudinally, and the lower margin slightly decurrent, the lower pinnae much smaller, and sometimes passing into a few narrow scales, a gland-like sallosity at the base of the pinnae on the upper side, sometimes prominent, sometimes very obscure; male cones 6–10 inches long, 1 $\frac{1}{2}$ –2 inches thick, the scales much attenuated, the upper ones, tapering more than in *Frensis*, about $\frac{1}{2}$ inch broad, $\frac{1}{2}$ inch long or more on the upper ones; fruiting cones varying much in size, but usually shorter than the male, and 3–6 inches long, the apex of the larger scales 1– $\frac{1}{2}$ inch broad, and usually 2–4 lines thick, with an incurved point usually short. *Eent.* Austral., i. p. 518. *Eos.*, i. p. 513. *Proc.* xv. i. p. 52. *Zamia spiralis*, R. Brown, *Proc.* 348; *Encyclopaedia spiralis*, Lehm. *Fugillus*, 6.—Of this species Bentham admits as varieties *Proc.* 349; *Proc.* 504; 3. *Eos.*, i. p. 513. *Proc.* 349. *Macrocypriandra* (a garden name) with a glabrous trunk and more terete rachis; 4. *diplomera*.

with several longitudinal nerves. The segments or pinnae are very numerous, and some of them are deeply bifurcated, as in the variety of *M. spiralis* called by F. v. Mueller *M. spiralis* var. *diplomera*. It is probable also that the peculiar spiral twist of the foliage is to a large extent peculiar to the young plant, though according to F. v. Mueller not wholly so. In any case we have in this plant one of the most elegant of this noble family. The very slender elongate leaf-segments give the plant a very graceful appearance, and render it a very valuable

It is only necessary to caution the reader against confounding the *Encephalartos Frederici Gulielmi* of Lehmann, now referred to *E. cycadifolius*, and a native of South Africa, with the *Macrozamia Paulo-Gulielmi* of Queensland. *M. T. M.*

× ODONTOGLOSSUM MURRELLIANUM.*

Nulla dies sine linea! If not "dies," let us modestly say "hebdomas." There is, indeed, no end to our learning in Orchidology, getting wider, clearer views, having answers for old questions, and new un-

with a light tinge of purplish violet and with some such darker blotches distributed with the greatest irregularity, and put on the base of the three-lobed narrow lip those lamelliform toothed calli of *O. Pescatorei* of the most splendid yellow and before some yellow calli of *O. novium*, and give to the column oblong toothletted wings and some purplish violet and yellow blotches. To show to excess the hybrid nature, there was no candelua, no glandula, and the pollen masses themselves were not waxy but soft. This lovely plant, unique, as far as we know, has

FIG. 132.—MACROZAMIA PLUMOSA, HORT. BULL (PAULO-GULIELMI?).

plant for decorative purposes. Mueller describes the stem of *M. Paulo-Gulielmi* as subterranean, the number of pinnae as nearly eighty. *M. plumosa* differs from *M. spiralis* in the rachis and leaflets, in addition to the cones. The seeds of some of the allied species are collected by the natives as food. *M. Paulo-Gulielmi* was first found by Mr. W. Hill, near Moreton Bay, and afterwards by Gregory in the "Expedition Range Mountains." The trunk is said by both gentlemen not to be visible above ground, whereas in Mr. Bull's *plumosa* there is, as seen in the sketch, a short but well marked trunk.

We append in the foot note an extract from Bentham's *Flora Australiensis*, which may be serviceable to those not in possession of the original work.

solved questions arising from those answers ever teaching us how much is to be learned. Here is once more such a lovely novelty as one could scarcely have imagined. Take a raceme of a good *Odonoglossum novium*, but with blunter sepals, petals and lip, not waxy at all; imagine all those organs washed

* × *Odonoglossum Murrellianum*, H. G. Rehb. *F.*, n. hybr. — Racemo laxifloro; sepalis et petalis lanceolatis acutis planis; labello ab ungue late dilatato trilobo, lobis lateralibus semiovatis denticulatis, lobo antice ligulato acute crenulato; lanellis supra lobos laterales incrassatis adnatis extremum serratis; callis duobus oblongis denticatis cum carina mediana interpositis carina forcipata anteposta; columna trigonae curvae auriculis oblongis denticulatis. (*Odonoglossum nobile* [Pescatorei] *novium*.) Flores albi violaceo-purpureo lavati maculis irregularibus obscure violaceo-purpureis. Calli labelli pulcherrima flavis. — Ex Nov. Granada importatum.

just flowered in the garden of Mr. W. Burnley Hume, so well known for his having flowered the first *Dactyamnia Durtili*. The plant, a small thing, quite like a plant of *O. Pescatorei*, was observed with a lot of that species. The lucky possessor wished it to be named in honour of his gardener, Mr. Murrell, who appears to be very successful from the copious splendid inflorescences I once saw under glass bells in Mr. Burnley Hume's drawing-room, arranged with artistic skill by Mrs. Hume. *H. G. Rehb. f.*

FRTILLARIA (AMBURION) DASYPHYLLA, Baker, n. sp.*

This is the Asia Minor plant joined with Caucasian

* *Fritillaria (Amburion) dasphylla*, Baker, n. sp. — Eubo

tulipifolia in my monograph upon the examination of imperfect dried specimens. Now upon the study of the living plant and a fine stock dried by Mr. Elwes in Asia Minor, I have no hesitation in separating it. The leaves are more numerous than in the Caucasian plant (which is well figured in *Botanical Magazine*, t. 5969), and not at all glaucous. The flower is much less purple, and the stamens considerably shorter in proportion to the perianth. The station where it was found by Mr. Elwes is in light sandy soil over serpentine between Moolah and Aidin, 2000 feet above the sea level. Both this and the other flower in England in the latter part of April.

Bulb globose, under $\frac{1}{2}$ inch thick, with membranous tunics. Stem 3—9 inches above the soil, bearing 6—12 fleshy green leaves, the lowest oblong, $\frac{1}{2}$ —2 inches long, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad, the upper close, linear, 1—2 lines broad, mostly all scattered. Flower drooping, usually solitary, broadly funnel-shaped, under an inch long, pale purple on the outside, yellowish within, quite unteselated, the nectary oblong obscure, greenish, the outer divisions oblong, $\frac{1}{4}$ inch broad at middle, the inner obovate-coneate, 4 lines broad above the middle, with a pubescent tip. Stamens 5—6 lines long; anther oblong, obscurely pointed, less than half as long as the pubescent filament. Ovary $\frac{3}{4}$ inch long, white, the 6-salvate at the upper half. Style filiform, as long as the ovary, falling decidedly short of the perianth-segments, quite entire and filiform, with a capitate stigma. *J. G. E.*

THE HANDSWORD NURSERIES.

A FEW miles from the smoky busy town of Sheffield are situated the very extensive and noteworthy nurseries of Messrs. Fisher, Holmes & Co. An ordinary observer would be apt to think that one large nursery must be very like another, but though there is necessarily a considerable similarity there are always special points of interest arising from local circumstances, or from the tastes and acquirements of the proprietors. Such is the case in the present instance,

but although we were prepared from the repute of this old established firm to find large collections of hardy ornamental trees and shrubs, especially Hollies and Rhododendrons, we did not expect to see such complete collections in other departments, nor were we prepared to see such a display of clever manipulation and successful propagation as is here apparent. The least little scraps of variegated Conifers are made to strike. Such things as "miffy" subjects, or such adverse conditions as "damping off," seem not to vex the souls of the proprietors—their root-grated Clematis, their grafted Dahlias, their layer-Lagerarias thriving in a shoot in every "eye," and a hundred other subjects, evince the extreme neatness and success of the operators. Out-of-doors our attention was principally attracted to the fine show of early Rhododendrons (time, end of April), many of them in fine specimen plants, not a few—the original types, as a botanist would say—raised in the nursery. These Rhododendrons are growing in a stiffish loam, and some hundreds of varieties are kept in stock. Among those we noted as most remarkable at the time of our visit were:

Venus, with very fine blooms, flushed with pink; Cathcart, Sebastopol, Paxton album, a fine variety; Brightness, crimson; Handswordblanum, a variety now of thirty years' standing, but still holding its own by virtue of its compact trusses of lilac-pink flowers; striction, an old white variety; Blanche, various forms of arborescent and argenteum, some of which proved tender in 1860; other varieties referable to campanulatum. One of these latter, named Robustum, has very large leaves, covered beneath with the rich orange-brown pubescence of campanulatum, and with large lilac flowers. R. Falconeri also stands out-of-doors here.

Hollies form another speciality of this nursery, Mr. Fisher having for years taken great interest in selecting the seedling varieties. Consequently we find here the noble specimens of varieties we know of in the woods of these plants, such as Shepherdii, at least 20 feet high, and well furnished to the bottom; phyllifolia, Golden Queen, Whittingtonensis, Handswordhensis, and one in particular like I. camelliaefolium, but with a loose habit, rapid growth, and producing abundance of fruit on the old wood. It was interesting to see on one variety, with leaves with a silver central blotch, a sport producing leaves with a green disc and a golden edge; and equally curious to see the great variation in size and appearance in seedlings of the same age,

taken from the same tree and grown in the same seed-pan. Ornamental Conifers are represented here in quantities, amongst others is a fine variety of Deodar with foliage so dense and compact as to give the branches the appearance of a clipped lawn. Another Deodar of forty years or more was hardly recognisable from a Cedar of Lebanon. Golden Yews in abundance and variety are to be found, and among them a new variety of Texas address called aureo-marginata, with a compact habit and very bright golden edge—a decided advance on any similar variety known to us. The Parsley-leaved Bramble is grown here in considerable quantities. Trained to an arcade of wire, its foliage is ornamental, and it produces an abundance of large juicy fruits. As may be expected in so old-established a nursery, fine specimens and old "stoals" that rejoice the heart of a propagator are to be seen here in plenty. Among others we noticed a Japanese Maple some 12—14 feet high and between thirty and forty years old. This nursery was also the birthplace of the very elegant and free-flowering *x* Berberis stenophylla, the parents of which are said to have been B. Darwinii and B. empetrifolia. For this alone gardeners owe their gratitude to the firm. We must leave the reader to imagine the acres of forest trees and hardy shrubs, the endless quarters of fruit trees, the thousands of Roses, and we must pass with the mere mention the collections of herbaceous plants.

In the houses a very large general collection of stove and greenhouse plants is got together. The object is, not to grow specimen plants, but to secure a large and healthy stock, and this is effectually done by the aid of the clever propagators, whose art is so conspicuous in this nursery. The houses themselves are light and serviceable, many of them built by Messengers of Lamborough, and all provided with that very handy latch introduced by Mr. Simpson of Wortley. To enumerate the contents of these houses would be to write a list of the best Orchids, the best Ferns, the best and popular stove and greenhouse plants of the day. Seedling Echeverias are raised here in quantities, and indeed there seems to be a general tendency hereabouts to make use of succulent plants for bedding purposes. Among Azaleas Lizzie Tillery is noticeable as a free-flowering variety with salmon-pink flowers. In and about the white Lycopodium Lyallii and Actinopteris, plants that do not succeed well with all folks, are here growing away vigorously. Aralia Veitchii is propagated by being worked on A. reticulata, and such is the skill and economy practised that a single eye and a leaf are found sufficient. Daphne elegantissima is also propagated largely, as its value as a hardy variegated shrub is likely to be great. This nursery has served as the training school for some who are now among our leading nurserymen, and when we see the extent of the establishment, and the business-like way in which it is managed, we are not surprised at the progress of the pupils.

Those who have the opportunity should not fail to visit this fine establishment, where they are pretty sure to find much to interest and not a little to instruct them, especially if they should have as a cicerone the head of the firm. Such, at least, is the experience of *A Rambler*.

GREYA SUTHERLANDII.

AMONG the many important contributions to botanical science for which it must ever be indebted to the amiable and lamented Dr. Harvey, his *Flora Capensis*, or "Plants of South Africa," is not the least important. While engaged in its preparation he was one day sitting in his rooms in College with some dried specimens of South African plants lying before him. With one of these, as Dr. Moore, of Glasnevin, happened to call on him, he just then appeared to be specially occupied. Handing the specimen to him, coupled with the remark that some eminent botanists with whom he had been in communication with regard to it were puzzled as to the order to which it should be referred, he asked Dr. Moore to look at and say where he thought this interesting nondescript should be domiciled. Having examined the specimen carefully, Dr. M. returned it, confessing at the same time that he was a good deal puzzled, but that he thought, if not actually belonging to, it came very near Saxifrage. "Good," replied Dr. Harvey, "it is exactly there I have placed it." While they were speaking Dr. Moore noticed something like seed or a seed capsule, we are not sure which. This was promptly laid hold of, carried home to Glasnevin, sown, and the result was, raising in that establishment—for the first time in Europe—plants of *Greya Sutherlandii*, than which we believe a more telling or more sensational subject has been or could be taken in hand by the intelligent and high-class plant grower. For the first time in Ireland this remarkable plant has quite recently flowered at Glasnevin. This and once

at the Chelsea Botanic Garden are the only occasions on record, we believe, of its flowering in Europe.

This very striking and beautiful shrub, though existing in several parts of Cape Colony, was first made known by the dried specimens forwarded thence by Dr. Sutherland to Dr. Harvey, and was named by the latter and Dr. Hooker in honour of Sir George Grey, K. C. B., who was at the time Governor of Cape Colony, and who, in the words of Dr. Harvey, invariably took "a warm interest in developing the natural history of South Africa." But hold. Plantmen, to whose special notice we are anxious to commend it, will care more to know what our plant is like than to be told of its whereabouts in system or little episodes in its history. Well, then, let them fancy an overgrown Felargonium of the woody or "show" section—not Zonal or variegated—rather long-jointed, and having smooth glossy leaves, exactly resembling those of a Felargonium of this kind, mostly towards the points of the branches. Instead, however, of Pelargonium-like flowers rising from their midst, we have a glorious, dense, many-flowered upright spike, or raceme, several inches long, composed of brilliant crimson flowers, bristling notably with the remarkably elongated white-anther-tipped stamens. Each flower has twenty of these arranged in two rows, those of the outer row are abortive, and are exceeded by many times in length by the inner or fertile ones, whose prominence and appearance add not a little to the general effect of the magnificent flower-spikes. We do not know a subject we should rather see taken in hand by the successful and enthusiastic plantman than this. It may be objected that it is, as seen at present, somewhat leggy and bare in habit, but we all know what has been done in getting over these in the case of Poinsettia, Cyclamen, and other less successful subjects; and the man who can subdue this magnificent South African, and will be the first to place it in similar form as we now see these on the exhibition stage, will produce a sensation and effect something to be proud of. Well might the lamented and rarely-gifted Wm. Henry Harvey write—"A more interesting addition to our conservatory shrubs has not been made for many years." *Irish Farmers' Gazette*.

USES OF THE COMMON RUSH.

IN previous numbers of the *Gardeners' Chronicle* (1874, p. 749; 1874, ii., 385, 417) attention has been directed to the uses of the common Rush, and other points of interest connected with it in our own country. Dr. Hance publishes in the current number of the *Journal of Botany* some notes upon its employment among the Chinese which contain some interesting facts supplementary to those which we have already recorded. The pith is sold in Canton in little bundles folded longitudinally, and then secured by the ends, being wrapped round spirally, just as one might make up a hank of twine, the whole forming a cylinder about 4 inches long and half an inch in diameter. The pith thus prepared is employed in Chinese domestic medicine, being simply boiled in water, and the water drunk; it is said to be "of considerable efficacy in febrile affections." The use of "rushlights" among ourselves is paralleled by the employment of this plant for lamp-wicks among the Chinese. "The ordinary light is a saucer, or a lamp like a candlestick, but with no aperture for the reception of a candle, the top being slightly excavated to hold oil, and the pith wick laid across this, and one of the ends lighted; or sometimes oil is poured into a glass half filled with water, the wick being held in a spiral tube of wire, with three hooked arms to attach to the edge of the vessel." So extensively is the Rush employed in this manner that it is cultivated for the purpose in one district of Canton, the pith being extracted by women, who run a blunt needle along the stem, splitting it up, and stripping off the pith entire. The species used is our common soft Rush (*Juncus effusus*); the *Sinpus capsularis* of Lour., which he describes as being similarly employed both in medicine and for domestic purposes, is no doubt the same plant; a Cantonese name signifying "lamp-wick grass" is common to both.

But perhaps the most important use of the Rush is in the manufacture of sun hats, of which Dr. Hance says—"I had always been under the impression that these hats were manufactured from rice-paper (*Patisia papyrifera*); but the dissection of a hat at once discovered this. In making these hats the *Stenactis japonica* appears to be as follows: The interior shell is first formed of pasteboard, then four or five pieces of pith, in lengths of between 2 and 3 inches, are taken and rolled up in a piece of the extremely tough paper always used by the natives for deeds and other legal documents, and which is made from Broussonetia. These rolls are packed in the shell until the required thickness is attained, the outer case is added, and the whole covered with silk or cotton." Dr. Hance says that these hats are almost universally worn in summer

parvo globose tunica; caule 3—9-pollucari sspissime unifloro; foliis 6—12 viridibus infimis oblongis vel obobovatis superioribus linearibus, basi cuneatis, nervis vix distinctis, nervis oppositis; perianthio late infundibuliformi 8—9 lin. longo flavo-purpureo hodie tessellato, foveolis oblongis obscure, segmentis interioribus oblongis, interius minutis; staminibus perianthio trispartito latiusculis brevioribus; stylo bifloro antheris separate ovario sesquialtero; stigmate capitato. — F. tulipifolia var. dasyphylla, Baker, Lion. Journ. xiv. 266.

by foreigners in the East, and suggests that it would be worth while for our English manufacturers to utilise this very common plant in the same manner, as the manufacture is easy, and the demand for such light and effective sun-protectors would probably be very extensive.

It may be noted here in connection with the paper upon "Rush-bearing," which appeared in our last volume (p. 385), that the practice of strewing the floor of Norwich Cathedral with Rushes upon great festivals is not at present maintained. For this information we are indebted to the Dean of Norwich, Dr. Goulburn, who has not been able to ascertain the date of its discontinuance. As the statement that the custom still exists is copied from one book to another, as if true of the present day, this note may be of interest.

UPTON HOUSE, DORSET.

A QUARTER of an hour's ride from the Bournemouth west railway station brings us to the town and port of Poole, from whence a walk of less than an hour will bring us to Upton House, known only before as a pretty house and estate in Dorset, but now of world-wide notoriety, thanks to "Sir Roger." Trudging along, enjoying the fresh and verdant beauties of the surrounding scenery, we come to the borders of the Canford estate at Hanworthy; and here we pause awhile to notice the model cottages built for the labourers on his grounds by Sir Ivor Guest, Bart., the wealthy proprietor of the splendid manor. Neat and comfortable looking dwellings, with pretty flower gardens in front, they form a charming contrast to the "Dorset hovels" of which we have read so much, and strike us as a redeeming feature in the ugly picture lately drawn in which landowners, farmers, and labourers have figured so holly.

Arriving at the lodge gates leading into the beautiful park of Upton, and passing through the gateway arch of a pretty landscape picture, into the charms of which, however, we must allow neither our steps nor our pen to wander to-day. The drive from the lodge gates to the house is nearly half-a-mile long, bordered on each side with plants and evergreens, serving to screen the railway embankment running parallel to it on the one side, but on the other to intercept some pleasing views of Poole Harbour and the surrounding country. The park contains Spruce, Larch, Birch and Scotch Firs, the latter of which emit a perfume not unlike that which greets the olfactory nerves of the visitor to our unique and pretty watering-place, and similar to that of the Eucalyptus globulus, a native of New Holland, which is found to be hardly also at Bournemouth.

Under the umbrageous shelter of the fine trees that shade the grounds we would fain linger, but Time says "pass on," and proceeding through the kitchen-gardens and pleasure-grounds we arrive at the fine old mansion, which is in the Grecian style of architecture, and tastefully covered on one side with trellis-work. The house contains about fifty rooms, having a large entrance-hall, handsome dining and drawing-rooms, with a library, the doors of which are unique in their construction, so closely resembling the crowded bookshelves as to deceive the eye, and leave a stranger as prisoner until spring is touched by a more practised hand, and the doors swing back. There is also a pretty little chapel for family service. From the upper windows of the house we can see that the beautiful lawn below is extensive; and raising the eyes we find spread out before us, over the tops of the trees, splendid views of the surrounding country miles away. We are informed that the pleasure-grounds of the mansion spread over 13 acres, and an hour's saunter through them reveals to us a superb collection of Roses, fine specimens of the *Magnolia purpurea*, and a splendid mass of *Rhododendron Cantinhamii*, 40 yards in diameter and 15 feet high, in a blaze of scarlet bloom. Here, too, are a couple of large plants which claim especial notice—the *Arcauria brasiliensis*, which appear to be quite hardy, as also the three varieties of the *Cedrus—atlantica*, *Deodara*, and *Lebanon*. And now we stand in the shade of one of the finest Virginian Cedars we have ever met with—a magnificent fellow, standing about 45 feet high, and measuring some 18 inches through the stem. Mr. Newton, the eminent landscape architect, at present superintending the laying out of the winter garden for Bournemouth, and a man of great experience in his profession, says of this tree that it is the finest stem he has seen out of Virginia, and recommends the planting of it, not only for ornamental purposes, but for profit in this district. Passing on we find some Junipers, averaging 40 feet high and 18 inches in diameter, and a number of large Purple Beeches that form a pleasing contrast to the eye. To the right of these is a beautiful little geometrical flower-garden, laid out in grass and surrounded by some choice specimens of Silver Firs. A path from this leads us again into the kitchen-garden, at the entrance to which stands one of the finest

Camellias we ever saw, trained to spread over the garden wall. Mr. Crabb, the head gardener, to whose courtesy we acknowledge our indebtedness, informed us that this tree had been planted before his time, and he reckons thirty-nine years on the estate. It covers 400 feet of surface, is perfectly hardy, and in full bloom. The Camellia-bush is also well filled with choice blooms, and we noticed a remarkable specimen of the *Wistaria sinensis*, which in another week or so will be well worth seeing. The kitchen-garden is well-stocked, and the walls are covered with Pear, Apricot, and Fig trees, foremost amongst which stands a splendid Marie Louise Pear. *Bournemouth Observer*.

BRITISH GARDENERS.—XVIII.

DAVID T. FISH.

MR. D. T. FISH was born in the year 1822, at Old Stone, Perthshire, and was educated in the parochial school of New Stone, where sound instruction was imparted, including mensuration, land surveying, mathematics, and the ability to read Latin. His first school of horticulture, he tells us, was the garden of the Earl of Mansfield, Stone Palace, Perthshire, then under the able management of Mr. James Dodds, who, during the three years of his apprenticeship, was assisted by three most efficient foremen—Mr. W. Purday, who succeeded to the curatorship of the Botanic Gardens, Calcutta, and died some years ago; Mr. Alex. Blackie, of Revesby Abbey; and Mr. John Lamont, of Dickson & Company, Edinburgh—a trio of worthy men who did much by their own enthusiasm in botany, floriculture, and kitchen gardening, to evoke similar qualities in the young men under their charge. Mr. Dodds was also able and energetic, seldom giving direct instructions, but rather teaching by example, and now and then by a pregnant saying, such as was addressed to him one Saturday, when working hard to clean the long range of houses, "That's right, Davy; cleanliness is the parent of health"—a sentiment that was soon made the common property of all the lads and men on the place.

No doubt, as Mr. Smith has observed, Science was a good school for the learning of the art of gardening as a handicraft. Work was not only plentiful, but hard to be well done. It mattered not whether it was mowing from 5 to 9 in the morning, hoeing, digging, raking, mowing, or "scamping" was ever allowed. Those marvellous Morello Cherries advertised by Messrs. Smith and Ward were looked up to with a sort of veneration, and the honour of being allowed to nail them was coveted as much as a senior vantage at a university. The curriculum for apprentices was also a useful and an unvarying one. One year (the first), fires and houses; the second, serve the kitchen; and the third, work in the flower garden. Custom generally gave a fourth as a journeyman, to establish more perfectly "prentice hands" by practice in all departments before changing to another place, or going into an Edinburgh nursery.

"Fortunately," observes Mr. Fish, "a better opening than either of these was made for me by my brother, Robert Fish, for many years gardener at Bournemouth, who, in 1841, I arrived there in the middle of November, 1842, and remained at Puttidge as second and first foreman till the spring of 1845. These years were among the busiest and happiest of my life. They were distinguished by hard work, harder study, warm brotherly and sisterly sympathy—for my sister, Mrs. Erskine, then kept my brother Robert's house at Puttidge—and wise help. In the garden Robert was a strict impartial master—no favour to any one; no labourer's rule was given to the work in the shortest time, of the highest quality, from every man and boy in the place. Out of the garden no man could have had a more affectionate brother, nor a truer friend. At Puttidge the far-reaching issues of gardening as a science began to unfold themselves, and assumed new and higher aspects. Chosen at first from a mere youthful love of flowers, and a romantic desire to tread in the footsteps of my two brothers, Robert and John, and the distinguished botanical collector David Douglas—all of whom graduated in Stone gardeners under Mr. Beattie—gardening now revealed itself as a fine art, on a level as a means of culture and in ennobling influence with poetry, music, or painting. The flower-garden at Puttidge first suggested the idea of a beautiful poem without words. From the moment these high ideals took possession of the mind, gardening was pursued with the ardour of a passion; and no labour was accounted too severe, no study too hard, no application too unwearied, to master its principles or carry out its details. The one thought and purpose was, not how to make gardening of use to me, but how best to qualify myself for serving it. Thought and work were the more obvious modes of service; and in these easy-going times, when so many young men seem to have made

up their minds to glide on to success and win fame on the lazy steeds of indolence or indifference, it may be useful to cut out the plan of an evening's study from my note-book of those times.

"First reading, then writing, composition, and finally drawing. The reason for this order was that reading, being less of a mental effort than writing, sooner led to drowsiness. As soon as that came on the book was exchanged for the pen, copying first in a book extracts, then direct composition, which acted as a powerful stimulant, and drove away sleep. The final remedy was found in drawing, which was done standing, and not till sleep mastered me with compasses in hand were the studies relinquished. This course may be looked at as an example in two ways—to be avoided as well as imitated. But such was the sort of voluntary forcing to which I subjected myself at Puttidge, and doubtless it had its influence in calling out the enthusiasm from my first mistress—"an old head on young shoulders!"

"From Puttidge to Knight & Perry's nursery was indeed a change. The spring of 1845 was so severe that we had to take turn about all night with the fires; and to fortify (so it was thought) us youngsters, the man on night duty went in at 11 P.M. to Mr. Perry to report temperature, and drink up or carry forth with him an enormous glassful of brandy and water—a sure recipe for stupidity or the sleep of insensibility to duty to those who drank it off. Mr. Knight's manner with young men was, as a composition. He never let an opportunity escape of giving them a word of reproof, instruction, or correction, if need be. He gave me my first lesson in the application of closet sewage to pot plants at an old pump behind the orangery, and, seeing how distasteful it was, supplemented it by a useful lecture on the uses made of such materials in the culture of Orange trees and Camellias on the Continent. 'Old Joe,' as we all called him, gave me many a sly smile as he passed the pails of young Camellias that were duly liquored by me twice a week from that date, stopping to point out one rich how much darker green the foliage was since the day food had been given them in their liquor.

"This incident led to the study of these sewage question and to the conclusion, though rather a novel one at that time, that the only possible solution of it was the conversion of dead matter into living, and to change poison into food, through the ministry of plants and the cleansing agency of the earth. The sanitary powers of plants and the ability of the earth to deal with the results of life, labour, combustion, as a composition, have now been practised, tested, and proved sufficient for nearly a quarter of a century. The nursery is a most useful school for young men, and all ought to pass through it. A fuller knowledge of men, business, and plants can be gleaned in nurseries than in private gardens. The mental culture and intellectual advancement of the men in the nursery were also stimulated and cared for at that time, and in the prizes of books for drawings of her novices at the *Pittsburg* nursery was won by Mr. Manders which was the germ of the establishment of the study, &c., we had the germs of those more perfect arrangements that have been made by the Messrs. Veitch and others for the intellectual culture and physical comfort of the men in their employment.

"The West London Gardeners' Association was then in full vigour, under the able presidency of Mr. John Cate, then of Bedford Hill, and now for many years lost to horticultural literature in the far north gardens of Inverary Castle, Argyllshire. Mr. Cate welcomed me for my brother's sake, and at that time Messrs. Keen, Gray, Mitchell, Peel, Doran, and many others gave life, animation, and great usefulness to the meetings held at Parson's Green, Fulham.

"Amid all these engagements time sped swiftly, and with the middle of the summer came the offer of a head place. This offer proved my first great professional trial. From the summit of my ideal I was brought suddenly down to the lowest level of everyday life by the offer of a situation on the *Wentworth*, with board, and the half of a footman's room for lodging. Hardly had these terms escaped 'Joe's' lips, when my indignation blazed forth, much to the good man's amazement. 'Why,' I asked, 'couple the knowledge and culture of professional men with the rewards of a livery servant?' Joe, with all his knowledge and tact, could not answer that question; and it may be added that notwithstanding all that has been said and done since it still needs an answer. Rewards should bear a closer relation to qualification, service, and character, than they yet do in horticulture.

"In this first struggle, which was partly successful, was laid the germ of those efforts which I have never ceased to put forth for the bettering of the condition of gardeners.

"About July 1, 1845, I entered the service of Sir Philip Broke, Bart., of Broke Hall, Norton, Ipswich, a near relative of Sir Wm. Miles, and the son of a Shrubland Park, Ipswich. At that time Mr. Beaton was in his prime, and it must be recorded to the honour of his memory, that from the time of my entry into Suffolk until his death he treated me as a father,

and delighted to pour his rich stores of knowledge and fertilising streams of practice into the young man who was all ear to listen and afterwards to learn. If James Dodd and his staff of assistants had some hand in hammering the school-boy into a shapely workman, Robert Fish and Donald Beaton finished the horticultural man for his best work. The discipline of Broke Hall was also useful—new houses had just been built, and the first business was to plant them with Vines and Peaches. No sooner was this done than advice gratis poured in upon Sir Philip from all quarters, and being a novice in gardening he not only wished to take it all, but actually asked for more from every possessor of a garden in the neighbourhood. There were, in addition, the usual contests between Sir Philip and Miss Broke, his sister, who was fond of plants and looked upon the new houses as a means of wealth to her greenhouse and drawing-room, &c. Sir Philip, a post-captain in the navy, also wished to control temperature on the same principles as he ordered the steering of his wooden walls, and to this end furnished the houses with indexed thermometers, and carried the key to the magnet for setting them in his pocket; this, with a programme of temperature framed by myself, he held, and used the whip-hamlet without mercy. Within about six months I had talked and grown myself out of all these and other difficulties. The critics were silenced by results, the magnet was lost, the confidence of employer won and kept till the last. Difficultly only sharpened diligence and strengthened the determination to succeed; never were Vines, trees, or plants nurtured as these were. No hand touched them but my own. Air, water, food, heat, were all dealt out as if life and death hung upon the issue. Baskets of sweet decomposing manure were held in reserve throughout the evening, to be changed and turned in the vineries to charge the atmosphere anew with ammonia at every visit. Whole hours were passed in study under the Vines, that the respired carbonic acid might add to their strength. And the reward was won when, not only Sir Philip and his friends, but the late Sir Wm. and Lady Middleton, and, better than all, Donald Beaton, came over—saw—praised, and were satisfied.

Broke Hall, though a good start, hardly afforded elbow-room enough; and Glevering Hall—then one of the finest places in East Suffolk—becoming vacant, I (one of sixty applicants, so it was said) obtained that situation. Broke Hall was left with much regret, after writing to London for a successor; and as illustrative of the terms on which I left, and the kindness of heart of my first master, who has now been dead many years, it may be stated that, on his first visit to Glevering after my arrival, he left his carriage at the front door and walked straight into the garden to seek and find his young Scotchman, and to wish me success and happiness in my new-place, where he hoped I would find sufficient scope for my abilities. Sir Philip's visit was more expressive than words.

The chief characteristics of Glevering were its large kitchen garden and shrubberies, lawns and flower gardens, extensive ranges of vineries, plant stoves, large conservatory, and choice collection of Pears on walls, and a nice lot of Orchids. Unfortunately about six months after my removal to Glevering the late Mr. Arceadeckne's father died, and the place was left, and likely to continue so, and this led to my leaving it. About this time, too, an offer was made to me by Mr. Nesfield to lay out his plans at Bylghat in Norfolk, and had not certain delays occurred in regard to the prosecution of this work, I should possibly have devoted the remainder of my days to work of this kind, which is, perhaps, my favourite branch of gardening. But, weary of waiting, I accepted a situation, previously offered by Mr. Weeks, of Chelsea, to go to Kirkcatham Hall, near Redcar, the seat of Mrs. Newcomen. And this was the easiest situation I ever filled, having lived about ten years as housekeeper's rooms, I left on account of some difficulty in the way of getting a home of my own. Living in the house, if one is perfectly sober—a total abstainer—is not without its advantages. One learns the wants and ways of households, and young men lose the rawness of garden life, and take on a little polish from the men and maidens with whom they are brought in contact. And though gentle manners will neither make men nor gardeners, they add grace and smoothness to everyday life, and render gardeners more agreeable to their employers—a point which even such a great statesman as Lord Palmerston was keenly alive to, for we find him in his biography complaining that his new gardener was a much less pleasant companion than his old one.

"Arrived in London one of my first calls was upon Dr. Lindley, at 21, Regent Street, then the headquarters of the Horticultural Society of London. His eye looked me through and through, as he was informed who I was, and what I wanted. In an instant he called me a fool point blank for staking a comfortable situation on a matrimonial venture, but retained instantly, and added that were I only one-tenth

as clever as my brother Robert I was fit to fill the best place in England. Nothing, however, came of the formal registration in the books, and again my attention was turned to landscape gardening, and while engaged in such work a letter was received from Lady Cullum, offering me my present situation. It seems that kind friends in East Suffolk had not forgotten their old neighbour, and, hearing of a vacancy, had recommended me to Sir Thomas and Lady Cullum while I was yet ignorant of the place being vacant. The novelty of the offer, coupled with the presentiment, which had grown into a firm conviction from the time of first seeing Hardwicke, perhaps ten years before, that I should one day live there, made the way to an engagement easy.

"I find that I arrived at Hardwicke on April 2, 1855, over twenty years ago. The late Sir Thos. Cullum, who died before my arrival, was a great planter and an accomplished horticulturist. Lady Cullum was also devoted to gardening, and distinguished by refined and highly cultured taste. Hardwicke is largely their creation, and in its planning and furnishing they were ably assisted by the late Rev. Frederick Cheere and some good practical gardeners—Mr. Smy, who is just dead, my immediate predecessor, and Mr. Saml. Barrel, still land steward at Hardwicke. Of my own goods here it would ill become me to write, or to say more than that all the changes and extensions have been planned and executed with a view to preserve the old beauties of the place while adding new ones to

D. S. Fish

them, and, in a word, to endeavour to fill the garden and glasshouses with plants, and adorn them with beauty all the year round.

"How far I have succeeded or failed in this ideal it is not for me to record; suffice it, that through all these years I have been able to give pleasure and satisfaction to an employer who long since merged the authority of the mistress in the kindness of a friend; have added somewhat to the beauties of a place not destitute of natural and artificial charms; have formed and boldly expressed my convictions on all public questions; have continued to advocate in public and in private all measures tending to the elevation of horticulturists and the advancement of horticulture; to diffuse among all classes a deeper love and a truer knowledge of gardening as one of the strongest antidotes to debasing pleasures and sweetest allurements to virtue; and to be, in a word, in some humble means worthy of a profession that is allied to all that is beautiful in Nature and skilled and refined in Art; that condenses the vegetable wealth and plenty of the world into the limited areas of gardens, embodies the revelations of science, the scintillations of genius, and the results of the most successful practice into profusely illustrated poems of stately measure and well-balanced rhythm, or weaves them into finished pictures flushed with beauty and filled in with plenty—an art that, in fine, affords to all its votaries, of whatever rank or station, some of the purest and most satisfying pleasures that fall to the lot of man."

Since the above was written, some months since, Lady Cullum has died, and Mr. Fish, writing of this, says, "The sun of Hardwicke seems put out."

MASDEVALLIA POLYSTICTA.

THIS plant was introduced by M. Roezl from Northern Peru in the spring of 1874, in company with two others, viz., *M. caloptera* and *M. melanopus*, all of which were described and named by Professor Reichenbach in the *Gardeners' Chronicle* for March 14, 1874; since then we have had the pleasure of seeing it flower, and it is, as M. Roezl described it, "a little wonder." It is very distinct from all other known *Masdevallias*, and produces several flowers on the same spike at one time; the colour of the flower is pure white, thickly covered with a quantity of purplish brown spots; the tails are bright yellow. This is a very free-flowering species, and, therefore, cannot fail to recommend itself to all lovers of Orchids. The plant here figured (fig. 134) flowered with Mr. B. S. Williams, of the Victoria and Paradise Nurseries.

Foreign Correspondence.

THE ADELAIDE BOTANIC GARDENS.—These gardens are situated on the banks of the River Torrens, which flows between the two great divisions of the city of Adelaide, and is a portion of the park lands surrounding the city on all sides, which for extent and natural beauty are not surpassed, and which contribute in no small degree to the health of the citizens. This wise provision made in laying out the city will be felt with greater force by each succeeding generation as population increases in number and density. The course of the river is from east to west, and the gardens are on the south side. The surface is of an undulating character, falling gradually from the level of the elevated plateau on which the larger and most important portion of the city stands to the level of the valley of the river. The grounds comprise about 50 acres of rich chocolate loam, with a substratum of limestone on the higher grounds to alluvial on the flats. A creek runs through the grounds, on the course of which some fine sheets of water have been formed to cover about 6 acres. The main entrance to the gardens is near the north-east angle of the city. The entrance-gates are of ornamental cast-iron. From thence the main walk, which is 20 feet wide, leads in a straight line through the gardens. It is intersected by a fine sheet of water about the middle of the grounds, over which it is intended to erect a handsome bridge. The walks which intersect the grounds in different directions are all laid out in the highest style of landscape and artistic gardening. The walks are beautifully made, and the curves are perfect lines of beauty. The edges to the walks and borders and the lawns and flower beds are all kept in the highest order. The trees, shrubs, plants, &c., are all arranged with the best possible effect. Statuary, fountains, and rockwork, adorn the grounds, and meet the eye of the visitor in every turn in the walks, and the skillful distribution of the trees renders the gardens eminently interesting. The great object in laying out a public garden, not to compel visitors to crowd together too much in one place, but to disperse and meet again as their inclinations may direct, has been attained. The visitor has choice of three routes on entering the gardens, either by the centre avenue, or to the right by the Pine grove and arboretum, or to the left, which leads to the greenhouses, stoves, conservatory, fernery, &c.

The Director's residence is to the left of the entrance, and is a handsome two-storied house. The lower storey is covered with trelliswork, over which climbers are trained of the rarest sorts. The Director's library is here, and comprises all the newest works on botany and floriculture, &c. Here also are a number of fine chromolithographs of scenes and incidents in the Director's travels on the Orinoco with his late brother, Sir Robert Schomburgk. The grounds surrounding the house are very tastefully laid out as a flower garden and shrubbery, and are open to the general public, houses, stoves, conservatory, fernery, &c. which altogether form a very handsome and extensive range of glasshouses.

In the greenhouses we noticed a magnificent display of *Camellias*, *Pelargoniums*, *Cinerarias*, *Gloxinias*, *Primula sinensis*, *Fuchsias*, and other showy greenhouse plants, all in splendid order. We might particularise some remarkably fine *Begonias*, seedlings, grown by Dr. Schomburgk, and far superior in size or beauty of flowers and foliage to the old varieties. The plant-stoves and conservatory contain a magnificent collection of plants, and are in the very highest order, both as regards luxuriant growth and handsome appearance. The plants are too crowded, however, but the Director will remedy this as soon as the very magnificent Palm-house about to be erected is finished.

In the conservatory we particularly noticed some very fine Tree Ferns, amongst others *Alophilla exelma* and *A. Cooperii*, *Dicksonia antarctica*; also some fine *Streptizias*, and fine collections of *Palms*, *Dracenas*, and *Crotons*. Amongst single plants we noticed *Tillandsia splendens*, the beautiful *Bornean*

FIG. 134.—MASDEVALLIA POLYSTICTA (NAT. SIZE).

Cypripedium Loweii; also a magnificent specimen of Calanthe veratrifolia, Theophrasta imperialis, Pandanus Veitchii, Randia macrophylla, Rhopala magnifica, Cycas revoluta, Cochlostema Jacobianum—a most superb stemless monocotyledonous plant with masses of beautiful flowers, which issue from the base of the leaves in large racemes; Echinia Marice Regina, a stove Bromeliad with beautifully-coloured bracts. In the Orchid-house there is a fine display of beautiful and healthy plants. In the early attempts to grow these it was found that the dry hot winds did them much injury in spite of all that could be done to keep them in a congenial atmosphere during their

continuance, and the Director hit upon the happy expedient of placing all the plants in moss (sphagnum), which is imported, as our native mosses were after trial found unsuitable. There is here a fine collection of Cypripediums, amongst which may be noticed C. caudatum, niveum, and Hookerianum; Miltonia spectabilis, &c.; Stanhopeas, Oncidium, Cattleyas, Dendrobiums, Epidendrum, &c. In the houses at the rear of the conservatory there are many rare and beautiful plants. Amongst others there are some very fine Gloxinias, also a nice collection of the genus Ixora; a good Pitcher-plant (Nepenthes distillatoria); Dieffenbachia Pearcei, picta, and Weirii; a

very beautiful plant of the Yam family (Dioscorea metallica), with splendid bronze-like leaves; a species of Coffee (Coffea liberica), which the Director believes will grow well in Port Darwin; a new Peperomia, very fine; and Godwinia gigas, new. There is a fine collection of Achimenes, and we saw some in baskets which looked really splendid. In the Fern-house there are some magnificent specimens of the beautiful genus Adiantum. The following genera are well represented:—Alsophila, Aspidium, Blechnum, Dicksonia, Lycopodium, Polypodium, Pteris, &c. On the whole nothing can exceed the beauty of the arrangement, and the fine healthy appearance of the

plants. Adjoining the fernery there is a museum. The building is of rustiwork, and is, we believe, an exact model of the Pantheon of Athens. It is open to the public, and contains an splendid collection upwards of 2000 specimens of vegetable products used in the arts and sciences and in domestic economy, including dye-stuffs, resins, gums, medicinal products, drugs, and beautifully-prepared sections of woods from different countries; also samples of the first prize Wheats from the late London and Paris Exhibitions, and a large collection of beautifully-executed models of fruits, all neatly arranged under glass and correctly named.

We must also notice the aviaries, which form quite an ornamental adjunct to the range of glass-houses, and which give quite a pleasing variety to the gorgeous floral display; nor must we forget to notice as we pass along the beauty of the close green turf of the lawns, the beautiful masses of flowers artistically arranged in beds on the lawn, the fountains and rockeries, and the single specimens of ornamental trees and shrubs which dot the lawn here and there, and show off their foliage and proportions on the sides of the walk.

Proceeding from the glass-houses we pass some fine trees, amongst which may be noticed *Sterculia acerifolia*; *Arbutus Unedo*, var. *cocecia*; *Bauhinia purpurea*, a magnificent plant, in full flower, which looks at a little distance like a huge *Rhododendron ponticum*; it seems perfectly hardy, and is growing with great rapidity. We now reach the large lake, which lies to the right of the walk we are upon. Here the banks of the lake are margined with magnificent Weeping Willows, which afford a delightful shade, and the winds are liberally distributed throughout the garden, and may be found under every tree affording shade. Here are some fine vistas. On looking over the lake glimpses are to be obtained of the gardens beyond. A most beautiful effect is produced by an island in the lake, on which there is a magnificent display of *Verbena*, artistically arranged as to colours. Here also may be seen the Bamboo (*Bambusa arundinacea*), upwards of 40 feet high, and several other types of ornamental vegetation, which, with the weeping willow, form amongst the foliage, gives to the place a charm and novelty not often to be met with. On the banks of the lake, in addition to the magnificent Weeping Willows, we noticed a very fine Poplar (*Populus alba*), also the Alder (*Alnus glutinosa*), and *Betula alba* var. *pendula*.

Passing on we reach the open space which has been set apart for the magnificent Palm-house about to be erected. The building will be 100 feet long by 35 feet wide. The dome will be 40 feet high, and the wings 25 feet. Double glass walls will be provided. It will be the finest structure of the kind in the southern hemisphere, and like the one recently erected in Bremen, of which it is an exact model. We observe that the contract for the building is now let, and in a few months we may hope to see it finished. It is estimated to cost £1800, which will include the cost of the structure and the completion of the earthwork of the raised terrace, formation of aqueducts, walls, &c. Adjoining this is the glass ground, about 2 acres in extent. Here all the families of the vegetable kingdom are well represented, comprising about 130 orders in the two great divisions of Monocotyledons and Dicotyledons, occupying respectively the centre compartments and the outer borders. It is laid out in oval form, with walks dividing it into an inner and outer circle, with others intersecting, and in the centre is a handsome cistern with fountain intended for five orders of water plants. Here the student, with Balfour, Lindley, and Wilson in his hand, may soon acquire a practical acquaintance with the Justus system of classification, which has now completely superseded the Linnaean. The plants throughout the garden are all correctly labelled, having the generic and specific names and the natural order to which the plant belongs, together with its native country, neatly painted on. Dr. Schomburgk had considerable difficulty in this respect in his early years. He has now, however, discovered a better method of preparing them by brushing over the iron with a chemical preparation, on which a coat of black paint is applied. When dry the name is painted on in white; it is then coated over with fine white sand while the paint is still wet. These when dry effectually resist the action of the weather, and are beautifully distinct and clear to the eye. Near here is a fine shady walk, having a row of *Ficus*, one specimen on each side. They have been planted nine years, and are now quite 50 feet high, and present a perfect picture of symmetrical beauty and regularity. Here are also some noble trees on the lawn—*Ficus spuria*, very fine; *Cedrus Deodara*, a very large and handsome tree; *Hymenoporus flavum*, a very fine specimen, in full flower. At this point we notice various cages and enclosures for animals, most tastefully arranged, and in the perfect keeping with the rest of the garden. We here cross the main avenue, at a point midway between the lake and the boundary between the gardens and the park. It is here lined on each side by the Moreton Bay Fig (*Ficus macrophylla*), which for luxuriance, symmetry, beauty

of foliage, and regularity of growth cannot be excelled. They stand about 15 feet high, and have only been planted eight years. A little to the right of this point is the roseary, which contains 400 varieties. They are nearly all grown as standards, arranged in amphitheatre form, the dark varieties at the back, and shaded down to the lighter-coloured in front. As you approach the roseary the first thing that attracts attention is the magnificent show of pillar Roses. These are trained to cast-iron pillars, 12 feet high, with festoons, 20 feet in length, between the pillars. The season for Roses was nearly over when we visited it, but some few of the late sorts were in full bloom, and amongst these *Aimée Vibert* shone conspicuously. The large clusters of pure white flowers were really gorgeous, and the delicate perfume was delightful. Everything here as elsewhere is in the highest order. The spaces between the standards were planted with double-flowering Stocks; when these go out *Globe Amaranth* and *Zinnia elegans* will take their place. *Portulaca* (double) occupy the space round the edges of the borders, and the whole is surrounded by a low hedge or edging of the dwarf China Rose (*macrantha*). A fine bronze equestrian statue of the Amazon occupies the centre of the roseary, with fountains on each side, all of which assist in rendering this portion of the beautiful gardens a real gem.

Proceeding onwards towards the north-east we pass through a portion of the arboretum. Here are a large number of trees from all parts of the world growing side by side, and all appearing as luxuriant as if in their native climes, and this is one of the most marked features in them, and we mention *Phacelia dioica*, a native of South America, which measures 6 feet in diameter at the base of the main stem, and 25 feet high, and is only three years planted; the *Umbrella-tree* of Queensland (*Brassia actinophylla*), doing well; *Pisonia grandis*, doing well; *Sophora japonica pendula*, *Cytisus Laburnum pendulum*, *Liriodendron tulipiferum*. These form handsome trees for lawns, and present a striking contrast to the upright growing species.

Amongst a number of other specimen trees and shrubs we noticed the following—*Macaranga ternstroemii*, *Leucadendron argenteum*, *Panolinia imperialis*, doing very well; *Argania Sideroxylin*, doing well. Seeds of this were imported by Sir Henry Young when Governor of this colony, from the neighbourhood of Morocco, where it is a native, and produces a large nut, which is much relished by cattle. These seeds were then distributed to numerous persons throughout the colony, but we believe few succeeded in raising plants from them, and this is the first we have seen of it. *Lagunaria Patersonii*, *Platanus acerifolia*, three years planted and 15 feet high; the weeping Elm, *Ulmus fulva* var. *pendula*; and a large collection of *Eucalyptus*, including *E. marginata*, *maculata*, *calophylla*, 25 feet high; *E. Risdoni cornuta*, in bloom; *trigonata*, &c. The clump of *Eucalyptus globulus* at the lower end of the garden are magnificent trees, and must be at least 70 feet high with straight, tapering trunks, 30 or 40 feet long, without a branch. G. McEwen, in "South Australian Register."

Notices of Books.

Text Book of Botany, Morphological and Physiological. By Julius Sachs; translated and annotated by Alfred W. Bennett, M.A., assisted by W. T. Thiselton Dyer, M.A. Clarendon Press (Macmillan), Large 8vo. Pp. 858.

This book is issued in a form and manner worthy of the Oxford University Press, and consonant with the esteem in which the original work is now held in Germany as the text-book of physiological botany. Its publication in an English guise is a welcome opportunity. English botanists have become of late somewhat dissatisfied with the position which their science occupies in this country. While great progress has been made in systematic botany, in classifying and cataloguing the plants of various countries; while important additions have been made to our knowledge of the geographical distribution of plants; and while—thanks especially to Mr. Darwin, and the immense impulse he has given—certain departments of the life-history of plants have been studied with zeal and excellent result; yet in other departments, especially in those connected with minute anatomy, pure physiology, and the application of physics and chemistry to the unravelling of the problems of vegetation, British naturalists have in the main lagged far behind their German fellow-workers. One great reason for this is that, with few exceptions, this great country is absolutely destitute of any competent teachers, and of physiological laboratories and appliances suitable for the use of students in vegetable physiology.

The ordinary courses of lectures at the several medical schools, till lately the only places where anything like systematic instruction in botany was given, naturally include those portions of the science only which can

be most readily demonstrated. For want of time, and particularly for want of means and appliances, vegetable physiology, properly so called, has been most inefficiently and imperfectly taught. Lately there have been indications of the rising of a better state of things. In the School of Science and Art at South Kensington, under the superintendence of Professor Dyer, special classes have been formed for direct practical instruction in physiological botany; and the manner in which those classes have been conducted and the pupils made to teach themselves, instead of trusting merely to lectures or books, has been, so far as we have had the opportunity of seeing, admirable. In the older University of Oxford, too, we are glad to learn that a similar plan is about to be adopted by Professor Lawson and Mr. Ray Lankester. Immediately such classes are established and professors have to work with, and not merely talk to, their pupils, then immediately will be felt the want of some text-book embodying all the most important facts that German patience and ingenuity have brought to light of late years. None of our English text-books, good as some of them are in their way, are fully up to the mark in this particular. On these grounds, then, and in the interest of professors and of advanced pupils, we cordially welcome the present work, which has evidently been laboriously and carefully edited and translated. Several notes have been added, and advantage in many cases taken of the important annotations made by Van Tieghem in the French edition.

From a morphological point of view we are sorry Professor Sachs has not more boldly grappled with the evils at present arising from the use of misleading terminology. We have in these pages all the terms, cohesion and adhesion, applied, which is customary where there is neither the one thing nor the other. It is true that an attempt is made to give the correct explanation of the apparent cohesions and adhesions, but the attempt is not always very successful. It would require an advanced student, we expect, to understand without difficulty such an explanation as this:—"Coherent perianth-whorls are produced by the formation of the distinct protuberances at the circumference of the receptacle by the pushing of an insertion of these distinct structures being raised up by intercalary growth as an annular wall, and forming as it continues to develop the part common to the whole whorl of floral leaves." This is rather an obscure way of stating that the tube, whence the several parts of the perianth spring, gradually emerges from the axis which bears it.

The necessity for a clear understanding of what these "cohesions" and "adhesions" really mean is more than ever urgent since the uprising of Darwinian principles. These latter, based as they are to a large extent on genealogical considerations, and on the adaptation of particular parts to fulfil certain offices, demand, on the part of morphologists, the most careful inquiry into the history and mode of development of the plant or animal. The inquirer now-a-days cannot rest satisfied with ascertaining that the structure of a reference is of a certain kind, he must also inquire why, how, and under what circumstances, and to what purpose all the varieties of conformation he meets with are present.

The more perfect our knowledge of the mode of growth and of development—their arrest, their perversion, their exaltation—the more easy will be our investigations into the history (using that word in its widest significance) of living beings, the more complete our appreciation of the office they fulfil.

It is, however, with the physiological portions of the book that our readers will probably be most interested; and they will feel it, as we do, a great boon to have the views of a master condensed into so small a compass. Those who have the opportunity will still, we imagine, prefer to make use of the same author's *Handbuch der Experimental-Physiologie*, of which a good French translation was published a few years since by M. Micheli; but, for many reasons, the present volume will be specially looked up to as the standard reference work, on the subject of vegetable physiology. This, moreover, if we except certain special departments, is one of the branches of science that has been too much neglected in Great Britain. It is, in particular, a great misfortune for agriculture and horticulture that we have so few practical cultivators who are at the same time competent and disposed to undertake physiological experiments—men, for instance, of the stamp of Thomas Andrew Knight, men who would do for other departments of physiology what Darwin has done in those which came within his allotted scope. The *Theory of Horticulture*, in which our gardeners still place implicit confidence, is thirty-five years old, and what a vast difference that period makes in the history of vegetable physiology. The want of such a man, too, is specially felt, when we come to look into special subjects, on the true solution of which the gardener's practice should depend, and of which we give an instance. Ask any gardener whether plants absorb water or water vapour by their leaves, and he will, of course, tell you Yes. He regulates his proceeding accordingly—the syringes, "dumps down," waters overhead, and

the like; and his practice, whatever the explanation be, is unquestionably right. On the other hand, ask a physiologist whether leaves absorb water or watery vapour, and he will give you a negative, or at best an uncertain answer. Sachs, in the work before us, p. 613, asserts that they do not, except to a limited degree. In this he follows the opinion of Unger, Duchartre, Prillieux, and many others. Indeed in those cases where the epidemic is cooled with water, it is difficult to see how absorption could take place.

Knop, Baillon, Honnet, Calletet, de Lanessan, and others, seem to prove that plants can absorb water by their leaves.

Now here is a matter which one would have supposed easy of determination—one of great importance to cultivators, but one upon which skilled experimenters are diametrically opposed. The truth appears to be that water, or watery vapour, is absorbed sometimes, and at other times not, according to circumstances not yet fully known. The wisest thing for the cultivator, in that case at any rate, is to continue to follow the practice which experience and general usage have told him is the best to follow, and to await the proper explanation till the physiologists have come to a definite conclusion. Then, most likely, he will be able to learn something to his advantage, as he may do already from the researches of Darwin, Lawes, Gilbert, and other experimentalists.

We have adduced the above information to show the need that exists in this country of a physiological laboratory or laboratories, with competent chiefs, and attached to some experimental garden, where such really vital questions as that we have alluded to could be investigated. The book before us, and which has suggested these remarks, would form, and is likely to do so for some time to come, the best reference book for advanced pupils; and we cannot bring our remarks upon it to a close without expressing our thanks to all concerned for the production in an English dress of so valuable a work of reference.

A new journal, devoted especially to music and the sister arts, has just been started, under the title *Concordia*. Judging from the prospectus, and still more from the contents of the first number, we shall have a journal of high merit and interest, not so conventional and narrow as musical and artistic reviews are apt to be. The present number, in addition to articles interesting specially to professed musicians or skilled amateurs, contains several which may be read with profit and pleasure by those who can make no pretensions to such acquirement. A high standard of criticism will be aimed at, and means taken to secure early and full reports on all matters connected with music and the drama. Messrs. Novello & Co., of BERNERS STREET, are the publishers of this new venture, to which we heartily wish every success.

The *Botanical Magazine* for the present month contains plates of *Crocus chrysanthus*, a yellow-flowered, sweet-scented species, re-introduced from the Levant by Mr. Elwes; *Odontoglossum Warszewiczii*, Rehb. f., in *Gardners' Chronicle*, 1875, p. 270, a charming species flowered by Messrs. Veitch, and allied to *O. vexillarium* and *O. Phalaenopsis*; *Hemichiona fruticosa*, a yellow-flowered Mimulus-like undershrub from Guatemala; *Dichorisandra Saundersii*, with flowers prettily variegated with white and violet; *Galanthus Elwesii*, a fine species, evidently nearly allied to *G. plicatus*. It was introduced from the mountains north of Smyrna by Mr. Elwes.

The last issued part of the *Transactions of the Arboricultural Society* contains Dr. Cleghorn's inaugural address, an interesting article on the literature of Scottish arboriculture by Mr. Hutcheson of Carlowie; Mr. Gilchrist contributes a paper on forestry in Aberdeenshire, Mr. Payne one on draining plantations by open or curved drains, Mr. Hutcheson one on the conservation of old and remarkable trees in Britain—a very suggestive and valuable paper on the method of averting decline and promoting vigour in trees; Mr. McKenzie treats of the use of steam power in forestry; Mr. Gorrie on the advantage of planting in groups; lastly, Mr. Duchan supplies a report on meteorological observations in Lanarkshire and on the influence of forests on climate and rainfall. Among the results obtained it was found that during the annual rise of temperature in the spring and summer months, the highest temperature of the day inside the wood was 1°-2° higher than that outside the wood; and during the annual fall of temperature in autumn the highest temperature of the day inside the wood was on the mean about half a degree lower than that outside the wood. In spring and early summer the air inside the wood is warmer and moister than that outside, but during the fall of the year it is colder and drier.

The first part of M. de Tchihatcheff's translation of Professor Grisebach's *Végétation der Erde* has been issued by Theodore Morgand, Rue Bonaparte, Paris, under the title of *La Végétation du Globe vivante les Climats*. This will be a great boon to those to whom the original is as a sealed book.

TETRANYCHUS TAXI (?).

IN 1856 Professor Westwood described and figured in the pages of this journal (p. 841 of that year) a mite, which was then and has been since very injurious to the young buds of the Currant. It is in the young

FIG. 135.—GALL ON YEW.

state that it does its chief mischief, and Professor Westwood's description was mainly devoted to that stage. A similar allied species (also doing its mischief in the young state) has recently been brought

FIG. 136.—CURRANT BUD MITE.

under my notice, which I now propose to describe, and it may be convenient, for comparison with it, that Professor Westwood's figures should here be reproduced.

FIG. 137.—MITES FROM A YEW BUD.

At a recent meeting of the Scientific Committee of the Royal Horticultural Society, Professor Threlson Dyer drew the attention of the committee to the species I refer to. He found it apparently causing considerable damage to the hedges of the Yew trees in the Society's garden at South Kensington by injuring the buds,

many of which were going back and decaying without any obvious cause. On examining the buds great numbers of a minute Acarus were discovered in their folds. They were all of the same four-legged type figured by Professor Westwood, and are, no doubt, the young of a six-legged, or possibly an eight-legged, species. Professor Westwood was of opinion that they probably belonged to the genus *Tetranychus*, and, in the absence of any other information, I am quite satisfied to follow him as a guide, who very rarely fails to lead us right. The accompanying woodcut (fig. 137) represents the insect taken from the Yew buds, in different aspects, and it will be seen that, although in general appearance it is very similar to the Currant species, it yet differs in some material respects. It does not taper so much towards the head, and the body, instead of being covered by minute transverse striae, is smooth and glossy, which in certain lights enables us to see the segments of which it is composed. I make out the head, then two large segments, followed by six smaller ones, which are no doubt the abdomen. The two anterior segments of the body contain a curdy milkiness, which obscures the interior, but the abdominal segments are without it. The creature is fleshy, milky-white, and translucent. It has no eyes, neither had Professor Westwood's. He was unable to detect the parts of the mouth, and I have not been more fortunate—the difficulty in observing the parts of such minute creatures being that when the animal is dead the parts become shut up, and cannot be defined at all, and, when living, they may in the first place not be displayed, or if displayed they are in constant motion, it being impossible to keep the creature still, so that it is only a passing momentary glance that one can get—too instantaneous to allow any confidence to be reposed in it. Professor Westwood considers that the structure of the mouth will doubtless consist of a central sucker, defended on each side by an articulated palpus or feeler.

At the tail of Professor Westwood's figure (fig. 136) will be seen two bristles, which he believes to be the rudimental fourth pair of legs. I hesitate to adopt this view, because the terminal penultimate segment of the body (to which the bristles are attached) does not seem a part from which we could expect limbs to be developed. Professor Claparède, in his *Stéatien an Acarien* (Léopold 1868), shows that in the development of the limbs the two anterior legs belong to the head segment, the two next to the pro-sternum, the two next to the mesosternum, and the two last to the metasternum, which of course leaves the whole of the abdomen behind the last pair, and in conformity with this so far the anterior pair here certainly seem to spring from the cephalic segment, and the next pair, which is very close upon them, springs from the prothoracic segment. In the present species the bristles seem to belong to the termination of the penultimate segment, and it is to be remembered that in very many Acari in the perfect state two strong bristles stick out, one on each side of the end of the abdomen, next to the anal segment. These bristles, no doubt, assist the insect in locomotion, but the tail itself is used as a sucker for this purpose. A common attitude of the insects is to raise themselves upon their tail and wave the fore-part of their body about, reminding one of the manners of the Falkland Island seal at the Zoological Gardens. When in this position the tail seems at times to expand on either side, like a flap, which may possibly have given rise to the statement made by Professor Westwood by one of his correspondents, that besides the bristles and legs one of them had two projecting appendages at the termination of the abdomen.

The progress of the Currant mite has been traced onwards at least one stage further, and in its next stage has been found to be a six-footed creature; it remains yet to be seen whether further development converts it into an eight-footed species. Whatever may be its course of growth, we may be pretty sure that that of the Yew-bud species will be the same; they are obviously too closely allied for us to expect any material difference in this respect.

Dr. Masters mentioned, at the meeting of the Scientific Committee, that he had been informed by Mr. Albert Miller that the curious abnormal tuft of leaves (fig. 135) at the ends of the shoots which may not be unfrequently seen in the Yew tree, was the result of an injury inflicted by a species of Cecidomyia, and he suggested that the mite referred to by him might be the species now in question. I have been unable to trace the species named by Mr. Müller, but it seems very possible that this may be the insect he alludes to. *Andrew Murray.*

* I hope no systematist will take exception to my calling an Acarus an insect. I do it not in ignorance or *per incuriam*, but deliberately, because, according to my view, the spiders and mites have been separated from the insects on insufficient grounds.

† It must be remembered that these creatures are so minute that if brushed off from the bud by the hand of a gardener, the unaided eye often fails to detect them. We may see the slightest suspicion of an atom of dust such as may dance in a sunbeam, but it is only when we look at it under a microscope that we find the apparent speck of dust is an animated mite.

HORTICULTURAL EXHIBITIONS, 1875.

MAY.

- 31.—Coventry and Warwickshire Floral and Horticultural Society's First Show of the Season. Sec., Thomas Wigston, 3, Portland Terrace, Lower Ford St., Coventry.
- 31 to June 4.—East and West of England Society's Exhibition at Croydon.

JUNE.

- 1 and 2.—Royal Western Horticultural Society's Exhibition at Plymouth. Hon. Sec., F. B. Bond, 16, Pentrose Street, Plymouth.
- 2.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Great Summer Show.
- 9, 10, and 11.—Leeds Horticultural Society's Twelfth Annual Summer Show. Sec., James Birbeck, Delph Lane, Woodhouse, Leeds.
- 10.—South Essex Floricultural Society's Exhibition at Leyton. Sec., G. E. Cox, Leyton.
- 16.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
- 16.—Glasgow and West of Scotland Horticultural Society. Midsummer Exhibition. Sec., F. G. Dougall, 167, Canning Street, Glasgow.
- 16.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 17 and 18.—Lee and Blackheath Horticultural Society's Exhibition. Sec., C. Helmer, 5, Boones Road, Lee.
- 18.—Scottish Fancsy Society's Exhibition at Edinburgh. Sec., W. M. Walsh, 1, Waterloo Place, Edinburgh.
- 18.—Exeter Rose Show. Hon. Sec., J. W. Gray, Exeter.
- 22 and 23.—The Kingston and Suburban Royal Horticultural Society's Eleventh Exhibition, at Norbiton. Sec., J. Kirk, 2, East Villas, East Road, Richmond Road, Kingston-on-Thames.
- 23.—Fareham and South Hants Horticultural Society's Show. Sec., Harry Smith, Fareham.
- 24.—Royal Horticultural Society of Ireland. Great Summer Exhibition. Sec., A. Balfe, 28, Westland Row, Dublin.
- 24.—Droghda, Clifton, and West of England Rose and Strawberry Show at Clifton.
- 24 and 25.—Great Rose Show at the Alexandra Palace, London. Sec., A. H. Kennerly.
- 26.—Crystal Palace Rose Show. Sec., F. W. Wilson.
- 26.—Royal Botanic Society, Regent's Park. Exhibition of Fruit and Cut Flowers. Sec., W. Sowerby.
- 30.—Wisbech Rose Show and Horticultural Exhibition. Hon. Sec., Charles Parker, Wisbech.

Gardeners' Chronicle.

SATURDAY, MAY 22, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 24	Lincoln Society: Anniversary Meeting at 8 P.M.
		Stock at Mr. R. Parker's Nursery, Tooting, by Prothero & Morris.
TUESDAY,	May 25	Sale of Bedding Plants, &c., at the Horsey Nursery, Horsey, by Prothero & Morris.
WEDNESDAY,	May 26	Royal Botanic Society, Regent's Park: First Summer Exhibition.
		Crystal Palace: Great Flower Show.
THURSDAY,	May 27	Meeting of the Central Horticultural Society of France, at Paris (until June 6).

A SPECIAL MEETING has been called by the Council of the ROYAL HORTICULTURAL SOCIETY, to be held on Tuesday next, at South Kensington, at 3 P.M., for the purpose of receiving a communication from the Council respecting the future prospects and condition of the Society.

We are not in a position to state what the nature of that communication may be, but we have good reason to fear that it will not be of a satisfactory nature. It behoves those, therefore, who are interested in the Society to watch very narrowly what is done at that meeting, and if it be not possible to devise then and there some scheme of reorganisation, at least to secure the adjournment of the meeting.

It is a question whether, in the event of the communication of the Council being unsatisfactory, it will not be a wise step to nominate an independent committee of inquiry into the affairs of the Society.

The first thing to do is, at least, to endeavour to vindicate the now tarnished honour of the Society by taking immediate steps to keep faith with the exhibitors and prize-takers. For this purpose a subscription must be organised among the Fellows, if no other means be forthcoming. The re-organisation of the Society is the next step, and that upon the basis of horticulture only. We have had enough of adventitious assistance and outside aid. See what it has come to: Horticulture is nowhere—the South Kensingtonian party want to keep the manger to themselves, and won't even furnish the corn and hay to stock it with. The horti-

culturists—those among them who are not disgusted with the whole affair—have no cohesion among them, and are the tools of whomsoever will manipulate them most effectually, and Her Majesty's Commissioners look on waiting till they can find somebody who can or will treat with them on reasonable terms, fearing the while to take any overt step, lest they should prejudice themselves in the eyes of the public.

We believe, nevertheless, if they would take more decided action they would earn the gratitude of the Fellows of the Society. Meanwhile, the question to be solved, as it has been for a very long time past, is, what is to be done? The present Council, in spite of its ardent protests, has done no better than the former one. We do not believe any Council will do better which is not composed of working horticulturists—amateur and professional; and we do not believe in the regeneration of the Society unless some manager is placed at the head of the administration who is horticulturist enough to know personally what are the proper functions, horticultural and botanical, of a horticultural society, and what is the best means of fulfilling them. For this purpose a first-rate man should be selected and a first-rate salary paid him. Yes, but where are the funds? is the question that will be asked. Well, let the financiers consider these two points—1, that a very large part of the income of the Society is now diverted, perverted we would rather say, to purposes only very remotely connected with horticulture—and this will continue to be the case all the time the Council and officers of the Society are to a large extent non-horticultural; 2, that at Sheffield last year, at a flower show in the Botanic Garden, there were taken, as we are assured, on one day, in sixpences, more than seven hundred pounds. This week, too, has shown what Manchester can do of a like character. Assuming, as we have every right to do, that these statements are substantially correct, we see in them two prominent reasons of the Society's decline and suggestions as to the means for its regeneration. It will be well if horticulturists would ponder these facts, and meet together to discuss them on Monday next, at 3 P.M., at the Horticultural Club, 3, Adelphi Terrace, Strand—the rooms of which will, by permission of the Committee, be open for that purpose. It may then be possible to consider what are the best steps to be taken at the general meeting of the Society on the following day.

SOME of our readers may have been amused at the revival on the part of Mr. CLARE SEWELL READ of the old story of the possibility of, or rather of the actual TRANSMUTATION, under given circumstances, of OATS into WHEAT. Far be it from us to deny the possibility of the occurrence. Many things as strange, and seemingly unlikely to happen, have happened, and will happen again. But while admitting the possibility we must, with all deference to a man deservedly so highly esteemed by his fellows, confess that we are at present utterly sceptical that any such change really has happened. Until some more satisfactory evidence is put before those competent to judge in the matter we are likely to remain so. Of course we shall receive, and we have received, letters more or less supporting the assertion; but up to this time we have heard nothing but opinions and assertions, often at second-hand, without confirmatory evidence of any value. Knowing the great difficulty experienced in many cases by trained observers rightly to interpret facts, we can readily understand how easily untrained observers may be deceived and arrive at false conclusions. We have had but too many illustrations lately, and some of a very glaring

character, of this inability, even on the part of intelligent upright men, who would shrink from conscious falsehood or misstatement, to appreciate evidence. Some one says such a thing without the least intention to deceive, and some one else believes the assertion because he has heard it "on good authority," and so the statement comes to be accepted as true without inquiry or investigation. The worst of it is that even if inquiry or investigation be systematically made, there is still a large class of people who prefer what they call "the evidence of their own senses" to any evidence which other people can offer. Suppose, for instance, some competent botanist were to pronounce after due examination that this Oat-Wheat of which Mr. READ speaks was not Wheat at all, the class of whom we are speaking would hesitate to accept any such verdict; to them it would be Wheat, whatever the professor might say. The only hope in such a case is that they may feel interest enough in the matter to investigate for themselves, and then it is possible, but not certain, that the fallacy would be detected, and the real explanation of the alleged fact be arrived at. It is the occurrence of such cases as these which leads us to doubt the benefit of farm experiments in different counties, such as Professor WRIGHTSON advocated in the lecture before the Society of Arts, which elicited the assertion of Mr. READ. Unless such experiments can be initiated, watched, carried on, and completed by some competent experimenter—some one provided by Nature and experience with the requisite knowledge, skill, patience, and ability to observe and reason correctly—their value is likely to be but slight. They will have a value, no doubt, and by their multiplication errors may be eliminated; still, on the whole, we do not think the results likely to be obtained by the average farmer are likely to be very trustworthy.

The problem to be solved is a far more complicated one than it appears to be at first sight, and we are at present destitute of many data absolutely necessary for its accurate solution.

The application of a certain quantity of manure to a given area of ground carrying a certain crop might seem a simple matter enough; but even the admittedly rough experiments made for practical purposes only, and cited in Professor WRIGHTSON'S paper, show, by their varied results, that it is not so. We are getting a better knowledge of the chemical history of manures; analysis of the soil and of the crops teach us much that is valuable. Meteorological investigations show us, at least, how much heat and how much water our crops have received in any given period, and how much on the average they are likely to receive in a similar period. But averages fall when applied to individual cases; no two individual plants are alike in all points; no plant is ever subjected precisely to the same conditions as its fellows; assuredly no plant is ever surrounded by precisely the same "environment" as its predecessor. Where our knowledge is at fault is in the history of the chemical and physical changes which take place in different soils when manures are added. No doubt something is known, but not sufficient; we want especially comparative investigations upon this point upon soils of different characters and water-holding power. But if our knowledge of the mutations which take place under different circumstances in the soil is defective, still more so, or rather would we say still more profound, is our ignorance of the mutations which occur in the plant. We know that certain manures stimulate the plant; we see their effects in their increased vigour and size, in their enhanced colour, in the yield of the crop. But when we come to inquire how all this is brought about?—what is the reason of it?—how these actions

are carried on or modified?—we are met with an obstacle—ignorance—that physiologists have as yet only very imperfectly overcome.

What makes the matter more difficult is the fact that plants (we confine our remarks to plants, though the same holds good in the case of animals)—that plants evidently very closely allied are yet affected very differently by the same conditions.

There are two grasses very common in most meadows—*Poa trivialis* and *Poa pratensis*. These two grasses are so much alike that it requires a practised eye to discriminate them, and yet the effects of manures on them, as proved year after year in the experimental plots in Mr. LAWES' park at Rothamsted, are (we speak in general terms) diametrically opposite. Several instances of a similar character have been observed at Rothamsted. Again, in some

ROYAL HORTICULTURAL SOCIETY, South Kensington, fixed for the 26th inst., has been postponed on account of that day being Derby Day. The next meeting of these committees will take on Wednesday, June 2.

— On Wednesday afternoon last the open space lying between the Bethnal Green Museum and St. John's Church was declared open and dedicated to the public for ever by the First Commissioner, Lord HENRY G. LENNOX. The site of the new garden, which is about 2 acres in extent, together with the ground on which the Museum stands, was originally the site of the old green, a browsing-ground for donkeys, kept up in accordance with the terms of a will of some benevolent testator, a receptacle for the dead members of the canine and feline races, and a perfect disgrace to the neighbourhood. In 1863 the local parochial authorities purchased the rights of those who claimed the privilege of grazing under the terms of the before-mentioned will, and handed the ground over to the Government on condition that it should be kept only as ornamental ground. Some eight

local boards. Mr. FOREST, the churchwarden of St. John's, having briefly welcomed his lordship, Sir ANTONIO BRADY and the Rev. SEPTIMUS HANSARD had each something handsome to say on the accomplishment of so good a work, and the good results likely to accrue from it; and Lord HENRY LENNOX, after a happy speech, which was enthusiastically applauded, proceeded to the main gates, and opened them to an immense crowd, who at once took possession of every available part.

— *CRASPEDIA KIEWE* is flowering in the herbaceous ground at Kew. It is a curious member of the Composite, with ornamental globular yellow-flowered capitules, elevated on stalks a foot high. The foliage is not unlike some species of *Gnaphalium*. The lower leaves are spatulate, lanceolate, and petiolate, gradually becoming smaller and sessile up the stem. It is described as an annual, but is at least sometimes a biennial, and in either case deserves cultivation. The capitule is composed of a number of lesser capitules, stalked and involucrate, though the head is so close that it cannot be observed without

FIG. 138.—STREET SCENE: TARTAR CITY, PEKIN.

cases the two halves of the same experimental plot, treated to all appearance and intention in identically the same manner, vary considerably in the results they yield. We mention these instances to show the difficulties in the way of arriving at correct results, and to show the necessity for carrying on experiments with greater care and supervision and less risk of the introduction of sources of fallacy than are likely to be met with, except in very exceptional cases, by farm experiments such as those advocated by Professor WRIGHTSON.

— A SPECIAL GENERAL MEETING OF THE ROYAL HORTICULTURAL SOCIETY will be held in the Council-room, South Kensington, on Tuesday, the 25th inst., at 3 o'clock, P.M., for the purpose of receiving a communication from the Council respecting the future prospects and condition of the Society, and to receive an answer to proposals made by the Council to Her Majesty's Commissioners.

— We are requested to state that the meeting of the Scientific and Fruit and Floral Committees of the

years elapsed before the Government in power could be induced to carry out their engagements, and it was not until the present First Commissioner came into office in 1874 that the work was set about in good earnest, with the result that in much less than two years that has been completed which it took eight years to begin, and the East-enders have now, in addition to the beautiful Victoria Park, the free use and enjoyment of a recreation ground which, we are sure, when the trees shall have grown up, will prove a fitting ornament to any locality. The ground is almost square, and has been levelled, laid out, and planted under the direction of Mr. McINTYRE, the Superintendent of Victoria Park, who, thoroughly appreciating the wants of the immense population of the district, has given as much grass and as many good broad paths as it was possible to afford in consistency with the development of his general plan, which we hope shortly to place before our readers, with details of the planting, &c. The opening ceremony, which was of an extremely modest character, took place during a drenching downpour of rain, in the presence of the members for the Tower Hamlets; Sir ANTONIO BRADY, whose deep interest in all that concerns the welfare of the East End is highly appreciated; the Rev. SEPTIMUS HANSARD, and a number of gentlemen connected with various

dissection. "This is one of the many remarkable genera of Composite peculiar to Australia." The present species has a wide geographical range, being a native of Tasmania and South-eastern Australia, and it is also recorded from the Swan River.

— We understand that Mr. W. A. LINDSAY has resigned the post of Secretary to the Royal Horticultural Society, from his inability to concur in the policy of the Council. We believe that it would be most advantageous to the Society if some paid officer were selected to fill his place—such officer to be highly paid, and to be, not only a thorough administrator, but one conversant by practical experience with horticulture and garden botany—able to appreciate their requirements, and influential enough to fulfil them.

— *SAXIFRAGA PELTATA* is in flower on the strip of rockwork devoted to the genus in the herbaceous ground at Kew. From its peculiar and distinct character, combined with a considerable amount of beauty, it must find favour with cultivators, though not strikingly ornamental. The leaves are just appearing, and of the known species of the genus this is the only one in which they are peltate, requiring for it

the sectional distinction of petiophyllum. It is one of the largest in habit. The rhizome creeps on the ground, partly buried. The petioles are erect, from 1 to 2 feet high, supporting a peltate blade 6–12 inches in diameter, 6–10 lobed, lacinated and toothed, depressed in the centre. The scape is erect, as long or longer than the petioles, and the flowers are produced in dense subcapitate branching cymes, with a diameter of from 3–9 inches. The colour is usually pale pink. It is a native of California, where it is known as the "Umbrella Plant." The best treatment is that given to submergals, although it will succeed in a comparatively dry position.

— In Mr. INGRAM's experience at Belvoir, BLACK HAMBURG and ALCANTE VINES do not inarch with successful results. The Alicante is, indeed, improved in quality, but its maturity is hastened and its keeping powers deteriorated.

On Tuesday evening last the ANNUAL FLOWER SERMON was delivered at the church of ST. CATHERINE CREE, Leadenhall Street, by the Rev. W. M. WHITTEMORE, D.D. The occasion was the twenty-third since the institution of the service, which is intended wholly for the young; and all attending it are requested and expected to carry with them a bouquet of flowers.

The preacher, after some introductory observations, announced as his text a portion of the eleventh verse of the sixth chapter of the Song of Solomon—"I went into the garden to see whether the Pomegranates had budded." His congregation knew, he said, that on these occasions he never took any notice of grown-up people. Many grown-up people who ought not to be there had smuggled themselves in. The church doors were open, and could hardly be closed against them, but this service was especially intended for boys and girls. He thanked a friend who for the past twenty years had on these occasions sent him a nosegay to set in the pulpit as a text for his flower sermon. Twenty-three years ago he had resolved to have a garden wherein in place of flowers and fruit he would train children, and on this special day he had ever since come down to see how the young plants grew and developed—he came down into the garden to see whether the Pomegranates budded—whether his plants grew up to the youthful flower of their habit, and in indication any promise of future piety and usefulness. In the course of his introductory remarks the preacher lamented that, owing to the old-fashioned and box-like form of the pews, it was impossible for the flowers borne by the youthful members of the congregation to be seen, and expressed a hope that by the time at which the next flower sermon came to be preached a donation of £500 would have put it in his power to modernise the internal arrangements of the church.

— Among others in flower on the rockwork at Kew are the following:—*Chlorogalum Leichtlinii*, long erroneously known as *Camassia alba*; it is rather handsome, with tall racemes of *Camassia*-like flowers. A splendid plant of *Phlox divaricata* evidently delights in the shade here afforded; it is about 1 foot high, and covered with lilac-purple coloured blossoms. *V. setacea* var. *albiflora* is also very showy; it is similar in habit to *P. frondosa*, and the much darker flowers recommend it for the same purpose of spring bedding; why called *violacea*, if this is the plant intended, it is difficult to see. A good tuft of *Androsace imbricata* has its dense silvery foliage almost hidden by the pure white flowers which from the shortness of their stalks appear sessile. The rare and choice *Erysimum pomum* is very beautiful, and looks a diminutive of *Chalcantus alpinus*, itself a small plant, except that the leaves are in greater subjection to the flowers.

— At Belvoir recently we saw an ingenious mode of forming a HEDGE WITH LILAC BUSHES at intervals. The hedge was of Privet, and every here and there Mr. INGRAM had grafted on to the Privet a Lilac. Any one on a first glance would have thought the Lilacs were standards on their own roots.

— The large exhibition tent in the Botanical Garden at Old Trafford, Manchester, is to be planted at the termination of the present exhibition with an assortment of Rhododendrons from MESSRS. H. LANE & SON'S nursery at Berkhamstead, where, it will be remembered, they are grown in pure loam. Some very extensive ones have already arrived in the gardens, and they give every indication of a fine display of blossoms, which may be expected to commence opening at the end of the month.

— We understand that Mr. BENNETT has resigned his appointment as gardener to the Marquis of SALISBURY, Hatfield House, Herts, and has taken the Knebly Nursery, near Barnet, which contains some very extensive ranges of glass. Here, after June 6, Mr. BENNETT will offer his services to the public as a consulting gardener and garden architect, and carry on the business of a florist, seedsman, &c. Mr. BENNETT has for many years been well known to

the gardening world, and has been a highly prized contributor to our columns for the past twenty-four years, besides having held some of the best places in the country, and taken a very active part as censor at various exhibitions. We trust that success will attend his efforts in this new sphere of work.

— DR. ASA GRAY has recently published, in the tenth volume of the *Proceedings of the American Academy of Arts and Sciences*, a conspectus of the North American HYDROPHYLLACEÆ. We observe that among the cultivated species *Nemophila atomaria* and *N. discolor* are referred as varieties to *N. Menziesii*. *Eutocia viscidula* is *Phacelia viscidula* of TORREY, *Whitlavia grandiflora* of HARVEY is *Phacelia Whitlavia* of GRAY, *Eutocia divaricata* and *Whangelliana* are both referred to *Phacelia divaricata*.

— In the same publication Mr. SERENO WATSON has published a useful revision of the genus *Ceanothus*, of which he admits twenty-eight species, all American.

— *AZALEA LINEARIFOLIA*, the most remarkable of the genus, is flowering in the temperate-house at Kew. It is beautiful as well as peculiar, and though one of the choicest plants for a botanic garden, deserves still further cultivation. The leaves confer individuality from their extreme narrowness; they are about 3 inches long, ciliated, and light green. The lobes of the corolla are divided nearly, if not quite to the base, are very long, and, being also narrow, seem to assume the leaf form. The colour is pale rose. Suitable cuttings are easily rooted. It is a native of Japan, whence it was introduced by MESSRS. STANDISH. A figure is published in the *Botanical Magazine* of 1869.

— Some time since we had occasion to speak of some tinned CRANBERRIES which were forwarded to us from America. Lately we received other samples in bottles from the New Jersey Cranberry Association, upon which we can report even more favourably than of the first consignment. We have no doubt that, when better known in this country, they will be in request as affording a pleasant variety to our fruit diet. It is hardly necessary to add, that Cranberries so grown and prepared are totally different from what we usually get in this country. It is obvious, too, that there are Cranberries and Cranberries even in America; and we would suggest to our Transatlantic friends to turn their special attention to the thin-skinned varieties.

— As an elegant plant, *EUONYMUS RADICANS VARIEGATUS* is most valuable from its free but low growth and bright appearance. It is much used for the purpose indicated by Mr. INGRAM, at Belvoir.

— We are informed that Mr. ANDERSON, of Meadowbank, has had a splendid bloom of *AMALANIS* this season. The seedlings have turned out particularly good, being specially fine in regard to variety of colouring, as well as highly meritorious in regard to form and substance. We believe that MESSRS. VEITCH have also something good in this way, of which the public will learn in due time.

— The managers of the Alexandra Park have made arrangements with the Messrs. JOHN WATERER & SONS, of Bagshot, Surrey, for a display of their RHODODENDRONS. They will be exhibited beneath a large tent prepared expressly for their reception, and from the celebrity of the firm for this magnificent class of plants, a grand treat may be expected throughout the month of June.

— DEEP PLANTING, we are told, in a recent number of the *Journal de la Société Centrale d'Horticulture de France*, has been generally accepted as a necessary condition to ensure the success of APPLE AND PEAR TREES in the south of France and in Algeria, in order to enable them to escape the fatal effects of heat and drought. But experiments made with several thousand young trees at Hamma, in Algeria, have fully demonstrated the fallacy of this idea. At a meeting of the above-named Society, in February last, Mr. A. RIVIÈRE exhibited a number of vigorous specimens of young Apple and Pear trees, which were then near the surface, to establish this fact. We have so often seen the bad effects of deep planting, and we have repeatedly pointed them out, but it is still practised to a great extent, partly to save the trouble of staking, but more frequently under the mistaken notion that the trees are more likely to flourish. We certainly should plant a trifle deeper in a light sandy or gravelly soil than we should in a stiff loam or clay, but not more than 3 or 4 inches.

— Mr. RIVIÈRE reports (*Bulletin de la Société d'Acclimatation*) on the plantations of *EUCALYPTUS* IN ALGERIA, and the beneficial results gained from a sanitary point of view. Indeed, he affirms that certain places formerly noted for their unhealthiness, arising

from miasmatic exhalations, have become comparatively salubrious! In 1868 and 1869 the *Société Générale Algérienne* planted about 30,000 *Eucalyptus* on the borders of Lake Fezzara, where they thrived so exceedingly well that it was decided in 1870 to increase the number to 100,000. Previous to 1868 there was no woody vegetation in this locality, which at that time was almost uninhabitable. Now the banks of this lake are covered with a little forest of *Eucalyptus*, those planted in 1870 having attained a height of 20 to 25 feet, and, what is more, the unhealthy exhalations have almost ceased. This is a double success, and doubtless much unproductive land in Africa will in this way be reclaimed from the desert waste.

— It is stated that Lady SMITH, widow of Sir JAMES EDWARD SMITH, the President of the Linnean Society, on Tuesday entered her 103d year. Lady SMITH is in perfect health.

— M. DE LANESSAN has recently presented some observations on the ABSORPTION OF WATER BY LEAVES to the Entomological Society of Paris, and which go to show that leaves do absorb water if they are previously flagging from excessive evaporation. A branch of *Lysimachia nummularia*, for instance, weighing 30 centigrammes when in a fresh condition, was immersed in water for twenty-four hours without any augmentation in weight. The same branch was allowed to become withered by exposure to the air for ten hours, at the end of which time it weighed only 20 centigrammes. It was then placed again in water, and when taken out after twelve hours' immersion it weighed 30 centigrammes, as it did at first.

— We are informed that the number of visitors to KEW GARDENS on Whit-Sunday was 21,536, on Whit-Monday 60,619, and on Tuesday 25,070. We are further gratified to learn that not a plant indoors or outdoors was damaged. This intelligence is eminently satisfactory, and is creditable to all concerned.

— THE POPLAR WEEVIL, *Cryolobynchus lapata*, appears to continue very destructive in some parts of France and Germany. It not only attacks the Poplar, but likewise the Alder and Willow and other trees that grow in wet places. In a plantation at Val d'Yèvre, of about 50 acres extent, the loss has been 500 trees a year. The larva of this insect devours the pith of the tree from the collar of the root upwards, and the slightest wind blows down the injured tree. Various remedies have been suggested, most of them too tedious to be practicable or injurious in themselves. One writer recommends the application of a coating of coal-tar before planting young trees, from the roots upwards, about 5 feet of the stem, or higher if there are any traces of the presence of the insect. Care must be taken, he adds, not to put any on the roots or branches, for it will inevitably kill them. We do not like the remedy, and doubt its efficacy, but it would be difficult to find an easy and cheap method of destroying a burrowing insect.

— Mr. BARNBY, director of the Botanic Garden of TOURS, has been trying the relative HARDINESS of different species of *EUCALYPTUS*. The species planted were *E. rostrata*, *gigantica*, *collosa*, and *globulus*, the first of which appears to be the hardiest. In nearly every case the stems were killed to the ground, but the plants threw up again from the base. They withstood the winter of 1873-4, and during the past winter they have been subjected to 14° 4 Fahr. of frost. In Vendée, *E. globulus* has stood eight winters without any injury. According to Baron MUELLER, *E. rostrata* thrives equally well in the latitude of Melbourne and within the tropics, and it certainly is one of the handsomest of the genus, as the figure lately given in the *Botanical Magazine* will testify.

— Mr. BARR has sent us an interesting bunch of *SCILLAS*, including as extreme forms *S. nutans* and *S. campanulata*, with divers intermediates, such as *patula*, *belgica*, &c., of many colours. With them came flowers of two little-known Narcissus—*N. gracilis* and *N. triandrus*.

— The *Revue Horticole* having described the flowering of the offsets of *Agave americana* (to which we referred at p. 594, of May 8), it is interesting to place on record a similar case which occurred at Kew. In the Palm-house, about two years ago, was in flower a fine specimen of A. JACQUINI, and after the central panicle had flowered, the suckers (two?) also threw up panicles, which did not exceed the height of the leaves. It was an unusually fine specimen of the species, but the age was unknown.

— A NEW TURF PLANT for hot, dry countries, *LIPPIA ACYPTICA*, is very favourably spoken of by Mr. QUIHOU, the head-gardener to the Acclimatation Society of Paris. Mr. DELCHEVALLERIE, a gardener in Egypt, was struck with the verdure of a plot of this plant met with on one of his excursions,

and he transferred some of it to the gardens under his care. The result was highly satisfactory, and it has since been tried in France. It spreads rapidly, rarely flowers, and it is of a beautiful dark green. It is hoped that it will prove valuable for forming a turf in the south of France and Algeria, where grass lawns are scorched up and sometimes killed outright during the summer. It will be good news to many if this little *Verbenacaceae* plant should fulfil these expectations, for nothing is more depressing than to see the grass of a lawn all burned brown, notwithstanding all the pains taken to preserve its verdure.

— There is nothing more showy and attractive in the herbaceous department of the Royal Botanic Society's garden, Regent's Park, at the present time than a nice patch of *Aubrietia Campbellii*. Compared with *A. purpurea* growing beside it, *CAMPBELL'S Aubrietia* is a much superior thing, being a stronger grower or "abetter doer," as gardeners say, and having larger flowers of a violet-purple colour, and which are thrown up in abundance. It produces a brilliant bit of colour whenever seen.

A STREET SCENE: TARTAR CITY, PEKIN.

ON October 13, 1866, the Anting Gate (the northern entrance to Pekin) was surrendered to the European allied forces, and at last the interior of the mysterious city was revealed.

Some idea may be formed of the size of the town when it is appreciated that the wall extends over 16 miles in circumference. These walls, which exceed in size the famous walls of Babylon, are upwards of 50 feet in breadth, very nearly the same in height, in excellent repair, and paved on the top, where, with a little management five coaches and four could drive abreast. This caseway is broken at intervals by large massive fortresses at each gateway. These gateways, one of which is shown at the end of the street (in fig. 138, p. 661), are defended with several tiers of cannon, but many of the embrasures are only occupied with make-believe battlements. Besides the fortified gateways there are also bastions at intervals.

The Chinese city, which lies to the south of the Tartar town—from which it is divided by a wall and fosse—is much cleaner than the Manching city, the streets broader and better paved. It is the Paris of Pekin, and here are all the theatres, parks, merchant's houses, wealthy shops. The main streets, one of which is here depicted, in the Tartar portion are broad and straight, but can hardly be termed handsome. The centre or highway is much broken and full of ruts and holes—a mass of mud when wet and deep with dust when dry. This centre way is flanked by two roads on either side close to the houses, which are low and mean. Observe in the foreground the *monocycle* wheelbarrow—a clever contrivance, on the same principle as that mentioned by Mr. Hanbury at p. 632. These huge wheelbarrows, so constructed, carry very heavy loads, and as collision with them would be serious, the coolies who wheel them make a wonderful noise, bawling at the people in their path.

The covered carts, too, remnants of the original nomad customs of the Tartars, are strongly made, and look not unlike oblong boxes on wheels. They are covered over so as to afford protection from sun and rain, and it will be observed that the tilt is extended in front to shelter the mule or horse which draws the conveyance. There are regular stands of these carts in Pekin.

The shop fronts in Pekin are quaint and picturesque. Three, four, or more poles divide the front of the shop into equal parts. At a convenient height from the ground a signboard fills up the space between the poles, and has magnificent characters upon it, giving the title and calling of the trader. The tops of the poles are higher than the roof of the shop, and are surmounted with carved and sometimes gilded ornamentation.

Vegetables and fruits are abundant, whilst Grapes and Peaches are plentiful and fair in season. Pears are very common, although Fortune noticed that the most highly-flavoured and melting species of Pears were unknown in Tientsin, 70 miles to the east.

The nursery gardens of Pekin are to the south-west, in the suburbs, at some distance from the walls, in which direction the whole country is covered with them. As elsewhere in China and Japan the nurserymen, like the other trades, have formed themselves here into a community or guild. Among the hardy plants here propagated will be found the *Jasminum nudiflorum*, *Prunus triloba*, the Judas-tree, *Weigela rosea*, *Honeysuckles*, and the *Banksian* and other *Roses*. *S. P. Oliver*.

THE PROTECTION OF POLLEN.

A GREAT many plants, it is known, are fertilised by the agency of the wind, which carries the abundant, fine, dry pollen from one plant to the female flowers of another of the same species at a distance. The lightness and the large quantity of pollen in such cases insures the occurrence of a good fertilisation. In another large class of plants the fertilisation is done by means of insects, which carry away the pollen from one plant to the flowers of another, which they visit in search of nectar. In such cases the pollen must wait till the insect visits the flower, and must be kept intact for that event, and so it requires special means of protection at once against premature removal and the injurious action of the weather. The arrangements met with in Nature for this end form the subject of a recent investigation by M. A. Kerner, from whose paper in the *Archives des Sciences* the following information is taken:—

The reproductive organs themselves are often charged with protection of the pollen. Thus in *Iris* the stigmas are developed into large petaloid plates, which are turned towards and meet the parts of the perianth. In this way they enclose the stamens perfectly in a kind of narrow canal, through which the insect must violently force itself to collect the nectar, but to which neither rain nor wind can penetrate. In the genus *Aspidistra* the flower takes the form of a widely open cup, at the bottom of which the stamens are very short. The stigma is developed into a large disc situated about half-way up the flower, and quite closing it, protecting the anthers, and leaving only a narrow passage for insects. In the *Oleander*, &c., the stamens have at their point a sort of prolongation in the form of a spoon, and the style is surrounded by a band of long hairs. The combination of these two organs forms a perfect roof for the pollen. In the *Compositae* the tube which arises from the union of the stamens, and within which the pollen lies, is a protection till the insects come.

Often the protective covering is afforded by the perianth. A large number of plants have a part of the top of the flower developed into a true roof over the pollen. This peculiarity of organisation characterises some very important families—*Labiatae*, *Scrophulariaceae*, *Orobanchae*, *Gesneriaceae*, *Utriculariae*, *Polygalae*, *Violaceae*, many *Papilionaceae*, some *Ranunculaceae*, &c.

In other cases, the upper portion of the petals of the corolla remains united during the first part of the development of the flower, and so protects the filaments and the style; or, as in *Trollius*, the flower-leaves, very concave inwards, unite at the top of the flower. In other cases the tube of the corolla which incloses the stamens is so narrow that the water cannot penetrate, the air can find no exit, and remains behind as in a bladder, keeping the pollen dry; or (what is more frequent) the entrance of the tube is closed by hairs, scales, &c.

The spathes of many *Aroidae*, and the leaves of certain *Musaceae*, and of the *Linden*, often cover the flower like a true umbrella.

If any part of the flower is not constructed in such a way as to be capable of protecting the stamens against external injuries, the result sought is attained either through periodical movements of the perianth, or through bendings of the axis.

In the first category we find, especially, all so-called ephemeral flowers, the flowering of which lasts only a day (*Villarsia*, *Tradescantia*, *Convolvulus tricolor*, &c.). The anthers open, and let the pollen escape into the bud; this, on the other hand, opens only in the hottest hours of the day, when the sun is bright, and the insects swarm from all sides ready to effect the fertilisation. The flowers which present a like structure, but whose complete development lasts several days, are ruled by the same laws. In the coolest hours, when the dew might injure the pollen, when the weather is rainy, and when there is little activity of insect life. Some among them love the twilight only; they open a little before sunset, closing in the evening. Their usual visitors are naturally the insects of twilight, and to attract these, they assume lively and shining colours. Others have quite dull colours, but their presence is manifested by a penetrating odour unobscurable by day (*Relbunium triste*, *Hesperis tristis*, *Nyctanthes arbor-tristis*). But these cases are quite exceptional, and the very large majority of flowers with periodic movements open in the brightest hours of the day; this is the time when, in gardens and meadows, the flowers of *Gentian*, *Crocus*, *Anemone*, *Ranunculus*, many *Compositae*, &c., are brightest.

The flower-leaves resume, when they close, the position they had in the bud, and so bring the filaments and anthers into mutual cover.

When fertilisation is insured through curvature of the flower axis, the perianth forms a protective roof over the organs of reproduction; its form, and also the degree of bending, depend naturally, in

great measure, on the length of the filaments. When, as in the *Lily*, the filaments, they are quite short, a little developed perianth and a simple bending to one side is sufficient to attain the desired end. Where, on the other hand, as in *Fuchsia*, the anthers are on long filaments, the perianth is much more expanded radially, and the flower is quite pendulous.

For the rest, there are all degrees of curvature in Nature; sometimes the phenomenon is observable from the bud, sometimes it appears only at the moment of expansion. When fertilisation is completed the young fruit mostly turns backwards, at least where it is not fleshy, and so too heavy to be again moved by the elasticity of the peduncle.

It sometimes occurs that the bending of the axis, like the closure of the perianth, is periodical; this is the case with the flower of *Oxalis Acetosella*, which during the day is directed quite upright, forms an arc of more than 100° at sunset, and at length is bent quite towards the ground. The periodic changes of elasticity in the tissue of the peduncle, which this motion indicates, is shown in many other plants under influence of an external stimulus, and many flowers that usually stand erect, sink to the earth and so protect their anthers, if they are shaken by the wind or by the fall of raindrops.

Lastly, in the *Boraginaceae* and some other families whose inflorescence is scorpioid we find the development of the flowers successively in all kinds of positions to the horizon; they mostly open in such a way that at the moment when the pollen would be exposed to injury the opening of the flower is directed towards the ground, and the rain may hit it without doing damage.

Such are the various peculiarities of organisation, which all have the special object of facilitating the fertilisation of the flowers, inasmuch as they protect the pollen against what might injure it, without, at the same time, preventing the free entrance of insects which aid in this function. Of course these various means are often combined, and where, e.g., a flower which closes every evening, leaves an opening at the point, it is found on a stalk that is more or less curved.

In general it may be said that the pollen is more perfectly protected the less abundant and coherent it is, the more absolutely the fertilisation depends on insects the shorter the time of complete opening of the flower, and the more unfavourable the climate.

The *Orchideae* present, perhaps, the most perfect combination of all means of protection; which fully agrees with the nature of their pollen and the small number of their flowers. In the *Pomaceae* and the *Amygdaleae*, on the other hand, the anthers are very numerous, and the flowers are so abundant that, if only the half were developed to fruit, the tree could not carry its load. Accordingly, in this case the means of protection are very rudimentary.

A superficial glance, even, at the flora of a country will generally show an intimate relation between the character of the weather and the structure of the most largely distributed families. A cold and damp region, where the fertilisation must always be difficult, where the flowers must sometimes wait several days for a sunshine favourable to the excursions of insects, will not fail to exert a remarkable influence on the character of its flora. Thus on the Alps, where the dew is very heavy, and persistent clouds cover the mountain summits for days together, the prevailing species have all perfect means of guarding their pollen (*Gentiana*, *Primula*, *Andromeda*, *Soldanella*, *Pedicularis*, *Campanula*, *Euphrasia*, *Veronica*). There are here no plants with ephemeral flowers; the anthers never rise much above the crown of the flower. If we compare the flora of South Australia (a region where during the whole flowering season not a drop of rain falls), the *Mimosae*, the *Myrtaceae*, the *Proteaceae*, which are here so abundantly distributed, have all stiff flowers with very short perianths, and very long stamens, which leave the pollen quite exposed.

Some apparent exceptions confirm, on a closer examination, the above rules, and are those cases in which there is an unprotected though dependent pollen the injury to fertilisation thus rendered possible is compensated by an enormous quantity of the pollen and a very long time of persistence of the flower. *A. W. M.*

FLY-TRAPS.

As this is a time when certain plants are on their trial for their carnivorous propensities, it may be worth while, on the score of fair play, to hear counsel on both sides. Not that I am prepared to measure weapons with the advocates of the other side, but I think that certain statements of facts, well known to plantmen, should be put in, in time to save the reputation of the plants in question; for not only are they charged with slaying their victims, but also with devouring them, and, finally, with digesting them. As I have been familiar with these plants for some thirty years or more, I may state their behaviour under my own observation.

The Sundews (*Drosera rotundifolia* and *D. longifolia*) abounded until lately in all the bogs round Manchester, so that I could send specimens by post to distant friends, who admired these curious tiny herbs; but the hot summer some years ago burnt up all the Sundews of our mosses, and since that time I have had to go far a-field for specimens. The pretty little *Pinguicula*; our most moorlands is also blamed for eating flesh; but the most notorious offender in this way is the Venus' Fly-trap (*Dionaea muscipula*), whose machinery when set in motion is quick as thought in securing its prey. The Side-saddle plants (*Sarracenia*) are clumsy growers, holding dirty water for ants and flies to drown in; and the same may be said of the true Pitcher-plants (*Nepenthes*). Now, if any one goes into an Orchard-house he may see shallow shrimp pots with treacle and water in the bottom, and thousands of ants, some in good health, tempting their fate, some dying, and thousands dead; but the shrimp-pot has no digestive power; it is simply a fly-trap, and differs in nothing from the vegetable traps of *Nepenthes* and *Sarracenia*, with their thimblefuls of water, and half a pitcherful of dead ants and flies, usually ending in the destruction of the ornamental plant instead of manuring the plant.

In Dr. Drummond's *First Steps in Botany* he mentions a shrub found at the Cape called the Flag-bush, whose botanical name he gives as *Koridula dentata* [A near relative of *Drosera*]. Its leaves, he says, are furnished with glandular hairs, so that people keep it in their houses to catch flies, as we do twigs smeared with birdlime. This plant ought to stand at the head of the class of fly-catchers. I counted 200 dead flies on a piece of treacled paper less than a foot square in my own kitchen in this year of grace, and it was due to the clammy coating, and to no other cause, that the feet of these 200 flies got fast, and their life was snuffed out. There was nothing to be laid to the score of acrimony or intolerance, as in the case of the Sundews, whose clammy secretions are said to be deadly, which they need not be, as the pretty globules at the tips of their hairs are viscid enough to hold the fly, and it could hardly escape coming in contact with half-a-dozen red bullets when, feeling entangled, it began to struggle. Out of the thousands of Sundews, however, that I have seen with my young, and in flower and in seed, I have never met one with a digestive tract, or with any other mark by which one would suspect it of carnivorous proclivities; and as the plant grows in wet bogs, usually in company with living *Sphagnum*, the carcass of a fly could be of little avail in such a case, where clean water, or water tainted with peat, was the chief dietical element. As this tiny British plant has no protection against storms and heavy rains, two things become evident—the one, that the rain would wash off anything like dust deposited on the foliage thus fully exposed to it, and the other, that the rain never does wash off the transparent substance at the tip of every hair; thereby proving that this clammy substance is not of the nature of dew. The "vertues" of this plant are set down in books as a perfect cure for warts, and powerful enough to blister the skin; it may be so, but many such "vertues" in *Herbals*, &c., are rank quackery.

It is well known for the Sensitive Plant (*Mimosa pudica*) that nothing of this kind can be laid to its charge, for its leaves have only to be lightly touched, even with a single hair, to droop as if by magic; not only do its leaflets drop one after another upon one's eyes, but the footstalk follows suit, as if the soft infection ran through its too delicate tissue. This has amused children greatly. The movements among plants are far more common than most people think, for we find in the flowers of the common Barberry that when its filaments are touched on the inside they suddenly contract, and impregnate the flower by striking the anther against it, so depositing the pollen on the stigma. The tendrils of the *Pea* feel their way all round for a support, like a blind man groping for his staff. In frosty weather the *Rhododendrons* hang their leaves as if dying, like the Sensitive Plant, but they very soon get stretched up again as soon as mild weather comes. The daily opening and closing of flowers is a slow process, but the less rare, nor the less marvellous, for the heat and the light do not always explain the mystery. Thus we find the night-flowering *Cereus* (*Cereus grandiflorus*) blooming in the dark, and the night-scented Stock (*Matthiola tristis*) giving out its grateful odour only when the sun goes down [for the benefit of night-flying insects]. The Broom (*Spartium scoparium*) and the Gorse (*Ulex europaeus*) sow themselves, for the pods burst open with a loud crack and fling the seeds on to fresh soil, yet few wonder at the deed or praise the design. It seems, however, evident that the still life of the vegetable kingdom was not to exist alone, for we find that the impregnation of many flowers could not be well done without the aid of insects that move as well as live. Hence the beautiful fitness of the honey-bee for its work, and of the peat-cad mountain with its square miles of blooming Heather and its honey to attract the bees, whose disturbing movements were wanted to get fertile seed; and the

wonderful impregnation of the Orchids as explained in Darwin's works only shows the fitness of the tropical insect for the wants of the tropical plant, just as the bee of Britain is for the Heather of that ilk.

I have often wondered whether the Northern national music of the bagpipes with its drones and chanter, had been borrowed from the humming song of the honey-bee—for when bees are about to sting they give you their music in quite another key, their battle-cry being sharp and shrill as compared with their airs when gathering honey. Therefore much of the charm to Scottish ears of the Highland bagpipes may lie in the sound being so like that of the bee on its native hills.

Whoever would study the habits of *Pinguicula* should traverse the Scottish moors and fens, where Heather of various hues and floods of water meet like friends, and deck each other's charms.

It is unfortunate that all the plants blamed for this vice of eating their visitors are rare. The *Dionaeas*, *Nepenthes*, and *Sarracenia* are all rare exotics, and I have already stated how scarce Sundews have become in our bogs, and as for *Pinguicula* Smith gives them a habitation, and a name, of volcanic swamps and fens, and *P. grandiflora* in Irish bogs, rare.

I do not dispute any of the facts adduced. I have shown that movements in plants, flowers, and seeds are no arguments in favour of plants impaling insects, or of eating them, still less of digesting them, when applied, as they must be, at the wrong end; for plants feed by their roots (and by their leaves also), and as for their "inward digestion" that is not yet a settled question; but it is not upon the small mole-hill of the impregnation of an Orchid that we are to place the lever that is to overturn the world? Verily we must not then despise small matters. *Alex. Forth.*

P.S.—A very exalted personage lately made the remark that he sympathised with learned men and bore with their errors, because, he said, their dear good heads were so filled with learning that they had no room for "common" sense. Some years ago I had the misfortune to spoil a good theory of a very learned man. A light of knowledge over the land of South Devon in April, or, as the almanacs have it, "thereabouts," and toads, which were on their way to their spawning-beds, left a curious track in the snow as of some animal with a hoof. The print of the hoof was figured in the papers, and reports poured in from all quarters. In one case the animal had come to a haystack, and the track was seen beyond it, and the question was how did this animal get over the stack. Worse than all, it was traced to the water's edge, and here it took to a navigable river, reminding one of the lines—

"He stayed not for brake, and he stooped not for stone,
He swam the Esk river, where ford there was none."

To cut the matter short, the learned Professor gave it as his opinion that the badge put one foot before the other when he walked straight forward, and it could only be the track of a badger; but I found on the high road the same track—a toad's, and also his bruised and mangled body crushed by a cart-wheel. There were no further tracks of this humble traveller beyond that spot. So it is sometimes wise to wait for facts before we jump at conclusions. *A. F.*

Home Correspondence.

The Fruit Manual.—I thank you for the favourable notice you have given of my book in your last week's number, and at the same time I ask permission to be allowed to make some explanations in reply to what your reviewer calls "its deficiencies." I have used my best efforts to make systems of classification by which the names of fruits might be ascertained, and in this I have succeeded in all cases except in Peas and Strawberries. The arrangement of Apples which I have discovered is based on characters so fixed and natural (or at least as fixed and natural as I could find) as to allow me to say that the arrangement usually adopted is not the purpose intended; but I have not been able as yet to place the numerous varieties in their proper divisions, from some of the characters upon which the system is based not being found in the published descriptions of the fruits. In such a case as this the pomologist has difficulties to contend with which the botanist has not. The latter has merely to make use of the many well-stored *herbaria* which are so easily accessible, whereas the pomologist must wait patiently for times favourable to supply him with materials for his work. The basis of classification which my reviewer suggests to me are not what I should have expected to have been proposed by a man of science, such as I believe most of your reviewers profess to be. What his ideas of "Permaius, Pippins, Reinets, Codlins, &c." are he does not explain. [That is for those who use or adopt the terms to do. It is the ordinary practice of an author to specify the sense in which he uses certain terms, but such definitions in the *Fruit Manual*.] In former days I had some crude notions on the same subject, but I have failed to mould them into anything that I considered creditable to my own ingenuity or useful to the study which

it has been my object to promote. Five and twenty years ago I published a classification of Apples much on the plan of the "definite or arbitrary rules" which the writer suggests, but they were not definite enough, and they were so arbitrary they would not work, and after all these years, during which I sometimes used and sometimes abused this classification, I gave it up as a delusion and a snare. I must therefore ask my reviewer and the beginner for whom he pleads, to frame a classification such as they require for the present, on rules which their own minds dictate as most "definite or arbitrary" to satisfy their wants. [Why ask a beginner to do that which should be done for him by the hand of experience? Such a system may suit very well for nurserymen's catalogues, but in a work which makes some slight pretension to scientific claims it would be as great an anachronism in the present day to adopt such classification as my reviewer proposes, as it would be for a botanist to classify plants on the system of *Cuspalpinus* of any of the old herbalists. Another deficiency in the book complained of is that no mention is made of the "stock" Apples of which there is a collection at Chiswick. So far as I am aware, only one out of that collection has borne fruit in the garden, and as it is not on record that the whole collection has been fruited, I do not quite see how it was possible for me to give a description of them. If the knowledge is in possession of the writer, he will confer on many who are interested in the subject if he will publish the description with figures in next week's *Gardeners' Chronicle*. [See 1874, vol. i., p. 541, where the general characters, apart from the fruit, are given.] The French Paradise, which is the only one that has fruited in the garden, ripened its fruit after the first 50 pages of my book were printed; and to show that I neither neglect nor ignore of the fact, the fruit was figured and described by me in my *Gardeners' Year-Book* last November, within two months of the time when it was produced. There are many "fine Nectarines" I dare say about the country, which are not mentioned in the new edition of the *Fruit Manual*, besides the Welbeck Seedling. I have many "fine" fruits of all kinds sent me from time to time, which are not new, though they may be seedlings. In saying this, I do not attempt to depreciate the Welbeck Seedling, which I know nothing about. It has never been submitted to me for approval, to the Fruit Committee; or, if it was, it received no approval; neither am I aware that it has met with the approval of any competent authority. It may be one of those seminal productions, for aught I know, which so frequently occur, and of which an example was given in the extract taken from my book on *Grosse Mignonne* Peach. Mr. Rivers throws away dozens of "fine Nectarines" every year, which he has raised from seed, knowing that they were not required, and which, if named and cultivated, would only swell the pages of the fruit catalogues without adding to the value of our collections. As to the omission of any notice of some of the Nuts figured and described in your pages for 1873, I can only say you must excuse my criticising that article. If I had thought that it contained any contribution to pomology, I would have asked permission to do so, and that all that is of any importance in it was already contained in the *Fruit Manual*, I saw no need for loading my pages with matter which was not needful. [That is for others to determine. EDS.] In conclusion, let me again thank you for the commendatory terms in which you have spoken of my book; notwithstanding which it contains a mistake which the eye of my critic has failed to detect. As it is an important one, I shall be glad if you will give it publicity. In describing President Strawberry I have, through an error of my informant, ascribed the merit of raising it to Mr. Bradley of Elton Manor, whereas I have learned since the book was published that it was raised by Mr. Green, a gardener at High Cross, near Ware, and that it was first exhibited at the Royal Horticultural Society, Regent's Park, by Mr. Hill, gardener to Robert Hanbury, Esq., of Poles Park, Hert.

Robert Hogg.

Primula Parryi.—A few months ago I wrote you a few remarks for insertion in the *Gardeners' Chronicle* respecting the Rocky Mountain Primrose, *Primula Parryi*. In examining the flowers to-day at the York Nurseries, where it is now in full flower, I discovered that my former statement respecting the inflorescence was incorrect. When I wrote in the winter my remarks were entirely from the previous year, and the plant in flower at York the present summer, I believe, when speaking of the inflorescence, said the flowers were produced on a one-sided spike, whereas they form a terminal umbel, much in the same way as in *Primula involucrata*. The individual flowers are large (about 1 inch in diameter), firm in texture, and very handsome. The plants are much more vigorous and earlier in season than they were last. The leaves are entire, strap-shaped, and a deep glossy green. For the successful culture of this high mountain Primrose, it should be planted in deep, rather stiff loam, with a

slight admixture of peat, taking care to select a shady part of the border or rock garden. It should be liberally supplied with water: I find it does well when planted near the water's edge. *R. P.*

Cypripedium japonicum, &c.—After reading the notes of the New Plant and Bulb Company on *Cypripedium japonicum* perhaps you will let me say that of our few plants bought from them the two planted in the rock border seem to grow the strongest. The order of flowering here of the hardy *Orchis* is—*Cypripedium pubescens*, almost over; *C. arcticum*, small, but very pretty, fully out; *C. japonicum*, in large buds; *C. spectabile*, not yet showing bud. *Cypripedium japonicum* seems a valuable introduction, as, in addition to the flower, the leaves are curious and quaint. *Van Houttei's Azalea mollis* is in great beauty on the rockwork; three plants, buff-rose, rose-buff, and orange-buff, each with from twenty to forty large trusses of their great flowers, have a fine effect. *Erythronium giganteum* in the rock was being beautiful; four large flowers on a stem; colour a pale primrose with bright yellow centres. *George F. Wilson, Heatherbank, Weybridge Heath, May 17.*

Strawberry Culture in Pots: Sods & Saucers.—Thanks to Mr. McIndoe (p. 632) for calling the attention of Strawberry forcers to the above subject, and which call, I trust, will be answered satisfactorily to those interested in the culture of this delicious fruit; and no doubt most gardeners (myself included) will give a decided preference to the mode of standing the pots on sods; that is, where it is found practicable to do so, which is not so in every place. For instance, How would sods answer on wooden shelves suspended one above the other from the rafters or otherwise? and what about getting new shelves made when the old ones get worn out, which assuredly they would do in "double quick time" were they to have wet sods upon them for two, three, or more months in the year. I think, too, there will be found some gardeners who, at least, will not condemn the saucers without saying a word in their praise. Saucers have been for many years associated with the experience and practice of Strawberry forcers, and of the latter I think there must be few who cannot say that they found the saucers very useful, and that they have been of great advantage to the fruits when they were swelling off. Moreover, they are very useful when a careless "chap" has charge of the Strawberries, or at least whose duty it is to water them—and how often does this man only surface-water the plants; but, how it runs through the pots into the saucers, where it remains until the plants absorb it—say for ten or fifteen minutes. During bright sunny weather like that which we had during the last week there is not much fear of the water remaining long in the saucers, and should the weather be dull the saucers should be emptied once a day, otherwise the fruit is sure to be soft, watery, and insipid—which would be no wonder if left standing in stagnant water day after day. *H. W. Ward, Longford Castle, Salisbury, May 18.*

Birds and Crows.—In reading "*S. II.*"'s description of sparrows destroying Crows in page 634, his plan of feeding the birds upon more favourite food so as to divert them from the Crows seems very likely to succeed; but when "*S. II.*" asks "Why should sparrows destroy Crows in one garden and not in another?" &c., he answers it as occasioned by want of food. I do not think that the real reason of the outrage is when the charmed circle of birds and animals that, like ourselves, they are apt to be led away by evil example. Some forty years ago I lived at Epperstone, in Notts, where every kind of bird food abounded, but where it was impossible to grow Primrose or Polyanthus in consequence of the green linnet invariably picking the flowers to pieces before development for the sake of the young seeds. This extended for several miles round the neighbourhood, and when the charmed circle of birds was not a plant was touched, and throughout Notts and Derbyshire I never could find any depredation committed by these birds. Again, I was, some years after, looking over what ought to have been a kitchen garden in Cheshire, and I found the game destroying everything except Potatoes, it being situated in the midst of a large preserve. I suggested a 2 or 3-foot wire netting; and some time after my friend thanked me for the suggestion, and found it perfect, even against pheasants. A neighbour of his situated in exactly the same circumstances was so pleased with the netting that he got some from the same shop, and surrounded his garden in an exactly similar manner. At eventide he sat down at his drawing-room window to see the result, as his friend had often done, with much amusement, to watch the puzzled look of the hares. In the latter instance, however, after being completely posed for some half-hour, the pheasants, hares, and cock, a wicket jump over the wire, and all the rest followed, and continued playing at leap-frog till dark. In this case the wire netting seemed to add to the enjoyment

of the hares, while years after the first garden remained secure from their attacks, and as far as I know, is still so. In my part of Cheshire I found the Thousand-headed Cabbage never touched by rabbits, where they abounded. A friend was delighted on observing this, and planted them largely near Congleton, 12 miles off, but there the rabbits eat it voraciously. I could give many more such instances. I remember a flower-garden near a large pond, where for years the Crocuses were never touched by the water hens which abounded; but at last some bad bird found them out, and none could after be grown, as they devoured all the corns. *W. D. F.*

Clematis montana for Spring Decoration.—In our report of one of the recent meetings at South Kensington it was mentioned that Mr. Barron had brought up from Chiswick some nicely bloomed small plants of the old *Clematis montana*, which proved to be extremely useful in this form for the decoration of the greenhouse and conservatory about March and April. The sketch annexed (fig. 139), shows one form in which the plant was grown; two or three branches of young wood were tied up to a short flower-stick, little more than a foot in height, the ends of the branches being allowed to hang rather loosely, and these formed the prettiest little standards imaginable, and, as will be seen from our illustration, were covered with blossoms. Though not large, the pure white flowers, being numerous, were very attractive and ornamental. Another form in which the plants were grown, and one equally well adapted for decorative uses, was that of a small cone or pyramid. In this

FIG. 139.—CLEMATIS MONTANA.

case the young shoots were longer, and they were coiled around a trellis composed of a few slender flower-sticks stuck into the pots, and brought together to a point at the apex, the trellis thus formed being about a couple of feet in height. These being also well bloomed were equally effective. Such plants are easily grown, and in the case alluded to were bloomed in 6-inch pots. What is particularly necessary is to get the young wood well ripened, as it is from this that the flowers are put forth. *T. M.*

Rot in Onions.—Year after year my spring Onions take what is known as the "rot at the roots," and in the hot days of May become in patches quite withered and decayed. The disease seems to be owing to some kind of fungus. Perhaps some of your correspondents could suggest a remedy, unless, indeed, it is incurable, like the Potato disease. Change of ground seems of no use. *J. S., Llewellyn, Worcester.*

Maize.—If "*A. F.*" (p. 567) alludes to the Maize or Indian Corn now being offered to agriculturists by Mr. William Cobbett, I am in a position to say something with reference to its qualities, as during the past year Mr. William Cobbett was my next-door neighbour. Cobbett's corn was some years since quite a rage, although it soon died out. The elder Cobbett was notoriously opposed to the Potato, and he hoped that his Indian Corn would ultimately supersede the famous esculent; but in this belief he was miserably deceived. The original Cobbett's corn is extinct, whilst the Potato is universally grown. My former neighbour terms his corn an "improved variety;" and if its true character was developed here last sea-

son, then it deserves all that is said in its favour. When Mr. Cobbett came to reside in Bedford some two years since he brought with him a small stock of the seed, but where it had been grown previously I cannot say. This first summer, the garden of the cottage he then occupied sufficed to grow his stock, and this all ripened thoroughly, and when he came to reside close to me the following spring he had a sufficient quantity of seed to plant, not only his own garden of 40 rods of ground, but also about 2 acres in a field not far off.—That in the garden being sown in rows where it was to stand, and that grown in the field being first raised in a seed-bed, and afterwards transplanted. This latter course was necessitated because the ground could not be got ready sufficiently early to enable the corn to be sown in drills as usual. That grown in the garden was sown in drills 4 feet apart, the ground having been first ridged and lightly rolled, as is commonly the case with Mangel Wurzel. I did not think that the 4 feet interval was a necessary one, and in good garden soil I believe that equally satisfactory results would be obtained in drills 2 feet apart, still in 4 feet drills it would be possible to grow an intermediate crop of dwarf Beans, Lettuce, or some other vegetable. The time for sowing is about the middle of April, and in drills about the depth usually given to Peas. The corn should be sown thinly, and ultimately thinned out to 6 inches from plant to plant. Just as the corn is coming through it proves exceedingly tempting to the birds, and therefore it should be carefully watched until it is out of danger. I have a vivid recollection of the exertions of Mrs. Cobbett as a "bird-starver," as that lady gave the feathered thieves little chance to despoil her precious crop. As the plants grow they should be deeply stirred about the roots with the hoe, and when from 12 inches to 15 inches in height be well earthed up, to give them all possible support. During the summer the plants will throw up suckers from the base of the stem, these should be cut or pulled away, as they only serve to strain the plant without adding to its productiveness. These few directions constitute most of what it is necessary to know as to garden cultivation. In field culture a greater width between the rows is necessary, as the hoeing and earthing must be performed by horse labour; and where sown in a seed-bed and afterwards transplanted it simply requires to be done with an ordinary dibble in showery weather to make the work successful. I cannot now give the exact time when Mr. Cobbett's corn was ripe; but I think the earliest cobs were ready about the end of August; certainly from sowing to ripening the time occupied was from three to four months. Of course all the cobs do not ripen at once, but that is of no consequence, as the crop can be gone over twice or thrice and the cobs gathered, or, if thought desirable, the whole crop can remain until all is ready to harvest; and there is this merit attached to the Maize, that it is not affected by wet or frost, and may be harvested at any time when the weather is dry, as the leathery sheathing in which the cobs are encased keeps the corn quite dry and clean. Mr. Cobbett strongly impressed upon me the fact, that with a crop of his corn, the grower was quite independent of a wet harvest. The average height of well-grown plants of this variety is 3½ feet, and a good plant will produce from four to six cobs. I think the latter number to be nearest the mark, but all depends on the cultivation. As evidence of the productive character of this corn, I may say that I counted the cobs on a large number of fair-sized cobs, and found them to be usually eight rows of thirty each, thus giving a total of 240 to each cob, or from 1000 and upwards from one corn—certainly an enormous produce. Well-ripened clean cobs are of a rich golden bright yellow, and very handsome. I am growing some myself this year, and there is some being grown elsewhere in the village, so that, ere long, you will be able to call on me for themselves about the end of August. Mr. Cobbett was very eulogistic as to the extremely delicious nature of the green cobs when properly cooked, and served as a table vegetable, characterising it as a dish for an epicure; but of this I cannot write with authority. Perhaps "*A. F.*" has had some experience of it in this state, and would say whether the green cobs are a delicacy or not. At any rate, the Maize's corn of the stem is of its qualities, and if such is the case, surely this corn should be found in every well-appointed garden. As to its value in a ripened state, I presume that would depend materially as to the case with which it could be discoloured and ground ready for domestic use. Discobbing machines are to be had, and no doubt hand mills for grinding are to be had also; and, granted these things, a real delicacy in the shape of pure corn-flour becomes at once both possible and easy of production. *Alex. Dean, Bedford, W.*

International Potato Exhibition.—In Mr. Dean's letter, inserted in your issue of last week, reference is made to the additional prizes offered through us by our friends Messrs. Bliss & Sons, of New York, and a desire expressed that the sorts

should be indicated to which their prizes would be awarded. It was the intention of Messrs. Bliss to offer prizes for the best dishes of Alpha, Snowflake, and Eureka, but the previous resolutions of the committee prohibited any prizes being offered for sorts specially named. In order, therefore, to be consistent with this resolution, we authorised the alteration of their offer to its present form, and consequently any really American variety which was not sold in England before the spring of 1874 is now admissible. Competitors cannot do better than adhere to the sorts for which Messrs. Bliss intended their prizes—viz., Alpha, Snowflake, and Eureka. Hooper & Co.

Potherbs.—Some thirty years or more ago the gardener at Chiswick House, the then residence of the Duke of Devonshire, was noted for his management of potherbs, and for vapour baths indicated by the use of herbs. The leaves of the various potherbs were picked from the stalks just as we read of the Tea leaves being gathered from the bushes, and when thus collected they were pressed into thin cakes of the shape and size of a flue tile, say 12 x 12 inches by 1½ inch, and dried by fire-heat, and finally packed in paper and stored for use. This was a great improvement upon ancient usage, when the herbs were harvested like corn in small sheaves and hung up in sheels to dry as best they might, and when afterwards they were awkwardly handled the leaves, that were the only useful parts, would drop off and the naked stalks, more or less dusty, would finally be the form that potherbs would take in winter for the supply to the kitchen. The Chinese had taught us how to dry leaves, and we had only to imitate our betters in this respect to have our potherbs preserved in perfection. I was agreeably surprised the other day to see in my own house potherbs in bottles, neatly got up, not a stalk to be seen, but the leaves as neatly dried as any Tea leaves ever were, and that, too, at a very reasonable price, about 7d. per half-pint bottle, and these were supplied by the regular traders in preserves (Crosse & Blackwell), thereby saving any trouble to the housekeeper. When I had to keep up a supply of potherbs for the use of a large family, I got the tinman to make me canisters and to get the name of each herb put on in inch letters, and following in the wake of Mr. George Robinson, the gardener at Chiswick, I had the potherbs carefully picked and dried by fire-heat, but instead of pressing them I packed them into the tin canisters, from which they were supplied as wanted, precisely as tea would have been served out. This was duly recorded in the gardening periodicals of the day, and, therefore, I may claim for Mr. Lindsay and myself the credit of keeping potherbs clean and sweet: at all events we were pioneers in that line. I was one day shown through the propagating department of a London nursery, and the propagator claimed the credit of striking cuttings between two flower-pots, the inner one plugged at the bottom with a lump of clay and kept full of water. He little thought that he was paying his unknown visitor a compliment, for I had had that in print long enough before he had practised it. I have also a recollection of detailing the working of a dry earth closet on the premises of Mr. George Robinson, 10, Great Street, Aberdeen, some twenty years before the thing had been mooted in England. Mr. Robinson used the wood ashes of the waste wood, sawdust, and shavings of the workshop, and as wood ashes of themselves are excellent manure, the system was better worked by him than it could be in ordinary hands. It certainly helps an inventor a good deal when he finds anything fully detailed for him to copy. *Alex. Forsyth.*

Watercress Beds.—Can any of your readers give me any information as to the proper way to make a Watercress bed? I have choice of field between two brooks or some shaded streams. The latter would be least trouble, but are very much shaded by high banks and trees. Would this be against it? If so, is best for a Watercress bed? If not, what is best? How deep should the water be kept? What size beds are best? And how many yards does it take to grow one hundredweight? *Aqua.* [See *Gardener's Chronicle*, 1866, pp. 193, 416.]

Apiary.

ITALIAN BEES.—Englishmen have a great rage for novelties. This was the case some few years ago in regard to the Italian, Alp, or Ligurian bees, for by all these names they have been recognised, but somehow they have not gained the popularity which their first appearance foretold. Many bee-masters after a brief trial gave up keeping them, and perhaps one cause of this failure was the difficulty in keeping the breed pure, in consequence of the frequent hybrids, and wherever any black drones exist within 1½ or 2 miles they will seldom be preserved very long in a pure state, or as a pure race. Also many apiarists do not believe they are superior in any point to our hardy black bees. It is difficult when any prejudice of this kind exists to convince persons to the contrary. We

will try briefly to lay before our readers a little experience, not shared solely by ourselves, but gained by years of study by some of the most practical, as well as scientific, bee-keepers in the North of England.

A friend states as follows:—"I have kept Ligurians now for twelve years. I first saw them at the exhibition working beside a black stock; the latter was much stronger as a colony, but I fancied the Ligurians were far more active. Whilst watching them a shower of rain fell, which had the effect of detaining the black bees prisoners, not so the handsome Alp bee, which worked bravely through the rain. I have since kept them, and am convinced they are much better honey-collectors than our black bees."

Their superiority consists in:—
1st. They are far less sensitive to cold and moisture.

2d. The queens are remarkably prolific. We have known stocks of these bees started as artificial swarms with but few workers, which in a short time have become powerful and strong colonies.

3d. They swarm earlier and far more frequently. This is a consequence of the prolific queens.

4th. They are excellent honey gatherers. We have gleaned more super honey from the Alp bee than could have been gained by the black breed. In bad seasons they have proved most valuable.

5th. They are more courageous and active in self-defence. We have never known a stock destroyed by robbing, which is commonly witnessed in apiaries of the common bees. They are also more active on the wing. We confess they have one bad quality—they are notorious thieves. Sooner than be deficient of their winter supply of provisions they will attack their neighbours without the least scruple of conscience. My bees have robbed and destroyed stocks half a mile from their own hives. Many of my neighbours have complained bitterly of the strange yellow bees in this case.

I had to keep silence about the ownership of the wasp-bees, so-named by the cottagers.

6th. They are handsome bees, and are most worthy of a place in the ornamental garden, where bees are kept only to make the spot more home-like.

The difference in appearance consists in the first rings of the abdomen, except the posterior edge and base of third, being of an orange colour instead of a deep brown. The coloured parts are transparent when closely examined with the sun shining on them. All Alp bees have the same distinctive marks if pure—the two orange-red girths; some are lighter than others; a dark green will, however, produce just as well as a light one. The drones differ from workers in having the upper half of their abdominal rings black and the lower half an ochry yellow, thus causing the abdomen, when viewed from above, to appear annulated.

We have never briefly brought before our readers a few noteworthy characteristics, wherein the Ligurian differs from our common bees; these views are firmly believed by Langstroth and Quinby, the two foremost apiarists of America. We merely state, in conclusion, if you have a long purse and are wondering how you must spend all your spare cash, invest a little in the "yellow bees;" they will yield you a good return in the shape of innocent pleasure if nothing more. But we advise the farm labourer and working gardener, who, in many instances have to make their evening pipe surrounded by a little family of nine or ten children with an income of less than £1 per week, to leave the study of the yellow bees to others, and keep only the black stocks, for these will gather honey perhaps equal to the Ligurian, both in quantity and quality; and this is the chief thing to be attended to in bee-keeping. *R.*

Reports of Societies.

Manchester Botanical and Horticultural: May 14 to 21.—The annual Grand National Whitstable Exhibition of this Society opened in the Botanical Gardens at Old Trafford on the 14th inst., and closed last night, and whatever may have been the result financially, it was—as a display of practical horticulture—perhaps the best of the series which the Society has ever had. The well-known glass pavilion was an exhibition in itself, so thoroughly good were its contents. The stove and greenhouse plants were a grand lot, especially the flowering and fine-foliaged plants contributed by Messrs. J. Cole & Sons, of Wingham, and Mr. Cypher, of Cheltenham, and the fine-foliaged plants by Mr. B. S. Williams. Orchids, though not so well represented as last year—the show being quite a fortnight earlier—were still exceedingly fine, while the Ferns, hardy and exotic, call for our special commendation. A specimen of *Gleichenia Spelunca*, 6 feet high, and, as near as we could judge, from 7 to 8 feet through, and grandly furnished, was a sight to behold with admiration, so rarely is such a noble specimen seen. T. M. Shuttleworth, Esq., Preston, was the fortunate exhibitor. The much-talked-of "war of the Roses," fought out between the rival champions of Slough and Cheshunt, will long be

remembered, to the credit of both exhibitors, so noble were the specimens and so even the contest. New and rare plants came in formidable numbers from Mr. John Wills, Exotic Nursery, Old Brompton, and Mr. Williams, of Holloway; and among other striking features of the exhibition we must not omit to mention a charming group of Clematis from Messrs. G. Jackman & Son.

STOVE AND GREENHOUSE PLANTS.—What may not inappropriately be called the champion class in the exhibition, since £60 in prizes were devoted to it, was the one for twenty plants, ten fine-foliaged, and ten in flower. Messrs. E. Cole & Sons staged a grand collection, and came in a good 1st in front of Mr. J. Cypher and Mr. Herman Samson, of Bowdon, the other competitors. We noticed in the Messrs. Cole's group *Eriostemon scaber*, from 4 to 5 feet over, a sheet of white blossoms; *Azalea Conqueror*, Iveryana, and *Duc de Nassau*, all of immense size, and well flowered; *Erica tetralix* Wilson, 4 to 5 feet over and full of bloom; *Croton pictum*, about 5 feet through, finely furnished with superb foliage; *Erica Lindleyana*, first-rate; *Pimelea mirabilis*, a large specimen, well flowered; *five Palms* and *Cycads*, and a noble *Phormium tenax variegatum*. In the group from Mr. James Cypher, which stood 2½, were some capital *Azaleas*, a specimen of *Erica verticosa coccinea minor*, 4 feet over, splendidly bloomed; *Phloxes*, *Camellias*, *Chimonolobos*, and equally well flowered; *Ericis* fuchsoides, also good; *Tetratheca genoides hirsuta*, 4 to 5 feet in diameter, and grandly flowered—a most meritorious specimen; *five Palms*, *Tree Ferns*, &c. For ten stove and greenhouse plants in flower Messrs. E. Cole & Sons were unapproachable, and the 1st prize of £20 was easily judged to be due to the Wingham firm, who staged *Azaleas Magnificent*, white, and *Trotteriana*, bright purplish rose, about 1 foot high, and from 7 to 8 feet through, and full of flowers, and recalling to our mind the palmy days of this flower, when Mr. Turner and Messrs. James Veitch & Sons so stoutly fought for victory in a long series of encounters which culminated in that grand horticultural encounter—the London International of 1866. Besides the *Azaleas*, which gladdened our eyes, the Wingham growers had a very fine example of *Erica Princess Royal*, *Anthurium Scherzerianum*, 3 to 4 feet through, well furnished with good spikes; *Genetella Julipifera*, about 5 feet through, and thickly studded with its large richly-coloured, bell-shaped involucres; *Erica affinis*, very large and good; *Boronia pinnata*, from 4 to 5 feet over, and thickly flowered; *Clerodendron Balfourianum*, about the same size, and well-flowered, &c. The best eight specimens contributed by amateurs came from Edward Pilgrim, Esq., Cheltenham, who had good examples of *Erica*, *Clerodendron Balfourianum*, *Genetella Julipifera*, *Pimelea spectabilis* rosea, and *Anthurium Scherzerianum*, &c. T. M. Shuttleworth, Esq., was 2d. Fine-foliaged plants were well represented by six from Mr. B. S. Williams, which included *Croton longifolium*, fine in size and beautiful in colour; a fine *Lantana borbonica*, *Croton pictum*, very large; and *Maranta Veitchii*, also exceedingly fine; and by fine groups of *Erica*, *Boronia*, *Phlox*, *Camellia*, and *Shuttleworthii*. Messrs. E. Cole & Sons had the best *Ericas*, which were not shown in any numbers, and also the best eight *Azaleas*—Mr. Turner having the best twenty small plants, nicely flowered. In the nurserymen's class for ten *Dracenas* the competition was confined to Mr. John Wills and Messrs. Kollisson & Son, the former winning easily with a splendid lot of plants, which included *D. Mooreana* and *D. Shepherdii*, 4 feet high, and smaller specimens in proportion of *D. Chelsoii*, *Weismanni*, *Youngii*, *Baptistii*, *regina*, &c. Mr. Wills also contributed a remarkably well-grown group of *Dracenas*, which gained an extra prize.

ORCHIDS.—The Orchids were a fine feature in the show, though, as we before observed, the display was not so good as last year. The whole of the 1st prizes in the amateurs' classes went to O. O. Wrigley, Esq., of Bury, the competition for 2d honours lying between Dr. Ainsworth, of Lower Broughton, Mrs. Leach, of Staleybridge, and Mr. James Broome, of Didsbury; while in the corresponding classes for nurserymen three 1st prizes went to Mr. B. S. Williams, and one to Mr. R. S. Yates, of Sale. The specimens from Mr. Wrigley's famous collection were of the highest order of merit, which makes us the more regret having to complain of the total disregard (on the part of himself or his gardener) of article 2 of the regulations, which stipulates that "every article must be legibly labelled." In Mr. Wrigley's 1st prize collection of sixteen were *Cypripedium niveum* with twenty flowers and buds; *Anguloa Clowesii*, a very fine specimen with about thirty flowers; *Saccolabium ampullaceum*, very fine; *Odontoglossum vexillarium*, two spikes of five flowers each, very beautiful; an immense pot of *Odontoglossum Phalaenopsis*, consisting of twelve finely-flowered plants, a glaring case of "making up," which the wording of the regulations ought to prevent. Dr. Ainsworth, who was 2d, had *Oncidium sphecelatum majus* with twenty-one very

fine spikes—a noble plant; *Lælia Brysiana*, with sixteen flowers, remarkable for the rich coloring of the lip; *Dendrobium Wardianum*, with about fifteen spikes; *Vanda* variety of *Vanda swavis*, with six spikes; *Vanda* variety of *Vanda swavis*, with four splendid spikes; *Mossie superba*, with from two to three dozen flowers; *Vanda swavis*, a plant from 4 to 5 feet high, with four spikes; *Dendrobium Bensoniana*, with nine spikes, one of them having nearly thirty flowers; *Dendrobium lituliflorum*, a fifteen spikes, very fine; and *Lælia purpurata*, a very large plant, with sixteen flowers. Mr. Wrigley's six com-plant, with six flowers. Mr. Wrigley's six com-plant, with sixteen flowers. *Arceles roseum*, four; a nice *Phalenopsis amabilis*; *Arceles roseum*, with spikes, very pretty; *Anguloa Clowesii*, with sixteen flowers; *Calanthe veratrilifolia*, with fifteen spikes, &c. The 2d prize group, from Mrs. Leech, contained a specimen of *Cattleya Mendelii*, with nine beautiful flowers; *Dendrobium Bensonianum*, with six spikes, two of them especially fine; *Oncidium splachnellatum*, sixteen spikes, a plant about 4 feet through; *Phalenopsis Lindemanniana*, three spikes; *Cattleya* variety with twelve flowers, &c. The 3d prize group, from Mr. B. S. Williams' 1st prize collection of sixteen in the nurserymen's class, we noticed *Cattleya Mossie*, 3 feet through, and well flowered; *Odontoglossum luteo-purpureum*, with two fine spikes; *O. nebulosum*, four spikes; *Vanda tricolor superba*, two spikes; *Cattleya*, five flowers, very fine; *Cattleya*, four flowers, very fine; *Cypripedium barbatum superbum*, from 2 to 3 feet, with twenty-one very fine flowers; *C. caudatum*, and *C. fimbriatum*, with twenty-one very fine flowers; *Cattleya intermedia*, &c. In Mr. Williams' group of six were *Dendrobium thysidiflorum*, with fourteen fine spikes; *Cypripedium barbatum Warneri*, with seventeen flowers; *Odontoglossum scepterum*, with two long spikes, &c., while a specimen of *Cypripedium villosum*, with between twenty-five and thirty flowers, was the best single specimen. Mr. R. S. Yates, of Sale, was 1st for ten, with a nice collection, including *Sobralia macrantha* superba, *Arceles Fieldingii*, with three fine spikes; *Odontoglossum citrosolum*, with one dozen spikes, &c. In this place rather than in the miscellaneous class. In which they belonged honourable mention must be made of a collection of about twenty well-flowered plants of *Cattleya Mossie*, from Peter Spence, Esq., of Whalley Range.

The Ferns, taken as a whole, were an exceedingly fine lot, and to T. M. Shuttleworth, Esq., is due the credit of being the most successful exhibitor. In his credit of being the most successful Ferns which beat that group of eight stove and greenhouse Ferns which were a good collection from O. O. Wrigley, Esq., were three *Gleichenias* which will not readily be forgotten (e.g. *Spelenece*, 6 feet high, and from 7 to 8 feet through, and grandly furnished; *G. rupestris*, and *G. flabellata*, but slightly inferior in size, and none in quality. *Davallia elegans*, 5 feet over, was also a magnificent specimen; and *Necostegia immersa*, of the same dimensions; and the most specimens of *Cyathea principis*, *C. Dregii*, and *C. medialis* were very conspicuous. In Mr. Wrigley's group there was the largest example of the elegant *Davallia Mooreana* we have seen in England. Mr. Shuttleworth also took the 1st prize for six *Adiantums*, with very good specimens of *A. farleyense*, *A. cucunatum*, *A. Capillus-Veneris Dawsoni*, *A. assimile*, *A. formosum*, and *A. tenerum*. The same gentleman was also 1st for twelve hardy Ferns, with a charming group, which was well seconded by specimens shown by Miss Penrose, of Prestwich. The best group of Pine Ferns, and the best pair of Tree Ferns, came from Mr. B. S. Williams.

New and rare plants were shown in great numbers, especially by Mr. John Wills, of Sussex Place, Old Brompton, and Mr. B. S. Williams, of Holloway. In the competition with twelve the last named gentleman came in 1st with nice examples of *Draconia Baptisti*, *Archeia Maria Regine*, *Croton Weismannii*, *Aralia Veitchii*, *Anthurium crystallinum*, *Kentia Moorei*, *Draconia chlorosticta*, *Adiantum gracilimum*, *Crotonium variegatum*, *Draconia amabilis*, *Crotonium sellowianum*, *marmoratum*, *Draconia Hendersoni*, *Calamus viminalis*, *Azalea Flambea*, and the white show *Pelargonium* Duchess of Edinburgh. Messrs. Rollison & Sons came in a close 2d with capital examples of *Croton Cooperi*, *Diefenbachia brasilensis*, *Maranta leopardina*, *Thylocladum Lindeni*, *Draconia Hendersoni*, *Abutilon yellowianum*, *marmoratum*, *Reclia glauca*, *Abutilon crystallinum*, *marmoratum*, *Crotonium bifolium*, *Draconia amabilis*, *D. Baptisti*, *Diefenbachia nobilis*. Mr. John Wills was 3d. The group of new and rare plants contributed by the last named exhibitor was a large and most meritorious one—perhaps the finest miscellaneous lot ever seen at Manchester—and was awarded the 1st prize in the miscellaneous class. Mr. Williams was also a large exhibitor in this department. Amongst amateurs the leading exhibitor of new plants was T. M. Shuttleworth, Esq.

The contributions of *Roses* in pots made by Mr. Turner, Messrs. Rolison & Son, and Messrs. H. Lane & Sons were a host in themselves, while in the amateurs' classes the examples shown were of the poorest

description. The competition between the two first-named exhibitors in the class for twelve was an immense source of interest, and the judges had a difficult task to say which was the best, and when a reward was eventually made in favour of the Rolison plants, able critics were not wanting to question the decision. Many were of opinion that if they were the best pot *Roses* ever seen, but were of those who believe that the same growers shown at South Kensington last year were not equalled on this occasion, but as regards size the present plants certainly had the advantage, and splendid examples they undoubtedly were. As regards the foliage and flowers the specimens from Messrs. Paul & Son filling a large circular bed on the flat opposite. The varieties staged by Mr. Turner were Edward Morven, Madame Willmore, Victor Verdier, Paul Perras, Charles Lawson, Celine Forestier, Paul Perras, La France, Anna Alexieff, Madame de St. Joseph, Beauty of Waltham, and Souvenir d'un Ami. The average measurement of these plants, as regards their diameter, would be from 4 to 6 feet, Paul Perras and Celine Forestier being larger, and all very finely-bloomed and beautifully furnished with foliage. Messrs. Paul & Son's plants were scarcely so large although, but had splendid foliage, and we think the greatest number of first-class blooms. Their varieties were Juno, Dr. Andry, Princess Mary of Cambridge, Charles Lawson, Madame Victor Verdier, Anna Alexieff, Celine Forestier, Marçal Vaillant, and Souvenir d'un Ami. In the class for forty *Roses* in pots Mr. Turner was 1st. In the class for forty *Roses* in pots Mr. Turner was 1st. More than 9 inches across, Messrs. Paul & Son turned the tables on their rivals, and came in 1st with a remarkably well-flowered group, though Mr. Turner and Messrs. H. Lane & Sons followed them very closely in the order of merit given. The last-named also exhibited a group of about a hundred small plants with very fine blooms, which were much admired.

Amongst subjects which may be grouped under the miscellaneous heading may be mentioned first *Yucca filamentosa*—a popular plant in this neighbourhood—from Mrs. Gray, Withington, and Mr. Broome, Huddersbury. Messrs. Rollison & Sons, Tooting, were 1st for eighty alpine and herbaceous plants, in 5-inch pots, in competition with Messrs. G. & W. Yates, Market Street, Manchester; the combined £1000, both groups, with a background of *Rhododendrons*, being exceedingly good. For the variegated Japanese plants Messrs. J. Standish & Co., of Ascot, were 1st. A large quantity of well-coloured plants of *Euoymus radicans aurum variegatus*, *Thujopsis dolabrata variegata*, *Acer polymorphum pectinatum*, *Alnus rubra*, *Juniperus japonica alba variegata*, and *Acacia japonica marmorata aurea variegata*. A pair of standard *Bays* shown by Messrs. Caldwell & Sons, Knutsford, were very fine, and another good pair was contributed by Messrs. H. Lane & Sons. A group of twenty plants of Messrs. G. H. Wickham & Sons' *Clematises*, principally unnamed seedlings, were among the most admired things in the show, their rich and effective colours being very telling. A smaller group from Messrs. J. Standish & Co. also came in for considerable praise. *Rhododendrons* were fairly well shown by Mr. Yates, of Huddersbury, and Mr. G. & W. Yates, of Ascot. A decided novelty, being white with a pro- defined deep carlet or almost black blotch; it produced a good trunk, and is very distinct. From the Ascot firm also came a choice group of Japanese *Acer*. A quantity of cut blooms of *Marçal Niel Rose*, a new variety of *Rose*, came from Mr. Cooling, of Bath; and from Mr. Hooper, of Widcombe Hill, near the same town, came a capital lot of *Ranunculuses*, *Pansies* and *Tulips*. Some very good examples of *Strawberry* culture in pots were contributed by Mr. Uphorn, to the Earl of Ellesmere. The varieties represented being *Victorine*, *Hericard de Thury* and *President*. A nice group of small plants suitable for table work came from Messrs. Dickson & Robinson, Market Place, Manchester. Show and Fancy *Paragons* were not particularly good as a class, though very creditable specimens were shown by Mr. Charles Rylance of Ormskirk. *Tricolor Pelargoniums*, some 3 or 4 feet over, came from Mr. J. Grestry, gr. to James Kershaw, Esq., Cheetham Hill; but, though well furnished with good leaves, they were very dull in colour.

In an exhibition which is made up of some seventy-odd classes it is impossible for us to notice everything that we think we have stated sufficient to show that the display was one of no ordinary merit; and we are glad to hear that it has ministered to the enjoyment of some 50,000 visitors. We are not likely to see such another this year; and in conclusion we heartily congratulate Mr. Findlay, the energetic manager, on the great success which has attended his labours, and which we hope may long continue.

Glasgow Botanic Garden: *May 8 and 9*.—The Kibble Conservatory, so useful for many purposes as an exhibition-room, where the public can promenade with some degree of comfort, was on this occasion set apart for a floral display, and there can be no doubt that it is in every way adapted for showing plants to advantage, from the elegance and lightness of its construction and from the ample space at its disposal. It has this drawback, that there is such an extent of superficial feet of glass for the rays of the sun to play upon, that at times it becomes inconveniently hot. Some capital plants were exhibited, and there was also considerable variety. We do not remember to have seen so good a general lot of plants from so few exhibitors. The exhibitions, in truth, are falling into few hands, and but for the nurserymen there would be a sparse display. The quality, however, of such contributions as come from A. H. Stewart, Esq., of Kew; Mr. J. C. Wakefield, Langside; Mr. Findlay, Esq., of Maryfield; Mr. Stewart, and a few others, are highly meritorious. By far the best lot of plants in their various groups on this occasion came from Mr. Stewart, whose ornamental-leaved plants were superb—better exhibited than we have hitherto seen them, and reflecting the highest credit on Mr. Todd, the gardener. The singularly pinnated linear-leaved *Dasyllium glaucum*, the *Phycanthus* and *Pandanus Veitchii*, were fine pictures, and so were every plant in the group. In Palms the same exhibitor had all a magnificent *Cocos Weddelliana*, one of the finest of pinnated-leaved Palms, so elegant in its outline, and the pinnae beautifully cut; as well as many others. In Ferns, his *Gleichenia flabellata* and *Mendelii* were highly cultivated plants, and well merited first honours. The flowering plants were also fine, particularly the *Clerodendron Balfourianum*, with its white calyces and crimson corollas, as well as the *Eriostemon*, with its multitudinous flowers, as well as the *Plamigo* plant, which is a first variety of the *Cup* were well contested, but it would have taken much to have beaten *Cyathia Burkei*, the handsomest weeping fringed Fern in cultivation, and the nearly white *Odontoglossum Rozellii*, one of the newest and best of Orchids. Mr. Findlay, who ran Mr. Stewart very closely, had also a fine group—the *Demoneopsis pericantibus* being in splendid condition, and, indeed, one of the finest specimens I have seen. His *Cicely Azalea*, too, especially exhibited, being one sheet of mixed and white blossoms, and well staged by Mr. Beveridge. Mr. Wakefield had flowering plants, the best of which was *Azalea Roi Leopold*. The indigenous Ferns were in good groups.

The nurserymen were in strong muster, and their productions as a whole were exceedingly creditable. By far the largest lot came from Messrs. J. and R. Thyne, who decorated the centre-piece with capital groups of Palms; *Tree Ferns*, *Blondeletrons*, and suchlike plants. The effect was striking, although the plants were too thinly scattered over the surface. The other exhibitors had a splendid lot of twelve new plants for Mr. Bull's Cup; the *Draconia Fraseri*, *Phyllanthus nivosus*, several *Crotons* of the first water, and *Encephalartos villosus* standing out prominently among their neighbours. The same exhibitors were also successful in taking first place for the collection of miscellaneous plants suitable for hall, window, or table decoration. In this group were *Ferns*, *Draconias*, and a miscellaneous assortment of nondescript plants, bordered with *Hydrangeas*, *Fuchsias*, *Spiræas*, *Ferns*, &c. Mr. James Anderson, of Meadowbank Nurseries, Uddingston, had a fine miscellaneous assortment, prominent among which was one of the best examples of *Erica Deboniana* (a yard across) that has ever been exhibited, and which was bristling with scarlet-tubed, white-tipped flowers; and then several finely-leaved *Everlastings*, and some *Rose* for *May*, *mayrilli*, among which we saw a fine crimson of great substance and good form named *Andronache*; *La Belle* *Blancheur*, the best white in cultivation; and several seedlings of the first quality. These again were interspersed with *Cycads*, *Palms*, *Pandanus*, *Maidenhair Ferns*, *Azaleas*, and *Flamingo* plants in small and in larger sizes, and fringed with *Azaleas* and *Ferns* and other miscellaneous plants, making a most effective group. Mr. Peter Mackenzie took the leading position in the forced hardy plants with a fine lot of *Roses* and other plants suitable for city sowing. This exhibitor had a very good miscellaneous group, among which were some fine *Todeas*, both *superba* and *intermedia*, some of the latter very distinct. Messrs. Smith & Simons had also a very good lot, the *New Zealand* *Flax* (*Phormium tenax variegata*), and others too numerous to mention being among them. Mr. Wm. Paterson had a very fine group, suitable for general purposes, filling a considerable space with his exhibits. Among detached groups we must single out the *Orchids* from Mr. Todd as worthy of special notice, the *Moth* *Orchid* and the pendulous tooth-tongued *Orchid* being among the most effective. The *Flamingo* plant from Dr. Paterson, Bridge of Allan,

which received a medal for highly meritorious culture, was the best variety we have seen exhibited in Scotland. The Bellonias (under bell-glasses), from M. Louis Van Iloutte, of Ghent, Belgium, were marvellously pretty things in their markings, being reticulated with roseate crimson and spotted with crimson. They were considerably marred in appearance by long transit, but there were sufficient of them to show that they were gems. The whole affair was under the able superintendence of Mr. Bullen, the curator of the Botanic Garden, who had an onerous task imposed upon him. (From a Correspondent.)

Obituary.

The sudden death of M. THURET, of Antibes, of which we have received intimation, will be received with profound regret by botanists and horticulturists. M. Thuret was a botanist of the first rank in his own department, and was the discoverer of points in the reproduction of seaweeds which will suffice to give him a most honourable place in the history of science so long as science is cultivated. In addition, M. Thuret was an enthusiastic gardener—the Wilson Saunders of France. In no other establishment have we seen so magnificent and extensive a collection of plants in the open air. The illustrations which we have been privileged to give from time to time will exemplify our statement. We learn that M. Thuret's death was wholly unexpected. Universal sympathy will be felt for his faithful friend and coadjutor, M. Bomet.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 19, 1875.

- May 13.—Fine and warm throughout, though dull and gloomy at times.
- 14.—A very fine warm cloudless day.
- 15.—A very fine day. Hot.
- 16.—A fine cloudless day.
- 17.—A fine warm day. Lightning seen at night.
- 18.—Fine and bright in morning. Overcast, dull, and slight rain fell in afternoon. Fine night.
- 19.—A fine morning. Overcast, dull; hail and rain fell, accompanied by a thunderstorm, in afternoon. A fine night.

In the vicinity of the metropolis the reading of the barometer at the level of the sea increased from 29.83 inches at the beginning of the week to 30.45 inches by the morning of the 11th, and then decreased to 30.14 inches by the afternoon of the 15th, and again increased to 30.25 inches by the end of the week. The mean daily readings were all above their averages. The mean reading for the week was 30.23 inches, being 0.34 inch above that of the preceding week. The highest temperatures of the air at 4 feet above the ground varied from 64° on the 9th to 81° on the 15th, the mean weekly value being 72°. The lowest temperatures of the air ranged between 45° on the 11th and 54° on the 15th, the mean for the week being 50°. The mean daily range of temperature in the week was 22½, varying from 14° on the 9th to 27½ on the 15th. The mean daily temperatures of the air were as follows—10th, 55° 3'; 11th, 55° 3'; 12th, 59° 4'; 13th, 61° 5'; 14th, 63° 2'; 15th, 69° 1'; and the departures in their respective averages—+ 3° 8', + 2° 5', + 7° 7', 9° 7', 11° 2, and 14° 7'. The mean temperature for the week was 59° 6, being 7° 9 in excess of the average, as deduced from observations extending over a period of sixty years. The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in the rays of the sun,

were 127° and 130° respectively on the 12th and 15th, but on the 17th the highest reading was 120°. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 35½ and 36½ on the 11th and 12th, but on the 15th it did not fall below 45°. The mean for the seven low readings was 40½. The direction of the wind was W.S.W., and its strength gentle.

The weather during the whole of the week was very fine and warm, especially on Saturday, the 15th. The amount of cloud was generally small.

Rain fell on one day; the amount collected was 0.01 inch.

In England, the extreme high temperatures ranged between 82° at Blackheath and Sunderland, the general average over the country being 77°. The extreme low night temperatures varied from 47° at Liverpool and Bradford nearly, the general average being 42½. The mean of the extreme ranges of temperature in the week was 34½, the greatest range being 41° at Sunderland, and the least 26½ at Bradford. The mean high temperatures observed by day varied between 72½ at Blackheath and 62° at Liverpool, with an average value of 68½. The mean low temperatures observed by night ranged from 50½ at Bradford to 44½ at Truro, with an average value of 47½. The mean daily range of temperature in the week was 20½, the greatest daily range being at Leicester, 24½, and the least at Liverpool, 12½. The mean temperature of the air for the week was 54½, being 10½ above the value of the corresponding week in 1874; the highest in the week occurred at Blackheath, 59½, and the lowest at Eccles, 53½. Rain fell on one day in the week generally over the country; the amounts varied from six-tenths of an inch at Bristol, to one-hundredth of an inch at Blackheath, Leicester, and Truro; the general average fall over the country was one-tenth of an inch.

The weather during the week was very fine and warm, light clouds were prevalent.

In Scotland the highest temperatures ranged from 73½ at Aberdeen to 61° at Greenock, the lowest temperatures varied between 46½ at Leith and 42½ at Aberdeen, their respective averages being 66½ and 45°. The mean range of temperature in the week was 21½. The mean temperature of the air for the week was 54½, being 10½ above the value of the corresponding week in 1874, the highest was at Dundee and Aberdeen, both 56½, and the lowest at Glasgow, 53½. Rain was measured at Greenock to the amount of 1 inch and seven-tenths, but at Leith only four-hundredths of an inch was recorded; the average fall over the country was five-tenths of an inch.

At Dublin the highest temperature was 78°, the lowest 35½, the mean 56½, and the fall of rain 0.11 inch.

JAMES GLAISHER.

Variorum.

THE PRESERVATION OF FLOWERS.—A vessel with a movable cover is provided, and having removed the flowers, the inside of the vessel is lined with moderate fineness is fixed over it, and the cover replaced. A quantity of sand is then taken sufficient to fill the vessel, and passed through a sieve into an iron pot, where it is heated, with the addition of a small quantity of stearic, carefully stirred, so as to thoroughly mix the ingredients. The quantity of stearic to be added is at the rate of half a pound to 100 lb. of sand. Care must be taken not to add too much, as it would sink to the bottom and injure the flowers. The vessel with its cover on, and the gauze upon are carefully placed on the gauze and the sand gently poured in, so as to cover the flowers entirely, the leaves being thus prevented from touching each other. The vessel is then put in a hot place—such as for instance, as the top of a baker's oven, where it is left for forty-eight hours. The flowers thus become dried, and they retain their natural colours. The vessel still remaining bottom upwards, the lid is taken off, and the sand runs away through the gauze, leaving the flowers uninjured. *Pharmaceutical Journal.*

WHEN TO CUT FIR TIMBER.—It is stated by some that Scots Fir, Larch, and Spruce can be most profitably cut at from twenty to thirty years of age, when growing in a locality where they can be disposed of for mining purposes; but I have not found this to be the case in my experience in the management of plantations within 15 miles of large coal mines. In such a locality, when the price of prop-wood is high, it will almost invariably be found that proportionally high prices will be obtained for larger timber; while, if the plantations be far from a market, or a railway station, or seaport, the crop at that age would not be worth the planting, cutting, and removing, and would therefore be a dead loss to the grower of from twenty to thirty years' rent of the land. Further, it would

not pay to cut down trees of the above description for fencing and estate purposes, because these can easily be supplied from the thinnings of well managed plantations. As a rule, timber trees should be allowed to grow to large dimensions before being cut; but the situation in which they grow often necessitates a different course. For instance, in glens and mountainous districts, and in places inaccessible to horses, the most profitable management would be to cut them down before they arrive at a size too large to be removed in entire lengths by manual labour. At that early stage Fir trees would be valuable for prop-wood, fencing, and other estate purposes; Ash for handle-wood, and Birch or Alder for charcoal or bobbin-wood, &c.; whereas, if allowed to grow to a large size, they would have to be cross-cut in lengths to admit of removal by men, and this would, in the first place, make the timber useless for many purposes for which it might otherwise have been valuable; and secondly, the expense of removal by manual labour might equal, or even exceed, the value of the timber itself. When Scots Fir, Larch, or Spruce have been planted as nurseries for hard-wooded trees, they should be thinned out as soon as they begin to encroach on the trees intended for the main crop, as this is necessary for the welfare of the plantation, irrespective of the value of the thinnings. But when such trees are planted as the future crop, on suitable ground, it will almost always be found most profitable to allow them to attain timber size. The Larch, being of fast growth, and useful for various purposes at an early age, can be cut down profitably much sooner than the Scots Fir. *Mr. Bayne, in "Transactions of Scottish Arboricultural Society."*

The Villa Garden.

ROSES.—The "Queen of Flowers," as it is not inappropriately termed, now requires a little attention from the Villa gardener; the weather being dry, and the winds withering in their influence, the plants should have a little extra care, for are we not rapidly reaching onward to that time when flowers will be looked for? Buds are already swelling, and generally there is a good promise of a glorious bloom. Our own Roses, growing in a good holding, though not a clayey loam, look well, they are either half-standards on the Briar stock, or dwarfs on the seedling Briar. While not desiring to express any preference for this stock over that of the Manetti, nor making use of the last, we are yet bound to say that our dwarfs are making splendid growth; the buds are large, as if they enfolded the germs of flowers of precious substance and beauty; and scarcely a sucker comes up from the Briar stock to cause us trouble.

We have slightly loosened the soil on the surface without going deep enough to disturb any of the roots; and as the weather was dry we gave the plants a good soaking with rain-water, and then added a mulching of moist rotten farmyard manure. Then follows a round of attentions, which, however apparently slight in themselves, yet exercise an important influence on the production of good flowers. Not the least urgent among these is the search after the Rose-bug. He must be hunted and destroyed, or the incipient Roses will suffer. He is a pest to the Rose-cultivator, and he hides himself under a curled leaf or recommends himself under a curled leaf or occupies debilitated plants with a sort of paralysis ensues. We carefully unroll the leaves, and find him out, make an end of him, and, assisted by the spray from a Rose watering-pot, cleanse the leaves amid which he had ensconced himself.

The chances of producing fine Roses should not be perilled by allowing the plants to carry too much wood. The advice is both good and pertinent which recommends that the bushes of dwarf Roses and the heads of standard Roses should be so kept thinned out that a wholesome circulation of air may take place. If some exhibition Roses are wanted in a few weeks' time, thin out the flowering shoots to two or three on a branch; when Rose trees are over-cropped, small thin flowers will be certain to result. It will be also necessary to take away all the buds but the central one to each shoot. This is one of the essential requirements of exhibiting; it seems cruel work, but he that would have fine flowers must practise self-denial, and to some extent close his heart to the dictates of mercy.

PRIMULA CORTUSOIDES AMGENA.—For some weeks past this grand hybrid Primrose has been very effective in pots in the conservatory, and is now very showy in the open mixed border, where it is a good all the winter with just the protection of a small heap of

coal-ashes thrown over it. The plants grown in pots were in the 32 and 24 size, and the crowns, selecting some strong ones, were potted up in the autumn in a rich soil, using plenty of leaf-mould, fibry loam, some sand and moisture. This is better than potting in the spring, as we find by experience that the roots lay hold of the soil during the winter and get established, and when growth sets in it is made strong and vigorous. The pots were housed in the conservatory during winter, which, however, did not prevent them from being frozen hard occasionally. They were kept in the house till the strong shoots began to appear above-ground, then they were removed to the open air, and the pots plunged up to their rims in coal-ashes. The plants were freely watered as required, and when the buds began to show colour the pots were removed to the conservatory, and during hot weather liberally supplied with manure-water; the flowers were superbly coloured, and as decorative agents unsurpassed. It is a plant to be enthusiastic about, for it is the most brilliant, as it is also the freest and enduring of all the hardy Primroses. It is murdering this showy plant to keep it in a warm house during the time it is making its growth, getting it drawn up and half-starved, in which condition its flowers are necessarily very poor. In a warm house with a hot atmosphere the buds are affected; the red-spider, which seems to be fond of attacking it; but when the growth is vigorous this pest seldom puts in an appearance, or, if it does, is comparatively innocuous in a moist atmosphere. This is so essentially a plant for Villa gardeners that these cultural notes must not be deemed intrusive. Then its varieties—*Illicina*, *grandiflora*, and *alba*—all quite distinct, and very charming because so distinct, are now getting somewhat plentiful, and should be grown. They require similar treatment, and it is so sure a plant that it can hardly fail. Our plants, having done flowering, are now plunged again in the ashes, to let them ripen their seeds, and there is much hope of the shyest seeder, *amena*, ripening some pods this season. We attribute this to a great extent to the generous course of treatment afforded it.

How shall we describe this plant as it now appears in the open ground in our cool, forecourt garden? Of the passers-by many are attracted by its brilliancy of colour, and wonder what it can be. When told that it is a hardy Primrose they become sceptical; with pass on their way with an injured air. Growing in good soil, and having a free drainage, it is brilliantly coloured in the open air; with the shade cast over them they have a blood-crimson hue. Scarcely less attractive is the variegated-leaved double crimson *Daisy* growing near it; a large tuft, in a moist cool spot, is now in splendid condition, the variegation beautifully displayed, the flowers large and superbly coloured. It also illustrates the great advantage of being generously treated.

PRIMULA JAPONICA.—This fine Primrose, at first introduced to the skies as something almost unparalleled in beauty, and then announced as an impostor, if not so good as it was pronounced to be, is certainly not so bad. Like *P. cortusoides amena*, it must be generously grown, whether in pots or in the open air. It is a fine plant for Villa Gardens, only let it be treated as its excellence deserves. Grow it generously and feed it well, therefore lies the secret of success; the leaves will be robust and of great size, the flower-stems stout, and bearing even the traditional three or four whorls of blossoms at one time.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVE.—*Celosia pyramidalis* is a most useful autumn flowering plant, either for use as a conservatory subject or for cutting. Few things will keep better so long as these. *Celosia* is a most interesting as they do up to the end of the year, are almost indispensable where there is a large demand for flowers. To have them in succession it is necessary to sow at different times; by early sowing it can be had during the summer, but it is for the autumn and winter that I should more particularly direct attention to its growth. Seed put in now, and again in the course of a month, will come in at a time when flowers are not plentiful; should be sown in a gentle heat, and does not need keeping so warm as an ordinary Cockscomb, although in its early stages it is benefited by moderate heat. When the plants are up and large enough to handle, pot them off singly in loam, well enriched, and keep rather close until they get strong, after which they require little above an ordinary greenhouse temperature. Keep them near the glass so as to induce short growths, and syringe in the afternoons to keep down spider. *Isorais* will now be throwing up their flowers; any that will be required for placing in the conservatory about the middle of next month should now be prepared for the cooler treatment they will there be subject to by having all the light possible, with a moderate amount

of air, and by not being kept too hot, especially during the night. *L. coccinea* and *L. aurantiaca* are the best to use for this purpose, and if properly prepared and placed whilst in the conservatory away from draughts, they will stand for some weeks. *Allamandas* can be used in the same way, but when these are intended for removal to the conservatory they need not be kept so warm in the early stages of their growth as *Isorais* and require to be. *Stephanotis* is also well adapted for this purpose when not started too early in the spring, and brought on slowly its flowers will last much longer in a cool house than if kept in heat. *Bougainvillea glabra*, similarly treated, will stand in flower in a cool house for two months—its blossoms in such a situation being much more highly coloured than when in strong heat. This plant when required for conservatory use should be moved from the stove before the first flowers have attained their full size and have expanded, as they are liable to drop off prematurely. *Tuberous-rooted Begonias* that have been started in heat should be treated so as to prepare them for cooler quarters. They are the most useful grown in small pots, 6 or 7 inches in diameter, being large enough for standing on front shelves and similar places, where they are the most suitable. For large stoves some of the *Mosses* are very effective; and although these large free-growing ferns are seen to a great advantage when planted out, yet they may be grown in large pots or tubs so as to make them most telling objects. The flowers of *M. coccinea* are very distinct from the generality of the other occupants of the stove, whilst the noble foliage of such varieties as *M. Cunninghamii* and *M. Ensete* contrast well with things of smaller growth. They grow freely in turfy loam, with enough sand to keep the whole in a healthy open condition—the large quantities of water required by these plants when in full growth making this provision imperative. *Tuberous-rooted Begonias* are now making free growth. These fine plants are not so much grown as at one time, no doubt on account of the disposition they have to drop their buds when kept too hot. They may with advantage be grown in houses where there is not sufficient heat kept up for some things. They are impatient of being too wet at the roots, and never require water in such quantities as some stove plants of stronger growth. The easily-grown *Ficus alba*, *oculata*, and *benjamina*, although they continue to grow during the summer season, are the most useful in the autumn. To have them in nice condition, then, the shoots, instead of being allowed to flower now, should be stopped, which will cause several to break in place of one.

Ferns.—Many of the plants will now be making active growth, to assist which an application of manure-water once a week will be of great service. When Ferns are freely supplied with water they will do well for years in much smaller pots than are now used. Such species as *Dicksonia antarctica* and *Cyathea dealbata* throw up their fronds a number at a time, and when they have completed their growth are for a time at comparative rest. When plants of these and similar species are moved during the summer season to decorate houses where the temperature is cooler and atmosphere drier than the fernery, advantage should be taken to move them when their first growth is complete, for although many Ferns that get the character of requiring heat will grow during the summer in a greenhouse temperature, yet if moved from a moist close atmosphere when the fronds are in an immature state they never attain their full size. *Adiantum cuneatum*, *A. pubescens*, *Pteris serrulata*, and *Lomaria gibba* should be grown in quantity for conservatory, table and room decoration: these if prepared in numbers, by potting on such as come from spores self-sown in the fernery, are most useful. As soon as the seedlings are large enough to handle place them in the open air-pots, and let them have a place near the light, where they will make stout growth; by attending to this two or three times during the year there will always be a stock of small plants ready for shifting on into 48's—which is the most useful size to have them in for use. *T. Baines*.

FRUIT HOUSES.

VINES.—A continuance of bright sunshine during the past fortnight has wrought wonders in the condition of Vines in all stages. Very little fire-heat will now be necessary if the houses are closed early. The thermometer may run up to 90°–100°, and will do more in one day to advance the crop than a week's firing in dull weather. Of course these remarks apply only to Vines in full growth, as those that are ripe, or nearly so, will be better if kept cooler. Give air very early in the morning, or the moment the sun shines on the glass, as the sun coming in contact with the condensed moisture formed on the foliage during the night previously causes scorching, unless air has been freely given. Vines will now be about coming into flower, and to insure a good set of sorts as Royal Vineyard, Muscats, and Lady Downe's Seedling, maintain a minimum temperature of 70°,

and shake the rods several times daily, which will distribute the pollen and thereby assist fertilisation. Whilst in blossom, pinching or stopping of lateral growth should be discontinued, but as soon as the fruit is set pinch out the points as previously directed, as it is ruinous to allow the laterals to extend and afterwards be compelled to remove them by the labourer. Keep houses of ripe fruit cool and airy, and have regard to the preservation of the foliage by never allowing the atmosphere to become arid or parching. A little moisture at this season will not injure the Grapes. Red-spider having made its appearance in our earliest house, I had the foliage carefully sponged with clear water, and thereby a cure effected; and to all this pestered I would say, go and do likewise—for whatever may be said against the tediousness of this operation, it certainly is the only thorough remedy. Give the struck from eyes in February and March, and grown on in pots or turves, may now be planted out; after which give a soaking with water at a temperature of 100°, and mulch the border with a couple of inches of soil to keep in the heat produced by the warm water. Keep up a humid atmosphere, and shade during bright sunshine till the Vines are established. With proper management a good crop of fruit may be had next season. *W. Williams*.

GRAPES. The ripening fruit on the early forced trees must now have plenty of air and sunshine to improve their flavour. The fruit of early forced Grapes are comparatively insipid if not ripened under the most favourable circumstances as regards a free circulation of dry air and warmth. On purpose to effect this, if the nights are cold, the temperature must be kept from 65° to 70°, and in the day from 80° to 90° by sun-heat. When the ripe fruit is all gathered from the pot plants another mulching of well rotted manure may be added to that formerly put on the surface of the pots, and this will encourage root action and help the trees to perfect their second crop. The syringing daily must be again attended to, as red-spider may have gained a footing on the foliage during the dry period of the ripening of the first crop. The young Fig trees struck from cuttings will soon want their second shifting into the fruiting pots. These pots need not be of an inconvenient size, for I find if they are about 12 inches in diameter at the top that size is sufficient to grow and fruit Figs well in. The trees must be trained and the soil covered that formerly recommended for the first shifting from the cutting pots. Still attend to the stopping, thinning, and regulating the shoots of the trees where they are permanently planted out, and ply the syringe daily till the fruit begins to ripen. If the borders can be mulched with some well decomposed manure during the summer heats, it will encourage a more vigorous growth of the surface-roots. *William Tillyer*.

MELONS. Continue to growing crops the directions given in both the last and previous Calendars. Plants ripening their fruit, however, as the first batch will shortly be, need a change of treatment. So far as my experience goes, there is only one *modus operandi* to be adopted to secure a highly finished fruit. By the term "highly finished" I mean a richly-flavoured fruit, and which is, or should be, the great aim of all Melon growers. A Melon devoid of this latter quality is a Melon in name only, and can afford no credit to the grower or pleasure to the consumer. The best means of securing this desideratum is simply this—that directly the fruits begin to change colour or to manifest the least signs of ripening, observe a dry condition of both the roots and atmosphere, and in the case of very early or very late crops increase the temperature by 3° or 4° if possible; the foliage must at the same time be fairly thinned out to admit the sun, the great flavour-producing agent. The weather has been for the last ten days all that can be desired for Melons. Keep vigilant watch for "cracked fruit," as it has been previously pointed out, by a superabundance of moisture, together with a sudden rise in the temperature. Directly any are perceived, therefore, be sparing in the supply of water, and insert a pinch of freshly-slaked lime into the affected parts; at the same time dust a modicum of flowers of sulphur amongst the foliage, and on the walls and pipes, as an antidote to red-spider. Beware of canker at the collar, too, as well as in the old growths, the cure for which is also freshly-slaked lime pressed well in between the thumb and finger. Be careful to observe a dry condition of both the roots and atmosphere in pits and frames, wherein the fruits are setting. After the fruits have attained the size of a bantam's egg, let them be raised on pieces of tile, after previously giving the roots a good earthing-up, and afterwards keep the growths well thinned out. *T. Simpson, Chelmsford*.

CUCUMBERS.—There is little or nothing fresh to be added to this heading just now; the great and principal work is, as has been previously pointed out, to secure a clean growth at whatever pains or labour. See that the busy bedding-out season does not interfere with this. The weather for the last fortnight has been such as to warrant the disuse of fires both day

CONSERVATORY FLOWER STANDS.

For Conservatories fitted up with this Flower Stand, see Catalogue.

R. HOLLIDAY, HORTICULTURAL IRON and WIRE WORKS,
2A, PORTOBELLO TERRACE, NOTTING HILL GATE, LONDON, W.

Manufactures—FLOWER STANDS, BASKETS, TRELLIS for Creepers, ESPALIERS, WALL WIRING for Fruit Trees, ARCHWAYS, COVERED-WAYS, ROSERIES, WIRE FENCING, &c.; FOUNTAINS and WATER CONDUITS for Garden Decoration. See Illustrated CATALOGUE of Designs.

PRICE WATER and LIQUID MANURE CARTS.

Prices and particulars on application at the London Road Ironworks, Chelmsford.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone.

This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 20 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Gloucestershire, Llanpumsant, Carmarthen, Nov. 27, 1873. "Mr. Lloyd Lloyd encloses cheque for £3 5s., amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful things he ever possessed."

Apply to HILL and SMITH, Bristol Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

Reduced Prices.

THE CELEBRATED GRANITIC PAINT.

Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company.

For Price Lists, Testimonials, and Patterns of Colours, apply to THOMAS CHILD, Manager, 39A, King William Street, London, E.C.

THE SILICATE ZOPISSA

COMPOSITION. TO CURE DAMP IN WALLS, and PRESERVE STONE, &c., from DECAY, at a very trifling cost. Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company, Colourless, and in all Colours.

For particulars and Testimonials, apply to THOMAS CHILD, Manager, 39A, King William Street, London, E.C.

CARSONS' PAINT,

PATRONISED BY THE QUEEN,

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz.: the water space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron, are not liable to crack. They are made of the following sizes:—

Sizes.		To heat of 4-in. Pipes.		Price.
High.	Wide.	Feet.	L. & d.	
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	48 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

FULL PARTICULARS ON APPLICATION.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—

These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction, and a month's trial allowed. Orders executed on receipt.

Important to Market Gardeners and Others.
THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking cut rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverizing the ground. These pieces are made separate, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and tasty, and fully adapted to the purposes designed. A large number have been sold, and are giving unqualified satisfaction.

Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

VIENNA PRIZE WIRE NETTING.

Awarded The Medal For Merit

At Vienna, 1873.

CAUTION TO BUYERS OF WIRE NETTING.

The great reputation and success of Messrs. J. B. BROWN AND CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & Co. are the SOLE MANUFACTURERS.

Messrs. BROWN & Co. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced prices. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting.

90, Cannon Street, London, E.C.—March 12.

THE

AGRICULTURAL GAZETTE ALMANAC, 1875.

The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compendiums are many good services, such as hints on fattening cattle, growing of root crops, &c. The illustrations are admirably executed, many being engraved from photographs."—*Weekly Dispatch*, Jan. 31, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition."—*Lloyd's*, Jan. 17, 1875.

"It is a very cheap threepennyworth of information of interest and utility to farmers, and contains numerous illustrations."—*The Field*, Jan. 16, 1875.

"In addition to the usual matter to be found in an almanac, we have here useful information to the farmer, as to stock and crops, with illustrations of prize animals."—*Globe and Sun*.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for daily use."—*Farmer's Herald*.

"The Calendar contains all the fixtures for cattle shows, races, &c., space for diaries and memoranda by the side, and various useful information of an agricultural character."—*Oxford Times*.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics, and a series of portraits of the Prince of Wales, Dr. Voelcker, and Viscount Droop, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'"—*Bath Express*.

"To farmers, cattle dealers, and others interested in agriculture, this work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is profusely illustrated with engravings chiefly taken from photographs."—*Devonshire Chronicle*.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We wish all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

Protheroe & Morris, 93, Gracechurch Street, E.C.

WANTED, a HEAD GARDENER, married, no family; must thoroughly understand Vineries, Hothouses, Fernery, &c. Small cottage in the Grounds. Good character indispensable. Also a SILENT GARDENER, who must understand Glass and the arrangements of a Conservatory, and make himself generally useful.—Apply, by letter only, to J. B. Wailes, Messrs. Howcroft & Wailes, 4, Tavistock Row, Covent Garden, W.C.

WANTED, a GARDENER, to take the Management of a small Garden (Greenhouses and Gardener's Cottage about to be built)—A married man, whose wife would take household washing, preferred.—Apply, stating wages, to T. H. B., Redcar, Yorkshire.

WANTED, as GARDENER, at Bounds Green, by Wood Green, N., a thoroughly competent Man who understands the Cultivation of Fruit, Flowers, and Vegetables, to take charge of an Amateur's Garden and Greenhouse, and to give Instruction in every branch of Gardening. This is a capital opportunity for any one who has already engaged or at eventide. No one need apply whose character will not bear the strictest investigation.—Apply, stating full particulars and wages required, to GARDENER, W. H. Smith & Sons, Wood Green Station, N.

WANTED, a GARDENER (SINGLE-HANDED), who understands the Management of Vines, Kitchens and Flower Gardening, and willing to make himself generally useful.—Mr. SIMON, 1, Old Broad Street, Woking.

WANTED, TWO UNDER GARDENERS, who also to GARDEN LABOURERS. Wages 18s. to 24s.—Mr. CARTER, Nursery, Keighley, Yorkshire.

WANTED, as UNDER GARDENERS, several young Men, for good places.—Dicekings required, ages, and where last employed, to STATIONER, BROWN, and TAIT, Seed Merchants, Manchester.

WANTED, an active intelligent Man as NURSERY FOREMAN and GENERAL PROPAGATOR. Character must bear the strictest investigation. State age, experience, where last employed, and wages expected.—HIPPEN and ROBINSON, Victoria Nursery, Reading.

WANTED, a FOREMAN and PROPAGATOR, for the Outside Department. Liberal wages will be given to a competent and steady Man.—Address, with references, &c., to E. B. HAYNES, Fenge Nursery, S.E.

WANTED, several smart, active, industrious young MEN, accustomed to General Nursery Work. State age, experience, wages expected, and to whom expected for character, to FRANCIS & ARTHUR DICKSON & SONS, "Upton" Nurseries, Chester.

To the Seed Trade.—Head Counterman. WANTED, an active and intelligent Man as principal SALESMAN in a large Retail Establishment in the North of England; must have good address and appearance, and a thorough knowledge of the Seed and Plant Trade indispensable. Also, an ASSISTANT, well acquainted with the Execution of Vegetable and Flower Seed Orders. State particulars, where last employed, age, and salary expected, to J. V. Mr. Robert Cooper, Seed Merchant, Fleet Street, London, E.C.

WANTED, a YOUTH, who writes a good hand, and has had some experience in the Nursery and Seed Trade, applying to taking a Nursery Office or Seed Shop.—Apply, stating age, experience, and salary expected, to WILLIAM HENDERSON, 36, Hamilton Street, Birkenhead.

WANTED, for Spring Hill College, a MAN who understands plain Gardening, and the care of Forest Trees. Lodge provided, to be attended to by his Wife.—Apply, by letter, to Dr. SIMON, Spring Hill College, Moseley, Birmingham.

Seed Trade.—Traveller and Shopman. WANTED, an experienced Man as TRAVELLER, to do a Journey in the summer and to Pack Shop Orders in the winter. Must be of good address, energetic, and well up in the business.—Apply, stating amount of experience and salary required, to L. M., Gardener's Chronicle Office, W.C.

WANT PLACES.

To Gardeners in Want of Situations, WHOSE CHARACTERS WILL BEAR STRICT INVESTIGATION. THE PINE-APPLE NURSERY COMPANY devote special attention to this important matter for persons in such situations. For a GARDENER in a SITUATION, please send full particulars to Mr. JOHN BESTER, the Pine-Apple Nursery Company, Maids Vale, London, W.

Gardeners and Under Gardeners. WM. CUTBUSH and SON beg to state that they have at all times on their Books MEN of VARIOUS QUALIFICATIONS, whose characters will bear strictest inquiry. Any Gentleman making application would save time, clearly stating the duties to be undertaken, wages offered, &c., so that suitable Men may be selected.—Highgate Nurseries, London, N.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head Gardeners. JOHN LAING can at present recommend with every confidence several energetic and practical Men, of tested ability and first-class character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Single-hand situations, should be enabled, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

GARDENER (HEAD).—Messrs. WM. CUTBUSH & SON have in their Nurseries a thoroughly practical Head Gardener, whom they can confidently recommend to any Nobleman or Gentleman requiring a steady persevering Man.—Highgate Nurseries, London, N.

GARDENER (HEAD).—J. W. LAURENCE, Gardener to the late Right Rev. Bishop Sumner, Farnham, is at liberty to engage with any Nobleman or Gentleman requiring the services of an experienced Man.—Prospect Cottage, Upper Hale, Farnham, Surrey.

GARDENER (HEAD), to any Lady or Gentleman requiring the services of a good practical Man.—Age 38, married, no incumbrance; understands the general requirements of a good Establishment; can undertake the Management of Grass Land, Stock (as Cows, &c.), if required. Good references.—X. Y. Z., Northgate Nursery, Chichester.

GARDENER (HEAD), to any Lady, Nobleman, or Gentleman requiring the services of a thoroughly practical Gardener.—Age 31, married; understands the profession in all its branches, having had sixteen years' experience both in England and Ireland.—HORTUS, 59, Denmark Road, Hammersmith, W.

GARDENER (HEAD).—Age 39, married; J. McCORRICK, Head Gardener for the last four and a half years to the Bradford Corporation at Lister Park, is in want of a situation where the services of a first-class practical Man are required. He is thoroughly up in the Laying-out and Planting of Grounds, and is an excellent Florist and Fruit Grower. The highest testimonials as to character and ability from the Mayor and Town Council of the Borough of Bradford.—4, Burton Street, Victor Road, Manningham, Bradford.

GARDENER (HEAD).—Age 40, single; understands the Management of Fruit and Flower Gardens, and general character.—A. N., 61, Durham Road, Seven Sisters Road, Holloway, London, N.

GARDENER (HEAD), where assistance is given.—Age 30, single; thoroughly understands the profession in all its branches. Four years' experience as present employer, where staying till suited.—C. D., Mrs. Brown, The Hollies, Eltham, Kent.

GARDENER (HEAD), or MANAGER of small Estate.—Age 33, married, no family; understands Repairs and Sanitary Matters. Eleven years in present place. Would like to take a first-class Housemaid's situation, having filled the present one for two years.—A. B., Messrs. Saltmarsh & Son, Nurserymeo, Chelmsford.

GARDENER (HEAD, WORKING), where three or more are kept.—Age 35, married, no family; experienced in all branches of the profession. Seven years' good character.—M. S., 126, Grove Lane, Camberwell, Surrey, S.

GARDENER (HEAD WORKING).—Age 31, married, one child; well experienced in the cultivation of Vines, Peaches, Cucumbers, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening, &c. The highest recommendations as to character and ability from present employer.—B. R., Messrs. Cripps & Son, Tunbridge Wells Nurseries, Kent.

GARDENER (HEAD, WORKING), age 38, married.—WILLIAM HENDERSON, for the last four and a half years Gardener to R. R. Robinson, Esq., Henley Park, Henley-on-Avon; also, for the last three years, to the Nobleman, or Gentleman requiring the services of a thorough practical Man, who well understands the Early and Late Forework of all kinds of Fruit, Flowers, and Vegetables, and the Management of Fruit, Flower, and Kitchen Gardens. Wife, having no family, is qualified to take charge of Gentleman's Residence during the employer's absence. Characters will bear investigation.

GARDENER, or STEWARD and GARDENER (married, one child, Protestant)—Advertiser requires a situation in Ireland; is a thoroughly understands the profession in all its branches. Has held first-class situations in Ireland, and is certified in Fruit, Flowers, and Vegetables, and trustworthy Man.—HORTUS, 147, Great Brunswick Street, Dublin.

GARDENER (UNDER), in a large Garden, or FOREMAN in a small one.—A GARDENER can recommend a sober, honest, industrious young Man (age 22) as above.—D. B., Dolley's Hill, Kilbrann, N.W.

GARDENER (UNDER), in a good Establishment.—Age 20; has a knowledge of Vines, Plants, Cucumbers, Melons, &c. Five years' character. Good references.—F., Post Office, Brixton, Plympton, Devon.

GARDENER (UNDER), or IMPROVER, in the Houses.—Age 19. Five years and nine months' good character from present situation.—A. D., Mr. Chandler, Dood's Road, Reigate, Surrey.

GARDENER (UNDER), as IMPROVER.—Age 20.—M. CHARLTON, Havelock Street, Bartsley.

Landscape Gardening. SUPERINTENDENT.—Age 47, married, no family; thoroughly practical in all branches of Gardening, the Building and Heating of Hothouses, Laying-out New Grounds, Planting, Draining, &c.; also Ferneries and Rockwork in the best of style.—G. GOOD, Mr. Buttersfield, Little Heath, Potter's Bar, N.

To Nurserymen and Landscape Gardeners. FOREMAN.—Can Prepare Plans, and Lay-out from same.—H., Pine-Apple Nursery, Maids Vale, W.

FOREMAN, in a good Establishment.—Experienced in all kinds of Forcing and Plant Growing. First-class references.—A. B., Mrs. Edmunds, 26, Land Lane, Croydon, Surrey.

PROPAGATOR and FOREMAN in a good Establishment.—Age 29. Four very good references as to character and abilities.—A. S., Mr. Stacey, 5, Whitehall Street, Tottenham, N.

THE "ARCHIMEDEAN" AMERICAN LAWN MOWER

HAS BEEN AWARDED

GRAND DIPLOMA of HONOURABLE MENTION, Vienna, 1873.
SILVER MEDAL, Vienna, 1870. SILVER MEDAL, Hamburg, 1869.

NOTE.—The "Archimedean" was specially selected from the Mowers exhibited at Vienna for constant use in the Exhibition Grounds, and gave great satisfaction; and we have pleasure in calling attention to the following Testimonial, received from the Inspector of the Royal Gardens, Schönbrunn, Vienna:—

"Your 'Archimedean' Lawn Mowers have been used for some time past at the Imperial Gardens, and I have great pleasure in stating that they have given perfect satisfaction. Their quick and good work prove them to be the best and most efficient machines of the kind."

PATRONIZED BY

HER GRACIOUS MAJESTY THE QUEEN,
HER IMPERIAL MAJESTY THE EMPRESS OF GERMANY,
THE LATE EMPEROR OF THE FRENCH,

HIS ROYAL HIGHNESS THE PRINCE OF WALES,
HIS IMPERIAL MAJESTY THE EMPEROR OF AUSTRIA,
THE VICEROY OF EGYPT,

And many of the Nobility and Gentry of Great Britain.

CHIEF ADVANTAGES.

- They are extremely LIGHT IN DRAUGHT, SIMPLE IN CONSTRUCTION, WELL MADE, and NOT LIKELY TO GET OUT OF ORDER.
- They cut LONG or SHORT, WET or DRY Grass, and do not clog.
- They have no ROLLERS in FRONT of the Cutters, and therefore cut the Grass as it GROWS, and do not miss the BENTS.
- They work well on SLOPES, STEEP EMBANKMENTS, UNDER SHRUBS, and close up to Trees, &c.
- They can be USED either WITH OR WITHOUT GRASS BOX, as may be desired.

TESTIMONIALS.

From A. F. BARRON, Esq., Royal Horticultural Society, Chiswick Gardens, W.

"GENTLEMEN,—We have now had your 'Archimedean' Lawn Mower in use for several months, and without hesitation I can truly say it is the best and most efficient implement of the kind we have ever used."

From the late Mr. GEORGE WYNESS, Royal Gardens, Buckingham Palace.

"GENTLEMEN,—I beg to say that we have had your Patent 'Archimedean' Lawn Mower at work in Her Majesty's gardens at Buckingham Palace for some time past, and I have much pleasure in testifying that it has given every satisfaction, as it does its work well and quickly."

From the Rev. J. H. WHITE, Hemingford Grey, St. Ives, Hunts.

"I am much pleased with the working of your 'Archimedean' Mowing Machine. I think it superior to others which I have used in previous years."

OPINIONS OF THE PRESS.

"The quickest, most simple, and most efficient Mower ever used."—*Gardeners' Chronicle*.

"Far superior to any of ours."—*The Field*.

"Remarkably easy to work."—*Gardeners' Mag.*

"We feel bound to recommend it to our readers as one of the best Mowers we have as yet made acquaintance with."—*Floral World*.

EVERY MOWER IS WARRANTED TO GIVE AMPLE SATISFACTION,

And if not approved of may be returned within a Month, and the amount paid be refunded.

Worcestershire, in the far-famed Vale of Evesham. PRELIMINARY ADVERTISEMENT.

MESSRS. CHESSHIRE and GIBSON have received instructions to SELL by AUCTION, in JULY NEXT, in consequence of the death of the Proprietor, under the terms of a Lease, a valuable meadow land in a long lease Contract, a very excellent FREEHOLD ESTATE of 240 Acres, known as "Seaford Grange," situated at Peppitton, within 15 miles of the Pershore Station on the Great Western Railway.

A considerable portion of the above has been laid out as Fruit Gardens, the Trees being of the choicest kinds, now in their prime, the produce being in great demand, and the business carried on by the late Proprietor.

In addition to a complete set of FARM BUILDINGS, with 50 Acres, there is a very comfortable and desirable RESIDENCE, replete with every convenience, and the portion of the Estate not laid out as Fruit Gardens is occupied as a Farm, and comprises Arable and Pasture land exceedingly fertile.

For further particulars and plans will be issued in due course, in the meantime further information may be obtained of H. G. GOLDINGHAM, Solicitor, or A. BUCK, Estate Agent, both of Worcester; or to the Auctioneers, Messrs. CHESSHIRE and GIBSON, 93, New Street, Birmingham.

The Plumstead Park Estate, Plumstead, Kent.

About 16 acres of FREEHOLD BUILDING LAND, to be sold at the upset price of £1800 for the whole Estate, or in six lots at the respective upset prices of £1300, £1700, £2600, £2800, £1000, and £600. The Land is of a very undulating and park-like character, and presents several splendid sites adapted for the erection of Public Schools, Hospitals, and other large public buildings.

MESSRS. RICE BROTHERS are instructed to SELL by AUCTION, at the Mart, on FRIDAY, June 18, at 3 o'clock precisely, in one lot, at the price of £1800, or if not sold in one lot then in six lots at the above upset prices, the very valuable FREEHOLD BUILDING ESTATE, comprising about 16 acres, delightfully situate upon a commanding eminence, and embracing most extensive views over the Thames and surrounding country, and yet only half a mile from the Plumstead Station on the North Kent Line.

Particulars, with plans, may be had at the principal taverns in the neighborhood of WILLIAM HORSLEY, Esq., Solicitor, 2, Gresham Buildings, Basinghall Street, City, E.C., at the Mart; and of the Auctioneers, 2, Adelaide Place, London Bridge, City, E.C.

Victoria Estate, Kansas, U.S.—To Farmers and OTHERS.

FINE STOCK FARMS of 640 Acres and upwards, to be SOLD, Freehold, from 12s. to 50s. per acre. Grass in its natural condition unsurpassed for feeding Sheep and Cattle. For PAMPHLET containing full particulars respecting this Property, apply to ROBERT W. EDIS, Esq., F.S.A., 14, Fitzroy Square, London, W., Architect to the Estate.

To Gardeners and Florists.

TO BE SOLD, the LEASE and GOODWILL of the BEULAH CRESCENT NURSERY, New Town, Heath, in the centre of Grosvenor Road, near the Crystal Palace, surrounded with Villas, containing 1 acre of ground, with about 4000 feet of Glass therein.

For further particulars apply on the Premises.

Freehold—28 Miles S.W.

TO BE SOLD, a beautiful ESTATE of 240 acres, with elegant Swiss Villa, and capital Stabling, Gravelly Soil, fine views, and extensive frontages, free from title and incumbrances. For PAMPHLET containing full particulars respecting this Property, apply to W. TARRY, Bailiff, "Golden Farmer," Bagshot, Surrey.

To Florists.—Walbarnstow.

TO BE LET ON LEASE, in Summit Road, Walbarnstow, a small compact NURSERY GROUND, with COTTAGE and Three Large GREENHOUSES, one of which is 18 feet in length by 21 feet in width, and is heated by hot water. Possession can be had in about a month. For particulars, apply to Mr. HOUGHTON, 15A, Saint Helens Place, London, E.C.

To Nurserymen and Others.

THE GUILFORD NURSERY, Whitefield, near Dover, comprising a Residence, Stable, and Outbuilding, with 7 acres of first-class Land. Rent £50. The Viney, Greenhouse, Stove and Fern Pits, together with some Nursery Stock, to be taken by valuation or arrangement with the Auctioneers, Messrs. WORSFOLD and HAYWARD, Auctioneers, New Bridge, Dover.

 VICTORIA and PARADISE NURSERIES, Upper Holloway, London, N.

PERNS FOR SALE, fine specimens—
 Fifty Todea spectabilis, 2 1/2 feet through; fifty do., 1 to 2 feet through; fifty Todea pelucida, 2 to 3 feet through; fifty Todea pelucida and superba, 1 foot through. These plants are superb, perhaps the finest specimens in Britain, and will be sold at very reasonable prices for cash, as the house they are growing in is wanted for my Cut Flower Trade. Apply to **PETER MCKENZIE**, Nurseryman and Florist, 1, Gordon Street, Glasgow, and Bedford Nursery, Paisley, N.B.

Bedding Roses.
CRANSTON'S CRIMSON BEDDER:
 A strong plant, in 5-inch pots, 50s. per dozen. TEA-SCENTED, CHINA, NOISE-PETTES, and HYBRID PERPETUAL ROSES, in 4 and 5-inch pots, 7s. to 15s. per dozen.
 Now is the best time for bedding-out the Tea-scented and China Roses, and Hybrid Perpetuals, on their own roots. Address, **CRANSTON and MAYOS**, King's Gate Nurseries, Hereford.

New Dwarf Silver Variegated Geranium, "LITTLE TROT"
WM. POTTER is now sending out the above GERANIUM, which is the best and most distinct silver variegated variety yet offered. Its dwarf and free habit, and broad clear white margin, will make it invaluable as a bedding-plant for edging or for the vase. A First-class Certificate from the Royal Horticultural Society, August 29, 1874. Price 2s. 6d. each, 24s. per dozen. The usual Discount to the Trade.
 An Office Order, payable at Sissinghurst, must accompany all orders from unknown Correspondents.
 Camden Nursery, Sissinghurst, Staplehurst, Kent.

NEW CLEMATIS, now being sent out by JOHN STANDISH AND CO. — ASCOTENSIS.—The flowers are considerably larger than above GERANIUM, which is the best and most distinct silver variegated variety yet offered. Its dwarf and free habit, and broad clear white margin, will make it invaluable as a bedding-plant for edging or for the vase. A First-class Certificate from the Royal Horticultural Society, August 29, 1874. Price 2s. 6d. each, 24s. per dozen. The usual Discount to the Trade.
 An Office Order, payable at Sissinghurst, must accompany all orders from unknown Correspondents.
 Camden Nursery, Sissinghurst, Staplehurst, Kent.

MRS. M. QUATER.—A magnificent white flower, containing eight petals; it is the largest, smoothest, and purest of all the whites, and a very free bloomer, with strong habit, 2s. 6d. each.
 The above are decided acquisitions, and should be in every collection. Orders are now being booked for them.
 Royal Nurseries, Ascot, Berks.

RODGER, McCLELLAND AND CO. have to offer, in good plants, as follows:—
 ARALIA SIEBERTII, 1 1/2 to 2 1/2 feet, 2s. to 24s. per dozen.
 BAMBUSA METAKEE, 12s. to 18s. per dozen.
 CHAMEROPS HUMILIS, 18s. to 24s. per dozen.
 DIAPYCNION LONGIFOLIUM, 3s., 6s., 2s., and 7s. 6d. each.
 MIMULUS, extra fine varieties, 2s., 6d., and 3s. 6d. per dozen.
 MUEHLBECCKIA COMPLEXA, the most elegant evergreen hardy climber plant in cultivation. Slender shoots and small foliage, giving the plant the appearance of a Maidenhair Fern: 12s. to 18s. per dozen.
 SEMPERVIVUM ARBORUM RUBRUM, 1 1/2 to 2 feet, 15s. to 24s. per dozen.
 * BOLLI, 20s. per 100, 3s. 6d. per dozen.
 * TABULIFORME, 20s. per 100, 8s. per dozen.
YUCCA ALPHONSEA PUKPURA, 12s., 18s., and 24s. per dozen.
 * ANGUSTIFOLIA, 1 1/2 feet, 30s. per dozen.
ALYSIA CITRIFOLIA, 25s. and 40s. per 100.
 64, Hill Street, Smyrna.

F. G. HENDERSON AND SON will place in commerce, for the first time, the following **NEW FLAXES**, full descriptions of which are given in their 'NEW PLANT' CATALOGUE, a copy of which will be immediately forwarded on application:—

Carters

THE FINEST COLEUS EVER INTRODUCED.

NEW COLEUS,
"DUCHESS OF EDINBURGH."

AWARDED FIRST-CLASS CERTIFICATES:—

Royal Horticultural Society, June 17, 1874; Royal Botanic Society, June 20, 1874.

The foliage of this distinct and beautiful variety has margins of purple and creamy yellow, with a centre of bright crimson-magenta, forming a superb contrast to the green-leaved section of Coleus, by reason of its dazzling brilliancy of colour.

Professor THURER, in the *American Agriculturist*, says:—"It is the most beautiful foliage plant that has ever been exhibited."

Price 8s. 6d. each. Extra Strong Plants 5s. each. Post Free 6d. extra.

See Illustration in "*Gardeners' Chronicle*," May 22, and also *Carters' Illustrated Plant Catalogue with beautifully coloured Engraving of above.* Price 6d., Post Free, Gratis to Customers.

CATALOGUES two Stamps. See Specimens at either address Also at Stand 228*, Bath and West of England Agricultural Show, at Croxley, May 31 to June 4.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it is so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Mildland Chronicle Herald*.
 "This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bath's Messenger*.
 "We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heater in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow, this little book broadcast."—*Gardener's Magazine*.

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

SPECIAL PRIZES FOR NEW PLANTS.

TWELVE SILVER CUPS (the third Annual Series), will be given by
WILLIAM BULL, F.L.S.,

On WEDNESDAY NEXT, June 2, at the Royal Horticultural Society's Exhibition.

ENTRIES SHOULD BE SENT AT ONCE TO MR. BARRON, ROYAL HORTICULTURAL GARDENS, SOUTH KENSINGTON.

Particulars of these Prizes are given at p. 19 of the Schedule of the Royal Horticultural Society, which can be had on application at South Kensington, and at p. 193 of Mr. William Bull's New Plant Catalogue for 1875. They are as follows:—

FOR PRIVATE GROWERS.

1st Prize, a Silver Cup, value	£15 15 0
2d Prize, a Silver Cup, value	£10 10 0
3d Prize, a Silver Cup, value	£ 6 6 0

FOR NURSERYMEN.

1st Prize, a Silver Cup, value	£15 15 0
2d Prize, a Silver Cup, value	£10 10 0
3d Prize, a Silver Cup, value	£ 6 6 0

The following Silver Cups will be given to those not having previously won any of Mr. William Bull's Silver Cups:—

FOR PRIVATE GROWERS.

1st Prize, a Silver Cup, value	£15 15 0
2d Prize, a Silver Cup, value	£10 10 0
3d Prize, a Silver Cup, value	£ 6 6 0

FOR NURSERYMEN.

1st Prize, a Silver Cup, value	£15 15 0
2d Prize, a Silver Cup, value	£10 10 0
3d Prize, a Silver Cup, value	£ 6 6 0

In each and all cases the above Prizes to be offered for Twelve New Plants of Mr. W. Bull's introductions, and sent out since the commencement of 1872. The Plants available for the Prizes to comprise only those announced in Mr. W. Bull's Catalogues as sent out by him for the first time. The Catalogues can easily be referred to, or a List of the Plants had on application.

In each and every entry the names of the Twelve Plants to be exhibited must be sent with the entry. Exhibitors can only compete for one Prize at a time in each class.

The Twelve Plants must be twelve distinct species or varieties, but each may be composed of one or more individual plants, if grouped in one pot, pan, or vase.

ESTABLISHMENT for NEW and RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

NEW PLANTS

FOR 1875.

B. S. WILLIAMS

Begs to intimate that he is now sending out his New Plants, the whole of which he can confidently recommend as being far superior to any hitherto offered in their respective classes, prices and particulars of which will be found in large advertisement, p. 499, April 17.

B. S. W. begs to invite an inspection of his Houses just now, which are very gay with large specimen Azaleas, Ericas, and other Stove and Greenhouse Plants, as well as Orchids, which are always a speciality of this Nursery. Also, his large and varied stock of Ornamental Plants suited either for the Stove or Conservatory, consisting of matchless specimens of Palms and Tree Ferns.

A long Range of New Houses have lately been added to this Establishment, which is being made a special feature, and already contain some New Plants of rare excellence lately received from his Foreign Correspondents.

The NEW PLANT CATALOGUE is now ready, and will be sent, Post Free, to all applicants.

B. S. WILLIAMS, VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

DENDROBIUM CHRYSANTHEMUM,	DENDROBIUM FARMERI,	DENDROBIUM THYRSIFLORUM,	VANDA CATHCARTI,
" CRASSINOIDE,	" FALCONERI,	" TRANSPARENS,	" CERULESCENS,
" BARBERIANA,	" MARMOKATUM,	" WARDIANUM—(of this most lovely	" CRISTATA,
" DALHOUSIANUM,	" PARISHI,	and hitherto rare species plants of	" BENSONIÆ,
" DEVONIANUM—(this lovely species	" PIERARDI,	unusual size are offered),	BICOLOR,
can be offered by the 100 at a very low	" PEIMULINUM,	PHALÆNOPSIS LOWI,	SACCOLABIUMS in variety,
price),	" SUAVISIMUM,	" MANNI,	THUNIAS, two distinct species.

The Stock of Established Plants of PHALÆNOPSIS, consisting of AMABILIS varieties, SCHILLERIANA, LUDEMANNIANA, and GRANDIFLORA is very large. Also just to hand, an extensive Importation of the Borneo Variety of PHALÆNOPSIS GRANDIFLORA—they can be supplied by the dozen or 100. A quantity of ODONTOGLOSSUMS from New Granada, just received by R.M.S.S. *Tasmanian*.

AMATEURS ARE RESPECTFULLY INVITED TO INSPECT THE PLANTS.

CLAPTON NURSERY, LONDON, E.

SATURDAY, MAY 29, 1875.

ROYAL OAK DAY.

BY this name the 29th of May is still known in many parts of the country; though almost everywhere the event which it commemorates has fallen into oblivion in the popular mind. There is nothing like some readily obtainable and easily recognisable symbol for making an event memorable; and, if the emblem be a floral one, it seems to be particularly fortunate. Where is the Irishman, for instance, whose eye will not kindle at the sight or sound of the Shamrock, albeit the well-known story of its use by St. Patrick does not appear in any of the lives of the saint, and rests entirely upon tradition. Most countries, indeed, have their floral badge, or one in some way associated with a particular plant and tree; and for ourselves, besides the Roses, which gave the name to one of our most serious and disastrous civil wars, and which are especially emblematic of England, we have had the Broom plant (Planta genista) furnishing a name for one of our lines of kings; while on this day the Oak boughs commemorate the preservation of another monarch, and the restoration, in his person, of another of the dynasties which have ruled our country.

It seems to be generally supposed that the Oak is worn on May 29 to commemorate the concealment of Charles II. in the branches of that tree upon the date in question. But a little reflection will show that by this date the leaves of the Oak would scarcely be sufficiently fully expanded to furnish a shelter; and it is clear from history that the hiding of the king in the branches must have taken place at the beginning of September. The battle of Worcester, which was so disastrous to the Royalist cause, was fought on the 3d of that month; and it was on the following day that the Boscobet tree earned the title of "the Royal Oak," and the services of "trusty Dick Penderell" were brought into requisition. The following year, however, Charles entered London upon the 29th of May, which was also his birthday, and the Oak was then conspicuously displayed in the streets by his sympathisers; it thus served the double purpose of commemorating his birthday and his restoration.

In some parts of England the custom of wearing Oak branches or twigs on May 29 is still very general, as in Derbyshire and Cheshire, where the carters and their horses display them prominently in their hats and harness. The large soft Oak-galls, or "Oak-apples," which are often conspicuous at this season, are sometimes gilded and worn on this day. In London the custom was, even in recent times, pretty general among the lower classes, but it is now dying out. Gilded "Oak-apples" and twigs are nevertheless still exposed in Covent Garden Market about this time. The "Chelsea pensioners" used to be conspicuous in old days for their display of "Royal Oak" and the statue of Charles II, which stands in the grounds of Chelsea College was decorated with Oak-boughs until very recently on May 29, and, perhaps, is so still. The statue of Charles I, at Charing Cross was similarly adorned until a comparatively recent date; and at one time the tomb of Richard Penderell ("Trusty Dick," by whose means the king was preserved), in St. Giles' churchyard, was strewn with Oak branches on the same anniversary.

In Northampton Restoration Day was a day of special observance. Miss Baker says:—"On this day it was formerly the custom for all the principal families in the town of Northampton to place a large branch over the door of their houses, or in their balconies, in remembrance of the restoration of Charles II. The Oak boughs are gradually disappearing; but the corporate body still goes in procession to All Saints' Church, accompanied by the boys and girls of the different charity schools, each of them having a sprig of Oak, with a gilt Oak-apple placed in the front of their dress; and should the season be unpropitious, and Oak-apples be scarce, small gilded Potatoes are substituted. The commemoration of this day has been probably more generally and loyally observed in this town than in any other place, from a feeling of gratitude to that monarch who munificently contributed 1000 tons of timber out of Whitteewood Forest, and remitted the duty of chimney-money in Northampton for seven years, towards the rebuilding of the town after the destructive fire in 1675. The statue of the king, which is placed in the centre of the balustrade on the portico of All Saints' Church, is always enveloped in Oak boughs on this day. Some of the villagers in the country notice the day by decorating their houses with branches of Oak, or by children carrying them about in their hands."

Brand tells us that about Newcastle the boys who wore Oak leaves in their hands used to taunt those who were not so adorned, by the rhyme—

"Royal Oak,
The Whigs to harme."

and that some in opposition wore the leaves of the Plane tree, and retorted—

"Plane tree leaves,
The Church folk are thieves."

In Hertfordshire, according to Mr. Timbs, the 29th of May was called "Shig-shag day," the origin of which name is not obvious. It was not, however, always safe to manifest Stuartian sympathies in this manner, as Brand says that two soldiers were whipped almost to death and turned out of the service for wearing boughs in their hats on May 29, 1716.

As to the Royal Oak itself at Boscobet, which has long ceased to exist, having fallen a victim to that passion for relics which is so characteristic of the popular mind. Fragments were removed by visitors, and the tree, although at length enclosed by a brick wall, did not receive this protection in time to save its life. A young tree from the same Oak, however, still occupies its place. Charles himself visited the Oak during the latter part of his reign, and took from it some acorns, which he planted in St. James' and Hyde Parks, and used to water with his own hands. One of these still remained as lately as 1859. It will be remembered that the special service commemorating the Restoration was removed from the Book of Common Prayer in 1858. B. H.

New Garden Plants.

DENDROBIUM CRASSINODE BARBERIANUM, n. var. The Dendrobium crassinode of Mr. Low's last grand sale appears to be a highly improved variety of the original species, whose typical specimens are in my hands, provided the new plants are all like what I have just obtained, as I hope they may be, to the benefit of the possessors. The flowers are much larger, and of firmer substance. The colours are much warmer. The violet-purplish spots at the ends of both sepals and petals are so much larger and deeper, that the first impression of the flower is totally novel, though one cannot fail to think immediately of D. Wardianum. The whole of the anterior part of the lip is tinted with the same beautiful violet-purplish, which is a great success; and the hairs of the lip are larger and stronger. Can there have been some cross between D. crassinode and Wardianum? The affinity of those Dendrobies, with the same colours, is different development, and such different stems, is exceedingly tiresome for a monographer, though they

Cheap New Roses from Paris. LÉVÊQUE AND SON, NURSERYMEN, &c., Ivry-sur-Seine, near Paris, beg to state that they have, in strong and healthy plants, all the new sorts of 1874, 1875, and all the following, at per 100—J. P. Jannin, Diana, Annelie Hoste, Ant. Mouton, Hernald Verlet, Marie Siskley, Jean Duchery, Casimir Perrier, C. P. de Serenye, and others (72 sorts). Also, at per 100 of each, Captain Christy, Madame Louis Lévesque, and Perle de Lyon, at low rates. Prices on application.

Strong Verbenas.—Special Offer. WILLIAM BADMAN offers the following VERBENAS, strong plants, from single pots:—PURPLE KING.

CRIMSON KING, best scarlet. LE GRAND BOUTE DE NEIGE, finest white. GEANT DES BATAILLES, crimson. LADY COWLEY, rose, fine bedder. All healthy good stock, 15, 6d. per dozen, 10s. per 100, 80s. per 1000, package included. Terms cash. Cemetery Nursery, Gravesend.

Tree Ferns. THE NEW PLANT AND BULB COMPANY having received large importations, Tree Ferns need no longer be considered a luxury. They can be had in all sizes and in a fine growing condition, from 10s. 6d. each. Detailed Lists of sizes and Prices, just published, free on application.

FILMY FERNS, LOMARIAS, POLYSTICHUMS, and other FERNS from New Zealand and suitable for planting out, or for culture, shortly to give effect, at the prices of ordinary pot plants.

ORCHIDS are being constantly received in splendid condition in fine pieces. We respectfully invite Cultivators of these to send their Names and Addresses, that particulars of consignments, as to condition and quality, may be forwarded from time to time, and at a moderate profit. For present consignments, see Lists, free on application.

AMARYLLIS.—Hundreds of these now throwing up fine flower-spikes. CYPRIPEDIUM JAPONICUM.—See Catalogue. FRESIA DE LEIDEN.—See particulars of this grand bulbous plant, see Gardeners' Chronicle, May 7, 1875. LILIES and other BULBIOUS PLANTS.—An unrivalled collection. Lion Walk, Colchester.

Perlargoniums, Fuchelias, Bodding and other Plants, all established in Single Pots. Reduced Wholesale Prices.

WOOD INGRAM

- beg to offer:— FUCHSIAS, named, in 5-inch pots, 35s. per 100, 4s. per dozen. PELARGONIUM, double white, Aline Sisley, 4s. per dozen. " Sims Zonal, 4s. per dozen, 4s. per dozen. STELLARIA GRAMINEA AUREA, 10s. per 100. The Nurseries, Huntingdon.

ROYAL AGRICULTURAL

BENEFIT INSTITUTION. Patron—HER MOST GRACIOUS MAJESTY THE QUEEN. President—HIS GRACE THE DUKE OF RICHMOND. Founded 1860.

For the Relief of Decayed Farmers and their Widows, and for the Maintenance and Education of their Orphans. THE FIFTEENTH ANNIVERSARY FESTIVAL, in aid of the Funds of the Institution, will take place at WILLIS'S ROOMS, King Street, St. James's, W., on SATURDAY, June 5, at halfpast 6 o'Clock.

H. R. H. THE PRINCE OF WALES, K.G., in the Chair.

List of Stewards.

- HIS GRACE THE DUKE OF Buckingham and Chanda. John Baldwin, Esq. Frank Battcock, Esq. Thomas Beddall, Esq. W. B. Brindram, Esq. William Canfield Brooks, Esq., M.P. J. W. Brown, Esq. Chas. S. Cantrell, Esq. George Cavendish Bentinck, Esq., M.P. John Collins, Esq. Joseph Drake, Esq. John Floyer, Esq., M.P. J. K. Fowler, Esq. Abraham Garrett, Esq. A. H. Johnson, Esq. John Leach, Esq., M.P. Hanslip Long, Esq. John Marten, Esq. Thomas Verrall, Esq. William Adam Mundell, Esq., Q.C. The Rt. Hon. the Earl of Malmesbury. The Rt. Hon. the Earl of Northampton. The Rt. Hon. Lord Rivers. The Rt. Hon. Lord Sondes. The Rt. Hon. Lord Vernon. The Rt. Hon. Lord Walsingham. Sir William Bageot, Bart., M.P. Sir Edward House, Bart., M.P.

Dinner Tickets, 2s., application for which should be made to the SECRETARY, at the Offices of the Institution, 26, Charles Street, St. James's, W., not later than May 22.

would not much trouble one of those ruthless book-compilers, who describe their ten species in one day, quite penetrated with their infidelity, and never return to their steps, ever wandering from one family to another. After all, if the plant is difficult to the botanist, it is most attractive to the loving amateur. It has just flowered with Mr. John T. Barber, Spondon, Derby, the very successful possessor of a splendid collection of Orchids, who observed that it was very sweet-scented. I have to thank Mr. Low for the flower. Let us not forget that the flower travelled as a bud: what then will be the flowers of a full-grown, well-managed plant? *H. G. Rehb. f.*

*DENDROBIUM RHODOPTERYGIUM, n. sp.**

A Monobium novelty, much in the way of the now well-known *D. Parishii*. The pseudobulbs are much longer, and erect. There is also something that reminds one of bulbs of *D. Bensons*, Mr. S. Low writes. As to the flowers, they have much more the colours of those of *D. macrorhynchum*, Lindl. (not A. Rich.); they want totally those dark blotches on the lip; but have half a dozen purple streaks both sides of the base. The disk of the lip is only covered with very short little warts in lieu of the velvet hairs so conspicuous in *D. Parishii*. I have to thank for it Mr. Stuart Low. *H. G. Rehb. f.*

ONCIDIUM DACTYLOPTERUM, †

A small Oncid with pyriform bulbs, linear-lanceolate leaves, and a small panicle of yellow-brown flowers, all such as abortive ones are met with in the "Heterantha." The chief merit of the small plant consists in its having nice bipartite wings to the column, the partitions with small lobes. It comes from Ocaña, and is no doubt one of Mr. Bruchmiller's discoveries. I have to thank Mr. Bull for it. *H. G. Rehb. f.*

MESSRS. JACKMAN'S
CLEMATISES.

MESSRS. JACKMAN & SON'S popular exhibition at Regent's Park has now been brought to a close, and we may fittingly call attention at its termination to some of the charming novelties which it has been the means of introducing to our notice. Amongst the later novelties of the patens group were Miss Crawshaw, a handsome and distinct variety, with large pink flowers passing off to pale flesh colour, and contrasted with pale brown anthers. Baroness Burdett Coult, also a pink, but paler than Miss Crawshaw, and with a tendency to develop a second row of sepals. Prince Alfred of Edinburgh, a very attractive variety, selected by the Duchess of Edinburgh; it had delicate mauve flowers, with a paler bar becoming white, and was very free-blooming and showy. Mrs. George Jackman, a large, broad-sepal white, of great beauty and excellence. Early Purple, a plum colour changing to purple, the sepals flushed with two colours, after the style of Sir Garnet Wolseley; it is likely to be extremely useful as an early-blooming, dark-coloured variety of this section. Lord Derby, which was in flower at the opening, lasted almost throughout the whole period, and proved one of the most free-blooming and attractive sorts of this section.

Several fine novelties of the lanuginosa set were added during the later days of the show, and among them the following—Princess of Wales, with very broad sepals, which are slightly recurved, giving the flower a distinct outline. In this and several other varieties of the same cross the sepals are so broad that the four inner ones meet, so as to produce of themselves a close flower. The colour in this case is a deep, smooth-looking satiny mauve, and the whole character of the plant is regal. Mrs. Hope is another eight-sepal satiny mauve, but paler in colour than the foregoing. Blue Gem is a third, with the same general character and refined appearance, the colour being a distinct but delicate shade of mauve. William Kennett, a variety of the same section, is very showy, and similar to the foregoing in colour, but by comparison is

coarse and rough. Robert Hanbury, on the other hand, is a fine full and rather concave flower, but of a smooth texture, and a bluish shade of mauve. J. P. Gassiot is of a pale shade of mauve, with rich purple bar, sepals 6–8 in number, and very broad. One of the finest of the novelties, however, was alba magna, of which we give a woodcut representation (fig. 140). This has the leaves either simple and cordate or ternate with ovate leaflets, and woolly; and six to eight-sepal flowers, the sepals being exceptionally broad, fully 3 inches across, roundish ovate in outline, apiculate, necessarily very much overlapped; the flowers are quite 8 inches across, and of a pure white, without a dash of the purple that which so often soils the purity of these white flowers; the anthers are purplish brown, and the buds woolly and erect. It appears to us to be the finest of all the whites yet raised, and the most perfect flower, as regards shape, which has yet been obtained.

The Scotch varieties, Lawsoniana and Symeana, were blooming, but we were greatly disappointed in the latter, the flowers, though large, being composed of elongate elliptic sepals, which very slightly overlap and do not therefore form a well-filled flower. As now shown, Duke of Richmond appeared to be of the same type; indeed, being rather paled by the forcing process, its flowers were exceedingly near to it both in shape and colour. Doubtless they would all come better under more natural conditions of growth. The Duchess of Teck, which belongs to this same group of lanuginosa, is a remarkably fine white, with very broad overlapping sepals, and must share with alba magna the precedence amongst the whites of this group; it is very fine in colour, with a fine satiny surface, and of superb form.

In regard to the lanuginosa group, named after two Japanese visitors to England, Morikaki Oké and Samuel Moulson, are in the most perfect we have met with—indeed they are in this respect models; their flowers are about 4 inches across, and they have eight somewhat concave sepals, and these fit together so closely and perfectly as to leave nothing to be desired in this respect. They are of different shades of lilac, and are very free-flowering.

One thing has been clearly shown by this exhibition, and that is, that the late summer blooming sorts of the Jackmanni and Viticella sections, are spoiled by such an amount of forcing as is required to induce them to bloom in May. Hence the plants of the varieties of these groups were not exhibited in their true character, and without this caution as to the cause they might lose favour in the public estimation. They are not, however, surpassed as outdoor plants, in their proper season, and at that time the varieties which have afforded this novel display will be out of flower and resting for another spring. Hence, as the colours of the early varieties run rather upon mauves and blues, and are, all charming but delicate tints, the value of such dark plants sown early-flowering sorts as Sir Garnet Wolseley, Early Purple, W. J. Essington, and one or two others to grow in contrast with the paler coloured sorts.

We may dismiss Mr. Jackman's Clematis exhibition with the assurance that it has been not only a novel sight, captivating to the eyes of the thousands who have witnessed it, but that it has also been of so high an order of cultural merit that one might justly sing peans in its praise. *T. M.*

THE ROYAL HORTICULTURAL
SOCIETY.

I SHALL be much obliged if you will allow me to state, with reference to the remarks which fell from Mr. Kellock at the meeting of the Royal Horticultural Society (to the effect that it was bad taste on my part to attack the Council), that my resignation avowedly proceeds from a difference of opinion as to the proper manner of directing the Society's affairs. I am, therefore, bound to express that difference of opinion. I particularly requested the Council to place my resignation on the agenda for Tuesday's meeting, but they declined to do so, and I was much surprised at the announcement of it by the President—an announcement wholly irregular, as it was not on business for which the meeting was summoned. It was made probably for some reason not stated. I have avoided bringing personal matters before the Fellows, but I think it right to say, in answer to Mr. Kellock, that I conceive want of good taste to lie elsewhere than in me, and if any Fellow care to examine so worthless a question, I shall be happy to show him the correspondence. With regard to my reference to a provincial show, and the flat contradiction with which Mr. Kellock met me, I beg to say that before leaving office I had put matters in train for a show this year in the Winter Garden at Southport. A meeting of directors had been summoned to consider it, and a very strong feeling existed in favour of the show. The place is admirable, the

gardens fashionable, and the finest aquarium in England would have been added to the attractions. But after my resignation the Council postponed the whole plan, on the ground of "want of time," which in my opinion meant "want of energy." In conclusion, I have to say that I am so far wrong with regard to the debt that one item has been compounded for a less sum than was due, but, inasmuch as for the last two years the expenditure has been greater than the receipts, it is impossible by any twisting of figures to prevent any reduction of debt during that period. *H. A. Lindsay, 17, Cromwell Road, South Kensington, May 26.*

— The Parthian arrow discharged by the President of the Royal Horticultural Society at the meeting on Tuesday, took the Fellows by surprise. They could not very well realise the idea that they had put in the hands of the Council the power to terminate their existence at their absolute will, or that the Council could so abuse the power entrusted to them, without authority or consultation with the Society, to snuff it out by a fiat of bankruptcy. They could not make out what it meant. Was it an act of spite? Were they saying—

"Why should we not, had we the heart to do it,
Like to the Egyptian thief at point of death,
Kill what we love—a savage jealousy
That sometimes savours nobly?"

Or was it a piece of deep diplomacy, a sort of *brutum fulmen* to frighten the Commissioners, like the boy in *Punch* who exclaims, "Now then, granny, I've eaten the plums, and if you don't give me sixpence I'll swallow the stones?"

It is clear that if the explanation given by the President be the sole and the true one, it is a melancholy confession of incompetence on the part of the Council. Their estimates for the year are only three months old, and none of the serious expenses of the year have been incurred—no disappointment in their anticipated receipts has been experienced—and already they are beaten to a standstill. No new light has come upon them. If a storm be coming on, they knew it as well twelve months ago as now, and, knowing it, should have made preparations to meet it. In such a plight a man in ordinary business would have seen his creditors, ascertained who would not wait and who would agree to be postponed—would have applied to his friends and relations for help, and would not have thrown up the sponge until he had done his best and failed. Our Council have taken no such pains. They do not seem to care whether we live or die. They seem quite prepared to put the world aside, and talk of going through the Insolvent Court with as much indifference as if it were a Saturday's promenade. It is, indeed, only what might be expected from a new Council, who has no heart in the interests of the Society, and no feeling for its aims or traditions. What a contrast with the old Councils! On such an emergency then every member that could afford it put his hand in his pocket and lent material help. If I recollect rightly, when I joined I found that four members had so contributed a loan of £300 each. They had their hearts in the prosperity of the Society, and were not afraid of a little responsibility. But our present Council have no such feelings. How should they? They have not time to acquire them. They are, however, distinguished by a plentiful lack of courage. They would not try a provincial show because they had no guarantee. The Council they displaced did not shrink from that responsibility when they started these shows. They ran the risk personally for the first year, and then found no difficulty in getting guarantees. Our new men start at shadows, and on the first scratch fancy they are stabbed in the heart, and they are unstartled. But oh! if they were determined to die, could they not have died decently—could they not have covered the face of this grand old Society with their mantle? Was there no place to die upon but the dirty floor of a County Court? Why did they not defend us from so great a shame?

The apologies for the infliction of this ignominy are most flimsy, and transparently unsound. The treasurer tells us that he would rather cut off his right hand than sign a cheque for the debts sued for, as he would be obliged to give a preference. Passing the fact that giving a preference only means incurring the risk of having to repay the preferred payment out of his own pocket—passing that, I should like to know, if paying these debts be creating a preference, what he has been doing but creating preferences ever since he entered on the office of treasurer? His colleagues maintained to us on Tuesday, and he did not correct or dispute the statement, that the Society was in no way financially in a position now then when the present Council took office. If so, why is it creating a preference to pay prize money in 1875, when it was not so in 1873 or 1874. The truth is that the statement made was erroneous. It is only in a Pickwickian sense that the financial position is unchanged, and the only apology for suspending payment, in order to avoid giving preferences, is the fact that the

financial position is much worse. But then it is no worse now than it was at the beginning of this year, and surely some payments have been made since then—nay, we learn from the Council's report that an old debt of twenty years' existence had been compromised, and £600 paid out of last year's receipts, thus giving it a preference over the poor exhibitors who had helped to raise the means by which this payment was made; and the Council actually plumed themselves on having settled this debt, and cast an implied reflection on the old Councils for having ignored it (as they had good reason to do, at least until every one else was paid); and now they are of such *stridissimi juris* that the treasurer flourishes about cutting off his right hand rather than sign a

cheque giving payment to the exhibitors, who have been prevented receiving their prize money by his application (or, as they will call it, his misapplication) of the funds, which by rights should have gone to pay them. Be these thy men of business, O Kensington!

I say nothing on the negotiations with the Commissioners, in deference to their delicate position and to the request of the President; I say nothing as to the means of extrication from our present position, which our Council alone fails to see or refuses to adopt; but I cannot keep silence on the unwarrantable attempt to hurry the Society to an act of *felo de se*, and the ignominious manner in which the act is attempted to be carried out. *Andrew Murray.*

PHALÆNOPSIS VARIATIONS.

It is somewhat remarkable that for many years our importations of Orchids were confined to certain type forms, which reappeared with very trifling variations, but that latterly the plants sent home by collectors have become considerably "mixed," and the variations are frequent and striking. Some two or three months since we saw at least half-a-dozen distinct forms, none of them referrible to any named kind, blooming, as part of one importation made by Mr. Bull, and of these the following are notes made at the time. As it is not desirable to apply even garden names to them, we notice them under numbers.

1. This has terete roots, and short oblong leaves, flushed with wine-red, most distinct on the younger leaves. The scape is spotted, reddish. Flowers medium-sized, white, compact in form; lip, with the stalk-like base, cross-barred with purple, the broad white incurved side lobes with two or three bold bars of red-purple extending for half an inch from behind the yellowish crest, which is marked with tawny red spots; the two contiguous edges of the front and side lobes slightly tinged with yellow, the front lobe itself terminating in long curled cirri.

2. The roots compressed, but scarcely flattened, the leaves elongate oblong, purplish beneath when young. The scape purplish, spotted. Flowers large, the sepals and petals white, the lateral ones tinged with yellow; lip long stalked, mottled, with reddish purple behind the crests, the marking extending up the posterior side of the lateral lobes in streaks breaking up into spots, which are conspicuous; crest yellow, with tawny red spots; base of front lobe and anterior side of lateral lobes deeply flushed with yellow, the margins purplish in the sinus; front lobe cirrose.

3. The roots terete, the leaves oblong, green. The scape greenish, slightly mottled with red. Flowers large, pure white; lip long stalked, the crest yellow, dotted with red; the base transversely blotched with red-purple, running out behind the crest into one bar, and numerous dots of red-purple, the spotting of the crest continued in a short line down the base of the middle lobe, the two contiguous edges flushed with yellow, that of the front lobe with a red line at the edge; front lobe cirrose.

4. The roots terete, the leaves oblong, green, the young ones flushed with red. Flowers medium-sized, the base of the lateral sepals spotted, lip transversely blotched at the base, the marking extending laterally up the side lobes, a bold bifurcate band in front, and spotting behind of rich wine-purple; crest white, spotted with red; edges of lobes with slight dots with yellow, that of the front lobe red-edged; centre of the front lobe with an oblong patch of spots half an inch long, the point cirrose.

5. The roots compressed; the leaves large, oblong, green. Flowers large, the sepals and petals white, the lateral sepals slightly spotted on the anterior edge; lip cross-barred at the base, with one bold line, and behind this several boldish dots up the side lobes, the front edge and base of the middle lobe strongly tinted with yellow, the centre of the base of the latter slightly flushed with purple, the crest white spotted with red, the point of front lobe cirrose.

6. The roots flat, compressed; the leaves short, oblong, stained behind, even in age, with purple. Flowers small, the lateral sepals flushed with yellow, and spotted with wine-purple on the anterior side; lip cross-barred at the base, with four to five distinct lines running up the lateral lobes, and without dots, the front side yellow; front lobe yellow at base, with a flange of purple dots in centre and cirrose; crests taller, white with yellow tops spotted with red.

These all belong to the leucorrhoda type. The flowers of *P. leucorrhoda* itself, as compared with the foregoing, are smaller; but the markings on the lateral lobes are red, forming short lines. The crest is very yellow, and there is much yellow at the base of the front lobe, and on the contiguous edges of that and the lateral lobes. The lateral sepals are spotted, and the cirri shorter. The leaves are marked with transverse bands, and the roots are flat. The flowers of *P. leucorrhoda grandiflora* are more open and more distinctly marked at the base of the front lobe, where there are red dots; the lateral markings are lines of short bars, and the cirri are longer and finer at the points. *M.*

THE TULIP.

We gather the following interesting details relating to the history of the Tulip from a biographical sketch of Ogier-Ghislain de Busbecq, published by M. Ed. Moren in the last number of *La Belgique Horticole*:—

After having stopped at Adrianople for a day we went on towards Constantinople, which was our destination. It was near these places that we saw great quantities of flowers—Narcissi, Hyacinths, and those which the Turks call Tulips. It was with great pleasure that we saw these flowers in the middle of the season so injurious to them. Greece abounds in Narcissi and Hyacinths, which have an agreeable odour, but, when a great many flowers are together, this is apt to give one a headache. Tulipans have very little scent, if any, but these plants have instead great variety and diversity of colour. The Turks cultivate them largely, and although they are new, they sometimes go to great expense to get beautiful ones. De l'Écluse and de Busbecq met at Vienna, where they

stopped together. The identity of nation and of tastes brought the two men together, and the friendship soon ripened into intimacy. Many points of resemblance may be discovered between them. Charles de l'Écluse treats of the Tulip in the 8th chapter of the second volume of his *Rariorum Plantarum Historia*. At the end of this chapter he explains himself thus:—"Before ending this chapter, I think I ought to add what I have myself observed of the Tulips grown from seeds sent from Constantinople. Anguie de Busbecque had received some with certain other bulbous plants the same year that I came to Vienna (1573), and having to go to France the following year he left them with me. These seeds were old and withered, and little thinking they would grow, I planted them in 1575 and 1576. A great number came up, and had in the following years flowers remarkable for their diversity of colour. I was thus able to obtain yellow, red, white, and purple Tulips, or sometimes these colours were combined; that is to say, variegated with yellow, red, white, or purple. The greater part were of the species called *præcox* (P. *præcox*), but on examining them more closely I found some that may be referred to the late-flowering species (T. *serotina*)."

The preceding documents do not positively ascribe the discovery of the Tulip and its introduction into European gardens to Busbecq. We might suppose that this culture dates from the beginning of the sixteenth century, but, however, this is not so. It was while Busbecq was collecting plants at Constantinople, and sending them to his friends in the west that Tulips made their appearance in European gardens and in botanical works. Thus no mention is made of them in any book before 1561; for example, in the first works of Dodoens, or in l'Écluse's *de Plantis*, translated by Charles de l'Écluse, in 1557, even though Lilies, Hyacinths, Narcissi, and other bulbous plants are there spoken of.

The first description of the Tulip is given by Conrad Gesner, in a memoir published in 1561. Gesner had seen it in bloom in April, 1559, at Augsburg, in the garden belonging to Jean-Henri Herwart, who told him he had received the seeds from Byzantium. Gesner says no more, but when we remember that Busbecq was then in Constantinople, that he had been struck with the beauty of the Tulips, and that he had some supposed and seeds to Austria, it may reasonably be supposed that the Tulips which bloomed in the garden of the citizen of Augsburg in 1559 were of Busbecq's discovery. But the discovery of this flower was like that of America: the name of Americus Vesputius was given to the new world just as Linnaeus has given the name of Gesner's Tulip (*Tulipa Gesneriana*) to Busbecq's flower. Gesner introduced it to science; he praised the beauty of the flower, and gave an engraved representation of the plant; but we see in reading the description and looking at the engraving that the Tulip was scarcely known then. The engraving is coarse and faulty, the description is full of uncertainties and inaccuracies; he had not seen the root, and was not quite certain whether it was bulbous or not.

The Tulip spread rapidly, and was soon figured in all the botanical books which, by the way, at that time appeared in great numbers. We see it, for example, in the *Flores et Coronaria Historia de Dodonæo* (Lugdun. 1568), p. 177, and is generally mentioned in all the works of the second half of the sixteenth century. Cusius brought out in 1576, while living in Vienna, his *History of Spanish Plants—Rariorum aliquot stirpium per Hispanias observatorum Historia*—printed at Antwerp by Christopher Plantin. In an appendix printed at the end of this celebrated work he treats of some strange and elegant plants which come from the east, especially from Persia, and which are chiefly curious plants, Anemones and Ranunculus; at the head of this is found the Tulip, well-figured and exactly described for the first time. Cusius there (p. 514) relates a pleasing anecdote, which shows how the Tulip was introduced into the Netherlands. "It is doubtful," he says, "whether we know the name by which it was known to the ancients. However, some savants think that it is better to refer it to the Satyrion of Dioscorides, which is designated also under the name Trifolium. It is certain that the description agrees upon certain points. As to knowing if it is gifted with the same properties as Satyrion, I do not know if any one has proved it by experience. Some years ago a merchant of Antwerp was able to pronounce an opinion upon the cause. He had received from one of his friends in Constantinople some bales of cotton amongst which was a great number of Tulip bulbs, and thinking they were Opiums he had some cooked for supper in the ordinary way with oil and vinegar. He had the rest planted in the garden amongst Cabbages and other vegetables, where if neglected they would soon all have perished if a Malines merchant, Van Kye, a lover of botany, had not saved a certain number; by his care and know-

ledge he soon obtained admirable flowers of the most beautiful variety."

Cusius reproduced the same account in his *Histoire Générale des Plantes de 1601* (p. 150), but fixed better the date of the introduction of Tulips into the Netherlands, which took place in 1571, and gave a detailed account of this species and of its varieties.

The comparison of the succeeding editions of the *Commentaries* of Matthioli is instructive on account of the history of the Tulip. We will look at the 157th chapter of the 4th book, which treats of Narcissi. Now, in the edition of 1554, mention is only made in that chapter of Narcissi and Snowdrops; in the edition of 1565 (p. 1244) we see under the name of Narcissus v. a coarse figure of the Tulip, incorrect as to foliage, and we find nothing in the text about the subject of the picture. It is evident that but little was known of the Tulip at this time. In the large edition of 1598, published by C. Gesner, with the complete works of Matthioli, we find at last a good figure of the Tulip with the fruit and seed, and in the text (p. 859) the particulars concerning this Narcissus v.

The Narcissus v. of Matthioli and of the florist of Lyons is the Tulip, of which there are several sorts known by the colour of the flower, but which can be divided into three principal groups, one for the spring-flowering species, the other for the late-flowering species, and the third for those doubtful ones which flourish in the interval; forty-seven species are thus classed by de l'Écluse. The most common are yellow, white, or purple. We still to this day receive them from Constantinople—the spring-flowering ones under the name of *Café lalé*, and the late-flowering ones under that of *Cavala lalé*, from the localities from whence they were first introduced into Constantinople. Thus *lalé* signifies flower; *Café* is a town on the *Taurica peninsula*, between the sea of Marmora and the Black Sea; *Cavala* is a maritime town of Macedonia. As to the name of Tulip, it is taken from the resemblance of the flowers to the Dalmatian bonnets or turbans which these people are in the habit of wearing on their heads. Some give it to the *Anemone Limonia* of Theophrastus, others to the *Criorrhodon* of Pliny, and some to the *Satyrion erythracum*; it seems, however, to be like the *arabidion* of Theophrastus. It is called *Tulipa Turcarum* by C. Gesner (*de Herbis*, 1561), and *Tulipa* by Cusius, Lonicer (1569), Durand (1585), &c.

The Tulip was introduced into England in 1577 by James Garret, and into France by Peirese, who cultivated it in 1610 at Aix, having received it from Tournay.

The taste for Tulips has increased, and their bulbs have become an article of commerce: it was carried to a ridiculous extent when the Tulip was the object of a celebrated memoir, and the Tulip mania reached its apogee in Holland from 1634 to 1637. Tulip cultivation in Haarlem does not date further back than this.

TRANSFORMATION OF CEREALS.

"An enemy hath done this," was the ready reply of the master in the striking parable of the Tares and the Wheat. Good Wheat had been sown, and lo!—Tares had sprung up! It is in no irreverent spirit that we apply the above to a controversy at present waged over an alleged transmutation of Oats into Wheat. Singularly enough the Tare element is not entirely wanting, for "South Norfolk" informs us [*Agricultural Gazette*, p. 622] that it was in a field of Tares that he grew *Rye* produced from Barley. Had some of our leading agriculturists been practising their art in the locality where, and at the time when, the discovery was made that Wheat had "turned to Tares" they would doubtless with commendable consistency have refused to believe in the work of the "enemy," and would have procured and continued to grow their "Wheat-Tares" or "Tare-Wheat" just as they now grow their "Oat-Wheat." Surely credulity has no bounds, or here it would find them. The law of reproduction is that "like begets like," a law long since laid down in the statement that the earth brought forth grass, herb, and beast, each "after its kind." Men who turn with horror from the thought that man himself may by process of long cycles have been evolved out of a lower form of being—out of some lower animal form—are content to believe that Nature should be no more true to herself than at once to change Oats into Wheat. But why into Wheat? Why not into something betwixt and between? Is it Nursery, Talavera, Chiddim, Rough Chaff, or what sort of Wheat? Is it a new variety, or is it one of our own? Is it a reproduction of some extinct simple form, which might possibly be viewed as a primordial type, from which both Wheat and Oats came? Surely it is too absurd to believe that Nature in a sportive mood would give us a Wheat quite like other Wheats,

A. G. *Busbecq omnino que extulit*, 1633, p. 47; translation by M. Moren in *Éclaircissements*, &c., 1842, p. 6. The translation by De Foy, Paris, 1748, l. 1, p. 73, is faulty and fanciful.

C. *Chaili Rari. Hist.*, 1609, pp. 120-123.
A. Valeri *Cordi Simusius, Annotaciones*, &c., C. Gesner collecta, 1561, p. 212.

rather than a compromise between Oats, Wheat, and Barley, all perhaps supported on a Bean stalk. This we could understand. We have at this moment a field of Tares, in which Oats were sown, as is customary, and we can vouch for the fact that the Vetches have grown up mixed with Wheat. The explanation is not difficult, and is not worth making.

Those agriculturists who believe that Oats will turn into Wheat, should know that they have given their opinion on a subject which would require proof far stronger than they are prepared to give. Have they considered Pasteur's rigidly conducted experiments, after all open to doubt, as to the possibility of spontaneous generation even in the case of the lowest forms of life? They proclaim an absurdity which they have taken no pains to prove; for what proofs of such a momentous fact are the statements of a dozen men "whose words are truth." They were very probably not competent to carry out the requisite isolation of external interruptions, the sifting of the soil, the protection from birds, and likewise from the practical joker, who of all birds would most keenly enjoy securing the success of the experiment. Agriculturists appear to be particularly liable to such hallucinations. It is no new thing, one sent us as a "lop" (Bromus mollis) with a letter gravely assuring us that the best seed Oats had been sown, and that the mysterious plant, the name and nature of which were evidently unknown to the sender, had come up instead.

At the present moment there is a field, within 2 miles of us, bearing a full crop of this same "lop," while probably the farmer who occupies it is confident that he sowed the very best Italian Ryegrass. In the North of England we have heard farmers contend that Rye-grass and bent "turned to coach," and it is a matter of belief with many most intelligent farmers that weeds grow out of the soil without the intervention of seeds. We have ourselves seen large fishes the size of ordinary perch in newly-formed ponds into which they had never been introduced by man, and yet it never struck us that they had developed spontaneously. The fact of their presence simply proved that they had been brought, but whether by water-spout, reptiles, or birds was a matter of secondary importance. In Wheat appears either after or before them, it is a proof positive that a Wheat seed had been deposited there. If we come to any other conclusion we had better resign ourselves to magic, spiritualism, and table-turning; but while we maintain our respect and belief for science, we must refuse credence to such improbable absurdities as the transformation of Oats into Wheat. *Agricultural Gazette.*

THE GENUS CEANOTHUS.

[We subjoin a complete synopsis of all the species of Ceanothus, many of which are cultivated in British gardens. The synopsis was drawn up by Mr. Seno Watson, and published in the *Proceedings of the American Academy of Arts and Sciences.*]

§ 1. EUCEANOTHUS.—Leaves all alternate, 3-nerved or pinnately veined, glandular-toothed or entire; fruit not crested.

* *Leaves 3-nerved from the base.*

+ Erect shrubs, the branches not rigidly divaricate nor spiny; inflorescence thyrsoid; leaves usually large, serrate except in (5).

a. Low (1-3 feet high); flowers white, or sometimes light blue in (5).

1. *C. americanus*, Linn. More or less villous-pubescent; leaves thin, ovate or oblong-ovate, 1½-2½ inches long, on short petioles 2-6 lines long; peduncles elongated. From the Atlantic to Winnipeg Valley, Iowa and Texas.

2. *C. ovatus*, Bigel. Nearly glabrous or pubescent; leaves narrowly oval or elliptic-lanceolate, 1-2 inches long; peduncles usually short; otherwise like the last into which it seems to pass. Range same.

3. *C. sanguineus*, Pursh. (*C. Oregonus*, Nutt.) Becoming glabrous or nearly so; leaves thin, ovate, 1-4 inches long, on slender petioles 6-15 lines long; peduncles very short; older branches reddish. From North-western Montana to Washington Territory.

4. *C. velutinus*, Dougl. Stout, usually glabrous; leaves coriaceous, broadly ovate or elliptical, 1½-3 inches long, resinous and shining above, sometimes velvety beneath; glandular serrulate; petioles stout, 6 lines long; peduncles usually short. Abundant in the mountains from Colorado to the Columbia and Northern California.

5. *C. integrimus*, Hook. and Arn. Glabrous or soon becoming so, rarely pubescent; branches terete, usually warty; leaves thin, bright green, ovate to ovate-oblong, 1-3 inches long, entire or very rarely slightly glandular-serrulate, on slender petioles 2-6 lines long; thyrses often large and open, terminating the slender branches, or axillary after rather shortly peduncled, mostly white-flowered. Frequent in the mountains from Central California to the Columbia River. This will include *C. californicus* and *nevadensis* of Kellogg.

Var. ? *parviflorus*. Of very slender habit, wholly glabrous; leaves much smaller, about ½ inch long, short-petioled; flowers light blue, in rather short simple racemes. In the Sierra Nevada from the Yosemite Valley northward.

6. Tall shrubs or small trees, 6-15 feet high; flowers bright blue; leaves oblong to oblong-ovate, rather thick.

6. *C. thyriflorus*, Esch. Subglabrous; branches strongly angled; leaves usually smooth and shining above, cuneate beneath, glandular-serrulate, 1-1½ inch long; flowers in dense subcompound racemes, terminating the usually elongated and somewhat leafy peduncles. In the Coast Range, California, from Monterey to Humboldt County, and popularly known as the California Lilac.

Var. ? *macrothyrsus*, Torrey in *Bot. Wilkes' Explor. Exped.* 263. This is described as having terete branches; leaves 1-2½ inches long, greyish tomentose underneath and somewhat silky-villous on the prominent veins, entire, on petioles 3-5 lines long; flowers in elongated, interrupted somewhat leafy panicles. It was found on the banks of the Umpqua, Oregon, and is probably distinct.

7. *C. azureus*, Desf. Pubescent; leaves densely rusty-tomentose beneath, smooth above, 1-2½ inches long; thyrses more open. Mountains of Mexico from Tepic to Guatemala.

+ + Low, the branches not rigidly divaricate nor spiny; flowers in short simple racemes or pedunculate clusters; leaves small.

a. Eastern species; flowers white.

8. *C. microphyllus*, Michx. Erect, nearly glabrous; branches numerous, slender, leafy, yellowish; leaves thick, very small, 1-2 lines long, fasciated, oblong-elliptic to obovate, entire or sparingly toothed, on very short petioles; flowers in small terminal clusters. Fine forests of Georgia and Florida.

9. *C. serpyllifolius*, Nutt. Decumbent, glabrate; branches slender, bristly; leaves less rigid and not fasciated, 3½ lines long, obovate, serrulate, somewhat hairy beneath; flowers in small clusters on slender axillary peduncles. Southern Georgia.

b. Western species; flowers blue.

10. *C. dentatus*, Nutt. Erect, hirsutely pubescent, rarely nearly glabrous; leaves ¾-1 inch long, usually small and fasciated, obovate to oblong-elliptic or lanceolate, acute at both ends or obtuse at the apex, glandular-serrate, the margin becoming strongly undulate or revolute; flowers in small roundish clusters, on naked terminal peduncles about an inch long; fruit resinously coated and somewhat triangular, the valves being obscurely costate. On dry hills in the Coast Range.

11. *C. decumbens*. Slender, trailing, hirsutely pubescent with spreading hairs; leaves rather thin, flat, ¾-1½ inch long, elliptic-oblong, somewhat cuneate at base, obtuse or acutish, glandular-serrate, the greatest glands used in stipitate; flowers in short dense shortly pedunculate racemes, about ½ inch long or less. Frequent in the mountains of Central California from the Mariposa Grove northward.

+ + + Erect shrubs, the branches usually rigid, divaricate, or spinose; flowers in simple racemes or clusters; leaves rather small.

a. Rarely or never spinose; leaves glandularly serrulate; flowers mostly blue, racemose.

12. *C. hirsutus*, Nutt. (*C. oliganthus*, Nutt.) Silky-pubescent with soft subappressed or spreading hairs, or sometimes hirsute, the branches rather rigid and said to be sometimes spinose; leaves ovate to oblong-ovate, usually subcordate or rounded at base and acute at apex, ¾-1½ inch long, not smooth above; flowers blue, in simple axillary and terminal racemes 1-3 inches long, or rarely thyrsoid; fruit unknown. Dry hills about Santa Barbara and in the Santa Susana mountains.

Var. ? *glaber*. (*C. sorediatus*, var. *glaber*, Watson in King's *Rep.* 5, 51.) Glabrous throughout or nearly so; leaves sometimes entire; flowers white. East Humboldt Mountains, Nevada.

13. *C. sorediatus*, Hook. Nearly glabrous, the inflorescence pubescent; leaves smooth above, more or less tomentose beneath or rarely nearly glabrous, silky on the veins, oblong-ovate, ¾-1½ inch long, subcordate or rounded or often acutish at base, acute or obtuse at the apex; flowers blue, in shortly peduncled simple racemes, ¾-2 inches long; fruit unknown. From San Diego to the Sacramento.

b. Branches mostly spinose, greyish; leaves subteretaceous, usually entire; flowers mostly white, racemose.

14. *C. divaricatus*, Nutt. Nearly glabrous; leaves oblong-ovate to ovate, 1½ inches long, rounded at base, acute or obtuse above, not tomentose beneath; flowers light blue or white, in subsimple often elongated racemes 1-4 inches long. California, from San Diego northward.

15. *C. incanus*, Hook. Leaves hoary beneath, with a very minute tomentum, broadly ovate to

elliptic, ¾-2 inches long, cuneate to cordate at base, acutish or obtuse at apex; flowers in short racemes; fruit over 2 lines in diameter, resinously warty. Santa Cruz to Lake County, California; "a large straggling shrub on the banks of creeks."

16. *C. cordulatus*, Kellogg, *Proc. Calif. Acad. Sci.* 124, f. 39. Hirsutely pubescent, with short erect or spreading hairs; leaves oval-elliptic, 1-1½ inch long, cuneate to subcordate at base, usually rounded and sometimes serrate at the apex, the serratures scarcely glandular; flowers in short simple racemes, an inch long or less; fruit smaller, not resinously dotted. In the Sierra Nevada, from the Yosemite Valley northward.

17. *C. pendleri*, Gray. Silky pubescent; leaves narrowly oblong to elliptic, 4-12 lines long, usually small, somewhat narrowed and cuneate at base, obtuse or acute above; flowers in short terminal racemes. In the Rocky Mountains from Colorado to New Mexico.

6. Spinose; leaves serrate; flowers in small sessile clusters. Mexican.

18. *C. buxifolius*, Willd. Nearly glabrous, branches slender; leaves rather thin, elliptic, ½ inch long or less, hairy on the veins beneath, sharply serrate; flowers in axillary clusters, the colour uncertain. Mountains of Central and North-western Mexico.

19. *C. depressus*, Benth. Stout and very rigid, tomentose; leaves thick, densely tomentose beneath, elliptical, ¾-¾ inch long, mostly rounded at each end, glandular-serrulate; flowers in mostly terminal clusters; colour uncertain. Central Mexico.

** *Leaves pinnately veined.* (Forms of *C. dentatus* might refer to this group.)

20. *C. spinosus*, Nutt. Becoming a small tree, 20-30 feet high, basally rigid and somewhat spinose; glabrous or nearly so; leaves subcoriaceous, entire, oblong, 9-15 lines long, obtuse or retuse, subcuneate at base, on slender petioles 2-4 lines long; flowers deep blue, in a thyrses or in simple racemes, very fragrant; fruit 2½-3 lines in diameter, resinously coated. From Santa Barbara to Los Angeles.

21. *C. papillosus*, Torr and Gray. More or less subsidually villous or tomentose, 4-6 feet high; leaves glandularly serrulate, the upper surface glandular-punctate, narrowly oblong, obtuse at each end, 1-2 inches long, on slender petioles; flowers blue, in close clusters or short racemes terminating slender naked peduncles; fruit 1½ line broad, not resinous. Coast Range, from Monterey to San Francisco.

22. *C. floribundus*, Hook., *Bot. Mag.*, t. 486. Pilose scabrous; leaves small, 3-4½ lines long, oblong, acute, glandularly denticulate and undulate, shortly petioled; flowers blue, in dense globose clusters sessile at the ends of the short branchlets. Known only from the figure and description in the *Botanical Magazine*; raised from Californian seeds, and closely related to *C. dentatus*.

23. *C. Veitchianus*, Hook., *Bot. Mag.*, t. 5127. Glabrous nearly throughout; leaves thick, obovate-cuneate, rounded at the apex; glandular-serrate, smooth and shining above, minutely tomentose beneath between the veinslets, 6-9 lines long, on short stout petioles; flowers bright blue, in dense crowded clusters at the ends of the leafy branches. Likewise known only from figures and descriptions of specimens cultivated in gardens.

§ 2. CERASTES.—Leaves mostly opposite, 1-ribbed, with numerous straight parallel veins, very thick and coriaceous, spinosely toothed or entire; flowers in sessile or shortly pedunculate axillary clusters; fruit larger, with three horn-like or warty prominences below the summit. Rigidly branched or rarely spiny with small leaves; stipules mostly swollen and warty.

24. *C. cerastoides*, Torr. Erect, 4-12 feet high, on young branchlets wholly with willows tomentum; leaves ovate-oblong, 1-1½ inch long, obtuse or retuse, more or less tomentose beneath, rarely entire and revolutely margined, the petioles very thick; flowers light blue or white, in dense very shortly peduncled clusters. In the Coast Range from Mendocino County to San Diego.

25. *C. cuneatus*, Nutt. Erect, 3-12 feet high, less tomentose or nearly smooth; leaves cuneate-obovate or oblong, rounded or retuse above, on rare slender petioles, entire or very rarely few-toothed; flowers white or occasionally light blue, in rather loose clusters. From the Columbia River to Santa Barbara.

26. *C. Greggii*, Gray. Closely resembling the last, but more tomentose, and the leaves not cuneate at base; 5 feet high. From Northern Arizona to New Mexico and Northern Mexico.

27. *C. rigidus*, Nutt. Erect, 5 feet high, the branchlets tomentose; leaves 2-5 lines long, cuneate-oblong or usually very broadly obovate, often emarginate, few-toothed above. Very shortly petioled; flowers bright blue, in sessile clusters. About Monterey and Oakland (?).

28. *C. prostratus*, Benth. Prostrate, nearly glabrous; leaves 3-12 lines long, obovate or usually oblong-cuneate, spinose usually only at the apex, on

short slender petioles; flowers bright blue, the clusters on stout peduncles. Frequent in the mountains from Humboldt County and the Upper Sacramento to Mariposa County.

THE HAWTHORN.

MR. SELBY in his *History of British Forest Trees* has apologised for the introduction of the Hawthorn or Whitethorn (*Crataegus Oxyacantha*) among them, on the ground of its being "so long accustomed to rank as a mere hedge plant;" and people in general no doubt associate the Hawthorn chiefly in its humble though useful capacity of forming quickest hedges. Yet, as Selby further remarks, in natural or wild situations he has known it to have "attained a timber like size;" and this must be the experience of all those who have wandered about waste woodland tracts or neglected declivities of hills, such as the sides or "bottoms" of the broken-backed Cotswolds in Gloucestershire, the Monmouthshire hills, or in sequestered parks where the axe is seldom allowed to intrude, and where the Hawthorn, left to grow unmolested, entwines its thorny branches in an impervious labyrinth 40 to 50 feet high, and with a bole that is either of considerable size in itself or made up of a number of conjoined ones that separate in old age, and give the tree the aspect of a little grove.

An association of Hawthorn bushes, as generally called, on a hill-side just beyond the limits of cultivation, as may be seen in many parts of the midland counties, is an exhilarating sight in the month of June, and proclaims that our fickle summer has fairly set in, and haymaking is drawing nigh. "The milk-white Thorn that scents the evening gale," as Burns has depicted it, is then as beautiful a sight as the country can produce, and may well call up poetical ideas and remembrances of the search for the flowering Hawthorn on May Day, its flowering at that time giving it the name of the month in which it first appears. An old Thorn is by no means an unsightly object in a park, its dense bushy umbrage contrasting with other trees of greater height; but its natural position is on hilly declivities, where it spreads a dense array of thorny branches in accordant companionship with the prickly golden Gorse, equally fond of the sides of hills. When allowed to grow in a congenial soil and favourable position, the Hawthorn will as a tree attain a considerable height, and I have depicted

Sir T. Dick Lauder in commenting on Gilpin's remarks, objects to his ideas, and having, as he says, seen many fine Hawthorns, he designates it as a "beautiful tree." It progresses into the far North with undiminished charms; for Mr. Selby says:—"In this northern district it is one of the greatest accessories to the beauty and scenery of our dunes and deep ravines, and few that are at all wooded but owe a great portion of their interest to the presence of

FIG. 141.—VERY TALL HAWTHORN, WITH MISTLETO, LENCHFORD, WORCESTERSHIRE (9 FT. GIRTH: ABOUT 60 FT. HIGH).

this tree." It must be acknowledged that a young Hawthorn is too slim in figure and scant of foliage to be an object of beauty except in its flowering state, and it is only when it survives to old age that it attains a remarkable and even imposing aspect, more especially when its bole divides, as age comes on, into separate columns, as represented in the sketch of an aged Hawthorn in the grounds at Garnstone,

split up into eleven divergent stems. This aspect denotes great age, and Mr. Jesse considers the Bushey Park Thorns to have been in existence more than two centuries ago. This division, however, does not always occur, as in some cases the bole, though divided into sections, still keeps conjoined, as in an old memorial Hawthorn standing at Upper Wyck, near Worcester, and which I have been told is mentioned as an old boundary Thorn in writings appertaining to the estate on which it grows more than two centuries ago. It is 10 feet in girth round the conjoined boles, and is still a vigorous tree (see fig. 143).

But if an old Hawthorn becomes hollow in its decrepitude, it does not divide into subsidiary boles, but declines towards the ground from the weight of its numerous entangled branches, and then presents a picturesque aspect, as in an old Thorn that I have noticed growing on Apley Terrace, a romantic height on the side of the Severn above Bridgnorth, Shropshire. This hollow Thorn is 8 feet in girth at a yard from the ground, and its branches spread 30 feet from the base of the tree (see fig. 145). When drawn up and growing too lofty and thin the Hawthorn, if unable to support itself against equinoctial gales, is upset, as in an individual now lying prostrate, yet alive, being not quite uprooted, in Downton Park, Herefordshire, evidently of considerable antiquity, as shown by its decayed bole. As laid down it proves to have been over 50 feet in height (see fig. 146). Even thus overthrown it maintains a precarious existence, though its foliage is but scanty, and recalls to mind—

"Yon reverend Hawthorns harden'd to the rod
Of winter storms,"

alluded to by Wordsworth.

Occasionally old Thorns are to be met with that have become so hoary, distorted, and thorny, their branches stunted from an unfavourable position in the shade, that though alive, the functions of vitality are almost in abeyance, and only a scanty foliage is produced, without either flowers or fruit. Such a scathed hoary veteran I have observed in Richmond Park, the very semblance of blasted desolation. How old such a tree may be it is difficult to say (see fig. 144). Wordsworth has well described such an old decrepit Thorn located on the mountains of Cumberland:—

"There is a Thorn—it looks so old,
In truth you'd find it hard to say
How it could ever have been young,
It looks so old and gray."

* * * * *

It stands erect this aged Thorn,
No leaves it has but prickly points,
It is a mass of knotted joints,
A wretched thing forlorn:

FIG. 142.—OLD MANY-BOLED HAWTHORN, GARNSTONE, HEREFORDSHIRE: 11 FT. IN GIRTH. (ENGRAVED ON HAWTHORN WOOD.)

FIG. 143.—OLD HAWTHORN, WYCK, NEAR WORCESTER (10 FT. GIRTH).

one at Lenchford, near Shrawley, Worcestershire, not far from the river Severn, which had been favoured with a protective mound around its base, and whose topmost branches reached 60 feet from the ground. It measured 9 feet in girth, and, like many other old Thorns, had many tufts of Mistletoe nestled among its boughs (see fig. 141).

Gilpin in his *Forest Scenery* speaks unfavourably of the Hawthorn as having "little claim to picturesque beauty," and even thinks its bloom, which is so attractive, "spread over it in too much profusion." But

Herefordshire (see fig. 142), which measures 11 feet round the separated stems. Mr. Jesse has remarked this of the old Thorns in Bushey Park, and says of them:—"As they increase in age they have the property of separating themselves into different stems, some having four or five, or even six, which as they separate become regularly barked round, forming to appearance so many distinct trees close planted together." This I have frequently remarked in old Hawthorns, and I have noted an instance in Bushey Park, Worcestershire, in which the original bole had

It stands erect, and like a stone
With lichens it is overgrown."

The Hawthorn varies much in its growth and increase of size, according to situation and the soil in which it grows. Mr. Selby mentions a Hawthorn planted in 1708, and now therefore 166 years old, that a few years since measured round its trunk 3 feet, and the diameter of the circle overspread by the branches was nearly 50 feet. But, on the other hand, Hawthorns growing on the side of the Malvern Hills, some of which were cut down, and which I examined

at the time, showed more than 300 rings of annual growth, though their boles scarcely exceeded a foot in diameter. However quick it may grow at first, there can be no doubt that the Hawthorn increases very slowly in age, and being thus a long-enduring tree may exist many centuries, though certain proof as to an old Hawthorn being extant at some particular time in past years, and then remarked as standing, and noted, seems to be wanting. Evelyn has regretted that reliable notices of trees in particular places were not made in olden times, "that the ages to come may have both the satisfaction and encouragement by more accurate and certain calculations." This is now better attended to.

The largest and oldest Hawthorn in England of which there is any record appears to be the Hethel Thorn in Norfolk, which stands in a field adjoining Hethel Church, the property of Hudson Gurney, Esq., and of which Mr. Grigor, in his *Eastern Arbor-tum*, says—"In looking upon it one would suppose it had been here for thousands of years; and, indeed, if the common tradition of the place is to be relied upon, it must be acknowledged to be in a high degree patriarchal." He gives its dimensions at 1 foot from the base of the trunk as 12 feet 1 inch in circumference, and (as it swells out) at 5 feet high it is 14 feet 3 inches, and the space over which the branches spread is 37 yards. "Its trunk is reduced to a mere shell, and, though somewhat divided, it has none of that shattered appearance which we sometimes observe in the Oak. The branches at the top form a thick grotesque mass, most curiously interwoven. It is covered all over with lichens, and crowned with Mistletoe, adding still more to the effect which age confers upon such objects." Mr. Grigor was told by the owner of the land on which the Hethel Thorn is located, that the late Sir Thomas Blear asserted that he was in possession of a deed bearing date early in the thirteenth century, in which this old Thorn is referred to as a boundary tree. Though the deed itself may not be now accessible, yet from the endurance and vitality of old Hawthorns it may well be believed that trees of this character and aspect, and known as old Thorns to those who have lived in the vicinity from infancy, have existed, at a fair calculation, from 700 to 800 years.

It may be noteworthy, to use the phraseology of the day, that the Hawthorn more than any other British tree has been represented by poets as the trysting place of lovers. Herrick calls upon his Corinna to come to a bower "made up of Whitethorn neatly interwoven." Goldsmith, too, in the adjuncts of his *Deserted Village*, tells of—

"The Hawthorn bush, with seats beneath the shade,
For talking age and whispering lovers made."

Burns, also, in his fervid words describes the bliss of a youthful, loving, happy pair, who—

"In other's arms breathe out the tender tale,
Beneath the milk-white Thorn that scents the evening gale!"

Pollok, in his *Course of Time*, takes occasion to depict—

FIG. 145.—OLD HAWTHORN, APLEY TERRACE, SALOP.

"A hermit Thorn, that on the rising hill
Had seen a hundred flowery ages pass.
This ancient Thorn had been the meeting-place
Of love."

Here a lover, on his return from abroad after long absence, "with glory crowned," finds his affianced beauty kneeling at "the sacred Thorn to memory dear," where he had parted from her. Both in the "good old times," as well as in modern days, the Whitethorn has always been associated with the month of May, and it thus became connected with

May games; and to go "a-maying," to gather the flowering Hawthorn on May-day, was formerly an institution devoted to mirthful pleasantry and rural dancing round the May-pole. This, like many other ancient observances, has fallen into disuse, and, indeed, the alteration of the style in the middle of the last century, by taking eleven days from the Calendar, was unfavourable for the appearance of the Hawthorn flowers on the new May-day, so that it is not often now that "May" can be gathered on the May-day of the amended calendar.

I may here mention a rustic superstition in con-

FIG. 144.—OLD STUNTED, HOARY, SCRAGGY THORN, RICHMOND PARK.

nection with this tree, which bears the name of "the Speechless Hawthorn." The observance consists in a damsel gathering a flowering branch on some evening, and taking it to bed with her without speaking a word to any one, which would break the spell. The branch being thus taken to bed "speechless," the girl who has thus so managed is certain to see her future husband presented to her view in a dream; so I have been told by the initiated. Except as places for rustic resort and gathering May at the vernal time, old Thorns are not objects of much consideration in England; but Mr. Johns informed the author of

bove branches of Hawthorn in their hands. In memory of this it is said that the altar of Hymene was lighted with torches made of the wood of this tree, which also formed the flambeaux that lit up the nuptial chamber.

In connection with the Hawthorn the peculiarity attached to the Glastonbury, or "Holy Thorn," as commonly denominated, requires to be mentioned. It only differs from the ordinary form in producing a second crop of flowers, either about Christmas or early in the new year. The old legend was that Joseph of Arimathea, on his arrival in Britain to preach Christianity, on ascending Weary-all Hill, near Glastonbury, stuck his staff in the ground, which happened to be a Hawthorn stick, and it vegetated forthwith, thenceforth producing flowers on Christmas eve—the time at which it was planted. Abandoning the legend, the fact remains that on the said Weary-all Hill the monks of Glastonbury Abbey had a Hawthorn in their keeping which produced a second crop of flowers about Christmas-tide, and was declared to unfold them precisely at 12 o'clock on Christmas eve. The tree remained at the spot after the dissolution of monasteries, and still flowering at Christmas, and sent up branches of it were gathered at that time, and sent to various places for sale to the curious. But in the troubles of Charles I.'s time the original Glastonbury tree was cut down as superstitious. Various "Holy Thorns," however, yet exist in different parts of England, and it is said that all these are the result of grafts from the original Glastonbury Thorn, but this seems rather dubious. Two Hawthorns, however, do still exist at Glastonbury, and these may be the progeny of the original tree. But the "Holy Thorn," not sympathizing with the alteration of the calendar, now produces flowers about the middle of January, or, as it is still affirmed, at old Christmas. I know of two of these "Holy Thorns," both in gardens, one at Snokley, in Worcestershire, and another in Bromyard Down, Herefordshire. From these I have received half-expanded flowers in January several times, but the flowers soon wither, and no fruit is produced from them. The trees flower again at the usual time.

With regard to the alleged fact of a Hawthorn staff or stick really growing when thrust into the soil, though we may disbelieve in Joseph of Arimathea, yet it is not improbable that this may have formerly happened accidentally, and then by a pious fraud of the monks made miraculous, and ascribed to a Scripture celebrity, to whom their Church was dedicated. Sir T. Dick Lauder, in his edition of Gilpin's *Forest Scenery*, states that a forester of veracity assured him that he had once driven a stake from a dead (?) Hawthorn hedge into the ground, "which, to his astonishment, rooted spontaneously, budded, and put forth becoming a thriving tree, as shown to the baronet himself at Fountain Hall, Haddingtonshire, North Britain.

A similar instance to this occurred in my own garden, where a few years since Mrs. Lees inserted a Whitethorn stick as a support to a tall liliaceous plant, and this stick rooted, budded, produced leaves the year after it was stuck in the soil, and is now a

FIG. 146.—OLD PROSTRATE HAWTHORN, DOWNTON PARK, HEREFORDSHIRE.

Forest Trees in Britain, published by the Society for Promoting Christian Knowledge, that "old Thorns are numerous in Ireland, and are greatly venerated. They are sometimes found in fields in crop, but in ploughing care is taken not to approach the roots lest injury should be done. I have seen old Thorns near wells almost covered with garments, particularly in the South of Ireland." In ancient times Evelyn says that the Hawthorn "was accounted among the fortunate trees," but gives the curious reason that the Romans who forcibly carried off the Sabine women

tall tree that produced this year a most abundant crop of flowers, succeeded by ripe haws. It has not, however, as yet shown symptoms of progressing to Glastonbury fame in having Christmas flowers. Apple and Pear trees occasionally produce autumnal flowers, and I have seen the same on the Elder and Dogwood, though not advancing into the dead of winter. *Edwin Lees, F.L.S., Greenhill Summit, Worcester.*

Postscript.—The Garstone Hawthorn (fig. 142), and the Wyck Hawthorn (fig. 143), are engraved on Hawthorn wood. For the purposes of engraving

Hawthorn is the best of all the woods we have experimented upon; it is quite as good as ordinary Box, and possesses a far better colour. The best Box cuts a little smoother, and it consequently has a somewhat closer grain. *W. G. S.*

Home Correspondence.

Sachs' Text-Book of Botany.—In your review of the English edition of Sachs' *Text-Book of Botany* your criticism is principally directed to two points, on which I trust you will allow me to make a few observations, as each raises a question of some theoretical interest. Your reviewer remarks that "we have in these pages the old terms cohesion and adhesion applied as is customary where there is neither the one nor the other." Now the term used by Professor Sachs, "Verwachsung," is probably not so much open to criticism on the ground taken by your reviewer as that which we have adopted as being the one current amongst English botanists. For the use of cohesion the translators and not Professor Sachs are responsible. And for my own part I am prepared to defend it. It is quite true that if it leads a student to suppose that in a gamopetalous flower a number of distinct petals are produced and are then glued together into a single piece, such a misconception is to be regretted. But it is one which a little practical investigation would speedily correct, and it would be soon understood that the term "cohesion" is to be employed in a technical and conventional sense. I am aware that the term "inseparate" has been proposed as a substitute for "coherent." It appears to me that it is open to precisely the same kind of objection, and as it is extremely undesirable to alter accepted terminology without some clear gain I prefer to stick to cohesion; for, surely, if to speak of flowers with coherent petals implies that they were first united, and inseparate implies that they were first united, and that Nature's scissors were arrested in their snipping. Your reviewer appears to hint that the use of the term cohesion is incompatible with Darwinian principles. I cannot of course imagine that he has not observed the prominence which all through his text-book Professor Sachs gives to the "doctrine of descent." But apart from this I maintain that the fact is quite the other way. On Darwinian principles I apprehend that flowers with coherent parts are derived from ancestral types, in which the parts were not coherent but distinct. In such consolidations I only see examples of which the instances are innumerable, of the "integration," which is an essential feature of all organic evolution. If we compare a myriapod with a crab there is in the cephalo-thorax of the latter the same confluence or cohesion of separate segments that there is in the corolla of a Bell-flower. It is no reasonable objection that the tube of the corolla of a Bell-flower never consists of separate parts at any period of its development; for, integration once effected, we know from numerous other instances that it reaches back to the earliest stages of development. With regard to the absorption of water, whether in the liquid or gaseous state, by leaves, there is not, I think, much more to be done. It is tolerably clear that the business of leaves in this matter is to give off water, not to take it in. That they may do the former to an injurious extent if the air be too dry is a thing of everyday experience, and I presume the main reason of syringing, watering over head, and the like, is to take advantage of the foliage of plants as evaporating surfaces, and in this way rapidly moisten the air. If a gardener waters in his accustomed way because he believes plants take in water by their leaf surfaces, I can only say that he does the right thing for the wrong reason. I may add, that if I recollect rightly, Bonnet's experiments on the different functions of the upper and lower surfaces of leaves, but I conceive they did not demonstrate their capacity for absorbing water. Lanessan's mode of procedure must have been open to a serious source of error from the water which would mechanically adhere to the outside surfaces of the fragments of plants which he immersed. *W. T. Thistlethorn Dyer.*

[We seem to be agreed as to the meaning to be put on the terms "cohesion" and "inseparation," the illustration of which latter by our correspondent is, we think, happy, if by "united" he means not yet "integrated." As to the compatibility of the term "cohesion" with Darwinian principles, our correspondent has misapprehended our meaning. We were not concerned with the question whether that particular term or any other was compatible with Darwinian views or not. We simply meant that for the full appreciation of those views or of any other proposed to give an account of the building up of structures, a terminology in accordance with the present state of our knowledge is essential. For catalogue-making the acceptance of conventional terms with an arbitrary meaning is necessary on the grounds of expediency, and there would be a preponderance of loss over gain in making a change—at least at present. It is far different when questions

of lineage, degree of kinship, or even of physiological origin are concerned. Whether the ancestral types of our present "coherent whorled" flowers had "separate" parts or not, is a question we believe to be quite insoluble at present. The last question, as to whether leaves have greater certain power of absorbing water or watery vapour, is one on which we join issue with our correspondent. We think there is still a great deal to be done before the matter can be considered settled, and as it is of the highest consequence to gardeners, we trust that much more will be done in order to arrive at some definite rules of practice, and some intelligible reason why. *EHS.*]

The Past Winter.—Having seen the interesting notes on this subject in your paper, I now enclose the results in this district—Merionethshire, North Wales. According to annual custom I paid a visit to Aberia, the beautiful residence of Lewis Davis, Esq., near Port Madoc, which has long been celebrated for its fine collection of trees and shrubs. I found the place had undergone great alterations and improvements, under the hand of Mr. Shortt, the landscape gardener, one of the best hands we have among rocks and mountain scenery. He has introduced a great number of new and rare plants, many of them in quantity; so that in a few years this will be one of the best places in Wales for seeing rare hardy plants in perfection. The following have stood without protection, some of them of large size:—

Laurus Camphora	Eurya latifolia variegata
"regalis	Ligustrum lucidum variegatum
Cassia chrysoyllifolia	Cypripedium macropurpureum variegata
Benthamia fragifera (now coming into flower)	Catalpa syringifolia aurea
Magnolia Campbelli	Eucalyptus robusta
Acer palmatum rubrum	Edwardsia grandiflora
"dissectum roseo-marginatum	"microphylla
Diospyros Kaki	Holboellia latifolia
Grevillea juniperoides	Emabarium coccineum
Pinus australis	Cianthus puniceus
Euphorbia hypericifolia	Charwoodia stricta
Desfontainia spinosa	Aralia Sieboldii
C. F. W. Williams, Penrhyn-dereath.	

The following plants have withstood the effects of the last winter at Tyn-y-coed, the residence of David Davis, Esq., 7 miles from Dolgelly, North Wales—*Ceanothus rostratus spectabilis*, *Magnolia Campbelli*, *Ceanothus cuneatus glabra*, *Pinus australis*, *Eucalyptus robusta*, *Viburnum Sieboldii*, *Dicksonia antarctica*, *Aralia Sieboldii*, *Eriobotrya japonica*, *Egenia Ugni*, *Rapiolepis ovata*, *Acer palmatum atropurpureum*, *Catalpa syringifolia aurea*, *Prunella laetifica*, *Goodyera pubescens*, *Gunnera scabra*, *Gunnera manicata*. *Thomas Shortt.*

Sheffield and Horticulture.—In a leader in the *Gardeners' Chronicle* of last week the following passage occurs:—"At Sheffield last year, at a flower show in the Botanic Garden, there were taken in one day in sixpences more than seven hundred pounds." You must have been wrongly informed, for although there is a society in Sheffield which is termed the Botanical and Horticultural Society, it never holds an exhibition for the promotion of the object for which it was established, and this is a lamentable fact that in order to draw company in the beautiful gardens at Sheffield all sorts of low and degrading means have to be resorted to. You have unconsciously paid Sheffield a tribute which is not its due. The Royal Horticultural Society would be doing good service if they would hold their next provincial meeting in a locality which is sadly in need of some refining influence, for in these days of exhibitions it is a remarkable fact that, in a large district like Sheffield, not a single horticultural exhibition is held from one year's end to another. *A. B.*

Roses at the Manchester Show.—I see, from your report of the Manchester Show, that in the competition between Messrs. Turner and Paul for the premiership to the Queen of Flowers, "the judges had a difficult task to say which was the best, and when the award was eventually made the able critics were not wanting to question the decision." And also, "It may safely be averred that, had equal 1st prizes been given, general satisfaction would have been felt, for they well deserved it." Allow me to remark that, in adjudicating between the merits of two collections, which seem at first sight, or upon a general survey, to be equal, it is the duty of a censor to scrutinise every plant circumspcctly, that is, all round; that no critic who had not examined specimens all round as well as from without was qualified to question the award; and that if equal 1st prizes had been awarded an injustice would have been done, unless I have grown Roses (in pots and out) for thirty years in vain. *S. Reynolds Hole, Cauntton Manor, May 26.* [Our reporter and the "able critics" he alludes to had the same means and opportunities of scrutinising all the plants circumspcctly, that is, all round, as our correspondent, who surely does not claim to be the only man capable of judging a Rose. *EHS.*]

Pearson's Golden Queen Vine.—When I first saw this fruiting at Chilwell in a pot, I felt sure it would turn out a really valuable Grape, for any Grape

that will do well in a pot may be depended upon for doing better planted in a good border; and I believe, after a good deal of experience, that no better test can be applied to a new Grape than to ask to have it fruited and brought before the Fruit Committee in a pot, say a 2-gallon one. At the time I saw it, I told Mr. Pearson I hoped it would repay him for the large expenditure of time and money he had incurred in raising seedling Grape Vines. Having seen it in fruit each year since that time, my opinion has been confirmed more and more; indeed I have thought more highly of it each time I have seen it in fruit, and am more than ever convinced it is a real gardener's Grape. The strong, healthy foliage; the hard, waxy wood—which, even in quite a young state assumes a real time and ripened appearance, and when ripe of the colour of cinnamon—the abundant show of blossom, many times more than is required for a crop—all attest its fine constitution and vigorous habit, whilst none can set better or produce more even-sized berries. Considering its fine golden colour and rich flavour, and good habit of growth, there is no doubt it will give general satisfaction; and having stood godfather to it by giving it a name, I am glad to find it has proved as good as I expected. Mr. Pearson told me several years since that if he found it had any faults he would destroy it, but none of the numerous persons who have seen and tasted it have suggested one, so it is to be sent out this season; and unless I am a very bad judge, it will give general satisfaction. *T. Speed, F.R.H.S., The Gardens, Chatsworth.*

Gloriosa superba.—This beautiful old plant, generally considered a stove plant, is perfectly hardy, and where well grown a great acquisition to the open border. It succeeds best in a deep rich peat. The Rhododendron bed is a good situation, as it there finds support from the shrubs, and shows its flowers to great advantage. In cold and damp situations the foot of a north wall is advisable, all that is requisite being a dry bottom in winter, and sufficient depth to be secure from frost. *Thomas Shortt.*

Roses.—I have this year grown in a cool conservatory, from two Roses that are four years old, the one a Marechal Niel, the other a Cloth of Gold, upwards of 100 Roses, which have been generally pronounced a wonderful show. On measuring one, a Cloth of Gold, which I cut the other day, I found it to measure 6½ inches in diameter. I have never in my experience seen so large a Rose from so young a tree grown indoors. *F. F., The Grange, Ellesmere, Salop.*

The Welbeck Seedling Nectarine.—As the raiser of this variety perhaps I may be permitted to explain briefly its history. It was a seedling raised between the Balgown and the Elrge, being the only one I selected out of a batch of seedling fruiting Nectarine trees in pots. I have since it has been planted out in a Peach-house fruited it now for three years, and last year, the fruit being particularly high and of fine colour, the Editor of the *Florist and Pomologist* was kind enough to figure it. Last year I should have sent a dish to the Fruit Committee of the Royal Horticultural Society to report on, but I was so much annoyed in 1873 by the way in which a dish of fine Barrington Peaches was passed over by the chairman of the day, who explained that although Barrington Peaches grew very large, they were of very inferior flavour. I shall be very glad to take Dr. Hogg's opinion of my seedling Nectarine's merits this year by sending a few fruits of it for his inspection in September, as it fruits in a late Peach-house. If approved of, it may then worthily appear in the next edition of his excellent *Fruit Manual*. I cannot, however, understand his saying (p. 664) that the Welbeck Seedling Nectarine "may be one of those seminal productions, for aught I know, which so frequently occur, and of which an example was given in the extract taken from my book on the Grosse Mignonne Peach." Now I do not know how new varieties of Nectarines can be raised except by seminal production. *William Tillyer.*

Onion Rot.—I have pleasure in informing "F.S." that this disease is curable. By applying gas-tar, at the rate of 2 gallons to 1 pole, to his land which he intends for next year's sowing, he will have the satisfaction of raising a good sound crop of Onions. This may be done, the ground being vacant, any time between now and January, any well-mentioned quantity applied at twice, the first dressing well worked in, say three or four days after the application; the second slightly pointed over with a fork. Double this quantity is an excellent dressing for Carrot beds. It completely eradicates all insects, and hence the skin of the Carrot is perfectly clean. *F. M., Tuzmore, Bicester.*

Tulipa botica.—This pretty species is perfectly hardy in England. More than two years ago I received a bulb from my friend Mr. Gamberton, of Belgrove, to whom it had been sent by M. Max Leichtin, of Baden. I planted it in autumn in the open border, where it flowered well the following

spring. It was attacked with mildew last summer, after it had died down and been taken up, and, I regret to say, perished. This species has also flowered well with Major Trevor Clarke at Welton Place, near Doncaster, and I believe he still has it in cultivation. It has much more delicate petals, and is, I think, a prettier species than T. Eichleri, which I was much pleased to see in bloom a fortnight since in Mr. Elwes' most interesting garden at Miserdine House. I was much delighted this spring with Tulipa Boissieri var. pulchella, which I succeeded in blooming for the first time. It is a very small and dwarf species, with narrow leaves and an almost stemless flower, pale pink, the centre white, shaded with purplish-black. The bulbs were sent me by M. Max Leclitlin two or three years ago. *Z. Harpur-Cresser, Drayton-Brauchamp Rectory, Tring.*

Some Lancashire Orchids.—Calling at the residence of R. B. Dodgson, Esq., of Blackburn, Lancashire, a few days ago, I was much pleased to find a rather extensive collection of Orchids in a very highly and satisfactory condition. About twenty specimens were at the exhibition that was being held in the immediate neighbourhood under the auspices of the Blackburn Floral and Horticultural Society, so that we were prepared for the comparatively small number of plants in flower. In the East India house one of the first to claim attention was a fine plant of *Vanda Lowii*, nearly 5 feet high, with leaves down to the pot, and three breaks just starting from the base of the stem. This plant, rare in itself, is even more rarely seen in the heat and light of the specimen under notice. Its dark-green leaves without a spot, its stout stem and massive roots and the perfect form of growth the plant has taken, constitute this, as I should say, one of the finest specimens of this *Vanda* to be met with in cultivation. There may be some taller (Mr. Kucker's old plant is a proof of what it will do), but I question whether there are many plants that are in every respect so faultless as this. A fine plant of *V. Cathcartii*, 3 feet high, with the spike ends of last year showing in the axils of the leaves, gives good promise that the present plants recently received are certainly favourable to the development and perfection of their flowering capabilities. The white *V. Denisoniana* was flowering very nicely, as also were five specimens of *Cypripedium levigatum*, which had thrown up a very strong spike with three flowers, and had another spike just starting away. This plant has several leads to it, and being so rare will be very valuable. *Cypripedium Dayi*, Veitchii, Lowii, &c., were well represented; *Cypripedium chuburnum* in this room was also in fine condition. In the grand specimen of *Acerides crassifolium*, grown in a pan suspended from the roof, was doing remarkably well. This plant has flowered several times under the care of Mr. Whitehead, and it certainly is one of the finest and most desirable of this very attractive genus. In the Cattleya-house we noticed a fine piece of *Laelia anceps* Dawsoni breaking strongly; the growth of last season was very fine, the plant having matured a bulb 4 inches high, and stout and plump in proportion. *Dendrobium* and *Phalaenopsis* were doing well suspended in a pan, whilst on a block planted in a pot was a very strong plant of the true *Cattleya Schilleriana*, its short, stout bulbs, and almost round, chocolate-coloured leaves, giving good proof that it was enjoying the strong light in which it was growing. Here also was a quantity of *Cattleya Warneri*, and also C. Mendeli, throwing up a fine lot of spikes of bloom. *C. lobata*, with five flowers on a spike, was also coming on very nicely. *Cattleya gigas* and *Laelia Jonghii* were well represented, both plants breaking very vigorously. In the *Oncidium*-house we noticed a fine plant of *O. nevium* majus; also a nice plant of *Oncidium Phalaenopsis*, doing freely. *Trichopilia fragrans* is well represented, one plant we noticed having a quantity of leading growths coming away very strong. A fine collection of stove and greenhouse plants, flowering and foliage, are also grown, many of which were away at the exhibition. I cannot conclude without mentioning the very cordial manner in which we were received by Mr. Dodgson, who, though still very weak from a recent severe illness, kindly went all through the houses with us in the absence of his gardener, Mr. Whitehead, who was at the exhibition, and many times expressed his pleasure at seeing his pets throwing up their flowering spikes. *W. Swan, May 18.*

Strawberry Culture: Sods v. Saucers.—At this place we have great accommodation for forcing the Strawberry, having 400 yards of forcing sheds from 1 to 2 feet from the glass, without interfering with other crops, and I may state that our success in fruiting them is according to our accommodation. With proper attention, we much prefer the plain shelves to either sods or saucers. I have not now used sods for many years; where forcing in quantity has to be carried out they are a nuisance, in transferring pots from one temperature to another. Of saucers I still use a few; they save a little watering, but if not attended to when the fruit is finishing off the flavour of the Strawberry is spoiled

from over-watering. The sorts which we force are my selected Keens' Seeding for our first batch (although this season I have had Queens nearly as soon), Sir C. Napier, and La Constanse. I use a 6 and 7 inch pot, where we can pull and come again. Thinning the blossoms is about as tedious a job with us as thinning Grapes; and out of three dozen set blooms it is difficult to calculate correctly what number of fruit each plant will bring to a respectable size for the dessert-table; for exhibition purposes (of liffies) less fruit must be left. *J. Miller, Chumler.*

—I send you a fair sample of Strawberries of the variety called Black Bell, which has been grown on the bare shelf, which I think will demonstrate the fact that both sod and saucers are of no possible use. We grow here 2500, and from March to we have had a daily supply from the 7th of this month to the 15th we gathered 25 lb. of good useful fruit. We have no Strawberry-house proper, but grow them in vineries, Melon-houses, and Pine-stoves. Immediately they are coloured we put them into cold houses to flavour, and just now we have about 200 flavouring in the early pot vinery. If sods were used, shifting them would not be practicable, and as to employing the saucers in dull weather, as practised by Mr. Ward, it would take up more time than can be spared here. *R. Gilbert, Burgess, Stamford.*

Camellias Flowering Out-of-Doors.—To prove that Camellias will bloom out-of-doors much further north than Leicester-shire, I may note that one of the old single scarlet has stood many winters here (West Cumberland), being about 24 feet in circumference and 4 feet high, and has hundreds of flowers on it annually. It is growing in a light sandy soil. Another plant, growing in a sandy soil inclined to peat, is nearly the same in circumference and about 5½ feet high. It is a double variety, with the most luxurious dark bright green foliage, as you will see from the enclosed. I may also state that the *Desfontainia spinosa* and the *Fabiana imbricata* have stood out unprotected for many years, and flower with us profusely. *Azalea sinensis* is also just coming into bloom outside. *Cumbrian.*

Hydrangeas.—An early walk through Covent Garden has taken the conceit out of many a gardener, and has caused him to deeply ponder as to how such perfectly even and finished specimens can be produced; and it requires a visit to the manufactory, as it may be called, and see them in process of manufacture to realise the amount of skill and industry expended on the different things grown for market—and the best are not always produced in the most pretentious establishments. I have been led to the above remarks by a visit to Mr. Plimley's little place at Acton, where the Hydrangeas are now in splendid condition, and it will not be unfair to say they are generally acknowledged to be the best in the market. The stock consists of about 200 plants in the stages of forwardness. The first batch is now in full bloom, and such bloom! Each plant bearing from one to four heads, each head from 1 foot to 16 inches in diameter. They are all in 5-inch pots, called in the trade 40's, and grown in a low, narrow, span-roof house, and fully exposed to the full blaze of the sun, resulting in a perfectly even mass of flower from end to end of the house. Mr. Plimley is also equally successful with the old *Crasulata coccinea*, of which he has hundreds at present in cold frames, and every plant throwing up strong heads of bloom. These results are not attained without the most untiring assiduity, and thorough knowledge of the subject. *J. W. Lawrence, Farnham.*

Natural History.

WASPS.—A large number of wasps has been noticed flying about the gardens here for some time past. I was very anxious to get as many of them destroyed as possible, and offered my men 2d. each for all they could catch, and by that means thirty-one were secured. I was fortunate enough to destroy twenty-three, making a total of fifty-four. As, no doubt, many of them were queen wasps, so, probably, the construction of a large number of nests has been prevented. *Robert Smith, gr. to Colonel Makins, M. P., Fifehead Court, Dorset-shire, Dorset, Devon.*

We have a man trained up our garden cottage of the *Cotoneaster microphylla*. I have never seen so many queen wasps this year. I went out the other evening at 8 o'clock and in half an hour I killed eighteen, and with the help of my boys, &c., have killed over sixty. If a queen produces a nest we must have done a great amount of good for the fruit. Perhaps some of our kind friends, the entomologists, will tell us why the above plant proves so attractive to the wasps, for dozens have been fortunate enough to escape. I may state that the plant is just coming into flower, and they seem to go to the flowers. They are very large. I enclose a couple for you to see that there is no doubt about their being queens. *Noah Kneller, Malshanger, Basingstoke.*

ANTI-LIARHINUS SIGNATUS, SCI.—The tribe to which this insect belongs is distinguished by one of the sexes having a remarkably long and slender straight proboscis, simulating a good deal the appearance of the *Brentidae*. It does not belong to them, however, but it is a true curculionid, and is placed by Lacordair in close proximity to our *Centorhynch*, which also has a slender but curved rostrum, one of which (*C. assimilis*) causes the galls so frequent on the Cabbage roots in the neighbourhood of London. The *Anti-liarhinus* would appear to have no such habit. It is a South African genus, and four or five species have been described (by Schöenherr, vols. iii. and v.), but only two of them seem to be good species. These are—1. *A. Zamie*, which is stated by Schöenherr to be found in the cones of *Zamia Caffra* in Caffaria. The species described under the names of brunneus, rectirostris, coriaceus and Dregei appear to be synonyms of this, the chief difference being in size. 2. The present species (*A. signatus*), which was brought under the notice of the Scientific Committee of the Royal Horticultural Society by Professor Thistleton Dyer as having been found dead in numbers in the empty kernels of the seed of a species of *Incephalartos*. There the dead beetles lay flat between the skin of the kernel and the shell, for which their very compressed form, as flat and as thin as a sheet of paper, is well adapted. Very great variation existed in their size, some being twice or three times as large as others, thus confirming the view that the small individuals, which differ from *Zamie* only in size, such as *Dregei* and *coriaceus*, are merely varieties of that species. The colour also varied considerably in intensity. It is normally of a rich burnt sienna-brown, with paler shoulders, and a pale band behind the middle of the elytra.

We have no information as to the adaptation of the remarkable structure of this insect to its habits. It no doubt will be something similar to that of our

FIG. 147.—ANTI-LIARHINUS SIGNATUS.

Balaninus nucum, which is one of the beetles that feed on the Hazel-nut, and is provided with a snout proportionately as long as that of the *Anti-liarhinus*, only curved instead of straight. There is, however, this important difference—in *Balaninus* both sexes have the snout long, although that of the female is a little shorter than that of the male; but in *Anti-liarhinus* one of the sexes only has it, and it is supposed, from other peculiarities, that, contrary to what usually occurs in insects, it is the female that has this very long apparatus, while the male has only a very short one. It is not improbable, therefore, a structure having some bearing upon the reproduction of the insect. Unlike *Balaninus*, it would appear to complete its metamorphoses in the seed it has been born in, not coming out as a full-fed grub to undergo its metamorphoses in the ground.

As they have utterly destroyed the imported seeds of the *Incephalartos* in which they were found, they are entitled to a place in our gallery of insect injurious to man. *Andrew Murray.*

TETRANCVIUS TAXI.—Since writing the notice of this species, which appeared in last week's *Gardener's Chronicle*, I have had the advantage of referring to Mr. Müller's description of the insect mentioned in my closing paragraph as brought to my notice by Dr. Masters, as the maker of the gall of the Yew bud, and which on the spur of the moment I thought might possibly be the mite I was describing. It turns out to have nothing to do with it. Mr. Müller's insect is a midge named *Cecidomyia Taxi*, and I have also had the means of verifying the accuracy of his observation by since examining some of the young bud-galls of the Yew in which already the gall maker has passed into the pupa state (a bright orange-red insect). His paper will be found in the *Gardener's Chronicle* for 1873, p. 1110, and I certainly ought to have been aware of it. *Andrew Murray.*

HORTICULTURAL EXHIBITIONS, 1875.

JUNE.

- 9, 10, and 11.—Leeds Horticultural Society's Twelfth Annual Summer Show. Sec., James Birbeck, Delph Lane, Woodhouse, Leeds.
- 10.—South Essex Floricultural Society's Exhibition at Leyton. Sec., G. E. Cox, Leyton.
- 11, 12, and 13.—Rose Show at Lyons. Gen. Sec., Jean Sisley.
- 16.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
- 16.—Glasgow and West of Scotland Floricultural Society, Midsummer Exhibition. Sec., F. G. Dongall, 167, Canning Street, Glasgow.
- 16.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 17 and 18.—Lee and Blackheath Horticultural Society's Exhibition. Sec., C. Helmer, 5, Boones Road, Lee.
- 18.—Scottish Fancsy Society's Exhibition at Edinburgh. Sec., W. M. Welch, 1, Waterloo Place, Edinburgh.

THE

Gardeners' Chronicle.

SATURDAY, MAY 29, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 31	Coroery and Warwick Horticultural Society's Show.
		Bath and West of England Society's Exhibition at Crowder's (Unit 4).
		Sale of Orchids and Lillium auratum, at Stevens' Rooms.
TUESDAY,	June 1	Royal Western Horticultural Society's Exhibition at Plymouth.
		Sale of Peonies and Pigeons, at Stevens' Rooms.
WEDNESDAY,	June 2	Royal Horticultural Society's Summer Show, and Meeting of the Fruit, Floral, and Scientific Committees.
		Sale of Peonies and Pigeons, at Stevens' Rooms.
THURSDAY,	June 3	Meeting of the Linnean Society, at 8 P.M.
		Sale of Orchids, at Stevens' Rooms.
FRIDAY,	June 4	Adjourned General Meeting of the Royal Horticultural Society, at 8 P.M.

"*QUOS Deus vult perdere prius dementat*" is an aphorism which seems peculiarly applicable to the Council of the ROYAL HORTICULTURAL SOCIETY, or at least to certain members of it. By their inconceivable want of tact they have done more in one short half hour to extinguish a great society, and to disgust the few who still take interest in its affairs than years of feeble bewilderment or downright mismanagement have done. We all know that it has been found advisable, perhaps necessary, to postpone the payment of certain debts of honour, and we could sympathise with the Council in the difficult and humiliating position in which they were placed in having to make that announcement. We believe, however, that this is not the only Society which is obliged to postpone the payment of its obligations. Still, we should have supposed that a body of right-minded business men would have found means to meet this temporary difficulty; or, if this had not been practicable—which we altogether dispute—to have made some arrangements with the prize-winners, and induced them to wait till tardy Fellows had discharged their obligations to the Society, or till other means had been forthcoming to supply the funds necessary to raise the comparatively small amount required for this purpose. At any rate, we should have supposed that it would have been deemed imperative that the Davis Prize money, which we believe is trust money, should have been paid before now. We are convinced, moreover, that, had a proper application been made to the Fellows at large, sufficient might have been raised at once to enable the Council to keep faith with the exhibitors, and to have spared the Society the unspeakable humiliation inflicted on the Fellows of seeing the Society "County-Courted."

We are certain that, had the Council made overtures in a proper spirit to the leading exhibitors they, or a large majority of them, would, in the interests of the Society and of horticulture, have sunk any personal grievance they may have had, and come to the rescue of the Society, and made an exhibition on the last occasion, as well as made another on Wednesday next. This is no surmise of ours, we know it as a fact. It was even stated so publicly in the room on Tuesday last.

A little wise generalship, a little proper courtesy and conciliation, and the present difficulties would have been met, and that good feeling would have been secured which is so necessary as a basis for any future reconstruction of the Society. Instead of that, it will scarcely be believed that the two leading members of the Council, the President and the Treasurer, seemed to try and outvie one another which should most deeply insult and wound the susceptibilities of gentlemen-exhibitors and their gardeners. We do not suppose that every individual, either in the one case or the other, is wholly immaculate. We would strenuously uphold the Council in any legitimate attempt to maintain the moral standard of exhibitions, and to discountenance any practice repugnant to a fine sense of honour. But that is a very different matter to running a-muck among exhibitors and gardeners in general, and insulting the whole body on account of alleged misdeeds on the part of some—allegations, moreover, publicly proclaimed without the slightest evidence set forward in corroboration, and which we are assured, in one case that has been brought under our notice, are utterly untrue.

No objections would have been offered to an adjournment, however inconvenient it may be. Most people came prepared for such a delay. Most people attended the meeting with an honest desire, not to embarrass the Council, but to aid them by their support in any reasonable attempt they may have made, or be making, with Her Majesty's Commissioners. Even if they had failed, every allowance would have been made for them. They would have failed where others had no greater success.

But now things are different. What possible confidence can we place in a Council which allows its leading exponents to indulge in such vagaries? It has been hard enough to put up with a Council the leading and more active members of which have shown themselves utterly ignorant of horticulture and its requirements, and worse still, incapable of appreciating the nature of their duties. By force of circumstances, and the mistakes of our predecessors, horticulture, so far as the Royal Horticultural Society is concerned, has been starved, its energies wasted, its means dissipated, and its position lowered. It is a cruel thing, indeed, that its chosen protectors should now put the finishing strokes by directly insulting horticulturists, by flourishing a threat of insolvency, and by allowing a great and noble society to be dragged through the mire of the law courts. Of course all this arises, not so much from wilful wantonness, however much it may seem to do so, as from downright ignorance of and utter want of sympathy with horticulture. That being the case, it is clear that no effectual re-organisation of the Society as a horticultural society is possible so long as the leading spirits and the main officers of the Society are non-horticulturists. We do not deny the rights of the South Kensington party—as we would maintain our own so we can respect theirs,—but we do say, if the unhappy partnership with them is to be continued it must be on such a basis that each shall have its own department allotted to it, and in that department each must be free from the interference of its neighbour. Horticulturists, in fact, must undertake the horticultural work of the Society without let or hindrance from those who have shown themselves utterly incompetent to reign over them. There are many who think a wholesale secession of horticulturists the proper course to follow—we do not adopt that view; but if there is one thing more than another which would justify such a course it is the recent utterances of the President and Treasurer. Between this and the adjourned meeting it is to be hoped that wiser counsels may prevail, and

that if the Society is to continue to exist, the Council may be able to come to some reasonable and equitable terms with Her Majesty's Commissioners, by virtue of which each section of the Society shall have free use of such portions of the Society's property as they may proportionately want, and each portion have a proportionate share of the income of the Society inalienably set apart for its own purposes. It may thus be possible for both sections to work harmoniously together, and if they are to be tied together it is obviously advantageous that they should do so; but no harmony will be possible if to ignorance and incapacity to appreciate horticultural matters be added gratuitous insult to its professors.

Knowing the difficulty of organising a new Society we should prefer, so long as there is a shred of hope, to maintain and reorganise the old one; but if it should so happen that the old Society really falls to the ground, the responsibility for the fall will rest with the present Council, who have shown by their mismanagement of an old society that they are incompetent to organise a new one.

— In the House of Commons on Monday last, Mr. COWEN asked the Home Secretary whether he had had his attention directed to the OPENING OF THE ZOOLOGICAL GARDENS, THE BOTANIC GARDENS, THE HORTICULTURAL GARDENS, and other places of public resort, on SUNDAYS; and whether such opening was contrary to the provisions of the Act 21 Geo. III., under which the Brighton Aquarium had recently been closed; and, if so, whether he would take the necessary steps to secure uniform compliance with the law. Mr. CROSS said in reply that his attention had not been specially directed to the opening of the Zoological Gardens, the Botanic Gardens, and the Horticultural Gardens on Sundays. As to the latter part of the question, it was impossible for him to state what might be the opinion of the Court of Queen's Bench, or any other Court, as to a state of facts with which he was not thoroughly informed. But, as far as he could obtain any information on the matter, he had no reason to believe that the judgment in the case of the Brighton Aquarium would be the same as in that of the Zoological, the Botanic, or the Horticultural Gardens, because he was advised that they stood on a different footing. Therefore, he had no intention whatever to interfere in the matter.

— It is believed that the OLDEST EUCALYPTUS TREE IN FRANCE is in the nursery of Messrs. HUBER & Co., at Hyères, though there are several larger specimens in the same neighbourhood of less age. Is is the *E. globulus*, and was sown in 1857, and is now 65 feet high, with a circumference of nearly 7 feet, and has grown from a seedling of the same species, two or three years younger, also at Hyères, is nearly 90 feet high, and still growing very rapidly. A very remarkable specimen, about 65 feet high, may also be seen in the beautiful grounds belonging to the Duke DE LUYNES. At the age of two years it was accidentally broken off about 2 yards from the ground, where it gave origin to three main branches, and has since grown most vigorously, forming at the present time a majestic tree. Mr. NARDY, who gives the foregoing details in the *Journal de la Société Centrale d'Horticulture de France*, goes so far as to say that this species, and some others of rapid growth, are preferable as shade-giving trees to the Plane, Chestnut, &c., in the Mediterranean region, where they are perfectly hardy. He also recommends them as foliage plants for the sub-tropical gardens in a climate similar to that of London. For this purpose they should be treated in the same manner as some gardeners adopt for the *Paulownia imperialis*, that is, cut down every winter, and they will doubtless make as great a show of foliage every season as the *Paulownia*, though of a very different nature. It may interest those who care to try their cultivation in the warmer parts of the kingdom to know which are the hardest species yet tried. Mr. NARDY enumerates the following:—*E. fissilis*, *Gumii*, *cornata*, *leucocylon*, and *corrigeria*. This list does not include the hardest species known to us, namely, *E. polyanthemos*, which has not been seriously injured by frost at Kew to our knowledge within these last fifteen years.

— THE STAMFORD FLORAL AND HORTICULTURAL SOCIETY proposes to hold a great show of plants, flowers, fruits, and vegetables on September 15 and 16, in connection with the Northamptonshire Agricultural Society's Annual Show, to be held in Burchley Park. A well-arranged and liberal schedule will shortly be issued; meanwhile an effort will be made to increase the number of special prizes, amongst which, received up to the present time, may be men-

tioned one of £20, for twelve stove and greenhouse plants in or out of bloom, given by the Marquis of EXETER, to which are added 2d and 3d prizes, respectively of £10 and £5, by the Society; and £10 as the 1st prize in a class for a dessert of twelve kinds of fruit, including not more than three varieties of Grapes, not more than two Pines or Melons, nor more than one kind of any other fruit, given by the Marchioness of EXETER. For a collection of twenty-four dishes of Potatoes, distinct, nine tubers of each, three prizes are offered, of the value of £10, £5, and £2 respectively.

— Nothing can compete with the common large-leaved or IRISH IVY, when employed to cover spaces beneath trees where grass will not grow. Even a dense shade suits it, such as that cast by the spreading branches of the Cedar of Lebanon. The woodland walks at Chiswick House, and the grounds surrounding Baron ROTHSCHILD'S mansion at Gunnersbury, furnish many illustrations of this fact. Turf, Periwinkle, St. John's Wort, and other agents have been tried, but with indifferent results. At Gunners-

fringed and flaked with rose: this is very pretty and distinct. Valeria is something like Portia, but the colour is deeper on the surface of the fringed petals; it also is novel and very pretty. Fairy is a very pleasing variety; delicate mauve at back, almost pure white on the surface, the segments also handsomely fringed. Olivia is tinted with pale rosy mauve at back, the surface white, the segments stout, broad, and flat, and, as a whole, having much more substance than grandiflora. Octavia is in the way of Olivia, but has less colour at the back of the segments, which are very broad and stout. Cordelia, though in the same way, is decidedly better than either of the foregoing; the flowers are very large and fine, delicate mauve at back, segments very broad and stout. Another group is represented by Diana and Ophelia; the former is peculiar in hue, being much paler than amœna, with large broad segments, but thin in point of substance; it is yet pretty and attractive. The latter is a decided advance towards a purple amœna; the surface is rosy purple, the reverse pale rose, the flowers stout, and of good form and substance. Mr. ALLEN is to be congrat-

Bristol, 5420 into London, 197 into Liverpool, and 1212 into Hull.

— CHRYSANTHEMUM CATANANCHE, a new species, and a choice alpine, is flowering on the rockwork at Kew. Speaking from a horticultural point of view, it is one of the best of the plants sent home by the Moroccan expedition. In general appearance it much resembles Santolina alpina, though far superior from its ornamental flowers. It branches freely, forming a dense tuft. The leaves have long petioles, are about 2 inches in length, variously cut into linear acute divisions, and covered with silky hair. The scapes are erect, bearing a single head 2 inches in diameter, with rays of creamy yellow, maroon at the base, forming a ring of colour round the disc. The involucre bracts are scarious and transparent, with a green midrib, so much resembling Catananche as to have suggested the specific name. It was figured in the *Botanical Magazine* of last year, where it is said to be "one of the most beautiful plants of the Greater Atlas." It was found at elevations of 7000 to 9000 feet, forming large silvery-green patches on the slopes

FIG. 148.—A FASHIONABLE QUARTER OF YEDO.

bury the spaces beneath the great Cedars are all covered with this Ivy, and a dense green carpet, healthy and robust in appearance, is the result. Mr. EDMUNDS is now largely using it in the same way, and as a fringe to shrubbery and woodland walks, and the results are equally successful with those at Gunnersbury.

— We have been favoured with a sight of some of the later seedling forms of PRIMULAS Mr. JAMES ALLEN, of Shepton Mallet, has raised from *P. cortusoides* lilacina and grandiflora. They show not only a considerable but a pleasant variation, and the result points to what appears now to be an ascertained fact, that this fine hardy Primrose can be made to produce as much variety as *P. sinensis* has displayed in recent years. Crosses with *P. japonica*, if actually made, which is a matter of considerable doubt, do not appear to have produced definite results, so far, in the case of attempts put forth by Mr. ALLEN. One of Mr. ALLEN'S happiest results is the production of flowers with fringed petals, which decidedly enhances the appearance of the flowers as decorative agents. One of these he has provisionally named *Portia*; it has the tint of amœna at the back of the flowers, with a white upper surface, the segments

lated on what he has achieved, and seedlings from the flowers just described will in all probability, as far as analogy warrants the prediction, show yet greater advances in variety, size, substance, and breadth of the segments.

— A finely grown and handsomely variegated plant of *PHORMIUM TENAX VARIEGATUM*, growing in the large conservatory at Castle Ashby, Northampton, the residence of the Marquis of NORTHAMPTON, has thrown up a fine spike of flowers, some of the forward buds of which will be expanded in the course of a few days. The flower-stem issues from the centre or heart of the plant, and from the rim of the pot to the tip of the spike it is some 9 to 10 feet in height. Mr. BEECH, the gardener at Castle Ashby, states this is the first time in his experience that the plant has flowered.

— From the Azores journal, *O Cultivador*, we find that, between October, 1874, and March, 1875, there were despatched from the Azores to various ports, chiefly English, 133,306 cases of Oranges, excluding Tangerines. Of these 14,446 were sent to Bristol, 56,965 to London, 4315 to Liverpool, and 29,333 to Hull. Of Pines 1189 were imported into

exposed to the sun, and in rocky valleys. Though it will doubtless succeed best on rockwork, it submits well to the confinement of pot cultivation. It is increased easily by division.

— The new Rhododendron garden in the Old Nurseries, Cheshunt, Herts, which is equal in extent to the one in the Royal Botanic Society's Garden in the Regent's Park, and to the old one at South Kensington, is, now that the plants are in full bloom, particularly worthy of inspection. In adding this new feature to the attractions of their well known establishment, Messrs. PAUL & SON have had the laudable object in view of showing the value of AMERICAN PLANTS for the decoration of VILLA GARDENS. As regards the Rhododendron we may remark, that in the suburbs of Manchester it is much more largely grown in small gardens than is the case in the neighbourhood of the metropolis, where the climate is surely more in its favour.

— A new conservatory for the ADELAIDE BOTANIC GARDEN is in course of erection. It was constructed in Bremen, after the plan of one already built in that city by Mr. HOFER. The cost of the house, with glass and all necessary requirements,

delivered in Bremen, will be £1087. The weight of the iron and glass will be 48,000 lb., and the critical measure is 750 yards. The site of the house is a fine level. Length, 120 feet, and width, 35 feet. The height of the rotunda is 37 feet, and that of the wings, 23 feet high. To ensure the good effect of the building, it is necessary that it be built on a terrace 5 or 6 feet high. The house will be surrounded by a broad walk and a grass margin, adorned with flower-beds, statues, and fountains, and four separate stairs will lead to it.

— We extract the following from Dr. SCHOMBURGK'S report on the condition of the BOTANIC GARDENS, ADELAIDE, for 1874 :—

"Notwithstanding we have had one of the driest seasons, the rainfall having been a little more than 17 inches—the minimum on record being 14 inches—as the rains fortunately fell in genial times for the development of the Wheat plant, we have been blessed with one of the most abundant harvests on record—a proof that in a dry season, if only the rain falls in proper time, we may also expect an abundant crop. Since the month of September the fall of rain has only been 1 inch, which is altogether insufficient for the orchards and gardens; and the setting in of very hot weather in the middle of January, the thermometer ranging from 105° to 115° in the shade, and 76° in the sun, will undoubtedly prove very injurious to our young plantations, especially in the park, where about 4000 trees have been planted, had not the early planting, the attention paid to them, and the supply of water enabled us to save them nearly all; and I consider the loss of this season's planting—about 2 per cent.—a very low percentage indeed, considering the very dry summer—the trees from cooler climates, as New Zealand, Europe, and North America, having been generally the greatest sufferers. I understand the loss of trees planted by other public bodies this season is very material; but I consider that their own fault is when the land is properly watered, so that the water carries the soil among the roots, it will become imbedded in it, and will withstand great dryness, which is impossible when the tree is planted without watering; the roots are then left hollow in their own fault, and in a few days will wither. Since the first year it will secure their growth and safety. This fact may be observed at the Park, where all the trees are in a healthy growing condition. By neglecting the watering of new planted trees, thousands are lost annually, as may be noticed in a good many public walks, where the planting has been repeated many years without success.

— The anniversary meeting of the LINNEAN SOCIETY was held on Monday last, when the following gentlemen were elected members of the Council :—J. D. Hooker, M.D., C.E., J. G. Jeffrey, LL.D., Major-General Scott, C.E., R. B. Sharpe, Esq., and Charles Stewart, Esq., in the room of John Miles, Esq., F. Pascoe, Esq., Major-General Strachey, and Henry Trimen, M.B. The officers are G. J. Allman, M.D., President; J. G. Jeffrey, LL.D., Treasurer, and Frederick Curry, Esq., and St. George J. Mivart, Esq., Secretaries. The financial condition of the Society is very healthy, and in no year has more been done in the way of publications. The loss of members by death has been serious so far as the arrangements for the year are concerned, but the number of the new members more than compensate for the old. Some discussion arose as to the method of rendering the evening meetings more generally interesting, and then the President delivered an address on the history and development of the Infusoria, in the course of which he showed that the tendency of modern research was in favour of the descent of all existing animal forms from two separate types. It was also shown that particular structures are common to the whole of the members of each group, and that though not necessarily present in the adult stage they were so at some stage or another of the creatures' existence. The address will be printed in full.

— We believe that Parliament has sanctioned the appointment of an ASSISTANT-DIRECTOR to THE ROYAL GARDENS, KEW, and that Professor W. T. THISELTON DYER has been selected to fill the office. From the tried ability and known energy of the Assistant-Director, we may hope not only that the Director's heavy labours will be materially lightened, but also that a great advantage may accrue to botany and horticulture.

— At the anniversary meeting of the ROYAL GEOGRAPHICAL SOCIETY, held on Monday last, the President presented the Founders' Gold Medal, awarded by the Council, to Rear-Admiral W. E. P. Mitchell of the Austrian Navy, for the enterprise and ability displayed in the command of two expeditions between Spitzbergen and Nova Zembla; also the Patron's Gold Medal, to Mr. JULIUS PAYER, for his sledge journey and discoveries along the coast of Franz Josef's Land. A presentation gold watch was also handed to Colonel T. G. MONTGOMERIE, of the Trigonometrical Survey of India, for transmission to Mr. W. H. Johnson, the explorer of the interior of the Khibin. The annual Geographical medals offered by the Society

to the chief public schools were then presented to the following successful competitors:—Physical Geography: gold medal, HENRY ALEXANDER MIERS, Eton College; bronze medal, ARCHIBALD EDWARD GARROD, Marlborough College. Political Geography: gold medal, SIDNEY H. B. SAUNDERS, Dulwich College; bronze medal, WM. C. GRAHAM, Eton College. It was announced that the next subject for competition would be the forthcoming Arctic Expedition.

— MESSRS. BARR & SUGDEN have favoured us with the following reply from a Dutch firm to a communication of theirs respecting the TULIP DISEASE (see ante, p. 534):—

"The misfortune you described about the Tulips of your lady friend is not a disease of the roots, but the fault lies with the soil the roots have been planted in. If she removes the soil, and puts fresh soil in, she will find the disease gone. We have observed the same soil in this country in some localities, although not frequently. It is what we call "'koss' in the ground" in this country, and the quality of the bulbs has nothing to do with the mischief, which, however, is very disagreeable to experience."

This explanation seems to us to be open to question.

— THE INAUGURAL DINNER of the HORTICULTURAL CLUB will be held at the Club house, 3, Adelphi Terrace, Strand, on Wednesday next, June 2, at 6.30, P.M., the Hon. and Rev. J. T. BOSCAWEN in the chair. As members of the Club have the power of admitting visitors, it is hoped that a large and representative gathering may be present. The Rev. H. H. DOMERAIN, Westwell, Ashford, Kent, is the secretary, and to him communications should be addressed.

— A ROSE SHOW, the jury at which will be composed of the principal European rosarians, is to be held at LYONS on June 11, 12, and 13. English rosarians are invited to send their new seedlings.

— We have received the following letter from the gentleman who has distributed the so-called OAT-WHEAT. We are glad to give him the opportunity of making his statement, of which we do not for a moment contest the good faith; but we repeat, after Mr. EVERETT'S letter, and after inspecting the sample he has sent us—which is a good sample of Nursery Wheat—that no shred of proof has yet been adduced in confirmation of the statement. It is, moreover, one so extremely improbable that any evidence brought forward in support of it should be correspondingly strong.

"After your severe criticism of Mr. C. S. REAP'S remarks at the Society of Arts respecting Wheat being grown from Oats, I cannot let this opportunity escape without bearing witness to the truth of Mr. REAP'S statement. I saw a shred of proof has yet been adduced in confirmation of the statement. It is, moreover, one so extremely improbable that any evidence brought forward in support of it should be correspondingly strong. "After your severe criticism of Mr. C. S. REAP'S remarks at the Society of Arts respecting Wheat being grown from Oats, I cannot let this opportunity escape without bearing witness to the truth of Mr. REAP'S statement. I saw a shred of proof has yet been adduced in confirmation of the statement. It is, moreover, one so extremely improbable that any evidence brought forward in support of it should be correspondingly strong. "After your severe criticism of Mr. C. S. REAP'S remarks at the Society of Arts respecting Wheat being grown from Oats, I cannot let this opportunity escape without bearing witness to the truth of Mr. REAP'S statement. I saw a shred of proof has yet been adduced in confirmation of the statement. It is, moreover, one so extremely improbable that any evidence brought forward in support of it should be correspondingly strong. I have grown the stock ever since, and consider it the best Wheat in cultivation, being a red Wheat with white chaff, large ears, very stiff in the straw, suitable for strong lands, and an extraordinary crop of oat. I beg to enclose sample for your unbelieving eyes to behold. I have sent this 'Oat-Wheat' to all parts of England for seed, and it has always given satisfaction. By inserting these remarks in next Saturday's publication you will greatly oblige, yours faithfully, P. H. EVERETT, Sudbourne, Wickham Market, April 25."

Appended is a public advertisement of the Wheat in question:—

SEED WHEAT! SEED WHEAT!
OAT WHEAT,
GROWN FROM OATS.

A RED WHEAT, white chaff, very stiff in the straw, suitable for strong lands. The best Wheat of the kind, and one of the best for oat, sacks included. Samples forwarded on application.

MR. F. H. EVERETT,

SUDBOURNE, WICKHAM MARKET.

— THE BEDDING PANSIES and VIOLAS at CHISWICK are just now coming into profuse flower, and will be for the next few weeks well worthy of inspection. Mr. BARRON has planted up with them the whole of the thirty-one beds that border the right-hand side of the entrance broad walk, the sorts grown being those selected by the Floral Committee last year as worthy of a further trial. Nearest the entrance the beds are planted with yellow kinds, then follow blues, purples and whites—all the best old sorts and many good new kinds being represented. Then in six of the large beds at the lower end of the lawn are growing, in quantities of four or more plants, some other forty-six kinds; many of these are not yet in commerce, whilst others are but recently introduced. There is an entire total of at least eighty varieties, and

as the plants are doing well and have been topped-dressed with cocoa-nut fibre refuse, they promise to make a display at once novel and effective.

— A respondent on whose judgment we can rely recommends, as a sure INSECTICIDE, a saturated solution of Camphor in methylated spirit mixed with soft soap to the consistency of cream; mixed with warm water this may be used with the syringe. The proportions of the insecticide to the water will naturally vary according to the nature of the plant, but for soft-wooded plants a table-spoonful to a gallon of warm water is about a fair proportion. Experience must determine the matter.

A FASHIONABLE STREET
SCENE: YEDO.

THE fair city of Yedo extends for many miles along the shores of a lovely bay in the form of a crescent, and the collection of innumerable houses, temples, and gardens extends far inland. A wide river, spanned by large bridges, runs through the town and empties itself in the bay.

In the Daimio's quarter the streets are wide, straight, and cleanly kept, and have altogether quite a different appearance from the ruinous, ill-kept streets of Peking. Good drains are carried down each side to take off the superfluous water. All that can be seen of the houses are the outer walls, the grated windows, and the massive roof-beams and rafters of their owners. The buildings are low, their foundations of massive stonework, and the upper part of wood and *chunam*. At the back of the houses are gardens, and on advantageous eminences various temples, whose precincts are well planted with Pines, Cryptomerias, Salisburia, Podocarpus, &c.; and in the gardens are Maples, Azaleas, Camellias, Plums, and Willows, &c. At certain distances, at the intersection of the long streets, are barriers and a guard-room for police, whilst also at intervals are fire alarm stations. These are provided with bells, and the manner in which these bells are tolled informs the people whether the fire be near or afar off; whether they ought to come to render assistance at once, or hold themselves in readiness to come on a second warning. Beyond the eastern suburb of Yedo is Dang-o-zaka, celebrated for its nursery gardens, fish-ponds, and tea-houses. The most curious objects here are imitation ladies, made up out of the flowers of the Chrysanthemum. Thousands of flowers are used for this purpose, and as these artificial beauties smile upon the visitors out of the little alcoves and summer-houses, the effect is rather startling. The Japanese gardener understands the art of Chrysanthemum culture better than we do, and produces blooms of wonderful size, by allowing only one or two blooms to be perfected at the end of a shoot. The favourite flowering Plum-trees are planted in groups and avenues in all parts of the garden, white lilies and islands of rockwork add to the general effect. The Tea plant is commonly used as an edging, and kept clipped it has a pretty appearance. At Su-mac-yah, also a suburb of Yedo, the whole country is covered with nursery gardens; perhaps nowhere in the world are such large numbers of plants cultivated for sale.

Each nursery covers 3 or 4 acres, and generally the proprietor's house is in the centre, up to which a winding path leads, bordered on either side with specimens of the many hardy ornamental trees and shrubs of the country, many of which are dwarfed or clipped into round table forms. The beautiful little Yew (*Taxus cuspidata*) which Robert Fortune introduced into Europe from China occupies a prominent place among these dwarf shrubs. Then there are Pines, Thujas, Retinosporas, and the handsome *Sciadopitys verticillata*, all duly represented. Plants cultivated in pots are kept near the house enclosed in a house of glass. Instead of glass-houses the Japanese gardener uses sheds and rooms with shelves, into which are huddled all the tender plants for shelter during the winter months. Here the Acorns are cultivated in pretty Nanking square porcelain pots, with a little rock of agate, crystal or other rare stone, which produces a novel and striking effect. Altogether, Yedo, with its temples, watch-towers, and wooded hills, its hedges of Camellia and Rose, its flowering Plums and Cherries, forms a more picturesque city than any other throughout the world.

The population of this fine city has been estimated at about 2,000,000 of souls. The extent of the ground covered by Yedo and the main part of its suburbs has been stated to be about 16 English miles long, 12 miles broad, and 50 miles in circumference. When Robert Fortune was at Yedo, the highway of Yedo was a way of death to the foreigner; now the foreigner can travel in safety. In a short generation the Japanese have achieved a position in the civilised world that the foremost nations of Europe took centuries to accomplish. The

legitimate monarch has thrown aside the imperial seclusion, and, with his dynasty, has entered the comity of nations. The feudal system and its sanguinary domineering oligarchy have been swept away, and constitutional government on a foreign basis placed in its stead. The hated foreigners, their commerce and religion, are no longer detarred from the body politic, but are employed in the State; and last, not least, Vedo has now telegraphic communication with England within fifty hours. In the midst of these gigantic and revolutionary changes we trust the Japanese will lose neither their architectural nor their horticultural arts, *S. P. Oliver.*

THE COWSLIP.

It is one of the most popular of spring flowers—a favourite not only with country children, who delight to make from it the fragrant "Cowslip-balls," the manufacture of which is so charmingly described by Miss Mitford in *Our Villages*, but even with the

upside down will become a Polyanthus. Wild Cowslips, which approach the Polyanthus in colour, and to a certain extent in form, are not so very unfrequent. We know besides, that Buckinghamshire is celebrated for its red Cowslips, and in the British Museum herbarium are some scarlet Cowslips from Northumberland, and a black one from Dr. Abbot, who wrote to Sir J. E. Smith that it was not uncommon in Worcestershire, in old rich pastures, at the edges of brooks and in orchards, and had also been found near Bedford. In this form the calyx is cleft almost to the base, a condition which is sometimes observed in ordinary Cowslips.

Cowslips, indeed, offer many aberrant forms of considerable interest. Not to mention the handsome, large-flowered variety, which is sometimes known as major, there is sometimes noticeable a tendency to produce a second umbel of blooms, the axis being prolonged, as it were, through the first, and terminating in a second bunch of flowers. The interest of this phenomenon, which is not so very uncommon, lies in the connection which it shows between the

is much to be wished that the cultivation of the Polyanthus were more extensively carried out; it is sufficiently evident that the plant is one which varies to an indefinite extent, and would fully repay any trouble which might be expended upon it. The readiness with which the plant is propagated, whether by seeds or by roots, renders it additionally easy to experiment upon; and some of the really fine forms at present in cultivation would doubtless be capable of still further improvement.

Reports of Societies.

Royal Horticultural Society.—Last Tuesday afternoon a special general meeting of the Royal Horticultural Society was held in the Council-room, South Kensington, for the purpose of receiving a communication from the Council respecting the prospects and condition of the Society, and to receive an answer to proposals made by the Council to Her Majesty's Commissioners.

FIG. 149.—THE COWSLIP.

town-bred little ones, to whom it is familiar as one of the prominent members of the street flower-seller's collection. But to be really enjoyed, the Cowslip must be taken *en masse* in its native haunts. Just as Mr. Richard Swiveller proclaimed that beer could not be tasted in sips, so a solitary Cowslip gives no adequate idea of the beauty of the plant when seen in quantity; and this we say in spite of Mr. Fitch's admirable drawing which accompanies these remarks (fig. 149). Cowslips, like so many other beautiful things, are common enough in most districts of England; there is, indeed, a tradition that they are not to be found in Devonshire, but this has been disproved, as have the statements that the Mistletoe and nightingale are also absent from that county. It was formerly stated to be very rare in Scotland, but this also is inaccurate, as a reference to our columns for January 24, 1874, will show, although it seems unfrequent in the west of that country, while it is also very uncommon in the north and north-west of Ireland.

So common a plant needs no description, but one or two points of interest in connection with it may receive a passing notice. Such, for example, is the fact that it is the parent of the garden Polyanthus, with all its forms and varieties; and that there is a general belief in England that a Cowslip planted

Cowslip type of the genus *Primula* and that verticillate arrangement of flowers which characterises the now well-known *Primula japonica*. The Cowslip sometimes varies in just the opposite direction; that is, the scape is suppressed, and the blossoms grow singly in long pedicels from among the leaves, just as do those of the Primrose. The development of the calyx-segments into leaves in some of the forms of Polyanthus is also curious; these are known in cottage gardens by many quaint names, such as "Dick in Green Doublets," and "Charles in the Oak." Parkinson figures one which he calls the "Frantick or Foolish Cowslip, or Jacke-an-apes on horsebacke." A glance at the varieties of Cowslip figured by this author in his *Paradise* shows that the cultivation of the Polyanthus must have advanced very considerably since his time, as his examples approach neither in size nor colour the commonest forms now grown in cottage gardens. He includes, however, a double Cowslip, on the authority of Gerard, and a "double green feathered Cowslip," in which the blossoms consist entirely of small green leaves; besides the still common "hose-in-hose" Cowslip, and another with a large jagged calyx, which "somewhat resembles men's hose that they did wear, and took the name of Gallegaskins from thence." It

The chair was taken by Viscount Bury, President of the Society, and the room was crowded with a large number of Fellows, many ladies being also present. Amongst those who sat at the Council Board were Sir Coutts Lindsay, Bart., Mr. Dobree (Treasurer), Colonel Davenport (Assistant Secretary), the Hon. and Rev. J. T. Boscawen, Mr. W. B. Kellock, Mr. Henry Little, Mr. Henry Webb, Mr. Campion, &c. The proceedings appeared to excite a large amount of interest, and at times were particularly noisy.

After the preliminary business had been disposed of, the CHAIRMAN said: "The first announcement which I have to make you is that of the resignation of our late Honorary Secretary, who says in the letter I hold in my hand that, having taken a very great interest in the Society, and adopted the best steps he could to improve its position, it was with deep regret that he could not agree with the policy of the Council or with the views of the President, and therefore he thinks it 'best for all parties for him to resign.'" Now, ladies and gentlemen, I have to ask from this meeting a confirmation of the resignation placed in our hands by Mr. Lindsay.

The motion, to the effect that the resignation of

Mr. Lindsay should be confirmed, was put, and carried unanimously.

The CHAIRMAN on rising to address the meeting upon the subject which brought them together said: I have now to explain the position in which we are at this present moment, and my task, I very much regret to say, is an extremely easy one. It will be discharged in but a very few words, and the result of it is to tell you that the Council—and it is a matter of regret to them and to me—feel that it will be necessary to adjourn this meeting for ten days. On the last occasion you confided to us a certain trust, which was to make arrangements with Her Majesty's Commissioners for the future carrying on of the Society, and to submit to the Fellows a scheme for the future guidance and government of the Society. That, gentlemen, was the position in which we stood, and we had hoped to be prepared with such a scheme to lay before you, but I regret to say that we have been again unable to do so. The meeting to which I have referred—that is, the meeting adjourned from the annual meeting—was held on March 9, but it was not until April 16 we were able to obtain a first interview or meeting with Her Majesty's Commissioners. As I have said, that meeting was obtained on April 16, and at it propositions were submitted by us which we had hoped, and which we thought, with good reason, would have been acceptable to Her Majesty's Commissioners. However, these propositions were not considered satisfactory by Her Majesty's Commissioners. We amended our propositions on that occasion and on subsequent occasions, and at last we felt that it was our duty to submit to you—to you, the Fellows of the Society, the circumstances in which we found ourselves placed. I may say that we were certainly under the impression that a definite "yea" or "nay" would have been received from Her Majesty's Commissioners, and then we should have been able to assure you that we had either entered into an agreement with Her Majesty's Commissioners, or that we had failed to do so. If it should have happened that the latter were the circumstances, and that we had failed to enter into an arrangement, we should have felt it our duty to say that, under the circumstances, it was due to our own honour to resign into the hands of the Fellows of the Society the trust they had committed to us, and beg of the Fellows to appoint in our stead those who might be able to enter into the arrangements with Her Majesty's Commissioners. It was under these circumstances we summoned the present meeting, believing as we did, that before the meeting was held a definite reply would have been received from Her Majesty's Commissioners to our last proposal, which I may say was one of six. I do not now enter into the subject, so far as it refers to the refusal of Her Majesty's Commissioners to accept our proposals—their reasons, and the questions which were for discussion hereafter; and in making these observations I merely state the facts without prejudice to either party, and without imputing blame to any one. We thought we should have been in a position to give you what I may call definite information as to the future maintenance and conduct of the Society at the present time, and it was under that impression that we convened this meeting. In the meanwhile I may say we have received what we considered a definite answer from Her Majesty's Commissioners.

Mr. FLEMING asked his lordship when the answer had been received.

The CHAIRMAN: It was about seven or eight days ago that we received it, but shortly afterwards, in that outside intimate conversation in which, as we all know, business is more often transacted than in more formal meetings, we found that the Commissioners did not fully apprehend the meaning of a part of our last proposal, and that it was not at all probable that they could come to any decision. General Scott was good enough to attend the last meeting of our Council, which took place a week ago, and we then had four or five opinions of the Commissioners on our last proposal were such as that it would be very possible that a little longer time would bring us face to face with Her Majesty's Commissioners. I offer no opinion upon this, but I should feel more pleased if my honourable friends sitting here at the Council and myself could say we had done all we could, and that we resigned our trust into your hands. But the circumstances of the case being as they are—the Commissioners having made the explanations we thought it our duty to submit to them, and as we have not as yet received an answer to our communication—all, ladies and gentlemen, we can ask of you is to adjourn the present meeting. We are of opinion that ten days from this time will be ample for us to receive a definite reply from the Royal Commissioners. In justice to Her Majesty's Commissioners I must point out that during the Whitsun-tide holidays one man was probably "gone to his farm," while another man had "gone to his errand," and hence it was not quite possible for the Commissioners to assemble together. So, as far as that goes, Her Majesty's Commissioners cannot be said to be in fault. Nevertheless, I cannot refrain from saying that it is very unfortunate for the Society

that its Council should be, as it were, "hung up" in suspense; and I now speak for my colleagues here and for myself when I say that, should we be so unfortunate as not to be able to announce to you that a definite arrangement with the Commissioners has been come to, we shall feel it our duty to place ourselves unreservedly in your hands and ask you to take such action as to you may seem fit. I do not think I have anything further to add, with the exception of this, that if on this occasion you will take my advice—and it may be that it is given on the last occasion, but in any case it is given after due deliberation and consultation with my colleagues on the Council—you will refrain from any discussion at our present meeting on the position in which the Society now stands. It cannot possibly further the objects we all have in view to raise discussions which, in all probability, might be difficult to answer at this moment; and I therefore ask you to pass the motion with which I shall conclude—that the meeting be adjourned for ten days. There is another observation I ought to make, and that is, our financial position has been greatly exaggerated. When we took office our debts—and I will not now enter particularly into figures—were very much larger than they are now. The amount of our debts has been steadily diminished under our exertions; but I regret to tell you that very unpleasant action has been taken against our Society by persons from whom I do not name. Every one ought here to be aware that our funds have been falling off during the last two or three years, and every one is equally aware we have been obliged to postpone the payment of the prizes granted in former years—of course I mean, as you can well understand, in last year. Well, certain gentlemen having made arrangements with their gardeners that part of the wages of these men should be whatever prizes they could make out of the pocket of the Royal Horticultural Society, and their gardeners, who have claimed those prizes, actions to recover them have been brought in the names of the gardeners, but in reality on behalf of gentlemen who ought, I think, to show greater consideration for our Society. We have now been placed in the position either of having to pay these prizes, or to be cited in the County Court for them. We choose the latter alternative, for this reason, but although we have funds in our hands, and more than sufficient to pay those prizes yet our entire debts at this moment are rather larger than the funds at our present disposal. We think, therefore, that to pay the gardeners under their threats of actions before us would be, under the circumstances I have described, an objectionable form of preferential payment. We (the Council) thought we ought not to pay at all under these circumstances—under threats—unless we could pay twenty shillings in the pound for them, which we can hardly do. But we thought it would be very unfair to our tradesmen if, because of these gentlemen—for whom I have very little compassion—choose to press us in an indecent manner, we did not reserve the rights of those who have treated us with consideration. Our tradesmen have not pressed us, as they know very well we shall have ample funds from which every one shall have his due. Well, ladies and gentlemen, at the worst we do not owe half a year's income, and I should like to ask, Can any man propose that you should not have half a year in advance of their income? I know I may say a great many people who consider themselves extremely—indeed, remarkably—fortunate when they are no worse off than that. I merely mention this circumstance here because between this and the time of our adjourned meeting you may see reported in the newspapers proceedings in the County Court which may go against us, and in that case, in order to carry out our principle, we shall have to file a declaration of insolvency to protect our credit. I do not say this, however, we shall in a short time be able to make such a statement respecting an arrangement between the Commissioners, the Council, and our own Fellows outside, as will place us in ample funds. But it is well it should be borne in mind that, of all these liabilities we are the inheritors, not the causers. Take my own case as an instance. It was not until after the vote which displaced the Council that I was asked to become a member of the Society. After that vote I was asked to become a Fellow of the Society, and to do the best I could to place the Society in a better position than that in which it then was placed. I acceded to the call, but I did not consider I should be made responsible for the state of things which then existed. In common with other members of the Society, I regretted that such a state of affairs should exist, but we did not consider ourselves responsible for it. I am prepared, and my friends of the Council are, to say we are prepared, to enter fully and minutely into the circumstances of the Society. We are prepared to submit to you a scheme which we believe will land this society in a prosperous position among the great societies of the country, but, under the present circumstances, you see my lips are sealed, and the lips of my colleagues are also sealed. I hope you will

take our advice, and not further discuss the position of the Society. We regret that many of you should have been brought from a distance to attend this meeting in order to aid the freeing of the Society from its difficulties. We, as a Council, are not responsible for the present position, and we anxiously hope and expect you will give us, after I have made this explanation, your undivided support.

Mr. S. H. GODSON asked if the Council had any guarantee that Her Majesty's Commissioners would entertain their proposals between this and the expiration of the ten days spoken of by the Chairman?

The CHAIRMAN: We have no guarantee whatever. Mr. W. A. LINDSAY wished to say that he was of opinion that if the meeting wished to adjourn for ten days, it would be consistent with the duty the Council owed to the Society to state to the meeting what the nature of the proposals is which Her Majesty's Commissioners had under consideration. The schemes brought before the Commissioners, when he had knowledge of these matters, were such as neither this meeting nor any other meeting of the Fellows would entertain; and if the Council of the Royal Horticultural Society was in a position to say Her Majesty's Commissioners had accepted them, it would be for the meeting to negative them, which he had no doubt they would do. It was highly important that this meeting, which was now asked to adjourn, should know exactly what the nature of the proposals before Her Majesty's Commissioners were. More than that, it was particularly important that the meeting should have the knowledge of the nature of the proposals, and be able to say whether they were such as they could or could not accept. So much for that part of the address of the Chairman, and he should, in the interests of the Society, ask the Fellows to weigh the matter carefully before they gave their vote upon this question. With regard to a statement of the Chairman he desired to say that as far as his own knowledge went it was not perfectly correct to say that the debts of the Society were less than they had been when the present Council were in office. He believed that the debts of the Society were at present larger than they had been. Well, the debts were smaller in one sense, no doubt, but if they were smaller it was because the assets of the Society had been applied by the Council to the payment of the Society's debts. There was one other point in his lordship's speech to which he should allude—it was that with respect to the prizes.

As regarded those gentlemen who had obtained the prizes, he felt bound to say that those of them to whom his lordship in the chair referred were very strong reasons to resent the way in which they had been reflected upon. He never knew a gentleman who made the prizes his gardener obtained a portion of his wages, but there were a great many gentlemen who said to their gardeners that if they could get out of the pocket of their own cost they might exhibit that which had been grown at their cost and expense. Acts of that description were very common, and he did not think it right to say that gentlemen who acted in this way were conducting themselves in an ungentlemanly manner. These very gardeners who had been spoken of by his lordship were out of pocket according to the extent to which they exhibited, and the result of the present position of affairs with respect to the Society was that the gardeners who had exhibited not only did not receive the honours to which, as the prize winners, they were entitled, but, in addition, were out of pocket, and losing money which was their own *bona fide* property. Under these circumstances he did not think it justifiable to say the actions in the County Court were being taken in reality by the gentlemen and only ostensibly by the gardeners. He sincerely hoped these gardeners would succeed in their actions. The real reason why the funds of the Society were in the state in which we neglect of providential shows, but that was not the fault of the Council but of the general public. The Council might have held a show, and a good show, in the North this year. In conclusion, Mr. Lindsay said he was of opinion that the Chairman ought to state the grounds upon which an adjournment of the present meeting was asked for, and why it was necessary.

Mr. KELLOCK said that as regarded the gardeners and the loss of their prize-money, Mr. Lindsay really knew nothing at all about the matter. With respect to holding a meeting in the North, it was perfectly impossible to do so. There was no prize-money to be got up there, and it would have cost the Society £2000 in money prizes to go to Wigan at the least.

Mr. LINDSAY: I ask you, have you any authority for that statement?

Mr. KELLOCK: Indeed I have. You were on the Council at that time, and you know all about it.

Mr. LINDSAY: What is your authority for that statement?

Mr. KELLOCK: It was Wigan that you referred to, and it is unfair for any person to make such ungentlemanly and intemperate remarks. You only retired a few weeks ago from the Council, and if you had other good manners or good taste you would not to-day have spoken as you have done.

Sir ALFRED SLADE, Bart., observed that there could be no doubt any one would have thought that the late Secretary of the Council would or could have spoken with some authority. With respect to that he had exactly the same source of information that Mr. Lindsay, the late Secretary, had, and therefore he altogether objected to the principle laid down by Mr. Lindsay; that the proposals of the Commissioners should either be disclosed to or discussed by that meeting. He had understood it was the expressed wish of the annual general meeting, and of the adjourned meeting of Fellows of the Royal Horticultural Society, that all these negotiations between this Society and Her Majesty's Commissioners should be entrusted to the Council of the Society. If Mr. Lindsay were in the Council now he would be the very last man to make the speech he had just delivered. Mr. Lindsay said it was untrue the debts of the Society were less than what they were when he first sat at the Board, but in the report presented that fact was stated, and that report was drafted by Mr. Lindsay himself, so that when on the Council he was one who assured the Fellows that he laboured constantly to reduce the debts of the Society. He (Sir Alfred Slade) could assure the meeting that he had as much confidence in the present Council—now that he sat amongst the Fellows—as he had when he sat at the Council Board.

Sir ALEXANDER GORDON remarked that there was one observation he wished to make, and it was this, that it would be most unfair were they to declare their approval of any proposals or arrangement in the meeting without consulting the 5000 Fellows of the Society. Verbal communications had been stated to be sufficient for adjourning the meeting, but he took verbal communications to be most unsatisfactory and dangerous to act upon. He should like to know whether the proposals made to Her Majesty's Commissioners were in writing, and whether they were to be taken into consideration at a future time by the Society?

Mr. GUEBALLA asked that the Council should withdraw the plea of insolvency, and pay the claims put forward in the County Court. It must be repugnant to every gentleman present, especially when it was considered their society was a "Royal" one, to have a plea of insolvency entered on their behalf. Why, he asked, should the Council file a plea of insolvency or a plea of insolvency as the Chairman told them? Let the Council pay every claim to the last farthing, and they would be supported by the Fellows of the Royal Horticultural Society.

The CHAIRMAN desired to call the speaker to order for one moment. He (the Chairman) did not say the Council was going to file a declaration of insolvency, but he said that if the cases went on, the Council would rather do so, than pay what they considered preferential claims.

Mr. GUEBALLA thought they should pay what was due to the prize-holders. Why should they be obliged to pay by compulsion? Let them pay away as far as they could, and when they had paid all they had got, then let them fall back upon the Fellows. He was sure it must be repugnant to every member of the Society to do such a thing as that proposed by the Chairman.

The CHAIRMAN: I trust the subject will not be pressed further. We are ready with our schemes. There are two of them in my hand, and I could read them to you, and tell you everything that has taken place between ourselves and the Royal Commissioners. We are perfectly ready to explain, but we say it is not for the benefit of the Society that we should do so. Addressing to the meeting questions like that which Sir Alexander Gordon put will simply place the Society in the very position I deprecate.

Sir ALEXANDER GORDON: I will only put this question—Whether the fact of asking if the proposals made by the Council of this Society to Her Majesty's Commissioners are in writing, can place the Society in an embarrassing position?

The CHAIRMAN: Of course the whole correspondence with Her Majesty's Commissioners is in writing, and the only reason we do not bring the correspondence before the meeting is that we have not received an answer in writing from Her Majesty's Commissioners. We certainly expect an answer from Her Majesty's Commissioners within ten days, and then we shall be glad to lay the whole matter before you.

Sir ALEXANDER GORDON: Yet you may declare yourselves insolvent before the next ten days.

The CHAIRMAN: We will, as a matter of course, defend the actions. What I said was put by way of illustration. What I did certainly say was that it would be better for us to declare ourselves insolvent than to pay any preferential claim.

Mr. DOBREE (Treasurer): If the Fellows really want to support the Society they ought to pay up the amount of subscriptions they owe: they come to a very considerable amount.

A FELLOW: How much?

Mr. DOBREE: £1240 is due from Fellows on this year. Why do not these Fellows pay up their sub-

scriptions? If they did so, they would materially assist us in carrying on the business of the Society. We have done all we can do, but we cannot get on without money.

A FELLOW: How much would put the Society on a sound financial footing?

Mr. DOBREE: If we could only get £5000 or £6000 dropped into our mouths we should be all right. Supposing we suspended payment to-day, we should have at the bank about £2000. We owe for prizes £1400, and, if I were to pay these rabid prizemen, we should come to a dead stand. I will rather cut my hand off than sign a cheque to pay these prizes. By paying them we should give an undue preference to those men who won prizes at their masters' expense, because those very men who win the prizes win them at the cost of their masters' fuel, hothouses, &c. The thing is ridiculous. I have here from the most ungentlemanly letters I ever read from a man named Wilkins about his gardener.

A FELLOW: Read the letter.

Mr. DOBREE: No, we will not read it. Then to go on as to our financial position. We owe sundry accounts up to December 31, and some up to March 25, amounting to £1218 14s. 7d. We owe our accountant 52 guineas, and we owe a member of our Council 10 guineas out of his pocket to pay for the die of the Lindley Medal, between £60 and £70. That brings up our liabilities to a sum of £2703. Then there are current accounts amounting to say £200 or £300, making us owe, supposing we stopped to-day, rather more than £3000. Against that we have in our banker's hands £2000, and that we intend to protect; and if judgment is given against us in these County Court cases, the best thing we can do is to file a declaration of insolvency, and bring matters to a crisis. (A Voice: "We will find funds.") What are we to do if these men get judgments against us? Are we to pay all or some of them? (Cries of "Pay, pay," and "Order, order.") Well, you may take my place as treasurer of the Society, but I will not sign a cheque to pay these prizes.

Mr. P. BARR: Then some one else must.

Mr. DOBREE: So you may, but I will not. As the treasurer of the Society, I am bound to protect the Society, and hence I will pay no preferential claim. If you insist on my doing it, you will have to find another treasurer. We owe about £2000, and against that you have £2000 in hand. That will pay a very handsome dividend. Your Fellows owe £1200, and we have a claim against Her Majesty's Commissioners for rent, &c., of between £900 and £1000. Still, all that won't enable you to get along to the end of the year. You will want a large sum to enable you to get along to the end of the year.

Dr. DENNY and Mr. Godson rose to address the chair, but the latter gave way.

Dr. DENNY observed that the Treasurer had stated, whether rightly or wrongly he would not say, that they should declare themselves insolvent if judgment went against them. Well, they would be insolvent if judgment went against them previous to next meeting. Now he (Dr. Denny) asked what was to become of the Society's show after the statement made to-day that the prizes would not be paid? Would they have any show whatever on June 2? Would it not be better for them to close their doors? Let them not turn swiners' heads in, and take 7s. 6d. for admission and you have no show. Let them keep up the Society as honourable men, and, even if the Society must fail, don't let them open their doors and charge 7s. 6d. for admission and have no show whatever. Let them pay their prizes, because if they went further and they declined to pay their prizes they would not have a single exhibited plant in their tent on Wednesday, June 2. All he could say was, that it was a very serious matter to take the public in.

The CHAIRMAN said the Council did not propose to turn swiners' heads in. In the last occasion they did not consider the show sufficiently good to warrant them in charging the prices fixed, and they altered the admission to one shilling.

Dr. DENNY: Very good so far, but what is to become of the Society, my lord?

The CHAIRMAN: Perhaps you will find the way to put it straight.

Dr. DENNY: Had we not better wind it up.

The CHAIRMAN: I say wait for ten days, and for God's sake wind it up at the end of that time.

Dr. DENNY: You actually propose to do it before then.

Mr. A. MURRAY observed that the Society was not altogether insolvent, because they had a large amount of stock at Chiswick, and various matters at Kensington which would bring in considerable sums of money. They had a large number of subscribers and Fellows, and these prizemen, if they were asked, would be only too glad to postpone pressing their claims.

Mr. DOBREE: I observed some one-and-twenty years ago they were in a position similar to their present one, and what did they do? They did not listen to the cuckoo-cry uttered not only by the present but by the former Council. Why did not the Council and the Fellows put their hands in their

pockets? He (Mr. Godson) was ready to put down £20 and £5 towards the prizes. Let one hundred others say the same and the whole business would be easily settled. If the present Council or the Royal Commissioners could not give their time to the business of the Society, let a Committee of Investigation be appointed the same as there was twenty years ago. At that time they paid everybody. Let them all now pay as honest men, and let every Fellow put down his name for a certain sum. What had the Society done? They had induced people to come there and go to the expense of exhibiting various produce for prizes. Let them be honest at all events, even if they took the coats off their backs. If, however, a Commission of Investigation were appointed he should be able to show that the Commissioners owed the Fellows some £9000. Well, it was the question now whether they would pay or would not pay.

A FELLOW: Pay of course.

The CHAIRMAN: I now formally move "that this meeting do stand adjourned for ten days."

Mr. ANDREW MURRAY seconded the motion, which was put from the chair and carried, about half a dozen hands being held up against it.

Mr. W. BULL said he wished, before the meeting separated, to say, and while he sympathised with the Council, he was anxious to see the wind was done about the show announced to take place next week. They had not heard a syllable as to what was being done to carry out that show. He thought some scheme should be adopted by which prizes could be got. Why did not the Council take some action with those who were the friends of the Society? The prize money would amount to some £600 or £700, and what was to prevent a number of the Fellows making up the amount? It was a most humiliating thing to see the Society in such a position as it was. In the concluding part of his remarks Mr. Bull was understood to say that he should be glad to put down £100 towards the prize money.

The CHAIRMAN assured Mr. Bull that his suggestion would be duly considered.

The meeting, which began to break up as soon as the motion for adjournment was carried, then closed.

— With reference to the statement made by the President, that part of the wages of the gardeners of those gentlemen who exhibit at the Society consisted in the prize money the gardeners might happen to obtain, we are requested by Mr. F. G. Wilkins to state that that statement is, as regards himself, utterly untrue. We are further requested by him to state that he has brought no action against the Society, and has nothing to do with any steps that may have been taken in the matter by his gardener.

Royal Botanic: May 26.—The first summer show at Regent's Park, held on Wednesday last, was a marked improvement on those of its predecessors, and, as the day was one of those in which the wind was rather chilling, there was a fair attendance of fashionables, despite the counter attractions at Epsom. The stove and greenhouse flowering plants were, as usual, the chief features of the display, and the palm of superiority may fairly be awarded to Mr. J. Ward, gr. to F. G. Wilkins, Esq., Leyton, who contributed the finest group in the exhibition to the amateurs' class for ten. Most noticeable in his collection were *Statice profusa*, a plant about 4 feet over, well flowered, and very tall in color; *Erica Cavendishiana*, of gigantic proportions, and well done, reminding us of Messrs. Cole's famous old plant; a fine *Draecophyllum gracile*, with large flowers, and perfectly fresh; *Azalea indica sinensis*, 4 feet through, with a rich profusion of bright orange flowers, charmingly combined with its fresh green foliage; *Aphelexis macrantha purpurea*, also very fine, but will be better yet; capital examples of *Azaleas Louise Margottin* and *Duc de Nassau*, and a fine *Anthurium Scherzerianum*, and very tall in color. The water-lilies came from Mr. W. Chapman, gr. to J. Spode, Esq., Hawkesley Park, Rugeley, and it contained, amongst others, an attractive specimen, some 4 feet through, of *Ixora Dixiana*, and which bore quite a profusion of trusses of its orange-red flowers; *Erica cymia superba* was also finely represented; while the next good things in the group were *Ixora coccinea* and *Pimelea mirabilis*. Mr. J. Carr, gr. to P. L. Hinds, Esq., Weybridge, Mr. Wheeler, gr. to Sir Francis Goldsmith, and Mr. G. Toms, gr. to W. Wetenhall, Esq., Seven Sisters' Road, Holloway, were also competitors. For six, the two leading prizes were also taken by Messrs. Ward and Chapman, in the order named. The first-named exhibitor put up his very fine variety of *Anthurium Scherzerianum*, now distinguished as variety *Wardianum*, and which bore seven immense spathes; together with another good example of *Azalea indica sinensis*, a large and fine *Erica Cavendishiana*, and a beautifully flowered *Erica florida*, over 6 feet high. Mr. Chapman had *Ixora Williamsii*, in fine flower and foliage, some of the trusses measuring quite 6 inches across; and *Aphelexis macrantha rosea*, very bright in colour, and most attractive by its freshness. In the nurserymen's class for twelve, Messrs. Jackson & Son, of Kingston

took the lead, followed by Mr. B. S. Williams and Mr. E. Morse, of Epsom. In Messrs. Jackson's fine group were *Erica depressa multiflora*, from 3 to 4 feet through, and finely flowered—a very telling plant; *Dracophyllum gracile*, large and nicely flowered; *Aphelax maritima purpurea*, over 4 feet through; a good *Anthurium Scherzerianum*, *Statiche prolusa*, and *Pimelea Hendersoni*, both well done, &c. Mr. B. S. Williams followed, with a large and finely flowered *Azalea Baron de Pret*, a good *Hedera tulipifera*, and capital specimens of *Erica Cavendishiana*, *E. tricolor* Wilsoni, *Aphelax rupestris rosea*, and an *Anthurium Scherzerianum* with some thirty spikes. In a group of six from Messrs. Jackson & Son the most noticeable examples were of *Clerodendron Balfourianum*, and *Phenacoma prolifera* Barnesii, though all were in fine condition.

Fine-foliated plants were not represented in any numbers. The best six amongst amateurs came from Mr. G. Legg, gr. to S. Ralli, Esq., Clapham Park, who put up some young plants remarkably well grown, including *Dracena Bapstii*, from 3 to 4 feet high, and possessing most perfect foliage; *Yucca Wiemannii*, none so good and plant about 2 feet high, finely furnished with foliage, but hardly in so fine colour as it will be presently; a fine *Geonoma pumila*, a good *Diefenbachia nobilis*, and a very fine *Croton Youngii*. Mr. W. Chapman was 2d, with good examples of *Croton angustifolium*, *Lantana borbonica*, *Croton variegatum*, *Corypha australis*, a fine *Dæmonorops*, &c. In the corresponding class for nurserymen Mr. B. S. Williams was 1st with two fine *Crotoms*, a very fine *Yucca angustifolia*, *Gleichenia semivivida*, and *Pandanus Veitchii*.

The Orchids were few in numbers, but very fair in quality for a metropolitan show. The most attractive plant of the whole was one of *Odontoglossum vexillarium*, with three spikes upon one bulb, the total number of flowers being seventeen, and all magnificent in size, and most charming in colour. This, with a nice *Odontoglossum Phalaenopsis*, a *Cypripedium villosum* with about thirty flowers, *Phalaenopsis grandiflora* with seven branching spikes, &c., came from Mr. J. Ward, and took the 1st honours in the amateur class. For 2d, Mr. J. Child, gr. to Mrs. Torr, Garbrand Hall, Epsom, was 2d, in the same competition with *Dendrobium Farmeri* having six good spikes, *Lælia purpurata superba*, *Oncidium ampliatum majus*, *Aerides Fieldingii*, &c. Mr. B. S. Williams took the lead amongst nurserymen with a fine *Cypripedium villosum*, *Lælia purpurata*, with seven spikes of five and six flowers each, richly coloured; *Cattleya Mossie* with seventeen flowers, a fine mass of *Cypripedium barbatum superbum*, and some examples of *Vanda tricolor* insignis and *Aerides odoratum majus*. Messrs. Jackson & Son stood next with *Vanda suavis*, bearing a dozen spikes; *Cattleya Mossie superba*, with twenty flowers; *Dendrobium macrophyllum giganteum*, &c. Mr. E. Morse, Epsom, was 3d.

Azaleas were plentifully represented as to numbers, but, generally speaking, they were rather poor. In the amateurs' class for six in 12-inch pots, a neat group of well flowered cone-like plants, some 3 feet high, came from Mr. Child, and 1st prize was awarded to them. Wheeler being 2d, and Mr. Ratty, gr. to R. Thornton, Esq., Sydenham Hill, 3d. The last named exhibitor had the best six amongst amateurs, all being large specimens, and the best, a flat-headed plant, about 5 feet over, of *Striata formosissima*. Mr. Child was 2d. The corresponding class for nurserymen brought out a group from Messrs. J. Ivery & Sons, Dorking, which, though only of medium size, were distinguished by anything for finish, profusion of bloom and richness of colour, and the 1st prize was awarded to them; Messrs. B. S. Williams being 2d, and Messrs. H. France, Esq., Son 3d. For a dozen plants in 12-inch pots the Messrs. Ivery & Son again came 1st, followed by Mr. Turner and Messrs. H. Lane & Son, the latter of whom were also awarded a bronze medal for a small group.

Heaths were capitally represented as to numbers, but the plants ran small all through. Mr. Ward and Messrs. Jackson & Son took the 1st prizes in the amateur and trade classes respectively. Mr. Ward's specimens of *E. tricolor impressa*, *elegans*, *ventricosa magnifica*, *eximia superba*, and *ventricosa coccinea minor*, were very nicely bloomed. Messrs. Jackson's best were of *E. depressa*, a fine plant, and *E. ventricosa coccinea minor*. Mr. Morse came in 2d, with, amongst others, well bloomed plants of *E. westphalica* and *E. mirabilis*. The last two exhibitors also took the prizes in the same order in the class for twelve, while in a corresponding competition amongst amateurs Mr. Ward and Mr. G. Wheeler took the lead.

Of exotic Ferns there were but a few, and the best of these came from Mr. Ritchie, gr. to R. H. France, Esq., Frogna, Hampstead; his specimen of *Davallia Mooreana*, the only plant calling for any particular notice, is certainly a grand plant, surpassing in its dimensions Mr. Oswald Wrigley's specimen alluded to in our last. This fine Fern promises to become one of the most popular for exhibition work. Mr. Williams had the best six amongst nurserymen.

The competition with Roses in pots was confined to Messrs. Paul & Son and Mr. Turner, the first-named firm being 1st for nine and for twenty in 8-inch pots. Mr. Turner being 2d in both cases, while he was 1st for five in 12-inch pots. Paul & Son were 2d in the examples from the latter firm we noticed highly-finished specimens of *Céline Forestier*, *Vicomte Vigier*, *Madame Alice Dureau*, *Victor Verdier*, and *Camille Bernardin*; and Mr. Turner's best were of *Miss Ingram*, *Madame Margottin*, *Maréchal Vaillant*, *Junio*, *Victor Verdier*, all fresh and well bloomed.

The show *Pelargoniums*, as a whole, were an improvement on last year's plants, and made a capital display. Mr. J. Ward occupied his old position in the show as well as in the prize list, and his specimens, though good, will yet be better in a few days. The varieties he staged were *Rose Celestial*, *Alabana*, *Rob Roy*, *Maid of Honour*, *Desdemona*, *Lady Canning*, *Warrior*, *Mary Hoyle*, and *Royal Albert*. Mr. J. James was 2d, showing a better-finished group of plants than we have seen from him before; Messrs. Dolson & Sons being 3d. Mr. James was also 1st for six, with a neat group.

The show *Palms* were particularly well represented in a dozen specimens from Mr. R. Parker, most noticeable amongst which were *Pinguicula grandiflora*, with nineteen flowers, very fine; *Hyacinthus amethystinus*, porcelain-blue, very pretty; *Orchis foliosa*, with eleven strong spikes; *Spiræa palmata*; *Lupinus polyphyllus magnificus*, *Pyrethrum*, *Peonies*, &c.

New plants were shown, as usual at the summer shows here, in considerable numbers, by Messrs. Williams, Veitch, Henderson, Bur, and others; and Botanical Certificates were voted to Mr. Croucher for *Agaves Besseriana major*, *Veitchii*, *Beaucarni*, *mariorata*, *Pilgrinii*, *polycantha*, *pubescens*, *Fourcroya variegata*, and *Dasylium longifolium glaucum*. To Messrs. Jackson & Son for *Athyrium Filix-femina* Jacksoni and *Phegopteris Dianæ*. To Messrs. Veitch & Sons for *Vanda Parishii*, *Cattleya tricolor*, *Cypripedium selligerum*, *Nepenthes alomarginata*, *Abutilon Darwini*, *Agave Salmaia* var. *herzogii*, *Arundo variegata*, *Adiantum Hendersoni*, *Platyterium Wallichii*, *Odontoglossum vexillarium album*. To Messrs. Jackson & Son for *Clematis alba* (see p. 685), *Mrs. Hope* and *J. P. Gassioti*. To Mr. B. S. Williams for *Acalypha marginata*, *Agave marmorata*, *Alphosila australis* Williamsii, *Geonoma gracilis*, *Platyterium Wallichii*, *Dictyogramma japonica variegata*, and *Polystichum lepidocaulum*. To Messrs. E. G. Henderson & Son for *Sonerila Hendersoni*, and *Dracena Princess Teck*. To Messrs. Low & Co. for *Dendrobium forsterianum* var. *To*. Mr. Hill for *Blandfordia princeps*, *Athyrium Filix-femina apicale*, *Osunda obtusifolia*, *Sadleria cyathoides*, *Cibotium glaucum*, and *Nephrودیum truncatum*. Floral Certificates were awarded to C. B. Foster, Esq., Clewer Manor, for Show *Pelargoniums* *Sappho*, *Flirt*, *Magician*, *Eclipse*, *Revenge*, and *Edithe*. To Mr. Turner for Fancy *Pelargoniums* *Miss Porter* and *Countess of Dudley*; and for forcing *Pinus*, *Derby Day*. To Mr. Bull for *Pelargonium Beauty of Oxtou*.

Blackburn Horticultural. *May 17, 18, and 19.*

—This flourishing Society held its annual show on the 17th, 18th, and 19th inst. at the New Wimbledon Hotel, which we have had and the exhibition being held a fortnight earlier than usual, the show was a good one. Stove and greenhouse flowering plants especially were produced in such numbers, and so profusely flowered, as to evidence the close attention that had been bestowed upon them. Orchids were forthcoming in good condition, but there was not so much variety as is possible a little later on. Exhibitors of *Pelargoniums* put in any appearance in numbers, and made a fine display, as also was the case with variegated and fine foliage plants. Mr. Bull's handsome cups brought out three competitors, showing a dozen plants each. Mr. E. Whitehead, gr. to R. B. Dodgson, Esq., Bearwood, Blackburn, was 1st, with a very good collection, the best of which was *Croton majesticum*, large and well grown, *Vriesea reticulata*, and *Dracena Bapstii*; Mr. J. Eyes, gr. to John Tattersall, Esq., Quarry Bank, Blackburn, 2d, with a smaller group. For ten miscellaneous plants, in 10-inch pots, not less than five in flower (the prizes given by Mr. B. S. Williams), Mr. Eyes took 1st honours, with a fine fresh lot, noticeable amongst which was a fine plant of *Ixora Prince of Orange*, and *Dendrobium Devonianum*. Mr. Whitehead, who was 2d, also staged an interesting collection. In the class for ten large mixed flowering and foliage plants (*Orchids* excluded) there was a keen competition, all the competitors showing very good examples of both flowering and foliage subjects. Mr. Eyes was 1st; his *Hedera tulipifera*, *H. fuchsoides*, *Clerodendron Balfourianum*, and *Ixora Williamsii* were beautifully flowered; amongst his foliage plants were good specimens of *Cocos Weddelliana* and *Phormium Veitchii variegatum*. Mr. R. Goodall, gr. to John Thompson, Esq., Bank Villas, Blackburn, was 2d; and conspicuous amongst his blooming subjects were a beautiful example of *Acrophyllum venosum*, a very large and well

flowered *Anthurium Scherzerianum*, the bright red *Erica verticosa grandiflora*, and *Azalea Duc de Nassau*. In this lot was a good specimen of the rush-leaved *Bonipartea juncea*. Mr. Walton, Edge End, near Burnley, was 3d, exhibiting amongst others a well bloomed *Chorizanthe maculata splendens*, and a fine specimen of *Cycas revoluta*. For six stove and greenhouse plants in flower Mr. Whitehead was 1st, his best plants being *Anthurium Scherzerianum*, with some forty large well-coloured flower-spikes, a highly coloured *Bougainvillea glabra* and *Dracophyllum gracile*; Mr. Goodall, who was 2d, had a nice example of *Adenandra fragrans*, *Clerodendron Balfourianum*, and *Eparis Eclipse*. In the class for four stove and greenhouse plants in flower Mr. Goodall came in 1st, showing a well-flowered *Anthurium Scherzerianum*, and *Erica verticosa magnifica*.

For six *Orchids* Mr. Whitehead took both 1st and 2d prizes, with, amongst others, a well bloomed *Cattleya Mendellii*, the lovely *Vanda teres* Andersoni, with four good spikes—a scarce plant, which few succeed in flowering well; *Dendrobium densiflorum* with thirty spikes, *D. Schroderii* bearing eleven spikes, and *Phalaenopsis maculata* in condition, many of its spikes branching. Mr. J. Perrin, gr. to W. Bury, Esq., Accrington, was 3d, his plants being smaller than Mr. Whitehead's, but well grown and very fresh—the best were *Madevallia Lindeni*, and *Aerides Fieldingii*. Mr. Whitehead was again 1st for four *Orchids*, his collection containing a very good *Cattleya Warneri*; Mr. Goodall 2d, Mr. Perrin 3d. For six fine-foliage plants Mr. Whitehead was 1st, having amongst others a very fine *Levistonia altissima* and *Marcanta Veitchii*. Four fine-foliage plants, Mr. Eyes 1st, showing a good example of *Zamia Lehmanni*, *Anthurium crystallinum*, and others; 2d, Mr. Whitehead, his best being *Macrozamia spiralis eburnea*, and *Pandanus Veitchii*. Fine-foliage plants, in 8-inch pots, were collectively well shown; 1st, for eight, was Mr. Eyes, his *Aralia Veitchii*, *Croton Weismanni*, and *Curellogia recurvata variegata* were remarkably well done. Mr. Walton and Mr. Whitehead were respectively 2d and 3d, and Mr. Goodall 4th, with six *Azaleas*, his finest plants being *magnificans* and *Juliana*. For four *Azaleas* Mr. Goodall was here again 1st, Mr. Eyes 2d.

For Twelve exotic Ferns Mr. Eyes was 1st, showing amongst others *Gleichenia cirinata glauca*, *G. Speluncei*, *Davallia Tyermanni*, and *D. Mooreana*; 2d, Mr. Whitehead. Six Ferns; 1st, Mr. Eyes. In the class of ten and also six British Ferns, Mr. Whitehead was 1st, with a very neatly matched plants.

For six show *Pelargoniums*, which were well shown, Mr. Eyes was 1st. In the tricolor class Mr. Faragher, gr. to William Thompson, Esq., Clerk Hill, Whalley, and Mr. Newsham, gr. to W. F. Calvert, Esq., Accrington, were equal 1st. In Zonals and Bronzes Messrs. Goodall and Faragher took 1st prizes respectively.

Mr. Eyes exhibited half-a-dozen very good pot Roses clothed with healthy foliage, and well flowered. Mr. Rylance, nurseryman, Grimsby, showed a good collection of *Pelargoniums*; Mr. E. S. Williams varied and interesting group of miscellaneous plants; as also did Mr. Walton, of Edge End Nurseries, Burnley; and Mr. Bury, nurseryman, New Mills. Mr. Matthews, of the Royal Pottery, Weston-super-Mare, had a very extensive assortment of vases, pots, and Orchid baskets. (From a Correspondent.)

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Small plants of *Aplousia* that it is desirable to grow on quickly will be much benefited by the removal of the flowers as soon as open; so treated they will make double the growth through the season that they can be induced to do if the blooms are allowed to remain long on them. The bright flowered *Gompholobium polymorphum splendens* and *G. barbigerrum*, *Chorizanthe*, *Dillwynia*, and *Pimelea* must not be allowed to remain without shade when in bloom, or the colour of the flowers will be much injured, and their duration shortened. Specimen plants of all the above, and also *Eparis*, *Polygala*, *Boronia*, *Acrophyllum*, and any others of similar character required for exhibition later on must be shaded from the sun more or less, according to the time they will be wanted, but whatever is used in this way must not be too thick so as to darken them too much, and should it ever be allowed to remain over them when not absolutely required. Light the plants must have, or they will suffer in health, as also in the quality of the present season's bloom: plant that are thus placed in retarding houses are much cooler than such as are in houses that the sun comes full upon, and if they are shaded make little progress at the root, and require to be watered with care, letting the soil

get drier before watering than would be advisable with plants whose roots were in a more active state. Young hard-wooded stock that was potted early, and whose roots have now got well hold of the soil, should receive more water.

It is a very common but obvious error to suppose that only stove plants require the water they receive to be at a temperature something like the atmosphere of the house they are in. In this way greenhouse subjects often have water applied to them many degrees colder than the air they exist in; this naturally cools the soil and chills the roots, and at no time in the year is it so injurious as during the spring when both roots and leaves are in a growing tender state. Water used for plants of this description should stand in the house where they are grown. Provision should be made for this by a cistern, large tub, or anything that will hold enough for at least a day's supply; if in a small cistern, this should not be sunk in the earth within the house, or the surrounding soil will keep the water much cooler than the air in the house, especially when the daylight held is small and has to be replenished from day to day. Neither is water from large underground tanks, wherein is collected that which falls from the roofs, always fit for us, even the most common plant—if, as often seen, such tanks are insufficiently ventilated, emitting a putrid bad smell. Plants watered continuously with such water cannot be expected to keep in a healthy condition.

Camellias.—The plants that flowered late, now making growth, will, if their pots are well filled with water, be benefited by the use of manure water, which may be given regularly to them until the buds are gone. Those that bloomed early and were at once started into growth so as to have them in bloom by the end of October and through the close of the year, will by this time have set their flowers. The buds in some cases having attained considerable size the plants must not be allowed to remain in heat too long or they may possibly open their flowers before the time they are wanted. The rate of progress they make after being removed from heat will all depend upon the aspect of the house they are in, and should therefore ever be signs through the summer of Camellias coming into bloom too early, a north house, if such is available, will be the proper place to put them in, or behind a north wall with a temporary covering of loose lights; this means, if taken in time, will effect the desired object. Camellias should never, if avoidable, be placed out fully exposed, for although they require a deal of water whilst making their growth, the soakings they get during thunderstorms, when in the open air after their growth is completed, during what may be termed their dormant season, often has the effect of doing serious injury by causing the buds to fall later on, although this may occur at a time so far after as not to be always attributed to the true cause.

Azaleas.—Plants that have flowered some time back will now be making growth, and such as require more root-room should be at once potted. It is not well to shift Azaleas before the growth has made some progress (as is done with most other hard-wooded plants), through the fact of their not beginning to root so after flowering, and whose progress made in growth. Do not over-pot, as they are very liable to so much root-room as many things. Shade for a few weeks after potting, and keep the house close and moist. Keep a good look-out for thrips, especially on any plants that were much affected last year. As has frequently before been advised, washing with tobacco-water is the safest remedy, as fumigation is always liable to injure the leaves, and more so whilst they are in a young and tender state. *T. Daines.*

FRUIT HOUSES.

PINES.—Strong suckers which were potted last March should by this time be in the fruiting pots, and those of lesser size should likewise be already advanced a stage towards that condition. If this be not the case with regard to the plants in question, no further delay should be tolerated, as even under most careful attention, to retain them for a prolonged period in small pots at this season will prove to be both debilitating and detrimental to them. Recently potted plants should have a regular temperature of from 85° to 95° at the roots, and be thoroughly watered after being potted. If there is a period at which more care than usual should be exercised in this matter, it dates from this time onwards until new roots have taken firm hold of the new soil; much care, therefore, is necessary, and the state of individual plants should be first ascertained before its application. All young stock should now be making rapid progress; every necessary requirement should, therefore, be attended to with regularity. By all means allow such plants liberal space; nothing is more inimical in the formation of sturdy plants than crowding them thickly together at this stage of growth; slightly ventilate the structures early in the day at 75° or 80°, so as to withdraw from the foliage of the plants condensed moisture before powerful sunshining comes in contact with it; its frequent presence will have by this time sufficiently injured it

so as to withstand its effects without injury; and therefore, shading should be discontinued to successional plants, but in the case of fruiting ones, with the crowns in close proximity to the glass, it will be prudent to continue it. Continue to afford every encouragement to plants with fruit swelling off, as before advised. Where too many fruits are ripening at one time, and it is desirable to somewhat retard that period, remove the plants to a cooler place after the colouring process has commenced. *G. T. Miles, Wycombe Abbey.*

THE ORCHARD HOUSE.—Apricot trees in this structure should by this time have had their fruit carefully thinned out. In nearly all instances this fruit has this season set in abundance. Strong growing shoots should also be stopped or pinched back in order to give increased strength to more weakly ones, and by this means secure if possible a uniform development of the trees. Peaches and Nectarines will now likewise require similar attention as regards pinching in of strong shoots and thinning of fruit. This may also be necessary in the case of *Cherries, Plums, and Pears*, as a moderate crop of well-ripened fruit is much to be preferred to a larger crop of inferior quality. Figs have also set plentifully, and all strong shoots should now be stopped, and weak and superfluous ones rubbed off. All trees in pots may now be benefited by weak manure-water, applied at intervals, say about twice a week, in order to encourage the swelling of the fruit. In cases where Peach and Nectarine trees are planted out in prepared borders of soil, the surface of the same should be well mulched with partially rotted manure, as this encourages the roots to rise nearer to the surface, and tends also to check undue evaporation, and to render less water necessary. It also prevents the water when applied from running off, or forming channels for itself, which it is very likely to do should there be the least inequality in the level of the surface of the soil; consequently, portions of the borders are not unfrequently left quite dry, the water having merely flowed over the surface without having had time to sink into and thoroughly moisten the earth. *P. Grice, Cudford, Bury St. Edmunds.*

KITCHEN GARDEN.

Tender things, comprising the following subjects, if properly hardened by gradual exposure, will be in a fit state for planting out, and should forthwith have attention. *Capsicum, Sweet Basil, Knotted Marjoram, and Summer Savory*, will do well planted in individual rows at the base of a wall having a south or eastern aspect, at about 9 inches or a foot distant apart, or otherwise, the leaves, shaded with partially rotted manure, 15 inches asunder. For *Vegetable Marrow* is wanted a piece of ground which is fully exposed to sunshine, which abounds with manure, and where water can readily be supplied whenever it is required. If hand-glasses—"those from early Cauliflowers being generally available in private establishments for this purpose"—can be afforded for a short period it will be an advantage.

Tomatoes.—These plants delight in well-enriched soil, and which, if prepared for the purpose, should consist of two parts strong dry atmospheric soil, and one part decomposed manure, to which, under any conditions of cultivation, about 3 inches more of the latter should be added as a surface mulching. The earliest fruits of this useful esculent ripen tolerably well in the southern and midland counties generally. This, however, is not the case in all parts of the country, and even where it is so, quantities are cut annually in the autumn in an immature state, and consigned in bunches, or laid out singly on shelves, in glasshouses or elsewhere, to be ripened in an unnatural manner. Under such conditions the fruit cannot be expected to obtain that degree of perfection which is to be found, both in regard to colour and flavour, in those which are perfectly matured on the plant; therefore, where means are at command to cultivate them entirely under glass, the practice is worthy of commendation. Our chief supply is obtained in this way. The conditions under which we have secured the best results, have been in places where a free circulation of air is provided, as most of the early crops, by keeping the fruit entirely free from moisture, but supplying it liberally with an admixture of guano at the roots.

Celery plants in an advanced state should also be put out in trenches; single rows are preferable now, because in that way it is not so likely to get drawn, and become piped. In the preparation of trenches, a plentiful supply of well-decomposed manure is requisite. This should be dug in in a moist state, and be kept so constantly, leaving from 4 to 6 inches of soil on the surface. The rain we have recently had has already produced marvellous effects on vegetation, and so far the condition of things generally is such as to prognosticate the promise of abundant fruitfulness. The early crops of *Pears, &c.*, which were mulched, will now withstand drought. The occasion was timely for all thinning operations, and for such purposes was doubtless made available, and for planting out advanced crops of *Cauliflower, Broccoli, Brussels Sprouts,*

Savoy, &c. At all seasonable times keep the surface soil, when it is exposed, well stirred about all growing crops. *Stake Sliced Runner Beans* before the bins are much advanced in growth, using strong stout stakes for this purpose if they are obtainable. If requisite, another sowing of *Dwarf and Runner Beans* should be made at the end of this month. Well ventilate late crops of *French Beans* in frames, and keep them and *Carrots* also abundantly supplied with water. *G. T. Miles, Wycombe Abbey.*

Variorum.

TO AN EMINENT POMOLOGIST—
ONE OF THE JUDGES AT THE CRYSTAL PALACE CAT SHOW.
Forsaking Apple, Plum, Grape, Pear and cherry,
The pips of Quinces and the stone of Berry,
Pomaceous Doctor—what are you at
To leave your Pippins—all to judge a cat!
Whether this Tom was heavy, that one light,
I thought that Tabby would stop out all night,
To find why Louis would so fond of cat,
And whether Manx's tails had had to do to sprouting—
Why blue-eyed cats are deaf, Angoras fat,
And kittens blind are born as any hat,
Is it that Codlin Cat-heads led the way,
Or solely was it honour had the day?
Has the great Crystal Palace, like a stove,
Forced you from Malic pleasures far to rove?
Did animal delights tempt you away
To furry cages on the Calistow Day?
From garden joys as straight as is a pine-line
To quiz those "cats-heads" from a felloe fallow line?

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,
FOR THE WEEK ENDING WEDNESDAY, MAY 26, 1875.

May 20.—Overcast, dull; heavy rain in afternoon. A gale of wind from the west, and partially cloudy throughout.
21.—A fine day, though dull at times. A smart shower of hail fell at 4 P.M.
22.—A very fine clear day.
23.—Fine, bright, and partially cloudy throughout.
24.—A very fine cloudless day. Warm.
25.—A fine day, but dull and gloomy in morning.
26.—Fine, bright, and partially cloudy throughout.

— In the vicinity of London the reading of the barometer at the level of the sea decreased from 30.25 inches at the beginning of the week to 29.53 inches by about noon on the 18th. It then turned to increase, and by the morning of the 20th was 29.81 inches; decreased to 29.74 inches by the afternoon of the same day, increased to 29.85 inches by the early morning of the 21st, decreased to 29.62 inches by the afternoon of the same day, and increased to 29.92 inches by the end of the week. The mean reading for the week was 29.84 inches, being 0.39 inch lower than that of the preceding week.

The highest day temperatures of the air at 4 feet above the ground varied from 72° on the 16th to 56° on the 20th, the mean weekly value being 65°. The lowest night temperatures of the air ranged between 43° on the 17th and 52° on the 21st, with a mean for the week of 47°. The mean daily range of temperature was 18°, varying from 24° on the 17th to 13° on the 20th. The mean daily temperatures of the air, and the departures from their respective averages were as follows:—16th, 58° 9', +6.1'; 17th, 54° 5', +1.3'; 18th, 55°, +1.5'; 19th, 48° 6', -5'; 20th, 49° 5', -4.2'; 21st, 59° 7', +5° 8'; and 22d, 56° 4', +2.3'. The mean temperature for the week was 54° 7', being 1° 3' below the average as deduced from sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's

rays, were 133 $\frac{1}{2}$ and 135 $\frac{1}{2}$ on the 16th and 17th respectively, but on the 20th it did not rise above 96 $\frac{1}{2}$ °. The lowest readings of a thermometer on grass with its bulb fully exposed to the sky, were 39° on the 17th, and 40 $\frac{1}{2}$ ° on the 20th, but on the 16th 49° was the lowest reading recorded by this instrument. The direction of the wind was mostly from the S.W., and its strength gentle. The weather was fine throughout with the exception of the 20th, which was dull and overcast. Lightning was seen on Monday night, and a thunderstorm occurred on Wednesday afternoon, accompanied by heavy rain and hail. Rain fell on four days to the amount of 0.30 inch.

In England, the extreme high temperatures observed by day ranged from 77° at Manchester to 68° at Liverpool and Hull, the general average being 71°. The extreme low temperatures observed by night varied between 44° at Truro and 36° at Manchester and Hull; the general average over the whole country was 39 $\frac{1}{2}$ °. The mean of the extreme ranges of temperature in the week was 51 $\frac{1}{2}$ °, the greatest range being at Manchester, 41°, and the least range at Liverpool, 25 $\frac{1}{2}$ °. The mean high day temperatures ranged between 66 $\frac{1}{2}$ ° at Manchester and 59 $\frac{1}{2}$ ° at Liverpool, with an average value of 63 $\frac{1}{2}$ °. The mean low night temperatures varied from 49 $\frac{1}{2}$ ° at Truro to 42° at Eccles and Hull, the general average being 44 $\frac{1}{2}$ °. The mean daily range of temperature in the week was 10 $\frac{1}{2}$ °; the greatest range was at Sunderland 23 $\frac{1}{2}$ °; and the least at Liverpool, 14 $\frac{1}{2}$ °. The mean temperature of the air for the week was 52 $\frac{1}{2}$ °, being 3° higher than the value for the corresponding week in 1874; the highest occurred at Blackheath, 55 $\frac{1}{2}$ °, and the lowest at Eccles, 50 $\frac{1}{2}$ °. Rain fell on five or six days in the week at most stations, the amounts collected at the various places varying from one inch and six-tenths at Sheffield, and one inch and three-tenths at Manchester and Eccles, to two-tenths of an inch only at Norwich; the average fall over the country was eight-tenths of an inch. The weather was fine and bright throughout, except on the 20th, which was dull, and overcast throughout.

Lightning was seen on Monday night, and a thunderstorm occurred on Wednesday afternoon.

In Scotland the highest temperatures ranged from 67° at Perth and Paisley, the general average being 63°. The lowest temperatures varied between 40° at Glasgow and 38° at Perth, with a general average of 39 $\frac{1}{2}$ °. The mean range of temperature in the week was 23 $\frac{1}{2}$ °. The mean temperature of the air for the week was 51 $\frac{1}{2}$ °, being 2 $\frac{1}{2}$ ° above the value of the corresponding week in 1874, the highest being at Leith and Dundee, 52 $\frac{1}{2}$ °, and the lowest at Glasgow and Paisley, both 50°. Rain was measured at each of the above-mentioned stations, the amounts ranged between six-tenths of an inch at Glasgow and two-tenths of an inch at Dundee, the average fall over the country was four-tenths of an inch. At Dublin the highest temperature was 71°, the lowest 34°, the mean 51 $\frac{1}{2}$ °, and the fall of rain 0.45 inch.

JAMES GLAISHER.

Answers to Correspondents.

ADIANTHUM: J. S. The variety magnificent is one with very large pinnules, rather thickly placed, so that the fronds look well filled. What you send does not appear to be this, but a somewhat vigorous growth of Adiantum Capillus-Veneris.
APPLE: L. H. V. We are unable to name it. It is too late in the season to name such fruits with any degree of certainty.
BLUE BEDDING PANSY: C. P. Try Viola Blue Bell. We cannot say whether it comes true from seed.
CALCEOLARIAS: F. & S. The flowers sent represent a very good strain of the yellow ground spotted series.
CURRENT SHOOTS INJURED: A Northern Subscriber. The materials you have sent are scarcely sufficient to enable us to give an answer. From the development of the only bud, and a peculiar appearance about the impoverished shoot, we suspect that your Currant tree is attacked by the little mite which is so destructive, and which has been so often described in the Gardeners' Chronicle. If you will send next year some buds from the same bush just ready to be developed, and packed so as to arrive in a fresh condition, we may possibly be able in a condition to answer the question.
M. J. B. Weeny's Egg. Your seedling quilled red Daisy is certainly worth growing on account of its rich deep blood-red colour. The conical form of the flower, too, is very peculiar.
INSECTS: Ch. Van G. The insect sent, found upon a plant of Eucynurus angustifolius, is a species of Coccus closely allied to, if not identical with, the common Vine Yretter, C. vitis. The eggs are deposited beneath the body, and as they increase in number and size they raise up the body of the parent (which gradually assumes the appearance of a scale), and are enveloped in the waxy cottony material so common in these and allied insects. I. O. W.
MONSTROUS APPLES: H. Morgan and G. Cannon. You send us double Apple blossoms in which the true fruit, the core, is not formed, and wherein the

petals are increased in number. Such productions are more common on the midsummer shoots than on the earlier ones.

NAMES OF PLANTS: John Fryer. Pavia rubra. You ought to be able to get it at any tree nursery.—F. Solanum jasminoides.—Zitt. 1. Tilia europaea, var. laetifolia.—2. Alouatta.—3. Lonitara albigena.—5. Cornus.—7. A. P. Allium substriatum.—H. H. C. Yours is the true Viola pubescens, Ait. The plant mentioned as being in flower at Kew, p. 630, under the name of V. pubescens, was incorrectly named. It is V. cucullata, Ait.—G. G. Lycopodium, 1. Anchusa sempervirens; 2. Corydalis lutea; 3. Phlox procumbens; 4. Symphytum tuberosum; 5. Pulmonaria officinalis; 6. Epimedium alpinum.—G. E. Daphne Cneorum.—N. C. 1. Vaccinium corymbosum; 2. Staphylea trifoliata.—3. Halesia tetraptera. We shall be obliged for the sketches you propose sending.

PHORMIUM TENAX FOLIIS VARIEGATIS: W. Brown. This plant is not often seen in bloom. The flowers of P. tenax are bright orange tipped with red, and produced one long panic.

ROYAL HORTICULTURAL SOCIETY. We inadvertently omitted to make in our report of the last meeting of this Society that Messrs. James Carter & Co. were voted a silver medal for a nice group of plants, including some excellent pot specimens of Mignonette, and their richly coloured new Coleus, Duchess of Edinburgh.

WIREWORMS: Amaturus. There is no more efficient method of getting rid of wireworms than by turning the soil over several times and hand-picking them. As the space you have infested with them is so limited this would seem the easiest and best way to deal with them. Other remedies are to mix a little gas lime or spirit of turpentine with the soil, turning it over sparingly; or to mix pieces of linseed cake and Potatoes with the soil.

CATALOGUES RECEIVED.—Louis Van Houtte (Royal Nurseries, Ghent, Belgium), Illustrated Catalogue of Stove and Greenhouse Plants, Cactuses, Pelargoniums, New Roses, &c.—E. G. Henderson & Son (Wellington Road, St. John's Wood, London), Illustrated Spring Catalogue of Stove, Conservatory, and Bedding Plants.—C. T. Paul & Son (The Old Nurseries, Chestnut), Catalogue of New Roses, and Dahlias, Delphiniums, Fuchsias, Pelargoniums, &c.

Markets.

COVENT GARDEN, May 27.

A FREE supply of outdoor produce, and better attendance at market; that from under glass does not at present come up to the usual standard. The Cress, Parsley, and Ashleaf Potatoes are a dull trade, at considerable reduction, the consignments being very large during the week. We have notice of a fresh arrival of St. Michael's Pines, most probably will be sold by this time. Thos. Taylor, Wholesale Apple Market.

CUT FLOWERS.

Table with columns for flower names and prices. Includes Azaleas, Carnations, Cineraria, Daisies, Echinops, Enchirid, Heliotropes, Lily-of-the-Valley, Mignonette, Myosotis, Narcissus, Pheasant's eye, etc.

PLANTS IN POTS.

Table with columns for plant names and prices. Includes Azaleas, Begonias, Broomrape, Calceolaria, Cineraria, Cyperus, Daisies, Draecena, Fuchsia, Geranium, Heath, etc.

VEGETABLES.

Table with columns for vegetable names and prices. Includes Artichokes, Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflower, Celery, Cress, Endive, Herbs, Horse Radish, Potatoes, etc.

Table with columns for fruit names and prices. Includes Apples, Apricots, Cherries, Figs, Grapes, Raspberries, Lemons, Nuts, etc.

SEEDS.

LONDON: May 27.—Our markets are now, as might be expected, very thinly attended, with scarcely any business passing. The sowing season, however, is now, of course, at an end, and for the small stock of seeds remaining unsold no speculative demand has yet sprung up. An unusual and larger inquiry is shown for spring Tares, which are with difficulty met with; the supply being all but exhausted, long prices are easily obtained. For agricultural Mustard and Rape seed quotations remain steady. There is a good sale for blue boiling Peas. The unparalleled rates demanded for Canary seed (now about six times the average) are beginning to materially diminish its consumption, and other kinds of seeds, such as Millet, Hemp, and Co. seed, are being used in its place. Hemp seed must be noted 15 per quarter cheaper. Linsed unchanged. John Shaw & Sons, Seed Merchants, 27, Mark Lane, E.C.

CORN.

At Mark Lane on Monday the supplies of English Wheat were limited, and of foreign the quantity offering was moderate. Business opened very quiet, and at the close English gave way 1/2 under the rates of Monday fortnight. A moderate quantity of foreign was offered. Flour was quiet, and drooping in price. For French maling Barley there was some inquiry, but rates were rather under those of a fortnight back. Grinding sorts sold slowly, at 1/2 lower on the week. Beans were 1/2 per q. lower, but Peas sold at the extreme of late quotations. For Oats the market has given way 9/2 since Friday. Maize was 6d. to 9/2 lower on the week.—On Wednesday business was without improvement, and rates had a downward tendency. The supply of English Wheat was small, while that of foreign was moderate, and dealings in both descriptions were made on rather lower terms than on Monday. Barley was weak, so also was malt, and less money was taken for Oats in most cases, the supplies offering being considerable. Maize also was flat, but there was no material change in the quotations of Peas, Beans, and Lentils. Average prices of corn for week ending May 22.—Wheat, 42s.; Barley, 38s.; Oats, 35s. 3d. For the corresponding week of last year:—Wheat, 62s. 4d.; Barley, 45s. 11d.; Oats, 30s. 1d.

CATTLE.

In the Metropolitan Cattle Market on Monday the previous advance in beasts was not fully upheld, but there was an improvement in the prices obtained that day week by 2d. to 4d. per stone, making 6s. 4d. the fairly current top rate. The sale of foreign stock was adversely affected by arrivals, and Dutch were the turn lower, say 5s. 4d. to 5s. 6d. for best. In sheep prices were back to about these current Monday week. The quote 7s. as the top price for very choice sizeable Down wethers, but 6s. 10d. was, perhaps, a more general price for best qualities. On the foreign side also prices receded to last Monday's level, but the pens cleared pretty readily at the reduction to 5s. 10d. to 6s. 4d. were considered the top price for sheep, and 6s. 8d. for lambs. Lambs hardly exceeded 8s. 6d. for the prime. Calves were in short supply and dear, price realising 6s. 4d. Figs were not much in demand.—On Thursday choice beasts were freely disposed of, but trade for other kinds was dull. The increase in the supply of sheep and lambs was extraordinary; prices were considerably lower for all kinds—a large proportion remaining over unsold. Calves were plentiful, and lower in price. Trade was dull for milch cows.

HAY.

The Whitechapel market report states that there was a large supply of fodder, which sold with difficulty on rather easier terms. Prime Clover realised from 100s. to 120s.; inferior ditto, 85s. to 95s.; prime meadow hay, 100s. to 110s.; inferior ditto, 85s. to 95s. per ton, 55s. per bag, per load.—Cumberland Market quotations.—Superior meadow hay, 120s. to 134s.; inferior, 100s. to 112s.; superior Clover, 120s. to 128s.; inferior, 95s. to 112s.; and straw, 40s. to 44s. per load.

POTATOS.

The demand at the Borough and Spinnfields markets had been principally limited to the better descriptions, the arrivals of which were proportionally small. The quotations were—Regents, 80s. to 120s.; Victorias, 115s. to 120s.; Rufes, 110s. to 155s.; rocks, 65s. to 75s. per ton. The imports of Potatoes into London last week consisted of 1375 tons, 10,527 sacks, and 961 bags from Dunkirk; 10,612 bags from Antwerp; 2038 packages and 1943 boxes from Lisbon; 577 sacks Boulogne, 553 bags Brussels, 292 sacks Rotterdam, 145 tons Harlingen, 676 bags Bruges, 60 bags Kotterdam, and 1 bag from Jamaica.

COALS.

There was a good demand for best house coals at market on Monday, at an advance of 1s. per ton; Seconds remained unaltered in value. The "Derby" affects coils, for, Wednesday being "Derby Day," there was no attendance at market.

For particulars and Testimonials, apply to THOMAS CHILD, Manager, 39A, King William Street, London, E.C.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application. Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Glanelygh, Llanpau, Carmarthen, Nov. 27, 1873. "Mr. Lloyd Lloyd encloses cheque for 25 5s. amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful things he ever possessed." Apply to HILL AND SMITH, Beatty Hill Ironworks, near Dudley, and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained. CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of the Varnish is faithfully marked with their name and address, without which none is genuine.

BOULTON & PAUL (LATE W. S. BOULTON & CO.), NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

Now Ready, our NEW ILLUSTRATED CATALOGUE OF HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings with Prices of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

AS A LAWN CONSERVATORY.

FOR PLANTS OR VEGETABLES.

AS A VINERY.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these Patent Plant Preservers and Ground Vineries to be by far the best and most useful articles of the kind they ever saw, and awarded them the only prize.

Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 ft. by 4 ft. wide; thus proving them to be really portable. They are made in the following sizes. One pair of ends is sufficient for any number of lengths, if set in a continuous row.

Cash Prices carriage paid to any Station in England on Orders amounting to 60s. and upwards.

	Price.	Ends per pair extra.		Price.	Ends per pair extra.
6 feet long by 2 feet wide	£1 5 0	.. 5s. 6d.	6 feet long by 4 feet wide	£2 6 0	.. 8s. 6d.

Lawn Conservatories, with Glass sides and ends, 12 feet long by 4 feet wide, £7 5s.; 12 feet long by 5 feet wide, £8 15s.; 12 feet long by 6 feet wide, £10.

PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to Build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. Write for New Illustrated List post free.

OPINIONS OF THE PRESS.

"The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value."—*Gardeners' Chronicle*.

"The Ground Vinery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co."—*Floral World*.

"Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known."—*Gardener's Magazine*.

"Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and putted—an essential point. They are complete and ready for use the moment they are received, &c."—*The Gardener*.

MELON OR CUCUMBER FRAMES.

All sizes (glazed with 21-oz.) ready for immediate delivery.
Height at back, 24 inches; at front, 13 inches; sides, 1 1/2 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as putted in. Each light is provided with an iron strengthening rod and handle.

Glazed with 21-ounce.

THE COWAN PATENTS COMPANY, LIMITED,
21, WHITEHALL PLACE, LONDON, S.W.

VIENNA PRIZE WIRE NETTING.

**CAUTION TO BUYERS
Of WIRE NETTING.**

The great reputation and success of Messrs. J. B. BROWN and CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & Co. are the SOLE MANUFACTURERS.

Messrs. BROWN & Co. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced price. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting.

90, Cannon Street, London, E. C.—March 12.

Under the Patronage of the Queen.

J. SMITH'S IMPROVED METALLIC LABELS.

The above Labels—which have just been adopted for the Royal Gardens at Windsor—are made of a White Metal, with RAISED BLACK-FACED LETTERS, and are of various shapes and sizes. Samples and Price List free.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—

These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Price, with Spreader . . . £6 0 0 Price, fitted with Garden Engine 8 0 0 PRICE WATER and LIQUID MANURE CARTS. Prices and particulars on application at the London Road Ironworks, Chelmsford.

Important to Market Gardeners and Others. THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separate, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and trusty, and fully adapted to the purposes designed. A large number have been sold, and are giving unequalled satisfaction.

Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

THE GARDENERS' CHRONICLE.

Second Edition, Price 3d., Post Free 4d.

THE AGRICULTURAL GAZETTE ALMANAC, 1875.

The best Illustrated Agricultural Almanac.

OPINIONS OF THE PRESS.

"It is an excellent and useful work for farmers and all interested in rural pursuits. Beyond the matter usual in such compilations are many good services on hints on fattening cattle, growing of root crops, &c. The illustrations are admirably executed, many being derived from photographs." - Weekly Dispatch, Jan. 31, 1875.

"The 'Agricultural Gazette Almanac,' which deals with matters of interest to farmers, has reached a second edition." - Lloyd's, Jan. 17, 1875.

"It is a very cheap threepennyworth of information of interest and utility to farmers, and contains numerous illustrations." - The Field, Jan. 16, 1875.

"In addition to the usual matter to be found in an almanac, we have here useful information to the farmer, as to stock and crops, with illustrations of prize animals." - Gloucestershire Chronicle.

"This is a cheap and useful almanac and diary, well illustrated. Its contents will be found interesting to the agriculturist, and adapted for daily use." - Farmer's Herald.

"The Calendar contains all the fixtures for cattle shows, races, &c., space for diary and memoranda by the side, and various useful information of an agricultural character." - Oxford Times.

"The 'Agricultural Gazette Almanac' is a cheap quarto almanac, comprising information on agricultural topics and a series of portraits of the Prince of Wales, Dr. Voelcker, and Viscount Bridport, and engravings of different prize cattle, reproduced from the 'Agricultural Gazette.'" - Bath Express.

"To farmers, cattle dealers, and others interested in agriculture, this work will be found invaluable. It contains a deal of information relative to cattle, crops, land, and miscellaneous matters, and is profusely illustrated with engravings chiefly taken from photographs." - Devonshire Chronicle.

"This almanac, which appears to be carefully compiled, and the contents judiciously selected, may be commended to the notice of agriculturists generally. It is issued at a low figure, and contains a large variety of information. There are numerous illustrations, and the likeness of the Prince of Wales, which forms the frontispiece, is especially deserving of mention." - Grantham Journal.

"To all persons interested in agriculture in this neighbourhood, the 'Agricultural Gazette Almanac' for 1875, price 2d., will be worth attention. It contains a fund of information, as well as a variety of advertisements on topics especially connected with the portion of the community which it is intended to serve." - Halifax Guardian.

"Although this almanac comes rather late it is none the less welcome; as containing a most interesting, both interesting and commended. In addition to the usual calendar it contains a diary, supplies us with authentic portraits and descriptions of prize cattle, sheep, and pigs, a list of the members of both Houses of Parliament, another of the Chambers of Agriculture, another of County Agricultural Societies, besides hints as to the various notices. Such containing information may be recommended itself to every agriculturist." - Western Daily Mercury.

"Though it is rather late to be noticing an almanac for 1875, we make an exception in favour of the one before us, which, owing to its great merits and low price, ought to be purchased by every agriculturist in the kingdom. The illustrations of prize cattle, implements, &c., are a valuable feature in the Almanac." - Prescott Reporter.

"Considering the valuable information for the farmer and stock breeder to be found in this publication, no wonder the first edition has had to be followed by a second. In addition to the usual of farming matters, it contains a diary, paper on 'Cricket in the Counties in 1874,' and alphabetical lists of the members of the Houses of Parliament. It is besides admirably illustrated with notable prize-winning stock. The diary is well adapted to the requirements of agriculturists." - East Anglian Daily Times.

"It contains a lot of information useful to farmers and breeders." - Cornish Times.

"It contains a mass of information which will be found exceedingly useful to all who are engaged in agricultural pursuits. In addition to this there is a capital portrait of H.R.H. the Prince of Wales, and several other engravings." - Gloucester Mercury.

"It is a wonderfully good threepennyworth, containing, as it does, in addition to the calendar specially arranged for agriculturists, some of the beautiful portraits of stock which have appeared in the columns of our contemporary within the last year and a-half. Among other things, are portraits of the Duke of Devonshire, of Folemachus, and Duke of Galloway, of the Duke of Devonshire, and a lithographic portrait of a Jersey cow. There are also illustrations descriptive of noteworthy American 'short-horns,' and a lithographic portrait of a Jersey cow. These are the worth consulting, the advice they contain being sound and practical." - Land and Water.

"It contains much interesting matter for the farmer, who may get many a wrinkle from this unpretentious little publication. As may be imagined, the notes relate to matters of purely farming interest, and are of a practical nature. The advice they contain being sound and practical." - Land and Water.

W. RICHARDS, 7, Catherine Street, Strand, W.C.

A Work which Every One should have who has a Garden. HIGH-CLASS KITCHEN GARDENING. A Handy Manual of Improved Culture of all Vegetables. By WILLIAM EARLEY, author of 'How to Grow Medicines,' &c. H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

Works on Botany, by Dr. Lindley.

THE VEGETABLE KINGDOM; OR, THE STRUCTURE, CLASSIFICATION, AND USES OF PLANTS. Illustrated upon the Natural System. In One Volume, 8vo, cloth, price 25s., with upwards of 1000 Illustrations.

EXTRACT FROM THE AUTHOR'S PREFACE. "The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic economy. The principal part of those which can be brought by teachers in Europe under the notice of students, or carried out subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the Vegetable Kingdom of the author, with the sequence of matter departed from in a few instances, which was believed that the convenience of younger students would be conciliated by doing so. The author trusts that this selection will be found to have been made in such a way that all who possess reasonably extensive gardens, may furnish the larger part of the species which are mentioned. A small selection of those which are not so common, but which would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science, should be enabled to Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

By the same Author. INTRODUCTION TO BOTANY. Fourth Edition, greatly enlarged, with six Plates, and numerous Wood Engravings. In One Volume, 8vo, cloth, price 15s.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added, so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

DINNEFORD AND CO., 172, New Bond Street, London, W.; and of all Chemists throughout the World.

GREEN'S PATENT "SILENS MESSOR" & "ROYAL,"

Or NOISELESS LAWN MOWING, ROLLING, AND COLLECTING MACHINES for 1875.

The Winners of Every Prize in all Cases of Competition.

PATRONIZED BY
HER MOST GRACIOUS MAJESTY THE QUEEN
On numerous occasions,

H.R.H. the PRINCE of WALES, The KING of the BELGIANS,
The LATE EMPEROR of the FRENCH,
The EMPEROR of RUSSIA,

And most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 75,000 of the above Machines have been Sold since the year 1856.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—
1st. Simplicity of Construction—every part being free of access. 2d. They are worked with far greater ease than any other. 3d. They are the least liable to get out of order.
4th. They make little or no noise in working. 5th. They will cut either long or short Grass, and wet as well as dry.

SINGLE AND DOUBLE-HANDED LAWN MOWER.

To cut 8 inches	£ s. d.
Can be worked by a Lady.	2 10 0
" 10 "	3 10 0
" 12 "	4 15 0
Can be worked by one Person.	
" 14 "	5 16 0
" 16 "	6 17 0
Can be worked by one Person on an even Lawn.	

To cut 18 inches	£ s. d.
Can be worked by a Man and Boy.	8 0 0
" 20 "	8 10 0
" 22 "	9 0 0
" 24 "	9 10 0

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Side Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches	£ 15 0 0
" 28 "	17 0 0
" 30 "	18 10 0
Leather Boots for Donkey	1 0 0
" " Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£ 22 0 0
" 36 "	26 0 0
" 42 "	30 0 0
" 48 "	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

GREEN'S PATENT "ROYAL" LAWN MOWER.

The special features of this Machine, which recommend it for universal adoption, are its novel construction and its extreme simplicity. It is composed of the smallest number of parts of any Lawn Mower extant.

The Framework is cast all in one piece, and, therefore, is not liable to be twisted, or by any means get out of order.

The Cutters are fit in the cylinder without wedging or wiring, and yet they are so firmly fixed that they cannot be shaken, or in any way become loose.

The Fixings or Caps of the Cylinder are fitted together by two bolts and two screws only; and the cylinder itself can be adjusted or removed by the most inexperienced person in two or three minutes.

WITH SINGLE GEARING.

To Cut 6 inches ...	£ 1 5 0
" 8 " ...	1 15 0
" 10 " ...	2 10 0
" 12 " ...	3 5 0
" 14 " ...	4 0 0
" 16 " ...	5 0 0

The Motive Power is given by the travelling wheels, into which a pinion fixed on the end of the cylinder shaft is geared, giving revolving motion to the cutters; and it will cut either short, long, wet, or dry grass, hents, &c.

The Grass-box is placed in front of the cutters, and by removing it the Machine will cut grass close up to trees, seats, and underneath shrubs, &c. It is eminently adapted for Banks, Slopes, Flats, &c.

The Rollers fixed behind the cutters enable the Machine to cut over the edges of Flower Beds, Borders, Verges, &c., and close to any object.

The Handle of the Machine is self-adjusting, and will suit the height of the person using it at any angle.

The Mowers are of the strongest manufacture, simple in their construction, not liable to get out of order, and require the least repairing of any Machines of their kind extant.

WITH GEARING ON EACH SIDE.

To Cut 18 inches ...	£ 6 10 0
" 20 " ...	7 0 0
" 22 " ...	7 10 0
" 24 " ...	8 0 0

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

Every Machine is Warranted to give entire satisfaction, or may be returned at once unconditionally, without any expense to the Purchaser.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every Prize that has been given in all cases of competition.

Our reason for bringing out the "Royal" Mower is to meet a want which has been repeatedly expressed by the purchasing public to have a good, useful, and efficient Machine CHEAP.

Green's Lawn Mowers are the only Machines used by the Royal Horticultural Society, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as AN EFFICIENT STAFF OF WORKMEN IS KEPT AT BOTH PLACES.

A Stock of 500 Mowers, including all sizes, is kept at our London Establishment, from which Purchasers can make their selection, and have prompt delivery.

SPECIAL NOTICE.

GREEN'S PATENT LAWN MOWERS possess (over those of all other makers) the advantage of self-sharpening: the cutters, being steel on each side, when they become dull or blunt by running one way round, the cylinder can be reversed again and again; and by bringing the bottom edge of the cutters against the bottom blade, the Machines will cut equal to new ones. Arrangements have been made so that the cylinder can be reversed by any inexperienced person in two or three minutes.

When Green's Lawn Mowers are used there is no ridgy or wave-like appearance left on the sward, but they leave the lawn with a smooth, even, and carpet-like surface, which is pleasing and delightful to the eye of the observer.

THEY CAN BE HAD FROM ALL RESPECTABLE IRONMONGERS AND SEEDSMEN IN THE UNITED KINGDOM; OR FROM

THOMAS GREEN & SON, Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London, S.E.

SALES BY AUCTION.

Wilkesden.—Clearance Sale of Choice Stove, GREENHOUSE, and BEDDING PLANTS. MESSRS. BROTHEROE and MORRIS are instructed by the Owner to SELL BY AUCTION, without reserve, on the Premises, Halseda House, within five minutes' walk of Wilkesden Junction, Middlesex, on WEDNESDAY, June 3, at 12 o'clock precisely, the whole of the well-grown STOVE and GREENHOUSE PLANTS, comprising many fine specimens; also about 12,000 BEDDING PLANTS, consisting principally of Wintered Geraniums, including Mrs. G. Falck; also a large number of other leading kinds, Lobelias, &c. May be viewed the day prior to the Sale. Catalogues had on the Premises, and the Auctioneers, Messrs. Estate Agents, 93, Gracechurch Street, City, E.C., and Leytonstone, E.

Very Choice Orchids from New Granada and the EAST INDIES. MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 20, at half-past 12 o'clock precisely, the following assortment of ODONTOGLOSSUM ALEXANDRE (BLUNT), unusually fine both as to size and condition; strong imported plants of MASDEVALLA, DRYADIA, and other ODONTOGLOSSUM GLORIOSUM; strong growing plants of DENDROBIUM WARDIANUM, FALCONERI, and CRASSINOIDE; PHALANOPSIS, including Mrs. J. DAVI; also strong imported plants of SACCOLABIA BLUNDELLI var. DAVI; and thirty six fine plants of MUSA ENSETTE. On view the morning of Sale, and Catalogues had.

New Phalaenopsis. MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on FRIDAY, June 21, at half-past 12 o'clock precisely, SEVERAL NEW PHALANOPSIS, including a fine strong plant of P. casta. This beautiful variety was fully described by Professor Reichenbach in p. 199 of the Gardeners' Chronicle. Only two plants of it are known to exist. Also a good plant of the new Phalaenopsis leucotricha, described by Professor Reichenbach in p. 366 of Gardeners' Chronicle for 3d series. Also several varieties of P. amabilis, as described at pp. 685 and 686 of the Gardeners' Chronicle for May 29; a plant of the new Phalaenopsis fasciata; and a quantity of plants of Phalaenopsis Schilleriana and Phalaenopsis grandis. On view the morning of Sale, and Catalogues had.

Established Orchids. MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on FRIDAY, June 21, at half-past 12 o'clock precisely, the following assortment of ESTABLISHED ORCHIDS, including Oncidium curtipendula. This is extremely rare, and one of the handsomest Oncidiums known; a plant of it in flower will be exhibited at the Sale. At the same time will be sold the rare Oncidium concolor in flower; also Pterocarya Dayana candidula in flower, Cyrtopodium Dominicanum, C. hexagrammum, Laelia elegans Andersonianum, one of the handsomest Laelias known, Vanda Denisiana, Anguicum secpule, pedale, Odontoglossum secpule, Cattleya aurea, C. Mendelii, C. crispus, Dendrobium crassidense, and various other rare species. On view the morning of Sale, and Catalogues had.

Imported Orchids. MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on FRIDAY, June 21, at half-past 12 o'clock precisely, the following assortment of ORCHIDS from New Granada, including several hundreds of Masdevalla Hartwegii and its handsome variety, many of them in very fine masses, and some good plants of a new "Sobralia." It has large pure white flowers, with yellow centres, the lobes and anthers being margined with purple, and, the Collector writes, "so deliciously fragrant, that the air is completely perfumed where it grows;" and the collector Schimper triumphans, Augustus, Augustus, Clowesi, Odontoglossum coronarium, O. hastilabium, Cattleya Tronae; also an importation of Orchids from Burmah, including several new Dendrobiums. On view the morning of Sale, and Catalogues had.

Worcestershire, in the far-famed Vale of Evesham. PRELIMINARY ADVERTISEMENT. MESSRS. CHESSHIRE and GIBSON have received instructions to SELL BY AUCTION, in JULY NEXT, in consequence of the death of the Proprietor, unless in the meantime an acceptable offer be made by Private Contract, a very excellent FRESHLY DUG and well-drained Estate of 240 Acres, known as "Seafood Grange," situated at Peaporton, within 1 1/2 miles of the Parishure Station on the Great Western Railway. A considerable portion of the above has been laid out as Fruit Gardens, the Trees being of the choicest kinds, now in their prime; and a ready sale at Liverpool, Manchester and Birmingham, has been a very profitable business was carried on by the late Proprietor. In addition to a complete set of FARM BUILDINGS, with COTTAGES, this is a very comfortable and desirable RESIDENCE, replanted with 100 conifers, and the portion of the Estate not laid out as Fruit Gardens is occupied as a FARM, and comprises Arable and Pasture of excellent quality. A Balance Sheet, showing the profits for the last five years, has been prepared, and may be obtained of the undersigned. References. Further particulars and plans will be issued in due course, in the meantime any information may be obtained of H. G. GOLDINGHAM, Solicitor, at BUCKINGHAM, or of the Agent, both of Worcester; or to the Auctioneers, Messrs. CHESSHIRE and GIBSON, 93, New Street, Birmingham.

Fresh-dug 25 Miles S.W. TO BE SOLD, a beautiful ESTATE of 240 acres, with elegant Swiss Villa, and capital Stabling, Gravelly Soil, fine views, and extensive frontages, free from title and land-tax. Two-thirds on mortgage. The Furniture may be taken at valuation. A Plot of about 30 acres, planted with fine Evergreens, Fruit, and other trees, would be sold separately; also a Plot of 25 acres. Apply to W. TARRY, Bailiff, "Golden Farm," Egham, Surrey.

ROSES—New Varieties.

RAISED AT THE ROYAL NURSERIES, SLOUGH.

CHARLES TURNER

Is now sending out can with great confidence recommend the following new kinds. They have been very successfully exhibited and much admired during the past season, having received First-class Certificates at London and Provincial Shows.

HYBRID PERPETUALS.

JOHN STUART MILL, bright clear red, large, full, and beautiful form, fine shell-like petal, of great substance, well adapted for exhibition purposes; being also a Rose of strong constitution and free-flowering habit. It forms a beautiful variety for general garden purposes; quite distinct. Received First-class Certificates as follows—Royal Botanic Society, June 24, 1874; Oxford Horticultural Society, June 16, 1874; Oxford Amateur Rose Show, June 25, 1874.

Strong plants, in pots, 7s. 6d. each.

MISS HASSARD, beautiful delicate pinkish flesh colour, large, full, and fine form, very sweetly scented; free autumnal bloomer. A first-class Rose either for exhibition or general garden purposes, having the strongest and best habit of any Rose of similar colour; quite distinct and very fine.

Strong plants, in pots, 7s. 6d. each.

REV. J. B. M. CAMM, very bright rose pink, most pleasing colour, large, very full, and fine globular form; a magnificent show flower, very sweet, constant and thoroughly distinct, growth vigorous. Received First-class Certificates as follows—Oxford Horticultural Society, June, 1873; Royal Botanic Society, June 20, 1874.

Strong plants, in pots, 7s. 6d. each.

ROYAL STANDARD, beautiful soft satiny Rose, large, very full, and exquisitely formed, somewhat in the way of Emile Hausburg, but a larger flower and much better grower. Received First-class Certificates as follows—Royal Horticultural Society, July 2, 1873; Royal Horticultural Society, July 15, 1874.

Strong plants, in pots, 7s. 6d. each.

The above set of Four Varieties for 30s.

CHARLES TURNER, The Royal Nurseries, Slough.

NEW ENGLISH ROSES

STAR of WALTHAM.—First-class Certificates from the Royal Horticultural and Royal Botanic Societies. Nice plants in pots, 10s. 6d. each.

"Star of Waltham is the best new Rose we have seen this season." *Gardener's Chronicle*.

"A noble Rose, with great substance of petal, good colour, splendid foliage, and, what is more, delicious perfume." *Journal of Horticulture*.

"An exceedingly fine Hybrid Perpetual Rose." *The Garden*.

"A grand Hybrid Perpetual." *Gardener's Magazine*.

"Large, full, lustrous in colour, and superbly beautiful." *Florist*.

QUEEN of WALTHAM.—Nice plants in pots, 10s. 6d. each.

"Star and Queen of Waltham are splendid examples in their colours." *The Queen*.

"Star of Waltham and Queen of Waltham, really gems of which every rosarian ought to possess respectively." *The Country*.

THE NEW FRENCH ROSES of 1875.—Good plants, in pots, of all the best varieties, 2s. 6d. each, 24s. per dozen.

THE NEW FRENCH ROSES of 1874.—2s. each, 18s. to 21s. per dozen.

OLDER ROSES, a splendid stock, in pots, 10s. 6d. to 21s. per dozen, £1 7s. to £1 10s. per 100.

Priced Descriptive Catalogue Post Free on application.

2d, Mr. R. Dean, Raneigh Road, Ealing, W.

CLASS 25.—9 FINE-FOLIAGE PLANTS, distinct. (Nurserymen)
1st, Mr. J. Wills. | 3d, Mr. J. Aldous.

CLASS 29.—4 TREE FERNS, large. (Nurserymen)
1st, Mr. J. Wills.

CLASS 31.—12 PALMS, distinct, in pots not exceeding 8 inches in diameter.
1st, Mr. J. W. Wimsitt, King's Road, Chelsea, S.W.
2d, Mr. W. Bull.

CLASS 32.—6 PALMS, distinct, large. (Nurserymen)
1st, Mr. J. Wills.

CLASS 34.—6 CROTONS, distinct. (Open)
1st, Mr. W. Bull.

CLASS 35.—12 DRACÆNAS and CORDYLINES, distinct. (Open)
1st, Mr. W. Bull. | 2d, Mr. J. Wills.

CLASS 36.—6 NEW PLANTS (Orchids excluded), in or out of flower, not in commerce. (Open)
1st, Mr. W. Bull.

CLASS 37.—NEW ORCHIDS, in flower, not in commerce. (Open)
1st, Mr. W. Bull, for Odontoglossum Roezlii alba.

CLASS 38.—NEW PLANT, in flower. (Open)
1st, Mr. W. Bull, for Blandfordia princeps.

CLASS 41.—2 DASYLIPTONS. (Open)
1st, Mr. J. Croucher, Gr. to J. T. Peacock, Esq., Sudbury House, Hammersmith, W.

CLASS 42.—2 BEAUCAURNEAS. (Open)
1st, Mr. J. Croucher.

CLASS 43.—6 YUCCAS, distinct. (Open)
1st, Mr. J. Croucher.

CLASS 44.—6 CYCADS, distinct. (Open)
1st, Mr. W. Bull.

CLASS 46.—12 HARDY FERNS, distinct. (Nurserymen)
1st, Messrs. J. Ivery & Son. | 2d, Mr. R. Parker.

CLASS 48.—2 SMOOTH CAYENNE PINE-APPLES. (Open)
1st, Mr. G. T. Miles, Gr. to Lord Carrington, Wycombe Abbey, High Wycombe.

CLASS 49.—1 PINE-APPLE, any other kind. (Open)
1st, Mr. A. Grant, Gr. to J. B. Glegg, Esq., Withington Hall, Congleton.
2d, Mr. G. T. Miles.

CLASS 50.—3 Bunches of BLACK HAMBURGH or FRANKENTHAL GRAPES. (Open)
1st, Mr. J. Douglas.
2d, Mr. G. Brush, Gr. to Lady Hume Campbell, High Grove, Pinner.
3d, Mr. T. Bannerman, Gr. to Lord Bagot, Elithfield Hall, Rugeley.

CLASS 53.—3 Bunches of MUSCAT of ALEXANDRIA GRAPES. (Open)
1st, Mr. W. Bones, Gr. to D. McIntosh, Esq., Havering Park, Romford.
2d, Mr. J. Douglas.
3d, Mr. J. Stephenson, Gr. to F. C. Barker, Esq., Leigh House, Essex.

CLASS 54.—3 Bunches of BUCKLAND SWEETWATER GRAPES. (Open)
1st, Mr. J. Douglas.

CLASS 55.—3 Bunches of GRAPES, any other white kind. (Open)
1st, Mr. T. Bannerman. | 3d, Mr. W. Bones.
2d, Mr. J. Douglas.

CLASS 56.—3 Bunches of FRONTIGNAN GRAPES, or any other Muscat-flavoured, round-berried kind. (Open)
1st, Mr. W. Earley, the Gardens, Valentines, Hford.
2d, Mr. T. Bannerman.

CLASS 57.—6 PEACHES, any kind. (Open)
1st, Mr. G. T. Miles.

CLASS 58.—9 NECTARINES, any kind. (Open)
1st, Mr. G. T. Miles.

CLASS 60.—9 FIGS, any kind. (Open)
1st, Mr. G. T. Miles.
2d, Mr. J. Pottle, Gr. to Sir R. Wallace, Bart., Sudbourne Hall, Wickham Market.

CLASS 61.—50 BLACK CHERRIES, any kind. (Open)
1st, Mr. G. T. Miles.

CLASS 62.—50 WHITE CHERRIES, any kind. (Open)
1st, Mr. G. T. Miles.

CLASS 63.—25 STRAWBERRIES, of the British Queen or Dr. Hogg type. (Open)
1st, Mr. J. Douglas. | 2d, Mr. J. Pottle.
3d, Mr. W. S. Stevens, Gr. to J. B. B. Elliott, Esq., Chesterford Park, Essex.

CLASS 64.—25 STRAWBERRIES, of the Sir J. Paxton or Sir C. Napier type. (Open)
1st, Mr. J. Douglas.
2d, Mr. J. Rigout, Gr. to W. S. Brown, Esq., Woodhatch House, Stamford.
3d, Mr. J. Pottle.

CLASS 65.—1 MELON, Green or Pale-fleshed. (Open)
1st, Mr. R. Gilbert, Gr. to the Marquis of Exeter, Burghley House, Stamford.
2d, Mr. W. S. Stevens.

CLASS 66.—1 MELON, Scarlet-fleshed. (Open)
1st, Mr. R. Gilbert. | 2d, Mr. W. S. Stevens.
3d, Mr. W. Sanders, Gr. to J. East, Esq., Longstock House, Stockbridge.

Prizes Offered by Mr. W. Bull.

(CLASSES 67 to 70.)
CLASS 67.—12 NEW PLANTS introduced by Mr. Bull, and sent out for the first time since the commencement of 1872. (Amateurs.)

1st, Mr. J. Croucher, Silver Cup, value £15 15s.
2d, Mr. G. Legge, Clevedon House, Thornton Road, Clapham Park, Silver Cup, value £10 10s.
3d, Mr. E. Pilgrim, Fern Lawn, Pitville Crescent, Cheltenham, Silver Cup, value £6 6s.

CLASS 68.—12 NEW PLANTS introduced by Mr. Bull, and sent out for the first time since the commencement of 1872. (Nurserymen.)

1st, Messrs. J. & R. Thynne, Great Western Nurseries, Glasgow, Silver Cup, value £15 15s.
2d, Mr. J. W. Wimsitt, Silver Cup, value £10 10s.

CLASS 69.—12 NEW PLANTS introduced by Mr. Bull, and sent out for the first time since the commencement of 1872. For those not having previously won any of Mr. Bull's Silver Cups. (Amateurs.)

1st, Mr. G. Legge, Silver Cup, value £15 15s.
2d, Mr. J. Coomber, Gr. to Lieut.-Col. Wilkinson, Southampton Lodge, Fitzroy Park, Reigate, Silver Cup, value £10 10s.
3d, Mr. E. Pilgrim, Silver Cup, value £6 6s.

CLASS 70.—12 NEW PLANTS introduced by Mr. Bull, and sent out for the first time since the commencement of 1872. For those not having previously won any of Mr. Bull's Silver Cups. (Nurserymen.)

1st, Mr. H. Wright, Lee, Kent, Silver Cup, value £15 15s.
2d, Mr. W. E. Dixon, Norwood Nursery, Beverley, Silver Cup, value £10 10s.
3d, Mr. J. Cypher, Queen's Road Nursery, Cheltenham, Silver Cup, value £6 6s.

Prizes offered by Messrs. J. Carter & Co.

CLASS 71.—For 6 Dishes of PEAS, to include Carter's Extra Early Premium Green, Maclean's Blue Peter, Carter's First Crop, and Carter's White Gem.
1st, Mr. W. G. Pragnell, Gr. to G. D. W. Digby, Esq., Sherborne Castle, Dorset, £2 2s.
2d, Mr. G. Brown, Gr. to E. McKenzie, Esq., Fawley Court, Henley-on-Thames, £1 1s.

Prizes offered by Messrs. Sutton & Sons,

READING.—(CLASSES 72 and 73)

CLASS 72.—For the best 6 Dishes of PEAS, to include Suttons Emerald Gem, Suttons' Ringleader, and Suttons' new early dwarf wrinkled Pea, Bijou.
1st, Mr. W. G. Pragnell, Silver Medal and £2 2s.

CLASS 73.—Four sorts of MELONS, and four sorts of CUCUMBERS, one brace of each, to include Suttons' new Scarlet-flesh Hero of Bath, Read's Hybrid Scarlet-flesh, and Suttons' Royal Horticultural Prize Melons, and Suttons' Duke of Connaught and Marquis of Lorne Cucumbers.
1st, Mr. J. Read, the Gardens, Arley Hall, Northwich, Cheshire, Gold Medal and £3 3s.

Davis Competition Prizes.

CLASS 74.—8 STOVE or GREENHOUSE PLANTS. (Open.)

1st, Mr. W. Kemp, Gr. to the Duke of Northumberland, Albury Park, Guildford.

Miscellaneous.—Extra Prizes.

Mr. J. Wills, for large Group of Foliage and Flowering Plants, Gold Medal.
Mr. B. S. Williams, for Group of Foliage and Flowering Plants, Silver Medal.
Mr. J. Laing, The Nurseries, Forest Hill, for Group of Foliage Plants, Silver Medal.
Mr. J. Wills, for Group of Dracaenas, Silver Medal.
Messrs. Kelsey & Son, The Nurseries, Langport, for Cut Blooms of Pyrethrums, Bronze Medal.
Mr. J. Harris, Gr. to Mrs. J. H. Vivian, Singleton, Swansea, for One Smooth Cayenne Pine-apple, Bronze Medal.
Mr. G. T. Miles, for One Dish of Tomatoes, and One Dish of Chilies, Bronze Medal.

MR. WILLIAM BULL is now sending out the following new FUCHSIAS:—

ADMIRER.—A beautifully formed flower; tube and sepals rich crimson, the latter completely recurved; corolla well expanded, and of a purplish crimson colour; a showy and attractive variety. 10s. 6d.

BARONESS.—A very pretty and attractive flower, with long white tube, white sepals well reflexed, and violet-red corolla; an extremely pleasing and distinct colour. 10s. 6d.

CALYPSO.—An extremely fine variety, with large well-formed flowers; tube and sepals rich crimson; sepals completely reflexed; large expanded bell-shaped corolla, of a rich crimson-purple colour. 10s. 6d.

CHARMER.—A magnificent variety, producing fine large flowers, with extremely rich and bright reddish crimson tube and sepals; tube short, and sepals immensely broad and well reflexed; fine rich purple-pink corolla; the blossoms are of excellent quality and wonderful substance. 10s. 6d.

GEORGE FREDERICK.—Tube and sepals rich scarlet-crimson; tube short; sepals broad and thick, and rich purple-crimson color; a fine and handsome variety, of free branching habit, and a profuse bloomer. 10s. 6d.

HIGHLAND CHIEF.—Tube and sepals bright crimson; tube short, sepals elegantly reflexed, leaving completely exposed the large bell-shaped corolla, which is of a deep purple color; expands as the flowers mature away, and a bloomer and of good habit. 10s. 6d.

NYSA.—Bright scarlet-crimson tube and sepals, the latter beautifully recurved; corolla of a rich purplish crimson colour; very fine. 10s. 6d.

ESTABLISHMENT FOR NEW AND RARE PLANTS, King's Road, Chelsea, London, S.W.

E. G. HENDERSON AND SON will place in commerce, for the first time, the following NEW PLANTS, full descriptions and prices of which are given in their NEW PLANT CATALOGUE, a copy of which will be immediately forwarded on application:—

- Amaryllis Hendersoni (l) Convolutus mauritanicus atrocerculus
- " coccinea (l) Cereus angustifolia
- " " Little Dracena Duffii
- Armeria cephalotes alba Epigynum acuminatum (l)
- Ageratum confiditum Clematis Kosovici (l)
- Begonia Orange Bonum Ixora Fraserii (l)
- " Dollinger Nerine rosea
- " " White Plumbago bicolor
- Madragda flammula elegans Sonerila Hendersoni (l)
- Bouvardia bicolor " argentea (l)
- " multiflora " marmorata (l)
- Canna comobiliana Vicia sativa (Kos.) ; with other
- Cypripedium Pezomachus (l) New and Florist Flowers.

Large Coloured Illustrations of the kinds marked * will be forwarded for twelve stamps each. Those marked (l) have been awarded First-class Certificates.

E. G. HENDERSON AND SON'S SEED

CATALOGUE for 1875, containing over 200 illustrations of flowers, will be posted free on application, and from which the following can be supplied, of first-class quality:—
CALCEOLARIA, in mixed colours, 1s. 2s. 6d., and 5s. per pkt.
CINERARIA, 1s. 2s. 6d., and 5s. per packet.
PRIMULA SINENSIS, fine strain, 2s. 6d. and 5s.
" RUBRA FLORE-PLENA, 2s. 6d. and 5s.
" ALBA FLORE-PLENA, 2s. 6d. and 5s.
AURICULA, 1s. 2s. 6d., CARNATION, 2s. 6d. and 5s.
CYCLAMEN PERSICUM, 1s. 2s. 6d.
HOLLYHOCK, 1s. and 2s. 6d. PINKS, 1s. and 2s. 6d.
MIMULUS, 1s. PANSIES, 6s. and 12s.
PETUNIAS, 6s. and 1s. VERBENA, 1s. and 2s. 6d.
SWET WILLIAM, Perfection, 1s., from named growers, 1s. and 2s. 6d.
The Wellington Nursery, St. John's Wood, London, N.W.

RODGER, MCCLELLAND AND CO. have

to offer, in good plants, as follows:—
ARALIA SIERRA, 1 1/2 to 2 feet, 18s. to 24s. per dozen.
BAMBUSIA METAKE, 12s. to 18s. per dozen.
CHAMÆROPS HUMILIS, 18s. to 24s. per dozen.
DIEHLII, 12s. to 18s. per dozen.
EACHIN, 12s. to 18s. per dozen.
MIMULUS, extra fine varieties, 2s. 6d. and 3s. 6d. per dozen.
MULLENBECIA COMPLEXA, the most elegant evergreen hardy climber, plus a number of slender shoots Maidenhair Fern; 12s. to 18s. per dozen.
SEMPERVIVUM ARBOREUM RUBRUM, 1 1/2 to 2 feet, 15s. to 24s. per dozen.
" BOLLII, 20s. per 100, 3s. 6d. per dozen.
" TABULIFORME, 20s. per 100, 3s. 6d. per dozen.
YUCCA OLEIFOLIA PURPUREA, 12s. 18s. and 24s. per dozen.
ANGUSTIFOLIA, 1 1/2 foot, 30s. per dozen.
ALOYSIA CITRINA, 12s. 18s. and 24s. per 100.
64, Hill Street, Newry.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION, for the relief of decayed Farmers, their Widows and Orphans.

Patron—HER MAJESTY THE QUEEN.
President—HIS GRACE THE DUKE OF RICHMOND.
All Allowances to Pensioners.
Married " " " " £40 per annum.
Male " " " " £20 " "
Widow and unmarried Orphan Daughters £20 " "
Every information to be had of the Secretary, by whom Subscriptions and Donations will be thankfully received.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION—THE FIFTEENTH ANNIVERSARY FESTIVAL, in aid of the Funds of the Institution, will take place at Willis's Rooms on SATURDAY, June 5, at 6 o'clock.

H.R.H. THE PRINCE OF WALES, R.G., in the Chair.
Dinner tickets, 21s., application for which should be made to the Secretary not later than May 22.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION—THE ANNUAL GENERAL MEETING will be held at Willis's Rooms, St. James's, on WEDNESDAY, June 16, at 11 o'clock precisely, and the ELECTION OF PENSIONERS will take place on the same day, at half past 11 o'clock.

All Subscriptions shall be deemed payable on January 1 in each year; and no Contributor shall vote in respect of an Annual Subscription while the same is in arrear.
Offices of the Institution:—
26, Charles Street, St. James's, London, S.W.

SATURDAY, JUNE 5, 1875.

MAITRANK.

THIS somewhat strange-looking word has for the last few years appeared about this season in the windows of some of the more enterprising of the London and Liverpool restaurants, and has no doubt puzzled many passers-by. The name, which is simply the German form of "May-drink," is applied to a beverage which is very popular in Germany at this season, and of which the Woodruff (*Asperula odorata*)—surely one of the most charming among our wild flowers—supplies the characteristic feature. German manners and customs—albeit unpopular with a few—are undoubtedly in general favour just now; and it is probable that some of our readers may like to experiment-alise for themselves in the manufacture of Maitrank. Its preparation is by no means difficult; it consists simply in throwing the wine shoots of Woodruff into any of the light Rhine wines, and allowing it to remain there for a few hours, when it will be found that the plant has communicated its hay-like fragrance to the wine. We are told that "a table-spoonful of young shoots, about an inch in length, will be sufficient for a bottle of wine;" and it is recommended that the shoots should be picked clean, so as to avoid the necessity of washing them. The above simple process is that by which the genuine Maitrank is prepared; so, however, consider the addition of sugar, or the juice of a Lemon or Orange, as an improvement. "It is generally made in a bowl and served in green glasses, allowing the herb to remain in the fluid," says a genial writer in *Notes and Queries*: "if bottled, the drink has to be strained through muslin."

The use of Woodruff in beverages is by no means a new one in England. Gerarde and Parkinson mention it, although the latter seems to regard it as a German custom: and Langham in his *Garden of Health* says that, "being put in wine, it rejoiceth the heart, comforteth the diseased liver, and so it doth being sodden in wine," besides being useful in divers and sundry diseases. Its pretty old German name of Hertfreydt, or "Heart's delight," which is given by Gerarde, probably refers to this cordial property. Miss Pratt tells an amusing story regarding the Maitrank, which is only equalled by that of the gentleman who, being on his travels, came across a common glowing with furze in full blossom, and on his return home at once told his steward to order a large supply, oblivious of the fact that it abounded on portions of his own estate. He says:—"A gentleman, known to the author, was travelling with a friend in Germany, when, stopping at a hotel, this May-drink was brought as a refreshment to the travellers. They inquired of what the pleasant beverage was composed, and were informed that sugar, Rhine wine, and sweet Woodruff were the ingredients. Next morning, at breakfast, the gentleman missed his companion, and was, some hours after, amused to see him returning to the hotel, accompanied by a peasant laden with a basket of the roots of the sweet Woodruff, which he had patriotically determined to transplant to the woods of his native land, that Englishmen might henceforth enjoy the delicious May-drink. It was not without some disappointment that he heard from his friend that his early morning labour was wasted, and that he had only need to walk into some woods within a mile of his

own house to find the plant as beautiful as in those of Germany." Let us hope that the readiness with which the plant could be obtained did not depreciate its value in his eyes.

Among ourselves the Woodruff was one of the favourite plants for church decoration, and entries "for Rose garlands and Woodrove garlands on St. Barnebe's Day" occur in accounts of the reign of Edward IV. At Rheimsberg, in Prussia, a feast which takes its name from this plant, which figures prominently in its observance, is annually celebrated on the Sunday after Ascension Day. It is known as the Möske-fest, Möske being a local German name for the Asperula. In old times the festival simply consisted of the going into the woods of the children of the town to gather the Woodruff, with which on their return they decorated the altars and pillars of the church. But in 1757, by a coincidence, the news of the victory of the Prussians in the battle of Prague reached Rheimsberg on the Sunday of the Möske-fest, and the festival has been kept more generally ever since.

The peculiar hay-like fragrance of the Woodruff, which is shared by the Melilot, Anthoxanthum, Tonquin Bean, and other plants, is very remarkable in recently-dried specimens of the rare and beautiful *Orchis purpurea*. It is due, as most of our readers will be aware, to a fragrant principle called by chemists coumarin, and the scent of the Woodruff so exactly resembles that of the Tonka or Tonquin Bean (*Dipterix odorata*) that we have heard it called by the latter name in London gardens. Gerarde tells us how in old days it was customary to hang up bunches and garlands of Woodruff in houses to "attemper the aire, and coole and make fresh the place, to the delight and comfort of such as are therein."

This custom still prevails in Germany, especially in the northern districts, although it is said that if a great quantity be kept in a bedroom it will produce sickness and other disagreeable symptoms. These wreaths and bunches are even regarded as weather indicators, their scent being much more powerful in damp weather.

The name Woodruff, which is the generally received title of the plant in England, demands a brief notice. It is usually understood as referring to the whorls of leaves, which Turner, as long ago as 1548, speaks of as representing "certain rowelles of spores" (spurs), and as having been originally Woodrowel, Woodrose is Gerarde's name for it, It has been suggested, however, that Woodruff is rather a corruption or modification of woodreeve, the steward of the wood, in allusion to the large patches which it forms in Beech and other woods; and the common German name for the plant, Waldmeister, as well as the French Reine des Bois in a lesser degree, tends to support this theory. Its name forms an old-fashioned puzzle, in consequence of the number of double letters which it may be made to contain. Thus:—

"Double u, double o, double d, e, R o, double u, double f, e."

New Garden Plants.

FRITILLARIA (MONOCOON) MACRANDRA, Baker, n. sp.

This is another Frityllary, brought by Mr. Elwes from the East last spring, which proves to be an entirely new species. It is a native of the island of Syria, in the Levantine Archipelago, and was flowered by him at Cirencester in May of the present year. It comes nearest the Greek *F. conica* of Boissier, a plant

Fritillaria (Monocoon) macrandra, Baker, n. sp. — Caulis multifloro semipetalo; foliis 5-6 orbatis ovatis vixatis; sepalis ovatis, medio lobis, superioribus linearibus; perianthii infundibularis semipellucidis segmentis dorso purpureis glaucoscentibus facie flavo-obscura foveolatis nullo modo tessellatis; exterioribus majoribus ovato-oblongis, interioribus angustioribus oblongo-lanceolatis; staminibus perianthio viis brevioribus, antheris magnis distincte cuspidatis filamentis glabris; apiculis; pistillo perianthio triente brevioris; stylo dimidio superioris trifido.

which I know from description alone. In habit and leaf it looks like *F. tulipifolia* and *dasyphylla*, but these belong to the section *Ambrilium*, which has an entire style and a capitate stigma.

Bull like that of *F. Melagris*, but larger in proportion to the size of the plant. Stem half a foot high, single-flowered. Leaves 5-6, beginning a little before the flower, and extending within a short distance of the ground, all scattered, green, fleshy, ascending, lowest oblong-lanceolate, 3-4 inches long, an inch broad at the middle; upper linear, under an inch long, $\frac{1}{2}$ inch broad. Perianth half an inch deep, funnel-shaped, the divisions purple with a glaucous tinge on the outside, yellow with green lines quite untextured on the face, the foveole round, greenish, very small, placed near the base, the tips incurved and yellowish green, the outer three obovate-oblong, $\frac{1}{2}$ inch broad, the inner three lanceolate-oblong, 2 lines broad. Stamens nearly as long as the perianth; anthers 2 $\frac{1}{2}$ lines long, oblong, with a very distinct cusp, as long as the glabrous filaments. Pistil reaching to the base of the anthers. Style as long as the ovary, slender away down into three slender connivent subulate branches. *F. G. B.*

*ERIOSPERMUM CALCARATUM, Baker, n. sp.**

A new species, well marked by its peculiar bracts; sent by Mr. Bolus, in 1873, from Graaf-Reinet to the Kew collection, where it flowered in June, 1874, the leaf not being produced till the end of August.

Corm large, fleshy, just like that of *E. latifolium*. Leaf sessile, lanceolate acute, 2 inches long, 5-6 lines broad, glabrous on both sides, marked with two longitudinal depressed lines. Scape terete, half a foot long, slender, glaucous. Raceme laxly 20-30 flowered, 3-4 inches long when fully expanded, under an inch broad. Pedicels ascending, cernuous at the tip, the lowest $\frac{1}{2}$ inch long. Bracts minute deltoid, furnished with a very large spur ($1\frac{1}{2}$ -2 lines long). Perianth 2 $\frac{1}{2}$ lines long, the segments oblanceolate obtuse, white with a green keel, a line broad, the lobes rather narrow, the segments nearly as long as the perianth; filaments deeply perigynous subulate, twice as long as the oblong anthers. Style as long as the oblong ovary; ovules many in a cell. *F. G. B.*

ERIOSPERMUM ALBUICOIDES, Baker, n. sp.†

A new species from Cape Colony, which came to Kew amongst a quantity of bulbs gathered by Mr. Thos. Cooper. It flowered for the first time in July, 1873, the leaf not being developed till October.

Corm oblong, grey, irregular, an inch thick. Leaf round-cordate, bright green, fleshy, glabrous on both sides, 2 inches long and broad, with a petiole $\frac{1}{2}$ -1 inch long. Scape half a foot long, very slender. Raceme laxly 10-12 flowered, when expanded 2-3 inches long, 1 $\frac{1}{2}$ inch broad. Pedicels erect-patent, 6-10 lines long. Bracts deltoid, very minute. Perianth 2 lines deep, the divisions yellow with a green keel, the outer oblanceolate-oblong obtuse, the three inner shorter, contig. or nearly so. Stamens nearly as long as the Albuico, obovate-pathulath with a cucullate apiculus. Stamens half as long as the perianth, the outer three lanceolate, the inner three shorter and broader, not more than half a line long. Style as long as the ovary. Ovules biseriate, several in each of the three cells. *F. G. B.*

THE OXLIP.

DR. PRIOR has shown very conclusively that the "Primrose" of former days was not our *Primula vulgaris*, but the Daisy; and our American cousins apply the name of the Cowslip to our Marsh Marigold (*Caltha palustris*); but in spite of this there are few plants which are more generally recognised as distinct, both in popular nomenclature and in gardening, than the two which we nowadays call respectively Primrose and Cowslip. They may both be forms of one species, as Linnaeus believed, and as many modern writers suppose; but they are sufficiently distinct for all practical purposes.

This, however, cannot be said of their near ally, the Oxlip; indeed, there are few plants which have been more confused, or have caused more confusion among botanists. The popular observer, indeed, is able to solve the matter by applying the name indis-

criminately to any plant with yellow Primrose-like flowers, which form a number of the "top" of a scape; but when it is desired to trace the origin of such like, the difficulty of such a task is apparent. Mr. Fitch has at fig. 159 represented one form which appears to be the umbellate variety of the common Primrose; but the name Oxlip is applied to at least three, or perhaps four, distinct plants, only one of which can claim specific rank, while the origin of the other three is in each case different.

To begin with the true Oxlip, as botanists often call the first of these which is better known to them as *Primula elatior* of Jacquin, but not of many other authors; indeed, until 1842 it was confused with the hybrid Oxlip hereafter to be noticed. In our columns for February 20 (p. 239) we called attention to this as a desirable garden plant, and each season convinces us of its importance for horticultural purposes. At the page referred to will be found the more obvious characters by which this plant is distinguished from the other Oxlips, such as the drooping flowers, more erect leaves, and peculiar habit. Dr. Boswell-Sale points out that it differs from its ally the Cowslip [$\frac{1}{2}$ in the leaves being generally less contracted at the base, though in some specimens they are quite as much so, in the flowers being less drooping, the calyx-teeth longer and much acuminated towards the apex, which is acute. The corolla has the limb usually larger than in the Cowslip, and widely funnel-shaped, not saucer-shaped, and of a pale buff-yellow, without any contraction at the throat, being quite destitute of the Anthers which are present in the Primrose and Cowslip [this character is most important]; the segments of the limb are also narrower. The capsule is much longer in proportion to the calyx. The pubescence is longer and more shaggy." The plant is distinct enough, not only from a botanical but from a gardener's standpoint; and we can only repeat our advice to those of our readers who live in Suffolk, Cambridge, or Essex—the three counties in which this Oxlip occurs—or who have correspondents in those counties, to secure a good supply of specimens for cultivation. It seeds freely, and is easily grown from seed.

The second Oxlip on our list is a not very common variety of the Cowslip, which is sometimes called *Primula veris major*. This is a plant which is at once recognisable as belonging to the Cowslip type, but the limb of the flower is flat or nearly so, as in the Primrose, although darker in colour, and is also much larger than in the Cowslip. This form is alluded to in the *Flora Londinensis*, and is probably the original of some of our Polyanthuses, of which more anon.

The most common representative of the Oxlip has yet to be considered, and in this is the *Caltha* frequently cultivated under that name. It is usually regarded as a hybrid between the Cowslip and the Primrose, and doubtless has this origin in many cases; but it seems at least probable that a developed form of the Primrose is also so called. We have often found this Oxlip among Primroses, and at a considerable distance from any Cowslips; and when it is remembered that in the common Primrose the corolla is flattened, as though the scape is not developed, it is easy to see that the accidental development of the scape would produce a very good Oxlip. In the *Flora Londinensis*, indeed, (where there is a beautiful figure of this plant), Sir W. J. Hooker states that he "found that the flowers almost regularly appear with the common scape imbedded in the ground, so that they would be considered as growing altogether single." Dr. Syme says that the hybrid Oxlip usually differs from *P. elatior*, Jacq., in its large flowers on much longer pedicels, triangular calyx-teeth, and in the limb of the corolla being brighter coloured, more spreading, the segments much broader and rounder, and the throat somewhat contracted with five bilobed bosses, as in the Primrose and Cowslip; while others approach the latter more closely, and in a third form the Primrose type is more prominent. He is of opinion that in all cases this Oxlip is a hybrid; but this we are inclined to doubt. We have seen a number in which Oxlips and Primroses grew from the same root. If the hybrid theory, however, be accepted in every case, the plant which we have referred to as *Primula veris major*, is probably only a form in which the Cowslip predominates over the Primrose type.

The statement at p. 695, that the Polyanthus is derived from the Cowslip, was written *currente calamo*, and requires some modification. It is probably true in some cases, but it is more likely that the Oxlip last described has given rise to the majority of the kinds of Polyanthus. Miller considers that the Primrose, Oxlip, and Cowslip have each produced Polyanthuses; which he says in his time were so much esteemed in some parts of England as to sell for a guinea a root. A writer in *Science Gossip* for 1867 (p. 137), states that he has raised Cowslips, Oxlips, and Polyanthuses, but no Primroses, from the seed of a garden Polyanthus. The original Polyanthus appears to have been a red-flowered variety. When the name first appeared in books we do not yet know how to ascertain definitely. Rea, in his *Complete Florist* (1665), does not give it, although he appears to have

been acquainted with the plant, as he says "the red Cowslip or Oxlip is of several sorts, all of them bearing many flowers on one stalk, in fashion like those of the field, but of several red colours, some deeper, other lighter, some bigger, like Oxlips, others smaller, like Cowslips." He also says he had "five distinct diversities" of "the red Cowslip hose-in-hose," which differed in size and colour. Miller in the *Gardener's Dictionary* (1752), mentions the Polyanthus by name, and gives full directions for its culture; it appears to have attained its greatest popularity about this period.

RICHLY-COLOURED AVENUES.

AN AVENUE plantation over 200 yards long, of six rows of leaf-coloured ornamental trees, has recently been planted on either side of a gravel walk in our Isleworth Nursery, and I was so much struck with the brilliant effect produced by the rich contrast of foliage so early as the middle of May, that I resolved to give you some idea of the effect that may be obtained by the judicious selection of trees, whose colouring will either contrast or blend with each other. I do not mean to say that the avenue above-named is planted quite in the manner I am about to describe, but it contains short lines of most of the kinds named below, which serve to illustrate my meaning. For the use of planters, I will now give lists of twelve lines to be planted on each side of a broad road; the width between the lines should be increased from 5 feet between the first and second lines, up to 10 or 15 feet between the eleventh and twelfth lines; and the width from plant to plant from 3 feet in the first line increased gradually to 10 to 15 feet in the twelfth line. The number of lines may be increased or reduced at the pleasure and convenience of the planter.

These trees can all be kept within bounds by judicious winter pruning and occasional summer stopping, the height of each row remaining the same as indicated for many years with increasing vigour and effect. I have inserted a good many green-leaved varieties, that the lines may not appear too much pointed up, and these different shades of green may be increased at pleasure. I am frequently asked at what period of the autumn the colouring of the foliage of trees is at its best, and can only reply that autumn tints are never so conspicuous in England as they are in America. This arises from two causes. One is that many American autumn-tinted trees do not abound in England, and the other, the want of intense sun-heat to ripen the wood to produce the colouring before leaf-fall.

The merit, however, of our leaf-tinted trees is that they are in beauty throughout the summer, and so allow us the advantage of planting them in contrast to trees of various shades of green, and they thus far surpass in utility those which yield only the short-lived tints of autumn. Not that I do not appreciate the richness of such of the latter as we possess in this country, but every climate has its peculiar treasures; and as I believe we shall never have the opportunity of enjoying autumn tints to the extent our cousins rightly glory in, let us be satisfied that we can enjoy throughout the summer of our moderately warmed climate a goodly display of leaf colouring that is yearly increasing in number and interest, and which the intense heat of America would so far injure as to render them objects anything but enjoyable.

I think I ought to say a few words about some of the shrubs and trees in my two lists.

First List.—No. 1 is a lovely green, and among leaf tinted trees may well be excused for giving out its snowy flowers in May; 2, is very showy in early spring; 3, is a rare and beautiful Oak; *Quercus nigra* is the best coloured variety, but it is a slower grower and is often obliged to give place to *Q. purpurascens*, which, though not quite so dark, is still effective. 4, is well known as of silvery whiteness; 5, is of an exquisite light green; 6, is the glory of the plantation; 7, is too well known to need description; 8, is simply a magnificent sheet of brown gold; 9, is a bright silver variegation and is very elegant and effective; 10, 11, 12, grow on a rich background, but they must not be allowed to grow so high as to cast a shade over the golden trees.

Second List.—No. 1 is an elegant Privet of a lively

* *Eriospermum calcaratum*, Baker, n. sp.—Cormo magno difformi; folio unico post scapum producto sessili lanceolato fereb. glabro lineis duabus longitudinalibus percursis; racemo laxo 20-30 floro; pedicellis perianthio aequilongis; bracteis minutis deltoidibus conspicue calcaratis; perianthio campanulato 2 1/2 lin. longo, segmentis oblanceolatis obtusis albis viridi carnatis; staminibus perianthio paulo brevioribus, filamentis conformibus subulatis.

† *Eriospermum albuicoides*, Baker, n. sp.—Cormo magno difformi; folio unico post scapum producto sessili rotundato cordato utrinque glabro; racemo laxo 10-12 floro; pedicellis erecto-patentibus perianthio multo longioribus; bracteis minutis deltoidibus conspicue calcaratis; perianthio campanulato 2 1/2 lin. longo, segmentis oblanceolatis obtusis albis viridi carnatis; exterioribus oblanceolatis-oblongis obtusis interioribus conniventibus oblongis cuspidatis; staminibus perianthio brevioribus, tribus exterioribus lanceolatis, tribus interioribus brevioribus, tribus

pale green, and ought to be more known; 2, if I have said the Golden Oak is the glory of the plantation, surely this Elder is the glory of the shrubbery, and deserves extensive cultivation; 3, is of a soft, light purple tint; 4, who will deny to *Negundo variegata* the title of Queen of the silver trees? 5, here we have a real gem, fit to occupy a place in every shrubbery; 6, an interesting Lime, of elegant habit and neat foliage; 7, of the Russell's Golden Elm I cannot speak too highly, it is simply a mountain of the richest gold; 8, is inserted here to form a contrast in colour and habit to 9, which is a truly magnificent tree; 10, 11, 12, will form a good background, and the latter has quite an oriental appearance.

The above lists might be varied according to taste by the substitution of such trees as *Alnus glutinosa imperialis* and *A. incana laciniata*, two beautiful cut-leaved trees; *Fagus ferruginea latifolia* and *F. macrophylla*, *F. filicifolia*, *Juglans nigra* (true Hickory), *J. regia laciniata*, *Liquidambar*, whose leaves are scarlet in autumn, as are also those of *Quercus coc-*

Simpson speaks well of the Rivers' Victoria Nectarine as a good bearer that may always be depended on. For forcing purposes Mr. Simpson sets great store on Vicomtesse Hélicart de Thury Strawberry. Pines are but little grown, the improved quality of the Pines introduced from the Azores to a large extent obviating the necessity of growing them here. For first-rate quality, nevertheless, an English-grown Pine is still unsurpassable.

The edgings in the kitchen-garden here are made of pressed asphalt, which is serviceable and very durable. For bedding purposes great use is made of *Pachyphytums*, *Echeverias*, *Kleinias*, and other succulents. Mr. Simpson has adopted one of the handiest and most efficient latches for the doors of his houses that we have ever seen. The handle which raises the latch is curved like the letter *O*, so that to raise the latch from the one side of the door the handle is raised, while it is lowered for a similar purpose on the other side. So simple and efficient is this fastening that we observed all the houses in Messrs. Fisher & Holmes' nurseries were provided with this style of

Such a monster would form an excellent substitute for a "trespassers beware" notice-board, but a similar purpose is now filled by some American bions, which it is not prudent to approach too closely. Wharcliffe has other associations than those connected with grand natural scenery or questionable legend. It was the residence of the beautiful and witty Lady Mary Wortley Montagu, the brave woman who was the first to introduce inoculation into Britain, a boon we can hardly estimate, now that it has been superseded by the far more valuable and less dangerous practice of vaccination. At Wortley there is a portrait of this clever though fierce lady, whose charming "Letters" and bitter encounters with Pope and Swift give her no mean place in the literature of the last century.

THE AMERICAN PLANTS AT KNAP HILL.

"YOUR English gardens are greatly indebted to us," observed an American tourist recently while sur-

FIG. 150.—THE ONLUP.

cinea and *Q. nobilis*. Among other fine Oaks I may name *Q. Cerris variegata* and *Q. panonica*, *Fraxinus aucubetolia*, very effective this season; the golden *Acacia*, the colour of Australian gold; the Tulip tree, *Sophora*, *Tamarix japonica*, the most elegant of its class; and many others too numerous to mention. I must now add a caution to planters of the golden-leaved portion of these trees, and that is, they demand being planted in the fullest exposure to the sun. If they are over-topped by other trees, or the rays of the sun are not directed fully upon them, they will only prove miserable failures. Charles Lee, Hounslow, May 29.

WORTLEY HALL.

MR. SIMPSON of Wortley, of whose skill as a fruit culturist we had evidence lately, when visiting the gardens under his charge, has to contend with a cold bleak situation, and a thin poor soil in the midst of a coal and iron district. Even Apples do not ripen to perfection at Wortley. It is, therefore, in the forcing-houses that Mr. Simpson has fairest play, and there he well sustains his reputation as a Vine grower. At the end of April we noticed some leaves of Black Hamburg 14 inches across and in fine health. Mr.

latch. In the immediate vicinity of Wortley are Wharcliffe woods and crags, the former well peopled with noble Oaks, remnants of the old Sherwood forest, the latter consisting of a lofty wall of rock, reaching from the high table moorland to the valley of the Don, and thickly bestrewn with magnificent rock-masses of millstone grit, between whose crevices stunted trees struggle for existence, while wherever shelter is afforded the Ling, the Bilberry, and other moorland plants thrive to perfection. From the lofty and exposed situation the trees are frequently blown over, and it is then surprising to see how little anchorage they have, the hard rock being so close to the surface that such things as tap-roots have no chance of going down. The view from hence is very magnificent; the air fresh and invigorating. It is no small boon to the Sheffield folk that Lord Wharcliffe allows free access to these romantic woods and crags on certain days of the week. The dragon of Wantley has long since departed this life, which is not remarkable, seeing that

"Houses and churches
Were as geese and turkeys;
He ate all, and left none behind,
Save some stones, dear Jack, which he could not
crack.
Which on the hillside you will find."

veying the floral treasures of the Knap Hill Nurseries. "I meet with 'our' Rhododendrons, 'our' Azaleas, 'our' Kalmias and Andromedas, wherever I go." It is true we are indebted to the Land of the West for the originals of these plants, but our Transatlantic cousins greatly overstep the mark when they thus lay claim to the results which have followed from the application of horticultural skill and science on the part of our English cultivators. Even enthusiastic Americans are at last obliged to confess, that America herself cannot produce such a display of what she claims as her own plants, as we can do in such establishments as that of Mr. Waterer of Knap Hill, and that, in this respect at least, she cannot claim precedence of "all creation."

Seldom of late years has the season been so favourable for the flowering of the American plants at Knap Hill as it has been the present year. The Rhododendrons and Azaleas are now in glorious bloom, and those who desire a feast of flowers such as we venture to say is nowhere to be equalled, should at once seek Mr. Waterer's permission to inspect them. It is well-known that on these moist, low-lying grounds the spring frosts often damage the floral display, but this year the fates have been propitious. There is something peculiarly enchanting in a fine display of these so-called American plants. The very

air is redolent of the perfume of the Azalea flowers, which in every lovely shade of scarlet, rose, pink, orange, yellow, and white, together or combined, cluster every twig, so that the individual plants are literally masses of blossoms, just relieved, in many of the newer sorts, by the tender green of the peeping young shoots, which it has been an effort of years, in this establishment, to secure at the same season as the flowers. Then the Rhododendrons, with their persistent dark green leaves and tender-coloured flowers of every hue, spreading out as they do over acre after acre, far as the eye can trace them—here forming huge bushes sheeted with them, there noble standards, decked with choicest floral gems—these are indescribably lovely. A walk through the grounds, one straight drive in which is at least a mile long, confirms this, for in passing down it the visitor finds Rhododendrons to the right, to the left, in front and behind; hosts of bedded stock plants, furnishing their quota of flower trusses; border after border of specimen plants whose value runs high up the golden scale; and everywhere dotted about trees like maples, with noble heads, waiting for removal to the pleasure-ground some spirited admirer of flowers. Besides these, there are other marshalled hosts of well-grown plants, less generally attractive perhaps, but of great interest to the proprietor, being seedlings, which at this season are closely scanned, day by day, the search being every now and then rewarded by the discovery of some novelty hitherto unattained, or of some improvement upon types already existing, not, however realised, occasionally but less often than might be expected by the acquisition of a gem of the first water.

Still one of the best of the Rhododendrons for growing in the tree form is an old sort called *roseum elegans*, a soft pleasing shade of rosy lilac, and one of the hardiest of the whole race, a certain bloomer, and one which always forms a close well-furnished head somewhat pendulous at the extremities. Some varieties cast off their old leaves too readily, and leave none mere snow-crowns; these are not at all adapted for standards, nor indeed are they fit for growing as ordinary bushes, since they have a starved and miserable appearance when not in bloom. It has in consequence always been an object at Knap Hill to breed from close-habited bold-leaved sorts, which to the sterling quality of fine showy flowers might add the "all-the-year-round" character of a well-furnished evergreen.

To attempt an enumeration of even the choicer varieties would be tedious. Those who are interested in these had better go and see them. We noticed amongst the coming sorts some fine purples; some with light centres, giving the appearance of a stripe down the middle of each segment; and many with fine rich spotting. Some of these will doubtless in due time be introduced to the public as trade plants, others will be used merely for breeding purposes, as starting points for the acquisition of new gains. Considering the care with which all the seed sown is fertilised, the percentage of really fine flowers obtained is not very encouraging; and then as it takes long to work up anything like a stock of a new sort, it is no wonder that good novelties are somewhat tardy in making their appearance.

We cannot refrain from mentioning what is believed to be the finest standard Rhododendron in the world, a noble stem bearing a magnificent head. It is a grafted plant of the variety called *Scipio*, a deep rose-coloured flower with conspicuous dark spots. This is one of the best of all varieties for standards, as it clothes itself so completely with hold handsome foliage, and is also very prolific of flowers. This specimen is worth at least fifty guineas. Old standard plants which have become thin, or any of the sparse-foliaged sorts, might be beneficially grafted with this variety, which on a healthy stem would in this way soon form a vigorous and well-furnished head.

The soil and situation at Knap Hill appear to suit *Lilium* and *Penstemon*, and likewise numerous other genera, both from seeds and scapes, the result being the production of much more vigorous and healthy bulbs than those which have had to travel from Japan.

We have only space to add that the *Cypripedium* *Lawsoniana erecta* viridis, the merits of which we were amongst the first to point out (and which, by the way, we are surprised to see relegated to the supplement in the new edition of Gordon's *Pinetum*), improves, if that be possible, on longer acquaintance; the reason, no doubt, being that it is only after the plant has gained some size that its remarkably refined style of beauty is fully brought out. The young nursery stock, such as we sometimes meet with second-hand under pot culture, though pretty and spruce enough, is wanting in character, and therefore ineffective; but when the plants get to 4 or 5 feet high their elegant outline and slender tapered shapeliness begin to tell upon the eye, and from that size upwards every successive year's growth is nobler and more beautiful; the very choicest and most exquisitely beautiful of all hardy evergreens—green as a Leek, hardy as a Yew, and surpassing in refinement of habit and elegance of growth every other conical-habited evergreen at present known in our gardens. *T. M.*

BOILERS AT MANCHESTER.

THE most noticeable features among the several boilers shown were what may be termed coal-saving contrivances. Small stoves or boilers, such as Watson's Masterpiece and Ezerd's gas-pipe or boiler, aimed at securing this object by the placing the whole heating surface within the house to be heated. Practical difficulties might arise on attempting to do this with large heating apparatus, though it does seem a tremendous waste of coal and calorific to thrust our heat worker wholly outside of the houses to be warmed. It ought to be an easy task for mechanical genius to expose so much boiler surface as would be consistent with the safety of the plants, and also so to arrange the stoking and fire arrangements as to keep all smoke and gases out of the air of the plant-houses. Now, notwithstanding we have just passed through a coal famine, more heat is lost in thousands of stoke-holes than would heat many a whole range of glass. In order to utilise this waste heat we must either partially expose our boilers into the houses to be heated, or enclose the furnace in a sort of Palmaise chamber, in which the dry air may be vapourised and then admitted within the glasshouses.

Most of the boilers shown at Manchester seemed the indirect products of the coal famine. Hardly one of them but had some special contrivance to get a double supply of calorific out of the fuel before the products of combustion were discharged into free space. For instance, Mr. John, of Manchester, exhibited a useful-looking saddle boiler, with check-back and water fire-bars. There is a very general impression abroad in favour of saddle boilers. There can be no doubt they heat well, and just as little that saddle boilers of the ordinary kind are wasteful of fuel. Of course the check-end and the water-bars under the fire absorb more heat, and a gentleman who had used this boiler for some time assured us that he was afraid to put much fire on, for fear of excess of heat—a comfortable condition to be in during the last severe and protracted winter. Mr. Mees' patent duplex action heating apparatus is another coal saver that can be applied to any existing boiler without much labour or expense. It may be described as a series of wrought-iron hot-water pipes, let into a water-box at each end. This forms the base, front, and back of any furnace. A saddle, tubular, or any kind of boiler may be set over it, thus obtaining a compound or duplex action. The bars and ends may also be used alone, and form a simple and efficient boiler. In that case, however, there ought to be at least two sets of water-pipes. Mr. Mees exhibited his duplex contrivance under a saddle boiler, and there cannot be a question that the bars and ends would absorb much heat that would otherwise be lost.

A practical detail or two in reference to these boilers was also worthy of notice. The pipes forming the base of the furnace could either be corked in the usual way at front and back or screwed, and the front part of the water-box is made to come off, so that a pipe might be easily replaced if accident happened, and any sediment removed from the bottom pipes. To facilitate this the water-bars are set with a rake to the front instead of level, as usual; and this position was held to quicken the circulation, as well as to facilitate the removal of sediment.

Mr. Peake, of Altrincham, carried the principle of coal saving still further. Not content with using check-plates and water furnace-bars, in the same way as Mr. Mees, he thrusts another set of hollow water-bars into the crown of his saddle boiler, just leaving room for the fire to play through them, and then before it hits the arch of the saddle. The upper series of bars is well placed for heat, as the strength of the fire invariably flies upwards, and spends its chief energy on the crown of the boiler. It is impossible to doubt, on looking carefully into Mr. Peake's boiler, almost half full of iron hollow water-tubes, that these additions must perforce utilise much of the heat that would otherwise be wasted. The heat from all these different sources unites in the crown of the boiler, where the currents meet, and speed on in one stream into the flow-pipe. It might be advisable to have them made entirely separate and independent by means of a few extra connections and stopcocks, so that if a fire-bar gave way or a joint sprung a leak, the boiler itself might still be safely worked, and a tubular bar or common furnace-bar put in on an emergency by means of Mr. Mees' removable front plate.

There were several other boilers displayed, all exhibiting coal-saving expedients, and proving that the lesson, which has been hammered at by the Dees for years, has now been taken to heart in good earnest by inventors—viz., that it is cheaper far to buy iron in almost any quantity once than coal every year. The idea of accumulating heating force by the vertical multiplication of boilers one within or on the top of another, which was the chief feature of Cannell's boiler, is now being generally adopted. The majority

of boilers shown at Manchester might have been justly labelled ingenious iron traps to catch and to hold calorific until its heat gets exhausted in the circulating water. Hence we saw plate above plate, water-pipes for furnace bars, water-jackets for back or front of furnaces, and water-pipes for the flames to play through before they spent their last force and exhausted their heating power on the boiler proper which enclosed all these supererogatory sources of heat.

We are yet very far from getting the amount of heat we ought to obtain from the quantity of fuel consumed. Our very dissatisfaction, intensified by the coal famine, is the best sign and surest precursor of improvement. The boilers shown at the great Whitsun exhibition are attempts at satisfying the just and legitimate demands of horticulturists for cheaper heat. Heat, as one of the most potent factors of production, is always the heaviest tax on cheap production. We cannot do without it, and as the demand for luxuries increase—and it is increasing rapidly—yet more and more heat will be needed to meet and satisfy that demand. Boiler makers are all endeavouring to save coal at rates varying from 20 to 50 per cent. And the Scientific Industrial Society's Exhibition that opens on the same day is full of the same sort of fuel-saving contrivances of various sorts. Dr. Anderson in his eloquent opening lecture on tools, thus speaks of force and fuel:—"We know nothing of force itself only by its effects. The force of our factories, locomotives, steamships, comes from the sun; but the knowledge brings us no nearer to an answer to the great question, 'What is force?' But we have this force at our disposal, and our simple duty is to turn it to the best account. The one man that has done most for the economy of force and fuel in our day is Dr. Joule of Manchester. The effect due to the discovery of Dr. Joule's equivalent of heat and working, both now and in the future, are incalculable. For one thing, it has removed our self-sufficiency and made us dissatisfied with the amount of work done by our steam-engines with a given quantity of fuel. This is a healthy condition to be in. The 10 lb. of fuel per horse-power per hour which pleased our fathers, is already reduced in some steam-engines to 2 lb.; still we are dissatisfied, and thousands of earnest souls, scattered over the civilised countries, are at this moment trying to lift the corner of their veils to discover one other of Nature's secrets, so as to enable another pound to be saved, and it is more than probable that before the year 1975 comes round the fuel required for steam-engines will be reckoned by ounces." We want also a Dr. Joule in the placing and setting of a new boiler that will save something like four-fifths of the fuel in horticultural furnaces. Hot-water heating is all very well, but our modes of getting the heat out of the fire into the water, and utilising the whole of the heat by linking it to our only object in consuming the fuel, the work of heating our glass-houses, are still most defective and unsatisfactory. Too much fuel is consumed for the equivalent of work rendered, and the sooner horticultural engineers turn their whole energies to the matter of getting more heat from the coal the better for their own interest and the interests of horticulture.

Dissatisfaction merges into impotency unless it becomes the pioneer of improvement. We gladly welcome all that has been done, and the much more attempted, but our cry is yet for cheaper horticultural heat. *D. T. Fish.*

THE ROYAL HORTICULTURAL SOCIETY.

There are few who have ever been in any way connected with this Society, or who take an interest in its welfare, but must feel deeply grieved that the direction of its affairs should have fallen into the hands of individuals who are either so ignorant, or so oblivious of the interests of the Society, as to give utterance to such words as are reported to have fallen from the President and Treasurer at the meeting held on May 25. Nothing less than sheer ignorance of the relative position that the Society holds to horticulture at the present time, or a disposition to wreck the ship they are incapable of steering, could have induced any member of the Council to have indulged in such an unwarrantable attack upon gentlemen who allow their plants to be exhibited at the Society's shows, and the gardeners who show them, as was then made. Time was when the Society might be said to be independent of either exhibitions or those who make them, but it is not so now. It may be some matter for regret that the Society's sphere of usefulness in the advancement and promotion of horticulture has, by force of circumstances, over which it could have no control, become much narrower than it was at one time. By the introduction and distribution of new plants it in past years lifted a most important mission; private enterprise has supplanted it here, and in

this, as in all things of a similar nature, will outstrip the action of any corporate body, no matter how great its resources may be. Christlike, with its pretent limited area, as an experimental garden, cannot possibly be much more than the name, especially when its talented and energetic superintendent is cramped in every way for means; moreover at the present day every well-appointed private establishment in the country is more or less an experimental garden, the results of which are far more conclusive for its own immediate locality than anything of a similar nature, however well carried out in a distant place, respectively be. Hence so far as the practice of practical horticulture is concerned, the Society has little scope except through the influence of its exhibitions, especially those it holds in the provinces. At all events, except to those who live sufficiently near the garden at Kensington to use it as an airing-ground, the Society has little to offer to its Fellows in return for their subscriptions but the shows; and I have never met with a Fellow, residing in a distant part of the country, but who has not himself satisfied with these, and looked upon them as a legitimate return for his money, so long as they really were what they ought to be.

It might have been supposed that the Council collectively would, ere this, have learnt that it is the gentlemen who permit their plants to be shown who virtually make these exhibitions, yet the President and Treasurer take advantage of the office they hold to flagrantly misrepresent and grossly insult the whole body. From a lengthened and intimate acquaintance with the gentlemen who permit their plants to be shown years have been, and are now the principal exhibitors, I am in a position to state positively that the insulting statements made by the President are not true. Men who can grow plants up to the high point of excellence required for exhibition at the present day, are comparatively few, and command high wages. I speak advisedly when I say that the gentlemen whose plants take the principal prizes pay very much higher wages to their gardeners than they would have occasion to do did they not grow such plants. They are, as they distinctly and justly claim so much towards the support of the principal horticultural societies throughout the country as the gentlemen who, at considerable risk to plants of great value, allow these to be seen by the public at the exhibitions. By a certain class of people an ungenerous construction may be put upon exhibiting as being simply a means of gratifying a feeling of pride in taking honours. This might in some cases apply to beginners, but the time comes when the highest round in the ladder is reached, when there is no more to contend for, when honours to be gained; and yet it is no uncommon thing even after this point is attained for gentlemen to allow their plants regularly to appear at the principal shows. Take, for instance, the splendid collections of Orchids, stove and greenhouse plants, Heaths, and Telargoniums shown by Mr. Wilkins' gardener, of Leyton. These, at the present time, are regularly first at the London shows—for the simple reason that there are none produced that can successfully compete with them, consequently were they to exhibit elsewhere would be so much the worse; yet their owner is the gentleman whom the Treasurer, in his extreme courtesy, speaks of as "a man named Wilkins," complaining that he had addressed to the Council an "ungentlemanly letter," but the Treasurer forgot to inform the meeting that this letter from Mr. Wilkins was in answer to one received by him from the Council, and also refused to substantiate his assertions by reading the letter to the meeting. Possibly it might have disclosed something more than would have been convenient. Mr. Wilkins is one of a number of gentlemen who for years have regularly supported the Society's shows by their contributions of first-class plants. Is it likely, I would ask, that they will continue to help a society, the principal representatives of which scatter broadcast such imputations?

The gardeners also come in for a full share of invective. Let us look into the actual position they hold as exhibitors of their employer's productions. They are spoken of in a way that implies their being under an obligation to the Society for the prizes they have so dearly earned, and censured by the President of pressing the Council in an indecent manner. Have those who thus speak any idea of the expense the gardeners are put to in exhibiting collections of large plants? Mr. Ward, one of those who is thus accused of thus pressing for his prize money, had to pay for vans, horses and men, at the Society's June show at Kensington last year, no less than £15, although residing at a comparatively short distance from London. Exhibitors coming from a greater distance, necessarily, must be under heavy expenses, and censured by the President of a gentleman's gardener myself, living in North Cheshire, I was for years in the habit of exhibiting once in the season at the Royal Horticultural or other of the London shows. On these occasions my expenses were never less than £25 or over, which was a clear sacrifice on my part of a very considerable sum, as each time I came to London it prevented my exhibiting somewhere else near home, where the expenses would not have been more than half as much, and in most

cases the prizes much larger. For a number of years back there have been many more important shows than the leading exhibitors could attend. I believe I was the first to moot through the horticultural press the advisability of the Society holding yearly exhibitions in the provinces. I exhibited largely at each place the Society visited on every occasion (except when the show was held at Manchester, and consequently near), doing so at a direct sacrifice, through the cause above named.

I simply mention these matters for the information of those who may happen to be under the impression that the prize money gardeners win is all clear gain, and also to make it distinctly understood that the councils and committees of the various societies are quite as much obliged to those who exhibit at their shows as the exhibitors are to them for the prizes they offer. This is a fact that the authorities connected with the different metropolitan societies would appreciate never to have been able to realize, hence their decadence. The promoters of the leading provincial societies fully understand it, and to acting thereon may in a great measure be attributed their success—meeting exhibitors in the most liberal manner, in addition to offering handsome prizes. To illustrate this I may mention one—the Bishop Auckland—second to none for the successful position it holds; this society, besides offering liberal prizes, pays the carriage of plants coming from distant parts. Gentlemen who exhibit plants up to the highest cultural standard receive many more applications from the committees of the principal provincial societies to show their plants than they are able to comply with.

Ten years ago the Lindley Medal was instituted. It is looked upon as the highest award that can be made to cultural skill, and as such is undoubtedly esteemed accordingly. It is now over nine years since the first was awarded, others from that time since, up to the last, which has now been due three years. Not one of these medals has yet reached the should-be recipients. Of course the present Council is not to blame for this, albeit the flourish of trumpets they made a short time ago has as yet come to nothing. Seven out of the nine to whom the medals have been awarded were gardeners in private places, and belong to the class whom the Treasurer designates in such gentlemanly terms as "rabid prizemen!" Although such a length of time has elapsed since many of these medals have been awarded, scarce a murmur has been raised at the delay, not by any means through a feeling of indifference about them. Speaking for myself, I would much rather have the Lindley Medal that has been awarded to me than a far greater value in money, and I have reason for saying that I have no doubt the same feeling actuates others who are in the same position. If it is true that "all things come to those who wait," there is yet hope. But still there is a limit to the patience of even those who are blessed with that virtue in the highest degree. *T. Baines.*

Master and Gardener.—With other exhibitors I was much interested in the result of the special general meeting of the Royal Horticultural Society—hoping against hope that somehow something would arise out of the meeting that would place the old Society once more on its original foundation, whereon we could all work together for the furtherance of the art for which the Society has been established. However, our expectations have been once more doomed to disappointment. Probably this will always be so until the Council are advised to consult the leading horticulturists as well as the general body of Fellows when they are in any difficulty. About five or six years ago, when it was thought desirable to amend the schedule, all the exhibitors were summoned to meeting convened by the Council; and His Grace the Duke of Buccleuch and Queensberry did not think it derogatory to his dignity to preside over that meeting, supported by the late lamented Bishop of Winchester. I was present as an exhibitor, and had an opportunity of stating my views on the matter with other gardeners. Major-General Scott, the late Honorary Secretary, was also present, and everything was arranged to our entire satisfaction. Now if a meeting of this kind had been arranged at the time the Council determined to make the 10 per cent. reduction on the schedule of this year, the exhibitors to a man would have supported them in whatever arrangement it was thought desirable to adopt. Unfortunately the men who are now in power prefer sledge-hammer argument to any system of conciliation. This was fully proved in the unwarrantable attack made by Lord Bury and the Treasurer of the Society on gardeners and their unpaid Fellows to bear the humiliation of being dragged into the County Court; and I wish to state here that I do not approve of the action taken by exhibitors. Although one of the largest creditors amongst them, and however much I disapprove of the way the Council have managed their business this year, I have too much respect for the honour of the Society ever to be prevailed upon to take action against them. Another reason—fortunately

I am not one of "those men" who receive part of their wages out of the prize funds. My kind employer pays large sums of money annually to support the exhibitions, and never has inquired how or when I receive the prizes; he was kind enough to say, when I thought it my duty to ask who was to receive them, "You, of course;" and that is all that has ever passed between us about them. Then as to wages, an employer might say, "My gardener is making a good thing out of his prizes; it will not be necessary for me to raise his wages, as I would have done if he had not been competing." This could hardly be said to be paying the gardener out of the prize-money, but it would amount to the same thing. It has not been so with me; my employer naturally supposed that, as his gardener was able to carry off a very large proportion of first prizes, he must be a good gardener and worthy of encouragement, and my wages have been much increased in consequence. I would rather, much rather, have refrained from entering into the subject of personal relations between master and gardener, but if there is any impropriety in doing so the blame rests with Lord Bury in the first place; and his lordship either ought to say who are the men who pay their gardeners partly out of the prize-money, or, if he cannot do this, make ample apology for the expressions he has used. The stigma at present lies at the door of all of us, and particularly of the gardener, as nearly all the exhibitors, have had intimate relations with the most prominent of them for years, and never yet heard any gardener say that part of his wages was paid out of his prize-money. If reckless, unproved statements continue to be made at meetings by members of the Council, and bitter feelings are thereby engendered, the reconstruction of the Society on a satisfactory basis will be impossible. *J. Douglas, gr. to Francis Whitbourn, Esq., Loxford Hall, Hford, E.*

BRITISH GARDENERS.—XIX.

ALEXANDER CRAMB.

"I was born in 1810, in the parish of Scoote, about four miles from Perth," writes Mr. Cramb, "and educated at the parish school. I was apprenticed in the gardens of Lord Gray, at Kinfauns Castle, then under the superintendance of Mr. Robertson. The principal ambition among gardeners at that period was not plant cultivation as we now find it, but rather to bring together the greatest number of genera and species. Kinfauns was then famous for its extensive collection of herbaceous and alpine plants, among which I spent every spare minute, preparing a *hortus sicus*, a much more difficult task than now. Botanical books were both scarce and dear. We had no *Gardeners' Chronicle* to consult or reply to questions. The decoration of the flower garden was then in its infancy; Grape and Pine-apple culture was, in the majority of cases, in a sorry condition; had any gardener produced such specimens of either as we now see, the county would have risen *en masse* and presented him with an annuity.

"At the expiration of my apprenticeship I went as journeyman into the gardens of the Earl of Kinnoull, at Dupplin Castle, under Mr. Shillinglaw, an excellent gardener and British botanist. Here my love of British plants was increased, and it has clung to me through life. Owing to the Castle being burnt to the ground I remained here only ten months, as the hands were reduced to two men. Next I moved on to Edinburgh, and found employment in one of the nurseries, at wages insufficient to pay for food and lodging. Still I do not regret the many hardships I suffered, as I gained considerable knowledge of nursery routine, which I have found very useful.

"My next appointment was in the gardens at Tarbert House, now the property of the Duchess of Sutherland, under Mr. Henderson. There was little or nothing to be learned here, so after a term of eighteen months I started for London. One thing I may notice, which is rather unusual in that northern county—the Fig and Apricot ripen thoroughly on the open wall of the kitchen-garden.

"My first place in England was in Essex, where I remained a year; and then went as foreman in the garden of Lord Portman, under Mr. Rogers, an excellent Grape and the grower. After remaining three years I returned to London, and then to Scotland, owing to domestic matters. Subsequently I found employment in the nursery of the late Mr. Cunningham, at Comely Bank, near Edinburgh, then famous for new plants, and fortunately was placed in the houses, where I secured a knowledge of propagation, in which at this time Mr. Cunningham had few equals. Heaths were struck by thousands by a very simple and unpretentious plan. I may hereafter describe the system, if thought to be useful. [Please do.] Here I remained for eighteen months, and left to lay out a villa garden in the neighbour-

hood of Edinburgh. The entire space was devoted to measure-ground and plant-houses. During the winter months I attended the evening classes at the School of Arts—chemistry, natural philosophy, and architectural drawing—and have ever found the information I gained of essential service. Our lectures were in every sense practical, each fact being proved by direct experiment. For instance, we were told that boiling steam and boiling water are, according to the test of our ordinary thermometers, exactly of the same temperature—212°, but that this is incorrect, as boiling steam is very many degrees in advance, containing what is frequently called latent caloric (insensible or hidden heat), as may be clearly proved by converting the vapour into a fluid by introducing the steam through a tube into a body of cold water. Another experiment I may mention is possibly more beneficial to gardeners, and clearly shows us that we should never trench or dig into the ground frozen earth or snow. In proof of which a piece of ice was placed at the bottom of a glass tube and covered to a considerable depth with hot water. Here it remained for a very long time before being dissolved, as heat descends slowly. But reverse the experiment and the ice quickly disappears.

“Dr. Lindley’s *Theory of Horticulture*, which was published at this time, raised horticulture almost to an exact science, providing us with a knowledge of the natural action of plant life and its requirements, and so demolishing that huge monster—empiricism.

“I remained at Comely Bank five years, and after a short space went as gardener to H. G. G. Ludlow, Esq., at Heywood House in Wiltshire. I found the garden in a sad condition, the fruiting plants without a live root, and the foliage from top to bottom covered with white scale. Any remedial measure would have been useless. The young stock was nearly as bad, but easier managed, owing to its small size. It was evident they must undergo a cleansing process, and for this purpose I made a liquid of soft soap and turpentine, and thickened by snot; I had each plant dipped singly in the solution, keeping up a constant temperature of 150°, which proved effectual, as not a scale was seen afterwards. All the heating material was cleaned out, and the pits white-washed in case of infection. The Vines were not a whit better; the young growths were not stronger than a good-sized Ost-straw, and they had scarcely any roots, so I had no alternative but removal, remaking the borders, and planting a young stock. The Peach trees on the open wall were sadly out of order; very few fruit had been produced for the many years past. And how could they be productive?—the border was of a heavy clay without drainage, so that the yearly produce was strong water wood, less or more destroyed during winter. During the last week in September I had them carefully removed and planted on a prepared border, and merely fastened to the wall. So soon as the buds began to push in spring, the gross wood was removed or cut back to a couple of eyes to fill up vacancies. This plan had the effect of bringing the trees into a sound and useful condition. Every other department, as time would permit, received its full share of attention; and even now I have to thank Mr. Ludlow for his kind and unvarying support.

“On leaving Heywood, after a residence of over nine years, I entered the service of Earl Ducie, who had a new kitchen garden in progress. The majority of the fruit houses had been built. The additions since that time consist of three Melon-houses, two Fig-houses, a greenhouse, an Orchard-house, and an intermediate house, principally for Ferns; as well as several ranges of pits. Latterly 100 feet of an Apricot wall has been cased with glass, as a mere protection against spring frosts, which has the effect of securing heavy crops yearly. The Vine borders had been made and planted, but in no instance were the crops satisfactory; I fought on with them for years without the least amendment, the Muscat of Alexandria offering the most resistance. As a last resource I had the Vines cut, and made a change from calcareous soil to that of the new red sandstone, and ever since they have expressed their gratitude. When planting the fruit trees in the kitchen garden I have invariably grouped every kind by itself, which in several instances is a convenient arrangement, enabling me to protect in the smallest compass against spring frosts, wasps, and birds.

“The greater part of our walls are built a foot deep upon a foundation which keeps them warmer by preventing the ascent of moisture by capillary attraction. No Apples are grown in the kitchen garden, the whole of the borders by the walk sides, with the exception of a few Plums, are occupied with dwarf trained Pears worked upon the Pear stock. Here, as elsewhere, every fruit is correctly named, the names being impressed on lead by steel types.

“Our collection contains over fifty varieties, and the selection has been made with much care. The kitchen garden was, in the first instance, trenched 30 inches deep—a refuge for the roots of both vegetables and trees during the late dry summer. Just on the outside, 3 acres of ground have been set apart as an Apple orchard. This is of a variable texture, the soil

of one part is light and brashy, and the other a heavy muddy clay, and well drained. On the former the trees are subject to canker, particularly the Kilbston Pippin, whereas on the latter it is quite free, and yearly bears heavy crops of excellent quality. We cultivate about seventy kinds, which give an abundant supply so long as Apples are useful. As a late dessert fruit, none equals Sturmer Pippin, which is juicy and crisp to the last.

“In every instance our fruit trees are dwarf-trained, as the blossoms and fruit are afforded more protection, and more particularly on high situations. A few years ago we had an immigration of the American bug, which at one time threatened to do us considerable damage. We have, however, by perseverance and the use of paraffin oil, been able to kill the major part. It is sometimes said that this oil is injurious to the tree, but it is really not so. I suspect this pest came from some of the neighbouring farm orchards.

“For more than eleven years I have regularly devoted one evening weekly for the instruction of my

Alex. Cramb

young men who chose to attend, taking up such subjects as were likely to benefit them hereafter. With some this was a pleasant task, and with others it proved a continued struggle to fix their attention. In the case of the majority the sight of a book, particularly if requiring the exercise of any mental effort, was about as palatable as a dose of bitter aloes.

“The flower garden, arranged purely in the geometric style, is situated on the south side of the Court, bounded by terrace walls, and overlooking the lake. The pleasure-ground is extensive, and planted with choice trees and shrubs, both deciduous and evergreen, which in the course of time will produce a striking feature throughout the place. Torworth possesses an extensive collection of Conifers, but no attempt has been made to form a pinetum; the different species have been planted on a variety of soils and situations, to prove which is best adapted to their requirements. Some kinds, indeed the majority, dislike the limestone, while none refuse the red sandstone; the Wellingtonia treats the greater part with indifference.”

ROTHAMSTED.

The name of this estate has become, as it were, a household word with agriculturists and men of science all the world over. Its reputation is modern, and wholly due to the ability, zeal, and munificence of the present proprietor, J. B. Lawes, Esq. Though, as our engraving shows, the mansion is a large and pictorial example of Elizabethan architecture; though its contents comprise much which forms the admiration of connoisseurs; though it stands in a park with many noble trees—Sycamores, Limes, Beeches, &c.—yet it is little known for any of these things. It has somehow almost entirely escaped the notice of the compilers of county histories and guide books. This is certainly somewhat surprising, as among a hundred that would appreciate the charm of this fine mansion and its surroundings, there would probably be not more than

one who could appreciate at anything like their value the extensive series of experimental researches which have made Rothamsted famous.

It appears that we have to thank Philip of Spain and his sanguinary lieutenants, not only for this picturesque mansion, but also for the experiments to which we have just alluded. The connection is remote certainly, but the contrast between the narrow-minded tyranny and oppression of the Spanish monarch and the free spirit of inquiry and liberality evinced by the present proprietor of Rothamsted is such as to invite comment. In any case, the fact is noteworthy that the ancestors of Mr. Lawes fled from Ghent for conscience sake during the persecutions of the Protestants in the reign of our Elizabeth; that they settled at Rothamsted, and that to one of them is due the erection of the present mansion. Whatever historic associations may pertain to this Hertfordshire manor, they are, however, entirely eclipsed by the researches which have made Lawes and Gilbert names of renown throughout the civilized world. We have, therefore, thought that it would be of interest to a large number of our readers to see the representation of this classic place. Our illustrations tell their own tale; there (fig. 153) is the old gabled mansion with its finely-kept swains in front, a pictorial bit of architecture, to describe which would demand the pen of a Dickens, and there, hard by (fig. 152), is a glorious row of Limes, whose arching branches rooting in the soil, and then uprising in a dense tangle of young shoots, form leafy corridors, the charm of which is best appreciated on a hot and sunny summer day when the air is heavy with the perfume of the blossoms.

Part of the park is fenced off for the purposes of the experiments on permanent pasture land, some three or four-and-twenty plots being divided off, and to each a different combination of manures is applied, two being left as test-plots unmanured. The results of these experiments, carried on now for nearly a quarter of a century, and most fully and carefully noted, are very extraordinary.

Not only is the general character of the herbage as to vigour, colour, date of ripening, &c., materially modified, but the composition of the plot is entirely altered. In the unmanured plots there are, for instance, a large number of plants of different species, but no one markedly predominating over the others. On the several manured plots the case is widely different. Some species are, as it were, banished, others encouraged, according to the description of the manures employed; and thus it happens that in the plots to which ammoniacal manures are added the herbage consists almost entirely of grasses, sometimes of particular species of grasses, to the exclusion of others, while in those plots to which a purely mineral manure is added Clovers and other leguminous plants prevail. We cannot now enter more fully into this matter. It must suffice to say that the difference in the vegetation of the several plots here indicated is very conspicuous to the eye in spring and early summer, owing to the bands of different colours which the plots present. One plot will be covered with a yellow sheet of Buttercup blossoms, while its neighbour scarcely has one. Another plot will be white with flowers of Anthriscus, while the next plot has not a single plant of this species; and so on. It will be seen that these experiments are interesting, not only to the farmer, but to the gardener who has the management of lawns; while every fruit grower who appreciates low muck and the quality of his crop are affected by different manures may derive suggestions without end from an attentive survey of those experimental plots. We cannot now do more than allude to similar experiments on the farm-land on the growth of the various cereals, of Beans, Turnips, Beetroot, Clover, &c. We shall probably take another opportunity of alluding to these matters, and to the opposite tendencies shown by certain orders, such as grasses and leguminous plants, and sometimes even between two species of the same genus. In the meantime we may say that no one can form an idea of the magnitude and infinite detail of these experiments who does not visit Rothamsted for himself. This visit, owing to the liberality of Mr. Lawes, is not a difficult matter—more difficult is it to grasp the scope of experiments made on such a scale and under such varied circumstances.

A laboratory, presented by the farmers of England as some acknowledgment of Mr. Lawes' services to agriculture, stands on the verge of the estate, and the museum attached to it is filled with the evidences and proofs resulting from the experiments in question. Not to speak of the elaborate experiments on the feeding of animals, and confining ourselves merely to certain prominent matters interesting alike to horticulturists and agriculturists, we may briefly

FIG. 152.—THE LIME WALK AT ROTHAMSTED.

indicate some of the more remarkable researches which have been carried out here by Mr. Lawes and Dr. Gilbert. First, we may mention, the *coup de grâce* given to the mineral theory of Liebig, who, contrary to the practice of all cultivators, maintained that, provided the mineral ingredients in the soil were sufficient and available, no organic manure further than that contained naturally in the soil was necessary. The proofs that plants do not absorb free nitrogen from the atmosphere were gained here. Here, too, were made the series of experiments on the evaporation of water from the surface of leaves which constitutes one of the most valuable contributions to vegetable physiology and practical horticulture. These researches—we shall surprise some of our readers, who look upon horticultural societies as merely associations for the

promotion of flower-shows—are contained in the *Journal of the Royal Horticultural Society*. The experiments with the various manures have necessitated thousands of analyses, the results of which are kept for future examination and comparison. In addition to all this there are the experiments and investigations on the amount of rainfall which penetrates to different depths of soil under various conditions. But the mere enumeration of what has been accomplished and what is still being done at Rothamsted would occupy more space than we can now afford. We must not, however, omit to mention Mr. Lawes' splendid munificence in providing for the future continuance of the laboratory, and of the experiments we have alluded to. Nor has he been unmindful of the welfare of the labourers on the

estate. For them allotment gardens are provided and a working man's club, managed by the men themselves, and which proves an admirable boon to the men, by supplying them with all the comforts and recreation they could get in a public-house, without the risk of excess and demoralisation, which is so serious an evil in the latter case. In any other country than England, Mr. Lawes' splendid services to his country would have received some national acknowledgment. The Royal Society, as the fountain of scientific honour, has been more mindful of its obligations to Messrs. Lawes and Gilbert, but, to the wonder of foreign scientific men and agriculturists, successive Ministries come and go, and no national acknowledgment of the greatest services hitherto rendered to agriculture by British men of science has yet been made.

Notices of Books.

Pruning, Grafting, and Budding Fruit Trees. By D. T. Fish. (Country Office, 32, Wellington Street, W. C.)

This is a small shilling brochure of some fifty-two pages. The author is well known as one of our best practical gardeners, is a ready writer, and consequently well able to impart a deal of useful information on such subjects as this. We cannot say that the result is quite equal to our expectation. A plain practical manual on pruning fruit trees, &c., would be desirable; but the one now before us has little claim to such a title. The part devoted to pruning and training is chiefly eulogistic of the author's pet theory about "root pruning," which we take almost entire exception to. "Modern pruners," our author tells us, "merely take fruit trees gently in hand by the roots and lead them into fertile ways. The top cannot be cut into fertility, but the roots can be led with ease and certainty in that direction." To this we would remark that, or the production of fruit, simply root-pruning is scarcely ever necessary, and is never resorted to by great fruit growers. They let root and branch both grow, and reap abundant crops. Where trees are trained to some particular form and restricted to certain limits, it is sometimes necessary to resort to root-pruning as a last resource, but to do it habitually, as our author recommends, is absolutely folly.

The chapter on grafting is illustrated with a great many, we will not say impossible, but very fanciful methods of performing this simple operation, and, strange to say, the most common and simple, whip or slice grafting, is not shown at all, or not in the manner usually practised. Moreover, our author is not very clear about the performance of the operation when he speaks about selecting scions and stocks of about the same diameter, so that the same parts of the scion and stock should be brought together. "To place the scion in the centre of the cut portion of the stock would be, in case of diversity of diameter between the two, to invite failure," we say, not so; the diameter of the stock is of no consequence; the author should have here explained that the union only takes place along the edges of the inner bark, so that, having the scion prepared, all that is required, whatever the diameter of the stock may be, is to lay bare a corresponding space of wood on the stock and the inner bark of the one will fit that of the other. All those hackneyed expressions of "bark to bark, wood to wood, cambium to cambium," are confusing and at the same time erroneous and misleading. It should ever be remembered that no union ever takes place between the wood or the bark. Whilst finding these general faults with this little work, we would add there are many good passages in it that may repay its perusal.

—We have received a copy of Mr. Serjeant Cox's inaugural address to the Psychological Society of Great Britain (Longmans), a society established to investigate the most tremendous problems that can be conceived of by human intelligence, and most of which, according to the general belief of mankind, are not only unknown but unknowable. This, however, should not prevent honest reverent scientific inquiry, which is sure to be beneficial in some way even if it fall far short of its aim. To show the nature of the questions the Psychological Society seeks to study the President boldly sets up by answering the question, "What is Matter?" by saying it is a collection of molecules (themselves composed of atoms in definite combination). Our senses can only take cognisance of molecular matter, but this is only an infinitesimal part of the universe, which it is not within our power to conceive of. Similarly and in alliterative style Mr. Serjeant Cox defines a man to be "All that our senses perceive is a marvelous mechanism of molecular structure, admirably adapted for existence upon a world also structured of molecules. This mechanism is subject to all the forces that control matter. But it is subject also to certain other forces that appear specially to control organic matter." It is with these "other forces" that psychology has to deal. We suspect that in taking up this ground the psychologists will embroil themselves with the theologians, and for the present of actions dispute it would be well to map out the territory each should occupy. This, however, is not our business. It must suffice for us to state that in the opinion of the psychologists the science of mind can be based on as many facts and phenomena, and therefore on as secure a basis, as any of the physical sciences. Elsewhere in the essay before us we have some other definitions, such as "science is proof," "proof 'tis the best evidence the nature of the subject will permit," "Facts, to be used as the basis of science," "must have their verity established by evidence, which, if not always amounting to positive demonstration, shall be such proof as the unbiased judgment may reasonably accept. But in all cases the evidence must be the best evidence procurable that the nature of the case will permit. A fact is anything, or any state or condition of any

thing the existence of which can be proved by evidence. Absolute truth being unattainable, we must content ourselves with such a measure of relative truth as we can, with our present organisation of mind and body, take practical cognisance of. All this is reasonable enough. The real difficulty lies with the varying corporeal and mental endowments of different men. The evidence of a fact may in itself be good enough, but the power of reasoning and appreciating that evidence, and still more of reasoning correctly from it, may be, and, as we have daily illustrations, are often feeble in the extreme, even among educated persons. The Psychological Society would do good service if it in any degree amend this state of things.

—Dr. Pfeiffer's elaborate *Nomenclatura Botanica* is now completed (Williams & Norgate). It forms two very thick 8vo volumes, containing the names of the genera, tribes, and orders of plants as published up to 1858. The name, reference to authorities, dates, synonyms, and frequently the derivation of all the genera of flowering and flowerless plants are given in these bulky volumes, which are indispensable in a reference library. We even notice in some cases that evident errors of transcription, which are so common in the case of garden plants, are included—*G.S.*; *Swanalioa*, *Iiort*, which is *Juanelloa* of Ruiz and Svanalio.

Home Correspondence.

Early Peas.—Although the winter has been long and the season rather a dull one, Peas are now making up for lost time. Of the sorts we shall call in rotation, according to present appearances, the first on the list is Laxton's Alpha, dwarf and well podded, with from three to five Peas in each pod, and will be fit to gather by the end of the week. Easte's Kentish Invicta follows next, if indeed it be not equally early, and is rather a stronger grower, containing about the same number of Peas in its pods; and close upon the two previous sorts are Laxton's Prolific, somewhat similar to Sangster's No. 1, but living longer to all appearance in the pod. Next, as to quantity of pods, is Dickson's First and Best, and Sangster's No. 1; and lastly, Laxton's Popular and Laxton's Dr. Hogg—a wonderful early sort with nine Peas in a pod, and rather a taller growing variety than any of the above. Laxton's Supplanter and Fillbasket are just coming into flower—both hardly looking sorts of the Maclean "ilk." Maclean's Best of All is barely showing flower; it was sown at the same time and upon the same north border, and although sown at vigorous, will be a fortnight, if not three weeks, behind the others. Around Workop, a great Pea-pulling district, the Peas in the fields are looking well and are white with bloom. When I lived at Workop Manor, and had sown my first batch of Peas in December or January, and with all the shelter and "codling" of a south border, the field growers would pull their first dish gals as soon as I could, although six weeks later in a larger; or, on thing in their favour being that they had sown a field to cover. *S. Miller, Camber.*

—I gathered this day (May 24) a good dish of Peas from Sutton's Ringleader and Laxton's Alpha, sown November 9, on a south border—the latter quite as forward as Ringleader. *R. Thain, Wortley Park, Winchester, Hants.*

The Accounts of the Royal Horticultural Society.—While the pecuniary position of the Royal Horticultural Society is before the Fellows, will you allow me to draw their attention to the manner in which the accounts of the Society have been issued for the last two years, and also to point out a "slight" error of some £500 in the balance. I find it almost impossible to get a word in edgeways at the meetings, so I must ask you to kindly find me space in your columns. In the first place, the statement of accounts for 1873 was never audited, or certainly not verified by the auditors of the Society, as required by bye-law 121, they having been previously appointed in conformity with bye-law 99; and secondly, those for 1873 are only signed by one of them—Mr. Liggins. Did the other two gentlemen object? If so, I think we ought to know why. Mr. Liggins used some very hard words in reference to the manner in which the late committee kept their accounts—"scandalous and disgraceful" were, I think, the words. I am sure you will refer in reference to them, let us see whether he has been absolutely immaculate in those which he certainly has authorised. I must begin with the account for 1873. On the creditor side I find the following figures—Balance of provincial show account at bankers, £268 19s. 8d.; less owing to Royal Horticultural Society for hire of tents, £200; leaving £68 19s. 8d., which, added to the amount loaned to the Society, make £868 19s. 8d. Now, I must explain that after the 1868's show at Birmingham, the Society took the canvas that had been used in it at a valuation, in part payment of the balance of profits accruing from that show, and consequently the canvas stands to the credit of the provincial show ac-

count, and every time it is used that account should be credited with the hire of it; so that at Bath, instead of deducting this £200, it ought to have been added to the balance, which would then stand at £268 19s. 8d. Now, let us follow this account into the balance-sheet for 1874. In the 1873 account it has £1868 19s. 8d. to its credit. In the 1874 account it has increased to £1900. May I inquire how? There was no provincial show that year, and if the amount had been altered at all, a certain sum ought to have been charged for deterioration of the canvas; but this is nothing compared to the next item. Finding, "from information that they had received, that a mistake had been made in the previous year, the gentlemen who make up the account try it right—how? By again deducting the £200 from the unfortunate balance, and thus reducing it to £1700, when it ought really to appear as above—namely, £2268 19s. 8d.; and yet, after all this, the accounts are balanced. If this is explainable, I for one shall feel much obliged to Mr. Liggins if he will give the Fellows of the Society the trouble to let me to a very necessary explanation. *W. Marshall, Bath.* In your report of the last meeting of the Society I saw Mr. Kellock tells Mr. W. A. Lindsay that he really knows nothing about the gardeners and the loss of their prize money; but on referring to his (Mr. L.'s) speech, I am of opinion that he does perfectly, and beg, after a number of years' experience amongst exhibitors, to bear him out in what he says entirely. The gardeners are really out of pocket until their prize money is paid; and, considering the shows would be nothing without the plants, I really think the prize money ought to be paid within a month at the latest, and I must also express my surprise that a gentleman in Mr. Kellock's position does not know more of the subject.

Brome and Wheat.—Mr. W. Marshall (p. 599) expresses disappointment at not hearing further from me. I was on the point of replying, but desisted—first, because I had promised a distinguished botanical friend, who thought the matter getting too personal, and would be of no benefit to science, to let it drop; and secondly, to be candid, because I thought Mr. Marshall's letter indicated the "attorney for the prosecution," rather than the spirit of judicial fairness, with which only I have time to discuss. In spite of my own protest, Mr. M. insists on other means of my language, and when the words were so plain that they could not possibly be misconstrued, he can find no better explanation than that I "must have asked the reference of the specimen to the microscopical committee in a spirit of bravado" (I quote from memory). I think no American would enter on a scientific discussion on such terms as these; and I, if I was expected of me under such circumstances, I should pardon. With due respect, I would suggest that very earnest desire for information on some of my first letters I gave the references to Professor Gage's paper, and even took the trouble to find out where in England the paper could be seen, and named these places; yet it is evident from the references in this letter that he has not taken the trouble to read it, as they do no justice to Professor Goode's facts, which I am sure any unbiased person would regard, as I said in my first letter, as "furnishing an overwhelming evidence." Though from these circumstances I have a little expectation that Mr. Marshall will read the paper after I have referred him to it, not to send wanting in courtesy on my part, I beg to say that the report of the chairman of the microscopical section of the Academy of Natural Sciences of Philadelphia, Dr. J. Gibbons Hunt, to which committee—"in bravado," I am told—I asked to have it referred, is given in full at p. 163 of the volume of *Proceedings* for 1874. The whole of it is very ably and lucidly detailed, and I am sorry that I have not a copy to send you. The volume is, however, in all the leading scientific libraries in England. *Thomas Meehan, Philadelphia, U.S., May 18.*

Referring to the *Gardeners' Chronicle* of May 8, at the beginning of p. 599, I beg to resent, as a groundless, and therefore offensive assumption, the remark of Mr. Marshall, that in the "trick" played upon Mr. Meehan and others "so many scientific Americans were taken in, and for so long a period." Apart from Mr. Meehan, who may speak for himself, I would ask Mr. Marshall how he knows that a single scientific American was taken in, even for an hour? I know of none. *A. Gray, Botanic Garden, Cambridge, Mass. May 20.*

Spring-Blooming Phloxes.—I am making a small collection of these pretty hardy plants, but am a little bothered in getting the correct names of some of them. I can make no mistake about *P. verna*, as it is an old acquaintance, and makes a beautiful mass of rosy red colour in the spring garden. *Phlox divaricata* resembles *P. verna* in habit and foliage, but the flowers are rather looser, and in colour are pale blue; indeed the tinges of bloom much resemble those of *Plumbago capensis*. *Phlox Nelsoniana*, sometimes called *Nivalis*, is well known by its pure white

masses of flowers and small pointed foliage. Of the same species is *Phlox frondosa*, pale rose pink, and I am in doubt whether this variety is, or is not, the same as *setacea*, which it at least closely resembles. *Phlox subulata oculata* only differs from *frondosa* in having flowers that are rather deeper in colour and with a darker eye. *P. setacea violacea*, as growing at Kew, was by the more correctly named *setacea rubra*, as the flowers are of a deep rich colour. Lastly, I have one of the same species that has flowers in colour very pale blue. Would that be *setacea violacea*? *Alex. Dean, Belfast.*

Late Frosts.—How about the effects of frosts? With the common kinds of shrubs here the autumn and winter frosts made great havoc. The shrubs generally, a short time ago, presented a most miserable appearance, but now, after a visit from our late "friend Frost," they look wretched, the young growth being completely shrivelled up. The downward look of the cottagers tells too plainly the destruction done to Potatoes, Beans, and every other tender thing above ground, as also some of the orchard crops. As it is our lot to be situated on the lovely banks of the River Dove, "which wends its way from the mountain spot, Dove Dale," we expect late frosts but this year it seems later still, leaving a blight on the eager expectations of the inhabitants of this locality. *A. Bradshaw, Calwich Abbey Gardens, June 1.*

Transmutation of Grain.—This idea of transmutation would appear to spring up in the agricultural mind somewhat periodically, or at intervals of a few weeks, in much the same way as vast crops of certain weeds, such as Charlock or wild Mustard, occasionally decide themselves upon cultivated land, while the cause of their unexpected and undesired reappearance is unknown. A good many years ago, it might be about the year 1863 or 1864, Barley was sold in the various markets of this neighbourhood for seed at a very high price under the name of "Oat-Barley," and was reported to be an improved variety, and to have been raised from Oats. Very considerable interest was taken in the matter about this time, and without having any decided opinion upon the subject I examined what the thing was, considered a fair trial, although upon a very small scale. I procured about half a pint of good white Oats, which appeared at first sight to be tolerably clean, but on close inspection a few grains of Wheat, Barley, and Rye, were discovered in the sample; so all were scattered upon a table, and some two or three hundred grains of Oats picked out individually. These were then sown upon a piece of land which had long been used as mowing ground, the sowing taking place during the month of April. This land had not for a very long time, if ever, had the benefit of stable-yard manure, or borne a grain crop of any kind—so there was no likelihood of its containing vital seeds of any of the cultivated cereals. The seeds sown soon germinated, and in accordance with the prescribed formula I cut the plants down three or four times during the summer, and the land being light and dry, and the spot sheltered, they all, or nearly all, survived the ensuing winter without having had any protection or covering of any kind. During the following season the plants came into ear, and the result was that every one of them proved to be Oats. This experiment, with its result, I think I communicated to the *Gardeners' Chronicle* at the time. I have no doubt whatever of your correspondent of last week (p. 694) obtaining Wheat from his experiment, and distributing the produce of the same as a distinct and improved variety—and this, too, in good faith with the public, for such it might really be, as I believe that most of the improved varieties of cereals in cultivation have been obtained by selection. But it appears pretty clear that the Oats had much less to do with this result than the clean Wheat straw with which they were covered up during the winter, which, by excluding air and engendering damp, would be sure to prove fatal to them; while the cleanest of Wheat or other straw is seldom so very clean as not to retain at least a small percentage of grain, which might grow naturally, by aid of its gravity alone, find their way to the surface of the soil where the unfortunate Oat plants were being smothered, might establish themselves there, and thus become the progenitors of the celebrated Oat-Wheat, which your correspondent says "has been sent to all parts of England for seed, and has always given satisfaction." *P. Grieve, Cullford, Bury St. Edmunds.*

Bedding Pansies.—All lovers of spring flowers will rejoice to hear that the comparative merits of our bedding Pansies and Violas are to be tested at the Chiswick Gardens this year. I hope the committee will make their report public as early as possible, to enable gardeners and others interested to add their experiences to the common stock, and thus some reliable information generally applicable may be obtained. I particularly wish to see the new variety which was delighted with his beautiful display of these very useful gems. It is Mr. Ware's aim to produce

good individual flowers, as well as a profuse flowering habit. A new variety, named by him *Cerulean*, is an illustration of this. It is as floriferous as *Blue King* or *Blue Bedder*, while the individual flower is as great an improvement upon each of the foregoing as they were upon the earlier and now well-nigh forgotten varieties. Cloth of Gold (Ware) and Cloth of Gold (Dean) are now so well known that it seems superfluous to refer to them; but seeing them side by side, my verdict is decidedly in favour of the former. The deep blotch in the centre, at the base of each petal, makes the rich golden hue more effective and brilliant than is the case with Mr. Dean's variety, which is only pencilled. Could Mr. Dean succeed in eliminating the dark pencilling his would be a splendid variety, as the habit is all that could be wished. By the way, what a pity it is that our nurserymen will adopt the same names for their productions, causes no end of confusion and trouble. The foregoing is a case in point. *Viola lutea Grievii*, sulphur, shaded with clear yellow, is a very acceptable addition, where masses of bloom are required; viewed, however, as a florist's flower, it is simply nowhere. Buttercup (Ware), golden-yellow, with large deep purple blotch, is a desirable acquisition. The flower is very large, and of good form and substance; the only defect appears to be the compact habit of the plant. If the variety were called so closely as at Tottenham, the effect is very beautiful. I saw no better purple than the old Cliveden variety. White varieties were only indifferently represented, and appearing quite up to the general standard. *S. B. D.*

Fruit Prospects and the Plague of Wasps.—Have any of the numerous correspondents of the *Chronicle* noticed a greater number of these pests than usual this spring? I never remember to have done so, for from the end of February until May I have killed over two dozen, and others on the place have slain an equal number, and still they come. One afternoon this week I saw half a dozen in a fruit-house where I had a lot of ripe Strawberries, for which I suppose they had come: only two of them was I able to place *hors de combat*, the rest making good their escape through the ventilators. I attribute the presence of so many to the rich aroma rising from the Strawberries, which they scent from afar. Strawberries are not the only attraction, for there were here before they were ripe. The next inducement is two bee-houses that we have in the garden, and around which there is often some of the robbers hovering. There seems to be an enormous crop of fruit set almost everywhere in this locality, Apricots, Peaches and Nectarines are very good and quite as forward on the south wall as in the orchard house. In the open orchard we have a good set of Apples, Pear, Plums and Cherries, and of bush fruit I never remember to have seen the trees so loaded; but what will it avail if we are to have a swarm of these pests in the autumn at every turn?—for we all know what short work they make with a Jargonelle or a Marie Louise Pear—their two special favourites. Last year I saw large fruits of each attacked and demolished to nothing but the shell in two hours. *Joseph Murdoch, The Gardens, Green Heyes, Warwick.*

Fruit Prospects.—The charming weather we have been having during May has brought on all kinds of vegetation at a rapid rate. Trees that showed but slight signs of returning vitality a few weeks back are now clothed with foliage that has not received a single check in its development. The respective tints are of the richest and most delicate description, and it is seldom one sees them in such splendid array as they are at the present moment, as it is only in seasons like the present that such results can be produced. All kinds of flowering trees or shrubs are, or have been, laden with a profusion of bloom, and the thinning of fruit will be a serious item in the labour account, as most of it appears to be setting. Apple orchards were, perhaps, never more gay than at present, and with such ample foliage to protect and shelter the blossoms, it is a little late season little or no danger to be apprehended from frost; while the maggot, often so destructive during a period of slow growth, will stand little chance of committing his usual depredations. Peaches and Nectarines have not been in such a satisfactory state for many years past, as they have set abundant crops, and are making healthy, quick growth that keeps well a-head of green-fly. As to blistered leaves, I do not think it would be possible to find one showing the slightest tendency that way. Sudden transitions of temperature are sure to produce this by acting on the tender tissues, but this year they have fortunately escaped any great variations that way. The frosts in April affected the young wood of Apricots, and cut off a good deal of the bloom where the spurs were long and projected far from the wall, but even with this the "set" was so good that at least two-thirds of the fruit will have to be thinned off. Pears on the Quince have been laden with bloom, most of which is set, and thinning will be a work of some labour. Those on the Pear stock have been rather thin, except

Passe Colmar, which has been very full. Cherries and Plums have set full crops, and the former have nearly got safely through the stoning period—a time when a low temperature often proves fatal. Altogether the fruit prospects are most cheering, as with the season so advanced, danger from frost is scarcely to be apprehended. *F. Sheppard.*

The Fruit Manual.—As I had previously published the *Orchardist*, a somewhat similar work, containing three times more matter than the *Manual* does, I could not help looking at the tabular statement in your review of this book of the number of sorts said to be described in this new fourth edition without surprise. I procured a copy of the work and counted the sorts described, and I now send you a tabular statement of the numbers of each kind which I find actually described, with a column added of the number described in the *Orchardist*. I do not think that any one has worked harder or done more to advance practical pomology in this country. My collection of Apples now comprises 1500 sorts, my Pears number 2200 sorts, and other kinds of fruit in proportion, gathered from all quarters of the earth where such fruits are grown. The kinds, being largely but not exclusively English, are arranged in alphabetical order after I read no more, and I shall be satisfied in my calling I have done my country some good. The *Orchardist*, if it ever sees another edition, will contain authentic descriptions, made by myself, of every kind grown by me, and not from single specimens, but from a dozen of a sort, laid on the table before me, so that all their characteristics can be seen; this is the only true way to describe fruits, and not from single or adventitious specimens, such as are often exhibited, but which do not give a true idea of the general orchard crop. Several of these overgrown sorts of Apples are described in the *Manual*, such as Annie Elizabeth, Damelon's Seedling, both generally medium sized; Galloway Pippin, Grand Duke Constantine; this is always medium to small, and the author has mistaken Grand Richard for it. With me the first grows small, the second large; see the two sorts as figured and described by M. Leroy in the *Dictionary of Pomology*, pp. 335 and 336. But to the main purport of this letter, the tabular statement. By giving the real name of the reviewer whether he considered all the synonyms equal to true sorts? If so, his table is right; but I should think it strange if any one offered me the Brown Burreed Pear under its thirty different names as thirty distinct sorts, or the Belle Angevine with its twenty synonyms as twenty distinct varieties. *J. Scott, Merriott, Somerset, May 24.* [We have not space to include Mr. Scott's table in full, it must suffice to say that he claims that 7568 more varieties are described in the *Orchardist* than in the fourth edition of the *Manual*. Eps.]

Strawberry Culture in Pots.—The all-sufficient remedy for a good supply of water to Strawberries in pots is a simple wooden trough-shelf. During my fifty years' practice as a gardener, I have invariably found the trough-shelf the best, and in the end quite as cheap as soils or saucers. The wooden shelves for Strawberries or early French Beans, if converted into shallow water troughs by bradding on the sides strips of half-inch board, to hold water three-quarters of an inch deep, will be found to answer the purpose. A half-inch hole and plug, or tap, will be very useful to draw off stagnant water; besides there will be a great saving of labour: the "careless chap" whose duty it is to water them will not have occasion to surface-water very often, for he merely stands at one end and pours in sufficient water to fill the trough from end to end. Wooden trough-shelves I have had in use for eight years, and they require no repairs excepting an occasional coat of paint. *W. P.*

Natural History.

QUEEN WASPS are certainly more abundant this year than they have been for many seasons. Mr. Kneller, in the *Gardeners' Chronicle* of May 29, speaks of their now frequenting the Cotonestars which are in bloom. They certainly do so; and though I have watched them carefully on the plants, I have noticed that they rarely touch the blossoms, appearing to be more attracted by some gumminess on the bark. I have taken two dozen in a couple of hours of this shrub. The best plan to catch them is with an ordinary net, and about an hour before sunset. They then appear to be half-stupid, and rarely fly more than a few yards, settling again, so that if you miss them the first time you get another chance. Ivy or Laurel screens, walls with a westerly aspect, or Scotch Firs, if not too high, are sure places to find queen wasps any evening when the sun is shining. Whether it is a fact or not that for each killed a nest of 50,000 is prevented, it is certainly as well to get rid of as many as possible. The incentive to boys of a penny, or even a halfpenny, for every queen brought in before the end of May will produce many dozens. If your readers doubt this, let them try it next spring. *J. M., Southgate.*

HORTICULTURAL EXHIBITIONS, 1875.

- JUNE.
- 16.—Royal Botanic Society, Regent's Park. Summer Exhibition. Sec., W. Sowerby.
- 16.—Glasgow and West of Scotland Horticultural Society, Midsummer Exhibition. Sec., F. G. Douglall, 167, Caning Street, Glasgow.
- 16.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees.
- 17 and 18.—Lee and Blenheim Horticultural Society's Exhibition. Sec., C. Helmer, 5, Boones Road, Lee.
- 18.—Scottish Pansy Society's Exhibition at Edinburgh. Sec., W. M. Welsh, 7, Waterloo Place, Edinburgh.
- 18.—Exeter Rose Show. Hon. Sec., R. W. Gray, Exeter.
- 22 and 23.—The Kingston and Surbiton Royal Horticultural Society's Eleventh Exhibition, at Norbiton. Sec., J. Kirk, 2, East Valdes, East Road, Richmond Road, Kingston-on-Thames.
- 23.—Foreham and South Hants Horticultural Society's Show. Sec., Harry Smith, Foreham.
- 24.—Royal Horticultural Society of Ireland, Great Summer Exhibition. Sec., A. Balle, 28, Westland Row, Dublin.
- 24.—Bristol, Clifton, and West of England Rose and Strawberry Show at Clifton.
- 24 and 25.—Great Rose Show at the Alexandra Palace. Manager, A. McKenzie.
- 25.—Crystal Palace Anniversary. Sec., F. V. Wilson.
- 30.—Royal Botanic Society, Regent's Park. Exhibition of Fruit, and Cut Flowers. Sec., W. Sowerby.
- 30.—West-End and West-End Horticultural Exhibition. Hon. Sec., Charles Parker, Wisbeach.

JULY.

- 1 and 2.—Spalding Horticultural Society's Exhibition. Hon. Sec., George F. Barrell.
- 1, 2, 3 and 5.—Horticultural Exhibition at the Lower Grounds, Aston, Birmingham.
- 2.—The Tunbridge Wells Horticultural Society's Exhibition. Sec., E. F. Loof, The Parade.
- 2.—Thirtieth Anniversary Festival of the Gardeners' Royal Benevolent Institution.
- 3.—Southgate Horticultural and Cottage Gardeners' Society's Exhibition. Hon. Sec., J. Mills, Esq., Southgate, N.
- 3.—West Kent Horticultural Society's Exhibition in Camden Park, Chislehurst. Hon. Sec., H. Nevill, Esq.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Cut Rose Show.
- 7 and 8.—Grantham and South Lincolnshire Horticultural Society's Exhibition at Grantham. Sec., Thomas Lyne, Jun., Grantham.
- 8.—Frome Rose Show. Sec., A. R. Bally, Frome.
- 8 and 9.—Manchester Botanical and Horticultural Society, Special Evening. Sale and Exhibition of Roses, Floral Decorations, &c. Manager, Bruce Finlay.
- 8, 9, and 10.—Nottingham and Midland Counties' Grand Rose Show, Nottingham. Sec., Alfred Kirk, Municipal Offices.
- 9.—Oxford Rose Show.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 5, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- MONDAY, June 7. Meeting of the Entomological Society of London.
- TUESDAY, June 8. Sale of Minerals, Fossils, Shells, &c., at Leeds Horticultural Society's Annual Show (till 11th).
- WEDNESDAY, June 9. Unreserved Sale of Plants at Hasledean House, near Willesden, by Protheroe & South Essex Horticultural Society's Show at Leyton.
- THURSDAY, June 10. Sale of Orchids, at Stevens' Rooms. (Rose Show at Lyons till 11th).
- FRIDAY, June 11. Sale of Orchids and Imported Orchids, at Stevens' Rooms.

THE time at which we are obliged to go to press prevents us from giving in the present number a report of the proceedings at the adjourned meeting of the ROYAL HORTICULTURAL SOCIETY on Friday afternoon; indeed, our publication must necessarily be made a few hours prior to that meeting. We are not, therefore, in a position to comment to any useful purpose on what should be done on that occasion. We may, however, say that the intemperate language of the President and Treasurer has brought us a pile of correspondence greater than we can publish, and that while all our correspondents are justly indignant at the insulting language used by the officials alluded to, some are disposed to rejoice at it as promoting the downfall of a Society which they look upon as effete and mischievous to horticulture. These gentlemen advocate the entire withdrawal of the exhibitors and of the horticulturists from the Society, and propose to leave the local Fellows in their glory at Kensington. It appears to us that those who advocate that view are not fully aware of the manner in which the horticultural part of the Society is inextricably entangled with Her Majesty's Commissioners, with life Fellows, debenture holders, and local Fellows. Cut the Gordian knot and

be free, say some; and then start a new Society. Well, where is the knife that will cut such a knot? The process recommended by our correspondents would only sever a few strands. In other words, though individual Fellows might terminate their existence as Fellows, the Society could not be so brought to an end. That would still exist. It is almost impracticable to kill a chartered Society outright, especially when there are so many Life Fellows who might object to their privileges being destroyed at a swoop. Bad as things are, and advantageous as in many respects an entirely new start would be, we do not think it would be practicable. We must not desert the old ship; we must make the best of a bad bargain, from which there is no possibility of ridding ourselves.

A new Society, even if it were called into existence, would in all probability be a mere flower-show Society, and the higher functions, even now at least partially carried on by the Society, would be unfulfilled.

As we have said so often, there is relatively no difficulty in getting up a flower-show. The proceedings last Wednesday confirm our remarks. At first sight it would have seemed as if the insulting tone of the President and Treasurer a few days before must have prevented any one from exhibiting, and that no show would have been held worth the name; and if it had been so the South Kensington party would have rather rejoiced than not. Fortunately for the Society, however, Mr. BULL was tied by previous engagements, and, thanks to him and one or two others, one of the most interesting exhibitions we have seen for a long while was held.

We cannot at the time of writing venture to predict what will happen at the ensuing meeting; but if it results in the entire elimination of the local Fellow element from the Council we should heartily rejoice. The horticulturists on the Council have been placed in an unfortunate position: they have necessarily had to bear the brunt of attacks intended, not for them, but for others with whom they are associated, and with whom the necessities of their position compelled them to act. Great thanks are due to those gentlemen for what they have done, and we would fain hope they will find their reward in an accession of strength and influence. It is quite possible that the horticulturists may be altogether ousted, and the South Kensingtonians largely reinforced by Sir ALRED SLADE and his friends. The cup would then surely be full. But these remarks may be rendered meaningless by the events of the meeting, which we await with no little anxiety.

A PUBLIC MEETING to consider the position and prospects of the ROYAL HORTICULTURAL SOCIETY will be held at the Claridge Cross Hotel on Wednesday, June 16. The chair will be taken at 4 o'clock precisely by S. H. GODSON, Esq. This meeting is convened by the Lindley Club, which, of course, will bear the attendant expenses, and regulate the order of procedure. The object is to have an open discussion on the state of the Royal Horticultural Society, and the possibility of restoring it to a respectable position. After the meeting the members of the Lindley Club will dine together, and will be glad of the company of horticulturists who may wish to join them.

In the heraceous ground at Kew there is now in bloom the pretty herbaceous *SAPONARIA OCYANTHIDES MAJOR*. It has a close, creeping habit of growth, and the flowers resemble those of the Vinca, but are much smaller, and are borne freely at the extremity of the shoots; these are in colour pale pink. The plant is evidently well adapted for pot culture, or for rockwork. One of the gems of the gardens just now is the *Silene maritima* flore-pleno. It has a close dwarf creeping habit, Dianthus-like foliage, and large double flowers, pure white in colour, and as big over as a penny piece, that are borne singly on slim, wiry stalks. It is a true herbaceous plant. Near the latter is *Silene maritima* var. *rosea*, a single form, with pale rose cup-shaped flowers; it is, however, much less effective than the double kind. There is a large collection of *Aquilegia* in flower, but the

finest variety, *A.erulea* alba, is growing on the rockwork. The bed of *Aquilegia* evidently needs re-naming; as a dark blue is named *Aquilegia glandulosa* alba; a reddish peach kind, *A. Whitmanniana* alba; and *A. blanda azurea* alba is the purest white in the whole bed.

The annual exhibition of the WEST KENT HORTICULTURAL SOCIETY will be held on Saturday, July 3, in Camden Park, Chislehurst.

One of the most beautiful trees of the West Indies is *CALLIANDRA SAMAN*—a leguminous tree, often known as *Inga Saman*. It grows to a height of about 60 feet, and not only bears its flowers in great profusion, but also ripens its fruit in enormous quantities, producing large crops of Beans, which are very nutritious as cattle food, and of which cattle are very fond; indeed, in Trinidad they are said to form the principal sustenance of the cattle during the dry months. The timber also is very useful. So much is the tree valued in the West Indies that it has been introduced into the East in the hope of its proving as valuable there. Many other species of *Inga*, as *I. vera*, *I. spectabilis*, &c., are worthy of more general cultivation, not only for the ornamental appearance of the trees themselves, but also on account of the sweet pulp which is contained in the pods and surrounds the seeds, and is constantly eaten as food in the West Indies and South America.

Large quantities of *CITICORY*, it is stated, are annually imported into New Zealand for uses similar to those to which we put the root. The cultivation of the plant to supply the home consumption is strongly advocated in the colony, as is also that of the Beet-root for the purpose of sugar making. The soils of the plains, especially around Otago, are said to be eminently suited for its culture, experience having shown that the roots grown there are most abundant in saccharine matter.

The report made to LORD DERBY on THE TIMBER OF HONDURAS by MR. J. F. DEBROT, Vice-Consul at Orma and Puerto Cortés, confirms statements as to the value of the woods which have hitherto been regarded with some suspicion. The Vice-Consul gives a long list of woods produced in the country, most of which are, as the shareholders of the Inter-Oceanic Railway will be glad to hear, admirably adapted for railway sleepers. The dye-wood fustic is described as nearly imperishable, as superior to Oak, and a substitute for Teak in ship-building, and especially valuable for the knees of ships. There is a tree from the bark of which exudes the gum called dragon's blood, and *Pitch Pine* grows in great abundance. The majority of the forests are owned by the Government, though large tracts of land belong to private persons. The extent of timber-producing lands is estimated at about 5000 square miles, including a tract on the Atlantic coast extending 50 miles towards the interior, and about 500 square miles on the Pacific coast. On the Atlantic coast, where the principal forests are, the rainy season lasts from nine to ten months, while elsewhere it is only six months, with a result in this thinly-populated country, with a rich and virgin soil, the life of the planter is a struggle against the encroaching vegetation, cleared patches in the forests sending forth spontaneously a new growth of trees, and the quantity of timber which might be cut in a year, not only without permanent injury, but with benefit to the forests, which in many parts are impenetrable, would be from 20,000,000 to 30,000,000 superficial feet. The annual quantity actually cut is from 7,000,000 to 8,000,000 feet of which all but 1,000,000 feet are exported. In the last ten years 45,000,000 superficial feet more or less have been shipped, at a value of about £700,000; and of this quantity one-fifth went to the United States and the Continent, the rest to Great Britain. The woods exported comprised about 37,000,000 feet of Mahogany, 5,000,000 Cedar, 1,000,000 fustic, 1,000,000 other woods, 500,000 rosewood, and 500,000 other woods. Exact statements cannot, however, be obtained, "as the continued revolutions and changes of Government prevent the compilation." After this it is not surprising to learn from Mr. DEBROT that the capital employed in cutting and exporting timber is very small in comparison with the capacity of production. There are no Acts of the native Legislature on the subject of the forests.

In some notes on BRAZILIAN DRUGS in a recent number of the *Pharmaceutical Journal*, a root is mentioned as being used, in the form of infusion, extract, and powder, in chronic hepatitis, dyspepsia, &c. This root is known by the name of *Bütia*; its botanical origin, however, is not proved, but Mr. HOLMES, the author of the paper in question, states it to be almost identical in appearance and taste to the root *Paricora* *Leuca root*, which Mr. HANBURY has shown to be derived from *Chenopodium tomentosum*, R. et P. The most remarkable thing connected with this root is, that in a manuscript list

accompanying the specimens which were sent to the Museum of the Pharmaceutical Society, occurs the following passage:—"This root has a basic salt which unites with sulphuric acid, is white, &c., almost like that of Cinchona. It is exported to Europe in great quantities to adulterate quinine." On this point we have the authority of Mr. J. Moss, F.C.S., who has examined the salt, that he proves it to be sulphate of quinine. This matter is one of interest, which some of our readers may be able to throw more light upon.

— An interesting feature in the Old Nurseries, Cheshunt, is a trial of HYBRID PERPETUAL ROSES AS PILLAR PLANTS, and it may be of some service if we mention which sorts Messrs. PAUL & SON have proved to do the best. Judged by its beautiful pyramidal habit of growth, the best of all pillar Roses is Madame de Trotter, but it has the disadvantage of not continuing to flower very late in the autumn. *Maréchal Vaillant* is quite in the front rank, fine in form, and a mass of buds. Next comes Madame Victor Verdier. Cheshunt Hybrid, only planted two years, has made a fine growth, and is very free-

the crimson heads of the brilliant *Trifolium incarnatum*. What may be termed the Orchid swindle was in great force somewhat earlier in the season—roots of *Orchis mascula* being conspicuously labelled Bee, Spider, Butterfly, or Fly Orchis. The worst feature of this is that the vendors are clearly cognisant of the deception they are practising.

— The sixth annual exhibition of the WAKEFIELD HORTICULTURAL SOCIETY will be held in the Grammar School grounds, Wakefield, on Saturday, August 28.

— The planting of some of the LONDON CHURCHYARDS is a comparatively recent improvement of some importance. Those of St. Sepulchre and St. Andrew in Holborn, especially the former, are quite gay this year with spring flowers, and the space in front of St. Mary-le-Strand is occupied by some *Rhododendrons* in nice bloom, and a good thick Ivy border, which seems doing very well, as well as by other shrubs and plants. After the handsome frontage of some of the Paris churches—such, for example, at that of La Trinité, such ornamentation seems but

some of our readers can suggest appropriate additions to this list.

— Messrs. PAUL & SON have acquired a large collection of the so-called HARDY BAMBOOS, principally from Algiers, and we are glad to state that they all stood out through the past winter, at the Cheshunt Nursery, without being the least injured, and are now making capital growth.

— The *Horticultural Calendar* for March, published by LANG & CO., of Melbourne, relates the hardships occasionally suffered by INFERIOR GARDENERS, or men with no right to the title at all, seeking and gaining positions which their attainments and professional position do not warrant.

"In order, however, that employers might be assisted in their choice, and in order that gardeners might occupy their true positions, we would respectfully point out that the gardeners have a remedy in their own hands, and if they want to be in a better position they must help themselves. 'Who would be free himself must strike the blow.' Let them institute a Board of Examination, composed of two or three recognised leaders of the profession—men of whose

FIG. 153.—ROTHAMSTED, THE RESIDENCE OF J. B. LAWES, ESQ. (SEE P. 720.)

flowering, while at the same time it has grand foliage; Climbing Victor Verdier is very fine, flowering from the very bottom; Madame Thèrèse Levet is rather a slow grower, but fine when once established; Monsieur Boncenne is a fine old dark Rose, and splendid habit; Madame Clémence Joigneaux has very fine foliage, and a capital style of growth; Coup de Hèbe, Anna Alexieff, and Glory of Waltham, are amongst the best. For the same purpose, Paul Verdier, a Hybrid China, and Noisette La Biche have excellent characters; while for covering arches, nothing in Mr. GEORGE PAUL'S experience beats the old *Félicité Perpetual*. As regards the selection of Roses for covering pillars we may mention, as a useful hint, that according to Mr. GEORGE PAUL'S experience, all Roses which by their style of growth the best adapt themselves to pot culture always make the best pillar Roses.

— Some of our common BRITISH PLANTS are appearing in Covent Garden this year in unusual force for employment in bouquets. The elegant grasses, *Melica nutans* and *Milium effusum*, have been prominent; and the Woodruff, and even the Oxeye Daisy, appear to have found favour in the eyes of the bouquetists. The latter is indeed a strikingly handsome plant, and were it not so common, would be generally admired. We also noticed a large bunch of

small, yet it is a step in the right direction, and if the heavy railings which surround St. Mary's could be removed, the effect would be very good. We noticed the other day that the turf in front of the British Museum is composed in great measure of the Swine's Cress (*Senecioia Coronopus*).

— In the Cheshunt Nurseries may be seen a small group of small Conifers, which, on account of their neat habit and slow growth, are recommended by Messrs. PAUL & SON as the most suitable subjects for planting on graves. Most nurserymen have now and then to answer such questions as "What can you recommend me to plant on a grave?" and we think it a happy idea of the Messrs. PAUL to get together a group of GRAVE PLANTS, consisting for the most part of Retinospores, such as *R. plumosa alba*, *R. obtusa nana aurea*, *R. plumosa argentea*, *R. leptoclada*, *R. obtusa gracilis*, and the true *R. pisifera aurea*, which has brighter golden variegation than the form generally cultivated under that name; *Thuja occidentalis recurva nana*, *Cupressus Lawsoniana nana*, and *C. Lawsoniana alba spica nana*. *C. Lawsoniana lutea* will also be of value for the same purpose, if it does not prove to be too quick a grower. *Thuja pygmaea* is highly desirable on account of its very dwarf habit and pretty form of growth. Perhaps

integrity, impartiality, and skill there is no doubt. It is a vital point that the right man should be on this Board, or the whole scheme would be of no avail. No forward, blowing, presumptuous knaves should be allowed to force themselves into the Board, but educated gardeners, of sagacity and experience and honesty, should be sought out and placed there. To this Board of Examination let all gardeners submit themselves as to their professional education and their professional skill alone. It is not a matter of moral character that is to be here determined, it is simply a matter of professional skill or ability. Let there be four classes, and when a gardener applies for examination let him say in which class he wishes to be placed; let him furnish the Board with the necessary information, such as where he served his apprenticeship, where he was journeyman, where he was head gardener, &c. It will be found that there are men amongst us who have held positions in noblemen's gardens in Europe, who are acquainted with gardening in all its highest details, such as the cultivation of the Grape and Pine-apple and tropical fruits in hothouses, who have had charge of conservatories, and are thorough plantmen, and who design and lay off extensive grounds; let these men get first-class certificates. Then, there are many most excellent gardeners who have not had opportunities of growing Grapes, Pine-apples, or tropical fruits, or of designing plans for grounds, but who, nevertheless, can carry out designs on the ground according to plans, who are thoroughly acquainted with the cultivation of all

outdoor fruit trees, who understand how to grow in the best manner all sorts of outdoor vegetables, who are well acquainted with the details of the flower garden, and can cultivate greenhouse plants. Let these good men get second-class certificates. There are also many gardeners who have not had so much experience as the last class, who have hitherto been journeymen merely, who have a general knowledge of kitchen-gardening and flower-gardening, but who would not pretend to be men of thorough experience and skill. Let these men apply for and obtain third-class certificates, and when their knowledge and experience extends, let them apply for admission into the ranks of the higher class. Next let be the aim of the Board to establish a fourth class of good useful men—men who would be able to dig, rake, hoe, and sow seeds, who could groom horses, or milk cows, or clip the wings of hens; men who pretend to nothing more, and to whom a certificate from the Board would be of service, and let it be the duty of the Board to exclude from this class men who have no experience and no intelligence."

— We have been requested to publish the following communication relating to the statement made by the President of the Royal Horticultural Society at the meeting on May 25:—"As the solicitor for the gardeners who commenced actions and obtained judgments against the Royal Horticultural Society, I beg to deny the statement of Lord BURY that the actions were brought by the masters of the gardeners in their names. I was solely instructed by the gardeners, and I have paid the amounts recovered to them; and I have not, directly or indirectly, had any communication with their employers. *S. J. Robinson.*" [With reference to this communication we may state that a rumour, which we believe to be well founded, is prevalent to the effect that by the private initiative of one of the Councilors of the Society these claims have been settled. Such a sacrifice on the part of a member of Council should not be expected. *Eds.*]

— The following plants are now in flower in Mr. J. T. PEACOCK'S rich collection at Sudbury House, Hammersmith:—

<i>Cereus pectinifera</i>	<i>Mammillaria polygona</i>
" <i>harzeri</i>	" <i>villifera</i>
" <i>serotinosissimus</i>	" <i>argentea</i>
" <i>Mallossini</i>	" <i>hystrix</i>
" <i>leopopus</i>	" <i>mutabilis</i>
" <i>negligissima</i>	" <i>Fischeri</i>
<i>Echinopsis Scheelhausii</i>	" <i>capitata</i>
" <i>oxygona</i>	" <i>pyrocephala</i>
" <i>anemae</i>	" <i>Phyllocactus</i> , many sorts
" <i>Zuccariniana</i>	" <i>Echinocactus multistriatus</i>
<i>Mammillaria polyedra</i>	" <i>Wanderleyi</i>
" <i>recurva</i>	" <i>Kochii</i>
" <i>centrosephala</i>	" <i>bioides</i>
" <i>glochidiata</i>	" <i>myriostigma</i>
" <i>Wildiana</i>	" <i>namulosus</i>
" <i>sphaerocephala</i>	" <i>Grahamii</i> , many species
" <i>uberimamma</i>	" <i>Aloe nobilis</i>

— The inaugural dinner of the newly-established HORTICULTURAL CLUB took place at the Club-house, 3 Adelphi Terrace, Strand, on Wednesday evening last. Mr. JOHN W. PEARSON, in the absence of the Hon. and Rev. J. T. BOSCAWEN, who was unfortunately prevented from attending till late in the evening. The dinner was well attended by a thoroughly representative body of horticulturists, amateur and professional. We are informed that the prospects of the Club are very satisfactory, and it certainly seems likely to form a very suitable and central meeting place for horticulturists. It may be well to remark, at a different position prevails, that the Club, as a Club, has no politics, horticultural or general. It is intended solely to afford a meeting place for horticulturists, with the usual conveniences of a London club, at a very moderate rate.

Forestry.

AT this season of the year there is generally greater danger of woods, plantations, and forests being destroyed by fire than at any other, and there is scarcely any rural calamity, apart from the sacrifice of human lives and the destruction of dwellings so deeply to be deplored as that of a fine young, or indeed any plantation being devoured by fire. Any one who has beheld the disagreeable spectacle of a recently burnt plantation—the bare scorched surface of the ground, the charred skeletons, trunks, and limbs, and the red brown and half-decoloured branches and leaves, can testify to the sad and depressing feelings produced thereby, not to speak of the loss to the landscape, loss of shelter, and money loss, &c. It is often with a feeling of mingled delight and fear that I look upon some splendid woodland, knowing that a spark from a passing railway engine or lucifer match carelessly thrown down may in one brief hour lay all the leafy honours in one grim mass of ruins.

The maxim, "Prevention is better than cure," is strikingly applicable here, hence every precaution should be used to prevent fires occurring; and as many of them originate through neglect and carelessness strict attention and caution well-directed prevent them. The most common way by which woods are set on fire are by sparks from railway

engines, throwing down burning lucifer matches, persons lighting fires at peat mosses for boiling water, &c., and children at play making miniature fires in imitation of what is done at home.

In order, therefore, to prevent such fires occurring by these or any other ways every available means should be employed. Teachers in schools should instruct their pupils in regard to the dangers of fire-raising. Parents and guardians should be faithful in pointing out the risks and dangers attending it. Employers, and especially foresters, should on all fit and proper occasions seek to impress upon those under them the absolute necessity of exercising care and caution in the use of pipes in smoking, &c. In spite, however, of all due precautions fires will occasionally take place, and while they do so every prompt effort should be made to extinguish them. On most well-regulated estates cottages are erected on specially chosen sites, where a proper view can be commanded of the surrounding district and woodlands, in which cottages workmen employed on the estate reside. The watchmen in the cottages make it their special duty to look out in all dangerous seasons before going to bed, and also during the night as occasion requires.

A private arrangement should always be made between the forester and the men, and all others specially interested in the estate, both as to how communication is to be made amongst them, and what action is to be taken to extinguish the fire. Unless these are clear and well defined, so that each may know his place and authority, time may be lost, and thereby a wood be burnt, which otherwise might be saved.

One way of lessening the evils attending a burning wood or forest, is to prevent the fire from spreading, which is usually done by means of long bushy switches, the best of which are young Birch trees, or long branches, used like flails in the threshing out of grain.

Trenches are sometimes dug where a sufficient staff of hands is at command; clearances by cutting down the taller growths and barbing with the hands the lower surface growths, such as grass, Ferns, and Heath, &c.

The most effectual, and frequently the only practical way of arresting the progress of the flames of a furiously burning wood, is to advance a considerable distance ahead of the fire and take advantage of the nearest roadway, footpath, ditch, water-run, dyke, or other breakage or opening through the wood. Draw a match, ignite a tuft of heath, or grass, &c., and run along that side next to the advancing flames. Care must be taken on lighting that the fire does not cross to the opposite side, otherwise the evil would be increased rather than cured. The newly lighted tuft burns on towards the advancing fire, slowly but no doubt as it is burning against the wind, and when the two advancing fires meet, like hostile armies in the battlefield, death is the speedy result.

A fire newly lighted burns with much less force than it afterwards does when the air becomes heated, after which I have heard it rush and roar like a mighty torrent, the flames leaping from tree to tree in maddened, wild, but terrific grandeur.

Every forester, and those who set with him in case of fire, should know thoroughly every part of the ground—roads, ditches, drains, fences, swamps, ravines, &c., so as to be able to go to any part, whether by night or day, and do what under the circumstances is considered best. After a fire has occurred, it should be diligently watched, even after the external appearances of fire have disappeared, and no attempt should be made to cover up and smother the burning embers, but, on the contrary, every part suspected of concealing a single spark should be dug out and watered. In some cases, when peaty soils occur, or old tree roots exist, the extinguishing process is both tedious and expensive, but it must not on these considerations be given up, especially with the prospect, or at least hope before us that a copious shower of rain will terminate the ills. *C. Y. Michie, Cullin.*

BURRS.

MOST of our readers must be familiar with the enormous "burrs" which are so common on Elms, and which are found also on other trees. They consist of a huge swelling of the woody tissue, and an enormous increase in the number of buds. These buds lengthen into shoots, and thus produce a most singular appearance. The exciting cause of these formations is not known in most cases, but it is very probable that it is connected with insect agency.

In the specimen which we figure (fig. 154) a chaffinch had built its nest amid the branches. We suppose Mr. Miles, who kindly forwarded us the burr, has rather more birds than he wants, else we could have wished he had left the nest undisturbed. Nay, we are not sure, with a view of preventing the disfigurement of his trees, it would not have been the best policy to have preserved the birds.

Reports of Societies.

Royal Horticultural: June 2. — W. Burnley Home, Esq., in the chair. The Rev. M. J. Berkeley announced the awards made by the Fruit and Floral Committees, and called attention to the more interesting subjects brought under notice, and amongst them some fruit of what was called the Improved Orleans Plum, and which was well recommended for pot culture. A nice dish of Peaches had also been received, but without a name, and it was very difficult to say what it may be in the absence of shoots or any information as to the size of the flowers. The same observation applies equally to Plums as to Peaches. It is necessary to see the young shoots and leaves, and more especially of Peaches, where the flowers vary so much in different varieties, and where the presence or absence of glands in the leaves is of so much importance. The Fern-leaved Parsley shown by Messrs. James Carter & Co. would, he thought, be most useful as a bedding plant, as well as for garnishing purposes. Mr. Webb, the chairman of the Fruit Committee, had brought some young Pears destroyed by the grub of the more dipterous insect, but in the absence of an eminent entomologist, the meeting of the Scientific Committee they had not been able to determine what it was. Mr. Berkeley also brought up himself specimens of Apple-shoots destroyed by an oldism, and which could only be cured by the application of sulphur, as in the case of the well-known Vine mildew. Another subject he might mention at the same time was that a caterpillar sometimes joins the petals together like a sort of cupola, about the time when they ought to drop off, and the crop would certainly be destroyed if such flowers were not picked off as soon as they are found. He (Mr. Berkeley) had had an opportunity of going over the gardens at Chiswick on the previous day, and he had never seen them in a more flourishing condition. They were now doing with the Onions what they had last year done with the Potatoes. The crop of fruit on everything outside was unprecedentedly heavy; the orchard-house had a good and regular set; the same was experienced with the other stove cordons, Peaches in the glass wall, and at the present time the trial of bedding Fansees and Violas was most interesting.

SCIENTIFIC COMMITTEE.—Dr. J. D. Hooker, C.B., Pres. R.S., in the chair.

Albion's Leaves of Telfairia pedata.—The Rev. M. J. Berkeley alluded to some specimens sent to a previous meeting by Dr. Moore of Glasgow, and which, in addition to other changes, had some small white spots on them which Mr. Berkeley stated were caused by a species of *Depazea*. Mr. Berkeley had also found a common mould, *Cladosporium herbarum*, on the leaves, but this was a consequence not a cause.

Galls on Yew caused by Tetranychus Taxi.—Professor Thistleton Dyer mentioned, with regard to Mr. Murray's communication on *Tetranychus Taxi*, printed in the *Gardener's Chronicle*, May 22, p. 659, that his acarid did not, as far as he had observed, attack the ordinary buds, but only those containing the female flowers. They appeared to feed on the ovule and the adjacent scales, while the external scales became brown and withered. He had also found the same mites on a large *Yew* at Kew, and as this also bore the curious so-called "galls" alluded to by Dr. Masters, he thought it not impossible that these replaced the female flowers which had been destroyed. Properly speaking, they were not galls, although they might be regarded as shoots abbreviated in their growth by the action of the acarid, but only tufts of leaves in which a spiral instead of the usual distichous arrangement obtained. The question was whether these tufts had anything to do with Mr. Müller's galls? He might venture to correct Mr. Murray with regard to the minute transverse striae. In the examples he had met with, these striae were quite as evident as in the *Curtis* bud mite.

Dr. Masters inquired if it were an ascertained fact that the female plant was alone affected, and stated that after all the arrangement of the leaves was not essentially altered. The normal arrangement is spiral, and it is only by torsion of the leaf or of its stalk that the leaves appear to be all in one plane, in the case of the *Yew*. In the so-called galls the leaves are not twisted, but each develops in the same plane as that in which it originated.

Leaf Galls of Spemann, Pair, &c.—Mr. Berkeley showed specimens of galls on *Spemann* leaves, and on the variety called *Leopoldi*. These galls were produced by a four-legged acarid of the genus *Volvulifex*. In the case of the Pears the galls were produced by a very minute acarid, but another species (*Tyldromus* sp.) was also found on the same leaves, and occasionally entered the cavity made by the first.

Hypoxylon ostraceum.—Mr. Berkeley showed specimens of this, which he supposed to be a fungus, and was figured by Bulliard, in fig. 3, p. 10, as such. It had been referred by Fries to *Lophium mytilinum*, but was really, as Soverby was aware, the cocoon of a midge. Mr. Berkeley has forwarded to Professor

Westwood two similar cocoons, one found on a fungus, *Laccaria* delicious, and of which he had seen the perfect insect, and the other on dead decorticated wood. Professor Westwood is understood to be preparing a memoir on the three.

Oidium on Apple Blossom.—Mr. Berkeley showed specimens in which the petals and other parts were distorted by the presence of a white mould (*Oidium*). **Apelaloe Lychinis.**—Mr. Berkeley also showed flowers of the common *Lychinis diurna* in which the petals were abortive.

Grub Pests.—The same gentleman showed Pears destroyed by the larva of a dipterous fly.

Fruiting of *Hibiscus rosa sinensis*.—Professor Dyer showed fruits of this species obtained by artificial fertilisation by Mr. W. Gorrie, The Gardens, Mauldsie Castle, Carlisle. This is the more interesting as in India and China the plant is not known to produce ripe fruit, and is always propagated by cuttings. In Barbados, on the other hand, in the garden of General Munro, the plant produces its capsules.

On the Packing of Living Plants for Transport.—Mr. Murray read the following paper on this subject:—

"I have hesitated whether to make my present communication to the Floral Committee, or to this committee of the Floral Committee are undoubtedly better qualified to pronounce upon its practical merits than we are, but whether wisely or not, they seem to prefer to deal with results rather than processes, and as these generally depend upon some scientific principle, it is perhaps quite in my power to be taken up by this committee. I have been led to bring the subject under your consideration by finding that the mode of packing for transport adopted in Japan is quite different from ours, and as it is successful, it appears to me desirable that we should examine it with the view of ascertaining whether it embodies any hint that may be adopted with advantage by ourselves. I am not at all challenging the excellence of our present practice. All that I say is, that if it can be improved we should try to do it. I have seen a bundle of plants a fortnight on the way arrive not much the worse, but I presume all nurserymen must be familiar with reclamations from their customers for injury sustained by these packages not being delivered in time. Now if by any new plan we could make them keep for twice as long unharmed I imagine it would be a great boon to them, and it is when the Japanese do, and their process is to shake the earth entirely from the roots of the plants, and then to envelop them carefully in a kind of stuff seemingly a mixture of dust, saw-dust, fibres, and *debris*, of which I exhibit a portion, and which keeps the roots from injury and from the air during the transit.

"The way in which I happen to know about it is this: I have a brother in San Francisco who, as perhaps some of the committee know, is something of a horticulturist. Last season he imported some young living plants of certain species of forest trees from Japan. They arrived in perfect health, packed in the material I have just shown. Struck by the success of the plan, he immediately repacked a portion of the envoi in it and despatched it to my sister in Edinburgh. When they reached her most of them were unscathed, but a few were two or three well showed signs of life, and it is only now, some months subsequently, that she has given up all hope of bringing them through. They also are dead. Now the committee will remember that the distance from Yokohama to San Francisco is 5773 miles, which, at the rate of 300 miles a day, about occupies twenty days. The breadth of the Atlantic between New York and Liverpool is only 9080 miles, and including the transit across the continent from St. Francisco takes twenty-three days. The plants thus kept well for twenty days, and if they had remained unpacked there seems no reason to doubt that they might have done so for some days longer. Nurserymen will be able to say how far the degree of success here indicated is worth pursuing and experimenting upon. Our business, I apprehend, is rather to look at the physiological principles required for success, and say whether they can be obtained by the means used. The Japanese and European cultivators will both start from the same point, viz., shaking the earth from the roots. This, undoubtedly, is sound. There is nothing equal to earth for growing plants, and nothing worse for transporting them, so do not break it up by tramping it about the earth or in earth still attached to the roots. The object of that is to prevent disturbance, breakage and exposure, and where plants can be transported to their destined place of growth so protected, whether with a bound up ball of earth or in a flower-pot, no more weight can be improved upon it by shaking off the earth, but where they are to travel so unprotected and for such a distance or time that the earth will dry up and crumble and break away, it can serve no purpose but to injure the more delicate parts of the roots by rubbing against them.

It is in the next stage that the difference between the Japanese and European packing takes place. The European ties the roots up tightly, puts moss about them (often moistened with water), and then wraps them up carefully with matting. The Japanese does the same, more gently, fixes up the moss about them with his padding, more loosely, covers them with matting. I do not know for certain whether he moistens his padding at starting or not—I believe not. There is no appearance of it ever having been wet—no adhesion—no portions sticking together, and I am sure that the more cottony padding in the plan in all cases, except where we can calculate on the plants arriving before the moisture has evaporated, is to give no moisture. Moisture about the roots is not an absolute requisite for the survival of plants,

In dry summers we have plants living with the earth about their roots as dry as a bone for a foot down. It is the exposure to the air that does the mischief—not the want of water. Every cultivator knows that a plant left with its roots bare will sustain more damage in a couple of hours than another with them covered will in a week. The great secret of successful transmission of plants with the roots out of the earth is the exclusion of air from them, and in my judgment the Japanese plan does this more effectually than our European practice, besides injuring the rootlets less."

In the discussion which followed, Dr. Hooker stated that nothing was so objectionable as packing plants both loosely and moistly. Mr. Smeed stated that he was in the habit of sending plants packed dry but firmly in India-rubber bags. Dr. Masters spoke favourably on the plan of packing firmly with dry sphagnum, where the size of the plants permitted.

Coccus on *Trichophila*.—Mr. Murray showed specimens of an undescribed coccus on the leaves of a *Trichophila*, on which further remarks will be made on another occasion.

Larch Disease.—Referring to this subject, brought before the committee by Mr. Murray at a recent meeting, Professor Dyer called attention to a paper of Dr. Moritz Wilkomm, entitled "*Der Rinderkrebs der Larchenkrankheit*" (the bark-cancer of the Larch disease). Dr. Wilkomm refers the disease to a fungus which preys on the young layers of wood, and which he calls a species of *Corticium*, but Mr. Berkeley stated it to be *Fezzia pulchella*. Dr. Hooker stated that *Larix Griffithii* was entirely killed by it.

FIG. 154.—BURK ON ELM.

Mr. Murray believed the disease was due to climatal changes rather than to the fungus, which he considered to be a consequence, not a cause.

Rev. M. J. Berkeley considered there were two diseases—one the "pump disease," the other which originated when the roots arrived at a hard "pan" which they could not penetrate. Mr. Berkeley had only seen the fungus in the latter class of cases.

Mr. Murray thought they were not two separate diseases, but merely stages of one.

GREAT SUMMER SHOW.—It was not to be expected, after the extraordinary remarks upon gardeners and their employers which fell from the President and Treasurer at the late special general meeting, that the large tent usually called into requisition at the June show would be wanted on this occasion, but we were not quite prepared for so excellent a display as Mr. Barron was enabled to place before the Fellows in the arcades, thanks to his own exertions in the matter, and especially to the liberality of Mr. Bull, whose prizes for new plants brought out a splendid competition, and who himself had a glorious day in the matter of prize-winning, besides having the honour of showing perhaps as good a dozen new plants as were ever staged, and which will be found more fully alluded to below. A word of praise is also due to Mr. Barron for the admirable manner in which the show was arranged. There is no place more difficult to deal with artistically than these arcades, yet by the judicious grouping of the fine-foliated plants, of which there was a decided preponderance, and by the regular dispersion amongst them of the groups of flowering plants at his command, he certainly extracted more beauty out of the situation than we have been in the habit of seeing.

Fine-foliated plants were very well represented, not by the large plants we usually see, but by young and fresh examples of the more recent introductions. Mr. Wills had the best six amongst nurseries—a very effective group. Mr. Bull had a dozen fine young specimens in the open class, including the very distinct *Acanthorrhiza Warszewiczii*, *Verschaffelia splendens*, *Geonoma pumila*, *Oncosperma Van Houtteanum*, *Dæmonorops palambianus*, *Cocos Weddelliana*, &c. The best couple of *Beaucarnea* were contributed by Mr. Croucher, gr. to J. T. Peacock, Esq., and the same exhibitor also came in with six distinct *Yuccas*, with fine specimens of *Y. Mooreana*, *Eylisii*, *alcolia variegata filifera*, *alcolifera mucronata*, &c. Mr. Bull and Mr. Wills each contributed very pretty groups in the class for twenty fine-foliated plants, and the prizes went in the order we have given above. *Croton Veitchii*, *Pandanus Veitchii*, *Paullinia thalictrifolia* on a flat wire trellis, *Geonoma Seemannii*, *Cycas imperialis*, *Croton Weismanni*, *Dæmonorops cinnamomeus*, and *Aralia Veitchii* were superbly shown by Mr. Bull, and the smaller examples of various *Draenas*, *Cycads*, *Pandanus*, *Dieffenbachia* and *Palms*, &c., from Mr. Wills, were most creditable. A group of twelve plants from Mr. J. W. Wimsitt, King's Road, Chelsea, and which took the 1st prize, were also very effective—not large, but very handsome. For six *Cycads* Mr. Bull came in 1st, with a particularly fine group, including plants of *Enecephalartos majesticus*, *Cycas revoluta*, *Macrozamia spiralis*, with grand trunks, and handsome specimens of *Enecephalartos Brownii* and *E. villosus*. Handsome specimens of *Dasyliiron longifolium glaucum* and *D. acrotrichum*, shown by Mr. Croucher, gr. to J. T. Peacock, Esq., were the best in their class. The class for *Draenas* and *Cordylines* was an uncommonly good one, the competition being very strong between Mr. Bull and Mr. Wills. The former was 1st with very fine, well-coloured and very fresh specimens of *Baptistia*, *Regina*, *Mooreana*, *Shepherdii*, *Rex*, *triumphans*, *Chelsoni*, *Fraseri*, and *Goldieana*, the latter being over 2 feet high, and a very striking object, so distinct is its foliage and variegation. Mr. Wills' 2d prize collection the most noticeable were *Knurkiana*, *Youngii*, *Shepherdii*, *amabilis*, *Mooreana*, *Rexiana*, and *Macleyi*—a nice specimen of a plant difficult to grow.

In the Davis Competition the 1st prize went to the only exhibitor, Mr. W. Kemp, gr. to the Duke of Northumberland, Albury Park, Guildford, who had very nicely flowered half specimens of *Aphelaxis marcantha purpurea*, *Darwinia tulipifera*, *Boronia serrulata*, *Acrophyllyum venosum*, *Erica Cavendishiana* with wonderfully bright flowers; *Clerodendron Balfoarium*, &c.

In the amateurs' class for six greenhouse *Azaleas*, Mr. Batty, gr. to R. Thornton, Esq., Sydenham Hill, came in 1st with large and generally well-flowered examples, the best being of *Burlingtoni* and *Iveryana*. The premier award in the nurserymen's class for eight went to Messrs. Ivery & Son, Dorking, for a showy group; and the same firm also took another 1st prize with a capital group of fifteen.

There was no competition in the amateurs' classes for nine and twelve *Orchids*. Mr. Douglas, gr. to F. W. Whitmore, Esq., Loxford Hall, being the only exhibitor in both cases, and 1st prizes were awarded to him. The North American *Cypripedium spectabilis* was nicely shown with four flowers; *Mastelleya Harryana* had six very finely-coloured flowers; *Cattleya Warneri*, *Lælia purpurata*, *Dendrobium Farmeri*, *D. Bensonae*, and *Oncidium phymatocilium*, &c., were represented by nicely-flowered plants.

Hardy Ferns were remarkably well shown by Messrs. Ivery & Son and Mr. R. Parker, the former gaining the first position, and the exceedingly well grown lot, including *Lastrea Filix-mas cristata Iveryana*, *L. Filix-mas grandiceps*, *L. Filix-mas Hollandica*, *Athyrium Filix-femina Fieldiae*, *A. Filix-femina corymbiferum*, &c. Mr. Parker had *Adiantum pedatum*, *A. Capillus-Veneris*, *Scopolendrium vulgare crispum*, *Athyrium Filix-femina Moorei*, *Lastrea Filix-mas palacea cristata*, &c., in a very fine condition.

There was only one group of six *Lilies*, and to these, which came from Mr. Bull, the 1st prize was voted: the forms represented were *aratum*, *pyrenicum*, *flavum erectum*, *Sovitzianum*, "tigrinum" splendens, and *bulbiferum umbellatum*, and all were nicely flowered. In herbaceous plants Mr. Parker was again to the fore, with grand plants of various *Paeonies*, *Pyræthrums*, *Thalictrum rubrum*, *Lupinus*, *Iberis*, *Spiræas*, &c. The 2d prize went to Mr. R. Dean, Ealing, with a neat group, including the bedding *Ranunculus Othello* and *Viola Mulberry*, *Sedum lydium*, *Scilla peruviana alba*, *Scilla amabilis*, *Garganica*, *Polemonium*, &c. Mr. Dean also showed cut spikes of the Giant White Brompton Stock, deliciously scented like the Clove.

For twelve new plants (*Orchids* excluded) Mr. Bull was 1st, with a magnificent group, which included grand specimens of *Aralia Veitchii*, 5 feet

high. Croton majesticum, 3 feet high and the same through, finely coloured; Anthurium crystallinum, with capital foliage; Kentia Moorei, very fine; Draena Hendersoni, Phyllostemum Lindenii, a Caladium-like plant, with very boldly marked white venation—a specimen 4 feet over; Croton imperiale, Pritchardia grandis, a grand Palm; Draena Goldieana, Plectocoma Leuzannea, Draena Baptisti, and Croton spirale, a remarkably good specimen of a deep bronze colour. The best group of new plants probably ever staged. Mr. B. S. Williams was 2d, with *Alophia australis* Williamsii, *Cyathia Burkei*, both very fine specimens; *Zamia Lindenii*, *Draena amabilis*, D. Shepherdii, D. Fraseri, *Croton majesticum*, *Metroxylum flavae*, &c. Mr. Bull was also 1st for one Orchid in flower and not in commerce, with *Odontoglossum Roezlii* album, and also for six new plants (Orchids excluded), with *Blandfordia princeps*, *Pritchardia grandis*, *Draena Goldieana*, *Lomaria dobrotydensis*, *Croton picturatum*, and *Draena canescens*; and also for one new plant in flower, with *Blandfordia princeps*. The 1st prize for six Crotons also went to Mr. Bull, who had charming specimens of *majesticum*, *spirale*, *undulatum*, particularly fine; *volutum*, *Weismanni*, and *Youngii*.

A silver medal was voted to Mr. John Wills for a large and effective group of *Draenas*; and to Mr. John Laing for a large and attractive group of foliage and flowering plants; to Mr. B. S. Williams for a beautiful group of stove and greenhouse plants; and a gold medal to Mr. John Wills for perhaps the largest and most tastefully arranged group of miscellaneous plants ever staged. A grand lot of plants.

MR. BULL'S PRIZES FOR NEW PLANTS.—Mr. Bull had the pleasure of seeing a splendid competition for his liberal prizes; and as the result of a beautiful prize and perseverance, that such a grand lot of new plants should have been introduced by him within three years. The 1st prize amongst nurserymen in the class for twelve new plants sent out since the commencement of 1872—the competition being confined to those who have never won one of these prizes before—went to Mr. H. Wright, Lee, Kent; Mr. W. E. Dixon, Norwood Nursery, Beverley, being 2d; and Mr. Cypher, Queen's Road, Cheltenham, 3d. Mr. Wright's group was composed of finely-grown examples of *Draena baccharis*, *nobilis*, *Draena Baptisti*, D. Shepherdii, D. splendens, D. imperialis, and D. Fraseri, *Alocasia illostris*, *Gymnogramma decomposita*, *Plectocoma Andersoni*, *Croton majesticum*, *Demonorops palembanica*, *Maranta Makoyana*. In the corresponding class for amateurs the 1st prize was well won by Mr. G. Legg, gr. to S. Ralli, Esq., Thornton Road, Clapham Park, who had a fine specimen of *Diplazena Brearleyana*, nicely coloured, large and bushy; *Draena baccharis*, *nobilis*, *Draena Shepherdii*, D. Bapstii, *Plectocoma Leuzannea*, *Aralia Guilfoylei*, *Alpinia vittata*, *Croton volutum*, C. spirale and C. majesticum, &c. Mr. J. Coomber, gr. to Lient-Col. Wilkinson, Fitzroy Park, Highgate, was 2d, with a capital lot; and Mr. E. Pilgrim, Fern Lawn, Pitville Crescent, Cheltenham, was 3d. In the class devoted to amateurs, without any restrictions as to previous competitions, the premier award was easily won by Mr. Goucher, gr. to J. T. Peacock, Esq., who had a fine specimen of *Demonorops perianthica*, *Gulielmia utilis*, *Demonorops palembanica*, and *Draena metallica*; also nice specimens of *Aralia Guilfoylei*, *Maranta Makoyana*, *Macrozamia elegantissima*, *Draena ornata*, *Nidularium spectabile*, and *Kentia canterburyana*. Mr. G. Legg was again a prizewinner in this class, taking 2d honours, with Mr. E. Pilgrim 3d. In the corresponding class for nurserymen the competition lay between Messrs. J. & R. Pine, Great Western Nursery, Norwood, and Mr. Wimsitt, the prizes being awarded in the order named. *Macrozamia plumosa*, M. spiralis *eburna*, *Demonorops palembanica*, *Enceltharatos villosus* ampliat, and *Draena Shepherdii* were very finely shown in Messrs. Thyne's group. Mr. Wimsitt had the largest mass of *Maranta Makoyana* we have ever seen, while many of the plants named above were nearly done here.

FRUIT.—The display of fruit for the season was very good indeed, especially the Black Grapes and Strawberries. The finest dish of Black Hamburgs, a nicely finished lot, came from Mr. Douglas, gr. to F. Whitbourn, Esq., who was followed by Mr. G. Brush, gr. to Lady Hume Campbell, High Grove, Fife, and Mr. Bammer, gr. to Lord Bagot; colour and size of berry were good points in these. Mr. Harrison, gr. to Lord Derby, Knowsley, Mr. Bones, gr. to D. McIntosh, Esq., and Mr. J. Lane, gr. to General Fyche, also competed—Mr. Harrison's bunches and berries being particularly fine for the time, but not so well finished as some of the others. The best Muscats of Alexandria came from Mr. Bones, gr. to D. McIntosh, Esq., Havering Park, Mr. Douglas, Loxford Hall, and Mr. Stenning, 10, St. Mark's, Essex, but they were all wanting in colour, though in other respects good; Mr. Douglas was 1st,

with three bunches of Buckland Sweetwater, and in another class for White Grapes with the Canon Hall Muscat, fine in the berry. In the same class Mr. Bammer, gr. to Lord Bagot, was 1st with first-rate Foster's Seedling; Mr. Earley, the Gardens, Valentines, was 1st with three fine bunches of Red Froggnan; Mr. G. T. Miles, gr. to Lord Carrington, had the 1st prize for two smooth Cayenne Pines; and a bronze medal was voted to Mr. Harris, gr. to Mrs. J. H. Vivian, Singleton, Swineshead, for a very handsome fruit of the same variety. In the class for any other variety Mr. A. Grant, gr. to J. B. Glegg, Esq., Wittington Hall, Chelford, was 1st with a handsome Black Prince, Mr. Miles being 2d with a fine Charlotte Rothschild. Read's Hybrid was the best scarlet-fleshed Melon, and Colston Bassett the best of the green-fleshed section—fine fruits of both varieties being shown by Mr. Gilbert, gr. to the Marquis of Exeter, Bury Park, Stamford. Mr. Miles was 1st for Peaches, with Striding Castle; for Nectarines, with Elrige; for Cherries, with Elton and Black Cirassia; and for Figs, with Brown Ischia and White Marselles, all being of good quality. President, Sir Joseph Paxton, Sir Charles Napier, and British Queen Strawberries, were also well shown, the chief winners of prizes being Mr. Douglas and Mr. J. Pottle, gr. to Sir R. Wallace, Ludbourne Hall, Suffolk. In the miscellaneous class a bronze medal was voted to Mr. Mills for a splendid dish of the large red Tomato, and some very fine Chillies.

MESSRS. SUTTONS' PRIZES.—The competition for these prizes was very limited. The best six dishes of Peas, and a remarkably fine lot, came from Mr. W. G. Pragnell, gr. to D. W. Digby, Esq., Sherborne Castle, Dorset, who staged half a peck of nicely-filled pods of each of the following sorts:—William the First, Suttons' Kingleder, Maclean's Little Gem, First Crop (blue), Suttons' new early dwarf wrinkled Pea, Bijon, &c. In the same class the only other exhibitor was Mr. Brown, gr. Pawley Court, Henley-on-Thames, who was disqualified, on account of his dish of Peas of the stimulated variety, Bijon, not being of that variety. There was only one exhibitor in the class for four sorts each of Melons and Cucumbers—Mr. J. Read, the Gardens, Arley Hall, Northwich, to whom the 1st prize—a gold medal and three guineas—was awarded. His Cucumbers consisted of Suttons' Duke of Connaught, Marquis of Lorne, Tender and True, and Rollison's Telegraph; and the Melons staged were Read's Hybrid, Golden Perfection, Suttons' Royal Horticultural Society's Prize, and Suttons' Hero of Both. None of these were cut, so that judgment of their quality must go by default.

MESSRS. CARTER & CO.'S PRIZES.—Messrs. Carter & Co. likewise offered prizes for six dishes of Peas, to include Carter's extra early Premium Gem, Maclean's Blue Petal, Carter's First Crop, and Carter's White Gem; but the competition was confined to the same exhibitors as in Messrs. Suttons' class, and the 1st prize again went to Mr. Pragnell, who had, in addition to the stipulated varieties, Laxton's Unique and William the First, all of very fine quality. Mr. Brown was 2d.

FLORAL COMMITTEE.—R. B. Postans, Esq., in the chair. A First-class Certificate was awarded to Messrs. Cripps & Son, Tunbridge Wells, for *Clematis* Lord Nevill, mauve-lilac, with a purple bar, the sepals possessing remarkable substance, but lacking the refined finish which is so great a characteristic in the Messrs. Jackson's most recent novelties. A Second-class Certificate was also voted to the same firm for *Clematis* Lady Alice Nevill, a scented rosy lilac flower, with mauve bar, and fairly good form. The Messrs. Cripps also exhibited small plants of *Quercus striata*, an Elm-like shrubby-habited plant with golden venation, not very bright at present but will no doubt come more decided in colour as they become older; and *Cateagus filicifolia*, a very pretty form with the leaves cut in a similar manner to the pinnae of *Adiantum farleyense*. The above are shown in the nursery at present, but in its natural colour, as we saw it a few days ago in Messrs. Paul & Son's nursery at Cheshunt, it is a charming plant. Mr. John Webster, gr. to the Duke of Richmond, Gordon Castle, sent a boxful of cut blooms of choice seedling hybrid *Aquilegia*; and from G. F. Wilson, Esq., Heatherbank, Weybridge Heath, came a flowering plant of *Lilium Hansonii*, which is the same as the *L. maculatum* var. *avencampii* of the *Botanical Magazine*, tab. 6166. According to the rules of priority the plant must now be known as *L. Hansonii*, as it seems that Mr. Max Leichtlin had it under that name before Mr. Wilson's plant—which was bought, unnamed, in 1871—flowered, and was named by Dr. Hooker last year. A Second-class Certificate was awarded to it. Mr. Wilson also showed flowers of *L. Thunbergianum* splendens, of a fine rich orange colour, and large form. Messrs. Kelywey & Son, Langport, showed some nice *Vibretums*, and Mr. Bull had a First-class Certificate for *Oncidium curtum*, distinct and pretty species, with broadish

bronzy petals and sepals, and a broad, smooth, yellow lip, edged with chocolate, and somewhat fringed. A similar award was also made to Mr. B. S. Williams for *Polystichum lepidocaulon*, figured and described in our columns at p. 202. From the Tweedside Vineyard Mr. Thomson sent a remarkably fine cut spike of *Vanda suavis* with nineteen flowers. A Second-class certificate was voted to Mr. Bull for *Pelargonium* Prince of Wales, a useful decorative variety of a rich vermilion red colour with a pale centre and frilled edges. From Messrs. Veitch & Sons came *Cypridium selligerum*, a hybrid between *C. levigatum* and *C. barbatum*, partaking in a modified degree of the character of both parents, and a fine lot of cut blooms of hardy bulbous plants, the greater proportion being pretty forms of *Kiaks*. The thanks of the committee was accorded.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. Mr. James Batters, gr. to Willis Fleming, Esq., Chilworth Manor, Romsey, sent a Smooth Cayenne Pine of handsome proportions, and weighing 5½ lb weight, which deservedly gained a Cultural Commendation, being a most creditable production for the time of year. J. J. Watts, Esq., Whitley Farm, Devon, sent specimens of Improved Orleans Plum, which is said to adapt itself admirably to pot culture, and which also gained a Cultural Commendation. Mr. J. Booth, gr. Osmaston Manor, Derby, had examples of Wright's Favourite and Osmaston Manor Hybrid Melons, both being pale or white-fleshed, and either not ripe or the flavour not fully developed. Messrs. James Carter & Co. showed admirable examples of their new Fern-leaved Parsley—the most curled of all curled Parsley, and a desirable substitute for the ordinary good Peaches, not named, came from Mr. Gardiner, gr. to E. P. Shirley, Esq., Lower Etoning Park; and Mr. Cox, Redleaf, contributed a fine specimen of *Polyporus squamosus*.

Cystal Palace: May 29.—This exhibition proved to be a very good one, and an improvement on several of its predecessors. In the matter of arrangement there was also a noticeable change for the better, due to the sagacity and taste of Mr. F. W. Wilson, the Master of the Ceremonies, while one of the most striking features in the Palace was a large group of Palms, Tree Ferns, and other fine-foliated plants, tastefully grouped opposite to the Handel Orchestra by the Palace Company's garden superintendent, Mr. Thomson, under whose management the plants in the interior of the Palace have been greatly improved by judicious thinning. Stove and greenhouse plants, and especially *Azaleas*, were contributed in considerable numbers. The Orchids were not quite so good altogether as we have seen them, while the pot Roses were very fine, and the show *Pelargoniums*, as a class, were much better than usual. The class for groups of stove and greenhouse plants arranged for effect led to a spirited competition, the groups from Mr. John Wills, Onslow Crescent, and Mr. Warren, gr. to A. Mongredien, Esq., Forest Hill, being so good that equal 1st prizes had to be awarded.

Many of the fine specimens of stove and greenhouse plants had already done duty at Regent's Park on the previous Wednesday, but they came out here wonderfully fresh again. The leading class was for twelve, confined to nurserymen, and Messrs. Jackson & Son, Kingston, came in 1st, followed by Mr. B. S. Williams, Holloway, and Mr. E. Morse, of Ipswich. *Azalea peninsulifolia* and *Roi Leopold* were very fine in Messrs. Jackson's collection, and Mr. Williams had *Allamanda grandiflora*, *Clorodendron Balfoianum*, *Diplazena amabilis*, *Mediella magnifica*, *Azalea Criterion*, &c., all well represented. The amateurs' class for nine was a very good one, Mr. Ward coming in 1st, and equal 2d prizes awarded to Mr. B. Peed, gr. to Mrs. Tredwell, St. John's Lodge, Lower Norwood, and Mr. W. Chapman, gr. to J. Spode, Esq., Hawkesbury Park. Mr. Ward's plants were in fine condition, but as we have mentioned them before, we must pass on to an important addition to Mr. Chapman's group of a splendidly flowered *Ixora*, Prince of Orange. Mr. Peed had *Francisca calycina* and *F. confertiflora*, very finely flowered, also well-flowered specimens of *Eriostemon pulchellus*, *Clorodendron Balfoianum*, and *Erica Cavendishiana*, &c. Mr. B. S. Williams was the only exhibitor of twelve fine-foliated plants, and deservedly obtained the 1st prize, while in the amateurs' class for six the chief award went to Mr. Legg, gr. to S. Ralli, Esq., Thornton Road, Clapham Park, with the same group he had at Regent's Park. Mr. W. Chapman was 2d, and Mr. W. Child 3d.

In the class for nine *Draenas* there was only one exhibitor—Mr. John Wills, and the 1st prize was awarded to him. The group consisted of very fine examples of *Mooreana*, *Shepherdii*, *Youngii*, *Baptisti*, *amabilis*, *Weismanni*, *regina*, *exelsa*, and *Denisoniana*, all well coloured.

The 1st prize for nine Orchids went to Mr. J. Ward,

who had, amongst others, nicely-flowered plants of *Odontoglossum Pescatorei*, *O. crispum*, *Oncidium sarcoides*, *Cattleya Mossie superba*, *Dendrobium thyriforme*, &c. Mr. Walter Gray, gr. to H. Smithies, Esq., Spring Grove, Lawrie Park, Sydenham, took the 2d prize with a group consisting of nicely-flowered examples of *Dendrobium Devonianum*, *Cattleya Mossie grandiflora*, *Dendrobium Dalhousianum*, *Odontoglossum crispum*, *Cattleya labiata*, &c. The 1st prize for six also went to Mr. Ward, Mr. Child being 2d, and Mr. C. Budd, gr., Heathfield, Sydenham Hill, 2d. Mr. B. S. Williams had a fine group in the nursery-men's class, and came in a good 1st, with Messrs. Jackson & Son 2d, and Mr. Morse 3d.

There were only two classes for *Heaths*, and Mr. Ward and Messrs. Jackson & Son were the winners of the highest prizes, Mr. Morse being 2d to the last named amongst nurserymen, and Mr. B. Peed 2d amongst amateurs. The four classes for *Azaleas* brought out a considerable number of plants, and some of them very good ones. Mr. Katty, gr. to R. Thornes, Esq., The 110th, Sydenham, took the 1st prizes for six and for twenty, with a capital lot, in the latter class especially, the plants averaging from 3 to 4 feet over, and well flowered. Mr. Turner was 2d for twenty, with a neat collection. For the six, Mr. James Child was 2d, and Mr. G. Roach, gr. to C. Dorman, Esq., Lawrie Park, Sydenham, and Mr. G. Wheeler, equal 3d. In the nursery-men's class for ten, the 1st prize went to Mr. B. S. Williams, who had some large specimens, well bloomed, and was the only exhibitor.

The show *Pelargoniums* made a fine display. In this class were eleven groups for nine in 8-inch pots. Mr. Ward and Mr. J. James contributed similar groups to those staged at Regent's Park, and were respectively 1st and 2d. Mr. Turner and Messrs. Dobson & Sons were the competitors in the corresponding class for nurserymen, and the awards went in the order named. Mr. Turner had very nicely flowered specimens of *Example*, *Clarelle*, *Pompey*, *Blue Bell*, &c., and all were noticeable for the richness of their colours. The same exhibitors also met again, and with the same result, in the class for six fine varieties.—Mr. Turner's examples being of Mrs. A. Wigan, *Acme*, *Helen Beck*, *Madame Sainton-Dolby*, *Neatness*, and *Brightness*. Only one group of *Clematis* was staged, and to this, which came from Messrs. G. Jackson & Sons, the 1st prize was awarded. The original plant of *Alba Magna* had eighteen grand flowers upon it—a striking object.

Roses in pots were very well shown, and we are glad to say especially well, by the amateurs. Mr. E. Han Ellis, gr. to J. Galsworthy, Esq., Coombe Water, Kingston Hill, had the best group lot of *Roses* we have seen for some time from an amateur, and well won the 1st prize in the class for six. Mr. J. Moorman, gr. to the Misses Christy, Coombe Bank, Kingston-on-Thames, came in 2d. Mr. Turner had the 1st prize for twenty in 8-inch pots, showing a capital lot; but was beaten by Messrs. Paul & Son in the class for nine, in which both firms were strongly represented.

In the class for new and rare plants, whether in bloom or not, Mr. B. S. Williams was 1st with his fine group, including his fine *Alsophila australis* *Williamsii*, *Ficus Parcellii*, over 4 feet high and in fruit; *Aralia Veitchii*, 3 feet high, a fine plant; a beautiful piece of *Adiantum gracillimum*, *Croton majesticum*, fine in leaf and colour; *Croton Weismanni*, also fine in colour; *Dipladenia Brearleyana*, &c. Mr. J. H. Ley, Croydon, was 2d.

New plants were also largely shown in groups by Mr. Wills and Mr. B. S. Williams, and the latter gentleman gained First-class Certificates for *Phegopteris taniana*, *Adiantum Filix-mas*, *Ficus Jacksonii*, *Columba gracilis*, *Bilandsia muscica*, *Zamia Linkeri*, *Acalypha marginata*, *Polystichum lepidocaulon*, *Draecena Fraseri*, *D. hybrida*, *Pleconema Leuzeneae*, *Alsophila Williamsii*, *Metroxylon filare*, *Dipladenia Brearleyana*, and *Vanda imbatra*. The same award was also made to E. B. Foster, Esq., Clewer Manor, Windsor, for seedling *Pelargoniums*, *Grace*, *Prince Rupert*, and *Malcolm*; to Mr. C. Turner, Slough, for fancy *Pelargoniums*, *Contents* of *Dudley*, *Duchess of Edinburgh*, and Mrs. Robert Baker, and for forcing *Fuchs*, *Derby Day*; and to Messrs. George Jackson & Sons, Woking, for *Clematis alba magna* and *Mrs. Hope*.

Table plants were a nice feature in the show, and there was a spirited competition. The winner of the 1st was Mr. F. Lambert, gr. to H. W. Segelcke, Esq., Herne Hill, who had four small *Palms*, *Draecena gracilis* and *Adiantum gracillimum*, and all the pots were nicely grown over with moss. Equal 2d prizes were awarded to Mr. Wills and Mr. Turner, at Champion Hill, S.E., the former having nice little examples of *Terninia elegans*, *Cocos Weddelliana*, *Aralia Veitchii*, *Croton Weismanni*, *Pandanus Veitchii* and *Nepenthes Sedeni*; while the latter had, amongst others, *Jacaranda mimosaefolia*, two nice *Palms*, &c. Mr. G. Wheeler was 3d.

Amongst the contributions to the miscellaneous class were a particularly effective group of herbaceous

plants, in pots, from Mr. R. Parker, together with cut blooms of twenty-four varieties of *Iris germanica* and *Pyrethrums*. Noticeable amongst the former were *Lilium monadelphum*, *Lynchii viscaria rubra* and *pleuro*, very pretty, and the yellow *Cyripedium spectabile*. Collections of herbaceous *Calceolarias*, attractive by the size of their individual blooms and the brightness of their colours, came from Mr. C. Satchell, gr. to J. W. Amsden, Esq., Lawrie Park, Messrs. Dolson & Sons, and Mr. Waters, gr. to A. Mongredien, Esq., the latter having too great a preponderance of dark-coloured flowers. Mr. Smith, market gardener, Isleworth, showed a white variegated fancy *Pelargonium*, named *Alice*, with white flowers and a large bright rose blotch. Messrs. Jackson & Son, Kingston, sent a nice group of finely-flowered plants of *Saxifraga pyramidalis*, under the name of *S. neppense*. Fine cut blooms of *Devonianis* *Roses* came from Mr. C. Taylor, Tottenham, Lord, and two boxes of the bloom of *Matéchal*, *Niel* came from Mr. D. Chapman, Broad Street, Oxford. A dozen very well grown plants of the pyramidal bouquet *Mignonne*, and specimens of the richly coloured *Coleus*, *Duchess of Edinburgh*, came from Messrs. James Carter & Co.; and Mr. John Laing, Stanstead Park, Forest Hill, contributed a collection of choice foliage and flowering plants.

Royal National Tulip Society: May 29.—The annual exhibition of this Society took place at the Botanic Gardens, Old Trafford, Manchester, on the above date, the Council of the Manchester Horticultural Society, Ltd., extended to this year a liberal encouragement it gave to the National Aricula Society a few weeks since. The competition was mainly confined to the northern and midland growers, the flowers of the southern growers having been quite past at this date. It was thought, owing to the prevalence of cold nights and hot days that the show of Tulips would have been small and the flowers indifferent, but the fates were propitious, and it is doubtful whether a finer exhibition was ever held by the Society, both as to the number and quality of the flowers, and in the opinion of some of the best cultivators the quality of the flowers had never before been exceeded, while the number of exhibitors was in every way assuring.

The Champion Silver Cup for the best stand of twelve dissimilar Tulips, two feathered and two flamed in each class, was awarded to Mr. William Whittaker, Manchester, who had a remarkably fine stand, the flowers generally being of the most refined quality. *Hepworth's* feathered byblowmen *Bessie*, *Lady's flamed* byblowmen *Talisman*, *fatysm*, *flamed*, *Masterpiece*, and a seedling feathered rose, were especially fine. The 2d prize was awarded to the Rev. F. D. Horner, Kirkby Malzeard, Ripon, who had a very fine stand of flowers, but smaller in size than the preceding stand, owing to the backwardness of the season in the Yorkshire district; and the day being cold, they did not open freely. His most striking flowers were feathered byblowmen *Bessie*, flamed byblowmen *Mrs. Cooper*, feathered roses *Modesty* and *Heroine*, and flamed roses *Kate Connor* and *Triomphe Royale*. Mr. Thomas Mellor, Ashton, was 3d, with a stand of flowers which were shown in excellent character; and Mr. Joshua Hage, Stockport, 4th. When it is stated that eleven stands of flowers competed in this class, furnished by growers residing in the northern and midland districts, it will at once be seen that there is no diminution of the interest felt in this gorgeous flower. The best stand of six dissimilar Tulips, one feathered and one flamed, in each class, was also furnished by Mr. W. Whittaker, Manchester, having *Bessie*, *Kate Connor*, *Masterpiece*, *Nancy Gibson*, and *Sarah Headly*. Mr. Thomas Haynes, Derby, was 2d with *Duke of Edinburgh*, *Heroine*, *Talisman*, *Triomphe Royale*, *Mrs. Pickerill*, and *Sir Joseph Paxton*; 2d, the Rev. F. D. Horner; 3d, Mr. Samuel Barlow, Chadderton, Manchester. The best stand in a similarly expressed class, the competition confined to half-guinea subscribers only, was staged by Mr. H. Housley, who had good examples of *Talisman*, *Sir Joseph Paxton*, *Mabel*, *Aglaia*, *Violet*, *Aimable*, and one unnamed; 2d, Mr. William Lee, jun., with *Madame de St. Arnaud*, *Heroine*, *Duchess of Sutherland*, *Adonis*, *Dr. Hardy*, and *Demosthenes*; 3d, Mr. Samuel Smedley; 4th, Mr. Daniel Woolley. The best stand of three feathered Tulips came from Mr. Thomas Mellor, who had *Lord Lilford*, *Angelina*, and *Rachel*; the 2d best from the Rev. F. D. Horner, who staged *Friar Tuck*, *Heroine*, and *John Sanderson*; 3d, Mr. W. Lea; 4th, Mr. C. Forman. The best three flamed Tulips came from Mr. Thomas Haynes, Derby, and consisted of *Dr. Hardy*, *Duchess of Sutherland*, and *Triomphe Royale*; 2d, Mr. William Whittaker, with *Sir Joseph Paxton*, *Maid of Orleans*, and *Aglaia*; 3d, Mr. W. Lea; 4th, Mr. Thomas Mellor. The best two Tulips, one feathered and one flamed, in each class, were furnished by Mr. Whittaker, having *Masterpiece* and *Dr. Hardy*; 2d, Mr. C. Forman, with *Mary Placitt*

and *Sir John Franklin*; 3d, Mr. T. Mellor; 4th, Mr. John Turner. The best flamed *Rose* was *Aglaia*, shown by Mr. H. Housley; Mr. Mellor was 2d and 3d, with *Mabel* and *Catherine Gordon*; Mr. Lea, 4th, with *Lady O. Sparrow*; and then followed, in the order of merit, Mr. Alseton, *Ada*, Mr. Talford, *Triumph Improved*, *Queen of England*, and *Madame de St. Arnaud*. The best feathered *bizarre* was *Masterpiece*, shown by Mr. W. Lea; 2d, Mr. Whittaker, with *Richard Yates*; 3d, the Rev. F. D. Horner, with *John Sanderson* and 4th with *Demosthenes*; and then followed *Sulphurea*, *John Ratcliffe*, *Sir J. Paxton*, *Sovereign*, seedling, and *Garibaldi*. The leading flamed *bizarre* Tulip was *Sir Joseph Paxton*, shown by Mr. T. Hagac; 2d and 3d Mr. W. Lea, with *Dr. Hardy* and seedling; and 4th Mr. Hagac, with *Lord Stanley*, *Prince of Wales*, *Ajax*, *Gany-mede*, *Sulphurea*, and the seedlings were also placed. *Heroine*, staged by the Rev. F. D. Horner, was the best feathered *rose*, and the same exhibition was 2d with *Modesty*; 3d, Mr. Whittaker, with *Sister to Lomax*; and 4th, the Rev. F. D. Horner, with Mr. Rochau. Then followed *Fanny Gibson*, *Lady Wilton*, *Angelina*, *Mr. Lea*, &c. The best feathered byblowmen was *Adonis*, from Mr. Lea; 2d, Mr. Whittaker, with Mr. Pickerill; 3d, Mr. J. Morris, with *Queen of the North*; 4th, Mr. Whittaker, with *Violet*, *Aimable*; followed by *Talisman*, seedling, *First-rate*, *Majestic*, seedling, and *Adonis*. The best flamed byblowmen was *Nimbus*, shown by Mr. Samuel Barlow; 2d, *Queen of Sutherland*; 3d, Mr. Barber, with *Talisman*; 4th, Mr. Whittaker, with *Bacchus*; and then followed *Thalia*, *Lord Denman*, *Alexander Haynes*, *Adonis*, *Queen of May*, and seedling.

The premier feathered Tulip selected from the whole of the show was *Bessie*, in the stand of Mr. William Whittaker; and the best flamed Tulip, *Sir Joseph Paxton*, shown by Mr. H. Housley.

Breeders were finely shown, especially by Mr. Thomas Mellor, who had the best six, two of each class, and the best three, one of each class. In the first case his flowers were—*Lady Grosvenor*, *Alice Grey*, *Annie McGregor*, *Sir Joseph Paxton*, *Norval*, and one unnamed. The three best were *Annie McGregor*, *Aristo*, and *Norval*; the best *bizarre* breeder, *Atlantic*; the best *rose*, *Annie McGregor*; and the best byblowmen, *Northern Light*—were all staged by Mr. Mellor; and the premier breeder was Mr. Mellor's *Sir Joseph Paxton*.

A look through the winning stands gave the following as the best flowers among the feathered *bizarres*:—*Masterpiece*, *Demosthenes*, *Duke of Edinburgh*, *Sir Joseph Paxton*, *Sovereign*, or *Charles X.*, *Richard Yates*, and *Commander*. Flamed *bizarres*:—*Sir J. Paxton*, *Dr. Hardy*, and *Ajax*. Feathered byblowmen:—*Bessie*, *Mrs. Cooper*, *Jeimna Forman*, *Adonis*, and *Mrs. Placitt*. Flamed byblowmen:—*Talisman*, *Duchess of Sutherland*, *Nimbus*, and *Bacchus*. Feathered roses:—*Heroine*, *Modesty*, *Mr. Lomax*, *Charmar*, *Little Annie*, *Aglaia*, *industry*, and seedling. Flamed roses:—*Aglaia*, *Triomphe Royale*, *Kate Connor*, *Annie McGregor*, and *Madame de St. Arnaud*. The best *bizarre* breeders were *Sir Joseph Paxton*, *Dr. Hardy*, *Richard Yates*, *Dr. Dalton*, and *William Wilson*. Among the byblowmen:—*Talisman*, *Hardy's seedling*, and *William Bentley*. The best *rose* breeders were *Annie McGregor*, *Lady Grosvenor*, *Hepworth's* seedling, and *Mabel*.

The following First-class Certificates of Merit were awarded to new varieties of Tulips:—*Dr. Hardy's Nimbus*, by Mr. Samuel Barlow's Mrs. Cooper and *Little Annie*, Mr. C. Forman's *Jeimna Forman*, Mr. W. Whittaker's seedling *rose*, Mr. Thomas Haynes' *Duke of Edinburgh*, and Mr. C. Forman's Mrs. Placitt.

After the prizes were awarded the members and friends dined together, and held a meeting of subscribers, at which it was resolved to hold the exhibition for 1876 at Manchester—probably at the Botanic Garden, Old Trafford, Mr. Barlow to act as hon. secretary and treasurer. Thanks were given to the Council of the Manchester Horticultural Society for the liberal encouragement it has given to Tulip cultivators, and to the secretary and curator, Mr. Bruce Findlay, for his valuable assistance. The sum of £45 was subscribed in the room towards a prize fund for next year.

Reading Horticultural: May 29.—The first of the two summer exhibitions of this Society was held on the above date, and proved an exceedingly good one, whether and all accessories being of a very satisfactory character. The prosperity which has attended the Society for the past year enabled the committee to augment some of their leading classes, and this resulted in some new exhibitors coming to the fore, which fact materially assisted the value and attractiveness of the show. The tent, which, as has been before stated, represents a miniature Regent's Park ground-plan, owing to its winding walks and turf banks, had a very bright and attractive appearance, owing to the presence of various flowering plants,

such as Azaleas, Pelargoniums, Ericas, Calceolarias, Roses, &c., which were effectively distributed over the tent.

The premier group of twelve stove and greenhouse plants came from Mr. W. Mearing, gr. to W. Whiteley, Esq., Guildford, and were nice, even well-grown and flowered plants. Among them were the charming *Adenandra speciosa*, *Ikora Lobbia*, *Bougainvillea glabra*, *Epacris Eclipse*, *Clerodendron Balfourianum*, C. Thompsoni, *Polygala cordata*, *Chrozoma varia*, *nana*, *Darwinia tulipifera*, *Stechophantia floribunda*, Mr. W. Pepper, gr. to Mr. Marsland, Ereligh, came 2d, his best plants being *Erica verticosa superba* and *alba*, *Fransisca calycina*, nicely-flowered; *Aphelaxis macrantha rosca*, *Clerodendron Balfourianum*, *Allamanda Schottii*, and *Rhynchospermum jasminoides*. Mr. E. Tudey, gr. to J. Williams, Esq., Worcester, was 3d. The best group of six greenhouse plants came from Mr. J. C. Higgs, gr. to Mrs. Crawshaw, Caversham Park; well-grown specimens, but comprising nothing worthy of special notice.

Mr. Higgs is well-known in the Reading district as an able cultivator of stove and greenhouse Ferns, and the fine group of twelve set up on this occasion did him great credit, and they were much in advance of anything in competition with them. The subjects were *Cyathia medullaris*, C. dealbata, *Gleichenia semi-vestita*, *Phlebodium sporopocarpum*, *Cibotium regale*, *Dicksonia antarctica*, *Platycyrium alaicorne*, *Cyrtium latifolium*, *Lomaria gibba*, and *Adiantum chloroleuca*. Much smaller, but even well-grown group, staged by Mr. W. Pepper, was and had the 2d prize, and included a good *Adiantum farleyense*, *Blechnum corvaceum*, *Gymnogramma tarata*, *Lomaria gibba*, &c. The best group of British Ferns also came from Mr. Higgs, all distinct and well-grown; and a good group from Mr. Geo. Pile, gr. to J. Wheble, Esq., was placed 2d. As a good group of six *Lycopodium*s as one could well wish to see was staged by Mr. W. Mearing, and secured the 1st prize; they were all cone-shaped, and remarkably well furnished, as healthy and luxuriant in appearance as could be desired. The group consisted of *Selaginella Martensii*, *S. Martensii variegata*, *S. flexuosa*, *S. apus*, a remarkable example; *S. atroviridis*, and *S. involvens*. A nice collection from Mr. J. Hawes, gr. to Mrs. Rhodes, Henley, was placed 2d, and this included *S. caulescens*, *S. robusta*, *S. Martensii variegata*, and *S. stolonifera*.

Equally fine in development was Mr. Higgs' group of ten foliaged and ornamental-leaved plants, some of them being of grand proportions, and especially was the trio of *Alseodaphne Cooperi*, *Theophrasta imperialis*, and *Alseodaphne Lowii*, all of which were superbly grown. The following with the foregoing made up the group:—*Maranta Veitchii*, *M. zebrina*, *Araucaria excelsa*, *Lantana borbonica*, *Pandanus utilis*, *Croton variegatum*, and C. pictum. Mr. H. Elliott, gr. to J. T. Hibbert, Esq., Braywick, Maidenhead, was 2d, with *Duranta Baumgartii variegata*—a somewhat striking plant, where the leaves are rarely margined with gold; *Alseodaphne macrorhiza variegata*, *Yucca angustifolia*, *Croton angustifolium*, C. variegatum, *Dracaena australis*, &c. Mr. W. Mearing and Mr. W. Pepper received equal 3d prizes for very creditable groups.

Flowering plants were made up of Azaleas, Pelargoniums, large flowering and fancy, both nicely done; Roses in pots, Calceolarias, Gloxinias, &c.; Fuchsias were noteworthy for their size and the admirable manner in which they were flowered.

Cut flowers were represented by collections of bouquets, but which ought to be substituted by bunches of stove and greenhouse and hardy flowers; some capital Roses, shown by Mr. J. Trant, gr. to Ley-on-Thames, an amateur cultivator of some note in the district; bouquets, vases of wild flowers, &c., all materially assisting the show from a decorative point of view; but we missed the fine stands of *Maréchal Niel* Roses Mr. R. Webb, of Calcot, has been in the habit of exhibiting at the May shows.

Fruit and vegetables were well shown, but somewhat restricted in point of numbers, as might reasonably be expected in this season of the year. Some capital Black Hamburg and Buckland's Sweetwater Grapes, from Mr. Tegg, gr. to J. Walter, Esq., N. P. Bearwood, Wokingham, obtained the 1st prize in each class; as also did the Peaches and Nectarines, the latter very fine, from the same exhibitor. Capital Sir Charles Napier Strawberries, to which the 1st prize was awarded, came from Mr. Ashby, gr. to Mr. Fanning, Whitechurch. Cucumbers were well represented, the best brace being Lockie's Masterpiece, a very handsome white-spined variety, 18 inches in length, and perfect in point of quality; this came from Mr. T. Lockie, gr. to Lord G. Fitzgerald, Oakley Court, Windsor. The next best was Tander and True, from Mr. Geo. Brown. Very good kidney and round Potatoes were staged; and in the class for French Beans both Messrs. Higgs and G. Brown staged Canadian Wonder, which appears to be an excellent forcing variety. Capital miscellaneous collections of vegetables were shown by Messrs. G.

Brown, W. Webb, and J. Read, the former having everything especially first-rate. R. D.

Devon and Exeter Botanical and Horticultural.—This Society held its one hundred and thirty-eighth exhibition on The Northernhay, Exeter, on Friday, May 25. The weather was most unfavourable. The rain descended in heavy showers most of the day, from which the canvas tents were but poor protection.

The display of plants was of a superior description; many of the specimens were really grand, and rarely have so good examples been staged of the *Ixoras amboinensis*, Prince of Orange, and *coccinea*.

A small but interesting example of *Cypripedium niveum* was exhibited, and a small pot of *Bougainvillea speciosa*, well flowered—its deep, rose-coloured bracts giving it the preference over the better known *glabra* when the secret of inducing it to flower equally freely is got over.

Stove and greenhouse Ferns were numerous and well-grown. The collection contained fine examples of *Davallia Moorei*, *Peris caferula*, *Adiantum cultratum*, a new and interesting form of *Poly-stichum angulare* was shown, but I failed to learn the name of the exhibitor; it was said to have been found wild in the neighbourhood. The whole of the plants were forked, and the top of each frond was terminated with a tuft of small fronds. Herbaceous Calceolarias were well grown, and shown in great numbers, doing credit to the cultivator.

The season was a little too early for the general collection of Roses, and the fine display of *Maréchal Niel*, *Devonians*, and *Souvenir d'un Ami* in separate boxes was truly grand.

Much of the success of the show was due to the local nurserymen, who competed in a very spirited manner. J. S. T.

The Bath and West of England Society's Meeting at Croyd.—The annual exhibition of this Society opened at Waddon, near Croyd, on Monday, and, taking it on the whole, it was the most complete show the Society has ever held. Horses were very fairly represented; there was a good show of Short-horns; an unprecedented show of the local Sussex breed; and as good a show as has ever been seen of Channel Islands cattle; while, considering the distance from their homes, the Devons and Herefords were very fairly represented. Amongst the sheep, the South-downs were exhibited in the greatest numbers; Cotswolds and Leicesters were tolerably well represented, while of Shropshires, Oxford Downs, and Hampshire Downs, there was a fairly good show. Mountain sheep, which are generally a characteristic feature of the exhibition, were represented here in only in small numbers. The show of pigs was one of the largest the Society has ever had, the Berkshire classes being especially good. The poultry show also had claims to be considered satisfactory to all concerned, while the display of agricultural implements and machinery was the most perfect that the Society has been favoured with, and no better has been seen in the neighbourhood of the metropolis since 1862, when the Royal Agricultural Society of England pitched its tents at Battersea. The exhibition of fine arts did not strike us as being so good as usual, but the show of Honiton lace was very small, though of splendid quality. Space does not permit us to go into the details of all those departments of the great show; our concern is more for the horticultural department, under the stewardship of the Hon. and Rev. J. T. Boscawen, whose mode of conducting flower-shows has been frequently described. Here, too, we found a slight falling off as compared with the corresponding shows at Dorchester or Plymouth, a fact which is the more surprising, considering the close proximity of the show-ground to a centre of horticultural establishments far greater in extent than either of the localities we have mentioned. We had anticipated a fine show of Orchids, but these and flowering plants generally were not forthcoming in sufficient numbers to relieve the monotony of the many good fine-foliaged plants staged. This relative deficiency may partly be accounted for by misapprehension of the plan in which these shows are conducted, and by statements as to the non-payment of gardeners for their trouble—statements which, we are informed, are wholly untrue. The principal exhibitors and their contributions may be mentioned as follows:—The Rev. A. H. Bridges, Bedington House (gr., Thomas Penfold), had some fine pans of *Gymnadenia conopsea*, *Habenaria chlorantha*, *Epipactis grandiflora*, *Aceras anthropophora*, *Orchis ustulata*, and other terrestrial Orchids; a nice lot of *Begonias*, *Caladiums*, Ferns, *Iris chinensis*, exceedingly pretty; large specimens of *Dracenas*, *Diefenbachias*, *Trey Ferns*, *Pandanads*, and other fine-foliaged plants, with a charming hanging basket of the pretty *Begonia foliosa*. Mr. B. S. Williams, Holloway, had a small group of choice new plants, such as *Adiantum gracillimum*, *Aralia Veitchii*, *Acalypha marginata*, *Kentia Moorei*, and other Palms; and also a group

of such Orchids as *Cattleyas*, *Vandas*, *Lælias*, and *Dendrobies*, together with some large Tree Ferns, *Cycas*, &c. Messrs. Rollison & Sons, Tooting, contributed a considerable number of handsome fine-foliage plants, and a magnificent specimen of *Tolera intermedia*, about 3 feet over, and splendidly furnished. Philip Crowley, Esq. (gr., Stephen Strahan), sent a fine lot of plants, especially fine-foliaged, and also many good flowering specimens, conspicuous amongst them being a plant of *Erica brunioides*, 3 feet through, and superbly flowered, a very good *Rhynchospermum jasminoides*, &c. The fine-foliaged plants were an especially good lot. Stephenson Clarke, Esq., Croydton Lodge (gr., John King), sent some fine specimens of *Clamocarpus humilis* and *Fortunei*, nice examples of *Adiantum farleyense*, various *Selaginellas*, *Crotons*, &c. Messrs. Paul & Son, Chestnut, contributed ten very fine Roses in pots; and from Mr. Noble, Bagshot, came three beautiful standard *Rhododendrons*, a small group of Orchids, a beautiful pan of *Nertera depressa*, and two grandly flowered examples of *Utricularia montana* came from Sir William Marriott, Down Hemy, Croydton (gr., James Hill); and a smaller collection came from Mr. Brymer, Esq., M. P., Ilington House, Puddleton (gr., J. Salford).

The Villa Garden.

FORECOURT GARDENING.—This is the season of the year when attention is turned to the embellishment of forecourt gardens, balconies, windows, &c., with a view of having something gay and effective during the summer months. The forecourt garden is a comparatively easy matter, and it simply requires plants adapted to its position and surroundings. In those suburbs of London having open and airy streets the forecourt garden—none very large—should be planted with a few cheerful-looking flowers, something that will be bright and effective, and last as long as possible. On the sunny side, that mostly open to genial southern influences, something a little elaborate may be attempted in the way of pretty foliaged plants, but the position must be open, light, and airy. It is a waste of time to place border foliage plants in low, cold, shaded spots—flowering plants will hardly do there, but foliage plants never.

Really, however, there is not much room for choice of subjects. As a rule the forecourt garden is overshadowed with trees, and there is too much shade for flowers—but even trees are something in a street for flowers. Grass will not grow either; and the best thing to be done is to plant something, or that will do well beneath trees; and if there is a spare space or two plant some of our common Lady and Hart's-tongue Ferns. They will grow where flowering plants will not, and hawkers in the streets are always presenting them for sale; besides, they can be got from other sources with but little trouble. When the surface is furnished with Ivy, and the fronts of Ferns reap up here and there, and the deciduous shrubs and the trees overhead get into green leaf, it is always a pleasant sight in a populated neighbourhood, and a relief to turn the eyes from scorched flagstones to some cheerful green of plant and tree. An occasional sprinkling or syringing keeps the leaves pretty free from deposits of dust, and Nature is assisted thereby.

When there are no trees overhead, and the forecourt garden is open above and around, attempts at decoration can be made with flowering plants. A few Pelargoniums, yellow Calceolarias or *Nasturtiums*, blue *Lobelia*, *Verbena*, &c., will grow either in garden plants likely to do well, can be used, with the ferns, there a patch of fragrant *Mignonette*, *Candytuft*, *Nigella Stock*, and a few other hardy annuals. Nice bits of cheerful colouring could be supplied if the planting be properly done. There lies three-fourths of the success. It is no use to put plants into old, stiff, worn out town soil; it must be removed, and something good from the nursery substituted for it, and in these plants should be placed and they will then have a fair chance of successful growth. Frequent sprinklings overhead in dry weather will greatly assist them, and occasional root waterings when such weather lasts for a time and no rain falls.

But, leaving the circumference for the centre, and getting into the heart of city or town, where the fierce stream of its busy life rolls onward incessantly, there can be found many side courts and alleys, lined on either side by houses of somewhat remote construction, or having gardens at the back, where something can be done, even though ground and dirt appear such hostile influences. Let any one take the train from Broad Street station to Dalston Junction, or from Ludgate Hill to the Elephant and Castle, and many such spots come into view. Apparently gardening is done here under great difficulties, but our City flower shows reveal what cheering results follow when a real love for

plants, and the pleasure their companionship imparts, are the motive-powers which occasion so much attention being given to them. There must be heartiness brought to bear on city and town gardening, or it cannot succeed. See—and the illustrations are copious—see what can be done with Sedums, House Leeks, Grass, Scarlet Runners, Creeping Jennies, and such like. Very little flower it is true, but fresh, bright, green leaves, cleansed from dirt, watered and tended because unspeakably precious to the cultivator.]

BALCONY GARDEN.—The exposed position of this part of the dwelling is somewhat against gardening attempts, but in a large majority of cases plants die speedily for want of water. Thousands of plants die annually in London for lack of special attention. On the other, that very much can be done in the way of balcony gardening, let Portman Square, Piccadilly, and many other places testify. What is a more pleasant sight than a Virginian Creeper growing over and about the balcony of a dwelling-house, and its rich tresses hanging down from it in profusion? Vases might be introduced in which a few suitable flowering plants could be placed in the crevices of the balcony. At the present moment there is a house on the east side of Portland Crescent, Easton Road, which forcibly illustrates how charmingly the balcony of a house can be decorated during the summer months. Its elaborateness of arrangement, no doubt, makes it expensive, but it is suited to the means of the resident. But much simpler attempts can be worked out with no less satisfactory results. A wire trellis against the front wall of a house is of great value, and by means of it plants may be raised in living greenery and flowers during the summer. Ivy might be used for winter effect, but it would need to be cut out somewhat at stated seasons if other plants were employed. The Virginian Creeper is indispensable, it is so suited to London; but why should not in some cases the fine hardy Clematis be employed in connection with it? Planted in tubs large enough to afford sufficient root-room, and aided by gentle stimulants when properly established, these showy creepers would be striking objects when in flower. The great requirement of balcony gardening is a constant supply of water, and, unfortunately, the high pressure of fashionable life during the London season causes this indispensable attention to be much neglected, and balcony gardening falls into disrepute through no faulting of its own.

WINDOW GARDENING.—Let us earnestly plead for mercy for the poor flowers also. Of the many hundred attempts made in the way of window gardening in London how many fall for want of an adequate supply of water! It is pitiable to see charming flowers—possessing almost unreal capacities for ministering to pure pleasure—dying for lack of that which would keep them in robust health—water, if it were only forthcoming. Of all attempts at window gardening nothing beats the wooden box in which the subjects used are planted in the soil it contains. They stand a much better chance of succeeding in the face of neglect, whereas plants in pots succumb rapidly and completely. A box filled with ordinary bedding plants, according to lines of red, blue, yellow, pink, and white, with some foliage interspersed, and having Ivy-leaved Pelargoniums hanging over the front, seems the best arrangement that can be adopted. The drooping flowers of the Fuchsias are very effective in combination with the others, but it is a mistake to crowd the plants too much.

The areas of fashionable London residences frequently afford reliable indications of the attention given to flowers in the balcony and windows. If the plants found there, on the window-sill, on plant-stands, or suspended from the area railings are well tended, they will be carefully looked after in other parts of the house also. There are many very pleasing illustrations of area gardens to be met with in various parts of London. We could point to a few where the arrangements are worked out with so much taste, and the plants are kept in such excellent health, that the gardener—often a woman—well deserves the Lindley Medal of the Royal Horticultural Society.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVE.—*Poinsettias*: Cuttings of this indispensable winter-flowering plant that were put in some time ago will now be rooted, and should be at once potted. Do not at first give them too much root-room. Three or 4-inch pots are large enough to begin with. They are not particular as to soil, succeeding in either peat or loam; but in the latter they are not quite so disposed to grow tall or make such large leaves, as when grown in peat. One-fifth of rotten manure and leaf soil in equal proportions, added to four parts good loam and a little sand, will grow them well. The natural disposition of this plant to get tall and leggy is aggravated by being kept very hot and far from the glass. After the cuttings have got

well established in the pots give them a fair amount of air, and place them as near the glass as possible. Cuttings for successional flowering may yet be put in, always in the case of this plant taking them off with a good heel; if deficient of this they do not strike freely. In the southern parts of the kingdom, in warm sheltered situations, the old plants may be planted out in the open ground; so treated they form close compact heads, consisting of a number of shoots that grow strong, and not more than half the length that they attain under glass. Before the plants are thus turned out they must be well hardened, or they will lose the leaves they already possess, which would much injure their appearance afterwards. Successional cuttings of the equally useful *Euphorbia jacquiniiflora* should be potted on as soon as they are well rooted, using similar soil and size of pots to that recommended for the *Poinsettias*. When they have got well hold of the new soil pinch out the points, to induce them to break. The earliest struck plants will by this time have filled their first pots with roots, and should at once be moved into such as they are intended to flower in. They are spare-rooting subjects, and must not have too much root-room; for ordinary purposes 7 or 8-inch pots are large enough; they do not like much water until the roots have fairly taken to the soil. If a few larger specimens are wanted, some of the old plants may be shifted on into 10 or 12-inch pots. These, if well attended to, will make fine decorative subjects for a warm conservatory in the early spring. Keep as near the glass as possible. When small-sized decorative plants are required *Dianthus barbatus* is very useful; it can be increased readily from seed. If this is sown now, and the seedlings potted off as soon as large enough, and kept growing through the autumn and winter, by the spring they will make nice plants, and will be found suitable for standing on side stages and in front of larger growing things. It can also be increased by division of the crowns; it does well in sandy peat, to which has been added a little well-rotted leaf-mould. Its most delicate coloured flowers are very useful for cuttings. Sown into such as they are intended for habit of growth, either when trained to the rafters or grown on trellises, should, as soon as they show flowers freely, be well supplied with manure-water. By a timely and regular application of this most things that possess a continuous habit of flowering can be induced to keep on blooming so long as desirable, or there is enough solar or fire-heat to keep them in free growth. Such things as *Allamandas* and *Dipladenias*, that are looked upon by many as summer-flowering plants, will, if liberally sown, continue to give a succession of flowers more than half the year; and where flowers are in regular demand for the decoration of shallow stands, nothing is more useful than to have a supply of such as the above to fall back upon, their delicate yet brilliant colours giving a character to other things of a more common description; but their use when employed in this way is commensurate with the length of time they will stand. If grown in a dark house at a considerable distance from the glass in a very humid atmosphere they are very susceptible of mildew, flagging almost as soon as several days after the plants are potted off under the opposite conditions as to light, with sufficient air, they will last for three or four days. Where the flowers are thus wanted the plants should not be trained on trellises, but on either strings or wires, so near the glass as only just to avoid touching it.

Thunbergia Harrisii and *T. laurifolia* should be similarly treated, not using too large pots for these free-growing plants, and keeping them at the coolest end of the house. *Clerodendron Balfourianum*, although by many looked upon as only of use as a specimen plant, is a most useful subject for cutting; its delicate bracts associating well with any other flower; but to be of use in this way the flowers should be brought on in a comparatively cool temperature, or the plants gradually inured to a cooler atmosphere before they open. In private establishments, where large quantities of cut flowers are wanted, it is necessary to provide a reasonable amount of variety, and the treatment that many things require to enable them to stand well in a cut state has of late years become a very important matter. With stove plants the greatest possible amount of light, with as much air during the summer season as they will thrive with, will be found the best means of imparting that solidity necessary to enable the blossoms to last long when cut. *T. Baines*.

FRUIT HOUSES.

MELONS.—The first batch is just coming in, and the present sunny weather is such as will, under proper treatment, produce a rich flavour. The nights are for the most part, however, very cold, necessitating the use of extra firing. It is the reverse of good practice, either in Melon or Cucumber growing, to permit of wide disparity between the night and day temperatures. See what was said in the last Melon Calendar in regard to flavouring the Melon, also the cracking of the fruits and canker at the collar. Keep plenty of moisture in houses wherein young plants are

growing, and gently damp the foliage, the walls, and floor, and close the ventilators about 3.30 P.M. This is recommended for houses which have a southerly aspect; houses facing south-east, or south-west, must be closed earlier and later respectively. Continue to fertilise all female blossoms every day, observing a dry condition of both the roots and atmosphere. Cease to use the knife during the setting period; the finger and thumb should be active, however, nipping out the growing points at one or two joints above fruit. The plants should never be fertilized, should the time of setting; take care, therefore, to fumigate previously if the least signs of aphid are manifest. Earth up from time to time those which have set their fruits, and continue to make further sowings to meet the requirements of the individual establishment. Feed liberally those plants which are swelling their fruits in pots and boxes, and take care they do not become dry at the root; ours are watered two or three times a day this weather. If the glass be 21 or 2, of second or third quality, very little watering will be necessary to grow a (Belgian), however, should be slightly shaded for an hour or two at mid-day. In pips and frames a fair bottom-heat should still be maintained. *Thos. Simpson, Chelmsford.*

VINES.—The thinning of late crops of Grapes should not be delayed a moment after they are ready for this operation, as at this season they swell so rapidly that, if not taken in time, they soon get too large to be thinned quickly or nicely. In a former department it was pointed out that, in the case of sowing or sowing laterals when the Vines were in flower, but as soon as the fruit is set this should be resumed, and the shoots tied into position. Also cut off all badly placed, small, or deformed bunches, and crop lightly, or according to the vigour and age of the Vines. It is best to err on the side of light cropping and high finish rather than bulk, accompanied by shanking, &c. When watering is necessary let it be done thoroughly, as one good watering is worth a good many surface dribblings. To crops in the process of swelling, a little good water sprinkled over the surface of the border previously to watering will prove of great service. A mulching of manure of any kind, after a good watering, will help to keep the border moist, and prevent the necessity for a repetition of it for a considerable time. Do not neglect the borders from which the Grapes have been cut, but if at all dry, water and mulch as for Vines in other stages of growth, and keep the foliage clean and healthy to the last that it may aid in the proper development of the fruiting buds in the autumn. In houses where the Grapes are ripe, keep the Vines free from lateral growth, the atmosphere cool and airy, and as dry as is consistent with the maintenance of the health of the foliage. Pot Vines should have the leading shoots pinched when about 3 feet long, and the laterals and sublaterals stopped at one point as produced. This applies more especially to those intended for fruiting next season; those intended for planting only are better to have the laterals left longer, or indeed not pinched at all if the Vines are intended to be cut back to three or four eyes at planting time. *W. Wildman, Hockford.*

FIGS.—Still continue to follow the directions lately given about the ripening fruit in pots, so that when the first crop is all gathered the trees may be gradually syringed twice a day, and more water given to the roots for the advancement of the second crop. Do not neglect mulching the surface of the pots now that the heat of summer is setting in, and the necessary waterings through the mulchings will carry vigour to the roots. If the second crop is set too thickly on the shoots, thinning will now be required, for the trees should not be over-taxed with too many fruit so as to have them large and finely flavoured. If some of the trees that were forced the earliest do not show to be in a vigorous state of growth, it will be better for them not to be allowed to ripen a second crop. When their wood is ripened they should be placed in some warm corner in the open air, and kept well mulched and watered, when they will be in excellent condition for forcing early in another year. The later started crops will still want lying in the shoots, and stopping and thinning them where too thickly placed, and when the fruit begins to ripen they may have the same treatment as advised for the early forced Figs, that is, the syringing and supply of water to the roots must be gradually diminished till the crop is gathered. *William Tillyer.*

CUCUMBERS.—Red-spider is wonderfully troublesome this year in our Chelmsford district, so much so that it almost baffles the efforts of our large growers to prevent its becoming master of the situation. I have plenty of opportunity of seeing areas of Cucumbers under glass, and there is an unspoken warning to those who have any authority when they say the Cucumber-houses having a southerly aspect are a mistake for summer work. Indeed, there is no necessity for a south aspect even in mid-winter. Let horticultural builders and garden architects take note of this. It is in such an aspect that we suffer most from red-spider, and that because the heat is too

much at mid-summer. Then, again, blinds must be employed, and that, besides being unnatural and detrimental, is a very expensive item where large quantities are grown, as here. I recommend, therefore, that Cucumber-houses, lean-to's, have an easterly aspect, and an open back, and that there is no necessity to shade in either of these aspects; a moderate coating of thin whitewash over the middle of the roofs might, however, be desirable in the very hot weather. I have previously pointed to the remedy for the destruction of red-spider. Still employ fires by night, and keep plenty of moisture in houses all day long. Fumigate on the appearance of the first greenfly. Cut over the plants every week, removing all weakly and exhausted growths, and feed liberally with copious doses of weak liquid manure. Earth up the roots from time to time. In pits and frames endeavour to secure straight fruits by means of glass tubes or other appliances. Husband a good heat by closing the lights early, after previously watering both the roots and foliage. Dust flowers of sulphur amongst the foliage as an antidote to mildew and spider. *Theos. Simpson, Chelmsford.*

HARDY FRUIT GARDEN.

The excessive crop of fruit of all kinds this season will necessitate an unusual amount of thinning among the more choice varieties. *Apricots* by this time should have been finished, as the fruit is now of large size. The leading shoots of these where required for filling vacant spaces on the walls should now be tied or nailed in, and the forehort shoots stopped by pinching back to three or four buds, so as to induce the early formation of short-jointed spurs, which are essential for the production of bloom next season. Provided the tree is otherwise well furnished with young and healthy wood, now is the best time for removing any barren or projecting spurs. Grub should now be well looked after; its appearance is soon seen by the folding-up of the foliage. When this is observed, lose no time in having the tree carefully picked over, otherwise the pest soon makes serious damage both to foliage and fruit. *Plum* and *Nectarine* will now require considerable attention. Complete disbudding, if not already done, and thin the fruit as soon as possible. This will in large establishments be a work of some magnitude. Here a wall 120 yards long, every tree is completely clustered with fruit, and many thousands must be taken off. The trees generally are very healthy; in fact this season, so far, very little blight has made its appearance in any form, but judging from the sudden alterations of temperature lately prevalent, we may expect to be troubled with it very shortly. Dessert *Cherries* on walls may be treated much as recommended for *Apricots*. *Morrellos* should have as much young wood laid in as will uniformly furnish bearing wood for next season. Should aphids appear, the best and most effective remedy I have found is to hand-dust the affected shoots with dry soot finely sifted; this may be allowed to remain on for a few days, and can then be washed off with a syringe or hand engine. Some of the badly affected trees had to be cut last season with the best possible result; the fruit being finer than usual and perfectly clean, while the trees appeared to benefit by the fertilising power of the soot being washed down to the roots. *Strawberries* should now be mulched with straw or other material suitable to keep the fruit clean; we use the longest of the litter brought from the stable-yard. Applied in good time this becomes bleached and clean before the fruit begins to drop. A good soaking of water or liquid manure, if available, should be given to each plant as soon as the fruit is set, the mulching will then keep the roots cool and moist during the process of swelling the fruit. Where very large fruit are required, either for dessert or exhibition, the trusses should be well thinned as soon as the best swelling fruits are discernible, leaving not more than two or three fruits to each truss. These should be tied up to small sticks, so as to get full advantage of light and sun. Such kinds as British *Green Dr. Hogg's*, &c., are seldom well-coloured without this attention, while the quality of the fruit amply repays the additional trouble of tying. *W. Cor.*

The Weather.

DURING the week ending Saturday, May 29, in the vicinity of the metropolis the reading of the barometre at the level of the sea increased from 29.92 inches at the beginning of the week to 30.34 inches by the morning of the 24th, decreased to 29.79 inches by the evening of the 28th, and increased to 29.90 inches by the end of the week. The mean reading for the week was 30.15 inches, being 0.31 inch higher than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged from 70° at the 24th to 55½° on the 29th, the mean weekly value being 63½°. The lowest temperatures of the air varied between 45½° on

the 24th and 51° on the 28th, the mean for the week being 47½°. The mean daily range of temperature in the week was 16°, the greatest range was 25½° on the 24th, and the least, 8½° on the 20th. The mean daily temperatures of the air, and the departures from their respective averages, were as follows:—23d, 54°, +0.4; 24th, 56° 3/8, +2.2; 25th, 57°, +2.2; 26th, 56° 1/2, -0.6; 27th, 51° 4, -3.9; 28th, 55°, -0.5; 29th, 49° 4, -4.7. The mean temperature for the week was 54° 1/2, being 1° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 120° on the 23d, and 124½° on the 24th, but on the 20th 69° was the highest reading, the sky being nearly overcast throughout. The lowest readings of a thermometer on the grass with its bulb fully exposed to the sky were 33° and 32½° on the 26th and 27th, but on the 20th 44° was the lowest reading. The mean for the several low readings was 38½°.

The direction of the wind was mostly from S.W. on the 23d and 24th, and N.N.W. afterwards, and its strength brisk.

The weather was fine and bright on the first five days of the week, but overcast, dull, and cold on the last two, especially on Saturday the 29th.

Rain fell on two days to the amount of 0.24 inch. In England the extreme high day temperatures ranged between 71° at Manchester and Sunderland, and 64° nearly at Liverpool, Newcastle-on-Tyne, and Truro; the general average over the whole country being 67½°. The extreme low night temperatures varied from 45½° at Blackheath to 38° at Hull, with a general average of 41½°. The mean of the extreme ranges of temperature in the week was 26½°, the greatest range being 32° at Sunderland, and the least, 19° at Liverpool.

The mean high temperature observed by day ranged from 64½° at Wolverhampton and Sunderland to 57½° at Liverpool, with an average value of 61½°. The mean low temperatures observed by night varied between 48½° at Newcastle-on-Tyne at 43° at Truro, the general average being 45½°. The mean daily range of temperature in the week was 17°, ranging from 20½° at Sunderland to 9½° at Liverpool. The mean temperature of the air for the week was 52½°, being 3½° lower than the value for the corresponding week in 1874; the highest occurred at Blackheath, 54°, and the lowest at Lilles and Truro, 50½° nearly. Rain fell generally on two, three, or four days in the week at all stations excepting Truro; the various amounts collected ranged from 1 inch at Newcastle-on-Tyne, to three-hundredths of an inch at Truro, which fell on the 28th; the average fall over the country was four-tenths of an inch.

The weather during the week (for the most part) was fine, though cloudy and showery at times.

In Scotland, the highest temperatures of the air ranged from 68½° at Paisley to 56½° at Greenock, with a general average of 63½°. The lowest temperatures of the air varied from 44½° at Leith to 32° at Dundee, the general average being 40½°. The mean range of temperature in the week was 23°. The mean temperature of the air for the week was 51½°, being 1° higher than the value of the corresponding week in 1874; the highest was 53½°, at Edinburgh, and the lowest, 50½°, at Aberdeen. Rain fell at Greenock to the amount of one inch and two-tenths, but at Dundee one-tenth of an inch only was measured; the average fall over the whole country was five-tenths of an inch.

At Dublin, the highest temperature was 71°, the lowest 37°, the range 34°; the mean temperature of the air for the week was 53½°, and the rainfall was a quarter of an inch.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JUNE 3, 1875.

- May 27.—A fine bright morning. Overcast and dull in afternoon and evening.
- 28.—Overcast, dull, and showery throughout.
- 29.—Overcast, dull, and cold throughout. Heavy rain in early morning.
- 30.—A fine day.
- 31.—A very fine day.
- June 1.—A brilliant and clear day.
- 2.—A fine bright day. Strong wind from west.

JAMES GLAISHER.

Answers to Correspondents.

CANON HALL MUSCAT: *J. A. S.* This is perhaps the worst Grape to set in cultivation. We have seen excellent results follow the thinning out of the embryo flowers, and also the application of water through a fine syringe when the flowers are fully developed. FARM ACCOUNT BOOKS: *A. B.* Write to Mr. Jemmett, Murrell Hill Farm, Binfield, Berks. He publishes a series of such books. INSECTS: *Beta*. Your insects are the larvae of the common Daddy Longlegs. In their present state they are difficult to get rid of. The remedies given last week against wireworms (p. 700) may be used. If they are very numerous, there will be many which will arrive at the perfect state, and children may be useful employed in catching them. *I. O. W.* KITCHEN GARDENING: *H. G. S.* Get Mr. Earley's *High Class Kitchen Gardening*, just issued by Messrs. Bradbury, Agnew & Co.; or the new edition of *Thompson's Gardener's Assistant*, which will shortly be published.

- NAMES OF PLANTS: *Correa*. *Staphylea pinnata*.—*B. D.* *Fraxinus Ornus*.—*R. S. H.* *Odontoglossum*.—*Reichenow*.—*Comptonian species*.—*J. A. S.* *Dianella tasmanica*.—The new edition of *The little spotted flower* is *Polygonum Bistorta*; the one with a leaf growing out of a leaf is *Ruscus Hypoglossum*.—*C. W. D.* *Crepis taraxacifolia*.—*H. Harpur-Cresswell*. *Beris aristata*, var. *horibunda*.—*N. B.* It is impossible to name from such specimens; the flowers must be sent with the leaves; then there is some chance of identifying them.—*H. St. C.* *Monchia erecta*.—*P. W. ?* *Cerastium trifidum*.—*W. H.* *Aloisac nicoiflora* (scarlet flower), *Rhus cotinus*. Does the wood belong to the shoots with *four buds*?—*Victor*. 1, *Calluna palustris*, double-flower; 2, *Lychnis diurna*, double flower; 3, *Lychnis viscaria*; 4, *Centaurea montana*; 6, *Veronica paniculata*.—*W. H.* 1, *Dendrobium Devonianum*; 2, *Encalyptus dichotoma*; 3, *Cyrtium falcatum*; 4, *Selaginella tuberosa*; 5, *Laxtra Sibiricola*.

TREE PEONY: *Mrs. Smoother*. One of the fine varieties of *Peonia Moutan*; but whether one of Fortue's introductions, or one of the new sorts raised in Belgium, we have no materials for determining.

VINES: *Tigwante*. Your Vines are perfectly smothered with mealy-bug. It will take a lot of time and perseverance in washing to get rid of the pest. The better way would be to cut them right down, and to repaint the house, and clean the whole thoroughly, before they begin to grow.

FOREIGN SUBSCRIBERS.—We are requested by the Publisher to direct Foreign Subscribers sending Post Office Orders, and cheques, to be paid at the post-office, King Street, Covent Garden, London, to be good enough to write to the Publisher, at the office of this paper, 47, Wellington Street, Covent Garden, at the same time.

CUT FLOWERS.

Table listing various cut flowers such as Carnations, Anemones, and Pinks with their respective prices and quantities.

PLANTS IN POTS.

Table listing various plants in pots including Begonias, Bouvardias, and Fuchsias with their prices.

SEEDS.

LONDON: June 3.—Extreme inactivity now characterises our seed market. In Clover seed, as might be expected, there is nothing whatever doing.

CORN.

At Mark Lane on Monday the supply of English Wheat was very small, but there were liberal imports from abroad, and the sales effected in either class were at some reduction from the rates current on Monday last.

CATTLE.

At the Metropolitan Market on Monday the number of beasts was smaller than on Monday se'night. The demand was good, and prices improved for all kinds.

HAY.

The Whitechapel report is to the effect that though the supply was large, there was also a fair amount of activity in the trade, and prices ruled firm.

POTATOS.

From the Borough and Spitalfields market reports we learn that supplies were in excess of the demand, which remained slow at the quotations subjoined.—Regents, 80s. to 100s.; Metags, 100s. to 125s.; Flies, 100s. to 150s.; 150s.; Superior Clover, 120s. to 150s.; inferior, 95s. to 105s.; and straw, 40s. to 44s. per load.

COALS.

The market was dull on Monday, and house coals gave way 1d. per ton. On Wednesday there was a further decline of 6d. per ton in the same classes,

RICHARDSON'S PATENT PORTABLE HORICULTURAL BUILDINGS

THE ROYAL POTTERY, WESTON-SUPER-MARE. UNDER ROYAL PATRONAGE.

JOHN MATTHEWS (late C. PHILLIPS), MANUFACTURER OF TERRA COTTA VASES, FOUNTAINS, STATUARY, GARDEN POTS (from 2 to 30 inches in diameter), of superior quality, withstand frost, and do not become green.

THE CELEBRATED GRANITIC PAINT.

THE SILICATE ZOPISSA COMPOSITION. TO CURE DAMP IN WALLS, AND PRESERVE STONE, &c., FROM DECAY.

HILL AND SMITH'S BLACK VARNISH

FOR PRESERVING IRONWORK, WOOD, OR STONE. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper.

UNSOLICITED TESTIMONIAL. "Glanewilly, Llanpumpans, Carmarthen, Nov. 27, 1873. "Mr. Lloyd Lloyd encloses cheque for £3 5s., amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful things he has ever possessed."

CARSON'S PATENT, PATRONS BY THE QUEEN, H.R.H. THE PRINCE OF WALES, THE BRITISH, INDIAN AND COLONIAL GOVERNMENTS, 8000 OF THE NOBILITY, GENTRY, AND CLERGY, RAILWAY AND CANAL COMPANIES, COLLIERIES, IRONMASTERS, &c., &c.

OUTDOOR WORK. IT IS ESPECIALLY APPLICABLE TO WOOD, IRON, BRICK, STONE & COMPO. CAN BE LAID ON BY UNSKILLED LABOUR.

WALTER CARSON & SONS, LA BELLE SAUVAGE YARD, LUDGATE HILL, LONDON, E.C., AND 21, BACHELOR'S WALK, DUBLIN, NO AGENTS.

TOBACCO PAPER—TOBACCO CLOTH—TOBACCO CORD—TOBACCO JUICE.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post free on application.

RUSSIA MATS.—A large stock of Archanzel and Petersburg, for Covering and Packing. Second size Archanzel, 100s.; Petersburg, 60s. and 80s.1

HESSIAN MATS AND SCRIMS for COVERING.

MARENDAZ AND FISHER, 9, James Street, Covent Garden, W.C., Importers of Archanzel and St. Petersburg Mats, have a large stock of MATS, NETTING, TIFFANY, KAFFIA FIBRE, &c., at Wholesale Prices.

E. T. ARCHER'S "FRIGI DOMO." Patronised by Her Majesty the Queen for Windsor Castle; Prince Christian for Frogmore Lodge; the Royal Gardens, Kew; the late Sir Joseph Paxton; and the late Professor Lindley &c.

Metallic Hothouse Builder to Her Majesty. HENRY HOPE (late Clark & Hoak, formerly Clark), HOUSING, REFRIGERATING, and HOT-WATER APPARATUS ENGINEER.

MAW AND CO.'S PATENT.—Prices, Printed Patterns, and Specimens, sent post free on application; also Patterns of Ornamental Tile Pavements for Conservatories, Entrance Halls, &c.

PRUSSIAN WOOD GARDEN STICKS and TALLIES, commended by the Royal Horticultural Society. The above can be had, of all sizes, wholesale, of CHARLES J. BAKER, Royal Horticultural Society's Cox's Quay, Lower Thames Street, London, E.C.

Rosher's Garden Edging Tiles. THE above and many other PATTERNS are made in materials of great durability. The plainer sorts are especially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and are, in fact, under, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Also Tiles, Grooves, and other Stable Paving of great durability, Wall Copings, Drain Pipes, and Tiles of all kinds, Roofing Tiles of all variety, Slates, Cements, &c.

SILVER SAND, fine or coarse grain as desired. Prices by Post for Ton or Truck Load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post.

GARDEN POULTRY NETTING,
25,000 yards, strong, sound, 1 1/2d. per square yard; 100 yards, 4s 12s. 6d., or 1 1/2d. per yard. **USED HEKING NET,** 550 yards, 4s 2s. 1d. per square yard. **TIFFANY,** 1s. to 7s. 6d. per 20 yards. **ARCHANGEL MATS,** 21s.; **PETERSBURGS,** 18s. per dozen.
M. SMITH, 6, Potter Street, Workop.

TANNED GARDEN NETTING, 1 1/2d. per Square Yard, for Protecting Seed-beds, Peas, Fruit, Strawberries, &c., from Birds, Frost, Blight, &c., and as a Fence for Fowls, in 1, 2, 3, and 4-yards widths. Hexagon, Triangular, and other Nettings. Galvanised Wire Netting, Pea Hurdles, and Seed Protectors, by
C. WRIGHT, 29, Lime Street, E.C., late 376, Strand, W.C.

NETTING FOR FRUIT TREES, SEED BEDS, RIFE STRAWBERRIES, &c.

TANNED NETTING for protecting the above from Frost, Blight, Birds, &c., 2 yards wide 2s. 6d. per yard; 4 yards wide, 4s. 6d. per yard; or 50 yards, 20s.

NEW TANNED NETTING, suited for any of the above purposes, or as a Fence for Fowls, 2 yards wide, 6d. per yard; 4 yards wide, 1s. per yard; 3/4-inch mesh, 4 yards wide, 1s. 6d. per yard. **TIFFANY, 6s. 6d. and 7s. 6d. per piece of 20 yards.**
EATON AND DELLER, 6 & 7, Crooked Lane, London Bridge.

TANNED NETTING, for Protecting Seeds and Fruits from Birds, in all widths, at lowest prices. Wholesale Priced List sent, post-free, on receipt of Trade Card. **POOLEY AND CO., Horticultural Sundriesmen, 23, Bush Lane, Cannon Street, E.C.**

EDGINGTON'S GARDEN NETTING, the cheapest and most durable, at 1d. per square yard, or in quantities of 250, 500, or 1000 yards, carriage free. **EDGINGTON'S CRICKET AND GARDEN TENTS** are the prettiest. **EDGINGTON'S MARQUEES** for Hire are the most elegant and capacious. **EDGINGTON'S RICK CLOTHS** for 69 years have maintained their celebrity as the best. **TIFFANY, SCRIM CANVAS,** and every other kind of NETTING.

Be particular—**FREDK. EDGINGTON AND CO.,** Rick Cloth, &c., Manufacturer to Her Majesty, 52, Old Kent Road, London, S.E.
A quantity of good Second-hand Government TENTS for Sale, Cheap.

HARRY BUNYARD supplies:—
NETTING for FRUIT TREES, &c., 2 yards wide, 2d., 4 yards, 4d. per yard—in pieces 50 yards each.
SHADING CANVAS, 1 yard wide, 3d. and 6d.; 2 yards, 7d. per yard—only in pieces 140 yards each. Smaller quantities at an advance.
TENTS, Garden and Cricketing. **CRICKETING NETS, MARQUEES** and **FLAGS** on Sale or Hire.

Samples and prices on application. Prepayment by Post Office Orders, payable at Tooty Street, S.E., from unknown Customers, ensures goods, carriage paid, on amounts of 4s and over.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—
These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction, and a month's trial allowed. Orders executed on receipt.

Price, fitted with Garden Engine 8 0 0
PRIZE WATER and LIQUID MANURE CARTS.
Prices and particulars on application at the London Road Ironworks, Chelmsford.

Silver Medal, 1874.

THE TERMINAL SADDLE BOILER.—
First-class Certificate, 1867; Highly Commended, 1873.

The following Letter from Mr. Wm. THOMPSON needs no comment.—
"Dear Sir,—I have now had your Terminal Saddle Boiler heating two large Span-houses, 21 feet wide and 15 feet high, containing 1484 feet of 4-inch pipe, and it does its work to my entire satisfaction. In fact I know of no Boiler of the same size and cost that will do the same amount of work with the same quantity of fuel. It is an excellent Boiler. You should advertise more than you do, for it deserves to be better known than it is.—Yours truly, Wm. THOMPSON."
Illustrated Circulars, post free.
THOMAS JONES, Temple Street, Manchester.

STEVENS'

TRENTHAM GREENHOUSE BOILER,
After long experience, has proved the most Simple, Economical, Efficient, and Lasting Boiler extant; recently much improved. For Illustrations, with full particulars, apply to the Sole Makers, F. AND J. STEVENS, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz. the water space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron, are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	48 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W.,
May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, South-west, London, S.E.

Prices of Horse, Pony, and Donkey Machines on application.
Carriage Paid to all the principal Railway Stations
in the United Kingdom.

The "SILENS MESSOR" Machines have a world-wide reputation for their superiority and excellence, and the improvements which have been made in them from time to time still keep this Machine the best and most approved one in the Market.
They will cut either SHORT or LONG GRASS, BENTS, &c., and wet as well as dry, advantages which no other Lawn Mowers possess. They are the only Lawn Mowers in constant and daily use in the Royal Gardens, and in most of the principal Gardens and Parks throughout the Kingdom.
A stock of 500 Mowers is kept at our London Establishment, including all sizes, from which purchasers can make their selection and have prompt delivery.

GREEN'S PATENT "ROYAL" LAWN
MOWER is a far superior Machine of its kind to any
Lawn Mower extant, and it will cut either short or long grass,
bents, &c., and wet as well as dry.

Prices of the "ROYAL" Machines. To cut—
6 inches | 8 inches | 10 inches | 12 inches | 14 inches | 16 inches
35s. | 40s. | 45s. | 50s. | 55s. | 60s.

Delivered carriage free at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland. Every Machine is warranted to give entire satisfaction, and if not approved of, may be returned at once unconditionally, without any expense to the purchaser.

Our reason for bringing out the "ROYAL" Mower is to meet a want which has been repeatedly expressed by the purchasing public, to have a good, useful, and efficient Machine, CHEAP.
N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

GREEN'S PATENT ROLLERS FOR
LAWNS, DRIVES, BOWLING GREENS,
CRICKET FIELDS, AND GRAVEL PATHS.
Suitable for Hand or Horse Power.

VIENNA PRIZE WIRE NETTING.

Awarded
The Medal
For Merit
At
Vienna,
1873.

**CAUTION TO BUYERS
OF WIRE NETTING.**
The great reputation and success of Messrs. J. B. BROWN and CO.'S VIENNA PRIZE WIRE NETTING seem to have induced certain Dealers in Wire Netting to advertise an inferior article at reduced prices, specifying the mesh, gauge, &c., as if such were the same in quality and value as the Prize Wire Netting of which Messrs. J. B. BROWN & CO. are the SOLE MANUFACTURERS.

Messrs. BROWN & CO. would suggest that, before ordering quantities, one roll of their Wire Netting should be ordered and one roll of that advertised at reduced prices. The size and shape of the mesh may then be examined, the thickness or strength of wire, the weight of the rolls and the exact measurements, the general finish of the manufacture, and the quality of the galvanising.

This examination will prove the respective qualities of the Netting.
90, Cannon Street, London, E.C.—March 12.

**FOWLER'S PATENT STEAM PLOUGH
AND CULTIVATOR** may be SEEN at WORK in
every Agricultural County in England.
For particulars apply to **JOHN FOWLER and CO.,**

MESSINGER & COMPANY,
CONTRACTORS, MIDLAND HORTICULTURAL BUILDING
AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Beg to inform their numerous Patrons and the Public generally, that having erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, large or small, they are in a position, from their great facilities and experience, to carry out with dispatch, in the best manner, at very moderate cost, the orders with which they are entrusted. Only thoroughly well-seasoned timber used. Glasshouses erected on Messinger's patent principles are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed; are economical in cost and maintenance. Messinger's Patent Rollers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application. Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out. Richly Illustrated CATALOGUE post free for 38 Stamps. Illustrated CIRCULAR free.

6 INCH CLIMAX 25/-

10 INCH CROQUET 70/-

Important to Market Gardeners and Others.
THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separate, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and tasty, and fully adapted to the purposes designed. A large number have been sold, and are giving unequalled satisfaction.

FOLLOWS & BATE, Makers, Dutton Street Works, MANCHESTER.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise: but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—Hullford Counties Herald.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—Lloyd's.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—Bell's Messenger.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to buy this little book broadcast."—Gardener's Magazine.

PARTNERSHIP—Owing to the decease of the Proprietor of an Old Established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who would be disposed to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Protheroe & Morris, 98, Chancery Street, E.C.

TO ESTABLISHED NURSERMEN.—A practical Nurseryman of great experience and full competence in Producing, Hybridising, and Growing all kinds of Heraceous Florist Flowers, wishes to meet with an Established Nurseryman, to whom he is desirous of transferring the addition of a Department for these Plants. The Advertiser would only treat with a view to Partnership, and would invest a moderate capital.—H. KELLY, Esq., Solicitor, 49, Bedford Row, London, W.C.

WANTED, as GARDENER, a thorough and practical Nurseryman who understands the profession in all its branches. Unexceptional references required.—Salary £50 per annum.—Apply by letter, stating last employed, and name carried or single, to G. COPE, Esq., Lord Nelson Street, Liverpool.

WANTED, a GARDENER, thoroughly qualified in Kitchen and Flower Garden, and Greenhouse, with Vines. Occasional assistance given. Good cottage and satisfactory wages. Good moral character indispensable.—Address, stating references, and qualifications.—REV. H. R. BAILEY, Gray's Inn, London, W.C.

WANTED IMMEDIATELY, a hard working GARDENER, married; must be able to Lay Out Grounds. Preference given to one who understands Stock and Grass Land. Wages 23s per week, with Lodge to live in, but no fire.—Address, with references, to the Proprietor, in experience, &c., to M. STEWART, Wingfield, Banstead, Surrey.

WANTED, as WORKING GARDENER, and to attend to a Cow and Pony, at Muswell Hill, N., an industrious Man, with good personal character. Wages 30s.—Apply to Mr. ARNOLD, 20, Foultry, London, E.C.

WANTED, a MAN and WIFE—the former as Working Gardener, the latter as Laundress. Both must understand their business. Wages £200 per annum, with good cottage and garden and laundry fitted with every appliance, but nothing else found. Situation vacant on the 24th.—Apply first by letter, to DR. ARMSTRONG, Bracknell, Berks.

WANTED, an OUTDOOR FOREMAN.—Must be an expert Budder and Grafter, and well acquainted with Nursery Work, to a competent man liberal wages will be given. No one need apply whose character will not bear the strictest investigation.—Apply in own handwriting, to M. & K., Exotic Nursery, Canterbury.

WANTED, as GARDENER and FARM BAILIFF, in a Gentleman's Establishment in Hertfordshire, five miles from Garden City, experienced, especially in the Cultivation of Fruit and Vegetables, capable of taking general Charge of Live Stock, and the Management of Grass Land; a married Man, with family preferred. An English Gardener and a Hertfordshire bred man, with wages and all particulars, to A. M., Mr. J. R. Bonny, Estate Agent, 47, Old Broad Street, E.C.

Carter's THE FINEST COLEUS EVER INTRODUCED. NEW COLEUS; "DUCHESS OF EDINBURGH."

AWARDED FIRST-CLASS CERTIFICATES:—

Royal Horticultural Society, June 17, 1874; Royal Botanic Society, June 20, 1874.

The foliage of this distinct and beautiful variety has margins of purple and cream yellow, with a centre of bright crimson-magenta, forming a superb contrast to the green-leaved section of Coleus, by reason of its dazzling brilliancy of colour. Professor Thubert, in the *American Agriculturist*, says:—"It is the most beautiful foliage plant that has ever been exhibited."

Price 3s. 6d. each. Extra Strong Plants 5s. each. Post Free 6d. extra.

See Illustration in "Gardeners' Chronicle," May 22, and also Carter's Illustrated Plant Catalogue with beautifully coloured Engraving of above. Price 6d., Post Free, Gratis to Customers.

Now Ready, our NEW ILLUSTRATED CATALOGUE OF HORTICULTURAL BUILDINGS, containing upwards of 60 Engravings with Prices of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., Free by Post for 12 stamps.

AS A LAWN CONSERVATORY.

The Judges at the Royal Horticultural Society's Great Meeting lately held at Birmingham, pronounced these Patent Preservers and Grand Vineries to be by far the best and most useful articles of the kind they ever saw, and awarded them the ONLY PRIZE.

Instead of having to remove or slide loose glass every time it is necessary to attend to the plants, we attach the glazed lights (21-oz.) with hinges to the frame of each light, thereby doing away with continual breakage of glass and loss of time. Two men can instantly remove a complete length, 12 ft. by 4 ft. wide; thus proving them to be really portable. They are made in the following sizes. One pair of ends is sufficient for any number of lengths, if set in a continuous row.

Cash Prices carriage paid to any Station in England on Orders amounting to 60s. and upwards.

PATENT UNIVERSAL PLANT PRESERVERS, Large Sizes to build on Brick Walls, for use as Span-roof Pits, suitable for Forcing, Propagating, Growing Cucumbers, Melons, and a variety of other things too numerous to mention. Write for New Illustrated List post free.

OPINIONS OF THE PRESS.

"The uses to which such frames can be put are fully recognised by practical gardeners, and if any notice can be taken of the great demand arising for such contrivances amongst amateurs, it would appear that they too are not ignorant of their great value."—*Gardeners' Chronicle*.

"The Lawn Vinery which has the greatest advantages is unquestionably that manufactured by W. S. Boulton & Co."—*Floral World*.

"Considering their substantial character, portability, and the many ways in which they may be employed, we anticipate a very large demand when they become generally known."—*Gardeners' Magazine*.

"Every convenience is provided to save time in cases of removal, planting, watering, and giving air. The glass is firmly fixed and put-tilted—an essential point. They are complete and ready for use the moment they are received, &c."—*The Gardener*.

MELON OR CUCUMBER FRAMES.

All sizes (glazed with 21-oz.) ready for immediate delivery. Height at back, 24 inches; at front, 13 inches; sides, 1 1/2 inch thick; lights, 2 inches thick. All made of very best red deal. Painted three coats. Every pane of glass is nailed as well as puttied in. Each light is provided with an iron strengthening rod and handle.

Glazed with 21-ounce.

CHATSWORTH,

THE SEAT OF THE DUKE OF DEVONSHIRE, K.G.

THE "GARDENERS' CHRONICLE" for JUNE 26 will contain a *Special Supplement, uniform with those already published of HATFIELD and WINDSOR, and consisting of Eight Pages of Original Illustrations and Letterpress description.*

Price Fivepence; Post Free, Fivepence-halfpenny.

ADVERTISERS DESIROUS OF HAVING EXTRA SPACE IN THIS NUMBER are particularly requested to communicate at once with the Publisher.

PUBLISHED BY W. RICHARDS, 41, WELLINGTON STREET, STRAND, W.C.

SUTTONS' CHOICE STRAINS OF FLORISTS' FLOWERS

(POST FREE).

The Finest Strain of Calceolaria.

SUTTONS' SUPERB CALCEOLARIA.

This splendid strain has been most carefully selected from the very finest collections in cultivation. The plants are compact in habit, with beautiful green foliage and a profusion of bloom. The flowers are large, perfect in form and substance, and of every shade of brilliant colour.—Price 2s. 6d. per packet, post free.

From A. E. RUSSELL, Esq., *Dalnacreech, N.E., July 10.*

"My Calceolaria plants from your seed of last year are particularly fine, of very compact habit, and very fine in colour."

From Mr. A. ALLERTON, *Coleman's Prittlewell, May 8, 1875.*

"Our Cinerarias this year, from your seed, are splendid; far surpass any I saw at the Botanic Gardens yesterday.

The Finest Strain of Cyclamen.

SUTTONS' PRIZE CYCLAMEN.

The following varieties have been carefully selected from one of the finest strains in cultivation, and, as they remain in bloom from November till March, are invaluable for decorating the conservatory or drawing-room during the winter months. The flowers also are extremely valuable for bouquets, as they retain their freshness for a considerable period when kept in water.

ALBUM, pure white.	ROSEUM ALBUM, white
MARGINATUM, rose, edged with white.	and red.
ROSEUM, rose and carmine.	RUBRUM, bright crimson.
	FURFUREUM, purple.

Price 5s. the Collection, post free.

From W. H. MELLEERS, Esq., *Eversham Lodge, Cheltenham, Feb 12.*

"The Cyclamens I had from you last autumn have given me great satisfaction."

The Finest Strain of Primula.

SUTTONS' SUPERB PRIMULA.

A splendid strain, which has been carefully selected from the largest fringed flowers of good colour. Habit robust, with bloom thrown well above the foliage. Red, white, or mixed, 2s. 6d. per packet, post free.

SUTTONS' SUPERB CINERARIA.

This will be found unequalled by any in cultivation, the seed having been saved from the finest named varieties only. Price 1s. 6d. and 2s. 6d. per packet.

From WALTER EDWARDS, Esq., *Wellington, Somerset, Jan. 21, 1875.*

"A more beautiful strain of Primulas than I have had this winter, from the seed you supplied me with last spring, I never saw."

ROSES—New Varieties.

RAISED AT THE ROYAL NURSERIES, SLOUGH.

CHARLES TURNER

Is now sending out and can with great confidence recommend the following new kinds. They have been very successfully exhibited and much admired during the past season, having received First-class Certificates at London and Provincial Shows.

HYBRID PERPETUALS.

JOHN STUART MILL, bright clear red, large, full, and beautiful form, fine shell-like petal, of great substance, well adapted for exhibition purposes: being also a Rose of strong constitution and free-flowering habit. It forms a beautiful variety for general garden purposes: quite distinct. Received First-class Certificates as follows:—Royal Botanic Society, June 15, 1874; Oxford Horticultural Society, June 16, 1874; Oxford Amateur Rose Show, June 25, 1874.

Strong plants, in pots, 7s. 6d. each.

MISS HASSARD, beautiful delicate pinkish flesh colour, large, full, and fine form, very sweetly scented; free autumnal bloomer. A first-class Rose either for exhibition or general garden purposes, having the strongest and best habit of any Rose of similar colour; quite distinct and very fine.

Strong plants, in pots, 10s. 6d. each.

REV. J. B. M. CAMM, very bright rose pink, most pleasing colour, large, very full, and fine globular form; a magnificent show flower, very sweet, constant and thoroughly distinct, gray, very sweet, and much better grown. Received First-class Certificates as follows:—Royal Horticultural Society, July 15, 1874; Oxford Horticultural Society, June 16, 1874; Royal Botanic Society, June 10, 1874.

Strong plants, in pots, 10s. 6d. each.

ROYAL STANDARD, beautiful soft satiny Rose, large, very full, and exquisitely formed, somewhat in the way of Emma's Hauberg, but a larger flower and much better grown. Received First-class Certificates as follows:—Royal Horticultural Society, July 5, 1873; Royal Horticultural Society, July 15, 1874.

Strong plants, in pots, 7s. 6d. each.

The above set of Four Varieties for 30s.

CHARLES TURNER, The Royal Nurseries, Slough.

SATURDAY, JUNE 12, 1875.

PLANT LIFE.

M. R. W. S. CLARK, President of the State Agricultural College, Amherst, Massachusetts, has published a paper, which he presented to the Massachusetts Board of Agriculture, containing a record of observations on the phenomena of plant life. About twelve months ago we noticed the same author's lecture on the circulation of the sap in plants. The interest awakened by his observations concerning this phenomenon, he informs us, rendered it impossible to refrain from further investigations, which he has carried through in conjunction with some of the officers and students of his College. The phenomena submitted to observation were:—The structure, composition, and arrangement of the winter buds of hardy trees and shrubs; the percentage of water to be found in the branches and roots of trees during their annual period of rest, as well as when in active growth; the causes of the flow of sap from wounds in trees when denuded of their foliage, as well as the flow from the stumps of woody and herbaceous plants when cut near the ground in summer; the structure and functions of the bark of exogenous trees, with special reference to the circulation of the sap, the formation of the wood, and the effects of girdling; and the measurement of the expansive force of growing vegetable tissue.

So wide a field of research yielded, as might be expected, some very interesting results, but the means employed to register the different forces may possibly, we are inclined to think, have led to error. True, we know very little respecting the phenomena of plant life, but we hope the time is approaching when some attention will be given in this country to this branch of inquiry. We would commend this to the consideration of Messrs. Lawes and Gilbert, who have effected so much in experimental scientific agriculture, and who possess great facilities for carrying out such work with the necessary exactitude. Some of the costly experiments conducted at Rothamsted may be said to have reached a stage of refinement of ascertained facts, and might well be discontinued in favour of new ones in other directions.

We will briefly summarise Mr. Clark's somewhat lengthy but very interesting paper. Our remark respecting the possibility of inaccuracy in the results will be understood literally, not as any reflection on the capacity of the observer or his conscientiousness in the search for truth. On this point the writer himself enlarges, and adds, in reference to botanical research, "when we consider that, to observe the transit of Venus, expeditions have been sent to different parts of the earth, at a cost of more than a million dollars, we may, at least, hope that scientific observations upon things nearer home, and having more to do with every-day life, will soon be appreciated and suffered." An experiment to ascertain the expansive force of growing vegetable tissue furnished results that appear almost incredible. A fruit of the large Pumpkin—Cucurbita maxima—was chosen for this purpose. The plant bearing it grew in a large bed in a propagating-house, the bed being built above, and free from the floor. Without going further into particulars, we may say that all the details appear to have been conducted with great care. In order, however, that the reader may understand the experiment, it seems necessary to explain the way in which Mr.

Clark proceeded to determine the lifting or expansive power of the growing Gourd. The female flower which bore the Gourd was artificially impregnated on August 1, and on the 17th of the same month the fruit measured 27 inches in circumference. We will here employ Mr. Clark's own words:—

"Though the rind of the young fruit was very soft, it was now determined to confine it in such a way as to test its expansive power. In doing this great care was taken to preserve the health and soundness of every part of the Squash (Pumpkin), and to expose at least one-half of its surface to the air and the light. The apparatus for testing its growing force consisted of a frame, or bed, of 7-inch boards, 1 foot long. These were arranged in a radial manner, like the spokes of the lower half of a wheel, their inner edges being turned towards the central axis. These pieces were held firmly in place by two end boards, 12 inches square, to the lower half of which they were secured by nails and iron rods. A hemi-ellipsoidal cavity, about 5 inches deep in the centre, and 8 inches long, was cut from the inner edges of the seven boards, and in this the Squash was carefully deposited, the stem and vine being carefully protected by blocks of wood from injury by compression. Over the Squash was placed a semi-cylindrical harness, or basket of strap-iron, firmly riveted together. The meshes between the bands, which crossed each other at right angles, were about 1½ inch square. The harness was 12 inches long, and the same in width, so that when placed over the Squash it just filled the space between the end boards. Upon the top of the harness, and parallel with the axis of the cylinder and the Squash, was fastened a bar of iron with a knife-edge to the fulcrum of a lever to support the weight by which the expansive force was to be measured."

The fulcrum and the lever both had to be replaced by stronger ones several times, as the weights were increased. The weight lifted by the Gourd in the course of its development increased from day to day until the experiment came to an end on October 31, through the breaking down of the apparatus. On August 21 it lifted 60 lb.; 25th, 225; 31st, 500; September 11, 1100; 15th, 1400; 30th, 2015; October 12th, 2500; 18th, 3120; 24th, 4120; and 31st, 5000 lb. The last weight, although borne for ten days, was never clearly lifted, in consequence of the bending and final breaking of the harness. The growing Pumpkin adapted itself to whatever space it could find, filling up the meshes of the harness; nor did it ever crack, except in the epidermis. The lifting power was observed to be greatest after midnight, when the growth of the vine and the exhalation from the foliage were least. The weight of the fruit was 47½ lb., and when opened, the rind was found to be about 3 inches thick, and unusually hard and compact. The internal cavity corresponded in general form to the exterior, but was very small, and nearly filled with fibrous tissue, and plump and apparently perfect seeds in about the usual number. The plant having been grown in a separate raised bed, an examination of its root development was practicable. Accordingly, the soil was thoroughly saturated with water, and a few days afterwards some holes bored in the bottom of the bed, and the soil washed away from the roots. These were spread out on the floor of a room, and carefully measured, and it was estimated that their total length exceeded 15 miles, the greater portion of which was produced at the rate of 1000 feet or more per day.

A second plant of Cucurbita maxima was used for the purpose of measuring the pressure exerted by the rising sap of a herbaceous plant. When it was about two months old, and had a length of 12 feet, it was cut off nearly close to the ground, and a mercurial guage fixed to the root part left in the ground. The maximum force with which the root of this plant exuded the water absorbed by it was equal to a column of water 48.50 feet in height. Guages were also attached to the stumps of large plants of Indian Corn, Tobacco, and the Dahlia, with results similar to those recorded by Hofmeister and others.

From observations on trees growing on and between rocks, Mr. Clark thinks there is no doubt that trees are actually lifted in such cases by about half the thickness of their horizontal

roots, and he describes and figures instances, as also of trees whose roots have lifted large slabs of rock in the course of their growth. Mr. Clark ridicules Dr. Pettigrew's hypothesis of the flow of the sap, and hopes that he himself is adding some new facts to the general stock of knowledge, "though painfully conscious of the need of much more investigation before a complete and correct theory of the circulation of the sap can be stated." He still adheres to his former assertion, that too much has been claimed for osmosis. On this point he says:—

"One of the most surprising facts to be noticed in examining the wood of any tree with well-developed foliage, is the entire absence of free or fluid water. A freshly-cut surface of the sap-wood is not even moist to the touch, and if a tube be inserted in the trunk of such a tree it will frequently absorb water with great avidity. On June 6 last, a half-inch tube, 6 feet in length, was attached to a stop-cock inserted into the trunk of an Elm and filled with water. The absorption was so rapid that the fluid dropped in the thirty minutes, and this was repeated several times the same day. . . . Now, the absorption was not osmotic, since the rapidity of it was too great, and there was no outward flow, but apparently the result of imbibition, or the affinity of the cellulose of the woody fibre for water. Is not this, then, the proper name for the force which carries up the crude sap?"

The writer enlarges upon this, basing his argument mainly upon the power exercised by the cellulose. An experiment was made to determine how small a proportion of the sap-wood could conduct the necessary supply of sap to the foliage of a growing tree, and also whether the bark alone could furnish the requisite water to prevent the leaves from withering. A stem of *Hibiscus splendens*, about 4 inches in girth, was selected for the purpose, and the whole of the bark, an inch in length, and all the wood, excepting a small piece of the outside layer of sap-wood, which was 1 inch long and seven-sixteenths of an inch in circumference, were removed. The result was that the plant remained perfectly fresh and green for ten days, when the specimen was cut for the museum. Another stem of the same plant was operated upon to test the ability of the bark to furnish the water supply, but the leaves drooped in an hour, and never recovered. This leads to the remark, "If osmosis were the cause of the ascent of the sap it would seem that the abundant parenchyma of the bark, intimately united as it is with the wood of the medullary rays, must freely transmit the amount required in this case."

Of a counter-movement of the elaborated sap in the bark, as generally understood, the writer gives abundant proof in his observations on girdling or ringing, &c., if perfectly performed. An excellent demonstration of the transverse diffusion of the sap was obtained in some experiments performed to observe the result of protecting girdled places on trees from the effects of exposure. Healthy young trees, or large branches of Elm, Chestnut, Apple, Grape, and White Pine were drawn through glass tubes, 2 inches in diameter and 2 feet long, upon either end of which were fastened short pieces of rubber hose.

"These tubes were placed over girdled spots, from which the bark was removed on the 30th of the previous May, and the rubber securely fastened with iron wire to the tree. From all of these specimens a considerable quantity of sap escaped, apparently in the form of vapour, and was collected in the tubes. There was no layer of wood formed, but the foliage of all except the Pine was killed before autumn, apparently by the fermentation of the sap and its re-absorption into the wood."

An experiment to ascertain whether the annual layer of wood upon trees is developed from the outside or the old wood or from the inside of the bark satisfactorily demonstrated that it proceeds from the latter. Mr. Clark's investigations into the consequences of ringing Apple trees, &c., lead him to the conclusion that this treatment cannot be recommended (though it frequently has the effect of inducing fruitfulness), for if effectually performed the death of the tree is almost certain.

We have only space left to mention some experiments on the bleeding of various trees. Contrary to popular opinion, the Grape Vine bleeds far less than many other trees. A large number of experiments were devised and carried

out with a great amount of labour and no little expense. The collection and weighing of the sap flowing from the trees from November until the following May, formed no small portion of it. The results showed that the Paper Birch gave the most copious flow, amounting (from a tree 75 feet high) in less than two months to 1486 lb. of sap; and in one day it reached 63 lb. *Carpinus americanus* bled only 6 lb. from April 9 to May 22. A Sugar Maple furnished 566 lb. from December 16, 1873, to April 30, 1874; and another, from April 1 to May 1, 55 lb.; *Acer pennsylvanicum*, from March 23 to May 4, 15 lb. Full tables of the progress and results of the different experiments, as well as illustrations, are appended; also the names and parts taken by the different officers and students who assisted. Analyses of the sap collected from different trees, percentage of water in the wood and bark of the branches and roots of trees at different seasons of the year, and meteorological tables, render this set of observations exceedingly valuable. Doubtless the discoveries made by Mr. Clark and his coadjutors will induce them to continue and extend their observations on the phenomena of plant life.

New Garden Plants.

ONCIDIUM CARDERI, n. sp.*

Among all the group of the *Cyrtocchia* "labello elongato sepalis expandiculis," twelve species, including the old *Humboldtii*, undulatum, and eleven of my species, there is no one with such a pandurate lip as this. It appears to grow just like *O. zebrinum*, as I judge from a sketch prepared by the collector. The flowers stand in "a most profuse" panicle. They are equal to those of *O. superbium*—light coffee colour, the petals half white; the superior part of the lip yellow, the anterior beautifully pink." These indications are given on the discoverer's authority. I feel certain doubts as to the brown of "coffee" colour, since it is very doubtful whether the allusion goes towards the roasted beans, or towards that dreadful beverage of chicory and a few coffee beans that is so much drunk and liked (!) in England, where the trade brings immense cargoes of the noblest coffee. At all events, we must acknowledge some brown colour, as is the case in all the allied species. The half white petals afford a quite novel ornament, and make one think of a *Vanda*. The discovery is due to Mr. Carder, a rising star in the firmament of collectors, to whom the species is dedicated. May Mr. Carder be very lucky, find many good things, and dry many specimens. I have to thank Mr. Bull for the materials—an inflorescence and a sketch. *H. G. Rehb. f.*

ONCIDIUM ROSTRANS, n. sp.†

This is an interesting plant. It belongs to that assemblage of "Macropetalia pentapetalia," whose Lindleyan type is the old *O. pyramidale*. All the other species are my children—*chrysopyramis*, *ochthodes*, *elephantotis*, *alcorone*. Here is the sixth member of the company. They all have the column very gracefully bent, with most peculiar wings and an immense long beak to the rostellum. The numerous flowers stand in dense clusters, and make a rather gay appearance. The bulbs look quite peculiar, pear-shaped, with a gray hue. It was discovered by Mr. Carder, and I have obtained it from Mr. Bull. *H. G. Rehb. f.*

SCILLA (LEDEBOURIA) MACOWANI, Baker, n. sp.‡

Sent by Mr. MacOwan from Somerset East in South Africa in 1873, to the living collection at Kew, where it flowered May, 1875. Not a striking species. Horticulturally it is like a reduced inferior edition of *Scilla Cooperi*, Hook. fil. (*Bot. Mag.*, tab. 5580), and the flowers are greenish instead of bright purple, so that it is what the gardening dictionaries would call "only of botanical interest."

* *Oncidium Carderi*, Rehb. f., n. sp. (*Cyrtocchia labello elongato, exauriculata*). "Caulescens; pseudobulbis oblongo ligulatis compressis; foliis linear-lanceolatis acutis"; panicula ampullacea; sepalis unguiculatis oblongis acutis, hinc elongato undulatis expandiculis; tepalibus ab ungue brevissimo oblongis-acutis; cruralibus; labello ligulato pandurato acuto rotato-retusculo in centro callouso; albis apiculis utrinque ligulatis quaternis; callo rhombeo utrinque superposito iuxta cucullatum parvum, carina linearis extrorsa utrinque; columna nuda, apice valde dilatata, tabula infragmatica utrinque argentea."

† *Oncidium rostrans*, Rehb. f., n. sp. (*Pentapetalia macropetalia*). Aff. *O. pyramidale*; labello pandurato basilati; lobis anticis valde latis; callis bis terminis in basi, modis elongatis; columna cycniculis albis linearibus ascenduntibus apice bifidis sub quadrifidis."

‡ *Scilla Ledebouria Macowani*, Baker, n. sp.—Bulbo ovoideo truncato; foliis 3-4 synanthibus erectis carnosius viridibus 3-4 poll. longis profunde cancellatis dorso prope lobum apiculis maculatis; sepalis brevibus sublongis; racemo denso comato parvo; pedicellis patulis pulchre rubropurpureis; bracteis minutis deltoideis; perianthio campanulato ovato ovato utrinque viridato; genitalibus perianthio vix brevioribus."

Bulb ovoid, an inch thick, clothed with brown membranous tubercles. Leaves 3-4, cotemporary with the flowers, suberect, linear, green, fleshy, bluntish, 3-4 inches long, 3-4 lines broad, deeply channelled down the face, very convex on the back, much mottled with purple on the back in the lower third or half. Scape 4 inches long, slender, terete, mottled with purple. Raceme dense, conic, containing 20-30 flowers, 3 inch broad, above an inch long when expanded. Lower pedicels spreading, brilliant mauve-red, $\frac{1}{2}$ inch long. Bracts deltoidei, very minute. Perianth campanulate, 2 lines deep, greenish both inside and out; the ligulate blunt divisions falcate when expanded from below the middle. Stamens scarcely shorter than the perianth, bright mauve-red except at the very base. Anthers oblong, milk-white, with a slight purple tinge. Ovary round, green, deeply 6-angled; style under a line long, bright mauve-purple. *J. G. B.*

ODONTOGLOSSUM VEXILLARIUM, Rehb. f.

I have just received a wonderfully developed raceme of seven very grand lilac flowers. The lateral keels of the base of the lip are toothed as in so many *Odontoglossums*. The dark streaks are a very peculiar decoration. The inflorescence comes from J. Brunton, Esq., The Ferns, Beckenham, whose intelligent and able gardener, Mr. Henley, understood so well how to manage the plant that it produced 30 flowers, 3 inch broad, above an inch long when expanded. One grew in such grand inflorescences, one with eight, one with seven, the last with five flowers. Another plant has a single shoot with four racemes, each with six blooms. This grand plant, we see it now, wonderfully free in its habit. Mr. Rucker, the Nestor of Orchid growers, is repaid for his indefatigable zeal by a plant of *O. vexillarium* with seven spikes and thirty-five (!) blooms. These details, and the inflorescence above alluded to, were given me by Mr. Harry Veitch, who may indeed easily be understood to be gratified at seeing the immense success of the lovely plant that appeared on the European scene as an introduction of the Royal Exotic Nursery. And let us not forget, I say it once more, that Mr. Wallis discovered the true locality of the plant when nearly sinking to the grave from having worked so long, so vigorously, and so successfully for his employer. If, indeed, he has just been praised so much and so well by him (see No. 72, p. 630), why should we not praise Mr. Wallis too? *H. G. Rehb. f.*

LARCH DISEASE.

At the meeting of the Scientific Committee of the Royal Horticultural Society on December 2 of last year, Mr. Andrew Murray "exhibited specimens illustrative of the Larch disease in various stages, and made a brief comment on them. He considered it probable that the increased dryness of the climate of Scotland from drainage might account for the prevalence of the disease, which was also beginning to attack the Spruce and the Pinus excelsa."

Mr. Murray's long experience in matters connected with arboriculture entitles his remarks to great respect, but from the examination of the fine series of specimens which he has liberally presented to the pathological collection now being arranged by Mr. Jackson in one of the rooms of No. 2 Museum at Kew, I could not help feeling that the disease of the Larch is rather a local than a constitutional malady; it seemed to me, without, however, having paid any previous attention to the subject, to be in all probability connected in some way with the ravages of a fungus.

Quite recently in the library of the Linnæan Society I came by accident on Professor Willkomm's *Die mikroskopischen Feinde des Waldes*. The second part of this (published in 1867) contains the memoir on "The Bark-canker of the Larch, or Larch Disease," to which I alluded at the last meeting of the Scientific Committee. The admirable figures leave no doubt in my mind that this is the same thing as that which Mr. Murray arrives at. The conclusion which Professor Willkomm discusses at with respect to the disease he states in the following words (p. 208)—"The sickening and death of the Larch is occasioned by the luxuriant development in the bark of the mycelium of *Corticium amorphum*, which consequently plays the part of a parasitic fungus." I have very little doubt that this is the true state of the case.

The structural details which Professor Willkomm has worked out most carefully show that the so-called *Corticium* is not, as might be expected, a hymenocytic fungus, but that its spores are contained in asci. Its history is extremely curious. It was first described by Person as a Peziza. It was then transferred to *Telephora* by Fries, and when that genus was broken up was placed by him in *Corticium*, where, in the new edition of his *Hymenomycetum*

Epicrisis, recently published, he still retains it with a mark of interrogation. He adds, however:—"Habit exactly that of *Corticium*, but the structure of the disk is doubtful. De Bary found it to bear asci in specimens distributed by Mougeot, and in numerous others from America, asci are present—often, however, they are empty."

I have searched, but in vain, for any observations of De Bary's upon the subject, and am disposed to think that Fries must have had what Willkomm has written in his mind. The present synonymy of the species stands as follows:—

Corticium *amorpha*, Fr., *Summ. Veg.* 333; *Ilymen.* Eur. ed. alt., 648.

Telephora amorpha, Fr., *Elench.* 183; *Berk.*, Eng. Fl. vi. 167.

Pezia amorpha, Pers., *Syn.* 657; *De Cand.*, Fl. Franc. vi. 23.

A more recent writer—Hartig—is, however, of

SENECIO MACROGLOSSUS.*

AT one of the recent meetings of the Royal Horticultural Society, Mr. Green, The Botanical Nursery, Holmesdale Road, Reigate, exhibited a small flowering specimen of this very singular plant, from which the accompanying illustration fig. 155, was prepared. The *Botanical Magazine* for February last contains a beautifully coloured plate of it, and we cannot do better than quote the remarks which accompany it, from the pen of Dr. Hooker:—"A remarkably handsome plant, and one fitted for dwelling-room culture, its lvy-like glossy leaves being evergreen, its large flowers produced in mid-winter, and its habit well adapted for a trelliswork. I have indeed heard of either this or an allied species being cultivated in drawing-rooms abroad, and trained round the walls beneath the ceiling. Like most Cape plants, it wants very careful watering and plenty of fresh air. It is the

from a plant cultivated in the succulent-house at Kew, where it is trained upon one of the rafters, and forms a very ornamental feature, blossoming at Christmas; it was raised from seed sent by Mr. Sanderson in 1868."

HOLES AND CORNERS.

IN what is understood by landscape gardening the artistic administration of a large tract of ground is usually presumed, lawn, woodland, distant prospect, home glades, and so on—all to be blended with the more dressed foreground into various picturesque effects; even where, as in the greater number of cases, these are not at command and the beauties of the garden must be drawn from itself, the same principle still holds good. It is in utilising the capabilities of the place, making the most of each piece of sunlight and shadow, following up the ideas suggested by the various natural growths or groupings, the failures or successes of special spots, that the home picture is usually formed with the most success; and in the very smallest spot which can be called a garden there is usually, besides the amount of lawn and flower-beds—whatever this may be—a certain amount of what may be called "holes and corners," patches where nothing will (or at least nothing does) grow, non-thriving and truly described "rusty" bushes, tubs or pumps (or whatever may be the centre of the water supplies) with moisture running all about to no purpose save causing a most inconvenient mess, and other miscellaneous "bits," perplexing and annoying in themselves, but which if followed up in their indications might be thoroughly cured, and in some cases turned to very good account.

Bushes are often troublesome, simply from being choked below with the accumulated leaves dropped in the course of years from their own and neighbouring boughs, and the mouldiness from the unstirred mass at times is both unpleasant and unwholesome. In a Lilac (to give a single instance) the bush may be and solidly filled up with the droppings of previous years fully 2 feet above the ground, the mass in different stages of progressive decay; but near a house other revelations will probably be found.

Where a hiding-hole exists rubbish will go in, and here probably will be a store of all *debris* that no common means will get rid of—broken china and scraps of oilcloth, saucapan lids and old scrubbing brushes, and similar curiosities of the most miscellaneous sort will reward a search, and one turns from the inspection with the reflection, "no wonder the bushes were rusty."

If easily penetrable bushes must exist near the back door, it is well for some member of the family to have an especial eye to their condition, and by removing the rubbish stores, refreshing the surface earth and pruning the boughs as admissible, a fresh growth of leaves and a proper state of soil is insured, which will usually remove the unpleasant state of affairs often noticeable. In many cases, however, some ornamental climber or evergreen shrub, which can be fastened to the house—a *Magnolia*, for instance—answers every purpose, or some low shrub impenetrable without some degree of pain, as well as difficulty, is serviceable, such as the variegated Holly, or the double-flowered *Gorse*, cheerful and bright with its golden blossoms for a good part of the year.

Another point (which seems especially adapted to get over two horticultural difficulties together) is the bit of ground often left half waste at the edge of country gardens, where land is not of great value. Garden flowers will not prosper on the unmanured soil, wild flowers only exceptionally thrive on the rich artificial soil of the garden, and on a piece of ground of this kind, and beneath the shade of a shrubbery not thick enough to shut out all sunshine, a collection of wild plants of the neighbourhood, both the sun and shade loving sorts, might be made which would soon drive out the unornamental growths too often in possession. The *Lily of the Valley*, the wild *Squill*, and the *Bluebell* all have a good effect in masses under large trees or in a coppice, *Bluebells* especially, and those who have lately seen them carpeting the ground beneath the trees in some of the localities near London for hundreds of feet together, with their bright blue blossoms, will need no reminding of their beauties. Foxgloves, again, flower well in sunshine or moderate shade, and *Chicory*, evergreen *Alkanet*, common *Honeysuckle*, and the larger *Bindweed*, the common wild *Broom*, and countless other plants which only need a glance round the neighbourhood to suggest themselves for selection, would often (with a little care in removal, so as to replace them with unbroken fibres, and their own earth round them) give a constant brightness and cheerfulness to what is apt to look very much the reverse.

A deal of cheerful effect may also be given to bare pieces of earth under the shade of struggling bushes by introducing some white-leaved plant—variegated *Periwinkle*, for instance, or the white-leaved or varie-

FIG. 155.—SENECIO MACROGLOSSUS.

opinion that Willkomm's fungus is not really *Corticium amorpha*, but a species of *Pezia*, not identical as Hoffmann supposed with *P. calycina*, but hitherto undescribed. He gives it the name of *P. Willkommii*, n. sp. Willkomm's figures show that the fruit has all the characters of that of *Pezia*. It consists of small asigerous disks from $\frac{1}{8}$ to $\frac{1}{2}$ inch in diameter; these are developed from the mycelium, which penetrates the bark, and, forcing their way through the outer layers, make their appearance at the surface.

Willkomm points out that the disease principally makes its appearance on plants four or five years old. It destroys or seriously injures the bark and subjacent cambium. This dies or forms unhealthy wood, and although the "ulcer" which is formed may heal over, it frequently goes from bad to worse. A damp situation favours the germination of the spores, which are carried from dying or dead wood in older diseased trees, on which the fruit matures. All this, therefore, ought to be cleared away and destroyed. The Larch especially demands abundance of light and air, and the absence of these when the plants are grown too much crowded together, by weakening their growth, predisposes them for the attacks of the disease. *W. T. Thistleton Dyer.*

largest flowered species of the enormous genus to which it belongs, and which contains nearly one thousand species, and the flowers remain for a considerable period in perfection. According to the *Flora Capensis*, *S. macroglossus* extends from the Keiskamma River (west of Algoa Bay) to Natal, but the only specimen we have that precisely agrees with the cultivated plant was collected by Mr. Sanderson on the Palmiet River, immediately to the east of Table Bay in the western Cape district. The specimen figured (tab. 6149) is

* *Senecio macroglossus*.—Quite glabrous, lucid, shining. Stems slender, twining, climbing trees for many feet, cylindrical, terete, red-brown below; branches green. Leaves alternate, petioled, $\frac{1}{2}$ to $\frac{3}{4}$ inches in diameter, triangular, acute, or acuminate with acuminate simple lobed or toothed lateral lobes, base deeply cordate with a narrow sinus, dark glossy green above, pale beneath, rather fleshy, nerves palmate as in the lvy. Pendentles terminal and axillary, 3 to 5 inches long, slender, green, naked, or with a few subulate green bracts. Heads $\frac{1}{2}$ inches across. Involucre 1 inch long; outer scales or bracteoles spreading and incurved, narrow linear, acuminate, as long as the inner, which are broader, acute, erect, and connivent into a cylinder, tips all green. Ray flowers eight to twelve, very large; limbs $\frac{1}{4}$ inch long, elliptic, pale yellow, with three minute blunt teeth at the much contracted lip; disk flowers about forty, small. Pappus of fine soft hairs. Achene slender, terete, striate.

gated Arabis; or, if there is rough unmanageable ones by plants with ribbon grass in front. A surface of black earth, with dinky black stems of Laurel, or similarly straggling growths above, such as it is difficult to avoid in confined spaces near back doors either in town or country gardens, is gloomy and uncomfortable picturesquely considered, but the clean white carpet of constantly changing vegetation at once puts a deal of the objectionable part out of sight, and gives the spot a bright and cared-for appearance.

Another point where two difficulties might often remove each other, is the spot round the garden-pump, tub, or whatever may be the centre from which water is supplied. In large gardens, of course, where space and means are at command, it is presumed such matters are only regulated by the wishes of the proprietor, but the amateur owner of many a small garden might often utilise the spot round the pump basin into something very ornamental.

A dry standing place should first be secured, and, if it is in the thick of the garden, by simply putting a row of bricks or of bricks and mortar limits, and preparing the soil inside, a small bed well adapted for Watercresses may at once be made. With a little care, all the water running to waste may be sent in one direction, and in the flower garden it may be turned into the spot often wanted for moisture-loving plants which are unattainable in any other way. An old tree trunk for a casing to the pump, with a square stone basin beneath, forms a good centre; and a hole at the bottom of front or side of the basin, with a little channel, will take the spare water where it is wished, or give a thorough soaking when desirable. In such a situation, a constant succession of flowering plants may be kept up, including some of the half-wild kinds, such as the rose-collared Spiraea Ulmaria, and others, seldom seen in full beauty for want of more moisture, and, with the aid of a few masses of stone or similar material to group with, may of our English Ferns, especially the Osmunda, with a thrive luxuriantly.

For dry banks, as well as for wet and shady nooks, one or other of the different kinds of Ferns may always be found to suit. The Liverwort or the Wall Rue may fill up holes in an unsightly stone wall, and the Blechnum, or Hard Fern, with the aid of some good soil, if its roots are protected from the extreme heat of the sun, will thrive in unusually dry exposures, and with wild Thyme, and the wild white and yellow Cistus grouped around, with some small pieces of rock or flat stone on which they may spread their bright sheets of colour, and trim foliage in natural growth, will give a suggestion of a heathland or rocky moor, much pleasanter than the simple view of a dry bank.

In the management of the main part of the garden itself the common rules of growth must necessarily be followed, but the exceptional bits, which in their entire unsuitability to plants grown in the common way give a scope for taste, and invite both groupings and specimens of a totally different character to all about them, may, by following out their own suggestions, be treated to the best account as spots of interest and picturesque beauty. O.

ZEBRA-WOOD.

In a paper "On the Identity of Goua Powder and Araroba," read before the Pharmaceutical Society on April 7 last, and published in the Society's *Journal* for April 10 (p. 801), Mr. E. M. Holmes, the author, refers incidentally to the botanical source of zebra-wood, and, quoting from Martius' *Flora Brasiliensis*, refers it to *Centrolabium robustum*, Bth., a large leguminous tree bearing winged fruits very similar in shape to those of the Maple, but very much larger. In the discussion which ensued upon Mr. Holmes' paper Professor Bentley took occasion to show that, according to Schomburgk, zebra-wood is derived from *Omphalobium Lambertii*, a tree of Guiana, belonging to the Connarceae. This reference to a valuable ornamental wood opens a question of some interest, inasmuch as a good deal of doubt has hitherto existed regarding the source of zebra-wood.

In Holtzapffel's *Descriptive Catalogue of the Woods Commonly Employed in this Country for the Mechanical and Ornamental Arts*, the botanical notes to which are by Dr. Royle, zebra-wood is described as the produce of the Brazils and Rio Janeiro. Its colour is described as orange-brown and dark brown variously mixed, generally in straight stripes. It is considered by cabinetmakers to be intermediate in general appearance between mahogany and rosewood, so as to form a pleasing contrast with either of them. It is used in cabinetwork and in turnery, and has a very handsome appearance when polished. It is described as being "sent in logs and planks as large as 24 inches." No reference is made to the tree furnishing it, but from a note we are told that "zebra-wood is also called pigeon-wood by Browne. One kind of pigeon-

wood in amaitica is *Guettardia speciosa*; another kind, called also zebra-wood, is described by Browne, but he was unable to name the genus." What this last may have been we are unable to say; it seems clear, however, that none of the zebra-wood of commerce comes from the West Indies, though Griseb., in his *West Indian Flora*, tells us that the name is applied to *Eugenia fragrans* var. *cuneata*. So far as we have been able to make out, Martius' description and identification of the zebra-wood of Rio de Janeiro with *Centrolabium robustum* seems correct, and Schomburgk's identity of *Omphalobium Lambertii* with that of Guiana is probably correct, for we are told by one of the largest importers of foreign woods in this country that the best zebra-wood comes from Rio de Janeiro, the next best from Bahia, which may, perhaps, also be the produce of *Centrolabium*. Honduras supplies an inferior sort, although the wood is larger in diameter. Of the tree furnishing this kind we have no information; that obtained from Demerara, which undoubtedly is furnished by *Omphalobium Lambertii*, is of a poorer class than all the preceding, and is probably the same, or commercially being produced in Nicaragua, to the botanical origin of which we have no clue.

From these remarks it will be seen that zebra-wood is the produce not of one tree but of several, two of which it may be considered are pretty satisfactorily settled, namely, that the Rio de Janeiro zebra-wood is obtained from *Centrolabium robustum*, and the Demerara sort from *Omphalobium Lambertii*. There is a peculiar mystery hanging over the origin of most of the South American woods, many of which are highly ornamental, and are imported in large quantities, considering the uses to which they are put. Thus, for instance, a wood known in the trade as angica-wood, which is very similar in appearance to zebra-wood, was at one time shipped in quantity from Parahiba and Paranaiba (Brazil), but its origin was never known, and its importation has ceased for many years. *John R. Jackson, Museum, Kew.*

HARDINESS OF INDIAN AZALEAS.

In the winter of 1873-74, on mentioning to a friend the statement which had been made by a writer in the *Gardeners' Chronicle* that Indian Azaleas had proved hardy in England in an exposed situation, he said, "Take these two, and try them. They are not good for much; they will do nothing in the spring; the loss will be but trifling should they die." So the Azaleas were turned out of their comfortable greenhouse and planted, with the balls of earth from their pots, in ordinary garden soil, rather hard, and containing a considerable proportion of lime, on the sunny side and beneath the branches of a Yew which serves to shade a small group of Ferns. This was all the care bestowed on them; they were watered when the rain from above could reach them, which was not always, on account of the Yew. In the summer they put forth a few sickly flowers, then they had that summer's drought to go through and then the winter of 1874-75 without the slightest protection or assistance. Last December, for days and nights together, the thermometer did not rise higher than 25° Fahr., and one or two nights it fell as low as 15° or even 13°. On looking at the wretched Azaleas this spring one of them was decidedly dead; it had suffered quite enough ill treatment and neglect to kill it, without the cold. If asked why I had so forgotten it, I can only ask in return, "Why do people leave undone those things which they ought to do, and do those things which they ought not to do?" The other plant still showed signs of life; the bark adhered firmly, and the twigs when broken were green and sappy.

Its tenacity excited admiration and pity. I had it potted in leaf-mould, took it indoors, nursed it, and now it is breaking into leaf all over, not vigorously, but with an evident determination and strong effort to live and gain sufficient health and strength to show itself as an Azalea which passed the December of 1874 and the February and March of 1875 in the open ground, without a hand to help it. It deserves to be potted like an arctic voyager who has been to the North Pole and come back again alive. The resistance thus offered to frost by Indian Azaleas is no conclusive reason for advocating their culture in the open ground, still less for diminishing in any way the present practice of growing them under glass. Were they ever so hardy, it is not likely we should obtain outdoors as perfect specimens as are now produced in greenhouses; and as they are almost exclusively used for indoor decoration, their earlier date of blooming is of some importance. The Rose is hardy, and yet who does not admire and love well grown pot Roses, a little hastened in their flowering by gentle heat? Early flowering plants and shrubs, however tolerant of frost themselves, are too much at the mercy of our cruel springs to allow their blossoms to be exposed to

all weathers without great risk of failure. Apricot, Peach, and Plum trees are familiar examples. But for that the Camellia might be made a shrubby or border plant in many sheltered situations; the shrub would survive although the blossoms might fall. And nothing is gained, in an ornamental point of view, by a plant which has to be swaddled, or thatched, or screened with straw at the time when it is wanted to be decorative. That pretty little shrub, the *Deutzia gracilis*, has its bunches of snow-white flowers so often spoilt beyond recovery in spring, that the only certain and satisfactory way of enjoying its blooming time is to grow it in pots under glass, when it proves one of the most winter plants we have. And yet it is perfectly hardy in British winters, probably no harder than Indian Azaleas would show themselves to be, if tested on an extensive scale. These latter will therefore remain what they are at present—the glory of our conservatories in spring, which is better than being the invalids of our parterres. E. S. D.

RECLAMATION OF SAND WASTES IN NEW ZEALAND.

AT p. 726, vol. 1., of the *Gardeners' Chronicle* for 1874 we drew attention to some experiments that had been made in San Francisco in planting European and other plants for reclaiming sand dunes. The subject is one of such general importance, affecting as it does coast land in all parts of the world, that we shall again refer to the matter in introducing to our readers the substance of a paper read before the Auckland Institute by Mr. T. Kirk, F.L.S., "On the Plants best Adapted for the Reclamation of Sand Wastes." Mr. Kirk's remarks have special reference to the coast of New Zealand, and consequently his first consideration is in reference to indigenous trees, shrubs, grasses, &c. Amongst native grasses the following are recommended—*Festuca littoralis*, a common grass on rocks all round the coast, and native also of Tasmania and Australia. Of the genus *Poa* nine species are recorded in New Zealand, besides which the common English *P. annua* is also found on roadsides. Of the native species, *P. australis* var. *levis* and *P. breviligata* are recommended as the best, and amongst other grasses are *Spinifex hirsutus*, a common coast plant, growing also in Tasmania, Australia, India, and the Pacific Islands. It is so abundant on sandhills on the New Zealand coast that almost any quantity could be obtained for planting. Its bushy, rigid, branching habit makes it a valuable sand-binding grass, though not equal to the Marram or Lyme-grass. *Zoysia pungens* is a grass of much smaller growth, the herbage of which rarely exceeds 2 inches in height, but forms a dense compact sward. It has creeping roots, and is suitable for planting with the larger-growing species. It is common on the coasts of Australia, India, and the China Seas, and though growing in New Zealand only to the small size indicated above, it is very valuable in other situations, growing sometimes to a foot in height.

With regard to naturalised or cultivated grasses, *Cynodon Dactylon*, the Doab-grass of India, is naturalised throughout the colony, and is of great value. The well-known Marram (*Psamma arenaria*), is cultivated in New Zealand. Mr. Kirk says that between the town of New Plymouth and the Sugar Loaves he recently observed some dead culms of an exotic grass, apparently belonging to this species, and which exhibited great luxuriance, being 4 to 5 feet in height; he was unable to ascertain if it occurred in other localities in the neighbourhood, or to procure any particulars respecting its introduction; but, from its being found in several patches of considerable extent, and in many widely-scattered and isolated tussocks, it would appear that seeds were scattered on the beach without protection.

The sedges and grasses, chiefly with creeping roots, of indigenous and foreign growth suitable for sand-binding purposes, and adapted to the New Zealand climate, are given in a list and number twenty-four; while under the head of "suffruticose and sub-herbaceous plants, most of which cover the surface with their foliage," are enumerated such plants as *Crambe maritima*, *Portulaca oleracea*, *Trifolium subterraneum*, *Mesembryanthemum australe*, *M. maximum*, and *M. falciforme*, *Tetragonia exarata*, *Eryngium maritimum*, *Salsola australis*, *Euphorbia glauca*, *Iris germanica*, &c. Amongst undershrubs and creepers the native plants include *Hyemantthera crassifolia*, *Coprosma acrota*, *Olearia semidentata*, and others, and the introduced plants—*Ulex europaeus* (which is naturalised throughout the colony), *Rubus discolor* (likewise naturalised in many localities), *Agave americana*, *Opuntia vulgaris*, &c. With regard to this latter plant, it is stated that it has been successfully employed in reclaiming coast sands in Madras; but it has become so abundant that it is a serious impediment to travellers in certain localities. It has long been cultivated in the province of Auckland, without evincing any ten-

dency to spontaneous propagation. In most parts of the North Island it would prove serviceable, and the ease with which it can be increased by cuttings, which merely require to be laid on the surface of the sand, is another recommendation for its use.

Several fine native trees and shrubs are included in a list devoted to this larger-growing vegetation. *Metrosideros tomentosa*, a stout much-branched tree, 30 to 40 feet high, grows on sandy and rocky coasts in Auckland, enduring the sea spray without injury, and producing a hard wood useful for ship-building. *Pittosporum crassifolium* is a fine shrub or small tree, sometimes growing to a height of 20 or 25 feet, and common on sandy and rocky coasts from the North Cape to Poverty Bay. It produces its seed freely, and would be extensively propagated. The several species of *Salix* as well as *Populus* are of course included, also the Stone Pine (*Pinus Pinaster*) the Aleppo Pine (*P. halepensis*), and the Pinus of New Zealand. This is described as one of the best known trees for the purpose, and one that can be obtained at all the nurseries in the colony. "It has been so generally planted about Auckland and other places in New Zealand that seeds can be procured in large quantities." Both *P. Pinaster* and *P. halepensis* produce their seeds in the vicinity of Auckland.

The sand wastes in some parts of New Zealand seem to require exceptional treatment, for it is said that the violence of the south-west winds is such that it would not prevent any shrubs or trees from having the sand blown from under them, unless it is first protected by a sward of some grassy sort of vegetation; to secure the sward it is suggested that a plan might be adopted of using grass ropes made of properly ripened and selected grasses which contained the ears and matured seeds; these ropes when made are "pegged down to the sand all over the area to be reclaimed in chequered lines." The seed is thus enabled to germinate and take firm hold of the sand, and very soon the whole area becomes an uniform mass of vegetation.

Mr. Kirk concludes his paper by remarking that—"It would prove advantageous to the colony if a small portion of the money now being spent on public works could be applied to the reclamation of sand wastes. The magnitude of the evil to be remedied is admitted by all who have paid the slightest attention to the subject. In several localities the natives are compelled year by year, to abandon their cultivation as the sand-waves advance, and settlers are helpless witnesses of the destruction of their paddocks from the same cause. Fences, large trees, and patches of hush have been overwhelmed within the memory of settlers of comparatively recent standing, and, in some cases, serious and serious measures are necessary to prevent further measures are taken. The danger is not confined to any one district or province, it is general, and demands prompt attention. It must be confessed that such localities as the Waikato Heads, and some parts of the Kaipara Sand hills are calculated to produce an impression of man's inability to cope with Nature; but if we look at what has been accomplished with more slender resources than those now indicated it will be seen there is abundance of encouragement. In the Gulf of Gascony immense wastes of trackless sand were utterly destitute of vegetation, and during violent storms exhibited a complete change of surface—hills becoming valleys, and valleys taking the place of hills, these being gradually carried into the interior, and covering cultivated fields, villages, and entire forests. This process of devastation has been completely arrested, and thousands of acres of fertile and waste land now yield a handsome revenue, and support a considerable population. To arrest the process of destruction now to be seen in so many localities in this colony is an object for which we may well venture to encounter the possibility, the probability even, of repeated failures, in the certainty of ultimate success." 7.

FERNS ON THE WEST COAST OF NORWAY.

The general run of tourists are becoming weary of the old-fashioned Continental round, and are beginning to look out for a new field. Thus, Norway is attracting more visitors year by year.

If asked by a botanical friend to point out the best place for a few weeks' botanising, we would strongly recommend him (speaking from experience) to lose no time in the neighbourhood of Christiania, where he will probably land on his arrival, but at once proceed by the railway to the Mosen lake, thence per steamer to Lillehammer. The Lake Mosen is surrounded by lovely scenery. From Lillehammer we must take up with the primitive mode of travelling, now almost peculiar to Scandinavia, and proceed on our journey with a carole and pony; the latter are excellent little animals, very sure-footed, and swift. It is a cheap way of travelling, although tedious, slow, and disagreeable, to be compelled to change horse and carole about every Norske mile, equal to 7 English miles. From Lillehammer to Dronthim the route, or Government road, is by the Gudbrandsdal valley, and in many places *en route* the views are magnificent, not to say wild and picturesque.

The best spot for alpine botanising is undoubtedly on the Dovrefield, and the wisest plan is to make our stay for about a fortnight at the station called Jerkin (pronounced Verkin), situated at the summit of the Dovrefield, and close to Snaelatten, whose summit is clothed with perpetual snows. In this neighbourhood a rich harvest of alpine rarities can be gleaned with a little exertion.

Having exhausted this locality, we would urge the visitor to retrace his steps and diverge towards the west coast, so as to make another short stay at some convenient station in the Sogne district. Much valuable time may be saved by fixing at the outset upon some central position, where daily walks and rides will lead to good ground.

On the other hand, if asked by any one wishful only to see the grand waterfalls and huge glaciers, for which this northern land is noted, without taking into consideration the many, and well recognized, reasons to leave the steamer on the Mosen (it usually stops to land passengers about half-way up the lake) and make tracks for the western coast. Every one who visits Scandinavia for sightseeing, returns disappointed if he has not had an opportunity of seeing the glaciers, lakes, and waterfalls in the Bergen district; but if the botanist follows the above route he may embark on the steamer at Bergen for Hull, without again going round to Christiania.

We hope to be able again shortly to refer to this subject and give our readers a little advice, which was suggested by the writer, who went to Norway as a botanical collector, after hard experience and suffering, which he wishes others to avoid. Many tourists look about for Ferns who do not care much for Pteridogamous plants. It is for these that the following notes are written, for it is well known that Scandinavia is an attractive place for the Pteridologist. It contains some of our rarest British Ferns—may be rare with us but common or abundant on the Norske mountains. All the unmentioned species are to be met with on the west coast; the Sognefjord district is especially pointed out as being rich in these plants. About six are unknown in the British islands, the rest are natives in both countries.

Alloosora crispata, Bernh. (Parsley Fern).—This is to be met with, in much the same situations as it occurs in the North of England, about Justedal, Vig, Fjeraland.

Asplenium Adiantum-nigrum, L. (Black Maiden-hair).—Walls, &c., but liable to be overlooked, and seldom as fine specimens as in North Wales.

A. Trichomanes, L. (Catnip-ed Spleenwort).—In crevices of rocks, in sheltered situations, not common.

A. viride, Huds. (Green Spleenwort).—Rare; I only met with a few specimens at Vig; it ascends higher above the sea-level than many other Ferns.

A. septentrionale, Sw. (Forked Spleenwort).—Scarce; mountain ledges above Vig.

A. Bregonii, Retz.—Lærdal, Urdal, &c.

A. Ruta-muraria, L. (Wall Rue).—Walls; often overlooked from its diminutive character; Tungodden, Salen, &c.

Adiantum Filix-foemina, L. (Lady Fern).—Aardal, Justedal, frequent in many places. We have often thought of Roderick Dhu's men, as described in the *Lady of the Lake*, rising from beneath the Bracken at the whistle of their chieftain. It is seldom we find any of our Bracken sufficiently tall to screen armed men; but in Scandinavia the botanist is surprised to find the Lady Fern, *Pteris aquilina*, and *Lastrea Oreopteris* (montana), very tall—8 and 9 feet is not uncommon; we have seen most luxuriant fronds on the border of the Bojumsbræ glacier, where of all places it should not have expected them—near melting ice.

Blechnum Spicant, Smith (Northern Hard Fern).—Common; often seen in the valleys at a high elevation.

Botrychium Lunaria, Swartz (Moonwort).—Frequent in fields, heaths, &c.; it seems very hardy, for we found it peeping from beneath a snow-drift near Snaelatten.

B. boreale (Northern Moonwort).—This is probably an incorrect specific name; we only found one specimen at Lærdalsfjorden, and another in the Aardal district; it is evidently rare in its distribution.

Cyrtopteris Fragilis, L. (Common Brittle Fern).—Frequent, becoming more rare as we proceed farther north.

C. dentata (Toothed Brittle Fern).—We gathered what we believe to be this variety in several places near Bergen.

Lastrea Filix-mas, Presl. (Male Fern).—Common.

L. Oerlepters, Presl. (Sweet Mountain Fern).—Frequent; very fine specimens are occasionally gathered.

L. dilatata, Presl. (Shield Fern).—Perhaps not uncommon, but liable to be confused with the following.

L. spinulosa, Presl. (Prickly Shield Fern).—Frequent about Vig, Jorden, &c.

Polypodium vulgare, L. (Common Polypody).—Common.

P. vulgare γ *acutum*.—Christiania, &c.

P. Dryopteris, L. (Oak Fern).—Frequent in hill situations.

P. Phlegopteris, L. (Beech Fern).—Lærdal, Vig, Liffjell, &c.; frequent.

P. Robertianum, Hoffm.—Rare, or passed over sometimes in mistake for the Beech Fern; near Lærdal.

P. thalictrum, L.—Frequent.

Polystichum Lonicitæ, Roth. (Holly Fern).—In mountain districts, often near glaciers, as at Justedal; and a very pretty variety of this Fern is met with in Norway.

P. aculeatum, Roth.—Bergen.

P. angulare, Presl.—Frequent.

Pteris aquilina, L. (Bracken).—Common.

Struthiopteris germanica, Willd.—Aardal, &c.

Athyrium phyllitum Wilsoni, Hook. (Filmy Fern).—Very rare; by damp rocks; Oundalsfjogen.

Woodsia ilvensis, K. Br.—Frequent in walls, crevices of rocks, &c.

W. glabella, R. Br.—Occasionally met with in walls. R.

ON JUDGING GRAPES.

The importance of the Grape to mankind needs no eulogium, for it has cheered the heart of man from time immemorial, and when we read of this great gift of Providence having been abused, that is no reason why such a blessing should be lightly spoken of. The art of Grape growing under glass is now so well understood in this country that I doubt if any country, however favoured its climate may be, could produce such splendid samples of perfect fruit as is to be seen in England at our great exhibitions, and inferior ones being discarded we have to decide only between good, better and best.

The immense bunches of Grapes exhibited last year from the Earl of Durham's gardens, put all previous samples into the shade, for not only were the bunches large, but the berries were so swelled above the normal size as to make good judges doubt of their being the sorts which they were named. When exhibited in Ireland they "took a rise" out of the Irish Grape growers as well as out of those on the west side of the Channel, and the first check that they met with was when they were shown at the Pomona Gardens, Manchester, where the judges awarded the first prize to some highly finished Grapes from the Earl of Ellesmere's gardens at Worsley. Now as the character of the judges for skill and impartiality has not been impeached it is but right to inquire how such a case was brought about, and this more especially as the season has come round for exhibiting Grapes.

The points of excellence in a bunch of Grapes are these—size of bunch and berry, shape or form, colour or being fair to the eye, and perfect ripeness—ripeness here meaning high to the standard as tested by the palate. Size and form are necessarily condemned for want of size and weight, and it would be idle to justify them, however agreeable to the palate. Badly-shaped bunches, having little or no resemblance to the normal type, that is, to the outline of an equilateral triangle, are objected to, on the score of form, and although this is a weak point, an elegantly shaped bunch, taken by itself, is preferable to one with an outline like that of an oyster. But there is a common sense criterion in judging Grapes that cannot be left out of the calculation, and that is the test of the palate to discover ripeness. The ordinary marks of maturity by colour and by bloom on the berries may mislead, but this test once applied by the judges places their opinion far above that of the visitors, who can only look at the outward signs of perfection. I have called this a common sense criterion because Grapes in this country are only used for table, and that not either green or half ripe; so that there is never any half way resting place, no "rest and thankful"—for it is a grave error to call Grapes not fully ripe, whether for table or for exhibition; and this simple fact clearly established would settle heartburnings between rivals and blame to the judges, who have no choice but to prefer ripe to unripe Grapes.

I have a clear recollection of taking Grapes to Chiswick, where Mr. Dowding expected to walk over the course and win the first prize for Grapes easily, but Mr. Wilmot came in first with bunches smaller than Dowding's, and berries smaller also, but highly finished; in short, ours were not so ripe as Wilmot's, and he "caused" it off with the medal. Now, ever since that practical lesson was taught me, I for one know that the judges had the advantage of tasting before giving in their award, and the palate would generally clench the verdict.

There is a good deal of mystery about bloom on various fruits of the berry type. We see it on the Plum in the greatest perfection whilst the fruit is still sour and unwholesome; it is evidently an ornamental epiphyte, growing after its own fashion on the skin of certain fruit—green with those of that hue, golden with others, and shot blue-

black with black Plums and black Grapes. Now although bloom is a chief test of highly finished Grapes, yet no scientific work gives us any data of its character, and we all know how highly ornamental it is. Bloom is independent of the fruit that carries it, and however quaint its character may be, it cannot be done without. It is a veil thin and delicate thrown over a favourite fruit, as the moss on the Rose fair and sweet, and is, like many of Nature's gifts, the "measure heaped and running over" given in love as a father gives. I see now in the shops in Manchester Muscat and Hamburgh Grapes, but they have been rubbed in transit, and the decet is exposed and the value thereby lessened—in short, they were ripe. Muscat of Alexandria Grapes fully ripe in the month of May would take the powers of the best Grape grower in the best situation.

I think I hear Crabstock of the City Vineyard say—If a bunch of Grapes for exhibition were ever so much rubbed in carrying from the Vine to the table the flavour of the fruit and its nutritious qualities would not thereby be impaired. Now, this doctrine does not hold good, for the dish of Grapes at table is valued not only as useful, but as being exceedingly ornamental; and although the subject of a human being might be nowise altered whether it was a bald pate or a luxuriant head of hair—and it might open to cavil whether the hair, however ornamental, is ever of any use, like the eyes, ears, &c.—in the battle of life the golden tresses of the Southern "Blue Belle" and the raven hair of the southern "Brunette" will be found heavy metal, and fearful odds in favour of the side to which they belong. And ladies, wise in their day, using this useless ornament with effort, and the graceful curls and more compact chignon, with the Kewland Kalydor, put it out of the power of man to say with any kind of certainty, as a judge, how much of this display is inherited and what got by purchase; and so much depends upon taste and usage that no one can alter, that the bloom on Grapes, although a small affair, is in reality vastly important. *Alexander Forsyth.*

THE ROYAL HORTICULTURAL SOCIETY.

As an old, well-tried, and, as I think some of my horticultural friends will acknowledge, not untrue friend of the Royal Horticultural Society, allow me to say a few words on the subject of its present position. In the first place I would most strongly urge the Fellows of the Society to consider what you so truly speak of in your leading article (p. 724) as to the fatal results of breaking up the Society. Whatever mess the Society may be in, in consequence of the unfortunate Kensington speculation, it still holds a position, and must do so as long as there is no new Society could possibly acquire. The establishment of the Fruit and Floral and Scientific Committees, and of the provincial shows, have been steps in advance during the last few years. Of course the blighting influence of Kensington has prevented these from becoming what the committees and shows of the Horticultural Society ought to be, and what, in spite of Kensington, I hope to see them become, but be sure that they are not what they should be, as committees and shows of the Horticultural Society; without the Society they would not be at all. From the time when our friend Dr. Lindley sought to turn the Society into a London Club, I have felt very strongly that there is one ground, and only one, on which the Society can safely build. It must take up its rightful position as the Horticultural Society, and as such must devote all its energies to the promotion of horticulture in all its branches throughout England, and to the support and interest of all horticulturalists in the kingdom in its behalf. The establishment of the committees and of the provincial shows was a step in this direction; the establishment at South Kensington was a step the other way; but the step in advance was a very small one, and was taken somewhat timidly. For instance, in the Fruit Committee, the establishment of local branches throughout the kingdom and the keeping them up to their work has never been carried out, and without doing this, it is impossible to have any real knowledge of the fruits at present grown in England, or of how to improve them. But there is no reason why we should despair of the Society's some day taking up its true position; only let us remember and be quite certain that, if the Society be broken up, there will be no Horticultural Society of England, for he must be very sanguine indeed who thinks that there will ever arise another one. It is impossible to have any benefit at the garden at South Kensington should necessarily be prejudicial to the Society, if only the moneys intended for its support, and that which is subscribed for the purpose of promoting horticulture, were kept distinct, and under separate management. I have been a Fellow, and have paid my subscription, for a great many years, in the hope of some day seeing the Society take its proper position at the head of Eng-

lish horticulture; and I care nothing whatever for the Cockney tea garden, but I do not in the least see why those who do care for it, and who use it, should not do so as much as they please so long as they will pay for it themselves, and do not spend my subscription upon it. On these conditions do I see any objection to the Society managing the said garden. *C. W. Strickland, Hildenley, Malton.*

— Until we have the opportunity of deliberately perusing the whole text of the various propositions made by the Council to Her Majesty's Commissioners, and their replies, which I wish to do, but which I cannot do until the meeting on Friday, it would be premature to discuss them. There are, however, some collateral points in his lordship's speech which invite comment for which no delay is necessary, and it may be as well to clear them out of the way at once.

In the first place allow me to express my admiration for the way in which his lordship, at a later period of the meeting, atoned for the little burst of petulance with which he received the check administered by the meeting at its commencement, when he announced his intention of reading and commenting on the majority of the propositions before communicating the papers to which the reply was an answer. "I always like to add my hullo when I see a good shot or a good blow," on whichever side it be; and the mixture of *bohomoie* and good-humoured self-depression and apology which he put on, and which is everything that could be wished. But I doubt if his lordship fully understood the meaning of the opposition he met. The fact was that the incautious and ill-advised terms in which he had spoken at the previous meeting, had done the gentlemen and their exhibiting gardeners, had done the Fellows generally, and the meeting were in no mood to make any allowances. When, therefore, he proposed to begin by reading and commenting on the answer first, the natural inference that rose in every man's mind was, that this was an attempt to do as they had done, and that the intention of the Commissioners on half-fold premises—a course against which their English love of fair play at once revolted; and although in the ordinary course of things they would have allowed it to pass without more than a tacit condemnation, in their present mood they would not stand it, and I lacked over one trace.

Passing that, my next remark is upon his lordship's statement that when his Council took office the debts of the Society (other than debenture debt) amounted to £6000, whereas they had now been reduced to £4000. This statement or something akin to it has been made before, but it has never been true. Lord Bury, and the Treasurer would give explanations as to this, but the interminable length of his lordship's speech left no time for it. We have, therefore, still to get it, and I trust that either Mr. Dobree or his successor will do so, and that there may be no mistake as to what we want, I shall give my understanding of it. Everybody knows that the Society has been going to the bad ever since Lord Bury's Council took its direction, and therefore a statement that they had reduced the debts by £2000 has been looked upon with suspicion, and that the general explanation of it has been that it was a mere culinary operation consisting in a *double entendre* of the word "debts,"—the Council understanding it in the sense of sums actually due without regard to the money in hand to pay them, while the public and the Fellows understood it to mean it as the balance of debt that remained after deducting assets; so that to say that the debts had been reduced to the extent of £2000 only meant that they had applied the £2000 which was standing to the credit of the Publicity and Fruit Committees to the extinction of debts to that amount, and any of the fellows who had taken their matter rather laughed at the pomposity of Lord Bury's assurance at the former meeting that "when we took office our debts (and I will not now enter particularly into figures) were much larger than they are now, but they have been steadily diminished under our exertions," the exertions consisting in drawing a cheque for £2000, which had been made by several years' labour and some responsibility by the old Council. This explanation has, as I say, been generally supposed to meet the case—the £2000 of £2000 intended to be reduced and the £2000 from the Provincial Show Fund corresponding to that amount; so that the inference would be that, allowing the Council credit for their exertions, the Society was at least in no worse position than it was in 1873. So much assets drawn out, so much debt paid, and yet his lordship's assurance that Lord Bury had now dispelled that illusion. He has entered into figures, and the first thing that strikes one is that he states that the debts left by the old Council were £6000. The old Council stated them, if I recollect rightly, at £3800. I have now to suppose up £2000? I am told, I know not how truly—but I want to know how it has been done, and it has been by adding the total amount of certain disputed claims to the amount of the £3800 of admitted debts, and treating the whole as actual debt. Now it is surely an unheard-of mode of stating the accounts of an estate to put the disputed debts in the same footing with the admitted debts, and to treat them both as of equal obligation. But if this would be deemed strange measure while the final value of the disputed claims was still in abeyance, what can be said in defence of it after their value has been ascertained? Surely, to treat there is no apology for stating them at a higher figure than ascertained value. And yet this is what has been done by Lord Bury, after the claims have been settled and actually paid.

It is his Council now to tell us by how much the debt has been thus overweighed. By however much that has been done by so much must the deficiency that work have made be increased. I have endeavoured to work

it out for myself, and what I bring it to is that instead of the Society being £2000 in a sounder position than it was in 1873, it is £2000 worse; but I have not access to the figures, and it is not my business. It is the Treasurer's business to tell us. The settlement of these disputed claims suggests another question. The Council treated them as good just debts how came they to compromise them? Why did they deal with them differently from any of the other creditors? The Society does not want to take any advantage of anybody. They want to pay every man his just debt, and do admit if they could get the relief without the discredit that attended it they might be willing to shut their eyes. If the Council could or would take the odium to themselves and leave the profit to the Society—if they would say with Sampson Brass, "The shame, gentlemen, if there is any, is any, it betrays that the Society should be spared it,"—no doubt then the transaction might be condoned, but otherwise I don't think they would like. But neither the old Council nor the new regarded these as just debts. They might be legal, but they were not equitable, and both alike without discredit tried to compromise them. The old Council were in treaty for a compromise of the principal one (of £1200) for £450. The new one did it for £600; they were less liable in this instance by £150. I find from his lordship's speech that both you and I, Mr. Editor, have had to retract our names in recent number of my journal on the bankruptcy which, I had erroneously supposed, threatened the Society. It is a great relief to be assured by his lordship that the gardening papers had quite misunderstood him. At the same time I cannot admit that we were wrong in our own apprehension, for, on turning to the newspaper report of his speech (which entirely agrees with my own remembrance of it), I find that he did say—"I merely mention this circumstance here because, between this time and the time of our adjourned meeting, you may be reported in the newspapers that we were in treaty with the County Court, which may go against us; and in that case, in order to carry out our principles, we shall have to file a declaration of insolvency to protect our other creditors." If he really meant to say this, then I apprehend that what we said was fully justified. But if he had been carried away in the heat of speaking, and had not meant or intended, then do not you think that instead of saying that we had misapprehended him, the more proper expression would have been that he had misled us?

It has not much to do with the matter, but the concluding force of the proceeding on Friday would seem to be passed wholly over. It was a new version of "To be or not to be." We had been already told by Lord Bury that resignation was the only course open to him, and those who thought with him, consistent with their honour, and self-respect, although it appeared that some wrong-headed individual members of the Council could not be brought to see it in that light. Then we had an affecting series of farewells from Lord Bury and others; if indeed, they were farewells, which after all seemed doubtful for like the worthy man, who had said his old adieu and seemed loth to resign, and had last word was that they had not repented yet, and might not do it after all—a statement which seemed to the meeting rather to smack of levity.

Then we had a mutual admiration testimonial, which might be said to be a partial act of reconciliation between the two parties. The members of the Council narrated how they had been the most united, amiable, harmonious, and unanimous body that ever existed—a view which, however, it is right to mention, was not endorsed by any of the four gentlemen who were the body of the matter. For the latter said, "I had quarrelled with their colleagues," and successfully seceded from the Council. Finally, we had a touching parental admonition and blessing from his lordship; and, to conclude, the recalcitrant fling about not resigning. It was very droll. *Andrew Murray.*

RARE CONIFERS.

PICEA MAGNIFICA.—No species is safe from an attack of synonymy. However distinct it may be, however clear the description and unmistakable the illustrations, there is no security that an author will not come who does not appreciate its characters in the same light, and will relegate it to the limbo of synonyms. That has been the fate of the present species, only it has not stayed there, for its distinctness has gradually been recognised.

And nobody that knows it, now disputes its being a good species. Before attaining that established position, however, it had been referred as a synonym to at least two very different species—first to *P. nobilis*, and then to *P. amabilis*. There was some apology for the former. For the latter I find none. The former error was very much confined to practical horticulturists, who perhaps had never seen my description of its cone and other special characters, and only judged of it by the leaves of the plants in nurseries and gardens, which, as I acknowledged lately, were so similar that I was myself unable to distinguish them at that stage. Mr. Syme has supplied a careful diagnose which, if he is correct in one assumption, will enable any one to distinguish them in future, viz., briefly, that the leaf of *P. nobilis* is slightly teretate in section while that of *P. amabilis* is channelled on the upper side. He has found that this is the character of the two plants when reared from

seed, and he assumes (I do not say unreasonably) that all the other plants in this country that bear these characters are of similar parentage respectively; but still this is an assumption, for there are a great many plants in this country which have always been considered *P. nobilis*, which have been bought as *P. nobilis*, which have been raised from seed sent home as *P. nobilis*, which yet have tetragonal leaves. I anticipate Mr. Syme's answer to this objection, that *P. magnifica* has been confounded with *P. nobilis* in its native country, and that these plants with sub-tetragonal leaves are really *P. magnifica* raised from seed sent home as *P. nobilis* by mistake. This seems a very reasonable explanation, and I have no doubt is a true one, although it will not be possible to prove it until the plants in question have borne cones. It accords with the fact that the specimens of

there is no description like a figure; you can skip or overlook a description, but you can hardly skip a picture. To atone as far as possible for the omission, I now give one of a small cone (fig. 156). That which I described from was twice the size, and it will at once be seen that, however similar the leaves may be, the cones are widely different. *Andrew Murray.*

Forestry.

EVERY attentive forester finds enough, and generally more than enough for all his hands to do, and while about to congratulate himself upon the near prospect of gaining full mastery over his work for once, some untoward circumstance, in all likelihood, occurs, nonplussing all his schemes and efforts, and

evil and prevent its occurrence every effort should be made when planting ravines to extend the boundary line backwards, even a few yards (when land is valuable), from the top of the sloping bank, to form a margin or border of bushy trees to lodge the snow, and prevent it from blowing into the ravine, where it does the damage. I have at present several young plantations under treatment, from between five and twenty years old, some of them very much injured by accumulations of snowdrift. It becomes a matter of deep consideration, not only how to treat each plantation efficiently and cheaply, but how and what to do with each individual tree injured.

If the tree, of whatever species, is either crushed flat to the ground, or in any way put off the upright position, it should at once be set up. If the tree is small, one or two men are able simply with the hands

FIG. 156.—PICEA NOBILIS.

FIG. 157.—PICEA MAGNIFICA, SECTION OF LEAF.

FIG. 158.—PICEA NOBILIS, SECTION OF LEAF.

P. magnifica sent home are furnished with much thicker leaves than anything we have yet seen as the introduced plants, indicating a reason for their assuming their tetragonal form. The reader may, perhaps, care to see the relative disposition of the resin canals, &c., in these two species, and I therefore show them in figs. 157 and 158. I have not complicated the cuts with the hypoderm partly because I am not sure about it in my sections, and partly because my faith in it is small. The letters A indicate the resin canals.

There is not the same apology for confounding *P. magnifica* with *P. amabilis*, and yet Professor Parlatores has entered it as a synonym of that species in his monograph. I do not think he would have done so had he seen the cone. I remember when I described it hesitating about giving a figure of the cone, and I refrained because it was too big to go into the pages of the *Proceedings* of the Royal Horticultural Society, in which I described it, and I thought a description might do instead, but

casting him with his work as far into arrears as ever. Such is my own exact experience and position at the present time.

Trusting to have been able to thin, prune, and dead-wood a number of young plantations, and undertake a considerable amount of other work too long held in abeyance, I am sorry to find an express and urgent call to attend to a series of disasters, the result of last winter's snowstorms. In this, as in many other parts of the country, heavy falls of snow occurred, the first of them on the first day of January. The dry state of the snow and violence of the winds combined soon filled every hollow and sheltered place with deep wreaths of snowdrift, and, as is generally the case, glens, deep ravines, exhausted gravel and marl pits, old quarry holes, and similar places inaccessible to the plough, are such as are generally planted in agricultural districts; hence the liability of all such plantations being filled with snowdrift, and the trees being seriously damaged thereby. In order to mitigate this

to adjust it, but if large a rope must be attached, and sufficient strength applied to bring it into its proper position. If a hard-wood tree is too large to be restored in this way, the top branches had better be lightened, and the whole top of the tree considerably reduced, which not only admits of the tree being more easily raised, but prevents the wind from injuriously affecting it afterwards. As all such prostrated trees have their roots less or more forced out of the ground on one side, they should be carefully re-established, and a turf placed over them with the earthy side down. The turf both covers and protects the roots, and forms a sort of buttress to the tree. If the tree is considerably large, it should be secured by means of rope-yarn twisted and attached to a short peg or post driven into the ground; generally one anchor is sufficient, but in some cases two, and even three, in the form of a triangle, are required to keep it secure against winds till it again establishes itself. Small trees, if only put upright, and a thick turf by way of a buttress firmly

tramped against the side to which they incline, will generally recover without further trouble or expense; but all such as are secured by ropes, wire, or other similar means, must subsequently have strict attention paid to them, lest the moorings give way, or the ligatures gall or fret the bark, &c.

Some trees, both hard-woods and Conifers, are found in such a broken and mangled condition as to perplex the most skillful in the treatment of them; indeed, there are some cases where no alternative is left but to remove them either by grubbing or cutting down. Hard-wood trees, and even Silver Fir and Larch, may, if broken at any considerable distance from the ground, be successfully treated by cutting over below the fracture, allowing them to produce new leaders, which, if healthy, they soon do. All sites whence the trees had to be removed must be left vacant till the proper season for planting arrives, when either neighbouring trees that can be spared may be lifted and transplanted into them, or sufficiently large plants brought from a distance to do it.

The urgent necessity for attending to trees in the state described must be obvious to all when it is borne in mind that if only one season's growth is made by a tree in a prostrate or reclining position, it is next to impossible, with even the best subsequent treatment, to restore it to uprightness and symmetry. *C. Y. Michx, Callen, June 1.*

Notices of Books.

Blüthen-diagramme, constraint und erläutert von Dr. W. Eichler, Professor der Botanik an der Universität, Kiel. Erster theil, enthaltend Einleitung, Gymnospermen, Monocotylen und sympetale Dicotylen; mit 176 figuren in Holzschnitt. 1875. 8vo, pp. 348. [The Plan of the Flower, &c.] (Williams & Norgate.)

A series of empirical and theoretical floral diagrams or ground plans, illustrating the construction of flowers and the arrangement and mutual relation of their parts, constructed and explained from one point of view, cannot fail to be of the greatest interest and service to systematists and students of oögenogy in following up their investigations in whatsoever direction. This is the first work devoted wholly to an examination of this subject, and, as might be expected, there are many gaps left to be filled up as opportunities offer; but had the author delayed publishing until he had himself critically examined every family it is probable that the book would never have seen the light. The author tells us in his preface that it is with considerable diffidence and some misgivings that he offers this book to his colleagues, because he is aware that others, whom he need not name, were better qualified for the task—an assertion we are by no means disposed to assent to. Nevertheless, he does not doubt that it will be welcome to many, and he is satisfied that he has spared neither care nor pains to render his work, as far as it goes, as complete as possible. In spite of his wishes to the contrary, he has been obliged, however, to omit several families on account of inadequate personal knowledge of their structure, and this defect, he says, will be still more apparent in the forthcoming volumes. Respecting his guiding principles, Dr. Eichler says that he has attached great importance to the theoretical explanation of floral structures, and in working these out he has always employed general comparative investigations, in which equal stress is laid upon the condition of affairs in the perfect flower and upon the history of its development and progressive changes.

In his introduction the author says that a general theory of the structure of the flower might be expected to precede the floral diagrams, which, however, he does not feel himself in a position to offer, as there are so many questions involved that he has had no opportunities of personally studying.

We will take a rapid survey of the introductory portion as best giving an idea of the manner in which he has handled his subject.

On the Diagram.—This is, as above stated, merely a device like a ground plan, drawn so as to show the number and mutual relationships of the several parts of the flower.

On the Flower.—The writer first of all reminds us of the difficulties in the way of framing an absolute

and universal definition of the flower, and remarks that we must be content here, as in many other problems of natural history, with a sort of compromise. A gradual transition from the bracts to the inner floral envelopes in the case of certain flowers will be familiar to all who study this subject. With reference to the axis of the flower, Dr. Eichler regards it as simple, for otherwise, he says, we should have no distinction between flower and inflorescence. But yet, he adds, it is quite clear that it is not so in cases where it bears lateral ovules, on an axile placenta. These, he suggests, might be regarded as lateral branches for the purpose of reproduction, though this view is untenable, because if we extend it to the staminal growth of Euphorbia what other solution could we give than that the entire "cyathium" is one flower?

The floral axis is sometimes quite simple, as in the Gnetales, Piperaceae, &c., and bears only one ovule-bud. Sometimes it bears ovule-buds in the form of lateral shoots (Primulaceae), perhaps also sometimes placentas, in which case the ovule buds are lateral shootlets of the second degree. Against this notion of the undivided nature of the floral axis we may instance many prolific flowers, as also those which present what gardeners call many centres. The development of the floral leaves is usually in a homology, though there are cases which must at present be admitted as exceptions. The author thinks that some of the numerous "exceptions" pointed out by Hofmeister are to be explained in the ordinary way. It would be superfluous for us to follow the author in his description of symmetrical and asymmetrical flowers, aestivation, &c.

As to the disposition of the parts of the flower, Dr. Eichler refers to the spiral whorled and other arrangements, and discusses the relative position and number of the parts of different whorls. Next, in considering the parts of the flower, the author says that nearly all disk formations are to be regarded as outgrowths from the axis, while such parts as the appendages on the petals of Silene, &c., and the corona of Narcissus are to be regarded as outgrowths from the leaf.

Bracteoles.—Under this head are discussed the relation of the bracteoles to the floral whorls, the insertion of the flower with regard to the axis from which it is given off when the bracteoles are absent. In monocotyledons there is usually one, and in dicotyledons usually two bracteoles. In the former the back of the bracteole is commonly turned towards the axis from which the flower is produced, and in the latter the two bracteoles are usually lateral or oblique to the position of the axis. Brackets in the diagrams denote the absence of the bracteoles spirally arranged at the bracts, lateral bracteoles and floral envelope, and various other arrangements are described and illustrated.

On the Inflorescence.—The author adopts in this section the most recent views promulgated by Warming and others, which, however, are too technical for us to do more than mention in this place.

The Nature of the Ovary.—Eichler accepts "Braun's view," that it is morphologically a bud, and the nucleus the axis of the bud. He thinks it is invariably a bud, and that its morphological status is the same in all cases; that it is not to be considered some other kind of growth, as a leaf, lobe of a leaf, or appendage. In this, as in other cases, he briefly discusses the more plausible theories that have been advanced by different writers.

Nature of the Placenta.—Within certain limitations he accepts the view that the placenta in different plants is of different morphological value. Thus in Primulaceae it is an axis, while in Delphinium, Liliaceae, &c., it is to be regarded as the thickened margins of the carpels.

Structure of the Stamen.—Eichler does not consider this a settled point, but he is of opinion that a stamen is invariably a leaf or lobe of a leaf.

Perigyny and Epigyny.—Usually this is the result of a cup-shaped expansion of the floral axis. Occasional adhesion and cohesion of organs in gamopetalous flowers is proved by their separation in the earlier stages of development. No hard-and-fast line can be drawn between the two conditions.

Under each family he gives copious references to morphological literature, and in all cases faithfully discards all that for what is not strictly his own.

Comparative morphology, including the history of the stages of development from the beginning to the completed condition, must form the basis of the botanical science of the future. The consideration of those questions which have assumed so much importance of late, viz., adaptation to particular office, variation, inheritance, reversion, &c., must be considered from a morphological point of view; while, for purposes of classification, so far as that is general, natural morphology, as opposed to what is conventional and arbitrary, is, of course, all-important. We can imagine few greater services to classificatory science than such a treatise as Dr. Eichler has here given us. He has most carefully and conscientiously

performed his self-imposed task, and although some of his views will not pass unchallenged, the essential value of the book cannot be affected by that circumstance. It is a pity that it is almost useless except to those possessing a pretty good knowledge of the German language, especially as we fear it is not likely to find a translator.

Home Correspondence.

A Frost in the End of May.—On the morning of the 30th the thermometer was as low as 35° here, but in low and exposed situations it was frosty enough to blacken all the Potato tops as well as Scarlet Runners and French Beans. The late Duke of Portland once informed me that, when a lad, he remembered that the Oaks in Welbeck and Thoresby Parks, in exposed situations, were so injured by a frost on May 29 that when the sun shone on the trees all the foliage became as black as his Grace's hat. This shows that we are never safe from spring frosts till May is out, and that extreme climatal changes were the same a hundred years ago as they are now. The rainfalls here in April and May have been much below the average (about 2½ inches in the two months), and this deficiency, after the very dry year of 1874, has told upon the state of the springs, brooks, and rivers, and caused them to be much lower than usual. Rain is now much wanted, for the soil is getting as hard as a board, and the hot sun and drying north-east winds are telling every day against a vigorous growth in vegetation. I was fortunate enough last year in having the kitchen garden here thoroughly furnished with water-pipes and hydrants, so that we can irrigate every vegetable quarter, as well as the fruit tree borders, and we now find great advantages from the system. Fruit of all the hardy sorts have set abundantly this year, but I see the Apples and Pears are dropping their young fruits. I do not think this will matter very much, for some kinds want a thinning, they having set so thickly, yet I believe the crops of these fruits will not be so good as is generally reported, at least in this district. Strawberries are looking well for a great crop, and with the hose at work every other night they will swell their fruit out to a good size. This day (the 7th) although breezy, is one of the hottest we have yet had, the thermometer reading 81° in the shade. *William Tillery.*

Double White Narcissus Damping Off.—Can any correspondent explain why the double white Narcissus, after attaining its full bud, so frequently damps off and collapses into decay? I have this season, just as I was expecting a floral display, lost nearly every Narcissus of this double white description, whether planted in light and warm soil with a south aspect, or in a heavy and cooler situation. And I have seen hundreds of similar failures in grounds having the same situation, at Brighton, for which I can in no way account. *W. E. Heathfield.*

Sheffield and Horticulture.—In the *Gardeners' Chronicle* of May 29 "A. B." makes a sweeping assertion which is very incorrect. He states that we have to resort to all sorts of low and degrading means to draw company. "A. B." means by "all sorts" "I have seen more than sixty *galas* here, but I have not seen anything very low and degrading about them. Once a year we have some comic singing and dancing, sometimes performances on the trapeze, and three or four bands of music—that is all. Some very good local flower shows are held near this town every year, and the best one takes the precaution of having Punch and Judy as well as other attractions in that line of business. At a fine flower show which I held in Derbyshire every year, and which is patronised by a Duke, and all the country gentlemen in that neighbourhood, I have seen jugglers, a man-fish, comic singers, dances, and such like amusements carried on; much to the enjoyment of the thousands who were at that show, when the flower tents were so crowded that the people could not see with any degree of comfort and were glad to get out into the open air and see those feats on the stage. If "A. B." could come to our next *galá* on July 12, which will be got up by the Bank of Hope, he will, if it is a fine day, hear more than 2000 children on a stage singing beautiful hymns, and also three or four fine bands of music. Speakers will also deliver orations on the temperance cause, and I should like to know if that is degrading? When wines, spirits and beer are sold at flower shows I think they are more apt to degrade some, more than the amusements which "A. B." allude to. *J. Ewing, Botanical Gardens, Sheffield.*

American Potatoes.—In consequence of various prizes being offered for American Potatoes this season an inquiry has arisen amongst intending competitors as to which sorts of the great number of varieties in cultivation are of American origin. In order, therefore, that no confusion may exist upon this point, and

that no exhibitor may be disqualified by the presentation of sorts not American, we ask you to publish for as the following list of Potatoes which have been introduced to this country from America—*Alpha*, *Eureka*, *Snowflake*, *Brownell's Beauty* (syn. *Vermont Beauty*), *Extra Early Vermont*, *Compton's Surprise*, *Early Gem*, *Late Rose*, *King of the Earlies*, *Climax*, *Bresse's Peerless*, *Bresse's Prolific*, *Early Goodrich*, *Garnet Chili*, *Peachblow*, *Early Rose*. The above names stand about in the order of date of their introduction, the newest varieties being first. *Hooper & Co., Covent Garden, W.C.*

Early Peas in Durham.—By to-day's post I forward you in a box a few Peas of *Dillstone's Early*, which I have selected from some gathered to-day. These Peas were sown on February 2; they are the earliest I have heard of in this neighbourhood, and it is considered good work to have early Peas in the third week of June here. I am situated four miles from Newcastle, near to the Tyne, whose banks, I need not tell you, are literally clothed with manufactories, many of which are chemical; collieries also abound in the vicinity. The rainfall here this last month has been almost a minimum; we have had hot, dry, arid days, with the thermometer standing at 70°, whilst at night in many cases it has fallen to 28°, with a cold, cutting spring wind. *E. Cowan, Gy, to Sir H. Clavering, Bart., Newcastle Park, Blyden, Durham.*

Sweet Peas.—The advantage of sowing Sweet Peas in autumn, so as to get an early bloom the following year, is hardly sufficiently appreciated. I have now in my garden at Binsted Wyck, in the north of Hampshire, strong plants of Sweet Peas in bloom which were sown towards the end of last summer, came up in the autumn, and stood the long and severe winter without any protection. *William Wicheam.*

Strawberry Culture in Pots.—During the last week or two I have been reading the different ideas of your correspondents on Strawberry culture, in regard to placing saucers underneath the pots. I have found very bad results to take place from such a system; in fact, the Strawberry plant is very impatient of anything like stagnation of water at the roots. Late in the forenoon, when the sun is very extensively and with considerable success, having picked for some time from 6 lb. to 40 lb. in a morning. These have all been grown on plain shelves, some near the glass and others at a good distance from it, with a moderate supply of water, and nothing in the way of liquid manure. *William Bowman, Leybourne Grange, Kent. P.S.—* From April 22 to May 26 we picked 319 lb.

Wireworms and Vine Roots.—I do not, as a rule, care to answer letters on disputed subjects when written by persons who do not sign their names to their communications. "J. S. W.," p. 600, doubts the truth of what I stated, that wireworms never eat Vine roots, or indeed the roots of any tree or shrub, because he had found young Vines eaten, and knew his soil contained wireworms. If that is the extent of his knowledge of the subject, it would be unjust of him to have any objection to being invited to make "J. S. W." believe my statement; but I do think it well that the minds of such as fear injury from this insect attacking their Vines should be set at rest. Gardeners have enemies enough, vegetable and animal, to combat without being troubled with imaginary ones, and if their plants suffer it is anything but kindness to mislead them as to the cause. As I stated, we grow thousands of Vines every year in green turf abounding in wireworms—neither I nor any of my men ever found a root injured by wireworm. "J. S. W." may have had greater experience, but if so his opinion would have greater weight if we knew his name. I have little doubt the grub which injured his Vines was the larvæ of the Otorrhynchus sulcatus, which is most injurious to Vine roots. *J. R. Pearson, Chiswell.*

The Old Oaks at Dallwitz.—I do not know whether my account has been published of the old Oak trees at Dallwitz, near here; but as I have never seen any mention of them, I think it as well to inform you that I measured the largest one accurately, and found the circumference at 4 feet from the ground 25 feet, and at 3 feet from the ground 32 feet. They have all lost a good deal of top, but the stems seem as sound as ever. They are said to be 1000 years old—a statement not much perhaps over the fact. A Lime near to the Oaks I also measured; this at 5 feet from the ground is 16 feet in circumference. *James Howard, Kings-villa, Carlbad, June 3.*

Seedling Primroses.—I should be glad if Major Trevor Clarke could mention from what raised the blue Primrose. I am rather interested in this question on account of the unmistakable crimson patch on the smaller blue Polyanthus given to your inspection some weeks ago, taken from a plant two or three years old, made by dividing a much older one, both blue. If his "stalked Lilac" is a Polyanthus resembling the double lilac Primrose, it must be very fine. As to the relation of Primroses and Polyanthuses, most of the single Primroses I know are in the habit of throw-

ing up Polyanthus stalks occasionally (I mean, of course, the garden sorts), and I have never considered it anything but a sign of lavish growth. One large seedling I know has always about an equal number of Primrose flowers, and others collected on stalks; and, what is worth remarking, the flowers are all Primroses in shape; the Polyanthus heads are bunches of large crimson Primroses, with yellow stars, and perfectly flat. It is a handsome showy flower, and I have great hopes from a very similar white one. Both, I believe, are hybridised seedlings of the single white Primrose. On the other hand, I have more than once noticed a solitary flower of the old dark double Polyanthus, which is a true Cowslip, and in each case the solitary flower was a Polyanthus still, for it had the joint in the stem. My experience, such as it is, inclines me to agree with Major Trevor Clarke, in supposing that the change in your correspondent, "C. W. D.," Primroses is owing to "fatalism," to use a fine word, and not to manure—notably because the wild Primrose grows chiefly in soil that is little else than leaf-mould, and is often in the way of every sort of animal manure; yet out of millions of blooms I must have seen, I never saw but one plant which varied at all, and then the blooms were of a somewhat paler yellow than ordinary. I think that change of shape with the change of colour points to the same thing, besides being interesting in itself. I certainly have suspected garden Primroses of a tendency to "back" by seedlings, or otherwise, to a dull fleshy pink; and also I think rather new, colour, which could have been nothing but simply a seedling of such a Primrose. *J. M.*

The Cost of Limekin Heating.—I read in your number of June 5, in an article on "Boilers at Manchester," signed D. T. Fish, the following lines:—"Too much fuel is consumed for the equivalent of work rendered, and the sooner the horticultural engineers turn their whole energies to the matter of getting more heat from the coal the better for their own interest and the future prosperity of horticulture. Dissatisfaction merges into discontent unless it becomes the pioneer of improvement. We gladly welcome all that has been done, and the much more attempted, but our cry is yet for cheaper horticultural heat." The enclosed balance-sheet, which Lord Cawdor has allowed me to publish, will answer the cry for cheaper horticultural heat:—

Balance-sheet of Limekin erected at Stackpole Court— Twelve Months from May 1, 1874, to May 1, 1875.

May 1.—Digging 270 loads stone at 10d. per load.	£14 6 8
Hauling ditto.	20 0 0
32 tons culm at 9s.	23 8 0
Fright of gas.	4 11 0
25 loads coal and small coal from the house at 5s.	6 5 0
Fifty-two weeks' attendance: half-day each day for breaking stone and charging kiln, at 7s. 6d.	19 10 0
	£89 0 8
May 1.—254 loads of lime, at 7s. 6d. per load	£195 5 0
	£89 0 8
Balance	£10 4 4

With this new system we get our houses heated cost free, and a good balance to pay for repairs.

Old System: Twelve Months.

Culm and freight	£30 0 0
20 loads coal and small coal from the house, 5s.	20 0 0
20 loads clay and hauling	3 10 0
20 loads firewood, at 7s. 6d.	7 10 0
A man making balls for twelve months and attending fires, 12s. per week	33 16 0
Second man six months wheeling in and out culm and ashes, cleaning stokeholes, &c., 13s. per week	16 18 0
	£96 14 0

No returns but dust and ashes. The extra cost here under the old system is taken from an average of five years. *Charles P. Hoffman, Chairman, The Crown Patents Co. (Limited), 21, Whitehall Place, S.W., June 7.*

Scents of Flowers.—I have a personal observation about the scents of flowers which rather illustrates your correspondent, "H.," curious case, given in your paper of May 15. To me the smells of Mignonette and the sweet Violet are sometimes indistinguishable; not generally in the open air, but if there is a small bouquet in the room I sometimes have to look to know which it is. This really does one identify the idea of Mignonette having a double scent, one identical with that of the Violet. At other times, in a room, strong Mignonette grown out-of-doors seems to me to smell like Raspberry jam; how is "H.," I wonder, as to the smell of Raspberries? I quite think the partial want of the sense of smell is a very rare thing; colour blindness in some small degree, about some particular colour, seems to be much more the rule than the exception; but the sense of smell is so intimately connected with our sense of food, and other sensations of life and health, that Nature rarely ventures to play tricks with it. There is, of course, the greatest difference as to general keenness of smell between one

person and another very often, and also as liking or being annoyed by smells, good, bad, or indifferent. I believe the well-known Italian horror of a good smell, as I remember a traveller savagely expressing it, to have something to do with the old idea of poison being conveyed in perfumes. I think every one would agree that the smell of the Pansy was totally distinct from that of the Violet (it is very pleasant to me); while I ought to mention that that peculiar smell of Mignonette which clearly distinguishes it to me far the most agreeable of the stronger flower scents. It strikes me this season, when it has been so very fine, that the smell of Lily of the Valley has a basis, so to speak, of Lemon. *J. M.*

Natural History.

WASPS.—Like Mr. Smith we have been swarmed with large wasps this year, and my employer wishing to get rid of the pests gives a penny for each one killed by the men and boys, and has done so for the last ten years or more. The largest amount paid during any one year of that period is 10s. 6d., making 234 wasps. This year they have killed nearly 700, one of the lads having killed 140 himself. As regards their being all queens, I believe there are male as well as female, for one of the men was digging a piece of ground on Monday and he dug up two nests, about the size of a large Walnut, in one of which there were two large wasps and in the other only one. This, I think, is very early for them to begin. I have also observed that they seem particularly fond of the Coteoneaster microphylla. I should think it would not be amiss to form a wasp club in every village, which would be much better than a sparrow club. *P. Bennett, Ockendon House, Cuckfield, Sussex.*

—One of your correspondents has drawn attention to the number of wasps frequenting the flowers of the Coteoneaster microphylla in his garden. I have had my attention also drawn to the number of humble bees frequenting its flowers. There are three kinds, or more properly I suppose I might say four kinds. There is the common broad yellow and black-banded kind; another, a smaller bee, with narrower stripes of the same colour; and a third, a tawny-coloured bee, more hairy about the body; whilst there are a few very few, of the black bee with scarlet tail. The plant is situated at the south-east corner of the house, and though the flower is fully out on both sides, very few come to the eastern side, while the southern side is crowded. Although I have been in the garden their visits are very few and far between. I have only seen two wasps as yet in all this year. I have carefully watched the bees at a large *Vistaria* (blue), but I have not been able to find a dead one near it; I cannot think if its flowers are destructive to the bee. *J. A. C., Cloughhead, Annan, June 1.*

MOLES.—The principal traps used for catching moles are made of iron, with a steel spring, and cost, I believe, sixpence. It is a very simple contrivance, is easily set, and can scarcely be seen. A young fellow caught a great many on my uncle's estates last winter, and among them was a brown one with a light yellow breast,—quite a curiosity. I always thought moles were shy, timid animals, and that in winter. I was out with a couple of young spaniels when they caught something, and kept tossing it in the air, and yelping. Wondering what the device was, I went to them, and found they had caught a mole; but the vicious little animal, instead of yielding quietly, turned on the dogs, and bit them severely about the lips, just like a rat. On examination, I found the mole had a set of splendid teeth, finer than a ferret's—in fact, as small and sharp as needles. *Arthur Smyth, in "Hardswick's & Sharp's Gossip."*

THE BURNET MOTH.—I should be much obliged if any of your correspondents could tell me if there is a larger kind of Burnet moth than the one usually seen in the fields at this season. The kind I refer to is 2 inches across when the wings are open, and marked in a similar manner to the common small Burnet moth. I have seen it in a plantation of Pines here for the last fortnight. *M. D. S.*

£ Culm 3s. per ton dearer than it ever was before 1874.

HORTICULTURAL EXHIBITIONS, 1875.

JUNE.

- 22 and 23.—The Kingston and Surbiton Royal Horticultural Society's Eleventh Exhibition, at Norbiton. Sec., J. Kirk, 2, East Villas, East Road, Richmond Road, Kingston-on-Thames.
- 22 and 23.—Lewisham Horticultural Society's Third Summer Exhibition. Hon. Sec., R. Armstrong, Esq., Lansdowne Terrace, Eastdown Park, Lewisham.
- 23.—Fareham and South Hants Horticultural Society's Show. Sec., Harry Smith, Fareham.
- 24.—Royal Horticultural Society of Ireland. Great Summer Exhibition. Sec., A. Balle, 28, Westland Row, Dublin.
- 24.—Bristol, Clifton, and West of England Rose and Strawberry Show at Clifton.
- 24 and 25.—Great Rose Show at the Alexandra Palace. Manager, A. McKenzie.
- 26.—Crystal Palace Rose Show. Sec., F. W. Wilson.
- 30.—Royal Botanic Society, Regent's Park. Exhibition of Fruit and Cut Flowers. Sec., W. Sowerby.
- 30.—Wisbeach Rose Show and Horticultural Exhibition. Hon. Sec., Charles Parker, Wisbeach.
- 30.—Maldstone Rose Show. Sec., Hubert Barsted, Maldstone.

JULY.

- 1 and 2.—Spalding Horticultural Society's Exhibition. Hon. Sec., George F. Barrell.
- 1, 2, 3, and 4.—Horticultural Exhibition at the Lower Grounds, Acton, Birmingham.
- 2.—The Tunbridge Wells Horticultural Society's Exhibition. Sec., E. F. Looke, The Parade.
- 3.—Thirty-second Annual Festival of the Gardeners' Royal Benevolent Institution.
- 3.—Southgate Horticultural and Cottage Gardeners' Society's Exhibition. Hon. Sec., J. Mills, East, Southgate, N.
- 3.—West Kent Horticultural Society's Exhibition in Camden Park, Chislehurst. Hon. Sec., H. Nevill, Esq.
- 6 and 7.—Grantham and South Lincolnshire Horticultural Society's Exhibition at Grantham. Sec., Thomas Lyne, Jun., Grantham.
- 6 and 7.—Brentwood Horticultural Society's Summer Exhibition. Hon. Sec., R. Eartly.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Cut Rose Show.
- 8.—Frome Rose Show. Sec., A. R. Baily, Frome.
- 8 and 9.—Manchester Botanical and Horticultural Society. Special Evening Fête and Exhibition of Roses, Floral Decorations, &c. Manager, Brice Findlay.
- 8, 9, and 10.—Nottingham and Midland Counties' Grand Rose Show and Horticultural Exhibition at the Arboretum, Nottingham. Sec., Alfred Kirk, Municipal Offices.
- 9.—Oxford Rose Show.
- 14.—Royal Botanic Society, Regent's Park. Evening Fête. Sec., W. Sowerby.
- 14.—Woodford Horticultural Society's Third Annual Exhibition. Hon. Sec., J. Taylor, Woodford.
- 14.—Loughborough Horticultural Society's Show. Sec., William Pallett, 55, Baxter Gate, Loughborough.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 12, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- TUESDAY, June 15 { Sale of British Birds' Eggs, at Stevens' Rooms.
Royal Botanic Society's Summer Exhibition at Regent's Park.
Royal Horticultural Society: Meeting of the Fruit, Floral, and Scientific Committees. Grand Floral Fête at York (three days).
Glasgow and West of Scotland Horticultural Society's Midsummer Exhibition.
- WEDNESDAY, June 16 { Sale of British Birds' Eggs, at Stevens' Rooms.
Lincoln Society: Meeting at 8 P.M.
London and Middlesex Horticultural Society's Exhibition (two days).
- THURSDAY, June 17 { Sale of British Birds' Eggs, at Stevens' Rooms.
Scottish Fanny Society's Exhibition at Edinburgh.
- FRIDAY, June 18 { Exeter Rose Show.

FEW but those who have examined the official returns of our import trade could form any idea of the large amount we pay annually for FOREIGN FRUIT, raw, dried, and preserved, &c. In the year 1873—the latest for which we have the full details—the computed value at entry was close upon £5,500,000, and in all branches, whether fresh, dried, or preserved fruits, the imports show a steady increase. We will take a glance at the trade in green or fresh fruit, although of late years the Board of Trade officials have deprived us of the opportunity of tracing some descriptions of fruit, by lumping them all together under one general head.

For many choice fruits requiring a high range of temperature we are necessarily dependent upon foreign countries, the expense of forcing them rendering their produce too costly for general sale to the public.

We can produce by care and attention very fine Grapes here; but hothouse Grapes are sold cheap, and outdoor Grapes in our climate are seldom worth much. In the latest year of which we have any official record (1870) we received 142,723 bushels of Grapes, valued at £874,16. The greater portion of these came

from Portugal and Spain, the rest from Holland and France. The demand for Oranges in this country has nearly doubled in the last six years. In 1867 we imported 1,400,000 bushels of Oranges and Lemons, valued at £744,732; while in the three years ending with 1873, the average annual import was 2,400,000 bushels, of the value of £1,100,000; our supplies come from Spain, Portugal, and the Azores, Italy, and Malta. For many years the production in the Azores was almost annihilated by the attack of a predatory insect, which destroyed the trees; but of late years the plantations have recovered, and our supplies are again larger from this source, ranging in the past six years from 625,000 to nearly 900,000 bushels. The trade calculate the imports by boxes, which can carry on an average 226 fruit. A chest of Oranges, a box and a-half, would have 340. In 1861 209,263 boxes were shipped from St. Michael's, valued at £101,287. A full-grown tree will produce from 12,000 to 16,000 Oranges. Although St. Michael's is the great mart, the other western islands, Fayal, Terceira, and St. Mary's, also grow and ship Oranges.

Of the imports of wall fruit and orchard fruit in the season from the Continent, such as Peaches, Apricots, Green Gages, and Plums, &c., we have no precise details. In 1870 we imported 678,468 bushels of raw Apples, and 53,615 bushels of Pears; whilst in some years we have imported double that quantity, much depending on the yield of our own orchards. In 1873 we also imported 947,789 bushels of dried Apples and Pears. The imports of undescribed raw fruit is large, amounting in 1873 to 1,324,608 bushels, valued at £762,710. In this lump quantity is probably included Pine-Apples, Melons, Bananas, Cherries, and a miscellaneous host of small items. Of Cherries we import variable quantities, ranging from 82,000 bushels up to 153,000 bushels per annum. Melons (*Cucumis Melo*) from the Continent, and Water Melons (*Cucurbita Citrullus*) from Malaga and Portugal, are other fleshy fruits which enter into commerce to some small extent. The latter is considered to be the Melon of the Jews, frequently mentioned in Scripture. The juice makes a refreshing drink, but has not much taste. In India it is considered one of the best of fruits, and forms a considerable portion of the food of millions of the people. In Egypt it is used in medicine, especially in ardent fevers; the people collecting the juice when almost rotten and mixing it with sugar and rose water.

The Melon is grown very abundantly in France, and quantities reach this country from thence. One little village, Cavaillon, in the neighbourhood of Vaucluse, often sends out for distribution 5,500,000 in the year, which at the rate of 2s. per 100, produce £5000 to the cultivators. The Bahamas, from whence we used to draw the chief proportion of our supply of Pine-apples, now find more ready and profitable customers at the American ports. Out of 381,222 dozen shipped in the quarter ending June, 1873, only 25,000 dozen were sent to London.

In San Salvador there are fields of Pines containing 25 to 60 acres in one block. The long stiff leaves are so short and interwoven as to be almost impassable except in the trodden paths, and the rich green fruitage rear their heads haughtily in countless numbers. In good seasons the yield is about 800 dozen per acre. They are raised from the sucker or slip, which shoots out just at the base of the Pine, and comes into bearing in 18 months. They should be planted in rich red soil about 18 inches apart, and weeded out every three months. Besides the fruit exported, there is a great local demand for tinning it, and 113,000 dozen fruit were bought by one factory at Nassau, and preserved, filling more than 1,000,000 cans of sliced Pine-

apples. For tinning the Pines are required fully ripe, and average 15 inches in circumference, none to be less than the usual shipping sizes, 13 and 12 inches for 1st and 2d cutting scarlet, and 12 and 11 inches for sugarloaf. The operation of peeling and slicing is performed on tables in the yards of the waterside premises, over which an awning is placed to protect the operators from the influence of the sun. When the cans are filled they are carried to the warehouse on wooden trays (each containing fifteen), to be immersed in syrup. About 20,000 Pine-apples are peeled and 12,675 cans filled in a day. The tops of the cans are then soldered on, and they are lowered in an iron framework—between 400 and 500 at a time—into the steam boiling vats. After boiling the cans are perforated at the top, to allow the steam to escape. They are then hermetically sealed, and spread over the yard to cool. Each can of fruit, before the syrup is added, weighs 2 lb.

The Pine-apple is now being cultivated with energy in St. Michael's, Azores. The produce of this recent cultivation having realised very considerable profits in the English market, and the quality having been recognised as superior to those of foreign growth generally, conservatories on a large scale are being constructed. The Pine-apple of first quality now returns to the grower from 16s. to 20s. each, which is a remunerative price, of 3s. to 40s. per cwt., and some large fine specimens have been sold for as much as 60s. each. They attain to a greater size than those received from the West Indies, some weighing 12 lb. to 13 lb. having come to hand. Great care is taken in packing them, to secure their arriving here in sound condition. The stalk is cut several inches below the Pine, an ordinary large-sized flower-pot is then filled with mould, into which the stalk is inserted in such a manner that a casual observer would almost take it to be the way it was grown. Each Pine is then put into a skeleton wooden case, made just large enough to hold it, so that it can be safely handled without the risk of being bruised or injured, the Pine itself being frequently wrapped round with paper as a further protection.

It is satisfactory to find that more attention is now being given in our West Indian colonies to the development of the fruit trade; a good profit might be made, and much that is now wasted be utilised. We are somewhat too far distant here to derive much of the benefit of these shipments, but the Americans and the people of British North America will take any quantity of fruit. The Bahamas are going in extra severely for the culture of Oranges as well as Pine-apples. There was shipped to the States last season from those islands about 4,000,000 Oranges. They are sent in barrels, which hold on an average about 250 Oranges. As yet in its infancy as a branch of West Indian commerce, this fruit trade is capable of wide expansion, and we may reasonably hope that the now constant shipments of Pine-apples, Oranges, and other tropical fruit to London and American ports, are the small beginnings of a business in which the other Antilles will soon take a large part.

The fruit trade between Jamaica and America is satisfactorily progressing. Besides the facilities for transport which are now afforded by regular steam communication from Kingston with New York, the trade continues to increase on the north side of the island by means of sailing vessels, and has now extended from Portland in the east to Hanover in the west, from which last-named place several shipments of fruit are from time to time made. The value of Bananas, Oranges, and other fruit exported in 1870 was but £901; in 1871 it amounted to £2736; and in the last few years it has been greater still.

The fruit is chiefly, however, sent from the

West Indies in bulk, and the heedlessness of the picking and the subsequent handling leads to vast waste and loss. With proper gathering and packing, and with well ventilated vessels, our West India colonists might secure the whole trade of the United States in tropical and subtropical fruit, leaving the Mediterranean, the Peninsula and the Azores to supply their natural market in North and Central Europe.

There are many tropical fruits which are never seen in this kingdom, and there is no reason why experimental efforts should not be made to introduce some of them into the London market; with the special facilities now offered by continuous fast-running steamers from India, the Mediterranean, the West Indies

be at once turned with advantage; and the same remark applies to many other of our younger possessions.

In this hasty examination we have only touched upon a few of the principal green or fresh fruits entering into commerce, although the field of description is a wider and interesting one.*

ONCE more it would seem as if the horticulturists—would they be but true to themselves and their cause—might have the ball in their own hands, and so long as the ROYAL HORTICULTURAL SOCIETY exists, this ought decidedly to be the case; for a horticultural society with horticulture left out is, it must be

ing horticultural members of the Council, who have had so trying and difficult a position to fill. The earnest thanks of all friends of horticulture are due to those gentlemen who accepted office in such times and under such circumstances, and who have necessarily, but very unfairly, had to bear the brunt of blame for matters for which they were not individually responsible. It may be hoped now that these gentlemen, who have so worthily borne the flag of horticulture through little good repute and much ill-repute, will find themselves supported by all the horticultural body, and that they may associate with themselves other friends of horticulture not fettered by any selfish desire to keep the South Kensington garden solely as an

FIG. 159.—NYMPHÆA GIGANTEA AS GROWING IN THE LAGOON IN THE BRISBANE BOTANIC GARDEN.

and Brazil, West Africa, and the Cape. New York receives Oranges even now from Calcutta.

The Horticultural Society of Victoria satisfactorily proved at the Vienna Exhibition in 1873, that for the future there need be no difficulty in sending fresh fruit from one side of the world to the other. After having been carefully picked so as to avoid bruising each Apple was wrapped in clean tissue paper and placed in layers between dry cotton wool. The cases which contained these specimens were placed in the ice-rooms of the Peninsular and Oriental steamers by which they were sent, and when unpacked and placed in the show cases they were, with one or two exceptions, in excellent condition. The drying and preservation of fruits of which all sorts grow well in the colony, is an industry to which attention might

admitted, something worse than an anomaly. Assuming that the resignations of the President, Treasurer, and other gentlemen of the South Kensington party will be completed, it will then become the duty of the horticulturists to support, with all their influence and goodwill, the remain-

* The following is a summary of the returned computed value of the several kinds of fruits imported, green and dried and preserved, for the year 1873:—

Almonds	£140,584
Nuts	514,910
Oranges and Lemon	1,124,248
Fruit preserved in their own juice without sugar	95,242
Raw fruit	762,750
Dried fruit (not described)	73,329
Citrus	1,275,445
Figs	220,113
Plums and Prunes	32,614
Raisins	668,790
Succedanes and confectionery, including fruits and vegetables preserved in sugar	215,188
	£5,493,473

airing-place for their nurserymaids and children, but men capable of taking a broad general view of the requirements and functions of horticulture—men, too, who will be enabled to meet the Commissioners on something like equal terms, and who will be able to come to some satisfactory arrangements with that not very practicable body.

In any case, we advise our horticultural friends to be on the alert lest some of the retiring members of the Council, aided by others who have not long since quitted it, return with a scheme by which they will appropriate the name and the funds of the Royal Horticultural Society, and will use them to keep the garden to themselves without interference from or control by the horticulturists. This seems to us a very likely plan to be attempted, and if it suc-

ceed horticulturists and horticulture will be worse off than ever. We believe we have but to mention the possibility of some such scheme being attempted, to secure its frustration. The danger is very real, but it is one not difficult to overcome. Horticulturists must be prepared to accept some compromise, but it must be a compromise consistent with their own dignity, and one which will not entail, as former compromises have, material injury to horticulture. In any case we may assume that we have no longer at our head men who take advantage of their position to insult one of the most important if not the very most important section of their clients.

In the meantime the pressing business is to complete the Council, so far as it may be desirable to do so at this juncture, by filling in the further vacancies—for after the statements of Lord BURY and Sir COUTTS LINDSAY, and the letter of Mr. HUME we cannot suppose either of them would seek to remain—with gentlemen who will be acceptable to Her Majesty's Commissioners, and who also have the confidence of Horticulturists, the South Kensington interest not being overlooked; for we altogether deprecate the idea of division into two sections, which can only weaken the influence of both. We understand that the remaining members of the Council have already filled up the four vacancies caused by the resignation a short time since of Sir A. SLADE, Mr. CHETWYND, Mr. CHAMBERS, and Mr. W. A. LINDSAY, by the nomination of Lord LAWRENCE, Admiral HORNBY, Mr. A. GROTE, and Dr. HOGG, all good, honest, straightforward men—the two latter especially acceptable as horticulturists. Lord LAWRENCE, we regret to hear, declines to serve, on the ground of delicate health, and Mr. HAUGHTON has subsequently been chosen in his stead.

Now that there is a prospect of matters taking a turn favourable to horticulture (we are not so churlish as to wish to deprive the Kensingtoners of their fair share of pleasure, too), the whole body of horticulturists, amateur and professional, should stand shoulder to shoulder in support of their craft. Minor differences there will and must be in any considerable body of men, but these should be overlooked, at least, while the effort is being made to reconstitute the Horticultural Society on a horticultural basis, that it may not longer remain the laughing-stock of the country. Those who will not thus act are not friends to horticulture, whatever they may profess to be. As one evidence of this union of purpose, it has been suggested to hold a grand exhibition—the spontaneous effort of our great nurserymen and the leading amateur cultivators, and that, as there is likely to be the nucleus of a good show in the exhibition of the Pelargonium Society and the contest for Messrs. VEITCH's fruit prizes on July 21, that day should be chosen for the united effort. We heartily commend this proposal, since the contrast between the well-filled benches to be then expected, and the recollections of the empty ones which in the main have this year greeted the flower-show visitors to Kensington, will read a salutary lesson to those in power, whoever they may be. May we suggest that the leading exhibitors should constitute themselves a committee forthwith to carry out this beneficial idea, which, it is to be remembered, is quite outside the efforts of the Council, and intended as a moral support to them, if only they will keep in the straight path, and push forward to the desired goal, which is that HORTICULTURE MAY FLOURISH—by means of its connection both with the Commissioners and the Kensingtonians if possible, but at any rate that horticulture may flourish as it ought to do in such a prosperous country as ours, and one so thoroughly imbued with the horticultural spirit.

— We have in preparation, to be issued with our number for June 26, a SPECIAL SUPPLEMENT, consisting of eight pages of original illustrations and letter-press, descriptive of the gardens at Chatsworth, Derbyshire, the seat of the Duke of DEVONSHIRE, K.G.

— We are requested to state that June 17 is the last day upon which entries can be received for the MIDLAND COUNTIES GRAND HORTICULTURAL EXHIBITION, to be held in the Lower Grounds, Aston, Birmingham, on July 1, 2, 3, and 5.

— The June number of the *Botanical Magazine* contains representations of the following plants:—*Kniphofia Macowani*, a small species best treated as a greenhouse plant, though probably as hardy as the other species of the genus. *Crocus Crewei*, a new species with solitary flowers, with a slender tube, and segments whitish striped with purple, and with purple anthers; it is a native of Syria, where it was discovered by Mr. ELWES. *Dracena Smithii*, a very handsome white-flowered species, cultivated at Syon House and at Kew, and presumably of African origin. *Balbisia verticillata*, a charming half-hardy shrub, with opposite tripartite leaves with linear segments and large yellow *Eschscholtzia*-like (superficially) flowers. This beautiful and very interesting shrub was introduced by the Horticultural Society in 1825, but, like so many other plants requiring occasional protection to insure its continuance in the open air, it soon was lost from out-of-doors, and, coming from a dry cool climate (China), it dampened off when transferred to a pit. Such plants, indeed, can be secured only through a constant repetition by cuttings, and by more care than is usually bestowed on plants with unfamiliar names. When properly grown it is an exceedingly handsome thing, flowering in August and September, and resembles a gigantic *Hypericum* more than an *Genothera*, with which latter it has more usually been compared. Messrs. VEITCH are the lucky re-introducers of this fine shrub, on the strength of the illustration here referred to, we commend to the notice of those who have winter gardens, or who are favoured by a climate like that of our southern and western coasts. *Masdevallia Estradae* was originally described by Professor REICHENBACH in our columns. It is a free flowering species, with pretty violet-spotted flowers. It was introduced to the nursery of Mr. B. S. WILLIAMS by Mr. PATIN. The last figure in the present number is devoted to *Viburnum Sandankwa*, a hardy evergreen shrub, native of Japan, but which has proved hardy against our wall at Kew. The specimen figured was furnished from the Sillery Islands by J. DORRIN SMITH, Esq., who, we are delighted to hear, keeps up the splendid collections made by the late AUGUSTUS SMITH, Esq.

— The June number of the *Revue de l'Horticulture Belge* opens with a coloured figure of the true *Spiraea palmata*, and illustrations of the magnificent winter garden of M. DE KERCHOVE, lately described in our columns by M. OSWALD DE KERCHOVE. A good practical article on watering, addressed to amateurs, is contributed by M. A. SIRAUX.

On the 24th inst. the freehold property known to many of our readers as SISTER HOUSE, Clapham Common, the residence of AMBROSE BASSETT, Esq., is to be sold by auction, and as a consequence thereof, the fine collection of plants, which has been under the care of Mr. GEORGE BAKER, one of the most successful of our Orchid growers, for the last seventeen years, will probably soon afterwards be dispersed in a similar manner. Mr. BAKER has, we are pleased to learn, met with another appointment worthy of his high character and professional ability; and at the beginning of July takes charge of the garden establishment of EDWARD BARKING, Esq., at Coombe Wood.

— Who is responsible for the term "ENGLISH GARDEN," or *Jardin Anglais*, as applied to a garden arranged in a natural picturesque style, as contradistinguished from a formal or architectural method? We in England never speak of our landscape gardens as "English" gardens. On the Continent, however, the expression *Jardin Anglais* is frequent. M. F. BARRILET takes us, as a nation, to task in a recent number of the *Revue Horticole* for this expression. We plead not guilt, as we do not use the term to which he takes exception. M. BARRILET claims for a Frenchman, DUFRESNY, the origination of this method, stating that DUFRESNY preceded KENT by thirty-six years; but we suspect that M. BARRILET would have to go very much further back, and into the eastern hemisphere, to find the precursor of our landscape garden.

— Mr. BATEMAN has forwarded to us examples of the *CYTISUS ADAMI*, which had been sent to him as a "curious Laburnum," from the gardens at The Grange, Congleton. The tree is a fine one, having reached a height of 20 feet, and is this season full of flowers, the blossoms being described as alternately yellow and pink, the former colour predominating—all growing from one stock, which does not appear to have been grafted. With these were also sent 15 specimens of another flower growing on the same Laburnum tree," which proved to be *Cytisus purpureus*. This very remarkable plant, commonly

called the Purple Laburnum, has been frequently mentioned in our columns, and is certainly a very interesting and to some extent mysterious member of the vegetable kingdom. It is supposed to be a sport or a graft-hybrid (for the accounts of its origin vary) between *Cytisus Laburnum* or alpinus, and the dwarf shrubby *Cytisus purpureus*. Whatever its origin, it is by no means uncommon to see trees, such as that above referred to, bearing the golden racemes of the common or Scotch Laburnum (as the one or other may happen to have been used as a stock), the purplish racemes of the Purple Laburnum, and tufts of the *Cytisus purpureus*, all mixed up together, and certainly produced without special grafting—one branch being of one colour and another of the other, with the tufts of *C. purpureus* sitting amongst them like "witches' brooms," sometimes fragments of the same branch, bearing the two sorts of Laburnum, in a thoroughly capricious manner, are to be met with. In fact, it is impossible to predicate what part of the tree may bear purple and what part yellow blossoms.

— M. CARRIÈRE describes in the *Revue Horticole* a variety of *Robinia Pseud-Acacia*, remarkable for its free flowering qualities and long continuance in flower, and to which he therefore applies the epithet *semperflorens*.

— Botanists of the present day admit very few monotypic natural orders, and therefore a genus which still maintains its title to that dignity is of more than ordinary interest, and all plant lovers will be glad of an opportunity to see a living specimen of *COLUMELLA SERICEA*, one of two or three species constituting the genus *Columella* and the order *Columellales*. The plant in question is now in flower in the winter garden at Kew, and a portrait of it will probably soon appear in the *Botanical Magazine*. The name *Columella*, or one very similar, has been applied by different writers to species of *Pisonia*, *Pavonia*, *Vitis*, and *Nestlera*, with none of which has the *Columella* of Ruiz and Pavon any relationship. It is remarkable in having only two stamens, the nature of which has been variously explained, but having had no opportunity of examining them ourselves we can give no opinion. We believe, however, that Mr. BENNETT considers the nearest affinity of the genus to be with the *Gesneraceae*, near which it will be placed in the forthcoming part of the *Genera Plantarum*. In general appearance this *Columella* resembles some of the Australian *Hibbertias*. It is a dwarf apparently evergreen shrub, with small opposite simple leaves, and solitary terminal yellow flowers, about an inch in diameter; and although not wanting in beauty, it is of more interest on account of its peculiar floral structure. We are not quite sure at the present moment whether it has ever before flowered in this country, but we think not.

— We learn from the *Revue de l'Horticulture Belge*, that Professor EDWARD MORREN, of Liège, the editor of the *Belgique Horticole*, has been appointed a Chevalier of the Order of LEOPOLD. We congratulate our *confrères* on the attainment of a distinction to which nothing analogous is open to British men of science.

— To guard against the possibility of causing the spread of the *PHYLOXERA*, it has been decided to exclude Grapes and Grape Vines from the forthcoming International Exhibition at Cologne. If it be necessary to exclude the Grapes as well as the Vines, our fruit shows will be deprived of one of the chief points of interest. Perhaps this precaution is justifiable in the case of an International Exhibition.

— A plant of the most perfect symmetry of *FREMONTIA CALIFORNICA* is splendidly in flower at Kew on the west side of the herbaceous ground wall. It has the appearance of being studded over with gigantic buttercups, and, having very neat foliage, is one of the choicest shrubs introduced.

— THE TEMPERATE HOUSE at Kew is now in a condition of much interest from the number of good things in flower. *Greya Sutherlandii* is one of the most important, blooming in one of the octagons. It flowered for the first time in the kingdom at the Chelsea Botanic Garden about two years ago, and more recently at Glasnevin. We reprinted an interesting article concerning it from the *Irish Farmers' Gazette* in our issue of May 22. To flower the plant it will doubtless be found essential to secure well-ripened wood. *Agapetes buxifolia* is very handsome, flowering along the old wood up to the young growths. This was imported from the eastern frontier of Bhotan, where it grows epiphytically on trees, but in cultivation it forms a good shrub grown in a pot. The flowers are produced in great profusion for several weeks, the corolla is tubular, 1 inch long, and scarlet. *Streptocarpus floribundus* is productive of a good display from the large number of its lilac *Gloxinia*-like flowers. Fine specimens are formed by having three or more plants in a pan. Of *Fuchsia splendens* there are two fine plants beauti-

fully in flower, one more than 12 feet high. Cordyline australis, near the centre of the house, is bearing a fine panicle. It stands the winter out-of-doors at Edinburgh and other places, and possibly by hybridising a valuable series of hardy forms might be produced. Bossiaea linophylla is represented by a most beautiful specimen. An idea of its appearance may be obtained by imagining a plant 6 feet high of Eutaxia myrtifolia, with extremely slender branches, creeping to the pot in graceful masses. Passiflora cinnabarina is covered with flowers, of a colour indicated by the name, seeming to be a valuable greenhouse climber. A fine shrub of Magnolia fuscata perfumes a considerable space in the house with its delicious Melon-like odour. Ruscus androgynus is in great beauty, near one of the staircases, reaching from the ground to the gallery. The pinnated branches are considerably more than 2 feet long, and the flattened bracts are densely margined with flowers. Michelia lanuginosa has just flowered, perhaps for the first time in the country. The leaves are oblong acute, 8 inches long and woolly on the under surface. The flowers were large, pale yellow, with many flimsy petals, and sweetly scented. It is a native of Nepal, where it forms a tree 60 feet high. Phylidrum glaberrimum is hand some thoughnot very showy. It is a new plant, figured in the *Botanical Magazine* of 1873. It forms a tuft of eniform dark green leaves about 3 feet high, the flowers are white, and small, generally disposed in panicles, with spicate branches. The introduction of this by Mr. W. BULL makes a third species for the order Phylidrum. It is supposed to be a native of the Pacific Islands. A large tree of Eucalyptus globulus is in flower, and can be seen well from the gallery. The buds before opening might easily be mistaken for seed-vessels; they have a blue glaucous appearance, and look as if touched over with the blue paint used in the ornamentation of the house. Young plants have been raised from the seeds saved from this tree last year.

AGAVE CELSIANA is flowering in the succulent-house at Kew. Two other species, A. hystrix and A. filamentosa, are throwing up vigorous scapes.

Dr. KALENIZENKO has recently published, in the *Bulletin of the Imperial Society of Naturalists of Moscow*, a monographic description of the species of *CRATEGUS* cultivated by him in his garden at Khar-kow. He divides the genus into fifteen groups, including twenty-nine species.

Mr. D. MACFARLINE, late of Warnham Court, Sussex, is appointed to the management of the extensive gardens of THOMAS PILKINGTON, Esq., Knowsley Cottage, Prescott, Lancashire.

A remarkable instance of the provisions of Nature to ensure the propagation of a species is recorded in the *Monthly Notices of Papers and Proceedings of the Royal Society of Tasmania* for 1873. Under ordinary conditions the Chill Pine, *Aracaria imbricata*, does not bear cones until it has attained a considerable size and age, and the sexes are usually (?) on separate trees; indeed until recently it was believed to be strictly dioecious. However, a plant in the Botanic Garden at Hobart Town, Tasmania, about 8 feet high, but of stunted growth, produced two cones, from which about one hundred seedlings have been raised. The fact is very interesting, not only on account of the smallness of the plant, but also because the sexes are often separated. In this case we have a small isolated plant producing [apparently] both sexes, and ripening its seed. Is this a fact, may we ask, or is it possible that it was fertilised by pollen from another species? The seedlings will furnish the answer to this question in time. It is supposed that is the first instance of this species bearing fertile cones in the Australian colonies.

ALISTER MURRAY, residing at Durie, Fife, was recently charged before Bailie HOWDEN, at the Edinburgh Police Court, with STEALING FIFTY ALPINE PLANTS or slips from the Botanic Garden, Tweedmouth Row. The accused pleads guilty, and was fined £5, with the alternative of fifteen days' imprisonment, and ordered to procure £10 to caution or suffer other fifteen days' imprisonment.

The executive committee for the INTERNATIONAL HORTICULTURAL EXHIBITION AT COLOGNE informs us that the work is progressing steadily in the Exhibition grounds; the great flower and fruit hall is almost completed, and the hall for machinery will be ready in a short time. The foundations for the glass houses nearly finished, which have been already ordered—and were really magnificent. The ground has been prepared and beds cut out for the Roses, flowers, and plants in general in the Exhibition ground adjoining the Flora. Some of the ground has been already planted, and we are happy to state that the plants are flourishing. The grass seed has been furnished by the well-known London firm of JAMES CARTER & CO. The Government railways have

agreed to a reduction of 50 per cent. on the ordinary rates of freight, as have also almost all rail and steam navigation companies. Much interest has been taken in the exhibition of fossil plants. Contributions have been offered from all sides—from Government, private and public associations, and from mine owners. Dr. AUDRAC, Professor in Bonn, is at the head of this department.

Mr. H. HOLLNER has lately detected an insect closely allied to Aphis and Phylloxera, which attacks the ROOTS of ABIES BALSAMICA and A. FRASERI. The disease ceases when the insect is destroyed, but if the insect returns the disease reappears.

We learn from the *Journal of Botany* that the botanical collections of the late Rev. R. T. LOWE are to be divided between the herbaria of Kew and the British Museum, the former taking any uniques. These specimens are important as containing the types of Mr. LOWE'S (unfortunately incomplete) *Manual Flora of Madeira*. The same journal also understands that a somewhat similar herbarium of his collections was made by Mr. D. HANDBURY. He also left by will £100 each to the libraries of the Linnean and Pharmaceutical Societies.

BRISBANE BOTANIC GARDEN.

LAGOON IN FRONT OF PARLIAMENT HOUSES. AMONGST the several botanic gardens belonging to our colonial possessions, none are administered with greater ability or with more satisfactory results than those of Australia. We have often had occasion to refer to work done in the promotion of botany and horticulture by the botanic gardens of Sydney, Melbourne, Brisbane, and Adelaide, the reports of whose directors have furnished notes for our columns, and photographs taken in the gardens at Adelaide have been reproduced by us. We now engrave from a photograph a view taken in the Botanic Garden, Brisbane, showing a lagoon in front of the new Parliament Houses (fig. 159, p. 757). This lagoon measures 206 feet in length and 144 feet broad, and is thickly planted with the native Water Lily (*Nymphaea gigantea*), the flowers of which are either blue, purple, or pink, and when fully opened they produce a wonderful effect, forming a great attraction to visitors. The species is figured at t. 4647 of the *Botanical Magazine*, and Mr. Bentham thus speaks of it in the *Flora Australiensis*:—"The species is apparently confined to Australia, unless it be really a modification of the Asiatic and African *N. stellata* (Willd.), as appears to have been the opinion of Brown. It varies exceedingly in size. The larger specimens have the leaves about 18 inches across, with much raised reticulations underneath, the flowers 12 inches across, with exceedingly numerous petals, and above 200 stamens; the smallest have leaves of 5 or 6 inches, not reticulate, the flowers 3 or 4 inches across, and the petals and stamens much fewer but always more numerous than in usual *N. stellata*, to which F. Mueller is disposed to refer several specimens. This Indian species may also be distinguished by the connection lengthened beyond the anther cells into a very prominent appendage, and it appears to me that Caspary (*Notes in Herb.*, Hooker) is right in considering all the Australian specimens as forms of *N. gigantea*. In Kew Gardens the flowers and leaves are very small in the early part of the season, and larger and larger ones are developed as the season advances. F. Mueller also distinguishes the seeds in size and shape, and many of our own more completely enclosed in the arillus than those he refers to *N. stellata* than in the true *N. gigantea*, but in the true *N. stellata* the seeds are nearly globular, and usually marked with raised longitudinal costae not mentioned by F. Mueller." Such is Mr. Bentham's testimony with regard to the affinities of the Australian Water Lily, the representative in that great continent of a large and widely diffused genus belonging to a very attractive family, the members of which, from our own *Nymphaea alba* to the stellated Victoria regia, are universal favourites. As economic plants the Nymphaeaceae are, perhaps, of very little importance, nevertheless the rhizomes and the fruits of many of them are eaten, and the species under consideration, *N. gigantea*, furnishes food to the Australian aborigines. With regard to the Brisbane garden itself, as we shall have occasion to refer to it in future numbers, we will content ourselves with noting the popularity of these lakes or lagoons. Mr. Hill in his last report says that not only is the lake a source of great attraction to visitors, owing to the water plants, but that much interest is taken by the public in the fish with which the present lagoon is well stocked—they include the Fitzroy perch, the mullet, and other species. These lakes also help to drain the grounds, and so with the co-operation of the water-fowl and fishes to effectually dispose of the numerous frogs with which some parts of the grounds abound. John R. Jackson.

Foreign Correspondence.

THE ADELAIDE BOTANIC GARDEN (continued from p. 658).—The experimental garden is of a most interesting part of the grounds to persons engaged in agricultural or pastoral pursuits. The experiment is simply a test of the suitability of particular plants useful to the agriculturist and grazier, or in the arts and manufactures, and the value of these experiments is of great importance to the colony at large. Dr. Schomburgk has earned a reputation for his unwearying efforts to benefit the colony, as well by his pen as in the introduction of various useful and economical plants. The garden contains upwards of one hundred varieties of grasses, and amongst these the Director in his last admirable and exhaustive report particularly mentions the following, which have stood the test of our arid climate:—The Bunch-grass, the Guinea-grass (*Panicum maximum*), the Prairie-grass (*Bromus unioloides*), Phillips' grass (*Panicum spectabile*), the Cat's-tail-grass (*Phleum pratense*), the Oat-grass (*Avena elatior*), the Falling-awn grasses (*Diptatherium Thomasi* and *P. multiflorum*), Millet-grass (*Milium multiflorum*), the Panic-grasses (*Panicum tomentosum*, *P. tenerius*, and *P. crus-galli*). Amongst the fodder plants may be noticed the *Pentzia virgata*, a plant from the Cape of Good Hope, which is highly prized in that colony as invaluable for sheep; the Plantains or Rib-grasses (*Plantago major* and lanceolata), the Burnet (*Potterium sanguisorba*), and the Clovers. Amongst fibrous and dye plants we saw the Spanish Flax, which is growing most luxuriantly, and stands our summers well, and no doubt will prove a valuable addition to our list of agricultural productions; the Madder (*Rubia tinctoria*), which is doing remarkably well; the Teasel (*Dipsacus fullonum*), the American Broom, Millet, and many other useful plants, including medicine, all doing remarkably well. The experimental garden is laid out in parallel borders, with paths between, leading out from the main walk which runs through the centre. The plants are neatly arranged and labelled, so that the visitor has no trouble in finding any particular plant. After leaving here we pass some very pretty cages for birds and animals; they are from designs by Dr. Schomburgk, and are after the Chinese, Swiss, and Italian styles. We now reach the gem of the garden, the Victoria regia house. The centre of the house is occupied by a large oval cistern of 36 feet by 26 feet, and 6 feet deep. The house is 60 feet long by 40 feet wide, and 16 feet high. One single plant of this superb and most magnificent Water Lily in the wild fills the centre basin, with the exception of three or four *Nymphaeas*, which occupy the few spaces amongst the salver-shaped leaves of the Victoria regia. The one now growing was planted six weeks previous to our visit, and the leaves were then 3 feet 6 inches in diameter, and will shortly reach a diameter of 6 or 7 feet; flowers 1 foot diameter. The iron pillars supporting the roof are covered with the bark of the Fern tree, on which has been placed slender growing Ferns, and these seem to thrive in the moist hot atmosphere, which ranges from 80° to 85° Fahrenheit. Here also is a most magnificent collection of leaf plants, amongst which may be mentioned *Curculigo recurvata variegata*, with large green leaves banded with pure white stripes; *Maranta Baraquinii*, *M. cinerea*, *M. Legrelliana*, *M. Makoyana*—all magnificent foliage plants. There are fifty varieties of *Caladiums*, and some of them are very fine, particularly Prince Albert Edward and the Princess of Wales; *Pavetta borbonica*, *Dieffenbachia Bausei*, *Baranquiniana*, *Weirii*—all most striking and beautiful. There are several very fine climbers, which we very much to be mentioned as deserving of special notice, viz. *Allamanda nobilis*, a most splendid free-flowering stove plant; *Vanilla planifolia*, which produces the vanilla of commerce; *Aristolochia galeata*, *Duchartrei*, *labiata*; *Combretum grandiflorum*, *Campsidium valdiviana*, *Passiflora odorata*, *Dioscorea chrysophylla*, *D. melanocarpa*. We saw here also some new beautiful plants lately introduced, viz. *Phyllostemum Lindenii*, *Curmeria picturata*, *Maranta hieroglyphica*, *Anthurium crystallinum*, *foribundum*, and hybridum; *Dieffenbachia imperialis*, *hitmaculata*; *Philodendron daguense*, *P. melanochrysum*; *Cyrtodeira fulgida*, and the new magnificent *Acanthaceae*, *Aphelandra fascinator*. The Orchids here are also magnificent, and all the plants in the house are so arranged as to produce a pleasing effect on the visitor. The Victoria regia house stands on a raised terrace, which is tastefully laid out as a flower garden, with fountains and statuary. Here we observed a very fine collection of *Glauciums*, which were in full flower, and were really magnificent. There is also here a fine collection of *Pseonias*, which were nearly out of flower when we saw them. Amongst shrubs we noticed *Aralia reticulata*, in flower, very fine; *Boronia elatior*, in flower, also fine; *Hydrangea hortensis*, *japonica* var. *argenteo-variegata*, and *aureo-variegata*, *Strophanthus capensis*, &c. Twelve varieties of the Mulberry form a fine background on one side of this garden, and beyond this, still following round,

we reach another portion of the arboretum and Pine grove. The majority of the Pines have been planted six years only, and the growth they have made is really wonderful; many of them are now 15 to 20 feet high. The Californian Pines are doing remarkably well, and would doubtless succeed well in our mountain districts as forest trees. Amongst these we noticed *Pinus Coulterii*, *P. Sabiniana*, *P. grandis*, *P. Massoniana* (Japan), *P. Smithiana* (Himalaya). Altogether, there are between 60 and 70 distinct species of the genus *Pinus* in the gardens. The Junipers are also well represented; amongst others we note the following:—*Juniperus Oxycedrus*, *bermudiana*, *splendens*, *drupacea*, and *recurva*, &c., and the beautiful *Thuja Lobbi*. Near the eastern end of the gardens is a fine statue of Niobe. It stands on a commanding eminence, from whence are to be obtained some fine views of the gardens. Descending from here we proceed onwards by paths leading through grass lawns dotted with specimen trees and shrubs, with here and there flower borders, fountains, statuary, and cages for animals and birds, while on the lake numerous aquatic birds of different varieties give a charm to the whole scene, which is truly delightful.

Here are some fine *Araucarias*, which seem to

and the plant really deserves its name, for the heads resemble both in roundness and for compact growth and regularity a ball, and are really very fine. We noticed here a fine specimen of *Ficus spuria*; a splendid tree of *Pinus insignis*, 50 feet high and only seven years planted; also a magnificent *Cedrus Deodara*, and a *Clematis* with dark purple flower (*Clematis Jackmanni*); also *Clematis Fortunei* and *Viticella*, all good. Near here is a fine trellised walk covered over with beautiful climbers, which afford an agreeable shade in hot weather.

We observed here a fine obelisk erected in memory of the late Mr. Francis, the first director of the garden, and who died in 1862. He was a gentleman of high literary and scientific attainments; and he displayed much taste and artistic skill in laying out the older portion of the garden, and was highly respected by all who had the pleasure of knowing him.

We here turn to the right, and follow round the margin of the large lake, where there are some fine Weeping Willows.

We then turn up the main avenue towards the entrance-gate. Here are some fine statues and fountains, ribbon flower-beds, and grass lawns dotted

addition has been made to the gardens, and named the Botanic Garden Park. This consists of about 80 acres of beautiful land lying between the gardens and the River Torrens. A carriage drive about a mile in length goes through the grounds. The main walk of the Botanic Garden is carried right through the park to the Torrens. It is 10 feet wider, however, and is planted on each side with two rows of avenue trees. Midway in this walk has been formed a circle for the purpose of concerts, flower shows, &c. This has been planted with shade trees. Two broad walks lead from the circle as promenades, ending in half-circles, also planted with shade trees. At the end of the main avenue there is provision made for a carriage-stand. The carriage drive—66 feet wide—is lined with two rows of umbrageous trees on each side. Between these, curved and winding walks lead in different directions through the grounds. Seats will be provided, from which magnificent views of the grand ranges of hills which surround Adelaide can be obtained; also different parts of the city and suburbs. The Director planned the whole of the walks and drives; and he has this season put out upwards of 3000 avenue and shade trees, which he placed ready for planting with his own hands. The trees are all doing remarkably well, and

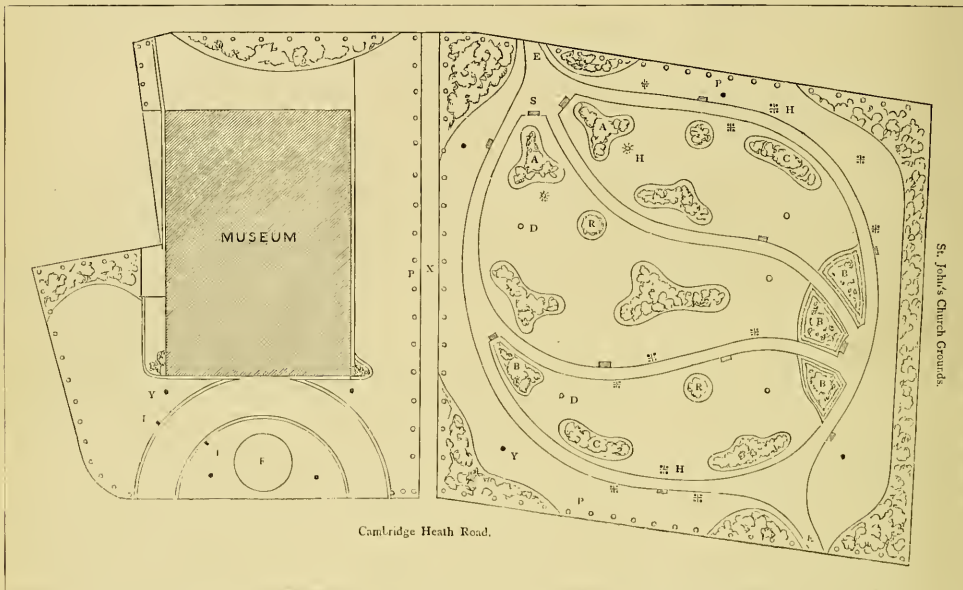

FIG. 160.—BETHNAL GREEN MUSEUM GARDEN. (SCALE ABOUT 94 FEET TO AN INCH.)

thrive as if indigenous to the colony, and are magnificent objects. *Araucaria Cunninghamii* is a splendid tree, being upwards of 50 feet high. *Araucaria Cookii*, very fine, 35 feet high; *A. Bidwillii*, 35 feet; and *A. Cunninghamii glauca*, *A. excelsa*, and *A. imbricata*, all doing remarkably well; *Dammara australis*, twelve years planted, and 40 feet high. Specimens of the beautiful Palm-like genus *Dracaena* adorn the lawns. *Cupressus torulosa* var. *elegans* is a noble tree, upwards of 35 feet high; its greatest diameter is at its base, gradually tapering to a thin point. *Schinus Molle* is a fine tree from Brazil, and is doing well. The Red Cedar (*Cedrela australis*) is growing most luxuriantly. One tree we saw measured 4 feet round the stem, and 30 feet high. Dr. Schomburgk has experienced great difficulty in procuring seeds of the Cedar—in fact, they are not to be got; but the Doctor will soon be independent of supplies from the other colonies, as this tree we observed was just coming into flower. Here we noticed a fine collection of the genus *Phladelphus*, consisting of upwards of twenty varieties. A very fine specimen of *Ficus Roxburghii* stands on the lawn here; also *Pinus halepensis* and *P. verticillata*, both very fine, and 50 or 60 feet high. The beautiful little *Biota aurea* is the finest plant for a lawn of small dimensions we know of, and may here be seen in perfection. The Ball Acacia (*Robinia Pseud-Acacia* var. *inermis*) is a most beautiful plant for lawns. It is grafted on stocks of the common *Robinia*, about 6 feet high,

here and there with choice trees and shrubs, standard Roses, &c. On the sides of the avenue there are placed, at regular distances apart, cases with open glass roofs, made to shut down in cold stormy weather, and containing a large collection of the genera *Mammillaria* and *Echinocactus*, the Nipple Cactus, and the Hedgehog Cactus, and we believe that the gardens possess the finest collection of this order of plants in the Southern Hemisphere, numbering 600 species. The collection of plants, as a whole, is very large, upwards of 9000 distinct species; in addition there are also nearly 2000 varieties of florists' flowers, and the collections are constantly receiving additions from nearly every botanical garden in Europe, East and West Indies, America, &c., with all of which Dr. Schomburgk is in correspondence. It will not be saying too much if we ascribe to Dr. Schomburgk the very highest attainments as a botanist and a gentleman of refined taste and versatility of genius. It was fortunate for the colony when the Doctor consented to leave his beautiful estate on the banks of the Gawler, and assume the directorship of the gardens. The colony owes him much for the source of enjoyment he has conferred by the skill and taste he has displayed in designing and laying out such a beautiful garden, and for his unwearied endeavours by his pen in pointing out the many sources of wealth we have in the vegetable productions suited to our soil and climate. May he long be spared to occupy his present position of usefulness. A fine

in a few years will have attained a magnitude which will render them real objects of beauty, if we measure their growth by those in the garden. Nothing, however, has been done to the avenues or walks except laying them out and paring the grass off, the director's object being to get as many of the trees planted out as possible, evidently imbued with the same idea as the Laird of Logan when he gave the counsel to his son, "Aye be sicken in a tree, Jock; it'll be grown' when ye're sleepin'." The creek which runs through the grounds, and was in its natural state a most unsightly object, the banks in many places being then precipices from 20 to 30 feet high, has undergone a wonderful transformation. The banks for a considerable distance have been sloped, hollows have been filled in, leaving charming nooks for choice plants, and the slopes have been planted in with *Mesembryanthemum* tegens, which is of low dwarf habit, and forms a pretty surface resembling at a little distance grass sward. Operations were begun on the park in the beginning of winter, and the amount of work which has been accomplished by twelve men is really astonishing. Much requires doing yet, however, and it is hoped that the Legislature will vote a liberal sum to complete what may with justice be termed a national work. The Botanic Garden Park is only an instalment of what will eventually be done to the whole of the park lands surrounding the city. The annual grant to the garden is £3000—a small sum

compared with the results attained, not only in the excellent order in which the grounds are kept, but in the buildings and extension of the garden which this annual grant accomplishes. The Director does the whole of the clerical work, occupying much time, and which is of considerable importance. He has an invaluable head gardener in Mr. Rankine, who has charge of the propagation-houses, Orchard-house, and the Victoria-house; also in Messrs. Humphries and Johnson, who have charge of the stoves and green-houses. In addition to these there are four practical gardeners, eight labourers, and two keepers of animals, a carpenter, and a painter and plumber. Altogether the colony has just reason to be proud of these fine gardens, which are acknowledged by competent authorities to be the finest in the Southern Hemisphere. G. McEwen, in "South Australian Register."

THE NEW GARDEN AT THE BETHNAL GREEN MUSEUM.

THE opening of this new "lung" in the East End of London on May 19 was announced in our columns at p. 661, and we have now, thanks to the kind co-operation of Mr. McIntyre, the pleasure of placing before our readers a plan of the grounds as that gentleman has laid them out (fig. 106), together with an indication of the subjects used in planting the beds and the shrubbery borders surrounding the grounds, which will no doubt interest many of our readers as showing what a man of Mr. McIntyre's experience considers suitable subjects for such a soot-begrimed atmosphere as that of Bethnal Green.

In general planting the following trees and shrubs are employed—*Ailantus glandulosa*, *Acer erio-carpum*, *A. platanoides*, *A. monspessulanum*, *A. colchicum rubrum*, *A. Lobelii*, *Planera acuminata*, *Robinia fastigiata*, *R. inermis*, *Populus canadensis*, *P. canescens pendula*, *P. nivea*, *Platanus macrophylla*, *P. hybrida*, *Alnus cordata*, *Pavia humilis*, *P. atrosanguinea*, *P. Lyoni*, *Fagus salicifolia pendula*, *Cotoneaster frigida*, *C. baccharifolia*, *C. Simonsii*, &c. *Prunella aerea*, *Prunella sibirica*, *C. Kämpferi*, *Ribes aureum*, *R. sanguineum pl. pleno*, *R. atropurpureum*, *Ulmus cordata*, *U. rugosa pendula*, *Rhus altissima*, *R. Cotinus*, *Fagus purpurea major*, *F. pendula*, *F. salicifolia*, *Ptelea trifoliata*, *Cornus mascula var.*, *Carpinus quercifolia*, *Caragana Chamlangi*, *C. Altagana*, *Cerasus Padus*, *Liquidambar*, *Phillyrea latifolia*, *Evergreen Oaks* in variety, *Thorns* in variety, *Laburnum* in variety, *Lilacs* in variety, *Hypericum* in variety, *Broom*, *Ligustrum* in variety, *Gaultheria Rose*, *double Peach*, *Purple Filbert*, *Arbutus Unedo*, *double Furze*, *Spiraea* in variety, *Rosemary*, *Laurustinus*, *Acuba*.

The references to the plan are—A. Beds of variegated Holly and *Yucca recurva*, edged with *Euonymus radiatus*. B. Dwarf beds with burnt edges, with Ivy and Periwinkle, and filled with the hardier succulents, alpines, *Cotoneaster*, *Scilla*, &c. C. Bedded Hollies, *Acubas*, *Euonymus*, *Box*, &c., mixed with *Delphinium*, edged with *Golden Chicksweed*. D. Weeping Lime, Ash, Poplar, and Elm. E. Entic. F. Majolica fountain. G. H. Hollies in standard variegated, weeping, and pyramidal. I. Ivy borders round fountain. P. Planes, surrounding ground. R. *Rhododendrons* with white Lily, edged with *Cerastium*. S. Seats. Y. *Yucca gloriosa* and *recurva*. X. Public path.

Reports of Societies.

Royal Horticultural Society: June 4.—The adjourned special meeting of the Fellows of the Royal Horticultural Society was held in the Council-room, South Kensington, under the presidency of Viscount Bury. Amongst the members of the Council present were Sir Coutts Lindsay, Bart., Mr. Little, Mr. Kellock, Mr. Webb, Hon. and Rev. J. T. Boscawen, Mr. Warner, Mr. Campton, Mr. Dobree (Treasurer), &c. There was a large number of Fellows present, and the proceedings, which lasted nearly three hours, were exceedingly animated.

THE PRESIDENT rose a few minutes after three o'clock, and said:—I think, ladies and gentlemen, that the best way to commence the proceedings of this meeting is to read a letter which has now been received from Her Majesty's Commissioners in answer to the proposals made by us. You will remember that our meeting was adjourned ten days ago until this day, in order that we might consider the answer, if one was received, of Her Majesty's Commissioners. We were not then in possession of the views Her Majesty's Commissioners entertained upon the proposals of our Society, and, having heard what the Commissioners have to say, it will be my duty to briefly review the position of the Society, to tell you how it stands with Her Majesty's Commissioners, and then to exchange with you some deliberations, and take counsel as to what our future action with regard to the Society is to be. I will now call upon the Secretary to read the reply of Her Majesty's Commissioners.

Mr. SHIRLEY HIBBERD: I think it would be desirable to have the proposals of the Society read first. The CHAIRMAN: I am in the chair, and will do the best I can to conduct the business of the meeting. Sir ALEXANDER GORDON moved that the proposals of the Society be read, and this having been seconded, was agreed to.

The CHAIRMAN: Well, I will now make a statement which I thought might be advantageously done after the letter of Her Majesty's Commissioners was read. The letter begins—"Office of Her Majesty's Commissioners of the Exhibition of 1851.—I have to acknowledge the receipt of your letter of May 10."

Mr. S. H. GODSON: First read the proposals. I beg to move that the proposals first be read.

A FELLOW: I second that with pleasure. The CHAIRMAN: If Mr. Godson's motion is carried I shall resign my position in the chair. I shall make the speech and adopt the course which seems to me fit.

Sir A. SLADE wished to ask a question, but he was unable from the confusion of voices to put it.

Mr. GUEBALLA made some observations which were scarcely intelligible, but he thought that the proposals ought to be read.

When order was somewhat restored,

The CHAIRMAN said: If you believe the critical statement I have to make is to be made at the dictation of any person you are very much mistaken.

Mr. SHIRLEY HIBBERD said there was no dictation whatever—why not let the Fellows have the proposals before the reply?

The CHAIRMAN: Then perhaps you will make my speech.

Mr. FRED SLADE: I must say, although I agree it is desirable the proposals should be submitted to the meeting, and that if any gentleman chooses to read the reply to them first in the course of his speech, it would be so much the worse for his speech, still it is unusual to interrupt a gentleman in making a speech, even if he puts the cart before the horse, as in this case.

Sir COUTTS LINDSAY: We have done everything we could to come to an arrangement with the Commissioners. There are six schemes, and not one, and I don't think we should make them in sequence. If you think it is competent for you to see all the schemes, and really the Chairman is anxious you should see all the schemes we have brought forward. (Cheers.)

Mr. W. A. LINDSAY: Let them be read.

Sir COUTTS LINDSAY: Let them be read in due course and in proper order.

Mr. W. A. LINDSAY: May I venture then to suggest that you will read the substance of the letter instead of reading it verbatim? (Here several Fellows cried "No.")

The CHAIRMAN: I must say that in all my experience of public meetings, it has never been my fate to find a meeting at which the person who was elected to preside over its proceedings was not allowed to make his statement just as he wished to make it. I beg respectfully to say I shall make the statement in my own way, and as I think best, or I shall leave the chair. (The Chairman here took up his hat as if to carry out his threat.)

COUNTRY FELLOW: Let the Secretary read all the letters.

Mr. GUEBALLA: The Chairman can embody them in his speech.

The CHAIRMAN: That is the very thing I proposed to do. If you do not let me make my speech in my own way, how am I to make it at all? I assure the meeting they would be in possession of the whole case if I were allowed to go on.

Mr. HAUGHTON said: All we object to is the reading of the reply before the proposals. The correspondence ought to be placed before the meeting in proper order.

The CHAIRMAN: Well, then, ladies and gentlemen, if the meeting chooses to say that, I will do the best I can. I wish to state that Her Majesty's Commissioners have refused the proposals made them. I intended to place before you the way in which they have done so, but I honestly confess this interruption has fairly scattered the course of my thoughts, and although I should like to present to you as well and as briefly as I can the position of the affairs of the Society, rather than observe upon an attempt made by ex-members of the Council who, having quarrelled with the Council, could not remain in it, to—

Sir ALEX. GORDON asked whether this had not better be avoided?

The CHAIRMAN: Very well. I deprecate the course taken without hearing any of the facts discussed on the one side or the other, and I think it very unfortunate. Honestly, ladies and gentlemen, I confess my ideas are so scattered, I very much doubt whether I can make the satisfactory statement I could have otherwise made to you. I will, for the moment, content myself with a brief review of the position of the Society at the present moment, and then in a few words give a parting counsel to the Society. I say a "parting counsel," for if I had been allowed to read the letter, it would have been

observed that the way in which my negotiations had closed with Her Majesty's Commissioners had conclusively in my mind and in the minds of several of my colleagues to the opinion that we could do no further good for the Society in resuming negotiations with Her Majesty's Commissioners. It is quite possible that others who may succeed and replace us may be more fortunate in establishing good relations between Her Majesty's Commissioners and the Royal Horticultural Society; but, for myself and colleagues, I can only say, with all respect for the Society, I shall decline to resume or continue these negotiations. Therefore, and coming as my colleagues propose to resign into your hands the trust you were good enough to give us some time ago, and we ask you to select others who may have better fortune in dealing with Her Majesty's Commissioners than we have had. I should like to go back for a few moments to the origin of the Society. After the Exhibition of 1851, the Commissioners of that Exhibition, with the great and illustrious Prince Consort at their head, found themselves in possession of a very large tract of land which was in fact public money, and it occurred to His Royal Highness the Prince Consort that the surplus of the funds arising from the Exhibition could not be better applied than in promoting science and art in every way attainable. Hence the gardens scheme was inaugurated. This South Kensington estate was bought and vested in trustees on behalf of Her Majesty's Commissioners of the Exhibition of 1851 for the promotion of science and art for ever. The place in which we now sit, and the gardens we now have, were the ground of the time waste ground. It is now surrounded by houses of great pecuniary value, and, moreover, it is of great value as one of the lungs of the metropolis. There are two things essential to the consideration of this part of the question, especially to the whole of the West End of London, that this shall not be built over, but shall be preserved as an open space for ever; and another is, that the Royal Horticultural Society, by means which I will explain to you or rather sketch to you, become possessed of a very large interest in the plot of ground which Her Majesty's Commissioners desired that this wild land should be beautified and adorned according to a plan which His Royal Highness himself designed, and he set about carrying out his design for the furtherance of science and art. He turned to a Society then pursuing the even tenor of its way at Chiswick, doing great service to horticulture, but not, as I believe—for it was not in my time—in the enjoyment of a large revenue. His Royal Highness asked the Society to accept a charter and become tenants of this part of the ground on certain conditions, and these conditions were, that the Royal Horticultural Society should expend at the outset £50,000 on the decoration of the grounds of which they became possessed. Money must be obtained for the purpose somehow. The gardens were already mortgaged to Chelsea Hospital, and therefore could not be made available for the requirements of the Society. That statement rests upon the authority of my predecessor in this chair—the Duke of Buccleuch. (The Chairman read this extract from the report of the Duke of Buccleuch at a meeting held March 29, 1873.) Well, continued the Chairman, I was not aware the grounds were mortgaged, but I may take the fact as being substantially correct. The gardens being thus heavily mortgaged, what security could be given to anybody who would step forward and find the money for the beautification of these gardens. I hold one of the original debentures issued under the control of Her Majesty's Commissioners. Any one who is fortunate enough to possess such a document, will see that the interest obtained any security in the gardens, but upon the receipts. Now, we must consider the attitude of mind the Commissioners and his late Royal Highness were in. The Exhibition had succeeded beyond any one's expectation. It was expected that a new Eldorado, a new Fortunatus' cap, had fallen upon the Commissioners. It was thought we should have made so much money, that when the £2400 rent was paid, and the debenture interest was paid, there would be a large surplus to be divided. This was the enormous estimate which then existed in the minds of the late Prince Consort and of his advisers, when the debentures were issued. The debenture holders, no doubt, shared in the sanguine expectation of his late Royal Highness, and believed the garden receipts would be ample to pay the interest, and in part the capital. International Exhibitions, however, were held in Paris, New York, and St. Petersburg, and the Eldorado was found to be a limited one, none having small boundaries. International Exhibitions became scarce in the market; and then the Chairman read, from the Exhibition of 1851, the bathos of the annual exhibitions held in the railway-like sheds at the head of South Kensington. Great results were expected from these exhibitions, but people were deceived, and the result was that it was found the debentures rested upon no solid foundation. I nevertheless believe the debenture holders will receive

sending the Royal Commissioners, the Horticultural Society, and the resident Fellows; shows and exhibitions to be held at South Kensington as heretofore. This scheme would leave the scientific horticulturists in possession of Chiswick for their operations, and would give the management of the South Kensington Gardens to those who paid for them, and would yet retain to the Royal Horticultural Society the use of the gardens for shows and similar purposes.

"To carry out this it is proposed that there should be two committees for subscription—(a) one of which shall admit to the South Kensington Gardens alone under certain restrictions, hereafter called South Kensington Fellows; (b) the other shall admit to Chiswick and the Royal Horticultural Society's shows, hereafter called Chiswick Fellows.

"The subscription *a* to be fixed at such a sum as shall be deemed sufficient to keep up the South Kensington Gardens (permanent buildings and a portion of rates and taxes excepted). Subscription *b* shall be fixed at such a sum as shall be deemed sufficient to keep up Chiswick Gardens, and to pay the expenses of the shows. The profits of the shows held at South Kensington go to Chiswick. The Council of the Society to be increased and divided into two permanent committees, one for the control of the interior economy of South Kensington, the other for the sole control of Chiswick, and a committee of the Royal Horticultural Society, and a committee of members from each committee to regulate the general affairs of the Society."

"The other conditions of this scheme, summarised, are as follows:—

"The general funds of the Society to be fairly divided between the two branches of the Society. An appropriation to be kept by the general Council for the payment of the debenture debt and general debts of the Society. Her Majesty's Commissioners to be asked to keep the permanent buildings at South Kensington in repair. Her Majesty's Commissioners to sanction the erection of a rink."

Then the third scheme was as follows:—

"The Fellows' two guineas subscription to be raised to three guineas, and the four guineas subscription to six guineas for a period of say three years. The tickets to be transferable. All entry fees to be abolished. Personal tickets of one guinea each to be issued to persons who belong to the gardening profession, and to other persons resident within a given radius from London, giving the Fellows the privilege of attending all the exhibitions and Wednesday committee meetings of the Society. To ask the Commissioners to lend the Society the sum of £5000 at 4 per cent., to enable the Society to pay off outside current liabilities. The increase of income under these new rates of subscription would be about £3991, which, added to the other estimated income, would give a total income of £13,091. All entrance fees to be abolished. A letter from the Assistant Secretary covered these proposals.

That makes six schemes which we have proposed to Her Majesty's Commissioners. I now come, ladies and gentlemen, to the letter of Her Majesty's Commissioners, which will be read, and here I take the opportunity of apologising for any warmth of manner which I displayed at the earlier part of our proceedings. Now I shall read for you the letter of Her Majesty's Commissioners refusing our proposals. It is this:—

"Office of Her Majesty's Commissioners for the

"Exhibition of 1875.—June 1, 1875.

"Sir,—I have to acknowledge the receipt of your letter of May 10, wherein, after referring to the non-acceptance by the Special Inquiry Committee of Her Majesty's Commissioners of the proposals made on behalf of the Royal Horticultural Society by Lord Bury and Sir Coutts Lindsay, certain further propositions are submitted by the Council of the Society for the consideration of the committee. I have also to acknowledge the receipt of your explanatory letter of May 20. In reference to the passage of your letter of May 10, I am to state that the Council cannot admit the accuracy of the figures given in my letter of May 5, I am to state that the whole of the data made use of in reviewing the financial prospects of the Society (with the exception of the statement for repairs) were furnished by your committee, and the difference between the amount of the liabilities now given by you and that stated by the deputation is not so important, compared with the total deficit, as to have influenced the committee in coming to a decision, conveyed to you, this question need be no further debated.

"The committee regret that they must decline the further proposals made to them in your letter of May 10. The Commissioners are still desirous to assist the Society as far as they can do so consistently with their duty, but the committee, having in view their responsibility as trustees of the public funds, cannot recommend that they should consent to contribute towards the maintenance of the Society in the modes specified. It is not apparent to them that the concession even of the large assistance requested would be productive of advantage to horticulture, or in any way benefit the public. In the final paragraph of your letter of May 10, the Committee state committee what propositions they could recommend for adoption by the Society in the pure interests of horticulture. I am instructed to reply that the Commissioners do not think it to be for the advantage of the Society that they should interfere with the management of its concerns further than absolutely needful. The committee have had their attention called to the proceedings of the general meeting of May 25, and they observe with

much regret that serious differences still continue to exist within the body of the Society. The committee direct me to state in conclusion that before recommending any proposition from the Society for assistance by the Royal Commissioners, they will feel it incumbent upon them to satisfy themselves that the differences between the various sections of the Society have been composed, that the advancement of horticulture will be the chief object of the Society, and that steps will be taken to put the Society financially on a more satisfactory footing.—I am, Sir, your obedient servant,
HENRY V. D. SCOTT, Major-General.

"The Secretary, Royal Horticultural Society."

With reference to that letter, it closed our negotiations with the Commissioners. I may remark, however, that the Commissioners still say it is their wish to offer some aid to the Society if they can do so. For my own part, I shall be quite willing to accept the assurance, provided some other member of your body fortunate in his negotiations with Her Majesty's Commissioners than I have been. With regard to the remarks made as to the meeting of the 25th of last month being marked or distinguished by considerable discussion, I should like to tell Her Majesty's Commissioners that if they think a body of 3000 men are to possess a unanimity never known in the whole world, and that if they are to wait until we shall have that unanimity they must wait for the lamb. Unless the lion will lie down with the lamb. Unless there are of that opinion, the "composing" of the differences they speak of is a long way off. I think some differences of opinion must exist amongst the members of the Commission themselves—because they are always saying they are willing to give us assistance, but the motive power in General Scott's hand is stronger than the large amount of sympathy they bear with the Royal Horticultural Society. It is to be hoped our successors will find themselves better able to "compose" the differences between the two parties than we have been. I may say at once, I am afraid we should not be able to frame any scheme which would be acceptable to Her Majesty's Commissioners. Still, I am willing to accept the statement that they are willing to do what they can. I am also willing to say the Council have done all they could to frame such a scheme as they thought would be acceptable to Her Majesty's Commissioners. I now come to a matter somewhat personal, and I am a member of Council. Sir Coutts Lindsay, Mr. Dobree, Mr. Hume, and myself, consider we should be only acting in the interests of the Society, with a due regard to our own dignity and position, and also to the trust which you have reposed in us, by surrendering into your hands the trust; and to persuade you, if we can do so, as I trust I have done, that we have not been either wrong or remiss with respect to your interests, and that we have done all we knew how to do. We feel the only honourable course is for us to give you the opportunity to do what we will, and here I take the opportunity of helping you as well as we can, and all minor differences shall be sunk. We will do all we can to relieve the Royal Horticultural Society, as far as it rests in us, from its difficulties, but we consider it our duty to resign our offices. I resign—Mr. Hume does so, Mr. Dobree does so, and Sir Coutts Lindsay does so. I have to thank those members of the Council who do not agree with us in this for their support. Now I have never found in my life a more active or unanimous Council, or one more devoted to the duties of their office. Some of my colleagues do not think it their duty to resign their offices, because, as I believe, they think they were appointed by one section of the Society, and do not think they ought to resign until that section takes the power out of their hands. The horticultural Fellows have been in the majority, and therefore these gentlemen do not feel it their duty to resign. I will, if you will permit me, give you a parting word of advice. My own belief is that the only way to save the Society is that you should divide the body into the pure and the mixed horticulturists and the Kensingtonians, as they are called. Let the Chiswick Gardens be put in possession of a purely scientific body; the funds required would get still smaller. Then I think the Fellows who live around these gardens ought to pay for their maintenance. Let us divide for the common good. Let the scientific horticulturists go to Chiswick and keep the "Kensingtonians" at South Kensington. That is a scheme you can carry out without the sanction of the Commissioners, and by reducing your expenditure you can keep within your income. I do trust whatever course you pursue may be for the benefit of the Society, for its relief from the embarrassments which lie upon it, from its difficulties which are by no means insuperable. Pay your rent next year and then you can keep possession. I must say before I close that what the horticultural papers stated was not altogether fair. It was never intended that, by anything which fell from me, the idea that the Society was insolvent should be conveyed. In the first place, if I said so it would not be true. I may say that the claims brought against us have been paid. I beg now to conclude this statement with a hope that you will find our retirement conducive to

the benefit and honour of the Royal Horticultural Society.

The CHAIRMAN, resuming, said he wished to state that many members of the Society had expressed their wish to subscribe money to relieve the Society from its embarrassments. Mr. Ricketts promised £25, Mr. Godson £25, Mr. Paul £100 a year for ten years on the condition that nine others would do the same, Mr. Bill promised £100 in aid of our show, which he hoped might stand good, and Mr. Dohrn said he would give £100. That was an encouragement. Mr. KILCK observed that as a horticulturist he did not feel it his duty to resign his seat at the Council. Neither do the other horticultural Fellows on the Council think it their duty to resign. They respected the South Kensingtonians, but literally they had nothing to do with them. On that ground the horticultural members of the Council did not tender their resignations.

Dr. DENNY remarked that the meeting ought to thank the noble lord for his able statement, and it could not be without regret that they heard it. The Council had come in as a Kensingtonian Council, and as a horticultural Council they had failed; for it must be admitted upon all hands that the horticultural part of the Society was not in the position it was when the present Council took office. The horticultural Fellows were becoming disgusted, and were leaving the Society wholesale, and more than that, the attendance at the gardens was falling off. In fact, under the present management, the Society would fall to pieces in a few months. The Council might say they were paying their present prize money, but why? Because no one was exhibiting. The present Council took office in opposition to the Royal Commissioners—"No No". Why, the Council turned out Royalty—they turned out Prince Arthur.

A FELLOW: No; Prince Arthur resigned.

Dr. DENNY: Well, he could not remain in office under the condition of affairs. I think our thanks are due to those members of the Council who do not resign their seats.

Mr. GUEBADA believed the dead-lock was entirely due to the shuffling conduct of Her Majesty's Commissioners. They kept the Society in a fix for upwards of twelve months, and then in the month of February they came down and said they were ready to come to an arrangement. The Council had placed most excellent plans before the Commissioners, and what right had the Commissioners to indict their acts? The last plan proposed was the only one to work any real substantial good, and that was to separate Chiswick from South Kensington. He was extremely sorry to see these members of the Council resign, but it was really the only manly course open to them as honourable men.

Sir COUTTS LINDSAY begged, before he left his seat on the Council, to express his extreme satisfaction at the way in which he had been met by all the members of the Council and by the Fellows generally. He quite endorsed what Lord Bury said with respect to the Society. As to the charge brought against the Council of not having fostered horticulture, the answer was that the Council had neither money nor means. Lord Bury had very ably shown them the misfortune under which their Society laboured. They never had funds to meet the expenses placed upon their shoulders by the Commissioners, and so the Society had been brought to a position, if not of bankruptcy, of great impecuniosity. It would be better, after all, to divide the two interests which existed in the Society. Let those who took most direct interest in horticulture take its management in their own hands. As regarded the resignations, he might say that he believes every gentleman on the Council acted to the best of his judgment. Mr. Hume, who was not able to be present, had written a letter, which he would read. He (Sir Coutts Lindsay) could say, with entire sincerity, that those who retired did so with no feeling of soreness, and with the belief that they had at all times received the support of their colleagues and of the Fellows in general.

Mr. DOBREE begged to express his thanks for the support he had received from all connected with the Society. He was sorry his time had not been of more use to the Society than it had been, but he could not afford to give any more time as he was engaged in commercial pursuits. Mr. Hume much regretted he could not attend that meeting as he had to be present that day at a School Board in Norfolk.

Sir ALFRED SLADE wished to say that, according to the 16th Bye-law no business except that for which the adjournment was made could take place. Therefore the meeting was incapable of accepting the resignation of the members of Council or to appoint their successors. He regretted very much that there should be any reason for the resignation of the members of the Board who had tendered it.

The CHAIRMAN: No doubt Sir Alfred Slade is right. Another meeting will have to be called to deal with the resignations. That is quite in accordance with the bye-law quoted. The simple fact is, we shall have to call another meeting. I and my col-

leagues have not yet resigned, and perhaps we shall not.

Mr. W. A. LINDSAY wished to say he regretted having made some remarks at the last meeting which created or introduced a feeling of bitterness. All he could do was to express regret for these expressions. Without going into any further matter, he wished to say that he believed the state of the Society was perfectly sound, and he felt it could be re-organised, but only by reverting, both actively and mentally, to the past represented by the picture over the Chairman's head, painted at a time when this Society was renowned for its science but not for its local fashion.

The CHAIRMAN: Well, ladies and gentlemen, I have nothing further to say than that the meeting is at an end for the present.

Mr. SHIRLEY HIBBERD asked if the Chairman had really taken his farewell of them, and this was met with cries of "No." Mr. Hibberd then said the Chairman had made his farewell speech, and, as he had done good hard work, they ought to thank him. He begged to vote of thanks to the Chairman.

Mr. W. A. LINDSAY said he had much pleasure in seconding the vote so appropriately moved by Mr. Hibberd.

The motion was carried unanimously, and the Fellows, who had been kept at the meeting an unusually long time, rapidly dispersed.

Obituary.

On June 6, at Ragstad, Worthing, MARY ANNE, wife of W. WILSON SAUNDERS, Esq., F.R.S., in the seventy-fourth year of her age.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JUNE 9, 1875.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRIC DEGREE OF SATURATION, from Glaisher's Tables, 5th Edition.	WIND.	RAINFALL.
	Mean Reading.	Least.	Lowest.	Range.

June 3—A very fine but cloudless day. Distant thunder heard at 4 P.M.
 4—Fine, bright, warm, and partially cloudy throughout.
 5—A fine warm day, though dull and cloudy at times.
 6—Overcast, and dull in morning. Fine and bright afterwards.
 7—Fine, but dull throughout, occasional showers of rain from 12 A.M. to 2 P.M.
 8—A fine bright day. Cloudy at times.
 9—A fine, but dull day. At 2.30 P.M. a flash of lightning, thunder followed with a smart shower of rain, but for a few minutes only. Lightning seen again at 9.30 P.M.

During the week ending Saturday, June 5, in the vicinity of London, the reading of the barometer at the level of the sea increased from 29.90 inches at the beginning of the week to 30.19 inches by the morning of the 4th, decreased to 29.87 inches by the morning of the 5th, and was 29.03 inches at the end of the week. The mean reading for the week was 30.02 inches, being 0.13 inch less than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged from 63° on May 30 to 81½° on June 3, with a mean value for the week of 75°. The lowest temperatures of the air varied between 41° on May 31 and 55° on June 4 and 5 respectively, the mean for the week being 49°. The mean daily range of temperature in the week was 23½°, ranging from 28½° on June 1 to 17° on the 5th. The mean daily temperatures of the air and the departures from their respective averages were as follows—May 30, 52.1, -3.9; 31st, 51.6, -4.7; June 1, 58.3, +1.8; 2d, 61, +4.3; 3d, 57.7, +1.8; 4th, 65.5, +7.9; 5th, 63.7, +6.4; 6th, 61. The mean temperature for the week was 57.2, or 0.7 above the average, as deduced from observations extending over 60 years. The highest readings of a thermometer with blackened bulb in

vacuo, placed on grass in sun's rays, were 140° and 137° on June 1 and 3; the highest reading on the 5th was 90°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 40° and 36½° on May 30 and 31; the lowest reading on June 4 was 52°. The mean of the seven low readings was 44½°. The direction of the wind was mostly E. N. E., and its strength brisk. The weather during the week was fine and bright throughout. Lightning was seen on the evening of June 2, and distant thunder was heard on the afternoon of the 3d.

In England the extreme high day temperatures ranged from 85° at Norwich and 84½° at Leicester to 64° at Newcastle-upon-Tyne, the lowest in the country being 78°. The extreme low night temperatures varied between 44½° at Liverpool and 33° at Eccles, with a general average of 38½°. The mean of the extreme range of temperatures in the week was 39½°, the greatest range being at Eccles, 47½°, and the least at Newcastle-upon-Tyne, 24°. The mean high temperatures observed by day ranged between 74½° at Leicester and 60½° at Newcastle-upon-Tyne, the general average being 69½°. The lowest temperatures observed by night varied from 64° at Liverpool to 42° at Hull, with a mean value of 46°. The mean daily range of temperature in the week was 23½°, the greatest range being at Leicester, 28½°, and the least at Liverpool, 16½°. The mean temperature of the air for the week was 56½°, being 4° less than the value for the corresponding value in 1874. The highest in the week occurred at Blackheath, 59½°, and the lowest at Newcastle-upon-Tyne, 49½°. The fall of rain during the week varied from two-tenths of an inch at Eccles to one-hundredth of an inch at Sheffield. In the southern counties no rain fell, the average fall over the country was five-hundredths of an inch.

The weather during the week was fine and bright throughout. Distant thunder was heard on June 3 in the afternoon.

In Scotland, the highest temperatures ranged from 72° at Greenock to 64° at Leith; the general average was 68½°. The lowest temperatures varied between 45° at Greenock and 39½° at Leith, with a general average of 41½°. The mean range of temperature in the week was 26½°. The mean temperature of the air for the week was 54½°, being 3° lower than the value for the corresponding week in 1874. The highest happened at Greenock, 56½°, and the lowest at Leith, 52½°. Rain fell at Dundee and Greenock to the amount of a quarter of an inch, but at Aberdeen two-tenths of an inch only was measured; the average fall was two-tenths of an inch nearly.

At Dublin, the highest temperature was 71½°, the lowest 35½°, the mean 55½°, and the fall of rain 0.08 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

SOFT-WOODED AND GREENHOUSE PLANTS.—Upon present and timely attention to many of these will depend their ability to furnish their wonted quantity of flower through the autumn and winter months. Nothing is more common, in the urgent immediate demands of the innumerable things that require looking to at this busy season, than that later flowering subjects are allowed to suffer for want of attention in the early stages of their growth, and which no amount of after-care can set to rights. This especially applies to *Christus thomasi*, which, although easily grown, must have regular attention throughout the season. If not already done, the plants should at once be transferred to their flowering pots, using good loam well enriched; where they are expected to develop a number of full-sized flowers they should have 12-inch pots. In potting make the soil tolerably firm; they should then be plunged in an open situation, where they will be fully exposed to sun and air, but not where subjected to the unbroken force of the wind, or, despite all that can be done in regard to syringing, they get broken. A bed of coal ashes, if such can be had, is much better for them to stand on than soil, on account of its freedom from worms. Place the plants sufficiently far apart to prevent them becoming drawn. To admit of getting amongst them they are frequently stood in rows by the side of walks, but when the pots are exposed to the action of the sun and the drying influence is such that, in addition to the water-requiring nature of the plants, it is difficult, when the pots get filled with roots, to keep them sufficiently supplied; and so grown the bottom leaves are almost sure to get bad before they flower—a condition that spoils their appearance. Do not stop them after this time; syringe overhead in the evening during sunny weather, this will prevent greenfly. *T. bairni*.

ORCHIDS.—Give a general look through the collection, and any plants that have made vigorous growth, and have filled their pots with roots, should

now have a shift. Where the plants are grown in pots the roots frequently attach themselves so firmly to the pot that it is impossible to turn them out without injury to the plants—the *Phalænopsis* especially so. The best plan in such cases is to take a pot out of the soil, and carefully place the one containing the plant into it, working in a few crocks and sphagnum. Where baskets are used, and the plant has outgrown the basket, it is better to carefully remove the roots from the wood with a thin knife, and give the plant a new basket. Care must be taken not to over-pot. Orchids do not require large pots, nor yet a great mass of material to root into. All the East-India plants that do not require shifting should be top-dressed with fresh sphagnum, and *Lyco podium*, with many of the *Anacrotichis*, should be planted on the surface; both will grow well, and benefit rather than otherwise the roots of the Orchids—they also give an additional charm to the Orchid-house. If the repotting is carefully done the growth of the plants will not get any check. Examine the blocks of wood, and if any are found to be decaying replace them with new ones; by relocking at this season the plants will have a chance to make new roots before the plants are in a growing season. *Odontoglossum* will require constant attention, air must be given early in the morning, so as to keep a cool temperature; also, with a view of keeping a sweet atmosphere. These plants require copious supplies of water at their roots, and frequent syringings overhead; this syringing will keep their bulbs fat and clean. The yellow thrips is a great pest to *Odontoglossum* at this season; they must be kept under by frequently and carefully fumigating them; many of them may get rid of by sponging, but unfortunately they secret themselves so low down in the young growth that it is impossible to reach them in any way but by blowing the smoke into them. *Mastocallis* will do very well if placed in a cool north pit for the next two or three months. When these plants are kept in too warm a house they become drawn and weakly, and rarely produce any flowers; they require plenty of water at their roots: their leaves must be frequently sponged, to keep down thrips. *Odontoglossum* that are starting into growth may be repotted; many of these will require a greater heat than *Odontoglossum* when making their growth. *Angulorum* will now require large supplies of water. *Androbium* must receive liberal treatment to enable them to make strong growth and be well matured. G. Baker, Clapham Common.

FLOWER GARDEN, &c.

PARTERRE AND MINED GARDEN.—The heavy rainfall on May 28 has been of great service to all newly planted shrubs and bedding stuff by settling the earth well about the roots, and the latter are now making rapid progress towards filling the beds for an early display. All the tender varieties of plants used for summer decoration should now be got out, provided they are properly hardened, and should be sown in at all bright at the time of planting a slight shade, such as may be afforded by a few Laurel or other evergreen branches, will be of great service in assisting them to become established. For such things as have not been previously established in pots protection in this way becomes a necessity. The grouping of the different varieties of subtropical plants, so as to be effective, requires a considerable amount of taste and skill; and when well done is sure to command admiration. In groupings, make choice of such as associate well together, and for isolated specimens plants only of bold type and easy outline, such as Palms, &c., should be chosen. It is useless attempting this style of decoration unless in very sheltered and favourable situations, as such large-leaved plants are torn to ribbons long before the season is over unless they are afforded proper shelter, and their appearance in a torn and ragged state is equally deplorable. Before planting see that the beds for summer decoration should be sown in, or positions it is intended the plants should occupy are thoroughly enriched, as much of their beauty depends on the full development of the leaf, and with such gross feeding plants this can only be brought about by the most liberal treatment. Plants of this description that hold a good deal of wind, on account of their large foliage, should be neatly and securely staked at the time of planting, and receive an abundant supply of water as growth proceeds. Beds intended for *Asters*, *Stocks*, and *Zinnias*, could be thoroughly enriched previous to planting or sowing the seed. Stocks are more satisfactory if sown thinly in rows where they are intended to bloom, as they transplant badly, and by allowing the bulk to remain till they show flower all the single varieties may be removed and a grand display of double flowers obtained. *Zinnias* well grown are perhaps the most effective and showy of all annuals, and no garden should be without a bed of them. If sown now they will be in ample time, as they grow very rapidly, and being of rather tender nature should not be ventured out too soon. Other varieties of annuals that may have been sown in masses in beds or borders should be freely thinned out, or they will

present a weedy appearance, as neither plants nor flowers will come to their proper size and development.

Now that the busy season of heading is fast drawing to a close, labour will be set at liberty for other work that is apt to fall in arrear at most places. Neatness and order should be the first consideration, and suitable weather chosen to wage war with weeds, and for the several other operations to bring about this desirable end. Much time and labour may be saved by taking advantage of the state of the weather in most of the work connected with gardening, and when favourable for certain operations a good general plan will then manifest its force, and concentrate its strength in certain quarters instead of filtering it away when conditions are adverse to rapid progress. Herbaceous borders will now require constant attention in staking and tying the various kinds of plants as they advance in growth. The practice of bundling them up, by just running a piece of matting round, is very objectionable, as they are never seen to advantage, and the stems become drawn and attenuated, and many of the principal leaves destroyed from want of light and air. If only one stake is employed for the purpose of support, the different branches should be looped up separately so that the plants may have breathing room, and present an easy natural appearance. The hoe and rake should be run frequently over the ground to destroy weeds and keep the surface neat and tidy, without which much of the effect an pleasure is lost. Before staking the plants will be much benefited by having the greater portion of the weeds shoots removed, so as to concentrate the strength in those remaining, and induce them to send up fine heads of bloom. Roses are now fast swelling their flower-buds, and will be greatly benefited by liberal applications of liquid manure. The beds should previously receive a mulching of rotten dung, so as to prevent any escape of this through evaporation.

Ranunculus beds can scarce be over-watered at this season, and as they come into bloom a slight shade will be necessary, or the beauty of the plants will only be of short duration. The stock of plants used for spring bedding will now require attention, to insure a good supply of bloom when the season arrives, and this can only be effected by growing the plants well now instead of leaving them uncared for in the reserve garden. Nothing is more beautiful for spring blooming than the old *Geniana acaulis*, and yet one seldom sees it in quantity. A few old plants obtained now will divide easily, and soon make a large stock, if planted in favourable situations. *P. Sheppard*.

FRUIT HOUSES.

ORCHARD HOUSE.—*Insects of various kinds now begin to be troublesome, and in order to keep them down it will be quite necessary to syringe the trees every night, and if this fails to do them thoroughly, then it sometimes does, then recourse must at once be had to fumigation. The young shoots of Cherry trees are often sadly infested by the black-fly, which fasten themselves upon the under sides of the leaves, and water thrown by the syringe or garden engine, with whatever force, has but little effect upon them. They can also withstand a considerable amount of tobacco smoke. Although they will generally succumb to repeated and powerful applications of this narcotic, still in large structures there is frequently much difficulty in applying this sufficiently strong, and merely dipping the infested shoots in tobacco-water, however strong, is seldom effective, as the insects are protected by a glutinous substance which has the effect of throwing off the water, so that they remain uninjured. The most effectual method, however, is to gently rub the infested leaves with the fingers, which should be well and repeatedly wetted with tolerably strong tobacco-water. This should be done during the evening, and early on the following morning the trees should be well washed with the syringe or garden engine. During fine weather the ventilators may be allowed to remain open by night as well as by day, taking care to close them during the prevalence of high winds. *P. Grieve, Cuford*.*

KITCHEN GARDEN.

The *Roulette Celerwort* is a subject which is worthy of extensive cultivation in gardens generally, and especially so in those which are required to furnish a supply of hard blanched Cabbages for soups or other purposes through the winter months. Its cultivation is also to be recommended on account of its productivity, and requiring so little space for that purpose, and also because of its hearty constitution, and capability of withstanding the effects of severe weather better than any other variety of Cabbage. It is, however, in this case very important to sow the seed of it at the proper time, which we have by experience found to be about the 20th of the present month. Prick out the plants as soon as they are sufficiently advanced to be done; this must be attended to in

order to secure sturdiness in habit. When they are fit for transferring to the quarters or elsewhere, plant them out 15 inches apart every way. We appropriate for this purpose ground which has been occupied with autumn-sown Onions. The cutting of another portion of the beds of *Asparagus* should be discontinued at once, and this operation should not be prolonged on the others longer than it is absolutely required, as it is very important that the plants have sufficient time allowed them to perfectly develop a natural growth, in order that the buds for the forthcoming season's supply may be perfectly matured. In exposed situations it is advisable to secure the top from being broken off by means of stakes, or by placing these at distances apart, and running string from one to the other. Peas are now coming on rapidly. Amongst early varieties William the First is pre-eminent as an early variety—combining, as it does, earliness with productiveness and quality; as such it is at present unsurpassed. We have also another promising early sort in *Dr. Hogg*, which apparently is one that requires but little time comparatively in attaining perfection. Copious supplies of water should be given to those in a bearing state, and also to advancing crops. When the seed in later rows are too thickly placed, thin out to about 2 inches apart. These should be mulched with either litter or manure, and stacked as soon as fit, and apply the same means in the case of late rows of *Scarlet Runners*. Take advantage of favourable opportunities to plant out, as ground becomes vacant, successional crops of *Broccoli*, *Winter Greens*, *Cauliflowers*, *Savoy*, &c. Maintain successional supplies of *Turnips*, by occasional sowings as required, as also of *Lettuce*, *Rutabaga*, and *Endive*, which should at this season be constantly, "when necessary," supplied with water to insure fine quality. Transplant *Endive* "before it gets too much advanced in growth," about 15 inches apart every way. Plentifully supply water at the roots of *Celery* in all stages of growth; earth up that which was planted out early; plant out for a succession, and prick out from outside seed-beds for late supplies. Prepare trenches for these, and make available the space between them for crops of *Lettuce* or *Endive* by sowing them in drills there for summer *Synchis*. Attend with regularity to the requirements of *Gherkins*, *Cucumbers*, and *Vegetable Marrows*, which are planted out in hand-lights; as soon as the vines begin to run elevate the handlight to allow them to pass out underneath. *G. T. Miles, Wycombe Abbey*.

Answers to Correspondents.

INSECTS: *J. T. B.* The small galls of the size of Peas on the male flower-stems of the Oak (see fig. 161), are

FIG. 161.—CURRANT GALLS ON OAKS.

known by the name of Currant galls, and are formed by *Cynips Quercus petiolii*. *J. O. W.—A. C.* Your Larch, *Nordmanniana*, and Silver Fir, are attacked by the common *Chermes laricis*. Repeated fumigation to windward, and syringing with lime-water and soap-suds, may be used; but Nature is already taking steps to diminish the mischief, one of the sprigs sent being cleared by an Aphid-feeding larva of one of the two-winged Syrphides, nearly full-grown. *J. O. W.—An Old Subscriber.* The wild bees sent are the *Andrena cineraria*. All the numerous species of this genus burrow in the earth. *J. O. W.—M. S.* The Olive trees in the South of Europe are attacked by the scale, *Coccus olea*, which is often very injurious, and even destructive to them there. Washing the stems with the ordinary fluids for the destruction of the scale is the only remedy. There are numerous treatises on the insect by Bernard, Olivier, Bompar, Costa, Rizzo, Bayle Barelle, Gremaldi, Passerini, &c. *J. O. W.—ACTION OF MANURES: S. B. D.* Your questions would require a small volume to answer them fully. Some are absorbed unchanged from the soil, others (most) are changed in the plant itself; others again, as you

says, act on the soil, and render some otherwise insoluble ingredients available as plant food.

CARSWICK GARDEN: *F. A. Maggard*, Any Fellow of the Society can give an order of admission.

FENCING: *L. F. You* do not say whether you intend the fencing to be permanent or not, hence we cannot answer you to the point. Presuming that you only want a temporary fence, we would recommend that strong Oak posts, pointed and charred, be driven into the ground in squares of four, six, or even eight. Drive them in sloping outwards, and fix four rails to them horizontally, those near the ground being the closest together.

FRUIT SHOW AT SOUTH KENSINGTON: We are requested to correct an error which crept into our report at p. 728, col. 6, with reference to the fine Black Hamburg and Foster's Seedling Grapes shown by Mr. Henson, gr. to the Earl of Derby, Knowlesly. These were entered "not for competition" consequently it was an error to say, as we have done, that they did compete, though we saw no notice to that effect on the exhibition table.

NAMES OF PLANTS: *P. H. Ipswich*. *Phyllocactus crenatus—L. Sabkrier*, *T. Trollius europaeus*; 5, may be *Jasminum revolutum*, but we cannot be sure without flowers. All the other specimens are not sufficient to name. The variegation of the Rose leaves is certainly unusual.—*M. F. C.* *Cz. Cypripedium calceolatum*. *A. J. O.* *Lysimachia nemorosum*, *C. F. J.* 1, *Helianthemum multif. var. roseum*; 2, *Helianthemum hybrid*; 4, *Veronica inana*; 5, *Catastium luridum*; 8, indeterminate. The others next week. Please do not send more than six another time.—*Mrs. C. M. Shirub*, *Lonicera Xylostemon*; tree, *Yrus Arai.—B. G.* The large leaved plant is *Viturnum Leugast*, the other *Leucothoe axillaris.—M. N.* *Trewia nudiflora.—M. J.* 1, *Cordylie australis*; 2, *Fraxinus Ornus*; 3, *Cotyledon umbilicus*.

PINK LABURNUM: *Laburnum*. Only the well-known *Cytisus Adami*. See a note respecting it on p. 758. ROSE: *An Amateur*. The one old Persian *Yew*, we believe. The other plant was too much withered.

CATALOGUES RECEIVED: James Cook & Sons (Aberdeen), General Spring Catalogue of Bedding and other Soft-wooded Plants—Rollisson & Sons (The Nurseries, Stoveing, London, S.W.), General Catalogue of Stove, Greenhouse, Hardy, and Bedding Plants—James Veitch & Sons (Royal Nurseries, King's Road, Chelsea, S.W.), Illustrated Catalogue of New and Beautiful Plants—Messrs. Markets.

COVENT GARDEN, June 10.

Heavy consignments from the Continent, including Strawberries, Cherries, and Apricots, arrive daily. Strawberries from the west of England are also largely in bulk, selling at 2s. to 4s. per dozen lb., but they are very common goods. Peaches and Nectarines have improved, but English Pines have made very little progress in size and quality; 10,000 are announced from the West Indies as first arrival. *Thos. Taylor, Wholesale Apple Market.*

VEGETABLES.

Table listing various vegetables and their prices per bushel or dozen, including Asparagus, Lettices, Mushrooms, Onions, Parsley, Peas, Carrots, Cauliflowers, Celery, Beans, Endive, Herbs, Horse Radish, and Potatoes.

SEEDS.

LONDON: June 9.—Our agricultural seed trade, as might be expected, is now so inactive that it affords scarcely any subject for remark. Occasional export orders for Clover seed only, but at present there is no speculation in the article. It does not seem probable that much Trifolium will be saved in this country for seed; and offers of Trifolium which now come to hand from France are made at a considerable advance on those of a few weeks since. Very little of this there is still some inquiry, but the supply is almost nil. Mustard and Rape seed are without quotable variation. Canary seed, having apparently seen its highest, and the demand having sensibly diminished, is now dropping in value. Hemp seed is firm, but very little being scarce, is dearer. John Shaw & Sons, 37, Mark Lane, E.C.

CORN.

At Mark Lane, on Monday, the small quantity of English Wheat on the market prevented any pressure to be felt, whilst purchases were small. The rates had to be paid. The same remarks apply to foreign Wheat. Flour was very unsteady, and American barrels rather easier to buy. Barley was without quotable change in value, and Beans showed an occasional reduction of 1s. per quarter. The late extreme rates for white Peas were not maintained, as supplies are coming to hand. Oats remained the same as on last Friday week, with a quiet trade. Maize was cheaper on the week, but met with very few buyers.—Wednesday's market was poorly attended, and little business was done in any class of produce. The market of English Wheat was small, of foreign large, and sales could only be effected on some slight reduction. Barley was nominally unaltered, as was also malt; while Oats, Maize, Beans, and Peas were rather cheaper than otherwise. Flour remained dull.—Average prices of corn for the week ending June 5:—Wheat, 41s. 1d.; Barley, 35s. 9d.; Oats, 30s. 1d. For the corresponding week last year:—Wheat, 61s. 8d.; Barley, 45s. 8d.; Oats, 29s. 11d.

CATTLE.

The trade in every department at the Metropolitan cattle market on Monday was exceedingly dull, and lower prices than in any previous instance were effected. In the best market the reduction was quite 2d. to 4d. per stone, the middling qualities being the most depressed. For the best the rates could not be quoted over 6s. as a current top price. On the foreign side a similar decline in prices was observed, and a slow dragging trade. The demand for sheep was extremely dull, and at a similar reduction to that quoted for beasts. Sales were difficult to close on the English side, 6s. 4d. to 6s. 8s. were extreme rates current, and on the foreign side 6s. was the top quotation. Lambs sold badly, and at 4d. to 6d. per stone decline. Calves were almost unsteady, and prices were very irregular. Pigs met little or no inquiry.—Trade in beasts on Thursday was very dull, prices were lower, and a clearance was not effected. For sheep and lambs rates were lower, and a considerable number remained unsold. Calves sold at fully late rates, choice making rather more money.

HAY.

The Whitechapel report states that with a small supply trade was firm, and rather higher rates prevailed for hay. Quotations—Prime meadow hay, 50s. to 52s.; inferior, 45s. to 50s.; prime Clover, 45s. to 50s.; inferior, 40s. to 45s.; and straw, 35s. to 38s. per load.—Cumberland Market quotations:—Superior meadow hay, 126s. to 135s.; inferior, 100s. to 110s.; superior Clover, 120s. to 132s.; inferior, 90s. to 110s.; and straw, 40s. to 44s. per load.

POTATOS.

The Borough and Spitalfields reports state that supplies were large and much in excess of the demand, so that prices were flat. Quotations:—Regents, 80s. to 115s.; rocks, 60s. to 70s.; Victorias, 80s. to 125s.; finer, 125s. to 135s. per ton.—Last week the imports of Potatoes into London consisted of 2025 bags from Antwerp, 4673 sacks and 733 tons Dunkirk, 1227 boxes Lisbon, 99 boxes Valencia, 67 casks 93 baskets Malta, 50 bags 40 packages Hamburg.

COALS.

The market on Monday was firmer than in the preceding week, previous prices being fully supported. On Wednesday house coals advanced 6d. per ton. Quotations:—Beaside West Hartley, 19s. 3d.; Percy do., 18s. 3d.; West Hartley, 19s. 3d.; Walls End.—Lambton, 21s.; South Hetton, 21s. 6d.; Kellie, 19s.; East Hartlepool, 21s. 3d.

THE LONDON MANURE COMPANY

(Established 1846) Have now ready for delivery in fine dry condition—CORN MANURE, for spring sowing. PURE DISSOLVED BONES. PURSER'S ROSE MANURE. PURSER'S BONE TURNIP MANURE. SUPERPHOSPHATE. SCOTCH SILVER SAND

AND FIBROUS PEAT.

Silver Sand and Fibrous Peat, of the finest quality, same as supplied to the Royal Botanic Gardens, Edinburgh; Messrs. the Lawson Seed & Nursery Co., Limited; Downie, Laird & Co., Ltd.; J. & W. Grieve, Glasgow & McAlister, and all the principal Nurseries in Scotland.

The Sand is one of the finest samples of the purest Silica, without any admixture of earthy matters whatever, and is allowed to be the best English. It is invaluable for Propagating or General Purposes. The Heat is from the layer lying on the Silver Rock, and has a considerable proportion of clear Silver Sand in its natural texture. Admirably adapted for Heat, Analysis, &c., and the choicest portous for Orchids.

In Sacks, for Amateurs, &c., at 12. 6d. each, sack included. Price per ton on application to

George McLaws & Co., GREENFOOT SAND QUARRIES, AIRDRIE, N.B.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK

VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application. Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufacturers, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNRESERVED TESTIMONIAL.

"Glasgow, 11th August, Carmarthen, Nov. 27, 1873. 'Mr. Lloyd Lloyd encloses cheque for 43 3s. 6d., amount due to Messrs. Hill & Smith, and he considers my black Varnish one of the most useful things he ever possessed.' Apply to HILL AND SMITH, Brierly Hill Iron Works, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—Having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

Reduced Prices.

THE CELEBRATED GRANITIC PAINT.

Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company. For Price Lists, Testimonials, and Patterns of Colours, apply to THOMAS CHILD, Manager, 39A, King William Street, London, E.C.

Important to Market Gardeners and Others.
THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separate, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and tasty, and fully adapted to the purposes designed. A large number have been sold, and are giving unqualified satisfaction.
Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

Prices of Horse, Pony, and Donkey Machines on application.
Carriage Paid to all the principal Railway Stations
in the United Kingdom.

The "SILENS MESSOR" Machines have a world-wide
reputation for their superiority and excellence, and the improve-
ments which have been made in them from time to time still keep
this Machine the best and most approved one in the Market.

They will cut either short or long grass, hives, &c.,
and wet as well as dry, advantages which no other Lawn Mowers
possess. They are the only Lawn Mowers in constant, and
daily use in the Royal Gardens, and in most of the principal
Gardens and Parks throughout the Kingdom.

A stock of 500 Mowers is kept at our London Establishment,
including all sizes, from which purchasers can make their selection
and have prompt delivery.

GREEN'S PATENT "ROYAL" LAWN
MOWER is a far superior Machine of its kind to any
Lawn Mower extant, and it will cut either short or long grass,
hives, &c., and wet as well as dry.

Prices of the "Royal" Machines. To cut—	6 inches	8 inches	10 inches	12 inches	14 inches	16 inches
	25s.	35s.	50s.	65s.	80s.	100s.

Delivered carriage free at all the principal Railway Stations
and Shipping Ports in England, Ireland, and Scotland. Every
Machine is warranted to give entire satisfaction, and if not
approved of, may be returned at once unconditionally, without
any expense to the purchaser.

Our reason for bringing out the "Royal" Mower is to meet a
want which has been repeatedly expressed by the purchasing
public, to have a good, useful, and efficient Machine, &c. &c.

N.B.—Those who have Lawn Mowers to repair will do well
to send them either to our Leeds or London Establishments,
where they will have prompt attention, as an efficient staff of
workmen is kept at both places.

GREEN'S PATENT ROLLERS for LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, and GRAVEL PATHS.

Suitable for Hand or Horse Power.

The above can be had from all respectable Ironmongers and
Seedsmen in the United Kingdom; or from the Manufacturers,
THOMAS GREEN & SON,

SMITHFIELD IRONWORKS, LEEDS; and
And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.

Carriage paid to all the principal Railway Stations in the
United Kingdom.

Descriptive Illustrated Price List Free on application.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—

These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground
in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the
Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers
is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either
collected in the box—the nearest plan—or delivered at the back of the Machine and left on the lawn, to prevent the
grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and
hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction,
and a month's trial allowed. Orders executed on receipt.

"The Gardeners' Chronicle"

FOR SALE, from 1858 to 1872 inclusive, £3 15s. not bound. C. W. M., 13, Nelson Street, Congleton.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—Edinburgh Counties Herald.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—Lloyd's.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—Bell's Messenger.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—Gardener's Magazine.

Price 3d., Post Free 3 1/2d.

PARTNERSHIP.—Owing to the decease of the Proprietor of an Old Established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who would be disposed to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Protheroe & Morris, 83, Gracechurch Street, E.C.

WANTED, as HEAD WORKING GARDENER, where two others are kept to assist. Must thoroughly understand the profession in every branch, be willing, active, industrious, sober, and honest. No other need apply. A moderate salary, comfortable board, and good lodgings. Wages, 2s. per week, with a two-roomed cottage and vegetables.—X. S. H., Mr. Earle, Baker, Acton, Middlesex, W.

WANTED, a GARDENER and WIFE (without children), the Man to act as Gardener and make himself generally useful; the Wife to take charge of the Infirmary and otherwise assist in the Establishment, if required. A moderate salary, comfortable board, and good lodgings, fuel, and light provided. Written applications to be sent, by the 15th inst., to R. WENTWORTH LITTLE, Secretary, R.M.I.G., 5, Freeman's Hall, Great Queen Street, W.C.

WANTED, near London, an energetic SINGLE-HANDED GARDENER, able to Manage Bedding-out Plants in small House over winter, and who understands the Culture of the Vine, and is a good workman.—Apply, by letter only, with full particulars, to "G.," Nash & Teuton, 4, Saville Place, Regent Street, London, W.

WANTED, a GARDENER (SINGLE-HANDED), to manage a compact little Garden, with help when required. Must understand management of Viney, Orchard-house, and general Cultivation of Greenhouse Plants. Apply by letter, containing full references, to Messrs. C. & P. R. M. C., Mr. Hine, 18, Store Street, Tottenham Court Road, W.C.

THE Directors of the Crystal Palace District Cemetery Company require a WORKING GARDENER who is competent to Lay-out, Plant, and attend to the Grounds, &c. Applications to be in the writing of the applicants, and must state age, qualifications, wages required, and contain references to two persons who can speak to his ability and industry. Residence in the lodge while in the service of the Company. Letters to be sent (post-paid) not later than June 17, addressed to Mr. J. TAYLOR, 1074, Fenchurch Street, London, E.

WANTED, an UNDER GARDENER, by a gentleman living near London. Must be about 22 years of age, and have a thorough knowledge of Flowers, Fruit, and Vegetables. Wages 21s. per week. Also a LAD about 16, used to a Garden.—Apply by letter, with full particulars, or personally between the hours of 11 and 2, at 226, Holmditch, London, N.E.

WANTED, a MAN and WIFE, without incumbrance, the former as Under Gardener, the latter as Landlady. Both must understand their business. Wages commencing at 47s. increasing to 65s. per week, including, and washing. Apply to the PROPRIETOR, T. ASHBY, Asylum, Prestwick, Manchester.

WANTED, a PRACTICAL WORKING FOREMAN for a small Nursery, to Grow Plants and Cut Flowers for the Market. Must be of strictly temperance principles.—Address, with full particulars, X. Y. Z., Post Office, Manchester.

WANTED, TWO young MEN—one to assist the Foreman in the House, &c.; the other to Bud, Graft, Train, &c., outdoors. Must have had considerable experience, and produce good character. Wages about 16s. per week.—EDWIN HILLIER, Nurseryman, &c., Winchester.

WANTED IMMEDIATELY, a good GRAPE THINNER; wages 20s. per week. Also a LAD and a BOY, both under 16, to assist in the garden. Man without incumbrance could have house accommodation in consideration of part services of wife.—D. WAKEFIELD, on the Premises, Aldbrough Hatch, Hford, Essex, E.

WANTED, a TRAVELLER, to represent an extensive and well-known Provincial House in the Nursery and Seed Trade. A thorough practical knowledge of both departments indispensable, and one who has held a similar appointment preferred. No need apply who cannot give satisfactory references as to character and ability.—Apply by letter to D.C., Gardeners' Chronicle Office, W.C.

Warehouseman. WANTED, as SECOND WAREHOUSEMAN, an active, industrious Man, who is thoroughly master of the work in a Seed Warehouse—to Superintend Pikes, and Single Stocks.—Wages, 30s. per week.—Messrs. HENRY CLARKE AND SONS, 39, King Street, Covent Garden, London, W.C.

Working Farm Bailiff. WANTED, a MAN and his WIFE, with children grown up or else without any children, to take charge of a Farm in the neighborhood of Preston upon his behalf of a Cowman. The Man will have to Buy Lean and Sell Fat Cattle, and be able to judge their weight; to work on the land, and look well upon crops. Will be required to carry and Foultry.—Address, stating wages and reference, to W. H. Messrs. James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, S.W.

WANTED, a Man to do PAINTING and GLAZING. Must fill up spare time in the Garden. Wages 15s. per week, with board and 2s. without. Apply to MARTIN, The Gardens, Lillingstone Castle, Dartford, Kent.

WANT PLACES.

To Gardeners in Want of Situations, WHOSE CHARACTERS WILL BEAR STRICT INVESTIGATION. Anticlysi, Anticlysi, Dendrobium, Dendrobium, also a number of other Orchids.

On view the morning of Sale, and Catalogues had.

Most Important Sale.—Liverpool.

MESSRS. BRANCH AND LEETE will sell by AUCTION, on WEDNESDAY, June 24, and two following days, at 11 o'clock each day, in the South Shed of the Wadsworth Ironworks and Foundry, Spickelard Street, Edgchill, Liverpool, the very valuable and most extensive STOCK of IRON MANUFACTURES of Mr. Isaac Dixon, of Hatton Garden, Liverpool, who, being about to remove his business to the extensive premises lately occupied by Hamilton's Wadsworth Ironworks, Limited, and also having decided to relinquish some branches of his trade, has had the stock removed to the above premises for greater facilities of inspection and sale. The stock comprises about 50 Galvanized Corrugated Curved Iron Roofs, which are admirably adapted for hay and corn sheds, and all agricultural, manufacturing, and general purposes, and are suitable for use in all climates; for the purpose, the spans will be from 15 to 30 feet, and lengths from 30 to 100 feet; 15,000 Galvanized Corrugated Straight Iron Roofing Sheets, 3000 Galvanized Corrugated Plates, 100,000 Galvanized Flat and Black Flat Iron Sheets, Ridge Capping, Eaves Guttering, Rain-water Down Pipes, 20 Heavy Cast-iron Columns, about 120 Short Zinc-coated Zinc, about 50 Wrought-iron Tanks, to hold from 20 to 400 gallons; 20 Galvanized Corn Bins, 300 Gall Pails, Cast Iron Traps, Garden Ejectors, Gateways, Lawns, Mowers, &c.; about 100 dozen Galvanized Buckets or Bails, Galvanized Chimney Tops and Smoke Curves, about 20,000 linear yards of Galvanized Wire Netting, 1000 Wire Pillars, Continents, &c.; Continents, Fencing, Galvanized Fencing Rope of Strand, Field, Entrance and Garden Gates; Hurdles, Tree Guards, Rick Stands; Wire Mesh, Garden Sieves, Hay Rakes, &c. The stock also includes about 40,000 superficial feet of Roofing Slate, about 50 tons Bar Iron, about a tons Compound Metallic Paint, casks of best Jet Varnish, Galvanized Iron Hollow Ware of all descriptions, and some Tools and Machinery.

The Lots will be arranged to meet the requirements of Landed Proprietors, Agriculturists, Manufacturers, &c.

The place of Sale is within a very short distance of Edgchill Station of the London and Liverpool Railway, and in connection with the entire railway system of the kingdom. In the interior part to sale Mr. Dixon will be happy to give every possible information, and any particulars of Catalogue, &c., may be had at the office of the Auctioneers, Mr. Branch and Mr. Leete, at the above address, or by sending them to erect on the most favourable terms.

The goods will be on view on Monday the 28th, and Tuesday the 29th inst., and on Wednesday the 30th inst., from 10 o'clock till 4 o'clock, on personal application to Messrs. BRANCH AND LEETE, Hanover Street, Liverpool.

Highly Important Sale of Orchids, collected by M. ROEHL in Mexico.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, June 22, a consignment of ORCHIDS collected by M. Roehl in Mexico, nearly all adapted for growing in cool houses, and including the beautiful Laelia majalis, Oncidium tigrinum, Otagothesium Rossi majus, O. citrosimum roseum, Oncidium Barkeri, Laelia autumnalis, many of the sorts in large masses and in very excellent condition.

On view the morning of Sale, and Catalogues had.

Worcestershire, in the far-famed Vale of Evesham. PRELIMINARY ADVERTISEMENT.

MESSRS. CHESHIRE AND GIBSON have received instructions to sell by AUCTION, on THURSDAY, July 15 next, at the "Hen and Chickens Hotel," in New Street, Birmingham, at 6 o'clock in the evening for half-past, in consequence of the death of the Proprietor, unless in the meantime an acceptable offer be made by Private Contract, a very excellent FREEHOLD ESTATE of 240 Acres, known as "Scaford Grange," situated at Poppleton, within 1½ mile of the Pershore Station on the Great Western Railway.

A considerable portion of the above has been laid out as Fruit Gardens, and the best of the choicest kinds, now in full bearing, the produce finding a ready sale at Liverpool, Manchester and Birmingham, where a very lucrative business was carried on by the late Proprietor.

In addition to a complete set of FARM BUILDINGS, with COTTAGES, there is a very comfortable and desirable RESIDENCE, together with other buildings, and the portion of the Estate not laid out as Fruit Gardens is occupied as a FARM, and comprises Arable and Pasture of excellent quality. A Balance Sheet, showing the profits for the last five years, has been prepared, and may be obtained at the undersigned Referees.

Further particulars and plans will be issued in due course, in the meantime further information may be obtained of H. G. GOLDINGHAM, Solicitor, or A. BUCK, Estate Agent, both of Worcester; or to the Auctioneers, Messrs. CHESHIRE AND GIBSON, 93, New Street, Birmingham.

Respectfully invites the Nobility and Gentry to an inspection of the above; also of his **MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS**, Adapted for the decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

Carter's THE FINEST COLEUS EVER INTRODUCED.
 NEW COLEUS;
 "DUCHESS OF EDINBURGH."

AWARDED FIRST-CLASS CERTIFICATES.—
 Royal Horticultural Society, June 17, 1874; Royal Botanic Society, June 20, 1874.
 The foliage of this distinct and beautiful variety has margins of purple and creamy yellow, with a centre of bright crimson-magenta, forming a superb contrast to the green-leaved section of Coleus, by reason of its dazzling brilliancy of colour.
 Professor Trevisan, in the *American Agriculturist*, says:—"It is the most beautiful foliage plant which has ever been exhibited."
 Price 3s. 6d. each. Extra Strong Plants 5s. each. Post Free 6d. extra.
 See Illustration in "Gardens' Chronicle," May 22, and also Carter's Illustrated Plant Catalogue with beautifully coloured Engravings of Architecture. Price 6d., Post Free, Gratis to Customers.

CARTERS (The Queen's Seedsmen), 237 and 238, HIGH HOLBORN, LONDON, W.C.

JOHN J. SCOTT, The Seed Stores, Yeovil.
N.B. Beware of spurious imitations.

SCOTCH SILVER SAND AND FIBROUS PEAT.

Silver Sand and Fibrous Peat, of the finest quality, same as supplied to the Royal Botanic Gardens, Edinburgh; Messrs. the Lawson Seed & Nursery Co., Limited; Downie, Laird & Laing; J. & R. Thyne, Austin & McAulan, and all the principal Nurseries in Scotland.

The Sand is one of the finest samples of the purest Silica, without any admixture of earthy matters, whatever, and is allowed to be superior to the best English. It is invaluable for Propagating or General Purposes. The Peat is from a thin layer lying on the Silver Rock, and has a considerable proportion of clear Silver Sand in its natural texture. Admirably adapted for Heaths, Azaleas, &c., and the choicer portions for Orchids.

In Sacks, for Amateurs, &c., at 1s. 6d. each, sack included. Price per ton on application.

The Extensive Ranges of Metallic Hothouses in the Royal Gardens, Windsor and Osborne, were executed at this Establishment.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone.

This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNRESOLVED TESTIMONIAL.

"Glangwilly, Llanpumpant, Carmarthen, Nov. 27, 1873.

"Mr. Lloyd Lloyd encloses cheque for £3 5s., amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful things he ever possessed."

Apply to **HILL AND SMITH**, Brichy Hill Ironworks, near Dudley; or 115, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of HILL & SMITH that unprincipled imitations of their Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

THE CELEBRATED GRANITIC PAINT.

Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company.

For Price Lists, Testimonials, and Patterns of Colours, apply to **THOMAS CHILD**, Manager, 39A, King William Street, London, E.C.

SUTTONS' CHOICE STRAINS OF FLORISTS' FLOWERS

(POST FREE).

The Finest Strain of Calceolaria.

SUTTONS' SUPERB CALCEOLARIA.

This splendid strain has been most carefully selected from the very finest collections in cultivation. The plants are compact in habit, with beautiful green foliage and a profusion of bloom. The flowers are large, perfect in form and substance, and of every shade of brilliant colour.—Price 2s. 6d. per packet, post free.

From A. E. RUSSELL, Esq., *Dalmeack, N.B., July 10.*

"My Calceolaria plants from your seed of last year are particularly fine, of very compact habit, and very fine in colour."

From Mr. A. ALLERTON, *Coleman's Prittlewell, May 8, 1875.*

"Our Cinerarias this year, from your seed, are splendid; far surpass any I saw at the Botanic Gardens yesterday."

The Finest Strain of Cyclamen.

SUTTONS' PRIZE CYCLAMEN.

The following varieties have been carefully selected from one of the finest strains in cultivation, and, as they remain in bloom from November till March, are invaluable for decorating the conservatory or drawing room during the winter months. The flowers also are extremely valuable for bouquets, as they retain their freshness for a considerable period when kept in water.

ALBUM, pure white. PURPUREUM, purple.
MARGINATUM, rose, edged | and red.
ROSEUM, rose and carmine. RUBRUM, bright crimson.

From W. H. MELLERSH, Esq., *Everham Lodge, Cheltenham, Feb 10.*

"The Cyclamens I had from you last autumn have given me great satisfaction."

The Finest Strain of Primula.

SUTTONS' SUPERB PRIMULA.

A splendid strain, which has been carefully selected from the largest fringed flowers of good colour. Habit robust, with bloom throng well above the foliage. Red, white, or mixed, 2s. 6d. per packet, post free.

SUTTONS' SUPERB CINERARIA.

This will be found unequalled by any in cultivation, the seed having been saved from the finest named varieties only. Price 1s. 6d. and 2s. 6d. per packet.

From WALTER EDWARDS, Esq., *Wellington, Somerset, Jan. 21, 1875.*

"A more beautiful strain of Primulas than I have had this winter, from the seed you supplied me with last spring, I never saw."

SATURDAY, JUNE 19, 1875.

THE WOOD SORREL.

AMONG the wealth of wild flowers which spring, however long delayed, is sure, sooner or later, to bring in her train, it is difficult to select a special favourite. It always seems to us as though spring flowers were fairer than those of the later seasons. They are not so brilliant as those of the summer months, or as rich in hue as those which autumn brings, but there is a freshness and delicacy of colour in them which we do not find in the more mature beauties of a later period, and this is enhanced by the tender green of the new clothed trees and shrubs. Anemones, Primroses, Cowslips, and Violets, the wild and the barren Strawberry, are all charming and typical; but none have more claim to admiration and consideration than the Wood Sorrel (*Oxalis Acetosella*), to which we will for a short space direct attention.

The Wood Sorrel may be taken as the British representative of the genus to which it belongs—a genus which comprises more than a hundred species, mainly natives of the Cape, and in many instances of very great beauty. Two other species are represented in Britain, one being the cosmopolitan *O. corniculata*, which is perhaps native in the South of England; and the other the American *O. stricta*, which is by some regarded as only a form of *O. corniculata*, and which is not an uncommon garden weed about London and in other places; but these can scarcely be considered as sufficiently general to be known to every one. Our Wood Sorrel, however, is common and widely distributed enough to be within reach of all, and, with its delicate pink or lilac-veined flowers and emerald leaves is, as we have already said, one of the glories of returning spring.

One or two of the foreign species deserve a passing notice before we settle down to the consideration of our English Wood Sorrel. Among them are certain South American species, which are of some value from an economical point of view. The *Oca*, as *O. tuberosa* is called in Bolivia, produces edible Potato-like tubers, and is cultivated on this account; and the fleshy roots of *O. Deppel*, a Mexican species, the leaves of which are formed of four leaflets instead of three, and remind us of Marsilea, are also eaten. *O. crenata* was even introduced into England as a proposed substitute for the Potato; but the tubers are too small to be of any considerable importance: it is a Peruvian species, and is cultivated about Lima for its leafstalks, which are very acid. It is known as *Arracacha*. An Abyssinian variety of *O. caprina* is employed in medicine by the Abyssinians on account of its anthelmintic properties. Most of the Cape species are also bulbous-rooted, and some produce bulbs in the axils of the lower leaves. Of these *O. cernua* is an example, a species with yellow flowers, which are produced in umbels on long succulent peduncles. This plant has become completely naturalised in the island of Malta, where it was first noticed in 1811. Mr. Duthie says it "has now become almost ubiquitous, and a pest to the farmer. Few spots appear uncongenial to its growth, for it may be found alike in the rich soil of the valley and by the sides of dusty roads, and on wall-tops." It is called in Malta "Haxixa ta' l'Englisi" (the English plant), although why it should be so designated is not apparent.

Our English Wood Sorrel is by no means

deficient in points of special interest. The writer of this notice in his very early botanical days grew a tuft of it in a pot, and was thus enabled to notice many of the phenomena which it presents—such, for instance, as the dimorphism of the flowers, and the ripening of the seeds produced by the inconspicuous summer blossoms of the plant. The abrupt discharge of these may fitly be termed startling even when one is prepared for it; and we confess to having been considerably surprised when it first came under our notice. This mode of dispersion is very remarkable in that handsome copper-coloured variety of *O. corniculata* which gardeners call *O. corniculata rubra*. If one sits down by the side of a border of this plant, such as is grown in "ribbon" borders, the miniature cannonading which is carried on by the opening seed-vessels is very amusing. The sensitiveness of the leaves of the Wood Sorrel was manifested very plainly in this cultivated specimen; if they were struck or roughly handled they would droop and fold up—slowly indeed, but perceptibly; and at night they closed with great regularity. Linnaeus observed that the flowers closed before rain.

The Wood Sorrel is not one of the plants which rests its claims to popularity on its beauty alone; it is also useful, as it yields the "salt of Lemons" sold in our chemists' shops, and employed for the removal of iron-mould or ink stains. Mr. Hardy, in an interesting paper on this plant published in the *Border Magazine* for 1863, says of this production, which is more correctly designated superoxalate of potash, "This salt is seldom sold genuine; it is either mixed with cream of tartar, or cream of tartar and vitriolic acid are substituted for it. It, or the juice of the plant in its place, is employed to take iron-mould and ink stains out of linen. The salt is thus prepared on the Continent.—The juice is allowed to subside, after being slightly heated, and then clarified, by adding to it water, in which some fine clay is suspended. This clarified juice is next boiled, till a pellicle forms on its surface, and is then placed aside for a month to crystallise, the operation being repeated until the whole of the salt is obtained, when it is purified by a second crystallisation. It is an object of commerce for several cantons in the mountains of Germany and Switzerland. A hundred pounds of fresh leaves, in a good year, and well treated, can furnish five or six pounds of marketable salt; but the produce is very variable. Oxalic acid, in a concrete form, is sometimes kept to clean boot-tops, and has been frequently mistaken for Epsom salts, and acts as a virulent poison." The Wood Sorrel was formerly cultivated in English gardens as a salad herb, and was also used as a sauce, in which latter capacity it is still employed on the Continent. Lightfoot speaks of its use in fevers in the Isle of Arran, a tea being made from its leaves and administered in such cases; and, diluted with milk, it is employed in Russia in similar cases.

A variety of the Wood Sorrel having dark reddish flowers is occasionally, though not very frequently, met with, and when it occurs seems to be permanent. Varieties in which the whole blossom is suffused with pale pink are more frequent; and a blue variety is mentioned by some authors. The ordinary form is a plant of wide distribution, extending throughout Europe to the arctic regions, and found in Northern Africa, Siberia, the Himalayas, and North America.

The question as to whether the *Oxalis* is or is not the true Shamrock of Ireland has often been mooted, but would require too much space to be brought forward on the present occasion. It may, however, be observed *en passant* that it is certainly not the plant now employed in the Irish commemoration of St. Patrick's Day.

The names of the Wood Sorrel are both

Paul's and Rosa's.

WM. PAUL begs to announce that the COLLECTION OF ROSES at WALTHAM CROSS NURSERIES is now in bloom. Everybody interested in Roses is invited to inspect the display. The Hardy Ornamental and Fricorial Trees, Fruit Trees, Geraniums, and Camellias are also in fine condition.

Entrance to the Nurseries from the platform "Waltham" Station, Great Eastern Railway. Frequent trains daily from Bishopsgate Station, and occasionally from St. Pancras.

Blue Gum Seed.

T. AND B. GULLIVER, AUSTRALIAN SEED COLLECTORS, &c., beg to draw the attention of European Seedsmen, and Nurserymen to their extensive Collections of NATIVE SEEDS and PLANTS—Australian and Tasmania Seeds—collected fresh every season, and forwarded, per Mail Steamer, at most reasonable prices. Carlton, Tasmania.

The following Prizes are offered for

M. R. LAXTON'S PEAS, sent out by Messrs. HURST & SON, viz.:—At the Royal Horticultural Society's Rose, &c. Show, on July 7, 1875, for any Six Varieties, including Two of each of those sent out by us in 1874, 75, and 76, fifty pods of each, 1st prize, £4; 2d prize, £3; 3d prize, £2; 4th prize, £1. The following are the varieties: 1874—Unique, Dr. Hogg, Supplanter, and Connoisseur. 1875—Laxton's No. 1 and Filibasket. 1876—William the First, Superlative, Popular, and Omega.

For the following varieties, twelve plants of each, to be exhibited in the green state, with pods fit to gather, and root and haulm complete, so as to show the true character of each variety, viz.:

Unique	1st prize. 2d do.	1st prize. 2d do.
William the First	1st prize. 2d do.	Laxton's No. 1
Filibasket	1st prize. 2d do.	Dr. Hogg
Omega	1st prize. 2d do.	Supplanter

The Society and Hurst & Son to be allowed to retain such of these as may be required.

At the Midland Counties Grand Horticultural Exhibition at Birmingham, on July 1, 2, 3, and 5, 1875, for any four of the following varieties, viz.: Laxton's No. 1, Filibasket, Superlative, William the First, Omega, and Popular, fifty pods of each—1st prize, £3; 2d prize, £2; 3d prize, £1.

For fifty pods each of the following varieties of 1874, 75, viz.:—1st prize, 2d do. Unique, 1st prize. 2d do. Dr. Hogg, 1st prize. 2d do. Supplanter, 1st prize. 2d do. Laxton's No. 1, 1st prize. 2d do. Connoisseur, 1st prize. 2d do.

HURST AND SON, 6, Leadenhall Street, London.

New Double Zonal Pelargoniums for 1875. First-class Certificate Royal Horticultural Society.

Emily Laxton.

MESSRS. W. AND J. BROWN have again been entrusted by Mr. Laxton with the distribution of the following set of New Double ZONAL PELLERONIUMS raised by him, viz.:

EMILY LAXTON.—First-class Certificate, Royal Horticultural Society. The largest flowered and most remarkable Scarlet Pelargonium, either double or single, hitherto sent out. Individual flowers upwards of 2 inches in diameter; full, but not crowded; truss enormous. Free flowering and suitable for winter work. Figured in the *Floral Magazine* for October last. Strong plants, 12s. each.

GUIDING STAR.—The most beautiful and dwarf Double Pelargonium yet raised. Foliage pale green and partaking somewhat of the character and habit of the Show Pelargonium. Flower very pretty purplish pink and double, quite unique and distinct. Strong plants, 9s. 6d. each.

ILLUMINATOR.—A striking and distinct purplish carmine-colored variety of the Emily Laxton type, but darker in color, semi-double, but full; petals large and stout. Unique and distinct. Strong plants, 9s. 6d. each.

Prizes will be offered for the above in 1876. Coloured Plates of Emily Laxton post free for 1s. 6d. Electros of single bloom 2s. 6d. each.

New Strawberries.

Messrs. W. & J. BROWN are also now sending out Mr. Laxton's fine firm-fleshed New Strawberries—TRAVELLER and EXQUISITE—the flavor of both these is distinct and unequalled. Traveller has received a First-class Certificate from the Royal Horticultural Society, and is undoubtedly the most suitable Strawberry for autumn sowing yet raised. Strong plants of last season—Traveller, £1 per 25, £3 per 100. Exquisite, 12s. 6d. per 25, £2 per 100. Early struck runners of each, in 6-sized pots, 1s. per 25 extra. Prizes for fruits of these will be offered in 1876. Trade terms on application to

W. AND J. BROWN, Nurserymen and Florists, Stamford.

FOR SALE, four fine Conservatory AURACARIA, in tubs and pots—EXCELSA, 8 feet high and 6 feet through; COOKII, 10 feet high and 6 feet through; BIDLWILLII, 9 feet high and 6 feet through; CUNNINGHAMII, 10 feet high and 6 feet through. A moderate price will be taken for the lot. Purchaser to bear expense of packing and carriage and risk of transit. Apply by letter to R. G. G., Craig Wood, Rawdon, near Leeds.

pretty and varied. Such, for example, is "Alleuia," by which the plant is still known in Spain and Italy, and which refers to the blossoming of the plant at a time when, as Gerarde has it, "Alleuia was wont to be sung in churches;" i.e., between Easter and Whitsuntide. It was called Stubwort, from growing about the stubs or stumps of old trees; the shape of the leaflets has gained for it the name of "hearts" on the Scottish border; in Cornwall it is called hare's meat, and in South Devon rabbit's meat. But its chief association is with the cuckoo, and that not only in England, but in other countries; this, indeed, is the case with many other spring flowers—indeed an interesting chapter might be written upon cuckoo-flowers alone. Gerarde quotes its old herbal name, "Panis cuculi, or cuckowes meate," and says it is so-called "because either the cuckow feedeth thereon, or by reason when it springeth forth and flowereth the cuckow singeth most;" he adds that it is called "in low Dutch coeckcoek broot, in French pain de cocu." Mr. Hardy follows the name through various languages. "In French it is pain du cocu, pain de cocon; in Italian, pan cuculi; in old German, gouches-ampfer; in modern German, kukucksbrot; other German names are gackhlee, guckgackhlee, kukugsklee (cuckoo Clover), gachbrot, guckgachbrot, guchenlauch, and gachlin; in Swiss, guggersauer; in Flemish, coeckouckbrodt; in Danish gjoebrodt, giogemad, giogesyre; in Swedish, gokmat. It is the Anglo-Saxon gaces-sure and the Welsh suran-y-gog; the cuckowes meat of Turner's *Names of Herbs* [and of his yet earlier *Libellus*]. It is the English cuckoo Sorrel, cuckoo bread, cuckoo spice, the Scottish gowk's meat, the border cuckoo's meat, cuckoo Clover, cuckoo's sourcloes [i.e., Sorrel], and the cuckoo Sorrel of the North of Ireland." To which already long list of cuckoo names we may add cuckoo meat, by which it is known in many districts; and cuckoo's bread-and-cheese, and cuckoo's "vittles," by which last title it is known in South Buckinghamshire. This general connection between the bird and this and other plants leads to interesting speculations, which, however, must be postponed for the present. Another pretty name for it is the Welsh "Fairy-bells."

It would seem that the Wood Sorrel had formerly some religious significance, possibly from its trifoliate leaf. It frequently appears in the foreground of early Italian pictures, and is thus employed by Fra Angelico in his painting of the Crucifixion. *B. M.*

New Garden Plants.

ONCIDIUM HEBRAICUM, *Rehb. f. n. sp.†*

A botanical curiosity, with very nearly wrinkled bulbs, whence the name is given, since the wrinkles may be compared to Hebrew letters. The flowers are in a long, slender, short-branched panicle. They are yellow, middle-sized, with scattered, beautifully dark maroon-brown blotches. The lip has a small blotch on each auricle, and a similarly coloured field around and before the calli, with a rhomboid yellow field. The column is exceedingly peculiar, very slender, with a long beaked rostellum, and under the tabula infrastigmatica it is stalked. The plant came from New Granada, where it was gathered by Mr. Corwinne. I have to thank Messrs. Veitch for it. *H. G. Rehb. f.*

ONCIDIUM TECTUM, *Rehb. f. n. sp.†*

This is one of that endless herd of so-called "plurituberculata," distinguished at once by the very broad

* *Oncidium (Pentabotela macroptala) hebraicum*, *Rehb. f. n. sp.*—Pseudobulb oblongis compressis superne mirifice sulcatis et multijugis; foliis cuneato-ligulatis acutis; panicle longissima brachyleala; sepalis ligulatis obtusis; pappulo elongata, laciniis auriculis angustis, emarginatis bilobis cum apice; lobis in basi angulis, quinque parallelis, geminis tenuissimis; columna gracillima curva, rostellulo crurali-brachylo, fovea profunda a lateribus exserta, tabula utrinque tapida, medio utrinque emarginata, albis acutis minutissimis. Ex Nova Granada.

† *Oncidium tectum*, *Rehb. f. n. sp.*—Artif. "Basilata" natural, "plurituberculata maizocifolia." Pseudobulbo compresso

base of its lip, so that it could likewise be placed at the end of "Basilata" near *O. pergamenum*, Lindl. Yet it appears to rank much better nearer the *O. maizocifolia*, Lindl. The pseudobulbs are pear-shaped, acuticorns, sulcate. The leaves rather narrow, linear, ligulate. Panicle perhaps very wide, with many zigzag branchlets. I am sorry to say I have only a small branchlet at hand, but succeeded in naming it by help of an older unnamed specimen. The flowers are yellow, spotted with rich maroon brown. The wings of column are acute on both sides, covering totally the anther: hence the name. I have to thank Messrs. Veitch for this species, discovered by Mr. Wallis in New Granada. My older specimen is also of Wallisian origin. *Tourjours Wallis! H. G. Rehb. f.*

BATEMANIA ARMILLATA, *Rehb. f. n. sp.**

For the last five or six years we have had in the Hamburg Botanic Gardens a little glaucous epiphyte, named *Colognye Gardneriana*, which, finally, giving but one bulb and not more each year, brought a new shoot and a little three-flowered raceme with green, white tipped flowers, at least one-third smaller than those of the old *Batemania Colleyi*, the smallest yet known in this genus. It has the genuine colour of it, and the leaves are folded inwards as in nearly all species. Though quite like *B. Colleyi* it has the panicle being so conspicuous in all the species except *B. Colleyi*—thus giving evidence, at least for me, that they all belong together.

There are still several *Batemanias* nearly unknown, which collectors have come in contact with. A giant species, perhaps *B. grandiflora*, was found by my late friend Endres in Costa Rica. It came to England for sale, but appears lost. There are no dry specimens. Who knows whether it may be found before the ground may be invaded by Coffee planters—the falls of Orchid growers. Another species, rather a nice thing, was discovered by Sir R. Schomburgk in British Guiana. A third one was discovered in Ecuador by Mr. Wallis. I have at least sketches of these two. *H. G. Rehb. f.*

EPIDENDRUM LEUCOCHILUM, *Klotzsch; see Lindl. Bot. Orch. Epid., No. 158.*

A rather tall plant, with beautiful coriaceous oval bilobely-acute leaves, which are quite ligulate in very young or very poor plants. The inflorescence rises from a green spathe, being a subcorymbose raceme; ovary nearly 5 inches long or so. Sepals and petals linear lanceolate acuminate, yellow or green; white lip trifid; side lobes cordate oblong, middle lobe linear acuminate. Calli of base upright, semi-ovate, with two projecting angles. Androclinium exsert (viz., cut out from the borders of column); column itself very large, and, according to our taste, much too stout for the slender sepals, petals, and lip. The result in the living plant resembles that of sliced Cucumbers, but I have found it horribly feline, such as I have never experienced before, in the withered flower I have just obtained. The four species which form our group—viz., *longiflorum*, *H. B. Kth.*; *lacustris*, Lindl.; *leucochilum*, Klotzsch; *spectatissimum*, *Rehb. f.*—are all very easily distinguished by the calli and the androclinium.

Dr. Lindley called this a "very fine plant." It is so for the botanist or for the amateur? I do not believe it is so for the amateur, but Mr. Bockett, of Stamford Hill, must know best, he having purchased the plant (at a high price, I hope) at a Lindenian sale, under the promising name of "Imperator" (viz., *Caillius*, *Rehb. f. et Wewz.*). We must refer to this enthusiastic amateur for his judgment, which may be more easily given than that of young Paris between the goddesses. *H. G. Rehb. f.*

ROOF CONSERVATORIES.

COUNTRY people, whose ground is not confined to the few square yards of earth on which their houses are built, would probably look with disfavour on any scheme that might be proposed to them for placing conservatories on the roofs of their residences; but with townspeople the case is very different. Many of the latter have spent their early days in the country,

pyrifloris diphylo sulcato; foliis lanceo-ligulatis acutis angustis; panicle ramosa; sepalis lanceo-linearis ligulatis obtusis angustis; labelli auriculis transversis triangulis laciniis acutis regularibus; isthmo bene angusto trianguli ad nitar exserto breviter; laciniis auriculis reniformi bilobis, autem angustis, callo basae velutino basi quadrilobellato, callis crenatis, angulis triangulis tere antepositis; columnae albis dolabriformibus utrinque acutis.

* *Batemanis armillata*, *Rehb. f.*—Pseudobulbo tetragono; folio cuneato-oblongo-ligulato acuto solitario apicali; racemo porrecto paucifloro (trifloro) lato; bracteis cucullatis ovaria pediculis linearibus aequantibus; sepalis ovum oblongo obtuso, sepalis lateribus ligulatis obtusissimis lateri interno unguicula, tegulis oblongis obtusis; labello cuneato assurgente, dem flexo trifido; laciniis lateribus parvis triangulis serratis, laciniis media ad isthmum elliptico apiculato, apice reflexo; carina minute denticulata inter lacinas, lateribus; columnae androclinio denticulato; anthera apiculata—Flores parvuli viridis. Columna et labellum albis. Stylus elegantissimus originis omnino dubie in Hammonie hortu botanico educata.

and the love for flowers and green leaves acquired there is never forgotten by them. This is exemplified by the dusty Southernwood in the proverbial spoutless teapot, which may be seen adorning the attic window-sills of many a lane and back street, and now that flat roofs are more common than they used to be, occasionally a few tolerably well-grown plants may be found on them; but few have thought of covering them with glass. For that bold and spirited idea we are indebted to Messrs. Barr & Sugden, who have erected on the roof of their newly-built establishment in King Street, Covent Garden, a conservatory 36 feet square, and in every respect worthy of the name (see fig. 162). It has a circular roof 18 feet in height, and besides the central portion, which is to be devoted to the growth of Palms and other tropical vegetation, there are two side wings, in which are to be grown bulbs and other plants that require less heat. The heating is effected by 4-inch pipes, connected by means of a flow and return pipe an inch or so in diameter, with a 41 feet saddle boiler placed at the basement of the building. The King Street elevation represents that of a handsome house in the modern Italian style, and inside it is fitted up with every appliance requisite for the carrying on of a large plant and seed trade; each floor is heated by a separate coil of pipes supplied with hot water through small pipes connecting with the boiler just named. Taylor's ventilating apparatus has been used in connection with the hot-water pipes employed in the conservatory, and by means of this air, either moist or dry as may best suit the requirements of the inmates of the house, can be supplied from the outside, thus affording a constant and efficient means of ventilation, ample facilities for which have also been secured along the apex of the roof. The glass used is Hartley's rough plate in straight squares of considerable width and length; the ribs of the curved part of the roof are of tubular iron, and the colour being of light stone tint relieved with blue, the whole has a light and elegant appearance.

In a conservatory of this description all kinds of plants may be grown, even in our dusty cities, almost as well as in one erected in the country; on its roof might be trained all kinds of climbers for shade, and even Vines might be used for the same purpose. In short, there is no end to the uses to which such a house may be put. It was erected by Messrs. Fletcher & Lowndes, Great George Street, Westminster, and is the first really good roof conservatory that has been built in London. Let us, however, hope that it may be the forerunner of many others of a similar character. *Joseph Newton.*

THE BEDDING PANSIES AT CHISWICK.

ALLUSION has from time to time been made to the collection of bedding Pansies which has been planted at Chiswick this season, with a view to the selection of the most meritorious. A considerable extent of ground was devoted to them, whole beds being appropriated to each sort in cases where sufficient stock was forthcoming. On the occasion of a recent visit to Chiswick we found them to be blooming in a very satisfactory way, and the following is a transcript of notes then made, the names being arranged alphabetically.

All the varieties described below, where not otherwise stated, received First-class Certificates, at a meeting of the Floral Committee held at Chiswick on June 9, for the special purpose of examining these plants. In several instances the certificates awarded under less favourable conditions last season, were confirmed this year. The following may therefore be regarded as a group of the best of the bedding Pansies, selected in the main rather for their compact habit, dwarfness, profuseness and continuity of bloom, and useful and effective colours, than for the size or shape of their individual flowers—selected, in fact, for the very points which give their value to Pansies as bedding plants.

Alpha (sent by Dicksons & Co.).—A very compact-growing, vigorous-habited, free-flowering variety; flowers large, bluish-purple, with a reddish flush, the eye yellow, with a blotted dark spot in front; good.

Bejout Yellow (Dean).—A free-growing, compact-habited sort; flowers large, bright golden-yellow, with pencilled eye; good.

Blue Bell (Dean).—A very showy variety, of compact, spreading, and free-blooming habit; flowers numerous, medium-sized, mauve-purple, with a small

yellow eye pencilled with dark lines. The individual flowers are inferior, but the effect of the mass good, and it is a continuous bloomer. Awarded a First-class Certificate last year, which was confirmed on the occasion above referred to.

Blue Perfection (Westland).—Of compact, free-blooming habit; flowers medium-sized, of a deep reddish mauve with yellow eye; a fine effective self-coloured variety. The variety sent in as Purple Perfection proved to be the same as this.

Dickson's Golden Gem (Dicksons & Co.).—A variety of dwarf spreading habit, and a free bloomer; flowers large, deep yellow with deeper eye, over which occur dark pencillings; good.

Dickson's Queen (Dicksons & Co.).—A variety of free compact habit, an abundant bloomer, but rather later than some others; flowers large, white with yellow eye and pencilled lines. The First-class Certificate awarded last year was confirmed.

Dickson's Snowflake (Dicksons & Co.).—A moderately vigorous sort, of free-flowering habit; flowers white with a yellow eye marked by a few faint lines. This was awarded a Second-class Certificate.

Dr. Stuart (Stuart).—Of dwarf compact habit; flowers mauve-purple, with small yellow eye, sur-

flowers dark reddish plum-purple with very small yellow eye; the flowers are well displayed. The First-class Certificate of last year was confirmed.

Novelty (Cocker & Son).—A showy variety, of free-growing habit, but getting rather tall; flowers reddish or puce purple, with yellow eye, showy; a pleasing variety amongst the self-coloured flowers.

Queen of Lilacs (Dicksons & Co.).—A variety of free bold habit, forming close vigorous tufts; flowers reddish lilac, paler at the edge, being freely produced; a soft neutral colour, considered to be novel and effective, and useful for grouping.

Sovereign (Dicksons & Co.).—Of close growing habit, dwarf, free, and prolific of blossoms; flowers moderate in size, bright golden-yellow, with a pencilled eye; very effective.

The Tovy (Dicksons & Co.).—A variety of free and vigorous growth, blossoming abundantly and continuously; flowers large, deep bluish-purple, with white eye, and a bilobed mulberry spot in front of it; good. The First-class Certificate already awarded was confirmed. Under the name of Monarch was grown a variety not distinguishable from this in the colour of its flowers.

Tyrian Prince (Dean).—A handsome variety,

THE RADISH: ITS CHARACTERISTICS AND CULTURE.

THE Radish, as is well known, consists of several sorts or kinds, varying between long, round, and Pear or Olive-shape. The colour of the root is even more variable, ranging from pink to rosy red, crimson, and black. According to the sorts grown, so, to the accustomed eye, do the leaves also vary in size and form. The Pear or Olive-shaped varieties generally have the leaves longer and more jagged than the other sorts. The long-rooted varieties have their leaves more upright and serrated, but intermediate in form between the former and the round-rooted kinds, more commonly known as Turnip Radishes. I am not aware whether there exists any such an affinity between the roots of a plant and its leaves, but it is certain that the latter has leaves more like the Turnip; they are more pendent, or lie flatter over the roots, and are perhaps also more brittle. The Pear or Olive-shaped is the true representative of the original garden Radish, or *Raphanus sativus*—the

FIG. 162.—MESSRS. BARR AND SUGDEN'S ROOF CONSERVATORY.

rounded by a narrow dark ring; a neat and pretty flower. A Second-class Certificate was awarded.

Lilacina (Dean).—A charming variety, of dwarf compact spreading habit, free-growing, and very distinct; flowers of moderate size, the upper petals of a reddish-lilac, the lower ones bluish-lilac, with small yellow eye; an exceedingly pretty and taking flower.

Lily-white Tom Thumb (Dean).—A clumsy name for a very useful variety, of free compact spreading habit; flowers white, with yellow eye and dark pencillings; a fairly good white, but the flowers occasionally blotch in hot weather. The First-class Certificate awarded last year was confirmed.

Lothair (Dean).—A novel variety, with a dwarf compact habit of growth; flowers large, deep purple, with small yellow eye, and broadish bronzy spot just below it on the lower petal; a distinct and rich-looking flower.

Magpie (Dean).—An old, but still useful variety, striking in appearance from the strongly contrasted colouring of its flowers; vigorous, and of a hardy constitution, but rather tall-growing, and an abundant bloomer; flowers blackish-mulberry, with a large wedge-shaped spot of white at the tip of each petal; the spotting sometimes runs out, when for a time it becomes self-coloured.

Mulberry (Dean).—A dwarf-growing variety of compact but spreading habit, and free-flowering;

awarded a First-class Certificate last year, but now ranked Second-class; of free compact stout-growing habit; flowers large, dark velvety mulberry purple, with small yellow eye.

White Swan (Dean).—A fine variety, of close tufted habit; flowers of moderate size, pure white with pencilled eye, of good substance, and very chaste looking; fine.

There were besides some rather striking flowers, which from their promise may be looked for again another season. Of these we may especially mention—The Shah, a dark plum purple, considered inferior to Cliveden Purple—the latter unfortunately not in the collection; Dickson's King, a free blooming purple, but not equal to Alpha; Princess of Teck, a large pale lilac; Waverley, a purple in the way of Alpha; and Ormiston, a dwarf compact puce rose. None of these latter were successful in gaining certificates. A very pretty variety, named Williams, which appeared to be an improved form of *Viola calcarata*, or perhaps the result of a cross with that species, seemed likely to continue blooming for a considerable period, but from its distinct character it scarcely fitted in with the sorts with which it was associated. The flowers were small, cornut-like, mauve colour.

After the late refreshing rains the plants will probably remain in good condition, and perhaps go on improving, for some time to come. *T. Moore*.

long, small garden Radish being but a variety of the latter, and named *Raphanus radicularis sativus minor*. The round or "Turnip Radish"—a term which always strikes one as having been unnecessarily applied—is, I believe, the original *Raphanus orbiculatus*. Our original garden Radish, *R. sativus*, is accredited as being originally a native of China.

In regard to the merits of these distinct forms, judged from an edible point of view, I must give the palm to the round or Turnip-like forms; and this because the roots are more solid, and, in consequence, less watery or indigestible. There can be no doubt, moreover, they are far more palatable and pleasant, being cooler to the taste when eaten. I am aware that our aristocracy, and those who can afford to secure the best of everything, give preference to the long-rooted forms. This I take to be owing to the fact that the round ones are more easily grown, and hence are supposed to be common. The long varieties, moreover, are sought after on all such occasions in an extremely small, young, and tender form, which greatly obviates the too immediate experience of their sharp or burning attributes. Round-rooted sorts when used equally young are, however, pungent in a less degree. As an edible root the Radish does not stand very high; though from its manifest heat it incites the stomach, and possibly aids the digestive organs if partaken of before or after substantial meals. They

are, however, very indigestible when used along with the ordinary staff of life, being, perhaps, more so than meat; indeed our oldest authorities, such as Galen, say they are fit only for a sauce to any meat, possessing nourishment in a very low degree only. Pliny in his writings, and, I believe, Dioscorides, accord to Radish-roots certain medicinal or curative virtues, as they state that a decoction formed by steeping the roots in water is good against an old cold.

Coming to more modern times, we possess what are accredited as improved forms, although I fail to see any great advance in them. Stocks that are kept true and select, however, require of necessity some distinctive name, hence approval should be given to such appellations as "Wood's Early Frame," "New French Olive," &c., which are selections that should be secured by all who grow the roots for home consumption. Lately an innovation, in the form of a long white-rooted kind—large and coarse in size, &c.—has been introduced from California. As to its origin, it is not improbable that it had been carried by some "celestial," who had migrated from China to those parts, and hence, that it is one of the later improvements brought to us in a roundabout way, from the native country of the kinds generally. I say generally, because it is necessary to qualify these facts, by the suggestion that it is more than a little probable that the same kind, known originally as *Raphanus pyramiformis radice nigra*, may have originated either in Spain, or from our own native weed, *R. sylvestris*.

The culture of Radishes is, in a general way, extremely simple, that is, in so far as committing the seeds to the ground and their subsequent germination is concerned. The greater difficulty consists in the practice required to keep up a constant supply "all the year round," to do which requires much stances where the necessary means do not exist, to do so in ease and possible constancy. As a rule the seeds may be sown with a good expectation of successive crops quite nine or ten months in the year. The best time for the outdoor crop, and the best crop of the season, is during May and June, when they grow freely and form their edible roots in the least time possible. Indeed herein exists the whole secret of Radish culture, which is to sow and so grow, or let all collateral inducements be such, that the edible part be formed of the necessary size in the least possible time. Good Radishes, amply large enough with regards size, should be furnished for table use, but little else beyond the cotelidons or seed leaves having formed upon them, as the formation of the more permanent leaves invariably superinduces toughness of texture and objectionable heat. To insure this, two important facts, too frequently overlooked, must be borne in mind. They are these: the seeds must always be sown on an open fully exposed aspect, so that they have all the light and air possible; and they must only be sown just so thickly as to insure to each single plant immunity from being crowded by others. The latter, as will be seen, is but a furtherance of the former idea of affording light, air, &c., by insuring ample room to all. It is difficult, at all times, to sow as thinly as is necessary for the benefit of the future crop, owing to the need of procuring from frames of limited extent as large a crop as possible. All progressive growers, however, must assuredly that the largest crop of useful stuff is got by thin sowing, and that owing to the quantity absolutely spoiled when the plants come up too thickly. Radishes delight in a free open soil, of a sandy nature, and such as has been greatly enriched a few months previously with good unctuous manure. They form large bottoms in stiff and cool soils, though they take much longer to grow, and are in such soils almost invariably much worm-eaten, which is no trifling objection.

For a succession there exist many contrivances, where, as we have said, no proper frames, &c., exist to grow them in. Early sowings may be made, commencing with the year, towards the end of January, upon a warm, sunny border, a moderate layer of new wheaten straw or Fir branches being placed over the seed-bed as soon as sown. These must be removed during very fine days, and be replaced during adverse or severe weather. In time a useful crop will grow thus. By the same means successive crops sown towards the middle of February, March 1, March 15, March 30, April 12, &c., may be had according to the demand; the latter sowings, fitting in happily with the return of spring, should need no artificial protection. Outdoor sowings as above, continued in succession in warm sunny sites, until about July 15, should subsequently and until about August 20 be made, if practicable, upon a moist cool site, and somewhat shaded from the fierce and drying rays of the sun towards that date, and rays of the sun. The border at the back of a north or west wall would suit them well at such a time if—and this is important—they are not sown too thickly.

About the end of the third week in September resort should again be had to the warmer site and

aspect, and a good large sowing made. Make yet other large successional sowings about October 12 and October 23, which, if properly looked after, &c., and provided with such winter protection as I have suggested above, should afford a supply to draw from until such as are sown early during the subsequent year are fit for use. Thus we band the year round.

It may scarcely be necessary to enter into facts on forcing Radishes along with Potatoes, &c., because as a rule they are only secondary crops, which are treated in such a way only as the prior crop, whatever it be, demands. One fact may be added, however—light and air, in all possible abundance, are of the utmost possible importance, along with thin sowing, in regard to this as with other methods, natural or artificial. The round and Olive-rooted varieties, of whatever colour, are far the best for winter work.

The Californian Radish—a monster, so to speak, wanted for sending to table whole—is used during winter for slicing, to use as an addition to mixed salads, by those who appreciate salads so coarsely made. For my part, and I have some experience of good salads, I would never countenance Radishes in admixture with a salad, when, by any manner of means, I could do without them. They utterly destroy the crispness and the wholesomeness of ordinary good Lettuce, Endive, Cress, Mustard, and such like admixtures. To grow the "Californian," it should sow only towards autumn, or following the month of July; by sowing earlier, not only does the crop, where it can be grown to an edible size, become hot and ill-flavoured, but the probabilities are that all the plants will run to flower. By sowing, on the contrary, between July and the end of August, a crop may be assured of tolerably good size, and with roots anything but hot or stringy; this according to the large size attained. These roots, so grown, will subsist in the ground, fresh and crisp, throughout the winter, and may therefore be dug, used, and appreciated by all who may not be in possession of any kindred edible root at that season of the year.

One fact of interest in conclusion. Acres of Radishes are grown in market gardens and bunched for market, and I believe it is a fact, needing no confirmation, that women "bunchers" are universally employed, owing to the fact that they do double, and even more "bunching" per diem, than the hardest of men. *William Earley, Valentine.*

A PLEA FOR MOSSES.—III.

It is not likely that mosses will be sought for by beginners now that flowers are in abundance. I shall, therefore, finish off on this subject for the present, with a few that are sure to come across one's notice even in summer. *Hypnum triquetrum* (triquetrous Feather-moss), a robust common moss, forms a most elastic sate, growing in dry thick masses, and although not in fruit is distinct, and not to be mistaken, from the stems being much thicker at the extremity. This is the moss one sees at fruiterers in little bundles dyed of a most unnatural green—it is of a yellowish green even in winter. Possibly growing among it is the well-known lichen, *Peltidea canina* (Dog's-tongue), rooting through the moss with long fibres: in winter the large pieces of grey leather-like substance curled up at the edges, which are then of bright gold colour, are very attractive—now it is dry and dull in appearance. On ashes where wood has been burnt, or where cinder-heaps for top-dressing are laid, is that interesting little moss, *Funaria hygrometrica* (hygrometric Cord-moss). In hot dry parching weather its setae are curled up in a most distinct manner; when damped, they stand erect. It is a terminal moss, and the fruit orange-red and capsuled like the mosses of the pale green patches, and catch the eye when found on such burnt-up ground. On bare damp earth in the shade *Marchantia polymorpha* (polymorphous Marchantia) is now in full fruit, completely different from the conica. Its surface is studded with stout stalked little green tables, powdered, and with an edge around. *Hypnum splendens* (Glittering Feather-moss), from its shining appearance, is a moss to attract in summer or winter; its setae are not so long as those of *H. lucidum*; its degree of siles is quite common, as is also *H. velutinum* (Velvet Feather-moss), a confusing moss, as it is so very like *rutabulum*: its being of smaller growth is not a distinctive distinction. *H. cupressiforme* (Cypress-leaved Feather-moss) is another *Hypnum* growing in similar situations, very common; and *H. denticulatum* (sharp Fern-like Feather-moss) which fruits in summer and is particularly silky, and of a beautiful light green. These last are all very common Feather-mosses, and a handful plucked up at random off a bank may include them all. Long study must it have taken to be able, as I have seen Mr. Sadler when I have handed him a tangled tuft, to draw out at once an inch of *H. splendens* in its young state, and another morsel full grown—"this is *H. sericeum*, that is *cupressiforme*;" I consider I have made good pro-

gress when I feel certain and free from doubt, and that some half-dozen very similar *Hypnums* are in my way not the same species. And here let me acknowledge my obligations to Mr. Sadler for his patient naming of the many mosses I have taken to him in my perplexity, and his obliging assistance, which therefore insures the trustworthiness of the names in these little notes.

Dicranum varium (Variable Fork-moss) and *D. heteromallum* (Silky-leaved Fork-moss) have their terminal fruit in autumn and winter. They are both much smaller mosses than *D. scoparium*, and very attractive from their close velvety appearance of dark (varium) and bright green (heteromallum). *Didymodon purpureum* (Purple Didymodon) is one of the most common small mosses, and its reddish fruit-stalks give quite a colour to the ground where it grows in large patches. It is one of the terminal mosses, and its fruit now. Although so plentiful, mosses cannot resist gathering it, when seen with the sunlight through its red setae on a turf-topped wall. Common on the wet moors is *Bryum palustre* (Marsh Thread-moss), distinct from the green tips of many of the stems; it seldom fruits, but summer is the time of year for its capsules. The green gemmae or buds give quite a character to this *Bryum*, which it retains even when dyed. *Hypnum loreum* (Rambling Mountain Feather-moss) grows in long hard branches on the ground in dry woods, mixed up with other *Hypnums*. *Trichostomum lanuginosum* (Woolly Fringe-moss) one would take for a Grimmia. I only found it in small patches among stones, but it grows by the acre on the Highland mountains, "forming an elastic grey carpet."

Here I will stop. Having since commencing this paper been myself to Belvoir, to see once again the beautiful spring gardens, and going weekly to the rock garden at the Botanic Garden here, to try and catch the endless collection of plants as they come into flower, I find my own thoughts turning from mosses, for the time, and there is no doubt winter is the most likely season to impress a beginner with a love of such flowerless plants. For summer, seaweeds are perhaps the most tempting cryptogamic tribe, and very fascinating is it to dabble in the cool rock pools, and exciting to catch the tide as it "stands" for a few minutes before it turns, and your chance of some choice species to be found growing on the stalks of the tangle is ever for another fortnight; or, possibly, a month, until next low tide. Allow me to recommend a taste of the algae—olive, red, and grass-green seaweeds—during the hot months, which will prepare for a glance in autumn at the most evanescent branch of cryptogamia—the fungi. Such a plan reads like a wretched smattering of all, ending in nothing; but any one plant that is gathered with one's own hands, watched and studied, never to be forgotten, although its name may be, is a fact completing in itself if no further prosecuted, or a firm stepping-stone to an endless galaxy of facts, if, as is most likely, "appetite will grow by what it fed on." And let not the earnest amateur shrink from being called a smatterer, but accept the title for its own certain fact at once, and for life. *F. J. Hope, Wardie Lodge, Edinburgh.*

GREENHOUSE PLANTS.—XXI.

THEIR CULTURE AND MANAGEMENT.

LASTANDRA MACRANTHA.—There are two varieties of this plant, *L. macrantha* and *L. macrantha floribunda*, quite distinct, and both equally well worth growing, but for totally different purposes. They do not possess the intense colour of *Pteroma elegans*, but the flowers are much larger and produced in greater quantities. They are undoubtedly the grandest of all Melastomaceae plants. *L. macrantha floribunda* was introduced after *L. macrantha*, and is best adapted for specimen pot culture, being naturally of a bushy habit of growth, blooming profusely in the autumn and winter, when flowering subjects are much in demand and not over-plentiful. It is a free-grower, and will flower in a very small state, even in 5 or 6-inch pots; its large, rich, violet-purple blossoms are not of very long duration, like most other Melastomads, some two or three days, but are succeeded by others, the plant producing them in clusters from the points and axils of the leaves of the young shoots, giving a succession for several weeks. Young plants in 5 or 6-inch pots are the best to commence with; select such as have been stopped at the second or third joint above the collar, and are branched out into several shoots; it is necessary to begin with those that have been so treated, for if they have been allowed to run up without stopping it is difficult to afterwards get the base furnished. They should be moved into pots 4 inches larger in February, so as to make the growing season as long as possible; they will succeed in either peat or loam, the latter being, perhaps, the best; mix a fair amount of sand with the soil, as this plant with its

ample foliage requires, when in active growth, a good quantity of water.

Early season by placing in a house where it can receive a little more warmth than the generality of greenhouse plants require—45° or 48° in the night will suit it well, and a little higher in the day. Through the spring give them plenty of light until the sun gets very powerful, after which, in the middle of the day, they will need a little shade; give a sufficiency of air during the early part of the day, but close the house with a fair amount of sun-heat, syringing the plants overhead at the same time; do not let them go short of water whilst in active growth, or it will have the effect of checking root-action, which would seriously interfere with the season's progress. Pinch out the points of the shoots so as to induce the formation of enough branches to furnish the plants well; it is one of the easiest managed subjects in this respect, but must not have this stopping neglected, otherwise it will entail cutting back of the strong upright shoots that are formed in the centre of the plant, the removal of which will be so much loss in size. By midsummer, if the progress has been satisfactory, the strongest plants will bear another shift into pots 3 inches larger, using the soil a little more lumpy, and containing as much of the decayed roots of the grass as can be obtained, potting quite hard where a good quantity of this fibre exists. In soil of this description, this plant will make rapid growth, forming a nice half-spike in the first year. After this summer syringing keep them a little closer for a fortnight, raising plenty of moisture in the atmosphere, and continuing to damp the plants overhead; keep the strongest shoots well tied out so as to balance their strength, allowing the weaker ones to assume an upright position, which will much increase their growth. About the beginning of August nip out the points of any that are taking the lead; but after this time do not stop any more, or it would interfere with their flowering. Through September withhold shade, give more air, and cease syringing overhead, to effect the ripening process in the growth, and formation of the buds; by the end of the year, or somewhat earlier, these will be apparent, when the plant should be placed in a temperature of 48° or 50° in the night, to induce them to open freely, when they can be removed to the conservatory, for the decoration of which this subject is most suitable. The temperature here should be similar to such as the plant has been previously in, otherwise its flowers are liable to drop before opening; after blooming remove to a house where they will be kept about 45° in the night, if lower the leaves are apt to drop, seriously affecting the plants.

About the end of February cut the plants back moderately, if the object is not to get them large, and place them where the temperature is a few degrees higher, which will cause them soon to break, after which they should be turned out of the pots and a small portion of the surface-soil removed, giving 3 inches larger pots, using soil similar to such as has been recommended. Tie the strongest branches well out, and treat generally as advised for the preceding season in respect to syringing, shade, and air, with attention to giving any shoots that are disposed to take the lead too much; but this year the plants will, in all probability, not show so much disposition to make unequal growth; they will not require a second pot this season, but must be subjected in the autumn to the slight ripening process, by withholding shade and a drier condition of the atmosphere. When the bloom-buds begin to swell considerably give them a similar treatment to that of the preceding autumn, to open their flowers. The time of blooming may, if desired, be somewhat delayed by keeping the plants in a little lower temperature, but this must not be carried too far, by so keeping them either too cool or too long, or the result will most likely be the total loss of the flowers, for this is essentially an autumn and winter-blooming subject, and unless by some accident which gives it a check as to its ripening process, it is not likely to be disposed to flower at any other season. After blooming the plants may be cut back and treated in every way similarly to the preceding year, giving them a further shift of 3 inches, and removing a little of the old soil, without disturbing the roots much. After they have bloomed the next autumn it will be best to destroy them, unless where required very large, as young plants are in every way to be preferred, and from their quick and easy growth succession stock can always be brought on to take their place.

The other variety, *L. macrantha*, which first set out very much disappointed those who grew it, from its straggling upright habit, which no amount of stopping and attentive cultivation appeared capable of counteracting, and for this reason, in most cases, it was discarded as worthless. It frequently happens that a plant which is admirably adapted for some particular purpose gets a bad character by reason of its inability to conform to a process of culture opposed to its natural habit. Thus it was with *L. macrantha*; its straggling habit, although rendering it unfit for growing into a compact bushy specimen, naturally suits it for the purpose of training up a pillar, wall, or rafter; grown in any of these situations in a structure, with a

few degrees more warmth in the winter than the ordinary hard-wooded house, it is one of the finest flowering objects in existence, blooming for weeks in such profusion that no one, except those who have seen it so employed, can form any idea of the gorgeous effect it produces, forming large clusters of from a dozen to a score of flowers at the points of the shoots, which be confined to a pot, but kept on opening in succession for weeks together; but to see it to perfection in such situations it should not be well-drained bed of good loam, to which has been added a liberal admixture of sand, with the addition of a good sprinkling of charcoal or bricks, broken the size of pigeons' eggs, to prevent the soil getting sour.

In thus using this plant, as in the case of many others, there is frequently the mistake committed of turning them out whilst in a small state; so treated the soil becomes sour before the plant has enough roots to lay sufficient hold on it. On this point it may be, and frequently is, urged that plants in a state of Nature commence their existence, even from the germination of the seed, in an unconfined space, without the soil becoming unsuited for their well-being; but in the open air the conditions of the soil, in common with the other things, are altogether changed; full exposure to the air and light prevents its becoming in such an admitting structure, and in Nature's planting it must be borne in mind that all do not grow that come in contact with the soil—such as happen to be placed under conditions of situation suitable to their requirements. Thus with plants that are intended to be turned out in borders, such as the one under consideration, I have always found, except in the case of extremely strong-growing subjects, that it was much the best way to grow them on for a time in pots until they had acquired considerable strength before turning out, with the precaution, at the time of planting, of always spreading the roots out so as to prevent the ill-effects of the spiral root-curve inseparable from pot culture. For the above reason it is better to grow this *Lasiandra* in a pot for the first season, treating it in every way as to soil, water, air, and shading, similar to what has been advised for *L. macrantha floribunda*; but in the selection of plants for this purpose it is better to have such as have not been at all stopped, but simply grown up with the soil. Do not stop them until they have attained the height you have in mind that you require for the position they are required for, after which it will be necessary to take out the points, so as to induce the formation of shoots to cover sufficiently their allotted space, when they will require nothing more than being kept tied loosely in, with sufficient use of the knife, after flowering, to keep them within bounds. In such situations this and other plants frequently get weakly, through the soil becoming impoverished, to prevent which every spring, before active growth commences, an inch or two of the surface-soil should be removed and new added, with an occasional application of manure-water during the growing season; so treated they will last many years.

Lasiandras are not plants particularly subject to insects. Red-spider will sometimes make its appearance if the syringe is not sufficiently used; in such case repeated washings with clean water will be the best remedy, the texture of the leaves being such as not to bear without danger or injuring them any application of the usual insecticides. Such either white or brown, will live on them; yet the brown species is usually small and puny, but in such state it is not so easily destroyed as when upon a plant that suits it better, and on which it is found in that peculiar fat condition indicative of being well fed. Where it exists upon this plant, the best way to proceed is, after flowering, to shorten it back, cutting away all the leaves and then washing thoroughly with Fowler's Insecticide—5 oz. to the gallon—repeating it two or three times in the course of the summer; the plant, after this cutting, being kept in a temperature of 50°, so as to induce it to break, for it often happens when any plant is headed back, if kept in a temperature too low to excite growth, that it either dies or breaks weakly—the roots, under such condition, generally suffering more than they otherwise would through the severance of the branches. If affected with white scale, it will require cutting back to the hard, mature wood, and dressing with Abyssinian Myrtle-oil, and the washing of the bark, repeating the dressing several times before the plants break into growth. *T. Baines.*

ROYAL HORTICULTURAL SOCIETY.

A CONFERENCE of horticulturists, convened by the Lindley Club, was held at the Claring Cross Hotel on Wednesday evening, to consider the position and prospects of this Society. Mr. A. F. Gordon presided. After a brief introductory address, the Chairman said he should call upon Mr. Shirley Hibberd, who had proposed this conference, to open it by submitting proposals for the better management of the Society.

Mr. Hibberd said: In order to save the time of the gentlemen present he would assume that they were all

familiar with the more prominent facts of the question before them. He would not now enter into any of the numerous complicated arrangements that have been made between the Society and its Commissioners, but he proposed to sketch out a practical scheme, the adoption of which would, he believed, render the Society respectable, powerful, wealthy, and useful—would, in fact, place it in the proud position in which the late Prince Consort wished and expected to see it when he devoted his great and good mind to its reorganisation and settlement at South Kensington in the year 1860. Revolutions were of necessity costly, and they were not always successful. If any section of the Fellows entertained desperate resolves, he would advise them to combine their energies to make the best of what they found them—that is to say, in connection with existing charters, covenants, and agreements—before attempting anything so wild as a divorce of the Society from Her Majesty's Commissioners. They were tied up in a scheme which had failed from the first, but they could not so far from their land to speculative builders; they had no available assets; they had, in fact, absolutely nothing they could carry into the open market; and they were bound by considerations of ordinary prudence to ask if they had not secured a more profitable and possible account. In his (Mr. Hibberd's) opinion they had not. Here was a great open space in the most wealthy and fashionable quarter of the metropolis, and not a space simply, but a beautiful garden, so badly managed by those whose sole business was to make facilities for the Society; it did not contribute to the Society's funds sufficient to completely cover the expenditure its maintenance entailed. The local element had of late made itself manifest in energetic action, but it would have done more to acquire a title to deal specially with the land, if it had not been in the Society's hands. Now, he had no quarrel with the resident Fellows. It was no fault of theirs that the terms of membership were so arranged that they obtained the use of a beautiful outdoor lounge for themselves and a healthy and airy playground for the young Fellows; for the £7000 per annum that this garden cost was very much in excess of the aggregate contributions of the local Fellows, and, in fact, it nearly equalled the entire income of the Society. As this garden constituted the main difficulty, it was the proper part provided for by the resident Fellows. The revenue account for the year ending January 1, 1874, showed that the keeping of the Kensington garden cost the Society £2707. The interest on debentures, which were issued solely to defray the cost of the garden, for this account, amounted to £1062. The establishment expenses amounted to £1809, of which we may fairly charge £1000 to the special account of Kensington. As a considerable number of plants are grown at Chiswick for the decoration of the conservatory and gardens at Kensington, a third or more of the total of £2907 incurred for Chiswick garden may be charged to the Kensington account—say, £700 more. Now, it will not be unreasonable to charge Kensington an additional £700 in part payment of the costs of exhibitions and other miscellaneous matters that it is bound to defray. The result of this view of the subject is that the South Kensington gardens cost the Society £7369 last year, and, as the admission fees and subscriptions actually paid (£174 6s., £781 15s., and £275) amounted to only £2800, there need be no more account of £4569, which the Society's financial difficulties. The total outgoings last year for the gardens at Kensington equalled the whole of the Society's income, and yet there was no rent paid and no provision whatever made for those departments which stand apart from Kensington, such as the establishment and the London Committee, and other matters pertaining to practical horticulture. The total outgoings in a year of injuriously small expenditure amounted to nearly £12,000, and the current account shows a debt of £4023. In the year 1870 there legally postponed, £2400, and if the present debt is carried on, and a debt of a similar amount again incurred, we shall close up the next year with a debt of £10,425. Minute particulars cannot now be taken into consideration. It is enough for present purposes to deal with round numbers, and to show the source of the Society's weakness cannot be matter for doubt. The local Fellows contribute to the general fund very much less than their fair share, the formation and keeping of the gardens at South Kensington constituting the principal part of the heavy and burdensome expenditure.

In making proposals for improving the position of the Society, I consider it of the very first importance to honour existing covenants, to perform all duties and labours prescribed by the charter, to make the best of the lease, the best of the Society's relations with the Commissioners, and to do all in my power to prevent any possible repudiation of debt, but I would receive gifts of money, and, indeed, organise a fund to which the friends of horticulture might contribute, for the purpose both of paying debts current and also for the redemption of debentures. It will be observed that in entering into any proposal for the future we must specify; in other words, we must make sure of expending money, while it will remain to be seen if the money expended will in a reasonable time return. We have fallen short of the great designs of the princely founder of the South Kensington scheme; let us endeavour to rise nearly as near to the height of his idea. To do this it is certain the London garden must be kept in the most perfect condition possible. I propose, therefore, to increase the expenditure thereon from £2707, incurred last year, to £3500. For the purpose of the

expenditures should be made at Chiswick, raising the expenditures

ture from £2007, the cost last year, to £3000. As a matter of course, establishment expenses would have to be provided for, and we might as well give a present figure of £1800 to £2500. Last year the special expenses in relation to horticulture were only £701, but we must allow in our estimate at least £2000. The cost of exhibitions last year was £2401; the least we can allow in future. The result, therefore, would be to double that amount with perfect safety to the Society and great advantage to horticulture. We have now to add, for interest on debentures, £2000, and rent, £500, which is rather more than the Society is actually required to pay. The total of these arrangements would be an annual expenditure of £17,000.

It will be observed, however, that such an expenditure judiciously administered would render the Society respectable and attractive. It would exercise an enormous influence on the Society's status as a corporation specially charged to entertain the London and Kent Societies and competitors. The question arises, How are we to recover the increased outlay? The answer is, by making a reasonable charge upon those for whose advantage more especially this increased outlay would be incurred. I have the idea of lowering the rates of subscription, but I have a firm conviction that, in one respect at least, the rates of subscription are too low to be safe, and ridiculously low as compared with what is ostensibly provided in exchange. A resident in the immediate vicinity of the garden may participate in all the entertainments provided by the Council, and enjoy the free use of the garden the whole year round, for the absurdly small payment of two guineas annually. I propose as a condition of Fellowship for those residing within a mile of the garden at such a rate as to pay in advance of a subscription of not less than £10 10s. annually. In the event of the removal of a Fellow into or from the one-mile radius his subscription should be raised or lowered accordingly. In all other respects I would reduce the rates of subscription, but they are for the fewer changes the attempt the better. Amongst many arguments that may be adduced in support of this proposal I shall be content to place before you only two. In the first place, then, those who reside in the immediate vicinity of the garden may, if they choose, obtain an amount of pleasure far exceeding and pleasure for a subscription of ten guineas each. In the second place, we have a precedent for such a course of procedure in the case of those London clubs that charge their town members double the rate paid by those who reside in the country.

The question is, What would be the result of such a change? We must of course assume that these gardens have become immensely attractive, for a yearly outlay of £17,000 is to be incurred in the administration of the Society's affairs. The raising of the subscription would tend to enhance the value of the attractions by restricting the enjoyment of them to a select company. I find in the list of Fellows last published the postal letter W, affixed to the addresses of 1049. Those in the S.W. district number nearly as many. It may be assumed that four per cent. of the members are subscribers per annum, and the result would be from this source alone considerably more than the sum-total of all the subscriptions now received. The carrying out of the plan I submit to you would result in raising the Society's income from subscriptions of Fellows about £20,000, which would be paid in the way of a grant for redemption of debenture debt. But we will set down the income from subscriptions at £10,000; that is to say, only £12,000 in excess of the total of last year. We should have in addition the usual fifteenth of life compositions, £300, and we might have an ample surplus to produce £2000; additions to the gardens, which produced last year £594, would probably produce £3000; and miscellaneous receipts, now amounting to £1384, would surely be no less; but we need only estimate them at £1200, and we have a return in full of the expenditure of £17,000, which appears to be the very least necessary.

I will, therefore, conclude by remarking that as the garden at Kensington should be made abundantly attractive to the residents in the district, a skating rink and an aquatic are things to be desired, provided only they can be carried out in a creditable manner and with advantage to the revenue. Gardeners might be admitted as Associates for a small subscription—say, of a guinea a year—which should entitle them to attend all the exhibitions and shows at all times, and to the gardens and exhibitions at South Kensington some time in the forenoon only. And there might be instituted in connection with the Associates a system of life assurance and annuities, the profits resulting from which would still further augment the Society's income. For the present, however, we must find the means to increase both the income and the expenditure; for while horticulture is staved the Fellows obtain literally nothing more than vexation for their money.

Dr. DENNY agreed in principle but not in detail with Mr. Hibberd's wishes, and suggested a separate family ticket for resident Fellows. He commented on the dead-lock occasioned by the four members of Council, who, after intimating publicly their intention of resigning, still continued in office.

Mr. WOOTTON wished it possible for the local Fellows and the horticulturists to work together.

Mr. S. H. GODSON suggested an appeal to the Fellows for the means to extinguish the debt.

Mr. HIBBERD concluded by submitting the following resolution which was carried and ordered to be forwarded to the Council:—"That in any scheme which may be promoted with a view to the restoration of the Royal Horticultural Society to its original high position the annual subscriptions of Fellows residing within one mile of the gardens at South Kensington should be fixed

at a minimum rate of ten guineas, and that the Fellows tickets should be used only by resident members of the families of Fellows."

The meeting concluded with the usual vote of thanks to the Chairman.

—Allow me before relapsing into silence to say a few words on the proposition submitted by the Council to Her Majesty's Commissioners, and then to reply to them. These, coupled with Lord Bury's explanatory remarks, teach us some things which it is very important for us to know. They tell us, in the first place, that we need be under no uneasiness as to the ultimate payment of the debenture debt by the Commissioners. They themselves have said nothing, but it is impossible that his lordship could have expressed himself as he has done regarding this without having ascertained that if the worst came to the worst they would meet it, and it is so generally known that it is so. In the next place, we learn that in the existing position of affairs (both theirs and ours) the Commissioners desire not to have to undertake at present either that liability or the cost of maintaining the gardens. Such a feeling supplies them with powerful inducements to support the Society and the acceptance of the first proposition made by the Council as a basis from which to treat is a proof of their desire to do so. The preliminary qualification which they annexed, that the Council should show them that if they refused to do so they would be able to carry on the Society, was surely most natural and proper one. To what good was it to adjust a new agreement if it was to fall through next year? The Council admitted the fairness of the requirement by complying with it. How could they do that and not know, for they were not allowed to see the estimates which were supplied to the Commissioners. All that we know is that they were rejected as illusory, and I do not see how it is possible that they could be otherwise if they showed or pretended to show that they could do so. The Council's proposal to submit the matter to an open court that further reduction of expenditure was incompatible with efficiency, and we know their standard for what they call efficiency. The present year is not half done, and they already talk of bankruptcy. They expect that an announcement will have a favourable effect upon next year's receipts. They have received the number of resignations during the last two years—at what do they estimate them for next year? It must have been to the Commissioners, if not to them, that unless something important were done to put the Society on a new footing, the only chance of its rehabilitation was not to be effected by reduction of expenditure but by increase of income, and what was the Council's expedient for obtaining such an increase? Nothing but the skating rink. It is true that after the Council had been prompted by the Commissioners they produced two schemes for remodelling or readjusting the payments and privileges of the Fellows, and Lord Bury has bequeathed us a third of his own; but none of these contain any glimpse of a thought or idea for imparting new life or attraction to the Society, or increasing its usefulness or adding to its funds, with the sole exception of the skating rink; and few will think that the Commissioners could hold the Society to be in a sound condition if its existence depended upon £1000 a year drawn from the uncertain hands of the subscribers, and most of the background; for myself, I like the skating rink very well if it is kept in its proper place—*i.e.*, an accessory relaxation or amusement for the younger members of the Society, which should be heard no more of, and occupy no more important place in our plans for the future. It might occupy a more important place in our accounts; but I utterly protest against the Society being turned from a horticultural society with a skating ground into a skating society with horticultural shows. Horticulture must stand well to the front; it must occupy the foreground, the middle distance, and most of the background; a corner may be spared in the distance for croquet, and another for skating, but that is all; and such a view is what none of the schemes of the Council give us. Lord Bury's own scheme, indeed, has not been before them; but seeing that it is a mere readjustment of payments and privileges, without any new and only diminished old inducements to any one to avail themselves of them, it is wasteful in the most pressing necessity of the moment. But even although this were provided for, and in the view of the horticulturists, it would not benefit them. Suppose that separate budgets were provided for horticulture and for the South Kensington garden—that the Kensingtonians exerted themselves, and increased such subscriptions as they could give to the South Kensington garden—that the horticulturists did not, and that horticulture went to the wall. Could the Kensingtonians then hug themselves in security, tell horticulture to take care of itself, and suppose that they would be allowed to retain the garden for the use of the horticulturists? If that is the case, his lordship's expectations have been made very little use of his opportunities of studying the Commissioners. If there has been one thing standing out plainer than another in all their dealings with the Society, it has been a straightforward determination that the priority of the property in their hands should go either to science, or the public, or both; and surely Lord Bury must have found out by this time that any attempt to draw wool over their eyes is a very hopeless speculation. He may depend upon it that in the least possible time the horticulturists will be made that they will take especial good care to insert the most stringent provisions for the determination of the lease the moment it ceases to be directly used in the promotion of horticulture. I should be sorry to do his lordship injustice, but his scheme

certainly seems open to the imputation I have suggested. However, it will soon be known, for if I am right we shall see his interest in the double budget scheme quietly go to sleep as soon as he finds that the Commissioners see through his proposition. Can, then, Lord Bury and his friends do nothing to assist the horticulturists in recovering their position? We can complete their resignations, and do them from their positions on the shoulders of our poor Sinbad. It is plain that they can do no good by remaining. His lordship has quite misunderstood the special qualifications of his councillors. To those standing outside, and who have not been privileged to behold the union in which they dwell, they have seemed to be *Act's* stirring up strife. Certainly whatever the apology may be the fact remains, that without counting their own internal quarrels—which, despite their vouchered-for harmony, report says have not been very short since the close of the year they have alienated Royalty," estranged the Court, fought with the Commissioners, and sought to pain them by ill-founded imputations and impolitic insinuations, irritated the old Council and their many friends by gratuitous and objectionable abuse, offended many of the Fellows by their ill-considered overtures, and alienated many of the men in their dearest interests by mismanagement, disappointed and restrained the Fellows of many of their lawful pleasures and their enjoyments, driven the gentlemen's gardeners into open rebellion—bitterly angered many of the horticulturists, and, by their ill-considered side public and the Press by their undisguised attempts to exploit the Society for their own interests; their empire has obviously not been peace. Received popularity from such a source is not to be expected, and it is needlessly exasperating the Society in this race for to insist on working it under their auspices. Let them relieve their brethren from the odium attaching to their proceedings, and at least give them a chance. And here let me say that I allude only to the Kensingtonian party. I was very sorry that Mr. Hume felt it his duty to follow their lead. The Council are charged of all this persons stuff can then face the question with a better chance of success. I have no desire to say a word in anticipation of their decision; I only remind the Fellows that no scheme that does not aim at increased usefulness and increased means will be of any good. We are not without such schemes, but they will be better than the present arrangements. We have Mr. Strickland's, shadowed forth in the last number of this journal; and we have Mr. George Wilson's of guinea county Fellows with country Boards and affiliated societies. Past Councils have for years been working at it, but they have failed to put it into execution. Let them take a leaf from Sir Henry Cole's book. I remember him once saying, "I do not take any credit for originality in this—you have only thought of it—the credit I claim is that you have only thought of it, but I have done it." "What will they do with it?" will be the next question.

The mention of Sir Henry's name leads me to add that I have written on the assumption that the Society is to work out its own salvation. Of course, if, as suggested by him, Government could by any means be induced to come in and help, it falls to be considered as all from our difficulties by taking the gardens out of the hands both of the Commissioners and the Society, it would be a very pleasant and delightful solution of the dilemma. That some such termination lies in the future I do not most certainly believe. I am, however, a little afraid the Fear is not yet ripe. At any rate it is clear that the more we can make our usefulness and value as a scientific body felt and recognised, the better will our chance be of protection and support from any Government. Andrew Murray.

BRITISH GARDENERS.—XX.

DANIEL JUDD.

THIS worthy gardener, whose portrait is annexed, was born at Edmonton, Middlesex, in October, 1815. At the age of seven years his father, who was gardener to Charles Campbell, Esq., of Bury Street, procured for him from that gentleman, who was a trustee of a grammar school founded by Edward Latimer, Esq., a presentation to this school, where he remained until he was fourteen years old. During that time young Judd's father made him spend all half-holidays—the Wednesday and Saturday afternoons in each week, also the Christmas and Midsummer holidays in the garden—cleaning out stockholes, and in doing any job that fell in the way of any of the man, in each of the departments, from the lowest grade up to the highest. "Well," he says, "do I remember how proud I was when I could prune and nail a Peach tree tolerably well, and build a Cucumber bed some 4 feet high at back and 3 feet in the front, with somewhat short dung, on which to place a three or four-light box. The dung in those days used to be worked and turned some six weeks before using to get it tolerably sweet, and to be able to keep the plants so upright and square was considered a specimen of good workmanship; this was my great aim. So particular was my father in these matters that he would even take the fork out of my hand and show me how to take the dung up with it and place it on the bed so that it could not slip off, trying to instil into my mind the utility of combining theory and science with daily practice. He would try to make me study angles and parallels in all my operations, more especially when nailing and in new ground-work. I should accomplish these jobs pretty well before I left school."

Mr. Judd speaks with just pride and veneration of his father, to whose practical lessons and grounding in the science he attributes his subsequent success as a gardener. "It was my lamented father," he observes, "who before I left school taught me the secret of root-pruning. Those fine Ellenheim Pippins which the Horticultural Society had modelled in wax, presenting him with one of the models, were grown by the aid of root-pruning. I well remember looking on as he told his foreman where to dig for a strong root, and the spot—generally in the same direction and directly under a strong branch—was generally the correct one; in fact, I never knew him wrong. The trees were orchard trees, or, more correctly, 12 to 15 feet high lush trees. His practice was to cut one or two large roots every alternate year for a few years, and then to allow the trees to rest for a time, say five or six years. So that root-pruning is of much older date than some people imagine." There are several communications on practical gardening by Mr. Judd's father in the early volumes of the *Transactions of the Horticultural Society*.

"My father," continues Mr. Judd, "was a great admirer of the late Thomas Andrew Knight, Esq., and Sir Joseph Banks; and, being a Fellow of the Horticultural Society, he occasionally would ask leave of absence for me from school on Tuesdays, in order to take me with him to the meetings of the society, then held at 21, Regent Street, to see the plants, &c., exhibited, and to hear the discussions thereon. Many a useful lesson I learned in this way; in one in particular impressed my young brain. The great Mr. Oldacre considered two fine styles, the first grown in a house with a wooden roof and the other under an iron roof, and showing how the different juices or acids under the excessive heat produced under the iron roof had run together. The fact was that fermentation had commenced. This was at a time when iron roofs were in their infancy, and ventilation but imperfectly understood.

"After leaving school I spent six months under my father, and was put to assist in laying-out a small plot, the task charge of, and that gave me an insight into new groundwork, in fact he made me a kind of foreman of the job under his guidance. Honoured be his name, for to him I owe the groundwork of the feeble efforts I have been able to make in the pursuit of horticulture, and in making my position in the world as a practical gardener.

"My first start in life was to Brockett Hall, in Hertfordshire, the seat of Lord Melbourne, at the time he was Secretary of State for the Home Department. Mr. Dawson, sen., his gardener, who was considered in those days the 'great gun' and a very good gardener, was very strict, and not over considerate with young men. I cannot say much for the comforts we experienced there. The bothy was a wretched place, situated between and joining two stoekholes—one miserable room at the back of the houses, and looking out on a high grassy bank about 10 feet distant, the roof covered with the old-fashioned pantiles, without any ceiling, so that when there came a drifting snow it found its way to us as we lay in bed. I remained there between two and three years, and spent many happy days with one of my master's sons to share with me all the hardships we had to undergo.

"The Royal kitchen garden at Kew was my next venture; there it was my lot to serve some three and a-half years in the several departments. The degrees to pass through, and the rules to observe in that place were of a strange character, such as being chained up before the bothy fire, and going through a process of being branded with the letters 'K. G.—Kew Garden, while the constable of the garden read over the rules to be observed, and woe betide the young fellow who attempted to resist the to-mofology.

"Although there were certain stages to pass through, such as wallman, Melon-groundman, and day fireman, before reaching the houses and bothy, I was not long in getting to the top of the tree; and when that eminence was reached, plenty of hard work was found, also much scope for reflection for an active mind. The style of gardening was very loose. Forcing was carried on in the true sense of the word.—both day and night; Pines had not time to form fruit for want of rest—report said that some of them were seven years old, and certain it was that I found some when I went, and I left the same plants there when I left, with fine long legs and well furnished with bug. I looked upon it more as a place of 'all work' than a school for young gardeners. The young men had to carry all the coals into waggons from barges moored off Kew Bridge, and from the waggons into the stoekholes, and men heaved them at the back of the houses, some 60 tons per day. I myself have had 118 sacks on my back in one day. We also had to dig and wheel the loam from the park across the ha-ha opposite Sun House, that divided the towing path from the park, into barges moored in the river, and such adepts were some of the men at navvying that occasionally one or two went off the plank along with the barrows into 6 or 7 feet of water. What would the present race of young gardeners think if

they were asked to perform such work? I fear they would look upon it as degrading. We in those days looked upon it as a lark, obeyed orders and were happy over it. It is well that young gardeners should know what was expected of their class in years gone by. At the present day their ideas appear to be that they ought, to a certain extent, to be fine gentlemen, and they fancy if they can get only into the 'houses' for a time they will become gardeners 'ready dressed,' a grand mistake, for without intelligent study and close persevering observation, they will no more make gardeners worthy of the name than would have been the case in days of yore.

"The one thing done well at Kew was forcing Cherries; some fair Peaches and Nectarines were also grown.

"My next adventure was at Gunnersbury, under the late Mr. Mills, whom I served as foreman for twelve months. There I got my first ideas about forcing Figs, and which have proved a lasting boon to me; there also I saw the foundation laid for those famous Providence Pines that he grew, and some of which cut unripe to send over to Frankfort to the then Baron Rothschild, the possessor of Gunnersbury. Mr. Mills was a good gardener, and his was a good school for a young gardener.

"From this I went to the Duke of Devonshire's garden at Chiswick, and after a time was appointed foreman, which post I filled three years. During that time my old friends the late Robert Fish, then of

bleed), closed the house, and treated them exactly as I should a spring crop. The result was, a good crop of Grapes; so much so, that a brother gardener who came to see them told the late Mr. Forbes, of Woburn, that the worst bunch in my house was better than the best in his, he having some at the same time which were making a great noise in the gardening world.

"This state of things was brought about by continual early forcing, which caused the Vines, as it were, to gain a season; and so soon as I saw Nature determined to assert her rights I used all my efforts to assist her. Such should be the object of all young gardeners, and if it were we should by that means get far better men.

"For the present Earl, at Althorp, I laid out a new flower-garden, a portion of which consisted of one of those fanciful foolish polychrome gardens, with monograms, butterflies' wings, &c., planned by Mr. Thomas, the landscape gardener. Certainly there is no accounting for taste, but it is a delusion to think that broken bricks, slates, &c., can vie with or harmonise with the beautiful colour of Nature has implanted in flowers, or produce such pleasing and softening influences.

"On March 1, 1864, I entered on my present situation—Hawstone Park, Shropshire, and very recently have had to lament the death of one of the best of masters, the late Viscount Hill. He loved Nature in all her doings, and was passionately fond of his garden. From him I received every kindness, and in return my utmost endeavours were exercised to please him. Learning from his own experience of Figs, I had no time in procuring him some, greatly to his satisfaction. It has pleased the present Viscount Hill to ask me to remain with him, and sincerely do I hope he will prove as good a master as was his lamented father.

"I have all through my life worked for the love of gardening, and done my best to make others love it; and I hold my honoured father's name in reverence for giving me so thorough a groundwork and such wise counsel."

Of his practice at Hawstone Mr. Judd has said but little, but we may say we have nowhere seen a better example of thorough practical gardening. Everything is handled with the skill of a master. Amongst what we should call the specialties of Hawstone gardening we must give the first place to the Pines, which are admirably grown, and we should be glad to lay before our readers an outline of Mr. Judd's practice. Poinsettias, again, are superbly grown, and in such quantities as are seldom, if ever, met with elsewhere; and at the time we had the pleasure of seeing the gardens at Hawstone, a short time before the death of its noble proprietor, the crops in the kitchen garden—the foundation of a gardener's reputation—were among the finest we have ever met with, Celery and Broccoli being amongst the prominent examples at that season. We only do justice to the subject of our portrait when we say it represents the genial face of one of the best of British gardeners.

Daniel Judd

CEYLON.

COLOMBO TO KANDY.—To avoid the hot season in the low country in Ceylon all who can, leave Colombo for the hills. For some miles the road crosses the marshy plains that lie between the river and the sea.

So long as it runs within a moderate distance of the sea the groves of Coco-nut trees continue to surround every hamlet, but on turning more inland these gradually disappear and are succeeded by the graceful Arecas (A. Catechu), which are the invariable features of the native gardens, being planted near the wells and watercourses as they rejoice in moisture. Of all the tribe the Areca is the most graceful and delicate, rising to the height of 40 or 50 feet, without an inequality on its thin polished stem, which is dark green towards the top, and sustains a crown of feathery foliage, in the midst of which are clustered the astringent nuts for whose sake it is carefully tended. Mixed with the Arecas there now appears the Kitool or Jaggery Palm. This Palm (Caryota urens) is chiefly cultivated for its sap, which is drawn, boiled down, and crystallised into a coarse brown sugar. From its pith, also, a farina scarcely inferior to sago is extracted, whilst the black fibre of the leaf is twisted by the Kodyias into ropes of considerable smoothness and tenacity. Half-way is the picturesque rest-house of Amhessuwa, after leaving which the road crosses the spurs of the hills which descend from the mountain zone, and the aspect of the country gradually changes from maritime plains to the ruder and less cultivated Kandyan highlands. Instead of broad inundated paddifields, Rice is grown in the moist crannies of the hills and dry grain is cultivated on their slopes. The woodcut (fig. 165, p. 789) represents the scenery at Kaigalle, fifty-one miles from Colombo towards Kandy. Here the majestic crowns of the Talipot Palm begin to

Tattersall's, Hyde Park Corner, and John Caie, then gardener to the Duchess of Bedford, at Bedford Lodge, Campden Hill, formed the Mutual Instruction Society for young gardeners at Hammersmith; of this I became a member, and gathered some very useful lessons from the papers read, and the discussions that ensued.

"On February 3, 1840, I entered the service of W. H. Whitbread, Esq., Southill Park, Bedfordshire, as head gardener, and remained with him upwards of seven years, during which time I used all the means in my power to make myself a gardener.

"On February 16, 1848, I was engaged by the late Earl Spencer, Althorp Park, Northampton, and remained with him ten years until his death, and with the present Earl five years. Here my motto was—"Onwards," and I succeeded in growing some Figs, which much pleased his lordship (he being very fond of that fruit), and took several prizes at the Horticultural Society's garden at Chiswick with them, as also with Peaches, British Queen Strawberries, Melons, &c. But the greatest triumph I achieved at Althorp happened in the year of the termination of the Crimean War. On January 1 of that year I placed new and old Black Hamburg Grapes on the table for dessert, and so good were they that the guests (amongst whom was the late Earl Cardigan) paid me a very high compliment, as they did not think such a thing could have been accomplished.

"I claim no credit for this achievement further than that of having taken advantage of Nature's teachings. In the June of the year preceding, the Vines in my early vineyard were as bare of leaves and as dormant as any Vines could be in mid-winter; and I pruned them the first week in June (they did not

appear near the villages, and graceful Bamboos wave their feathery plumes in every hollow. This Talipot, or Talpat (*Corypha umbraculifera*), is the most majestic and wonderful of the Palm tribe, the stem of which sometimes attains the height of 100 feet, and each of its enormous fan-like leaves when laid upon the ground will form a semicircle of 16 feet in diameter. The tree flowers but once and dies. Elaborate fans are made from the leaves of the Talpat; but the most interesting use to which its leaves are applied is as a substitute for paper, both for books and for ordinary purposes. Here and there also may be seen the beautiful *Palmyra* (*Borassus flabelliformis*), whose physiology, culture, and uses have so accurately described in Mr. Fergusson's monograph. But what most excites the wonder of the stranger are the flowering trees which adorn the landscape—the *Muruta* (*Lagerstromia regina*) with its profusion of lilac blossoms, and the gorgeous *Imbul* (*Bombax malabaricus*), whose crimson petals thickly strew the ground when making way for the oblong pods that contain the silky cotton for which the tree is prized. The carts by the side of the road are banded, barbarous two-wheeled wagons, with coverings of plaited Coco leaves, in which a pair of strong bullocks will draw from 1 to 2 cwt., according to the nature of the country, and with this they will perform a journey of 20 miles a day on a level. The oxen thus employed, laden with coffee from the interior or carrying rice and stores for the supply of the plantations in the hill country, are estimated at upwards of 20,000 on this single road.

The forests become so dense that troops of monkeys venture in sight, and flocks of plum-headed parrots (*Falcoenis Alexandri*) romp and scream amongst the branches.

The houses instead of groves of Coco-nuts are surrounded with a fence of Coffee bushes with their polished green leaves and wreaths of Jasmine-like flowers, and everything indicates the change from the low-country and its habits to the hills and their harder peasantry. We have no space to mention the other wonders of the Singhalese flora—orchids, festoons of flowering creepers (*Pomona* and *Bigonia*), the *Culiana Borace* with its siliceous seeds, the powerful *Iiana* (*Bauhinia scandens*), and the yet more extraordinary climber, the powerful jungle rope (*Bauhinia racemosa*) whose strong strays, resembling in form and dimensions the chain cable of a man-of-war, lash together the tall trees of the forest. Another tree, the *Del* or wild Bread-fruit, is indigenous to the forests of this province. The *Del* (*Artocarpus pubescens*), whose leaves are prominent in the foreground of the cut, affords a valuable timber not alone for architectural purposes but also for ship-building.

So many observations have lately appeared relative to queen wasps, or the date of the first nests, that it may be worth observing that it is now full time for the commencements to be found. When the winter sleep of the queen is terminated (which this year happened a good many weeks ago) she has to seek a spot for the future nest and construct its beginning, and also wait the development, as far as I have observed, of the eggs contained in herself from the embryo state in which they have remained during the winter; but the operations are coincident, and the nests are probably now well begun.

At present the small beginnings of comb in the light paper shells will in all cases probably only contain the eggs of the workers, which will assist the queen in enlarging her dwelling, presently to contain the males and females, whose cells are distinguishable by size from each other and from that of the nesters.

In their later stages wasps' nests are easy of observation, requiring nothing but a little prudence and dexterity in moving and refixing, to place them where they may remain in safety and comfort to their owners (whether the observed or observers), but in their early state this is not so easy. One wasp, instead of hundreds or thousands, does not give room for the chances of watching to happen, and I have never succeeded in watching the construction of a nest, which would be interesting as involving the removal as well as addition of material. With the advent of summer I would recommend a wasps' nest or two as a most interesting study, not only for personal view of the well known minutiae of construction, but for the observation of less known or exceptional points. With a little care, and a good magnifying glass, the larvæ may be clearly seen spinning themselves into their cells, and the substitution of earth for paper (when some re-roofing is made suddenly necessary on a large scale in wet weather), the paping up of obnoxious substances, and many other applications of instinct diverted from its usual channels, may be watched at ease and leisure. With regard to destroying the queens in spring, as far as I have found in a long course of years of observation, the number of nests does not at all necessarily depend on the number of mother wasps seen early in the year.

During the time intervening between the conclusion of the hibernation and the formation of their new homes, they are exposed to every sort of danger from attack and weather, and in the course of the natural sequences it is so very likely that what has been unusually favourable to their preservation during the winter will be followed by cold, wet, or something very much the reverse of previous influences, that the appearance of many queen wasps in the spring gives no certain indication of many nests in summer.

In the cases coming immediately under my notice the destruction of the queens in spring did not appear to affect the subsequent numbers at all, as if I understand rightly in the note on the subject, given at p. 755 of your last number, in the case where queens have been steadily destroyed for ten years they are now more numerous than ever, the largest previous amount noted being 234 killed, and in the present year "nearly 700."

A great prevalence of wasps in the fruit season is a decided evil, and an appreciable money loss to fruit growers, but in the proportion (as with all smaller birds) it appears at least doubtful whether their presence is not really much to be desired. If the natural balance is destroyed on either side, whether the scale rises or sinks, the effect of the change has to be made good. Where a fair supply of wasps is absent, speaking from my own experience only, flies congregate during the autumn fruit season so as to be a perfect pest, and are sometimes as injurious and, from the numbers, even more disagreeable than the wasps themselves.

With the hornet, the *Vespa crabro*, the case is different, the great size and deliberate fierce attacks of these insects when irritated make them dangerous, and also as they, at least occasionally, hibernate close to one another and the nests are of comparatively rare occurrence, a well conducted search where one queen hornet is found may destroy the whole sisterhood which otherwise would have been an annoyance to the neighbourhood. O.

It has been the practice here, from time immemorial I was about to say, but at all events for a great many years, to pay to the men employed in the gardens the sum of one penny for every wasp or hornet they may capture up to the end of the month of May. It has been part of my duty for the last twenty-eight years to count the slain, and this duty has never before been so onerous as it has been this season, as on the first of the present month no less than 2566 dead bodies were brought in, and the sum of £10 13s. 10d. paid for the same. About 5 or 6 per cent. of this number may be queen hornets, but whether all were queens, and capable, had fate spared them, of establishing a colony of some 50,000 or thereabouts, I am unable to say; but if so, the advent for good or evil of some 128,300,000 wasps and hornets has this season been prevented. The number captured during former seasons has varied

from 500 or 600 to the unprecedented number of the present season. I think it is to be regretted that the practice of paying for the destruction of these insect pests is not more general than appears to be the case, as, were the system adopted in most garden establishments, it would certainly soon have the effect of materially diminishing their numbers; and this is doubtless very desirable, as most people know how very difficult it is to protect fruit of any kind from their ravages as soon as it approaches to a ripening condition. And whatever the mission of the hornet and the wasp may be in the scheme of creation, one thing is certain, viz., that few people hesitate to disturb the balance of the same by destroying as many of them as they possibly can, whenever an opportunity of doing so presents itself. The hornet appears to be regarded with even more dread and aversion than he actually deserves, as he is without doubt a bold, fearless insect, who only descends to use the fearful weapon with which Nature has furnished him in cases of dire necessity, so that we seldom hear of any one being stung by a hornet, and still less are we likely to find any one who may have had the misfortune to be so stung and who does not retain a vivid recollection of the circumstance. Although the hornet and the wasp appear to work amicably enough together, while engaged in the destruction of ripe fruit, &c., the former nevertheless appears to prey upon the latter, and the hornet may be frequently seen to seize upon a wasp and instantly divide his victim in the middle, select the thorax, which, when he has divested it of head, legs, and wings, he carries off with him. *P. Grieve, Cuford, Bury St. Edmunds.*

HABITS OF THE CUCKOO.—Last year, in the kitchen garden here, a quarter where the Gooseberries were planted in was frequented early every morning by some cuckoos. I afterwards found out that they were feeding on the Gooseberry caterpillars, which infested the bushes in legions. I therefore took care to disturb the cuckoos as little as possible, and the bushes are this year, up till this period, comparatively free from the caterpillars. One cause for this immunity from their ravages this year may be in the paring off the old soil below the bushes, and filling up the spaces with old tan. This I have no doubt has cleared away the larvae buried in the old soil, and the old tan would be free from them. I see, however, that the cuckoos, having no Gooseberry caterpillars to eat this year, have taken to feed on the caterpillars which infest the Oaks. In the young Oak plantations here, where the trees are thickly planted, these caterpillars have made some of the trees quite bare of foliage, and the rooks, starlings, and cuckoos are feasting on the grubs in greater quantities than I ever observed them before. *William Tillyer.*

Dotires of Books.

Twelve Months in Madagascar. By Joseph Mullens, D.D., Foreign Secretary of the London Missionary Society. (James Nisbet & Co.)

Dr. Mullens and the Rev. J. Pillans were deputed to visit the Government and churches of Madagascar by the Missionary Society, which so many years ago first introduced Christianity into that distant country. These two gentlemen visited an extensive portion of that country, seeing in all their length and breadth the two central provinces of the island, Imerina and the Betshio, as well as the Sihnanaka province, and they left the island by the north-west route and the port of Majunga. Unlike his predecessor, Mr. Ellis, Dr. Mullens is more geographical and geological than horticultural, and he has contributed to science the discovery of a wide volcanic region hitherto undescribed. Here is a piece of coast scenery—

"There is no road, properly so called, along the coast; we just followed a path more or less broad over the grassy glades, through patches of wood, or across the bare sand. Cocoa-nuts, Plantains, a few Palms, the Fir and the Pandanus, were the usual trees—familiar friends to me of years gone by—but many trees were quite new. Passing through the village of Viondro, we crossed the river, which here cuts the sand belt, and flows into the sea. Traversing fine open glades, the bordering banks of which were beautifully curved, we came out upon the beach, and for a long way toiled over

Natural History.

WASPS.—It is true enough, as your correspondents assert at p. 723, that queen wasps abound in plenty this season. With the view of diminishing their number hereabouts, and to avoid the somewhat clumsy process of nest taking, I offered in early spring 1*l.* each for all caught about our grounds, and the result, to my astonishment, is up to this date a capture of 559. Now assuming, as we are told, that each queen represents 50,000, we have reduced their number prospectively 27,950,000. While paying some of these the thought suggested itself to me, are they a universal evil? I think not, for I have in nests, then actively employed during the summer months in clearing trees from scale and greenfly, and also, to my great delight, busily feeding on that pest of all pests of gardeners, the mealy-bug, &c.

Your last two impressions have contained notices of the very large and unusual number of queen wasps which have been seen this spring. Although I have always noticed this as preceding an extraordinary fruit crop, it is somewhat remarkable this year, from the severity of the past winter. I have for years adopted the suggestion of "M. M." and given 1*l.* for each wasp brought to me before June 1. I think it has been stated by an eminent naturalist that on an average one queen will produce 700 broods. My gardener last month took from a canvas blind in my window the commencement of a nest containing seventeen cells. *H. K. Mayor, Winchmore.*

the dunes, or trod the firm wet sand upon which with ceaseless roar the long waves poured out their hissing foam. The coast was lined with the Filao, a Fir-tree closely resembling the Casuarina, which grows well in England, where it is known as the Sumatra Fir. The Filao is, however, native to Madagascar; its feathery hair hangs gracefully over its gnarled and knotted branches, and with the strong winds makes pleasant music. Fine clumps of these graceful trees continued all the way."

Speaking of one of the lagoons, he says:—"The water was not very deep, but it was full of small Water Lilies, the leaves of which, on their under side, were a crimson-pink in colour. The flower also was crimson. Nympheas were also probably there. The water at first had a brilliant red tint, but ere long it became deeper, and it seemed to us all as if we were sailing on a river of blood. As the lagoon ended, the colour changed to a rich red gold." "Landing once more we travelled on a narrow strip of land, a piece of country which had all the appearance of a beautiful park. It contained sloping banks crowned with Fir-trees. Here stood the Tree Fern, and there the Bamboo Palm: here were fine specimens of the Number tree with its glossy leaves; there tall, thick Pandanus trees with their crimson; and there the path was arched by the Pandanus.

"From some lofty trees hung huge black bees'-nests: the trunks of others were adorned with the Angrecum Orchids with their long spray of twelve white flowers; and from the strongest hung enormous creepers. Over where winding in and out among the trees was the open grassy glade, on which a fine herd of red cattle was grazing."

"Near Andevoronto both sides of the river have great swamps, in which we saw growing many hundreds of the noble Arum Lily (Colocasia?) and the Astrapæa Wallichii, with its thick trunk and broad scolloped leaves. Further inland we came upon a row of the plants bearing the first flowers of the season."

"The travellers next reached the Mahela River, "rich with tropical vegetation. The Ferns covered the slope of the hill in thousands, and were plants of the finest kind. The fronds of the Hart's-tongues were a yard and a half long. The wild Raspberry was common, and the men gathered copious of the fruit."

"At the capital, "Antananarivo," the weekly market, or *zoma*, is well supplied with vegetable and farinaceous food.

"Rice abounds of several kinds, and is sold both cleaned and in the husk. Potatoes are provided more for the English families than for the natives generally, and with green Peas, are usually brought to their houses. Yams and sweet Potatoes are abundant, and also Indian Corn. Green vegetables are not common; yet twelve or fifteen kinds are known and eaten by the people, but they do not form so decided an element in their food as in England. Rice is all-in-all to the Malagasy. There is a good supply of fruit in the market, the Bananas, large and small, are good. Pine-apples are abundant, good and bad; also green Lemons, large red Tomatoes, Mulberries, wild Peaches, and a little round fruit, the Cape Gooseberry. There is plenty of honey; also of Tobacco, of native growth. The Potato is sold in leaf, stem, and root, and with a little snuff mulls made from bamboo; and the people do not smoke nor smell, but suck and eat it!"

"On the journey to Majunga on the north-west coast Dr. Mullens relates of their most pleasant march through the solitudes of this lone land: "Our course lay up long valleys, over first one pass and then another; or over hard clay ridges, sprinkled with quartz gravel, and then along some clear stream bordered with fresh green wood. The valleys were simple and open and very green. The Rofia Palm grew more abundant; there were varieties of the Acacia with their pinnate leaves; with a few specimens of the Bamboo Palm; and of the Dého, a coarse Fig tree. The Bamboo cane was common with its tall stalk from 15 to 20 feet high, and its soft white feather at the crown; there was the wild Citron also."

"When they reached the tidal portion of the river Betsiboka at Mahabo, "at sunset, we passed along the east side of a large island; wood and jungle were rich; the mud banks were evidently fertile; the Mangrove was thick with its matted roots, and again we saw vast quantities of the great Arum Lily, which we had admired so on the east coast."

"At Mojanga, "below the Hova town, the hill is richly covered with wood; indeed, there is quite a forest of Tamarind, Mango, Palm, and Cocoa-nut trees, many of which are noble specimens of their class. The Talipot* Palms also were strong and massive, and there were ten or twelve specimens of the Baobab. Of the great Baobab I obtained a good photograph; the tree is over 60 feet high, and the trunk near the ground is 40 feet in girth."

"Should the Talipot be indigenous to Madagascar as well as Ceylon, it would supply a missing link as to the existence of a submerged continent formerly connecting the two islands, and to which some naturalists have applied the term "Lemuria."

"It is much to be regretted that Dr. Mullens' botanical acquisitions lead him to repeat such solecisms as "Arum-Lily," and leave us so often in doubt as to what plant is really meant."

* *Corypha umbraculifera* (F)

Apiary.

AMERICAN SWARM SIGNAL.—Nothing gives us so much pleasure as bringing before our many friends any novelty that may from time to time be introduced to the public. It may be questionable, however, if this novelty will ever come into general use in our English apiaries, because in hundreds of cases it would be useless, for the bee-stand is often either beneath the window or close by the door, when owned by cottagers, so that a swarm seldom makes its appearance without being speedily noticed by one of the family. In other instances the gardener is never very far away at the time of day when swarming takes place. Our American friends have introduced the swarm signal, which is now placed before our readers—the illustration (fig. 164) will convey a more perfect idea of the instrument than any mere verbal description. It consists of a wire cage, *F*, about a foot in length; this, when placed over the mouth of the hive on the edge of the bottom-board, is firmly held by the weight *E*, resting upon a thin iron plate marked *O*, which is fastened to one corner of the cage; the signal, *K*, is attached to a string beneath the weight *E*. When fixing to the hive, just before a swarm is expected, it must be so placed that only about three-fourths of the entrance is covered by the cage, thus not interfering with the workers; this can be managed by sliding the hive gently to the edge of the bottom or floor-board. On the sharp point of the signal, *K*, a gun-cap is fixed, and so hung that when freed by the weight it should drop on a brick

FIG. 164.—SWARM SIGNAL.

placed beneath the signal on the ground; when the swarm is leaving the hive they crowd into the cage in their haste to escape, so that by the weight of the bees in the cage *F*, the signal is liberated and falls on to the brick, thus apprising the happy bee-master of his good fortune. Small holes are made in the cage at *D D*, to allow the workers to escape, for it often happens, even before swarming, that many bees become prisoners; if the report made by the explosion of the gun-cap is not sufficiently loud to be heard, the signal should be bored and a small charge of gunpowder inserted to communicate with the cap. *K*.

THE SWARMING SEASON.—No part of the bee-keeper's year is so much prized as the swarming season, which ranges in England from May to July. Not only is it prized but it is also an anxious period; for this reason, there seems to be no certainty as to the exact time when a swarm will issue from the parent hive. We have known many young bee-masters who lost much valuable time from being constantly on the watch, from fear lest they should lose a stock by not being on the spot when they left.

Although there may be much uncertainty about the particular day when a swarm may venture forth, there can be none as to the part of the day when it issues; it is true we have had swarms from 7 A.M. to 7 P.M., but we never knew a first swarm later than 12 A.M. The first swarm is led by the old reigning queen, and she has got too old a head on her shoulders either to emigrate when rain is falling, or in the after part of the day when she may have but little time to select a favourable spot for her future home—i.e., if the first place is unsuitable which may have been selected by the scouts. She also takes

good care to choose a fine and warm morning. So far as the second swarm is concerned, we may judge almost to a day when a swarm will leave by the peculiar piping of her majesty.

The first swarm is only rightly named "swarm," the second is called a "cast," and the third is often nick-named a "colt;" whilst a fourth, by way of distinction from the third, is called a "filly." A swarm from a swarm is justly named a "maiden swarm."

In many villages it is customary when swarming takes place to make a horrid noise with tin cans, kettles, or ringing with a key on a frying-pan. Sometimes this is carried to great lengths. It is not unusual to observe some half-dozen females busy as possible, trying which can make the greatest noise. It is, however, scarcely needful now to remind all our intelligent readers that this is really unnecessary. If anything will bewilder the queen, who, to a certain extent, guides the swarm to the selected bough, it must be this intolerable nuisance. We have for several years noted many apiarian customs with extreme care and jealousy in this matter. We have observed that the queen is not, in nineteen instances out of each twenty, lost, when the tanging is discarded; but in numerous cases of ringing we have known the swarm to return to the hive, showing us that the queen was either lost or had never left the hive. We have been so fully condemned as a heretic and unbeliever by all the good old maiden ladies of the village in which we reside, merely because we have opposed this needless work, or rather task of ringing the swarms, and would never allow it to be used in our garden. In everything beside we can gain their goodwill, but here we have failed, so we are given to understand, by their constantly asserting "your bees cannot prosper."

We now stay to inquire why it was first introduced by our forefathers. Like many other customs, which at first were really useful, and originally valuable for their intended purpose, it has been corrupted, or become useless. In days long since passed, when stones even were quite a sufficient guide as landmarks, and as such were honoured, bees then were far more valuable than now, because of their scarcity. Their owners, when swarming was perceived, at once gave timely notice to all the neighbourhood, by tanging or ringing, that the swarm was the right and property of the person so occupied in ringing. By this was given notice he was allowed the privilege of a following, or what we should now call trespassing, on his neighbour's land to claim his swarm. We also believe they had another object in view in this giving notice, viz., for the neighbours to come forward, in a friendly way, to aid him in securing the swarm. We are aware another reason has been assigned for this custom, which we scarcely credit as trustworthy; it has been stated that the tanging was intended to drive away evil spirits, and prevent them having any influence over the bees. Church bells have been rung to drive away thunderstorms, &c., but this can have no connection whatever with swarming.

WHAT IS SWARMING?—Why it is simply this: the old hive becomes over-peopled by its industrious inmates, so, not having sufficient room for storing and breeding, they are compelled to emigrate. When the hive becomes thus overstocked, we observe them hanging out at the entrance in a large cluster, not unlike an immense bunch of Grapes in appearance. This is the first sign of a prime or first swarm. Mark! If we have known them under these circumstances, if it should fortunately happen that the bees observe a small opening in the floor-board sufficiently large for them to creep through, at once commence making comb beneath the stand, for bees do not like being idle—they make hay when the sun shines.

NADRING SYSTEM.—Many intelligent apiarians recommend this system, especially for inexperienced bee-keepers. One author advises his readers to purchase a large quantity of American cheese-boxes, and making slight openings in the lid to place them beneath the hive, a few doing he, curiously enough, intimates to all respectable labourers, who are "wise enough" (?) to take in everything they see in print as facts, to be sure they will make at the very least £100 per annum. We knew one poor fellow so led away by this reasoning as to give up a good situation to attend to his bees, quieting his better-half by assuring her he should make a good living by it, but the result in the end rather shocked his faith when he found himself a heavy loser. But this nading most certainly, if adopted in time—always providing the bees take to the boxes—will stop swarming, but it is no advantage. Let us always set it down as a fact, and we shall not go very far wrong, that the nearer we manage our stocks so as to resemble the operations of Nature the more profitable it will be in the end. Some of our readers may say, "Well, you do not advise us to ever super the hives so as to provide a little good and pure honey." We most assuredly have said nothing to the contrary; we say, "follow Nature," and Nature says bees never do so well as when we allow them to swarm. *K*.

HORTICULTURAL EXHIBITIONS, 1875.

JUNE.

- 29.—West of England Rose Show at Hereford. Hon. Sec., Rev. C. H. Palmer, Credehill Rectory, Hereford.
 30.—Royal Botanic Society, Regent's Park. Exhibition of Fruit and Cut Flowers. Sec., W. Sowerby.
 31.—Wisbech Rose Show and Horticultural Exhibition. Hon. Sec., Charles Parker, Wisbech.
 32.—Maldstone Rose Show. Sec., Hubert Barsted, Maldstone.

JULY.

- 1 and 2.—Spalding Horticultural Society's Exhibition. Hon. Sec., George F. Barrell.
 1, 2, 3, and 4.—Horticultural Exhibition at the Lower Grounds, Aston, Birmingham.
 2.—The Cambridge Wells Horticultural Society's Exhibition. Sec., E. F. Loof, The Parade.
 3.—Thirty-second Anniversary Festival of the Gardeners' Royal Benevolent Institution.
 2.—Southgate Horticultural and Cottage Gardeners' Society's Exhibition. Hon. Sec., J. Mills, Esq., Southgate, N.
 3.—West Kent Horticultural Society's Exhibition in Garden Park, Chislehurst. Hon. Sec., H. Nevill, Esq.
 6 and 7.—Grantham and South Lincolnshire Horticultural Society's Exhibition at Grantham. Sec., Thomas Lyne, Jan., Grantham.
 6 and 7.—Brentwood Horticultural Society's Summer Exhibition. Hon. Sec., R. Earby.
 7.—Royal Horticultural Society's South Kensington Meeting of Fruit, Floral, and Scientific Committees. Cut Rose Show.
 7 and 8.—Leicester and Leicestershire Floral and Horticultural Society's Show. Sec., W. C. Morris, 3, New Street, Leicester.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 19, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- MONDAY, June 21.—Sale of Orchids, at Stevens' Rooms, Kingston and Surbiton Royal Horticultural Society's Exhibition at Robiton (two days).
 TUESDAY, June 22.—Lewham Horticultural Society's Show (two days).
 Sale of Indian Orchids, at Stevens' Rooms, Farnham and South Hants Horticultural Society's Show.
 WEDNESDAY, June 23.—Royal Horticultural Society of Ireland's Great Summer Show.
 THURSDAY, June 24.—Bristol, Clifton, and West of England Rose and Strawberry Show at Clifton.
 Alexandra Palace's Great Rose Show.
 SATURDAY, June 26.—Crystal Palace Rose Show.

WHAT infatuation it is that leads men of reputed honour and position to stultify themselves, and injure the cause they are bound to protect? We had an illustration of this the other day, when the President and Treasurer of the ROYAL HORTICULTURAL SOCIETY not only refused to pay what we consider "debts of honour," but went out of their way to insult and abuse the men of all others whom it was their duty, as officers of the Society, to conciliate and encourage. We attributed this at the time to infatuation, and it was the most charitable course we could adopt. But what are we to say now, when, after a formal leave-taking, a last dying speech, and an affecting farewell, the Kensingtonian members of the Council are so destitute of a sense of honour, so blind to the equivocal position in which they place themselves, that they, as we are informed, refuse to carry out their expressed intention to resign! It is to be hoped, for all our sakes, that we have been misinformed; for if the statement be true it adds another disgrace to the Society, and intensifies the sense of weariness and disgust with everything connected with it, in its present state, that loyal horticulturists must feel.

Nothing could well be plainer than the words in which the President, the Treasurer, and Sir COUTTS LINDSAY expressed their intention to resign their office, while a letter from Mr. BURNLEY HUME to the same effect was read to the meeting. With reference to this last-named gentleman, it must be remarked that he became a member of the Council as the nominee of the horticulturists; but from the manner in which he has identified himself with the section which has shown itself so hostile to horticulture, we are bound to say he has betrayed his trust as a representative, and that in common decency he should at once place his resignation in the hands of those to whom he owed his election.

It is not easy at first to see what the motives are which can induce men of position and character to endanger their reputation in this way,

and it is a most invidious thing to be obliged to discuss them. One explanation we believe to be, as we have already hinted, that the South Kensington section of the Council will endeavour not to formally complete their resignation unless they can succeed in nominating in their place others of the same view as themselves, but even more opposed to, or indifferent to, the objects for which the Society was expressly founded. Again, without wishing to be offensively personal, we cannot ignore the fact that the Assistant-Secretary is stated to be nearly connected by marriage with the President, and in any case it is notorious that when the office of Assistant-Secretary was vacant, men of known position and capacity for the office were passed over in favour of a gentleman with no special competence for the post, and whose tenure of office might possibly be endangered were the President to resign.

It is with extreme reluctance that we mention these matters, but a sense of duty to the Society in the present crisis impels us to make them public. If they are, as we believe them to be, substantially true, they afford sufficient ground for insisting on the resignation of a section who have publicly confessed their incompetence, who have insulted those whom they should have protected, and who have shown themselves utterly indifferent to the objects for which the Society was founded. We cannot wonder that the Commissioners reject proposals put forward by such a body. Knowing what the relations of the Society and the Commissioners are, we should wonder if it were otherwise.

It is exceedingly vexatious and dispiriting to have to write in this strain, and to have continually to draw the attention of the Fellows to the discords of the governing body. It might almost seem to those at a distance that no horticultural work was done now-a-days in the Society, but this would be a great misconception. Our columns testify to-day to one branch of horticultural work very successfully—considering the circumstances—carried on at Chiswick; while the records of the Scientific Committee ought to furnish a warning to Potato growers as to the outset of a disease which threatens to be even more disastrous than the Potato murrain itself, seeing that it almost entirely prevents the formation of tubers. The investigation of such matters, and the making public the researches and observations of its Committees, is surely of far greater national importance than is the maintenance of a town garden and a fine conservatory for the delectation of the wealthy residents of the neighbourhood.

Whatever scheme be ultimately adopted, the local residents, who have the almost exclusive use and enjoyment of the Kensington garden and its beautiful conservatory, if they would retain these advantages, must pay accordingly. As matters are at present they pay considerably less than the residents in the best London squares, which latter are destitute of the attractions furnished by South Kensington. That is one way by which the greatest incubus of all (so far as current expenses are concerned) may be made to pay its due proportion of the charges upon the Society. Another way is to largely increase the horticultural element by adopting a lower fee for genuine gardeners, and by a strengthening and reconstruction of the various committees so that they may organise and direct the horticultural work of the Society, insure the co-operation of local horticultural societies throughout the kingdom, enter into relations with foreign societies and with the Government, and so justify the existence of the Society as a national institution deserving of public support. The present South Kensington fact appears incapable of appreciating such things. They have pro-

claimed their own incompetence. Now let them go—and go at once.

No better situation could be selected for studying the DISTRIBUTION OF PLANTS AS AFFECTED BY SOIL than the coast between Hythe on the west and Walmer eastward on the Kentish shore. The upper chalk rises from the low level land about Deal to the noble cliffs on which Dover Castle stands. Beyond that, going westward, the lower chalk without flints forms a magnificent sea-wall along the coast almost the whole way to Folkestone. At the foot of these cliffs is a pictorial waste of rugged ground not far inferior in wildness and picturesque beauty to the undercliff in the Isle of Wight, and offering even greater attractions to the naturalist. This wild district, where mounds of verdure-clad chalk are, as it were, tossed about in wild confusion, owes its peculiar characteristics to the fall of huge masses of chalk by the action of frost, and specially to the circumstance that beneath the chalk a thick layer of tenacious, slippery clay, locally termed gault, exists. Beneath this gault crop out, in successive layers, the beds of greensand which form the cliffs between Folkestone and Hythe, where they tend inland, and are replaced seawards by the alluvial flats of Romney Marsh. So much of geological description is requisite to understand the relation of the indigenous flora to the soil; more we need not say, unless to add that the coast section is one of the grandest and most instructive possible. Each formation is full of its characteristic fossils, those of the gault being especially perfect and beautiful, though apt to perish on exposure. From our point of view as horticulturists we have a dry compact limestone soil in the case of the chalk, sometimes (in the lower chalk especially) covered with a thin capping of decomposed ironstone soil, giving a glorious red foil to the white chalk and the blue of the sea and sky; then we have in the gault a thick clegdy waterlogged bluish clay, with little or no lime in its constitution; and in the several greensand beds we have layers of coarse sand, large tabular masses of ragstone intervening in more or less horizontal layers.

The indigenous flora of this interesting region presents, as may be expected, some marked characteristics. On the chalk, to mention only a few cases, the cliffs in early June were yellow with the wild Cabbage, *Brassica oleracea*, and *Hippocrepis comosa* and *Diplotaxis tenuifolia*. The rare *Silene nutans* is scarcely conspicuous enough to form a feature at a distance, but it is noticeable from its rarity, and from the fact that it is confined to the chalk. *Iris fetidissima* occurs sparingly on the chalk, as also *Chlora perfoliata*, *Antirrhinum majus*, *Cheiranthus Cheiri*, and the common Madder.

Orchids, again, are among the choicest and most interesting natives of the chalk downs, including the Bee, the Drone, the Early Spider, the Late Spider, *Orchis ustulata*, and others. The Sea Buckthorn, *Hippophaë rhamnoides*, and the Elder form large bushes, under which *Eupatorium cannabinum* and other herbs thrive. While the flora of the chalk is rich both in species and in individuals, that of the gault is poor. Coltsfoot, Rushes, and *Equisetum* abound, but of the characteristically chalk plants, either none are found, or so scanty in numbers as to be by no means characteristic.

From the greensand cliffs the wild Cabbage is absent, its place being filled by the common Charlock, while, quite peculiar to these cliffs, are *Medicago denticulata* and others of its allies. The Thrift, *Armeria vulgaris*, clothes the banks with a sheen of pink; its near ally, *Statice Limonium*, and its variety, *S. baubensis*, do not occur off the chalk. The Stinking Iris, to which we have already alluded as rare on the chalk, is very abundant on these sandy cliffs.

We do not pursue this subject further now, our object being simply to call the attention of those of our readers who may visit this attractive coast to sundry features which give additional interest to a district which has so many charms for the lovers of fine scenery, and for geologists and naturalists. It furnishes a little bit of wild Nature, where the battle of life among plants, and the circumstances influencing the combat, may most advantageously be studied, the more so as for the most part little or no interference has been or is likely to be wrought by human agency. The lessons it teaches are not likely to be overlooked by the thoughtful horticulturist.

— We have at sundry times called attention to various CURIOSITIES OF GRAFTING, being impelled to do so, not only from the direct practical importance

results were duly watched. During the first year the graft (Poirier de Charneu) grew but little, it only produced rudimentary leaves and no flowers, but in the course of the summer the body of its roots emitted several Quince buds, which attained a length of 8—10 centimetres. The stock (Beurré d'Arenberg), on the other hand, grew well, flowered, but did not ripen fruit. In the autumn the leaves fell at the same time as from neighbouring trees. The exposed roots of the graft were not at all protected during the winter, and the graft was entirely exposed to the action of the winter of 1866-67. In the following year the stock developed perfectly; it flowered, but ripened no fruit. The season developed buds, flowered and ripened two fruits, and the Quince shoots produced from its roots attained a length of 20—30 centimetres. On four of these Quince shoots M. CARRELET grafted four different varieties of Pears, of which two took perfectly and lengthened into leaf-bearing shoots. The tree was, therefore, thus constituted:—Below in the soil were the roots of the Quince stock, on this was grafted a Beurré d'Arenberg; on this again, but head down-

scented flowers render it no bad substitute for Orange blossoms, and it appears to bear the climate of the south-eastern coast as well as *Enonymus japonicus*, Evergreen Oak, or Tamarisk. *Eucalonia macrantha* may also be named as a grand plant, both in flowers and foliage, for walls by the sea.

— In the *Comptes Rendus* for April of the present year M. PRILLIEUX has a paper on the AMERICAN BRIGHT INSECT, *Aphis lanigera*, which is well worth the attention of horticulturists. The insect is described as piercing the under side of the shoots, the woody layers of which become, consequently, transparent greenish, soft and pulpy. The bark at first is not much affected. The true wood-cells, instead of presenting their usual elongated appearance, retain the characters of ordinary cells as in the tissues, which are concerned in the production of "gumming" in the case of fruit trees. These cells and fibres divide and subdivide, and the vessels become isolated and as distinct as if macerated purposely by the anatomist. Near the circumference of the tumour produced by the

FIG. 165.—VIEW AT KAIGALLE ON THE KANDY ROAD, FIFTY-ONE MILES FROM COLOMBO, CEYLON.

of the subject, but also from the light they throw on such cardinal questions as the currents of the sap, the growth of wood, the development of leaves, flowers, fruit, &c. In a recent number of the *Revue Horticole* we find another illustration worthy of being added to the series we have already given at various times. The facts of the case, as given in the French journal above cited, are as follows:—M. CARRELET selected in the spring of 1866 two four-year-old Pear trees, both grafted on the Quince, trained spindle-wise, and each between 5 and 6 feet in height. One of the two, a Beurré d'Arenberg, was left in the ground, and made to act as stock; the other, a Poirier de Charneu [Fondante de Charneu], was taken up with the greatest care, so as not to injure the roots. It was then grafted by approach (inarched) on the Beurré d'Arenberg, but in a reversed position, that is to say, the roots were allowed to grow upwards while the leader was directed to the soil. In this way, when the operation was completed, there were two Pear trees united by their leaders, but the upper one was reversed, with the roots completely exposed to the air; grafting wax was applied to the union, and the

wards, was a graft of Charneu Pear, from whose exposed roots Quince shoots sprang, and on two of these latter were grafted as many varieties of Pears. We are sorry to use the past tense in speaking of this tree, but, most unluckily, the grub of some beetle (*Scolytus*) bored into the graft (Beurré Charneu) and, as it was not at first discovered, the tree perished. Assuming the facts as here stated to be correct—which, indeed, we have no doubt, as other cases of a similar character have been previously published—we have sufficient proof that the old notion still religiously believed in by most gardeners, of an ascending current of sap going up, up, up, and a descending current going down, down, down, requires very considerable modification to make it fit the facts. Such a case, also, requires to be carefully considered by those who maintain that root and stem are separate and distinct organs; if so their distinctiveness does not preclude the one from assuming the properties and fulfilling the functions of the other in case of need.

— Among evergreen shrubs that do well on the south coast we may specially call attention to *PITTOSPORUM TOBIRA*. Its lustrous foliage and sweetly-

puncture of the insects some fibro-vascular bundles may be seen, almost intact and forming a network over the surface. Over this network may occasionally be seen a zone of growing tissue, which also may become hypertrophied in consequence of the puncture of the insects. Generally, however, the hypertrophy of the woody system is quite local, and the bark splits, exposing the swollen tissue which fills up the chink, and which is thus directly exposed to the reiterated attacks of the insects. At the end of the summer vegetation is arrested by the cold, the young and tender cells of the swelling dry up and perish, and thus a deep cavity is formed which penetrates from the exterior to the very heart of the branch. When vegetation begins again in the spring a circular swelling forms around the edges of the wound, as usual in such cases. The young tissue thus produced is available for the food of the young aphides, which have passed the winter in the cracks of the old tumours and in the pits of the bark. Into this young tissue the insects plunge their proboscides, and thus originate fresh growths, which in the course of their development press on, but do not amalgamate with one another. In this manner are produced those large swellings in the interior of which the aphides find

shelter in the winter, while the new growths, annually reproduced, furnish to successive generations of aphides an ever renewed feeding-ground.

— Among the contents of the *Journal of Botany* for the present month are articles on *DEIDAMIA THOMPSONIANA*, the type of *BROWN'S* genus *Thompsonia*, by Dr. MASTERS; note on a new moss from Tasmania by Dr. LINDBERG, and which is stated to be as interesting to mycologists as *Welwitschia* or *Rafflesia* to general botanists. As it seems to be only a lateral-fruited phascoid plant, the analogy seems rather far-fetched, but we are promised further details which may bring to light something more intrinsically important than mere position. Professor CURCHIE furnishes some useful and suggestive notes on plant chemistry; and Mr. BALL continues his enumeration of Morocco plants.

— Cut flowers of NEW CLEMATISSES have been received within the last few days both from Messrs. G. JACKMAN & SON, of Woking, and Mr. CRIPPS, of Tunbridge Wells. Mr. JACKMAN'S is a new double-flowered sort, of a quality. It is referred, along with Tortunei, one of its parents, to the florid type, and has ternate leaves, with rather small ovate leaflets. The flowers are rather over 4 inches across, with very many of the same, but are characterised by the Duchesne of Edinburgh, having about eight rows of sepals, which are obversely lanceolate acuminate, narrowed below into a short stalk-like base, but forming a close rosette about 3 inches in depth. The colour is a decided but exceedingly delicate mauve or silvery-grey, the innermost sepals having here and there a bar or dash of reddish-lilac, which, however, is scarcely apparent. A small tuft of stamens occupies the centre, the filaments of which are white, and the anthers cream-coloured. The petals, which are simple or form leaves are simple, variously formed, and more or less coloured, as often occurs in these double flowers. It is an exceedingly fine acquisition, and is, we believe, to be called *Belle de Woking*. Mr. JACKMAN sends another flower, apparently of the lanuginosa type, which has pale mauve or lavender-coloured flowers, a good deal mottled throughout, especially towards the centre of the sepals, with bright purple, and having purple anthers. This is a six to eight sepal, but variety, characterised by the diameter of 6 inches in diameter, with water-cliptic acuminate close sepals overlapping to the base, so to close in the centre. As a novelty this will be a pleasing variation if constant to its markings, in reference to which it is proposed to call it *C. picturata*. Mr. CRIPPS sends a flower of *Madame Van Houtte*, now pretty well known as a large-flowered white lanuginosa; and also an unnamed seedling, which was exhibited on Wednesday last under the name of *Charles de Woking*. The flowers are reported to have measured to inches across when fresh gathered, the colour being a pale lilac on first opening, and changing as it gets older to a still paler shade, but not bleaching to white. These latter sorts both bear striking and handsome flowers, but we have now so many really fine sorts in cultivation that we can afford to be exceedingly critical, and to require fine form as well as large size and pleasing colours. The narrow-sepal sorts, which do not close up in the centre, are therefore rather at a discount. In some of the modern eight-sepal sorts the four inner sepals alone suffice to meet around the stamens, and such flowers are of course of far higher merit than those which, however large, have narrow sepals which do not close up. This defect attaches to Mr. CRIPPS' Grand Duchesse, and to others of the same type, as *Symeiana*, Duke of Richmond, *Gloire de St. Julien*, &c., though, leaving such critical questions out of view, these are all fine and showy varieties.

— The attention of the President of the General Committee of Management for the forthcoming INTERNATIONAL HORTICULTURAL EXHIBITION AT COLOGNE, having been called to a letter from Mr. WARNER, which appeared in this journal on April 17 (p. 502), he has addressed a communication to that gentleman, the satisfactory nature of which will be gleaned from the following extract, sent to us for publication by Mr. WARNER:—

"I beg to tender you my best thanks for sending me the extract from the *Gardener's Chronicle*, which I have perused with great interest, and whose contents have my entire approval. The committee has also partly foreseen the grievances mentioned therein, and at its instance the Ministry of Agriculture has put at our disposal six large medals of State, which the jury will be invited to award to the best horticultural &c., contributions to the exhibition; moreover, Her Majesty the Empress Queen has graciously promised a special prize of honour, and undoubtedly His Highness the Crown Prince will do the same."

"You would put me and the committee under great obligation by bringing the above to the knowledge of the British public—perhaps it will help to promote the interest in our undertaking."

— A very curious Malvaceous plant, *PAVONIA WLOTZII*, is figured and described in the April number

of *La Belgique Horticole*. In habit and foliage it presents nothing different from familiar types of this family; it is in the flowers that we find an unusual development and colouring of the different parts, approaching in some respects those of *Goethea strictiflora*. The calyculus or outer calyx here consists of two whorls of narrow slender bright red bracteoles, the outer whorl shorter than the inner, which equal the closed corolla. Both the latter and the calyx are of a dull "red-black." From the mouth of the cretular corolla the bright red staminal column protrudes about an inch, and bears numerous blue anthers. The plant from which the figure was taken was about a foot in height. It is a native of Brazil, and was imported by Messrs. JACOB-MARQV, of Liège.

At a meeting of the Edinburgh Botanical Society, last week, Dr. BALFOUR read notes of experiments he had been making on *DIONÆA MUSCIFIDA* and allied plants. These experiments painfully confirmed the suspicions entertained by ELLIS, CURTIS, HOOKER, and DARWIN that the *Dionæa* is a carnivorous, and, it may be added, a most brutal plant. Dr. BALFOUR classified the facts he had observed in regard to it under the heads of irritability, contraction, secretion, digestion, and absorption. The irritability, it seems, is resident in certain delicate hairs, so placed as to be touched by no insect, and which avoid touching them in crawling over. Dr. BALFOUR touched with a needle every other part of the leaf, and no response followed; but no sooner was the point applied to one of these hairs than a contraction of the leaf ensued. Chloroform dropped on a hair caused the leaf to close like a winking eye, but water had no such effect. It was only when the object seized was capable of affording nutrition that the contraction continued for any considerable length of time. A piece of wood was soon released, and so was a dried fly; but when a live fly or caterpillar or spider was enclosed the contraction lasted, on an average, for about three weeks. The leaf at the same time gave out a viscid acid secretion. This appeared to be only the case when an insect was captured, and it was always present on such occasions; but whereas with a fat spider it was abundant, with a shrivelled fly there was very little. The notion that any nourishment was obtained from insects so enclosed and devoured, but not digested, is pointed out significantly to the facts, that young plants of *Dionæa* under bell-glasses had been found not to thrive so well as those left free, and that while a piece of leaf wrapped in another leaf became putrid, a piece enclosed by the *Dionæa* remained perfectly inodorous, but soon lost its red colour, and was gradually disintegrated more and more till it was reduced to pulp. This statement, showing the predilection and ferocity of the *Dionæa*, created quite a sensational sensation among the members of the Edinburgh Society, and the Chairman, while recommending a continuance of the experiments, wisely suggested that they should be completed before the Anti-Vivisection Act comes into operation, since otherwise Dr. BALFOUR may get into trouble. *Fall Mall Gazette*.

— The committee of management of the forthcoming HORTICULTURAL EXHIBITION AT THE DUNDEE GARDENS, ASTON PARK, Birmingham, on July 1 and following days, announce in another column that the time for sending in entries has been extended to Thursday next, the 24th inst., complaints having been made, especially by Rose growers, that the required fourteen days' notice is too long.

We have much pleasure in calling the attention of our readers to the following liberal PRIZES FOR FRUIT, offered for competition at the Royal Horticultural Society's show on July 21 next by Messrs. JAMES VEITCH & SONS. The competition for these prizes is quite distinct from that for the "Veitch Memorial" prizes, and is limited to the *bona fide* gardeners of Great Britain. Entries are to be made, as usual, at the Royal Horticultural Gardens, South Kensington.—On July 7 Messrs. CARTER & CO.'S £50 cup, for the best twenty-four dishes of vegetables, will be competed for; and on the same date Messrs. STURTON & SONS and Messrs. HURST & SON offer several prizes for Peas.

— THE ORCHID-HOUSES AT GUNNERSBURY PARK, ACTON, have been very gay with *Odontoglossums*, among them some fine examples of *O. veicularium*. One plant bore two spikes, one of which had nine and the other seven flowers of great size and beauty, some of the flowers measuring quite 4 inches in depth. A pale form of it, which might be denominated *album*, is very inferior in character. A young plant of this *Orchid*, with two large buds, and throwing out numerous growths all round, bids fair to become one of the finest plants in cultivation. O. Alexandria, for which Gunnersbury is famous, has been very fine also, and has shown considerable variety. There is a very fine spike of *Cypripedium* beautiful, bearing five handsome flowers, which, though to be one of the finest plants in the country, it appears to be scarcely possible that *Orchids* could

be in better condition than those under the care of Mr. J. RICHARDS. *Calanthes* are making a wonderfully vigorous growth, planted in loam and cow-dung and a little charcoal. Mr. RICHARDS has entirely dispensed with peat, believing that it engenders poverty, and causes the points of the leaves to go brown. The genus *Phalenopsis*, represented by *Schilleriana*, *amabilis* and *grandiflora*, is in the most healthy condition, with thick, leathery, vigorous leaves. They are in small baskets suspended from the sides of the house, crocks and charcoal at the bottom, and but very little soil, and putting forth a fine root-growth which appears to like to find its way outside the baskets. The baskets are dipped in water about once a day. *Orchid* cultivators should make a point of visiting Gunnersbury, to inspect the fine collection of these splendid plants.

— Excellent standard plants of VARIEGATED IVY-LEAVED *PLATANUS* *L'ÉLÉGANTE* can be obtained by grafting it on to a stem of the old crimson Ivy-leaf. Some plants of this, recently exhibited by Mr. J. KINGSBURY, Bevois Valley Nursery, Southampton, were remarkable for the fine development of their heads, and they prove capital objects for conservatory decoration.

— While cordially welcoming new additions to garden plants, the great value of some of the older ones should not be lost sight of. As a *FORCING PINK*, or as suited for growing in beds to cut from, what can compare with that fine variety, *Lord Lyons*? It is among the earliest in cultivation, and is so remarkably free of bloom that it is somewhat difficult to get pipings with which to propagate it. The flowers are large, full, and handsome, of a pale rosy purple colour, the petals having a maroon bluish on the base. It supplies a great number of beautiful flowers. It was raised by Mr. JAMES CLARK, Bury St. Edmunds, who also produced that fine variety *Derby Day*, recently shown by Mr. C. TURNER.

— THE DOUBLE PURPLE *SENECIO* is one of the most effective bedding plants used in the flower garden at Gunnersbury Park, Acton—the plants raised from cuttings, not from seed. The plants so obtained make but a spare growth, and flower with great profusion throughout the summer. It also supplies an extremely pleasing and effective hue of colour.

Home Correspondence.

Pinguicula.—I visited the other day the splendid collection of alpine plants, at Todmorden, belonging to the Messrs. Stansfield, and, after looking out the little matter of business that I had come for, I took a hurried glance at the rare rock plants and alpine for which this nursery has been so long famed. Three generations of gentleman botanists are to be seen alive, and to these the stock is intelligible without the name pencilled on a label. But this is not the point in hand, which is, "Have we any proof that *Pinguicula* are able to eat insects?" Seeing some of these plants rather dry in a cold frame I took the liberty to ask the gentleman that conducted me about if he had ever seen any evidence of *Pinguicula* eating anything belonging to the animal kingdom. I paused, anxiously awaiting this experienced planter's reply, and while I gazed on the plants I saw the edges of the leaves cupped a little, as they are reported to be when they are about to prey upon the subjects of the sister kingdom. The dog raises his bristles and the cat's tail gets to the form of a bottle brush when either of them are on the point to slay, and the *Pinguicula* certainly looked threatening. Mr. Stansfield replied, and his reply levelled the poetic idea down to the veriest everyday prose, for, saying the action to the word, he rubbed off some living *Aphides* from the leaves of the *Pinguicula*, and calmly said, "I wish the insects would not eat them." *Alex. Forsyth*.

Wireworms and Vines.—It may please Mr. Pearson, and it will not affect me, to stand upon his dignity in dealing with "persons who do not sign their names to their communications," particularly when his observations are called in question; but I may remind him that the Editors generally know something of their correspondents, as in my own case; that not a few of the important original and other articles which appear in the *Gardener's Chronicle* are by "persons" of this kind, and that in a public journal they meet on common ground, whether on "disputed subjects" or not. While the writer is prepared to vouch for his statements, if necessary, I do not see that his identity is of the least consequence, though it is often made an excuse for want of a better argument. I related my experience candidly about the wireworm, and in a way not likely to be mislead, and I may yet be able to defend Mr. Pearson's notions on the subject conclusively. I found the wireworms in the sods in which the Vines grew; and in one of the latest attacked, as indicated by the leaves flagging,

I found the wireworm beside the eye, when the soil was broken through by myself to discover the cause. This may not be positive evidence, but it is equal to that furnished by Mr. Pearson. He may be correct in his opinion of this subject, and I hope he is, but if it is not founded upon better data than his recently advanced opinion about Vine bleeding being harmless, though it may go on "badly" or for "many days," he may expect his observations to be called in question, without an apology, by those who probably know as much about Vines as he does, and yet do not pretend to know everything. J. S. W.

Spring Frosts.—There is scarcely a day in the year I believe on which we may not in England have a frost. I should almost think that Mr. Tiliery must remember a July 2 about twenty years ago (I think that it was in 1854, but am not quite sure) when there was a frost in Nottinghamshire which killed all the branches in the park at Osberton, and no doubt elsewhere, completely to the ground. C. W. Strickland.

Blue Primroses.—I fear I cannot give you correspondent a clean pedigree for my blue Primrose. Some years ago I crossed a white-stalked Primrose, using the pollen of the old blue, which, though itself sterile, bears fertile pollen. The seedlings were violet, with a decided tinge of the blue, and preserving other resemblances to the pollen-parent. They were fertile, and produced many seedlings, much like themselves; finally, they were mixed up with my general stock. Last year I sowed seed from the best of my lot, and the plant in question came up amongst them. It is just a case of old blood coming out after many generations, hardly to be called atavism, which is applied to another and distinct phenomenon in the animal kingdom. The plant is bearing seed. My new double is just the old double lilac on stilts, but with a larger and somewhat handsome flower. I shall feel happy to correspond with "J. M.," and any assistant him in such matters. R. Trevor Clarke, Welton Place, near Daventry.

The Canon Hall Muscat.—Doubtless the Canon Hall Muscat Grape is one of the finest and best Grapes in this country. As you observe, it is also the worst to set in cultivation. In examining the organic structure of the plant, we have convincing proof of cause and effect. One defect is prevented by planting in proper soil. As organography shows us one defect, so physiology brings out another; we find the sexual organs are imperfect. This is obviated by horizontal training, and a careful regard to the temperature of the soil. If a few lines on the subject will be of any service to your correspondents, I shall be happy to supply them in time of need. Twenty-five years ago I felt the necessity. W. Preston. [Please do.]

Early Peas.—Mr. Miller's remarks on early Peas have induced me to offer a few words on the same subject. I was somewhat surprised to see Laxton's Alpha first on his list for pulling, a sort which I discarded after the first trial, on account, as I thought, of its deceptive character. The pods to all appearance seemed ready to burst, but when opened scarcely a Pea had formed. I may have been too hasty in my decision; but I never said I would never grow it again. Eastes' Kentish Invicta has always been a special favourite of mine, a good cropper, and quite as early as any of them, coming in same time as King-leader and Emerald Gem, which are the two earliest with which I am acquainted, with one exception, viz., William the First—a sort perhaps not so well known, but I think all who have given it a fair trial will endorse my humble opinion that it is a first-class early Pea in every point; its productivity is equal to good as is also its flavour—two good qualities which most people can appreciate, but which few of the early sorts possess. In proof of its earliness I may say I gathered from a row sown across the open garden on February 12, the same time I gathered from Dickson's First and Dest and Kentish Invicta, sown three days earlier on a south border; this, I think, is sufficient to justify me in pronouncing it one of the earliest Peas, and I am fully convinced it is the excellent both in flavour and productivity. Another excellent Pea is Mutton in Parvo, an abundant cropper and of delicate flavour, but not quite so early. Maclean's Blue Peter is another good dwarf Pea; may be sown very closely together, its average height being only 9 inches—a good Pea for small gardens. E. Morgan, The Butts, Harrow-on-the-Hill.

Hailstorm.—On Friday, June 11, about mid-day, we had a very severe thunderstorm, with heavy rain and hail; in a short time the hail covered the ground to about an inch deep, causing great destruction amongst the tender foliage. In the woods the Lime trees look as if they had been riddled with grape-shot, and in the kitchen garden the leaves of the trees upon the walls facing the blast are completely riddled. Lettuce and Celery look as if a flock of sheep had been pasturing amongst them, they are so

cut up; and Peas fit for pulling look as if they were well hammered. Fortunately we had no glass broken with the hail, but along the front of the hothouses the hailstones could be collected in quantity for some time after; and from what I can learn from a certain distance round this locality, the farmers' field Beans and young Turnips have suffered severely. J. Miller, Chumber. [We have received letters from different parts of the country, complaining of the great amount of damage done by the hailstorm on the 11th, and especially in the neighbourhood of Dorking and High Wycombe. Eds.]

Pedigree Seedling Potatoes.—Under the head of "Potatoes from seed an antidote against the disease," you were so good as to publish my remarks in your issue of August 8 last, and I trust you will allow me now to continue my observations on the subject, acquired from practical researches and results since then. In that communication I mentioned that I was pursuing a system of raising annually from seed a consecutive race of seedlings which, after passing through five or six generations in succession, it was my firm belief, would become wholly free from disease, and my progeny therefrom afterwards continue so. A single generation, I therein stated, would not produce the desired effect, having repeatedly tried it from an early period, and always found the offspring as liable to its attack as the parent. My crop last year was obtained from the second generation of seed, and certainly it afforded me every encouragement to continue the process, for I could not discover among the entire crop produced, taken up in August and September, above one or two in the slightest degree affected, while "Peral" appeared so among the old sorts grown by me; and after they were stowed away the former remained perfectly sound, while a good quantity of bad ones were picked out from the latter. However, I do not mean to say that these seedlings are disease-proof. In order to try what the effect would be if left in the ground for some time after their coming to maturity, I allowed a row to stand undisturbed till the end of November, at which period the crop was completely saturated with the winter rains that had previously fallen. When taken up the stems of all were entirely decayed, that is to say in a hard, woody state, and among the tubers I found a considerable portion in various stages of corruption, some of them completely decomposed, but, so far as I was able to judge, no indication of Peronospora was discoverable. They were pupified up with water, and not blackened inside, as occurs when it (Peronospora) is present. In fact, they displayed precisely the same appearance as those stated in my communication to you last July, p. 48, which headed "Potatoes artificially produced," when I also sent you a sample of the rotted tubers for investigation, relative to which you informed me that neither yourself nor Mr. Worthington Smith could detect any trace of Peronospora. In like manner, for the edification of others as well as myself, I have now taken the liberty to forward to you by rail several of the rotted tubers before alluded to, taken indiscriminately, and shall feel exceedingly obliged by you, so kindly favouring me with a report thereon, to confirm into such a mass of corruption when they reached you. I have thought it better to dry what are now forwarded, and trust my having done so will not prevent your being able to determine the question. Assuredly the true malady does not prevail to the same extent in the present day as it did at first, and, therefore, the expectation entertained by many persons at the beginning, that it would wear itself out in the course of time, may probably be realised eventually. It is the usual custom of nearly every grower of Potatoes to attribute to the attack of the real disease all the tubers they find in a decomposed state among their crop, which undoubtedly is an entire mistake, because in unfavourable seasons a vast number more perish from excess of wet than from it, the Potato not being an aquatic plant; and therefore a wet season, I say, is infinitely more to be dreaded than the much talked of and written about "Potato disease," which I believe is Peronospora infestans or any other ailment. Indeed, judging from my rotted seedlings taken up in November, and artificially affected ones as above-mentioned, I very much doubt if wet actually does tend to increase the true disease, according to the general opinion; but this point you can decide, far better than I can, from the samples now sent and those you formerly received from me. Experience has afforded us this undeniable evidence, that if the disease appears even in the finest of seasons, whereas the wet rot does not at all exist under such circumstances. It may be asked, Why did not the wet rot occur previously to 1845 (the year the disease commenced) as well as in the present day? I am not myself old enough to know, from personal observation, what happened antecedently to that period, but an amateur gentleman anticlimaxist residing in this neighbourhood, now on the verge of fourscore years of age (who it was suggested to me in 1870 the seed system I am still continuing), tells me that he per-

fectly remembers the crop being frequently destroyed by wet before then, just the same as now; but the rot occasioned by it not being of a hereditary character, as he considers the Peronospora to be, it did not affect the succeeding crops, and, therefore, created little notice. The year 1816 or 1817, he says, he recollects was a most disastrous one for cereals as well as for Potatoes, the reapers in some localities cutting the corn in October, in the midst of deep snow, and the latter were so affected with rot that they were scarcely worth digging up; nevertheless, the following season proving to be a dry one, there was not then the slightest vestige of rot or any kind of disease among them. Again it may be inquired, Why did not the present prevailing epidemic appear before 1845? That question, of course, neither myself nor any one else can answer. We find that both animals and vegetables are attacked now with diseases that were formerly quite unknown, and I see no reason why the Potato should be exempt from a like visitation. In conclusion, I feel quite convinced in my own mind that the real Potato disease may be entirely got rid of by frequent raisings from seed; but no one, of course, can control the weather, and therefore the crop will always be subject to its influence, according as it may prove to be favourable or otherwise. I have begun to-day frost being now apparently over, I have begun to-day to plant out from the pots my present year's seedlings, these forming the third successive generation. They are fine, strong, healthy plants, with tubers attached already the size of Peas, some of them bigger, and will produce this season Potatoes sufficiently large for table use. The experiment is not conducted on a very extensive scale, but amply so for the purposes intended. After the crop has been secured, I shall, with pleasure, give you a detailed account of the results, should you like to do so. J. A. Whittard, Curmrentons, &c. [We shall have something to say on this matter in a future issue. Eds.]

Pine-apples.—Twelve months ago, when we were forecasting some alterations amongst our Pine pits, the Pines in several of them were planted out to fruit upon the "Hamiltonian system," but unfortunately the heating medium was sadly below par for doing much good with fruiters during the winter months. I selected the strongest of the suckers, and potted them according to their size into 9 and 11-inch pots, using a fresh sandy turf torn into pieces by hand with plenty of half-inch bones and wood charcoal. All danger from compost rot pretty firmly round the suckers into the pots. The suckers, being short and stiff, looked pretty much like old plants. They were plunged in leaves and tan in slide pits, with hot-water pipes for top and bottom heat, and during summer they soon filled their pots with fine healthy roots; with occasional waterings of liquid manure the plants grew vigorously, and by the autumn I determined to fruit them in spring in the pots they were growing in. As the days shortened we lessened the quantity of water for their beginning to move, and left off syringing, and through November, December, and January they were nearly as dry as dust, and kept during the severe winter at a very low temperature. In February I had an old flued pit of thirty-six lights reglazed, the bed for the leaves deepened and filled with best Oak leaves, and as soon as fermentation got above 80° I selected fifty-five of the most likely to fruit, and plunged them into one half of the pit, the bottom-heat ranging between 85° and 90°, the top-heat about 60° or 65°, until I perceived them beginning to move, while water was carefully given until the fruit was almost in sight, warmed to about 90°, with little or no stimulant, but when the fruit came fairly in sight rich stimulants were frequently given in order to support their roots in the small pots. At one time I intended to have repotted them into larger pots; no doubt the plants would have become larger, and in time would have produced larger fruit, but at the same time running the risk of being six months longer in showing fruit than if they had been in two or three smaller pots. They showed fruit in about ten days' time, the temperature being raised to 70° at night and a corresponding higher temperature during the daytime; and now the fruit is about three parts swelled, with shining, clean, broad pits, and looking likely to average nearly 4 lb. each, and with very few exceptions they appear to be going to be a very even lot. They get plenty of air and liquid manure, and no shading. The smallest of the plants in the adjoining division got an extra shift into larger pots, and they look as if they would produce much heavier fruit, but will take longer time to do it. In various quarters it is questioned as to the profit of cultivating Pine-apples in this country, but as most places have a family name, cultivators must act accordingly. On a late occasion I had a visit from a distinguished and high authority; he informed me that no foreign Pine-apples came up to a well-grown English Pine. J. Miller, Chumber, June 7.

Judging Grapes.—In Mr. Forsyth's articles on Judging Grapes he alludes to the Grapejudging at the Pomona Palace, and wishes to know how he came to put Mr. Hunter behind Mr. Uphorn, the

Earl of Ellesmere's gardener. I am glad Mr. Forsyth has given me the opportunity of explaining the reason, as many of the lookers-on might think we had not used Mr. Hunter fairly, because he had got the largest bunches, not having the advantage of examining and testing their other merits in the same way as the judges. The Worsley collection was finer in berry, denser in colour taking the collection through, with thicker and fresher bloom and perfect ripeness as to fact never tasted the Gros Colman and White Lady Downe's so well up in flavour as those. Some of the bunches in the Lambton Castle collection were past their best, the interior and points of some of the bunches were shrunk both in berry and stalk, and were comparatively flavourless in comparison with the other. Even allowing that the sorts were chiefly the large coarse-growing varieties, we could only get two points, that is, size and symmetry in bunch, over the Worsley collection; so we considered the fine qualities of the latter were indicative of higher merit than the large size in the Lambton collection. I always consider perfect ripeness the leading point in judging all sorts of fruit, and size with compactness in bunch the next point. Colour is deceptive in Black Grapes, if they are not tasted, for in the class for two bunches of Black Grapes we sorted out three dishes for 1st, 2d, and 3d: the finest in appearance were two beautiful bunches of Gros Colman, but on being tasted they proved quite sour and unripe, while both the Lady Downe's were newly ripe, and close to a match in appearance that we had to decide the honour by the flavour. Not only in this instance have I found colour a deception, but I have seen a beautiful house of Black Hamburgs, grown without fire-heat, perfection in appearance, but on tasting them they were as sour as if they had been green. This is how judges are often condemned by the lookers-on, because they have no means beyond appearances of testing the real qualities. Yet in judging Grapes there is one thing to be kept in view, that a large bunch of Grapes requires great skill to bring it to perfection than a loose open bunch; so that the latter should not ride over the other because it happens to be a little better in point of ripeness. *James Smith, Watford, St. Helens.*

Primula japonica.—Some discussion appeared in these columns some months ago as to the hardiness of this fine *Primula*, and if it would prove suitable for outdoor decoration. From a plant in bloom with me in 1872 I saved a quantity of seed, which, as soon as gathered, I sowed. In about three months after I had hundreds of fine seedlings; many of these were the spring following planted out, and have now stood two of our cold northern winters without injury save to the larger leaves. They are at present in fine bloom, some of the strongest throwing up to twelve spikes, and from 15 to 18 inches high. *R. F., Fyvie, June 12.*

The Elms in Windsor Great Park.—Visitors to this magnificent park are startled to find notices staring them in the face, warning them to avoid the Elm-trees, because of the danger that is likely to arise from the sudden falling of branches. The warning is thoughtful on the part of the Ranger, and evidences of its necessity are here and there apparent, the limbs hanging on the ground having snapped off within a few feet of the main stems, and displaying a weight that would have crushed human life to a frightful death. It is well to ask whether the prominent displaying of such a notice is all that the authorities are capable of doing under the circumstances, and whether they are powerless to arrest the decay and destruction that must inevitably come. There are no grander features in Windsor Park than the long lines of fine Elms that skirt in a quadruple row the Lang Walk, or border on each side the long grassy glade known as Queen Anne's Ride; but these trees are so far suffering from decay as to have become absolutely dangerous, it is only too certain that unless some strong remedy is applied it may not be many years before such gaps will have been made as to entirely mar the beauty of these avenues, and probably lead to their entire disappearance. Every one acquainted with the Elm knows how deceitful is the appearance of large trees; apparently healthy and vigorous externally, but too often rotting at the core. When trees reach this stage, having reared their enormous heads high in the air, and spread out their immense branches to the wind, it is not to be wondered at if some sudden tempest should hurl branches or even entire trees to the ground with terrific force, as their grip is but a rotten one. If a ship under press of canvas has her masts dangerously strained, there is no resource but to shorten sail, and thus avoid the calamity of the total smash; and it is a fair illustration of what ought to be done in the case of these dangerous trees, as if now carrying more top-hammer in the shape of branches than the trunk is capable of sustaining, common sense indicates that the stems should be relieved of much of the superincumbent weight, and therefore, although it may seem to indicate an act of vandalism, it is worthy of consideration whether a judicious lopping of the heads of these fine trees would not be a desirable course to adopt. If

any one will now take the trouble to compare the terminal growth in the large branches with that immediately beneath where a limb has been cut or broken away, they will perceive how weak and meagre is the first, and how healthy and robust is the latter. If, therefore, all these fine Elms were to be carefully headed-back—not pollarded, but the branches simply shortened in to a reasonable length—there would be at once such a renewed growth as would not only quicken root-action, but would also endow the trees with comparatively a new lease of life, and convert their present dangerous state into one of robust health and comparative security. *A. D.*

Tropical Travelling Dress.—Herewith I send you a photograph (fig. 166) of the travelling dress usually worn by botanical collectors (in fact by all travellers) in the tropics of South America. Doubtless many of your readers will be interested in knowing the use of such a peculiar costume. When travelling for Mr. Bull I found a good light coloured felt that resisted the intense rays of the sun (the heat being something considerable) better than the native Palm hat; and the cape, as hereshown much superior to a coat, as the circulation of the breeze (when one can get it) is more regular over the body. The cape is, moreover, an excellent shade to the shoulders and arms. The leggings are quite indispensable, and as a rule they are made of macintosh, but some of the skins of the wild animals, being very wide, they are brought into use, and allow a free circulation. If in the rainy season one is smothered with mud, which is very often the case, the clothes can be thrown off with the greatest ease,

FIG. 166.—TROPICAL TRAVELLING DRESS.

after unbuckling the bottom strap, which partly holds up the spurs. These latter I must admit are as formidable and as ticklish to the mule as are the ticks and other noxious insects to man. One of these insect pests dives into your toes, and requires the use of a lancet for its removal, and if neglected you are certain to ultimately lose your toes. *E. Shuttleworth.*

Confers.—Mr. Murray has happily anticipated my reply to the objection raised by him against the assumption that all the plants in this or any other country whose leaves bear the characters lately attributed by me to *Picea magnifica* and *P. nobilis* respectively are of similar parentage respectively. But I cannot agree with him in thinking that the only way left us to prove it is to wait until "the plants in question have borne cones"; it must be argued out in another way. There are a few large plants here that I know to have been raised from seeds extracted from a cone similar in every character to the one illustrated in your journal; and as their leaves are structurally different from the leaves of thousands of plants that I know to have come from seeds extracted from home-grown cones of *P. nobilis* pure and simple, I consider that these few plants of *P. magnifica* will do to judge the questionable sub-triangular-leaved nobilis plants by, referred to by Mr. Murray; and if he will kindly send me leaves of a few of them, I will have pleasure in making the comparison and in reporting the result. The section of leaf of *P. nobilis* figured in last week's *Gardener's Chronicle* is evidently from near the base of the leaf, for all the nobilis leaves that I have seen were sub-triangular near their points; and even very old leaves—say eight or nine years old, their extreme age—generally assume a sub-triangular outline towards their base, but without

ever losing their peculiar gorge-like groove; so that it is highly probable that the plants referred to by Mr. M. may be *P. nobilis* after all. But it is not so much a question of angle or no angle as it is of groove or no groove; and I hold that the leaves of nobilis are grooved towards their base, while those of magnifica are not. *George Syme, Elvaston Nurseries, Borrowash.*

Strawberry Culture in Pots.—Under the above heading I see your correspondent "W. P." says the usual remedy for a good supply of water to Strawberries in pots is a simple wooden trough shelf. I am surprised to read that a practitioner of fifty years' standing should still recommend so cumbersome a method of pot culture, or, indeed, anything allied to the old and properly discarded saucer system. I read with some interest the advocacy of some gardeners who I thought had buried their saucers in oblivion long ago. I can understand in some measure people who grow say two or hundred plants in pots, and who can afford a small pit in which to place their plants from start to finish, imagining that there is some virtue in their turf shelves; but I am at a loss to understand how people who force a couple of thousand plants in vineries and Peach-houses could possibly adopt the turf or saucer system. I am expected to keep up a supply of Strawberries from the middle of March until fruit are gathered from the outside, without a Strawberry-house, and I am afraid if I adopted "W. P.'s" *modus operandi* I should very often find myself in difficulties, if vegetable life be in any way allied to animal life. I don't think any of us would like to be propped up in a water-barrel to imbibe its contents whether we wanted it or not. Long before I became a head gardener, some of my ablest masters placed their saucers on the shelf; this was in the days when we used to strike Tom Thumb Pelargoniums in bottom-heat. How, I ask, are amateurs to draw a line between such conflicting theories as we have had propounded in the different journals on Strawberry forcing lately? The sum total of my practice I will give in a very few words. I have my own pet varieties, and take means to procure running as early in June as I can; the plants are liberally treated during the summer months. Bear in mind they must make no second growth. In autumn the plants are plunged amongst leaves in small pits specially erected for the purpose before the heavy autumn rains set in; frames will do as well. They must be subject to no chrying off, nor stewing. About the middle of November or the 1st of December we start the first batch with the early vinery and Peach-house; they are not hurried until the fruit are fairly set, after which time they are pressed according to circumstances. When the fruits begin to change colour they are taken to a cooler and drier atmosphere to insure flavour. One word as to watering; the "careless chap" is not tolerated in the forcing houses—he gets a spade or a barrow, which he is not likely to injure. A good 6-inch pot packed with healthy jugs will want a quantity of manure-water, but we do not care to administer any over-dose. All the turf trays, saucers, &c., which "W. P." may use, will never make up for what must be stored up in an embryo state the previous autumn, and using saucers is a very good plan for losing all your bottom roots. *W. Hinds, Gr. to Sir Thomas Edwards, Moss Bottom, Liverpool.*

The Royal Horticultural Society.—The report of the meeting at South Kensington on the 4th inst. holds out a hope that the Society may be put on its legs again, and that it is very desirable that those who wish to see the Society take its proper place amongst the fostering societies of arts and science should do their best to get the Society on its sound and healthy position again. There are about the country many hundreds of floral societies, who hold one or more exhibition every year, and a great number of whom have a good balance in hand. Connected with these societies are invariably some who are known in the gardening world, and if an appeal could be made to these societies, backed up by proper local influence, that money grants should be given from their funds in hand or from their forthcoming exhibitions to help the Royal Horticultural Society out of their present temporary difficulties, I feel that something would be done. I have just referred to the report of the first International Exhibition, in 1866, at South Kensington, and I find that Glasgow, Bradford, Manchester, Coventry, Doncaster, Chelmsford, and other towns, contributed good sums of money in support of that exhibition. Could not a somewhat similar organisation now be put into operation to help the Royal out of its troubles? I think that if some of our practical nurserymen could be on the committee—men who are thoroughly conversant with the working of a large business which must be made to pay—they would soon pull the Society through. It is sheer nonsense to say that there would be too much trade influence on the committee, or that selfish interests would predominate. With such an offer as Mr. William Paul's, and such liberal help as Mr. Bull's, and others who have practically shown that they have the interests of

the Society at heart, ought not these men to have a greater voice in the management of the Society's affairs? Cannot one or more great fruit and autumn flower exhibitions be arranged for the Society's benefit this year—say one in London, and another at Birmingham, which Mr. Quilter might perhaps be induced to take in hand, and Mr. Findlay another at Manchester? Liverpool and Leeds would be great centres for others, if arrangements could be made with the local societies and if Mr. Kerr, of Liverpool, and his coadjutors took up the matter, I am sure that success would follow. I am old enough to remember what the Horticultural Society was thirty years ago, in its Chiswick days, and I want to see a "going back" to the practical doings of those days, when the Society commanded the respect of all who took any interest whatever in good gardening. *D. W.*

—We cordially agree with your suggestion that at the present crisis in the affairs of the Royal Horticultural Society "the whole body of horticulturists, amateur and professional, should stand shoulder to shoulder in support of their craft," and that no better earnest of their resolve to do so can be shown than in holding a great show, the spontaneous effort of the whole body. We therefore shall be most happy to co-operate heartily in carrying out your suggestion of holding a great show on July 21 next, and we sincerely hope that our brother nurserymen will likewise come forward and give practical effect to the suggestion by the unanimous consent that shall secure a grand success. *James Veitch & Sons.*

Pyrethrum Golden Gem.—Under this name I have now growing a new golden form of the Pyrethrum that has a different habit of growth from the old Golden Feather, but I have doubts as to whether it will ever displace that well-known variety. Seedling plants of the Golden Feather flower but little the first year, and then not usually until the autumn, when about one pinching saves the plants for the season. Golden Gem, on the contrary, starts off to flower at once, and has a more upright and less bushy habit, although very handsomely cut, are not sufficiently dense to produce that rich golden hue so much desired in a bedding plant. I find Golden Gem to be simply the variegated duplicate of a green variety common enough in gardens, and which I should imagine must be *pinnatifidum*, as the leaves are so deeply cut. The old Golden Feather, *Pyrethrum Parthenium aureum*, is the very best golden-leaved bedding plant we have, and it will take a remarkably good thing to displace it. *A. D.*

Green Maize.—I have to thank Mr. Alexander Dean, of Bedford, for his account of the younger Mr. Cobbett's experience in the cultivation of Maize in this country. Mr. Cobbett and the writer are evidently on separate tracks. I do not care so much about the ripe corn as he does, for reasons which I will name by-and-by, but must say to every practical gardener that green Maize will have to be provided for the table of the gentleman, whether the gardener be agreeable or not, for the winter he will not be put off without giving it a fair trial, and the whole is so perfectly feasible; but it is necessary to correct one or two statements that have hitherto been held as guides in the cultivation of Maize. The time of sowing, or rather of planting Kean's Forty-day Maize, should be about the last week in May or first week in June, and not in April—at all events in the midland and northern counties. The nicety in point of time, when half-hardy plants may safely be trusted out-of-doors, has been long settled by dearly bought experience. Another statement, that Maize will not bear to be transplanted like bedding plants, but must be sown where it is to remain, is likewise "inexact," for the variegated variety of Maize is bedded-out like any other denizen of the flower garden. Mr. Dean, speaking of Cobbett's corn, says some were dibbled like Cabbage plants, in dripping weather. Surely, then, gardeners may lengthen the summer by growing Maize in pots to be afterwards planted out; but a better plan would be to sow the Maize in a cold frame on turf, and let the seeds with a set on each, and thus plant them out honestly—not with the dibber but with its maker's representative, the half-circular planting trowel, not forgetting to give the sets a sound watering. The small growing kinds or varieties of Maize, as "Kean's Forty-Day Maize," and "Cobbett's Improved," are the only kinds yet known to come to perfection in our climate, and when gardeners have got so far as to supply the table with green ears of Maize as easily as they supply green Peas now, the treatment for the corn grown in fields will come long a day behind. Mr. Cobbett's remark, that the Potato "the accursed root," because in his political philanthropy he reckoned that the peasant who could not afford to live upon anything better than Potatoes was far too low in the social scale. No doubt he was so, and no doubt he is so still, but the Potato, the favourite of young and old, of rich and poor, never had any share in the peasant's degradation. The Maize differs from all corn plants and grasses with which I am acquainted in the extraordinary natural

protection with which its seeds or ears are provided which almost sets the weather at defiance; for whilst Wheat, Oats, Barley, and hay are all liable to be spoiled by foul weather in harvest time, the Maize may be delayed, but as it is done up in wrappers by Nature, it seems designed to meet the exigencies of our changeable climate. The advocates of field-culture for ripe Maize must bear in mind that Maize meal is never likely to be relished in this country, and that it would only rank with that of Peas or Barley, however nourishing it might be; and this fact kept in view will help to moderate our ideas about following the elder Mr. Cobbett's advice to try to grow Maize in Ireland instead of Potatoes. There can be no doubt that plants 6 inches high in pots, &c., can be successfully planted out in gardens up to the middle of June, and produce a crop of green Maize for the table—a delicacy declared by good judges to be fit for a prince. *A. F.* [We find that Maize never starts growing in earnest till real summer weather sets in, and then it goes away rapidly. Hence there is no advantage in planting early. EDs.]

Frost.—Mr. Tillyer complains of frost so late as the end of May. We should be glad if May would terminate the frost in Aberdeenshire, for now, while writing (on the evening of June 12), we have had about a half-hour of a steady hailstorm; ground white, and some of the pieces three-eighths of an inch in diameter that had been sown in the middle of May. The only damage I see as yet is the Gooseberry trees a little thinned, and Potato leaves riddled as if by shot; but I am apprehensive of frost, and covering with tiffany some of the more select 3s. 6d. a lb. sorts, because last year about this same time (June 14) French Beans, Potatoes, and a few other tender things were blackened on that evening. Four years ago, on June 17, the same occurred; but upon the whole this season has been very fine, and till now more than usually free from frost. While speaking of Potatoes, I may mention another American sort of recent introduction, and not in Hooper & Co's list in to-day's *Gardeners' Chronicle*—viz., Compton's Nonsuch. It is well spoken of in America, and a rich cropper, but so recently brought over I can say little about it. *R. F., Eves.*

Reports of Societies.

Leeds Horticultural: June 9, 10, and 11.—This Society has now for a number of years stood in the front rank of provincial societies. This, the twelfth annual show, was the best, taking it altogether, that the Society has had. Stove and greenhouse, flowering and fine-foliage plants, were not only produced in fine condition, but in such quantities as to make a grand display. Orchids were forthcoming in large numbers and in the best possible order, occupying the whole of one side of the centre stage of a very large tent. The rich treat the lovers of these plants enjoyed will be understood when we state that in addition to the fine collections staged by Mr. B. S. Williams, and Messrs. M. Dixon, Beverley; and Mr. Toll, Manchester, in the nurserymen's class, several of the leading private growers from the Manchester district mustered in strong force, including Mr. Hubberstey and Mr. Mitchell, in addition to those growers in the neighbourhood of Leeds, making altogether an exhibition of these most attractive plants well worth seeing. Ferns also were magnificent, the groups staged by Mr. Hubberstey, gr. to O. O. Wrigley, Esq., Bury, Manchester; and Mr. Thornber, gr. to T. M. Shuttleworth, Esq., Howick House, Preston, were such that it would be impossible to match in the country; they received deservedly exult prizes. Pot Roses, as might be supposed, from the season being so far advanced, were past their best. Cut Roses were staged in considerable numbers and in fine condition. Pelargoniums were well shown and very attractive, almost filling a large tent. There was not a great display of fruit, but some of the Grapes shown were very good.

The show was held upon the grounds of the Leeds Horticultural Garden Company, a place well adapted for the purpose. There are several essentials necessary to the success of horticultural and kindred societies, the two most important of which are a thoroughly efficient committee of management, and the attendance of the public in sufficient numbers to afford the requisite support. Nothing short of the determined perseverance of the committee, and the immense numbers of the people in the northern counties who will go to a flower-show in anything short of incalculable numbers, could have enabled the Society to have held its present show under the remarkable recurrence of bad weather that almost yearly accompanies their shows; the present was no exception, for after an unprecedentedly dry period down came the rain all the three days.

In the open class of twelve STOVE and GREENHOUSE plants Messrs. E. Cole & Sons, Withington, Manchester, were 1st with a fresh, clean grown, and well-flowered lot, the most meritorious of which was a magnificent example of *Erica Massoni* major, 4 feet

through, in the finest possible health, and profusely bloomed; *Darwinia tulipifera*, a complete sheet of flowers from the base to the top, 5 feet through; a good example of *Anthurium Scherzerianum*; the Willow-leaved *Ixora*, *I. salicifolia*; *Azalea Criterion*, finely flowered and well coloured; and other good plants. Mr. Cypher, Queen's Road Nursery, Cheltenham, showed a smaller group very well bloomed, and nicely arranged as to colour, conspicuous amongst which was *Allamanda grandiflora*, *Ixora Williamsii*, very large and fine trusses of flowers. *Statice profusa*, indispensable for its colour; *Darwinia fuchsoides*, *Azalea Duchesse de Nassau*, the true variety of *Aphelaxis nacrantha rosea*, and *Staphanotis floribunda*. Mr. Stevenson, Lark Hill, Timperley, Manchester, also exhibited in this class, and amongst others, had good examples of the charming white *Erica obobata*, *Dracophyllum gracile*, a good *Aphelaxis*, and a well-flowered *Pimelea mirabilis*. In the class for six flowering stove and greenhouse plants (amateurs) Mr. Thornber, gr. to T. M. Shuttleworth, Esq., was well 1st with large finely-grown plants. He had a good *Pimelea mirabilis*, 5 feet through, beautifully coloured; *Azalea Iveryana*, and a large *Erica depressa* in good bloom. Mr. Fox, Lidgett Green, Bradford, was 2d, with a nice well-grown lot, in which was *Dracophyllum gracile*, *Darwinia tulipifera*, and *Allamanda grandiflora*; Mr. H. Oxley, Weetwood, Leeds, was 3d, his best being *Statice brassicifolia*, and *Erica venicosa magnifica*. Nicotiana, amongst others, a fine coloured *Croton andulatum* and *Cycas circinalis*, 2d, Mr. Stevenson; 3d, Mr. Oxley.

ORCHIDS were in great force, all the classes being well-filled. In the nurserymen's twelve, Mr. Williams, Holloway, was 1st, amongst others having a remarkably large finely bloomed *Cypripedium barbatum superbum*, *Masdevallia Harryana*, *Saccolabium guttatum*, *Anguloa Clowesii*, *Laelia purpurata*, large and fine, and a good *Cattleya Mossiae*. Mr. Dixon, who was 2d, had *Odontoglossum Alexandreae*, *Oncidium purpuratum*, *Aerides Clowesii*, *Aerides odoratum*, and *A. Dayii*. Mr. Toll, Hullard Hall Nursery, Manchester, was 3d; in his group was a remarkable fine dark variety of *Laelia purpurata*, *Oncidium Weltoni*, a *Cattleya Mossiae* and *C. Mendelii*. Six Orchids were extremely well shown by Mr. Hubberstey, gr. to O. O. Wrigley, Esq., his plants being large and beautifully-flowered. *Odontoglossum Biontii* was here, with a dozen finely coloured well-developed spikes, *Masdevallia Harryana*, grandly done; *Saccolabium procumbens*, amongst good ones, and an excellent *Aerides Lindleyana* in splendid condition. Mr. Mitchell, gr. to Dr. Ainsworth, Broughton, Manchester, was 2d, with a smaller but excellent six, his best being *Aerides Lobbia superbum*, with five large branching spikes; *Saccolabium guttatum*, equally well done; a magnificent *Aerides Schroderii*, having four fine branching spikes. Mr. Goddard, gr. to W. Hadwen, Esq., Fairfield, Manchester, was 3d. His most remarkable plants were *Oncidium crispum*, *Aerides Fieldingii*, in fine order, and *Cattleya Warneri*. For three Orchids Mr. Hubberstey was also 1st, with beautiful examples of *Saccolabium ampullaceum*, *Odontoglossum Alexandreae*, and *Masdevallia Harryana*. Mr. Mitchell, 2d; his best plant here was *Aerides Lindleyana*, the largest spike of which had three side branches. Mr. Hubberstey also staged an extra group of Orchids, which received an award; amongst them was the lovely *Odontoglossum vexillarium*, with three good spikes; two distinct examples of *Odontoglossum Roezlii*, *Dendrobium Bensons*, *Odontoglossum Pescatorei*, a large pot of *Cypripedium avenae*, *Masdevallia Harryana*, and a large profusely-bloomed *Dendrobium Devonianum*, still one of the finest Orchids grown.

AZALEAS were very poor, the principal prizes being withheld. It is surprising how comparatively few growers at the present day bring these easily-grown plants out in the condition in which they are capable of being produced.

STOVE and GREENHOUSE Ferns were quite a feature; the collections staged by Mr. Thornber and Mr. Hubberstey were grand examples of skillful plant growing, and were deservedly placed equal 1st, so nicely balanced were these two lots that it is a difficult matter to point to the best plants amongst them. Each showed three *Gleichenias*, the same varieties in both collections—*G. fabelata*, *G. Splachneae*, and *G. rupestris*. Mr. Hubberstey had besides a marvellous plant of *Davallia Mooreana*, *Cyathea dealbata*, and *Nephrolepis davallioidea*. Mr. Thornber had in addition to his *Gleichenias* a grand *Cibotium Schiedei*, 12 feet across, and as green as a Leaf; and

Cytha dealbata and Dicksonia antarctica. Mr. West, gr. to Mr. G. Joy, Esq., Headingly, Leeds, was 2d, with a large and well-grown lot, including *Thamnopteris Nidus*, 6 feet high and as much through; a splendid *Dicksonia antarctica*, and the elegant drooping *Goniophlebium subcauculatum*. For three Ferns, Mr. Thornber took 1st, with *Gleichenias microphylla*, *semi-vestita*, and *Spelunca*, in perfect condition, averaging over 5 feet through. Mr. Eastwood, gr. to F. W. Tetley, Esq., Westwood, Leeds, was 2d, with three good Ferns, *Dicksonia squarrosa*, *Cibotium Schiedei*, and *Cytha dealbata*. Hardy Ferns were well and numerous shown. For twelve Mr. Thornber was 1st with a well-grown large even lot; Mr. Frankland, gr. to J. Barran, Esq., Chapel-Allerton, Leeds, 2d, with smaller but nicely grown plants; Mr. Dixon, 3d. Six hardy Ferns: Mr. Stevenson 1st, with a good six, the kinds distinct—a point not always sufficiently considered by exhibitors of this class of plants; Mr. Thornber 2d.

LILYUMS.—For these Mr. Eastwood was 1st, with well flowered but small varieties of *Lilium auratum*; 2d, Mr. T. Dale, gr. to Armley Lodge, Leeds.

ROSES in plenty were past their best, except the small plants. The season being too far advanced the leading growers from the South were not able to put in an appearance. For twelve Mr. H. May, Hope Nurseries, Bedale, was 1st, as also for twenty in 9-inch pots; Mr. Wright, gr. to G. Talbot, Esq., Leeds, 2d; Mr. Dale, 3d. The plants in these collections were nice and fresh, averaging some half-dozen or over good flowers each. For six in 6-inch pots, Mr. Wright was 1st, Mr. Eastwood 2d, and Mr. Sleightholm, gr. to Mrs. Wood, Armley, Leeds, 3d, with fair examples of moderate sized plants.

PELAGRONIUMS were an exhibition in themselves, filling the centre stage (raised in tiers) of a large tent, effectively divided down the middle by a row of tall Fuchsias. There was a close run between Mr. May and Mr. G. Edward, York, for twelve show varieties, Mr. May taking 1st honours, Mr. Edward 2d. In the winning group were finely-flowered examples of Emperor, Captain John, Belle of the Ball, Queen of Whites, Mary Hoyle, Pericles, and Rose Celestial. Mr. Edward had, remarkably well done, Congress, Royal Bride, Mrs. Harvey, Desdemona, Heirloom, and Queen Bess. Mr. Eastwood was 3d. For six, in the amateurs' class, Mr. Eastwood was 1st, with moderate-sized, well-grown plants; Mr. Winterbourne, gr. to W. L. Joy, Esq., New Wood Mount, Leeds, 2d. Six fancies (open). For these Mr. Eastwood was also 1st, showing an even, well-flowered six; Mr. Edward 2d, his plants being a few days short, or the tables would have been turned between 1st and 2d; Mr. Winterbourne 3d, his plants also insufficiently open. Zonal Pelargoniums were large and profusely bloomed. Mr. Winterbourne was 1st, with a splendid flowered lot, but containing too many red roses; Mr. W. Winterbourne, gr. to T. Simpson, Esq., Westwood, Leeds, 2d, with a fine assortment of colours, not quite so profusely flowered; Mr. Wright and Mr. Hodgson, gr. to W. L. Jackson, Esq., Chapel-town, Leeds, equal 3d. Six Nosegays: Mr. W. Winterbourne 1st, Mr. Eastwood 2d, Mr. Wright 3d. The competition in this class was very close. Six Doubles: Messrs. H. F. Smith & Son, Selby, 1st. Madame Michael Buchner in this collection was very fine, bright pink, a profuse flowerer. Six Tricolors: Mr. J. Lazenby, Apperley Bridge, near Leeds, 1st, with large well coloured examples—equal 1st, Mr. Fox; Mr. S. Hartley, Hendingly Nursery, Leeds, 2d; Mr. Edward 3d. The plants shown in this class were well done, but nothing new as to varieties. Six Bronze Pelargoniums: Mr. S. Hartley 1st, with a finely coloured lot of moderate-sized plants; Mr. Lazenby 2d, Mr. W. Hodgson 3d.

FOXGLOVES, usually the most dejected-looking plants brought to an exhibition, were here splendidly shown. Mr. Stanley was 1st with a grand lot of seedlings, having enormous flowers of a half-erect habit, and fine in colour; Mr. Eastwood 2d, Mr. Backhouse, gr. The Wyther, Kirkstall, Leeds, 3d.

CUT ROSES were produced in considerable numbers, and, for so backward a season, in good condition. Mr. May was 1st for forty-eight with a very uneven lot, containing some good flowers and some very inferior. Messrs. Paul & Son, Chessnut, 2d; Mr. Turner, End A Nurseries, Slough, 3d. Mr. Turner was 1st for thirty-six with a beautiful even collection. Messrs. Paul 2d, Mr. May 3d. In the class for twenty-four Mr. Turner was again 1st, Messrs. Paul 2d, Mr. May, 3d. Mr. Turner was awarded a First-class Certificate, and a prize in addition, for a box of twenty-four flowers of his fine new Rose, Miss Harard, a pink, flesh-coloured variety, of great merit, very large, vigorous in habit, and having all the appearance of a good grower. Messrs. Paul's new Rose, Emily, is a fine class. It is considered a variety, this also has, so far as can be judged from a single bloom, the appearance of being a fine variety—pink with a shade of violet, splendid petal, and very full.

For six dinner-table decoration plants Mr. Thornber was 1st, with a good lot of plants, but a little too large for the purpose; Mr. Dixon, who was 2d, had a smaller very nice lot; Mr. Hubberstey was 3d, and some of his also were too large.

Group of flowers arranged for the dinner-table: Here Mr. Cypher was a long way ahead of the other competitors, his exhibit being composed of good flowers, most tastefully arranged, not overdone with a profusion of colour. Mr. Wright was 2d; Mr. J. Slater, gr. to Mrs. Hill, Apperley Bridge, 3d. In bridal bouquets there was a strong competition; Mr. Slater 1st, Mr. J. W. Jessop 2d. In the coronation sponding class for ball-room bouquets Mr. House, Eastgate Nursery, Peterborough, was 1st; Mr. Frankland 2d. Twelve bunches of cut flowers: These, as always is the case when produced in quantity, were very effective; Messrs. Cole & Sons were 1st, with a very fine collection, consisting of *Ixoras*, *Heaths*, *Allamandas*, *Stephanotis*, *Pimeleas*, &c.

There was not a very large show of fruit. For four dishes, Mr. Clark, The Gardens, Studley Royal, Ripon, was 1st, showing Black Hamburg Grapes, a Melon, Prince of Wales Plants, and Violet-leaved Nectarines. Three bunches of Black, and three bunches of White Grapes: Mr. Smith, gr. to W. Blinkhorn, Esq., Waterdale, St. Helen's, was 1st; his Muscats were magnificent, good in bunch and berry, and finely coloured. The Black Hamburgs accompanying them were also good. Mr. Wallis, gr. Kirby Hall, York, was 2d. Mr. Smith was 1st for two bunches Muscats, equal in quality to and larger than those he exhibited in the class for six bunches. The 1st was also 1st for a Pine, Black Grape single dish; Mr. Wood, gr. to A. Wilson, Esq., Tanby Hall, Hull, was 1st with moderate-sized bunches, well-coloured, and even in berry. Heaviest bunch of Grapes: 1st, Mr. Wallis; 2d, Mr. J. Noble, Boston Spa, near Leeds. Dish of Peaches: 1st, Mr. Woodfield, The Gardens, Osberton, Worksop. Nectarines (small dish): 1st, Mr. Westcott. Melons: 1st, Mr. Woodfield. Strawberries: 1st, Mr. Wallis; 2d, Mr. Eastwood. Single fruit in a pot: 1st, Mr. B. Crowther, gr. to Feirn, Esq., Mootown; 2d, Mr. Backhouse. Two Pines in pots: 1st, Mr. Sleightholm. Brace of Cucumbers: 1st, Mr. J. Clark.

Mr. Williams exhibited a fine group of new and rare plants, for which he received an award. Messrs. J. & W. Yates, The Nurseries, Heaton Norris, Manchester, also had a miscellaneous group of flowering and fine-foliated plants, which likewise received a prize. (From a Correspondent.)

Royal Botanic: June 16.—This proved to be an even better show than the last, the large show tent being fairly filled with good things. Stove and greenhouse flowering plants were perhaps in smaller numbers than they were in the last year, but the fine-foliated plants very good and plentiful. Orchids, remarkably good in the metropolis. Pelargoniums, quite first-rate, and of new plants the show was exceedingly fine. During the judging the rain came down in torrents, and threatened to spoil the day as far as visitors were concerned, but the afternoon proved fine, and there was about the usual attendance. In the morning the Sultan of Zanzibar and several members of his suite visited the exhibition, and remained for some time in the tent and grounds, with which his Highness appears to have been highly gratified. He was especially pleased with what he saw in the great tent, and, turning to Dr. Badger, who, earlier in the day had been extolling the beauty of Englishwomen, he said, "If your Englishwomen are as beautiful as your flowers, this country must indeed be a paradise." The Roses and other cut flowers were examined with much interest, and a grand new seedling Rose, shown by Messrs. Paul & Son, and named in his honour that morning, came for a fair share of his approval. In departing he repeated, what he had said more than once previously at other places, that he must return some other time. It is stated that, when being driven through the Park, he expressed his admiration of the fine trees, but thought they would be better if they bore fruit!

STOVE AND GREENHOUSE flowering and fine-foliated plants were, as usual, the leading features of the exhibition, and as a whole they were of quite first-rate quality, the only fault to be found being the old one of sameness in the plants shown. Whatever may be the case in the provinces, we in London certainly suffer from over-doses of a certain set of plants which it seems impossible to persuade our cultivators are not the only things worth growing. Regularly as the shows come round are the old familiar faces trotted out, sometimes better and sometimes the worse for their winter's rest, but always the same everlasting *Paul's* *Conia*, and *Conia* (for which it would seem that no metropolitan exhibitor considers a collection complete), *Clorodendron Balfourianum*, *Stephanotis floribunda*, one or other of the common *Aphelicias*, *Draconhyllum gracile*, *Darwinia tulipifera*, an

Allamanda, an *Ixora*, an *Azalea*, one or two *Heaths*—and with these the changes are rung with unfading regularity, breeding a positive feeling of disgust in the spectators which intensifies as the pastifal to a degree. For this the societies are the most to blame, inasmuch that they do nothing to encourage young and rising men to enter the lists. Lately Mr. Baines held the lead, now Mr. Ward carries the trump card, and young growers naturally ask what chance they have against such giants. None at all, at present, but let the managers of exhibitions offer liberal prizes to be competed for by men who have never before shown in those particular classes at their respective exhibitions—and after a while has won, say two or three 1st prizes, let him be drafted into a champion class, to give those behind him a chance—and a move out of the present deadlock must certainly be the result, to the decided gain of all concerned. Unless some such scheme is carried out the public, who are the main supporters of horticultural exhibitions, must become more and more tired of paying to see the same things, and it needs no prophetic to predict the result, not our readers compare the reports of the shows for the next few years with those of to-day, and see what difference they will find in the plants shown in the more important classes. None at all—the only difference is a slight variation from time to time in the names of the exhibitors. Who will be the first to start a reform?

We must now come back to the subjects before us, and have to state, as we have often done, that Mr. May was 1st in all the classes he showed in, and well withal, to his credit, notwithstanding the objections before stated. In his group of twelve the largest specimen was one over 6 feet through of *Erica Cavendishiana*; *Kalosanthes Phoenix*, 4 feet over, and flowered as finely as it is possible to do it; *Erica tricolor impressa*, a large plant, nicely flowered; a specimen of *Aphelicia macrantha purpurea*, to which the same observations apply; *Bougainvillea glabra*, a large plant, in nicely bloomed; *Clorodendron Balfourianum*, a group of smaller plants; Mr. Carr, gr. to P. Hinds, Esq., in the foregoing were again represented, the variations consisting of *Primula mirabilis* and *Ixora coccinea superba*, &c.

In the amateurs' class for six Mr. Ward staged *Ixora Williamsii*, a grand plant with a profusion of trusses over 6 inches across; *Statico profusa*, *Erica Cavendishiana*, *E. Candolleana*, *Stephanotis floribunda*, all well-grown specimens. Mr. Childs, gr. to Mrs. Fow, Ewell, and Mr. W. Mearns, gr. to W. Whitley, Esq., Guildford, also competed. In the nurserymen's class for six, Mr. B. S. Williams had *Allamanda grandiflora*, 3 to 4 feet through, and very well flowered; a fine *Dipladenia amabilis*, and a very large well-flowered *Darwinia tulipifera*, &c. From Messrs. Jackson & Son came large and well-flowered examples of *Draconhyllum gracile*, *Aphelicia macrantha purpurea*, *Bougainvillea glabra*, *Statico profusa*, &c. Mr. Morse also came in, and Mr. Jackson & Son also put up a neat lot of plants in the class for twelve in 12-inch pots, but there was not a single novelty amongst them.

The amateur's class for six fine-foliated plants was a particularly good one both as to numbers and quality. A new exhibitor here, Mr. Strahan, gr. to P. Crowley, Esq., Croydon, had large and very finely coloured specimens of *Croton angustifolium* and variegatum; a perfect plant of *Dracaena australis*, about 6 feet high; a good *Phormium tenax variegatum*, *Alcaesia Lowii*, &c. From Mr. Child came amongst others a very fine plant of the Tasmanian *Gleichenia dicarpa*, and a very taking lot from Mr. Legg, gr. to S. Ralli, Esq., included a handsome pair of pyramidal *Crotons*—*Weismanni* and *interruptum*, a handsome *Geonoma punila*, and grand plants of *Diefenbachia Bausel* and *Alcaesia Lowii*. Mr. D. Donald also competed, with a very handsome *Coccoloba circinalis*, *Croton angustifolium*, variegatum, both very fine, and a large *Pandanus elegantissimus*, &c. In the nurserymen's class Mr. B. S. Williams staged twelve *Crotons*, a very fine *Livistonia Cycas*, *Pandanus*, and *Gleichenia*, all in the best of condition. Miscellaneous contributions in this section consisted of an exceedingly fine group of *Draconas*, and a smaller one of *Crotons* from Mr. Bull; an attractive group of small Palms from Mr. J. H. Ley, Croydon, and a collection of *Cadidiums* from Mr. Clark, gr. to A. Shaker, Esq., Hampstead.

The collection of ORCHIDS brought together was as large and as good in quality as any that has been seen for some time in the South of England, the bank usually devoted to them being very well filled on this occasion. In the amateurs' class for six Mr. Denning, gr. to Lord Lodesborough, contributed a fine group, including a beautiful bit of *Dendrobium Bensonei*, *D. formosum*, with fourteen very large flowers; *Cyclopogon*, a very strong one, the flowers on which were particularly large and bright; *Laelia purpurata*, with three spikes; *Aerides crispum Lindleyanum*, with two fine spikes; and *Anguloa Clowesi*, very fine. From Mr. J. Ward, gr. to F. G. Wilkins,

Esq., came, amongst others, a plant of *Masdevallia* *Harrayana*, with fifteen brightly coloured flowers; *Odoglossum Blunziei*, nicely bloomed; *Phalenopsis amabilis*, with eight spikes, &c. *Lycastris aromatica* and *Vanda survis* were nicely shown by Mr. Childs, and *Acinetia Humboldtii*, with two good spikes, was shown in a group from Mr. R. Ritchie, gr. to R. H. France, Esq. In the corresponding class for nurserymen Mr. B. S. Williams showed a grand pan of *Cypripedium barbatum superbum*, *Aceris odoratum majus*, with fifteen spikes, gracefully arranged in two tiers; a fine *Cattleya Mossii*, &c. In another class for twelve Mr. Williams contributed a strong and nicely flowered plant of *Cypripedium spectabile*, *Orchis foliosa*, with eighteen spikes and prettily coloured; *Vanda tricolor insignis*, with four nice spikes; *Cattleya Mossii*, large and well flowered; *Laelia purpurata*, *Vanda Batemanii*, &c. A contribution to the same class from Messrs. Jackson & Son included a fine and well-flowered *Epidendrum crassifolium*, and nice plants of the following *Aceris*:—*Lindleyana*, *odorata*, *Larpenis*, *crispum*, and *virens* *Dayana*, &c. Specimen of *Cattleya* *subata*, with ten good spikes of nicely-coloured flowers, came with others from Mr. E. Morse, of Epsom. Mr. J. Ward, Mr. G. Wheeler, and Mr. H. Heims, gr. to F. A. Philbrick, Esq., Regent's Park, were the competitors in the amateurs' class for twelve—the first-named having a pretty bit of *Dendrobium McArthurii*, a remarkably healthy plant of *Epidendrum vittatum majus*, with two spikes of brilliant flowers; a good *Odoglossum* *Ortizii*, also a specimen of *Phalenopsis amabilis*, *Masdevallia Harrayana*, &c. Mr. J. Ward had, amongst others, a large and very healthy plant of *Aceris odoratum majus*, with from twenty-five to thirty spikes, but hardly yet in bloom enough; *Stanhopea oculata*, with two large spikes; and a small plant of *Phalenopsis grandiflora* alba, with seven very fine blooms.

Amongst exotic Ferns, in the amateurs' class, were a grand specimen of *Davallia Mooreana*, and fine *Adiantum* *obliquatum*, *obliquatum*, &c. Others from Mr. R. Ritchie, gr. to R. H. France, Esq., a nice example of *Adiantum cardiophyllum*, &c. from Mr. D. Donald; a very good *Acrophorus immerus* and nice *Adiantum farleyense*, &c., from Mr. T. Sheen, gr. to D. E. Brook, Esq., Highgate. Mr. Carr and Mr. Child were also competitors, and Mr. B. S. Williams was the only representative of the nurserymen with a very fine group. Heaths were not so well represented as usual, and as no novelties were introduced we may state that Mr. Ward was first amongst amateurs, and Messrs. Jackson & Son amongst nurserymen. The only collection of herbaceous plants worthy notice was a group from Mr. R. Parker, which was really a fine display of good things.

Florists' flowers were capitally represented by show and fancy Pelargoniums, and fairly well by Roses and Zonal Pelargoniums. In the class for nine show varieties Mr. Ward again came in 1st, but he was run very close by Mr. James, gr. to W. F. Watson, Esq. Eleventhly, those plants were not so large, but very highly finished. The most perfectly coloured varieties in Mr. Ward's group were *Caractacus*, Example, Maid of Honour, Prince Leopold, and Conflagration. Mr. Turner also competed, and superbly beautiful were the colours of such varieties as *Charlemagne*, *Ruth*, and *Imperator*. Mr. James also contributed a nicely finished group to the class for six, in which Mr. G. King, gr. to R. Peen, Esq., Escher, also competed with very creditable examples. The two last-named exhibitors also took the lead with only state that Mr. Ward was first in all respects but little inferior. The most striking varieties represented were *Ellen Beck*, *Prince Teck*, *Acme*, *Mrs. Graham*, *Roi des Fantaisies*, *Lucy*, *Mrs. Alfred Wigan*, and *Madame Sainton-Dolby*. In the zonal class for six, Mr. G. King far outdistanced the other competitors with a very well-grown lot, which individually measured from 3 to 4 feet over, and well clothed with good foliage and nicely bloomed. A specimen of *Clippers* was most attractive from all points, its brilliant colour showing up well under canvas. The other varieties were—*Delightful*, white with salmon eye; *Le Grand*, a dark scarlet nosegay; *Rose Rendalter*, pink; *Gloire de Cortheny*, salmon-red; and *Mrs. William Paul*, pink. The next best came from Mr. Catlin, gr. to Mrs. Lermite, Finchley, whose hand with these plants seems to have lost its cunning in the last few years. Of nine Roses in pots the exhibitors were Messrs. Paul & Son, Chesnut, who had a very effective group of medium-sized specimens. The same firm also contributed a grand lot of small flowering plants in pots, and a smaller collection came from Messrs. Veitch & Sons, who, with Mr. Turner, were also the contributors of some exceedingly fine cut blooms.

The exhibition of new plants consisted of four splendid groups set up by Messrs. Veitch, Mr. W. H. With, Mr. Williams, and Messrs. E. G. Henderson & Son, and which occupied the four beds in the centre of the tent. In Messrs. Veitch's group we noticed *Alsophila hirta*, an elegant bipinnate Tree

Fern; *Asplenium ferulacum*, a Columbian species, with minutely cut fronds, the pinnales of which are deflexed from the secondary rachilles; a vigorous-growing New Caledonian Fern, named *Davallia Youngii*, possibly a species of *Dematoclaia*, with the fronds cut into very fine segments; *Draecena Taylori*, a dense-habited broad-leaved fern bred between magnifica and Mooreana, and of a deep bronzy hue; *Platycentrum Willinkii*, described and figured by us at p. 303; *Anthurium coridifolium*, a shining green-leaved species, with the basal lobes rounded and forming an open sinus, the blade itself somewhat elongated; *Nepenthes rubra*, a dwarf and rare species of the island of Zamboanga, with a specimen of the way of Z. Skinner, the one leaf having a reddish thorny petiole and a few large lanceolate plaited pinnae a foot long; the purple-leaved *Peach*, with dull sanguineous purple leaves; *Betula purpurea*, also with leaves of a deep dull reddish purple, both these being good shrubby plants; *Begonia Emperor*, a very fine orange-scarlet variety of the new bulbous section; and three *Gloxinias*, namely, *Liséré d'Argent*, which is a white variety with a white edge, very telling; *Madame Patti*, a very large drooping flowered red, pale at the edge with purple throat; and *Marquis of Lorne*, a drooping lilac-purple, with the pure white of the throat bordered by purple. In Mr. Bull's group the principal subjects were *Kentia Moorei*, the true plant, a very elegant stout-growing greenhouse Palm, with drooping dark green leaves; *Croton picturatum*, a curious and striking form, with the green leaves variegated with yellow and red, and the blade sometimes interlarded with bright white edges, a very ribbon-like and twisted, 18 inches long; *Dracaena*, a tall strong-growing erect form, with bronzy leaves, and free copper red variegation; *D. triumphans*, a tall-growing, narrow-leaved spreading dark purplish form, very distinct; *D. rubra*, a short pointed-leaved sort, dark green, with broad bright rosy red edge and variegation; *Anthurium Scherzerianum album*; *Sibthorpa europaea variegata*, a pretty white-margined variety, adapted for baskets; *Lomaria drobydensis*, a fern with a bluish bipinnatifid sterile and erect elegantly toothed fertile fronds; *Lomaria* *sp.*, a fine pinnate tree-like Fern, in a finely developed condition; and *Cibotium Menziesii*, a Tree Fern of the Sandwich Islands, with a black scaly stem, and large spreading bipinnate fronds, glaucous beneath. Mr. Williams showed a group of fine things, amongst which *Zamia Ludeni*, a pinnate species with the pinna serrated near the tip; and *Pellaea ornithopus*, a dwarf evergreen Fern, with small glaucous pinnales, were the most strikingly novel. Mr. Van Houtte's ferns included a bluish bipinnatifid fern, and two *Bertolomias* which came in the collection having been already dealt with. In Messrs. E. D. Henderson & Sons' group the most noticeable subjects were *Zamia calocoma*, an elegant species, with a moderately thick stem, 2 feet high, and pinnate fronds with numerous close-set narrow linear leaflets; *Draecena Princess of Wales*, a distinct-looking, slender, narrow-leaved sort, the leaves being recurved, the older ones green, and the young strongly marked with bluish creamy-red variegation; *Sedum californicum*, a rosulate growing species, bearing some resemblance to *Saxifraga rosularis*; the flowering stems about 6 inches high, and bearing bright yellow flowers; and *Saxifraga notata*, a small compact-growing rosulate species, with oblong-toothed leaves. All the above received the Certificates awarded by this Society for novelties. The respective groups, moreover, comprised many other interesting subjects which we have not space to notice, amongst them an interesting group of *Echeverias* which came in the collection, the best of which had been previously certificated, as was the case also with several of the so-called novelties shown in the other groups. Some very promising *Draecenas* in Messrs. Veitch's group needed further development; indeed, these plants are becoming so numerous through hybridisation, that it is necessary to be rather chary before commending a new kind.

Amongst the seedling florists' flowers some Certificates were given to several *Pelargoniums* from Mr. C. Turner and others, the names of which appear in the advertised list in another column. They were flowers of good quality, fairly up to the usual mark of excellence, distinct, but not exhibiting any striking novelty of character. A Rose, shown by Messrs. Paul & Son, appropriately named *Sultan of Zanzibar*, in commemoration of his Highness's visit to the show, was remarkable for its high colour, a dark crimson, flashing with brighter crimson, but not over large. The new double-flowered 1-lv. leaved *Pelargonium*, *König Albert*, with double lilac flowers, shown by Mr. Bull, seems to be a break in the right direction.

Royal Horticultural: June 16.—The Hon. and Rev. J. T. Boscawen in the chair. The Rev. Mr. J. Berkeley introduced the awards made by the Fruit and Floral Committees, and expressed his regret that there were so few practical men present (there being only fourteen persons, including members of Council, in the room when the meeting began), as he had some important observations to make with reference to a

new form of Potato disease which at present seems to be confined to the American varieties only; and concerning which he should have been glad of the opinions of growers. In the gardens at Chiswick the American varieties, and especially the *Early Rose*, were sadly affected with some form of disease communicated from the tuber to the haulm. He had only been able to make a superficial examination at present, but he thought it might prove analogous to the "curl," a disease well known to the writers of old works on agriculture, but which has not been seen in England for many years past. [See report of Scientific Committee below.]

Mr. Alexander Dean attributed the disease in the haulm to which Mr. Berkeley had referred, to the fact that owing to the drought of last season there was existing in the seed tubers much dormant disease that had not during the winter developed into rot, as was usually the case. These tubers when planted, although apparently sound, had yet, when they came in contact with the moist earth, developed disease—had, in fact, rotted, hence the immature blight. In all cases where the seed tubers were cut they were quite rotten, and, in the case of whole tubers found under the diseased haulm, they would be found firm, but would prove to be diseased when cut. The appearance of this disease in the American kinds more than in the English ones he attributed to the fact that the American varieties produced large tubers, which have to be cut before planting, hence the greater mortality amongst them. If this was a new disease he could assert that English kinds were not quite free from it, and it was desirable to have further information about it before any stamping-out measures were resorted to.

SCIENTIFIC COMMITTEE.—Andrew Murray, Esq., in the chair.

Conophallus bulbifer.—The Rev. M. J. Berkeley exhibited the spadix of this plant, which he had raised among some tubers received from India. In Burmah the stalk of this or some allied species was eaten in place of Asparagus.

Diseased Potatoes.—A letter was read from the Hon. Secretary of the Wiltshire Horticultural Society relating to some diseased Potatoes, upon which Mr. Berkeley remarked that he had recently found the same American varieties at Chiswick, especially the *Early Rose*, dreadfully affected with disease, communicated from the tuber to the haulm. Mr. Berkeley had hitherto been only able to make a superficial examination, but he suggested that possibly the disease in question was analogous to the "curl," a disease well-known many years ago, but since then not noticed. He had found in the cells of the leaf an obscure fungal organism—a species of *Protomyces*. Mr. Berkeley proposed to give a further report on another occasion. Dr. Masters observed that he had noticed the same disease affecting one particular plot of Potatoes growing among others in a field by the sea near Folkestone. It was suggested, moreover, that Mr. Barron be requested to report on the subject.

Paraguay Tea.—Mr. Bateman exhibited a package of the Paraguay Tea, *Ilex paraguayensis*, together with the gourd and strainer used by the natives in the preparation of this tea, as figured in Hooker's *Journal of Botany* many years since.

Peach Blister.—Mr. W. G. Smith exhibited a beautiful coloured drawing of the mould which is associated with the Peach Blister. The mould (*Ascomyces deformans*) is apparently entirely superficial, although the tissue of the leaf is much thickened and the cells altered in shape. The fungus was clearly ascophorous, but Mr. Berkeley suggested that the same fungus might produce basidia.

Must on Pear Leaves.—Mr. Murray exhibited leaves affected with *Roeselia pomorum*, a moth of which is stated to be a stage of the orange gelatinous fungus occasionally found on the Savin (*Podisma*). The only remedy is to pick the leaves off and burn them.

An Undesirable Roof-plant, &c.—Dr. Masters exhibited on the part of the Rev. H. N. Ellacombe a portion of the roof of an Apple nearly gnawed through by the Water Vole, as already alluded to in these columns. Dr. Masters also showed *Cheiranthus Cheiri* var. *gymnantherus*, an old and curious variety, to show that the peculiarity was produced from seed.

Trap-door Spider.—Dr. Hookey sent for exhibition the nest of a trap-door spider, found in the bark of a tree at Uitenhage, Port Elizabeth, South Africa, where it was obtained by Mr. Bidwell, a member of the Legislative Assembly of Cape Town. The nest and the lid were so nearly like the bark itself, that it was with difficulty the lid could be seen, and it was with some difficulty that the lid could be raised, as the insect was still within the nest. Mr. Murray suggested that the spider had taken possession of the empty cocoon of another, and had woven a lid to it with silk and fragments of bark.

Lerch Disease.—A letter was read from Dr. Cooke calling attention to some remarks of his in *Grevillea*, iii., p. 136, in which a similar conclusion as to *Corticium amorphum* was arrived at to that expressed by Mr. Berkeley at the last meeting.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. From T. Laxton, Esq., Stamford, came examples of a seedling Strawberry named Pioneer, of fine size and colour, and in shape like a pin cushion. Mr. Laxton also sent several clusters that the committee might taste them, and it was seen that only the first fruit of these clusters came in a pin cushion shape, all the others being conical, and the committee were of opinion that there were already better varieties of that form in cultivation. Mr. Laxton also sent a promising seedling Pea, named Dr. Hogg, slightly curved, about 4 inches long, and of a dark green colour, the pods being fairly well filled. The committee would not pass any opinion upon it without tasting them boiled, and for that there was not enough, so that it will probably be grown at Chiswick.

FLORAL COMMITTEE.—Dr. Denny in the chair. The counter-attraction at Regent's Park drew away all but a mere handful of things from this meeting, and it was consequently of insignificant proportions. First-class Certificates were awarded to Messrs. James Veitch & Sons for *Adiantum Hendersoni*, a very graceful Fern; and for *Begonia Emperor*, a very fine novelty, distinguished by its large flowers, great breadth of petals, and bright vermilion colour; to Thomas Laxton, Esq., Stamford, for a double white or bluish white Zonal Pelargonium named *Wildfire*, sent to Messrs. Tippis & Sons, for Clematis *Grand Duchess*, a delicately tinted, with pink, a large flower, but wanting in the breadth of the sepals which distinguishes the more recent introductions in this class, and poor beside *Alba Magna*. Cut flowers of *Crinum amabile* came from Mr. Ross, gr. to C. Eyre, Esq.; and from the Society's garden at Chiswick came several small but well-flowered plants of the fine scarlet *Scutellaria Mocciniana*. Messrs. James Carter & Co. showed a *Coleus* named *The Mandarin*, with large deeply cut leaves of a chocolate red colour marked with yellow. Mr. R. Dean, Ealing, sent bedding *Panthea*, almost black, of fine form and not over large, with a neat habit, a small plant of *Primula Scotica*, a pretty little species, with violet-mauve coloured flowers; and cut flowers of a fine strain of Canterbury Bells.

Bitterne and West End Horticultural.
Fine 9.—This annual exhibition, which may be said to take the form of a village fête, was held in the pretty grounds of Brownlow, Bitterne, the residence of J. J. P. Hoare, Esq. Not the least interesting of the features belonging to this show is that the wealthy supporters of it give the use of the grounds in turn for the show, and among the class of society resident in the district the exhibition has become a social reunion, and it is the invariable rule for a *recherché* luncheon to be laid out in a tent provided by the host for the entertainment of his visitors. The annual exhibition is supported with great cordiality by all classes, and the children of the neighbouring schools are invited to share in the floral festival.

The leading feature was the spirited competition in the class for a group of nine plants, Mr. Cox, gr. to Lady Glass, being 1st with well-grown examples of *Calium esculentum*, a large cone-shaped specimen of *Panicum variegatum* in fine condition, *Draacena terminalis versicolor*, *Phlox paniculata*, *Capitulum Antherium magnificum*, *Begonia nitida*, &c. Captain Andrew, R.N., was 2d, having nice examples of the following Ferns:—*Cyathea princeps*, *Croton variegatum*, *Thamnopteris australis*, *Dicksonia antarctica*, *Draacena terminalis*, &c. Mr. Blandford, gr. to Mrs. Hazefoot, and Mr. Smith, gr. to B. Ayre, Esq., were equal 3d, having nice groups of foliage and flowering plants combined. Mr. Blandford was the only exhibitor in the class for a group of nine plants in flower, having well-grown and flowered examples of *Clerodendron Balforianum*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Dendrobium nobile*, extra fine; *Rhynchospermum jasmuinoides*, and an *Azalea*. Mr. Blandford had the best six Ferns: very nice examples indeed of *Adiantum macrophyllum*, *A. cancutum*, *A. pedatum*, and *Polaris cincta albo-lineata*, very clean and finely marked, were among them. A capital group of hardy Ferns was staged by Mr. Smith, gr. to B. Ayre, Esq.

Fuchsias, handsomely grown pyramid plants, were nicely shown by Mr. Blandford, and consisted of *Cremorne*, *Wiltshire Lass*, *Wave of Life*—all well coloured golden leaves contrasting well with the dark flowers, *marginata*, *Rose of Castile*, and *strata perfecta*, white tube and sepals and red corolla, which is distinctly striped with white.

Show Pelargoniums were nicely done by Mr. Blandford and Mr. Cox, who were placed equal 1st with six plants. The former had *Pliny*, *Fair Ellen*, *Adam Bede*, *Rose Celestial*, *Eugenie Duval*, and *La France*. Mr. Cox's leading plants were *William Bull*, finely coloured; *Adam Bede*, and *Bridesmaid*. Mr. Cline, gr. to J. J. P. Hoare, Esq., had a capital collection of variegated Zonal Pelargoniums, even in size, well grown, and nicely coloured, consisting of *Prince Silverwings*, *Italia Unita*, *Mrs. Turner*,

Beauty, *Princess Beatrice*, *Minnie*, *Lady Cullum*, *Empress Eugénie*, and *Mrs. John Clutton*. Mr. Blandford, who was placed 2d, had nice examples of *Fascination*, *Mrs. Turner*, *Princess of Wales*, *Lass of Gowrie*, and *Louisa Smith*.

Mr. Smith was the only exhibitor of six double Petunias, six herbaceous Calceolarias, six Gloxinias and six Achimenes, all well grown, and deserving a place in any London show. The best specimen plant was a capital *Dendrobium nobile*, from Mr. Blandford.

There is always a spirited competition for twelve cut Roses, and some of the amateur cultivators do this flower remarkably well round Bitterne. Mr. Alfred Jackson, the champion cultivator, was again 1st, having the bloomers *Maurice Bernardin*, *Madame Bernardin*, *John Hopper*, *Louise—very fine*; *Gloire de Bordeaux*, *Maréchal Niel*, *Madame Moreau*, *Climbing Devonensis*, *Exposition de Brie*, *Cdine Fleming*—very fine and full; *Général Jacqueminot*, and *Charles Lefebvre*. Mr. Blandford and Mr. Smith were placed equal 2d, their best flowers being *Maréchal Niel*, *La France*, *Gloire de Dijon*, *Charles Lefebvre*, *Marquis de Castellane*, and *Madame Williams*.

A large number of prizes are given to cottagers for flowers, fruit, and vegetables; and the children of the various schools are encouraged to make up nosegays of flowers, both from the gardens and hedges, and the results, on the whole, are quite satisfactory.

Some excellent Vines, in pots, of Black Hamburgh and Buckland Sweetwater, bearing ripe fruit, and trained to umbrella-shaped wire frames, were shown by Mr. Amy, gr. to G. H. Sheriff, Esq., Netley Castle, propagated from eyes put in in January, 1874. Some good Strawberries, in pots, came from the same exhibitor. Some fruit was staged, and very good collections of vegetables.

The only exhibitor of a group of twenty-four plants in the nurserymen's class was Mr. J. Kingsbury, Bevois Valley, Southampton; and he also staged some new Zonal and Hybrid Nougay Pelargoniums of his own raising, including *Exquisite*, with a fine orange-crimson. A double white *Fuchsia* named *Kingsburyana* is very fine and showy. A strikingly variegated *Petunia*, the leaves broadly margined with pale yellow, was an attractive object.

Linnean Society.—Dr. Allman, F.R.S., President, in the chair.

Professor Thibault Dyer exhibited, on the part of Mr. Archer of Dublin, specimens of *Stephanospora*, an Alga allied to *Volvox*, and having a similar gyratory motion. The specimens were remarkable from the extreme rarity of the species, which is found in one small pool at Bray Head, and nowhere else in Britain.

Mr. Miers communicated an elaborate paper on the *Barringtoniaceae*, which will probably appear in the *Societies' Transactions*.

Dr. Trimen exhibited specimens of two species or varieties new to Britain, viz. *Zamichellium polycarpa*, found in the Orkneys and by most botanists considered to be a variety of *Z. palustris*, and *Carex ornithopoda*.

Mr. Moore exhibited specimens of a species of *Hibiscus* with lacinated petals, found in south-east Tropical Africa by Dr. Kirk, and which Professor Oliver suggested might possibly be the wild form of *H. rosa sinensis*, which is only known in a cultivated state in India and China. Dr. Masters doubted whether the specimen could be considered a normal one, and thought it more probable it was an accidental monstrosity. He commented on the interesting relation exhibited by the lacinated petals and the branched stamens.

Dr. Gilbert read a paper on Fairy Rings, which naturally occur on poor pasture land and are usually driven out by manures. Fungi, as a class, are remarkable for the relatively large quantities of nitrogen they contain; but in the experimental plots at Rothamsted, fairy rings occur especially on those plots which are the poorest in nitrogen and potash. An interesting correspondence was thus manifested between these fungi and leguminous plants in general, which though also containing a large proportion of nitrogen are by no means specially benefited by the application of nitrogenous manures. Seeing that the fungi are also not benefited by nitrogenous manures, though containing so much nitrogen, it becomes a most important question to ascertain from what sources they derive their nitrogen, whether from the air, the soil, or from other plants on which they may be parasitic. In other words, are the manurial conditions favourable to the growth of the fungi, or are these plants better able to hold their own, under the circumstances, than are the grasses and other plants, or have the fungi the power of assimilating nitrogen from the air or from the soil?

An interesting discussion followed, in the course of which Professor Dyer spoke of the different ways in which fungi procure their food; and Dr. Masters called attention to the different conditions under which Mushrooms were grown by the gardener, who always supplied large quantities of nitrogenous manure.

Seeing what great differences sometimes existed between two nearly allied grasses as to their nutrition, he considered it highly probable that similar differences occurred among different species of fungi.

Florists' Flowers.

CARNATIONS, PINKS, &c.—We are in danger of being bewildered among the many beautiful varieties now in cultivation of some of our choice florist flowers. In fact, when we come to examine the lists published annually by nurserymen, we are confused and unable to choose out of the hundreds of names of heroes, statesmen, public singers, botanists, clergymen, and lots of others, given to our favourite Carnations, Pansies, Roses, &c. Many botanical authors of the lumping school have long decried the splitting up of the Rubi, Roses, and Willows of even our limited British flora; but this is nothing when compared with floral varieties. However, there are those, especially amateur cultivators, whose opinion is far more to be relied upon than that of nurserymen, because it is unbiased. If our friends would come out and help us to riddle these lists of the worthless varieties, and tell us from actual observation and experience which specimens they have proved to be valuable, and worthy of a nook in the garden border, they would do immense service, as well as perform an act of kindness. For my own part, having paid close attention, during the past few seasons, to Carnations, Picotees, and Pinks, not only in my limited collection, but to those of several large nurseries and cultivators of these novelties, I can honestly recommend your readers who are about to purchase their spring plants to secure the following varieties, which are in their way really first-class, excellent, and distinct in colour, &c., from all others. If the florist will supply them true to name, no purchaser will be disappointed.

PINKS.

Elcho, Lady Craven, John Ball, Shirley Hibberd, Perfecton, G. Jeans, Agnes, and Mrs. McLean.

PICOTÉES.

Bright red edge: Miss Turner, W. Summers, Ada May.

Dark red edge: John Smith, Lord Valentine.

Light purple edge: Mary, Princess of Wales, National.

Light-edge rose: Mrs. Fisher, Maid of Clifton, Rosy Circle.

Dark rose edge: Flower of the Day, Scarlet Queen.

Dark purple edge: Mrs. Summers, Admiration, Picco.

Perpetual flowering vars.: Prince of Orange, Ascot Yellow.

CARNATIONS.

Rose flakes: John Kiel, Queen Boadicea, Lovely Ann.

Purple flakes: Squire Meynell, Dr. Foster, True Blue.

Scarlet flakes: Annihilator, William Cowley, Sly.

Scarlet bizares: Dreadnought, John Norman.

Pink bizares: Falconbridge, Captivation, Purity, Fanny.

Crimson bizares: Eccentric Jack, Warrior, Earl of Zetland, Colonel North, Lamplighter, &c.

Law Notes.

ACTION FOR DAMAGE DONE BY FOWLS TO A GARDEN.—At the Bloomsbury County Court on Thursday last, before the presiding Judge, G. Lake Russell, Esq., the case of *Beaman v. Cummings* was heard, in which the plaintiff, described as a gentleman fond of horticultural pursuits, and residing at 53, Lawford Road, Kentish Town, sued the defendant, residing at No. 55 in the same road, for damage done to the flowers in the plaintiff's garden by the trespass of the defendant's poultry, and for money paid by the plaintiff in respect of the following particulars—namely, 53 dozen of choice Carnations, costing £2 6s., and 18s., for damage done to the plaintiff's garden, and for the gardener's time in replacing the same. Mr. Charles Williams appeared as solicitor for the plaintiff, and Mr. Wright for the defence. The plaintiff being called, stated he took great pride in his garden, which was continually invaded by the defendant's fowls, and he had frequently warned the defendant to restrain his fowls, but as he (the defendant) had taken no heed of the plaintiff's remonstrances, the present action was brought.

The plaintiff's gardener was called, who proved that the damage sued for was done, and the amounts charged were fair and reasonable; he further stated that as many as twenty of the defendant's fowls overran the plaintiff's garden, that he had many times repaired the damage done by them, and that it was quite impossible to keep the garden in proper order.

Mr. Wright, called the defendant, who said every precaution had been used by him to restrain his fowls, but even if any damage had been done, 8s. each for a common flower like a Carnation was a preposterous price.

The learned Judge thought that this was not so, and was of opinion that, as the defendant had not pro-

perly restrained his poultry from committing depredations, he must pay for the damage done.

Judgment was accordingly given for the full amount claimed, with costs of attorney and one witness.

The Villa Garden.

FRUIT TREES: WATERING, MULCHING, AND SPRINGING.—Some attention to these is now absolutely necessary if the Villa gardener would have well-matured and ripened crops of fruit; and, secondly, his trees prepared to ensure productiveness another year. Fruit trees require constant attention at this season, and on the discharge of these attentions depends much of the perfection of the fruit crop. And now for a few simple yet very necessary directions. First, are the wall trees—Peaches, Nectarines, Apricots, Plums, Cherries, Pears, &c.—showing signs of suffering from the continuance of the dry weather? The symptoms are soon apparent: the leaves curl and get a yellow tint, the points of the shoots are brown, and they seem incapable of putting forth an effort, and the trees get a general languid appearance, as if exhausted after some severe exertion. We are daily observing trees getting into this state, where they are planted in a gravelly soil, and it is thought it is all owing to blight, light dreaming it arises from want of moisture at the roots. When soils are poor and sandy that most-to-be-aborred pest the red-spider is likely to attack fruit trees, and if it once gets the upper hand the results are pitiable.

Where the drought is felt, let a trench some 4 inches or so in depth be opened round the stem of the tree, drawing the soil back and placing it round the opening so as to form the earthworks of a bay. Then pour in plenty of water, thoroughly saturating the roots. If the family washing be done at home, secure all the warm soap-suds for this purpose, and use them also for syringing the trees. At all events syringe plentifully and frequently during drought. Having poured a good supply of water into the trench, fill it in with a layer of manure, and pour water on it occasionally as long as the dry weather lasts. Thorough root waterings and the free use of the syringe soon effect a renewal of the health of the trees, but an attentive and thoughtful gardener will not suffer his wall trees to get harm through dryness at the roots. Our wall trees are all in a stiff clayey loam, in which they have rooted deeply, and in the driest weather they do not suffer, but we syringe freely at this time of year, and the surface roots thereby become nicely moistened.

We invariably syringe our trees of a morning, and that for the main reason that if done at night it induces the snails to visit and cluster about the trees, and they are then very apt to commence eating the fruit when swelling into size. Where there is much undergrowth about the trees snails will congregate, and when a shower falls they get into motion and make for the walls, and by examining the trees at that time a good many are captured. Water and mulch the trees at the roots, and syringe the branches occasionally when the weather is dry, and healthy trees can hardly fail to be obtained.

SUMMER PRUNING: STOPPING AND THINNING.

—The common error of setting to work and cutting out almost every young shoot made by a Peach, Nectarine or Apricot tree, on the ground that there is already enough wood in it, is one to be avoided. It is an error too frequently committed by inexperienced gardeners, who are under the impression that if the young wood be left on the tree the fruit must suffer. A good cultivator husband the resources of his tree, but this plan is like calling on them almost beyond their capacities. Don't be afraid that, because a healthy young growth is distributed on the tree, that therefore the fruit cannot be matured. The renewal of a tree, i.e., the laying in of the young wood that shall bear bud and blossom for another year, is a most important matter, and it is done during the summer months. The thing to be done is to lay in certain of the shoots, either to fill up bare spaces, if any exist, or to take the place of spent wood that should be cut away at pruning time next winter, and it should be laid in by fastening it to the wall with a nail and shred or by means of a tie made to a nail in the wall, or by fastening the shoots to wires if provided. Sometimes the main trunk of a tree, as well as its leading branches, will send out strong gross shoots, but unless required to form a branch they should be cut away. The young wood to be retained is that of a

moderate wiry growth; from such fruit may be looked for another year. All the shoots not required for laying in should be quite removed, cutting them away close to the base. This allows the air to circulate among the trees; it assists in the development of the fruit crop, and aids the ripening of the fruit-bearing wood for the following year. A lesson or two from a neighbouring gardener—and we have always found them ready and willing to assist and instruct the inexperienced—is of great value at this time; it is of more practical utility than the laying down of the simplest rules.

Thinning out the fruit is so important a matter when the crop is numerous, that its contemplation as a duty carries a pang to the heart of many a Villa Gardener. Naturally enough he wants all the fruit he can get, and he is very loth to thin it out. He has our warmest sympathies, but he must be taught. One of our cleverest fruit gardeners, Mr. William Wildsmith, of Heckfield Gardens, writing on this subject, says:—"Apricots, Peaches, and Nectarines, should now be finally thinned; and were this always completed before stoning commenced there would be fewer complaints of fruit droppings at the stoning period. It is the excessive demand for nourishment made on the trees by the fruit at this critical period that causes it to drop. Hence the importance of thinning. It is, therefore, best by judicious thinning to ensure a crop, rather than, by leaving a large number, peril the chances of having any at all. Young trees must not be over-cropped; older vigorous trees can carry more." Some one once laid down the rule that each fruit should have a space of at least six square inches on a tree, and let it be remembered that it is always best to have some fruit of large size and fine quality than a larger number of less attractive produce, smaller in size, and lacking quality.

PYRAMID AND BUSH FRUIT TREES.—At this time of the year these also require attention, especially as it has come to be a recognised fact among gardeners that in the matter of hardy fruits, such as Apples, Pears, Plums, and Cherries, summer pinching is preferable to winter pruning. Our trees are now making a vigorous growth, and we allow all shoots required to extend the tree in size and shape to remain, but all others are pinched back to two and three eyes. The swelling of the fruit is the best assisted, while a free circulation of air among the trees is promoted. As our trees make vigorous growth, being in good, deep, holding soil, we do not water at the roots; but when trees are planted in shallow gravelly soils they should be mulched and watered both. In early morning we occasionally sprinkle overhead, and insects are looked for and summarily destroyed. Hawthorn, Warner's King, Orange Pippin, Cellini Pippin, and other Apples are promising to be very fine on pyramids this season.

CUTTING BED.—This is a most useful agency in a garden, and it is one that can be set up in any odd corner and turned to valuable account. We have now in use a bed of oblong shape, the framework made of old boards, about 6 or 7 inches in depth. At the bottom is a good layer of brick rubbish, over that a layer of Laurel branches, obtained in the course of thinning out a Laurel hedge, and on these a layer of soil, and on the turf at least 2 inches of a good light sandy soil. We find this very useful for striking cuttings of Pansies, Violas, double Rockets, Cheiranthus Marshallii, Pink pippings, &c. There are many things in a garden that it is desirable to propagate, and cuttings put in pots and pans seldom do so well as those pricked out in a bed such as that described when set up in a cool shady spot. In a bed of this character we find Pinks, Carnations, and Picotee cuttings strike readily, and a good supply of young plants can be thereby obtained.

The Weather.

DURING the week ending Saturday, June 12, in the suburbs of London, the reading of the barometer at the level of the sea decreased from 29.98 inches at the beginning of the week to 29.93 inches by the morning of the 6th, increased to 29.20 inches by the morning of the 8th, decreased to 29.63 inches by the morning of the 11th, increased to 29.75 inches by the evening of the same day, decreased to 29.66 inches by the afternoon of the 12th, and was 29.76 inches at the end of the week. The mean reading for the week was 29.88 inches, being 0.14 inch less than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground varied from 77½° on the 9th to 58½° on the 12th, with a mean value for the week of 69°. The lowest temperatures of the air ranged between 55½° on the 8th and 47½° on the 12th, the mean for the week being 52½°. The mean daily range of temperature in the week was 16½°, varying from 23½° on the 9th to 10½° on the 12th. The mean daily temperatures of the air and the departures from their respective averages were as follows:—6th, 61° 2', +3° 7'; 7th,

61° 1', +3° 5'; 8th, 63° 3', +6° 1'; 9th, 62° 6', +4° 7' 10th, 58° 1', 0° 0'; 11th, 52° 3', —6°; 12th, 51° 4', —7° 1'. The mean temperature for the week was 58° 6', being 0.7 above the average as deduced from sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 140° and 143½° on the 6th and 9th; on the 7th 90° was the highest reading. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 44° and 40½° respectively on the 10th and 11th; on the 8th 50½° was the lowest reading. The mean for the seven low readings was 46½°.

The direction of the wind was W.S.W., and its strength brisk.

The weather during the week was fine, but showery. A strong gale on the 11th. Distant thunder heard on the afternoon of Wednesday, June 9.

Rain fell on three days, the amount measured was 1.15 inch.

In England, for the week ending June 12, the extreme high temperatures observed by day ranged from 78½° at Cambridge to 66° at Newcastle-on-Tyne, the general average over the country being 73½°. The extreme low temperatures observed by night varied between 49° at Truro and 43° at Newcastle-on-Tyne, the general average being 55½°. The mean of the extreme ranges of temperature in the week was 27½°, the greatest range being 34°, at Cambridge, and the least, 19°, at Truro. The mean high day temperatures ranged between 72½° at Cambridge and 62½° at Newcastle-on-Tyne, with a general average of 67°. The mean low night temperatures varied from 53½° at Truro to 48½° at Eccles and Cambridge, with an average value of 50½°. The mean daily range of temperature in the week was 16½°, the greatest range being at Cambridge, 23½°, and the least at Truro, 11°. The mean temperature of the air for the week was 57°, being 1½° higher than the value for the corresponding week in 1874; the highest was 59°, at Blackheath, and the lowest 54½°, at Liverpool and Newcastle-on-Tyne. Rain fell on five days in the week at most stations; the amounts varied from one inch and six-tenths at Eccles to three-tenths of an inch at Norwich and 11th, the average fall over the country was nineteenth of an inch nearly.

The weather during the week was fine, though cloudy and showery. Thunderstorms occurred generally over the country on June 9.

In Scotland the highest temperatures ranged from 60½° at Aberdeen to 61° at Greenock, the general average over the country was 64½°. The lowest temperatures varied between 45° at Greenock and Paisley, and 40° at Aberdeen, the general average being 43½°. The mean range of temperature in the week was 21½°. The mean temperature of the air was 54½°, being half a degree above the value for the corresponding week in 1874; the highest happened at Dundee, 55½°, and the lowest at Paisley, 53½°. The fall of rain varied from one inch and four-tenths at Dundee, to four-tenths of an inch at Paisley and Leith; the average fall over the country was seven-tenths of an inch.

At Dublin the highest temperature was 72½°, the lowest 44½°, the mean 57°; and the rainfall one-thirteenth of an inch.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, JUNE 16, 1875.

June 10.—A fine day. Strong wind. Thin rain at night.
 — 11.—Wind, frequent heavy showers throughout. Gale of wind.
 — 12.—Fine, cloudy, and occasional heavy rain.
 — 13.—Fine in early morning. Overcast, dull, and rain fell throughout afternoon.
 — 14.—A dull day, fine at times. A little rain fell in the morning.
 — 15.—A fine dull day, frequent showers of rain in morning. Strong wind all day.
 — 16.—A fine day; showery in morning. Cloudless at night.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

PLANT HOUSES.

PLANT STOVE.—The old *Euphorbia splendens*, that used to be met with in almost every plant stove, is now rarely seen; yet a more useful subject for a private establishment where button-hole flowers are consistently required does not exist. Large specimens of this *Euphorbia* are never out of bloom all the year round when kept in a growing temperature. The flowers are naturally so durable that they will last in water when cut for a week in the dry atmosphere of a room. Its stout leathery texture, peculiar form, and intense colour make it most useful for mixing with white or light-coloured flowers. It is a plant of the easiest possible growth, and does not need a great deal of root-room; a 15-inch pot is big enough for a large specimen. It does well on a back wall, for which it makes a suitable covering, occupying little space, and not being much subject to insects. If moderate-sized plants are procured, and, if they require it, potted on, they will soon make useful specimens, flowering continuously whilst any growth is being made, and which will go on all the year round if in heat sufficient without in any way injuring the plants, provided they get plenty of light. They do not require any shade. *Crucianum pulchellum*.—This winter-flowering subject is the most useful grown from cuttings struck each spring. Plants now in 5 or 6-inch pots should at once be removed to others a couple of sizes larger; stop the points to induce a bushy habit, and give them plenty of air.

Gardenias that have done flowering may be cut close back; few things are more liable to the attacks of mealy-bug and scale. After cutting back is the best time for thoroughly cleansing any that have been affected, as when sold of leaves the stools will stand dressing with insecticide sufficiently strong to destroy these pests. For bug, wash with Abyssinian Mixture at 6 oz. to the gallon; if the application is thorough, neither insects nor eggs will escape; if they are only troubled with brown scale, Fowler's Insecticide at 5 oz. to the gallon applied at a temperature of 95° will clear them. Return the plants to the stove, and as soon as they have broken shake half an old soil from the roots, which reduce a little, and place in pots a trifle larger. Young plants that have been struck this spring should be well attended to in giving them the requisite pot-room, and maintaining a genial growing temperature. Where these are struck each spring, and thoroughly well done all through the season, they are preferable to old ones, but where there is not the necessary heat kept up to get them on, the old plants should not be destroyed. *G. intermedia* is the most useful variety for cutting, not producing such large flowers as *G. Fortunei*, but being more manageable in size. The small growing citron-scented variety, *G. citriodora*, bears blossoms which are very useful for mounting for bouquets similarly to orange-blossom; the plant is easily grown, and does not occupy much room, requiring similar treatment to *G. intermedia*. This is a comparatively slow-growing species, and will be years before it gets too large; after flowering shorten the shoots back a little and re-pot, getting as much of the old soil away as can be done without disturbing the roots too much.

Bougainvilleas that have completed their flowering should be now cut back, removing at the same time 4 or 5 inches of the surface soil without interfering with the roots more than unavoidable, and replacing it with new, to which has been added one-third of rotten dung; return the plants to the stove, and when the roots have begun to move freely give more water. *Sepholanthes* are grown permanently on the roof, and their flowering should so far as required be cut back to the extent necessary. To carry this will depend upon the size of the plants, and the more or less vigorous condition they are in, bearing in mind that whatever cutting in is required through the year, should be done after flowering before growth commences. Plants of this fragrant climber that have been run on the roof whilst growing and afterwards trained upon trellises to flower, should after bloom is past be cut back, as the young growth as it is formed can be run upon strings close to the glass; this, being a light-loving subject, cannot be depended upon to flower freely unless its growth is made under conditions favourable to being thoroughly solidified as it progresses. If this solidification does not take place no amount of drying-up or pinching the plant can be relied upon as certain to induce the requisite quantity of flower. Specimen plants of *Melastoma magnificum* that have bloomed and are as large as it is desirable to grow them, should be shortened back, and as soon as they have broken turned out of the pots, a third or so of the old soil removed and then replaced in the same pots, or others a size larger. It is necessary to perform this partial shaking out operation before the young growth has made much progress, or much of it will be stopped from advancing further. *T. Baines*.

FLOWER GARDEN, &c.

GREENHOUSE HARD-WOODED PLANTS.—If, as often happens, a considerable time is allowed to elapse after flowering before *Acrophyllums* are prevented seeding, their ability to make growth for the ensuing year is so far impaired that it is reduced to not more than half its wonted amount; but this plant requires special treatment, in this matter, so as to be careful that no injury is done to the points of the shoots that grow through the whorls of flowers that encircle the preceding year's growth, for if these are injured the plant is very reluctant to break back from below where the flowers have been produced, the ripe wood being almost as hard as whalebone. As will be evident from this, *Acrophyllums* will not bear cutting back in the least, unless in the case of such as have thrown up a quantity of strong young shoots from the collar. When this occurs, if the plants happen to have become thin and straggling in the old wood, it may be removed, and the young bottom shoots will then form a plant. *Cilanthus pinnatus*.—This remarkably distinct and fine old decorative subject, so useful for conservatory decoration, grown either bush-fashion or to clothe a pillar or wall, would appear to be fast lapsing into the limbo of undesirability, and is fast being neglected without any reason, except that it is liable to the attacks of red-spider. To prevent this a diligent look-out should be kept from the time the weather becomes warm. With this, as with all similar company, prevention is preferable to cure. Copious applications of water with the syringe, both over and under the leaves, will keep the plants clean. Where this *Cilanthus* is planted out in a narrow confined space, or has been long without the soil being renewed, frequent applications of manure-water will promote a free growth, and cause that goes far to discourage this pest. The beautiful *C. Dampieri*, that so well deserves a place in the most select company, will not, even when too much confined at the roots, bear re-potting after it has attained any considerable size, it being one of the plants that should be managed on the one-shift system; but where it is suffering through insufficient nutriment in too small pots the deficiency must be made up by watering it altogether with clear weak liquid manure. *Fuchsias* that have flowered early are liable to get exhausted and shabby in their foliage. If plants in this condition are placed out-of-doors for a month, in a sheltered situation, the flowers and seed-pods picked off, and the wood when it has got a little hardened is shortened one-third, and after the shoots have broken back they are moved into pots 2 or 3 inches larger in good rich soil and then taken indoors, they will again flower through the autumn as late as required. Spring-struck cuttings of these plants intended for late display are difficult to keep in a condition of free growth after the sun gets powerful, as the heat imparts them a greater disposition for making flower than wood. Continuous removal of the blooms and shading in bright weather is the best means of counterbalancing the inclination to present flowering, they will also be stimulated by manure-water once a week, but in using this with *Fuchsias* it must not be given strong or it will cause the leaves, and if in a blooming state the flowers also, to fall off.

FRUIT HOUSES.

MELONS.—Further sowings must still be made according to the wants and means of the individual establishment. To the amateur and the small grower, whose appliances consist of a few dung-heated pits and frames only, I would recommend to make their last sowing at once, which sowing will, under ordinarily favourable conditions, produce a supply of good fruits during the sunny days, towards the end of September. The large grower, however, who has at command the most modern appliances, by way of nice light and well-heated houses, may make further sowings up to about the last week in July, and this batch will continue the supply up to the end of October, or early in November, after which time it is impossible to have home-grown Melons of first-rate good bottom, except in dung or manure fermenting material, should still be secured to young plants about to be turned out, and which will not only contribute what the Melon delights in, but will also lessen the necessity for much fire-heat—a little by night, however, is still recommended. Continue to remove laterals freely where the fruits are fast swelling, and to support by means of tables (previously described) or nets those fruits which are becoming heavy. Avoid the bad practice of removing fruits directly they begin to change to a sunless fruit-room. This is often done to prolong the season of supply, and the result is that the flavour becomes much deteriorated. Fruits that must be cut from nearly exhausted plants to make room for a successional batch had better be placed in a sunny position in one of the late vineries. Continue to fertilise all female blossoms every day in a dry atmosphere, and for general cultural details consult previous Calendars. Husband a good sun-heat, by closing early, in pits and frames, and these, as

well as houses, might be slightly shaded for a couple of hours at mid-day. *Thos. Simpson, Chelmsford, June 15.*

PIES.—Under ordinary circumstances fire-heat should now be discontinued in most Pine structures, excepting for the purpose of providing the requisite degree of warmth (80° to 90°) at the roots, or to assist in accelerating plants with fruit in an advanced condition of growth. Its use for other purposes will now be no longer required, and in those houses which contain successional stock to continue it would ultimately prove to be more detrimental than beneficial. In such structures the temperature rarely falls below 65° by reason of the assistance which is obtained from the heated beds wherein the plants are plunged. This temperature, under such conditions, is most suitable at this season for the satisfactory development of the plants. Newly potted plants will, as soon as the roots have taken hold of the fresh soil, make growth speedily, therefore care should be exercised in management, particularly in regard to the ventilation, so as to avoid an attenuated state of growth which would limit the amount of the crop, or gradually increase this supply until the temperature reaches 85° at this degree a plentiful supply will be needful at the apex and front or sides of the house as the case may be. In like manner it should be diminished by degrees to about 80° in the afternoon, and at finally closing the house for the day a light sprinkling with the syringe should be indulged daily when sunny weather prevails. The early section of fruiting Pines will soon be finished off. From the stocks of suckers on these plants a number sufficient in quantity to meet the demand should be taken off and started at once, the present time being a suitable one for coming plants, which will fruit from this time onwards next year. These will form a supplementary batch to those which were started last March. The requirements of these plants will be identical with those which were potted in March, excepting that water should be applied to the soil in which they are potted as often as it gets all dried and the shoots will, under present conditions, require to be done more effectually. The degree of excellence to which fruit attains when cultivated under glass depends very much upon proper ventilation during the colouring process. Nothing contributes more beneficially towards this object, both as regards quality and appearance than a free circulation of air in a suitable condition. Pine-apples are not an exception to this rule, therefore whenever favourable influences prevail externally this matter should have the foremost consideration. *G. T. Miles, Wycombe Abbey.*

CUCUMBERS.—Much of the instructions given in this week's Melon Calendar are also applicable to the Cucumber, and if the cultivator has taken advantage of what has been advanced under this heading for the last few weeks, little remains to be enforced upon his attention just now. The weather for the past fortnight has not been altogether favourable to the Cucumber; we have had cool and strong winds accompanying the bright sunshine, which necessitates the giving of air, and thus admitting the winds, which are a powerful absorbent of moisture. In such weather, therefore, it is better to shade a little more rather than admit too much strong wind; more moisture, too, both at the roots and in the atmosphere should be employed. Now is a good time to save a few fruits for seed, and such varieties as it is desirable to retain should be fertilised with a view to that end. As the fruits are swelling off it will be easily seen which will bear seed, indicated by the lower end of the fruit being what is termed in gardening phraseology "bull end." A piece of matting tied round straight fruits, however, will sometimes produce the desideratum, but not always. Strive to maintain a clean growth and an even temperature. Remove handlings from ridge varieties, and give them a good mulching of rotten dung previous to pegging out the growths. *Thos. Simpson, Chelmsford.*

HARDY FRUIT GARDEN.

The stopping and nailing or tying-in of wild trees generally should now be proceeded with as fast as possible, laying in a sufficiency of the young shoots to fill up or extend the trees where necessary. In pruning Pears the foreright shoots should be pruned to three or four buds, as if cut-in too hard the trees will probably start into a second growth, instead of forming fruit-buds for next season. Where the fruit is thick, and this is the case in most places where fruit is grown to any extent, lose no time in judiciously thinning the crop, leaving it sufficient in this as to keep clear of each other when matured. Little is gained in a plentiful season by retaining too heavy a crop, which, if allowed, must inevitably result in a failure of next year's crop. The present cold and sunless weather is unfavourable to the growth of Peaches and Nectarines, and aphids is now becoming somewhat troublesome. Where this is the case the affected shoots should be dipped in tobacco-water, and after remaining one day the trees should be well washed with a syringe or engine. Pyramidal or bush trees

of Apples, Pears, Plums, &c., may also be pruned in, and the fruit thinned as before directed for wall trees. Bush fruits, as Gooseberries, Currants, &c., should also be stopped back when the growth is over-abundant, but the crops of these are so heavy that less than usual has taken place. These, and also Strawberries, which are now ripening fast, should be netted or otherwise protected from frost, which are already very troublesome. Where Strawberries are required in quantity for forcing, preparations should be made for laying runners as early as possible, it being essential to get the plants well rooted early in July so as to give a good season of growth. We usually plant out in the latter month a few runners of each kind; these not being allowed to fruit give a good supply of runners for the following season, and with us the more forward of these are now ready to be planted out. We use 3 inch pots for laying in, and as soon as the layers become well rooted they are taken off and removed to a sheltered spot, under a north wall or hedge, for a few days previous to planting in the fruiting pots. The best varieties for forcing are Keens' Seedling, President, Sir Charles Napier, British Queen, and Sir J. Paxton, which ripen much in the order named. Le Gros Suceré, a new and very early kind, of good size and quality, seems likely to be valuable for this purpose: I hope to give it a fair trial next season. *William Cox.*

Enquiries.

He that questioneth much shall learn much.—BACON.

[MANY enquiries which reach us would be more suitably answered by those of our correspondents whose experience or requirements are, or have been, similar to those of the questioner. These we propose, in future, to gather together for facility of reference; and as fellow feeling makes us wondrous kind, so we would fain hope that this enquiry column may serve as a kind of sympathy and good-will between our correspondents and readers, and be the means of eliciting much valuable information. Eds.]

50. ICE-HOUSE.—Can any of your numerous correspondents enlighten me as to the repairing of an ice-house, to make it "keep" ice? I have a well about 15 feet deep, and basket-wickered round the inside, but the draining and emptying into the trough part of which the hole is cut. A small thatched round roof covers the top. *A Wiltshire Man.*

51. PYRUS DOMESTICA.—*Inquirer* asks where the true Service Tree, *Pyrus domestica*, can be obtained?—What goes under that name in the nurseries is usually *P. torminalis*, or *P. Aria*.

52. TO ROSE GROWERS.—Can any one offer a palliative, preventive, or cure, for red-rust on Roses?—or must it run its course, like its new ally the Hollyhock disease? *D. T. Fish.*

Answers to Correspondents.

BOOKS: S. There is nothing better than the last edition of Mr. Thomson's *Practical Treatise on the Grape Vine*, published by Messrs. Blackwood.—E. S. Hooker's *Students' Flora*, published by Macmillan.

CLEMATIS: *Lawson Seed Co.* Unless the flowers of your *Thomas Tontem* come more decidedly double than in the sample sent, it is not a high rank amongst modern varieties, although in itself necessarily a fine showy plant. If now blooming for the first time, we should pronounce it very promising, and should grow it on vigorously for next year. If it fills up better it will class with Countess of Lovelace as to style, but, being French white, is quite distinct.

CUCUMBER, DANIEL'S DUKE OF EDINBURGH: *H. R.* The specimen you send us, measuring 2 feet 9 inches in length, is a fine one of its kind; but such large fruits are in no way desirable for consumption.

CUCUMBER: *Messrs. Sutton & Sons.* Your Duke of Connaught is a well-formed handsome fruit of the large show type, but not equal in flavour to those of the Telegraph type.

HEATING GREENHOUSE: *R. B.* (1) The flow-pipe on top of boiler should be at least 1 inch below the lowest pipes in the greenhouse, or where they pass under any door or passage. This is not absolutely necessary, but it is better for the working of the apparatus, and more economical in the end. The boiler may be left, if necessary for the position of stove-hole—the lower the better. (2) Three 2-inch pipes would be sufficient to keep out frost, but there ought to be three 4-inch ones for general greenhouse purposes. (3) A 27-inch saddle boiler; one of the best is the riveted saddle.

INSECTS: *A. D.* The plum leaves are infested by a small and active insect belonging to the frog-hopper or cuckoo-spit family, and to the little genus *Tiphocyba*. Spraying with strong lime-water might possibly much annoy them, or they would be dislodged by hunning with a fine window sash. *O. W.* *F. J. L.* The beetles which have gnawed the bark of the Rhododendron underground are the common omnivorous *Otiorynchus sulcatus*, the white grubs of which, similar to those of the Nut-maggot, are equally common. We have seen them in the act of hand-picking, carefully disturbing the earth at the roots of the plants. *I. O. W.* *F. McJ.*, *Handwurm.* We believe your pale green caterpillars are those of the Van moth (*Geometra vanaria*), and the dark coloured ones those of the Geometra (*Melanippe*) *hastata*. *I. O. W.*

IRIS: T. Z. There is no published list, but Mr. Baker has one in preparation, to be published in our columns.

LILY OF THE VALLEY: *E. H. R. T.* The roots are probably straggled from growing too thickly; possibly also from drought. Take up the crowns next autumn when they become dormant and plant out thinly, in small patches, on a well-enriched north border, and you will get stronger crowns.

NAMES OF PLANTS: *W. Withers.* *Orchis latifolia*. That which grows on a chalk hill will be a different species. *J. Scott.* Not a *Verbascum*, but *Celsia cretica*, a native of Southern Europe, but naturalized in some parts of Australia. *J. A. M.* *Maxillaria tenuifolia*.—*Carex*. 1. *Jasminum revolutum*; 2. *Symphoricarpos racemosus*; 3. *Deutzia scabra*; 4. *Fabiana imbricata*; 5. not sufficiently advanced to name; 6. *Abies pectinata*.—*P. W. J.* (1) *Avena pubescens*; (2) 1. *Aira cespitosa*, 2. *Festuca pratensis*; 3. *P. ovina*, 4. *Setaria tenuifolia*; 5. *Tetradlea nitida*.—*Nomenclature.* *Rhododendron hirsutum*.—*J. Dimmick*. 1. *Ornithogalum thyrsoides*; 2. *Asclepias curassavica*. *A. Old Subscriber.* 1. *Scilla peruviana*, var. *glabra*; 2. *Albostea incandescens*; 3. *Permetzia macrantha*; 4. *Rhipitropis Tobira*; 5. *Iris Niphum*; 6. *Buddleia globosa*; 7. *Heliclychrum cordifolium*; 19. *Rhamnus Alaternus*; 20. *Coprosma Baueriana variegata*; 24. *Stachys lanata*. Please remember in future that we only deal with half-a-dozen at once. *E. G.* 3. *Polygonum viviparum*; 6. *Pristiocardium*, new species? 7. *Chaenostoma rhipithica*? Nos. 6 and 7 seem to be Cape plants. Do you know their origin? We should be greatly obliged for as good specimens of these two as you could spare for the herbarium. *J. H. Goodacre.* *Dictamnus fraxinella*.—*E. G. C.* *Alostrome pittacina*.

PEACHES: *C. A.* Flowers of sulphur dusted on the affected parts is the only remedy.

PELARGONIUM HAPPY THOUGHT: *W. W. C.* This does not belong to the group usually designated "tricolors;" and therefore, notwithstanding the three colours in the leaf, we consider it open to disqualification if shown as such. A good deal depends on the words used in defining the class, and of these you do not inform us.

ROSE-LEAF FUNGUS: *E. S.* The fungus on Rose-leaves is *Colosporium pingue*. The plant is impregnated from spores of the previous year, and it is so very common that the affection is quite beyond any remedy. Every hedge and garden has the fungus if you could find a moment that it is out of the garden. *M. J. B. VERMENAS: J. M.* The leaves have been eaten up, probably by some caterpillar.

WARTS ON VINE LEAVES: *F. Smith.* A close moist atmosphere will produce the warts on the back of vine leaves, and this was probably the cause in your case. A better circulation of air will prevent its spread.

* * * Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being posted as early in the week as possible, so as to reach us *before the printer, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

COMMUNICATIONS RECEIVED.—W. Elliott, G. G. E. P. T. Campbell, O. G. F. M. A. M. C. J. C. P. H. W. G. W. W. R. G. A. B. W. Lacey, T. L. J. H. H. J. E. S. D.

Markets.

COVENT GARDEN, June 17.

A good supply of home-grown produce. Strawberries becoming very plentiful, and the Kent goods largely increasing in bulk, especially common early Cherries. Green Currants are offered, but do not find buyers to any extent. *Thos. Taylor, Wholesale Apple Market.*

FRUIT.

<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>	<i>s. d.</i>

SEEDS.

LONDON: June 17.—Our seed market is now pretty nothing with, with an almost complete absence of business. In both red and white Clover seeds there is still nothing whatever passing. In consequence of the recent rains less disposition is shown to purchase Trifolium for future delivery. A few speculative sales have, however, taken place. For Rape seed there is a diminished interest, but Mustard seed is still in demand. The extra rates obtained for Tares are bringing out the few odd sacks remaining unsold about the country. There is still an eager inquiry for this article. Canary seed, as indicated last week, is falling in value. White Millet (now largely used as substitute for Canary seed) is now better used as such. Blue-billed Peas seem to be used up. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, E.C.*

CORN.

The supply of English Wheat at Mark Lane on Monday was very short, the demand was firm, and an advance of 1s. per quarter was obtained in a few instances. Foreign Wheat was also firmly held for 1s. advance, but this was not generally conceded. Barley was in moderate supply. Prices for malting were nominal; grinding was inactive, and malt dull and without change. Oats ruled about the same as on Monday's night. Maize was dull, at about late rates; Beans and Peas were quiet and without change; flour was inactive, but rather firmer.—On Wednesday the market was quiet. Wheat, being in limited supply, was rather firmly held, but in consequence of the good harvest prospects, millers were not generally disposed to operate, unless on some reduction. Barley had a drooping tendency, so also had malt. Oats were in short supply, and little or no change occurred in their value. Maize was rather weak, and a dull tone pervaded the market for Beans, Peas, and Flour.—Average prices of corn for week ending June 12:—Wheat, 41s. 1d.; Barley, 34s. 11d.; Oats, 32s. 11d. For the corresponding week of last year:—Wheat, 61s. 4d.; Barley, 41s. 5d.; Oats, 30s. 11d.

CATTLE.

On Monday, at the Metropolitan market, the demand for beasts was chiefly directed to the primest qualities for which full prices were paid. In sheep prime breeds were scarce, and in calves few were offered. Lambs were dull of sale, and calves were quiet at late rates. Pigs sold slowly. Quotations:—Beasts, 3s. 4d. to 4s. 8d. and 5s. to 6s.; calves, 4s. 8d. to 5s. 4d.; sheep, 3s. 4d. to 5s. 6d. and 5s. 8d. to 6s. 8d.; lambs, 6s. 4d. to 7s. 4d.; pork, 4s. 4d. to 6s.—On Thursday trade in beasts was brisk, and the quotations (4s. to 6s. 4d.) readily obtained, occasionally exceeded. For sheep the demand was good at 5s. to 5s. 8d., and 6s. 4d. to 7s. In calves choice qualities were not cheaper. For milch cows trade continues dull.

HAY.

From the Cumberland Market we have the following quotations:—Superior meadow hay, 126s. to 135s.; inferior, 100s. to 110s.; superior Clover, 123s. to 132s.; inferior, 100s. to 108s.; and straw, 40s. to 45s. per load.

POTATOS.

Increased supplies have been on offer at the Borough and Spaldfields markets, new kinds coming forward freely. The inquiry was slow, at the amended quotations:—Regents, 80s. to 100s.; Victoria, 80s. to 120s.; flukes, 100s. to 130s.; and rocks, 50s. to 65s. per ton.—Last week's imports into London consisted of 1038 bags Malta; 250 barrels and 35 casks Bourdeaux; 150 sacks Bourdeaux; 3475 bags and 250 casks Lisban; and 2074 sacks and 216 tons from Dunkirk.

COALS.

The market on Monday showed a steady demand for coals at last prices. There were no Hartleys for sale. Prices: Wallends—South Hetton, 22s.; West Hartlepool, 21s. 6d.; Lambton, 21s. 6d.; Tees, 21s. 6d.; Newbottle, 18s. 6d.; Tunstall, 19s. 3d.; West Main, 19s.; East Wylam, 19s.—On Wednesday house coal advanced 6s. per ton, and the quotations were as follows:—West Hartleys, 19s. 6d.; Wallends—Fletton, 22s. 6d.; Hetton Lyons, 19s. 6d.; Kelloe, 20s.; East Hartlepool, 22s. 3d.; Tees, 22s. 3d.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.—
 These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction, and a month's trial allowed. Orders executed on receipt.

Important to Market Gardeners and Others. THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one
 light but strong steel shovel, for marking out rows to plant, or for loosening up
 the ground after the plants are up. Also a small Steel Plough, to be used for
 billing up the rows when desired, and a Cutter for exterminating weeds, and
 Rake for pulverising the ground. These pieces are made separate, and attached
 or detached to a moment by means of a simple fastening. Its construction
 enables the user to push it readily and easily through the ground, stirring the
 earth, if required, to a depth of six inches. It is exceedingly light, strong, and
 tasty, and fully adapted to the purposes designed. A large number have been
 sold, and are giving unqualified satisfaction.
 Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

FOLLOWS & BATE, Makers, Dutton Street Works, MANCHESTER.

THE GARDENERS' CHRONICLE.

Scale of Charges for Advertising.

Table with 4 columns: Line number, Rate per line, Total rate, and Additional notes. Includes rates for 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, and 14 lines.

And two shillings for every additional five lines. If set across columns, the lowest charge will be 3s.

Table with 2 columns: Item (Page, Half Page, Column) and Rate (6s 0d, 3s 0d, 3s 0d).

Gardeners, and others, wanting places, 26 words 1s. 6d., and 6d. for every additional line, or part of a line.

Fifth Edition, crown 8vo., 7s. 6d. A BOOK ABOUT ROSES: How to Grow and Show Them. By S. REYNOLDS HOLE.

From Reviews of First Edition. "While it is intensely practical, it will interest general readers by an unflagging vivacity which supplies garish and ornament to the array of facts, and furnishes 'ana' in such rich profusion that one might do worse than lay by many of Mr. Hole's good stories for future table-talk. . . . It is by the enrichment of pages full of solid information on the whole subject of Rose-culture with such like quips, cranks, and comic references, that the 'Book about Roses' earns its title to a place in every drawing-room and library."—Saturday Review.

"It is the production of a man who boasts of thirty 'all England' cups, whose Roses are always looked for anxiously at flower shows, who looks the lion's share in originating the first Rose Show *pur et simple*, whose assistance, as judge or *amicus curiæ* is always courted at such exhibitions. Such a man 'ought to have something to say worth hearing to those who love the Rose,' and he has said it."—Gardener's Chronicle.

WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers, have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—Midland Counties Herald.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—Lloyd's.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—Bell's Messenger.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to buy this little book broadcast."—Gardener's Magazine.

Price ad. 1 post free, 46d. Published by WILLIAM RICHARDS, at the Office, 7, Catherine Street, Strand, W.C.

PARTNERSHIP.—Owing to the decease of the Proprietor of an Old established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who would be disposed to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Froehner & Morris, 92, Gracechurch Street, E.C.

WANTED, a HEAD WORKING GARDENER, where three are kept. Must thoroughly understand all Vines, Fruit and Flowering Plants, &c. Wages about 25s., with cottage.—Mr. POLLARD, Caterham, Surrey.

WANTED, as thorough good GARDENER, an unmarried Man, to take care of the Grounds and Gardens of a large School, with the help of a good Under Gardener. He must understand Propagating and Forcing. Good wages given. First-rate character required.—Rev. T. FENN, Trent College, Nottingham.

WANTED, a WORKING GARDENER of experience, for a Gentleman's Place, about 35 to 40s. married, without family. Also a single Man as UNDER GARDENER, and willing to be useful. State wages required.—M. L. M., Post Office, Richmond, Surrey.

WANTED, a young MAN, not under 22, to look after a small Nursery and up to his time in the Houses in a Nobleman's Establishment. None but those who have filled a similar place need apply. Wages 4s per week, with Eschyl, and vegetables found. Good character required.—COCKS, The Gardens, Edenthorpe, Doncaster.

WANTED, an OUTDOOR NURSERY FOREMAN, must be a good Buddler and Grafter of Roses, &c. Also a good GROOMING MAN and general PROPAGATOR of Stove and Greenhouse Plants.—Apply, stating terms and experience, to J. POUNCE, 23, Villiers Street, Strand, London, W.

WANTED, a young MAN to take Charge of Houses under the General Foreman. He would require to have a fair knowledge of the Propagation and Growth of a good general Collection of Stove and Greenhouse Plants. One having had some experience in Growing for Market would have a preference. To an energetic, industrious person this would be a good opportunity for improvement.—RODGER, McCLELLAND, AND CO., 64, Hill Street, Newry, Ireland.

WANTED, as PROPAGATOR, a young MAN, used to Layering, Budding, Grafting, &c., and a Foreman, a middle-aged married Man would find this a permanent situation. A good cottage on the farm.—Apply, stating experience and terms, to Messrs. J. AND C. LEE, Hounslow.

WANTED, as PROPAGATOR, a young Man, used to Propagate Roses and Clematis, under the Foreman.—Apply, stating experience and terms to Messrs. J. AND C. LEE, Hounslow.

WANTED, a young MAN (under the Foreman), who thoroughly understands Growing for Sale Blooming and Bedding Plants, &c. Wages 7s. per week.—State experience, &c., GEO. J. WOOLLETT, Nurseries, Caterham, Surrey.

WANTED, several smart, active, industrious young MEN, for general Nursery Work. Constant employment to suitable young Men.—State experience and wages expected, to FRANCIS & ARTHUR DICKSON & SONS, "Upton" Nurseries, Chester.

WANTED, several young MEN—good hands at Budding Fruit Trees and Roses.—Apply, stating wages required, to JOHN FRASER, Lea Fridge Road Nursery, Leyton, E.

Seed Trade.

WANTED, a JUNIOR ASSISTANT.—Must have been used to Counter-work.—Apply, in own handwriting, stating age, and salary expected, to B. L. PIERPOINT, Seedsman, Horse Market, Warrington.

WANT PLACES.

Head Gardeners.

JOHN LAING can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS or GARDENERS for First-rate Establishments or Single-hands situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

Gardeners and Under Gardeners.

WM. CUTBUSH and SON beg to state that they have at all times on their Books MEN of VARIOUS QUALIFICATIONS, whose characters will bear the strictest inquiry. Any Gentleman making application would save time by clearly stating the duties to be undertaken, wages offered, &c., so that suitable Men may be selected.—Highgate Nurseries, London, N.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

To Gardeners in Want of Situations,

THE PINNACPLE NURSERY COMPANY devote special attention to this important matter—proper Men to suitable Situations. For a GARDENER, or for a SITUATION, please send full particulars to Mr. JOHN BESTER, the Pine-Apple Nursery Company, Maida Vale, London, W.

GARDENER (HEAD).—Age 35, married. Twenty years' experience. Highly recommended as thoroughly practical and trustworthy. Eight years' character.—J. B., 57, Amberley Road, Harrow Road, Paddington, W.

GARDENER (HEAD).—Age 31, married, one child.—Messrs. THOMAS CRIPPS & SON will have great pleasure in recommending to any Nobleman or Gentleman requiring a Head Gardener, a thoroughly practical, industrious, and trustworthy Man. ALSOPHILA WILLIAMSII (THE WEEPING TREE FERN).

JEAN VERSCHAFFELT

Having a fine stock of healthy young plants of this extremely fine and novel Tree Fern, which was imported by him, and figured and described in the *Gardeners' Chronicle* of June 6, 1874, begs to offer them at the following low prices, viz:—

Single Plants	7s. 6d.	Per 25 Plants	100s.
Per Dozen Plants	60s. 0d.	„ 100 „	£12

The Plants, taken out of pots, may be sent, per Continental Parcels Express, at very little expense.

EARLY ORDERS SOLICITED BY

JEAN VERSCHAFFELT,

THE NURSERIES, 134, FAUBOURG DE BRUXELLES, LEDEBERG, GHENT, BELGIUM.

N.B. The following PALMS can still be supplied in store pots:—

	per 100	2	8	0
PHENIX RECLINATA	per 100	2	8	0
PHENIX RECLINATA	per 1000	20	0	0
PHENIX TENUIS	per 100	2	8	0
PTYCHOSPERMA ALEXANDRÆ	per 100	4	0	0
SEAFORTHIA ELEGANS	per 100	2	8	0
SEAFORTHIA ELEGANS	per 1000	20	0	0
ARECA MONOSTACHYA	per 100	6	0	0

SUTTONS' CHOICE STRAINS OF FLORISTS' FLOWERS

(POST FREE).

The Finest Strain of Calceolaria.

The Finest Strain of Cyclamen.

The Finest Strain of Primula.

SUTTONS' SUPERB CALCEOLARIA.

This splendid strain has been most carefully selected from the very finest collections in cultivation. The plants are compact in habit, with beautiful green foliage and a profusion of bloom. The flowers are large, perfect in form and substance, and of every shade of brilliant colour.—Price 2s. 6d. per packet, post free.

From A. E. RUSSELL, Esq., Dalnabreck, N.B., July 10.

"My Calceolaria plants from your seed of last year are particularly fine, of very compact habit, and very fine in colour."

From Mr. A. ALBERTON, Coleman's Frittlewell, May 2, 1875.

"Our Cinerarias this year, from your seed, are splendid; far surpass any I saw at the Botanic Gardens yesterday.

SUTTONS' PRIZE CYCLAMEN.

The following varieties have been carefully selected from one of the finest strains in cultivation, and, as they remain in bloom from November till March, are invaluable for decorating the conservatory or drawing-room during the winter months. The flowers also are extremely valuable for bouquets, as they retain their freshness for a considerable period when kept in water.

ALBUM, pure white.	ROSEUM ALBUM, white and red.
MARGINATUM, rose, edged with white.	RUBRUM, bright crimson.
ROSEUM, rose and carmine.	PURPUREUM, purple.

Price 2s. the Collection, in a tin, post free.

From W. H. MELLESH, Esq., Eversham Lodge, Cheltenham, Feb 12.

"The Cyclamens I had from you last autumn have given me great satisfaction."

SUTTONS' SUPERB PRIMULA.

A splendid strain, which has been carefully selected from the largest fringed flowers of good colour. Habit robust, with bloom thrown well above the foliage. Red, white, or mixed, 2s. 6d. per packet, post free.

SUTTONS' SUPERB CINERARIA.

This will be found unequalled by any in cultivation, the seed having been saved from the finest named varieties only. Price 1s. 6d. and 2s. 6d. per packet.

From WALTER EDWARDS, Esq., Wellington, Somerset,

Jan. 21, 1875.

"A more beautiful strain of Primulas than I have had this winter, from the seed you supplied me with last spring, I never saw."

ROYAL BERKSHIRE SEED

Suttons Sons

ESTABLISHMENT, READING.

HENRY ORMSON,
DESIGNER AND BUILDER OF CONSERVATORIES AND WINTER GARDENS,

EITHER PLAIN OR ORNAMENTAL, CONSTRUCTED OF IRON OR WOOD,
 OR A COMBINATION OF BOTH.

Plans and Estimates for Horticultural Buildings of all descriptions to suit any Garden, large or small.

Gentlemen waited on and Surveys made in any part of the country.

Estimates given for Architects' Drawings.

BOILERS and HEATING APPARATUS of the best description.

HOT-WATER PIPES and CONNECTIONS and a variety of the best BOILERS always kept in Stock.

PRICES AND ESTIMATES ON APPLICATION.

HENRY ORMSON,
 HORTICULTURAL BUILDER AND HOT-WATER APPARATUS ENGINEER,
 STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

BY SPECIAL APPOINTMENT TO
HER MAJESTY

AND HIS ROYAL HIGHNESS THE
PRINCE OF WALES.

JOHN WILLS, F.R.H.S.,

RESPECTFULLY SOLICITS AN INSPECTION OF HIS UNRIVALLED

COLLECTIONS OF HANDSOME FOLIAGE PLANTS, TREE AND OTHER FERNS,
ORCHIDS, NEW PLANTS, &c.,

At his various Establishments, as under :—

I.
THE ROYAL EXOTIC NURSERY AND WINTER GARDEN, ONSLOW CRESCENT,
SOUTH KENSINGTON, S.W.

II.
SUSSEX PLACE, OLD BROMPTON, S.W.

III.
THE MELBOURNE NURSERY, ANERLEY ROAD, NORWOOD,
(NEAR THE CRYSTAL PALACE).

At this Establishment are to be seen the finest Collection of Dracenas, Crotons, and various New Plants in the country; Pitcher Plants, Ferns, &c.,
in endless variety; cultivated by Mr. F. Bause, J. Wills' skilful Manager.

Prices given for all the leading DRACÆNAS, by the Dozen, Hundred, or Thousand.

IV.
NURSERY FOR ORCHIDS, PALMS, ROSE TREES, SHRUBS, &c., LEWIS PLACE,
FULHAM FIELDS, S.W. And

V.
THE BOUQUET GROTTTO, EXHIBITION ROAD, SOUTH KENSINGTON, S.W.,
Where Specimens of Rustic Work, Waterfalls, and Rockeries may be seen.

THE MOST MODERATE PRICES, IN ALL INSTANCES, ARE CHARGED FOR PLANTS AND DECORATIONS.

MOST EXTENSIVE FLORAL DECORATIONS in LONDON are ARRANGED under J. W.'s PERSONAL SUPERINTENDENCE.

J. W. is also extensively engaged in the Arranging and Planting of Conservatories, the Construction of Waterfalls, Rockeries, &c., in all parts of
the country, and may be consulted in any part of the Kingdom. References are kindly permitted to several large and important
Works already carried out. A large Staff of most reliable Workmen are kept.

CATALOGUES OF PLANTS, BULBS, &c., SENT ON APPLICATION.

WEDDING AND OTHER BOUQUETS, CHOICE CUT FLOWERS, &c., CAREFULLY PACKED AND SENT TO ANY PART OF THE COUNTRY
ON THE SHORTEST NOTICE.

JOHN WILLS, F.R.H.S.,

(BY SPECIAL APPOINTMENT NURSERYMAN, FLORIST, AND BOUQUETIST TO HER MAJESTY AND THE ROYAL FAMILY),

ROYAL EXOTIC NURSERY AND WINTER GARDEN,
ONSLOW CRESCENT, SOUTH KENSINGTON, LONDON, S.W.

June 25, 1875.

TRADE NOTICE.

PRIMULA PRINCE ARTHUR.

Is described by the Press as—"An exquisite carmine-crimson double variety of the *Primula sinensis* fimbriata type, of pyramidal form and vigorous habit. Admirably adapted for a dinner-table plant. It comes quite true from seed."

WAITE, BURNELL, HUGGINS, AND CO.,

SEED MERCHANTS,

79, SOUTHWARK STREET, LONDON, Having arranged with the Raiser, Mr. F. PERKINS, of Leamington, for the Wholesale Distribution of this splendid novelty, beg to say they will be prepared to supply the Trade on and after the 15th of July next.

The following leading Nurserymen and Seedsmen have already ordered.

BRUNNING, J., & Co. ...	Great Yarmouth
BRIDGEN, T. ...	King William Street
BARR & SUGDEN ...	King Street, W.C.

A Supplemental List will be published.

SATURDAY, JUNE 26, 1875.

MIDSUMMER FLOWERS.

ALMOST before the spring blossoms have disappeared from our woods and fields, and while even in our midland counties the Hawthorn remains in nearly full blossom, the "longest day" arrives, and midsummer is upon us. Like many other terms, this one of midsummer is perhaps somewhat misleading. Spring, in the popular acceptation of the term, can scarcely be said to begin on March 21, in spite of the almanac; and midsummer, so far as perfection and abundance of flowers is concerned, has hardly arrived by June 24. Yet it is with this day that many of the ancient observances connected with flowers are especially associated; such, for example, as the collecting of fern-seed and all its legendary details, which we have noticed somewhat at length at p. 755 of our first volume for 1874; and the reason for this may be found, at any rate in part, in the fact that this day was held in pre-Reformation times as a feast of considerable importance in honour of the nativity of St. John the Baptist—a feast which is still retained in the present Church of England prayer-book.

The popularity of St. John the Baptist in old times is manifested by the number of traditions connected with his day, both regarding natural and supernatural events. This may be partly accounted for by the fact that he occupied in the Christian faith a position similar to that previously filled by "Baldr the beautiful," the Apollo or sun-god of northern mythology. This planting of the new faith upon the remains of a past superstition was a thing of constant occurrence in the early days of the Church, and was even literally carried out—as in the case of the Cathedral of Chartres, the first Christian church founded in France, which stands upon ground anciently devoted to the rites of Druidic worship. The character of St. John was one which naturally appealed strongly to the sympathies, more especially of the rude northern nations, and resulted, as a matter of course, in the collection around his festival of many traditions.

Leaving on one side, however, as somewhat beyond the scope of this journal, any such speculations, however tempting, as are indicated above, we will confine ourselves to a notice of a few of the plant traditions and associations connected with Midsummer Day. It may be noted that the weather on this, as on other festivals, is in many places supposed to exercise an important influence upon the crops of the year. Rain is generally regarded as likely to exercise an unfavourable influence, especially upon nuts and grain of various kinds; although upon weeds its effect is favourable, if we may judge from an English proverb cited by Mr. Swainson:—

"Cut your Thistles before St. John,
You will have two instead of one."

The St. John's Wort—by which name Hypericum in general and *H. perforatum* in particular are generally known—naturally occurs first to one's mind in connection with Midsummer Day, and this association of the plant is both general and widespread. With us in England, indeed, it is chiefly by its name that this connection is recalled; but it was formerly the custom, as Pennant states to have been the case in his time in Wales, to stick it over the doors on Midsummer Eve, with a view, no doubt, of arresting the power of witches, to

whom it was supposed to be especially obnoxious. Mr. Conway traces its use throughout Europe on this day. "In Sweden and Norway," he says, "it is the central plant of the midsommar-gavstar, the bouquet gathered on St. John's Eve, and hung up as an antidote to witches. In the Tyrol it was thought that if a traveller has it in his shoes he will never get weary. On the Lower Rhine it is placed in wreaths on the roofs as a general protection. Its sap is esteemed of especial potency—it being the elf's or the Baptist's blood, and is sometimes mixed with beer. In Wales St. John's Wort is sometimes made into a tea which produces a certain exhilaration. In France we may often see the harvesters having their hats decorated with it. It is held sacred by many in the Levant, where it is a current superstition that the plague is sure to leave a city on St. John's Day." The supposed power of the plant is manifested in one of its old names, "fuga demonum," as also in the distich—

"Trefail, Vervain, John's Wort, Dill,
Hinder witches of their will."

The curiously perforated appearance of the leaves when held up to the light, to which the St. John's Wort owes its specific name, perforatum, is accounted for by the malice of the devil, who, in his anxiety to injure the plant, pierced its foliage with a needle! In Norway the connection of St. John with Baldr, to which we have already referred, becomes very apparent; as the red markings of the root are known both as "Baldr's blood" and the "blood of St. John." The rhetorical version of a German legend relating to this plant, which originally appeared in *Blackwood's Magazine*, has been so often quoted that we need not do more than refer to it here.

Another plant of ancient association with Midsummer Day is the Orpine (*Sedum Telephium*). As long ago as 1578, Lyte, in his translation of Dodoeus, tells us that "the people of the country delight much to set it in pots and shells on Midsummer Even, or upon timber, slates, or trenches, daubed with clay, and so to set or hang it up in their houses, whereas it remaineth greene a long season, and groweth." The plant was commonly called Midsummer Men; and a writer in the *Connoisseur* refers to it by this name, and refers to the love-divination which was practised with it. "I stuck up two Midsummer Men, one for myself and one for him. Now, if his had died away, we should never have come together, but I assure you his blowed and turned to mine." In connection with this, it may be mentioned that a ring, apparently of the fifteenth century, which was found near Cawood in Yorkshire at the beginning of the present century, had for its device two Orpine plants turned towards each other and joined by a true-lovers'-knot.

Mugwort (*Artemisia vulgaris*) was another plant dedicated to St. John; a girdle was made of it, called *Cingulum Sanctis Joannis*, which was supposed to be endowed with various properties, and the plant was hung before doors upon St. John's Eve. The most curious point connected with it, however, was the virtue attached to a certain marvellous "coal," which was found on this day only under the roots of the Mugwort and Plantain. The virtues of this coal were both numerous and varied, and the coal itself would take rank as a serious rival to many of the quack nostrums of the present day. Lupton, who appears to have believed in it, tells us in his *Notable Things* that "it is certainly and constantly affirmed that on Midsummer Eve there is found under the root of Mugwort a coal which saves or keeps them safe from the plague, carbuncle, lightning, the quartan ague, and from burning, that bear the same about them;" and Thomas Hill, in 1650, adds to this list of ills which are prevented by the

magic coal, and says that it is only to be found upon Midsummer Eve, "just at noon." The romance of the affair is, however, rather removed by a writer in 1675, who says that "they are not coals, but old acid roots, consisting of much volatile salt, and are almost always to be found under Mugwort; so that it is only a certain superstition that those old dead roots ought to be pulled up on the eve of St. John Baptist, about twelve at night." Both Lupton and Hill also mention the Plantain "coal," but it would appear from Aubrey that its use in his day was of less practical importance, albeit more romantic, than had formerly been the case. He says that at twelve o'clock on Midsummer Day in 1694, while accidentally walking in the pasture behind Montague House (where the British Museum now stands), he saw there "about two or three and twenty young women, most of them well habited, on their knees, very busie, as if they had been weeding. I could not presently learn what the matter was; at last a young man told me that they were looking for a coal under the root of a Plantain to put under their heads that night, and they should dream who would be their husbands. It was to be found that day and hour."

Love divinations, in fact, appear to have had unwonted efficacy upon this day. Besides those to which we have already alluded one or two others claim a brief notice. The sowing of Hemp seed, which was in many places practised on All Souls' Eve, also took place on Midsummer Eve. In the *Connoisseur*, from which we have already quoted, is the following:—"The same night, exactly at 12 o'clock, I sowed Hemp seed in our back yard, and said to myself—

'Hemp seed I sow, Hemp seed I hoe,
And he that is my true love aie after me and now.'

Will you believe me? I looked back, and I saw him behind me as plain as eyes could see him." The same writer gives the following custom regarding the Rose:—"Our maid Betty tells me that if I go backwards, without speaking a word, into the garden upon Midsummer's Eve, and gather a Rose, and keep it in a clean sheet of paper without looking at it till Christmas Day, it will be as fresh as in June, and if I then stick it in my bosom, he that is to be my husband will come and take it out."

The decoration of churches and houses on Midsummer Day with boughs of Birch and Beech, and with various other plants, was in former times very general. Stow, in his *Survey of London*, says that "on the vigil of St. John Baptist every man's door" was "shadowed with green Birch, long Fennel, St. John's Wort, Orpine, white Lilies, and such like," and "garnished upon with garlands of beautiful flowers." Disbursements for Birch occur in many churchwardens' accounts of the fifteenth and sixteenth centuries, often associated with Broom; and it was probably at this season that Coles, riding through Little Brickhill, in Buckinghamshire, noticed that "every signe-post in the towne almost was bedecked with green Birch."

A few of the European plant-associations of Midsummer Day may fitly conclude this notice. In many parts of Germany the Hazel rod used for divining purposes has to be cut on the mid-night before St. John's Day. Elder berries gathered on St. John's Night are essential to the safety of the Styrian who would stand in the centre of a magic circle on Twelfth Night. "The Bohemian poacher," says Mr. Conway, "thinks he can make himself shot-proof for twenty-four hours by finding, on St. John's Day, Fine cones on the top of a tree, creeping around them, taking them home, and eating a single kernel on each day that he wishes to be invulnerable. In East Prussia there is a superstition concerning Dogwood, that its sap, absorbed in a handkerchief on St. John's Night, will fulfil all

wishes." In the same district wreaths of Camomile are gathered on Midsummer Day, and hung up in houses as a preservative against storms. Even in Iceland we find a Midsummer superstition: it is supposed that the Meadow-sweet (*Spiraea Ulmaria*) taken on this day and placed in water will discover, at any rate, the sex of a thief; if it sink the thief is a man, if it swim a woman. *B. M.*

New Garden Plants.

ALBUCA (EUALBUCA) GLANDULOSA, Baker, n. sp.*

This is a well-marked new species of the group of *Albuca* which have the three outer filaments entirely destitute of anthers. Of the five species already known it comes nearest *A. viridiflora* (*Bot. Mag.*, tab. 1656), but may be distinguished at a glance by its flowers, which are very fragrant, permanently erect, with pure white segments having a green central band, instead of inodorous and cernuous, with the whole segment more or less green. Bulbs were sent by Mr. McOwan, in 1872, from the eastern part of Cape Colony, to the living collection at Kew, where it flowered in the month of April in the present year.

Bulb globose, an inch or more thick, the tunics quite truncate at the top. Leaves 2-3, cotemporary with the flowers, linear semiterete, half a foot long, 3-4 lines broad, tapering to the point, fleshy and somewhat fragile, deeply channelled and naked down the face, bright green on both sides, with 4-5

collection at Reigate, from which these notes were taken. From all the other species with the stamens and style much exserted from the perianth it is readily marked by its leaves; and from the numerous varieties of *A. crotia*, which in habit and leaf it most resembles, by its different perianth, and much exserted stamens.

Plant 7 feet high in Mr. Cooper's specimen at Reigate, seen 10-12 feet high in its native country, 3 inches thick at the base, half as much at the top. Leaves crowded in a dense rosette in the top foot and a half, ensiform, falcate, more decidedly oblique than in any other species, 15-18 inches long, 2½ inches broad at the base, narrowed gradually to the point; a uniform rather dead glaucous green throughout, not at all marked with either spots or blotches; flat down the face, rounded on the back, half an inch thick, soft and pliable in texture; the edge armed with moderately close spreading green spines with a horny border, not more than a line deep. Flowers 150, in a dense raceme, which when expanded is 3 inches broad, and above half a foot long. Pedicels ascending, half an inch long. Bracts lanceolate, shorter than the pedicels. Perianth tubular, 9-12 lines long, gamophyllous in a short cup at the base, the segments ligulate, much imbricated, pink before opening, when mature whitish, with 1-3 very distinct green ribs. Stamens one-third as long again as the perianth. Anther oblong, ½ inch long. Style longer than the stamens, curved, exserted at least half an inch from the perianth. *7. G. B.*

ODONTOGLOSSUM ANDERSONIANUM, Rehb. f.

I have at hand a most beautiful variety of this plant. It is conspicuous by reason of its very large

FIG. 167.—STRAWBERRY HOUSE AT CHATSWORTH.

distinct ribs on each side of the costa, semi-terete on the back and finely glandular. Scape a foot long, terete, densely glandular throughout. Corymb in this specimen three-flowered, but doubtless producing more flowers when the bulb gets well established. Bracts lanceolate, 6-9 lines long, equalling or rather shorter than the permanently erect densely glandular pedicels. Flowers very fragrant, permanently erect, outer divisions of the perianth erecto-patent, oblong, 4 lines broad, the central third bright green, glandular on the back; the two outer thirds pure white. Inner segments rather shorter, permanently connivent, with an incurved yellowish tip. Filaments flat, pure white, narrowed into a haft, only those opposite the three cuneate inner segments anther-bearing. Triquetrous obconic style as long as the ampulliform ovary. *7. G. B.*

ALOE (PACHIDENDRON) DREPANOPHYLLA,

Baker, n. sp.†

A native of the district of Somerset in Cape Colony, and of the Zuurberg range of mountains, where it was discovered by Mr. Thomas Cooper, who brought it to this country, and has now a plant in flower in his

* *Albuca (Eualbuca) glandulosa*, Baker, n. sp.—Bulbo globose apice nullo modo fibroso; foliis 2-3 anguste linearibus semipendulis facie glabris dorso semiteretibus subtiliter glandulosis; scapo tereti pedali dense glanduloso apice parce corymboso; bracteis lanceolatis pedicellis ascendentibus subuloniis; floribus suavelentibus distincte erectis; perianthio unciali segmentis albis dorso late viridibus glandulosis; staminibus exterioribus castratis; stylo clavato obconico prismatico ovario zequilongis.

† *Aloe (Pachidendron) drepanophylla*, Baker, n. sp.—Longe caulescens; foliis dense rosulatis falcatis obliquis sesquipalibus glauco-viridibus nullo modo lineatis nec maculatis facie plantis dorso rotundatis margine dentibus parvis patulis deltoideis cartilagineis praeditis; racemo simplici densifloro; pedicellis ascendentibus bracteis lanceolatis superantibus; perianthio 9-12 lin. longo basi brevissime gamophyllo; segmentis ligulatis late imbricatis junioribus rubro-tinctis, maturis pallidis 1-3 nervis distinctis viridibus percursis; genitalibus longe exsertis.

and very dark blotches, and by the very shining yellow on the lip. I have to thank for it Mr. Van Branteghem, who is the pioneer of *Orchidophilia* on the Bosphorus at Constantinople. *H. G. Rehb. f.*

HALF HOURS AT KEW.—III.

ACACIAS.

HAVING been prevented from continuing our gossip on plants in the Kew Gardens in regular order, this article is somewhat out of season, as most of the Acacias are already out of bloom. Nevertheless, there is so much that is curious and beautiful in the genus *Acacia* that we will not pass it over on that account. In the first place it is remarkable for the diversity of form it displays in the foliage of its numerous species, which may be studied as well now as at any other time; and it is equally singular in the uniformity in structure and colour exhibited by the flowers of species inhabiting the most distant parts of the globe. The number of species known at the present time is nearly 450, dispersed over nearly all tropical and sub-tropical regions, a few reaching the warmer temperate zones. In a recent revision of the sub-order Mimosaceae of the Leguminosae, by Mr. Bentham, in the *Transactions of the Linnean Society*, 432 species of *Acacia* are described, many of which offer a great variety in their foliage, the extreme forms of which were regarded as distinct species by some botanists before the connecting links were discovered, and for horticultural purposes these names are retained. Doubtless a considerable number of species yet remain undiscovered in the interior of Australia, and other little explored tropical regions; and probably forms will be found connecting some of those now considered as distinct. Thus, Dr. Grisebach has lately described four new species in a small collection of plants

gathered in the territory of the Argentine Republic. Now a few words as to the distribution of the species, very few of which, it will be observed, are common to separate countries, and we may add that most of them, especially the Australian, have a very limited geographical area. Australia contributes 293 species, America 61, Africa 57, Asia 19, Polynesia 4, and the Mascarene Islands 2. A fact worth noting is that the genus is not represented in New Zealand, although the species are numerous in Tasmania. In the northern hemisphere the genus is represented as far north as Japan and the Mississippi States of North America, but none appear to reach the tropical parallel of latitude. We will first of all say something of the Australian species, the majority of which exhibit a peculiarity in their foliage exceedingly rare in other genera and in the species of *Acacia* inhabiting other countries. The peculiarity is this, that the true leaf is not developed, but in the place of this the stalk or petiole is more or less flattened out or lengthened, assuming a wonderful variety in size and shape. The latter is actually the case is produced by some species in which the finely divided (bipinnate) blade is borne at the end of the phyllode, as the flattened leaf-stalk is termed, and the young seedling plants of all (?) the species have pinnate leaves. Under cultivation *A. Melanoxylon*, *A. implexa*, and others, usually develop some of the true leaves; indeed, it would seem that generous treatment favours their development. A similar thing occurs in the foliage of two South American species of *Mimosa*, and one species of *Prosopis* from the same country. Some American species of *Biophytum* (*Oxalis*) are likewise phylloineous.

Of the 293 Australian species of *Acacia*, 271 belong to the phylloineous section, which numbers only about 280 altogether. The extra-Australian phylloineous *Acacias* occur in the Pacific Islands and in Indian Archipelago. One, *A. Ricchii*, is found as far north as the island of Formosa, and curiously enough the northern limit in the western hemisphere is in about the same latitude, just within the tropics, in the Sandwich Islands, where *A. Koa* is one of the largest and most important of the trees which furnish the canoes of the natives are formed. The earliest known species of this section was found in Amboina, and is figured by Rumphius in the *Herbarium Amboinense*, but it has not been re-discovered. It is described as having phyllodes 18 inches long, which is much larger than those of any other. Practically, the first-known species was *A. laurifolia*, described as *Mimosa simplicifolia* by Linnaeus, who does not appear to have understood the foliage. This is a very remarkable species, with broad, dark green, fibrous phyllodes. It is a native of the Isle of Flores, Fiji and other islands in the South Pacific Ocean, and was introduced by J. R. Forster as early as 1775, but it has almost, or quite, disappeared from our gardens. Not much later Lamarck described a phylloineous species from Bourbon, under the name of *Mimosa heterophylla*, a very appropriate appellation, inasmuch as this species develops some true leaves, and furnished the soldier of the tree with the phyllodes. It was introduced into this country in 1821.

To continue the history of the discovery and introduction of this group we may mention that Willdenow (*Species Plantarum*, 1805) includes nine species; in the third edition of Aiton's *Hortus Kewensis* (1810) a few more were added, but only thirty-seven were known to Wendland (*Commentatio Acaciae aphyllis*) in 1820. After that date new species were rapidly discovered and introduced by Drummond, Fraser, and others, who collected in West Australia, to which part nearly one hundred of the known phylloineous species are confined. By way of further illustration of the limited area of the species, it may be mentioned that fifty others are limited to North Australia, as defined in Mr. Bentham's *Flora Australiensis*. But out of seventeen species found in Tasmania only two are endemic, including the beautiful *A. Kiceana*. Again, a few species have a very wide range—such are *A. juniperina*, *armata*, *sentis*, *salicina*, *myrtifolia*, *Melanoxylon*, *longifolia*, &c. The twenty-two species of *Acacia* in Australia having true leaves are scattered all over, but are much more abundant in the eastern and especially the south-eastern parts. The almost ubiquitous tropical species, *A. Farnesiana*, is also indigenous in Australia. Before entering more fully into a description of the merits of a selection of species for greenhouse and outdoor cultivation, we may give some idea of the general appearance, uses, &c., of the Australian species. In habit and stature they vary as much as in the form and disposition of their phyllodes, forming a conspicuous feature of the vegetation on the most different soils and in the most diverse situations. Some are mere trailing or prostrate shrubs (*A. humifusa*, *nitida*, &c.), others compact, dwarf, erect shrubs (*A. armata*), others stout erect shrubs, of 8 or 10 feet or more in height (*A. myrtifolia*), others elegant small trees (*A. pendula*), and others lofty timber trees (*A. Melanoxylon*). The flowers are almost invariably some shade of yellow, very rarely white, and arranged in globular heads or cylindrical spikes. In many species they are very

fragrant, and usually produced in such unbounded profusion that an *Acacia* scrub or forest in bloom is a most striking and beautiful sight. Taken altogether, the genus *Acacia* is more numerous in species than any other represented in Australia, although there are many very large genera in that country.

The arborescent species form entire forests, and those of shrubby growth constitute the principal vegetation of miles of "scrub." Among the more important for their timber, bark, gum, or other products are *A. Melanoxylon*, or Blackwood, *A. mollissima*, or Black Wattle, *A. homalophylla*, or Myall, and *A. dealbata*, or Silver Wattle, but a large number of them that have received no distinctive popular names, yield gum and bark suitable for tanning, or handsome hard wood suitable for the cabinet maker. The timber of *A. Melanoxylon* is described in the report on the Victorian Exhibition as the most valuable of all colonial timbers; it is sometimes called Lightwood, as well as the more appropriate name of Blackwood. It is extensively employed in the construction of railway and private carriages, as it is well adapted both for light and heavy framing purposes, and in this respect contrasts most favourably with the best of the English woods. The naves and spokes of light wheels are often made of it; and from its quality of bending with facility, it is highly prized for gigs and buggy shafts, and the rims of light carriage wheels. It also makes excellent gun-stocks, being harder and more durable than Walnut, and not inferior to it in beauty. It is a favourite with cabinet-makers for furniture of every description, and receives a very high and beautiful polish. The Black Wattle furnishes a valuable wood for the cooper, and the bark is largely used for tanning purposes. *A. homalophylla*, the Myall, and several other species bearing the same trivial name, have a hard fragrant wood which retains its odour for years. Bennet says, in his *Gatherings of a Naturalist*, "I have a small cup of Myall wood which has been in my possession for the last fourteen years and retains its fragrance as powerfully as ever."

For the preparation of leather the barks of the various *Wattle* trees are the most useful, and the most commonly employed. The trees are fayed in September and the two following months. The leather produced by the use of the bark of the Black Wattle is characterised by a reddish-brown colour, much deeper than that communicated by Oak bark, and it is considered to act more speedily. According to Mitchell (*Tropical Australia*) cattle eagerly browse upon the branches of *A. pendula*; whilst the same traveller states that the natives use boughs of *A. varians* to poison fishes in their holes. The gum exuded by various species is described as excellent eating, and Wilhelm affirms that the Port Adelaide tribes lived almost exclusively during the summer months on the gum obtained from different *Acacias*. Respecting the *Acacia* see the same writer observes that those of all the varieties are collected in large quantities under the name of *Nundo*. They are roasted in hot ashes, which causes them to swell to double their former size. As a proof how valuable these trees are to the aborigines it may be mentioned that the Kukata tribe, living in the north-west, and renowned as very savage and possessing the art of sorcery, often threaten to burn the *Nundo* bushes or otherwise destroy them, to harass the inimical tribes. Various other economical applications are made of different products of this genus, but not on a sufficient scale to have become of commercial importance. The characters for grouping are chiefly taken from the form, disposition, and venation of the phyllodes and the arrangement of the flowers. In our next we propose giving a rapid sketch of the principal groups, selecting a few of the more curious and interesting species for comment, and specially noting the most desirable for cultivation. H.

(To be continued.)

HYBRID RHODODENDRONS.

As the summer nears the beauty of this excellent group of plants wanes within-doors. Then the unpleasant duty devolves upon us to crop away the remains of what was recently brilliant in regal pomp, with aspect enduring, free from the taint of decay, but now shrunk and soiled masses, clinging to but disfiguring what they once adorned. Reluctant to part with the objects which afforded so much real pleasure one may be pardoned the confession of feeling a tinge of sadness when the period of their richness has expired. However, such sentiments soon evaporate on recounting the pleasure experienced as each member of this great family in its turn unfolded its beauty, and lightened with its brightness the bleak and gloomy months, even before "grim November's surly blasts" had set in. *R. Nobileanum*, supported with its varieties, first awakes into renewed activity, unfolding to our senses a feast of good cheer served in piles of rosy scarlet cups, along with others of rose and bluish tint. Close in their train follow *R. ciliatum*,

a maiden of neat, compact stature, and beautiful in her modest clothing of white flowers, campanulate, lucid, waxy, of solid texture, profusely produced. Cunningham's White may well look up with confidence as near the end of the first month, there being none to outstrip it then. *R. multiflorum* furnishes its clusters of blossoms, which taken singly might be mistaken for blooms of *R. ciliatum*, but there can be no difficulty in determining their respective difference; *multiflorum* produces flower buds down the stems as well as on the points of all its growths. This one dislikes excessive forcing, but readily yields to a little gentle persuasion by means of heat and moisture; thus urged she usually puts in a fair appearance in February and March. *R. praecox* ought not to be despised, although not claiming to be one of the "fairest of the fair"; its bluish purple flowers are useful when flowers generally are at a ransom value; and even old *R. atrovirens* produces a telling plant when taken out of the ground in February and placed into very moderate moist heat; but as a hardy, contented, unfeeling friend there is none before *R. barbatum*, exposed in a tub with the pasty grave winter, without any protection whatever, and a splendid plant of this species, with considerably over a hundred flower crowns on it; this plant suffered nothing by the exposure, excepting a few leaves which caught the rays of the morning sun before the previous night's frost had got out of them. Independent to this hard usage, *R. barbatum* commenced to expand its splendid trusses when we were forced to afford it lodgings under glass, where its startling richness expressed an amazing rapidity, displaying in the sunlight which played about it, a cluster of ruby crimson a halo of its own glowing colour. Flowers campanulate, medium sized, of extraordinary substance. The flowers are closely set into a globe form; the leaves are long, lanciform, inclined to droop, they are rather harsh in look, and their foot-stalks are densely furnished with rigid hairs or barbs. I am aware of the existence of other varieties in commerce which go under this name, but a good test is the presence of this tuft of barbs on the footstalks of the leaves, which is conspicuously shown in the true *barbatum*.

The forthcoming enumeration is given without any reference to their period of flowering. They are grouped according to prevailing colours.

White Flowers and White Suffused Blush.—The Queen is snowy white, displaying a small blotch composed of orange pencillings; truss large, bold, and of refined build; pipe perfect in mould and substance. Minnie has also the noble bearing of a queen, having a truss of charming airy fineness; the individual flowers are full and perfect, and so is their arrangement into great pointed trusses; colour bluish-white, which conspicuously large and telling, composed of dense motlings of chocolate. Mrs. John Clutton is generally acknowledged the fairest and most accomplished member of the white section. I know that I never shall forget her appearance, having once seen her flowers, but I cannot venture a description of her parts from the remembrance of them. *R. perspicuum* has for prevailing colour a delicate white, suffusing blush; blotch formed of softest green scales; nice full trusses. *R. elegans* is a white of superior purity, unless for the feather-like blotch traced in canary-yellow punctures confined to the upper petals. *R. Vesta* is also a lovely bluish-white, with orange markings on the superior segments. *R. Evelyn* displays a beautiful truss, full, and of superior finish; its blossoms are models in form, colour white, flushed with purple, more intense around the margins of the corollas. *R. album grandiflorum* has also a grand truss of excellent white flowers, stained with a blotch of orange-yellow. *R. guttatum* colorans is second to none in whatever respect it may be judged; ground colour French white, profusely stained by pencil touches of maroon over the entire exterior of the corolla, which is cupped; truss large and perfection itself. *R. Jean Stern* should have figured at the commencement; her sterling worth merits special description, but I cannot furnish one, although I retain a sufficient remembrance of her to know her when we meet.

These classed as Crimson.—*R. Coregio* is a brilliant maroon-crimson, flushed with rose, upper petals showing scattered freckles of black; truss of great globular form. *R. Decorator* has crimson flowers, with stray punctures of black scattered over its upper petals, and compact truss of well-formed flowers. *R. John Waterer* is a showy crimson, pencilled black densely over the lower portion of its flowers; fine. *R. Michael Waterer* is still more showy, and on the whole a superior variety, being conspicuous for the brilliancy of its crimson, excellent large flowers, and boldly marked with each of a blotch of orange-yellow. *R. grandiflorum* large, excellent build. *R. Grand Arab* and *Sir Robert Peel* are very much alike, but Sir Robert I consider the best. *R. Warrior* is another after the same style. The three are classed first-rate in the bright crimson section, with black or maroon markings.

Rose Colours, and inclining to Rose.—*R. Betsy Trotwood* is a lively rose, mingling with lighter shades, and vivid tints of dense rose prevailing around

the marginal portion of the corolla, centre blush with greenish yellow freckled blotch; flowers of moderate size; truss somewhat confused, owing to the shortness of the footstalks of the flowers, still Betsy Trotwood may well rank high. *R. splendens* exhibits a more style as the former, but *splendens* exhibits a more closely fitted blotch of ochre-yellow spots. Mrs. John Waterer occupies a similar position amongst rose colours to that which Michael Waterer does amongst crimson; colour, light rose. *R. Brilliant* is a brilliant magenta, and forms an excellent truss of cupped flowers, showing a few dim freckles of brown; exquisite. *R. Barclayanum*, another of the upper class noted for its superior attractions, and *R. Brilliant*, are very much alike; *R. Jago* and *R. General Cabrera* especially shine; their marked distinction rests on their approaching in form and marking those of the *Pelargonium*. *Jago's* main colour inclines to rose-purple, while that of *General Cabrera* inclines to rose-crimson; both are marked with effective blotches of black pencillings, and are first-rate. *R. Brayanum* is the pride of the magenta order, without spot or stain; its truss is lightsome and free, exhibiting a pleasing pose so as to complete a perfect truss, flowers of moderate size, firm, leathery consistency. *Brayanum* is one of the most favoured. *R. giganteum elegans* is a dark rose inclining to crimson; its blotch is closely beset with pencillings of dense maroon. *R. Madame Warner* produces a jaunty but charming truss of lively rose, toning down to blush as the centre of the flowers is approached; blotch composed of brown markings; corolla flat-tish, but smooth and uniform. *R. concessum* is a delicate and lively pink, with touches of peach in its colour; flowers large, flat-tish, and rather confused in the get-up of the truss, still very showy. *R. Earl of Shannon* is a bright rose-pink, with excellent truss, and strongly marked blotch in freckles of maroon. *R. R. S. Field* is another bright rose, showing but few faint freckles of light brown; flowers cup-formed, properly built into a well constructed truss.

Flowers Purple and inclining to Purple.—*R. Nero* is a worthy one to commence with. Its flowers are purple, inclining to lilac towards the inner portion of the flower; blotch triangular in outline, feathered with a strong washing of maroon, copiously filled in with mottlings of glossy maroon. *R. Schiller*, another excellent variety, is quite worthy the name it is intended to honour; the truss is of exquisite build, composed of medium-sized, neatly-formed flowers, with bold blotch of varnished black. *R. roseum elegans* may be rose colour out-of-doors, but it is more inclined to lilac under glass; however that may be, it has a cheerful appearance, its truss is well constructed, and the pips creditable, showing a blotch of ochre-yellow. *R. Blatcum* is a star of the first magnitude, with truss massive, elegantly poised on the shoots; in build it is difficult to surpass; flowers deep purple, expansive, smooth, with solid, conspicuous blotch of triangular form, filled in by shining black spots. *R. Chancellor* has rather pale purplish-lilac flowers, which are extra large. *R. Princess of Wales* has a dark purple border, the interior of the corolla white dyed with purple; blotch traced by mottlings of greenish brown; splendid truss and flower, remarkably distinct from all others but *R. Prince of Wales*, which in every important respect resembles the Princess, but is of a darker shade. *R. Sherwoodianum* produces handsome trusses of well-formed flowers, the petals are well-rounded, shell-like, of purple hue, blending to white; blotch strikingly bold in its well-defined markings and outline; freckles composing blotch maroon, exhibiting in the blotch a washing of maroon. *R. Joseph Whitworth* may be designated the acme of perfection, so far as we have seen in this class of *Rhododendrons*; its truss is faultless, as are its flowers, with a colour unique, in short it is one of the most imposing of them all; colour maroon-purple, uniting a metallic gloss, and besides, although difficult to trace, at a distance there exists evidence of the presence of lurid crimson in its composition; the flowers are fringed with minute mottlings of glossy maroon, overliven by a blotch, which is clearly defined by its frecklings of the same shade. *A. Kerr.*

CHATSWORTH.

[SEE ALSO SPECIAL SUPPLEMENT.]

FRUIT GROWING at Chatsworth is nearly all carried on under glass, in consequence of the great uncertainty attendant upon late spring frosts, which are very keenly felt here. On the 30th of May last there was sufficient frost to cut down Yews, Laurels, Lilacs, and other trees pushing into growth, to kill nearly all the Apples, and an immense quantity of Gooseberries, and all the blossoms then out on Peas. For the last seven years Mr. Speed has never escaped a sharp frost during the last week in May, consequently all crops out-of-doors are quite a fortnight later than in gardens

on higher ground. Peaches, Nectarines, and Apricots cannot be depended upon for a crop outside, and consequently none are grown. But little is also done with Plums, which cannot be trusted, the oldest men in the garden never having seen a bushel of fruit gathered from outside trees in any one year. On the contrary, Cherries of all kinds do grandly on the walls, and yearly produce an abundance of fruit. Mr. Speed attributes his success with this fruit to the fact that the borders in which they grow are never dug, and the trees are never touched with a knife, all the wood they make being nailed in without much regard to the rule of thumb. Apples are nearly always cut off by frost, and no dependence can be placed upon them. Pears are grown entirely upon the walls, and the best grown here are Winter Nells, Glou Morceau, Jargonelle, and Beurré de Rance, while some fine young trees of Louise Bonne of Jersey promise to be equally serviceable.

Vine growing is carried out at Chatsworth on a large extent, and some sixteen houses are devoted to it. Thirteen of these houses are lean-to's, with the Vines planted out, and

finds no remedy more effectual than syringing with cold water for a night or two.

Pines are grown in pots in soil from the magnesian-limestone formation, to the extent of about 600 plants, 300 being fruited every year. The varieties most favoured are Queens, Charlotte Rothschilds, Smooth Cayennes, and a few Black Jamaicas, and all are plunged in leaves in six well-built pits. For these Mr. Speed never uses water of a lower temperature than 85°, and there is a copper handy for furnishing the supply of hot water for mixing. Mr. Speed has been unfortunate in obtaining a bad sample of guano, which has injured rather than improved his plants, but a change to home-made liquid manure has done wonders in getting the stock round to their normally fine condition.

About 3000 plants of Strawberries are forced, the varieties preferred by Mr. Speed for this purpose being Underhill's Sir Harry, Reeves' Eclipse, and Vicomtesse Héricart de Thury, the latter being especially valuable as requiring less light than most other varieties. For growing Strawberries Mr. Speed has arranged a span-

FIG. 168.—OLD PEACH TREES AT CHATSWORTH.

three are handy span-roofed erections, for Vines in pots, which are grown—and remarkably well, too—for early work. The only sorts grown in pots are Black Hamburg, Foster's Seedling, and Buckland Sweetwath, and the first cutting is generally made about the middle of April. All the best varieties are planted out permanently, in addition to several of the newer ones. Pearson's Golden Queen is well spoken of by Mr. Speed, while another of Mr. Speed's Grapes, *M. de Lesseps*, is valued as ripening six weeks earlier than most others. Dr. Hogg and the Chilwell Alicante may also be seen in fine condition, and Mr. Speed anticipates that the last named will prove a remarkably good acquisition. In Vine culture Mr. Speed lays great stress on the free admission of air, the outside borders are even covered with loosely fitting tiles in preference to shutters, as allowing freer access of air. Having to produce Grapes for a large family consumption, Mr. Speed favours those bunches which weigh from 1½ lb. to 4 lb., with good berries, and visitors to Chatsworth will find an abundance of both. We may incidentally mention that for mildew Mr. Speed's remedy is simple and effectual, it consists merely in drying the house and allowing free access of air; while for red-spider he

roofed pit (fig. 167, p. 814), the lights of which lift off on either side. The pots are plunged in leaves, and the plants are close to the glass. From this they can be taken into the forcing-houses and placed on the shelves to ripen. Early runners being in request for pot culture, Mr. Speed has a plan of his own for obtaining them. After he has layered a sufficient quantity for forcing, he takes about 200 of the next best runners of each of the sorts in demand, and plants them out. Then when they come into flower in the following year, all those which do not flower are at once pulled up, and the result of this process of selection is, that out of his 3000 plants he has not a single blind one.

Melons are for the most part grown in 2-peck pots at the back of the Pine stoves, and a good supply of excellent fruits is obtained from such varieties as Colston Bassett, Gilbert's Scarlet-flesh, and Gilbert's Victory of Bath. The Cape Gooseberry is a speciality at Chatsworth, and a roomy span-roofed house is devoted to its culture. The plants are propagated by cuttings, and grown in pots, the shoots being trained up the roof like a fan-shaped Peach tree. The plants are in very fine condition, and Mr. Speed has not been without a dish of fruit since last November, and very delicious and refreshing

the fruits are. Several houses are devoted to Peaches and Nectarines, and the principal varieties are Royal George, Flrge, Violette Hâtive, Prince of Wales, Victoria, Belle-garde, Stirling Castle and the Royal Ascot Peach, the last-named being considered by Mr. Speed the finest late variety, while Prince of Wales is esteemed by him as the best late Nectarine, and one that stands fire-heat well. In the Plum-houses the plants are grown as small bushes planted out in the front border, and as single vertical cordons on the back wall. In the Fig-house—a lean-to—the beds are raised to the height of about 3 feet, and the trees planted out back and front, are doing splendidly. Mr. Speed considers a variety named Pallance the best early Fig grown, and for a general crop Lec's Perpetual, *alias* Brown Turkey, is the best. Some small plants which have been layered only three months are now showing five and six fruits each—a sufficient hint that this is not the wrong way to propagate them.

Kitchen Garden.—We have unfortunately but little space left to devote to the vegetable department; consequently, we can only indicate

as it is possible to get them. The hoe is the principal tilling implement in use, and the secret of the fine growth all around lies in its frequent use and in the application of manure on the surface of the ground only. Peas, Beans, and all such crops are treated in the same manner, and starved vegetables are conspicuous by their absence. Horse Radish is grown to a considerable extent, and in a way differing from that ordinarily practised. When a new plantation is made thin roots about 18 inches long are selected, and, after having all the side rootlets rubbed off, are planted in rich soil in a slanting direction instead of vertically, so that all parts are comparatively near the surface; and the sticks grow frequently as thick as one's wrist, every bit of which is usable.

THE ROYAL BOTANIC GARDEN, BELFAST.

FIRST impressions have generally an influence upon our subsequent estimate of most things; yet if such were invariably the case, few persons would come away

of its surface. In different parts of the garden are some good examples of the white-leaved Willow and English Elms: in one corner of the grounds are growing a number of memorial trees, amongst which is the Cedrus Deodara planted by the Duke of Abercorn, the present Lord-Lieutenant; C. Libani, by the Duchess of Manchester; Thuja Lobbi, by the Countess Spencer. The ground is undulating, and the surface varied, although having a pleasing appearance. From different parts of the elevated ground a glimpse is caught of the surrounding country; westward is the high range of hills which rise abruptly and run from north to south, shutting out the western gales; on the east the eye stretches, to the left, far over the old town of Carrickfergus, and more to the right over the River Lagan.

At the bottom, or eastward end of the garden, is situated the exhibition ground, noticed in the report of the exhibition which appeared at the time in the *Gardeners' Chronicle*. This was a hollow, which Mr. Johnson, the present able curator, converted from a useless corner into one of the best and most effective show grounds that have ever been made, and which, even when stripped of its show-tide embroidery, is a very interesting example of original gardening (see fig. 170, p. 821). The principal posts that support the framework, and which is covered with canvas during the time of the shows, are draped with Ivy and other climbing plants, that go far to do away with the objectionable bare timber, which is still further hid by the judicious planting of here and there an evergreen or deciduous shrub. The whole has a most natural and pleasing effect, without a particle of stiffness; it is surrounded with shrubs that are planted so as to produce an irregular inner line.

From this end of the garden we turn westwards towards the flower-garden, which is in front of the principal range of glass-houses, and here the general effect produced is good and quite different from anything that I have seen attempted; there is a combination of materials such as is not usually brought together. Mr. Johnson has not been in any way conventional. This garden is not composed of heterogeneous, subtropical, or ordinary bedding plants, but of all combined; the beds are large and irregular in shape, not any of them filled with plants that give an even surface, but differ in their height, yet the centre plants in most of them are not of such a close, dense description as to effectually conceal whatever they stand betwixt and the eye, being mostly of a light, airy habit of growth; the beds again are, most of them, more or less elevated irregularly, in different parts above the level of the turf, exhibiting in one place an even surface to suit a considerable breadth of some particular plant adjoining to some other distinct in habit, colour, and general outline. Those who are fond of masses of colour can see their ideas worked out in considerable breadths of such things as scarlet Pelargoniums, yellow Calceolarias, or blue Lobelias, in a broad circle, a division, or a match corner of a bed, but in all cases divided from the grass by a considerable breadth of some grave-coloured dwarf edging plant, from the surface of which, in its turn, springs here and there a plant of a character quite different in both colour and height, so as to effectually break a too even surface. By this means the individual who admires form alone can have his fancy gratified to the full, for there are very great numbers of what may be called foliage plants used, as well as some common hardy shrubs, such as small Rhododendrons, for a background for any plant that may be improved by them. Large beds exclusively filled with subtropical plants there are none, the great majority of the things used are hardy, or nearly so; in fact, Mr. Johnson's practice has here, in a great measure, been ruled by necessity.

To replant every year such a space as the large beds comprising this garden would tax the resources of the place, especially in labour, beyond the means at command; consequently, the greater portion of the whole is occupied by subjects of a permanent character. That such can be selected from the immense storehouse of cultivated plants which we possess is here exemplified; one striking feature, and most effective in its result, is that most of the plants used for a margin or inner circle are not confined to a given breadth all round a bed or any portion of a bed they occupy, but are broad or narrow as the case may be—here confined to a narrow strip, there spreading out to greater width; consequently when a dull-coloured edging plant is so planted the inner circle of something possessing more colour is divested, not alone of its objectionable formality, but also of an unwelcome glare, hereafter will be evident from a more particular description of the occupants of some of the beds. Those who are fond of strong contrasts in vivid colours, with strict formality in outline and equality in surface, will not meet here with much to please their taste; neither will those who abhor colour, and see perfection in form alone, be satisfied; but those who love a garden for the diversity of form and colour in leaf and flower which the different plants it contains can afford, will here find as much to please and

FIG. 169.—VIEW IN THE ROCK-GARDEN AT CHATSWORTH.

some of the more prominent features. Of the quantities annually furnished we may mention 2000 plants of Snow's Winter White Broccoli; 12,000 Celery, Williams' Matchless Red, and Turner's Incomparable Dwarf White, grown in beds of four rows each; 6000 Endive, mostly used as a vegetable; 1 acre of Asparagus, a quarter of an acre of Rhubarb, for forcing; an immense quantity of Seakale, for the same purpose; Kidney Beans all the year round—the supply for ten months out of the twelve being obtained from pot plants; 2000 Brussels Sprouts, &c. Mushrooms are grown in a long shed constructed of brick, iron and slate—an indestructible shed, in fact—and a generally abundant supply is kept up without intermission. Mr. Speed crops very closely, two crops being in all cases where practicable on the ground at the same time. The soil is a sandy loam deposit from the grit formation, but the situation is low, and we should suspect the subsoil is cold, judging from Mr. Speed's disbelief in the advantages of digging; that the ground is not too often dug over is certain, for here is a plantation of Strawberries on ground that has not been dug for seven years, but which carried crops of Peas, Cabbages, &c., before the Strawberries were planted, and the latter are as fine

with a very favourable impression of this place, for the wretched apology for an entrance that leads to the garden is such as to induce a stranger to suppose he has lost his way and in mistake got to the potting sheds. But once fairly inside the visitor is agreeably surprised to find the internal appearance of the grounds so much superior to the approach. The time of my visit was on the occasion of the great fruit and flower show, held in the gardens during the time the British Association met here in August last year. The first thing noticeable to southern eyes was the beautiful, green, close condition of the turf, as elastic to the foot as stepping upon a thick piece of india-rubber, contrasting so favourably with the burnt-up condition of the surface in the South of England; this verdant luxurious growth was not alone confined to the grass, but was apparent everywhere in the shrubs, the herbaceous and bedding plants, and particularly the trees, especially the fine collection of Oaks, for which this garden is celebrated. Here are some good examples of Abies Douglasii, Taxodium distichum, T. semper-virens, Cedrus Deodara, C. Libani, C. atlantica, and other allied trees, doing well, the humid climate and the proximity to the sea appearing to suit them as well as many other moisture-loving plants, without the stunting effect of exposure to cutting breezes. On the left of the entrance is a wall covered with a number of plants, most remarkable amongst which is a *Wistaria sinensis*, covering over 100 yards

satisfy them as can well be imagined. This flower garden is composed of sixteen large beds,—the centre one being occupied by a large massive vase filled partly with Pelargoniums intermixed with flowers of graver colour well edged with drooping plants; then, next these, planted round the base, are a combination of Yuccas, Agaves, Bamboos, Dracenas, and flowering plants. The four beds that immediately surround this centre one are raised considerably in the middle, a plant of *Arundinaria japonica* occupying the centre of each, round which are planted four large masses of scarlet Pelargoniums. In the centre of each is a plant of *Artemisia vulgaris variegata*, rising high above the Pelargoniums, which are edged with *Santolina incana*, combined with *Dianthus Heddewigii* and *Koniga variegata*, the whole margined with a broad belt of *Sedum*. There are two beds right and left of these, which are raised in three tiers; in the centre of each is a good specimen of *Dracena australis*, with four Bamboos round at a short distance; these spring from a carpet of *Mesembryanthemum cordifolium*. The rise of each tier is planted with *Sedums*—*S. acre aureum*, *S. rupestre*, *S. reflexum*, *S. targidum*, and *S. oppositifolium*; the two lower tiers are planted with an admixture of *Echeveria grandiflora*, *E. metallica*, and *E. metallica glauca*, forming a carpet; *Agaves*, *Chamæpeuce Diacantha*, *Dasyliroton acrotrichum*, &c., in the margin; at some distance apart are eight standard *Fuchsias*. Here was a mixture of forms and colours that, combined, were very effective. The remaining beds were filled in a similar manner with such as the above and numbers of other plants, foliage and flowering combined, with a view to displaying both the individual character of each species of plant, and the general effect produced by the whole.

This flower garden is situated in front of the principal range of plant-houses which faces the south, and is 200 feet in length by 24 in width. The houses are iron-built erections, very substantial, and well calculated for growing the different plants they contain. Entering at the western end, the first is a house devoted to greenhouse stock in general; in the front corner, next the door, is a remarkable plant of *Maréchal Niel Rose*. It has been planted out four years, and has now a stem 7 inches in circumference, with a head that covers a considerable portion of the roof. Whatever may be said of this *Rose* being adapted for outdoor growth, it is evident that, so placed, it is never half seen in the condition that it attains under glass. The enormous quantity of the splendid yellow flowers produced by such a plant as this, when it has room to extend itself fully, makes it worth while to give it all the encouragement possible. Associated with it on the roof is a plant of *Gloire de Dijon*, and another of the climbing *Devoniensis*; all three are trained thinly, so as not to shade too much the plants underneath, and which consist largely of *Camellias*, occupying the back portion of the house. These are just the things to grow under the partial shade of the roof-trained *Roses*, being benefited during their growing season by the shade—any insects likely to infest the *Roses*, such as aphides or red spider, being little calculated to injure the *Camellias*, which latter are benefited by the use of the syringe required to keep the *Roses* clean. They are the best plants that can be grown together.

The space in front of the *Camellias*, and on the stage in front of the house, is filled with a mixed general collection of ordinary greenhouse plants. The adjoining central division is large and lofty, standing at right angles with the last, and running back a considerable distance. It is well adapted for the growth of the plants it contains, amongst which are *Aranaria Bidwillii*, *A. Cunninghamii*, *A. brasiliensis*, *Dacrydium cupressinum*, *Dracena australis*, *Rhododendron arboreum*, *R. Edgworthii*, *R. Falconeri*, *R. barbatum*, and *R. Dalhousianum*. These are all grand plants, sufficiently large to show their character, associated with a number of fine specimens of *Tree Ferns*, with stems from 12 to 15 feet in height, with grand heads, and consisting of *Dicksonia antarctica* and *D. squarrosa*, and a magnificent pair of *Cyathea dealbata*. Among the *Palms* may be mentioned the *Nepalense Chamærops excelsa*, and the rare *C. Martiana*, some 10 feet in diameter; *C. Fortunei*, *C. Palmetto*, *Scaevola elegans*, *Jubæa spectabilis*; these are amongst the finest plants in the country. In this house, under the partial shade of the other plants, is a large case filled with *Todeas*, which Mr. Johnson is so successful in growing; they consist of *T. superba*, *T. pellicuda*, and *T. Fraseri*; they are in magnificent health, as green and fresh as possible, many of them 4 feet across. Here also are the *Van Diemen's Land Phyllocladus rhomboidalis* and *P. trichomanoides*. The house is nicely arranged, the surface of the large pots and tubs being covered with moss, which much improves their appearance.

Leading from this house, in a continuation, is the stove, on the back wall of which is a large plant of *Cyrtanthera magnifica*, flowering all the year round; here, also in a large tub, is a magnificent specimen of *Imatophyllum minutum*, full 6 feet across. On the

roof of this house is a plant of *Lasiandra macrantha*; grown in this way it shows its true character, which it never can do when the attempt is made to keep it dwarf by stopping, which evidently is opposed to its nature, so far as to prevent it blooming in anything but the most meagre manner. Here it produces bunches of flowers a foot long, with as many as fifty on the point of a single shoot. Seen so it is certainly one of the very finest plants in cultivation, its profusion of intense purple blossoms showing to the greatest advantage; but it is well to mention here that the house in which it grows is only kept at an intermediate heat—nearer the temperature of a greenhouse than a stove for growing subjects from the hottest regions. If submitted to the great heat required by such plants it would not flower at all, but keep on growing. Here also are some examples of tropical fruits, medicinal plants, &c., amongst which was the Pear-bearing *Guava*, *Cinnamon* (*Cinnamomum verum*), *Cinchona officinalis* (bark of commerce), the *Tea plant* (*Thea Bohea*), *Sarsaparilla*, the sweet-smelling *Lemon-grass* (*Cymbopogon Schenanthus*), and many others usually found in botanic gardens merely existing—the veriest shadows of living vegetable forms—but here much better grown. Why cannot these plants, so interesting to the casual observer, independently of their use to the student, be grown more generally in a way that would show in some measure their natural character? As it is, they are usually seen in a condition to excite the commiseration of every one who has a love for plants? Entering the adjoining house the first thing that arrests the attention is, I should suppose, the finest plant of *Bougainvillea glabra* ever seen out of its native wilds; it almost covers the whole roof, its splendid mauve-coloured bracts hanging in such profusion as almost to hide the leaves. It is planted out in pure loam. Here also is a magnificent plant of *Chamærops Palmetto*, and beside it an example of *Encephalartos caffer*, 6 feet across, *Cycas revoluta*, equally fine; and standing near it is a splendid *Ceroxylon andicola*, at least 20 feet in height. These are a few of the most noticeable plants, many others there are little inferior and equally well grown. At the back of this range are a number of smaller houses devoted to wintering, and propagating the large quantities of plants turned out in the summer which require protection in the winter, and which by rights should have much more room to accommodate them; but here, as in the other departments of the place, there is ample evidence of what may be accomplished, even with inadequate means, where there is a fixed determination to struggle against difficulties. *T. Baines.*

Foreign Correspondence.

FARMS IN PORTO RICO.—Porto Rico, anciently called Boringuen, is the smaller of the two insular fragments which still remain to Spain of her once almost boundless colonial empire in the New World. It is a healthy and fertile island, and contains some of the most beautiful scenery in the world; its character is essentially mountainous, and the valleys and plains occupy scarcely one-fourth of its surface. Lofty hills and verdant valleys alternate with each other; dense forests of valuable trees clothe the sides and summits of the mountains, and broad expanses of rich meadow-land stretch at their feet; through wide districts of *Maize* and *Rice* fields, of *Sugar-cane* and *Coffee* plantations, wind limpid streams, along whose banks, in individual loveliness, stand the white mansions of the planters or the modest huts of the peasants. Towns and villages are rare; there are no manufactures, and the population is almost exclusively engaged in agricultural pursuits. The rural population is six times as numerous as the town; the seven departments into which the island is divided contain five towns and fifty-two villages. In Porto Rico there are three classes of farms—*haciendas*, *potreros*, and *ritios*. The *haciendas* are mostly situate along the shores, or among the low hills and table-lands which lie between the flat coasts and the high mountains of the interior; these estates contain from 500 to 2000 acres, and are devoted to the culture of a single staple product, such as *Coffee*, *Sugar*, or *Cotton*. The *haciendas* are invariably in the hands of the owners, who constantly reside upon them, and, with their families, form the aristocracy of the island. The *potreros* are generally situate in the highlands, and contain from 80 to 400 acres; except in rare cases these farms are also the exclusive property of the occupiers. The products of the *potreros* are of a very mixed nature; cattle and mules are bred and reared upon them, and *Rice*, *Maize*, *Tobacco*, fruits, and vegetables are grown. The *ritios* are scattered over all parts of the island, but are chiefly placed among the mountains; they usually contain from 5 to 15 acres. *Tobacco*, fruits, and vegetables are the principal products. Comparatively few of the *ritios* are the property of the occupier; they are generally held in perpetuity of tenure from the owners of the *haciendas*. The rent varies from 10s. to £5 per acre, according to the situation of the holding. In the

vicinity of towns the *ritios* are termed *huertas*, and correspond to our market gardens.

The *potreros* are the most interesting, as well as the most important, class of farms. The *haciendas* are chiefly confined to the production of *Cotton*, *Sugar*, and *Coffee*, all of which are valuable only as articles of export, and contribute but little to the food of the people. The same may be said of the *ritios*, the principal products of which are *Tobacco*, *Cotton*, and *Oranges* for exportation. On the other hand the *potreros* are devoted to the production of bread-stuffs, such as *Maize* and *Rice*; to the breeding and rearing of horses, mules, and oxen for agricultural purposes, and to the manufacture of butter and cheese. The agricultural census of 1870 fixes the number of *potreros* in the island at 4120, with a collective area of 204,450 acres, of which 105,210 are arable and the remainder in pasture. Unlike the small holdings of *Jamaica*, where, by reason of estrays and trespass, continual litigation exists among the farmers, the *Porto Rican farms* are always securely fenced with strong hedges of *Cacti* or *Agaves*, which present a formidable barrier even to the thick-skinned wild bull of the mountains. The farmhouses, which are generally situate as near the highway as possible, are sometimes built of stone, but oftener of wood; on account of the frequent hurricanes and earthquakes they never exceed one storey in height. The farm offices are placed a little in the rear of the dwelling-house, and usually form three sides of a quadrangle; the fourth side is sometimes enclosed by a hedge or paling. Arable culture and cattle breeding are carried on simultaneously upon these farms, and this practice, although of comparatively recent introduction, has already effected great improvements in the system of agriculture. The fashion which so long prevailed of sowing again and again the same kind of crop upon the same ground, is being rapidly abandoned throughout *Porto Rico*, and a rational system of rotation adopted. The farmers have also begun to see the necessity of restoring to the exhausted soil some part of the riches extracted from it. Ashes, lime, and the refuse of the farmyard are the only manures employed. On the *haciendas* and *potreros* the majority of the implements are of American construction, and generally of good quality. The climate, however, is very severe upon iron implements, which, even with the greatest care, do not long withstand its influence. Very few of the old wooden ploughs and other primitive implements which, fifteen or twenty years ago, were almost universal in the island, are now to be seen except on the *ritios*. Another great obstacle to the progress of agriculture and the development of the rich resources of *Porto Rico* was the almost total absence of passable roads. According to *Sotomayor*, who wrote in 1784, the island did not then contain a single bridge, and the roads were mere bridle paths. This evil has now been in a great measure remedied, and broad, well-made roads, with stone-built bridges, traverse the country in all directions.

Rice and *Maize* are the only cereal products of the *Porto Rican farm*, and large quantities of both are annually grown. The *Maize* of *Porto Rico* is an indigenous product. It is a very fine variety of a bright yellow colour, and yields meal of a superior quality. It is not sown broadcast but in regular drills, four grains being dropped into each hole; the sowing is generally performed by women and children. The ploughing is done by *American gang-ploughs*, drawn by two or three pairs of oxen; the furrows are generally shallow. The *Maize* crop is sown three times a year, and is harvested four months after sowing. It requires a rich alluvial or volcanic soil, germinates very rapidly, and yields from three hundred to four hundredfold. The heads are usually cut off in the fields and conveyed to the barns; sometimes the straw is gathered in heaps and burned, and sometimes it is burned standing; the ashes are scattered over the field and ploughed in. *Rice* is cultivated chiefly in the highlands, and at an elevation of 2500 and even 3000 feet above the level of the sea; the variety cultivated is that known as *mountain Rice*. It is sown broadcast upon the hill-sides at the end of each rainy season, and is harvested three months after sowing; the increase is about twentyfold. The stalks are about 2 feet high, and the grains are small, hard, and white, but finely flavoured. The *Rice* fields are never watered, but manured only with vegetable ashes, which are mainly obtained by burning the straw. A very valuable plant is the *Banana*, which was introduced from the *Canary Islands* in 1516. As an article of food it occupies the same place in *Porto Rico* as the *Potato* in *Ireland*. The fruits are used both unripe and ripe; in the former case they are roasted and ground into meal, from which bread and soups are prepared. Tuberous plants hold an important place upon the farm; they form the chief food of the people when the other crops have suffered from hurricanes, droughts, or other causes. The principal are *Yuccas*, *Yams*, *Cussadas*, and *Batatas*. The principal fruit trees of the farm are *Pomegranate*, *Orange*, and *Fig trees*, *Cocoa Palms*, and *Nutmegs*; they are sometimes planted in the hedges, but more

frequently in the immediate vicinity of the dwelling-house. Neither the fruit trees nor vegetables of the temperate zone thrive in Porto Rico.

Agriculture in Porto Rico suffers much from hurricanes and floods, which prevail from July to October; from the ravages of mice, ants, grasshoppers, and other insects; and from snakes, which infest the pastures, and frequently cause great havoc amongst the cattle. Cattle breeding is a very important branch of farming in Porto Rico, where it is carried on with great success. The other West Indian Islands, and a large part of South America, obtain their chief supplies of cattle and mules, butter and cheese, from Porto Rico. With the exception of the oxen and mules employed in labouring, the animals remain in the open fields all the year round; there is no stall-feeding, but milch cows receive in addition Maize and Bananas. Guinea-grass forms the principal pasture; it is a rich, strong plant, and attains a height of 4 or 5 feet. The mules of Porto Rico are very handsome, powerful, and enduring animals; they are 3342 in number. The horses, which number 35,000, were originally introduced from Haiti; they are very inferior animals, being small and lean. The climate of Porto Rico, as elsewhere in the West Indies, does not seem favourable to the pig, which is a small, lean animal, covered with thick, coarse bristles. Sheep and goats are not favourites, and are chiefly kept by negro squatters in the mountains. The breed of horned cattle, although capable of great improvement, is undoubtedly the best in the West Indies; the cows are good milk-givers, and the butter and cheese are generally of fine quality. There are 270,844 head of cattle in the island. All kinds of poultry are extensively kept, and about 3,000,000 of eggs are annually exported. Great Britain receives 35 per cent. of the agricultural exports of Porto Rico, and sends 10 per cent. of the imports. The area of Porto Rico is 2,176,451 acres, divided among 19,140 landowners. The present value of the landed property is £6,750,000, and the value of the annual produce is £1,125,000; the amount of capital invested in land is £4,586,398. Slavery still exists in the island, but it is chiefly confined to the haciendas, and a few years will probably witness its total extinction. The labour upon the potreros is chiefly performed by free white men; there are 36,228 white agricultural labourers, above sixteen years of age, in the island. The importation of negroes has entirely ceased; there is no inducement for the trade, as slave labour has become much more expensive than free labour. The average annual cost of a slave is estimated at £20 17s. against £15 12s. for a free white labourer, at 1s. per day, for the same period. The hours of work are from half-past six in the morning until half-past five in the afternoon, with an hour's interval at mid-day. The houses of the labouring class are of the most wretched description; they are roughly constructed of boards, and seldom contain more than one apartment. There are 64,567 of these houses scattered over the country. The food of the peasantry is rich and abundant; it consists chiefly of beef and pork, soups, Rice, and Maize bread, a great deal of milk, butter, and cheese, Bananas, and fruits. The population of Porto Rico amounts to 770,870 persons, of whom 423,000 are whites, 281,498 coloured (*i.e.*, mulatos and quadroons), and 66,572 blacks. The slaves are 46,200 in number. All whites are obliged to serve on the militia, but the coloured population is exempted. Porto Rico is the only West Indian island which can be regarded as ripe for political independence. *J. D. W.*

Florists' Flowers.

BLUE PANSIES AND VIOLAS.—A careful inspection of the flowers of the blue section of Violas and Pansies now in flower at Chiswick shows, in spite of the improvement made in recent years, how short they all fall of the genuine blue colour. This is made specially evident when blooms are compared with those of the blue *Lobelia*, *Delphinium formosum*, or that richest of all blue flowers, *Salvia patens*. Blue Violas may be said to commence with the pale mauve Princess Teck. A hue that is somewhat intensified in *Lilacina* is depressed in *Blue Perfection*, *Magnificent* and *Blue Bell*—all of which are of a pale purplish blue—is richer in *Queen Victoria*, *Blannerne*, and *Waverley*; and runs into a deep bluish purple in *The Tory*. Beyond this darker kinds become violet and purple. There is one variety named *Royal Blue*—a seedling out of *Blue Bell*—that indicates a nearer approach to the true blue colour than does any other variety. If flowers of all these Violas be gathered and laid side by side on a sheet of white paper in the order given, it will be seen how the hues run into each other, and it will better enable the observer to decide as to what progress has been made in the production of really blue Violas. Blue Pansies are not so varied in hue as the Violas, as there are none having the mauve tints found in *Princess Teck* or in

Lilacina, except such as may be found in a batch of seedlings of a German strain; but these are all too inconstant and flimsy to be worthy the designation of bedding kinds. One of the very best pale blue Pansies is *Blue King*, a variety that is now deservedly popular in gardens. Following this in colour is the old *Imperial Blue*, and darker still, because much shaded with purple, is *Backhouse's Celestial*. A more genuine blue is found in *Bluebeard*, and the richest shade of blue in *Blue Jacket*. This variety will be found to approach nearer to the ideal found in the hue of the *Salvia* blooms than any other kind. The darkest of all the blue shades is *In Memoriam*, as it is in colour rich violet-blue, being altogether much richer than *Viola The Tory*, but it is not a good bedding kind. No doubt raisers are on the right track, and, as we have now an abundance of white, primrose, yellow, and purple kinds, so without doubt a genuine blue colour will eventually be obtained. *A. D.*

Natural History.

CABBAGE ROOT-GALL WEEVIL.—*Ceutorhynchus assimilis*, Payk. (*pleurostigma*, Cust.).—I have had an exceptionally good opportunity this season of studying the life history of the *Ceutorhynchus assimilis*, or Cabbage Root-gall Weevil, a tiny grey round weevil, about an eighth of an inch in length—one of those insects whose peculiar province it is to cause the masses of galls with which the Cabbage roots are often injured and disfigured. In some of the districts near London, where large quantities of Cabbages are grown for the London market, the beetles are very prevalent, and generally distributed. The galls are usually situated below the ground level on the thick part of the root, and there they may be found in all ages of the Cabbage from the time it is fit for planting out till, its duty done, the stem has been drawn and thrown aside as worthless, and throughout the whole of this time larvæ are to be found present in some of the galls.

On young plants the gall excrescences are often mere rounded lumps of the same white colour as the root on which they grow, averaging about three-eighths of an inch in diameter, and placed singly or joined a few together as the case may be; on older plants the gall masses may be found much larger, sometimes an inch and a-half or more over, and formed of a quantity of galls, frequently communicating inside with each other, and with a corresponding number of larval tenants. Commonly, however, each gall contains a single larva, fleshy, much wrinkled, and legless, varying in size according to age up to as much as a quarter of an inch in length, the general colour white, the head (or the fore-part of the head in the specimens before me) chestnut-brown, and the jaws of the same colour, deepening to dark brown or black at the tips, and the eyes particularly noticeable as minute black specks at the side of the head.

When about to undergo the pupal change, the larva gnaws an opening in the side of the gall, through which it passes into the earth, and by securing a few grubs in this condition, and laying them on some fine mould in a little box (or in anything that will limit the sphere of action), the process of the formation of the earth cocoons, in which the change to the perfect beetle takes place, may be conveniently observed. The larvæ, on being placed on the surface of some damp crumbly earth, bury themselves almost immediately, showing considerable strength in the size of the masses they are able to displace, and two days after the cells may be found so far advanced as to cover about a quarter of the grub, which apparently steadies the progress of affairs at first by fixing the caudal extremity to the work, as at this stage it can drag the commencement of the earth cocoon about with it.

The cell is gradually and regularly built onwards round the larva, as a kind of outer skin of earth, and when completed, which it is in five days or less from the disappearance of the larva, is from an eighth to three-sixteenths of an inch in length, obtuse oval, or nearly round in shape, smooth inside, and rough on the exterior, and formed of the smallest pieces of stone, quartz, earth, and occasionally vegetable matter, accessible. The structure appears to be put together merely with the aid of moisture from the mouth of the larva, as the inside shows wet patches occasionally, as though the grub had then exuded it in its building operations, and is without any woven lining, so that the whole cocoon may be washed entirely away by the application of a little water. From the whole process of building being conducted underground it was difficult to ascertain the precise time occupied in the development of the beetle; but approximately dating from the disappearance of the larvæ the time occupied appeared to be about eight weeks.

The weevils on development are lively and active, and soon disposed to attack food supplied to them (as the root of a young Cabbage) with vigour, forcing the rostrum into it nearly up to the insertion of the antennæ, and using it when in as a pivot to turn on, pulling and dragging the while at the wound in the root in a way which, where many are present, must be very injurious to the tissues.

The galls themselves, excepting where very numerous, appear to do little harm, but where in great masses they must necessarily, from the misappropriation of so much material of growth, be bad for the plant.

The larva appears to have great difficulty in gnawing through the gall if the outside is artificially toughened, and probably any external application distasteful to it applied to the roots of the Cabbage when planted out would have a good effect by keeping the grub from eating its way through the unpleasantly tasted exterior, and so preventing the pupal change from taking place under the natural circumstances. Dipping in soot appears to answer for this purpose, and where the beetle exists in such a degree as to make it worth while to attempt a remedy, probably rolling the ground with a very heavy roller when the Cabbages are drawn would destroy many of the embryo beetles by crushing them, as they lie a little below the surface in their cocoons of earth. *O.*

THE BURNET MOTH.—In your *Natural History* column, at p. 755, "M. D. S." asks "if there be a larger kind of Burnet moth than those usually seen in the fields, &c.," and adds that the kind he refers to is 2 inches in expansion, but "similar to the common Burnet." I have no doubt he is speaking of the *Cinnabar* moth (*Euchelia Jacobæa*), which although differing in form and heavier in flight than the Burnet is similar in colour, but without the metallic lustre of the latter. Its habitat is where the common Ragwort (*Senecio Jacobæa*) abounds. The larvæ may be found in the autumn feeding on that plant, stripping it of foliage and flowers, then migrating to other patches, and generally by the time they are full-grown have reduced the whole to a miniature forest of naked stems. The larva is black, with segmental yellow rings. *G. Gascoyne, Newark.*

—There are, according to Newman, four varieties of the Burnet, all about the same size—1½ inch. The *Cinnabar* (*Euchelia Jacobæa*) is very similar in colour and markings—two crimson spots and a crimson bar on the upper wings; hind wings crimson. It has been commoner than usual this year, and is sometimes 1¾ inch across. *E. P.*

Law Notes.

ACTION BY A FLORIST AGAINST THE LONDON PARCELS DELIVERY COMPANY.—*Important Decision.*—*Britt v. the London Parcels Delivery Company.*—This action was heard at the Shoreditch County Court on the 22d inst., in which the plaintiff, a florist of Stoke Newington, sued the company to recover the sum of 34s. for eight packets of assorted plants delivered to the company to be sent to Twickenham, and which were lost *in transitu*. The plaintiff's solicitor, in opening the case, stated that a large assortment of plants and flowers had, in May last, been delivered at one of the local booking offices of the company to be sent to one of the plaintiff's customers at Twickenham, out of which consignment the eight packets were found missing on the arrival of the consignment at its destination. The company had been written to, and having denied their liability, the present action was brought. The plaintiff, having corroborated his attorney's opening, called the booking clerk who received the goods, and who forwarded them to the chief office in Rolls Buildings, from whence they were forwarded to the Chelsea branch, for transmission to Twickenham. Charles Deidman, the manager of the company's Chelsea branch, stated that the package when it reached that office did not appear to have been tampered with, and was dispatched in the same condition as it arrived. Mr. Cockell, of Twickenham, to whom the package was consigned, was called, who, with another witness, proved that the package was not in accordance with the invoice when it arrived. This evidence completed the plaintiff's case, when the solicitor for the company urged that the party to whom the goods were consigned was the party liable, and not the company; which objection being overruled by the Judge, the booking-clerks at the various offices were called to prove that the package was in a sound condition when it reached their respective offices, and this evidence completed the case for the defence. The Judge, in reviewing the facts of the case, considered he could not disbelieve the evidence of the plaintiff and his witnesses; and looking at all the probabilities of the case, and finding the number of clerks and drivers through whose hands the goods had passed, it appeared to him that the company were liable. It was well known that Messrs. Pickford had been so extensively robbed by their employes, that the prosecution of several of their men had been rendered necessary. It behoved companies like the defendants to be very careful as to the characters of the men they employed, and to keep a strict surveillance over them. Looking at the facts of the case by this light, he should give judgment in favour of the plaintiff, with costs of attorney and witnesses.

HORTICULTURAL EXHIBITIONS, 1875.

JULY.

- 6 and 7.—Grantham and South Lincolnshire Horticultural Society's Exhibition at Grantham. Sec., Thomas Lyne, Jun., Grantham.
- 6 and 7.—Brentwood Horticultural Society's Summer Exhibition. Hon. Sec., R. Earthy.
- 7.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Cut Rose Show.
- 7 and 8.—Leicester and Leicestershire Floral and Horticultural Society's Show. Sec., W. C. Morris, 8, New Street, Leicester.
- 7 and 8.—Brighton and Sussex Horticultural Society's Summer Exhibition. Sec., Edward Carpenter.
- 8.—Richmond Horticultural Society's First Exhibition. Hon. Sec., A. Chancelor, Esq., Richmond.
- 8.—Frome Rose Show. Sec., A. R. Baily, Frome.
- 8 and 9.—Manchester Botanical and Horticultural Society. Special Evening Fête and Exhibition of Roses, Floral Decorations, &c. Manager, Bruce Findlay.
- 8, 9, and 10.—Nottingham and Midland Counties' Grand Rose Show and Horticultural Exhibition, at the Arboretum, Nottingham. Sec., Alfred Kirk, Municipal Office.
- 9.—Oxford Rose Show.
- 14.—Royal Botanic Society, Regent's Park. Evening Fête. Sec., W. Sowerby.
- 14.—Woodford Horticultural Society's Third Annual Exhibition. Hon. Sec., J. Taylor, Woodford.
- 14.—Loughborough Horticultural Society's Show. Sec., William Pallett, 25, Baxter Gate, Loughborough.
- 14.—Richmond Horticultural Society's Exhibition. Sec., H. Coppin, Rose Nursery, Shirley.
- 14.—Exhibition of Flowers, Fruits, Vegetables, and Poultry at Oundle. Sec., Alfred J. Fox.
- 14 and 15.—Wimbledon and District Horticultural and Cottage Garden Society's Annual Exhibition. Hon. Sec., P. Appleby, 5, Linden Cottages, Wimbledon.
- 15.—Colchester and East Essex Horticultural Society's Show. Sec., W. Harrison, Colchester.
- 16 and 17.—Altrincham and Bowdon United Floral, Horticultural, and Rose Society's Exhibition. Sec., John Hams.
- 21.—Royal Horticultural Society, South Kensington. Meeting of Fruit, Floral, and Scientific Committees. Zonal Pelargonium Show.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 26, 1875.

APPOINTMENTS FOR THE ENSUING WEEK.

- TUESDAY, June 29.—West of England Rose Show at Hereford. Sale of a Collection of Shells, at Stevens' Rooms.
- Wednesday, Rose Show and Horticultural Exhibition.
- Wednesday, June 30.—Malton Rose Show.
- Thursday, July 1.—Site of 400 Lots of Orchids, at Stevens' Rooms.
- Thursday, July 1.—Royal Botanic Society, Regent's Park: Exhibition of Fruit and Cut Flowers.
- Thursday, July 1.—Spalding Horticultural Society's Exhibition (two days).
- Thursday, July 1.—Horticultural Exhibition at the Lower Rupt Drops, Still water will this difference appear.
- Friday, July 2.—Turbridge Wells Horticultural Society's Exhibition.
- Friday, July 2.—Gardeners' Royal Benevolent Institution: Anniversary Festival.
- Friday, July 2.—Southern Horticultural and Cottage Gardeners' Exhibition.
- SATURDAY, July 3.—West Kent Horticultural Society's Exhibition in Camden Park, Chislehurst.

WHILE alarm is being felt in some quarters as to the appearance of a new scourge in Potatoes, brighter prospects appear in store for gardeners in others. It was a great thing for horticulture when, owing to the removal of vexatious and burdensome imposts, the price of glass was lowered and its use increased tenfold. Now a further boon is promised, in the shape of HARDENED OR TOUGHENED GLASS—glass strong enough to resist, without breaking, any blow or force to which glass vessels or glass structures are ordinarily exposed, and this without any diminution of translucency. Glass of this character was known to the Romans, who were even acquainted with flexible glass, but the art of producing it was lost. Recently, however, a French gentleman, M. DE LA BASTIE, has devised a process for depriving glass of its brittleness, which, judging from what we have seen, bids fair to be of the greatest importance to all who have to use glass in any shape or form, and particularly to gardeners and greenhouse builders, &c. The principle of M. DE LA BASTIE'S method, as we gather from a lecture by Mr. NURSEY, recently published in the *Journal of the Society of Arts*, is to temper the glass by plunging it while hot into a bath of oil, wax, tallow, and other similar ingredients mixed in certain proportions.

"The physical change which glass thus treated undergoes is no less complete than remarkable. Its extreme brittleness is exchanged for a degree of toughness and elasticity which enables delicate glass articles to be thrown indiscriminately about the room, and more

substantial ones to resist the impact of heavy iron weights, falling from considerable heights—wax glasses, plates, dishes, and sheets of glass, both coloured and plain, were thrown across a large room, and fell spinning on the floor. Water was boiled in a tempered glass saucer for some time over a brisk fire, and the saucer was quickly removed to a comparatively cold place, and stood on iron, but was in no way affected by change of temperature. A small piece of plate glass was held in a gas flame until the corner became very hot. The glass proved a bad conductor of the heat, which did not extend any appreciable distance beyond the point of contact with the flame, neither was the glass cracked from unequal expansion, nor was it damaged by sudden immersion in cold water.

In order to judge of the comparative resistance offered by untoughened and toughened glass to the force of impact, a piece of the former, measuring 6 inches by 5 inches by $\frac{1}{4}$ inch thick, was supported in a frame about half an inch from the floor. A 2 oz. brass weight was then dropped upon it from a height of 18 inches above the table, without damage, but on the height being increased to 24 inches, the glass was broken into several fragments. A piece of toughened glass of the same size, but rather thinner, was then treated in the same way, and the height being raised to 1 foot at a time, up to 10 feet, but without producing the slightest visible impression. Finding the 2 oz. weight to make no impression, an 8 oz. iron weight was substituted, and was dropped on the glass from a height of 2 feet, and then from 4 feet, and finally from 6 feet. The glass being increased to 6 feet, however, the glass broke with a distinct report. But here another phenomenon presented itself; instead of the toughened glass being broken into some twelve or fifteen large angular pieces, as was the ordinary glass, it was literally reduced to atoms. There were, it is true, some pieces about half an inch square, but these were traversed in all directions by delicate lines of fracture, and on being gently touched crumbled into small pieces, and many of these small pieces were easily reduced by gentle pressure into mere atoms, so that the complete disintegration of the entire mass appeared to be. A similar result was produced by placing a piece of toughened glass flat on the table, with a corner projecting over, and endeavouring to chip the corner off with a hammer. The corner will, after a series of smart blows, be broken off, but the whole mass will, at the same moment, disintegrate into atoms, reduced to atoms. Another peculiarity about toughened glass is, that the fragments are by no means so sharp, and therefore so capable of piercing the flesh, or of causing incised wounds, as are those of ordinary glass.

One important point of difference between M. DE LA BASTIE'S hardened glass and Prince Rupert's Drops is, that although the skin of the former may be broken through with the diamond, the body cannot even then be scored through by ordinary force, much less does the mass fly to pieces and disintegrate, as in the case of the Rupert Drops. Still wider will this difference appear when I state that toughened glass is readily susceptible of a high degree of polish, and it can be cut by the wheel for lustre-work and such-like. The glass can likewise be engraved, either by hydrofluoric acid, or by Mr. TILGHMAN'S elegant sand-blast process."

These statements are so remarkable that some scepticism might be permitted. We can, however, bear out from ocular evidence the correctness of the assertions, having been witnesses, through the courtesy of Messrs. REY BROS., of Mincing Lane, the representatives of M. DE LA BASTIE, of several experiments of a similar character. Objections have been raised to this glass on the score that it is hardened but not elastic, and for roofing purposes elasticity is very important; but this objection is, we believe, scarcely tenable. It is also stated that it cannot be cut with a diamond, but this is an objection which could be obviated by other means, as by manufacturing sheets of glass of certain sizes. In any case we hope it will not be long ere this toughened or hardened glass be put to a practical test by our greenhouse builders.

THE NEW POTATO DISEASE, which has been lately observed at Chiswick, and which was commented on by Mr. BERKELEY at the last meeting of the Royal Horticultural Society, has very naturally given rise to some alarm. We are far from wishing to say that the alarm is not well founded—what we have seen at Chiswick, as also near Folkstone, and what we have learnt as to the experience of other people, leads us to the belief that the danger is really great. At the same time, before we talk of "stamping out," even if such a process were possible, we think that more information is needed. At present we know only of the existence of the disease, we know nothing of its origin, or of the circumstances which favour its production. We hope shortly to be in a position to give the results of Mr. BERKELEY'S

examination, and we trust that the recommendation made by the Scientific Committee—that a full report on the disease as observed at Chiswick be drawn up—may be acted on without delay. When these documents are before us we shall be better able to judge of the propriety of attempting to "stamp out" the disease, or whether such a course be possible. It is well to give an alarm, but it is still better to observe and investigate; but these latter processes have as yet only been very superficially accomplished.

We learn from the committee of the INTERNATIONAL HORTICULTURAL EXHIBITION IN COLOGNE that great activity has been displayed in the exhibition grounds. The balls for the finer kinds of garden ornamentation, vases, statues, &c., as also the two wings in which garden literature and artificial plants and flowers are to be exhibited, are now finished, with the exception of the towers. The large restaurant is far advanced; the water conduits, aqueducts, &c., together with the fountains and ponds, are almost completed. The ponds from which the centrifugal pumps are to receive water will be executed in a new cement composition, together with the large central fountain, by the well-known firm of J. F. ESPENSCHIED, Mannheim. The large hall for machinery requiring to be exposed under cover is immediately adjoining the pond. Numerous announcements have been made in this department from Belgium, England, America, &c. A house in three compartments is being built by the firm of RAHLES & LIMBACH, of Cologne. A house is also being constructed by RÖDER BROTHERS, of Magdeburg, opposite the hall erected on a small elevation, in which American drinks are to be furnished. The plantations are progressing favourably. We need only mention here that two large Dahlias beds have just been laid out. The number of sub-committees and agents engaged in promoting the exhibition has been considerably augmented.

—Chance COMBINATIONS OF FLOWERS are frequently more effective than those in which arrangement has been more carefully studied. Such a case is before us in a few flowers thrown together heedlessly by a child. The flowers are *Deviensis* Rose, pale cream colour; a deep orange-coloured variety of *Azalea mollis* with its foliage, and a bud or two of the common monthly Rose. The combination is charming.

—We have been favoured with the following proposal for a NEW COUNCIL OF THE ROYAL HORTICULTURAL SOCIETY:—

President—The Right Hon. A. S. Arvon.
Vice-Presidents (specially selected as being distinguished literary characters)—The Rev. H. H. Dombain, Mr. George Glenny, jun., Mr. William Earley, and Mr. George Abbey.

Treasurer—Baron Albert Grant.
Honorary Secretaries—Sir Henry Cole, and Mr. Shirley Hibberd, who, in the event of his appointment, will retire from the editorship of the *Gardeners' Magazine*, and be succeeded by Dr. Hogg.

Assistant Secretary—Sir Alfred Sidel, Bart.
Council—Dr. Denby, Dr. Kellogg, Mr. S. H. Godson, Mr. G. F. Wilson, Mr. H. G. Quiter, Mr. T. Baines, and, in order to impart a little locality and vivacity to the proceedings of the Council, the following gentlemen to be added:—Mr. H. Guedalla, Mr. E. Bennett, Mr. J. R. Petch, Mr. P. Burr, Mr. R. Gilbert, and Dr. Cenealy—the last in special consideration of the great success he has achieved in cultivating the flowers of rhetoric.

Botanical Director and General Exhibitor of the Policy of the Council—Mr. D. T. Fish.
Florological Director—Mr. Joseph Meredith.
Floral Director—Mr. John Willis.

General Superintendent (with unlimited and irresponsible power)—Mr. A. F. Barron.

We can only regret that place has not been found for Mr. LIGGINS and the London correspondent of the *Irish Gardeners' Record*.

—From a recent report to the Foreign Office by Mr. A. GRAYSON DUNLOP, on the FORESTS of CUBA, we obtain the following notes on useful Cuban trees. There is the hard and compact Mahogany; the softer Cedar, "one of the most precious trees, and everlasting in dry places"; the light yellow Acana, a very hard wood; the Sabina (*Sabicea*—*Lysiloma Sabicea*), "everlasting, and good for all uses"; the Ramon (*Trophis americana*), a great resource in drought for feeding cattle with its leaves; the bluish-green flexible Majagua (*Lonchocarpus sericeus*), the best for wood known for gun-stocks, carriage poles, and ship keels; the quick-growing Lanero, "bearing an abundant fruit, which encloses an enormous quantity of silky fibres, from which great advantages might be derived in industry"; the Yaba, a hard wood, fit for shipbuilding, it being "indestructible under water and under ground," but it is poisonous, "the smoke

produces blindness, and the bark is used to destroy worms." Cuba produces an immense variety of coloured woods for cabinet-work. Mr. CHAPMAN, the representative in Cuba of a large English engineering house, makes mention of a floor in a room he has seen, inlaid with fifteen or sixteen kinds of beautiful hard woods. The fustic wood of this part of the world "resists the action of water better than any other wood known, and house-posts made of it have been found sound and fresh after being in the ground for a century." Almost all the forest land in Cuba belongs to private persons. The Government forests have been neglected, and left to chance and plunder; and there has been no attempt to control the misuse, and waste and wanton destruction of forests. Immense quantities of trees have been felled by the breeders of cattle and swine to make enclosures, what was not required being burnt, and no regard being paid to leaving valuable hard timber. The planters find sugar can be made cheaply in wooded districts, and the remains of the forests are burnt and destroyed. But still there is a vast amount of valuable timber, and Mr. DUNLOP states that, if

— The POTATO DISEASE, to which the Rev. M. J. BERKELEY made allusion at the meeting of the Royal Horticultural Society on June 16, has manifested itself among the collection grown by Mr. PETER MCKINLAY, Woodbine House, Beckenham, Kent, and in a form which may serve to throw a little fresh light on the subject. It is confined entirely to American varieties grown from home-grown seeds. All grown from seeds imported direct from the United States are as perfectly healthy as Potatoes could well be; and this holds good of the English varieties also. In all cases there is the arrested paralysed growth, the leaves unhealthy and curled, and covered above and beneath with numerous small dark spots. A good number of the plants were lifted and the roots examined, and in only two cases had the seed tuber rotted, and in almost every case the cut sets had been planted with all but one eye taken out. The sets were cut in two, and in no case was there the slightest evidence of disease in the tuber causing immature and diseased haulm, as stated by Mr. A. DEAN at the meeting above noted. At the point where the shoots grew out from the eye it appeared to be as healthy as

plants are grown in pots is very dwarf and dense. Its white variety—*turbinata alba*—should not be overlooked also, and some seedlings, showing considerable variation in colour, are finding their way into cultivation, and finding much favour among cultivators of hardy plants.

— The thirty-second anniversary festival of the GARDENERS' ROYAL BENEVOLENT INSTITUTION will be held at the London Tavern, Bishopsgate Street, on July 2, when the Master of the Fruiterer's Company, ROBERT BROADWATER, Esq., will take the chair. The list of stewards contains some of the leading horticulturists, and it is greatly to be hoped that they may be supported by a large gathering of the craft, and, still better, by a large subscription list. There is on these occasions a good opening for those who from whatever cause may be unable to contribute from their purses, to contribute in kind by sending flowers and fruits, and thus insuring the success of an institution whose objects must commend themselves to all connected with horticultural pursuits. Seventy-two pensioners are now on the list, and it is much to be

FIG. 170.—SHOW GROUNDS IN THE BELFAST BOTANIC GARDENS.

the fellings were properly regulated, the export of timber from Cuba might be very large, even though the Government should not insist on "replantings," 3,000,000 square feet of Mahogany, 5,000,000 square feet of Cedar, and 2000 tons of fustic wood would be ready for the axe every year. Mr. CHAPMAN observes that in the last century forty-two ships of war were built in the Royal Arsenal of Havannah, chiefly with Cuban wood, and some of them still exist as hulks; and ships of excellent quality were built in Cuba not very long ago. But complaint is made now of the forests not even attracting rain enough for the crops in the plains, although with proper management there would have been produced sufficient timber for the navies of several Powers.

— COMPTON'S SURPRISE, one of the newer American POTATOES, ungainly in shape and rough in appearance, is yet a remarkably fine variety, keeping well till April and May, making little growth, boiling mealy, and full-flavoured; but it should be grown on light and somewhat early soils to do it full justice. Compton's Surprise, Model, and Paterson's Victoria are in all probability the three best late-keeping Potatoes in cultivation. The former should be grown only by those who can keep it over till the spring and early summer.

could well be desired; but at the distance of from 1 to 2 inches from the set the stem of the foliage was rotted through to the centre, and so thoroughly was the centre rotted in some instances that it suggested the question whether the malady arose in the interior of the stem and came outwards. In two or three instances the diseased leaves appeared on the growth of tubers that were left in the earth at the time of digging and had come up among others planted in the spring. Here, also, the seed tubers were found to be perfectly sound.

— We are informed that M. LE COMTE DE KERCHOVE DE DENTERGHEM has been elected President of the ROYAL AGRICULTURAL AND BOTANICAL SOCIETY OF GHENT, in place of the late M. DE GHELLINCK DE WALLE.

— CAMPANULA TURBINATA deservedly ranks high in a select collection of hardy perennials, and is a most striking object in a border. It is not a whit less valuable as a pot plant, and we have lately seen some pretty little tufts in 60-pots, bearing no less than from six to eight large, erect, bell-shaped flowers, of a bright lilac-purple colour. The size of the individual flowers contrasts in a remarkable degree with the diminutive growth of the foliage, which when the

hoped that the amounts awarded to each, as well as the number of recipients, may soon be largely augmented. It is clear this cannot be done unless the institution is largely supported by the gardening class. As things are at present, outsiders constitute the most important body in the Society. This ought not to be. The present affords a good opportunity for amendment, and the treasurer, ROBERT WRENCH, Esq., London Bridge, E.C.; the bankers, Messrs. GLYN, MILLS & CO., Lombard Street; or the secretary, Mr. CUTLER, 14, Tavistock Row, Covent Garden, would very willingly grant absolute on easy terms. We would by no means advocate either the sale or the purchase of indulgences, but we may, with the greatest truth, say that no means are more effectual in procuring a contented frame of mind than successful efforts to promote the well-being of others less fortunate than ourselves.

— The publication of Mr. DARWIN'S new work on INSECTIVOROUS PLANTS is announced for the present week.

— The charming LATHYRUS SATIVUS, though a very old plant, representing a tint of blue rarely found among annuals, deserves cultivation because of its free dwarf growth, and profusion of flowers. It is far superior to many annuals generally cultivated,

but it is very rarely met with. A few blossoms, backed up with a green leaf, make a pretty button-hole, only it is said that button-holes are now becoming quite unfashionable! and the lawgivers of fashion have ceased to sport them.

— Dr. DE LA SAVINIERRE is about to undertake a botanical exploration in the CELEBES, and will prepare dried specimens of plants of that island for distribution among subscribers. So little is known of the flora of this island that it is to be hoped that M. DE LA SAVINIERRE'S enterprise may meet with ample support. Applications should be made to the General Secretary of the Botanical Society of France, 84, Rue de Grenelle, Saint Germain, Paris.

— That fine H.P. ROSE, LOUIS VAN HOUTTE, is said by Rose cultivators to be wanting in vigour of habit—that it is, in fact, what they term a "bad doer." We have lately seen it in most vigorous growth, worked as a dwarf on the seedling Briar, and growing in a somewhat free gravelly loam. The growth is remarkably vigorous, and large full flowers of a rich shaded crimson hue are produced. Etienne Levet, Richard Wallace, and Marie Baumann, were scarcely more vigorous in habit than Louis Van Houtte.

— We learn from the daily papers that H.R.H. the Duke of EDINBURGH will visit Edinburgh at the time of the International Fruit Show in September next.

— We have received from Messrs. C. J. BLACKTH & Co., Cox's Quay, Lower Thames Street, several samples of GARDEN LABELS AND TRAINING STICKS, which we can commend to the notice of our readers. They are hand-made, very regular in size, and sold at an exceedingly cheap rate in bundles of 100 each. The sticks are made from 1 to 5 feet in length, the longer ones being proportionately thicker, and the labels from 4 to 18 inches. Mr. J. SMITH, the Royal Label Factory, Stratford-on-Avon, has also submitted to us a specimen of a new permanent Rose tree label, and a sample of his permanent labels for Conifers, of a much larger size. Both are made of a white metal, and the names are raised from the surface. Both are admirably adapted for the purpose intended, and cheap in price, considering their imperishable nature.

— Mr. ROBERT SOWERBY, gardener, late of Newburgh Park, Yorkshire, has succeeded Mr. ALFRED EAMES, as gardener to the Earl of MACCLESFIELD, Shirburn Castle, Tetsworth, Oxon.

— We have not yet heard that the South Kensington members of the COUNCIL of the ROYAL HORTICULTURAL SOCIETY have carried out their publicly expressed intention to resign. As they have shown themselves quite incompetent to appreciate the higher aims of horticulture, and the circumstances which render a society worthy of national encouragement, every day that they delay to fulfil their voluntary promise does but add to the legacy of mischief which they will leave behind them, while any scheme for the reconstruction of the Society on a horticultural basis must necessarily be frustrated by the continuance in office of these obstructives. Under such circumstances we would suggest to the exhibitors whether it would not be better to defer the proposed demonstration on July 21, except in so far as they are tied by the schedule or other previous engagements, till such a time as the prospects of the Society are more favourable. An additional reason for postponement may be found in the short time available for the purpose intended. As the end draws very perceptibly nigh, and reconstruction and reconstruction become inevitable—for we scout the idea of annihilation—we would impress on those interested the absolute necessity of keeping broad general principles in mind, to remember that the chief object is to advance the science and practice of horticulture, and that exhibitions, however useful, are only one means, and that the most important, of advancing an art, the practical utility of which is rather apt to be overlooked and made subordinate to flower shows and promenades.

— We learn that the time for entries at the NORTHINGHAM AND MIDLAND COUNTIES GRAND ROSE SHOW and horticultural exhibition has been extended until July 1.

— We invite the special attention of our readers to the fact that in pursuance of the new postal regulations adopted by the GENERAL INTERNATIONAL POSTAL UNION, and which come into force on July 1 next, the postage of letters to most parts of Europe and to the United States, is fixed at 2½d. per half ounce. Post-cards 1½d. each will be available for the same countries, and what is of special importance to our foreign readers, newspapers will be henceforth transmitted at a uniform rate of 1d. for 4 oz. Printed papers, patterns, and circulars (not of the nature of private letters) will be charged at the rate of 1d. for

2 oz. The only important exception is in the case of France, and of letters, &c., sent through France, in which country the above regulations will not come into force until January next.

The quantity of rain which falls in England is very carefully noted in various parts of the kingdom, and the result of the observations is published far and wide, but says the *Times*, the amount of OUR SUNSHINE is not so well known. It is not out of season at this time to notice that in Scotland the Registrar-General regularly reports the number of hours of sunshine with which that country is favoured, as shown by the mean of returns from 55 stations of the Meteorological Society of Scotland. The hours of sunshine in a year in that country most frequently range between 1650 and 1750; but in 1874 they reached the large number of 1815, and these were distributed as follows—74 in January, 103 in February, 138 in March, 170 in April, 170 in May, 277 in June, 239 in July, 188 in August, 145 in September, 140 in October, 78 in November, and 84 in December. The average was above nine hours a day in June, and not quite 2½ in January.

— With the present number we give a SPECIAL SUPPLEMENT, with numerous original illustrations from the pencil of Mr. W. G. SMITH, of the gardens of his Grace the Duke of DEVONSHIRE, K.G., at Chatsworth.

Home Correspondence.

Notes of a South Shropshire Garden.—The rain that has fallen somewhat copiously during the last week has made our lawns green, our bedded plants thrive, and the weeds grow apace, but the winds that have accompanied the welcome moisture batter our Roses, and break the tender shoots of the Rhododendrons. Our Roses promised a splendid show of bloom, but they have not opened so kindly as we hoped, the outer petals being in many cases damaged by the weather; still we have some remarkable specimens. One standard, that bears a head that is 8 feet high and 40 feet in circumference, and almost a perfect hemisphere, carries at least 2000 flowers, fully or all but fully opened. A Gloire de Dijon near it, 10 feet high, has more than 500 well-formed flowers, and the shyer Marechal Niel has over 200. This garden is favourable to all kinds of Roses. A hedge of Sweet Briar, planted four years since, has grown to goodly dimensions, making the morning and evening air delicious with its refined fragrance. A bed of orange-yellow Lilies, many of which were bought at one of Mr. Stevens' sales last year as *Lilium Humboldtii*, and the rest supplied from Holland as scarlet Martagons, from both of which species they are, however, very far removed, has been one of the gayest objects during the past week, and these are contrasted well with a bed of Delphiniums, delightful in their blue brilliancy. I wonder why this beautiful plant is not more frequently made a feature at this season. The bed in which it grows is a mass of colour in the early part of the year, yellow, blue, dark and pale, and white with Crocuses. Of these we planted about 1000 bulbs, alternating the colours so that when the sun shines upon them during their time of flowering the circular bed looks like a splendid island of painted glass. Next year we intend to plant it with Forget-me-nots that will follow the Crocus, then will come this Larkspur, and after the Delphinium comes on a growth of the old-fashioned *Fuchsia coccinea* that will last till late in the autumn. These three, viz., Crocus, Delphinium, and *Fuchsia*, in no wise interfere with each other's growth, and they keep up the interest we always feel in watching the changing but recurring beauties of the year. In the house the Pelargoniums are just now the chief show, but a *Taxonia Van Volxemi* and a *Clematis Jackmanni* are great attractions. In the viney we look well, although, in consequence of building a new house and making alterations not yet completed, we have been unable to use heat, the bloom has set very well; even the Muscats, which are usually supposed to require a high temperature, will not disappoint us. In the kitchen garden we gathered our first green Peas on the 10th inst., and new Potatoes a few days before, being about the usual date, and showing that summer easily makes up for the time lost through the cold of early spring. Until to-day the river has been very low, but the rain that has fallen lately has caused

it to rise, and for the first time this year a salmon was playing in the pool. *S.*, June 15.

Synonymy of Marantas.—We have lately received some Marantas, introduced into commerce by Mr. W. Bull, and among them we find some species already previously introduced by us, and described under other names by Professor Morren. Thus Maranta pinata-pleta (Hort. Bull.) is our *Calathia applicata*, *Belgique Horticole*, 1874, 228; M. prasina (Hort. Bull.) is our *C. medio-pica*, *Belg. Hort.*, 1874, 228. These two plants were exhibited at Ghent on June 28, 1874, and at Liège, July 5, 1874. Maranta bella (Hort. Bull.) is identical with our M. Kegeljani, exhibited by us at Antwerp in April, 1875, and described in the *Belgique Horticole*, 1875, 133. We think, then, we are justified in claiming the priority. In fact, Mr. Bull's catalogue, in which these novelties are announced—1875, No. 610, p. 7—was published at the end of April, this year, and it does not appear that the plants have been described elsewhere. In any case the public should be apprised of the identity above stated. *L. Jacob-Makoy & Co., Liège, Belgium.*

Strawberry Forcing in Pots.—I see there is a dispute going on in your columns about wooden troughs, pans, and turf shelves for Strawberry forcing, but I do not see any reference made to Mr. Ward's old-fashioned plan of layering the runners in small pots—a point, in my estimation, of equal if not more importance than the other, considering it has to be done at one of the busiest seasons of the year. I allude to layering the runners into the fruiting pots. I cannot boast of the thousands we force, but I can assure you of our perfect success in fruiting the plants, and of the good saving of time and labour effected by layering the runners into the fruiting pots at once. The method is so simple as to compare with the other as to be no need of description. *E. Bayman, The Gardens, Holmby, Dorking.*

The Pinguicula.—Mr. Forsyth has scarcely acquainted himself with the habits of the Pinguicula, or he would have known that it does not catch insects by cupping its leaves; and I have never heard that it has been so reported of. If any unfortunate insects should pitch upon its leaves they are, if small enough, seized by the minute hairs that cover the upper surface of the foliage, or glued to it by the gummy secretion that is so easily distinguished if the foliage be moistened or rubbed with a wet finger. When thus captured there is no hope of escape, and, as insect life is specially evanescent, they soon die. The disappearance is, however, not so rapid as has been indicated; and I believe that such minute bodies would disappear as rapidly as any other coming to rest after death. Whatever may be the nature of the *Dionaea*, I feel sure that further observation must exonerate the humble Pinguicula from the charge of being insectivorous; the same designation might be with equal validity applied to the *Petunia*, as at times during the summer the foliage of plants growing in the open air are, owing to the numerous secretions of the web of insects, covered, often much infested with the bodies of dead insects, especially just after a strong wind has been blowing. It may be that in the case of the Pinguicula the gummy secretion on the leaves is an attraction to the insects, and the smaller ones, when once in contact with it, are unable to get free again. I have to-day placed a number of the green aphid on my plants, and these, as long as they kept their legs, seemed uninjured; but if by chance they got on their backs, they were irrevocably fixed. I found also that the bodies of these were still sound eight hours afterwards. This would indicate that the digestive process, if any, was not very rapid. Mr. Forsyth rather astonished me when he wrote about plants of the Pinguicula being infested with greenfly. If anything could indicate that the plants in question had been grown under unnatural conditions, that would do so. Certainly they had no business to be dry, and should not be kept in a frame. A cool, shady place in the open air, and plenty of moisture, are the requirements during the summer; and if at Tomorden the aphids were preying upon it, instead of the plant eating the aphid, the mode of cultivation was to blame. *A. D.*

Mr. Laxton's Peas and Strawberries.—In your report of the meeting of the Fruit Committee of the Royal Horticultural Society, on the 16th inst., it is stated that a seedling Pea named Dr. Hogg was exhibited by me, and that the committee would not pass any opinion upon it without tasting them boiled, and that it would probably be grown at Chiswick. You appear to have overlooked the fact that this Pea has already been tried at Chiswick, received a First-class Certificate, and is now in the hands of the public. The pods were merely sent to the committee to show how quickly they ripen, and to favour the Pea may be brought in. The Peas from which the ripe pods were gathered having been sown on March 18. It would also appear from the report that I sent some clusters of Pioneer Strawberry for tasting. These

were merely sent to show the bearing character of the plant, and a great many of them were necessarily unripe. I regret, however, to state as a fact that the committee did not eat the fine and ripe specimens sent to be tested. Pioneer was submitted to the committee as a large, highly flavoured, very early Strawberry, which comes in close on the heels of Black Prince, and considerably before Keen's Seedling and Vicomtesse d'Haricot de Thury; and I know no other Strawberry of its size and flavour which comes in so early. The first fruit was gathered and tasted by Mr. Gilbert, of Burchley, from plants grown in the open ground here on the 4th inst., the same day in which May Queen and Black Prince also ripened. May I therefore trust to your usual courtesy to explain this in your next issue? *Thomas Laxton, Stanford, June 21.*

In your report of the meeting of the Fruit Committee of June 16, published in last week's paper, you state that "Mr. Laxton also sent a promising seedling Pea, named Dr. Hogg," and that the committee would not "pass any opinion on it without tasting them boiled, and for that there was not enough, so that it will probably be grown at Chiswick." I do not know where your reporter could have gained this piece of information. It forms no part of my "minutes" of the meeting. Your reports of these meetings are generally so accurate to account for the fact that I receive mis-statements like this is left uncontradicted your readers will naturally imagine that the Fruit Committee was in the arms of Morpheus. Dr. Hogg Pea is well-known to the committee, was grown at Chiswick in 1872, and awarded a First-class Certificate, and has been noticed in your own columns frequently since. It has been sent out this present season by Messrs. Hurst & Son, and is undoubtedly one of the best and handsomest early green marrow Peas in existence. The few Peas in question were exhibited by Mr. Laxton simply to show how early it could be produced, the seeds having been sown on March 18. *A. F. Barron, Secretary to the Fruit Committee.* [Our remarks were based upon the statement officially made at the general meeting, Eds.]

Spring Frosts.—On referring to the registers of the weather kept here, I find that it was on July 2, 1875, that the first frost occurred. It was then mentioned by Mr. Strickland on p. 701. The thermometer here that morning was as low as 34° on the grass, and in a note it is stated that the Fern in exposed places was blackened in the park. There is always a lower temperature at Osberton, Clumber, and Thoresby, than at Welbeck, owing to their situation; and I perfectly remember the injury done to tender vegetables in the gardens of those places in that July, as well as to the Oaks and Spanish Chestnuts in the parks. *William Tillyer.*

Leafing of the Ash and Oak.—A number of paragraphs appeared in the pages of the *Gardeners' Chronicle* last year upon the great dissimilarity which then existed between the time of coming into leaf of these two trees. As the season proved a very dry and warm one, weather prognosticators who are inclined to believe in the leafing of these several rival trees forboding the weather for the summer months, would have their faith somewhat strengthened. Those who are accustomed to watch the opening foliage of forest trees will have observed how much more simultaneously these two sorts have expanded their flowers this spring. The fact is the more remarkable, as the winters and spring months, as regards temperature, were so entirely opposite, and would seem to favour the idea that the retarded flow of sap in the case of the Ash may be owing to some imperfect development of the wood and buds of the previous autumn. Some trees which were unusually late attracted my notice last year, and the dates of coming into leaf were noted down. This year I find there is fully five weeks' difference, being that much earlier after a severe winter and a cold backward spring. The crop of seed on some of these trees this season is immense, and must tend to weaken their growth considerably. All forest trees show well for flowering in the present year, and the opening and growth generally is healthy and strong in this northern locality. *J. Webster, Gordon Castle.*

Early Peas.—I am astonished at Mr. Morgan's opinion (see p. 791) of Laxton's Alpha early Pea. To be despised is nothing to be wondered at now-a-days, but for him to discard one of the best Peas in cultivation is a great matter of surprise, independently of what I have said of Laxton's Alpha, as to its earliness, I find that it has been the earliest outdoor Pea amongst my neighbours this season; and from what I can see of William the First, it appears to be a fine early dwarf Pea, following upon the heels of some which I named in a former article. With this I send you samples of Laxton's Alpha, Eastes' Kentish Invicta, and Dr. Hogg. They are all remarkably well ripened, particularly, as you will observe, Laxton's Alpha—it is as tight, firm, and well filled with meat, instead of wind! I dream, and will, but to all appearance a week younger; and Dr.

Hogg, a much larger pod with finer Peas, is as ripe as Kentish Invicta, with no deception as to the fulness of the pods, and I may state it is the best and earliest Pea of the large sorts that I have hitherto grown. Several of the Peas sent still bear the marks upon their pods of the peppering which they received from the late hailstorm. The above Peas were all grown in a south border. Early last week we pulled twenty pecks at one pulling of Dickson's First Best and Sangster's No. 1 Peas, sown the middle of January upon a border with a west aspect; and the same border is now being cleared to plant Veitch's Autumn Giant Cauliflower. *J. Miller, Clumber.* [The samples received fully bear out our correspondent's statements. Eds.]

The Gardeners' Royal Benevolent Institution.—Permit me to call the attention of your readers, and of my brother gardeners in particular, to the proximity of the thirty-second anniversary festival of the Gardeners' Royal Benevolent Institution, which is to take place at the London Tavern, Bishopsgate Street, on Friday next, July 2, under the appropriate presidency of R. Broadwater, Esq., Master of the Worshipful Company of Fruiteers. I say appropriate, for who is there that can value more highly the proper worth the great services rendered by gardeners to the community than the fruiterers, and who therefore are better able to infuse an earnest and generous feeling of support into those they may come in contact with, and thus nurture the necessary fruits of a practical sympathy? In looking through the long list of stewards—about seventy in number—I am struck with the many familiar names of persons who year by year give their valuable time and support in this way to this invaluable institution. Fondly does it bring to my mind the fact that "charity which begins at home" and which nurtures so many aged and infirm entirely of its own, still goes on prospering, and which thus brings back to its originators and supporters that proverbial return of good and charitable deeds—the "measure of fulness even to overflowing"—is deserving of every individual's support. Gardeners have the power to aid this festival by inducing their employers to send fruit and flowers to enliven the display, and thereby to increase the pleasure of those who assemble to aid former or future aged and infirm growers of such by their material subscriptions. And, to say nothing of the sympathetic support directly accorded by so doing, they will thereby save the funds by supplying such necessities as would otherwise have to be bought for the occasion. Finally, let me most earnestly ask every non-subscribing brother gardener not to lay this appeal down without deciding to become a member of this true federation of gardeners. The simple guinea per annum can surely be spared, if there is the will, even from what I confess with painful feelings are in far too many cases wretchedly low salaries. Such a guinea will never be really missed by any one, and it might some day become to any of us, however unexpectedly, a jewel of increased value—to solace old age, infirmity, and the adverse visitations of Providence, and to which the highest, as well as the most lowly, are liable. Apart from this, whilst any hesitate and delay, to view the list of names which is the personal right of every fifteen years' subscriber, namely, to receive the aid of the Institution, or himself or his wife, should either require it. All packages should be addressed to Mr. E. R. Cutler, G.R.B.I., London Tavern, Disposage, on Thursday, July 1, or not later than the earlier trains on the morning of Friday, July 2. Let all who will aid, therefore, be so kind as to write to the Secretary as soon as possible. *William Earley, June 23.*

Eucalyptus collosa.—At pp. 238 and 239 (February 20) the question is raised—What is *Eucalyptus collosa*? and gratuitously it is added, "It is a peculiarity of Baron von Mueller that he rarely sends out specimens or seeds of plants without provisional names." &c. I had to read over this sentence several times before I could make myself believe that "without" had been substituted in error for "with." Will your correspondent cite the numerous "provisional names"? No phytographic worker has ever been more careful in adopting correct names than myself. I can fairly state that I have reduced thousands of useless synonyms of other writers on Australian plants first, to their real names; as instance *Calythrix tetragona*, to which I reduced correctly seventeen species of acknowledged high authorities and in one occasion I like my contemporaries, have adopted provisional names, there was full reason for it, which must be apparent to the meanest understanding. Even in so difficult a genus as *Eucalyptus*—in which first of all by myself sound principles for specific demarcation were established—nearly all the species (about half a hundred) established by me have stood the test of comparison with original specimens of species previously known and mostly ill-described before my time. That in such a genus an occasional duplicity may occur (as in similar instances with *Cypripedium macrocarpum* and *Lambertiana*) can readily be comprehended; so it is yet an unsettled point whether the

E. fissilis should be separated as a species or as a variety from *E. obliqua*; the wood and bark of both are very distinct to the woodspellers, builders, and commercial dealers. Thus it was for a very long time uncertain when this, my *E. diversicolor*—one of the fifty called Blue Gum tree of West Australia—was identical with the famous Karri tree; and this identity I was only able to establish when I visited West Australia personally in 1857, after the name *E. collosa* was adopted for the Karri wood in our locality, and also in several foreign industrial exhibitions. When this identity was made out, I informed M. Ramel and many other correspondents of the fact. It seems almost beneath one's dignity to spend time in refuting attacks, such as the one in your number of Feb. 20; but the baseless attacks of traducers have brought an honourable departmental position to the dust (while under the Civil Service regulations the dust colony I could not defend myself), and no one in Europe seems to care to aid in rebuilding it, so far as I can perceive. Whenever in my writings *E. collosa* was mentioned it was coupled with the vernacular name "Karri," hence there could be no great difficulty in finding out what it was, and even that difficulty could have been easily removed by a letter to myself. There are still several *Eucalypti* about whose exact specific position I am uncertain, and to avoid confusion temporary names have been adopted for them in your own country the controversy about the British Oaks in not yet brought to a close—*i.e.*, whether you have one species with two varieties, or two species. Cannot then some allowance be made for 150 *Eucalypti*? Surely, therefore, a little more charity might have been shown in this instance to a distant foreign worker, who would fain have hoped that he had struggled here against illiberality and envy for a quarter of a century not altogether in vain. *Ferd. von Mueller, Melbourne.*

Culture of Strawberries in Pots.—Your correspondent, Mr. W. Hinds, p. 792, seems sadly put out with my remarks concerning the watering of Strawberries. It was the last of my thoughts to disturb the equanimity of any one, or to lead Mr. Hinds astray, or even to invite him to test my old-fashioned practice, which would much rather leave him alone in his glory and his liquid manure, also his shovels, plunging bits, and plunging material. It is one and all too artificial and expensive for the age we live in—permanent trenches, plants naturally grown, fruit receiving a full crop of fresh air, nine months wet out of twelve, nothing short of this will satisfy "W. P." "W. H." makes funny remarks about striking Tom Thumb Pelargoniums in bottom-heat, which prove him to be thirty years behind in these matters. I "W. H." will take the temperature of his soil in the middle of his garden during July or August, he will find it at about 60° to 65°, and what is this but bottom-heat? More of this anon. I would ask Mr. Hinds to bear in mind it is Strawberry culture we have in hand, not only from March to the end of August, but every month in the year. "W. H." may keep his "pet varieties" to himself, but old gardeners will not give up Keen's Seedling, Cuthill's Alice, President, Due de Malakoff, Sugar Ball, Sugar Loaf, and so on. These are the best fruit as a table fruit, as none other better, for being monstrously large. The middle-sized, well-ripened, subacid and good flavoured fruit are wanted, and these supplied with pure rain-water. What, grow Strawberries artificially, regardless of expense!—train the fruit over the side of the pot as a show off, allow them to ripen and imbibe the fumes of nasty liquid manure!—away with this. All gardeners will know stagnant water, of any kind, is injurious to plant life. *P. P.*

Kniphofia Macowiana.—Referring to *Kniphofia Macowiana*, Baker, figured in the *Botanical Magazine* (tab. 6167), my attention has been called to the fact that this pretty novelty was raised by Mr. Green from seeds sent by Mr. Macow to W. Wilson Saunders, Esq., and was subsequently flowered by Mr. Green at nursery at Beigate, and by whom the flowering specimen was sent to Kew. In so far as I am aware, it has not been flowered elsewhere, and the statement that Mr. Macow has sent roots to Kew is erroneous. *J. D. Hooper, Kew, June 15.* [We believe that Mr. Green intends to distribute this plant in the autumn. Eds.]

Treatment of Ornamental Trees.—It is worth while to state the great success I have had in a mode of treatment of large old and ornamental trees on a lawn and area of ground adjacent to a residence, where it is a great object to preserve such trees in a state of vigour to guard against the commencement of decay. It is desirable to state in the outset that where leaves are annually removed in order to keep a place in nice condition, trees are deprived of their natural nourishment, but even when removed they are blown about so as to render them of little or no avail in affording food and nourishment to the roots of the trees. It is also clear that these trees have been grown for 100 to 150, or a greater number of years, and

where the soil is not perhaps very good it must necessarily be exhausted and impoverished. Therefore after a long period has elapsed, it is not to be wondered at—on the contrary it is to be expected—that time will tell on the trees, and that they show the symptoms of standing still in their growth—in a stationary condition at least in the first instance, and subsequently of the commencement and advance of decay. These considerations attracted my attention years ago, and created a desire to arrest such downhill progress, and devise a remedy, at the same time to steer clear of any experiments which might prove injurious. One of the symptoms I observed, especially on Lime trees, was an increasing smallness of the leaf and a shortness of the annual shoots. I set to work some fifteen or eighteen years ago to give some safe treatment to the trees. Without stirring the existing surface, I began to lay on around the stems of the trees, and at least as far round as a circle with a circumference rather beyond the extremities of the branches, a coating of good earth with which some lime had been mixed. The compost, which was laid on about 5 inches thick when loose, gradually became solid, and remained about 3 inches thick. There was a difficulty in giving this amount of compost to a small tree, but it was obvious that earth could not be found within a moderate distance to apply the same treatment to a large number, and that the cartage, even if it could be found, would be a large expense if twenty or thirty cartloads were to be applied to a large number of trees. But as regards the trees to which this treatment was applied, the result was most satisfactory. The earth being laid on in the winter and spring no effect was visible in the first summer; but in the second summer the leaves were double their former size with quite a new vigour; in the third year the leaves, which had before been little bigger than half-a-crown, were four times that size, and some of them almost as large as dessert plates, on thick and succulent shoots. To a certain extent similar results were attained, but on no tree was the difference so great as on the Lime tree, as all the fine fibres of the roots pushed up into the new soil and nutriment. But I was desirous to see how a similar result might be attained by a less expensive and laborious process, so that the effect might be kept up and extended to a greater number of trees. I thought myself of a very simple and cheap process, which I have now practised for a succession of years with most satisfactory results. The leaves of the whole of the trees must be cleared at all events, in order to keep the place in nice order, and the practice I have followed is to rake all the leaves off a certain area round the stumps of about one-third of the whole number of trees within a certain space, and to place a coating of leaves about 7 inches thick in a circle from them to a circumference as far as the branches extend. This will gradually sink down to a coating of 3 inches of solid and decaying leaves; and thus there is created a coating of decaying leaves or leaf-mould—the most appropriate food of trees. Into this coating the root fibres push and are sure to find their best nutriment, the youth of the tree is renewed, and a new lease of life seems to be given to it, with all the vigour of youth and the strength and magnitude of manhood. If a little earth or vegetable rubbish can be laid over the leaves it secures their not being scattered by the wind, and a few branches of trees will assist in this object—these can be removed when the leaves are somewhat consolidated. I can state with truth that on a mass of large trees which I have had thus treated, I see an increase in the size of the trees and quite a new vigour in their growth. It is my intention to repeat the treatment once in three years, to keep the gentle action of the nourishment of the trees in the wood and outlying trees to which I mean to apply it. I consider that the leaves will afford the means and necessary supply once in three years to the whole of the trees. Much more might be said, but already this statement is too long, and persons who may take an interest in the subject will readily think for themselves, and see how simple a matter it is to confer a benefit on favourite trees. *T. F. F.*

Vanda suavis.—I understand that Mr. Thomson, of Clovenfords, exhibited recently at the Royal Horticultural Society's meeting a spike of *Vanda suavis* with nineteen flowers! Was this a monstrosity, or was it an ordinary spike? It must have been of considerable length—so I thought, at least, until Mr. Dunn, who saw it before it was cut, told me that its length did not strike him so much as the closeness of the flowers upon the raceme. Now this is so unusual an occurrence that it deserves more than a mere passing notice. The late Mr. James Veitch, with whom I had many pleasant chats on Orchid culture, and orchid long thoughts, along with myself, that no *Vanda suavis* was capable of producing more than sixteen flowers to a spike. That number both of us had several times upon several plants, but I never knew of more until, by the way, I saw Mr. Dunn's variety at Dalkeith last year, which bore seventeen flowers. But when we come to hear of nineteen it certainly excites some surprise, and possibly Mr. Thomson may tell us, if

this should meet his eye, if it is an unusual variety of the species that he has got hold of, or if it be one of the ordinary type and the production of flowers due to cultivation. I certainly should be very thankful to hear more about it. *James Anderson, Meadowbank Nurseries, Uddingston, N.B.*

Curved Roof Conservatories.—It may not be known to your correspondent of last week that the house he describes as erected by Messrs. Barr & Sugden is not the first that has been put up in London. I believe I may lay claim to the credit of anything that belongs to this innovation. In building my new offices in 1872, I covered the whole of my roof with a curved conservatory of wood bars, bent on my patent principle. It was noted in the papers at the time, and you will see that Messrs. Barr & Sugden's is very much like it. Mr. Barr, with his architect, visited my place previous to the erection of his conservatory, and my building was shown, and the principles of its construction explained by *W. D. Lascells, 121, Bushill Row, Finsbury, E.C.* [London was one of the first to advocate these house-top greenhouses. Eds.]

Root Pruning by Water Voles.—Our illustration (fig. 171) shows how a tree may be destroyed by the persistent nibblings of a water vole, The tree in question grew in Mr. Ellacombe's garden, and

FIG. 171.—ROOT PRUNING EXTRAORDINARY.

has been repeatedly mentioned in our columns, but as considerable interest attaches to the subject, we now give an illustration which may serve to put others on their guard against what has been well styled an undesirable root-pruner.

Fancy Pelargoniums at the Botanic Show.—I think many of your readers will share with me the surprise I have felt at the account you give of the Fancies exhibited by Mr. James and myself at the Royal Botanic last week, in which you say, "Mr. James' plants were in all respects most admirable," while you describe mine only as being "but little inferior." [Your plants were not fully in flower, while Mr. James' were at their best: only in this sense inferior. Eds.] That my plants were strikingly superior to any six plants in the exhibition was so generally admitted by other exhibitors, that astonishment was widely expressed at Mr. James' six plants being bracketed with mine; and Mr. Frost, the well-known Pelargonium grower to Mr. Turner, of Slough, said that mine "were the most even and best class of Fancies he had ever seen staged." And here I must ask you to allow me to notice an article by Mr. James in the *Gardener's Magazine* for May 20 last, in which he says, after speaking of the "ignorance" of other writers on the subject, "one of the most important steps to take in the cultivation of Fancy Pelargoniums for exhibition purposes is to begin with grafted plants;" adding, "if on their own roots, they are liable to die off during the winter season when several years old, and just becoming large enough to produce a good effect." Now, the plants I exhibited last week were only twenty-seven months old, and measured from 3 feet to 3 feet

6 inches in diameter—being, I believe, a greater size than those exhibited by Mr. James; while for compactness, fullness, and evenness of bloom, there was nothing to desire. Yet these were all planted on their own roots, and some of them gained the prize, bracketed with Mr. James' plants in the previous year, when of course they were only fifteen months old, and even then measured 2 feet 6 inches to 3 feet in diameter. Such facts will dispense of the theory that Fancies should be grafted, and not grown on their own roots; the main secret of their successful cultivation being referable to the soil selected, and to the avoidance of all needless watering. *George King, The Gardens, Wolsey Ground, Esher.*

Alderney Cows.—Now that Alderney cows have so risen in price many of your readers will, perhaps, gladly hear that a cross almost equal for milk to the pure animal may be had between a Kerry or Welsh heifer and an Alderney bull, with the advantage of being much more easily disposed to fatten. It would be worth any one's while to breed a number. They are quite docile. *Z.*

The Royal Horticultural Society.—Messrs. Veitch & Sons, as most fittingly representing the large exhibitors in the trade, have pronounced in favour of the suggested great show on July 21. Allow me to state, as one of the small exhibitors, that I will do my very best to assist in making up an exhibition worthy the name and traditions of the Royal Horticultural Society. I have already supported the Society during the present year, despite the nonpayment of the prize money of 1874, and the absurdly reduced prizes of 1875 exhibiting something at almost every one of the meetings. Can Mr. A. F. Barron convene a meeting of exhibitors at which a plan of action can be agreed upon and carried into effect on July 21? *Richard Dean, Ealing, W.*

The Cedar of Lebanon.—On recommending the Cedar of Lebanon to friends discussing the selection of ornamental trees on home grounds, a common objection has been at once made as to the slowness of their growth. Now, that your younger readers may not be discouraged from planting this beautiful tree at a sufficient distance from the dwelling-house, I send you the inclosed particulars respecting the growth of a Cedar, which, on laying out the grounds about my new-built house in the year 1828, I planted a mere shrub about 3 feet high—less, unfortunately, than 20 yards from the house. As mensuration is one of the many items of instruction at our College, and superior instruments abound, the Principal, Mr. Constable, at my request, kindly attended with some of the students to make an accurate admeasurement of the girth, height, and the superficial extent of ground over which the branches extend. The most striking feature in the growth of this tree is the great extent of the branches from the bottom to the top, bearing in mind that it does not stand about forty years' growth. I inclose a copy of the report as worked out at the College, which shows that the "circumference at 4 feet from the ground is 10 feet 8 inches; at 5 feet, 8 feet 10 inches; height, 51 feet 6 inches. The tree covers about the sixteenth part of an acre." *Charles Lawrence, The Querns, Cirencester.* [Thanks for the photograph. Eds.]

Canterbury Bells.—I send you with this a box of flowers of Canterbury Bells, which may be said to represent quite a new strain. In the seedling bed I have counted no less than fourteen distinct varieties, double and single. Some are very double, others semi-double, and a few of the flowers are of enormous size, as you will perceive by the examples sent. They are a great improvement on the old forms of the Canterbury Bull, with their small flowers and somewhat pointed petals. The bed of seedlings, now in full bloom, is a remarkable sight at my seed garden at Bedford. *Richard Dean, Ealing, London, W.* [They are a very fine strain indeed, remarkable for the size of the flowers and their variety of colour. Eds.]

Reports of Societies.

Alexandra Palace Rose Show: June 24 and 25.—It is our pleasant duty to record that the first horticultural exhibition held at the Alexandra Palace since the re-opening was a very good one; and as a Rose show we must say that, with the exception of a few awkward details in the arrangements, which will no doubt be altered with experience, it reflected great credit alike on the exhibitors and the Palace committee, whose schedule of prizes was certainly a most liberal one. The exhibition was held in the large concert-room, the staging being erected in two parallel rows down either side, with large and well-filled baskets of plants down the centre of the room, and a row of ornamental foliaged plants down the centre of each of the side-tables. On either side of the orchestra Mr. B. S. Williams had fine collections of large fine-foliaged and flowering plants, and

in the centre, under the conductor's seat, a collection of smaller specimens of new and rare plants were furnished by the same exhibitor. Looking towards the orchestra the effect was very good. The nurserymen's classes for Roses were particularly well contested, and a fine lot of blooms were staged all round. The competition in some of the amateurs' classes was very strong, a large number of stands being put up, but there were a greater number of poor blooms than we like to see.

Taking the nurserymen's classes first, we have that for seventy-two distinct blooms, in which there were six competitors, and the competition very close. Messrs. Paul & Son, Cheshunt, came in 1st; Messrs. Cranston & Mayos, Hereford, 2d; Mr. B. M. Camm, Colchester, 3d; and Mr. Turner, Slough, 4th; an extra prize being awarded to Mr. John Keynes, Salisbury. The 1st prize stands contained an exceedingly fine lot of blooms, not particularly large, but well finished and perfectly fresh. The best blooms struck us as being those of Charles Rouillard, Charles Lefebvre, Edward Morren, Centifolia Rosea, Madame Caillat, Alfred Colomb, Madame Berard, S. Reynolds Hole, Marie Johnson, and the variety of Waltham, Etienne Levet, Marquise de Castellane, Annie Wood, and Madame Nachury, a pretty rosy-pink flower. Looking through the other stands we noticed especially fine blooms of Niphetos, Madame Crapetel, Madame Laurent, François Michelon, Devonensis, Paul Néron, Duke of Edinburgh, Madame Hippolyte Jamin and Clémence Raoux. In the next class, for forty-eight Roses, three trusses of each, there were five exhibitors, and so good were the flowers that prizes were awarded to six, in the following order—Mr. Turner, Messrs. Paul & Son, Mr. Keynes, Mr. Cant, and Messrs. Cranston & Mayos. The best blooms in Mr. Turner's stand were of Xavier Olibo, François Michelon, Madame Clémence Joigneux, Climbing Devonensis, Etienne Levet, Souvenir de Monsieur Boll, La France, Boule de Neige, Antoine Dacher, Baroness Rothschild, Elie Morel, Edward Morren, Maréchal Niel, La Fontaine, Oxonian, Souvenir de la Malmaison, Marquise de Castellane, Marguerite de St. Zélie, and Madame Thérèse Levet. The same varieties were more or less conspicuous in the other groups, which were very fine. There were ten competitors in the class for twenty-four blooms, and the awards were made to Mr. Keynes, Messrs. Cranston & Mayos, Mr. Prince, Oxford, Mr. Cant, and Messrs. Davison & Whitten, Hereford—the two last-named being equal 4th. All the stands were of considerable merit, but the space at our command does not permit us to name more than the best dozen flowers selected from the whole. These were, Etienne Levet, Marie Baumann, François Michelon, Nary, Feres, Madame Clémence Joigneux, Marquise de Morremart, Madame Lacharme, Princess Beatrice, Horace Vernet, Duc de Rohan, Madame Hippolyte Jamin, and Maréchal Niel. Again in the class for twelve Tea-scented and Noisette Roses the competition was very close, and extra equal 4th prizes had to be awarded, the result in the stand being thus 1st, Devonia, Norfolk, 2d, Mr. Prince, 3d, Mr. Cant, and equal 4th, Mr. Keynes and Messrs. Davison & Whitten. In the corresponding class for amateurs the awards of the judges were given in favour of the Rev. J. B. M. Camm, Captain Christy, T. Laxton, Esq., and Mr. Pulling. The varieties best represented throughout both classes were—Céline Forestier, Madame Villermoz, Souvenir d'un Ami, Devonensis, Maréchal Niel, Madame Capucine, orange, shaded with bright crimson, and delicately scented; Cheshunt Hybrid, Souvenir d'Elie; Marie Van Houthe, Niphetos, Perle de Lyon, and Belle Lyonaise.

The other classes, confined to amateurs, were for forty-eight, thirty-six, twenty-four, and twelve blooms respectively. There were five collections of forty-eights, and the blooms generally were very good indeed, and especially those of Camille Bernardin, M^{me}. Marie Rady, Alfred Colomb, Marie Baumann, François Michelon, Annie Laxton, and Centifolia Rosea, in the 1st prize lot, contributed by Mr. Baker, Heaville, Essex. The other awards went to Miss Devonia, Norfolk; 2d, Mr. Prince; 3d, T. Laxton, Esq.; Hall, Colchester; and T. Laxton, Esq. No less than thirteen lots of thirty-six were staged in competition, the result of the judging being that Mr. Baker was again placed 1st, Mr. Curtis, of Chatteris, being 2d; Mr. Cavell, of Oxford, 3d; and Mr. John Mayo, Oxford, 4th; the Rev. J. B. M. Camm securing an extra award. Seventeen collections of twenty-four blooms were put up, and, as might have been expected among amateurs, there were a considerable number of inferior blooms, but generally each stand contained a few exceptionally fine samples. Six prizes were awarded here, viz., 1st to Mr. H. Atkinson, Brentwood; 2d to Mr. A. J. Bloxham, Oxford; 3d to Mr. T. Jovitt, Hereford; equal 4th to Mr. Curtis and Mr. Baker, and an extra to Mr. J. Mayo. All the before mentioned varieties were more or less represented in these classes, and it is useless to repeat their names. The best two came from Mr. Baker, and equal 2d prizes went to Rev. A. Charles, Reigate, and Mr. Taylor.

The best twelve blooms of new Roses of 1873, 1874, or 1875, came from Mr. Turner—Messrs. Paul & Son coming in 2d, Mr. Cant 3d, and Mr. Keynes 4th. The varieties shown in the best condition generally in this class (made up of ten exhibitors), were Captain Christy, Sir Garnet Wolsely, Cheshunt Hybrid, Antoine Mouton—large and very full, a well built pink Rose; Caroline Kuster, pale straw-yellow, fine in the bud; Oxonian, Beauty of Slough, a fine rosy scarlet colour; Mademoiselle Dumain, and Mons. Claude Levet. Eighteen trusses of English raised Roses in commerce were shown by two exhibitors, Mr. Turner and Messrs. Paul & Son, and the prizes awarded in the order named. The finest flowers were of John Stuart Mill, John Hopper, Lord Napier, Climbing Devonensis, Beauty of Waltham, W. Wilson Saunders, Annie Laxton, Duke of Edinburgh, and Bessie Johnson. In the open class for twelve distinct blooms, Mr. J. Walker, Thame, was 1st.

Prizes were also offered for the best twelve blooms of certain varieties specially named, a feature which may be commended to the notice of other managers on account of its usefulness in bringing out more prominently the faults or good qualities of a Rose. The best Alfred Colomb came from Mr. Turner, Mr. Baker, and Messrs. Paul & Son; while appropriately enough Messrs. Paul & Son showed the Duke of Edinburgh to the best advantage, Mr. Turner being 2d. Out of four lots of Baroness Rothschild the best came from Mr. Baker and Mr. Prince; and Mr. Baker and Messrs. Paul & Son had the best of the competition in a good class of La France. Mr. Curtis and Mr. Baker contributed the best examples of Marie Baumann, and Mr. Cant and Mr. Walker of Maréchal Niel; while Mr. J. House, Peterborough, sent the best specimens of Princess Beatrice and Edward Morren. The much-abused Madame Lacharme was exceedingly well-shown by Mr. Cant and Messrs. Paul & Son.

Dwarf Roses in pots, to the number of fifty in each collection, were exhibited by Messrs. Paul & Son and Mr. Turner; and vases of cut Roses, set up with Rose foliage only, came from Miss Money, of the Alexandra Palace, and Mr. Gardiner, gr. to Lady Garnier, Southgate. Miss Williams, gr. to Mr. and Mrs. Williams, of Millway, and two elegant vases of Roses set up with Fern fronds and other accessories of a graceful character.

Messrs. Barron & Son, Elvaston, showed several small plants of the golden *Cupressus Lawsoniana elegantissima*, and *Retinospora tetragona* aurea. Mr. Turner showed two new seedling Roses, named Oxonian and Mrs. Baker, the first-named being the most promising. It is a cupped Rose, very full, and of a cerise shade of rose with darker guard petals.

Pinks and new Pelargoniums were also staged by Mr. Turner, two boxes of seedling Roses came from Mr. William Paul, and amongst them Firebrand, a rich crimson cupped Rose; Peach Blossom, and Queen of Waltham, bright rose, were the most conspicuous. From Mr. Laxton also came a box of seedling Roses, including Mrs. Laxton, crimson-scarlet; Emily Laxton, deep rosy pink; and Dr. Hogg, very dark claret. Mr. T. S. Ware had numerous samples of a new double dwarf Sweet William. It grows to the height of 12 inches, and the flowers are of a blood-red colour.

Glasgow and West of Scotland Horticultural: June 16.—The midsummer show, under the auspices of the above Society, was an unusually excellent one. The plants, generally, were of better quality than we commonly see, particularly those conspicuous for their blossoms. The glow of colour was particularly attractive, enhanced as it was by the presence of many rare and beautiful foliage plants. Unfortunately there were few there to see and admire. How it is that these periodical flower displays bring out so few sightseers, in comparison to others of a similar nature south of the Tweed, it is difficult to imagine. Amongst the most meritorious productions exhibited we must first point out those shown by Mr. A. E. Stewart, of Rawcliffe Lodge, Langside, and of Mr. Thomas Coats, Ferguslie—the one showing for the coveted prize of the season, the directors' silver cup, the other for purely exhibition purposes. Certainly Mr. Stewart's plants—although the field was left completely to himself—would have graced any exhibition stage in the three kingdoms; and there seemed to be no end of his treasures, for they met one upon nearly every table. This gentleman has entered into the spirit of horticulture with zest, and he appears to be highly scolded in his efforts by Mr. Robert Todd, his gardener. His plants undoubtedly were superb. The centre line was decorated with such fine Palms as *Livistona rotundifolia* and *Phenacophorum*, having the character of fans in outline of frondage; and some beautiful pinnated-leaved sorts, such as *Demonopsis palambicus*, filled in with a huge *Azalea Chelsoni*, like a tree for size, and literally covered with flowers. Then there were, besides, *Erica Cavendishiana*, the fine cut-leaved *Gleichenia*, and the extraordinarily slender Maiden-hair Fern, *Adiantum gracillimum*, mixed with the choicest of Orchids, fine *Ixoras*, the handsome

Medinilla, and quantities of the Princess of Wales *Montoglo*, plain which a finer or more beautiful flower is scarcely to be seen. Mr. Coats sent from his very rich collection of plants an extra well arranged lot, the Orchids being wonderfully beautiful, the pink racemes of the *Aerides* and *Saccolabiums* standing well among their fellows. These and the pure white *Dracophyllum gracile*, the Flamingo plant, the unique *Blandfordia* with orange and scarlet tubular flowers, and many other flowering plants, looked all the better for the magnificent silver Fern, *Cyathea dealata*, *Demonopsis*, and *Gibotium*—plants of such size as give dignity to a collection, and draw forth no end of encomiums from lingering promenadeurs. Then came the miscellaneous groups, which were in splendid condition, and the *Heaths*, the Ferns, and the Palms, which were shown in quantities and in a fine state of cultivation. As usual, along with Mr. Stewart were associated Mr. James Finlay, Mr. Eadie, and Mr. J. C. Wakefield, and in addition Mr. Kidston, Newton House, who exhibited by far the best specimens of flowering plants in the hall. Indeed, much praise is due to Mr. Craig, the gardener, his *Cattleya Mossie* and *Everlasting* plant being about the most superb flowering plants exhibited. Nor was Mr. Fleming, or Mr. Beveridge, or Mr. Chapman very much behind in examples of merit. So long as we have such specimens exhibited, so long will the interests of horticulture in the West of Scotland be maintained. For nurserymen there were no special prizes offered, but as usual, their plants were well exhibited, the principal collections being those of Messrs. Austin & McAlan, and of Mr. Anderson, Meadowbank. In the Meadowbank collection was a very choice variety of *Vanda suavis* called *Pescatorei*, with three very fine spikes; a particularly choice *Phalenopsis amabilis*, as perfect in the flower as could be well produced; some good examples of *Clerodendron Balfourianum*, full of flower in small-sized plants; a new *Stephanotis floribunda*, with much larger flowers than the normal form, and flowering precisely as a normal specimen; and an excellent *Amaryllis* called *Princess Alice*, one of the choicest of the Meadowbank seedlings, after the character of *Pardina*, being, we understand, a cross between that variety and *Ackermandia pulcherrima*, but of the deepest shaded crimson sufficed with white. Messrs. Downie & Laird had a fine stand of fancy Pansies. Miss McNutt being one of the showiest and best. Messrs. J. & R. Thymne sent a choice lot of plants, which have been named and described already, and which have taken first honours in the metropolis. These were all creditable groups, while the *Heaths*, *Rhododendrons*, and other miscellaneous plants from Rhodlaw were all neat, and generally good.

The Orchids are becoming greater favourites every year, and the plants are well shown by many exhibitors. Mr. Kidston had an excellent *Aerides*, full of flower, a *Cypripedium*, and an orange-lipped *Cattleya Mossie*; while Mr. Todd had a grand *Cattleya Warneri* and other beautiful varieties. The Ferns, particularly those from Mr. A. Stewart, *Crossophyllum* merit more than a passing remark. The *Adiantum cuneatum* was about as perfect as it was possible for plant to be, and quite 4 feet across; and *Davallia Mooreana* and the handsome *Pteris scaberula* were equally good. The variegated *Pelargoniums* from Mr. N. Campbell were better than we ever remember to have seen them; and similar plants from Mr. J. Hogg were first-rate. The cut Roses were beautiful, distributing their fragrance all round. The bouquets were a good exhibition, and so were the *Rhododendrons* and *Pansies*, and other cut flowers. The amateurs had a praiseworthy lot, Mr. Edward Boyes, Uddington, taking, as usual, the best position for specimen plants.

Fruit was limited in quantity, but of good quality. Mr. Crerar sent excellent Black Hamburg Grapes from Sir James Lumsden's garden, and good Peaches came from Mr. Smollett's, well put up by Mr. McConnachie. Strawberries were good, but we expected a larger display. The whole exhibition was highly creditable to the Society.

Obituary.

We have to record, with much regret, the death of Mr. GEORGE EDWARD, of York, which took place on the 10th inst. Mr. Edward has for many years been known as an enthusiastic florist and acorn, exhibiting florists' flowers, such as *Pelargoniums*, *Dahlia's*, &c., with considerable success at the great shows of the North of England. He was in his 59th year.

We have also to record, with deep regret, the death of Mr. WILLIAM ROLLISSON, of the well-known and highly-respected ancient firm of William Rollisson & Sons, of Tooting, Surrey—a nursery establishment which during the lifetime of the elder Mr. Rollisson, father of the gentleman now deceased, acquired great reputation for the numerous first-rate varieties of Cape *Heaths* raised and sent out from thence. As cultivators of Orchids and importers of

new plants, the Messrs. Rolleston, father and sons, at one time stood pre-eminent amongst the London nurserymen—for Tooting, though in those days a country hamlet, is, in fact, but a suburb of London; indeed, the Tooting establishment in those days stood in the fore-front of the London trade, and was especially famous as a plant nursery. Mr. W. Rolleston, the younger of the two brothers by whom the business has been carried on for many years, died on the 18th inst., at his residence, Springfield, Upper Tooting, in his 73d year. He was a genial unassuming man, kind and considerate towards all about him; and, though advancing years had shut him out from taking an active part in business matters, he will pass away amidst the keen regrets of a wide circle of friends.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JUNE 23, 1875.

- June 17.—A fine bright morning; rather dull afternoon. Fine, and distant thunder heard at night.
- 18.—Overcast, dull, gloomy and showery. Slight thunder-storm at 2 P.M.
- 19.—Fine, bright, and partially cloudy throughout.
- 20.—Overcast, dull, and rain fell in morning. Fine afternoon.
- 21.—Dull at night.
- 22.—Overcast, dull, and cold throughout.
- 23.—A fine day, warmer and gloomy.
- 24.—Overcast, dull and cold. Fine at times.

— During the week ending Saturday, June 19, in London and its suburbs the reading of the barometer at the level of the sea increased from 29.76 inches at the beginning of the week to 29.82 inches by the morning of the 13th, decreased to 29.48 inches by the afternoon of the 15th, increased to 30.18 inches by the morning of the 19th, and was 30.00 inches at the end of the week. The mean reading for the week was 29.79 inches, being 0.09 inch lower than that of the preceding week.

The highest temperatures of the air at 4 feet above the ground ranged from 64° on the 13th to 72° on the 19th, the mean value for the week being 65½°. The lowest temperatures of the air varied between 53° on the 14th and 46° on the 10th, the mean for the week being 49½°. The mean daily range of temperature in the week was 15½°, varying from 10½° on the 14th and 26° on the 19th. The mean daily temperatures of the air and the departures from their respective averages were as follows—13th, 53° 4' - 5° 3'; 14th, 57° 3' - 1° 6'; 15th, 55° 3' - 3° 7'; 16th, 55° 3' - 3° 8'; 17th, 55° 5' - 3° 8'; 18th, 54° 5' - 5'; and 19th, 57° 5' - 2° 2'. The mean temperature for the week was 55° 5', being 3° 6' lower than the average of the preceding six days observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed on grass in sun's rays, were 144° on the 13th, on the 17th and 19th; on the 13th 80° was the highest reading. The lowest readings of a thermometer on grass, with its bulb fully exposed to the sky, were 39½° and 45¼° on the 13th and 15th; on the 16th and 17th 47½° was the lowest reading. The mean for the seven low readings was 45½°.

The direction of the wind was S.S.W., and its strength brisk.

The weather during the week was generally fine, but somewhat cold, cloudy, and showery. A slight thunderstorm occurred on June 18.

Rain fell on five days to the amount of 0.46 inch.

In England, for the week ending June 19, the extreme high day temperatures varied between 74° at Sunderland and 63° at Bradford, with a general average all over the country of 69½°. The extreme low night temperatures ranged from 46½° at Liverpool

to 34½° at Birmingham, the general average being 43°. The mean of the extreme ranges of temperature in the week was 16¼°, the greatest range being at Birmingham, 34½°, and the least at Bradford, 17°. The mean high temperatures observed by day ranged between 60½° at Cambridge and 66½° at Liverpool, with a general average of 64°. The mean low temperatures observed by night varied from 50½° at Truro to 42½° at Newcastle-on-Tyne, with an average value of 47°. The mean daily range of temperature in the week was 17½°, varying from 21½° at Hull to 11½° at Liverpool and Truro. The mean temperature of the air for the week was 53° 3', being 1½° higher than the value for the corresponding week in 1874. The highest was at Nottingham, 57½°, and the lowest at Newcastle-on-Tyne, 50½°. Rain fell on every day in the week at Cambridge and Cambridge to the amounts of 1½ inch and 1½ inch respectively; at Bradford it fell on three days only, and the amount measured was a little more than a quarter of an inch. The average fall over the country was three-quarters of an inch.

The weather during the week was generally fine, though cloudy and showery at times.

A slight thunderstorm occurred generally over the country on June 17 and 18.

In Scotland the highest temperatures by day ranged from 68° at Edinburgh and Aberdeen to 62½° at Glasgow. The lowest temperatures by night varied between 43½° at Glasgow and 35° at Aberdeen, their respective averages being 65½° and 41½°. The mean range of temperature in the week was 24½°. The mean temperature for the week was 54°, being 1° higher than that of England, and 2° lower than the value for the corresponding week in 1874. The highest occurred at Edinburgh, 55°, and the lowest at Greenock, 55°. The fall of rain varied from one inch and four-tenths at Greenock to one inch at Leith, the general average fall over the country was eight-tenths of an inch.

At Dublin the highest temperature was 65½°, the lowest 38½°, the mean, 53½°, and the fall of rain 1.12 inch.

JAMES GLAISHER.

Garden Operations.

(FOR THE ENSUING FORTNIGHT.)

[The subjoined directions are intended to supply general information, and must, of course, be adapted to the peculiar circumstances of each locality. Other departments of the garden will be treated on from week to week in succession, according to the requirements of the season. Special directions for the management of "The Villa Garden" will be found in the preceding columns.]

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—In growing hard-wooded greenhouse plants there are two methods of procedure. The ordinary one is that of simply potting the young stock in the spring, generally not very early, and growing them on through the summer without another shift until the year following. Now the quicker plants of this section are grown without anything in their treatment that would come under the head of ordinary excited growth, but simply allowing the plenty of root-room, tends not only so much sooner to get them up to a handsome size, but, after lengthened observation of the two methods, I am quite satisfied that plants that are thus grown on quickly in their early stages not only live longer after they have attained the size of full specimens, but are less liable to go off whilst young through the effects of potting, by reason of their roots never getting so much cramped round the sides of the pots, and consequently not being liable to injury from shifting. Plants that are grown on this system and were potted early in the spring at the time advised, will now require a second shift; this I particularly apply to the free rooting subjects, such as *Boronia pinnata* and *serrulata*, *Polygalas*, *Pimeleas*, *Eriostemonas*, *Adenandras*, *Acacias*, *Darwinia lupifera*, *Leschenaultias*, and *Statice profusa*. If the roots of these have made their wonted progress since the early potting they will now have got well hold of the soil, and will be much benefited by being at once moved into larger pots. The size of the pots to which they are transferred should in all cases be determined by the condition each individual plant is found in, when turned out of that it already occupies. The more roots a plant has got, the larger shift it will bear, but in no case give more room than there is a likelihood of the roots fully occupying before winter, for should they not be able to fill the pot there is danger of the soil becoming sour. After potting, if the weather is bright and the atmosphere dry, they must be shaded for two or three weeks from the sun, and the air of the house kept moist by throwing about plenty of water. Do not, for a time, allow a greater circulation of air amongst these newly-potted plants than is necessary to keep the temperature from getting too high. In the sum-

mer potting of plants of this description there is one thing that must not be lost sight of, that is, the necessity of doing it without delay, as if put off later than the first fortnight in July there is not sufficient time for them to get established before the autumn is upon them.

SOFT-WOODED GREENHOUSE PLANTS.—*Veronica Andersoni* and *salicifolia* are amongst the most useful autumn flowering plants for conservatory decoration when grown in pots and properly prepared. To keep them dwarf and bushy, as also to induce a free disposition to flower, the pots should now be plunged in coal ashes in a sunny situation, and well supplied with water. When they get filled with roots give them manure-water once a week. *Kalanthes* that are coming into flower should be neatly tied; if the plants are intended for exhibition use a stick to each shoot, or the flowers from their weight will get bruised in moving. If only required for some decoration fewer sticks will suffice, looping a portion of the shoots up with bast. Whatever purpose they are used for they should be so treated as to give the flowers their proper colour, which they never get when they open under glass. As the heads of bloom begin to expand, place the plants out-of-doors in a sheltered place at the north side of a wall, or in a similar position near a tree that will break the mid-day sun from them. The colour then developed so treated will acquire will be such that the varieties would not be recognisable when compared with others kept indoors. When fully open they may be removed to the conservatory, or where required, and shaded from the sun, by which means they will last longer. Sometimes there is a difficulty found in getting these useful plants to flower freely. This is simply through their not being properly treated during the preceding summer. If they are turned out-of-doors at mid-summer in an open sunny situation, and allowed to remain until the beginning of September, the shyest varieties will flower freely. *Sabias* of the useful decorative class, *splendens* and *gemserifera*, should, if not already done, be shifted into their flowering pots and placed out-of-doors. Before turning out, secure them with sufficient sticks and ties to prevent their being broken with the wind. If they are plunged in cool ashes they will require less attention in watering, and the bottom leaves will be less likely to suffer.

Conservatory plants that have now arrived when there is less profusion of flowering plants to select from; still, by the introduction of fine-leaved subjects, and the use of such blooming things as have in past Calendars been advised to be prepared for use here during the summer, an effective display may be kept up. *Zonal Pelargoniums*, *Balsams*, *Campanulas*, especially the blue and white varieties of *pyramidalis*, *Hydrangas* double and single, *Petunias*, *Plumbago* *variegata*, *Achimenes*, *Claytonia*, *Antirrhinums*, *Fuchsias*, *Lilium auratum*, &c.—these, as well as those moved by tasteful arrangement with the foliage plants, will make a display quite as pleasing as that produced earlier in the season by *Azaleas*, *Pelargoniums*, and similar things of a profuse flowering habit. For mixing amongst *Draecenas*, *Coleus*, and such coloured-leaved plants, the different varieties of *Centaurea* are very effective; the large-leaved *Echeveria metallica* may also be used to advantage be used in the same way. *T. Baines*.

FLOWER GARDEN, &c.

PARTERRE AND MIXED GARDEN.—Favoured by the late rains, bedding plants are making rapid progress towards filling the beds, and to aid them in effecting this as quickly as possible all blooms should for the present be picked off as they continue to show themselves. The trailing varieties, such as *Verbenas*, *Petunias*, &c., will now require frequent attention in regulating and fastening them to the surface of the ground, by means of a strong cord, or a wire passed over the stem, the ends of which should be thrust into the soil by using a blunt stick for the purpose, but before carrying this out the beds should be thoroughly mulched over with rotten dung, such as may be obtained from old Mushroom beds, or, failing this, any other short spent material that may be at hand, provided it is not of too rich a nature, as that would induce gross growth instead of blossoms. Grass saved from the mowing machine, cut up, substituted for the surface, will have the advantage of being ready to hand. In dry seasons mulching the flower-beds is of the utmost benefit, and I would strongly recommend those who may have a light dry soil to deal with, to give it a trial, and I am sure they will be pleased at the result. Beds treated in this way give double the amount of bloom, and are almost independent of the water-pot, as they strike their roots deep down in search of moisture, instead of being attended to the surface by frequent and insufficient waterings, where they perish most as quickly as they are formed. Indeed, watering without mulching is sheer waste of labour. If given in small quantities water often does more harm than good, from causes alluded to above, and heavy waterings invariably cause the soil to crack open, letting in large volumes of hot, dry air, that quickly absorbs the moisture and injures the tender

THE MOST VALUABLE VEGETABLE PRIZE OF THE YEAR

IMPORTANT NOTICE.

JAMES CARTER & CO. have the pleasure to announce that, by special permission of the Royal Horticultural Society, the Competition for the

CARTER CUP, value FIFTY GUINEAS, WITH THIRTY POUNDS IN MONEY PRIZES,

WILL TAKE PLACE AT THE GARDENS, SOUTH KENSINGTON, on JULY 7th.

PRIZE SCHEDULE.

FIRST PRIZE—THE "CARTER CUP," value FIFTY GUINEAS, to become the absolute property of the Employer to whom the PRIZE may be awarded; also Ten Guineas for the Gardener. SECOND PRIZE—Seven Guineas. THIRD PRIZE—Five Guineas. FOURTH PRIZE—Three Guineas.

THE BEST COLLECTION OF VEGETABLES, 24 DISHES,

FOR TO INCLUDE

- 1 peck Carters' Early Premium Gem Pea. 1 peck Carter's Commander-in-Chief Pea. 1 peck Carter's New Mammoth Long-pod Bean.
3 " James' Prolific Pea. 3 " Hardy's Pedigree Windsor Bean. Best Curled Parsley, and Little Heath Melon.
3 " G. F. Wilson Pea. 3 " Carter's White Advancer French Bean.
3 " Carter's Blue Peter Pea.

FIRST PRIZE—Two Guineas, SECOND PRIZE—One Guinea, for 6 DISHES OF PEAS, (1/2 peck of each variety) to include—

Carter's G. F. Wilson, James' Prolific Marrow, Carter's Hundredfold or Cook's Favourite, Carter's Commander-in-Chief.

CONDITIONS, &c.—All Vegetables to be grown by bona fide Gentlemen's Gardeners or Gentlemen Amateurs, and in the open Ground, excepting Chumbers and Melons—The following to comprise dishes: Of Peas, 1/2 peck (unless otherwise stated); Onions, 12; Melons or Cucumbers, 1 brace; Lett, 3; Potatos, 15; Cauliflower, 2; Parsnips, 6; Celery, 3; Broad Beans, 18 pods; French Beans, 24 pods.

SPECIAL NOTES—ALTERATION OF SCHEDULE.

Any variety of Parsley is eligible for Competition. Eighteen pods instead of half pecks of Beans of all kinds enumerated. In consequence of the past unfavourable season it has been decided to make the dish of Carter's Champion Runner Beans optional in the Collection.

This magnificent Cup to become the Absolute Property of the Winner.

FOR FULL PARTICULARS APPLY TO

THE QUEEN'S SEEDSMEN, 237 & 238, HIGH HOLBORN, LONDON, W.C.

Carters

Wood Engraving. M. R. W. G. SMITH, ARTIST and ENGRAVER on Wood, 15, Mildmay Grove, London, N. Window Glass, Sheet Lead, Paints, &c. THOMAS MILLINGTON AND CO., IMPORTERS and MANUFACTURERS. New LIST of PRICES, very much reduced, on application. 87, Bishopsgate Street Without, E.C.

Government Emigration. SYDNEY, NEW SOUTH WALES.—Passages are provided for Married Couples not exceeding forty years of age, with or without children, and Single Men and Women not exceeding thirty-five years of age, being FARMERS, MECHANICS, MINERS, LABOURERS, and FEMALE DOMESTIC SERVANTS, on payment of the following rates:—Twelve years and not exceeding forty, £5 10s; one year and under twelve, £5 12s. For passages by the ship "Samuel Plimsoll" (her third voyage), to embark at Plymouth on August 2, and further information, apply to the Agent-General, 3, Westminster Chambers, Victoria Street, S.W.

Russia Mats, Garden Nets, &c. MARENDARE AND FISHER, 9, James Street, Covent Garden, W.C., Importers of Archangel and St. Petersburg Mats, have a large stock of MATS, TANNED NETTING, TIFFANY, RAFFIA FIBRE, &c., at Wholesale Prices.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, which gives the size of every class, may be seen on application. JAS. T. ANDERSON, 77, Commercial Street, Shoreditch, London, E.C.

RUSSIA MATS.—A large stock of Archangel and Petersburg, for Covering and Packing. Second sized Archangel, 20s.; Petersburg, 60s. and 80s.; superior close Mats, 45s., 50s., and 55s.; Packing Mats, 20s., 30s., and 35s. per 100; and every other description of Mats at equally low prices; at J. BLACKBURN AND SONS, Russia Mat and Sack Warehouse, 4, and 5, Wormwood Street, E.C.

E. T. ARCHER'S "FRIGI DOMO."—Patronised by Her Majesty the Queen for Windsor Castle; Prince Christian for Frogmore Lodge; the Royal Gardens, Kew; the late Sir Joseph Paxton; and the late Professor Lindley, &c. MADE OF PREPARED WOOL AND HAIR. A perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied.

PROTECTION FROM THE SCORCHING RAYS OF THE SUN. "FRIGI DOMO" CANVAS.— 2 yards wide ... 1s. 10d. per yard run. 3 yards wide ... 2s. 6d. per yard run. 4 yards wide ... 3s. 6d. per yard run. "FRIGI DOMO" NETTING. 2 yards wide ... 6d. and 7d. per yard run. None genuine unless stamped with Name and Trade Mark. E. T. ARCHER, Stanstead and Brockley Roads, Forest Hill, S.E.; and all Nurserymen and Florists. All goods free to London.

SIR J. PAXTON'S HOT-HOUSES FOR THE MILLION are SIMPLE, CHEAP, and PORTABLE. HERMAN and MORTON, 14, Tichborne Street, Regent Quadrant, W., Horticultural Builders and Hot-water Engineers.

Rosher's Garden Edging Tiles. THE above and many other PATTERNS are made in materials of great durability. The Tiles are especially suited for KITCHEN GARDENS, as they harbour no slugs or insects, take up little room, and, once put down, incur no further labour or expense. Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL FRICKS. Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c. from 3s. per square yard upwards. Pattern Sheets, of plain or more elaborate designs, with prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Bath, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds, and Edging Tiles in great variety. SIZES, CEMENTS, &c. F. ROSHER and CO., Brick and Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truck Load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. PLINTS and BRICK BURNS for Rokerries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities. F. ROSHER and CO.—Addressed see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

HOT-WATER APPARATUS. BARNARD, BISHOP & BARNARDS will be happy, upon application, to furnish estimates for Heating Churches, Conservatories, Greenhouses, Forcing Pits, &c. NORFOLK IRONWORKS, NORWICH.

TANNED GARDEN and POULTRY NETTING.—1. 1 1/2d. per square yard, in 1, 2, 3, and 4-yard widths, not less than 100 yards; 200 yards, £2 12s. 6d. 11. 450 yards, 20 yards wide, £2 3s. 6d. III. 550 yards, 12 yards wide, £2 3s. 6d. TIFFANY, cheap. M. SMITH, 6, Potter Street, Worksp.

NETTING FOR FRUIT TREES, SEED BEDS, RIFE STRAWBERRIES, &c. TANNED NETTING for protecting the above from Frost, Blight, Birds, &c., 2 yards wide 2d. per yard, or 100 yards, 20s., 4 yards wide, 6d. per yard, or 50 yards, 20s. NEW TANNED NETTING, suited for any of the above purposes, or as a Fence for Fowls, 2 yards wide, 6d. per yard; 4 yards wide, 1s. per yard; 3/4-inch mesh, 4 yards wide, 1s. 6d. per yard. TIFFANY, 6s. 6d. and 7s. 6d. per piece of 20 yards. EATON and DELLER, 6 & 7, Crooked Lane, London Bridge.

EDGINGTON'S GARDEN NETTING, the cheapest and most durable, at 1d. per square yard, or in quantities of 250, 500, or 1000 yards, carriage free. EDGINGTON'S CRICKET and GARDEN TENTS are the prettiest. EDGINGTON'S MARQUEES for Hire are the most elegant and capacious. EDGINGTON'S RICK CLOTHS for 69 years have maintained their celebrity as the best. TIFFANY, SCRIM CANVAS, and every other kind of NETTING. Be particularly—FREDK. EDGINGTON & CO., Rick Cloth, &c., Manufacturer to Her Majesty, 52, Old Kent Road, London, S.E. A quantity of good Second-hand Government TENTS for Sale, Cheap.

HARRY BUNYARD supplies:— NETTING FOR FRUIT TREES, &c., 2 yards wide, 2d., 4 yards, 4d. per yard—in pieces 50 yards each. SHARPING CANVAS, 1 yard wide, 2d. and 6d.; 2 yards, 7d. per yard—only in pieces 140 yards each. Smaller quantities at an advance. TENTS, Garden and Cricketing. CRICKETING NETS, MARQUEES and FLAGS on Sale or Hire. Preparation by Post Office Orders, payable at Tootley Street, S.E., from unknown Customers, ensured goods, carriage paid, on amounts of £2 and over. HARRY BUNYARD, Manufacturer, 63 and 64, Tootley Street, S.E.; and 11, Bermondsey Street, London, S.E.

Notice. (By Appointment to the Royal Horticultural Society.) To HORTICULTURAL IMPLEMENT MAKERS, NURSERYMEN, FLORISTS, and OTHERS. ADAMS and FRANCIS INSERT ADVERTISEMENTS in all Newspapers, Magazines, and Periodicals. List of London Papers on application. ADAMS and FRANCIS, Advertisement Agents, 59, Fleet Street, E.C.

Beehives.—Two Silver Medals awarded to
GEO. NEIGHBOUR and SONS at the Paris Exhibition of
 1867. The only English Exhibitors who obtained a Silver
 Medal for Beehives.

NEIGHBOUR'S IMPROVED COTTAGE
 BEEHIVE, as originally introduced by **GEO. NEIGHBOUR & SONS**, working three bell-glasses, is neatly and strongly made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced.

Price, complete £1 15 0
 Stand for ditto 0 10 6
 The **LIGURIAN or ITALIAN ALP BEE** being much in repute, **G. N. & SONS** supply a Swarm of Bees with genuine Italian Queen, in the Improved Cottage Hive, at 4s. Hive included.

An Italian Alp Queen, with full directions for uniting to Black Stocks, 15s. each.

ENGLISH BEES.—Stocks and Swarms may be obtained as heretofore.

THE APIARY. By A. NEIGHBOUR. 5s., postage 4d.
 A newly arranged Catalogue of other improved Hives, with Drawings and Prices, sent on receipt of two stamps.

Agents for Straw, Woodbury, and other Hives and Supers, made by James Lee, at his prices.
GEO. NEIGHBOUR and SONS, 127, High Holborn, W.C., or 149, Regent Street, London, W.

W. H. LASCELLES, HORTICULTURAL
 BUILDER, Finchbury Steam Joinery Works,
 121, Bunhill Row, London, E.C.

Estimates given on application for GREENHOUSES and CONSERVATORIES of all kinds, and to any design.

Reduced Prices.

THE CELEBRATED GRANITIC
 PAINT. Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company.
 For Price Lists, Testimonials, and Patterns of Colours, apply to **THOMAS CHILD, Manager**, 39A, King William Street, London, E.C.

THE SILICATE ZOPISSA
 COMPOSITION. TO CURE DAMP IN WALLS, and PRESERVE STONE, &c., from DECAU, at a very trifling cost. Manufactured Solely and Only by the Silicate Zopissa Composition and Granitic Paint Company, Colomijnss, and in all Colours.
 For particulars and Testimonials, apply to **THOMAS CHILD, Manager**, 39A, King William Street, London, E.C.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK
 VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which **HILL & SMITH** will forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNQUALIFIED TESTIMONIAL.

"Glangwily, Llanpumpant, Carmarthen, Nov. 27, 1873.
 Mr. Lloyd Lloyd encloses cheque for £3 5s., amount due to Messrs. **HILL & SMITH**, and he considers the Black Varnish one of the most useful things he ever possessed."

Apply to **HILL AND SMITH**, Brierly Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of **HILL & SMITH** that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

MESSENGER & COMPANY,
 CONTRACTORS, MIDLAND HORTICULTURAL BUILDING
 AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Beg to inform their numerous Patrons and the Public generally, that having erected new, more extensive, and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, large or small, they are in a position, from their great facilities and experience, to carry out with dispatch, in the best manner, at very moderate cost, the orders with which they are entrusted. Only thoroughly well-seasoned timber used. Glasshouses erected on Messenger's patent principles are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed; are economical in cost and maintenance. Messenger's Patent Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application.

Plans and Estimates forwarded. Ladies and Gentlemen waited upon. The Plans of Architects and others carried out. Richly Illustrated CATALOGUE post free for 33 Stamps. Illustrated CIRCULAR free.

THE COWAN PATENTS COMPANY, LIMITED, 21, WHITEHALL PLACE, LONDON, S.W.

ESPALIER WALKS,

FOR NEATLY TRAINING FRUIT TREES,

Of which figure No. 107 is a representation, and which is adapted to the Training of Apples, Pears, and other kinds of Fruit Trees, such as Raspberry, Currant, &c. The Fruit is much improved both in size and flavour by this treatment, deriving the full benefit of sun and air. As a Division for each side of a Kitchen Garden Walk, for Screening the Plots of Vegetables, especially where visitors have to pass through, their adoption is highly recommended. The Wire suitable for this purpose should be Rope or Cable Wire, on account of its neat appearance. The same being about nine inches apart, attached at each end to a strong wrought iron post, each Wire having a separate winding ratchet, can be tightened with the greatest ease when required.

No. 107.

Estimates given for the above Espalier Work on receipt of lengths required.

USEFUL AND ORNAMENTAL FOR GARDENS AND CONSERVATORIES.

Iron and Wire Work—Arches
Iron and Wire Work—Rose Fence or Screen
Iron and Wire Work—Roseries

R. H. begs most respectfully to solicit the favour of Gentlemen or their Gardeners who are contemplating making Alterations in their Gardens, to apply for one of his "NEW ILLUSTRATED CATALOGUES OF DESIGNS," suitable for Gardens and Conservatories.

R. HOLLIDAY, Horticultural Iron and Wire Works, 2A, PORTOBELLO TERRACE, NOTTING HILL GATE, W.

In One Vol., 4to, price 2s. 6d., by post 2s. 8d., Illustrated by CHATSWORTH; by LLEWELLYN JEWITT, F.S.A.

Those of our readers who would learn more of the Palace of the Tueries, its beautiful gardens and unrivalled art-treasures, will do well to consult Mr. Llewellyn Jewitt's admirably written and charmingly illustrated monograph, published by Messrs. Bland and Sons, of the Strand, &c., &c., under the title of *Notes of the Visit of F.R.S., the Prince of Wales to Chatsworth in the "Graphic," December 28, 1872.*

"It is well written, and is sure to be a favourite book of reference for all who can appreciate a scholarly account of one of the noblest mansions in Great Britain. We heartily thank Mr. Jewitt for this contribution to the literature of Derbyshire." *Every Hour.*

"This is an elegantly got-up book, in small quarto, with upwards of fifty engravings, by a writer of well-known ability, and possessing special facilities granted for the purpose of publication." *Sheffield Independent.*

Also, uniform with "Chatsworth," in One Vol., 4to, price 2s. 6d., by post 2s. 8d., Illustrated upwards of fifty engravings. **HADDON HALL: an Illustrated Guide and Companion to the Tourist and Visitor, with Notices of Huxton, Bakewell, Rowsley, Matlock, Bath, and other Places in the Neighbourhood.** By S. C. HALL, F.S.A., and LLEWELLYN JEWITT, F.S.A.

"At length Haddon Hall has had justice done it." *Every Hour.*
 "A popular account of the Hall and its neighbourhood." *Athenaeum.*

"One of the most desirable works of the kind with which we are acquainted." *Midland Counties Herald.*
 "This little book should find many readers in this populous district." *Manchester Examiner and Times.*

"The book is pleasantly written and profusely illustrated." *Manchester Courier.*
 An "admirable monogram." "Our American cousins are held by their countrymen to have done England imperfectly, if, when visiting the old country, they omit to make a pilgrimage to Haddon." *The Graphic, January 4, 1873.*

"Chatsworth" and "Haddon Hall" may also be had bound together, price 5s., by post 5s. 4d.
 Huxton: J. C. BATES, Advertiser's Office.

RANSOMES' AUTOMATON LAWN MOWERS.

TEN THOUSAND IN USE, GIVING FULL SATISFACTION.
 These Machines leave no Ribs in the Grass, and are unsurpassed for keeping a Lawn or Croquet Ground in first-rate order. They are now fitted with adjustable handles, to suit the height of the person using the Machine. Either "corrugated" or "plain" front rollers can be supplied at pleasure. A pair of short side rollers is sent with every Machine, to replace the usual front rollers when cutting long grass. The grass can be either collected in the box—the neatest plan—or delivered at the back of the Machine and left on the lawn, to prevent the grass burning in dry seasons. These Machines are fitted with the best wheel gearing, the best steel-edged knives, and hardened steel points and bearings.

Sizes from 8 to 20 inches. Prices from 55s.

Carriage paid to the principal Railway Stations in England. Warranted to give satisfaction, and a month's trial allowed. Orders executed on receipt.

Write for Illustrated Price List to

RANSOMES, SIMS AND HEAD, IPSWICH.

Important to Market Gardeners and Others. THE PATENT HAND GARDEN PLOUGH.

This effective little implement meets a long-felt want. It consists of one light but strong steel shovel, for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough, to be used for hilling up the rows when desired; and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separately, and attached or detached in a moment by means of a simple fastening. Its construction enables the user to push it readily and easily through the ground, stirring the earth, if required, to a depth of six inches. It is exceedingly light, strong, and tasty, and fully adapted to the purposes designed. A large number have been sold, and are giving unqualified satisfaction.

Price, complete, with Shovel, Plough, Weed-Cutter, and Rakes, £2 2s.

A Book which every Gardener, every one who has a Garden, and all who are interested in a Garden should have.

HIGH CLASS KITCHEN GARDENING.

A HANDY MANUAL OF IMPROVED CULTIVATION OF ALL VEGETABLES.

By WILLIAM EARLEY.

Author of "How to Grow Mushrooms," &c., &c., &c.

A handy Crown 8vo volume, with Coloured Frontispiece. Price 4s. 6d.

In this volume Mr. Earley has directed attention to a portion of our soil which is frequently overlooked, and at the best of times gets but scant attention—namely, the Kitchen Garden. Everything which is wanted in a Kitchen Garden would well repay any amount of care which is bestowed upon its cultivation, and even the commonest of Vegetables might be vastly improved if a small portion of the labour which is devoted to the Flower Garden were transferred to them. Mr. Earley's work gives detailed instructions for the growing of all kinds of vegetable produce—a subject upon which he has been for some years past a recognised authority.

A Work which should be at every Gardener's right hand, and which should have a place in every Country Gentleman's Library.

SIR JOSEPH PAXTON'S BOTANICAL DICTIONARY.

COMPRISING THE NAMES, HISTORY, AND CULTURE OF ALL PLANTS KNOWN IN BRITAIN, TOGETHER WITH A FULL EXPLANATION OF TECHNICAL TERMS.

Communications for the Editor and Advertisements to be addressed to the *Villa Gardener* Office, Salisbury Square, Fleet Street, London, E.C.

Work on Botany, by Dr. Lindley.

THE VEGETABLE KINGDOM; or, THE STRUCTURE, CLASSIFICATION, AND USES OF PLANTS. Illustrated upon the Natural System. In One Volume, 8vo, cloth, price 25s., with upwards of 300 Illustrations.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic economy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages; where they are arranged in the manner proposed in the *Vegetable Kingdom* of the author, with the sequence of matter departed from a few instances, when it was believed that the convenience of Younger students would be promoted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

London: BRADBURY, AGNEW AND CO., Bouverie Street, E.C.

PAXTON'S CALENDAR.

NOW READY, A NEW AND THOROUGHLY REVISED EDITION OF THE

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruits, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

PARTNERSHIP.—W. BROWN, Florist,

Weybridge, Surrey, is desirous of meeting with a person willing to enter into Partnership with him with a view of entering into other branches of the Trade (either sleeping or working). Capital required about £600.—Apply to the Nursery, &c., to Mr. JENKINS, Solicitor, 5, Tavistock Street, Strand, W.C.

PARTNERSHIP.—Owing to the decease of

the Proprietor of an Old Established Nursery Business, the Executors are desirous of meeting with a person possessing moderate capital, who would be disposed to take the whole or a portion of the business.—Address, EXECUTOR, care of Messrs. Prothero & Morris, 48, Gracechurch Street, E.C.

Nursery; must have had considerable experience in Budding, Grafting, Training, and the Propagation of Hardy Stuff. Wages 25s. per week.—Mr. J. LUFF, St. Helen's Nursery, Hastings.

WANTED, in a country Nursery, where a

good collection of plants is grown, a young, intelligent, young MAN, anxious to improve himself.—Apply in own writing to K. Nutting & Sons, 65, Barbican, E.C.

To Budders.

WANTED, shortly, TWO good ROSE BUDDERS for a few weeks.—Address, stating terms, to GEO. BOLTON, Wyddial, Buntingford, Herts.

WANTED, a HEAD SHOPMAN, in

an August or September; he must have a thorough knowledge of the Seed Trade in all its departments.—Apply, stating age, experience, and wages expected, to THOMAS KENNEDY and CO., Nurserymen and Seedsmen, Dumfries.

Farm Manager Wanted.

BOROUGH OF BEDFORD URBAN SANITARY AUTHORITY.—The Sanitary Authority for the Borough of Bedford are desirous of procuring a person possessing a competent knowledge of Market Gardening, applications for the office of Manager of their Irrigation Farm. The salary will be £200. per annum, with 10 per cent. on the net returns of the produce of the Farm. The gross return for the year 1874 was about £2500. The Manager will be required to superintend the whole of the duties of the office. Further information may be obtained of the Town Clerk. Applications for the office, stating the age and qualification of applicants must be made to me by letter, on or before the 17th inst.—THOMAS WILKINSON, Town Clerk, Bedford, June 17.

WANT PLACES.

To Gardeners in Want of Situations,

WHOSE CHARACTERS WILL BEAR STRICT INVESTIGATION. **THE PINE-APPLE NURSERY COMPANY** devote special attention to this important matter—Apply to suitable Situations. For a GARDENER, or for a SITUATION, please send full particulars to the PINE-APPLE NURSERY COMPANY, Maids Vale, London, W.

B. S. WILLIAMS, having at the present

time several very excellent GARDENERS on his Register, is desirous of placing them in Situations where good experience and trust are required. B. S. W. would at the same time be glad to receive applications from GARDENERS who would be glad to intimate that when a Gardener is applied to, the nature of the situation should be left with him, so that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Gardeners and Under Gardeners.

WM. CUTBUSH and SON beg to state that they have at all times on their Books MEN of VARIOUS QUALIFICATIONS, whose characters will bear the strictest inquiry. Any Gentleman making application would save time by clearly stating the duties to be undertaken, wages offered, &c., so that suitable Men may be selected.—Highgate Nurseries, London, N.

JOHN LAING can at present recommend

with every confidence several energetic and practical Men of good ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Single-hand situations, can be suited, and have full particulars by applying to St. Dunstons Park and Rutland Park Nurseries, Forest Hill, London, S.E.

GARDENER (HEAD).—Age 28; under-

stands Kitchen and Flower Gardening, Vines and Fines, also Planting, Levelling, and Laying-out of Grounds; could be a Free, and Well-qualified, and a first-rate florist in Liverpool, and New York. Can give good testimonials.—JOHN SHAW, 28, Hethrop Street, Hall Park, Paddington, London, W.

GARDENER (HEAD).—Age 30, single; has

a thorough practical knowledge of all branches. Five years' character.—H. C. J. Huggins, New Wandsworth Railway Station, S.E.

GARDENER (HEAD).—Age 31, married,

one child.—Messrs. THOMAS CRIPPS & SON will have great pleasure in recommending to any Nobleman or Gentleman requiring a Head Gardener, a thoroughly practical, industrious, and trustworthy Man. First-class recommendations and references.—The Nurseries, Tunbridge Wells, Kent.

GARDENER (HEAD).—Age 33, married,

two children. Seventeen years practice in Fruit, Flower, and Vegetable Cultivation, and the routine of a well-kept Garden.—J. H., Vale Nursery, Acton, W.

GARDENER (HEAD).—Age 34; energetic

and practical in all branches. Of tested ability and unexceptionable character. Twenty years' experience.—G. PHILLIPS, 6, Longford Cottages, Feltham, Middlesex.

GARDENER (HEAD).—Age 40, married, no

family; well skilled in all branches of the profession. Good reference.—W. B., 7, Barton Road, Tewkesbury.

GARDENER (HEAD).—Age 40; has a good

knowledge of Fruit and Flower Gardening. Good character.—A. F. 67, Durham Road, Seven Sisters Road, Holloway, London, N.

GARDENER (HEAD), where two or more

are kept.—Age 24, married; thoroughly practical in all branches of the profession. Six years' good character.—H. S., Bishop's Hall Gardens, near Romford, Essex.

GARDENER (HEAD), where two more

are kept.—Age 26, single; has had good practical experience in all branches of the profession. Good character from past and present employers.—H. PLUMBE, East Street, Sleaford, Lincolnshire.

GARDENER (HEAD), where two or more

are kept.—Age 32, married, two children. Will be well recommended by the Gentleman whom he has lately left, with whom he has served in the above capacity for the last six years; also by Mr. Stalker, Gardener to the Right Hon. Gathorne Hardy, M.P., Hemsted Park, Staplehurst, Kent.—H. MANDY, Allington Cottages, West Hill, Epsom, Surrey.

GARDENER (HEAD), where two more

are kept.—Age 27, married, no children; understands Stove and Greenhouse Plants, Early and Late Forcing, Vines, Melons, Cucumbers, and Kitchen Gardening. Six years' good character.—J. W. BINT, Forest Gate, Windsor Park, Park, Berks.

GARDENER (HEAD), where Gardening is

carried on with spirit.—JAMES T. MATTHEWS, late Gardener to General Lord Strathmore, Newalls Park, is open to an engagement as above. Address, stating wages, to JAMES T. MATTHEWS, South Street, Ponders End, N.

GARDENER (HEAD, WORKING), where

three or more are kept.—Married, no family; experienced in all branches of the profession. Seven years' good character.—M. S., 25, Grumman Road, Peckham Road, Camberwell, S.E.

GARDENER (HEAD, WORKING), where

four or five are kept.—Age 27, single. Good references. State wages and all particulars to R. R., Hetchfield Gardens, Bowers, Wiltshire.

GARDENER (HEAD, or good SINGLE-

HANDED).—Age 27; understands Vines, Cucumbers, and Stove and Greenhouse Plants.—A. W., 4, Back Lane, Hampstead, N.W.

GARDENER.—A. N. GERMAN, Gardener,

of Crowhurst Park, Battle, Sussex, will be disengaged on July 1, and is a liberty to treat with any Lady or Gentleman in want of a thorough Gardener.—Address as above.

GARDENER.—Married, no incumbence;

thoroughly practical.—Offers and Late Forcing of Flowers and Fines in all branches.—A. B., 15, Chesterman Street, Southampton Street, Reading, Berks.

To Noblemen and Gentlemen.

GARDENER.—A first-class Man, who has had great experience in the Management of Men and general Superintendence of Nobleman's Establishments.—H. A. Z., Post Office, Waltham, Diss, Norfolk.

GARDENER (WORKING, or SINGLE-

HANDED).—Age married, no family; experienced. Good character. Can look after a horse and trap, if required.—H. C., 8, Addington Place, Queen's Road, Mortlake, Surrey.

FOREMAN, or FOREMAN and PROPAGATOR.—Age 34, married.

Many years' experience in several of the large Nurseries.—C. C., Borough Road, Northorn, Surrey.

FOREMAN, in a good Establishment.—

Age 25; 10 years' good practical experience in all branches of the profession. Will be disengaged the first week in July.—H. S., Ringwood Gardens, Chesterfield.

FOREMAN, in a Nobleman's or Gentle-

man's Establishment.—Twelve years' experience in good places.—H. J., Gardener, Halstead, near Sevenoaks, Kent.

GARDENER (SECOND, or SINGLE-HANDED).

Age 25, single; experienced. Good character.—G. J., 15, Collins Street, Blackheath, S.E.

GARDENER (SECOND).—Age 26, single;

well experienced in the houses. Good references can be given.—S. G., Post Office, Uxal, Monmouthshire.

GARDENER (SECOND), or under a Fore-

man, in the Houses.—Age 29. Good character.—Z. V. X., The Grove Nursery, Southampton Street, Camberwell, S.E.

GARDENER (UNDER).—Age 20; lately

employed in a large Fruit Garden near London preferred. Six years' excellent character from present situation.—F. P., The Vicar, Ilford, Essex.

GARDENER (UNDER), in a Gentleman's

Garden.—Age 20. Has a good knowledge of Greenhouses, and Flower and Kitchen Gardening.—Age 20. Good character from last situation.—A. B., 15, Well's Place, South Street, Camberwell, Surrey.

GARDENER (plain KITCHEN).—Married,

no incumbence; no objection to a Pony and Trap.—H. H., Sidmouth Lodge, 75, Tulse Hill, S.E.

JOURNEYMAN, under a good Foreman

(Honeses preferred).—Age 20. Good character. State wages.—A. E. B., The Gardens, Easton Lodge, Dunmow, Essex.

IMPROVER, in a Nobleman's or Gentleman's

Garden, where Gardening is carried on systematically and with spirit.—H. L., Messrs. Daniels Bros., Seed Growers, Norwich.

To Nurserymen.

ASSISTANT, in the Houses.—Age 23, single. Well up in Plant Growing, Bouquet-making, and other Nursery-work.—GEO. CULLUM, Mrs. Loft's, Water Gate, Beccles, Wiltshire.

SEED, BULB, and NURSERY TRADE.

Wanted a Stationary by a young Man well up in the above.—S. M., Post Office, Newport, near Barnstable.

TO NURSERYMEN.—Wanted to

APPRENTICE a YOUTH for three years indoors, to be treated as one of the family, within 25 miles of London.—J. B., Hadley Post Office, near Barnet, N.

KINAHAN'S S. L. L. WHISKY.

This celebrated and most delicious old mellow spirit is the very CREAM OF IRISH WHISKIES, in quality unrivalled, perfectly pure, and more wholesome than the finest Cognac, Brandy, The Red Seal, Pink Label, and Cork brand of Quinlan's L.L. Whisky. Wholesale Depot, 20, Great Titchfield Street, Oxford Street, W.

DINNEDORF'S FLUID MAGNESIA.

The best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion; and the best mild Aperient for delicate Constitutions, especially adapted for Ladies, Children and Infants.

DINNEDORF and CO., 172, New Bond Street, London,

W.; and of all Chemists throughout the World.

SUPPLEMENT TO THE GARDENERS' CHRONICLE.

CHATSWORTH

MANY circumstances invest Chatsworth with a special interest. Its lovely situation, its palatial character, its treasures of art and literature, its historic associations, the prominent position which the family of Cavendish have always held as patrons of art, literature, and science, the discovery in 1786

of the composition of water by an ancestor of the present Duke; all these circumstances contribute to give Chatsworth a foremost place among the mansions of England. In addition to these points of general interest, it has particular attractions for horticulturists, not only from the completeness and good keep-

ing of its garden establishment, but from the enlightened liberality of, and the services to horticulture rendered by the former and by the present Duke, and also from its association with the memory of some of whom the gardening fraternity have good reason to be proud, [in particular the late Sir Joseph

CHATSWORTH HOUSE FROM THE DERWENT.

Paxton and his pupil, John Gibson, not to mention others still among us.

Chatsworth came into the possession of the Cavendish family in the reign of Queen Elizabeth, but the present mansion was not finished till 1702, under the auspices of the first Duke of Devonshire, while the long *annex*, which somewhat spoils the symmetry of the whole, was added in the time of George IV. by Sir Jeffrey Wyattville. It is placed in the valley of the Derwent, on a slight eminence overlooking the river, and backed up by superbly wooded hills, through breaks among which glimpses may be obtained of the barren Derbyshire moors.

It is a question which is the better way to approach Chatsworth—whether from Rowsley station, when the tourist passes through a few miles of the most delicious park scenery

the rich library, the collection of pictures and drawings by the old masters, Landseer's pictures—these are among the most noteworthy features of this treasure-house. Our business, however, lies with the setting of the casket—with the glories of park and pleasure-ground, the treasures of the conservatories and the stores of the fruit houses. For the same reason we can only mention that ruined moat-encircled tower which formed, so it is said, the prison of Mary Queen of Scots for thirteen long years.

In indicating some of the more remarkable features of so vast an establishment it is a difficult matter to know where to begin, and where our space is too limited to do justice to the whole it is equally difficult to decide what to select and what to pass over unnoticed. The fact that the principal features have repeatedly

in length by 16 feet 6 inches in width. Among its contents may also be mentioned a magnificent crystal of quartz and a noble marble vase.

A long glazed corridor, extending almost from the mansion to a point near the Orchid-houses, is filled with fine specimen greenhouse plants trained against the back wall, among which we mention a noble plant of *Camellia reticulata*, another of the old double white *Camellia*, and a large assortment of other kinds. At the time of our visit the *Camellias* were in free growth, and all abundantly set with flower-buds, though started in February. They are all grown in drift loam, and receive enormous quantities of water. *Escallonias*, *Correas*, *Fuchsias*, *Myrtles*, *Roses*, and such-like plants are also grown here, while *Gloire de Dijon* Rose furnishes an inexhaustible supply of flowers.

EXTERIOR VIEW OF THE GREAT CONSERVATORY.

possible, with the winding river on his right nearly the whole way, and occasional glimpses of the model village of Edensor on his left; or whether he arrives from the direction of Sheffield, crossing the bleak moorlands, very characteristic if not exactly beautiful, and descending through

“Pastoral dales thin set with modest farms,”

into the richly-wooded and well stocked deer park. Tastes will differ upon this point; our advice is, try both.

The general appearance of the “Palace of the Peak,” as seen from the opposite side of the river, is shown in the illustration on the front page. Of its contents we propose to confine ourselves to the mere mention. The sculpture gallery, with its grand examples of the art of Canova and Thorwaldsen, and the chapel and other rooms with their fine specimens of the art of Gibbons;

been described in these columns, particularly in our volume for 1873, pp. 1175, 1238, relieves us of the necessity of going into detail, while the division of the garden establishment into two main portions—*viz.*, the flower garden with the pleasure-grounds, and the kitchen-garden with the forcing-houses—in some degree facilitates our task.

In the former are the Orchid-houses and the great conservatory; in the latter are the Amherstia-house, the Victoria-house, the vineries and other fruit growing houses, and the residence of Mr. Speed, who has charge of the whole.

Beginning our survey of the garden, we have first to call attention to the Orangery, adjoining the mansion, and which contains some very fine specimen greenhouse plants, particularly *Camellias* and *Oranges*. It is about 110 feet

ORCHID HOUSES, &c.—On a terrace near the mansion are three span-roofed houses side by side, with a transverse one crossing them at one end. These houses are light and roomy, and seem adapted not only for growing, but for showing plants to advantage. The one chiefly destined for growing Orchids is divided into three compartments, maintained at different temperatures, according to the particular needs of the species grown in them. In one of these at the time of our visit in spring were a number of specimen plants of *Sarracenias*, with pitchers rivaling in size those with which Mr. Baines was wont to astonish us, though the plants themselves were smaller. Mr. Speed prefers the pitchers formed in the autumn, as being finer and more durable.

Here, too, is a truly magnificent collection of Orchids, including most of the well-known species as well as others of great rarity, but all

cultivated with a skill and degree of success that has made the Chatsworth Orchids notorious. It is Mr. Speed's object not only to grow a grand collection of Orchids but to grow them well, and to furnish very large supplies of their flowers for decoration. Large plants, and plenty of them, are, therefore, required: in illustration of which we may record that of *Dendrobium nobile* upwards of 2000 spikes were cut in the season; of *Vanda suavis*, 160 spikes; of *Phaius grandifolius*, fifty spikes in one day. The *Vandas* are specially remarkable for their size and robust vigour, while they are well furnished with leaves to the bottom, the spikes numbering as many as thirty on the same plant. The genus is represented by almost all the known species and varieties, including *Vanda coerulescens* and the more common *V. teres*. *Dendrobiums* are grown in quantities; among them we note *D. fimbriatum*, *Dayi*, *Devonianum*, *Farmeri*, and others. The collection of *Acridas* and *Saccobolium* is equally complete and remarkable.

wonderful growth. Mr. Speed attributes much of their robust vigour to the practice of syringing them pretty freely overhead.

The plants are grown on slate stages covered with spar, others on blocks, and, as a general rule, Mr. Speed finds that moss or any substance which prevents the free access of air to, or retains stagnant moisture around, the roots of Orchids on blocks, is injurious, and certainly the difference in the growth of the roots where the moss was dispensed with, as compared with that in which it was present, was very marked.

In this house also were some of the more ornamental and curious Ferns, among which we may cite *Lindsaea Portei*, which Mr. Speed succeeds in propagating by pegging the stems down; *Adiantum gracillimum*, that most delicate of *Adiantums*, and which does not, as was feared by some, lose its misty veil-like aspect as it gets older; and *Athyrium Gorin-gianum pictum*, a Fern with whose beauties

of the old and new styles without the bad ones of either. The one great advantage of such a garden is the infinite variety of which it is capable. At all seasons of the year it may be made interesting, and every day will reveal something fresh and novel to the plant lover, which is a good deal more than can be said of the modern style of bedding out. Overlooking this garden is an old conservatory, containing some fine specimen *Camellias*, &c.

THE ROCK GARDEN.—Huge masses of brownish millstone grit piled irregularly here and there on undulating ground, with paths winding about among them—a cascade splashing noisily over one giant boulder called the Wellington Rock, and losing itself in the ravines below—dark funeral Yews, relieved in the blooming season by gorgeous masses of *Rhododendrons* and brilliant groups of *Berberis Darwinii*—such are the main features of this, the most extensive and most ambitious rock-garden made by the

THE MUSA AVENUE.

TANK IN THE CONSERVATORY.

Angrecum eluraneum, with magnificent foliage, and a fine specimen of *Miltonia virginialis*, probably the best in the country, also demand special notice. It is worth noting here that many of our finest Orchids, such as *Dendrobium Devonianum*, *Vanda teres*, and others, were introduced to Chatsworth and to Europe by the late John Gibson. Of *Calanthe Veitchii* the quantities grown are enormous, the bulbs being plump and so large as to suggest the idea of Mangel Wurzel rather than of Orchids. The tops of these bulbs are cut across and struck as cuttings. Of *Cælogyne cristata* there are truly magnificent specimens, and the bulbs cover the pots like so many small Potatoes. Mr. Speed finds this species does not do so well on blocks as in pans. *C. Lemoniana* is found useful as coming in later, though it is scarcely so fine as the typical *C. cristata*. *C. pandurata* and the rare *C. Parishii* are also to be seen here, the latter with green flowers springing from the top of the pseudobulb.

Pleiones were not in bloom at the time of our visit, but their foliage was as vigorous as that of Lettuces. In one of the cooler houses were some plants of *Disa grandiflora* making really

most gardeners are conversant. We cannot stay to mention more of the contents of these houses. The general reader, who is familiar with the enormous demand made now-a-days for cut flowers and for decorative plants, will understand that a very large collection of stove and greenhouse plants must be grown for the purpose. We must not, however, omit to mention a plant of *Hypocalymna robusta*, an elegant myrtaceous shrub, which is not so often seen now-a-days as it should be.

THE ITALIAN GARDEN.—Very quaint in appearance is the garden known under this name, and of which the figure on p. 7 gives an illustration. It is a garden of the old style, maintained as nearly as possible in the same way and planted with the same plants as were in vogue at the time of its formation. It is thus a most interesting relic, and at the present time may be advantageously contrasted with more modern efforts. At the same time it is easy to see how, by a judicious selection and furnishing, such a garden might, without materially altering its lines, be made to combine the good qualities

hands of man that is known to us. As might be expected, alpine and rock plants find here congenial homes, but not in such numbers or diversity as might be looked for; truly there is room for representatives of the whole flora of Switzerland or the Pyrenees. Up on the hill-side, not far off, under some gnarled Oaks, is a glorious wilderness of fallen rock and boulders, and, did circumstances permit, a little judicious planting there would produce an even finer effect than does the existing rock-garden, but then it would be comparatively inaccessible, while one charm of the present rock-garden consists in this—that you may pass abruptly from smooth dressed garden to this picturesque undulating spot, with its rocking stones, nicely poised stone doors, and other surprises, not forgetting the "water tree," so fascinating to the Sheffielders; and again, still more surprising, you pass under a rocky arch, and find yourself suddenly face to face with the great conservatory—a grand structure, so cleverly hidden that you would scarce suspect its existence were it not for an occasional glint between the trees.

THE GREAT CONSERVATORY.
—Long unrivalled as the great conservatory of the kingdom, still second only to the Palm-house at Kew in dimensions, and superior to it as to the arrangement of its contents—this fine structure may serve as an appropriate monument to the skill of its designer, Paxton. It is placed on a sunken platform bordered by Wellingtonias, one of which is remarkable for its elegant drooping habit. The general appearance of this magnificent house is well shown in the illustration on page 2.

It is some 300 feet in length, 145 feet in width, and 65 feet in height, and covers an acre of ground. The roof is curvilinear, and surmounted by an upper storey of the same shape. For details of its construction we may refer to our volume for 1845, p. 339. Its plan is very simple, consisting merely of a central nave and two side aisles; a gallery runs round the building between the main structure and the lantern, and a broad walk—broad enough to admit a carriage being driven through—traverses the building from end to end. In the centre a smaller path, called the *Musa Avenue* (see p. 3), crosses this at right angles.

Almost all the plants are planted out, and thus unsightly tubs and contrivances for raising this or lowering that specimen are dis-

pensed with. A stage for pot plants runs round the sides of the building. A large mass of rockwork concealing the steps leading to the gallery occupies one corner of the building,

considerations beyond mere beauty and elegance have to be attended to; scarcely a single deciduous tree or shrub, for instance, finds a place at Chatsworth in the Palm-stove. It would be

HANGING BASKET IN THE CONSERVATORY.

and is laved at the base by a serpentine streamlet of water (see p. 3). Overhead are magnificent hanging baskets of Ferns, of Achimenes, of Epiphyllums, in various combinations. The basket of *Adiantum cuneatum* shown on p. 5 is about 6 feet through, and has a grand appearance in its position over the entrance door. The basket shown in the accompanying illustration is a combination of *Platycerium* and other Ferns, and *Epiphyllum*, and measures 10 feet through.

Such are the main features of this glorious plant-house: the plan is simplicity itself, the effect proportionately grand and majestic. As it is not an object to grow a collection, but rather a selection of the best and most effective plants, each plant is allowed plenty of room to develop itself, and thus the tangled confusion inevitable where an immense number of different plants have to be grown together is avoided. The Palm-stove at Kew may be more imposing as to its contents, but Chatsworth presents the more grace and elegance, and is destitute of many eyesores which are unavoidable where other

INTERIOR OF THE VICTORIA HOUSE.

tedious to attempt the enumeration of the contents of this Palace of Palms. We must content ourselves with alluding to a few only.

How grand the view on entering from either end is may be gleaned from Mr. Worthington Smith's illustrations. Almost equally effective is the transept, which forms a veritable grove of Musas—*M. Cavendishii*, *M. sapientum*, *M. coccinea*, &c. It matters not in which direction the eye is turned, something grand or elegant meets the view; but if we suppose the visitor entering by the door nearest to the mansion, and passing first round the aisles and then up the centre, we shall be enabled to indicate, in something like order, some of the more prominent objects of interest.

First of all, after feasting on the grand vista of the central avenue, the hanging baskets before alluded to will attract attention, not only from their dimensions, but from their beauty, richness and variety of furnishing. A *Dicksonia*, one of the first imported, is one of the first plants that demands notice. Near it is a group of giant *Agaves*, looking grander and finer here, in all probability, than in their native country, where no fostering care prevents them from injury and disfigurement. The side stages at the time of our last visit were largely

HANGING BASKET IN THE CONSERVATORY.

occupied with *Epiphyllums*, of which Mr. Speed makes great use for decorative purposes, and other flowering plants. From this side walk a view is obtained of a remarkable plant of *Re-*

nanthera coccinea, one of the features of Chatsworth. It is attached to a birch stump, and is now as high as the top of the column near which it is placed; it has bloomed for six years in succession, the remains of the old inflorescences being left on the plant to satisfy the doubts of the incredulous. *Crimums*, including the deliciously scented *C. Elphinstoni*, occupy the foreground, while in the background *Beaucarneas*, *Dracenas* and arborescent *Yuccas* rear aloft their long leafy tresses. A glorious mass of *Bamboo*, with leaves of richest green, the secret of which was rendered patent to nose and eye at the time of our visit, in the shape of copious applications of rich manure, forms an arch over one end of the central avenue, passing by which we come to masses of *Sugar-cane*, to a *Cinnamon* bush, with its tender unfolding leaves of a lovely pink colour. Near here is a fine specimen of the *Looking-glass tree*, *Heritiera macrophylla*; and then crossing the end of the *Musa* transept we come to a clear pool (see p. 3), bordered with *Colocasias* and *Papyrus*, *Richardias* and *Pontederias*, and other aquatic plants, and backed up by a giant rocky mass all overgrown with countless *Begonias* and seedling Ferns, *Dicksonias* and *Adiantums* chiefly, and between whose crevices noble specimens

INTERIOR OF THE GREAT CONSERVATORY.

of *Monstera*, with their grand foliage, entwine themselves, and, as it were, bind the stones together. Near here is placed a rugged branch of many arms, thickset with Elk's-horn Fern—a striking picture in itself. Having now completed the circuit of the house, we may pass up the central avenue, noticing on the left fine specimens of Palms, including *Phoenix dactylifera*, *Sabal*, *Corypha australis*, about 50 feet in height; *Chamærops Griffithii*, *Arenga saccharifera*, and *Ceroxylon andicola*. *Dracæna Draco* and *Araucaria brasiliensis* are also represented by large specimens.

On the opposite side is one of the finest plants of *Latania borbonica* in the kingdom, and near it are good examples of *Sabal Blackburniana*, *Corypha unbraculifera*, *Borassus flabelliformis*, and *Seaforthia elegans*; the last-named was bearing its beautiful clusters of lilac flowers at the time of our visit. Some little time since the fruiting of *Hedychium Gardnerianum* was observed by Mr. Bennett at Hatfield, and a representation

air, copious supplies of water, abundance of manure, and as free exposure to light as is possible.

The whole of this conservatory is heated by two flues and four rows of pipes, the boilers being situated in the basement. It is of wood and glass chiefly, and with a ridge-and-furrow roof which furnished the pattern for that of the Great Exhibition of 1851 and of the Crystal Palace at Sydenham.

THE FOUNTAINS, &c.—High up on a plateau on the hill-tops, embowered in trees, are several vast reservoirs which receive the rainfall from the adjacent hills and moors. These reservoirs supply the water for the cascades and fountains. One comes straight down from the hill-top in a rather stiff formal manner, now bounding over rocks, now splashing over steps, now foaming over a water-temple, the whole imposing from its magnitude and height, but too artificial to be pleasing. The Wellington Rock is laved by

autocrat should do—he brooks no peer nor rival near him—and a glance suffices to show that he is worthy the position, and that it would be an impertinent intrusion for minor potentates to approach too closely. The magnitude of this fountain may be judged when it is stated that when playing it lowers one acre of water a foot in the course of an hour.

THE PLEASURE GROUNDS.—Some idea of the extent of this portion of the grounds may be obtained from the fact that there are at least 7 miles of broad walks to maintain in condition, and 104 acres of dressed ground to keep in order, including 50 acres of grass to mow. A portion of this latter is set apart as an arboretum, and in the following notes we shall not confine ourselves strictly to locality, but mention a few of the finer or more interesting trees to be found, either in the park or in the pleasure-grounds. It may then be excusable to mention here the avenue of clipped Tulip-trees leading to the

VIEW IN THE ROCK GARDEN.

THE AMHERSTIA HOUSE.

of it was given in our pages. It was therefore with some interest that we observed the plant to be also fruiting in the conservatory here, where it has not previously been known to fruit. Access to the gallery is obtained by a stone staircase in the rockery, and from it may be obtained a splendid bird's-eye view of the house and its contents. The symmetrical forms of the *Ceroxylon* and other Palms may, from this vantage ground, be seen to great perfection, and as each plant has room to develop itself, the magnificence of the prospect may readily be imagined.

As we have already remarked, almost all the larger specimens are planted out, only those on the side stages, with few exceptions, being in pots. To feed these giants manure is liberally forked in the borders and water supplied with no niggard hand, the hose being kept running on the borders at the roots of the Palms for three months at a time during the day-time. Indeed, in every department Mr. Speed carries out the principle, with modifications according to special requirements, of affording abundant food to his plants in the shape of plenty of

another stream, which, falling into a pool at the foot of the rock, thence meanders through the rock-garden, to which it contributes a large share of beauty.

But the fountain of Chatsworth is, of course, the "Emperor" (see p. 8), and it deserves the name. It was constructed in 1844 (see *Gardener's Chronicle* of that year), and rises from the centre of a basin near the terrace flower gardens as a simple jet to the height of 296 feet, thus overtopping in its airy grace the highest trees in its vicinity. It is difficult to imagine anything more beautiful in its way than this simple jet. Of course, its noble proportions have much to do with the effect, but setting them aside, what a contrast does it present, in its elegant simplicity, with the dolphins and mermaids, the sea-sick monsters, and meaningless squirts that constitute what so many people understand as fountains. The great fountain at the Crystal Palace may challenge comparison as to size, but the effect of that is impaired by the dozens of minor jets, the artificial water temples and the steps in its vicinity. The Emperor stands out alone, as an

principal entrance of the mansion—an avenue we believe to be as unique as effective.

Mention may also be made of a fine weeping Ash, of about 50 feet in height, which some years since was moved from a distance when already of such a size that turnpike gates and other obstructions had to be removed to allow it to pass. In the park are some grand Limes, Beeches, and Hornbeams, while among the rough rocks by the hill-side—rocks which recall the famous Wharfedale crags—fine old Oaks abound. Conifers have been planted among the woods, but some, such as *Araucarias*, have suffered from frost.

In the arboretum proper are groups of special genera, such as *Æsculus*, *Acer*, *Populus*, &c., and numerous fine specimen Conifers, some of which are so remarkable that we are surprised that they have not obtained a wider repute. In particular there is a very fine *Abies Douglasii*, fine enough to suggest a comparison with the grand tree at Dropmore. Of *Picea nobilis* there is also a very fine example, and another which is remarkable for a series of longitudinal cracks in the bark, passing somewhat obliquely

down the trunk, but not continuous one with the other, nor yet completely encircling the trunk. It is surmised that these cracks may be due to excessive sun-heat. *Picea grandis* is also represented by a splendid specimen.

Among others we may cite *Pinus monticola*, *P. Beardsleyana*, *P. excelsa*, *P. pumila*, *P. Banksiana*, *Abies Morinda* and *A. Menziesii alba*. Specimens of *Abies orientalis* and *A. nigra* are remarkable for their habit, which in the former case is very neat, while in the other it is remarkable for the pyramidal growth of the central trunk and the circumstance that the lateral branches have taken root, and in their turn sent up clustering pyramids of foliage around the central one. It may be well, also, in passing, in these days of Larch disease, to note how well the Larch thrives in the plantations here.

that entry and exit are easy. It is nearly 100 feet in length by 26 feet in breadth, 13 feet 6 inches in the lowest and 15 feet in the highest part of the back wall, while in front the height is respectively 8 feet 6 inches and 10 feet. The construction of this house is described in *Paxton's Magazine of Botany* for 1836. At present it is used for growing ordinary greenhouse plants—Acacias, Camellias, Fuchsias, and contains some fine plants of *Rhododendron Gibsoni*, *arborescens*, &c., and many of the original specimens of plants introduced by Gibson but now familiar in most gardens.

At the back is a north house, devoted to Ferns, among which we noticed fine specimens of *Notholaena lanuginosa*, a newly-introduced Fern, *Ceterach aureum*, &c.

THE AMHERSTIA HOUSE.—When, in 1836,

might almost imagine the plant conscious of the consideration paid to it.

To our readers it is not necessary to give any more full description of a plant of which many must have seen the flowers, and more read. As becomes a plant of such exalted rank, it is not easy to multiply it. Nevertheless, cuttings do occasionally succeed, of which we saw an instance in the nursery of Messrs. Fisher, Holmes & Co., near Sheffield. On the shelves around the Amherstia-house is grown a fine collection of Pitcher-plants, which thrive in the damp moist heat, which is maintained in imitation of the climate of Martaban. The Pitchers serve as veritable insect-traps, and from one we saw the half-decayed body of a gigantic cockroach extracted. *Dracenas*, *rotans*, *Marantas* and other heat-loving

THE ITALIAN GARDEN.

FRUIT AND VEGETABLE GARDEN.—This department of the Chatsworth establishment is situated, like the mansion, in the valley of the Derwent, and three quarters of a mile distant on the Chesterfield side of the park. The ground fenced in is about 12 acres, divided into four compartments, with a wide slip all round, and within the boundary are situated the gardener's residence—a handsome stone structure, erected for Sir Joseph Paxton (see p. 8)—the Amherstia and Victoria houses, Vinceries, Peach-houses, Fig-houses, Pine-pits, &c., *ad infinitum*.

THE RIDGE-AND-FURROW GREENHOUSE, close by Mr. Speed's residence, is one of the earliest of Paxton's ridge-and-furrow erections, having been erected about 1834. It is of wood and glass, and has a sloping roof, thrown into ridges and furrows. This house has no doors, but the side sashes slide in double grooves, so

English plant lovers first became acquainted, mainly through the writings and illustrations of Dr. Wallich, with the Amherstia, it became an object of ambition with the late Duke of Devonshire to possess and cultivate a tree described as "one of the most superb objects imaginable, with large pinnate leaves, and large scentless flowers, of a bright vermilion colour, diversified with three yellow spots, and disposed in gigantic ovate pendulous bunches." To secure this plant the Duke despatched the late Mr. Gibson, who subsequently became known as the creator of Battersea Park, to Burmah. How Gibson succeeded, and how he contrived to send over to his employer many Orchids and other choice plants before alluded to, need not here be told; suffice it to say, the Amherstia has now the place of honour in a polygonal house with a curved roof (see p. 6). Planted out in the centre of the house, one

plants, find a congenial home in this house. Here, too, is a fine example of the lattice-leaf plant, *Ouvirandra fenestralis*, which Mr. Speed succeeds in growing to great perfection, attributing much of his success to frequent syringings overhead. Some of the leaves we found to measure 12 inches in length and 6 inches in width; and at present the plant has two flower-spikes.

THE VICTORIA HOUSE.—This was one of the earliest structures built for the reception of the Queen of Water Lilies, and it remains quite one of the best, if not, indeed, the very best in the country. It was fully described and illustrated in our columns in 1850, p. 548, and again in 1873, pp. 1175, 1238.

It is a square structure, with ridge-and-furrow roof (see p. 4), a circular tank in the centre for her nymph-like majesty, and other smaller tanks in the corners and sides of the building for her

THE EMPEROR.

courtiars. The water in the central tank is kept in gentle motion by two small water-wheels. A good collection of *Nymphæas*, *Nelumbiums*, and other aquatic plants is here maintained, and when one sees how beautiful they are it is a matter of surprise that they are not more frequently grown.

Here, it may be remembered, the *Victoria* first flowered in November, 1849. The fine red variety of *Nymphæa Lotus*, called *N. Devoniana*, was also raised here. The effect of this house is considerably enhanced by placing Palms, *Colocasias*, and other fine-foliage plants in pots around the edges of the tank. Overhead are some hanging baskets filled with *Achimenes*, and which, measuring some 5 and 6 feet through, are now perfect globes of blossoms.

In terminating this necessarily very condensed account of Chatsworth, we cannot forbear from making passing allusion to Paxton, who went to Chatsworth from Chiswick in 1826, rose to be superintendent of the whole Chatsworth estates, suggested the design for the Exhibition of 1851, and of the Sydenham Crystal Palace, who was knighted by Her Majesty, and who became M.P. for Coventry. He was one of the founders of this journal, and a full account of his career will be found in our columns soon after his decease in 1865. At present the garden is under the management of Mr. Speed, and all the departments under his charge testify to his skill and excellent management. A portrait and brief account of Mr. Speed's gardening career is given at p. 783, vol. ii., 1874, while some

notes on the fruit-houses and kitchen gardens, for which we have no space in this supplement, will be found in the pages of our present issue.

Lastly, we must record our thanks to his Grace the Duke of Devonshire, to whose courtious permission we are indebted for this opportunity of bringing under the notice of our readers a horticultural establishment second to none in the kingdom, and one which has never-failing attractions for the gardening fraternity as for the general public to whom these attractions are made available by the ungrudging liberality of the Duke. To Mr. Speed and his assistants our thanks are also due, for the facilities so cordially offered us in inspecting and noting some among the many treasures of Chatsworth.

THE GARDENER'S HOUSE.
